temporary modifications in behavior; (3) the absence of any significant habitat within the project area, including rookeries, significant haul-outs, or known areas or features of special significance for foraging or reproduction; (4) the presumed efficacy of the planned mitigation measures in reducing the effects of the specified activity to the level of least practicable impact. In addition, these stocks are not listed under the ESA or considered depleted under the MMPA. In combination, we believe that these factors, as well as the available body of evidence from other similar activities, demonstrate that the potential effects of the specified activity will have only short-term effects on individuals. The specified activity is not expected to impact rates of recruitment or survival and will therefore not result in population-level impacts. Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the planned monitoring and mitigation measures, we find that the total marine mammal take from Navy’s pier maintenance activities will have a negligible impact on the affected marine mammal species or stocks.

Small Numbers Analysis

The number of incidences of take authorized for these stocks would be considered small relative to the relevant stocks or populations (less than one percent for both sea lion stocks and less than five percent for harbor seals; Table 3) even if each estimated taking occurred to a new individual. This is an extremely unlikely scenario as, for pinnipeds in estuarine/inland waters, there is likely to be some overlap in individuals present day-to-day.

Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the mitigation and monitoring measures, we find that small numbers of marine mammals will be taken relative to the populations of the affected species or stocks.

Impact on Availability of Affected Species for Taking for Subsistence Uses

There are no relevant subsistence uses of marine mammals implicated by this action. Therefore, we have determined that the total taking of affected species or stocks would not have an unmitigable adverse impact on the availability of such species or stocks for taking for subsistence purposes.

Endangered Species Act (ESA)

No marine mammal species listed under the ESA are expected to be affected by these activities. Therefore, we have determined that a section 7 consultation under the ESA is not required.

National Environmental Policy Act (NEPA)

In compliance with the NEPA of 1969 (42 U.S.C. 4321 et seq.), as implemented by the regulations published by the Council on Environmental Quality (40 CFR parts 1500–1508), the Navy prepared an Environmental Assessment (EA) to consider the direct, indirect and cumulative effects to the human environment resulting from the pier maintenance project. We made the Navy’s EA available to the public for review and comment, in relation to its suitability for adoption in order to assess the impacts to the human environment resulting from issuance of an IHA to the Navy. In compliance with NEPA, the CEQ regulations, and NOAA Administrative Order 216–6, we subsequently adopted that EA and signed a Finding of No Significant Impact (FONSI) on November 8, 2013.

We have reviewed the Navy’s application for a renewed IHA for ongoing construction activities for 2014–15 and the 2015–14 monitoring report. Based on that review, we have determined that the proposed action is very similar to that considered in the previous IHA. In addition, no significant new circumstances or information relevant to environmental concerns have been identified. Thus, we have determined that the preparation of a new or supplemental NEPA document is not necessary, and, after review of public comments, reaffirm our 2013 FONSI. The 2013 NEPA documents are available for review at www.nmfs.noaa.gov/pr/permits/incidental/construction.htm.

As a result of these determinations, we have issued an IHA to the Navy for conducting the described pier maintenance activities in Sinclair Inlet, from October 1, 2014 through March 1, 2015, provided the previously described mitigation, monitoring, and reporting requirements are incorporated.

Dated: September 24, 2014.

Donna S. Wieting,
Director, Office of Protected Resources, National Marine Fisheries Service.

Takes of Marine Mammals Incidental to Specified Activities; Taking Marine Mammals Incidental to Breakwater Replacement Project in Eastport, Maine

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Notice; issuance of an incidental take authorization.

SUMMARY: In accordance with the Marine Mammal Protection Act (MMPA) regulations, notification is hereby given that NMFS has issued an Incidental Harassment Authorization (IHA) to the Maine Department of Transportation (ME DOT) to take, by harassment, small numbers of four species of marine mammals incidental to breakwater replacement project in Eastport, Maine, between October 1, 2014, through September 30, 2015.

ADDRESSES: A copy of the application containing a list of the references used in this document, NMFS’s Environmental Assessment (EA), Finding of No Significant Impact (FONSI), and the IHA may be obtained by telephoning the contact listed below (see FOR FURTHER INFORMATION CONTACT) or visiting the Internet at: http://www.nmfs.noaa.gov/pr/permits/incidental.htm#applications.

Documents cited in this notice may be viewed, by appointment, during regular business hours, at 1315 East West Highway, Silver Spring, MD 20910.

FOR FURTHER INFORMATION CONTACT: Shane Guan, Office of Protected Resources, NMFS, (301) 427–8401.

SUPPLEMENTARY INFORMATION:

Background

Sections 101(a)(5)(A) and (D) of the MMPA (16 U.S.C. 1361 et seq.) direct the Secretary of Commerce to allow, upon request, the incidental, but not intentional, taking of small numbers of marine mammals by U.S. citizens who engage in a specified activity (other than commercial fishing) within a specified geographical region if certain findings are made and either regulations are issued or, if the taking is limited to harassment, a notice of a proposed authorization is provided to the public for review.

FOR FURTHER INFORMATION CONTACT: Shane Guan, Office of Protected Resources, NMFS, (301) 427–8401.
An authorization for incidental takings shall be granted if NMFS finds that the taking will have a negligible impact on the species or stock(s), will not have an unmitigable adverse impact on the availability of the species or stock(s) for subsistence uses (where relevant), and if the permissible methods of taking and requirements pertaining to the mitigation, monitoring and reporting of such takings are set forth. NMFS has defined “negligible impact” in 50 CFR 216.103 as “an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival.”

Except with respect to certain activities not pertinent here, the MMPA defines “harassment” as: Any act of pursuit, torment, or annoyance which (i) has the potential to injure a marine mammal or marine mammal stock in the wild [Level A harassment]; or (ii) has the potential to disturb a marine mammal or marine mammal stock in the wild by causing disruption of behavioral patterns, including, but not limited to, migration, feeding, or sheltering [Level B harassment].

Summary of Request

On February 21, 2014, NMFS received an application from ME DOT requesting an IHA for the take, by Level B harassment, of small numbers of harbor seals (Phoca vitulina), gray seals (Halichoerus grypus), harbor porpoises (Phocoena phocoena), and Atlantic white-sided dolphins (Lagenorhynchus acutus) incidental to in-water construction activities in Eastport, Maine. Upon receipt of additional information and a revised application, NMFS determined the application complete and adequate on May 6, 2014. On July 31, 2014, NMFS published a Federal Register notice (FR 79 44407) for the proposed IHA. No changes were made to the breakwater replacement work as described in the proposed IHA. Please refer to Federal Register notice for the proposed IHA for a detailed description of the project activities.

Comments and Responses

A notice of NMFS’ proposal to issue an IHA to ME DOT was published in the Federal Register on July 31, 2014 (79 FR 44407). That notice described, in detail, ME DOT’s activity, the marine mammal species that may be affected by the activity, and the anticipated effects on marine mammals. During the 30-day public comment period, NMFS received comments from the Marine Mammal Commission (Commission). All comments specific to ME DOT’s application that address the statutory and regulatory requirements or findings NMFS must make to issue an IHA are addressed in this section of the Federal Register notice.

Comment 1: The Commission questions the Level A and B harassment zones presented in the Federal Register notice (79 FR 44407; July 31, 2014) for the proposed IHA. The zones presented by ME DOT, and subsequently adopted in the proposed IHA, were based on measurements for the Ocean Renewable Power Company, LLC, (ORPC) pile driving of 30-in piles in much deeper water (26–32 m). However, the proposed ME DOT’s breakwater replacement will have piles as large as 36-inch and in water depth much shallower (2.4–17 m). The Commission recommends NMFS refer to the California Department of Transportation pile driving measurement report (CALTRANS, 2009) for information regarding source levels of larger piles as well as modeled take zone sizes.

Response: After review of ME DOT’s take zone calculation and comparing those with empirical measurements for equivalent piles, NMFS worked with ME DOT and recalculated the Level A and B harassment zones. Subsequently, ME DOT adopted CALTRANS pile driving measurement data of equivalent pile size (36-in diameter) in comparable environment to establish Level B harassment zones for impact and vibratory pile driving and Level A harassment zone for impact pile driving as recommended by NMFS.

Comment 2: The Commission also recommended that NMFS (1) consult with its analysts who have expertise in pile-driving activities and associated in-situ monitoring to estimate appropriate Level B harassment zones for (a) 36-in pipe piles installed using impact and down-hole hammers and vibratory hammers based on 160 and 120 dB re 1 μPa, respectively, (b) sheet piles installed using a vibratory hammer based on 120 dB re 1 μPa, and (c) sheet piles removed using either a vibratory extractor or underwater saw based on 120 dB re 1 μPa and (2) include those zones in the final IHA.

Response: For impact and vibratory pile driving, the initial harassment zones are provided in Table 1 above. For sheet piles removal using either a vibratory extractor or underwater saw based on 120 dB re 1 μPa, the initial zone are set to be 1000 m from the source. This distance will be updated based on hydroacoustic measurements. These zones are included in the final IHA issued to ME DOT.

</tr>
</tbody>
</table>

These zones are included in the final IHA issued to ME DOT.
Comment 3: The Commission recommended that NMFS (1) explicitly require ME DOT to conduct in-situ measurements of all activities (impact, down-hole, and vibratory installation of the 36-in piles and vibratory extraction and sawing of the sheet piles) and, (2)(a) consult with its analysts who have expertise in acoustic monitoring to determine the appropriate methods for collecting the in-situ measurements and establishing the duration of data collection (e.g., 10 piles or sheets using each method) and (b) include those methods in the final IHA.

Response: NMFS agrees with the Commission that ME DOT and will require ME DOT to conduct in-situ measurements of all activities. However, NMFS does not agree with the Commission’s recommendation of including specific in-situ measurement methods in the final IHA. Due to the timing of contractor bidding, ME DOT was not able to provide NMFS with detailed hydroacoustic measurement methods prior to NMFS’s issuance of an IHA. Nevertheless, NMFS will review and approve the contractor acoustic data collection method before ME DOT begins in-water pile driving and removal activities.

Comment 4: The Commission recommends that NMFS explicitly require in the final IHA ME DOT to conduct in-situ measurements of any concurrent activities (impact, down-hole, and vibratory installation and vibratory extraction and sawing of the sheet piles) and adjust the individual Level A and B harassment zones accordingly.

Response: ME DOT will be required to conduct in-situ measurements of any concurrent activities (impact, down-hole, and vibratory installation and vibratory extraction and sawing of the sheet piles) and adjust the individual Level A and B harassment zones accordingly.

Comment 5: The Commission noted that the Federal Register notice for the proposed IHA indicated that ME DOT estimated the potential numbers of takes based on the maximum expected size of all animals observed during Ocean Renewable Power Company’s (ORPC’s) construction activities in Eastport, Maine, has the potential to result in injury, serious injury, or mortality are expected as a result of the breakwater construction activities associated with the Eastport breakwater construction activities in Eastport, Maine. The Commission points out that ME DOT’s application for the proposed IHA were based on numbers of marine mammals observed by ORPC on an hourly basis for each month scaled to ME DOT’s assumed activity hours. The Commission recommends that NMFS authorize the estimated numbers of marine mammal takes for ME DOT activities based on the maximum group size of animals observed during ORPC’s marine mammal observation effort multiplied by the maximum expected number of pile/sheet installation and sheet removal days, consistent with the ORPC incidental harassment authorization.

Response: NMFS worked with ME DOT and revised take estimates based on maximum group size as recommended by the Commission. The updated take numbers are provided in Table 2 below.

Comment 6: The Commission noted that a minke whale was observed during ORPC marine mammal monitoring, but incidental taking of that species was not proposed. Accordingly, the Commission recommended that NMFS specify in its final IHA that ME DOT delay or cease pile installation or sheet removal/sawing if an animal(s) from any species or stock for which authorization has not been granted approaches or is observed within any of the Level B harassment zones and would not resume those activities until the animal(s) has been observed to leave the Level B harassment zone.

Comment 7: The Commission recommended that NMFS require ME DOT to conduct monitoring out to the driving area.

Response: NMFS agrees with the Commission’s recommendation and included a condition in requiring ME DOT to delay or cease pile installation or sheet removal/sawing if an animal(s) from any species or stock for which authorization has not been granted approaches or is observed within any of the Level B harassment zones and would not resume those activities until the animal(s) has been observed to leave the Level B harassment zone.

Comment 6: The Commission recommends that NMFS require ME DOT to conduct monitoring out to the extent of the relevant Level B harassment zones for vibratory pipe pile installation, vibratory sheet pile installation, vibratory sheet pile extraction, and sheet sawing for at least the majority of time spent conducting each of the four activities.

Response: NMFS agrees with the Commission’s recommendation and has included this condition in the final IHA.

Description of Marine Mammals in the Area of the Specified Activity

In the Federal Register notice (79 FR 44407; July 31, 2014) for the proposed IHA and in ME DOT’s IHA application, it was identified that four marine mammal species under NMFS jurisdiction are likely to occur in the construction area: Harbor seal (Phoca vitulina), gray seal (Halichoerus grypus), harbor porpoise (Phocoena phocoena), and Atlantic white-sided dolphin (Lagenorhynchus acutus). There is no change on the information regarding the species in the vicinity of the construction area.

Potential Effects of the Specified Activity on Marine Mammals

The effects of underwater noise from in-water pile driving and pile removal associated with the Eastport breakwater construction activities in Eastport, Maine, has the potential to result in Level B (behavioral) harassment of marine mammal species and stocks in the vicinity of the action area. The Notice of Proposed IHA included a discussion of the effects of anthropogenic noise on marine mammals, which is not repeated here. No instances of hearing threshold shifts, injury, serious injury, or mortality are expected as a result of the breakwater construction activities given the strong likelihood that marine mammals would avoid the immediate vicinity of the pile driving area.

Potential Effects on Marine Mammal Habitat

The primary potential impacts to marine mammals and other marine species are associated with elevated sound levels, but the project may also result in additional effects to marine mammal prey species and short-term local water turbidity caused by in-water construction due to pile removal and pile driving. These potential effects are discussed in detail in the Federal Register notice for the proposed IHA and are not repeated here.

Mitigation

In order to issue an incidental take authorization (ITA) under section 101(a)(5)(D) of the MMPA, NMFS must set forth the permissible methods of taking pursuant to such activity, and other means of effecting the least practicable impact on such species or stock and its habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance, and on the availability of such species or stock for taking for certain subsistence uses (where relevant).

For the proposed ME DOT Eastport breakwater construction activities, NMFS has required that ME DOT implement the following mitigation measures to minimize the potential impacts to marine mammals in the project vicinity.

Use of Noise Attenuation Devices

When using a diesel impact hammer to "proof" piles, ME DOT shall use sound attenuation devices and/or a bubble curtain to reduce hydroacoustic sound levels and avoid the potential for marine mammal injury. Based on previous studies, sound attenuation devices are expected to reduce sound levels by at least 5 dB.

Exclusion Zones and Zones of Influence (ZOIs)

The purpose of the proposed exclusion zone is to prevent Level A harassment (injury) of any marine mammal species. During all in-water impact pile driving, ME DOT shall establish a preliminary marine mammal exclusion zone around each pile to avoid exposure to sounds at or above 180 dB. In addition, ME DOT shall establish ZOIs within which marine mammals will be exposed to noise levels that could cause Level B behavioral harassment. The received levels for Level B harassment from impact and downhole hammers is 160 dB re 1 μPa, and from vibratory hammer is 120 dB re 1 μPa. The preliminary distances of each zone based on the results of CALTRANS’ hydroacoustic monitoring and NMFS recommendation are provided in Table 1 above.

Prior to commencing pile driving, ME DOT shall establish initial harassment zones based on Table 1. These zones shall later be verified by conducting hydroacoustic measurements of sound from in-water construction activities. The hydroacoustic monitoring plan would include the following elements: Monitoring for dB (rms) levels at 10 m from the pile; monitoring at 100 m to proof the marine mammal monitoring areas; and real time reporting of noise levels to the construction team. ME DOT would provide NMFS with a report following completion of the hydroacoustic monitoring.

If hydroacoustic monitoring indicates that threshold isopleths are greater than the initial zones in Table 1, ME DOT would contact NMFS within 48 hours and make the necessary adjustments. Likewise, if threshold isopleths are actually less than originally calculated, downward adjustments may be made to the exclusion zones and/or ZOIs. The exclusion zone for vibratory pile driving and underwater sawing is unnecessary as source levels would not exceed the Level A harassment threshold.

Shutdown and Delay Procedures

If a PSO sees a marine mammal within or approaching the exclusion zone prior to start of impact pile driving, the observer would notify the on-site project lead (or other authorized individual) who then would be required to delay pile driving until the marine mammal has moved out of the exclusion zone or if the animal has not been sighted within 30 minutes. If a marine mammal is sighted within or on a path toward the exclusion zone during pile driving, pile driving would cease until that animal has moved out of the exclusion zone or 30 minutes has lapsed since the last sighting.

In addition, although it is unlikely, if a marine mammal that is not covered (e.g., identified species) is sighted within the HMA under the IHA prior to the project vicinity. The hydroacoustic monitoring plan would include consideration of the following factors in relation to one another:

- The manner in which, and the degree to which, the successful implementation of the measure is expected to minimize adverse impacts to marine mammals.
- The proven or likely efficacy of the specific measure to minimize adverse impacts as planned.
- The practicability of the measure for applicant implementation.

Any mitigation measure(s) prescribed by NMFS should be able to accomplish, have a reasonable likelihood of accomplishing (based on current science), or contribute to the accomplishment of one or more of the general goals listed below:

(1) Avoidance or minimization of injury or death of marine mammals wherever possible (goals 2, 3, and 4 may contribute to this goal).

(2) A reduction in the numbers of marine mammals (total number or number at biologically important time or location) exposed to received levels of pile driving and pile removal or other activities expected to result in the take of marine mammals (this goal may contribute to 1, above, or to reducing harassment takes only).

(3) A reduction in the number of times (total number or number at biologically important time or location) individuals would be exposed to received levels of pile driving and pile removal, or other activities expected to driving, the soft-start procedure requires contractors to initiate noise from the vibratory hammer for 15 seconds at 40–60 percent reduced energy followed by a 1-minute waiting period. The procedure would be repeated two additional times before full energy may be achieved. For impact hammering, contractors would be required to provide an initial set of three strikes from the impact hammer at 40 percent energy, followed by a 1-minute waiting period, then two subsequent three-strike sets. For operating the underwater saw, contractors would be required to turn on the saw 3 or 4 times for 2 to 3 seconds each time over the course of 30 seconds. Soft-start procedures would be conducted any time hammering ceases for more than 30 minutes.

Mitigation Conclusions

NMFS has carefully evaluated the applicant’s proposed mitigation measures and considered a range of other measures in the context of ensuring that NMFS prescribes the means of effecting the least practicable impact on the affected marine mammal species and stocks and their habitat. Our evaluation of potential measures included consideration of the following factors in relation to one another:

- The manner in which, and the degree to which, the successful implementation of the measure is expected to minimize adverse impacts to marine mammals.
- The proven or likely efficacy of the specific measure to minimize adverse impacts as planned.
- The practicability of the measure for applicant implementation.

Any mitigation measure(s) prescribed by NMFS should be able to accomplish, have a reasonable likelihood of accomplishing (based on current science), or contribute to the accomplishment of one or more of the general goals listed below:

(1) Avoidance or minimization of injury or death of marine mammals wherever possible (goals 2, 3, and 4 may contribute to this goal).

(2) A reduction in the numbers of marine mammals (total number or number at biologically important time or location) exposed to received levels of pile driving and pile removal or other activities expected to result in the take of marine mammals (this goal may contribute to 1, above, or to reducing harassment takes only).

(3) A reduction in the number of times (total number or number at biologically important time or location) individuals would be exposed to received levels of pile driving and pile removal, or other activities expected to
result in the take of marine mammals (this goal may contribute to a, above, or to reducing harassment takes only).

(4) A reduction in the intensity of exposures (either total number or number at biologically important time or location) to received levels of pile driving, or other activities expected to result in the take of marine mammals (this goal may contribute to a, above, or to reducing the severity of harassment takes only).

(5) Avoidance or minimization of adverse effects to marine mammal habitat, paying special attention to the food base, activities that block or limit passage to or from biologically important areas, permanent destruction of habitat, or temporary destruction/disturbance of habitat during a biologically important time.

(6) For monitoring directly related to mitigation—an increase in the probability of detecting marine mammals, thus allowing for more effective implementation of the mitigation.

Based on our evaluation of the applicant’s proposed measures, as well as other measures considered by NMFS, NMFS has determined that the proposed mitigation measures provide the means of effecting the least practicable impact on marine mammals species or stocks and their habitat, paying particular attention to rookeries, mating grounds, and areas of similar significance.

Monitoring and Reporting

In order to issue an ITA for an activity, section 101(a)(5)(D) of the MMPA states that NMFS must set forth, “requirements pertaining to the monitoring and reporting of such taking.” The MMPA implementing regulations at 50 CFR 216.104 (a)(13) indicate that requests for ITAs must include the suggested means of accomplishing the necessary monitoring and reporting that will result in increased knowledge of the species and of the level of taking or impacts on populations of marine mammals that are expected to be present in the proposed action area. USCG submitted a marine mammal monitoring plan as part of the IHA application. It can be found at http://www.nmfs.noaa.gov/pr/permits/incidental.htm. The plan may be modified or supplemented based on comments or new information received from the public during the public comment period.

Monitoring measures prescribed by NMFS should accomplish one or more of the following general goals:

(1) An increase in the probability of detecting marine mammals, both within the mitigation zone (thus allowing for more effective implementation of the mitigation) and in general to generate more data to contribute to the analyses mentioned below;

(2) An increase in our understanding of how many marine mammals are likely to be exposed to levels of pile driving that we associate with specific adverse effects, such as behavioral harassment, TTS, or PTS;

(3) An increase in our understanding of how marine mammals respond to stimuli expected to result in take and how anticipated adverse effects on individuals (in different ways and to varying degrees) may impact the population, species, or stock (specifically through effects on annual rates of recruitment or survival) through any of the following methods:
   - Behavioral observations in the presence of stimuli compared to observations in the absence of stimuli (need to be able to accurately predict received level, distance from source, and other pertinent information);
   - Physiological measurements in the presence of stimuli compared to observations in the absence of stimuli (need to be able to accurately predict received level, distance from source, and other pertinent information);
   - Distribution and/or abundance comparisons in times or areas with concentrated stimuli versus times or areas without stimuli;

(4) An increased knowledge of the affected species; and

(5) An increase in our understanding of the effectiveness of certain mitigation and monitoring measures.

Monitoring Measures

Hydroacoustic monitoring shall be performed using appropriate method reviewed and approved by NMFS at the initial installation of each pile driving and pile extraction method and underwater sawing to ensure that the harassment isopleths are not extending past the initial distances established and to assess the efficiency of the sound attenuation devices.

In addition, ME DOT shall conduct in-situ hydroacoustic measurements of any concurrent activities (impact, downhole, and vibratory installation and vibratory extraction and sawing of the sheet piles) and adjust the individual Level A and B harassment zones accordingly.

For visual monitoring of marine mammals, ME DOT shall designate two biologically-trained, on-site protected species observers (PSOs), approved in advance by NMFS, to monitor the exclusion zones (preliminarily set at 30 m) for marine mammals 30 minutes before, during, and 30 minutes after all impact pile driving activities and call for shut down if any marine mammal is observed within or approaching the exclusion zone. These PSOs would be positioned on the pier. One observer would survey inwards toward the pile driving site and the second observer would conduct behavioral monitoring outwards to a distance of 1 km during all impact pile driving.

PSOs shall provide 100% coverage for marine mammal exclusion zones and conduct monitoring out to the extent of the relevant Level A harassment zones for vibratory pile driving, vibratory sheet pile driving, vibratory sheet pile extraction, and sheet sawing for at least the majority of time spent (>50%) conducting each of the four activities.

PSOs shall be provided with the equipment necessary to effectively monitor for marine mammals (for example, high-quality binoculars, compass, and range-finder as well as a digital SLR camera with telephoto lens and video capability) in order to determine if animals have entered into the exclusion zone or Level B harassment isopleth and to record species, behaviors, and responses to pile driving.

Reporting

ME DOT is required to submit a report to NMFS within 90 days of completion of in-water construction activities. The report would include data from marine mammal sightings (such as date, time, location, species, group size, and behavior), any observed reactions to construction, distance to operating pile hammer, and construction activities occurring at time of sighting and environmental data for the period (wind speed and direction, Beaufort sea state, cloud cover, and visibility).

In the unanticipated event that the specified activity clearly causes the take of a marine mammal in a manner prohibited by the IHA (if issued), such as an injury (Level A harassment), serious injury, or mortality, ME DOT would immediately cease the specified activities and immediately report the incident to the Permits and Conservation Division, Office of Protected Resources, NMFS, at 301–427–8401 and/or by email to Jolie.Harrison@noaa.gov and Shane.Guan@noaa.gov and the Greater Atlantic Regional Fisheries Office Stranding Coordinator (Mendy.Garron@noaa.gov). The report must include the following information:

- Time, date, and location (latitude/longitude) of the incident;
- Name and type of vessel involved;
- Vessel’s speed during and leading up to the incident;
Based on marine mammal sightings Multi-impact Period: 2007 and 2010. ORPC’s marine mammal monitoring threshold during impact pile driving. The 30-m distance to expected sound levels at each source and the expected attenuation rate of sound (Table 1). The 30-m distance to the Level A harassment threshold provides PSOs plenty of time and adequate visibility to prevent marine mammals from being exposed to sound levels that reach the Level A harassment threshold during impact pile driving.

The estimated number of marine mammals potentially taken is based on ORPC’s marine mammal monitoring observations between 2007 and 2010. Based on marine mammal sightings during that period, further consultation between ORPC and NMFS, and the estimated number of pile driving and underwater sawing days for the Eastport Breakwater project, ME DOT requests authorization for the incidental take of 456 seals (because they cannot always be identified to the species-level), 456 harbor porpoises, and 76 Atlantic white-sided dolphins. The estimated take is based on the maximum group size of animals observed during ORPC’s marine mammal observations multiplied by the maximum expected number of pile driving and underwater sawing days.

**Analysis and Determinations**

**Negligible Impact**

Negligible impact is “an impact resulting from the specified activity that cannot be reasonably expected to, and is not reasonably likely to, adversely affect the species or stock through effects on annual rates of recruitment or survival” (50 CFR 216.103). A negligible impact finding is based on the lack of likely adverse effects on annual rates of recruitment or survival (i.e., population-level effects). An estimate of the number of Level B harassment takes, alone, is not enough information on which to base an impact determination. In addition to considering estimates of the number of marine mammals that might be “taken” through behavioral harassment, NMFS must consider other factors, such as the likely nature of any responses (their intensity, duration, etc.), the context of any responses (critical reproductive time or location, migration, etc.), as well as the number and nature of estimated Level A harassment takes, the number of estimated mortalities, and effects on habitat.

ME DOT’s proposed Eastport breakwater replacement project would
involve pile driving and removal activities as well as the use of an underwater saw. Elevated noise levels are expected to be generated as a result of these activities. However, ME DOT would use noise attenuation devices (e.g., pile cushions, bubble curtains) during impact pile driving to ensure that sound levels of 180 dB (rms) do not extend more than 10 m from the pile, which eliminates the potential for injury (PTS) and TTS. Given the required mitigation and monitoring, no injuries or mortalities are anticipated to occur as a result of ME DOT’s proposed action in Eastport, and none are proposed to be authorized. In addition, as described above, marine mammals in the area would not be exposed to activities or sound levels which would result in hearing impairment (TTS or PTS) or non-auditory physiological effects. The small number of takes that are anticipated to occur would be limited to short-term Level B harassment.

In-water construction activities would occur in relatively shallow coastal waters of Cobscook Bay. The proposed project area is not considered significant habitat for marine mammals. Marine mammals approaching the action area would likely be traveling or opportunistically foraging. There are no rookeries or major haul-out sites nearby, foraging hotspots, or other ocean bottom structure of significant biological importance to marine mammals that may be present in the marine waters in the vicinity of the project area. The closest significant pinniped haul out is more than 6 nm away (ME DOT, pers. comm.), which is well outside the project area’s largest harassment zone. The proposed project area is not a prime habitat for marine mammals, nor is it considered an area frequented by marine mammals. Therefore, behavioral disturbances that could result from anthropogenic noise associated with breakwater replacement activities are expected to affect only a small number of marine mammals on an infrequent basis. Although it is possible that some individual marine mammals may be exposed to sound from in-water construction activities more than once, the duration of these multi-exposures is expected to be low since animals would be constantly moving in and out of the area and in-water construction activities would not occur continuously throughout the day.

Marine mammals may be temporarily impacted by noise from pile driving activities and the operation of an underwater saw. These low intensity, localized, and short-term noise exposures may cause brief startle reactions or short-term behavioral modifications by the animals. These reactions and behavioral changes are expected to subside quickly when the exposures cease. Moreover, marine mammals are expected to avoid the area during in-water construction because animals generally move away from active sound sources, thereby reducing exposure and impacts. In addition, through mitigation measures including soft start, marine mammals are expected to move away from a sound source that is annoying prior to its becoming potentially injurious, and detection of marine mammals by observers would enable the implementation of shutdowns to avoid injury, serious injury, or mortality. In-water construction activities involving pile driving and underwater sawing are expected to occur for about 12 days total each month. Repeated exposures of individuals to levels of sound that may cause Level B harassment are unlikely to result in hearing impairment or to significantly disrupt foraging behavior. Thus, even repeated Level B harassment of some small subset of an overall stock is unlikely to result in any significant realized decrease in fitness to those individuals, and thus would not result in any adverse impact to the stock as a whole. Level B harassment will be reduced to the level of least practicable impact through use of mitigation measures described herein and, if sound produced by project activities is sufficiently disturbing, animals are likely to simply avoid the project area while the activity is occurring. Based on the application and subsequent analysis, the impact of the described in-water construction activities may result in, at most, short-term modification of behavior by small numbers of marine mammals within the action area. No injury, serious injury, or mortality is expected to occur and due to the nature, degree, and context of the Level B harassment anticipated, the activity is not expected to impact rates of recruitment or survival.

Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the proposed monitoring and mitigation measures, NMFS finds that the total marine mammal take from the Eastport breakwater replacement project will have a negligible impact on the affected marine mammal species or stocks.

**Small Numbers**

The amount of take NMFS proposes to authorize is considered small (less than one percent) relative to the estimated populations of 70,142 harbor seals, 250,000 gray seals, 79,883 harbor porpoises, and 48,819 Atlantic white-sided dolphins. Based on the analysis contained herein of the likely effects of the specified activity on marine mammals and their habitat, and taking into consideration the implementation of the mitigation and monitoring measures, NMFS finds that small numbers of marine mammals will be taken relative to the populations of the affected species or stocks.

**Impact on Availability of Affected Species for Taking for Subsistence Uses**

There are no relevant subsistence uses of marine mammals implicated by this action. Therefore, NMFS has determined that the total taking of affected species or stocks would not have an unmitigable adverse impact on the availability of such species or stocks for taking for subsistence purposes.

**Endangered Species Act (ESA)**

No species listed under the ESA are expected to be affected by these activities. Therefore, NMFS has determined that a section 7 consultation under the ESA is not required.

**National Environmental Policy Act (NEPA)**

In compliance with the National Environmental Policy Act of 1969 (42 U.S.C. 4321 et seq.), as implemented by the regulations published by the Council on Environmental Quality (40 CFR parts 1500–1508), and NOAA Administrative Order 216–6, NMFS prepared an Environmental Assessment (EA) to consider the environmental impacts of issuance of a one-year IHA. A Finding of No Significant Impact was signed on September 24, 2014.

**Authorization**

NMFS has issued an IHA to ME DOT for the potential harassment of small numbers of marine mammal species incidental to its Eastport breakwater replacement project Eastport, Maine, provided the previously mentioned mitigation, monitoring, and reporting requirements are incorporated.

Dated: September 26, 2014.

Donna S. Wieting,
Director, Office of Protected Resources,
National Marine Fisheries Service.
