Response: We appreciate the commenters' support for our proposals. We address comments pertaining to the difference between the 3-year urban to rural transition adjustment and the 1-year 50/50 blended wage index transition adjustment, as well as the requested 3-year transition period for all hospitals experiencing a negative impact in section III.B.2.e.(4) of the preamble of this final rule.

After consideration of the public comments we received, we are finalizing our proposals without modification. We will provide hospitals that are changing from an urban to a rural labor market area a 3-year wage index adjustment. Specifically, for hospitals that are currently located in an urban county that became rural under the new OMB delineations, and have no form of wage index reclassification or redesignation in place for FY 2015 (that is, MGCRB reclassifications under section 1886(d)(10) of the Act, redesignations under section 1886(d)(8)(B) of the Act, or rural reclassifications under section 1886(d)(8)(E) of the Act), we will assign them the urban wage index value of the CBSA in which they are physically located for FY 2014 for a period of 3 fiscal years (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied to the area wage index). If the hospital cannot be assigned the wage index value of the CBSA to which it is geographically located in FY 2014 because that CBSA is split apart and no longer exists, and some or all of its constituent counties are added to another urban labor market area under the new OMB delineations, hospitals located in such counties that became rural under the new OMB delineations will be assigned the wage index of the FY 2015 urban labor market area that

contains the urban county in their FY 2014 CBSA to which they are closest (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied) for a period of 3 fiscal years. Any hospital that is currently located in an urban county that would become rural for FY 2015 under the new OMB delineations, but also has a reclassification or redesignation in effect for FY 2015 (from a preexisting reclassification or redesignation granted prior to FY 2015), will not be eligible for the 3-year transition wage index. Accordingly, if a hospital is currently located in an urban county that would become rural for FY 2015 under the new OMB delineations and such hospital sought and was granted reclassification or redesignation for FY 2015 or such hospital seeks and is granted any reclassification or redesignation for FY 2016 or FY 2017, the hospital will permanently lose its 3-year transitional assigned wage index status, and will not be eligible to reinstate it.

With respect to the wage index computation, we will follow our existing policy regarding the inclusion of a hospital's wage index data in the CBSA in which it is geographically located (we refer readers to Step 6 of the method for computing the unadjusted wage index in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51592)). Beginning with FY 2015, the wage data of all hospitals receiving this type of 3-year transition adjustment will be included in the statewide rural area in which they are geographically located under the new OMB delineations. After the 3-year transition period, beginning in FY 2018, these formerly urban hospitals discussed above will receive their statewide rural wage index, absent any reclassification or redesignation. In addition, the hospitals receiving this 3-year transition because they are in counties that are urban under the current CBSA definitions, but become rural under the new OMB delineations, will not be considered urban hospitals. Rather, they will maintain their status as rural hospitals for other payment considerations.

(3) Transition for Hospitals Deemed Urban Under Section 1886(d)(8)(B) of the Act Where the Urban Area Became Rural Under the New OMB Delineations

As discussed in section II.H.3. of the preamble of the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28061 through 28062) and this final rule, there are some hospitals that are currently geographically located in rural areas but are deemed to be urban under section 1886(d)(8)(B) of the Act. For FY 2015,

some of these hospitals currently redesignated under section 1886(d)(8)(B) of the Act would no longer be eligible for deemed urban status under the new OMB delineations, as discussed in detail in section III.H.3. of the preamble of this final rule. Similar to the policy implemented in the FY 2005 IPPS final rule (69 FR 49059), and consistent with the policy we proposed for other hospitals in counties that were urban and would become rural under the new OMB delineations, we proposed to apply the 3-year transition to these hospitals currently redesignated to urban areas under section 1886(d)(8)(B) of the Act that would no longer be deemed urban under the new OMB delineations and would revert to being rural. That is, for FYs 2015, 2016, and 2017, assuming no other form of wage index reclassification or redesignation is granted, we proposed to assign these hospitals the FY 2015 area wage index value of hospitals reclassified to the urban CBSA (that is, the attaching wage index) to which they were redesignated in FY 2014 (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied). If the hospital cannot be assigned the reclassified wage index value of the CBSA to which it was redesignated in FY 2014 because that CBSA would split apart and no longer exist, and some or all of its constituent counties would be added to another urban labor market area under the new OMB delineations, we proposed that such hospitals would be assigned the wage index of the hospitals reclassified to the FY 2015 urban labor market area that contains the urban county in their FY 2014 redesignated CBSA to which they are closest for a period of 3 fiscal years. We proposed to assign these hospitals the area wage index of hospitals reclassified to a CBSA because hospitals deemed urban under section 1886(d)(8)(B) of the Act are treated as reclassified under current policy, under which such hospitals receive an area wage index that includes wage data of all hospitals reclassified to the area.

We did not receive any specific public comment addressing these proposals. In general, commenters were supportive of CMS' proposal to implement the new OMB labor market delineations, including the policy to mitigate the negative effects of the transition to a new labor market area. We are finalizing our proposal to provide a 3-year adjustment to hospitals that were deemed urban under 1886(d)(8)(B) of the Act under the current labor market delineations, but are considered rural under the new delineations. We will

apply the 3-year transition to these hospitals currently redesignated to urban areas under section 1886(d)(8)(B) of the Act that are no longer be deemed urban under the new OMB delineations and will revert to being rural. That is, for FYs 2015, 2016, and 2017, assuming no other form of wage index reclassification or redesignation is granted, we will assign these hospitals the FY 2015 area wage index value of hospitals reclassified to the urban CBSA (that is, the attaching wage index) to which they were redesignated in FY 2014 (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied). If the hospital cannot be assigned the reclassified wage index value of the CBSA to which it was redesignated in FY 2014 because that CBSA was split apart and no longer exists, and some or all of its constituent counties were added to another urban labor market area under the new OMB delineations, such hospitals will be assigned the wage index of the hospitals reclassified to the FY 2015 urban labor market area that contains the urban county in their FY 2014 redesignated CBSA to which they are closest for a period of 3 fiscal years. We will assign these hospitals the area wage index of hospitals reclassified to a CBSA because hospitals deemed urban under section 1886(d)(8)(B) of the Act are treated as reclassified under current policy, under which such hospitals receive an area wage index that includes wage data of all hospitals reclassified to the area. Beginning in FY 2015, affected hospitals will be assigned the reclassified wage index of an urban area (as described above) for a period of up to 3 years. This wage index assignment will be forfeited if the hospital obtains any form of wage index reclassification or redesignation.

(4) Transition for Hospitals That Will Experience a Decrease in Wage Index Under the New OMB Delineations

While we believe that instituting the latest OMB labor market area delineations would create a more accurate wage index system, we also recognize that implementing the new OMB delineations may cause some short-term instability in hospital payments. Therefore, in addition to the 3-year transition adjustment for hospitals being transitioned from urban to rural status as discussed above, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28062), we proposed a 1-year blended wage index for all hospitals that would experience any decrease in their actual payment wage index (that is, a hospital's actual wage index used for payment, which accounts for all

applicable effects of reclassification and redesignation) exclusively due to the proposed implementation of the new OMB delineations. Similar to the policy adopted in the FY 2005 IPPS final rule (69 FR 49033), we proposed that a post-reclassified wage index with the rural and imputed floor applied would be computed based on the hospital's FY 2014 CBSA (that is, using all of its FY 2014 constituent county/ies), and another post-reclassified wage index with the rural and imputed floor applied would be computed based on the hospital's new FY 2015 CBSA (that is, the FY 2015 constituent county/ies). We proposed to compare these two wage indexes. If the proposed FY 2015 wage index with FY 2015 CBSAs would be lower than the proposed FY 2015 wage index with FY 2014 CBSAs, we proposed that a blended wage index would be computed, consisting of 50 percent of each of the two wage indexes added together. We proposed that this blended wage index would be the hospital's wage index for FY 2015. We stated our belief that a 1-year, 50/50 blend would mitigate the short-term instability and negative payment impacts due to the proposed implementation of the new OMB delineations, providing hospitals with a transition period during which they may adjust to their new geographic CBSA or may assess any reclassification options that would be available to them starting in FY 2016. We proposed a longer 3-year transition adjustment for hospitals losing urban status because there are significantly fewer affected urban-to-rural hospitals, and we believe the negative impacts to a hospital shifting from urban to rural status would typically be greater than other types of transitions. We believe that a transition period longer than 1 year to address other impacts of the proposed adoption of new OMB delineations would reduce the accuracy of the overall labor market area wage index system because far more hospitals would be affected.

In addition, for FY 2015, for hospitals that would receive the proposed 3-year transition, it is possible that receiving the FY 2015 wage index (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied) of the CBSA where the hospital is geographically located for FY 2014 might still be less than the FY 2015 wage index that the hospital would have received in the absence of the adoption of the new OMB delineations (particularly in States where the rural floor is historically very high). Therefore, such a hospital may

additionally benefit from application of the 50/50 blended wage indexes. Accordingly, we proposed to include the assignment of the 3-year transitional wage index in our calculation of the FY 2015 portion of the 50/50 blended wage index for that hospital. After FY 2015, such a hospital may revert to the second year of the 3-year transition. For example, if Hospital X (formerly part of CBSA 12345, now rural) is assigned CBSA 12345's FY 2015 wage index value of 1.0000 as part of the 3-year transition, but that FY 2015 wage index value would have been 1.1000 under the previous OMB delineations, that hospital would receive a 50/50 blended wage index of 1.0500 for FY 2015. In FY 2016 and FY 2017, Hospital X would still be eligible to receive the remaining 2 years of the 3-year transition wage index of CBSA 12345 (that is, in FY 2016, Hospital X would receive the FY 2016 wage index of CBSA 12345 (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied)), and in FY 2017, Hospital X would receive the FY 2017 wage index of CBSA 12345 (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied).

Comment: Commenters were generally supportive of CMS' efforts to mitigate the negative impacts from the transition to the new OMB delineations. A number of commenters requested that CMS expand the 1-year 50/50 blended wage index adjustment for a longer period of time. One commenter suggested the adjustment be phased in over multiple years, with a first year adjustment equal to the hospital's wage index under the current CBSA definitions. Several of these commenters stated that because hospitals cannot obtain an MGCRB reclassification under the new OMB delineations until FY 2016, the adjustment for FY 2015 should negate any negative impacts from the transition to the new OMB delineations. These commenters explained that the MGCRB timetable would not allow them to benefit from newly available reclassification opportunities until at least 1 year following the implementation of new OMB delineations. Other commenters questioned why hospitals that switch from urban to rural could benefit from a longer 3-year transition adjustment, while other hospitals that also would be negatively affected by the transition could only benefit from a single year of a blended transition adjustment, and requested a 3-year transition period for all hospitals experiencing a negative impact. They suggested a similar 3-year

transition adjustment for affected hospitals experiencing a negative impact, including the hospitals that are moving from urban to rural, or are not moving at all, but are being impacted by other hospitals moving in or out of the labor market area.

Response: We appreciate the commenters' support. We explored multiple alternatives to the proposed 1-year 50/50 blended wage index adjustment. While we acknowledge that some providers will see negative impacts based upon the adoption of the new OMB delineations, we also point out that some providers will experience increases in their wage index values from the new OMB delineations. It is CMS' longstanding policy to provide temporary adjustments to mitigate negative impacts from the adoption of new policies or procedures. However, these adjustments must be made in a budget-neutral manner, and all wage index values would be reduced to provide for any such transition benefit.

We continue to believe that, in general, rural labor markets tend to have lower area wage index values than nearby urban areas. We proposed a longer 3-year transition adjustment for hospitals losing urban status because there are significantly fewer affected urban-to-rural hospitals, and we believe the negative impacts on a hospital shifting from urban to rural status would typically be greater than other types of transitions. We believe that a transition period longer than 1 year to address other impacts of the proposed adoption of new OMB delineations would reduce the accuracy of the overall labor market area wage index system because far more hospitals would be affected. We identified nine hospitals that could be negatively affected by their transition from urban to rural status under the new OMB delineations. Based on our experience regarding the impact of the policy established in FY 2005, we believe it is necessary to provide up to a 3-year transition adjustment for these hospitals to prevent the potential for drastic reductions in wage index values. The relatively small number of affected providers causes little concern for potential budget neutrality adjustment distortions in overall wage index values. However, significantly more providers will be negatively affected by other impacts from adopting the new labor market area delineations. Moving away from a 1-year 50/50 blend to an adjustment value that more closely approximates the hospital's previous labor market assignment, or providing for a longer transition period, would result in a significantly larger national

budget neutrality adjustment. We believe the implementation of the new labor market area delineations will create more accurate representations of a hospital's labor market areas, and we do not believe it is appropriate to expand or extend the 50/50 blended wage index adjustment further than what was proposed, because doing so would only further delay what we believe are the more refined and accurate labor market areas, based on the recent 2010 Census. Because the wage index is a relative measure of the value of labor in prescribed labor market areas, we believe it is important to implement the new delineations with as minimal a transition as is reasonable.

Hospitals currently must wait more than a year for an MGCRB reclassification application to become effective. We do not believe the implementation of new OMB delineations requires any modification to this policy. We believe the 1-year 50/50 blended wage index adjustment provides an adequate safeguard against significant hospital payment reductions, and provides hospitals time to assess their reclassification options for future fiscal years.

Comment: One group of commenters suggested CMS made an error in calculating the Connecticut rural wage index value under the old FY 2014 OMB definitions. Commenters claimed that CMS incorrectly assigned a hospital as being reclassified under section 1886(d)(8)(B) of the Act (that is, a "Lugar" hospital) when calculating the wage index under the old delineations. This hospital is located in a county that became urban under the new OMB delineations. Commenters claimed that the hospital opted to waive its "Lugar" status effective for FYs 2013, 2014, and FY 2015 in order to receive its outmigration adjustment. However, when CMS calculated the FY 2014 rural wage index for the purpose of applying the proposed transition blend, CMS calculated the rural wage index with this hospital being reclassified. By including this hospital as reclassified to an urban area, the commenters claimed that the wage index based on the "old" labor market area definitions, and therefore, the proposed FY 2015 payment wage index was significantly lower than it would be if this provider was properly identified as rural under the old definitions.

Response: In prior fiscal years, the Connecticut rural wage index was set by a single hospital. While there were multiple hospitals located in rural areas in the State, all but one obtained or was granted some form of reclassification to another area. The wage data of rural

hospitals that reclassify elsewhere may only be included in their State's rural wage index if doing so would increase the wage index value (section 1886(d)(8)(C)(ii) of the Act). Because including the reclassified rural Connecticut hospitals would have lowered the State's rural area wage index value, the wage index was instead based on that single hospital's data. That hospital was designated urban under section 1886(d)(8)(B) of the Act but waived this status to receive an outmigration adjustment. As discussed in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600), a hospital may submit a request to waive its "Lugar" status for a period of 3 years. By doing so, we would no longer consider the hospital to be reclassified and would always use that hospital's data in the calculation the State's rural wage index. (We note that while we agree that the hospital waived its reclassification status for FY 2014 by accepting the outmigration adjustment, we disagree that the hospital in question waived its reclassified status for FY 2015. According to our records, the hospital sent a letter to CMS dated July 15, 2011, requesting to accept the outmigration adjustment and waive its Lugar redesignation for FYs 2012, 2013, and 2014.) When calculating the wage index based on the "old" labor market area definitions, CMS considered this hospital as being reclassified under section 1886(d)(8)(B) of the Act. Because all the rural Connecticut hospitals were now considered reclassified, the wage index was based upon their combined data because the baseline rural wage index did not include any hospitals. The result of including all reclassified hospitals was a rural wage index value that was significantly lower than in previous years. Considering that several hospitals in Connecticut benefited from the State's rural floor, this reduction in the rural wage index affected multiple hospitals in the State.

After further consideration of the commenters' concerns, we agree with the commenters that this hospital should be treated as rural for the portion of the 1-year blended wage index under the FY 2014 delineations because this hospital had waived its Lugar status by accepting the outmigration adjustment in FY 2014. Therefore, we are revising this hospital's wage index and the wage index of the hospitals affected by this change for FY 2015, as reflected in Tables 2-2, 4A-2 and 4B-2, 4C-2, and 4D-2.

After consideration of the public comments we received, we are finalizing the transition policy as proposed. We will apply a 1-year

blended wage index for all hospitals that would experience any decrease in their actual payment wage index (that is, a hospital's actual wage index used for payment, which accounts for all applicable effects of reclassification and redesignation) exclusively due to the proposed implementation of the new OMB delineations. In FY 2015, a post-reclassified wage index with the rural and imputed floor applied will be computed based on the hospital's FY 2014 CBSA (that is, using all of its FY 2014 constituent county/ies), and another post-reclassified wage index with the rural and imputed floor applied will be computed based on the hospital's new FY 2015 CBSA (that is, the FY 2015 constituent county/ies). We will compare these two wage indexes. If the FY 2015 wage index with FY 2015 CBSAs is lower than the FY 2015 wage index with FY 2014 CBSAs, a blended wage index will be computed, consisting of 50 percent of each of the two wage indexes added together. This blended wage index will be the hospital's wage index for FY 2015.

For FY 2015, for hospitals that would receive the proposed 3-year transition, it is possible that receiving the FY 2015 wage index (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied) of the CBSA where the hospital is geographically located for FY 2014 might still be less than the FY 2015 wage index that the hospital would have received in the absence of the adoption of the new OMB delineations (particularly in States where the rural floor is historically very high). In this situation, we will include the assignment of the 3-year transitional wage index in our calculation of the FY 2015 portion of the 50/50 blended wage index for that hospital. After FY 2015, such a hospital may revert to the second year of the 3-year transition.

(5) Impact of Adoption of New OMB Labor Market Area Delineations

As we did for the proposed rule (79 FR 28062 through 28063), for this final rule, to illustrate how the adoption of the new OMB labor market area delineations will impact hospitals' FY 2015 wage indexes, we compared the final FY 2015 occupational mix adjusted

post-reclassified wage indexes with rural floor budget neutrality applied under the FY 2014 CBSAs and under the FY 2015 CBSAs using the new OMB delineations. (This analysis does *not* include the effects of the out-migration adjustment, the frontier floor, the 3-year hold harmless transition wage indexes, or the 1-year transition blended wage indexes). As a result of applying the new OMB delineations to the wage data, the wage index values for 2,409 urban hospitals (85.6 percent) and 412 (65.2 percent) rural hospitals will increase. The wage index values of 2,372 (84.3 percent) urban hospitals will increase by less than 5 percent, and the wage index values of 14 (0.5 percent) urban hospitals will increase by at least 5 percent but less than 10 percent. The wage index values of 23 (0.8 percent) urban hospitals will increase by greater than or equal to 10 percent. The wage index values of 383 (60.6 percent) rural hospitals will increase by less than 5 percent, 18 rural hospitals (2.8 percent) will increase by at least 5 percent but less than 10 percent, and 11 rural hospitals (1.7 percent) will increase by greater than or equal to 10 percent. However, the wage index values for 397 urban hospitals (14.1 percent) and 220 (34.8 percent) rural hospitals will decrease. The wage index values of 341 (12.1 percent) urban hospitals will decrease by less than 5 percent, 50 urban hospitals (1.8 percent) will decrease by at least 5 percent but less than 10 percent, and 6 urban hospitals (0.2 percent) will decrease by greater than or equal to 10 percent. The wage index values of 191 (30.2 percent) rural hospitals will decrease by less than 5 percent, 28 rural hospitals (4.4 percent) will decrease by 5 percent and less than 10 percent, and 1 rural hospital (0.2 percent) will decrease by greater than or equal to 10 percent. The wage index values of 8 (0.3 percent) urban hospitals and zero rural hospitals will remain unchanged by the adoption of the new OMB delineations. The largest positive impacts are for 8 hospitals in 5 States (Texas, Michigan, Minnesota, Louisiana, and Alabama) that will be moving from a rural to an urban area under the new OMB delineations (ranging from a 17.23 percent increase in Texas to a 24.02 percent increase in wage index in

Alabama), and for 14 hospitals that will be moving from one urban CBSA (FY 2014 CBSA 20764, Edison-New Brunswick, NJ) to new urban CBSA 35614 (New York-Jersey City-White Plains, NY-NJ) under the new OMB delineations, representing a 15.13 percent increase in wage index. The largest negative impacts will be for 5 hospitals in 4 States (New York, Alabama, Idaho, and North Carolina) that will be moving from an urban to a rural area under the new OMB delineations (ranging from a 12.18 percent decrease in North Carolina to a 27.06 percent decrease in wage index in New York). One hospital in Delaware is moving from a rural to an urban area under the new OMB delineations and will experience an 11.38 percent decrease in wage index. Another hospital in Texas is moving from one urban area to another urban area under the new OMB delineations and will experience a 10.19 percent decrease in wage index. These results illustrate that hospitals that move from rural CBSAs to urban CBSAs under the new OMB delineations generally will benefit significantly, while hospitals that move from urban to rural CBSAs generally will have negative impacts. For all hospitals combined, the wage index values of 2,821 hospitals (81.9 percent) overall will increase, and 617 hospitals (17.9 percent) overall will decrease, indicating that most hospitals will be positively affected by the adoption of the new OMB delineations. Furthermore, the magnitude of the changes will be relatively small overall, with only 151 hospitals (4.4 percent) experiencing either an increase or decrease of at least 5 percent.

The following table shows the impact of the adoption of the new OMB delineations on hospitals' FY 2015 wage indexes, comparing the FY 2015 occupational mix adjusted post-reclassified wage indexes with rural floor budget neutrality applied under the FY 2014 CBSAs and the FY 2015 CBSAs using the new OMB delineations. (This analysis does *not* include the effects of the out-migration adjustment, the frontier floor, the 3-year hold harmless transition wage indexes, or the 1-year transition blended wage indexes.)

Percent change in FY 2015 wage index	Number of post-reclassified rural hospitals based on FY 2014 CBSA	Number of post-reclassified urban hospitals based on FY 2014 CBSA	Total number of hospitals
Decrease greater than or equal to 10.0	1	6	7
Decrease greater than or equal to 5.0 but less than 10.0	28	50	78
Decrease greater than or equal to 2.0 but less than 5.0	33	88	121

Percent change in FY 2015 wage index	Number of post-reclassified rural hospitals based on FY 2014 CBSA	Number of post-reclassified urban hospitals based on FY 2014 CBSA	Total number of hospitals
Decrease greater than 0.0 but less than 2.0	158	253	411
No change	0	8	8
Increase greater than 0.0 but less than 2.0	376	2,331	2,707
Increase greater than or equal to 2.0 but less than 5.0	7	41	48
Increase greater than or equal to 5.0 but less than 10.0	18	14	32
Increase greater than or equal to 10.0	11	23	34
Total	632	2,814	3,446

We did not receive any public comments on the analysis in the proposed rule showing the effects of adopting the new CBSA delineations.

(6) Budget Neutrality

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28063), for FY 2015, we proposed to apply both the 3-year transition and 50/50 blended wage index adjustments in a budget neutral manner. We proposed to make an adjustment to the standardized amount to ensure that the total payments, including the effect of the transition provisions, would equal what payments would have been if we would not be providing for any transitional wage indexes under the new OMB delineations.

We did not receive any public comments specific to our proposal to implement the 3-year transition and the 50/50 blended wage index adjustments in a budget neutral manner. We are finalizing the policy as proposed. For a complete discussion on this budget neutrality adjustment for FY 2015, we refer readers to section II.A.4.b. of the Addendum to this final rule.

We note that, consistent with past practice (69 FR 49034), we are not adopting the new OMB delineations themselves in a budget neutral manner. We do not believe that the revision to the labor market areas in and of itself constitutes an “adjustment or update” to the adjustment for area wage differences, as provided under section 1886(d)(3)(E) of the Act.

(7) Determining Disproportionate Share Hospital (DSH) Payments Under the New OMB Delineations

As noted in the FY 2005 IPPS final rule (69 FR 49033), the provisions of § 412.102 of the regulations continue to apply with respect to determining DSH payments for hospitals affected by our adoption of the new OMB delineations. Specifically, in the first year after a hospital loses urban status, the hospital would receive an additional payment that equals two-thirds of the difference

between the urban DSH payments applicable to the hospital before its redesignation from urban to rural and the rural DSH payments applicable to the hospital subsequent to its redesignation from urban to rural. In the second year after a hospital loses urban status, the hospital would receive an additional payment that equals one-third of the difference between the urban DSH payments applicable to the hospital before its redesignation from urban to rural and the rural DSH payments applicable to the hospital subsequent to its redesignation from urban to rural.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28063 through 28064), we proposed to make changes to the regulations to delete § 412.64(b)(1)(ii)(D). In this provision, we currently define a “hospital reclassified as rural” as a hospital located in a county that, in FY 2004, was urban but was redesignated as rural after September 30, 2004, as a result of the most recent census data and implementation of the new MSA definitions announced by OMB on June 6, 2003. Because the term “hospital reclassified as rural” is not used in § 412.64, but is used in § 412.102, we proposed to delete § 412.64(b)(1)(ii)(D) and revise the language at § 412.102 to address the circumstances set forth in § 412.64(b)(1)(ii)(D). The regulation at § 412.102, which addresses special treatment of hospitals located in areas that are changing from urban to rural as a result of a geographic redesignation, is the only location that currently references a “hospital reclassified as rural”, as defined at § 412.64(b)(1)(ii)(D). To avoid confusion with urban hospitals that choose to reclassify as rural under § 412.103, we proposed to revise the regulation text at § 412.102 so that it no longer refers to the defined term “hospital reclassified as rural,” and instead specifically states the circumstances in which § 412.102 applies. In addition, we proposed to modify the regulation text so that it would apply to all transitions from

urban to rural status that occur as a result of any future adoption of new or revised OMB standards for delineating statistical areas adopted by CMS. Specifically, we proposed to revise the regulations at § 412.102 to state that an urban hospital that was part of an MSA, but was redesignated as rural as a result of the most recent OMB standards for delineating statistical areas adopted by CMS, may receive an adjustment to its rural Federal payment amount for operating costs for 2 successive fiscal years as provided in paragraphs (a) and (b) of the section.

We did not receive any public comments regarding either of these proposals. We are finalizing the changes to § 412.102 and § 412.64(b)(1)(ii)(D) as proposed, effective for FY 2015.

C. Worksheet S–3 Wage Data for the FY 2015 Wage Index

The FY 2015 wage index values are based on the data collected from the Medicare cost reports submitted by hospitals for cost reporting periods beginning in FY 2011 (the FY 2014 wage indexes were based on data from cost reporting periods beginning during FY 2010).

1. Included Categories of Costs

The FY 2015 wage index includes the following categories of data associated with costs paid under the IPPS (as well as outpatient costs):

- Salaries and hours from short-term, acute care hospitals (including paid lunch hours and hours associated with military leave and jury duty);
- Home office costs and hours;
- Certain contract labor costs and hours (which includes direct patient care, certain top management, pharmacy, laboratory, and nonteaching physician Part A services, and certain contract indirect patient care services (as discussed in the FY 2008 final rule with comment period (72 FR 47315 through 47318)); and
- Wage-related costs, including pension costs (based on policies adopted in the FY 2012 IPPS/LTCH PPS

final rule (76 FR 51586 through 51590)) and other deferred compensation costs.

2. Excluded Categories of Costs

Consistent with the wage index methodology for FY 2014, the wage index for FY 2015 also excludes the direct and overhead salaries and hours for services not subject to IPPS payment, such as skilled nursing facility (SNF) services, home health services, costs related to GME (teaching physicians and residents) and certified registered nurse anesthetists (CRNAs), and other subprovider components that are not paid under the IPPS. The FY 2015 wage index also excludes the salaries, hours, and wage-related costs of hospital-based rural health clinics (RHCs), and Federally qualified health centers (FQHCs) because Medicare pays for these costs outside of the IPPS (68 FR 45395). In addition, salaries, hours, and wage-related costs of CAHs are excluded from the wage index, for the reasons explained in the FY 2004 IPPS final rule (68 FR 45397 through 45398).

3. Use of Wage Index Data by Suppliers and Providers Other Than Acute Care Hospitals Under the IPPS

Data collected for the IPPS wage index also are currently used to calculate wage indexes applicable to suppliers and other providers, such as SNFs, home health agencies (HHAs), ambulatory surgical centers (ASCs), and hospices. In addition, they are used for prospective payments to IRFs, IPFs, and LTCHs, and for hospital outpatient services. We note that, in the IPPS rules, we do not address comments pertaining to the wage indexes of any supplier or provider except IPPS providers and LTCHs. Such comments should be made in response to separate proposed rules for those suppliers and providers.

D. Verification of Worksheet S-3 Wage Data

The wage data for the FY 2015 wage index were obtained from Worksheet S-3, Parts II and III of the Medicare cost report for cost reporting periods beginning on or after October 1, 2010, and before October 1, 2011. For wage index purposes, we refer to cost reports during this period as the "FY 2011 cost report," the "FY 2011 wage data," or the "FY 2011 data." Instructions for completing the wage index sections of Worksheet S-3 are included in the Provider Reimbursement Manual (PRM), Part 2 (Pub. No. 15-2), Chapter 40, Sections 4005.2 through 4005.4 for Form CMS-2552-10. The data file used to construct the FY 2015 wage index includes FY 2011 data submitted to us as of June 25, 2014. As in past years, we

performed an extensive review of the wage data, mostly through the use of edits designed to identify aberrant data.

We asked our MACs to revise or verify data elements that result in specific edit failures. For the proposed FY 2015 wage index, we stated that we identified and excluded 50 providers with aberrant data that should not be included in the wage index, although we stated that if data elements are corrected, we intended to include data from those providers in the final FY 2015 wage index (79 FR 28064). We have since determined that we had only removed 49, not 50, providers with aberrant data from the proposed wage index. We have received corrected data from 19 providers and data from an additional provider, and therefore, we are including the data for these 20 providers in the final FY 2015 wage index. However, since issuance of the proposed rule, we have determined that the data from 4 other providers (not included in the original 49 providers) were aberrant and should not be included in the final FY 2015 wage index. Therefore, in total, we are excluding the data of 34 providers from the final FY 2015 wage index.

In constructing the FY 2015 wage index, we included the wage data for facilities that were IPPS hospitals in FY 2011, inclusive of those facilities that have since terminated their participation in the program as hospitals, as long as those data did not fail any of our edits for reasonableness. We believe that including the wage data for these hospitals is, in general, appropriate to reflect the economic conditions in the various labor market areas during the relevant past period and to ensure that the current wage index represents the labor market area's current wages as compared to the national average of wages. However, we excluded the wage data for CAHs as discussed in the FY 2004 IPPS final rule (68 FR 45397 through 45398). For the proposed rule, we removed 6 hospitals that converted to CAH status on or after February 14, 2013, the cut-off date for CAH exclusion from the FY 2014 wage index, and through and including February 13, 2014, the cut-off date for CAH exclusion from the FY 2015 wage index. After removing hospitals with aberrant data and hospitals that converted to CAH status, the final FY 2015 wage index is calculated based on 3,416 hospitals.

For the final FY 2015 wage index, we allotted the wages and hours data for a multicampus hospital among the different labor market areas where its campuses are located in the same manner that we allotted such hospitals'

data in the FY 2014 wage index (78 FR 50587). Table 2 containing the final FY 2015 wage index associated with this final rule (available via the Internet on the CMS Web site) includes separate wage data for the campuses of 6 multicampus hospitals.

Comment: Commenters representing hospitals located in CBSA 46140 disagreed with the removal of the wage data of one hospital in that CBSA from the FY 2015 wage index. They argued that CMS's removal of the hospital's data is arbitrary and capricious, based only on the fact that the hospital's average hourly wage is higher than those of the other hospitals in the CBSA. The commenters noted that the hospital's data were included in the wage index in previous years, and CMS has provided "no rational explanation for its inconsistent treatment now." The commenters further stated that "if CMS were to adopt a policy of excluding the hospital with the highest wage data from each CBSA, fairness would require that CMS also exclude the hospital with the lowest wage data from each CBSA." The commenters stated that if CMS is employing a "bright-line cut off," CMS must publish such "bright-line tests."

Response: Section 1886(d)(3)(E) of the Act requires the Secretary to adjust the proportion of hospitals' costs attributable to wages and wage-related costs for area differences reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level. We also refer readers to section 1886(d)(9)(C)(iv)(I) of the Act. Since the origin of the IPPS, the wage index has been subject to its own annual review process, first by the MACs, and then by CMS. Hospitals are aware that both the MACs (via instructions issued by CMS) and CMS evaluate the accuracy and reasonableness of hospitals' wage index data. Each year, in every IPPS proposed rule, we discuss the process wherein CMS asks the MACs to "revise or verify data elements that result in specific edit failures" (most recently, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28064)). We state that, in constructing the wage index, we include the wage data for facilities that were IPPS hospitals in the relevant cost reporting year (that is, FY 2011 for the FY 2015 wage index), and that we include "those facilities that have since terminated their participation in the program as hospitals, as long as those data did not fail any of our edits for reasonableness. We believe that including the wage data for these hospitals is, in general, appropriate to reflect the economic conditions in the various labor market

areas during the relevant past period and to ensure that the current wage index represents the labor market area's current wages as compared to the national average of wages" (emphasis added; 79 FR 28064). CMS has historically exercised its discretion in developing a wage index that reflects a relative measure of the value of the labor provided to a typical hospital in a particular labor market area. We applied these same procedures, as discussed below, to the hospital at issue, and we disagree with the commenters that we have arbitrarily and capriciously removed the wage data of the cited hospital from the FY 2015 wage index.

In the instance of the particular hospital to which the commenters refer, while the hospital's wage data was properly documented, it did not merely have the highest average hourly wage in the CBSA; its average hourly wage was extremely and unusually high, significantly higher than the next highest average hourly wage in that CBSA and in the surrounding areas. We do not believe that the average hourly wage of this particular hospital accurately reflects the economic conditions in its labor market area during the FY 2011 cost reporting period, and, therefore, its inclusion in the wage index would *not* ensure that the FY 2015 wage index represents the labor market area's current wages as compared to the national average of wages. Accordingly, we have exercised our discretion to remove this hospital's wage data from the February 20, 2014 PUF, and from the May 2, 2014 PUF as well. Similarly, we have exercised our discretion by removing from the wage index (in FY 2015 and in prior years) the data of hospitals with average hourly wages that are unusually and uncharacteristically low for their respective CBSAs because we believe that the wage data of those hospitals also do not accurately reflect the economic conditions in their labor market area. We included the hospital's data in the wage index in previous years because the hospital's average hourly wage was lower and more reasonable relative to its labor market area in the prior years and, thus, we did not remove the hospital's wage data from the prior years' wage index.

Questions have been raised recently regarding the reporting of contract housekeeping and dietary services on Worksheet S-3, Part II, lines 33 and 35 of the Medicare cost report. CMS finalized its proposal to begin collecting contract labor costs and hours for housekeeping, and dietary (along with management services and the overhead

services of administrative and general) in the FY 2003 IPPS final rule (67 FR 50022 through 50023). At that time, we stated, "We continue to consider whether to expand our contract labor definition to include more types of contract services in the wage index. In particular, we have examined whether to include the costs for acquired dietary and housekeeping services, as many hospitals now provide these services through contracts. Costs for these services tend to be below the average wages for all hospital employees. Therefore, excluding the costs and hours for these services if they are provided under contract, while including them if the services are provided directly by the hospital, creates an incentive for hospitals to contract for these services in order to increase their average hourly wage for wage index purposes" (67 FR 50022). In the FY 2003 IPPS proposed rule, we explained that we selected the three overhead services of administrative and general, housekeeping, and dietary because they are provided at all hospitals, either directly or through contracts, and together they comprise about 60 percent of a hospital's overhead hours (67 FR 31433). In the FY 2003 IPPS final rule, we stated that we "will monitor the hospital industry for information regarding the hospitals' ability to provide the data. Further, we will work with hospitals and intermediaries [MACs] to develop acceptable methods for tracking the costs and hours. Finally, before including these additional costs in the wage index, we will provide a detailed analysis of the impact of including these additional costs in the wage index values in the **Federal Register** and provide for public comment. Our final decision on whether to include contract indirect patient care labor costs in our calculation of the wage index will depend on the outcome of our analyses and public comments" (67 FR 50023).

Subsequent to the issuance of the FY 2003 IPPS final rule, we revised Worksheet S-3, Part II of the Medicare cost report (CMS Form 2552-96) to add four lines for the reporting of contract labor salaries, wages, and hours. The lines added for contract housekeeping and dietary services were lines 26.01 and 27.01, respectively. (Line 9.03 for contract management and line 22.01 for contract administrative and general (A&G) services were also added at that time). These lines were effective with cost reporting periods beginning on or after October 1, 2003 (that is, FY 2004). Because the cost report data used for the wage index are on a 4-year lag, data

from these new contract labor lines would first be available for the FY 2008 wage index.

In the FY 2008 rulemaking process, we provided an analysis of the effect on the inclusion in the wage index of the wages and hours related to the new contract labor lines. At that time, 56 hospitals (1.6 percent) failed edits for contract housekeeping line 26.01; and 99 hospitals (2.8 percent) failed edits for contract dietary line 27.01 (72 FR 24680 and 24782). We also noted that "many of these edit failures are for wage data that are not to be included in the wage index and will be excluded through the wage index calculation. . . . In addition, some of the aberrant data will be resolved by the final rule through the correction process" (72 FR 24680 and 24782). The small percentage of hospitals that failed edits for these contract labor lines indicates that the vast majority of hospitals completing these contract labor lines were able to obtain and report reasonable salaries, wages, and hours associated with contract housekeeping and dietary services. In the FY 2008 IPPS final rule, we stated that we believe that "the impact of this policy is generally very minor, and we do not believe the additional complexity of a transition wage index is warranted for an impact this small. Further, we continue to believe it is prudent policy to include in the wage index the costs for these contract indirect patient care services" (72 FR 47316). Therefore, we adopted the policy to include the new contract labor lines in the wage index, beginning with the FY 2008 wage index.

The questions that have recently come to our attention involve hospitals that consistently do not provide documentable salaries, wages, and hours for their contracted housekeeping and/or dietary services. (On the Medicare cost report (CMS Form 2552-10), contract housekeeping is on Worksheet S-3, Part II, line 33 and contract dietary is on line 35). When this situation occurs, CMS has instructed the MACs to use reasonable estimates, such as regional average hourly rates, as a substitute for actual wages and hours, and to report the estimates on the hospital's Worksheet S-3, Part II, line 33 or line 35, respectively. Our policy has been to use reasonable estimates for these housekeeping and dietary lines, rather than report zeroes for wages and hours, because, as discussed above and as stated in the FY 2003 IPPS final rule, "{c}osts for these services tend to be below the average wages for all hospital employees. Therefore, excluding the costs and hours for these services if they

are provided under contract, while including them if the services are provided directly by the hospital, creates an incentive for hospitals to contract for these services in order to increase their average hourly wage for wage index purposes” (57 FR 50022). We understand that the reason many hospitals provide for failing to report such contract wages and hours is that their contracts do not clearly specify this information, often because they use a single vendor to provide several different contract labor services. We believe that allowing hospitals to routinely use contracts that do not clearly break out the salaries, wages, and hours associated with these services as a reason for not being able to report proper salaries, wages, and hours for these cost report lines undermines the purpose of instituting these lines in the first place. Furthermore, because every hospital must provide housekeeping and dietary services, and because the wage index is a relative measure of the value of the labor provided to a hospital in a particular labor market area, to report zeroes for salaries, wages, and hours for housekeeping and dietary services is not only unrealistic (in that every hospital provides for these services), but also misrepresents the labor costs in that area and undermines our policy. Consequently, CMS has instructed the MACs not to zero out these line items when a hospital cannot document the housekeeping or dietary salaries, wages, and hours, but instead to use a reasonable estimation of these wages and hours.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28065 through 28066) rule, we reiterated our requirement that all hospitals must document salaries, wages, and hours for the purpose of reporting this information on Worksheet S-3, Part II, lines 32, 33, 34, and/or 35 (for either directly employed housekeeping and dietary employees on lines 32 and 34, and contract labor on lines 33 and 35). It is not acceptable for a hospital to request that the MACs zero out these line items if the hospital’s contract does not specifically break out the actual wages and hours. As indicated above, and stated in the FY 2008 IPPS proposed rule (72 FR 24680 and 24782), a small percentage of hospitals failed edits associated with the contract housekeeping and dietary lines, showing that the vast majority of hospitals reporting data on these lines were able to obtain and report reasonable salaries, wages, and hours associated with contract housekeeping and dietary services. We encourage

hospitals to ensure that their contracts clearly specify the salaries, wages, and hours related to all of their contract labor. Because these line items have been included in the cost report since FY 2004, we believe that hospitals have had adequate notice and time to structure their contracts so that the wages and hours of contract employees can be determined and included in the cost reports. We expect hospitals to provide accurate data on their cost reports.

We understand that there may be rare situations where a hospital would not have documentable salaries, wages, and hours for contract housekeeping and dietary services. In these situations, we believe that it is appropriate and necessary to use reasonable estimates for these numbers in order to determine the best, most realistic, wage index that we can. As discussed previously, housekeeping and dietary services are unique in that the costs for housekeeping and dietary services tend to be below the average wages for all hospital employees. Thus, an incentive is created for hospitals to avoid reporting these contract labor salaries, wages, and hours on the cost report in order to increase their average hourly wage for wage index purposes. To deter hospitals from not reporting this information and to ensure that the wage index more accurately reflects the labor costs in an area, we believe that it is both necessary and appropriate for the MACs to estimate such salaries, wages, and hours in the rare instance where a hospital cannot provide such information. Therefore, in the absence of documentable wages and hours for contract housekeeping and dietary services, MACs would continue to use reasonable estimates for these services. Examples of reasonable estimates are regional average hourly rates, including an average of the wages and hours for dietary and housekeeping services of other hospitals in the same CBSA as the hospital in question. Hospitals also may conduct time studies to determine hours worked. If, for whatever reason, regional averages or time studies cannot be used, MACs may use data from the Bureau of Labor Statistics to obtain average wages and hours for housekeeping and dietary services. Commenters may also suggest alternatives for imputing reasonable estimates for possible consideration by CMS. In all cases, MACs must determine that the data used are reasonable.

Comment: One commenter encouraged CMS to instruct the MACs to be consistent across their entire jurisdiction in how the MACs estimate wages and hours for contract dietary

and housekeeping services, in the instances where there is a lack of documentable wages and hours for these services. Another commenter noted that CMS stated that commenters may suggest alternatives for imputing reasonable estimates for possible consideration by CMS. This commenter asked that CMS consider eliminating entirely all wages and hours associated with dietary and housekeeping services, both for hospital employees and contract labor, based on the belief that these services represent an “immaterial” 3.27 percent of total Worksheet S-3, Part II, line 1 wages, and their removal from the wage index would remove a time-consuming burden for both providers and MACs. The commenter asserted that if all wages and hours associated with dietary and housekeeping services were eliminated from the wage index, the “comparison among hospitals would remain meaningful and would remove any disparity among hospitals related to the issue.”

Response: We agree with the first commenter that it is important for CMS’ policies and instructions to be implemented uniformly by the MACs across all jurisdictions. We provide updated and uniform instructions to the MACs each year prior to the start of the annual wage index desk review process, and also communicate with the MACs through various media throughout each annual wage index cycle, including instructions on how to estimate wages and hours for contract dietary and housekeeping services in the absence of documentable wages and hours for these categories. We do not agree with the second commenter’s request that CMS eliminate entirely all wages and hours associated with dietary and housekeeping services, both for hospital employees and contract labor. The IPPS wage index is a relative measure of the value of *all types* of labor provided to a typical hospital in a particular labor market area, not just the labor with high average hourly wages. We believe it would be inappropriate to agree to selectively include, or exclude, certain categories of labor from the wage index because doing so would result in a less accurate measure of labor costs and would undermine the relativity of the wage index as whole. We believe that hospitals have had adequate notice and time to structure their contracts so that the wages and hours of contract employees can be determined and included in the cost reports. We expect hospitals to provide accurate data on their cost reports, and the accuracy of the wages and hours of contract labor

will continue to be reviewed by the MACs as part of the annual desk review process. As we stated in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28065 through 28066), to deter hospitals from not reporting this information and to ensure that the wage index more accurately reflects the labor costs in an area, we believe that it is both necessary and appropriate for MACs to estimate such salaries, wages, and hours in the rare instance where a hospital cannot provide such information for its dietary and housekeeping services under contract. We will continue to instruct the MACs to use reasonable estimates for these services, in the absence of documentable wages and hours for contract housekeeping and dietary services.

E. Method for Computing the FY 2015 Unadjusted Wage Index

The method used to compute the FY 2015 wage index without an occupational mix adjustment follows the same methodology that we used to compute the FY 2012, FY 2013, and FY 2014 final wage indexes without an occupational mix adjustment (76 FR 51591 through 51593, 77 FR 53366 through 53367, and 78 FR 50587 through 50588, respectively).

As discussed in the FY 2012 final rule, in “Step 5,” for each hospital, we adjust the total salaries plus wage-related costs to a common period to determine total adjusted salaries plus wage-related costs. To make the wage adjustment, we estimate the percentage change in the employment cost index (ECI) for compensation for each 30-day increment from October 14, 2010, through April 15, 2012, for private industry hospital workers from the BLS’ Compensation and Working Conditions. We have consistently used the ECI as the data source for our wages and salaries and other price proxies in the IPPS market basket, and we did not propose any changes to the usage for FY 2015 (79 FR 28066). The factors used to adjust the hospital’s data were based on the midpoint of the cost reporting period, as indicated in the following table.

MIDPOINT OF COST REPORTING PERIOD

After	Before	Adjustment factor
10/14/2010	11/15/2010	1.02230
11/14/2010	12/15/2010	1.02078
12/14/2010	01/15/2011	1.01929
01/14/2011	02/15/2011	1.01782
02/14/2011	03/15/2011	1.01637
03/14/2011	04/15/2011	1.01494
04/14/2011	05/15/2011	1.01355

MIDPOINT OF COST REPORTING PERIOD—Continued

After	Before	Adjustment factor
05/14/2011	06/15/2011	1.01219
06/14/2011	07/15/2011	1.01084
07/14/2011	08/15/2011	1.00948
08/14/2011	09/15/2011	1.00811
09/14/2011	10/15/2011	1.00674
10/14/2011	11/15/2011	1.00538
11/14/2011	12/15/2011	1.00403
12/14/2011	01/15/2012	1.00269
01/14/2012	02/15/2012	1.00134
02/14/2012	03/15/2012	1.00000
03/14/2012	04/15/2012	0.99866

For example, the midpoint of a cost reporting period beginning January 1, 2011, and ending December 31, 2011, is June 30, 2011. An adjustment factor of 1.01084 would be applied to the wages of a hospital with such a cost reporting period.

Using the data as described above and in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50587 through 50588), the FY 2015 national average hourly wage (unadjusted for occupational mix) is \$39.2971. The FY 2015 Puerto Rico overall average hourly wage (unadjusted for occupational mix) is \$16.9893.

F. Occupational Mix Adjustment to the FY 2015 Wage Index

As stated earlier, section 1886(d)(3)(E) of the Act provides for the collection of data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program, in order to construct an occupational mix adjustment to the wage index, for application beginning October 1, 2004 (the FY 2005 wage index). The purpose of the occupational mix adjustment is to control for the effect of hospitals’ employment choices on the wage index. For example, hospitals may choose to employ different combinations of registered nurses, licensed practical nurses, nursing aides, and medical assistants for the purpose of providing nursing care to their patients. The varying labor costs associated with these choices reflect hospital management decisions rather than geographic differences in the costs of labor.

1. Development of Data for the FY 2015 Occupational Mix Adjustment Based on the 2010 Occupational Mix Survey

As provided for under section 1886(d)(3)(E) of the Act, we collect data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program.

As discussed in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50588), the occupational mix adjustment to the FY 2014 wage index was based on data collected on the 2010 Medicare Wage Index Occupational Mix Survey (Form CMS–10079 (2010)). For the FY 2015 wage index, we proposed to use the occupational mix data collected on the 2010 survey to compute the occupational mix adjustment for FY 2015. We did not receive any public comments on this proposal; therefore, we are finalizing our policy to use the occupational mix data collected on the 2010 survey to compute the occupational mix adjustment for FY 2015. We are including data for 3,183 hospitals that also have wage data included in the FY 2015 wage index.

2. New 2013 Occupational Mix Survey for the FY 2016 Wage Index

As stated earlier, section 304(c) of Public Law 106–554 amended section 1886(d)(3)(E) of the Act to require CMS to collect data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program. We used occupational mix data collected on the 2010 survey to compute the occupational mix adjustment for FY 2013, FY 2014, and the FY 2015 wage index associated with this final rule. Therefore, a new measurement of occupational mix is required for FY 2016.

On December 7, 2012, we published in the **Federal Register** a notice soliciting comments on the proposed 2013 Medicare Wage Index Occupational Mix Survey (77 FR 73032 through 73033). The new 2013 survey, which will be applied to the FY 2016 wage index, includes the same data elements and definitions as the 2010 survey and provides for the collection of hospital-specific wages and hours data for nursing employees for calendar year 2013 (that is, payroll periods ending between January 1, 2013 and December 31, 2013). The comment period for the notice ended on February 5, 2013. After considering the public comments that we received on the December 2012 notice, we made a few minor editorial changes and published the 2013 survey in the **Federal Register** on February 28, 2013 (78 FR 13679). This survey was approved by OMB on May 14, 2013, and is available on the CMS Web site at: <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Downloads/WAGE-INDEX-OCCUPATIONAL-MIX-SURVEY-2013.pdf>.

The 2013 Occupational Mix Survey Hospital Reporting Form CMS–10079

for the Wage Index Beginning FY 2016 (in excel format) is available on the CMS Web site at: <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/Medicare-Wage-Index-Occupational-Mix-Survey2013.html?DLPage=1&DLSort=1&DLSortDir=descending>. Hospitals were required to submit their completed 2013 surveys to their MACs by July 1, 2014. The preliminary, unaudited 2013 survey data was posted on the CMS Web site afterward, on July 11, 2014. The FY 2012 Worksheet S-3 wage data for the FY 2016 wage index review and correction process was posted on the CMS Web site in May 2014. Both the preliminary FY 2016 wage data and occupational mix survey data can be found on the CMS Web site at: <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY-2016-Wage-Index-Home-Page.html?DLPage=1&DLSort=1&DLSortDir=descending>.

3. Calculation of the Occupational Mix Adjustment for FY 2015

For FY 2015, we proposed to calculate the occupational mix adjustment factor using the same methodology that we used for the FY 2012, FY 2013, and FY 2014 wage indexes (76 FR 51582 through 51586, 77 FR 53367 through 53368, and 78 FR 50588 through 50589, respectively). As a result of applying this methodology, the proposed FY 2015 occupational mix adjusted national average hourly wage (based on the proposed new OMB labor market area delineations) was \$39.1177. The proposed FY 2015 occupational mix adjusted Puerto Rico-specific average hourly wage (based on the proposed new OMB labor market area delineations) was \$17.0526.

Because the occupational mix adjustment is required by statute, all hospitals that are subject to payments under the IPPS, or any hospital that would be subject to the IPPS if not granted a waiver, must complete the occupational mix survey, unless the hospital has no associated cost report wage data that are included in the FY 2015 wage index. For the proposed FY 2015 wage index, because we are using the Worksheet S-3, Parts II and III wage data of 3,400 hospitals, and we are using the occupational mix surveys of 3,165 hospitals for which we also have Worksheet S-3 wage data, that represents a “response” rate of 93.1 percent (3,165/3,400). In the proposed FY 2015 wage index established in the FY 2015 IPPS/LTCH PPS proposed rule, we applied proxy data for noncompliant hospitals, new hospitals, or hospitals

that submitted erroneous or aberrant data in the same manner that we applied proxy data for such hospitals in the FY 2012 wage index occupational mix adjustment (76 FR 51586).

In the FY 2011 IPPS/LTCH PPS proposed rule and final rule (75 FR 23943 and 75 FR 50167, respectively), we stated that, in order to gain a better understanding of why some hospitals are not submitting the occupational mix data, we will require hospitals that do not submit occupational mix data to provide an explanation for not complying. This requirement was effective beginning with the 2010 occupational mix survey. We instructed MACs to continue gathering this information as part of the FY 2014 and FY 2015 wage index desk review process. We stated that we would review these data for future analysis and consideration of potential penalties for noncompliant hospitals.

Comment: One commenter stated that all hospitals should be obligated to submit the occupational mix survey because failure to complete the survey jeopardizes the accuracy of the wage index. The commenter added that a penalty should be instituted for nonsubmitters. The commenter also stated that pending CMS’ analysis of the Commuting Based Wage Index and the Institute of Medicine’s study on geographic variation in hospital wage costs, CMS should eliminate the occupational mix survey and the significant reporting burden it creates.

Response: We appreciate the commenter’s concern for the accuracy of the wage index, and we have continually exhorted all hospitals to complete and submit the occupational mix surveys. We did not propose a particular penalty for hospitals that do not submit the CY 2013 occupational mix survey, but we are continuing to consider for future rulemaking various options for ensuring full compliance. Examples include applying a hospital’s occupational mix survey data from a previous survey period to the current wage index of a given fiscal year; including the occupational mix survey as part of the cost report, and if not completed, the cost report would be rejected by the MAC; or application of a State-specific minimum or reduced occupational mix adjustment. Regarding the commenter’s request that CMS should eliminate the survey due to the burden it creates, section 1886(d)(3)(E) of the Act requires us to measure the earnings and paid hours of employment by occupational category. As long as the requirement to apply an occupational mix adjustment to the wage index remains in place in the statute, there

may be some amount of administrative burden involved in reporting that data.

After consideration of the public comments we received, for FY 2015, we are finalizing our proposal to calculate the occupational mix adjustment factor using the same methodology that we used for the FY 2012, FY 2013, and FY 2014 wage indexes (76 FR 51582 through 51586, 77 FR 53367 through 53368, and 78 FR 50588 through 50589, respectively). As a result of applying this methodology, the FY 2015 occupational mix adjusted national average hourly wage (based on the new OMB labor market area delineations) is \$39.2591. The FY 2015 occupational mix adjusted Puerto Rico-specific average hourly wage (based on the new OMB labor market area delineations) is \$17.0410. For the FY 2015 wage index, because we are using the Worksheet S-3, Parts II and III wage data of 3,416 hospitals, and we are using the occupational mix surveys of 3,183 hospitals for which we also have Worksheet S-3 wage data, that represents a “response” rate of 93.2 percent (3,183/3,416).

G. Analysis and Implementation of the Occupational Mix Adjustment and the FY 2015 Occupational Mix Adjusted Wage Index

1. Analysis of the Occupational Mix Adjustment and the Occupational Mix Adjusted Wage Index

As discussed in section III.F. of the preamble of this final rule, for FY 2015, we apply the occupational mix adjustment to 100 percent of the FY 2015 wage index. We calculated the occupational mix adjustment using data from the 2010 occupational mix survey data, using the methodology described in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51582 through 51586).

Using the occupational mix survey data and applying the occupational mix adjustment to 100 percent of the FY 2015 wage index results in a national average hourly wage (based on the new OMB labor market area delineations) of \$39.2591 and a Puerto-Rico specific average hourly wage of \$17.0410. After excluding data of hospitals that either submitted aberrant data that failed critical edits, or that do not have FY 2011 Worksheet S-3, Parts II and III, cost report data for use in calculating the FY 2015 wage index, we calculated the FY 2015 wage index using the occupational mix survey data from 3,183 hospitals. For the FY 2015 wage index, because we are using the Worksheet S-3, Parts II and III wage data of 3,416 hospitals, and we are using the occupational mix survey data of

3,183 hospitals for which we also have Worksheet S–3 wage data, those data represent a “response” rate of 93.2 percent (3,183/3,416). The FY 2015 national average hourly wages for each occupational mix nursing subcategory as calculated in Step 2 of the occupational mix calculation are as follows:

Occupational mix nursing subcategory	Average hourly wage
National RN	37.420970136
National LPN and Surgical Technician	21.78229118
National Nurse Aide, Orderly, and Attendant	15.31107725
National Medical Assistant ...	17.251053917
National Nurse Category	31.769556957

The national average hourly wage for the entire nurse category as computed in Step 5 of the occupational mix calculation is \$31.769556957. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of greater than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of less than 1.0. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of less than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of greater than 1.0.

Based on the 2010 occupational mix survey data, we determined (in Step 7 of the occupational mix calculation) that the national percentage of hospital employees in the nurse category is 43.46 percent, and the national percentage of hospital employees in the all other occupations category is 56.54 percent. At the CBSA level, using the new OMB delineations for FY 2015, the percentage of hospital employees in the nurse category ranged from a low of 21.88 percent in one CBSA to a high of 62.04 percent in another CBSA.

We compared the FY 2015 occupational mix adjusted wage indexes for each CBSA to the unadjusted wage indexes for each CBSA. We used the FY 2015 new OMB delineations for this analysis. As a result of applying the occupational mix adjustment to the wage data, the wage index values for 219 (53.8 percent) urban areas and 29 (61.7 percent) rural areas increased. One hundred and nineteen (29.2 percent) urban areas will increase by 1 percent but less than 5 percent, and 4 (1.0 percent) urban areas will increase by 5 percent or more. Fourteen (29.8 percent) rural areas will increase by 1 percent but less than 5 percent, and no rural areas will increase by 5 percent or more. However, the wage index values for 186

(45.7 percent) urban areas and 18 (38.3 percent) rural areas decreased. Seventy nine (19.4 percent) urban areas will decrease by 1 percent but less than 5 percent, and 1 (0.2 percent) urban area will decrease by 5 percent or more. Seven (14.9 percent) rural areas will decrease by 1 percent and less than 5 percent, and no rural areas will decrease by 5 percent or more. The largest positive impacts will be 6.58 percent for an urban area and 3.36 percent for a rural area. The largest negative impacts will be 5.32 percent for an urban area and 1.73 percent for a rural area. Two urban areas’ wage indexes, but no rural area wage indexes, will remain unchanged by application of the occupational mix adjustment. These results indicate that a larger percentage of rural areas (61.7 percent) will benefit from the occupational mix adjustment than will urban areas (53.8 percent). However, approximately one-third (38.3 percent) of rural CBSAs will still experience a decrease in their wage indexes as a result of the occupational mix adjustment.

2. Application of the Rural, Imputed, and Frontier Floors

a. Rural Floor

Section 4410(a) of Public Law 105–33 provides that, for discharges on or after October 1, 1997, the area wage index applicable to any hospital that is located in an urban area of a State may not be less than the area wage index applicable to hospitals located in rural areas in that State. This provision is referred to as the “rural floor.” Section 3141 of Public Law 111–148 also requires that a national budget neutrality adjustment be applied in implementing the rural floor. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28068), based on the proposed FY 2015 wage index associated with the proposed rule and based on the proposed implementation of the new OMB delineations discussed in section III.B. of the preamble of the proposed rule, we estimated that 441 hospitals would receive an increase in their FY 2015 proposed wage index due to the application of the rural floor.

Based on the final FY 2015 wage index associated with this final rule and available on the CMS Web site and based on the implementation of the new OMB delineations, 422 hospitals are receiving an increase in their FY 2015 wage index due to application of the rural floor.

We received some public comments concerning the application of the rural floor. We respond to these public comments in Appendix A of this final rule.

b. Imputed Floor for FY 2015

In the FY 2005 IPPS final rule (69 FR 49109 through 49111), we adopted the “imputed floor” policy as a temporary 3-year regulatory measure to address concerns from hospitals in all-urban States that have argued that they are disadvantaged by the absence of rural hospitals to set a wage index floor for those States. Since its initial implementation, we have extended the imputed floor policy four times, the last of which was adopted in the FY 2014 IPPS/LTCH PPS final rule and is set to expire on September 30, 2014. (We refer readers to further discussion of the imputed floor in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50589 through 50590) and to our regulations at 42 CFR 412.64(h)(4).) Currently, there are two all-urban States, New Jersey and Rhode Island, that have a range of wage indexes assigned to hospitals in these States, including through reclassification or redesignation (we refer readers to discussions of geographic reclassifications and redesignations in section III.H. of the preamble of the proposed rule and this final rule). However, as we explain below, the method as of FY 2012 for computing the imputed floor (the original methodology) benefitted only New Jersey, and not Rhode Island.

In computing the imputed floor for an all-urban State under the original methodology, we calculated the ratio of the lowest-to-highest CBSA wage index for each all-urban State as well as the average of the ratios of lowest-to-highest CBSA wage indexes of those all-urban States. We then compared the State’s own ratio to the average ratio for all-urban States and whichever is higher is multiplied by the highest CBSA wage index value in the State—the product of which established the imputed floor for the State. Under the current OMB labor market area delineations that we used for the FY 2014 wage index, Rhode Island has only one CBSA (Providence-New Bedford-Fall River, RI–MA) and New Jersey has 10 CBSAs. Therefore, under the original methodology, Rhode Island’s own ratio equaled 1.0, and its imputed floor was equal to its original CBSA wage index value. However, because the average ratio of New Jersey and Rhode Island was higher than New Jersey’s own ratio, this methodology provided a benefit for New Jersey, but not for Rhode Island.

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53368 through 53369), we retained the imputed floor calculated under the original methodology as discussed above, and established an alternative methodology for computing

the imputed floor wage index to address the concern that the original imputed floor methodology guaranteed a benefit for one all-urban State with multiple wage indexes (New Jersey) but could not benefit the other all-urban State (Rhode Island). The alternative methodology for calculating the imputed floor was established using data from the application of the rural floor policy for FY 2013. Under the alternative methodology, we first determined the average percentage difference between the post-reclassified, pre-floor area wage index and the post-reclassified, rural floor wage index (without rural floor budget neutrality applied) for all CBSAs receiving the rural floor. (Table 4D associated with the FY 2013 IPPS/LTCH PPS final rule (which is available on the CMS Web site) included the CBSAs receiving a State's rural floor wage index.) The lowest post-reclassified wage index assigned to a hospital in an all-urban State having a range of such values then is increased by this factor, the result of which establishes the State's alternative imputed floor. We amended § 412.64(h)(4) of the regulations to add new paragraphs to incorporate the finalized alternative methodology, and to make reference and date changes.

In summary, for the FY 2013 wage index, we did not make any changes to the original imputed floor methodology at § 412.64(h)(4) and, therefore, made no changes to the New Jersey imputed floor computation for FY 2013. Instead, for FY 2013, we adopted a second, alternative methodology for use in cases where an all-urban State has a range of wage indexes assigned to its hospitals, but the State cannot benefit from the methodology in existing § 412.64(h)(4).

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50589 through 50590), we extended the imputed floor policy (both the original methodology and the alternative methodology) for 1 additional year, through September 30, 2014, while we continued to explore potential wage index reforms.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28068 through 28069), for FY 2015, we proposed to continue the extension of the imputed floor policy (both the original methodology and alternative methodology) for another year, through September 30, 2015, as we continue to explore potential wage index reforms. As discussed in section III.B. of the preamble of the proposed rule, we proposed to adopt the new OMB labor market area delineations beginning in FY 2015. Under OMB's new labor market area delineations based on Census 2010 data, Delaware would

become an all-urban State, along with New Jersey and Rhode Island. Under the new OMB delineations, Delaware would have three CBSAs, New Jersey would have seven CBSAs, and Rhode Island would continue to have only one CBSA (Providence-Warwick, RI-MA). We referred readers to a detailed discussion of our proposal to adopt the new OMB labor market area delineations in section III.B. of the preamble of the proposed rule. We proposed to revise the regulations at § 412.64(h)(4) and (h)(4)(vi) to reflect the proposed 1-year extension of the imputed floor. We invited public comments on our proposal regarding the 1-year extension of the imputed floor.

Comment: Several commenters supported the CMS proposal to extend the imputed floor for 1 year, stating that it establishes an approach to remedy the competitive disadvantage suffered by all-urban States in the absence of an imputed wage index floor; and that the imputed wage index floor policy creates a climate of symmetry, equity and consistency in the Medicare reimbursement process. One commenter suggested that the industry have an opportunity to provide input to CMS prior to finalizing any decisions regarding the imputed floor policy. The commenter also suggested that if CMS decides to finalize a policy that would result in the expiration of the imputed floor, CMS afford hospitals a multiyear phase-out in order to offset their lost revenue.

One commenter stated that CMS should reconsider the extension of the imputed floor policy, and questioned what statutory authority CMS has to extend the imputed floor policy and declare new States eligible. Another commenter objected to the proposal and stated that it does not support the policy behind the imputed floor. The commenter recommended that CMS not finalize the proposal to extend the imputed floor, and stated it agreed with the rationale that CMS previously provided in the FY 2012 IPPS/LTCH PPS proposed rule (76 FR 25878 through 25879) for not proposing to extend the imputed floor policy, and urged CMS to let the policy expire.

Response: We appreciate the commenters' support for our proposal to extend the imputed floor for 1 year and are finalizing this proposal. In response to the commenters who objected to the proposed policy and made other recommendations, we will give further consideration to those comments as we continue to explore potential wage index reforms. As we have done every year since the proposal of the imputed floor, we provide and will continue to

provide the industry with the opportunity to provide input on our proposals prior to finalizing any decisions regarding the imputed floor policy. We will take the commenters' recommendation to afford hospitals a multiyear phase-out into consideration should we propose not to extend the imputed floor policy in future years.

In response to the commenter who questioned what statutory authority CMS has to extend the imputed floor policy and declare new States eligible, as we stated in the FY 2005 IPPS final rule (69 FR 49110), we note that the Secretary has broad authority under section 1886(d)(3)(E) of the Act to "adjust the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs of the DRG prospective payment rates . . . for area differences in hospital wage levels by a factor (established by the Secretary) . . ." Therefore, we believe that we do have the discretion to adopt a policy that would adjust area wage indexes in the stated manner. We adopted the imputed floor policy and subsequently extended it through notice-and-comment rulemaking to address concerns from hospitals in all-urban states. Under the new OMB delineations discussed in section III.B. of the preamble of this final rule, Delaware becomes an all-urban State and, therefore, is subject to an imputed floor as well.

After consideration of the public comments we received, we are finalizing our proposal without modification to extend the imputed floor policy under both the original methodology and the alternative methodology for an additional year, through September 30, 2015, while we continue to explore potential wage index reform. We also are adopting as final the proposed revisions to § 412.64(h)(4) and (h)(4)(vi) to reflect the 1-year extension of the imputed floor.

The wage index and impact tables associated with this FY 2015 IPPS/LTCH PPS final rule that are available on the CMS Web site reflect the continued application of the imputed floor policy at § 412.64(h)(4) and a national budget neutrality adjustment for the imputed floor for FY 2015. There are 15 providers in New Jersey, and no providers in Delaware that will receive an increase in their FY 2015 wage index due to the continued application of the imputed floor policy under the original methodology. The wage index and impact tables for this FY 2015 final rule also reflect the application of the alternative methodology for computing

the imputed floor, which will benefit four hospitals in Rhode Island.

c. State Frontier Floor

Section 10324 of Public Law 111–148 requires that hospitals in frontier States cannot be assigned a wage index of less than 1.0000 (we refer readers to regulations at 42 CFR 412.64(m) and to a discussion of the implementation of this provision in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50160 through 50161)). Based on the implementation of the new OMB delineations discussed in section III.B. of the preamble of this final rule, 46 hospitals will receive the frontier floor value of 1.0000 for their FY 2015 wage index in this final rule. These hospitals are located in Montana, North Dakota, South Dakota, and Wyoming. Although Nevada also is defined as a frontier State, its FY 2015 rural floor value of 1.1373 is greater than 1.0000, and therefore, no Nevada hospitals will receive a frontier floor value for their FY 2015 wage index.

We did not propose any changes to the frontier floor policy for FY 2015, and we did not receive any public comments on the issue.

The areas affected by the rural, imputed, and frontier floor policies for the FY 2015 wage index are identified in Table 4D associated with this final rule, which is available via the Internet on the CMS Web site.

3. FY 2015 Wage Index Tables

The wage index values for FY 2015 (except those for hospitals receiving wage index adjustments under section 1886(d)(13) of the Act), included in Tables 4A, 4B, 4C, and 4F, available on the CMS Web site, include the occupational mix adjustment, geographic reclassification or redesignation as discussed in section III.H. of the preamble of this final rule, and the application of the rural, imputed, and frontier State floors as discussed in section III.G.2. of the preamble of this final rule. We note that because we are adopting the new OMB labor market area delineations for FY 2015, these tables have additional tabulations to account for wage index calculations computed under the previous and the new OMB delineations.

Tables 3A and 3B, available on the CMS Web site, list the 3-year average hourly wage for each labor market area before the redesignation or reclassification of hospitals based on FYs 2009, 2010, and 2011 cost reporting periods. Table 3A lists these data for urban areas, and Table 3B lists these data for rural areas. In addition, Table

2, which is available on the CMS Web site, includes the adjusted average hourly wage for each hospital from the FY 2009 and FY 2010 cost reporting periods, as well as the FY 2011 period used to calculate the FY 2015 wage index. The 3-year averages are calculated by dividing the sum of the dollars (adjusted to a common reporting period using the method described in Step 5 in section III.G. of the preamble of this final rule) across all 3 years, by the sum of the hours. If a hospital is missing data for any of the previous years, its average hourly wage for the 3-year period is calculated based on the data available during that period. The average hourly wages in Tables 2, 3A, and 3B, which are available on the CMS Web site, include the occupational mix adjustment. The wage index values in Tables 4A, 4B, 4C, and 4D also include the national rural floor budget neutrality adjustment (which includes the imputed floor). The wage index values in Table 2 also include the out-migration adjustment for eligible hospitals. As stated above, because we are adopting the new OMB labor market area delineations for FY 2015, these tables have additional tabulations to account for wage index calculations computed under the current labor market area definitions and the new OMB labor market area delineations. In addition, for certain applicable hospitals, the wage index values included in Table 2 are computed to reflect the transitional wage index or the 50/50 blended wage index discussed in detail in section III.B.2.e. of the preamble of this final rule.

H. Revisions to the Wage Index Based on Hospital Redesignations and Reclassifications

1. General Policies and Effects of Reclassification and Redesignation

Under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. Hospitals must apply to the MGCRB to reclassify not later than 13 months prior to the start of the fiscal year for which reclassification is sought (generally by September 1). Generally, hospitals must be proximate to the labor market area to which they are seeking reclassification and must demonstrate characteristics similar to hospitals located in that area. The MGCRB issues its decisions by the end of February for reclassifications that become effective for the following fiscal year (beginning October 1). The regulations applicable to reclassifications by the MGCRB are located in 42 CFR 412.230 through

412.280. (We refer readers to a discussion in the FY 2002 IPPS final rule (66 FR 39874 and 39875) regarding how the MGCRB defines mileage for purposes of the proximity requirements.) The general policies for reclassifications and redesignations that we proposed for FY 2015, and the policies for the effects of hospitals' reclassifications and redesignations on the wage index, are the same as those discussed in the FY 2012 IPPS/LTCH PPS final rule for the FY 2012 final wage index (76 FR 51595 and 51596). Also, in the FY 2012 IPPS/LTCH PPS final rule, we discussed the effects on the wage index of urban hospitals reclassifying to rural areas under 42 CFR 412.103. Hospitals that are geographically located in States without any rural areas are ineligible to apply for rural reclassification in accordance with the provisions of 42 CFR 412.103. While our general policies on geographic reclassification, redesignations under section 1886(d)(8)(B) of the Act, and urban hospitals reclassifying to rural under 42 CFR 412.103 will remain unchanged for FY 2015, we note that, due to our adoption of the new OMB labor market area delineations for FY 2015, there are numerous unique classification considerations for FY 2015 that are discussed in more detail in section III.H. of the preamble of this final rule. For a discussion of the new CBSA changes based on the new OMB labor market area delineations and our implementation of those changes, we refer readers to sections III.B. and VI.C. of the preamble of this final rule.

Comment: One commenter stated that because the new OMB labor market area delineations will be effective October 1, 2014, for FY 2015, hospitals should have been given an opportunity to apply for reclassification to these new labor market areas a year ago. The commenter suggested that CMS provide a one-time expedited MGCRB application and approval process to be effective October 1, 2014.

Similarly, another commenter stated that a hospital would not have had an adequate opportunity to assess reclassification options for FY 2015 because CMS did not publish 3-year average hourly wage data based on the new OMB labor market area delineations with the FY 2014 IPPS/LTCH PPS final rule. The commenter therefore suggested that either the effective date of the implementation of the new OMB labor market areas delineations be postponed until FY 2016, or a new period be opened to allow hospitals to reclassify for FY 2015.

Response: We do not agree with these comments. We did not propose to adopt the new OMB labor market area delineations in the FY 2014 IPPS/LTCH PPS proposed rule and, therefore, did not finalize the new OMB delineations in the FY 2014 IPPS/LTCH PPS final rule. Instead, we notified hospitals of our intention to propose changes to the wage index based on the new OMB delineations in the FY 2015 IPPS/LTCH proposed and final rules (78 FR 27552 through 27553; 78 FR 50586). Therefore, hospitals could not apply for reclassification on the basis of the new OMB labor market area delineations a year ago because they had not yet been implemented. Because we had not implemented the new OMB delineations, we were unable to release data, including average hourly wage data, based on these new delineations last year.

Section 1886(d)(10)(C) of the Act mandates that hospitals must apply to the MGCRB to reclassify not later than 13 months prior to the start of the fiscal year for which reclassification is sought (generally by September 1), and the MGCRB must issue its decision within 180 days after the first day of the 13-month period preceding the fiscal year for which a hospital has filed its application. Therefore, we believe we have balanced our obligation to implement the reclassification decisions of the MGCRB with our responsibility to implement the most accurate labor market areas through the new OMB delineations in as uniform a manner as possible.

However, we recognized that the new OMB delineations could affect reclassification decisions. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28073), we stated that hospitals that wished to be reassigned to an alternate CBSA (other than the CBSA to which their reclassification would be reassigned in this proposed rule) for which they meet the applicable proximity criteria could request reassignment within 45 days from the publication of the proposed rule. We also stated that if, for whatever reason, a hospital still finds itself assigned to a labor market area that would provide a wage index for FY 2015 that is lower than the wage index the hospital would have received under the FY 2014 CBSA delineations, we proposed a 50/50 blended wage index adjustment in FY 2015 for all hospitals that would experience a decrease in their FY 2015 wage index value due to the implementation of the new OMB delineations and are finalizing this transitional adjustment in this rule. This transitional adjustment will mitigate

negative payment impacts for FY 2015, while providing hospitals additional time to fully assess any additional reclassification options available to them under the new OMB delineations for FY 2016. Therefore, we do not believe it is necessary to implement a one-time expedited MGCRB application and approval process, postpone the effective date of the implementation of the new OMB delineations until FY 2016, or open a new period to allow hospitals to reclassify for FY 2015.

Comment: A few commenters stated that, in cases where a countywide (group) reclassification had been previously approved by the MGCRB, a new hospital is not able to obtain the same reclassified wage index until the first year that individual hospital's wage index data match one of the 3 years' data used by the MGCRB and a new 3-year countywide reclassification is requested by the county's hospitals (which can be a 4-year delay). The commenters stated that the hospital will have a wage index lower than the hospitals with which it competes for skilled labor. The commenter suggested that CMS change its policy to allow for a timelier competitive wage index for new hospitals.

Two commenters suggested that the proximity rule for countywide reclassifications for hospitals in an urban county be modified to permit adjacent county reclassifications, regardless of whether they are in the same CSA or CBSA, or at a minimum, create an exception that would allow this in the event that half of the hospitals in the county are seeking to reclassify.

Another commenter suggested that a county be permitted to apply for designation as a "core county" if its 3-year average hourly wage is at least 108 percent of the 3-year average hourly wage of its CBSA, excluding the core county. The commenter also suggested that other counties within the same CBSA that are either adjacent to or within the same city as the core county, and whose 3-year average hourly wage is at least 85 percent of the core county's average hourly wage, be permitted to join the core county to form a "core area" if the resulting wage index is beneficial to all hospitals in the core area.

Response: We thank the commenters for their comments. We already have established criteria and processes for MGCRB reclassification, which are specified in 42 CFR 412.230 et. seq, and we did not propose any changes to these provisions for FY 2015. Consequently, we are not making any changes to address the commenter's concerns at

this time. We refer the commenters to these regulations for complete details on wage index reclassifications.

2. FY 2015 MGCRB Reclassifications

a. FY 2015 Reclassification Requirements and Approvals

Under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. The specific procedures and rules that apply to the geographic reclassification process are outlined in regulations under 42 CFR 412.230 through 412.280.

At the time this final rule was constructed, the MGCRB had completed its review of FY 2015 reclassification requests. Based on such reviews, there were 309 hospitals approved for wage index reclassifications by the MGCRB starting in FY 2015 that did not withdraw or terminate their reclassifications within 45 days of the publication of the proposed rule. Because MGCRB wage index reclassifications are effective for 3 years, for FY 2015, hospitals reclassified beginning during FY 2013 or FY 2014 are eligible to continue to be reclassified to a particular labor market area based on such prior reclassifications for the remainder of their 3-year period. There were 155 hospitals approved for wage index reclassifications in FY 2013 that continue for FY 2015, and 270 hospitals approved for wage index reclassifications in FY 2014 that continue for FY 2015. Of all the hospitals approved for reclassification for FY 2013, FY 2014, and FY 2015, based upon the review at the time of this final rule, 734 hospitals are in a reclassification status for FY 2015.

Under the regulations at 42 CFR 412.273, hospitals that have been reclassified by the MGCRB are permitted to withdraw their applications within 45 days of the publication of a proposed rule. For information about withdrawing, terminating, or canceling a previous withdrawal or termination of a 3-year reclassification for wage index purposes, we refer readers to 42 CFR 412.273, as well as the FY 2002 IPPS final rule (66 FR 39887 through 39888) and the FY 2003 IPPS final rule (67 FR 50065 through 50066). Additional discussion on withdrawals and terminations, and clarifications regarding reinstating reclassifications and "fallback" reclassifications, were included in the FY 2008 IPPS final rule (72 FR 47333).

Changes to the wage index that result from withdrawals of requests for reclassification, terminations, wage

index corrections, appeals, and the Administrator's review process for FY 2015 are incorporated into the wage index values published in this FY 2015 IPPS/LTCH PPS final rule. These changes affect not only the wage index value for specific geographic areas, but also the wage index value redesignated/reclassified hospitals receive; that is, whether they receive the wage index that includes the data for both the hospitals already in the area and the redesignated/reclassified hospitals. Further, the wage index value for the area from which the hospitals are redesignated/reclassified may be affected.

Comment: One commenter stated that CMS' policy that hospitals must request to withdraw or terminate MGCRB reclassifications within 45 days of the proposed rule is problematic because a hospital could terminate a reclassification based on information in the proposed rule, and with the publication of the final rule, discover that its original reclassified status was more desirable. The commenter stated that hospitals cannot make informed decisions concerning their reclassification status based on values in a proposed rule that are likely to change and, therefore, recommended that CMS revise its existing policy to permit hospitals to withdraw or terminate their reclassification status within 45 days of the publication of the final rule. Similarly, another commenter stated that the requirement for withdrawal of an existing reclassification is unnecessary and unfair because it requires that a hospital give up the certain benefit of the existing reclassification for the uncertain benefit of a proposal. The commenter stated that it is possible that CMS could modify the reclassification rules, and suggested that hospitals be allowed 30 days after the publication of the final rule to withdraw their reclassification requests or to reverse a withdrawal that was made based on the proposed rule in situations where data corrections could result in the hospital no longer benefiting by the alternative they selected.

Response: We did not make any proposals to change any of the reclassification processes or criteria for FY 2015. Any changes to the reclassification processes or criteria would first need to be proposed in a separate rulemaking. Consequently, we are not making any changes to address the commenters' concerns at this time. We maintain that information provided in the proposed rule constitutes the best available data to assist hospitals in making reclassification decisions. The

values published in the final rule represent the final wage index values reflective of reclassification decisions.

b. Effects of Implementation of New OMB Labor Market Area Delineations on Reclassified Hospitals

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28070 through 28074), we indicated that because hospitals that have been reclassified beginning in FY 2013, 2014, or 2015 were reclassified based on the current labor market delineations, if we adopted the new OMB labor market area delineations beginning in FY 2015, the areas to which they have been reclassified, or the areas where they are located, may change. Under the new OMB delineations, we stated that many existing CBSAs would be reconfigured. We encouraged hospitals with current reclassifications to verify area wage indexes on Tables 4A-2 and 4B-2 associated with the proposed rule (which are available via the Internet on the CMS Web site), and confirm that the areas to which they have been reclassified for FY 2015 would continue to provide a higher wage index than their geographic area wage index. We stated that hospitals may withdraw their FY 2015 reclassifications by contacting the MGCRB within 45 days from the publication of the proposed rule.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28070), we stated that, in some cases, adopting the new OMB delineations would result in counties splitting apart from CBSAs to form new CBSAs, or counties shifting from one CBSA designation to another CBSA. Reclassifications granted under section 1886(d)(10) of the Act are effective for 3 fiscal years so that a hospital or county group of hospitals would be assigned a wage index based upon the wage data of hospitals in a nearby labor market area for a 3-year period. If CBSAs are split apart, or if counties shift from one CBSA to another under the new OMB delineations, it raises the question of how to continue a hospital's reclassification for the remainder of its 3-year reclassification period, if that area to which the hospital reclassified no longer exists, in whole or in part. We dealt with this question in FY 2005 as well when CMS adopted the current OMB labor market area definitions. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28071), we indicated that, consistent with the policy CMS implemented in the FY 2005 IPPS final rule (69 FR 49054 through 49056), if a CBSA would be reconfigured due to the new OMB delineations and it would not be possible for the reclassification to

continue seamlessly to the reconfigured CBSA, we believe it is appropriate for us to determine the best alternative location to reassign current reclassifications for the remaining 3 years. Therefore, to maintain the integrity of a hospital's 3-year reclassification period, we proposed a policy to assure that current geographic reclassifications (applications approved for FY 2013, FY 2014, or FY 2015) that would be affected by CBSAs that are split apart or counties that shift to another CBSA under the new OMB delineations, would ultimately be assigned to a CBSA under the new OMB delineations that contains at least one county from the reclassified CBSA under the current FY 2014 OMB definitions, and would be generally consistent with rules that govern geographic reclassification. That is, consistent with the policy finalized in FY 2005 (69 FR 49054 and 49055), we proposed a general policy that affected reclassified hospitals would be assigned to a CBSA that (1) would contain the most proximate county that is located outside of the hospital's proposed FY 2015 geographic labor market area, and (2) is part of the original FY 2014 CBSA to which the hospital is reclassified. We stated our belief that by assigning reclassifications to the CBSA that contains the nearest eligible county (as described above) satisfies the statutory requirement at section 1886(d)(10)(v) of the Act by maintaining reclassification status for a period of 3 fiscal years, while generally respecting the longstanding principle of geographic proximity in the labor market reclassification process. The hospitals that we proposed to reassign to a different CBSA based on our proposed policy above were listed in a special Table 9A-2 for the proposed rule, which is available via the Internet on the CMS Web site. In addition, we proposed to allow a hospital, or county group of hospitals, to request reassignment to another CBSA that would contain a county that is part of the current FY 2014 CBSA to which they are reclassified, if the hospital or county group of hospitals can demonstrate compliance with applicable reclassification proximity rules, as described later in this section.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28071), we stated that we recognize that this proposed reclassification reassignment described for hospitals that are reclassified to CBSAs that would split apart or to counties that would shift to another CBSA under the new OMB delineations may result in the reassignment of the

hospital for the remainder of its 3-year reclassification period to a CBSA having a lower wage index than the wage index that would have been assigned for the reclassified hospital in the absence of the proposed adoption of the new OMB delineations. Therefore, as discussed in section III.B.2.e.(4) of the preamble of the proposed rule, we proposed (and are finalizing in this final rule) that all hospitals that would experience a decrease in their FY 2015 wage index value due to the proposed implementation of the new OMB delineations would receive a 50/50 blended wage index adjustment in FY 2015. For FY 2015, we proposed to calculate a wage index value based on the current FY 2014 OMB definitions, and a wage index value based upon the proposed new OMB delineations (including reclassification assignments discussed in this section). If the wage index under the proposed new OMB delineations would be lower than the wage index calculated with the current (FY 2014) OMB definitions, we proposed that the hospital would be assigned a blended wage index (50 percent of the current; 50 percent of the proposed). We stated our belief that this proposed transitional adjustment would mitigate negative payment impacts for FY 2015, and would afford hospitals additional time to fully assess any additional reclassification options available to them under the new OMB delineations.

We are including the following descriptions of specific situations where we have determined that reassignment of reclassification areas is appropriate.

(1) Reclassifications to CBSAs That Are Subsumed by Other CBSAs

For the proposed rule (79 FR 28070), we identified 66 counties that are currently located in CBSAs that would be subsumed by another CBSA under the new OMB labor market area delineations. As a result, hospitals reclassifying to those CBSAs would now find that their reclassifications are to a CBSA that no longer exists. For these hospitals, we proposed to reassign reclassifications to the newly configured CBSA to which all of the original constituent counties in the FY 2014 CBSA are transferred. For example, CBSA 11300 (Anderson, IN) would no longer exist under the proposed FY 2015 delineations. The only constituent county in CBSA 11300, Madison County, IN, would be moving to CBSA 26900 (Indianapolis-Carmel-Anderson, IN). Because the original Anderson, IN labor market area no longer exists, we proposed to reassign reclassifications from the original Anderson, IN labor

market area to a newly configured CBSA where the original constituent county or counties are transferred, which is Indianapolis-Carmel-Anderson, IN. For hospitals reclassified to a CBSA that would be subsumed by another CBSA, we included a table in the proposed rule that reflected the hospitals' current reclassified CBSA, and the CBSA to which we proposed to assign them for FY 2015 (79 FR 28071).

We did not receive any public comments regarding this proposal to reassign hospitals reclassified to CBSAs that were subsumed by another CBSA. Therefore, we are finalizing this provision as proposed. For any hospital that is reclassified to a CBSA that no longer exists, and all of the CBSA's constituent counties moved to another CBSA under the new OMB delineations, we assigned that hospital's reclassification to the subsuming CBSA to which all of the original constituent counties in the FY 2014 CBSA are transferred.

The following table lists 63 hospitals that are currently located in CBSAs that will be subsumed by another CBSA under the new OMB labor market area delineations and reflects the hospitals' current reclassified CBSA and the CBSA to which we are assigning them for FY 2015. We note that three hospitals have terminated their reclassification since publication of the proposed rule and have been omitted.

(2) Reclassification to CBSAs Where the CBSA Number or Name Changed or to CBSAs Containing Counties That Moved to Another CBSA

For the proposed rule (79 FR 28072), we identified six CBSAs with current reclassifications that would maintain the same constituent counties, but the CBSA number or name would change if we adopted the new OMB delineations. For example, CBSA 29140 (Lafayette, IN) currently contains three counties (Benton, Carroll, and Tippecanoe Counties). The CBSA name and number for these counties would change to CBSA 29200 (Lafayette-West Lafayette, IN) under the new OMB delineations. Because the constituent counties in these CBSAs would not change under the new delineations, we would consider these CBSAs to be unchanged, and we did not propose any

reassignment for hospitals reclassified to those labor market areas.

In the proposed rule, we identified eight CBSAs with current reclassifications that have one or more counties that would split off and move to a new CBSA or to a different existing CBSA under the new OMB delineations. These CBSAs are shown in the following table.

Current FY 2014 CBSA	Current FY 2014 CBSA name
16620 ...	Charleston, WV.
16974 ...	Chicago-Joliet-Naperville, IL.
20764 ...	Edison-New Brunswick, NJ.
31140 ...	Louisville/Jefferson County, KY-IN.
35644 ...	New York-White Plains-Wayne, NY-NJ.
37964 ...	Philadelphia, PA.
39100 ...	Poughkeepsie-Newburgh-Middletown, NY.
48900 ...	Wilmington, NC.

In the proposed rule, we determined that 69 hospitals had current reclassifications to one of these CBSAs. Similar to the methodology finalized in the FY 2005 IPPS final rule (69 FR 49054 through 49055), we proposed to follow the general policy discussed in section III.H.2.b. of the preamble of the proposed rule. Specifically, we proposed that affected reclassified hospitals would be assigned to a CBSA (under the new OMB delineations) that would contain the most proximate county that is (1) located outside of the hospital's proposed FY 2015 geographic labor market area; and (2) is included in the current CBSA to which they are reclassified. For each of the 69 hospitals, we conducted a mapping analysis and determined driving distances from their geographic location to the borders of each county that is in the reclassified CBSA under the FY 2014 delineations and is also included in a CBSA under the new OMB delineations, excluding any counties that would be located in the hospital's proposed FY 2015 geographic labor market area. Following the general reassignment principle that we proposed, we proposed to reassign those reclassified hospitals to the CBSA which contains the geographically closest county. For example, there are hospitals that currently are reclassified to CBSA 39100 (Poughkeepsie-Newburgh-Middletown, NY) under the FY 2014 delineations, which is comprised of Dutchess County and Orange County, NY. Under the new OMB delineations, Dutchess County would become part of new CBSA 20524 (Dutchess County-Putnam County, NY), while Orange County would join CBSA

35614 (New York-Jersey City-White Plains, NY-NJ Metropolitan Division). Therefore, we mapped the distances from one reclassified hospital to the border of Dutchess County and Orange County, NY (the two counties that were part of CBSA 39100 under the FY 2014 delineations). Our analysis showed that the hospital is 2.2 miles from Dutchess County, and 25.9 miles from Orange County. Therefore, we proposed to reassign this hospital's reclassification from the FY 2014 CBSA 39100 to the new CBSA 20524.

For the proposed rule, we also identified affected county group reclassifications. For these reclassifications, we proposed that we would follow our proposed policy discussed above, except that, for county group reclassifications, we proposed to reassign hospitals in a county group reclassification to the CBSA under the new OMB delineations to which the majority of hospitals in the group reclassification are geographically closest. Because hospitals in a county group applied as a group, we believe the reassignment should also be applied to the whole group. For example, the hospitals of Fairfield County, CT are reclassified as a group to CBSA 35644 under the FY 2014 delineations. Under the new OMB delineations, CBSA 35644 would no longer exist and would be split into the following two new CBSAs: 20524 (Dutchess County-Putnam County, NY) and 35614 (New York-Jersey City-White Plains, NY-NJ). Of the six hospitals in the group reclassification, all but one would be closer to an eligible county (Westchester, NY) in CBSA 35614 than to an eligible county (Putnam, NY) in CBSA 20524. Because these hospitals in Fairfield, CT applied as a group, we believe the reassignment should also be applied to the whole group. Therefore, we proposed to assign the hospitals in this group reclassification to CBSA 35614, the reconfigured CBSA to which the majority of the hospitals in the group reclassification are geographically closest.

To summarize, of the 69 hospitals identified in the proposed rule as reclassified to 1 of the 8 CBSAs in the preceding table that have counties that would split off and move to a new CBSA or a different existing CBSA under the new OMB delineations, there are 27 hospitals that would maintain the same reclassified CBSA number under our proposals. Another 28 hospitals would be reassigned to a reconfigured CBSA that would contain a similar number of counties from their current reclassified CBSA. For the remaining 14 reclassified hospitals, we proposed to

assign them to a CBSA (under the new OMB delineations) that would have a different CBSA number from the labor market area to which they are currently reclassified (under the current FY 2014 delineations). This is because if the original CBSA to which the hospitals are reclassified is losing counties to another urban CBSA, it may be that the original reclassification determination would not be reflective of the new delineations. In addition, because proximity to a CBSA is a requirement of reclassifications approved under section 1886(d)(10) of the Act, we stated our belief that it is appropriate to propose to reassign reclassification status to an urban CBSA that contains the county (from the hospital's current CBSA reclassification) that is closest to the hospital. We stated our belief that this would more accurately reflect the geographic labor market area of the reclassified hospital.

Consistent with refinements implemented in the FY 2005 IPPS final rule (69 FR 49055), we proposed to allow hospitals that reclassified under section 1886(d)(10) of the Act to one of the eight CBSAs that split (that is, current FY 2014 CBSAs 16620, 16974, 20764, 31140, 35644, 37964, 39100, 48900) to be reclassified to any CBSA containing a county from their original reclassification labor market area, provided that the hospital demonstrates that it meets the applicable proximity requirements under 42 CFR 412.230(b) and (c) (for individual hospitals), 42 CFR 412.232(a)(1) (for a rural group), and 42 CFR 412.234(a)(2) and (a)(3) (for an urban group) to that CBSA. We stated that hospitals that wished to be reassigned to an alternate CBSA (other than the CBSA to which their reclassification would be reassigned in this proposed rule) for which they meet the applicable proximity criteria could request reassignment within 45 days from the publication of the proposed rule. Hospitals had to send a request to WageIndex@cms.hhs.gov and provide documentation certifying that they meet the requisite proximity criteria for reassignment to an alternate CBSA, as described above. We stated our belief that this option of allowing hospitals to submit a request to CMS would provide hospitals with greater flexibility with respect to their reclassification reassignment, while ensuring that the proximity requirements are met. We believe that where the proximity requirements are met, the reclassified wage index would be consistent with the labor market area to which the hospitals were originally approved for reclassification. Under this proposed

policy, a hospital could request to be assigned a reclassification to any CBSA that contains any county from the CBSA to which it is currently reclassified. However, to be reassigned to an area that is not the most proximate to the hospital (or the majority of hospitals in a county group), we believe it is necessary that the hospital demonstrates that it complies with the applicable proximity criteria. If a hospital cannot demonstrate proximity to an alternate CBSA, the hospital would not be considered for reclassification to that labor market area, and reassignment would remain with the closest eligible (new) CBSA.

In the proposed rule (79 FR 28073), we included a table showing proposed hospital reclassification assignments for hospitals reclassified to CBSAs from which counties would be split off and moved to a different CBSA under the new OMB delineations. The table showed the current reclassified CBSA and the CBSA to which CMS proposed reassignment.

We proposed that hospitals that disagreed with our determination of the most proximate county had to provide an alternative method for determining proximity to CMS within 45 days from the publication of the proposed rule. We stated that changes to a hospital's CBSA assignment on the basis of a hospital's disagreement with our determination of closest county, or on the basis of being granted a reassignment due to meeting applicable proximity criteria to an eligible CBSA would be announced in this FY 2015 IPPS/LTCH PPS final rule.

Comment: Commenters were generally supportive of our proposal to adopt the new OMB delineations. Commenters did not specifically address the proposed assignment of reclassification status for hospitals that are reclassified to labor market areas where the CBSA number or name changed or to CBSAs containing counties that moved to another CBSA.

Response: We thank the commenters for their support of our proposal to implement the new OMB delineations for the hospital wage index.

After consideration of the public comments we received, we are finalizing the reassignment methodology as proposed. Hospitals that were reclassified to a CBSA that had one or more counties that split off and moved to another CBSA under the new OMB delineations are reclassified to a CBSA that will contain the most proximate county that (1) is located outside of the hospital's FY 2015 geographic labor market area; and (2) is included in the current CBSA to which they are reclassified. Group

reclassifications are assigned to the CBSA under the new OMB delineations to which the majority of hospitals in that group reclassification are geographically closest and that (1) is located outside of the hospital's FY 2015 geographic labor market area; and (2) is included in the current CBSA to which they are reclassified.

We also allowed hospitals that reclassified under section 1886(d)(10) of the Act to one of the eight CBSAs that split (that is, current FY 2014 CBSAs 16620, 16974, 20764, 31140, 35644, 37964, 39100, 48900) to be reclassified to any CBSA containing a county from their original reclassification labor market area, provided that the hospital demonstrates that it meets the applicable proximity requirements under 42 CFR 412.230(b) and (c) (for individual hospitals), 42 CFR 412.232(a)(1) (for a rural group), and 42 CFR 412.234(a)(2) and (a)(3) (for an urban group) to that CBSA. Hospitals that wished to be reassigned to an alternate CBSA (other than the CBSA to which their reclassification would be reassigned in this proposed rule) for which they meet the applicable proximity criteria needed to request reassignment within 45 days from the publication of the proposed rule. We received one request in the *WageIndex@cms.hhs.gov* mailbox to request reassignment to another eligible labor market area. A rural hospital in North Carolina was originally reclassified to CBSA 48900 (Wilmington, NC). This CBSA had more than one county that was split off and moved to another CBSA under the new OMB delineations. Thus, under our proposed policy (which we are finalizing in this final rule), we reclassified this hospital to a CBSA that contained the most proximate county that is located outside of the hospital's FY 2015 geographic labor market area and is included in the current CBSA to which it is reclassified. Of all the former constituent counties of CBSA 48900, the hospital is geographically closest to Brunswick County, NC, which is outside of the hospital's FY 2015 geographic labor market area and is included in the current CBSA to which the hospital is reclassified. However, under the new OMB delineations, Brunswick County is moved from CBSA 48900 to CBSA 34820 (Myrtle Beach-Conway-North Myrtle Beach, SC-NC). Therefore, we assigned this hospital's reclassification to CBSA 34820 in the proposed rule. The hospital provided adequate evidence to demonstrate that it is located within 35-miles from Pender County, NC, which remains part of CBSA 48900. Because the proximity

criteria limit for MGCRB reclassification of an individual rural hospital is 35 miles (§ 412.230(b)(1)), we are approving the hospital's request for reassignment back to CBSA 48900. The change is reflected in the proceeding table.

The following table shows hospital reclassification assignments for hospitals reclassified to CBSAs from which counties were split off and moved to a different CBSA under the new OMB delineations. The following table shows the current reclassified CBSA and the CBSA to which CMS is making reassignments. We note that 23 hospitals terminated their reclassification status since the proposed rule was published and have been omitted.

HOSPITAL RECLASSIFICATION RE-ASSIGNMENTS FOR HOSPITALS THAT ARE RECLASSIFIED TO CBSAS FROM WHICH COUNTIES ARE SPLIT OFF AND MOVED TO A DIFFERENT CBSA

420085	48900	48900

Table 9A–2 for this final rule (which is available via the Internet on the CMS Web site) reflects all reassignments of hospital reclassifications for FY 2015.

(3) Reclassifications to CBSAs That Contain Hospital’s Geographic County

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28074), we identified 14 reclassified hospitals that would be geographically located in their reclassified labor market area under the new OMB delineations. For example, hospital 34–0015 is located in Rowan County, NC. Rowan County is currently a Micropolitan Statistical Area in NC, and treated as rural. The hospital is reclassified to CBSA 16740 (Charlotte-Concord-Rock Hill, NC–SC). Under the new OMB delineations, CBSA 16740 (Charlotte-Concord-Gastonia, NC–SC) would include Rowan County. Therefore, the current reclassification would become redundant. CBSA 16740 did not lose any counties to another labor market area; therefore, assignment to another alternate CBSA would not be an option under our proposed methodology. Because, by definition, a hospital would not be “reclassified” to its own geographic labor market area, and maintaining that “reclassified” status to its own geographic labor market area would serve no beneficial purpose for a hospital, we expected that all such affected hospitals would wish to terminate their reclassification status. Therefore, we assumed, for purposes of the proposed rule, that the affected hospitals would be terminating their reclassification status for the remaining years of their 3-year reclassification period, and for FY 2015, we proposed to assign them the wage index of the CBSA in which they are geographically located. We stated that affected hospitals should inform CMS if they wish to retain their current reclassification by sending notice to CMS within 45 days from the publication of the proposed rule. If an affected hospital did not inform us that

they wished to retain their current reclassification, we assumed that the hospital had elected to terminate the reclassification. For purposes of the proposed rule, we presented tables under the presumption that all 14 hospitals would opt to cancel their reclassification status. We proposed to assign these hospitals the wage index value of their home area from Table 4A–2 for the proposed rule (which is available via the Internet on the CMS Web site), and not include them as reclassified hospitals in Table 9A–2 for the proposed rule (which is available via the Internet on the CMS Web site).

We did not receive any public comments on this proposal, nor did any hospital contact CMS through the *WageIndex@cms.hhs.gov* mailbox. Therefore, we are finalizing the proposal without any modifications. The following hospitals’ reclassifications are terminated, and they are assigned the wage index of the CBSA to which they are geographically located under the new OMB delineations.

HOSPITALS RECLASSIFIED TO HOME LABOR MARKET AREA

CMS Certification Number (CCN)	Current geographic CBSA	Reclassified geographic CBSA
340015	34	16740
340129	34	16740
340144	34	16740

490019	49	47894

c. Applications for Reclassifications for FY 2016

Applications for FY 2016 reclassifications are due to the MGCRB by September 2, 2014 (the first working day of September 2014). We note that this is also the deadline for canceling a previous wage index reclassification withdrawal or termination under 42 CFR 412.273(d). As discussed in section III.B. of the preamble of this final rule, we are adopting the new OMB labor market area delineations announced on February 28, 2013. Therefore, hospitals should apply for reclassifications based on the new OMB delineations we are using for FY 2015. Applications and other information about MGCRB reclassifications may be obtained via the Internet on the CMS Web site at:

<http://www.cms.gov/Regulations-and-Guidance/Review-Boards/MGCRB/index.html>, or by calling the MGCRB at (410) 786–1174. The mailing address of the MGCRB is: 2520 Lord Baltimore Drive, Suite L, Baltimore, MD 21244–2670.3.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28074, 28075, and 28304), we proposed changes to the regulations at § 412.232(b)(2) and § 412.234(a)(3)(iv) to include reference to the most recent OMB standards for delineating statistical areas (using the most recent Census Bureau data and estimates) that were adopted by CMS. For rural groups, the group of hospitals must demonstrate that the county in which the hospitals are located meets the standards for redesignation to an MSA as an “outlying county.” For urban groups, hospitals located in counties that are in the same combined statistical area or CBSA as the urban area to which they seek redesignation qualify as meeting the proximity requirements for reclassification to the urban area to which they seek redesignation. We did not propose any changes to the reclassification policy, but included language in the regulations to reflect use of the most recent OMB standards for delineating statistical areas (using the most recent Census Bureau data and estimates) that are adopted by CMS in consideration of group reclassification applications submitted for review in FY 2015 (that is submitted by September 2, 2014 (this date was erroneously stated in the proposed rule as September 30, 2014), reviewed by the MGCRB in FY 2015, to be effective in FY 2016) and future years.

We did not receive any public comments on our proposed changes to the regulations at § 412.232(b)(2) and § 412.234(a)(3)(iv) to include a reference to the most recent OMB standards for delineating statistical areas (using the most recent Census Bureau data and estimates) that are adopted by CMS. Therefore, we are adopting as final the proposed changes to § 412.232(b)(2) and § 412.234(a)(3)(iv).

3. Redesignation of Hospitals Under Section 1886(d)(8)(B) of the Act

Section 1886(d)(8)(B)(i) of the Act requires the Secretary to “treat a hospital located in a rural county adjacent to one or more urban areas as being located in the urban metropolitan statistical area to which the greatest number of workers in the county commute” if certain adjacency and commuting criteria are met. The criteria utilize standards for designating Metropolitan Statistical Areas published in the **Federal Register** by the Director

of the Office of Management and Budget (OMB) based on the most recently available decennial population data. Effective beginning FY 2005, we used OMB’s CBSA standards based on the 2000 Census and the 2000 Census data to identify counties in which hospitals qualify under section 1886(d)(8)(B) of the Act to receive the wage index of the urban area. Hospitals located in these counties have been known as “Lugar” hospitals and the counties themselves are often referred to as “Lugar” counties.

As discussed in section III.B. of the preamble to the proposed rule, we proposed to implement OMB’s revised labor market area delineations based on the Census 2010 data for purposes of determining applicable wage indexes for acute care hospitals beginning in FY 2015. As we have done in the past, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28075 through 28078), we also proposed to use the new OMB delineations to identify rural counties that would qualify as “Lugar” under section 1886(d)(8)(B) of the Act and, therefore, would be redesignated to urban areas for FY 2015. We proposed to revise the regulations at § 412.64(b)(3)(i) to reflect the most recent OMB standards for delineating statistical areas adopted by CMS. In the FY 2015 IPPS/LTCH PPS proposed rule, we stated that, by applying the new OMB delineations, the number of qualifying counties would increase from 98 in FY 2014 to 127 in FY 2015, as reflected in a chart published in the proposed rule. Since publication of the proposed rule, we have discovered a mistake where we inadvertently did not account for Davidson County, NC

(which was a Lugar county in FY 2014 but is in a rural county no longer qualifying to be Lugar under the new OMB delineations, as discussed in section III.H.3.c. of the preamble of this final rule). Therefore, the number of qualifying counties increases from 99 in FY 2014 to 127 in FY 2015, and we are correcting this oversight in the preamble of this final rule. After evaluating and analyzing the 2010 Census commuting data, we proposed that, effective for discharges on or after October 1, 2014, in accordance with section 1886(d)(8)(B) of the Act, hospitals located in the rural counties listed in the first column of the table in the proposed rule would be designated as part of the urban area listed in the second column based on the criteria discussed above.

Comment: One commenter suggested that Lugar hospitals be considered rural for all Medicare IPPS purposes other than receiving the urban wage index.

Response: Lugar status is a deemed status, and there are only two provisions under the Medicare statute that would allow a Lugar hospital to be treated as a rural provider: (1) if the hospital is eligible for an out-migration adjustment under section 1886(d)(13) of the Act; or (2) if the hospital applies for an urban to rural reclassification under section 1886(d)(8)(E) of the Act. In either case, the hospital would be treated as rural for all IPPS purposes, which includes the wage index.

We did not receive any other specific comments with regard to our proposal to use the new OMB delineations to identify rural counties that would qualify as “Lugar” under section 1886(d)(8)(B) of the Act. Therefore, we are finalizing the policy as proposed.

We also are finalizing our proposed revision of the regulations at § 412.64(b)(3)(i) to reflect the most recent OMB standards for delineating statistical areas adopted by CMS.

In addition, since publication of the proposed rule we discovered that, in the FY 2015 IPPS/LTCH proposed rule, for five of the Lugar counties, we had erroneously printed the names and codes of the entire Metropolitan Statistical Areas rather than the Metropolitan Division names and codes. Because we recognize Metropolitan Divisions as CBSAs, we should have printed the division names and codes for the following counties: Starke County, IN; Fannin County, TX; Hill County, TX; Van Zandt County, TX; and Island County, WA. The table below contains the corrected listing of the rural counties designated as urban under section 1886(d)(8)(B) of the Act. We note that this error was made only in the chart; that is, the wage index tables and data associated the FY 2015 IPPS/LTCH PPS proposed rule (available via the Internet on the CMS Web site) properly captured the Metropolitan Divisions for hospitals in these five counties. We are finalizing that, effective for discharges on or after October 1, 2014, in accordance with section 1886(d)(8)(B) of the Act, hospitals located in the rural counties listed in the first column of the chart below will be designated as part of the urban area listed in the second column based on the finalized criteria discussed above.

We note that rural counties that no longer meet the qualifying criteria to be Lugar are discussed in section III.H.3.c. of the preamble of this final rule.

a. New Lugar Areas for FY 2015

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28077), we stated that of the 127 qualifying counties identified as Lugar counties based on the new OMB delineations, 58 counties would be newly designated as Lugar for FY 2015 if we finalize our proposed adoption of the new OMB delineations. Hospitals in these counties, with at least 25 percent of their workers commuting to a higher wage area, effective October 1, 2014, would be deemed to be located in the CBSA to which the highest number of their workers commute (which is identified in the column titled “Lugar Designated CBSA” in the table above). Hospitals in these counties would receive the reclassified urban wage index of the corresponding Lugar Designated CBSA, unless they choose to

waive their Lugar status, as discussed later in this section.

In the proposed rule (79 FR 28077), we stated that some areas that are currently urban counties would be geographically rural if we adopted the new OMB delineations and would meet the requirements for redesignation as Lugar areas. As described in section III.B.2.e.(2) of the preamble of the proposed rule, we proposed a 3-year hold harmless transitional wage index adjustment for hospitals located in urban counties that become rural under the new OMB delineations. Because Lugar status is a form of redesignation, hospitals that currently are located in urban counties that would become rural under the new OMB delineations and are also considered Lugar areas under the new OMB delineations would not be eligible for the 3-year transition wage

index adjustment unless they chose to waive Lugar status for FY 2015 (as discussed later in this section) and sought no other form of wage index reclassification.

As discussed above, we did not receive any public comments with regard to our proposal to use the new OMB delineations to identify rural counties that would qualify as “Lugar” under section 1886(d)(8)(B) of the Act, and we are finalizing the policy as proposed. We refer readers to the summary of public comments and our responses regarding the proposed transition policies for the wage index as a result of adoption of the OMB delineations for FY 2015 in section III.B.2.e. of the preamble of this final rule.

b. Hospitals Redesignated Under Section 1886(d)(8)(B) of the Act Seeking Reclassification by the MGCRB

As in the past, hospitals redesignated under section 1886(d)(8)(B) of the Act are also eligible to be reclassified to a different area by the MGCRB. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28077), we stated that by using Table 4C associated with the proposed rule (which is available via the Internet on the CMS Web site), affected hospitals could compare the reclassified wage index for the labor market area into which they would be reclassified by the MGCRB to the reclassified wage index for the area to which they are redesignated under section 1886(d)(8)(B) of the Act. We stated that hospitals may withdraw from an MGCRB reclassification within 45 days of the publication of the FY 2015 proposed rule. (We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51598 through 51599) for the procedural rules and requirements for a hospital that is redesignated under section 1886(d)(8)(B) of the Act and seeking reclassification under the MGCRB, as well as our policy of measuring the urban area, exclusive of the Lugar County, for purposes of meeting proximity requirements.)

We treat New England deemed counties in a manner consistent with how we treat Lugar counties. (We refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47337 through 47338) for a discussion of this policy.)

Since publication of the proposed rule, we discovered that there are four hospitals in rural counties that are newly deemed Lugar areas for FY 2015 that also have MGCRB reclassifications to the same CBSAs to which they are redesignated as Lugar. Lugar hospitals are treated like reclassified hospitals for purposes of determining their applicable wage index and receive the reclassified wage index for the urban area to which they have been redesignated. Because the Lugar redesignated CBSA is now the same as the MGCRB reclassified CBSA, the MGCRB reclassification becomes redundant. We note that hospitals with Lugar redesignations and hospitals with MGCRB reclassifications receive the wage index for hospitals that are reclassified as provided in Table 4C–2 associated with this final rule (which is available via the Internet on the CMS Web site). Table 9A–2 associated with this final rule (which is available via the Internet on the CMS Web site) reflects the reclassified and redesignated hospitals. Hospitals that are redesignated as Lugar are indicated as such when the “Lugar” column is populated. Although we did indicate in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28077) that hospitals redesignated as Lugar that also had an MGCRB reclassification may compare the reclassified wage index for the labor market area into which they would be reclassified by the MGCRB to the reclassified wage index for the area to which they are redesignated under section 1886(d)(8)(B) of the Act, and

terminate or withdraw from an MGCRB reclassification within 45 days of the publication of the proposed rule, we acknowledge that we did not highlight these four hospitals that also are Lugar that would have redundant reclassifications. We also note that these hospitals did not send requests to the MGCRB to terminate their reclassifications. Because the new Lugar status would deem these hospitals redesignated to the same area to which they have an approved MGCRB reclassification, the reclassified wage index would be the same for these four hospitals in either scenario. We realize that, for this reason, the hospitals may not have seen a need to withdraw the MGCRB reclassification. Because we did not state in the proposed rule that we would expect that these affected hospitals would be terminating the remaining years of their 3-year reclassification period, for FY 2015 we are not updating the Lugar column on Table 9A–2 for this final rule. However, we have indicated in a footnote that, under the new OMB delineations, these providers are now redesignated as Lugar to the same area to which they have an existing MGCRB reclassification that they did not terminate. We emphasize that the effect on the wage index of these four hospitals is immaterial because hospitals redesignated as Lugar as well as hospitals with approved MGCRB reclassifications both receive the reclassified wage index for the urban area to which they have been redesignated or reclassified.

HOSPITALS REDESIGNATED AS LUGAR TO AN AREA WHERE THEY HAVE AN APPROVED MGCRB RECLASSIFICATION FOR FY 2015

CMS Certification No. (CCN)	Rural county name	Lugar CBSA	MGCRB reclassification CBSA
150076	Marshall County, IN	43780	43780
190017	St. Landry Parish, LA	29180	29180
390016	Lawrence County, PA	38300	38300
420030	Colleton County, SC	16700	16700

c. Rural Counties No Longer Meeting the Criteria To Be Redesignated as Lugar

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28077 through 28078), we discussed that if we adopted the new OMB delineations, 29 rural counties would no longer meet the qualifying criteria to be redesignated as Lugar effective October 1, 2014, either because they would be geographically located in an urban area, or they would fail to meet the 25 percent cumulative out-migration threshold with application of the new 2010 Census

commuting data. Since the publication of the proposed rule, we have discovered a mistake where we inadvertently did not account for Davidson County, NC. Therefore, the number of rural counties that will no longer meet the qualifying criteria to be redesignated as Lugar effective October 1, 2014, as indicated above, is 30 as opposed to 29. We are correcting this oversight in the preamble of this final rule.

Counties that were deemed urban under section 1886(d)(8)(B) of the Act in

FY 2014, but would be geographically located in an urban area under the new OMB delineations for FY 2015 are:

- Windham County, CT
- Flagler County, FL
- Walton County, FL
- Morgan County, GA
- Peach County, GA
- De Witt County, IL
- Allen County, KY
- St. James Parrish, LA
- Montcalm County, MI
- Fillmore County, MN
- Davidson County, NC
- Lincoln County, NC

Cotton County, OK
 Linn County, OR
 Adams County, PA
 Monroe County, PA
 Falls County, TX
 Buckingham County, VA
 Floyd County, VA
 Green County, WI

Counties that would fail to meet the 25-percent threshold in FY 2015 are:

Banks County, GA
 Hendry County, FL
 Bingham County, ID
 Oceana County, MI
 Columbia County, NY
 Sullivan County, NY
 Wyoming County, NY
 Oconee County, SC
 Middlesex County, VA
 Wahkiakum County, WA

In section III.B.2.e.(2) of the preamble of the proposed rule, to help ease dramatic negative impacts in payment for hospitals designated as urban under the current FY 2014 OMB delineations, but would be classified as rural under the new OMB delineations, for FYs 2015, 2016, and 2017, assuming no other form of wage index reclassification or redesignation is granted, we proposed to assign these hospitals the FY 2015 area wage index value of the urban CBSA to which they geographically belonged in FY 2014 (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied to the area wage index). (For purposes of the wage index computation, the wage data of these hospitals would remain assigned to the statewide rural area in which they are located.) Similarly, we proposed that the same 3-year transition apply to hospitals located in those counties that would lose their deemed urban designation under section 1886(d)(8)(B) of the Act and would become rural if we adopt the new OMB delineations. Because these hospitals would, in fact, lose their designated urban status, we proposed to extend the 3-year hold harmless transitional wage index adjustment to these hospitals located in counties formerly designated as urban under section 1886(d)(8)(B) of the Act. That is, for FYs 2015, 2016, and 2017, assuming no other form of wage index reclassification or redesignation is granted, we proposed to assign these hospitals the FY 2015 area wage index value of the urban CBSA to which they were designated as urban in FY 2014 (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied). We proposed to use the wage data from these hospitals as part of computing the rural wage index. In addition, during

this 3-year transition period, these hospitals would be eligible to apply for reclassification by the MGCRB. As discussed in section III.B.2.e.(3) of the preamble of the proposed rule, we proposed that if a hospital is currently located in an urban county that would become rural for FY 2015 under the new OMB delineations, and such hospital seeks and is granted any reclassification or redesignation during FYs 2015, 2016, or 2017, the hospital would permanently lose its 3-year transitional assigned wage index, and would not be able to reinstate it. Similarly, we proposed that this policy also apply to hospitals located in those counties that would lose their deemed urban designation under section 1886(d)(8)(B) of the Act and would become rural if we adopt the new OMB delineations. In FY 2018, we proposed that these hospitals would receive their statewide rural wage index.

As indicated earlier, we did not receive any public comments with regard to our proposal to use the new OMB delineations to identify rural counties that would qualify as “Lugar” under section 1886(d)(8)(B) of the Act. Therefore, we are finalizing the policy and designations as proposed. As discussed previously, for FYs 2015, 2016, and 2017, assuming no other form of wage index reclassification or redesignation is granted, we are assigning hospitals that are in urban counties that will become rural under the new OMB delineations to the FY 2015 area wage index value of the urban CBSA to which they geographically belonged in FY 2014 (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied to the area wage index). (For purposes of the wage index computation, the wage data of these hospitals will remain assigned to the statewide rural area in which they are located.) Similarly, the same 3-year transition will apply to hospitals located in those counties that will lose their deemed urban designation under section 1886(d)(8)(B) of the Act and will become rural under the new OMB delineations. We will use the wage data from these hospitals as part of computing the rural wage index. In FY 2018, these hospitals will receive their statewide rural wage index. Furthermore, if any such hospital seeks and is granted any reclassification or redesignation during FYs 2015, 2016, or 2017, the hospital will permanently lose its 3-year transitional assigned wage index and will not be able to reinstate it. We refer readers to summaries of public comments and our responses

regarding proposed transition policies for the wage index in section III.B.2.e. of the preamble of this final rule.

4. Waiving Lugar Redesignation for the Out-Migration Adjustment

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600), we adopted the policy that, beginning with FY 2012, an eligible hospital that waives its Lugar status in order to receive the out-migration adjustment has effectively waived its deemed urban status and, thus, is rural for all purposes under the IPPS, including being considered rural for the DSH payment adjustment, effective for the fiscal year in which the hospital receives the out-migration adjustment. (We refer readers to a discussion of DSH payment adjustment under section IV.F. of the preamble of this final rule.)

In addition, we adopted a minor procedural change in that rule that would allow a Lugar hospital that qualifies for and accepts the out-migration adjustment (through written notification to CMS within 45 days from the publication of the proposed rule) to waive its urban status for the full 3-year period for which its out-migration adjustment is effective. By doing so, such a Lugar hospital would no longer be required during the second and third years of eligibility for the out-migration adjustment to advise us annually that it prefers to continue being treated as rural and receive the out-migration adjustment. Therefore, under the procedural change, a Lugar hospital that requests to waive its urban status in order to receive the rural wage index in addition to the out-migration adjustment would be deemed to have accepted the out-migration adjustment and agrees to be treated as rural for the duration of its 3-year eligibility period, unless, prior to its second or third year of eligibility, the hospital explicitly notifies CMS in writing, within the required period (generally 45 days from the publication of the proposed rule), that it instead elects to return to its deemed urban status and no longer wishes to accept the out-migration adjustment. If the hospital does notify CMS that it is electing to return to its deemed urban status, it would again be treated as urban for all IPPS payment purposes.

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600) for a detailed discussion of the policy and process for waiving Lugar status for the out-migration adjustment.

Comment: One commenter sought clarification about whether a hospital can waive Lugar status in other

instances, such as to retain a special rural status such as CAH, SCH, or MDH, and not just when a hospital is eligible for the out-migration adjustment.

Response: As stated in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600), the statute provides two methods for a Lugar hospital to be treated as rural for Medicare payment purposes: (1) If the hospital is eligible for an out-migration adjustment under section 1886(d)(13) of the Act; or (2) if the hospital applies for an urban to rural reclassification under section 1886(d)(8)(E) of the Act. There are no other provisions under the Medicare statute that would allow a Lugar hospital to be treated as a rural provider.

5. Update of Application of Urban to Rural Reclassification Criteria

Section 401(a) of the Medicare, Medicaid, and SCHIP Balanced Budget Refinement Act of 1999 (Pub. L. 106–113), which amended section 1886(d)(8) of the Act by adding a new paragraph (E), directed the Secretary to treat any subsection (d) hospital located in an urban area as being located in the rural area of the State in which the hospital is located, providing that the hospital applied for reclassification in a manner determined by the Secretary and met certain criteria. As discussed in the FY 2001 interim final rule (65 FR 47029 through 47031), we codified in regulation at § 412.103 the application process and the qualifying criteria for any hospital seeking rural reclassification.

In order to be approved for a rural reclassification, a hospital that is located in an urban area must meet one of the following four criteria under section 1886(d)(8)(E)(ii) of the Act (codified at § 412.103): (1) The hospital is located in a rural census tract of an MSA, as determined under the most recent version of the Goldsmith Modification, the Rural-Urban Commuting Area (RUCA) codes; (2) the hospital is located in an area designated by any law or regulation of such State as a rural area or is designated by such State as a rural hospital; (3) the hospital would qualify as a RRC or SCH if the hospital were located in an urban area; and (4) the hospital meets such other criteria as the Secretary may specify.

On February 28, 2013, OMB issued OMB Bulletin No. 13–01, which established revised delineations for Metropolitan Statistical Areas, Micropolitan Statistical Areas, and Combined Statistical Areas, and provided guidance on the use of the delineations of these statistical areas. These delineations are based on 2010 decennial Census data. Several

modifications of RUCA codes were necessary to take into account updated commuting data and revised OMB delineations. We refer readers to the U.S. Department of Agriculture's Economic Research Service Web site for a detailed listing of updated RUCA codes found at: <http://www.ers.usda.gov/data-products/rural-urban-commuting-area-codes.aspx>. The updated RUCA code definitions were introduced in late 2013.

As discussed at § 412.103(f), the duration of an approved rural reclassification remains in effect without need for reapproval unless there is a change in the circumstances under which the classification was approved. If a hospital located in an urban area was approved for a rural reclassification under § 412.103(a)(1), that reclassification would no longer be valid if the hospital is no longer located within a rural census tract of an MSA defined as an RUCA. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28078), we encouraged all hospitals with active rural reclassifications under section 1886(d)(8)(E) of the Act to review their original reclassification application and determine whether the reclassification status would still apply. As discussed in section VI.C.2. of the preamble of the proposed rule, we proposed a 2-year grace period allowing affected CAHs additional time to seek a new rural reclassification without the threat of losing its CAH status. As discussed in section VI.C.2. of the preamble of the proposed rule, we did not propose a grace period for other types of hospitals to seek a new rural reclassification. We noted that rural reclassification status under § 412.103 is effective as of the filing date of the application. Therefore, if the change in RUCA codes invalidates any hospital's rural reclassification status, we believe hospitals will have adequate time to apply for a new reclassification using an alternative qualification criterion specified at either § 412.103(a)(2) or § 412.103(a)(3). A rural referral center (RRC) or a sole community hospital (SCH) that continues to meet the appropriate qualification criteria would, in itself, qualify for a rural reclassification. If a complete application is received before October 1, 2014, and is approved by the CMS Regional Office, the hospital would experience no interruption in its rural status.

Comment: Several commenters requested that additional provider types (SCHs and MDHs) be afforded the 2-year transition period of deemed rural status that was granted to CAHs. Commenters stated the critical role these hospitals

serve in their communities, and cited the administrative burden that would be required to obtain rural status in order to maintain their provider type. Commenters asserted that hospitals that obtain an urban to rural reclassification are not entitled to receive an outmigration adjustment and would require additional time to assess their appropriate options.

Response: We thank commenters for sharing their concerns. However, we do not believe that extending a 2-year transition period of deemed rural status is necessary for additional provider types. While it is true that there are potential payment consequences for a CAH, SCH, or MDH currently located in a rural area that becomes urban under the new OMB delineations, the payment consequences for CAHs are generally greater, because, unlike SCHs and MDHs, CAHs are entirely excluded from the IPPS and would face an end to payments based on 101 percent of their reasonable costs. In addition, given the different Conditions of Participation (CoPs) for CAHs, and that it would be generally more difficult for a CAH to have to meet the hospital CoPs instead of the CAH CoPs, only a CAH also faces the potential loss of its ability to continue to participate in the Medicare and Medicaid programs. Specifically, to avoid termination not only of its CAH status (and associated cost-based reimbursement), but of its Medicare agreement in its entirety, the CAH would have to convert back to a hospital, including demonstrating via a survey that it complies with the hospital CoPs, which are generally more stringent than those for CAHs. We believe that the combination of the generally greater payment consequences for CAHs relative to other provider types combined with the unique consequences for CAHs with respect to the CoPs make it appropriate for CAHs to be afforded a 2-year transition period in which to reclassify not afforded to other provider types.

SCHs and MDHs that were located in rural areas that became urban under the new OMB delineations could have known of the upcoming change since February 2013 (when OMB published the new delineations); thus, these hospitals have had adequate time to assess options. SCHs and MDHs still can seek approval for rural reclassification for FY 2015 under § 412.103 if they meet the requirements of this section, provided that they apply before the beginning of FY 2015. This approval of rural status would be effective as of the date of the application. If any hospital's wage index is negatively affected due to the adoption of the new OMB

delineations, the hospital will receive a 50/50 blended wage index for FY 2015 (as discussed previously).

With respect to the out-migration adjustment, commenters noted correctly that hospitals reclassified rural under section 412.103 are not eligible to receive an out-migration adjustment. Section 1886(d)(13)(G) of the Act specifies that a hospital is not eligible to receive an out-migration adjustment if it is granted any form of wage index reclassification, including urban to rural reclassification. We believe that a hospital that chooses to reclassify to a particular labor market area should not also receive an additional payment benefit to reflect commuting patterns within its home area.

After consideration of the public comments we received, we are not implementing any additional changes to grant other provider types a transition period during which to reclassify as rural similar to that being adopted for CAHs. We refer readers to section VI.C.2. of the preamble of this final rule for a discussion of the CAH transition period policy.

I. FY 2015 Wage Index Adjustment Based on Commuting Patterns of Hospital Employees

In accordance with section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, beginning with FY 2005, we established a process to make adjustments to the hospital wage index based on commuting patterns of hospital employees (the “out-migration” adjustment). The process, outlined in the FY 2005 IPPS final rule (69 FR 49061), provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county but work in a different county (or counties) with a higher wage index.

When this provision was implemented for the FY 2005 wage index, we analyzed commuting data compiled by the U.S. Census Bureau which was derived from a special tabulation of the 2000 Census journey-to-work data for all industries (CMS extracted data applicable to hospitals). These data were compiled from responses to the “long-form” survey, which the Census Bureau used at the time, and it contained questions on where residents in each county worked (69 FR 49062). However, the 2010 Census was “short form” only; therefore, this information was not collected as part of the 2010 Census. The Census Bureau is working with CMS to provide an alternative dataset

based on the latest available data that is expected to meet our needs for developing a new out-migration adjustment. We believe we will have the necessary time to obtain, review and analyze the data in order to propose new out-migration adjustments based on new commuting patterns developed from the 2010 Census data beginning with FY 2016. Section 1886(d)(13)(B) of the Act requires the Secretary to use data the Secretary determines to be appropriate to establish the qualifying counties. The data used for the FY 2014 out-migration adjustment are the most recent data that have been analyzed, and we believe that these data are appropriate to establish the qualifying counties. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28079 through 28080), we proposed that the FY 2015 out-migration adjustments continue to be based on the 2000 Census data. We also proposed that the FY 2015 out-migration adjustments continue to be based on the policies, procedures, and computation that were used for the FY 2014 out-migration adjustment.

We did not receive any public comments with regard to the out-migration adjustment for FY 2015. Therefore, for FY 2015, we are finalizing our proposal that the FY 2015 out-migration adjustment continue to be based on the 2000 Census data used for the FY 2014 out-migration adjustment. We also are finalizing our proposal that the out-migration adjustment be based on the policies, procedures, and computation that were used for the FY 2014 out-migration adjustment. (We refer readers to a full discussion of the adjustment, including rules on deeming hospitals reclassified under section 1886(d)(8) or section 1886(d)(10) of the Act to have waived the out-migration adjustment, in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51601 through 51602)). Table 4J, which is available via the Internet on the CMS Web site, lists the out-migration adjustments for the FY 2015 wage index.

Section 1886(d)(13)(F) of the Act states that “[a] wage index increase under this paragraph shall be effective for a period of 3 fiscal years, except that the Secretary shall establish procedures under which a subsection (d) hospital may elect to waive the application of such wage index increase.” Therefore, for FY 2015, because we are continuing to use the out-migration adjustment data used for FY 2014, consistent with the statute, we also proposed to allow hospitals that qualified in FY 2013 or FY 2014 to receive the out-migration adjustment based on the commuting data and the CBSA delineations used for FY 2014 to continue to receive the same

out-migration adjustment for the remainder of their 3-year qualification period. Similarly, if a hospital qualifies for and opts to receive the out-migration adjustment for the first time in FY 2015, we also proposed to allow that hospital to receive the out-migration adjustment based on the data used for FY 2014 for FYs 2015, 2016, and 2017. Accordingly, even if we propose to adopt new out-migration adjustment data for FY 2016, as we believe we will be able to do, hospitals that are already receiving an out-migration adjustment beginning with a fiscal year prior to FY 2016 would still receive their out-migration adjustment based on the data used for FY 2014 for the years that remain of their 3-year qualification period in FY 2016 and after.

We did not receive any public comments with regard to our proposals. Therefore, we are finalizing our proposal that hospitals that qualified in FY 2013 or FY 2014 to receive the out-migration adjustment based on the commuting data and the CBSA delineations used for FY 2014 will continue to receive the same out-migration adjustment for the remainder of their 3-year qualification period. If a hospital qualifies for and opts to receive the out-migration adjustment for the first time in FY 2015, we will allow that hospital to receive the out-migration adjustment based on the data used for FY 2014 for FYs 2015, 2016, and 2017.

We intend to address application of the FY 2016 out-migration adjustment in greater detail in the FY 2016 proposed rule. However, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28079), we solicited public comments on how to implement the new out-migration adjustment data for FY 2016, given the statutory requirement at section 1886(d)(13)(F) of the Act that an out-migration adjustment be effective for 3 fiscal years. We did not receive any public comments on how to implement the new out-migration adjustment data for FY 2016.

As discussed in section III.B. of the preamble of this final rule, we are using OMB’s new labor market area delineations based on the 2010 Census data to identify counties qualifying as Lugar counties for FY 2015. In section III.H.3 of the preamble of this final rule, we discuss hospitals located in rural counties that are deemed to be urban under section 1886(d)(8)(B) of the Act. These rural counties are known as “Lugar” counties. Under the new OMB delineations, there are counties newly qualifying as Lugar as well as counties that were previously Lugar counties that will no longer meet the criteria to be redesignated as Lugar. As discussed in

section III.H.4. of the preamble of this final rule, if a Lugar hospital qualifies for and accepts the out-migration adjustment, it must waive its deemed urban status and can do so for the 3-year period for which the out-migration adjustment is effective. Therefore, hospitals located in counties newly designated as Lugar due to the new OMB delineations will have the choice to either maintain their Lugar status or waive it in order to receive the out-migration adjustment in FY 2015 based on the out-migration adjustment data used for FY 2014.

On the other hand, there are hospitals in counties deemed to be Lugar under the current OMB delineations that waived their Lugar status for the out-migration adjustment, but are not Lugar under the new OMB delineations. These hospitals will continue to receive the out-migration adjustment for the 3-year eligibility period through FY 2015 or FY 2016. However, these hospitals that are located in urban counties under the new OMB delineations, and wish to continue to maintain their rural status effective October 1, 2014, must do so by reclassifying from urban to rural under § 412.103. Section 1886(d)(13)(G) of the Act states that a hospital cannot simultaneously receive the out-migration adjustment and be subject to a reclassification under section 1886(d)(8) or 1886(d)(10) of the Act. Therefore, if such hospital is not located in a geographically rural area under the new OMB delineations, and reclassifies under § 412.103 of the regulations in order to be treated as rural for IPPS purposes, the hospital is ineligible to receive an out-migration adjustment, even if the 3-year eligibility period has not expired.

As discussed in section III.B.5. of the preamble of this final rule, we are finalizing our proposal to apply a 1-year blended wage index for any provider that experiences a decrease in wage index value due to the implementation of the new OMB labor market area delineations. This policy creates a wage index that is 50 percent of the wage index derived using the current FY 2014 OMB delineations, and 50 percent of the wage index based on the new OMB delineations. As discussed in section III.B.2.e.(4) of the preamble of this final rule, as we proposed, we are applying this blended wage index value to any affected hospital in a budget neutral manner. However, we proposed that hospitals receiving the out-migration adjustment would have it added to the result of the 50/50 blended wage index, after budget neutrality is applied. We established the blended wage index transition adjustment specifically to

address any negative impact that may be caused by the adoption of the new OMB delineations in FY 2015. To specifically identify and address any such negative payment impact, we proposed to apply the out-migration adjustment independent of the blended wage index and other wage index adjustments (for example, the rural floor) and related budget neutrality adjustments. This is consistent with our current policy to apply the out-migration adjustment after all other wage index adjustments and related budget neutrality adjustments have been applied. Therefore, we believe the out-migration adjustment would be properly applied as a supplemental addition to a hospital's final wage index value, similar to our treatment of hospitals receiving the frontier State floor value of 1.00, as described under 42 CFR 412.64(m), that also qualify for an out-migration adjustment and would receive that adjustment.

One group of commenters suggested CMS made an error in calculating the rural wage index for Connecticut under the old OMB delineations (as discussed in section III.B.2.e.(4) of the preamble of this final rule) for the purpose of applying the proposed transition blend. We respond to this comment in section III.B.2.e.(4) of the preamble of this final rule, and we refer readers to this section for further discussion.

After consideration of the public comments we received, we are finalizing our proposal without modification that we will add the out-migration adjustment for hospitals receiving such adjustment to the result of the 50/50 blended wage index, after budget neutrality is applied. Therefore, we will apply the out-migration adjustment independent of the blended wage index and other wage index adjustments (for example, the rural floor) and related budget neutrality adjustments.

J. Process for Requests for Wage Index Data Corrections

The preliminary, unaudited Worksheet S-3 wage data and occupational mix survey data files for the proposed FY 2015 wage index were made available on September 13, 2013, through the Internet on the CMS Web site at: <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY-2015-Wage-Index-Home-Page.html>.

In the interest of meeting the data needs of the public, beginning with the proposed FY 2009 wage index, we post an additional public use file on our Web site that reflects the actual data that are

used in computing the proposed wage index. The release of this file does not alter the current wage index process or schedule. We notify the hospital community of the availability of these data as we do with the current public use wage data files through our Hospital Open Door forum. We encourage hospitals to sign up for automatic notifications of information about hospital issues and the scheduling of the Hospital Open Door forums at the CMS Web site at: <http://www.cms.gov/Outreach-and-Education/Outreach/OpenDoorForums/index.html>.

In a memorandum dated September 16, 2013, we instructed all MACs to inform the IPPS hospitals they service of the availability of the wage index data files and the process and timeframe for requesting revisions (including the specific deadlines listed below). We also instructed the MACs to advise hospitals that these data were also made available directly through their representative hospital organizations.

If a hospital wished to request a change to its data as shown in the September 13, 2013 wage and occupational mix data files, the hospital was to submit corrections along with complete, detailed supporting documentation to its MAC by November 21, 2013. Hospitals were notified of this deadline and of all other deadlines and requirements, including the requirement to review and verify their data as posted in the preliminary wage index data files on the Internet, through the September 16, 2013 memorandum referenced above.

In the September 16, 2013 memorandum, we also specified that a hospital requesting revisions to its occupational mix survey data was to copy its record(s) from the CY 2010 occupational mix preliminary files posted to the CMS Web site in September, highlight the revised cells on its spreadsheet, and submit its spreadsheet(s) and complete documentation to its MAC no later than November 21, 2013.

The MACs notified the hospitals by early-February 2014 of any changes to the wage index data as a result of the desk reviews and the resolution of the hospitals' late-November revision requests. The MACs also submitted the revised data to CMS by late January 2014. CMS published the proposed wage index public use files that included hospitals' revised wage index data on February 20, 2014. Hospitals had until March 3, 2014, to submit requests to the MACs for reconsideration of adjustments made by the MACs as a result of the desk review, and to correct errors due to CMS' or the

MAC's mishandling of the wage index data. Hospitals also were required to submit sufficient documentation to support their requests.

After reviewing requested changes submitted by hospitals, MACs were required to transmit to CMS any additional revisions resulting from the hospitals' reconsideration requests by April 9, 2014. The deadline for a hospital to request CMS intervention in cases where the hospital disagreed with the MAC's policy interpretations was April 16, 2014. We note that, beginning with the FY 2015 wage index, in accordance with the FY 2015 wage index timeline posted on the CMS Web site at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Downloads/FY2015-WI-Timeline.pdf>, the April appeals had to be sent via mail and email. We refer readers to the wage index timeline for complete details.

Hospitals were given the opportunity to examine Table 2, which was listed in section VI. of the Addendum to the proposed rule and available via the Internet on the CMS Web site at: <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY-2015-Wage-Index-Home-Page.html>. Table 2 contained each hospital's proposed adjusted average hourly wage used to construct the wage index values for the past 3 years, including the FY 2011 data used to construct the proposed FY 2015 wage index. We noted that the proposed hospital average hourly wages shown in Table 2 only reflected changes made to a hospital's data that were transmitted to CMS by February 26, 2014.

The final wage index data public use files were posted on May 2, 2014 on the Internet at: <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY-2015-Wage-Index-Home-Page.html>. The May 2014 public use files are made available solely for the limited purpose of identifying any potential errors made by CMS or the MAC in the entry of the final wage index data that resulted from the correction process described above (revisions submitted to CMS by the MACs by April 9, 2014).

After the release of the May 2014 wage index data files, changes to the wage and occupational mix data could only be made in those very limited situations involving an error by the MAC or CMS that the hospital could not have known about before its review of the final wage index data files. Specifically, neither the MAC nor CMS

will approve the following types of requests:

- Requests for wage index data corrections that were submitted too late to be included in the data transmitted to CMS by the MACs on or before April 9, 2014.

- Requests for correction of errors that were not, but could have been, identified during the hospital's review of the February 20, 2014 wage index public use files.

- Requests to revisit factual determinations or policy interpretations made by the MAC or CMS during the wage index data correction process.

If, after reviewing the May 2014 final public use files, a hospital believed that its wage or occupational mix data were incorrect due to a MAC or CMS error in the entry or tabulation of the final data, the hospital was given the opportunity to notify both its MAC and CMS regarding why the hospital believes an error exists and provide all supporting information, including relevant dates (for example, when it first became aware of the error). The hospital was required to send its request to CMS and to the MAC no later than June 2, 2014. Similar to the April appeals, beginning with the FY 2015 wage index, in accordance with the FY 2015 wage index timeline posted on the CMS Web site at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Downloads/FY2015-WI-Timeline.pdf>, the June appeals were required to be sent via mail and email to CMS and the MACs. We refer readers to the wage index timeline for complete details. (We refer readers to section II.K. of the preamble to this final rule where we are making revisions to the wage index timetable.)

Verified corrections to the wage index data received timely by CMS and the MACs (that is, by June 2, 2014) were incorporated into the final wage index in this FY 2015 IPPS/LTCH PPS final rule, which will be effective October 1, 2014.

We created the processes described above to resolve all substantive wage index data correction disputes before we finalize the wage and occupational mix data for the FY 2015 payment rates. Accordingly, hospitals that did not meet the procedural deadlines set forth above will not be afforded a later opportunity to submit wage index data corrections or to dispute the MAC's decision with respect to requested changes. Specifically, our policy is that hospitals that do not meet the procedural deadlines set forth above will not be permitted to challenge later, before the PRRB, the failure of CMS to make a requested data revision. We refer

readers also to the FY 2000 IPPS final rule (64 FR 41513) for a discussion of the parameters for appeals to the PRRB for wage index data corrections.

Again, we believe the wage index data correction process described above provides hospitals with sufficient opportunity to bring errors in their wage and occupational mix data to the MAC's attention. Moreover, because hospitals had access to the final wage index data by early May 2014, they had the opportunity to detect any data entry or tabulation errors made by the MAC or CMS before the development and publication of the final FY 2015 wage index by August 2014, and the implementation of the FY 2015 wage index on October 1, 2014. Given these processes, the wage index implemented on October 1 should be accurate. Nevertheless, in the event that errors are identified by hospitals and brought to our attention after June 2, 2014, we retain the right to make midyear changes to the wage index under very limited circumstances.

Specifically, in accordance with 42 CFR 412.64(k)(1) of our existing regulations, we make midyear corrections to the wage index for an area only if a hospital can show that: (1) the MAC or CMS made an error in tabulating its data; and (2) the requesting hospital could not have known about the error or did not have an opportunity to correct the error, before the beginning of the fiscal year. For purposes of this provision, "before the beginning of the fiscal year" means by the June deadline for making corrections to the wage data for the following fiscal year's wage index (for example, June 2, 2014, for the FY 2015 wage index). This provision is not available to a hospital seeking to revise another hospital's data that may be affecting the requesting hospital's wage index for the labor market area. As indicated earlier, because CMS makes the wage index data available to hospitals on the CMS Web site prior to publishing both the proposed and final IPPS rules, and the MACs notify hospitals directly of any wage index data changes after completing their desk reviews, we do not expect that midyear corrections will be necessary. However, under our current policy, if the correction of a data error changes the wage index value for an area, the revised wage index value will be effective prospectively from the date the correction is made.

In the FY 2006 IPPS final rule (70 FR 47385 through 47387 and 47485), we revised 42 CFR 412.64(k)(2) to specify that, effective on October 1, 2005, that is, beginning with the FY 2006 wage

index, a change to the wage index can be made retroactive to the beginning of the Federal fiscal year only when CMS determines all of the following: (1) the MAC or CMS made an error in tabulating data used for the wage index calculation; (2) the hospital knew about the error and requested that the MAC and CMS correct the error using the established process and within the established schedule for requesting corrections to the wage index data, before the beginning of the fiscal year for the applicable IPPS update (that is, by the June 2, 2014 deadline for the FY 2015 wage index); and (3) CMS agreed before October 1 that the MAC or CMS made an error in tabulating the hospital's wage index data and the wage index should be corrected.

In those circumstances where a hospital requested a correction to its wage index data before CMS calculated the final wage index (that is, by the June 2, 2014 deadline for the FY 2015 wage index), and CMS acknowledges that the error in the hospital's wage index data was caused by CMS' or the MAC's mishandling of the data, we believe that the hospital should not be penalized by our delay in publishing or implementing the correction. As with our current policy, we indicated that the provision is not available to a hospital seeking to revise another hospital's data. In addition, the provision cannot be used to correct prior years' wage index data; and it can only be used for the current Federal fiscal year. In situations where our policies would allow midyear corrections other than those specified in 42 CFR 412.64(k)(2)(ii), we continue to believe that it is appropriate to make prospective-only corrections to the wage index.

We note that, as with prospective changes to the wage index, the final retroactive correction will be made irrespective of whether the change increases or decreases a hospital's payment rate. In addition, we note that the policy of retroactive adjustment will still apply in those instances where a final judicial decision reverses a CMS denial of a hospital's wage index data revision request.

K. Notice of Change to Wage Index Development Timetable

As explained in section III.J. of the preamble of this final rule, the preliminary, unaudited Worksheet S-3 wage data and occupational mix survey data files for the proposed FY 2015 wage index were made available on September 13, 2013, through the Internet on the CMS Web site. The posting of these preliminary files initiates what is virtually a year-long

cycle for developing the wage index associated with the following IPPS fiscal year. This lengthy, almost year-long cycle is unique to the development of the IPPS wage index, and occurs independently from the development of the IPPS proposed and final rules, which typically are published in the spring and summer each year. In addition, the wage index, which is based on hospitals' wage data reported on Worksheets S-3, Parts II and III of Form CMS-2552-10 of the Medicare cost report and occupational mix data, is the only portion of the IPPS that historically has been subject to its own annual review process, first by the MACs, and then by CMS, followed by distinct opportunities for hospitals to appeal decisions made by the MACs or CMS. This process is separate and independent from the standard cost report settlement and appeals processes established under the regulations at 42 CFR 405.1800 through 405.1889.

Although this unique wage index development timetable has been in place since the early days of the IPPS, the current timetable is rooted in changes adopted in the FY 1998 IPPS final rule with comment period (62 FR 45990 through 45993). However, with numerous legislative and regulatory changes made to the IPPS since FY 1998, the demands on hospitals, MACs, and CMS have increased substantially. As a result, it has become increasingly challenging for wage index stakeholders to manage the wage index timetable with competing priorities. For the FY 2015 wage index, CMS made slight changes to the wage index development timetable, by posting the preliminary public use file (PUF) in September 2013 rather than in October 2013, which, in turn, moved back the deadline for hospitals to request revisions to the data displayed in that preliminary PUF to November 2013, instead of December 2013. In addition, the date for the MACs to complete desk reviews on that data was similarly moved to a slightly earlier deadline in early CY 2014. The FY 2015 Wage Index Development Timetable, which is posted on the CMS Web site at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Downloads/FY2015-WI-Timeline.pdf>, shows that hospitals have a little more than 2 months to request revisions to their data displayed in the September 13, 2013 preliminary PUF, until the commencement of the desk review process by the MACs on November 21, 2013. The MACs also have a little more than 2 months to complete the desk reviews and submit revised cost report data to CMS by

January 29, 2014. Less than a month later, on February 20, 2014, the revised FY 2015 wage index and occupational mix PUFs were posted on the CMS Web site. Ensuring the accuracy of the February PUF is extremely important and beneficial to hospitals because, as the timetable shows, it is the basis for hospitals to appeal data that are incorrect, with March 3, 2014 being the last date that hospitals can request revisions to errors in the February 20, 2014 PUF.

Therefore, we want to take steps to improve the accuracy of the February PUF, most importantly by proposing changes to the wage index timetables for future IPPS fiscal years that are much more significant and fundamental than the slight revisions to the timetable implemented for FY 2015. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28082), we stated that we believe that the changes we proposed in that proposed rule would not only improve the accuracy of the February PUF, but also would reduce the number of hospital appeals based on the February PUF. For example, as specified below, instead of the current timetable which only provides CMS with less than a month to review the MACs' desk reviews and prepare the February PUF, we proposed approximately 3 months between the date that the MACs' desk reviews would end and the date that CMS would post the subsequent PUF. To allow hospitals and MACs adequate time to prepare for the changes to the wage index development timetable, we proposed to make significant changes beginning with the FY 2017 wage index cycle. We listed the proposed changes for FY 2017 in a table in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28082) shown below side by side with the existing timetable so that commenters could read the proposed changes in the context of the existing timetable. Under the proposed changes for FY 2017, although we did not provide exact dates for the FY 2017 wage index timetable, we noted that, with every change listed, we intend to provide hospitals and MACs with the same or somewhat *more* time than under the current timetable to complete reviews and request revisions. We stated that the proposed revisions would not reduce the amount of time that either hospitals or MACs have to review wage data. Therefore, the proposed changes would not result in additional work on the part of the hospitals or MACs; in fact, in shifting the various dates, we expect that more time would be provided to hospitals, MACs, and CMS

to ensure an even more accurate wage index.

Deadlines	FY 2015 timetable	Proposed FY 2017 timetable
Posting of Preliminary PUF on CMS Web site	September 13, 2013	Mid-May 2015.
Deadline for Hospitals to Request Revisions to Preliminary PUF	November 21, 2013	Early August 2015.
Deadline for MACs to Complete Desk Reviews	January 29, 2014	Mid-October 2015.
Posting of February PUF on CMS Web site	February 20, 2014	Late January 2016.
Deadline Following Posting of February PUF for Hospitals to Request Revisions	March 3, 2014	Mid-February 2016.
Completion of Appeals by MACs and Transmission of Final Wage Data to CMS	April 9, 2014	Mid- to Late March 2016.
Deadline for Hospitals to Appeal in April	April 16, 2014	Early April 2016.
Posting of Final Rule PUF	May 2, 2014	Late April 2016.
Deadline for Hospitals to Appeal in June	June 2, 2014	Late May 2016.
Expected Issuance of IPPS final rule	August 1, 2014	August 1, 2016.

With regard to the FY 2016 wage index cycle, we believe it can serve as a transition to the more significant changes we proposed for the FY 2017 wage index cycle. We believe that there are steps we can take to improve the accuracy of the February 2016 PUF by building in more time to the FY 2016 wage index review process as well. Specifically, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28083), we stated that we were notifying hospitals of changes to the deadlines only in the beginning of the FY 2016 wage index timetable, as a transition to the more significant proposed changes for the

entire FY 2017 wage index timetable. That is, for FY 2016, we were only changing the following four dates: The posting of the preliminary wage index PUF; the posting of the CY 2013 occupational mix survey data preliminary PUF; the deadline for hospitals to request revisions to the wage data and occupational mix data preliminary PUFs; and the deadline for MACs to complete the desk reviews. We stated that we were not changing the remainder of the FY 2016 timetable at this time. We stated that we expect that making these changes for the FY 2016 timetable will improve the accuracy of

the February 2016 PUF, and also mitigate the number of hospital appeals based on the February 2016 PUF. In addition, we believe these changes will help hospitals, MACs, and CMS adjust to the more significant timeline changes proposed for FY 2017. We listed only the changes for FY 2016 in the table shown below side by side with the existing FY 2015 timetable so that commenters could read the FY 2016 changes in the context of the existing timetable. We stated that we were not listing dates that would remain unchanged for FY 2016.

Deadlines	FY 2015 timetable	Adjusted FY 2016 timetable
Posting of Preliminary Wage Data PUF on CMS Web site	September 13, 2013 ..	Late May 2014
Posting of Preliminary CY 2013 Occupational Mix Data PUF on CMS Web site	September 13, 2013	Early to Mid-July 2014
Deadline for Hospitals to Request Revisions to Preliminary PUF	November 21, 2013 ...	Early October 2014
Deadline for MACs to Complete Desk Reviews	January 29, 2014	Mid-December 2014

Typically, the preliminary PUF initiating the start of an IPPS wage index fiscal year contains one spreadsheet with the Worksheet S-3 wage data for the applicable fiscal year on one tab, and another tab with the preliminary occupational mix data for that fiscal year. For the FY 2016 wage index, new occupational mix survey data will be available for use, based on the CY 2013 occupational mix survey. Hospitals were required to submit their CY 2013 occupational mix surveys to their MACs no later than July 1, 2014. Therefore, we did not have the preliminary CY 2013 occupational mix survey data in time to post it simultaneously in late May 2014 with the preliminary FY 2016 wage data. Accordingly, as the table above indicates, we posted the preliminary FY 2016 wage data by itself first in late May 2014, followed by a separate posting of the preliminary CY 2013 occupational mix survey data when the data became available, in mid-July 2014.

We invited public comments on our proposals set forth above to make revisions to the wage index timetables for FY 2017.

Comment: Numerous commenters were supportive of the general concept of changing the wage index timeline, and that the overall accuracy of the wage index could be improved by altering the timing of the process. Commenters generally agreed with CMS' adjusted FY 2016 timetable, which specified that the preliminary PUF would be posted in May 2014, and hospitals would request revisions to the preliminary PUF by early October, 2014. Commenters believed the extra time between the posting of the preliminary PUF and the desk review program would allow hospitals more time to "scrub" their data. However, commenters also asked that CMS work with its MACs to ensure that the MACs also are meeting their respective deadlines, as some hospitals have

noticed that their MACs missed deadlines to submit revisions to CMS. With respect to the adjustments to the FY 2017 timetable, the commenters believed that an early August 2015 deadline for hospitals to request revisions to the May 2015 preliminary PUFs was too ambitious because it would not provide sufficient time for hospitals to review their data, particularly when key personnel may be on vacation during the summer months. The commenters added that an August deadline would leave less time to compare the preliminary wage index information to the prior year's wage index data, given that the prior year's data are not even finalized and available to the public before August 1. Some commenters recommended an early October deadline, while others stated that an early September, mid-September, or a late September deadline would be feasible. One commenter believed that a December deadline would be best for hospitals with June 30

fiscal year ends, while another commenter stated that a late September or early October deadline would be acceptable for such hospitals. One commenter stated that the proposed FY 2017 deadline does not provide enough time for hospitals to incorporate their pension data into the desk review process because the Internal Revenue Service (IRS) Form 5500 (used as the basis for reporting pension contributions for defined benefit plans) is due 7 months after the end of the plan year (July 31), with possible extensions through mid-September. The commenter recommended that CMS either move the proposed deadline to October, or allow hospitals to submit their revisions for pension data during the MAC desk review process.

Response: We appreciate the commenters' general support for our proposed revisions to the wage index timetable. We listed general timeframes in the FY 2016 timetable but will communicate the exact dates for the FY 2016 timetable to hospitals through their MACs after issuance of this FY 2015 final rule. Regarding the FY 2017 Wage Index Timetable, we understand the commenters' concerns that an August deadline for hospitals to submit revisions to their preliminary wage data may be too challenging to meet. However, while almost all of the commenters believed that an August deadline was too ambitious, there was

no consensus from the commenters regarding when the deadline should be, with recommendations ranging from early September to December. We also partially agree with the commenter who raised the point that hospitals may not be able to provide their pension data until October, as further discussed below. In addition, we noted that commenters requested that CMS work with the MACs to ensure that the MACs are meeting their respective deadlines. We understand that the MACs have also faced pressure to accurately complete desk reviews and submit to CMS the appropriate revisions on behalf of hospitals in a timely fashion. The longer the time that hospitals have to submit revisions to their preliminary wage data, the less time the MACs have to conduct their desk reviews. Therefore, we believe that it is important to accommodate both the hospitals' and MACs' need for more time to adequately review the wage and occupational mix data. Because the earliest deadline that commenters stated would be feasible is early September, we are finalizing a date within the first week of September 2015 (rather than early August) as the deadline for hospitals to request revisions to their FY 2017 preliminary wage and occupational mix data. A deadline in early September would be manageable for hospitals, yet also provide the MACs with the most amount of time possible to complete

their desk reviews. In addition to a general deadline of early September, we are providing a limited exception for submission of a certain hospital's pension data. Specifically, we are only providing an extension for hospitals that have a fiscal year begin date on or after August 15 of a year to submit their pension data by mid-October because hospitals with fiscal year begin dates prior to August 15 would have already made their 3-year pension contributions by the end of September. We believe that the majority of hospitals, which do have fiscal year begin dates prior to August 15 of a year, would be able to submit their pension data, along with the remainder of their wage index documentation, to their MACs by the beginning of September each year. In this final rule, we are changing our wage index timetable for FY 2016 and after so that hospitals with fiscal years that begin on or after August 15 may submit their pension data to their MACs by mid-October. However, in future rulemaking, we may consider revisions to the 3-year average pension policy, which would allow all hospitals to submit their pension data at the same time. For FY 2017, the MACs would work on the desk reviews until mid-November 2015 (instead of mid-October, as proposed). Following are the revised FY 2016 and FY 2017 Wage Index Timetables that we are finalizing:

FY 2016 WAGE INDEX TIMETABLE

Deadlines	FY 2015 timetable	Adjusted FY 2016 timetable
Posting of Preliminary Wage Data PUF on CMS Web site	September 13, 2013 ..	May 23, 2014.
Posting of Preliminary CY 2013 Occupational Mix Data PUF on CMS Web site	September 13, 2013	July 11, 2014.
Deadline for Hospitals to Request Revisions to Preliminary PUF	November 21, 2013 ...	Early October 2014.
Deadline for Hospitals with FYBs on or after August 15 to Submit Pension Data to MACs	November 21, 2013 ..	Mid-October 2014.
Deadline for MACs to Complete Desk Reviews	January 29, 2014	Mid-December 2014.

FY 2017 WAGE INDEX TIMETABLE

Deadlines	FY 2015 timetable	FY 2017 timetable
Posting of Preliminary PUF on CMS Web site	September 13, 2013 ..	Mid-May 2015.
Deadline for Hospitals to Request Revisions to Preliminary PUF	November 21, 2013 ...	First week of September 2015.
Deadline for Hospitals with FYBs on or after August 15 to Submit Pension Data to MACs	November 21, 2013 ..	Mid-October 2015.
Deadline for MACs to Complete Desk Reviews	January 29, 2014	Mid-November 2015.
Posting of February PUF on CMS Web site	February 20, 2014	Late January 2016
Deadline Following Posting of February PUF for Hospitals to Request Revisions	March 3, 2014	Mid-February 2016.
Completion of Appeals by MACs and Transmission of Final Wage Data to CMS	April 9, 2014	Mid- to Late March 2016.
Deadline for Hospitals to Appeal in April	April 16, 2014	Early April 2016.
Posting of Final Rule PUF	May 2, 2014	Late April 2016.
Deadline for Hospitals to Appeal in June	June 2, 2014	Late May 2016.
Expected Issuance of IPPS final rule	August 1, 2014	August 1, 2016.

Comment: Commenters asked that CMS instruct MACs to notify State

hospital associations of aberrant data, in addition to the current practice of

notifying State hospital associations about hospitals that do not respond to

requests for data. In addition, commenters recommended that CMS provide more instructions to MACs and hospitals regarding how to correct errors and the timeframe for correcting errors. They believed that this action is necessary because the notification to hospital associations would be after the deadline for hospitals to request data adjustments. Another commenter suggested that accuracy and consistency in wage index verification would be improved if CMS would assign a single MAC to review all wage index data.

Response: We will take these comments into consideration as we develop the details of the Wage Index Timetables and the desk review instructions that we provide to the MACs.

L. Labor-Related Share for the FY 2015 Wage Index

Section 1886(d)(3)(E) of the Act directs the Secretary to adjust the proportion of the national prospective payment system base payment rates that are attributable to wages and wage-related costs by a factor that reflects the relative differences in labor costs among geographic areas. It also directs the Secretary to estimate from time to time the proportion of hospital costs that are labor-related: "The Secretary shall adjust the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs of the DRG prospective payment rates. . . ." We refer to the portion of hospital costs attributable to wages and wage-related costs as the labor-related share. The labor-related share of the prospective payment rate is adjusted by an index of relative labor costs, which is referred to as the wage index.

Section 403 of Public Law 108-173 amended section 1886(d)(3)(E) of the Act to provide that the Secretary must employ 62 percent as the labor-related share unless this "would result in lower payments to a hospital than would otherwise be made." However, this provision of Public Law 108-173 did not change the legal requirement that the Secretary estimate "from time to time" the proportion of hospitals' costs that are "attributable to wages and wage-related costs." Thus, hospitals receive payment based on either a 62-percent labor-related share, or the labor-related share estimated from time to time by the Secretary, depending on which labor-related share resulted in a higher payment.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50596 through 50607), we rebased and revised the hospital market basket. We established a FY 2010-based

IPPS hospital market basket to replace the FY 2006-based IPPS hospital market basket, effective October 1, 2013. In that final rule, we presented our analysis and conclusions regarding the frequency and methodology for updating the labor-related share for FY 2014. Using the FY 2010-based IPPS market basket, we finalized a labor-related share for FY 2014 of 69.6 percent. In addition, we implemented this revised and rebased labor-related share in a budget neutral manner. However, consistent with section 1886(d)(3)(E) of the Act, we did not take into account the additional payments that would be made as a result of hospitals with a wage index less than or equal to 1.0000 being paid using a labor-related share lower than the labor-related share of hospitals with a wage index greater than 1.0000.

The labor-related share is used to determine the proportion of the national IPPS base payment rate to which the area wage index is applied. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28083), for FY 2015, we did not propose to not make any further changes to the national average proportion of operating costs that are attributable to wages and salaries, employee benefits, contract labor, the labor-related portion of professional fees, administrative and facilities support services, and all other labor-related services. Therefore, for FY 2015, we proposed to continue to use a labor-related share of 69.6 percent for discharges occurring on or after October 1, 2014.

Tables 1A and 1B, which were published in section VI. of the Addendum to the FY 2015 IPPS/LTCH PPS proposed rule and available via the Internet on the CMS Web site, reflected this proposed labor-related share. For FY 2015, for all IPPS hospitals whose wage indexes are less than or equal to 1.0000, we proposed to apply the wage index to a labor-related share of 62 percent of the national standardized amount. For all IPPS hospitals whose wage indexes are greater than 1.0000, for FY 2015, we proposed to apply the wage index to a proposed labor-related share of 69.6 percent of the national standardized amount. We note that, for Puerto Rico hospitals, the national labor-related share is 62 percent because the national wage index for all Puerto Rico hospitals is less than 1.0000.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50601 through 50603), we also rebased and revised the labor-related share for the Puerto Rico-specific standardized amounts using FY 2010 as a base year. We finalized a labor-related share for the Puerto Rico-specific standardized amounts for FY 2014 of 63.2 percent. In the FY 2015 IPPS/LTCH

PPS proposed rule (79 FR 28084), for FY 2015, we did not propose to make any further changes to the Puerto Rico specific average proportion of operating costs that are attributable to wages and salaries, employee benefits, contract labor, the labor-related portion of professional fees, administrative and facilities support services, and all other labor-related services. For FY 2015, we proposed to continue to use a labor-related share for the Puerto Rico-specific standardized amounts of 63.2 percent for discharges occurring on or after October 1, 2014. Puerto Rico hospitals are paid based on 75 percent of the national standardized amounts and 25 percent of the Puerto Rico-specific standardized amounts. For FY 2015, we proposed that the labor-related share of a hospital's Puerto Rico-specific rate would be either the Puerto Rico-specific labor-related share of 63.2 percent or 62 percent, depending on which results in higher payments to the hospital. If the hospital has a Puerto Rico-specific wage index greater than 1.000 for FY 2015, we proposed to set the hospital's rates using a labor-related share of 63.2 percent for the 25 percent portion of the hospital's payment determined by the Puerto Rico standardized amounts because this amount would result in higher payments. Conversely, a hospital with a Puerto Rico-specific wage index of less than or equal to 1.000 for FY 2015 would be paid using the Puerto Rico-specific labor-related share of 62 percent of the Puerto Rico-specific rates because the lower labor-related share would result in higher payments. The proposed Puerto Rico labor-related share of 63.2 percent for FY 2015 is reflected in Table 1C, which was published in section VI. of the Addendum to the FY 2015 IPPS/LTCH PPS proposed rule and available via the Internet on the CMS Web site.

Comment: One commenter believed that CMS has provided incentives for hospitals to reduce costs through a declining wage index. The commenter stated that CMS has not kept pace by adjusting the labor-related share of 62 percent for hospitals with a wage index below 1.0000. The commenter noted that current law requires a labor-related share of 62 percent for hospitals with a wage index less than or equal to 1.0000. However, the commenter requested that, despite current law, in consideration of its comments, CMS lower the labor-related share from 62 percent to 42 percent for hospitals with a wage index below 1.0000.

One commenter recommended that CMS compute an alternative labor and nonlabor-related share percentage under the national standardized amount for hospitals in Puerto Rico. The

commenter explained that the current labor-related share percentage of 62 percent under the national standardized amounts meets the statutory definition in section 1886(d)(3)(E) of the Act, resulting in lower payments for providers in Puerto Rico. Therefore, the commenter believed that CMS should calculate an alternative national labor-related share percentage for hospitals in Puerto Rico that is lower than 62 percent.

Response: As mentioned by the commenter, current law requires that the labor-related share be set at 62 percent for hospitals with a wage index less than or equal to 1.0000. Specifically, as discussed above, section 403 of Public Law 108–173 amended section 1886(d)(3)(E) of the Act to provide that the Secretary must employ 62 percent as the labor-related share unless this “would result in lower payments to a hospital than would otherwise be made.” Therefore, we are unable to change the labor-related share of 62 percent. In addition, the commenters did not provide any empirical data to demonstrate why a lower labor-related share percentage is justified. Therefore, we are unable to verify the commenters’ statement.

After consideration of public comments received, we are finalizing our proposals without modification. For FY 2015, we are continuing to use a labor-related share of 69.6 percent for discharges occurring on or after October 1, 2014. Tables 1A and 1B, which are published in section VI. of the Addendum to this final rule and available via the Internet on the CMS Web site, reflect this labor-related share. For FY 2015, for all IPPS hospitals whose wage indexes are less than or equal to 1.0000, we are applying the wage index to a labor-related share of 62 percent of the national standardized amount. For all IPPS hospitals whose wage indexes are greater than 1.0000, for FY 2015, we are applying the wage index to a labor-related share of 69.6 percent of the national standardized amount. For Puerto Rico hospitals, the national labor-related share is 62 percent because the national wage index for all Puerto Rico hospitals is less than 1.0000. For FY 2015, we also are continuing to use a labor-related share for the Puerto Rico-specific standardized amounts of 63.2 percent for discharges occurring on or after October 1, 2014. Puerto Rico hospitals are paid based on 75 percent of the national standardized amounts and 25 percent of the Puerto Rico-specific standardized amounts. For FY 2015, the labor-related share of a hospital’s Puerto Rico-specific rate will be either the

Puerto Rico-specific labor-related share of 63.2 percent or 62 percent, depending on which results in higher payments to the hospital. If the hospital has a Puerto Rico-specific wage index greater than 1.000 for FY 2015, we will set the hospital’s rates using a labor-related share of 63.2 percent for the 25-percent portion of the hospital’s payment determined by the Puerto Rico standardized amounts because this amount will result in higher payments. The Puerto Rico labor-related share of 63.2 percent for FY 2015 is reflected in Table 1C, which is published in section VI. of the Addendum to this final rule and available via the Internet on the CMS Web site.

IV. Other Decisions and Changes to the IPPS for Operating Costs and Graduate Medical Education (GME) Costs

A. Changes to MS–DRGs Subject to the Postacute Care Transfer Policy (§ 412.4)

1. Background

Existing regulations at § 412.4(a) define discharges under the IPPS as situations in which a patient is formally released from an acute care hospital or dies in the hospital. Section 412.4(b) defines acute care transfers, and § 412.4(c) defines postacute care transfers. Our policy, set forth in § 412.4(f), provides that when a patient is transferred and his or her length of stay is less than the geometric mean length of stay for the MS–DRG to which the case is assigned, the transferring hospital is generally paid based on a graduated per diem rate for each day of stay, not to exceed the full MS–DRG payment that would have been made if the patient had been discharged without being transferred.

The per diem rate paid to a transferring hospital is calculated by dividing the full DRG payment by the geometric mean length of stay for the MS–DRG. Based on an analysis that showed that the first day of hospitalization is the most expensive (60 FR 45804), our policy generally provides for payment that is twice the per diem amount for the first day, with each subsequent day paid at the per diem amount up to the full MS–DRG payment (§ 412.4(f)(1)). Transfer cases are also eligible for outlier payments. In general, the outlier threshold for transfer cases, as described in § 412.80(b), is equal to the fixed-loss outlier threshold for nontransfer cases (adjusted for geographic variations in costs), divided by the geometric mean length of stay for the MS–DRG, and multiplied by the length of stay for the case, plus one day.

We established the criteria set forth in § 412.4(d) for determining which DRGs

qualify for postacute care transfer payments in the FY 2006 IPPS final rule (70 FR 47419 through 47420). The determination of whether a DRG is subject to the postacute care transfer policy was initially based on the Medicare Version 23.0 GROUPER (FY 2006) and data from the FY 2004 MedPAR file. However, if a DRG did not exist in Version 23.0 or a DRG included in Version 23.0 is revised, we use the current version of the Medicare GROUPER and the most recent complete year of MedPAR data to determine if the DRG is subject to the postacute care transfer policy. Specifically, if the MS–DRG’s total number of discharges to postacute care equals or exceeds the 55th percentile for all MS–DRGs and the proportion of short-stay discharges to postacute care to total discharges in the MS–DRG exceeds the 55th percentile for all MS–DRGs, CMS will apply the postacute care transfer policy to that MS–DRG and to any other MS–DRG that shares the same base MS–DRG. In the preamble to the FY 2006 IPPS final rule (70 FR 47419), we stated that “we will not revise the list of DRGs subject to the postacute care transfer policy annually unless we are making a change to a specific DRG.”

To account for MS–DRGs subject to the postacute care transfer policy that exhibit exceptionally higher shares of costs very early in the hospital stay, § 412.4(f) also includes a special payment methodology. For these MS–DRGs, hospitals receive 50 percent of the full MS–DRG payment, plus the single per diem payment, for the first day of the stay, as well as a per diem payment for subsequent days (up to the full MS–DRG payment (§ 412.4(f)(6))). For an MS–DRG to qualify for the special payment methodology, the geometric mean length of stay must be greater than 4 days, and the average charges of 1-day discharge cases in the MS–DRG must be at least 50 percent of the average charges for all cases within the MS–DRG. MS–DRGs that are part of an MS–DRG group will qualify under the DRG special payment policy if any one of the MS–DRGs that share that same base MS–DRG qualifies (§ 412.4(f)(6)).

2. Changes to the Postacute Care Transfer MS–DRGs

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28084 through 28086), we discussed that, based on our annual review of MS–DRGs, we had identified a number of MS–DRGs that should be included on the list of MS–DRGs subject to the postacute care transfer policy. In response to public comments and based on our analysis of

FY 2013 MedPAR claims data, we proposed to make several changes to MS-DRGs to better capture certain severity of illness levels, to be effective for FY 2015. Specifically, we proposed to modify the assignment of endovascular cardiac valve replacements currently assigned to MS-DRGs 216 (Cardiac Valve & Other Major Cardiothoracic Procedures with Cardiac Catheterization with MCC), 217 (Cardiac Valve & Other Major Cardiothoracic Procedures with Cardiac Catheterization with CC), 218 (Cardiac Valve & Other Major Cardiothoracic Procedures with Cardiac Catheterization without CC/MCC), 219 (Cardiac Valve & Other Major Cardiothoracic Procedures without Cardiac Catheterization with MCC), 220 (Cardiac Valve & Other Major Cardiothoracic Procedures without Cardiac Catheterization with CC), and 221 (Cardiac Valve & Other Major Cardiothoracic Procedures without Cardiac Catheterization without CC/MCC) to MS-DRGs 266 and 267 (Endovascular Cardiac Valve Replacement with and without MCC, respectively) to better reflect the differences in patients receiving endovascular cardiac valve replacements from patients who undergo an open chest cardiac valve replacement. We also proposed to further refine back and neck procedures

currently assigned to MS-DRGs 490 and 491 (Back & Neck Procedure Except Spinal Fusion with CC/MCC or Disc Device/Neurostimulator and without CC/MCC or Disc Device/Neurostimulator, respectively) into additional severity levels, now identified as MS-DRGs 518, 519, and 520 (Back & Neck Procedure Except Spinal Fusion with MCC or Disc Device/Neurostimulator, with CC, and without MCC/CC, respectively). Finally, we proposed to remove the severity levels for reverse shoulder replacements, merging MS-DRGs 483 and 484 (Major Joint & Limb Reattachment Procedure of Upper Extremity with CC/MCC and without CC/MCC, respectively) into MS-DRG 483 (Major Joint/Limb Reattachment Procedure of Upper Extremities). A discussion of these proposed changes can be found in section II.G.4.c., II.G.5.c. and II.G.5.a., respectively, of the preamble of the proposed rule.

In light of these proposed changes to the MS-DRGs according to the regulations under § 412.4(c), we evaluated these proposed FY 2015 MS-DRGs against the general postacute care transfer policy criteria using the FY 2013 MedPAR data. If an MS-DRG qualified for the postacute care transfer policy, we also evaluated that MS-DRG under the special payment methodology

criteria according to regulations at § 412.4(f)(6). We continue believe it is appropriate to reassess MS-DRGs when proposing reassignment of diagnostic codes that would result in material changes to an MS-DRG. As a result of our review, we found that MS-DRGs 216 through 221 would require no revisions in postacute care transfer or special payment policy status. However, we proposed to update the list of MS-DRGs that are subject to the postacute care transfer policy to include the proposed new MS-DRGs 266, 267, 518, 519, and 520. (These MS-DRGs are reflected in Table 5, which is listed in section VI. of the Addendum to this final rule and available via the Internet on the CMS Web site, and also are listed in the charts at the end of this section.)

In addition, based on our evaluation of the proposed FY 2015 MS-DRGs using the FY 2013 Med PAR data, we determined that proposed revised MS-DRG 483 would no longer meet the postacute care transfer criteria. Therefore, we proposed that it be removed from the list of MS-DRGs subject to the postacute care transfer policy, effective FY 2015. We refer readers to the asterisk (*) bolded text in the following table for which criterion was not met in our analysis for each MS-DRG removed from the postacute care transfer policy list.

LIST OF MS-DRGs THAT WOULD CHANGE POSTACUTE CARE TRANSFER POLICY STATUS IN FY 2015

MS-DRG	MS-DRG title	Total cases	Postacute care transfers (55th percentile: 1,471)	Short-stay postacute care transfers	Percent of short-stay postacute care transfers to all cases (55th percentile: 7.9060%)	Postacute transfer policy status
266	Endovascular Cardiac Valve Replacement with MCC.	4,086	2,851	1,030	25.21	YES.
267	Endovascular Cardiac Valve Replacement w/o MCC.	4,476	2,800	835	18.66	YES.
483	Major Joint/Limb Reattachment Procedure of Upper Extremities.	41,372	17,289	2,271	* 5.49	NO.
518	Back & Neck Procedure Except Spinal Fusion with MCC or Disc Device/Neurostimulator.	3,844	2,136	412	10.72	YES.
519	Back & Neck Procedure Except Spinal Fusion with CC.	15,238	7,405	1,126	* 7.39	YES.**
520	Back & Neck Procedure Except Spinal Fusion without CC/MCC).	31,792	7,859	0	* 0.00	YES.**

* Indicates a current postacute care transfer policy criterion that the MS-DRG did not meet.

** As described in the policy at 42 CFR 412.4(d)(3)(ii)(D), MS-DRGs that share the same base MS-DRG will all qualify under the postacute care transfer policy if any one of the MS-DRGs that share that same base MS-DRG qualifies.

Finally, we determined that MS-DRGs 266, 267, 518, 519, and 520 also would meet the criteria for the special

payment methodology. Therefore, we proposed that they would be subject to

the MS-DRG special payment methodology, effective FY 2015.

LIST OF MS-DRGs THAT CHANGED DRG SPECIAL PAYMENT POLICY STATUS IN FY 2015

MS-DRG	MS-DRG title	Geometric mean length of stay	Average charges of 1-day discharges	50% of average charges for all cases within MS-DRG	Special pay policy status
266	Endovascular Cardiac Valve Replacement with MCC ...	8.3643	\$42,081	\$126,326	YES.*
267	Endovascular Cardiac Valve Replacement without MCC	5.0271	128,013	95,141	YES.
518	Back & Neck Procedure Except Spinal Fusion with MCC or Disc Device/Neurostimulator.	4.2882	68,515	43,514	YES.
519	Back & Neck Procedure Except Spinal Fusion with CC	3.0507	0	0	YES.*
520	Back & Neck Procedure Except Spinal Fusion without CC/MCC).	1.7315	0	0	YES.*

*As described in the policy at 42 CFR 412.4(d)(6)(iv), MS-DRGs that share the same base MS-DRG will all qualify under the DRG special payment policy if any one of the MS-DRGs that share that same base MS-DRG qualifies.

We did not receive any public comments regarding our proposals to change the postacute care transfer and the special payment policy status for the identified MS-DRGs. Therefore, we are adopting the proposed changes as final for FY 2015.

B. Changes in the Inpatient Hospital Update for FY 2015 (§ 412.64(d))

1. FY 2015 Inpatient Hospital Update

In accordance with section 1886(b)(3)(B)(i) of the Act, each year we update the national standardized amount for inpatient operating costs by a factor called the “applicable percentage increase.” In FY 2014, consistent with section 1886(b)(3)(B) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we set the applicable percentage increase under the IPPS by applying the following adjustments in the following sequence. Specifically, the applicable percentage increase under the IPPS is equal to the rate-of-increase in the hospital market basket for IPPS hospitals in all areas, subject to a reduction of 2.0 percentage points if the hospital fails to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act, and then subject to an adjustment based on changes in economy-wide productivity (the multifactor productivity (MFP) adjustment), and an additional reduction of 0.3 percentage point as required by section 1886(b)(3)(B)(xii) of the Act. Sections 1886(b)(3)(B)(xi) and (b)(3)(B)(xii) of the Act, as added by section 3401(a) of the Affordable Care Act, state that application of the MFP adjustment and the additional FY 2014 adjustment of 0.3 percentage point may result in the applicable percentage increase being less than zero.

For FY 2015, there are three statutory changes to the applicable percentage increase compared to FY 2014. First, under section 1886(b)(3)(B)(viii) of the

Act, beginning with FY 2015, the reduction in the applicable percentage increase for hospitals that fail to submit quality information under rules established by the Secretary is one-quarter of the applicable percentage increase (prior to the application of statutory adjustments under sections 1886(b)(3)(B)(ix), 1886(b)(3)(B)(xi), and 1886(b)(3)(B)(xii) of the Act) or one-quarter of the applicable market basket update. For FY 2014, the reduction to the applicable percentage increase for hospitals that failed to submit quality information under rules established by the Secretary was 2.0 percentage points. Second, beginning with FY 2015, section 1886(b)(3)(B)(ix) of the Act requires that any hospital that is not a meaningful electronic health record (EHR) user (as defined in section 1886(n)(3) of the Act and not subject to an exception under section 1886(b)(3)(B)(ix) of the Act) will have “three-quarters” of the applicable percentage increase (prior to the application of statutory adjustments under sections 1886(b)(3)(B)(viii), 1886(b)(3)(B)(xi), and 1886(b)(3)(B)(xii) of the Act), or three-quarters of the applicable market basket update, reduced by 33 1/3 percent. The reduction to three-quarters of the applicable percentage increase for those hospitals that are not meaningful EHR users increases to 66 2/3 percent for FY 2016, and, for FY 2017 and subsequent fiscal years, to 100 percent. Third, for FY 2015, section 1886(b)(3)(B)(xii) of the Act applies an additional reduction of 0.2 percentage point compared to 0.3 percentage point for FY 2014.

To summarize, for FY 2015, consistent with section 1886(b)(3)(B) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we are setting the applicable percentage increase by applying the following adjustments in the following sequence. Specifically, the applicable percentage increase under the IPPS is equal to the

rate-of-increase in the hospital market basket for IPPS hospitals in all areas, subject to a reduction of one-quarter of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals that fail to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act and a 33 1/3 percent reduction to three-fourths of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals not considered to be meaningful EHR users in accordance with section 1886(b)(3)(B)(ix) of the Act, and then subject to an adjustment based on changes in economy-wide productivity (the multifactor productivity (MFP) adjustment), and an additional reduction of 0.2 percentage point as required by section 1886(b)(3)(B)(xii) of the Act. As noted previously, sections 1886(b)(3)(B)(xi) and (b)(3)(B)(xii) of the Act, as added by section 3401(a) of the Affordable Care Act, state that application of the MFP adjustment and the additional FY 2015 adjustment of 0.2 percentage point may result in the applicable percentage increase being less than zero.

We note that, in compliance with section 404 of the MMA, in the FY 2014 IPPS/LTCH PPS final rule, we replaced the FY 2006-based IPPS operating and capital market baskets with the revised and rebased FY 2010-based IPPS operating and capital market baskets for FY 2014. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28086), we proposed to continue to use the FY 2010-based IPPS operating and capital market baskets for FY 2015. We also proposed to continue to use a labor-related share that is reflective of the FY 2010 base year. For FY 2015, we

proposed to continue using the labor-related share of 69.6 percent, which is based on the FY 2010-based IPPS market basket. We did not receive any public comments on this proposal and, therefore, for FY 2015, we will continue to use the FY 2010-based IPPS operating and capital market baskets and the labor-related share of 69.6 percent.

Based on the most recent data available for the FY 2015 proposed rule, in accordance with section 1886(b)(3)(B) of the Act, we proposed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28087) to base the proposed FY 2015 market basket update used to determine the applicable percentage increase for the IPPS on IHS Global Insight, Inc.'s (IGI's) first quarter 2014 forecast of the FY 2010-based IPPS market basket rate-of-increase with historical data through fourth quarter 2013, which was estimated to be 2.7 percent. We proposed that if more recent data became subsequently available (for example, a more recent estimate of the market basket and the MFP adjustment), we would use such data, if appropriate, to determine the FY 2015 market basket update and MFP adjustment in the final rule.

Based on updated data for this FY 2015 IPPS/LTCH PPS final rule, that is, the IGI's second quarter 2014 forecast of the FY 2010-based IPPS market basket rate-of-increase with historical data through first quarter 2014, we estimate that the FY 2015 market basket update used to determine the applicable percentage increase for the IPPS is 2.9 percent.

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51689 through 51692), we finalized our methodology for calculating and applying the MFP adjustment. For FY 2015, we did not propose to make any change in our methodology for calculating and applying the MFP adjustment. For FY 2015, we proposed a MFP adjustment of -0.4 percentage point. Similar to the market basket adjustment, for the proposed rule, we used the most recent data available to compute the MFP adjustment.

Based on updated data for this final rule, we computed an MFP adjustment is 0.5 percentage point for FY 2015.

Comment: One commenter stated that the FY 2015 update factor is understated, as the productivity adjustment should be 0.4 (as projected in the proposed rule), not 0.5. The commenter stated that, as a result,

instead of a 1.2 percent update factor, the projection should use a 1.3 percent update factor.

Response: As stated in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28087), the proposed productivity adjustment for FY 2015 was 0.4 percent. Furthermore, we proposed to make a 1.3 percent update to the national standardized amount (79 FR 28355), which reflects a proposed 2.7 percent market basket update, the proposed reduction of 0.4 percentage point for the multifactor productivity adjustment, the 0.2 percentage point reduction in accordance with the Affordable Care Act and the proposed FY 2015 documentation and coding recoupment adjustment of -0.8 percent on the national standardized amount as part of the recoupment required by section 631 of the ATRA.

As stated in the proposed rule, we proposed to use more recently available data to determine the final market basket and multifactor productivity adjustment. We did not receive any public comments on this proposal. Therefore, for this final rule, we are finalizing a market basket update of 2.9 percent and an MFP adjustment of 0.5 percent based on more recently available data.

For FY 2015, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), we discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28087) that there are four possible applicable percentage increases that can be applied to the standardized amount. As noted above, we proposed that if more recent data became subsequently available (for example, a more recent estimate of the market basket and the MFP adjustment), we would use such data, if appropriate, to determine the FY 2015 market basket update and MFP adjustment in the final rule.

We did not receive any public comments on the four applicable percentage increases and our finalizing our proposal. Based on the more recent data described earlier, we have determined final applicable percentage increases to the standardized amount for FY 2015, as specified below.

- For a hospital that submits quality data and is a meaningful EHR user, we are finalizing an applicable percentage increase to the FY 2015 operating standardized amount of 2.2 percent (that is, the FY 2015 estimate of the market basket rate-of-increase of 2.9 percent less an adjustment of 0.5 percentage point for economy-wide productivity (that is, the MFP adjustment) and less 0.2 percentage point).

- For a hospital that submits quality data and is not a meaningful EHR user, we are finalizing an applicable percentage increase to the operating standardized amount of 1.475 percent (that is, the FY 2015 estimate of the market basket rate-of-increase of 2.9 percent, less an adjustment of 0.725 percentage point (the market basket rate-of-increase of 2.9 percent \times 0.75)/3) for failure to be a meaningful EHR user, less an adjustment of 0.5 percentage point for the MFP adjustment, and less an additional adjustment of 0.2 percentage point).

- For a hospital that does not submit quality data and is a meaningful EHR user, we are finalizing an applicable percentage increase to the operating standardized amount of 1.475 percent (that is, the FY 2015 estimate of the market basket rate-of-increase of 2.9 percent, less an adjustment of 0.725 percentage point (the market basket rate-of-increase of 2.9 percent/4) for failure to submit quality data, less an adjustment of 0.5 percentage point for the MFP adjustment, and less an additional adjustment of 0.2 percentage point).

- For a hospital that does not submit quality data and is not a meaningful EHR user, we are finalizing an applicable percentage increase to the operating standardized amount of 0.75 percent (that is, the FY 2015 estimate of the market basket rate-of-increase of 2.9 percent, less an adjustment of 0.725 percentage point (the market basket rate-of-increase of 2.9 percent/4) for failure to submit quality data, less an adjustment of 0.725 percentage point (the market basket rate-of-increase of 2.9 percent \times 0.75)/3) for failure to be a meaningful EHR user, less an adjustment of 0.5 percentage point for the MFP adjustment, and less an additional adjustment of 0.2 percentage point). Below we provide a table summarizing the four final applicable percentage increases.

FINAL FY 2015 APPLICABLE PERCENTAGE INCREASES FOR THE IPPS

FY 2015	Hospital sub- mitted quality data and is a meaningful EHR user	Hospital sub- mitted quality data and is NOT a mean- ingful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a mean- ingful EHR user
Market Basket Rate-of-Increase	2.9	2.9	2.9	2.9
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act.	0.0	0.0	-0.725	-0.725
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act.	0.0	-0.725	0.0	-0.725
MFP Adjustment under Section 1886(b)(3)(B)(xi) of the Act	-0.5	-0.5	-0.5	-0.5
Statutory Adjustment under Section 1886(b)(3)(B)(xii) of the Act	-0.2	-0.2	-0.2	-0.2
Final Applicable Percentage Increase Applied to Standardized Amount ..	2.2	1.475	1.475	0.75

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28087), we proposed to revise the existing regulations at 42 CFR 412.64(d) to reflect the current law for the FY 2015 update. Specifically, in accordance with section 1886(b)(3)(B) of the Act, we proposed to add a new paragraph (vi) to § 412.64(d)(1) to reflect the applicable percentage increase to the FY 2015 operating standardized amount as the percentage increase in the market basket index, subject to a reduction of one-fourth of the applicable percentage increase (prior to the application of other statutory adjustments) if the hospital fails to submit quality information (under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act) and a 33 1/3 percent reduction to three-fourths of the applicable percentage increase (prior to the application of other statutory adjustments) for a hospital that is not a meaningful EHR user in accordance with section 1886(b)(3)(B)(ix) of the Act, less an MFP adjustment and less an additional reduction of 0.2 percentage point.

In addition, we proposed to make technical changes to §§ 412.64(d)(1), (d)(1)(i) through (d)(1)(v), (d)(2)(i), (d)(2)(ii), and (d)(3) introductory text to reflect the order in which CMS applies the statutory adjustments to the applicable percentage increase under section 1886(b)(3)(B) of the Act. As mentioned above, consistent with section 1886(b)(3)(B) of the Act, CMS sets the applicable percentage increase under the IPPS by applying the following adjustments in the following sequence. Specifically, we set the applicable percentage increase under the IPPS equal to the rate-of-increase in the hospital market basket for IPPS hospitals in all areas subject to a reduction for hospitals that fail to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act and,

beginning in FY 2015, a reduction for hospitals not considered to be meaningful EHR users in accordance with section 1886(b)(3)(B)(ix) of the Act; and then subject to an adjustment based on changes in economy-wide productivity (the MFP adjustment), and an additional reduction as required by section 1886(b)(3)(B)(xii) of the Act.

The existing regulation text at § 412.64(d)(2) and (d)(3) describes the reductions for hospitals that fail to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act and hospitals not considered to be meaningful EHR users in accordance with section 1886(b)(3)(B)(ix) of the Act as reductions to “the applicable percentage change specified in paragraph (d)(1) of this section.” Section 412.64(d)(1) describes the applicable percentage change for the applicable fiscal year as the percentage increase in the market basket index less the MFP adjustment and less the additional reduction required by section 1886(b)(3)(B)(xii) of the Act. This text suggests that CMS applies the reduction for hospitals that fail to submit quality information and, beginning in FY 2015, the reduction for hospitals not considered to be meaningful EHR users, after it applies the MFP adjustment and the additional reduction under section 1886(b)(3)(B)(xii) of the Act. Therefore, we proposed to revise the regulations in § 412.64(d) to reflect the order in which CMS applies the adjustments to the applicable percentage increase under section 1886(b)(3)(B) of the Act. We note that we also proposed clarifying amendments to the regulatory text for prior fiscal years under §§ 412.64(d)(1)(i) through (d)(1)(v) to reflect the determination of the applicable percentage change for those prior years as well as other technical changes for readability.

We did not receive any public comments on our proposed changes to

the regulations at §§ 412.64(d)(1), (d)(1)(i) through (d)(1)(v), (d)(2)(i), (d)(2)(ii), and (d)(3) introductory text and therefore are finalizing these proposed changes without modification.

Section 1886(b)(3)(B)(iv) of the Act provides that the applicable percentage increase to the hospital-specific rates for SCHs and MDHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). Therefore, the update to the hospital-specific rates for SCHs and MDHs is also subject to section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28088), for FY 2015, we proposed the following updates to the hospital-specific rates applicable to SCHs and MDHs: An update of 2.1 percent for a hospital that submits quality data and is a meaningful EHR user; an update of 1.425 percent for a hospital that fails to submit quality data and is a meaningful EHR user; an update of 1.425 percent for a hospital that submits quality data and is not a meaningful EHR user; an update of 0.75 percent for a hospital that fails to submit quality data and is not a meaningful EHR user. (As noted below, under current law, the MDH program is effective for discharges occurring on or before March 31, 2015.) For FY 2015, the existing regulations in §§ 412.73(c)(16), 412.75(d), 412.77(e), 412.78(e), and 412.79(d) contain provisions that set the update factor for SCHs and MDHs equal to the update factor applied to the national standardized amount for all IPPS hospitals. Therefore, we did not propose to make any further changes to these five regulatory provisions to reflect the FY 2015 update factor for the hospital-specific rates of SCHs and MDHs. As mentioned above, for the proposed rule, we used IGI’s first quarter 2014 forecast of the FY 2010-based IPPS market

basket update with historical data through fourth quarter 2013. Similarly, we used IGI's first quarter 2014 forecast of the MFP adjustment. For the final rule, we proposed to use the most recent data available. We did not receive any public comments on these proposals and therefore our finalizing them as proposed to set the update for SCHs and MDHs in this final rule using the most recent data available.

As discussed above, based on the more recent data for IGI's second quarter 2014 forecast of the FY 2010-based IPPS market basket update with historical data through first quarter 2014, we estimate that the FY 2015 market basket update used to determine the update factor for this final rule for the hospital-specific rates of SCHs and MDHs is 2.9 percent. Similarly, for this final rule, we used IGI's second quarter 2014 forecast of the MFP adjustment, which is estimated at 0.5 percentage point for FY 2015. Accordingly, we are finalizing the following updates to the hospital-specific rates applicable to SCHs and MDHs: An update of 2.2 percent for a hospital that submits quality data and is a meaningful EHR user; an update of 1.475 percent for a hospital that fails to submit quality data and is a meaningful EHR user; an update of 1.475 percent for a hospital that submits quality data and is not a meaningful EHR user; an update of 0.75 percent for a hospital that fails to submit quality data and is not a meaningful EHR user.

We note that, as discussed in section IV.G. of the preamble of this final rule, section 1106 of the Pathway for SGR Reform Act of 2013 (Pub. L. 113-67), enacted on December 26, 2013, extended the MDH program from the end of FY 2013 through the first half of FY 2014 (that is, for discharges occurring before April 1, 2014). Subsequently, section 106 of the Protecting Access to Medicare Act of 2014, Public Law 113-93, enacted on April 1, 2014, further extended the MDH program through the first half of FY 2015 (that is, for discharges occurring before April 1, 2015). Prior to the enactment of Public Law 113-67, the MDH program was to be in effect through the end of FY 2013 only. The MDH program expires for discharges beginning on April 1, 2015 under current law. Accordingly, the update of the hospital-specific rates for FY 2015 for MDHs will apply in determining payments for FY 2015 discharges occurring before April 1, 2015.

2. FY 2015 Puerto Rico Hospital Update

Puerto Rico hospitals are paid a blended rate for their inpatient operating costs based on 75 percent of

the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. Section 1886(d)(9)(C)(i) of the Act is the basis for determining the applicable percentage increase applied to the Puerto Rico-specific standardized amount. Section 401(c) of Public Law 108-173 amended section 1886(d)(9)(C)(i) of the Act, which states that, for discharges occurring in a fiscal year (beginning with FY 2004), the Secretary shall compute an average standardized amount for hospitals located in any area of Puerto Rico that is equal to the average standardized amount computed under subclause (I) for fiscal year 2003 for hospitals in a large urban area (or, beginning with FY 2005, for all hospitals in the previous fiscal year) increased by the applicable percentage increase under subsection (b)(3)(B) for the fiscal year involved. Therefore, the update to the Puerto Rico-specific operating standardized amount equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act (that is, the same update factor as for all other hospitals subject to the IPPS). Accordingly, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28088), we proposed an applicable percentage increase to the Puerto Rico-specific operating standardized amount of 2.1 percent for FY 2015. We also proposed, for the final rule, to use the most recent data available to determine the FY 2015 applicable percentage increase. We note that the provisions of section 1886(b)(3)(B)(viii) of the Act, which specify the adjustments to the applicable percentage increase for "subsection (d)" hospitals that do not submit quality data under the rules established by the Secretary, and the provisions of section 1886(b)(3)(B)(ix) of the Act, which specify the adjustments to the applicable percentage increase for "subsection (d)" hospitals that are not meaningful EHR users, are not applicable to hospitals located in Puerto Rico.

We did not receive any public comments concerning our proposal. Therefore, using the most recent data available, we are finalizing an applicable percentage increase to the Puerto Rico-specific operating amount of 2.2 percent for FY 2015. As we noted above, for the proposed rule, we used the first quarter 2014 forecast of the FY 2010-based IPPS market basket update with historical data through fourth quarter 2013. For this final rule, we used the most recent data available,

which is IGI's second quarter 2014 forecast of the FY 2010-based IPPS market basket update with historical data through first quarter 2014. Similarly, for the proposed rule, we used IGI's first quarter 2014 forecast of the MFP adjustment. For this final rule, we used the most recent data available, which was IGI's second quarter 2014 forecast of the MFP adjustment.

For FY 2015, the existing regulations in § 412.211(c) set the update factor for Puerto Rico-specific standardized amount equal to the update factor applied to the national standardized amount for all IPPS hospitals. Therefore, we are not making any further changes to this regulatory provision to reflect the FY 2015 update factor for the Puerto Rico-specific standardized amount.

Comment: One commenter indicated that the nonlabor costs in Puerto Rico are closer or equal to those in the United States. It is unclear what the commenter was requesting. Based on our interpretation of the comment, it appears that the commenter may be requesting that CMS make equal the nonlabor payment amount of the Puerto Rico-specific standardized amount to the nonlabor payment amount of the national standardized amount.

Response: The commenter did not provide any empirical data to demonstrate how the nonlabor costs in Puerto Rico are equal to those in the United States. Therefore, we are unable to verify the commenter's statement. In addition, we did not propose to make any updates to the national or Puerto Rico-specific standardized amounts aside from applying the statutory updates as discussed earlier. We will continue to work with Puerto Rico and other stakeholders to ensure we are using appropriate data for ratesetting.

C. Rural Referral Centers (RRCs): Annual Updates to Case-Mix Index and Discharge Criteria (§ 412.96)

Under the authority of section 1886(d)(5)(C)(i) of the Act, the regulations at § 412.96 set forth the criteria that a hospital must meet in order to qualify under the IPPS as a rural referral center (RRC). RRCs receive some special treatment under both the DSH payment adjustment and the criteria for geographic reclassification.

Section 402 of Public Law 108-173 raised the DSH payment adjustment for RRCs such that they are not subject to the 12-percent cap on DSH payments that is applicable to other rural hospitals. RRCs are also not subject to the proximity criteria when applying for geographic reclassification. In addition, they do not have to meet the requirement that a hospital's average

hourly wage must exceed, by a certain percentage, the average hourly wage of the labor market area where the hospital is located.

Section 4202(b) of Public Law 105–33 states, in part, “[a]ny hospital classified as an RRC by the Secretary . . . for fiscal year 1991 shall be classified as such an RRC for fiscal year 1998 and each subsequent year.” In the August 29, 1997 IPPS final rule with comment period (62 FR 45999), CMS reinstated RRC status for all hospitals that lost the status due to triennial review or MGCRB reclassification. However, CMS did not reinstate the status of hospitals that lost RRC status because they were now urban for all purposes because of the OMB designation of their geographic area as urban. Subsequently, in the August 1, 2000 IPPS final rule (65 FR 47089), we indicated that we were revisiting that decision. Specifically, we stated that we would permit hospitals that previously qualified as an RRC and lost their status due to OMB redesignation of the county in which they are located from rural to urban, to be reinstated as an RRC. Otherwise, a hospital seeking RRC status must satisfy all of the other applicable criteria. We use the definitions of “urban” and “rural” specified in Subpart D of 42 CFR Part 412. One of the criteria under which a hospital may qualify as an RRC is to have 275 or more beds available for use (§ 412.96(b)(1)(ii)). A rural hospital that does not meet the bed size requirement can qualify as an RRC if the hospital meets two mandatory prerequisites (a minimum CMI and a minimum number of discharges), and at least one of three optional criteria (relating to specialty composition of

medical staff, source of inpatients, or referral volume). (We refer readers to § 412.96(c)(1) through (c)(5) and the September 30, 1988 **Federal Register** (53 FR 38513).) With respect to the two mandatory prerequisites, a hospital may be classified as an RRC if—

- The hospital’s CMI is at least equal to the lower of the median CMI for urban hospitals in its census region, excluding hospitals with approved teaching programs, or the median CMI for all urban hospitals nationally; and
- The hospital’s number of discharges is at least 5,000 per year, or, if fewer, the median number of discharges for urban hospitals in the census region in which the hospital is located. (The number of discharges criterion for an osteopathic hospital is at least 3,000 discharges per year, as specified in section 1886(d)(5)(C)(i) of the Act.)

1. Case-Mix Index (CMI)

Section 412.96(c)(1) provides that CMS establish updated national and regional CMI values in each year’s annual notice of prospective payment rates for purposes of determining RRC status. The methodology we used to determine the national and regional CMI values is set forth in the regulations at § 412.96(c)(1)(ii). The national median CMI value for FY 2015 is based on the CMI values of all urban hospitals nationwide, and the regional median CMI values for FY 2015 are based on the CMI values of all urban hospitals within each census region, excluding those hospitals with approved teaching programs (that is, those hospitals that train residents in an approved GME program as provided in § 413.75). These values are based on discharges

occurring during FY 2013 (October 1, 2012 through September 30, 2013), and include bills posted to CMS’ records through March 2014.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28089), we proposed that, in addition to meeting other criteria, if rural hospitals with fewer than 275 beds are to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2014, they must have a CMI value for FY 2013 that is at least—

- 1.5730; or
- The median CMI value (not transfer-adjusted) for urban hospitals (excluding hospitals with approved teaching programs as identified in § 413.75) calculated by CMS for the census region in which the hospital is located. (We refer readers to the table set forth in the FY 2015 IPPS/LTCH PPS proposed rule at 79 FR 28089.)

The final CMI values for FY 2015 are based on the latest available data (FY 2013 bills received through March 2014). In addition to meeting other criteria, if rural hospitals with fewer than 275 beds are to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2014, they must have a CMI value for FY 2013 that is at least—

- 1.5723; or
- The median CMI value (not transfer-adjusted) for urban hospitals (excluding hospitals with approved teaching programs as identified in § 413.75) calculated by CMS for the census region in which the hospital is located.

The final CMI values by region are set forth in the following table:

Region	Case-mix index value
1. New England (CT, ME, MA, NH, RI, VT)	1.3587
2. Middle Atlantic (PA, NJ, NY)	1.4318
3. South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV)	1.4807
4. East North Central (IL, IN, MI, OH, WI)	1.4938
5. East South Central (AL, KY, MS, TN)	1.4107
6. West North Central (IA, KS, MN, MO, NE, ND, SD)	1.5459
7. West South Central (AR, LA, OK, TX)	1.6039
8. Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	1.6586
9. Pacific (AK, CA, HI, OR, WA)	1.5658

A hospital seeking to qualify as an RRC should obtain its hospital-specific CMI value (not transfer-adjusted) from its fiscal intermediary or MAC. Data are available on the Provider Statistical and Reimbursement (PS&R) System. In keeping with our policy on discharges, the CMI values are computed based on all Medicare patient discharges subject to the IPPS MS–DRG-based payment.

2. Discharges

Section 412.96(c)(2)(i) provides that CMS set forth the national and regional numbers of discharges in each year’s annual notice of prospective payment rates for purposes of determining RRC status. As specified in section 1886(d)(5)(C)(ii) of the Act, the national standard is set at 5,000 discharges. In the FY 2015 IPPS/LTCH PPS proposed

rule (79 FR 28090), we proposed to update the regional standards based on discharges for urban hospitals’ cost reporting periods that began during FY 2012 (that is October 1, 2011 through September 30, 2012), which are the latest cost report data available at the time the proposed rule was developed.

We proposed that, in addition to meeting other criteria, a hospital, if it is

to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2014, must have, as the number of discharges for its cost reporting period that began during FY 2012, at least—

- 5,000 (3,000 for an osteopathic hospital); or

• The median number of discharges for urban hospitals in the census region in which the hospital is located. (We refer readers to the table set forth in the FY 2015 IPPS/LTCH PPS proposed rule at 79 FR 28090.)

Based on the latest discharge data available at this time (that is, based on

FY 2012 cost report data), the final median number of discharges for urban hospitals by census region are set forth in the following table:

Region	Number of discharges
1. New England (CT, ME, MA, NH, RI, VT)	7,635
2. Middle Atlantic (PA, NJ, NY)	10,841
3. South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV)	10,642
4. East North Central (IL, IN, MI, OH, WI)	8,530
5. East South Central (AL, KY, MS, TN)	7,975
6. West North Central (IA, KS, MN, MO, NE, ND, SD)	7,925
7. West South Central (AR, LA, OK, TX)	4,960
8. Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	8,525
9. Pacific (AK, CA, HI, OR, WA)	8,504

We reiterate that, if an osteopathic hospital is to qualify for RRC status for cost reporting periods beginning on or after October 1, 2014, the hospital would be required to have at least 3,000 discharges for its cost reporting period that began during FY 2012.

D. Payment Adjustment for Low-Volume Hospitals (§ 412.101)

1. Background

Section 1886(d)(12) of the Act provides for an additional payment to each qualifying low-volume hospital that is paid under IPPS beginning in FY 2005. Sections 3125 and 10314 of the Affordable Care Act provided for a temporary change in the low-volume hospital payment policy for FYs 2011 and 2012. Section 605 of the American Taxpayer Relief Act of 2012 (ATRA) extended, for FY 2013, the temporary changes in the low-volume hospital payment policy provided for in FYs 2011 and 2012 by the Affordable Care Act. Prior to the enactment of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) on December 26, 2013, and section 106 of the Protecting Access to Medicare Act of 2014 (Pub. L. 113–93) on April 1, 2014, for FY 2014 (and subsequent years), the low-volume hospital qualifying criteria and payment adjustment returned to the statutory requirements under section 1886(d)(12) of the Act that were in effect prior to the amendments made by the Affordable Care Act and the ATRA. (For additional information on the expiration of the temporary changes in the low-volume hospital payment policy for FYs 2011 through 2013 provided for by the Affordable Care Act and the ATRA, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50610 through 50613).)

Section 1105 of the Pathway for SGR Reform Act extended, for the first 6 months of FY 2014 (that is, through March 31, 2014), the temporary changes in the low-volume hospital payment policy provided for in FYs 2011 and 2012 by the Affordable Care Act and extended through FY 2013 by the ATRA. We addressed the extension of the temporary changes to the low-volume hospital payment policy through March 31, 2014 under the Pathway for SGR Reform Act in an interim final rule with comment period that appeared in the **Federal Register** on March 18, 2014 (79 FR 15022 through 15025) (hereafter referred to as the “March 2014 IFC”). In that March 2014 IFC, we also amended the regulations at 42 CFR 412.101 to reflect the extension of the temporary changes to the qualifying criteria and the payment adjustment for low-volume hospitals through March 31, 2014. (In section IV.P. of the preamble of this final rule, we are responding to the public comments we received on the March 2014 IFC and are stating our finalized policy for the extension of the temporary changes to the low-volume hospital payment policy through March 31, 2014, under the Pathway for SGR Reform Act.)

2. Provisions of the Protecting Access to Medicare Act of 2014

Section 105 of the Protecting Access to Medicare Act of 2014 (PAMA) (Pub. L. 113–93) extends, for an additional year (that is, through March 31, 2015), the temporary changes in the low-volume hospital payment policy provided for in FYs 2011 and 2012 by the Affordable Care Act and extended through FY 2013 by the ATRA and the first half of FY 2014 by the Pathway for

SGR Reform Act. We addressed the extension of the temporary changes to the low-volume hospital payment policy for the second half of FY 2014 (that is, from April 1, 2014 through September 30, 2014) under the PAMA in a notice that appeared in the **Federal Register** on June 17, 2014 (79 FR 34444). However, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28090), we proposed to make conforming changes to the existing regulations text at § 412.101 to reflect the extension of the changes to the qualifying criteria and the payment adjustment methodology for low-volume hospitals through the first half of FY 2015 (that is, through March 31, 2015) in accordance with section 105 of the PAMA. Specifically, we proposed to revise paragraphs (b)(2)(i), (b)(2)(ii), (c)(1), (c)(2), and (d) of § 412.101. Under these proposed changes to § 412.101, beginning with FY 2015 discharges occurring on or after April 1, 2015, consistent with section 1886(d)(12) of the Act, as amended, the low-volume hospital qualifying criteria and payment adjustment methodology would revert to that which was in effect prior to the amendments made by the Affordable Care Act and subsequent legislation (that is, the low-volume hospital payment adjustment policy in effect for FYs 2005 through 2010).

We did not receive any public comments on our proposed conforming changes to the existing regulations text at § 412.101 to reflect the extension of the changes to the qualifying criteria and the payment adjustment methodology for low-volume hospitals through the first half of FY 2015 (that is, through March 31, 2015) in accordance with section 105 of the PAMA. Therefore, in this final rule, we are adopting our proposed revisions to

paragraphs (b)(2)(i), (b)(2)(ii), (c)(1), (c)(2), and (d) of § 412.101 as final without modification. We note that these revisions supersede the conforming changes to these same regulatory provisions made in the March 2014 IFC to reflect the extension of the changes to the qualifying criteria and the payment adjustment methodology for low-volume hospitals through March 31, 2014, under the Pathway for SGR Reform Act, as discussed in section IV.P. of the preamble of this final rule. The public comments we received on our proposals related to the low-volume hospital payment policy for FY 2015 and our responses are presented in section IV.D.3. of the preamble of this final rule.

3. Low-Volume Hospital Definition and Payment Adjustment for FY 2015

As discussed above, under section 1886(d)(12) of the Act, as amended, the temporary changes in the low-volume hospital payment policy originally provided by the Affordable Care Act and extended through subsequent legislation, are effective for FY 2015 discharges occurring before April 1, 2015. To implement the extension of the temporary change in the low-volume hospital payment policy through the first half of FY 2015 (that is, for discharges occurring through March 31, 2015) provided for by the PAMA, in accordance with proposed § 412.101(b)(2)(ii) and consistent with our historical approach, we proposed to update the discharge data source used to identify qualifying low-volume hospitals and calculate the payment adjustment (percentage increase) for FY 2015 discharges occurring before April 1, 2015. Under existing § 412.101(b)(2)(ii), for the applicable fiscal years, a hospital's Medicare discharges from the most recently available MedPAR data, as determined by CMS, are used to determine if the hospital meets the discharge criteria to receive the low-volume payment adjustment in the current year. The applicable low-volume percentage increase, as originally provided for by the Affordable Care Act, is determined using a continuous linear sliding scale equation that results in a low-volume hospital payment adjustment ranging from an additional 25 percent for hospitals with 200 or fewer Medicare discharges to a zero percent additional payment adjustment for hospitals with 1,600 or more Medicare discharges. For FY 2015 discharges occurring before April 1, 2015, consistent with our historical policy, we proposed that qualifying low-volume hospitals and their payment adjustment would be

determined using the most recently available Medicare discharge data from the FY 2013 MedPAR file, as these data are the most recent data available. Table 14 listed in the Addendum of the proposed rule (which is available only through the Internet on the CMS Web site at http://www.cms.hhs.gov/AcuteInpatientPPS/01_overview.asp) lists the "subsection (d)" hospitals with fewer than 1,600 Medicare discharges based on the December 2013 update of the FY 2013 MedPAR file and their proposed low-volume payment adjustment for FY 2015 discharges occurring before April 1, 2015 (if eligible). We noted that the list of hospitals with fewer than 1,600 Medicare discharges in Table 14 did not reflect whether or not the hospital meets the mileage criterion. Eligibility for the low-volume hospital payment adjustment for the first 6 months of FY 2015 would also be dependent upon meeting the mileage criterion specified at proposed § 412.101(b)(2)(ii); that is, the hospital is located more than 15 road miles from any other IPPS hospital. In addition, we indicated that if more recent Medicare discharge data become available, we intended to use updated data to determine the list of "subsection (d)" hospitals with fewer than 1,600 Medicare discharges based on the March 2014 update of the FY 2013 MedPAR file and their potential low-volume payment adjustment for FY 2015 discharges occurring before April 1, 2015 (if eligible) in Table 14 of the final rule.

We did not receive any public comments on our proposal that qualifying low-volume hospitals and their payment adjustment for FY 2015 discharges occurring before April 1, 2015 would be determined using the most recently available Medicare discharge data from the FY 2013 MedPAR file, as these data are the most recent data available. Therefore, in this final rule, as we proposed, we are establishing that qualifying low-volume hospitals (that is, the list of "subsection (d)" hospitals with fewer than 1,600 Medicare discharges) and their potential low-volume payment adjustment for FY 2015 discharges occurring before April 1, 2015 (if eligible) will be based on Medicare discharge data from the March 2014 update of the FY 2013 MedPAR file. Table 14 listed in the Addendum of this final rule (which is available only through the Internet on the CMS Web site at http://www.cms.hhs.gov/AcuteInpatientPPS/01_overview.asp) lists the "subsection (d)" hospitals with fewer than 1,600 Medicare discharges based on the March 2014 update of the FY 2013 MedPAR file and their low-volume

payment adjustment for FY 2015 discharges occurring before April 1, 2015 (if eligible). We note that the list of hospitals with fewer than 1,600 Medicare discharges in Table 14 does not reflect whether or not the hospital meets the mileage criterion. Eligibility for the low-volume hospital payment adjustment for FY 2015 discharges occurring before April 1, 2015, is also dependent upon meeting (in the case of a hospital that did not qualify for the low-volume hospital payment adjustment in FY 2014) or continuing to meet (in the case of a hospital that did qualify for the low-volume hospital payment adjustment in FY 2014) the mileage criterion specified at revised § 412.101(b)(2)(ii) (that is, the hospital is located more than 15 road miles from any other subsection (d) hospital).

In accordance with section 1886(d)(12) of the Act, as amended, beginning with FY 2015 discharges occurring on or after April 1, 2015, the low-volume hospital definition and payment adjustment methodology will revert back to the statutory requirements that were in effect prior to the amendments made by the Affordable Care Act and subsequent legislation (including the PAMA). Therefore, as we stated in the proposed rule, consistent with section 1886(d)(12) of the Act, as amended, effective for FY 2015 discharges occurring on or after April 1, 2015 and subsequent years, in order to qualify as a low-volume hospital, a subsection (d) hospital must be more than 25 road miles from another subsection (d) hospital and have less than 200 discharges (that is, less than 200 discharges total, including both Medicare and non-Medicare discharges) during the fiscal year. Consistent with our existing policy for FYs 2005 through 2010, we stated that, effective for FY 2015 discharges occurring on or after April 1, 2015 and subsequent years, qualifying hospitals would receive the low-volume hospital payment adjustment of an additional 25 percent for discharges occurring during the fiscal year (or portion of the fiscal year). Also consistent with our existing policy for FYs 2005 through 2010, for FY 2015 discharges occurring on or after April 1, 2015 (and subsequent years), we stated that the discharge determination for the low-volume hospital payment adjustment would be made based on the hospital's number of total discharges, that is, Medicare and non-Medicare discharges based on the hospital's most recently submitted cost report. We use cost report data to determine if a hospital meets the discharge criterion because these data are the best available

data source that includes information on both Medicare and non-Medicare discharges. In addition to a discharge criterion, eligibility for the low-volume hospital payment adjustment also depends on the hospital meeting a mileage criterion. As specified at § 412.101(b)(2)(i), to meet the mileage criterion to qualify for the low-volume hospital payment adjustment for FY 2015 discharges occurring on or after April 1, 2015 (and subsequent years), a hospital must be located more than 25 road miles from the nearest subsection (d) hospital.

Comment: A few commenters expressed concern about the financial impact of the expiration of the temporary changes in the low-volume hospital adjustment originally provided for by the Affordable Care Act. Some of these commenters requested that CMS permanently adopt the temporary changes in the low-volume hospital adjustment, while other commenters urged CMS to support legislative efforts to permanently extend these provisions beyond the current March 31, 2015 statutory expiration date. (These comments are similar to comments we received previously, prior to the statutory extensions of the temporary changes in the low-volume hospital adjustment for FYs 2013 and 2014 provided by subsequent legislation.)

Response: While we appreciate the commenters' concerns about the change to the low-volume hospital policy that will occur for discharges occurring on or after April 1, 2015 under current law, we are unable to extend the temporary changes to the low-volume hospital adjustment originally provided for by the Affordable Care Act beyond the current March 31, 2015 statutory expiration date. As discussed in response to similar comment in both the FY 2013 IPPS/LTCH PPS final rule (77 FR 53408 through 53409) and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50612 through 50613), to implement the original low-volume hospital payment adjustment provision, and as mandated by statute, we developed an empirically justified adjustment based on the relationship between costs and total discharges of hospitals. (For more information on this analysis, we refer readers to the FY 2005 IPPS final rule (69 FR 49101 through 49102).) Under current law, the low-volume hospital definition and payment adjustment methodology will revert back to the policy established under statutory requirements that were in effect prior to the amendments made by the Affordable Care Act and subsequent legislation (include the PAMA) beginning with

discharges occurring on after April 1, 2015.

Therefore, consistent with section 1886(d)(12) of the Act, as amended, under the conforming changes to § 412.101(b)(2), effective for FY 2015 discharges occurring on or after April 1, 2015, and subsequent years, in order to qualify as a low-volume hospital, a subsection (d) hospital must be more than 25 road miles from another subsection (d) hospital and have less than 200 discharges (that is, less than 200 discharges total, including both Medicare and non-Medicare discharges) during the fiscal year. Consistent with our existing policy for FYs 2005 through 2010, effective for FY 2015 discharges occurring on or after April 1, 2015, and subsequent years, qualifying hospitals will receive the low-volume hospital payment adjustment of an additional 25 percent for discharges occurring during the fiscal year (or portion of the fiscal year). The discharge determination for the low-volume hospital payment adjustment will be made based on the hospital's number of total discharges, that is, Medicare and non-Medicare discharges, as specified at § 412.101(b)(2)(i). The hospital's most recently submitted cost report is used to determine if the hospital meets the discharge criterion to receive the low-volume hospital payment adjustment in the current fiscal year. We use cost report data to determine if a hospital meets the discharge criterion because these data are the best available data source that includes information on both Medicare and non-Medicare discharges. In addition to a discharge criterion, eligibility for the low-volume hospital payment adjustment also depends on the hospital meeting a mileage criterion. As specified at § 412.101(b)(2)(i), to meet the mileage criterion to qualify for the low-volume hospital payment adjustment for FY 2015 discharges occurring on or after April 1, 2015 (and subsequent years), a hospital must be located more than 25 road miles from the nearest subsection (d) hospital.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28091 through 28092), for FY 2015, we proposed a process for requesting and obtaining the low-volume hospital payment adjustment that was consistent with our previously established procedure. We proposed that in order to receive a low-volume hospital payment adjustment under § 412.101, a hospital must notify and provide documentation to its MAC that it meets the discharge and distance requirements under proposed § 412.101(b)(2)(ii) for FY 2015 discharges occurring before April 1,

2015, and under proposed § 412.101(b)(2)(i) for FY 2015 discharges occurring on or after April 1, 2015, if also applicable. Specifically, for FY 2015, we proposed that a hospital must make a written request for low-volume hospital status that is received by its MAC no later than September 1, 2014, in order for the applicable low-volume hospital payment adjustment to be applied to payments for its discharges occurring on or after October 1, 2014, and through March 31, 2015, or through September 30, 2015, for hospitals that also meet the low-volume hospital payment adjustment qualifying criteria for discharges occurring during the second half of FY 2015. Under this proposal, a hospital that qualified for the low-volume payment adjustment in FY 2014 may continue to receive a low-volume payment adjustment for FY 2015 discharges occurring before April 1, 2015, without reapplying if it continues to meet the Medicare discharge criterion established for FY 2015 and the distance criterion. However, the hospital must send written verification that is received by its MAC no later than September 1, 2014, stating that it continues to be more than 15 miles from any other "subsection (d)" hospital. We also proposed that if a hospital's written request for low-volume hospital status for FY 2015 is received after September 1, 2014, and if the MAC determines that the hospital meets the criteria to qualify as a low-volume hospital, the MAC would apply the applicable low-volume hospital payment adjustment to determine the payment for the hospital's FY 2015 discharges, effective prospectively within 30 days of the date of its low-volume hospital status determination.

Comment: One commenter requested that CMS not impose a notification requirement for hospitals that qualified for the low-volume hospital payment adjustment in FY 2014. The commenter stated that eliminating this verification would reduce the administrative burden for those hospitals and their MACs.

Response: We appreciate the commenter's suggestion to reduce the administrative burden for hospitals and MACs by not having a notification requirement under the FY 2015 low-volume hospital policy for hospitals that qualified for the low-volume hospital payment adjustment in FY 2014. However, as we explained in the proposed rule, under our proposal a hospital that qualified for the low-volume payment adjustment in FY 2014 does not need to reapply for FY 2015 if it continues to meet the applicable discharge and distance criteria (that is,

such a hospital would not have to resubmit a low-volume hospital request with supporting documentation to demonstrate that it meets the mileage criterion). Rather, such a hospital would only be required to send written verification that it continues to meet the distance criterion that is received by the MAC by the proposed notification deadline. This written verification could be a brief letter to the MAC stating that the hospital continues to meet the low-volume hospital distance criterion as documented in a prior low-volume hospital status request. We proposed this abridged notification requirement for hospitals that qualified for the low-volume payment adjustment in FY 2014 because we believe compliance with the statutory low-volume hospital criteria should be monitored while recognizing that it is not necessary to have such hospitals resubmit a low-volume hospital request with the necessary documentation. In addition, if we were to consider no longer requiring verification for hospitals that qualified for the low-volume hospital payment adjustment in the prior year, we may also want to develop alternative policies for monitoring compliance with the statutory low-volume hospital qualifying criteria. Therefore, we are not adopting the commenter's suggestion regarding hospitals that qualified for the low-volume hospital payment adjustment in FY 2014. However, should the temporary changes to the low-volume hospital adjustment be extended beyond March 31, 2015, by subsequent legislation, we may consider modifying the verification process in conjunction with developing an alternative compliance policy.

In this final rule, we are adopting our policy as proposed without modification. Therefore, in order to receive a low-volume hospital payment adjustment under § 412.101, a hospital must notify and provide documentation to its MAC that it meets the discharge and distance requirements under revised § 412.101(b)(2)(ii) for FY 2015 discharges occurring before April 1, 2015, and under revised § 412.101(b)(2)(i) for FY 2015 discharges occurring on or after April 1, 2015, if also applicable. The MAC will determine, based on the most recent data available, if the hospital qualifies as a low-volume hospital, so that the hospital would know in advance whether or not it will receive a payment adjustment. The MAC and CMS may review available data, in addition to the data the hospital submits with its request for low-volume hospital status, in order to determine whether or not the

hospital meets the qualifying criteria. Consistent with our previously established procedure, for FY 2015, a hospital must make a written request for low-volume hospital status that is received by its MAC no later than September 1, 2014, in order for the applicable low-volume hospital payment adjustment to be applied to payments for its discharges occurring on or after October 1, 2014, and through March 31, 2015, under revised § 412.101(b)(2)(ii) or through September 30, 2015, for hospitals that also qualify under revised § 412.101(b)(2)(i). A hospital that qualified for the low-volume payment adjustment in FY 2014 may continue to receive a low-volume payment adjustment for FY 2015 discharges occurring before April 1, 2015, without reapplying if it continues to meet the Medicare discharge criterion established for FY 2015 (shown in Table 14 of this final rule, which is available via the Internet on the CMS Web site) and the distance criterion. However, the hospital must send written verification that is received by its MAC no later than September 1, 2014, that it continues to be more than 15 miles from any other "subsection (d)" hospital. This written verification could be a brief letter to the MAC stating that the hospital continues to meet the low-volume hospital distance criterion as documented in a prior low-volume hospital status request.

If a hospital's written request for low-volume hospital status for FY 2015 is received after September 1, 2014, and if the MAC determines that the hospital meets the criteria to qualify as a low-volume hospital under revised § 412.101(b)(2)(ii), the MAC will apply the applicable low-volume hospital payment adjustment to determine the payment for the hospital's FY 2015 discharges, effective prospectively within 30 days of the date of its low-volume hospital status determination through discharges occurring on or before March 31, 2015. If the hospital also qualifies under revised § 412.101(b)(2)(i), the MAC will apply the 25-percent low-volume hospital payment adjustment to determine the payment for the hospital's FY 2015 discharges occurring on or after April 1, 2015. If a hospital's written request for low-volume hospital status for FY 2015 is received on a later date such that the prospective effective date would be on or after April 1, 2015, and the hospital qualifies under revised § 412.101(b)(2)(i), the MAC will apply the 25-percent low-volume hospital payment adjustment to determine the payment for the hospital's FY 2015

discharges occurring from the prospective effective date through September 30, 2015. (For additional details on our established process for the low-volume hospital payment adjustment, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53408).)

E. Indirect Medical Education (IME) Payment Adjustment (§ 412.105)

1. IME Adjustment Factor for FY 2015

Under the IPPS, an additional payment amount is made to hospitals with residents in an approved graduate medical education (GME) program in order to reflect the higher indirect patient care costs of teaching hospitals relative to nonteaching hospitals. The payment amount is determined by use of a statutorily specified adjustment factor. The regulations regarding the calculation of this additional payment, known as the IME adjustment, are located at § 412.105. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51680) for a full discussion of the IME adjustment and IME adjustment factor. Section 1886(d)(5)(B) of the Act states that, for discharges occurring during FY 2008 and fiscal years thereafter, the IME formula multiplier is 1.35. Accordingly, for discharges occurring during FY 2015, the formula multiplier is 1.35. We estimate that application of this formula multiplier for the FY 2015 IME adjustment will result in an increase in IPPS payment of 5.5 percent for every approximately 10 percent increase in the hospital's resident to bed ratio.

Comment: One commenter stated it has a longstanding commitment to graduate medical education, the practice of academic medicine, and successful training of surgical residents. The commenter expressed appreciation of Federal support of IME payments. The commenter stated these payments are an important part of ensuring a strong general surgery workforce, which is currently experiencing a growing shortage.

Response: We acknowledge the commenter's support. We note that the IME formula multiplier is set by Congress. We are specifying in this final rule that the IME formula multiplier for FY 2015 is set at 1.35.

2. IME Medicare Part C Add-On Payments to Sole Community Hospitals (SCHs) That Are Paid According to Their Hospital-Specific Rates and Change in Methodology in Determining Payment to SCHs

Section 1886(d)(11) of the Act provides for an additional payment

amount to a subsection (d) teaching hospital that has an approved medical residency training program for each applicable discharge of any individual who is enrolled under Medicare Managed Care under Part C. The amount of such payment is specified in section 1886(d)(11)(C) of the Act and “shall be equal to the applicable percentage (as defined in subsection (h)(3)(D)(ii)) of the estimated average per discharge amount that would otherwise have been paid under paragraph (5)(B) if the individuals had not been enrolled as described in subparagraph (B).”

Under section 1886(d)(5)(D) of the Act, sole community hospitals (SCHs) are paid based on their hospital-specific rate from specified base years or the IPPS Federal rate, whichever yields the greatest aggregate payment for the hospital’s cost reporting period. Payments based on the Federal rate are based on the IPPS standardized amount and include all applicable IPPS add-on payments, such as outliers, DSH, and IME, while payments based on the hospital-specific rate include no add-on payments. Under CMS’ current payment system, both the IME add-on payment for Medicare Part A patient discharges under section 1886(d)(5)(B) of the Act and the IME add-on payment for Medicare Part C patient discharges under section 1886(d)(11) of the Act are included as part of the Federal rate payment, whereas neither of these add-on payments are included as part of the hospital-specific rate payment. We note that SCHs that are paid based on their hospital-specific rate do not receive a separate IME add-on payment for Medicare Part A patient discharges because, generally, the hospital-specific rate already reflects the additional costs that a teaching hospital incurs for its Medicare Part A patients. In the case of Medicare Part C patients, there is no component of the hospital-specific rate that already accounts for the additional costs that SCHs incur for their Medicare Part C patients, and there is currently no payment mechanism for SCHs paid based on their hospital-specific rate to receive the IME add-on payment for Medicare Part C patients.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28092), for the reasons specified below, effective for discharges occurring in cost reporting periods beginning on or after October 1, 2014, we proposed: (1) To provide all SCHs that are subsection (d) teaching hospitals IME add-on payments for applicable discharges of Medicare Part C patients in accordance with section 1886(d)(11) of the Act, regardless of whether the SCH is paid based on the Federal rate or its hospital-specific rate;

and (2) that, for purposes of the comparison of payments based on the Federal rate (hereinafter also referred to as the “Federal rate payment”) and payments based on the hospital-specific rate (hereinafter also referred to as the “hospital-specific rate payment”) under section 1886(d)(5)(D) of the Act, IME payments under section 1886(d)(11) of the Act for Medicare Part C patients will no longer be included as part of the Federal rate payment. After the higher of the Federal rate payment amount or the hospital-specific rate payment amount is determined, any IME add-on payments under section 1886(d)(11) of the Act for Medicare Part C patient discharges would be added to that payment for purposes of determining the hospital’s total payment amount.

As noted above, under section 1886(d)(5)(D) of the Act, SCHs are paid based on their hospital-specific rate or the Federal rate, whichever yields the higher payment for the hospital’s cost reporting period. For each cost reporting period, the MAC determines which of the payment options will yield the higher aggregate payment. Interim payments are automatically made on a claim-by-claim basis at the higher rate using the best data available at the time the MAC makes the payment determination for each discharge. However, it may not be possible for the MAC to determine in advance precisely which of the rates will yield the higher aggregate payment by year’s end. In many cases, it is not possible to forecast outlier payments or the final amount of the DSH payment adjustment or the IME adjustment until cost report settlement. As noted above, these adjustment amounts are included only as part of the payments based on the Federal rate but not payments based on the hospital-specific rate. The MAC makes a final adjustment at cost report settlement after it determines precisely which of the two payment rates would yield the higher aggregate payment to the hospital for its cost reporting period. This payment methodology makes SCHs unique because SCH payments can change on a yearly basis from payments based on the hospital-specific rate to payments based on the Federal rate, or vice versa.

As we stated earlier, section 1886(d)(11) of the Act provides for an additional payment for each applicable discharge of any subsection (d) teaching hospital for treating Medicare Part C patients. Section 1886(d)(11)(C) of the Act specifies that the amount of the payment “shall be equal to the applicable percentage (as defined in subsection (h)(3)(D)(ii)) of the estimated average per discharge amount that

would otherwise have been paid under paragraph (5)(B) if the individuals had not been enrolled as described in subparagraph (B)” (emphasis added). Because an SCH that is paid based on its hospital-specific rate does not receive any IME add-on payment for Medicare Part A patients as provided under section 1886(d)(5)(B) of the Act, CMS has interpreted section 1886(d)(11)(C) of the Act to mean that an SCH that is paid based on its hospital-specific rate also is not entitled to receive payment for discharges of Medicare Part C patients under section 1886(d)(11) of the Act.

After further consideration of the language at section 1886(d)(11) of the Act, we believe that the statute would allow an SCH that is paid based on its hospital-specific rate to receive IME add-on payments for its Medicare Part C patient discharges. Section 1886(d)(11)(A) of the Act provides for an additional payment amount for each applicable discharge of a Medicare Part C patient of a subsection (d) hospital that has an approved medical residency training program. Section 1886(d)(11)(C) of the Act sets forth the amount of this additional payment, by reference to the amount that would otherwise have been paid under section 1886(d)(5)(B) of the Act. We believe that section 1886(d)(11)(C) of the Act can be interpreted as simply establishing the methodology for calculating the amount of the add-on payment, without limiting the applicability of the add-on payment to those SCHs that are paid based on the Federal rate.

As noted earlier, currently, in making the comparison of SCH payments under the Federal rate and the hospital-specific rate under section 1886(d)(5)(D) of the Act, the aggregate Federal rate payments are based on the IPPS standardized amount and include IME add-on payments for both Medicare Part A and Medicare Part C patient discharges. Payments based on the hospital-specific rate do not include the Medicare Part A IME add-on payment under section 1886(d)(5)(B) of the Act, under the rationale that, generally, the hospital-specific rate already reflects the additional costs that a teaching hospital incurs for its Medicare Part A patients. Payments based on the hospital-specific rate do not include the IME add-on payment for Medicare Part C patient discharges under section 1886(d)(11) of the Act. As a result, under the current methodology, if an SCH that is a teaching hospital is paid based on its hospital-specific rate, it receives no IPPS payment that reflects or accounts for the additional costs that a teaching

hospital incurs for its Medicare Part C patients.

In conjunction with our proposal to provide IME add-on payments under section 1886(d)(11) of the Act to SCHs, regardless of whether the SCH is paid based on the Federal rate or its hospital-specific rate, we also believe that, for purposes of the comparison of payments based on the Federal rate and the hospital-specific rate, it would be appropriate for IME add-on payments under section 1886(d)(11) of the Act to no longer be included as part of the Federal rate payment. Therefore, we proposed to no longer include these payments in the comparison in order to more accurately reflect comparable payments for Medicare Part A patient discharges. In addition, because the IME add-on payment for Medicare Part C patient discharges for a given provider would be the same, regardless of whether it is paid based on the Federal rate or its hospital-specific rate, there would be no need to include the IME add-on payment for Medicare Part C patient discharges in the comparison. This is because the Part C IME adjustment is always multiplied by the Federal rate that is used under section 1886(d)(5)(B) of the Act, regardless of whether the hospital-specific rate is higher, in accordance with section 1886(d)(11) of the Act, which states that the IME Part C add-on amount “shall be equal to the applicable percentage . . . of the estimated average per discharge amount that would otherwise have been paid under paragraph (5)(B).”

We invited public comments on both of these proposals and any alternatives that we should consider.

Comment: Several commenters supported CMS’ proposal to make IME add-on payments for Medicare Part C discharges to SCHs paid based on the hospital-specific rate. Some of these commenters also supported the proposal to change the methodology in determining whether an SCH is paid based on the Federal rate or the hospital-specific rate by excluding the IME add-on amount for Medicare Part C discharges from the comparison.

Although commenters supported the proposal to make IME add-on payments for Medicare Part C discharges to SCHs that are paid based on the hospital-specific rate, several commenters objected to the proposal to make a corresponding change to the methodology for determining whether an SCH is paid based on the Federal rate or the hospital-specific rate by excluding the IME add-on amount for Medicare Part C discharges from the comparison. The commenters claimed that this change would have the

unintended consequence of precluding hospitals from receiving DSH and uncompensated care payments, which would disadvantage a subset of SCHs that receive payment based on the hospital-specific rate. They recommended making no changes to the comparison.

Response: We appreciate the commenters’ support of our proposal to make IME add-on payments for Medicare Part C discharges to SCHs that are paid based on the hospital-specific rate. While we agree that a provider that receives payment based on the hospital-specific rate would not be eligible for DSH or uncompensated care payments, we do not agree that exclusion of the IME add-on payment for Medicare Part C discharges from the comparison of the Federal rate payments to the hospital-specific rate payments would disadvantage a given hospital. Our proposal does not preclude a provider from receiving payment based on the Federal rate (which includes DSH and uncompensated care payments as applicable), if the Federal rate payment is higher than the hospital-specific rate payment. However, it is true that a provider that receives payment based on the hospital-specific rate would not be eligible for DSH or uncompensated care payments.

As we stated in the proposed rule, we believe that the proposed methodology more accurately reflects the comparable payments for Medicare Part A discharges for SCHs. Generally the hospital-specific rate payment already reflects the additional costs that a teaching hospital incurs for its Medicare Part A patients. However, because the costs associated with Medicare Part C patient discharges are not reflected in the hospital-specific rate, we believe that excluding these amounts from the Federal rate payment provides for a more accurate comparison of payments for Medicare Part A discharges. The commenters did not provide any explanation in support of maintaining our current methodology of comparing the Federal rate payment with the IME add-on amount for Medicare Part C discharges to the hospital-specific rate payment. Moreover, these commenters did not include any explanation of how our proposal to exclude the IME add-on payments for Medicare Part C discharges from both sides of the comparison would specifically disadvantage a given provider by precluding it from receiving DSH and uncompensated care payments. For these reasons, we are not adopting the commenters’ suggestion to maintain the current comparison methodology.

Comment: One commenter urged CMS to extend the same payment IME add-on for Part C patients to MDHs because they also are paid the higher of the Federal rate payment or “the blended rate incorporating a hospital-specific rate.”

Response: Unlike SCHs, an MDH receives the higher of the Federal rate or the Federal rate payment plus 75 percent of the amount by which the Federal rate payment is exceeded by its hospital-specific rate payments (that is, payment based on the highest of its hospital-specific rates based on costs in one of its base years). Because payment, whether in whole or in part to an MDH, is always based on the Federal rate, an MDH that is a teaching hospital receives IME add-on payments for Medicare Part A patient discharges under section 1886(d)(5)(B) of the Act, and, therefore, under our historical interpretation of section 1886(d)(11)(C) of the Act, is entitled to receive IME add-on payments for Medicare Part C patient discharges. Consequently, there is no need to “extend” this payment add-on to MDHs that are teaching hospitals because they are already receiving IME add-on payments for Medicare Part C discharges. We also note that, as explained elsewhere, the Federal rate payment used in the MDH payment methodology is the same Federal rate payment that is used in the SCH payment methodology (79 FR 28096). This means that, under the proposed change to the comparison methodology to exclude IME add-on payments for Medicare Part C discharges from the Federal rate payment, the Federal rate payment used for the purpose of the MDH payment methodology, that is, to calculate the 75 percent of the amount by which the Federal rate payment is exceeded by the highest of its hospital-specific rate payments based on costs in one of the MDH’s base years, would likewise exclude the IME add-on payment for Medicare Part C discharges. After determining the higher of the Federal rate payment or the Federal rate payment plus 75 percent of the amount by which the Federal rate payment is exceeded by the hospital-specific rate payment, any add-on payments under section 1886(d)(11) of the Act for Medicare Part C patient discharges will be added to that payment for purposes of determining the hospital’s total payment amount.

Comment: One commenter addressed the general payment methodology for SCHs and the limited number of specified years upon which the hospital-specific rate is based. The commenter stated that the proposal to make additional IME Part C add-on

payments to SCHs does not cover IME costs for SCHs that did not have a teaching program during or prior to FY 2006. The commenter suggested allowing rural hospitals to rebase their hospital-specific rate in the fiscal year following the start of a new residency program.

Response: We consider this comment to be outside of the scope of the proposals described above. We also note that the fiscal years upon which the hospital-specific rates are based are specified in the statute. CMS does not have authority to authorize a rebasing of hospital-specific rates absent additional legislation.

After consideration of the public comments we received, we are adopting our proposals without modification. In summary, effective with discharges occurring in cost reporting periods beginning on or after October 1, 2014, our final policies are: (1) To provide all SCHs that are subsection (d) teaching hospitals IME add-on payments for Medicare Part C patient discharges in accordance with section 1886(d)(11) of the Act; and (2) for purposes of the comparison of payments based on the Federal rate and the hospital-specific rate for SCHs under section 1886(d)(5)(D) of the Act, IME add-on payments under section 1886(d)(11) of the Act for Medicare Part C patient discharges will no longer be included in the aggregate payment based on the Federal rate. After the higher of the Federal rate payment or the hospital-specific rate payment under section 1886(d)(5)(D) of the Act is determined, the Part C IME adjustment factor is multiplied by the Federal rate to determine the add-on payment amount under section 1886(d)(11) of the Act, and then any IME add-on payments under section 1886(d)(11) of the Act are added to the payment amount under section 1886(d)(5)(D) of the Act for purposes of determining the hospital's total payment amount.

3. Other Policy Changes Affecting IME

In section IV.K. of the preamble of this final rule, we present other policy changes relating to GME payments, which may also apply to IME payments. We refer readers to that section of the preamble of this proposed rule where we present these policies.

F. Payment Adjustment for Medicare Disproportionate Share Hospitals (DSHs) (§ 412.106)

1. Background

Section 1886(d)(5)(F) of the Act provides for additional Medicare payments to subsection (d) hospitals

that serve a significantly disproportionate number of low-income patients. The Act specifies two methods by which a hospital may qualify for the Medicare disproportionate share hospital (DSH) adjustment. Under the first method, hospitals that are located in an urban area and have 100 or more beds may receive a Medicare DSH payment adjustment if the hospital can demonstrate that, during its cost reporting period, more than 30 percent of its net inpatient care revenues are derived from State and local government payments for care furnished to needy patients with low incomes. This method is commonly referred to as the "Pickle method." The second method for qualifying for the DSH payment adjustment, which is the most common, is based on a complex statutory formula under which the DSH payment adjustment is based on the hospital's geographic designation, the number of beds in the hospital, and the level of the hospital's disproportionate patient percentage (DPP). A hospital's DPP is the sum of two fractions: The "Medicare fraction" and the "Medicaid fraction." The Medicare fraction (also known as the "SSI fraction" or "SSI ratio") is computed by dividing the number of the hospital's inpatient days that are furnished to patients who were entitled to both Medicare Part A and Supplemental Security Income (SSI) benefits by the hospital's total number of patient days furnished to patients entitled to benefits under Medicare Part A. The Medicaid fraction is computed by dividing the hospital's number of inpatient days furnished to patients who, for such days, were eligible for Medicaid, but were not entitled to benefits under Medicare Part A, by the hospital's total number of inpatient days in the same period.

Because the DSH payment adjustment is part of the IPPS, the DSH statutory references (under section 1886(d)(5)(F) of the Act) to "days" apply only to hospital acute care inpatient days. Regulations located at § 412.106 govern the Medicare DSH payment adjustment and specify how the DPP is calculated as well as how beds and patient days are counted in determining the Medicare DSH payment adjustment. Under § 412.106(a)(1)(i), the number of beds for the Medicare DSH payment adjustment is determined in accordance with bed counting rules for the IME adjustment under § 412.105(b).

2. Impact on Medicare DSH Payment Adjustment of Implementation of New OMB Labor Market Delineations

As discussed in section III.B. of the preamble of this final rule, in the FY

2015 IPPS/LTCH PPS proposed rule, we proposed to implement the new OMB labor market area delineations (which are based on 2010 Decennial Census data) for the FY 2015 wage index. We stated that this proposal also would have an impact on the calculation of Medicare DSH payments to certain hospitals. Hospitals that are designated as rural with less than 500 beds and that are not rural referral centers (RRCs) are subject to a maximum DSH payment adjustment of 12 percent. Accordingly, hospitals with less than 500 beds that are currently in urban counties that would become rural if we adopt the new OMB delineations, and that do not become RRCs, would be subject to a maximum DSH payment adjustment of 12 percent. (We note that urban hospitals are only subject to a maximum DSH payment adjustment of 12 percent if they have less than 100 beds.)

Under existing regulations at 42 CFR 412.102, a hospital located in an area that is reclassified from urban to rural, as defined in the regulations, may receive an adjustment to its rural Federal payment amount for operating costs for two successive fiscal years. Specifically, the regulations state that, in the first year after a hospital loses urban status, the hospital will receive an additional payment that equals two-thirds of the difference between the urban standardized amount and disproportionate share payments as applicable to the hospital before its redesignation from urban to rural and the rural standardized amount and disproportionate share payments otherwise applicable to the hospital subsequent to its redesignation from urban to rural. In the second year after a hospital loses urban status, the hospital will receive an additional payment that equals one-third of the difference between the urban standardized amount and disproportionate share payments applicable to the hospital before its redesignation from urban to rural and the rural standardized amount and disproportionate share payments otherwise applicable to the hospital subsequent to its redesignation from urban to rural.

We note that we no longer make a distinction between the urban standardized amount and the rural standardized amount. Rather, hospitals receive the same standardized amount regardless of their geographic designation. Accordingly, we proposed to revise the regulation at § 412.102 to remove references to the urban and rural standardized amounts.

We did not receive any public comments on this proposal and we are

adopting the revisions to the regulation at § 412.102 to remove references to the urban and rural standardized amounts.

The provisions of § 412.102 will continue to apply with respect to the calculation of the DSH payments to hospitals that are currently located in urban counties that will become rural under our adoption of the new OMB delineations as described in section III.B.2. of the preamble to this final rule. Specifically, the regulations state that, in the first year after a hospital loses urban status, the hospital will receive an additional payment that equals two-thirds of the difference between disproportionate share payments as applicable to the hospital before its redesignation from urban to rural and the disproportionate share payments otherwise applicable to the hospital subsequent to its redesignation from urban to rural. In the second year after a hospital loses urban status, the hospital will receive an additional payment that equals one-third of the difference between the disproportionate share payments applicable to the hospital before its redesignation from urban to rural and the disproportionate share payments otherwise applicable to the hospital subsequent to its redesignation from urban to rural.

For the purposes of ratesetting, calculating budget neutrality, and modeling payment impacts for this final rule, any hospital that was previously urban but will change to rural status in FY 2015 as a result of the adoption of the new OMB labor market area delineations will have its DSH payments modeled such that the payment equals the amount of the rural disproportionate share payments plus two-thirds of the difference between the urban disproportionate share payments and the rural disproportionate share payments.

3. Payment Adjustment Methodology for Medicare Disproportionate Share Hospitals (DSHs) Under Section 3133 of the Affordable Care Act (§ 412.106)

a. General Discussion

Section 3133 of the Patient Protection and Affordable Care Act, as amended by section 10316 of the same act and section 1104 of the Health Care and Education Reconciliation Act (Pub. L. 111–152), added a new section 1886(r) to the Act that modifies the methodology for computing the Medicare DSH payment adjustment beginning in FY 2014. For purposes of this proposed rule, we refer to these provisions collectively as section 3133 of the Affordable Care Act.

Medicare DSH adjustment payments are calculated under a statutory formula that considers the hospital's Medicare utilization attributable to beneficiaries who also receive Supplemental Security Income (SSI) benefits and the hospital's Medicaid utilization. Beginning with discharges in FY 2014, hospitals that qualify for Medicare DSH payments under section 1886(d)(5)(F) of the Act receive 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments. This provision applies equally to hospitals that qualify for DSH payments under section 1886(d)(5)(F)(i)(I) of the Act and those hospitals that qualify under the Pickle method under section 1886(d)(5)(F)(i)(II) of the Act.

The remaining amount, equal to an estimate of 75 percent of what otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals under age 65 who are uninsured, is available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. The payments to each hospital for a fiscal year are based on the hospital's amount of uncompensated care for a given time period relative to the total amount of uncompensated care for that same time period reported by all hospitals that receive Medicare DSH payments for that fiscal year.

As provided by section 3133 of the Affordable Care Act, section 1886(r) of the Act requires that, for FY 2014 and each subsequent fiscal year, a "subsection (d) hospital" that would otherwise receive a "disproportionate share hospital payment . . . made under subsection (d)(5)(F)" receives two separately calculated payments. Specifically, section 1886(r)(1) of the Act provides that the Secretary shall pay to such a subsection (d) hospital (including a Pickle hospital) 25 percent of the amount the hospital would have received under section 1886(d)(5)(F) of the Act for disproportionate share hospital payments, which represents "the empirically justified amount for such payment, as determined by the Medicare Payment Advisory Commission in its March 2007 Report to the Congress." We refer to this payment as the "empirically justified Medicare DSH payment."

In addition to this payment, section 1886(r)(2) of the Act provides that, for FY 2014 and each subsequent fiscal year, the Secretary shall pay to "such subsection (d) hospital an additional amount equal to the product of" three factors. The first factor is the difference between "the aggregate amount of

payments that would be made to subsection (d) hospitals under subsection (d)(5)(F) if this subsection did not apply" and "the aggregate amount of payments that are made to subsection (d) hospitals under paragraph (1)" for each fiscal year. Therefore, this factor amounts to 75 percent of the payments that would otherwise be made under section 1886(d)(5)(F) of the Act.

The second factor is, for FYs 2014 through 2017, 1 minus the percent change in the percent of individuals under the age of 65 who are uninsured, determined by comparing the percent of such individuals who are uninsured in 2013, the last year before coverage expansion under the Affordable Care Act (as calculated by the Secretary based on the most recent estimates available from the Director of the Congressional Budget Office before a vote in either House on the Health Care and Education Reconciliation Act of 2010 that, if determined in the affirmative, would clear such Act for enrollment), minus 0.1 percentage points for FY 2014, and minus 0.2 percentage points for FYs 2015 through 2017. For FYs 2014 through 2017, the baseline for the estimate of the change in uninsurance is fixed by the most recent estimate of the Congressional Budget Office before the final vote on the Health Care and Education Reconciliation Act of 2010, which is contained in a March 20, 2010 letter from the Director of the Congressional Budget Office to the Speaker of the House. (A link to this letter is included in section IV.F.3.d.(2) of the preamble of this final rule.)

For FY 2018 and subsequent years, the second factor is 1 minus the percent change in the percent of individuals who are uninsured, as determined by comparing the percent of individuals "who are uninsured in 2013 (as estimated by the Secretary, based on data from the Census Bureau or other sources the Secretary determines appropriate, and certified by the Chief Actuary" of CMS, and the percent of individuals "who are uninsured in the most recent period for which data is available (as so estimated and certified), minus 0.2 percentage points for FYs 2018 and 2019." Therefore, for FY 2018 and subsequent years, the statute provides some greater flexibility in the choice of the data sources to be used for the estimate of the change in the percent of uninsured individuals.

The third factor is a percent that, for each subsection (d) hospital, "represents the quotient of . . . the amount of uncompensated care for such hospital for a period selected by the Secretary (as

estimated by the Secretary, based on appropriate data . . .),” including the use of alternative data “where the Secretary determines that alternative data is available which is a better proxy for the costs of subsection (d) hospitals for . . . treating the uninsured,” and “the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under this subsection.” Therefore, this third factor represents a hospital’s uncompensated care amount for a given time period relative to the uncompensated care amount for that same time period for all hospitals that receive Medicare DSH payments in that fiscal year, expressed as a percent. For each hospital, the product of these three factors represents its additional payment for uncompensated care for the applicable fiscal year. We refer to the additional payment determined by these factors as the “uncompensated care payment.”

Section 1886(r) of the Act applies to FY 2014 and each subsequent fiscal year. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50620 through 50647) and the FY 2014 IPPS interim final rule with comment period (78 FR 61191 through 61197), we set forth our policies for implementing the required changes to the DSH payment methodology made by section 3133 of the Affordable Care Act for FY 2014. In those rules, we noted that, because section 1886(r) of the Act modifies the payment required under section 1886(d)(5)(F) of the Act, it affects only the DSH payment under the operating IPPS. It does not revise or replace the capital IPPS DSH payment provided under the regulations at 42 CFR Part 412, Subpart M, which were established through the exercise of the Secretary’s discretion in implementing the capital IPPS under section 1886(g)(1)(A) of the Act.

Finally, section 1886(r)(3) of the Act provides that there shall be “no administrative or judicial review under section 1869, section 1878, or otherwise” of “any estimate of the Secretary for purposes of determining the factors described in paragraph (2),” or of “any period selected by the Secretary” for the purpose of determining those factors. Therefore, there is no administrative or judicial review of the estimates developed for purposes of applying the three factors used to determine uncompensated care payments, or the periods selected in order to develop such estimates.

b. Eligibility for Empirically Justified Medicare DSH Payments and Uncompensated Care Payments

As indicated earlier, the payment methodology under section 3133 of the Affordable Care Act applies to “subsection (d) hospitals” that would otherwise receive a “disproportionate share hospital payment . . . made under subsection (d)(5)(F).” Therefore, eligibility for empirically justified Medicare DSH payments is unchanged under section 3133 of the Affordable Care Act. Consistent with the law, hospitals must receive empirically justified Medicare DSH payments in a fiscal year to receive an additional Medicare uncompensated care payment for that year. Specifically, section 1886(r)(2) of the Act states that “[i]n addition to the payment made to a subsection (d) hospital under paragraph (1) . . . the Secretary shall pay to *such subsection (d) hospital* an additional amount . . .” (emphasis supplied). Because paragraph (1) refers to empirically justified Medicare DSH payments, the additional payment under section 1886(r)(2) of the Act therefore, is limited to hospitals that receive empirically justified Medicare DSH payments in accordance with section 1886(r)(1) of the Act for the applicable fiscal year.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50622) and the FY 2014 IPPS interim final rule with comment period (78 FR 61193), we provided that hospitals that are not eligible to receive empirically justified Medicare DSH payments in a fiscal year will not receive uncompensated care payments for that year. We also specified that we would make a determination concerning eligibility for interim uncompensated care payments based on each hospital’s estimated DSH status for the applicable fiscal year (using the most recent data that are available). We indicated that our final determination on the hospital’s eligibility for uncompensated care payments would be based on the hospital’s actual DSH status on the cost report for that payment year.

In the FY 2014 IPPS/LTCH PPS final rule, we also considered whether several specific classes of hospitals are included within the scope of section 1886(r) of the Act. As we specified in that final rule (78 FR 50623), subsection (d) Puerto Rico hospitals that are eligible for DSH payments also are eligible to receive empirically justified Medicare DSH payments and uncompensated care payments under the new payment methodology.

Comment: Several commenters representing the hospital community of

Puerto Rico stated that the DSH payment methodology has historically disadvantaged hospitals in Puerto Rico because U.S. citizens residing in Puerto Rico are not entitled to SSI benefits. Because the formula prior to the enactment section 3133 of the Affordable Care Act relied so heavily on SSI and because SSI is statutorily excluded for citizens residing on Puerto Rico, these commenters asserted that DSH payments to Puerto Rico hospitals were disproportionately depressed in comparison to payments to hospitals in the 50 States. The commenters acknowledged that the new DSH payment formula implemented in FY 2014 represents an improvement because it significantly reduces the value of SSI enrollment in calculating DSH payments. However, the commenters also contended that the continued reliance under the new formula upon SSI enrollment means that payments remain unintentionally and unfairly lowered for hospitals in Puerto Rico. In particular, the commenters noted that one of the three factors in determining the uncompensated care payment is intended to account for a hospital’s specific portion of uncompensated care as a percent of uncompensated care by all hospitals. They stated that although CMS has adopted a policy of measuring uncompensated care as the sum of insured low-income Medicaid patient days and SSI days, the use SSI days in determining uncompensated care is not required by statute. Rather, they noted that the statute (section 1886(r)(2)(C) of the Act) states only that the Secretary determine uncompensated care “as estimated by the Secretary, based on appropriate data.” Therefore, the commenters pointed out that CMS has the discretion to consider other data in place of SSI days to determine uncompensated care. The commenters maintained that the Secretary is obligated to identify a substitute data source for Puerto Rico because section 1886(d)(9)(D) requires the Secretary to ensure that Medicare DSH payments made to Puerto Rico hospitals are made “in the same manner and to the extent as they apply” to PPS hospitals in the United States. The commenters believed that the revised DSH formula fails to make payments to Puerto Rico hospitals “in the same manner” because it factors in and is based upon an indicator that is not even available in Puerto Rico. Therefore, the commenters believed that DSH payments are applied in a disproportionately reduced manner to Puerto Rico hospitals based upon the inclusion of SSI data. The commenters

believed that this outcome is illogical because the main purpose of the DSH payment is to compensate hospitals for the higher costs of treating low-income Medicare patients.

Response: As we discussed in the proposed rule, we believe that SSI data combined with Medicaid data are the best data currently available for estimating hospitals' uncompensated care burdens. Accordingly, we proposed to use both SSI and Medicaid data in our estimates of uncompensated care for all hospitals. We employ the same payment methodology for hospitals in Puerto Rico and the 50 States, and therefore, consistent with section 1886(d)(9)(D) of the Act, Medicare DSH payments are made to subsection (d) Puerto Rico hospitals "in the same manner and to the extent as they apply" elsewhere. Accordingly, we do not agree with the commenters that the statute requires us to develop an alternative methodology for making uncompensated care payments to hospitals in Puerto Rico. Nevertheless, we will consider the issues posed by the commenters for future rulemaking. We would also point out that hospitals in Puerto Rico experienced a significant increase in Medicare DSH payments under the new uncompensated care provision. For example, the impact statement in the FY 2014 IPPS/LTCH PPS final rule (78 FR 51009) showed that Puerto Rico hospitals were expected to experience a 41.3 percent increase in payments from the implementation of the new Medicare DSH payment methodology under section 3133 of the Affordable Care Act.

In addition, in the FY 2014 IPPS/LTCH PPS final rule, we considered whether Maryland hospitals that were paid under section 1814(b)(3) of the Act would be eligible to receive uncompensated care payments. We explained that, under section 1814(b) of the Act, hospitals in the State of Maryland were subject to a waiver from the Medicare payment methodologies under which they would otherwise be paid. Because Maryland waiver hospitals were not paid under the IPPS (section 1886(d) of the Act), in the FY 2014 IPPS/LTCH PPS final rule, we determined that Maryland hospitals that operated under a waiver under section 1814(b)(3) of the Act were not eligible to receive empirically justified Medicare DSH payments and uncompensated care payments under the payment methodology of section 1886(r) of the Act (78 FR 50623). As stated in section IV.H. of the preamble of this final rule, effective January 1, 2014, the State of Maryland elected to no longer have Medicare pay Maryland hospitals in

accordance with section 1814(b)(3) of the Act and entered into an agreement with CMS that Maryland hospitals will be paid under the Maryland All-Payer Model. However, under the Maryland All-Payer Model, Maryland hospitals still are not paid under the IPPS. Therefore, they remain ineligible to receive empirically justified Medicare DSH payments or the uncompensated care payments under section 1886(r) of the Act.

SCHs are paid based on their hospital-specific rate from certain specified base years or the IPPS Federal rate, whichever yields the greater aggregate payment for the hospital's cost reporting period. If an SCH is paid under its hospital-specific rate, it is not eligible for Medicare DSH payments. In order to implement the provisions of section 1886(r) of the Act, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50624), we specified that we will continue to determine interim payments for SCHs based on what we estimate and project their DSH status to be prior to the beginning of the Federal fiscal year (based on the best available data at that time), subject to settlement through the cost report. We also specified that SCHs that receive interim empirically justified Medicare DSH payments in a fiscal year would receive interim uncompensated care payments for that fiscal year on a per discharge basis, subject as well to settlement through the cost report. Final eligibility determinations will be made at the end of the cost reporting period at settlement, and both interim empirically justified Medicare DSH payments and uncompensated care payments will be adjusted accordingly. Therefore, we follow the same processes of interim and final payments for SCHs that we follow for eligible IPPS DSH hospitals generally.

Comment: One commenter stated that the uncompensated care payment amount should be excluded from the payment under the Federal rate when being compared to payments under the hospital-specific rate in order to determine which payment rate an SCH receives. The commenter stated that the hospital-specific rate does not include the cost of care for indigent patients and, therefore, the uncompensated care payment amount should not be part of the comparison of the Federal payment and the hospital-specific payment. The commenter also stated that the uncompensated care payment should be given to a qualifying SCH, regardless of whether the SCH is paid under the hospital-specific rate or the Federal rate.

Response: We addressed a similar comment in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50624) where we

stated that we did not agree that an SCH that is paid under the hospital-specific rate should also receive an uncompensated care payment. We found that section 1886(r)(2) of the Act specifies that the uncompensated care payment amount is made in addition to the empirically justified Medicare DSH payment under section 1886(r)(1) of the Act. Therefore, in order to receive an uncompensated care payment, a hospital must receive an empirically justified Medicare DSH payment and if an SCH is paid under the hospital-specific rate, it does not receive an empirically justified Medicare DSH payment. Furthermore, for the reasons that we discussed in the FY 2014 IPPS/LTCH PPS final rule, we believe it is appropriate to include the uncompensated care payment amount in the payment under the Federal rate for purposes of making the comparison to the hospital-specific payment rate.

MDHs are paid based on the IPPS Federal rate or, if higher, the IPPS Federal rate plus 75 percent of the amount by which the Federal rate is exceeded by the updated hospital-specific rate from certain specified base years (76 FR 51684). The IPPS Federal rate used in the MDH payment methodology is the same IPPS Federal rate that is used in the SCH payment methodology. Uncompensated care payments to MDHs were not explicitly addressed in the FY 2014 IPPS/LTCH PPS final rule because, at the time of the publication of the final rule, the MDH program was set to expire at the end of FY 2013. Since the publication of the FY 2014 IPPS/LTCH PPS final rule, the MDH program was extended from October 1, 2013, to March 31, 2014, under the Pathway for SGR Reform Act (Pub. L. 113-67) and was further extended an additional year from April 1, 2014, to March 31, 2015, by the Protecting Access to Medicare Act of 2014 (Pub. L. 113-93). Because MDHs are paid under the IPPS Federal rate and, therefore, are eligible to receive Medicare DSH payments if their disproportionate patient percentage is at least 15 percent, we apply the same process to determine eligibility for Medicare DSH and the uncompensated care payment as we do for all other IPPS hospitals. That is, we make a determination concerning eligibility for interim uncompensated care payments based on each hospital's estimated DSH status for the applicable fiscal year (using the most recent data that are available) and our final determination on the hospital's eligibility for uncompensated care payments would be based on the hospital's actual DSH

status on the cost report for that payment year. In addition, as we do for all IPPS hospitals, we would calculate a numerator for Factor 3 for all MDHs, regardless of whether they are projected to be eligible for DSH during the fiscal year, but the denominator for Factor 3 would be based on the uncompensated care data from the hospitals that we have projected to be eligible for DSH during the fiscal year.

Furthermore, in the FY 2014 IPPS interim final rule with comment period (79 FR 15027), which addressed MDH payments for the first 6 months of FY 2014, we established a policy of including a pro rata share of the uncompensated care payment amount for that period as part of the Federal rate payment in the comparison of payments under the hospital-specific rate and the Federal rate. Consistent with that policy, for MDH payments for the first 6 months of FY 2015, a pro rata share of the uncompensated care payment amount for that period will be included as part of the Federal rate payment in the comparison of payments under the hospital-specific rate and the Federal rate. That is, in making this comparison at cost report settlement, we will include the pro rata share of the uncompensated care payment amount that reflects the period of time the hospital was paid under the MDH program for its discharges occurring on or after October 1, 2014, and before April 1, 2015. Consistent with the policy for hospitals with Medicare cost reporting periods that span more than 1 Federal fiscal year, this pro rata share will be determined based on the proportion of the applicable Federal fiscal year that is included in that cost reporting period (78 FR 61192 through 61194). As noted previously, section 106 of Public Law 113–93 provides for an extension of the MDH program through March 31, 2015, only. Therefore, beginning April 1, 2015, all hospitals that previously qualified for MDH status will no longer have MDH status under current law.

IPPS hospitals that have elected to participate in the Bundled Payments for Care Improvement initiative receive a payment that links multiple services furnished to a patient during an episode of care. We have stated in previous rulemaking that those hospitals continue to be paid under the IPPS (77 FR 53342). Hospitals that elect to participate in the initiative can still receive DSH payments while participating in the initiative, if they otherwise meet the requirements for receiving such payments. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50625), we specified that we will apply

the new DSH payment methodology to the hospitals participating in this initiative, so that eligible hospitals will receive empirically justified Medicare DSH payments and uncompensated care payments.

Section 410A of the Medicare Modernization Act established the Rural Community Hospital Demonstration Program. After the initial 5-year period, the demonstration was extended for an additional 5-year period by sections 3123 and 10313 of the Affordable Care Act. There are 23 hospitals currently participating in the demonstration. Under the payment methodology provided in section 410A, participating hospitals receive payment for Medicare inpatient services on the basis of a cost methodology. Specifically, for discharges occurring in the hospitals' first cost reporting period of the initial 5-year demonstration or the first cost reporting period of the 5-year extension, the hospitals participating in the demonstration receive payments for the reasonable cost of providing such services. For discharges occurring in subsequent cost reporting periods during the applicable 5-year period, hospitals receive the lesser of the current year's reasonable cost-based amount, or the previous year's amount updated by the percentage increase in the IPPS market basket (the target amount). The instructions (Change Request 5020 (April 14, 2006) and Change Request 7505 (July 22, 2011)) for the demonstration require that the MAC not pay Medicare DSH payments in addition to the amount received under the reasonable cost-based payment methodology. Because hospitals participating in the demonstration do not receive DSH payments, we determined in the FY 2014 IPPS/LTCH PPS final rule that these hospitals also are excluded from receiving empirically justified Medicare DSH payments and uncompensated care payments under the new payment methodology (78 FR 50625).

c. Empirically Justified Medicare DSH Payments

As we have discussed earlier, section 1886(r)(1) of the Act requires the Secretary to pay 25 percent of the amount of the DSH payment that would otherwise be made under subsection (d)(5)(F) to a subsection (d) hospital. Because section 1886(r)(1) of the Act merely requires the program to pay a designated percentage of these payments, without revising the criteria governing eligibility for DSH payments or the underlying payment methodology, we stated in the FY 2014 IPPS/LTCH PPS final rule that we did

not believe that it is necessary to develop any new operational mechanisms for making such payments. Therefore, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50626), we implemented this provision simply by revising the claims payment methodologies to adjust the interim claim payments to the requisite 25 percent of what would have otherwise been paid. We also made corresponding changes to the hospital cost report so that these empirically justified Medicare DSH payments can be settled at the appropriate level at the time of cost report settlement. We provided more detailed operational instructions and cost report instructions following issuance of the final rule that can be found on the CMS Web site at: <http://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2014-Transmittals-Items/R5P240.html>.

d. Uncompensated Care Payments

As we have discussed earlier, section 1886(r)(2) of the Act provides that, for each eligible hospital in FY 2014 and subsequent years, the new uncompensated care payment is the product of three factors. These three factors represent our estimate of 75 percent of the amount of Medicare DSH payments that would otherwise have been paid, an adjustment to this amount for the percent change in the national rate of uninsurance compared to the rate of uninsurance in 2013, and each eligible hospital's estimated uncompensated care amount relative to the estimated uncompensated care amount for all eligible hospitals. Below we review the data sources and methodologies for computing each of these factors, our final policies for FY 2014, and our proposed and final policies for FY 2015.

(1) Calculation of Factor 1 for FY 2015

Section 1886(r)(2)(A) of the Act establishes Factor 1 in the calculation of the uncompensated care payment. Section 1886(r)(2)(A) of the Act states that it is a factor "equal to the difference between (i) the aggregate amount of payments that would be made to subsection (d) hospitals under subsection (d)(5)(F) if this subsection did not apply for such fiscal year (as estimated by the Secretary); and (ii) the aggregate amount of payments that are made to subsection (d) hospitals under paragraph (1) for such fiscal year (as so estimated)." Therefore, section 1886(r)(2)(A)(i) of the Act represents the estimated Medicare DSH payment that would have been made under section 1886(d)(5)(F) if section 1886(r) of the Act did not apply for such fiscal year.

Under a prospective payment system, we would not know the precise aggregate Medicare DSH payment amount that would be paid for a Federal fiscal year until cost report settlement for all IPPS hospitals is completed, which occurs several years after the end of the Federal fiscal year. Therefore, section 1886(r)(2)(A)(i) of the Act provides authority to estimate this amount, by specifying that, for each fiscal year to which the provision applies, such amount is to be “estimated by the Secretary.” Similarly, section 1886(r)(2)(A)(ii) of the Act represents the estimated empirically justified Medicare DSH payments to be made in a fiscal year, as prescribed under section 1886(r)(1) of the Act. Again, section 1886(r)(2)(A)(ii) of the Act provides authority to estimate this amount.

Therefore, Factor 1 is the difference between our estimates of: (1) The amount that would have been paid in Medicare DSH payments for the fiscal year, in the absence of the new payment provision; and (2) the amount of empirically justified Medicare DSH payments that are made for the fiscal year, which takes into account the requirement to pay 25 percent of what would have otherwise been paid under section 1886(d)(5)(F) of the Act. In other words, this factor represents our estimate of 75 percent (100 percent minus 25 percent) of our estimate of Medicare DSH payments that would otherwise be made, in the absence of section 1886(r) of the Act, for the fiscal year.

In order to determine Factor 1 in the uncompensated care payment formula, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50628 through 50630) and in the FY 2014 IPPS interim final rule with comment period (78 FR 61194), we adopted a policy under which we develop final estimates of both the aggregate amount of Medicare DSH payments that would be made in the absence of section 1886(r)(1) of the Act and the aggregate amount of empirically justified Medicare DSH payments to hospitals under section 1886(r)(1) of the Act prior to each fiscal year to which the new provision applies. These estimates are not revised or updated after we know the final Medicare DSH payments for the fiscal year. Specifically, in order to determine the two elements of Factor 1 (Medicare DSH payments *prior* to the application of section 1886(r)(1) of the Act, and empirically justified Medicare DSH payments *after* application of section 1886(r)(1) of the Act), we use the most recently available projections of Medicare DSH payments for the fiscal year, as calculated by CMS’ Office of the

Actuary. The Office of the Actuary projects Medicare DSH payments on a biannual basis, typically in February of each year (based on data from December of the previous year) as part of the President’s Budget, and in July (based on data from June) as part of the Midsession Review. The estimates are based on the most recently filed Medicare hospital cost report with Medicare DSH payment information, cost report data provided by Indian Health Service (IHS) hospitals to CMS, and the most recent Medicare DSH patient percentages and Medicare DSH payment adjustments provided in the IPPS Impact File.

Therefore, for the Office of the Actuary’s February 2014 estimate, the data were based on the December 2013 update of the Medicare Hospital Cost Report Information System (HCRIS), cost report data provided by IHS hospitals to CMS as of December 2013 and the FY 2014 IPPS/LTCH PPS final rule IPPS Impact file, published in conjunction with the publication of the FY 2014 IPPS/LTCH PPS final rule. For the July 2014 estimate, the data are based on the March 2014 update of the HCRIS data, cost report data provided by IHS hospitals to CMS as of March 2014, and the FY 2015 IPPS Proposed Rule Impact File, published in conjunction with the FY 2015 IPPS/LTCH PPS proposed rule (and which is available via the Internet on the CMS Web site). For purposes of the proposed rule, we used the February 2014 Medicare DSH estimates to calculate Factor 1 and to model the proposed impact of this provision. For this final rule, we use the July 2014 Medicare DSH estimates to determine Factor 1 and to model the impact of this provision. In addition, because SCHs paid under their hospital-specific payment rate are excluded from the application of section 1886(r) of the Act, we also exclude SCHs that are projected to be paid under their hospital-specific rate from our Medicare DSH estimates. Similarly, because Maryland hospitals participating in the Maryland All-Payer Model and hospitals participating in the Rural Community Hospital Demonstration do not receive DSH payments, we also exclude these hospitals from our Medicare DSH estimates.

Using the data sources discussed above, the Office of the Actuary uses the most recently submitted Medicare cost report data to identify current Medicare DSH payments, cost report data provided by IHS hospitals to CMS, and the most recent DSH payment adjustments provided in the IPPS Impact File, and applies inflation

updates and assumptions for future changes in utilization and case-mix to estimate Medicare DSH payments for the upcoming fiscal year. The February 2014 Office of the Actuary estimate for Medicare DSH payments for FY 2015, without regard to the application of section 1886(r)(1) of the Act, was \$14.205 billion. This estimate excludes Maryland hospitals participating in the Maryland All-Payer Model, SCHs paid under their hospital-specific payment rate, and hospitals participating in the Rural Community Hospital Demonstration as discussed above. Therefore, based on this estimate, the estimate for empirically justified Medicare DSH payments for FY 2015, with the application of section 1886(r)(1) of the Act, was \$14.205 billion (25 percent of the total amount estimated). Under § 412.106(g)(1)(i) of the regulations, Factor 1 is the difference between these two estimates of the Office of the Actuary. Therefore, for the purpose of modeling Factor 1, we proposed that Factor 1 for FY 2015 would be \$10.654 billion (\$14.205 billion minus \$3.551 billion). We invited public comment on our proposed calculation of Factor 1 for FY 2015.

Comment: A number of commenters supported CMS’ methodology for determining Factor 1 and/or the proposed Factor 1 for FY 2015. However, other commenters complained that CMS did not provide enough information in the proposed rule regarding the methodologies, calculations, and data sources used to develop this and other estimates to provide a sufficient basis for comment. With regard to the estimate of Factor 1 in particular, these commenters contend:

- The estimated DSH payments do not account for the impact of *Allina v. Sebelius*, by excluding Medicare Advantage days from the SSI ratio and including dual-eligible Medicare Advantage days in the Medicaid fraction, thus understating Factor 1 DSH estimate.

- The 2012 estimated DSH payments of \$11.720 billion figure is understated because the 2012 “update” factor (provided for in the FY 2015 IPPS Proposed Rule DSH Supplemental Data File that displays the Office of the Actuary’s assumptions in determining the Medicare DSH estimate) is understated. Specifically, a 1.1 percent increase in light of the *Cape Cod* litigation result was not applied. As a result, instead of a –0.1 percent update factor, the projection should use a +1.0 percent update factor. Therefore the

2012 estimated DSH amount should be \$11.732 billion.

- The estimate of DSH payments for FY 2015 of \$14.205 billion is understated because the 2015 update factor is understated. Specifically, the productivity adjustment should be 0.4 percent (as projected in the FY 2015 IPPS/LTCH PPS proposed rule), not 0.5 percent. As a result, instead of a 1.2 percent update factor, the projection should use a 1.3 percent update factor. Therefore, including the 2012 correction and the cumulative impact, the 2015 estimated DSH amount should be \$14.234 billion.

- The summary analysis of the DSH estimate includes an adjustment factor for discharges. However, CMS has not provided the detail supporting the discharge factor used. In addition, the footnote to the discharge column states that all inpatient hospitals were used, not just IPPS hospitals. Because the purpose of the projection is to estimate the amount of DSH that will go to a subset of all inpatient hospitals, it would seem appropriate that factors that drive the estimate likewise would include only the hospitals projected to share in the payments.

- The DSH estimate is subject to 100 percent of any documentation and coding adjustments due to MS-DRGs. The FY 2015 IPPS/LTCH PPS proposed rule refers to a recoupment adjustment of “\$11 billion over a 4-year period of FYs 2014, 2015, 2016, and 2017.” CMS should model the impact of such adjustments to the DSH and uncompensated care payments before subjecting the DSH estimate to dramatic adjustments.

- The “Other” column from the Factor 1 source file is supposed to contain the DSH payment impact factor: The “Other” column includes impact of only IPPS discharges and impact of DSH payments increasing or decreasing at a different rate than other IPPS payments. This single input should at least reflect the changes in DSH payments, which will be significantly impacted by the effects of Medicaid/CHIP expansion. According to the February 2014 CBO report, an additional 12 million people are projected to enroll in Medicaid/CHIP during 2014 and 2015. That represents a 35-percent increase in Medicaid/CHIP population. Yet, the latest FY 2014 and 2015 “Other” factor

only applied a 3.28 percent and a 2.92 percent increase, respectively. Even the pre-Affordable Care Act FY 2012 and 2013 “Other” factor reflected 4.45 percent and 1.56 percent increases, and that was prior to widespread Medicaid expansion.

In the light of these and other concerns about data sources and methods, the commenters insisted that CMS adopt a process of reconciling the initial estimates of Factor 1 with actual data for the payment year in conjunction with the final settlement of hospital cost reports.

Response: Below we present the Office of the Actuary’s updated estimate of Factor 1. In order to satisfy the commenters’ request for additional information, we also provide additional information regarding the data sources, assumptions, and methods employed by the actuaries. We acknowledge that commenters have requested that we establish a reconciliation procedure for Factor 1. However, we continue to believe that applying our best estimates prospectively would be most conducive to administrative efficiency, finality, and predictability in payments (78 FR 50628). As we noted in the FY 2014 IPPS/LTCH PPS final rule, we do not know the aggregate Medicare DSH payment amount that would be paid for each Federal fiscal year until the time of cost report settlements, which occur several years after the end of the fiscal year. Furthermore, because the statute provides that Factor 1 shall be determined based on estimates of the aggregate amount of DSH payments that would be made in the absence of section 1886(r) of the Act and the aggregate amount of empirically justified DSH payments that are made under section 1886(r)(1) of the Act, we do not agree with commenters that we should establish such a reconciliation process at this time. However, we note the following about the Office of the Actuary’s estimates. Factor 1 is an estimate of the expected DSH payments under the previous DSH payment methodology under section 1886(d)(5)(F) of the Act. We believe it is reasonable that an estimate should represent a 50-percent chance of being too high and a 50-percent chance being too low in comparison to actual experience. In reviewing, the Office of the Actuary’s prior estimates for DSH

payments compared to actual experience, from FY 2005 to FY 2015, the original estimates have been higher than actual experience for 7 of the 11 years, and lower than actual experience in only 4 years. This result is reasonably consistent with the expectation that an estimate has a 50-percent chance of being too high and a 50-percent chance of being too low.

As indicated above, using the data sources discussed above, the Office of the Actuary uses the most recently submitted Medicare cost report data to identify current Medicare DSH payments, cost report data provided by IHS hospitals to CMS, and the most recent DSH payment adjustments provided in the IPPS Impact File, and applies inflation updates and assumptions for future changes in utilization and case-mix to estimate Medicare DSH payments for the upcoming fiscal year. The July 2014 Medicare DSH estimate for FY 2015, without regard to the application of section 1886(r)(1) of the Act, is \$13,383,462,195.71. This estimate excludes Maryland hospitals participating in the Maryland All-Payer Model, SCHs paid under their hospital-specific payment rate, and hospitals participating in the Rural Community Hospital Demonstration as discussed above. Therefore, based on this estimate, the estimate for empirically justified Medicare DSH payments for FY 2015, with the application of section 1886(r)(1) of the Act, is \$3,345,865,548.93 (25 percent of the total amount estimated). Under § 412.106(g)(1)(i) of the regulations, Factor 1 is the difference between these two estimates of the Office of the Actuary. Therefore, in this final rule, we are providing that Factor 1 for FY 2015 is \$10,037,596,646.78 (\$13,383,462,195.71 minus \$3,345,865,548.93). Below we provide additional detail regarding the development of this estimate in response to the commenters.

The Office of the Actuary’s estimates begins with a baseline of \$11.499 billion in Medicare DSH expenditures for FY 2011. The following table shows the factors applied to update this baseline through the current estimate for FY 2015:

INCREASES FROM 2011

FY	Update	Discharge	Case-mix	Other	Total	DSH
2012	0.999	0.9701	1.007	1.0447	1.019537	11724
2013	1.028	0.9799	1.014	1.0132	1.034923	12133
2014	1.009	0.9855	1.005	1.0355	1.034818	12556

INCREASES FROM 2011—Continued

FY	Update	Discharge	Case-mix	Other	Total	DSH
2015	1.014	1.0116	1.005	1.034	1.065942	13383

In this table, the discharge column shows the increase in the number of Medicare inpatient hospital discharges. The figures for FYs 2012 and 2013 are based on Medicare claims data which have been adjusted by a completion factor. The discharge figure for FY 2014 is based on preliminary data for 2014. The discharge figure for FY 2015 is an assumption based on recent trends recovering back to the long-term trend and assumptions related to how many beneficiaries will be enrolled in Medicare Advantage (MA) plans. The case-mix column shows the increase in case-mix for IPPS hospitals. The case-

mix figures for FYs 2012 and 2013 are based on actual data adjusted by a completion factor. The FY 2014 and FY 2015 increases are based on the recommendation of the 2010–2011 Medicare Technical Review Panel. The “other” column shows the increase in other factors which contribute to the Medicare DSH estimates. These factors include the difference between the total inpatient hospital discharges and the IPPS discharges, various adjustments to the payment rates which have been included over the years but are not reflected in the other columns (such as the increase in rates for the *Cape Cod*

litigation and the reduction in rates for the 2-midnight policy). In addition, this column includes a factor for the Medicaid expansion due to the Affordable Care Act. However, the increase due to the Medicaid expansion is not as large as commenters contended due to the actuarial assumption that the new enrollees are healthier than the average Medicaid recipient and, therefore, use fewer hospital services. We have included the impact of the Medicaid expansion in the FY 2015 DSH estimate and note that it was also included in the FY 2014 DSH estimate. Our estimates are as follows:

	FY 2014	FY 2015
Medicaid enrollment pre-ACA (in millions)	56.0	55.9
Medicaid enrollment post-ACA (in millions)	64.7	69.8
Under 65 pre-ACA enrollment (in millions)	50.6	50.4
Under 65 post-ACA enrollment (in millions)	59.3	64.3
Increase in Medicare DSH	4.9%	3.4%

As can be seen in the table above, there is assumed to be a 4.9 percent increase in Medicare DSH due to the Medicaid expansion in FY 2014, and an additional 3.4 percent increase in Medicare DSH in FY 2015. This results in approximately an 8.5 percent

increase due to the Medicaid expansion by FY 2015. This estimate is lower than the commenters may have expected due to the assumption that the expansion population is healthier than the rest of the Medicaid population and will utilize fewer hospital services. This

factor in the estimate is included in the “other” column of the breakdown.

The next table below shows the factors that are included in the “update” column of the above table:

FY	Market basket	Affordable Care Act payment reductions	Productivity	Documentation and coding	Total
2012	3	0.1	1	-2	-0.1
2013	2.6	0.1	0.7	1	2.8
2014	2.5	0.3	0.5	-0.8	0.9
2015	2.9	0.2	0.5	-0.8	1.4

In this table, all numbers are based on mid-session review of FY 2015 Budget projections.

With regard to the assumed update factor for FY 2012, the commenters are correct that the update to the Federal standardized amount due to the *Cape Cod* litigation should be reflected in our DSH estimate. However, we have included it in the DSH estimate and the 1.1 percent increase is reflected in the “other” column. We consider it not to be part of the update and that is consistent with our treatment of the 0.2 percent reduction to the rate in FY 2014 for the 2-midnight policy finalized in the FY 2014 IPPS/LTCH PPS final rule,

which is also included in the “other” column.

We agree with the commenters that the update for FY 2015 should include the productivity adjustment finalized for FY 2015 in our FY 2015 Medicare DSH estimates. Accordingly, we have revised our FY 2015 Medicare DSH estimates to reflect this final productivity adjustment. We also agree with the commenters that the DSH estimates are only affected by IPPS discharges. However, the discharge figures reflect all inpatient hospitals, and we adjust the Medicare DSH estimates to take into account the difference between the increase in

discharges for all inpatient hospitals and the IPPS hospital discharge increase in the “other” column. If the “discharge” column was limited to IPPS hospitals, the “discharge” column would be lower and the “other” column would be higher, and the increase reflected in the “total” column would be the same.

The commenters also are correct that the documentation and coding numbers for future years could be more than a 0.8 percent reduction to comply with the \$11 billion requirement, but those figures have not yet been determined. The reason for the higher possibility is

that the number of discharges has decreased significantly.

Lastly, we do not believe that the decision in *Allina v. Sebelius* is relevant to our estimate of Factor 1 for FY 2015. The decision in *Allina* did not address the FY 2014 IPPS/LTCH PPS final rule (78 FR 50614 through 50620) in which we readopted the policy of counting Medicare Advantage days in the SSI ratio for FY 2014 and all subsequent fiscal years. Accordingly, consistent with that policy, our estimate of Factor 1 for FY 2015 appropriately accounts for Medicare Advantage days by including them in the SSI ratio.

(2) Calculation of Factor 2 for FY 2015

Section 1886(r)(2)(B) of the Act establishes Factor 2 in the calculation of the uncompensated care payment. Specifically, section 1886(r)(2)(B)(i) of the Act provides: “For each of fiscal years 2014, 2015, 2016, and 2017, a factor equal to 1 minus the percent change in the percent of individuals under the age of 65 who are uninsured, as determined by comparing the percent of such individuals (I) who are uninsured in 2013, the last year before coverage expansion under the Patient Protection and Affordable Care Act (as calculated by the Secretary based on the most recent estimates available from the Director of the Congressional Budget Office before a vote in either House on the Health Care and Education Reconciliation Act of 2010 that, if determined in the affirmative, would clear such Act for enrollment); and (II) who are uninsured in the most recent period for which data is available (as so calculated), minus 0.1 percentage points for fiscal year 2014 and minus 0.2 percentage points for each of fiscal years 2015, 2016, and 2017.”

Section 1886(r)(2)(B)(i)(I) of the Act further indicates that the percent of individuals under 65 without insurance in 2013 must be the percent of such individuals “who are uninsured in 2013, the last year before coverage expansion under the Patient Protection and Affordable Care Act (as calculated by the Secretary based on the most recent estimates available from the Director of the Congressional Budget Office before a vote in either House on the Health Care and Education Reconciliation Act of 2010 that, if determined in the affirmative, would clear such Act for enrollment).” The Health Care and Education Reconciliation Act (Pub. L. 111–152) was enacted on March 30, 2010. It was passed in the House of Representatives on March 21, 2010, and by the Senate on March 25, 2010. Because the House of Representatives was the first House to

vote on the Health Care and Education Reconciliation Act of 2010 on March 21, 2010, we have determined that the most recent estimate available from the Director of the Congressional Budget Office “before a vote in either House on the Health Care and Education Reconciliation Act of 2010 . . .” (emphasis added) appeared in a March 20, 2010 letter from the director of the CBO to the Speaker of the House. Therefore, we believe that only the estimates in this March 20, 2010 letter meet the statutory requirement under section 1886(r)(2)(B)(i)(I) of the Act. (To view the March 20, 2010 letter, we refer readers to the Web site at: <http://www.cbo.gov/sites/default/files/cbofiles/ftpdocs/113xx/doc11379/amendreconprop.pdf>.)

In its March 20, 2010 letter to the Speaker of the House of Representatives, the CBO provided two estimates of the “post-policy uninsured population.” The first estimate is of the “Insured Share of the Nonelderly Population Including All Residents” (82 percent) and the second estimate is of the “Insured Share of the Nonelderly Population Excluding Unauthorized Immigrants” (83 percent). In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50631), we used the first estimate that includes all residents, including unauthorized immigrants. We stated that we believe this estimate is most consistent with the statute which requires us to measure “the percent of individuals under the age of 65 who are uninsured,” and provides no exclusions except for individuals over the age of 65. In addition, we stated that we believe that this estimate more fully reflects the levels of uninsurance in the United States that influence uncompensated care for hospitals than the estimate that reflects only legal residents. The March 20, 2010 CBO letter reports these figures as the estimated percentage of individuals with insurance. However, because section 1886(r)(2)(B)(i) of the Act requires that we compare the percent of individuals who are uninsured in the applicable year with the percent of individuals who were uninsured in 2013, in the FY 2014 IPPS/LTCH PPS final rule, we used the CBO insurance rate figure and subtracted that amount from 100 percent (that is the total population without regard to insurance status) to estimate the 2013 baseline percent of individuals without insurance. Therefore, for FYs 2014 through 2017, our estimate of the uninsurance percentage for 2013 is 18 percent.

Section 1886(r)(2)(B)(i) of the Act requires that we compare the baseline

uninsurance rate to the percent of such individuals “who are uninsured in the most recent period for which data is available (as so calculated).” In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50634), we used the same data source, CBO estimates, to calculate this percent of individuals without insurance. In response to public comments, we also agreed that we should normalize the CBO estimates, which are based on the calendar year, for the Federal fiscal years for which each calculation of Factor 2 is made (78 FR 50633). Therefore, in the FY 2014 IPPS/LTCH PPS final rule, we employed the most recently available estimate, specifically CBO’s May 2013 estimates of the effects of the Affordable Care Act on health insurance coverage (which are available at: http://www.cbo.gov/sites/default/files/cbofiles/attachments/44190_EffectsAffordableCareActHealthInsuranceCoverage_2.pdf) as amended by CBO’s July 2013 estimates of changes in estimates of the effects of insurance coverage provisions in the Affordable Care Act issued in conjunction with a memo regarding “Analysis of the Administration’s Announced Delay of Certain Requirements Under the Affordable Care Act,” which are available at: <http://www.cbo.gov/sites/default/files/cbofiles/attachments/44465-ACA.pdf>. The CBO’s May 2013 estimate of the rate of insurance for CY 2013 was 80 percent, and for CY 2014 was 84 percent. Therefore, the calculation of Factor 2 for FY 2014, employing a weighted average of the CBO projections for CY 2013 and CY 2014, was as follows:

- CY 2013 rate of insurance coverage (May 2013 CBO estimate): 80 percent.
 - CY 2014 rate of insurance coverage (May 2013 CBO estimate, updated with July 2013 CBO estimate): 84 percent.
 - FY 2014 rate of insurance coverage: (80 percent * .25) + (84 percent * .75) = 83 percent.
 - Percent of individuals without insurance for 2013 (March 2010 CBO estimate): 18 percent.
 - Percent of individuals without insurance for FY 2014 (weighted average): 17 percent.
- $$1 - [(0.17 - 0.18)/0.18] = 1 - 0.056 = 0.944 \text{ (94.4 percent).}$$
- $$0.944 \text{ (94.4 percent)} - 0.001 \text{ (0.1 percentage points)} = 0.943 \text{ (94.3 percent).}$$
- $$0.943 = \text{Factor 2}$$

Therefore, in the FY 2014 IPPS/LTCH PPS final rule, we adopted the 0.943 as the final determination of Factor 2 for FY 2014. In conjunction with this determination, we also determined in the FY 2014 IPPS/LTCH PPS final rule

and later revised in the FY 2014 IPPS interim final rule with comment period (78 FR 61195) that the amount available for uncompensated care payments for FY 2014 would be approximately \$9.046 billion (0.943 times our Factor 1 estimate of \$9.593 billion).

For the FY 2015 proposed rule, we used CBO's February 2014 estimates of the effects of the Affordable Care Act on health insurance coverage (which are available at http://www.cbo.gov/publication/43900?utm_source=feedblitz&utm_medium=FeedBlitzEmail&utm_content=812526&utm_campaign=0). The CBO's February 2014 estimate of individuals under the age of 65 with insurance in CY 2014 was 84 percent. Therefore, the CBO's most recent estimate of the rate of uninsurance in CY 2014 at the time of the FY 2015 IPPS/LTCH PPS proposed rule was 16 percent (that is, 100 percent minus 84 percent.) Similarly, the CBO's February 2014 estimate of individuals under the age of 65 with insurance in CY 2015 was 86 percent. Therefore, the CBO's most recent estimate of the rate of uninsurance in CY 2015 available at the time of the FY 2015 IPPS/LTCH PPS proposed rule was 14 percent (that is, 100 percent minus 86 percent.)

The calculation of the proposed Factor 2 for FY 2015, employing a weighted average of the CBO projections for CY 2014 and CY 2015, was as follows:

- CY 2014 rate of insurance coverage (February 2014 CBO estimate): 84 percent.
 - CY 2015 rate of insurance coverage (February 2014 CBO estimate): 86 percent.
 - FY 2015 rate of insurance coverage: (84 percent * .25) + (86 percent * .75) = 85.5 percent.
 - Percent of individuals without insurance for 2013 (March 2010 CBO estimate): 18 percent.
 - Percent of individuals without insurance for FY 2015 (weighted average): 14.5 percent.
- $$1 - [(0.145 - 0.18)/0.18] = 1 - 0.19444 = 0.80556 \text{ (80.556 percent)}$$
- $$0.80556 \text{ (80.556 percent)} - 0.002 \text{ (0.2 percentage points for FY 2015 under section 1886(r)(2)(B)(i) of the Act)} = 0.8036 \text{ (80.36 percent)}$$
- $$0.8036 = \text{Factor 2}$$

Therefore, we proposed that Factor 2 for FY 2015 would be 0.8036. We indicated that our proposal for Factor 2 was subject to change if more recent CBO estimates of the insurance rate became available at the time of the preparation of the final rule. We invited public comments on our proposed calculation of Factor 2 for FY 2015.

Comment: A number of commenters supported the use of the CBO estimates for determining Factor 2. However, other commenters objected to CMS' proposed calculation of Factor 2. Some commenters found that the calculation of Factor 2 appeared arbitrary. For example, some of the commenters complained that a 2-percent decrease in the percentage of uninsured does not seem reasonable based on current economic conditions. Other commenters asserted that, in their views, the Affordable Care Act was not implemented until January 1, 2014, so that such a large decrease in uninsured is very speculative and without historical data. Commenters requested additional information on how the CBO calculates its insurance estimates, including the assumptions in its estimates. Commenters also requested reconciliation of the Factor 2 estimates with actual data at the time of cost report settlements. While these commenters understood that estimates must be used for interim payments, they believed that more accurate numbers based on actual experience should be available for purposes of determining final payments at the time of cost report settlement.

Response: We note that, in the FY 2014 IPPS/LTCH PPS final rule, we finalized a policy to employ the most recent CBO estimates of the rates of uninsurance in the calculation of Factor 2 for FY 2014 and subsequent years, and did not adopt any policy for reconciling those estimates. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50632), we stated that we believe that employing actual data as the basis for reconciling the projections employed to determine Factor 2 would impose an unacceptable delay in the final determination of uncompensated care payments. Actual data on the rates of insurance and uninsurance would not become available until several years after the payment year, and the initial data for the year would continue to be adjusted for several years after that as further data become available.

In its April 2014 report,²² the CBO and the Joint Committee on Taxation (JCT) estimated that the Affordable Care Act would result in insurance coverage for 12 million more nonelderly individuals in FY 2014 than in the absence of the Affordable Care Act. The coverage projections included the changes arising from participation in the

health insurance exchanges, Medicaid and CHIP enrollment, and changes in employer-sponsored, nongroup and other insurance coverage. Included in the uninsured population are undocumented immigrants who are not eligible for Medicaid and exchange coverage and low-income residents of States not participating in the Medicaid expansion. In addition, other individuals will choose to remain uninsured, despite being eligible for Medicaid or having access through an employer, the exchange, or from an insurer.

The CBO and JCT estimate of the increase in insurance coverage represents the number of people who are expected to be insured this year under current law minus the number who would have been insured this year in the absence of the Affordable Care Act. More people are expected to obtain insurance through the exchanges over time due to subsidies and penalties for noncoverage. CBO and JCT expected more people to obtain insurance through Medicaid and CHIP because of increased eligibility due to the Medicaid expansion and more enrollments among those who were previously eligible for Medicaid or CHIP but would not have enrolled in the absence of the Affordable Care Act. Overall, the net coverage effect is a large decrease in the uninsured population.

Because not all States have expanded their Medicaid programs, the CBO and JCT revised their estimates for changes in the insured population due to Medicaid expansion. The table below presents the updated estimates of the change in insurance coverage under Medicaid and CHIP under the Affordable Care Act. The CBO and JCT revised their estimates to indicate a decrease in the number of insured individuals in CYs 2014 and 2015. In addition, CBO and JCT did not rely on State predictions about the Medicaid expansion under the Affordable Care Act.²³ Instead, they projected the approximate shares of the affected population residing in States that will fall into different broad categories. The broad categories range from States that did not expand their Medicaid program to States that choose Medicaid expansion. Due to the uncertainty of States' actions, estimates by the CBO and JCT reflected an assessment of the different outcome probabilities and the middle of the distribution of all possible

outcomes. For instance, the CBO's and JCT's estimates considered multiple factors that are associated with a State's choice on whether to expand Medicaid eligibility: Overall budgetary situation;

current thresholds for Medicaid eligibility; the amounts that States and local governments spend to provide health care to the uninsured or to pay providers for uncompensated care; the

number of people likely to enroll in the program after expansion; the Federal contributions toward the cost of their care, and other factors.

ESTIMATES OF THE INCREASE IN INSURANCE COVERAGE DUE TO MEDICAID AND CHIP UNDER THE AFFORDABLE CARE ACT *

* Millions of nonelderly people, by calendar year.

In their April 2014 report, CBO and JCT estimated that an average of 6 million people will be covered by insurance obtained through the exchanges by the end of CY 2014. The estimate was determined at the national level instead of at the level of individual States. Although CBO and JCT did not account for the variations of success in obtaining health insurance through the exchanges by State, they did account for the possibility of individuals moving in and out of insurance coverage over time due to changes in employment, family circumstances, and other factors.

The CBO and JCT estimates therefore do take into account some uncertainties and risks under the Affordable Care Act, including the probabilities of different outcomes of Medicaid expansions and changes in insurance coverage status over time.

For the FY 2015 final rule, we use the CBO's April 2014 estimates of the effects of the Affordable Care Act on health insurance coverage (which are available at <http://www.cbo.gov/sites/default/files/cbofiles/attachments/43900-2014-04-ACAables2.pdf>). The CBO's April 2014 estimate of individuals under the age of 65 with insurance in CY 2014 is 84 percent. Therefore, the CBO's most recent estimate of the rate of uninsurance in CY 2014 is 16 percent (that is, 100 percent minus 84 percent.) Similarly, the CBO's April 2014 estimate of individuals under the age of 65 with insurance in CY 2015 is 87 percent. Therefore, the CBO's most recent estimate of the rate of uninsurance in CY 2015 available for this final rule is 13 percent (that is, 100 percent minus 87 percent.)

The calculation of the final Factor 2 for FY 2015, employing a weighted average of the CBO projections for CY 2014 and CY 2015, is as follows:

- CY 2014 rate of insurance coverage (April 2014 CBO estimate): 84 percent.
 - CY 2015 rate of insurance coverage (April 2014 CBO estimate): 87 percent.
 - FY 2015 rate of insurance coverage: $(84 \text{ percent} * .25) + (87 \text{ percent} * .75) = 86.25 \text{ percent.}$
 - Percent of individuals without insurance for 2013 (March 2010 CBO estimate): 18 percent.
 - Percent of individuals without insurance for FY 2015 (weighted average): 13.75 percent.
- $$1 - [(0.1375 - 0.18)/0.18] = 1 - 0.2361 = .7639 \text{ (76.39 percent)}$$
- $$0.7639 \text{ (76.39 percent)} - .002 \text{ (0.2 percentage points for FY 2015 under section 1886(r)(2)(B)(i) of the Act)} = 0.7619 \text{ or } 76.19 \text{ percent}$$
- $$0.7619 = \text{Factor 2}$$

Therefore, the final Factor 2 for FY 2015 is 76.19 percent.

The FY 2015 Final Uncompensated Care Amount is: $\$10,037,596,646.78 \times 0.7619 = \$7,647,644,885.18$.

FY 2015 Final Uncompensated Care Total Available— $\$7,647,644,885.18$.

(3) Calculation of Factor 3 for FY 2015

Section 1886(r)(2)(C) of the Act defines Factor 3 in the calculation of the uncompensated care payment. As we have discussed earlier, section 1886(r)(2)(C) of the Act states that Factor 3 is “equal to the percent, for each subsection (d) hospital, that represents the quotient of (i) the amount of uncompensated care for such hospital for a period selected by the Secretary (as estimated by the Secretary, based on appropriate data (including, in the case where the Secretary determines alternative data is available which is a better proxy for the costs of subsection (d) hospitals for treating the uninsured, the use of such alternative data)); and (ii) the aggregate amount of uncompensated care for all subsection

(d) hospitals that receive a payment under this subsection for such period (as so estimated, based on such data).”

Therefore, Factor 3 is a hospital-specific value that expresses the proportion of the estimated uncompensated care amount for each subsection (d) hospital and each subsection (d) Puerto Rico hospital with the potential to receive DSH payments relative to the estimated uncompensated care amount for all hospitals estimated to receive DSH payments in the fiscal year for which the uncompensated care payment is to be made. Factor 3 is applied to the product of Factor 1 and Factor 2 to determine the amount of the uncompensated care payment that each eligible hospital will receive for FY 2014 and subsequent fiscal years. In order to implement the statutory requirements for this factor of the uncompensated care payment formula, it was necessary to determine: (1) The definition of uncompensated care or, in other words, the specific items that are to be included in the numerator (that is, the estimated uncompensated care amount for an individual hospital) and denominator (that is, the estimated uncompensated care amount for all hospitals estimated to receive DSH payments in the applicable fiscal year); (2) the data source(s) for the estimated uncompensated care amount; and (3) the timing and manner of computing the quotient for each hospital estimated to receive DSH payments. The statute instructs the Secretary to estimate the amounts of uncompensated care for a period “based on appropriate data.” In addition, we note that the statute permits the Secretary to use alternative data “in the case where the Secretary determines that alternative data is available,” which is a better proxy for the costs of subsection (d) hospitals for treating uninsured individuals.

In the course of considering how to determine Factor 3 during the rulemaking process for FY 2014, we considered defining the amount uncompensated care for a hospital as the uncompensated care costs of each hospital and considered potential data sources for those costs. For purposes of selecting an appropriate data source for this possible definition of uncompensated care costs, we reviewed the literature and available data sources and determined that Worksheet S–10 of the Medicare cost report could potentially provide the most complete data for Medicare hospitals. (We refer readers to the report “Improvements to Medicare Disproportionate Share (DSH) Payments” for a full discussion and evaluation of the available data sources. The report is available on the CMS Web site at: <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html>.) However, we noted that Worksheet S–10 is a relatively new data source that has been used for specific payment purposes only in relatively restricted ways (for example, to provide a source of charity care charges in the computation of EHR incentive payments (75 FR 44456)). We also noted that some stakeholders have expressed concern that hospitals have not had enough time to learn how to submit accurate and consistent data through this reporting mechanism. Other stakeholders have maintained that some instructions for Worksheet S–10 still require clarification in order to ensure standardized and consistent reporting by hospitals. At the same time, we noted that Worksheet S–10 is the only national data source that includes data for all Medicare hospitals and is designed to elicit data on uncompensated care costs. We discussed the possible use of data reported on Worksheet S–10 to determine uncompensated care costs in more detail in the FY 2014 IPPS/LTCH PPS proposed rule (78 FR 27586).

Because of concerns regarding variations in the data reported on Worksheet S–10 of the Medicare cost report and the completeness of these data, we did not propose to use data from the Worksheet S–10 to determine the amount of uncompensated care. However, we stated our belief that Worksheet S–10 of the Medicare cost report would otherwise be an appropriate data source to determine uncompensated care costs. In particular, we noted that Worksheet S–10 was developed specifically to collect information on uncompensated care costs in response to interest by MedPAC and other stakeholders regarding the

topic (for example, MedPAC’s March 2007 Report to Congress) and that it is not unreasonable to expect information on the cost report to be used for payment purposes. Furthermore, hospitals attest to the accuracy and completeness of the information reported in the cost report at the time of submission. We indicated that we expect reporting on Worksheet S–10 to improve over time, particularly in the area of charity care which is already being used and audited for payment determinations related to the EHR Incentive Program, and that we will continue to monitor these data. Accordingly, we stated that we may proceed with a proposal to use data on the Worksheet S–10 to determine uncompensated care costs in the future, once hospitals are submitting accurate and consistent data through this reporting mechanism.

As a result of our concerns regarding the data reported on Worksheet S–10 of the Medicare cost report, we believed it was appropriate to consider the use of alternative data, at least in FY 2014, the first year that this provision is in effect, and possibly for additional years until hospitals have adequate experience reporting all of the data elements on Worksheet S–10. We noted that this approach is consistent with input we received from some stakeholders in response to the CMS National Provider Call in January 2013, who stated their belief that existing FY 2010 and FY 2011 data from the Worksheet S–10 should not be used for implementation of section 1886(r) of the Act and who requested the opportunity to resubmit the data once more specific instructions were issued by CMS. Accordingly, we examined alternative data sources that could be used to allow time for hospitals to gain experience with and to improve the accuracy of their reporting on Worksheet S–10 of the Medicare cost report. We stated in the FY 2014 IPPS/LTCH PPS final rule that we believe that data on utilization for insured low-income patients can be a reasonable proxy for the treatment costs of uninsured patients. Moreover, due to the concerns regarding the accuracy and consistency of the data reported on the Worksheet S–10, we also determined that these alternative data, which are currently reported on the Medicare cost report, would be a better proxy for the amount of uncompensated care provided by hospitals. Accordingly, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50639), we adopted the policy of employing the utilization of insured low-income patients defined as inpatient days of Medicaid patients plus

inpatient days of Medicare SSI patients as defined in 42 CFR 412.106(b)(4) and 412.106(b)(2)(i), respectively, to determine Factor 3. We also indicated that we remained convinced that the Worksheet S–10 could ultimately serve as an appropriate source of more direct data regarding uncompensated care costs for purposes of determining Factor 3 once hospitals are submitting more accurate and consistent data through this reporting mechanism. In the interim, we indicated that we would take steps such as revising and clarifying cost report instructions, as appropriate. We stated that it is our intention to propose introducing the use of the Worksheet S–10 data for purposes of determining Factor 3 within a reasonable amount of time.

Since the publication of the FY 2014 IPPS/LTCH PPS final rule, we have continued to evaluate and assess the comments we have received from stakeholders about Worksheet S–10 as well as to evaluate what changes might need to be made to the instructions to make the data hospitals submit more accurate and consistent across hospitals. Although we have not yet developed revisions to the Worksheet S–10 instructions at this time, we remain committed to making improvements to Worksheet S–10. For that reason, we believe it would be premature to propose the use of Worksheet S–10 data for purposes of determining Factor 3 for FY 2015. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28101), we proposed to continue to employ the utilization of insured low-income patients defined as inpatient days of Medicaid patients plus inpatient days of Medicare SSI patients, as defined in § 412.106(b)(4) and § 412.106(b)(2)(i), respectively, to determine Factor 3 for FY 2015. Accordingly, we proposed to revise the regulations at 42 CFR 412.106(g)(1)(iii)(C) to state that, for FY 2015, CMS will base its estimates of the amount of hospital uncompensated care on the most recent available data on utilization for Medicaid and Medicare SSI patients, as determined by CMS in accordance with paragraphs (b)(2)(i) and (b)(4) of that section of the regulations. We invited public comments on this proposal and indicated that we will continue to work with the hospital community and others to develop the appropriate clarifications and revisions to Worksheet S–10 of the Medicare cost report for reporting uncompensated care data. In particular, we invited public comments on what would be a reasonable timeline for adopting Worksheet S–10 of the Medicare cost

report as the data source for determining Factor 3.

As we did for the FY 2014 IPPS/LTCH PPS proposed rule, for the FY 2015 IPPS/LTCH PPS proposed rule, we published on the CMS Web site a table listing Factor 3 for all hospitals that we estimate would receive empirically justified Medicare DSH payments in a fiscal year (that is, hospitals that we project would receive interim uncompensated care payments during the fiscal year), and for the remaining subsection (d) and subsection (d) Puerto Rico hospitals that have the potential of receiving a DSH payment in the event that they receive an empirically justified Medicare DSH payment for the fiscal year as determined at cost report settlement. Hospitals had 60 days from the date of public display of the FY 2015 IPPS/LTCH PPS proposed rule to review these tables and notify CMS in writing of a change in a hospital's subsection (d) hospital status, such as if a hospital has closed or converted to a CAH.

Comment: Most commenters agreed that the Worksheet S-10 data are not yet sufficiently consistent and reliable to be employed for purposes of determining each hospital's share of uncompensated care payments. The commenters therefore supported the proposal to continue employing SSI days and Medicaid days for this purpose in FY 2015. Some of these commenters did express support for eventually employing the Worksheet S-10 data for this purpose, once cost reporting instructions have been appropriately revised and the hospital community has been adequately instructed to render those data sufficiently consistent and reliable. Some commenters also requested a more specific timetable for adopting the Worksheet S-10 data. However, MedPAC and a few other commenters supported the use of the Worksheet S-10 data for FY 2015. MedPAC expressed disagreement with CMS' statement that the data on utilization for insured low-income patients can serve as a reasonable proxy for the treatment costs of uninsured patients. MedPAC specifically cited its 2007 analysis of data from the GAO and data from the American Hospital Association (AHA), which suggests that Medicaid days and low-income Medicare days are not a good proxy for uncompensated care costs. Given its prior findings that the Medicaid and SSI shares were poor predictors of uncompensated care costs, MedPAC argued that there is a need to transition to new measures. MedPAC therefore supported Worksheet S-10 in the Medicare cost report as an appropriate

measure of uncompensated care that could begin to replace the reliance on Medicaid and SSI shares. Specifically, it recommended employing charity care for the uninsured, which is reported on the Worksheet S-10 (line 23, column 1) as a reasonable proxy for the costs of treating the uninsured. In response to concerns about whether the quality of the data reported on Worksheet S-10 is adequate for use in distributing uncompensated care payments, MedPAC argued that it is already better than using Medicaid and SSI days as a proxy for uncompensated care costs, and that the data on Worksheet S-10 will improve over time as they are actually used in making payments. MedPAC also expressed its view that the Worksheet S-10 data currently available should only establish an interim allocation of uncompensated care payments; the final allocation of payments to each hospital should be determined based on the Worksheet S-10 data available at year-end settlement. To prevent financial shocks to hospitals, some commenters suggested that CMS could transition to use of the Worksheet S-10 data over 3 years.

Response: As we stated in the FY 2014 IPPS/LTCH PPS final rule, we believe that data on utilization for insured low-income patients can be a reasonable proxy for the treatment costs of uninsured patients. Moreover, due to the concerns that continue to be expressed by a large majority of commenters regarding the accuracy and consistency of the data reported on the Worksheet S-10, we continue to believe that these alternative data on utilization for insured low-income patients, which are currently reported on the Medicare cost report, remain a better proxy for the amount of uncompensated care provided by hospitals. Accordingly, in this final rule, we are finalizing for FY 2015 the policy that we originally adopted in the FY 2014 IPPS/LTCH PPS final rule, of employing the utilization of insured low-income patients defined as inpatient days of Medicaid patients plus inpatient days of Medicare SSI patients as defined in 42 CFR 412.106(b)(4) and 412.106(b)(2)(i), respectively, to determine Factor 3. However, we also remain convinced that Worksheet S-10 could ultimately serve as an appropriate source of more direct data regarding uncompensated care costs for purposes of determining Factor 3 once hospitals are submitting more accurate and consistent data through this reporting mechanism. In the interim, we will continue to take steps to revise and clarify cost report instructions, as appropriate. We also are

undertaking benchmarking analyses to compare available Worksheet S-10 data to other data sources on uncompensated care, such as on uncompensated care costs reported to the IRS on Form 990 by not-for-profit hospitals. Because the data submitted through Form 990 are audited and come from an external source, they represent a suitable standard of comparison. It remains our intention to propose introducing the use of the Worksheet S-10 data for purposes of determining Factor 3 within a reasonable amount of time.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50639), we considered public comments which recommended that we use the wage index to adjust insured low-income days in determining Factor 3 in order to account for the differences in "purchasing power" in different regions of the country. With respect to these public comments, we agreed that there may be regional variation in uncompensated care costs due to regional variations in the costs of care generally. However, we stated that we did not believe that there was sufficient basis for believing that the wage index reflects the variations in uncompensated care costs well enough to adopt it as the basis for adjusting Factor 3. The wage index reflects the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level. In computing the wage index, we derive an average hourly wage for each labor market area (total wage costs divided by total hours for all hospitals in the geographic area) and a national average hourly wage (total wage costs divided by total hours for all hospitals surveyed in the nation). A labor market area's wage index value is the ratio of the area's average hourly wage to the national average hourly wage. We note that, for FY 2014, 69.6 percent of the standardized amount is considered to be the labor-related share and, therefore, adjusted by the wage index. However, in addition to the labor-related share of the standardized amount being adjusted by the wage index, the entire standardized amount is also adjusted for the relative weight of the MS-DRG for each individual patient. In other words, the wage index only adjusts for a portion of the variation in costs, and does not address variations in resource use and patient severity. Therefore, we stated that we did not believe that there was sufficient basis for believing that adjusting low-income patient days by the wage index would better reflect variations in uncompensated care costs.

Since the publication of the FY 2014 IPPS/LTCH PPS final rule, we have

continued to consider whether to propose employing the wage index to adjust insured low-income days in determining Factor 3. After this consideration, we continue to believe that a wage index adjustment to insured low-income days is not an appropriate measure to account for variations in the costs of uncompensated care among hospitals. The intensity of such care, and therefore the costs, may vary by hospital, but we still lack convincing evidence that the wage index data are an accurate measure of that intensity. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule, we did not propose to adopt such an adjustment to low-income days for purposes of calculating Factor 3 in FY 2015.

Comment: Several commenters agreed that applying the wage index to Factor 3 is not an appropriate measure of variations in uncompensated care costs. One commenter stated that CMS should apply a wage and case-mix adjustment to the Medicaid and SSI days using the hospital area wage index and hospital-specific case mix index. The commenter believed that this information is readily available, well-understood, and is appropriate for measuring cost variation among hospitals.

Response: We appreciate the comments and continue to believe it is not appropriate to adopt a wage index adjustment to low-income days to calculate Factor 3 for FY 2015. Although wage index information is readily available, for the reasons discussed in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50639), we continue to believe that it is not an accurate measure of the intensity of uncompensated care costs and would not serve as an appropriate basis for making adjustments to Factor 3.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50639), we also considered public comments that requested that we include insured low-income days from exempt units (specifically, inpatient rehabilitation units paid under the IRF PPS and inpatient psychiatric units paid under the IPF PPS) of the hospital in the computation of Factor 3, in order to better capture the treatment costs of the uninsured by the hospital. In response to those public comments, we stated our belief that there may be some merit to including insured low-income days from exempt units of the hospital in order to better capture the full costs of the treatment of the uninsured by the hospital insofar as those data may be publicly available, subject to audit, and used for payment purposes. We also indicated that we believed it would be prudent to consider the degree to which these data meet these conditions before

adopting this recommendation. Therefore, we stated that we would consider including this recommendation among our proposals in future rulemaking.

Since the publication of the FY 2014 IPPS/LTCH PPS final rule, we have conducted an analysis of the impact of adopting this recommendation. That analysis has indicated that the inclusion of Medicaid and Medicare-SSI days for exempt inpatient units does not significantly change the distribution of uncompensated care payments to hospitals, with the exception of a few hospitals with high utilization associated with those exempt units that would see increases in their uncompensated care payments. Furthermore, Medicaid and SSI days for inpatient rehabilitation units have been audited and are used for payment purposes under the IRF PPS; specifically, these data are used to calculate the low-income payment (LIP) adjustment under the IRF PPS. However, the data for inpatient psychiatric units are not generally audited and have not been used previously for payment purposes. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule, we did not propose to include those days in the calculation of a hospital's share of uncompensated care payments for FY 2015. As we indicated earlier, we believe it would be appropriate to include such data in the calculation of uncompensated care payments only insofar as those data may be publicly available, subject to audit, and used for payment purposes. The use of data for inpatient psychiatric units would fail the second and third conditions. At the same time, we do not believe that including only inpatient rehabilitation unit days without inpatient psychiatric unit days would improve the accuracy of the uncompensated care payment calculation. We also observe, as we have previously noted, that the statutory references under section 1886(d)(5)(F) of the Act to "days" apply only to hospital acute care inpatient days. Section 412.106(a)(1)(ii) of the regulations therefore provides that, for purposes of DSH payments, "the number of patient days in the hospital includes only those days attributable to units or wards of the hospital providing acute care services generally payable under the prospective payment system and excludes" other days. In the absence of compelling reasons to do otherwise, we believe it is preferable to maintain consistency with this longstanding precedent in the context of this temporary method for determining uncompensated care

payments. However, we invited public comments on this issue.

Comment: Several commenters supported the proposal to not include Medicaid and SSI days from excluded units in the calculation. One commenter believed it would be inconsistent to distribute uncompensated care payments based on non-IPPS days and unfair to providers that do not have exempt units. Some commenters supported including Medicaid and SSI days from excluded units in our calculation of Factor 3. One commenter stated that the inclusion of days for psychiatric and rehabilitation units that are exempt from IPPS would improve the accuracy of these data, as IPPS days and exempt unit days combined would function as a proxy for total hospital uncompensated care services.

Response: We thank the commenters for their feedback and continue to believe that we should finalize our proposal to calculate Factor 3 based on a DSH hospital's share of their Medicaid and SSI days associated with their acute care units. We believe that it would be inappropriate to include Medicaid and SSI days from psychiatric units, as those days are not audited for payment purposes, and we do not believe that including only inpatient rehabilitation unit days without inpatient psychiatric unit days would improve the accuracy of the uncompensated care payment calculation.

The statute also allows the Secretary the discretion to determine the time periods from which we will derive the data to estimate the numerator and the denominator of the Factor 3 quotient. Specifically, section 1886(r)(2)(C)(i) of the Act defines the numerator of the quotient as "the amount of uncompensated care for such hospital for a period selected by the Secretary. . . ." (emphasis added). Section 1886(r)(2)(C)(ii) of the Act defines the denominator as "the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under this subsection for such period" (emphasis added). In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50638), we adopted a process of making interim payments with final cost report settlement for both the empirically justified Medicare DSH payments and the uncompensated care payments required by section 3133 of the Affordable Care Act. Consistent with that process, we also determined the time period from which to calculate the numerator and denominator of the Factor 3 quotient in a way that would be consistent with making interim and final payments. Specifically, we must have Factor 3 values available for

hospitals that we estimate will qualify for Medicare DSH payments using the most recently available historical data and for those hospitals that we do not estimate will qualify for Medicare DSH payments but that may ultimately qualify for Medicare DSH payments at the time of cost report settlement.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50638), therefore, we adopted the policy to calculate the numerator and the denominator of Factor 3 for hospitals based on the most recently available full year of Medicare cost report data (including the most recently available data that may be used to update the SSI ratios) with respect to a Federal fiscal year. In other words, we use data from the most recently available full year cost report for the Medicaid days and the most recently available SSI ratios (that is, latest available SSI ratios before the beginning of the Federal fiscal year) for the Medicare SSI days. We noted that these data are publicly available, subject to audit, and used for payment purposes. While we recognized that older data also meet these criteria, we often use the most recently available data for payment determinations. The data used are located in the HCRIS database for most hospitals, but the data for IHS hospitals are not included in that database. Accordingly, in the FY 2014 IPPS interim final rule with comment period (78 FR 61195), we revised our policy to also include cost report data submitted to CMS by IHS hospitals in order allow their Medicaid days to be used to calculate Factor 3.

Therefore, for FY 2014, we used data from the most recently available full year cost report for the Medicaid days and the most recently available SSI ratios, which meant data from the 2010/2011 cost reports (that is, cost reports that have cost reporting periods that begin in either FY 2010 or FY 2011) for the Medicaid days taken from the March 2013 update of the HCRIS database, 2011 cost report data submitted to CMS by IHS hospitals by March 2013, and the FY 2011 SSI ratios for the Medicare SSI days to estimate Factor 3 for FY 2014. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28102), for FY 2015, we again proposed to use data from the most recently available full year cost report for the Medicaid days (that is, we proposed to use the 2012 cost report, unless that cost report is unavailable or reflects less than a full 12-month year; in the event the 2012 cost report is for less than 12 months, we proposed to use the cost report from 2012 or 2011 that is closest to being a full 12-month cost report), cost report data submitted to CMS by IHS hospitals

and the most recently available SSI ratios. For purposes of the proposed rule, we used data from the 2011/2012 Medicare cost reports (that is, from cost reports that have cost reporting periods that begin in either FY 2011 or FY 2012) taken from the December 2013 update of the HCRIS database for the Medicaid days and the FY 2011 SSI ratios for the Medicare SSI days. Consistent with our FY 2014 IPPS interim final rule with comment period (78 FR 61195), for FY 2015, we also used supplemental cost report data provided by IHS hospitals to CMS as of December 2013 in order to calculate the proposed Factor 3. We indicated that, for the FY 2015 IPPS/LTCH PPS final rule, we intended to use the March 2014 update of the HCRIS database for the 2011/2012 Medicare cost reports, cost report data submitted to CMS by IHS hospitals as of March 2014, and the most recently available SSI ratios (FY 2012 SSI ratios and, if not available, the FY 2011 SSI ratios) to calculate Factor 3. We stated that we believed the March update to the Medicare cost reports would be the most recently available data to calculate Factor 3 at the time of publication of the FY 2015 IPPS final rule. We also indicated that this proposal is consistent with CMS' historical policy to use the best available data when setting the payment rates and factors in both the proposed and final rules. Furthermore, we noted that this approach is consistent with our approach in other areas of IPPS, where we historically use the March update of cost report data and MedPAR claims data to calculate IPPS relative weights, budget neutrality factors, the outlier threshold, and the standardized amount for the IPPS final rule. If we were to wait for a later update of the cost report data to become available, this would cause delay of the publication of the IPPS final rule.

Comment: Several commenters questioned the data used to calculate the hospitals' Factor 3. Several commenters stated that their Medicaid days were understated. Furthermore, commenters stated that they submitted their updated cost report to be included in the March 2014 update of the Medicare cost report data but the contractor had not yet uploaded the information in the HCRIS database. In addition, some commenters indicated that they had updated Medicaid days and had submitted their cost report to their contractors after the March 2014 update of the Medicare hospital cost report data and wanted their updated data included. Some commenters requested use of the June update of cost report data to obtain Medicaid days to

calculate Factor 3. Some commenters sought clarification of why some hospitals have their Medicaid days based on Worksheet S-2 and some hospitals have their Medicaid days based on Worksheet S-3. Some commenters stated that their Medicaid days were based on a 6-month cost report and they should be based on a 12-month cost report either by combining cost reports or annualizing the data. Some commenters questioned their DSH eligibility, stating that their hospitals had been listed as not being eligible for DSH for FY 2015, when they had previously received DSH on their cost report. Other commenters submitted corrections because their hospitals had been identified as SCHs, but were actually operating as MDHs. Finally, several commenters requested additional time after the publication of the final rule to review the data used to calculate Factor 3 and submit corrections.

Response: We are finalizing our proposal to use the most recently available full year cost report for the Medicaid days (that is, our proposal to use the 2012 cost report, unless that cost report is unavailable or reflects less than a full 12-month year; in the event the 2012 cost report is for less than 12 months, we will use the cost report from 2012 or 2011 that is closest to being a full 12-month cost report) and the most recently available SSI ratios. For this FY 2015 final rule, we are using the March 2014 update of the hospital cost report data in the HCRIS database and cost report data submitted to CMS by IHS hospitals as of March 2014 to obtain the Medicaid days to calculate Factor 3. In addition, we are using the FY 2012 SSI ratios published on the CMS Web site to calculate Factor 3 (<http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html>).

We note that we are unable to use a later update of the cost report data, like the June update, and still calculate the final Factor 3 in time for publication of the IPPS final rule. Any delay in the publication of the final rule would prevent changes and updates to payments under the IPPS from taking effect on October 1, the first day of the fiscal year. We are not able to accept supplemental data for hospitals, as we are not able to validate the information included in that supplemental data. We note that hospitals have ample time after the close of their fiscal year to submit the data that are used in this calculation. Specifically, Chapter I, section 104 of the Provider Reimbursement Manual, Part 2, generally allows a hospital 5 months after the close of its cost reporting

period to file its cost report. In addition, CMS allows hospitals to request amendments of their cost report submissions before CMS issues a Notice of Program Reimbursement. In response to the commenters that indicated they had submitted their updated cost reports, but that the MAC had not yet uploaded the information, we note that MACs follow guidelines to upload revised cost report information. In accordance with Medicare Financial Management Manual, Chapter 8, Section 10.4—Submission of Cost Report Data to CMS, the MACs are required to submit an extract of the following Medicare cost reports to CMS in accordance with the HCRIS specifications within 210 days of the cost reporting period ending date or 60 days after receipt of the cost report, whichever is later.

With respect to the comments requesting clarification on whether Worksheet S–2 or Worksheet S–3 is used to obtain Medicaid days, we addressed this concern in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50642) and reiterate that we use the Medicaid days reported on Worksheet S–2 of the Medicare Hospital Cost Report version 2552–10 for hospitals projected to receive Medicare DSH because the Medicaid days reported on Worksheet S–2 are used in the computation of the Medicaid fraction for Medicare DSH payments. Therefore, because they are used for payment of Medicare DSH, we believe that these data are more reliable than data not used for payment purposes. Hospitals that were not eligible to receive Medicare DSH payments on that cost report were unable to report Medicaid days on Worksheet S–2, but could report their Medicaid days on Worksheet S–3. Therefore, for hospitals that we project to not be eligible for Medicare DSH payments, we are using the Medicaid days reported on Worksheet S–3 to calculate their Factor 3. A transmittal has been issued to allow for hospitals that are not receiving DSH to report their Medicaid days on Worksheet S–2, and we hope to rely only on the data reported on that Worksheet S–2 in the future, if we continue to use this data on low-income insured days in the future.

With regard to the comments from hospitals that found that their Factor 3 was calculated using a cost report that was less than 12 months, we are finalizing our proposal to use the 2012 cost report, unless that cost report is unavailable or reflects less than a full 12-month year. In the event the 2012 cost report is for less than 12 months, we would use the cost report from 2012 or 2011 that is closest to being a full 12-month cost report. In the case where a

less than 12-month cost report was used to calculate a hospital's Factor 3, this would indicate that both the 2012 and 2011 cost reports were less than 12 months. In such a case, we would use the longer of the two cost reports to calculate a hospital's Factor 3. We did not make a proposal to annualize or combine cost reports to calculate Factor 3. We note that section 1886(r)(2)(c) of the Act specifies that Factor 3 is equal to the percent that represents “the amount of uncompensated care for such hospital for a period selected by the Secretary (as estimated by the Secretary, based on appropriate data . . .)” divided by “the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under this subsection for such period (as so estimated . . .)” In implementing this provision, as we did through rulemaking in FY 2014, we believe it is appropriate to first select the period—in this case, the period for which we have the most recently available data—and then to select the data from a cost report that aligns best with that period. However, we acknowledge that the situations presented by commenters, where a hospital remains in operation in both Federal fiscal years for which we analyze cost report data but submits cost reports for both Federal fiscal years that reflect substantially less than a full year of data, pose unique challenges in the context of estimating Factor 3. As a result, this is an issue that we intend to consider further and may address in future rulemaking.

With regards to the comments from hospitals stating that their DSH eligibility is inaccurate, we note that we used the FY 2012 SSI ratios and the Medicaid fraction listed in the March 2014 update of the Provider Specific File in order to identify which hospitals are projected to receive DSH for FY 2015, and thus are eligible to receive uncompensated care payments and interim uncompensated care payments for FY 2015. We did not use historical cost report data to make this determination. We believe that the FY 2012 SSI ratios and the Medicaid fraction in the March 2014 update of Provider Specific File are the most recently available information regarding whether a hospital is currently being paid Medicare DSH on an interim basis, and therefore, we believe they are an appropriate data source to make our determination of which hospitals are projected to receive DSH for FY 2015, and thus are eligible to receive uncompensated care payments, as presented in Table 18. As we have stated previously, final determination of

DSH eligibility and uncompensated care payments are made at cost report settlement.

In making our DSH projections for FY 2015, we also identify which hospitals are SCHs that we estimate will be paid the hospital-specific rate and not the Federal rate and, therefore, will not receive a Medicare DSH payment and will be ineligible to receive the uncompensated care payment. In the FY 2015 IPPS/LTCH PPS proposed rule, we inadvertently identified several MDHs as SCHs in our projections and have updated our list of SCHs for the final rule accordingly.

Finally, we accept the recommendation of many commenters to provide the public with an additional 30 days subsequent to the publication of the final rule in order to review and submit comments limited to whether any hospitals should be added to the list of hospitals eligible to receive interim empirically justified DSH payments and uncompensated care payments or if any hospitals should be removed from the list based on changes in their subsection(d) status, as we did in the FY 2014 IPPS/LTCH PPS final rule. Commenters can submit their comments to our inbox at Section3133DSH@cms.hhs.gov. After receiving and reviewing comments, if we make any changes to the list, we will post on the Web site a revised table showing the final Factor 3 for each hospital prior to October 1, 2014. This timetable will give MACs sufficient time in order to enter the final data into the provider specific file and make timely payments for discharges occurring on or after October 1, 2014.

Comment: Several commenters asked whether the Medicaid days used to calculate Factor 3 can be reconciled based on audit by the Medicare contractor and whether any recouped uncompensated care payments would be redistributed to the providers receiving an uncompensated care payment at cost report settlement.

Response: As we discussed in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50645), at this time, we do not intend to reconcile Factor 3 because we believe the statute provides the authority to make uncompensated care payments on the basis of estimates of Factors 1, 2, and 3 and that it is preferable to do so in order to avoid unacceptable delays in the final determination of uncompensated care payments.

Comment: One commenter objected to the proposal to calculate Factor 3 based on a hospital's share of total Medicaid days and Medicare SSI days as a proxy for measuring a hospital's share of uncompensated care. The commenter believed that this proxy does not

appropriately target hospitals with the highest burden of uncompensated care costs and instead rewards hospitals in states where Medicaid has expanded.

Response: For the reasons discussed in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50639), we continue to believe that our methodology to calculate Factor 3 based on a hospital's share of Medicaid days and SSI days does not inappropriately reward States that expand Medicaid coverage. Furthermore, as discussed above and in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50634 through 50639), we believe that using the low-income insured days as a proxy for uncompensated care costs provides a reasonable basis to determine Factor 3 on a temporary basis as we work to improve Worksheet S-10 to accurately and consistently capture uncompensated care costs.

Comment: Several commenters requested that hospitals have the opportunity to request to have the SSI days recalculated on the basis of their cost reporting period, not Federal fiscal year, as part of their Factor 3 calculation.

Response: We do not believe that this would improve our estimates for Factor 3. For the DSH calculation, CMS generally issues SSI ratios based on a Federal fiscal year to be used to determine a hospital's Medicare DSH payments at cost report settlement. For the purpose of the Medicare DSH payment, a provider may request a realignment under § 412.106(b)(3) such that its SSI ratio is recalculated based on the hospital's specific cost-reporting period. The choice to request a realignment and the timing of this choice may vary. Therefore, a hospital's decision whether to have its SSI ratio calculated on the basis of its cost reporting period may not have been made at the time we determine Factor 3 for a specific Federal fiscal year. Furthermore, we do not believe that allowing hospitals the option of having their SSI days calculated on the basis of their cost reporting period would improve our estimates of Factor 3. Therefore, to preserve consistency and administrative efficiency, we continue to believe it is appropriate to use SSI ratios based on the Federal fiscal year.

Comment: Several commenters asked how the decision in *Allina v. Sebelius* would affect the calculation of Factor 3. Commenters stated that the SSI days should exclude MA days, and MA dual-eligible days should be included as Medicaid days in the calculation of Factor 3 for FY 2015 and that CMS should reconcile the FY 2014 Factor 3

estimates based on the decision in *Allina v. Sebelius*.

Response: Similar to what we stated earlier in this final rule, we do not believe the *Allina* decision has any bearing on our estimate of Factor 3 for either FY 2014 or FY 2015. The decision in *Allina* did not address our decision to readopt the policy of counting Medicare Advantage days in the SSI ratio for FY 2014 and subsequent fiscal years. Nor did the decision address the issue of how patient days should be counted for purposes of estimating uncompensated care. Moreover, section 1886(r)(2)(C) of the Act provides discretion for the Secretary to determine how to estimate uncompensated care costs, and for FY 2015, we are finalizing our proposal to continue to apply the methodology adopted in the FY 2014 IPPS/LTCH PPS final rule to define uncompensated care based on the proxy of utilization by low-income insured patients. Specifically, Factor 3 will be based on a hospital's share of total Medicaid days and SSI days. Consistent with the policy that we finalized in the FY 2014 IPPS/LTCH PPS final rule regarding the counting of SSI days, we believe that, for purposes of determining uncompensated care payments, SSI days should include both MA and FFS SSI days.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50642), we discussed several specific issues concerning the use of cost report data to determine Factor 3. One issue concerned the process and data to be employed in determining Factor 3 in the case of hospital mergers. Specifically, two hospitals that merged in 2011 with one surviving provider number requested that we account for the merger by including data from both hospitals' cost reports immediately prior to the merger in the calculation of the Factor 3 amount. In that final rule, we had calculated Factor 3 using only the surviving hospital's cost report data and SSI ratio data. In the final rule (78 FR 50602), we responded to the public comment that Factor 3 would be calculated based on the low-income insured patient days (that is, Medicaid days and SSI days) under the surviving CCN, based on the most recent available data for that CCN (for FY 2014, from the cost report for 2011 or 2010). We noted that this was consistent with the treatment of other IPPS payment factors, where data used to calculate a hospital's Medicare DSH payment adjustment, CCRs for outlier payments, and wage index values are tied to a hospital's CCN. Data associated with a CCN that is no longer in use are not used to determine those IPPS hospital payments under the surviving CCN.

Since the publication of the FY 2014 IPPS/LTCH PPS final rule, we have received additional input from hospitals that have undergone mergers that suggest using only the surviving CCN produces an estimate of the surviving hospital's uncompensated care burden that is lower than warranted. For FY 2015, for example, Factor 3 of the uncompensated care payment calculation would be determined using 2011/2012 cost reports. As a result, for any mergers occurring between FY 2011 and FY 2015, Factor 3 of the uncompensated care payment for FY 2015 would reflect only the data of the hospital with the surviving CCN, not the combination of the data from the two hospitals that merged. We believe that revising our methodology to incorporate data from both of the hospitals that merged could improve our estimate of the uncompensated care burden of the merged hospital. Accordingly, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28103 through 28104), we proposed to revise our methodology for determining Factor 3 to incorporate data from both merged hospitals until data for the merged hospitals become available under the surviving CCN.

In addition, because the data systems used to calculate Factor 3 do not identify hospitals that have merged, we also proposed to establish a process to identify hospitals that have merged after the period of the historical data that are being used to calculate Factor 3, up to a point in time during ratesetting for that Federal fiscal year. Under this approach, we would combine the data for the merged hospitals to calculate Factor 3 of the uncompensated care payment. Specifically, we proposed that we would identify the hospitals that merged after the period from which data are being used to calculate Factor 3 (for FY 2015, 2012 and 2011) but before the publication of each year's final rule. For purposes of the proposal, we defined a merger to be an acquisition where the Medicare provider agreement of one hospital is subsumed into the provider agreement of the surviving provider. We would not consider an acquisition where the new owner voluntarily terminates the Medicare provider agreement of the hospital it purchased by rejecting assignment of the previous owner's provider agreement to be a merger. We believe it is appropriate to combine data to calculate Factor 3 for a merged hospital where the Medicare provider agreement of one hospital is subsumed into the provider agreement of the surviving provider because, in this type of acquisition as described in the September 6, 2013 Survey &

Certification Memorandum S&C: 13-60-ALL (<http://www.cms.gov/Medicare/Provider-Enrollment-and-Certification/SurveyCertificationGenInfo/Downloads/Survey-and-Cert-Letter-13-60.pdf>), the buyer is subject to all applicable statutes and regulations and to the terms and conditions under which the assigned agreement was originally issued. These include, but are not limited to, Medicare requirements to adjust payments to account for prior overpayments and underpayments, even if they relate to a pre-acquisition period (successor liability), and to adjust payments to collect civil monetary penalties. Therefore, we believe it is appropriate to also retain the data of the subsumed hospital to calculate the uncompensated care payment for the merged hospital. Conversely, by rejecting assignment of the Medicare provider agreement of the subsumed hospital, the surviving provider has voluntarily terminated the Medicare provider agreement and is precluded from having successor liability for Medicare overpayments or underpayments that would have otherwise been made to the subsumed provider. Furthermore, when the surviving hospital rejects automatic assignment of the existing provider agreement, but wishes to participate in the Medicare program, the merged hospital is considered an initial applicant to the Medicare program. In an instance in which the surviving provider has rejected assignment of the Medicare provider agreement of the subsumed provider, it would not seem appropriate to use data from the subsumed provider for purposes of Medicare payment, including for the calculation of a hospital's uncompensated care payment.

For FY 2015, we proposed to identify mergers by querying the Medicare contractors. We believe it is appropriate to obtain merger information from the Medicare contractors, as a copy of each final sales agreement/transaction indicating the effective date of the acquisition is generally submitted to the Medicare contractors once an acquisition is finalized. For the purpose of the proposed rule, we requested that the Medicare contractors provide us with a list of mergers that occurred between October 1, 2010 (the first day of FY 2011, which is the earliest date that would be included in any 2011 cost report data that are used to calculate a hospital's Factor 3) through January 2014 (when we started preparing for the FY 2015 IPPS/LTCH PPS proposed rule). On the basis of this information, we would then combine the data elements of any hospitals that had

merged to calculate the uncompensated care payment for the merged hospital. Specifically, we proposed to combine the Medicaid days from the most recently available full year cost reports and the SSI days from the most recently available SSI ratios tied to the two CCNs prior to the merger to calculate the merged hospital's Factor 3. For FY 2015, we proposed to combine the Medicaid days from either the 2011 or 2012 cost reports and would use the most recently available SSI ratios available at the time the final rule is developed.

In order to confirm these mergers and the accuracy of the data used to determine each merged hospital's uncompensated care payment, we proposed to publish a table on the CMS Web site, in conjunction with the issuance of the proposed and final rules for a fiscal year, containing a list of the mergers that we are aware of and the computed uncompensated care payment for each merged hospital. A copy of this table was published on the CMS Web site in conjunction with the issuance of the FY 2015 proposed rule. The affected hospitals had the opportunity to comment during the public comment period on the accuracy of this information.

We proposed to treat hospitals that merge after the development of the final rule similar to new hospitals. For these newly merged hospitals, we would not have data currently available to calculate a Factor 3 amount that accounts for the merged hospital's uncompensated care burden. In addition, we would not have data to determine if the newly merged hospital is eligible for Medicare DSH payment and, therefore, eligible for uncompensated care payments for the applicable fiscal year because the only data we would have to make this determination are those for the surviving CCN. Accordingly, we proposed to treat newly merged hospitals in a similar manner as new hospitals, such that the newly merged hospital's final uncompensated care payment would be determined at cost report settlement where the numerator of the newly merged hospital's Factor 3 would be based on the Medicaid days and SSI days reported on the cost report used for the applicable fiscal year. We proposed that the interim uncompensated care payments for the newly merged hospitals would be based on only the data of the surviving hospital's CCN at the time of the preparation of the final rule for the applicable fiscal year. In other words, for newly merged hospitals, eligibility to receive interim uncompensated care payments and the amount of any

interim uncompensated care payments would be based on the Medicaid days from either the 2011 or 2012 cost reports and the most recently available SSI ratios available at the time the final rule is developed for only the surviving CCN. However, at cost report settlement, we would determine the newly merged hospital's final uncompensated care payments based on the Medicaid days and SSI days reported on the cost report used for the applicable fiscal year. That is, we would revise the numerator of Factor 3 for the newly merged hospital to reflect the Medicaid and SSI days reported on the cost report for the applicable fiscal year. We invited public comment on our proposed change to the treatment of hospital mergers in the calculation of a hospital's uncompensated care payment.

Comment: Commenters uniformly supported the proposal to establish a process to identify the hospitals that have merged so CMS can calculate the merged hospital's share of the total uncompensated care amount available using the low-income patient days from all hospitals that existed prior to the merger. Several commenters identified additional hospitals that had undergone a merger that were not included on the list of mergers identified in the FY 2015 IPPS/LTCH PPS proposed rule. A number of commenters requested that the public have additional time after the publication of the final rule to review and submit corrections to CMS' list of identified mergers. One commenter asked CMS to clarify that, under the proposal, CMS would recalculate the hospital's uncompensated care payments by combining the Medicaid days and SSI days published with the final rule from the applicable "data year" for the surviving CCN, as well as for any acquired CCNs that were retired through the merger process.

Response: We appreciate the commenters' support and are finalizing our proposal as proposed. We have updated our list of mergers based on information submitted by the Medicare contractor as of June 2014. In addition, we have reviewed the commenters' submissions of mergers not previously identified in the proposed rule and have updated our list accordingly. In response to the request from one commenter, for the hospitals that we have listed as undergoing a merger, we are confirming that we would recalculate the hospital's uncompensated care payments by combining the Medicaid days and SSI days published with the final rule from the applicable "data year" for the surviving CCN, as well as for any acquired CCNs that were retired through

the merger process. For example, to calculate the FY 2015 Factor 3 using the FY 2012 SSI ratio and the full year cost report from 2012 or 2011, we would combine the FY 2012 SSI days and Medicaid days from the 2012 or 2011 cost report from the surviving and retiring providers. We would not update the merged hospital's Factor 3 after that. For a newly merged hospital, defined for the purpose of this policy as a hospital that we do not identify as undergoing a merger until after the public comment period and additional review period after the final rule or that undergoes a merger during the fiscal year, the final Factor 3 would be recalculated based on the Medicaid days and SSI days reported on the cost report used for the applicable fiscal year since the Factor 3 that we are publishing in this final rule would not reflect the merger. For example, for a newly merged hospital that merged in FY 2015, the numerator of its Factor 3 would be recalculated based on the FY 2015 SSI days and the Medicaid days reported on its 2015 cost report. Finally, in response to the comments seeking additional review of CMS' list of identified mergers, we are providing an additional 30 days after the publication of this final rule for hospitals to review and submit comments on the accuracy of the list of mergers that we have identified in this final rule. Comments can be submitted to our inbox at *Section 3133DSH@cms.hhs.gov* and any changes to Factor 3 will be posted on the CMS Web site prior to October 1, 2014.

Comment: One commenter expressed concern about the process of requesting that MACs provide information to CMS on mergers/acquisitions. The commenter noted that the MACs may not have the most up-to-date information on mergers to provide to CMS because documentation of the merger, such as tie-in or tie-out notices, can be delayed in getting to a contractor.

Response: We appreciate the commenters' concerns. We believe that we have implemented several safeguards in the event that a merger is not identified by the MACs, including allowing opportunity for comment on the accuracy of the mergers that we have identified during the comment period for the proposed rule and after the publication of the final rule. In addition, as described earlier, for any newly merged hospital or for a hospital that we do not identify as having undergone a merger, we will recalculate the merged hospital's Factor 3 at the end of the applicable fiscal year based on the Medicaid days and SSI days reported on the cost report used for the applicable fiscal year since the Factor 3 published

in the final rule would not reflect the merger.

Comment: MedPAC and one other commenter expressed concern about our policy of distributing the uncompensated care payments as a per-discharge add-on. They believed this policy is problematic because the per-discharge add-on varies widely from hospital to hospital. The variability of the add-on payments in turn distorts the MS-DRG prices and creates problematic incentives for ACOs and MA plans. Therefore, MedPAC and the other commenter believed that it would be better to provide a common interim add-on payment for all DSH hospitals in a county. Any underpayments or overpayments to an individual hospital could be corrected at year-end settlement or on an interim basis during the year (as is already necessary under the current system). One commenter also suggested applying a growth factor based on CBO projections to CMS' historical discharge data to calculate the interim per-discharge uncompensated care payments to mitigate overpayments and stabilize cash flow. Another commenter opposed MedPAC's recommendation and supported CMS' current methodology to calculate interim uncompensated care payments, stating that MedPAC's recommendation could cause cash-flow problems for providers.

Response: We consider these comments to be outside the scope of the proposed rule, as we did not propose any revision in our method of making interim payments for uncompensated care. However, we would like to make two preliminary reactions to this recommendation. The first observation is that we have received very few comments from the hospital industry indicating that the problem cited by these two commenters actually exists. We would expect that, if hospitals were truly disadvantaged in the manner cited by these commenters by our methodology for making interim payment uncompensated care payments, we would have received many more comments to that effect. The second preliminary reaction is that adopting the recommendation may pose, for some hospitals, serious problems that may conceivably exceed the problem that the recommendation is designed to solve. For example, reducing the interim uncompensated care payments of high DSH hospitals to a county-wide average payment may cause serious cash flow problems during the period before the interim payments can be adjusted or settled. Similarly, low DSH hospitals may receive significantly higher interim payments

than would be warranted by their actual uncompensated care data. As a result, these hospitals would have to take financial management steps to ensure that they are capable of making significant repayments when interim payments are adjusted or settled.

Comment: Commenters suggested that CMS implement a stop-loss and stop-gain policy to limit the amount by which a hospital's DSH payment could change in a single year.

Response: As we previously stated in a response to a similar comment in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50622), we do not believe that the statute provides authority for adopting a stop-loss and stop-gain policy designed to limit changes in DSH payments.

Comment: Commenters expressed concern that there shall be no administrative or judicial review of the uncompensated care factors.

Response: Section 1886(r)(3) of the Act provides that there will be no administrative or judicial review under section 1869 of the Act, section 1878 of the Act, or otherwise of any of the following:

- Any estimate of the Secretary for purposes of determining the factors described in paragraph (2) of section 1886(r) of the Act.
- Any period selected by the Secretary for such purposes.

The regulation at § 412.106(g)(2), which was finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50643), is consistent with these statutory limitations on review.

G. Medicare-Dependent, Small Rural Hospital (MDH) Program (§ 412.108) and Sole Community Hospitals (SCHs) (§ 412.92)

1. Background for MDH Program

Section 1886(d)(5)(G) of the Act provides special payment protections, under the IPPS, to a Medicare-dependent, small rural hospital (MDH). (For additional information on the MDH program and the payment methodology, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51683 through 51684).) As we discussed in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50287) and in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51683 through 51684), section 3124 of the Affordable Care Act extended the expiration of the MDH program from the end of FY 2011 (that is, for discharges occurring before October 1, 2011) to the end of FY 2012 (that is, for discharges occurring before October 1, 2012). Under prior law, as specified in section 5003(a) of Public Law 109-171 (DRA 2005), the MDH program was to be in effect through the end of FY 2011 only.

Since the extension of the MDH program through FY 2012 provided by section 3124 of the Affordable Care Act, the MDH program has been further extended multiple times. First, section 606 of the ATRA (Pub. L. 112–240) extended the MDH program through FY 2013 (that is, for discharges occurring before October 1, 2013). Second, section 1106 of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) extended the MDH program through the first half of FY 2014 (that is, for discharges occurring before April 1, 2014). In the interim final rule with comment period (IFC) that appeared in the **Federal Register** on March 18, 2014 (the “March 2014 IFC”) (79 FR 15025 through 15027), we discussed the expiration of the MDH program on March 31, 2014. (In section IV.P. of the preamble of this final rule, we are responding to any public comments we received on the March 2014 IFC and are stating our finalized policy for the extension of the MDH program for the first half of FY 2014, through March 31, 2014, under the Pathway for SGR Reform Act of 2013.) In the March 2014 IFC, we explained how providers may be affected by the 6-month extension of the MDH program under the Pathway for SGR Reform Act of 2013 and described the steps to reapply for MDH status for FY 2014, as applicable. Generally, a provider that was classified as an MDH as of September 30, 2013, was reinstated as an MDH effective October 1, 2013, with no need to reapply for MDH classification. However, if the MDH had classified as an SCH or cancelled its rural classification under § 412.103(g) effective on or after October 1, 2013, the effective date of MDH status may not be retroactive to October 1, 2013. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50647 through 50649) and the March 2014 IFC (79 FR 15025 through 15027), we made conforming changes to the regulations at § 412.108(a)(1) and (c)(2)(iii) to reflect the extensions of the MDH program provided for by the ATRA and Pathway for SGR Reform Act of 2013, respectively. Lastly, under current law, section 106 of the PAMA (Pub. L. 113–93) provides for a 1-year extension of the MDH program effective from April 1, 2014 through March 31, 2015. Specifically, section 106 of the PAMA amended sections 1886(d)(5)(G)(i) and 1886(d)(5)(G)(ii)(II) of the Act by striking “April 1, 2014” and inserting “April 1, 2015”. Section 106 of the PAMA also made conforming amendments to sections 1886(b)(3)(D)(i) and 1886(b)(3)(D)(iv) of the Act.

We addressed the extension of the MDH program for the second half of FY

2014 (that is, from April 1, 2014 through September 30, 2014) under the PAMA in a notice that appeared in the **Federal Register** on June 17, 2014 (79 FR 34446 through 34449). For additional information on the extensions of the MDH program after FY 2012, we refer readers to the following: the FY 2013 IPPS/LTCH PPS final rule that appeared in the **Federal Register** on August 31, 2012 (77 FR 53404 through 53405 and 53413 through 53414); the FY 2013 IPPS notice that appeared in the **Federal Register** on March 7, 2013 (78 FR 14689); the FY 2014 IPPS/LTCH PPS final rule that appeared in the **Federal Register** on August 19, 2013 (78 FR 50647 through 50649); the FY 2014 interim final rule with comment period that appeared in the **Federal Register** on March 18, 2014 (the “March 2014 IFC”) (79 FR 15025 through 15027); and the FY 2014 notice that appeared in the **Federal Register** on June 17, 2014 (79 FR 34446 through 34449).

2. PAMA Provisions for FY 2015 for MDHs

Prior to the enactment of the PAMA, under section 1106 of the Pathway for SGR Reform Act of 2013, the MDH program authorized by section 1886(d)(5)(G) of the Act was set to expire midway through FY 2014. Section 106 of the PAMA amended sections 1886(d)(5)(G)(i) and 1886(d)(5)(G)(ii)(II) of the Act to provide for an additional 1-year extension of the MDH program, effective from April 1, 2014 through March 31, 2015. Section 106 of the PAMA also made conforming amendments to sections 1886(b)(3)(D)(i) and 1886(b)(3)(D)(iv) of the Act.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28104), we proposed to make conforming changes to the regulations at §§ 412.108(a)(1) and (c)(2)(iii) to reflect the statutory extension of the MDH program for the first 6 months of FY 2015 made by section 106 of the PAMA.

We did not receive any public comments on our proposed conforming changes to the existing regulations text at §§ 412.108(a)(1) and (c)(2)(iii) to reflect the statutory extension of the MDH program through the first half of FY 2015 (that is, through March 31, 2015) in accordance with section 106 of the PAMA. Therefore, in this final rule, we are adopting our proposed revisions to the regulations at §§ 412.108(a)(1) and (c)(2)(iii) as final without modification. We note that these regulatory provisions supersede the conforming changes to §§ 412.108(a)(1) and (c)(2)(iii) made in the March 2014 IFC to reflect the extension of the MDH program through March 31, 2014, under the Pathway for

SGR Reform Act, as discussed in section IV.P. of the preamble of this final rule.

3. Expiration of the MDH Program

Because section 106 of the PAMA extends the MDH program through the first half of FY 2015 only, beginning April 1, 2015, the MDH program will no longer be in effect. Because the MDH program is not authorized by statute beyond March 31, 2015, beginning April 1, 2015, all hospitals that previously qualified for MDH status will no longer have MDH status.

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53404 through 53405), we revised our SCH policies to allow MDHs to apply for SCH status and be paid as such under certain conditions, following expiration of the MDH program at the end of FY 2012. We codified these changes in the regulations at § 412.92(b)(2)(i) and § 412.92(b)(2)(v). For additional information, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53404 through 53405 and 53674). We note that those same conditions apply to MDHs that intend to apply for SCH status with the expiration of the MDH program on March 31, 2015.

Specifically, the existing regulations at § 412.92(b)(2)(i) and (b)(2)(v) allow for an effective date of approval of SCH status that is the day following the expiration date of the MDH program. In accordance with these regulations, in order for an MDH to receive SCH status effective April 1, 2015, it must apply for SCH status at least 30 days before the end of the MDH program; that is, the MDH must apply for SCH status by March 1, 2015. The MDH also must request that, if approved as an SCH, the SCH status be effective with the expiration of the MDH program provision; that is, the MDH must request that the SCH status, if approved, be effective April 1, 2015, immediately after its MDH status expires with the expiration of the MDH program on March 31, 2015. We note that an MDH that applies for SCH status in anticipation of the expiration of the MDH program would not qualify for the April 1, 2015 effective date upon approval if it does not apply by the March 1, 2015 deadline. The provider would instead be subject to the usual effective date for SCH classification, that is, 30 days after the date of CMS’ written notification of approval as specified at § 412.92(b)(2)(i).

Although we made no proposals related to the expiration of the MDH program, we received the following comments.

Comment: A few commenters expressed concern about the financial

impact of the expiration of the MDH program. Some of these commenters urged CMS to continue the MDH program permanently, while other commenters urged CMS to support legislative efforts to extend these provisions beyond the current March 31, 2015 statutory expiration date. Some commenters urged CMS to work with Congress to extend the MDH provision because these hospitals are vitally needed in serving elderly persons with health care needs. Other commenters stated that the MDH program provides needed funding for hospitals with Medicare as their predominant payor. The commenters stated that many of these hospitals provide primarily outpatient services, and the low Medicare OPPS rates, which pay less than cost, threaten the financial viability of these hospitals without the added funding that Medicare dependent status provides. In order to maintain access to care for Medicare beneficiaries and others in many rural communities, the commenters urge CMS to continue the MDH program permanently.

Response: While we appreciate the commenters' concerns about the expiration of the MDH program, CMS does not have the authority under current law to extend the MDH program beyond the March 31, 2015 statutory expiration date. These comments are similar to comments we received previously, prior to the statutory extensions of the MDH program for FYs 2013 and 2014 provided by subsequent legislation, and discussed in both the FY 2013 IPPS/LTCH PPS final rule (77 FR 53413 through 53414) and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50647 through 50649).

Therefore, under current law, beginning April 1, 2015, all hospitals that previously qualified for MDH status will no longer have MDH status.

4. Effect on MDHs of Adoption of New OMB Delineations

We received some comments regarding the effect of the implementation of the new OMB delineations (discussed in section III.H.5. of the preamble of this final rule) on MDHs, including requests for a transition period for MDHs to adapt to the changes that would result from the new OMB delineations; in particular, changes from rural to urban status. We refer readers to section III.H.5. (Update of Application of Urban to Rural Classification Criteria) of the preamble of this final rule for our summary of public comments received and our responses to those comments.

5. Effect on SCHs of Adoption of New OMB Delineations and 2-Year Transition for CAHs

Section 1886(d)(5)(D)(iii) of the Act defines a sole community hospital (SCH) generally as a hospital that is located more than 35 road miles from another hospital or that, by reason of factors such as isolated location, weather conditions, travel conditions, or absence of other like hospitals (as determined by the Secretary), is the sole source of inpatient hospital services reasonably available to Medicare beneficiaries. The regulations at 42 CFR 412.92 set forth the criteria that a hospital must meet to be classified as a SCH. For more information on SCHs, we refer readers to the FY 2009 IPPS/LTCH PPS final rule (74 FR 43894 through 43897).

In connection with the implementation of the new OMB delineations for urban and rural areas, as discussed in section III.H.5. of the preamble of this final rule, we received public comments requesting a transition period for SCHs affected by implementation of the new OMB delineations, similar to the 2-year transition period for affected CAHs, as discussed in section VI.D.2. of the preamble of this final rule, during which the CAH must reclassify as rural in order to retain its CAH status after the 2-year transition period ends. We refer readers to section III.H.5. of the preamble of this final rule for the discussion of and responses to those public comments.

We also were asked to clarify the status of a CAH during the 2-year transition period and its effect on SCHs.

Comment: One commenter requested that CMS clarify that a hospital's SCH status would not be affected by a CAH that is now located in an urban area as a result of a new OMB delineation while that CAH is in its 2-year transition period to reclassify as rural.

Response: We are clarifying that during an affected CAH's 2-year transition period, the facility will continue to be considered a CAH and, therefore, would not fall under the definition of "like hospital" at § 412.92(c)(2). Therefore, an affected CAH will not impact the status of an SCH during that CAH's 2-year transition period. For purposes of determining whether an SCH is located near a CAH affected by the most recent change in OMB delineations implemented in this final rule effective October 1, 2014, we plan to post on the CMS Web site, a list of the affected CAHs. We refer readers to section VI.D.2. of the preamble of this

final rule for a discussion related to the CAH 2-year transition period.

H. Hospital Readmissions Reduction Program: Changes for FY 2015 Through FY 2017 (§§ 412.150 Through 412.154)

1. Statutory Basis for the Hospital Readmissions Reduction Program

Section 3025 of the Affordable Care Act, as amended by section 10309 of the Affordable Care Act, added a new section 1886(q) to the Act. Section 1886(q) of the Act establishes the "Hospital Readmissions Reduction Program," effective for discharges from an "applicable hospital" beginning on or after October 1, 2012, under which payments to those applicable hospitals may be reduced to account for certain excess readmissions.

Section 1886(q)(1) of the Act sets forth the methodology by which payments to "applicable hospitals" will be adjusted to account for excess readmissions. In accordance with section 1886(q)(1) of the Act, payments for discharges from an "applicable hospital" will be an amount equal to the product of the "base operating DRG payment amount" and the adjustment factor for the hospital for the fiscal year. That is, "base operating DRG payments" are reduced by a hospital-specific adjustment factor that accounts for the hospital's excess readmissions. Section 1886(q)(2) of the Act defines the base operating DRG payment amount as "the payment amount that would otherwise be made under subsection (d) (determined without regard to subsection (o) [the Hospital VBP Program]) for a discharge if this subsection did not apply; reduced by . . . any portion of such payment amount that is attributable to payments under paragraphs (5)(A), (5)(B), (5)(F), and (12) of subsection (d)." Paragraphs (5)(A), (5)(B), (5)(F), and (12) of subsection (d) refer to outlier payments, IME payments, DSH adjustment payments, and add-on payments for low-volume hospitals, respectively.

Furthermore, section 1886(q)(2)(B) of the Act specifies special rules for defining "the payment amount that would otherwise be made under subsection (d)" for certain hospitals, including policies for SCHs and for MDHs for FY 2013. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53374), we finalized policies to implement the statutory provisions related to the definition of "base operating DRG payment amount" with respect to those hospitals.

Section 1886(q)(3)(A) of the Act defines the "adjustment factor" for an applicable hospital for a fiscal year as

equal to the greater of “(i) the ratio described in subparagraph (B) for the hospital for the applicable period (as defined in paragraph (5)(D)) for such fiscal year; or (ii) the floor adjustment factor specified in subparagraph (C).” Section 1886(q)(3)(B) of the Act, in turn, describes the ratio used to calculate the adjustment factor. It states that the ratio is “equal to 1 minus the ratio of—(i) the aggregate payments for excess readmissions . . . and (ii) the aggregate payments for all discharges. . . .” Section 1886(q)(3)(C) of the Act establishes the floor adjustment factor, which is set at 0.99 for FY 2013, 0.98 for FY 2014, and 0.97 for FY 2015 and subsequent fiscal years.

Section 1886(q)(4) of the Act defines the terms “aggregate payments for excess readmissions” and “aggregate payments for all discharges” for an applicable hospital for the applicable period. The term “aggregate payments for excess readmissions” is defined in section 1886(q)(4)(A) of the Act as “the sum, for applicable conditions . . . of the product, for each applicable condition, of (i) the base operating DRG payment amount for such hospital for such applicable period for such condition; (ii) the number of admissions for such condition for such hospital for such applicable period; and (iii) the excess readmissions ratio . . . for such hospital for such applicable period minus 1.” The “excess readmissions ratio” is a hospital-specific ratio based on each applicable condition. Specifically, section 1886(q)(4)(C) of the Act defines the excess readmissions ratio as the ratio of actual-over-expected readmissions; specifically, the ratio of “risk-adjusted readmissions based on actual readmissions” for an applicable hospital for each applicable condition, to the “risk-adjusted expected readmissions” for the applicable hospital for the applicable condition.

Section 1886(q)(5) of the Act provides definitions of “applicable condition,” “expansion of applicable conditions,” “applicable hospital,” “applicable period,” and “readmission.” The term “applicable condition” (which is addressed in detail in section IV.C.3.a. of the FY 2012 IPPS/LTCH PPS final rule (76 FR 51665 through 51666)) is defined as a “condition or procedure selected by the Secretary among conditions and procedures for which: (i) Readmissions . . . represent conditions or procedures that are high volume or high expenditures . . . and (ii) measures of such readmissions . . . have been endorsed by the entity with a contract under section 1890(a) [of the Act] . . . and such endorsed measures have exclusions for readmissions that

are unrelated to the prior discharge (such as a planned readmission or transfer to another applicable hospital).” Section 1886(q)(5)(B) of the Act also requires the Secretary, beginning in FY 2015, “to the extent practicable, [to] expand the applicable conditions beyond the 3 conditions for which measures have been endorsed . . . to the additional 4 conditions that have been identified by the Medicare Payment Advisory Commission in its report to Congress in June 2007 and to other conditions and procedures as determined appropriate by the Secretary.”

Section 1886(q)(5)(C) of the Act defines “applicable hospital,” that is, a hospital subject to the Hospital Readmissions Reduction Program, as a “subsection (d) hospital or a hospital that is paid under section 1814(b)(3) [of the Act], as the case may be.” The term “applicable period,” as defined under section 1886(q)(5)(D) of the Act, “means, with respect to a fiscal year, such period as the Secretary shall specify.” As explained in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51671), the “applicable period” is the period during which data are collected in order to calculate various ratios and payment adjustments under the Hospital Readmissions Reduction Program.

Section 1886(q)(6) of the Act sets forth the public reporting requirements for hospital-specific readmission rates. Section 1886(q)(7) of the Act limits administrative and judicial review of certain determinations made pursuant to section 1886(q) of the Act. Finally, section 1886(q)(8) of the Act requires the Secretary to collect data on readmission rates for *all* hospital inpatients (not just Medicare patients) for a broad range of both subsection (d) and non-subsection(d) hospitals, in order to calculate the hospital-specific readmission rates for all such hospital inpatients and to publicly report these “all-patient” readmission rates.

2. Regulatory Background

The payment adjustment factor set forth in section 1886(q) of the Act did not apply to discharges until FY 2013. In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51660 through 51676), we addressed the issues of the selection of readmission measures and the calculation of the excess readmissions ratio, which will be used, in part, to calculate the readmissions adjustment factor. Specifically, in that final rule, we finalized policies that relate to the portions of section 1886(q) of the Act that address the selection of and measures for the applicable conditions,

the definitions of “readmission” and “applicable period,” and the methodology for calculating the excess readmissions ratio. We also established policies with respect to measures for readmission for the applicable conditions and our methodology for calculating the excess readmissions ratio.

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53374 through 53401), we finalized policies that relate to the portions of section 1886(q) of the Act that address the calculation of the hospital readmission payment adjustment factor and the process by which hospitals can review and correct their data. Specifically, in that final rule, we addressed the base operating DRG payment amount, aggregate payments for excess readmissions and aggregate payments for all discharges, the adjustment factor, applicable hospital, limitations on review, and reporting of hospital-specific information, including the process for hospitals to review readmission information and submit corrections. We also established a new Subpart I under 42 CFR Part 412 (§§ 412.150 through 412.154) to codify rules for implementing the Hospital Readmissions Reduction Program.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50649 through 50676), we finalized our policies that relate to refinement of the readmissions measures and related methodology for the current applicable conditions, expansion of the “applicable conditions” beginning for FY 2015, and clarification of the process for reporting hospital-specific information, including the opportunity to review and submit corrections. We also established policies related to the calculation of the adjustment factor for FY 2014.

3. Overview of Policies for the FY 2015 Hospital Readmissions Reduction Program

In this final rule, we are—

- Making refinements to the readmissions measures and related methodology for FY 2015 and subsequent years (section IV.H.4. of the preamble of this final rule);
- Expanding the scope of “applicable conditions” for FY 2017 to include coronary artery bypass graft (CABG) (section IV.H.6. of the preamble of this final rule);
- Discussing the maintenance of technical specifications for quality measures (section IV.H.7. of the preamble of this final rule);
- Describing a waiver from the Hospital Readmissions Reduction Program for hospitals formerly paid

under section 1814(b)(3) of the Act (§ 412.154(d)) (section IV.H.8. of the preamble of this final rule);

- Specifying the adjustment factor floor for FY 2015 (section IV.H.9. of the preamble of this final rule);
- Specifying the applicable period for FY 2015 (section IV.H.10. of the preamble of this final rule);
- Making changes to the calculation of the aggregate payments for excess readmissions to include two additional readmissions measures (chronic obstructive pulmonary disease (COPD) and THA/TKA)) (section IV.H.11. of the preamble of this final rule); and
- Discussing whether to establish an exceptions process to address hospitals with extraordinary circumstances (section IV.H.12. of the preamble of this final rule).

4. Refinement of the Readmission Measures and Related Methodology for FY 2015 and Subsequent Years Payment Determinations

We note that, during the comment period following the proposed rule, we received comments that were not related to our specific proposals and considered out of scope for the Hospital Readmissions Reduction Program in the FY 2015 IPPS/LTCH PPS proposed rule. Some of the out-of-scope comments were related to a wide range of aspects of the Hospital Readmissions Reduction Program and its readmission measures. For example, there were recommendations for statutory changes to the program payment structure and previously finalized program definitions, changes to the program goals, frequency of assessing and reporting performance on measures, and changes to the 30-day window of measuring readmissions. Notably, there were many comments on risk adjustment for socioeconomic status (SES) at the patient- and hospital-level. While we appreciate the commenters' feedback, these topics are out of scope of this rule, and we will not be specifically addressing them, with the exception of risk-adjustment for SES.

Among the out-of-scope topics, we are addressing the risk-adjustment for SES because of the volume of comments and the importance of this topic for outcome measures in payment programs. All other out-of-scope topics not specifically addressed in this rule will be taken into consideration when developing policies and program requirements for future years.

Comment: Many of the commenters on CMS quality programs and those specifically commenting on the Hospital Readmissions Reduction Program expressed concern that these programs

do not risk-adjust for SES. Many commenters expressed concern that the lack of risk adjustment for SES leads to the unintended consequences of unfair payment adjustments which: (1) Disproportionately penalize hospitals serving high proportions of low-SES patients; (2) penalize hospitals for patient characteristics outside of their control; and (3) decrease financial resources of the hospitals most likely to serve low-SES patients which would lead to lower quality of care for these patients. Many commenters outlined specific SES characteristics that are not adjusted for in the current readmission measures, including Medicare dual-eligible status, life circumstances, access to health care post-discharge, literacy, education level, community factors, language, income, poverty level, living conditions and support in the home (that is, post-discharge support structure), complex medical histories, and having chronic conditions.

One commenter noted that claims data cannot be used to identify SES, making it difficult for the commenter to support the Hospital Readmissions Reduction Program, which uses claims-based measures. Other commenters believed that risk adjustment for SES "levels the playing field" among all hospitals while still illuminating disparities.

Response: We appreciate the commenters' concerns and note that these concerns were addressed in the FY 2014 IPPS/LTCH PPS final rule (79 FR 50653 through 50654; 50673 through 50674). As described in prior rulemaking, we do not currently risk-adjust for SES in the Hospital Readmissions Reduction Program. However, we do risk-adjust for comorbidities (that is, correlated illnesses) and other factors to ensure that hospitals are not penalized for serving populations that are sicker or have higher incidences of chronic disease.

We are aware that there are differing opinions regarding this approach. We appreciate the commenters' suggestions on the importance of addressing SES in the Hospital Readmissions Reduction Program. We have continued to consider and evaluate stakeholder concerns regarding the influence of patient SES status on readmission rates.

Comment: One commenter noted that the purpose of the Hospital Readmissions Reduction Program is to transform the Medicare payment and delivery system. Other commenters supported this belief and urged CMS not to adjust the readmission measures for SES.

Response: We appreciate the feedback and support not to adjust the readmissions measures for SES.

Comment: Some commenters urged that CMS not risk-adjust the readmission measures with SES until it is proven that the program is biased against low-SES hospitals. These commenters noted that the Hospital Readmissions Reduction Program is designed to provide incentives for changes that also enhance the quality of health care and that the same care protocols that work with a different population of patients who are not low-SES may also work with low-SES patients.

Response: We appreciate support of the Hospital Readmissions Reduction Program's goal to encourage improved health care through this program. Like the commenters, we continue to believe that the same care protocols and processes that are successful in caring for nonlow-SES patient populations may also be successful in caring for low-SES patient populations.

Comment: Many commenters provided recommendations on how to risk-adjust for SES and specifically recommended adopting the recommendations of the draft report issued by NQF's Expert Panel on Risk-Adjustment for Sociodemographic Factors (Draft Report available at: http://www.qualityforum.org/Risk_Adjustment_SES.aspx). A few commenters supported risk adjustment for SES as recently proposed in two bills in the 113th Congress (S. 2501, "The Hospital Readmissions Program Accuracy and Accountability Act," and H.R.4188, the "Establishing Beneficiary Equity in the Hospital Readmission Program Act"). Both bills attempt to address the potential disproportionate impact of payment penalties on hospitals that serve high proportions of low-SES patients.

Response: We appreciate these comments and the importance of the role that SES plays in the care of patients. We are aware that there are differing opinions regarding our current approach in risk-adjusting measures in the Hospital Readmissions Reduction Program for SES. We note that the readmission measures aim to reveal differences related to the quality of care provided. We believe that quality of care received by patients of lower SES contributes at least in part to the observed association between SES status and the readmissions rate. We continue to have concerns about holding hospitals to different standards for the outcomes of their patients of low SES—we do not want to mask potential disparities or minimize incentives to

improve the outcomes of disadvantaged populations.

We routinely monitor the impact of SES on hospitals' results. To date, we have found that hospitals that care for large proportions of patients of low SES are capable of performing well on our measures (we refer readers to the 2013 Medicare Hospital Quality Chart Book on pages 46 through 53 at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Downloads/-Medicare-Hospital-Quality-Chartbook-2013.pdf>). Previous analyses presented at the NQF during endorsement proceedings of the Hospital-Wide All-Cause Unplanned Readmission Measure (available at: <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=70813>) also show that adding SES to the risk-adjustment has a negligible impact on hospitals' risk-standardized rates. The risk adjustment for clinical factors likely captures much of the variation due to SES, therefore resulting in an attenuation of the impact of SES factors on hospitals' results.

We continue to monitor related activities at NQF, such as the July 23, 2014 decision by the NQF Board in which the Board approved a trial period to test the impact of sociodemographic factor risk adjustment of performance measures (available at: http://www.qualityforum.org/Press_Release/2014/NQF_Board_Approves_Trial_Risk_Adjustment.aspx), and in Congress. As we stated in the past, we are committed to working with the NQF and other stakeholder communities to continuously refine our measures and to address the concerns associated with SES and risk adjustment. We believe that continued collaboration with the stakeholder communities will enable us to identify feasible ways to appropriately address any unintended consequences for providers serving high proportions of low-SES patients.

Comment: Many commenters provided recommendations on how to risk-adjust for SES and specifically referenced MedPAC's recommendation to use "peer group stratification," that is, stratifying hospitals by the hospital's proportion of low-SES patients, as a method to correlate readmission rates and penalties with patient income. These commenters also recognized that this new method would require legislative changes because the current payment adjustment formula used to compute the readmission penalty is set in law.

Response: We appreciate the suggestion for risk-adjustment by "peer group stratification" as a method to

address SES. We will take MedPAC's recommendations into consideration for the Hospital Readmissions Reduction Program, but also note that MedPAC recognizes that statutory changes would be required for us to adopt this recommendation because the current payment adjustment formula used to compute the readmission penalty is established by statute.

Comment: A few commenters supported the use of an unplanned hospital-wide readmission measure (some of these commenters specifically asked CMS to consider adding the Hospital-Wide All-Cause Readmission Measure (NQF #1789)) as this type of measure would capture a global perspective on hospital performance and urged CMS to consider these measures instead of CABG.

Response: We thank the commenters for this input and will continue to take the recommendation into consideration, as we stated previously in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50658). We developed the Hospital-Wide All-Cause Readmission Measure (NQF #1789) (HWR measure) that has been implemented in the Hospital IQR Program. The HWR measure estimates the hospital-level, risk-standardized rate of all-cause, unplanned readmission within 30 days of hospital discharge with any eligible condition. The measure reports a single composite risk-standardized readmission rate (RSRR), derived from the volume-weighted results of five different models, one for each of the following specialty cohorts (groups of related discharge condition categories or procedure categories): surgery/gynecology; general medicine; cardiorespiratory; cardiovascular; and neurology.

While we appreciate the commenters' recommendations to consider this measure for the Hospital Readmissions Reduction Program, we believe that section 1886(q)(5)(A) of the Act (defining "applicable condition") prohibits us from adopting the many categories of diagnoses and procedures comprising the HWR measure as a single "condition." Based on the limitations of the current statutory provisions for the Hospital Readmissions Reduction Program, we have not implemented the HWR measure in the Hospital Readmissions Reduction Program.

Comment: One commenter opposed the addition of the 30-day Ischemic stroke readmission measure in the Hospital Readmissions Reduction Program because it is not risk-adjusted using the National Institutes Stroke Severity Scale.

Response: We thank the commenter for this feedback and note that we did not propose this measure for the Hospital Readmissions Reduction Program. We note that, in the FY 2014 IPPS/LTCH PPS final rule, we discussed this issue with respect to the Hospital IQR Program (79 FR 50801). At that time we stated that we appreciated the concerns of the stakeholders on this issue. We also stated that not only are we committed to working with the stakeholder communities and to continuously refine our measures, which for the stroke outcome measures includes risk-adjusted patient severity, but also committed to working with the stroke communities and other stakeholders to seek feasible ways to incorporate additional severity adjustment as suggested. Finally, we highlighted that stroke is the fifth leading cause of adult mortality in the United States, and therefore we believe it would be a disservice to patients to delay inclusion of these current stroke outcome measures in quality reporting and quality improvement initiatives. We are committed to making these measures better and working with stakeholders to do so, and will take these comments into consideration.

Comment: A few commenters noted that heart failure readmission rates are inversely related to heart failure mortality rates.

Response: We appreciate the commenters' concerns and note that this issue was addressed in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50650).

Comment: A few commenters recommended that the Hospital Readmissions Reduction Program be improved by excluding admissions that are part of the natural disease or treatment progression, in order to fairly assess hospitals and avoid unintended consequences for patients and their families. One commenter specifically highlighted readmissions due to ongoing care for patients suffering traumatic injury and requiring staged operative therapies should also be excluded.

Response: We appreciate these suggestions and agree that admissions that are part of planned management to address disease progression should not be counted in the outcome. We identify and do not count in the measure results and the readmission outcomes those admissions that are planned readmissions for ongoing care management. For example, ongoing treatments such as maintenance chemotherapy for cancer or cardiac device placement for cardiovascular disease patients are excluded from the

calculation of the measure result for readmission rates.

Comment: Many commenters requested that CMS be more transparent and collaborative in its approach to all measures in the Hospital Readmissions Reduction Program.

Response: We appreciate this feedback regarding our proposed changes to the planned readmission algorithm and the proposed refinements to the measure cohort in the Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) All-Cause Unplanned 30-Day Risk-Standardized Readmission Measure. We strive to collaborate with stakeholders, as well as be transparent about the direction of the Hospital Readmissions Reduction Program and the measures proposed for the program. We previously discussed in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50657 through 50658) that we use multiple methods to communicate with stakeholders; for example, through press releases, open door forums, as well as through the Federal rulemaking process. We also post all measure methodology documents online for broad public access at our Web site (<http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>).

In addition, during measure development, we seek public comments on various stages of development, and also have the measures undergo the NQF's endorsement processes and measure maintenance reviews. We also adhere to the Affordable Care Act's provision that requires all measures that will be proposed in future rulemaking be reviewed by NQF's MAP as part of the pre-rulemaking process. All of these processes are open to the public for comment. While we believe all of these processes help to inform the public of our plans for and decisions regarding the Hospital Readmissions Reduction Program, we will strive to collaborate with all of our stakeholders to identify more effective ways of communicating our plans and decisions.

a. Refinement of Planned Readmission Algorithm for Acute Myocardial Infarction (AMI), Heart Failure (HF), Pneumonia (PN), Chronic Obstructive Pulmonary Disease (COPD), and Total Hip Arthroplasty and Total Knee Arthroplasty (THA/TKA) 30-Day Readmission Measures

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50651 through 50655), we finalized for 2014 and subsequent years' payment determinations the use of the CMS Planned Readmission Algorithm

Version 2.1 in the AMI, HF, PN, COPD, and THA/TKA readmission measures. The algorithm identifies readmissions that are planned and occur within 30 days of discharge from the hospital. A complete description of the CMS Planned Readmission Algorithm Version 2.1, which includes lists of planned diagnoses and procedures, can be found on our Web site (available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>). NQF has endorsed the use of the algorithm for these measures.

Last year's stakeholder comments supported the incorporation of the CMS Planned Readmission Algorithm Version 2.1 and suggested that we update it on a regular basis. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50652), we agreed to continually review the CMS Planned Readmission Algorithm and make updates as needed. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28106 through 28108) we proposed to use a revised version, the CMS Planned Readmission Algorithm Version 3.0, for the AMI, HF, PN, COPD, and THA/TKA readmission measures for FY 2015 and subsequent payment determinations. We also proposed to use this algorithm for the CABG readmission measure proposed for inclusion in the Hospital Readmissions Reduction Program starting in FY 2017.

Version 3.0 incorporates improvements that were made based on a validation study of the algorithm. Researchers reviewed 634 patients' charts at 7 hospitals, classified readmission as planned or unplanned based on the chart review, and compared the results to the claims-based algorithm's classification of the readmissions. The findings suggested the algorithm was working well but could be refined.

Specifically, the study suggested the need to make small changes to the tables of procedures and conditions used in the algorithm to classify readmission as planned or unplanned. The algorithm uses the Agency for Healthcare Research and Quality's (AHRQ's) Clinical Classification Software (CCS) to group thousands of procedure and diagnosis codes into fewer categories of related procedures or diagnoses. The algorithm then uses four tables of procedures and diagnoses categories and a flow diagram to classify tables as planned or unplanned. For all measures, the first table lists procedures that, if present in a readmission, classify the readmission as planned. The second table identifies primary discharge diagnoses that always

classify readmissions as planned. Because almost all planned admissions are for procedures or surgeries, a third table identifies procedures for which patients are typically admitted; if any of these procedures are coded in the readmission, we classify a readmission as planned as long as that readmission does not have an acute (unplanned) primary discharge diagnosis. The fourth table lists the acute (unplanned) primary discharge diagnoses that disqualify readmissions that include one or more of the potentially planned procedure in the third table as planned. These tables are structured the same across all measures but the specific procedure and conditions they contain vary slightly for certain measures based on clinical considerations for each cohort. The final proposed tables for each measure can be found on our Web site under the Measure Methodology reports (available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>).

Version 3.0 modifies two of these tables by removing or adding procedures or conditions to improve the accuracy of the algorithm. First, a validation study revealed that the algorithm could be improved by removing two procedure CCS categories from the third table, the potentially planned procedure table: CCS 211—Therapeutic Radiation and CCS 224—Cancer Chemotherapy. Typically, patients do not require admission for scheduled Therapeutic Radiation treatments (CCS 211). The study found that readmissions that were classified as planned because they included Therapeutic Radiation were largely unplanned.

The algorithm was also more accurate when CCS 224—Cancer Chemotherapy was removed from the potentially planned procedure table. The second table of the algorithm classifies all readmissions with a *principal diagnosis* of Maintenance Chemotherapy as planned. Most patients who receive cancer chemotherapy have both a code for Cancer Chemotherapy (CCS 224) and a principal discharge diagnosis of Maintenance Chemotherapy (CCS 45). In the validation study, the readmissions for patients who received Cancer Chemotherapy (CCS 224) but who did not have a principal diagnosis of Maintenance Chemotherapy were largely unplanned; therefore, removing CCS 224 from the potentially planned procedure table improved the algorithm's accuracy. Therefore, Version 3.0 removes CCS 211 and CCS 224 from the list of potentially planned

procedures to improve the accuracy of the algorithm.

As noted above, the algorithm uses a table of acute principal discharge diagnoses to help identify unplanned readmissions. Readmissions that have a principal diagnosis listed in the table are classified as unplanned, regardless of whether they include a procedure in the potentially planned procedure table. The validation study identified one diagnosis CCS that should be added to the table of acute diagnoses to more accurately identify truly unplanned admissions as unplanned: Hypertension with Complications (CCS 99). Hypertension with Complications is a diagnosis that is rarely associated with planned readmissions.

In addition, the validation study identified a subset of ICD-9-CM diagnosis codes within two CCS diagnosis categories that should be added to the acute diagnosis table to improve the algorithm. CCS 149, Pancreatic Disorders, includes the code for acute pancreatitis; clinically, there is no situation in which a patient with this acute condition would be admitted for a planned procedure. Therefore, Version 3.0 adds the ICD-9-CM code for acute pancreatitis, 577.0, to the acute primary diagnosis table to better identify unplanned readmissions. Finally, CCS 149, Biliary Tract Disease, is a mix of acute and nonacute diagnoses. Adding the subset of ICD-9-CM codes within this CCS group that are for acute diagnoses to the list of acute conditions improves the accuracy of the algorithm for these acute conditions while still ensuring that readmissions for planned procedures, like cholecystectomies, are counted accurately as planned. For more detailed information on how the algorithm is structured and the use of tables to identify planned procedures and diagnoses, we refer readers to discussion of the CMS Planned Readmission Algorithm Version 2.1 in our reports (available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>). As noted above, readers can find the specific Version 3.0 tables for each measure in the measure updates and specifications reports at the above link.

We invited public comment on these proposals.

Comment: Several commenters specifically supported all of the proposed modifications to the planned readmissions algorithm. Some commenters supported the use of the algorithm in general and others specifically supported the inclusion of the algorithm in the Hospital-Level 30-

Day Readmission Following Admission for an Acute Exacerbation of Chronic Obstructive Pulmonary Disease.

Response: We appreciate the support for the inclusion of the planned readmission algorithm in the Hospital Readmissions Reductions Program measures.

Comment: Several commenters support the periodic update to the Hospital Readmissions Reduction Program's planned readmission algorithm to ensure its lists of inclusions and exclusions are accurate.

Response: We appreciate the comment and, as discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28106), we have revised the planned readmission algorithm based on a validation study conducted at 7 hospitals. During the revision of the algorithm, we also collaborated with technical and medical experts.

Comment: Several commenters commended CMS for including the planned readmission algorithm updates in the FY 2015 IPPS/LTCH PPS proposed rule updates specifically related to the proposed exclusions. They also suggested CMS exclude unrelated readmissions.

Response: We appreciate the commenters' support and the support to remove the two procedure Clinical Classification Software (CCS) categories of Therapeutic Radiation (CCS 211) and Cancer Chemotherapy (CCS 224) as we strive to be transparent with the stakeholders. We note that we addressed the concern for exclusion of unrelated readmissions in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50654). We indicated last year that unrelated readmissions are addressed through the planned readmission algorithm and, in coordination with medical experts, we expanded the list of conditions considered planned. Generally, planned readmissions are not a signal of quality of care. Therefore, we have worked with experts in the medical community, as well as other stakeholders, to carefully identify procedures and treatments that should be considered "planned" and, therefore, not counted as readmissions.

Comment: Several commenters were concerned with the exclusion of two cancer related Clinical Classification Software (CCS) groups. Some commenters were specifically concerned that removal of Clinical Classification Software (CCS) groups CCS 211—Therapeutic Radiation and CCS 224—Cancer Chemotherapy from the potentially planned procedure table of the planned readmission algorithm will have the unintended consequences of discouraging needed cancer care. These commenters requested that CMS

therefore initiate an ad hoc review of this change. One commenter was unconvinced that the validation study findings for Maintenance Chemotherapy holds true for all hospitals and therefore hospitals that deliver a large amount of cancer services could be affected by this change.

Response: We note that removal of CCS 211 would be appropriate because patients are not typically admitted for therapeutic radiation, and admissions with this treatment were noted in general to be unplanned. In addition, we removed CCS 224 because the validation study showed admissions for individuals who receive cancer chemotherapy but do not have a principal diagnosis of maintenance chemotherapy are typically unplanned admissions. All admissions for patients with a principal diagnosis of Maintenance Chemotherapy (that is, CCS 45) will continue to be considered planned and will not be counted in the measure outcome. Therefore, we expect removal of CCS 211 and CCS 224 to improve the accuracy of the planned readmission algorithm and do not anticipate it will have the unintended consequence of discouraging needed cancer care. We appreciate the concern that the validation study findings may not apply to all hospitals and will consider further evaluation of this concern.

Comment: One commenter noted that he/she was aware of the methodologies that separate preventable versus nonpreventable readmissions while measures in the Hospital Readmissions Reduction Program continue to penalize hospitals for circumstances outside of their control. The commenter asserted that "well researched and documented methodologies" exist to separate potentially preventable versus nonpreventable readmissions.

Response: We note that it is difficult, and can be subjective, to categorize a readmission as preventable or unpreventable. The difficulty, and risk for being subjective, occurs because a readmission cannot be determined as being preventable or unpreventable based on the reason or diagnoses for the admission alone. For this reason, we have not chosen to categorize readmissions as preventable or unpreventable, but rather planned or unplanned. The planned readmission algorithm identifies those diagnoses codes, identified by medical experts in multiple specialties, as those frequently and most likely to be associated with planned reasons for a readmission. By categorizing readmissions as planned, we are trying to remove the subjective

nature of deeming readmissions as preventable or unpreventable.

Finally, we are not aware of any publicly known NQF-approved methodology for identifying preventable versus unpreventable readmissions. The goal of the Hospital Readmissions Reduction Program is to lower the risk of all types of admissions through the most appropriate care and care transitions. We believe this goal can best be achieved through measuring and reporting a risk-standardized metric of excess readmissions that reflects how well hospitals are doing in decreasing unplanned readmissions relative to hospitals with similar patients.

Comment: One commenter believed that CMS' measures would benefit from refinement, including exclusion of planned readmissions and unrelated readmissions. Other commenters were disappointed that CMS did not propose a process for excluding readmissions unrelated to the initial reason for admission in calculating the measures, which they characterize as being mandated by the Affordable Care Act. Several commenters continued to urge CMS to exclude from the Hospital Readmissions Reduction Program admissions unrelated to the prior hospital stay, including, for example, admissions for chemotherapy, trauma, burns, end-stage renal disease, maternity, and substance abuse, because, the commenters stated, by their nature, they are not preventable readmissions.

Response: We note that we have been responsive to stakeholder suggestions to not include planned readmissions in the calculations, as discussed in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50654), and as evidenced by multiple versions of the planned readmission algorithm since 2012. As with other aspects of any measure, we continue to review and revise the area of unrelated readmissions through our refinement of the planned readmissions algorithm. Regarding other types of unrelated readmissions, we currently do not seek to differentiate between related and unrelated readmissions because readmissions not directly related to the index condition may still be a result of the care received during the index hospitalization. For example, a patient hospitalized for COPD who develops a hospital associated infection may ultimately be readmitted for sepsis. It would be inappropriate to treat this readmission as unrelated to the care the patient received during the index hospitalization.

Furthermore, the range of potentially avoidable readmissions also includes those not directly related to the initial

hospitalization, such as those resulting from poor communication at discharge or inadequate follow-up. Therefore, we believe that creating a comprehensive list of potential complications related to the index hospitalization would be arbitrary, incomplete, and, ultimately, extremely difficult to implement. However, in coordination with medical experts, we created a planned readmission algorithm to determine which conditions and therefore, readmissions, that are generally considered planned. Generally, planned readmissions are not indicative of an inferior quality of care, therefore are not counted as readmissions.

Regarding the suggestion to remove "extreme circumstances [such as] chemotherapy, trauma, burns, end stage renal disease, maternity, and substance abuse because, by their nature, they are not preventable readmissions," we addressed this comment in the FY 2013 IPPS/LTCH PPS final rule. In that rule and the current rulemaking, the commenters requested that circumstances like those listed in the above comment be excluded from the index hospitalizations. In FY 2013 IPPS/LTCH PPS final rule, (77 FR 53377), we stated that "we appreciate the concern expressed by some commenters that patients of these 'extreme circumstances' clinically could be sicker and more likely to be readmitted. The measures address clinical differences in hospitals' case-mix through risk adjustment rather than through excluding patients from the measure as suggested by the commenter. The goal in developing outcomes measures is to create a clinically cohesive cohort that includes as many patients as possible admitted with the given condition. Greatly expanding our list of exclusions would result in a measure that was less useful and meaningful because it would reflect the care of fewer patients. In addition, we believe that, by excluding patients with significant comorbidities, the measure would not assess of the quality of care for those patients. To fairly profile hospitals' performance, it is critical to place hospitals on a level playing field and account for their differences in the patients that present for care. This is accomplished through adequate risk-adjustment for patients' clinical presentation rather than exclusion of patients."

Comment: One commenter urged CMS to work with the physician and hospital communities to identify other planned readmissions that should be excluded.

Response: We will continue to involve all stakeholders in the process of measure development and measure

maintenance. We also collaborate with various medical specialty societies and associations whenever feasible and appropriate to ensure that their input and feedback are considered in real-time during measure development and maintenance, which also include input from expert panels, and public comment periods. We will consider the comment in future revisions to the algorithm.

Comment: Many commenters believe that CMS should have had the proposed Planned Readmission Algorithm Version 3.0 changes reviewed by NQF before finalizing and using in the readmission measures. One commenter believed the changes to be substantive and did not support adopting changes for measures to incorporate the Planned Readmission Algorithm Version 3.0 until the revised measures have been recommended by the MAP. One commenter stated that the size of the validation study for the Planned Readmission Algorithm Version 3.0 was limited, and making recommendations based on this information, without external review from NQF, could create unintended consequences.

Response: We note that the NQF has reviewed the Planned Readmission Algorithm Version 3.0 multiple times over the past 6 to 8 months as it was submitted for review as part of the NQF's annual measure maintenance review for re-endorsement of the Hospital-Level 30-Day Readmission Following Admission for Heart Failure, Pneumonia, Chronic Obstruction Pulmonary Disease, and Total Hip Arthroplasty/Total Knee Arthroplasty measures. As of July 2014, all of these measures are still under review by NQF. NQF also reviewed the Planned Readmission Algorithm Version 3.0 with the Coronary Artery Bypass Surgery readmission measure during its endorsement proceedings of this measure, which led to the measure being recommended for endorsement. We will consider the comment in future revisions to the algorithm.

Comment: Several commenters requested that CMS clarify what is a "related" readmission or a "planned" readmission, while others noted the measures fail to distinguish between a planned and unplanned readmission. Other commenters expressed appreciation for the proposed exclusions for certain readmissions, but requested exclusion of unrelated readmissions.

Response: We note that the issue of excluding unrelated readmissions from the Hospital Readmissions Reduction Program was addressed in FY 2014 IPPS/LTCH PPS final rule (78 FR 50654 through 50655). Regarding clarification

of what is a planned readmission, we refer readers to the technical reports for each measure that define specifically how planned readmissions are defined for the measure. The technical reports can be found in the planned readmission algorithm at the following Web site: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. Finally, we continue to review and revise our algorithm for planned readmissions to improve its accuracy.

Comment: One commenter emphasized the need to continuously improve and evaluate the accuracy of a signal provided by a specific readmission measure.

Response: We thank the commenter for this feedback. We believe that unplanned readmissions, in general, are a signal of the quality of care that hospitals provide to their patients. The commenter is concerned with the accuracy of the readmission measures; we note that these measures have been NQF-endorsed and widely vetted by technical experts during measure development and annual measure maintenance. We will continue to monitor and update the measures to ensure their accuracy.

Comment: Some commenters recommended that CMS create a system to monitor unintended consequences related to planned readmissions and implement an audit function that will accurately account for true planned readmissions.

Response: We note that we have been concerned about the unintended consequence of hospitals' increased use of observation stays and emergency department visits to avoid counting a patient as having been readmitted, and we are tracking these incidences in the Medicare Hospital Quality Chartbook available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Downloads/-Medicare-Hospital-Quality-Chartbook-2013.pdf>. Regarding the recommendation to create an audit function that will accurately account for "true planned readmissions," we understand this to mean that the commenter is concerned about the validity of the planned readmission algorithm. We note that, during development and maintenance of the planned readmission algorithm, there have been several iterations of the algorithm as a result of review by medical experts and other stakeholders like the NQF. We believe that the constant review and update of the algorithm by medical experts and other

stakeholders provide a planned readmissions algorithm that accurately identifies truly planned readmissions.

After consideration of the public comments we received, we are finalizing our proposal to update the planned readmission algorithm. We believe the updated Planned Readmission Algorithm Version 3.0 continues to fulfill statutory requirements to remove planned readmissions, as well as addresses stakeholder recommendations to continually refine and adjust the algorithm.

b. Refinement of Total Hip Arthroplasty and Total Knee Arthroplasty (THA/TKA) 30-Day Readmission Measure Cohort

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28107), for FY 2015 and subsequent years, we proposed to refine the measure cohort for the Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) All-Cause Unplanned 30-Day Risk-Standardized Readmission Measure.

Currently, the THA/TKA Readmission Measure adopted for the Hospital Readmissions Reduction Program is intended to only include patients who have an elective THA or TKA. Therefore, this measure excludes patients who have a principal discharge diagnosis of femur, hip, or pelvic fracture on their index admission because hip replacement for hip fracture is not an elective procedure. However, after hospitals reviewed their hospital-specific THA/TKA Readmission Measure data during the national dry run conducted during September and October 2012, we learned that hospitals code hip fractures that occur during the same admission as a THA as either a principal or secondary diagnosis. According to feedback received from hospitals participating in the dry run, the measure methodology failed to identify and therefore appropriately exclude a small number of patients (that is, 0.42 percent of patients in 2009–2010 data) with hip fracture who had nonelective total hip arthroplasty.

To ensure that all such hip fracture patients are excluded from the measure, we proposed to refine the measure to exclude patients with hip fracture coded as either principal or secondary diagnosis during the index admission. We believe this refinement is responsive to comments from hospitals and will allow us to accurately exclude patients who were initially admitted for a hip fracture and then underwent total hip arthroplasty, making their procedure nonelective.

Comment: Several commenters supported the refinements to the Total Hip Arthroplasty and Total Knee Arthroplasty 30-day readmission cohort.

Response: We appreciate support of these refinements to this measure cohort.

Comment: Several commenters acknowledged that the change to the THA/TKA measure is likely appropriate, but recommended that CMS submit the proposal to NQF in an ad hoc review of updates to the planned readmission algorithm and this measure cohort, before finalizing this proposal.

Response: We appreciate this feedback, especially acknowledgement that the change to the THA/TKA measure is likely to be appropriate. We appreciate the suggestion for an ad hoc NQF review of this change to the THA/TKA measure cohort. We also understand the importance of seeking broad stakeholder review during routine measure maintenance and note that this measure was submitted to NQF for annual maintenance review in June 2014. We note that the proposed changes to the cohort were the result of feedback from hospitals that had participated in the dry run of this measure and noted that the prior measure methodology failed to identify, and therefore appropriately exclude, a small number of patients (that is, 0.42 percent of patients in the 2009–2010 data) with hip fracture who had nonelective total hip arthroplasty. The recommendations resulting from the hospitals participating in the dry run were also reviewed by a group of medical experts working with our measure developer.

Notwithstanding this expert medical opinion, we realize that broader stakeholder review is necessary as we continue to strive for transparency with management of the Hospital Readmissions Reduction Program. We will work towards improving and broadening stakeholder review of measure updates; we will take this recommendation under consideration.

Comment: One commenter encouraged CMS to continue to work with appropriate clinicians and stakeholder groups (for example, the American Association of Hip and Knee Surgeons and the American Academy of Orthopaedic Surgeons) to identify planned readmissions that may occur within 30 days of discharge from the hospital that are unrelated to the quality of care received during the initial admission.

Response: We continually work towards improving and broadening stakeholder review of measure updates.

Comment: One commenter encouraged CMS to work with the Yale-New Haven Hospital Health Services Corporation, Center for Outcomes Research and Evaluation (YNHHSC/CORE) to determine the most appropriate method for excluding or risk-adjusting for cases that involve conversion of previous hip surgery to total hip arthroplasty (represented by CPT code 27132).

Response: We note that the commenter's concerns focused on having us revise our Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) All-Cause Unplanned 30-Day Risk-Standardized Readmission Measure to exclude additional specific groups of patients with prior hip surgeries that place them at a significantly increased risk of complications, including revision procedures and those requiring removal of implanted devices from the femur (ICD-9-CM codes 78.65). We will continue to work closely with the YNHHSC/CORE to determine the most appropriate method for exclusions or risk-adjustment for these cases²⁴ for this measure.

After consideration of the public comments we received, we are finalizing our proposal to the refinements to the THA/TKA readmission measure cohort.

c. Anticipated Effect of Proposed Refinements on Measures

The proposed refinement of the CMS Planned Readmission Algorithm Version 2.1 to Version 3.0 would have had the following effects on the measures based on our analyses of discharges between July 2009 and June 2012, if these changes had been applied for FY 2014. We note that these statistics are for illustrative purposes only, and we did not propose to revise the measure calculations for the FY 2014 payment determination. Rather, we proposed to apply these changes to the readmission measures for the FY 2015 payment determination and subsequent years.

Among hospitals that were subject to the Hospital Readmissions Reduction Program in FY 2014 (Table IV.H.1), the number of eligible discharges based on the July 2009 through June 2012 data were 494,121 discharges for AMI; 1,165,606 discharges for HF; 954,033 discharges for PN; 926,433 discharges

for COPD; and 858,266 discharges for hip/knee (as shown in Table IV.H.1. below).

The proposed 30-day readmission rate (excluding the planned readmissions) would remain constant for AMI and COPD; increase by 0.1 percentage points for HF and PN; and increase by 0.4 percentage points for hip/knee.

The new national readmission (unplanned) rate for each condition would have been 17.9 percent for AMI; 23.0 percent for HF; 17.7 percent for PN; 21.1 percent for COPD; and 5.27 percent for hip/knee.

The number of readmissions considered planned (and, therefore, not counted as a readmission) would decrease by 319 for AMI; 1,313 for HF; 866 for PN, 547 for COPD; and 298 for hip/knee.

The proposed modification of the hip/knee measure cohort would have had the following effects on the measure: The measure cohort would have been reduced by 0.37 percent; the crude readmission rate would have been reduced by 0.02 absolute percentage points; and the mean RSRR would have been reduced by 0.03 absolute percentage points.

TABLE IV.H.1.—COMPARISON OF PLANNED READMISSION ALGORITHMS V 2.1 AND 3.0 FOR AMI/HF/PN/COPD/THA/TKA READMISSION MEASURES

[Based on 2009–2012 discharges from 3025 hospitals]

	AMI		HF		PN		COPD		THA/TKA

5. No Expansion of the Applicable Conditions for FY 2016

In FY 2014 IPPS/LTCH PPS final rule, we finalized for FY 2015 two new condition specific readmission measures: (1) Hospital-level 30-day all-cause risk-standardized readmission rate following elective total hip arthroplasty (THA) and total knee arthroplasty (TKA) (NQF #1551); and (2) Hospital-level 30-day all-cause risk-

standardized readmission rate following chronic obstructive pulmonary disease (COPD) (NQF #1891). This brought the total number of finalized applicable conditions to five over the past 2 years of implementation. We also noted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50657) that commenters requested that we delay adding other condition-specific measures. In view of these requests and our belief that it is

reasonable to allow more time for hospitals to become familiar with these five applicable conditions before adding other applicable conditions in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28108), we did not propose any new applicable conditions for FY 2016.

Comment: Several commenters encouraged CMS to strengthen the Hospital Readmissions Reduction Program through the inclusion of new

²⁴ Suter L.G., Parzynski C.S., Searfoss R., Dorsey K.B., Grady J.N., Keenan M., Okai M., Nwosu M., Ngo C., Lin Z., Bhat K.R., Krumholz H.M.,

Bernheim S.M. 2014 Procedure-Specific Readmission Measures Updates and Specifications

Report: Report prepared for the Centers for Medicare & Medicaid Services. 2014.

measures for FY 2016 and FY 2017 so that momentum of recent successes in the reduction of readmission rates is not lost. Other commenters not only supported CMS' decision not to expand measures in FY 2016 for the Hospital Readmissions Program, but also recommended that CMS delay expanding the program in FY 2017.

Response: We agree that it is important for the nation's hospitals to continue to be successful in the reduction of readmission rates and to utilize this momentum to implement other condition specific readmission measures. However, we noticed over the past 2 years a persistent dichotomy in stakeholder recommendations where some recommended expansion of the program with new measures each fiscal year and others recommended not expanding the program in FY 2016 and FY 2017.

In response to last year's proposed rule (78 FR 50657), stakeholders requested that they be given time to become familiar with the measures and the program. For this reason, we did not propose expanding the program in FY 2016. However, we proposed to expand the program in FY 2017 with the Hospital-Level, 30-Day, All-Cause, Unplanned Readmission Following Coronary Artery Bypass Graft (CABG) Surgery measure. We will continue to review condition-specific readmission rate performance gaps in conjunction with our Quality Improvement Strategy (available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Quality-InitiativesGenInfo/CMS-Quality-Strategy.html>) and the availability of robust risk-adjusted readmission measures. As we indicated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50657), we will continue to ensure that hospitals are aware of future proposed program expansion through press releases, open door forums, as well as through the Federal rulemaking process. We also continue to strive to ensure our measure selection process for the Hospital Readmissions Reduction Program is transparent and allows the public several opportunities to comment on measures being selected for the Hospital Readmissions Reduction Program.

Comment: Several commenters suggested expanding the Hospital Readmissions Reduction Program by adding the Society of Thoracic Surgeons' (STS) Risk-Adjusted Coronary Artery Bypass Graft (CABG) Readmission Rate measure (NQF #2514) in conjunction with CMS' Hospital 30-Day, All-Cause, Unplanned, Risk-Standardized Readmission Rate (RSRR)

Following Coronary Artery Bypass Graft (CABG) Surgery measure (NQF #2515). These commenters believed that having the STS registry-based measure in addition to CMS' claims-based measure would help providers and patients fully understand CABG care. Others commenters not only recommended including the Hospital 30-Day Risk—Standardized Readmission Rates following Percutaneous Coronary Intervention (PCI) measure (NQF #0695), believing it would drive improvements in quality and patient outcomes while simultaneously realizing significant cost savings for Medicare, but also implementing the Hospital 30-Day Risk-Standardized Readmission Rates following Percutaneous Coronary Intervention (PCI) measure (NQF #0695) no later than FY 2017.

Response: We note that both the STS and the CMS Coronary Artery Bypass Graft (CABG) Readmission measures (NQF # 2514 and 2515 respectively) were both recommended for endorsement by NQF in May 2014, and a final decision on the endorsement status will be forthcoming in the third quarter of 2014. We note that both measures are fully harmonized, despite using different data sources. The STS' Risk-Adjusted Coronary Artery Bypass Graft (CABG) Readmission Rate measure (NQF #2514) uses the STS National Database, while CMS' Hospital 30-Day, All-Cause, Unplanned, Risk-Standardized Readmission Rate (RSRR) following Coronary Artery Bypass Graft (CABG) Surgery measure (NQF #2515) uses administrative claims. We believe having two measures that are fully harmonized using two different data sources provides the greatest flexibility for stakeholders to identify which measure best fits their current capabilities for data collection and submission.

We also note that we believe the use of the administrative claims-based measure would be less burdensome for participating hospitals in the Hospital Readmissions Reduction Program. Regarding the recommendation to expand the program in FY 2017 with the Hospital 30-Day Risk-Standardized Readmission Rates following Percutaneous Coronary Intervention (PCI) measure (NQF #0695), we note that this issue was addressed in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50657). We stated that the addition of measures for the other vascular and PCI conditions are not feasible for two reasons: (1) Inpatient admissions for PCI and other vascular conditions appear to be decreasing; and (2) the hospitals are increasingly performing procedures

relating to these conditions in outpatient departments. For these reasons, addition of these measures in the Hospital Readmissions Reduction Program is not practical.

After consideration of the public comments we received, we are finalizing our proposal not to expand the applicable conditions in the Hospital Readmissions Reduction Program in FY 2016.

6. Expansion of the Applicable Conditions for FY 2017 To Include the Patients Readmitted Following Coronary Artery Bypass Graft (CABG) Surgery Measure

a. Background

Under section 1886(q)(5)(B) of the Act, “[b]eginning with FY 2015, the Secretary shall, to the extent practicable, expand the applicable conditions beyond the 3 conditions for which measures have been endorsed as described in subparagraph (A)(ii)(I) . . . to the additional 4 conditions that have been identified by the Medicare Payment Advisory Commission [MedPAC] in its report to Congress in June 2007, and to other conditions and procedures as determined appropriate by the Secretary.” The four conditions and procedures recommended by MedPAC are: (1) Coronary artery bypass graft (CABG) surgery; (2) chronic obstructive pulmonary disease (COPD); (3) percutaneous coronary intervention (PCI); and (4) other vascular conditions. Section 1886(q)(5)(A)(i) of the Act directs the Secretary, in selecting an “applicable condition,” to choose from among readmissions “that represent conditions or procedures that are high volume or high expenditures under this title (or other criteria specified by the Secretary).”

In accordance with section 1886(q)(5)(A) of the Act, effective for the calculation of the readmissions payment adjustment factors in FY 2017, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28108 through 28111), we proposed to expand the scope of applicable conditions and procedures to include patients readmitted following CABG surgery. This proposal is consistent with the prior FY 2014 IPPS/LTCH PPS final rule (78 FR 50657) where we indicated our intent to explore quality measures that address CABG readmission rates. We describe this measure in detail below.

We proposed the inclusion of the condition of CABG readmissions to the Hospital Readmissions Reduction Program based on MedPAC's recommendations. For this condition, we developed a Hospital-Level 30-Day

All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft (CABG) Surgery measure. The National Quality Forum (NQF) Measure Applications Partnership (MAP) Hospital workgroup conditionally supported this measure for use in the Hospital Readmissions Reduction Program. The condition for support is based on attainment of NQF endorsement. On February 5, 2014, we submitted the Hospital-Level 30-Day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft (CABG) Surgery measure to NQF for endorsement.

The rationale for expanding the applicable conditions and the measures used to estimate the excess readmissions ratio is described in detail below.

b. Overview of the CABG Readmissions Measure: Hospital-Level, 30-Day, All-Cause, Unplanned Readmission Following Coronary Artery Bypass Graft (CABG) Surgery

Among the seven conditions MedPAC identified in its 2007 Report to Congress as having the highest potentially preventable readmission rate, CABG had the highest rate of readmissions within 15 days following discharge (13.5 percent) and second highest average Medicare payment per readmission (\$8,136).²⁵ The annual cost to Medicare for potentially preventable CABG readmissions was estimated at \$151 million.²⁶

Evidence also shows variation in readmissions rates for patients with CABG surgery, supporting the finding that opportunities exist for improving care. The median, 30-day, risk-standardized readmission rate among Medicare fee-for-service patients aged 65 or older hospitalized for CABG in 2009 was 17.2 percent, and ranged from 13.9 percent to 22.1 percent across 1,160 hospitals.²⁷ Although data documenting readmission reductions in CABG are limited, there are data that support CABG readmission as an important quality metric.²⁸ Studying readmission rates after CABG surgery in New York, Hannan, et al. found: (1) Wide variation

in readmission rates; (2) the most common cause of readmission after CABG is complication related to the surgery; and (3) that hospital-level variables such as use of cardiac rehabilitation and length of stay influenced readmission rates.²⁹ The authors also noted that readmission rates were not closely correlated to mortality rates and thus measuring readmission rates likely offers a complementary metric intended to assess a different domain of quality. Mortality measures are more likely to encourage improvements in clinical quality, including rapid triage, effective safety practices, and early intervention and coordination in the hospital. Readmission measures place an increased emphasis on aspects of quality related to effective transitions to the outpatient setting, clear communication with patients and caregivers, and collaboration across communities and providers. Together, these data suggest that reducing readmission rates following CABG surgery is an important target for quality improvement. In addition, inclusion of this measure in the Hospital Readmissions Reduction Program aligns with CMS' Quality Strategy objectives to promote successful transitions of care for patients from the acute care setting to the outpatient setting, and to reduce short-term readmission rates. In its final recommendations for rulemaking, the MAP conditionally supported the inclusion of the proposed CABG measure pending NQF endorsement and implementation. In order to address this concern, we submitted the CABG readmission measure to NQF for endorsement on February 5, 2014.

We believe the proposed Hospital-Level, 30-Day, All-Cause, Unplanned Readmission Measure Following CABG Surgery measure warrants inclusion in the Hospital Readmissions Reduction Program for FY 2017 because it meets the criteria in section 1886(q)(5)(A) of the Act, as a high cost, high volume condition that was recognized by MedPAC Report to Congress in 2007 as a specific medical condition to focus on for improving readmission rates. As with other readmission measures, this measure also excludes such unrelated readmissions as planned readmissions and transfers to other hospitals. For these reasons, we believe this measure is appropriate for the Hospital Readmissions Reduction Program.

We invited public comments on this proposal.

Comment: Many commenters supported the use of the Hospital-Level, 30-Day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft Surgery (NQF #2515) measure unconditionally, while other commenters only supported the use of the measure if it was endorsed by the NQF. Some commenters supported the measure because it will add more conditions and procedures to the Hospital Readmissions Reduction Program. Other commenters supported the measure but encouraged CMS to implement the measure in FY 2016 instead FY 2017 because the measure will be NQF-endorsed by FY 2016 and the MAP conditionally recommended the measure upon endorsement.

Response: We appreciate the commenters' support for the inclusion of the Hospital-Level, 30-Day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft Surgery measure (NQF #2515) in the Hospital Readmissions Reduction Program. We also appreciate the recommendation to expand the program by another condition-specific measure a year earlier than proposed. We note that, in last year's final rule, we stated we would allow the stakeholders time to become familiar with the current finalized measures, and for this reason, we proposed to implement the measure in FY 2017 rather than FY 2016.

Finally, on May 5–6, 2014, both the STS Risk-Adjusted Coronary Artery Bypass Graft (CABG) Readmission Rate measure (NQF #2514) and the CMS Hospital 30-Day All-Cause, Unplanned, Risk Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery measure (NQF #2515) were recommended for endorsement by the NQF (Draft Report for Commenting at: <http://www.qualityforum.org/ProjectMaterials.aspx?projectID=73619>).

Comment: Many commenters did not support the use of the CMS Hospital 30-Day All-Cause, Unplanned, Risk Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery measure (NQF #2515) for the Hospital Readmissions Reduction Program. Some of the reasons commenters gave for not supporting the CABG readmission measure (NQF #2515) included:

- Not being given enough time to establish their quality improvement program before having to incorporate additional medical conditions into its program. These commenters indicated that expansion of the Hospital Readmissions Reduction Program

²⁵ Medicare Payment Advisory Committee. Report to the Congress: Promoting Greater Efficiency in Medicare, 2007.

through additional conditions (that is, readmission measures) and penalties while these hospital programs are being established will place additional strain on hospitals before they are given a chance to succeed in reducing their readmission rates;

- Not being given time to become familiar with the CABG readmission measure (NQF #2515) through the Hospital IQR Program;

- CMS not addressing Hospital Readmissions Reduction Program policies related to a lack of risk-adjustment for SES and excessive payment penalties for a single readmission;

- Belief that there is the potential negative consequence of unfairly targeting hospitals that do perform CABG surgical procedures, when CABG is not a universally performed procedure; and

- Belief that there is the potential negative unintended consequence of reducing access for high-risk, older patients to CABG procedures due to their increased potential for complications and readmissions. This commenter asked that CMS monitor CABG utilization in high-risk, older patients to ensure these patients are offered medically indicated care.

Finally, one commenter did not support the CABG readmission measure (NQF #2515) until concerns over the limitations of the readmissions exclusions, risk adjustment, and access to information on hospital performance on the readmission measures were resolved.

Response: We acknowledge that there is a balance between allowing time for stakeholders to initiate and establish programs to improve readmission rates and expanding the Hospital Readmissions Reduction Program to narrow the performance gaps noted throughout the nation with various medical conditions. We take into account many factors when we decide how and when to expand the readmission measure set, and believe that addition of the CABG readmission measure (NQF #2515) for FY 2017 is reasonable, especially considering that we had signaled in the FY 2014 IPPS/LTCH PPS proposed rule (78 FR 27597) that we were considering how to expand the Hospital Readmissions Reduction Program based on the recommendations in MedPAC's June 2007 report (available at: http://www.medpac.gov/documents/jun07_entirereport.pdf) which included CABG surgical procedures. We understand that hospitals prefer time to become familiar with new measures and, for this reason, we had posted the CABG readmission measure (NQF

#2515) measure methodology reports in April 2014 the CMS Web site (<http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>), as well as alerted the public of these reports documents in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28109). We also have intermittently performed dry runs for certain measures and may consider plans to have a dry run for the CABG readmission measure (NQF #2515) in order to allow hospitals and other stakeholders to become more familiar with the measure.

We also provide the opportunity for hospitals to review and correct their readmissions data relating to these measures prior to its release to the public on the *Hospital Compare* Web site. We anticipate the review and correction period to be in late July 2014. Because we have instituted a sequential pattern of implementing a readmission measure in the Hospital IQR Program before implementing it in the Hospital Readmission Reduction Program, we believe that stakeholders have sufficient time to become familiar with this measure because it will not be implemented until FY 2017. We also note suggestions we received from some commenters that we take advantage of the readmissions' improvement momentum, as evidenced by nationwide reductions in the rate of hospital readmissions, by expanding the Hospital Readmission Reduction Program measure set beginning in FY 2016 instead of FY 2017. We will continue to take into consideration comments regarding expansion of the Hospital Readmission Reduction Program during future deliberations on when to expand the readmission measure set.

Regarding the concern for a lack of SES risk-adjustment SES in the CABG readmission measure (NQF #2515), we refer readers to section IV.H.4 of this preamble of this final rule for our discussion of SES.

We note the commenter's views that CMS imposes excessive payment penalties for a single readmission. We recognize that not all hospitals perform CABG procedures. However, we also note that in the January 2009–September 2011 Medicare FFS data, there were over 150,000 CABG procedures eligible for inclusion in this measure, and that there was a broad range of hospital-level risk-standardized readmission rates after CABG surgical procedures among hospitals ranges from

12.0 percent to 23.1 percent.³⁰ We also note in MedPAC's June 2007 report (available at: http://www.medpac.gov/documents/jun07_entirereport.pdf) that CABG has the highest potentially preventable readmission rate within 15 days following discharge (13.5 percent) and the second highest average Medicare payment per readmission (\$8,136). For these reasons, and because of the physical and emotional burden of readmissions on patients themselves, we seek to ensure readmission rates following these common, costly, and preventable procedures are adequately monitored and hospitals are provided with performance data to allow quality improvement.

Finally, regarding the concern for a potential negative unintended consequence of reducing access for high-risk, older patients to CABG procedures due to such patients' increased potential for complications and readmissions, we note that the readmission measures take into account the care of older patients in the risk-adjustment model in order not to create disincentives to care for older patients. We also note that the goal of the readmissions measures is not to have readmission rates of zero, but rather to evaluate hospitals relative to hospitals with similar patients for excess readmissions. We will consider ways to monitor for this unintended consequence as well.

Comment: Many commenters stated that the CMS Hospital 30-Day, All-Cause, Unplanned, Risk Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery measure (NQF #2515) is unreliable due to a small number of CABG surgeries performed during the measurement period. One commenter suggested that hospitals may be unfairly penalized because of variation in readmission rates that results from a small number of cases during the measurement period.

Response: We appreciate the commenters' feedback, and note that reliability is related to sample size. We do not agree that the CABG readmission measure is unreliable. We note that the same statistical approach to reliability for the CMS Hospital 30-Day, All-Cause, Unplanned, Risk Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery measure (NQF #2515) is used and established for all other CMS NQF-

³⁰ Suter L.G., Wang, C., Vellanky S., Potteiger J., Curtis J., Lin Z., Geary L.L., Krumholz H.M., Drye E.D. Hospital-level 30-day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft Surgery: Report prepared for the Centers for Medicare & Medicaid Services. 2012.

approved, hospital risk-adjusted outcome measures, including the mortality and readmissions measures. We adopted a risk adjustment modeling methodology for our outcome measures that takes into account sample size.

We note that this issue was raised and responded to in part in the FY 2013 and FY 2014 IPPS/LTCH PPS final rules (77 FR 53379 and 78 FR 50659, respectively) in our discussion of the readmission measures for the Hospital Readmissions Reduction Program. In the former rule, we stated that “[w]e determined the 25-case threshold for public reporting based on a reliability statistic that is calculated from the intercluster correlation, a parameter of the model [we refer readers to pages 14 through 17 of the document ‘‘PulmonaryAdditionalComment.pdf’’ which can be retrieved at: [We acknowledge that smaller hospitals typically have less certain estimates because they have fewer cases for use in assessing quality. Our approach to modeling addresses the concern that small hospitals will be penalized due to random variation, and this challenge is inherent in outcome measurements. However, one advantage of the statistical model used for the CMS outcome measures is that it allows for the inclusion of small hospitals while characterizing the certainty of their estimates. The hierarchical logistic regression model that we use to calculate the risk-standardized outcome measures allows the inclusion of hospitals with relatively few observations, but takes into account the uncertainty associated with sample size in estimating their risk-standardized outcome rates. The model takes into account the uncertainty in the estimate of outcome rates for low-volume hospitals by assuming that each hospital is a typically performing hospital. It weighs that assumption along with the outcomes for the particular hospital in calculating the outcome rate. Therefore, the estimated outcome rates for smaller hospitals will likely be closer to the national rate because the limited number of eligible cases in the hospital](https://www.google.com/url?sa=t&rct=j&q=&esrc=s&source=web&cd=1&ved=0CB0QFjAA&url=https%3A%2F%2Fwww.qualityforum.org%2FWorkArea%2Flinkit.aspx%3FLinkIdentifier%3Did%26ItemID%3D71385&ei=CRDYU4D6BYPhsASm4oDACA&usg=AFQjCNEvsLpiX23smKpBINVsv-91IAsXGA&sig2=UMJeMe1LdVq3lP69ks-1Hg&bv=bv.71778758,d.cWc&cad=rja]”. We are maintaining the minimum 25-case threshold that we adopted through rulemaking last year.’’</p>
</div>
<div data-bbox=)

indicated little about that hospital’s true outcome rate.

c. Methodology for the CABG Measure: Hospital-Level, 30-Day, All-Cause, Unplanned Readmission Following Coronary Artery Bypass Graft (CABG) Surgery

The proposed CABG readmission measure assesses hospitals’ 30-day, all-cause risk-standardized rate of unplanned readmission following admission for a CABG procedure. In general, the measure uses the same approach to risk-adjustment and hierarchical logistic modeling (HLM) methodology that is specified for the AMI, HF, PN, COPD, and THA/TKA readmission measures that we previously adopted for this program. Information on how the measure employs HLM can be found in the 2012 CABG Readmission Measure Methodology Report (available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>). This approach appropriately accounts for the types of patients a hospital treats (that is, hospital case-mix), the number of patients it treats, and the quality of care it provides. The HLM methodology is an appropriate statistical approach to measuring quality based on patient outcomes when the patients are clustered within hospitals (and, therefore, the patients’ outcomes are not statistically independent) and sample sizes vary across hospitals. The measure methodology defines hospital case-mix based on the clinical diagnoses provided in the hospitals’ claims for the hospitals’ patient inpatient and outpatient visits for the 12 months prior to the hospitalization for CABG, as well as those present in the claims for care at admission. However, the methodology specifically does not account for diagnoses present in the index admission that may indicate complications rather than patient comorbidities.

Comment: One commenter supported the minimum case size and believed that hospitals that are included in this measure will far exceed the minimum case volume, which will result in better measurement of a predicted readmission rate.

Response: We appreciate the commenter’s support.

Comment: One commenter believed that, for the CABG measure, there should be areas for accountability on both the index and discharge hospitals. For example, if the discharge hospital does not perform accurate medication reconciliation, an error resulting in

readmission should not reasonably be attributed to the index hospital.

Response: We acknowledge that, unlike our other readmission measures in the Hospital Readmissions Reduction Program, the CABG readmission measure (NQF #2515) attributes the readmission outcome to the hospital that performed the initial CABG procedure, even if that hospital was not responsible for discharging the patient home or to a postacute setting for care. We took this approach for CABG readmission measure (NQF #2515) because, unlike for medical conditions, transfer to another acute care facility following CABG surgery is most likely due to a complication of the initial CABG procedure or the peri-operative care the patient received.³¹ Therefore, the care provided by the hospital performing the CABG procedure likely dominates readmission risk, even among transferred patients. We believe that the transferring hospital has control over the hospital to which they transfer their CABG patients and will be encouraged by this measure to work closely with the institutions they transfer patients to, to provide optimal continuity of care for their patients. We note that this approach is supported by the high proportion of CABG readmissions for diagnoses such as heart failure, pleural effusion, and pneumonia and is endorsed by clinical experts from the Society of Thoracic Surgeons and the nationally convened Technical Expert Panel members who helped develop this measure.³²

We discuss the measure methodology below.

(1) Data Sources

The proposed CABG readmission measure is based on data derived from administrative claims. It uses Medicare administrative data from hospitalizations for Medicare FFS beneficiaries hospitalized for a CABG procedure.

(2) Definition of Outcome

The proposed CABG readmission measure defines 30-day, all-cause readmission as an unplanned subsequent inpatient admission to any applicable acute care facility for any cause within 30 days of the date of discharge from the index

³¹ Hannan EL, Racz MJ, Walford G, Ryan TJ, Isom OW, Bennett E, Jones RH. Predictors of Readmission for Complications of Coronary Artery Bypass Graft Surgery. *JAMA*. 2003;290:773–780.

³² Suter L.G., Wang, C., Vellanki S., Potteiger J., Curtis J., Lin Z., Geary L.L., Krumholz H.M., Drye E.D. Hospital-level 30-day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft Surgery: Report prepared for the Centers for Medicare & Medicaid Services. 2012.

hospitalization. A number of studies demonstrate that improvements in care at the time of discharge can reduce 30-day readmission rates.^{33 34} Thirty days is a meaningful timeframe for hospitals because readmissions are more likely attributable to care received within the index hospitalization and during the transition to the outpatient setting.

The proposed CABG readmission measure assesses all-cause unplanned readmissions (excluding planned readmissions) rather than readmissions for CABG only. We include all unplanned readmissions for several reasons. First, from the patient perspective, a readmission for any reason is likely to be an undesirable outcome of care, even though not all readmissions are preventable. Second, limiting the measure to CABG-related readmissions may focus quality improvement efforts too narrowly rather than encouraging broader initiatives aimed at improving the overall care within the hospital and care transitions from the hospital setting. Moreover, it is often hard to exclude quality issues and accountability for a readmission based on the documented cause of readmission. For example, a patient who underwent a CABG surgery and developed a hospital associated infection might ultimately be readmitted for sepsis. It would be inappropriate to consider such a readmission to be unrelated to the care the patient received for their CABG surgery. Finally, while the measure does not presume that each readmission is preventable, quality improvement interventions generally have shown reductions in all types of readmissions.

The proposed measure does not count planned readmissions as readmissions. Planned readmissions are identified in claims data using the CMS Planned Readmission Algorithm Version 3.0 that detects planned readmissions that may occur within 30 days of discharge from the hospital. Version 2.1 of the algorithm was finalized for use in the Hospital Readmissions Reduction Program in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50651 through 50655). We have since updated the algorithm to Version 3.0 as part of yearly measure maintenance. The proposed CABG readmission measure uses the planned

readmission algorithm, tailored for CABG patients. We adapted the algorithm for this group of patients with input from cardiothoracic surgeons and other experts, narrowing the types of readmissions considered planned because planned readmissions following CABG are less common and less varied than among patients discharged from the hospital following a medical admission. More detailed information on how the proposed CABG readmission measure incorporates the CMS Planned Readmission Algorithm Version 3.0 can be found in the 2012 CABG Readmission Measure Methodology Report on the CMS Web site (available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>). For the proposed CABG readmission measure, unplanned readmissions that fall within the 30-day post-discharge timeframe from the index admission would not be counted as readmissions for the index admission if they were preceded by a planned readmission.

(3) Cohort of Patients

In order to include a clinically coherent set of patients in the measure, we sought input from clinical experts regarding the inclusion of other concomitant cardiac and noncardiac procedures, such as valve replacement and carotid endarterectomy. Adverse clinical outcomes following such procedures are higher than those following “isolated” CABG procedures; that is, CABG procedures performed without concomitant high-risk cardiac and noncardiac procedures.³⁵ Limiting the measure cohort to “isolated” CABG patients is consistent with published reports of CABG outcomes. Therefore, the proposed measure cohort considers only patients undergoing isolated CABG as eligible for inclusion in the measure. We defined isolated CABG patients as those undergoing CABG procedures without concomitant valve or other major cardiac, vascular or thoracic procedures. In addition, our clinical experts, consultants, and Technical Expert Panel (TEP) members agreed that an isolated CABG cohort is a clinically coherent cohort suitable for a risk-adjusted outcome measure. For detailed information on the cohort definition, we refer readers to the 2012 CABG Readmission Measure Methodology Report on the CMS Web site (available

at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>).

Comment: One commenter supported focusing on isolated CABG cases for the measure because it reflects a much more cohesive clinical population.

Response: We appreciate the commenter’s support.

(4) Inclusion and Exclusion Criteria

The proposed CABG readmission measure includes hospitalizations for patients who are 65 years of age or older at the time of index admission and for whom there was a complete 12 months of Medicare FFS enrollment to allow for adequate data for risk adjustment. The measure excludes the following admissions from the measure cohort: (1) Admissions for patients who are discharged against medical advice (excluded because providers do not have the opportunity to deliver full care and prepare the patient for discharge); (2) admissions for patients who die during the initial hospitalization (these patients are not eligible for readmission); (3) admissions for patients with subsequent qualifying CABG procedures during the measurement period (a repeat CABG procedure during the measurement period very likely represents a complication of the original CABG procedure and is a clinically more complex and higher risk surgery; therefore, we select the first CABG admission for inclusion in the measure and exclude subsequent CABG admissions from the cohort); and (4) admissions for patients without at least 30 days post-discharge enrollment in Medicare FFS (excluded because the 30-day readmission outcome cannot be assessed in this group).

Comment: One commenter did not support the CABG measure because it does not exclude readmissions unrelated to the initial reason for admission.

Response: We addressed a similar comment in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50654). We continue to review and revise the area of unrelated readmissions through our expansion of planned readmissions. Regarding other types of unrelated readmissions, we currently do not seek to differentiate between related and unrelated readmissions because readmissions not directly related to the index condition may still be a result of the care received during the index hospitalization. For example, a patient hospitalized for CABG who develops a hospital associated infection may ultimately be readmitted for sepsis. It would be inappropriate to treat this readmission as unrelated to the care the

³³ Gulshan Sharma, Kou Yong-Fang, Freeman Jean L, Zhang Dong D, Goodwin James S.: Outpatient Follow-up Visit and 30-Day Emergency Department Visit and Readmission in Patients Hospitalized for Chronic Obstructive Pulmonary Disease. *Arch Intern Med.* Oct. 2010;170:1664–1670.

³⁴ Nelson EA, Maruish ME, Axler JL.: Effects of Discharge Planning and Compliance with Outpatient Appointments on Readmission Rates. *Psychiatr Serv.* July 1 2000;51(7):885–889.

³⁵ Hannan EL, Zhong Y, Lahey SJ, et al. 30-day readmissions after coronary artery bypass graft surgery in New York State. *JACC Cardiovasc Interv.* 2011;4(5):569–576.

patient received during the index hospitalization. Furthermore, the range of potentially avoidable readmissions also includes those not directly related to the initial hospitalization, such as those resulting from poor communication at discharge or inadequate follow-up. Therefore, we believe that creating a comprehensive list of potential complications related to the index hospitalization would be arbitrary, incomplete, and, ultimately, extremely difficult to implement. However, in coordination with medical experts, we created a planned readmission algorithm to determine conditions considered planned. Generally, planned readmissions are not a signal of quality of care. Therefore, we have worked with experts in the medical community, as well as other stakeholders, to carefully identify procedures and treatments that should be considered “planned” and, therefore, not counted as readmissions.

(5) Transferred Patients and Attribution of Readmission Outcome

Among medical conditions, such as AMI, heart failure, and pneumonia, transfers between acute care facilities can occur for a variety of different reasons and it is likely that the discharging hospital has the most influence over a patient’s risk of readmission and therefore the readmission outcome is appropriately assigned to the hospital that discharges the patient. For that reason, the currently publicly reported AMI, HF, and PN readmission measures attribute the readmission outcome to the hospital discharging the patient, even if that is not the hospital that initially admitted the patient.

In contrast, following CABG surgery, transfer to another acute care facility after CABG is most likely due to a complication of the CABG procedure or the peri-operative care the patient received. Therefore, the care provided by the hospital performing the CABG procedure likely dominates readmission risk, even among transferred patients. This viewpoint is supported by the high proportion of CABG readmissions for diagnoses such as heart failure, pleural effusion, and pneumonia and endorsed by the clinical experts on YNHSC/CORE, and the STS CABG readmission measure development working groups and our TEP. Therefore, for this measure, the readmission outcome is attributed to the hospital performing the first (“index”) CABG, even if this is not the discharging hospital. For example, a patient may be admitted to hospital A for a CABG that qualifies the patient for inclusion in the measure and is then

transferred to hospital B. The initial admission to hospital A and the admission to hospital B are considered one acute episode of care, made up of two inpatient admissions. The measure identifies transferred patients as those who are admitted to an acute care hospital on the same day or following day of discharge from an eligible admission.

Comment: One commenter supported attributing the readmission following a CABG procedure to the hospital performing the first CABG procedure.

Response: We appreciate the commenter’s support.

(6) Risk-Adjustment

The proposed CABG readmission measure adjusts for differences across hospitals in the level of risk their patients have for readmission relative to patients cared for by other hospitals. The measure uses administrative claims data to identify patient clinical conditions and comorbidities to adjust patient risk for readmission across hospitals, but does not adjust for potential complications of care. We refer readers to section IV.H.4 of the preamble of this final rule for further discussion of risk-adjustment for socioeconomic factors.

Comment: One commenter was concerned with the CABG readmission measure’s predictive ability, but the commenter did not provide additional details of its concern.

Response: We believe the commenter’s primary concern is with the c-statistic of the measure, and would like to clarify the important difference between predictive models intended for patient-level risk-stratification versus models used to profile hospital performance. First, in a patient-level predictive model, the objective is to predict patient outcomes and the risk-adjustment variables as a means to best predict these outcomes. As an example, a patient who has a serious complication of care may be at higher risk of mortality and readmission, and therefore complications might be useful to include in a model used for patient-level prediction. Second, and in contrast, the role of risk-adjustment in hospital profiling models is to level the playing field for hospitals in measures that assess hospitals on their relative performance—that is, on how well a hospital is doing compared to other hospitals with similar patients. The risk-adjustment variables should only include those that are inherent to the patient and are present at the start of the time period. Although risk-adjusting for complications of care could increase the statistical power of a profiling model, it

would not make sense to risk-adjust for complications because it could lead hospitals with high rates of complications to appear to be performing better than hospitals that admitted similar patients even though the quality of care is worse. We note that, in addition to this clarification, the CABG readmission measure (NQF #2515) risk model has been validated using registry data from the STS’ Adult Cardiac Surgery Database and produced nearly identical c-statistics in a matched set of patients with correlation coefficients between 0.92 and 0.96, depending upon the statistic used.³⁶

Comment: One commenter encouraged CMS to ensure measures risk-adjust for comorbidities and preexisting conditions for vascular patients as these are major determinants of patient outcomes.

Response: We agree with the commenter that vascular comorbidities and preexisting conditions for vascular patients are important determinants of CABG patient outcomes. The CABG readmission measure adjusts for a range of preexisting comorbidities, including vascular and circulatory conditions, stroke and cerebrovascular disease, and other cardiac disorders such as congestive heart failure and arrhythmias, as well as comorbidities that place patients at risk for these conditions, such as diabetes and end-stage renal disease.³⁷

(7) Calculating the Excess Readmissions Ratio

The proposed CABG readmission measure uses the same methodology and statistical modeling approach as the other Hospital Readmissions Reduction Program measures. We published a detailed description of how the readmission measures estimate the excess readmissions ratio in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53380 through 53381).

In summary, we proposed to adopt the Hospital-Level, 30-Day, All-Cause, Unplanned Readmission Following Coronary Artery Bypass Graft (CABG) Surgery measure in the Hospital Readmissions Reduction Program beginning in FY 2017.

³⁶ Suter L.G., Wang, C., Vellanky S., Potteiger J., Curtis J., Lin Z., Geary L.L., Krumholz H.M., Drye E.D. Hospital-level 30-day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft Surgery: Report prepared for the Centers for Medicare & Medicaid Services. 2012.

³⁷ Suter L.G., Wang, C., Vellanky S., Potteiger J., Curtis J., Lin Z., Geary L.L., Krumholz H.M., Drye E.D. Hospital-level 30-day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft Surgery: Report prepared for the Centers for Medicare & Medicaid Services. 2012.

We note that the set of hospitals for which this measure is calculated for the Hospital Readmissions Reduction Program differs from the set of hospitals used in calculations for the Hospital IQR Program. The Hospital Readmissions Reduction Program includes only subsection (d) hospitals as defined in 1886(d)(1)(B) of the Act, while the Hospital IQR Program calculations include non-IPPS hospitals such as CAHs, cancer hospitals, and hospitals located in the Territories of the United States. However, we believe that the CABG readmissions measure is appropriate for use in both programs.

After consideration of the public comments we received, we are finalizing our proposal to adopt the Hospital-Level, 30-Day, All-Cause, Unplanned Readmission Measure Following CABG Surgery measure for inclusion in the Hospital Readmissions Reduction Program for FY 2017.

7. Maintenance of Technical Specifications for Quality Measures

Technical specification of the readmission measures are provided at our Web site in the Measure Methodology Reports (available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>). Additional resources about the Hospital Readmissions Reduction Program and measure technical specifications and methodology are on the QualityNet Web site on the Resources Web page (available at: https://www.qualitynet.org/dcs/ContentServer?c=Page&page_name=QnetPublic%2FPages%2FQnetTier3&cid=1228772412995).

Many of the quality measures used in different Medicare and Medicaid reporting programs are NQF endorsed. As part of its regular maintenance process for NQF-endorsed performance measures, the NQF requires measure stewards to submit annual measure maintenance updates and undergo maintenance of endorsement review every 3 years. In the measure maintenance process, the measure steward (owner/developer) is responsible for updating and maintaining the currency and relevance of the measure and will confirm existing or minor specification changes with NQF on an annual basis. NQF solicits information from measure stewards for annual reviews, and it reviews measures for continued endorsement in a specific 3-year cycle.

We note that NQF's annual or triennial maintenance processes for endorsed measures may result in the NQF requiring updates to the measures.

We believe that it is important to have in place a subregulatory process to incorporate nonsubstantive updates required by the NQF into the measure specifications we have adopted for the Hospital Readmissions Program so that these measures remain up-to-date. The NQF regularly maintains its endorsed measures through annual and triennial reviews, which may result in the NQF requiring updates to the measures. We note that, for this calendar year, the AMI readmission measure is undergoing the NQF maintenance endorsement process.

For the Hospital Readmissions Reduction Program, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28111), we proposed to follow the finalized processes outlined for addressing changes to adopted measures in the Hospital IQR Program "Maintenance of Technical Specifications for Quality Measures" section found in section IX.A.1.b. of the preamble of the proposed rule.

We believe this proposal adequately balances our need to incorporate NQF updates to NQF-endorsed Hospital Readmissions Reduction Program measures in the most expeditious manner possible while preserving the public's ability to comment on updates that so fundamentally change an endorsed measure that it is no longer the same measure that we originally adopted. We invited public comment on this proposal.

Comment: One commenter commended the proposal to follow the finalized processes outlined for addressing changes to adopted measures in the Hospital IQR Program "Maintenance of Technical Specifications for Quality Measures" section found in section IX.A.1.b. of the preamble of the proposed rule (79 FR 28218). The commenter noted that this policy of handling substantive and nonsubstantive changes to measures that arise through measure maintenance processes allows CMS two mechanisms to address measure updates: (1) The use of future proposed rules and review periods for substantive changes; (2) subregulatory processes for nonsubstantive changes which also preserves CMS' autonomy and flexibility to rapidly implement nonsubstantive updates to measures.

No commenters opposed or recommended changes to the proposal.

Response: We appreciate the commenter's support.

Comment: One commenter indicated that any changes to a measure developed for adults but now include those <18 years of age should not be considered nonsubstantive.

Response: We appreciate this comment and note that this concern was addressed in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50776).

After consideration of the public comments we received, we are finalizing the proposed maintenance of technical specifications for quality measures for the Hospital Readmissions Reduction Program.

8. Waiver From the Hospital Readmissions Reduction Program for Hospitals Formerly Paid Under Section 1814(b)(3) of the Act (§ 412.152 and § 412.154(d))

The definition of "applicable hospital" under section 1886(q)(5)(C) of the Act also includes hospitals paid under section 1814(b)(3) of the Act. Section 1886(q)(2)(B)(ii) of the Act, however, allows the Secretary to exempt such hospitals from the Hospital Readmissions Reduction Program, provided that the State submit an annual report to the Secretary describing how a similar program to reduce hospital readmissions in that State achieves or surpasses the measured results in terms of health outcomes and cost savings established by Congress for the program as applied to "subsection (d) hospitals."

The State of Maryland entered into an agreement with CMS, effective January 1, 2014, to participate in CMS' new Maryland All-Payer Model, a 5-year hospital payment model. This model is being implemented under section 1115A of the Act, as added by section 3021 of the Affordable Care Act, which authorizes the testing of innovative payment and service delivery models, including models that allow States to "test and evaluate systems of all-payer payment reform for the medical care of residents of the State, including dual-eligible individuals." Section 1115A of the Act authorizes the Secretary to waive such requirements of titles XI and XVIII of the Act as may be necessary solely for purposes of carrying out section 1115A of the Act with respect to testing models.

As part of this agreement, Medicare will no longer pay Maryland hospitals in accordance with section 1814(b)(3) of the Act. Therefore, section 1886(q)(2)(B)(ii) of the Act is no longer applicable to Maryland hospitals. The effect of Maryland hospitals no longer being paid under 1814(b)(3) of the Act is that they are not entitled to be exempted from the Hospital Readmissions Reduction Program under section 1886(q)(2)(B)(ii) of the Act but, for the model, would be included in the Hospital Readmissions Reduction Program. In other words, the exemption

from the Hospital Readmissions Reduction Program under section 1814(b)(3) of the Act no longer applies. However Maryland hospitals will not be participating in the Hospital Readmissions Reduction Program because section 1886(q) of the Act and its implementing regulations have been waived for purposes of the model, under the terms of the agreement.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28111 through 28112), we proposed to make conforming changes to the implementing regulations to reflect this change. Under § 412.152, we proposed to delete from the definition of an “applicable hospital” the following language: “or a hospital in Maryland that is paid under section 1814(b)(3) of the Act and that, absent the waiver specified by section 1814(b)(3) of the Act, would have been paid under the hospital inpatient prospective payment system.” Under § 412.154, we proposed to delete § 412.154(d) in its entirety.

We invited public comment on these proposals.

Comment: Several commenters supported CMS’ proposal to continue to exempt Maryland hospitals, now being paid under the Maryland All-Payer Model, from the Hospital Readmissions Reduction Program and the proposed conforming changes to the Hospital Readmissions Reduction Program regulations.

Response: We appreciate the commenters’ support.

After consideration of the public comments we received, we are finalizing the changes to the Hospital Readmissions Reduction Program regulations as proposed without modification. Specifically, we are finalizing our proposal to make conforming changes to our regulations at § 412.152 and § 412.154(d) to reflect that Maryland elected to no longer have Medicare pay Maryland hospitals in accordance with section 1814(b)(3) of the Act.

9. Floor Adjustment Factor for FY 2015 (§ 412.154(c)(2))

Section 1886(q)(3)(A) of the Act defines the “adjustment factor” for an applicable hospital for a fiscal year as equal to the greater of “(i) the ratio described in subparagraph (B) for the hospital for the applicable period (as defined in paragraph (5)(D)) for such fiscal year; or (ii) the floor adjustment factor specified in subparagraph (C).” Section 1886(q)(3)(B) of the Act, in turn, describes the ratio used to calculate the adjustment factor. Specifically, it states that the ratio is “equal to 1 minus the ratio of—(i) the aggregate payments for

excess readmissions . . . and (ii) the aggregate payments for all discharges” The calculation of this ratio is codified at § 412.154(c)(1) of the regulations. Section 1886(q)(3)(C) of the Act specifies the floor adjustment factor, which is set at 0.99 for FY 2013, 0.98 for FY 2014, and 0.97 for FY 2015 and subsequent fiscal years. We codified the floor adjustment factor at § 412.154(c)(2) of the regulations (77 FR 53386).

Consistent with 1886(q)(3) of the Act, codified at § 412.154(c)(2), the adjustment factor is either the greater of the ratio or, for FY 2015 and subsequent fiscal years, a floor adjustment factor of 0.97. Under our established policy, the ratio is rounded to the fourth decimal place. In other words, for FY 2015 and subsequent fiscal years, a hospital subject to the Hospital Readmissions Reduction Program will have an adjustment factor that is between 1.0 (no reduction) and 0.9700 (greatest possible reduction).

Comment: One commenter expressed concern that the maximum reduction has been raised from 2 percent to 3 percent and that, in conjunction with adding two new measures to the program, this change will only increase harm to safety net hospitals.

Response: We recognize the commenter’s concern regarding the magnitude of the maximum payment reduction for FY 2015 provided under the statute. Section 1886(q)(3) of the Act requires that, effective for discharges occurring in FY 2015 and beyond, the maximum readmissions payment adjustment factor or the floor adjustment factor to be 0.97 or a 3 percent reduction, applied to a hospital’s base operating DRG payment amount. We note that we estimate that only 39 hospitals will be subject to the maximum reduction for FY 2015.

After consideration of the public comments we received, we are finalizing our proposal that the floor adjustment factor be 0.97 for FY 2015, consistent with section 1886(q)(3) of the Act, as codified at § 412.154(c)(2).

10. Applicable Period for FY 2015

Under section 1886(q)(5)(D) of the Act, the Secretary has the authority to specify the applicable period with respect to a fiscal year under the Hospital Readmissions Reduction Program. We finalized our policy to use 3 years of claims data to calculate the readmission measures in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51671). In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53675), we codified the definition of “applicable period” in the regulations at 42 CFR 412.152 as the 3-year period from which data are

collected in order to calculate excess readmissions ratios and adjustments for the fiscal year, which includes aggregate payments for excess readmissions and aggregate payments for all discharges used in the calculation of the payment adjustment.

Consistent with the definition at § 412.152, we established that the applicable period for FY 2014 under the Hospital Readmissions Reduction Program is the 3-year period from July 1, 2009, to June 30, 2012. That is, we determined the excess readmissions ratios and calculate the payment adjustment (including aggregate payments for excess readmissions and aggregate payments for all discharges) for FY 2014 using data from the 3-year time period of July 1, 2009 to June 30, 2012, as this was the most recent available 3-year period of data upon which to base these calculations (78 FR 50669).

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28112), for FY 2015, consistent with the definition at § 412.152, we proposed an “applicable period” for the Hospital Readmissions Reduction Program to be the 3-year period from July 1, 2010 to June 30, 2013. In other words, we proposed that the excess readmissions ratios and the payment adjustment (including aggregate payments for excess readmissions and aggregate payments for all discharges) for FY 2015 would be calculated based on data from the 3-year time period of July 1, 2010 to June 30, 2013. We invited public comment on these proposals.

Comment: Several commenters requested that CMS make real-time reporting of readmission rates accessible to hospitals, while other commenters suggested that CMS monitor reported data for correlation and trends to identify if hospitals are making unacceptable trade-offs by reducing readmissions at the expense of increasing post discharge mortality.

Response: We note that these requests are considered out of scope for the Hospital Readmissions Reduction Program in the FY 2015 IPPS/LTCH PPS proposed rule and will take these requests under consideration during future rulemaking.

Comment: Several commenters requested that CMS revise the applicable time period to only include the most recent year. One commenter believed that it is unfair to penalize hospitals for performance from 2 or 3 years ago, especially if they have improved in the most recent year.

Response: We note that we addressed this concern in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53380), and that

we use a 3-year period of index admissions to increase the number of cases per hospital used for measure calculation, which improves the precision of each hospital's readmission estimate. Although this approach utilizes older data, it also identifies more variation in hospital performance and still allows for improvement from one year of reporting to the next.

After consideration of the public comments we received, we are finalizing as proposed the applicable period of the 3-year time period of July 1, 2010 to June 30, 2013 to calculate the excess readmission ratios and the readmission payment adjustment factors for FY 2015.

11. Inclusion of THA/TKA and COPD Readmissions Measures To Calculate Aggregate Payments for Excess Readmissions Beginning in FY 2015

Under the Hospital Readmissions Reduction Program the "base operating DRG payment amount" defined at § 412.152 is used both to determine the readmission adjustment factor that accounts for excess readmissions under section 1886(q)(3) of the Act and to determine which payment amounts will be adjusted to account for excess readmissions under section 1886(q) of the Act. Consistent with section 1886(q)(2) of the Act, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53374 through 53383), under the regulations at § 412.152, we define the "base operating DRG payment amount" and specify that it does not include adjustments or add-on payments for IME, DSH, outliers and low-volume hospitals as required by section 1886(q)(2) of the Act. Furthermore, consistent with section 1886(q)(2)(B)(i) of the Act, for SCHs and for MDHs for FY 2013, the definition of "base operating DRG payment amount" at § 412.152 excludes the difference between the hospital's applicable hospital-specific payment rate and the Federal payment rate.

For FY 2015 and subsequent years, for purposes of calculating the payment adjustment factors and applying the payment methodology, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28112 through 282117), we proposed that the base operating DRG payment amount for MDHs includes the difference between the hospital-specific payment rate and the Federal payment rate (as applicable).

Section 1886(q)(3)(B) of the Act specifies the ratio used to calculate the adjustment factor under the Hospital Readmissions Reduction Program. It states that the ratio is "equal to 1 minus the ratio of—(i) the aggregate payments for excess readmissions . . . and (ii) the

aggregate payments for all discharges.

. . ." The definition of "aggregate payments for excess readmissions" and "aggregate payments for all discharges," as well as a methodology for calculating the numerator of the ratio (aggregate payments for excess readmissions) and the denominator of the ratio (aggregate payments for all discharges) are codified at § 412.154(c)(2) of the regulations (77 FR 53387).

Section 1886(q)(4) of the Act sets forth the definitions of "aggregate payments for excess readmissions" and "aggregate payments for all discharges" for an applicable hospital for the applicable period. The term "aggregate payments for excess readmissions" is defined in section 1886(q)(4)(A) of the Act as "for a hospital for an applicable period, the sum, for applicable conditions . . . of the product, for each applicable condition, of (i) the base operating DRG payment amount for such hospital for such applicable period for such condition; (ii) the number of admissions for such condition for such hospital for such applicable period; and (iii) the excess readmissions ratio . . . for such hospital for such applicable period minus 1." We codified this definition of "aggregate payments for excess readmissions" under the regulations at § 412.152 as the product, for each applicable condition, of: (1) The base operating DRG payment amount for the hospital for the applicable period for such condition; (2) the number of admissions for such condition for the hospital for the applicable period; and (3) the excess readmissions ratio for the hospital for the applicable period minus 1 (77 FR 53675).

The excess readmissions ratio is a hospital-specific ratio calculated for each applicable condition. Specifically, section 1886(q)(4)(C) of the Act defines the excess readmissions ratio as the ratio of "risk-adjusted readmissions based on actual readmissions" for an applicable hospital for each applicable condition, to the "risk-adjusted expected readmissions" for the applicable hospital for the applicable condition. The methodology for the calculation of the excess readmissions ratio was finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51673). "Aggregate payments for excess readmissions" is the numerator of the ratio used to calculate the adjustment factor under the Hospital Readmissions Reduction Program (as described in further detail later in this section).

The term "aggregate payments for all discharges" is defined at section 1886(q)(4)(B) of the Act as "for a hospital for an applicable period, the sum of the base operating DRG payment

amounts for all discharges for all conditions from such hospital for such applicable period." "Aggregate payments for all discharges" is the denominator of the ratio used to calculate the adjustment factor under the Hospital Readmissions Reduction Program. We codified this definition of "aggregate payments for all discharges" under the regulations at § 412.152 (77 FR 53387).

We finalized the inclusion of two additional applicable conditions, COPD and THA/TKA, to the Hospital Readmissions Reduction Program beginning for FY 2015 in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50657 through 50664). In section IV.H.11. of the preamble of the proposed rule, we discussed the proposed methodology to include these two additional measures in the calculation of the readmissions payment adjustment for FY 2015. Specifically, we proposed how the addition of COPD and THA/TKA applicable conditions would be included in the calculation of the aggregate payments for excess readmissions, which is the numerator of the readmissions payment adjustment. We note that this proposal does not alter our established methodology for calculating aggregate payments for all discharges, that is, the denominator of the ratio (77 FR 53387).

As discussed above, when calculating the numerator (aggregate payments for excess readmissions), we determine the base operating DRG payments for the applicable period. "Aggregate payments for excess readmissions" (the numerator) is defined as "the sum, for applicable conditions . . . of the product, for each applicable condition, of (i) the base operating DRG payment amount for such hospital for such applicable period for such condition; (ii) the number of admissions for such condition for such hospital for such applicable period; and (iii) the excess readmissions ratio . . . for such hospital for such applicable period minus 1."

When determining the base operating DRG payment amount for an individual hospital for such applicable period for such condition, we use Medicare inpatient claims from the MedPAR file with discharge dates that are within the same applicable period to calculate the excess readmissions ratio. We use MedPAR claims data as our data source for determining aggregate payments for excess readmissions and aggregate payments for all discharges, as this data source is consistent with the claims data source used in IPPS rulemaking to determine IPPS rates.

For FY 2015, we proposed to use MedPAR claims with discharge dates

that are on or after July 1, 2010, and no later than June 30, 2013. Under our established methodology we use the update of the MedPAR file for each Federal fiscal year, which is updated 6 months after the end of each Federal fiscal year within the applicable period, as our data source (that is, the March updates of the respective Federal fiscal year MedPAR files) for the final rules.

The FY 2010 through FY 2013 MedPAR data files can be purchased from CMS. Use of these files allows the public to verify the readmissions adjustment factors. Interested individuals may order these files through the CMS Web site at: <http://www.cms.hhs.gov/LimitedDataSets/> by clicking on MedPAR Limited Data Set (LDS)—Hospital (National). This Web page describes the files and provides directions and further detailed instructions for how to order the data sets. Persons placing an order must send the following: A Letter of Request, the LDS Data Use Agreement and Research Protocol (refer to the Web site for further instructions), the LDS Form, and a check for \$3,655 to:

- If using the U.S. Postal Service: Centers for Medicare and Medicaid Services, RDDC Account, Accounting Division, P.O. Box 7520, Baltimore, MD 21207-0520.
- If using express mail: Centers for Medicare and Medicaid Services, OFM/ Division of Accounting—RDDC, Mailstop C#07-11, 7500 Security Boulevard, Baltimore, MD 21244-1850.

In the proposed rule, we proposed to determine aggregate payments for excess readmissions and aggregate payments for all discharges using data from MedPAR claims with discharge dates that are on or after July 1, 2010, and no later than June 30, 2013. However, we note that, for the purpose of modeling the proposed FY 2015 readmissions payment adjustment factors for the proposed rule, we used excess readmissions ratios for applicable hospitals from the FY 2014 Hospital Readmissions Reduction Program applicable period. For the final rule, applicable hospitals will have had the opportunity to review and correct data from the proposed FY 2015 applicable period of July 1, 2010 to June 30, 2013, before they are made public under our policy regarding the reporting of hospital-specific information, which is discussed later in this section.

In the proposed rule, for FY 2015, we proposed to use MedPAR data from July 1, 2010 through June 30, 2013. Specifically, in the proposed rule, we used the March 2011 update of the FY 2010 MedPAR file to identify claims within FY 2010 with discharge dates

that are on or after July 1, 2010, the March 2012 update of the FY 2011 MedPAR file to identify claims within FY 2011, the March 2013 update of the FY 2012 MedPAR file to identify claims within FY 2012, and the December 2013 update of the FY 2013 MedPAR file to identify claims within FY 2013 with discharge dates no later than June 30, 2013. For the final rule, we proposed to use the same MedPAR files as listed above for claims within FY 2010, FY 2011 and FY 2012. For claims within FY 2013, we proposed to use in the final rule the March 2014 update of the FY 2013 MedPAR file.

In order to identify the admissions for each condition, including the two additional conditions THA/TKA and COPD, to calculate the aggregate payments for excess readmissions for an individual hospital, for FY 2015, we proposed to identify each applicable condition using the ICD-9-CM codes used to identify applicable conditions to calculate the excess readmissions ratios. Under our existing policy, we identify eligible hospitalizations and readmissions of Medicare patients discharged from an applicable hospital having a principal diagnosis for the measured condition in an applicable period (76 FR 51669). The discharge diagnoses for each applicable condition are based on a list of specific ICD-9-CM codes for that condition. These codes are posted on the QualityNet Web site at: <http://www.QualityNet.org> > Hospital-Inpatient > Claims-Based Measures > Readmission Measures > Measure Methodology.

In order to identify the applicable conditions to calculate the aggregate payments for excess readmissions, for FY 2015, we proposed to identify the claim as an applicable condition consistent with the methodology to identify conditions to calculate the excess readmissions ratio. In other words, the applicable conditions of AMI, HF and PN are identified for the calculation of aggregate payments for excess readmissions if the ICD-9-CM code for that condition is listed as the principal diagnosis on the claim.

In order to identify claims with the applicable condition of THA/TKA, we proposed that any claim that has the procedure codes for THA/TKA listed in any diagnosis/procedure field of the claim would be included in the calculation of aggregate payments for readmissions, consistent with the methodology to calculate the excess readmissions ratio for THA/TKA. In order to identify claims with the applicable condition of COPD, we proposed to identify claims that either have the ICD-9-CM code for that

condition is listed as the principal diagnosis on the claim or has a principal diagnosis of some respiratory failure along with secondary diagnosis of COPD.

Under our established methodology for calculating aggregate payments for readmissions, admissions that are not considered index admissions for the purpose of the readmissions measures are excluded from the calculation of the excess readmissions ratio, and therefore also are not considered admissions for the purposes of determining a hospital's aggregate payments for excess readmissions (78 FR 50670 through 50876). With the addition of THA/TKA and COPD as applicable conditions beginning in FY 2015, we proposed to modify our current methodology to identify the admissions included in the calculation of "aggregate payments for excess readmissions" for THA/TKA and COPD in the same manner as the original applicable conditions (AMI, HF and PN). That is, THA/TKA and COPD admissions that would not be considered index admissions in the readmissions measures also would not be considered admissions for the purposes of calculation a hospital's aggregate payments for excess readmissions.

In the proposed rule, for FY 2015, we proposed to continue to apply the same exclusions to the claims in the MedPAR file as we applied for FY 2014 (78 FR 50670 through 50673), and we proposed to apply those exclusions for the two additional applicable conditions, THA/TKA and COPD. For FY 2015, in order to have the same types of admissions to calculate aggregate payments for excess readmissions as is used to calculate the excess readmissions ratio, we proposed to identify admissions for all five applicable conditions, AMI, HF, PN, THA/TKA and COPD, for the purposes of calculating aggregate payments for excess readmissions as follows:

- We would exclude admissions that are identified as an applicable condition if the patient died in the hospital, as identified by the discharge status code on the MedPAR claim.
- We would exclude admissions identified as an applicable condition for which the patient was transferred to another provider that provides acute care hospital services (that is, a CAH or an IPPS hospital), as identified through examination of contiguous stays in MedPAR at other hospitals.
- We would exclude admissions identified as an applicable condition for patients who are under the age of 65, as identified by linking the claim information to the information provided in the Medicare Enrollment Database.

- For conditions identified as AMI, we would exclude claims that are same day discharges, as identified by the admission date and discharge date on the MedPAR claim.

- We would exclude admissions for patients who did not have Medicare Parts A and B FFS enrollment in the 12 months prior to the index admission, based on the information provided in the Medicare Enrollment Database.

- We would exclude admissions for patients without at least 30 days post-discharge enrollment in Medicare Parts A and B fee-for-service, based on the information provided in the Medicare Enrollment Database.

- We would exclude all multiple admissions within 30 days of a prior index admission's discharge date, as identified in the MedPAR file, consistent with how multiple admissions within 30 days of an index admission are excluded from the calculation of the excess readmissions ratio.

These exclusions are consistent with our current methodology, which was established in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50671).

In addition to the exclusions described above for all five applicable conditions, for FY 2015, we proposed the following steps to identify admissions specifically for THA/TKA for the purposes of calculating aggregate payments for excess readmissions:

- We proposed to exclude admissions for THA/TKA for all transfer cases

regardless of whether the discharge was a transfer to another hospital or from another hospital, consistent with the calculation of the excess readmissions ratio for THA/TKA.

- We proposed to exclude admissions for THA/TKA for cases where the discharge includes a femur, hip, or pelvic fracture coded in the principal or secondary diagnosis fields, consistent with the calculation of the excess readmissions ratio for THA/TKA.

- We proposed to exclude admissions for THA/TKA for cases where the discharge includes a mechanical complication coded in the principal diagnosis field, consistent with the calculation of the excess readmissions ratio for THA/TKA.

- We proposed to exclude admissions for THA/TKA for cases where the discharge includes a malignant neoplasm of the pelvis, sacrum, coccyx, lower limbs, or bone/bone marrow or a disseminated malignant neoplasm coded in the principal diagnosis field, consistent with the calculation of the excess readmissions ratio for THA/TKA.

- We proposed to exclude admissions for THA/TKA for cases where the discharge includes more than two hip/knee procedures.

- We proposed to exclude admissions for THA/TKA for cases that meet either any of the following conditions or following procedures concurrent with THA/TKA: Revision procedures; partial hip arthroplasty (PHA) procedures;

resurfacing procedures; and removal of implanted devices/prostheses.

Furthermore, we proposed to only identify Medicare FFS claims that meet the criteria (that is, claims paid for under Medicare Part C (Medicare Advantage) would not be included in this calculation), consistent with the methodology to calculate excess readmissions ratios based solely on admissions and readmissions for Medicare FFS patients. Therefore, consistent with our established methodology, for FY 2015, we would exclude admissions for patients enrolled in Medicare Advantage as identified in the Medicare Enrollment Database. This proposal is consistent with how admissions for Medicare Advantage patients are identified in the calculation of the excess readmissions ratios under our established methodology. The tables below list the ICD-9-CM codes we proposed to use to identify each applicable condition to calculate the aggregate payments for excess readmissions under this proposal for FY 2015. The tables include the ICD-9-CM codes we proposed to use to identify the two conditions, THA/TKA and COPD, added to the Hospital Readmissions Reduction Program beginning for FY 2015. These ICD-9-CM codes also would be used to identify the applicable conditions to calculate the excess readmissions ratios, consistent with our established policy (76 FR 51673 through 51676).

ICD-9-CM CODES TO IDENTIFY PNEUMONIA (PN) CASES

ICD-9-CM Code	Description of code
480.0	Pneumonia due to adenovirus.
480.1	Pneumonia due to respiratory syncytial virus.
480.2	Pneumonia due to parainfluenza virus.
480.3	Pneumonia due to SARS-associated coronavirus.
480.8	Viral pneumonia: pneumonia due to other virus not elsewhere classified.
480.9	Viral pneumonia unspecified.
481	Pneumococcal pneumonia [streptococcus pneumoniae pneumonia].
482.0	Pneumonia due to klebsiella pneumoniae.
482.1	Pneumonia due to pseudomonas.
482.2	Pneumonia due to hemophilus influenzae [h. influenzae].
482.30	Pneumonia due to streptococcus unspecified.
482.31	Pneumonia due to streptococcus group a.
482.32	Pneumonia due to streptococcus group b.
482.39	Pneumonia due to other streptococcus.
482.40	Pneumonia due to staphylococcus unspecified.
482.41	Pneumonia due to staphylococcus aureus.
482.42	Methicillin Resistant Pneumonia due to Staphylococcus Aureus.
482.49	Other staphylococcus pneumonia.
482.81	Pneumonia due to anaerobes.
482.82	Pneumonia due to escherichia coli [e.coli].
482.83	Pneumonia due to other gram-negative bacteria.
482.84	Pneumonia due to legionnaires' disease.
482.89	Pneumonia due to other specified bacteria.
482.9	Bacterial pneumonia unspecified.
483.0	Pneumonia due to mycoplasma pneumoniae.
483.1	Pneumonia due to chlamydia.
483.8	Pneumonia due to other specified organism.
485	Bronchopneumonia organism unspecified.

ICD-9-CM CODES TO IDENTIFY PNEUMONIA (PN) CASES—Continued

ICD-9-CM Code	Description of code
486	Pneumonia organism unspecified.
487.0	Influenza with pneumonia.
488.11	Influenza due to identified novel H1N1 influenza virus with pneumonia.

ICD-9-CM CODES TO IDENTIFY HEART FAILURE (HF) CASES

ICD-9-CM Code	Code description
402.01	Hypertensive heart disease, malignant, with heart failure.
402.11	Hypertensive heart disease, benign, with heart failure.
402.91	Hypertensive heart disease, unspecified, with heart failure.
404.01	Hypertensive heart and chronic kidney disease, malignant, with heart failure and with chronic kidney disease stage I through stage IV, or unspecified.
404.03	Hypertensive heart and chronic kidney disease, malignant, with heart failure and with chronic kidney disease stage V or end stage renal disease.
404.11	Hypertensive heart and chronic kidney disease, benign, with heart failure and with chronic kidney disease stage I through stage IV, or unspecified.
404.13	Hypertensive heart and chronic kidney disease, benign, with heart failure and with chronic kidney disease stage I through stage IV, or unspecified failure and chronic kidney disease stage V or end stage renal disease.
404.91	Hypertensive heart and chronic kidney disease, unspecified, with heart failure and chronic kidney disease stage V or end stage renal disease heart failure and with chronic kidney disease stage I through stage IV, or unspecified.
404.93	Hypertensive heart and chronic kidney disease, unspecified, with heart failure and chronic kidney disease stage V or end stage renal disease.
428.xx	Heart Failure.

ICD-9-CM CODES TO IDENTIFY ACUTE MYOCARDIAL INFARCTION (AMI) CASES

ICD-9-CM code	Description of Code
410.00	AMI (anterolateral wall)—episode of care unspecified.
410.01	AMI (anterolateral wall)—initial episode of care.
410.10	AMI (other anterior wall)—episode of care unspecified.
410.11	AMI (other anterior wall)—initial episode of care.
410.20	AMI (inferolateral wall)—episode of care unspecified.
410.21	AMI (inferolateral wall)—initial episode of care.
410.30	AMI (inferoposterior wall)—episode of care unspecified.
410.31	AMI (inferoposterior wall)—initial episode of care.
410.40	AMI (other inferior wall)—episode of care unspecified.
410.41	AMI (other inferior wall)—initial episode of care.
410.50	AMI (other lateral wall)—episode of care unspecified.
410.51	AMI (other lateral wall)—initial episode of care.
410.60	AMI (true posterior wall)—episode of care unspecified.
410.61	AMI (true posterior wall)—initial episode of care.
410.70	AMI (subendocardial)—episode of care unspecified.
410.71	AMI (subendocardial)—initial episode of care.
410.80	AMI (other specified site)—episode of care unspecified.
410.81	AMI (other specified site)—initial episode of care.
410.90	AMI (unspecified site)—episode of care unspecified.
410.91	AMI (unspecified site)—initial episode of care.

ICD-9-CM CODES TO IDENTIFY CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD) CASES

ICD-9-CM Code	Description of code
491.21	Obstructive chronic bronchitis; With (acute) exacerbation; acute exacerbation of COPD, decompensated COPD, decompensated COPD with exacerbation.
491.22	Obstructive chronic bronchitis; with acute bronchitis.
491.8	Other chronic bronchitis. Chronic: tracheitis, tracheobronchitis.
491.9	Unspecified chronic bronchitis.
492.8	Other emphysema; emphysema (lung or pulmonary): NOS, centriacinar, centrilobular, obstructive, panacinar, panlobular, unilateral, vesicular. MacLeod's syndrome; Swyer-James syndrome; unilateral hyperlucent lung.
493.20	Chronic obstructive asthma; asthma with COPD, chronic asthmatic bronchitis, unspecified.
493.21	Chronic obstructive asthma; asthma with COPD, chronic asthmatic bronchitis, with status asthmaticus.
493.22	Chronic obstructive asthma; asthma with COPD, chronic asthmatic bronchitis, with (acute) exacerbation.
496	Chronic: nonspecific lung disease, obstructive lung disease, obstructive pulmonary disease (COPD) NOS. NOTE: This code is not to be used with any code from categories 491-493.
518.81*	Other diseases of lung; acute respiratory failure; respiratory failure NOS.

ICD-9-CM CODES TO IDENTIFY CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD) CASES—Continued

ICD-9-CM Code	Description of code
518.82*	Other diseases of lung; acute respiratory failure; other pulmonary insufficiency, acute respiratory distress.
518.84*	Other diseases of lung; acute respiratory failure; acute and chronic respiratory failure.
799.1*	Other ill-defined and unknown causes of morbidity and mortality; respiratory arrest, cardiorespiratory failure.

*Principal diagnosis when combined with a secondary diagnosis of AECOPD (491.21, 491.22, 493.21, or 493.22)

ICD-9-CM CODES TO IDENTIFY TOTAL HIP ARTHROPLASTY/TOTAL KNEE ARTHROPLASTY (THA/TKA) CASES

ICD-9-CM code	Description of code
81.51	Total hip arthroplasty.
81.54	Total knee arthroplasty.

For FY 2015, we proposed to calculate aggregate payments for excess readmissions, using MedPAR claims from July 1, 2010 to June 30, 2013, to identify applicable conditions based on the same ICD-9-CM codes used to identify the conditions for the readmissions measures, and to apply the proposed exclusions for the types of admissions discussed above. To calculate aggregate payments for excess readmissions, we proposed to calculate

the base operating DRG payment amounts for all claims in the 3-year applicable period for each applicable condition (AMI, HF, PN, COPD and THA/TKA) based on the claims we have identified as described above. Once we have calculated the base operating DRG amounts for all the claims for the five applicable conditions, we proposed to sum the base operating DRG payments amounts by each condition, resulting in five summed amounts, one amount for each of the five applicable conditions. We proposed to then multiply the amount for each condition by the respective excess readmissions ratio minus 1 when that excess readmissions ratio is greater than 1, which indicates that a hospital has performed, with respect to readmissions for that applicable condition, worse than the average hospital with similar patients. Each product in this computation

represents the payments for excess readmissions for that condition. We proposed to then sum the resulting products which represent a hospital's proposed "aggregate payments for excess readmissions" (the numerator of the ratio). Because this calculation is performed separately for each of the five conditions, a hospital's excess readmissions ratio must be less than or equal to 1 on each measure to aggregate payments for excess readmissions (and thus a payment reduction under the Hospital Readmissions Reduction Program). We note that we did not propose any changes to our existing methodology to calculate "aggregate payments for all discharges" (the denominator of the ratio).

We proposed the following methodology for FY 2015 as displayed in the chart below.

FORMULAS TO CALCULATE THE READMISSIONS ADJUSTMENT FACTOR

Aggregate payments for excess readmissions = [sum of base operating DRG payments for AMI × (Excess Readmissions Ratio for AMI-1)] + [sum of base operating DRG payments for HF × (Excess Readmissions Ratio for HF-1)] + [sum of base operating DRG payments for PN × (Excess Readmissions Ratio for PN-1)] + [sum of base operating DRG payments for COPD × (Excess Readmissions Ratio for COPD-1)] + [sum of base operating DRG payments for THA/TKA × (Excess Readmissions Ratio for THA/TKA-1)].

*Note, if a hospital's excess readmissions ratio for a condition is less than/equal to 1, then there are no aggregate payments for excess readmissions for that condition included in this calculation.

Aggregate payments for all discharges = sum of base operating DRG payments for all discharges.

Ratio = 1-(Aggregate payments for excess readmissions/Aggregate payments for all discharges).

Proposed Readmissions Adjustment Factor for FY 2015 is the higher of the ratio or 0.9700.

*Based on claims data from July 1, 2010 to June 30, 2013 for FY 2015.

We invited public comment on these proposals.

Comment: Several commenters supported the inclusion of the Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) All-Cause Unplanned 30-Day Risk-Standardized Readmission and the Hospital-level 30-day Readmission Following Admission for an Acute Exacerbation of Chronic Obstructive Pulmonary Disease measures. Others commenters supported the modified exclusions for both of these measures, as well as the payment adjustment factor and calculation of aggregate payments.

Response: We thank the commenters for support of the exclusions, payment adjustment factor, and calculation of aggregate payments for the Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA)

All-Cause Unplanned 30-Day Risk-Standardized Readmission and the Hospital-Level 30-day Readmission Following Admission for an Acute Exacerbation of Chronic Obstructive Pulmonary Disease measures, and the support to expand the Hospital Readmissions Reduction Program with this measures.

Comment: On CMS' proposed methodology to identify THA/TKA admissions to include in the calculation of Aggregate Payments for Excess Readmissions, one commenter recommended that CMS expand the list of exclusions to specifically exclude conversion of previous hip surgery to total hip arthroplasty (represented by CPT code 27132). The commenter noted that, while the current granularity of the ICD-9-CM coding framework may complicate isolating

these cases, the commenter believed that the previous surgery of the hip is a specific risk factor for complications (for example, infection, fracture), and therefore these cases should be identified for purposes of the readmission measure.

Response: As discussed earlier in this final rule, in order to calculate aggregate payments for excess readmissions, consistent with our existing policy, we proposed to identify each applicable condition using the ICD-9-CM codes used to identify applicable conditions to calculate the excess readmissions ratios. We do not believe it would be appropriate to apply an exclusion to the set of admissions used to calculate the aggregate payments that is not applied in the measure cohort definition that is calculation of the excess readmission ratio. The current measure for THA/

TKA excludes specific groups of patients with prior hip surgeries that place them at a significantly increased risk of complications, including revision procedures and those requiring removal of implanted devices from the femur (ICD-9-CM codes 78.65). We are currently exploring the specificity of ICD-9-CM versus CPT codes for prior hip surgery to assess whether the measure cohort definition could be further refined by including CPT codes. If we determine that any changes to the measure cohort may be appropriate, we would propose such changes through future rulemaking.

Comment: Several commenters recommended changes to the methodology to calculate the readmission payment adjustment factors. Several commenters stated that the proposed calculation of the readmission payment adjustment factor creates excessive payment reductions. Commenters noted that the calculation of the readmissions payment adjustment factors is flawed because the excess readmission ratio should be applied to the number of a hospital's readmissions, not admissions, in order to determine the hospital's excess payments for readmissions.

Furthermore, these commenters asserted that CMS has the authority through rulemaking to apply the excess readmission ratio to a hospital's readmissions to determine a hospital's excess payments for readmissions, which they believed would be consistent with Congressional intent. Commenters noted that CMS' estimated savings exceed the Congressional Budget Office (CBO) score for the provision, which commenters believed demonstrates that CMS' literal reading of the statute is not consistent with Congressional intent. Commenters also suggested that CMS could determine the magnitude of the readmission reduction using the 25th percentile of hospital performance on the readmission measures rather than assuming average hospital performance, which is the assumption of the current methodology used to determine the number of expected readmissions.

Response: We received a similar comment in response to the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 53393) and to the FY 2014 IPPS/LTCH PPS proposed rule (78 FR 50673). We continue to believe that the statute is prescriptive with respect to the calculation of "aggregate payments for excess readmissions" where the statute specifies that the "aggregate payments for excess readmissions" is the sum for each condition of the product of "the operating DRG payment amount for

such hospital for such applicable period for such condition" and "the number of admissions for such condition" and "the excess readmission ratio" minus one. We believe that section 1886(q)(4)(A) of the Act requires us to include all admissions for a condition in the calculation of "aggregate payments for excess readmissions." We do not believe we have the discretionary authority to implement an alternative methodology under the existing the statute. We continue to believe that we are implementing the provision as required by law.

Comment: Several commenters stated that the Hospital Readmissions Reduction Program does not account for improvement in readmission rates. One commenter asserted that there is no incentive for improvement under the Hospital Readmissions Reduction Program as there is in the Hospital VBP Program and stated that penalties under this program are due to issues out of the control of the hospital. One commenter suggested that the penalty should equal the cost of excess readmissions over a fixed target level of readmissions, as opposed to a hospital being measured against the national average.

Response: We appreciate the comments on various ways to change the calculations of the readmissions payment adjustment factors and readmissions measures to account for improvement in readmission rates or provide incentives for readmissions, as opposed to penalties. We received similar comments in responses in previous rulemaking (77 FR 53394 and 78 FR 50673). The Hospital Readmissions Reduction Program under section 1886(q) of the Act is structured to compare a hospital's performance for certain conditions compared to the average hospital. If a hospital can improve over time and those improvements result in a performance on readmissions for the applicable conditions that is better than the average hospital, the hospital has the potential to reduce its penalty or not be subject to a penalty at all. As we have stated in previous rules, the statute does not provide us with the authority to reward hospitals for improvement, which is allowed under section 1886 (p) of the Act for the Hospital VBP Program.

Comment: MedPAC provided several recommendations to change the Hospital Readmissions Reduction Program related to the calculation of the readmissions payment adjustment factor, which MedPAC acknowledged would require statutory changes. Specifically, MedPAC stated that the readmission penalty formula is flawed because aggregate penalties remain

constant even as national readmission rates decline. In addition, MedPAC pointed out that the condition-specific penalty per excess readmission is higher for conditions with low readmission rates, which becomes more important with the inclusion of elective total hip and total knee arthroplasty (relatively low readmission rate conditions) to the Hospital Readmissions Reduction Program. Lastly, MedPAC believed the readmissions multiplier should be removed from the formula and replaced with a penalty that roughly equals the cost of excess readmissions over a fixed target level of readmissions. Given a fixed target, under this approach penalties would decline if hospitals' collective performance improves.

Response: We appreciate the comments and suggestions made by MedPAC. We note that these comments are similar to comments submitted year for the FY 2014 IPPS/LTCH PPS final rule (78 FR 50674), and we agree that to implement these recommendations would require statutory changes.

Comment: Several commenters requested that CMS clarify whether admissions denied by the CMS Recovery Audit Contractor (RACs) are excluded from either the numerator or the denominator in the calculation of the excess readmission ratios or in the calculation of the readmissions payment adjustment factors. Commenters believed that by including admissions denied by the CMS RACs, a hospital would be penalized twice for the same admission—once by the RAC denial and a second time by having the admission included in the readmission payment penalty.

Response: As we explained in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50675), we use MedPAR claims data as our data source to calculate readmissions payment adjustment factors, specifically the excess payments for readmissions and payment for all discharges. In this final rule, for FY 2015, we are finalizing a policy to use MedPAR data for discharges from July 1, 2010 through June 30, 2013, consistent with our historical practice. We also are finalizing the policy to use the March 2011 update of the FY 2010 MedPAR file, the March 2012 update of the FY 2011 MedPAR, the March 2013 update of the FY 2012 MedPAR file and the March 2014 update of the FY 2013 MedPAR file to identify the discharges occurring from July 1, 2010 through June 30, 2013. In addition, the Standard Analytic File is the data source used to calculate the excess readmission ratios. We use the June 2011 update of the 2010 SAF file, the June 2012 update of the 2011 file, the June 2012 update of

the 2012 file, and the September 2013 update of the 2013 file.

RACs have up to 3 years to review claims to determine whether a claim was inappropriately billed as inpatient when it should have been an outpatient claim. If a claim is denied as an inpatient stay, the claim is adjusted through the standard Medicare claims processing systems, going through the CWF, SAF and MedPAR. However, given the timing of the RAC audits and the updates of the SAF and MedPAR files used to calculate the readmissions measures and readmissions payment adjustment factors, it is not certain that all denied claims will be reflected in our claims files at the time of our calculations. However, we continue to believe that using these updates of the MedPAR and SAF files is consistent with IPPS ratesetting and allows for transparency for the public to obtain this dataset for replication. Furthermore, inpatient stays that are denied payment under Medicare Part A typically remain classified as inpatient stays, and can be billed to Medicare Part B as an Medicare Part B inpatient stay. These inpatient stays that are denied payment under Medicare Part A will typically continue to count as a qualifying inpatient stay for other payment purposes such as qualifying for SNF benefits and Medicare DSH patient days. Therefore, we continue to believe that it is appropriate to include these admissions in the Hospital Readmissions Reduction Program.

Comment: One commenter opposed the proposal that the base operating DRG payment amount for MDHs include the difference between the hospital-specific rate payment and the Federal rate payment in FY 2015, noting that, for teaching MDHs, the hospital-specific rate add-on payment is inclusive of costs associated with teaching and that the inclusion of such payment would violate the Affordable Care Act. This commenter requested that CMS maintain the current definition of “base operating DRG payment amount,” which excludes this additional hospital-specific payment rate amount.

Response: We disagree with the commenter. The “base operating DRG payment amount” is generally defined as the wage-adjusted DRG operating payment plus any applicable new technology add-on payments (§ 412.152 and § 412.160). For years prior to FY 2014, the statutory provisions related to the definition of “base operating DRG payment amount” under section 1886(q)(2)(B)(i) of the Act excluded the difference between an MDH’s applicable hospital-specific payment rate and the Federal payment rate (referred to as the

hospital-specific add-on) from the definition of the base operating DRG payment amount. (MDHs are paid based on the Federal rate or, if higher, the Federal rate plus 75 percent of the amount by which the Federal rate is exceeded by the updated hospital-specific rate from certain specified base years.) However, section 1886(q)(2)(B)(i) of the Act states that the exclusion of the hospital-specific add-on from the base operating DRG payment amount is only effective for MDHs with respect to discharges occurring during FYs 2012 and 2013. Furthermore, section 1886(q)(2)(B)(ii) of the Act requires that the definition of base operating DRG payment amount exclude payments made under section 1886(d)(5)(B) of the Act (IME payments). While a portion of the hospital-specific rate is related to teaching services provided by teaching MDHs, we do not consider that amount to be a payment under section 1886(d)(5)(B) of the Act. We otherwise do not have authority to exclude the difference between the hospital-specific payment rate for MDHs from the definition of base operating DRG payment amount for discharges.

Therefore, in accordance with the statute, beginning in FY 2014, the definition of “base operating DRG payment amount” includes the difference between an MDH’s applicable hospital-specific rate payment and Federal rate payment (that is, the hospital-specific add-on). As a result, in the calculation of the readmissions payment adjustment factor, which is a ratio of a hospital’s “aggregate payments for excess readmissions” and a hospital’s “aggregate payments for all discharges”, the base operating DRG payment amounts used in this calculation for MDHs also includes the hospital-specific add-on, if applicable. Furthermore, the statute specifies that the readmissions payment adjustment factor is applied to the base operating DRG payment amount for each Medicare FFS discharge in a Federal fiscal year.

Therefore, we are adopting our proposal as final, and for FY 2015, the readmissions payment adjustment factor will be applied to the base operating DRG payment amount, including the hospital-specific add on for MDHs as applicable. This is consistent with the policy established for the treatment of MDHs under the Hospital Readmissions Reduction Program and the Hospital VBP Program for FY 2014 in the notice that appeared in the **Federal Register** on June 17, 2014 (79 FR 34448 through 34449) that implemented the extension of the MDH program through September 30, 2015, as provided by the PAMA. In that notice, we explained that this

change in the determination of base operating DRG for MDHs consistent is with the section 1886(q)(2)(B)(i) of the Act, and affects both the calculation of the readmission payment adjustment factor and the payments reduced by the readmission payment adjustment factor for MDHs that receive the hospital-specific add-on payment.

As noted previously, MDHs are paid the higher of the Federal rate payment or Federal rate payment plus the hospital-specific add-on payment on a per claim basis. At cost report settlement, the MAC determines which of the payment options yields a higher aggregate payment for an MDH, and also determines the final hospital-specific add-on payment (if applicable) for that MDH for each cost reporting period. Because a final payment determination for an MDH’s cost reporting period is not done until cost report settlement, if an MDH ultimately receives the hospital-specific add-on (that is, its final payment is determined to be the Federal rate payment plus 75 percent of the amount by which the Federal rate payment is exceeded by the updated hospital-specific rate payment), then additional adjustments under the Hospital Readmissions Reduction Program will be made during cost report settlement and not on the claim. If at cost report settlement an MDH ultimately does not receive a hospital-specific add-on for the cost reporting period (that is, its final payment is determined to be the Federal rate payment only), then no additional adjustment (if otherwise applicable) under the Hospital Readmissions Reduction Program will be made.

Comment: Some commenters supported the proposed series of changes to calculate the aggregate payments for excess readmissions for FY 2015 including the two additional conditions of COPD and TKA/THA. Specifically, some commenters supported CMS’ exclusions of admissions to calculate aggregate payments for excess readmissions, most of which conformed to the calculation exclusions of the individual measures. Commenters supported CMS’ proposals where index admissions that are not considered readmissions for the purpose of the readmissions measures and are excluded from the calculation of the excess readmission ratio, would also be excluded from the admissions used to determine a hospital’s aggregate payments for excess readmissions, such as exclusions for admissions for patients who did not have Medicare Part A and B for 12 months prior to the admission or 3030 days after the admission, as identified by linking MedPAR claims

files to the Medicare Enrollment Database (EDB). Some commenters supported CMS' proposal to use of MedPAR data to calculate the readmissions payment adjustment factors.

Response: We thank the commenters for their support of our proposed methodology to calculate the readmission payment adjustment factors with the inclusion of two additional readmissions measures of THA/TKA and COPD, and we are finalizing the policies as proposed. The MedPAR data we are finalizing to use to calculate the readmissions payment adjustment factors for FY 2015 is specified above.

We note that we stated in the proposed rule (79 FR 28113) that, for the final rule, applicable hospitals will have had the opportunity to review and correct data from the proposed FY 2015 applicable period of July 1, 2010 to June 30, 2013 before they are made public under our policy regarding the reporting of hospital-specific information. In previous years, the review and correction period occurred prior to the publication of the final rule, and we published the final excess readmission ratios and readmission payment adjustment factors on the CMS IPPS Web site and the final readmission payment adjustment factors in Table 15 in conjunction with the issuance of the final rule. Since the publication of the proposed rule, we experienced unexpected delays in the production of the excess readmission ratios, which has resulted in a later than expected start to the 30-day review and corrections period. For the data from the FY 2015 applicable period, the review and corrections period will still be ongoing through August 19, 2014, which extends beyond the issuance of this FY 2015 IPPS/LTCH PPS final rule. As a result, in Table 15A listed in the Addendum of this final rule (which is available only via the Internet on the CMS Web site), we are providing proxy FY 2015 readmission payment adjustment factors, and are posting the corresponding proxy excess readmission ratios, which are based on the FY 2015 application period of July 1, 2010 to June 30, 2013, on the CMS IPPS Web site. After the completion of the review and corrections process, we will publish the final FY 2015 readmissions payment adjustment factors in Table 15B that will be effective for determining payments for discharges occurring on or after October 1, 2014, and the corresponding final excess readmission ratios on the CMS IPPS Web site. We expect the final FY 2015 readmissions payment adjustment factors in Table 15B and the corresponding final excess

readmission ratios to be posted on the CMS IPPS Web site prior to October 1, 2014.

After consideration of the public comments we received, we are finalizing without modification our proposals pertaining to the inclusion of THA/TKA and COPD readmissions measures to calculate aggregate payments for excess readmissions beginning in FY 2015.

12. Hospital Readmissions Reduction Program Extraordinary Circumstances Exceptions

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50676), we indicated that commenters had requested a potential waiver or exemption process for hospitals located in areas that experience disasters or other extraordinary circumstances, even though we had not proposed an extraordinary circumstance exceptions/exemptions (ECE) policy for the Hospital Readmissions Reduction Program. We noted that there are several policy and operational considerations in developing a disaster exemption process for the Hospital Readmissions Reduction Program.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28117) we welcomed public comment on whether an exemption process should be implemented, and the policy and operational considerations for a potential Hospital Readmissions Reduction Program ECE policy.

Comment: A few commenters supported the creation of an extraordinary circumstance exemption process. The commenters recommended that an extraordinary circumstance exemption process should be allowed for hospitals that experience a natural disaster and should also be applied to the payment year in which the date of the disaster occurs because the Hospital Readmissions Reduction Program uses 2 years of performance data that also overlaps with subsequent payment years. Two commenters specifically indicated that the extraordinary circumstance exemption process should be similar to the existing Hospital VBP Program exceptions process. Finally, a commenter suggested establishing a 90-day period, beginning with the date of the disaster, for hospitals to submit a request for an exemption from the Hospital Readmissions Reduction Program for a specific fiscal year. No commenters made other recommendations on how to operationalize an extraordinary circumstance exemption policy and supporting processes.

Response: We appreciate the input from the commenters. We will take into consideration these recommendations as we consider whether an exemption process for the Hospital Readmissions Reduction Program should be implemented.

I. Hospital Value-Based Purchasing (VBP) Program

1. Statutory Background

Section 1886(o) of the Act, as added by section 3001(a)(1) of the Affordable Care Act, requires the Secretary to establish a hospital value-based purchasing program (the Hospital Value-Based Purchasing (VBP) Program) under which value-based incentive payments are made in a fiscal year to hospitals that meet performance standards established for a performance period for such fiscal year. Both the performance standards and the performance period for a fiscal year are to be established by the Secretary.

Section 1886(o)(1)(B) of the Act states that the Hospital VBP Program applies to payments for hospital discharges occurring on or after October 1, 2012. In accordance with section 1886(o)(6)(A) of the Act, we are required to make value-based incentive payments under the Hospital VBP Program to hospitals that meet or exceed performance standards for a performance period for a fiscal year. As further required by section 1886(o)(6)(C)(ii)(I) of the Act, we base each hospital's value-based payment percentage on the hospital's Total Performance Score (TPS) for a specified performance period. In accordance with section 1886(o)(7) of the Act, the total amount available for value-based incentive payments for a fiscal year will be equal to the total amount of the payment reductions for all participating hospitals for such fiscal year, as estimated by the Secretary. For FY 2014, the available funding pool was equal to 1.25 percent of the base-operating DRG payments to all participating hospitals, as estimated by the Secretary. The size of the applicable percentage has increased to 1.50 percent for FY 2015 and will increase to 1.75 percent for FY 2016, and to 2.0 percent for FY 2017 and successive fiscal years.

Section 1886(o)(1)(C) of the Act generally defines the term "hospital" for purposes of the Hospital VBP Program as a subsection (d) hospital (as that term is defined in section 1886(d)(1)(B) of the Act), but excludes from the definition of the term "hospital," with respect to a fiscal year: (1) A hospital that is subject to the payment reduction under section 1886(b)(3)(B)(viii)(I) of the Act (the Hospital IQR Program) for such fiscal

year; (2) a hospital for which, during the performance period for the fiscal year, the Secretary has cited deficiencies that pose immediate jeopardy to the health or safety of patients; and (3) a hospital for which there are not a minimum number (as determined by the Secretary) of measures that apply to the hospital for the performance period for the fiscal year involved, or for which there are not a minimum number (as determined by the Secretary) of cases for the measures that apply to the hospital for the performance period for such fiscal year.

2. Overview of Previous Hospital VBP Program Rulemaking

We refer readers to the Hospital Inpatient VBP Program final rule (76 FR 26490 through 26547), FY 2012 IPPS/LTCH PPS final rule (76 FR 51653 through 51660), CY 2012 OPSS/ASC final rule with comment period (76 FR 74527 through 74547), FY 2013 IPPS/LTCH PPS final rule (77 FR 53567 through 53614), FY 2014 IPPS/LTCH PPS final rule (78 FR 50676 through 50707), and CY 2014 OPSS/ASC final rule with comment period (78 FR 75120 through 75121) for further descriptions of our policies for the Hospital VBP Program.

We have also codified certain requirements for the Hospital VBP Program at Title 42, Sections 412.160 through 412.167 of our regulations.

3. FY 2015 Payment Details

a. Payment Adjustments

Section 1886(o)(7)(B) of the Act instructs the Secretary to reduce the base operating DRG payment amount for a hospital for each discharge in a fiscal year by an applicable percent. Under section 1886(o)(7)(A) of the Act, the sum total of these reductions in a fiscal year must equal the total amount available for value-based incentive payments for all eligible hospitals for the fiscal year, as estimated by the Secretary. We finalized details on how we would implement these provisions in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53571 through 53573) and refer readers to that rule for further details.

Under section 1886(o)(7)(C)(iii) of the Act, the applicable percent for the FY 2015 Hospital VBP Program is 1.50 percent. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28117 through 28118), using the methodology we adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53571 through 53573), we estimated that the total amount available for value-based incentive payments for FY 2015 was \$1.4 billion, based on the December 2013 update of the FY 2013 MedPAR file. We stated

that we intended to update this estimate for the FY 2015 IPPS/LTCH PPS final rule, using the March 2014 update of the FY 2013 MedPAR file. Based on the March 2014 update of the FY 2013 MedPAR file, we continue to estimate that the amount available for value-based incentive payments for FY 2015 is \$1.4 billion.

As finalized in the FY 2013 IPPS/LTCH PPS final rule, we will utilize a linear exchange function to translate this estimated amount available into a value-based incentive payment percentage for each hospital, based on its TPS. We will then calculate a value-based incentive payment adjustment factor that will be applied to the base operating DRG payment amount for each discharge occurring in FY 2015, on a per-claim basis. We noted in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28117–28118) that we were publishing proxy value-based incentive payment adjustment factors in Table 16 of that proposed rule (which is available via the Internet on the CMS Web site). The proxy factors are based on the TPSs from the FY 2014 Hospital VBP Program. These FY 2014 performance scores are the most recently available performance scores that hospitals have been given the opportunity to review and correct. The slope of the linear exchange function used to calculate those proxy value-based incentive payment adjustment factors was 2.0952951561. This slope, along with the estimated amount available for value-based incentive payments, was also published in Table 16.

We stated that we intended to update this table as Table 16A in this final rule (which will be available via the Internet on the CMS Web site) to reflect changes based on the March 2014 update to the FY 2013 MedPAR file. We also stated that we intended to update the slope of the linear exchange function used to calculate those updated proxy value-based incentive payment adjustment factors. The slope of the linear exchange function used to calculate those updated proxy value-based incentive payment adjustment factors is 2.0950773214. The updated proxy value-based incentive payment adjustment factors for FY 2015 continue to be based on historic FY 2014 Program TPSs because hospitals will not have been given the opportunity to review and correct their actual TPSs for the FY 2015 Hospital VBP Program until after this FY 2015 IPPS/LTCH PPS final rule is published. After hospitals have been given an opportunity to review and correct their actual TPSs for FY 2015, we will add Table 16B (which will be available via the Internet on the CMS Web site) to

display the actual value-based incentive payment adjustment factors, exchange function slope, and estimated amount available for the FY 2015 Hospital VBP Program. We expect that Table 16B will be posted on the CMS Web site in October 2014.

We received a number of public comments on our stated intention to update Table 16 as Table 16A for the final rule:

Comment: Commenters found Table 16 misleading and urged CMS to adopt a change in the process that would allow for a more meaningful release of information in the proposed rule on Hospital VBP performance. Specifically, commenters stated that Table 16 is not useful to hospitals that attempt to assess their performance in comparison to others when CMS has added or removed new measures and changed the domain weights. As a result, commenters urged CMS to calculate proxy factors using the updated measures and domain weights finalized in last year's rule for FY 2015 so that hospitals are not forced to rely on data provided to them from other entities, such as State hospital associations that provide updated information to their members.

Response: While we understand commenters' concerns with comparing Hospital VBP performance information across program years, we make these calculations using the most recently available performance data that hospitals have had the opportunity to review, which at the time of the IPPS/LTCH PPS rule's publication does not include the scoring data for the next fiscal year. We do not believe it would be useful to publish proxy factors using domain weights finalized for the next fiscal year without the corresponding performance scoring data from the same program year because that action would mix policies between fiscal years, which is why we have adopted the practice of calculating proxy factors from the previous year. We believe that these calculations represent the most accurate data available at the time of the final rule's publication and appropriately reflect policies for a single program year.

b. Base Operating DRG Payment Amount Definition for Medicare-Dependent, Small Rural Hospitals (MDHs)

Section 106 of Public Law 113–93, the Protecting Access to Medicare Act of 2014 (PAMA), extended the MDH program through March 31, 2015. We note that the special treatment for MDHs under section 1886(o)(7)(D)(ii)(I) of the Act, with regard to definition of base operating DRG payment amount,

does not apply to discharges occurring after FY 2013.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28118), for FY 2015 and subsequent years, for purposes of calculating the payment adjustment factors and applying the payment methodology, we proposed that the base operating DRG payment amount for MDHs will include the difference between the hospital-specific payment rate and the Federal payment rate (as applicable). We also proposed to revise the definition of “base operating DRG payment amount” in section 412.160 paragraph (2) of our regulations to reflect this change. We welcomed comments on this proposal.

Comment: One commenter opposed CMS’ proposal to revise the definition of base operating DRG payment amount for MDHs to include the difference between the hospital-specific payment rate add-on payment amount and the Federal payment rate, noting that for teaching MDHs, the hospital-specific rate add-on payment amount is inclusive of costs associated with teaching and that the inclusion of such payment would violate the Affordable Care Act. This commenter requested that CMS maintain the current definition of base operating DRG payment amount, which excludes this additional hospital-specific payment rate amount.

Response: We disagree with this comment. Section 1886(o)(7)(D)(i)(II) of the Act requires that the definition of base operating DRG payment amount exclude payments made under section 1886(d)(5)(B) of the Act. While a portion of the hospital-specific rate is related to teaching services provided by teaching MDHs, we do not consider that amount to be a payment under section 1885(d)(5)(B) of the Act. We do not believe that we have authority to exclude the difference between the hospital-specific payment rate and the Federal payment rate for MDHs from the definition of base operating DRG payment amount for discharges after FY 2013.

We did not receive any public comments on the corresponding proposed regulatory revision at 42 CFR 412.160.

After consideration of the public comments we received, we are finalizing our policy, as proposed, to revise the definition of “base operating DRG payment amount” for MDH to include the difference between the hospital-specific payment rate and the Federal payment rate (as applicable). We also are finalizing the revision to the definition of “base operating DRG payment amount” in section 412.160,

paragraph (2), of our regulations, as proposed.

We also received a number of general comments on the Hospital VBP Program:

Comment: Commenters asked that CMS to clarify why CMS did not address FY 2018 Hospital VBP Program requirements in the proposed rule.

Response: We adopted certain FY 2018 policies related to claims-based measures that require a long performance period in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50692 through 50694 and 50698 through 50699). For the same reason, we are adopting certain policies related to FY 2019 and FY 2020 measures in this final rule. We intend to propose additional FY 2018 policies, including additional measures, performance periods, performance standards, and other policies in future rulemaking.

Comment: One commenter expressed concern about the instability and changing requirements of the Hospital VBP Program. The commenter was especially concerned that 60 percent of the measures are calculated based on coding that could result in inaccurate measure rates. The commenter suggested that there be some sort of validation for hospitals performing well to assure that coding practices are being met.

Response: As discussed in the Hospital Inpatient VBP Program final rule (76 FR 26537 through 26538), we have finalized a policy under which we will use the validation process that we use for the Hospital IQR Program to ensure that Hospital VBP data are accurate. As we described in that final rule, we view the Hospital IQR Program’s validation processes as sufficient to ensure that Hospital VBP Program data are accurate, and we intend to continue working with stakeholders to develop additional validation processes as necessary to ensure data accuracy for the Hospital VBP Program.

Comment: One commenter urged CMS to put measures in place prior to affecting Medicare payments. The commenter suggested the best way to improve patient care is to “put into practice” a measure and track it over time. According to the commenter, if there is no improvement in the results, the measure could then be included in the Hospital VBP Program.

Response: We interpret the comment as suggesting that we adopt measures for reporting purposes prior to adopting them under the Hospital VBP Program. We note that we can only select measures for the Hospital VBP Program that have been specified under the

Hospital IQR Program and publicly reported on the *Hospital Compare* Web site. However, we appreciate the suggestion that we track measures over time before adopting them for the Hospital VBP Program to ensure that these measures will serve the goals of the program, and we will take the suggestion into consideration as we develop future policies.

Comment: Commenters strongly supported CMS’ removal of process measures that use chart-abstracted data and supported the use of outcomes measures.

Response: We thank the commenters for their support.

Comment: One commenter urged CMS to return a hospital’s “carve-out” if the hospital is deemed ineligible for the Hospital VBP Program as a result of the policy by which CMS requires that hospitals submit a minimum number of cases and measures across domains in order to receive a Total Performance Score.

Response: Hospitals that are excluded from the Hospital VBP Program for a fiscal year for any reason do not have the applicable percentage withheld from their base operating DRG payment amounts.

Comment: Several commenters stated that they do not believe 2 percent of the amount of Medicare hospital payments is significant enough to drive value-based change in the system. A few commenters suggested that CMS consider alternative ways to align Medicare payments with the policies developed in the Hospital VBP Program to promote more change.

Response: The statute ultimately caps the Hospital VBP Program’s funding at 2 percent of base-operating DRG payment amounts, and we view this amount as substantial enough to provide significant incentives to hospitals to improve the quality of care they provide to Medicare beneficiaries.

Comment: Several commenters supported CMS’ efforts to align the Hospital VBP Program with existing hospital and physician quality reporting initiatives, including the Physician Value-Based Modifier (VM) Program. One commenter stated that the programs should encourage consistent quality throughout the continuum of care.

However, one commenter cautioned CMS in its goal of increasing alignment between the Hospital VBP and physician quality reporting initiatives because, despite generally supporting alignment between Medicare reporting requirements to decrease the administrative burden on providers, the commenter expressed concern that the Medicare Spending per Beneficiary

(MSPB) measure is inappropriate for inclusion in the physician quality reporting programs.

Response: We will consider possible policies aimed at aligning our quality programs across different care settings in future rulemaking. We disagree, however, that the MSPB measure is generally inappropriate for inclusion in physician quality reporting programs. We view measures of efficiency like MSPB as critical components of quality measurement and pay-for-performance programs.

Comment: One commenter suggested that CMS adopt more specific achievement thresholds and benchmarks to draw comparisons between hospitals of similar size, with similar access to technology, specialized staff, and patient populations.

Response: We do not believe that these types of specific adjustments to

Hospital VBP Program performance standards are feasible at this time. To implement this change, we would need to incorporate detailed adjustment methodologies in each of the measures that we have adopted for the Hospital VBP Program. We do not believe we have sufficient data on the various comparison points that the commenter suggests to create separate Hospital VBP Program performance standards for different types of hospitals at this time.

Moreover, the Hospital VBP Program's scoring methodology, based on several years' research and policy development, is designed to provide incentives to hospitals based on national performance metrics. As discussed further below, we continue to believe that the scoring methodology appropriately holds hospitals accountable based on established and well-understood metrics. However, we may consider

adjustments of the type the commenter suggests in the future as more data becomes available for analyses.

4. Measures for the FY 2017 Hospital VBP Program

a. Measures Previously Adopted

In the FY 2013 IPPS/LTCH PPS final rule, we finalized our proposal to readopt measures from the prior program year for each successive program year, unless proposed and finalized otherwise (for example, because one or more of the measures is "topped-out" or for other policy reasons). We stated our belief that this policy would facilitate measure adoption for the Hospital VBP Program for future years, as well as align the Hospital VBP Program with the Hospital IQR Program (77 FR 53592). The FY 2016 Hospital VBP Program includes the following measures:

FINALIZED MEASURES FOR THE FY 2016 HOSPITAL VBP PROGRAM

Clinical process of care domain	
AMI-7a	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival.
IMM-2	Influenza Immunization.
PN-6	Initial Antibiotic Selection for CAP in Immunocompetent Patient.
SCIP-Inf-2	Prophylactic Antibiotic Selection for Surgical Patients.
SCIP-Inf-3	Prophylactic Antibiotics Discontinued Within 24 Hours After Surgery End Time.
SCIP-Inf-9	Urinary Catheter Removed on Postoperative Day 1 or Postoperative Day 2.
SCIP-Card-2	Surgery Patients on Beta-Blocker Therapy Prior to Arrival Who Received a Beta-Blocker During the Perioperative Period.
SCIP-VTE-2	Surgery Patients Who Received Appropriate Venous Thromboembolism Prophylaxis Within 24 Hours Prior to Surgery to 24 Hours After Surgery.
Patient experience of care domain	
HCAHPS	Hospital Consumer Assessment of Healthcare Providers and Systems Survey.
Outcomes Domain	
CAUTI	Catheter-Associated Urinary Tract Infection.
CLABSI	Central Line-Associated Blood Stream Infection.
MORT-30-AMI	Acute Myocardial Infarction (AMI) 30-day mortality rate.
MORT-30-HF	Heart Failure (HF) 30-day mortality rate.
MORT-30-PN	Pneumonia (PN) 30-day mortality rate.
PSI-90	Complication/patient safety for selected indicators (composite).
SSI	Surgical Site Infection: <ul style="list-style-type: none"> • Colon • Abdominal Hysterectomy
Efficiency domain	
MSPB-1	Medicare Spending per Beneficiary.

We received a number of comments on measures that we have previously adopted for the Hospital VBP Program.

Comment: Several commenters urged CMS to consider updating and researching the HCAHPS Survey as a whole because the measure has been used for over a decade and the technology and tools have changed in this period of time. Several commenters stated that less expensive survey administration modes should be

available to minimize survey costs for participating hospitals. One commenter noted that the methods for delivering the survey are outdated given today's Internet-based society.

Response: While the HCAHPS Survey has been in use for nearly a decade, we continually review the survey and, when warranted, make changes to improve its content, implementation and data submission processes, and public reporting of its results. For

instance, in recent years we added five new survey items, including the Care Transition Measure, made the patient-mix adjustment for 'language spoken at home' more granular to account for differences among speakers of major languages, investigated the suitability of new modes of survey administration, and made survey results and analytical tools available to the public via downloadable databases on CMS Web sites. We continually examine and

refine HCAHPS protocols for survey implementation, oversight, and public reporting to maintain the integrity of the survey and increase the usefulness and accessibility of its results. We will continue to assess, analyze and improve the HCAHPS Survey to increase its value to consumers and hospitals.

With regard to comments urging us to update the HCAHPS tool, we note that the HCAHPS Survey was purposely designed to accommodate, to the degree possible, the variety of patient survey methodologies hospitals employed prior to the introduction of HCAHPS. Thus, the HCAHPS Survey was made available in four modes of survey administration (mail only; telephone only; mail with telephone follow-up; and Active Interactive Voice Response modes). Hospitals are given the option to either self-administer the survey or engage an approved survey vendor, of which several dozen are listed on the official HCAHPS On-Line Web site, www.HCAHPSonline.org. In addition, hospitals are permitted to add their own supplemental items to the survey.

We are sensitive to the costs of survey administration, especially as patient experience surveys become a standard element of quality improvement and public reporting programs for other types of healthcare providers. In 2008, we conducted a large-scale mode experiment to test the suitability of a Web-based mode of the HCAHPS Survey and concluded that a number of factors, including unavailability of email addresses for a substantial portion of the hospital patient population and low response rates, preclude the adoption of a Web-based mode at this time. We will continue to monitor and periodically evaluate the suitability of alternative, electronic survey modes. We are continuing to look at this issue. In particular, we are tracking access to the Internet among the elderly and minority populations since currently access to the Internet is lower for these critical populations that participate in our surveys.³⁸

Comment: Several commenters expressed concerns about the sufficiency of the risk adjustment of the HCAHPS composite measures. One commenter pointed out that research shows that high-acuity patients score their patient experience at a lower level, systematically disadvantaging hospitals

that take on complex and sicker patients, and suggested that CMS incorporate additional adjustments to account for patients' illness severity. One commenter urged CMS to further research broad improvements to the HCAHPS survey delivery and adjustment methodologies. A few commenters suggested that CMS exclude HCAHPS scores from the Hospital VBP Program until risk-adjustments are updated and its validity has been determined.

Response: Research on health care providers indicates that a number of quality measures differ on a regional basis, which is indicative of true differences that should not be obscured by data adjustment.

CMS and the HCAHPS Project Team are familiar with the studies commenter cited. We also are aware of a number of studies published in peer-reviewed journals that have found that patient experience of care, as measured by the HCAHPS Survey, is strongly and positively related to clinical process measures, outcomes, readmissions, and mortality. For brief reviews of these findings, we refer readers to: "The Patient Experience and Health Outcomes"³⁹ and "What does the patient know about quality?"⁴⁰

With respect to the articles cited by the commenter, we note that other researchers have cited flaws in the approach, data and methodology employed in the Fenton, et al., study, which did not directly examine the HCAHPS Survey. The study by Lyu, et al. is premised upon the misunderstanding that we use patient experience as the sole criterion for measuring and assessing hospital quality. In addition, their findings, based on examination of 31 hospitals, may insufficiently represent the over 3,000 hospitals that participate in the Hospital VBP Program and the approximately 4,000 hospitals that participate in the Hospital IQR Program.

In addition, a recent national study found a significant positive relationship between patient experience of care and surgical quality, which suggests that incentives to improve surgical patient experience and surgical quality are aligned.⁴¹

Comment: One commenter suggested that CMS separate the Cleanliness & Quietness dimension on the HCAHPS

Survey, stating that it would be more helpful for consumers to know which element is driving hospitals' performance and improvement in those areas.

Response: "Hospital Environment" is one of eight equally-weighted dimensions in the Patient Experience of Care Domain of the Hospital VBP Program. The Hospital Environment dimension is itself composed of two equally-weighted measures from the HCAHPS Survey: Percent of patients who responded "Always" to the hospital cleanliness item, and percent of patients who responded "Always" to the hospital quietness item. Therefore, the Hospital Environment dimension assigns 5 points to each of the environment measures. The Hospital Environment dimension is given the same weight in Hospital VBP Program as other key HCAHPS measures, such as Communication with Nurses, and Discharge Information ("A Step-by-Step Guide to Calculating the Patient Experience of Care Domain Score in the Hospital Value-Based Purchasing FY 2013 Actual Percentage Payment Summary Report," available on HCAHPS On-Line Web site at: <http://www.hcahpsonline.org/HospitalVBP.aspx>.) While the two environment measures have been combined in the Hospital VBP Program, consumers can see how hospitals perform on cleanliness and quietness separately by examining the measure scores posted on the *Hospital Compare* Web site.

Comment: One commenter urged CMS to reevaluate the validity of questions used on the HCAHPS Survey related to pain management, including whether the survey appropriately reflects patient satisfaction and whether or not it may encourage inappropriate treatment. The commenter expressed concern about the abuse of opioid pain relievers in hospital settings. The commenter explained that the HCAHPS Survey principally focuses on effective use of pharmacotherapy, which may be consistent with the patient's wishes but is not always in his or her best interest.

Response: The Pain Management domain is derived from three items on the HCAHPS Survey. It is important to note that the HCAHPS Survey is designed to capture and report patient experience of care at the hospital level, not at the level of physician, and that only adult inpatients are eligible for the HCAHPS Survey (emergency room patients would be eligible for the survey only if they were subsequently admitted as inpatients). The HCAHPS sampling protocol does not support reliable measurement of performance at the physician level. Any use of the

³⁸ "A Randomized Experiment Investigating the Suitability of Speech-Enabled IVR and Web Modes for Publicly Reported Surveys of Patients' Experience of Hospital Care." M.N. Elliott, J.A. Brown, W.G. Lehrman, M.K. Beckett, K. Hambarsoomian, L.A. Giordano and E. Goldstein. *Medical Care Research and Review*. 70: 165-184. 2013.

⁴¹ Tsai, et al. "Patient Satisfaction and Quality of Surgical Care in US Hospitals." *Annals of Surgery*, 2014.

HCAHPS Survey to evaluate individual physicians is inconsistent with our guidance.

We understand and share the commenter's concerns about the rising level of abuse of opioid pain relievers in the United States. The HCAHPS Survey includes three questions about pain control to measure and publicly report patient experience with this common, yet critical, aspect of hospitalization; and neither the patient nor the physician(s) is identified in survey data submitted to CMS. Pain control is an important part of patient care in a hospital and should be evaluated at the hospital level. There are non-opioid options for pain control that many hospitals use.

All items on the HCAHPS Survey have been carefully constructed and tested, both in the field and in focus groups of patients and caregivers.⁴² The statistical reliability of the Pain Management domain was 0.80 in 2013.

We share the commenter's commitment to reducing abuse of opioids and will reach out to hospitals and physicians to help them more fully understand the capacities and limits of the HCAHPS Survey in this regard and will pursue further research on the wording of the pain management items in the HCAHPS Survey.

Comment: One commenter proposed replacing the MSPB measure with the NQF-endorsed Relative Resource Use (RRU) measure, or a measure designed to track health care resource use by providers, health plans, or other units for individuals having one of five chronic diseases (COPD, cardiovascular disease, diabetes, asthma, and hypertension).

Response: We disagree that the MSPB should be replaced with an RRU measure. We note that the MSPB measure is also NQF-endorsed. Inclusion of an overall measure of cost is an essential complement to the condition-specific measures included in the clinical process of care and outcomes domains. Relying on condition-specific measures alone, such as RRU measures, would disregard differences in overall cost. The MSPB measure is reported as a ratio of the payment-standardized, risk-adjusted MSPB amount for each hospital divided by the weighted median MSPB amount across all hospitals. As discussed in section IV.1.6.b. of the preamble of this final rule (Possible Future Efficiency and Cost Reduction Domain Measure Topics), we are considering expansion of the Efficiency and Cost Control

domain to include six condition-specific Medicare payment measures (three medical and three surgical condition-specific episodes) in addition to the MSPB measure and would do so through public notice and comment rulemaking.

Comment: Several commenters recommended that CMS refine its policies on risk-adjustment in the MSPB and other measures to include socioeconomic status because a patient's socioeconomic status affects clinical outcomes.

Commenters explained that comorbidities, socioeconomic status, and sociodemographic factors are major determinants of outcomes, and penalizing physicians and hospitals for readmissions of the most chronically ill patients without proper risk adjustment could provide unintended negative consequences. Commenters stated that, without a risk-adjustment factor, hospitals treating these patients become subject to penalizations for readmissions not related to the care provided as well as penalizations for extending an inpatient stay in order to better optimize the patient's health status. Further, commenters suggested that hospitals that serve a disproportionate share of these patients could conceivably do the most to improve their health status but are disproportionately penalized without a risk adjustment.

One commenter suggested that CMS examine NQF's Risk Adjustment for Socioeconomic Status or Other Sociodemographic Factors Draft Report for determining the appropriate risk adjustment methodology for the Hospital VBP Program. (Draft Report available at: http://www.qualityforum.org/Risk_Adjustment_SES.aspx.) Another commenter strongly supported the recommendations contained in the draft report and urged CMS to accordingly modify its risk-adjustment methodology to include such factors.

Response: We appreciate these comments and the importance of the role that SES plays in the care of patients. With regard to the MSPB measure's risk adjustment specifically, we note that the MSPB measure was finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51619 through 51627). In that rule, we addressed concerns about risk adjustment. We are aware that there are differing opinions regarding our current approach in risk-adjusting measures in the Hospital Readmissions Reduction Program for SES. We note that the readmission measures aim to reveal differences related to the quality of care provided. We believe that quality of care received

by patients of lower SES contributes at least in part to the observed association between SES status and the readmissions rate. We continue to have concerns about holding hospitals to different standards for the outcomes of their patients of low SES—we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations.

We routinely monitor the impact of SES on hospitals' results. To date, we have found that hospitals that care for large proportions of patients of low SES are capable of performing well on our measures (see the 2013 Medicare Hospital Quality Chart Book on pages 46 through 53 at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Downloads/-Medicare-Hospital-Quality-Chartbook-2013.pdf>). Previous analyses presented at the NQF during endorsement proceedings of the Hospital-Wide All-Cause Unplanned Readmission Measure (available at: <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=70813>) also show that adding SES to the risk-adjustment has a negligible impact on hospitals' risk-standardized rates. The risk adjustment for clinical factors likely captures much of the variation due to SES, therefore resulting in an attenuation of the impact of SES factors on hospitals' results.

We continue to monitor related activities at NQF, such as the July 23, 2014 decision by the NQF Board in which the Board approved a trial period to test the impact of sociodemographic factor risk adjustment of performance measures (available at: http://www.qualityforum.org/Press_Release/2014/NQF_Board_Approves_Trial_Risk_Adjustment.aspx), and in Congress. As we stated in the past, we are committed to working with the NQF and other stakeholder communities to continuously refine our measures and to address the concerns associated with SES and risk adjustment. We believe that continued collaboration with the stakeholder communities will enable us to identify feasible ways to appropriately address any unintended consequences for providers serving high proportions of low-SES patients.

Comment: Some commenters expressed concern about the influence of factors that are outside the hospital's control on the MSPB measure and the lack of associated quality or outcome measures. One of these commenters stated that any measures focusing exclusively on cost such as the MSPB measure create incentives to reduce services in ways that adversely affect patient outcomes and that such cost

⁴² Sofaer, et al., Health Services Research, 40: 6, 2018–2036. 2005.

measures also create disincentives to adopt new technologies.

One commenter expressed concern that the measure does not track the frequency of hospitalization, noting that a community that reduces avoidable hospitalizations may experience higher per-hospitalization costs, even if overall costs go down.

Response: Regarding the commenters' concern with the degree of the hospital's control over the MSPB measure, we continue to disagree that care furnished to beneficiaries after they are discharged from an acute care hospital is outside of the hospital's control. As we stated in the FY 2012 IPPS/LTCH PPS final rule, we believe that hospitals that provide quality inpatient care, conduct appropriate discharge planning, and work with providers and suppliers on appropriate follow-up care can achieve efficiencies and perform well on the measure (76 FR 51621).

Regarding the comment that the MSPB measure does not account for quality, we continue to agree that it is beneficial to view a cost measure in light of other quality measures. We do not believe that a including measure of cost, independent of quality in the Hospital VBP Program, would result in a reduction of needed services or in a disincentive to develop new technologies, because as we stated in the FY 2012 IPPS/LTCH PPS final rule, for purposes of the Hospital VBP Program, we will weight and combine the Efficiency and Cost Control domain with the other domain scores, in order to calculate each hospital's TPS, ensuring that that MSPB and any other Efficiency and Cost Control Domain measures we adopt make up only a portion of the TPS and that the remainder is based on hospitals' performance on the other quality measures (76 FR 51622). As we stated in the FY 2013 IPPS/LTCH PPS final rule, section 1886(o)(2)(B)(ii) of the Act expressly requires the inclusion of "measures of Medicare spending per beneficiary" in the Hospital VBP Program. We do not believe that the MSPB measure itself should assess both cost and quality. We believe that a inclusion of a distinct measure of cost, independent of quality, as part of the Hospital VBP Program enables us to identify hospitals involved in the provision of high quality care at a lower cost to Medicare (77 FR 53586).

With regard to tracking the frequency of hospital admissions, we do not believe that the measure would adversely affect communities involved in minimizing hospitalizations because the risk adjustment takes into account the severity of illness of hospitalized

beneficiaries so that hospitals admitting more complex patients would have their Medicare spending compared to the expected spending for similarly complex patients.

Comment: One commenter recommended that CMS delay any further implementation of the MSPB measure until after the Physician VM Program is implemented, stating that hospitals should not be expected to bear the consequences of physicians' decisions.

Response: We agree that alignment of incentives across programs is important. In the CY 2014 Physician Fee Schedule final rule (78 FR 74774 through 74780), we finalized the inclusion of the MSPB amount in the cost composite portion of the physician value-based modifier (VM), beginning with the 2016 VM. We do not believe that it would be appropriate to suspend the further use of the MSPB measure until after the VM is implemented.

We continue to believe, as we stated in the FY 2012 IPPS/LTCH PPS final rule, that the MSPB measure is an important step in encouraging hospitals to redesign and coordinate care with other providers and suppliers of care, and that its timely implementation is critical to incentivizing hospitals to provide the highest-quality, most efficient care possible to Medicare beneficiaries (76 FR 51657).

Comment: One commenter expressed concern that the MSPB measure overlaps conceptually with the Hospital Readmissions Reduction Program, as hospitals are already being penalized for excessive readmissions under that program. The commenter urged CMS to reevaluate the MSPB measures so that CMS does not place disproportionate domain weighting on spending outside of hospitals' control.

Response: We disagree that the MSPB measure inappropriately overlaps with measures used in the Hospital Readmissions Reduction Program. As we stated in the FY 2012 IPPS/LTCH PPS final rule, the MSPB measure is not a measure of readmission rates, but rather it is a measure of total Medicare spending per beneficiary, relative to a hospital stay. A Medicare spending per beneficiary measure is required by the section 1886(o)(2)(B)(ii) of the Act to be included in the Hospital VBP Program, and therefore, in the Hospital IQR Program. We also continue to believe that the Medicare payments made for readmissions must be attributable to the index hospital stay, in order to: fully capture Medicare spending relative to a hospital stay; encourage the provision of comprehensive inpatient care, discharge planning, and follow-up; and strengthen

incentives to reduce readmissions (76 FR 51621).

We further disagree, as we stated earlier, that the MSPB measure represents services that are outside of the hospital's control. As we stated above, and in the FY 2012 IPPS/LTCH PPS final rule, we believe that hospitals that provide quality inpatient care, conduct appropriate discharge planning, and work with providers and suppliers on appropriate follow-up care can achieve efficiencies and perform well on the measure (76 FR 51621).

We thank commenters for this feedback.

b. Changes Affecting "Topped-Out" Measures

(1) Removal of Six "Topped-Out" Measures

For the FY 2017 Hospital VBP Program measure set, we evaluated whether any measures that we previously adopted are now "topped-out" by focusing on two criteria: (1) national measure data showing statistically indistinguishable performance levels at the 75th and 90th percentiles; and (2) national measure data showing a truncated coefficient of variation (TCV) less than 0.10. We refer readers to the Hospital Inpatient VBP Program final rule (76 FR 26496 through 26497) for further discussion of these current "topped-out" criteria and to our proposal below to modify the second criterion.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28119), based on our evaluation of the most recently available data, we stated our belief that PN-6, SCIP-Card-2, SCIP-Inf-2, SCIP-Inf-3, SCIP-Inf-9, and SCIP-VTE-2 are all now "topped-out." Therefore, we proposed to remove these six measures from the FY 2017 Hospital VBP measure set because measuring hospital performance on these measures will have no meaningful effect on a hospital's TPS. We believe that removing these "topped-out" measures will continue to ensure that we make valid statistical comparisons through our finalized scoring methodology and will reduce the reporting burden on participating hospitals.

We welcomed public comments on this proposal.

Comment: Many commenters supported CMS' proposal to remove "topped-out" measures, expressing appreciation for our efforts to streamline the program.

Response: We thank the commenters for their support.

Comment: One commenter suggested that CMS flag additional measures that

are approaching “topped-out” status in future rulemaking.

Response: We thank the commenter for this suggestion and will take it into consideration in future rulemaking.

Comment: Commenters urged caution with CMS’ proposed removal of “topped-out” measures, stating that several are only recently “topped-out.” Commenters also suggested that CMS consider adding more measures to the Hospital VBP Program to make up for the proposed removal of “topped-out” measures and to ensure that no single measure has a disproportionate impact on hospital performance in more than one program.

Response: We will consider new measures as they become eligible for inclusion in the Hospital VBP Program.

Comment: One commenter suggested that identified “topped-out” measures remain available in other reporting programs because the commenter believes that reporting these six specific measures has contributed to recent increases and emphasis on improved healthcare quality in hospitals, with a significant impact on local improvement efforts.

Response: While we appreciate commenter’s observation that quality reporting has contributed to improved healthcare quality in hospitals, we believe that topped-out measures should be assessed to supplement a clinically-based assessment of the measure’s impact on a clinical topic or domain.

Comment: Commenters supported the removal of the “topped-out” measures but expressed confusion at why the measures will not be removed sooner than 2017.

Response: We evaluate the Clinical Care—Process Domain measures for “topped-out” status on an annual basis in order to propose changes, if necessary, during the rulemaking process, and we do not believe it would be helpful to participating hospitals to remove measures that have been previously adopted for the Program in previous rulemakings. We note that, for example, we are currently in the middle of the Clinical Process of Care domain’s performance period for the FY 2016 Hospital VBP Program, which was adopted as CY 2014. We do not believe it would be helpful to hospitals to attempt to retire a measure in the middle of their performance period, barring substantial extenuating circumstances. We believe removing these measures for the FY 2017 Hospital VBP Program, adopted with a CY 2015 performance period, is most feasible.

Comment: Some commenters suggested that CMS retire measures when their evidentiary basis has

changed, when the collection and measurement costs exceed their utility, or when measures have been demonstrated to have minimal impact on health outcomes and status.

Response: We thank the commenters for their suggestions, and may consider additional “topped-out” criteria in future rulemaking.

After consideration of the public comments we received, we are finalizing our proposal to remove PN–6, SCIP–Card–2, SCIP–Inf–2, SCIP–Inf–3, SCIP–Inf–9, and SCIP–VTE–2 from the FY 2017 measure set due to their being “topped-out.”

(2) Change to Truncated Coefficient of Variation Criterion to Determine Whether a Measure is “Topped-Out”

As stated above, we have adopted two criteria for determining the “topped-out” status of Hospital VBP Program measures:

- Statistically indistinguishable performance at the 75th and 90th percentiles; and
- Truncated coefficient of variation < 0.10.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28119), we proposed to modify the second criterion to the following:

- Truncated coefficient of variation ≤ 0.10 .

The coefficient of variation (CV) is a common statistic that expresses the standard deviation as a percentage of the sample mean in a way that is independent of the units of observation. Applied to this analysis, a large CV would indicate a broad distribution of individual hospital scores, with large and presumably meaningful differences between hospitals in relative performance. A small CV would indicate that the distribution of individual hospital scores is clustered tightly around the mean value, suggesting that it is not useful to draw distinctions among individual hospitals’ measure performance. By proposing to change the truncated CV from “less than” to “less than or equal to” 0.10 under our “topped-out” test, we will better be able to distinguish measures with significant variation in performance among hospitals and more accurately determine what measures are “topped-out” for purposes of the Program.

We welcomed public comments on this proposal.

Comment: Commenters agreed with the methodology regarding calculations to determine whether a measure is topped-out, and agreed with the proposal to alter the threshold from

“less than 0.10” to “less than or equal to 0.10.”

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our modification to the truncated coefficient of variation criterion for determining whether a measure is “topped-out” as proposed.

c. New Measures for the FY 2017 Hospital VBP Program

We considered if we should adopt additional measures for the FY 2017 Hospital VBP Program. We considered which measures are eligible for adoption based on the statutory requirements, including specification under the Hospital IQR Program and posting dates on the *Hospital Compare* Web site, and our priorities for quality improvement as outlined in the National Quality Strategy (NQS) (available for download at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Quality-InitiativesGenInfo/Downloads/CMS-Quality-Strategy.pdf>).

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28119 through 28121) we stated that we believe that the following three proposed measures meet the statutory requirements for inclusion in the FY 2017 Hospital VBP Program. We also believe that these measures represent important components of quality improvement in the acute inpatient hospital setting.

We received a number of general comments on quality measures for the Hospital VBP Program:

Comment: Many commenters supported CMS’ proposals to adopt MRSA, *C. difficile* Infection, and PC–01 for the FY 2017 Program. These commenters believed that the measures are appropriate for the Program and will have been publicly posted on *Hospital Compare* in accordance with the Hospital VBP Program’s statute.

Response: We agree and thank the commenters.

Comment: Commenters supported CMS’ proposal to readopt the IMM–2 measure for FY 2017 and suggested that CMS consider adopting additional immunization measures in the future.

Response: As with other suggested measure topics, we will consider new measures as they become available to us under the statutory requirements for the Hospital VBP Program.

Comment: A few commenters recommended that the Hospital VBP Program should include a mix of measures, including measures that would test adherence to evidence-based medical interventions.

Response: We agree, and we have attempted to introduce a variety of quality measure types into the Hospital VBP Program, including measures of processes, outcomes, and efficiency.

Comment: One commenter believed that all measures in the Hospital IQR, HAC Reduction, and Hospital VBP Programs should be NQF-endorsed before their adoption by CMS, because NQF-endorsement ensures that the measures have been evaluated by a panel of experts in quality measurement. The commenter therefore supported the removal of measures that have lost NQF-endorsement.

Response: We note that the Hospital VBP Program relies on data submitted under the Hospital IQR Program, and the Hospital IQR Program's statute enables us to select measures that have not been endorsed by NQF, as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. Our statistical and clinical assessment of the measures chosen for adoption in the Hospital VBP Program supports our belief that the measures are sufficiently valid and reliable. Each measure has been used in the Hospital IQR Program for at least one year, and we believe each measure we adopt will improve patient outcomes.

Comment: Commenters suggested that CMS consider exploring measures related to sepsis mortality as an alternative to current proposals. Commenters recommended that CMS prioritize the development of quality measures that promote nutrition screening and assessment of nutrition interventions. Additional commenters recommended that CMS consider measures of advance care planning, malnutrition care, measures related to diabetes, atrial fibrillation, COPD, and oncology, additional process measures, immunization measures, and a measure of all-cause readmission. Other commenters suggested that CMS consider PSI-4: Death among surgical inpatients with serious treatable complications, COPD 30-day mortality, and AMI Payment per Episode for the Hospital VBP Program.

Additional commenters suggested that CMS consider adopting STK-1 (venous thromboembolism (VTE) prophylaxis); STK-2 (discharged on antithrombotic therapy); and STK-4 (percentage of eligible patients receiving thrombolytic therapy within 0-3 hours of symptom onset). One commenter specifically noted that the STK-4 measure in the Hospital VBP Program as it is e-specified and has not been deemed "topped-out."

Response: We will consider new measures for the Hospital VBP Program as they become eligible for inclusion in the measure set. We note, however, that section 1886(o)(2)(A) of the Act specifically excludes measures of readmissions from the Hospital VBP Program.

Comment: One commenter urged CMS to expand the Surgical Site Infection list within the Outcomes domain to include Major Joint Replacement Surgeries and Spine procedures so that surgical specialty hospitals are able to participate in future Hospital VBP Programs. Otherwise, the commenter believed, hospitals that qualify for the Hospital VBP Program, and whose excellent performance records bolster the overall quality and efficacy of the program, may be excluded because the SSI list does not include these common procedures which make up the majority of the procedures they perform.

Response: We thank the commenter for this suggestion. We are continuously evaluating the program and working to identify new, potentially suitable measures to fill measure gaps. We appreciate the commenter's input for measure selection and will take this feedback into consideration in future rulemaking. We note that CDC maintains ongoing collaborations with a number of professional surgical organizations and is currently in the process of developing additional SSI metrics for higher volume surgical procedures. Once these measures are finalized, we may consider them for future inclusion in our quality reporting and pay for performance programs.

Comment: Many commenters expressed concern that measures in both the Hospital VBP and HAC Reduction Programs overlap. Commenters pointed to a wide variety of concerns, including: Multiple competing benchmarks, various penalty calculation methodologies, wasting precious resources, and the potential for confusion among hospitals and beneficiaries.

Many commenters noted that using measures in both HAC Reduction and the Hospital VBP Programs potentially penalizes participating hospitals twice, or could result in instances where hospitals perform well in one program and are penalized in the other. Another commenter stated that the overlap inappropriately magnifies the impact and importance of the measures.

Some commenters were concerned that the overlap between measures in the HAC Reduction and Hospital VBP Programs may create a defeatist attitude among certain hospitals that are

disproportionately affected, such as safety net hospitals. Commenters noted that such duplication between quality programs could draw needed dollars away from the very organizations that need to be focusing in this area.

Response: We acknowledge that there is some overlap in quality measures between the Hospital VBP Program and the HAC Reduction Program. While we are aware that commenters object to the possibility of scoring hospitals on certain measures under both programs, we note that these measures cover topics of critical importance to quality improvement in the inpatient hospital setting, and to patient safety. We selected these quality measures because we believe that HAC measures comprise some of the most critical patient safety areas therefore justifying the use measures in more than one program. The MRSA Bacteremia and *C. difficile* Infection measures that we have proposed to adopt track infections that could cause significant health risks to Medicare patients, and we believe it is appropriate to provide incentives for hospitals to avoid them under more than one program.

We further stress that the HAC Reduction Program and the Hospital VBP Program are separate programs with different purposes and policy goals. For example, the HAC Reduction Program is a program that reduces payments to hospitals for excess HACs to increase patient safety in hospitals. On the other hand, the Hospital VBP Program is an incentive program that redistributes a portion of the Medicare payments made to hospitals based on their performance on various measures. Therefore, although the measures exist in more than one program, the measures are used and calculated for very distinct purposes. Accordingly, as stated above, we believe that the critical importance of these measures to patient safety warrants their inclusion in both programs. We will, in the future, monitor the HAC Reduction and Hospital VBP Programs and analyze the impact of our measures selection, including any unintended consequences with having a measure in more than one program, and will revise the measure set in one or both programs if needed.

Comment: Many commenters stated that CMS' proposed measures for FY 2017, despite appearing to have the potential to be positive additions to the program, have not been publicly reported on the *Hospital Compare* Web site for 1 year as required by the Act.

Response: Section 1886(o)(2)(C)(i) of the Act requires that measures must have been "included on the *Hospital Compare* Internet Web site for at least 1

year prior to the beginning of the performance period.” As commenters noted, we first reported these measures’ data in December 2013, and have proposed an FY 2017 performance period for these measures of CY 2015, which complies with the statutory requirement in section 1886(o)(2)(C)(i) of the Act. Accordingly, we believe that the three proposed measures meet the statutory requirements for inclusion in the FY 2017 Hospital VBP Program. We also believe that these measures represent important components of quality improvement in the acute inpatient hospital setting. However, to the extent that there remains any question regarding our interpretation of section 1886(o)(2)(C)(i) of the Act, we are finalizing that the effective date of the new FY 2017 measures, PC–01, MRSA Bacteremia, and *C. difficile* Infection, will be January 1, 2015, consistent with the beginning of the performance period for those measures.

Comment: One commenter believed that the AMI–7a measure is inappropriate for the Hospital VBP Program because it does not apply to most hospitals due to a low volume of cases.

Response: While we understand that many hospitals do not provide services that would be measured by the AMI–7a measure, the finalized Hospital VBP Program scoring methodology does not penalize hospitals that do not have sufficient cases for that measure, or any measures that we have adopted. Even if the measure will only apply to a small number of hospitals, we believe that this measure accomplishes the goals of the Hospital VBP Program and will improve patient outcomes in the hospitals where the measure will apply. We will consider proposing removal of this measure in future policy making.

Comment: Commenters expressed continued concern about the three 30-day mortality measures that we have adopted and placed into the Clinical Care—Outcomes domain. Commenters stated that the measures do not meaningfully reflect hospital performance because they do not meet the lower limit of moderate reliability identified by CMS’ analytical contractor in a 2012 report. Commenters expressed their appreciation for our adoption of longer performance periods for these measures, but noted that even at 24 months, the measures’ reliability is significantly less than we require for chart-abstracted measures. Commenters suggested that we consider a plan to improve or replace the mortality measures and consider reducing the domain weighting allocated to the

Clinical Care—Outcomes domain in the meantime.

Response: As we stated in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53591) and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50693), we believe that the mortality measures capture important quality data for purposes of the Hospital VBP Program. We believe that the three 30-day mortality measures are sufficiently reliable for inclusion in the Hospital VBP Program, particularly in light of our finalized policies to set a 25 case minimum and to extend the performance period’s duration for these measures over successive years to reach 36 months.

Comment: One commenter requested that CMS change the mortality measures’ populations to ensure that the same patient is not counted under more than one measure. The commenter explained that its mortality measure scores had been adversely affected by a patient that had been counted under both pneumonia and AMI mortality.

Response: If a patient was hospitalized for AMI and Pneumonia on a different date and died within 30 days from the first hospitalization in the three-year time frame we used to calculate the mortality measures, the patient could be included in both AMI and Pneumonia mortality measures. However, cohorts of mortality are determined by the principle diagnosis on the index hospitalization claims (that is, the denominator is defined as discharges/admissions not patients). There is only one principal diagnosis on each claim, therefore it is not likely that a specific patient’s claim or admission would be in both AMI and Pneumonia measures.

(1) Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia (NQF #1716)

Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia (NQF #1716) is a risk-adjusted outcome measure monitoring hospital onset of MRSA Bacteremia bloodstream infection events using the standardized infection ratio (MRSA Bacteremia SIR) among all inpatients in the facility. The MRSA Bacteremia SIR is reported via the Center for Disease Control and Prevention’s (CDC) National Healthcare Safety Network (NHSN). We adopted this measure beginning with the FY 2015 payment determination under the Hospital IQR Program in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51630). Initial measure data were posted on *Hospital Compare* in December 2013.

We remain concerned about the persistent public health threat presented by MRSA Bacteremia infections. According to a 2013 study available at

the National Institute of Health’s Web site, MRSA Bacteremia “results in longer hospitalization, increased expenses, and poorer patient prognosis” and “has been swiftly increasing worldwide over the past several decades.”⁴³ As we noted in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51630), invasive MRSA Bacteremia infections may cause about 18,000 deaths during a hospital stay a year.⁴⁴

The Measure Application Partnership (MAP) supported the direction of the MRSA Bacteremia measure for inclusion in the Hospital VBP Program in the MAP Pre-Rulemaking Report: 2013 Recommendations on Measures Under Consideration by HHS found at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72746>. The MAP noted that the measure addresses an NQS priority not adequately addressed in the program measure set, the measure should be applied following public reporting on *Hospital Compare*, and the most recent version of the NQF-endorsed measure should be applied.

We believe that this measure is eligible for the Hospital VBP Program based on the MAP recommendation, our adoption of the most recent NQF-endorsed version under the Hospital IQR Program, and our posting of measure data on *Hospital Compare*. Based on the continued danger that MRSA Bacteremia infections present to patients and to public health, we further believe that this measure is appropriate for the Hospital VBP Program. Therefore, we proposed to adopt the MRSA Bacteremia measure for the FY 2017 Hospital VBP Program, and we proposed to place the measure into the Safety domain.

We invited public comment on this proposal.

Comment: Commenters supported CMS’ proposal to adopt MRSA Bacteremia and *C. difficile* infection measures for the FY 2017 Program, stating that the measures will provide incentives for hospitals to employ appropriate infection control and prevention and antimicrobial stewardship programs. (CMS discusses *C. difficile* infection in more detail in the next section). Another commenter noted that the measure is a first step towards encouraging hospitals to focus

⁴³ Tatokoro et al. BMC Urology 2013, 13:35. Available at <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC3720197/pdf/1471-2490-13-35.pdf>

⁴⁴ Catherine Liu, Arnold Bayer, et al., Clinical practice Guidelines for the treatment of Methicillin-Resistant *Staphylococcus aureus* Infections in Adult and Children. Infectious Disease Society of America 2011; 52:e18.

on prevention and appropriate treatment of these infections.

One commenter noted that quality measures implemented in the U.K. had a positive effect on *C. difficile* infections and treatments and that appropriate treatment of *C. difficile* infections have important implications for patient outcomes, society, and the reduction of healthcare expenditures. Another commenter noted that MRSA Bacteremia and *C. difficile* infections are both largely preventable diseases. Another commenter expressed specific support for CMS' proposal to adopt the *C. difficile* Infection measure, stating that stoma care management is necessary at all clinical stages to avoid life threatening and costly infections.

Response: We thank the commenters for their support.

Comment: One commenter urged CMS to delay use of the MRSA Bacteremia and *C. difficile* measures until FY 2018 because, while the measures are NQF-endorsed, the MAP did not fully support them for the Hospital VBP Program. The commenter stated that the MAP voted to "support direction" and noted that the measure should be publicly reported for a sufficient amount of time prior to being added to the Hospital VBP Program.

Response: We disagree. We view the MRSA Bacteremia and *C. difficile* Infection measures as important quality measures to be added to the Safety domain because they track infections that present significant danger to patients. We believe that tracking hospitals on these measures—and providing incentives for better performance—will result in reduced harm to patients, better health care quality, and an improved health care system.

Comment: One commenter urged caution with the *C. difficile* infection and MRSA Bacteremia measures, and argued that they must track to hospital onset-infections. Commenters suggested that many infections emerge in the community, meaning hospitals are not at fault for the origination of the infection. One commenter noted that infections caused by MRSA Bacteremia vary widely geographically, and there has been a rise in the frequency of community-associated MRSA Bacteremia skin/soft tissue infections, many of which are likely best treated with direct interventions at the site of infection and do not require antibiotics. The commenter believed that as the proportion of community-associated strains become predominant, hospitals will have less ability to have any appreciable impact on their frequency.

A few commenters requested that the MRSA Bacteremia and *C. difficile* Infection measures control for known regional variation in the infection rates so that hospitals that care for high-risk populations are not inadvertently targeted or encouraged to limit access to care by such high-risk patients. Some commenters suggested that a better way to track MRSA Bacteremia and *C. difficile* infections is to include measures that focus on best practices and guidelines for patients who contract MRSA Bacteremia or *C. difficile* infections.

One commenter also asked CMS to consider that *C. difficile* infections are higher in surgical patients, rather than non-surgical patients, and are particularly high in gastrointestinal surgery patients. Therefore, the commenter believed that hospitals that perform a greater number of colorectal procedures will have higher rates of *C. difficile* infections in their patients, even if they are perfectly compliant with all the applicable guidelines and practices.

Response: The MRSA and *C. difficile* measures differentiate between community-acquired and hospital-onset events based on a patient's date of admission and date(s) of specimen collection, and includes an adjustment for many risk factors specifically facility size, medical teaching hospital affiliation, prevalence of community-onset infection, and for CDI test type. Therefore, we do not believe the measures need to be revised to account for these factors because the current approach already addresses many of the commenters' concerns. However, we will collaborate with CDC to evaluate whether there is a need to consider additional risk adjustment factors, such as occurrence of gastrointestinal surgeries, suggested by the commenters for future policy development. While we are willing to consider other risk factors, the additional adjustment gained must be weighed against the extra burden added to collected more required data elements. The issue of the same measures being included in multiple programs is addressed further below.

After consideration of the public comments we received, we are finalizing our proposal to adopt the MRSA Bacteremia measure for the FY 2017 Hospital VBP Program.

(2) *Clostridium difficile* (*C. difficile*) Infection (NQF #1717)

C. difficile Infection (NQF #1717) is a risk-adjusted outcome measure monitoring hospital onset of *C. difficile* Infection events using the standardized

infection ratio (*C. difficile* SIR) among all inpatients in the facility. The *C. difficile* SIR is reported via CDC's NHSN. We adopted this measure beginning with the FY 2015 payment determination under the Hospital IQR Program in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51630 through 51631). Initial measure data were posted on *Hospital Compare* in December 2013.

As with MRSA Bacteremia infections, we are concerned about the seriousness of *C. difficile* infections. According to a 2012 study, "infection with *Clostridium difficile* is associated with poor outcomes for patients. Previous work has determined that, regardless of baseline risk of death, for every 10 patients that acquire *C. difficile* in the hospital, 1 patient will die. *Clostridium difficile* is also associated with increased health care costs. One of the primary mechanisms by which *C. difficile* increases costs is by increasing the length of time patients spend in hospital."⁴⁵

As we stated in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51630 through 51631), *C. difficile* infections have become more frequent, more severe, and more difficult to treat in recent years. Each year, tens of thousands of people in the United States get sick from *C. difficile*, including some otherwise healthy people who are not hospitalized or taking antibiotics.

The MAP noted that the measure addresses an NQS priority not adequately addressed in the program measure set, the measure should be applied following public reporting on *Hospital Compare*, and that the most recent version of the NQF-endorsed measure should be applied.

We believe that this measure is eligible for the Hospital VBP Program based on the MAP recommendation, our adoption of the most recent NQF-endorsed version under the Hospital IQR Program, and our posting of measure data on *Hospital Compare*, as well as the continued danger that *C. difficile* infections present to patients and the public health. Therefore, we proposed to adopt the *C. difficile* SIR measure for the FY 2017 Hospital VBP Program, and we proposed to place the measure into the Safety domain.

We invited public comment on this proposal.

Comment: One commenter urged CMS to delay use of the *C. difficile* Infection measure until FY 2018

⁴⁵ Forster et al. "The effect of hospital-acquired infection with *Clostridium difficile* on length of stay in hospital." *Canadian Medical Association Journal*, January 10, 2012. Available at <http://www.ncbi.nlm.nih.gov/pmc/articles/PMC3255231/pdf/1840037.pdf>.

because *C. difficile* infections have diverse sources and are not associated with symptomatic cases for which infection control interventions are primarily targeted. Further, the commenter had concerns about current lab identification definitions used for public reporting because (1) asymptomatic cases with positive lab identification events are included, (2) recurrences are counted as new cases if tested again after two weeks, and (3) patients may be asymptotically colonized prior to admission and develop the disease, resulting in attribution of a healthcare associated infection, regardless of any hospital's infection prevention strategies. Finally, the commenter noted that there is no standard strategy for testing patients for *C. difficile* infections.

Response: The CDC Web site includes posted information for appropriate clinical practice, testing, and identification of *C. difficile* infections at: http://www.cdc.gov/HAI/organisms/cdiff/Cdiff_clinicians.html. These practices are strongly suggested when tracking *C. difficile* cases for reporting to NHSN, and include guidance to only perform the test for *C. difficile* and its toxins on diarrheal (unformed) stool from symptomatic patients, unless ileus due to *C. difficile* is suspected, and to avoid testing stool from asymptomatic patients, for routine identification of asymptomatic carriers, or as a test of cure. Following this guidance as a standard of practice will avoid reporting of asymptomatic, colonized patients, who are not to be reported per NHSN protocol. Recurrent cases are counted separately from incident cases and are not included in the hospital-onset, incident *C. difficile* metric reported to CMS. Per published research and the NHSN protocol, a recurrent *C. difficile* LabID Event is defined as a specimen obtained >2 weeks (>= 2 weeks is a duplicate and not reported) and ≤8 weeks after the most recent CDI LabID Event for that patient. Incident cases are defined and counted as specimens obtained >8 weeks after the most recent CDI LabID Event for that patient (McDonald LC, et al. *Infect Control Hosp Epidemiol* 2007; 28:140–145).

Comment: One commenter cautioned that the *C. difficile* Infection measure may result in discouraging healthcare professionals from screening for or attempting to diagnose mild cases of CDI because the measure focuses on rates of infection rather than screening. The commenter suggested that CMS consider rewarding hospitals for limiting prolonged periods of multiple antibiotic use among patients, for

optimizing antimicrobial therapy, and for instituting CDI prevention programs.

Response: We will consider this feedback; however we do not think that this measure will discourage healthcare professionals from testing for *C. difficile* when clinically indicated, particularly given the potential for serious harm that *C. difficile* infections present to patients. Though healthcare professionals may have incentives to avoid diagnostic testing, they also have incentives to treat with confirmation of the diagnosis, in part because of the danger of overprescribing antibiotics and its associated complications for patients. We will consider the commenter's suggestions in the future.

After consideration of the public comments we received, we are finalizing our proposal to adopt the *C. difficile* infection measure for the FY 2017 Hospital VBP Program.

(3) PC–01: Elective Delivery Prior to 39 Completed Weeks Gestation (NQF #0469)

PC–01: Elective Delivery Prior to 39 Completed Weeks Gestation (NQF #0469) is a chart-abstracted measure that we adopted beginning with the FY 2015 payment determination for the Hospital IQR Program in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53528 through 53530). Initial measure data were posted on *Hospital Compare* in December 2013. Although this is a chart-abstracted measure, we finalized our policy in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53528 through 53529) that this measure would be collected in aggregated numerator, denominator, and exclusion counts per hospital via a Web-based tool, instead of collecting patient-level data from hospitals.

As we described in the FY 2013 IPPS/LTCH PPS final rule referenced above, the Strong Start Initiative (<http://www.innovation.cms.gov/initiatives/strong-start/>) was launched to help reduce early elective births. At launch, the HHS Secretary stated that more than half a million infants are born prematurely in America each year. Fortunately, the early elective birth rate has steadily decreased. In 2012, the number of early elective births had decreased to approximately 456,000 or 11.55 percent of the total number of births.⁴⁶ Early elective births may require additional medical attention and early intervention services. Research indicates that elective deliveries before 39 weeks increase the

risk of significant complications for mother and baby, as well as long-term health problems.^{47 48 49 50} Early elective births are a public health problem that has significant consequences for families well into a child's life.

As a public campaign to reduce early elective births, the Strong Start Initiative's objective is to test ways to reverse this trend by helping provide expectant mothers with the care they need for a healthy delivery and a healthy baby, and by focusing on reducing early elective deliveries, which can lead to a variety of health problems for mothers and infants. The Strong Start Initiative cuts across many agencies within HHS and involves external organizations including the March of Dimes and the American College of Obstetricians and Gynecologists (ACOG). We believe that a reduction in the number of nonmedically indicated elective deliveries at ≥37 to <39 weeks gestation will result in a substantial decrease in neonatal morbidity and mortality, as well as a significant savings in health care costs. In addition, the rate of cesarean sections should decrease with fewer elective inductions, resulting in decreased length of stay and health care costs.

The MAP supported adoption of the PC–01 Elective Delivery measure for inclusion in the Hospital VBP Program in the MAP Pre-Rulemaking Report: 2013 Recommendations on Measures Under Consideration by HHS found at <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72746>. The MAP noted that the measure addresses an NQS priority not adequately addressed in the program measure set.

We proposed to adopt this measure for the Hospital VBP Program and we proposed to place the measure into the Clinical Care—Process domain because we believe this measure furthers the NQS's three-part aim of better healthcare for individuals, better health for populations, and lower costs of healthcare. In addition, although the

PC-01 Elective Delivery measure captures data from all applicable patients, we also believe that the measure is specifically relevant to the nearly 2 million Medicare beneficiaries who are aged 44 and under, most of whom are dual eligible beneficiaries, who have the potential to be impacted by early elective births. In 2011, Medicare paid for roughly 14,000 births.

We welcomed public comment on this proposal.

Comment: Many commenters supported CMS' proposal to include the PC-01 measure in the Hospital VBP Program, noting that many hospitals continue to have rates of early elective delivery in excess of 15 percent despite the American College of Obstetricians and Gynecologists recommendations that no elective delivery be performed before the gestational age of 39 weeks without a medical indication. One commenter believed that this measure will reduce costs and also have the potential to greatly improve newborn outcomes of care.

Response: We thank the commenters for their support.

Comment: Several commenters expressed opposition to the PC-01 measure for the FY 2017 Hospital VBP Program because the measure is Web-based, and there has not been any chart validation for accuracy and consistency of data collection across hospitals. Some commenters specifically opposed using any data that are not validated under the Hospital VBP Program, stating that PC-01 should therefore not be finalized for the program based on data accuracy concerns. Commenters stated that, while hospitals are working diligently to collect accurate data for this measure, it is possible that hospitals collecting the most accurate data will have the lowest scores.

Commenters stated that the benchmark of 0 percent is not realistic considering that justifications for Elective Delivery are based off of ICD-9-CM codes and The Joint Commission (TJC) has stated that not all the justifications for an elective delivery are included on the ICD-9-CM Justification Table. Further, commenters noted that TJC has stated that the purpose of this measure is to enable hospitals to establish a baseline for their performance, which in turn serves as a determinant of whether improvement efforts are effective over time.

One commenter suggested that CMS wait to adopt this type of measure until the electronic clinical quality measure version is available. One commenter did not support the recommendation to add the PC-01 measure to the Clinical Care—Process domain because the

measure algorithm exclusions are applied prior to denominator selection. The commenter stated that these exclusions make the quarterly denominators very low, even for a large facility, and that, therefore, the measure does not truly assess the quality of care provided.

Response: We disagree with the concept that this measure may be inherently invalid because not all justifications for an elective delivery are included in the ICD-9-CM Justification Table, or invalid because of the volume of exclusions. All NQF-endorsed measures must meet strict reliability and validity criteria to gain endorsement. PC-01 is NQF-endorsed therefore the measure as defined is clinically valid. Regarding the accuracy of the submitted data, hospitals are required to acknowledge the accuracy of the data submitted through the Hospital IQR Program's Data Accuracy and Completeness Acknowledgment statement on an annual basis. To validate the accuracy of submitted data, we employ logic checks as we do for other measures. For example, the number of cases entered in the numerator cannot be greater than the number of cases entered in the denominator.

As explained in section IX.A.11 of this preamble, because the PC-01 data are collected in aggregate instead of for individual patients, we cannot use the same mechanism to assess reliability of PC-01 as we use for chart-abstracted clinical process of care measures reported at the patient level. The approach for other clinical process of care measures involves sampling, whereas the analogous approach for aggregate data would involve collecting all data from a hospital. We believe that the benefits of validating aggregate data in this way are outweighed by the burden to hospitals in submitting potentially hundreds of records to validate one measure, and also believe that this approach would be cost-prohibitive for CMS.

However, we are exploring different options to assess the general validity of PC-01 data more robustly. For the reasons outlined in the proposed rule, we continue to believe this measure is appropriate for the Hospital VBP Program. We have adopted the e-CQM version of this measure under our voluntary electronic reporting option for the Hospital IQR Program.

Comment: Some commenters opposed CMS' proposed adoption of the PC-01 measure, stating that CMS should first determine that there is sufficient room for making additional substantive

improvements that would result in better patient care.

Response: The NQF notes that pre-term births are a rapidly escalating public health problem, and that early elective delivery contributes to this problem.⁵¹ As stated above, many commenters have noted that many hospitals continue to have rates of early elective delivery in excess of 15 percent despite the American College of Obstetricians and Gynecologists recommendations that no elective delivery be performed before the gestational age of 39 weeks without a medical indication. Therefore, we believe that hospitals have the opportunity to improve upon a detrimental practice that was until very recently rapidly expanding.⁵²

Comment: Commenters expressed concerns about CMS' proposal to adopt the PC-01 measure, noting that many hospitals do not provide perinatal care services and stating that the volume of Medicare births is not high enough to justify this measure's placement into the Hospital VBP Program. Commenters suggested that CMS remove PC-01 from the proposed measure set.

Response: We continue to believe this measure is appropriate for the Hospital VBP Program, as we described in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28120). The measure is NQF-endorsed and was supported for the Hospital VBP Program by the MAP, and addresses an NQS priority not adequately addressed in the Program's measure set to date. In addition, as we noted, nearly 2 million Medicare beneficiaries are aged 44 and under, and in 2011, Medicare paid for roughly 14,000 births.

After consideration of the public comments we received, we are finalizing our proposal to adopt the PC-01 measure for the FY 2017 Hospital VBP Program.

d. Adoption of the Current Central Line-Associated Bloodstream Infection (CLABSI) Measure (NQF #0139) for the FY 2017 Hospital VBP Program

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50682 and 50686), we adopted the CLABSI measure for the FY 2016 Hospital VBP Program. We stated our belief that adopting the current CLABSI measure is consistent with the MAP's recommendation in the MAP Pre-Rulemaking Report: 2013 Recommendations on Measures Under

⁵¹ <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72746>.

⁵² Osterman MJK, Martin JA. Changes in cesarean delivery rates by gestational age: United States, 1996–2011. NCHS data brief, no 124. Hyattsville, MD: National Center for Health Statistics. 2013.

Consideration by HHS found at <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72746>, to use the standardized infection ratio version of the measure until the reliability-adjusted CLABSI measure is NQF-endorsed. We have stated our intent to consider adopting the reliability-adjusted CLABSI measure in future rulemaking.

The reliability-adjusted standardized infection ratio (SIR) is an outcome measure that summarizes the healthcare-associated infection experience by type of infection (for example, central-line associated bloodstream infection, surgical site infection) for individual hospitals. The reliability-adjusted measure enables more meaningful statistical differentiation between hospitals by accounting for differences in patient case-mix, exposures to medical devices or procedures (for example, central line days, surgical procedure volume), and unmeasured factors that are not reflected in the unadjusted SIR and that cause variation in outcomes between hospitals. Accounting for these sources of variability enables better measure discrimination between hospitals and leads to more reliable quality measurements.

However, in the absence of NQF endorsement of the reliability-adjusted CLABSI measure or any additional MAP recommendations, and unless and until the Hospital IQR Program adopts the reliability adjustments, we believe we may only consider the current version of the CLABSI measure for adoption under the Hospital VBP Program. We continue to believe that the CLABSI measure encourages hospitals to minimize infection events that present significant health risks to patients. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28120 through 28121), we proposed to adopt the current version of the CLABSI measure for the FY 2017 Hospital VBP Program and subsequent years. If a reliability-adjusted version of the measure becomes available to us in the future, we will consider adopting it.

We welcomed public comment on this proposal.

Comment: Commenters requested that CMS clarify whether the CLABSI and CAUTI measures will include non-ICU locations. Commenters also requested that CMS clarify whether hospitals that report CLABSI and CAUTI to NHSN as Mixed Acuity Units instead of ICUs will receive SIRs for the Hospital VBP Program, or if the measures will not be applicable for hospitals that do not report for ICUs.

Response: For the CLABSI and CAUTI measures, we will score hospitals using

adult, pediatric, and neonatal ICU data only for the FY 2017 and FY 2018 Hospital VBP Programs, because the baseline periods for FY 2017 and FY 2018 are CY 2013 and 2014 respectively. These baseline periods are prior to the Hospital IQR Program requirement that hospitals report data on selected non-ICU locations (78 FR 50787). Therefore, we will have no data on non-ICU locations to use for performance or improvement benchmarks for these program years.

Beginning with the FY 2019 Program, we intend to publicly report the CLABSI and CAUTI SIR data reported to the Hospital IQR Program on selected non-ICU locations (that is, adult or pediatric medical ward, surgical ward, and medical/surgical ward). We will consider inclusion of these locations in the Hospital VBP Program as soon as applicable reliable baseline data are available.

Mixed acuity units do not meet NHSN definitions for the six select non-ICU locations, and therefore are not required to be reported for Hospital IQR Program purposes, so we will not use data from those units for the Hospital VBP Program for any of the baseline or performance periods. We refer readers to the NHSN Helpdesk Mailbox (nhsn@cdc.gov) with any specific questions about correctly defining and mapping patient care locations into NHSN.

Comment: One commenter supported the continued inclusion of the existing risk-adjusted, rate-based ICU-only NHSN CLABSI measure in the FY 2017 Hospital VBP Program. The commenter also urged CMS to calculate the CLABSI measure using the ICU-only specifications until the facility-wide measure is available for both the baseline and performance periods of the Hospital VBP Program. The commenter was unaware of how CMS will deal with the CLABSI measure once it transitions to a facility-wide measure and expressed concern that CMS might dispense with the improvement score when the baseline and performance periods do not match. The commenter noted that the CDC has sufficiently granular data to continue reporting ICU-only results to CMS despite the collection moving to facility wide.

Response: We agree that improvement scores are an important part of the Hospital VBP Program. We refer readers to our response to the previous commenter, in which we explain our intention to follow the commenter's suggestion, and provide the timelines for transitioning from the ICU-only measure to the broader measure of CLABSI in ICU and select non-ICU locations.

Comment: One commenter urged CMS to rapidly incorporate a reliability-adjusted Standardized Infection Ratio (SIR) calculation for the CLABSI measure because it provides a more robust calculation to identify differences among hospital rates.

Response: We continue to believe that the CLABSI measure encourages hospitals to minimize infection events that present significant health risks to patients. However, in the absence of NQF-endorsement of the reliability-adjusted measure and any additional MAP recommendations, and unless we decide to adopt the reliability adjustments in the Hospital IQR Program, we believe we may only consider the current version of the CLABSI measure for adoption under the Hospital VBP Program. If a reliability-adjusted version of the measure becomes available to us in the future, we will consider adopting it.

Comment: One commenter stated that CMS should not finalize the CLABSI measure and should wait until the reliability-adjusted version of the measure is endorsed by NQF. The commenter explained that many hospitals are having difficulty reporting the current measure, resulting in deviations in accuracy that may create profound differences in hospital performance.

Response: We will consider adopting the new version of the measure if it is endorsed by NQF. However, reliability adjustment is a methodology designed to address hospitals with small numerators and denominators. The methodology is not designed to assist hospitals in reporting CLABSI data accurately. To assist hospitals in accurately reporting CLABSI, CMS and CDC have been working collaboratively to clarify NHSN protocol specifications and to educate hospitals on these protocols.

Comment: One commenter was pleased with CMS' proposal to adopt the CLABSI measure, stating that it measures important safety outcomes for consumers and purchasers.

Response: We agree and thank the commenter.

After consideration of the public comments we received, we are finalizing our proposal to adopt the current CLABSI measure for the FY 2017 Hospital VBP Program.

e. Summary of Previously Adopted and New Measures for the FY 2017 Hospital VBP Program

The following table outlines the measures for the FY 2017 Hospital VBP Program, including those that we are readopting and those measures we are

adopting for the first time. As discussed further below, this table also includes the FY 2017 domains into which we are placing the readopted measures, as well as the domains into which we are placing the newly adopted measures.

PREVIOUSLY ADOPTED AND NEW MEASURES FOR THE FY 2017 HOSPITAL VBP PROGRAM

Measure	Description	Domain
CAUTI *	Catheter-Associated Urinary Tract Infection (NQF #0138)	Safety.
CLABSI **	Central Line-Associated Blood Stream Infection (NQF #0139)	Safety.
C. difficile ***	Clostridium difficile Infection (NQF #1717)	Safety.
MRSA ***	Methicillin-Resistant Staphylococcus aureus Bacteremia (NQF #1716)	Safety.
PSI-90 *	Complication/patient safety for selected indicators (composite) (NQF #0531)	Safety.
SSI *	Surgical Site Infection: (NQF #0753) <ul style="list-style-type: none"> Colon Abdominal Hysterectomy 	Safety.
MORT-30-AMI *	Acute Myocardial Infarction (AMI) 30-day mortality rate (NQF #0230)	Clinical Care—Outcomes.
MORT-30-HF *	Heart Failure (HF) 30-day mortality rate (NQF #0229)	Clinical Care—Outcomes.
MORT-30-PN *	Pneumonia (PN) 30-day mortality rate (NQF #0468)	Clinical Care—Outcomes.
AMI-7a *	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival (NQF #0164)	Clinical Care—Process.
IMM-2 *	Influenza Immunization (NQF #1659)	Clinical Care—Process.
PC-01 ***	Elective Delivery Prior to 39 Completed Weeks Gestation (NQF #0469)	Clinical Care—Process.
MSPB-1 *	Medicare Spending per Beneficiary (NQF #2158)	Efficiency and Cost Reduction.
HCAHPS *	Hospital Consumer Assessment of Healthcare Providers and Systems Survey (NQF #0166)	Patient and Caregiver Centered Experience of Care/Care Coordination.

* Measures readopted for the FY 2017 Hospital VBP Program.

** Measure adopted for the FY 2017 Hospital VBP Program that were not previously subject to automatic readoption.

*** Measures newly adopted for the FY 2017 Hospital VBP Program in this final rule.

5. Additional Measures for the FY 2019 Hospital VBP Program

a. Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and Total Knee Arthroplasty (TKA)

Hospital-level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and Total Knee Arthroplasty (TKA) (NQF #1550) is an outcome measure that we adopted beginning with the FY 2015 payment determination under the Hospital IQR Program in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53516 through 53518). The measure assesses complications occurring after THA and TKA surgery from the date of the index admission to 90 days post date of the index admission. The outcome is one or more of the following complications: Acute myocardial infarction, pneumonia, or sepsis/septicemia within 7 days of admission; surgical site bleeding, pulmonary embolism or death within 30 days of admission; or mechanical complications, periprosthetic joint infection or wound infection within 90 days of admission. We posted THA/TKA measure data on the Hospital Compare Web site in December 2013.

We refer readers to the FY 2013 IPPS/LTCH PPS final rule and to the THA/TKA complication methodology report (http://qualitynet.org/dcs/BlobServer?blobkey=id&blobnocache=true&blobwhere=1228890067881&blobheader=multipart%2Foctet-stream&blobheadername1=Content-Disposition&blobheadervalue1=attachment%3Bfilename%3DTHK_CmpMsrUpdtSpecs_080113.pdf&blobcol=urldata&blobtable=MungoBlobs) for additional details on the THA/TKA measure.

We continue to believe that measuring and reporting risk-standardized complication rates will inform health care providers about opportunities to improve care, strengthen incentives for quality improvement, and promote improvements in the quality of care received by patients and in the outcomes they experience. We believe that THA/TKA is an important measure of clinical outcomes, and, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28121 through 28122), we proposed to adopt it for the FY 2019 Hospital VBP Program and subsequent years. The MAP supported the adoption of the measure for inclusion in the Hospital VBP Program in its MAP Pre-Rulemaking Report: 2013 Recommendations on Measures Under

Consideration by HHS found at <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72746>, noting it addresses a high-volume elective procedure with variation in performance. We proposed to adopt this measure for FY 2019 now based on the length of the measure's reporting period and the time necessary to complete scoring calculations. Because it is an outcome measure, we proposed to place it in the Clinical Care—Outcomes domain.

We welcomed public comments on this proposal.

Comment: Several commenters supported CMS' proposal to adopt THA/TKA for the FY 2019 Program, stating that the measure will further drive hospitals to boost their care quality initiatives focused on this procedure. Some commenters urged CMS to consider adopting it as early as FY 2018.

Response: We believe that the time periods necessary to collect sufficiently reliable performance data on this measure preclude us from adopting the measure sooner than FY 2019.

Comment: Several commenters opposed adoption of the THA/TKA measure, stating that it has not met the one-year public reporting requirement outlined in the Hospital VBP Program statute.

Response: As described above with respect to measures proposed for FY 2017, section 1886(o)(2)(C)(i) of the Act requires that measures must have been “included on the *Hospital Compare* Internet for at least 1 year prior to the beginning of the performance period.” As commenters noted, we reported these measures’ data in December 2013, and have proposed an FY 2017 performance period for these measures of CY 2015, which complies with the statutory requirement in section 1886(o)(2)(C)(i) of the Act. We believe that this measure meets the statutory requirements for inclusion in the FY 2019 Hospital VBP Program. We also believe that this measure represents an important component of quality improvement in the acute inpatient hospital setting. However, to the extent that there remains any question regarding our interpretation of section 1886(o)(2)(C)(i) of the Act, we are finalizing that the effective date of the THA/TKA measure will be July 1, 2015, consistent with the beginning of the performance period for that measure.

Comment: One commenter supported the addition of the THA/TKA quality measure because it is MAP-approved and will further drive hospitals to boost their quality of care initiatives around these high-volume procedures that reduce pain and increase mobility for hundreds of thousands of Medicare beneficiaries each year. The commenter noted that this measure is particularly important because it captures multiple complications and adverse events at various post-operative time intervals and would give hospitals a common benchmark around which to organize their quality improvement efforts.

Response: We agree and thank the commenter for its support.

Comment: One commenter expressed concern about the accuracy of the administrative data sets that are the basis for the THA/TKA measure, stating that the coding data have been known to underreport significant comorbidities that may therefore skew quality measurement.

Response: We believe that the administrative claims data used for the Hip/Knee Complication measure is sufficiently accurate for purposes of Hospital VBP Program inclusion. We have validated the AMI, HF, and pneumonia mortality measures by building comparable models using medical record data for risk adjustment for heart failure patients (National Heart Failure data), AMI patients (Cooperative Cardiovascular Project data), and pneumonia patients (National Pneumonia Project dataset). When the medical record-based models were

applied to the corresponding patient population, the hospital risk-standardized rates estimated using the claims-based risk adjustment models had a high level of agreement with the results based on the medical record model, thus supporting the use of the claims-based models for public reporting.

Regarding the commenter’s concern about underreporting significant comorbidities, during measure development, we also conducted a medical record validation study of the THA/TKA complications measure. The goal of that study was to determine the overall agreement between arthroplasty patients identified as having a complication (or no complication) in the claims-based measure and those who had a complication (or no complication) also documented in the medical record. Overall measure agreement was 93 percent (598/644 patients) before any changes were made to the model specifications. After the measure specifications were changed based upon both the results of this validation study, the measure agreement between claims data and the medical record was 99 percent (635/644).

Comment: Some commenters opposed the proposed adoption of the THA/TKA measure, stating that CMS should verify that the measure is properly risk-adjusted across patient populations to ensure that hospitals are not deterred from performing these surgeries for older, high-risk beneficiaries. One commenter opposed the adoption of the THA/TKA measure because it uses the same hierarchical logical modeling methodology that is specified for the mortality measures included in the Hospital VBP Program, and the commenter continued to have concerns about the ability of this model to accurately distinguish between hospitals’ performance. The commenter suggested instead that the model should include an adjustment for socioeconomic status, which commenter believes is an important predictor of complication rates. The commenter believes the measure is insufficient for inclusion in payment policies, for these reasons. Another commenter expressed support for the proposed THA/TKA measure, conditioned on CMS’ adoption of a sociodemographic adjustment to the measure.

Response: We refer readers to our earlier discussion of risk adjustment based on socioeconomic status with respect to the MSPB measure in section IV.I.4. of the preamble of this final rule, which also is relevant for this measure. As discussed in the previous section, we believe that the THA/TKA measure’s

risk adjustment methodology appropriately considers and adjusts for clinical factors.

After consideration of the public comments we received, we are finalizing the THA/TKA measure for the FY 2019 Hospital VBP Program and subsequent years.

b. PSI–90 Measure

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50698), we declined to finalize the PSI–90 measure for the FY 2019 Hospital VBP Program in order to adopt a more recent baseline period than would have been possible at that time. However, we did not intend to signal that we would not adopt the PSI–90 measure for FY 2019 and subsequent years. We continue to believe that adopting this Agency for Healthcare Research and Quality (AHRQ) Patient Safety Indicator (PSI) composite measure provides strong incentives for hospitals to ensure that patients are not harmed by the medical care they receive, which is a critical consideration in quality improvement. In order to clarify the measure’s status under the Hospital VBP Program and ensure that there is no confusion about our intent, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28122), we proposed to readopt the PSI–90 measure for FY 2019 Hospital VBP Program and subsequent years.

We welcomed public comments on this proposal.

Comment: Several commenters supported CMS’ proposal to adopt the PSI–90 measure for the FY 2019 Program. One commenter noted that the measure captures important patient safety outcomes for consumers and purchasers.

Response: We thank the commenters for their support.

Comment: Several commenters suggested that CMS publish hospitals’ performance on both the full composite measure and its individual indicators. One commenter suggested that CMS consider separate patient safety indicators for the Hospital VBP Program rather than the composite.

Response: With respect to commenters’ suggestions that we publish hospitals’ performance on individual indicators, we may consider doing so in the future. However, since we have adopted the composite measure for the Hospital VBP Program, we believe it is appropriate to publish hospitals’ performance on that measure, rather than its components, as a reflection of performance measured and scored under the Program. The composite measure is the basis for awarding achievement and

improvement points under the Hospital VBP Program, not its underlying indicators, and we believe it is appropriate to focus the Program's public reporting on the measures that receive points under the Program.

Comment: Some commenters urged CMS to remove the PSI-90 measure from the Hospital VBP, Hospital IQR, and HAC Reduction Programs immediately based on NQF's recent report on patient safety measures. Several commenters noted that the NQF's Patient Safety Standing Committee did not recommend the measure for endorsement during maintenance review.

Commenters also noted that the PSI-90 measure is undergoing maintenance review by the NQF. One commenter stated that AHRQ's proposed changes to the measure to regain NQF's endorsement may be significant and suggested that CMS consider whether it should continue to adopt the measure for the Hospital VBP, HAC Reduction, and Hospital IQR Programs.

Response: We would like to clarify the status of the PSI-90 measure with regard to NQF endorsement. As part of the routine NQF measure maintenance process, the Patient Safety Committee expressed concerns about the weighting of the PSI-90 component measures and requested to see additional measure information related to re-weighting of PSI-90 with three additional components (PSI-9, PSI 10 and PSI-11) before deciding if it would recommend continued endorsement of the measure. AHRQ has submitted the requested data for the NQF Patient Safety Committee's consideration.

If, during the NQF review process, significant changes are made to the measure, we will evaluate those changes, including whether the measure remains appropriate for the Hospital VBP Program.

Comment: Several commenters stated that the PSI-90 measure lacks robust risk-adjustment and tends to penalize hospitals with larger case volumes. Several commenters argued that the measure relies on inadequately validated claims data. Commenters stated that claims-based measures are not necessarily reliable for Hospital VBP Program purposes. Commenters argued that the measure's basis in administrative claims data presents significant limitations and that using administrative claims data is a less accurate method of identifying patient severity than clinical data abstracted from medical records.

Another commenter was opposed to further adoption of the PSI-90 measure for the Hospital VBP Program, stating

that composite measures calculated using retrospective claims data create many problems for quality improvement activities, as the commenter believes claims-based data create inherent difficulties that are not present in non-claims data. The commenter was also opposed to rebalancing the PSI-90 measure by adding new metrics or shifting weighting to better measures in the composite, and stated that non-claims data should be considered for future composites when feasible.

Response: Each of the PSI-90 composite component measures includes detailed risk-adjustment for clinical factors (for example, modified diagnostic related groupings, major diagnostic categories, comorbidities), age, and gender that influence the risk for experiencing a patient safety event during hospitalization. AHRQ's Quality Indicator program continually updates and refines the indicators to capture the best possible quality indicators for the measure.

We also note that there are previously conducted validation studies examining the relationship between billing or claims data and medical records.

In addition, AHRQ has advised us that the NQF-convened a group of experts to determine what criteria should be used for evaluating the indicators in the PSI-90 measure. The Technical Expert Panel provided clear guidance on the relationship between the individual component indicators and the composite in the Composite Performance Measure Evaluation Guidance document (NQF, April 2013), available at http://www.qualityforum.org/Publications/2013/04/Composite_Performance_Measure_Evaluation_Guidance.aspx. Specifically, individual component measures that are included in the composite performance measure: (1) Should be justified based on the clinical evidence; (2) do not need to be NQF endorsed; (3) generally should demonstrate a gap in performance; and (4) may not be sufficiently reliable independently, but contribute to the reliability of the composite performance measure.

AHRQ convened a Composite Measure Workgroup of experts in the field to determine the best weighting strategy. The methodology of the PSI-90 measure is detailed in the original technical report by the AHRQ Composite: http://qualityindicators.ahrq.gov/Downloads/Modules/PSI/PSI_Composite_Development.pdf. Several alternative approaches were discussed with the AHRQ Composite Measure Workgroup and the first NQF Composite Measure Steering Committee. Factor analysis was

considered as one approach and was deemed to have no clear advantages over less complex, more intuitively clear weighting schemes. In brief, numerator weighting that is used in PSI-90 was preferred due to its greater simplicity and clarity.

Comment: A few commenters strongly opposed the duplicative use of PSI-90 in both the Hospital VBP and HAC Reduction Programs.

Response: As discussed further above, while we are aware that commenters object to the possibility of scoring hospitals on certain NHSN measures under both the Hospital VBP and HAC Reduction Programs, we note that these measures cover topics of critical importance to quality improvement in the inpatient hospital setting, and to patient safety.

Comment: Some commenters opposed adoption of the PSI-90 composite measure, stating that its component indicators have serious flaws.

Commenters stated that, for example, the PSI-15 indicator (accidental puncture or laceration), does not clearly define what constitutes an "accidental puncture." Commenters also stated that PSI-12 (postoperative PE/DVT rate) relies on risk adjustment criteria that could lead to potential unintended consequences such as tagging every LE thrombophlebitis, whether or not they are clinically significant. One commenter stated that emergent cases and patients with a prior history of PE or DVT should also be excluded from that measure.

Response: We continue to believe the PSI-90 measure is an important measure of patient safety, and therefore warrants inclusion in the Hospital VBP Program. PSI 15—accidental puncture and laceration and PSI 12—Perioperative Pulmonary Embolism or Deep Vein Thrombosis Rate are endorsed as valid and reliable measures (NQF 0345, NQF 0450, respectively). Expert panels have felt that these are scientifically sound measures.

Comment: One commenter expressed concern about the reliability and reproducibility of the PSI-90 claims-based composite measure because of generally poor agreement between these and NHSN-based surveillance criteria, with the exception of surgical site infection (SSI). The commenter encouraged AHRQ and other independent researchers to examine the value, validity, reliability, and reproducibility of PSI-90 by comparing it to epidemiologic measures within NHSN's domain. The commenter recommended that CMS study how these measures correlate with SSI and NHSN-based surveillance criteria.

Response: We agree with the commenter that studying the correlation between PSI-90 and with SSI and NHSN-based surveillance criteria would provide additional insights into PSI-90 measure validity, and will consider this in the future. We note that we are finalizing a policy to access certain NHSN data reported to the Hospital IQR Program which would make it possible to conduct this type of alignment analysis between the PSI-90 measure and the NHSN measures.

Comment: Commenters suggested that CMS consider removing the PSI-12 indicator from the PSI-90 composite for the FY 2015 Program until stakeholder concerns with the indicator's validity have been resolved.

Response: We do not believe the PSI-12 indicator should be removed from the PSI-90 composite measure because it is designed to improve surveillance and awareness of post-operative deep vein thrombosis and pulmonary embolism. We believe that monitoring these conditions is important to protect patients from post-operative complications.

Comment: A few commenters asked CMS not to finalize several proposed new measures for the FY 2019 Hospital VBP Program until they are NQF-endorsed, recommended by the MAP, and hospitals have experience in reporting and understanding the measures.

Response: We believe that we have complied with the Hospital VBP Program's statutory requirements with respect to endorsement from NQF, MAP recommendations, and reporting through the Hospital IQR Program prior to adopting these measures under the Hospital VBP Program. Further, for the reasons we described in the proposed rule and in our responses to comments on that proposed rule, we continue to believe that the proposed measures represent improvements to the Hospital VBP Program's measure set by expanding to new clinical topics and addressing public health concerns.

After consideration of the public comments we received, we are finalizing our proposal to adopt the PSI-90 composite measure for the FY 2019 Hospital VBP Program.

6. Possible Measure Topics for Future Program Years

a. Care Transition Measure (CTM-3) Items for Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28122), we stated that we are considering proposing to

add the Care Transition Measure (CTM) from the HCAHPS Survey to the Patient and Caregiver Centered Experience of Care/Care Coordination (PEC/CC) domain of the FY 2018 Hospital VBP Program. We sought public comments on this topic.

The CTM was added to the HCAHPS Survey of hospital inpatients in January 2013 (77 FR 53513 through 53516). Three items were added to the HCAHPS Survey to create the new Care Transition Measure composite. After collecting four quarters of data on these items (January 2013 through December 2013), we intend to publicly report CTM scores for the first time on our *Hospital Compare* Web site in October 2014.

Once the CTM has been publicly reported on *Hospital Compare* for one year, in accordance with the statutory requirements of the Hospital VBP Program, we are considering proposing to adopt CTM as the ninth dimension of the HCAHPS survey in the PEC/CC domain for the FY 2018 Hospital VBP Program. We intend to propose that the PEC/CC domain in the FY 2018 Hospital VBP Program would have a baseline period of January 1, 2014 through December 31, 2014, and a performance period of January 1, 2016 through December 31, 2016.

Currently, the PEC/CC domain is comprised of eight dimensions of the HCAHPS Survey. Scoring in this domain is based on two elements: The HCAHPS Base Score and HCAHPS Consistency Points Score. For additional information on the calculation of the PEC/CC domain score, we refer readers to "A Step-by-Step Guide to Calculating the Patient Experience of Care Domain Score in the Hospital Value-Based Purchasing FY 2013 Actual Percentage Payment Summary Report," at: <http://www.hcahpsonline.org/HospitalVBP.aspx>.

We specifically sought public comments on how the new CTM dimension should be included in the scoring methodology that we have adopted for the PEC/CC domain. In accordance with the finalized Hospital VBP Program scoring methodology for other domains, we are considering the "normalization" approach, which would introduce only minor changes to the original scoring formula, as follows.

For purposes of the HCAHPS Base Score, the new CTM dimensions would be calculated in the same manner as the eight existing HCAHPS dimensions. For each of the nine dimensions, Achievement Points (0-10 points) and Improvement Points (0-9 points) would be calculated, the larger of which would be summed across the nine dimensions to create a pre-normalized HCAHPS

Base Score (0-90 points, as compared to 0-80 points when only eight dimensions were included). The pre-normalized HCAHPS Base Score would then be multiplied by 8/9 (0.88888) and rounded according to standard rules (values of 0.5 and higher are rounded up, values below 0.5 are rounded down) to create the normalized HCAHPS Base Score. Each of the nine dimensions would be of equal weight, so that, as before, the normalized HCAHPS Base Score would range from 0 to 80 points.

HCAHPS Consistency Points would then be calculated in the same manner as before and would continue to range from 0 to 20 points. The Consistency Points Score would now consider scores across all nine of the PEC/CC domain dimensions, whereas before it considered only the eight dimensions that preceded the CTM measure.

The final element of the scoring formula would be the sum of the HCAHPS Base Score and the HCAHPS Consistency Points Score and would range from 0 to 100 points, as before.

We welcomed public comments on this approach to including the CTM-3 dimensions in the PEC/CC domain score.

Comment: Many commenters supported incorporating the HCAHPS Care Transition Measure (CTM-3) into the PEC/CC domain, given the critical importance of the care transition for improving patient outcomes and reducing patient suffering. Other commenters strongly supported the addition and urged CMS to finalize it. Commenters also supported the proposed methodology for scoring and weighting the measure within the domain.

One commenter noted that the measure develops a ninth dimension of the HCAHPS Survey in the PEC/CC domain for FY 2018. The commenter stated that this measure is a significant first step in addressing shared accountability and quality of care during transitions of care periods and discharges from the health-system setting. The commenter further agreed that the normalization approach should be used for this care transition measure and calculation of total performance score.

One commenter commended CMS for considering adopting the CTM-3 items on the HCAHPS Survey, stating that effective management of care transitions is essential to ensuring proper patient recoveries while reducing readmissions and ensuring medication adherence. Another commenter supported our plan to include the CTM-3 items on the HCAHPS survey in the Hospital VBP Program in future years, noting that

providing incentives for hospitals to coordinate patient transitions will aid significantly in decreasing readmissions and potentially mortality among Medicare patients. Other commenters supported adoption of the CTM–3 items on the HCAHPS Survey under the Hospital IQR Program and offered to evaluate their inclusion under the Hospital VBP Program once the items have been publicly reported. Other commenters noted that their support because managing safe and effective transitions of care is a critical competency in the health care system.

Response: We appreciate the comments in support of adding the Care Transition Measure to the Hospital VBP Program and the proposed methodology and weighting of this dimension in the PEC/CC domain.

Comment: Several commenters did not support the addition of the three-question care transition measure as a ninth dimension to the HCAHPS Hospital VBP Program scoring before evidence supporting its validity and materiality to the Hospital VBP Program was released. One commenter suggested that CMS exclude HCAHPS scores from the program or adjust provider scores to account for demographic factors that have been shown to impact survey results. One commenter requested additional analysis of the measure results after its first year of implementation.

Response: Should we decide to formally propose the addition of the HCAHPS Care Transition Measure to the Patient Experience of Care domain of the Hospital VBP Program through the rulemaking process, we will release additional information about the validity, reliability and statistical properties of the CTM.

In order to achieve the goal of fair comparisons across all hospitals that participate in HCAHPS, it is necessary to adjust for factors that are not directly related to hospital performance but do affect how patients answer HCAHPS survey items. The HCAHPS patient-mix adjustment is intended to eliminate any advantage or disadvantage in scores that might result from patient characteristics beyond a hospital's control. We do not collect or adjust for patients' socioeconomic status, however the HCAHPS patient-mix adjustment does include patients' highest level of education, which can be related to socioeconomic status. (HCAHPS On-Line Web site, Mode and Patient-mix Adjustment: <http://www.hcahpsonline.org/modeadjustment.aspx>.)

Comment: One commenter pointed to an analysis by the Cleveland Clinic that shows that as patients' severity of

illness worsens, HCAHPS scores decline in a statistically significant manner.

Further, the commenter notes that the same relationship was observed when the researchers examined the relationship between patients' symptoms of depression and responses to HCAHPS—as symptoms of depression worsened, HCAHPS scores declined. The commenter believed this trend also may affect scores for other surveys in the CAHPS family. The commenter encouraged CMS to conduct an analysis that assesses the extent of the issue, and identifies potential mechanisms for enhancing how CAHPS scores are adjusted for patient factors.

Response: Since its national implementation in 2006, the HCAHPS Survey has included an item that asks for patients' assessment of their overall health. We use this information in a transparent manner in the standard patient-mix adjustment of HCAHPS scores, as explained on the official HCAHPS On-Line Web site, www.HCAHPSonline.org, in our research documents, in the patient-mix adjustment coefficients that are posted on this Web site, and in published research.

Responding to comments about HCAHPS in previous IPPS/LTCH PPS rulemaking, we added an item to the HCAHPS Survey in January 2013 that asks patients to assess their overall mental or emotional health. We have analyzed the impact of this item and found that its inclusion in patient-mix adjustment does not explain more or improve the model in which the 'overall health' item also appears. Therefore we include only the 'overall health' item in the HCAHPS patient-mix adjustment, as this adequately adjusts for patient severity.

With respect to a Cleveland Clinic analysis that is said to show a greater than expected impact of severity of illness on HCAHPS scores, we understand that this analysis does not examine associations between patient characteristics and HCAHPS scores after the standard HCAHPS patient-mix adjustment has been applied. The standard HCAHPS patient-mix adjustment would be expected to remove most or all of the association mentioned. We also understand that the Cleveland Clinic analysis is not based on national data. In addition, recent research found that using patients' clinical characteristics in adjustment models had relatively little impact relative to survey questions about patients' health and that adding such measures to the existing HCAHPS case-

mix adjustment model would have very little effect.⁵³

Comment: One commenter urged CMS to expedite the initiative to include additional patient-centered palliative care measures into the Hospital VBP Program because the HCAHPS Survey is currently the only measure of patient experience, which misses all who die in the hospital or who are too ill to fill out the survey. The commenter noted that these individuals are most vulnerable due to the severity of their illness and deserve to have their and their families' experiences measured.

Response: The survey methodology and question wording at this point cannot accommodate proxy respondents, so HCAHPS cannot measure the experience of care of those who died in the hospital. However, as about 6.6 percent of hospice patients in 2012 died in a hospital setting,⁵⁴ the new Hospice Experience of Care Survey, which is specifically designed for proxy respondents, will be able to capture some information about the experience in the hospital setting.

b. Possible Future Efficiency and Cost Reduction Domain Measure Topics

In the interest of expanding the Efficiency and Cost Reduction domain to include a more robust measure set, including measures that supplement the MSPB measure with more condition and/or treatment specific episodes, as well as facilitating alignment with the Physician VM Program, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28122 through 28224), we stated that we are considering proposing to add new episode-based payment measures to the Hospital VBP Program through future rulemaking. Expanding the Efficiency and Cost Reduction domain to include such measures would create incentives for coordination between hospitals and physicians to optimize the care they provide to Medicare beneficiaries and would increase alignment between the Hospital VBP and Physician VM Programs. Any future Hospital VBP Program measures would first be finalized for inclusion in the Hospital IQR Program and included on the *Hospital Compare* Web site for one year, as required by section 1886(o)(2)(C) of the Act.

As we discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28123), the six episode-based standardized

⁵³ Cleary, et al. *Medical Care*. 52: 619–625. 2014.

⁵⁴ *NHPCO's Facts and Figures: Hospice Care in America, 2013 Edition*. National Hospice and Palliative Care Organization. Available at http://www.nhpc.org/sites/default/files/public/Statistics_Research/2013_Facts_Figures.pdf.

payment measures we are considering are similar in many ways to the NQF-endorsed MSPB measure already included in the Efficiency domain and, like the MSPB measure, Medicare payments included in these episode-based measures would be standardized according to the CMS standardization methodology finalized for the MSPB measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51626). In the FY 2013 IPPS/LTCH PPS proposed rule (79 FR 28123 through 28124), we also discussed notable differences between these new measures under consideration and the MSPB measure.

Most notably, we would only include Medicare payments for services that are clinically related to the health conditions treated during the hospital stay that triggered the episode. We stated that the aim of including these episode-based payment measures in the Hospital VBP Program would be to differentiate between hospitals that provide care efficiently (that is, high quality care at a lower cost to Medicare). We stated our belief that risk-adjusted standardized Medicare payments are an appropriate indicator of efficiency as they allow us to compare hospitals without regard to such factors as geography and teaching status. This comparison is particularly important with clinically coherent episodes because it distinguishes the degree to which practice pattern variation influences the cost of care. We believe that creating incentives for appropriately reducing practice pattern variation is an important part of our aims to lower the cost of care appropriately and create better coordinated care for Medicare beneficiaries.

We noted another difference between the episode-based measures we are considering and the MSPB measure, which occurs when, during the 30 days following discharge from an index admission, a beneficiary is readmitted for a condition that is clinically related to the index admission and that also triggers an episode-based cost measure episode. We provided details of which admissions would begin a new episode and contribute to a preceding episode may be found at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/index.html?redirect=/hospital-value-based-purchasing>.

We stated that we are considering three medical and three surgical episodes for the potential inclusion in the initial expansion of the Efficiency domain. The medical episodes would address the following conditions: (1) Kidney/urinary tract infection; (2)

cellulitis; and (3) gastrointestinal hemorrhage. A medical episode would be 'triggered' by an inpatient claim with a specified MS-DRG. The surgical episodes currently under consideration are (1) hip replacement/revision; (2) knee replacement/revision; and (3) lumbar spine fusion/refusion. A surgical episode would be triggered when an inpatient claim has one of the specified MS-DRGs and at least one of the procedure codes specified for that episode. We welcomed public comment on the three medical and three surgical conditions that we are considering as new episode-based measures for initial expansion of the Efficiency domain.

Comment: A few commenters expressed support for one or more specific episodes, and some commenters suggested that CMS also consider adding additional measures to the domain in the future. One commenter supported the proposal to adopt a hip/knee replacement/revision measure in the future efficiency domain, as the episode would encourage care coordination. Some of those commenters who supported one or more of these episodes also expressed concerns.

Many commenters did not support inclusion of the episode-based standardized measures into the Hospital VBP Program. One commenter stated that the DRG triggers for urinary tract infection and cellulitis are often unrelated to an index inpatient admission. A few commenters also requested additional information on the measures CMS is considering.

Response: We appreciate the commenter's support of the hip and knee replacement/revision condition-specific measures.

Regarding the comment on the kidney/urinary tract infection and cellulitis episodes, we would like to clarify that these episode are only triggered by the presence of a specific MS-DRG on an inpatient claim. Thus, the episodes can only be initiated when the kidney/urinary tract infection or cellulitis is the primary reason for inpatient hospitalization.

With regard to the request for additional information, we note that we provided detailed measure specifications at <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/index.html?redirect=/hospital-value-based-purchasing>, and we reiterate that would implement any future measures for the Hospital VBP Program by first proposing and finalizing them for inclusion in the Hospital IQR Program, through notice and comment rulemaking.

We thank the commenters for the responses and we will consider them as we develop future measures for the Hospital VBP Program.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28122 through 28123), we noted that there are a number of other types of episodes that could also meet the episode selection criteria we describe below, including those related to heart and lung (for example, heart failure and pneumonia). We stated that we are exploring data related to episodes for these types of conditions under the Physician VM Program. We welcomed comment regarding the applicability of episode-based measures for these or other conditions for future expansion of the Efficiency domain.

Comment: One commenter applauded CMS' consideration of condition-specific episode-based cost measures, and suggested that CMS consider focusing on additional high-impact conditions such as heart failure, stroke, and diabetes. The commenter also suggested that CMS attempt to identify geographic areas and hospitals where volume may be unduly high. Another commenter stated that, in FY 2017, CMS will be reporting Cost per Episode for pneumonia and heart failure through the Hospital IQR Program and was unclear why CMS is using different medical episodes here. Another commenter recommended that CMS consider the development and inclusion of additional measures outside of therapeutic areas already represented in the Hospital VBP Program, including measuring relating to diabetes, atrial fibrillation, COPD, and oncology. Several commenters who supported the measures encouraged CMS to develop additional episodes although these commenters did not identify specific episode names.

Response: We thank the commenters for the support of the six measures and the suggestions for additional high impact conditions and will consider their suggestions in the future. Regarding the comment that pneumonia and heart failure episodes were in the Hospital IQR Program but not among the six measures among the proposed conditions for potential inclusion in the Efficiency domain, the 6 measures were selected for common conditions with the five criteria discussed below. Other measures such as pneumonia and heart failure could be considered among the medical episodes for potential inclusion in the future. As stated earlier, we would first propose any future Hospital VBP Program measures for the Hospital IQR Program, through notice and comment rulemaking.

We thank the commenters for the responses and we will consider them as we develop future measures for the Hospital VBP Program.

In selecting the six conditions around which we would develop episode measures for future expansion of the Efficiency domain, we considered the following five criteria: (1) The condition constitutes a significant share of Medicare payments for hospitalized patients during and surrounding the hospital stay; (2) the degree to which clinical experts consulted for this project agree that standardized Medicare payments for services provided during the episode can be linked to the care provided during the hospitalization; (3) episodes of care for the condition are comprised of a substantial proportion of payments for post-acute care, indicating episode payment differences are driven by utilization outside of the MS-DRG payment; (4) episodes of care for the condition reflect high variation in post-discharge payments, enabling differentiation between hospitals; and, (5) the medical condition is managed by general medicine physicians or hospitalists and the surgical conditions are managed by surgical subspecialists, enabling comparison between similar practitioner types within each episode measure.

For analysis purposes, the five selection criteria were applied to 2012 Medicare acute inpatient hospital data in a hierarchical manner, to prioritize the inpatient conditions. After the selection criteria were applied, we narrowed the medical and surgical episodes to those episodes that are less complex, in order to allow CMS and hospitals to gain experience with this new measure type. Full details of the episode selection criteria are available on the CMS Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/index.html?redirect=/hospital-value-based-purchasing>. We welcomed public comments on the episode selection criteria we utilized.

Comment: Some commenters expressed support for the criteria. One commenter asked who is responsible for defining the episodes of care for cost management purposes.

Response: We thank the commenters for the support of the criteria. We have worked closely with clinicians and contractors experienced in health services research to develop the episode measure selection criteria and to define the episodes of care cost measures.

We thank the commenters for the responses and we will consider them as

we develop future measures for the Hospital VBP Program.

Complete episode specifications, including the MS-DRG and ICD-9-CM procedure codes used to identify each of the episodes, details of episode construction methodology, and information on the clinical expert reviewers for this project are available on the CMS Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/index.html?redirect=/hospital-value-based-purchasing>. We welcomed public comments on these specifications and the construction of the six episode-based payment measures that we are considering.

Comment: A number of commenter expressed concern regarding the lack of assessment of quality within the 6 cost measures or association with existing quality measures, both among those who supported the measures and those who did not. One commenter did not support the addition of six episode-based payment measures to the Efficiency domain in addition to the MSPB measure until a sufficient number of appropriate clinical outcome or clinical process measures related to these therapeutic areas are included in the program and have demonstrated high provider performance, and noted that the inclusion of cost measures without relevant quality measures could have the unintended consequence of sacrificing quality of care for the sake of cost reduction.

Response: As we take incremental steps towards providing all stakeholders with comprehensive metrics, we have selected condition-specific cost measures for common conditions with evidence of large variation in payments to encourage higher value care where there is the most opportunity for improvement, the greatest number of patients to benefit from improvements, and the largest sample size to ensure reliability. Regarding the comment that the measures under consideration do not account for quality, we continue to believe that it is beneficial to view a cost measure in light of other quality measures. As we stated in the FY 2012 IPPS/LTCH PPS final rule, for purposes of the Hospital VBP Program, we would weight and combine the Efficiency and Cost Control domain with the other domain scores, in order to calculate each hospital's TPS. This ensures that any future spending measures would make up only a portion of the TPS and that the remainder would be based on hospitals' performance on the other quality measures (76 FR 51622). We continue to believe that distant

measures of cost, independent of quality, enable us to identify hospitals involved in the provision of high quality care at a lower cost to Medicare (77 FR 53586).

Comment: Several commenters expressed concern about the potentially small number of episodes, which leads to more random variation. These commenters expressed concern about the reliability of the proposed condition-specific cost measures. One commenter noted that there would be fewer observations for each condition than there would be for an all-condition measure, such as the MSPB measure, and expressed concern that this would result in more random variation without providing clear additional information about the average costliness of the hospitals' care. To ensure reliability, the commenter expressed the belief that it is important that the cost measures used should be as broadly based as possible. Another commenter expressed concern that CMS may not be able to reliably and validly calculate Hospital VBP improvement scores and recommended that CMS focus on achievement scores. This commenter suggested that condition-specific cost measures will split efficiency data into small pools of information that are more prone to random variation and inconclusive results.

Response: As we take incremental steps towards providing all stakeholders with comprehensive metrics, we have selected for potential future inclusion in the Efficiency domain condition-specific cost measures for common conditions with evidence of large variation in payments to encourage higher value care where there is the most opportunity for improvement, the greatest number of patients to benefit from improvements, and the largest sample size to ensure reliability. To further ensure reliability, inclusion of the condition-specific cost measures for individual hospitals would require a minimum number of cases, which would be based on statistical tests of reliability and would be proposed through future rulemaking.

We also note that commenters have previously suggested that we narrow the MSPB measure to condition-specific measures, and we responded in the FY 2012 IPPS/LTCH PPS final rule that we would consider adding condition-specific measures to the Efficiency domain through future rulemaking (76 FR 51623). As we stated in the FY 2015 IPPS/LTCH PPS proposed rule, we believe that these condition-specific, cost and-outcome-measure groupings would allow patients and payers to make more fully informed comparisons

of hospitals' performance. Including condition-specific cost measures would also provide hospitals with actionable feedback that would better assist them in targeting resources for improvements than would an overall cost-measure alone.

Comment: A number of commenters expressed their concern that the episode measures, like the MSPB measure, include the cost of services that they perceived to be beyond hospitals' control, including post-acute care and readmissions. Commenters also expressed their concern that including post-acute care may skew measure results, due to including greater effects of patient comorbidities. Some commenters suggested that the measures would be more appropriate for inclusion in the Shared Savings Program or after they are implemented in the Physician Value Modifier (VM). Some commenters also suggested that the measures account for site of service choices made by beneficiaries.

Response: We disagree that Medicare payments for post-discharge services are beyond the influence of hospitals, and we believe that including post-acute care services in the episodes of care is important because it ensure that these high-cost services, often with alternative post-acute options with large variations in cost, are included in the overall condition-specific episode costs. Patient comorbidities that contribute to higher post-acute care costs are included in the risk adjustment models to address the concerns raised.

We agree that it is important to align incentives across CMS payment incentive programs. While these measures have not been proposed for inclusion in the Shared Savings Program or the VBM at present, they have been included in the Supplemental Quality and Resource Use Reports distributed to groups of 100 or more EPs in the summer of 2014 and we intend to continue to include them in these reports, as they are disseminated to more groups of EPs, including solo practitioners, in the future. We would also consider proposing them for inclusion in the VM and MSSP programs through future rulemaking.

As we stated in the stated in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51625), we do not believe that site of service adjustments are appropriate for spending measures, because such adjustments would undermine the ability of the measures to meaningfully capture differences in Medicare spending. However, we would consider the potential inclusion of site of service choice as we further examine the measure.

Comment: Some commenters suggested that CMS explore the Bundling Payments for Care Improvement (BPCI) initiative before these six potential measures are implemented. These commenters expressed concern that the measure specifications and episode construction rules were not aligned with the Bundled Payments for Care Improvement initiative, resulting in confusion among hospitals, and suggested that CMS consider this initiative before further pursuing these six episodes.

Response: We considered the BPCI methodology when we developed the episode based payment measures we discuss in this rule. We believe the episodes included in the Hospital VBP Program should be more specific in their inclusion of clinically-related costs, because these measures would be publicly reported and used to evaluate hospitals and adjust their payments, based on performance for specific conditions.

The BPCI approach (model 2) includes the inpatient hospital stay for the anchor MS-DRG and all related care covered under Medicare Part A and Part B within 30, 60, or 90 days following discharge from the acute care hospital. Unrelated services are not included in the BPCI episode. These excluded services can be found at http://innovation.cms.gov/Files/x/BPCI2-4_ParA-B_Exclusion.pdf. In contrast, the 6 condition-based episodes discussed in the proposed rule include all costs from the index admission and only clinically-related costs from Part A and B services occurring immediately before and after the index admission. Service costs may only be included in the condition-based episodes if they meet certain cost thresholds and are billed with select procedures, services, and/or diagnoses. In other words, the BPCI approach is designed to pay for an episode of care, which includes all relevant services for a set period of time. The six condition-based episodes proposed for potential future consideration are designed to support more targeted assessments of hospital performance by using the cost of major, clinically-related services in the post-discharge period as an indicator of a hospital's success in delivering clinically-relevant, high quality, and appropriate services during the index hospital admission.

Comment: Many commenters stated that the 6 condition-based episode measures under consideration did not risk adjust for sociodemographic factors and encouraged CMS to review its risk adjustment models. One commenter noted that lack of proper risk-adjustment for sociodemographic status

could result in unintended negative consequences. Some commenters discussed the recent NQF draft report on the subject that suggested that measures take these factors into account.

Response: We refer readers to our earlier discussion of risk adjustment based on socioeconomic status with respect to the MSPB measure which also is relevant for these measures.

Comment: Many commenters stated that inclusion of the 6 measures would mean double counting the services that are already included in the MSPB measure, which is the only measure in the Efficiency domain. Some commenters suggested that if these measures are adopted for inclusion in the Efficiency domain, then they should replace, rather than supplement the MSPB.

Response: We disagree that inclusion of additional condition-specific measures in the Efficiency and Cost Control domain would inappropriately double count payments for episodes attributed to hospitals. Unlike the MSPB measure, the condition-specific cost measures only include costs from services/procedures related to the condition. These condition-specific, cost-and-outcome-measure groupings would allow patients and payers to make more fully informed comparisons of hospitals' performance.

Including condition-specific cost measures would also provide hospitals with actionable feedback that will better equip them to implement targeted improvements than an overall cost-measure alone. Relying on condition-specific measures alone would disregard differences in overall cost. The MSPB-1 measure is reported as a ratio of payment-standardized, risk-adjusted MSPB amount for each hospital divided by the weighted median MSPB amount across all hospitals. These six clinical episode measures, if adopted in the future, are intended to supplement the information provided by the MSPB. We note that, as mentioned above, commenters have previously suggested that we narrow the MSPB measure to condition-specific measures, and we responded in the FY 2012 IPPS/LTCH PPS final rule that we would consider adding condition-specific measures to the Efficiency domain through future rulemaking (76 FR 51623).

Comment: Several commenters noted that CMS should follow the MAP process and propose to include these measures in the Hospital IQR Program first, prior to inclusion in the Hospital VBP Program.

Response: Any future Hospital VBP Program measures would first be

finalized for inclusion in the Hospital IQR Program and included on the *Hospital Compare* Web site for one year, as required by section 1886(o)(2)(C)(i) of the Act.

Comment: Several commenters, including those who supported the measure, requested additional information on the six measures. One commenter expressed concern about the proposed cost measures and recommended that the public have additional opportunity to review and comment on this proposal before CMS moves ahead on a hip/knee surgical episode under the Hospital VBP Program.

Response: The six episode cost measures have been designed specifically for the Medicare program using transparent methodology that is described in materials that are publicly available on the CMS hospital value-based purchasing Web site: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/index.html>. There will be additional opportunity to review and comment on this proposal before we would move ahead on any of the six episodes under consideration.

Comment: One commenter stated that readmissions for a condition clinically related to the index admission should not start a new index admission because it would be holding hospitals accountable twice for the care provided.

Response: The methodology of the condition-specific cost measures assigns separate significance to a readmission that is grouped to a related previous hospitalization and a second triggered episode for the same condition. These admissions would not necessarily be attributed to the same hospitals, and assigning one as a readmission to the previous hospitalization and also allowing it to begin a second episode provides an opportunity for both managing hospitals to be evaluated.

We will consider the suggestion that readmissions not trigger new episodes, but we believe that it may be appropriate to begin a new episode in these cases, because Medicare payments made for the care provided during these subsequent hospitalizations represents a significant cost that would otherwise not be captured. We also note that the measures could be calculated similarly to the MSPB measure, where the total cost per episode could be divided by the number of episodes, so that the amount would represent an average of the episode costs for multiple admissions.

Comment: One commenter suggested that CMS focus on the development of a multi-dimensional patient-reported

composite measure of maternity care in the near-term, which could be collected six weeks after birth to measure outcomes and identify common new-onset morbidities during a post-partum visit. Another commenter recommended the adaptation of the generic Consumer Assessment of Healthcare Providers and Systems (CAHPS) survey to measure the experience of care of childbearing women and newborns.

Response: Patients admitted for maternity care are eligible for the HCAHPS Survey and comprise a significant portion of patients who report their experience of care. We are considering whether to extend the HCAHPS Survey to encompass the pediatric population; currently the HCAHPS Survey is oriented toward patients 18 years of age and older.

We thank the commenters for the responses and we will consider them as we develop future measures for the Hospital VBP Program.

7. Previously Adopted and Newly Finalized Performance Periods and Baseline Periods for the FY 2017 Hospital VBP Program

a. Background

Section 1886(o)(4) of the Act requires the Secretary to establish a performance period for the Hospital VBP Program for a fiscal year that begins and ends prior to the beginning of such fiscal year. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50689 through 50692) and the CY 2014 OPPI/ASC final rule with comment period (78 FR 75020 through 75021) for the performance periods and baseline periods for the Clinical Care—Process, Patient Experience of Care, Clinical Care—Outcomes, and Efficiency and Cost Reduction domains for the FY 2016 Hospital VBP Program.

As discussed further below, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50702 through 50704), we adopted new NQS-based quality domains for FY 2017, and in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28124 through 28125), we proposed to adopt performance and baseline periods using those new domains for the FY 2017 Hospital VBP Program.

b. Previously Adopted Baseline and Performance Periods for the FY 2017 Hospital VBP Program

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50692 through 50694 and 50698 through 50699), because of the time needed to process measure data for the three 30-day mortality measures (Clinical Care—Outcomes domain) and the PSI-90 measure (also referred to in

previous rulemaking as the AHRQ patient safety PSI-90 composite measure) (Safety domain), and in consideration of our policy goal to collect enough data to generate the most reliable scores possible, we adopted performance periods and performance standards for the 30-day mortality measures for FY 2017, FY 2018, and FY 2019, and for the PSI-90 measure for FY 2017 and FY 2018.

c. Clinical Care—Process Domain Performance Period and Baseline Period for the FY 2017 Hospital VBP Program

In the FY 2014 IPPS/LTCH PPS final rule, we adopted a 12-month performance period for the FY 2016 Clinical Care—Process domain measures of CY 2014 (January 1, 2014 through December 31, 2014). We also adopted a corresponding 12-month baseline period of CY 2012 (January 1, 2012, through December 31, 2012), for purposes of calculating improvement points and performance standards.

Based on our review of FY 2013 and FY 2014 Hospital VBP performance period denominator data, we continue to believe that a 12-month performance period provides us with reliable and sufficient data for scoring Clinical Care—Process domain measures under the Hospital VBP Program. These data are available for public review on our *Hospital Compare* Web site. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28124), we proposed to adopt a 12-month performance period for FY 2017 Clinical Care—Process domain measures (including the proposed PC-01 measure) of CY 2015 (January 1, 2015, through December 31, 2015). We also proposed to adopt a corresponding 12-month baseline period of CY 2013 (January 1, 2013, through December 31, 2013) for purposes of calculating improvement points and calculating performance standards.

We invited public comment on these proposals.

Comment: Many commenters supported CMS' proposed baseline and performance periods for FY 2017 measures in the Safety, Clinical Care—Process, and Efficiency and Cost Reduction domains.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing the FY 2017 Clinical Care—Process performance and baseline periods as proposed.

d. PEC/CC Domain Performance Period and Baseline Period for the FY 2017 Hospital VBP Program

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50689), we adopted a 12-month performance period for FY 2016 Patient Experience of Care domain measures of CY 2014, or January 1, 2014 through December 31, 2014, for the FY 2016 Hospital VBP Program. We also adopted a corresponding 12-month baseline period of CY 2012 (January 1, 2012 through December 31, 2012), for purposes of calculating improvement points and calculating performance standards. We continue to believe that a 12-month performance period provides us sufficient HCAHPS data on which to score hospital performance, which is an important goal both for CMS and for stakeholders.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28124), we proposed to adopt a 12-month performance period for the FY 2017 PEC/CC domain of CY 2015 (January 1, 2015 through December 31, 2015). We also proposed to adopt a corresponding 12-month baseline period of CY 2013 (January 1, 2013 through December 31, 2013) for purposes of calculating improvement points and calculating performance standards.

We invited public comment on these proposals. However, we did not receive specific comments on the PEC/CC domain's performance period for FY 2017. Accordingly, we are finalizing the FY 2017 performance and baseline periods for the PEC/CC domain as proposed.

e. Performance Period and Baseline Period for NHSN Measures in the Safety Domain for the FY 2017 Hospital VBP Program

In the CY 2014 OPDS/ASC final rule with comment period (78 FR 75121), for the three NHSN HAI measures that we have adopted for the FY 2016 Hospital VBP Program (Catheter-Associated Urinary Tract Infection (CAUTI), CLABSI, and Surgical Site Infection (SSI)), we adopted an FY 2016 performance period of CY 2014 (January 1, 2014 through December 31, 2014), with a corresponding baseline period of

CY 2012 (January 1, 2012 through December 31, 2012) for purposes of calculating improvement points and calculating performance standards.

We continue to believe that a 12-month performance period provides us with sufficient data on which to score hospital performance on NHSN measures in the Safety domain. We also noted that 12-month performance and baseline periods are consistent with the reporting periods used for these measures under the Hospital IQR Program (78 FR 50689). Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28124) for the FY 2017 NHSN measures in the Safety domain (including the proposed CLABSI, C. difficile Infection and MRSA Bacteremia measures), we proposed to adopt a performance period of CY 2015 (January 1, 2015 through December 31, 2015), and a corresponding baseline period of CY 2013 (January 1, 2013 through December 31, 2013) for purposes of calculating improvement points and calculating performance standards.

We invited public comment on these proposals.

Comment: One commenter supported the performance and baseline periods for the FY 2017 NHSN measures in the Safety domain but recommended collaboration with NHSN on limitations of SIR analysis, especially for smaller size facilities or those with lower volumes of use of devices such as central lines, urinary catheters, and surgical procedures. The commenter also expressed concern that an SIR may not calculate even for a 12-month block of time for some hospitals.

Response: We intend to continue working with CDC to ensure that reliable SIRs are calculated for participating hospitals.

After consideration of the public comment we received, we are finalizing the FY 2017 performance period and baseline periods for the NHSN measures in the Safety domain as proposed.

f. Efficiency and Cost Reduction Domain Performance Period and Baseline Period for the FY 2017 Hospital VBP Program

In the FY 2014 IPPS/LTCH PPS final rule, we adopted a 12-month

performance period for the MSPB measure for the FY 2016 Hospital VBP Program of CY 2014 (January 1, 2014, through December 31, 2014), with a corresponding baseline period of CY 2012 (January 1, 2012, through December 31, 2012). This performance and baseline period enable us to collect sufficient measure data, while allowing time to calculate and incorporate MSPB measure data into the Hospital VBP Program scores in a timely manner.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28124 through 28125), we proposed to adopt a 12-month performance period for the FY 2017 Efficiency and Cost Reduction domain of CY 2015 (January 1, 2015 through December 31, 2015), with a corresponding baseline period of CY 2013 (January 1, 2013 through December 31, 2013). We noted that this proposed performance and baseline period aligns with the performance and baseline periods for Clinical Care—Process, PEC/CC, and certain Safety measures under the new domain structure.

We invited public comments on these proposals.

Comment: Commenters supported CMS' proposed baseline and performance periods for FY 2017 measures in the Safety, Clinical Care—Process, and Efficiency and Cost Reduction domains.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing the FY 2017 performance and baseline periods for the Efficiency and Cost Reduction domain as proposed.

g. Summary of Previously Adopted and Newly Finalized Performance Periods and Baseline Periods for the FY 2017 Hospital VBP Program

The table below summarizes the newly finalized baseline and performance periods for the FY 2017 Hospital VBP Program (with previously adopted baseline and performance periods for the mortality and AHRQ PSI composite (PSI-90) measures noted).

PREVIOUSLY ADOPTED AND NEWLY FINALIZED PERFORMANCE AND BASELINE PERIODS FOR THE FY 2017 HOSPITAL VBP PROGRAM

Domain	Baseline period	Performance period
Safety:		
<ul style="list-style-type: none"> PSI-90* 	<ul style="list-style-type: none"> October 1, 2010–June 30, 2012* 	<ul style="list-style-type: none"> October 1, 2013–June 30, 2015.*
<ul style="list-style-type: none"> NHSN (CAUTI, CLABSI, SSI, C. difficile Infection, MRSA Bacteremia). 	<ul style="list-style-type: none"> January 1, 2013–December 31, 2013 	<ul style="list-style-type: none"> January 1, 2015–December 31, 2015.
Clinical Care—Outcomes:		

PREVIOUSLY ADOPTED AND NEWLY FINALIZED PERFORMANCE AND BASELINE PERIODS FOR THE FY 2017 HOSPITAL VBP PROGRAM—Continued

Domain	Baseline period	Performance period
<ul style="list-style-type: none"> Mortality* (MORT–30–AMI, MORT–30–HF, MORT–30–PN). Clinical Care—Process <ul style="list-style-type: none"> (AMI–7a, IMM–2, PC–01) Efficiency and Cost Reduction (MSPB–1)		

* Previously adopted performance and baseline periods.

We note that we intend to propose additional baseline and performance periods for the FY 2018 Hospital VBP Program in future rulemaking.

8. Previously Adopted and Newly Finalized Performance Periods and Baseline Periods for Certain Measures for the FY 2019 Hospital VBP Program

a. Previously Adopted and Newly Finalized Performance Period and Baseline Period for the FY 2019 Hospital VBP Program for Clinical Care—Outcome Domain Measures

As described above, we have previously adopted the FY 2019 performance and baseline periods for the three 30-day mortality measures that we have adopted for the former Outcome domain and that we have since placed into the Clinical Care—Outcomes domain under the new domain structure.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28121 through 28122), we proposed to adopt the THA/TKA measure for the FY 2019 Hospital VBP Program and to place that measure in the Clinical Care—Outcomes domain. THA/TKA is reported to the Hospital IQR Program for 36-month time periods. However, we do not believe that we can feasibly adopt a 36-month performance period for this measure and adopt it for the FY 2019 Hospital VBP Program. Based on the time needed to complete measure calculations and performance scoring, we believe that we must conclude the performance period for this measure by June 30, 2017. We believe that a 30-month performance period will result in sufficiently reliable quality measure data for purposes of Hospital VBP Program scoring, and our analysis of historic data supported our belief that comparisons between a 36-month baseline period and a 30-month performance period will not result in significant differences in measure scores. Further, adopting this proposed performance period would enable us to include the measure in the FY 2019 Hospital VBP Program, which would ensure that hospitals continue focusing

on measures of outcomes under the Hospital VBP Program and that we continue transitioning the Hospital VBP Program from its initial focus on process measures to outcome measures.

We note that we have proposed below to adopt a 36-month performance period for the THA/TKA measure for the FY 2020 Hospital VBP Program. We have examined the correlation between hospitals’ performance on the THA/TKA measure for 30-month and 36-month periods, and we believe that the 30-month period meets our standard for moderate reliability of quality measure data during the specified time period. However, as with the 30-day mortality and PSI–90 measures, we are attempting to align performance periods under the Hospital VBP Program with reporting periods under the Hospital IQR Program, while introducing measures covering important clinical topics into the Hospital VBP Program as quickly as possible. We believe that our proposal for a 30-month performance period for this measure for the FY 2019 Hospital VBP Program allows us to bring the measure into the program in FY 2019 and to accomplish that alignment beginning with the FY 2020 Hospital VBP Program.

Therefore, we proposed to adopt an FY 2019 performance period of January 1, 2015 through June 30, 2017 for the THA/TKA measure. Further, we proposed to adopt an FY 2019 baseline period for this measure of July 1, 2010 to June 30, 2013 for purposes of calculating performance standards and awarding improvement points.

We welcomed public comments on these proposals.

We did not receive any specific public comments on these proposals and are finalizing the FY 2019 performance and baseline periods for the THA/TKA measure as proposed.

b. Performance Period and Baseline Period for the PSI–90 Safety Domain Measure for the FY 2019 Hospital VBP Program

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50692 through 50694), we adopted performance periods and baseline periods for the PSI–90 measure for the FY 2017 and FY 2018 Hospital VBP Programs. We adopted this policy in light of the time needed to process measure data and our policy goal to collect enough data to generate the most reliable measure scores possible. We stated our belief that aligning the Hospital VBP Program performance periods with the Hospital IQR Program reporting period duration would allow hospitals to review *Hospital Compare* measure rates when they are updated and incorporate this information into their quality improvement efforts, rather than having to wait until the Hospital VBP Program provides its scoring reports to hospitals. We stated our further belief that aligning the Hospital IQR Program and the Hospital VBP Program in this manner will minimize the burden on participating hospitals by aligning the time periods during which they must monitor their performance on this measure.

We did not finalize a baseline period and performance period for the AHRQ PSI–90 measure for FY 2019 in that final rule (78 FR 50692 through 50694). We stated that, by declining to finalize the measure’s FY 2019 performance and baseline periods in that final rule, we would be able to adopt a more recent baseline period than we initially proposed. We stated that we intended to propose baseline and performance periods for the AHRQ PSI measure for the FY 2019 Hospital VBP Program in future rulemaking.

We continue to believe that we should adopt performance and baseline periods of 24 months for the PSI–90 measure. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28126) we proposed to adopt an FY 2019 performance period for the PSI–90 measure of July 1, 2015 through June 30,

2017, with a corresponding 24-month baseline period of July 1, 2011 through June 30, 2013, for purposes of calculating performance standards and awarding improvement points.

We welcomed public comments on these proposals. However, we did not receive any specific public comments on this proposal and are finalizing the

FY 2019 performance and baseline periods for the PSI-90 measure as proposed.

c. Summary of Previously Adopted and Newly Finalized Performance Periods and Baseline Periods for Certain Measures for the FY 2019 Hospital VBP Program

The following table summarizes previously adopted and proposed performance and baseline periods for the FY 2019 Hospital VBP Program:

PREVIOUSLY ADOPTED AND NEWLY FINALIZED PERFORMANCE AND BASELINE PERIODS FOR CERTAIN MEASURES FOR THE FY 2019 HOSPITAL VBP PROGRAM

Domain	Baseline period	Performance period
Safety:		
• PSI-90	• July 1, 2011–June 30, 2013	• July 1, 2015–June 30, 2017.
Clinical Care—Outcomes:		
• Mortality* (MORT-30-AMI, MORT-30-HF, MORT-30-PN).	• July 1, 2009–June 30, 2012*	• July 1, 2014–June 30, 2017.*
• THA/TKA	• July 1, 2010–June 30, 2013	• January 1, 2015–June 30, 2017.

* Previously adopted performance and baseline periods.

9. Performance Period and Baseline Period for the Clinical Care—Outcomes Domain for the FY 2020 Hospital VBP Program

As described above with respect to the mortality measures, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50692 through 50694), we adopted performance periods and baseline periods for the three 30-day mortality measures for the FY 2017, FY 2018, and FY 2019 Hospital VBP Programs. We adopted this policy in light of the time needed to process measure data and to ensure that we collect enough measure data for reliable performance scoring, as described further above. We continue to believe that we should adopt 36-month performance and baseline periods for the mortality measures when possible to accommodate those durations.

We believe that a similar rationale applies to the new THA/TKA measure that we proposed to adopt for the Clinical Care—Outcomes domain for the FY 2019 Hospital VBP Program, and

which, under our policy of measure readoption, we generally would readopt for the FY 2020 Hospital VBP Program if finalized. As stated above, we have examined the correlation between hospitals’ performance on the THA/TKA measure for 30-month and 36-month periods, and we believe that the 30-month period meets our standard for moderate reliability of quality measure data during the specified time period. However, as with the 30-day mortality and PSI-90 measures, we are attempting to align performance periods under the Hospital VBP Program with reporting periods under the Hospital IQR Program, while introducing measures covering important clinical topics into the program as quickly as possible. We believe that our proposal for a 30-month performance period for this measure for FY 2019 allows us to accomplish that alignment beginning with the FY 2020 Program.

Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28126

through 28127) we proposed to adopt a 36-month performance period for the measures in the Clinical Care—Outcomes domain in the FY 2020 Hospital VBP Program (including the proposed THA/TKA measure for FY 2020, if that measure is adopted for the FY 2020 Hospital VBP Program) of July 1, 2015 through June 30, 2018, with a corresponding 36-month baseline period of July 1, 2010 through June 30, 2013, for purposes of calculating performance standards and awarding improvement points.

We welcomed public comment on these proposals.

We did not receive any specific public comments on this proposal and are finalizing the FY 2020 performance and baseline periods for the Clinical Care—Outcomes domain as proposed.

The following table summarizes the finalized performance and baseline period for the Clinical Care—Outcomes domain for the FY 2020 Hospital VBP Program:

PERFORMANCE AND BASELINE PERIOD FOR THE CLINICAL CARE—OUTCOMES DOMAIN FOR THE FY 2020 HOSPITAL VBP PROGRAM

Domain	Baseline period	Performance period
Clinical Care—Outcomes:		
• Mortality (MORT-30-AMI, MORT-30-HF, MORT-30-PN).	• July 1, 2010–June 30, 2013	• July 1, 2015–June 30, 2018.
• THA/TKA	• July 1, 2010–June 30, 2013	• July 1, 2015–June 30, 2018.

10. Performance Standards for the Hospital VBP Program

a. Background

Section 1886(o)(3)(A) of the Act requires the Secretary to establish performance standards for the measures

selected under the Hospital VBP Program for a performance period for the applicable fiscal year. The performance standards must include levels of achievement and improvement, as required by section 1886(o)(3)(B) of

the Act, and must be established and announced not later than 60 days before the beginning of the performance period for the fiscal year involved, as required by section 1886(o)(3)(C) of the Act. We refer readers to the Hospital Inpatient

VBP Program final rule (76 FR 26511 through 26513) for further discussion of achievement and improvement standards under the Hospital VBP Program.

In addition, when establishing the performance standards, section 1886(o)(3)(D) of the Act requires the Secretary to consider appropriate factors, such as: (1) practical experience with the measures, including whether a significant proportion of hospitals failed to meet the performance standard during previous performance periods; (2) historical performance standards; (3) improvement rates; and (4) the opportunity for continued improvement.

b. Performance Standards for the FY 2016 Hospital VBP Program

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53599 through 53604), we adopted performance standards for FY 2015 and certain FY 2016 Hospital VBP Program measures. We also finalized our policy to update performance periods and performance standards for future Hospital VBP Program years via notice on the CMS Web site or another publicly available Web site.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50694 through 50698), we revised our regulatory definitions of “achievement threshold” and “benchmark” at 42 CFR 412.160 and adopted performance standards for additional FY 2016 Hospital VBP Program measures. We also adopted an

interpretation of “achievement threshold” and “benchmark” under section 412.160 to not include the numerical values that result when the performance standards are calculated. We further adopted a policy under which we may update a measure’s performance standards for a fiscal year once if we identify data issues, calculation errors, or other problems that would significantly affect the displayed performance standards. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50695 through 50698) for the complete set of FY 2016 performance standards.

c. Previously Adopted Performance Standards for the FY 2017, FY 2018, and FY 2019 Hospital VBP Programs

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50698 through 50699), we adopted performance standards for the three 30-day mortality measures for the FY 2017, FY 2018, and FY 2019 Hospital VBP Programs and for the PSI–90 measure for the FY 2017 and FY 2018 Hospital VBP Programs. We refer readers to that final rule for those performance standards.

d. Additional Performance Standards for the FY 2017 Hospital VBP Program

In accordance with our finalized methodology for calculating performance standards (discussed more fully in the Hospital Inpatient VBP Program final rule (76 FR 26511 through 26513)), in the FY 2015 IPPS/LTCH PPS

proposed rule (79 FR 28127 through 28128) we proposed to adopt the following additional performance standards for the FY 2017 Hospital VBP Program. We note that the numerical values for the performance standards displayed below represent estimates based on the most recently available data, and we intend to update the numerical values in the FY 2015 IPPS/LTCH PPS final rule. We note further that the MSPB measure’s performance standards are based on performance period data; therefore, we are unable to provide numerical equivalents for the standards at this time.

We note further that the performance standards for the NHSN measures (CAUTI, SSI, and proposed CLABSI, MRSA Bacteremia, and *C. difficile* Infection), the PSI–90 measure, and the MSPB measure are calculated with lower values representing better performance, in contrast to other measures, on which higher values indicate better performance. As discussed further in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50684), the performance standards for SSI are computed separately for each measure stratum. We will award achievement and improvement points to each stratum separately and then compute a weighted average of the points awarded to each stratum by predicted infections. We note that we misstated PC–01 measure’s benchmark in the proposed rule and have corrected that error in the table below.

PREVIOUSLY ADOPTED AND PROPOSED PERFORMANCE STANDARDS FOR THE FY 2017 HOSPITAL VBP PROGRAM: SAFETY, CLINICAL CARE—OUTCOMES, CLINICAL CARE—PROCESS, AND EFFICIENCY AND COST REDUCTION MEASURES

Measure ID	Description	Achievement threshold	Benchmark
Safety Measures			
CAUTI	Catheter-Associated Urinary Tract Infection	0.8371	0.0000.
CLABSI	Central Line-Associated Blood Stream Infection.	0.4483	0.0000.
<i>C. difficile</i>	<i>Clostridium difficile</i> Infection	0.7927	0.0000.
MRSA Bacteremia	Methicillin-Resistant <i>Staphylococcus aureus</i> Bacteremia.	0.8613	0.0000.
PSI–90*	Complication/patient safety for selected indicators (composite)*.	*0.577321	*0.397051.
SSI	Surgical Site Infection.		
	• Colon	• 0.7117	• 0.0000.
	• Abdominal Hysterectomy	• 0.7509	• 0.0000.
Clinical Care—Outcomes Measures			
MORT–30–AMI*	Acute Myocardial Infarction (AMI) 30-day mortality rate*.	*0.851458	*0.871669.
MORT–30–HF*	Heart Failure (HF) 30-day mortality rate*	*0.881794	*0.903985.
MORT–30–PN*	Pneumonia (PN) 30-day mortality rate*	*0.882986	*0.908124.
Clinical Care—Process Measures			
AMI–7a	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival.	0.954545	1.000000.
IMM–2	Influenza Immunization	0.995882	1.000000.

PREVIOUSLY ADOPTED AND PROPOSED PERFORMANCE STANDARDS FOR THE FY 2017 HOSPITAL VBP PROGRAM: SAFETY, CLINICAL CARE—OUTCOMES, CLINICAL CARE—PROCESS, AND EFFICIENCY AND COST REDUCTION MEASURES—Continued

Measure ID	Description	Achievement threshold	Benchmark
PC-01	Elective Delivery Prior to 39 Completed Weeks Gestation.	0.031250	0.000000.
Efficiency and Cost Reduction Measure			
MSPB-1	Medicare Spending per Beneficiary	Median Medicare Spending per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending per Beneficiary ratios across all hospitals during the performance period.

*Previously adopted performance standards.

PROPOSED PERFORMANCE STANDARDS FOR THE FY 2017 HOSPITAL VBP PROGRAM PATIENT AND CAREGIVER-CENTERED EXPERIENCE OF CARE/CARE COORDINATION DOMAIN

HCAHPS survey dimension	Floor (percent)	Achievement threshold (percent)	Benchmark (percent)
Communication with Nurses	56.90	78.08	86.41
Communication with Doctors	62.03	80.43	88.71
Responsiveness of Hospital Staff	36.46	64.83	79.62
Pain Management	49.47	70.20	78.18
Communication about Medicines	42.89	62.82	73.15
Hospital Cleanliness & Quietness	43.46	65.26	79.06
Discharge Information	61.86	85.59	91.04
Overall Rating of Hospital	35.00	69.81	84.27

We note that we intend to propose additional performance standards for the FY 2018 Hospital VBP Program in future rulemaking.

We welcomed public comments on these proposed performance standards.

We did not receive any specific public comments on the proposed performance standards. We are therefore finalizing the FY 2017 performance standards as outlined below.

Set out below are the updated the numerical values for the performance

standards. As with the NHSN measures and the PSI-90 measure, we note that better performance on the PC-01 measure is represented by lower numerical values.

PREVIOUSLY ADOPTED AND NEWLY FINALIZED PERFORMANCE STANDARDS FOR THE FY 2017 HOSPITAL VBP PROGRAM: SAFETY, CLINICAL CARE—OUTCOMES, CLINICAL CARE—PROCESS, AND EFFICIENCY AND COST REDUCTION MEASURES

Measure ID	Description	Achievement threshold	Benchmark
Safety Measures			
CAUTI	Catheter-Associated Urinary Tract Infection	0.845	0.000.
CLABSI	Central Line-Associated Blood Stream Infection.	0.457	0.000.
C. difficile	Clostridium difficile Infection	0.750	0.000.
MRSA Bacteremia	Methicillin-Resistant Staphylococcus aureus Bacteremia.	0.799	0.000.
PSI-90*	Complication/patient safety for selected indicators (composite)*.	*0.577321	*0.397051.
SSI	Surgical Site Infection.		
	• Colon	• 0.751	• 0.000.
	• Abdominal Hysterectomy	• 0.698	• 0.000.
Clinical Care—Outcomes Measures			
MORT-30-AMI*	Acute Myocardial Infarction (AMI) 30-day mortality rate*.	*0.851458	*0.871669.
MORT-30-HF*	Heart Failure (HF) 30-day mortality rate*	*0.881794	*0.903985.
MORT-30-PN*	Pneumonia (PN) 30-day mortality rate*	*0.882986	*0.908124.
Clinical Care—Process Measures			
AMI-7a	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival.	0.954545	1.000000.
IMM-2	Influenza Immunization	0.951607	0.997739.

PREVIOUSLY ADOPTED AND NEWLY FINALIZED PERFORMANCE STANDARDS FOR THE FY 2017 HOSPITAL VBP PROGRAM: SAFETY, CLINICAL CARE—OUTCOMES, CLINICAL CARE—PROCESS, AND EFFICIENCY AND COST REDUCTION MEASURES—Continued

Measure ID	Description	Achievement threshold	Benchmark
PC-01	Elective Delivery Prior to 39 Completed Weeks Gestation.	0.031250	0.000000.
Efficiency and Cost Reduction Measure			
MSPB-1	Medicare Spending per Beneficiary	Median Medicare Spending per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending per Beneficiary ratios across all hospitals during the performance period.

*Previously adopted performance standards.

PERFORMANCE STANDARDS FOR THE FY 2017 HOSPITAL VBP PROGRAM PATIENT AND CAREGIVER-CENTERED EXPERIENCE OF CARE/CARE COORDINATION DOMAIN

HCAHPS survey dimension	Floor (percent)	Achievement threshold (percent)	Benchmark (percent)
Communication with Nurses	58.14	78.19	86.61
Communication with Doctors	63.58	80.51	88.80
Responsiveness of Hospital Staff	37.29	65.05	80.01
Pain Management	49.53	70.28	78.33
Communication about Medicines	41.42	62.88	73.36
Hospital Cleanliness & Quietness	44.32	65.30	79.39
Discharge Information	64.09	85.91	91.23
Overall Rating of Hospital	35.99	70.02	84.60

e. Performance Standards for the FY 2019 and FY 2020 Hospital VBP Programs

As discussed further above, we have adopted certain Safety and Clinical Care—Outcomes domain measures for future program years in order to ensure that we can adopt performance periods

and baseline periods of sufficient length for performance scoring purposes. In the FY 2015 IPPS/LTCH PPS proposed rule, we also proposed to adopt the PSI-90 measure in the Safety domain and the THA/TKA measure in the Clinical Care—Outcomes domain for the FY 2019 Hospital VBP Program. We note that, as described above with respect to

the NHSN, PSI-90, and MSPB measures, better performance is represented by lower values for the THA/TKA measure. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28128 through 28129) we proposed to adopt the following performance standards for the FY 2019 Hospital VBP Program:

PREVIOUSLY ADOPTED AND PROPOSED PERFORMANCE STANDARDS FOR CERTAIN SAFETY AND CLINICAL CARE—OUTCOMES DOMAIN MEASURES FOR THE FY 2019 HOSPITAL VBP PROGRAM

Measure ID	Description	Achievement threshold	Benchmark
Safety Measures			
PSI-90	Complication/patient safety for selected indicators (composite)	0.840421	0.589716
Outcomes Measures			
MORT-30-AMI*	Acute Myocardial Infarction (AMI) 30-day mortality rate*	*0.850671	*0.873263
MORT-30-HF*	Heart Failure (HF) 30-day mortality rate*	*0.883472	*0.908094
MORT-30-PN*	Pneumonia (PN) 30-day mortality rate*	*0.882334	*0.907906
THA/TKA	Hospital-level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) And/Or Total Knee Arthroplasty (TKA).	0.032521	0.022895

* Previously adopted performance standards.

We welcomed public comments on these proposed performance standards.

We did not receive any specific public comments on this proposal and are

finalizing the FY 2019 performance standards as outlined below.

Set out below are the updated numerical values for the FY 2019 performance standards. We note that, as

described above with respect to the NHSN, PSI-90, and MSPB measures, better performance is represented by lower values for the THA/TKA measure.

PREVIOUSLY ADOPTED AND NEWLY FINALIZED PERFORMANCE STANDARDS FOR CERTAIN SAFETY AND CLINICAL CARE—
OUTCOMES DOMAIN MEASURES FOR THE FY 2019 HOSPITAL VBP PROGRAM

Measure ID	Description	Achievement threshold	Benchmark
Safety Measures			
PSI-90	Complication/patient safety for selected indicators (composite)	0.840335	0.589462
Outcomes Measures			
MORT-30-AMI*	Acute Myocardial Infarction (AMI) 30-day mortality rate*	*80.850671	*80.873263
MORT-30-HF*	Heart Failure (HF) 30-day mortality rate*	*80.883472	*80.908094
MORT-30-PN*	Pneumonia (PN) 30-day mortality rate*	*80.882334	*80.907906
THA/TKA	Hospital-level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) And/Or Total Knee Arthroplasty (TKA).	0.032229	0.023178

* Previously adopted performance standards.

We also proposed to adopt the following performance standards for the FY 2020 Hospital VBP Program:

PROPOSED PERFORMANCE STANDARDS FOR CLINICAL CARE—OUTCOMES DOMAIN MEASURES FOR THE FY 2020 HOSPITAL VBP PROGRAM

Measure ID	Description	Achievement threshold	Benchmark
Clinical Care—Outcomes Measures			
MORT-30-AMI	Acute Myocardial Infarction (AMI) 30-day mortality rate	0.853511	0.875840
MORT-30-HF	Heart Failure (HF) 30-day mortality rate	0.881394	0.905962
MORT-30-PN	Pneumonia (PN) 30-day mortality rate	0.882281	0.909460
THA/TKA	Hospital-level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) And/Or Total Knee Arthroplasty (TKA).	0.032521	0.022895

We welcomed public comments on these proposed performance standards.

We did not receive any specific public comments on this proposal and are

finalizing the FY 2020 performance standards as outlined below.

Set out below are the updated the numerical values for the FY 2020 performance standards. We note that, as

described above with respect to the NHSN, PSI-90, and MSPB measures, better performance is represented by lower values for the THA/TKA measure.

PERFORMANCE STANDARDS FOR CLINICAL CARE—OUTCOMES DOMAIN MEASURES FOR THE FY 2020 HOSPITAL VBP PROGRAM

Measure ID	Description	Achievement threshold	Benchmark
Clinical Care—Outcomes Measures			
MORT-30-AMI	Acute Myocardial Infarction (AMI) 30-day mortality rate	0.853715	0.875869
MORT-30-HF	Heart Failure (HF) 30-day mortality rate	0.881090	0.906068
MORT-30-PN	Pneumonia (PN) 30-day mortality rate	0.882266	0.909532
THA/TKA	Hospital-level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) And/Or Total Knee Arthroplasty (TKA).	0.032229	0.023178

f. Technical Updates Policy for Performance Standards

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50694 through 50698), we revised our regulatory definitions of “achievement threshold” and “benchmark” at 42 CFR 412.160 and adopted performance standards for additional FY 2016 Hospital VBP Program measures. We also adopted an interpretation of “achievement

threshold” and “benchmark” under section 412.160 to not include the numerical values that result when the performance standards are calculated. We further adopted a policy under which we may update a measure’s performance standards for a fiscal year once if we identify data issues, calculation errors, or other problems that would significantly change the displayed performance standards.

Our historic practice has been to display Hospital VBP Program performance standards’ numerical values in rulemaking. We adopted this practice for the convenience of the public. Although we have typically expressed the performance standards for each Hospital VBP measure as a numerical value prior to the start of the performance period for that measure, we do not display numerical values for the

MSPB measure because the measure is constructed as a measure of costs attributable to patient care during a specified episode of care during the performance period itself (77 FR 53601). We have stated that with respect to the MSPB measure, we do not believe it is helpful for hospitals to be compared against performance standards constructed from baseline period data given the potential changes in market forces and utilization practices that occur over time.

Further, during the long interval between the time we first display the performance standards for all measures but the MSPB measure and the time that we calculate the achievement and improvement scores for those measures based on actual hospital performance, one or more of those measures might have been technically updated in a way that inhibits our ability to ensure that we are making appropriate comparisons between the baseline and performance period. For example, the software used to calculate the PSI-90 measure is regularly updated to incorporate coding changes, refinements based on the consensus development process, and refinements to improve specificity and sensitivity. The statistical modeling we use to adjust measure calculations for PSI-90 and HCAHPS also needs to be periodically updated to incorporate coefficient factors that more properly account for patient mix (both measures) and the HCAHPS survey data collection mode (HCAHPS survey). These types of technical updates do not substantively affect the measure rate calculation methodology, but they do sometimes affect our ability to make appropriate comparisons between the baseline and performance period if, for example, the baseline performance standards are tabulated using one version of the software and hospital performance during subsequent performance periods is tabulated with another version. We believe that in order to make the most accurate comparison of hospital performance across time, we should use the most updated version of the measure that is available at the time we calculate that performance because the updated version will produce the most valid measure rates.

Further, as part of its regular maintenance process for NQF-endorsed performance measures, NQF requires measure stewards to submit annual measure maintenance updates and undergo maintenance of endorsement review every 3 years. In the measure maintenance process, the measure steward (owner/developer) is responsible for updating and maintaining the currency and relevance

of the measure and will confirm existing or minor specification changes with NQF on an annual basis. NQF solicits information from measure stewards for annual reviews, and it reviews measures for continued endorsement in a specific 3-year cycle.

The NQF's annual or triennial maintenance processes for endorsed measures may result in the NQF requiring updates to the measures in order to maintain endorsement status. We believe that it is important to incorporate nonsubstantive updates required by the NQF, as well as nonsubstantive updates made to other measures, into the measure specifications we have adopted for the Hospital VBP Program so that these measures remain up-to-date and ensure that we make fair comparisons between the performance and baseline periods that we adopt under the program. We also recognize that some updates to measures are substantive in nature and might not be appropriate for adoption without further rulemaking.

With respect to what constitutes substantive versus nonsubstantive changes to measures, we would make this determination on a case-by-case basis. Examples of nonsubstantive changes to measures might include updated diagnosis or procedure codes, medication updates for categories of medications, broadening of age ranges, and exclusions for a measure (such as the addition of a hospice exclusion to the 30-day mortality measures). We believe that nonsubstantive changes may include updates to measures based upon changes to guidelines upon which the measures are based.

Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28129 through 28130) we proposed to amend the definition of "performance standards" under section 412.160 to enable us to update performance standards' numerical values to incorporate nonsubstantive technical updates that are made to Hospital VBP Program measures between the time that they are adopted for a particular program year and the time that we actually calculate hospital performance on those measures after the performance period for the program year has concluded. Further, we proposed to inform hospitals of these technical updates through postings on our Hospital VBP Program Web site, the QualityNet Web site, other educational outreach efforts, and/or the scoring reports that we provide for each program year. We noted that these proposals, if finalized, may have the effect of superseding the performance standards that we establish prior to the

start of the performance period for the affected measures, but we believe them to be necessary to ensure that the performance standards in the Hospital VBP Program's scoring calculations enable the fairest comparisons between performance measured during the baseline period and performance period.

We would continue to use rulemaking to adopt substantive updates to the measures we have adopted for the Hospital VBP Program. Examples of changes that we might consider to be substantive would be those in which the changes are so significant that the measure is no longer the same measure or when a standard of performance assessed by a measure becomes more stringent (that is, changes in acceptable timing of medication, procedure/process, or test administration). We also noted that the NQF process incorporates an opportunity for public comment and engagement in the measure maintenance process.

We also proposed to include in our revised definition of "performance standards" under section 412.160 of our regulations the policy we adopted in the FY 2013 IPPS/LTCH PPS final rule to update the performance standards once if we identify data issues, calculation errors, or other problems that would significantly change the standards (78 FR 50695). We proposed to make this change so that our policies governing updates to the performance standards appear together.

We welcomed public comments on these proposals. We also specifically sought public comments on what we should consider to be substantive changes in measures' performance standards, including whether or not we should consider certain changes in performance standards as a result of technical or nonsubstantive updates to be substantive.

Comment: Several commenters opposed CMS' proposal to adopt technical updates for performance standards, stating that there is no reason we cannot use the public notice and technical corrections process to disseminate changes in performance standards to stakeholders. Some commenters stated that not all stakeholders have access to QualityNet to receive the updates that CMS proposed. One commenter noted that changing performance standards targets with more than annual frequency would undermine hospitals' ability to implement performance improvement efforts. Commenters noted that the Hospital VBP Program is designed to hold hospitals accountable for their performance during a specified time period based on standards that are

published before that performance period begins.

One commenter recommended that CMS apply changes in the risk adjustment system only when a new performance standard is published and then use those same updates when performance is measured for the performance period—if the changes are indeed “nonsubstantive,” as the proposed regulatory text would specify, delaying the application of such updates should not be detrimental to the Hospital VBP Program. The commenter expressed concern that changes could be made resulting both in different hospital performance and a different performance standard, which would eliminate the usefulness of the minimal amount of information currently available to hospitals on these measures.

Response: We disagree with the recommendation to have all measure changes subject to notice-and-comment rulemaking. As previously noted in FY 2014 IPPS/LTCH PPS final rule (78 FR 50776), we believe that the maintenance of technical specifications for quality measure policy for the Hospital IQR Program also is applicable to the Hospital VBP Program. We believe this policy adequately balances our need to incorporate nonsubstantive NQF updates to NQF-endorsed measures in the most expeditious manner possible, while preserving the public’s ability to comment on updates that so fundamentally change an endorsed measure that it is no longer the same measure that we originally adopted. We also note that the NQF process incorporates an opportunity for public comment and engagement in the measure maintenance process. These policies regarding what is considered substantive versus nonsubstantive apply to all measures in the Hospital IQR Program and the Hospital VBP Program, and we believe the same standard applies when determining what should be considered substantive changes to performance standards.

We believe that it is of paramount importance that the performance standards that we adopt accurately reflect hospitals’ actual performance during the baseline period. We view our Technical Updates authority policy as a means to ensure that accuracy and to ensure that the program scores hospitals based on performance standards that reflect the actual provision of care in hospitals around the country.

With respect to commenters’ concerns that we may update performance standards more than annually, we are aware that updates may have unintended consequences on hospitals’ quality improvement efforts. We do not

intend to make updates to performance standards except to improve the standards’ accuracy and to ensure that the numerical values that we display for hospitals accurately reflect hospitals’ performance during the baseline period, as applicable. In addition, with respect to commenters’ suggestion that delays to performance standards updates would not be detrimental to the Hospital VBP Program, we disagree. We believe that we must provide hospitals with as much accurate information as is possible so that they may develop and implement quality improvement policies. We do not believe it would be helpful to hospitals for us to delay publishing a technical update on the basis that the update will not significantly affect performance.

We note further that we do not intend to limit any updates made to performance standards using this authority to QualityNet accountholders. We intend to publish any changes made under this policy on the public QualityNet Web site and through our Hospital VBP Program listserv entitled, “Hospital Inpatient Value-Based Purchasing (HVBP) and Improvement,” available under the notifications and discussions link on our home page.

Comment: One commenter suggested that CMS should define in specific terms what should constitute a “substantive” versus a “nonsubstantive” update to the Hospital VBP Program performance standards before adopting the authority to make technical updates. The commenter further stated that CMS should be as transparent with stakeholders as possible about these changes, noting that midstream updates could have profound impacts on hospitals’ performance under Hospital VBP Program.

Response: With respect to what constitutes substantive versus nonsubstantive changes, we expect to make this determination on a case-by-case basis. Examples of nonsubstantive changes to measures might include updated diagnosis or procedure codes, medication updates for categories of medications, broadening of age ranges, and exclusions for a measure (such as the addition of a hospice exclusion to the 30-day mortality measures). We believe that nonsubstantive changes may include updates to NQF-endorsed measures based upon changes to guidelines upon which the measures are based. However, as commenters have requested, we intend to be as transparent as possible with stakeholders about any technical updates that we would adopt, including the rationale for any such updates and

their effects on finalized performance standards.

We will continue to use rulemaking to adopt substantive updates made to measures we have adopted for the Hospital IQR Program. Examples of changes that we might consider to be substantive would be those in which the changes are so significant that the measure is no longer the same measure, or when a standard of performance assessed by a measure becomes more stringent, for example, changes in acceptable timing of medication, procedure/process, or test administration. Another example of a substantive change would be where the NQF has extended its endorsement of a previously endorsed measure to a new setting, such as extending a measure from the inpatient setting to hospice. These policies regarding what is considered substantive versus nonsubstantive would apply to all measures in the Hospital IQR Program.

After consideration of the public comments we received, we are finalizing the technical updates policy for performance standards as proposed. We are also finalizing our proposed revisions to the definition of “performance standards” in section 412.160 of our regulations.

g. Request for Public Comments on International Classification of Diseases, Tenth Revision, Clinical Modification/ Procedure Coding System (ICD–10–CM/PCS) Transition

Beginning October 1, 2015, when the ICD–10–CM/PCS codes become the required code set, we will collect non-electronic health record-based quality measure data coded only in ICD–10–CM/PCS. Even though we expect that the endorsement status of the measures we have adopted for the Hospital VBP Program will remain the same, we are concerned that the transition to a new coding system might have unintended consequences on quality measure data denominators, statistical adjustment coefficients, and measure rates. We are concerned about the possible impacts on the Hospital VBP Program, and requested public comments on how we should accommodate the transition.

Specifically, we requested comments on how, if at all, we should adjust performance scoring under the Hospital VBP Program to accommodate quality data coded under ICD–10–CM/PCS, or otherwise ensure fair and accurate comparisons under the Hospital VBP Program once the transition date has passed. For example, we could consider analyzing the effects of the ICD–10–CM/PCS transition on hospitals’ measured performances and, if substantive

differences result, retrospectively adjust performance standards in order to ensure that they accurately reflect the underlying methodology. We could also consider performing similar adjustments to hospitals' measure rates, measure scores, or TPSs once our analysis is completed. We also might consider scoring hospitals only on achievement if analysis indicates that we are unable to reliably and validly calculate improvement scores when comparing International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) based baseline period data to ICD-10-CM/PCS based performance period data. However, while we intend to analyze the effects of the ICD-10-CM/PCS transition on hospitals' performance, we do not have the necessary data for all hospitals at this time.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28130) we stated that we intended to take two steps to analyze ICD-10-CM/PCS potential impact before receiving ICD-10-CM/PCS-based fall 2015 discharge data in May 2016. First, we stated that we will assess measure specifications to qualitatively assess impact to measure denominators after CMS releases ICD-10-CM/PCS-based measure specifications in the future. Second, we stated that we intend to voluntarily solicit information from no more than 9 hospitals before October 1, 2015 to estimate the impact of ICD-10-CM/PCS on their Hospital VBP measure rates and denominator counts. We intend to use this information to inform both proposed and future Hospital VBP Program policy and measures.

We welcomed public comments on this topic.

Comment: One commenter supported CMS' implementation of ICD-10-CM/PCS on October 1, 2015 without any further delays. The commenter also warned that, while adoption is welcome and overdue, implementation of the new system must be carefully orchestrated to minimize the administrative burden on hospitals. The commenter noted their appreciation of CMS' efforts to offer extensive educational opportunities for hospitals and noted that extensive end-to-end testing of both the electronic transaction and the adjudication of the claim by Medicare contractors and State Medicaid agencies will be needed to ensure a smooth transition from ICD-9-CM to ICD-10-CM/PCS.

Response: We thank the commenter for its support. We would like to clarify that HHS has not yet finalized an ICD-10 implementation date through rulemaking. We refer readers to the CMS

Web page on ICD-10 (<http://cms.hhs.gov/Medicare/Coding/ICD10/index.html>) and the **Federal Register** for current information.

Comment: A few commenters recommended that CMS work with more than nine hospitals, as well as other national hospital associations and stakeholders interested in volunteering to participate in the ICD-10-CM/PCS transition process, to gain a broader understanding of the coding transition and its impact on CMS' quality reporting and pay-for-performance programs.

Response: We believe an initial limited analysis will enable us to better understand the impact of the ICD-10-CM/PCS transition on hospitals' performance. We intend to continue discussing this topic with stakeholders in the future.

Comment: One commenter supported CMS' suggested strategy for analyzing Hospital VBP Program performance scores to accommodate the ICD-10-CM/PCS transition, but requested that CMS make any adjustment methodology public and continue to score hospitals on both achievement and improvement.

Response: We intend to discuss publicly any adjustments that we would subsequently propose through rulemaking for the Hospital VBP Program.

Comment: Many commenters urged CMS not to adopt achievement-only scoring as a result of the ICD-10-CM/PCS transition, stating that improvement points are a balancing feature of the Hospital VBP Program that provide incentives for progress. Some commenters stated that the Hospital VBP Program statute requires that CMS score hospitals on both achievement and improvement, and suggested that CMS "waive" hospitals' participation in the program until we have adequate data to provide both elements of performance scoring.

Several commenters suggested that CMS remove measures from the program for a year if we cannot calculate reliable improvement scores. Other commenters requested that CMS allow sufficient time to analyze the impact of the ICD-10-CM/PCS transition and address any potential issues before penalizing hospitals in future Hospital VBP Program years. One commenter suggested holding hospitals harmless if CMS cannot accurately accept and calculate quality measures.

Response: We thank the commenters for this feedback and will take it into consideration as we develop our policy on this issue.

Comment: Several commenters expressed concern that transitioning the

Hospital VBP Program to the ICD-10-CM/PCS system could significantly alter how measures are scored between the baseline and performance periods. The commenter opined that comparisons between the ICD-9-CM and ICD-10-CM/PCS systems would be unfair, and suggested that CMS score hospitals using ICD-9-CM data and an ICD-10-CM/PCS crosswalk. Commenters suggested that CMS run both the baseline data and the performance data using ICD-9-CM (using crosswalk software) and make the results of the testing publicly available. A few commenters urged CMS to formalize its ICD-10-CM/PCS testing plans to ensure that end-to-end testing begins no later than January 2015 and is made available to all hospitals.

Response: We thank the commenters for this feedback and will take it into consideration as we develop our policy on this issue.

Comment: One commenter recommended that CMS update its quality measures in order to best take advantage of the added granularity offered by ICD-10-CM/PCS. The commenter does not believe that it will be possible to accurately adjust performance standards retrospectively in order to correct the substantive differences in ICD-9-CM and ICD-10-CM/PCS quality data. The commenter suggested that evaluating quality measures solely on achievement would minimize the administrative costs associated with identifying the feasibility, validity, and reliability of comparing quality measures based on dissimilar code sets, and would also allow measure developers to freely update quality measures without the fear of distorting comparisons between baseline and performance period data coded in dissimilar formats.

Commenters agreed that the ICD-10-CM/PCS transition may have an impact on quality measurement based on claims data, and encouraged CMS to analyze those effects rigorously once data are available.

Response: We thank the commenters for this feedback and will take it into consideration as we develop our policy on this issue.

We thank the commenters for these responses and we will consider them as we plan for the ICD-10-CM/PCS transition under the Hospital VBP Program.

11. FY 2017 Hospital VBP Program Scoring Methodology

a. General Hospital VBP Program Scoring Methodology

In the Hospital Inpatient VBP Program final rule (76 FR 26514), we adopted a

methodology for scoring clinical process of care, patient experience of care, and outcome measures. As noted in that rule, this methodology outlines an approach that we believe is well understood by patient advocates, hospitals, and other stakeholders because it was developed during a lengthy process that involved extensive stakeholder input, and was based on a scoring methodology we presented in a report to Congress. We also noted in that final rule that we had conducted extensive additional research on a number of other important methodology issues to ensure a high level of confidence in the scoring methodology. In addition, we believe that, for reasons of simplicity, transparency, and consistency, it is important to score hospitals using the same general methodology each year, with appropriate modifications to accommodate new domains and measures. We finalized a similar scoring methodology for the MSPB measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51654 through 51656).

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53604 through 53605), for the FY 2015 Hospital VBP Program, we finalized our proposal to use these same general scoring methodologies to score hospital performance for the FY 2015 Hospital VBP Program. In that rule, we stated that we believe these scoring methodologies continue to appropriately capture hospital quality as reflected by the finalized quality measure sets. We also noted that readopting the finalized scoring methodology from prior program years represents the simplest and most consistent policy for hospitals and the public. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50699), we readopted the finalized general scoring methodology adopted for the FY 2015 Hospital VBP Program for the FY 2016 Hospital VBP Program.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50702 through 50704), we adopted new quality domains based on the NQS for FY 2017 and subsequent years.

We continue to agree with the reasoning for the scoring methodology outlined in the FY 2013 IPPS/LTCH PPS

final rule and summarized above. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28130 through 28131) we proposed to adopt the general scoring methodology adopted for the FY 2016 Hospital VBP Program for the FY 2017 Hospital VBP Program, with appropriate modifications to accommodate the new quality domains that we have previously adopted. These proposed modifications to our scoring methodology are limited to reclassified quality domains, new placements for measures within those domains, and domain weighting. We discuss below a proposal to revise the finalized domain weighting for FY 2017.

We welcomed public comment on this proposal. We also received a number of general comments on the Hospital VBP Program's scoring methodology.

Comment: Several commenters stated that CMS should consider phasing out improvement scoring for selected measures or the entire Hospital VBP Program that have been included in the Hospital VBP Program for several years in order to emphasize comparative performance on the measures. Several commenters agreed that phasing out improvement scoring after several years (one commenter suggested 3 years) would emphasize comparative performance on the measures. While some commenters noted that improvement at the outset of the program is very important to encouraging historically poor-performing hospitals to invest in improvement, those commenters believe that hospitals should be compared and paid on their achievements and not merely for improving on subpar performance after a period of time.

Several other commenters, on the other hand, expressed strong support for pay-for-performance programs that assess multiple aspects of care and recognize hospitals for achievement versus national benchmarks and improvement versus baseline performance. Commenters stated that this incentive structure can provide greater inducement for hospitals to improve performance. Commenters believed this construct is foundational

for hospitals to improve performance in a rational and predictable manner.

Response: We thank the commenters for this feedback. We will take it under consideration as we develop Hospital VBP Program policies.

Comment: One commenter recommended that CMS consider comparing "like" hospitals—such as those of similar sizes, teaching status, and case mix—under the Hospital VBP Program in order to avoid inadvertently providing scoring advantages or disadvantages to participating hospitals.

Response: We do not believe the quality measures that we have adopted for the Hospital VBP Program incorporate the necessary data to disaggregate hospitals' performance by size, teaching status, or case mix any further than they already do through risk adjustment. We do intend, however, to assess the feasibility of this suggestion through our program monitoring and evaluation efforts.

After consideration of the public comments we received, we are finalizing our proposal to adopt the general scoring methodology adopted for the FY 2016 Hospital VBP Program for the FY 2017 Hospital VBP Program, with appropriate modifications to accommodate the new quality domains that we have previously adopted. These modifications to our scoring methodology are limited to reclassified quality domains, new placements for measures within those domains, and domain weighting.

b. Domain Weighting for the FY 2017 Hospital VBP Program for Hospitals That Receive a Score on All Domains

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50702 through 50704), we adopted our proposal to align the Hospital VBP Program's quality measurement domains with the NQS's quality priorities, with certain modifications. We adopted this realignment beginning with the FY 2017 Hospital VBP Program. We also adopted the following domains and domain weights for the FY 2017 Hospital VBP Program for hospitals that receive a score in all newly aligned domains.

PREVIOUSLY ADOPTED DOMAINS AND DOMAIN WEIGHTS FOR THE FY 2017 HOSPITAL VBP PROGRAM FOR HOSPITALS RECEIVING A SCORE ON ALL NEWLY ALIGNED DOMAINS

Domain	Weight
Safety	15 percent.
Clinical Care	35 percent.
• Clinical Care—Outcomes	• 25 percent.
• Clinical Care—Process	• 10 percent.
Efficiency and Cost Reduction	25 percent.

PREVIOUSLY ADOPTED DOMAINS AND DOMAIN WEIGHTS FOR THE FY 2017 HOSPITAL VBP PROGRAM FOR HOSPITALS RECEIVING A SCORE ON ALL NEWLY ALIGNED DOMAINS—Continued

Domain	Weight
Patient and Caregiver Centered Experience of Care/Care Coordination	25 percent.

However, as discussed in more detail above, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28119), we are finalizing our proposal to remove six “topped-out” measures from the FY 2017 Clinical Care—Process subdomain. This substantial reduction in the number of measures adopted for the Clinical Care—Process subdomain warrants reconsideration of the finalized domain weighting for FY 2017 that we adopted in the FY 2014 IPPS/LTCH PPS final rule.

As described in more detail above, we are also finalizing our proposal to re-adopt the CLABSI measure and to adopt two new measures (MRSA Bacteremia and *C. difficile* Infection) for the Safety domain for FY 2017 Hospital VBP Program and subsequent years, which raises the total number of measures in this domain for FY 2017 to six. Because we proposed to make changes in the number of measures in only two domains (Safety and Clinical Care), we focused our proposed domain weighting

changes in the proposed rule on these domains only. Because we continue to believe that hospitals should be provided strong incentives to perform well on measures of patient safety, in view of the new measures we proposed to add to that domain, we proposed to revise the previously finalized domain weighting for the FY 2017 Hospital VBP Program for hospitals receiving a score on all newly aligned domains as follows:

PROPOSED REVISED DOMAIN WEIGHTS FOR THE FY 2017 HOSPITAL VBP PROGRAM FOR HOSPITALS RECEIVING A SCORE ON ALL NEWLY ALIGNED DOMAINS

Domain	Weight
Safety	20 percent.
Clinical Care	30 percent.
• Clinical Care—Outcomes	• 25 percent.
• Clinical Care—Process	• 5 percent.
Efficiency and Cost Reduction	25 percent.
Patient and Caregiver Centered Experience of Care/Care Coordination	25 percent.

We welcomed public comments on the proposed revised domain weights.

Comment: Several commenters expressed broad support for CMS’ proposed revision to the domain weighting for FY 2017, agreeing that it appropriately shifts the program’s focus to the Safety domain and away from Clinical Care—Process domain. One commenter commended CMS’ efforts to move the delivery system towards value-driven paradigms that reward high quality and cost effective health care providers. A few commenters noted that the Safety domain is largely comprised of well-developed HAI outcome measures. One commenter noted that the domain weights largely align with the National Quality Strategy’s quality priorities and places an increased focus on patient safety. Some commenters specifically expressed support for maintaining the weight of the Efficiency and Cost Reduction domain at 25 percent.

Response: We thank the commenters for their support.

Comment: Several commenters wanted CMS to maintain the Clinical Care—Process domain weighting at 35 percent, and noted that measures of clinical processes continue to play an important role in improving the quality of care. One commenter suggested CMS

not reduce the weight for Clinical Care—Process measures to 5 percent because commenter believed that these measures play a vital role in quality improvement and should remain a significant component of the Hospital VBP Program. The commenter also noted that a hospital’s level of performance on Clinical Care—Process measures reflects a hospital’s overall discipline and commitment to quality improvement that extends beyond just the specific topics being measured.

Other commenters suggested that the final rule should increase the weight for the Clinical Care—Process domain in order to ensure that the Hospital VBP Program’s focus is appropriately on improving patient outcomes. A few commenters noted that measuring clinical processes gives hospitals the data they need to improve performance and identify good process measures that are not burdensome to collect. One commenter stated that the Clinical Care—Outcomes and Safety domains already reflect higher priority than Clinical Care—Process domain measures. This commenter suggested that process measures may be used to identify gaps that may not be readily apparent from outcome measures. One commenter encouraged CMS to give the Clinical Care—Process measures the

greatest weight because of the limitations of the measures in the other domains and because this domain provides hospitals with the most actionable information on quality performance.

One commenter questioned the extent to which measures of clinical process are necessary given the low domain weighting allocated to the Clinical Care—Process domain. The commenter suggested that CMS consider phasing the measures out of the program entirely.

Other commenters suggested additional measures that should be added to the Clinical Care—Process Domain, including one commenter who suggested the Medicare Service Utilization measure be added to the Efficiency and Cost Reduction domain.

Response: Because we proposed to remove six “topped-out” measures from the FY 2017 Clinical Care—Process subdomain, the number of measures adopted for that subdomain will be significantly reduced. For that reason, we reconsidered the finalized domain weighting for FY 2017 that we adopted in the FY 2014 IPPS/LTCH PPS final rule. We continue to believe that hospitals should be provided strong incentives to perform well on measures of patient safety, and we believe the

revised domain weighting appropriately reduces the relative weighting allocated to the Clinical Care—Process domain, in accordance with the substantially reduced number of measures adopted under that domain. As we have stated in prior rulemaking, we believe that the Hospital VBP Program should shift from its initial focus on measures of processes to measures of outcomes and efficiency, and we believe that the proposed domain weighting change appropriately continues that policy change.

Comment: One commenter urged that CMS ensure that the IMM–2 measure is afforded sufficient weight in determining hospital value-based payments, such as by including this measure in the Safety domain.

Response: We believe we have placed the IMM–2 measure appropriately within the Clinical Care—Process domain, as it is a chart-abstracted measure. We further believe that we have allocated sufficient domain weighting to the Clinical Care—Process domain, and respond to additional comments on the FY 2017 domain weighting in subsequent sections below.

Comment: One commenter recommended that CMS decrease the weight of the consistency score in the HCAHPS survey to 10 percent and weight the HCAHPS measure total score with the new care transition measures at 90 percent. Alternatively, the commenter suggested that CMS revise the methodology of the consistency score to more accurately measure consistent performance and leave the weight of 20 percent in place. Instead of using the HCAHPS floor values as the minimum range for consistency, the commenter suggested that CMS use the 25th percentile value so that consistency points would only be rewarding hospitals maintaining a reasonable level of performance in each HCAHPS measure.

Response: We continue to believe that the HCAHPS survey is an important and significant component of the Total Performance Score. We further believe that Consistency Points appropriately encourage hospitals to attempt to improve their scores on all dimensions of the HCAHPS survey, and are therefore appropriately allotted 20 points within the domain. While we may reexamine the HCAHPS survey's scoring methodology if we adopt the CTM–3 items in the future, we do not believe that it is appropriate at this time to reduce the Consistency Points component of the PEC/CC domain to 10 percent.

Comment: Many commenters urged CMS to revise the MSPB measure to

include both quality and cost outcomes, which means achieving better outcomes at lower total health costs, rather than simply and crudely cutting costs. A few commenters stated that basing 25 percent of the TPS on a measure of cost comparison with no quality component will encourage hospitals to further cut costs beyond the incentives of the DRG system, with uncertain checks on corresponding quality impacts. Several commenters stated that because so much of the MSPB measure is outside of the hospital's control, the domain should not be factor so heavily into the TPS.

A few commenters urged CMS to consider removing the MSPB measure entirely or dropping the Efficiency and Cost Reduction domain's weighting to 5 percent because the commenters suggested that measures aimed at improving efficiency should be grounded in current best evidence, should evaluate clinical outcomes concurrently with resource use, and should be interpretable based on outcomes achieved with resources expended. Another commenter recommended lowering the weight of the Efficiency domain when the new episode-based payment measures' initial implementation begins to provide CMS and hospitals an opportunity to gain experience with these measures. The commenter noted that lowering the weight of the Efficiency domain provides a period of time for the development of more accurate or relevant Efficiency measures into the program.

However, several commenters suggested that CMS increase weighting of the Efficiency and Cost Reduction domain. A few commenters suggested that CMS consider incrementally increasing the Efficiency and Cost Reduction domain's weight to 50 percent as more efficiency measures are developed in the coming years. One commenter suggested that this change should occur in six years.

Response: We believe we have appropriately balanced our desire to provide strong incentives for hospitals to consider the cost and the quality of the care that they provide to Medicare beneficiaries and to all patients by assigning the Efficiency and Cost Reduction domain to 25 percent of the Total Performance Score. We note that the MSPB measure is still relatively new to the Hospital VBP Program, and represents the incorporation of efficiency metrics for the first time in the program. We view that step as important, and we continue to believe it merits significant domain weighting in order to ensure that hospitals monitor

the costs of the care they provide to Medicare beneficiaries during the inpatient hospitalization and are involved in the coordination of beneficiaries' care immediately prior to a hospitalization and post-discharge.

However, we thank the commenters for their thoughts and intend to continue examining domain weighting and will consider revisiting this issue in the future.

Comment: A few commenters wanted to decrease the PEC/CC weight. One commenter stated that anecdotal evidence shows significant variation in HCAHPS survey scores due to differences in acuity level and region. The commenter also noted that a recent study found that patient satisfaction was independent of hospital compliance with surgical processes and with hospitals' safety culture.

One commenter urged CMS to retain the PEC/CC domain's weighting at 25 percent, stating that the patient's experience is a critical component of quality health care. The commenter stated that, if CMS retains the Safety domain, CMS should not increase its allocated domain weighting, and should leave the Clinical Care—Process domain's weighting at 10 percent.

A few commenters suggested adding additional measures to the PEC/CC domain, in order to strengthen those domains.

Response: We disagree with commenters that suggested that we consider lower weighting for the PEC/CC domain. We continue to believe that the patient's experience is an important component of high-quality health care, and we believe that allocating significant domain weighting to the PEC/CC domain reflects that priority appropriately. As described further above, we also believe that the Consistency Points are properly set at 20 points within the domain. We believe the PEC/CC domain's weighting appropriately provides hospitals with strong incentives to improve their patients' experience during acute care hospitalizations.

Comment: A few commenters urged that CMS remove the Safety domain from the Hospital VBP Program and consider the HAC Reduction Program as its Safety domain, redistributing the weight to the other domains. In the alternative, one commenter suggested that CMS leave the Clinical Care—Process domain's weighting at 10 percent.

One commenter suggested that CMS increase the Safety or Clinical Care—Outcomes domain weights.

Response: We consider measures of patient safety to be of critical

importance to the Hospital VBP Program, and we believe that their inclusion in the program with significant domain weighting appropriately provides hospitals with substantial incentives to protect their patients during acute care episodes.

Comment: A few commenters suggested that CMS replace the Clinical Care—Outcome measures or develop a plan to improve the measures' reliability. One commenter expressed concern that three mortality measures in the Clinical Care—Outcomes domain do not reliably assess hospital performance and could have negative unintended consequences for certain hospitals.

One commenter urged CMS to modify the domain weights so that more emphasis is placed on achieving outcomes, providing quality clinical processes, and improving patient experience. Commenters expressed support for the goal of improving quality and cost outcomes within the system, which means achieving better outcomes at lower total health costs, rather than simply and crudely cutting costs.

Response: We believe that we have taken appropriate steps to increase the reliability of the 30-day mortality measures that we have placed into the Clinical Care—Outcomes domain by extending the performance periods for those measures. We believe that the measures appropriately receive substantial domain weighting in order to ensure that hospitals focus quality improvement efforts on patients with these harmful conditions. In addition, we believe that, our future measure set should evolve to emphasizing outcomes, safety cost and efficiency, population health, and patient experience of care as noted in the HHS National Quality Strategy. We continue to evaluate measures that assess these critical components of the HHS National Quality Strategy, and as we add more measures in this area, we intend to increase the weight of this domain.

We also believe that safety and the patient experience of care is important in assessing quality. As we note above, because we are adding two new measures to the Safety domain, we are increasing this domain's weight by 5 percent, we believe that this increase appropriately balances the importance of patient safety while balancing the need for excellence in the remaining domains. Likewise, we believe that a 25 percent weight for the Patient and Caregiver Centered Experience of Care/ Care Coordination domain appropriately balances the need to address the patient experience with the importance of

stressing quality clinical processes, outcomes, efficiency and safety.

After consideration of the public comments we received, we are finalizing the revised domain weighting for the FY 2017 Hospital VBP Program as proposed.

c. Domain Weighting for the FY 2017 Hospital VBP Program for Hospitals Receiving Scores on Fewer than Four Domains

In prior program years, we finalized a policy that hospitals must have received domain scores on all finalized domains in order to receive a TPS. However, because the Hospital VBP Program has evolved from its initial two domains to an expanded measure set with additional domains, we considered whether it was appropriate to continue this policy.

Therefore, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53606 through 53607), we finalized our proposal that, for the FY 2015 Hospital VBP Program and subsequent years, hospitals with sufficient data to receive at least two out of the four domain scores that existed for the FY 2015 Hospital VBP Program (that is, sufficient cases and measures to receive a domain score on at least two domains) will receive a TPS. We also finalized our proposal that, for hospitals with at least two domain scores, TPSs would be reweighted proportionately to the scored domains to ensure that the TPS is still scored out of a possible 100 points and that the relative weights for the scored domains remain equivalent to the weighting which occurs when there are scores in all four domains. We believe that this approach allows us to include relatively more hospitals in the Hospital VBP Program while continuing to focus on reliably scoring hospitals on their quality measure performance.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50701 through 50702), we continued this approach for the FY 2016 Hospital VBP Program and subsequent fiscal years for purposes of eligibility for the program even though, based on the NQS, we adopted four NQS-based domains for the FY 2017 Hospital VBP Program (78 FR 50702 through 50704), which include the subdivided Clinical Care domain.

In light of the four NQS-based domains we have adopted, we have reconsidered the appropriate minimum number of domains (that is, the number of domains on which hospitals must receive scores) in order to receive a TPS. We are concerned that requiring just two out of the four NQS-based domains in order to receive a TPS may be insufficient to ensure robust quality measurement under the Hospital VBP

Program. Further, given the transition to NQS-based domains that we have adopted, we believe an additional independent analysis of appropriate minimum numbers of domains under the new domain structure is appropriate. We commissioned that analysis from our Reports & Analytics contractor for the Hospital VBP Program. The results of that analysis informed our proposal below, and we stated that we intended to post a summary of the reliability and minimum numbers analysis on the CMS Web site during the public comment period. We believe that requiring three out of the four NQS-based domains appropriately balances our desire to be as inclusive as possible with Hospital VBP Program requirements while ensuring that TPSs under the program are sufficiently reliable.

Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28132) we proposed to require that, for the FY 2017 Hospital VBP Program and subsequent years, hospitals must receive domain scores on at least three quality domains in order to receive a TPS. For purposes of the Clinical Care domain score, we proposed to consider either the Clinical Care—Process or Clinical Care—Outcomes subdomains as one domain in order to meet this proposed requirement. By adopting this policy, we believe we will continue to allow as many hospitals as possible may participate in the program while ensuring that reliable TPSs result. However, we would only reweight hospitals' TPSs once and would therefore not reallocate the Clinical Care—Process and Clinical Care—Outcomes subdomains' weighting within the Clinical Care domain if a hospital does not have sufficient data for one of the subdomains. For example, a hospital receiving domain scores on all domains except the Clinical Care—Process subdomain would not have the 5 percent weighting from the Clinical Care—Process subdomain reallocated entirely to the Clinical Care—Outcomes subdomain. Instead, the 5 percent weighting from the Clinical Care—Process subdomain would be proportionately reallocated across all domains.

We welcomed public comments on this proposal.

Comment: One commenter supported CMS' proposal to require hospitals to have sufficient data on at least three domains in order to receive a Total Performance Score in FY 2017.

Response: We thank the commenter for their support.

Comment: One commenter expressed concern that CMS' proposal would

result in lower participation rates in the program. The commenter recommended that CMS retain the minimum number of domain scores at two.

Response: As described above, we are concerned that requiring just two domains to receive a Total Performance Score for FY 2017 may provide an insufficient basis in quality data for robust performance scoring. We believe that the proposed requirement appropriately balances our desire to include as many hospitals as possible in the Hospital VBP Program while ensuring that Total Performance Scores are based on reliable quality data.

After consideration of the public comments we received, we are finalizing the requirement that hospitals have sufficient data on at least three of the four domains for the FY 2017 Program as proposed. We also are finalizing that hospitals with sufficient data on at least three of four domains for FY 2017 will have their Total Performance Scores proportionately reweighted, and for purposes of that reweighting, we will not reallocate the Clinical Care—Process and Clinical Care—Outcomes subdomains' weighting within the Clinical Care domain if a hospital does not have sufficient data for one of the subdomains.

12. Minimum Numbers of Cases and Measures for the FY 2016 and FY 2017 Hospital VBP Program's Quality Domains

a. Previously Adopted Minimum Numbers of Cases and FY 2016 Minimum Numbers of Cases

In the Hospital Inpatient VBP Program final rule (76 FR 26527 through 26531), we adopted minimum numbers of at least 10 cases on at least 4 measures for hospitals to receive a Clinical Process of Care domain score. In the same final rule, we adopted a minimum number of 100 HCAHPS surveys for a hospital to receive a Patient Experience of Care domain score. In the CY 2012 OPPI/ASC final rule with comment period (76 FR 74532 through 74534), we adopted a minimum number of 10 cases for the mortality measures that we adopted for FY 2014. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53608 through 53609), we adopted a new minimum number of 25 cases for the mortality measures for FY 2015. In the same final rule, we adopted a minimum number of 25 cases for the MSPB measure (77 FR 53609 through 53610), a minimum of three cases for any underlying indicator for the PSI-90 measure based on AHRQ's measure methodology (77 FR 53608 through 53609), and a minimum of one predicted infection for NHSN-

based surveillance measures based on CDC's minimum case criteria (77 FR 53608 through 53609). However, we noted that we adopted these case minimums for FY 2015 only, although we intended to adopt them for FY 2015 and subsequent years. We continue to believe that the finalized minimum numbers of cases described above are appropriate and provide sufficiently reliable data for scoring purposes under the Hospital VBP Program. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28132), we proposed to adopt the specified case minimums for the FY 2016 Hospital VBP Program and subsequent years.

We welcomed public comment on this proposal. We noted that we proposed below to specify minimum numbers of measures for the FY 2017 Hospital VBP Program and subsequent years based on the new domain structure.

We did not receive any specific public comments on this proposal. Therefore, we are finalizing this policy as proposed.

b. Minimum Number of Measures—Safety Domain

As described in more detail above, we proposed to adopt six quality measures in the Safety domain for the FY 2017 Hospital VBP Program. Of these measures, five are NHSN-based surveillance measures and one is the PSI-90 measure. After consideration of these measures and of previous independent analyses of the necessary minimum number of measures adopted for the Outcomes domain, whose measures formed the basis for part of the new Safety domain, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28133) we proposed to adopt a minimum number of three measures for the Safety domain for FY 2017 and subsequent years. We believe this proposal balances our desire to be as inclusive as possible with the Hospital VBP Program and the need for reliable quality measurement data on which to base TPSs. We also clarified that we will continue to score hospitals on NHSN measures if, as we discussed with respect to the CLABSI measure (77 FR 53608) and the SSI measure (78 FR 50684), the hospital has met CDC's minimum case criteria of one predicted infection during the applicable period.

We welcomed public comment on this proposal.

We did not receive any specific public comments on this proposal, and therefore are finalizing this policy as proposed.

c. Minimum Number of Measures—Clinical Care Domain

(1) Background

In the FY 2014 IPPS/LTCH PPS final rule, we adopted a new domain structure for the FY 2017 Hospital VBP Program and subsequent years based on the NQS. In that final rule, we adopted a Clinical Care domain that was subdivided into the Clinical Care—Process and Clinical Care—Outcome subdomains. We adopted these subdomains in order to ensure that we place the appropriate domain weighting on measures of clinical processes and measures of clinical outcomes. We believe the same consideration is appropriate for determining minimum numbers of measures for each subdomain, and, based on prior independent analyses conducted of the appropriate minimum numbers for the Clinical Process of Care and Outcomes domains whose measures formed the basis for the new Clinical Care domain, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28133), we proposed separate minimum numbers for each of these subdomains below. As described further above, we also attempted to balance our desire to be as inclusive as possible with the Hospital VBP Program and the need for reliable quality measurement data on which to base TPSs.

(2) Clinical Care—Outcomes Subdomain

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50707), we adopted a minimum number of two measures in the former Outcome domain. We stated our belief that this minimum number is appropriate for the expanded Outcome domain that formed the basis for the Clinical Care—Outcomes subdomain because adding measure scores beyond the minimum number of measures has the effect of enhancing the domain score's reliability.

As noted above, the Clinical Care—Outcomes subdomain now contains the three 30-day mortality measures, and based on previous independent analysis of the appropriate minimum number of measures for the Outcomes domain that formed the basis for the Clinical Care—Outcomes subdomain (available on our Web site at: http://cms.hhs.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/Downloads/HVBP_Measure_Reliability-.pdf), we continue to believe that a minimum number of two measures within the subdomain appropriately balances scoring reliability with inclusiveness under the program. As noted above, we stated our intent to post a summary of the

reliability and minimum numbers analysis on the CMS Web site during the public comment period. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 281333), we proposed to adopt a minimum number of two measures in the Clinical Care—Outcome subdomain for FY 2017 and subsequent years.

We welcomed public comment on this proposal.

We did not receive any specific public comments on this proposal, and therefore are finalizing this policy as proposed.

(3) Clinical Care—Process Subdomain

We have reconsidered the finalized minimum number of measures given the significant reduction in Clinical Care—Process measures due to “topped-out” removals that we proposed in the proposed rule. We are concerned that requiring hospitals to report on all three proposed Clinical Care—Process measures for the FY 2017 Hospital VBP Program, or even requiring two out of three measures, could prevent a significant proportion of participating hospitals from receiving a Clinical Care—Process subdomain score. We are aware that relatively few hospitals report data for the AMI–7a measure, and the proposed PC–01 measure will only include hospitals that provide maternity services. In accordance with our preference for including as many hospitals as possible in the Hospital VBP Program while ensuring the reliability of the domain score, and based on a prior independent analysis that formed the basis for the Clinical Care—Process domain, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 281333) we proposed to require hospitals to report a minimum of one measure in the Clinical Care—Process domain for the FY 2017 Hospital VBP Program and subsequent years to receive a domain score.

We welcomed public comment on this proposal.

We did not receive any specific public comments on this proposal, and therefore are finalizing this policy as proposed.

d. Minimum Number of Measures—Efficiency and Cost Reduction Domain

Because the MSPB measure remains the only measure within the Efficiency and Cost Reduction domain for FY 2017, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 281333) we proposed to require that hospitals receive a MSPB measure score in order to receive an Efficiency and Cost Reduction domain score. If we adopt additional measures for this domain in

the future, we will consider if we should revisit this policy.

We welcomed public comments on this proposal.

We did not receive any specific public comments on this proposal, and therefore are finalizing this policy as proposed.

e. Minimum Number of Measures—PEC/CC Domain

As with the MSPB measure adopted for the Efficiency and Cost Reduction domain described further above, we have not adopted additional measures for the PEC/CC domain. Because the HCAHPS survey measure remains the only measure within the PEC/CC domain for FY 2017, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 281333), we proposed to require that hospitals receive an HCAHPS survey measure score in order to receive a PEC/CC domain score. If we adopt additional measures for this domain in the future, we will consider if we should revisit this policy.

We welcomed public comments on this proposal.

We did not receive any specific public comments on this proposal, and therefore are finalizing this policy as proposed.

13. Applicability of the Hospital VBP Program to Maryland Hospitals

Section 1886(o)(1)(C) of the Act specifies the hospitals for which the Hospital VBP Program applies. Specifically, the term “hospital” is defined under section 1886(o)(1)(C)(i) of the Act as a “subsection (d) hospital (as defined in section 1886(d)(1)(B) [of the Act]).” Section 1886(o)(1)(C)(ii) of the Act sets forth a list of exclusions to the definition of the term “hospital” with respect to a fiscal year. Section 1886(o)(1)(C)(iv) of the Act states that in the case of a hospital that is paid under section 1814(b)(3) of the Act, the Secretary may exempt the hospital from the Hospital VBP Program if the State submits an annual report to the Secretary describing how a similar program in the State for a participating hospital or hospitals achieves or surpasses the measured results in terms of patient health outcomes and cost savings established under the Hospital VBP Program. We have interpreted the reference to section 1814(b)(3) of the Act to mean those Maryland hospitals that were paid under section 1814(b)(3) of the Act and that, absent the “waiver” provided by section 1814(b)(3) of the Act, would have been paid under the IPPS.

The State of Maryland entered into an agreement with CMS, effective January

1, 2014, to participate in CMS’ new Maryland All-Payer Model, a 5-year hospital payment model. This model is being implemented under section 1115A of the Act, as added by section 3021 of the Affordable Care Act, which authorizes the testing of innovative payment and service delivery models, including models that allow States to “test and evaluate systems of all-payer payment reform for the medical care of residents of the State, including dual-eligible individuals.” Section 1115A of the Act authorizes the Secretary to waive such requirements of Titles XI and XVIII of the Act as may be necessary solely for purposes of carrying out section 1115A of the Act with respect to testing models.

Under the agreement with CMS, Maryland will limit per capita total hospital cost growth for all payers, including Medicare. In order to implement the new model, effective January 1, 2014, Maryland elected to no longer have Medicare pay Maryland hospitals in accordance with section 1814(b)(3) of the Act. Maryland also represented that it is no longer in continuous operation of a demonstration project reimbursement system since July 1, 1977, as specified under section 1814(b)(3) of the Act. Because Maryland hospitals are no longer paid under section 1814(b)(3) of the Act, they are no longer subject to those provisions of the Act and related implementing regulations that are specific to hospitals paid under section 1814(b)(3) of the Act, including but not limited to section 1886(o)(1)(C)(iv) of the Act, which provides an exemption for hospitals paid under section 1814(b)(3) of the Act from the application of the Hospital VBP Program if the State which is paid under that section meets certain requirements.

In order to implement the Maryland All-Payer Model, we have waived certain provisions of the Act, and the corresponding implementing regulations, as set forth in the agreement between CMS and Maryland and subject to Maryland’s compliance with the terms of the agreement. The effect of Maryland hospitals no longer being paid under section 1814(b)(3) of the Act is that they are not entitled to be exempted from the Hospital VBP Program under section 1886(o)(1)(C)(iv) of the Act and, but for the model, would be included in the Hospital VBP Program. In other words, although the exemption from the Hospital VBP Program no longer applies, Maryland hospitals will not be participating in the Hospital VBP Program because section 1886(o) of the Act and its implementing regulations have been waived for purposes of the

model, subject to the terms of the agreement.

Accordingly, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28133 through 28134) we proposed to make conforming revisions to section 412.160, in the definition of “base-operating DRG payment amount” and to section 412.161, which describes the applicability of the Hospital VBP Program. We proposed to delete references in these regulations to hospitals paid under section 1814(b)(3) of the Act because, at this time, there are no hospitals paid under that section.

We welcomed public comment on these proposals. After receiving no specific public comment on these proposals, we are finalizing our proposed regulation text changes to delete references in the regulation text to hospitals paid under section 1814(b)(3) of the Act because no hospitals are paid under that section.

14. Disaster/Extraordinary Circumstance Exception Under the Hospital VBP Program

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50704 through 50706), we adopted a disaster/extraordinary circumstance exception. We refer readers to that final rule for the policy’s details.

We note that we are currently in the process of revising the Extraordinary Circumstances/Disaster Extension or Waiver Request form, previously approved under OMB control number 0938–1171.

J. Changes to the Hospital-Acquired Condition (HAC) Reduction Program

1. Background

We refer readers to section V.I.1.a. of the FY 2014 IPPS/LTCH PPS final rule (78 FR 50707 through 50708) for a general overview of the HAC Reduction Program.

2. Statutory Basis for the HAC Reduction Program

Section 3008 of the Affordable Care Act added section 1886(p) to the Act to provide an incentive for certain hospitals to reduce the incidence of HACs. Section 1886(p) of the Act requires the Secretary to make an adjustment to payments to “applicable hospitals” effective beginning on October 1, 2014 and for subsequent program years. Section 1886(p)(1) of the Act sets forth the requirements by which payments to “applicable hospitals” will be adjusted to account for HACs with respect to discharges occurring during FY 2015 or later. For hospitals with HAC scores in the worst

performing quartile relative to other applicable hospitals for a given fiscal year, the amount of Medicare payment is reduced to 99 percent of the amount of payment that would otherwise apply to discharges under section 1886(d) or 1814(b)(3) of the Act, as applicable. Section 1886(p)(2)(A) of the Act defines “applicable hospitals” as subsection (d) hospitals that meet certain criteria. Section 1886(p)(2)(B)(i) of the Act defines these criteria and specifies that the payment adjustment would apply to an applicable hospital that ranks in the top quartile (25 percent) of all subsection (d) hospitals, relative to the national average, of conditions acquired during the applicable period, as determined by the Secretary. Section 1886(p)(2)(B)(ii) of the Act requires the Secretary to establish and apply a risk-adjustment methodology in calculating HAC scores for each hospital.

Sections 1886(p)(3) and (p)(4) of the Act define “hospital-acquired conditions” and “applicable period,” respectively. The term “hospital-acquired condition” means “a condition identified in subsection 1886(d)(4)(D)(iv) of the Act and any other condition determined appropriate by the Secretary that an individual acquires during a stay in an applicable hospital, as determined by the Secretary.” The term “applicable period” means, with respect to a fiscal year, a period specified by the Secretary.

Section 1886(p)(5) of the Act requires that, prior to FY 2015 and each subsequent fiscal year, the Secretary provides confidential reports to each applicable hospital with respect to the HAC Reduction Program scores for the applicable period, to give the hospitals an opportunity to review and correct the data. Section 1886(p)(6)(A) of the Act sets forth the reporting requirements by which the Secretary would make information available to the public regarding HACs for each applicable hospital. Section 1886(p)(6)(B) of the Act requires the Secretary to ensure that an applicable hospital has the opportunity to review, and submit corrections for, the information to be made public with respect to the HAC scores of the applicable hospital prior to such information being made public. Section 1886(p)(6)(C) of the Act requires that, once corrected, the HAC scores be posted on the *Hospital Compare* Web site on the Internet in an easily understandable format.

Section 1886(p)(7) of the Act limits administrative and judicial review of certain determinations made pursuant to section 1886(p) of the Act. These determinations include: what qualifies as an applicable hospital; the

specifications of a HAC; the Secretary’s determination of the “applicable period”; the provision of confidential reports submitted to the applicable hospital; and the information publicly reported on the *Hospital Compare* Web site.

3. Implementation of the HAC Reduction Program for FY 2015

a. Overview

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50707 through 50729), we presented the general framework for implementation of the HAC Reduction Program for the FY 2015 implementation. We included the following provisions for the program: (a) The relevant definitions applicable to the program; (b) the payment adjustment under the program; (c) the measure selection and conditions for the program, including a risk-adjustment and scoring methodology; (d) performance scoring; (e) the process for making hospital-specific performance information available to the public, including the opportunity for a hospital to review the information and submit corrections; and (f) limitation of administrative and judicial review.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50967), we established the rules governing the payment adjustment under the HAC Reduction Program at Subpart I of 42 CFR Part 412 (§§ 412.170 and 412.172). We also amended existing § 412.150 (the section that describes the basis and scope of Subpart I of Part 412, which contains the regulations governing adjustments to the base operating DRG payment amounts under the IPPS for inpatient operating costs) to incorporate the basis and scope of §§ 412.170 and 412.172 for the HAC Reduction Program.

In accordance with the provisions of section 1886(p) of the Act, in the FY 2014 IPPS/LTCH PPS final rule, we included, under § 412.170, definitions for the terms “hospital-acquired condition,” “applicable hospital,” and “applicable time period” (78 FR 50967). In § 412.170, we defined “hospital-acquired condition” as a condition as described in section 1886(d)(4)(D)(iv) of the Act and any other condition determined appropriate by the Secretary that an individual acquires during a stay in an applicable hospital, as determined by the Secretary. We defined an “applicable hospital” as “a hospital described in section 1886(d)(1)(B) of the Act (including a hospital in Maryland that is paid under section 1814(b)(3) of the Act and that, absent the waiver specified by section 1814(b)(3) of the Act, would have been paid under the

hospital inpatient prospective payment system) as long as the hospital meets the criteria specified under § 412.172(e)” (78 FR 50967). We specified that this definition does not include hospitals and hospital units excluded from the IPPS, such as LTCHs, cancer hospitals, children’s hospitals, IRFs, IPFs, CAHs, and Puerto Rico hospitals. We defined the “applicable period” as, with respect to a fiscal year, the 2-year period (as specified by the Secretary) from which data are collected in order to calculate the Total HAC Score for the HAC Reduction Program.

Comment: Commenters supported the HAC Reduction Program as a mechanism to identify hospitals that underperform in preventing well-identified, measurable, and preventable adverse events.

Response: We appreciate the commenters’ support. We are committed to reduce HACs, which are important markers of quality of care and whose reduction can positively impact patient outcomes and the cost of care.

Comment: Several commenters suggested changing the terminology of “hospital-acquired conditions” to “hospital-acquired complications” to signal more clearly the intent of the program is to focus on complications that arise from inappropriate delivery of care.

Response: The name of the HAC Reduction Program is specified in section 1886(d) of the Act. We believe that the name of the program reflects Congress’ intent in passing this provision of the Affordable Care Act.

b. Payment Adjustment Under the HAC Reduction Program, Including Exemptions

(1) Basic Payment Adjustment

Section 1886(p)(1) of the Act sets forth the requirements by which payments to “applicable hospitals” are to be adjusted for hospitals in the worst performing quartile relative to other applicable hospitals beginning on October 1, 2014. Section 1886(p)(1) of the Act specifies that the amount of payment shall be equal to 99 percent of the amount of payment that would otherwise apply to such discharges under section 1886(d) or 1814(b)(3) of the Act, as applicable. As specified in the statute, this payment adjustment is calculated and made after payment adjustments under sections 1886(o) and 1886(q) of the Act, the Hospital VBP Program and the Hospital Readmissions Reduction Program respectively, are calculated and made. (We note that the Hospital VBP Program is discussed in section IV.I. of the preamble of this final

rule and the Hospital Readmissions Reduction Program is discussed in section IV.H. of the preamble of this final rule.) Section 1886(p)(2)(A) of the Act defines “applicable hospitals” as subsection (d) hospitals that meet certain criteria. Section 1886(p)(2)(B)(i) of the Act defines these criteria and specifies that the payment adjustment would apply to an applicable hospital that ranks in the top quartile (25 percent) of all subsection (d) hospitals, relative to the national average of hospitals that report conditions acquired during the applicable period, as determined by the Secretary.

Therefore, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50967), we specified in § 412.172(b) of the regulations that, for applicable hospitals, beginning with discharges occurring during FY 2015, the amount of payment under § 412.172, or section 1814(b)(3) of the Act, as applicable, for such discharges shall be equal to 99 percent of the amount of payment that would otherwise apply to such discharges under § 412.172, or section 1814(b)(3) of the Act. This amount of payment will be determined after the application of the payment adjustment under the Hospital Readmissions Reduction Program under § 412.154, and the adjustment made under the Hospital VBP Program under § 412.162, and section 1814(l)(4) of the Act but without regard to this section 1886(p) of the Act.

Comment: Many commenters noted that the proposed 1-percent reduction in payment for the top quartile of lower performing hospitals will provide a stronger penalty than the current DRA HAC policy and has the potential to stimulate improvements in safety. The commenters supported CMS’ efforts to reduce HACs by paying less to hospitals for instances involving patients contracting HACs during a hospital stay. These commenters noted that quality payment adjustments continue to positively affect provider performance. Commenters further noted that several commercial health plans have implemented similar actions, processes, and guidelines to align their payment policies with CMS to adjust payment for reasonably preventable errors made by hospitals and health care facilities.

Response: We appreciate the commenters’ support and agree that the HAC Reduction Program, along with the other CMS quality initiatives set forth under the Affordable Care Act (for example, the Hospital VBP and Hospital Readmissions Reduction Programs), will lead to improvements in patient care, safety and outcomes.

Comment: Some commenters indicated that it was not clear in the FY 2015 IPPS/LTCH PPS proposed rule how the HAC Reduction Program payment adjustment would specifically be applied. The commenters stated that the HAC Reduction Program penalty appears to apply to all hospital payments (for example, outliers, DSH, uncompensated care, and IME) and they questioned why the policy should apply to IME and DSH payments that they asserted are not related to the underlying quality policy the provision enforces.

These commenters urged CMS to use administrative authority under section 1886(d)(5)(l)(i) of the Act to limit the HAC penalty to the base operating DRG payment only, which they reported would be consistent with Congressional intent and with the Hospital VBP and Hospital Readmissions Reduction Programs. The commenters noted that by restricting the penalty to the base operating DRG payment it could ensure consistency across the programs and reduce any confusion because under the Hospital VBP and Hospital Readmissions Reduction Programs the payment adjustment applies to the base operating DRG payment, not the base DRG rate and the additional add-on payments of outliers, DSH, uncompensated care, and IME.

Response: We did not propose to change the application of the payment adjustment that we finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50711). As we discussed in that rule, the statutory requirements for the HAC Reduction Program payment adjustment differ from those for the Hospital VBP and Hospital Readmissions Reduction Programs. In accordance with section 1886(q)(1) of the Act, the Hospital Readmissions Reduction Program adjustment is applied to the base operating DRG payment amount, which is defined at section 1886(q)(2) of the Act to exclude certain payments under subsection (d). Similarly, in accordance with sections 1886(o)(7)(A) and 1886(o)(7)(B) of the Act, the Hospital VBP Program applies adjustments to the base operating DRG payment amount, which is defined at section 1886(o)(7)(D) of the Act to exclude certain payments under subsection (d).

For the HAC Reduction Program, no such statutory exclusion exists and section 1886(p)(1) of the Act states that the payment for applicable hospitals “shall be equal to 99 percent of the amount of payment that would otherwise apply.” Therefore, the HAC Reduction Program payment adjustment will be applied after the application of the other program adjustments

including add-on payments consisting of outliers, DSH, uncompensated care, and IME.

As we have stated previously, our goal for the HAC Reduction Program is to heighten the awareness of HACs and reduce the number of incidences that occur through implementing the adjustments required by section 1886(p) of the Act. We believe that our efforts in using payment adjustments and our measurement authority will encourage hospitals to eliminate the incidence of HACs that could be reasonably prevented by applying evidence-based clinical guidelines. Given this goal, and the statutory language in 1886(p) of the Act, we do not believe this is an appropriate situation for us to exercise our authority under 1886(d)(5)(I)(i) of the Act.

(2) Applicability to Maryland Hospitals

Section 1886(p)(2)(c) of the Act specifies that the Secretary may exempt hospitals paid under 1814(b)(3) "from the application of this subsection if the State which is paid under such section submits an annual report to the Secretary describing how a similar program in the state for a participating hospital or hospitals achieves or surpasses the measured results in terms of patient health outcomes and cost savings established under this subsection." Accordingly, a program established by the State of Maryland that could serve to exempt hospitals in the State from the HAC Reduction Program would focus on hospitals operating under the waiver provided by section 1814(b)(3) of the Act, that is, those hospitals that would otherwise have been paid by Medicare under the IPPS, absent this provision. As we stated in section IV.J.3.b of the preamble of this final rule, because hospitals paid under section 1814(b)(3) of the Act are subsection (d) hospitals, unless the Secretary exempts these hospitals from the application of payment adjustments under the HAC Reduction Program under the authority of section 1886(p)(2)(C) of the Act, they are considered to be "applicable hospitals" (subject to the payment adjustments in the HAC Reduction Program) under the HAC Reduction Program.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50967 through 50968), we established criteria for evaluation to determine whether Maryland would be exempted from the application of the payment adjustments under the HAC Reduction Program for a given fiscal year, under § 412.172(c). Pursuant to our rule, if the State submitted an annual report to the Secretary describing how a similar program to reduce hospital

acquired conditions in that State achieves or surpasses the measured results in terms of health outcomes and cost savings for the HAC Reduction Program as applied to hospitals described in section 1886(d)(1)(B) of the Act, the State would be exempt from the HAC Reduction Program. We specified in the regulations that "CMS will establish criteria for evaluation of Maryland's annual report to the Secretary to determine whether Maryland will be exempted from the application of payment adjustments under this program for a given fiscal year." We also specified that Maryland's annual report to the Secretary and request for exemption from the HAC Reduction Program must be resubmitted and reconsidered annually. We provided that, for FY 2015, Maryland must submit a preliminary report to us by January 15, 2014 and a final report to us by June 1, 2014.

We noted that our criteria to evaluate Maryland's program is for FY 2015, the first year of the payment adjustment under the HAC Reduction Program, and that our evaluation criteria may change through notice and comment rulemaking as this program evolves.

The State of Maryland entered into an agreement with CMS, effective January 1, 2014, to participate in CMS' new Maryland All-Payer Model, a 5-year hospital payment model. This model is being implemented under section 1115A of the Social Security Act ("Act"), as added by section 3021 of the Affordable Care Act, which authorizes the testing of innovative payment and service delivery models, including models that allow states to "test and evaluate systems of all-payer payment reform for the medical care of residents of the State, including dual eligible individuals." Section 1115A of the Act authorizes the Secretary to waive such requirements of titles XI and XVIII of the Act as may be necessary solely for purposes of carrying out Section 1115A with respect to testing models.

Under the agreement with CMS, Maryland will limit per capita total hospital cost growth for all payers, including Medicare. In order to implement the new model, effective January 1, 2014, Maryland elected to no longer have Medicare reimburse Maryland hospitals in accordance with section 1814(b)(3) of the Act. Maryland also stipulated that it is no longer in continuous operation of a demonstration project reimbursement system since July 1, 1977, as specified under Section 1814(b)(3) of the Act. Because Maryland hospitals are no longer paid under section 1814(b)(3) of the Act, they are no longer subject to

those provisions of the Act and related implementing regulations that are specific to section 1814(b)(3) hospitals, including but not limited to section 1886(p)(2)(C) of the Act, which provides exemptions for hospitals paid under section 1814(b)(3) from the application of the HAC Reduction Program.

However, in order to implement the Maryland All-Payer Model, CMS has waived certain provisions of the Act for Maryland hospitals, including section 1886(p), and the corresponding implementing regulations, as set forth in the agreement between CMS and Maryland and subject to Maryland's compliance with the terms of the agreement. In other words, although section 1886(p)(2)(C) of the Act no longer applies to Maryland hospitals, Maryland hospitals will not be participating in the HAC Reduction Program because section 1886(p) of the Act and its implementing regulations have been waived for purposes of the model, subject to the terms of the agreement. Consequently, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28135), we proposed that the Total HAC Scores for Maryland hospitals would not be included when identifying the top quartile of all hospitals with respect to their Total HAC Score during the applicable period.

As a result of changes to the status of Maryland hospitals under 1814(b)(3) of the Act described above, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28136), we proposed conforming changes to these regulations and sought public comment on this proposal. Specifically, we proposed to remove the entire contents of paragraph (c) under § 412.172 and reserve the paragraph (c) designation.

No commenters opposed our proposal to exclude the Total HAC Scores for Maryland hospitals when identifying the top quartile of all hospitals and no commenters opposed CMS' proposed changes to the regulations regarding Maryland hospitals. Therefore, we are finalizing our proposal to exclude the Total HAC Scores for Maryland hospitals when identifying the top quartile of all hospitals and our proposed changes to the regulations regarding Maryland hospitals.

c. Measure Selection and Conditions, Including Risk-Adjustment Scoring Methodology

(1) General Selection of Measures

We did not propose any new measures for the HAC Reduction Program in the FY 2015 IPPS/LTCH PPS proposed rule. Although we are not required under section 1886(p) of the

Act to address specific measure scoring methodologies and domain weights regarding the HAC Reduction Program in notice-and-comment rulemaking, as required under the Hospital VBP program, we believe that it is important to set forth such scoring methodologies for each individual HAC measure, in order for the public to understand how the measures adopted in previous rulemaking relate to the performance methodology used to determine the applicable hospitals subject to the payment adjustment under the HAC Reduction Program. Below we set forth the specific measure scoring methodology and domain weights regarding the HAC Reduction Program for FY 2015 as finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50712 through 50719).

Comment: A few commenters thanked CMS for not adding any new measures to the HAC program for FY 2015 and FY 2016. One commenter encouraged CMS to fill measure gaps as soon as possible to ensure that this program provides the greatest possible value for quality improvement and consumer education. Several commenters suggested that CMS identify new measures for the HAC Reduction Program that would address a variety of quality and safety issues relevant to the broadest possible range of hospitals and affect a greater number of patients, as commenters asserted that this approach is more fair and would ensure hospitals are not penalized for the type of patients they treat. In addition, the commenters believed this approach would help improve the ability of the program to identify the real poor performers. One commenter recommended that these new measures should not be entirely claims-based.

Commenters made additional recommendations for future new measures including PSI-4: Death rate among surgical inpatients with serious, treatable complications (NQF #0351), PSI-16: Transfusion reaction count (NQF #0349), surgical site infections (SSIs) following hip and knee arthroplasty and SSIs following high-volume procedures such as caesarean section surgery. One commenter recommended expanding the iatrogenic pneumothorax rate (PSI-6), which currently addresses iatrogenic pneumothorax with venous catheterization, to also include iatrogenic pneumothorax with paracentesis and thoracentesis. One commenter recommended that new measures of infection be developed that incorporate infection rates per thousand discharges in order to inform patients of their likelihood of acquiring an infection at a given hospital.

Response: We did not propose new measures in this rulemaking as we intend to allow time for providers to gain experience with the finalized measures. We are continuously evaluating the program and working to identify new, potentially suitable measures to fill measure gaps. We appreciate the commenters' input for measure selection and will take this feedback into consideration in future rulemaking.

Comment: Many commenters suggested that all HAC Reduction Program measures should be NQF-endorsed and, while recognizing it is not a requirement for the HAC Reduction Program, commenters also recommended that CMS use the formal pre-rulemaking process of the Measure Applications Partnership (MAP) for any measures being considered for the program.

Response: While we note that section 1886(p)(3) of the Act does not require NQF endorsement for a measure to be considered for the HAC Reduction Program, we are aware of the value of the NQF endorsement and MAP processes in facilitating information exchange and agreement among stakeholders. We also note that all of the measures adopted for the HAC Reduction Program went through the pre-rulemaking process and were either recommended for inclusion by the MAP, or represent 1 of the 12 HACs that have been identified by the Secretary and which are referenced in section 1886(p) of the Act for the HAC Reduction Program.

(2) Updates on AHRQ PSI-90, and CDC NHSN CLABSI and CAUTI Measures

For FY 2015, we will keep the AHRQ PSI-90 composite measure (in Domain 1) that we adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717) because it is currently endorsed by NQF. However, we note that the AHRQ PSI-90 composite measure is currently undergoing NQF maintenance review. The PSI-90 composite measure consists of eight component indicators: PSI-3 Pressure ulcer rate; PSI-6 Iatrogenic pneumothorax rate; PSI-7 Central venous catheter-related blood stream infections rate; PSI-8 Postoperative hip fracture rate; PSI-12 Postoperative Pulmonary Embolism/Deep Vein Thrombosis rate; PSI-13 Postoperative sepsis rate; PSI-14 Wound dehiscence rate; and PSI-15 Accidental puncture & laceration rate. AHRQ is considering the addition of PSI-9 (Perioperative hemorrhage rate), PSI-10 (Perioperative physiologic metabolic derangement rate) and PSI-11 (Post-operative respiratory failure rate) or a combination of these

three measures into the PSI-90 composite measure. We consider the inclusion of additional component measures in the PSI-90 composite measure to be a significant change to the PSI-90 composite measure that we finalized in the FY 2014 IPPS/LTCH PPS final rule. If the changes are significant, we will engage in notice-and-comment rulemaking prior to requiring reporting of this revised composite.

Similarly, the CDC NHSN Catheter-Associated Urinary Tract Infection (CAUTI) and Central Line-Associated Blood Stream Infection (CLABSI) measures in Domain 2 that we adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717) for FY 2015 also are currently undergoing NQF maintenance review. If there are significant changes to these measures, we will engage in notice-and-comment rulemaking prior to requiring reporting of the changes made to CDC's NHSN CLABSI and CAUTI measures. For FY 2015, we will keep CDC's NHSN CAUTI and CLABSI measures in Domain 2 as they are currently endorsed.

Comment: Several commenters supported CMS' commitment to use the notice-and-comment rulemaking process for any HAC measure with significant changes made during the NQF review process.

One commenter specifically recommended that the AHRQ PSI-90 measure and the CDC NHSN CLABSI and CAUTI measures currently undergoing NQF maintenance review only be included for FY 2016 and beyond contingent upon continued NQF endorsement and any updates recommended for continued endorsement.

Response: We appreciate the commenters' support of our rulemaking process. As for the comments regarding NQF endorsement of the measures, we refer readers to our response in section IV.J.3.c. of the preamble of this final rule.

(3) Measure Selection

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717), we finalized the following measures for selection: (i) the AHRQ PSI-90 composite measure for Domain 1 and the CDC NHSN measures CAUTI and CLABSI for Domain 2 for FY 2015; (ii) addition of the CDC NHSN Surgical Site Infection (SSI) measure for FY 2016; and (iii) addition of the CDC NHSN Methicillin-Resistant Staphylococcus aureus (MRSA) Bactremia and *C. difficile* measures for FY 2017. Several of these measures are already part of the Hospital IQR

Program and are reported on the *Hospital Compare* Web site.

Comment: One commenter supported the implementation schedule of quality measures for the program, specifically stating that the AHRQ PSI-90 composite measure and the CDC NSHN CLABSI and CAUTI measures are sufficient starting points for the HAC Reduction Program. A few commenters also supported the addition of the CDC NHSN SSI, MRSA and *C. difficile* measures which they believed would address the increasing incidence of these infections in hospital settings. A few commenters supported the adoption of the NHSN SSI measure in Domain 2 for FY 2016.

Response: We thank the commenters for the recognition of the significance of potential patient harms in hospitals as well as for their support of our proposals for the implementation of the HAC Reduction Program. We emphasize that patient safety is our primary objective for the HAC Reduction Program.

Comment: A few commenters supported maintaining claims-based measures such as the PSI-90 composite measure in quality reporting programs because they are the least burdensome, least costly and most widely accessible and available reporting method.

Response: We agree that claims-based measures have the advantages of being minimally burdensome to providers while providing data covering a large proportion of the Medicare population. We consider several factors when selecting measures for quality programs, including but not limited to measurement gap areas, opportunities for quality improvement, and feasibility and burden for implementation. Claims-based measures, including AHRQ PSIs, are collected and widely accepted by States and other health care purchasers for payment purposes.

In addition to the claims-based measure in the FY 2015 HAC Reduction Program, we also adopt chart-abstracted measures as appropriate. There are currently two chart-abstracted measures in the program and the number of chart-abstracted measures will increase in subsequent years (three in FY2016 and five in FY 2017). We also are exploring options for new measures, including electronically specified measures, that could be incorporated into the HAC Reduction Program in future years.

Comment: Many commenters believed that coding biases result in unacceptable levels of reliability and validity for the PSI-90 composite measure and thus the measure fails to accurately and meaningfully reflect hospital performance. A few commenters

expressed concerns that the PSI measures are not clinically validated against medical records.

Response: We have previously addressed commenters' specific concerns regarding validity and coding issues of PSI-90 composite measure, and we refer readers to our responses to these comments in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50715). We also note that there are validation studies examining the relationship between billing or claims data and medical records.⁵⁵

Comment: Many commenters expressed a lack of confidence about the PSI-90 composite measure due to recent discussions at the NQF Patient Safety Standing Committee ("Patient Safety Committee" or "Committee"). Some commenters stated that the Patient Safety Committee did not recommend the measure for endorsement and other commenters noted that NQF Patient Safety Committee requested changes to the weighting of the individual components in the composite measure to better reflect their relative importance or preventability. One way the Committee suggested this reweighting could be achieved is through including three additional component measures (PSI-9—Perioperative Hemorrhage or Hematoma Rate, PSI-10—Postoperative Physiologic and Metabolic Derangement Rate and PSI-11—Postoperative Respiratory Failure Rate) in the composite. A few commenters expressed support for the potential inclusion of PSI-9, 10 and 11 in the PSI-90 composite measure. However, one commenter did not support the addition of any new components to the composite measure, while a few commenters opposed the inclusion of PSI-9 and PSI-10 in particular because they claimed that these components had a high false-positive rate due to lack of clarity on the coding criteria.

In the event that the composite measure is not re-endorsed by NQF, some commenters recommended that

CMS not consider using individual PSI-90 component measures that may still be endorsed. They also recommended that additional testing for consistency between individual components and the composite scores be undertaken and the results released. Other commenters had concerns that several of the PSI-90 component measures are not NQF-endorsed. Some commenters supported and understood that CMS may need to retain the PSI-90 composite measure, regardless of NQF endorsement status.

Response: We would like to clarify the status of the PSI-90 measure with regard to NQF endorsement. As part of the routine NQF measure maintenance process, the Patient Safety Committee expressed concerns about the weighting of the PSI-90 component measures and requested to see additional measure information related to re-weighting of PSI-90 with three additional components (PSI-9, PSI 10 and PSI 11) before deciding if the measure would be recommended for continued endorsement. AHRQ has submitted the requested data for the NQF Patient Safety Committee's consideration in making their decision regarding continued endorsement of the composite. As we stated earlier, if during the NQF review process, substantive changes are made to the measure, we will go through a notice-and-comment rulemaking process.

Regarding the concern for the claimed high false-positive rate of some of the PSI-90 component measures, we conferred with AHRQ which noted that most of the studies that examine positive predictive values predate the use of Present on Admission (POA) coding that is now integral to the PSIs. Detailed reviews of these studies indicate that most of the false positives were due to events that were POA. POA coding for IPPS hospitals was required by CMS beginning October 1, 2007 with a payment penalty beginning October 1, 2008. Studies that use data prior to 2009 would not have captured POA information. Therefore, we believe that proper coding will address the commenters' concerns.

In addition, AHRQ noted that the NQF convened a group of 12 experts to determine what criteria should be used for evaluating composite performance measurement for NQF endorsement. The Technical Expert Panel provided clear guidance on the relationship between the individual component indicators and the composite in the Composite Performance Measure Evaluation Guidance document (NQF, April 2013). Specifically, individual component measures that are included in the composite performance measure:

⁵⁵ (1) Zrelak PA, Romano PS, Tancredi DJ, Geppert JJ, Utter GH. Validity of the AHRQ Patient Safety Indicator for Postoperative Physiologic and Metabolic Derangement based on a national sample of medical records. *Medical Care* 2013; 51(9):806-11. (2) Utter GH, Zrelak PA, Baron R, Tancredi DJ, Sadeghi B, Geppert JJ, Romano PS. Detecting postoperative hemorrhage or hematoma from administrative data: The performance of the AHRQ Patient Safety Indicator. *Surgery* 2013; 154(5):1117-25. (3) Borzecki AM, Cevasco M, Chen Q, Shin M, Itani KM, Rosen AK. How valid is the AHRQ Patient Safety Indicator "postoperative physiologic and metabolic derangement"? *J Am Coll Surg*. 2011 Jun;212(6):968-976. (4) Borzecki AM, Kaafarani H, Cevasco M, Hickson K, Macdonald S, Shin M, Itani KM, Rosen AK. How valid is the AHRQ Patient Safety Indicator "postoperative hemorrhage or hematoma"? *J Am Coll Surg*. 2011 Jun;212(6):946-953.

(1) should be justified based on the clinical evidence; (2) do not need to be NQF endorsed; (3) generally should demonstrate a gap in performance; and (4) may not be sufficiently reliable independently, but contribute to the reliability of the composite performance measure.

AHRQ convened a Composite Measure Workgroup of experts in the field to determine the best weighting strategy. The methodology of the PSI-90 composite measure is detailed in the original technical report by the AHRQ Composite Measure Workgroup: http://qualityindicators.ahrq.gov/Downloads/Modules/PSI/PSI_Composite_Development.pdf. Several alternative approaches were discussed with the AHRQ Composite Measure Workgroup and the first NQF Composite Measure Steering Committee. Factor analysis was considered as one approach and was deemed to have no clear advantages over less complex, more intuitively clear weighting schemes. In brief, numerator weighting that is used in the PSI-90 composite measure was preferred due to its greater simplicity and clarity.

Comment: A few commenters stated that many of the AHRQ PSI-90 composite component measures are rare events and do not meet the high-volume requirement for the HAC Reduction Program.

Response: We note that section 1886(d)(4) (D)(iv) of the Act defines a hospital-acquired condition for the HAC Reduction Program as one that is high cost, high volume or both or any other conditions determined appropriate by the Secretary. We believe the PSI-90 composite measure and its components meet the statutory requirement for inclusion in the program.

Comment: Some commenters asserted that composite measures such as PSI-90 do not provide actionable information to hospitals.

Response: We disagree and note that hospitals have access to their results on the individual PSI-90 component measures and how they compare to the national risk adjusted rate on their Hospital Specific Reports which are issued during the review and corrections period. In addition, the component measure scores are available to hospitals and the public on our Web site at: <http://www.medicare.gov/>. Therefore, hospitals can use the individual component measure results to identify specific areas for improvement efforts.

Comment: Based on the belief that the PSI-90 composite measure has significant flaws as described above, many commenters recommended

identifying alternatives to the PSI-90 composite measure and phasing it out of the HAC Reduction Program as soon as possible. Some commenters suggested that the alternative measure(s) be derived from the NQF portfolio of safety measures.

Response: In the FY 2014 IPPS/LTCH PPS proposed rule (78 FR 27625 through 27626), we explained the rationale for including the PSI-90 composite measure in the HAC Reduction Program. We continue to believe the PSI-90 is an appropriate tool for calculation of HAC scores. Nonetheless, we will continue to explore options for new measures, including electronically specified measures that could be incorporated into the HAC Reduction Program to supplement or replace the PSI-90 composite measure. We also note that the PSI-90 is one of three measures included in the Program for FY 2015. The other two measures are chart-abstracted and we are increasing the number of chart-abstracted measures in subsequent years of the program (three in FY 2016 and five in FY 2017).

Comment: One commenter suggested revisions to four of the PSI-90 composite component measures. For PSI-6, the commenter recommended exclusion of high frequency outliers, such as iatrogenic pneumothorax in patients with a lack of intravenous access; acuity; and cases where iatrogenic pneumothorax is secondary to a life-saving procedure. The commenter also recommended that CMS not apply this measure if clinicians have used all available means of avoiding iatrogenic pneumothorax, such as ultrasound guidance. For PSI-7, the commenter recommended exclusions for trauma. For PSI-12, the commenter recommended clear definition of the inclusion criteria in order to avoid misclassification of providers and subsequent inappropriate penalties. For PSI-14, the commenter requested adding exclusions for trauma cases and patients in shock that require emergency procedures.

Another commenter recommended that PSI-7 be removed from the HAC calculation because it is not as well-validated as the NSHN CLABSI measure, the transition from ICD-9 to ICD-10 coding which some hospitals have already undergone could compromise the validity of this component and that, as it currently exists, some vascular catheter infections might be double counted.

Response: AHRQ's Quality Indicator program continually updates and refines measures to provide the best possible quality indicators to the public. We

conferred with AHRQ, which welcomed the commenters' suggestions and will examine the feasibility of including these exclusions. All of the AHRQ quality indicators go through a rigorous testing process prior to changes being made to the indicators. It should be noted that NQF policy and guidance generally has favored risk adjustment approaches over exclusion of high-risk patients, when possible, to optimize the generalizability and value of quality measures. Suggestions regarding potential PSI measure revisions can be made directly to QIsupport@ahrq.hhs.gov.

With regard to the commenter's specific suggestion for PSI-6—Iatrogenic Pneumothorax Rate, it is impossible to identify patients who lack peripheral intravenous access using ICD-9-CM coded data. However, given exclusions for trauma and respiratory disease, it is assumed that all patients who experienced this event had some type of procedure (such as central venous catheter placement or thoracentesis) that placed them at risk for iatrogenic (hospital-acquired) pneumothorax. For PSI-7—Central Venous Catheter-Related Blood Stream Infection Rate, ICD-10 implementation will take effect no sooner than October 1, 2015 and may be subject to additional delays. AHRQ will conduct extensive testing on the ICD-10 specified measures to ensure events are not double counted.

For PSI-12—Perioperative Pulmonary Embolism or Deep Vein Thrombosis Rate, inclusion criteria are clearly defined and have been narrowed as a result of changes in ICD-9-CM codes and user feedback. For example, the numerator inclusion criteria no longer include upper extremity or thoracic venous thrombosis, due to concern about the uncertain preventability of these events among patients who require long-term use of central venous catheters. The numerator inclusion criteria also no longer include superficial venous thrombosis, due to concern about the uncertain preventability of these events.

Comment: One commenter was concerned that several of the PSI composite component measures in the HAC Reduction Program—including PSI-6, PSI-12 and PSI-15—were finalized for removal from the Hospital IQR Program after FY 2014 in the FY 2013 IPPS/LTCH PPS final rule. The commenter contended that because these measures have been deemed unfit for use in a public reporting application, they are equally unsuitable for use in a payment penalty program.

Response: As we stated in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53507 through 53509), to avoid duplication, we removed PSI-6, PSI-12 and PSI-15 from Hospital IQR Program as these individual measures are already included in the PSI-90 composite measure which is currently part of the Hospital IQR Program measure set. The measures were not deemed to be unfit, as characterized by the commenter.

Comment: One commenter described its experience with the AHRQ Quality Indicator Software not allowing its organization to identify specific patient encounters included in the measure components and not always accurately reflecting POA. This commenter recommended that CMS ask AHRQ to update the software outputs to provide accurate case level patient information for patients in the numerator, to update the software to define which ICD code triggers the measure, to include simultaneous SAS and MonAHRQ releases and to include the PSI-90 outputs in the AHRQ process the same way as other measures.

Response: AHRQ informed us that they are constantly improving the AHRQ QI software and welcomes this and other suggestions for improvements. The AHRQ QI software and the MonAHRQ software are under different timelines for release for a variety of external reasons. Additional suggestions for improvements can be made directly to QIsupport@ahrq.hhs.gov.

Comment: One commenter recommended revisions to the CAUTI measure to minimize the potential for the possible unintended consequence of premature urinary catheter removal. The commenter's recommended revisions included adding exclusions for bedridden elderly patients whose urine output cannot be monitored otherwise, those who have had complex pelvic surgery, and those with a history of urinary retention; and inclusion of a data capture point for catheter reinsertion to capture the rate of repeat instrumentation and infection risk for those with early catheter removal.

Response: We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50716) for our discussion of the issue of potential unintended consequences of the CAUTI measure. In regard to the addition of a data capture point in the NHSN system, we conferred with CDC, which stated that they weigh each datum piece that is required for NHSN surveillance very carefully, considering the burden required to capture and collect the information and the benefits of the data collected. Individuals performing validation of CAUTI data have stated that locating insertion

documentation is very difficult, if not impossible in many cases. For this reason, NHSN does not require the documentation of the date of insertion of indwelling urinary catheters. The NHSN UTI data collection form and system do allow for voluntary collection of this information and NHSN encourages facilities to utilize these capabilities to inform their CAUTI prevention efforts as they deem necessary. However, it is not appropriate to require such documentation by all facilities.

Comment: Several commenters contended that the MRSA and *C. difficile* measures do not adequately distinguish between community-acquired and hospital-acquired infections and suggested the measures not be included in the HAC Reduction Program for that reason. Another commenter had the same concern and supported the inclusion of the MRSA measure but not the *C. difficile* measure. A commenter noted that rates of *C. difficile* are generally higher in patient with surgical procedures (particularly with gastrointestinal surgical procedures) versus non-surgical patients and that there are known regional variations in MRSA and *C. difficile* infection rates. For these reasons, this commenter recommended that process measures focusing on best practices and guidelines for patients who contract MRSA or *C. difficile* as inpatients would be more appropriate than outcome measures tracking MRSA and *C. difficile* infection rates. A few commenters recommended that the *C. difficile* measure be included in the Hospital VBP program, and not in the HAC Reduction Program.

Response: With respect to some commenters' concerns about MRSA and *C. difficile* measures, we note that these measures do enable differentiation between community-acquired and health care-associated events based on date of admission and date(s) of specimen collection. Therefore, we do not believe the measures need to be revised. While we appreciate the recommendations for process measures, we note that process measures are not usually risk adjusted and current statute requires risk-adjustment for the HAC Reduction Program. The issue of the same measures being included in multiple programs is addressed below.

Comment: Many commenters urged CMS to eliminate the overlap of measures between the Hospital VBP and HAC Reduction Programs. The commenters understood CMS' desire to align the programs in order to draw more attention to these important patient safety issues and to spur quicker

and more meaningful change in patient care. However, the commenters believed that this approach creates multiple operational challenges, results in the potential for double payment penalties, and sends conflicting signals about the true state of hospital performance (a hospital could incur a penalty under the HAC Reduction Program but receive an incentive under the Hospital VBP Program). Commenters overwhelmingly recommended that the HAC Reduction Program measures should only be included in either the HAC Reduction Program or the Hospital VBP program but not in both programs. One commenter recommended that either the HAC Reduction Program or the Hospital VBP program be eliminated completely.

Response: We acknowledge that there is overlap in measures between the Hospital VBP Program and the HAC Reduction Program and refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50716) for our discussion of the rationale for this overlap. As for elimination of these programs, they are statutory requirements and eliminating them is beyond the scope of the Secretary's authority.

Comment: Several commenters recommended that CMS consider a comprehensive strategy in which measures are placed into pay-for-performance programs using a staged approach: the Hospital IQR Program would be the basis for selection into the pay-for-performance programs; the Hospital VBP Program would be the next step and would include measures covering important safety issues but ones for which it is unclear if effective strategies exist to improve performance; and the HAC Reduction Program would be the final stop and would include measures that have generally good but not topped out performance with a limited performance gap to close and a set of highly effective, proven strategies that are widely implementable. Many commenters also suggested that measures should be publicly reported for at least one year before they are included in the HAC Reduction Program so that any unintended consequences of measurement and reporting can be addressed.

Response: We appreciate the commenters' feedback and will consider these suggestions in future rulemaking.

(4) Measure Risk-Adjustment Methodology

In the FY 2014 IPPS/LTCH PPS final rule, we established that we would use the existing measure-level risk-adjustment that is already part of the risk-adjustment methodology for the

individual measures in Domains 1 and 2 in order to fulfill this requirement (78 FR 50719). We codified the use of this methodology under § 412.172(d) of the regulations. The AHRQ PSI-90 composite measure and the CDC NHSN measures selected for the program are risk-adjusted and reliability-adjusted. Links to the measure specification documents can be found in section IV.J.4. of the preamble of this final rule. Specifically, risk factors such as the patient's age, gender, comorbidities, and complications will be considered in the calculation of the measure rates so that hospitals serving a large proportion of sicker patients are not unfairly penalized. We noted that the risk-adjustment methodology for these measures meets current NQF endorsement criteria. We believe that such risk-adjustment is appropriate, pursuant to section 1886(p) of the Act.

We will continue to examine the impact of the additional measures in the program, and propose refinements to the program if necessary. Should changes to the risk-adjustment models for the measures be adopted during NQF endorsement maintenance processes, we will propose adopting these changes as soon as possible through rulemaking.

Comment: Many commenters had concerns about the PSI-90 risk-adjustment methodology. Most commenters believed that inadequate risk-adjustment results in a disproportionate impact on teaching hospitals or hospitals that treat many sick and vulnerable patients, perform a high volume of emergency trauma and burn care, and perform a large number of surgical procedures. Another commenter expressed the opposite concern—that small hospitals might have artificially inflated HAC scores as a result of the risk-adjustment methodology algorithm, which gives hospitals with poor data reliability a low reliability weight therefore skewing their rates closer to the national mean.

Response: Each of the PSI-90 composite measure component measures includes detailed risk-adjustment for clinical factors (for example, modified diagnostic related groupings, major diagnostic categories, comorbidities), age, and gender that influence the risk for experiencing a patient safety event during hospitalization. The three risk factors mentioned explicitly above—trauma, burns, and surgical discharges—are accounted for in the PSI risk-adjustment models. For example, acknowledging that some hospitals do more transplants and trauma care than others, the models account for this heterogeneity of risk. AHRQ's Quality Indicator program

continually updates and refines measures to provide the best possible quality indicators to the public.

Comment: Several commenters expressed concerns that the HAC Reduction Program does not contain adequate adjustment for socioeconomic (SES) factors that influence HAC rates. Commenters recommended comparing providers to their peers, adjusting provider penalties based on SES of patients served, incorporating a provider's annual improvement into performance calculations, and adopting new measures that better adjust for socioeconomic factors. One commenter specifically recommended complying with the recommendations of the NQF's Expert Panel on Risk-Adjustment for Sociodemographic Factors (Draft Report available at: http://www.qualityforum.org/Risk_Adjustment_SES.aspx).

Response: We appreciate the commenters' suggestions on the importance of addressing socioeconomic status in the HAC Reduction Program and have continued to consider and evaluate these stakeholder concerns. We also note that these concerns were addressed in the FY 2014 IPPS/LTCH PPS final rule (79 FR 50653 through 50654, 50673 through 50674) and again in section IV.H.4. of the preamble of this final rule. While these discussions in section IV.H.4. of the preamble of this final rule are in response to comments regarding the Hospital Readmissions Reduction Program, we have received similar comments with respect to other quality reporting programs and our responses address considerations which also apply to the HAC Reduction Program.

To the extent that these commenters were requesting that CMS mitigate the HAC Reduction Program payment adjustment despite a hospital being in the top quartile, section 1886(p) of the Act specifies that the amount of payment for such a hospital "shall be equal to 99 percent of the amount of payment that would otherwise apply" and we refer readers to the earlier discussion of the payment adjustment in section IV.J.3.b. of the preamble of this final rule.

(5) Measure Calculations

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717 through 50719), we established that we will perform measure calculations for the AHRQ PSI-90 composite measure under Domain 1 and the CDC NHSN measures under Domain 2. We stated that measure calculations for the AHRQ PSI-90 composite measure included using ICD-9-CM diagnosis and/or procedure codes and, for the principal and secondary

diagnoses, a present on admission (POA) indicator value associated with all diagnoses on the claim. As noted in section IV.J.3.b. of the preamble of this final rule, in order to implement the new Maryland All-Payer Model, Maryland elected to no longer have Medicare payment made to Maryland hospitals in accordance with section 1814(b)(3) of the Act, effective January 1, 2014. Although CMS has waived certain provisions of the Act for Maryland hospitals as set forth in the agreement between CMS and Maryland and subject to Maryland's compliance with the terms of the agreement, CMS has not waived the POA indicator reporting requirement. In other words, the changes to the status of Maryland hospitals under section 1814(b)(3) of the Act as described above do not in any way change the POA indicator reporting requirement for Maryland hospitals. We also finalized that the same rules under the Hospital IQR Program be applied to determine how the AHRQ PSI-90 composite measure and CDC NHSN measures are applied and calculated.

(6) Applicable Time Period

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717), we adopted a 2-year applicable period to collect data that would be used to calculate the Total HAC Score for FY 2015. For Domain 1 (AHRQ PSI-90 composite measure), we established a 2-year data period to calculate the measures based on recommendations from AHRQ, the measure developer, as we believed that the 24-month data period will provide hospitals and the general public the most current data available. The 24-month data period also will allow time to complete the complex calculation process for these measures, to perform comprehensive quality assurance to enhance the accuracy of measure results, and to disseminate confidential reports on hospital-level results to individual hospitals.

As such, for FY 2015, we will use the 24-month period from July 1, 2011 through June 30, 2013 as the applicable time period for the AHRQ PSI-90 composite measure. The claims for all Medicare FFS beneficiaries discharged during this period will be included in the calculation of measure results for FY 2015. This includes claims data from the 2011, 2012, and 2013 Inpatient Standard Analytic Files (SAFs).

The CDC NHSN measures, CAUTI and CLABSI, are currently collected and calculated on a quarterly basis. However, for the purpose of the HAC Reduction Program, we will use 2 years of data to calculate the Domain 2 score. For FY 2015, we will use calendar years

2012 and 2013 for the HAC Reduction Program. As noted above, we codified the definition of “applicable time period” in the FY 2014 IPPS/LTCH PPS final rule at § 412.170.

Comment: One commenter supported use of the 2-year applicable time periods for the collection of Domain 1 and 2 measures for FY 2015. A few commenters suggested aligning the duration of performance periods for Hospital VBP and the HAC Reduction Programs, in particular suggesting using 1 year of data for the CDC NHSN measures. A few additional commenters had concerns that the data are retrospective and therefore do not provide actionable information.

One commenter disagreed with the finalized 2-year data collection period for the CDC measures for CAUTI and CLABSI and requested that CMS reconsider quarterly collection and calculation of these measures for Domain 2. The commenter stated that quarterly data would be more useful for providers in addressing areas in which they would like to improve, and would also allow consumers and purchasers to have timely information regarding areas of care that are meaningful and important to them.

Response: We refer readers to our response to the applicable time period comments in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717). We understand that hospitals might find quarterly data more useful and for that purpose, we refer stakeholders to *Hospital Compare* that includes quarterly updates of the measures included in the HAC Reduction Program.

d. Criteria for Applicable Hospitals and Performance Scoring Policy

The HAC Reduction Program does not contain specific statutory directives on scoring methods, as found with other programs. Therefore, our main concern when establishing scoring methods for the HAC Reduction Program was to align with existing scoring methodologies in similar hospital programs. Accordingly, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50721), we finalized a scoring methodology that aligns with the achievement scoring methodology currently used under the Hospital VBP Program (78 FR 27629). We believe aligning the scoring methodologies reduces confusion associated with multiple scoring methodologies. In addition, we note that alignment benefits the hospital stakeholders who have prior experience with the Hospital VBP Program.

In the FY 2014 IPPS/LTCH PPS proposed rule (78 FR 27629), we proposed to implement a methodology for assessing the top quartile of applicable hospitals for HACs based on performance standards, where we would score each hospital based on whether they fall in the top quartile for each applicable measure and where in the top quartile they fall. In addition, we proposed to calculate a Total HAC Score for each hospital by summing the hospital’s performance score on each measure within a domain to determine a score for each domain, then multiplying each domain score by a proposed weight (Domain 1—AHRQ Patient Safety Indicators 50 percent, Domain 2—CDC NHSN Measures 50 percent), and adding together the weighted domain scores to determine the Total HAC Score.

We reviewed the public input on the proposed 75th percentile benchmark. Several commenters requested that a change to the proposed minimum benchmark for scoring each measure be made. We agreed with these commenters, and in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50722), we modified our proposal and established that the scoring will begin at the minimum value for each measure rather than the 75th percentile. The methodology finalized in the FY 2014 IPPS/LTCH PPS final rule will assess the top quartile of applicable hospitals for HACs based on the Total HAC Score. The support for Domain 2 measures in general, coupled with multiple recommendations, and specifically those from MedPAC, to provide more weight to Domain 2 measures led us to conclude that such scoring changes were necessary. Therefore, we finalized a different weight for each Domain than originally proposed (78 FR 50721).

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50722), we further specified that we will calculate a Total HAC Score for each hospital by using the hospital’s performance score on each measure within a domain to determine a score for each domain, then multiply each domain score by the following weights: Domain 1—(AHRQ PSI–90 composite measure), 35 percent; and Domain 2—(CDC NHSN measures), 65 percent; and combine the weighted domain scores to determine the Total HAC Score (§ 412.172(e)(3)). We use each hospital’s Total HAC Score to determine the top quartile of subsection (d) hospitals (applicable hospitals) that are subject to the payment adjustment beginning with discharges on or after October 1, 2014. With respect to a subsection (d) hospital, we identify the top quartile of all hospitals that are subsection (d)

hospitals with respect to their rate of HACs during the applicable period (§ 412.172(e)(1)). We use a Total HAC Score to identify applicable hospitals and identify the 25 percent of hospitals with the highest Total HAC Scores as applicable hospitals (§ 412.172(e)(2)).

We finalized the PSI–90 composite measure for Domain 1. Because hospitals may not have complete data for every AHRQ indicator in the composite measure for this Domain 1 measure, we finalized the same methodology used for the Hospital VBP Program to determine the minimum number of indicators with complete data to be included in the calculation of the Domain measure.

In addition, we finalized the following rules to determine the number of AHRQ indicators to be included in the calculation for a hospital’s Domain 1 score. In this discussion, “complete data” refers to whether a hospital has enough eligible discharges to calculate a rate for a measure. Complete data for the AHRQ PSI–90 composite measure means the hospital has three or more eligible discharges for at least one component indicator. Specifically—

If a hospital does not have “complete data” for the PSI–90 composite measure, we will not calculate a Domain 1 score for that hospital.

If a hospital has “complete data” for at least one indicator for the AHRQ PSI–90 composite measure, we will calculate a Domain 1 score.

The calculation of the SIR for the CDC measures requires that the facility have a ≥ 1 predicted HAI event. The predicted number of events is calculated using the national HAI rate and the denominator counts (that is, number of device days, procedure days, or patient days depending on the HAI). In the event the SIR cannot be calculated for any domain 2 measures because the facility has < 1 predicted infection for each measure, Domain 1 scores exclusively will be used to calculate a HAC score. In other words, we will exclude from the overall HAC score calculation any measure for which an SIR cannot be calculated for the reason set out above.

Because of the differences among the measures for the HAC Reduction Program and the distribution of measure results, simply adding up the measure results to calculate the domain or Total HAC Score will make the scores less meaningful to hospitals and the general public. As a result, as we indicated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50720 through 50725), points will be assigned to hospitals’ performance for each measure. This approach aligns with the Hospital VBP Program for measuring hospital

achievement. In particular, the Hospital VBP Program assigns up to 10 points for each measure based on a hospital's performance result for that measure for a given time period. We note that, for the HAC Reduction Program, unlike the Hospital VBP Program where a higher score means better performance, the more points a hospital receives on a measure corresponds with a poorer score performance. For the HAC Reduction Program, we finalized use of a slightly different methodology for

scoring points, depending on the specific measure (Table C in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50723), which is also included below). Specifically—

- For the AHRQ Patient Safety for Selected Condition (PSI–90) composite in Domain 1, point assignment will be based on a hospital's score for the composite measure.
- For the PSI–90 composite measure, 1 to 10 points will be assigned to the hospital.

• For the CDC NHSN measures in Domain 2, point assignment for each measure will be based on the SIR for that measure.

- For each SIR, 1 to 10 points will be assigned to the hospital for each measure (CAUTI and CLABSI for FY 2015).
- The Domain 2 score will consist of the average of points assigned to the SIR (CAUTI and CLABSI for FY 2015).

TABLE C—CALCULATION OF DOMAIN 1 AND 2 MEASURES FOR FY 2015

Measure name	Measure result	Scenario	Individual measure score (points)
Domain 1 AHRQ PSI–90 ***	Weighted average of rates of component indicators.	Composite value	1–10.
Domain 2 CDC NHSN CAUTI CLABSI.	Standard Infection Ratio (SIR)	SIR	1–10 (refer to Figure A).

*** These measure rates are risk-adjusted and reliability-adjusted.

For all measures finalized for the HAC Reduction Program, we will use the following rules to determine the number of points assigned to a measure (78 FR 50723 through 50725). Based on the distribution for PSI–90 rates for all the hospitals, we will divide the results into percentiles in increments of 10 with the lowest percentile ranges meaning better performance. Hospitals with PSI–90 rates within the lowest tenth percentile will be given one point; those with PSI–90 rates within the second lowest percentile range (between the 11th and 20th percentile) will be given 2 points, and so forth.

FIGURE A—POINT ASSIGNMENT FOR HOSPITAL A'S PSI–90 SCORE

If Hospital A's PSI–90 rate falls into this percentile	Then assign this number of points
1st–10th	1
11th–20th	2
21st–30th	3
31st–40th	4
41st–50th	5
51st–60th	6
61st–70th	7
71st–80th	8
81st–90th	9
91st–100th	10

For Domain 2, we will obtain measure results that hospitals submitted to the

CDC NHSN for the Hospital IQR Program. The CDC NHSN HAI measures capture adverse events that occurred within intensive care units (ICUs), including pediatric and neonatal units. For the Hospital IQR Program, hospitals that elected to participate in the reporting program (that is, have an active IQR pledge), but do not have an ICU, can apply for ICU waivers so that the hospitals will not be subject to the 2-percent payment reduction for nonsubmission of quality reporting data.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50723), we noted in the second quarter of 2012, among the 3,321 IPPS hospitals with active IQR pledges for data submission, 377 (or 10.1 percent) applied and received an ICU waiver. At the same time, 2,939 hospitals (88.5 percent) of the IPPS hospitals did not have an ICU waiver and submitted data for the CDC HAI CLABSI measure, while 4 hospitals (0.1 percent) that had no ICU waiver failed to submit data to the NHSN. For the same quarter, of the 3,321 IPPS hospitals with active IQR pledges, 2,935 (88.4 percent) that did not have an ICU waiver submitted data for the CDC HAI CAUTI measure, whereas 8 hospitals (0.2 percent) did not submit data. Because data availability for the two CDC HAI measures impact the score for Domain 2 and eventually the Total HAC

Score, we aim to encourage hospitals with an ICU that did not submit data to begin data submission, and to encourage hospitals that have already submitted data to continue data submission for all the CDC HAI measures. To this end, we finalized the following rules (Figure B in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50724), which is included below):

- If a hospital has an ICU waiver for the CDC HAI measures, we will use only the Domain 1 score to calculate its Total HAC Score.
- If a hospital does not have an ICU waiver for a CDC HAI measure:
 - If the hospital does not submit data for the CDC HAI measures, we will assign 10 points to that measure for that hospital.
 - If the hospital does submit data for at least one CDC NHSN measure:
 - If there are “complete data” (that is, enough adverse events to calculate the SIR) for at least one measure, we will use those data to calculate a Domain 2 score and use the hospital's Domain 1 and Domain 2 scores to calculate the Total HAC Score.
 - If there are not enough adverse events to calculate the SIR for any of the measures, we will use only the hospital's Domain 1 score to calculate its Total HAC Score.

Figure B. Calculation of Total HAC Score for Domain 2 CDC NHSN Measures for FY 2015

Key:

Domain 1 = AHRQ Patient Safety Indicators

Domain 2 = CDC NHSN measures

Comment: Several commenters supported the use of a scoring methodology for the HAC Reduction Program that aligns with the achievement methodology of the Hospital VBP Program and agreed that this scoring alignment reduces confusion.

Response: We appreciate the commenters' support.

Comment: A few commenters stated that CMS implemented as reasonable a scoring methodology as was permitted by statute. A few commenters expressed support for the creation of two domains of measures using measures that are risk adjusted at the patient, unit and hospital levels and expressed support for the weighted contributions of Domain 1 and Domain 2 measures to the Total HAC score. Another commenter found the scoring to be very complex and detailed,

making it difficult for hospitals to replicate.

Response: We acknowledge that the scoring methodology is complex. The scoring methodology was described in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50719 through 50725) and is clarified later in the preamble to this final rule. During the review and correction period that will occur prior to assessment of the HAC Reduction Program penalty or posting of the data on *Hospital Compare*, hospitals will be given access to their HAC Reduction Program measure scores, domain scores and total HAC score accompanied by a document that describes how the scores were calculated.

Comment: One commenter questioned whether the HAC Reduction Program scores reflect meaningful differences in quality between hospitals. The commenter specifically stated that the

HAC scoring methodology makes distinctions between hospitals whose performance is not statistically different from one another which results in payment adjustments being levied on hospitals whose performance is not statistically different from the national benchmarks. The commenter also believed that there will be inconsistencies between results for the CMS programs using the same measures but different scoring methodologies.

Response: We note that HAC Reduction Program does not have national benchmarks in the current scoring methodology. We also recognize the possibility for inconsistencies between our programs when measures like the AHRQ PSI-90 composite measure and the CDC NHSN HAI measures are used in multiple programs; we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50728)

where we addressed this issue. We note that different CMS programs have different purposes and thus it is not unexpected that programs use different approaches to score hospitals' performance. For example, the Hospital IQR Program, which publicly reports measure performance on *Hospital Compare*, is intended to provide consumers with the information needed to allow them to make informed decisions about hospital quality when seeking care.

The HAC Reduction Program is intended to motivate hospitals to reduce the incidence of HACs. We will continue to monitor the HAC Reduction Program and take the commenter's concerns under consideration as we strive to improve the program.

Comment: A few commenters supported using the same method of determining if a hospital has enough data to calculate a PSI-90 score in both the Hospital VBP and HAC Reduction Programs and the same inclusion criteria for the CDC NHSN measures as is used in the Hospital IQR Program.

Response: We appreciate the commenters' support. This alignment was described in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50722).

Comment: One commenter requested the posting of more HAC Reduction Program measure thresholds and benchmark data in advance as has been accomplished with the Hospital VBP Program.

Response: We note that the HAC Reporting Program is not required by law to create measure thresholds and benchmarks, as is the Hospital VBP Program. By statute, the payment adjustments for the HAC Reporting Program are applied to hospitals with a Total HAC score in the 75th percentile. Based on the differing statutory approaches, we do not believe that the commenter's requests are applicable to this program.

(1) Clarification of Finalized Measure Result Scoring for FY 2015 and Subsequent Years

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50723), we finalized for the HAC Reduction Program a scoring methodology that divides the measure results into percentiles in increments of 10 and assigns points (1 to 10) in accordance with the percentile into which the hospital's measure result falls. Our preliminary analysis of the measures showed that multiple hospitals had the same measure results, and that in certain instances, the number of hospitals with the same measure results exceeded the number of hospitals for their appropriate

percentile. Consequently a few hospitals with the same measure results fall into the next higher percentile. In these instances, we will assign the same point for all hospitals with the same measure results, and that point will be based on the prior or the lowest appropriate percentile.

For example, if, for the CAUTI measure, 13 percent of hospitals have an SIR of 0, we will assign a point of 1 to all 13 percent of hospitals, even though, arguably, 10 percent of them fall into the first percentile, and 3 percent of the 13 percent fall into the second percentile. Because each percentile range ideally represents 10 percent of hospitals, we will assign a point of 2 to the remaining 7 percent of hospitals in the second percentile because their SIR is larger than 0. We believe this is the most favorable method for scoring measure results for hospitals. We note that randomly assigning some hospitals with the same SIR a higher (for example, less favorable) score would be both arbitrary and capricious, which are prohibited by the Administrative Procedure Act.

Comment: A few commenters applauded CMS for clarifying the process by which measure scores will be assigned in the case of hospitals with tied measure results spanning multiple deciles.

Response: We appreciate the commenters' support for the clarified process and believe it makes clear that we are applying the scoring criteria in a manner that is most equitable to hospitals.

(2) Clarification of FY 2015 Finalized Narrative of Rules to Calculate the Total HAC Score

In the FY 2014 IPPS/LTCH PPS final rule, we finalized a series of rules to determine how to calculate the Domain 2 score and ultimately the Total HAC Score when there were waivers for the collection of CDC NHSN HAI measures (78 FR 50723). We also illustrated and finalized these rules in Figure B of the final rule (78 FR 50724). In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28141), we proposed to clarify that the narrative for Figure B should also include "other waivers" that waive hospitals from collecting CDC HAI measure data. The clarified rules that we proposed are as follows for the collection of CDC HAI measures:

- If a hospital has an ICU waiver or other waiver for the CDC NHSN HAI measures, we will use only the Domain 1 score to calculate its Total HAC Score.
- If a hospital does not have an ICU waiver or other waiver for the CDC HAI measures:

- If the hospital does not submit data for the CDC HAI measures, we will assign 10 points to that measure for that hospital.

- If the hospital does submit data for at least one CDC NHSN measure:

- If there are "complete data" (that is, enough adverse events to calculate the SIR) for at least one measure, we will use those data to calculate a Domain 2 score and use the hospital's Domain 1 and Domain 2 scores to calculate the Total HAC Score.

- If there are not enough adverse events to calculate the SIR for any of the measures, we will use only the hospital's Domain 1 score to calculate its Total HAC Score.

As discussed earlier, if a hospital has enough data to calculate the PSI-90 composite measure score for Domain 1 and "complete data" for at least one measure in Domain 2, the scores of the two domains will contribute to the Total HAC Score at 35 percent for Domain 1 and 65 percent for Domain 2. However, if a hospital does not have enough data to calculate the PSI-90 composite measure score for Domain 1 but it has "complete data" for at least one measure in Domain 2, its Total HAC Score will depend entirely on its Domain 2 score. Similarly, if a hospital has "complete data" to calculate the PSI-90 composite measure score in Domain 1 but none of the measures in Domain 2, its Total HAC Score will be based entirely on its Domain 1 score. If the hospital does not have "complete data" to calculate the PSI-90 composite measure score for Domain 1 or any of the measures in Domain 2, we will not calculate a Total HAC Score for this hospital.

Comment: A few commenters were concerned that a hospital without any Domain 2 measure scores would have their Total HAC score based entirely on Domain 1, which comprises claims-based data. Because this situation could happen when a hospital does not have enough data to reliably calculate an SIR for the CDC NHSN HAI measures, one commenter recommended that CMS collaborate with CDC to determine if there are analytic approaches besides the SIR that would allow more hospitals to meet the minimum data criteria for reliable measure results for the CDC NHSN HAI measures.

Response: We understand the commenters' concern and point out that the intention of the scoring rules described above for calculating a Total HAC score is to make use of the available data for each hospital and encourage hospitals to report HAI data to CDC NHSN, even if they do not have enough data to reliably calculate an SIR for the CDC NHSN HAI measures in

Domain 2. In section IV.J.3.c. of the preamble of this final rule, we address stakeholders concerns about using claims data in general and the PSI-90 measure in particular, for the HAC Reduction Program.

We conferred with CDC, which indicated that they continuously evaluate the data reported to NHSN and consider the best measures for monitoring and comparative purposes. Currently the SIR is the best measure to allow for risk adjustment and production of a facility-level and/or CCN-level metric that can be used for comparison across similar facility types. This provides the opportunity to most accurately represent a facility's success. If the data are insufficient (for example, too few device days) to produce the SIR, CDC indicated that any calculation produced from such low numbers would be imprecise. CDC continues to review the data and evaluate options for metric development, including situations where facilities have low denominator volume and/or few infections.

After consideration of the public comments we received, we are finalizing the scoring clarifications for the HAC Reduction Program as proposed.

e. Reporting Hospital-Specific Information, Including the Review and Correction of Information

(1) Confidential Reports to Applicable Hospitals

Section 1886(p)(5) of the Act requires the Secretary to provide confidential reports to the applicable hospitals with respect to HACs. To meet the requirements under section 1886(p)(5) of the Act, in the FY 2014 IPPS/LTCH PPS final rule, we finalized the provision of confidential reports for the HAC Reduction Program to include information related to claims-based measure data for the PSI measures, the measure scores, the domain score for each domain, and the Total HAC Score (78 FR 50725). We noted that we use chart-abstracted measures in the HAC Reduction Program, and such information will be contained in the reports hospitals currently receive as part of the Hospital IQR Program and can be reviewed and corrected through the process specified for that program. We stated that we believe that this method would reduce the burden on hospitals, by alleviating the need to correct data present in two different programs.

(2) Availability of Information to the Public

Section 1886(p)(6)(A) of the Act requires the Secretary to “make information available to the public regarding HAC rates of each subsection (d) hospital” under the HAC Reduction Program. Section 1886(p)(6)(C) of the Act requires the Secretary to post the HAC information for each applicable hospital on the *Hospital Compare* Web site in an easily understood format. Section 1886(p)(6)(B) of the Act also requires the Secretary to “ensure that an applicable hospital has the opportunity to review, and submit corrections for, the HAC information to be made public for each hospital.”

To meet the requirements under section 1886(p)(6)(C) of the Act, in the FY 2014 IPPS/LTCH PPS final rule, we finalized policies that the following information will be made public on the *Hospital Compare* Web site relating to the HAC Reduction Program: (1) hospital scores with respect to each measure; (2) each hospital's domain specific scores; and (3) the hospital's Total HAC Score (78 FR 50725).

Comment: One commenter supported the public availability of facility-specific data on HACs. The commenter was concerned that these data had previously been available on *Hospital Compare* but were no longer posted there and urged that CMS repost these data. One commenter recommended that, at a minimum, in spite of the absence of measures for some HACs, CMS should make the raw counts of HACs publicly available on *Hospital Compare* or <https://data.medicare.gov/>.

Response: We appreciate the commenter's recognition of the importance of having facility level HAC data available publicly. Although the commenter did not specify which data were being referenced, we interpret this comment to refer to the eight HAC measures that were removed from the Hospital IQR Program (Air Embolism, Blood Incompatibility, CAUTI, Falls and Trauma, Foreign Object Retained After Surgery, Manifestation of Poor Glycemic Control, Pressure Ulcer Stages III or IV, and Vascular Catheter Associated Infections). The rationale for removing these measures from the Hospital IQR Program can be found in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53506 through 53507). The measures included in the HAC Reduction Program (PSI-90 composite, CLABSI and CAUTI) have been available on *Hospital Compare* since December 2010, January 2012 and January 2013, respectively. The HAC Reduction Program scores will also be publicly available later this year.

(3) Review and Correction of Information

Section 1886(p)(6)(B) of the Act requires the Secretary to ensure that each hospital has the opportunity to review and submit corrections for the information to be made available to the public with respect to each hospital under section 1886(p)(6)(A) of the Act prior to such information being made available to the public.

In the FY 2014 IPPS/LTCH PPS final rule, we codified our regulation regarding the reporting of hospital-specific information at § 412.172(f) (78 FR 50968). CMS will make information available to the public regarding HAC rates of all hospitals described in section 1886(d)(1)(B) of the Act, including hospitals in Maryland previously paid under section 1814(b)(3) of the Act, under the HAC Reduction Program (paragraph (f)). As noted in section IV.J.3.b. of the preamble of this final rule, in order to implement the new Maryland All-Payer Model, Maryland elected to no longer have Medicare pay Maryland hospitals in accordance with section 1814(b)(3) of the Act, effective January 1, 2014.

In summary, we established that CMS will provide each hospital with confidential hospital-specific reports and discharge level information used in the calculation of its Total HAC Score (paragraph (f)(1) of § 412.172). Hospitals will have a period of 30 days after receipt of the information provided under paragraph (f)(1) to review and submit corrections for the HACs measure scores, domain scores, and the Total HAC Score for the fiscal year. The administrative claims data used to calculate a hospital's Total HAC Score for those conditions for a fiscal year will not be subject to review and correction (paragraph (f)(2)). CMS will post the HAC Reduction Program scores for the applicable conditions for a fiscal year for each applicable hospital on the *Hospital Compare* Web site. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50725 through 50728) for detailed discussions of the above provisions.

CMS provided hospitals with their confidential hospital-specific reports and discharge level information used in the calculation of their Total HAC Score in late July 2014 on the Quality Net Web site. In order to have access to their hospital-specific report, hospitals must register for a *Quality Net Secure Portal* account. Hospitals have a period of 30 days after the information is posted on Quality Net to review and submit corrections for the calculation of their

HACs measure scores, domain scores, and Total HAC Score for the fiscal year.

(4) Preliminary Analysis of the HAC Reduction Program

In order to model estimated payment changes for the FY 2015 IPPS/LTCH PPS proposed rule, we conducted a preliminary analysis of the HAC Reduction Program using currently available historical data as a proxy for the actual data that will be used to determine hospital performance under the program. The results of this preliminary analysis can be found on the CMS Web site at: <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html> under the FY 2015 IPPS/LTCH PPS proposed rule Home Page link as Table 17.—FY 2015 Preliminary Analysis of the Hospital-Acquired Condition Reduction Program. We stated in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28142) that when the actual data for the performance periods finalized in the FY 2014 IPPS/LTCH PPS final rule for each measure are available, hospitals will have an opportunity to review and submit corrections as discussed in section IV.J.3.e. of the preamble of the proposed rule and this final rule.

Comment: One commenter objected to CMS making Table 17—FY 2015 Preliminary Analysis of the Hospital-Acquired Condition Reduction Program, publicly available via the CMS Web site at <http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html> under the FY 2015 IPPS/LTCH PPS proposed rule Home Page link. This commenter stated that the data had not yet been reviewed and its sources auditable and in compliance with the requirements of the law. The commenter stated that the Table did not provide insight into how the Composite Score was developed. The commenter acknowledged that there was a methodology included in the proposed rule preamble, however, also noted that any attempts to recalculate and confirm the scores in the Table with other information available to the public (such as CMS' *Hospital Compare* Web site) were not possible. Lastly, the commenter stated that the reporting periods used to calculate the Score in Table 17 (both for Domain 1 (Patient Safety) and Domain 2 (CLASBI and CAUTI)) are not those that are set in law.

Response: We acknowledge the commenter's objection and point out that as stated in the FY 2015 IPPS/LTCH PPS proposed rule, we conducted a preliminary analysis of the HAC Reduction Program using currently

available historical data as a proxy for the actual data that will be used to determine hospital performance under the program to model estimated payments. In addition, as stated earlier in this section, we established that we will provide each hospital with confidential hospital-specific reports and discharge level information used in the calculation of its Total HAC Score (paragraph (f)(1) of § 412.172). Hospitals will have a period of 30 days after receipt of the information provided under paragraph (f)(1) to review and submit corrections for the HACs measure scores, domain scores, and Total HAC Score for the fiscal year. The administrative claims data used to calculate a hospital's Total HAC Score for those conditions for a fiscal year will not be subject to review and correction (paragraph (f)(2)). CMS will post the HAC Reduction Program scores for the applicable conditions for a fiscal year for each applicable hospital on the *Hospital Compare* Web site. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50725 through 50728) for detailed discussions of the above provisions.

Providing a preliminary analysis of the HAC Reduction Program using currently available historical data as a proxy for the actual data is consistent with the law. We clearly indicated that these were not the final data. However, because this is the first year of the HAC Reduction Program, we wish to gain some initial experience under the review and correction process discussed in section IV.J.3.e. of the preamble of this final rule and determine to what extent the review and corrections process in this first year changes the preliminary hospital level data we provided in Table 17 of the proposed rule before providing updated hospital level data. Updated hospital level data will be made publicly available following the review and corrections process.

f. Limitation on Administrative and Judicial Review

Section 1886(p)(7) of the Act provides that there will be no administrative or judicial review under Section 1869 of the Act, under Section 1878 of the Act, or otherwise for any of the following:

- The criteria describing an applicable hospital under section 1886(p)(2)(A) of the Act.
- The specification of hospital acquired conditions under section 1886(p)(3) of the Act.
- The specification of the applicable period under section 1886(p)(4) of the Act.

- The provision of reports to applicable hospitals under section 1886(p)(5) of the Act.

- The information made available to the public under section 1886(p)(6) of the Act.

In the FY 2014 IPPS/LTCH PPS final rule, we included these statutory provisions under § 412.172(g) of the regulations (78 FR 50729 and 50968). We note that section 1886(p)(6) of the Act requires the Secretary to make information available to the public regarding HAC scores of each applicable hospital under the HAC Reduction Program. Section 1886(p)(6)(B) of the Act also requires the Secretary to ensure that an applicable hospital has the opportunity to review, and submit corrections for, the information to be made available to the public, prior to that information being made public. We believe that the review and correction process explained above in section IV.J.3.e. of the preamble of this final rule will provide hospitals with the opportunity to correct data prior to its release on the *Hospital Compare* Web site.

4. Maintenance of Technical Specifications for Quality Measures

Technical specifications of the HAC measures for the Agency for Health Research and Quality (AHRQ) Patient Safety Indicator 90 (PSI-90) in Domain 1 can be found at AHRQ's Web site at: http://qualityindicators.ahrq.gov/Modules/PSI_TechSpec.aspx. Technical specifications for the CDC NHSN's HAI measures in Domain 2 can be found at CDC's NHSN Web site at: <http://www.cdc.gov/nhsn/acute-care-hospital/index.html>. Both Web sites provide measure updates and other information necessary to guide hospitals participating in the collection of HAC Reduction Program data.

Many of the quality measures used in different Medicare and Medicaid reporting programs are NQF-endorsed. As part of its regular maintenance process for NQF-endorsed performance measures, the NQF requires measure stewards to submit annual measure maintenance updates and undergo maintenance of endorsement review every 3 years. In the measure maintenance process, the measure steward (owner/developer) is responsible for updating and maintaining the currency and relevance of the measure and will confirm existing or minor specification changes with NQF on an annual basis. NQF solicits information from measure stewards for annual reviews, and it reviews measures for continued endorsement in a specific 3-year cycle.

We note that NQF's annual or triennial maintenance processes for endorsed measures may result in the NQF requiring updates to the measures. We believe that it is important to have in place a subregulatory process to incorporate nonsubstantive updates required by the NQF into the measure specifications we have adopted for the HAC Reduction Program, so that these measures remain up-to-date.

For the HAC Reduction Program, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28142), we proposed to follow the finalized processes outlined for addressing changes to adopted measures in the Hospital IQR Program "Maintenance of Technical Specifications for Quality Measures" section found in section IX.A.1.b. of the preamble of this final rule.

We believe this proposal adequately balances our need to incorporate updates to HAC Reduction Program measures in the most expeditious manner possible while preserving the public's ability to comment on updates that so fundamentally change an endorsed measure that it is no longer the same measure that we originally adopted. We invited public comments on this proposal.

Comment: One commenter supported the proposed method of maintaining and updating the technical specifications for the quality measures, including adoption of a subregulatory process for nonsubstantive changes released by measure developers.

Response: We appreciate the commenter's support.

Comment: A few commenters believed that nonsubstantive changes identified during routine measure maintenance processes and during NQF measure maintenance review should all be subject to the annual notice-and-comment rulemaking process.

Response: We disagree with the recommendation to have all measure changes subject to notice-and-comment rulemaking. As previously noted in FY 2014 IPPS/LTCH PPS final rule (78 FR 50776) we believe that the maintenance of technical specifications for quality measure policy for the Hospital IQR Program also is applicable to the HAC Reduction Program. We believe this policy adequately balances our need to incorporate nonsubstantive NQF updates to NQF-endorsed measures in the most expeditious manner possible, while preserving the public's ability to comment on updates that so fundamentally change an endorsed measure that it is no longer the same measure that we originally adopted. We also note that the NQF process incorporates an opportunity for public

comment and engagement in the measure maintenance process. These policies regarding what is considered substantive versus nonsubstantive apply to all measures in the Hospital IQR Program and the HAC Reductions Program.

Comment: One commenter indicated that any changes to a measure developed for adults but now including those less than 18 years of age should be considered nonsubstantive.

Response: We refer the reader to our response to a similar suggestion in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50776). We will make a decision as to whether such changes constitute substantive changes on a case-by-case basis.

After consideration of the public comments we received, we are finalizing the maintenance of technical specifications for quality measures in the HAC Reduction Program as proposed.

5. Extraordinary Circumstances Exceptions/Exemptions

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50711), we indicated that we had received public comments requesting a potential waiver or exemption process for hospitals located in areas that experience disasters or other extraordinary circumstances (EC), even though we did not propose an extraordinary circumstance exceptions/exemptions (ECE) policy for the HAC Reduction Program. We stated in the FY 2014 IPPS/LTCH PPS final rule that we were reviewing this issue and might consider such a proposal in future rulemaking. We also noted that should we consider a policy we intend to focus on several policy and operational considerations in developing a disaster exemption process for the HAC Reduction Program. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28142), we welcomed public comments on whether an exemption process should be implemented and the policy and operational considerations for a potential HAC Reduction Program ECE policy.

Comment: Many commenters supported the creation of an extraordinary circumstance exemption process for hospitals that experience a natural disaster. Some commenters recommended that CMS consider adopting several aspects of the Hospital VBP waiver process for the HAC Reduction Program, including allowing hospitals to have 60 days from the occurrence of the extraordinary circumstance to file for an exemption. The commenters believed this would ensure that hospitals do not seek an

advantage on their HAC scores long after a disaster period has ended. Other commenters recommended that hospitals be given 90 calendar days from the date of the disaster to request an exemption and that the exemption apply for at least 2 payment years because the HAC Reduction Program currently uses a 2-year performance period.

Response: We appreciate the commenters' support. We will take into consideration these recommendations as we consider whether an exemption process for the HAC Reduction Program should be implemented.

6. Implementation of the HAC Reduction Program for FY 2016

a. Measure Selection and Conditions, Including Risk-Adjustment Scoring Methodology

(1) General Selection of Measures

In the FY 2014 IPPS/LTCH PPS final rule, we finalized measures for FY 2015 and onwards, but only finalized a scoring methodology for FY 2015 for the HAC Reduction Program (78 FR 50712 through 50713). In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28143), we did not propose any new additional measures for the HAC Reduction Program for FY 2016. We note that AHRQ's PSI-90 composite measure and CDC's NHSN CLABSI (NQF #0138) and CAUTI (NQF #0139) measures were submitted in January 2014 and December 2013, respectively, as part of the NQF maintenance endorsement process. As noted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50719), should changes to the risk-adjustment models for the measures be adopted during NQF endorsement maintenance processes, CMS will adopt these changes as soon as possible. Finally, as we stated in the FY 2015 IPPS/LTCH PPS proposed rule, although we are not required under section 1886(p) of the Act to address specific measure scoring methodologies regarding the HAC Reduction Program in notice-and-comment rulemaking, as required under the Hospital VBP Program, we believe that it is important to set forth such scoring methodologies for each individual HAC measure, in order for the public to understand how the measures discussed and finalized in this FY 2015 IPPS/LTCH PPS final rule relate to the performance methodology used to determine the applicable hospitals subject to the payment adjustment under the HAC Reduction Program.

(2) Measure Selection and Scoring Methodology for FY 2016

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717), we finalized for FY 2016 and onwards CDC's NHSN Surgical Site Infection (SSI) measure (NQF #0753) and its measure methodology. The SSI and other measure specifications are available at: <http://www.qualityforum.org/QPS/QPSTool.aspx>. To locate a specific measure, search by the NQF number: (1) for the SSI measure use NQF #0753; (2) for the CLABSI measure use NQF #0139; and (3) for the CAUTI measure use NQF #0138. For SSI updates related to CMS programs and the use of CDC's NHSN measures, we refer readers to the Web site at: <http://www.cdc.gov/nhsn/acute-care-hospital/ssi>. The SSI measure explanation of SIR in the *NHSN e-newsletter* is available at: http://www.cdc.gov/nhsn/PDFs/Newsletters/NHSN_NL_OCT_2010SE_final.pdf.

CDC's SSI measure was finalized as a Domain 2 measure in the calculation of the Total HAC Score (78 FR 50717). In the FY 2015 IPPS/LTCH PPS proposed rule, we did not propose to change CDC's measure methodology for the SSI measure.

b. Measure Risk-Adjustment

In the FY 2014 IPPS/LTCH PPS final rule, we finalized the measure risk-adjustment for AHRQ's PSI-90 composite measure for Domain 1 and the risk-adjustment for CDC's NHSN measures for Domain 2 (78 FR 50718 through 50719). In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28143), we did not propose any risk-adjustment changes for any of the measures finalized in the FY 2014 IPPS/LTCH PPS final rule.

c. Measure Calculations

In the FY 2014 IPPS/LTCH PPS final rule, we finalized the measure calculations for AHRQ's PSI-90 composite measure for Domain 1 and the measure calculations for CDC's NHSN measures for Domain 2 (78 FR 50718 through 50719). In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28143), we did not propose any measure calculation changes for any of the measures finalized in the FY 2014 IPPS/LTCH PPS final rule.

d. Applicable Time Period

In the FY 2014 IPPS/LTCH PPS final rule, we finalized and codified policy at § 412.170 that there will be a 2-year applicable time period to collect data used to calculate the Total HAC Score (78 FR 50717).

For the Domain 1 AHRQ PSI-90 composite measure, in the FY 2015

IPPS/LTCH PPS proposed rule (79 FR 28143), we proposed for FY 2016 a 24-month period from July 1, 2012 through June 30, 2014 as the applicable time period. The claims for all Medicare FFS beneficiaries discharged during this period would be included in the calculation of measure results for FY 2016. This includes claims data from the 2012, 2013, and 2014 Inpatient Standard Analytic Files (SAFs).

The Domain 2 CDC NHSN measures (CAUTI, CLABSI, and SSI) are currently collected and calculated on a quarterly basis. However, for the purpose of the HAC Reduction Program, we finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717) that we will use 2 years of data to calculate the Domain 2 score for FY 2015 for the CAUTI and CLABSI measures. For FY 2016, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28143), we proposed to use calendar years 2013 and 2014 for all three Domain 2 measures in the HAC Reduction Program.

e. Criteria for Applicable Hospitals and Performance Scoring

For FY 2016, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28143), we proposed a change to the scoring methodology of the Total HAC Score. This proposal, which is discussed below, was intended to address the implementation of CDC's NHSN SSI measure in Domain 2 finalized for implementation in FY 2016.

(1) Finalized Scoring Methodology for Domains 1 and 2 for FY 2015

We finalized a scoring methodology for the Total HAC Score in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50722). This finalized scoring methodology is similar to the achievement scoring methodology currently used under the Hospital VBP Program. With respect to an applicable hospital, we finalized that CMS will identify the top quartile of all hospitals with respect to their Total HAC Score during the applicable period (§ 412.170). In addition, we finalized that the Total HAC Score will be determined by the following three steps: (1) each measure result will be scored as outlined in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50723); (2) domain scores will be determined by the scores assigned to the measures within the domain; and (3) the Total HAC Score will be determined by the sum of the weighted domain scores. For FY 2015, the Total HAC Score is the sum of the Domain 1 score multiplied by 35 percent plus the Domain 2 score multiplied by 65 percent. For further details of the general scoring methodology finalized for the HAC

Reduction Program, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50719 through 50725).

(2) Scoring Methodology of Domain 2 and New Weighting of Domains 1 and 2 for FY 2016

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28143), we proposed to adjust the scoring methodology of Domain 2 and the weighting of Domains 1 and 2 beginning in FY 2016 due to the addition of CDC's NHSN SSI measure. We would like to clarify that the scoring methodology for Domain 1 in FY 2016 is unchanged from the scoring methodology for Domain 1 in FY 2015. This methodology is described above under our discussion of Criteria for Applicable Hospitals and Performance Scoring Policy. For the scoring of CDC's NHSN SSI measure, we proposed an identical process of assigning points to the SSI measure results. We note that the SSI measure, reported via CDC's NHSN, is currently specified under the Hospital IQR program and is restricted to colon procedures (including incision, resection or anastomosis of the large intestine and large-to-small and small-to-large bowel anastomosis), and abdominal hysterectomy procedures including those performed by laparoscope. The SSI measure assesses SSIs based on the type of surgery procedures (that is, the SSI measure is stratified into infections that occur with colonic procedures and those that occur in abdominal hysterectomy procedures). We also note that patient age and a preoperative health score are risk factors taken into account using the Standardized Infection Ratio (SIR) (78 FR 20625). Use of an SIR is consistent with CDC's NHSN CLABSI and CAUTI measures that also report SIRs. In order to calculate an SSI measure score for Domain 2, we proposed to calculate an abdominal hysterectomy procedure SSI SIR and a colonic procedure SSI SIR and pool both SIRs for each hospital. We proposed pooling the abdominal hysterectomy SSI SIR and colonic procedure SSI SIR as this would provide a single SSI SIR, which is consistent with reporting a single SSI SIR as meant by design of the NQF endorsed measure (NQF #0753), and would allow a risk-adjusted weighting of the surgical volume among the two procedures. We proposed that a pooled SSI SIR for an applicable hospital is the sum of all observed infections among abdominal hysterectomy and colonic procedures divided by the sum of all predicted infections among abdominal hysterectomy and colonic procedures performed at the applicable hospital.

The pooled SSI SIR would be scored in the same manner as all measures finalized for the HAC Reduction Program (refer to Figure A in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50723), which is also included above in this final rule). To determine a Domain 2 score, we proposed taking the average of the three CDC HAI SIR scores. We noted in the FY 2014 IPPS/LTCH PPS final rule that there will be instances in which applicable hospitals may not have data on all four measures and therefore a set of rules was finalized to determine how to score each Domain. We proposed to follow the same finalized rules used to determine scoring of Domains 1 and 2 (FY 2014 IPPS/LTCH PPS final rule (78 FR 50723 through 50725)), and the proposed changes in section IV.J.6.e. of the preamble of the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28144), which are included in section IV.J.6.e. of the preamble of this final rule. We invited public comments on this proposal.

In addition, for FY 2016 we proposed to weight Domain 1 at 25 percent and Domain 2 at 75 percent. We proposed to decrease the weight of Domain 1 from 35 percent to 25 percent for two reasons. First, with the implementation of CDC's SSI measure, we believed the weighting of both domains needed to be adjusted to reflect the addition of a fourth measure; and second, in keeping with public comments from the FY 2014 IPPS/LTCH PPS final rule, MedPAC and others stated that Domain 2 should be weighted more than Domain 1. Finally, we proposed for FY 2016 that the Total HAC Score for applicable hospitals would be the sum of the weighted scores from Domain 1 (weighted at 25 percent) and Domain 2 (weighted at 75 percent). We invited public comments on this proposal.

Comment: Several commenters supported the proposed approach of creating a pooled SIR for the SSI measure that includes colon surgeries and abdominal hysterectomy surgeries because this is consistent with how CDC currently reports the measure. A few commenters noted that this approach allows for risk adjusted weighting of the surgical volume between the two procedures. One commenter recommended that CMS collaborate with NHSN leadership and professional organization representing surgeons to develop a profile of surgical procedures that are high volume across the spectrum of acute care hospitals that might be added to the existing procedures in the SSI measure. The commenters suggested that an expansion of the number of procedures

may increase the likelihood that the SSI SIR is reliable.

Response: We appreciate the commenters' support for the approach of creating a pooled SIR for the SSI measure. We note that CDC maintains ongoing collaborations with a number of professional surgical organizations and is currently in process of developing additional SSI metrics for higher volume surgical procedures. Once these measures are finalized, we may consider them for future rulemaking.

Comment: A few commenters suggested that CMS and CDC monitor the impact of the consolidated SIR for hospitals that perform a higher volume of hysterectomies. The commenters pointed out that based on *Hospital Compare* data, where the SSI rates for the two procedures are reported separately, hysterectomies have a higher infection rate compared to colon surgeries, and fewer hospitals have a reported hysterectomy SIR. Commenters recommended that when the consolidated SIR adversely impacts hospitals that perform more hysterectomies, then the SIR should be modified to account for the different mix of services. One commenter recommended CMS weigh each individual SSI metric separately as they believe the combined SIR is a complicated, burdensome composite metric.

Response: We will consider these suggestions in future rulemaking.

Comment: A few commenters were concerned that adding the SSI measure to Domain 2 could lead to an average score that lacks specificity in determining a hospital's true HAI scores. In addition, one commenter stated that adding the MRSA bacteremia and *C. difficile* measures to Domain 2 score would further dilute the domain. The commenters suggested assigning each CDC NHSN HAI measure a separate percentage to total the domain weight versus averaging all HAIs in Domain 2. A few commenters stated that, with only two procedures in the SSI measure, it is reasonable to continue equally weighting the measures in Domain 2. However, if more procedures are added to the SSI measure, the commenters recommended that CMS consider providing a higher weight to the SSI measure.

Response: We note that the purpose of the domain scores is to provide a summary of a hospital's performance with regard to patient safety (Domain 1) and HAI (Domain 2) measures. A hospital's performance with regard to the individual measures is available on *Hospital Compare* and is updated quarterly for hospitals that participate in

the Hospital IQR Program. We appreciate the suggestion for weighting the CDC NHSN HAI measures separately and will take this into consideration in future rulemaking.

Comment: One commenter recommended that the weighting of measures in the Total HAC Score correspond to the relative amounts of harm found in the patient population based on what is reported in peer-reviewed literature.

Response: We will take this feedback into consideration as we add more measures to the program and evaluate if changes to the scoring methodology are needed.

Comment: Many commenters supported the CMS proposal to increase the weight given to Domain 2 and decrease the weight given to Domain 1 because Domain 2 includes the chart abstracted NHSN measures which the commenters believed to be more reliable and actionable than the claims-based PSI-90 composite measure in Domain 1. One commenter recommended that CMS continue to decrease the Domain 1 weight in future years. A few commenters believed that the overlap of measures between the Hospital VBP Program and the HAC Reduction Program should be eliminated, but expressed their support for the domain weight change if CMS retained all measures that overlap despite the commenters' objections.

Response: We agree that an increase in the Domain 2 weight is warranted, given that the number of measures in the domain is increasing.

Comment: A few commenters did not support the proposal to change the weight of Domain 1 to 25 percent from 35 percent and Domain 2 to 75 percent from 65 percent. One commenter stated that this approach would promote an overly narrow definition of HACs that places too much emphasis on infections alone and not enough on other patient safety risks. The commenter added that CMS should take a more balanced approach to weighting the existing domains in order to place a high bar for hospitals to avoid both infections and harmful complications that can be prevented, and seek and develop measures for hospital safety problems that have the most prevalence and impact.

Response: We agree that both patient safety events and infections are important components of the HAC Reduction Program. In the FY 2014 IPPS/LTCH PPS proposed rule (79 FR 28143 through 29144), we explain the rationale for assigning a higher weight to Domain 2. We believe that the AHRQ PSI-90 measure plays a vital role in

patient safety and it continues to comprise an integral part of the HAC Reduction Program with a weight of 25 percent of the Total HAC Score.

After consideration of the public comments we received, we are finalizing the scoring methodology of Domain 2 and new weighting of Domains 1 and 2 for FY 2016 as proposed.

f. Rules To Calculate the Total HAC Score for FY 2016

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28141, 28144), and in section IV.J.3.d. of the preamble of this final rule, we discuss our proposal to adopt the “Clarification of FY 2015 Finalized Narrative of Rules to Calculate the Total HAC Score.” We invited public comments on this proposal.

After consideration of the public comments we received, we finalized the proposed clarification of the FY 2015 rules to calculate the Total HAC Score. We received no public comments on this specific proposal for FY 2016; therefore, we are finalizing the clarification for FY 2016 as well.

7. Future Considerations for the Use of Electronically Specified Measures

We believe that collection and reporting of data through health information technology will greatly simplify and streamline reporting for many CMS quality reporting programs. Through electronic reporting, hospitals will be able to leverage EHRs to capture, calculate, and electronically submit quality data submitted to CMS for the Hospital IQR Program. CMS has become aware of some hospitals and health systems that have developed or adopted a methodology to identify and measure all-cause harm through their electronic health record (EHR) systems. Some hospitals and health systems are able to use the results of these electronic measures to address adverse events at the point of care and to track improvement over time. Many of these measures capture a broad range of common hospital-acquired conditions that may not be captured by existing national measures (examples include measures of adverse drug events and hypoglycemia). Given that these measures are captured using clinical data from EHR systems, collection of HAC data will allow CMS to align measures across multiple settings.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28144), we sought comment as to whether the use of a standardized electronic composite measure of all-cause harm should be used in the HAC Reduction Program in future years in addition to, or in place

of, claims-based measures assessing HACs. We welcomed any suggestions of specific all-cause harm electronic measures, including detailed measure specifications. Specifically, we invited public comments on the feasibility and the perceived value of such a measure, and what would be the most appropriate weighting of this measure in the Total HAC Score. In addition, we requested suggestions on the timeframe for which such a standardized electronic composite measure of all-cause harm should be proposed.

We intend for the future direction of electronic quality measure reporting to significantly enhance the tracking of HACs under the HAC Reduction Program. We stated in the FY 2015 IPPS/LTCH PPS proposed rule that we will continue to work with measure stewards and developers to develop new measure concepts, and conduct pilot, reliability and validity testing as part of efforts to promote the adoption of Certified Electronic Health Record Technology in hospitals.

Comment: Many commenters supported leveraging electronic technology to capture, calculate, and submit data. Commenters recommended that ultimately electronic measures could replace claims-based measures and could provide information in a timelier manner. Several commenters cautioned that electronic measures must undergo careful testing and that implementation occur in a phased manner and not mandated until technically feasible for all hospitals to comply. One commenter recommended that an e-measure related to antimicrobial stewardship be considered. One commenter recommended that, beginning in FY 2015, hospitals be given a waiver from complying with existing Domain 1 requirements, provided that they demonstrate transition toward or current use of an approach utilizing electronic measures in a manner supported by the peer reviewed literature.

Response: We appreciate the commenters’ feedback and support for the use of electronic measures in general. We will take the suggestions into account in future rulemaking.

Comment: Many commenters supported the development of an all-cause harm measure derived from electronic health records. Some commenters believed that all-cause harm measures could capture information on never events, adverse drug events, ventilator-associated events, diagnostic errors, hypoglycemia, transfusion reactions, and medication reconciliation (unintentional

medication discrepancies per patient (NQF #2456)). Another commenter encouraged innovative approaches and collaboration with organizations, hospitals and the CMS Innovation Center when developing all-cause patient harm measures derived from electronic health records. One commenter recommended an all cause harm measure be incorporated as a third domain.

Several other commenters expressed concern about use of composite measures in general stating that they do not provide actionable data and that inappropriate weighting of measure components may skew results. If a composite measure is used, commenters recommended that data on the component measures and the weighting methodology also be reported.

Response: We thank commenters for their viewpoints on the use of an electronic all-cause harm measure for inclusion in the HAC Reduction Program and will take them into consideration in future rule making.

Comment: One commenter requested more insight into what CMS envisions for the measure and how the measure will be reported through the EHR system, in order to provide feedback to CMS.

Response: At this time, we do not have a specific measure in mind but rather are soliciting feedback on the feasibility and perceived value of a standardized electronic composite measure of all-cause harm in the HAC Reduction Program. As we develop a more specific plan we will share that information in future rulemaking.

K. Payments for Indirect and Direct Graduate Medical Education (GME) Costs (§§ 412.105 and 413.75 Through 413.83)

1. Background

Section 1886(h) of the Act, as added by section 9202 of the Consolidated Omnibus Budget Reconciliation Act (COBRA) of 1985 (Pub. L. 99–272) and as currently implemented in the regulations at 42 CFR 413.75 through 413.83, establishes a methodology for determining payments to hospitals for the direct costs of approved graduate medical education (GME) programs. Section 1886(h)(2) of the Act sets forth a methodology for the determination of a hospital-specific base-period per resident amount (PRA) that is calculated by dividing a hospital’s allowable direct costs of GME in a base period by its number of full-time equivalent (FTE) residents in the base period. The base period is, for most hospitals, the hospital’s cost reporting period

beginning in FY 1984 (that is, October 1, 1983 through September 30, 1984). The base year PRA is updated annually for inflation. In general, Medicare direct GME payments are calculated by multiplying the hospital's updated PRA by the weighted number of FTE residents working in all areas of the hospital complex (and at nonprovider sites, when applicable), and the hospital's Medicare share of total inpatient days.

Section 1886(d)(5)(B) of the Act provides for a payment adjustment known as the indirect medical education (IME) adjustment under the hospital inpatient prospective payment system (IPPS) for hospitals that have residents in an approved GME program, in order to account for the higher indirect patient care costs of teaching hospitals relative to nonteaching hospitals. The regulations regarding the calculation of this additional payment are located at 42 CFR 412.105. The hospital's IME adjustment applied to the DRG payments is calculated based on the ratio of the hospital's number of FTE residents training in either the inpatient or outpatient departments of the IPPS hospital to the number of inpatient hospital beds.

The calculation of both direct GME and IME payments is affected by the number of FTE residents that a hospital is allowed to count. Generally, the greater the number of FTE residents a hospital counts, the greater the amount of Medicare direct GME and IME payments the hospital will receive. Therefore, Congress, through the Balanced Budget Act of 1997 (Pub. L. 105–33), established a limit on the number of allopathic and osteopathic residents that a hospital may include in its FTE resident count for direct GME and IME payment purposes. Under section 1886(h)(4)(F) of the Act, for cost reporting periods beginning on or after October 1, 1997, a hospital's unweighted FTE count of residents for purposes of direct GME may not exceed the hospital's unweighted FTE count for direct GME in its most recent cost reporting period ending on or before December 31, 1996. Under section 1886(d)(5)(B)(v) of the Act, a similar limit based on the FTE count for IME during that cost reporting period is applied effective for discharges occurring on or after October 1, 1997. Dental and podiatric residents are not included in this statutorily mandated cap.

The Affordable Care Act made a number of statutory changes relating to the determination of a hospital's FTE resident count for direct GME and IME payment purposes and the manner in

which FTE resident limits are calculated and applied to hospitals under certain circumstances. Regulations implementing these changes are discussed in the November 24, 2010 final rule (75 FR 72133) and the FY 2013 IPPS/LTCH PPS final rule (77 FR 53416).

2. Changes in the Effective Date of the FTE Resident Cap, 3-Year Rolling Average, and Intern- and Resident-to-Bed (IRB) Ratio Cap for New Programs in Teaching Hospitals

Section 1886(h)(4)(H)(i) of the Act requires the Secretary to establish rules for calculating the direct GME caps for new teaching hospitals that are training residents in new medical residency training programs established on or after January 1, 1995. Under section 1886(d)(5)(B)(viii) of the Act, such rules also apply to the establishment of a hospital's IME cap on the number of FTE residents training in new programs. We implemented these statutory requirements in rules published in the August 29, 1997 **Federal Register** (62 FR 46002 through 46008) and in the May 12, 1998 **Federal Register** (63 FR 26323 through 26325 and 26327 through 26336). Generally, under existing regulations at 42 CFR 413.79(e)(1) (for direct GME) and 42 CFR 412.105(f)(1)(vii) (for IME), if a hospital did not train any allopathic or osteopathic residents in its most recent cost reporting period ending on or before December 31, 1996, and it begins to participate in training residents in a new medical residency training program (allopathic or osteopathic) on or after January 1, 1995, the hospital's unweighted FTE resident cap (which would otherwise be zero) may be adjusted based on the sum of the product of the highest number of FTE residents in any program year during the third year of the first new program's existence, for each new residency training program established during that 3-year period, and the minimum accredited length for each type of program. The number of FTE resident cap slots that a teaching hospital receives for each new program may not exceed the number of accredited slots that are available for each new program. Once a hospital's FTE resident cap is established, no subsequent cap adjustments may be made for new programs, unless the teaching hospital is a rural hospital. A rural hospital's FTE resident caps may be adjusted for participation in subsequent new residency training programs. A hospital that did not train any allopathic or osteopathic residents in its most recent cost reporting period ending on or

before December 31, 1996, may only receive a permanent FTE resident cap adjustment for training residents in a truly "new" residency training program; no permanent cap adjustment would be given for training residents associated with an existing program. That is, if a hospital that did not train any allopathic or osteopathic residents in its most recent cost reporting period ending on or before December 31, 1996, serves as a training site for residents in a program that exists or existed previously at another teaching hospital that remains open, that "new" teaching hospital does not receive a "new program" cap adjustment because it is not participating in training residents in a truly "new" program. However, it may be possible for that "new" teaching hospital to receive a temporary cap adjustment if it enters into a Medicare GME affiliation agreement with the existing teaching hospital as specified at § 413.79(f) (for direct GME) and § 412.105(f)(1)(vi) (for IME). (For a detailed discussion of the distinctions between a new medical residency training program and an existing medical residency training program, we refer readers to the August 27, 2009 final rule (74 FR 43908 through 43920). For a detailed discussion regarding participation in Medicare GME affiliation agreements, we refer readers to 74 FR 43574.)

For new programs started prior to October 1, 2012, hospitals that did not yet have an FTE resident cap established had a "3-year window" in which to participate in and "grow" new programs, before the FTE resident caps for IME and direct GME were permanently set for the hospital beginning with the fourth program year of the first new program started. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53415 through 53425), we revised the regulations at § 413.79(e) to increase the cap-building period for new programs from 3 years to 5 years. That is, for a hospital that did not yet have an FTE resident cap established, the hospital's FTE resident cap is effective beginning with the sixth program year of the first new program's existence. This revised policy is effective for urban hospitals that first begin to participate in training residents in their first new program on or after October 1, 2012, and for rural hospitals that start a new program on or after October 1, 2012. In that final rule, we also finalized a methodology used to calculate a cap adjustment for an individual hospital if residents in a new program rotate to more than one hospital (or hospitals). The methodology is based on the sum

of the products of the following three factors: (1) the highest total number of FTE residents trained in any program year, during the fifth year of the first new program's existence at all of the hospitals to which the residents in that program rotate; (2) the number of years in which residents are expected to complete the program, based on the minimum accredited length for each type of program; and (3) the ratio of the number of FTE residents in the new program that trained at the hospital over the entire 5-year period to the total number of FTE residents that trained at all hospitals over the entire 5-year period. Finally, we made minor revisions to the regulation text at §§ 413.79(e)(2) through (e)(4) for purposes of maintaining consistency throughout § 413.79(e). We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53415 through 53425) for further details regarding the methodology for calculating the FTE resident caps.

While the FY 2013 IPPS/LTCH PPS final rule discussed the methodology for calculating the FTE resident caps to be effective beginning with the sixth program year of the first new program's existence, for hospitals that do not yet have FTE resident caps established, that final rule did not discuss when the 3-year rolling average for IME and direct GME or the intern- and resident-to-bed (IRB) ratio cap for IME is effective for FTE residents training in new programs. The regulations regarding the 3-year rolling average and the IRB ratio cap with respect to new medical residency training programs were established in the following **Federal Register** rules: the FY 1998 IPPS final rule with comment period (62 FR 46002 through 46008); the May 12, 1998 final rule (63 FR 26323 through 26325 and 26327 through 26336); FY 2000 IPPS final rule (64 FR 41518 through 41523); and the FY 2002 IPPS final rule (66 FR 39878 through 39883). Specifically, the regulations at § 412.105(f)(1)(v) regarding the 3-year rolling average and new medical residency training programs for IME states that if a hospital qualified for an adjustment to the limit established under paragraph (f)(1)(iv) of the section for new medical residency programs created under paragraph (f)(1)(vii) of the section, the count of residents participating in new medical residency training programs above the number included in the hospital's FTE count for the cost reporting period ending during calendar year 1996 is added after applying the averaging rules in paragraph (f)(1)(v) for a period of years. Residents participating in new medical

residency training programs are included in the hospital's FTE count before applying the averaging rules after the period of years has expired. For purposes of this paragraph, for each new program started, the period of years equals the minimum accredited length for each new program. The period of years for each new program begins when the first resident begins training in each new program. In addition, the regulations for the interaction of the IRB ratio cap and new medical residency training programs for IME at § 412.105(a)(1)(ii) states that the exception for new programs described in paragraph (f)(1)(vii) of the section applies to each new program individually for which the full-time equivalent cap may be adjusted based on the period of years equal to the minimum accredited length of each new program.

The regulations at § 413.79(d)(5) regarding the interplay of the 3-year rolling average with new medical residency training programs for direct GME similarly states that if a hospital qualifies for an adjustment to the limit established under paragraph (c)(2) of the section for new medical residency programs created under paragraph (e) of the section, the count of the residents participating in new medical residency training programs above the number included in the hospital's FTE count for the cost reporting period ending during calendar year 1996 is added after applying the averaging rules in paragraph (d), for a period of years. Residents participating in new medical residency training programs are included in the hospital's FTE count before applying the averaging rules after the period of years has expired. For purposes of paragraph (d), for each new program started, the period of years equals the minimum accredited length for each new program. The period of years begins when the first resident begins training in each new program.

Therefore, the FTE resident caps for IME and direct GME are *always* effective beginning with the start of the sixth program year of the first new program started for urban hospitals that do not yet have FTE resident caps established (§ 413.79(e)(1)(iii)), and for rural hospitals, beginning with the start of the sixth program year of each new individual program started (§ 413.79(e)(3)), regardless of the fact that other new programs may have started after the start of the first new program. However, the timing of when the 3-year rolling average for IME and direct GME and the IRB ratio cap for IME are first applied is dependent upon the minimum accredited length of each

new program started within the 5-year window. For example, new teaching Hospital A participates in training residents in new medical residency training programs for the first time beginning on July 1, 2013. On July 1, 2013, Hospital A participates in training residents in a new family medicine program (minimum accredited length is 3 years), on July 1, 2014, it also participates in training residents in a new sports medicine fellowship (minimum accredited length is 1 year), and on July 1, 2015, it also participates in training residents in a new general surgery program (minimum accredited length is 5 years). For the purpose of establishing Hospital A's FTE resident caps, the 5-year growth window for Hospital A closes on June 30, 2018, and the IME and direct GME FTE resident caps for Hospital A are effective on July 1, 2018, the beginning of the sixth program year of the first new program's existence; that is, family medicine. However, the 3-year rolling average and the IRB ratio cap are effective at different points in time. Because the family medicine residency is 3 years in length, FTE residents in the new family medicine program are subject to the 3-year rolling average and the IRB ratio cap beginning on July 1, 2016. Because the sports medicine fellowship is a 1-year program, and it started on July 1, 2014, the number of sports medicine FTE residents must be included in the 3-year rolling average and is subject to the IRB ratio cap effective on July 1, 2015. Lastly, the FTE residents in the new general surgery program would only be subject to the rolling average and the IRB ratio cap effective July 1, 2020. The Medicare cost report worksheets on CMS Form 2552-10 for IME (Worksheet E, Part A) and for direct GME (Worksheet E-4) currently can accommodate reporting of FTE residents separately based on whether those FTE residents are in new medical residency training programs and are not subject to the FTE resident cap (line 16 of Worksheet E, Part A, and line 15 of Worksheet E-4). However, these cost report worksheets are not designed to accommodate reporting of FTE residents that are exempt from the FTE resident cap, but *are* subject to the rolling average and IRB ratio cap, because the "period of years" equal to the minimum accredited length of each new program started has already expired. The reverse also may occur, as in the example above with the new general surgery program started by Hospital A, where the FTE resident caps are effective July 1, 2018, but the number of FTE residents in the general surgery program would not be

subject to the rolling average or the IRB ratio cap until July 1, 2020.

Complicating matters further is the fact that, while the effective dates of these policies associated with new medical residency training program FTE residents are effective on a program year basis (that is, July 1), many teaching hospitals do not have a fiscal year that begins on July 1. Therefore, under the existing policy, the number of FTE residents needs to be prorated, and special accommodations need to be made to calculate the portion of FTE residents that are subject to the FTE resident cap, the 3-year rolling average, and the IRB ratio cap for the respective portions of the hospital's cost reporting period occurring on and after July 1. Integrating the rolling average, the IRB ratio cap, and the FTE resident caps for residents in new medical residency training programs in an accurate manner on the Medicare cost report has proved challenging to the point where we have had to deal with each instance brought to our attention by the new teaching hospital or by a Medicare contractor on an individual and manual basis (in order to ensure application of a consistent methodology). In fact, the Medicare cost report instructions direct the hospital to do the following: for CMS Form 2552-10, Worksheet E, Part A, line 10—" . . . Contact your contractor for instructions on how to complete this line if you have a new program for which the period of years is less than or more than three years. . . ."; for CMS Form 2552-10, Worksheet E-4, line 6—" . . . Contact your contractor for instructions on how to complete this line if you have a new program for which the period of years is less than or greater than 3 years. . . ."

The MACs, in turn, have been instructed to contact CMS for instructions on how to report the number of FTE residents that are still within the "period of years" of the new program. The "three years" referenced in the Form 2552-10 cost report instructions are based on the 3-year growth window for new medical residency training programs that is in effect for new programs started prior to October 1, 2012, when, within the 3-year growth window, new teaching hospitals also may have started new medical residency training programs with different minimum accredited lengths. (We note that while the previous Form 2552-96 cost report did not include the same instructions, CMS did deal with the reporting of the number of FTE residents in new medical residency training programs on an individual basis when requests for

assistance were brought to its attention.) However, these instructions also apply for new medical residency training programs started with different minimum accredited lengths on and after October 1, 2012.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28147), we proposed to simplify and streamline the timing of when FTE residents in new medical residency training programs are subject to the FTE resident cap, the 3-year rolling average, and the IRB ratio cap, both for urban teaching hospitals that have not yet had FTE resident caps established under § 413.79(e)(1) and for rural teaching hospitals that may or may not have FTE resident caps established under § 413.79(e)(3). That is, we proposed that the methodology for calculating the FTE resident caps for hospitals that participate in training residents in new medical residency training programs would continue to be the same methodology instituted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53415 through 53425) for new medical residency training programs started on or after October 1, 2012, specified at § 413.79(e)(1). However, once the FTE resident caps are calculated, we proposed to change the timing of when the FTE resident caps would be effective, to synchronize the effective dates and the application of the 3-year rolling average and the IRB ratio cap with each applicable hospital's fiscal year begin date. Specifically, we proposed that the FTE resident caps would continue to be calculated as finalized in the FY 2013 IPPS/LTCH PPS final rule—the methodology is based on the sum of the products of the following three factors: (1) the highest total number of FTE residents trained in any program year, during the fifth year of the first new program's existence at all of the hospitals to which the residents in that program rotate; (2) the number of years in which residents are expected to complete the program, based on the minimum accredited length for each type of program; and (3) the ratio of the number of FTE residents in the new program that trained at the hospital over the entire 5-year period to the total number of FTE residents that trained at all hospitals over the entire 5-year period. However, once calculated in this manner, we proposed that, instead of the FTE resident caps being effective beginning with the sixth program year of the first new program started, those *FTE resident caps, the 3-year rolling average, and the IRB ratio cap would be effective beginning with the applicable hospital's cost reporting period that precedes the start of the*

sixth program year of the first new program started. Using the example of Hospital A that we presented earlier, assume Hospital A has a January 1 to December 31 cost reporting year. The first new program started, family medicine, was started on July 1, 2013. A sports medicine fellowship and a general surgery program also were started timely within the 5-year growth window. Hospital A has 5 program years to grow its FTE resident caps, from July 1, 2013 through June 30, 2018. The FTE resident caps would be calculated based on the 5 program years in accordance with the methodology established at § 413.79(e)(1) in the FY 2013 IPPS/LTCH PPS final rule; therefore, the hospital would wait until after June 30, 2018 to obtain the FTE counts to calculate the FTE resident caps. However, we proposed that those IME and direct GME FTE resident caps, once calculated after June 30, 2018, instead of being effective on July 1, 2018, *would be effective at the beginning of Hospital A's cost reporting period that precedes July 1, 2018; that is, the FTE resident caps for Hospital A would be effective permanently on January 1, 2018, the start of Hospital A's cost reporting period that precedes the start of the sixth program year of the first new program started.* The hospital could file its fiscal year end December 31, 2018 cost report including the FTE resident caps applicable to the entire cost reporting period accordingly.

As noted earlier, we proposed that, for all new medical residency training programs in which the hospital participates during the 5-year growth window, the FTEs in those new programs also would be subject to the 3-year rolling average and the IRB ratio cap simultaneously with the effective date of the FTE resident caps, at the beginning of the applicable hospital's cost reporting period that precedes the beginning of the sixth program year of the first new program started. Again, using the example of Hospital A that we presented earlier, the FTE residents in the family medicine program, the sports medicine fellowship, and the general surgery program would all be subject to the 3-year rolling average and IRB ratio cap beginning on January 1, 2018. With regard to reporting on the Medicare cost report, for Hospital A's fiscal year end dates of December 31, 2013 through and including December 31, 2017, we proposed that the number of FTE residents in the family medicine program, the sports medicine fellowship, and the general surgery program would be reported so as *not* to be included in the IME rolling average

or the IRB ratio cap, and so as *not* to be included in the direct GME rolling average. (On the CMS Form 2552–10, for Hospital A's fiscal year end dates of December 31, 2013 through and including December 31, 2017, this means that the number of FTE residents in the family medicine program, the sports medicine fellowship, and the general surgery program would be reported on Worksheet E, Part A, line 16, and on Worksheet E–4, line 15). However, on Hospital A's cost report for fiscal year ending December 31, 2018, the number of FTE residents in these three programs would be subject to the FTE resident cap, the 3-year rolling average, and the IRB ratio cap and would be reported accordingly. (On the CMS Form 2552–10, for Hospital A's cost report for fiscal year ending December 31, 2018, this means that none of the FTE residents in these three programs would be reported on Worksheet E, Part A, line 16 for IME, and Worksheet E–4, line 15 for direct GME. Instead, all of the FTE residents would be reported on Worksheet E, Part A, line 10 for IME, and Worksheet E–4, line 6 for direct GME, in order to be subject to the FTE resident cap, the 3-year rolling average, and the IRB ratio cap.) We note that once the 3-year rolling average is effective in that cost reporting period that includes the sixth program year of the first new program started, the number of FTE residents in the new programs also must be reported both as part of the prior year FTE resident counts and the penultimate FTE resident counts, in order to effectuate the 3-year rolling average calculation on the IME Worksheet E, Part A, and the direct GME Worksheet E–4, respectively.

In the example that we presented earlier, Hospital A has a fiscal year that begins on January 1. If Hospital A's fiscal year begin date would have been October 1, then, while the sixth program year of the first new program started would still be July 1, 2018, the FTE residents caps, the 3-year rolling average, and the IRB ratio cap would be effective on October 1, 2017, the fiscal year begin date that precedes July 1, 2018, the sixth program year. If Hospital A's fiscal year begin date would have been July 1, the FTE residents caps, the 3-year rolling average, and the IRB ratio cap would instead be effective on July 1, 2017, the fiscal year begin date that precedes July 1, 2018, the sixth program year.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28148), we stated that we understood that this proposal, if finalized, would reduce the amount of time that the new medical residency

training programs would be exempt from the FTE resident caps. However, even though we proposed to make the effective date of the FTE resident caps earlier than under current policy, because we also proposed that the calculation of the FTE resident caps would still be based on the highest total number of FTE residents trained in any program year, during the fifth year of the first new program's existence at all of the hospitals to which the residents in that program rotate, a new teaching hospital would still have the full 5 program years to grow its program(s), and its FTE resident caps would reflect a full 5 years of growth. Therefore, because, by the fifth program year, a program should, in most typical circumstances, have grown to its full capacity, barring unusual circumstances, the FTE resident caps that would take effect under the proposed policy at the beginning of the fiscal year that precedes the sixth program year should accommodate the FTE resident count training in the fifth and subsequent program years. Therefore, we stated in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28148) that we believe that this proposal to streamline and synchronize the effective dates of the FTE resident caps, the 3-year rolling average, and the IRB ratio cap not only is easier to comprehend and to implement, but also is reasonable and equitable in its effect on the IME and direct GME payments of hospitals establishing FTE resident caps. Specifically, we indicated that if the proposal is finalized, there would no longer be a need for CMS Form 2552–10, Worksheet E, Part A, line 10 and Worksheet E–4, line 6 to instruct hospitals to contact their MACs for instructions on how to complete those lines, as both hospitals and MACs would understand how to report the number of FTE residents in new programs, even when those programs have different accredited lengths. Instead, hospitals and MACs would follow the methodology instituted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53415 through 53425) to calculate the FTE resident caps for new medical residency training programs started on or after October 1, 2012, and once the FTE resident caps are calculated, hospitals and MACs would implement the FTE resident caps, the 3-year rolling average, and the IRB ratio cap effective beginning with the applicable hospital's cost reporting period that precedes the start of the sixth program year of the first new program started. Under the proposed methodology, FTE residents and FTE resident caps would no longer

need to be prorated, and we would no longer need to make special accommodations to calculate the portion of FTE residents that are subject to the FTE resident cap, the 3-year rolling average, and the IRB ratio cap for the respective portions of the hospital's cost reporting period occurring on and after July 1. The existing CMS Form 2552–10 already accommodates the proposed methodology, unlike the complicated process currently in place. Therefore, clarity, efficiency, and payment accuracy would be improved for hospitals, MACs, and CMS.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28148), we stated that with regard to rural hospitals that, under § 413.79(e)(3) of the regulations, may receive FTE resident cap adjustments at any time for participating in training residents in new programs, we proposed a similar policy, with modifications reflecting the fact that each new program in which the rural hospital participates receives its own 5-year growth window before the rural hospital's FTE resident cap is adjusted based on that new program. That is, we proposed that, for rural hospitals, the FTE resident caps, the 3-year rolling average, and the IRB ratio cap *for each new program started would be effective beginning with the applicable hospital's cost reporting period that precedes the start of the sixth program year of each new program started*. For example, rural Hospital B has a fiscal year that begins on January 1. It starts a family medicine program on July 1, 2013, and a general surgery program on July 1, 2016. The sixth program year for the family medicine program begins on July 1, 2018. The sixth program year for the general surgery program begins on July 1, 2021. With regard to Medicare cost reporting, during Hospital B's fiscal year end dates of December 31, 2013 through and including December 31, 2017, the number of family medicine FTE residents would be reported so as *not* to be included in the IME 3-year rolling average or the IRB ratio cap, and so as *not* to be included in the direct GME 3-year rolling average. (This means that on CMS Form 2552–10, during Hospital B's fiscal year end dates of December 31, 2013 through and including December 31, 2017, the number of family medicine FTE residents would be reported on Worksheet E, Part A, line 16 for IME, and on Worksheet E–4, line 15, for direct GME. Instead, the number of family medicine FTE residents would be reported on Worksheet E, Part A, line 16, and Worksheet E–4, line 15.) Then, beginning with Hospital B's cost report for fiscal year ending December 31,

2018, the number of FTE residents in *only the family medicine program* would be subject to the FTE resident caps, the 3-year rolling average, and the IRB ratio cap, and would be reported accordingly in order to be subject to the FTE resident cap, the 3-year rolling average, and the IRB ratio cap. (This means that on CMS Form 2552–10, beginning with Hospital B's cost report ending December 31, 2018, the number of family medicine FTE residents would be reported on Worksheet E, Part A, line 10 for IME, and Worksheet E–4, line 6 for direct GME.) Because the general surgery program started on July 1, 2016, for Hospital B's fiscal year end dates of December 31, 2016 through and including fiscal year end date of December 31, 2020, the number of general surgery FTE residents would be reported (on Worksheet E, Part A, line 16) so as *not* to be included in the IME 3-year rolling average or the IRB ratio cap, and (on Worksheet E–4, line 15), so as *not* to be included in the direct GME 3-year rolling average. Then, beginning with Hospital B's cost report for fiscal year ending December 31, 2021, the number of FTE residents in the *general surgery program* would be subject to the FTE resident caps, the 3-year rolling average, and the IRB ratio cap, and would be reported accordingly (on Worksheet E, Part A, line 10 for IME, and Worksheet E–4, line 6 for direct GME), in order to be subject to the FTE resident cap, the 3-year rolling average, and the IRB ratio cap. We note that once the 3-year rolling average is effective in that cost reporting period that includes the sixth program year of each new program started, the number of FTE residents in the new programs also must be reported as part of the prior year FTE resident counts, and the penultimate FTE resident counts, in order to effectuate the 3-year rolling average calculation on the IME Worksheet E, Part A, and the direct GME Worksheet E–4, respectively.

We proposed that this policy regarding the effective dates of the FTE residency caps, the 3-year rolling average, and the IRB ratio cap for FTE residents in new medical residency training programs would be consistent with the methodology for calculation of the FTE resident caps as described in the FY 2013 IPPS/LTCH PPS final rule, and implemented in the regulations at §§ 413.79(e)(1) and (e)(3). That is, because the policy providing a 5-year growth period for establishing the FTE resident caps (§§ 413.79(e)(1) and (e)(3)) is effective for new programs started on or after October 1, 2012, this proposal would be effective for urban hospitals

that first begin to participate in training residents in their first new medical residency training program, and for rural hospitals, on or after October 1, 2012. We also proposed to revise the regulations for IME and direct GME, respectively, at § 412.105(a)(1)(ii) for the IME IRB ratio cap, at § 412.105(f)(1)(v) for the IME 3-year rolling average, and at § 413.79(d)(5) for the direct GME 3-year rolling average to reflect that the exception from the IRB ratio cap and the 3-year rolling average for new programs applies to each new program individually during the cost reporting periods prior to the beginning of the applicable hospital's cost reporting period that precedes the start of the sixth program year of the first new program started, for hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(1), and prior to the beginning of the applicable hospital's cost reporting period that precedes the start of the sixth program year of each individual new program started, for hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(3). After the applicable hospital's cost reporting period that precedes the start of the sixth program year of the first new program started for hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(1), and after the applicable hospital's cost reporting period that precedes the start of the sixth program year of each individual new program started for hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(3), FTE residents participating in new medical residency training programs are included in the hospital's IRB ratio cap and the 3-year rolling average.

Comment: Many commenters supported CMS' proposal to simplify and synchronize the timing of when FTE residents in new medical residency training programs are subject to the FTE resident caps, the 3-year rolling average, and the IRB ratio cap. However, the commenters believed that the specific part of the proposal related to making the FTE resident caps effective beginning with the applicable hospital's cost reporting period that *precedes* the start of the sixth program year of the first new program started would result in premature application of the FTE resident cap while the hospital would still be within the 5-year cap building window, thereby reducing the number of FTEs to which the new teaching hospital would otherwise be entitled to payment. The commenters disputed CMS' suggestion in the proposed rule that the effect on a hospital's payment

would be inconsequential or nonexistent “in most typical circumstances.” The commenters provided examples of where they believed CMS' proposal would result in the loss of payment for new teaching hospitals establishing an FTE resident cap. The commenters acknowledged CMS' statement in the proposed rule that a new teaching hospital could experience a payment benefit from the proposed changes related to the synchronized implementation of the 3-year rolling average and the IRB ratio cap. However, the commenters did not believe this “benefit justifies an imposition of the FTE resident cap within the 5-year cap building window.” The commenters urged CMS to finalize an alternative effective date that would be the start of the hospital's cost reporting period that *follows* the start of the sixth program year of the start of the first new program. The commenters believed this alternative would achieve the simplicity that CMS seeks in its proposal, yet would also permit new teaching hospitals to retain the payments they are “entitled” to receive for at least a full 5 program years under existing regulations.

Response: We appreciate the commenters' support of the proposal, and the commenters' concern that, by proposing that the effective date would be the applicable hospital's cost reporting period that *precedes* the start of the sixth program year of the first new program started, this earlier application of the FTE resident cap might result in reduced payment because some amount of FTE residents would be in excess of the hospital's newly calculated FTE resident caps. We also agree that the streamlining and simplification that we are seeking would be achieved by revising the proposal to instead take effect, as the commenters suggested, with the beginning of the hospital's cost reporting period that follows the start of the sixth program year of the first new program started. Therefore, in this final rule, we are modifying our proposal as follows, both for urban teaching hospitals that have not yet had FTE resident caps established under § 413.79(e)(1), and for rural teaching hospitals that may or may not have FTE resident caps established under § 413.79(e)(3). That is, the FTE resident caps would continue to be calculated as finalized in the FY 2013 IPPS/LTCH PPS final rule—the methodology is based on the sum of the products of the following three factors: (1) the highest total number of FTE residents trained in any program year, during the fifth year

of the first new program's existence at all of the hospitals to which the residents in that program rotate; (2) the number of years in which residents are expected to complete the program, based on the minimum accredited length for each type of program; and (3) the ratio of the number of FTE residents in the new program that trained at the hospital over the entire 5-year period to the total number of FTE residents that trained at all hospitals over the entire 5-year period. However, once calculated in this manner, we are finalizing a policy that, instead of the FTE resident caps being effective beginning with the sixth program year of the first new program started, those FTE resident caps, the 3-year rolling average, and the IRB ratio cap would be effective beginning with the applicable hospital's cost reporting period that *coincides with or follows* the start of the sixth program year of the first new program started. (We are specifying "that coincides with or follows" the start of the sixth program year of the first new program started, rather than only specifying "that follows" the start of the sixth program year of the first new program started as the commenters suggested, in consideration of hospitals that have a fiscal year begin date of July 1, for whom the cost reporting period that starts after completion of the 5-year cap building window coincides with the beginning of the sixth program year of the first new program started. Under this finalized policy, hospitals with a fiscal year begin date of July 1 would not wait an entire 12 months after completion of their 5-year cap building window for their next cost reporting period to start in order for the FTE resident caps, the 3-year rolling average, and the IRB ratio cap to take effect. Rather, for hospitals with a fiscal year begin date of July 1, the FTE resident caps, the 3-year rolling average, and the IRB ratio cap would be effective beginning with the applicable hospital's cost reporting period that *coincides with* the start of the sixth program year of the first new program started.)

Using the example of Hospital A that we presented in the proposed rule, assume Hospital A has a January 1 to December 31 cost reporting year. The first new program started, family medicine, was started on July 1, 2013. A sports medicine fellowship and a general surgery program also were started timely within the 5-year growth window. Hospital A has 5 program years to grow its FTE resident caps, from July 1, 2013 through June 30, 2018. The FTE resident caps would be calculated based on the 5 program years

in accordance with the methodology established at § 413.79(e)(1) in the FY 2013 IPPS/LTCH PPS final rule. Therefore, the hospital would wait until after June 30, 2018, to obtain the FTE counts to calculate the FTE resident caps. However, those IME and direct GME FTE resident caps, once calculated after June 30, 2018, instead of being effective on July 1, 2018, *would be effective at the beginning of Hospital A's cost reporting period that follows July 1, 2018; that is, the FTE resident caps for Hospital A would be effective permanently on January 1, 2019, the start of Hospital A's cost reporting period that follows the start of the sixth program year of the first new program started.* The hospital would file its fiscal year end December 31, 2019 cost report including the FTE resident caps applicable to the entire cost reporting period accordingly.

Regarding the application of the 3-year rolling average and the IRB ratio cap, using the example of Hospital A, the FTE residents in the family medicine program, the sports medicine fellowship, and the general surgery program would all be subject to the 3-year rolling average and the IRB ratio cap beginning on January 1, 2019. With regard to reporting on the Medicare cost report, for Hospital A's fiscal year end dates of December 31, 2013 through and including December 31, 2018, the number of FTE residents in the family medicine program, the sports medicine fellowship, and the general surgery program would be reported so as *not* to be included in the IME rolling average or the IRB ratio cap, and so as *not* to be included in the direct GME rolling average. (On the CMS Form 2552-10, for Hospital A's fiscal year end dates of December 31, 2013 through and including December 31, 2018, this means that the number of FTE residents in the family medicine program, the sports medicine fellowship, and the general surgery program would be reported on Worksheet E, Part A, line 16, and on Worksheet E-4, line 15.) However, on Hospital A's cost report for fiscal year ending December 31, 2019, the number of FTE residents in these three programs would be subject to the FTE resident caps, the 3-year rolling average, and the IRB ratio cap, and would be reported accordingly. (On the CMS Form 2552-10, for Hospital A's cost report for fiscal year ending December 31, 2019, this means that none of the FTE residents in these three programs would be reported on Worksheet E, Part A, line 16 for IME, and Worksheet E-4, line 15 for direct GME. Instead, all of the FTE residents

would be reported on Worksheet E, Part A, line 10 for IME, and Worksheet E-4, line 6 for direct GME, in order to be subject to the FTE resident caps, the 3-year rolling average, and the IRB ratio cap.) We note that once the 3-year rolling average is effective, the number of FTE residents in the new programs also must be reported both as part of the prior year FTE resident counts and the penultimate FTE resident counts, in order to effectuate the 3-year rolling average calculation on the IME Worksheet E, Part A, and the direct GME Worksheet E-4, respectively.

In the example that we presented earlier, Hospital A has a fiscal year that begins on January 1. If Hospital A's fiscal year begin date would have been October 1, while the sixth program year of the first new program started would still be July 1, 2018, the FTE residents caps, the 3-year rolling average, and the IRB ratio cap would be effective on October 1, 2018, the fiscal year begin date that follows July 1, 2018, the sixth program year. If Hospital A's fiscal year begin date would have been July 1, the FTE residents caps, the 3-year rolling average, and the IRB ratio cap would be effective on July 1, 2018, the fiscal year begin date that follows completion of the fifth program year, and *coincides with* July 1, 2018, the sixth program year.

With regard to rural hospitals that, under § 413.79(e)(3) of the regulations, may receive FTE resident cap adjustments at any time for participating in training residents in new programs, we are finalizing a similar policy, with modifications reflecting the fact that each new program in which the rural hospital participates receives its own 5-year growth window before the rural hospital's FTE resident cap is adjusted based on that new program. That is, we are finalizing that, for rural hospitals, the FTE resident caps, the 3-year rolling average, and the IRB ratio cap *for each new program started would be effective beginning with the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year of each new program started.* For example, rural Hospital B has a fiscal year that begins on January 1. It starts a family medicine program on July 1, 2013, and a general surgery program on July 1, 2016. The sixth program year for the family medicine program begins on July 1, 2018. The sixth program year for the general surgery program begins on July 1, 2021. With regard to Medicare cost reporting, during Hospital B's fiscal year end dates of December 31, 2013 through and including December 31, 2018, the number of family medicine FTE residents would be reported so as

not to be included in the IME 3-year rolling average or the IRB ratio cap, and so as not to be included in the direct GME 3-year rolling average. (This means that on CMS Form 2552-10, during Hospital B's fiscal year end dates of December 31, 2013 through and including December 31, 2018, the number of family medicine FTE residents would be reported on Worksheet E, Part A, line 16 for IME, and on Worksheet E-4, line 15, for direct GME.) Beginning with Hospital B's cost report for fiscal year ending December 31, 2019, the number of FTE residents in *only the family medicine program* would be subject to the FTE residents caps, the 3-year rolling average, and the IRB ratio cap, and would be reported accordingly in order to be subject to the FTE resident caps, the 3-year rolling average, and the IRB ratio cap. (This means that on CMS Form 2552-10, beginning with Hospital B's cost report ending December 31, 2019, the number of family medicine FTE residents would be reported on Worksheet E, Part A, line 10 for IME, and Worksheet E-4, line 6 for direct GME.) Because the general surgery program started on July 1, 2016, for Hospital B's fiscal year end dates of December 31, 2016 through and including fiscal year end date of December 31, 2021, the number of general surgery FTE residents would be reported on Worksheet E, Part A, line 16 so as not to be included in the IME 3-year rolling average or the IRB ratio cap, and on Worksheet E-4, line 15, so as not to be included in the direct GME 3-year rolling average. Beginning with Hospital B's cost report for fiscal year ending December 31, 2022, the number of FTE residents in the *general surgery program* would be subject to the FTE resident caps, the 3-year rolling average, and the IRB ratio cap, and would be reported accordingly (on Worksheet E, Part A, line 10 for IME, and Worksheet E-4, line 6 for direct GME), in order to be subject to the FTE resident caps, the 3-year rolling average, and the IRB ratio cap. We note that once the 3-year rolling average is effective, the number of FTE residents in the new programs also must be reported as part of the prior year FTE resident counts, and the penultimate FTE resident counts, in order to effectuate the 3-year rolling average calculation on the IME Worksheet E, Part A, and the direct GME Worksheet E-4, respectively.

After consideration of the public comments we received, we are finalizing our proposal with certain modifications. Specifically, the policy regarding the effective dates of the FTE

residency caps, the 3-year rolling average, and the IRB ratio cap for FTE residents in new medical residency training programs will be consistent with the methodology for calculation of the FTE resident caps as described in the FY 2013 IPPS/LTCH PPS final rule, and implemented in the regulations at §§ 413.79(e)(1) and (e)(3). That is, because the policy providing a 5-year growth period for establishing the FTE resident caps (§§ 413.79(e)(1) and (e)(3)) is effective for new programs started on or after October 1, 2012, this policy will be effective for urban hospitals that first begin to participate in training residents in their first new medical residency training program, and for rural hospitals, on or after October 1, 2012. We also are revising the regulations for IME and direct GME, respectively, at § 412.105(a)(1)(ii) for the IME IRB ratio cap, at § 412.105(f)(1)(v) for the IME 3-year rolling average, and at § 413.79(d)(5) for the direct GME 3-year rolling average, to reflect that the exception from the IRB ratio cap and the 3-year rolling average for new programs applies to each new program individually during the cost reporting periods prior to the beginning of the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year of the first new program started, for hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(1), and prior to the beginning of the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year of each individual new program started, for hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(3). Beginning with the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year of the first new program started for hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(1), and beginning with the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year of each individual new program started for hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(3), FTE residents participating in new medical residency training programs are included in the hospital's IRB ratio cap and the 3-year rolling average.

3. Changes to IME and Direct GME Policies as a Result of New OMB Labor Market Area Delineations

a. New Program FTE Resident Cap Adjustment for Rural Hospitals Redesignated as Urban

As stated earlier in this final rule, under existing regulations, a new teaching hospital that starts training residents for the first time on or after October 1, 2012, has 5 years from when it first begins training residents in its first new program to build its FTE resident cap. If the teaching hospital is a rural teaching hospital, it can continue to receive permanent cap adjustments for training residents in new programs after the initial 5-year cap-building period that applies to new teaching hospitals ends. (We refer readers to section IV.K.2. of the preamble of this final rule for a discussion of our proposal and final policy to change the effective dates for when the FTE resident cap, the 3-year rolling average, and the IRB ratio cap are applied to new teaching hospitals and to new programs at rural teaching hospitals.)

In section III.B. of the preamble of this final rule, we discuss the final policies we are implementing as a result of the new OMB labor market area delineations announced in the February 28, 2013 OMB Bulletin No. 13-01. As a result of the new OMB delineations, some teaching hospitals may be redesignated from being located in a rural area to an urban area, thereby losing their ability to increase their FTE resident caps for new programs started after their initial 5-year cap-building period ends. We have been asked whether a rural teaching hospital that already has a cap and is redesignated as urban while it is in the process of establishing another new program(s) can still receive a permanent cap adjustment for that new program(s). We believe that because the hospital had already started training residents in the new program(s) while it was rural, the former rural hospital should be permitted to continue building its new program(s) and receive a permanent FTE resident cap adjustment for that new program(s). Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28149 through 28150), we proposed to revise the regulations to allow a hospital that was rural as of the time it started training residents in a new program(s) and is redesignated as urban for Medicare payment purposes during its cap-building period for that program(s) to be able to continue building that program(s) for the remainder of the cap-building period and receive a permanent FTE resident cap adjustment

for that new program(s). Once the cap-building period for the new program(s) that was started while the hospital was still rural expires, the teaching hospital that has been redesignated as urban would no longer be able to receive any additional permanent cap adjustments. We proposed that the teaching hospital must be actively training residents in the new program while it is still rural, that is, prior to the redesignation taking effect, in order for the hospital to continue receiving a cap adjustment for the new program. For example, if a rural hospital begins training residents in a new internal medicine program on July 1, 2013, and begins training residents in a new general surgery program on July 1, 2014, and the rural hospital is redesignated as urban effective on October 1, 2014, the teaching hospital would be able to continue receiving a cap adjustment for both the new internal medicine program and the new general surgery program after it has been redesignated as urban. However, if the rural hospital is redesignated as urban effective on October 1, 2014, and started training residents in a new internal medicine program on July 1, 2013, but did not start training residents in a new general surgery program while it was still rural, that is, prior to October 1, 2014, the teaching hospital would receive a permanent cap adjustment for the new internal medicine program, but would not receive a cap adjustment for the new general surgery program. We proposed to revise the regulations at § 412.105(f)(1)(iv)(D) for IME and § 413.79(c)(6) for direct GME to implement this proposed change. We proposed that these regulatory revisions be effective for cost reporting periods beginning on or after October 1, 2014.

Comment: Commenters supported the proposal to allow a rural hospital that was training residents in a new program when it was redesignated as urban due to the most recent OMB delineations, to be able to continue with the cap-building period for that new program and receive a permanent cap adjustment for that new program. Commenters stated that rural hospitals develop and build their new programs with the expectation that they will have a 5-year cap building period in which to grow these new programs. Commenters stated that the proposal is fair and equitable and helps address physician shortages in rural areas by promoting residency training in these areas. However, several commenters requested that CMS take the proposal one step further. These commenters stated that if a rural hospital has received a letter of accreditation for a new program prior to

the hospital being redesignated as urban, the hospital should be able to receive a permanent cap adjustment for that new program. One commenter stated that there are substantial resources and upfront costs that go into starting a new family medicine program. The commenter noted it may take some time for the program to begin training residents because the hospital must receive an initial letter of accreditation and then the program may have to wait for up to a year until it can participate in the match for residents to begin the following July 1.

Response: We thank the commenters for their support of our proposal. We appreciate that significant resources go into developing a brand new residency training program and that there may be a lag between when a program is accredited and when residents begin training in that program. We are persuaded by these comments and, therefore, we are finalizing our proposed policy with a modification, such that a rural hospital that has been redesignated as urban can receive a permanent cap adjustment for a new program (after a 5-year cap building period for that new program), if it received a letter of accreditation for the new program, and/or started training residents in the new program, prior to being redesignated as urban. Expanding upon the example that was included in the proposed rule, if a rural hospital is redesignated as urban effective on October 1, 2014, and started training residents in a new internal medicine program on July 1, 2013, but did not start training residents in a new general surgery program while it was still rural, that is, prior to October 1, 2014, but *did* receive a letter of accreditation for the general surgery program prior to October 1, 2014, the rural hospital would receive a permanent cap adjustment for the new internal medicine program, and would receive a permanent cap adjustment for the new general surgery program. We are amending the regulations at § 412.105(f)(1)(iv)(D) and § 413.79(c)(6) to implement this policy. Consistent with the effective date of the implementation of the new OMB delineations, we are making this final policy effective October 1, 2014.

Comment: Several commenters requested that CMS propose a policy through an interim final rule that would permit hospitals that remain rural referral centers (RRCs), even if they are no longer in a labor market designated as rural, to receive a cap increase for residents training in new programs. The commenters stated that RRCs are high-volume hospitals that treat complex

cases, which may be referred to them from significant geographic distances. The commenters stated that RRCs meet important health care needs of rural communities because residency programs in RRCs train physicians who are equipped to deal with rural populations. The commenters requested that CMS specify that grandfathered RRCs are able to increase their caps for new programs so long as during the current Federal fiscal year, they continue to meet all RRC requirements other than being located in a rural area.

Response: Section 1886(h)(4)(H)(i) of the Act states in part, “[i]n promulgating such rules for purposes of subparagraph (F), the Secretary shall give special consideration to facilities that meet the needs of underserved rural areas.” Subparagraph (F) refers to the establishment of a hospital’s FTE resident cap. We read this statutory language as providing special consideration only to *rural* hospitals for purposes of establishing their FTE resident caps, not that special consideration be provided to hospitals that are either not physically located in rural areas or have not reclassified as rural facilities (for IME payment purposes). Therefore, we are not making any special exceptions specific to RRCs that are no longer in rural areas in this final rule. As we have stated above for other hospitals that lose their rural status due to the new OMB delineations, an RRC that has been redesignated as urban may receive a permanent cap adjustment for a new program (after a 5-year cap building period for that new program), if it received a letter of accreditation for the new program, and/or started training residents in the new program, prior to being redesignated as urban. We note that if the redesignated RRC subsequently reclassified back to rural, it would be able to receive additional adjustments to its IME FTE resident cap for training residents in new programs.

Comment: One commenter stated that it operates a rural teaching hospital that received the 30-percent cap increase applicable to rural teaching hospitals. The commenter stated that, due to the most recent OMB delineations proposed to be implemented, the hospital will be located in an urban area. The commenter asked whether the 30-percent cap increase would carry over with the hospital’s urban status.

Response: The regulations at § 412.105(f)(1)(iv)(D) and § 413.79(c)(6) implemented in this final rule state in part that effective October 1, 2014, if a rural hospital is redesignated as urban due to the most recent OMB standards for delineating statistical areas adopted

by CMS, the redesignated urban hospital may retain any existing increases to its FTE resident cap that it had received prior to when the redesignation became effective. Therefore, in the situation the commenter described, the hospital that is redesignated from rural to urban may retain the 30-percent cap increase it received while it was still rural.

After consideration of the public comments we received, we are finalizing the proposed policy with a modification, such that a rural hospital that has been redesignated as urban can receive a permanent cap adjustment for a new program (after a 5-year cap building period for that new program), if it received a letter of accreditation for the new program, and/or started training residents in the new program, prior to being redesignated as urban. The finalized regulations at

§ 412.105(f)(1)(iv)(D) state the following:

- A rural hospital redesignated as urban after September 30, 2004, as a result of the most recent census data and implementation of the new labor market area definitions announced by OMB on June 6, 2003, may retain the increases to its full-time equivalent resident cap that it received under paragraphs (f)(1)(iv)(A) and (f)(1)(vii) of the section while it was located in a rural area.

- Effective October 1, 2014, if a rural hospital is redesignated as urban due to the most recent OMB standards for delineating statistical areas adopted by CMS, the redesignated urban hospital may retain any existing increases to its FTE resident cap that it had received prior to when the redesignation became effective.

- Effective October 1, 2014, if a rural hospital is redesignated as urban due to the most recent OMB standards for delineating statistical areas adopted by CMS, the redesignated urban hospital may receive an increase to its FTE resident cap for a new program, in accordance with paragraph (e) of the section, if it received a letter of accreditation for the new program and/or started training residents in the new program, prior to the redesignation becoming effective.

The finalized regulations at § 413.79(c)(6) state the following:

- A rural hospital redesignated as urban after September 30, 2004, as a result of the most recent census data and implementation of the new MSA definitions announced by OMB on June 6, 2003, may retain the increases to its FTE resident cap that it received under paragraphs (c)(2)(i), (e)(1)(iii), and (e)(3) of the section while it was located in a rural area.

- Effective October 1, 2014, if a rural hospital is redesignated as urban due to the most recent OMB standards for delineating statistical areas adopted by CMS, the redesignated urban hospital may retain any existing increases to its FTE resident cap that it had received prior to when the redesignation became effective.

- Effective October 1, 2014, if a rural hospital is redesignated as urban due to the most recent OMB standards for delineating statistical areas adopted by CMS, the redesignated urban hospital may receive an increase to its FTE resident cap for a new program, in accordance with paragraph (e) of the section, if it received a letter of accreditation for the new program and/or started training residents in the new program prior to the redesignation becoming effective.

b. Participation of Redesignated Hospital in Rural Training Track

To encourage the training of residents in rural areas, section 407(c) of Public Law 106–113 amended section 1886(h)(4)(H) of the Act to add a provision (subsection (iv)) that, in the case of a hospital that is not located in a rural area (an urban hospital) that establishes separately accredited approved medical residency training programs (or rural tracks) in a rural area or has an accredited training program with an integrated rural track, the Secretary shall adjust the urban hospital's cap on the number of FTE residents under subparagraph (F), in an appropriate manner in order to encourage training of physicians in rural areas. Section 407(c) of Public Law 106–113 was made effective for direct GME payments to hospitals for cost reporting periods beginning on or after April 1, 2000, and for IME payments applicable to discharges occurring on or after April 1, 2000. We refer readers to the August 1, 2000 interim final rule with comment period (65 FR 47033 through 47037) and the FY 2002 IPPS final rule (66 FR 39902 through 39909) where we implemented section 407(c) of Public Law 106–113.

The regulations at § 413.79(k) specify that, subject to certain criteria, an urban hospital may count the FTE residents in the rural track in addition to those FTE residents subject to its cap up to a "rural track FTE limitation" for that hospital. In the FY 2006 IPPS final rule, we revised the regulations at § 413.79(k) to add a new paragraph (7) to state that if an urban hospital had established a rural track program with a rural hospital and that hospital subsequently becomes urban due to the implementation of the new labor market area definitions

announced by OMB on June 6, 2003, the urban hospital may continue to adjust its FTE resident limit for rural track programs established before the implementation of the new labor market area definitions. We also stated that, in order for the urban hospital to receive a cap adjustment for a new rural track program, the urban hospital must establish a rural track program with hospitals that are designated rural based on the most recent geographical location designations adopted by CMS (70 FR 47456; 47489).

As discussed earlier in this section, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28054), we proposed to implement, effective October 1, 2014, the new OMB labor market area delineations announced in the February 28, 2013 OMB Bulletin No. 13–01. As a result of the new delineations, certain areas are redesignated from urban to rural or from rural to urban, which may, in turn, affect GME policies that require the participation of rural teaching hospitals. For example, as noted above, in order for an urban teaching hospital to receive a FTE resident cap adjustment for training residents in a rural track, the residents must rotate for more than one-half of the duration of the program to a rural hospital(s) or rural nonprovider(s) site. We have received a question as to what happens to a rural track when a rural hospital that is participating as the rural site is redesignated as urban, while the rural track for the urban hospital is in the process of being established. That is, what happens to the rural track when the rural hospital is redesignated as urban during the period that is used to establish the urban hospital's rural track FTE limitation, *prior* to the effective date of the urban hospital's rural track FTE limitation being established?

Existing regulations at § 413.79(k)(7) address the scenario where a rural hospital that is participating as the rural site is redesignated as urban, *after* the rural track FTE limitation for the urban hospital has already become effective. Specifically, the regulations at § 413.79(k)(7) state that if an urban hospital had established a rural track with a hospital located in a rural area and that rural area subsequently becomes an urban area due to the most recent census data and implementation of new labor market area definitions announced by OMB June 6, 2003, the urban hospital may continue to adjust its FTE resident limit for the rural track programs established prior to the adoption of the new labor market area definitions. Therefore, consistent with the existing regulations at § 413.79(k)(7) and with our proposal to allow rural hospitals redesignated as urban to

continue receiving a FTE resident cap adjustment for new programs that started while the redesignated hospital was still rural, we proposed to revise the existing regulations applicable to urban hospitals generally. Specifically, we proposed to address the status of the “original” urban hospital’s (throughout this preamble, “original” urban hospital refers to the hospital that is the urban participant in the rural track program) rural track FTE limitation, in the situation where a rural hospital that is participating in the original urban hospital’s rural track is located in an area redesignated by OMB as urban *during the 3-year period* that is used to calculate the “original” urban hospital’s rural track FTE limitation. We proposed that, in these situations, the “original” urban hospital’s opportunity to receive a rural track FTE limitation would not be negatively impacted by the fact that the rural hospital with which it has partnered to be the rural site for its rural training track is located in an area redesignated by OMB as urban *during the 3-year period* that is used to calculate the “original” urban hospital’s rural track FTE limitation. That is, we proposed that the “original” urban hospital may receive a rural track FTE limitation for that new rural track program.

With regard to the status of the rural hospital that is partnered with the “original” urban hospital to serve as a rural training site for the rural training track program, as mentioned earlier, existing regulations at § 413.79(k)(7) address the scenario where a rural hospital that is participating as the rural site is redesignated as urban, *after* the rural track FTE limitation for the “original” urban hospital has already become effective. (We note that we proposed to apply the existing policy at § 413.79(k)(7), which applies to redesignations that occurred on June 6, 2003, in a similar manner, to redesignations announced by OMB after June 6, 2003, as well.) In addition, we proposed that once the rural hospital is redesignated as located in an urban area due to the implementation of the new OMB labor market area delineations, regardless of whether that redesignation occurs during the 3-year period that is used to establish the rural track FTE limitation for the “original” urban hospital, or after the 3-year period that is used to establish the rural track FTE limitation for the “original” urban hospital, the redesignated urban hospital can no longer qualify as the rural site and the “original” urban hospital would not be able to count those residents under its rural track FTE

limitation if it continues to use the redesignated urban hospital as the rural site for purposes of the rural track. However, because the redesignated urban hospital was rural when residents started training in the rural track, we proposed to provide for a 2-year transition period during which either of the following two conditions must be met in order for the “original” urban hospital to be able to count the residents under its rural track FTE limitation when the 2-year transition period ends: (1) The redesignated newly urban hospital must reclassify back to rural under § 412.103 of the regulations; or (2) the “original” urban hospital must find a new geographically rural site to participate as the rural site for purposes of the rural track. We note that we proposed to apply these two criteria both in the case where the rural hospital is redesignated as urban *after* the “original” urban hospital already has its rural track FTE limit established, and also in the case where the rural hospital is redesignated as urban *during* the 3-year period when the rural track program is still growing, *prior* to the rural track FTE limit being established. This 2-year transition period would begin when new OMB labor market area delineations take effect for Medicare payment purposes and would end exactly 2 years from that date. During this 2-year transition period, we would hold the “original” urban hospital harmless and would pay the “original” urban hospital for the FTE residents in the rural track. At the end of the 2-year transition period, in order for the “original” urban hospital to receive payment for a rural track program under § 413.79(k)(1) or (k)(2), either the redesignated urban hospital must be granted reclassification as rural under § 412.103 or the “original” urban hospital must already be training FTE residents at a geographically rural site. We note that, because the rural reclassification provision of § 412.103 only applies to IPPS hospitals and for purposes of section 1886(d) of the Act, it only applies to IPPS hospitals for IME payment purposes and not for direct GME payment purposes because direct GME is authorized under section 1886(h) of the Act. Therefore, if the redesignated hospital reclassifies as rural under § 412.103, the “original” urban hospital would only be able to count FTE residents towards its rural track FTE limitation for IME payment purposes, but not for direct GME payment purposes. In addition, we note that this discussion has centered on the scenario where a rural hospital that is the rural site for purposes of the rural

track has been redesignated as urban. Under such a scenario, the redesignated urban hospital does have an option to reclassify as rural. However, as noted above, the reclassification only applies to IPPS hospitals for IME payment purposes. If a nonprovider site is functioning as the rural site under § 413.79(k)(2) for purposes of the rural track and the area where that nonprovider site is located is redesignated as urban, the nonprovider site would not have the option of reclassifying as rural and, therefore, the “original” urban hospital would be required to find a new geographically rural site within the 2-year transition period in order for the “original” urban hospital to receive payment for a rural track program under § 413.79(k)(1) or (k)(2).

The following examples illustrate how the proposed policy would be applied to a rural track in which the rural site is a hospital and the rural hospital has been redesignated as urban:

- An urban teaching hospital and a rural teaching hospital are participating in training residents in a new rural track program that begins July 1, 2014. Effective October 1, 2014, the rural hospital is redesignated as urban. We proposed that the timeframe for the “original” urban hospital to build the rural track program for purposes of calculating its rural track FTE limitation would continue to be through June 30, 2017. During the time period of October 1, 2014 to September 30, 2016, the redesignated urban hospital would continue participating as a rural hospital and the “original” urban hospital would count FTE residents it is training that are in the rural track for IME and direct GME. However, in order for the “original” urban hospital to continue to get paid for its rural track program after September 30, 2016, then, by September 30, 2016, the redesignated urban hospital must either reclassify as rural under § 412.103 of the regulations for purposes of IME payment only, or the “original” urban hospital must find a new geographically rural hospital or nonprovider site to train the residents in the rural track for more than one-half of their training. If neither of these conditions is met, by September 30, 2016, the “original” urban hospital would not be able to receive payment for that specific program as a rural training track under § 413.79(k)(1) or (k)(2) because it would no longer meet the requirement that more than one-half of the training must be provided in a rural setting.

- Another scenario could be one in which the rural hospital is redesignated as urban after the 3-year cap-building

period for the rural track has passed. For example, the rural track program began July 1, 2007, but effective October 1, 2014, the rural hospital is redesignated as urban. We proposed in this scenario that, by September 30, 2016, either the redesignated urban hospital must reclassify to rural under § 412.103 for purposes of IME payment only, or the “original” urban hospital must find a new geographically rural site that can participate as the rural site for purposes of the rural track. If neither of these conditions is met by September 30, 2016, the “original” urban hospital would not be able to receive payment for that specific program as a rural track under § 413.79(k)(1) or (k)(2) because it would no longer meet the requirement that more than one-half of the training must be provided in a rural setting.

We noted that if the “original” urban hospital was not able to meet one of the two proposed conditions noted earlier in this section by the end of the 2-year transition period, but at some point later is able to meet one of the two proposed conditions, we proposed that the “original” urban hospital would be able to “revive” and use its already established rural track FTE limitation from that point forward. In the instance where the “original” urban hospital’s rural track FTE limitation was not set because the hospital was not able to meet one of the two proposed conditions by the end of the 2-year transition period, which fell within the 3-year cap-building timeframe, but at some point later is able to meet one of the two proposed conditions, we proposed that the “original” urban hospital would be able to have a rural track FTE limitation calculated and established based on the highest number of FTE residents in any program year training in the rural track in the third year of the program, even if during the third year of the program, the “original” urban hospital was not in compliance with the two proposed conditions. Consistent with similar policy discussed in the FY 2002 IPPS final rule (66 FR 39905), it would be the responsibility of the hospitals involved to provide the necessary information regarding the rotations of the residents in the third program year to the MAC in order for the calculation to be completed and the rural track FTE limit to be set.

In summary, we proposed that any time a rural hospital participating in a rural track is in an area redesignated by OMB as urban after residents started training in the rural track and during the 3-year period that is used to calculate the “original” urban hospital’s rural track FTE limitation, the “original” urban hospital may receive a cap

adjustment for that rural track after the rural hospital has been redesignated as urban. Furthermore, we proposed that, regardless of whether the redesignation of the rural hospital occurs during the 3-year period that is used to calculate the urban hospital’s rural track FTE limitation, or after the 3-year period used to calculate the “original” urban hospital’s rural track FTE limitation, the redesignated urban hospital can continue to be considered a rural hospital for purposes of the rural track for up to 2 years. However, by the end of those 2 years, either the redesignated urban hospital must reclassify as rural under § 412.103 for purposes of IME payment only (in addition, this reclassification option only applies to IPPS hospitals, not nonprovider sites) or the “original” urban hospital must have found a new site in a geographically rural area that will serve as the rural site for purposes of the rural track in order for the “original” urban hospital to receive payment under § 413.79(k)(1) or (k)(2).

We proposed to revise the regulations at § 413.79(k)(7) to implement these provisions and to establish that these changes would be effective for cost reporting periods beginning on or after October 1, 2014.

Comment: In general, commenters supported the rural track proposals. Some commenters requested that, instead of providing for a 2-year transition period, CMS provide a 3-year transition period for the original urban hospital to find a new rural site. Commenters stated that it usually takes 3 years of financial and operational planning in order to develop a new training site and that it may take more time in rural areas where staffing is limited. Commenters stated that the program would also need time to request approval from the ACGME or the AOA to move its training site.

Response: We appreciate the commenters’ support of our proposals related to rural track programs. As a result of commenters’ concerns that 2 years is not a sufficient transition period to allow the “original” urban hospital to find another rural hospital to participate as the rural site for purposes of the rural track, we are finalizing a policy providing for an alternative transition period. The transition period will begin effective with the date of the implementation of the new OMB delineations and extend through the end of the second residency training year following the implementation date of the new OMB delineations. For example, if as a result of the OMB delineations implemented effective October 1, 2014, the rural hospital

participating in a rural track program is redesignated as urban, the transition period for the “original” urban hospital to find a new rural site or for the redesignated hospital to reclassify back to rural for IME payment purposes, would last from October 1, 2014 through June 30, 2017. In addition, consistent with the effective date of the new OMB delineations, we are making these final policies effective October 1, 2014. We are revising the regulations at § 413.79(k)(7) to implement this change.

The following examples illustrate how the policy finalized in this rule would be applied to an urban hospital that is training residents as part of a rural track program in the case where the rural hospital participating in the rural track program is redesignated as urban.

- In this scenario, the rural hospital is redesignated as urban during the cap-building period for the urban hospital’s rural track FTE limitation. The urban hospital (referred to as the “original” urban hospital) and the rural hospital are participating in training residents in a rural track program that begins July 1, 2014. Effective October 1, 2014, the rural hospital is redesignated as urban. Because urban teaching hospitals have a 3-year cap-building period in which to grow their rural track FTE limitation, the timeframe for the “original” urban hospital to build the rural track program for purposes of calculating its rural track FTE limitation will be July 1, 2014 (when the program begins) through June 30, 2017. In addition, for purposes of meeting the requirement that residents in a rural track program spend more than one-half of their time training at a rural site, the “original” urban hospital will have a transition period that lasts from October 1, 2014 (the implementation date of the new OMB delineations) through June 30, 2017 (the end of the *second* residency training year following the implementation date of the new OMB delineations, instead of September 30, 2016, as proposed). During the time period of October 1, 2014 through June 30, 2017, the redesignated urban hospital would continue participating as a rural hospital and the “original” urban hospital would count FTE residents it is training that are in the rural track for IME and direct GME. However, in order for the “original” urban hospital to receive a rural track FTE limitation effective July 1, 2017, and to continue to get paid for its rural track program after June 30, 2017, by June 30, 2017, the redesignated urban hospital must either reclassify as rural under § 412.103 of the regulations for purposes of IME payment only, or the “original” urban

hospital must find a new geographically rural hospital or nonprovider site to train the residents in the rural track for more than one-half of their training. If neither of these conditions is met, by June 30, 2017, the “original” urban hospital would not be able to receive payment for that specific program as a rural training track under § 413.79(k)(1) or (k)(2) because it would no longer meet the requirement that more than one-half of the training be provided in a rural setting. If at some point later, the “original” urban hospital is able to find a new rural site to participate in the rural track program, the “original” urban hospital would be able to receive a rural track FTE limitation based on the training that occurred from July 1, 2014 through June 30, 2017, and be paid for residents training in the rural track.

- Another scenario could be one in which the rural hospital is redesignated as urban after the 3-year cap-building period for the “original” urban hospital’s rural track FTE limitation has passed. For example, the rural track program began July 1, 2007, but effective October 1, 2014, the rural hospital is redesignated as urban. Again, in this example, the “original” urban teaching hospital has a transition period that runs from October 1, 2014 through June 30, 2017 (instead of September 30, 2016, as proposed). In this scenario, by June 30, 2017, either the redesignated urban hospital must reclassify to rural under § 412.103 for purposes of receiving IME payment only, or the “original” urban hospital must find a new geographically rural site that can participate as the rural site for purposes of the rural track. If neither of these conditions is met by June 30, 2017, the “original” urban hospital would not be able to receive payment for that specific program as a rural track under § 413.79(k)(1) or (k)(2) because it would no longer meet the requirement that more than one-half of the training must be provided in a rural setting. If at some point later, the “original” urban hospital is able to find a new rural site to participate in the rural track program, the “original” urban hospital would be able to use its rural track FTE limitation and be paid for residents training in the rural track.

Comment: Several commenters had concerns regarding rural tracks in general and concerns about what they believed would be unintended consequences resulting from the proposed policies. Commenters recommended that changes to OMB delineations be carefully managed with respect to rural track programs. Commenters stated that rural track programs are one of the best ways to

expose residents to practicing in rural areas which, in turn, helps to address physician shortages in those areas. Commenters stated that if a rural hospital is the rural site for a rural track program and that rural hospital is subsequently redesignated as urban, it may not want to reclassify back to rural for a variety of reasons. Commenters stated that if the newly redesignated urban hospital does not want to reclassify back to rural and the “original” urban hospital wants to train residents in another rural area, the “original” urban hospital does not have any means by which to grow its cap. Commenters stated that even if the rural track program would be able to find and move to a different rural site, because the program would usually have the same staff and program director, CMS’ policies would consider the program to be an existing program rather than a new program, and therefore, a rural hospital that is a new site for purposes of the rural track program would not be able to receive a cap adjustment for training residents in that program. Commenters stated that it is within CMS’ purview to address this problem by changing the definition of a “new” program through the authority provided to the Secretary under section 1886(h)(4)(H)(i) of the Act, which states, “[in] promulgating such rules for purposes of subparagraph (F), the Secretary shall give special consideration to facilities that meet the needs of underserved rural areas.” Commenters believed CMS could use this authority to allow rural hospitals that are new rural track participants to receive a cap adjustment for training residents in the existing rural track program.

One commenter expressed concern that CMS, in its rulemaking, has not provided enough consideration to the promoting of physician training in rural areas. The commenter referred to a study by Candice Chen, MD, et al, in *Academic Medicine*, which “reports that only 4.8% of all graduates of 759 sponsoring institutions practiced in rural areas and 198 of those 759 institutions produced no rural physicians. This percentage compares extremely unfavorably to the 19.3% of the population classified as rural by the 2010 census.” The commenter stated that it expects that hospitals that have been reclassified as urban will still have a focus on training residents to practice in rural areas. The commenter stated that CMS should realize that the training these hospitals provide is more important than the location of these hospitals, and therefore, CMS should

give special consideration to residents training in programs at these hospitals by changing its definition of “new” programs. The commenter included comments it previously submitted on the clarification of the definition of new residency training programs in the rule in the May 22, 2009 **Federal Register**.

Response: We appreciate the commenters’ support of residency training in rural areas, and we may consider their general concerns regarding CMS’ policies related to new programs and training in rural areas for future rulemaking. However, because we did not specifically propose any changes to our existing policy regarding what constitutes a “new” versus an “existing” program, we are not addressing those comments at this time. Instead, we wish to focus on several of the commenters’ concerns specifically related to our proposals in the FY 2015 IPPS/LTCH PPS proposed rule.

In response to the commenters’ concerns that if the “original” urban hospital wishes to establish training in another rural area, there is no way for the “original” urban hospital to grow its cap, we believe that the commenters have misunderstood our proposal. We proposed that if the “original” urban hospital does find a new rural hospital for its existing rural track program, the original urban hospital *would be able to apply its existing rural track FTE limitation* to the residents that train at its hospital as part of that rural track. In addition, if the “original” urban hospital was not able to receive a rural track FTE limitation because either the redesignated urban hospital did not reclassify back to rural for IME payment purposes during the transition period or the “original” urban hospital was not able to find a new rural site during the transition period, but either of these conditions is met in the future, the “original” urban hospital would receive a rural track FTE limitation at that time, based on the training that occurred during the 3-year cap-building period for the rural track FTE limitation. We also point out that if the “original” urban hospital moves the rural portion of its training to a nonprovider site that is located in a geographically rural area, under existing regulations at 42 CFR 413.79(k)(2), the “original urban” hospital may continue to count the FTE residents training in the rural nonprovider site for more than one-half the duration of the program up to its own existing rural track FTE limitation. In addition, if in the future, the “original” urban hospital would want to develop a rural track program in a different specialty, it would be able to receive a separate rural track FTE

limitation for that rural track program in a different specialty.

In terms of any potential cap adjustment for a rural hospital that trains residents as part of the rural track, if the rural track is considered a new program for Medicare payment purposes, and if at the time that the “original” urban hospital moves the program to the new rural hospital, the new rural training track is still within its cap-building period, any rural hospital that trains residents in that new program during the cap-building period for that new program will receive a permanent cap adjustment. Therefore, if the “original” urban hospital is able to find a new rural hospital to participate in the rural track during the cap-building period for the new rural track program, that new rural hospital will, in fact, also be able to receive a cap adjustment and receive direct GME and IME payments for training residents in the new rural track program.

After consideration of the public comments we received, we are finalizing a policy that if a rural hospital is training residents in a rural training track and is in an area redesignated by OMB as urban during the 3-year period that is used to calculate the “original” urban hospital’s rural track FTE limitation, the “original” urban hospital may receive a cap adjustment for that rural track after the rural hospital has been redesignated as urban. However, regardless of whether the redesignation of the rural hospital occurs during the 3-year period that is used to calculate the “original” urban hospital’s rural track FTE limitation, or even after the 3-year period used to calculate the “original” urban hospital’s rural track FTE limitation, the redesignated urban hospital may continue to be considered a rural hospital for purposes of the rural track for the term of a transition period. That transition period begins effective with the date the new OMB delineations are implemented by CMS and lasts through the end of the second residency training year following the implementation date of the new OMB delineations. By the end of the transition period, either the redesignated urban hospital must reclassify as rural under § 412.103 for purposes of IME payment only (in addition, this reclassification option only applies to IPPS hospitals, not nonprovider sites), or the “original” urban hospital must have found a new site in a geographically rural area that will serve as the rural site for purposes of the rural track in order for the “original” urban hospital to receive payment under § 413.79(k)(1) or (k)(2).

The finalized regulations at § 413.79(k)(7) state the following:

- Effective prior to October 1, 2014, if an urban hospital had established a rural track training program under the provisions of paragraph (k) with a hospital located in a rural area and that rural area subsequently becomes an urban area due to the most recent census data and implementation of the new labor market area definitions announced by OMB on June 6, 2003, the urban hospital may continue to adjust its FTE resident limit in accordance with paragraph (k) for the rural track programs established prior to the adoption of such new labor market area definitions. In order to receive an adjustment to its FTE resident cap for a new rural track residency program, the urban hospital must establish a rural track program with hospitals that are designated rural based on the most recent geographical location designations adopted by CMS.

- Effective October 1, 2014, if an urban hospital started a rural track training program under the provisions of paragraph (k) with a hospital located in a rural area and, during the 3-year period that is used to calculate the urban hospital’s rural track FTE limit, that rural area subsequently becomes an urban area due to the most recent OMB standards for delineating statistical areas adopted by CMS and the most recent Census Bureau data, the urban hospital may continue to adjust its FTE resident limit in accordance with paragraph (k) and subject to paragraph (k)(7)(iii) for the rural track programs started prior to the adoption of such new OMB standards for delineating statistical areas.

- Effective October 1, 2014, if an urban hospital started a rural track training program under the provisions of paragraph (k) with a hospital located in a rural area and that rural area subsequently becomes an urban area due to the most recent OMB standards for delineating statistical areas adopted by CMS and the most recent Census Bureau data, regardless of whether the redesignation of the rural hospital occurs during the 3-year period that is used to calculate the urban hospital’s rural track FTE limit, or after the 3-year period used to calculate the urban hospital’s rural track FTE limit, the urban hospital may continue to adjust its FTE resident limit in accordance with paragraph (k) based on the rural track programs started prior to the change in the hospital’s geographic designation. In order for the urban hospital to receive or use the adjustment to its FTE resident cap for training FTE residents in the rural track residency

program that was started prior to the most recent OMB standards for delineating statistical areas adopted by CMS, one of the following two conditions must be met by the end of a period that begins when the most recent OMB standards for delineating statistical areas are adopted by CMS and continues through the end of the second residency training year following the date the most recent OMB delineations are adopted by CMS: the hospital that has been redesignated from rural to urban must reclassify as rural under § 412.103, for purposes of IME only; or the urban hospital must find a new site that is geographically rural consistent with the most recent geographical location delineations adopted by CMS. In order to receive an adjustment to its FTE resident cap for an additional new rural track residency program, the urban hospital must participate in a rural track program with sites that are geographically rural based on the most recent geographical location delineations adopted by CMS.

We also have determined that there is an outdated, incorrect reference included in the definition of “Rural track FTE limitation” under § 413.75(b). The reference included in the definition is “§ 413.79(l)”. The correct reference is “§ 413.79(k)”. Therefore, as we proposed, we are making a technical correction to the definition of “Rural track FTE limitation” so that it means the maximum number of residents (as specified in § 413.79(k)) training in a rural track residency program that an urban hospital may include in its FTE count and that is in addition to the number of FTE residents already included in the hospital’s FTE cap.

4. Clarification of Policies on Counting Resident Time in Nonprovider Settings Under Section 5504 of the Affordable Care Act

In the November 24, 2010 final rule with comment period (75 FR 71808, 72134 through 72141, and 72153), we implemented section 5504 of the Affordable Care Act regarding counting resident time in nonprovider settings. We also mentioned the scope of section 5504 of the Affordable Care Act in the FY 2014 IPPS/LTCH PPS proposed rule (78 FR 27638) and final rule (78 FR 50735). Section 5504(a) of the Affordable Care Act made changes to section 1886(h)(4)(E) of the Act to reduce the costs that hospitals must incur for residents training in nonprovider sites in order to count the FTE residents for purposes of Medicare direct GME payments, but did so only on a prospective basis in connection with certain specified cost reporting

periods. Notably and more specifically, section 5504(a)(3) of the Affordable Care Act amended the Act effective only for “cost reporting periods beginning on or after July 1, 2010,” for direct GME, to permit hospitals to count the time that a resident trains in activities related to patient care in a nonprovider site in its FTE count if the hospital incurs the costs of the residents’ salaries and fringe benefits for the time that the resident spends training in the nonprovider site. Section 5504(b)(2) of the Affordable Care Act made similar changes to section 1886(d)(5)(B)(iv) of the Act for IME payment purposes, with the provision being effective only for discharges occurring on or after July 1, 2010, for IME. In connection with those periods and discharges, if more than one hospital incurs the residency training costs in a nonprovider setting, under certain circumstances, sections 5504(a)(3) and (b)(2) of the Affordable Care Act allow each hospital to count a proportional share of the training time that a resident spends training in that setting, as determined by a written agreement between the hospitals. When Congress enacted section 5504 of the Affordable Care Act, it retained the statutory language which provides that a hospital can only count the time so spent by a resident under an approved medical residency training program in its FTE count if that one single hospital by itself “incurs all, or substantially all, of the costs for the training program in that setting.” In doing so, Congress also revised the statutory language in sections 5504(a)(1) and (b)(1) to explicitly make this longstanding substantive standard and requirement applicable to “cost reporting periods beginning before July 1, 2010” for direct GME, and to “discharges occurring on or after October 1, 1997, and before July 1, 2010,” for IME (sections 1886(d)(5)(B)(iv)(I) and 1886(h)(4)(E)(i) of the Act). Beginning at least as early as 1988, the Secretary consistently noted in the preamble of various rules that the statute only allowed a hospital to count the time that its residents spent training in a nonprovider site in the FTE resident count for direct GME and IME purposes if that single hospital incurred “all of substantially all” of the costs of the training program in that setting. Indeed, in *Borgess Medical Center v. Sebelius* (966 F.Supp.2d at *6–*7 (D.D.C. 2013)), a court noted that CMS had done so in 1998, 2003, and 2007 preambles of rules. For a full discussion of the longstanding substantive standard and requirement that a hospital can only count residents training if that one single hospital incurs all or

substantially all of the costs for the training, we refer readers to the discussion in the November 24, 2010 final rule with comment period (75 FR 72134 through 72141), the May 11, 2007 final rule (72 FR 26953 and 26969), the August 1, 2003 final rule (68 FR 45439), the July 31, 1998 final rule (63 FR 40954 and 40995), the September 29, 1989 final rule (54 FR 40286 and 40288), and the September 21, 1988 proposed rule (53 FR 36589 and 36591).

Section 5504(c) of the Affordable Care Act specifies that the amendments made by the provisions of sections 5504(a) and (b) “shall not be applied in a manner that requires reopening of any settled hospital cost reports as to which there is not a jurisdictionally proper appeal pending as of the date of the enactment of this Act on the issue of payment for indirect costs of medical education . . . or for direct graduate medical education costs. . . .” The date of enactment of the Affordable Care Act was March 23, 2010.

In the November 24, 2010 final rule with comment period, we revised the regulations at § 412.105(f)(1)(ii)(E) for IME and §§ 413.78(f) and (g) for direct GME to reflect the changes made by section 5504 of the Affordable Care Act. Section 413.78(g) is the implementing regulation that corresponds to the statutory amendments set forth in sections 5504(a)(3) and (b)(2) of the Affordable Care Act. The introductory regulatory language of § 413.78(g) explicitly states that paragraph (g) governs only “cost reporting periods beginning on or after July 1, 2010.” Paragraph (g)(5) of § 413.78 also expressly states that the paragraph is limited to “cost reporting periods beginning on or after July 1, 2010.” Accordingly, we have repeatedly stated, and we believe that the existing regulation makes plain, that paragraph (g) of § 413.78 “is explicitly made applicable only to ‘cost reporting periods beginning on or after July 1, 2010,’ whereas earlier cost reporting periods are governed by other preceding paragraphs of § 413.78” (78 FR 50735). In addition, we also revised the definition of “all or substantially all of the costs for the training program in the nonhospital setting” in the regulations at § 413.75(b) to reflect that both the statute and regulations require that, for cost reporting periods beginning on and after July 1, 2007 and before July 1, 2010, one hospital must by itself incur “all or substantially all of the costs” of the residents training in the nonprovider site in order for the hospital to receive Medicare IME and direct GME payment for that training. Finally, we also revised the IME

regulations at § 412.105 to reflect these statutory amendments, by incorporating by reference § 413.78(g).

Despite the fact that sections 5504(a) and (b) of the Affordable Care Act provide clear effective dates with respect to the amendments provided therein to sections 1886(h)(4)(E) and 1886(d)(5)(B)(iv) of the Act, and that the preamble discussion of the implementation of these provisions and further discussion of the statutory amendments in the November 24, 2010 final rule with comment period and in the August 19, 2013 final rule provide further explanation that, specifically, nothing in section 5504(c) overrides those effective date (75 FR 72136), we have received questions about the applicability of section 5504(c) and the associated regulation text at § 413.78(g)(6). Specifically, questions have been raised with respect to the applicability of sections 5504(c) of the Affordable Care Act and § 413.78(g)(6) of the regulations to periods prior to July 1, 2010, particularly if a hospital had, as of March 23, 2010, appealed an IME or direct GME issue for a settled cost reporting period occurring prior to July 1, 2010. As noted earlier, section 5504(c) of the Affordable Care Act provides that the amendments made by the provisions of sections 5504(a) and (b) “shall not be applied in a manner that requires reopening of any settled hospital cost reports as to which there is not a jurisdictionally proper appeal pending as of . . . [March 23, 2010] on the issue of payment for indirect costs of medical education . . . or for direct graduate medical education costs. . . .”

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28153), we stated that upon revisiting the existing regulation text, we determined that § 413.78(g)(6) was not written in a manner that is as consistent with section 5504(c) of the Affordable Care Act and reflective of our reading of section 5504 and our policy as it could be. Specifically, § 413.78(g)(6) states that the provisions of paragraphs (g)(1)(ii), (g)(2), (g)(3), and (g)(5) of the section cannot be applied in a manner that would require the reopening of settled cost reports, except those cost reports on which there is a jurisdictionally proper appeal pending on direct GME or IME payments as of March 23, 2010. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28152 through 28154 and 28307), we reiterated our existing interpretation of the statutory amendments made by sections 5504(a), (b), and (c) of the Affordable Care Act and also proposed to clarify the regulation text implementing these provisions by revising the language at § 413.78(g)(6) to

read more consistently with our reading of section 5504 and the language in section 5504(c) of the Affordable Care Act and to ensure no further confusion with respect to the applicability of section 5504(c) of the Affordable Care Act and § 413.78(g)(6) of the regulations.

We believe that sections 5504(a) and (b) of the Affordable Care Act contained three primary directives (a fourth regarding recordkeeping requirement is tangential to this discussion): (1) under sections 5504(a)(1) and (b)(1) of the Affordable Care Act (sections 1886(h)(4)(E)(i) and 1886(d)(5)(B)(iv)(I) of the Act), for “cost reporting periods beginning before July 1, 2010” for direct GME, and for “discharges occurring on or after October 1, 1997, and before July 1, 2010” for IME, these sections explicitly retained the statutory language that provides that a hospital can only count the time so spent by a resident under an approved medical residency training program in its FTE count if a hospital by itself “incurs all, or substantially all, of the costs for the training program in that setting”; (2) under sections 5504(a)(3) and (b)(2) of the Affordable Care Act (sections 1886(h)(4)(E)(ii) and 1886(d)(5)(B)(iv)(II) of the Act), for “cost reporting periods beginning on or after July 1, 2010” for direct GME, and for “discharges occurring on or after July 1, 2010” for IME, these sections eliminated the “all or substantially all” requirement, instead requiring a hospital to incur the residents’ salaries and fringe benefits for the time spent at the nonprovider site; and (3) under sections 5504(a)(3) and (b)(2) of the Affordable Care Act (sections 1886(h)(4)(E)(ii) and 1886(d)(5)(B)(iv)(II) of the Act), for “cost reporting periods beginning on or after July 1, 2010” for direct GME, and for “discharges occurring on or after July 1, 2010” for IME, these sections created a new provision with regard to allowing more than one hospital to share the costs of residents training in a nonprovider setting under certain circumstances, in order for each hospital to count a proportional share of the FTE training time in the nonprovider setting.

Separately from sections 5504(a) and (b) of the Affordable Care Act, section 5504(c) of the Affordable Care Act, as mentioned earlier, specifies that the amendments made by the provisions of sections 5504(a) and (b) “shall not be applied in a manner that requires reopening of any settled hospital cost reports as to which there is not a jurisdictionally proper appeal pending as of” March 23, 2010, the date of the enactment of the Affordable Care Act, on the issue of payment for IME and

direct GME. When we proposed to implement section 5504(c) in the August 3, 2010 proposed rule (75 FR 46385) and when we implemented section 5504(c) in the November 24, 2010 final rule with comment period (75 FR 72136), we had to consider what new meaning it was adding to sections 5504(a) and (b) of the Affordable Care Act because unlike, for example, section 5505 of the Affordable Care Act which has an effective date *prior* to enactment of the Affordable Care Act and, therefore, would apply to prior cost reporting periods, section 5504’s applicable effective date for the new standards it creates was July 1, 2010, a date that came *after* enactment of the Affordable Care Act and was fully prospective. As we stated in the November 24, 2010 final rule with comment period (75 FR 72136), “Section 5504 is fully prospective with an explicit effective date of July 1, 2010, for the new standards it creates. Nothing in section 5504(c) overrides that effective date. Section 5504(c) merely notes that the usual discretionary authority of Medicare contractors to reopen cost reports is not changed by the provisions of section 5504; it simply makes clear that Medicare contractors are not required by reason of section 5504 to reopen any settled cost report as to which a provider does not have a jurisdictionally proper appeal pending. It does not require reopening in any circumstance; and the new substantive standard is, in any event, explicitly prospective. We believe if Congress had wanted to require such action or to apply the new standards to cost years or discharges prior to July 1, 2010, it would have done so in far more explicit terms.” We also noted in that rule (75 FR 72139) that “[the] statute does not provide CMS discretion to allow the counting of resident time spent in shared nonprovider site rotations for cost reporting periods beginning prior to July 1, 2010.” We continue to believe that Congress was clear in amending sections 1886(h)(4)(E) and 1886(d)(5)(B)(iv) of the Act to provide for new standards to be applied only prospectively, effective for cost reporting periods beginning on or after, and discharges occurring on or after, July 1, 2010. We also continue to believe that the plain meaning of section 5504(c) of the Affordable Care Act is that the Secretary is not required to reopen a cost report when there is *no* jurisdictionally proper appeal pending as of March 23, 2010, the date of the enactment of the Affordable Care Act, on the issue of payment for IME and direct GME. Therefore, we believe that

section 5504(c) of the Affordable Care Act is merely a confirmation of the Secretary’s existing discretionary authority in one particular context, and that sections 5504(a) and (b) of the Affordable Care Act and their effective dates become all the more prominent, and are not affected by section 5504(c).

As noted earlier, we revised the regulations at § 412.105(f)(1)(ii)(E) for IME, and § 413.78(g) for direct GME, to reflect the changes made by section 5504 of the Affordable Care Act in the November 24, 2010 final rule with comment period. We reiterate here that the introductory language of § 413.78(g) explicitly states that paragraph (g) governs only “cost reporting periods beginning on or after July 1, 2010” and paragraph (g)(5) also expressly states that the paragraph is limited to “cost reporting periods beginning on or after July 1, 2010” (78 FR 50735 and 78 FR 27639). As we noted before, we believe that the paragraphs of the regulations which precede paragraph (g), particularly paragraphs (c) through (f), consistent with the statute, make clear that a hospital may only count the time so spent by a resident under an approved medical residency training program in its FTE count, in connection with its pre-July 1, 2010 cost reporting periods and pre-July 1, 2010 patient discharges, if that one single hospital by itself “incurs all, or substantially all, of the costs for the training program in that setting.” Separately, we believe that the new standards set forth in sections 5504(a)(3) and (b)(2) of the Affordable Care Act and implemented by regulation at §§ 413.78(g) and 412.105(f)(1)(ii)(E), allowing cost sharing under certain circumstances do *not* ever apply to pre-July 1, 2010 cost reporting periods and pre-July 1, 2010 patient discharges. Moreover, we continue to believe the language in paragraph (g)(6) (along with the remainder of paragraph (g)) only applies to cost reporting periods beginning on or after July 1, 2010 and does *not* apply retroactively to cost reporting periods beginning before July 1, 2010. We had intended that the language under § 413.78(g)(6) do no more than simply paraphrase the language in section 5504(c) of the Affordable Care Act.

Accordingly, we believe that it is apparent that the provisions of sections 5504(a)(3) and (b)(2) of the Affordable Care Act are not to be applied prior to July 1, 2010, irrespectively of whether a hospital may have had a jurisdictionally proper appeal pending as of March 23, 2010, on an IME or direct GME issue from a cost reporting period occurring prior to July 1, 2010.

In the FY 2015 IPPS/LTCH PPS proposed rule, we reiterated our existing interpretation of the statutory amendments made by sections 5504(a) and (b) of the Affordable Care Act and also proposed to clarify the regulatory text that implements these provisions by revising the § 413.78(g)(6) to be more consistent with the language at section 5504(c) of the Affordable Care Act. We proposed to revise the regulatory language to read as follows: “The provisions of paragraphs (g)(1)(ii), (g)(2), (g)(3), and (g)(5) of this section shall not be applied in a manner that requires reopening of any settled cost reports as to which there is a jurisdictionally proper appeal pending as of March 23, 2010, on direct GME or IME payments. Cost reporting periods beginning before July 1, 2010 are not governed by paragraph (g) of this section.” The IME regulation at § 412.105(f)(1)(ii)(E) includes a reference to § 413.78(g)(6); therefore, no proposed change was needed to this section.

Comment: One commenter supported CMS’ proposed changes with regard to implementation of section 5504 of the Affordable Care Act. Other commenters objected to CMS’ interpretation that section 5504 is fully prospective with an effective date of July 1, 2010, and that CMS’ proposed revision of § 413.78(g)(6) would be with a “retroactive effective date.” The commenters asserted that CMS’ interpretation is contrary to the plain meaning of the statute because Congress expected that cost reports that were settled prior to 2010 would not be reopened, thereby explicitly adding under section 5504(c) that if the cost report was not settled, and if there was a jurisdictionally proper appeal pending as of the date of the enactment of the Affordable Care Act, the provisions of section 5504 would apply. One commenter noted that an interpretation must “give effect, if possible, to every clause and word of the statute” (*United States v. Menasche*, 348 U.S. 528, 538–39 (1955)). The commenter therefore believed that subsection (c) would be superfluous if section 5504 were only prospective, particularly considering that Congress had no need to instruct the Secretary not to do something that she would not have done anyway (that is, reopen cost reports without a statutory mandate). The commenters asserted that CMS, in the August 3, 2010 proposed rule (75 FR 46385), initially interpreted section 5504(c) to effectively override the directives in sections 5504(a) and (b) and to require reopening and application of the new standards set forth in section 5504(a)(3) and section 5504(b)(2) to pre-July 1, 2010 cost

reporting periods and patient discharges whenever a hospital had a pending, jurisdictionally proper appeal pending on a direct GME or IME issue as of March 23, 2010. The commenters also did not believe it is appropriate for CMS to contend that section 5504 is strictly prospective but, at the same time, propose to clarify an amendment to the regulations at § 413.78(g)(6) “with retroactive effect to 2010.” One commenter argued that a final rule must be a “logical outgrowth” of the proposed rule, and the final regulation implemented in the November 24, 2010 final rule with comment period was the same as that proposed. The commenter surmised that CMS “likely did not revise the final codified regulation in order to avoid a challenge that the final rule was not the ‘logical outgrowth’ of the proposed rule,” and asserted that CMS’ proposed clarification of § 413.78(g)(6) in the FY 2015 IPPS/LTCH PPS proposed rule cannot be applied prior to October 1, 2014. The commenters suggested that the Secretary and CMS reconsider its proposal to change § 413.78(g)(6), and acknowledge that, as promulgated in the November 24, 2010 final rule with comment period, § 413.78(g)(6) required reopening of a hospital cost report for which a jurisdictionally proper appeal was pending regarding GME and/or IME as of the date of enactment of the Affordable Care Act.

Response: We agree with the commenters that some meaning must be attributed to the statutory language at section 5504(c) of the Affordable Care Act that the amendments made by the provisions of sections 5504(a) and (b) “shall not be applied in a manner that requires reopening of any settled hospital cost reports as to which there is not a jurisdictionally proper appeal pending as of the date of the enactment of this Act on the issue of payment for indirect costs of medical education . . . or for direct graduate medical education costs. . . .” Congress knows how to explicitly provide for retroactive application or apply new standards to pending appeals when it so desires. Indeed, the same statute at issue here, the Affordable Care Act, contains numerous sections that, unlike section 5504 of the Affordable Care Act, are either explicitly retroactive or *expressly* apply new standards to pending appeals. For example, section 5505 of the Affordable Care Act (unlike section 5504) contains *explicitly* retroactive language. Section 5505 (c)(1) of the Affordable Care Act states, “[e]xcept as otherwise provided, the Secretary . . . shall implement the amendments made

by this section in a manner so as to apply to cost reporting periods beginning on or after January 1, 1983”; section 5505(c)(2) instructs that a subsection “shall apply to cost reporting periods beginning on or after July 1, 2009”; section 5505(c)(3) instructs that another subsection “shall apply to cost reporting periods beginning on or after October 1, 2001”. Section 5504 has nothing comparable to the express retroactive language which is to be found in section 5505. As another example, section 1556(c) is explicitly retroactively and expressly applies a standard to pending appeals, unlike section 5504 of the Affordable Care Act. Section 1556(c) of the Affordable Care Act states, “[t]he amendments made by this section shall apply with respect to claims filed under [a 1976 statute] after January 1, 2005, that are pending on or after the date of enactment of this Act”. The fact that Congress was explicit when it intended for particular provisions of the Affordable Care Act to apply retroactively and/or to apply to pending proceedings, but section 5504 of the Affordable Care Act contains no such statements, suggests that Congress did not intend for the new substantive standards set forth in sections 5504(a)(3) and (b)(2) of the Affordable Care Act to apply to earlier periods and discharges and/or to pending appeals. Instead, we can presume that Congress acted intentionally and purposely by omitting such language in section 5504 of the Affordable Care Act. As we explained in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28152 through 28154), when we proposed to implement section 5504(c) in the August 3, 2010 proposed rule (75 FR 46385), and when we implemented section 5504(c) in the November 24, 2010 final rule with comment period (75 FR 72136), we had to consider what new meaning it was adding to sections 5504(a) and (b) of the Affordable Care Act because unlike, for example, section 5505 of the Affordable Care Act, which has an effective date *prior* to enactment of the Affordable Care Act and, therefore, would apply to prior cost reporting periods, section 5504’s applicable effective date for the new standards it creates was July 1, 2010, a date that came *after* enactment of the Affordable Care Act and was fully prospective (the new standards being that hospitals would be permitted to count the time that a resident trains in activities related to patient care in a nonprovider site in its FTE count if the hospital incurs the costs of the residents’ salaries and fringe benefits for the time that the resident spends training in the nonprovider site, and if

more than one hospital incurs the residency training costs in a nonprovider setting, under certain circumstances, each hospital could count a proportional share of the training time that a resident spends training in that setting). As we stated in the November 24, 2010 final rule with comment period (75 FR 72136), “Section 5504 is fully prospective with an explicit effective date of July 1, 2010, for the new standards it creates. Nothing in section 5504(c) overrides that effective date. Section 5504(c) merely notes that the usual discretionary authority of Medicare contractors to reopen cost reports is not changed by the provisions of section 5504; it simply makes clear that Medicare contractors [MACs] are not required by reason of section 5504 to reopen any settled cost report as to which a provider does not have a jurisdictionally proper appeal pending. It does not require reopening in any circumstance; and the new substantive standard is, in any event, explicitly prospective. We believe if Congress had wanted to require such action or to apply the new standards to cost years or discharges prior to July 1, 2010, it would have done so in far more explicit terms.”

Therefore, we believe we were clear in the November 24, 2010 final rule with comment period that we did not interpret section 5504(c) to override the clear directives in sections 5504(a) and (b) concerning the substantive standards that would apply to pre- and post-July 1, 2010 cost reporting periods and discharges. We rejected the notion there that section 5504(c) requires reopening and application of the new, more generous standard (which sections 5504(a)(3) and (b)(2) created and expressly made “effective” only for cost reporting periods beginning and discharges occurring “on or after July 1, 2010”) to earlier periods and discharges whenever a hospital had a jurisdictionally proper appeal pending on direct or indirect GME as of the Affordable Care Act’s enactment. Since that time, we have maintained our position that the new, more generous standard set forth in sections 5504(a)(3) and (b)(2) only apply to cost reporting periods beginning, and discharges occurring, “on or after July 1, 2010.” We have at the same time noted that Congress chose in sections 5504(a) and (b) to explicitly and pointedly retain the longstanding statutory substantive standard (that requires a single hospital to incur “all, or substantially all” of the costs of the nonprovider residency training before it may receive Medicare direct GME and IME payment for that

training), and make it applicable to pre-July 1, 2010 cost reporting periods and discharges, while creating a new, more generous standard which it directed would apply to later periods and discharges. It is Congress who decided that the July 1, 2010 date would be significant, and we are honoring the choice Congress made. Therefore, we disagree with the commenters that it is inappropriate for CMS to propose to clarify an amendment to the regulations at § 413.78(g)(6) “with retroactive effect to 2010.” Moreover, we have consistently expressed our position that the new substantive standards which sections 5504(a)(3) and (b)(2) added to the Medicare statute apply only to cost reporting periods beginning, and discharges occurring, on or after July 1, 2010 (75 FR 46385) and 75 FR 72136). Accordingly, our proposed clarification of § 413.78(g)(6) reiterating our existing interpretation of the statutory amendments made by sections 5504(a) and (b) of the Affordable Care Act is appropriate.

Commenters argued that CMS’ statements in the August 3, 2010 proposed rule initially interpreted section 5504(c) to mean that section 5504 could be applied retroactively to hospitals that indeed had a pending, jurisdictionally proper appeal pending on a direct GME or IME issue as of March 23, 2010. However, the commenters misapprehended the position we took in the August 3, 2010 proposed rule. While it is true that the proposed rule defined the meaning of the term “pending, jurisdictionally proper appeal” that appears in section 5504(c) of the Affordable Care (75 FR 46385), it did *not* state that reopening was required when a hospital had such an appeal pending as of the date of enactment or in other circumstances. In addition, it never stated that the new standard set forth in sections 5504(a) and (b) could ever apply to a cost reporting period beginning prior to July 1, 2010 for direct GME purposes, or to a discharge occurring before July 1, 2010 for IME purposes. Quite to the contrary, the proposed rule noted that “[f]or direct GME payments, [section 5504] is effective for cost reporting periods beginning on or after July 1, 2010; for IME payments, the provision is effective for discharges occurring on or after July 1, 2010” (75 FR 46385 and 46386 (along similar lines)), and advised that: “We are proposing to revise our regulation at § 413.75(b) accordingly to conform to these new statutory requirements [in section 5504 of the Affordable Care Act]. Specifically, we are proposing to revise the existing definition of “all or

substantially all of the costs for the training program in the nonhospital setting” to be effective for cost reporting periods beginning on or after July 1, 2007, and before July 1, 2010. We also are proposing to add a new § 413.78(g) that details how hospitals should count residents that train in nonhospital sites for cost reporting periods beginning on or after July 1, 2010.”

Therefore, the August 3, 2010 proposed rule recognized that section 5504 required pre-July 1, 2010 cost reporting periods and discharges to be subject to the longstanding requirement that a single hospital incur all or substantially all of the costs of residents training in a nonprovider site, not the new, more generous standard set forth in section 5504(a) and (b) of the Affordable Care Act. As noted, in the November 24, 2010 final rule, in response to comments, the Secretary only made it even more explicit that she did not read section 5504(c) to require her to retroactively apply the new substantive standard in sections 5504(a) and (b) to pre-July 1, 2010 cost reporting periods and discharges (75 FR 72136 and 72153).

At least one court has held that our reading of section 5504 and the implementing regulation is reasonable and has rejected many of the arguments that the commenters made. The Eastern District of Michigan has recognized that “while section 5504(c) [of the Affordable Care Act] establishes that if there was not a pending appeal concerning a final cost report when the Affordable Care Act was enacted, that cost report will not be reopened, section 5504(c) does not establish that if there was a pending appeal concerning a final cost report when the Affordable Care Act was enacted, that cost report must be reopened; on this point the statute is silent,” and “Congress expressly indicated in the statute itself what standards apply to what cost periods” in sections 5504(a) and (b) of the Affordable Care Act (*Covenant Medical Center v. Sebelius*, No. 12–12901, 2014 WL 340247, at *8–*10 (E.D. Mich. Jan. 30, 2014)). The district court also noted that our reading of section 5504 gives effect to every clause and word of the provision as it honors the effective dates and standards prescribed in sections 5504(a) and (b). The court further noted that the current version of 42 CFR 413.78(g)(6) is “almost identical to section 5504(c)” and held that CMS’ “interpretation of § 5504(c) is not undermined by her identical conclusion regarding section 413.78(g)(6)” (*Covenant Medical Center v. Sebelius*, No. 12–12901, 2014 WL 340247, at *11–12 (E.D. Mich. Jan. 30, 2014)). Therefore,

we disagree with the commenter that surmised that, in the November 24, 2010 final rule with comment period, CMS “likely did not revise the final codified regulation in order to avoid a challenge that the final rule was not the ‘logical outgrowth’ of the proposed rule.” Rather, as the court noted, the current version of 42 CFR 413.78(g)(6) is “almost identical to section 5504(c)” and held that CMS’ “interpretation of § 5504(c) is not undermined by her identical conclusion regarding section 413.78(g)(6)” (*Covenant Medical Center v. Sebelius*, No. 12–12901, 2014 WL 340247, at *11–12 (E.D. Mich. Jan. 30, 2014)). We had intended that the language under § 413.78(g)(6) do no more than simply paraphrase the language in section 5504(c) of the Affordable Care Act. Accordingly, we did not believe that it was necessary to revise the final regulation in the November 24, 2010 final rule with comment period. Nevertheless, as stated in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28153), because we have received questions about the applicability of section 5504(c) and the associated regulation text at § 413.78(g)(6), we took the opportunity to revisit the regulations and clarify them so that they would be even more consistent with the language at section 5504(c).

Comment: One commenter asked that CMS clarify that section 5504 “filled a gap in the law” regarding funding of residency training occurring in a nonprovider setting “by establishing for the first time the definitive law regarding Medicare payment for medical education to hospitals jointly funding training in a nonprovider setting,” and that section 5504 applies to hospitals with jurisdictionally proper appeals regarding that issue that were pending as of the date of the enactment of the Affordable Care Act.

Response: We do not agree with the commenter that section 5504 “filled a gap in the law” regarding more than one hospital incurring the costs of training residents in a nonprovider setting. Beginning at least as early as 1988, the Secretary has consistently noted in the preamble of various rules that the statute only allowed a hospital to count the time that its residents spent training in a nonprovider site in the FTE resident count for direct GME and IME purposes if *that single hospital* incurred “all of substantially all” of the costs of the training program in that setting. Indeed, in *Borgess Medical Center v. Sebelius* (966 F.Supp.2d 1 at *6–*7 (D.D.C. 2013)), a court noted that CMS had done so in 1998, 2003, and 2007 preambles of rules. For a full discussion

of the longstanding substantive standard and requirement that a hospital can only count residents training if that one single hospital incurs all or substantially all of the costs for the training, we refer readers to the discussion in the November 24, 2010 final rule with comment period (75 FR 72134 through 72141), the May 11, 2007 final rule (72 FR 26953 and 26969), the August 1, 2003 final rule (68 FR 45439), the July 31, 1998 final rule (63 FR 40954 and 40995), the September 29, 1989 final rule (54 FR 40286 and 40288), and the September 21, 1988 proposed rule (53 FR 36589 and 36591). We continue to believe that Congress was clear in amending sections 1886(h)(4)(E) and 1886(d)(5)(B)(iv) of the Act to provide for new standards to be applied only prospectively, effective for cost reporting periods beginning on or after, and discharges occurring on or after, July 1, 2010. Moreover, we continue to believe the language in paragraph (g)(6) of § 413.78 (along with the remainder of paragraph (g)) only applies to cost reporting periods beginning on or after July 1, 2010, and does *not* apply retroactively to cost reporting periods beginning before July 1, 2010. We believe that the new standards set forth in sections 5504(a)(3) and (b)(2) of the Affordable Care Act and implemented by regulation at §§ 413.78(g) and 412.105(f)(1)(ii)(E), allowing cost sharing under certain circumstances, do *not* ever apply to pre-July 1, 2010 cost reporting periods and pre-July 1, 2010 patient discharges. We had intended that the language under § 413.78(g)(6) do no more than simply paraphrase the language in section 5504(c) of the Affordable Care Act.

Accordingly, after consideration of the comments we received, we are not making any changes to our proposed clarification to the regulatory language at § 413.78(g)(6). The regulatory language at § 413.78(g)(6) states that the provisions of paragraphs (g)(1)(ii), (g)(2), (g)(3), and (g)(5) of the section shall not be applied in a manner that requires reopening of any settled cost reports as to which there is not a jurisdictionally proper appeal pending as of March 23, 2010, on direct GME or IME payments. Cost reporting periods beginning before July 1, 2010 are not governed by paragraph (g) of the section. The IME regulations at § 412.105(f)(1)(ii)(E) include a reference to § 413.78(g)(6); therefore, no change is needed to this section of the IME regulations.

5. Changes to the Review and Award Process for Resident Slots Under Section 5506 of the Affordable Care Act

In the past, if a teaching hospital closed, its direct GME and IME FTE resident cap slots would be “lost” because those cap slots are associated with a specific hospital’s Medicare provider agreement, which would be retired upon the hospital’s closure. Under existing regulations at § 413.79(h) for direct GME and § 412.105(f)(1)(ix) for IME, a hospital that is training FTE residents at or in excess of its FTE resident caps and takes in residents displaced by the closure of another teaching hospital may receive a temporary increase to its FTE resident caps so that it may receive direct GME and IME payment associated with those displaced FTE residents. However, those temporary FTE resident caps are tied to those specific displaced FTE residents, and the temporary caps expire when those displaced residents complete their training program.

Section 5506 of the Affordable Care Act amended section 1886(h)(4)(H) of the Act to add a new clause (vi) that instructs the Secretary to establish a process by regulation under which, in the event a teaching hospital closes, the Secretary will permanently increase the FTE resident caps for hospitals that meet certain criteria up to the number of the closed hospital’s FTE resident caps. The Secretary is directed to ensure that the aggregate number of FTE resident cap slots distributed shall be equal to the aggregate number of slots in the closed hospital’s direct GME and IME FTE resident caps, respectively. For a detailed discussion of the regulations implementing section 5506 of the Affordable Care Act, we refer readers to the November 24, 2010 final rule with comment period (75 FR 72212 through 72238) and the FY 2013 IPPS/LTCH PPS final rule (77 FR 53434 through 53448).

a. Effective Date of Slots Awarded Under Section 5506 of the Affordable Care Act

In distributing slots permanently under the provisions of section 5506 of the Affordable Care Act, section 5506(d) provides that “the Secretary shall give consideration to the effect of the amendments made by this section on any temporary adjustment to a hospital’s FTE cap under § 413.79(h) . . . (as in effect on the date of enactment of this Act) in order to ensure that there is no duplication of FTE slots” In consideration of this statutory language, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53437), we stated that in distributing slots permanently

under section 5506, we would be cognizant of the number of FTE residents for whom a temporary FTE cap adjustment was provided under existing regulations at § 413.79(h), and when those residents will complete their training, at which point the temporary slots associated with those displaced residents would then be available for permanent redistribution. Therefore, in initially developing ranking criteria and application materials that we would use to award available slots, we considered how to interpret this statutory language at section 5506(d) of the Affordable Care Act within the context of our existing GME regulations and section 5506's amendment to section 1886(h) of the Act generally.

In the November 24, 2010 final rule with comment period and the FY 2013 IPPS/LTCH PPS final rule (75 FR 72216 and 77 FR 53436, respectively), we discussed the various ranking criteria that we would use for hospitals applying for slots from closed hospitals. Currently, if after distributing the slots from a closed hospital to increase the FTE caps for applying hospitals that fall within Ranking Criteria One, Two, and Three, there are still excess slots available and any of those excess slots are associated with displaced residents for whom temporary cap adjustments under § 413.79(h) are in place, any slots awarded to hospitals that fall within Ranking Criteria Four through Eight are permanently assigned only once the displaced residents have completed their training and the temporary cap adjustments associated with those residents have expired. That is, in applying the requirement for "no duplication of FTE slots" set forth in section 5506(d), we currently consider all temporary cap adjustments received by hospitals on a national basis and not specifically the hospital that is applying for cap slots under section 5506, when deciding the effective date for slots permanently awarded to hospitals applying under Ranking Criteria Four through Eight. Specifically, in the November 24, 2010 final rule with comment period, we stated that we believe the "no duplication of FTE slots" requirement applies across all hospitals. Therefore, although a hospital may not have received a temporary cap adjustment under § 413.79(h), other hospitals may have taken in residents and received temporary cap adjustments for the same program, and we believed that the appropriate policy was to delay the slots associated with that program from being permanently distributed until it is known that any and all

temporary cap adjustments for those slots have expired (75 FR 72227). Applying this policy to an example, if Hospital A is training displaced residents and is receiving a temporary cap adjustment under § 413.79(h) for training those residents and Hospital B, which is not receiving a temporary cap adjustment for training any displaced residents, has applied under Ranking Criterion Five to expand its internal medicine program, as explained in the November 24, 2010 final rule with comment period, we would only award permanent slots under section 5506 to Hospital B on a flow basis; that is, effective after each displaced resident completes his/her training, and, therefore, the temporary cap adjustments associated with that resident expire at Hospital A.

However, the policy of applying the "no duplication of FTE slot" requirement at section 5506(d) of the Affordable Care Act to all hospitals rather than simply to each specific hospital that is applying for slots has thus far proven to be a very complex process due to the number of displaced residents and the timing of multiple graduation dates which must be tracked and considered when awarding slots on a permanent basis. We believe this practice has delayed the awarding of slots and is also unnecessarily burdensome for hospitals applying under Ranking Criteria Four through Eight that are not receiving any cap adjustments for training displaced residents under § 413.79(h). We believe the current policy that we apply for "no duplication of FTE slots" is unnecessarily burdensome for these hospitals because, instead of receiving their permanent slots under section 5506 as soon as possible, the hospitals may receive their section 5506 awards with staggered effective dates due to the graduation dates of displaced FTE residents training at other hospitals that did receive temporary adjustments under § 413.79(h). While we believe that awarding permanent slots to a hospital that is simultaneously receiving a temporary cap adjustment for training displaced FTE residents under § 413.79(h) would clearly be a duplication of FTE slots and contrary to the statutory directive, we believe there is flexibility in interpreting this statutory language and that the statute does not require such a policy to be applied to hospitals that are *not* receiving temporary cap adjustments under § 413.79(h). Furthermore, in considering the specific statutory language regarding "no duplication of FTE slots," section 5506(d) in part

provides that "The Secretary of Health and Human Services shall give consideration to the effect of the amendments made by this section on any temporary adjustment to a hospital's FTE cap under section 413.79(h) of title 42, Code of Federal Regulations (as in effect on the date of enactment of this Act) in order to ensure that there is no duplication of FTE slots." Because this language refers to "a hospital," we believe the statute provides us with the flexibility to apply the "no duplication of FTE slots" requirement on a hospital-specific basis, considering separately whether each hospital did or did not receive a temporary cap adjustment under § 413.79(h), rather than on a national all-hospital basis. Bearing in mind the statutory language and our experience to date in awarding slots as well as the unnecessary burden placed on hospitals that are receiving section 5506 slots, but are not receiving temporary cap adjustments under § 413.79(h), we stated in the FY 2015 IPPS/LTCH PPS proposed rule our belief that it was appropriate to propose a policy that would provide for a more efficient and faster method for awarding of slots to hospitals applying under Ranking Criteria Four through Eight. Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28155), we proposed that, effective for section 5506 application rounds announced on or after October 1, 2014, for purposes of applying the requirement for "no duplication of FTE slots," we would only require that there be no duplication of FTE slots on a hospital-specific basis. That is, in determining the effective date for slots awarded permanently under section 5506, we would only be concerned with whether the hospital that is applying for slots is also receiving a temporary cap adjustment under § 413.79(h) for training displaced residents. When awarding slots to the applying hospital, we would not be concerned whether any other hospital is receiving a temporary cap adjustment for training displaced residents under § 413.79(h). For example, if Hospital A is receiving a temporary cap adjustment under § 413.79(h) for training displaced residents in its general surgery program but is applying under Ranking Criterion Five to start a pediatrics program and Hospital B is *not* receiving a temporary cap adjustment for training displaced residents and is applying under Ranking Criterion Eight to expand a cardiology program, in awarding section 5506 slots, we would only allow Hospital A to receive a permanent adjustment to its FTE cap for training residents in its

pediatrics program once its temporary adjustments for the displaced residents training in the general surgery program have expired. We would not consider displaced residents when awarding section 5506 slots to Hospital B.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28156), we stated that, in conjunction with our proposal to interpret the “no duplication of FTE slots” requirement to apply on a hospital-specific basis to hospitals that are receiving temporary cap adjustments under § 413.79(h), we proposed to amend the effective dates of section 5506 slots received under Ranking Criteria Four through Eight for those hospitals that are *not* receiving temporary cap adjustments under § 413.79(h). (We refer readers to section IV.K.5.c. of the preamble of this final rule where we discuss our proposal and final policy to amend Ranking Criteria Seven and Eight.) Existing policy requires that slots awarded under Ranking Criteria Four through Eight for expanding an existing residency training program or starting a new residency training program are effective the later of when a hospital can demonstrate to the MAC that the slots associated with a new program or program expansion are actually filled and, therefore, are needed as of a particular date (usually July 1, possibly retroactive), or the July 1 after displaced residents complete their training. If a hospital is awarded slots under Ranking Criterion Eight for cap relief, slots are effective the date of CMS’ award announcement, or the July 1 after displaced residents complete their training, whichever is later. However, because we proposed an alternative approach to interpreting section 5506(d) that would permit us to apply the “no duplication of FTE slots” requirement on a hospital-specific basis, we proposed to change the effective date for slots received under Ranking Criteria Four through Eight so that if a hospital is *not* receiving a temporary cap adjustment under § 413.79(h), the slots awarded under section 5506 would be effective when the hospital can demonstrate to its MAC that the slots needed for a new program or program expansion are actually filled and, therefore, are needed as of a particular date (usually July 1, possibly retroactive). If a hospital is awarded slots under Ranking Criteria Four through Eight and *is* receiving a temporary cap adjustment to train displaced residents under § 413.79(h), the existing policy would apply such that the slots are awarded on a permanent basis, the later of when a

hospital can demonstrate to the MAC that the slots associated with a new program or program expansion are actually filled and, therefore, are needed as of a particular date (usually July 1, possibly retroactive), or the July 1 after an equivalent amount of displaced FTE residents complete their training. In the proposed rule (79 FR 28156), we stated that, assume in a hypothetical situation that there is a closed teaching hospital and that another hospital takes in two displaced FTE residents for which the hospital is receiving a temporary cap adjustment under § 413.79(h). One resident is graduating on June 30, 2016, and the second resident is graduating on June 30, 2018. Assume that when the section 5506 Round is announced, the hospital also applies for two slots to expand an internal medicine program under Ranking Criterion Five. In January 2017, CMS awards two permanent slots to the hospital under Ranking Criterion Five. For the program year starting July 1, 2017, the hospital successfully demonstrates to the MAC that it filled the two additional internal medicine positions. Because one displaced FTE resident already graduated on June 30, 2016, the MAC may approve one slot on a permanent basis effective July 1, 2017. However, the hospital would have to wait until July 1, 2018, to receive from the MAC the permanent slot for the second displaced internal medicine resident because the second displaced FTE resident is not graduating until June 30, 2018.

Comment: Several commenters supported the proposal and agreed that applying the “no duplication of slots” policy on a national level, as opposed to a hospital-specific level, results in a very complex and unnecessarily burdensome review process which further delays the permanent distribution of slots from a closed hospital.

Response: We appreciate the commenters’ support.

Comment: Two commenters opposed the proposal because they believed it added an unnecessary restriction to the effective dates of permanent section 5506 awards received under Ranking Criteria Four through Eight for hospitals that have temporary cap adjustments under § 413.79(h) and are training displaced residents from the closed hospital. The commenters noted that the proposal would require a hospital that has a temporary cap adjustment and is training a displaced resident from the closed hospital and is awarded slots under Ranking Criteria Four through Eight to wait until the displaced resident graduates in order to receive

the permanent cap slot. On the other hand, if a hospital does not have a temporary cap adjustment and is awarded slots under Ranking Criteria Four through Eight, those slots would be effective when the hospital can demonstrate to its MAC that the slots needed for a new program or program expansion are actually filled without consideration of any temporary cap adjustment at another hospital. The commenters asserted that only Ranking Criteria One and Three are specifically tied to the training of displaced residents, and if a hospital applies under Ranking Criteria Four through Eight, they are, in fact, acknowledging that they do not qualify under Ranking Criterion One or Three and therefore should not be subject to limitations of the effective date of its award related to a temporary cap adjustment associated with a displaced resident. The commenters suggested that the revised effective date of slots awarded under Ranking Criteria Four through Eight apply for all hospitals and award slots, regardless of whether the hospitals received a temporary cap adjustment under § 413.79(h), and that the “no duplication of slots” policy should not apply when section 5506 slots are being awarded for a completely different program or purpose than the program for which the hospital was awarded a temporary cap adjustment.

Response: We appreciate the commenters’ concerns and suggestions regarding our application of the “no duplication of slots” policy as it applies to the effective dates for Ranking Criterion Four through Eight. However, we continue to believe that allowing a hospital to receive a permanent cap slot under section 5506 while at the same time receiving a temporary cap adjustment under § 413.79(h) would be contrary to the statutory directive of the “no duplication of slots” policy because as long as the displaced resident is still training and the hospital has a temporary cap adjustment for that resident and is receiving IME and direct GME payments, that slot is still in use by the hospital. Section 5506(d) in part provides that “The Secretary of Health and Human Services shall give consideration to the effect of the amendments made by this section on any temporary adjustment to a hospital’s FTE cap under section 413.79(h) of title 42, Code of Federal Regulations (as in effect on the date of enactment of this Act) in order to ensure that there is no duplication of FTE slots” (emphasis added). Thus, we disagree with the commenters’ overly broad interpretation of the statutory

language, and continue to believe that the statute does not allow for duplication of slots within a hospital overall, even when those slots are awarded for completely different programs or purposes. In addition, prior to our proposal, our existing policy regarding effective dates for slots awarded under Ranking Criteria Four through Eight has been that where a temporary cap adjustment was in effect for displaced residents from a closed hospital, the effective dates for awards under Ranking Criteria Four through Eight are tied to the graduation dates of the displaced residents because as long as a hospital was awarded a temporary cap adjustment for a particular displaced resident, the slot associated with that resident is not yet available, regardless of the ranking criteria or the program or purpose for which the permanent section 5506 FTE cap slot was awarded. We believe that our proposed policy strikes the necessary balance of avoiding unnecessary complexity in the review of section 5506 applications and maintaining a policy that conforms to the statutory requirement for “no duplication of slots” under section 5506.

Consistent with policy implemented in subregulatory guidance in Change Request 7746, Transmittal 1171 (issued January 31, 2013; <http://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/downloads/R1171OTN.pdf>) where we stated that slots awarded under a given round may only replace temporary FTE cap adjustments associated with residents displaced from that same round, we would like to clarify that our proposed application of the “no duplication of slots” policy would only apply for temporary cap adjustments and permanent section 5506 FTE cap slots associated with the same closed hospital (§ 413.79(h)). In addition, we note that, as we stated in the proposed rule (79 FR 28156), if a hospital is awarded slots under Ranking Criteria Four through Eight and is receiving a temporary cap adjustment to train displaced residents under § 413.79(h), the existing policy would apply such that the slots are awarded on a permanent basis, the later of when a hospital can demonstrate to the MAC that the slots associated with a new program or program expansion are actually filled and, therefore, are needed as of a particular date (usually July 1, possibly retroactive), or the July 1 after an *equivalent* amount of displaced FTE residents complete their training. That is, so long as a hospital continues to receive a temporary cap adjustment under § 413.79(h) for

residents displaced from a specific closed hospital, that hospital’s section 5506 award under Ranking Criteria Four through Eight associated with that specific closed hospital would also not be fully effective. Stating it simply, if a hospital has a temporary FTE cap adjustment of three FTEs due to the closure of Hospital Z, and the hospital is also awarded three permanent FTE cap slots under the section 5506 Round associated with Hospital Z, this hospital’s permanent FTE cap adjustment of three would not take full effect until all three displaced FTEs from Hospital Z graduate, when the hospital’s temporary FTE cap would go down to zero (§ 413.79(h)). When determining the effective dates of section 5506 FTE cap slots awarded under Ranking Criteria Four through Eight for a given Round of section 5506 from a given closed hospital, the hospital receiving the section 5506 slots would consider (1) whether it has a temporary cap adjustment associated with residents displaced from the closed hospital associated with that Round of section 5506, and (2) the difference (if any) between its section 5506 FTE cap slot award from that closed hospital, and the temporary cap adjustment associated with the same closed hospital. If a hospital is receiving a temporary cap adjustment for training displaced residents and its section 5506 award is less than or equal to the temporary cap adjustment, the section 5506 slots would become effective the later of when the hospital can demonstrate to the MAC that the slots associated with a new program or program expansion are actually filled and, therefore, are needed, or the July 1 after displaced residents complete their training. If a hospital is receiving a temporary cap adjustment for training displaced residents and its section 5506 award is greater than the temporary cap adjustment, the number of slots by which the section 5506 award exceeds the temporary cap adjustment would be available for use when the hospital can demonstrate to its MAC that the slots associated with the new program or program expansion are filled and, therefore, are needed as of a particular date (usually July 1, possibly retroactive). The effective dates for those slots in excess of the hospital’s temporary cap adjustment in a given round would not hinge on whether a displaced resident has completed his/her training and, therefore, the temporary cap adjustment associated with that resident expires because there would be no duplication of slots for that hospital with respect to the slots

awarded in excess of the hospital’s temporary cap adjustment. However, the portion of the hospital’s section 5506 award that is equal to or less than its temporary cap adjustment for displaced residents associated with the closed hospital from the same round would be subject to the “no duplication of FTE slots” requirement, and those section 5506 slot awards would become available only as an equivalent amount of temporary cap adjustment expires. The following examples illustrate the interplay between section 5506 slots awarded and temporary cap adjustments under § 413.79(h) associated with the same closed hospital:

Example 1: Hospital A takes in two displaced FTE residents from a closed teaching hospital for which the hospital is receiving a temporary cap adjustment of 2.0 FTEs under § 413.79(h). One resident is graduating on June 30, 2016, and the second resident is graduating on June 30, 2018. When the section 5506 Round is announced, Hospital A also applies for two slots to expand an internal medicine program under Ranking Criterion Five. In January 2017, CMS awards two permanent slots to the hospital under Ranking Criterion Five. Hospital A would consider (1) whether it has a temporary cap adjustment associated with residents displaced from the closed hospital associated with that Round of section 5506 (yes, 2.0 FTEs), and (2) the difference (if any) between its section 5506 FTE cap slot award from that closed hospital, and the temporary cap adjustment associated with the same closed hospital (2.0 temporary cap—2.0 section 5506 award = 0, no difference). Because Hospital A’s section 5506 award is (less than or) equal to the temporary cap adjustment, the section 5506 slots would become effective on a flow basis; that is, effective after each displaced resident completes his/her training, and as the temporary cap adjustment associated with that resident expires. For the program year starting July 1, 2017, Hospital A successfully demonstrates to the MAC that it filled the two additional internal medicine positions. Because one displaced FTE resident already graduated on June 30, 2016, the MAC may approve one slot on a permanent basis effective July 1, 2017. However, Hospital A would have to wait until July 1, 2018, to receive from the MAC the permanent slot for the second displaced internal medicine resident because the second displaced FTE resident is not graduating until June 30, 2018.

Example 2: Hospital B takes in two displaced FTE residents from a closed teaching hospital for which Hospital B is receiving a temporary cap adjustment of 2.0 FTEs under § 413.79(h). One resident is graduating on June 30, 2018, and the second resident is graduating on June 30, 2019. When the section 5506 Round is announced, Hospital B applies for five slots to expand a geriatrics program under Ranking Criterion Four. In January 2017, CMS awards five permanent slots to Hospital B under Ranking Criterion Four. Hospital B would consider (1) whether it has a temporary cap adjustment

associated with residents displaced from the closed hospital associated with that Round of section 5506 (yes, 2.0 FTEs), and (2) the difference (if any) between its section 5506 FTE cap slot award from that closed hospital, and the temporary cap adjustment associated with the same closed hospital (2.0 temporary cap—5.0 section 5506 award = 3, absolute value). Because Hospital B's section 5506 award is greater than the temporary cap adjustment, then the number of slots by which the section 5506 award exceeds the temporary cap adjustment would be available for use when the hospital can demonstrate to its MAC that the slots associated with the new program or program expansion are filled and, therefore, are needed. For the program year starting July 1, 2017, Hospital B successfully demonstrates to the MAC that it filled all five additional geriatrics positions. Even though the displaced residents did not yet graduate, the MAC may approve three slots on a permanent basis effective July 1, 2016 because Hospital B's section 5506 award exceeds its temporary cap adjustment and Hospital B can use up to three of its five slots while the displaced residents are still training. However, Hospital B would have to wait until July 1, 2018, to receive from the MAC the fourth slot for the geriatrics program because the first displaced FTE resident is not graduating until June 30, 2018, and would then have to wait until July 1, 2019, to receive from the MAC the fifth slot for the geriatrics program because the second displaced resident is not graduating until June 30, 2019.

Example 3: Hospital C does not take in any displaced residents and does not receive a temporary cap adjustment under § 413.79(h). When the section 5506 Round is announced, Hospital C applies for five slots to expand geriatrics program under Ranking Criterion Four. In January 2017, CMS awards five permanent slots to Hospital C under Ranking Criterion Four. For the program year starting July 1, 2017, Hospital C successfully demonstrates to the MAC that it filled all five additional geriatrics positions. Because Hospital C did not receive a temporary cap adjustment, there would be no need to consider displaced residents at other hospitals when awarding permanent slots and determining effective dates under section 5506 for Hospital C. Therefore, Hospital C could receive a permanent adjustment of five FTEs to its cap for training residents in its geriatrics program effective July 1, 2017.

With regard to a hospital that is training displaced FTE residents, has a temporary cap adjustment under § 413.79(h), and also applies both under Ranking Criteria One or Three, and under Ranking Criteria Four through Eight, the current policy with regard to the effective date of slots awarded under Ranking Criteria One and Three would still apply, and would not impact the policy described above for Ranking Criteria Four through Eight. That is, as stated in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53443), slots awarded under Ranking Criteria One or Three would continue to become permanent (or effective) on a flow basis as displaced FTEs finish their training programs. If a hospital has a temporary cap adjustment under § 413.79(h) and is awarded

slots under Ranking Criteria One or Three for training those displaced residents, then as the displaced FTE residents graduate, an equivalent amount of permanent section 5506 slots can become effective under Ranking Criterion One or Three (thereby avoiding duplication of FTE cap slots). If the amount of section 5506 slots awarded under Ranking Criterion One or Three is equal to the amount of the temporary cap adjustment, there would be no concern of duplication of FTE slots with respect to a hospital's other awards under Ranking Criteria Four through Eight because "no duplication" would already be addressed with regard to slots awarded within Ranking Criterion One or Three. Accordingly, other slots that the hospital is awarded under Ranking Criteria Four through Eight would not depend on whether a displaced resident has completed his/her training and, therefore, would be made available for use when the hospital can demonstrate to its MAC that the slots associated with the new program or program expansion are filled and, therefore, are needed. The following example illustrates this policy:

Example Four: Hospital D takes in two displaced FTE residents from a closed teaching hospital for which Hospital D is receiving a temporary cap adjustment of 2.0 FTEs under § 413.79(h). One resident is graduating on June 30, 2018, and the second resident is graduating on June 30, 2019. When the section 5506 Round is announced, Hospital D applies for two slots under Ranking Criterion Three, and also applies for five slots to expand a geriatrics program under Ranking Criterion Four. In January 2017, CMS awards to Hospital D two permanent slots under Ranking Criterion Three, and five permanent slots under Ranking Criterion Four. With regard to the effective dates of the slots awarded under Ranking Criteria Four through Eight, Hospital D would consider (1) whether it has a temporary cap adjustment associated with residents displaced from the closed hospital associated with that Round of section 5506 (yes, 2.0 FTEs), and (2) the difference (if any) between its section 5506 FTE cap slot award from that closed hospital, and the temporary cap adjustment associated with the same closed hospital (2.0 temporary cap—7.0 section 5506 award = 5, absolute value). Because Hospital D's section 5506 award is greater than the temporary cap adjustment, the number of slots by which the section 5506 award exceeds the temporary cap adjustment (5 slots) would be available for use when Hospital D can demonstrate to its MAC that the slots associated with the new program or program expansion are filled and, therefore, are needed. For the program year starting July 1, 2017, Hospital D successfully demonstrates to the MAC that it filled all five additional geriatrics positions. Even though the displaced residents did not yet graduate, the MAC may approve all five slots on a permanent basis effective July 1, 2017, because Hospital D's section 5506 award exceeds its temporary cap adjustment by five slots and the amount of section 5506 slots awarded under Ranking Criterion Three is equal to the amount of the temporary cap adjustment. Therefore, "no duplication" is

already addressed with regard to slots awarded within Ranking Criterion Three. On July 1, 2018, one displaced FTE graduated, and if Hospital D can demonstrate to the MAC that it filled a slot to replace the displaced resident under Ranking Criterion Three, Hospital D may receive from the MAC one permanent slot awarded under Ranking Criterion Three effective on that date. Similarly, on July 1, 2019, when the second displaced resident graduates, and Hospital D's temporary cap adjustment goes down to zero, if Hospital D recruits an additional resident to replace that second displaced resident, Hospital D may receive from the MAC its final permanent slot awarded under Ranking Criterion Three effective on that date.

However, if a hospital's number of permanent slots awarded under section 5506 Ranking Criterion One or Three is less than its temporary cap adjustment, and the hospital is also awarded slots under Ranking Criteria Four through Eight, the amount of the section 5506 slots awarded under Ranking Criterion Four through Eight that is equal to the remaining portion of the temporary cap adjustment would become effective the later of when the hospital can demonstrate to the MAC that the slots associated with a new program or program expansion are actually filled and, therefore, are needed on the July 1 after the appropriate amount of displaced residents complete their training.

After consideration of the public comments we received, we are finalizing, as proposed, the policy that effective for section 5506 application rounds announced on or after October 1, 2014, the statutory provision at section 5506(d) requiring the Secretary when awarding slots under section 5506 to consider any temporary cap adjustment to a hospital's FTE cap under § 413.79(h) to ensure no duplication of FTE slots, be interpreted in a manner such that the requirement for "no duplication of FTE slots" is applied on a hospital-specific basis rather than across all hospitals receiving temporary cap adjustments under § 413.79(h). Consistent with this change, we are finalizing our proposal to amend the effective date for slots received under Ranking Criteria Four through Eight so that if a hospital is *not* receiving a temporary cap adjustment under § 413.79(h), the slots awarded under section 5506 would be effective when the hospital can demonstrate to its MAC that the slots needed for a new program or program expansion are actually filled and, therefore, are needed as of a particular date (usually July 1, possibly retroactive). However, if a hospital is receiving a temporary cap adjustment under § 413.79(h), we would consider

the number of displaced residents in determining the effective date of the slots awarded under section 5506 such that as long as a hospital continues to receive a temporary cap adjustment under § 413.79(h) for residents displaced from a specific closed hospital, that hospital's section 5506 award under Ranking Criteria Four through Eight associated with that specific closed hospital would also not be fully effective. When determining the effective date of section 5506 FTE cap slots awarded under Ranking Criteria Four through Eight for a given round of section 5506 from a given closed hospital, the hospital receiving the section 5506 slots would consider (1) whether it has a temporary cap adjustment associated with residents displaced from the closed hospital associated with that round of section 5506, and (2) the difference (if any) between its section 5506 FTE cap slot award from that closed hospital, and the temporary cap adjustment associated with the same closed hospital. If a hospital is receiving a temporary cap adjustment for training displaced residents and its section 5506 award is less than or equal to the temporary cap adjustment, the section 5506 slots would become effective the later of when the hospital can demonstrate to the MAC that the slots associated with a new program or program expansion are actually filled and, therefore, are needed or the July 1 *after* displaced residents complete their training. If a hospital is receiving a temporary cap adjustment for training displaced residents, and its section 5506 award is greater than the temporary cap adjustment, the number of slots by which the section 5506 award exceeds the temporary cap adjustment would be available for use when the hospital can demonstrate to its MAC that the slots associated with the new program or program expansion are filled and, therefore, are needed as of a particular date (usually July 1, possibly retroactive). The effective dates for those slots in excess of the hospital's section 5506 award in a given round would not depend on whether a displaced resident has completed his/her training. However, the portion of the hospital's section 5506 award that is equal to or less than its temporary cap adjustment for displaced residents associated with the closed hospital from the same round would continue to be subject the "no duplication of FTE slots" requirement, and the section 5506 slots would become available only as an equivalent amount of temporary cap adjustment expires.

We did not propose any changes to the effective date for slots awarded under Ranking Criterion One, Ranking Criterion Two, or Ranking Criterion Three. Consistent with existing policy, if a hospital is applying under Ranking Criterion One or Ranking Criterion Three and is *not* receiving a temporary cap adjustment for training displaced residents under § 413.79(h), the effective date of the section 5506 slots is the date of the hospital closure. If a hospital is applying under Ranking Criterion One or Ranking Criterion Three and is receiving a temporary cap for training displaced residents under § 413.79(h), the effective date of the section 5506 slots is after the displaced resident(s) graduate. If a hospital *is* receiving a temporary cap for training displaced residents under § 413.79(h), and is applying under Ranking Criterion One or Ranking Criterion Three and is also separately applying under Ranking Criterion Four or subsequent Ranking Criteria, for slots awarded under Ranking Criteria One or Three, the effective date of the section 5506 slots is after the displaced resident(s) graduate. For slots awarded under Ranking Criteria Four or subsequent Ranking Criteria, the slots are awarded the later of when a hospital can demonstrate to the MAC that the slots associated with a new program or program expansion are actually filled and, therefore, are needed as of a particular date (usually July 1, possibly retroactive), or the July 1 after an equivalent amount of a displaced FTE resident(s) at the hospital complete their training. Therefore, for such a hospital, the effective dates of slots awarded under Ranking Criteria One/Three, and Ranking Criteria Four through Eight might coincide. Also, consistent with existing policy, if a hospital is applying under Ranking Criterion Two, the effective date of the permanent award of section 5506 slots is the date of the hospital closure. We discuss these existing policies in greater detail in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53437 through 53445).

b. Removal of Seamless Requirement

Under current policy, if a hospital is applying under Ranking Criterion One or Three, the hospital must show that it is seamlessly replacing displaced FTE residents with new FTE residents once the displaced residents graduate (75 FR 72219 and 72221 through 72222). We have stated that in instances where a hospital seamlessly operates an entire program or part of a program from the closed hospital (or takes over an entire program prior to the hospital's closure), such a hospital is demonstrating a

strong commitment to maintain GME programs in the community for the long term and should be awarded slots under higher ranking criteria (75 FR 72216). Therefore, we required that, in order to receive slots under Ranking Criterion One and Three, the applying hospital must demonstrate that upon graduation of the displaced FTE residents that it is training, the slots held by those displaced FTEs are seamlessly replaced with new FTE residents (75 FR 72219 and 72221 through 72222). In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53441), in response to concerns associated with the seamless requirement and timeline used by the National Resident Match Program and other resident match services, we revised the seamless requirement. We stated that, in the instance where a teaching hospital closed after December 31 of an academic year, in order for a hospital to qualify under Ranking Criterion One or Three for cap slots associated with displaced FTE residents who will graduate June 30 of the academic year in which the applying hospital took in the displaced FTE residents, the applying hospital must be able to demonstrate that it will fill slots vacated by displaced FTE residents by July 1 of the second academic year following the hospital closure. However, in the instance where a teaching hospital closed before December 31 of an academic year, in order for a hospital to qualify under Ranking Criterion One or Three for cap slots associated with displaced FTE residents who will graduate June 30 of the academic year in which the applying hospital took in the displaced FTE residents, the applying hospital must be able to demonstrate that it will seamlessly fill slots vacated by displaced FTE residents by that July 1; that is, the day immediately after the June 30 that the displaced FTE residents graduate (77 FR 53441 through 53442). We also revised the CMS Application Form to instruct a hospital applying under Ranking Criterion One or Three to list the names and graduation dates of specific displaced residents who, upon their graduation, have been or will be seamlessly replaced by new residents (77 FR 53446). Because Ranking Criteria One and Three fall under Demonstrated Likelihood Criterion 2, the hospital is taking over all of part of an existing residency program from the closed hospital, or expanding an existing residency training program, the requirement to include a list with the names and graduation dates of specific displaced residents who have been or will be seamlessly replaced was added

under Demonstrated Likelihood Criterion 2 on the CMS Application Form.

In addition to the match deadlines associated with the National Resident Matching Program and match deadlines associated with matching into osteopathic programs, we have recently been made aware of other match deadlines associated with certain fellowship programs. From the experience we have had so far in reviewing section 5506 applications, where we have observed the complexity of tracking various match deadlines as well as the intersection between these deadlines and when the section 5506 awards are announced by CMS, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28158), we proposed to remove the seamless requirement for slots awarded under Ranking Criterion One and Three effective for section 5506 application rounds announced on or after October 1, 2014. We did not propose to make any other additional changes to Ranking Criterion One or Three; that is, the hospital must still be training displaced residents and must either take over or have taken over an entire program from the closed hospital and continue operating that program in the same manner in which it was operated by the closed hospital or the hospital must take over part of a closed hospital's program and permanently expand its own program as a result of training displaced residents. Hospitals would continue to be required to submit supporting documentation when applying under Ranking Criterion One or Three that indicates that they have made a commitment to take over the closed hospital's program or that they have made the commitment to permanently expand their own residency training program resulting from taking over part of a closed hospital's program.

In determining the effective date of slots awarded under Ranking Criterion One or Three where the hospital has been training residents that were displaced by the closed hospital and receiving a temporary cap adjustment under § 413.79(h), the hospital would work with its MAC to determine when it could be permanently awarded the slots based on the graduation dates of the displaced residents it is training. Consistent with our proposal, we proposed to remove the following requirement under Demonstrated Likelihood Criterion 2 on the CMS Application Form: "Hospitals applying for slots under option (a) which correlates to Ranking Criterion 1 or (b) which correlates to Ranking Criterion 3 must list the names and graduation

dates of specific displaced residents who, upon their graduation, have been or will be seamlessly replaced by new residents. The list may be added as an attachment to this application." We proposed to replace this requirement with the following requirement under Demonstrated Likelihood Criteria 1 and 2: "Please indicate Y or N: As of the time of submitting this application, are you receiving a temporary cap adjustment for IME and/or direct GME under 42 CFR 413.79(h) for residents displaced by the closure of the hospital subject to this Round of section 5506? (Y/N)" so that we are aware which hospitals are receiving temporary cap adjustments for training displaced residents under § 413.79(h), and when we award slots, we would know which hospitals to instruct to work with their MACs to determine when the slots could be permanently awarded to them based on the graduation dates of the displaced residents they are training.

In summary, we proposed to remove the seamless requirement currently included as part of Ranking Criterion One or Three. We also proposed to remove from the CMS Application Form, the following requirement: "Hospitals applying for slots under option a) which correlates to Ranking Criterion 1 or b) which correlates to Ranking Criterion 3 must list the names and graduation dates of specific displaced residents who, upon their graduation, have been or will be seamlessly replaced by new residents. This list may be added as an attachment to this application."

Comment: Commenters supported the proposal to remove the seamless requirement for slots awarded under Ranking Criteria One and Three effective for section 5506 application rounds announced on or after October 1, 2014. One commenter stated that, in addition to complicating the CMS review process of section 5506 applications, the seamless requirement created an administrative burden for hospitals applying under Ranking Criteria One and Three. Another commenter stated it supported removing the seamless requirement because it has become very complicated and burdensome for hospitals that legitimately plan to continue training residents in a program once the displaced residents training in that program graduate. However, commenters requested that CMS "provide clear and consistent guidance" to explain the type of documentation that would meet the requirement that a hospital has made a commitment to take over the closed hospital's program or has made the commitment to

permanently expand their own residency training program resulting from taking over part of a closed hospital's program.

Response: We thank the commenters for their support of our proposed policy to remove the seamless requirement under Ranking Criteria One and Three. We are finalizing the policy as proposed. Effective for section 5506 rounds announced on or after October 1, 2014, we are removing the seamless requirement previously required as part of Ranking Criterion One and Three. We are removing from the CMS Application Form the following language: "Hospitals applying for slots under option a) which correlates to Ranking Criterion 1 or b) which correlates to Ranking Criterion 3 must list the names and graduation dates of specific displaced residents who, upon their graduation, have been or will be seamlessly replaced by new residents. This list may be added as an attachment to this application." We are adding to the CMS Application Form the following language under Demonstrated Likelihood Criteria 1 and 2: "Please indicate Y or N: As of the time of submitting this application, are you receiving a temporary cap adjustment for IME and/or direct GME under 42 CFR 413.79(h) for residents displaced by the closure of the hospital subject to this Round of section 5506? (Y/N)."

In response to the commenters' request that CMS "provide clear and consistent guidance" to explain the type of documentation that would meet the requirement under Ranking Criterion One or Three, commenters should submit documentation as part of their application which indicates a commitment to take over the closed hospital's program or permanently expand their own residency training program resulting from taking over part of a closed hospital's program. We believe that the documentation that the hospital submits to demonstrate the likelihood that it would fill the requested slots under Demonstrated Likelihood Criterion 2 is sufficient. Demonstrated Likelihood Criterion 2 is for taking over all or part of an existing residency program from the closed hospital, or expanding an existing residency program. Applicants should refer to the description of documentation included on the CMS Application Form under "Demonstrated Likelihood Criterion 2: Taking Over All or Part of an Existing Residency Program from the Closed Hospital, or Expanding an Existing Residency Program," for examples of acceptable documentation. For example, if a hospital is applying under Ranking Criterion Three because it is

permanently expanding its surgery program as a result of training residents displaced from a closed hospital's surgery program and it has submitted documentation to the accrediting body requesting approval of additional positions, or it has already received approval from the accrediting body for the expansion, such documentation would meet the requirement that a hospital applying under Ranking Criterion Three has made the commitment to permanently expand its own surgery program as a result of training displaced residents.

c. Revisions to Ranking Criteria One, Seven, and Eight for Applications under Section 5506

In the November 24, 2010 final rule with comment period (75 FR 72223), we finalized the Ranking Criteria within each of the three first statutory priority categories (that is, same or contiguous CBSAs, same State, and same region) to be used to rank applications for assignment of slots under section 5506 of the Affordable Care Act. For each application, we assigned slots based on Ranking Criteria, with Ranking Criterion One being the highest ranking and Ranking Criterion Seven being the lowest. For a detailed discussion of the ranking categories, we refer readers to the November 24, 2010 final rule with comment period (75 FR 72212 through 72240).

After reviewing applications submitted during the first section 5506 application process (those applications that were due to CMS on April 1, 2011), we observed that the overwhelming majority of applications fell under Ranking Criterion Seven; that is, the applying hospital seeks the slots for purposes that do not fit into any of Ranking Criterion One through Ranking Criterion Six. These applications included applications from hospitals that applied for FTE cap slots for both primary care and/or general surgery and for nonprimary care specialties as well as applications for general cap relief. The sheer number of applications we received under Ranking Criterion Seven indicated a need to further prioritize among the applicants that would have qualified under Ranking Criterion Seven. Therefore, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53434 through 53437), we finalized changes to the Ranking Criteria, replacing Ranking Criterion Seven with two separate Ranking Criteria (Ranking Criterion Seven and Ranking Criterion Eight) resulting in a total of eight Ranking Criteria. Under the Ranking Criteria, as modified by the FY 2013 IPPS/LTCH PPS final rule, a hospital that is

applying both for the purpose of establishing or expanding primary care or general surgery programs, and in addition is requesting slots for the purpose of establishing or expanding nonprimary care or nongeneral surgery programs and/or for cap relief must submit an application requesting additional FTE slots for its primary care or general surgery programs under Ranking Criterion Seven. The hospital's request for additional FTE slots to establish or expand a nonprimary care or nongeneral surgery program and/or for additional FTE slots for cap relief would then be made under Ranking Criterion Eight. Prior to this change, if a hospital applied for additional FTE slots to establish or expand both a primary care or general surgery program in addition to a nonprimary care or nongeneral surgery program and/or for additional FTE slots for cap relief, all of its applications (with the exception of Ranking Criteria One through Three) would fall under Ranking Criteria Seven. For a complete list of the Ranking Criteria, we refer readers to section IV.K.5.a. of the preamble of this final rule, which discusses the background for preservation of resident cap positions from closed hospitals under section 5506 of the Affordable Care Act.

After reviewing applications and making awards under several more rounds of section 5506 applications, we have observed that, as hospital closings continue to occur, there has been a significant increase in the time between a hospital's closure and the announcement of section 5506 awards by CMS. We believe that this delay is partly due to the administratively burdensome task of processing, reviewing, and responding to such a large number of applications for each hospital closure, or each round of section 5506 awards. When implementing section 5506 in the November 24, 2010 final rule with comment period (75 FR 72212 through 72249), we initially envisioned the reviewing of applications and awarding of section 5506 FTE slots as being a more streamlined and expedient process. However, as a practical matter, we have found that the process has been much more resource and time intensive than we had originally anticipated. This is partly due to the time and resources needed to properly apply the process established by CMS in reviewing section 5506 applications and awarding FTE cap slots. Since the initial implementation of section 5506, we have attempted to be responsive to these unexpected delays by refining the

ranking criteria to make the review process less administratively burdensome. However, these changes did not alleviate the process to the desired extent. Furthermore, we have observed that, while many of the applications submitted to CMS are applications requesting FTE slots for purposes of general cap relief, we have more often than not awarded no slots at all for cap relief. This is due in large part to the limited number of slots available (many of the closed teaching hospitals did not have large FTE resident caps) and an overwhelming demand for those slots from applicants who apply for FTE slots for reasons other than cap relief. Since we finalized the modified Ranking Criterion Seven and added Ranking Criterion Eight in the FY 2013 IPPS/LTCH PPS final rule, and as of the issuance of the FY 2015 IPPS/LTCH PPS proposed rule, we had announced three new rounds of section 5506 applications due to the closures of six hospitals. We have received a total of 424 applications from hospitals seeking cap relief. Of those 424 applications, only 6 applications were ultimately awarded FTE slots, which is only 1.42 percent of the total cap relief applications. We believe that the ratio of cap relief awardees to cap relief applications does not warrant the administrative burden and the delay in announcements of section 5506 awards that result from the large number of cap relief applications submitted to CMS that are invariably denied. Therefore, in an effort to streamline the review process and to facilitate publishing section 5506 awards in a more timely manner, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28159 through 28160), we proposed to modify Ranking Criterion Eight so that Ranking Criterion Eight would only apply to hospitals seeking FTE slots to establish or expand a nonprimary care or nongeneral surgery program. Ranking Criterion Eight would no longer be applicable to hospitals seeking FTE cap slots for cap relief. Our proposal to eliminate section 5506 awards of FTE slots for cap relief is consistent with current policy goals to increase training in primary care and general surgery. By proposing to eliminate awarding of FTE slots for residents that are already being trained by a hospital, there will be more FTE resident slots available to award to other hospitals seeking to establish or expand a primary care or general surgery program under Ranking Criteria Four through Seven.

Accordingly, we proposed to revise Ranking Criterion Eight so that it reads as follows:

Proposed Ranking Criterion Eight: The program does not meet Ranking Criteria 1 through 7, and the applying hospital will use additional slots to establish or expand a nonprimary care or a nongeneral surgery program. In light of the modifications we proposed to Ranking Criterion Eight, we believe it is also necessary to modify the language of proposed Ranking Criterion Seven to specify the types of applications that would properly be made under this Ranking Criterion; that is, we proposed to remove the reference to cap relief from Ranking Criterion Seven so that it read as follows:

Proposed Ranking Criterion Seven: The applying hospital will use additional slots to establish or expand a primary care or general surgery program, but the program does not meet Ranking Criterion 5 or 6 because the hospital is also separately applying under Ranking Criterion 8 for slots to establish or expand a nonprimary care or nongeneral surgery program.

Comment: One commenter supported CMS' proposal to eliminate awarding of FTE slots for cap relief because doing so would increase the chance for a rural hospital that is located near very few teaching hospitals in the same or contiguous CBSA to apply under Level Priority Category One, to be awarded slots from a closed teaching hospital in the same state or region. One commenter supported the proposal because it would make more FTE resident slots available to award to other hospitals seeking to establish or expand a primary care or general surgery program.

Many commenters opposed CMS' proposal to eliminate awarding of FTE slots for cap relief. They asserted that hospitals are, in fact, being awarded slots under Ranking Criterion Eight for cap relief, albeit sparingly, and therefore CMS should not remove hospitals' one and only opportunity to receive funding for training residents above their caps. Several commenters offered suggestions and alternate ways to modify Ranking Criterion Eight in order to ease CMS' administrative burden. One commenter noted that under section 5506, the only requirement that Congress mandated was that hospitals need to demonstrate the likelihood of filling the slots within 3 years, and that hospitals applying for cap relief meet this requirement.

Response: We appreciate the commenters' support and the numerous comments and suggestions regarding the awarding of FTE slots under section 5506 for cap relief. One of the objectives behind our proposal to eliminate awarding of slots for cap relief was to find a way to reduce the number of

applications submitted to CMS, most of which are not approved for awards due to the limited number of slots available for redistribution. By eliminating the possibility of applying for cap relief, the volume of applications that CMS would receive, process, and review would be reduced, allowing CMS to award slots in a more timely fashion.

While we appreciate that hospitals are training residents above their caps and that being awarded section 5506 slots for general cap relief would be a welcome opportunity to receive some funding for these positions, we believe that general cap relief is inconsistent with the intent of section 5506 and incompatible with the underlying principles of section 5506. We continue to believe that Congress intended that section 5506 be used to maintain the level of residents training in the area after the closure of a hospital by awarding permanent FTE cap slots to the hospital that take in and continue to train displaced residents from the closed hospital. In addition, the regulations promulgated under section 5506 are consistent with current policy goals to focus on increasing training in primary care and general surgery. By eliminating cap relief for residents that are already being trained by a hospital, more slots would be available to award to other hospitals in the same State as the closed hospital seeking to establish or expand a primary care or general surgery program. Moreover, we believe awarding slots for cap relief is contrary to the historical premise of Medicare GME payments, as it allows hospitals to shift costs borne by other means to the Medicare Trust Fund. Furthermore, we continue to believe that Congress did not intend for section 5506 awards to be used to pay hospitals for residents that they were already training, possibly even before the closure of the hospital whose slots are being redistributed.

For the reasons mentioned above, coupled with our efforts to streamline the review process and facilitate publishing section 5506 awards in a more timely manner, we are finalizing our proposal to modify Ranking Criterion Eight so that Ranking Criterion Eight would only apply to hospitals seeking FTE slots to establish or expand a nonprimary care or nongeneral surgery program, and would no longer be applicable to hospitals seeking cap slots for cap relief. In light of the modifications to Ranking Criterion Eight, we also are finalizing our proposed change to Ranking Criteria Seven to correctly specify the types of applications that would properly be made under this Ranking Criterion by

removing the reference to cap relief from Ranking Criterion Seven.

Accordingly, we are finalizing Ranking Criterion Seven and Ranking Criterion Eight as follows:

Ranking Criterion Seven: The applying hospital will use additional slots to establish or expand a primary care or general surgery program, but the program does not meet Ranking Criterion 5 or 6 because the hospital is also separately applying under Ranking Criterion 8 for slots to establish or expand a nonprimary care or nongeneral surgery program.

Ranking Criterion Eight: The program does not meet Ranking Criteria 1 through 7, and the applying hospital will use additional slots to establish or expand a nonprimary care or a nongeneral surgery program.

We are making changes to the Section 5506 Application Form to remove language associated with cap relief, including removal of the existing Demonstrated Likelihood Criterion 3, which was for cap relief.

Separately, we also proposed a change related to Ranking Criterion One. Current ranking Criterion One is for an applying hospital that assumed an entire program or programs from the hospital that closed. We proposed to revise Ranking Criterion One to provide priority to hospitals in one scenario. Section 5503 of the Affordable Care Act amended section 1886(h) of the Act by adding new paragraph (8), which provided for the permanent reduction and distribution of residency slots. Section 1886(h)(8)(A)(ii) of the Act provides specific exceptions to the application of the reduction at section 1886(h)(8)(A)(i) of the Act, and expressly states: "Exceptions—This subparagraph shall not apply to (I) a hospital located in a rural area (as defined in subsection (d)(2)(D)(ii)) with fewer than 250 acute care inpatient beds." The November 24, 2010 final rule with comment period (75 FR 72147) describes the agency's interpretation of this statutory provision. As of the time that the proposed rule was posted on the CMS Web site, we were aware of one instance in which CMS erroneously reduced a hospital's FTE resident cap contrary to this statutory exception. We proposed to amend Ranking Criterion One under section 5506 to provide priority to a hospital which had FTE resident cap slots erroneously removed under section 5503 contrary to the statutory exception at section 1886(h)(8)(A)(ii)(I) of the Act. We proposed to revise Ranking Criterion One as follows:

Ranking Criterion One. The applying hospital is requesting the

increase in its FTE resident cap(s) because it is assuming (or assumed) an entire program (or programs) from the hospital that closed, and the applying hospital is continuing to operate the program(s) exactly as it had been operated by the hospital that closed (that is, same residents, possibly the same program director, and possibly the same (or many of the same) teaching staff). The applying hospital's FTE resident caps were erroneously reduced by CMS under section 1886(h)(8)(A)(i) of the Act, contrary to the statutory exception at section 1886(h)(8)(A)(ii)(I) of the Act, and CMS Central Office was made aware of the error prior to posting of the FY 2015 IPPS proposed rule on the CMS Web site.

Comment: One commenter asked that CMS clarify that this modification to Ranking Criterion One does not override the statutory priority of the categories included in the text of section 5506. The commenter suggested that CMS clarify this by indicating that the applying hospitals located within or contiguous to the same CBSA as the closed hospital would be eligible to receive cap slots, regardless of their ranking criteria before an applying hospital that meets the new second clause included within Ranking Criterion One but is not located within the same or contiguous CBSA as the closed hospital.

Response: We are clarifying, as the commenter requested, that the applying hospitals located within or contiguous to the same CBSA as the closed hospital would be eligible to receive cap slots, regardless of their ranking criteria, before an applying hospital that meets the new second clause included within Ranking Criterion One but is not located within the same or contiguous CBSA as the closed hospital.

Comment: One commenter expressed concern that the proposed change to Ranking Criterion One does not ensure that a hospital that is located more than 70 miles from any other medical education program, and whose FTE resident caps were erroneously reduced by CMS under section 1886(h)(8)(A)(i) of the Act, can regain its lost slots when a teaching hospital closes in another part of its State. The commenter noted that CMS must follow the statutory categories in distributing slots under section 5506, and that, generally, the number of slots requested under the first priority category (same or contiguous CBSA as the closed hospital) far exceeds the number of slots available from the closed hospital, leaving no slots available for hospitals in the second or other priority category levels. The commenter cautioned that unless CMS takes steps to ensure that slots are

awarded not only to hospitals in the first priority category, but also to hospitals in the second (same state) or third (same region) priority categories, the proposed change to Ranking Criterion One will not help a hospital that is located more than 70 miles from the nearest medical education program. The commenter stated that "CMS has several options in the FY 2015 IPPS final rule to ensure that hospitals located in the same State, and not just the same or contiguous CBSA as the closed hospital, have an opportunity to add new resident slots under section 5506." The commenter made the following recommendations for CMS to finalize:

(1) In addition to finalizing the proposal to eliminate cap relief from Ranking Criterion Eight, CMS could further revise Ranking Criteria Seven and Eight so that even fewer hospitals located in the same or contiguous CBSA can satisfy either criterion. CMS could further narrow its Demonstrated Likelihood Criteria to achieve the same result.

(2) CMS could construe the language at section 1886(h)(4)(H)(vi)(II) of the Act to require the agency to follow the statutory priority categories, but to do so in a manner that at least some slots are awarded to hospitals within each of the first three priority categories, such as making a large proportion of slots available for the first priority category, and then successively smaller proportions of the slots available for the second and third priority categories.

(3) CMS could balance the competing statutory importance expressed within the statutory priority categories with the need to maintain and grow primary care residency programs in rural and underserved areas and maintain an adequate distribution of physicians, in general. CMS could conclude that one way to recognize this balance is to ensure that a hospital that had less than 250 beds and that was located in a rural area and had its FTE resident cap erroneously reduced by CMS would be awarded some of those slots after another teaching hospital in its State closes, even if the closed hospital is not located in the same or contiguous CBSA as such a hospital.

(4) CMS could conclude that section 1886(h)(4)(H)(vi)(II) of the Act did not contemplate the exact scenario where a hospital's FTE resident caps were erroneously reduced by CMS under section 1886(h)(8)(A)(i) of the Act, and that the hospital's remote location means it almost certainly will never be in the first priority level category.

Response: We regret that the commenter believes that CMS' proposed

revision to Ranking Criterion One is not sufficient to rectify the scenario where a hospital's FTE resident caps were erroneously reduced by CMS under section 1886(h)(8)(A)(i) of the Act. We do not agree with the commenter's options because each of the options that the commenter recommended would have an impact on other hospitals and stakeholders with an interest in how CMS implements section 5506. That is, the commenter's suggestions could potentially reduce the amount of slots available to other stakeholders. Moreover, accepting any such suggested options would require notice-and-comment rulemaking on each recommendation, respectively. We continue to believe that it is appropriate to provide priority to a hospital which had FTE resident cap slots erroneously removed under section 5503 contrary to the statutory exception at section 1886(h)(8)(A)(ii)(I) of the Act, and for which CMS Central Office was made aware of the error prior to posting of the FY 2015 IPPS/LTCH PPS proposed rule on the CMS Web site. Therefore, we are finalizing this policy, as proposed, in this final rule.

Comment: One commenter stated that the proposed language revising Ranking Criterion One could lead one to believe that a hospital must satisfy both conditions to qualify under this criterion. To clarify that this is not the case, the commenter recommended that CMS modify the language within Ranking Criterion One by adding an "or" as follows:

Ranking Criterion One. The applying hospital is requesting the increase in its FTE resident cap(s) because it is assuming (or assumed) an entire program (or programs) from the hospital that closed, and the applying hospital is continuing to operate the program(s) exactly as it had been operated by the hospital that closed (that is, same residents, possibly the same program director, and possibly the same (or many of the same) teaching staff); or, the applying hospital's FTE resident caps were erroneously reduced by CMS under section 1886(h)(8)(A)(i) of the Act, contrary to the statutory exception at section 1886(h)(8)(A)(ii)(I) of the Act, and CMS Central Office was made aware of the error prior to posting of the FY 2015 IPPS/LTCH PPS proposed rule on the CMS Web site.

Response: We agree with the commenter that the conditions in the revised Ranking Criterion One are separate and distinct, and a hospital applying for slots under Ranking Criterion One would need to satisfy only one of the requirements, not both. Therefore, we are adopting the

commenter's suggestion of adding "or" between the two conditions, and we are modifying the language of Ranking Criterion One in the CMS Application Form as well.

After consideration of the public comments we received, we are finalizing the following change to the text of Ranking Criterion One:

Ranking Criterion One. The applying hospital is requesting the increase in its FTE resident cap(s) because it is assuming (or assumed) an entire program (or programs) from the hospital that closed, and the applying hospital is continuing to operate the program(s) exactly as it had been operated by the hospital that closed (that is, same residents, possibly the same program director, and possibly the same (or many of the same) teaching staff); OR, the applying hospital's FTE resident caps were erroneously reduced by CMS under section 1886(h)(8)(A)(i) of the Act, contrary to the statutory exception at section 1886(h)(8)(A)(ii)(I) of the Act, and CMS Central Office was made aware of the error prior to posting of the FY 2015 IPPS proposed rule on the CMS Web site.

d. Clarification to Ranking Criterion Two Regarding Emergency Medicare GME Affiliation Agreements

Ranking Criterion Two gives preference to applying hospitals that received slots under the terms of a Medicare GME affiliation agreement from the closed hospital. Under section 1886(h)(4)(H)(ii) of the Act, hospitals may form a Medicare GME affiliated group and elect to aggregate their respective FTE resident caps and apply them on an aggregate basis. The regulations at 42 CFR 413.75(b) and 413.79(f) implemented this statutory provision, providing specific rules for sharing FTE resident cap slots among members of the Medicare GME affiliated group, one such rule being that member hospitals must have a "shared rotational arrangement." A "shared rotational arrangement" is defined at 42 CFR 413.75(b) as a residency training program under which a resident(s) participates in training at two or more hospitals in that program. Specifically, Ranking Criterion Two states the following:

Ranking Criterion Two. The applying hospital was listed as a participant of a Medicare GME affiliated group on the most recent Medicare GME affiliation agreement of which the closed hospital was a member before the hospital closed, and under the terms of that Medicare GME affiliation agreement, the applying hospital received slots from the hospital that closed, and the

applying hospital will use the additional slots to continue to train at least the number of FTE residents it had trained under the terms of the Medicare GME affiliation agreement. If the most recent Medicare GME affiliation agreement of which the closed hospital was a member before the hospital closed was with a hospital that itself has closed or is closing, preference would be given to an applying hospital that was listed as a participant in the next most recent Medicare GME affiliation agreement (but not one which was entered into more than 5 years prior to the hospital's closure) of which the first closed hospital was a member before the hospital closed, and that applying hospital received slots from the closed hospital under the terms of that affiliation agreement.

A question has been raised as to whether hospitals that were members of an emergency Medicare GME affiliation agreement with the closed hospital prior to its closure may be considered under Ranking Criterion Two as well. The regulations at 42 CFR 413.79(f)(7) govern emergency Medicare GME affiliation agreements, which are applicable in the instance where a statutory section 1135 waiver is invoked. In this situation, due to emergency conditions, the "home" hospital is unable to continue to train its residents. Therefore, under the terms of the emergency Medicare GME affiliation agreement, the "home" hospital may agree to temporarily transfer FTE resident cap slots to "host" hospitals that would train the displaced residents during the emergency period.

In the November 24, 2010 final rule with comment period (75 FR 72216), we stated that "section 1886(h)(4)(H)(vi) of the Act, as added by section 5506(a) of the Affordable Care Act, directs the Secretary to give preference to hospitals that are members of the same affiliated group as the hospital that closed. We believe that, generally, if the applying hospital was affiliated to receive slots from the hospital that closed, then the applying hospital was relying on that number of FTE resident slots that it received in order to maintain its fair share of the cross-training of the residents in the jointly operated programs. In the absence of those slots received from the closed hospital, the applying hospital may not be able to continue training that number of FTE residents, and those same residents would not only be displaced from the closed hospital, but might essentially become 'displaced' from the affiliated hospitals in which they were used to doing a portion of their training. Accordingly, we proposed this ranking

criterion to allow hospitals that were affiliated with the closed hospitals to at least maintain their fair share of the training of the residents in the programs that they had jointly operated with the closed hospital."

In determining whether Ranking Criterion Two may encompass emergency Medicare GME affiliation agreements, we considered the key differences and similarities between regular Medicare GME affiliation agreements and emergency Medicare GME affiliation agreements. Regarding the differences, in the case of emergency affiliations, there may not have been historical cross-training or jointly operated programs between the applicant hospital and the hospital that closed. Furthermore, after the natural disaster that precipitates the section 1135 waiver, the "home" hospital would be in no condition to train its share of residents, which is why the "shared rotational arrangement" requirements at 42 CFR 413.79(f)(2) for regular Medicare GME affiliation agreements are waived for emergency Medicare GME affiliation agreements. However, it is often true with emergency affiliations that a hospital agrees to take over the training of the hospital in need, "receiving" FTE cap slots and residents from the "home" hospital, thereby creating the training relationship. In the event where, following the disaster that triggers the section 1135 waiver, a hospital should actually close, the "host" hospital that accepted the residents perhaps might even continue to train its share of the residents in the program after the hospital closes. Therefore, emergency affiliation agreements are similar to regular affiliation agreements in that the "host" hospital received FTE cap slots from the "home" hospital to train the "home" hospital's residents. Further, in the event that the "home" hospital closes, triggering a Round of section 5506, the "host" hospital also would need those FTE cap slots in order to continue training the share of its program for which it had taken responsibility under the emergency Medicare GME affiliation agreement before the "home" hospital closed.

As we stated in the November 24, 2010 final rule with comment period (75 FR 72219 through 72220), "we believe the intent of section 5506 is to promote continuity and limit disruption in residency training. In that light, we believe it is logical to give preference to a hospital that received slots under the terms of the Medicare GME affiliation agreement so that the hospital could continue to train at least the number of FTE residents it had trained under the

terms of the Medicare GME affiliation agreement, avoiding the displacement of even more residents. . . .” We further stated that we “. . . are only giving preference to hospitals that received slots from the closed hospital under the terms of the Medicare GME affiliation agreement, so that the hospital could continue to train at least the number of FTE residents it had trained under the terms of the Medicare GME affiliation agreement. . . .” Finally, we stated “that the hospital or hospitals that were most recently affiliated with and received slots from the closed hospital would have the most immediate need for those slots.”

While the circumstances may vary, we believe that “host” hospitals under emergency Medicare GME affiliation agreements could fulfill much of the same role as hospitals that received slots from the hospital that closed under regular Medicare GME affiliation agreements. That is, continuity of training would be encouraged and disruption would be mitigated, to the extent that the “host” hospital could document to CMS that it would continue to “train at least the number of FTE residents it had trained under the terms of the” emergency Medicare GME affiliation agreement, and in doing so, would demonstrate it has the “most immediate need for those slots” as compared to another hospital. Given these similarities between regular Medicare GME affiliation agreements and emergency Medicare GME affiliation agreements, we believe that the existing Ranking Criterion Two may be read to already encompass emergency Medicare GME affiliation agreements. Accordingly, we are clarifying the existing Ranking Criterion Two to include emergency Medicare GME affiliation agreements, to read as follows:

□ *Ranking Criterion Two. The applying hospital was listed as a participant of a Medicare GME affiliated group on the most recent Medicare GME affiliation agreement or emergency Medicare GME affiliation agreement of which the closed hospital was a member before the hospital closed, and under the terms of that Medicare GME affiliation agreement or emergency Medicare GME affiliation agreement, the applying hospital received slots from the hospital that closed, and the applying hospital will use the additional slots to continue to train at least the number of FTE residents it had trained under the terms of the Medicare GME affiliation agreement, or emergency Medicare GME affiliation agreement. If the most recent Medicare GME affiliation agreement or emergency*

Medicare GME affiliation agreement of which the closed hospital was a member before the hospital closed was with a hospital that itself has closed or is closing, preference would be given to an applying hospital that was listed as a participant in the next most recent Medicare GME affiliation agreement or emergency Medicare GME affiliation agreement (but not one which was entered into more than 5 years prior to the hospital’s closure) of which the first closed hospital was a member before the hospital closed, and that applying hospital received slots from the closed hospital under the terms of that affiliation agreement.

We are making these changes to Ranking Criterion Two in the Section 5506 Application Form.

Comment: Commenters supported CMS’ clarification that the existing Ranking Criterion Two includes emergency Medicare GME affiliation agreements.

Response: We thank the commenters for their support. The revised description of Ranking Criterion Two on the CMS Application Form refers to both Medicare GME affiliation agreements and emergency Medicare GME affiliation agreements.

The following list includes the final ranking criteria along with the final effective dates.

- *Ranking Criterion One:* The applying hospital is requesting the increase in its FTE resident cap(s) because it is assuming (or assumed) an entire program (or programs) from the hospital that closed, and the applying hospital is continuing to operate the program(s) exactly as it had been operated by the hospital that closed (that is, same residents, possibly the same program director, and possibly the same (or many of the same) teaching staff); OR, the applying hospital’s FTE resident caps were erroneously reduced by CMS under section 1886(h)(8)(A)(i) of the Act, contrary to the statutory exception at section 1886(h)(8)(A)(ii)(I) of the Act, and CMS Central Office was made aware of the error prior to posting of the FY 2015 IPPS/LTCH PPS proposed rule on the CMS Web site. (This language reflects the finalized modification of Ranking Criterion One. We refer readers to section IV.K.5.c. of the preamble of this final rule where we discuss this proposed modification.)

- *Effective Date:* If the hospital is receiving a temporary cap adjustment, slots are effective the day after the graduation date(s) of actual displaced resident(s). If the hospital is not receiving a temporary cap adjustment, slots are effective with the date of the hospital closure.

- *Clarified Ranking Criterion Two:* The applying hospital was listed as a participant of a Medicare GME affiliated group on the most recent Medicare GME affiliation agreement or emergency Medicare GME affiliation agreement of which the closed hospital was a member before the hospital closed, and under the terms of that Medicare GME affiliation agreement or emergency Medicare GME affiliation agreement, the applying hospital received slots from the hospital that closed, and the applying hospital will use the additional slots to continue to train at least the number of FTE residents it had trained under the terms of the Medicare GME affiliation agreement, or emergency Medicare GME affiliation agreement. If the most recent Medicare GME affiliation agreement or emergency Medicare GME affiliation agreement of which the closed hospital was a member before the hospital closed was with a hospital that itself has closed or is closing, preference would be given to an applying hospital that was listed as a participant in the next most recent Medicare GME affiliation agreement or emergency Medicare GME affiliation agreement (but not one which was entered into more than 5 years prior to the hospital’s closure) of which the first closed hospital was a member before the hospital closed, and that applying hospital received slots from the closed hospital under the terms of that affiliation agreement.

(This language reflects our clarification in the proposed rule and this final rule regarding inclusion of emergency Medicare GME affiliation agreements in Ranking Criterion Two. We refer readers to section IV.K.5.d. of the preamble of this final rule where we discuss this clarification.)

- *Effective Date:* Slots are effective with the date of the hospital closure.

- *Ranking Criterion Three:* The applying hospital took in residents displaced by the closure of the hospital, but is not assuming an entire program or programs, and will use the additional slots to continue training residents in the same programs as the displaced residents, even after those displaced residents complete their training (that is, the applying hospital is permanently expanding its own existing programs).

- *Effective Date:* If the hospital is receiving temporary cap adjustment, slots are effective the day after the graduation date(s) of actual displaced resident(s). If the hospital is not receiving a temporary cap adjustment, slots are effective with the date of the hospital closure.

- *Ranking Criterion Four:* The program does not meet Ranking Criteria

1, 2, or 3, and the applying hospital will use additional slots to establish a new or expand an existing geriatrics residency program.

- *Ranking Criterion Five:* The program does not meet Ranking Criteria 1 through 4, the applying hospital is located in a HPSA, and will use all the additional slots to establish or expand a primary care or general surgery residency program.

- *Ranking Criterion Six:* The program does not meet Ranking Criteria 1 through 5, and the applying hospital is not located in a HPSA, and will use all the additional slots to establish or expand a primary care or general surgery residency program.

- *Ranking Criterion Seven:* The applying hospital will use additional slots to establish or expand a primary care or general surgery program, but the program does not meet Ranking Criterion 5 or 6 because the hospital is also separately applying under Ranking Criterion 8 for slots to establish or expand a nonprimary care or nongeneral surgery program.

(This language reflects our proposal in this proposed rule to revise Ranking Criteria Seven and Eight. We refer readers to section IV.K.5.c. of the preamble of this final rule where we discuss our proposals and final policies to amend Ranking Criteria Seven and Eight.)

- *Ranking Criterion Eight:* The program does not meet Ranking Criteria 1 through 7, and the applying hospital will use additional slots to establish or expand a nonprimary care or a nongeneral surgery program.

(This language reflects our proposal in the proposed rule to revise Ranking

Criterion Eight. We refer readers to section IV.K.5.c. of the preamble of this final rule where we discuss our proposals and final policies to amend Ranking Criterion Eight.)

- *Effective Date Policy for Ranking Criterion Four through Ranking Criterion Eight:* If the hospital is receiving a temporary cap adjustment for training displaced residents and its section 5506 award is less than or equal to the temporary cap adjustment, the section 5506 slots would become effective the later of when the hospital can demonstrate to the MAC that the slots associated with a new program or program expansion are actually filled, and therefore, are needed, or the July 1 *after* displaced residents complete their training. If the hospital is receiving a temporary cap adjustment for training displaced residents and its section 5506 award is greater than the temporary cap adjustment, the number of slots by which the section 5506 award exceeds the temporary cap adjustment would be available for use when the hospital can demonstrate to its MAC that the slots associated with the new program or program expansion are filled and, therefore, are needed as of a particular date (usually July 1, possibly retroactive). If the hospital is *not* receiving a temporary cap adjustment, slots would become effective when the hospital can demonstrate to the MAC that the slots needed for a new program or program expansion are actually filled and, therefore, are needed as of a particular date (usually July 1, possibly retroactive).

At the end of this GME section, we are including a revised Section 5506

Application Form that reflects all of the final changes discussed above.

Out of Scope GME Comments

We received several comments that were not related to the GME proposals in the FY 2015 IPPS/LTCH PPS proposed rule. Some commenters urged CMS to be more transparent and provide data on the effects of the section 5503 and the section 5506 redistributions. One commenter asked that CMS consider changing the calculation of the FTE cap for new teaching hospitals so that it is based on the final 1-year period of the 5-year growth window, as opposed to the entire 5 years. Another commenter stated that policies to redirect funding from specialty to primary care do not take into consideration the serious consequences of a potential shortage of specialty physicians, and that Medicare GME should fully fund the entire length of training required for initial board certification for neurosurgery, which is 6 to 7 years. Several commenters urged CMS to publish a clear statement that neither a hospital's PRA nor its cap-building window is triggered by the presence of a small number of residents performing brief rotations at the hospital. Another commenter asserted that second-year pharmacy residencies should receive Medicare pass-through reimbursement.

We appreciate these comments. However, because we did not propose any changes related to these issues in the proposed rule, we consider these comments to be outside the scope of the proposed rule and are not addressing these comments at this time.

CMS Application Form**As Part of the Application for the Increase in a Hospital's FTE Cap(s) under Section 5506 of the Affordable Care Act: Preservation of FTE Cap Slots from Teaching Hospitals that Close**

Directions: Please fill out the information below for each residency program for which the applicant hospital intends to use the increase in its FTE cap(s). If the hospital is applying for slots for a particular program, but the requested slots in that program qualify under two different ranking criteria, submit two separate application forms accordingly. If the hospital is applying for slots associated with a Medicare GME affiliation agreement with a hospital that closed, that application must be submitted separately from an individual program request.

NAME OF HOSPITAL: _____

MEDICARE PROVIDER NUMBER (CCN): _____

NAME OF MEDICARE ADMINISTRATIVE CONTRACTOR: _____

CORE-BASED STATISTICAL AREA (CBSA in which the hospital is physically located--write the 5 digit code here): _____

COUNTY NAME (in which the hospital is physically located): _____

Indicate the following, as applicable:

- 1. Name of Specialty Training Program:** _____
- 2. Medicare GME Affiliated Group:** _____

(Check one): Allopathic Program Osteopathic Program

NUMBER OF FTE SLOTS REQUESTED FOR SPECIFIC PROGRAM (OR OVERALL IF SEEKING SLOTS ASSOCIATED WITH A MEDICARE GME AFFILIATED GROUP) AT YOUR HOSPITAL:

Direct GME: _____ **IME:** _____

Section A: Demonstrated Likelihood Criteria (DLC) of Filling the FTE Slots

The applicant hospital must provide documentation to demonstrate the likelihood of filling requested slots under section 5506 within the 3 academic years immediately following the application deadline to receive slots after a particular hospital closes. Please indicate the specific use for which you are requesting an increase in your hospital's FTE

cap(s). If you are requesting an increase in the hospital's FTE cap(s) for a combination of DLC1, DLC2, or DLC3, you must complete a separate CMS Application Form for each DLC and specify the distinct criterion from the list below within each Form.

Demonstrated Likelihood Criterion 1: Establishing a New Residency Program

The hospital does not have sufficient room under its direct GME FTE cap or IME FTE cap, or both, and will establish a new residency program in the specialty.

Please indicate Y or N: As of the time of submitting this application, are you receiving a temporary cap adjustment for IME and/or direct GME under 42 CFR 413.79(h) for residents displaced by the closure of the hospital subject to this Round of section 5506? (Y/N) _____

The hospital must check at least one of the following:

_____ Application for approval of the new residency program has been submitted to the ACGME, AOA or the ABMS **(The hospital must attach a copy.)**

_____ The hospital has submitted an institutional review document or program information form concerning the new program in an application for approval of the new program. **(The hospital must attach a copy.)**

_____ The hospital has received written correspondence from the ACGME, AOA or ABMS acknowledging receipt of the application for the new program, or other types of communication from the accrediting bodies concerning the new program approval process (such as notification of site visit). **(The hospital must attach a copy.)**

_____ The hospital has other documentation demonstrating that it has made a commitment to start a new program **(The hospital must attach a copy.)**

Demonstrated Likelihood Criterion 2: Taking Over All or Part of an Existing Residency Program from the Closed Hospital, or Expanding an Existing Residency Program

The hospital does not have sufficient room under its direct GME FTE cap or IME FTE cap, or both, and (a) has permanently taken over the closed hospital's entire residency program, or (b) is permanently expanding its own previously established and approved residency program resulting from taking over *part* of a residency program from the closed hospital, or (c) is permanently expanding its own existing residency program.

Please indicate Y or N: As of the time of submitting this application, are you receiving a temporary cap adjustment for IME and/or direct GME under 42 CFR 413.79(h) for residents displaced by the closure of the hospital subject to this Round of section 5506? (Y/N) _____

The hospital must check at least one of the following:

_____ Application for approval to take over the closed hospital's residency program has been submitted to the ACGME, AOA, or the ABMS, or approval has been received from the ACGME, AOA, or the ABMS. **(The hospital must attach a copy.)**

_____ Application for approval of an expansion of the number of approved positions in its residency program resulting from taking over *part* of a residency program from the closed hospital has been submitted to the ACGME, AOA or the ABMS, or approval has been received from the ACGME, AOA, or the ABMS. **(The hospital must attach a copy.)**

_____ Application for approval of an expansion of the number of approved positions in its residency program has been submitted to the ACGME, AOA or the ABMS, or approval has been received from the ACGME, AOA, or the ABMS. **(The hospital must attach a copy.)**

_____ The hospital currently has unfilled positions in its residency program that have previously been approved by the ACGME, AOA, or the ABMS, and is now seeking to fill those positions. **(The hospital must attach documentation clearly showing its current number of approved positions, and its current number of filled positions).**

_____ The hospital has submitted an institutional review document or program information form concerning the program in an application for approval of an expansion to the program **(The hospital must attach a copy).**

Demonstrated Likelihood Criterion 3: Receiving Slots by Virtue of Medicare GME Affiliated Group Agreement or Emergency Medicare GME Affiliated Group Agreement with Closed Hospital

The hospital was listed as a participant of a Medicare GME affiliated group on the most recent Medicare GME affiliation agreement ***or emergency Medicare GME affiliation agreement*** of which the closed hospital was a member before the hospital closed, and under the terms of that Medicare GME affiliation agreement ***or emergency Medicare GME affiliation agreement***, the applying hospital received slots from the hospital that closed, and the applying hospital will use the additional slots to continue to train at least the number of FTE residents it had trained under the terms of the Medicare GME affiliation agreement ***or emergency Medicare GME affiliation agreement***. If the most recent Medicare GME affiliation agreement ***or emergency Medicare GME affiliation agreement*** of which the closed hospital was a member before the hospital closed was with a hospital that itself has closed or is closing, the applying hospital was listed as a participant in the next most recent Medicare GME affiliation agreement ***or emergency Medicare GME affiliation agreement*** (but not one which was entered into more than 5 years prior to the hospital's closure) of which the first closed hospital was a member before the hospital closed, and that applying hospital received slots from the closed

hospital under the terms of that affiliation agreement. **(Copies of EACH of the following must be attached.)**

Copies of the recent Medicare GME affiliation agreement (or emergency Medicare GME affiliation agreement) of which the applying hospital and the closed hospital were a member of before the hospital closed.

For regular Medicare GME affiliation agreements, copies of the most recent accreditation letters for all of the hospital's training programs in which the hospital had a shared rotational arrangement (as defined at §413.75(b)) with the closed hospital.

Section B. Level Priority Category

(Place an "X" in the appropriate box that is applicable to the level priority category that describes the applicant hospital.)

- First, to hospitals located in the same core-based statistical area (CBSA) as, or in a CBSA contiguous to, the hospital that closed.
- Second, to hospitals located in the same State as the closed hospital.
- Third, to hospitals located in the same region as the hospital that closed.
- Fourth, if the slots have not yet been fully distributed, to qualifying hospitals in accordance with the criteria established under section 5503, "Distribution of Additional Residency Positions"

Section C. Ranking Criteria

(Place an "X" in the box for each criterion that is appropriate for the applicant hospital and for the program for which the increase in the FTE cap is requested.)

- Ranking Criterion One. *The applying hospital is requesting the increase in its FTE resident cap(s) because it is assuming (or assumed) an entire program (or programs) from the hospital that closed, and the applying hospital is continuing to operate the program (s) exactly as it had been operated by the hospital that closed (that is, same residents, possibly the same program director, and possibly the same (or many of the same) teaching staff); OR, the applying hospital's FTE resident caps were erroneously reduced by CMS under section 1886(h)(8)(A)(i) of the Act, contrary to the statutory exception at section 1886(h)(8)(A)(ii)(I) of the Act, and CMS Central Office was made aware of the error prior to posting of the FY 2015 IPPS/LTCH PPS proposed rule on the CMS Web site.*
- Ranking Criterion Two. *The applying hospital was listed as a participant of a Medicare GME affiliated group on the most recent Medicare GME affiliation agreement **or***

emergency Medicare GME affiliation agreement of which the closed hospital was a member before the hospital closed, and under the terms of that Medicare GME affiliation agreement or emergency Medicare GME affiliation agreement, the applying hospital received slots from the hospital that closed, and the applying hospital will use the additional slots to continue to train at least the number of FTE residents it had trained under the terms of the Medicare GME affiliation agreement, or emergency Medicare GME affiliation agreement. If the most recent Medicare GME affiliation agreement or emergency Medicare GME affiliation agreement of which the closed hospital was a member before the hospital closed was with a hospital that itself has closed or is closing, preference would be given to an applying hospital that was listed as a participant in the next most recent Medicare GME affiliation agreement or emergency Medicare GME affiliation agreement (but not one which was entered into more than 5 years prior to the hospital's closure) of which the first closed hospital was a member before the hospital closed, and that applying hospital received slots from the closed hospital under the terms of that affiliation agreement.

- Ranking Criterion Three. *The applying hospital took in residents displaced by the closure of the hospital, but is not assuming an entire program or programs, and will use the additional slots to continue training residents in the same programs as the displaced residents, even after those displaced residents complete their training (that is, the applying hospital is permanently expanding its own existing programs).*
- Ranking Criterion Four. *The program does not meet Ranking Criteria 1, 2, or 3, and the applying hospital will use additional slots to establish a new or expand an existing geriatrics residency program.*
- Ranking Criterion Five: *The program does not meet Ranking Criteria 1 through 4, the applying hospital is located in a HPSA, and will use all the additional slots to establish or expand a primary care or general surgery residency program.*
- Ranking Criterion Six: *The program does not meet Ranking Criteria 1 through 5, and the applying hospital is not located in a HPSA, and will use all the additional slots to establish or expand a primary care or general surgery residency program.*
- Ranking Criterion Seven: *The applying hospital will use additional slots to establish or expand a primary care or general surgery program, but the program does not meet Ranking Criterion 5 or 6 because the hospital is also separately applying under Ranking Criterion 8 for slots to establish or expand a nonprimary care or non-general surgery program.*
- Ranking Criterion Eight: *The program does not meet Ranking Criteria 1 through 7, and the applying hospital will use additional slots to establish or expand a nonprimary care or a nongeneral surgery program.*

Application Process and CMS Central Office Mailing Address for Receiving Increases in FTE Resident Caps

In order for hospitals to be considered for increases in their FTE resident caps, each qualifying hospital must submit a timely application. The following information must be submitted on applications to receive an increase in FTE resident caps:

- The name and Medicare provider number, and Medicare administrative contractor (to which the hospital submits its cost report) of the hospital.
- The total number of requested FTE resident slots for direct GME or IME, or both.
- A completed copy of the CMS Application Form for each residency program for which the hospital intends to use the requested increase in FTE residents.
- Source documentation to support the assertions made by the hospital on the CMS Application Form.
- FTE resident counts for direct GME and IME and FTE resident caps for direct GME and IME reported by the hospital in the most recent as-filed cost report. Include copies of Worksheets E, Part A, and E-4.

An attestation, signed and dated by an officer or administrator of the hospital who signs the hospital's Medicare cost report, with the following information:

“I hereby certify that I understand that misrepresentation or falsification of any information contained in this application may be punishable by criminal, civil, and administrative action, fine and/or imprisonment under federal law. Furthermore, I understand that if services identified in this application were provided or procured through payment directly or indirectly of a kickback or were otherwise illegal, criminal, civil, and administrative action, fines and/or imprisonment may result. I also certify that, to the best of my knowledge and belief, it is a true, correct, and complete application prepared from the books and records of the hospital in accordance with applicable instructions, except as noted. I further certify that I am familiar with the laws and regulations regarding Medicare payment to hospitals for the training of interns and residents.”

6. Clarification and Policy Change
 Applicable to Direct GME Payments to Federally Qualified Health Centers (FQHCs) and Rural Health Clinics (RHCs) for Training Residents in Approved Programs

Under section 1886(k) of the Act, and as implemented in the regulations at 42

CFR 405.2468(f), federally qualified health centers (FQHCs) and rural health clinics (RHCs) may receive payment for the costs of direct GME for training residents in an approved program under certain circumstances. Specifically, the regulations at § 405.2468(f)(1) state that effective for that portion of cost

reporting periods occurring on or after January 1, 1999, if an RHC or an FQHC incurs “all or substantially all” of the costs for the training program in the nonhospital setting as defined in § 413.75(b), the RHC or FQHC may receive direct graduate medical education payment for those residents.

We refer readers to the July 31, 1998 final rule (63 FR 40986) for a detailed discussion of this longstanding policy. As noted earlier, the regulatory text of § 405.2468(f)(1) incorporates the definition of “all or substantially all of the costs for the training program in a nonhospital setting” that is defined at § 413.75(b), as part of a number of definitions applicable generally to hospital direct GME payments and those regulations at § 413.76 through § 413.83. Section 413.75(b) is based on the statutory provision at section 1886(h)(4)(E) of the Act, which establishes the requirements that hospitals must meet in order to receive direct GME payment for residents training in nonprovider settings.

The statutory use of the phrase “all or substantially all of the costs for the training program in that setting” is located in section 1886(h)(4)(E) of the Act, as added by section 9314 of the Omnibus Budget Reconciliation Act of 1986 (Pub. L. 99-509) (OBRA ‘86). For a detailed discussion of the implementation of section 9314 of OBRA ‘86, we refer readers to the September 29, 1989 final rule (54 FR 40292). Section 1886(h)(4)(E) of the Act, as added by OBRA ‘86, established the requirements that hospitals must meet in order to receive direct GME payment for residents training in nonprovider settings. However, section 5504(a) of the Affordable Care Act made changes to section 1886(h)(4)(E) of the Act to reduce the costs that hospitals must incur for residents training in nonprovider sites in order to count the FTE residents for purposes of direct GME payments. In making these changes to section 1886(h)(4)(E) of the Act, section 5504(a) of the Affordable Care Act amended the Act prospectively, effective with “cost reporting periods beginning on or after July 1, 2010” for direct GME, by removing the phrase “all or substantially all of the costs for the training program in that setting” and instead permitting hospitals to count the time that residents train in activities related to patient care in a nonprovider site if the hospital incurs the costs of the residents’ salaries and fringe benefits for the time that the resident spends training in the nonprovider site. In effect, this amendment reduced the costs that hospitals must incur for residents training in nonprovider settings.

Based on this statutory amendment, in the November 24, 2010 final rule with comment period (75 FR 72134), we revised the regulations at § 412.105(f)(1)(ii)(E) for IME and §§ 413.78(f) and (g) for direct GME to

reflect the changes made by section 5504(a) of the Affordable Care Act. In addition, we revised the regulatory definition of “all or substantially all of the costs for the training program in the nonhospital setting” in order to implement the statutory amendment and apply the effective date as set forth in the statute to cost reporting periods beginning on or after July 1, 2010. Specifically, the regulations at § 413.75(b), which define “all or substantially all of the costs for the training program in the nonhospital setting” were revised to state:

- Effective on or after January 1, 1999 and for cost reporting periods beginning before July 1, 2007, the residents’ salaries and fringe benefits (including travel and lodging where applicable) and the portion of the cost of teaching physicians’ salaries and fringe benefits attributable to direct graduate medical education (GME); and

- Effective for cost reporting periods beginning on or after July 1, 2007 and before July 1, 2010, at least 90 percent of the total of the costs of the residents’ salaries and fringe benefits (including travel and lodging where applicable) and the portion of the cost of teaching physicians’ salaries attributable to nonpatient care direct GME activities.

Ultimately, with regard to the costs that hospitals must incur for residents training in nonprovider sites in order to count the FTE residents for purposes of direct GME payments, the phrase “all or substantially all of the costs for the training program in the nonhospital setting” no longer applies, effective for cost reporting periods beginning on and after July 1, 2010.

In the November 24, 2010 final rule with comment period (75 FR 72134), we amended the regulations applicable to direct GME payments to hospitals at §§ 413.75(b) and 413.78(g) to reflect the changes made by section 5504(a) of the Affordable Care Act. However, at that time, we inadvertently did not make conforming changes to the regulations at § 405.2468(f)(1) to clarify the requirements that FQHCs and RHCs must meet in order to receive direct GME payment for training residents in their facilities. Therefore, in compliance with our longstanding policy that FQHCs and RHCs must meet the same requirements applicable to teaching hospitals for direct GME payments with respect to training residents in nonprovider settings, as we did in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28164), we are providing clarification that, based on statutory amendments discussed earlier, the applicable policy cross-referenced in § 405.2468(f)(1) has changed for cost

reporting periods beginning on or after July 1, 2010. In addition, to ensure statutory and regulatory consistency, we proposed to revise the regulations at § 405.2468(f)(1) to add a sentence at the end of the paragraph that stated that in connection with cost reporting periods for which “all or substantially all of the costs for the training program in the nonhospital setting” is not defined in § 413.75(b), if an RHC or an FQHC incurs the salaries and fringe benefits (including travel and lodging where applicable) of residents training at the RHC or FQHC, the RHC or FQHC may receive direct graduate medical education payment for those residents.

We did not receive any public comments regarding our proposed clarification and policy change applicable to direct GME payments to FQHCs and RHCs for training residents in approved programs. Therefore, we are finalizing this policy as proposed.

L. Rural Community Hospital Demonstration Program

1. Background

Section 410A(a) of Public Law 108-173 required the Secretary to establish a demonstration program to test the feasibility and advisability of establishing “rural community” hospitals to furnish covered inpatient hospital services to Medicare beneficiaries. The demonstration pays rural community hospitals under a reasonable cost-based methodology for Medicare payment purposes for covered inpatient hospital services furnished to Medicare beneficiaries. A rural community hospital, as defined in section 410A(f)(1), is a hospital that—

- Is located in a rural area (as defined in section 1886(d)(2)(D) of the Act) or is treated as being located in a rural area under section 1886(d)(8)(E) of the Act;

- Has fewer than 51 beds (excluding beds in a distinct part psychiatric or rehabilitation unit) as reported in its most recent cost report;

- Provides 24-hour emergency care services; and

- Is not designated or eligible for designation as a CAH under section 1820 of the Act.

Section 410A(a)(4) of Public Law 108-173 specified that the Secretary was to select for participation no more than 15 rural community hospitals in rural areas of States that the Secretary identified as having low population densities. Using 2002 data from the U.S. Census Bureau, we identified the 10 States with the lowest population density in which rural community hospitals were to be located in order to participate in the demonstration: Alaska, Idaho, Montana,

Nebraska, Nevada, New Mexico, North Dakota, South Dakota, Utah, and Wyoming. (Source: U.S. Census Bureau, Statistical Abstract of the United States: 2003).

CMS originally solicited applicants for the demonstration in May 2004; 13 hospitals began participation with cost reporting periods beginning on or after October 1, 2004. In 2005, 4 of these 13 hospitals withdrew from the program and converted to CAH status. This left nine hospitals participating at that time. In 2008, we announced a solicitation for up to six additional hospitals to participate in the demonstration program. Four additional hospitals were selected to participate under this solicitation. These four additional hospitals began under the demonstration payment methodology with the hospital's first cost reporting period starting on or after July 1, 2008. At that time, 13 hospitals were participating in the demonstration.

Five hospitals (3 of the hospitals were among the 13 hospitals that were original participants in the demonstration program and 2 of the hospitals were among the 4 hospitals that began the demonstration program in 2008) withdrew from the demonstration program during CYs 2009 and 2010. (Three of these hospitals indicated that they would be paid more for Medicare inpatient hospital services under the rebasing option allowed under the SCH methodology provided for under section 122 of the Medicare Improvements for Patients and Providers Act of 2008 (Pub. L. 110-275). One hospital restructured to become a CAH, and one hospital closed.) In CY 2011, one hospital that was among the original set of hospitals that participated in the demonstration withdrew from the demonstration. These actions left seven of the originally participating hospitals (that is, hospitals that were selected to participate in either 2004 or 2008) participating in the demonstration program as of June 1, 2011.

Sections 3123 and 10313 of the Affordable Care Act (Pub. L. 111-148) amended section 410A of Public Law 108-173, which established the rural community hospital demonstration program. Sections 3123 and 10313 of the Affordable Care Act changed the rural community hospital demonstration program in several ways. First, the Secretary is required to conduct the demonstration program for an additional 5-year period that begins on the date immediately following the last day of the initial 5-year period. Further, the Affordable Care Act requires, in the case of a rural community hospital that is participating

in the demonstration program as of the last day of the initial 5-year period, the Secretary to provide for the continued participation of such rural hospital in the demonstration program during the 5-year extension, unless the hospital makes an election, in such form and manner as the Secretary may specify, to discontinue participation (section 410A(g)(4)(A) of Pub. L. 108-173, as added by section 3123(a) of the Affordable Care Act and further amended by section 10313 of such Act).

In addition, the Affordable Care Act provides that, during the 5-year extension period, the Secretary shall expand the number of States with low population densities determined by the Secretary to 20 (section 410A(g)(2) of Public Law 108-173, as added by section 3123(a) and amended by section 10313 of the Affordable Care Act). Further, the Secretary is required to use the same criteria and data that the Secretary used to determine the States under section 410A(a)(2) of Public Law 108-173 for purposes of the initial 5-year period. The Affordable Care Act also allows not more than 30 rural community hospitals in such States to participate in the demonstration program during the 5-year extension period (section 410A(g)(3) of Public Law 108-173, as added by section 3123(a) of the Affordable Care Act and as further amended by section 10313 of such Act).

We published a solicitation for applications for additional participants in the rural community hospital demonstration program in the **Federal Register** on August 30, 2010 (75 FR 52960). Applications were due on October 14, 2010. The 20 States with the lowest population density that were eligible for the demonstration program are: Alaska, Arizona, Arkansas, Colorado, Idaho, Iowa, Kansas, Maine, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, and Wyoming (Source: U.S. Census Bureau, Statistical Abstract of the United States: 2003). We approved 19 new hospitals for participation in the demonstration program. We determined that each of these new hospitals would begin participating in the demonstration with its first cost reporting period beginning on or after April 1, 2011.

Three of these 19 hospitals declined participation prior to the start of the cost reporting periods for which they would have begun the demonstration. In addition to the 7 hospitals that were selected in either 2004 or 2008, the new selection led to a total of 23 hospitals in the demonstration. During CY 2013, one additional hospital among the set

selected in 2011 withdrew from the demonstration, similarly citing a relative financial advantage to returning to the customary SCH payment methodology, which left 22 hospitals participating in the demonstration.

In addition, section 410A(c)(2) of Public Law 108-173 required that, "[i]n conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration program under this section was not implemented." This requirement is commonly referred to as "budget neutrality." Generally, when we implement a demonstration program on a budget neutral basis, the demonstration program is budget neutral in its own terms; in other words, the aggregate payments to the participating hospitals do not exceed the amount that would be paid to those same hospitals in the absence of the demonstration program. Typically, this form of budget neutrality is viable when, by changing payments or aligning incentives to improve overall efficiency, or both, a demonstration program may reduce the use of some services or eliminate the need for others, resulting in reduced expenditures for the demonstration program's participants. These reduced expenditures offset increased payments elsewhere under the demonstration program, thus ensuring that the demonstration program as a whole is budget neutral or yields savings. However, the small scale of this demonstration program, in conjunction with the payment methodology, makes it extremely unlikely that this demonstration program could be viable under the usual form of budget neutrality.

Specifically, cost-based payments to participating small rural hospitals are likely to increase Medicare outlays without producing any offsetting reduction in Medicare expenditures elsewhere. Therefore, a rural community hospital's participation in this demonstration program is unlikely to yield benefits to the participant if budget neutrality were to be implemented by reducing other payments for these same hospitals.

In the past 10 IPPS final regulations, spanning the period for which the demonstration program has been implemented, we have adjusted the national inpatient PPS rates by an amount sufficient to account for the added costs of this demonstration program, thus applying budget neutrality across the payment system as a whole rather than merely across the

participants in the demonstration program. As we discussed in the FYs 2005 through 2014 IPPS final rules (69 FR 49183; 70 FR 47462; 71 FR 48100; 72 FR 47392; 73 FR 48670; 74 FR 43922; 75 FR 50343; 76 FR 51698; 77 FR 53449; and 78 FR 50740; respectively), we believe that the language of the statutory budget neutrality requirements permits the agency to implement the budget neutrality provision in this manner. In light of the statute's budget neutrality requirement, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28166 through 28167), we proposed to continue to use the methodology we finalized in FY 2013 to calculate a budget neutrality adjustment factor to the FY 2015 national IPPS rates.

In general terms, in each of these previous years, we used available cost reports for the participating hospitals to derive an estimate of the additional costs attributable for the demonstration. Prior to FY 2013, we used finalized, or settled, cost reports, as available, and "as submitted" cost reports for hospitals for which finalized cost reports were not available. Annual market basket percentage increase amounts provided by the CMS Office of the Actuary reflecting the growth in the prices of inputs for inpatient hospitals were applied to these cost amounts. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53452), we used "as submitted" cost reports (for cost reporting periods ending in CY 2010) for each hospital participating in the demonstration in estimating the costs of the demonstration. In addition, in FY 2013, we incorporated different update factors (the market basket percentage increase and the applicable percentage increase, as applicable, to several years of data as opposed to solely using the market basket percentage increase) for the calculation of the budget neutrality offset amount. Finally, in each of the previous years, an annual update factor provided by the CMS Office of the Actuary reflecting growth in the volume of inpatient operating services was also applied. For the budget neutrality calculations in the IPPS final rules for FYs 2005 through 2011, the annual volume adjustment applied was 2 percent; for the IPPS final rules for FYs 2012, 2013, and 2014, it was 3 percent. For a detailed discussion of our budget neutrality offset calculations, we refer readers to the IPPS final rule applicable to the fiscal year involved.

In general, for FYs 2005 through 2009, we based the budget neutrality offset estimate on the estimated cost of the demonstration in an earlier given year. For these periods, we derived that estimated cost by subtracting the

estimated amount that would otherwise be paid without the demonstration in an earlier given year from the estimated amount for the same year that would be paid under the demonstration under the reasonable cost-based methodology authorized by section 410A of Public Law 108-173. (We note that section 410A of Public Law 108-173 was later amended by the Affordable Care Act.) The reasonable cost-based methodology authorized by section 410A of Public Law 108-173, as amended, is hereafter referred to as the "reasonable cost methodology." (We ascertained the estimated amount that would be paid in an earlier given year under the reasonable cost methodology and the estimated amount that would otherwise be paid without the demonstration in an earlier given year from "as submitted" cost reports that were submitted by the hospitals prior to the inception of the demonstration.) We then updated the estimated cost described above to the current year by multiplying it by the market basket percentage increases applicable to the years involved and the applicable annual volume adjustment. For the FY 2010 IPPS/R 2010 LTCH PPS final rule, data from finalized cost reports reflecting the participating hospitals' experience under the demonstration were available. Specifically, the finalized cost reports for the first 2 years of the demonstration, that is, cost reports for cost reporting years beginning in FYs 2005 and 2006 (CYs 2004, 2005, and 2006) were available. These data showed that the actual costs of the demonstration for these years exceeded the amounts originally estimated in the respective final rules for the budget neutrality adjustment. In the FY 2010 IPPS/R 2010 LTCH PPS final rule, we included in the budget neutrality offset amount an amount in addition to the estimate of the demonstration costs in that fiscal year. This additional amount was based on the amount that the costs of the demonstration for FYs 2005 and 2006 exceeded the budget neutrality offset amounts finalized in the IPPS rules applicable for those years.

Following upon the FY 2010 IPPS/R 2010 LTCH PPS final rule, we continued to propose and use a methodology for calculating the budget neutrality offset amount to account for both the estimated demonstration costs in the upcoming fiscal year and an amount by which the actual demonstration costs corresponding to an earlier, given year (which would be known once finalized cost reports became available for that year) exceeded the budget neutrality offset amount finalized in the

corresponding year's IPPS final rule. However, we noted in the FYs 2011, 2012, and 2013 IPPS final rules that, because of a delay affecting the settlement process for cost reports for IPPS hospitals occurring on a larger scale than merely for the demonstration, we were unable to finalize this component of the budget neutrality offset amount accounting for the amount by which the actual demonstration costs in a given year exceeded the budget neutrality offset amount finalized in the corresponding year's IPPS final rule for cost reports of demonstration hospitals dating to those beginning in FY 2007.

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53449 through 53453), we adopted changes to the methodology for calculating the budget neutrality offset amount in an effort to further improve and refine it. We noted that the revised methodology varied, in part, from that finalized in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51698 through 51705). Specifically, in adopting refinements to the methodology, our objective was to simplify the calculation so that it included as few steps as possible. In addition, we incorporated different update factors (the market basket percentage increase and the applicable percentage increase, as applicable, to several years of data as opposed to solely using the market basket percentage increase) for the calculation of the budget neutrality offset amount. We stated that we believed this approach would maximize the precision of our calculation because it would more closely replicate payments made with and without the demonstration. We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53449 through 53453) for a detailed discussion of the methodology we used for FY 2013. We noted that, although we were making changes to certain aspects of the budget neutrality offset amount calculation for FY 2013, several core components of the methodology would remain unchanged. For example, we continued to include in the budget neutrality offset amount methodology the estimate of the demonstration costs for the upcoming fiscal year and the amount by which the actual demonstration costs corresponding to an earlier year (which would be determined once we have finalized cost reports for that year) exceeded the budget neutrality offset amount finalized in the corresponding year's IPPS final rule. However, finalized cost reports for the hospitals participating in the demonstration were not available for FYs 2007, 2008, 2009, and 2010 at the time of development of the FY 2013

IPPS/LTCH PPS final rule. Therefore, we were unable to finalize this component of the budget neutrality offset calculation. We stated in the final rule that we expected settled cost reports for all of the demonstration hospitals that participated in the applicable fiscal year (FYs 2007, 2008, 2009, and 2010) to be available prior to the FY 2014 IPPS/LTCH PPS proposed rule.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50739 through 50744), we determined the final budget neutrality offset amount to be applied to the FY 2014 IPPS rates to be \$52,589,741. This amount was comprised of two distinct components: (1) the final resulting difference between the estimated reasonable cost amount to be paid under the demonstration to the 22 participating hospitals in FY 2014 for covered inpatient hospital services and the estimated amount that would otherwise be paid to such hospitals in FY 2014 without the demonstration (this amount was \$46,549,861); and (2) the amount by which the actual costs of the demonstration for FY 2007, as shown in the finalized cost reports for the hospitals that participated in the demonstration during FY 2007, exceeded the budget neutrality offset amount that was finalized in the FY 2007 IPPS final rule (this amount, \$6,039,880, was derived from finalized cost reports for cost reporting periods beginning in FY 2007 for the 9 hospitals that participated in the demonstration during that year).

2. FY 2015 Budget Neutrality Offset Amount

For the reasons discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53449 through 53453), we proposed in the FY 2015 IPPS/LTCH PPS proposed rule (78 FR 28167) to continue to use the methodology finalized in the FY 2013 IPPS/LTCH PPS final rule to calculate a budget neutrality adjustment factor to be applied to the FY 2015 national IPPS payment rates. As we stated in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53451), we revised our methodology in that final rule to further improve and refine the calculation of the budget neutrality offset amount and to simplify the methodology so that it includes only a few steps. Consistent with the methodology finalized in the FY 2013 IPPS/LTCH PPS final rule, the methodology proposed for calculating the estimated FY 2015 demonstration cost for the participating hospitals was as follows:

Step 1: For each of the participating hospitals, we proposed to identify the general reasonable cost amount

calculated under the reasonable cost methodology for covered inpatient hospital services (as indicated on the “as submitted” cost report for the hospital’s cost reporting period ending in CY 2012). The general reasonable cost amount calculated under the reasonable cost methodology is hereafter referred to as the “reasonable cost amount.” As we explained in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53451), we believe that a way to streamline our methodology for calculating the budget neutrality offset amount would be to use cost reports with the same status and from the same time period for all hospitals participating in the demonstration. Because “as submitted” cost reports ending in CY 2012 are the most recent available cost reports, we believe they would be an accurate predictor of the costs of the demonstration in FY 2015 because they give us a recent picture of the participating hospitals’ costs.

Because section 410A of Public Law 108–173 stipulates swing-bed services are to be included among the covered inpatient hospital services for which the demonstration payment methodology applies, we proposed to include the cost of these services, as reported on the cost reports for the hospitals that provide swing-bed services, within the general total estimated FY 2012 reasonable cost amount for covered inpatient hospital services under the demonstration. As indicated above, we proposed to use “as submitted” cost reports for the hospital’s cost reporting period ending in CY 2012 for this calculation.

We proposed to sum the two above-referenced amounts to calculate the general total estimated FY 2012 reasonable cost amount for covered inpatient hospital services for all participating hospitals.

We proposed to multiply this sum (that is, the general total estimated FY 2012 reasonable cost amount for covered inpatient hospital services for all participating hospitals) by the FY 2013, FY 2014, and FY 2015 IPPS market basket percentage increases, which are formulated by the CMS Office of the Actuary. In this final rule, we are using the current estimate of the FY 2015 IPPS market basket percentage increase provided by the CMS Office of the Actuary as specified in section IV.B.1. of the preamble of this final rule. We then multiply the product of the general total estimated FY 2012 reasonable cost amount for all participating hospitals and the market basket percentage increases applicable to the years involved by a 3-percent annual volume adjustment for FYs 2013 through 2015—the result is the general

total estimated FY 2015 reasonable cost amount for covered inpatient hospital services for all participating hospitals.

We proposed to apply the IPPS market basket percentage increases applicable for FYs 2013 through 2015 to the FY 2012 reasonable cost amount described above to model the estimated FY 2015 reasonable cost amount under the demonstration. We proposed to use the IPPS market basket percentage increases because we believe that these update factors appropriately indicate the trend of increase in inpatient hospital operating costs under the reasonable cost methodology for the years involved. The 3-percent annual volume adjustment was stipulated by the CMS Office of the Actuary and is being used because it is intended to accurately reflect the tendency of hospitals’ inpatient caseloads to increase. On account of the possibility that inpatient caseloads for small hospitals may fluctuate, we are incorporating into the estimate of demonstration costs a factor to allow for a potential increase in inpatient hospital services.

Step 2: For each of the participating hospitals, we proposed to identify the general estimated amount that would otherwise be paid in FY 2012 under applicable Medicare payment methodologies for covered inpatient hospital services (as indicated on the “as submitted” cost report for cost reporting periods ending in CY 2012) if the demonstration was not implemented. Similarly, as in Step 1, for the hospitals that provide swing-bed services, we proposed to identify the estimated amount that generally would otherwise be paid for these services (as indicated on the “as submitted” cost report for cost reporting periods ending in CY 2012) and include it in the total FY 2012 general estimated amount that would otherwise be paid for covered inpatient hospital services without the demonstration. We proposed to sum these two amounts in order to calculate the estimated FY 2012 total payments that generally would otherwise be paid for covered inpatient hospital services for all participating hospitals without the demonstration.

We proposed to multiply the above amount (that is, the estimated FY 2012 total payments that generally would otherwise be paid for covered inpatient hospital services for all participating hospitals without the demonstration) by the FYs 2013 through 2015 IPPS applicable percentage increases. For the proposed rule, the estimate of the FY 2015 applicable percentage increase was specified in section IV.B. of the preamble. This methodology differs

from Step 1, in which we proposed to apply the market basket percentage increases to the sum of the hospitals' general total FY 2012 estimated reasonable cost amount for covered inpatient hospital services. We believe that the IPPS applicable percentage increases are appropriate factors to update the estimated amounts that generally would otherwise be paid without the demonstration. This is because IPPS payments would constitute the majority of payments that would otherwise be made without the demonstration and the applicable percentage increase is the factor used under the IPPS to update the inpatient hospital payment rates. Hospitals participating in the demonstration would be participating under the IPPS payment methodology if they were not in the demonstration. Then we proposed to multiply the product of the estimated FY 2012 total payments that generally would otherwise be made without the demonstration and the applicable IPPS percentage increases for the years involved by a 3-percent annual volume adjustment for FYs 2013 through 2015. The result represents the general total estimated FY 2015 costs that would otherwise be paid without the demonstration for covered inpatient hospital services to the participating hospitals.

Step 3: We proposed to subtract the amount derived in Step 2 (representing the sum of estimated amounts that generally would otherwise be paid to the participating hospitals for covered inpatient hospital services for FY 2015 if the demonstration were not implemented) from the amount derived in Step 1 (representing the sum of the estimated reasonable cost amount that generally would be paid under the demonstration to all participating hospitals for covered inpatient hospital services for FY 2015). We proposed that the resulting difference would be one component of the estimated amount for which an adjustment to the national IPPS rates would be calculated (as further discussed below).

For the proposed rule, the resulting difference was \$53,673,008. This estimated amount is based on the specific assumptions identified regarding the data sources used, that is, "as submitted" recently available cost reports.

We did not receive any public comments on our proposed budget neutrality offset methodology, as discussed above. Therefore, we are finalizing the budget neutrality offset methodology as proposed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28165 through 28168).

In the FY 2015 IPPS/LTCH PPS proposed rule, we noted that if updated data became available prior to the FY 2015 IPPS/LTCH PPS final rule, we would use them to the extent appropriate to estimate the costs of the demonstration program in FY 2015. Therefore, we noted that the estimated budget neutrality offset amount might change in the final rule, depending on the availability of updated data. In this final rule, we have used the market basket update and applicable percentage increase that have been finalized for FY 2015. Using these updated data, the difference between the total estimated FY 2015 reasonable cost amount to be paid under the demonstration to the 22 participating hospitals for covered inpatient hospital services and the total estimated amount that would otherwise be paid to the participating hospitals in FY 2015 without the demonstration is \$54,177,144.

In addition, similar to previous years, we proposed to include in the budget neutrality offset amount the amount by which the actual demonstration costs corresponding to an earlier given year (which would be determined once we had finalized cost reports for that year) exceeded the budget neutrality offset amount finalized in the corresponding year's IPPS final rule. In the FY 2015 IPPS/LTCH PPS proposed rule, we calculated the amount by which the actual costs of the demonstration in FY 2008 (that is, the costs of the demonstration for the 10 hospitals that participated in FY 2008, as shown in these hospitals' finalized cost reports for the cost report period beginning in that fiscal year), exceeded the budget neutrality offset amount that was finalized in the FY 2008 IPPS final rule. The amount calculated for the FY 2015 IPPS/LTCH PPS proposed rule, \$10,389,771, remains unchanged for this final rule. We did not receive any public comments on this aspect of the proposed budget neutrality offset methodology, and therefore, are finalizing this aspect of the methodology as proposed. We continue to examine the cost report data for FY 2009, and to work with the MACs that service the hospitals participating in the demonstration to obtain finalized cost reports for FYs 2010, 2011, and 2012. We note that if settled cost reports for all of the demonstration hospitals that participated in an applicable year (FYs 2009, 2010, 2011, or 2012) are available prior to the FY 2016 IPPS/LTCH PPS proposed rule, we intend to adjust the budget neutrality offset amount for FY 2016 for any amounts by which the final settled costs of the demonstration for

the year (FYs 2009, 2010, 2011, or 2012) differ from the budget neutrality offset amount applicable to such year as finalized in the respective year's IPPS final rule.

Therefore, the total budget neutrality offset amount that we are applying to the FY 2015 IPPS rates is \$64,566,915. This is the sum of two separate components: (1) the difference between the total estimated FY 2015 reasonable cost amount to be paid under the demonstration to the 22 participating hospitals for covered inpatient hospital services and the total estimated amount that would otherwise be paid to the participating hospitals in FY 2015 without the demonstration (\$54,177,144); and (2) the amount by which the actual costs of the demonstration for FY 2008 (as shown in the finalized cost reports for cost reporting periods beginning in FY 2008 for the hospitals that participated in the demonstration during FY 2008) exceeded the budget neutrality offset amount that was finalized in the FY 2008 IPPS final rule (\$10,389,771). In this final rule, we are adjusting the national IPPS rates by this total amount (\$64,566,915). We discuss the final payment rate adjustment that is required to ensure the budget neutrality of the demonstration program for FY 2015 (the budget neutrality adjustment factor) in section II. of the Addendum to this final rule.

M. Requirement for Transparency of Hospital Charges Under the Affordable Care Act

1. Overview

Hospitals determine their charges for items and services provided to patients and are responsible for those charges. While Medicare does not pay billed charges, hospital reported charges are used in determining Medicare's national payment rates (for example, billed charges are adjusted to cost to determine how much to pay for one type of case relative to another). Although the Medicare payment amount for a discharge under the IPPS or a service furnished under the OPSS is not based directly on the hospital's charges for the individual services provided, we believe that hospital charges nevertheless remain an important component of our healthcare system. For example, hospital charges are often billed, in full, to uninsured patients who cannot benefit from discounts negotiated by insurance companies. Hospital charges also vary significantly by hospital, making it challenging for patients to compare the cost of similar services across hospitals.

In 2013, we released data that demonstrated significant variation across the country and within communities in what hospitals charge for a number of common inpatient and outpatient services. These data also showed that hospital charges for services furnished in both the inpatient setting and the outpatient setting were, in general, significantly higher than the amount paid by Medicare under the IPPS or the OPSS. The data that we released are posted on the Web site at: <https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/Medicare-Provider-Charge-Data/index.html>. Our intent in releasing these data was to enable the public to examine the relationship between the amounts charged by individual hospitals for comparable services and Medicare's payment for that inpatient or outpatient care. We believe that providing charge data comparisons is introducing both transparency and accountability to hospital pricing, and we are continuing to pursue opportunities to report on hospital charging practices.

2. Transparency Requirement Under the Affordable Care Act

The Affordable Care Act contains a provision that is consistent with our effort to improve the transparency of hospital charges. As a result of the Affordable Care Act, section 2718(e) of the Public Health Service Act requires that "[e]ach hospital operating within the United States shall for each year establish (and update) and make public (in accordance with guidelines developed by the Secretary) a list of the hospital's standard charges for items and services provided by the hospital, including for diagnosis-related groups established under section 1886(d)(4) of the Social Security Act."

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28169), we reminded hospitals of their obligation to comply with the provisions of section 2718(e) of the Public Health Service Act. We appreciate the widespread public support we received for including the reminder in the proposed rule. We reiterate that our guidelines for implementing section 2718(e) of the Public Health Service Act are that hospitals either make public a list of their standard charges (whether that be the chargemaster itself or in another form of their choice), or their policies for allowing the public to view a list of those charges in response to an inquiry. MedPAC suggested that hospitals be required to post the list on the Internet, and while we agree that this would be one approach that would satisfy the

guidelines, we believe hospitals are in the best position to determine the exact manner and method by which to make the list public in accordance with the guidelines.

We encourage hospitals to undertake efforts to engage in consumer friendly communication of their charges to help patients understand what their potential financial liability might be for services they obtain at the hospital, and to enable patients to compare charges for similar services across hospitals. We expect that hospitals will update the information at least annually, or more often as appropriate, to reflect current charges.

We are confident that hospital compliance with this statutory transparency requirement will improve the public accessibility of charge information. As hospitals continue to make data publicly available in compliance with section 2718(e) of the Public Health Service Act, we also will continue to review and post relevant charge data in a consumer friendly way, as we previously have done by posting on the CMS Web site the following hospital and physician charge information: May and June 2013 hospital charge data releases; 2013 physician data requests for information; and the April 2014 physician data releases and data provided on geographic variation in payments and payments per beneficiary.

N. Medicare Payment for Short Inpatient Hospital Stays

As discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28169), some members of the hospital community have expressed support for the general concept of an alternative payment methodology under the Medicare program for short inpatient hospital stays. We sought public comments on such a payment methodology, specifically how it might be designed. We outlined some specific questions and considerations that we identified as critical for developing such a methodology. We noted that this list of questions and considerations was not exhaustive, and we welcomed additional questions, suggestions, and input from stakeholders.

- Defining short or low cost inpatient hospital stays:

One issue would be how to define a short inpatient hospital stay for the purpose of determining the appropriate Medicare payment. For instance, would a short inpatient hospital stay be one where the average length of stay for the MS-DRG is short or would it be atypically short or low cost cases relative to other cases within same MS-

DRG? There are significant differences in mean lengths of stay among MS-DRGs. For example, many frequently billed MS-DRGs have historically had mean lengths of stay of approximately 2 days, such as MS-DRG 313 (Chest Pain). Other MS-DRGs such as MS-DRG 871 (Septicemia or Severe Sepsis without Mechanical Ventilation 96+ hours with MCC) have had longer lengths of stay.

If we adopted a policy that paid less for atypically low-cost or short-stay cases relative to the average case in the same MS-DRG, we believe such a policy is more likely to affect an MS-DRG like MS-DRG 871 that has a longer average length of stay or higher average cost associated with the typical patient. Such a policy is less likely to apply to MS-DRG 313 because the typical case is already low cost or short stay.

- Determining appropriate payment for short inpatient hospital stays:

Another issue would be how to determine the appropriate payment once a short stay has been identified. Some have suggested a per diem based payment amount, perhaps modelled on the existing transfer payment policy. Again, such a policy is far more likely to affect payment for an atypically short-stay or low-cost case in an MS-DRG with a longer average length of stay. For short-stay cases in an MS-DRG where the average length of stay for the MS-DRG is short, this methodology would be unlikely to affect payment as the full IPPS payment would be made in 1 or 2 days.

For these types of short-stay cases, one relevant issue to address may be that payment for the same case will be very different under the OPSS and the IPPS depending upon whether the patient has been formally admitted to the hospital as an inpatient, pursuant to a physician order. Under what circumstances should the IPPS payment amount be limited to the OPSS payment amount and under what circumstances might it be appropriate for the payment amount to be higher? If it were appropriate for the payment amount to be higher, how would the amount of the additional payment be determined?

In the proposed rule, we welcomed input on these and other issues related to an alternative payment methodology under the Medicare program for short inpatient hospital stays.

Comment: Many commenters indicated that any short-stay policy should adhere to certain general principles, specifically citing some or all of the following: a short-stay policy should provide more appropriate and adequate payment for medically necessary inpatient services that span less than 2 midnights—payment should

be higher than the outpatient PPS rate for the service, but should not exceed the full IPPS payment; a short-stay policy should not apply to those procedures on the “inpatient only” list; a short-stay policy should be budget neutral; hospitals should be eligible for all add-on payments they would otherwise receive (for example, DSH and IME), either in full or on a pro rata basis; beneficiaries requiring short inpatient hospital stays paid under a short-stay policy should be considered inpatients and cost-sharing obligations should be calculated under Medicare Part A; a short-stay policy should be developed in a way that would not increase administrative burden for hospitals, physicians, or other medical providers; and CMS should provide clear and consistent guidance and allow adequate time for hospitals to implement the short-stay policy prior to its effective date.

Other commenters indicated that CMS could or should consider approaches such as a per diem approach modeled after the existing transfer policy, creating separate MS–DRG weights for short-stay cases and nonshort-stay cases, or allowing the full MS–DRG payment on an interim basis while the issue is studied further.

Some commenters also stated that the MS–DRG system is predicated on the understanding that there will be a diversity of treatment patterns and individual patient circumstances for any given clinical condition, and that this diversity balances out—high-intensity cases are balanced by low-intensity cases. These commenters contended that creating a new category of “short stays” and paying for them differentially undermines the MS–DRG system.

Many commenters stated that additional research and collaboration were needed before a formal short-stay policy proposal could be made. MedPAC indicated that it intended to explore alternative short-stay policies in its upcoming work cycle.

Almost all commenters provided their comments on Medicare payment for short hospital stays in the context of broader comments on the current 2-midnight policy.

Response: We thank commenters for the many comments submitted on this issue, and we will take these into account in any potential future rulemaking. Although there was no consensus among the commenters, we look forward to continuing to actively work with stakeholders to address the complex question of how to further improve payment policy for short inpatient hospital stays.

O. Suggested Exceptions to the 2-Midnight Benchmark

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50943 through 50954), we modified and clarified CMS’ longstanding policy on how Medicare contractors review inpatient hospital and CAH admissions for payment purposes. Under that final rule, we established a 2-midnight benchmark for determining the appropriateness of an inpatient hospital admission versus treatment on an outpatient basis. We provided in regulations at § 412.3(e)(1) that, in addition to services designated as inpatient only, surgical procedures, diagnostic tests, and other treatments are generally appropriate for inpatient hospital admission and payment under Medicare Part A when the physician (1) expects the beneficiary to require a medically necessary hospital stay that crosses at least 2 midnights and (2) admits the beneficiary to the hospital based upon that expectation. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50944), we stated that the medical judgment of the physician and the physician’s order for inpatient admission should be based on the expectation of care surpassing 2 midnights, with both the expectation of time and the determination of the underlying need for medical care at the hospital supported by complex medical factors such as history and comorbidities, the severity of signs and symptoms, current medical needs, and the risk of an adverse event. We also indicated that, in accordance with longstanding policy, factors that may result in an inconvenience to a beneficiary or family would not justify an inpatient hospital admission. The factors that lead a physician to admit a particular beneficiary based on the physician’s clinical expectation are significant clinical considerations and must be clearly and completely documented in the medical record. Medicare review contractors consider complex medical factors that support a reasonable expectation of the needed duration of the stay relative to the 2-midnight benchmark. The FY 2014 policy responded to both hospital calls for more guidance about when an inpatient admission and Part A payment are appropriate, and beneficiaries’ concerns about increasingly long stays as outpatients due to hospital uncertainties about payment.

In the FY 2014 IPPS/LTCH PPS final rule, at § 412.3(e)(2), we recognized that if an unforeseen circumstance, such as a beneficiary’s death or transfer, results in a shorter beneficiary stay than the physician’s expectation of at least 2

midnights, the patient may be considered to be appropriately treated on an inpatient basis and hospital inpatient payment may be made under Medicare Part A. We also clarified, in both the final rule and subsequent subregulatory guidance, that the unforeseen circumstances specified at § 412.3(e)(2) are not all-inclusive and could include additional circumstances such as unexpected clinical improvement, election of hospice care, or departure against medical advice.

The FY 2014 IPPS/LTCH PPS final rule also indicated that there are exceptions to the 2-midnight benchmark. In other words, there will be cases in which an admitting practitioner expects the beneficiary’s length of stay to last less than 2 midnights and yet inpatient admission would still be appropriate. For example, we specified that procedures on the OPPI inpatient only list are always appropriately inpatient, regardless of the actual time expected at the hospital, so long as the procedure is medically necessary and performed pursuant to a physician order and formal admission.

In addition to procedures contained on the OPPI inpatient only list, we noted in the FY 2014 IPPS/LTCH PPS final rule that there may be other rare and unusual circumstances in which a hospital stay expected to last less than 2 midnights would nonetheless be appropriate for inpatient hospital admission and Part A payment. We indicated that we would explore other potential exceptions to the generally applicable benchmark and would detail any such rare and unusual circumstances in subregulatory guidance. As part of this process, throughout the year, we have accepted and considered suggestions from stakeholders on this topic.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 280170), we described the process for submitting suggestions regarding potential additional exceptions to the 2-midnight benchmark. Such suggestions may be sent to CMS via written correspondence or via email to SuggestedExceptions@cms.hhs.gov. As noted in the proposed rule, CMS will notify providers of any additional guidance regarding 2-midnight exceptions through subregulatory means, such as postings on the CMS Web site or manual instruction.

Although the FY 2015 IPPS/LTCH PPS proposed rule did not include any proposed regulatory changes relating to the 2-midnight benchmark, we nonetheless received a number of public comments regarding the current regulation. Commenters opined on the

usefulness of the 2-midnight benchmark for making inpatient admission decisions and provided suggestions for improving the policy. During the summer and fall of 2014, CMS plans to evaluate the results of the “probe & educate” process (a process by which MACs are reviewing a prepayment, provider-specific probe sample of inpatient Part A claims for appropriateness of inpatient admission under the revised 2-midnight benchmark and providing provider-specific education, as necessary, to correct improper payments) and issue additional subregulatory guidance to our claim review contractors, if necessary, to ensure consistency in application of the 2-midnight policy. We will consider all suggestions as we develop this subregulatory guidance. We also will continue to maintain open communication with stakeholders to ensure that the inpatient classification and payment policies provide a uniform process for beneficiary treatment and claim submission.

P. Finalization of Interim Final Rule With Comment Period on the Extension of the Payment Adjustment for Low-Volume Hospitals and the Medicare-Dependent, Small Rural Hospital (MDH) Program for FY 2014 Discharges Through March 31, 2014

1. Background

In the interim final rule with comment period (IFC) that appeared in the **Federal Register** on March 18, 2014 (79 FR 15022) (hereinafter referred to as the March 2014 IFC), we implemented the extension of temporary changes to the payment adjustment for low-volume hospitals and the MDH program under the IPPS for FY 2014 discharges through March 31, 2014, in accordance with sections 1105 and 1106, respectively, of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) enacted on December 26, 2013. In this final rule, we are providing a brief summary of the provisions of that IFC, responding to the public comments we received, and stating our final policy.

Section 1105 of the Pathway for SGR Reform Act extended changes to the payment adjustment for low-volume hospitals for an additional 6 months, through March 31, 2014, of FY 2014. Section 1106 of the Pathway for SGR Reform Act extended the MDH program for an additional 6 months, through March 31, 2014, of FY 2014. (As discussed previously in sections IV.D. and IV.G. of the preamble of this final rule, the provisions of the PAMA, enacted on April 1, 2014, further extended changes to the payment

adjustment for low-volume hospitals and the MDH program for an additional year, through March 31, 2015.)

2. Summary of the Provisions of the Interim Final Rule With Comment Period

a. Extension of the Payment Adjustment for Low-Volume Hospitals

(1) Background

Section 1886(d)(12) of the Act provides for an additional payment to each qualifying low-volume hospital under the IPPS beginning in FY 2005. The regulations describing the payment adjustment for low-volume hospitals are at 42 CFR 412.101.

Sections 3125 and 10314 of the Affordable Care Act provided for a temporary change in the low-volume hospital payment policy for FYs 2011 and 2012. Section 605 of the American Taxpayer Relief Act of 2012 (ATRA) extended, for FY 2013, the temporary changes in the low-volume hospital payment policy provided for in FYs 2011 and 2012 by the Affordable Care Act. Prior to the enactment of the Pathway for SGR Reform Act, for FY 2014 (and subsequent years), the low-volume hospital qualifying criteria and payment adjustment returned to the statutory requirements under section 1886(d)(12) of the Act that were in effect prior to the amendments made by the Affordable Care Act and the ATRA. (As previously noted, the provisions of the PAMA, enacted on April 1, 2014, further extended changes to the payment adjustment for low-volume hospitals and the MDH program for an additional year, through March 31, 2015. The extension of the temporary changes to the low-volume hospital payment adjustment for FY 2014 discharges occurring on or after April 1, 2014 through September 30, 2014 was announced in a notice that appeared in the **Federal Register** on June 17, 2014 (79 FR 34444). The extension of the temporary changes to the low-volume hospital payment adjustment for FY 2015 discharges occurring on or after October 1, 2014 through March 31, 2015, is discussed in section IV.D. of the preamble of this final rule.

The Affordable Care Act expanded the definition of low-volume hospital and modified the methodology for determining the payment adjustment for hospitals meeting that definition for FYs 2011 and 2012. In general, the amendments made by the Affordable Care Act modified the qualifying criteria for low-volume hospitals such that a hospital qualifies as a low-volume hospital if it is more than 15 road miles from another subsection (d) hospital and

has less than 1,600 Medicare discharges during the fiscal year. In addition, the amendments made by the Affordable Care Act provide that the low-volume hospital payment adjustment (that is, the percentage increase) is determined “using a continuous linear sliding scale” that ranges from 25 percent for low-volume hospitals with 200 or fewer Medicare discharges in the fiscal year to 0 percent for low-volume hospitals with greater than 1,600 Medicare discharges. For additional information on the implementation of the temporary changes in the low-volume hospital payment policy provided by the Affordable Care Act, we refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50238 through 50275) and the FY 2012 IPPS/LTCH PPS final rule (76 FR 51677 through 51680).

Section 605 of the ATRA extended the temporary changes in the low-volume hospital payment policy provided for in FYs 2011 and 2012 by the Affordable Care Act for FY 2013, that is, for discharges occurring before October 1, 2013. For additional information on the extension of the temporary changes in the low-volume hospital payment policy for FY 2013 as provided by the ATRA, we refer readers to the notice that appeared in the **Federal Register** on March 7, 2013 (78 FR 14689 through 14694). Additional information on the expiration of the temporary changes in the low-volume hospital payment policy for FYs 2011 through 2013 provided for by the Affordable Care Act and the ATRA can be found in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50610 through 50613).

(2) Summary of the Implementation of the Extension of the Low-Volume Hospital Payment Adjustment for FY 2014 (through March 31, 2014)

Section 1105 of the Pathway for SGR Reform Act extended the changes made by the Affordable Care Act and extended by the ATRA by amending sections 1886(d)(12)(B), (C)(i), and (D) of the Act. In the March 2014 IFC (79 FR 15023 through 15025), we amended the regulations text at 42 CFR 412.101 to make conforming changes to the qualifying criteria and the payment adjustment for low-volume hospitals according to the amendments made by section 1105 of the Pathway for SGR Reform Act as discussed in that rule.

To implement the extension of the temporary change in the low-volume hospital payment policy through the first half of FY 2014 (that is, for discharges occurring through March 31, 2014) provided for by the Pathway for SGR Reform Act, we updated the discharge data source used to identify

qualifying low-volume hospitals and calculate the payment adjustment (percentage increase) for FY 2014 discharges occurring before April 1, 2014. This approach was consistent with the existing regulations at § 412.101(b)(2)(ii) and with our implementation of the changes in FYs 2011 and 2012 and the extension of those changes in FY 2013. Specifically, for FY 2014 discharges occurring before April 1, 2014, consistent with our historical policy, we established that qualifying low-volume hospitals and their payment adjustment are determined using Medicare discharge data from the March 2013 update of the FY 2012 MedPAR file, as these data were the most recent data available at the time of the development of the FY 2014 payment rates and factors established in the FY 2014 IPPS/LTCH PPS final rule. Table 14 of the March 2014 IFC (which is available only through the Internet on the CMS Web site at http://www.cms.hhs.gov/AcuteInpatientPPS/01_overview.asp) lists the “subsection (d̄)” hospitals with fewer than 1,600 Medicare discharges based on the March 2013 update of the FY 2012 MedPAR files and their FY 2014 low-volume payment adjustment (if eligible). However, that list of hospitals with fewer than 1,600 Medicare discharges in Table 14 does not reflect whether or not the hospital meets the distance criterion for FY 2014 discharges occurring before April 1, 2014.

We explained in the March 2014 IFC (79 FR 15024 through 15025) that in order to receive a low-volume hospital payment adjustment under § 412.101, in accordance with our previously established procedure, a hospital must notify and provide documentation to its MAC that it meets the distance criterion. We explained that the MAC would refer to the hospital’s Medicare discharge data determined by CMS (as provided in Table 14) to determine whether or not the hospital meets the discharge criterion, and the amount of the payment adjustment for FY 2014 discharges occurring before April 1, 2014, once it is determined that the distance criterion has been met.

Consistent with our previously established procedure, we implemented a procedure for a hospital to request low-volume hospital status for FY 2014 discharges occurring before April 1, 2014. Specifically, we established that in order for the applicable low-volume percentage increase to be applied to payments for its discharges beginning on or after October 1, 2013 (that is, the beginning of FY 2014), a hospital must make its request for low-volume

hospital status in writing and this request must be received by its MAC no later than March 31, 2014. We also stated that a hospital that qualified for the low-volume payment adjustment in FY 2013 may continue to receive a low-volume payment adjustment for FY 2014 discharges occurring before April 1, 2014 without reapplying if it continues to meet the Medicare discharge criterion based on the March 2013 update of the FY 2012 MedPAR data (shown in Table 14 of the March 2014 IFC), and the distance criterion. However, the hospital must send written verification that was received by its MAC no later than March 31, 2014, that it continued to be more than 15 miles from any other “subsection (d)” hospital. We noted that this procedure is similar to the policy we established when we implemented the extension of the temporary changes to the low-volume hospital payment adjustment for FY 2013 provided by the ATRA, as well as the procedure for a hospital to request low-volume hospital status for FYs 2011 and 2012 under the provisions of the Affordable Care Act.

b. Extension of the MDH Program

Section 1106 of the Pathway for SGR Reform Act of 2013 provided for a 6-month extension of the MDH program, effective from October 1, 2013 to March 31, 2014. Specifically, section 1106 of the Pathway for SGR Reform Act amended sections 1886(d)(5)(G)(i) and 1886(d)(5)(G)(ii)(II) of the Act by striking “October 1, 2013” and inserting “April 1, 2014”. Section 1106 of the Pathway for SGR Reform Act also made conforming amendments to sections 1886(b)(3)(D)(i) and 1886(b)(3)(D)(iv) of the Act.

In the March 2014 IFC (79 FR 15025 through 15027), we stated that, in general, as a result of the extension of the MDH program under the Pathway for SGR Reform Act, a provider that was classified as an MDH as of the September 30, 2013 expiration of the MDH program, would be reinstated as an MDH effective October 1, 2013 through March 31, 2014, subject to the requirements of the regulations at § 412.108, with no need to reapply for MDH classification. In that same IFC, we amended the regulations at § 412.108(a)(1) and (c)(2)(iii) to reflect the statutory extension of the MDH program through March 31, 2014, as provided for by section 1106 of the Pathway for SGR Reform Act. We also discussed that, while generally hospitals that previously qualified for MDH status would be reinstated as an MDH retroactively to October 1, 2013, there were two situations where the effective

date of MDH status may not have been retroactive to October 1, 2013 (that is, MDHs that classified as SCHs on or after October 1, 2013, and MDHs that requested a cancellation of their rural classification under § 412.103(b)). We provided examples of various scenarios that illustrate how and when MDH status under section 1106 of the Pathway for SGR Reform Act would be determined for hospitals that were MDHs as of the September 30, 2013 expiration of the MDH program, subject to the timing considerations described in that IFC.

c. Summary of Public Comments, Responses, and Statements of Final Policies

We received approximately four timely pieces of correspondence in response to the March 2014 IFC.

Comment: Commenters generally supported CMS’ implementation of the extension of the temporary changes to the payment adjustment for low-volume hospitals and the MDH program through March 31, 2014. However, they expressed concern that the March 31, 2014 deadline for hospitals to submit a written request for low-volume hospital status to the MAC did not allow sufficient and reasonable time period for hospitals to submit the documentation necessary to qualify for the low-volume payment adjustment during the 6-month extension. Therefore, the commenters urged CMS to extend this deadline to allow hospitals a minimum of 30 days to submit the documentation necessary to qualify for the low-volume payment adjustment for FY 2014 discharges through March 31, 2014.

Response: We appreciate the commenters’ general support for our implementation of the extension of the temporary changes to the payment adjustment for low-volume hospitals and the MDH program through March 31, 2014. While we understand the commenters’ concern regarding the time available for hospitals to request low-volume hospital status for FY 2014 discharges occurring before April 1, 2014, we note that, at this time, we are not aware of any hospitals that were unable to meet the March 31, 2014 deadline for hospitals to request the low-volume hospital payment adjustment for FY 2014 discharges occurring before April 1, 2014. Furthermore, as we stated in the March 2014 IFC, a hospital that qualified for the low-volume payment adjustment in FY 2013 did not need to reapply for FY 2014 if it continues to meet the applicable discharge and the distance criteria (that is, such a hospital did not have to resubmit a low-volume hospital

request with supporting documentation to demonstrate that it continues to meet the distance criterion). Rather, such a hospital was only required to send written verification to its MAC that it continues to meet the distance criterion (that is, that it continues to be more than 15 miles from any other “subsection (d)” hospital) by the March 31, 2014 notification deadline. As in prior years, a short letter to the MAC stating that the hospital continues to meet the low-volume hospital distance criterion as documented in a prior low-volume hospital status request would be considered sufficient for this verification requirement.

For hospitals newly eligible for the low-volume hospital payment adjustment, in the March 2014 IFC, we included guidance, consistent with our previously established procedure, to provide focus to their request preparation efforts. Specifically, we stated that the use of a Web-based mapping tool, such as MapQuest, as part of documenting that the hospital meets the distance criterion for low-volume hospitals, is acceptable for the low-volume hospital request, along with providing other relevant information such as the name and street address of the nearest hospitals, location on a map, and distance from the hospital requesting low-volume hospital status. We also stated that the MAC may follow up with the hospital to obtain additional necessary information to determine whether or not the hospital meets the low-volume hospital status distance criterion.

Given the limited nature of the information required to satisfy the request and notification requirement, and the opportunity to provide additional information if needed, we believe that the March 31, 2014 deadline allowed for sufficient and reasonable time for hospitals to submit their requests. In addition, as we noted in the March 2014 IFC, the process for requesting and obtaining the low-volume hospital payment adjustment for FY 2014 discharges occurring before April 1, 2014 was similar to the policy we established when we implemented the extension of the temporary changes to the low-volume hospital payment adjustment for FY 2013 provided by the ATRA. For the reasons stated above, we are not adopting the commenters’ request to allow hospitals a minimum of 30 days to submit the documentation necessary to qualify for the low-volume payment adjustment for FY 2014 discharges occurring before April 1, 2014.

Comment: One commenter opposed using Medicare discharge data from the

March 2013 update of the FY 2012 MedPAR file (as listed in Table 14 of the March 2014 IFC) to assess the discharge criterion for low-volume hospital eligibility (that is, to determine if the hospital had less than 1,600 Medicare discharges) and to determine the amount of the payment adjustment for FY 2014 discharges occurring before April 1, 2014. The commenter believed certain scenarios were not accounted for by using historical Medicare discharge data in the MedPAR file to prospectively determine low-volume hospital eligibility and payment. For example, a hospital that became an IPPS hospital (either as a newly participating hospital or conversion from another provider type, like a CAH) would not be included in the historical MedPAR discharge data, or a hospital that previously did not meet the discharge criterion based on the historical Medicare discharge data in the MedPAR file that now has fewer than 1,600 Medicare discharges in the current year. The commenter requested that CMS modify its established policy of using historical MedPAR discharge data to determine if a hospital meets the discharge criterion to allow for scenarios such as the ones described above, and noted that CMS could develop a settlement procedure on the Medicare cost report for hospitals that did not have fewer than 1,600 Medicare discharges in the historical Medicare discharge data in the MedPAR file but have fewer than 1,600 Medicare discharges in the payment year.

Response: As explained in the March 2014 IFC (79 FR 15024), under the existing regulations at § 412.101(b)(2)(ii), for FYs 2011, 2012 and 2013, a hospital’s Medicare discharges from the most recently available MedPAR data, as determined by CMS, are used to determine if the hospital meets the discharge criteria to receive the low-volume payment adjustment in the current year. Since its initial implementation in FY 2005, we established a policy of using historical discharge data to determine if the hospital meets the discharge criterion to receive the low-volume payment adjustment in the current year. Prior to the temporary changes to the low-volume hospital payment adjustment policy under the amendments made by the Affordable Care Act, discharges from a prior cost reporting period were used to determine if the hospital qualified for the low-volume payment adjustment in the current year. We adopted the use of historical Medicare discharge data from the MedPAR files when we implemented the amendments made by

the Affordable Care Act because MedPAR data are the most recent available data that provide the number of discharges for individuals that are entitled to or enrolled for Medicare Part A, as required by statute (75 FR 50241). The most recent Medicare discharge data are generally available in the MedPAR files before the corresponding Medicare discharges from the cost report data are available due to the established timeframes for completion and submission of the Medicare cost report. (We note that the MedPAR file contains only Medicare discharge information, and does not contain discharge information for non-Medicare patients. Therefore, hospital cost report data are the best available data source for total discharges under the discharge criterion in § 412.101(b)(2)(i).)

As we discussed when we initially implemented the low-volume hospital payment adjustment in the FY 2005 IPPS final rule (69 FR 49100 through 49101), if the determination of whether hospitals qualify for low-volume payment adjustments and the computation of the payment adjustment amount are based on the number of discharges in the current fiscal year, neither CMS nor the hospital will know with certainty whether a hospital qualifies for the adjustment, or what the amount of the adjustment would be, until after the end of the payment year (probably not until the time of final cost report settlement for the year). In such circumstances, CMS could be faced with the prospect of recouping large overpayments in some cases or reimbursing for large underpayments in others, and hospitals would face similar uncertainties. On the other hand, if these determinations are based on discharge counts from a prior fiscal year, hospitals will know in advance whether they will be receiving a payment adjustment and what the size of the adjustment will be, which provides fiscal stability by allowing both hospitals and CMS to plan accordingly. Therefore, we established that the count of discharges, for purposes both of meeting the qualifying definition of a low-volume hospital and determining the amount of the low-volume hospital payment adjustment, is based on the number of discharges occurring during the cost reporting period for the most recent submitted cost report. In that same final rule, we also recognized that this policy may temporarily disadvantage certain hospitals, such as the situations mentioned by the commenter. However, we believe that the fiscal stability provided under a policy based on

historical data offsets any temporary disadvantage hospitals in such situations may experience until their historical data are used to meet the low-volume hospital payment adjustment discharge criterion in a future year, and for these reasons we believe a settlement process on the Medicare cost report is not needed. Therefore, we are not adopting the commenter's suggestion to modify our established policy of using historical MedPAR discharge data to determine if a hospital meets the low-volume hospital discharge criterion or to determine the amount of the low-volume hospital payment adjustment for FY 2014 discharges occurring before April 1, 2014.

After consideration of the public comments we received, we are finalizing all of the provisions set forth in the March 2014 IFC without modification. We note that the revisions to the low-volume hospital payment adjustment regulations at § 412.101 and the MDH program regulations at § 412.108 under the March 2014 IFC are superseded by the final conforming changes to these same regulatory provisions to reflect the subsequent extension of the changes to the qualifying criteria and the payment adjustment methodology for low-volume hospitals and the MDH program through March 31, 2015 under the PAMA. We refer readers to sections IV.D. and IV.G. of the preamble of this final rule, respectively, for more information on these final conforming changes.

For information on the estimated change in payments to IPPS hospitals in FY 2014 as a result of the implementation of sections 1105 and 1106 of the Pathway for SGR Reform Act, we refer readers to the regulatory impact section of the March 2014 IFC (79 FR 15028 through 15030).

Q. Finalization of Interim Final Rule With Comment Period Relating to Changes to Certain Cost Reporting Procedures for Medicare Disproportionate Share Hospital (DSH) Uncompensated Care Payments

1. Background

Section 3133 of the Patient Protection and Affordable Care Act, as amended by section 10316 of the same Act and section 1104 of the Health Care and Education Reconciliation Act (Pub. L. 111–152), added a new section 1886(r) to the Social Security Act (the Act) that modified the methodology for computing the Medicare disproportionate share hospital (DSH) payment adjustment beginning in FY 2014. We implemented section 1886(r)

of the Act in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50620 through 50647). For a detailed discussion of the background on the reduction in DSH payments under section 1886(d)(5)(F) of the Act and the uncompensated care payment under section 1886(r) of the Act, we refer readers to section IV.F.3.a. of the preamble of this final rule.

Following the publication of the FY 2014 IPPS/LTCH PPS final rule, we issued an interim final rule with comment period (CMS–1599–IFC) in which we revised certain policies and processes described in the FY 2014 IPPS/LTCH PPS final rule. The interim final rule with comment period appeared in the **Federal Register** on October 3, 2013 (78 FR 61191 through 61197). In the interim final rule with comment period, we revised certain operational considerations for hospitals with Medicare cost reporting periods that span more than one Federal fiscal year and also made changes to the data that will be used in the uncompensated care payment calculation in order to ensure that data from Indian Health Service (IHS) hospitals are included in Factor 1 and Factor 3 of that calculation. We found that there was good cause to waive prior notice and comment and the delay in effective date with respect to the revisions discussed in the interim final rule with comment period (78 FR 61195 through 61196). Accordingly, the provisions of the interim final rule with comment period went into effect on October 1, 2013.

We received 12 timely pieces of correspondence in response to the interim final rule with comment period. Below we summarize the provisions of the interim final rule with comment period and the public comments we received, present our responses, and finalize the policies that were originally implemented in the interim final rule with comment period.

2. Summary of Provisions of the Interim Final Rule With Comment Period, Public Comments Received, Responses, and Finalized Policy

a. Operational Considerations for Hospitals With Medicare Cost Reporting Periods That Span More Than One Federal Fiscal Year

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50645), we finalized “a process to distribute interim uncompensated care payments under the IPPS on a per-discharge basis through our claims processing system, with a reconciliation of the hospitals’ [uncompensated care] payments at cost report settlement to ensure that hospitals receive no more than the

estimated amount included in this final rule”. We described that process as follows (78 FR 50646):

“[A]t cost report settlement, the . . . fiscal intermediary/MAC will issue a notice of program reimbursement that includes a determination concerning whether each hospital is eligible for empirically justified Medicare DSH payments and, therefore, eligible for uncompensated care payments in FY 2014 and each subsequent year. In the case where a hospital received interim payments for its empirically justified Medicare DSH payments and uncompensated care payments for FY 2014 or a subsequent year on the basis of estimates prior to the payment year, but is determined to be ineligible for the empirically justified Medicare DSH payment at cost report settlement, the hospital would no longer be eligible for either payment and CMS would recoup those monies. For a hospital that did not receive interim payments for its empirically justified Medicare DSH payments and uncompensated care payments for FY 2014 or a subsequent year, but at cost report settlement is determined to be eligible for DSH payments, the uncompensated care payment for such a hospital is calculated based on the Factor 3 value determined prospectively for that fiscal year. . . . The reconciliations at cost report settlement would be based on the values for Factor 1, Factor 2, and Factor 3 that we have finalized prospectively for a Federal fiscal year.”

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50646), we provided an example in which a DSH eligible hospital has a cost reporting period of January 1, 2014 through December 31, 2014. We stated that this hospital would receive interim payments for its uncompensated care payments beginning on October 1, 2013. For cost reporting purposes, we stated that the uncompensated care payments for federal FY 2014 would be assigned to cost reporting periods beginning on or after October 1, 2013, and would be reconciled on those cost reports. Thus, in the example of the hospital with a cost reporting period beginning on January 1, 2014, if the hospital remained eligible for empirically justified DSH payments at cost report settlement, it would receive its full FY 2014 uncompensated care payment on its cost report for the cost reporting period beginning on January 1, 2014. Although we acknowledged that it is possible to align interim and final payments for the uncompensated care payment with an individual hospital's cost reporting periods, we believed it would be administratively efficient and practical

to pay the uncompensated care payment on the basis of the Federal fiscal year because that is how it is determined, and to reconcile that amount in the cost reporting period that begins in the respective Federal fiscal year. We stated in the final rule (78 FR 50647) that we believed this methodology would not delay the full payment of FY 2014 payments to hospitals with cost reporting periods that begin after October 1, 2013.

However, as we prepared to implement the FY 2014 IPPS/LTCH PPS final rule, several difficulties regarding this approach that we had not previously considered came to our attention. We initially proposed to make interim uncompensated care payments on a biweekly basis, finalizing a different process to make interim uncompensated care payments on a per discharge basis in response to comments. In addition to proposing and finalizing a process for making interim uncompensated care payments, we also proposed and finalized a reconciliation process that would reconcile the uncompensated care payment for a given fiscal year, such as FY 2014, on the cost report for the cost reporting period beginning in that fiscal year (that is, for FY 2014, the cost report for the cost reporting period beginning in FY 2014). We proposed and finalized this approach because we believed it would be administratively efficient and practical. As indicated previously and in the FY 2014 IPPS/LTCH PPS final rule, we initially believed that this policy would neither delay nor substantially affect the disbursement of final uncompensated care payments; but, since the final rule was issued, we came to doubt these conclusions.

In the interim final rule with comment period, we stated that we had come to believe that the policy we adopted in the FY 2014 IPPS/LTCH PPS final rule was inconsistent with longstanding cost reporting requirements. As a general rule, payments for discharges are reported in the cost reporting period in which they occur, and all payments made for discharges during a cost reporting period are reconciled on the cost report for that period (PRM-I, Section 2805 and 42 CFR 412.1(a)). We did not specifically address or propose to change the cost reporting rules in either the FY 2014 IPPS/LTCH PPS proposed or final rules. However, for hospitals with cost reporting periods that were not concurrent with the Federal fiscal year, the policy adopted in the FY 2014 IPPS/LTCH PPS final rule departed from these cost reporting requirements by reconciling interim uncompensated care

payments made for discharges occurring during the hospital's 2013 cost reporting period on the hospital's 2014 cost report. Under ordinary cost reporting requirements, those payments (having been made during the hospital's 2013 cost reporting period) would have to be treated as an overpayment on the hospital's 2013 cost report and therefore recouped. However, as finalized in the FY 2014 IPPS/LTCH PPS final rule, if the hospital was found to be eligible for DSH payments for its cost reporting period that began during FY 2014, we would pay the hospital its full FY 2014 uncompensated care payment during the settlement of the hospital's 2014 cost report (that is, we would repay the previously recouped uncompensated care payments when we reconciled the hospital's 2014 cost report). We stated that these administrative issues would effectively delay uncompensated care payments, frustrate our policy of making uncompensated care payments promptly, and would likely lead to serious cash flow difficulties for some hospitals. In summary, we did not believe the policy we finalized in the FY 2014 IPPS/LTCH PPS final rule of reconciling uncompensated care payments for hospitals with cost reporting periods that begin after October 1, 2013 would work as intended for the large majority of IPPS hospitals that have cost reporting periods that are not concurrent with the Federal fiscal year.

To effectuate a revised process, in the interim final rule with comment period, we sought to align final payments for the uncompensated care payment with each individual hospital's cost reporting periods and to reconcile interim uncompensated care payment amounts on the hospital's cost report for the proportion of the cost reporting period that overlaps a Federal fiscal year and in which the interim payments were made or should have been made. Therefore, the final uncompensated care payment amounts that would be included on a cost report spanning 2 Federal fiscal years would be the pro rata share of the uncompensated care payment associated with each Federal fiscal year. This pro rata share would be determined based on the proportion of the applicable Federal fiscal year that is included in that cost reporting period. We considered the same example from the FY 2014 IPPS/LTCH PPS final rule, where a hospital is estimated to be eligible for the empirically justified DSH payment and also an uncompensated care payment in FY 2014 and has a cost reporting period of January 1, 2014 through December 31, 2014. Under the

revised process we adopted in the interim final rule with comment period, in that example, that hospital would still begin to receive interim payments for its uncompensated care on October 1, 2013. However, instead of having the entire FY 2014 payment reconciled on its cost report for the cost reporting period beginning on January 1, 2014 (which ends on December 31, 2014, and would therefore require the hospital to pay back monies received for the portion of its cost reporting period beginning on January 1, 2013, that occurs in Federal fiscal year 2014), we would reconcile the interim FY 2014 uncompensated care payments received for discharges from October 1, 2013 through December 31, 2013 on the hospital's cost report for the cost reporting period beginning on January 1, 2013 against a pro rata share of its FY 2014 uncompensated care payment. If this hospital were eligible for DSH on its cost report for the cost reporting period ending on December 31, 2013, it would receive a pro rata share of its FY 2014 uncompensated care payment. This pro rata share would be approximately three-twelfths (that is, the period of time from October 1, 2013 through December 31, 2013, divided by the period of time from January 1, 2013 through December 31, 2013) of the hospital's FY 2014 uncompensated care payment. If the hospital's subsequent cost reporting period is January 1, 2014 through December 31, 2014, we also would reconcile the interim FY 2014 uncompensated care payments received for discharges from January 1, 2014 through September 30, 2014 on the hospital's cost report for the cost reporting period beginning on January 1, 2014 against a pro rata share of its FY 2014 uncompensated care payment. We also would reconcile the interim FY 2015 uncompensated care payments received for discharges from October 1, 2014 through December 31, 2014 (that is, discharges occurring in FY 2015 during that hospital's cost reporting period) on the hospital's cost report for the cost reporting period beginning on January 1, 2014 against a pro rata share of its FY 2015 uncompensated care payment. Accordingly, for the hospital in this example, if it remained eligible for Medicare DSH on its cost report for the cost reporting period beginning on January 1, 2014, it would receive the sum of two pro rata shares of uncompensated care payments, one pro rata share equal to approximately nine-twelfths (that is, the period of time from January 1, 2014 through September 30, 2014 divided by the period of time from January 1, 2014 through December 31,

2014) of the hospital's FY 2014 uncompensated care payment and one pro rata share equal to approximately three-twelfths (that is, the period of time from October 1, 2014 through December 31, 2014 divided by the period of time from January 1, 2014 through December 31, 2014) of the hospital's FY 2015 uncompensated care payment.

Under the interim final rule with comment period, and in accordance with the policies we finalized in the FY 2014 IPPS/LTCH PPS final rule regarding eligibility for the uncompensated care payment, hospitals with cost reporting periods that span more than one Federal fiscal year will be eligible for the respective pro rata shares of their uncompensated care payment if they were eligible for DSH in that cost reporting period. If they were ineligible for DSH in that cost reporting period, they would be ineligible to receive the respective pro rata share of the uncompensated care payment for the respective Federal fiscal year (or years). We stated that we believed this approach remained fundamentally consistent with the policy we finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50622) where we stated that "our final determination on the hospital's eligibility for uncompensated care payments would be based on the hospital's actual DSH status on the cost report for that payment year." However, it avoided the cost reporting difficulties that would have arisen from the reconciliation process originally adopted in the final rule.

Comment: Several commenters supported the modifications to align uncompensated care payments based on the Federal fiscal year, instead of based on a hospital's cost reporting period. Commenters supported the change in policy such that the final uncompensated care payment amounts that would be included on a hospital's cost report that spans 2 Federal fiscal years will be the pro rata share of the uncompensated care payment associated with each Federal fiscal year.

Response: We appreciate the commenters' support.

Comment: One commenter recommended that when CMS reconciles uncompensated care payments on a pro rata basis based on the portion of a hospital's cost reporting period that falls in the Federal fiscal year, CMS prorate on a calendar month basis as opposed to calendar day basis for administrative simplicity.

Response: We appreciate the commenter's recommendation. Under the policy finalized in the interim final rule with comment period, we determine a pro rata share based on the

proportion of the applicable Federal fiscal year that is included in that cost reporting period. We intend to establish the pro rata share on a calendar day basis, as opposed to a calendar month basis. We believe we can more accurately account for the uncompensated care payment amounts when we reconcile on a calendar day basis, as we can easily obtain the number of days from a hospital's cost reporting period on the hospital's Medicare Hospital Cost Report. Therefore, this process will not be administratively burdensome. Furthermore, we disagree that it would be administratively easier or simpler to prorate on a monthly basis, particularly in cases where a hospital's cost report may end in the middle of the month.

b. Treatment of Indian Health Service Hospitals

In the FY 2014 IPPS/LTCH PPS final rule, we discussed the hospitals that are eligible to receive the uncompensated care payments under section 1886(r)(2) of the Act. Specifically, we stated (78 FR 50622) that the "new payment methodology under subsection (r) applies to 'subsection (d) hospitals' that would otherwise receive a 'disproportionate hospital share payment . . . made under subsection (d)(5)(F).'" Therefore, eligibility for empirically justified Medicare DSH payments is unchanged under this new provision. Consistent with the law, hospitals must receive empirically justified Medicare DSH payments in FY 2014 or a subsequent year to receive an additional Medicare uncompensated care payment for that year.

In the FY 2014 IPPS/LTCH PPS final rule, we finalized our methodology for calculating the new uncompensated care payments. As we discussed in that final rule, section 1886(r)(2) of the Act provides that for each eligible hospital in FY 2014 and subsequent years, the new uncompensated care payment is the product of three factors. Factor 1 of that methodology is the "difference between our estimates of: (1) the amount that would have been paid in Medicare DSH payments for FY 2014 and subsequent years, in the absence of the new payment provision; and (2) the amount of empirically justified Medicare DSH payments that are made for FY 2014 and subsequent years, which takes into account the requirement to pay 25 percent of what would have otherwise been paid under section 1886(d)(5)(F) of the Act. In other words, this factor represents our estimate of 75 percent (100 percent minus 25 percent) of our estimate of Medicare DSH payments that would

otherwise be made, in the absence of section 1886(r) of the Act, for FY 2014 and subsequent years" (78 FR 50627).

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50630), we finalized our proposal to use the most recently available estimates, as calculated by the CMS Office of the Actuary, to determine both the aggregate amount of empirically justified DSH payments under section 1886(r)(1) of the Act and the aggregate amount of payments that would otherwise have been made under section 1886(d)(5)(F) of the Act. In order to calculate these estimates, the Office of the Actuary used the March 2013 update of the Medicare Hospital Cost Report Information System (HCRIS) and the proposed rule's IPPS Impact file. The estimate excluded Maryland hospitals, SCCHs paid under their hospital-specific rate, and hospitals in the Rural Community Hospital Demonstration Program, as these hospitals do not receive a Medicare DSH payment. The CMS Office of the Actuary's final estimate for Medicare DSH payments for FY 2014 without regard to the application of section 1886(r)(1) of the Act, was approximately \$12.772 billion. The estimate for empirically justified Medicare DSH payments for FY 2014, with the application of section 1886(r)(1) of the Act, was approximately \$3.193 billion. Factor 1 is the difference of these two estimates by our Office of the Actuary; therefore, in the FY 2014 IPPS/LTCH PPS final rule, we calculated Factor 1 to be approximately \$9.579 billion.

IHS hospitals are subsection (d) hospitals that can receive empirically justified Medicare DSH payments under section 1886(r)(1) of the Act if they meet the eligibility requirements under subsection (d)(5)(F). Therefore, eligible IHS hospitals also receive the new uncompensated care payment under subsection (r)(2). However, following the issuance of the FY 2014 IPPS/LTCH PPS final rule, it came to our attention that, although IHS hospitals can receive Medicare DSH payments, they submit Medicare hospital cost reports to CMS that are not uploaded in the HCRIS database. Therefore, their Medicare DSH payments were not included in the estimates by our Office of the Actuary that were used to calculate Factor 1. We stated in the interim final rule with comment period that because IHS hospitals are eligible to receive Medicare DSH payments and the new uncompensated care payments, we believe it is inappropriate to exclude the Medicare DSH payments to IHS hospitals from the estimates used to calculate Factor 1. In addition, we acknowledged that we did not intend to

finalize a policy that specifically excludes DSH payments to IHS hospitals from our estimate of Medicare DSH payments for purposes of calculating Factor 1 in the calculation of the uncompensated care payment.

Therefore, in the interim final rule with comment period, we revised the policy originally adopted in the FY 2014 IPPS/LTCH PPS final rule in order to change the data that will be considered in calculating Factor 1 for FY 2014 and subsequent years. Specifically, in addition to the March 2013 update of HCRIS, we will also consider cost report data provided by IHS hospitals to CMS as of March 2013. We also will recalculate Factor 1, to reflect the Office of the Actuary's estimate of Medicare DSH payments to IHS hospitals, based on these cost report data. With the inclusion of the Medicare DSH payments to IHS hospitals, our Office of the Actuary's revised estimate of Medicare DSH payments for FY 2014 without regard to the application of 1886(r)(1) of the Act was approximately \$12.791 billion (this revised estimate also includes the correction for Factor 1 made in the correcting document for the FY 2014 IPPS/LTCH PPS final rule that also appeared in the **Federal Register** on October 3, 2013 (78 FR 61198)). The CMS Office of the Actuary's revised estimate of empirically justified Medicare DSH payments for FY 2014, with the application of section 1886(r)(1) of the Act, was approximately \$3.198 billion (this revised estimate also includes the correction for Factor 1 made in the correcting document for the FY 2014 IPPS/LTCH PPS final rule (78 FR 61198)). Factor 1 is the difference of these two estimates of our Office of the Actuary; therefore, in the interim final rule with comment period, we recalculated Factor 1 to be approximately \$9.593 billion (this revised estimate also includes the correction for Factor 1 made in the correcting document for the FY 2014 IPPS/LTCH PPS final rule (78 FR 61198)). We noted that, based on the recalculation of Factor 1, the amount available for uncompensated care payments for FY 2014 would be approximately \$9.046 billion (our determination of Factor 2 as finalized in the FY 2014 IPPS/LTCH PPS final rule of 0.943 times our revised Factor 1 estimate of \$9.593 billion).

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50634 through 50643), we discussed the methodology used to calculate Factor 3 in the calculation of the uncompensated care payment. Under the final policy adopted in that final rule, for FY 2014 we determined a DSH hospital's Factor 3 as the sum of its

Medicaid days and SSI days (numerator) relative to the total number of Medicaid days and SSI days for all DSH hospitals (denominator). We determined a hospital's SSI days based on the most recent SSI fraction. As we stated in the FY 2014 IPPS/LTCH PPS final rule, the most recent SSI fractions available for making this determination for FY 2014 were the FY 2011 SSI fractions. The FY 2011 SSI fractions for each subsection (d) hospital were published on the CMS Web site on June 27, 2013. In addition, under the final policy adopted in the FY 2014 IPPS/LTCH PPS final rule, we determine a hospital's Medicaid days based on the Medicaid days reported on the 2011, or if not available, the 2010 Medicare Hospital Cost Report, using the March 2013 update of HCRIS.

Because the cost reports submitted by IHS hospitals are not uploaded into HCRIS, we did not include their Medicaid days in our calculation of Factor 3. Specifically, Medicaid days for IHS hospitals were excluded from the numerator of Factor 3 for those IHS hospitals and from the denominator of Factor 3 for all hospitals. As a result, in the interim final rule with comment period, we indicated that we believed that the Factor 3 that was calculated for each IHS hospital under the policies adopted in the 2014 IPPS/LTCH PPS final rule, based only on FY 2011 SSI days, significantly understated the actual amount of uncompensated care furnished by these hospitals. The uncompensated care payment amounts calculated for these hospitals were also significantly lower than they would have been had these days been included. We were concerned that, under the policy originally adopted in the FY 2014 IPPS/LTCH PPS final rule, IHS hospitals that serve a significant low income population would be subject to the 75-percent reduction to their Medicare DSH payments under section 1886(r)(1) of the Act but would receive reduced uncompensated care payments under section 1886(r)(2) of the Act due to their cost reports not being included in the HCRIS database. Given that we intended to base our estimate of the uncompensated care provided by IHS hospitals, in part, on the care they provide to Medicaid patients, we believed it was appropriate to make a change to the data that are considered in determining Factor 3 of the new uncompensated care payment to allow the Medicaid days for IHS hospitals to be included. This change would also help to ensure that eligible IHS hospitals receive an uncompensated care payment that does not significantly understate the amount of

uncompensated care they provide. Accordingly, in the interim final rule with comment period, we revised the policy adopted in the FY 2014 IPPS/LTCH PPS final rule to permit us to consider cost report data submitted to CMS as of March 2013 only by IHS hospitals in addition to data reflected in the March 2013 update of HCRIS, in calculating Factor 3 of the uncompensated care payment. The Medicaid days for IHS hospitals that are reflected in the cost report data would be included in the numerator of the Factor 3 calculation for IHS hospitals and would be included in the denominator of Factor 3 for all hospitals eligible to receive the uncompensated care payment.

Comment: Several commenters supported the change in policy to incorporate hospital cost report data for IHS hospitals that was not included in the HCRIS database in the calculation of Factor 1 and Factor 3. Commenters agreed that it was inappropriate to exclude cost report data for IHS hospitals from the calculation of Factor 1 and supported the inclusion of cost report data for these hospitals in the calculation of Factor 1, which represents the Secretary's estimate of 75 percent of Medicare DSH payments in FY 2014. In addition, commenters supported using IHS cost report data to identify Medicaid days to incorporate into the calculation of Factor 3 for these IHS hospitals. One commenter sought clarification of the definition of an IHS hospital in order to clarify what category of hospitals are subject to the policies finalized in the interim final rule with comment period. The commenters sought confirmation that an IHS hospital includes "any hospital operated by an Indian Tribe or Tribal health program carrying out IHS programs under the Indian Self-Determination and Education Assistance Act (ISDEAA)." In other words, the commenters sought clarification that IHS hospitals include facilities that are either owned or leased by IHS or are deemed by CMS to be IHS facilities because they are operated by an Indian Tribe or Tribal organization under the ISDEAA. The commenters also sought clarification that CMS will treat cost reports from all such qualifying hospitals in the same way that it treats IHS directly operated hospitals in determining the amount of uncompensated care payments.

Response: We appreciate the commenters' support of our policy change. An IHS hospital is defined under section 1880 of the Act as a "hospital or skilled nursing facility of the Indian Health Service, whether

operated by such Service or by an Indian tribe or tribal organization (as those terms are defined in section 4 of the Indian Health Care Improvement Act)” Therefore, with regard to the policies in the interim final rule with comment period related to IHS hospitals, we do not make a distinction with respect to whether the hospital is owned or operated by the Indian Health Service or by an Indian tribe or tribal organization. Cost report data submitted both by hospitals operated by the IHS and by hospitals operated by an Indian tribe or tribal organization are excluded from HCRIS. Therefore, the policies described in the interim final rule with comment period regarding the use of cost report data submitted by IHS hospitals in order to calculate Factor 1 and Factor 3 apply to all IHS hospitals whether they are owned or operated by the Indian Health Service or by an Indian tribe or tribal organization.

Comment: Several commenters raised concerns that CMS did not adequately address mergers in the calculation of the uncompensated care payment. The commenters disagreed with CMS’ treatment of mergers under the policy finalized in the FY 2014 IPPS/LTCH PPS final rule that if one DSH-eligible hospital merges with another DSH-eligible hospital, only the data associated with the surviving hospital is used to calculate the hospital’s share of uncompensated care payments. Commenters asserted that the policy on mergers understates uncompensated care payments for merged providers and does not accurately reflect the merged hospital’s uncompensated care costs.

Response: We thank the commenters for these comments. However, we consider these comments to be out of the scope of the policies addressed in the interim final rule with comment period. We discuss our policies regarding the treatment of mergers in the calculation of the Factor 3 in section IV.F. of the preamble of this FY 2015 IPPS/LTCH PPS final rule.

Comment: One commenter suggested that, for hospitals that had low-income insured days calculated using a cost report for a cost reporting period that was less than 12 months, CMS should use low-income insured days based on an older cost reporting period that was 12 months.

Response: We thank the commenter for this comment. However, we consider this comment to be out of the scope of the policies addressed in the interim final rule with comment period. We discuss our methodology to calculate Factor 3, including our treatment of short cost reporting periods, in section

IV.F. of the preamble of this FY 2015 IPPS/LTCH PPS final rule.

Comment: One commenter addressed the calculation of the interim per claim uncompensated care payment amounts that are paid to hospitals projected to be eligible to receive DSH payments in a Federal fiscal year; the per claim amount is based on a hospital’s total uncompensated care amount divided by the hospital’s average number of claims from the most recent 3 years of data. Specifically, the commenter requested that CMS use the claims published in the case-mix files to calculate the 3-year average because, in the commenter’s view, CMS’ data source understates the average number of claims potentially resulting in an overpayment on a per claim basis. The commenter also recommended that CMS use a growth factor to account for new enrollees that may increase the number of claims in the calculation of the three year average number of claims. The commenter also noted the wide variation in per claim amounts from approximately \$9 to \$167,000 and requested that CMS place a cap on the per claim amount to minimize swings in cash flow at cost report settlement and because it did not make sense that Medicare or MA plans pay such a high amount.

Response: We thank the commenter for this comment. However, we consider the issues raised in the comment to be out of the scope of the policies addressed in the interim final rule with comment period. We received a similar comment on the FY 2015 IPPS/LTCH PPS proposed rule and address the comment in section IV.F. of the preamble of this FY 2015 IPPS/LTCH PPS final rule.

After consideration of the public comments we received, we are finalizing all of the provisions set forth in the interim final rule with comment period without modification, to allow final uncompensated care payments to be paid on the same schedule as Medicare DSH payments, so that both the uncompensated care payment and Medicare DSH payments will be paid and reconciled on a hospital’s cost report, based on the applicable Federal fiscal year(s) and to allow information included in the cost reports submitted by IHS hospitals to be used in the calculation of Factor 1 and Factor 3. For information on the estimated change in payments to hospitals in FY 2014 as a result of the provisions set forth in the interim final rule with comment period, we refer readers to the regulatory impact statement in the interim final rule with comment period (78 FR 61197). We note that the impact of our decision to finalize the interim final rule with

comment period is included in the regulatory impact statement in Appendix A of this FY 2015 IPPS/LTCH PPS final rule as part of the discussion of the estimated change in payments to hospitals in FY 2015 as a result of the policies regarding Medicare DSH payments and uncompensated care payments that we are adopting in the final rule.

V. Changes to the IPPS for Capital-Related Costs

A. Overview

Section 1886(g) of the Act requires the Secretary to pay for the capital-related costs of inpatient acute hospital services “in accordance with a prospective payment system established by the Secretary.” Under the statute, the Secretary has broad authority in establishing and implementing the IPPS for acute care hospital inpatient capital-related costs. The IPPS for capital-related costs was initially implemented in the Federal fiscal year (FY) 1992 IPPS final rule (56 FR 43358), in which we established a 10-year transition period to change the payment methodology for Medicare hospital inpatient capital-related costs from a reasonable cost-based methodology to a prospective methodology (based fully on the Federal rate).

FY 2001 was the last year of the 10-year transition period established to phase in the IPPS for hospital inpatient capital-related costs. For cost reporting periods beginning in FY 2002, capital IPPS payments are based solely on the Federal rate for almost all acute care hospitals (other than hospitals receiving certain exception payments and certain new hospitals). (We refer readers to the FY 2002 IPPS final rule (66 FR 39910 through 39914) for additional information on the methodology used to determine capital IPPS payments to hospitals both during and after the transition period.)

The basic methodology for determining capital prospective payments using the Federal rate is set forth in § 412.312 of the regulations. For the purpose of calculating capital payments for each discharge, the standard Federal rate is adjusted as follows:

$$(\text{Standard Federal Rate}) \times (\text{DRG Weight}) \times (\text{Geographic Adjustment Factor (GAF)}) \times (\text{COLA for hospitals located in Alaska and Hawaii}) \times (1 + \text{Capital DSH Adjustment Factor} + \text{Capital IME Adjustment Factor, if applicable}).$$

In addition, under § 412.312(c), hospitals also may receive outlier payments under the capital IPPS for

extraordinarily high-cost cases that qualify under the thresholds established for each fiscal year.

B. Additional Provisions

1. Exception Payments

The regulations at § 412.348 provide for certain exception payments under the capital IPPS. The regular exception payments provided under §§ 412.348(b) through (e) were available only during the 10-year transition period. For a certain period after the transition period, eligible hospitals may have received additional payments under the special exceptions provisions at § 412.348(g). However, FY 2012 was the final year hospitals could receive special exceptions payments. For additional details regarding these exceptions policies, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725).

Under § 412.348(f), a hospital may request an additional payment if the hospital incurs unanticipated capital expenditures in excess of \$5 million due to extraordinary circumstances beyond the hospital's control. Additional information on the exception payment for extraordinary circumstances in § 412.348(f) can be found in the FY 2005 IPPS final rule (69 FR 49185 and 49186).

2. New Hospitals

Under the capital IPPS, § 412.300(b) of the regulations defines a new hospital as a hospital that has operated (under previous or current ownership) for less than 2 years and lists examples of hospitals that are not considered new hospitals. In accordance with § 412.304(c)(2), under the capital IPPS a new hospital is paid 85 percent of its allowable Medicare inpatient hospital capital-related costs through its first 2 years of operation, unless the new hospital elects to receive full prospective payment based on 100 percent of the Federal rate. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725) for additional information on payments to new hospitals under the capital IPPS.

3. Hospitals Located in Puerto Rico

Section 412.374 of the regulations provides for the use of a blended payment amount for prospective payments for capital-related costs to hospitals located in Puerto Rico. Accordingly, under the capital IPPS, we compute a separate payment rate specific to Puerto Rico hospitals using the same methodology used to compute the national Federal rate for capital-related costs. In general, hospitals located in Puerto Rico are paid a blend

of the applicable capital IPPS Puerto Rico rate and the applicable capital IPPS Federal rate. Capital IPPS payments to hospitals located in Puerto Rico are computed based on a blend of 25 percent of the capital IPPS Puerto Rico rate and 75 percent of the capital IPPS Federal rate. For additional details on capital IPPS payments to hospitals located in Puerto Rico, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725).

C. Annual Update for FY 2015

The annual update to the capital PPS Federal and Puerto Rico-specific rates, as provided for at § 412.308(c), for FY 2015 is discussed in section III. of the Addendum to this final rule.

We note that, in section II.D. of the preamble of this final rule, we present a discussion of the MS-DRG documentation and coding adjustment, including previously finalized policies and historical adjustments, as well as the recoupment adjustment to the standardized amounts under section 1886(d) of the Act that we are finalizing for FY 2015 in accordance with the amendments made to section 7(b)(1)(B) of Public Law 110-90 by section 631 of the ATRA. As we discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28171), because section 631 of the ATRA requires CMS to make a recoupment adjustment only to the operating IPPS standardized amount, we are not making a similar adjustment to the national or Puerto Rico capital IPPS rates (or to the operating IPPS hospital-specific rates or Puerto Rico-specific standardized amount). This approach is consistent with our historical approach regarding the application of the recoupment adjustment authorized by section 7(b)(1)(B) of Public Law 110-90.

In section II.D.7. of the preamble of this final rule, we also note our discussion in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50747) of the possibility of applying an additional prospective adjustment to account for the cumulative MS-DRG documentation and coding effect through FY 2010. In that same final rule (78 FR 50515 through 50517 and 50747), we stated that if we were to apply an additional prospective adjustment for the cumulative MS-DRG documentation and coding effect through FY 2010, we believe the most appropriate additional adjustment is -0.55 percent. We did not apply an additional prospective adjustment in FY 2014 for the cumulative MS-DRG documentation and coding effect through FY 2010, consistent with the approach taken for the operating IPPS standardized amount (and hospital-specific rates). We

continue to believe that if we were to apply an additional prospective adjustment for the cumulative MS-DRG documentation and coding effect through FY 2010, the most appropriate additional adjustment is -0.55 percent. However, we did not propose such an adjustment to the capital Federal rate in FY 2015, consistent with the approach taken for the operating IPPS standardized amount (and hospital-specific rates) as discussed in section II.D.7. of the preamble of this final rule. We will consider whether such an adjustment to the capital IPPS Federal rate is appropriate in future years' rulemaking.

VI. Changes for Hospitals Excluded From the IPPS

A. Rate-of-Increase in Payments to Excluded Hospitals for FY 2015

Certain hospitals excluded from a prospective payment system, including children's hospitals, 11 cancer hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) receive payment for inpatient hospital services they furnish on the basis of reasonable costs, subject to a rate-of-increase ceiling. A per discharge limit (the target amount as defined in § 413.40(a) of the regulations) is set for each hospital based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage. For each cost reporting period, the updated target amount is multiplied by total Medicare discharges during that period and applies as an aggregate upper limit (the ceiling as defined in § 413.40(a) of Medicare reimbursement for total inpatient operating costs for a hospital's cost reporting period. In accordance with § 403.752(a) of the regulations, RNHCIs also are subject to the rate-of-increase limits established under § 413.40 of the regulations discussed above.

As explained in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50747), beginning with FY 2006, we have used the percentage increase in the IPPS operating market basket to update the target amounts for children's hospitals, cancer hospitals, and RNHCIs. Consistent with §§ 412.23(g), 413.40(a)(2)(ii)(A), and 413.40(c)(3)(viii), we also have used the percentage increase in the IPPS operating market basket to update the target amounts for short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana

Islands, and American Samoa. For the reasons explained in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50747), we proposed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28171) to continue to use the percentage increase in the IPPS operating market basket to update the target amounts for children’s hospitals, cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa for FY 2015 and subsequent fiscal years.

In addition, because we have revised and rebased the IPPS operating market basket to a FY 2010 base year, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28172) we proposed to continue to use the percentage increase in the FY 2010-based IPPS operating market basket to update these target amounts for FY 2015 and subsequent fiscal years. (We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50596 through 50603) for a further discussion of the revision and rebasing of the IPPS operating market to a FY–2010 base year.)

We did not receive any public comments on these proposals. Therefore, we are finalizing our proposals as discussed above and in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28171 through 28172). Accordingly, for FY 2015, the rate-of-increase percentage to be applied to the target amount for these children’s hospitals, cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa is the FY 2015 percentage increase in the FY 2010-based IPPS operating market basket.

For the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28172), based on IHS Global Insight, Inc.’s 2014 first quarter forecast, we estimated that the FY 2010-based IPPS operating market basket update for FY 2015 was 2.7 percent (that is, the estimate of the market basket rate-of-increase). We indicated in the proposed rule that if more recent data became available for the final rule, we would use them to calculate the IPPS operating market basket update for FY 2015. For this FY 2015 IPPS/LTCH PPS final rule, based on IHS Global Insight, Inc.’s 2014 second quarter forecast (which is the most recent data available), we calculated the FY 2010-based IPPS operating market basket update for FY 2015 to be 2.9 percent. Therefore, the FY 2015 rate-of-increase percentage that is applied to the FY 2014 target amounts in order to calculate the final FY 2015 target amounts for children’s hospitals, cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa is 2.9 percent, in accordance with the applicable regulations at 42 CFR 413.40.

B. Report on Adjustment (Exceptions) Payments

Section 4419(b) of Public Law 105–33 requires the Secretary to publish annually in the **Federal Register** a report describing the total amount of adjustment payments made to excluded hospitals and hospital units by reason of section 1886(b)(4) of the Act during the previous fiscal year.

The process of requesting, adjusting, and awarding an adjustment payment is likely to occur over a 2-year period or longer. First, generally, an excluded

hospital must file its cost report for a fiscal year in accordance with § 413.24(f)(2). The MAC reviews the cost report and issues a notice of program reimbursement (NPR). Once the hospital receives the NPR, if its operating costs are in excess of the ceiling, the hospital may file a request for an adjustment payment. After the MAC receives the hospital’s request in accordance with applicable regulations, the MAC or CMS, depending on the type of adjustment requested, reviews the request and determines if an adjustment payment is warranted. This determination is sometimes not made until more than 180 days after the date the request is filed because there are times when the applications are incomplete and additional information must be requested in order to have a completed application. However, in an attempt to provide interested parties with data on the most recent adjustments for which we do have data, we are publishing data on adjustment payments that were processed by the MAC or CMS during FY 2013.

The table below includes the most recent data available from the MACs and CMS on adjustment payments that were adjudicated during FY 2013. As indicated above, the adjustments made during FY 2013 only pertain to cost reporting periods ending in years prior to FY 2012. Total adjustment payments given to excluded hospitals during FY 2013 are \$1,829,578. The table depicts for each class of hospitals, in the aggregate, the number of adjustment requests adjudicated, the excess operating costs over the ceiling, and the amount of the adjustment payments.

Class of hospital	Number	Excess cost over ceiling	Adjustment payments
Children’s	4	\$2,032,227	\$1,182,011
Cancer	0	N/A	N/A
Religious Nonmedical Health Care Institution (RNHCI)	3	1,056,142	647,567
Total			1,829,578

C. Updates to the Reasonable Compensation Equivalent (RCE) Limits on Compensation for Physician Services Provided in Providers (§ 415.70)

1. Background

Under section 1848 of the Act and 42 CFR Parts 414 and 415, medical or surgical services furnished by physicians to individual Medicare beneficiaries generally are billed and paid under Medicare Part B on a fee-for-service basis under the Medicare

Physician Fee Schedule (MPFS). As required by section 1887(a)(2)(B) of the Act, the amount of allowable compensation for services furnished by physicians to providers that are paid by Medicare on a reasonable cost basis is subject to reasonable compensation equivalent (RCE) limits. Under these limits, Medicare recognizes as reasonable, for purposes of payment to the provider, the lower of the actual cost of the services furnished by the physician to the provider (that is, any

form of compensation to the physician) or an RCE. The allowable compensation costs for physicians’ services to a provider are described in § 415.55 of the regulations. Under § 415.60(a) of the regulations, for purposes of applying the RCE limits, physician compensation costs means monetary payments, fringe benefits, deferred compensation, and any other items of value (excluding office space and billing and collection services) that a provider or other organization furnishes a physician in

return for the physician's services to the provider.

On March 2, 1983, we published a final rule in the **Federal Register** that codified regulations to implement section 1887(a)(2)(B) of the Act (currently at 42 CFR 415.70) and established the first set of RCE limits (48 FR 8902). In accordance with § 415.70(a)(2), RCE limits do not apply to the costs of physician compensation attributable to furnishing inpatient hospital services for which payment is made under the IPPS or to the costs of physician compensation attributable to approved GME programs that are payable under §§ 413.75 through 413.83 of the regulations. In addition, under § 415.70(a)(3), compensation that a physician receives for activities that may not be paid for under either Medicare Part A or Part B is not considered in applying these RCE limits. Furthermore, in accordance with § 413.70, RCE limits are not used in determining the reasonable costs that CAHs incur in compensating physicians for services furnished to the CAH.

The RCE limits apply equally to all physicians' services to providers that are payable on a reasonable cost basis under Medicare. If a physician receives any compensation from one or more providers for his or her services to the provider (that is, those services that benefit patients generally), payment to those providers for the costs of such compensation is subject to the RCE limits. The RCE limits are not applied to payment for services that are identifiable medical or surgical services to individual patients and paid under the MPFS, even if the physician agrees to accept compensation (for example, from a hospital) for those services. Payments to teaching hospitals that have elected cost reimbursement for their physicians' direct medical and surgical services in accordance with section 1861(b)(7) of the Act are subject to the RCE limits (68 FR 45458).

2. Overview of the Current RCE Limits

a. Application of the RCE Limits

Currently, we use the RCE limits to compute Medicare payments when a physician is compensated by a provider that is subject to the RCE limits. We also use these limits when the physician is compensated by any other provider-related organization for physician administrative, supervisory, and other services to the provider under Medicare. In applying the RCE limits, we compute the Medicare payments using information submitted on the cost report, and ensure that each compensated physician is assigned to

the most appropriate specialty category. The current physician specialty categories for RCE limits are General/Family Practice, Internal Medicine, Surgery, Pediatrics, OB/GYN, Radiology, Psychiatry, Anesthesiology, Pathology, and Total. If there is no specific specialty category (for example, for an emergency room physician), we use the "Total" category, for which the RCE limits are calculated based on mean annual income data for all physicians.

If the physician's contractual compensation covers all duties, activities, and services furnished to the provider and, under a reassignment, all physicians' services furnished to individual patients of the provider, and the physician is employed by the provider full time, we use the RCE limit for the appropriate specialty, adjusted by the physician's allocation agreement (which reflects the percentage of total time spent performing services furnished to the provider) to arrive at the Medicare program's share of the provider's allowable physician compensation costs (§ 415.60). In the absence of an allocation agreement, we would assume that 100 percent of the compensation paid to the physician by the provider is related to physicians' services for which payment is made under the MPFS and that there are no allowable physician compensation costs to the provider (§ 415.60(f)(2)).

If a physician's compensation from the provider represents payment only for services that benefit patients generally (that is, the physician bills for all services furnished to individual patients), we use the appropriate specialty RCE limit. If a physician is employed by a provider to furnish services of general benefit to patients on other than a full-time basis, the RCE limit will be adjusted to reflect the hours the physician actually worked, as reported on the provider's cost report, related to a full work year of 2,080 hours.

b. Exceptions to the RCE Limits

Some providers such as small or rural hospitals may be unable to recruit or maintain an adequate number of physicians at a compensation level within the prescribed RCE limits. In accordance with section 1887(a)(2)(C) of the Act and § 415.70(e) of the regulations, if a provider can demonstrate to the MAC its inability to recruit or maintain physicians at a compensation level allowable under the RCE limits (as documented, for example, by unsuccessful advertising through national medical or health care publications), the MAC may grant the provider an exception to the RCE limits

established under these rules. Such exceptions would allow the provider to be paid based on costs for compensation higher than the RCE limit.

c. Methodology for Establishing the RCE Limits

In the March 2, 1983 final rule with comment period (48 FR 8902), we published the initial RCE limits, along with the methodology used to calculate those limits, that were applicable to cost reporting periods beginning during CYs 1982 and 1983. As part of that same rule, we established regulations that outline our general authority to develop, publish, and apply RCE limits (currently at § 415.70). Section 415.70(b) of the regulations specifies that we establish the methodology for determining annual RCE limits, considering, to the extent possible, average physician incomes by specialty and type of location, using the best available data.

The methodology for establishing the initial RCE limits was based on the analysis contained in an internal working paper, "A Methodology for Determination of Reasonable FTE Compensation for Hospital-Based Physicians."⁵⁶ (Copies of this working paper are available on the CMS Web site at: <http://www.cms.gov/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html>.) As outlined in this working paper, our methodology for establishing the initial reasonable levels of compensation includes the following five steps (for additional discussion of this methodology, we refer readers to the March 2, 1983 final rule with comment period (48 FR 8902)):

Step 1: We estimated the national average (mean) income for all physicians using 1979 physician net incomes from the American Medical Association (AMA) Periodic Survey of Physicians (PSP), published by the AMA in its *Profile of Medical Practices*, 1981.

Step 2: We projected physicians' 1979 base net income levels to the appropriate future year to account for changes in net income levels occurring after the period for which we have data using the Consumer Price Index for All Urban Consumers (CPI-U), and projected the results using forecasts of the CPI-U for future years.

Step 3: We determined the relationship between average net income for all physicians (estimated in the first step above) and net income of

⁵⁶ Cantwell, James R. and Sobaski, William J., *A Methodology for Determination of Reasonable FTE Compensation for Hospital-Based Physicians*, Working Paper No. OR-32, revised December 1982.

certain categories of specialist physicians that are commonly compensated by providers for services that generally benefit Medicare beneficiaries resulting in separate specialty adjusters for nine physician specialties as well as the adjuster for the "Total" category.

Step 4: We also adjusted each of these specialty (including the "Total") adjusters for differences in costs between types of geographic locations using Standard Metropolitan Statistical Areas (SMSAs) as defined by the Office of Management and Budget (OMB).

Step 5: Using the AMA PSP data, we calculated the average hours practiced per year for each specialty and location adjuster combination, which we then related to a standard full-time equivalent (FTE) work year of 2,080 hours. We used these ratios to weight the specialty-location adjusters from the previous step.

This same methodology was used to update the RCE limits published in a notice in the **Federal Register** on May 5, 1997 (62 FR 24483). These updated RCE limits were effective for cost reporting periods beginning on or after May 5, 1997.

For RCE limits established prior to January 1, 1998, we used the CPI-U to update the RCE limits. In a final rule with comment period published in the **Federal Register** on October 31, 1997 (62 FR 59075), we finalized a policy to use the Medicare Economic Index (MEI) to update the RCE limits (rather than the CPI-U), effective for cost reporting periods beginning on or after January 1, 1998. We adopted the MEI as the applicable update factor in order to achieve a measure of consistency in the methodologies used to determine payments to physicians for direct medical and surgical services furnished to individual patients and reasonable compensation levels for services that are of general benefit to a provider's patients. However, we did not update the RCE limits at that time.

In the FY 2004 IPPS final rule published in the **Federal Register** on August 1, 2003 (68 FR 45458), we published updated RCE limits that were effective for cost reporting periods beginning on or after January 1, 2004. We updated the RCE limits using the CPI-U to adjust the data to 1997, and the MEI to adjust the data from 1998 to 2004. In addition, we continued to adjust the RCE limits to account for differences in salary levels by location, as well as by specialty. For the location adjustment, we continued to base the geographical classifications of the providers on Metropolitan Statistical Areas (MSAs) (the OMB changed the

area name to describe metropolitan areas in the 1980's from SMSAs to MSAs, but the definition of MSAs differed only slightly from the previously used SMSAs).

3. Changes to the RCE Limits

In accordance with § 415.70(b), when establishing the methodology to determine the RCE limits, we consider, to the extent possible, the average physician incomes by specialty and type of location using the best available data. Since the initial RCE limits were developed, we have adjusted the RCE data to account for specialty and location (as discussed earlier in this section). In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28173), we proposed to use the most recent MEI data to update the RCE limits and to replace the RCE limits that have been in effect since January 1, 2004. We believed that doing so will enhance the accuracy of the RCE limits. In addition, for the reasons discussed below, we proposed to eliminate the location adjustment to the RCE data, while continuing to adjust the RCE limits by specialty. We did not propose changes to any of the other existing policies with respect to the application of and exceptions to the RCE limits.

We invited public comments on our proposals to update the RCE limits and to eliminate the location adjustment for the RCE limits for cost reporting periods beginning on or after January 1, 2015. In addition, we invited public comments on our proposal to revise § 415.70(b) of the regulations to eliminate consideration of the type of location as part of the methodology to establish RCE limits for cost reporting periods beginning on or after January 1, 2015.

Comment: One commenter expressed appreciation that CMS is updating the RCE limits and suggested that CMS update the RCEs on an annual basis. The commenter also requested that the proposed RCEs be effective for cost reporting periods beginning on or after January 1, 2014, instead of cost reporting periods beginning on or after January 1, 2015.

Response: We will continue to review the RCE limits on a regular basis by applying the most recent economic index data and publish updates as necessary. We plan to keep the proposed effective date for the updated RCEs, as we do not believe it would be appropriate in this situation to make this provision retroactively effective.

As discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28173 through 28175), in establishing the initial and subsequently updated RCE limits, we included an adjustment to

account for differences in salary levels based on the location of the provider using geographic classifications based on the MSAs as defined by the OMB. We assigned an appropriate MSA designation based on the State/county in which the provider is located. We included a table in each of the previous RCE limit notices and rules, whereby each MSA designation was grouped into one of three categories: Metropolitan areas with a population greater than 1 million, metropolitan areas with a population less than 1 million, and nonmetropolitan areas. The MSA designation of the provider is then used to identify the appropriate RCE limit.

To update the current RCE limits by location under the current methodology, we would need to use, as in past updates, the MSA designations that correspond with the update period. However, since 2003, the OMB no longer updates or uses MSAs. We considered continuing to use the MSA designations, as we have in the past, but we would have no way to account for shifts in populations among MSAs because the OMB no longer updates geographic classifications based on MSA designations. The OMB regularly updates the geographic definitions, and the counties included in each area, to account for population shifts due to migrations, birth, and death rates but currently the OMB uses Core-Based Statistical Area (CBSA) designations rather than MSAs. If we were to continue to use the MSA designation, providers could potentially be underpaid or overpaid if the population of their MSA changed significantly from 2004. Therefore, we determined that, because the MSA designations are no longer updated, it would not be appropriate to continue using the previous location adjustment methodology. The most recent geographic delineations used by the OMB are CBSAs, a term used to refer to both Metropolitan and Micropolitan Statistical Areas. However, CBSA delineations do not match the MSA definitions that were used to develop the initial and subsequently updated RCE limits. As noted above, we have used the AMA PSP data to develop previous and current RCE limits. The AMA PSP data were collected from 1970 to 1980 and included physicians' income, hours worked, and MSA-based population information. The data that have been used to develop and update the RCE limits were developed using MSAs as the geographic unit. It is not possible to exactly crosswalk the MSA designations to the CBSA designations in order to update the RCE limits using

the current location adjustment methodology. Even if it was possible to crosswalk the MSAs to the CBSAs, it would not be appropriate to use the MSA-based AMA PSP data to develop CBSA-based RCE limits. There have been significant changes in the populations of the MSA-based locations contained in the AMA PSP data that could not be translated into CBSAs. As such, that data would no longer be valid as the basis to develop RCE limits based on CBSAs.

The OMB has cautioned users about using the new CBSA designations. For instance, in OMB's 2010 "Standards for Delineating Metropolitan and Micropolitan Statistical Areas (CBSAs)" published on June 28, 2010 in the **Federal Register** (75 FR 37246), OMB states:

"OMB establishes and maintains these areas solely for statistical purposes. *In reviewing and revising these areas, OMB does not take into account or attempt to anticipate any public or private sector nonstatistical uses that may be made of the delineations. These areas are not designed to serve as a general-purpose geographic framework applicable for nonstatistical activities or for use in program funding formulas.*

"Furthermore, the Metropolitan and Micropolitan Statistical Area Standards do not produce an urban-rural classification, and confusion of these concepts can lead to difficulties in program implementation. Counties included in Metropolitan and Micropolitan Statistical Areas and many other counties may contain both urban and rural territory and populations. . . . OMB urges agencies, organizations, and policy makers to review carefully the goals of nonstatistical programs and policies to ensure that appropriate geographic entities are used to determine eligibility for the allocation of Federal funds." (Emphasis in original.)

For CMS to accurately update the location-adjusted RCE limits using the CBSAs, as we stated in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28174), we believe it would be necessary to use a new data source for information on physician salaries, specialties, location, and hours worked; and the data would need to be allocated to different geographic areas based on CBSAs. The AMA PSP collected data from a large sample of office-based physicians. We considered using data that are currently collected and publicly available. We could not find a reliable dataset that contained all of the necessary data elements needed to update the location-adjusted RCE limits based on CBSAs. The most reliable data

we could find came from the Bureau of Labor Statistics (BLS) Occupational Employment Statistics (OES). The BLS OES data are collected annually, and capture a large and diverse population of physicians and corresponding CBSAs. We believe the BLS OES data are the most current, reliable source of income data for physicians. Although, the BLS OES is very reliable and collects data points for physician specialties, salary, and location, it does not collect detailed information for all 10 specialties; the "Radiology" and "Pathology" specialties are not separately captured. As such, we did not believe it was appropriate to use the BLS OES data to create an updated RCE limit if we would not have data available for two specialties.

We also weighed the benefit of collecting updated information from physicians (through use of a new nationwide survey) in order to obtain the data necessary for application of an appropriate locality adjustment based on CBSAs against the burden placed on such physicians in providing such data. In order to have a dataset that could accurately capture all the necessary information, we would need to collect data from a large population of physicians, including a sufficient sample size for each physician specialty in each CBSA. We weighed the burden that such a nationwide survey would entail for all physicians, including office-based physicians, to be asked to respond to an in-depth survey regarding their salary, specialty, location, hours worked, and other practice information against the benefit of using updated, CBSA-based information to include a location adjustment for the providers that are subject to the RCE limits.

When the RCE limits were developed in 1983, other than inpatient acute care hospitals paid under the IPPS, most provider types were reimbursed on a reasonable cost basis. Since then, providers such as skilled nursing facilities (SNFs), long-term care hospitals (LTCHs), inpatient rehabilitation facilities (IRFs), inpatient psychiatric facilities (IPFs), and home health agencies (HHAs) that previously were paid on a reasonable cost basis have transitioned to prospective payment systems and are no longer subject to the RCE limits. As of FY 2011 (the most recent cost report year for which we have complete data), our data show that there were only 59 children's hospitals and cancer hospitals and 46 teaching hospitals (that have elected cost reimbursement for their physicians' direct medical and surgical services) that are subject to the RCE limits. As such, we believe the benefit that could

be gained by gathering the new data that would be necessary to maintain a location adjustment for the RCE limits is outweighed by the burden of conducting such a comprehensive survey of physicians.

Furthermore, we analyzed how the elimination of the location adjustment would affect the accuracy and appropriateness of the proposed RCE limits. To perform this analysis, we needed a reliable source of physician income data (without a location adjustment) which could be compared to the RCE limits without a location adjustment. We determined that the best available source of physician income data is the mean annual income data for similar RCE physician specialties collected by the BLS OES. As mentioned above, the BLS OES data are collected annually and capture a large and diverse population of physicians. These data are the most current, reliable source of income data by physician specialties. In addition, when comparing salaries, it is important to compare salary amounts that reflect the same number of hours worked per year. Because many physicians do not work a 2,080 hour work year, their salary may seem higher or lower due to the number of hours actually worked. The RCE limits are based on physicians who worked a 2,080 hour work year. The BLS OES data also are based on a 2,080 hour work year; therefore, we believe that comparing the RCE limits to these BLS OES data is appropriate for purposes of our analysis.

We performed an analysis comparing RCE limits for 2012, calculated without a location adjustment and solely for purposes of the analysis, to the most recently published (at the time of the analysis) BLS OES physician mean annual income data for the same year, to determine whether RCE limits based on the AMA PSP data, but without a location adjustment, would continue to reasonably reflect mean annual physician income data. For 2012, the BLS OES had income information for 8 of the 10 RCE specialties, which include the "Total" category; the BLS OES data did not capture the "Radiology" and "Pathology" specialties. We searched for another reliable data source for "Radiology" and "Pathology" but we could not find one with sufficient data elements to compare with the RCE limits. We used the MEI to update the RCE limits for these eight specialties to 2012 without including the location factor. We then compared these 2012 RCE limits to the 2012 BLS OES data for these same eight specialties. As shown in the table below, we found that the RCE limits ranged from 10.41 percent

above the BLS OES mean annual income data to 3.58 percent below the BLS OES data. Only three of the eight

specialties had RCE limits slightly less than the then-current BLS OES mean annual wages for their specialty. The

remaining five specialties had RCE limits above the current BLS OES mean annual wages for the specialties.

ANALYSIS CHART

Specialty	RCE Limits updated to 2012*	BLS OES Mean 2012 annual wage	Percent difference
Total	\$206,300	\$184,820	10.41%
General/Family Practice	174,600	180,850	-3.58%
Internal Medicine	192,700	191,520	0.61%
Surgery	240,300	230,540	4.06%
Pediatrics	165,500	167,640	-1.29%
OB/GYN	231,200	216,760	6.25%
Radiology	265,200	N/A	N/A
Psychiatry	176,800	177,520	-0.41%
Anesthesiology	233,500	232,820	0.29%
Pathology	253,900	N/A	N/A

* These limits were calculated using the methodology only for purposes of this impact analysis.

The RCE amounts updated to 2012 and the BLS OES numbers for 2012 varied only slightly, and in most cases, the RCE limit was higher than the BLS OES mean annual wage. Based on this analysis, as we stated in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28175), we believe that RCE limits calculated using the AMA PSP data, and our proposed elimination of the location adjustment for the updated RCE limits, would result in RCE limits that are a reasonable reflection of mean annual physician income and would continue to ensure that providers subject to the RCE limits are paid in a fair and accurate manner.

Because there are a relatively small number of providers currently affected by the RCE limits and because, as discussed above, we believe the revised RCE limits without a location adjustment would continue to ensure appropriate payment to such providers, we believe that eliminating the location adjustment would have a minimal overall effect on providers subject to the RCE limits and on the industry as a whole.

For the reasons discussed above, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28175), we proposed to eliminate the location adjustment under the RCE limit methodology, and to revise § 415.70(b) of the regulations to remove consideration of the “type of location” as part of the methodology used to establish RCE limits.

Comment: One commenter suggested CMS work with the BLS to obtain the information needed to calculate the RCE limits with a location adjustment. One commenter suggested that CMS develop an alternative method of establishing a location adjustment.

Response: We plan to evaluate the BLS Occupational Employment

Statistics and any other alternative data sources to further determine if a location adjustment is a viable option for future RCE updates.

Comment: A few commenters suggested that CMS keep the location adjustment as part of the RCE limits. They stated that location-adjusted RCE limits continue to be important in capturing accurate physician salary costs for all providers because all hospitals apply the RCE limits to physician salaries on Worksheet A-8-2 of the Medicare cost report. A few commenters expressed concern over the accuracy of costs, such as GME costs, that would result from applying RCE limits without a location adjustment.

Response: RCE limits currently have a payment impact on 105 Medicare providers, including 8 cancer hospitals, 51 children’s hospitals and 46 electing teaching amendment (ETA) hospitals that elected cost reimbursement for their physicians’ direct medical and surgical services. While it is true that all hospitals use the RCE limits on Worksheet A-8-2, for hospitals paid under the IPPS, the application of the RCE limits on Worksheet A-8-2 does not have a Medicare payment impact. Specifically, Worksheet C that is used for payment purposes calculates cost-to-charge ratios for IPPS hospitals using data prior to the application of the RCE limits on Worksheet A-8-2. Therefore, RCE limits have no effect on payments to providers paid under the IPPS. For the 46 ETA hospitals, Worksheet D-5 is used to apply the RCE limits to determine the proper payment on a reasonable cost basis of direct medical and surgical services of the physician. Given the current limitations of the location designation data described in the proposed rule, we believe it is appropriate to eliminate the location

adjustment to the RCE limits. Based on the analysis discussed above and in the proposed rule, we believe that the RCE limits calculated without a location adjustment are a reasonable reflection of mean annual physician income and will continue to ensure that providers subject to the RCE limits are paid in a fair and accurate manner. Because of this, and because the RCE limits impact a relatively small number of providers, we believe that eliminating the location adjustment will have a minimal overall effect on providers subject to the RCE limits and on the industry as a whole. While a few commenters expressed concern over the accuracy of GME costs, we note that, under § 415.70(a)(2) of the regulations, RCE limits do not apply to costs of physician compensation attributable to approved GME programs that are payable under §§ 413.75 through 413.83.

After consideration of the public comments we received, in this final rule, we are adopting as final the proposed methodology for establishing the RCE limits. We are setting forth the final updated RCE limits on the amount of allowable compensation for services furnished by physicians to providers (and for ETA hospitals, for direct medical and surgical services of physicians) for cost reporting periods beginning on or after January 1, 2015. To calculate these final RCE limits, we used the same methodology that was used to calculate the original and previous updates to the RCE limits, but did not apply an adjustment based on geographical classification. As noted earlier, this methodology was derived from the 1982 working paper. We used the mean physician income by specialty from that working paper to calculate the RCE limits without adjusting for geographical classification. We then

updated these data by the CPI-U (from 1982 to 1997) and then by the MEI (from 1998 to 2015) to compute the updated RCE limits. The RCE limits implemented by this final rule vary slightly from those in the proposed rule due to a more recent estimate of the MEI for 2015.

The chart below sets forth the final updated RCE limits on the amount of allowable compensation for services furnished by physicians to providers for cost reporting periods beginning on or after January 1, 2015, established using the same methodology that was used to calculate the original and previous updates to the RCE limits, but not applying an adjustment based on geographical classification.

FINAL CY 2015 RCE LIMITS

Total	\$211,500
General/Family Practice	179,000
Internal Medicine	197,500
Surgery	246,400
Pediatrics	169,700
OB/GYN	237,100
Radiology	271,900
Psychiatry	181,300
Anesthesiology	239,400
Pathology	260,300

In addition, we are adopting as final our proposed revision of § 415.70(b) of the regulations to eliminate consideration of the type of location as part of the methodology to establish RCE limits for cost reporting periods beginning on or after January 1, 2015.

D. Critical Access Hospitals (CAHs)

1. Background

Sections 1820 and 1861(mm) of the Act, as amended by section 4201 of the Balanced Budget Act (BBA) of 1997, replaced the Essential Access Community Hospitals and Rural Primary Care Hospitals (EACH/RPCH) program with the Medicare Rural Hospital Flexibility Program (MRHFP), under which a qualifying facility can be designated as a CAH. CAHs participating in the MRHFP must meet the conditions for designation by the State and be certified by the Secretary in accordance with section 1820 of the Act. Further, in accordance with section 1820(e)(3) of the Act, a CAH must meet other criteria that the Secretary specifies.

The regulations that govern the conditions of participation (CoPs) for CAHs under the statutory requirements of section 1820 are codified at 42 CFR Part 485, Subpart F.

2. Proposed and Final Policy Changes Related to Reclassification as Rural for CAHs

Under section 1820(c)(2)(B)(i) of the Act, a facility is eligible for designation as a CAH only if it is located in a county or equivalent unit of local government in a rural area (as defined in section 1886(d)(2)(D) of the Act), or is being treated as being located in a rural area in accordance with section 1886(d)(8)(E) of the Act. The regulations implementing this location requirement are located at § 485.610(b). The regulations governing the process for a facility located in an urban area to apply for reclassification as a rural facility under section 1886(d)(8)(E) of the Act are located at § 412.103.

As discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28054 through 28064), we proposed to implement the most recently published OMB delineations announced in OMB Bulletin No. 13–01. (We refer readers to section III.B. of the preamble of this final rule for a discussion of our final decision to implement the new OMB delineations announced in OMB Bulletin No. 13–01.) As previously stated, a facility must be located in a rural area in order to be eligible for designation as a CAH. Therefore, a new OMB delineation that redesignates an area from rural to urban, affects the status of a facility that is currently a CAH and had met the CAH location requirements prior to implementation of the new OMB delineation. A facility that is located in an urban area cannot remain a CAH unless it is reclassified as rural under § 412.103 of the regulations. In both the FY 2005 IPPS final rule (69 FR 49221 through 49222 and 69 FR 60242 and 60252) and the FY 2010 IPPS/LTCH PPS final rule (74 FR 43939 through 43940), we amended the regulations at § 412.103(a) and § 485.610(b) to provide for a transition period during which CAHs that had previously been located in rural areas but, as a result of new OMB delineations, were now located in urban areas, could reclassify as rural under § 412.103. Specifically, in both the FY 2005 IPPS final rule and the FY 2010 IPPS/LTCH PPS final rule, we provided for a 2-year period during which a CAH located in an urban area as a result of the new OMB delineations could continue participating without interruption as a CAH, thereby allowing the CAH sufficient time to reclassify as rural under § 412.103. If the facility did not reclassify as a rural facility by the end of that 2-year period, the CAH would not be able to retain its CAH status beyond that 2-year period.

However, under the FY 2005 IPPS final rule and the FY 2010 IPPS/LTCH PPS final rule, the application of the regulation was limited to October 1, 2004 through September 30, 2006, and October 1, 2009 through September 30, 2011, respectively. As a result, in the absence of a new amendment to the regulations each time there are new OMB delineations, a CAH that becomes located in an urban area as a result of those OMB delineations would not be given 2 years to reclassify as rural under § 412.103 of the regulations.

In the FY 2010 IPPS/LTCH PPS final rule (74 FR 43940), we stated that we would consider whether it would be appropriate to propose, in future IPPS rulemaking, to revise § 485.610 and § 412.103 to provide for a transition period any time a CAH that was formerly located in a rural area is designated as being located in an urban area as a result of the redesignation of its county from rural to urban. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28176), we stated that after further consideration, we believe that it is appropriate to propose to change the regulations to provide for a transition period that is not restricted to a timeframe, but rather can be applied any time a facility that is currently designated as a CAH becomes located in an urban area as a result of a new OMB delineation.

Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28176), we proposed that, effective October 1, 2014, a CAH that was previously located in a rural area but is now located in an urban area as a result of a new OMB labor market area delineation will continue to be treated as rural for 2 years from the date the OMB delineation is implemented. Accordingly, we stated in the proposed rule that if the OMB delineations announced in OMB Bulletin No. 13–01 on February 28, 2013 discussed in section III.B. of the preamble of the proposed rule are implemented in this FY 2015 IPPS/LTCH PPS final rule, effective October 1, 2014, any CAH affected by the new OMB delineations in OMB Bulletin No. 13–01 would retain its rural status through September 30, 2016. An affected CAH would be required to reclassify as a rural facility under § 412.103 within that 2-year period in order to continue participating in the Medicare program as a CAH after the 2-year transition period ends. Therefore, taking into consideration the example above, any CAH affected by a new OMB delineation that is implemented in this FY 2015 IPPS/LTCH PPS final rule would be required to reclassify as rural by September 30, 2016, in order to

retain its CAH status after September 30, 2016.

To implement this proposed change, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28176), we proposed to revise § 412.103 by adding a new paragraph (a)(6), and to revise § 485.610 by making a conforming change to the introductory text of paragraph (b) and adding a new paragraph (b)(5) to provide for a 2-year transition period that will apply any time a new OMB delineation causes a facility that was previously located in a rural area and is designated as a CAH to be located in an urban area. We stated we believe that this proposal to revise the regulations to automatically provide for a 2-year transition period following the implementation of new OMB delineations is more efficient than providing for a regulatory change limited to a timeframe, and, as a result, will be more effective in reducing any disruption caused by new OMB delineations.

Comment: Commenters supported CMS' proposal to provide for a 2-year transition period to allow CAHs affected by the implementation of new OMB delineations time to reclassify as rural in order to retain their CAH status after the 2-year transition period ends. Several commenters requested that CMS work with and provide notification to affected CAHs to alert them to the need to reclassify as rural in order to retain their CAH status. One commenter asked how new OMB delineations would impact necessary provider CAHs previously reclassified under prior updates.

Another commenter requested that CMS provide for a 3-year transition period to allow affected CAHs additional time to reclassify as rural or to prepare to transition to urban PPS facilities. The commenter stated that the size of CAHs and the number of regulations they must follow make it difficult for these facilities to process and respond to new requirements. The commenter stated that although only a small number of CAHs are affected by the new OMB delineations, those affected require considerable time to locate applicable State law, examine Rural Urban Commuting Area (RUCA) scores, and in general determine whether they are eligible to reclassify as rural facilities. The commenter stated that CMS has a precedent for providing a 3-year transition period because it proposed to apply such a grace period to urban facilities redesignated as rural so that these facilities have time to prepare for lower reimbursement resulting from several factors, including a lower wage index. The commenter

stated that CAHs that lose their CAH status would also be subject to these lower payment rates and therefore would also benefit from being provided with a 3-year transition period.

Response: We appreciate the commenters' support of our proposal to provide CAHs affected by new OMB delineations with a 2-year transition period to reclassify as rural in order to retain their CAH status after the 2-year transition period ends. In response to the commenters' request that CMS notify each CAH affected by a change in OMB delineations, we encourage CAHs to contact CMS if they have questions regarding their rural status and whether this status has changed as a result of the implementation of the new OMB delineations as discussed in section III.B. of the preamble of this final rule.

In response to the question concerning necessary provider CAHs, section 1820(c)(2)(B)(i) of the Act requires that in order for a facility to be certified as a CAH, it must be located in a rural area or have reclassified as a rural facility. Therefore, if a necessary provider CAH is located in an urban area as a result of the new OMB delineations implemented in this final rule effective October 1, 2014, that CAH must now reclassify as rural in order to keep its CAH status after September 30, 2016. If a necessary provider CAH had previously reclassified as rural due to a prior change in OMB delineations, that CAH's rural status remains unchanged.

In response to the request to provide affected CAHs with a 3-year transition period during which they could either reclassify as rural or prepare to transition to an PPS facility, we continue to believe that 2 years is the appropriate amount of time for such a transition period. Consistent with the regulation changes made in FY 2005 and FY 2010 final rules (69 FR 49221 through 49222, 69 FR 60242 and 60252, and 74 FR 43939 through 43940), we believe 2 years is a sufficient period of time in order for the CAH to work with its State to be designated as rural and engage in any other research it believes is necessary to determine whether it should reclassify as rural. Therefore, we are finalizing our proposal to provide CAHs affected by our implementation of the new OMB delineations with a 2-year transition period during which they must reclassify as rural in order to retain their CAH status after the 2-year period ends.

Comment: Commenters requested that, in addition to providing CAHs affected by the implementation of a new OMB delineation with a 2-year transition period to reclassify as rural, SCHs and MDHs affected by the

implementation of a new OMB delineation also be provided with a transition period to reclassify as rural. One commenter requested that CMS clarify that a hospital's SCH status would not be affected by a CAH that is now located in an urban area as a result of a new OMB delineation while that CAH is in its 2-year transition period to reclassify as rural. Specifically, the commenter requested that a CAH not be considered a "like hospital" as defined at § 412.92(c)(2) during its transition period.

Response: We are clarifying that during an affected CAH's 2-year transition period, the facility will continue to be considered a CAH. We respond to the public comments related to transition periods for SCHs and MDHs in sections IV.G.4. and IV.G.5. of the preamble of this final rule.

After consideration of the public comments we received, we are finalizing our policy as proposed to provide for a 2-year transition period for CAHs affected by the implementation of a new OMB delineation during which the CAH must reclassify as rural in order to retain its CAH status after the 2-year transition period ends. To implement this change, we are revising § 412.103 by adding a new paragraph (a)(6), and revising § 485.610 by making a conforming change to the introductory text of paragraph (b) and adding a new paragraph (b)(5) to provide for a 2-year transition period that will apply any time the implementation of a new OMB delineation causes a facility that was previously located in a rural area and is designated as a CAH to be located in an urban area. These regulation changes are effective October 1, 2014. For purposes of applying these regulation changes to the new OMB delineations implemented in this final rule effective October 1, 2014, CAHs affected by these most recent OMB delineations will be treated as CAHs through September 30, 2016 and will have until September 30, 2016, to reclassify as rural in order to keep their CAH status after September 30, 2016.

3. Revision of the Requirements for Physician Certification of CAH Inpatient Services

For inpatient CAH services to be payable under Medicare Part A, section 1814(a)(8) of the Act requires that a physician certify "that the individual may reasonably be expected to be discharged or transferred to a hospital within 96 hours after admission to the critical access hospital." The regulations implementing this statutory requirement are located at § 424.15.

Prior to FY 2014, this physician certification was required no later than 1 day before the date on which the claim for payment for the inpatient CAH service is submitted. In the FY 2014 IPPS/LTCH PPS final rule, we revised the CAH regulations concerning the timing requirements for certification of inpatient CAH services. Specifically, we revised § 424.15(b) to state that certification begins with the order for inpatient admission. The certification must be completed, signed, and documented in the medical record prior to discharge (78 FR 50970). This change was effective October 1, 2013.

However, in order to provide CAHs with greater flexibility in meeting this certification requirement, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28176 through 28177), we proposed to amend the regulations governing the timing of the 96-hour certification requirement at § 424.15(b) such that physician certification is required no later than 1 day before the date on which the claim for payment for the inpatient CAH service is submitted. That is, we proposed to remove the requirement that certification of the 96-hour requirement must be completed prior to discharge and we proposed to reinstate the timing requirement that was in place prior to October 1, 2013.

We proposed to revise § 424.15(b) to remove the phrase “prior to discharge” and replace it with “no later than 1 day before the date on which the claim for payment for the inpatient CAH service is submitted”. In addition, we proposed to make a conforming amendment to § 424.11(d)(5). Section 424.11(d)(5) states that for all inpatient hospital or critical access hospital inpatient services, including inpatient psychiatric facility services, a delayed certification may not extend past discharge. Because we proposed to change the timing requirement for physician certification of CAH inpatient services at § 424.15(b), such that the certification could be completed past discharge, we proposed to revise § 424.11(d)(5) to remove the phrase “or critical access hospital inpatient”. We sought public comment on these proposed changes to the regulations governing the requirement for physician certification of CAH inpatient services.

Comment: Most commenters supported the proposed change to allow physician certification to be completed 1 day prior to when the claim for the inpatient service is submitted. Commenters requested that CMS provide additional flexibility and avoid further confusion by clarifying that CAHs have until no later than 1 day prior to the day on which the claim for

the inpatient service is submitted to complete all certification requirements. One commenter stated that the proposed change could cause inaccurate and delayed chart entries because the certification may take place 30, 60, or 90 days after the inpatient is discharged. The commenter recommended that physician certification be completed within 24 hours of admission and that the medical record be used to meet all certification requirements. One commenter stated that asking a physician to certify his or her expectation for an individual’s length of stay after the individual’s inpatient stay has exceeded 96 hours will create additional confusion and will be met with greater resistance from physicians. Commenters asked for clarification in understanding how the proposal would help CAHs if the certification is still required to state that the individual will be discharged or transferred to another hospital within 96 hours after admission to the CAH.

Response: We appreciate the commenters’ support of our proposal. In response to commenters who requested that CMS clarify that all certification requirements can be met no later than 1 day prior to when the claim is submitted, we are revising our proposed amendment to § 424.15(b) to provide that a CAH has until 1 day prior to when the claim for the inpatient service is submitted to complete all certification requirements. In order to finalize this policy, we are amending the regulation text at § 424.11(d)(5) to remove the phrase “or critical access hospital inpatient.” In addition we are revising the regulations at § 424.15(b) to state that certification begins with the order for inpatient admission. All certification requirements must be completed, signed, and documented in the medical record no later than 1 day before the date on which the claim for payment for the inpatient CAH service is submitted. We believe these changes are consistent with the 96-hour certification requirement and the existing CoP requirements.

In response to commenters’ concerns about providing a delayed certification, the policy finalized in this rule requires that all certification requirements be completed no later than 1 day prior to when the claim for the inpatient service is submitted. Therefore, CAHs are not precluded from completing these certification requirements in advance of this deadline if they believe an earlier completion of certification requirements is appropriate. We note that we are not making any changes related to the order requirements for admission and that in accordance with § 412.3, an order is

required before or at the time of admission to admit an individual as an inpatient. In addition, we refer readers to the CY 2015 OPPS/ASC proposed rule, specifically section “XVI. Proposed Revision of the Requirements for Physician Certification of Hospital Inpatient Services Other Psychiatric Inpatient Services” (79 FR 41056 through 41058). In the CY 2015 OPPS/ASC proposed rule, we proposed to require inpatient admission orders as a condition of payment based upon our general rulemaking authority under section 1871 of the Act rather than as an element of the physician certification under section 1814(a)(3) of the Act. In addition, in the CY 2015 OPPS/ASC proposed rule, we proposed to change our interpretation of section 1814(a)(3) of the Act to require a physician certification only for long-stay cases and outlier cases. In that rule, we proposed that 20 days is an appropriate minimum threshold for physician certification and we proposed to define long-stay cases as cases with stays of 20 days or longer. These proposed changes refer to the general physician certification requirements under section 1814(a)(3) of the Act and do not address the 96-hour certification requirement at section 1814(a)(8) of the Act.

Comment: Although many commenters supported the proposed change, many commenters indicated that they continue to have significant concerns with the 96-hour certification requirement and that the proposed change does not do enough to alleviate these concerns. Commenters stated they continue to support the Critical Access Hospital Relief Act of 2014, which would remove the 96-hour certification requirement for payment. Commenters requested that CMS exercise its discretion and make clear it will not enforce the 96-hour certification requirement because as long as this requirement is enforced, CAHs may not be eligible for Medicare payment. One commenter stated that occasionally admitting a patient who is expected to stay longer than 96 hours is permissible and should be paid. Commenters stated that physicians have been given the impossible task of coordinating the 96-hour certification requirement for payment with the 2-midnight policy and that, in some cases, the physician must certify that the patient will be transferred or discharged within a 49-hour timeframe. Another commenter stated that the 96-hour certification requirement is obsolete and does not recognize advancements in services which CAHs provide, including telehealth services. Commenters

requested that CMS seek a legislative change that would align the certification requirement for payment with the CAH CoP requirement, which requires an annual average length of stay of 96 hours. Commenters stated that the certification requirement for payment could be met by requiring that the CAH certify that it has the appropriate resources and staff to treat the inpatient. Commenters stated that the CAH program was established to provide individuals living in rural areas with access to critical health care services so that these individuals can receive high quality and cost efficient care close to home even though providing this type of care may prove to be unprofitable for a CAH. Commenters stated that CAHs provide services that may require longer lengths of stay, and while the provision of these services does not violate the CoP requirement for an annual average length of stay of 96 hours, CAHs are prevented from providing these types of services because they cannot meet the 96-hour certification requirement for payment. Commenters stated they are concerned about their ability to treat patients, employ new providers, and maintain services essential to their community.

Commenters expressed concern about the impact of the 96-hour certification requirement for payment on surgical procedures. Commenters stated CAHs have put much effort into providing these procedures so that beneficiaries, particularly elderly individuals, can receive these services close to home. One commenter stated that surgeons who practice in rural areas rely on performing specific surgical procedures such as colon resections. The commenter stated that if these surgeons are only able to provide short-stay procedures and can no longer provide procedures that require longer lengths of stay, they would likely discontinue practicing at CAHs. One commenter stated that delaying the 96-hour certification requirement is not a resolution because it does not eliminate the fact that a surgeon will be unable to admit an individual to a CAH if he or she ethically believes that the individual will need 5 days as an inpatient.

One commenter recommended CMS withdraw the policy related to the 96-hour certification requirement for payment in the final rule for several reasons. The commenter stated that the policy jeopardizes a physician's ability to care for his or her patient as required by the patient's condition because admission should be based on medical judgment once an individual's condition and symptoms are evaluated.

The commenter stated that implementation of the policy will result in dissatisfaction and confusion because patients will have to become accustomed to new hospitals and new medical staff and a decline in patient satisfaction scores is something from which a hospital may not be able to recover. The commenter stated that although the 96-hour certification requirement is in statute, it was not enforced by CMS until FY 2014 and that CAHs were not given advance notification of the enforcement and there has been little preparation, training or guidance from CMS until very recently. The commenter noted that medical staff of its member CAHs are angry and frustrated especially because of the detrimental effect of the 96-hour certification requirement on their patients.

Response: As stated earlier in this preamble, we believe the policy we are finalizing in this rule is consistent with the 96-hour certification requirement and the existing CoP requirements. The remainder of this response provides a review of the 96-hour certification requirement.

For inpatient CAH services, section 1814(a)(8) of the Act requires for Medicare Part A payment that "in the case of inpatient critical access hospital services, a physician certifies that the individual may reasonably be expected to be discharged or transferred to a hospital within 96 hours after admission to the critical access hospital." Because this statutory requirement is based on an expectation, if a physician certifies in good faith, that an individual may reasonably be expected to be discharged or transferred to a hospital within 96 hours after admission to the CAH and then something unforeseen occurs that causes the individual to stay longer at the CAH, Medicare will pay for the costs of treating that patient and there would not be a problem with regard to the CAH designation as long as that individual's stay does not cause the CAH to exceed its 96-hour annual average CoP requirement. However, if a physician cannot in good faith certify that an individual may reasonably be expected to be discharged or transferred within 96 hours after admission to the CAH, the CAH will not receive Medicare Part A payment for any portion of that individual's inpatient stay.

In addition, time as an outpatient at the CAH is not included in applying the 96-hour requirement, nor does time in a CAH swing bed, which is being used to provide skilled nursing services, count towards the 96-hour requirement. The clock for the 96 hours only begins once

the individual is admitted to the CAH as an inpatient.

After consideration of the public comments we received, we are finalizing a policy that a CAH is required to complete all physician certification requirements no later than 1 day before the date on which the claim for the inpatient service is submitted. In order to finalize this change, we are amending the regulation text at § 424.11(d)(5) to remove the phrase "or critical access hospital inpatient." In addition, we are revising the regulations at § 424.15(b) to state that certification begins with the order for inpatient admission. All certification requirements must be completed, signed, and documented in the medical record no later than 1 day before the date on which the claim for payment for the inpatient CAH service is submitted. These changes are effective October 1, 2014.

VII. Changes to the Long-Term Care Hospital Prospective Payment System (LTCH PPS) for FY 2015

A. Background of the LTCH PPS

1. Legislative and Regulatory Authority

Section 123 of the Medicare, Medicaid, and SCHIP (State Children's Health Insurance Program) Balanced Budget Refinement Act of 1999 (BBRA) (Pub. L. 106–113) as amended by section 307(b) of the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000 (BIPA) (Pub. L. 106–554) provides for payment for both the operating and capital-related costs of hospital inpatient stays in long-term care hospitals (LTCHs) under Medicare Part A based on prospectively set rates. The Medicare prospective payment system (PPS) for LTCHs applies to hospitals that are described in section 1886(d)(1)(B)(iv) of the Act, effective for cost reporting periods beginning on or after October 1, 2002.

Section 1886(d)(1)(B)(iv)(I) of the Act defines a LTCH as "a hospital which has an average inpatient length of stay (as determined by the Secretary) of greater than 25 days." Section 1886(d)(1)(B)(iv)(II) of the Act also provides an alternative definition of LTCHs: specifically, a hospital that first received payment under section 1886(d) of the Act in 1986 and has an average inpatient length of stay (LOS) (as determined by the Secretary of Health and Human Services (the Secretary)) of greater than 20 days and has 80 percent or more of its annual Medicare inpatient discharges with a principal diagnosis that reflects a finding of neoplastic

disease in the 12-month cost reporting period ending in FY 1997.

Section 123 of the BBRA requires the PPS for LTCHs to be a “per discharge” system with a diagnosis-related group (DRG) based patient classification system that reflects the differences in patient resources and costs in LTCHs.

Section 307(b)(1) of the BIPA, among other things, mandates that the Secretary shall examine, and may provide for, adjustments to payments under the LTCH PPS, including adjustments to DRG weights, area wage adjustments, geographic reclassification, outliers, updates, and a disproportionate share adjustment.

In the August 30, 2002 **Federal Register**, we issued a final rule that implemented the LTCH PPS authorized under the BBRA and BIPA (67 FR 55954). For the initial implementation of the LTCH PPS (FYs 2003 through FY 2007), the system used information from LTCH patient records to classify patients into distinct long-term care diagnosis-related groups (LTC-DRGs) based on clinical characteristics and expected resource needs. Beginning in FY 2008, we adopted the Medicare severity long-term care diagnosis-related groups (MS-LTC-DRGs) as the patient classification system used under the LTCH PPS. Payments are calculated for each MS-LTC-DRG and provisions are made for appropriate payment adjustments. Payment rates under the LTCH PPS are updated annually and published in the **Federal Register**.

The LTCH PPS replaced the reasonable cost-based payment system under the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA) (Pub. L. 97-248) for payments for inpatient services provided by a LTCH with a cost reporting period beginning on or after October 1, 2002. (The regulations implementing the TEFRA reasonable cost-based payment provisions are located at 42 CFR Part 413.) With the implementation of the PPS for acute care hospitals authorized by the Social Security Amendments of 1983 (Pub. L. 98-21), which added section 1886(d) to the Act, certain hospitals, including LTCHs, were excluded from the PPS for acute care hospitals and were paid their reasonable costs for inpatient services subject to a per discharge limitation or target amount under the TEFRA system. For each cost reporting period, a hospital-specific ceiling on payments was determined by multiplying the hospital’s updated target amount by the number of total current year Medicare discharges. (Generally, in section VII. of the preamble of this final rule, when we refer to discharges, we describe

Medicare discharges.) The August 30, 2002 final rule further details the payment policy under the TEFRA system (67 FR 55954).

In the August 30, 2002 final rule, we provided for a 5-year transition period from payments under the TEFRA system to payments under the LTCH PPS. During this 5-year transition period, a LTCH’s total payment under the PPS was based on an increasing percentage of the Federal rate with a corresponding decrease in the percentage of the LTCH PPS payment that is based on reasonable cost concepts, unless a LTCH made a one-time election to be paid based on 100 percent of the Federal rate. Beginning with LTCHs’ cost reporting periods beginning on or after October 1, 2006, total LTCH PPS payments are based on 100 percent of the Federal rate.

In addition, in the August 30, 2002 final rule, we presented an in-depth discussion of the LTCH PPS, including the patient classification system, relative weights, payment rates, additional payments, and the budget neutrality requirements mandated by section 123 of the BBRA. The same final rule that established regulations for the LTCH PPS under 42 CFR Part 412, Subpart O, also contained LTCH provisions related to covered inpatient services, limitation on charges to beneficiaries, medical review requirements, furnishing of inpatient hospital services directly or under arrangement, and reporting and recordkeeping requirements. We refer readers to the August 30, 2002 final rule for a comprehensive discussion of the research and data that supported the establishment of the LTCH PPS (67 FR 55954).

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51733 through 51743) for a chronological summary of the main legislative and regulatory developments affecting the LTCH PPS through the annual update cycles prior to the FY 2014 rulemaking cycle. In addition, in this final rule, we discuss the provisions of the Pathway for SGR Reform Act of 2013 (Pub. L. 113-67), enacted on December 26, 2013, that affect the LTCH PPS. In section VII.I.2. of the preamble of this final rule, we discuss the provisions of section 1206(a) of Public Law 113-67, which amended section 1886(m) of the Act by adding paragraph (6) and established, among other things, patient-level criteria for payments under the LTCH PPS for implementation beginning with FY 2016. In section VII.E. of the preamble of this final rule, we discuss the provisions of section 1206(b)(1) of Public Law 113-67, which provide for the retroactive reinstatement and

extension, for an additional 4 years, of the moratorium on the full implementation of the 25-percent threshold payment adjustment policy (except for “grandfathered” hospitals-within-hospitals (HwHs), which are permanently exempt from this policy). In section VII.G. of the preamble of this final rule, we discuss the provisions of section 1206(b)(2) of Public Law 113-67 (as amended by section 112(b) of the Protecting Access to Medicare Act (Pub. L. 113-93), which, subject to certain defined exceptions, provide for statutory moratoria on the establishment of new LTCHs and LTCH satellite facilities and a new statutory moratorium on the increase in the number of hospital beds in LTCHs or LTCH satellite facilities for the period beginning April 1, 2014 and ending September 30, 2017. In section IX.C. of the preamble of this final rule, we discuss the provisions of section 1206(c) of Public Law 113-67, which amended the LTCH Quality Reporting Program established under section 1886(m)(5) of the Act by requiring the Secretary to establish a functional status quality measure to evaluate the in mobility among inpatients requiring ventilator support no later than October 1, 2015. In section VII.H. of the preamble of this final rule, we discuss the findings of a review of payments to certain LTCHs (that is, LTCHs classified under subclause (II) of section 1886(d)(1)(B)(iv) of the Act) that was conducted in accordance with section 1206(d) of Public Law 113-67, and finalize a policy to apply a payment adjustment under the LTCH PPS to “subclause (II)” LTCHs beginning in FY 2015 that will result in payments to this type of LTCH resembling payments under the reasonable cost TEFRA payment system model.

2. Criteria for Classification as an LTCH

a. Classification as an LTCH

Under the regulations at § 412.23(e)(1), to qualify to be paid under the LTCH PPS, a hospital must have a provider agreement with Medicare. Furthermore, § 412.23(e)(2)(i), which implements section 1886(d)(1)(B)(iv)(I) of the Act, requires that a hospital have an average Medicare inpatient length of stay of greater than 25 days to be paid under the LTCH PPS. Alternatively, § 412.23(e)(2)(ii) states that, for cost reporting periods beginning on or after August 5, 1997, a hospital that was first excluded from the PPS in 1986 and can demonstrate that at least 80 percent of its annual Medicare inpatient discharges in the 12-month cost reporting period ending in

FY 1997 have a principal diagnosis that reflects a finding of neoplastic disease must have an average inpatient length of stay for all patients, including both Medicare and non-Medicare inpatients, of greater than 20 days.

b. Hospitals Excluded From the LTCH PPS

The following hospitals are paid under special payment provisions, as described in § 412.22(c) and, therefore, are not subject to the LTCH PPS rules:

- Veterans Administration hospitals.
- Hospitals that are reimbursed under State cost control systems approved under 42 CFR Part 403.
- Hospitals that are reimbursed in accordance with demonstration projects authorized under section 402(a) of the Social Security Amendments of 1967 (Pub. L. 90-248) (42 U.S.C. 1395b-1) or section 222(a) of the Social Security Amendments of 1972 (Pub. L. 92-603) (42 U.S.C. 1395b-1 (note)) (Statewide all-payer systems, subject to the rate-of-increase test at section 1814(b) of the Act).
- Nonparticipating hospitals furnishing emergency services to Medicare beneficiaries.

3. Limitation on Charges to Beneficiaries

In the August 30, 2002 final rule, we presented an in-depth discussion of beneficiary liability under the LTCH PPS (67 FR 55974 through 55975). In the RY 2005 LTCH PPS final rule (69 FR 25676), we clarified that the discussion of beneficiary liability in the August 30, 2002 final rule was not meant to establish rates or payments for, or define Medicare-eligible expenses. Under § 412.507, if the Medicare payment to the LTCH is the full LTC-DRG payment amount, consistent with other established hospital prospective payment systems, a LTCH may not bill a Medicare beneficiary for more than the deductible and coinsurance amounts as specified under §§ 409.82, 409.83, and 409.87 and for items and services specified under § 489.30(a). However, under the LTCH PPS, Medicare will only pay for days for which the beneficiary has coverage until the short-stay outlier (SSO) threshold is exceeded. Therefore, if the Medicare payment was for a SSO case (§ 412.529) that was less than the full LTC-DRG payment amount because the beneficiary had insufficient remaining Medicare days, the LTCH could also charge the beneficiary for services delivered on those uncovered days (§ 412.507).

4. Administrative Simplification Compliance Act (ASCA) and Health Insurance Portability and Accountability Act (HIPAA) Compliance

Claims submitted to Medicare must comply with both the Administrative Simplification Compliance Act (ASCA) (Pub. L. 107-105), and the Health Insurance Portability and Accountability Act of 1996 (HIPAA) (Pub. L. 104-191). Section 3 of the ASCA requires that the Medicare Program deny payment under Part A or Part B for any expenses incurred for items or services “for which a claim is submitted other than in an electronic form specified by the Secretary.” Section 1862(h) of the Act (as added by section 3(a) of the ASCA) provides that the Secretary shall waive such denial in two specific types of cases and may also waive such denial “in such unusual cases as the Secretary finds appropriate” (68 FR 48805). Section 3 of the ASCA operates in the context of the HIPAA regulations, which include, among other provisions, the transactions and code sets standards requirements codified under 45 CFR Parts 160 and 162 (generally known as the Transactions Rule). The Transactions Rule requires covered entities, including covered health care providers, to conduct certain electronic health care transactions according to the applicable transactions and code sets standards.

The Department of Health and Human Services has a number of initiatives designed to encourage and support the adoption of health information technology and promote nationwide health information exchange to improve health care. The Office of the National Coordinator for Health Information Technology (ONC) leads these efforts in collaboration with other agencies, including CMS and the Office of the Assistant Secretary for Planning and Evaluation (ASPE). Through a number of activities, including several open government initiatives, HHS is promoting the adoption of electronic health record (EHR) technology certified under the ONC Health Information Technology (HIT) Certification Program developed to support secure, interoperable, health information exchange. The HIT Policy Committee (a Federal Advisory Committee) has recommended areas in which HIT certification under the ONC HIT Certification Program would help support providers that are eligible for the Medicare and Medicaid EHR Incentive Programs, such as long-term and postacute care (including LTCHs) and behavioral health care providers.

We believe that the use of certified EHRs by LTCHs (and other types of providers that are ineligible for the Medicare and Medicaid EHR Incentive Programs) can effectively and efficiently help providers improve internal care delivery practices, support the exchange of important information across care partners and during transitions of care, and could enable the reporting of electronically specified clinical quality measures (eCQMs) (as described elsewhere in this rule). More information on the ONC HIT Certification Program and efforts to develop standards applicable to LTCHs can be found by accessing the following Web sites and resources:

- http://www.healthit.gov/sites/default/files/generalcertexchangeguidance_final_9-9-13.pdf;
- <http://www.healthit.gov/facas/FACAS/health-it-policy-committee/hitpc-workgroups/certificationadoption>;

B. Medicare Severity Long-Term Care Diagnosis-Related Group (MS-LTC-DRG) Classifications and Relative Weights for FY 2015

1. Background

Section 123 of the BBRA requires that the Secretary implement a PPS for LTCHs (that is, a per discharge system with a diagnosis-related group (DRG)-based patient classification system reflecting the differences in patient resources and costs). Section 307(b)(1) of the BIPA modified the requirements of section 123 of the BBRA by requiring that the Secretary examine “the feasibility and the impact of basing payment under such a system [the long-term care hospital (LTCH) PPS] on the use of existing (or refined) hospital DRGs that have been modified to account for different resource use of LTCH patients, as well as the use of the most recently available hospital discharge data.”

When the LTCH PPS was implemented for cost reporting periods beginning on or after October 1, 2002, we adopted the same DRG patient classification system (that is, the CMS DRGs) that was utilized at that time under the IPPS. As a component of the LTCH PPS, we refer to this patient classification system as the “long-term care diagnosis-related groups (LTC-DRGs).” Although the patient classification system used under both the LTCH PPS and the IPPS are the

same, the relative weights are different. The established relative weight methodology and data used under the LTCH PPS result in relative weights under the LTCH PPS that reflect “the differences in patient resource use . . .” of LTCH patients (section 123(a)(1) of the BBRA (Pub. L. 106–113)).

As part of our efforts to better recognize severity of illness among patients, in the FY 2008 IPPS final rule with comment period (72 FR 47130), the MS–DRGs and the Medicare severity long-term care diagnosis-related groups (MS–LTC–DRGs) were adopted under the IPPS and the LTCH PPS, respectively, effective beginning October 1, 2007 (FY 2008). For a full description of the development, implementation, and rationale for the use of the MS–DRGs and MS–LTC–DRGs, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47141 through 47175 and 47277 through 47299). (We note that, in that same final rule, we revised the regulations at § 412.503 to specify that for LTCH discharges occurring on or after October 1, 2007, when applying the provisions of 42 CFR Part 412, Subpart O applicable to LTCHs for policy descriptions and payment calculations, all references to LTC–DRGs would be considered a reference to MS–LTC–DRGs. For the remainder of this section, we present the discussion in terms of the current MS–LTC–DRG patient classification system unless specifically referring to the previous LTC–DRG patient classification system that was in effect before October 1, 2007.)

The MS–DRGs adopted in FY 2008 represent an increase in the number of DRGs by 207 (that is, from 538 to 745) (72 FR 47171). The MS–DRG classifications are updated annually. There are currently 751 MS–DRG groupings. After finalizing the proposed changes to the MS–DRG groupings described in section II.G. of this preamble, there are a total of 753 MS–DRG groupings for FY 2015. Consistent with section 123 of the BBRA, as amended by section 307(b)(1) of the BIPA, and § 412.515 of the regulations, we used information derived from LTCH PPS patient records to classify LTCH discharges into distinct MS–LTC–DRGs based on clinical characteristics and estimated resource needs. We then assigned an appropriate weight to the MS–LTC–DRGs to account for the difference in resource use by patients exhibiting the case complexity and multiple medical problems characteristic of LTCHs. Below we provide a general summary of our existing methodology for determining

the FY 2015 MS–LTC–DRG relative weights under the LTCH PPS.

In a departure from the IPPS, and as discussed in greater detail below in section VII.B.3.f. of this preamble, we are continuing to use low-volume MS–LTC–DRGs (that is, MS–LTC–DRGs with less than 25 LTCH cases) in determining the MS–LTC–DRG relative weights because LTCHs do not typically treat the full range of diagnoses as do acute care hospitals. For purposes of determining the relative weights for the large number of low-volume MS–LTC–DRGs, we grouped all of the low-volume MS–LTC–DRGs into five quintiles based on average charge per discharge. (A detailed discussion of the initial development and application of the quintile methodology appears in the August 30, 2002 LTCH PPS final rule (67 FR 55978).) Under our existing methodology, we accounted for adjustments to payments for short-stay outlier (SSO) cases (that is, cases where the covered length of stay at the LTCH is less than or equal to five-sixths of the geometric average length of stay for the MS–LTC–DRG). Furthermore, we made adjustments to account for nonmonotonically increasing weights, when necessary. That is, theoretically, cases under the MS–LTC–DRG system that are more severe require greater expenditure of medical care resources and will result in higher average charges such that, in the severity levels within a base MS–LTC–DRG, the relative weights should increase monotonically with severity from the lowest to highest severity level. (We discuss nonmonotonicity in greater detail and our methodology to adjust the MS–LTC–DRG relative weights to account for nonmonotonically increasing relative weights in section VII.B.3.g. (Step 6) of this preamble.)

2. Patient Classifications into MS–LTC–DRGs

a. Background

The MS–DRGs (used under the IPPS) and the MS–LTC–DRGs (used under the LTCH PPS) are based on the CMS DRG structure. As noted above in this section, we refer to the DRGs under the LTCH PPS as MS–LTC–DRGs although they are structurally identical to the MS–DRGs used under the IPPS.

The MS–DRGs are organized into 25 major diagnostic categories (MDCs), most of which are based on a particular organ system of the body; the remainder involve multiple organ systems (such as MDC 22, Burns). Within most MDCs, cases are then divided into surgical DRGs and medical DRGs. Surgical DRGs are assigned based on a surgical

hierarchy that orders operating room (O.R.) procedures or groups of O.R. procedures by resource intensity. The GROUPER software program does not recognize all ICD–9–CM procedure codes as procedures affecting DRG assignment. That is, procedures that are not surgical (for example, EKGs), or minor surgical procedures (for example, a biopsy of skin and subcutaneous tissue (procedure code 86.11)) do not affect the MS–LTC–DRG assignment based on their presence on the claim.

Generally, under the LTCH PPS, a Medicare payment is made at a predetermined specific rate for each discharge and that payment varies by the MS–LTC–DRG to which a beneficiary’s stay is assigned. Cases are classified into MS–LTC–DRGs for payment based on the following six data elements:

- Principal diagnosis;
- Additional or secondary diagnoses;
- Surgical procedures;
- Age;
- Sex; and
- Discharge status of the patient.

Through FY 2010, the number of diagnosis and procedure codes considered for MS–DRG assignment was limited to nine and six, respectively. However, for claims submitted on the 5010 format beginning January 1, 2011, we increased the capacity to process diagnosis and procedure codes up to 25 diagnoses and 25 procedures. This includes one principal diagnosis and up to 24 secondary diagnoses for severity of illness determinations. We refer readers to section II.G.11.c. of the preamble of the FY 2011 IPPS/LTCH PPS final rule for a complete discussion of this change (75 FR 50127).

Under HIPAA transactions and code sets regulations at 45 CFR Parts 160 and 162, covered entities must comply with the adopted transaction standards and operating rules specified in Subparts I through S of Part 162. Among other requirements, by January 1, 2012, covered entities were required to use the ASC X12 Standards for Electronic Data Interchange Technical Report Type 3—Health Care Claim: Institutional (837), May 2006, ASC X12N/005010X223, and Type 1 Errata to Health Care Claim: Institutional (837) ASC X12 Standards for Electronic Data Interchange Technical Report Type 3, October 2007, ASC X12N/005010X233A1 for the health care claims or equivalent encounter information transaction (45 CFR 162.1102).

HIPAA requires covered entities to use the applicable medical data code set requirements when conducting HIPAA transactions (45 CFR 162.1000). Currently, upon the discharge of the

patient, the LTCH must assign appropriate diagnosis and procedure codes from the most current version of the Internal Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM). For additional information on the ICD-9-CM coding system, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47241 through 47243 and 47277 through 47281). We also refer readers to the detailed discussion on correct coding practices in the August 30, 2002 LTCH PPS final rule (67 FR 55981 through 55983). Additional coding instructions and examples are published in the *Coding Clinic for ICD-9-CM*, a product of the American Hospital Association. (We refer readers to section II.G.13. of the preamble of this final rule for additional information on the annual revisions to the ICD-9-CM codes.)

Providers use the code sets under the ICD-9-CM coding system to report diagnoses and procedures for Medicare hospital inpatient services under the MS-DRG system. We have been discussing the conversion to the ICD-10 coding system for many years. In the FY 2015 IPPS/LTCH PPS proposed rule, we referred readers to section II.G.1. of the preamble of that proposed rule for additional information on the implementation of the ICD-10 coding system.

Comment: One commenter requested that CMS develop a crosswalk between ICD-9-CM codes and ICD-10 codes to specifically assist LTCH providers in determining the appropriate MS-LTC-DRGs that are affected as a result of the transition to ICD-10-PCS. The commenter stated that additional guidance is needed regarding the specific MS-LTC-DRGs that LTCHs should concentrate their efforts on during the delay in the implementation of ICD-10-PCS.

Response: As noted above, the MS-LTC-DRGs under the LTCH PPS are structurally identical to the MS-DRGs used under the IPPS. For a detailed discussion of the conversion from the ICD-9-CM to the ICD-10-PCS code set and the ICD-9-CM to ICD-10 MS-DRGs, we refer readers to section II.G.1.a. of the preamble of this FY 2015 IPPS/LTCH PPS final rule. Included in this discussion are all the ICD-10 resources publicly available via the Internet on the CMS ICD-10 Web site: <http://www.cms.gov/Medicare/Coding/ICD10/index.html>. For example, the General Equivalence Mappings (GEMs) that consist of forward and backward mappings of ICD-9-CM and ICD-10-PCS coding sets are available for providers to review their current list of ICD-9-CM codes and map (or

crosswalk) them to the appropriate available ICD-10-PCS codes. However, we note that the GEMs are not a substitute for coding from actual medical record documentation using the ICD-10-PCS code set. We also have held several ICD-10-PCS National Provider Calls where interested parties can listen to past presentations and review the accompanying slide presentations available. We refer readers to the following Web site: <http://www.cms.gov/Medicare/Coding/ICD10/CMS-Sponsored-ICD-10-Teleconferences.html>.

To create the MS-DRGs (and by extension, the MS-LTC-DRGs), base DRGs were subdivided according to the presence of specific secondary diagnoses designated as complications or comorbidities (CCs) into one, two, or three levels of severity, depending on the impact of the CCs on resources used for those cases. Specifically, there are sets of MS-DRGs that are split into 2 or 3 subgroups based on the presence or absence of a CC or a major complication or comorbidity (MCC). We refer readers to section II.D. of the FY 2008 IPPS final rule with comment period for a detailed discussion about the creation of MS-DRGs based on severity of illness levels (72 FR 47141 through 47175).

Medicare administrative contractors (MACs) enter the clinical and demographic information submitted by LTCHs into their claims processing systems and subject this information to a series of automated screening processes called the Medicare Code Editor (MCE). These screens are designed to identify cases that require further review before assignment into a MS-LTC-DRG can be made. During this process, certain cases are selected for further development (74 FR 43949).

After screening through the MCE, each claim is classified into the appropriate MS-LTC-DRG by the Medicare LTCH GROUPER software on the basis of diagnosis and procedure codes and other demographic information (age, sex, and discharge status). The GROUPER software used under the LTCH PPS is the same GROUPER software program used under the IPPS. Following the MS-LTC-DRG assignment, the Medicare contractor determines the prospective payment amount by using the Medicare PRICER program, which accounts for hospital-specific adjustments. Under the LTCH PPS, we provide an opportunity for LTCHs to review the MS-LTC-DRG assignments made by the Medicare contractor and to submit additional information within a specified timeframe as provided in § 412.513(c).

The GROUPER software is used both to classify past cases to measure relative hospital resource consumption to establish the MS-LTC-DRG relative weights and to classify current cases for purposes of determining payment. The records for all Medicare hospital inpatient discharges are maintained in the MedPAR file. The data in this file are used to evaluate possible MS-DRG and MS-LTC-DRG classification changes and to recalibrate the MS-DRG and MS-LTC-DRG relative weights during our annual update under both the IPPS (§ 412.60(e)) and the LTCH PPS (§ 412.517), respectively.

b. Changes to the MS-LTC-DRGs for FY 2015

As specified by our regulations at § 412.517(a), which require that the MS-LTC-DRG classifications and relative weights be updated annually, and consistent with our historical practice of using the same patient classification system under the LTCH PPS as is used under the IPPS, we proposed to update the MS-LTC-DRG classifications effective October 1, 2014, through September 30, 2015 (FY 2015) consistent with the proposed changes to specific MS-DRG classifications (that is, proposed GROUPER Version 32.0). We did not receive any public comments on this proposal. Therefore, we are adopting the proposal without modification in this final rule. In accordance with § 412.517(a) and consistent with our historical practice, we are updating the MS-LTC-DRG classifications effective October 1, 2014, through September 30, 2015 (FY 2015) consistent with the changes to specific MS-DRG classifications presented in section II.G. of this preamble (that is, GROUPER Version 32.0). Therefore, the MS-LTC-DRGs for FY 2015 presented in this final rule are the same as the MS-DRGs that are being used under the IPPS for FY 2015. In addition, because the MS-LTC-DRGs for FY 2015 are the same as the MS-DRGs for FY 2015, the other changes that affect MS-DRG (and by extension MS-LTC-DRG) assignments under GROUPER Version 32.0 as discussed in section II.G. of the preamble of this final rule, including the changes to the MCE software and the ICD-9-CM coding system, also are applicable under the LTCH PPS for FY 2015.

3. Development of the FY 2015 MS-LTC-DRG Relative Weights

a. General Overview of the Development of the MS-LTC-DRG Relative Weights

One of the primary goals for the implementation of the LTCH PPS is to

pay each LTCH an appropriate amount for the efficient delivery of medical care to Medicare patients. The system must be able to account adequately for each LTCH's case-mix in order to ensure both fair distribution of Medicare payments and access to adequate care for those Medicare patients whose care is more costly (67 FR 55984). To accomplish these goals, we have annually adjusted the LTCH PPS standard Federal prospective payment system rate by the applicable relative weight in determining payment to LTCHs for each case.

The basic methodology used to develop the MS-LTC-DRG relative weights is generally consistent with the general methodology established when the LTCH PPS was implemented in the August 30, 2002 LTCH PPS final rule (67 FR 55989 through 55991), with the exception of some modifications of our historical procedures for assigning relative weights in cases of zero volume and/or nonmonotonicity resulting from the adoption of the MS-LTC-DRGs. (For details on the modifications to our historical procedures for assigning relative weights in cases of zero volume and/or nonmonotonicity, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47289 through 47295) and the FY 2009 IPPS final rule (73 FR 48542 through 48550).) Under the LTCH PPS, relative weights for each MS-LTC-DRG are a primary element used to account for the variations in cost per discharge and resource utilization among the payment groups (§ 412.515). To ensure that Medicare patients classified to each MS-LTC-DRG have access to an appropriate level of services and to encourage efficiency, we calculate a relative weight for each MS-LTC-DRG that represents the resources needed by an average inpatient LTCH case in that MS-LTC-DRG. For example, cases in a MS-LTC-DRG with a relative weight of 2 will, on average, cost twice as much to treat as cases in a MS-LTC-DRG with a relative weight of 1.

b. Development of the MS-LTC-DRG Relative Weights for FY 2015

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50755 through 50760), we presented our policies for the development of the MS-LTC-DRG relative weights for FY 2014. The basic methodology we used to develop the FY 2014 MS-LTC-DRG relative weights was the same as the methodology we used to develop the FY 2013 MS-LTC-DRG relative weights in the FY 2013 IPPS/LTCH PPS final rule and was consistent with the general methodology established when the LTCH PPS was

implemented in the August 30, 2002 LTCH PPS final rule (67 FR 55989 through 55991). In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28181 through 28187), we proposed to continue to use our existing methodology to determine the MS LTC-DRG relative weights for FY 2015, including the application of established policies related to the data, the hospital-specific relative value methodology, the treatment of severity levels in the MS LTC-DRGs, low-volume and no-volume MS-LTC-DRGs, adjustments for nonmonotonicity, and the steps for calculating the proposed MS-LTC-DRG relative weights with a budget neutrality factor.

Beginning with the FY 2008 update, we established a budget neutrality requirement for the annual update to the MS-LTC-DRG classifications and relative weights at § 412.517(b) (in conjunction with § 412.503), such that estimated aggregate LTCH PPS payments would be unaffected, that is, would be neither greater than nor less than the estimated aggregate LTCH PPS payments that would have been made without the classification and relative weight changes (72 FR 26882 through 26884). Consistent with § 412.517(b), we proposed to continue to apply our established two-step budget neutrality methodology. As such, the proposed update to the MS-LTC-DRG classifications and relative weights for FY 2015 was based on the FY 2014 MS-LTC-DRG classifications and relative weights established in Table 11 listed in section VI. of the Addendum to the FY 2014 IPPS/LTCH PPS final rule (78 FR 51002).

Comment: A few commenters recommended that CMS review its calculation of the proposed FY 2015 MS-LTC-DRG relative weights with the proposed budget neutrality factor to confirm that the those weights resulted in no change in aggregate LTCH PPS payments under § 412.517. The commenters made this request after performing their own analysis of the proposed relative weight calculations. One commenter performed a comparative analysis using the LTCH discharges from the MedPAR data and its estimate of LTCH PPS payments using the FY 2014 MS-LTC-DRGs relative weights and the proposed FY 2015 MS-LTC-DRGs relative weights, and found an aggregate reduction in LTCH PPS payments, in which the majority of that reduction was due to the proposed decrease in the relative weight for MS-LTC-DRG 207. Another commenter's analysis found a reduction in the proposed relative weight for 11 of the 20 most frequently utilized MS-

LTC-DRGs, which the commenter believed suggested that the proposed MS-LTC-DRGs relative weights result in an aggregate decrease in LTCH PPS payments. Because these commenters believed that their analyses revealed an estimated aggregate decrease in LTCH PPS payments, they further believed that the proposed MS-LTC-DRGs relative are not "budget neutral" and, therefore, are not consistent with the requirement under § 412.517(b) that CMS ensure that estimated LTCH PPS payments are not affected by the annual update to the MS-LTC-DRGs classifications and relative weights. We note that the commenters did not comment specifically on any of our specific proposals related to the determination of the MS-LTC-DRGs relative weights for FY 2015, which includes our calculation of the normalization factor and the budget neutrality factor determined under the proposed application of our two-step budget neutrality methodology (discussed in Step 7 of section VII.B.3.g. of the proposed rule).

Response: We appreciate the commenters' analysis of the determination of the proposed MS-LTC-DRG relative weight calculations. In consideration of these public comments, we have reviewed the application of our methodology and the calculation of the MS-LTC-DRGs relative weights for FY 2015. We found no methodological or computational errors. In particular, in light of the commenter's focus on MS-LTC-DRG 207, we reviewed our budget neutrality calculations to ensure that the proposed decrease in the relative weight for MS-LTC-DRG 207 was accurately reflected in our aggregate LTCH PPS payment estimates. As described in step 7 under section VII.B.3.g. of the proposed rule, after determining and applying the normalization factor, we compared estimated aggregate LTCH PPS payments using the FY 2014 MS-LTC-DRGs and relative weights to estimate aggregate LTCH PPS payments using the proposed FY 2015 MS-LTC-DRGs and relative weights using LTCH claims data from the December 2013 update of the FY 2013 MedPAR file. Prior to the application of the proposed budget neutrality factor, we estimated that aggregate LTCH PPS payments using the proposed FY 2015 MS-LTC-DRGs and normalized relative weights would have resulted in an increase in aggregate LTCH PPS payments in FY 2015. To remove this estimated increase in aggregate LTCH PPS payments, we determined that a factor of 0.995275 needed to be applied to each of the

proposed normalized FY 2015 MS–LTC–DRG relative weights. Therefore, we disagree with the commenters that the proposed MS LTC DRG relative weights are not “budget neutral,” and are not consistent with the budget neutrality requirement under § 412.517(b). As noted above, the commenters did not comment specifically on our calculation of the normalization factor and the budget neutrality factor determined under the proposed application of our two-step budget neutrality methodology.

The budget neutrality provision under § 412.517(b) requires that estimated aggregate LTCH PPS payments would be unaffected, that is, would be neither greater than nor less than the estimated aggregate LTCH PPS payments that would have been made without the classification and relative weight changes (72 FR 26882 through 26884). Consistent with § 412.517(b), we proposed to continue to apply our established two-step budget neutrality methodology. Under both steps of this methodology, based on the best data available, we assess the aggregate effects of the annual classification and relative weight changes. Specifically, as described in the proposed rule, in the first step we determine a normalization factor to ensure that estimated payments are not affected by changes in the composition of case types or the changes to the classification system using a ratio of average CMIs calculated across all LTCH PPS cases used for recalibration. Similarly, in the second step, the comparison of estimated aggregate LTCH PPS payments used to determine the budget neutrality factor is based on the sum of the estimated payments for all LTCH claims in the specified database. While the commenter is correct that the proposed relative weights for 11 of the 20 most frequently utilized MS–LTC–DRGs (or approximately 55 percent) are decreasing (which includes MS–LTC–DRG 207), the LTCH cases in those MS–LTC–DRGs only includes less than 60 percent of the LTCH claims. When the analysis is expanded to the 50 most frequently utilized MS–LTC–DRGs, which includes over 80 percent of the LTCH claims, the percentage of MS–LTC–DRGs with a proposed decrease in its relative weight drops to approximately 45 percent. This demonstrates that the number of MS–LTC–DRGs included in such an analysis can show contrary results. Therefore, we disagree with the commenter’s assertion that its analysis of the proposed relative weights for 11 of the 20 most frequently utilized MS–LTC–DRGs is an indication

that the proposed MS–LTC–DRG relative weights will result in an aggregate decrease in LTCH PPS payments and, therefore, are not budget neutral.

In this FY 2015 IPPS/LTCH PPS final rule, after consideration of public comments we received, as proposed, we are continuing to apply our established methodology to develop the MS–LTC–DRG relative weights for FY 2015. Specifically, we are finalizing our proposed methodology for developing the FY 2015 MS–LTC–DRG relative weights without modification, including the proposed application of established policies related to the data, hospital-specific relative value methodology, the treatment of severity levels in the MS–LTC–DRGs, low-volume and no-volume MS–LTC–DRGs, adjustments for nonmonotonicity, and the proposed steps for calculating the MS–LTC–DRG relative weights with a budget neutrality factor. Below we present the methodology that we are continuing to use to determine the MS–LTC–DRG relative weights for FY 2015, which is consistent with the methodology presented in the FY 2014 IPPS/LTCH PPS final rule. In addition, after consideration of the public comments we received, we are adopting as final the continued application our established two-step budget neutrality methodology, which is based on the current year MS–LTC–DRG classifications and relative weights (that is, the annual update to the MS–LTC–DRG classifications and relative weights for FY 2015 are based on the FY 2014 MS–LTC–DRG classifications and relative weights established in Table 11 listed in section VI. of the Addendum to the FY 2014 IPPS/LTCH PPS final rule (78 FR 51002)). For additional information on the established two-step budget neutrality methodology, we refer readers to the FY 2008 IPPS final rule (72 FR 47295 through 47296).

c. Data

For the FY 2014 IPPS/LTCH PPS final rule (78 FR 50755), to calculate the MS–LTC–DRG relative weights for FY 2014, we obtained total charges from FY 2012 Medicare LTCH bill data from the December 2012 update of the FY 2012 MedPAR file, which were the best available data at that time, and used the finalized Version 31.0 of the GROUPER to classify LTCH cases. As stated previously in this section, this approach is consistent with our proposals regarding the continued application of established policies related to the data as presented in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28181 through 28182), which we are finalizing

without modification in this final rule. Consistent with our historical practice, to calculate the MS–LTC–DRG relative weights for FY 2015 in this final rule, we obtained total charges from the FY 2013 Medicare LTCH bill data from the March 2014 update of the FY 2013 MedPAR file, which are the best available data at this time, and used Version 32.0 of the GROUPER to classify LTCH cases.

In this final rule and consistent with our historical methodology, we excluded the data from LTCHs that are all-inclusive rate providers and LTCHs that are reimbursed in accordance with demonstration projects authorized under section 402(a) of Public Law 90–248 or section 222(a) of Public Law 92–603. Furthermore, consistent with our historical practice, we excluded Medicare Advantage (Part C) claims, which are now included in the MedPAR files, in the calculations for the relative weights under the LTCH PPS that are used to determine payments for Medicare fee-for-service claims. Specifically, we did not use any claims from the MedPAR files that had a GHO Paid indicator value of “1,” which effectively removed Medicare Advantage claims from the relative weight calculations. Accordingly, in the development of the FY 2015 MS–LTC–DRG relative weights in this final rule, we excluded the data of 12 all-inclusive rate providers and one LTCH that is paid in accordance with demonstration projects that had claims in the March 2014 update of the FY 2013 MedPAR file, as well as any Medicare Advantage claims.

d. Hospital-Specific Relative Value (HSRV) Methodology

By nature, LTCHs often specialize in certain areas, such as ventilator-dependent patients and treatment of infections and wound care. Some case types (MS–DRGs) may be treated, to a large extent, in hospitals that have, from a perspective of charges, relatively high (or low) charges. This nonrandom distribution of cases with relatively high (or low) charges in specific MS–LTC–DRGs has the potential to inappropriately distort the measure of average charges. As stated previously in this section, this approach is consistent with our proposals regarding the continued use of the HSRV methodology as presented in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28182), which we are finalizing without modification in this final rule. Therefore, in this final rule, to account for the fact that cases may not be randomly distributed across LTCHs, consistent with the methodology we

have used since the implementation of the LTCH PPS, we are continuing to use a hospital-specific relative value (HSRV) methodology to calculate the MS-LTC-DRG relative weights for FY 2015. We believe this method removes this hospital-specific source of bias in measuring LTCH average charges (67 FR 55985). Specifically, under this methodology, we reduce the impact of the variation in charges across providers on any particular MS-LTC-DRG relative weight by converting each LTCH's charge for a case to a relative value based on that LTCH's average charge.

Under the HSRV methodology, we standardize charges for each LTCH by converting its charges for each case to hospital-specific relative charge values and then adjusting those values for the LTCH's case-mix. The adjustment for case-mix is needed to rescale the hospital-specific relative charge values (which, by definition, average 1.0 for each LTCH). The average relative weight for a LTCH is its case-mix, so it is reasonable to scale each LTCH's average relative charge value by its case-mix. In this way, each LTCH's relative charge value is adjusted by its case-mix to an average that reflects the complexity of the cases it treats relative to the complexity of the cases treated by all other LTCHs (the average case-mix of all LTCHs).

In accordance with our established methodology, we are continuing to standardize charges for each case by first dividing the adjusted charge for the case (adjusted for SSOs under § 412.529 as described in section VII.B.3.g. (Step 3) of this preamble) by the average adjusted charge for all cases at the LTCH in which the case was treated. SSO cases are cases with a length of stay that is less than or equal to five-sixths the average length of stay of the MS-LTC-DRG (§ 412.529 and § 412.503). The average adjusted charge reflects the average intensity of the health care services delivered by a particular LTCH and the average cost level of that LTCH. The resulting ratio is multiplied by that LTCH's case-mix index to determine the standardized charge for the case (67 FR 55989).

Multiplying the resulting ratio by the LTCH's case-mix index accounts for the fact that the same relative charges are given greater weight at a LTCH with higher average costs than they would at a LTCH with low average costs, which is needed to adjust each LTCH's relative charge value to reflect its case-mix relative to the average case-mix for all LTCHs. Because we standardize charges in this manner, we count charges for a Medicare patient at a LTCH with high average charges as less resource

intensive than they would be at a LTCH with low average charges. For example, a \$10,000 charge for a case at a LTCH with an average adjusted charge of \$17,500 reflects a higher level of relative resource use than a \$10,000 charge for a case at a LTCH with the same case-mix, but an average adjusted charge of \$35,000. We believe that the adjusted charge of an individual case more accurately reflects actual resource use for an individual LTCH because the variation in charges due to systematic differences in the markup of charges among LTCHs is taken into account.

e. Treatment of Severity Levels in Developing the MS-LTC-DRG Relative Weights

For purposes of determining the MS-LTC-DRG relative weights, under our historical methodology, there are three different categories of MS-DRGs based on volume of cases within specific MS-LTC-DRGs: (1) MS-LTC-DRGs with at least 25 cases are each assigned a unique relative weight; (2) low-volume MS-LTC-DRGs (that is, MS-LTC-DRGs that contain between 1 and 24 cases based on a given year's claims data) are grouped into quintiles (as described below) and assigned the relative weight of the quintile; and (3) no-volume MS-LTC-DRGs (that is, no cases in the given year's claims data are assigned to those MS-LTC-DRGs) are cross-walked to other MS-LTC-DRGs based on the clinical similarities and assigned the relative weight of the cross-walked MS-LTC-DRG (as described in greater detail below). As stated previously in this section, this approach is consistent with our proposals regarding the continued use of our existing methodology related to the treatment of severity levels as presented in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28182), which we are finalizing without modification in this final rule.

Therefore, in this final rule, we are continuing to utilize these same three categories of MS-LTC-DRGs for purposes of the treatment of severity levels in determining the MS-LTC-DRG relative weights for FY 2015. (We provide in-depth discussions of our policy regarding weight-setting for low-volume MS-LTC-DRGs in section VII.B.3.f. of the preamble of this final rule and for no-volume MS-LTC-DRGs, under Step 5 in section VII.B.3.g. of the preamble of this final rule.) Furthermore, in determining the FY 2015 MS-LTC-DRG relative weights, when necessary, we made adjustments to account for nonmonotonicity, as discussed in greater detail below in Step 6 of section VII.B.3.g. of this preamble. We refer readers to the discussion in the

FY 2010 IPPS/RV 2010 LTCH PPS final rule for our rationale for including an adjustment for nonmonotonicity (74 FR 43953 through 43954).

f. Low-Volume MS-LTC-DRGs

In order to account for MS-LTC-DRGs with low volume (that is, with fewer than 25 LTCH cases), consistent with our existing methodology for purposes of determining the FY 2015 MS-LTC-DRG relative weights, we are continuing to employ the quintile methodology for low-volume MS-LTC-DRGs, such that we grouped the "low-volume MS-LTC-DRGs" (that is, MS-LTC-DRGs that contained between 1 and 24 cases annually) into one of five categories (quintiles) based on average charges (67 FR 55984 through 55995 and 72 FR 47283 through 47288). As stated previously in this section, this approach is consistent with our proposals regarding the continued use of our existing methodology for the treatment of low-volume MS-LTC-DRGs as presented in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28182 through 28183), which we are finalizing without modification in this final rule. Therefore, in determining the FY 2015 MS-LTC-DRG relative weights in this final rule, in cases where the initial assignment of a low-volume MS-LTC-DRG to a quintile results in nonmonotonicity within a base-DRG, in order to ensure appropriate Medicare payments, consistent with our historical methodology, we made adjustments to the treatment of low-volume MS-LTC-DRGs to preserve monotonicity, as discussed in detail below in section VII.B.3.g. (Step 6) of the preamble of this final rule.

In this final rule, using LTCH cases from the March 2014 update of the FY 2013 MedPAR file (which is currently the best available data), we identified 295 MS-LTC-DRGs that contained between 1 and 24 cases. This list of MS-LTC-DRGs was then divided into one of the 5 low-volume quintiles, each containing 59 MS-LTC-DRGs (295/5 = 59). We assigned a low-volume MS-LTC-DRG to a specific low-volume quintile by sorting the low-volume MS-LTC-DRGs in ascending order by average charge in accordance with our established methodology. Based on the data available for this final rule, the number of MS-LTC-DRGs with less than 25 cases was evenly divisible by 5, and therefore, it was not necessary to employ our historical methodology for determining which of the low-volume quintiles contain an additional low-volume MS-LTC-DRG. Specifically for this final rule, after organizing the MS-LTC-DRGs by ascending order by

average charge, we assigned the first fifth (1st through 59th) of low-volume MS-LTC-DRGs (with the lowest average charge) into Quintile 1. The MS-LTC-DRGs with the highest average charge cases were assigned into Quintile 5. Table 13A, which is listed in section VI. of the Addendum to this final rule and is available via the Internet, lists the composition of the low-volume quintiles for MS-LTC-DRGs for FY 2015.

Accordingly, in order to determine the FY 2015 relative weights for the MS-LTC-DRGs with low volume, we used the five low-volume quintiles described above. We determined a relative weight and (geometric) average length of stay for each of the five low-volume quintiles using the methodology that we applied to the MS-LTC-DRGs (25 or more cases), as described below in section VII.B.3.g. of the preamble of this final rule. We assigned the same relative weight and average length of stay to each of the low-volume MS-LTC-DRGs that made up an individual low-volume quintile. We note that, as this system is dynamic, it is possible that the number and specific type of MS-LTC-DRGs with a low volume of LTCH cases will vary in the future. Furthermore, we note that we will continue to monitor the volume (that is, the number of LTCH cases) in the low-volume quintiles to ensure that our quintile assignments used in determining the MS-LTC-DRG relative weights result in appropriate payment for such cases and do not result in an unintended financial incentive for LTCHs to inappropriately admit these types of cases.

g. Steps for Determining the FY 2015 MS-LTC-DRG Relative Weights

In this final rule, we determined the FY 2015 MS-LTC-DRG relative weights based on our existing methodology. (For additional information on the original development of this methodology, and modifications to it since the adoption of the MS-LTC-DRGs, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 55989 through 55995) and the FY 2010 IPPS/RV 2010 LTCH PPS final rule (74 FR 43951 through 43966).) As stated previously in this section, this approach is consistent with our proposals regarding the continued use of our existing methodology to determine the FY 2015 MS-LTC-DRG relative weights as presented in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28183 through 28187), which we are finalizing without modification in this final rule.

In summary, to determine the FY 2015 MS-LTC-DRG relative weights, we

grouped LTCH cases to the appropriate MS-LTC-DRG, while taking into account the low-volume quintile (as described above). After grouping the cases to the appropriate MS-LTC-DRG (or low-volume quintile), we calculated the FY 2015 relative weights by first removing statistical outliers and cases with a length of stay of 7 days or less (Steps 1 and 2 below). Next, we adjusted the number of cases in each MS-LTC-DRG (or low-volume quintile) for the effect of SSO cases (Step 3 below). After removing statistical outliers (Step 1 below) and cases with a length of stay of 7 days or less (Step 2 below), the SSO adjusted discharges and corresponding charges were then used to calculate “relative adjusted weights” for each MS-LTC-DRG (or low-volume quintile) using the HSRV method. Below we discuss in detail the steps for calculating the FY 2015 MS-LTC-DRG relative weights. We note that, as we discussed in section VII.B.3.c. of the preamble of this final rule, we excluded the data of all-inclusive rate LTCHs, LTCHs that are paid in accordance with demonstration projects, and any Medicare Advantage claims in the March 2014 update of the FY 2013 MedPAR file.

Step 1—Remove statistical outliers.

The first step in the calculation of the FY 2015 MS-LTC-DRG relative weights is to remove statistical outlier cases. Consistent with our historical relative weight methodology, we are continuing to define statistical outliers as cases that are outside of 3.0 standard deviations from the mean of the log distribution of both charges per case and the charges per day for each MS-LTC-DRG. These statistical outliers were removed prior to calculating the relative weights because we believe that they may represent aberrations in the data that distort the measure of average resource use. Including those LTCH cases in the calculation of the relative weights could result in an inaccurate relative weight that does not truly reflect relative resource use among the MS-LTC-DRGs. (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 2—Remove cases with a length of stay of 7 days or less.

The MS-LTC-DRG relative weights reflect the average of resources used on representative cases of a specific type. Generally, cases with a length of stay of 7 days or less do not belong in a LTCH because these stays do not fully receive or benefit from treatment that is typical in a LTCH stay, and full resources are often not used in the earlier stages of admission to a LTCH. If we were to

include stays of 7 days or less in the computation of the FY 2015 MS-LTC-DRG relative weights, the value of many relative weights would decrease and, therefore, payments would decrease to a level that may no longer be appropriate. We do not believe that it would be appropriate to compromise the integrity of the payment determination for those LTCH cases that actually benefit from and receive a full course of treatment at a LTCH by including data from these very short stays. Therefore, consistent with our historical relative weight methodology, in determining the FY 2015 MS-LTC-DRG relative weights, we removed LTCH cases with a length of stay of 7 days or less. (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 3—Adjust charges for the effects of SSOs.

After removing cases with a length of stay of 7 days or less, we were left with cases that have a length of stay of greater than or equal to 8 days. As the next step in the calculation of the FY 2015 MS-LTC-DRG relative weights, consistent with our historical relative weight methodology, we adjusted each LTCH's charges per discharge for those remaining cases for the effects of SSOs (as defined in § 412.529(a) in conjunction with § 412.503).

In this final rule, we made this adjustment by counting an SSO case as a fraction of a discharge based on the ratio of the length of stay of the case to the average length of stay for the MS-LTC-DRG for non-SSO cases. This has the effect of proportionately reducing the impact of the lower charges for the SSO cases in calculating the average charge for the MS-LTC-DRG. This process produces the same result as if the actual charges per discharge of an SSO case were adjusted to what they would have been had the patient's length of stay been equal to the average length of stay of the MS-LTC-DRG.

Counting SSO cases as full discharges with no adjustment in determining the FY 2015 MS-LTC-DRG relative weights would lower the FY 2015 MS-LTC-DRG relative weight for affected MS-LTC-DRGs because the relatively lower charges of the SSO cases would bring down the average charge for all cases within a MS-LTC-DRG. This would result in an “underpayment” for non-SSO cases and an “overpayment” for SSO cases. Therefore, we adjusted for SSO cases under § 412.529 in this manner because it results in more appropriate payments for all LTCH cases. (For additional information on this step of the relative weight

methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 4—Calculate the FY 2015 MS–LTC–DRG relative weights on an iterative basis.

Consistent with our historical relative weight methodology, we calculated the FY 2015 MS–LTC–DRG relative weights using the HSRV methodology, which is an iterative process. First, for each LTCH case, we calculated a hospital-specific relative charge value by dividing the SSO adjusted charge per discharge (see Step 3) of the LTCH case (after removing the statistical outliers (see Step 1) and LTCH cases with a length of stay of 7 days or less (see Step 2)) by the average charge per discharge for the LTCH in which the case occurred. The resulting ratio was then multiplied by the LTCH's case-mix index to produce an adjusted hospital-specific relative charge value for the case. An initial case-mix index value of 1.0 was used for each LTCH.

For each MS–LTC–DRG, we calculated the FY 2015 relative weight by dividing the average of the adjusted hospital-specific relative charge values (from above) for the MS–LTC–DRG by the overall average hospital-specific relative charge value across all cases for all LTCHs. Using these recalculated MS–LTC–DRG relative weights, each LTCH's average relative weight for all of its cases (that is, its case-mix) was calculated by dividing the sum of all the LTCH's MS–LTC–DRG relative weights by its total number of cases. The LTCHs' hospital-specific relative charge values (from above) were then multiplied by the hospital-specific case-mix indexes. The hospital-specific case-mix adjusted relative charge values were then used to calculate a new set of MS–LTC–DRG relative weights across all LTCHs. This iterative process was continued until there was convergence between the relative weights produced at adjacent steps, for example, when the maximum difference was less than 0.0001.

Step 5—Determine a FY 2015 relative weight for MS–LTC–DRGs with no LTCH cases.

As we stated above, we determined the FY 2015 relative weight for each MS–LTC–DRG using total Medicare allowable total charges reported in the best available LTCH claims data (that is, the March 2014 update of the FY 2013 MedPAR file for this final rule). Using these data, we identified the MS–LTC–DRGs for which there were no LTCH cases in the database, such that no patients who would have been classified to those MS–LTC–DRGs were treated in LTCHs during FY 2013 and, therefore, no charge data were available for these MS–LTC–DRGs. Therefore, in the

process of determining the MS–LTC–DRG relative weights, we were unable to calculate relative weights for the MS–LTC–DRGs with no LTCH cases using the methodology described in Steps 1 through 4 above. However, because patients with a number of the diagnoses under these MS–LTC–DRGs may be treated at LTCHs, consistent with our historical methodology, we assigned a relative weight to each of the no-volume MS–LTC–DRGs based on clinical similarity and relative costliness (with the exception of “transplant” MS–LTC–DRGs and “error” MS–LTC–DRGs, as discussed below). (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55991 and 74 FR 43959 through 43960.)

In general, we determined FY 2015 relative weights for the MS–LTC–DRGs with no LTCH cases in the March 2014 update of the FY 2013 MedPAR file used in this final rule (that is, “no-volume” MS–LTC–DRGs) by cross-walking each no-volume MS–LTC–DRG to another MS–LTC–DRG with a calculated relative weight (determined in accordance with the methodology described above). Then, the “no-volume” MS–LTC–DRG was assigned the same relative weight (and average length of stay) of the MS–LTC–DRG to which it was cross-walked (as described in greater detail below).

Of the 753 MS–LTC–DRGs for FY 2015, we identified 237 MS–LTC–DRGs for which there are no LTCH cases in the database (including the 8 “transplant” MS–LTC–DRGs and 2 “error” MS–LTC–DRGs). As stated above, we assigned relative weights for each of the 237 no-volume MS–LTC–DRGs (with the exception of the 8 “transplant” MS–LTC–DRGs and the 2 “error” MS–LTC–DRGs, which are discussed below) based on clinical similarity and relative costliness to one of the remaining 516 (753 – 237 = 516) MS–LTC–DRGs for which we were able to determine relative weights based on FY 2013 LTCH claims data using the steps described above. (For the remainder of this discussion, we refer to the “cross-walked” MS–LTC–DRGs as the MS–LTC–DRGs to which we cross-walked one of the 237 “no volume” MS–LTC–DRGs, with the exception of the 8 “transplant” MS–LTC–DRGs and the 2 “error” MS–LTC–DRGs, for purposes of determining a relative weight.) Then, we assigned the no-volume MS–LTC–DRG the relative weight of the cross-walked MS–LTC–DRG. (As explained below in Step 6, when necessary, we made adjustments to account for nonmonotonicity.)

For this final rule, we cross-walked the no-volume MS–LTC–DRG to an MS–LTC–DRG for which there were LTCH cases in the March 2014 update of the FY 2013 MedPAR file, and to which it was similar clinically in intensity of use of resources and relative costliness as determined by criteria such as care provided during the period of time surrounding surgery, surgical approach (if applicable), length of time of surgical procedure, postoperative care, and length of stay. We evaluated the relative costliness in determining the applicable MS–LTC–DRG to which a no-volume MS–LTC–DRG was cross-walked in order to assign an appropriate relative weight for the no-volume MS–LTC–DRGs in FY 2015. (For more details on our process for evaluating relative costliness, we refer readers to the FY 2010 IPPS/RV 2010 LTCH PPS final rule (73 FR 48543).) We believe in the rare event that there would be a few LTCH cases grouped to one of the no-volume MS–LTC–DRGs in FY 2015, the relative weights assigned based on the cross-walked MS–LTC–DRGs would result in an appropriate LTCH PPS payment because the crosswalks, which are based on similar clinical similarity and relative costliness, generally require equivalent relative resource use.

We then assigned the relative weight of the cross-walked MS–LTC–DRG as the relative weight for the no-volume MS–LTC–DRG such that both of these MS–LTC–DRGs (that is, the no-volume MS–LTC–DRG and the cross-walked MS–LTC–DRG) have the same relative weight for FY 2015. We note that if the cross-walked MS–LTC–DRG had 25 cases or more, its relative weight, which was calculated using the methodology described in Steps 1 through 4 above, was assigned to the no-volume MS–LTC–DRG as well. Similarly, if the MS–LTC–DRG to which the no-volume MS–LTC–DRG was cross-walked had 24 or less cases and, therefore, was designated to one of the low-volume quintiles for purposes of determining the relative weights, we assigned the relative weight of the applicable low-volume quintile to the no-volume MS–LTC–DRG such that both of these MS–LTC–DRGs (that is, the no-volume MS–LTC–DRG and the cross-walked MS–LTC–DRG) have the same relative weight for FY 2015. (As we noted above, in the infrequent case where nonmonotonicity involving a no-volume MS–LTC–DRG resulted, additional adjustments as described in Step 6 were required in order to maintain monotonically increasing relative weights.)

For this final rule, a list of the no-volume MS–LTC–DRGs and the MS–LTC–DRGs to which each was cross-

walked (that is, the cross-walked MS-LTC-DRGs) for FY 2015 is shown in Table 13B, which is listed in section VI of the Addendum to this final rule and is available via the Internet.

To illustrate this methodology for determining the relative weights for the FY 2015 MS-LTC-DRGs with no LTCH cases, we are providing the following example, which refers to the no-volume MS-LTC-DRGs crosswalk information for FY 2015 provided in Table 13B.

Example: There were no cases in the FY 2013 MedPAR file used for this final rule for MS-LTC-DRG 61 (Acute Ischemic Stroke with Use of Thrombolytic Agent with MCC). We determined that MS-LTC-DRG 70 (Nonspecific Cerebrovascular Disorders with MCC) was similar clinically and based on resource use to MS-LTC-DRG 61. Therefore, we assigned the same relative weight of MS-LTC-DRG 70 of 0.8632 for FY 2015 to MS-LTC-DRG 61 (obtained from Table 11, which is listed in section VI of the Addendum to this final rule and is available via the Internet).

Again, we note that, as this system is dynamic, it is entirely possible that the number of MS-LTC-DRGs with no volume of LTCH cases based on the system will vary in the future. We used the most recent available claims data in the MedPAR file to identify no-volume MS-LTC-DRGs and to determine the relative weights in this final rule.

Furthermore, for FY 2015, consistent with our historical relative weight methodology, we are establishing a relative weight of 0.0000 for the following transplant MS-LTC-DRGs: Heart Transplant or Implant of Heart Assist System with MCC (MS-LTC-DRG 1); Heart Transplant or Implant of Heart Assist System without MCC (MS-LTC-DRG 2); Liver Transplant with MCC or Intestinal Transplant (MS-LTC-DRG 5); Liver Transplant without MCC (MS-LTC-DRG 6); Lung Transplant (MS-LTC-DRG 7); Simultaneous Pancreas/Kidney Transplant (MS-LTC-DRG 8); Pancreas Transplant (MS-LTC-DRG 10); and Kidney Transplant (MS-LTC-DRG 652). This is because Medicare will only cover these procedures if they are performed at a hospital that has been certified for the specific procedures by Medicare and presently no LTCH has been so certified. At the present time, we include these eight transplant MS-LTC-DRGs in the GROUPER program for administrative purposes only. Because we use the same GROUPER program for LTCHs as is used under the IPPS, removing these MS-LTC-DRGs would be administratively burdensome. (For additional information regarding our treatment of transplant MS-LTC-DRGs, we refer readers to the RY 2010 LTCH PPS final rule (74 FR 43964).)

Step 6—Adjust the FY 2015 MS-LTC-DRG relative weights to account for nonmonotonically increasing relative weights.

As discussed earlier in this section, the MS-DRGs contain base DRGs that have been subdivided into one, two, or three severity of illness levels. Where there are three severity levels, the most severe level has at least one secondary diagnosis code that is referred to as an MCC (that is, major complication or comorbidity). The next lower severity level contains cases with at least one secondary diagnosis code that is a CC (that is, complication or comorbidity). Those cases without an MCC or a CC are referred to as “without CC/MCC.” When data do not support the creation of three severity levels, the base MS-DRG is subdivided into either two levels or the base MS-DRG is not subdivided. The two-level subdivisions could consist of the MS-DRG with CC/MCC and the MS-DRG without CC/MCC.

Alternatively, the other type of two-level subdivision may consist of the MS-DRG with MCC and the MS-DRG without MCC.

In those base MS-LTC-DRGs that are split into either two or three severity levels, cases classified into the “without CC/MCC” MS-LTC-DRG are expected to have a lower resource use (and lower costs) than the “with CC/MCC” MS-LTC-DRG (in the case of a two-level split) or both the “with CC” and the “with MCC” MS-LTC-DRGs (in the case of a three-level split). That is, theoretically, cases that are more severe typically require greater expenditure of medical care resources and will result in higher average charges. Therefore, in the three severity levels, relative weights should increase by severity, from lowest to highest. If the relative weights decrease as severity increases (that is, if within a base MS-LTC-DRG, an MS-LTC-DRG with CC has a higher relative weight than one with MCC, or the MS-LTC-DRG “without CC/MCC” has a higher relative weight than either of the others), they are nonmonotonic. We continue to believe that utilizing nonmonotonic relative weights to adjust Medicare payments would result in inappropriate payments because the payment for the cases in the higher severity level in a base MS-LTC-DRG (which are generally expected to have higher resource use and costs) would be lower than the payment for cases in a lower severity level within the same base MS-LTC-DRG (which are generally expected to have lower resource use and costs). Therefore, in determining the FY 2015 MS-LTC-DRG relative weights in this final rule, consistent with our historical methodology, we combined

MS-LTC-DRG severity levels within a base MS-LTC-DRG for the purpose of computing a relative weight when necessary to ensure that monotonicity was maintained. For a comprehensive description of our existing methodology to adjust for nonmonotonicity, we refer readers to the FY 2010 IPPS/RV 2010 LTCH PPS final rule (74 FR 43964 through 43966). Any adjustments for nonmonotonicity that were made in determining the FY 2015 MS-LTC-DRG relative weights in this final rule by applying this methodology are denoted in Table 11, which is listed in section VI of the Addendum to this final rule and is available via the Internet.

Step 7—Calculate the FY 2015 budget neutrality factor.

In accordance with the regulations at § 412.517(b) (in conjunction with § 412.503), the annual update to the MS-LTC-DRG classifications and relative weights is done in a budget neutral manner such that estimated aggregate LTCH PPS payments would be unaffected, that is, would be neither greater than nor less than the estimated aggregate LTCH PPS payments that would have been made without the MS-LTC-DRG classification and relative weight changes. (For a detailed discussion on the establishment of the budget neutrality requirement for the annual update of the MS-LTC-DRG classifications and relative weights, we refer readers to the RY 2008 LTCH PPS final rule (72 FR 26881 and 26882).)

The MS-LTC-DRG classifications and relative weights are updated annually based on the most recent available LTCH claims data to reflect changes in relative LTCH resource use (§ 412.517(a) in conjunction with § 412.503). Under the budget neutrality requirement at § 412.517(b), for each annual update, the MS-LTC-DRG relative weights are uniformly adjusted to ensure that estimated aggregate payments under the LTCH PPS would not be affected (that is, decreased or increased). Consistent with that provision, we are updating the MS-LTC-DRG classifications and relative weights for FY 2015 based on the most recent available LTCH data, and applying a budget neutrality adjustment in determining the FY 2015 MS-LTC-DRG relative weights.

To ensure budget neutrality in the update to the MS-LTC-DRG classifications and relative weights under § 412.517(b), we are continuing to use our established two-step budget neutrality methodology. As discussed previously in this section, this approach is consistent with our proposals regarding the continued use of our existing methodology to calculate the FY 2015 budget neutrality factor for the

FY 2015 MS–LTC–DRG relative weights as presented in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28183 through 28187), which we are finalizing without modification after consideration of public comments we received in this final rule.

In this final rule, in the first step of our MS–LTC–DRG budget neutrality methodology, for FY 2015, we calculated and applied a normalization factor to the recalibrated relative weights (the result of Steps 1 through 6 above) to ensure that estimated payments were not affected by changes in the composition of case types or the changes to the classification system.

That is, the normalization adjustment is intended to ensure that the recalibration of the MS–LTC–DRG relative weights (that is, the process itself) neither increases nor decreases the average CMI.

To calculate the normalization factor for FY 2015 (the first step of our budget neutrality methodology), we used the following three steps: (1.a.) we used the most recent available LTCH claims data (FY 2013) and grouped them using the FY 2015 GROUPER (Version 32.0) and the recalibrated FY 2015 MS–LTC–DRG relative weights (determined in Steps 1 through 6 of the Steps for Determining the FY 2015 MS–LTC–DRG Relative Weights above) to calculate the average CMI; (1.b.) we grouped the same LTCH claims data (FY 2013) using the FY 2014 GROUPER (Version 31.0) and FY 2014 MS–LTC–DRG relative weights and calculated the average CMI; and (1.c.) we computed the ratio of these average CMIs by dividing the average CMI for FY 2014 (determined in Step 1.b.) by the average CMI for FY 2015 (determined in Step 1.a.). In determining the MS–LTC–DRG relative weights for FY 2015, each recalibrated MS–LTC–DRG relative weight was multiplied by 1.12464 (determined in Step 1.c.) in the first step of the budget neutrality methodology, which produced “normalized relative weights.”

In the second step of our MS–LTC–DRG budget neutrality methodology, we determined a budget neutrality factor to ensure that estimated aggregate LTCH PPS payments (based on the most recent available LTCH claims data) after reclassification and recalibration (that is, the FY 2015 MS–LTC–DRG classifications and relative weights) are equal to estimated aggregate LTCH PPS payments before reclassification and recalibration (that is, the FY 2014 MS–LTC–DRG classifications and relative weights). Accordingly, consistent with our existing methodology, we used FY 2013 discharge data to simulate payments and compared estimated aggregate LTCH PPS payments using the

FY 2014 MS–LTC–DRGs and relative weights to estimate aggregate LTCH PPS payments using the FY 2015 MS–LTC–DRGs and relative weights. Specifically, for this final rule, as discussed previously in section VII.B.3.c. of this preamble, we used LTCH claims data from the March 2014 update of the FY 2013 MedPAR file, as these are the best available data at this time.

For this final rule, we determined the FY 2015 budget neutrality adjustment factor using the following three steps: (2.a.) we simulated estimated total LTCH PPS payments using the normalized relative weights for FY 2015 and GROUPER Version 32.0 (as described above); (2.b.) we simulated estimated total LTCH PPS payments using the FY 2014 GROUPER (Version 31.0) and the FY 2014 MS–LTC–DRG relative weights in Table 11 of the Addendum to the FY 2014 IPPS/LTCH PPS final rule available on the Internet (78 FR 51002); and (2.c.) we calculated the ratio of these estimated total LTCH PPS payments by dividing the estimated total LTCH PPS payments using the FY 2014 GROUPER (Version 31.0) and the FY 2014 MS–LTC–DRG relative weights (determined in Step 2.b.) by the estimated total LTCH PPS payments using the FY 2015 GROUPER (Version 32.0) and the normalized MS–LTC–DRG relative weights for FY 2015 (determined in Step 2.a.). In determining the FY 2015 MS–LTC–DRG relative weights, each normalized relative weight was multiplied by a budget neutrality factor of 0.9956326 (determined in Step 2.c.) in the second step of the budget neutrality methodology to determine the budget neutral FY 2015 relative weight for each MS–LTC–DRG.

Accordingly, in determining the FY 2015 MS–LTC–DRG relative weights in this final rule, consistent with our existing methodology, we applied a normalization factor of 1.12464 and a budget neutrality factor of 0.9956326 (computed as described above). Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet, lists the MS–LTC–DRGs and their respective relative weights, geometric mean length of stay, five-sixths of the geometric mean length of stay (used to identify SSO cases under § 412.529(a)), and the “IPPS Comparable Thresholds” (used in determining SSO payments under § 412.529(c)(3)), for FY 2015 (and reflect both the normalization factor of 1.12464 and the budget neutrality factor of 0.9956326).

C. LTCH PPS Payment Rates for FY 2015

1. Overview of Development of the LTCH Payment Rates

The basic methodology for determining LTCH PPS Federal prospective payment rates is set forth at § 412.515 through § 412.536. In this section, we discuss the factors that we are using to update the LTCH PPS standard Federal rate for FY 2015, that is, effective for LTCH discharges occurring on or after October 1, 2014 through September 30, 2015.

For further details on the development of the FY 2003 standard Federal rate when the LTCH PPS was initially implemented, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 56027 through 56037). For subsequent updates to the LTCH PPS standard Federal rate as implemented under § 412.523(c)(3), we refer readers to the following final rules: RY 2004 LTCH PPS final rule (68 FR 34134 through 34140); RY 2005 LTCH PPS final rule (68 FR 25682 through 25684); RY 2006 LTCH PPS final rule (70 FR 24179 through 24180); RY 2007 LTCH PPS final rule (71 FR 27819 through 27827); RY 2008 LTCH PPS final rule (72 FR 26870 through 27029); RY 2009 LTCH PPS final rule (73 FR 26800 through 26804); FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 44021 through 44030); FY 2011 IPPS/LTCH PPS final rule (75 FR 50443 through 50444); FY 2012 IPPS/LTCH PPS final rule (76 FR 51769 through 51773); FY 2013 IPPS/LTCH PPS final rule (77 FR 53479 through 53481); and FY 2014 IPPS/LTCH PPS final rule (78 FR 50760 through 50765).

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28187 through 28190), we presented our proposals related to the update to the LTCH PPS standard Federal rate for FY 2015, which included the proposed annual market basket update to the LTCH PPS standard Federal rate. Consistent with our historical practice of using the best data available, we also proposed to use more recent data, if available, to determine the FY 2015 annual market basket update to the LTCH PPS standard Federal rate in the final rule. We did not receive any public comments in response to these proposals and, therefore, are adopting the proposals as final without modification in this final rule, using the most recent available data.

The update to the LTCH PPS standard Federal rate for FY 2015 is presented in section V.A. of the Addendum to this final rule. The components of the annual market basket update to the

LTCH PPS standard Federal rate for FY 2015 are discussed below, including the reduction to the annual update for LTCHs that fail to submit quality reporting data for fiscal year FY 2015 as required by the statute (as discussed in section VII.C.2.c. of the preamble of this final rule). Furthermore, as discussed in section VII.C.3. of the preamble of this final rule, for FY 2015, in addition to the update factor, under the final year of the 3-year phase-in under the current regulations at § 412.523(d)(3), we are making a one-time prospective adjustment to the standard Federal rate for FY 2015 so that the effect of any significant difference between the data used in the original computations of budget neutrality for FY 2003 and more recent data to determine budget neutrality for FY 2003 is not perpetuated in the prospective payment rates for future years. In addition, as discussed in section V.A. of the Addendum of this final rule, we are making an adjustment to the standard Federal rate to account for the estimated effect of the changes to the area wage level adjustment for FY 2015 on estimated aggregate LTCH PPS payments, in accordance with § 412.523(d)(4). (We refer readers to the discussion of the reduction to the annual update for LTCHs that fail to submit quality reporting data under section VII.C.2.c. of the preamble of this final rule, the application of the one-time prospective adjustment under the final year of the 3-year phase-in under section VII.C.3. of this preamble, and the budget neutrality adjustment for changes in the area wage levels under section V.A. of the Addendum of this final rule.)

2. FY 2015 LTCH PPS Annual Market Basket Update

a. Overview

Historically, the Medicare program has used a market basket to account for price increases in the services furnished by providers. The market basket used for the LTCH PPS includes both operating and capital-related costs of LTCHs because the LTCH PPS uses a single payment rate for both operating and capital-related costs. As discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53468 through 53476), we adopted the newly created FY 2009-based LTCH-specific market basket for use under the LTCH PPS beginning in FY 2013. For additional details on the historical development of the market basket used under the LTCH PPS, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53467 through 53468) and this preamble.

Section 3401(c) of the Affordable Care Act provides for certain adjustments to any annual update to the standard Federal rate and refers to the timeframes associated with such adjustments as a “rate year” (which are discussed in more detail in section VII.C.2.b. of the preamble of this final rule.) We note that because the annual update to the LTCH PPS policies, rates, and factors now occurs on October 1, we adopted the term “fiscal year” (FY) rather than “rate year” (RY) under the LTCH PPS beginning October 1, 2010, to conform with the standard definition of the Federal fiscal year (October 1 through September 30) used by other PPSs, such as the IPPS (75 FR 50396 through 50397). Although the language of sections 3004(a) 3401(c), 10319, and 1105(b) of the Affordable Care Act refers to years 2010 and thereafter under the LTCH PPS as “rate year,” consistent with our change in the terminology used under the LTCH PPS from “rate year” to “fiscal year,” for purposes of clarity, when discussing the annual update for the LTCH PPS, including the provisions of the Affordable Care Act, we use “fiscal year” rather than “rate year” for 2011 and subsequent years.

b. Revision of Certain Market Basket Updates as Required by the Affordable Care Act

Section 1886(m)(3)(A) of the Act, as added by section 3401(c) of the Affordable Care Act, specifies that, for rate year 2010 and each subsequent rate year through 2019, any annual update to the standard Federal rate shall be reduced:

- For rate year 2010 through 2019, by the “other adjustment” specified in sections 1886(m)(3)(A)(ii) and (m)(4) of the Act; and
- For rate year 2012 and each subsequent year, by the productivity adjustment (which we refer to as “the multifactor productivity (MFP) adjustment”) described in section 1886(b)(3)(B)(xi)(II) of the Act.

Section 1886(m)(3)(B) of the Act provides that the application of paragraph (3) of section 1886(m) of the Act may result in the annual update being less than zero for a rate year, and may result in payment rates for a rate year being less than such payment rates for the preceding rate year.

Section 1886(b)(3)(B)(xi)(II) of the Act defines the MFP adjustment as equal to the 10-year moving average of changes in annual economy-wide, private nonfarm business multifactor productivity (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, calendar year, cost reporting period, or other

annual period). Under our methodology, the end of the 10-year moving average of changes in the MFP coincides with the end of the appropriate FY update period. In addition, the MFP adjustment that is applied in determining any annual update to the LTCH PPS standard Federal rate is the same adjustment that is required to be applied in determining the applicable percentage increase under the IPPS under section 1886(b)(3)(B)(i) of the Act as they are both based on a fiscal year. The MFP adjustment is derived using a projection of MFP that is currently produced by IHS Global Insight, Inc. (For additional details on the development of the MFP adjustment and its application under the LTCH PPS, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51691 through 51692 and 51770 through 51771).)

For FY 2015, as we proposed, we are continuing to use our methodology for calculating and applying the MFP adjustment to determine the annual update to the LTCH PPS standard Federal rate for FY 2015. (For details on the development of the MFP adjustment, including our finalized methodology for calculating and applying the MFP adjustment, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51689 through 51692).)

c. Adjustment to the Annual Update to the LTCH PPS Standard Federal Rate under the Long-Term Care Hospital Quality Reporting (LTCHQR) Program

1. Background

In accordance with section 1886(m)(5) of the Act, as added by section 3004(a) of the Affordable Care Act, the Secretary established the Long-Term Care Hospital Quality Reporting (LTCHQR) Program. (As noted above, although the language of section 3004(a) of the Affordable Care Act refers to years 2011 and thereafter under the LTCH PPS as “rate year,” consistent with our change in the terminology used under the LTCH PPS from “rate year” to “fiscal year,” for purposes of clarity, when discussing the annual update for the LTCH PPS, including the provisions of the Affordable Care Act, we use “fiscal year” rather than “rate year” for 2011 and subsequent years.) Under the LTCHQR Program, as required by section 1886(m)(5)(A)(i) of the Act, for FY 2014 and each subsequent year, in the case of an LTCH that does not submit quality reporting data to the Secretary in accordance with section 1886(m)(5)(C) of the Act with respect to such a year, any annual update to a standard Federal rate for discharges for

the hospital during the year, and after application of section 1886(m)(3) of the Act, shall be reduced by 2.0 percentage points. Section 1886(m)(5)(A)(ii) of the Act provides that the application of the 2.0 percentage points reduction may result in an annual update that is less than 0.0 for a year, and may result in LTCH PPS payment rates for a year being less than such LTCH PPS payment rates for the preceding year.

Furthermore, section 1886(m)(5)(B) of the Act specifies that the 2.0 percentage points reduction is applied in a noncumulative manner, such that any reduction made under section 1886(m)(5)(A) of the Act shall apply only with respect to the year involved, and shall not be taken into account in computing the LTCH PPS payment amount for a subsequent year. For additional information on the history of the LTCHQR Program, including the statutory authority and the selected measures, we refer readers to section IX.C. of the preamble of this final rule.

2. Reduction to the Annual Update to the LTCH PPS Standard Federal Rate under the LTCHQR Program

Consistent with section 1886(m)(5)(A)(i) of the Act, for FY 2014 and subsequent fiscal years, for LTCHs that do not submit quality reporting data under the LTCHQR Program with respect to such a fiscal year, any annual update to a standard Federal rate for discharges for the LTCH during the fiscal year and after application of the market basket update adjustments required by section 1886(m)(3) of the Act, is further reduced by 2.0 percentage points. That is, in establishing an update to the LTCH PPS standard Federal rate for FY 2014 and subsequent fiscal years, the full LTCH PPS market basket increase estimate, subject to an adjustment based on changes in economy-wide productivity (“the MFP adjustment”) required under section 1886(m)(3)(A)(i) of the Act and an additional reduction required by sections 1886(m)(3)(A)(ii) and 1886(m)(4) of the Act, is further reduced by 2.0 percentage points for LTCHs that fail to submit quality reporting data under the LTCHQR Program. The reduction in the annual update to the LTCH PPS standard Federal rate for failure to report quality data under the LTCHQR Program for FY 2014 and subsequent fiscal years is codified under § 412.523(c)(4) of the regulations.

Specifically, consistent with section 1886(m)(5)(A)(i) of the Act, under § 412.523(c)(4)(i), for an LTCH that does not submit quality reporting data in the form and manner and at the time specified by the Secretary under the

LTCHQR Program, the annual update to the standard Federal rate under § 412.523(c)(3) is further reduced by 2.0 percentage points. In addition, consistent with section 1886(m)(5)(A)(ii) of the Act, § 412.523(c)(4)(ii) specifies that any reduction of the annual update to the standard Federal rate under § 412.523(c)(4)(i) will apply only to the fiscal year involved and will not be taken into account in computing the annual update to the standard Federal rate for a subsequent fiscal year. Lastly, consistent with section 1886(m)(5)(B) of the Act, under § 412.523(c)(4)(iii), the application of any reduction of the annual update to the standard Federal rate under § 412.523(c)(4)(i) may result in an annual update that is less than 0.0 percent for a fiscal year, and may result in payment rates for a fiscal year that would be less than such payment rates for the preceding rate year.

We discuss the application of the 2.0 percentage point reduction under § 412.523(c)(4)(i) in our discussion of the annual market basket update to the LTCH PPS standard Federal rate for FY 2015 below in section VII.C.2.e. of the preamble of this final rule.

d. Market Basket Under the LTCH PPS for FY 2015

Under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53468), we adopted a newly created FY 2009-based LTCH-specific market basket for use under the LTCH PPS beginning in FY 2013. The FY 2009-based LTCH-specific market basket is based solely on the Medicare cost report data submitted by LTCHs and, therefore, specifically reflects the cost structures of only LTCHs. For additional details on the development of the FY 2009-based LTCH-specific market basket, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53467 through 53476).

For FY 2015, as we proposed, we are continuing to use the FY 2009-based LTCH-specific market basket to update the LTCH PPS for FY 2015. We continue to believe that the FY 2009-based LTCH-specific market basket appropriately reflects the cost structure of LTCHs for the reasons discussed when we adopted the FY 2009-based LTCH-specific market basket for use under the LTCH PPS in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53467 through 53476).

e. Annual Market Basket Update for LTCHs for FY 2015

Consistent with our historical practice and as we proposed, we estimate the market basket update and the MFP adjustment based on IGI’s forecast using

the most recent available data. Based on IGI’s second quarter 2014 forecast, the FY 2015 full market basket estimate for the LTCH PPS using the FY 2009-based LTCH-specific market basket is 2.9 percent. Using our established methodology for determining the MFP adjustment, the current estimate of the MFP adjustment for FY 2015 based on IGI’s second quarter 2014 forecast is 0.5 percent, as discussed in section IV.B. of the preamble of this final rule. In addition, consistent with our historical practice of using the best available data, as we proposed, we used the most recent data available to estimate the market basket update and the MFP adjustment for FY 2015 in this final rule.

For FY 2015, section 1886(m)(3)(A)(i) of the Act requires that any annual update to the standard Federal rate be reduced by the productivity adjustment (“the MFP adjustment”) described in section 1886(b)(3)(B)(xi)(II) of the Act. Consistent with the statute, we are reducing the full FY 2015 market basket update by the FY 2015 MFP adjustment. To determine the market basket update for LTCHs for FY 2015, as reduced by the MFP adjustment, consistent with our established methodology, as we proposed, we subtracted the FY 2015 MFP adjustment from the FY 2015 market basket update. Furthermore, sections 1886(m)(3)(A)(ii) and 1886(m)(4)(E) of the Act requires that any annual update to the standard Federal rate for FY 2015 be reduced by the “other adjustment” described in paragraph (4), which is 0.2 percentage point for FY 2015. Therefore, following application of the productivity adjustment, as we proposed, we are reducing the adjusted market basket update (that is, the full market basket increase less the MFP adjustment) by the “other adjustment” specified by sections 1886(m)(3)(A)(ii) and 1886(m)(4) of the Act. (For additional details on our established methodology for adjusting the market basket increase by the MFP and the “other adjustment” required by the statute, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51771).)

As discussed previously in section VII.C.2.c. of the preamble of this final rule, for FY 2015, section 1886(m)(5) of the Act requires that for LTCHs that do not submit quality reporting data under the LTCHQR Program, any annual update to a standard Federal rate, after application of the adjustments required by section 1886(m)(3) of the Act, is further reduced by 2.0 percentage points. Therefore, the update to the LTCH PPS standard Federal rate for FY 2015 for LTCHs that fail to submit

quality reporting data under the LTCHQR Program, the full LTCH PPS market basket increase estimate, subject to an adjustment based on changes in economy-wide productivity (“the MFP adjustment”) as required under section 1886(m)(3)(A)(i) of the Act and an additional reduction required by sections 1886(m)(3)(A)(ii) and 1886(m)(4) of the Act, will also be further reduced by 2.0 percentage points.

In this final rule, in accordance with the statute, we are reducing the FY 2015 full market basket estimate of 2.9 percent (based on IGI’s second quarter 2014 forecast of the FY 2009-based LTCH-specific market basket) by the FY 2015 MFP adjustment (that is, the 10-year moving average of MFP for the period ending FY 2015, as described in section IV.B. of the preamble of this final rule) of 0.5 percentage point (based on IGI’s second quarter 2014 forecast). Following application of the productivity adjustment, the adjusted market basket update of 2.4 percent (2.9 percent minus 0.5 percentage point) is then reduced by 0.2 percentage point, as required by sections 1886(m)(3)(A)(ii) and 1886(m)(4)(E) of the Act. Therefore, in this final rule, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, we are establishing an annual market basket update under the LTCH PPS for FY 2015 of 2.2 percent (that is, the most recent estimate of the LTCH PPS market basket update of 2.9 percent, less the MFP adjustment of 0.5 percentage point, and less the 0.2 percentage point required under section 1886(m)(4)(E) of the Act), provided the LTCH submits quality reporting data in accordance with section 1886(m)(5) of the Act. Accordingly, consistent with our proposal, we are revising § 412.523(c)(3) by adding a new paragraph (xi), which specifies that the standard Federal rate for FY 2015 is the standard Federal rate for the previous LTCH PPS year updated by 2.2 percent, and as further adjusted, as appropriate, as described in § 412.523(d). For LTCHs that fail to submit quality reporting data under the LTCHQR Program, under § 412.523(c)(3)(xi) in conjunction with § 412.523(c)(4), we are further reducing the annual update to the LTCH PPS standard Federal rate by 2.0 percentage points in accordance with section 1886(m)(5) of the Act. Accordingly, consistent with our proposal, we are establishing an annual update to the LTCH PPS standard Federal rate of 0.2 percent (that is, 2.2 percent minus 2.0 percentage points) for FY 2015 for LTCHs that fail to submit quality

reporting data under the LTCHQR Program. As stated above, consistent with our historical practice of using the best available data, we used the most recent data available to establish an annual update to the LTCH PPS standard Federal rate for FY 2015 under § 412.523(c)(3)(xi) in this final rule. (We note that, we also are adjusting the FY 2015 standard Federal rate by applying a one-time prospective adjustment under the final year of the 3-year phase-in under § 412.523(d)(3) (discussed in section VII.C.3. of the preamble of this final rule) and by an area wage level budget neutrality factor in accordance with § 412.523(d)(4) (as discussed in section V.B.5. of the Addendum of this final rule).)

3. Adjustment for the Final Year of the Phase-In of the One-Time Prospective Adjustment to the Standard Federal Rate under § 412.523(d)(3)

We set forth regulations implementing the LTCH PPS, based upon the broad authority granted to the Secretary, under section 123 of the BBRA (as amended by section 307(b) of the BIPA). Section 123(a)(1) of the BBRA required that the system “maintain budget neutrality” in the August 30, 2002 LTCH PPS final rule (67 FR 55954). The statutory budget neutrality requirement means that estimated aggregate payments under the LTCH PPS for FY 2003 would be equal to the estimated aggregate payments that would have been made if the LTCH PPS were not implemented for FY 2003. The methodology for determining the LTCH PPS standard Federal rate for FY 2003 that would “maintain budget neutrality” is described in considerable detail in the August 30, 2002 final rule (67 FR 56027 through 56037). Our methodology for estimating payments for the purposes of budget neutrality calculations used the best available data, and necessarily reflected several assumptions (for example, costs, inflation factors, and intensity of services provided) in estimating aggregate payments that would have been made if the LTCH PPS had not been implemented (without accounting for certain statutory provisions that affect the level of payments to LTCHs in years prior to the implementation of the LTCH PPS, as required by the statute).

In the August 30, 2002 final rule, we also stated our intentions to monitor LTCH PPS payment data to evaluate whether later data varied significantly from the data available at the time of the original budget neutrality calculations (for example, data related to inflation factors, intensity of services provided, or behavioral response to the implementation of the LTCH PPS). To

the extent the later data significantly differed from the data employed in the original calculations, the aggregate amount of payments during FY 2003 based on later data may be higher or lower than the estimates upon which the budget neutrality calculations were based. Therefore, in that same final rule, under the broad authority conferred upon the Secretary in developing the LTCH PPS, including the authority for establishing appropriate adjustments, under section 123(a)(1) of the BBRA, as amended by section 307(b) of the BIPA, we provided in § 412.523(d)(3) of the regulations for the possibility of making a one-time prospective adjustment to the LTCH PPS rates, so that the effect of any significant difference between actual payments and estimated payments for the first year of the LTCH PPS would not be perpetuated in the LTCH PPS rates for future years. We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53487 through 53488) for a complete discussion of the history of the development of the one-time prospective adjustment to the LTCH PPS standard Federal rate at § 412.523(d)(3).

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53495), we finalized our policy to make a one-time prospective adjustment to the standard Federal rate so that it will be permanently reduced by approximately 3.75 percent to account for the estimated difference between projected aggregate FY 2003 LTCH PPS payments and the projected aggregate payments that would have been made in FY 2003 under the TEFRA payment system if the LTCH PPS had not been implemented. Specifically, using the methodology we adopted in that same final rule, we determined that permanently applying a factor of 0.9625 (that is, a permanent reduction of approximately 3.75 percent) to the standard Federal rate is necessary to ensure estimated total FY 2003 LTCH PPS payments equal estimated total FY 2003 TEFRA payments consistent with our stated policy goal of the one-time prospective adjustment under § 412.523(d)(3) (that is, to ensure that the difference between estimated total FY 2003 LTCH PPS payments and estimated total FY 2003 TEFRA payments is not perpetuated in the LTCH PPS payment rates in future years). (We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53487 through 53502) for a complete discussion of the evaluation approach, methodology, and determination of the one-time prospective adjustment to the LTCH PPS standard Federal rate at § 412.523(d)(3).)

Given the magnitude of this adjustment, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53501 through 53502), under § 412.523(d)(3), we established a policy to phase-in the permanent adjustment of 0.9625 to the standard Federal rate over a 3-year period. To achieve a permanent adjustment of 0.9625, under the phase-in of this adjustment, in that same final rule, we explained that we will apply a factor of 0.98734 to the standard Federal rate in each year of the 3-year phase-in, that is, in FY 2013 (which does not apply to payments for discharges occurring on or after October 1, 2012, and on or before December 28, 2012, consistent with current law), FY 2014, and FY 2015. By applying a permanent factor of 0.98734 to the standard Federal rate in each year for FYs 2013, 2014, and 2015, we will completely account for the entire adjustment by having applied a cumulative factor of 0.9625 (calculated as $0.98734 \times 0.98734 \times 0.98734 = 0.9625$) to the standard Federal rate. Accordingly, under § 412.523(d)(3), we applied a permanent factor of 0.98734 to the standard Federal rate in both FY 2013 and FY 2014 under the established 3-year phase-in of the one-time prospective adjustment.

In this final rule, for FY 2015, as we proposed, we are applying a permanent one-time prospective adjustment factor of 0.98734 to the standard Federal rate for FY 2015 under the last year of the 3-year phase-in of the one-time prospective adjustment, in accordance with the existing regulations under § 412.523(d)(3).

4. Summary of Other Public Comments Received on the Proposed LTCH PPS Payment Rates for FY 2015

We received a number of public comments that were not within the scope of the proposed rule, but we appreciate the commenters for providing that feedback. We also received a few public comments on issues related to the proposed LTCH PPS payment rates for FY 2015, but these issues were not specifically addressed by the proposals and related discussion presented in the FY 2015 IPPS/LTCH PPS proposed rule.

Comment: One commenter requested that CMS provide additional payment for end-stage renal disease (ESRD) patients under the same circumstances as under the IPPS under the LTCH PPS, noting that section 1881(b) of the Act does not limit the adjustment to subsection (d) hospitals. The commenter indicated that included information and analysis previously provided to CMS supports their request for this additional payment amount.

Response: Despite the fact that this comment is beyond the scope of the proposed rule, we note that we have responded to the issue that this commenter raised in a detailed response in the FY 2014 IPPS/LTCH PPS final rule (79 FR 50767). As discussed in that final rule, based on our analysis of FY 2012 LTCH PPS claims data, we continue to believe that the costs of treating ESRD patients in LTCHs are adequately reflected in data used to determine the MS-LTC-DRG relative weights for non-dialysis MS-LTC-DRGs, and that the additional resources associated with renal dialysis treatments are included in the LTCH PPS payments. Therefore, we are not adopting the commenters' request to provide for an additional payment for ESRD patients under the LTCH PPS.

D. Revision of LTCH PPS Geographic Classifications

1. Background

As discussed in the August 30, 2002 LTCH PPS final rule, which implemented the LTCH PPS (67 FR 56015 through 56019), in establishing an adjustment for area wage levels, the labor-related portion of an LTCH's standard Federal payment rate is adjusted by using an appropriate wage index based on the labor market area in which the LTCH is located. Specifically, the application of the LTCH PPS area wage-level adjustment, which is codified under existing § 412.525(c) of the regulations, is based on the location of the LTCH—either in an “urban” area or a “rural” area. Currently, under the LTCH PPS, as codified under § 412.503 of the regulations, an “urban area” is defined as a Metropolitan Statistical Area (which includes a Metropolitan division, where applicable) as defined by the Executive OMB, and a “rural area” is defined as any area outside of an urban area.

In the RY 2006 LTCH PPS final rule (70 FR 24184 through 24185), we revised § 412.525(c) to update the labor market area definitions used under the LTCH PPS, effective for discharges occurring on or after July 1, 2005, based on the Executive OMB's Core-Based Statistical Area (CBSA) designations (“CBSA designations”), which are based on 2000 Census data. We made this revision because we believed that the CBSA designations (geographic classifications) would ensure that the LTCH PPS wage index adjustment most appropriately accounts for and reflects the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level. We noted that these

were the same CBSA designations implemented for acute care hospitals under the IPPS, which were codified under § 412.64(b) of the regulations, beginning in FY 2005. (For a further discussion of the CBSA-based labor market area designations currently used under the LTCH PPS, we refer readers to the RY 2006 LTCH PPS final rule (70 FR 24182 through 24191).) We have generally updated the LTCH PPS CBSA designations annually since they were adopted for RY 2006 when updates from OMB were available (73 FR 26812 through 26814, 74 FR 44023 through 44204, and 75 FR 50444 through 50445).

In OMB Bulletin No. 10–2, issued on December 1, 2009, OMB announced that the CBSA changes in that bulletin would be the final update prior to the 2010 Census of Population and Housing. We adopted those changes under the LTCH PPS in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50444 through 50445), effective October 1, 2010. We continued to use these CBSA designations for FYs 2012 and 2013 (76 FR 51808 and 77 FR 53710, respectively). New OMB labor market area delineations (which we refer to in this section as “new OMB delineations”) based on 2010 standards and the 2010 Decennial Census data were announced by OMB on February 28, 2013. OMB issued Bulletin No. 13–01, which announced revisions to the delineation of Metropolitan Statistical Areas, Micropolitan Statistical Areas, and Combined Statistical Areas, and provided guidance on the uses of the delineation of these labor market areas. (For a copy of this bulletin, we refer readers to the following Web site: <http://www.whitehouse.gov/sites/default/files/omb/bulletins/2013/b-13-01.pdf>. This bulletin specifically provides the delineations of all Metropolitan Statistical Areas (MSAs), Metropolitan Divisions, Micropolitan Statistical Areas, Combined Statistical Areas, and New England City and Town Areas in the United States and Puerto Rico based on the standards published in the **Federal Register** on June 28, 2010 (75 FR 37246 through 37252) and 2010 Census data. (We note that, as discussed in section III.B. of the preamble of this final rule, consistent with the terminology used in the OMB Bulletin No. 13–01 and the standards published in the **Federal Register** on June 28, 2010, when referencing the new OMB geographic boundaries of Metropolitan Statistical Areas (MSAs) based on 2010 standards, we are using the term “new OMB delineations” rather than the term “CBSA-based labor market area definitions” that we have used in the

past to refer to OMB geographic boundaries of statistical areas (75 FR 37249).

As discussed in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50994 through 50995), in order to implement these changes for the LTCH PPS (as in the case of the IPPS), it is necessary to identify the new OMB delineations for each county and hospital in the country. While the revisions OMB published on February 28, 2013, are not as sweeping as the changes OMB announced in 2003, the February 28, 2013 bulletin does contain a number of significant changes. For example, under the new OMB delineations, there are new CBSAs, urban counties that have become rural, rural counties that have become urban, and existing CBSAs that have been split apart and moved to other CBSAs. Because the update was not issued until February 28, 2013, and it was necessary for the changes made by the update and their ramifications to be extensively reviewed and verified, we were unable to undertake such a lengthy process before publication of the FY 2014 rulemaking cycle. That is, by the time the update was issued, the FY 2014 IPPS/LTCH PPS proposed rule was in the advanced stages of development, and the proposed FY 2014 LTCH PPS wage indexes based on the CBSA designations that are currently used under the LTCH PPS had been developed. Therefore, we did not propose to use the changes to the LTCH PPS CBSA designations for FY 2014 based on the new OMB delineations. Rather, to allow for sufficient time to assess the new changes and their ramifications, we stated that we intended to propose the adoption of the new OMB delineations and the corresponding changes to the wage index based on those delineations under the LTCH PPS for FY 2015 through notice and comment rulemaking, consistent with the approach used under the IPPS (78 FR 50994 through 50995). In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28191 through 28194), we proposed to adopt the new OMB delineations announced in the February 28, 2013 OMB Bulletin No. 13–01, effective for FY 2015 under the LTCH PPS. As discussed below, after consideration of the public comments we received, in this final rule, under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we are adopting the new OMB delineations announced in the February 28, 2013 OMB Bulletin No. 13–01, effective for FY 2015 under the LTCH PPS as proposed without modification. We note that this policy consistent with

the approach being adopted under the IPPS as discussed in section III.B. of the preamble of this final rule.

2. Use of the New OMB Labor Market Area Delineations (“New OMB Delineations”)

Historically, Medicare prospective payment systems have utilized labor market area definitions developed by the OMB. As discussed above, the CBSA designations currently used under the LTCH PPS are based on the most recent market area definitions issued by the OMB. The OMB reviews its market area definitions/delineations based on data from the preceding decennial census to reflect more recent population changes. As discussed above and in section III.B. of the preamble of this final rule, the new OMB delineations are based on the OMB’s latest market area delineations based on the 2010 Decennial Census data. Because we believe that the OMB’s latest labor market area delineations are the best available data that reflect the local economies and wage levels of the areas in which hospitals are currently located, as we proposed, we are adopting the new OMB delineations based on the 2010 Decennial Census data under the LTCH PPS, beginning in FY 2015, for the reasons discussed below (which are consistent with the IPPS policy discussed in section III.B. of the preamble of this final rule).

When we implemented the wage index adjustment under § 412.525(c) for the LTCH PPS, and updated the LTCH PPS labor market area definitions based on the CBSA designations beginning in RY 2006, we explained that the LTCH PPS wage index adjustment was intended to reflect the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level. (We refer readers to the RY 2003 LTCH PPS final rule (67 FR 56016) and the RY 2006 LTCH PPS final rule (70 FR 24184).) Because we believe that the new OMB delineations based on 2010 Decennial Census data (reflect the most recent available geographic classifications (market area delineations), as we proposed, we are revising the geographic classifications used under the LTCH PPS based on these new OMB delineations to ensure that the LTCH PPS wage index adjustment continues to most appropriately account for and reflect the relative hospital wage and wage-related costs in the geographic area of the hospital as compared to the national average hospital wage and wage-related costs. Specifically, as we proposed, we are adopting the new OMB delineations (as discussed in greater detail below), effective for LTCH

PPS discharges occurring on or after October 1, 2014 (that is, effective for FY 2015). As we noted in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28191), because the application of the LTCH PPS area wage-level adjustment under existing § 412.525(c) is made on the basis of the location of the LTCH—either in an “urban” area or a “rural” area as those terms are defined under existing § 412.503. Under § 412.503, an “urban area” is defined as a Metropolitan Statistical Area as defined by the Executive OMB. A “rural area” is defined as any area outside of an urban area. Therefore, we did not make any changes to the existing regulations under this policy.

As discussed in section III.B. of this preamble, while CMS and other stakeholders have explored potential alternatives to the current CBSA-based labor market system, no consensus has been achieved regarding how best to implement a replacement system. While we recognize that MSAs are not designed specifically to define labor market areas, we believe that they do represent a useful proxy for this purpose. Consistent with the approach taken for the IPPS, we have used MSAs to define labor market areas for purposes of Medicare wage indices under the LTCH PPS since its implementation in FY 2003. MSAs also are used to define labor market areas for purposes of the wage index for many of the other Medicare payment systems (for example, the IRF PPS, the SNF PPS, the HHA PPS, the OPPS, and the IPF PPS). (We refer readers to the RY 2006 LTCH PPS final rule (70 FR 24184).) Therefore, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28191 through 28194), under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we proposed to adopt the new OMB delineations as described in the February 28, 2013 OMB Bulletin No. 13–01, effective for FY 2015 under the LTCH PPS. In addition, we proposed to use the new OMB delineations to calculate area wage indexes in a manner that is consistent with the CBSA-based methodologies finalized in the RY 2006 LTCH PPS final rule, as refined in subsequent rulemaking. We also proposed to implement a transitional wage index policy (as discussed in more detail below) for LTCHs that would experience a negative payment impact due to the adoption of the new OMB delineations. This proposed policy, including the transitional wage index policy, is consistent with the policy proposed under the IPPS for FY 2015, as

discussed in section III.B. of this preamble.

Comment: A few commenters supported the proposal to adopt the new OMB delineations and to use these new OMB delineations to calculate area wage indexes effective for FY 2015 under the LTCH PPS. We did not receive any public comments opposing the proposed adoption of the new OMB delineations under the LTCH PPS. We also note that we did not receive any public comments that specifically addressed the details of our proposals with regard to the adoption of the new OMB labor market area delineations relating to Micropolitan Statistical Areas, urban counties that would become rural, rural counties that would become urban, or urban counties that moved to a different urban CBSA. (We refer readers to the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28192 through 28193) for details regarding these proposals.) A few commenters also commented on the proposed transitional wage index policy, which we discuss below in section VII.D.2.e. of this preamble.

Response: We appreciate the commenters' support for the proposal to adopt the new OMB delineations under the LTCH PPS, as we believe that the new OMB delineations based on 2010 Decennial Census data reflect the most recent data available to define geographic classifications (market area delineations) for LTCHs and ensure that the LTCH PPS wage index adjustment continues to most appropriately account for and reflect the relative hospital wage and wage-related costs in the geographic area of the hospital as compared to the national average hospital wage and wage-related costs. Therefore, under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, in this final rule, we are adopting the new OMB delineations as described in the February 28, 2013 OMB Bulletin No. 13-01, effective for FY 2015 under the LTCH PPS, as we proposed without modification. We also are using these new OMB delineations to calculate area wage indexes in a manner that is consistent with the CBSA-based methodologies finalized in the RY 2006 LTCH PPS final rule, as refined in subsequent rulemaking. In addition, as discussed below in section VII.D.2.e. of this preamble, after consideration of the public comments we received, as we proposed, we are implementing a budget neutral transitional wage index policy for LTCHs that will experience a negative payment impact due to the use of the new OMB delineations. This policy, including the transitional wage index policy, is consistent with the

policy being adopted under the IPPS presented in section III.B. of the preamble of this final rule. The discussion below focuses on issues related to the use of the new OMB delineations to define labor market areas for purposes of the wage index adjustment under the LTCH PPS, and as we explained in the proposed rule, is consistent with what is being adopted under the IPPS.

a. Micropolitan Statistical Areas

When we adopted the CBSA designations under the LTCH PPS in RY 2006, we discussed CMS' consideration of whether to use Micropolitan Statistical Areas to define the labor market areas for the purpose of the LTCH PPS wage index. OMB defines a "Micropolitan Statistical Area" as a Consolidated Metropolitan Statistical Area (CMSA) "associated with at least one urban cluster that has a population of at least 10,000, but less than 50,000" (70 FR 24183). We refer to these areas as "Micropolitan Areas." After conducting an extensive impact analysis, we determined that the best course of action would be to treat all hospitals located in "Micropolitan Areas" as "rural," and to include these hospitals in the calculation of each State's rural wage index. Because Micropolitan Areas tend to encompass smaller population centers and contain fewer hospitals than MSAs, we determined that if Micropolitan Areas were to be treated as separate labor market areas, the IPPS wage index would include drastically more single-provider labor market areas. This larger number of labor market areas with fewer providers could create instability in year-to-year wage index values for a large number of hospitals; could reduce the averaging effect of the wage index, lessening some of the efficiency incentive inherent in a system based on the average hourly wages for a large number of hospitals; and could arguably create an inequitable system when so many hospitals would have wage indexes based solely on their own wage data while other hospitals' wage indexes would be based on an average hourly wage across many hospitals. For these reasons, we adopted a policy to include Micropolitan Areas in the State's rural wage area, and have continued this policy through the present. (We refer reader to the RY 2006 LTCH PPS final rule (70 FR 24187).)

Based upon the 2010 Decennial Census data, a number of rural and urban counties have joined or have become Micropolitan Areas, while other counties that once were part of a Micropolitan Area under previous OMB

CBSA designations, have become either urban or rural under the new OMB delineations. Overall, there are fewer Micropolitan Areas (541) under the new OMB delineations based on 2010 Decennial Census data than existed under the data from the 2000 Census (581). As discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28192), we believe that it is appropriate to continue the policy established in the RY 2006 LTCH PPS final rule, and we are treating Micropolitan Areas as rural labor market areas under the LTCH PPS. These areas continue to be defined as having relatively small urban cores (populations of 10,000–49,999). We do not believe that it would be appropriate to calculate a separate wage index for areas that typically may include only a few hospitals for the reasons set forth in the RY 2006 LTCH PPS final rule, as discussed above.

As previously noted, we did not receive any public comments on our proposals relating to the adoption of the new OMB labor market area delineations with regard to Micropolitan Statistical Areas. Therefore, we are adopting these policies as final without modification in this final rule. In conjunction with our policy to adopt the new OMB labor market area delineations, under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, for FY 2015, we are continuing to treat Micropolitan Areas as "rural," and will assign the Micropolitan Area the statewide rural wage index for the State in which the LTCH is located. We also are establishing that, beginning in FY 2015, the wage data for any IPPS hospitals located in the Micropolitan Areas will be included in the calculation of each State's LTCH PPS rural area wage index. (As discussed in section V.B.2. of the Addendum to this final rule, the LTCH PPS area wage index values are calculated using the wage data of IPPS hospitals.) We note that this policy is consistent with the policy adopted under the IPPS discussed in section III.B.2.a. of the preamble of this final rule. For a discussion of our policies to moderate the impact of our adoption of the new OMB delineations under the LTCH PPS, we refer readers to section VII.D.2.e. of the preamble of this final rule.

b. Urban Counties That Became Rural under the New OMB Labor Market Area Delineations

Under the new OMB delineations, which are based upon 2010 Decennial Census data, for FY 2015, we found that there are a number of counties (or county equivalents) that are defined as

“urban” under the previous CBSA designations that are now defined as “rural” under the new OMB delineations. As discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28193) and in section III.B. of this preamble, an analysis of the new OMB delineations shows that a total of 37 counties (and county equivalents) that were considered to be part of an “urban” CBSA will now be considered to be located in a “rural” area, beginning in FY 2015, based on the new OMB delineations. We refer readers to a table presented in section III.B.2.b. of the preamble of this final rule that lists the 37 urban counties that are defined as rural under our adoption of the new OMB delineations.

As previously noted, we did not receive any public comments on our proposals relating to the adoption of the new OMB labor market area delineations with regard to urban counties that would become rural. Therefore, we are adopting these policies as final without modification in this final rule. Under our adoption of the new OMB delineations for the LTCH PPS, we are establishing that LTCHs located in any of the 37 counties listed in the table under section III.B.2.b. of the preamble of this final rule will be considered “rural,” and will receive their respective State’s rural area wage index for FY 2015 under the LTCH PPS. We note that, currently, there are no LTCHs located in any of the 37 counties listed in the table that are currently considered to be part of an “urban” CBSA and that will be considered to be located in a “rural” area, beginning in FY 2015. The wage data for any IPPS hospitals located in those 37 counties listed in the table now will be considered “rural” when calculating the respective State’s LTCH PPS rural area wage index beginning in FY 2015. (As discussed in section V.B.2. of the Addendum to this final rule, the LTCH PPS area wage index values are calculated using the area wage data of IPPS hospitals.) We note that this policy is consistent with the policy adopted under the IPPS discussed in section III.B.2.b. of the preamble of this final rule. We refer readers to section VII.D.2.e. of this preamble for a discussion of our policies to moderate the impact of our policy to implement the new OMB delineations under the LTCH PPS.

c. Rural Counties That Became Urban under the New OMB Labor Market Area Delineations

In using the new OMB labor market area delineations (which are based upon 2010 Decennial Census data) for FY

2015, we found that there are a number of counties (or county equivalents) that are defined as “rural” under the previous OMB definitions (that is, CBSA designations) will be considered “urban” based on the adoption of the new OMB delineations. As discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28193) and in section III.B.2.c. of the preamble of this final rule, an analysis of the new OMB labor market area delineations shows that a total of 105 counties (and county equivalents) that were previously located in “rural” areas now are located in an “urban” area under the new OMB delineations. We refer readers to a table in section III.B.2.c. of the preamble of this final rule that lists the 105 “rural” counties that will now be located in an “urban” area, based on our policy to adopt the new OMB delineations presented in section III.B.2.c. of the preamble of this final rule. There are currently no LTCHs located in the 105 “rural” counties listed in that table.

As previously noted, we did not receive any public comments on our proposals relating to the adoption of the new OMB labor market area delineations with regard to rural counties that would become urban. Therefore, we are adopting these policies as final without modification in this final rule. Under our adoption of the new OMB labor market area delineations, we are establishing that LTCHs located in any of those 105 counties will now be included in their new respective “urban” CBSAs and will receive the respective “urban” CBSA’s area wage index. We also are establishing that, beginning in FY 2015, the wage data for any IPPS hospitals located within those 105 counties will now be included in the calculation of the LTCH PPS area wage index for those hospitals’ respective “urban” CBSAs. (As discussed in section V.B.2. of the Addendum to this final rule, the LTCH PPS area wage index values are calculated using the area wage data of IPPS hospitals.) We note that this policy is consistent with the policy adopted under the IPPS discussed in section III.B.2.c. of the preamble of this final rule. We refer readers to section VII.D.2.e. of the preamble of this preamble for a discussion of our policies to moderate the impact of our policy to implement the new OMB delineations under the LTCH PPS.

d. Urban Counties Moved to a Different Urban CBSA under the New OMB Labor Market Area Delineations

In addition to “rural” counties that became “urban” and “urban” counties that became “rural” under the new

OMB delineations, we found that several urban counties shifted from one urban CBSA to another urban CBSA. In certain cases, the new OMB delineations involved a change only in the CBSA name or code, while the CBSA continued to encompass the same constituent counties. However, in other cases, under the new OMB delineations, some counties are shifted between existing urban CBSAs and new urban CBSAs, changing the constituent makeup of those CBSAs. For example, in some cases, entire CBSA are subsumed by another CBSA. In other cases, some CBSAs have counties that are split off as part of a different urban CBSA, or to form entirely new labor market areas. We refer readers to section III.B.2.d. of the preamble of this final rule for additional information, including examples, on urban counties that have moved from one urban CBSA to a different urban CBSA under the new OMB delineations. As discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28193), LTCHs located in these affected counties that will move from one urban CBSA to a different urban CBSA under our policy to adopt the new OMB delineations will experience both negative and positive impacts in regard to the LTCH’s specific area wage index values. We refer readers to section VII.D.2.e. of this preamble for a discussion of our policies to moderate the impact imposed upon hospitals because of our policy to adopt the new OMB labor market area delineations under the LTCH PPS. As previously noted, we did not receive any public comments on our proposals relating to the adoption of the new OMB labor market area delineations with regard to urban counties that moved to a different urban CBSA. Therefore, we are adopting these policies as final without modification in this final rule.

e. Transition Period

As indicated above, overall, we believe that our policy to adopt the new OMB delineations will result in LTCH PPS wage index values being more representative of the actual costs of labor in a given area. However, as we discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28193), we also recognize that some LTCHs would experience decreases in their area wage index values as a result of our policy. We also realize that many LTCHs would have higher area wage index values under our policy. To mitigate the impact imposed upon hospitals, we have in the past provided for transition periods when adopting changes that have significant payment implications, particularly large negative impacts.

While we believe that using the new OMB delineations would create a more accurate payment adjustment for differences in area wage levels, we also recognize that adopting such changes may cause some short-term instability in LTCH PPS payments. Therefore, under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we proposed to implement a transitional wage index policy for LTCHs that would experience a decrease in their area wage index values due to our proposal to adopt the new OMB delineations under the LTCH PPS. Specifically, we proposed a 1-year transitional wage index policy under which any LTCH that would experience a decrease in its area wage index value solely due to the adoption of the new OMB delineations would get a “50/50 blended area wage index” value that would be calculated as the sum of 50 percent of the wage index computed under the FY 2014 CBSA designations and 50 percent of the wage index computed under the new OMB delineations proposed for FY 2015. Furthermore, we proposed that this proposed transitional wage index policy would be applied in a budget neutral manner, consistent with the existing requirement under § 412.525(c)(2) that any changes to the adjustment for differences in area wage levels will be made in a budget neutral manner. We also presented a proposed methodology for calculating an area wage level adjustment budget neutrality factor for FY 2015 that included the proposed 50/50 blended wage index as applicable (79 FR 28193 through 28194).

Comment: Commenters that supported the proposed adoption of the new OMB delineations under the LTCH PPS also supported our proposed transitional wage index policy for LTCHs that would experience a negative payment impact due to the adoption of the new OMB delineations. While the commenters conveyed their appreciation for the proposed transitional wage index policy to help mitigate any negative financial ramifications, they requested that the proposed transitional wage index policy be extended beyond FY 2015 to allow hospitals more time to operationally adjust to the change to their area wage adjustment. We note that we did not receive any public comments on our proposal to apply the proposed transitional wage index policy in a budget neutral manner, or on our proposed methodology for calculating an area wage level adjustment budget neutrality factor for FY 2015 that

included the proposed 50/50 blended wage index as applicable.

Response: We appreciate the commenters’ support for the proposed transitional wage index policy for LTCHs that would experience a negative payment impact due to the adoption of the new OMB delineations. While we understand the commenters’ concern regarding the potential financial impact, as we explained in the proposed rule, the revisions under the new OMB delineations are not as extensive as the changes that OMB announced in 2003 that were adopted under the IPPS in FY 2005 with a 1-year transition and adopted under the LTCH PPS in FY 2006 with no additional transitional policy other than the transitional wage index policy in effect at that time. While it is our longstanding policy to provide temporary adjustments to mitigate negative impacts from the adoption of new policies or procedures, we continue to believe that the 1-year “50/50 blended wage index” transitional policy provides an adequate safeguard against any significant payment reductions, allows for sufficient time to make operational changes for future fiscal years, and provides a reasonable balance between mitigating some short-term instability in LTCH PPS payments and improving the accuracy of the payment adjustment for differences in area wage levels.

While we acknowledge that some LTCHs will experience a reduction in their wage index as a result of the adoption of the new OMB delineations, we also point out that several LTCHs will experience an increase in their wage index based on the adoption of the new OMB delineations. Because the new OMB delineations reflect the most recent data available to define geographic classifications (market area delineations) for LTCHs, we believe that the wage index values computed under those delineations will result in more appropriate payments to providers by more accurately accounting for and reflecting the differences in area wage levels (that is, the relative hospital wage and wage-related costs in the geographic area of the hospital as compared to the national average hospital wage and wage-related costs). Because we believe that the implementation of the new OMB delineations will create more accurate representations of a LTCH’s labor market areas and result in LTCH PPS wage index values being more representative of the actual costs of labor in a given area, we believe that it is important to implement the wage index values calculated under new OMB delineations with as minimal a transition as possible. Extending the

transitional “50/50 blended wage index” policy beyond FY 2015 would only further delay the improved accuracy of area wage level adjustments to LTCH PPS payments under the new OMB delineations. In addition, because the proposed transitional 50/50 blended wage index policy would be made in a budget neutral manner, all LTCH PPS payments are reduced to offset the additional payments that result under the transitional policy. For these reasons, we are not adopting the commenters’ suggestion to extend the proposed transitional 50/50 blended wage index policy beyond FY 2015.

Therefore, in this final rule, under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we are adopting a 1-year transitional wage index policy for LTCHs that will experience a decrease in their area wage index values due to our policy to adopt the new OMB delineations under the LTCH PPS, as we proposed without modification. In addition, we are finalizing our proposal to apply the transitional area wage index policy in a budget neutral manner, and our methodology for calculating an area wage level adjustment budget neutrality factor for FY 2015, which includes the proposed 50/50 blended wage index as applicable, as proposed without modification.

Under the transitional wage index policy that we are establishing for FY 2015 we computed a blended area wage index value for any LTCH that will experience a decrease in its area wage index value solely due to the adoption of the new OMB delineations. That is, for purposes of determining an LTCH’s area wage index for FY 2015, we computed LTCH PPS wage index values using the area wage data (discussed in section V.B.4. of the Addendum to this final rule) under both the FY 2014 CBSA designations and the FY 2015 new OMB delineations based on the 2010 OMB Decennial Census data. For each LTCH, we compared these two wage indexes. If an LTCH’s wage index for FY 2015 under the new OMB delineations was lower than the LTCH’s wage index under the FY 2014 CBSA designations, we are establishing that, for FY 2015, the LTCH will be paid based on a blended wage index that is computed as the sum of 50 percent of each of the two wage index values described above (referred to as the 50/50 blended wage index). If an LTCH’s wage index for FY 2015 under the new OMB delineations is higher than the LTCH’s wage index under the FY 2014 CBSA designations, we are establishing that, for FY 2015, the LTCH will be paid based on 100 percent of the wage index

under the FY 2015 new OMB delineations (and will not receive the 50/50 blended wage index).

Furthermore, we are establishing that the transitional area wage index policy will be adopted in a budget neutral manner. Under § 412.525(c)(2), any changes to the adjustment for differences in area wage levels will be made in a budget neutral manner such that estimated aggregate FY 2015 LTCH PPS payments are unaffected; that is, will be neither greater than nor less than estimated aggregate LTCH PPS payments without such changes to the area wage level adjustment. Under this policy, we determine an area wage-level adjustment budget neutrality factor that is applied to the standard Federal rate (under § 412.523(d)(4)) to ensure that any changes to the area wage level adjustments are budget neutral such that any changes to the wage index values or labor-related share would not result in any change (increase or decrease) in estimated aggregate LTCH PPS payments. Because our transitional wage index policy for LTCHs that will experience a decrease in their area wage index values solely as a result of our finalized policy to adopt the new OMB delineations under the LTCH PPS will result in an increase in estimated aggregate LTCH PPS payments without such changes, we are including the finalized 50/50 blended wage index values in our calculations for the area wage level adjustment budget neutrality factor that is applied to the standard Federal rate to ensure that any changes to the area wage level adjustment are budget neutral. Specifically, consistent with our established methodology, we used the following methodology to determine an area wage level adjustment budget neutrality factor for FY 2015:

- *Step 1*—We simulated estimated aggregate LTCH PPS payments using the FY 2014 wage index values as established in Tables 12A and 12B for the FY 2014 IPPS/LTCH PPS final rule (which is available via the Internet on the CMS Web site) and the FY 2014 labor-related share of 62.537 percent as established in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50996).

- *Step 2*—We simulated estimated aggregate LTCH PPS payments using the FY 2015 wage index values as shown in Tables 12A through 12D for this final rule (which are available via the Internet on the CMS Web site), including the transitional 50/50 blended wage index values, if applicable (as discussed above and in section V.B.4. of the Addendum of this final rule), and the FY 2015 labor-related share of 62.306 percent (as

discussed in section V.B.3. of the Addendum to this final rule).

- *Step 3*—We determined the ratio of these estimated total LTCH PPS payments by dividing the estimated total LTCH PPS payments using the FY 2014 area wage level adjustments (calculated in Step 1) by the estimated total LTCH PPS payments using the FY 2015 area wage level adjustments (calculated in Step 2) to determine the FY 2015 area wage level adjustment budget neutrality factor.

- *Step 4*—We applied the FY 2015 area wage level adjustment budget neutrality factor from Step 3 to the FY 2015 LTCH PPS standard Federal rate after the application of the FY 2015 annual update as discussed in section V.A.2. of the Addendum to this final rule.

As explained above, we are applying this factor in determining the FY 2015 standard Federal rate to ensure that the updates to the area wage level adjustment for FY 2015 will be implemented in a budget neutral manner. For this final rule, using the steps in the methodology described above, we determined a FY 2015 area wage level adjustment budget neutrality factor of 1.0016703.

We note that this transitional wage index policy under our policy to adopt the new OMB delineations for FY 2015 under the LTCH PPS is consistent with the policies adopted under the IPPS presented in sections III.B.2.e.(5) and (6) of the preamble of this final rule. As noted previously in section VII.D.2.b. of the preamble of this final rule, there are currently no LTCHs located in an “urban” county that became “rural” under the policy to adopt the new OMB delineations. Therefore, as we discussed in the FY 2015 IPPS/LTCH PPS proposed rule, we are not establishing a transitional wage index policy that is consistent with the IPPS policy presented in section III.B.2.e.(2) of the preamble of this final rule for hospitals that are currently located in an “urban” county that became “rural” under the adoption of the new OMB delineations. We also note that we are not establishing any transitional policies under the LTCH PPS that are consistent with those presented under the IPPS for hospitals with a reclassification or redesignation as discussed in section III.B.2.e.(3) of the preamble of this final rule, or for hospitals deemed urban under section 1886(d)(8)(B) of the Act as discussed in section III.B.2.e.(4) of the preamble of this final rule, as those reclassifications, redesignations, and statutory deems are not applicable to LTCHs.

E. Reinstatement and Extension of Certain Payment Rules for LTCH Services—The 25-Percent Threshold Payment Adjustment

1. Background

Section 1206(b)(1)(A) of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67), enacted on December 26, 2013, provides for the retroactive reinstatement and extension, for an additional 4 years, of the moratorium on the full implementation of the 25-percent threshold payment adjustment (hereinafter referred to as “the 25-percent policy”) under the LTCH PPS established under section 114(c) of the MMSEA, as amended by section 4302(a) of the ARRA and sections 3106(c) and 10312(a) of the Affordable Care Act. In addition, section 1206(b)(1)(B) of Pub. L. 113–67 provides for a permanent exemption from the application of the 25-percent policy for certain grandfathered co-located LTCHs.

Section 1206(b)(1)(C) of Public Law 113–67 also requires that “. . . [n]ot later than 1 year before the end of the 9-year period referred to in section 114(c)(1) of the Medicare, Medicaid, and SCHIP Extension Act of 2007 (42 U.S.C. 1395ww note), as amended by subparagraph (B) [of section 1206 of Pub. L. 113–67], the Secretary of Health and Human Services shall submit to Congress a report on the need for any further extensions (or modifications of the extensions) of the 25 percent rule described in sections 412.534 and 412.536 of title 42, Code of Federal Regulations, particularly taking into account the application of section 1886(m)(6) of the Social Security Act, as added by subsection (a)(1) [of section 1206 of Pub. L. 113–67].”

The 25-percent policy is a payment adjustment under the LTCH PPS, originally established in our regulations at 42 CFR 412.534 for LTCHs and LTCH satellite facilities and their co-located referring hospitals in the FY 2005 IPPS final rule (69 FR 49191), and at 42 CFR 412.536 for all other LTCHs and referring hospitals in the RY 2007 LTCH PPS final rule (72 FR 26870), based on analyses of Medicare discharge data that indicated that patterns of patient shifting appeared to be occurring more for provider financial advantage than for patient benefit. In order to discourage such activity, a payment adjustment was applied for LTCH discharges of patients who were admitted to the LTCH from the same referring hospital in excess of an applicable percentage threshold, which was to transition to a 25-percent threshold after specified phase-in periods. (For rural and single-urban LTCHs and those with MSA-dominant

referring hospitals, a 50-percent threshold was applied.) Under this policy, discharges in excess of the threshold are paid at an “IPPS equivalent” rate, instead of the much higher LTCH PPS rate. (We refer readers to detailed discussions of the 25-percent policy for LTCH HwHs and LTCH satellite facilities in the FY 2005 IPPS final rule (69 FR 49191 through 49214) and its application to all other LTCHs in the RY 2008 LTCH PPS final rule (72 FR 26919 through 26944).)

The results of the different rulemaking schedules in effect when §§ 412.534 and 412.536 were implemented (FY 2005 (October 1, 2004) and RY 2007 (July 1, 2006), respectively) are as follows: for co-located LTCHs and LTCH satellite facilities governed under § 412.534, the 25-percent policy was effective for cost reporting periods beginning on or after October 1, 2005 (“October” LTCHs); for LTCHs and LTCH satellite facilities governed under § 412.536, the 25-percent policy was effective for cost reporting periods beginning on or after July 1, 2007 (“July” LTCHs). In addition, even though grandfathered LTCH HwHs and LTCH satellite facilities are governed under § 412.534(h), they are “July” LTCHs because the 25-percent policy was applied to these facilities in the RY 2008 LTCH PPS final rule.

Section 114(c) of the MMSEA, as amended by section 4302(a) of the ARRA and sections 3106(c) and 10312(a) of the Affordable Care Act, provided for a 5-year moratorium on the full application of the 25-percent policy that expired for some LTCHs and LTCH satellite facilities for cost reporting periods beginning on or after October 1, 2012 (“October” LTCHs) and for other LTCHs and LTCH satellite facilities for cost reporting periods beginning on or after July 1, 2012 (“July” LTCHs). (For a detailed description of the moratorium on the application of the 25-percent policy, we refer readers to the May 22, 2008 Interim Final Rule with Comment Period (73 FR 29699 through 29704) and the August 27, 2009 Interim Final Rule with Comment Period for the ARRA, which was published in the FY 2010 IPPS final rule and Changes to the LTCH PPS and Rate Years 2010 and 2009 Rates final rule (74 FR 43990 through 43992).)

The expiration of the statutory moratorium for both “July” and “October” LTCHs was delayed because CMS established regulatory extensions in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53483 through 53484), as amended by the FY 2013 IPPS/LTCH PPS correcting amendment (77 FR 63751 through 63753). Specifically, we

established a 1-year extension (that is, for cost reporting periods beginning on or after October 1, 2012, and before October 1, 2013) on the full application of the 25-percent policy for “October” LTCHs. For those “July” LTCHs that would have been affected by the “gap” between the expiration of the statutory moratorium (for cost reporting periods beginning on or after July 1, 2012) and our prospective regulatory relief (for cost reporting periods beginning on or after October 1, 2012), we also provided for an additional moratorium based on LTCH discharges occurring on or after October 1, 2012 and ending at the start of the LTCHs’ next cost reporting period. For those “July” LTCHs with cost reporting periods beginning on or after October 1, 2012, the regulatory extension of the statutory moratorium, described above, effective for the hospital’s first cost reporting period beginning on or after October 1, 2012, resulted in seamless coverage for that group. However, for those “July” LTCHs with cost reporting periods beginning on or after July 1, 2012, and before October 1, 2012, that would have otherwise been subject to the “gap” between the expiration of the statutory moratorium and the effective date of the regulatory moratoria, we established a second regulatory moratorium effective with discharges occurring beginning October 1, 2012, through the end of the LTCH’s cost reporting period (that is, the end of the cost reporting period that began on or after July 1, 2012, and before October 1, 2012). Therefore, by providing for the above described regulatory extension for “July” LTCHs, we eliminated the distinction between “July” and “October” LTCHs, which resulted in the 25-percent policy being applied for all cost reporting periods beginning on or after October 1, 2012, following the expiration of the moratorium. For more details about these moratoria, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53483 through 53484).

Because we did not extend the regulatory moratorium on the 25-percent policy in the FY 2014 IPPS/LTCH PPS final rule, the full application of the payment adjustment policy was effective for all LTCHs (both “October” and “July” LTCHs) for cost reporting periods beginning on or after October 1, 2013 (78 FR 50772).

2. Implementation of Section 1206(b)(1) of Pub. L. 113–67

As stated earlier, section 1206(b)(1)(A) of Public Law 113–67 provides an additional amendment to section 114(c) of the MMSEA, as amended by section 4302(a) of the ARRA and sections

3106(c) and 10312(a) of the Affordable Care Act, that extends the “original” statutory moratorium on the full implementation of the 25-percent policy to a total of 9 years from the original effective dates established by the MMSEA (July 1 or October 1, 2007, as applicable). As a result, the lapse of the regulatory moratorium on the full implementation of the 25-percent policy is moot. This “seamless” statutory moratorium provides relief until cost reporting periods beginning on or after July 1, or October 1, 2016, as applicable. Section 1206(b)(1)(B) provides a permanent exemption from the 25-percent policy for certain grandfathered co-located LTCHs. In this final rule, based on the statutory changes made by sections 1206(b)(1)(A) and (b)(1)(B) of Public Law 113–67, we are making conforming amendments to the regulations governing application of the 25-percent policy. Specifically, we are revising §§ 412.534(c)(1)(i) and (c)(1)(ii), (c)(2), (c)(3), (d)(1) and (d)(1)(i), (d)(2), (d)(3), (e)(1) and (e)(1)(i), (e)(2), (e)(3), the introductory text of paragraph (h), (h)(4), and (h)(5) and removing paragraph (h)(6); and removing paragraphs (a)(1)(iii) and (a)(2)(ii), revising (a)(2), and removing paragraph (a)(3) of § 412.536 to reflect the statutory changes.

Comment: One commenter suggested that the costs associated with the new limitations provided by the application of the 25-percent policy, that is, any additional costs to the Medicare program because of the moratorium on full implementation of the 25-percent policy, be absorbed by the hospitals that receive the benefit from the extension of this moratorium. The commenter questioned whether this absorption of costs could be accomplished by a hospital-specific adjustment similar to the one presently used for failure to submit quality data, and whether the suggested adjustment amount could be calculated based on a facility’s compliance with 25-percent policy.

Response: We appreciate the commenter’s suggestion, but note that these suggestions are beyond the scope of the proposals presented in the FY 2015 IPPS/LTCH PPS proposed rule. We believe that Congress specified how we are to implement this policy when it instructed the Secretary to extend the relief provided by section 114(c) of the MMSEA of 2007, and its amendments, until the moratorium expires, or in the case of certain grandfathered LTCHs, indefinitely. The provisions of section 114(c) of the MMSEA of 2007, nor its amendments, include any measures to absorb any Medicare program costs associated with the moratorium on the

full application of this policy. We do not believe that further regulatory initiatives are appropriate at this time.

Comment: Several commenters urged CMS to repeal the 25-percent policy immediately. Some commenters reasoned that “Congress has not required the partial implementation of the 25 percent rule, but rather has prohibited the full implementation of the 25 percent rule.” Other commenters believed that applying the 25-percent policy after patient-level criteria are implemented would “violate” the provisions in Public Law 113–67 that require use of patient-level criteria to determine which cases receive standard or site neutral Medicare payments. Some commenters also believed that the 25-percent policy is unnecessary recognizing the forthcoming changes to the LTCH PPS, and stated that the 25-percent policy would reduce the payment distinctions between the number of cases receiving payments based on standard payment rates and the number of cases receiving payments based on site-neutral payment rates, thereby “weakening” the incentives that the commenters believed Congress intended to impose under the statute.

Response: Although we initially implemented the 25-percent policy under §§ 412.534 and 412.536 of the regulations through our general rulemaking authority, the 25-percent policy is now mandated under section 114(c) of the MMSEA, as amended. This statutory moratorium currently expires effective with cost reporting periods beginning on July 1, 2016, or October 1, 2016, as applicable. Therefore, CMS does not have the authority to “repeal” a statutory provision. As discussed in the May 22, 2008 interim final rule with comment period, and as we further discussed in the FY 2010 IPPS/LTCH final rule (74 FR 43980 through 43986), we believe that section 114(c)(1) of the MMSEA provided a 3-year delay in the application of §§ 412.534 and 412.536 to “only two categories of LTCHs . . . [s]imilarly, the 3-year relief . . . in section 114(c)(2) in the form of increased thresholds . . . was narrowly targeted to only those ‘applicable LTCHs and LTCH satellite facilities,’ that is, those ‘subject to the transition rules under § 412.534(g) of title 42 Code of Federal Regulations’” (74 FR 43982). In fact, with the enactment of the extension of the original moratorium under section 1206(b)(1)(B) of Public Law 113–67, and the extended relief provided from the 25-percent policy, Congress added only one specific change to the provisions of the original moratorium, that is, the permanent exemption of grandfathered LTCHs from

the 25-percent policy. We also note that there is an additional provision of the statute that specifies the viability of the 25-percent policy, at least until the initial implementation of the new payment framework under the LTCH PPS. Specifically, section 1206(b)(1)(C) requires CMS to submit a report to Congress “[n]ot later than 1 year before the end of the 9-year period referred to in section 114(c) of the Medicare, Medicaid, and SCHIP Extension Act of 2007 . . . on the need for any further extensions (or modifications of the extensions) of the 25 percent rule . . . particularly taking into account the application of section 1886(m)(6) of the Social Security Act as added by subsection (a)(1).” In response to the commenters expressed concerns relating to an “overlapping” of the full implementation of the 25-percent policy and the new payment framework specified under section 1206(a) of Public Law 113–67, we assure the commenters that any such interplay will be fully considered during the development of the required July 2015 Report to Congress. This date is at least a full year prior to the expiration of the current moratorium. Furthermore, as the statutory payment methodology revisions to the LTCH PPS will be phased-in under a “blended” payment methodology effective with LTCH cost reporting periods beginning during FY 2016, there still may be a need for the 25-percent policy during that phase-in period, although our study may or may not conclude that this policy is not required after full implementation of the new statutory payment methodology under the LTCH PPS.

F. Discussion of the “Greater Than 3-Day Interruption of Stay” Policy and the Transfer to Onsite Providers Policies Under the LTCH PPS

The interrupted stay policy is a payment adjustment that was included under the LTCH PPS from the inception; that is, for cost reporting periods beginning on or after October 1, 2002 (FY 2003). In this discussion, we use the terms “interrupted stay” and “interruption of stay” interchangeably. An “interruption of stay” occurs when, during the course of an LTCH hospitalization, a patient is discharged to an inpatient acute care hospital, an IRF, or a SNF for treatment or services not available at the LTCH for a specified period followed by a readmittance to the same LTCH. We refer readers to the RY 2003 LTCH PPS final rule (67 FR 56002). When we established this policy, we believed that the readmission to the LTCH represented a continuation of the initial treatment, a stay in which

an “interruption” occurred, rather than a new admission if the length of stay at the intervening facility was within a specified number of days. If an “interruption of stay” occurred, payment for both “halves” of the LTCH discharge were then “bundled,” and Medicare would make one payment based on the second date of discharge. Specifically, under this policy, we established a fixed-day threshold, which applied to the specified number of days a Medicare beneficiary spends as an inpatient at an acute care hospital, an IRF, or a SNF. In the RY 2003 LTCH PPS final rule, we explained that we were implementing this policy because we wanted “. . . to reduce the incentives inherent in a discharged-based prospective payment system of ‘shifting’ patients between Medicare-covered sites of care in order to maximize Medicare payments. This policy is particularly appropriate for LTCHs because, as a group, these hospitals differ considerably in the range of services offered such that where some LTCHs may be able to handle certain acute conditions, others will need to transfer their patients to acute care hospitals.

“For instance, some LTCHs are equipped with operating rooms and intensive care units and are capable of performing minor surgeries. However, other LTCHs are unable to provide those services and will need to transfer the beneficiary to an acute care hospital. We believed that our policy also provided for a patient . . . “who no longer requires hospital-level care, but is not ready to return to the community,” and who “. . . could be transferred to a SNF.” (We refer readers to the RY 2003 LTCH PPS final rule (67 FR 56002).)

In the regulations under 42 CFR 412.531, we defined two types of interruptions of stays. Under § 412.531(a)(1), “[a] 3-day or less interruption of stay” means a stay at a LTCH during which a Medicare inpatient is discharged from the LTCH to an acute care hospital, IRF, SNF, or the patient’s home and readmitted to the same LTCH within 3 days of the discharge from the LTCH. Under the “3 day or less interruption of stay policy,” the fixed-day threshold period begins with the calendar date of discharge from the LTCH and ends not later than midnight of the third day. If an LTCH patient’s “interruption” exceeds this threshold, payment is governed by the “greater than 3-day interruption of stay” policy. (We refer readers to the RY 2005 LTCH PPS final rule (69 FR 25690 through 25700), the RY 2006 LTCH PPS final rule (70 FR 24206), and the RY 2007 LTCH PPS final rule (71 FR 27872 through 27875) for detailed discussions

of the 3-day or less interruption of stay policy.) In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28196), we did not propose to revise the 3-day or less category of interrupted stays, but we make mention of the policy for clarity in making a distinction between the 3-day or less interruption of stay policy and the greater than 3-day interruption of stay policy that we proposed to revise in our proposed rule.

The “greater than 3-day interruption of stay policy,” is defined under § 412.531(a)(2) as a stay during which a Medicare inpatient is transferred upon discharge to an acute care hospital, an IRF, or a SNF for treatment or services that are not available in the long-term care hospital and returns to the same long-term care hospital within the applicable fixed-day period specified in regulations under § 412.531(a)(2)(i) through (a)(2)(iii). For a discharge to an acute care hospital, the applicable fixed-day period is between 4 and 9 consecutive days; the counting of the days begins on the calendar day of discharge from the LTCH and ends on the 9th day when the patient is readmitted to the LTCH. For a discharge to an IRF, the applicable fixed-day period is between 4 and 27 consecutive days; the counting of the days begins on the calendar day of discharge from the LTCH and ends on the 27th day. For a discharge to a SNF, the applicable fixed-day period is between 4 and 45 consecutive days; the counting of the days begins on the calendar day of discharge from the LTCH and ends on the 45th day. We refer readers to our proposed rule for a more detailed description of the derivation of our day thresholds (79 FR 28196).

Under the greater than 3-day interrupted stay policy, if an LTCH readmission occurs within the fixed-day period both halves of the LTCH discharge are treated as a single discharge for the purposes of payment under the LTCH PPS. In such instances, the beneficiary’s readmittance to the LTCH is paid for with a single MS–LTC–DRG payment that covers the initial admission to the LTCH and the subsequent readmission. That is, a single Medicare payment is made for the entire two-part discharge. Payment to the acute care hospital, the IRF, or the SNF is then made in accordance with the applicable payment policies for those providers when the interruption of stay exceeds 3 days. Therefore, we balanced the payment incentives of both the LTCH and the acute care hospital, the IRF, or the SNF to which the LTCH patient might be discharged before being readmitted to the LTCH.

As we discussed in the RY 2003 LTCH PPS final rule (67 FR 56007), our concerns about patient shifting were significantly increased in the context of transfers between co-located LTCHs and LTCH satellite facilities, or for LTCH hospital-within-hospital transfers. Collectively, we refer to these arrangements as transfers to “onsite” providers. In the regulations under § 412.532(b), we define a facility that is “co-located or “onsite” as a hospital, satellite facility, unit, or SNF that occupies space in a building also used by another hospital or unit or in one or more buildings on the same campus, as defined in § 413.65(a)(2), as buildings used by another hospital or unit. Under this LTCH PPS policy, if more than 5 percent of the Medicare patients discharged from an LTCH during a cost reporting period were discharged to an “onsite” SNF, IRF, or psychiatric facility, or to an “onsite” acute care hospital, and directly readmitted to the same LTCH, the LTCH would be paid one MS–LTC–DRG payment to cover both LTCH discharges, regardless of the length of the interrupted stay. As is the case in regard to the greater than 3-day interruption of stay policy, payment to an acute care hospital, an IRF, or a SNF would not be affected under the 5-percent policy.

Our concern about patient shifting among “onsite” providers did not originate with the implementation of the LTCH PPS. The LTCH 5-percent policy under § 412.532 was recodified from an earlier regulation under § 413.40(a)(3), which applied a payment adjustment to hospitals paid under the TEFRA payment system, including LTCHs, to address inappropriate discharges of patients to a host hospital paid under the IPPS from an excluded hospital-within-a-hospital (such as a LTCH) that culminated in a readmission to the hospital-within-a-hospital. We refer readers to the FY 2000 IPPS final rule, the RY 2003 LTCH PPS final rule, and the FY 2015 IPPS/LTCH PPS proposed rule for a detailed description of the 5-percent policy, its initial application under the TEFRA payment system, and our policy concerns (64 FR 41535, 67 FR 56007 through 56014, and 79 FR 28196 through 28197).

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28196), we proposed to revise our policies on interrupted stays. Specifically, we proposed to modify the fixed-day thresholds under the greater than 3-day interruption of stay policy to provide for a 30-day fixed threshold as an “acceptable standard” for determining a linkage between an index discharge and a readmission from an inpatient facility

as specified under this policy (that is, an IPPS hospital, an IRF, or a SNF) consistent with the intervals presently used in two recently implemented Medicare initiatives: the Hospital Readmissions Reductions Program and the Hospital Inpatient Quality Reporting Program. (We refer readers to our proposed rule for a description of these two policies (79 FR 28197). We also proposed to remove our regulation at § 412.532, *Special payment provisions for patients who are transferred to onsite providers and readmitted to a long-term care hospital*, stating that as an “after the fact” payment adjustment (that is, following cost report settlement), we believed that this policy had a limited impact on provider behavior, and additionally our proposed changes to the interrupted stay policy make it unnecessary.

Comment: Commenters objected to the CMS proposal to modify the fixed-day threshold for the greater than 3-day interrupted stay policy. The commenters provided many reasons for their objections to the proposal, including that:

- CMS should first implement the new statutory framework under Public Law 113–67 that applies patient-level criteria to payments under the LTCH PPS in FY 2016 and then “. . . assess whether any problems related to the interrupted stay policy exist under the transformed payment system.”
- CMS used an “inappropriate analogy” in its proposal to change the fixed-day threshold under the greater than 3-day interrupted stay policy to 30 days because the referenced thresholds for the Hospital IQR Program and the Hospital Readmissions Reduction Program are used under the IPPS, but not under the LTCH PPS. Therefore, the commenters believed that 30 days is an inappropriate benchmark for the LTCH PPS policy. The commenters further noted that the LTCH PPS greater than 3-day interrupted stay policy applies a payment adjustment when an LTCH discharges a patient for access to clinical services not available at the LTCH and the patient is readmitted to the LTCH within the fixed-day threshold. In contrast, under the Hospital Readmissions Reduction Program, a payment reduction is applied to the hospital’s payment if the patient returns to the hospital for care within the fixed-day threshold, and it was not expected that the patient would return to the hospital for continuation of care in relation to the most recent discharge. The commenters specifically stated that “the interrupted stay thresholds are intended . . . to define a point at which the care required for a

current episode of illness changes significantly enough to warrant ‘re-setting the clock’ to an entirely separate episode of care for the subsequent readmission . . .” to the LTCH. They added that “The 30-day readmission threshold, on the other hand, can be likened to a 30-day warranty period during which a readmission *could* indicate suboptimal quality of care during the initial admission.” The commenters believed that comparing the interrupted stay policy to the readmissions initiatives would result in “crucial incongruence” because the two policies address fundamentally different clinical care scenarios. Furthermore, the commenters stated that a clinical threshold is not the same as a quality initiative. Some commenters stated that CMS had not demonstrated that an LTCH stay interrupted by 30 days at an IPPS hospital followed by a readmission to the LTCH constitutes a single episode of care or hospital stay. Several commenters asserted that “the agency’s previous research contradicts this premise upon which the proposed policy change is based.”

- The proposal did not include an adequate discussion of CMS’ rationale as an explanation of the Agency’s proposal. The commenters asserted that the publically available data sets did not provide adequate information for stakeholders to study the potential impact on hospitals based on this proposed policy. The commenters noted that the inclusion of such material in the FY 2012 proposal enabled LTCH stakeholders to meaningfully comment in response to the proposals.

Furthermore, the commenters believed that as a result of the policy changes that will be implemented in FY 2016, LTCHs would be subject to significant financial and operational upheaval if this new policy is implemented as well.

- CMS did not offer evidence to indicate that LTCHs have been overpaid under the current policy or adequate data detailing the impact this proposed policy would have on LTCHs. The commenters suggested a more detailed impact analysis for this policy, including whether patient access to care would be harmed.

- Given that the potential impact imposed upon LTCHs based on the proposal to change the fixed-day threshold from 9 to 30 days for an intervening IPPS stay is so “drastic,” if finalized, there should be 3-year transition period from the current policy if CMS were to finalize such a policy, and CMS should change the MS–LTC–DRG relative payment weights to account for the resulting changes in

LTCH treatment costs and Medicare payments.

Response: We appreciate the commenters’ responses. After careful consideration of the public comments we received, we agree with the commenters who indicated that, in light of the forthcoming modifications to the LTCH PPS, a major revision to the existing greater than 3-day interrupted stay policy may be premature at this time. We will take the other comments we received into consideration in preparation for any potential future rulemaking on this issue.

Despite our decision to not finalize our proposal to change the fixed-day threshold under the LTCH PPS greater than 3-day interrupted stay policy, our goal continues to be to help ensure that readmission decisions are made on a clinical basis and not based on payment considerations. During the past several years, the Office of the Inspector General (OIG) has been evaluating the effects of the interrupted stay policies for LTCHs, primarily focusing on readmissions from acute care hospitals. In the OIG’s March 28, 2014 report, “Vulnerabilities in Medicare’s Interrupted-Stay Policy” (OEI–04–12–00490), the OIG stated that “we identified several vulnerabilities in the LTCH interrupted-stay policy, including inappropriate payments (and) financial incentives to delay readmissions. . . .” The report further stated that “. . . 59 LTCHs had a high number of readmissions after the fixed-day period. . . .” (We refer readers to the Executive Summary of the OIG’s March 28, 2014 report for further details.) The report also noted that “[f]orty-five of the 59 LTCHs were part of a chain, and 23 of these LTCHs were part of the same chain . . . For 50 of these 59 LTCHs, the number of returns doubled immediately after the fixed-day period.” (We refer readers to page 17 of the OIG’s March 28, 2014 report for further details.) The OIG recommended, among other things, that CMS take appropriate action regarding LTCHs with a high number of readmissions immediately after the fixed-day period and LTCHs with a high number of readmissions following multiple short intervening facility stays.

In our response to the OIG’s report, CMS agreed that LTCH readmission decisions should be based on the patient’s clinical needs and not the hospital’s financial benefit. We stated that if we find evidence that an individual hospital or chain is making readmission decisions based on financial considerations rather than the patient’s clinical needs, we would take the appropriate action in those cases to rectify the inconsistencies in adhering

to the current policy. In addition, as noted earlier, we will consider potential changes to the greater than 3-day interrupted stay policy as we gain experience under the new framework for the LTCH PPS.

Comment: Commenters supported the proposal to remove the regulation at § 412.532 (*Special payment provisions for patients who are transferred to onsite providers and readmitted to a long-term care hospital*), noting that the existing greater than 3-day interrupted stay policy addresses many of CMS’ concerns about patient shifting. Commenters also indicated that they believed that the patient-level criteria that we will be implementing for FY 2016 will result in changes to LTCH PPS that further reduce the need for this policy.

Response: We appreciate the commenters’ support. After consideration of the public comments we received, we are finalizing our proposal to remove the regulatory requirements under § 412.532 because we believe that this policy has had a limited impact on provider behavior.

In summary, in this final rule, we are not finalizing our proposal to change the fixed day threshold under the greater than 3-day interrupted stay policy under §§ 412.531(a)(2) and (b)(4) of the regulations. However, we are finalizing the proposal to remove § 412.532 in its entirety and to make a conforming change to § 412.525 by removing and reserving paragraph (d)(3), which references payments under § 412.532.

G. Moratoria on the Establishment of LTCHs and LTCH Satellite Facilities and on the Increase in the Number of Beds in Existing LTCHs or LTCH Satellite Facilities

As previously noted, Public Law 113–67 was enacted on December 26, 2013. Section 1206(b)(2) of Public Law 113–67 amended section 114(d) of the MMSEA of 2007, as previously amended by section 4302 of the American Recovery and Reinvestment Act (ARRA) of 2009 (Pub. L. 111–5) and sections 3106(b) and 10312(b) of the Affordable Care Act (Pub. L. 111–148). As further amended by section 112(b) of the Protecting Access to Medicare Act of 2014 (Pub. L. 113–93), section 114(d) of the MMSEA includes a “new” statutory moratoria on the establishment of new LTCHs and LTCH satellite facilities, and on the increase in the number of hospital beds in existing LTCHs and LTCH satellite facilities, “for the period beginning April 1, 2014 and ending September 30, 2017, which mirrors nearly identical provisions of the “expired” moratoria under section 114(d)(1) of the MMSEA,

as amended by sections 4302 of the ARRA and sections 3106(b) and 10312(b) of the Affordable Care Act. These prior, yet nearly identical, provisions of section 114(d)(1) of the MMSEA, as amended by the ARRA and the Affordable Care Act, expired on December 28, 2012. For clarity and brevity, we will refer to the “expired” moratoria or moratorium to reference those that expired on December 28, 2012, and the “new” moratoria or moratorium to reference those that began on April 1, 2014, as applicable, throughout this discussion.

The primary difference between the “expired” moratoria and the “new” moratoria is that, while the “expired” moratoria provided for specific exceptions to both the moratorium on the establishment of new LTCHs and LTCH satellite facilities and on increases in the number of beds in existing LTCHs and LTCH satellite facilities, the “new” moratoria only provides exceptions to the moratorium on the establishment of new LTCHs and LTCH satellite facilities. No exceptions are provided under the “new” moratorium on increases in the number of hospital beds in existing LTCHs and LTCH satellite facilities. (For a detailed description of the “expired” moratoria provisions (including the applicable exceptions) that were in effect from December 29, 2007 through December 28, 2012, we refer readers to the May 22, 2008 Interim Final Rule with Comment Period (73 FR 29705 through 29708).

In light of the expiration date of the “expired” moratoria on December 28, 2012, and the effective date of the “new” moratoria on April 1, 2014, there has been a period of time in which new LTCHs and LTCH satellite facilities have been allowed to be established, and during which time there may have been increases in the number of hospital beds in LTCHs and LTCH satellite facilities. In accordance with section 114(d)(1) of the MMSEA, as amended by section 112(b) of Public Law 113–93, for the period beginning April 1, 2014 through September 30, 2017, CMS will be unable to designate any hospital as an LTCH or recognize a new LTCH satellite facility as such, unless one of the exceptions (described below) is met.

Additionally, as of April 1, 2014, in accordance with sections 114(d)(6) and (d)(7) of the MMSEA, as amended by section 112(b) of Public Law 113–93, an existing LTCH may not increase the number of its hospital beds. This moratorium will extend through September 30, 2017, and is not subject to any exceptions.

To qualify for an exception under the “new” moratorium to establish a new

LTCH or LTCH satellite facility during the timeframe between April 1, 2014, and September 30, 2017, a hospital or entity must meet the following criteria:

- The hospital or entity must have begun its qualifying period for payment as an LTCH under 42 CFR 412.23(e).
- The hospital or entity must have a binding written agreement with an outside, unrelated party for the actual construction, renovation, lease, or demolition for an LTCH, and must have expended before April 1, 2014, at least 10 percent of the estimated cost of the project or, if less, \$2,500,000.
- The hospital or entity must have obtained an approved certificate of need in a State where one is required.

While this exception only applies to the “new” moratorium on the establishment of new LTCHs and LTCH satellite facilities under section 114(d)(7) of the MMSEA, as amended by section 112(b) of Public Law 113–93, the mechanics of the exception are analogous to those established under the “expired” moratorium, which ended in 2012. The “expired” moratoria were implemented in a May 22, 2008 Interim Final Rule with Comment Period (73 FR 29704 through 29707). As discussed in that rule, some of the terminology in the statutory provision was internally inconsistent. A strictly literal reading of the statutory language under section 114(d)(2) of the MMSEA, as amended by section 4302 of the ARRA and sections 3106(b) and 10312(b) of the Affordable Care Act, presented practical challenges for implementation in light of the established LTCH classification criteria under § 412.23(e) of the regulations. Therefore, we adopted interpretations that we believed would reasonably reconcile seemingly inconsistent provisions and that would result in a logical and workable mandate. Specifically, as drafted, the exception only applies to a hospital or entity when it is already classified as an “LTCH.” Such entities will not need an exception to the moratorium on becoming an “LTCH” because they will already be an LTCH. As such, we are interpreting this provision under the new exception as we interpreted the exceptions to the “expired” moratorium. We discuss our interpretations below.

At the outset of this discussion, we want to clarify which provisions of section 114(d) of the MMSEA, as amended, were subject to the “expired” moratoria, as distinguished from those which are subject to the “new” moratoria. Sections 114(d)(2) and 114(d)(3) of the MMSEA, as amended, only address exceptions under the “expired” moratoria. Section 114(d)(6) of the MMSEA, as amended, defines

when the exceptions addressed in sections 114(d)(2) and 114(d)(3) expired. Section (d)(7) of the MMSEA addresses the exception under the “new” moratorium on the establishment of new LTCHs and LTCH satellite facilities. There are no exceptions to the “new” moratorium on the increases in the number of beds in existing LTCHs and LTCH satellite facilities, as noted above.

Section 114(d)(7)(A) of the MMSEA, as amended, mirrors the expired provisions of section 114(d)(2)(A). Both provisions refer to an LTCH that began its qualifying period for payment as a “long-term care hospital” on or before a given date. However, a hospital would not be classified as an LTCH during that qualifying period; the facility or entity would typically be classified as an IPPS hospital. For a full discussion of our rationale for interpreting section 114(d)(2)(A) of the MMSEA to refer to an IPPS hospital meeting the stated requirements, we refer readers to our May 22, 2008 Interim Final Rule with Comment Period (73 FR 20704 through 29707) regarding the implementation of the “expired” moratorium. In this final rule, we are applying the same rationale in regard to the interpretation of section 114(d)(7)(A), that is, we are interpreting the provision to refer to an acute care hospital meeting the stated requirements as the hospital or entity seeking classification as an LTCH. As we did when interpreting the same language under the “expired” moratorium exception under section 114(d)(2)(A) of the MMSEA, as amended by section 4302 of the ARRA and sections 3106(b) and 10312(b) of the Affordable Care Act, we note that the exception under section 114(d)(7)(A) of the MMSEA cannot provide any relief to LTCH satellite facilities because there is no “qualifying period” for the establishment of a LTCH satellite facility for payment as a LTCH under § 412.23(e). Therefore, an LTCH satellite facility cannot meet the stated requirements for an exception under section 114(d)(7)(A) of the MMSEA.

Section 114(d)(7)(B) of the MMSEA specifies the conditions for an exception to the moratorium on the establishment of new LTCHs and LTCH satellite facilities having: (1) a binding written agreement with an outside, unrelated party for the actual construction, renovation, lease, or demolition for an LTCH; and (2) expended, before the date of enactment of Public Law 113–93, April 1, 2014, “at least 10 percent of the estimated cost of the project (or, if less, \$2,500,000).” As drafted, this provision is also problematic. In cases in which a hospital has not yet been built, but there is a binding written agreement for the

actual construction of a hospital that intends to be classified as an LTCH, the entity hiring those who would complete the construction would not be classified as an LTCH. Prior to the designation or classification of a hospital or an entity as an LTCH, a hospital must first be established and certified and must then complete the procedures specified under § 412.23(e) in order to qualify as an LTCH, at which point the hospital would be reclassified as an LTCH.

In accordance with our interpretation of section 114(d)(2)(B) of the MMSEA, as amended by section 4302 of the ARRA and sections 3106(b) and 10312(b) of the Affordable Care Act, we are interpreting the contracting and expenditure provisions under section 114(d)(7)(B) of the MMSEA, as added by section 112(b) of Public Law 113–93, to apply to the hospital/entity requesting an exception to the moratorium on the establishment of new LTCHs and LTCH satellite facilities between April 1, 2014, and September 30, 2017—the entity that would be classified as an LTCH if it meets the stated requirements. That entity must have a binding written agreement with an outside unrelated party for the actual construction, renovation, lease, or demolition for converting the hospital to an LTCH, and it must have expended at least 10 percent of the estimated cost of the project (or, if less, \$2,500,000) by the date of enactment of Public Law 113–93—April 1, 2014.

Furthermore, with regard to the first prong, as when we implemented the “expired” moratoria, we continue to believe that the use of the term “actual” in the context of the “actual construction, renovation, lease, or demolition” indicates that the provision focuses only on the specific actions cited in the statute, and does not include those actions that are being contemplated or are not yet substantially underway. Although we are aware that a hospital or some other type of entity may enter into binding written agreements regarding services and items (for example, feasibility studies or land purchase) and incur costs for those services and items prior to actual construction, renovation, lease or demolition, we believe that those services or items are not included in what we are permitted to consider under the statutory language of the exception requirements.

With respect to the second prong, the statute specifies that the hospital or entity must have “expended” at least 10 percent of the estimated cost of the project (or, if less, \$2,500,000) by April 1, 2014. As we did in regard to the interpretation of section 114(d)(2)(B) of

the MMSEA, as amended by section 4302 of the ARRA and section 3106(b) and 10312(b) of the Affordable Care Act, we are interpreting the phrase “cost of the project” to mean the activities enumerated in the first prong: “the actual construction, renovation, lease, or demolition for a long-term care hospital.” That is, the statute requires the hospital or entity to have spent the amount specified in the statute on the actual construction, renovation, lease, or demolition for the contemplated LTCH. Furthermore, as we did previously in regard to the interpretation of section 114(d)(2)(B) of the MMSEA, as amended by section 4302 of the ARRA and sections 3106(b) and 10312(b) of the Affordable Care Act, because the statute uses the phrase “has expended” (that is, a past tense phrase), we are limiting funds counting toward the 10 percent or \$2,500,000 minimum to those funds that have actually been transferred as payment for the stated aspects of the project prior to April 1, 2014, as opposed to merely obligating capital and posting the cost of the project on its books. We believe that the provision addressed the concept of “obligate” in the first prong of the test where the statute specifies “a binding written agreement . . . for the actual construction, renovation, lease, or demolition of the long-term care hospital. . . .” and there is no reason to believe that the second prong of the test, which requires the “expenditure” of 10 percent of the project or, if less, \$2,500,000, was intended as a redundancy. The ability to post the expense on the hospital’s or entity’s books could be satisfied by merely having a binding written agreement under the first prong of section 114(d)(7)(B) of the MMSEA. The fact that a second requirement is included that involves an expenditure indicates that an additional threshold must be met.

Finally, section 114(d)(7)(C) of the MMSEA includes an exception to the moratorium if an LTCH, prior to April 1, 2014, has “obtained an approved certificate of need in a State where one is required”. As discussed above, we are applying this exception requirement to the entity that is requesting approval for an exception to the moratorium on the establishment of new LTCHs and LTCH satellite facilities between April 1, 2014, and September 30, 2017—the entity that would be classified as an “LTCH” if the stated requirements are met.

However, with that said, we are clarifying what kind of certificate of need we will accept under the provisions of section 114(d)(7) of the MMSEA. We believe that the certificate

of need exception applies to a “hospital” or entity that was actively engaged in developing an LTCH, as evidenced by the fact that either an entity that wanted to create a LTCH but did not exist as a hospital prior to April 1, 2014, had obtained a certificate of need for a hospital by the date of enactment, or an existing hospital had obtained a certificate of need to convert the hospital into a new LTCH by that date. We are applying this exception requirement to a hospital that is already in existence prior to the date of enactment of Public Law 113–93, and that had previously obtained an approved certificate of need for a hospital (other than a LTCH) prior to April 1, 2014. We believe that Congress intended the exception to the moratorium to save those entities that were already actively engaged in becoming an LTCH. The fact that a hospital may have had a certificate of need issued to it years before April 1, 2014, to operate a hospital (other than a LTCH) is not indicative of such active engagement, and, we believe, is outside of what is contemplated in these LTCH-specific statutory provisions. We are only applying this exception requirement where the certificate of need is specifically for an LTCH. Because the certificate of need process is controlled at the State level, in determining whether the hospital or entity has obtained an approved certificate of need prior to April 1, 2014, we will consult the applicable State on a case-by-case basis for that determination.

Decisions regarding the application of these moratoria and exceptions provided within the provisions of section 114(d) of the MMSEA will be handled on a case-by-case basis by the applicant’s MAC and the CMS Regional Office. “Final” instructions on implementing the moratoria will be posted following the publication of this final rule.

In accordance with these policies, in this final rule we also are revising our regulations under § 412.23(e)(6) and (e)(7) to include a description of the “new” moratoria, which is in effect from April 1, 2014, through September 30, 2017, on the establishment of new LTCHs and LTCH satellite facilities (with specific exceptions), and on increasing the number of beds in existing LTCHs and existing LTCH satellite facilities.

Comment: Several commenters urged CMS to establish a regulatory exception to the statutory moratorium on the increase in the number of beds in existing LTCHs and LTCH satellite facilities. The commenters pointed out

that, unlike the “expired” moratoria, the “new” moratoria under section 1206(b)(2) of Public Law 113–67 do not provide for such exceptions. The commenters further stated that when the statute was further amended by section 112(b) of the PAMA of 2014, Congress elected to provide an exception for the establishment of new LTCHs and LTCH satellite facilities, but not for the increase in the number of LTCH beds. Specifically, the commenters requested that CMS provide two regulatory exceptions to the moratorium to allow for the increase in the number of beds in existing LTCHs and LTCH satellite facilities if: (1) the LTCH has a binding written agreement as of the date of the enactment of this paragraph with an outside, unrelated party for the actual construction, renovation, lease or demolition for long-term care hospital beds, and has expended, before such date of enactment, at least 10 percent of the estimated cost of the project (or, if less, \$2,500,000) (the “binding written agreement exception”); or (2) if the LTCH has obtained an approved certificate of need (CON) from the State where one is required on or before the date of enactment (the “CON exception”). The commenters believed that the creation of these exceptions would be within CMS’ authority because: (1) the statute is “ambiguous” and, therefore, CMS may exercise its authority under the general rulemaking provisions under sections 1102 and 1871 of the Act to “resolve the ambiguity”; (2) with the enactment of section 112(b) of the PAMA, the effective date of the new moratorium on the increase in the number of beds in existing LTCHs and LTCH satellite facilities was changed from January 1, 2015, to April 1, 2014, which creates a disadvantage for those LTCHs that were in the process of increasing the number of beds in their facilities based on “reasonable reliance” on the January 1, 2015 effective date; (3) Congress acted in haste when enacting the PAMA, and not including a bed number exception was an error; and (4) the health needs of the critically ill Medicare beneficiary population will go unmet without these additional beds.

Response: We do not agree with the commenters’ assertion regarding CMS’ authority to establish two regulatory exceptions to the statutory moratorium on the increase in the number of beds in existing LTCHs and LTCH satellite facilities. Unlike the “expired” moratoria, the “new” moratoria under section 1206(b)(2) of Public Law 113–67 expressly noted that such exceptions would not apply under the “new”

moratoria. We refer readers to section 1206(b)(2)(B) of Public Law 113–67. When further amended by section 112(b) of the PAMA of 2014, Congress only elected to provide exceptions for the establishment of new LTCHs and LTCH satellite facilities, but not for the increase in the number of LTCH beds. We do not believe that these two laws, read in concert, are ambiguous. Congress explicitly addressed the former exceptions as they relate to the “new” moratorium. In doing so, Congress clearly demonstrated its awareness of the prior exceptions, and by stating that the exceptions do not apply under the “new” moratorium while concurrently not offering new exceptions, clearly indicated that Congress intended to offer no such exceptions. Furthermore, there is no reason for CMS to presume that the subsequent provisions for exceptions under the “new” moratoria on the establishment of new LTCHs and LTCH satellite facilities, but not for the increase in the number of LTCH beds was anything other than intentional, absent evidence to the contrary. The commenters did not present any evidence of this nature. Therefore, in the absence of some indication that Congress intended to reverse its specific statement under section 1206(b)(2)(B) of Public Law 113–67 that limits the application of exceptions, such as it did in establishing exceptions to the moratorium on the establishment of new LTCHs and LTCH satellite facilities, we see no reason to infer that the absence of any exceptions in regard to the moratorium on the increase in the number of beds in existing LTCHs and LTCH satellite facilities was anything other than intentional.

Furthermore, in response to the commenters’ “reasonable reliance” assertions, while we may understand the commenters’ concerns regarding wasted resources, such concerns do not permit us to offer rulemaking that would be contrary to the express intent of Congress. Finally, while we understand the commenters’ concerns regarding access to care for Medicare beneficiaries, we believe that Congress would have provided exceptions if it believed that beneficiary access to LTCH and LTCH satellite facility beds would be negatively impacted. Furthermore, we expect that Congress would address any unanticipated access issues, should these issues arise. Therefore, we disagree with the commenters’ assertions.

Comment: One commenter urged CMS to revise its interpretation of the exceptions provisions under the moratorium on the development of new

LTCHs and LTCH satellite facilities so as to include “ownership” of the property in the list of permitted activities that could be included in the criteria for qualifying for the “binding written agreement” exception. The commenter also urged CMS to include the purchase of architectural plans as a necessary element that would count towards quantifying the total expenditure amount.

Response: In the FY 2015 IPPS/LTCH PPS proposed rule, we noted that the “new” moratorium on the development of new LTCHs and LTCH satellite facilities provided under section 1206(b)(2) of Public Law 113–67, as amended by section 112(b) of the PAMA, and incorporated as section 114(d)(7) of the MMSEA “. . . mirrors the expired provisions of section 114(d)(2)(A)” of the ‘expired’ moratorium.” Because Congress used the identical wording for these provisions, we proposed to apply the same interpretation of the exceptions provisions that we used for the “expired” moratorium in regard to the “new moratorium. (We refer readers to the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28198).) The specific exception provision that the commenters are questioning is outlined under section 114(d)(7)(B) of the MMSEA, as amended, and is defined as the “binding written agreement” exception. Section 114(d)(7)(B) of the MMSEA of 2007, as amended, specifies one of the qualifying criterion for this exception, namely, the requirement for the facility to have a binding written agreement with an outside, unrelated party for the actual construction, renovation, lease, or demolition for a long-term care hospital, and have expended, before the date of the enactment of the PAMA, at least 10 percent of the estimated cost of the project (or, if less, \$2,500,000).

After we implemented the provisions of the “expired” moratorium, published in the May 22, 2008 interim final rule with comment period (73 FR 29699), in response to the FY 2010 IPPS/LTCH PPS final rule, commenters urged CMS to revise its interpretation of the “binding written agreement” exception under section 114(d)(2)(B) of the MMSEA to include “. . . feasibility studies, land purchases, architectural fees, attorneys’ fees, appraisals, purchase of rights of way, as well as other activities that occur during the development of a hospital . . .” At that time, we stated in our response that, “. . . Congress expressly specified only four ‘actual’ activities in the statute.” We also believe, as we stated in the May 22, 2008 interim final rule with

comment period, that the use of the term “actual” in the context of the exception provisions terminology of “actual construction, renovation, lease, or demolition” limits the activities that Congress considers to represent a substantial commitment to that particular project of developing an LTCH or an LTCH satellite facility. By using the term “cost of the project,” we believe that the statute refers to the activities enumerated in the first prong, “the ‘actual’ construction, renovation, lease, or demolition for a long-term care hospital.” (We refer readers to the FY 2010 IPPS/LTCH PPS final rule with comment period (74 FR 43988).) Our interpretation of the exception provisions for a “binding written agreement” under the “expired” moratorium was implemented in FY 2008 with the publication of the May 22, 2008 interim final rule with comment period (73 FR 29699), and finalized in the FY 2010 IPPS/LTCH PPS final rule with comment period (74 FR 43754). While we understand that our longstanding interpretation of the language in this exception may cause hardship to developing LTCHs and LTCH satellite facilities that seek to qualify for the exception under the “expenditure” prong, we continue to believe that only the specific costs cited in the statute may be considered in evaluating and granting exceptions to the “new” moratorium. Furthermore, we also believe that by using the same language in the exceptions provisions under the “new” moratorium that was used in the provisions of the “expired” moratorium, Congress had reason to expect that CMS would apply the same interpretation under the “new” exception provisions as were applied under the “expired” moratorium exception provisions. If Congress disagreed with our interpretation, or believed that other costs should be included or considered in determining whether an LTCH or LTCH satellite facility would qualify for this exception to the moratorium, it could have revised the language used under section 112(b) of the PAMA, which applies the exceptions, accordingly.

H. Evaluation and Treatment of LTCHs Classified Under Section 1886(d)(1)(B)(iv)(II) of the Act

Section 1206(d) of the Pathway for SGR Reform Act (Pub. L. 113–67) instructs the Secretary to evaluate payments and regulations governing “hospitals which are classified under subclause (II) of subsection (d)(1)(B)(iv) . . .” as part of the annual rulemaking for payment rates under subsection (d) of section 1886 of the Act for FY 2015

or FY 2016. (We refer to hospitals “classified under subclause (II) of subsection (d)(1)(B)(iv) . . .” as “subclause (II) LTCHs.”) Based on the results of this evaluation, the Secretary is authorized to adjust the payment rates under section 1886(b)(3) of the Act for this type of hospital (such as by applying a payment adjustment such that the payments resemble those under a “TEFRA-payment model”). To implement such a payment adjustment, the Secretary would have to propose changes to the existing regulations governing subclause (II) LTCHs.

For this final rule, under the requirements of section 1206(d)(1) of Public Law 113–67 to evaluate the payment rates and regulations governing subclause (II) LTCHs, we have reviewed Medicare data from the only hospital meeting the statutory definition of a subclause (II) LTCH. As a result of these analyses, we are applying a payment adjustment to subclause (II) LTCHs beginning in FY 2015, which will result in payments for this category of LTCHs that resemble a payment based upon a TEFRA payment model (that is, a reasonable cost payment, subject to a ceiling).

Section 4417(b) of the BBA established the meaning of “subsection (d) hospitals,” which are paid under the IPPS, and in doing so, excluded two categories of hospitals that experience extended average inpatient length of stays. It also authorized the Secretary to define how an average inpatient length of stay would be calculated for these excluded hospitals. These provisions are included under sections 1886(d)(1)(B)(iv)(I) and (d)(1)(B)(iv)(II) of the Act, and the two categories of hospitals are generally referred to as subclause (I) and subclause (II) LTCHs.

Subclause (I) LTCHs are required to have an average inpatient length of stay that is greater than 25 days. Subclause (II) LTCHs are only required to have an average inpatient length of stay of greater than 20 days. The subclause (II) LTCH definition further limited the classification of a subclause (II) LTCH by including the requirement that the LTCH must have been first excluded from the IPPS in CY 1986, and treated a Medicare inpatient population in which 80 percent of the discharges in the 12-month reporting period ending in Federal FY 1997 had a principal diagnosis that reflected a finding of neoplastic disease. This statutory requirement is implemented under 42 CFR 412.23(e)(2)(ii).

In establishing the category of subclause (II) LTCHs, Congress essentially authorized special treatment of a hospital that, since 1986, had

focused on the provision of palliative care to Medicare beneficiaries diagnosed with end-stage cancer. In consideration of the distinction between hospitals qualifying as LTCHs, either as a subclause (I) LTCH or a subclause (II) LTCH, we established different standards for counting the average inpatient length of stay values for these two categories of LTCHs. We calculate the greater than 25-day average length of stay criteria using only Medicare claims data for subclause (I) LTCHs. However, for subclause (II) LTCHs, we calculate the average length of stay based on its entire patient population. We refer readers to the RY 2003 LTCH PPS final rule (67 FR 55974) for a full discussion of our rationale for implementing these average length of stay calculation methodologies.

The theoretical foundations of any PPS are based on a system of averages, where the costs of some cases may exceed the payment, while other cases’ costs will be less than the payment, creating an adequate balance in payments. Therefore, it is assumed that a hospital paid under a PPS would be able to maintain a balance of patients that will allow the hospital to achieve fiscal stability. With that said, in developing the LTCH PPS we were aware that a per discharge PPS system that pays the same amount for every case in a specific MS–LTC–DRG could encourage hospitals to make decisions based on financial considerations (such as prematurely discharging patients to reduce the cost of such cases). As per discharge payments under the LTCH PPS are based on the extended lengths of stay that characterize LTCHs, at the outset of the LTCH PPS, we established a short-stay outlier (SSO) policy under which we apply a payment adjustment for LTCH discharges with lengths of stay that do not exceed 5/6 of the geometric average length of stay of the MS–LTC–DRG. Equally, we were aware that there would be exceptionally expensive cases that could create financial disincentives to treat such patients and, therefore, we adopted a high-cost outlier (HCO) policy as well. However, given the nature of a subclause (II) LTCH’s patient population, it may not be reasonable to expect a balancing of more and less costly cases, as these LTCHs are generally only treating a subset of very sick patients. As such, we modified our original SSO payment policy for subclause (II) LTCHs, and we exempted this category of LTCHs from additional changes to the SSO policy to account for the extremely high percentage of cases that our data analysis revealed would have been subject to our SSO policy if

that policy were to be applied to subclause (II) LTCHs.

In accordance with the requirements of section 1206(d)(1) of Public Law 113–67, we conducted an evaluation of the payment rates and regulations governing subclause (II) LTCHs. We analyzed MedPAR claims data for FY 2010 and estimated Medicare costs incurred by the one LTCH currently classified as a subclause (II) LTCH, a 225-bed LTCH located in New York. We also evaluated the same metrics for two comparison groups of LTCHs, that is, approximately 40 LTCHs located in the same census region (that is, the Northeast Census Region, which includes Connecticut, Maine, New Jersey, and Pennsylvania), and approximately 25 LTCHs with the same bed size category (that is, between 150 and 250 beds) in order to assess the distinctions between a subclause (I) LTCH and a subclause (II) LTCH. For purposes of this analysis, LTCH PPS payments were calculated from the payment field in the MedPAR claims data, and the estimated costs for those claims were calculated using the covered charges and CCRs in the Provider-Specific File (PSF) that correlate to the discharge date on each claim. We calculated the aggregate average margins (ratio of payment to costs) for the subclause (II) LTCH and for the two sets of comparison groups of LTCHs using the calculated FY 2010 costs and payments. Our analysis found that, under current LTCH PPS payment policy, the subclause (II) LTCH has much lower margins than comparable LTCHs located in the Northeast Census Region or LTCHs with 150–250 beds. Specifically, the subclause (II) LTCH had a negative margin for its Medicare patients paid under LTCH PPS in FY 2010, while both the Northeast Census Region LTCHs and LTCHs with 150–250 beds had positive aggregate margins for its Medicare patients paid under LTCH PPS for the same period.

In our evaluation of subclause (II) LTCHs under the LTCH PPS, in accordance with the requirements of section 1206(d) of Public Law 113–67, we also compared the types of patients treated at subclause (I) and subclause (II) LTCHs. The top five MS–LTC–DRGs for patients treated at the subclause (II) LTCH in FY 2010 account for almost one-third of all of its Medicare discharges. Four of the top five MS–LTC–DRGs for the subclause (II) LTCH involve a neoplastic disease, and its case-mix differs significantly from the subclause (I) LTCHs, which had large proportions of ventilator and respiratory patients. The five most common MS–LTC–DRGs for the subclause (I) LTCHs were: Respiratory system diagnosis with

ventilator support 96+ hours (MS–LTC–DRG 207); Pulmonary edema and respiratory failure (MS–LTC–DRG 189); Septicemia or severe sepsis without ventilator support 96+ hours with MCC (MS–LTC–DRG 870); Skin ulcers with MCC (MS–LTC–DRG 592); and Respiratory system diagnosis with ventilator support < 96 hours (MS–LTC–DRG 208). In comparison, for the subclause (II) LTCH, the five most common MS–LTC–DRGs were: Respiratory neoplasms with CC (MS–LTC–DRG 181); Digestive malignancy with CC (MS–LTC–DRG 375); Respiratory neoplasms with MCC (MS–LTC–DRG 180); Organic disturbances & mental retardation (MS–LTC–DRG 884); and Malignancy, female reproductive system w CC (MS–LTC–DRG 755). These data highlight significant differences between a subclause (I) LTCH and a subclause (II) LTCH based on patient-mix and Medicare margins, notwithstanding the considerations that have been made in structuring the current LTCH regulations to acknowledge the uniqueness of an LTCH meeting the statutory definition of a subclause (II) LTCH.

In evaluating “both the payment rates and regulations governing hospitals which are classified under subclause (II) . . . ,” as required by section 1206(d) of Public Law 113–67, we also analyzed the impacts of upcoming changes to the LTCH PPS under section 1206(a) of Public Law 113–67. In discussing these analyses, we note that, as discussed in section VII.I.2. of the preamble of this final rule, we are not making any specific policy and payment changes in this final rule to implement the provisions of section 1206(a) of Public Law 113–67. We intend to establish policies related to the types of LTCH cases expected to meet the legislative patient-level criteria for the “standard LTCH PPS payment” and cases expected to meet the criteria for the “site neutral” payments under the LTCH PPS in the FY 2016 rulemaking cycle. Although we are not making any specific policy or payment changes in this final rule related to the provisions of section 1206(a) of Public Law 113–67 at this time, we discuss these provisions in this section because they relate to our analysis of the LTCH PPS payment rates and regulations governing subclause (II) LTCHs.

Absent the adoption of policies for the implementation of section 1206(d) of Public Law 113–67, the payment changes required by section 1206(a) of Public Law 113–67 will apply to subclause (II) LTCHs beginning with discharges occurring in cost reporting periods beginning on or after October 1,

2015 (that is, FY 2016 and beyond). Due to the changes required by the provisions of section 1206(a) of Public Law 113–67 (discussed at greater length under section VII.I. of the preamble of this final rule), beginning in FY 2016, only those LTCH discharges meeting specified patient-level clinical criteria will be paid a “standard LTCH PPS payment amount.” Discharges not meeting those criteria will be paid based on a “site neutral” payment amount (the lesser of the “IPPS comparable” amount, as applied under our SSO policy at \$ 412.529, or 100 percent of the estimated costs of the case). The statutory requirements to be paid the “standard LTCH PPS payment amount” are that the LTCH discharge *does not* have a principal diagnosis relating to a psychiatric diagnosis or to rehabilitation, and:

- The stay in the LTCH was immediately preceded by a discharge from an acute care hospital that included at least 3 days in an intensive care unit (ICU); or
- The stay in the LTCH was immediately preceded by a discharge from an acute care hospital and the patient’s LTCH stay is assigned to an MS–LTC–DRG based on the receipt of ventilator services of at least 96 hours.

Furthermore, section 1206(a)(1)(C)(ii)(II) of Public Law 113–67 specifies that, effective with cost reporting periods beginning on or after FY 2020, any LTCH with an “LTCH discharge payment percentage” that demonstrates that more than 50 percent of that LTCH’s discharges were paid for based on the “site neutral” payment rate will subsequently be paid for all discharges at the rate “. . . that would apply under subsection (d) for the discharge if the hospital were a subsection (d) hospital.” We refer readers to section VII.I. of the preamble of this final rule for a further discussion of the provisions of section 1206(a) of Public Law 113–67.

In light of these forthcoming statutory changes, we evaluated MedPAR claims data from the only hospital meeting the statutory definition of a subclause (II) LTCH for FY 2010 to project the impact of the revisions to the LTCH PPS made by section 1206(a) of Public Law 113–67. Our simulations included analyses of the potential financial impact of applying the patient-level criteria and “site neutral” payment policies to a subclause (II) LTCH, and the financial impact on payments if that LTCH were to be paid for more than 50 percent of its discharges at the “site neutral” payment rate. In conducting this analysis in the absence of rules implementing the changes mandated by

section 1206(a) of Public Law 113–67, we assumed that there would be no changes in LTCH admission patterns in response to the LTCH PPS payment changes required by section 1206(a) of Public Law 113–67. Furthermore, we used the FY 2010 claims data for the subclause (II) LTCH and the two LTCH comparison groups described above in order to compare the potential effects of the payment changes under the LTCH PPS required by section 1206(a) of Public Law 113–67 between subclause (I) LTCHs and subclause (II) LTCHs. We simulated payments for those discharges that would be expected to meet the legislative patient-level criteria for the “standard LTCH PPS payment” and for discharges that would be expected to receive “site neutral” payments under the LTCH PPS. Our analysis found that the subclause (II) LTCH would be expected to have significantly fewer (approximately 5 times fewer) discharges that would be expected to meet the legislative patient-level criteria for the “standard LTCH PPS payment” than the comparison groups of subclause (I) LTCHs (that is, Northeast Census Region LTCHs and LTCHs with 150–250 beds).

Additionally, we analyzed the potential effects of the “LTCH discharge payment percentage” provision under the requirements of section 1206(a)(1)(C)(ii)(II) of Public Law 113–67, as noted above. We evaluated FY 2010 claims data from the subclause (II) LTCH to project the potential impact of this provision. Based on our simulations in which we projected which FY 2010 LTCH claims would be expected to receive “site neutral” payments under the LTCH PPS (as described above), and having found a significant number, we project that a significant negative financial impact would be imposed upon the subclause (II) LTCH’s payments. Without considerable behavioral changes, the subclause (II) LTCH would be expected to have more than 50 percent of its discharges paid based on a “site neutral” payment and, therefore, would receive a payment adjustment under the provisions of section 1206(a)(1)(C)(ii)(II) of Public Law 113–67 for all of its discharges. Furthermore, our analysis revealed that, given the particular medical profile of their patient population, that the “subsection (d)” comparable payment amount under the payment adjustment required by section 1206(a)(1)(C)(ii)(II) of Public Law 113–67 would not likely cover the costs for a significant number of their discharges. Consequently, our analysis shows that the subclause (II) LTCH is projected to experience a large

negative aggregate average margin for its Medicare discharges under the payment changes required by section 1206(a) of Public Law 113–67.

Based on our findings under our evaluation of payments to subclause (II) LTCHs under the LTCH PPS and consistent with the provisions of section 1206(d) of Public Law 113–67, we evaluated adjustments that could be applied to ensure appropriate payments under the LTCH PPS for a subclause (II) LTCH under the LTCH PPS. This analysis included consideration of a reasonable-cost based model, such as the TEFRA payment system under which certain PPS-excluded hospitals (such as children’s and cancer hospitals) are currently paid. The TEFRA payment system, which was established under the provisions of Public Law 97–248, is implemented under the regulations at 42 CFR 413.40.

In addition to governing the current payment of certain PPS-excluded hospitals, the TEFRA payment system was also previously used to pay LTCHs prior to the implementation of the LTCH PPS. As described in the RY 2003 LTCH PPS final rule (67 FR 55957), the TEFRA payment system was “. . . established [to make] payments based on hospital-specific limits for inpatient operating costs. A ceiling on payments to such hospitals is determined by calculating the product of a facility’s base year costs (the year on which its target reimbursement limit is based) per discharge, updated to the current year by a rate-of-increase percentage, and multiplied by the number of total current year discharges.” (A detailed discussion of target amount payment limits under Public Law 97–248 can be found in the September 1, 1983 final rule published in the **Federal Register** (48 FR 39746).) Under the TEFRA payment system, in accordance with section 1886(g) of the Act, Medicare allowable capital costs are paid on a reasonable cost basis. We refer readers to the FY 2015 IPPS/LTCH PPS proposed rule for a detailed description of our analysis and evaluation of the application of the TEFRA payment model to a subclause (II) LTCH (78 FR 28202 through 28203). We note that in describing our estimated operating and capital payments under the TEFRA payment system principles in the proposed rule, we mistakenly stated that we used FY 2010 cost report data when those estimates were determined using FY 2011 cost report data.

Our analysis of the subclause (II) LTCH’s projected payments under a TEFRA-payment model indicated that such payments would reasonably cover the costs for most of their discharges,

and consequently, the subclause (II) LTCH is not projected to experience a negative aggregate margin for its Medicare discharges, unlike our projections under both the current LTCH PPS and the forthcoming payment changes to the LTCH PPS required by section 1206(a) of Public Law 113–67.

In the above analyses, we evaluated the current regulations as well as anticipated payment rates under various statutorily mandated policies for FY 2016 on a subclause (II) LTCH under the LTCH PPS based on FY 2010 discharge data, including payments, costs and case-mix. As discussed above, our evaluation indicates that, given the required patient-mix for a subclause (II) LTCH, the forthcoming changes to the LTCH PPS are likely to result in a financial situation that is not sustainable for the subclause (II) LTCH evaluated above. Furthermore, our analysis also shows that current LTCH PPS payments for a subclause (II) LTCH, even with taking into account the considerations that have been made in structuring current LTCH PPS policies to acknowledge the uniqueness of a subclause (II) LTCH, may not be sufficient to cover the costs incurred for the treatment of patients of the particular medical profile of the subclause (II) patient population prescribed by the statute. Furthermore, we believe that in establishing subclause (II) LTCHs, Congress endorsed the support of the unique mission of this particular category of hospital. In fact, while mandating a significant revision to the LTCH PPS under section 1206(a) of Public Law 113–67, under section 1206(d) of the same statute, Congress directed the Secretary to evaluate the impact of the LTCH PPS on subclause (II) LTCHs, and, based on those findings, authorized the Secretary to adjust payment rates and other regulations, as appropriate, for this category of LTCHs.

Accordingly, in recognition of the subclause (II) LTCH’s current estimated payment-to-cost ratio under the LTCH PPS and further anticipated losses that would likely otherwise occur under the forthcoming statutory changes to the LTCH PPS, which would render this type of specially recognized facility fiscally untenable, we believe that it is appropriate to exercise the authority under section 1206(d)(2) of Public Law 113–67. Therefore, in this final rule, for cost reporting periods beginning on or after October 1, 2014 (FY 2015 and beyond), we are applying a payment adjustment to subclause (II) LTCH payments under the LTCH PPS such that these LTCH PPS payments will

resemble payments made under the reasonable cost-based TEFRA payment system. We believe that it is appropriate to apply this payment adjustment for a subclause (II) LTCH's first cost reporting period beginning on or after October 1, 2014, rather than discharges occurring on or after October 1, 2014, because it is consistent with the annual update of the hospital-specific limits (ceiling) for inpatient operating costs under the TEFRA payment system (as described below). We are implementing this payment adjustment for subclause (II) LTCHs in the regulations by adding new § 412.526 under 42 CFR Part 412, Subpart O.

Specifically, in this final rule we are establishing new regulations under § 412.526 that will provide that, for cost reporting periods beginning on or after October 1, 2014, payments to a "subclause (II)" LTCH will be made under the LTCH PPS under Subpart O of Part 412, as adjusted. This adjusted payment amount will generally be equivalent to an amount determined under the reasonable cost-based reimbursement rules for both operating and capital-related costs under 42 CFR Part 413. As described above, Medicare payments for inpatient operating costs under the reasonable-cost based TEFRA payment system are subject to a hospital-specific ceiling on payments that is determined as the product of a hospital's base year costs per discharge ("target amount per discharge"), updated to the current year by a rate-of-increase percentage, and multiplied by the number of its Medicare discharges for the year. Medicare allowable inpatient capital-related costs are paid on a reasonable cost basis, in accordance with section 1886(g) of the Act.

Under this payment adjustment under new § 412.526 for inpatient operating costs, the adjusted payment amount will generally be determined in accordance with the cited provisions of § 413.40. Accordingly, we are establishing a "target amount" for a subclause (II) LTCH for purposes of calculating a hospital-specific ceiling on payments for inpatient operating costs under this payment adjustment. We will determine such a target amount based on the subclause (II) LTCH's target amount that was used to determine its payments for inpatient operating costs under the TEFRA payment system prior to the implementation of the LTCH PPS, updated by the TEFRA payment system rate-of-increase percentages under § 413.40(c)(3). Furthermore, in determining a subclause (II) LTCH's target amount for purposes of this payment adjustment, consistent with

the statute (as explained below), we are not including the increases to LTCHs' TEFRA target amounts and caps provided for by section 307(a) of the BIPA. As discussed previously, prior to the implementation of the LTCH PPS, section 307(a) of the BIPA provided a 2-percent increase to the wage-adjusted 75th percentile cap on the TEFRA target amounts for existing LTCHs for cost reporting periods beginning in FY 2001 and a 25-percent increase to the hospital-specific TEFRA target amounts for LTCHs, subject to the increased 75th percentile cap. Section 307(a)(2) of the BIPA also specifies that the 2-percent increase to the 75th percentile cap and the 25-percent increase to the TEFRA target amounts were not to be taken into account in the development and implementation of the LTCH PPS. Therefore, consistent with the statutory requirement under section 307(a)(2) of the BIPA, under new § 412.526, we will determine a subclause (II) LTCH's updated target amount based on its FY 2000 TEFRA payment system target amount, the year prior to when the increases under section 307(a) of the BIPA were effective. Using its FY 2000 TEFRA payment system target amount will ensure that the increases provided for by section 307(a) of the BIPA will not be included in the LTCH PPS payments to subclause (II) LTCHs under this LTCH PPS payment adjustment. This approach for excluding those increases to the TEFRA payment system target amounts is consistent with the methodology that was used to develop the one-time prospective adjustment to the standard Federal rate in which we calculated what amount would have been paid under the TEFRA payment system had the LTCH PPS not been implemented (77 FR 53497 through 53500). Therefore, under the payment adjustment for subclause (II) LTCHs under new § 412.526, we will determine a FY 2015 LTCH PPS target amount by updating the subclause (II) LTCH's FY 2000 TEFRA target amount using the applicable rate-of-increase percentages for FYs 2001 through 2015 established under § 413.40(c)(3).

In addition, as with TEFRA payment system, we will pay for inpatient capital-related costs in accordance with the regulations under 42 CFR Part 413, under which Medicare allowable capital costs are paid on a reasonable cost basis, consistent with section 1886(g) of the Act.

Comment: Several commenters supported the proposed policy to apply a payment adjustment to subclause (II) LTCHs payments modeled on the TEFRA payment system. In addition, the commenters suggested that CMS

provide the authority for this LTCH to request and receive an adjustment to its rate-of-increase ceiling, as specified in our TEFRA regulations at 42 CFR 413.40 (e), (g), and (i) for other hospitals paid on a TEFRA basis ". . . to address circumstances that arise that are beyond a hospital's control and render an applicable TEFRA ceiling amount inadequate."

Response: We have evaluated the provisions specified by the commenters and considered the fiscal circumstances of the one subclause (II) LTCH that will be affected by the payment system revisions finalized in this final rule. In response to the commenters' concerns, we believe that it would be reasonable to consider circumstances that may arise that are beyond a hospital's control and that may render an applicable LTCH PPS ceiling amount inadequate. Therefore, we are adding new paragraph (c)(5)(i) under new § 412.526 entitled "*Adjustments for Extraordinary circumstances.*" Paragraph (c)(5)(i)(A) under new § 412.526 states that CMS may adjust the ceiling determined under paragraph (c)(1) of the section for one or more cost reporting periods when unusual inpatient operating costs have resulted in the hospital exceeding its ceiling imposed under this section due to extraordinary circumstances beyond the hospital's control. These circumstances include, but are not limited to, strikes, fire, earthquakes, floods, or similar unusual occurrences with substantial cost effects.

The other suggestion recommended by the commenters deal with the LTCH's ability to request an adjustment to their allowed LTCH PPS rate-of-increase ceiling, if their costs during a specific period are no longer comparable to the base year and the authority to request a new base year for its LTCH PPS target amount. Because our data reveal that, on average, for the past 6 years, this LTCH's costs are considerably below the amount that OACT calculated as its FY 2015 target amount, we believe that these additional features are unnecessary at this time. Moreover, if future data indicate that a change is warranted, we will consider proposing to add these features to our policy in future rulemaking.

In summary, for cost reporting periods beginning on or after October 1, 2014, we are establishing that payment to a "subclause (II)" LTCH will be made under the LTCH PPS, as adjusted. The adjusted payment amount will be comprised of an amount determined under the reasonable cost-based reimbursement rules for both operating and capital-related costs in accordance with the cited portions of Part 413.

Under this payment adjustment, Medicare inpatient operating costs will be reimbursed on a reasonable cost basis, subject to a ceiling; that is, subject to an aggregate upper limit on the amount of a hospital's net Medicare inpatient operating costs that will be recognized for payment purposes. For each cost reporting period, the ceiling on payments for Medicare inpatient operating costs will be determined by multiplying the updated target amount for that period by the number of LTCH PPS discharges during that period. For cost reporting periods beginning during FY 2015, the target amount will be equal to the hospital's target amount determined under § 413.40(c)(4) for its cost reporting period beginning during FY 2000, updated by the applicable annual rate-of-increase percentages specified in § 413.40(c)(3) to the subject period (that is, for FYs 2001 through 2015). For subsequent cost reporting periods, the target amount will equal the hospital's target amount for the previous cost reporting period updated by the applicable annual rate-of-increase percentage specified in § 413.40(c)(3) for the subject cost reporting period. Payment for Medicare allowable inpatient capital-related costs under this payment adjustment will be made on a reasonable cost basis, in accordance with the cited portions of 42 CFR Part 413. In this final rule, we are codifying the provisions of this payment adjustment to subclause (II) LTCHs under new § 412.526 of the regulations. We are adding paragraph (c)(5), which establishes the general rules for requesting adjustments and also includes a provision to provide adjustments for unusual costs arising from extraordinary circumstances. In addition, we are making conforming changes to § 412.521(a)(2) to cross reference this payment adjustment under new § 412.526.

I. Description of Statutory Framework for Patient-Level Criteria-Based Payment Adjustment Under the LTCH PPS Under Pub. L. 113-67

1. Overview

In the FY 2014 IPPS/LTCH PPS proposed rule (78 FR 27668 through 27676), we presented a description of our research on the development of patient-level and facility-level criteria for LTCHs and a potential framework for developing changes to the LTCH PPS. The framework was based on the preliminary findings of two projects conducted by Kennell and Associates (Kennell) and its subcontractor, RTI, under the guidance of CMS' Center for Medicare and Medicaid Innovation (the

Innovation Center). We stated that we believed that the findings from these projects, in large part, could be used to identify the subpopulation of Medicare beneficiaries that should form the core group of patients under the LTCH PPS (that is, a chronically critical ill/medically complex (CCI/MC) framework for the LTCH PPS). Although this research was not completed at the time of issuance of the FY 2014 IPPS/LTCH PPS proposed rule, we solicited feedback from LTCH stakeholders in the FY 2014 IPPS/LTCH PPS proposed rule on the description of the interim framework, and indicated that any public comments submitted would be evaluated and considered by our contractors with the expectation of formulating a proposal for FY 2015 based on this research (78 FR 27668 through 27676).

Section 1206(a) of Public Law 113-67 amended section 1886(m) of the Act by adding paragraph (6), which establishes patient-level criteria for payments under the LTCH PPS for implementation beginning in FY 2016. Therefore, our prior intention to present a proposal for a CCI/MC framework for the LTCH PPS (as discussed in the FY 2014 IPPS/LTCH PPS proposed and final rules) in the FY 2015 IPPS/LTCH PPS proposed rule was superseded. Accordingly, we did not propose revisions to the LTCH PPS based upon the Kennell/RTI framework for FY 2015. Rather, we stated that we intend to propose to implement the requirements established by section 1206(a) of Public Law 113-67 in the FY 2016 LTCH PPS rulemaking cycle. (We note that the final report on the CCI/MC framework developed by Kennell/RTI under our research contract is expected to be available later this year and will be made available to the public through a Web site.)

We refer readers to section VII.I.2. of the preamble of the proposed rule in which we summarized the statutory provisions of section 1206(a) of Public Law 113-67 (78 FR 28204). In section VII.I.2. of the preamble of this final rule, we discuss several significant issues arising from these statutory changes to the LTCH PPS, on which we requested stakeholder feedback prior to developing our proposals for FY 2016 implementation. We intend to propose the specific policy and payment changes that will be necessary to implement the provisions of Public Law 113-67 for cost reporting periods beginning on or after October 1, 2015, during the FY 2016 rulemaking cycle. Although we did not propose to make any policy and payment changes mandated by section 1206(a)(1) of Public Law 113-67 in the FY 2015 IPPS/LTCH PPS proposed rule,

in light of the degree of the forthcoming changes, in section VII.I.3. of the preamble of the proposed rule, we discussed some of the changes and requested public feedback to inform our proposals for FY 2016.

2. Additional LTCH PPS Issues

The LTCH PPS was originally established for cost reporting periods beginning on or after October 1, 2002, by section 123(a) of the BBRA (Pub. L. 106-113) and section 307(b) of the BIPA (Pub. L. 106-554). (We also refer readers to section 1886(m) of the Act, as added by section 114(e) of the MMSEA.) Section 307(b) of the BIPA granted the Secretary considerable authority in developing the LTCH PPS, specifying that the Secretary shall “. . . examine and may provide for appropriate adjustments to the long-term hospital payment system, including adjustments to DRG weights, area wage adjustments, geographic reclassification, outliers, updates, and a disproportionate share adjustment. . . .”

Accordingly, as we evaluate the revisions to the LTCH PPS required by section 1206(a)(1) of Public Law 113-67, we believe that the broad authority permitted by the original statutory mandates continues to grant us the authority to modify, if appropriate, methodologies for our payment determinations under the LTCH PPS. (We refer readers to the RY 2003 LTCH PPS final rule (67 FR 55954), which describes the development and implementation of the LTCH PPS for FY 2003.) Specifically, section 1206(a) of Public Law 113-67 establishes two distinct payment groups for LTCH discharges under the revised system: discharges meeting specified patient-level criteria that will be paid under the “standard LTCH PPS payment amount” and all other patient discharges that will be paid under the “site neutral” payment rate and methodology (discussed above). In setting the payment rates and factors under the LTCH PPS as required by section 1206(a) of Public Law 113-67 for certain LTCH PPS payment adjustments, such as the MS-LTC-DRG relative weights and high-cost outlier payments, we plan to evaluate whether it would be appropriate to modify our historical methodology to account for the establishment of the two distinct payment methodologies for LTCHs. For example, we intend to examine whether, beginning in FY 2016, it is still appropriate to include data for *all* LTCH PPS cases, including “site neutral” payment cases, in our methodology for setting relative payment weights for MS-LTC-DRGs. We also intend to

explore the need for changes to the LTCH PPS high-cost outlier payment policies. Given the fact that, for a number of LTCH patients, payment will be made based on the lower of the “IPPS comparable” per diem payment and the estimated cost of the case, we will need to decide whether to maintain a single high-cost outlier “target” for all LTCH PPS cases (including “site neutral” payment cases) or whether it may be more appropriate to establish separate high-cost outlier “targets” for each of the two payment groups under the revised LTCH PPS. Our existing methodology for calculating the MS–LTC–DRG relative weights is discussed during the annual rulemaking cycle and was, most recently, included in the FY 2014 IPPS/LTCH final rule (78 FR 50753 through 50760). Our detailed description of our existing high-cost outlier payment policy, which has remained the same since being implemented, can be found in the RY 2003 LTCH PPS final rule (67 FR 56022 through 56027). (We note that our methodology for calculating the MS–LTC–DRG relative payment weights for FY 2015 can be found in section VII.B.3. of the preamble of this final rule, and our policies under the high-cost outlier payment policy for FY 2015 can be found in section V.D. of the Addendum to this final rule.)

In the FY 2015 IPPS/LTCH PPS proposed rule, we stated that we were interested in receiving feedback from LTCH stakeholders on our plans to evaluate whether it would be appropriate to modify any of our historical methodologies as we implement the payment changes to the LTCH PPS under section 1206(a) of Public Law 113–67. In particular, we were interested in public feedback on the issues mentioned earlier (that is, policies relating to establishing the relative payment weights and high-cost outliers) so that we may evaluate various options in preparation for developing proposals to implement the statutory changes beginning in FY 2016.

Comment: In response to our request for feedback from LTCH stakeholders, numerous commenters addressed the setting of relative payment weights for MS–LTC–DRGs and establishing a high-cost outlier policy under the new LTCH PPS framework. MedPAC urged CMS to establish “. . . new LTCH base payment rates and new relative payment weights for each MS–LTC–DRG based solely on the most recent available standardized data associated with discharges meeting the specified patient-level criteria.” MedPAC stated that the change in methodology required by the new LTCH PPS framework should not result in

increased aggregate payments for the cases paid under the standard LTCH PPS rate under the new LTCH PPS framework. MedPAC also recommended that both standard and site neutral payments receive high-cost outliers, and that total outlier payments under the LTCH PPS continue to account for 8 percent of total LTCH payments for all cases (both payment types combined) with the “same uniform national fixed-loss amount . . . applied to both cases being paid the standard LTCH PPS payment amount and to cases being paid the site neutral amount.” Most of the other commenters recommended that the high-cost outlier threshold and MS–LTC–DRG relative payment weights be calculated only using data from cases that meet the patient-level criteria established by section 1206 of Public Law 113–67; that is, cases for whom Medicare will make standard payments under the LTCH PPS, without including data on “site neutral” payments. Some of the commenters urged CMS to focus on keeping payments for standard cases at the same payment level as they have recently been, and recommended focusing only on standard cases for the calculation of the high-cost outlier threshold and for establishing MS–LTC–DRG relative payment weights. Other commenters recommended setting the fixed-loss threshold for high-cost outliers at 8 percent initially and then readjusting the threshold as more data become available. Several commenters conducted individual analyses and specifically recommended setting the fixed-loss threshold at 8 percent for each of the two payment types, standard and site neutral. A number of commenters made recommendations regarding specific aspects of the law. Other commenters opined that site neutral payments should be based on a full IPPS payment rather than the lesser of an IPPS comparable payment and the estimated costs of the case. Many commenters expressed concern regarding the severity of illness of many LTCH patients for whom site neutral payments would be made under the new LTCH PPS framework, and noted that the costs of treating such patients would not be covered under the statutory framework and could result in patient access problems for LTCH care. Other commenters suggested that the patient-level criteria that would have to be met in order for an LTCH to receive the standard payment rate be expanded to include severe wound care patients and diabetes diagnoses with post-surgical complications. Several commenters suggested that the statutory language be clarified regarding the

application of IPPS ICU and CCU codes 020X and 021X to determine compliance with the 3-day criteria, and urged CMS to consider all categories within those codes. Several commenters requested that CMS hold public meetings for stakeholders to address the issues presented by the implementation of section 1206 of Public Law 113–67.

Response: We appreciate the commenters’ thoughtful and detailed feedback, particularly those comments received regarding setting relative payment weights for MS–LTC–DRGs and establishing a high-cost outlier policy under the new LTCH PPS framework. In preparation for proposing the new LTCH PPS framework in the FY 2016 IPPS/LTCH PPS proposed rule, we will consider these suggestions and respond to stakeholders’ concerns with openness and transparency.

Comment: MedPAC included additional comments on CMS’ SSO policy in light of the new LTCH PPS framework that it believed are appropriate for inclusion in this final rule. MedPAC believed that the existing SSO policy, which pays an adjusted amount for cases with lengths of stay less than or equal to five-sixths of the geometric average length of stay for the MS–LTC–DRG, provides an incentive for LTCHs to make discharge decisions based on financial gain rather than purely clinical reasons. MedPAC analyses of LTCH discharge patterns indicate that the frequency of discharges rises sharply immediately after the SSO threshold. Once the statutory changes to the LTCH PPS are implemented, MedPAC recommended limiting the application of the existing SSO policy solely to cases paid under the standard LTCH PPS rate, and modifying the SSO policy to reduce the existing financial incentives by lowering the payment penalty for discharging patients before the SSO threshold. MedPAC recommended adopting the methodology used under the IPPS transfer policy; that is, for the first day of SSO cases payments would be twice the per diem rate for the MS–LTC–DRG with payment for each additional day set at the per diem rate up to the maximum of the full standard per discharge payment, which would only be reached 1 day before the average length of stay for the MS–LTC–DRG. For LTCH cases paid based on the site neutral payment methodology under the forthcoming statutory framework, MedPAC suggested that CMS adopt the short-stay policies that apply under the IPPS. Another commenter urged CMS to consider implementing a number of the SSO suggestions made by MedPAC.

Response: We appreciate MedPAC's detailed and thoughtful suggestions.

J. Technical Change

In this final rule, we are updating the legislative authorities cited for the regulations governing the LTCH PPS under Subpart O of Part 412. Specifically, we are adding references under new paragraphs (a)(4), (a)(5), and (a)(6) of § 412.500 of the regulations to the revisions to the Act made by section 4302(a) of Public Law 111–5, sections 3106(a) and 10312(a) of Public Law 111–148, and section 1206 of Public Law 113–67, respectively.

VIII. Administrative Appeals by Providers and Judicial Review

A. Proposed and Final Changes Regarding the Claims Required in Provider Cost Reports and for Provider Administrative Appeals

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 27978), we proposed to revise the cost reporting regulations in 42 CFR Part 413, Subpart B, by requiring a provider to include an appropriate claim for a specific item in its Medicare cost report in order to receive or potentially qualify for Medicare payment for the specific item. If the provider's cost report does not include an appropriate claim for a specific item, we proposed that payment for the item will not be included in the notice of program reimbursement (NPR) issued by the Medicare administrative contractor (MAC) (formerly known as fiscal intermediary and herein referred to as "contractor") or in any decision or order issued by a reviewing entity (as defined in 42 CFR 405.1801(a) of the regulations) in an administrative appeal filed by the provider. In addition, we proposed to revise the appeals regulations in 42 CFR Part 405, Subpart R, by eliminating the requirement that a provider must include an appropriate claim for a specific item in its cost report in order to meet the dissatisfaction requirement for jurisdiction before the Provider Reimbursement Review Board (Board), and by specifying the procedures for Board review of whether the provider's cost report meets the proposed substantive reimbursement requirement of an appropriate cost report claim for a specific item. We also proposed technical revisions to other Board appeal regulations to conform those regulations to the main revisions (described above) to the cost reporting regulations and the provider appeal regulations, and proposed similar revisions to the Part 405, Subpart R regulations for appeals before the

contractor hearing officers. We proposed that these revisions to the cost reporting regulations and the provider appeals regulations would apply to provider cost reporting periods beginning on or after the effective date of the final IPPS annual update rule.

We received numerous public comments of varied legal and procedural opinions in response to our proposals to revise the cost reporting regulations and the provider appeals regulations. The concerns raised by commenters about the breadth of the proposed provisions, and the questions raised in public comments about the interpretations we provided in the preamble to the proposed rule, have instead provided us with an opportunity to further and more fully dissect and digest the public comments. Therefore, we are not finalizing our proposals to revise the cost reporting regulations and the provider appeals regulations as set forth in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 27978). We note that, in this final rule, we are not addressing public comments received with respect to the provisions of the proposed rule that we are not finalizing at this time. Rather, we will address them at a later time, in a subsequent rulemaking document, as appropriate.

B. Proposed and Final Changes To Conform Terminology From "Intermediary" to "Contractor"

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 27978), we proposed to conform the terminology in Part 405, Subpart R and all subparts of Part 413 from "intermediary" or "fiscal intermediary" to "contractor" pursuant to sections 1816, 1874A and 1878 of the Act.

We did not receive any public comments on our proposal to conform the terminology in Part 405, Subpart R and all subparts of Part 413 from "intermediary" or "fiscal intermediary" to "contractor" pursuant to sections 1816, 1874A and 1878 of the Act. Therefore, we are finalizing our proposal to conform the terminology in Part 405, Subpart R and all subparts of Part 413 from "intermediary" or "fiscal intermediary" to "contractor".

C. Technical Correction to § 405.1835 of the Regulations and Corresponding Amendment to § 405.1811 of the Regulations

1. Background and Technical Correction to §§ 405.1811 and 405.1835 of the Regulations

Section 1878(a) of the Act allows providers to appeal to the Provider Reimbursement Review Board (the

Board) final determinations of program reimbursement made by a contractor, as well as certain final determinations by the Secretary involving payment under section 1886(d) (the inpatient hospital prospective payment system) and section 1886(b) (commonly known as the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA) payment system) of the Act. In addition, by regulation, providers are given the right to appeal to the Board or to contractor hearing officers certain other determinations.

Under section 1878(a)(1)(A), (2), and (3) of the Act, and § 405.1835(a)(1), (2), and (3)(i) of the regulations, a provider may obtain a Board hearing if it meets three jurisdictional requirements: (1) the provider is dissatisfied with a final determination of the contractor or the Secretary; (2) the amount in controversy is at least \$10,000; and (3) the provider files a request for a hearing to the Board within 180 days of notice of the final determination of the contractor or the Secretary. The same jurisdictional requirements govern provider appeals to contractor hearing officers under § 405.1811(a)(1), (a)(2), and (a)(3)(i) of the regulations, except that the amount in controversy requirement is at least \$1,000 but less than \$10,000.

However, the statutory requirements for Board jurisdiction are somewhat different if the provider does not receive a final determination of the contractor on a timely basis. Under section 1878(a)(1)(B), (a)(2), and (a)(3) of the Act, a provider may obtain a Board hearing if: (1) the provider does not receive a final determination of the contractor on a timely basis; (2) the amount in controversy is at least \$10,000; and (3) the provider files a request for a hearing to the Board within 180 days after notice of the contractor's final determination would have been received if such contractor determination had been issued on a timely basis. Moreover, § 405.1835(a)(3)(ii) of the regulations provides that a contractor determination is not timely if it is not issued, through no fault of the provider, within 12 months of the contractor's receipt of the provider's perfected cost report or amended cost report (as specified in § 413.24(f) of the regulations). The same jurisdictional requirements govern provider appeals to contractor hearing officers, based on an untimely contractor determination, under § 405.1811(a), except that the amount in controversy requirement is at least \$1,000 but less than \$10,000.

As noted, section 1878(a)(1)(A) of the Act requires that the provider "is dissatisfied with a final determination" of the contractor or the Secretary.

However, section 1878(a)(1)(B) of the Act does not require provider dissatisfaction for Board appeals based on an untimely final contractor determination.

Before a 2008 final rule (73 FR 30190; May 23, 2008) substantially amended the appeals rules, the regulations tracked fully the statute as to whether provider dissatisfaction was a prerequisite for Board jurisdiction. In the 2007 edition of the appeals regulations, § 405.1835(a) addressed the requirements for Board appeals of final contractor determinations, and referred to § 405.1841(a), which required the provider to set forth its dissatisfaction with specific aspects of the contractor determination. Thus, consistent with section 1878(a)(1)(A) of the Act, § 405.1835(a) and § 405.1841(a) of the 2007 regulations required provider dissatisfaction for Board appeals of final contractor determinations.

By contrast, Board appeals based on untimely contractor determinations were addressed in § 405.1835(c), which did not reference provider dissatisfaction. Instead, § 405.1835(c) simply provided that notwithstanding the provisions of paragraph (a)(1) of the section, the provider also has a right to a hearing before the Board if an intermediary's determination is not rendered within 12 months after receipt of a provider's perfected cost report or amended cost report provided such delay was not occasioned by the fault of the provider. Thus, as with section 1878(a)(1)(B) of the Act, § 405.1835(c) of the 2007 regulations did not require provider dissatisfaction for Board appeals based on untimely final contractor determinations.

In the 2008 final rule (73 FR 30190), § 405.1835 was substantially revised, § 405.1841 was removed, and the prior provisions in paragraph (c) of § 405.1835 for Board appeals based on untimely contractor determinations were also eliminated. As amended, § 405.1835(a) now states that a provider has a right to a Board hearing "only if" three criteria are satisfied. First, the provider must have "preserved its right to claim dissatisfaction with the amount of Medicare payment" by making a cost report claim for the item in dispute, or by "self-disallowing" the item by listing it as a "protested amount" in the cost report. Second, the amount in controversy must be at least \$10,000. Third, the Board must receive the provider's hearing request within 180 days after the provider received the final determination of the intermediary or the Secretary. However, if a final contractor determination is not issued (through no fault of the provider) within 12 months

of the contractor's receipt of the provider's perfected cost report or amended cost report, a Board hearing must be requested within 180 days after the expiration of that 12 month period. Under the existing regulations, provider dissatisfaction is a requirement for Board jurisdiction over appeals based on an untimely contractor determination, as well as for appeals of a final determination of the contractor or the Secretary.

As amended by the 2008 final rule (73 FR 30190), § 405.1835(a)'s provisions for Board appeals based on untimely contractor determinations no longer track fully the provisions for such appeals in section 1878(a)(1)(B) of the Act. Specifically, § 405.1835(a) of the regulations now requires provider dissatisfaction as a condition for Board jurisdiction over appeals based on an untimely contractor determination, but section 1878(a)(1)(B) of the Act does not impose a provider dissatisfaction requirement for such appeals.

When this difference between § 405.1835(a) of the regulations and section 1878(a)(1)(B) of the Act came to our attention, we looked into this matter. After reviewing the 2008 final rule and the corresponding parts of the 2004 proposed rule (69 FR 35716; June 25, 2004), we determined that the inclusion in § 405.1835(a) of a provider dissatisfaction requirement for Board appeals based on an untimely contractor determination reflects an inadvertent error in the drafting of the 2008 final rule and the 2004 proposed rule.

In this final rule, we are revising § 405.1835 of the regulations to eliminate provider dissatisfaction as a requirement for Board jurisdiction over appeals based on untimely contractor determinations. This is simply a technical correction inasmuch as this amendment to § 405.1835 conforms the regulations to the provisions in section 1878(a)(1)(B) of the Act for Board appeals based on an untimely contractor determination. In effect, this amendment to § 405.1835 of the regulations restores the full conformity of the regulations with the statutory requirements for Board jurisdiction over appeals based on untimely contractor determinations—a conformity that obtained before the 2008 final rule (73 FR 30190) inadvertently imposed a provider dissatisfaction requirement for Board appeals based on untimely contractor determinations. Moreover, in order to maintain consistency between the regulations for Board appeals and the rules for contractor hearing officer appeals, we also are revising § 405.1811 of the regulations to eliminate provider dissatisfaction as a requirement for

contractor hearing officer jurisdiction over appeals based on untimely contractor determinations.

2. Waiver of Notice of Proposed Rulemaking

We ordinarily publish a notice of proposed rulemaking in the **Federal Register** to provide a period for public comment before the provisions of a rule take effect in accordance with section 553(b) of the Administrative Procedure Act (APA) (5 U.S.C. 553(b)). However, we can waive this notice and comment procedure if the Secretary finds, for good cause, that the notice and comment process is impracticable, unnecessary, or contrary to the public interest, and incorporates a statement of the finding and the reasons therefore in the notice.

We find it unnecessary to undertake notice-and-comment rulemaking for the above-described revisions because those revisions are simply technical corrections that bring § 405.1835 of the Board appeals regulations into full conformity with section 1878(a)(1)(B) of the Act, and maintain consistency between § 405.1811 of the intermediary (contractor) hearing officer appeals regulations and § 405.1835 of the Board appeals regulations. The revisions do not represent changes in policy, nor do they have a substantive effect, and the public interest would be best served by timely correction of these technical errors. Therefore, we find good cause to waive notice and comment procedures.

3. Effective Date and Applicability Date; Finality and Reopening

The technical correction to § 405.1835 of the Board appeals regulations and the corresponding revision to § 405.1811 of the intermediary (contractor) hearing officer appeals regulations is effective October 1, 2014. The revisions to § 405.1835 of the Board appeals regulations and § 405.1811 of the intermediary (contractor) hearing officer appeals regulations are applicable, subject to the rules of administrative finality and reopening in § 405.1807 and § 405.1885 of the regulations, to appeals pending or filed on or after the August 21, 2008 effective date of the 2008 final rule (73 FR 30190).

The technical correction to § 405.1835 of the Board appeals regulations and the corresponding revision to § 405.1811 of the intermediary (contractor) hearing officer appeals regulations apply automatically to appeals, based on an untimely contractor determination, pending or filed on or after the October 1, 2014 effective date of this final rule. If the Board or the Administrator of CMS finally dismissed an appeal, based

on an untimely contractor determination, due to the provider's failure to make an appropriate cost report claim for the matter at issue, the provider may ask the Board or the Administrator, as applicable, to reopen such decision pursuant to § 405.1885 of the regulations and apply this technical correction to § 405.1835 of the Board appeals regulations, provided that such final jurisdictional dismissal decision was issued no more than 3 years before the October 1, 2014 effective date of this final rule. Similarly, if the contractor hearing officer or the CMS reviewing official finally dismissed an appeal, based on an untimely contractor determination, due to the provider's failure to make an appropriate cost report claim for the matter at issue, the provider may ask the contractor hearing officer or the CMS reviewing official, as applicable, to reopen such decision pursuant to § 405.1885 of the regulations and apply this technical correction to § 405.1811 of the intermediary (contractor) hearing officer appeals regulations, provided that such final jurisdictional dismissal decision was issued no more than 3 years before the October 1, 2014 effective date of this final rule.

We believe that, because the above-described regulatory amendments are simply technical corrections that do not make substantive changes to the regulations for appeals to the Board and the contractor hearing officers, the public interest is served by correcting the inadvertent drafting errors in the 2008 final rule's provisions for appeals to the Board and the contractor hearing officers based on untimely contractor determinations. As technical corrections to the 2008 final rule, we believe the above-described amendments to § 405.1811 and § 405.1835 should apply as of the August 21, 2008 effective date of the 2008 final rule, subject to the rules of administrative finality and reopening in § 405.1807 and § 405.1885 of the regulations.

We believe that fixing the applicability date, subject to the rules of administrative finality and reopening in § 405.1807 and § 405.1885 of the regulations, of these amendments by reference to the August 21, 2008 effective date of the 2008 final rule is not impermissibly retroactive in effect because the amendments simply correct and clarify longstanding agency policy and practice, and are procedural in nature. For example, we refer readers to *Heimmermann v. First Union Mortgage Corp.*, 305 F.3d 1257, 1260–61 (11th Cir. 2002) (a rule clarifying the law, especially in an unsettled or confusing area of the law, is not a substantive

change in the law, and thus the rule may apply to matters that preceded issuance of the rule.) However, if the above-described amendments to § 405.1811 and § 405.1835 were deemed a retroactive application of a substantive change to a regulation, section 1871(e)(1)(A) of the Act permits retroactive application of a substantive change to a regulation if the Secretary determines that such retroactive application is necessary to comply with statutory requirements or that failure to apply the change retroactively would be contrary to the public interest. We have determined that any retroactive application of these amendments to § 405.1811 and § 405.1835 is necessary to ensure full compliance with the statutory provisions for Board appeals based on untimely contractor determinations (under section 1878(a)(1)(B) of the Act). We have further determined that it would be in the public interest to apply these amendments, subject to the rules of administrative finality and reopening in § 405.1807 and § 405.1885 of the regulations, to Board appeals and contractor hearing officer appeals that were initiated or pending on or after the August 21, 2008 effective date of the 2008 final rule. The alternative, of not applying these amendments to § 405.1811 and § 405.1835 to Board appeals and contractor hearing officer appeals that were initiated or pending on or after the August 21, 2008 effective date of the 2008 final rule, would be inconsistent with the statutory provisions for Board appeals based on untimely contractor determinations (under section 1878(a)(1)(B) of the Act) and would undermine the public interest in maintaining consistency between the requirements for Board appeals and contractor hearing officer appeals.

IX. Quality Data Reporting Requirements for Specific Providers and Suppliers

We seek to promote higher quality and more efficient health care for Medicare beneficiaries. This effort is supported by the adoption of widely agreed-upon quality measures. We have worked with relevant stakeholders to define quality measures for most settings and to measure various aspects of care for most Medicare beneficiaries. These measures assess structural aspects of care, clinical processes, patient experiences with care, care coordination, and improving patient outcomes.

We have implemented quality reporting programs for multiple care settings, including:

- Hospital inpatient services under the Hospital Inpatient Quality Reporting (IQR) Program (formerly referred to as the Reporting Hospital Quality Data for Annual Payment Update (RHQDAPU) Program);
- Hospital outpatient services under the Hospital Outpatient Quality Reporting (OQR) Program (formerly referred to as the Hospital Outpatient Quality Data Reporting Program (HOP QDRP));
- Care furnished by physicians and other eligible professionals under the Physician Quality Reporting System (PQRS, formerly referred to as the Physician Quality Reporting Program Initiative (PQRI));
- Inpatient rehabilitation facilities under the Inpatient Rehabilitation Facility Quality Reporting Program (IRF QRP);
- Long-term care hospitals under the Long-Term Care Hospital Quality Reporting (LTCHQR) Program;
- PPS-exempt cancer hospitals under the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program;
- Ambulatory surgical centers under the Ambulatory Surgical Center Quality Reporting (ASCQR) Program;
- Inpatient psychiatric facilities under the Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program;
- Home health agencies under the home health quality reporting program (HH QRP); and,
- Hospice facilities under the Hospice Quality Reporting Program.

We have also implemented the End-Stage Renal Disease Quality Incentive Program and Hospital Value-Based Purchasing Program (described further below) that link payment to performance.

In implementing the Hospital IQR Program and other quality reporting programs, we have focused on measures that have high impact and support CMS and HHS priorities for improved quality and efficiency of care for Medicare beneficiaries. Our goal for the future is to align the clinical quality measure requirements of the Hospital IQR Program with various other Medicare and Medicaid programs, including those authorized by the Health Information Technology for Economic and Clinical Health (HITECH) Act, so that the reporting burden on providers will be reduced. As appropriate, we will consider the adoption of clinical quality measures with electronic specifications so that the electronic collection of performance information is part of care delivery. Establishing such a system will require interoperability between EHRs and CMS data collection systems,

additional infrastructural development on the part of hospitals and CMS, and adoption of standards for capturing, formatting, and transmitting the data elements that make up the measures. However, once these activities are accomplished, adoption of measures that rely on data obtained directly from EHRs will enable us to expand the Hospital IQR Program measure set with less cost and reporting burden to hospitals. We believe that in the near future, collection and reporting of data elements through EHRs will greatly simplify and streamline reporting for various CMS quality reporting programs, and that hospitals will be able to switch primarily to EHR-based data reporting for many measures that are currently manually chart-abstracted and submitted to CMS for the Hospital IQR Program.

We also have implemented a Hospital Value-Based Purchasing (VBP) Program under section 1886(o) of the Act. In 2011, we issued the Hospital Inpatient VBP Program final rule (76 FR 26490 through 26547). We most recently adopted additional policies for the Hospital VBP Program in section XIV. of the CY 2014 OPPI/ASC final rule with comment period (78 FR 75120 through 75121). We are finalizing additional policies for this program in section IV.I. of the preamble of this final rule. Under the Hospital VBP Program, hospitals will receive value-based incentive payments based on their quality performance with respect to performance standards for a performance period for the fiscal year involved. The measures under the Hospital VBP Program must be selected from the measures (other than readmission measures) specified under the Hospital IQR Program as required by section 1886(o)(2)(A) of the Act.

In selecting measures for the Hospital IQR Program, we are mindful of the conceptual framework we have described for the Hospital VBP Program. The Hospital IQR Program is linked with the Hospital VBP Program because many of the measures and the reporting infrastructure for the programs overlap. We view the Hospital VBP Program as the next step in promoting higher quality care for Medicare beneficiaries by transforming Medicare from a passive payer of claims into an active purchaser of quality healthcare for its beneficiaries. Value-based purchasing is an important step to revamping how care and services are paid for, moving increasingly toward rewarding better value, outcomes, and innovations instead of merely volume.

We also view the Hospital-Acquired Condition (HAC) payment adjustment

program authorized by section 1886(p) of the Act, as added by section 3008 of the Affordable Care Act, and the Hospital VBP Program, as related but separate efforts to reduce HACs. The Hospital VBP Program is an incentive program that awards payments to hospitals based on quality performance on a wide variety of measures, while the HAC Reduction Program creates a payment adjustment resulting in payment reductions for the lowest performing hospitals based on their rates of HACs. Newly finalized policies for the Hospital VBP Program are included in section IV.I. of the preamble of this final rule. Newly finalized policies for the HAC Reduction Program are included in section IV.J. of the preamble of this final rule.

Although we intend to monitor the various interactions of programs authorized by the Affordable Care Act and their overall impact on providers and suppliers, we also view programs that could potentially affect a hospital's Medicaid payment as separate from programs that could potentially affect a hospital's Medicare payment.

In the preamble of this final rule, we are finalizing changes to the following Medicare quality reporting systems:

- In section IX.A., the Hospital IQR Program.
- In section IX.B., the PCHQR Program.
- In section IX.C., the LTCHQR Program.

In addition, in section IX.D. of the preamble of this final rule, we are finalizing changes to the Medicare EHR Incentive Program.

A. Hospital Inpatient Quality Reporting (IQR) Program

1. Background

a. History of the Hospital IQR Program

We refer readers to the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43860 through 43861) and the FY 2011 IPPS/LTCH PPS final rule (75 FR 50180 through 50181) for detailed discussions of the history of the Hospital IQR Program, including the statutory history, and to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50789 through 50807) for the measures we have adopted for the Hospital IQR measure set through the FY 2016 payment determination and subsequent years.

b. Maintenance of Technical Specifications for Quality Measures

The technical specifications for the Hospital IQR Program measures, or links to Web sites hosting technical specifications, are contained in the CMS/The Joint Commission (TJC)

Specifications Manual for National Hospital Quality Measures (Specifications Manual). This Specifications Manual is posted on the QualityNet Web site at <http://www.qualitynet.org/>. We generally update the Specifications Manual on a semiannual basis and include in the updates detailed instructions and calculation algorithms for hospitals to use when collecting and submitting data on required measures. These semiannual updates are accompanied by notifications to users, providing sufficient time between the change and the effective date in order to allow users to incorporate changes and updates to the specifications into data collection systems.

The technical specifications for the HCAHPS patient experience of care survey are contained in the current HCAHPS *Quality Assurance Guidelines* manual, which is available at the HCAHPS On-Line Web site, <http://www.hcahponline.org>. We maintain the HCAHPS technical specifications by updating the HCAHPS *Quality Assurance Guidelines* manual annually, and include detailed instructions on survey implementation, data collection, data submission and other relevant topics. As necessary, HCAHPS Bulletins are issued to provide notice of changes and updates to technical specifications in HCAHPS data collection systems.

Many of the quality measures used in different Medicare and Medicaid reporting programs are endorsed by the National Quality Forum (NQF). As part of its regular maintenance process for endorsed performance measures, the NQF requires measure stewards to submit annual measure maintenance updates and undergo maintenance of endorsement review every 3 years. In the measure maintenance process, the measure steward (owner/developer) is responsible for updating and maintaining the currency and relevance of the measure and will confirm existing or minor specification changes with NQF on an annual basis. NQF solicits information from measure stewards for annual reviews, and it reviews measures for continued endorsement in a specific 3-year cycle.

The NQF regularly maintains its endorsed measures through annual and triennial reviews, which may result in the NQF making updates to the measures. We believe that it is important to have in place a subregulatory process to incorporate nonsubstantive updates made by the NQF into the measure specifications we have adopted for the Hospital IQR Program so that these measures remain up-to-date. We also recognize that some

changes the NQF might make to its endorsed measures are substantive in nature and might not be appropriate for adoption using a subregulatory process.

Therefore, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53504 through 53505), we finalized a policy under which we use a subregulatory process to make nonsubstantive updates to measures used for the Hospital IQR Program. With respect to what constitutes substantive versus nonsubstantive changes, we expect to make this determination on a case-by-case basis. Examples of nonsubstantive changes to measures might include updated diagnosis or procedure codes, medication updates for categories of medications, broadening of age ranges, and exclusions for a measure (such as the addition of a hospice exclusion to the 30-day mortality measures). We believe that nonsubstantive changes may include updates to NQF-endorsed measures based upon changes to guidelines upon which the measures are based.

We will continue to use rulemaking to adopt substantive updates made to measures we have adopted for the Hospital IQR Program. Examples of changes that we might consider to be substantive would be those in which the changes are so significant that the measure is no longer the same measure, or when a standard of performance assessed by a measure becomes more stringent (for example, changes in acceptable timing of medication, procedure/process, or test administration). Another example of a substantive change would be where the NQF has extended its endorsement of a previously endorsed measure to a new setting, such as extending a measure from the inpatient setting to hospice. These policies regarding what is considered substantive versus nonsubstantive would apply to all measures in the Hospital IQR Program. We also note that the NQF process incorporates an opportunity for public comment and engagement in the measure maintenance process.

We believe this policy adequately balances our need to incorporate updates to Hospital IQR Program measures in the most expeditious manner possible while preserving the public's ability to comment on updates that so fundamentally change an endorsed measure that it is no longer the same measure that we originally adopted.

c. Public Display of Quality Measures

Section 1886(b)(3)(B)(viii)(VII) of the Act, as amended by section 3001(a)(2) of the Affordable Care Act, requires that

the Secretary establish procedures for making information regarding measures submitted available to the public after ensuring that a hospital has the opportunity to review its data before they are made public. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28218 through 28219), we did not propose to change our current policy of reporting data from the Hospital IQR Program as soon as it is feasible on CMS Web sites such as the *Hospital Compare* Web site (<http://www.medicare.gov/hospitalcompare>) and/or the interactive <https://data.medicare.gov> Web site, after a preview period.

The *Hospital Compare* Web site is an interactive Web tool that assists beneficiaries by providing information on hospital quality of care to those who need to select a hospital. For more information on measures reported to *Hospital Compare*, please see <http://www.medicare.gov/hospitalcompare>. Other information not reported to *Hospital Compare* may be made available on other CMS Web sites such as <http://www.cms.hhs.gov/HospitalQualityInits/data.medicare.gov>.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50777 through 50778) we responded to public comments on what additional quality measures and information featured on *Hospital Compare* may be highly relevant to patients and other consumers of health care, and how we may better display this information on the *Hospital Compare* Web site.

2. Removal and Suspension of Hospital IQR Program Measures

a. Considerations in Removing Quality Measures From the Hospital IQR Program

As discussed further below, we generally retain measures from the previous year's Hospital IQR Program measure set for subsequent years' measure sets except when we specifically propose to remove or replace them. As we stated in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50185), the criteria that we consider when determining whether to remove Hospital IQR Program measures are the following: (1) Measure performance among hospitals is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made ("topped-out" measures); (2) availability of alternative measures with a stronger relationship to patient outcomes; (3) a measure does not align with current clinical guidelines or practice; (4) the availability of a more broadly applicable

(across settings, populations, or the availability of a measure that is more proximal in time to desired patient outcomes for the particular topic; (5) performance or improvement on a measure does not result in better patient outcomes; (6) the availability of a measure that is more strongly associated with desired patient outcomes for the particular topic; and (7) collection or public reporting of a measure leads to negative unintended consequences other than patient harm. We also take into account the views of the Measure Applications Partnership (MAP) when determining when a measure should be removed, and we strive to eliminate redundancy of similar measures (77 FR 53505 through 53506).

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28219), we proposed to change the criteria for determining when a measure is "topped-out." A measure is "topped-out" when measure performance among hospitals is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made ("topped-out" measures) (77 FR 53505 through 53506). We do not believe that measuring hospital performance on "topped-out" measures provides meaningful information on the quality of care provided by hospitals. We further believe that quality measures, once "topped-out," represent care standards that have been widely adopted by hospitals. We believe such measures should be considered for removal from the Hospital IQR Program because their associated reporting burden may outweigh the value of the quality information they provide.

In order to determine "topped-out" status, we proposed to apply the following two criteria, the first of which was previously adopted by the Hospital VBP Program in the Hospital Inpatient VBP Program final rule (76 FR 26496 through 26497), to Hospital IQR Program measures. The second criterion is a modified version of what was previously adopted by the Hospital VBP Program in the above mentioned final rule, with the change from the "less than" operator (<) to the "less than or equal to" operator (≥):

- Statistically indistinguishable performance at the 75th and 90th percentiles; and
- Truncated coefficient of variation ≤ 0.10.

The coefficient of variation (CV) is a common statistic that expresses the standard deviation as a percentage of the sample mean in a way that is independent of the units of observation. Applied to this analysis, a large CV would indicate a broad distribution of

individual hospital scores, with large and presumably meaningful differences between hospitals in relative performance. A small CV would indicate that the distribution of individual hospital scores is clustered tightly around the mean value, suggesting that it is not useful to draw distinctions among individual hospitals' measure performance. By adopting "less than or equal to" in our "topped-out" test, we are clarifying the interpretation of the CV when a tie at 0.1 occurs due to rounding. We believe that the proposed criteria distinguish measures with significant variation in performance among hospitals.

In the Hospital VBP Program context, we used a modified version of the CV, namely a truncated CV, for each measure, in which the 5 percent of hospitals with the lowest scores, and the 5 percent of hospitals with highest scores were first truncated (set aside) before calculating the CV. This was done to avoid undue effects of the highest and lowest outlier hospitals, which if included, would tend to greatly widen the dispersion of the distribution and make the measure appear to be more reliable or discerning.

Comment: A number of commenters supported the criteria for determining when a measure is "topped-out." Some commenters specifically noted that removing "topped-out" measures will reduce hospital reporting burden.

Several commenters supported removing "topped-out" chart-abstracted measures. Some commenters specifically supported the removal of structural measures.

Response: We appreciate the commenters' support for removing "topped-out" measures. We will consider removal of topped-out structural measures in future years consistent with our measure removal and topped-out status policies.

Comment: A commenter stated that the process of care measures that are "topped-out" should be removed both in their chart-abstracted and electronic clinical quality measure versions. The commenter believed that interpreting disparate and incorrect performance rates for the measures as reported in their electronic versions is burdensome to stakeholders, and that the specifications for the chart-abstracted and electronic versions of measures would be misaligned which may lead to issues in capturing the full range of patient care. The commenter also expressed concern about which electronic versions of these measures will be submitted to CMS. Finally, the commenter stated that process of care measures, whether submitted as chart-

abstracted or electronic versions, distract from measures of outcomes and hospital-acquired conditions.

Response: We would like to clarify that we consider both the chart-abstracted and the electronically specified versions to be "topped-out." However, we would like to retain the electronically specified versions of these "topped-out" measures for the following reasons: (1) To align the Hospital IQR Program and the Medicare EHR Incentive Program, (2) to allow us to monitor the effectiveness of measure reporting by EHRs, and (3) to familiarize hospitals with reporting electronically specified measures to us.

As we continue aligning the Hospital IQR Program and the Medicare EHR Incentive Program, and we believe collecting this measure on a voluntary basis enables us to continue collecting quality data on this topic while working to minimize reporting burden on participating hospitals. We believe that the benefits outweigh the possible disadvantages to reporting the electronic clinical quality measure versions of these measures. Collecting the electronic version of these measures would prepare hospitals for data submission using our electronic measure specifications prior to electronic clinical quality measures becoming a requirement in the Hospital IQR Program. Retaining of the electronic versions of these topped-out measures creates alignment with the Medicare EHR Incentive Program.

We remind commenters that hospitals could choose whether to submit the voluntary electronic clinical quality measures. We also would allow the voluntary submission of the chart-abstracted version of the "topped-out" measures for those hospitals that prefer to submit measure data in that format. In this way, we believe that we are representing the full range of care provided to patients and responding to commenters' concerns.

We acknowledge the commenter's concerns that with multiple versions of a particular electronic clinical quality measure creates confusion for hospitals to determine which one to use. To address this concern, we are modifying our proposal to finalize a policy that hospitals must submit the April 2014 version of the electronic clinical quality measures as discussed in section IX.A.2.h.(1) of the preamble of this final rule.

Comment: Several commenters urged CMS to consider the broader context and uses of measures before removing them based on quantitative data only, noting that some measures meeting the

"topped-out" criteria may still provide value to patients and hospitals.

Response: We agree that both quantitative criteria and clinically-based qualitative criteria should be used in assessing "topped-out" measures. These criteria are part of the existing criteria available to us to determine whether to remove a measure from the Hospital IQR Program. As we stated in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50185), the criteria that we consider when determining whether to remove Hospital IQR Program measures are the following: (1) Measure performance among hospitals is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made ("topped-out" measures); (2) availability of alternative measures with a stronger relationship to patient outcomes; (3) a measure does not align with current clinical guidelines or practice; (4) the availability of a more broadly applicable (across settings, populations, or the availability of a measure that is more proximal in time to desired patient outcomes for the particular topic; (5) performance or improvement on a measure does not result in better patient outcomes; (6) the availability of a measure that is more strongly associated with desired patient outcomes for the particular topic; and (7) collection or public reporting of a measure leads to negative unintended consequences other than patient harm.

We also take into account the views of the Measure Applications Partnership (MAP) when determining when a measure should be removed, and we strive to eliminate redundancy of similar measures (77 FR 53505 through 53506).

Comment: A few commenters wanted CMS to continue publicly reporting topped-out measures used in pay-for-performance or payment penalty programs or to maintain focus on issues hospitals achieved high performance.

Response: We will allow those hospitals that would like to submit the voluntary measures in chart-abstracted format or as electronic clinical quality measures.

After consideration of the public comments we received, we are finalizing our proposal to update the criteria to determine "topped-out" measure status as proposed.

b. Removal of Hospital IQR Program Measures for the FY 2017 Payment Determination and Subsequent Years

As we continue moving towards including more clinical outcomes measures as opposed to process-of-care measures in the Hospital IQR Program

measure set, we have considered removing additional measures using our previously-adopted removal criteria. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28219 through 28220), we proposed to remove five measures from the Hospital IQR Program for the FY 2017 payment determination and subsequent years, which begins in the CY 2015 reporting period: (1) AMI-1 Aspirin at arrival (NQF #0132); (2) AMI-3 ACEI/ARB for left ventricular systolic dysfunction (NQF #0137); (3) AMI-5 Beta-blocker prescribed at discharge (NQF #0160); (4) SCIP Inf-6 Appropriate Hair Removal; and (5) Participation in a systematic database for cardiac surgery (NQF #0113).

We proposed to remove the first four measures because they were previously determined to be “topped-out” and suspended (77 FR 53509). We proposed to remove the fifth measure because the MAP recommended the measure’s removal in its MAP Pre-Rulemaking Report: 2014 Recommendations on Measures for More than 20 Federal Programs, which is available at: http://www.qualityforum.org/Publications/2014/01/MAP_Pre-Rulemaking_Report_2014_Recommendations_on_Measures_for_More_than_20_Federal_Programs.aspx. The MAP report states that the measure’s NQF endorsement has been placed on reserve status because the measure is “topped-out.” The purpose of reserve status is to retain endorsement of reliable and valid quality performance measures that have

overall high levels of performance with little variability so that performance could be monitored in the future if necessary to ensure that performance does not decline. This status would apply only to highly credible, reliable, and valid measures that have high levels of performance due to quality improvement actions (often facilitated or motivated through public reporting and other accountability programs). More information about NQF reserve status is available at: https://www.qualityforum.org/docs/Reserve_Endorsement_Status.aspx.

By removing these measures, we would alleviate the maintenance costs and administrative burden to hospitals associated with retaining them. Should we determine that hospital adherence to these practices has unacceptably declined, we would propose to resume data collection in future rulemaking. In addition, we would comply with any requirements imposed by the Paperwork Reduction Act before re-proposing these measures.

We also analyzed the remainder of the Hospital IQR Program measure set for other potential “topped-out” measures using the previously adopted criteria. The analysis was based on the most recent two quarters of clinical process of care data available in the CMS Clinical Data Warehouse for IPPS eligible hospitals, which covers a measurement period from 01/01/2013 to 06/30/2013 (Q1 2013–Q2 2013). Based on this analysis and using the previously

adopted criteria, we noted that an additional 15 chart-abstracted measures were “topped-out,” and we proposed to remove them from the measure set for the FY 2017 payment determination and subsequent years.

However, we proposed to retain the electronic clinical quality measure version of 10 of these chart-abstracted measures for Hospital IQR Program reporting as discussed further in section IX.A.7.f. of the preamble of this final rule. As we continue aligning the Hospital IQR Program and Medicare EHR Incentive Program, and we believe collecting this measure on a voluntary basis enables us to continue collecting quality data on this topic while working to minimize reporting burden on participating hospitals.

Further, allowing hospitals the option to electronically report topped-out measures will provide hospitals with an opportunity to test the accuracy of their electronic health record reporting systems. We believe that retaining “topped-out” measures under certain circumstances enables us to continue monitoring the clinical topic covered by the measure to ensure that hospitals continue to maintain high levels of performance. Further, we believe the additional reporting burden associated with retaining these measures is mitigated by retaining electronic versions of those measures, which are more easily reported by hospitals. These 10 measures are denoted in the chart below by an asterisk.

“TOPPED-OUT” CHART-ABSTRACTED MEASURES PROPOSED FOR REMOVAL FOR THE FY 2017 PAYMENT DETERMINATION

- AMI-1: Aspirin at Arrival (previously suspended)
- AMI-3: ACEI or ARB for left ventricular systolic dysfunction—Acute Myocardial Infarction (AMI) Patients (previously suspended) (NQF #0137)
- AMI-5: Beta-Blocker Prescribed at Discharge for AMI (previously suspended) (NQF #0160)
- AMI-8a: Primary PCI received within 90 minutes of hospital arrival * (NQF #0163)
- HF-2: Evaluation of left ventricular systolic function (NQF #0135)
- PN-6: Initial antibiotic selection for community-acquired pneumonia (CAP) in immunocompetent patients* (NQF #0147)
- SCIP-Card-2: Surgery patients on beta blocker therapy prior to arrival who received a beta blocker during the perioperative period (NQF #0284)
- SCIP-Inf-1: Prophylactic antibiotic received within one hour prior to surgical incision* (NQF #0527)
- SCIP-Inf-2: Prophylactic antibiotic selection for surgical patients* (NQF #0528)
- SCIP-Inf-3: Prophylactic antibiotics discontinued within 24 hours after surgery end time (48 hours for cardiac surgery) (NQF #0529)
- SCIP-Inf-4: Cardiac surgery patients with controlled postoperative blood glucose (NQF #0300)
- SCIP-Inf-6: Surgery patients with appropriate hair removal (previously suspended) (NQF #0301)
- SCIP-Inf-9: Urinary catheter removed on Postoperative Day 1 (POD1) or Postoperative Day 2 (POD2) with day of surgery being day zero* (NQF #0453)
- SCIP-VTE-2: Surgery Patients Who Received Appropriate Venous Thromboembolism (VTE) Prophylaxis Within 24 Hours Prior to Surgery to 24 Hours After Surgery (NQF #0218)
- STK-10: Assessed for rehabilitation* (NQF #0441)
- STK-2: Discharged on antithrombotic therapy * (NQF #0435)
- STK-3: Anticoagulation therapy for atrial fibrillation/flutter* (NQF #0436)
- STK-5: Antithrombotic therapy by the end of hospital day two* (NQF #0438)
- VTE-4: Patients receiving un-fractionated Heparin with doses/labs monitored by protocol*
- Participation in a systematic database for cardiac surgery (NQF #0113)

* To be retained as an electronic clinical quality measure.

We welcomed public comments on our proposal to remove these measures.

Comment: Many commenters supported the removal of “topped-out”

measures, some saying that by doing so CMS is reducing hospital burden.

Response: We thank the commenters for their support.

Comment: A commenter opposed the removal of the AMI-1 measure. The commenter noted that aspirin after a myocardial infarction is a potentially life-saving measure and should continue to be tracked.

Response: We thank the commenter for their recommendation. We are removing AMI-1 because the measure is “topped-out” and was previously suspended in FY 2012 IPPS/LTCH PPS final rule. We believe that the practice of providing aspirin to patients on arrival to the hospital addressed by this measure continues to be routinely practiced. As the practice measured by the AMI-1 measure is standard procedure among most hospitals, we do not believe that retaining it as a chart-abstracted measure would be a value to hospitals or for monitoring quality performance.

Comment: A commenter opposed the removal of AMI-8a: Primary PCI Received within 90 Minutes of Hospital Arrival because it is “topped-out.” The commenter did not believe that it is appropriate to retire a measure without first finding a replacement measure. The commenter was concerned that the retirement of numerous AMI and heart failure measures may unintentionally shift hospital resources to other measures and adversely affect the quality of care received by these patients.

Response: We respectfully disagree with the commenter that we should not remove a measure until a replacement is found. We believe that we should retire measures once we determine that there is no further value to hospitals or patients because the process of care the measure is monitoring has become standard practice. We believe that removing “topped-out” measures are appropriate and necessary to improve patient care. As we stated in the proposed rule, we believe that quality measures, once “topped-out,” represent care standards that have been widely adopted by hospitals (79 FR 28219). Therefore, it makes sense to remove the “topped-out” measures and adopt other measures which may represent care standards that are not widely adopted by hospitals, but which we believe should be widely adopted.

We invite the commenter to recommend measures for the Hospital IQR Program through the Measures Under Consideration process for our consideration. Information on how to recommend measures for the Hospital IQR Program is available at <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment->

Instruments/MMS/CallForMeasures.html.

Comment: One commenter opposed the removal of HF-2: Evaluation of Left Ventricular Systolic Function because it is “topped-out.” With the removal of this measure, the commenter noted that the only heart failure measures left in the program will be the 30-day readmission and 30-day mortality measures. The commenter is concerned that removing this measure will signal to hospitals that heart failure is not a CMS priority.

Response: We respectfully disagree with the commenter that the removal of “topped-out” measures will result in hospitals no longer focusing on the practice the measure is monitoring. Hospitals are committed to providing good quality care to patients and we do not have any indication that they will stop doing so in these areas for which the quality of care measured has become standard practice.

Comment: A commenter suggested that CMS continue to collect chart-abstracted data on SCIP-Inf-3 for another year because is inappropriate to assume that the measure will be “topped-out” given that the measure had significant data definition changes effective January 1, 2014. SCIP-Inf-3 no longer excludes for patients on home antibiotics or that do not receive general anesthesia.

Response: We acknowledge that SCIP-Inf-3 no longer excludes for patients on home antibiotics, however our analysis showed that these patients were being excluded by documentation of infection. For this reason, this change was not considered to be substantive enough to withhold removal of the measure. With regard to the concern about the exclusion for patients that do not receive general anesthesia, SCIP-Inf-3 measure has never had an exclusion for anesthesia type so this would have no impact on the measure results, and would not change our topped-out status analysis. We continue to believe SCIP-Inf-3 is “topped-out” and should be removed from the Hospital IQR Program.

Comment: Several commenters questioned the removal of SCIP-Inf-4, stating that CMS cannot assess whether the measure is topped-out. These commenters stated that CMS revised the specifications for the SCIP-Inf-4: Cardiac Surgery Patients with Controlled Postoperative Blood Glucose measure to incorporate the recent NQF endorsement maintenance decisions, beginning with January 1, 2014, discharges. These commenters stated that the NQF changed the measure from controlled glucose at 6AM to a more

comprehensive measure of controlled glucose 18–24 hours post-cardiac surgery, and required that corrective action be documented if post-operative glucose is over 180mg/dl. These commenters expressed concern that these substantial changes would change the performance scores.

Response: We acknowledge that there were refinements made to SCIP-Inf-4 that were finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50787 through 50788). The “topped-out” analysis cited in the proposed rule (79 FR 28220) was completed using SCIP-Inf-4 data before these refinements were implemented. Because we do not yet have sufficient data to accurately assess whether this refined measure meets “topped-out” criteria, we are modifying our proposal and will not remove this measure. Instead, we will continue to require reporting on SCIP-Inf-4 in the Hospital IQR Program as previously finalized.

Comment: Several commenters supported the removal of STK-2, STK-3, STK-5, and STK-10.

Response: We thank the commenters for their support. We believe that these four measures are “topped-out” and will be removed from the Hospital IQR Program in their chart-abstracted measure version. Please note, however, that we will continue to accept STK-2, STK-3, STK-5, and STK-10 data as electronic clinical quality measures.

Comment: A commenter opposed the removal of STK-2, STK-3, STK-5, and STK-10 measures because they are “topped-out.” The commenter believed that CMS should allow hospitals to choose whether they wish to report these measures via EHR or via claims registry. The commenter stated that providing hospitals with alternate mechanisms for reporting is important at this juncture, and can allow for the measure developer to identify any issues with the electronic specifications of the measures.

Response: We note that the commenter seeks alternative reporting mechanisms for measures. However, submission via a claims registry, which would be such an alternative reporting mechanism, is not a feasible option at this time as these measures do not have claims-based specifications nor do we have a claims registry for the Hospital IQR Program. Hospitals may report on these measures using the electronic clinical quality measure specifications and submit using QRDA Category I. We believe that these four measures are “topped-out” and should be removed as a requirement from the Hospital IQR Program in their chart-abstracted measure versions.

Comment: A commenter supported the proposal to remove the six “topped-out” measures noted for permanent removal and the 4 “topped-out,” previously suspended measures proposed for permanent removal. This same commenter did not support the retention of the electronic version of 10 measures to support the voluntary electronic reporting option due to the cost of implementing electronic tools, and having the loss or convenience of chart abstracted measures that help the commenter keep track of their performance of these medical conditions. The commenter was also concerned that without clearly established goals and expectations for core measures by CMS and TJC that there will be discrepancies in performance.

Response: We thank the commenter for this feedback. We appreciate how the commenter is making full use of the “topped-out” measures and applaud their striving towards constant quality improvement. We note, however that we are encouraging, through alignment with Medicare EHR Incentive Program, to have all facilities move to electronic measures. We also believe that aligning electronic measures across facilities will minimize confusion between quality reporting programs. Regarding the concern that without clearly established goals and expectations for core measures by CMS and TJC there will be discrepancies in performance, we appreciate this concern and will take this into consideration during our daily operations.

Comment: A commenter asked CMS to clarify how the SCIP measures can be topped-out for the Hospital IQR Program but required for PPS-exempt Cancer Hospitals (PCHs). The commenter asked whether the measures specifications will be provided in a manual other than the Inpatient Specifications Manual if they are removed from the Hospital IQR Program. The commenter also asked whether the measures will still be programmed into the CMS Abstraction and Reporting Tool (CART).

Response: Although the SCIP measures are “topped-out” under the Hospital IQR Program, for the reasons discussed in the FY 2014 IPSS/LTCH PPS final rule (78 FR 50840 through 50841), we believe that the SCIP measures are appropriate for the PCH setting. At this time, we do not have sufficient data to determine whether these SCIP measures are “topped-out” in the PCH setting, given that hospital inpatient facilities and PCHs treat different patient populations and the lack of evidence that the SCIP measures are “topped-out” in the PCH setting.

We will assess “topped-out” status of the SCIP measures as part of our PCHQR measure analysis in our annual measures consideration. We believe that this analysis must focus on evidence specific to the PCH setting. We recognize that the PCHQR patient population is exclusively comprised of cancer patients, unlike “subsection (d)” hospitals included in the Hospital IQR Program. We will, however, continue to monitor and evaluate the PCHQR SCIP measures. In addition, we will consider adopting the “topped-out” criteria and measure removal policies for the PCHQR Program similar to those adopted by other quality reporting programs, including the Hospital IQR Program, in future years. We will also support PCHQR program reporting of patient level data to QualityNet by updating the CART tool to reflect the current SCIP measure specifications.

We intend to post SCIP and other PCHQR measures in the PCHQR Specifications Manual. As a result, the existing information technology infrastructure will be available for the PCHQR Program.

Comment: A commenter supported the transition of SCIP–Inf–1, SCIP–Inf–2, and SCIP–Inf–9 to voluntary electronic clinical quality measures.

Response: We thank the commenter for their support.

Comment: Some commenters opposed the proposal to retain the electronic versions of 10 of the “topped-out” chart-abstracted measures to support the voluntary electronic measure reporting option. A commenter stated that the proposed modification in the voluntary electronic reporting program holds the form of the data collected for quality measurement to a higher scientific significance than the data collected as a metric to assess the delivery of care. The commenter stated that this proposal would neither lead to improved hospital quality nor offer us insight on how to improve electronic clinical quality measures. The commenter recommended that CMS work with the Office of the National Coordinator (ONC) and the Agency for Healthcare Research and Quality (AHRQ) to study the feasibility, reliability and validity of electronic clinical quality measures to effectively calculate and report clinical quality measures that are at least as accurate as chart-abstracted measures.

Response: As discussed above, we believe that retaining electronic versions of chart-abstracted measures in certain circumstances enables us to continue monitoring the covered clinical topic while reducing hospitals’ reporting burden, and we view both of those actions as desirable. We note further

that we are encouraging hospitals to familiarize themselves with the electronic measure submission process by retaining electronic versions of certain measures, and we will also be able to assess differences in clinical quality measure data between the two data capture methods. We believe that understanding any discrepancies between the two data capture methods will help us as we transition to electronic reporting of clinical quality measures. This also will lead to hospitals improving how they report clinical quality data electronically, which can be used to improve patient care.

We respectfully disagree that the proposed measures lack scientific significance. Each measure, as it is fully described, provides evidence of its significance.

We thank the commenter for their suggestion to work with the ONC and AHRQ to study the feasibility, reliability and validity of electronic clinical quality measures to effectively calculate and report clinical quality measures that are at least as accurate as chart-abstracted measures. We will take this suggestion under consideration.

Comment: Some commenters asked CMS to delay adopting “topped-out” measures as voluntary electronic clinical quality measures for one year to allow hospitals time to prepare to collect the measure electronically.

Another commenter suggested that including these measures sends the wrong message about the goals of the Hospital IQR Program and the Stage 3 Meaningful Use Program and inappropriately distracts resources from areas that would more readily benefit from targeted attention. Instead, the commenter recommended that we address further alignment through the advancement of electronic quality measures required for the Medicare EHR Incentive Program. If CMS decide to move forward with this policy, the commenter urged CMS to publicly report the measures somewhere other than *Hospital Compare* to leave the space for measures that are more meaningful to consumers and purchasers.

Response: We respectfully disagree with the commenters. We do not agree that delaying by one year the adoption of “topped-out” measures as voluntary electronic clinical quality measures would be useful because reporting is voluntary. Any hospital can choose not to report these “topped-out” measures as electronic clinical quality measures. By retaining “topped-out” chart-abstracted measures as voluntary electronic clinical quality measures, we

are encouraging hospital to familiarize themselves with the electronic measure submission process and we can assess differences in clinical quality measure data between the two data capture methods. Allowing voluntary submission of the “topped-out” measures will help us monitor for declines in performance.

We also disagree with the commenter that the removal of “topped-out” measures will result in hospitals no longer focusing on the practice the measure is monitoring. We believe that hospitals are committed to providing good quality care to patients and we do not have any indication that they will stop doing so in these areas for which the quality of care measured has become standard practice.

We thank the commenter for their suggestion to publicly report the measures somewhere other than *Hospital Compare*. We will take this suggestion under consideration. We welcome any suggestions commenters have on further aligning the Hospital IQR Program with the EHR Incentive Program.

Comment: A few commenters advised that although CMS may no longer require hospitals to submit data on topped-out measures, hospitals will be required to submit data on measures required by TJC for accreditation. The commenters stated that this lack of alignment creates a burden for hospitals and does not allow hospitals to plan for the future. A commenter encouraged us to work with TJC when proposing measures to remove from the Hospital IQR Program because many of these measures remain core measure reporting requirements for TJC.

Response: We wish to reduce burden on hospitals for reporting “topped-out” measures to us, and believe that our proposal accomplishes that intent and focuses measurement on quality areas that can be improved. We invite the commenter to relay their concerns to TJC as to why TJC requires hospitals to report “topped-out” measures.

Comment: A commenter asked that CMS move cautiously with respect to removing measures and adopting more clinical outcome measures noting it should be done with ample opportunity for public comment to ensure these measures are tested and validated prior to adoption. The commenter noted that vetting is important, as hospitals need sufficient lead in time to implement measures, especially those with information technology requirements.

Response: We thank the commenter for the suggestion and will provide the public the necessary time period to comment. We have six criteria for

determining whether to remove a measure from the Hospital IQR Program, including a measure’s “topped-out” status as described above in section IX.A.2.a. of the preamble of this final rule.

We would like to clarify that the public has many opportunities to comment on potential measures through the measure adoption process, which includes the public posting of the MUC (Measures Under Consideration) list, the NQF measure endorsement process, and comments on the annual rulemaking process for the Hospital IQR Program.

Comment: A commenter requested clarification regarding why CMS is proposing to remove all of the suspended/voluntary measures except IMM–1 and if IMM–1 will continue to be suspended for FY 2017.

Response: We proposed to remove the suspended voluntary measures because of their “topped-out” status. IMM–1 was not proposed for removal because this measure will be reported in another program and we are responding to the need for more harmonized and global clinical quality measures. This measure was finalized for reporting in the PQRS in the CY 2013 Medicare Physician Fee Schedule final rule with comment period (see Table 95 at 77 FR 69215). As we stated above in section IXA.2.(a), “topped-out” status is only one of the six considerations we use in determining whether to remove a clinical quality measure from the Hospital IQR Program.

Comment: One commenter expressed concern that CMS may use a subregulatory process to make “nonsubstantive” updates to measures and that CMS may consider changes to age groups to be “nonsubstantive.” The commenter recommended that any review of changes to include individuals under the age of 18 in measures that were initially developed for adult populations include a process for review by a panel of pediatric experts, opportunity for broad stakeholder comment and appropriate testing of the revised measure.

Response: We thank the commenter for the suggestion. We will consider the suggestion to include a pediatric expert review process when considering the inclusion of the under 18 population to measures exclusively including the adult population.

After consideration of the public comments we received, we are finalizing our policy as proposed with one modification. We are finalizing removal of 19 measures for the FY 2017 payment determination and subsequent years as noted in the chart above with the exception of the SCIP–Inf–4

measure, which we are retaining in the Hospital IQR Program measure set in its chart-abstracted form as previously finalized.

We are also finalizing our proposal to retain reporting for 10 of these “topped-out” measures as electronic clinical quality measures as noted in the chart above. We believe this approach provides CMS an opportunity to monitor topped-out measures for performance decline. This policy simplifies alignment between the Hospital IQR and Medicare EHR Incentive Programs for eligible hospitals and provides a more straight-forward approach to educate stakeholders on electronic reporting options.

3. Process for Retaining Previously Adopted Hospital IQR Program Measures for Subsequent Payment Determinations

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53512 through 53513), for our finalized measure retention policy. When we adopt measures for the Hospital IQR Program beginning with a particular payment determination, these measures are automatically adopted for all subsequent payment determinations unless we propose to remove, suspend, or replace the measures.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28220) we did not propose any changes to our policy for retaining previously adopted measures for subsequent payment determinations.

4. Additional Considerations in Expanding and Updating Quality Measures Under the Hospital IQR Program

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53510 through 53512) for a discussion of the considerations we use to expand and update quality measures under the Hospital IQR Program. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28220) we did not propose any changes to the considerations in expanding or updating quality measures.

5. Previously Adopted Hospital IQR Program Measures for the FY 2016 Payment Determination and Subsequent Years

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28220 through 28221), for currently adopted and future condition-specific, claims-based measures, beginning with the FY 2017 payment determination and subsequent years, we proposed to use 3 years of data to calculate measures unless otherwise specified. In other words, this reporting period would apply to all

future calculations of condition specific measures already adopted in the Hospital IQR Program and any condition-specific measures that may be subsequently adopted in future years. The currently adopted, applicable measures are:

- Hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following acute myocardial infarction (AMI) hospitalization for patients 18 and older (NQF #0230).
- Hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following heart failure (HF) hospitalization for patients 18 and older (NQF #0229).
- Hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following pneumonia hospitalization (NQF #0468).
- Stroke 30-day mortality rate.
- Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) following Chronic Obstructive

- Pulmonary Disease (COPD) Hospitalization (NQF #1893).
- 30-day all-cause, Acute Myocardial Infarction (AMI) 30-day risk standardized readmission rate (RSMR) following Acute Myocardial Infarction (AMI) hospitalization (NQF #0505).
- 30-day all-cause, risk standardized readmission rate (RSMR) following Heart Failure (HF) hospitalization (NQF #0330).
- 30-day all-cause, risk standardized readmission rate (RSMR) following Pneumonia (PN) hospitalization (NQF #0506).
- 30-day risk standardized readmission rate (RSMR) following Total Hip/Total Knee Arthroplasty (NQF #1551).
- 30-day risk standardized readmission rate (RSMR) following Stroke hospitalization.
- 30-day risk standardized readmission rate (RSMR) following COPD hospitalization (NQF #1891).
- Hip/Knee Complication: Hospital-level Risk-Standardized Complication

Rate (RSCR) following Elective Primary Total Hip Arthroplasty (NQF #1550). We welcomed public comments on our proposal to use 3 years of data to calculate current and future condition-specific, claims-based measures.

Comment: Several commenters supported CMS' proposal to use 3 years of claim-based data for all currently adopted and future condition-specific, claims-based measures, for the FY 2017 payment determination and subsequent years.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to use 3 years of data to calculate current and future condition-specific, claims-based measures as proposed.

The following table shows measures previously adopted for the Hospital IQR Program, including suspended measures.

HOSPITAL IQR PROGRAM MEASURES PREVIOUSLY ADOPTED FOR THE FY 2016 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Short name	Measure name	NQF No.	FY 2016 payment determination
AMI-1	Aspirin at Arrival	N/A	Data collection suspended.
AMI-3	ACEI or ARB for LVSD	NQF #0137	Data collection suspended.
AMI-5	Beta-Blocker Prescribed at Discharge	NQF #0160	Data collection suspended.
AMI-7a	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival.	NQF #0164	Required.
AMI-8a	Primary PCI Received Within 90 Minutes of Hospital Arrival.	NQF #0163	Required.
HF-2	Evaluation of LVS Function	NQF #0135	Required.
PN-6	Initial Antibiotic Selection for community-acquired pneumonia (CAP) in Immunocompetent Patients.	NQF #0147	Required.
SCIP-Inf-1	Prophylactic Antibiotic Received Within One Hour Prior to Surgical Incision.	NQF #0527	Required.
SCIP-Inf-2	Prophylactic Antibiotic Selection for Surgical Patients	NQF #0528	Required.
SCIP-Inf-3	Prophylactic Antibiotics Discontinued Within 24 Hours After Surgery End Time—Overall Rate.	NQF #0529	Required.
SCIP-Inf-4	Cardiac Surgery Patients with Controlled Postoperative Blood Glucose.	NQF #0300	Refined measure specifications.
SCIP-Inf-6	Surgery Patients with Appropriate Hair Removal	NQF #0301	Data collection suspended.
SCIP-Inf-9	Urinary catheter removed on Postoperative Day 1 (POD 1) or Postoperative Day 2 (POD 2) with day of surgery being day zero.	NQF #0453	Required.
SCIP-Card-2	Surgery Patients on Beta-Blocker Therapy Prior to Arrival Who Received a Beta-Blocker During the Perioperative Period.	NQF #0284	Required.
SCIP-VTE-2	Surgery Patients Who Received Appropriate Venous Thromboembolism Prophylaxis Within 24 Hours Prior to Surgery to 24 Hours After Surgery.	NQF #0218	Required.
CLABSI	National Healthcare Safety Network (NHSN) Central line-associated Bloodstream Infection (CLABSI) Outcome Measure.	NQF #0139	Required.
SSI	American College of Surgeons—Centers for Disease Control and Prevention (ACS—CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	NQF #0753	Required.
	Colon procedures		
	Hysterectomy procedures		
CAUTI	National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.	NQF #0138	Required.

HOSPITAL IQR PROGRAM MEASURES PREVIOUSLY ADOPTED FOR THE FY 2016 PAYMENT DETERMINATION AND
SUBSEQUENT YEARS—Continued

Short name	Measure name	NQF No.	FY 2016 payment determination
MRSA	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) Bacteremia Outcome Measure.	NQF #1716	Required.
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Clostridium difficile Infection (CDI) Outcome Measure.	NQF #1717	Required.
HCP	Influenza vaccination coverage among healthcare personnel (HCP).	NQF #0431	Required.
ED-1	Median time from ED arrival to ED departure for admitted ED patients.	NQF #0495	Required submission, but voluntary electronic clinical quality measure.
ED-2	Admit Decision Time to ED Departure Time for Admitted Patients.	NQF #0497	Required submission, but voluntary electronic clinical quality measure.
Imm-1	Pneumococcal Immunization	NQF #1653	Data collection suspended.
Imm-2	Influenza Immunization	NQF #1659	Required.
Stroke-1	Venous thromboembolism (VTE) prophylaxis	NQF #0434	Required.
Stroke-2	Discharged on antithrombotic therapy	NQF #0435	Required submission, but voluntary electronic clinical quality measure.
Stroke-3	Anticoagulation therapy for atrial fibrillation/flutter	NQF #0436	Required submission, but voluntary electronic clinical quality measure.
Stroke-4	Thrombolytic therapy	NQF #0437	Required submission, but voluntary electronic clinical quality measure.
Stroke-5	Antithrombotic therapy by the end of hospital day two	NQF #0438	Required submission, but voluntary electronic clinical quality measure.
Stroke-6	Discharged on statin medication	NQF #0439	Required submission, but voluntary electronic clinical quality measure.
Stroke-8	Stroke education	N/A	Required submission, but voluntary electronic clinical quality measure.
Stroke-10	Assessed for rehabilitation	NQF #0441	Required submission, but voluntary electronic clinical quality measure.
VTE-1	Venous thromboembolism prophylaxis	NQF #0371	Required submission, but voluntary electronic clinical quality measure.
VTE-2	Intensive care unit venous thromboembolism prophylaxis	NQF #0372	Required submission, but voluntary electronic clinical quality measure.
VTE-3	Venous thromboembolism patients with anticoagulation overlap therapy.	NQF #0373	Required submission, but voluntary electronic clinical quality measure.
VTE-4	Patients receiving un-fractionated Heparin with doses/labs monitored by protocol.	N/A	Required submission, but voluntary electronic clinical quality measure.
VTE-5	VTE discharge instructions	N/A	Required submission, but voluntary electronic clinical quality measure.
VTE-6	Incidence of potentially preventable VTE	N/A	Required submission, but voluntary electronic clinical quality measure.
PC-01	Elective delivery (Collected in aggregate, submitted via Web-based tool or electronic clinical quality measure).	NQF #0469	Required submission, but voluntary electronic clinical quality measure.
MORT-30-AMI	Hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following acute myocardial infarction (AMI) hospitalization for patients 18 and older.	NQF #0230	Required.
MORT-30-HF ..	Hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following heart failure (HF) hospitalization for patients 18 and older.	NQF #0229	Required.
MORT-30-PN ..	Hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following pneumonia hospitalization.	NQF #0468	Required.

HOSPITAL IQR PROGRAM MEASURES PREVIOUSLY ADOPTED FOR THE FY 2016 PAYMENT DETERMINATION AND SUBSEQUENT YEARS—Continued

Short name	Measure name	NQF No.	FY 2016 payment determination
COPD Mortality	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	NQF #1893	Required.
STK Mortality	Stroke 30-day mortality rate	N/A	Required.

6. Refinements and Clarification to Existing Measures in the Hospital IQR Program

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28223 through 28226), we proposed to incorporate refinements for several measures that were previously adopted in the Hospital IQR Program. These refinements have either arisen out of the NQF endorsement maintenance process, or during our internal efforts to harmonize measure approaches. The measure refinements include the following: (1) refining the planned readmission algorithm for all seven readmission measures included in the Hospital IQR Program; (2) modifying the hip/knee readmission and complication measure cohorts to exclude index admissions with a secondary fracture diagnosis; and (3) modifying the hip/knee complication

measure to not count as complications coded as “present on admission” (POA) during the index admission.

We received one general comment on our proposed refinements.

Comment: One commenter supported CMS’ continued refinements to the readmission measures.

Response: We thank the commenter for their support.

a. Refinement of Planned Readmission Algorithm for 30-Day Readmission Measures

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50785 through 50787) we adopted the CMS Planned Readmission Algorithm Version 2.1 (the Algorithm) for the Hospital IQR Program. In the same final rule (78 FR 50785 through 50787, 50790 through 50792, and 50794 through 50798), we also finalized the

use of the CMS Planned Readmission Algorithm Version 2.1 in the AMI, HF, PN, THA/TKA, HWR, and COPD measures. This algorithm identifies readmissions that are planned and occur within 30 days of discharge from the hospital. A complete description of the Algorithm, which includes lists of planned diagnoses and procedures, is available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html> in the “Planned Readmission” folder. NQF has endorsed the use of the Algorithm for these measures.

In that final rule (78 FR 50652) and in response to comments, we agreed to continually review the Algorithm and make updates as needed. Since its development, we have identified and

made improvements to the Algorithm. As a result, in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28223 through 28224) we proposed to use an updated, revised version, the CMS Planned Readmission Algorithm Version 3.0, for the AMI, HF, PN, THA/TKA, HWR, COPD, and Stroke readmission measures for the FY 2015 payment determination and subsequent years. As discussed further below, we also proposed to use Version 3.0 of this algorithm for the CABG readmission measure that we proposed to include in the Hospital IQR Program starting in FY 2017, proposed in section IX.A.7.a. of the preamble of the proposed rule.

Version 3.0 incorporates improvements made based on a validation study of the algorithm. Researchers reviewed 634 patients' charts at 7 hospitals, classified readmission as planned or unplanned based on the chart review, and compared the results to the claims-based algorithm's classification of the readmissions. The findings suggested the algorithm was working well but could be improved.

Specifically, the study suggested the need to make small changes to the tables of procedures and conditions used in the algorithm to classify readmission as planned or unplanned. The algorithm uses AHRQ's Clinical Classification Software (CCS) to group thousands of procedure and diagnosis codes into fewer categories of related procedures or diagnoses. The algorithm then uses four tables of procedures and diagnoses categories and a flow diagram to classify tables as planned or unplanned. Additional information on this software is available at: <http://www.hcup-us.ahrq.gov/toolssoftware/ccs/ccs.jsp>. For all measures, the first table identifies procedures that, if present in a readmission, classify the readmission as planned. The second table identifies primary discharge diagnoses that always classify readmissions as planned. Because almost all planned admissions are for procedures or surgeries, a third table identifies procedures for which patients are typically admitted; if any of these procedures is coded in the readmission, we classify a readmission as planned as long as that readmission does not have an acute (unplanned) primary discharge diagnosis. The fourth table lists the acute (unplanned) primary discharge diagnoses that disqualify readmissions that include one or more of the potentially planned procedure in the third table as planned. These tables are structured similarly across all measures, but the specific procedure and conditions they contain vary slightly for certain measures based

on clinical considerations for each cohort. The current tables for each measure can be found in the measure methodology reports at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

Version 3.0 modifies two of these tables by removing or adding procedures or conditions to improve the accuracy of the algorithm. First, the validation study revealed that the algorithm could be improved by removing two procedure CCS categories from the third table, the potentially planned procedure table: CCS 211—Therapeutic Radiation and CCS 224—Cancer Chemotherapy. Typically, patients do not require admission for scheduled Therapeutic Radiation treatments (CCS 211). The study found that readmissions that were classified as planned because they included Therapeutic Radiation were largely unplanned.

The algorithm was also more accurate when CCS 224—Cancer Chemotherapy was removed from the potentially planned procedure table. The second table of the algorithm classifies all readmissions with a *principal diagnosis* of Maintenance Chemotherapy as planned. Most patients who receive cancer chemotherapy have both a code for Cancer Chemotherapy (CCS 224) and a principal discharge diagnosis of Maintenance Chemotherapy (CCS 45). In the validation study, the readmissions for patients who received Cancer Chemotherapy (CCS 224), but who did not have a principal diagnosis of Maintenance Chemotherapy were largely unplanned, therefore removing CCS 224 from the potentially planned procedure table improved the algorithm's accuracy. Therefore, Version 3.0 removes CCS 211 and CCS 224 from the list of potentially planned procedures to improve the accuracy of algorithm.

As noted above, the algorithm uses a table of acute principal discharge diagnoses to help identify unplanned readmissions. Readmissions that have a principal diagnosis listed in the table are classified as unplanned, regardless of whether they include a procedure in the potentially planned procedure table. The validation study identified one diagnosis CCS that should be added to the table of acute diagnoses to more accurately identify truly unplanned admissions as unplanned: Hypertension with Complications (CCS 99). Hypertension with complications is a diagnosis that is rarely associated with planned readmissions.

In addition, the validation study identified a subset of ICD-9 diagnosis codes within two CCS diagnosis categories that should be added to the acute diagnosis table to improve the algorithm. CCS 149, Pancreatic Disorders, includes the code for acute pancreatitis; clinically there is no situation in which a patient with this acute condition would be admitted for a planned procedure. Therefore, Version 3.0 adds the ICD-9 code for acute pancreatitis, 577.0, to the acute primary diagnosis table to better identify unplanned readmissions. Finally, CCS 149, Biliary Tract Disease, is a mix of acute and non-acute diagnoses. Adding the subset of ICD-9 codes within this CCS group that are for acute diagnoses to the list of acute conditions improves the accuracy of the algorithm for these acute conditions while still ensuring that readmissions for planned procedures, like cholecystectomies, are counted accurately as planned. For more detailed information on how the algorithm is structured and the use of tables to identify planned procedures and diagnoses, we refer readers to CMS' Planned Readmission Algorithm Version 2.1: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. As noted above, readers can find the specific Version 3.0 tables for each measure in the measure updates and specifications reports at the above link.

We invited public comment on our proposal to use the CMS Planned Readmission Algorithm Version 3.0, for the AMI, HF, PN, THA/TKA, HWR, COPD, and Stroke readmission measures for the FY 2015 payment determination and subsequent years.

Comment: One commenter supported the use of the planned readmission algorithm for the COPD readmission measure. Several commenters believed updates to the COPD readmission rate calculation will increase the measures precision.

Response: We thank the commenters for their support.

Comment: Several commenters did not support the Cancer Exclusions and urged CMS to continue excluding therapeutic radiation and cancer chemotherapy from readmissions penalties. Commenters stated that given the immunosuppression associated with these conditions and treatments, it is in the best interest of the patients to be sent home as soon as possible as it reduces their chances of getting hospital acquired infections that are often more virulent than community-acquired pathogens. One commenter was

concerned that the proposed exclusion may not be able to fully account for the increased readmissions associated with this population that are often not preventable. Another commenter also noted that some hospitals may treat more patients who receive these treatments compared to other hospitals, which would not be accounted for in the measures. Another commenter did not believe that CMS presented convincing evidence that the cancer codes proposed for exclusion are appropriate to exclude at this time. The commenter urged CMS to report its findings to NQF for a transparent review prior to implementation.

Response: We recognize that cancer care readmissions are often not preventable. In response to commenters' concerns regarding the cancer exclusions and certain hospitals treating more cancer patients than other hospitals, we are removing both CCS 211—Therapeutic Radiation and CCS 224—Cancer Chemotherapy from the potentially planned procedure table of the planned readmission algorithm to improve the accuracy of the algorithm. We are removing Therapeutic Radiation because patients are not typically admitted for therapeutic radiation, and admissions with this treatment in a validation study we conducted of the algorithm were generally unplanned. Further, our validation study showed admissions for people who receive cancer chemotherapy, but do not have a principal diagnosis of maintenance chemotherapy are typically unplanned admissions. Therefore, we expect that removal of CCS 211 and CCS 224 will improve the algorithm's accuracy and we do not anticipate it will have the unintended consequence of discouraging needed cancer care.

We acknowledge that in many cases it is in the best interest of the patients to be sent home as soon as possible as it reduces their chances of getting hospital acquired infections that are often more virulent than community-acquired pathogens.

As we are removing these cancer exclusions, we believe that we would not need to report additional information to NQF, as requested by the commenter.

Comment: Several commenters believed that the readmission algorithm is critically important in the appropriate attribution of readmissions. One commenter was disappointed that CMS have not sent the planned readmissions algorithm back to the NQF and several suggested that CMS seek an ad hoc review before proposing changes to the readmission measures that are used in the Hospital IQR Program and the

Hospital Readmissions Reduction Program.

Response: We would like to reassure the commenters that our proposed changes to the readmission algorithm will have minimal effect on how it attributes readmissions. We believe the changes should undergo NQF review as part of the endorsement maintenance and annual update processes for individual measures instead of an ad hoc review because the changes to the algorithm have a minimal effect on the planned readmission rates for each measure as detailed in the proposed rule (Table IV.H.1) (79 FR 28107 through 28108) and improve the accuracy of the algorithm. We have submitted changes related to the heart failure, pneumonia, and hip/knee, COPD and CABG readmission measures with Version 3.0 to NQF, all under annual update review with the exception of the CABG readmission measures which are new. For the AMI measure, endorsement maintenance occurred in 2013 prior to CMS' updating the algorithm to Version 3.0; therefore, we will submit the AMI readmission measure with the revised algorithm in the next NQF review cycle.

We acknowledge the commenter's view that the readmission algorithm is critically important in the appropriate attribution of readmissions.

After consideration of the public comments we received, we are finalizing our policy to use the CMS Planned Readmission Algorithm Version 3.0, for the AMI, HF, PN, THA/TKA, HWR, COPD, and Stroke readmission measures for the FY 2015 payment determination and subsequent years as proposed.

b. Refinement of Total Hip Arthroplasty and Total Knee Arthroplasty (THA/TKA) 30-Day Complication and Readmission Measures

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28224 through 28225), for the FY 2015 payment determination and subsequent years, we proposed to refine: (1) the measure outcome and cohort for the Elective Primary THA/TKA All-Cause 30-Day Risk-Standardized Complication Measure (NQF #1550); and (2) the measure cohort for the Elective Primary THA/TKA All-Cause Unplanned 30-Day Risk-Standardized Readmission Measure (NQF #1551).

As part of measure implementation, we conducted a dry run for both the THA/TKA readmission and complication measures in September/October of 2012. More information on the dry run is available at: <https://www.qualitynet.org/dcs/BlobServer?blobkey=id&blobno>

cache=true&blobwhere=1228889945763&blobheader=multipart%2Foctet-stream&blobheadername1=Content-Disposition&blobheadervalue1=attachment%3Bfilename%3DDryRun_HWR-HK_SummRept_122112.pdf&blobcol=urldata&blobtable=MungoBlobs.

During the dry run, several commenters suggested that we evaluate the use of Present on Admission (POA) codes for both the hip/knee readmission and complication measures. We agreed with the suggestion and have been monitoring POA data collection and testing its readiness for use in claims-based measures. We also noted our intent to evaluate the use of POA codes in Hospital IQR Program measures, such as the stroke mortality rate measure, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50801). We have since tested the use of the POA codes and proposed to incorporate POA codes into the hip/knee complication measure for FY 2015 payment determination and subsequent years in order to prevent identifying a condition as a complication of care if it was present during admission.

In addition, currently, the THA/TKA Readmission Measure (NQF #1551) adopted for the Hospital IQR Program is intended to only include patients who have an elective THA or TKA. Currently, this measure excludes patients who have a principal discharge diagnosis of femur, hip, or pelvic fracture on their index admission since hip replacement for hip fracture is not an elective procedure. However, after hospitals reviewed their hospital-specific THA/TKA Readmission Measure data during the national dry-run, we learned that hospitals code hip fractures that occur during the same admission as a THA as not only a principal diagnosis, but also alternatively, a secondary diagnosis, instead of just a principal diagnosis as currently specified by the measure. According to feedback received from hospitals participating in the dry-run, the measure methodology failed to identify, and, appropriately exclude, a small number of patients (that is, 0.42 percent of patients in 2009–2010 data) with a hip fracture that had non-elective total hip arthroplasty as captured by these secondary diagnoses.

Therefore, to ensure that all such non-elective hip fracture patients are excluded from the measure, we proposed to refine the measure to exclude patients with hip fractures coded as either a principal or secondary diagnosis during the index admission beginning with the FY 2015 payment determination and subsequent years. We believe this refinement is responsive to

comments previously received from hospitals (78 FR 50709) and will allow us to accurately exclude patients who were initially admitted for a hip fracture and who then subsequently underwent total hip arthroplasty, making their procedure non-elective.

We invited public comment on these proposed refinements.

Comment: Many commenters supported these refinements. Specifically, commenters supported CMS' proposals to:

- Add POA condition codes to the THA/TKA measures, contending that doing so will minimize the misidentification of pre-existing conditions as complications related to the procedure.
- Exclude from this 30-day readmission measure cohort patients with hip fracture who had a non-elective total hip arthroplasty.
- Exclude patients who have a hip fracture coded as either a principal or secondary diagnosis during the index admission from the THA/TKA complication and readmission measures.
- Remove cases where the hip/knee complication was present prior to the relevant admission as such complications should accrue to the hospitals furnishing the procedure prior to follow-up care.
- Evaluate the performance of the Risk Standardized Readmission and Complication Rate (RSRR and RSCR) measures for total hip and total knee arthroplasty.

Response: We thank the commenters for their support.

Comment: Several commenters appreciated CMS' efforts to make measure improvements but explained that they did not support the update until measures have completed the NQF measure maintenance process, arguing that changes should not be made through the subregulatory process.

Response: To clarify, since we are using the notice and comment rulemaking process to make these measure refinements here, we are not making these changes using subregulatory methods. We believe these refinements are necessary to ensure that the measure accurately reflects the care provided to patients. We do not believe that we should delay making efforts to improve the measure's accuracy.

Comment: One commenter did not support the modifications to the THA and TKA readmission and complication measures, noting that the need to make corrections reinforces the view that there should be sufficient

comprehensive testing before they are adopted for use.

Response: We agree with the commenter that the measures should undergo extensive testing prior to inclusion in reporting programs. The modifications here were identified during field testing of the THA/TKA readmission and complication measures and were incorporated prior to inclusion of the measures in the Hospital IQR Program. In addition, we reevaluate our measures on an annual basis in order to make methodological refinements required by: (1) Ongoing changes in clinical practice; (2) coding update; and (3) evolving input from stakeholders.

Comment: One commenter was concerned about the accuracy of administrative claims data used for the Hip/Knee Complication measure. The commenter suggested that the claims data used for the measure has been known to underreport significant comorbidities, particularly obesity.

Response: We believe that the administrative claims data used for the Hip/Knee Complication measure are accurate. We have validated the AMI, HF, and pneumonia readmission and mortality measures by building comparable models using medical record data for risk adjustment for heart failure patients (National Heart Failure data), AMI patients (Cooperative Cardiovascular Project data), and pneumonia patients (National Pneumonia Project dataset). When the medical record-based models were applied to the corresponding patient population, the hospital risk-standardized rates estimated using the claims-based risk adjustment models had a high level of agreement with the results based on the medical record model. This supports the use of the claims-based models for public reporting.

Regarding the commenters' concern about under-reporting significant comorbidities, particularly morbid obesity, we have also conducted a medical record validation study of the THA/TKA complications measure. The goal of that study was to determine the overall agreement between arthroplasty patients identified as having a complication (or no complication) in the claims-based measure and those who had a complication (or no complication) also documented in the medical record. Overall measure data agreement was 93 percent (598/644 patients) before any changes were made to the model specifications. After the measure specifications were changed based upon the results of this validation study, the measure agreement between claims data

and the medical record was 99 percent (635/644).

We also acknowledge the commenters' concern that obesity is associated with poorer outcomes after joint replacement; however, evidence supports that the potential greatest risk lies in patients who are morbidly obese.⁵⁷ Administrative codes for morbid obesity have been shown to have greater sensitivity and specificity than obesity codes overall, with a specificity of 99 percent,⁵⁸ and morbid obesity (ICD-9-CM code 278.01) is currently included in the measure risk model.

Comment: Several commenters requested that the Hip/Knee Complication measure be adjusted for socioeconomic status (SES).

Response: We appreciate the commenters' concerns and note that these concerns were addressed in the FY 2014 IPPS/LTCH PPS final rule (79 FR 50653 through 50654, 50673 through 50674). As described in prior rulemaking, we do not currently risk adjust for SES in the Hospital IQR Program. However, we do risk adjust for comorbidities (that is, correlated illnesses) and other factors to ensure that hospitals are not penalized for serving populations that are sicker or have higher incidences of chronic disease.

We are aware that there are differing opinions regarding this approach. We appreciate the commenters' suggestions on the importance of addressing SES in the Hospital IQR Program. We have continued to consider and evaluate stakeholder concerns regarding the influence of patient socioeconomic status on clinical quality measures. We refer readers to section IV.H.4. of the preamble of this final rule for a discussion of the use of SES in our quality programs.

After consideration of the public comments we received, we are finalizing the refinements to the THA/TKA measure as proposed.

c. Anticipated Effect of Refinements to Existing Measures

Based on our analyses of discharges between July 2009 and June 2012, our proposal to use the Planned Readmission Algorithm Version 3.0 would have the following effects on measures had these changes been

⁵⁷ Horan F. Obesity and joint replacement. *J Bone Joint Surg [Br]* 2006;88-B:1269-71.

⁵⁸ Nicholas S. Golinvaux, Daniel D. Bohl, Bryce A. Basques, Michael C. Fu, Elizabeth C. Gardner, Jonathan N. Grauer. Limitations of Administrative Databases In Spine Research: A Study in Obesity. *Spine Journal*, In Press, Accepted Manuscript, Available online 26 April 2014.

applied for the FY 2014 payment determination as an example. We are sharing this information to provide the public with a sense of the extent to which these refinements to the measures will change the measure scores. As the results show, while the refinements improve the accuracy of the measures, the changes in actual scores are very slight.

The proposed 30-day readmission rate (excluding the planned readmissions) would increase by 0.1 percentage points for AMI; 0.2 percentage points for HF; 0.1 percentage points for PN; 0.1 percentage points for COPD; 0.0 percentage points for hip/knee; 0.1 percentage points for HWR; and 0.0 percentage points for stroke.

The new national measure (unplanned) rate for each condition

would have been 18.4 percent for AMI; 23.2 percent for HF; 17.7 percent for PN; 21.1 percent for COPD; 5.4 percent for hip/knee; 16.1 percent for HWR; and 13.8 percent for stroke.

The number of readmissions considered planned (and, therefore, not counted as a readmission) would decrease by 334 for AMI; 1,375 for HF; 981 for PN; 574 for COPD; 309 for hip/knee; 7,417 for HWR; and 242 for stroke.

Comparison of Planned Readmission Algorithms V 2.1 and 3.0 for AMI/HF/PN/COPD/HK/HWR/Stroke Readmission Measures (Based on 2009-2012 Discharges)														
	AMI		HF		PN		COPD		Hip/Knee		HWR		Stroke

d. Clarification Regarding Influenza Vaccination for Healthcare Personnel

The Influenza Vaccination Coverage Among Healthcare Personnel (HCP) (NQF #0431) measure was finalized for the Hospital IQR Program in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51633) and the Hospital Outpatient Quality Reporting (HOQR) in the CY 2014 OPSS/ASC final rule with comment period (78 FR 75099). We received public comments regarding the burden of separately collecting and reporting HCP influenza vaccination statuses for both the inpatient and outpatient settings. In response to these concerns, we clarified that beginning with the 2014–2015 influenza season (CY 2014 reporting period and FY 2016 payment determination), facilities should collect and report a single vaccination count for each healthcare facility by CMS Certification Number (CCN), instead of separately by inpatient or outpatient setting, in order to reduce burden. We announced this clarification regarding how to designate HCP for this measure in an Operational Guidance document which can be found on our on our Web page at: <http://origin.glb.cdc.gov/nhsn/PDFs/HCP/Operational-Guidance-ACH-HCP-Flu.pdf>. Using the CCN will allow healthcare facilities with multiple care settings to simplify data collection and submit a single count applicable across the inpatient and outpatient settings. We will then publicly report the percentage of HCP who received an influenza vaccination per CCN. This single count per CCN will inform the public of the percentage of vaccinated HCP at a particular healthcare facility, which would still provide meaningful data and help to improve the quality of care. Specific details on data submission for this measure can be found at: <http://www.cdc.gov/nhsn/acute-care-hospital/hcp-vaccination/> and at <http://www.cdc.gov/nhsn/acute-care-hospital/index.html>.

(We discussed this clarification in section IX.A.5. of the preamble to the proposed rule (79 FR 28221).)

Comment: Several commenters supported the collection and submission of the influenza vaccination measure as a single facility count, which the commenters agreed will reduce the burden on providers and lead to more meaningful results. One commenter specifically supported the healthcare personnel influenza vaccination coverage clarification because it accommodates injectable and nasal spray vaccines.

Response: We thank the commenters for their support.

Comment: A commenter requested clarification on reporting for the inpatient and outpatient settings, stating that it reports to NHSN separately for these settings through a Facility Organization Identification (Org ID) rather than by CCN. The commenter believed that, after all data have been submitted by Org ID, the CDC will roll-up the data reported by Org ID to the CCN level, in order to report data to CMS.

Response: We agree with the commenter's assessment and clarify that hospitals should report by enrolled facility, according to their NHSN OrgID, in order to be consistent with CDC NHSN infrastructure. These data are to be reported for all patient care units included within the enrolled facility's OrgID that also share the same CCN (some patient care units within the OrgID may have separate CCNs and those should not be included in these counts). Therefore, data will be submitted to NHSN by facility Org ID, not CCN. CDC will then aggregate the facility level data into a CCN HCP rate and submit aggregate hospital-level measure rates at the CCN level to us on behalf of facilities for *Hospital Compare* public reporting purposes.

After consideration of public comments we received, we are clarifying that hospitals should report a single count per enrolled facility, and not CCN, for the previously finalized Influenza Vaccination Coverage Among Healthcare Personnel (HCP) (NQF #0431) measure. We will require facilities to collect and submit a single vaccination count for each health care facility enrolled in NHSN by facility OrgID. This modifies our statement in the proposed rule indicating that facilities should submit data by CCN, and better aligns with the FY 2015 OPSS Proposed rule (79 FR 41035) as well as NHSN guidance documents.

7. Additional Hospital IQR Program Measures for the FY 2017 Payment Determination and Subsequent Years

For purposes of the Hospital IQR Program, section 1886(b)(3)(B)(IX)(aa) of the Act requires that any measure specified by the Secretary must have been endorsed by the entity with a contract under section 1890(a) of the Act. However, the statutory requirements under section 1886(b)(3)(B)(IX)(bb) of the Act provide an exception that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may

specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28227 through 28243) we proposed to add a total of 11 measures to measure set for the FY 2017 payment determination and subsequent years. The first nine new measures are: (1) Hospital 30-day, all-cause, unplanned, risk-standardized readmission rate (RSRR) following coronary artery bypass graft (CABG) surgery (claims-based); (2) Hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following coronary artery bypass graft (CABG) surgery (claims-based); (3) Hospital-level, risk-standardized 30-day episode-of-care payment measure for pneumonia (claims-based); (4) Hospital-level, risk-standardized 30-day episode-of-care payment measure for heart failure (claims-based); (5) Severe Sepsis and Septic Shock: Management Bundle (NQF #0500) (chart-abstracted); (6) EHDI–1a Hearing Screening Prior to Hospital Discharge (NQF #1354) (electronic clinical quality measure); (7) PC–05 Exclusive Breast Milk Feeding and the subset measure PC–05a Exclusive Breast Milk Feeding Considering Mother's Choice (NQF #0480) (electronic clinical quality measure); (8) CAC–3 Home Management Plan of Care (HMPC) Document Given to Patient/Caregiver (electronic clinical quality measure); and, (9) Healthy Term Newborn (NQF #0716) (electronic clinical quality measure).

In addition, to align the Hospital IQR Program with the Medicare EHR Incentive Program for Eligible Hospitals and CAHs and allow hospitals as many measure options as possible that overlap both programs, we proposed to readopt two measures previously removed from the Hospital IQR Program as voluntary electronic clinical quality measures: (10) AMI–2 Aspirin Prescribed at Discharge for AMI (NQF #0142) (electronic clinical quality measure); and (11) AMI–10 Statin Prescribed at Discharge (NQF #0639) (electronic clinical quality measure). These two measures are part of the Stage 2 Medicare EHR Incentive Program measure set for eligible hospitals and CAHs.

The four proposed claims-based measures (1–4, above) were included on a publicly available document entitled "List of Measures Under Consideration for December 1, 2013" in compliance with section 1890A(a)(2) of the Act, and they were reviewed by the MAP in its MAP 2014 Recommendations on Measures for More Than 20 Federal

Programs final report, available at: http://www.qualityforum.org/Publications/2014/01/MAP_Pre-Rulemaking_Report_2014_Recommendations_on_Measures_for_More_than_20_Federal_Programs.aspx.

The proposed chart-abstracted measure (5 above) Severe Sepsis and Septic Shock: Management Bundle (NQF #0500) was included in the MAP Pre-Rulemaking Report: 2013 Recommendations on Measures Under Consideration by HHS final report, available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72738>.

The proposed measures 6–9 above were included on a publicly available document entitled “List of Measures Under Consideration for December 1, 2012” in compliance with section 1890A(a)(2) of the Act, and they were reviewed by the MAP in its MAP Pre-Rulemaking Report: 2013 Recommendations on Measures Under Consideration by HHS final report, available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72738>.

Measures 10 and 11 were included on a publicly available document entitled “Measures Under Consideration for Calendar Year 2012” in compliance with section 1890A(a)(2) of the Act, and they were reviewed by the MAP in its Pre-Rulemaking Report: Input on Measures Under Consideration by HHS for 2012 Rulemaking available at https://www.qualityforum.org/Publications/2012/02/MAP_Pre-Rulemaking_Report_Input_on_Measures_Under_Consideration_by_HHS_for_2012_Rulemaking.aspx.

We received a number of comments applying across proposed measures and will address those comments first before individually addressing comments related to specific measures.

Comment: One commenter supported the inclusion of the CABG mortality and readmission, heart failure payment, and pneumonia payment measures in the Hospital IQR Program. The commenter preferred that the measures be NQF-endorsed. Another commenter supported CMS’ proposal to increase the number of outcome measures.

Response: We thank the commenters for their support.

Comment: Several commenters expressed concern that four of the five measures proposed for adoption under the Hospital IQR Program were not NQF-endorsed and have not been recommended by the MAP. The most frequently expressed concerns were in regards to the CABG mortality, CABG readmission, heart failure and pneumonia payment measures, although

there were several comments addressing the other proposed measures that are not NQF-endorsed. A commenter noted the NQF process is important to the reliability and validity of the measures used in the programs and to monitor adverse events.

Response: As described above, we may adopt non-NQF-endorsed measures under the Hospital IQR Program exception authority in section 1886(b)(3)(B)(IX)(bb) of the Act. This provision provides that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. Although we proposed some measures that are not currently NQF-endorsed, they are pending NQF endorsement. We also considered other available measures that have been endorsed by the NQF and found no other feasible and practical measures. In addition, the MAP has supported or conditionally supported several of the measures. We are actively seeking NQF endorsement for the claims-based measures. More detailed discussions for individual measures are below.

Comment: A commenter requested that CMS outline its standards for conducting an environmental scan of available measures in the absence of a non-NQF-endorsed measure.

Response: We conduct thorough environmental scans of available measures using a standardized system set out in *A Blueprint for the CMS Measures Management System* (http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/Measures_ManagementSystemBlueprint.html). We follow these core processes set out in the Blueprint as we develop, implement, and maintain quality measures. Our process for conducting an environmental scan of existing or related measures is set out below.

First we search for similar or related measures (existing or in development) that will help achieve the quality goals. We keep the search parameters broad to obtain an overall understanding of the measures in existence, including measures that closely meet the contract requirements and other potential sources of information. We then look for measures endorsed and recommended by multi-stakeholder organizations whenever applicable and include a

search for measures developed and/or implemented by the private sector. Then we determine what types of measures are needed to promote the quality goals for a particular topic/condition or setting and determine what measurement gaps exist for the topic area, as well as existing measures that may be adopted or adapted for the project. For example, if the objective is the development of immunization measures for use in the home health setting, it will be necessary to identify and review existing home health measures. In addition, it might also be helpful to analyze immunization measures used in other settings such as nursing homes and hospitals.

The CMS Measures Management staff assists in identifying measures in development to ensure that no duplication occurs or to ensure related measures are developed with harmonization in mind. Search parameters include: (1) Measures in the same setting, but for a different topic; (2) Measures in a different setting, but for the same topic; (3) Measures that are constructed in a similar manner; (4) Quality indicators; (5) Accreditation standards; and (5) NQF preferred practices for the same topic.

Searching for existing and related measures may involve two steps: (1) searching databases, and (2) searching for other sources of information, such as performance indicators, accreditation standards, or preferred practices. We use a variety of databases and sources to search for existing and related measures. Below are links to a few readily available sources:

- National Quality Measures Clearinghouse (<http://www.qualitymeasures.ahrq.gov/>);
- HHS Inventory (<http://www.qualitymeasures.ahrq.gov/hhs-measure-inventory/browse.aspx>);
- CMS Measures Inventory and Pipeline (<http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/CMS-Measures-Inventory.html>);
- National Quality Forum (http://www.qualityforum.org/Measures_List.aspx);
- AHRQ (<http://www.qualityindicators.ahrq.gov/>); and,
- American Medical Association-Physician Consortium for Performance Improvement (<http://www.ama-assn.org/apps/listserv/x-check/qmeasure.cgi?submit=PCPI>).

We also search other HHS agency pipeline measures. We search for other sources of information, such as performance indicators, accreditation standards, or preferred practices, that may pertain to the contract topic.

Though they may not be as fully developed as a quality measure, quality indicators could be further developed to create a quality measure by providing detailed and precise specifications. Measures aligned with those standards may be easier to implement and be more readily accepted by the providers. These standards are linked to specific desired outcomes, and quality measures may be partially derived from the preferred practices reflected in the standards.

Comment: Several commenters believed that all measures should be risk-adjusted for SES, explaining that failing to risk adjust for SES factors will skew our data measurements and produce inaccurate and unreliable outcomes. One commenter emphasized the need for adjusting for SES factors in all outcomes measures, arguing that such variables have an impact on patient outcomes, but are outside of a hospital's control. The commenter added that CMS as not provided data that shows this point to be untrue. One commenter stated that CMS should analyze the differences in performance for safety net providers to other hospitals by determining if the means of performance distribution are significantly different thus resulting in penalties. If it does, the commenter believed that SES risk adjustment would provide incentives for hospitals to improve as quality differences for reasons outside of a hospital's control would be illuminated.

Another commenter explained that many studies show reliable statistical results that SES is a risk factor for patient outcomes and that we have not demonstrated otherwise. As a result, the commenter believed that not adjusting for this risk factor obscures quality differences. One commenter believed that empirical studies demonstrate that patient SES impacts outcomes and failure to account for such impact disadvantages hospitals that treat them. Another commenter believed that hospitals should not be accountable for outcomes attributable to patient risk factors. Instead, the commenter believed that risk adjustment should be performed if data-stratified by SES show that safety net hospitals are providing poorer care for reasons unrelated to quality.

Another commenter suggested that CMS' argument for not risk adjusting for SES factors is that it would hold hospitals serving these areas to a different standard than others. The commenter stated that CMS' belief that risk adjusting for SES obscures true quality differences is based on the assumption that SES is not a risk factor beyond the hospital's control. Another

commenter listed unintended consequences that may result from not risk adjusting for SES which were echoed by several commenters. These potential consequences included not providing care for disadvantaged patients so as to not be labeled a poor performer, shifts in funds to hospitals caring for affluent patients, and consumers avoiding providers labeled poor performers when they are not. Several commenters were concerned that not risk-adjusting for SES could result in safety net providers losing scarce resources that are necessary to care for vulnerable patients, which would potentially make disparities worse.

Further, one commenter stated that current CMS measures do not improve quality and weaken the social safety net. Another commenter believed that the current policy to exclude "factors related to the disparities in care" from all measures creates a "one size fits all" approach that ignores fundamentally the challenges that many academic health centers face in delivering high-quality care to their entire patient population, regardless of race, income, or other socioeconomic characteristics. Commenters urged CMS to review important studies published about risk adjustment for SES and revise measure methodology to account for SES. One commenter suggested that CMS comply with the NQF's recommendations related to the use of risk adjustment versus stratification for patient SES.

Response: We have received many comments regards risk-adjusting measures for SES in several quality programs. We appreciate the commenters' concerns and note that these concerns were addressed in the FY 2014 IPPS/LTCH PPS final rule (79 FR 50653 through 50654, 50673 through 50674). As described in prior rulemaking, we do not currently risk adjust for SES in the Hospital IQR Program. However, we do risk adjust for comorbidities (that is, correlated illnesses) and other factors to ensure that hospitals are not penalized for serving populations that are sicker or have higher incidences of chronic disease.

We are aware that there are differing opinions regarding this approach. We appreciate the commenters' suggestions on the importance of addressing SES in the Hospital IQR Program. We have continued to consider and evaluate stakeholder concerns regarding the influence of patient socioeconomic status on clinical quality measures. We refer readers to section IV.H.4. of the preamble of this final rule for further discussion of this issue.

Comment: One commenter stated that "a large proportion of low-income patients sometimes achieve good quality scores even as compared the scores for hospitals that have a lower proportion of low-income patients. But this is simply an anecdotal observation. It is not a statistically acceptable and reliable analysis."

Response: We thank the commenter for their feedback, we understand this comment to mean a hospital with a high proportion of low SES patients can perform high in comparison with hospitals with a relatively low proportion of SES patients. We note similar findings in our Chartbook that follows the trends of hospital performance on readmission, mortality, and complication (<http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Downloads/Medicare-Hospital-Quality-Chartbook-2013.pdf>.) The statement referred to was based on descriptive statistics of the measure scores that can be found in our 2013 Medicare Hospital Quality Chartbook at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Downloads/Medicare-Hospital-Quality-Chartbook-2013.pdf>.

The risk-adjustment for clinical factors likely captures much of the variation due to SES, therefore resulting in an attenuation of the impact of SES factors on hospitals' results. We continue to monitor related activities at NQF, such as the July 23, 2014 decision by the NQF Board to approve a trial period to test the impact of sociodemographic factor risk adjustment of performance measures (available at: http://www.qualityforum.org/Press_Releases/2014/NQF_Board_Approves_Trial_Risk_Adjustment.aspx), and in Congress. As we stated in the past, we are committed to working with the NQF and other stakeholder communities to continuously refine our measures and to address the concerns associated with SES and risk adjustment. We believe that continued collaboration with the stakeholder communities will enable us to identify feasible ways to appropriately address any unintended consequences for providers serving high proportions of low SES patients.

Comment: A commenter was concerned that CMS proposed several new measures for the Hospital IQR Program that the commenter believes lack the scientific rigor needed for public reporting. However, the commenter did not specify which proposed measures caused concern.

Response: We respectfully disagree with the commenter that the proposed measures lack the scientific rigor needed for public reporting. We believe that these measures, as they are detailed below, are scientifically rigorous as they are described.

Comment: Several commenters did not support the use of the pneumonia payment measure in the Hospital IQR Program since it is not NQF-endorsed. One commenter believed that, because the measure is not NQF endorsed, it is too soon to finalize the measure for the FY 2017 Hospital IQR Program.

Response: We received numerous comments that concerned both the Hospital-level, risk-standardized 30-day episode-of-care payment measure for pneumonia and Hospital-level, risk-standardized 30-day episode-of-care payment measure for heart failure payment measures. We are addressing those comments here first before addressing the individual measures.

a. Hospital 30-day, All-cause, Unplanned, Risk-Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery

(1) Background

CABG is a priority area for outcomes measure development because it is a common procedure associated with considerable morbidity, mortality, and health care spending. In 2007, there were 114,028 hospitalizations for CABG surgery and 137,721 hospitalizations for combined surgeries for CABG and valve procedures (“CABG plus valve” surgeries) in the U.S.⁵⁹

Readmission rates following CABG surgery are high and vary across hospitals. For example, in 2009 Medicare fee-for-service (FFS) data, the median hospital-level risk-standardized readmission rate after CABG was 17.2 percent and ranged from 13.9 percent to 22.1 percent.⁶⁰ This is consistent with published data as the average 30-day all-cause, hospital-level readmission rate in New York state was 16.5 percent and ranged from 8.3 percent to 21.1 percent among all patients who underwent CABG surgery between January 1, 2005 and November 30, 2007.⁶¹ Among

⁵⁹ Drye E, Krumholz H, Vellanky S, Wang Y. Probing New Conditions and Procedures for New Measure Development: Yale New Haven Health Systems Corporation; Center for Outcomes Research and Evaluation.; 2009:1–7.

⁶⁰ Suter L.G., Wang, C., Vellanky S., Potteiger J., Curtis J., Lin Z., Geary L.L., Krumholz H.M., Drye E.D. Hospital-level 30-day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft Surgery: Report prepared for the Centers for Medicare & Medicaid Services. 2012.

⁶¹ Hannan EL, Zhong Y, Lahey SJ, et al. 30-day readmissions after coronary artery bypass graft

patients readmitted within 30 days, 87.3 percent of readmissions were for reasons related to CABG surgery, with a 30-day rate of readmissions due to complications of CABG surgery of 14.4 percent. Patients readmitted within 30 days also experienced a 2.8 percent in-hospital mortality rate during their readmission(s), three-fold higher than the 30-day mortality rate for patients without readmissions.⁶² Hence, addressing the causes of readmission will improve outcomes for patients.

Readmissions after CABG also impose significant health care costs. In 2007, the Medicare Payment Advisory Committee (MedPAC) published a report to Congress in which it identified the seven conditions associated with the most costly potentially preventable readmissions in the U.S.⁶³ Among these seven, CABG ranked as having the highest potentially preventable readmission rate within 15 days following discharge (13.5 percent) and the second highest average Medicare payment per readmission (\$8,136).⁶⁴ The annual cost to Medicare for potentially preventable CABG readmissions was estimated at \$151 million.

High readmission rates and wide variation in these rates suggest that there is room for improvement. Reducing readmissions after CABG surgery has been identified as a target for quality measurement. An all-cause readmission measure for patients who undergo CABG surgery will provide hospitals with an incentive to reduce readmissions through prevention and/or early recognition and treatment of postoperative complications, and improved coordination of peri-operative care and discharge planning.

The specifics of the measure methodology are included in the measure methodology report we have posted on our Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. We refer readers to the report for further details on the risk-adjustment statistical model.

We proposed to include this non-NQF-endorsed measure in the Hospital IQR Program under the exception authority in section 1886(b)(3)(B)(IX)(bb) of the Act as previously discussed in section IX.A.7. of the preamble of this final rule.

⁶⁴ Ibid.

Although the proposed measure is not currently NQF-endorsed, we considered available measures that have been endorsed or adopted by the NQF. We also are not aware of any other 30-day, all-cause, unplanned, risk-standardized readmission rate (RSRR) following coronary artery bypass graft (CABG) surgery measures that have been endorsed or adopted by a consensus organization, and found no other feasible and practical measures on this topic. The measure has been reviewed by the MAP and was conditionally supported pending NQF endorsement as detailed in its Pre-Rulemaking 2014 Map Recommendations Report available at: https://www.qualityforum.org/Setting_Priorities/Partnership/MAP_Final_Reports.aspx. This measure was submitted to NQF on February 5, 2014 and is currently under review.

(2) Overview of Measure

The CABG readmission measure assesses hospitals' 30-day, all-cause risk-standardized rate of unplanned readmission following admission for a CABG procedure. In general, the measure uses the same approach to risk adjustment and hierarchical logistic modeling (HLM) methodology that is specified for CMS' other readmission measures previously adopted for this program. Information on how the measure employs HLM can be found in the 2012 CABG Readmission Measure Methodology Report (available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>).

(3) Data Sources

The proposed measure is claims-based. It uses Medicare administrative data from hospitalizations for Medicare FFS beneficiaries hospitalized for a CABG procedure.

(4) Outcome

The outcome for this measure is 30-day, all-cause readmission, defined as an unplanned subsequent inpatient admission to any applicable acute care facility for any cause within 30 days of the date of discharge from the index hospitalization. This outcome period is consistent with other NQF-endorsed publicly reported readmission measures (AMI, HF, PN, COPD, HWR, and THA/TKA).

The measure assesses all-cause unplanned readmissions (excluding planned readmissions) rather than readmissions for CABG only for several reasons. First, from the patient perspective, a readmission for any reason is likely to be an undesirable

outcome of care, even though not all readmissions are preventable. Second, limiting the measure to CABG-related readmissions may limit the effort focus too narrowly rather than encouraging broader initiatives aimed at improving the overall care within the hospital and transitions from the hospital setting. Moreover, it is often hard to exclude quality issues and accountability based on the documented cause of readmission. For example, a patient who underwent a CABG surgery and develops a hospital-acquired infection may ultimately be readmitted for sepsis. It would be inappropriate to consider such a readmission to be unrelated to the care the patient received for their CABG surgery. Finally, while the measure does not presume that each readmission is preventable, interventions generally have shown reductions in all types of readmissions.^{65 66}

The measure does not count planned readmissions as readmissions. Planned readmissions would be identified in claims data using the CMS Planned Readmission Algorithm Version 3.0 that detects planned readmissions that may occur within 30 days of discharge from the hospital. Version 2.1 of the algorithm was finalized for use in the current Hospital IQR Program readmission measures in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50785 through 50787, 50790 through 50792 and 50794 through 50798). However, we proposed to update the algorithm to version 3.0, and details on the updates to this algorithm can be found in section IX.A.6.a. of the preamble of this final rule. The proposed CABG readmission measure uses the planned readmission algorithm tailored for CABG patients. We adapted the algorithm for this group of patients with input from CABG surgeons and other experts, narrowing the types of readmissions considered planned since planned readmissions following CABG are less common and less varied than among patients discharged from the hospital following a medical admission. More detailed information on how the CABG measure incorporates the Planned Readmission Algorithm Version 3.0 can be found on the CMS Web site at: <http://www.cms.gov/Medicare/Quality->

Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html. Once at the Web site, users should open the Coronary Artery Bypass Graft (CABG) Readmission ZIP file, then open the file labeled, “Version10_Readmission_CABG_Measure_Methodology_Report_3_19_2014” and refer to Section 2.3.3. For the CABG measure, unplanned readmissions that fall within the 30-day post-discharge timeframe from the index admission would not be counted as readmissions for the index admission if they were preceded by a planned readmission.

(5) Cohort

The cohort includes patients aged 65 years and older who received a qualifying CABG procedure at an acute care facility. Patients are eligible for inclusion if they had a qualifying CABG procedure and continuous enrollment in Medicare FFS one year prior to the first day of the index hospital stay and through 30 days post-discharge. The index stay is the stay that triggers the 30-day measurement period.

In order to include a clinically-coherent set of patients in the measure, we sought input from clinical experts regarding the inclusion of other concomitant cardiac and non-cardiac procedures, such as valve replacement and carotid endarterectomy. Adverse clinical outcomes following such procedures are higher than those following “isolated” CABG procedures, that is, CABG procedures performed without concomitant high-risk cardiac and non-cardiac procedures.⁶⁷ Limiting the measure cohort to “isolated” CABG patients is consistent with published reports of CABG outcomes⁹; therefore, the measure cohort considers only patients undergoing isolated CABG as eligible for inclusion in the measure. We defined isolated CABG patients as those undergoing CABG procedures without concomitant valve or other major cardiac, vascular or thoracic procedures. In addition, our clinical experts, consultants, and Technical Expert Panel (TEP) members agreed that an isolated CABG cohort is a clinically coherent cohort for quality measurement. For detailed information on the cohort definition, we refer readers to the 2012 CABG Readmission Measure Methodology Report on the CMS Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment->

Instruments/HospitalQualityInits/Measure-Methodology.html.

(6) Inclusion and Exclusion Criteria

The measure includes hospitalizations for patients who are 65 years of age or older at the time of index admission and for whom there was a complete 12 months of Medicare FFS enrollment to allow for adequate risk adjustment. The measure excludes the following admissions from the measure cohort: (1) Admissions for patients who are discharged against medical advice (excluded because providers do not have the opportunity to deliver full care and prepare the patient for discharge); (2) admissions for patients who die during the initial hospitalization (these patients are not eligible for readmission); (3) admissions for patients with subsequent qualifying CABG procedures during the measurement period (a repeat CABG procedure during the measurement period very likely represents a complication of the original CABG procedure and is a clinically more complex and higher risk surgery, therefore we select the first CABG admission for inclusion in the measure and exclude subsequent CABG admissions from the cohort); and (4) admissions for patients without at least 30 days post-discharge enrollment in Medicare FFS (excluded because the 30-day readmission outcome cannot be assessed in this group).

(7) Risk-Adjustment

The measure adjusts for differences across hospitals in how at risk their patients are for readmission relative to patients cared for by other hospitals. The measure uses claims data to identify patient clinical conditions and comorbidities to adjust patient risk for readmission across hospitals, but does not adjust for potential complications of care. We refer readers to section IV.4.H of the preamble of this final rule for further discussion of risk-adjustment for socioeconomic factors.

(8) Calculating the Risk-Standardized Readmission Ratio (RSRR)

The measure is calculated using hierarchical logistic modeling (HLM). This approach appropriately accounts for the types of patients a hospital treats (that is, hospital case mix), the number of patients it treats, and the quality of care it provides. The HLM is an appropriate statistical approach to measuring quality based on patient outcomes when the patients are clustered within hospitals (and therefore the patients’ outcomes are not statistically independent) and the number of eligible patients for the

measure varies from hospital to hospital. As noted above, the measure methodology defines hospital case mix based on the clinical diagnoses provided in the hospital claims for their patients' inpatient and outpatient visits for the 12 months prior to the CABG hospitalization, as well as those present in the claims for care at admission. The methodology, however, specifically does not account for diagnoses present in the index admission that may indicate complications rather than patient comorbidities.

The RSRR is calculated as the ratio of the number of predicted readmissions to the number of expected readmissions and then the ratio is multiplied by the national unadjusted readmission rate. The ratio is greater than one for hospitals that have more readmissions that would be expected for an average hospital with similar cases and less than one if the hospital has fewer readmissions than would be expected for an average hospital with similar cases. This approach is analogous to a ratio of "observed" or "crude" rate to an "expected" or risk-adjusted rate used in other similar types of statistical analyses.

The RSRR is a point estimate—the best estimate of a hospital's readmission rate based on the hospital's case mix. For displaying the measure for the Hospital IQR Program, we computed an interval estimate, which is similar to the concept of a confidence interval, to characterize the level of uncertainty around the point estimate. We use the point estimate and interval estimate to determine hospital performance (for example, higher than expected, as expected, or lower than expected). For more detailed information on the calculation methodology, we refer readers to our Web site at: <http://cms.gov/Medicare/QualityInitiatives/PatientAssessmentInstruments/HospitalQualityInits/Measure-Methodology.html>.

We invited public comment on this proposal.

Comment: Several commenters supported the inclusion of CABG readmission into the Hospital IQR Program. One commenter specifically believes the CABG measure will lead to increased attention to care after discharge.

Response: We thank the commenters for their support.

Comment: Several commenters recommended that CMS focus on developing an electronically specified measure based on the ICD-10-CM/PCS coding system for future adoption instead of the current proposed measure.

Response: We thank the commenters and will take this suggestion into consideration as we move towards use of electronic clinical quality measures for CABG measures.

Comment: Several commenters did not support inclusion of the CABG readmission measure in the Hospital IQR Program because the measure is not NQF-endorsed.

Response: We proposed to include this non-NQF-endorsed measure under the Hospital IQR Program exception authority in section

1886(b)(3)(B)(IX)(bb) of the Act. Although the proposed measure is not currently NQF-endorsed, we considered available measures that have been endorsed or adopted by the NQF. We also are not aware of any other similar measures that have been endorsed or adopted by a consensus organization, and found no other feasible and practical measures on this topic. We refer readers to section IX.A.7. of the preamble of this final rule where we discuss other comments on our adoption of non-NQF-endorsed measures. On February 5, 2014, we submitted the Hospital-Level 30-Day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft (CABG) Surgery measure to NQF for endorsement.

Comment: Several commenters oppose the CABG readmission measure because it is not risk-adjusted for SES. Another commenter also suggested removing other readmission measures from the Hospital IQR Program until they are risk-adjusted for SES. Several commenters suggest following NQF-endorsed panel recommendations that propose evidence be presented in either support for or against the inclusion of SES in the measure. A commenter requested we risk-adjust the measure for SES and stated that this materially impacts the patient's likelihood of being readmitted, and the members on NQF's panel to examine adjusting for SES recommended adjusting for SES when appropriate. A commenter stated that the lack of risk-adjustment of this measure materially impacts the patient's likelihood of being readmitted.

Response: We appreciate the commenters' concerns and note that these concerns were addressed in the FY 2014 IPPS/LTCH PPS final rule (79 FR 50653 through 50654, 50673 through 50674). As described in prior rulemaking, we do not currently risk adjust for SES in the Hospital IQR Program. However, we do risk adjust for comorbidities (that is, correlated illnesses) and other factors to ensure that hospitals are not penalized for serving populations that are sicker or

have higher incidences of chronic disease.

We are aware that there are differing opinions regarding this approach. We appreciate the commenters' suggestions on the importance of addressing SES in the Hospital IQR Program. We have continued to consider and evaluate stakeholder concerns regarding the influence of patient socioeconomic status on clinical quality measures. We have received many comments regards risk-adjusting measures for SES in several quality programs. We refer readers to section IV.H.4. of the preamble of this final rule for further discussion of this issue.

Comment: Several commenters noted that there could be unintended consequences from adopting this measure. One commenter believed it is equally likely to result in hospitals avoiding complex cases in order to avoid potential penalty. Another commenter requested that CMS carefully monitor CABG utilization in high-risk, older patients to ensure hospitals are not avoiding performing them for high risk patients in order to appear as lower readmission. If evidence is found that CABG surgeries are not being offered to high-risk patients, the commenters suggested that CMS may need to reconsider its risk adjustment methodology to mitigate this unintended consequence.

Response: We note that the measures are risk-adjusted to take into account clinically complicated conditions. We appreciate commenters' concerns for potential unintended consequences of the measure. We believe the measure is adequately risk-adjusted for high-risk patients and so will not create a disincentive to treat these patients, but we will consider monitoring for any shift in their care (for example, by evaluating the risk profile of Medicare patients undergoing surgery before and after commencement of public reporting). The proposed CABG readmission measure adjusts for differences across hospitals in the level of risk their patients have for readmission relative to patients cared for by other hospitals. The measure uses administrative claims data to identify patient clinical conditions and comorbidities to adjust patient risk for readmission across hospitals, but does not adjust for potential complications of care.

Comment: One commenter opposed the measure construction and risk-adjustment methodology, citing concerns that the low R-squared meant that the measure does not truly differentiate performance between hospitals.

Response: The commenter refers to the R-squared statistic, but this is not a statistic used to evaluate the CABG measures. Therefore, we are assuming the commenter's primary concern is with the c-statistic of the measure. The c-statistic evaluates the measure's ability to discriminate or differentiate among low- versus high-risk patients. For measures used to profile hospital performance the goal is not always to achieve the highest c-statistic possible. The role of risk-adjustment in hospital profiling models is to level the playing field for hospitals for measures that assess relative performance—that is, how well hospitals fare compared to others with a similar patient case-mix. The risk-adjustment variables should be only those that are inherent to the patient and present at the time of admission. Some variables that might increase predictive power, such as complications of care, would not be appropriate for inclusion in an outcome quality measure, even if they would lead to a higher c-statistic. The c-statistic of this CABG measure is similar to other measures that are NQF-endorsed and in use, such as the AMI/HF/PN readmission measures.

In addition, this measure's risk model has been validated using registry data from the Society of Thoracic Surgeons' (STS) Adult Cardiac Surgery Database, which produced nearly identical c-statistics in a matched set of patients with correlation coefficients between 0.92 and 0.96, depending upon the statistic used.⁶⁸

Comment: One commenter does not support the CABG readmission measure, because it holds hospitals responsible for pre-existing underlying conditions. The commenter expected that risk adjusting is unlikely to be sufficient.

Response: We believe that the measure should appropriately account for patient case mix, including pre-existing conditions. This measure's risk model includes a range of medical and surgical comorbidities predictive of complications and readmissions following CABG surgery. In addition, as noted above, the risk model has been validated against a clinical risk model using registry data from the STS' Adult Cardiac Surgery Database.⁶⁹

⁶⁸ Suter L.G., Wang, C., Vellanky S., Potteiger J., Curtis J., Lin Z., Geary L.L., Krumholz H.M., Drye E.D. Hospital-level 30-day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft Surgery: Report prepared for the Centers for Medicare & Medicaid Services. 2012.

⁶⁹ Suter L.G., Wang, C., Vellanky S., Potteiger J., Curtis J., Lin Z., Geary L.L., Krumholz H.M., Drye E.D. Hospital-level 30-day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft Surgery: Report prepared for the Centers for Medicare & Medicaid Services. 2012.

Comment: One commenter noted that the CABG readmission measure has poor discrimination ability.

Response: As outlined above, we believe the commenter's primary concern is with the c-statistic of the measure. Discrimination refers to the ability to distinguish high risk subjects from low risk. The c-statistic is one of the statistical tools used to assess discrimination. We would like to clarify the important difference between predictive models intended for patient-level risk-stratification versus models used to profile hospital performance. In a patient-level predictive model, the objective is to best predict patient outcomes; the risk-adjustment variables are a means to better predict these outcomes. As an example, a patient who has a serious complication of care may be at higher risk of mortality and readmission; therefore, complications might be useful to include in a model used for patient-level prediction.

By contrast, the role of risk-adjustment in a hospital profiling model is to level the playing field for hospitals for measures that assess relative performance—that is, how well hospitals are doing compared to others with similar patients. The risk-adjustment variables should be only those that are inherent to the patient and present at admission. Although risk adjusting for complications of care could increase the statistical power of a profiling model, it would not make sense to risk-adjust for complications here since it could lead hospitals with high rates of complications to appear to be performing better than hospitals with similar patients even though the quality of care is worse.

In addition, as noted above, this measure's risk model has been validated using registry data from the STS' Adult Cardiac Surgery Database and produced nearly identical c-statistics in a matched set of patients with correlation coefficients between 0.92 and 0.96, depending upon the statistic used.⁷⁰

Comment: One commenter requested that the measure differentiate between readmissions within and outside the control of the bypass surgeon.

Response: We interpret readmissions “within and outside the control of the bypass surgeon” to mean those that are only related to the CABG surgery. We proposed this measure for hospital-specific performance measurement, not for measurement of surgeon-level

⁷⁰ Suter L.G., Wang, C., Vellanky S., Potteiger J., Curtis J., Lin Z., Geary L.L., Krumholz H.M., Drye E.D. Hospital-level 30-day All-Cause Unplanned Readmission Following Coronary Artery Bypass Graft Surgery: Report prepared for the Centers for Medicare & Medicaid Services. 2012.

performance. The measure defines the outcome as “all-cause” unplanned readmissions rather than readmissions only related to the CABG surgery for several reasons. First, from the patient perspective, readmission for any reason is likely to be an undesirable outcome of care.

Second, there is no reliable way to determine whether a readmission is related to the previous hospitalization based on the documented cause of readmission. For example, a CABG patient with post-operative left ventricular dysfunction inadequately managed by the hospital performing the surgery may ultimately be readmitted for heart failure. It would be inappropriate to treat this readmission as unrelated to the care the patient received for their CABG surgery.

Third, the range of potentially avoidable readmissions also includes those not directly related to the index condition such as those resulting from medication reconciliation errors, poor communication at discharge, or inadequate follow-up post-discharge. Therefore, we believe that creating a comprehensive list of potentially avoidable readmissions related to the previous hospitalization's condition category would be arbitrary and, ultimately, challenging to implement.

Fourth, all existing CMS readmission measures report all-cause readmission, making this approach consistent with existing measures.

Fifth, research shows that readmission reduction interventions can reduce all-cause readmission, not only condition-specific readmission.

Finally, defining the outcome as all-cause readmissions may encourage hospitals to implement broader initiatives aimed at improving the overall care within the hospital and transitions from the hospital setting instead of limiting the focus to a narrow set of condition-specific approaches.

Comment: One commenter cited a study⁷¹ that concluded that readmission rates for the majority of hospitals were unreliable due to low case volume over the measurement period.

Response: The study cited uses a different approach to calculate hospital-specific risk-adjusted readmission rates, including a logistic regression model and distinct risk variables, than that used in our proposed measure. Our proposed measure uses a hierarchical logistic regression model to account for the clustering of patients within

⁷¹ Shih and Dimick. Reliability of readmission rates as a hospital quality measure in cardiac surgery. *Annals of Thoracic Surgery*. April 2014; 97:1214–1219.

hospitals while risk-adjusting for differences in patient case-mix. Therefore, we do not believe that conclusions drawn from this study are generalizable to this measure. Reliability testing of this measure score using a split-sample approach, in which each hospital's patients are divided into two completely distinct groups and the measure score is calculated for each group and compared, produces an intraclass correlation coefficient of 0.33 on a three year data sample (which is the equivalent of a year and a half of data for each comparison group).

One limitation of this split-sample approach is that the reliability is estimated under the assumption of only half the number of patients per hospital that would normally be used. Using the Spearman Brown prophecy formula⁷² to estimate the reliability of the measure if the entire three year cohort was used (that is, if the number of items in a test increases by a factor of N, then the new reliability ρ' can be estimated from the original reliability. Validity for this measure has been documented by both: (1) face validity assessment by a Technical Expert Panel (TEP)—79 percent of TEP members agreed (71 percent moderately or strongly agreed) that the measure will provide an accurate reflection of quality, and (2) in a formal validation study against clinical registry data that documented correlations in excess of 0.90 between clinical data and claims-based risk models.⁷³

To assess face validity, we surveyed the Technical Expert Panel and asked each member to rate the following statement using a six-point scale (1=Strongly Disagree, 2=Moderately Disagree, 3=Somewhat Disagree, 4=Somewhat Agree, 5=Moderately Agree, and 6=Strongly Agree): "The readmission rates obtained from the readmission measure as specified will provide an accurate reflection of quality." Fourteen TEP members provided the following responses: Moderately Disagreed (2), Somewhat Disagreed (2), Somewhat Agreed (4), Moderately Agreed (5), and Strongly Agreed (1). Therefore, 71 percent of TEP members agreed (43 percent moderately or strongly agreed) that the measure will provide an accurate reflection of quality.

⁷³ Suter L.G., Wang C., Araas M., Joyce E., Vellanky S., Potteiger J., Lin Z., Curtis J., Geary L.L., Krumholz H.M., Drye E.D. *Hospital-level 30-day All-Cause Mortality Following Coronary Artery Bypass Graft Surgery: Report prepared for the Centers for Medicare & Medicaid Services*. 2012.

After consideration of the public comments we received, we are finalizing the Hospital 30-day, All-cause, Unplanned, Risk-Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery measure as proposed.

b. Hospital 30-day, All-cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery.⁷⁴

(1) Background

CABG is a priority area for outcomes measure development because it is a common procedure associated with considerable morbidity, mortality, and health care spending. In 2007, there were 114,028 hospitalizations for CABG surgery and 137,721 hospitalizations for combined surgeries for CABG and valve procedures ("CABG plus valve" surgeries) among Medicare FFS patients in the U.S.⁷⁵

CABG surgeries are costly procedures that account for the majority of major cardiac surgeries performed nationally. In FY 2009, isolated CABG surgeries accounted for almost half (47.6 percent) of all cardiac surgery hospital admissions in Massachusetts.⁷⁶ This provides an example of the frequency in which a CABG is performed for a patient admitted for cardiac surgery. In 2008, the average Medicare payment was \$30,546 for CABG without valve and \$47,669 for CABG plus valve surgeries.⁷⁷

Mortality rates following CABG surgery are not insignificant and vary across hospitals. For example, in 2009 Medicare FFS data indicated that the median hospital-level, risk-standardized mortality rate after CABG was 3.0 percent and ranged from 1.5 percent to 7.9 percent.⁷⁸ Even within a single state, the observed in-hospital, 30-day all-cause, hospital-level mortality rate was 1.81 percent and ranged from 0.0 percent to 5.6 percent among patients who were discharged after CABG surgery (without any other major heart

⁷⁸ Ibid.

surgery earlier in the hospital stay) in New York in 2008. The risk-adjusted mortality rate ranged from 0.0 percent to 8.2 percent.⁷⁹

Variation in these rates suggests that there is room for improvement. An all-cause mortality measure for patients who undergo CABG surgery will provide hospitals with an incentive to reduce mortality through improved coordination of perioperative care and discharge planning. This is further supported by the success of registry-based mortality measures in reducing CABG mortality rates. For example, California reports that CABG mortality in that state has steadily declined from 2.9 percent in 2003, the first year of mandatory reporting of their state registry measure, to 2.2 percent in 2008.⁸⁰

The specifics of the measure methodology are included in the measure methodology report we have posted on our Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. We refer readers to the report for further details on the risk-adjustment statistical model.

We proposed to include this non-NQF-endorsed measure in the Hospital IQR Program under the exception authority in section 1886(b)(3)(B)(IX)(bb) of the Act as previously discussed in section IX.A.7. of the preamble of this final rule. Although the proposed measure is not currently NQF-endorsed, we considered available measures that have been endorsed or adopted by the NQF, and we were unable to identify any measures that assess hospital 30-day, all-cause, risk-standardized mortality rate (RSMR) following coronary artery bypass graft (CABG) surgery. We also are not aware of any other 30-day, all-cause, RSMR measures that have been endorsed or adopted by a consensus organization, and found no other feasible and practical measures on this topic. The measure has been reviewed by the MAP and was conditionally supported pending NQF endorsement as detailed in its Pre-Rulemaking 2014 Map Recommendations Report available at: https://www.qualityforum.org/Publications/2014/01/MAP_Pre-Rulemaking_Report_2014_Recommendations_on_Measures_for_More_than_20_Federal_Programs.aspx.

⁸⁰ California CABG Outcomes Reporting Program. *The California Report on Coronary Artery Bypass Graft Surgery: 2007–2008 Hospital and Surgeon Data*. 2011:119.

This measure was submitted to NQF on March 17, 2014 and is currently under review.

(2) Overview of Measure

The CABG mortality measure assesses hospitals' 30-day, all-cause risk-standardized rate of mortality following admission for a CABG procedure. In general, the measure uses the same approach to risk adjustment and hierarchical logistic modeling (HLM) methodology that is specified for CMS' other mortality measures previously adopted for this program. Information on how the measure employs HLM can be found in the 2012 CABG Mortality Measure Methodology Report (available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>).

(3) Data Sources

The proposed measure is claims-based. It uses Medicare administrative data from hospitalizations for Medicare FFS beneficiaries hospitalized for a CABG procedure.

(4) Outcome

The outcome for this measure is 30-day, all-cause mortality, defined as death for any cause within 30 days of the date of the index procedure date. We use a standard period of assessment so that the outcome for each patient is measured consistently. Without a standard period, variation in length of stay would have an undue influence on mortality rates, and institutions would have an incentive to adopt strategies to shift deaths out of the hospital without improving quality. The measure differs from the timeframe used in the other 30-day mortality measures in the Hospital IQR Program by starting the outcome window from the procedure date rather than the admission date. Data from 2009 Medicare FFS patients demonstrates that 25 percent of CABG procedures occurred more than 3 days after the admission date. Therefore, dating the measurement period from admission would potentially underestimate the period of risk for a substantial number of hospitals.

We chose 30-day mortality because it is an outcome that can be strongly influenced by hospital care and the early transition to the outpatient setting. Clinical experts concur that a 30-day timeframe is clinically sensible for measuring outcomes following CABG surgery.

The measure assesses all-cause mortality rather than CABG-specific mortality for several reasons. First, limiting the measure to CABG-related

mortalities may limit the focus of efforts to improve care to a narrow set of approaches as opposed to encouraging broader initiatives aimed at improving the overall in-hospital care. Second, cause of death may be unreliably recorded and it is often not possible to exclude quality issues and accountability based on the documented cause of mortality. Finally, from a patient perspective, death due to any cause is the outcome that matters.

(5) Cohort

The cohort includes patients aged 65 years and older who received a qualifying CABG procedure at an acute care facility. Patients are eligible for inclusion if they had a qualifying CABG procedure and continuous enrollment in Medicare FFS one year prior to the first day of the index hospital stay and through 30 days post-procedure.

In order to include a clinically-coherent set of patients in the measure, we sought input from clinical experts regarding the inclusion of other concomitant cardiac and non-cardiac procedures, such as valve replacement and carotid endarterectomy. Adverse clinical outcomes following such procedures are higher than those following "isolated" CABG procedures, that is, CABG procedures performed without concomitant high-risk cardiac and non-cardiac procedures.⁸¹ Limiting the measure cohort to "isolated" CABG patients is consistent with published reports of CABG outcomes;⁸² therefore, the measure cohort considers only patients undergoing isolated CABG as eligible for inclusion in the measure. We defined isolated CABG patients as those undergoing CABG procedures without concomitant valve or other major cardiac, vascular or thoracic procedures. In addition, our clinical experts, consultants, and Technical Expert Panel (TEP) members agreed that an isolated CABG cohort is a clinically coherent cohort for quality measurement. For detailed information on the cohort definition, we refer readers to the 2012 CABG Mortality Measure Methodology Report on the CMS Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

(6) Inclusion and Exclusion Criteria

The measure includes hospitalizations for patients who are 65 years of age or older at the time of index

⁸¹ Hannan EL, Zhong Y, Lahey SJ, et al. 30-day readmissions after coronary artery bypass graft surgery in New York State. *JACC Cardiovasc Interv.* 2011;4(5):569–576.

⁸² Ibid.

admission and for whom there was a complete 12 months of Medicare FFS enrollment to allow for adequate risk adjustment. The measure excludes the following admissions from the measure cohort: (1) Admissions for patients who leave hospital against medical advice excluded because providers do not have the opportunity to deliver full care and prepare the patient for discharge; and (2) admissions for patients with subsequent qualifying CABG procedures during the measurement period (a repeat CABG procedure during the measurement period very likely represents a complication of the original CABG procedure and is a clinically more complex and higher risk surgery, therefore we select the first CABG admission for inclusion in the measure and exclude subsequent CABG admissions from the cohort).

(7) Risk-Adjustment

The measure adjusts for differences across hospitals in how at risk their patients are for death relative to patients cared for by other hospitals. The measure uses claims data to identify patient clinical conditions and comorbidities to adjust patient risk for readmission across hospitals, but does not adjust for potential complications of care. We refer readers to section IV.H.4 of the preamble of this final rule for further discussion of risk-adjustment for socioeconomic factors.

(8) Calculating the Risk-Standardized Mortality Ratio (RSMR)

The measure is calculated using hierarchical logistic modeling (HLM). This approach appropriately accounts for the types of patients a hospital treats (that is, hospital case mix), the number of patients it treats, and the quality of care it provides. The HLM is an appropriate statistical approach to measuring quality based on patient outcomes when the patients are clustered within hospitals (and therefore the patients' outcomes are not statistically independent) and the number of eligible patients for the measure varies from hospital to hospital. As noted above, the measure methodology defines hospital case mix based on the clinical diagnoses provided in the hospital claims for their patients' inpatient and outpatient visits for the 12 months prior to the CABG hospitalization, as well as those present in the claims for care at admission. The methodology, however, specifically does not account for diagnoses present in the index admission that may indicate complications rather than patient comorbidities.

The RSMR is calculated as the ratio of the number of predicted deaths to the number of expected deaths and then the ratio is multiplied by the national unadjusted mortality rate. The ratio is greater than one for hospitals that have more deaths than would be expected for an average hospital with similar cases and less than one if the hospital has fewer deaths than would be expected for an average hospital with similar cases. This approach is analogous to a ratio of “observed” or “crude” rate to an “expected” or risk-adjusted rate used in other similar types of statistical analyses.

The RSMR is a point estimate—the best estimate of a hospital’s mortality rate based on the hospital’s case mix. For displaying the measure for the Hospital IQR Program, we computed an interval estimate, which is similar to the concept of a confidence interval, to characterize the level of uncertainty around the point estimate. We use the point estimate and interval estimate to determine hospital performance (for example, higher than expected, as expected, or lower than expected). For more detailed information on the calculation methodology, we refer readers to our Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

We invited public comment on this proposal.

Comment: Several commenters supported the inclusion of CABG mortality into the Hospital IQR Program.

Response: We thank the commenters for their support.

Comment: Several commenters opposed adoption of this measure because it is not NQF-endorsed.

Response: We proposed to include this non-NQF-endorsed measure under the Hospital IQR Program exception authority in section 1886(b)(3)(B)(IX)(bb) of the Act. This provision provides that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We refer readers to section IX.A.7. of the preamble of this final rule where we discuss other commenters concerns regarding our use of non-NQF-endorsed measures.

Although the proposed measure is not currently NQF-endorsed, it is pending NQF endorsement. We considered available measures that have been endorsed or adopted by the NQF. We also are not aware of any other similar measures that have been endorsed or adopted by a consensus organization, and found no other feasible and practical measures on this topic. We refer readers to section IX.A.7. of the preamble of this final rule for a general discussion on adoption of non-NQF-endorsed measures. This measure was submitted to NQF for endorsement and is currently under review.

Comment: One commenter recommended that CMS focus on developing an electronically-specified measure based on ICD-10-CM/PCS for future adoption instead of the current proposed measure.

Response: We will take this suggestion into consideration as we move towards use of electronic clinical quality measures for CABG measures.

Comment: One commenter did not support the measure construction and risk-adjustment methodology, citing concerns that the low R-squared meant that the measure does not truly differentiate performance between hospitals.

Response: We refer readers to our discussion of this issue above in response to the same concern regarding our proposed Hospital 30-day, All-cause, Unplanned, Risk-Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery measure.

Comment: One commenter expressed concerns about the reliability and validity of CMS’ mortality measures. Several commenters opposed this measure because they believed that a more robust methodology is needed to appropriately hold hospitals accountable.

Response: We refer readers to our discussion of this issue above in response to the same concern expressed for reliability, validity, and robust methodology regarding our proposed Hospital 30-day, All-cause, Unplanned, Risk-Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery measure.

We understand “robust” as having good reliability and validity and we believe we demonstrated this in the response below which is the similar to the response for the CABG readmission measure.

Comment: Several commenters believed that the CABG mortality measure has poor discrimination ability. One commenter expressed concern regarding the ability of claims data to

adequately adjust for mortality risk. The commenter suggested comparing results for this measure with results for the STS CABG mortality measure. A commenter expressed concern regarding the ability of claims data to adequately adjust for mortality risk. The commenter suggested comparing results for this measure with results for the Risk-Adjusted Operative Mortality for CABG mortality measure.

Response: We thank the commenters for their feedback. The STS CABG measure provides a clinical model based upon registry data and the CMS CABG mortality measures uses administrative claims data. These measures have similar but not identical mortality outcomes STS NQF #0119, includes inpatient deaths beyond 30 days, and NQF #2558, excludes inpatient deaths beyond 30 days. For these reasons we would not compare the results of these measures. We refer readers to our discussion of this issue in response to the same concern above regarding our proposed Hospital 30-day, All-cause, Unplanned, Risk-Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery measure.

Comment: Several commenters did not support the CABG mortality measure as it does not risk adjust for SES. Commenters requested CMS risk adjust the measure for SES and stated that this materially impacts the patient’s likelihood of death and the members on NQF’s panel to examine adjusting for SES recommended adjusting for SES when appropriate.

Response: We refer readers to our earlier responses in sections IX.A.6. and 7. Of the preamble to this final rule under our Hospital IQR Program discussion. We also refer readers to our responses in section IV.H.4. of the preamble to this final rule for further discussion of this issue.

Comment: One commenter requested that CMS carefully monitor CABG utilization in high-risk, older patients to ensure hospitals are not avoiding performing them for high risk patients in order to appear as lower mortality. The commenter noted that if evidence is found that CABG surgeries are not being offered to high-risk patients, CMS may need to reconsider its risk adjustment methodology to mitigate this unintended consequence.

Response: We refer readers to our discussion of this issue in response to the same concern regarding our proposed Hospital 30-day, All-cause, Unplanned, Risk-Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery measure.

After consideration of the public comments we received, we are finalizing the Hospital 30-day, All-cause, Risk-standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery measure as proposed.

c. Hospital-level, Risk-standardized 30-day Episode-of-Care Payment Measure for Pneumonia

(1) Background

Providing high-value care is an essential part of our mission to provide better health care for individuals, better health for populations, and lower costs for health care. In order to incentivize innovation that promotes high-quality care at high value it is critical to examine measures of payment and patient outcomes concurrently. There is evidence of variation in payments at hospitals for pneumonia patients; mean 30-day risk-standardized payment among Medicare FFS patients aged 65 or older hospitalized for pneumonia in 2008–2009 was \$13,237, and ranged from \$8,281 to \$27,975 across 4,155 hospitals. However, high or low payments to hospitals are difficult to interpret in isolation. Some high payment hospitals may have better clinical outcomes when compared with low payment hospitals while other high payment hospitals may not have better outcomes. For this reason, the value of hospital care is more clearly assessed when pairing hospital payments with hospital quality. Therefore, we proposed to include this non-NQF-endorsed measure in the Hospital IQR Program under the exception authority in section 1886(b)(3)(B)(IX)(bb) of the Act as previously discussed in section IX.A.7. of the preamble of this final rule. Although the proposed measure is not currently NQF-endorsed, we considered available measures that have been endorsed or adopted by the NQF, and we were unable to identify any measures that assess hospital risk-standardized payment associated with a 30-day episode-of-care for pneumonia. We also are not aware of any other 30-day episode-of-care pneumonia measures that have been endorsed or adopted by a consensus organization, and found no other feasible and practical measures on this topic. The MAP supports this measure but reiterated the need for this measure to be submitted for NQF-endorsement: https://www.qualityforum.org/Setting_Priorities/Partnership/MAP_Final_Reports.aspx. This measure was submitted to the NQF for endorsement on April 18, 2014.

We believe it is important to adopt this measure as pneumonia is one of the leading causes of hospitalization for Americans 65 and over, and pneumonia patients incur roughly \$10 billion in aggregate health care costs.⁸³ Furthermore, because 30-day all-cause mortality and readmission measures for pneumonia are already publicly reported, pneumonia serves as a model condition for assessing relative value for an episode of care that begins with an acute hospitalization because including this measure in the Hospital IQR Program and publicly reporting it on *Hospital Compare* will allow stakeholders to assess information about a hospital's quality and cost of care for pneumonia. The measure reflects differences in the management of care for patients with pneumonia both during hospitalization and immediately post-discharge. By focusing on one specific condition, value assessments may provide actionable feedback to hospitals and incentivize targeted improvements in care.

(2) Overview of Measure and Rationale for Examining Payments for a 30-Day Episode-of-Care

The pneumonia payment measure assesses hospital risk-standardized payment associated with a 30-day episode-of-care for pneumonia for any hospital participating in the Hospital IQR Program. The measure includes Medicare FFS patients aged 65 or older admitted for pneumonia and calculates payments for these patients over a 30-day episode-of-care beginning with the index admission. In general, the measure uses the same approach to risk-adjustment as our 30-day outcome measures previously adopted for the Hospital IQR Program. We refer readers to our Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

When examining variation in payments, consideration of the episode-of-care triggered by admission is meaningful for several reasons. First, hospitalizations represent a brief period of illness that requires ongoing management post-discharge and decisions made at the admitting hospital affect payments for care in the immediate post-discharge period. Second, attributing payments for a continuous episode-of-care to admitting

hospitals may reveal practice variations in the full care of the illness that can result in increased payments. Third, a 30-day preset window provides a standard observation period by which to compare all hospitals. Lastly, the pneumonia payment measure is intended to be paired with our 30-day pneumonia mortality and readmission measures and capture payments for Medicare patients across care settings, services, and supplies, except for Medicare Part D (that is, inpatient, outpatient, skilled nursing facility, home health, hospice, physician/clinical laboratory/ambulance services, supplier Part B items, and durable medical equipment, prosthetics/orthotics, and supplies).

We have posted the measure methodology report on our Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. We refer readers to the report for further details on the risk adjustment statistical model as well as the model results.

(3) Data Sources

The proposed measure is claims-based and uses Medicare administrative data that contain hospitalizations and payments for Medicare FFS beneficiaries hospitalized with pneumonia.

(4) Outcome

The primary outcome of the pneumonia payment measure is the hospital-level risk-standardized payment for a pneumonia episode-of-care. The measure captures payments for Medicare patients across all care settings, services, and supplies, except Part D. By risk-standardizing the payment measure, we are able to adjust for case-mix at any given hospital and compare a specific hospital's pneumonia payment to other hospitals with the same case-mix. The analytic time frame for the pneumonia payment measure begins with the index admission for pneumonia and ends 30 days post-admission.

In order to isolate payment variation that reflects practice patterns rather than CMS payment adjustments, the pneumonia payment measure excludes policy and geography payment adjustments unrelated to clinical care decisions. We achieve this by “stripping” or “standardizing” payments for each care setting. Stripping refers to removing geographic differences and policy adjustments in payment rates for individual services from the total payment for that service. Standardizing refers to averaging

⁸³ Lindenaier PK, Lagu T, Shieh M, Pekow PS, Rothberg MB. Association of diagnostic coding with trends in hospitalizations and mortality of patients with pneumonia, 2003–2009. *JAMA: The Journal of the American Medical Association*. 2012;307(13):1405–1413.

payments across geographic areas for those services where geographic differences in payment cannot be stripped. Stripping and standardizing the payment amounts allows for a fair comparison across hospitals based solely on payments for decisions related to clinical care of pneumonia.

(5) Cohort

We created the pneumonia payment measure cohort to be aligned with the publicly reported pneumonia mortality measure cohort. Consistent with these measures, the pneumonia payment measure includes hospitalizations with a principal hospital discharge diagnosis of pneumonia using the International Classification of Diseases, 9th Edition, Clinical Modification (ICD-9-CM). These measures will use data from July 2010–June 2013, which does not yet include the period for which ICD-10 codes are mandatory. We refer readers to our discussion of data collection for this measure during the transition period from ICD-9-CM codes to ICD-10-CM/PCS codes (79 FR 28232). A full list of ICD-9-CM codes included in the final cohort can be found in Appendix B of the technical report on our Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. The measure includes only those hospitalizations from short-stay acute care hospitals in the index cohort and restricts the cohort to patients enrolled in FFS Medicare Parts A and B (with no Medicare Advantage coverage).

(6) Inclusion and Exclusion Criteria

The pneumonia payment measure includes hospitalizations for patients 65 years or older at the time of index admission and for whom there was a complete 12 months of FFS enrollment to allow for adequate risk adjustment. An index admission/hospitalization is the initial pneumonia admission that triggers the 30-day episode-of-care for this payment calculation. The measure excludes the following admissions from the measure cohort: (1) Admissions for patients with fewer than 30 days of post-admission enrollment in Medicare because this is necessary in order to identify the outcome (payments) in the sample over the analytic period; (2) admissions for patients having a principal diagnosis of pneumonia during the index hospitalization who were transferred from another acute care facility are excluded, because the hospital where the patient was initially admitted made the critical acute care decisions (including the decision to transfer and where to transfer); (3)

admissions for pneumonia patients who were discharged on the same or next day as the index admission and did not die or get transferred are excluded, because it is unlikely these patients suffered a clinically significant pneumonia; (4) admissions for patients enrolled in the Medicare Hospice program any time in the 12 months prior to the index hospitalization, including the first date of the index admission are excluded, because it is likely that these patients are continuing to seek comfort care and their goal may not be survival; (5) admissions for patients who are discharged alive and against medical advice are excluded because providers did not have the opportunity to deliver full care and prepare the patient for discharge; (6) admissions for patients transferred to or from federal or Veterans Administration hospitals are excluded, because we do not have claims data for these hospitals; thus, including these patients would systematically underestimate payments; and (7) admissions without a DRG or DRG weight for the index hospitalization are excluded, because we cannot calculate a payment for these patients' index admission using the IPPS; this would underestimate payments for the entire episode-of-care. There are two portions of the DRG system that determine how much a provider is reimbursed. The first is the DRG itself which indicates the reason a patient was admitted. The second is the DRG weight which determines the severity of the admission. Without either of these, we were unable to calculate the payment for the index admission.

(7) Risk Adjustment

The measure adjusts for differences across hospitals in how payments are affected by patient comorbidities relative to patients cared for by other hospitals. We refer readers to section IV.H.4 of the preamble of this final rule for further discussion of risk-adjustment for socioeconomic factors.

(8) Calculating the Risk-Standardized Payment (RSP)

The measure is calculated using a hierarchical generalized linear model with a log link and a Poisson error distribution. This is a widely accepted statistical method that enables fair evaluation of relative hospital performance by taking into account patient risk factors as well as the number of patients that a hospital treats. This statistical model accounts for the structure of the data (patients clustered within hospitals) and calculates: (1) how much variation in hospital

payment overall is accounted for by patients' individual risk factors (such as age and other medical conditions); and (2) how much variation is accounted for by hospital-specific performance. This approach appropriately models a positive, continuous, right-skewed outcome like payment and also accounts for the types of patients a hospital treats (that is, hospital case mix), the number of patients it treats, and the quality of care it provides. The hierarchical generalized linear model is an appropriate statistical approach to measuring quality based on patient outcomes when the patients are clustered within hospitals and sample sizes vary across hospitals. Clustered patients are within the same hospital, and the quality of care of the hospital affects all patients, so the outcomes for each hospital's patients are not fully independent (that is, completely unrelated) as is assumed by many statistical models. As noted above, the measure methodology defines hospital case mix based on the clinical diagnoses provided in the hospital claims for their patients' inpatient and outpatient visits for the 12 months prior to the pneumonia hospitalization, as well as those present in the claims for care at admission. This methodology specifically does not, however, account for diagnoses present in the index admission that may indicate complications rather than patient comorbidities.

The RSP is calculated as the ratio of predicted payments to expected payments and then the ratio is multiplied by the national unadjusted average payment for an episode of care. The ratio is greater than one for hospitals that have higher payments than would be expected for an average hospital with similar cases and less than one if the hospital has lower payments than would be expected for an average hospital with similar cases. This approach is analogous to a ratio of "observed" or "crude" rate to an "expected" or "risk-adjusted" rate used in other similar types of statistical analyses.

The RSP is a point estimate—the best estimate of a hospital's payment based on the hospital's case mix. To calculate the measure for the Hospital IQR Program, we computed an interval estimate, which is similar to the concept of a confidence interval, to characterize the level of uncertainty around the point estimate, we use the point estimate and interval estimate to determine hospital performance (for example, higher than expected, as expected, or lower than expected). The interval estimate indicates that the true value of the

payment ratio lies between the lower limit and the upper limit of the interval. For more detailed information on the calculation methodology, we refer readers to our Web site at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

This measure is meant to be paired with our 30-day pneumonia mortality and/or readmission measure in order for us to gain a better understanding of the value of care for a hospital's patients and the nation as a whole.

We invited public comment on this proposal.

Comment: One commenter did not support inclusion of the heart failure and pneumonia payment measures in the Hospital IQR Program because of concern that much of the variation in 30-day episode measures is attributable to factors outside of the hospitals control, most notably post-acute care (PAC) services. The commenter felt that measures of accountability should hold all entities accountable as opposed to focusing only on hospitals.

Response: We appreciate the commenter's suggestion and note that we addressed this question in the FY 2014 IPPS/LTCH PPS final rule. In that final rule (78 FR 50804), we stated that "when considering payments to hospitals, we attributed payments for a 30-day episode of care to the hospital since the episode is triggered by admission to an inpatient hospitalization. Hospitalizations represent a brief period of acute illness that requires ongoing management post-discharge and hospitals are often directly responsible for scheduling post-discharge follow-up. Therefore decisions made at the admitting hospital affect not only the hospitalization payments, but payments for care in the immediate post-discharge period."

Comment: Several commenters generally supported and appreciated CMS' proposal to report 30-day risk-standardized episode of care payment measures for pneumonia and heart failure, as a way to optimally measure care for these patients. A commenter urged CMS to monitor measure results with respect to volume of procedures. A commenter supported condition-specific or more granular, episode-based payment measures over the Medicare Spending Per Beneficiary (MSPB) measure.

Response: We thank the commenters for their support. We will take their recommendations to monitor measure results with respect to volume of procedures and the request to add condition-specific or more granular,

episode-based payment measures into consideration when planning future measure development.

Comment: Several commenters believed payment measures are necessary, but do not support payment measures that examine episodes of care beyond the inpatient admission due to variations in availability of PAC services.

Response: Because acute care providers make decisions that affect PAC spending, including scheduling follow-up care and others, we believe it is appropriate to attribute payments arising from the PAC setting to the acute care provider.

Comment: A commenter stated that CMS should adjust episode-based payment measures for outcome differences that accrue over clinically relevant time horizons.

Response: We thank the commenter for this suggestion, and will consider these comments in the future. We appreciate the commenter's feedback. However we believe that the proposed measure does account for outcome differences over clinically relevant time horizons as the measure captures payments for Medicare patients across all care settings, services, and supplies, except Part D.

Comment: Several commenters did not support the use of the Hospital-level, Risk-standardized 30-day Episode-of-Care Payment Measure for Pneumonia measure in the Hospital IQR Program because they believed that the proposed measure reflected actions of many health care entities that are beyond the hospital's control, such as cost variation in Medicare spending and notably PAC services. The commenters felt measures of accountability should hold all entities accountable as opposed to focusing only on hospitals. Commenters noted that hospitals are legally unable to direct patient toward high-quality, cost-efficient providers. Several commenters were concerned that the payment measures assume hospitals have more control over costs that occur post hospitalization than what is realistic and it reflects actions of many health care entities that are beyond the hospital's control. Therefore, the commenters stated that the pneumonia and heart failure payment measures were not appropriate for evaluating care exclusively in the inpatient setting.

Commenters suggested the measures would be more appropriate for physician, LTCH, home health, and PAC reporting programs. Several commenters believed measures should hold accountable all entities so that incentives are aligned across

continuum. A commenter noted that legal and regulatory challenges at the State and federal level prevent hospitals from coordinating care as fully as possible and episode of care measures holding only the hospital accountable create misaligned incentives which could lead to unintended consequences.

Response: We appreciate the commenters' suggestions and note that we addressed many of these questions in the FY 2014 IPPS/LTCH PPS final rule. In that final rule (78 FR 50804), we stated that, "when considering payments to hospitals, we attributed payments for a 30-day episode of care to the hospital since the episode is triggered by admission to an inpatient hospitalization. Hospitalizations represent a brief period of acute illness that requires ongoing management post-discharge and hospitals are often directly responsible for scheduling post-discharge follow-up. Therefore decisions made at the admitting hospital affect not only the hospitalization payments, but payments for care in the immediate post-discharge period." Finally, the objective of these episode of care payment measures is to encourage efficiencies gained by well-coordinated care across a patient's experience of illness.

We understand the commenters concerns about differences among hospitals in the availability of post-acute services, such as LTCHs. We hope that the differences in episode payments revealed by these measures will catalyze hospitals, other providers and communities to engage in an examination of local service availability to encourage efficient and sufficient services are available to all patients. Without the reporting of standardized episode payment measures, the knowledge of differences among hospitals payment patterns would not be available to provide incentives for such efforts. Although hospitals are not responsible for all differences in episode payments alone, they are well-positioned to participate in such collaborations.

Comment: A commenter was disappointed that CMS continue to develop and adopt measures that examine episodes of care beyond the inpatient admission. The commenter stated that measures of accountability, such as the proposed episode measures, should hold accountable all entities so that the incentives are aligned across the continuum.

Another commenter opposed measures that reflect the broad spectrum of care inside and outside of the hospital. The commenter did not believe that measures that encompass a range of

services from admission until 30 days post-discharge should be used as an indicator of hospital-specific care.

Response: We respectfully disagree with the commenters. We refer readers to our discussion of this issue in response to the same concern in the response above. In addition, we believe that these measures should reflect the broad spectrum of care inside a hospital as well as care transitions, which are important for hospitals' and for the health care system's efforts to reduce readmissions and prevent hospitals from being financially penalized. We believe measures that look beyond the discharge will encourage hospitals to communicate more effectively with their patients and their peers thereby, improving care, reducing costs, and improving the health of the nation.

Comment: A commenter did not support inclusion of the pneumonia or heart failure payment measures in the Hospital IQR Program, because they do not exclude certain high-cost patients (patients with ESRD, cancer, or HIV/AIDS).

Response: We appreciate the concern about high-cost patients. The payment measures are intended to assess differences in payment associated with different practice patterns for the broad range of patients cared for by a hospital. We note that the episode of care measures account for the fact that some hospitals care for more patients with needs for high-cost care by risk adjusting for patients' conditions, such as cancer, rather than excluding such patients. In the course of selecting variables for risk-adjustment, high-cost chronic conditions such as cancer, end-stage renal disease, HIV/AIDS, and others are considered. Once the variables are considered, we determined if the variable should be included in the measure. To be included in the measure, each risk variable must be found to be significantly and consistently related to the payment outcome in the risk-model selection process. We note that the Agency for Healthcare Research and Quality's Condition Categories for HIV/AIDS; Metastatic Cancer and Acute Leukemia; Lung, Upper Digestive Tract, and Other Severe Cancers; Lymphatic, Head And Neck, Brain, and Other Major Cancers; Dialysis Status; and Renal Failure are included in the final risk adjustment model for pneumonia payment. The Condition Categories for HIV/AIDS; Dialysis Status; and Renal Failure were also included the final risk-adjustment model for HF payment. The HF measures' risk-adjustment was discussed at length by the NQF Cost and Resource Steering Committee. In its final vote, the NQF Cost and Resource

Steering Committee recommended endorsement of the episode-of-care payment measure for heart failure.

Comment: A commenter was concerned that the measures unfairly disadvantage hospitals that treat sicker patients. For example, patients with heart failure who receive a defibrillator are sicker, however they are not excluded from the measures, so hospitals that perform this service appear less efficient.

Response: We appreciate the commenter's concern about complex patient factors that may contribute to the cost of care. The payment measures are risk-adjusted in order to account for differences in case-mix, or patient complexity, between hospitals. For each patient, the claims for the 12-months prior to the measured hospitalization are examined to identify additional clinical conditions that patients may have which could contribute to costs of care. These conditions are included in the risk-model for the measure to ensure that all providers are assessed fairly and avoid putting providers at risk of appearing to have patient costs that are higher than other hospitals due to the clinical complexity of their patients. Although we do not believe that the use of defibrillators is likely to substantially change hospitals' results, we appreciate this comment and plan to investigate the prevalence of defibrillators in the heart failure cohort and its effect on the payment outcome.

Comment: A commenter did not support the inclusion of the PN and HF payment measures in the Hospital IQR Program and recommended using a single hospital-wide payment measure instead of condition-specific payment measures to pool information for all patients to increase sample size and improve reliability.

Response: We believe the condition-specific payment measures are useful for several reasons. By focusing on one specific condition, payment measures may provide actionable feedback to hospitals and incentivize targeted improvements in care. Heart failure and pneumonia are both common conditions in the elderly with a substantial range in payments due to different practice patterns. Furthermore, because 30-day all-cause mortality and readmission measures for heart failure and pneumonia are already publicly reported, heart failure and pneumonia serve as model conditions for examining both payments for an episode-of-care and the quality of a hospital's care for the same patient population.

Comment: Commenters recommended that CMS pilot the PN and HF payment measures prior to implementation.

Response: We thank the commenter for their recommendation. We will consider this as we plan dry runs in the future. A dry run provides the opportunity for hospitals to review their measure results and ask questions about the measure methodology. The measure results used during a dry run are based on data outside of the performance period designated for a given fiscal year, and the measure results are made available to hospitals on a secure Web site and are not publically reported. From our perspective, a dry run is type of pilot in which hospitals become familiar with their measure results and the measure methodology.

Comment: A commenter requested that CMS transparently assess the reliability of the PN and HF payment measures prior to adoption into the Hospital IQR Program.

Response: We appreciate this feedback. We note that we have been transparent in assessing the reliability of the PN and HF payment measures, in that the measure methodologies for these measures contain the reliability testing results and have been posted at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html> in May 2015. We note that the Intraclass Correlation Coefficient (ICC) is a statistical process used to assess the reliability of measures. The ICC score can be used to determine the extent to which assessments of a hospital using different, but randomly selected subsets of patients produces similar measures of hospital performance. To the extent that the calculated measures of these two subsets agree, we have evidence that the measure assesses an attribute of the hospital, not of the patients. The agreement between the two independent assessments of each hospital was 0.825 for the PN measure and 0.752 for the HF measure, which according to the conventional interpretation, is "almost perfect" for the PN measure and "substantial" for the HF measure.⁸⁴

Comment: A commenter was concerned about CMS measuring overuse, as there are patient scenarios that are not addressed by available evidence. The commenter stated that proper evaluation of validity and reliability is lacking; however, current registry-based measures are filling this gap. The commenter recommends halting the development and implementation of these measures.

⁸⁴ Landis JR, Koch GG. The measurement of observer agreement for categorical data. *Biometrics*. 1977;159-174.

Response: These measures are not specifically designed to identify overuse. We interpret overuse to mean using more resources than expected given how sick the patients are. Rather, the measures are designed to evaluate broad patterns of care, both within the inpatient environment and in the transition to the outpatient setting, that might lead to higher overall payments. As noted in another response above, the reliability and validity of these measures has been evaluated by both a Technical Expert Panel and the NQF Cost and Resource Use Standing Committee. We also analyzed the ICC score for these measures to help assess reliability. Although registry data offers some advantages, it is much more burdensome for hospitals to collect and is not uniformly available.

Comment: Several commenters requested that CMS adjust the payment measures for SES based on the NQFs expert panel recommendations.

Response: We refer readers to section IV.H.4. of the preamble to this final rule for further discussion of this issue.

After consideration of the public comments we received, we are finalizing the Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode of Care for Pneumonia measure, as proposed.

d. Hospital-Level, Risk-Standardized 30-Day Episode-of-Care Payment Measure for Heart Failure

(1) Background

There is evidence of variation in payments at hospitals for heart failure patients; mean 30-day risk-standardized payment among Medicare FFS patients aged 65 or older hospitalized for heart failure in 2008–2009 was \$13,922, and ranged from \$9,630 to \$20,646 across 3,714 hospitals. However, high or low payments to hospitals are difficult to interpret in isolation. Some high payment hospitals may have better clinical outcomes when compared with low payment hospitals while other high payment hospitals may not have better outcomes. For this reason, the value of hospital care is more clearly assessed when pairing hospital payments with hospital quality. Therefore, we proposed to include this non-NQF-endorsed measure: hospital risk-standardized payment associated with a 30-day episode-of-care for heart failure in the Hospital IQR Program under the exception authority in section 1886(b)(3)(B)(IX)(bb) of the Act as previously discussed in section IX.A.7. of the preamble of this final rule. Although the proposed measure is not currently NQF-endorsed, we considered

available measures that have been endorsed or adopted by the NQF, and we were unable to identify any measures that assess hospital risk-standardized payment associated with a 30-day episode-of-care for heart failure. We also are not aware of any other 30-day episode-of-care heart failure measures that have been endorsed or adopted by a consensus organization, and found no other feasible and practical measures on this topic. The MAP supports this measure but reiterated the need for this measure to be submitted for NQF endorsement: https://www.qualityforum.org/Setting_Priorities/Partnership/MAP_Final_Reports.aspx. The HF measure was submitted to the NQF and is currently under review as part of the cost and resource use project.

We believe it is important to adopt this measure as heart failure is one of the leading causes of hospitalization for Americans 65 and over and costs roughly \$34 billion annually.^{85 86} Furthermore, because 30-day all-cause mortality and readmission measures for heart failure are already publicly reported, heart failure serves as a model condition for assessing relative value for an episode of care that begins with an acute hospitalization. Including this measure in the Hospital IQR Program and publicly reporting it on *Hospital Compare* will allow stakeholders to assess information about a hospital's quality and cost of care for heart failure. The measure reflects differences in the management of care for patients with heart failure both during hospitalization and immediately post-discharge. By focusing on one specific condition, value assessments may provide actionable feedback to hospitals and incentivize targeted improvements in care.

(2) Overview of Measure and Rationale for Examining Payments for a 30-Day Episode-of-Care

The heart failure payment measure assesses hospital risk-standardized payment associated with a 30-day episode-of-care for heart failure for any hospital participating in the Hospital IQR Program. The measure includes Medicare FFS patients aged 65 or older admitted for heart failure and calculates payments for these patients over a 30-day episode-of-care beginning with the

index admission. In general, the measure uses the same approach to risk-adjustment as our 30-day outcome measures previously adopted for the Hospital IQR Program. We refer readers to the measure methodology report on our Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

When examining variation in payments, consideration of the episode-of-care triggered by admission is meaningful for several reasons. First, hospitalizations represent brief periods of illness that require ongoing management post-discharge; and decisions made at the admitting hospital affect payments for care in the immediate post-discharge period. Second, attributing payments for a continuous episode-of-care to admitting hospitals may reveal practice variations in the full care of the illness that can result in increased payments. Third, a 30-day preset window provides a standard observation period by which to compare all hospitals. The term preset window means that every admission will be tracked 30 days post admission in order to apply a standardized measurement window. In order to compare payments across providers it is important that the comparison window is identical for each admission at each hospital. Lastly, the heart failure payment measure is intended to be paired with our 30-day heart failure mortality and readmission measures and capture payments for Medicare patients across all care settings, services, and supplies, except for Medicare Part D (that is, inpatient, outpatient, skilled nursing facility, home health, hospice, physician/clinical laboratory/ambulance services, supplier Part B items, and durable medical equipment, prosthetics/orthotics, and supplies).

We have posted the measure methodology report on our Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. We refer readers to the report for further details on the risk adjustment statistical model as well as the model results.

(3) Data Sources

The proposed measure is claims-based and uses Medicare administrative data that contain hospitalizations and payments for Medicare FFS beneficiaries hospitalized with heart failure.

⁸⁵ Russo CA, Elixhauser, A. Hospitalizations in the Elderly Population, 2003. Agency for Healthcare Research and Quality. 2006.

⁸⁶ Heidenreich PA, Trogon JG, Khavjou OA, Butler J, Dracup K, Ezekowitz MD, et al. Forecasting the future of cardiovascular disease in the United States: a policy statement from the American Heart Association. *Circulation*. 2011;123(8):933–44.

(4) Outcome

The primary outcome of the heart failure payment measure is the hospital-level risk-standardized payment for a heart failure episode-of-care. The measure captures payments for Medicare patients across all care settings, services, and supplies, except Part D. By risk-standardizing the payment measure, we are able to adjust for case-mix at any given hospital and compare a specific hospital's heart failure payment to other hospitals with the same case-mix. The analytic time frame for the heart failure payment measure begins with the index admission for heart failure and ends 30 days post-admission. The index admission is any admission included in the measure calculation that begins the 30-day heart failure episode of care.

In order to isolate payment variation that reflects practice patterns rather than CMS payment adjustments, the heart failure payment measure excludes policy and geography payment adjustments unrelated to clinical care decisions. We achieve this by "stripping" or "standardizing" payments for each care setting. These concepts were also discussed previously in the proposed hospital-level, risk-standardized 30-day episode-of-care payment measure for pneumonia measure in section IX.A.7.c.(4) of the preamble of this final rule.

(5) Cohort

We created the heart failure payment measure cohort to be aligned with the publicly reported heart failure mortality measure cohort. Consistent with these measures, the heart failure payment measure includes hospitalizations with a principal hospital discharge diagnosis of heart failure using ICD-9-CM codes included in the final cohort can be found in Appendix B of the technical report on our Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>. The measure will be using data from July 2010–June 2013, which does not yet include the period when ICD-10 codes are mandatory. We refer readers to our discussion of data collection for this measure during the transition period from ICD-9-CM codes to ICD-10-CM/PCS codes (79 FR 28234).

An index admission/hospitalization is the initial heart failure admission that triggers the 30-day episode-of-care for this payment calculation. The measure includes only those hospitalizations from short-stay acute care hospitals in the index cohort and restricts the cohort

to patients enrolled in FFS Medicare Parts A and B (with no Medicare Advantage coverage). These hospitalizations are the admissions which were included in the measure after applying all inclusion/exclusion criteria.

(6) Inclusion and Exclusion Criteria

The heart failure payment measure includes hospitalizations for patients 65 years or older at the time of index admission and for whom there was a complete 12 months of FFS enrollment to allow for adequate risk adjustment. The measure excludes the following admissions from the measure cohort: (1) admissions for patients with fewer than 30 days of post-admission enrollment in Medicare because this is necessary in order to identify the outcome (payments) in the sample over the analytic period; (2) admissions for patients having a principal diagnosis of heart failure during the index hospitalization who were transferred from another acute care facility are excluded, because the hospital where the patient was initially admitted made the critical acute care decisions (including the decision to transfer and where to transfer); (3) admissions for heart failure patients who were discharged on the same or next day as the index admission and did not die or get transferred are excluded, because it is unlikely these patients suffered a clinically significant heart failure; (4) admissions for patients enrolled in the Medicare Hospice program any time in the 12 months prior to the index hospitalization, including the first date of the index admission are excluded, because it is likely that these patients are continuing to seek comfort care and their goal may not be survival; (5) admissions for patients who are discharged alive and against medical advice are excluded because providers did not have the opportunity to deliver full care and prepare the patient for discharge; (6) admissions for patients transferred to or from federal or Veterans Administration hospitals are excluded, because we do not have claims data for these hospitals; thus, including these patients would systematically underestimate payments; (7) admissions without a DRG or DRG weight for the index hospitalization are excluded, because we cannot calculate a payment for these patients' index admission using the IPPS; this would underestimate payments for the entire episode-of-care; and (8) admissions for patients who receive a heart transplant or LVAD during the index admissions or episode of care because these patients are clinically distinct, generally very

high payment cases, and not representative of the typical heart failure patient that this measure aims to capture.

(7) Risk Adjustment

The measure adjusts for differences across hospitals in how payments are affected by patient comorbidities relative to patients cared for by other hospitals. We refer readers to section IV.H.4 of the preamble of this final rule for further discussion of risk-adjustment for socioeconomic factors.

(8) Calculating the Risk-Standardized Payment (RSP)

The measure is calculated using hierarchical generalized linear statistical models with a log link and a Gamma error distribution. This approach appropriately models a positive, continuous, right-skewed outcome like payment and also accounts for the types of patients a hospital treats (that is, hospital case-mix), the number of patients it treats, and the quality of care it provides. The hierarchical generalized linear model is an appropriate statistical approach to measuring quality based on patient outcomes when the patients are clustered within hospitals (and therefore the patients' outcomes are not statistically independent) and sample sizes vary across hospitals. As noted above, the measure methodology defines hospital case mix based on the clinical diagnoses provided in the hospital claims for their patients' inpatient and outpatient visits for the 12 months prior to the heart failure hospitalization, as well as those present in the claims for care at admission. This methodology specifically does not, however, account for diagnoses present in the index admission that may indicate complications rather than patient comorbidities.

The RSP is calculated as the ratio of predicted payments to expected payments and then the ratio is multiplied by the national unadjusted average payment for an episode of care. The ratio is greater than one for hospitals that have higher payments than would be expected for an average hospital with similar cases and less than one if the hospital has lower payments than would be expected for an average hospital with similar cases. This approach is analogous to a ratio of "observed" or "crude" rate to an "expected" or "risk-adjusted" rate used in other similar types of statistical analyses.

The RSP is a point estimate—the best estimate of a hospital's payment based on the hospital's case mix. For displaying the measure for the Hospital

IQR Program, we computed an interval estimate, which is similar to the concept of a confidence interval, to characterize the level of uncertainty around the point estimate, we use the point estimate and interval estimate to determine hospital performance (for example, higher than expected, as expected, or lower than expected). For more detailed information on the calculation methodology, we refer readers to our Web site at: <http://cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>.

This measure is meant to be paired with our 30-day heart failure mortality and/or readmission measure in order for us to gain a better understanding of the value of care for a hospital's patients and the nation as a whole.

We invited public comment on this proposal.

Comment: Several commenters opposed the payment measures because they did not believe it is fair to hold a hospital responsible for payments that occur outside of its walls. The commenters recommended that these mortality and readmissions measures instead be adopted in the PQRS, as well as long-term care, PAC, home health, and other entities that participate in the patient's care.

One commenter cited a study that stated that 80 percent of the variability in the payment measures is driven by PAC and noted that areas with more LTCHs will likely have higher spending. Several commenters believed measures should hold accountable all entities so that incentives are aligned across the continuum of care. Another commenter noted that legal and regulatory challenges at the State and federal levels prevent hospitals from coordinating care as fully as possible and episode of care measures holding only the hospital accountable create misaligned incentives, which could lead to unintended consequences.

Response: We interpret the commenter's statement that, "these types of measures should instead be adopted in the PQRS, as well as long-term care, PAC, home health, and other entities that participate in the patient's care," to mean the Long-Term Care Quality Reporting (LTCHQR) Program, PAC (all care provided after a patient is discharged from an index hospitalization), Home Health Quality Reporting Program and other CMS quality reporting programs applicable to entities that participate in the patient's care. As described above, because heart failure is one of the leading causes of hospitalization for Americans 65 and over, and its associated care costs

roughly \$34 billion annually, we believe it is appropriate to pair a measure of Medicare payments for heart failure with the existing quality measures on this topic. We intend to closely monitor the measure's effects on hospitals' and PAC providers' behavior.

We developed these measures in accordance with national guidelines⁸⁷ and in consultation with clinical and measurement experts, key stakeholders, and the public. Furthermore, the AMI/HF measures were recommended for endorsement by the NQF Standing Committee for Cost and Resource Use, Phase 2. This information can be located in the following report: <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=76905>.

Comment: Several commenters expressed concern that the heart failure payment measure did not receive NQF endorsement, and specifically, that the Cardiovascular Technical Advisory Panel or the Cost and Resource Use Standing Committee did not endorse the measure. These commenters noted that the Cost and Resource Use Standing Committee felt the risk model did not properly account for differences in patient risk and it was not until CMS pressed for a third vote that it received endorsement (see <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=76905>). Consequently, the commenters believed the measure is premature and should not be implemented.

Response: We appreciate this comment. We note the following sequence of events regarding the recommendation for endorsement of this measure confirms that this measure is not premature in consideration for implementation. Earlier this year the measure was assessed by the Cost and Resource Use Standing Committee. During this part of the endorsement process the Standing Committee did not reach consensus on a recommendation

⁸⁷ Krumholz HM, Brindis RG, Brush JE, et al. Standards for statistical models used for public reporting of health outcomes: an American Heart Association Scientific Statement from the Quality of Care and Outcomes Research Interdisciplinary Writing Group: cosponsored by the Council on Epidemiology and Prevention and the Stroke Council. Endorsed by the American College of Cardiology Foundation. *Circulation*. Jan 24 2006;113(3):456-462 and "Standards for Measures Used for Public Reporting of Efficiency in Health Care" (Krumholz HM, Keenan PS, Brush JE, Jr., et al. Standards for measures used for public reporting of efficiency in health care: a scientific statement from the American Heart Association Interdisciplinary Council on Quality of Care and Outcomes Research and the American College of Cardiology Foundation. *Circulation*. Oct 28 2008;118(18):1885-1893.

for endorsement and the measure was submitted for public comment. After review of CMS' responses to the public comments the Consensus Standards Approval Committee (CSAC) voted to recommend the Hospital-Level, Risk-standardized 30-day Episode-of-Care Payment Measure for Heart Failure for endorsement. The NQF Board is expected to review this measure in August 2014. We are actively seeking NQF endorsement for this measure. A Voting Draft Report of the Cost and Resource Use Standing Committee can be found at <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=76905>.

Comment: A commenter suggested the need for innovative solutions for providers in addition to outcome measures. This commenter believed that hospitals should: consider innovative ways to identify heart failure patients early in admission; implement evidence-based clinical pathways to assure the patient moves efficiently through their stay with optimal outcomes; develop a tight network of post-acute providers; and implement an enhanced communication system to identify where the patient is at any point in time during the 30-day window.

Response: We agree with the commenter's points about the need for continued innovation to drive high-quality and efficient care. We believe the measures that we have selected will help drive hospitals to provide that care.

Comment: One commenter noted that much of the care expended during the first 30 days is aimed at increasing long-term survival and requested that CMS consider a measure with a longer outcome window to pair with the measure.

Response: We agree that it is possible that some of the variation in hospital payments will be due to patterns of care that are intended to improve longer term outcomes. However at this time, we are not aware of a publicly reported, or non-NQF endorsed NQF-endorsed quality metric that considers a longer-term outcome with which we can harmonize the payment measure. As part of ongoing measure reevaluation and surveillance, we will evaluate the relationship between payments and longer term outcomes to assess if the performance of hospitals differs when looking at a longer time frame. Our plan is to eventually compare 30-day payments with longer outcomes like 1-year mortality to determine if high upfront payments have a longer term benefit.

Comment: One commenter was concerned that the proposed payment

measure will be used in isolation and not understood by practitioners and the public. The commenter recommended that CMS instead create a composite measure with both cost and quality.

Response: We will take into consideration the suggestion to create a single composite measure of cost and quality for future measure development. In order to ensure practitioners and the public appreciate our intent, which is to evaluate payment in the context of quality, we plan to report the payment measure alongside the outcomes measures on the *Hospital Compare* Web site.

Comment: A commenter noted that it will be difficult to determine value with the existing heart failure measures since mortality and readmission are inversely related and the process measures are almost “topped-out.”

Response: We appreciate this feedback. We intend this episode of care measure to be used in conjunction with the other outcome heart failure measures of readmission and mortality. We do not intend to use the outcome heart failure measures with the heart failure process measures as the outcome and process measure results would not provide useful and comparable information. Regarding the concern of not being able to determine the value of the heart failure episode of care measure since the heart failure mortality and readmission are inversely related, we believe that there is value in the episode of care measure because a hospital’s performance on mortality and readmissions measures represents different aspects of quality. We also note that there does not appear to be a meaningful correlation between hospital risk-standardized mortality rates and readmission rates. Finally, we believe that this measure can determine value as it was specifically developed to align with the heart failure mortality and readmissions measure. A recent MedPAC report indicates that there may be an inverse correlation between readmission and mortality rates, but we note that this inverse relationship has been found to be modest (available at http://www.medpac.gov/documents/Jun13_EntireReport.pdf). We recognize the commenter’s concern and will monitor changes in the strength of these inverse correlations over time.

Comment: Several commenters did not support adopting the heart failure payment measures for the Hospital IQR Program due to concerns regarding the measures’ utility and its attribution specifications, all episode-of-care payments to the admitting hospital.

Response: We view the proposed measure of payments made for heart

failure as an important component of quality improvement when paired with existing quality measures. We believe it is important for hospitals to be held accountable for care decisions made during acute care episodes, particularly when those decisions include, for example, scheduling post-discharge follow-up care. We believe the measure appropriately attributes spending during the heart failure episode to the admitting hospital, and we will monitor close hospitals’ performance on the measure, as well as possible unintended consequences for patient care. We do not understand the commenter’s concern regarding “all episode-of-care payments to the admitting hospital,” but we welcome the opportunity to address it upon clarification.

Comment: A commenter recommended performing multi-level testing to determine the appropriate level for use of this measure.

Response: The episode-of-care payment measures are hospital-level measures. They account for risk at the patient-level, but attribute payments to the hospital. We interpret “multi-level testing” to mean the influence of community-level variables, like patient income levels or rural or urban setting, on the payment outcomes. Although hospitals cannot fully control all payments during the episode of care, they are well positioned to influence the outcome or the total episode-of-care payment. We will take into consideration the recommendation to test multiple levels.

Comment: A commenter did not support this measure due to concerns that the measure’s risk adjustment model does not properly account for differences in patient case mix and severity, which may lead to the misinterpretation of differences in episode cost performance.

Response: We believe that the measure properly accounts for differences in patient case mix and severity. We developed the measure in accordance with national guidelines and in consultation with clinical and measurement experts, key stakeholders, and the public. The measure is consistent with the technical approach to outcomes measurement set forth in the NQF guidance for outcomes measures (http://www.qualityforum.org/projects/Patient_Outcome_Measures_Phases1-2.aspx), CMS’ Measure Management System (http://www.cms.gov/Medicare/Quality-Initiatives-PatientAssessment-Instruments/MMS/index.html?redirect=/MMS/19_MeasuresManagementSystemBlueprint.asp), and the guidance articulated in two American Heart

Association scientific statements.^{88 89} Furthermore, this measure was vetted by the NQF Standing Committee for Cost and Resource Use, Phase 2. Furthermore, this measure was recommended for endorsement by the NQF Standing Committee for Cost and Resource Use, Phase 2 and the Consensus Standards Approval Committee in the third quarter of 2014. It is anticipated to be reviewed by the NQF Board in August 2014.

Comment: One commenter agreed with comments made by the NQF Cardiovascular TEP that accountability for heart failure payment outcomes should be attributed to primary care providers. The commenter believed that there is a wide range of heart failure severity, which determines the level of accountability and that patients with heart failure are often cared for by a range of providers who vary in level and skill.

Response: Although many providers contribute to the cost of care, we attributed payments for a 30-day episode of care to the hospital because the episode is triggered by admission to an inpatient hospitalization. Inpatient hospitalizations represent a brief period of acute illness that require ongoing management post-discharge, and hospitals are often directly responsible for scheduling post-discharge follow-up. Therefore, decisions made at the admitting hospital affect not only the hospitalization payments, but payments for care in the immediate post-discharge period. Finally, the objective of this episode of care payment measure is to encourage efficiencies gained by well-coordinated care across a patient’s experience of illness.

Comment: One commenter felt that the measure is counter to CMS’ implementation of episode groupers since it would capture all costs associated with the patient instead of only the costs of medical and procedural services related to heart failure. The commenter recommended that CMS include episode groupers that

⁸⁸ Krumholz HM, Brindis RG, Brush JE, et al. Standards for statistical models used for public reporting of health outcomes: an American Heart Association Scientific Statement from the Quality of Care and Outcomes Research Interdisciplinary Writing Group: cosponsored by the Council on Epidemiology and Prevention and the Stroke Council. Endorsed by the American College of Cardiology Foundation. *Circulation*. Jan 24 2006;113(3):456–462.

⁸⁹ Krumholz HM, Keenan PS, Brush JE, Jr., et al. Standards for measures used for public reporting of efficiency in health care: a scientific statement from the American Heart Association Interdisciplinary Council on Quality of Care and Outcomes Research and the American College of Cardiology Foundation. *Circulation*. Oct 28 2008;118(18):1885–1893.

assign specific services to certain episodes in the heart failure payment measure.

Response: Episode Groupers are designed to capture episodes of care in the Medicare Population. However, these groupers are used to evaluate physicians' resource use while our measure is constructed to capture hospitals' resource use.

Comment: One commenter did not agree with a 30-day outcome timeframe because it does not align with heart failure disease progression and recommended more focus be placed on the ambulatory care environment with a longer time period focused on outpatient care.

Response: Although heart failure is a chronic condition, patients often suffer acute decompensation requiring hospital admission. Acute decompensation is acute exacerbation that compromises the patient's cardiorespiratory status and requires admission. This measure focuses on this acutely decompensated cohort of heart failure patients, not on ambulatory patients. Heart failure admissions are associated with a substantial 30-day mortality rate as well as variation in costs.⁹⁰ In addition, heart failure admissions have high rates of readmission prompting heart failure to be targeted in current readmission reduction programs. For these reasons, we believe that heart failure is an appropriate focus for a hospital-based episode-of-care measure.

Comment: Several commenters did not believe transfer patients should be attributed to the admitting hospital because the organization that initially admits a patient may not have as much control over the patient's course of care. Furthermore, the commenters were concerned that hospitals would have a stronger incentive to hold onto patients longer to avoid being held accountable for the costs of another facility.

Response: While we understand the commenters' concerns, attributing the outcome to the first admitting hospital makes the most sense given the focus of this particular payment measure, which is hospital risk-standardized payment associated with a 30-day episode-of-care for heart failure]. We define a transfer as any admission that requires acute inpatient care at two or more hospitals for the same HF. We attribute total episode payments that involve a transfer for acute care of HF to the transferring hospital because:

- The episode of care begins at the time of the index admission, which thereby, provides a standard measure time frame for each hospital.

- The transferring hospital is responsible for initial care decisions as well as the decision to transfer the patient, both of which can have a cascading effect on subsequent care decisions.

- This method avoids incentivizing hospitals to transfer patients who are critically ill and at high risk of being very expensive to treat. As a result, we disagree with the commenter that hospitals would have a stronger incentive to hold onto patients longer to avoid being held accountable for the costs of another facility.

- This method aligns with CMS' publicly reported measure for HF risk-standardized mortality.

- The objective of this episode-of-care payment measure is to encourage efficiencies gained by well-coordinated care across a patient's experience of illness.

Comment: Several commenters believed the HF payment measure should exclude transplant or LVAD patients who underwent the procedure in the previous 12 months.

Response: We interpret this comment to mean that the measure should exclude patients with any type of transplant or a left ventricular assist device (LVAD) within 12 months of the index admission for heart failure. We agree that these patients will likely cost more than other HF patients. Accordingly, we plan to evaluate the data to see if either a heart transplant or LVAD placement occurred within 12 months prior to HF admission and exclude these patients from the measure beginning in FY 2016. We will then determine whether or not we should exclude patients from the measure with a history of LVAD or transplant.

Comment: One commenter was concerned that the measure may not adequately adjust for older and more frail patients who are at a higher risk for readmission.

Response: We note that the measure specifically adjusts for age and multiple indicators of patient frailty such as malnutrition and dementia. The measure is risk-adjusted in order to account for differences in case-mix, or patient complexity, between hospitals. For each patient, the claims for the 12-months prior to the measured hospitalization are examined to identify additional clinical conditions that patients may have which could contribute to costs of care. These conditions are included in the risk model for the measure to ensure

providers are: 1) compared on their performance; 2) are not penalized for caring for sicker patients; and 3) to prevent putting providers at risk of being profiled as high cost facilities due to the clinical complexity of their patients.

Comment: Several commenters believed that the measure does not adequately adjust for patient risk and cited NQF concerns regarding R-square values of 0.03–0.05 in the development and validation samples.

Response: While we appreciate the concern that the measure does not adequately adjust for patient risk factors, we disagree for several reasons. First, the measure model was evaluated with a number of statistical methods in addition to the R-square. The results of these other diagnostic tests (over-fitting indices, distribution of Standardized Pearson residuals, and predictive ratios) all suggest that the model predicts payments well, after adjustment for patient risk factors. These results consider the measure from a different perspective than the R-square. Second, we feel the focus on the R-square value for this measure is not appropriate because the statistical methods we used do not produce a traditional R-square value. To provide conceptually similar number, we produced a quasi-R-square, the details of which can be found in our technical report (available at: <http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html>). Third, this quasi-R-square is consistent with other patient-level risk-adjustment models for health care payment. Lastly, the R-square results suggest that factors other than clinical severity may be predictive of resource utilization that can increase payments as discussed at length during the NQF proceedings.^{91 92} We note that despite the concerns raised about the R-square value during endorsement proceeding, in June 2014, the NQF Standing Committee for Cost and Resource Use Phase 2 recommended endorsement of the HF episode of care measure.

After consideration of the public comments we received, we are finalizing the Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode of Care for Heart Failure measure as proposed.

e. Severe Sepsis and Septic Shock: Management Bundle Measure (NQF #0500)

(1) Background

Sepsis, severe sepsis, and septic shock can arise from a simple infection, such as pneumonia or urinary tract infection. Although it can affect anyone at any age, it is more common in infants, the elderly, and patients with chronic health conditions such as diabetes and immunosuppressive disorders seen in transplant patients. Information for this measure comes from the NQF Measure Information-Composite for the Severe Sepsis and Septic Shock: Management Bundle (NQF #0500).⁹³ More information on this issue is available from the Surviving Sepsis Campaign: International Guidelines for Management of Severe Sepsis and Septic Shock: 2012.⁹⁴ Sepsis is associated with mortality rates of over 16 to 49 percent, which is more than 8 times higher than the rate for inpatient stays for other hospital admissions. Findings from the National Hospital Discharge Survey indicate that the number of hospital stays for septicemia more than doubled between the years of 2000 and 2008, and patients with this condition were more severely ill than patients hospitalized for other conditions. Severe sepsis and septic shock are frequent causes of re-hospitalizations, especially during the first year after the initial hospitalization.

Based on national discharge data reported by the AHRQ, sepsis was the sixth most common principal reason for hospitalization in the United States in 2009, accounting for 836,000 hospital stays. There were an additional 829,500 stays with a secondary diagnosis of sepsis for a total of 1,665,400 inpatient stays and 258,000 deaths. From 1993 to 2009, sepsis-related hospital stays increased by 153 percent, with an average annual increase of 6 percent. Medicare was the predominant payer for sepsis-related hospital stays, covering 58.1 percent of patients. Sepsis cases and sepsis-related deaths are expected to continue to increase with the aging of the population.

In a landmark study by Rivers et al.,⁹⁵ it has been shown that an absolute and

relative reduction in mortality from sepsis can be reduced 16 percent and 30 percent, respectively, when aggressive care is provided within 6 hours of hospital arrival. Furthermore, a recent study of the 2008 Healthcare Cost and Utilization Project (HCUP) Nationwide Inpatient Sample⁹⁶ determined that patients admitted through the Emergency Department had a 17 percent lower likelihood of dying from sepsis than when directly admitted.

The Severe Sepsis and Septic Shock: Management Bundle measure (NQF #0500) was supported by the MAP for the Hospital IQR Program, contingent on NQF endorsement in its Pre-Rulemaking Report: 2013 Recommendations on Measures Under Consideration by HHS, available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72738>. The MAP noted the measure addresses an NQS priority not adequately addressed in the program measure set and that early detection and treatment of sepsis in the emergency department and inpatient settings is important (page 125). This measure was initially endorsed by the NQF in 2008 for the hospital/acute care facility setting, underwent maintenance review and update in March 2013, June 2013, and May 2014.

The MAP conditionally supported this measure as a Meaningful Use measure in its Pre-Rulemaking Report: 2014 Recommendations on Measures Under Consideration by HHS, available at: http://www.qualityforum.org/Publications/2014/01/MAP_Pre-Rulemaking_Report_2014_Recommendations_on_Measures_for_More_than_20_Federal_Programs.aspx. The MAP stated, "Not ready for implementation; measure concept is promising but requires modification or further development." In its Additional Findings the MAP stated that it, "noted the need for continued development of electronic specifications for NQF #0500 Severe Sepsis and Septic Shock: Management Bundle. While some workgroup members challenged the feasibility and evidence behind this measure, MAP deferred to the recent endorsement review of this measure and conditionally supported it for the Meaningful Use Program. Public comment from Edwards Lifesciences supports MAP's conclusion [page 168]." (In the proposed rule (79 FR 28236), we

and septic shock. *N Engl J Med.* 2001; 345: 1368–77.

⁹⁶ HCUP Nationwide Inpatient Sample (NIS). Healthcare Cost and Utilization Project (HCUP). 2007–2009. Agency for Healthcare Research and Quality, Rockville, MD. <http://www.hcup-us.ahrq.gov/nisoverview.jsp>.

attributed all of the MAP's statements to its 2013 Pre-Rulemaking Report.)

(2) Overview of Measure

The purpose of the proposed Severe Sepsis and Septic Shock: Management Bundle measure is to support the efficient, effective, and timely delivery of high quality sepsis care in support of the Institute of Medicine's (IOM) aims for quality improvement. This is consistent with the Department of Health and Human Service National Quality Strategy's priorities directed at one of the leading causes of mortality. By providing timely, patient-centered care, and making sepsis care more affordable through early intervention, reduced resource use and complication rates can result. The severe sepsis and septic shock early management bundle provides a standard operating procedure for the early risk stratification and management of a patient with severe infection. Through applying this standard operating procedure, a clinically and statistically significant decrease in organ failure, mortality, and the utilization of health care resources has been demonstrated for over 10 years. Additional information about this measure is available on the NQF's Web site at <http://www.qualityforum.org/QPS/0500>.

(3) Data Sources

The proposed measure is chart-abstracted data of patients presenting with septic shock who received treatment detailed in the *Calculations* section below.

(4) Outcome

The outcome criteria for this measure consists of: measure lactate; blood cultures; timely antibiotics; fluid resuscitation; lactate clearance; vasopressors, central venous pressure (CVP), central venous oxygen saturation (ScvO₂); and overall bundle compliance. These are discussed in more detail below

• Measure Lactate

Measurement of lactate levels is specifically associated with improved outcomes in sepsis, and an elevated lactate value identifies patients at higher risk for poor outcomes. Up to 10 percent of in-hospital cardiac arrest in the United States per year is secondary to sepsis (pneumonia). These patients are often misdiagnosed and sent to the medical floors only to suffer acute hemodynamic deterioration. These outcomes could be potentially avoided with lactate measurement upon admission providing risk stratification triggering alternative dispositions.

⁹³ National Quality Forum (NQF). Measure Information-Composite. #500 Severe Sepsis and Septic Shock: Management Bundle. Updated 2014 Jan 2. NQF: Washington, DC <http://www.qualityforum.org/Home.aspx>.

⁹⁴ Dellinger RP, Levy MM, Rhodes A, Annane D, et al. Surviving Sepsis Campaign: international guidelines for management of severe sepsis and septic shock: 2012. *Crit Care Med.* 2013 Feb; 41(2):580–637.

⁹⁵ Rivers E, Nguyen B, Havstad S et al. Early goal-directed therapy in the treatment of severe sepsis

Levy et al.⁹⁷ conducted an international, multisite “Surviving Sepsis Campaign” (SSC) initiative to determine the rate of change at which the sites reached the SSC guideline targets. In the first quarter of this initiative, only 61.0 percent of patients had lactate values measured consistent with guidelines. In addition, prior studies have shown that care prompted by measurement of lactate levels in sepsis patients reduced resource utilization and cost. This leads to lower likelihood of hospital-acquired conditions. This performance measure has been previously used as a core component of multicenter and national quality improvement initiatives. Formalizing it as a national performance measure will provide direct targets for intervention that are closely linked with improvements in mortality and cost.

- Blood Cultures

In the first quarter of the Levy et al. SSC initiative, only 64.5 percent of patients had blood cultures collected prior to antibiotic administration. Collecting blood cultures prior to antibiotic administration is specifically associated with improved outcomes in sepsis, and pathogens identified by blood cultures allow for customized therapy. As a result, blood cultures continue as a recommendation of the current Surviving Sepsis Guidelines.

By obtaining blood cultures, antibiotic regimens can be customized to treat the specific infecting organism. This will result in less unnecessary exposure to antibiotics, reducing complications associated with antibiotic use, including drug reactions, allergies and adverse events, the development of drug-resistant organisms, and the occurrence of *Clostridium difficile* colitis. The performance measure for collecting blood cultures for suspected sepsis has been previously used and continues as a core component of the SSC guidelines.

- Timely Antibiotics

Kumar et al.⁹⁸ found the median time to appropriate antibiotics was 6 hours after shock. In the first quarter of the Levy et al.⁹⁹ SSC initiative, only 60.4 percent of patients received timely

antibiotics. Multiple studies, for example, have demonstrated that delays in administration of appropriate antibiotics in patients with sepsis and other severe infections are associated with longer lengths of stay, higher costs, and higher mortality. In septic shock, the Kumar et al. study demonstrated that every hour in delay of appropriate antibiotics was associated with a 7.6 percent higher mortality. The timely administration of broad-spectrum antibiotics was associated with significantly higher risk adjusted survival. Based on a preponderance of data, the current recommendations in the international guidelines for the management of severe sepsis and septic shock includes the administration of broad-spectrum antibiotic therapy within 1 hour of diagnosis of septic shock and severe sepsis.

- Fluid Resuscitation

A common finding in patients with septic shock, manifested by low blood pressure and/or other signs of organ hypoperfusion, such as elevated serum lactate levels, is intravascular volume depletion. The degree of the intravascular volume deficit in sepsis varies, yet nearly all patients require initial volume resuscitation and many patients require continuing fluid resuscitation over the first 24 hours.

Early fluid resuscitation is associated with improved outcomes for patients with acute lung injury due to septic shock. International guidelines recommend that patients with suspected hypovolemia be initially treated with at least 30 mL/kg of crystalloid (for example, Ringer’s solution) to determine clinical response. In the first quarter of the Levy et al.¹⁰⁰ SSC initiative, only 59.8 percent of patients received fluid resuscitation consistent with guidelines. Timely fluid resuscitation avoids an error of omission in which indicated therapy is delayed or omitted. By improving outcomes, length of stay is reduced. This leads to lower likelihood of hospital-acquired conditions. This performance measure has been previously used as a core component and continues as a core component of the SSC guidelines. Formalizing it as a national performance measure will provide direct targets for intervention that are closely linked with improvements in mortality and cost.

- Lactate Clearance

Elevated lactate levels prompt the consideration of specific care practices toward hemodynamic optimization guided by either central venous oxygen saturation or lactate clearance. International guidelines recommend

that patients with sepsis and continued elevated lactate values have additional therapies until lactate levels are normalized. However, normal lactate levels can be seen in septic shock, especially in children.

- Vasopressors, Central Venous Pressure (CVP), and Central Venous Oxygen Saturation (ScvO₂)

Performance gaps in individual bundle elements can range from 79 percent (Confidence Interval (CI) 69–89 percent) for vasopressors, to 27 percent (CI 18–36 percent) for Central Venous Pressure (CVP) measurement, and as low as 15 percent (CI 7–23 percent) for Central Venous Oxygen Saturation (ScvO₂) in some community emergency departments. These numbers increase (50–75 percent) in larger hospital settings. CVP has been shown to have a significant association with mortality¹⁰¹ and multiple studies and meta-analysis have shown a significant association with reaching an ScvO₂ of 70 percent and improved mortality.

- Overall Bundle Compliance

Multiple initiatives promoting bundles of care for severe sepsis and septic shock were associated with improved guideline compliance and lower hospital mortality. Even with compliance rates of less than 30 percent, absolute reductions in mortality of 4–6 percent have been noted. Coba et al.¹⁰² found that when all bundle elements were completed within 18 hours and compared with patients who did not have bundle completion, the mortality difference was 10.2 percent. Thus, there is a direct association between bundle compliance and improved mortality. In addition, a continuous quality improvement (CQI) initiative, can improve compliance rates. CQI is a quality management process that encourages continually assessing performance and whether improvements can be made.¹⁰³ Multiple studies have shown that standardized order sets, enhanced bedside monitor display, telemedicine and comprehensive CQI feedback is feasible, modifies clinician behavior and is associated with decreased hospital mortality.

¹⁰⁰ Ibid.

(5) Cohort

This measure will focus on patients aged 18 years and older who present with symptoms of severe sepsis or septic shock. These patients will be eligible for the 3 hour (severe sepsis) and/or 6 hour (septic shock) early management measures.

(6) Inclusion and Exclusion Criteria

Numerator Statement: the numerator is: Patients from the denominator who received all the following: Step 1, Step 2, and Step 3 within 3 hours of time of presentation, and if septic shock is present (as either defined as hypotension or lactate ≥ 4 mmol/L), who also received Step 4, Step 5, Step 6, and Step 7 within 6 hours of time of presentation. The steps are described in detail below.

Step 1: Measure lactate level

Step 2: Obtain blood cultures prior to antibiotics

Step 3: Administer broad spectrum antibiotics

Step 4: Administer 30 ml/kg crystalloid for hypotension or lactate ≥ 4 mmol/L

Step 5: Apply vasopressors (for hypotension that does not respond to initial fluid resuscitation to maintain a mean arterial pressure ≥ 65)

Step 6: In the event of persistent arterial hypotension despite volume resuscitation (septic shock) or initial lactate ≥ 4 mmol/L (36 mg/dl), measure central venous pressure and central venous oxygen saturation

Step 7: Re-measure lactate if initial lactate is elevated

Denominator: The denominator is the number of patients presenting with severe sepsis or septic shock. The following patients presenting with severe sepsis or septic shock will be excluded from the denominator:

- Patients with advanced directives for comfort care;
- Patients with clinical conditions that preclude total measure completion;
- Patients for whom a central line is clinically contraindicated;
- Patients for whom a central line was attempted but could not be successfully inserted;
- A patient or a surrogate decision maker declines or is unwilling to consent to such therapies or central line placement; and
- Patients who are transferred to an acute care facility from another acute care facility.

(7) Calculations

In calculating this measure, the denominator is the number of patients presenting with severe sepsis or septic

shock. The numerator in this measure is patients from the denominator who had their lactate levels measured, had blood cultures obtained prior to receiving antibiotics, and who received broad spectrum antibiotics within 3 hours of presentation. If septic shock is present, the patients also must receive 30 ml/kg crystalloid for hypotension or lactate ≥ 4 mmol/L, apply vasopressors (for hypotension that does not respond to initial fluid resuscitation to maintain a mean arterial pressure ≥ 65), in the event of persistent arterial hypotension despite volume resuscitation (septic shock) or initial lactate ≥ 4 mmol/L (36 mg/dl) measure central venous pressure and central venous oxygen saturation, and the patient's lactate level must be re-measured if the initial lactate level is elevated.

We invited public comment on this proposal.

Comment: Several commenters supported adopting this measure. Some commenters supported adopting this measure because it is NQF-endorsed. One commenter supported the addition of this measure and noted that it fills an important measure gap, and should positively impact patient care.

Another commenter strongly supported incorporating the sepsis/septic shock measure into the Hospital IQR Program beginning in the FY 2017 payment determination because of the association of sepsis with patient deaths, hospital admissions, and length of hospital stays. Further, the commenter stated that Medicare is the largest payer for sepsis-related hospital stays, accounting for close to 60 percent of all patients.

Response: We proposed adopting this measure because we believe this measure improves patient health outcomes.

Comment: Several commenters noted that there are two other trials that examine the risks/benefits of protocolized care of septic patients which are yet to be published. As this field is evolving, the commenter believed that it is not appropriate to set benchmarks which were not confirmed in the most recent, largest randomized controlled trial. Specifically, the commenters suggested that specific measure criteria should await the results of the Australian Resuscitation In Sepsis Evaluation Randomised Controlled Trial (ARISE) and The Protocolised Management in Sepsis Trial (ProMISe).

Response: We thank the commenter for feedback. We acknowledge the importance of the results pending from the ARISE and the ProMISe trials and will take those results and their potential impact into consideration

when available. However, we believe that care of patients with severe sepsis and septic shock is of paramount importance and there is a significant performance gap within the Hospital IQR Program. The presence of this gap warrants the adoption of this clinical quality metric prior to the finalization of the two pending trials referenced above. The severe sepsis/septic shock bundle measure is the only NQF-endorsed sepsis measure currently available to CMS.

Comment: Many commenters opposed CMS adopting this measure citing the recent Protocolized Care for Early Septic Shock (ProCESS) trial published after publication of the proposed rule. The ProCESS trial found no additional benefit in including measurement of central venous pressure (CVP) and central venous oxygen saturation.

Response: We thank the commenters for this feedback. We note from the measure steward that the Severe Sepsis and Septic Shock: Management Bundle (NQF #0500) measure “has undergone the rigorous NQF evaluation process for over 6–7 years based on over 13 years of confirmatory studies. These studies provided the framework which allowed the measure to navigate the validity and reliability metrics as a whole measure including the central venous catheter to measure central venous pressure and oxygen saturation (S_{CvO_2}).”¹⁰⁴ We note that these two clinical parameters guide the administration of intravenous fluids, vasopressors, inotropes, and blood transfusions. Further, both parameters provide critical information about cardiac dysfunction, which when treated appropriately improves outcome. The steward further notes “As a result CVC placement has been shown to be one of the most important bundle elements^{34–37} and independently associated with a 9 percent reduction in mortality.”^{38 39}

Regarding the ProCESS trial, we note that this randomized trial focused on a different set of guidelines for septic shock patients and did not require patients to have a central venous catheter placed, unless peripheral access was insufficient.¹⁰⁵ The protocol-based standard therapy was the result of the ProCESS Investigators reviewing the literature, surveying emergency physicians and intensivists worldwide with consensus feedback from investigators.² The ProCESS trial

¹⁰⁴ NQF. Patient Safety Measure. Henry Ford Comments. June 2014. Available at: <http://www.qualityforum.org/ProjectMaterials.aspx?projectID=73701>.

¹⁰⁵ ProCESS Investigators. A Randomized trial of Protocol-Based Care for early septic shock. NEJM. 2014; 370:1683–1693.

protocol-based standard therapy also included administration of fluids and vasoactive agents to reach goals for systolic blood pressure and shock index (the ratio of heart rate to systolic blood pressure).² The results of this trial were published in March 2014 and NQF reviewed the Severe Sepsis and Septic Shock: Management Bundle (NQF #0500) measure and narrowly voted to remove the central venous catheter portion of the EGDT bundle in June 2014. We note that the ProCESS trial was performed in 31 U.S. hospital emergency departments known to have a high volume of patients and that over a 5-year period randomized 1351 patients with septic shock into the trial, or on average 8 patients per site per year. The measure steward noted that a meta-analysis of 49 studies found the ProCESS trial population to account for 3 percent of the 41,064 patients in these studies and that the 31 centers in the trial are not reflective of community settings where the majority of patients are treated in the U.S.,² nor are the 31 centers a majority of the 4500 hospitals in the U.S.

Finally, during the NQF Patient Safety Measure Standing Committee meeting, the steward noted that the recommendation to remove the CVC portion of the Severe Sepsis and Septic Shock: Management Bundle (NQF #0500) measure had not been tested to assess if the measure would still be reliable and valid with this change to the measure, and that the recommendation was based on a single study's protocol-based standard therapy which was noted not to be identical to the EGDT treatment used in the Severe Sepsis and Septic Shock: Management Bundle (NQF #0500) measure.

In view of this background of information we believe the most logical next step is to gather more information from two other studies that will be completed in the near future, as well as to await further recommendations from the NQF Patient Safety Measures Project as the ProCESS investigators collaborate with the stewards of the Severe Sepsis and Septic Shock: Management Bundle (NQF #0500) measure to refine the measure. We believe that sepsis and its mortality rate are important medical conditions which have also shown wide variation in treatment and outcome. We believe severe sepsis and septic shock should be monitored for improvements in mortality rates.

Comment: Commenters noted that the CVP and central venous oxygen saturation monitoring and other processes were adopted in the Surviving Sepsis Campaign (SSC) after the results of a single center trial published in

2001.¹⁰⁶ Commenters also stated that the Surviving Sepsis Campaign (SSC) moderated some of its recommendations based on the results of the ProCESS trial citing the SSC's response to the ProCESS trial.¹⁰⁷

Response: We thank the commenter for feedback. We note that monitoring CVP and central venous oxygen saturation monitoring are important components of the sepsis bundle. The SSC recommendations note that mortality outcomes increase if CVP or oxygen saturation of 70 percent or 65 percent respectively, is not achieved with fluid resuscitation to the central venous pressure target. We acknowledge that the CVP and central venous oxygen saturation monitoring and other processes were adopted by the Surviving Sepsis Campaign (SSC) after the results of a single center trial published in 2001. However, we would like to point out the SSC recommendations have been updated since their initial publication and these updated recommendations are based on many different international studies. With regard to the comment that SSC has moderated some of its recommendations based on the ProCESS trial. We note that in their response to the ProCESS trial dated May 19, 2014, SSC recognizes that there are alternative ways to obtain these results and they will address ways to include this data in future versions of their quality improvement database.

Comment: One commenter stated that support for this measure was not lessened by the ProCESS trial questioning the level of support for element "F" (measurement of central venous pressure and central venous oxygen saturation) of this measure. The commenter noted that, while the NQF Patient Safety Steering Committee voted in favor of removing element "F," final ratification is pending by the NQF Board of Directors.

The commenter noted that the NQF Patient Safety Steering Committee did not remove its endorsement of the full measure, and cited the Draft Report for Comment¹⁰⁸ on the ad hoc review that stated that "usual care for severe sepsis

and septic shock had changed dramatically in the past decade with dramatic improvements in sepsis-related morbidity and mortality with several elements of the NQF #0500 measure being key to this improvement in outcomes" (p. 20).

Response: We agree that support for this measure has not lessened as a result of the ProCESS trial. As part of its ongoing work, the NQF Patient Safety Standing Committee conducted an ad hoc review of the sepsis measure (NQF #0500) based on results from the ProCESS trial. While the NQF Patient Safety Steering Committee voted in favor of removing element "F," it recommended retaining endorsement of the measure as a whole. At this time final ratification is pending by the NQF Board of Directors. We refer readers to the NQF Web site for complete information on this measure's review at: http://www.qualityforum.org/News_And_Resources/Press_Releases/2014/Statement_from_NQF_on_Review_of_Sepsis_Measure.aspx. We intend to closely monitor and incorporate new information as the evidence base improves.

Comment: A commenter asked CMS to invest additional resources in developing a stronger sepsis outcome measure. Another commenter asked CMS to consider adding non-NQF-endorsed measures that address early detection of sepsis.

Response: We thank the commenters for these suggestions and will take them into consideration in the future.

Comment: A commenter supported the severe sepsis/septic shock: management bundle measure provided the chart-abstracted measures that are proposed for removal in this rule are removed. The commenter noted that, if all existing chart-abstracted measures are left intact and the proposed mandatory electronic submission requirements for CY 2016 are added, it will be difficult for the commenter to find the resources to add the new measures.

Response: We are working to lessen the burden by removing several chart-abstracted measures.

Comment: One commenter was concerned that the measure, as defined, may have a high rate of false positives.

Response: We are unaware of any studies indicating the severe sepsis/septic shock measure, as defined, has a high rate of false positives. We would be interested in seeing any evidence of a high rate of false positives.

Comment: One commenter stated that the science of sepsis treatment is evolving and measurements of the incidence of sepsis and sepsis outcomes

¹⁰⁶ Rivers E, Nguyen B, Havstad S et al. Early goal-directed therapy in the treatment of severe sepsis and septic shock. *N Engl J Med.* 2001; 345: 1368–77.

¹⁰⁷ Surviving Sepsis Campaign. Surviving Sepsis Campaign Responds to ProCESS Trial. May 19, 2014. Available at: <http://www.survivingsepsis.org/SiteCollectionDocuments/SSC-Responds-Process-Trial.pdf>.

¹⁰⁸ National Quality Forum. NQF-Endorsed Measures for Patient Safety. Draft Report for Comment. May 28, 2014. Available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=76698>.

are likely inaccurate due to coding variances and payment incentives.

Response: We acknowledge that the science of sepsis treatment is evolving. We note that this is common phenomenon in medicine, and this is why all measures undergo routine measure maintenance. We believe that the coding of sepsis is accurate because these codes are used for payment reimbursement. In addition, our payment reimbursement processes allow for review, correction, and appeals. The payment incentive in the Hospital IQR Program is for reporting, therefore there is no financial incentive associated with actual sepsis/septic shock outcomes.

Comment: Many commenters suggested that this measure poses a possible risk to patients and would be a burden on hospitals to collect the data. Specifically, one commenter was concerned about whether emergency department staff would be required to complete elements of the bundle while they triage patients.

Response: We believe this measure will benefit consumers seeking information regarding the quality of health care outcomes. Sepsis is associated with patient deaths, hospital readmissions, and increased length of hospital stays. The measure fills an important measure gap, and will positively impact patient care. We believe that these benefits will outweigh data collection burdens. We also do not believe this measure will be more burdensome than other measures for hospitals because the measure data may be collected concurrently, retrospectively, or a combination of both.

Regarding the concern of the inability to complete the bundle elements in the emergency department during triage, we note that the measure allows for completion of elements A–C within 3 hours. Timeliness of accurate detection and treatment of sepsis has been associated with improved survival in numerous studies, for example.^{109 110}

Comment: A commenter suggested that CMS defer the sepsis reporting requirements until 2016, when the next version of the Surviving Sepsis Guidelines (SSG) is published.

¹⁰⁹ Castellanos-Ortega A, Suberviola B, Garcia-Astudillo LA, Holanda MS, et al. Impact of the Surviving Sepsis Campaign protocols on hospital length of stay and mortality in septic shock patients: Results of a three-year follow-up quasi-experimental study. *Crit Care Med.* 2010, 8(4):1036–1043.

¹¹⁰ Ferrer R, Artigas A, Suarez D, Palencia E, et al. Effectiveness of Treatments for Severe Sepsis. A Prospective, Multicenter, Observational Study. *Am J Respir Crit Care Med.* 2009, 180:861–866.

Response: We believe the measure is important and addresses a critical gap in measurement and therefore, should be adopted at this time. However, we intend to closely monitor and incorporate new information as the evidence base improves.

Comment: Several commenters requested that CMS consider alternative sepsis measures that are NQF-endorsed, reliable, accurate, feasible, evidence-based, streamlined, and can be collected consistently and reliably, with minimal burden.

Response: At the time of this publication, we note that here are no other NQF-endorsed severe sepsis/septic shock measures available.

Comment: A commenter asked for clarification as to which patients would be excluded from this measure. This commenter also wanted clarification on whether we are developing a sampling methodology for the sepsis measure. The commenter suggested that we define a minimum case threshold for publicly reporting this measure.

Response: The exclusions for this measure were outlined above, in the proposed rule (79 FR 28237), and at: <http://www.qualityforum.org/QPS/0500>. We intend to develop a sampling strategy for the sepsis measure. In addition, regarding a minimum case threshold for public reporting, we will follow our existing guidelines. We display a footnote on *Hospital Compare* when the number of cases/patients is too few to report, that is fewer than 11 cases.¹¹¹

Comment: Many commenters also asked for changes to specific aspects of the measure. Components of the sepsis measure commenters would like to change include:

- Allowing exclusions to the required fluid resuscitation amount of 30 ml/kg to take into account the elderly, frail, and cardiac compromised that are not able to handle this amount of fluid, and may have fluid overload. For example, one exclusion could be 25 ml/kg for cardiac compromise, which the commenter stated the literature also supports in sepsis fluid resuscitation.
- Allowing administration of 30 ml/kg crystalloid for hypotension or lactate ≥ 4 mmol/L should be administered within 3 hours of time of presentation and not 6 hours, according to current guidelines.
- Excluding patients from the blood culture before antibiotic measure if blood cultures are attempted without success and patients that present to the emergency department with an atypical

sepsis presentation (cardiac arrest prior to arrival).

Many commenters opposed the inclusion of element F from the measure, specifically “In the event of persistent hypotension despite volume resuscitation (septic shock) or initial lactate ≥ 4 mmol/L (36 mg/dl) measure central venous pressure and central venous oxygen saturation,” per the recommendation of the Patient Safety Measure Committee. A commenter cautioned that central lines have many complications and this trial showed early goal directed therapy without a central line was equivocal to placing a central line for monitoring. Commenters also noted that central venous catheters should be used sparingly, as they can lead to infections and other complications.

A commenter stated that the measure specifications of care steps within six hours (required only for patients with septic shock) should not include steps five through seven because they are no longer considered the standard of care or high-quality sepsis resuscitation metrics and are outdated.

Response: We thank the commenters for their feedback. We are adopting this measure as developed by the measure steward, Henry Ford Hospital, and endorsed by the NQF. We suggest the commenters recommend any changes to this measure to the measure developer/steward so that those changes would go through the consensus development process.

Comment: Several commenters sought clarification on aspects of the sepsis measure, such as:

- Clarification of the denominator for identification of septic shock patients. The commenter asked that we clarify if the measure has specific ICD–9–CM diagnosis codes that would limit the review. If those are present, the commenter did not object to this measure. However, if they are not present, the commenter strongly objected to this measure based upon the significant burden of work that it imposes.
- Clarification on whether the measure will be collected as aggregate data (Web-based) or if we will require the submission of patient-level data.
- Clarification as to if the measure specifications will be provided in the standard manual format and when those specifications will be released. At this time, the commenter noted that there is no algorithm, data elements, initial patient population or sampling guidelines available to be able to begin programming this measure for collection. As this is a very complicated measure, the commenter noted that to

¹¹¹ <http://www.medicare.gov/hospitalcompare/Data/Footnotes.html>.

collect this measure as a chart-abstracted measure will be a burden to the hospitals.

- Clarification and rationale as to why we wanted to collect this as a chart-abstracted measure and not as an electronic clinical quality measure. A commenter suggested that the Severe Sepsis and Septic Shock measure be introduced as an electronic clinical quality measure rather than as a chart-abstracted measure. The inclusion of this measure should be timed to occur when electronic measure specification is available to support its inclusion. Another commenter requested clarification and rationale as to why we want to collect this as a chart-abstracted measure and not as an electronic clinical quality measure.

Response: The denominator is the number of patients presenting with severe sepsis or septic shock. These types of patients have specific ICD-9-CM codes and the codes will be provided with the measure specifications. The measure is a composite patient safety measure, which will require submission of patient-level data.

The electronic specifications of the measure are not ready for implementation. We will consider adopting the electronic clinical quality measure version when it becomes fully electronically-specified.

Comment: A commenter requested that, pending approval of the Sepsis and Septic Shock: Management Bundle Measure (NQF #0500), CMS provide the measure specifications six months in advance of the abstraction period to provide hospitals with ample time to review and evaluate any necessary process changes before the data collection period begins. Another commenter requested clarification as to if the measure specifications will be provided in the standard manual format and when those specifications will be released. At this time, the commenter notes that there is no algorithm, data elements, initial patient population or sampling guidelines available to be able to begin programming this measure for collection. As this is a very complicated measure, the commenter notes that to collect this measure as a chart-abstracted measure will be a burden to the hospitals.

Response: The measure specifications will be released in the standard format, in the Specifications Manual, which will contain the data elements and algorithm. Typically, our specifications manuals are posted on QualityNet in January for July–December discharges and July for January–June discharges. We also provide addendums each year

after the finalization of the IPPS/LTCH PPS final rule. The release date of this addendum is to be determined.

Comment: One commenter stated that the quality improvement opportunities are when missed diagnosis occurs. The commenter asked if CMS will include possible diagnosis from an electronic health record problem list as a data source.

Further, the commenter stated that the first three elements for severe sepsis have best-practice times of three hours from presentation. The commenter asked if that is three hours from arrival to the facility, upon transfer between units, from presentation of symptoms, or all of the above. The commenter advised that three hours could also be very difficult to meet depending on emergency department volumes at any given time.

Response: We note that this is a chart-abstracted measure and hospitals can collect data from all available sources of medical records including EHRs.

Regarding the best-practice times for the measure, we refer the commenter to the Inclusion and Exclusion Criteria described above for a description of the steps to be completed within 3 hours of the patient's presentation. According to the measure steward, Henry Ford Hospital, the measure's intent is to use three hours following presentation/onset from one endpoint to another, be it facility transfer/arrival or unit transfer/arrival.

After consideration of the public comments we received, we are finalizing the Severe Sepsis and Septic Shock: Management Bundle Measure (NQF #0500) as proposed. We will closely monitor this measure as new clinical evidence becomes available, and will update the public via future rulemaking and/or operational guidance as necessary.

f. Electronic Health Record-Based Voluntary Measures

(1) Overview of New Electronic Health Record-Based Voluntary Measures

In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28238 through 28239) we proposed four new voluntary electronic health record-based measures to be submitted as electronically specified measures: (1) Hearing Screening Prior to Hospital Discharge (NQF #1354); (2) PC-05 Exclusive Breast Milk Feeding and the subset measure PC-05a Exclusive Breast Milk Feeding Considering Mother's Choice (collectively referred to as NQF #0480); (3) Home Management Plan of Care (HMPC) Document Given to Patient/Caregiver; (4) and Healthy Term

Newborn (NQF #0716). The four proposed electronic health record-based measures were included on a publicly available document entitled "List of Measures Under Consideration for December 1, 2012" in compliance with section 1890A(a)(2) of the Act, and they were reviewed by the MAP in its MAP Pre-Rulemaking Report: 2013 Recommendations on Measures Under Consideration by HHS. The final MAP report is available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72746>. We considered the input and recommendations provided by the MAP in selecting measures to propose for the Hospital IQR Program.

The specifications for the electronic clinical quality measures for eligible hospitals are found at: http://cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/eCQM_Library.html.

Many commenters raised similar concerns applicable across the proposed electronic clinical quality measures; we summarize and respond to these general comments first below before discussing the individual electronic clinical quality measures.

Comment: Many commenters opposed one or more of these voluntary electronic clinical quality measures for the following reasons:

- A significant portion of the measures' populations are not covered by Medicare.
- The proposed measures would not lead to improved hospital quality or offer insight on how to improve electronic clinical quality measures.
- CMS did not propose to allow hospitals to submit chart-abstracted data on these measures in addition to the electronic clinical quality measures.

Response: We are concerned with improving the quality of care provided to all patients, not just Medicare patients. All of our non-claims-based measures include all-payer patients, meaning they include non-Medicare patients as well as Medicare beneficiaries.

We disagree that these measures would not lead to improved hospital quality of care. The measures address high-impact conditions not adequately addressed in the program measure set. We also disagree that these measures will not improve electronic clinical quality measures. Reporting clinical quality measures in their electronic form is a different mode of data collection that, as with any measure, will require refinement over time. We believe that implementing and using will drive quality improvement through measuring quality through EHR's, and

provide nationally representative information to inform future electronic clinical quality measure refinements.

Finally, we believe these measures will give hospitals useful information that can be used to improve the quality of care for those patients in the measure population regardless of the mode of collection and submission. We are in the process of moving away from chart-abstracted measures. Therefore, in part to minimize hospitals data collection burden and when electronic specifications are available, we intend to adopt those versions. We proposed to adopt these measures as voluntary electronic clinical quality measures to align with the Medicare EHR Incentive Program to provide hospitals' flexibility in reporting. We note that the proposed measures are voluntary and a hospital may choose to not report one or more of the proposed measures.

Comment: One commenter was concerned that the complexity of the data currently in chart abstraction for these measures will make it difficult to ensure that this information will accurately be translated when submitting these measures electronically.

Response: These measures are already electronically-specified and as such, no translation is required. As previously stated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50817 through 50818), we do not believe that the electronic clinical quality measures are substantively different from their chart-abstracted form.

Comment: Commenters recommended aligning CMS and TJC requirements for these measures in an effort to reduce the amount of resources that are spent when requirements are different or the timing of changes in requirements creates additional challenges.

Response: We intend to continue working with TJC and other stakeholders to reduce hospitals' quality reporting burden.

(2) Voluntary Electronically Specified Measure: Hearing Screening Prior to Hospital Discharge (NQF #1354)

The Hearing Screening Prior to Hospital Discharge (NQF #1354) measure assesses the proportion of all live births born at a hospital that have been screened for hearing loss before hospital discharge. The Joint Committee on Infant Hearing encourages early screening and intervention in infants with hearing loss to maximize linguistic competence and literacy development in children with hearing loss or who are hard of hearing. Early intervention improves developmental and social outcomes for children. The States and

CDC have collected this measure as a population-based measure for more than 10 years.

This measure is NQF-endorsed and was supported by the MAP in its Pre-Rulemaking Report: 2013 Recommendations on Measures Under Consideration by HHS, available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72738>. The MAP noted that the measure addresses a high-impact condition not adequately addressed in the program measure set.

The numerator is all live births during the measurement period born at a facility and screened for hearing loss prior to discharge, or screened but still not discharged, or not screened due to medical reasons or a medical exclusion.

The denominator includes all live births during the measurement period born at a facility and discharged without being screened, or screened prior to discharge, or screened but still not discharged.

The measure excludes any patient deceased prior to discharge and has not received hearing screening.

Comment: One commenter supported the hearing screening prior to hospital discharge measure.

Response: We thank the commenter for their support.

Comment: One commenter opposed the Hearing Screening Prior to Hospital Discharge measure, and expressed concern that it will encourage physicians to obtain other preventative screenings during the hospitalization that are unnecessary or unrelated to the cause of the patient's admission.

Response: This measure relates to hearing screening for newborns prior to discharge, not all patients. Newborns, as defined by this measure, are not in the same category as other admitted patients as they are born to an admitted patient. Early screening allows for early intervention in infants with hearing loss. We do not believe newborn preventative hearing screenings will encourage physicians to perform unneeded preventative screenings.

After consideration of the public comments we received, we are finalizing the adoption of the Hearing Screening Prior to Hospital Discharge measure for voluntary electronic reporting as proposed.

(3) Voluntary Measure: PC-05 Exclusive Breast Milk Feeding and the subset measure PC-05a Exclusive Breast Milk Feeding Considering Mother's Choice (collectively referred to as NQF #0480)

Exclusive breast milk feeding for the first 6 months of neonatal life has long been the expressed goal of World Health

Organization (WHO), HHS, American Academy of Pediatrics (AAP) and American College of Obstetricians and Gynecologists (ACOG).

The PC-05 Exclusive Breast Milk Feeding measure and the subset measure PC-05a Exclusive Breast Milk Feeding Considering Mother's Choice (NQF #0480) is endorsed by the NQF and supported by the MAP in its Pre-Rulemaking Report: 2013 Recommendations on Measures Under Consideration by HHS, available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72738>. The MAP noted that the measure addresses a high-impact condition not adequately addressed in the program measure set.

This measure assesses the number of newborns exclusively fed breast milk during the newborn's entire hospitalization; and the subset measure only includes those newborns whose mothers chose to exclusively feed breast milk.

The numerator is the same for both the measure and subset measure—newborns that were fed breast milk only since birth. However, the denominators differ. For PC-05, the denominator is defined as single term liveborn newborns discharged alive from the hospital with ICD-9-CM Principal Diagnosis Code for single liveborn newborn. The denominator for the subset measure, PC-05a, is defined as single term newborns discharged alive from the hospital excluding those whose mothers chose not to breast feed with ICD-9-CM Principal Diagnosis Code for single liveborn newborn. The ICD-9-CM Principal Diagnosis Codes for single liveborn newborns are found in Appendix A, Table 11.20.1: Single Live Newborn in the Specifications Manual for Joint Commission National Quality Measures available at: <http://manual.jointcommission.org/releases/TJC2013A/AppendixATJC.html>.

Excluded populations:

- Admitted to the Neonatal Intensive Care Unit (NICU) at this hospital during the hospitalization.

- ICD-9-CM Other Diagnosis Codes for galactosemia as defined in Appendix A, Table 11.21 in the Specifications Manual for Joint Commission National Quality Measures found at: <http://manual.jointcommission.org/releases/TJC2013A/AppendixATJC.html>.

- ICD-9-CM Principal Procedure Code or ICD-9-CM Other Procedure Codes for parenteral infusion as defined in Appendix A, Table 11.22 in the Specifications Manual for Joint Commission National Quality Measures found at: <http://>

manual.jointcommission.org/releases/TJC2013A/AppendixATJC.html.

- Experienced death.
- Length of Stay >120 days.
- Enrolled in clinical trials.
- Patients transferred to another hospital.
- ICD-9-CM Other Diagnosis Codes for premature newborns as defined in Appendix A, Table 11.23 in the Specifications Manual for Joint Commission National Quality Measures found at: <http://>

manual.jointcommission.org/releases/TJC2013A/AppendixATJC.html.

- Documented Reason for Not Exclusively Feeding Breast Milk.
- The maternal reasons for not exclusively breastfeeding are limited to the following situations:
- HIV infection;
 - Human t-lymphotropic virus type I or II;
 - Substance abuse and/or alcohol abuse;
 - Active, untreated tuberculosis;
 - Taking certain medications, that is, prescribed cancer chemotherapy, radioactive isotopes, antimetabolites, antiretroviral medications and other medications where the risk of morbidity outweighs the benefits of breast milk feeding;

- Undergoing radiation therapy;
- Active, untreated varicella;
- Active herpes simplex virus with breast lesions; and
- Admission to Intensive Care Unit (ICU) post-partum.

We invited public comments on this proposal.

Comment: One commenter strongly supported the adoption of PC-05: Exclusive Breast Milk Feeding and the Subset Measure PC-05a Exclusive Breast Milk Feeding Considering Mother's Choice (Collectively Referred to as NQF #0480). Another commenter urged CMS to make the exclusive breast milk feeding measure a mandatory measure no later than FY 2017. The commenter believed that exclusive electronic reporting of these measures could ultimately reduce the burden of collection and increase the potential for timely feedback to all stakeholders on the ever important area of maternity care. The commenter indicated that the health benefits of breastfeeding for mothers and for babies are well established and that the measure has the virtue of being included in TJC's core Perinatal Care measure set (PC-05), which hospitals with more than 1,100 births annually are now required to collect and report. The commenter indicated that the use of standardized measures helps avoid confusion among consumers and health professionals and

reduces duplication of related measure concepts and burden of collection.

Response: We thank the commenters for their support. We will take into consideration their recommendations as we plan Hospital IQR Program policies in the future.

Comment: One commenter stated that it is unclear whether noncompliance with the breast feeding measure would be created if the mother changed her mind at some point during the stay.

Response: For PC-05a only, if the mother's initial feeding plan was to exclusively feed breast milk and she diverges from that plan to feed formula later in the hospitalization, then the case will fail. A case is only excluded from the denominator if formula feeding is the initial stated feeding plan.

Comment: One commenter believed there should be exclusions for newborns' medical conditions that require supplemental feedings. This commenter did not support the measure because it is an electronic clinical quality measure only. The commenter would support the measure in its chart-abstracted form because it is NQF-endorsed and supported by the MAP.

Response: We suggest that any recommendations for changes to the measure be shared with the measure developer/steward, TJC. As is, the measure is NQF-endorsed and includes the electronic specification. In 2012, The MAP declined to support the electronic clinical quality measure because of an issue regarding patient choice. However, the measure developer has addressed this issue following the 2012 MAP recommendation. Patients that choose not to exclusively breast feed are excluded from the denominator. In 2013, the MAP supported the measure for adoption by the Hospital IQR Program, noting the measure addresses an NQS priority not adequately addressed in the program measure set.

Comment: Several commenters recommended the integration of technical assistance provided by TJC and the United States Breastfeeding Committee (USBC) to assist with implementation of the measure. The commenters pointed out that USBC has published an online toolkit¹¹² to help hospitals implement the measure and suggested that we should inform hospitals of the availability of the toolkit.

Response: We thank the commenters for their suggestions and will consider them in the future.

¹¹² <http://www.usbreastfeeding.org/HealthCare/HospitalMaternityCenterPractices/ToolkitImplementingTJCCoreMeasure/tabid/184/Default.aspx>.

After consideration of the public comments we received, we are finalizing are finalizing the PC-05 Exclusive Breast Milk Feeding and the subset measure PC-05a Exclusive Breast Milk Feeding Considering Mother's Choice (collectively referred to as NQF #0480) measure as a voluntary electronic clinical quality measure as proposed.

(4) Voluntary Measure CAC-3: Home Management Plan of Care (HMPC) Document Given to Patient/Caregiver

Asthma is the most common chronic disease in children and a major cause of morbidity and health care costs nationally. For children, asthma is one of the most frequent reasons for admission to hospitals. There were approximately 157,000 admissions for childhood asthma in the United States in 2009. Under-treatment and/or inappropriate treatment of asthma are recognized as major contributors to asthma morbidity and mortality. Guidelines developed by the National Asthma Education and Prevention Program (NAEPP) of the National Heart, Lung and Blood Institute (NHLBI), as well as by the American Academy of Pediatrics (AAP) for the diagnosis and management of asthma in children, recommend establishing a plan for maintaining control of asthma and for establishing plans for managing exacerbations.

The CAC-3: Home Management Plan of Care (HMPC) Document Given to Patient/Caregiver measure is no longer endorsed by the NQF and was not supported by the MAP in its Pre-Rulemaking Report: 2013 Recommendations on Measures Under Consideration by HHS available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72738>, because the measure no longer meets the NQF endorsement criteria. However, based on the prevalence of asthma among children, as well as the risks associated with under-treatment or over-treatment described above, we believe the measure is appropriate for voluntary collection. Because asthma is a serious, and potentially life-threatening disease, we believe that it is important to allow hospitals to voluntarily report this data, which may help inform our policy.

This measure assesses the proportion of pediatric asthma patients (aged 2-17 years) discharged from an inpatient hospital stay with a HMPC document in place. The numerator is the number of pediatric asthma inpatients with documentation that they or their caregivers were given a written HMPC document that addresses: (1)

Arrangements for follow-up care, (2) environmental control and control of other triggers, (3) method and timing of rescue actions, (4) use of controllers, and (5) use of relievers.

The denominator is the number of pediatric asthma inpatients (age 2 years through 17 years) discharged with a principal diagnosis of asthma.

The measure excludes: (1) Patients with an age less than 2 years or 18 years or greater; (2) patients who have a length of stay greater than 120 days; and (3) patients enrolled in clinical trials.

We invited public comments on this proposal.

Comment: A commenter supported the CAC-3 HPMC measure and noted that this plan of care supports patients' successful transition from the hospital to home.

Response: We thank the commenter for their support.

Comment: Some commenters opposed the measure's adoption as a voluntary electronic clinical quality measure because the NQF has removed its endorsement and the MAP has not recommended this measure. Another commenter requested that CMS provide additional information beyond what was stated in the proposed rule regarding our rationale for inclusion of the CAC-3 Home Management Plan of Care Document Given to Patient/Caregiver. The commenter noted that this measure's loss of NQF endorsement is cause for concern, but more importantly, the commenter did not feel this documentation measure appropriately contributes to evaluating the state of perinatal care in the U.S.

Response: This is a pediatric measure addressing children aged 2-17, not a perinatal care measure. Since it is a pediatric measure, CAC-3 fills a gap in the Hospital IQR Program measure set. We are moving away from chart-abstracted measures and when electronic specifications are available, we intend to adopt the electronic clinical quality measure version of a new measure. We acknowledge that the MAP did not support the adoption of this measure because the NQF withdrew their endorsement. According to the NQF report, the reason for this was because the measure did not pass the criteria for the category "Importance to Measure and Report."¹¹³ NQF stated that the evidence is not as strong for care plan as for use of ICS. The Committee noted the recent publication in JAMA by Morse in October 5, 2011 that found "Among children admitted to pediatric hospitals for asthma, there was

high hospital-level compliance with CAC-1 and CAC-2 quality measures and moderate compliance with the CAC-3 measure but no association between CAC-3 compliance and subsequent ED visits and asthma-related readmissions" (<http://jama.ama-assn.org/content/306/13/1454.abstract>). The NQF also cited concerns over the lack of standardization of a quality care plan, how language is constructed, and health literacy issues. Despite these findings, however, the NQF still agreed that "patient education is clearly an essential component in successful asthma management." Our purpose for adopting this voluntary electronic clinical quality measure is to align with the Medicare EHR Incentive Program and to provide hospitals with flexibility in their quality reporting. We reiterate that the proposed measure is voluntary and a hospital may choose to not report this measure.

Furthermore, we proposed to include this non-NQF endorsed measure under the Hospital IQR Program exception authority as discussed in section IX.A.7. of the preamble of this final rule.

After consideration of the public comments we received, we are finalizing the Home Management Plan of Care (HMP) Document Given to Patient/Caregiver measure as a voluntary electronic clinical quality measure as proposed.

(5) Voluntary Measure: Healthy Term Newborn (NQF #0716)

This measure assesses the optimal outcome of pregnancy and childbirth, specifically a healthy term newborn. It evaluates the impact of any changes in the management or intervention on the positive outcome for the newborn.

The measure is NQF-endorsed. The MAP recommended removal of this measure in its Pre-Rulemaking Report: 2013 Recommendations on Measures under Consideration by HHS available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72738>, because the measure required modification or further development. However, the MAP strongly supported the measure concept for inclusion once technical issues were resolved. Given its endorsement by NQF, as well as the MAP's strong support for the measure concept, we believe the measure is appropriate for voluntary reporting.

The result of the measure calculation is the percentage of term singleton live births (excluding those with diagnoses originating in the fetal period) that do

not have significant complications during birth or the nursery care.¹¹⁴

The numerator of this measure is the absence of conditions or procedures reflecting morbidity that happened during birth and nursery care to an otherwise normal infant.

The denominator is composed of singleton, term (>=37 weeks), inborn, live births in their birth admission. The denominator further has eliminated fetal conditions likely to be present before labor. Maternal and obstetrical conditions (for example, hypertension, prior cesarean, malpresentation) are not excluded unless there is evidence of fetal effect prior to labor (for example, Intrauterine Growth Restriction (IUGR)/ Small for Gestational Age (SGA)).

This measure excludes: (1) multiple gestations; (2) preterm, congenital anomalies; and, (3) fetuses affected by selected maternal conditions.

We invited public comments on this proposal.

Comment: Some commenters supported the adoption of this measure. One commenter noted the measure has recently been refined and renamed as "Unexpected Newborn Complications" and expressed the hope that CMS will adopt the updated version.

Further, one commenter recommended that CMS make the measure mandatory no later than FY 2017. The commenter believed that the exclusive electronic reporting of this measure could ultimately reduce the burden of collection and increase the potential for timely feedback to all stakeholders on the ever important area of maternity care.

Response: We will monitor the progress of the refined measure and consider adopting it after the measure completes the NQF-endorsement process. We will take into consideration the commenters' recommendations as we plan Hospital IQR Program policies in the future.

After consideration of the public comments we received, we are finalizing the Healthy Term Newborn (NQF #0716) measure as a voluntary electronic clinical quality measure as proposed.

g. Readoption of Measures As Voluntarily Reported Electronic Clinical Quality Measures

In order to align with the Medicare EHR Incentive Program for eligible hospitals (EHs) and critical access hospitals (CAHs), in the FY 2015 IPSPs/

¹¹³ <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=73041>.

¹¹⁴ National Quality Forum. National Voluntary Consensus Standards for Patient Outcomes 2009. Available at: <http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=67546>.

LTCH PPS proposed rule (79 FR 28239 through 28242) we proposed to re-adopt two measures previously removed from the Hospital IQR Program; (a) AMI–2 Aspirin Prescribed at Discharge for AMI (acute myocardial infarction) (NQF #0142) (electronic clinical quality measure); and (b) AMI–10 Statin Prescribed at Discharge (NQF #0639) (electronic clinical quality measure). In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28239) we proposed to add these measures to the list of voluntarily reported electronic clinical quality measures as described in section IX.A.7.f. of the preamble of this final rule. We believe we should continue aligning the Hospital IQR Program and the Medicare EHR Incentive Program in order to minimize reporting burden and continue the transition to reporting of electronic clinical quality measures, and we believe voluntary adoption of these measures will further that aim. Further, we believe that allowing hospitals the option to electronically report topped-out measures will provide hospitals with an opportunity to test the accuracy of their electronic health record reporting systems.

(1) Readoption of AMI–2 Aspirin Prescribed at Discharge (NQF #0142)

The AMI–2 Aspirin Prescribed at Discharge (NQF #0142) assesses the percentage of acute myocardial infarction (AMI) patients who are prescribed aspirin at hospital discharge.

The measure is NQF endorsed, but has been placed in reserve status, as the performance on this measure is “topped-out.” The MAP recommended the measure should be suspended and phased out in its Pre-Rulemaking Report: 2013 Recommendations on Measures under Consideration by HHS available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72738>. However, as stated above, we intend to continue aligning the Hospital IQR Program and Medicare EHR Incentive Program, and we believe collecting this measure on a voluntary basis enables us to continue collecting quality data on this topic while working to minimize reporting burden on participating hospitals. Further, allowing hospitals the option to electronically report topped-out measures will provide hospitals with an opportunity to test the accuracy of their electronic health record reporting systems.

The numerator includes AMI patients in the denominator who are prescribed aspirin at hospital discharge. The denominator includes patients with the following ICD–9–CM principal diagnosis codes of AMI: 410.00, 410.01,

410.10, 410.11, 410.20, 410.21, 410.30, 410.31, 410.40, 410.41, 410.50, 410.51, 410.60, 410.61, 410.70, 410.71, 410.80, 410.81, 410.90, and 410.91.

The following patients are excluded from this measure:

- Patients less than 18 years of age;
- Patients who have a length of stay greater than 120 days;
- Patients enrolled in clinical trials;
- Patients who were discharged to another hospital;
- Patients who expired;
- Patients who left the hospital against medical advice;
- Patients who were discharged to home for hospice care;
- Patients who were discharged to a health care facility for hospice care;
- Patients with comfort measures only documented; and
- Patients with a documented reason for no aspirin at discharge.

(2) Readoption of AMI–10 AMI-Statin Prescribed at Discharge (NQF #0639)

AMI–10 AMI-Statin Prescribed at Discharge (NQF #0639) assesses the percent of acute myocardial infarction (AMI) patients who are prescribed a statin at hospital discharge.

The measure is NQF endorsed. The MAP recommended phased removal in its Pre-Rulemaking Report: 2013 Recommendations on Measures under Consideration by HHS available at: <https://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=72738> because the performance on this measure is likely “topped-out.” However, as stated above, we intend to continue aligning the Hospital IQR Program and Medicare EHR Incentive Program, and we believe collecting this measure on a voluntary basis enables us to continue collecting quality data on this topic while working to minimize reporting burden on participating hospitals. Further, allowing hospitals to electronically report topped-out measures on a voluntary basis will provide hospitals with an opportunity to test the accuracy of their electronic health record reporting systems.

The numerator includes AMI patients in the denominator who are prescribed a statin medication at hospital discharge. The denominator includes patients with the following ICD–9–CM principal diagnosis codes of AMI: 410.00, 410.01, 410.10, 410.11, 410.20, 410.21, 410.30, 410.31, 410.40, 410.41, 410.50, 410.51, 410.60, 410.61, 410.70, 410.71, 410.80, 410.81, 410.90, and 410.91.

The following patients are excluded from this measure:

- Patients less than 18 years of age;

- Patients who have a length of stay greater than 120 days;

- Patients with comfort measures only documented;

- Patients enrolled in clinical trials;
- Patients who were discharged to another hospital;

- Patients who left the hospital against medical advice;

- Patients who expired;

- Patients who were discharged to their home for hospice care;

- Patients who were discharged to a health care facility for hospice care;

- Patients with low-density lipoprotein less than 100 mg/dL within the first 24 hours after hospital arrival or 30 days prior to hospital arrival and not discharged on a statin; and

- Patients with a reason for not prescribing statin medication at discharge.

We invited public comments on our proposal to readopt these two measures as electronic clinical quality measures.

Comment: Some commenters supported the inclusion of voluntary reporting for certain electronic clinical quality measures for the Hospital IQR Program, and noted that voluntary reporting allows hospitals to be better prepared for submitting new quality measures from EHRs and to correct any operational issues that arise. Several commenters supported adopting AMI–2 and AMI–10 as electronic clinical quality measures, because aligning the Hospital IQR Program with the Medicare EHR Incentive Program could reduce reporting burdens. The commenter hoped that CMS will continue to expand efforts to allow for electronic reporting to include registries, which are commonly used for data collection and reporting, in addition to EHRs.

Response: We thank these commenters for their support. We would like to clarify that at this time we do not allow registry reporting for these measures.

Comment: One commenter did not support CMS’ proposal to readopt two topped-out measures for purposes of electronic reporting, arguing that topped-out measures, by definition, are removed because they are no longer an accurate measure of hospital performance. The commenter was concerned that these measures would not advance hospital quality or improve electronic reporting.

Other commenters opposed AMI–2 and AMI–10 as electronic clinical quality measures because they were topped-out and retired as chart-abstracted measures and they believed retaining them would not advance hospitals’ understanding of how to

submit electronic clinical quality measures or improve the quality of hospital care.

Response: As we explained in section IX.A.2.g.(2) of the preamble of this final rule in response to a similar comment, even though these measures are topped-out, we would still like to retain the electronically specified versions for the following reasons: (1) to align the Hospital IQR Program and the Medicare EHR Incentive Program, (2) to allow us to monitor the effectiveness of measure reporting by EHR's, and (3) to familiarize hospitals with reporting electronically specified measures. Topped-out status is also only one of many factors which we consider before determining whether a measure should be removed.

While these measures may be topped-out, they are still an accurate measure of performance. Continuing to report on these measures is a way to monitor for continued high performance. Electronic measure data will help us evaluate variations in data capture modes (chart-abstracted versus electronic clinical

quality measures) in order to determine whether and what adjustments are necessary for the two different modes of collection. In addition, we believe that by allowing hospitals to voluntarily report these measures via electronic submission, we will provide hospitals needed flexibility in electronic clinical quality measure reporting, as requested by hospitals in their comments to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50813 through 50814). As stated in the proposed rule (79 FR 208243), we intend to propose to require electronic clinical quality measure reporting in future rulemaking. We are providing this voluntary option to provide hospitals time to prepare for required electronic clinical quality measure reporting.

After consideration of the public comments we received, we are finalizing the readoption of both AMI-2: Aspirin Prescribed at Discharge (NQF #0142) and AMI-10: Statin Prescribed at Discharge (NQF #0639) as voluntary electronic clinical quality measures as proposed.

In summary, for FY 2017 payment determination and subsequent years, we are finalizing: (1) the adoption of 11 total measures—9 new measures (4 of which are voluntary electronic clinical quality measures) and 2 previously removed measures re-adopted as voluntary electronic clinical quality measures, and (2) the removal of 19 measures (4 of which were previously suspended), ten of which are being retained as voluntary electronic clinical quality measures. We are not finalizing the removal of one of the required chart-abstracted measures (SCIP-Inf-4). This gives a total of 63 measures (47 required and 16 voluntary electronic clinical quality measures) in the Hospital IQR Program measure set.

Set out below is a table showing both the previously adopted and the newly finalized quality measures for the FY 2017 payment determination and subsequent years. Please note that this table does not include suspended measures.

PREVIOUSLY ADOPTED HOSPITAL IQR PROGRAM MEASURES AND MEASURES NEWLY FINALIZED IN THIS FINAL RULE FOR THE FY 2017 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Short name	Measure name	NQF No.	Submission methods for FY 2017 payment determination	New for FY 2017 payment determination
AMI-7a	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival.	NQF #0164	Electronic clinical quality measure or chart-abstracted REQUIRED.	
SCIP-Inf-4	Cardiac Surgery Patients With Controlled 6 A.M. Postoperative Blood Glucose.	NQF #0300	Chart-abstracted only REQUIRED	
Sepsis	Severe sepsis and septic shock: management bundle.	NQF #0500	Chart-abstracted only REQUIRED	New for FY 2017.
Imm-2	Influenza Immunization	NQF #1659	Chart-abstracted only REQUIRED	
Stroke-1	Venous thromboembolism (VTE) prophylaxis.	NQF #0434	Chart-abstracted only REQUIRED	
ED-1	Median time from ED arrival to ED departure for admitted ED patients.	NQF #0495	Electronic clinical quality measure or chart-abstracted REQUIRED.	
ED-2	Admit Decision Time to ED Departure Time for Admitted Patients.	NQF #0497	Electronic clinical quality measure or chart-abstracted REQUIRED.	
Stroke-4	Thrombolytic therapy	NQF #0437	Electronic clinical quality measure or chart-abstracted REQUIRED.	
Stroke-6	Discharged on statin medication	NQF #0439	Electronic clinical quality measure or chart-abstracted REQUIRED.	
Stroke-8	Stroke education	N/A	Electronic clinical quality measure or chart-abstracted REQUIRED.	
VTE-1	Venous thromboembolism prophylaxis	NQF #0371	Electronic clinical quality measure or chart-abstracted REQUIRED.
