

data reporting (NMFS, 2014b). There are existing regulatory mechanisms throughout the species' range—although catch limits and seasonal and spatial closures appear to be the most effective in addressing the primary threat to the species (harvest). There are also significant concerns related to the enforcement of existing regulations; however, CITES has embargoed many countries for not complying with their obligations under the treaty. In some cases, CITES references the lack of regulatory enforcement as a factor that contributed to embargo decisions. In addition, despite continued deficiencies related to enforcement and regulatory compliance in queen conch fisheries, this threat does not appear to be impacting the species' continued existence, as conch landings trends appear to be stable.

Although the global population has likely declined from historical numbers, the species still occurs over a broad geographic range, has dispersal mechanisms that have ensured high degrees of genetic mixing, and its current range is unchanged from its historical range. In addition, there is little evidence to suggest that disease or predation is contributing to increasing the risk of extinction of the species.

Based on these findings, we conclude that the queen conch is not currently in danger of extinction throughout all or a significant portion of its range, nor is it likely to become so in the foreseeable future. While ongoing conservation efforts could be more effective, since the queen conch is not currently in danger of extinction throughout all or a significant portion of its range or likely to become so in the foreseeable future, we do not need to rely on the effectiveness of conservation efforts to make this finding. Accordingly, the queen conch does not meet the definition of a threatened or endangered species, and our listing determination is that the queen conch does not warrant listing as threatened or endangered at this time.
