The comment further stated that amino acids deficient in one food or meal can be supplied by another, so that dietary needs are met over the course of the day. Therefore, according to the comment, foods with a low PDCAAS are a valuable source of protein in the context of the overall diet, and the labeling regulations should not completely discount their value.

(Response) We decline to amend § 101.9(c)(7) to replace the statement ''not a significant source of protein'' with ''not a source of complete protein'' when a product contains protein with a low PDCAAS. We agree that amino acids that are deficient in one food or meal can be supplied by another so that dietary needs are met over the course of the day. However, it is not clear, based on the information provided in the comment, if the general public would understand what a ''complete'' protein is and, even if consumers did understand, whether the statements would be viewed differently. Therefore, we are not replacing the statement ''not a significant source of protein'' with ''not a source of complete protein'' when a product contains protein with a low PDCAAS.

3. DRV

Our preexisting regulations, at § 101.9(c)(9), set the DRV for protein at 50 grams, and this represents 10 percent of the 2,000 reference calorie intake level. The preamble to the proposed rule (79 FR 11879 at 11913 through 11914) discussed scientific recommendations for setting the DV for protein and comments we received in response to the 2007 ANPRM. The preamble to the proposed rule (79 FR 11879 at 11913) explained how using the IOM Labeling Committee's recommended approach for setting the DV for protein would result in no change to the DRV for protein and how the DRV of 50 grams for protein falls within the range of the RDAs calculated using reference weights.

We did not propose to change the DRV of 50 grams for protein.

(Comment 319) Several comments supported maintaining the current DRV of 50 grams for protein. However, other comments recommended increasing the DRV for protein. One comment suggested that the DRV for protein should be 23 percent of calories, which is the median of the IOM's Acceptable Macronutrient Distribution Range (AMDR) range (Ref. 5). Taking into account the average actual weight of people in the United States, which is 195.5 pounds (lbs) for men and 166.2 lbs for women based on data from the Centers for Disease Control and Prevention National Center for Health Statistics (Ref. 162), the comment said an individual would need to eat 66 grams/day of protein to meet the recommended grams/kilogram of protein. The comment suggested that increasing the DRV for protein would help people lose weight because it would allow people to increase their muscle mass. However, the comment did not provide scientific support for this statement.

Other comments recommended increasing the DRV for protein from 10 percent to 15 percent or a minimum 15 percent of calories. The comments suggested that the current DRV of 10

percent of energy from protein is too low considering the IOM's AMDR for protein is 10 to 35 percent of energy intake for adults. One comment stated that Americans typically consume 15 to 17 percent of calories from protein, so increasing the DRV for protein to 15 percent would be consistent with protein intakes in the United States. One comment expressed concern that a DRV of 10 percent of energy from protein could lead to overconsumption of calories from other macronutrients, such as carbohydrates or fats.

Another comment compared the current DRV for protein to the IOM's RDAs. The comment acknowledged that our DRV for protein is not based on the RDA for protein, but said it is less than the RDA for adolescent and adult men. The comment further stated that, because protein is an essential nutrient and because the RDA is set based on grams/kilogram of body weight, protein needs may exceed the RDA for some men, especially for men who are taller than average and/or have increased muscle mass. The comment expressed concern that we are not determining the DRV for protein in a similar manner to that for vitamins and minerals (*i.e.,* the population coverage approach).

One comment suggested that the DRV for protein should reflect dietitian-suggested values (*e.g.,* 60 grams/day), but did not provide any basis for the change.

(Response) We decline to increase the DRV for protein and are not making any changes to the existing DRV for protein of 50 g. The preamble to the proposed rule discussed comments we had received in response to an ANPRM and explained why we declined to change the DRV (79 FR 11879 at 11913). In brief, we considered basing the DRV for protein on the midpoint of the AMDR for protein 22.5 grams (79 FR 11879 at 11913), but declined to base the DRV for protein on the midpoint of the AMDR range because we had no data to show that protein intakes in the United States were inadequate or that setting a higher DRV that is based on the midpoint of the AMDR is needed to reduce the risk of chronic diseases. Furthermore, the DRV of 10 percent of calories from protein falls within the AMDR range of 10 to 35 percent of calories from protein (id.).

We also disagree that the DRV for protein should be increased to 15 percent of calories from protein. The only basis provided in comments for increasing the DRV for protein to 15 percent of calories from protein is consumption data indicating that Americans typically consume 15 to 17 percent of calories from protein. In reference to the concern that the established DRV for protein does not cover the needs of adolescent and adult men, recent consumption data shows that, on average, males 19 years and older are exceeding the RDA for protein, and thus a DRV of 10 percent has not had a negative impact on protein consumption (Ref. 163). The mean protein intake from foods and beverages in males 20 years of age and older is 98.8 grams/day and ranges from 80 grams/day to 110.0 grams/day. Four percent or less of males 19 years of age and older are consuming below the EAR for protein. Therefore, regardless of the current DRV, males 19 years of age and older are consuming well above the RDA for protein.

We also disagree that the DRV should reflect suggested values from a dietitian. There is a range of values that could be recommended by a dietitian depending on the individual or group that a dietitian is counseling. Dietitians work in a variety of settings such as hospitals, long-term care facilities, wellness or rehabilitation centers, food industry, and non-profit organizations. They provide recommendations based on the patient or client's needs. The protein recommendations provided by dietitians vary greatly depending on the audience. Therefore, a DRV based on values suggested by dietitians would not necessarily be reflective of the needs of the general population.

4. Miscellaneous Comments

(Comment 320) One comment recommended reorganizing § 101.9(c)(7) so that the regulated industry can more easily understand its provisions. The comment stated that the regulation is written in a manner that is convoluted and confusing, such that many readers have a hard time understanding its requirements. For example, the comment said that readers are often confused as to when, how, and to what the PDCAAS correction is to be applied in labeling, and when declaration of the percent DV is required, prohibited, or optional. The comment also stated that there is also confusion regarding the most appropriate method to determine the declared quantity of protein.

The comment suggested revisions to the codified text, which included: (1) Removal of the discussion related to protein quality and when the statement ''not a significant source of protein'' must be declared from § 101.9(c)(7); (2) removal of the discussion of how protein content may be determined from § 101.9(c)(7) and placement of this information under§ 101.9(c)(7)(i); (3) addition of ''(The quantity of protein in grams shall not be corrected based on protein quality values as described in paragraph (c)(7)(vii) of this section.)'' to § 101.9(c)(7); (4) addition of the statement ''for foods in which the only significant source of nitrogen is from protein (*i.e.,* chains of amino acids linked by peptide bonds) followed by information related to the calculation of protein content (moved from § 101.9(c)(7)) to § 101.9(c)(7)(i)); (5) addition of a new § 101.9(c)(7)(ii) which includes requirements for foods containing non-protein sources of nitrogen; (6) replacement of the proposed language in § 101.9(c)(7)(iii) related to the DRV and RDI values for protein with information related to the protein quality of foods purported to be for children and adults 4 years of age and older and new requirements for when the statement ''not a source of complete protein'' or a calculated percent DV for protein can be declared; (7) addition of a new § 101.9(c)(7)(iv), which includes requirements for when the statement ''not a significant source of protein'' or the percent DV for protein must be declared on foods represented or purported to be for children greater than 1 but less than 4 years of age; (8) addition of a new § 101.9(c)(7)(v), which includes requirements for when the statement ''not a significant source of protein'' must be declared and the prohibition of the declaration of the percent DV for foods represented or purported to be specifically for infants 7 through 12 months of age; (9) addition of a new § 101.9(c)(7)(vi) which includes information related to the voluntary declaration of a percent DV for protein, except that the percent DV declaration is prohibited if a food is represented or purported to be for infants 7 through 12 months of age; (10) addition of a new § 101.9(c)(7)(vii), which includes all of the information in proposed § 101.9(c)(7)(ii) related to the calculation of the ''corrected amount of protein (gram) per serving''; and (11) addition of a new § 101.9(c)(7)(viii), which includes all of the information in proposed § 101.9(c)(7)(iii) related to the proposed DRVs and RDIs for protein.

The comment also recommended revising § 101.36(b)(2)(iii)(B) to state that the percent DV of all dietary ingredients declared under § 101.36(b)(2)(i) must be listed, except that the percent for protein may ''or shall'' be omitted as provided in § 101.9(c)(7). In addition, the comment recommended clarifying § 101.36(b)(2)(iii)(B) so that the percent DV for protein, when present, be calculated using the corrected amount of protein as specified in § 101.9(c)(7).

(Response) We decline to revise § 101.9(c)(7) based on the comment. It is

not clear that the suggested reorganization of the codified makes it easier for the reader to understand the requirements related to when, how, and to what the PDCAAS correction is to be applied, and when the declaration of the percent DV is required, prohibited, or optional.

We do agree, however, that § 101.36(b)(2)(iii) should be revised for clarity to explicitly state that the percentage of the RDI for protein shall be omitted when a food is purported to be for infants through 12 months of age, and we have revised the rule accordingly. (We explain, in our response to comment 441, our reasons for changing ''infants 7 through 12 months of age'' to ''infants through 12 months of age.'')

We also agree to clarify, in § 101.36(b)(2)(iii), that the percent DV for protein should be calculated using the corrected amount of protein as specified in § 101.9(c)(7). Therefore, we have revised § 101.36(b)(2)(iii) to state that the percent DV for protein, when present, shall be calculated using the corrected amount of protein as specified in § 101.9(c)(7)(ii).

J. Sodium

The preamble to the proposed rule discussed key consensus reports and recommendations that we reviewed in reconsidering the DRV (79 FR 11879 at 11914 through 11915). After we published the proposed rule in March 2014, three new reports were issued that provided corroborative evidence to our proposal to set a DRV of 2,300 mg.

The first report was the ''NHLBI Lifestyle Interventions to Reduce Cardiovascular Risk: Systematic Evidence Review from the Lifestyle Work Group'' (Ref. 17). In 2013, the Lifestyle Work Group evaluated evidence on the role of specific dietary patterns, nutrient intake (*e.g.,* macronutrients, sodium, and potassium), and levels and types of physical activity, through effects on such modifiable CVD risk factors as high BP and lipids, in reducing CVD risk. The results of this systematic review were intended to be used to establish clinical recommendations that are directed at patients with CVD risk factors (*i.e.,* abnormal lipids and/or prehypertension and hypertension). The Lifestyle Work Group evaluated evidence statements on the: (1) Overall effect of dietary intake of sodium on blood pressure; (2) comparison of different levels of dietary intake of sodium on blood pressure; (3) sodium and blood pressure in subpopulations defined by sex, race/ethnicity, age, and hypertension status; (4) sodium intake and blood pressure in the context of dietary pattern changes; (5) sodium and blood pressure in the context of other minerals; and (6) effect of dietary intake of sodium on CVD outcomes. The Lifestyle Workgroup found that the strength of the evidence was high and that, in adults 25 to 80 years of age with blood pressure 120 to 159/80 to 95 mm HG, reducing sodium intake lowers blood pressure. The Lifestyle Work Group found moderate evidence that, in adults 25 to 75 years of age with blood pressure 120 to 159/80 to 95 mm HG, reducing sodium intake that achieves a mean 24-hour urinary sodium excretion of approximately 2,400 mg/day relative to approximately 3,300 mg/day lowers blood pressure by 2/1 mm HG and reducing sodium intake that achieves a mean 24-hour urinary sodium excretion of approximately 1,500 mg/day lowers blood pressure by 7/3 mm Hg. There was low evidence that a reduction in sodium by approximately 1,000 mg/day reduces CVD events by about 30 percent and that higher sodium intake is associated with greater risk for fatal and nonfatal stroke and CVD. The Lifestyle Work Group did not find sufficient evidence to determine the association between sodium intake and the development of heart failure.

The second report was the 2015 DGAC. The DGAC informs the Federal government of current scientific evidence on topics related to diet, nutrition, and health. The 2015 DGAC considered the 2010 DGAC reviews, the 2013 NHLBI Lifestyle Evidence Review, the 2013 IOM Sodium in Populations report, and new evidence released since 2013 for sodium intake and blood pressure and CVD outcomes. The 2015 DGAC recommended that the general population, ages 2 years and older, rely on the recommendations in the 2005 IOM DRI Electrolytes report that set the UL at 2,300 mg/day based on evidence showing associations between high sodium intake, high blood pressure, and subsequent risk of heart disease, stroke, and mortality. The committee also noted that, given the well-documented relationship between sodium intake and high blood pressure, sodium intake should be reduced and combined with a healthful dietary pattern (Ref. 19).

The third report was the 2015–2020 Dietary Guidelines for Americans (Ref. 28). The 2015–2020 DGA made a key recommendation to limit calories from added sugars and saturated fats and reduce sodium intake and to consume an eating pattern low in added sugars, saturated fats, and sodium. Cutting back on foods and beverages higher in these components will help people achieve diets that fit into healthy eating patterns. The 2015–2020 DGA also made a key recommendation to consume less than 2,300 mg of sodium per day. This recommendation was based on the UL for individuals ages 14 years and older set by the IOM (Ref. 28)).

1. Mandatory Declaration

Under section 403(q)(1)(D) of the FD&C Act, nutrition information in food labels or labeling must include, among other things, the amount of sodium, and our preexisting regulations, at § 101.9(c)(4), require the declaration of sodium content on the Nutrition Facts label. The preamble to the proposed rule (79 FR 11879 at 11914) explained that Americans 4 years and older consume an average of approximately 3,650 mg sodium/day, which is more than twice the amount required to meet their adequate intake (1,500 mg/day for individuals 9 to 50 years old). We also noted that evidence continues to support the association between increased sodium consumption and increased blood pressure (id.). Consequently, the preamble to the proposed rule indicated that we would continue to require mandatory declaration of sodium at § 101.9(c)(4).

(Comment 321) Several comments supported the ongoing mandatory declaration of sodium content on the Nutrition Facts label. Some comments noted that providing this information will assist consumers in maintaining healthy dietary practices by helping them identify products with less sodium and to follow the advice of their health care professionals, specifically those consumers who are at higher risk of cardiovascular disease (CVD) (*e.g.,* people with chronic kidney disease, African Americans, people 51 years and older, and those with hypertension). One comment stated that consumer research indicates that sodium is one of the top three food components Americans consider when making decisions about buying packaged foods or beverages (Ref. 164). Another comment suggested that mandatory declaration along with the declaration of potassium would encourage food manufacturers to reduce sodium that is added to foods. However, the comment did not provide data to support these assertions.

(Response) We agree that the declaration of sodium on the food label will provide consumers with information on sodium content that can help them make appropriate food choices to help them maintain healthy dietary practices. However, with respect to the comment suggesting that mandatory declaration of sodium, along

with the declaration of potassium, would encourage food manufacturers to reduce sodium addition to foods, the extent that mandatory declaration of sodium and potassium will encourage reformulation is unknown.

The final rule also requires disclosure of potassium. We discuss comments regarding the mandatory declaration of potassium at part II.L.3.b.

(Comment 322) One comment opposed mandatory declaration of sodium and asked us to look critically at the science behind the dietary sodium recommendations and to consider removing sodium from the list of mandatory nutrients. However, the comment recognized that, given the 2010 DGA (Ref. 30) and the 2010 IOM Sodium Strategies Report (Ref. 165), FDA may feel that eliminating sodium as a mandatory nutrient is not possible at the current time.

(Response) We decline to remove sodium from the list of mandatory nutrients. We note that section 403(q) of the FD&C Act expressly lists sodium as one of the nutrients to appear on the Nutrition Facts label. While the FD&C Act also provides a mechanism for us to remove nutrients from the label or labeling of food, we would have to determine that the information related to that nutrient is not necessary to assist consumers in maintaining healthy dietary practices. In the case of sodium, evidence continues to support the association between increased sodium consumption and blood pressure. In 2005, the IOM DRI Electrolytes Report noted a direct relationship between sodium intake and increased blood pressure (Ref. 166). The 2010 DGAC (Ref. 30) and the 2013 IOM report on Sodium Intake in Populations, Assessment of the Evidence (Ref. 167) concluded that a strong body of evidence has been documented in adults that blood pressure decreases as sodium intake decreases. The 2015 DGAC Report corroborates our position in the proposed rule because it also concluded that there is a strong body of evidence linking increased sodium intake to increased blood pressure (Ref. 19). Thus, the evidence continues to support mandatory declaration of sodium on the Nutrition Facts label.

2. DRV

We proposed to revise § 101.9(c)(9) to reduce the DRV for sodium from 2,400 mg to 2,300 mg. The preamble to the proposed rule (79 FR 11879 at 11914 through 11915) explained that new scientific data and consensus reports on sodium highlighted the need to reconsider the DRV.

(Comment 323) Several comments supported a DRV of 2,300 mg and agreed that the UL established by the IOM in 2005 is an appropriate basis for setting a DRV. The comments also noted that the 2013 IOM Sodium Intake in Populations, Assessment of the Evidence report (Ref. 167) concluded that evidence on direct health outcomes is not consistent and insufficient to conclude that lowering sodium intakes below 2,300 mg/day either increases or decreases risk of CVD outcomes or all-cause mortality for the general population. The comments also noted that the IOM concluded there was no evidence on health outcomes to support treating subpopulation groups differently from the general U.S. population. A few comments noted that a recent meta-analysis by Graudal et. al (2014) showed that there is a U-shaped relationship between sodium intake and health outcomes (Ref. 168). (A U-shaped curve indicates that, at low levels of intake, there is a risk of inadequacy and, at high levels of intake, there is a risk of adverse events.) The comments noted that the Graudal et al. study extends the IOM report by identifying a specific range of sodium intake, 2,645 to 4,945 mg, associated with the most favorable health outcomes, within which variation in sodium intake is not associated with variation in mortality. The comments stated that this analysis underscores the conclusions of the 2013 IOM Sodium Intake in Populations, Assessment of the Evidence report (Ref. 167) and supports setting a DRV of 2,300 mg and does not support reducing the DV to 1,500 mg.

Other comments supporting a DRV of 2,300 mg argued that a DRV based on a UL (rather than an RDI based on an AI) is consistent with our current and proposed approach for other nutrients (*e.g.,* saturated fat and cholesterol) that should be limited in the diet and for which there are concerns of excess intake and risk of chronic-disease or health-related conditions.

Some comments supporting a DRV of 2,300 mg said that this value is consistent with the 2010 DGA recommendation for the general population. Another comment stated that scientific evidence and Federal nutrition policy do not support recommending that the general public reduce their daily intake of sodium to 1,500 mg/day. The comment noted that 2005 DGA report's statement for specific population groups to ''consume no more than 1,500 mg'' inadvertently implied that the 2005 DGA had defined a new UL for these groups. Furthermore, the comments said that the NHLBI's Lifestyles Evidence Review recommended no more than 2,400 mg/day and that a further reduction to 1,500 mg/day would be even more beneficial for adults with pre-hypertension and hypertension who could benefit from blood pressure lowering. While the NHLBI report found strong evidence for reducing sodium intake and lower blood pressure, the comment said that the evidence for specifying an optimal intake level for sodium intake was moderate, and the evidence for sodium intake and CVD events was low.

(Response) We agree with the comments supporting a DRV of 2,300 mg for sodium. The DRV is consistent with the scientific evidence from consensus reports, such as the 2005 IOM DRI Electrolytes report (Ref. 166) and the 2013 IOM Sodium Intake in Populations, Assessment of the Evidence (Ref. 167), as well as our approach for other nutrients (such as saturated fat and cholesterol) that should be limited in the diet. The final rule, therefore, establishes a DRV of 2,300 mg for sodium.

To the extent the comment suggests that the 2005 DGA implied that 1,500 mg was the new UL for specific subgroups, we disagree. While the 2010 DGA recommended reducing sodium intake to the AI of 1,500 mg/day for certain subpopulations at increased risk of the blood-pressure raising effects of sodium (*e.g.,* older persons, African-Americans, and individuals with hypertension, diabetes or chronic kidney disease), the 2005 IOM Electrolytes report concluded that there was insufficient scientific evidence to set a separate UL for these groups (see 79 FR 11879 at 11914 through 11915). The AI for sodium of 1,500 mg/day was based on meeting essential needs of sodium (*e.g.,* replacing sweat losses) and not blood pressure. We note that the NHLBI Lifestyles Evidence Review recommendations apply to adults with pre-hypertension and hypertension who would benefit from blood pressure lowering.

(Comment 324) Some comments stated that, while intake below 2,300 mg/day of sodium is desirable for some individuals, particularly those at risk of hypertension, the 2,300 mg/day recommendation seems most achievable given the current food supply and intake levels in the general U.S. population. The comments said that sodium targets below 2,300 mg/day would make it hard to meet other nutrient needs, particularly potassium. In addition, one comment said that substantially lowering the current DV to 1,500 mg would reduce the palatability of foods that can be labeled as ''low sodium'' (*e.g.,* assuming, as FDA

recognized, the eligibility criteria of 140 mg/RACC) used to define low sodium would likely be adjusted to remain consistent with current cut points for ''low'' nutrient content claims which are set at levels around 5 percent DV or less).

(Response) The DRV of 2,300 mg is based on clinical data on sodium and blood pressure that is applicable to the general U.S. population and represents an amount not to exceed. The DRV for sodium is not based on the levels of sodium in the food supply or eligibility requirements for nutrient content claims. However, we recognize that revisions of other regulatory requirements, such as nutrient content claims (*e.g.,* low sodium), would be less likely if the DV were updated to 2,300 mg (see 79 FR 11879 at 11916) and that there may be fewer technological barriers and product acceptance issues (*e.g.,* palatability) for products that meet the current definition of ''low'' sodium.

(Comment 325) A few comments supported establishing a DRV of 2,300 mg, but suggested that we should consider the 2015–2020 DGA before issuing a final rule. Other comments suggested that we ask the IOM to re-evaluate the DRI for sodium or conduct our own re-evaluation to determine a sodium intake range. The comments stated that a new reevaluation should consider data on biomarkers, clinical outcomes as well as the sodium and potassium ratio.

(Response) Given the extensive reviews already conducted by the IOM, the 2010 DGA, and the 2015 DGAC, we decline to ask the IOM to re-evaluate the existing evidence for sodium or to conduct our own re-evaluation. The UL set by the IOM in 2005 was based on clinical studies on sodium intake and blood pressure. Additionally, the 2005 IOM Electrolytes report evaluated the data on the sodium and potassium ratio and concluded that the data were insufficient to be used to set requirements. The 2013 IOM report, Sodium Intake in Populations, evaluated the evidence on sodium intake and CVD outcomes, and the report's conclusions support the UL of 2,300 mg/day. Furthermore, the 2015 DGAC reviewed the evidence for blood pressure and clinical outcomes and recommended that the general population, 2 years and older, should rely on the UL of 2,300 mg/day based on evidence showing associations between increased sodium intake, increased blood pressure, and subsequent risk of heart disease, stroke, and mortality (Ref. 166). Therefore, we continue to consider the UL of 2,300 mg/day to be appropriate for the DRV for sodium. However, if significant changes in the science occur in the future, we would re-evaluate the evidence. We also note that the 2015–2020 DGA also supported a UL of 2,300 mg/day for individuals ages 14 years and older.

(Comment 326) Some comments stated that consumers recognize that sodium is a nutrient to limit and that it is appropriate to use the UL of 2,300 mg/day to establish a DRV because the UL is the dietary intake level of a nutrient that is recommended not to exceed during any given day. Some comments noted that setting a DRV of 2,300 would result in less consumer confusion than changing to an RDI of 1,500 mg because consumers already understand that sodium is a nutrient to limit (Ref. 164).

(Response) Results from the FDA Health and Diet Surveys (Refs. 169–171) have shown that consumers are aware that sodium is a nutrient to limit in the diet. As we noted in the preamble to the proposed rule (79 FR 11879 at 11916), this awareness would suggest that consumer acceptance of a DV based on a level not to exceed would be consistent with a DRV of 2,300 mg.

(Comment 327) Several comments objected to a DRV of 2,300 mg and supported a different level instead. Some comments supported using 1,500 mg and said that lowering the DV for sodium from 2,400 mg to 1,500 mg/day would align with the 2010 DGA recommendation for the majority of Americans, including persons who are 51 years or over, African-Americans, or individuals who have hypertension, diabetes, or chronic kidney disease.

(Response) We decline to establish an RDI for sodium of 1,500 mg. We note that the 2010 DGA recommended 2,300 mg/day for the general population. While the 2010 DGA recommended reducing sodium intake to the AI of 1,500 mg/day for certain subpopulations at increased risk of the blood-pressure raising effects of sodium (*e.g.,* older persons, African-Americans, and individuals with hypertension, diabetes or chronic kidney disease), the 2005 IOM Electrolytes report concluded that there was insufficient scientific evidence to set separate UL for these groups (see 79 FR 11879 at 11914 through 11915). The AI for sodium of 1,500 mg/day was based on meeting essential needs of sodium (*e.g.,* replacing sweat losses) and not blood pressure. The UL of 2,300 mg/day applies to the majority of the U.S. population (persons aged 14 years and older) and is the highest daily nutrient intake level that is likely to pose no risk of adverse health effects to almost all individuals in the general population (79 FR 11879 at 11914). More recently, the 2013 IOM Sodium Intake in Populations (Ref. 167) report concluded that evidence was insufficient and inconsistent to recommend sodium intake levels below 2,300 mg/day for the general U.S. population based on the direct outcomes of CVD or all-cause mortality. In addition, the IOM concluded that the evidence on both benefit and harm is not strong enough to indicate that these subgroups should be treated differently from the general U.S. population. Thus, the evidence on direct health outcomes does not support recommendations to lower sodium intake within these subgroups to or even below 1,500 mg/day (see 79 FR 11879 at 11915). We also note that the 2015–2020 DGA recommended limiting sodium intake to less than 2,300 mg/day for individuals ages 14 years and older.

(Comment 328) Some comments supporting a DV of 1,500 mg noted that the 2010 IOM Strategies to Reduce Sodium Intake in the U.S. report recommended that we lower the DV for sodium to 1,500 mg based on the AI.

(Response) In the preamble to the proposed rule (79 FR 11879 at 11916, 11917), we recognized that the 2010 IOM report recommended that we base the DV for sodium on the AI of 1,500 mg/day, and we invited comment on whether an RDI of 1,500 mg would be more appropriate and why. We also noted that the IOM said that using the AI would be consistent with the approach used for all other essential nutrients, where the DV is based on a reference value of adequacy rather than a reference value of safety (79 FR 11879 at 11916). However, the 2010 IOM report did not focus on reviewing the scientific evidence between sodium intake and health or with reevaluating the dietary guidance levels of sodium that should be consumed. The AI is a level to achieve in the diet to meet essential needs and is not an UL. Thus, we continue to consider that the 2005 IOM DRI Electrolytes report and 2013 IOM Sodium in Populations report, which conducted extensive reviews of the literature on sodium intake and blood pressure and/or CVD outcomes, are the most appropriate basis for a DRV of 2,300 mg.

(Comment 329) Some comments stated that a DV of 1,500 mg would be consistent with recommendations of the 2010 DGAC, CDC, the American Public Health Association, and the American Heart Association.

(Response) In the preamble to the proposed rule (79 FR 11879 at 11890), we explained the factors we consider for nutrients of this type: (1) Existence of

quantitative intake recommendations, particularly reference intake levels provided in consensus reports that can be used to set a DRV or RDI; and (2) public health significance, as demonstrated by either well-established evidence or evidence of a problem with the intake of the nutrient in the general U.S. population and evidence of the prevalence of the chronic disease, health-related condition, or health-related physiological endpoint that is linked to that nutrient in the general U.S. population. While the 2010 DGAC Report recommended that sodium be reduced over time to 1,500 mg/day, the 2010 DGA did not recommend 1,500 mg/day for the general population. The CDC recommendations are consistent with the 2010 DGA. The recommendations of the American Heart Association and the American Public Health Association of 1,500 mg/day did not persuade us to adopt a lower value as the DRV for sodium for the general U.S. population. We determined that the data and information on sodium intake and health from U.S. consensus reports that support a quantitative intake recommendation for sodium of 2,300 mg/day provide an adequate basis on which we can rely to establish 2,300 mg/day as the DRV for sodium.

(Comment 330) Several comments said we should not use the ''flawed'' 2013 IOM Sodium Intake in Populations report to set dietary policy. According to the comments, the IOM did not consider hypertension itself as a health outcome despite the relationship between blood pressure and cardiovascular disease. The comments also said that there are methodological concerns with some studies that the IOM considered, such as unreliable measures of sodium intake and results that are not generalizable to the general population. The comments also said that the IOM based its conclusions, in part, on a study with suspect evidence that focused on people with heart failure who received an aggressive treatment that is not used in the United States. The comments said that these methodological issues limit the IOM report's usefulness in setting dietary recommendations that are applicable to the general population and that we should base the DV for sodium on a robust body of evidence linking sodium intake with elevated blood pressure and on the few existing trials of sodium reduction and CVD. One comment stated that among those population trials is the Trials of Hypertension Prevention Study (TOHP I and II). The comment noted that the observational followup study showed a 30 percent reduction in the risk of CVD even among those in the reduced sodium group that decreased sodium intake by 20 to 30 percent (Refs. 172–173). The followup study found a continued decrease in CVD events among those with sodium levels as low as 1,500 mg/day with no evidence of a J-shaped curve (increased risk of CVD at upper and lower levels of sodium intake) (Ref. 174). Those who excreted less than 2,300 mg/day had a 32 percent reduction in risk; however, this reduction was not statistically significant (Ref. 174).

(Response) We based the DRV of 2,300 mg primarily on the UL established in the 2005 IOM DRI Electrolytes report. The UL is, itself, based on clinical studies on sodium intake and blood pressure. Moreover, the 2013 IOM Sodium Intake in Populations report conclusions that are based mostly on observational studies on intake of sodium and outcomes for CVD and all-cause mortality are consistent with a DRV of 2,300 mg. While the IOM included studies in patients with Congestive Heart Failure (CHF), it did consider the other subgroups separately. The IOM concluded that, while the current literature provides some evidence for adverse health effects of low sodium intake among individuals with diabetes, chronic kidney disease (CKD), or preexisting CVD, the evidence on both benefit and harm is not strong enough to indicate that these subgroups should be treated differently from the general U.S. population. Thus, the IOM concluded that the evidence on direct health outcomes does not support recommendations to lower sodium intake within these subgroups to or even below 1,500 mg/day.

As for the comment regarding the use of a ''robust body of evidence,'' our decision to use the DRV of 2,300 mg is based on a robust body of evidence. Both IOM consensus reports were comprehensive reviews on the evidence between sodium intake and blood pressure and/or CVD outcomes. Additionally, the TOHP I and TOHP II trials and the followup observational study (Ref. 172) cited by the comment were included in the IOM's comprehensive review in 2013. The 2013 IOM report noted that Cook et al. 2007 (Ref. 172), an observational followup of the TOHP I and II sodium reduction trials, found a 25 percent reduction in CVD incidence (RR = 0.75, [Confidence Interval [CI]: 0.57 to 0.99], P = 0.04) when average sodium intake decreased from approximately 3,600 to 2,300 mg/day in the intervention group in TOHP I and from 4,200 to 3,200 mg/day in TOHP II (Refs. 167, 172). Further adjustment for baseline sodium excretion and body weight found a 30 percent lower risk (RR = 0.70 [CI: 0.53, 0.94], P = 0.02). The recent additional analysis conducted by Cook et al., 2014 (Ref. 174) on a subset of the TOHP participants not in the sodium reduction intervention group and stratified based on sodium intake (<2,300 mg, 2,300 to <3600 mg, 3,600 to <4,800 mg, and 4,800 mg and higher) was published after the 2013 IOM report. This additional analysis showed a significant P for trend; however, CIs for CVD risk were not statistically significant between the lower daily intake levels (<2,300 mg; 2,300 to <3,600 mg) and the reference intake level (of 3,600 mg to <4,800 mg) for the three models used in the analysis. Many studies analyze for the statistical significance of the linear relationship (P for trend) between the substance and the disease. While this trend may be significant (P <0.05), the difference in risk between subjects at the various levels of intake (*e.g.,* tertiles, quartiles or quintiles of intake) may not be significant (Ref. 85). In this case, because the CIs are not significant, the Cooke et al., 2014 study shows no effect for the association of sodium intake and risk of CVD when stratified by intake levels. When establishing a DRV, we consider the totality of the scientific evidence and do not consider it appropriate to rely on one observational study in lieu of a larger body of evidence that includes intervention studies on sodium and blood pressure and other observational studies on sodium and CVD outcomes. Therefore, we consider the UL of 2,300 mg/day appropriate for establishing a DRV.

(Comment 331) Some comments supporting a DRV of 1,500 mg stated that this value would be consistent with what we had proposed for other nutrients (*e.g.,* vitamin K, biotin, pantothenic acid, manganese) where the IOM had established an AI, but not an RDA.

(Response) We disagree that the DRV for sodium should be consistent with vitamins and other minerals. Unlike vitamins and other minerals, the majority of the population consumes sodium at levels that exceed the AI and the UL. There is not a concern with overconsumption of these vitamins and other minerals. This makes sodium unique in comparison to other vitamins and minerals for which people generally strive to meet their daily needs.

(Comment 332) Some comments opposed to a DRV of 2,300 mg stated that using the UL might confuse consumers into thinking that it is a recommended intake level.

(Response) The comment provided no data to support its position, and we are not aware of data indicating that consumers would be confused with using a DRV based on an intake level not to exceed. The current DRV for sodium has been listed on food labels for the past 20 years and represents an amount not to exceed. Additionally, the FDA Health and Diet Surveys (Refs. 169–171) have shown that consumers are aware that sodium is a nutrient to limit in the diet. Furthermore, our approach for sodium is consistent with the approach we use for other nutrients, such as saturated fat and cholesterol, that should be limited in the diet (see 79 FR 11879 at 11915 through 11916).

(Comment 333) One comment said that we had indicated that consumers would find it difficult to reduce their sodium consumption to 1,500 mg/day because of the high-sodium content in the food supply and because of taste preferences. The comment said that tastes can change as sodium levels are reduced and that lowering the DV for sodium would give manufacturers greater incentive to reduce the sodium content of their foods.

(Response) We are establishing a DRV of 2,300 mg/day for reasons unrelated to the sodium content in the food supply and taste preferences. Therefore, the issues the comment raises are no longer relevant, and we are not making changes in response to this comment. We note that we are considering other ways to support the reduction of sodium in the food supply that take into account technological challenges to sodium reduction (see 76 FR 57050, September 15, 2011).

(Comment 334) One comment said that not setting the DV at 1,500 mg would be arbitrary and capricious. The comment said that Agency action is arbitrary and capricious if the action departs from prior Agency policy without explanation or with disregard for factual determinations that we made in the past. The comment acknowledged that we had presented several alternatives to the DV of 2,300 mg, including alternative DVs of 1,500 and 1,900 mg and a ''tiered approach,'' but said that our proposal ''lacks an adequate basis in the record'' and that a DV of 2,300 mg is not protective of vulnerable populations. The comment cited the preamble to the proposed rule to indicate that most DRVs have been based on a quantitative intake recommendation associated with chronic disease risk of a health-related condition (79 FR 11879 at 11892) and that, in the case of iron, we set a DV to protect population subgroups that require more iron, such as young children (1 to 4 years of age), women of childbearing age (12 to 49 years old), and pregnant women. It contrasted the DV for sodium as being a ''UL for all of the population over 14 years of age and substantially in excess of that for younger children.'' The comment said that we acknowledged that roughly one-half of the adult population, namely African Americans, individuals ages 51 years or older, and individuals with hypertension, chronic kidney disease, or diabetes, should be consuming lower levels of sodium (Ref. 175). For those subgroups, 1,500 mg/day is the recommended maximum intake for sodium (Ref. 30). The comment claimed that the DV ''will affirmatively mislead the most affected but suggesting a much higher target for their consumption than is healthy or medically appropriate.''

The comment referred to the preamble to the proposed rule where we discussed using 1,500 mg as a possible DV for sodium (79 FR 11879 at 11914 through 11915) and said we focused inappropriately on a ''flawed'' 2013 IOM report to arrive at a DV of 2,300 mg for sodium.

(Response) We disagree with the comment. The preamble to the proposed rule discussed, at some length, the options we considered for updating the DV for sodium and why we proposed to set a DRV of 2,300 mg for sodium based on the UL for individuals aged 4 years and older and how a DRV of 2,300 mg for sodium is the most appropriate DV (79 FR 11879 at 11914 through 11917). For example, we stated that:

- A DRV of 2,300 mg represents the UL for the majority of the population (persons 14 years of age and older) and is consistent with both the 2005 and 2010 DGA recommendations for sodium intake in the general population as the 2013 IOM report on Sodium Intake in Populations (id. at 11914);
- Setting the DV at 2,300 mg would classify the level as a DRV (rather than an RDI) and represent a reference intake level not to exceed. This would be consistent with our approaches to using DRVs for other nutrients that should be limited in the diet and for which there are concerns of excess intake and risk of chronic or health-related conditions (id.). Thus, although the comment claimed that a DV of 2,300 mg would mislead consumers into believing they should consume more sodium, we reiterate that, as a DRV, it is a reference intake level not to exceed. Moreover, as we stated in the preamble to the proposed rule, if we were to adopt a DV of 1,500 mg, we anticipate that consumer education efforts would be needed to help consumers understand that the updated DV for sodium is a level to achieve rather than a level to consume less than and also that consuming in excess of this level would not be helpful (id. at 11916);
- Although the comment said we used a different approach for iron, the comment's comparison is misplaced. As the preamble to the proposed rule noted, iron *deficiency* is a concern (see id. at 11919), so the DV for iron represents a level that is to be achieved. Sodium, in contrast, is a concern due to overconsumption, so the DV for sodium is based on a reference intake level that should not be exceeded. As we stated in the preamble to the proposed rule, unlike the consumption of other vitamins and minerals, the majority of the population consumes sodium at levels that exceed the AI and the UL, and this makes sodium unique in comparison to the other vitamins and minerals for which people generally must strive to meet their daily needs (id. at 11916);
- As for the comment's depiction of the 2013 IOM report as ''flawed,'' as discussed in our response to comment 330, we disagree. Furthermore, we stated, in the preamble to the proposed rule, that a DRV of 2,300 mg, which represents the UL, would be consistent with the 2005 and 2010 DGA recommendations for sodium intake in the general population (id. at 11915). (We also note that it is consistent with the 2015–2020 DGA and that the ''Scientific Report of the 2015 Dietary Guidelines Advisory Committee'' maintains a goal of less than 2,300 mg dietary sodium per day for the general population);
- We disagree that the UL is ''substantially in excess of that for younger children.'' The UL for children 4 to 8 years is 1,900 mg/day and 2,200 mg/day for adolescents 9 to 13 years. (We note that these values are the same in the 2015–2020 DGA.) The IOM derived these ULs for these age groups by extrapolating downward from the adult UL of 2,300 mg/day based on mean energy intakes because the evidence for sodium reduction on blood pressure in children is limited and inconsistent and was therefore insufficient to directly set a UL. We reiterate that the DRV for sodium is an amount not to exceed and not a recommended intake level. Therefore, it is appropriate to use the UL that represents the majority of the population as the basis for setting the DRV; and
- We also disagree with the comment's assertion that for subgroups the DV ''will affirmatively mislead the most affected by suggesting a much higher target for their consumption than

is healthy or medically appropriate.'' The 2013 IOM Sodium in Populations report concluded that the evidence on both benefit and harm is not strong enough to indicate that these subgroups should be treated differently from the general U.S. population. Thus, the evidence on direct health outcomes does not support recommendations to lower sodium intake within these subgroups to or even below 1,500 mg/day (see 79 FR 11879 at 11915). Additionally, the 2005 IOM Electrolytes report concluded that there was insufficient scientific evidence to set a separate UL for these groups (see 79 FR 11879 at 11914 through 11915). Furthermore, consumers in these subgroups may be able to use quantitative information on the label to follow advice they have received from a health care professional concerning their conditions (see 79 FR 11879 at 11887).

Thus, we disagree that a DV of 2,300 mg for sodium is ''arbitrary and capricious,'' departs from our past practice, or lacks an adequate basis in the record.

(Comment 335) Several comments supported retaining a DV of 2,400 mg. Some comments said experts disagree what the recommended daily amount for sodium should be and said that the 2013 IOM report on Sodium Intake in Populations did not recommend an intake level. Some comments cited a meta-analysis by Graudal et al. (Ref. 168) that included over 250,000 participants; the comment said that there is a u-shaped relationship between sodium intake and health outcomes (Ref. 168). One comment noted that this relationship could enable a more precise determination of intake levels to be achieved rather than relying on dietary modeling and a somewhat arbitrary cutoff on a continuous scale. Therefore, the comment said we should convene a panel to review the evidence, examine the scientific evidence associating sodium intake to measurable health outcomes, or wait for the publication of the 2015–2020 DGA report to be published for consideration.

(Response) We disagree that there is not agreement on a sodium intake level among experts. The 2005 IOM DRI Electrolytes report, a U.S. consensus report, set a UL of 2,300 mg/day based on clinical trials that evaluated the dose-response relationship between sodium intake and blood pressure. Retaining the existing DRV of 2,400 mg would exceed the UL for sodium for the majority of the population (persons 14 years of age and older) (see 79 FR 11879 at 11915). While the 2013 IOM Report on Sodium Intake in Populations Assessment of the Evidence was not given the task to set a target intake level, the conclusions of this review that examined the benefits and adverse outcomes of reducing sodium intake primarily in observational studies are consistent with the UL of 2,300 mg/day. Furthermore, all of the individual studies in the Graudal meta-analysis (2014) cited by the comments have been considered in the IOM reports (Refs. 166–168). In addition, this meta-analysis does not represent the totality of the scientific evidence. Given the extensive reviews already conducted by the IOM, we do not agree that it is necessary to convene a panel to re-review the existing evidence at this time. The scientific evidence from the 2005 IOM DRI Electrolytes report, the 2013 IOM Sodium in Populations report, and the 2010 DGA report that we relied on in the proposed rule are a sufficient basis to establish a DRV of 2,300 mg. Furthermore, the 2015–2020 DGA conclusions corroborate a DRV of 2,300 mg.

(Comment 336) The preamble to the proposed rule discussed the possibility of using a ''tiered approach'' whereby we would set an interim DRV of 2,300 mg and lower to an RDI of 1,500 mg over time (79 FR 11879 at 11916 through 11917). We explained that a tiered approach would give companies more time to manufacture new foods or reformulate existing products, would help gradually achieve an adequate intake level of 1,500 mg/day, and would be consistent with the 2010 DGAC recommendation, but we stated that there was inadequate justification for proposing a tiered approach.

A few comments agreed with our conclusion that there is inadequate justification in consensus reports to use a tiered approach. The comments noted that a tiered approach would be an unprecedented process and inconsistent to the approach used for other nutrients, such as saturated fat and cholesterol, to limit in the diet. Another comment noted that a tiered approach may not help consumers adjust their taste preferences for sodium (Ref. 176).

Other comments, however, recommended that we consider the tiered option if an RDI of 1,500 mg is not used. The comments said a tiered approach would provide food manufacturers with more time to reformulate, allow consumer taste preferences to adjust, and be consistent with the 2010 DGAC recommendation to reduce sodium intake to 1,500 mg/day over time. Some comments said a phased-in approach also would be consistent with the 2010 IOM Strategies to Reduce Sodium Intake in Populations report which recommended reducing sodium content in a stepwise manner (Ref. 165).

(Response) We decline to amend the rule to adopt a tiered approach. As we explain in our response to comment 325, we have set a DV of 2,300 mg based on a UL. We also maintain that DVs are based on scientific data supporting healthy dietary practices rather than the levels of a nutrient present in the food supply (see 79 FR 11879 at 11914). However, we are working on efforts to reduce sodium content in various foods and encourage manufacturers to take steps towards reducing sodium content.

(Comment 337) One comment suggested that reference to any daily nutritional intake or requirement for sodium is misleading and that we should halt any further consideration of regulations on the sodium content of food. The comment said that neither the AI nor the UL established by the IOM should be used to recommend intake levels of sodium because they are inconsistent with results from populations studies on sodium intake (Refs. 177–178). The comment also said that using the AI and UL would violate the National Nutrition Monitoring and Related Research Act, 7 U.S.C 5301 *et seq.* The comment added that the 2013 IOM report concluded that there is no consistent evidence supporting any association between sodium intake and health outcomes and the Dietary Guideline of 1,500 mg sodium per day and could increase health risk for certain population groups. The comment asserted that the range of sodium intake at which there is the least negative health outcomes based on mortality and measureable feedback responses (renin, aldosterone, catecholamines, cholesterol and triglycerides) is above 130 mmol (approximately 3,000 mg/day) and that this is the level that most people around the world already consume (Ref. 179). The comment stated that restriction of sodium intake stimulates the renin-angiotensin-aldosterone (RAS) response and may lead to insulin resistance, increased mortality from diabetes, increased congestive heart failure risk, negative blood chemistry and increased overall mortality (Refs. 179–182). The comment also stated that the IOM had agreed to re-evaluate the DRIs for sodium.

(Response) We disagree that any reference to any daily intake is misleading, that there should be no reference to an intake recommendation for sodium, and that we should stop working on ways to reduce the sodium content of food. While we agree that the AI for sodium, which was based on

meeting essential needs, is not a suitable basis for establishing a DRV, we disagree that the UL should not be used to establish a DRV for sodium. There is well-established evidence from consensus reports on the relationship between sodium intake and blood pressure (Ref. 166). The UL of 2,300 mg/day was based on clinical trials that evaluated the dose-response relationship between sodium intake and blood pressure (Ref. 166). In addition, the 2013 IOM Sodium Intake in Populations report concluded that clinical outcomes primarily from observational studies are consistent with the UL of 2,300 mg/day. One observational population study cited by the comment (Ref. 177) was reviewed by the IOM in 2005 and 2013 and another study done by Powles et al., 2013 (Ref. 178) did not evaluate sodium intake to CVD outcomes or blood pressure and only estimated sodium intakes around the world.

We also disagree with the comment that suggests there should be no restriction of sodium below current intake levels of 3,000 mg/day because of concerns of negative health outcomes. The 2005 IOM Electrolytes report reviewed the evidence on low sodium intake and blood lipid concentrations and insulin resistance and noted that the Al of 1,500 mg/day exceeds the levels of sodium intake (typically less than 700 mg/day) that have been associated in some studies with adverse effects of blood lipid concentrations and insulin resistance (Ref. 166). The 2005 IOM Electrolytes report reviewed the evidence for plasma renin and concluded that, in contrast to blood pressure, there is no consensus on the interpretation of plasma renin activity and its role in guiding therapy for high blood pressure (Ref. 166). Similar to plasma renin activity, the evidence for the role of sympathetic nerve activity (*e.g.,* release of catecholamines) and aldosterone is limited, and neither catecholamines, aldosterone, plasma renin, or triglycerides are recognized as validated surrogate endpoints for predicting CVD risk (see 79 FR 11879 at 11916). Furthermore, while consumers with acute or chronic disease, such as obesity, CVD (including CHF), or diabetes, may be able to use quantitative information on the label to follow advice they have received from a health care professional concerning their conditions, the nutrient declarations and percent DVs on the label are to help consumers make more informed choices to consume a healthy diet and are not intended for the clinical management of an existing disease (see 79 FR 11879 at 11887 and part II.B.2). In addition, while sodium was nominated as part of the DRI nomination process that was developed to help Federal Agencies prioritize which nutrients are reviewed, the IOM has not been asked to undertake a re-evaluation of the DRI for sodium as asserted by the comment (Ref. 183). To our knowledge, the IOM also has not agreed to reevaluate the DRI for sodium as asserted by the comment.

Lastly, in response to the comment asserting that using the AI and UL would violate the National Nutrition Monitoring and Related Research Act (NNMRRA), to the extent the comment suggests our establishment of a DRV of 2,300 mg/day for sodium for purposes of labeling is somehow not consistent with nutritional monitoring and related research activities related to the NNMRRA, we disagree. We are requiring a DRV of 2,300 mg/day for sodium consistent with our authority in section 403(q) of the FD&C Act to assist consumers to maintain healthy dietary practices and to enable consumers to observe and comprehend the information and to understand the relative significance of the information in the context of a total daily diet. We also note that the NNMRRA was enacted on October 22, 1990 and that the NLEA was enacted on November 8, 1990. Nothing in the NLEA states or even suggests that the NNMRRA imposes limits or conditions on the declaration of nutrients on food labeling or on our statutory obligations under the NLEA.

(Comment 338) A few comments said that food labels should distinguish the amount of sodium that is added to food from the amount that is naturally occurring. The comments said we proposed a similar result for added sugar and that both sodium and added sugar cause serious health problems.

(Response) We decline to require the amount of added sodium to be declared separately from the amount that occurs naturally in food. The comment did not explain why we should consider a distinction between naturally occurring and added sodium for purposes of the sodium declaration or provide a scientific rationale for that distinction. (In contrast, the preamble to the proposed rule (79 FR 11879 at 11902 through 11905) discussed why we were proposing to require the declaration of added sugars, and the preamble to the supplemental proposed rule (80 FR 44303 at 44307 through 44309) explained why we were proposing to establish a DRV of 10 percent of total energy intake from added sugars and to require a percent DV for added sugars.) We are not aware of any scientific evidence to support a distinction for added sodium in labeling. Therefore, we are not making changes in response to this comment.

(Comment 339) One comment said we should require disclosure of ''salt'' instead of ''sodium.'' The comment said that consumers understand ''salt,'' but may not know what ''sodium'' means. The comment also noted that most sodium we consume is in the form of salt and that other countries use the term ''salt.'' The comment stated that requiring use of the term ''salt'' would mean that consumers would see a larger number on food labels and that could deter consumers from eating high sodium foods.

(Response) We decline to revise the rule to replace ''sodium'' with ''salt.'' We note that section 403(q)(1)(D) of the FD&C Act expressly refers to ''sodium'' (rather than a specific form of sodium) as a nutrient and that ''sodium'' has been in the Nutrition Facts label since 1993 (see 58 FR 2079). We also note that our surveys suggest that consumers are aware that too much sodium is unhealthy (see 79 FR 11879 at 11916 (referring to results from the FDA Health and Diet Surveys)).

Furthermore, while most sodium consumed in the diet comes from sodium chloride (which is the compound associated most with ''salt''), other forms of sodium, such as sodium bicarbonate (*e.g.* baking soda) and monosodium glutamate (MSG), used in foods contribute to the intake of sodium and can also raise blood pressure.

K. Fluoride

1. Voluntary Declaration

Our preexisting regulations do not require or permit the declaration of fluoride on the Nutrition Facts label. Fluoride is a nonessential nutrient, but there is well-established evidence for the role of fluoride in reducing the risk of dental caries. As we said in the preamble to the proposed rule (79 FR 11879 at 11917), the declaration of fluoride content of a food can provide consumers with information to assist them in maintaining healthy dietary practices. However, because the evidence available to us did not allow us to establish a DRV for fluoride, we proposed to amend § 101.9(c)(5) to provide for voluntary declaration of fluoride. In addition, consistent with existing provisions for voluntary declaration of other nutrients, we proposed that the declaration of fluoride would be mandatory when a claim about fluoride is made on the label or in labeling of foods and that, when fluoride content is declared, it must be expressed as zero when a serving

contains less than 0.1 mg of fluoride, to the nearest 0.1 mg increment when a serving contains less than or equal to 0.8 mg of fluoride, and the nearest 0.2 mg when a serving contains more than 0.8 mg of fluoride, consistent with how we have approached incremental values for other nutrients that are present in food in small amounts.

(Comment 340) Several comments supported voluntary fluoride labeling and agreed that there is well-established evidence for the role of fluoride in reducing the risk of dental caries.

One comment suggested that manufacturers of foodstuffs/beverages voluntarily label fluoride content if levels do not exceed 0.2 ppm from fluoride-contaminated materials during product preparation or are less than 2 ppm if fluoride is present naturally. The comment would require foodstuffs/beverages to be labeled if fluoride is intentionally added to the product.

(Response) Under the final rule, declaration of a product's fluoride levels is voluntary whether intentionally added or present naturally. As we stated in the preamble to the proposed rule (79 FR 11879 at 11917), a DRV cannot be established for fluoride based on the available quantitative intake recommendations. Therefore, while fluoride is a nutrient with public health significance, consistent with the factors we considered for declaration of non-statutory nutrients such as this, fluoride declaration is voluntary in the Nutrition Facts label. The final rule also states how fluoride content must be expressed, depending on the amount of fluoride in a specified serving.

As for the comment suggesting that the declaration of fluoride be mandatory if it is added intentionally to a product, we disagree. The comment did not provide, nor do we have, a basis to require labeling of fluoride content when intentionally added. The addition of fluorine compounds to foods that would be subject to a voluntary fluoride declaration in the Nutrition Facts label includes fluoride in water that is used as an ingredient in food from fluoridation of public water supplies and fluoridation of bottled water within the limitations set forth in § 165.110(b)(4)(ii) (see § 170.45). We are not aware of added fluorinated compounds to other foods and would consider such an addition to be subject to a food additive approval under section 409 of the FD&C Act. Moreover, mandatory declaration is required if a claim about fluoride content is made on the label or in the labeling of foods (see § 101.9(c)(5)). Thus, we decline to revise the rule as suggested by the comment.

(Comment 341) One comment stated that declaration of fluoride should be mandatory because fluoride consumption is one of the safest and most effective ways to help prevent tooth decay. The comment said that most bottled waters contain negligible amounts of fluoride or are fluoride-free, so displaying the fluoride content of bottled water on Nutrition and Supplement Facts labels will help consumers make informed decisions about their choice of drinking water. The comment noted that, without such labeling, individuals who use bottled water as their primary water source could unknowingly be missing the decay preventive effects of optimally fluoridated water available from their community water supply.

(Response) We decline to amend the rule as suggested by the comment. There are already quantitative limits for fluoride with respect to bottled water. Furthermore, labeling of fluoride on bottled water would not be sufficient to inform a consumer about whether to consume water from the local municipal water supply. The consumer would need to understand the fluoride content of the local municipal water supply (or well water, if applicable) to understand the relative contribution of fluoride from each. Therefore, we do not consider it necessary to require labeling on the fluoride content of bottled water.

We also do not expect fluorination of food. To the extent fluoride is approved for use as an ingredient in a food, its form must be listed in the ingredient list, and so one can determine if there is fluoride in food by checking the ingredient list (§ 101.4(a)(1)).

(Comment 342) One comment agreed with the proposed requirements for voluntary declaration of fluoride and for mandatory declaration of fluoride if a claim is made about fluoride content or the label includes a FDA health claim for fluoride and dental caries. However, the comment objected to the need for a fluoride nutrient content declaration on bottled water when the product bears a statement of ''added fluoride'' as part of the statement of identity with an accompanying quantitative declaration elsewhere on the label. The comment said that declaring fluoride in the Nutrition Facts label in such a situation would not help consumers. The comment stated that including a statement about fluoride in the statement of identity (*e.g.,* spring water with fluoride added) under the bottled water standard should not be treated as a fluoride claim that triggers mandatory nutrition labeling as long as the amount of fluoride is otherwise declared on the label. The comment said that the proposed rule would impose a burden without any consumer benefit because fluoride is already declared and all other nutrients would be declared as zero. The comment added that, if we required Nutrition Facts labels on all foods that are otherwise exempt from nutrition labeling, labels on these foods would have to increase in size.

(Response) We agree that a declaration of fluoride would not be required on the label for bottled water if statements such as ''fluoridated,'' fluoride added,'' or ''with added fluoride,'' consistent with § 101.13(q)(8), are included. The use of these statements would, however, require use of a simplified format for nutrition labeling. In the preamble to the final rule establishing the standard of identity and standard of quality for bottled water (60 FR 57076 at 57079; November 13, 1995), we recognized that bottled water may be used by some consumers as an alternative to community drinking water and that the Surgeon General's Report on Nutrition and Health recommends that community water systems contain fluoride at optimal levels to prevent tooth decay. Therefore, we included, as part of the standard of identity for bottled water (§ 165.110(a)(1)), the optional addition of fluoride to bottled water within the limitations established in the quality standard (§ 165.110(b)(4)(ii)). We stated that a bottled water with added fluoride would be a multi-ingredient food and, as such, its label must bear ingredient labeling (21 CFR 101.4(a)(1)) (id.). We also stated that we provided for the use of terms ''fluoridated,'' ''fluoride added,'' or ''with added fluoride'' on the label or in labeling of bottled water that contains added fluoride in 21 CFR 101.13(q)(8) (id.). By doing so, we did not define a nutrient content claim for fluoride, and, instead, provided that a statement indicating the presence of added fluoride could be used, but that the claim cannot include a description of the level of fluoride present (*e.g.,* ''good source'' or ''high'') (58 FR 2302 at 2314). We also stated, in the preamble to another final rule (58 FR 2079 at 2149), that we considered the identity statement ''fluoridated water'' to be misleading if the product is derived from a source naturally containing fluoride. We concluded that the term ''fluoridated'' should be used to describe only products to which fluoride has been added in the manufacturing process and that such products must bear nutrition labeling that complies with the simplified format (id.). Thus, fluoride that is added to bottled water consistent with the

standard of quality in § 165.119(b)(4)(ii) and that bears a statement consistent with § 101.13(q)(8) must comply with the simplified format for labeling in § 101.9(f). However, we did not require any inclusion or declaration of fluoride in the simplified format for Nutrition Facts label because of the regulatory status of fluoride declarations and fluoride claims at the time. The terms ''fluoridated,'' ''fluoride added,'' or ''with added fluoride'' were not provided for use as nutrient content claims (which would require declaration of fluoride if defined as such), but rather as statements regarding the presence of added fluoride, which were declared exempt from the nutrient content claim general requirements (§ 101.13(q)). Moreover, even if the terms ''fluoridated,'' ''fluoride added,'' or ''with added fluoride'' were defined as nutrient content claims at that time, fluoride had not been included in § 101.9 as a nutrient for inclusion in Nutrition Facts label and would not have been able to be included in the simplified format for Nutrition Facts label even if those claims were used.

Through this final rule, we provide for the voluntary declaration of fluoride in the Nutrition Facts label, but, under the preexisting regulations, statements on the presence of added fluoride remain exempt from the nutrient content claim general requirements. We may evaluate our regulations for nutrient content claims (and health claims) for any necessary changes after publication of this final rule and the final rule on serving sizes. To be clear, with respect to labeling requirements when statements are made on the label about added fluoride in bottled water consistent with § 101.13(q)(8), we are not requiring the mandatory declaration of fluoride for bottled water that bears a statement about added fluoride. We are, however, including additional language in § 101.9(c)(5) to make clear that bottled water that bears a statement about added fluoride, as permitted by § 101.13(q)(8), must bear nutrition labeling that complies with requirements for the simplified format in § 101.9(f). If any other fluoride claim is used on the label (*e.g.,* the FDAMA health claim for fluoride or an amount statement under § 101.13(i)(3)), the declaration of fluoride would be mandatory on the Nutrition Facts label.

(Comment 343) One comment would revise the rule to require the declaration of fluoride if the amount of fluoride exceeds 0.5 mg per serving. The comment said that fluoride is a dangerous neurotoxin and that consumption of over 2 mg/day of fluoride in drinking water would cause widespread, significant dental fluorosis. The comment said that athletes or others who drink twice the average intake of water could easily consume more than 2 mg of fluoride per day.

(Response) The level of fluoride in public drinking water is outside the scope of this rulemaking.

With respect to community water sources, we note that, on April 27, 2015, the U.S. Public Health Service (PHS) recommended an optimal fluoride concentration of 0.7 mg/L for community water systems that add fluoride (see Department of Health and Human Services, ''HHS Issues Final Recommendation for Community Water Fluoridation,'' dated April 27, 2015; ''U.S. Public Health Service Recommendation for Fluoride Concentration in Drinking Water for the Prevention of Dental Caries,'' *Public Health Reports,* vol. 130, pages 1 through 14 (July–August 2015) (''PHS Recommendation'') (accessed on the Internet at *http://www.publichealthreports.org/documents/PHS_2015_Fluoride_Guidelines.pdf*). PHS indicated that this fluoride concentration, which replaces the previous recommended range of 0.7 to 1.2 mg/L, would maintain caries prevention benefits while reducing the risk of dental fluorosis (PHS Recommendation at 2). It also noted that the Environmental Protection Agency (EPA) is in the process of reviewing the maximum amount of fluoride allowed in drinking water (id.).

As for bottled water, although we have regulations establishing a quality standard for bottled water (§ 165.110), we issued a letter on April 27, 2015, based on the PHS recommendation, advising manufacturers, distributors, and importers of bottled water to not add fluoride to bottled water at concentrations greater than a maximum final concentration of 0.7 mg/L (see Letter from Susan T. Mayne, Ph.D., F.A.C.E., Director, Center for Food Safety and Applied Nutrition, to Manufacturer, Distributor, or Importer of Bottled Water, dated April 27, 2015 (available on the Internet at *http://www.fda.gov/Food/GuidanceRegulation/GuidanceDocumentsRegulatoryInformation/BottledWaterCarbonatedSoftDrinks/ucm444373.htm*)). We intend to revise our quality standard for fluoride added to bottled water (at § 165.110(b)(4)(ii)) to be consistent with the PHS recommendation.

As for the comment's mention of dental fluorosis, the majority of dental fluorosis in the United States is the very mild form, and severe dental fluorosis is not common in the United States (Ref. 184). The prevalence of severe dental fluorosis could not be estimated in U.S. adolescents due to few cases in the participants in a national survey (Ref. 184). The PHS stated that ''to lower the fluoride concentration for community water fluoridation should decrease fluoride exposure during the time of enamel formation (birth through 8 years of age) for most permanent teeth, and further lessen the chance for children's teeth to have dental fluorosis, while keeping the decay prevention benefits of fluoridated water'' (Ref. 184). The PHS and FDA recommendations or advice should reduce the risk of dental fluorosis while still preserving the benefit of caries prevention.

2. DRV

Our preexisting regulations do not provide an RDI or DRV for fluoride, and, in the preamble to the proposed rule (79 FR 11879 at 11917), we stated that we were not proposing to establish a DRV for fluoride.

(Comment 344) Some comments agreed with our decision to not establish a DRV for fluoride.

(Response) The final rule does not establish a DRV for fluoride.

3. Miscellaneous Comments

Several comments raised additional issues regarding fluoride.

(Comment 345) One comment said the fluoride declaration should be in units of mg per liter (mg/L) rather than mg/serving. The comment stated that that the FDAMA health claim is in mg/L, that we mandated the amount of fluoride in bottled water in mg/L, and that consumers are accustomed to seeing fluoride as mg/L on bottles. Therefore, according to the comment, to facilitate consumer understanding and comparisons between the amount of fluoride in bottled water or other products and the recommended intake levels, we should adopt mg/L as the unit for fluoride declarations. The comment further stated that if mg/serving were to be used as the unit, some servings of bottled water would need to be declared as 0 mg fluoride, despite containing a meaningful amount of fluoride from a public health perspective on a mg/L basis and that consumers may be confused if the label said ''with fluoride added'' but the Nutrition Facts label declared 0 mg of fluoride.

(Response) We decline to require the declaration of fluoride in the Nutrition Facts label to be in units of mg/L. The declaration of fluoride in the Nutrition Facts label is comparable to the other nutrients which are declared in absolute amounts per serving. Reporting mg per serving gives consumers an accurate amount of fluoride in a serving of the

product. Providing the amount of fluoride per liter may confuse consumers because the consumer may not be aware how much fluoride will be in the amount per serving (*e.g.,* 12 ounces of bottled water which is equal to about 360 mL).

As for the comment's mention of the FDAMA health claim and our bottled water regulation, the FDAMA health claim language did not mention a specific quantity of fluoride nor did it use a specific unit of measure; the claim language is ''Drinking fluoridated water may reduce the risk of [dental caries or tooth decay].'' We acknowledge that the bottled water regulation uses units in mg/L, yet we also note that the bottled water regulation is directed at manufacturers, distributors, and importers of bottled water and establishes a standard of identity and standard of quality for bottled water and includes maximum levels of fluoride in bottled water. In contrast, the Nutrition Facts label information declares nutrient content in a serving of a product to assist consumers in maintaining healthy dietary practices. Thus, we decline to amend the rule to require the declaration of fluoride to be in mg/L.

Finally, regarding the comment's claim that consumers would be confused if the label said ''with fluoride added'' and the Nutrition Facts label declared fluoride content as 0 mg, we note that the use of a statement, consistent with § 101.13(q)(8) would not require fluoride be declared on the label as ''0 mg.'' We are not aware of, and think it would be unlikely for, a manufacturer to voluntarily declare ''0 mg'' for fluoride if the level of added fluoride is at a level that must be declared as zero when making statements on its product consistent with § 101.13(q)(8). Any labeling must be truthful and not misleading, within the meaning of sections 403(a) and 201(n) of the FD&C Act.

(Comment 346) One comment interpreted the proposed rule as allowing fluoride claims for dental caries on all food labels. The comment asked if these health claims will be permissible, beyond fluoride in bottled water products, for conventional foods and dietary supplements of any matrix because we have evidence acknowledging fluoride's health benefits and whether we will update the current qualified health claim for fluoridated water and reduced risk of dental caries. Alternatively, the comment asked if claims for the reduction in dental caries in the labels for conventional food products (other than bottled water) and dietary supplements would lead us to regulate those products under a different category (such as an unapproved drug). The comment said that, if our evidence suggests benefits of dietary fluoride exposure in preventing dental caries, it is reasonable to conclude that the qualified health claim should be expanded to allow the claim in conventional foods and dietary supplements, labeled with dietary fluoride, and in all forms (capsule, tablet, liquid).

(Response) The proposed rule did not set forth a qualified claim with respect to fluoride. In the preamble to the proposed rule (79 FR 11879 at 11917), we explained that we received a FDAMA notification in 2006 for a health claim for fluoride in bottled water and that we did not object to the claim. The FDAMA health claim is limited to bottled water and does not extend to other foods. Under the FDAMA health claim, the food eligible to bear the claim is bottled water meeting the standards of identity and quality set forth in § 165.110, and general requirements for health claims in § 101.14 with the exception of the minimum nutrient contribution (§ 101.14 (e)(6)). For a health claim to be expanded to more foods, a health claim petition (§ 101.70) or a FDAMA notification must be submitted for our review (section 403(r)(3)(C) of the FD&C Act).

(Comment 347) One comment suggested that, when fluoride is intentionally added to foods/beverages for ingestion by consumers, the following disclaimer/label appear before the listed amount: ''Fluoride is not a mineral nutrient, has no daily allowance, and is not FDA approved for ingestion particularly for women who are pregnant. Fluoride is recognized by U.S. EPA as a water contaminant.'' One comment stated that voluntary labeling could help because those who add fluoride and claim it as a ''dietary ingredient'' will show fluoride content. The comment noted that consumers who understand that fluoride is unsafe to add to food can avoid buying the product.

(Response) We decline to revise the rule to include the comment's suggested language. While we agree that fluoride is a non-essential nutrient, there is well-established evidence for the role of fluoride in reducing the risk of dental caries, and the IOM set a quantitative intake recommendation (AI) based on its role in the reduction of risk of dental caries, but a DRV for fluoride has not been established. Furthermore, we have a standard of identity and a standard for quality for bottled water that allows voluntary addition of fluoride within the limitation established in § 165.110, and, as we stated in our response to comment 343, the PHS recently recommended an optimal fluoride concentration of 0.7 mg/L for community water systems that add fluoride. Based on the PHS recommendation, we advised manufacturers, distributors, and importers of bottled water to not add fluoride to bottled water at concentrations greater than a maximum final concentration of 0.7 mg/L.

As for the comment's suggestion to include language that the EPA has recognized fluoride as a water ''contaminant,'' the fact that EPA has a maximum contaminant level for fluoride in public drinking water does not mean bottled water or other products containing fluoride should state that fluoride is recognized by U.S. EPA as a water contaminant. Fluoride, as a contaminant to public drinking water, is outside the scope of this rule.

(Comment 348) One comment stated that labeling could promote the false notion that fluoride is a nutrient and said that any accompanying claim that fluoride has ''nutritional value'' or is a ''dietary ingredient'' would constitute false labeling and would violate the FD&C Act.

(Response) We disagree with the comment. We consider fluoride to be a nutrient (specifically, a mineral) (Ref. 185) for purposes of nutrition labeling in section 403(q) of the FD&C Act. We consider a nutrient that is subject to nutrition labeling under section 403(q)(1) or (q)(2) of the FD&C Act also to be a dietary ingredient in section 201(ff) of the FD&C Act.

(Comment 349) One comment suggested that, when fluoride is declared over 0.5 grams per serving, the manufacturer declare the form of fluoride present. The comment said that this information is highly relevant given the well-known differences between the bioavailability and pharmacokinetic profiles of artificial fluorides (*e.g.* hydrosilicic acid, sodium monofluorophosphate) as compared with naturally occurring ones (principally calcium fluoride).

(Response) If a nutrient is added to a food, the form that is added must be declared in the ingredients list (§ 101.4(a)(1)). Moreover, under § 101.4(a)(1), if the ingredient is a dietary ingredient, the form would be in the ingredient list, unless already labeled in accordance with § 101.36. Under the Supplement Facts label requirements at § 101.36(d), the source ingredient may be identified within the nutrition label in parenthesis immediately following or indented beneath the name of a dietary ingredient and preceded by the word ''as'' or

''from''. Therefore, we decline to revise the rule as suggested by the comment.

(Comment 350) One comment rejected the notion that fluoride is a safe ingredient that only provides benefit and no harm. The comment said that ingested fluoride is toxic and that we should cite references that address the harm of ingested fluoride. Another comment stated that all synthetic industrial fluorides (*e.g.,* hydrosilic acid, sodium monofluorophosphate) are toxic calcium chelators that are assimilated well. The comment said that fluoride is incorporated permanently in the bone during lifelong consumption, contributes to osteoporosis, accentuates hypothyroidism and dysfunctional kidneys, and can cause dental fluorosis in children and other effects. The comment said that natural calcium fluoride is not well assimilated and is the fluoride source for which labeling could be voluntary. The comment added that EPA's maximum contaminant level (MCL) for fluoride in drinking water (2 ppm) is derived for calcium fluoride in natural sources in public water supplies and that there is no established MCL for synthetic fluoride where toxicity can vary under differing environmental conditions and disease conditions of the consumers.

(Response) The preamble to the proposed rule highlighted the adverse impacts of high fluoride consumption set by IOM (Ref. 185) and U.S. EPA report (Ref. 186) (see 79 FR 11879 at 11917 through 11918). We also stated that other FDA regulations (§§ 165.110 and 170.45) have limited what foods contain added fluoride. We reiterate that we recently advised manufacturers, distributors, and importers of bottled water to not add fluoride to bottled water at concentrations greater than a maximum final concentration of 0.7 mg/L.

As for the comment regarding synthetic and natural forms of fluoride, the final rule does not restrict itself to a specific source of fluoride. Absent data or information, we do not have a sufficient basis in the administrative record on which to distinguish ''natural'' forms of fluoride from ''synthetic'' forms and to base the fluoride declaration in the Nutrition Facts label on a particular form of fluoride.

We have not made any changes to the rule in response to these comments.

L. Essential Vitamins and Minerals of Public Health Significance

In addition to sodium, a statutorily required nutrient, our preexisting regulations, at § 101.9(c)(8)(ii), require the declaration of four essential vitamins and minerals, namely, vitamin A, vitamin C, calcium, and iron. Vitamins and minerals that may be declared voluntarily are vitamin D, vitamin E, vitamin K, vitamin B_6, vitamin B_{12}, thiamin, riboflavin, niacin, folate, biotin, pantothenic acid, phosphorus, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, chloride, and potassium.

1. General Comments

(Comment 351) One comment opposed the mandatory declaration of any vitamins or minerals other than sodium and potassium. The comment noted that all vitamins and minerals are required in the diet and said that singling out a few nutrients on the label encourages unnecessary fortification and overconsumption. The comment stated that labeling potassium would encourage food manufacturers to reduce sodium to achieve a better balance.

(Response) The comment did not provide data or information to support its argument that the inclusion of a vitamin or a mineral on the Nutrition Facts label will encourage fortification or overconsumption. With respect to fortification, we encourage manufacturers to follow the principles in our fortification policy at § 104.20 if they add nutrients to food. We issued the fortification policy to promote the rational addition of nutrients to foods and to preserve a balance of nutrients in the U.S. diet. In addition, our food additive regulations or GRAS status of some nutrients (*e.g.,* vitamin D and folic acid) may limit which foods may be fortified and at what level. For example, the food additive regulations on folic acid (21 CFR 172.345) and vitamin D (§ 172.379 (21 CFR 172.379); § 172.380) stipulate which foods may be fortified and at what level.

As for the mandatory declaration of vitamins and minerals, as we stated in the preamble to the proposed rule (79 FR 11879 at 11918 through 11922), we determined that iron, calcium, vitamin D, and potassium are nutrients of public health significance and their mandatory declaration on the label can help consumers maintain healthy dietary practices. We mentioned how we considered several factors, such as intake and/or biomarker data, IOM setting a quantitative intake recommendation for a nutrient based on its relationship to a chronic disease, or a health-related condition to determine whether a particular nutrient was of public health significance for the general U.S. population (id.). The comment did not dispute our assessment of the data or provide information that would cause us to reconsider our analysis of the factors supporting mandatory declaration. Thus, we decline to revise the rule as suggested by the comment.

(Comment 352) Some comments said that our nutrients of public health significance (*e.g.,* calcium and vitamin D) are similar to nutrients of public health concern as determined by the 2010 DGA recommendations. The comments suggested that we wait for the 2015–2020 DGA decision on nutrients of public health concern, so we can be consistent with the 2015–2020 DGA.

(Response) We note that our nutrients of public health significance are the same as the 2010 DGA and the 2015 DGAC recommendations. The 2015 DGAC used a three pronged approach similar to our factors for determining whether nutrients that have a specific relationship to chronic disease risk or a health-related condition are nutrients of public health concern, including an analysis of intake data, available valid biochemical indices from NHANES dietary survey, and data on the prevalence of health condition in the U.S. population. Based on the 2015 DGAC approach, vitamin D, calcium, potassium, iron, and fiber were considered as nutrients of public health concern for under-consumption.

We also note that the 2015–2020 DGA identifies calcium, potassium, dietary fiber, vitamin D, and iron as nutrients of public health concern.

2. Essential Vitamins and Minerals That Are Mandatory

a. Calcium. Our preexisting regulations, at § 101.9(c)(8)(ii), require the declaration of calcium content as a percent DV on the Nutrition Facts label. We require the declaration of calcium in nutrition labeling because: (1) There were a limited number of calcium-rich foods in the food supply; (2) calcium intakes in the United States were generally marginal; (3) adequate calcium intakes are needed to allow for optimal bone mass development during childhood and young adulthood; and (4) calcium was identified as a nutrient of public health significance in the 1990 IOM report and in other consensus reports (58 FR 2079 at 2106).

In the preamble to the proposed rule (79 FR 11879 at 11918 through 11919), we discussed the benefits of adequate calcium intake on bone health, the relatively low intakes of calcium, and the high prevalence of osteoporosis and osteopenia among the U.S. population. We decided to continue requiring the declaration of calcium on the Nutrition Facts label, and so the proposed rule would not change § 101.9(c)(8)(ii).

(Comment 353) Most comments supported mandatory declaration of calcium on the Nutrition Facts label.

However, some comments supported mandatory declaration for different reasons. Some comments focused on calcium's role in bone health, but most comments said that calcium is important for dialysis and renal patients.

(Response) While a mandatory calcium declaration may help patients who have chronic kidney disease, this was not a factor we considered in mandating the declaration of calcium. The Nutrition Facts label is not intended to focus on individuals with a specific acute or chronic disease (see part II.B.2). To evaluate the public health significance of essential vitamins and minerals, we considered several factors in determining the mandatory declaration of vitamins and minerals in the Nutrition Facts label. We considered the essential vitamins and minerals with the greatest public health significance to be those for which IOM based DRIs on chronic disease risk (*e.g.,* osteoporosis), a health-related condition (*e.g.,* high blood pressure), or a nutrient deficiency with clinical significance (*e.g.,* low iron storage leading to iron deficiency anemia) for which inadequate intake of these nutrients are likely to have important clinical consequences. We also considered whether the national survey data on nutrient intake and/or, when available, biomarkers of nutrient status, provide evidence of inadequate intake of the nutrient in the general healthy U.S. population, and whether a substantial prevalence of health consequences that was linked to the particular nutrient exists in the general healthy U.S. population (see 79 FR 11879 at 11890). In setting DRIs for calcium, the IOM reviewed various endpoints (*i.e.,* bone health, cancer, cardiovascular disease and diabetes), and bone health was the only endpoint with sufficient scientific evidence to set a DRI (Ref. 38). Therefore, given the benefits of adequate intake on bone health, reflected in the IOM's DRIs, relatively low intake of calcium (about 49 percent of individuals ages 4 years and older have usual calcium intake from conventional foods below the EAR and 37 percent have intakes from both conventional foods plus supplements below the EAR), and the high prevalence of osteoporosis and osteopenia among the U.S. population, we concluded that calcium is a nutrient of public health significance, and its declaration continues to be necessary to assist consumers in maintaining healthy dietary practices. Our preexisting regulation, at § 101.9(c)(8)(ii), continues to require the declaration of calcium content as a percent DV on the Nutrition Facts label, so the final rule does not affect the requirements for the declaration of calcium.

(Comment 354) One comment noted that adding calcium (plus vitamin D and potassium) to the Nutrition Facts label will be ''nice'' for those who understand these details, but, for most consumers (except perhaps those with Chronic Kidney Disease), information regarding calcium is just more information to sift through on an already-confusing food label.

(Response) We consider that a vitamin or mineral of public health significance should continue to be the key factor in deciding when to require mandatory declaration in labeling. Available quantitative evidence suggests that the declaration of nutrient of public health significance, including vitamins and minerals, can help consumers maintain healthy dietary practices (Refs. 187–188). Additionally, we intend to work with other Federal Agencies and organizations on communication and education for health professionals and consumers regarding the revised Nutrition Facts and Supplement Facts labels after we issue the final rule.

b. Iron. Our preexisting regulations, at § 101.9(c)(8)(ii), require the declaration of iron as a percent DV on the Nutrition Facts label. We require the declaration of iron because: (1) Iron was identified as a nutrient of public health significance in a 1990 IOM report and in other consensus reports; and (2) iron deficiency was a risk for certain segments of the U.S. population (*i.e.,* young children, adolescents and women of childbearing age and pregnant women, especially those with low incomes) (58 FR 2079 at 2106). In the preamble to the proposed rule (79 FR 11879 at 11919), we discussed our analysis of NHANES intake data showing that 3.5 percent of the population ages 4 years and older (excluding pregnant and lactating women) have inadequate iron intakes from conventional foods (*i.e.,* an intake below the EAR), and about 3.3 percent have inadequate iron intakes from conventional foods and dietary supplements. We also stated that about 11.2 and 10.4 percent of women of childbearing age (12 to 49 years old) continue to have iron intakes below the EAR, from conventional foods and conventional foods plus dietary supplements, respectively. We also considered data for several status biomarkers related to iron nutrition. Analyses of these data showed that about 14 percent of women of childbearing age (12 to 49 years) had serum ferritin concentration (the major iron storage compounds) less than 15 ng/mL, while 10 and 14.5 percent of women had inadequate stores of body iron based on the body iron model or ferritin model, respectively (see 79 FR 11879 at 11920). Additionally, about 3.76 million of these women of childbearing age are considered to have iron deficiency anemia, so that iron continues to be of public health significance among women of childbearing age and pregnant women, who account for 26 percent of the general U.S. population (id.).

We noted that iron continues to be identified as a nutrient of public health significance in consensus reports such as Healthy People 2020 and the 2010 DGA (see 79 FR 11879 at 11920). Thus, we did not propose any changes to the mandatory declaration of iron under § 101.9(c)(8)(ii).

(Comment 355) Most comments supported the mandatory declaration of iron on the Nutrition Facts label.

One comment suggested that, instead of declaring iron as ''iron,'' we should require the declaration of specific forms, such as ''reduced iron'' or ''ferrous sulfate,'' on the label. The comment said that some people have an allergic reaction to added iron, but do not react to natural iron.

(Response) We decline to revise the rule as suggested by the comment. Based on our regulations, only iron can be used on the food labels (§ 101.9(c)(8)(iv)), but the specific form that is added to the food, (*e.g.,* ferrous sulfate) must be listed in the ingredient list (§ 101.4). Individuals with allergic reactions to added iron in food are advised to check the ingredient list.

Under the Supplement Facts label requirements at § 101.36(d), the source ingredient may be identified in parenthesis immediately following or indented beneath the name of a dietary ingredient and preceded by the word ''as'' or ''from.'' When a source ingredient is not identified within the nutrition label, it must be listed in an ingredient statement in accordance with § 101.4(g). However, when a source ingredient is identified in the nutrition label, it will not be listed again in the ingredient statement.

Our preexisting regulation, at § 101.9(c)(8)(ii), continues to require the declaration of iron content as a percent DV on the Nutrition Facts label, so the final rule does not affect the requirements for the declaration of iron.

c. Vitamin A and Vitamin C. Our preexisting regulations, at § 101.9(c)(8)(ii), require the declaration of vitamins A and C as percent DVs on the Nutrition Facts label.

With respect to vitamin A, we require the declaration of vitamin A because: (1) It was found in a limited number of foods within the food supply; and (2) a 1990 IOM labeling report identified vitamin A as a nutrient of potential public health significance and stated that certain subpopulations (children under 5 years of age) were still at risk of deficiency for this vitamin (see 58 FR 2079 at 2106). In the preamble to the proposed rule (79 FR 11879 at 11920), we mentioned that, in response to the 2007 ANPRM, several comments recommended retaining the mandatory declaration of vitamin A, but we also said that, even though vitamin A intakes appear to be low, vitamin A deficiency based on an assessment of vitamin A status is rare in the U.S. population. Consequently, we tentatively concluded that vitamin A is no longer a nutrient of public health significance for the general U.S. population, and, consistent with the factors for declaration of these types of non-statutory nutrients, we proposed to amend § 101.9(c)(8)(ii) to permit, but no longer require, the declaration of vitamin A on the Nutrition Facts label. However, vitamin A declaration would remain mandatory when vitamin A is added as a nutrient supplement or claims are made about it on the label or in labeling of foods. The proposed rule also would not change the current provision for voluntary declaration of the percent of vitamin A that is present as β-carotene, as specified in § 101.9(c)(8)(vi). The preamble to the proposed rule (79 FR 11879 at 11920) did, however, invite comment on whether there is an appropriate alternative analysis to application of the factors regarding the mandatory declaration of vitamin A.

As for vitamin C, we require the declaration of vitamin C because: (1) A 1990 IOM labeling report identified vitamin C as a nutrient of potential public health significance and stated that certain subpopulations were considered at risk of deficiency (such as elderly individuals on inadequate diets and infants fed cow's milk exclusively); and (2) vitamin C was thought to play a role in promoting the intestinal absorption of non-heme iron, meaning that vitamin C in the same food as iron was considered to help prevent iron deficiency anemia, while excess vitamin C was considered to increase the risk of excessive iron absorption (55 FR 29487 at 29501). In the preamble to the proposed rule, we noted that, in response to the 2007 ANPRM, several comments recommended retaining the mandatory declaration of vitamin C, but we also noted that, while the prevalence of inadequate intake of vitamin C is high, prevalence of vitamin C deficiency is not apparent in the U.S. population as only about 6 percent of the general population had serum vitamin C concentrations below 11.4 micromoles (μmol)/L, a cutoff level that is used as an indicator of vitamin C deficiency (79 FR 11879 at 11921). We further noted that the effects of vitamin C on risk of chronic diseases, such as cardiovascular disease or cancer, are not conclusive, that, in a letter of enforcement discretion on qualified health claims for vitamin C supplement intake and reduced risk of cancers, we concluded that there was no credible evidence on the risk reduction from vitamin C for most cancers (squamous cell cancer of the esophagus, colorectal, laryngeal, lung, oral cavity, pancreatic, pharyngeal, renal cell, and salivary gland cancers), and very limited evidence for an association between vitamin C supplement intake and gastric cancer, and that the 2010 DGA does not include vitamin C among the list of nutrients of public health concern for the general U.S. population (id.). Consequently, we tentatively concluded that, while vitamin C intakes are low, vitamin C deficiency is uncommon, and vitamin C is no longer a nutrient of public health significance for the general U.S. population. Therefore, consistent with the factors we consider for declaration of these types of non-statutory nutrients, we proposed to amend § 101.9(c)(8)(ii) to permit, but no longer require, the declaration of vitamin C on the Nutrition Facts label. However, vitamin C declaration would remain mandatory when vitamin C is added as a nutrient supplement or claims are made about it on the label or in labeling of foods. The preamble to the proposed rule (79 FR 11879 at 11920) invited comment about whether there is an appropriate alternative analysis to the application of the factors regarding the mandatory declaration of vitamin C.

(Comment 356) Several comments agreed with our proposal to amend § 101.9(c)(8)(ii) to allow for the voluntary declaration of vitamins A and C. Although we invited comment on whether there is an appropriate alternative analysis to the application of factors regarding the mandatory declaration of vitamin A and vitamin C, we did not receive any comments on that topic other than general agreement with the factors we applied.

Most comments, however, disagreed with voluntary declaration. Many comments did not explain why they felt that mandatory declaration of vitamins A and C is necessary, but some comments provided a rationale. A few comments agreed that vitamins A and C deficiencies are not common in the general population, but said vitamins A and C are extremely important and that the public will benefit from seeing them on the label. The comments suggested that removing vitamins A or C from the label would prevent consumers from determining the amount of each vitamin in their diet. Other comments suggested keeping vitamins A and C on the label because we also proposed eliminating other portions of the Nutrition Facts label; thus, the comments said there should be adequate room for mandatory declaration of vitamins A and C.

(Response) We decline to amend the rule to require the disclosure of vitamins A and C. We base the mandatory listing of vitamins and minerals on public health significance relative to inadequate dietary intakes and biomarkers of nutrient status, as well as the possible association between the nutrients and the risk of chronic disease. Consistent with the factors set for the declaration of essential vitamins and minerals, we concluded that vitamins A and C are no longer considered nutrients of public health significance for mandatory declaration on the label, and the final rule removes vitamins A and C from the list of nutrients in § 101.9(c)(8)(ii) for which the quantitative amount by weight and percent of the RDI are required in nutrition labeling. However, manufacturers can declare these vitamins on the label voluntarily, and if vitamin A or vitamin C is added as a nutrient supplement or claims are made about the vitamin on the label or in labeling of foods, then they must be declared on the Nutrition Facts label.

As for the comment referring to other information that would be removed from the Nutrition Facts label, space constraints on the label were not the reason behind the removal of these vitamins from the Nutrition Facts label.

(Comment 357) One comment stated that vitamins A and C are markers for fruit and vegetable intake, and so declaring vitamins A and C on the label will promote increased intake of fruits and vegetables. Another comment noted that having vitamins A and C on the label will help consumers to figure out how much real fruits and vegetables are in a food product.

(Response) We consider whether a vitamin or mineral is of public health significance (rather than its possible role as a marker for certain food groups) to be a key factor in deciding whether to require mandatory declaration on the Nutrition Facts label. However, the four selected mandatory vitamins and minerals plus fiber represent various

food categories, such as fruits and vegetables. For example, potassium and fiber are found in fruits and vegetables and could be used as markers for fruits and vegetables, and non-heme iron sources come from plant foods, such as beans and lentils and some vegetables such as spinach. Paying particular attention to nutrients of public health significance on the Nutrition Facts label can help consumers in selecting a variety of foods in the diet and help the U.S. population make healthy dietary choices.

(Comment 358) One comment suggested that the reason why vitamin A and vitamin C deficiencies are rare is because they are on the Nutrition Facts label. The comment said that if we remove the vitamins from the label, there might be deficiencies in the future because manufacturers would not fortify the foods. Another comment stated that food fortification is a significant contributor to the intakes of both vitamins A and C and is instrumental for controlling vitamins A and C deficiency. The comment said we should consider the impact on the fortification and consumer access to vitamins A and C in foods if we do not require declaration of these vitamins. The comment said that presence of these vitamins on the Nutrition Facts label has encouraged fortification by the food industry and that a large percentage of vitamins A and C in the diet is supplied through food fortification. Thus, if declaration of vitamins A and C is not required, the comment said that the industry may reconsider fortifying foods with those vitamins. The comment stated that there are no data to indicate the impact that removing the requirement for vitamins A and C from the Nutrition Facts label will have on the practice of food fortification or on the adequacy of those vitamins in the U.S. population.

One comment stated that it is misleading and incorrect scientifically to consider any essential nutrient as being ''no longer of public health significance.'' Rather than removing two nutrients from the mandatory declaration list to make way for two new ones, the comment said it is important for consumers to know as much as possible about the micro-nutritional content of the foods they choose to purchase and consume. One comment asked whether one can really judge which vitamins and minerals are more important to people or whether vitamin D and potassium are more beneficial to people than vitamins A and C. The comment said that all vitamins and minerals play an important role in the healthy functioning of the human body. The comment suggested that, to determine which vitamins and minerals to list in the Nutrition Facts label, we should study which vitamins or minerals are more difficult for the body to synthesize or make on its own, and we should list those vitamins or minerals because consumers need to find other sources of those vitamins or minerals help their body function.

(Response) The preamble to the proposed rule invited comments, including the submission of data and information on whether the mandatory listing of vitamins and minerals impacts food fortification practices. We did not receive any comments providing data or information that inclusion of mandatory vitamins and minerals on the label will increase or decrease fortification practices. The comments also did not provide data to substantiate the claim that removing vitamins A and C from the label will change the industry fortification practices, although one comment suggested that such data does not exist. Consequently, we do not have evidence that would let us determine whether removing these nutrients from the Nutrition Facts label will affect fortification.

As for the claim that removing vitamins A and C from the Nutrition Facts label may cause deficiencies in the U.S. population, we have evaluated all essential vitamins and minerals intake (including vitamins A and C) in the U.S. population for purposes of determining the nutrients of public health significance, and we will continue monitoring vitamins A and C (among other nutrients) intake and the status (to determine both deficiency and excess) of the U.S. population after the final rule becomes effective. We also intend to monitor the marketplace to determine the impact of requiring the declaration of nutrients on the Nutrition Facts label or removing nutrients from the label on fortification practices.

As for the comment stating that it is misleading and incorrect scientifically to consider any essential nutrient as being ''no longer of public health significance,'' the fact that we do not require the declaration of a particular vitamin or mineral on the Nutrition Facts label should not be interpreted as saying that these vitamins and minerals are no longer essential nutrients or do not need to be consumed in adequate amounts each day. We base the mandatory listing of vitamins and minerals on several factors that link public health concerns relative to inadequate dietary intakes and status biomarker levels as well as the association between the nutrients and the risk of chronic disease and the prevalence of disease in the general U.S. population.

(Comment 359) One comment stated that, while frank vitamin C deficiency may not be common, almost 20 percent of individuals 6 years of age and older have serum vitamin C concentrations indicative of being at moderate risk for developing vitamin C deficiency and cited a published article as support (Ref. 189). The comment also said that individuals who smoke or who are in lower income categories may be more likely to be deficient in vitamin C (Ref. 189), which may put these vulnerable populations at higher risk for vitamin C deficiency and associated morbidity.

(Response) We disagree with the comment. Based on our data analysis (NHANES 2003–2006), we determined that about 6 percent of people ages 6 years and older (including smokers) have serum vitamin C concentrations below 11.4 µmol/L. This cutoff level is used as indictor of vitamin C deficiency (Refs. 190–191). The CDC analysis of NHANES 2003–2006 showed the same results as ours (Ref. 190).

As for the article cited by the comment, Schleicher et al., 2009 (Ref. 189), we note that the authors reported that 7.1 percent of the total population in NHANES 2003–2004 were deficient (using cutoff of less than 11.4 µmol/L). Additionally, in establishing the nutrients of public health significance, while nearly 35 percent of the general healthy U.S. population (4 years and older) have vitamin C intakes below the EAR from conventional foods, and nearly 28 percent of the general healthy U.S. population (4 years and older) have vitamin C intakes below the EAR from conventional foods plus dietary supplements, vitamin C deficiency is uncommon. Thus, it is no longer considered a nutrient of public health significance for the general U.S. population. Similar to our findings, vitamin C was not considered to be a nutrient of public health concern by the 2010 DGA and the 2015 DGAC, but these reports considered vitamin C to be a shortfall nutrient because intakes are below the recommended intake. (The 2015 DGAC states that ''shortfall nutrients'' are ''those that may be underconsumed either across the population or in specific groups relative to the IOM-based standards, such as the Estimated Average Requirement (EAR) or the Adequate Intake (AI)'' (Ref. 192).

We will continue monitoring all nutrient intake (including vitamins A and C) and the status of the U.S. population (to determine both deficiency and excess) after the final rule becomes effective.

(Comment 360) One comment said that segments of U.S. population have inadequate intakes of both vitamins A and C, so we should not remove vitamins A and C from the label. The comment said that provitamin A carotenoids provide approximately 26 and 34 percent of vitamin A consumed by men and women, respectively. Because recent data indicate a much lower conversion rate of carotenoids to vitamin A, the comment said that many reports of vitamin A intake have been over-estimated (Ref. 193). The comment also said that 45 percent of American males and females over the age of 2 years (excluding pregnant/lactating women) consume less than the EAR for vitamin A from food and that, even when dietary supplements were considered, 34 percent of Americans did not meet the EAR for vitamin A (Ref. 194). The comment also said that vitamin A intake from any source (naturally in foods, fortified in food and dietary supplement) were below the EAR in 25 percent of 9- to 13-year-old girls, and over 50 percent of 14 to 18 year olds failed to meet the EAR (Ref. 195). The comment added that 37 and 25 percent of Americans consume less than the EAR for vitamin C from food or from food plus dietary supplements, respectively (Ref. 194).

The comment said, similar to vitamin A, vitamin C intakes are poor in children (2 to 18 years old) (Ref. 195). Another comment stated that, given increased awareness and knowledge about the importance of nutrient interactions (*e.g.,* between calcium and magnesium, sodium, potassium, iron, copper, and vitamins D, K, and A), the best approach to providing informed choice to consumers is to require a declaration of all essential vitamins and minerals when present in a serving over a predetermined significant amount, for instance between 10 and 20 percent of the DV.

(Response) We considered whether a vitamin or mineral is of public health significance to be a key factor in deciding whether to require mandatory declaration of that vitamin or mineral on the Nutrition Facts label. We have done our own analyses of both intake and status (using biomarker data when available in NHANES with a valid cutoff) data from NHANES for those ages 4 years and older (excluding pregnant women) for all vitamins and minerals (including vitamins A and C). Based on the factors considered in establishing a nutrient of public health significance (see 79 FR 11879 at 11899 through 11891), we concluded that, while vitamins A and C intakes are low, their deficiency based on assessment of vitamin A or vitamin C status is not common in the general healthy U.S. population. Furthermore, the IOM did not set a quantitative intake recommendation for vitamins A or C based on a public health endpoint (see 79 FR 11879 at 11920 through 11921).

We also note that, similar to our findings, vitamins A and C were not considered to be nutrients of public health concern in the 2010 DGA (Ref. 30) and the 2015 DGAC (Ref. 19). However, both 2010 DGA and 2015 DGAC considered these vitamins to be shortfall nutrients because their intakes are below the recommended intake level.

As for the comment regarding declaration of all essential vitamins and minerals when present over a predetermined significant amount (10 to 20 percent of DV), we must be selective with regard to the information to be listed on the label. Therefore, we emphasize only the essential vitamins and minerals that meet our factors for determining nutrients with the greatest public health significance to be declared on the Nutrition Facts label in order to assist consumers in maintaining healthy dietary practices. We permit voluntary declaration of other vitamins and minerals on the Nutrition Facts label. However, the declaration of these vitamins and minerals will be mandatory when they are added as a nutrient supplement or claims are made about them on the label or in labeling of foods.

Thus, we decline to revise the rule as suggested by the comments.

(Comment 361) One comment said we were being inconsistent in our evaluation of non-statutory nutrients for mandatory declaration. The comment said that the intake data for vitamin A and calcium are very comparable, and so our proposal to include calcium on the label, while removing vitamin A, is inconsistent. The comment compared vitamin A to calcium consumption; it stated, for example, that 45 and 34 percent of Americans consume less than the EAR for vitamin A from food, or food plus dietary supplements, respectively, while 48.9 and 38 percent of Americans consume less than the EAR for calcium from food or food plus dietary supplements, respectively.

One comment said that removing vitamins A or C from the Nutrition Facts label will lead consumers to believe these vitamins are not nutrients of concern. The comment said the removal also may cause USDA nutrition programs, such as MyPlate, to reconsider their emphasis on vitamins A and C.

One comment said that consumers are still looking for vitamins A and C and, in fact, are trying to purchase more products containing these vitamins. The comment said that a study done by NPD reveals that 50 percent of shoppers are trying to get more vitamin C, and 40 percent are trying to get more vitamin A. Additionally, the 2013 HealthFocus Trend Report, A National Study of Public Attitudes and Actions, found that the importance of numerous label claims remains relatively steady with more than 40 percent of shoppers looking for ''good source claims.'' Specifically, the comment said, 40 percent are looking for food products that are a ''good source of antioxidants'' (*e.g.,* vitamin C).

(Response) Besides looking at only intake data, we also looked at biomarker data (when available) as well as the endpoints upon which the IOM based a DRI and the disease prevalence associated with that nutrient in order to determine public health significance of nutrients. For example, in view of the benefits of adequate calcium intake on bone health (established in the IOM's DRIs), low intakes of calcium, and the higher prevalence of osteoporosis and osteopenia among the U.S. population, we concluded that calcium is a nutrient of public health significance and its declaration continues to be necessary to assist consumers in maintain healthy dietary practices.

For vitamin A, although our analysis showed that vitamin A intakes appears to be low, vitamin A deficiency based on assessment of vitamin A status is rare in the U.S. population. The IOM did not set a quantitative intake recommendation for vitamin A based on a public health endpoint (Ref. 193). Thus, we concluded that vitamin A is no longer a nutrient of public health significance. We do not necessarily consider a high prevalence of nutrient intake inadequacy by itself as a sufficient justification of being a nutrient of public health significance and warranting mandatory declaration on the Nutrition Facts label (Ref. 196).

Vitamins A and C were not also considered to be nutrients of public health concern in the 2010 DGA (Ref. 30) and the 2015 DGAC (Ref. 19). However, both the 2010 DGA and the 2015 DGAC considered these vitamins to be shortfall nutrients because their intakes are below the recommended intake level.

As for the comment pertaining to MyPlate, MyPlate is based on the USDA food intake patterns, which provide a recommended daily selection of foods that is generally adequate in essential nutrients and moderate in food

components often consumed in excess. The USDA food intake patterns emphasize eating the recommended intake of all essential vitamins and minerals, regardless of whether those vitamins and minerals are on the Nutrition Facts label.

As for consumer interest or shopping patterns, we agree that many consumers may be interested about the levels of vitamins A and C, among other nutrients, on the label, but not all nutrient information can be mandated on the Nutrition Facts label. We consider mandatory declaration appropriate, for a nutrient that has a specific relationship to chronic disease risk or a health-related condition, when there is public health significance and a quantitative intake recommendation that can be used for setting a DV (DRV or RDI). We consider voluntary declaration to be appropriate when such a nutrient either has a quantitative intake recommendation, but does not have public health significance, or does not have a quantitative intake recommendation available for setting a DRV but has public health significance. For vitamins A and C, the final rule provides for voluntary declarations, and, if the nutrient is added to a food or a claim is made on the label or in the labeling of food (*e.g.,* good source of vitamin C), the nutrient must be declared on the label.

(Comment 362) Some comments suggested that vitamin A can be toxic in high levels and can cause birth defects, so consumers need to know the amount of vitamin A on the label.

(Response) Consumption of vitamin A (as preformed vitamin A (retinol)) above the UL may pose risk of toxicity in the population. The IOM set a UL for preformed vitamin A based on teratogenicity in women of childbearing age or liver abnormalities in all other adults (Ref. 193). If a vitamin A is present at very high levels in a conventional food, it is most likely in the added form, therefore, it must be declared on the label, and the forms added must be listed in the ingredient list (§ 101.4). Consumers can check the ingredient list to learn about the forms of vitamin A added in the food. Furthermore, the amount of added vitamin A and its form must be reported either on the Supplements Facts label or the ingredient list of a dietary supplement (§ 101.36).

(Comment 363) One comment suggested that vitamin A is important in eye vision, immune function, and the prevention of other diseases, so we should continue to require the declaration of vitamin A on the Nutrition Facts label.

Another comment noted that scurvy is a big problem in the homeless population and in youth due to poor diet. The comment said it would be difficult for people to consume adequate amounts of vitamin C if we no longer required the declaration of vitamin C on the Nutrition Facts label.

(Response) We agree that adequate vitamin A intake is important for normal vision and immune function (Ref. 193). However, the IOM set the DRIs (EAR/RDA) based on the amount of dietary vitamin A required to maintain adequate liver stores in well-nourished subjects, rather than on normal vision or immune function (Ref. 193). Furthermore, there is no clear evidence that suggests a protective association between dietary vitamin A or β-carotene and reduction of risk for chronic disease, such as cardiovascular disease and cancer (Ref. 193). Instead, consistent with the factors we set forth regarding mandatory and voluntary declaration, we have determined that vitamin A is no longer a nutrient of public health significance and so the final rule does not require declaration of vitamin A on the Nutrition Facts label.

As for the comment regarding vitamin C and scurvy, the comment did not provide evidence to support the proposition that scurvy is high among homeless individuals and among youth. We do note that our regulations have required the declaration of vitamin C declaration on the Nutrition Facts label for over 20 years, so if we were to accept the comment's premise that scurvy is high among the homeless and youth, then it does not appear that declaring vitamin C on the Nutrition Facts label has affected the purchasing behavior of these subpopulations to buy products higher in vitamin C. Instead, based on the factors considered in determining mandatory declaration of essential vitamins and minerals, vitamin C was no longer considered as a nutrient of public health significance for the general U.S. population.

(Comment 364) One comment said that mandatory declaration of vitamins A and C is crucial for government food programs and that there might be an unintended consequence if we stopped requiring mandatory declaration of vitamin C. The comment said that the IOM recommended increasing vitamin C levels for women of reproductive age as a priority in the revision of food packages under the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC), that vitamin C intake is important in reducing the risk of iron deficiency in women of child bearing age, and that the 2010 DGA emphasized vitamin C's importance in improving iron absorption. The comment also said that the WIC program has been successful in decreasing iron-deficiency anemia, and this may be, in part, because of nutrition education and the provision of easily identified vitamin C-rich foods, which aid in the absorption of iron. The comment said that WIC benefits for qualifying juices are issued monthly to 2.05 million pregnant and postpartum women who receive benefits for up to 144 fluid ounces of juice each month, and 4.58 million children ages 1 to 4 who receive benefits for 128 fluid ounces of juice each month. The comment said that, to be authorized for WIC purchase, juices must contain 30 mg of vitamin C per 100 mL of juice, which translates to 120 percent of vitamin C per eight ounce serving using the RDA for women. The comment said that consumers can identify WIC-authorized juices by reading the Nutrition Facts label to determine if the juice contributes 120 percent of vitamin C per serving. Thus, according to the comment, eliminating mandatory declaration of vitamin C on food labels removes the mechanism for WIC clients to readily identify WIC-approved juices while shopping. This may result in WIC clients forgoing this important benefit rather than risk potential product rejection and the associated embarrassment upon checkout.

The comment added that, if we no longer require declaration of vitamin C content in the Nutrition Facts label, State agencies will have to review all potential eligible juices from multiple manufacturers to meet regulation each time the food list is updated, and this process would create an unnecessary administrative burden for both the WIC State agencies and manufacturers.

(Response) We consider whether a vitamin or mineral is of public health significance to be the key factor in deciding when to require mandatory declaration in labeling. As we explained in the preamble to the proposed rule (79 FR 11879 at 11921), while vitamin C intakes are low, vitamin C deficiency is uncommon, so we no longer find vitamin C to be a nutrient of public health significance for the general U.S. population. Juice manufacturers who would like their products to be authorized for WIC purchase can declare vitamin C voluntarily on their product labels.

All juices under the WIC authorization must meet the vitamin C minimum (at least 30 mg of vitamin C per 100 mL), either naturally or via fortification (Ref. 197). However, many eligible juices (*e.g.,* pineapple, apple, or grape juice) have to be fortified with

vitamin C to be authorized by WIC; so, because vitamin C is added to those juices, the declaration of vitamin C would be mandatory on the label.

As for the comment's statements regarding the rule's potential impact on WIC clients and the WIC program, such issues are outside the scope of this rulemaking.

(Comment 365) One comment supported voluntary declaration of vitamins A and C, but said that, because these two nutrients are linked to the minimum nutrient contribution requirements for the nutrient content claim ''healthy'' and for health claims, we should make any changes to the nutrient content and health claim regulations at the same time when we finalize the rule.

(Response) We decline to adopt the comment's suggestion. As we stated in the preamble to the proposed rule (79 FR 11879 at 11889), we plan to evaluate the final rule's impact on other FDA regulations and to address, as appropriate, the impact on other FDA regulations in future separate rulemakings. Issues related to nutrient content claims and health claims are outside the scope of this rulemaking (see part II.B.4).

3. Essential Vitamins and Minerals That Are Voluntary

a. Vitamin D. Our preexisting regulations, at § 101.9(c)(8)(ii), provide for the voluntary declaration of vitamin D content on the Nutrition Facts label, unless vitamin D is added as a nutrient supplement or claims are made about it. In 1993, we determined that vitamin D was not of particular public health significance in the United States because the human requirement for vitamin D could be met with sufficient exposure to sunlight and consumption of milk and other foods that were fortified with vitamin D; as a result, deficiencies in this vitamin were very rare (58 FR 2079 at 2107). In the preamble to the proposed rule (79 FR 11879 at 11921), however, we described how comments responding to the 2007 ANPRM recommended vitamin D for mandatory declaration citing vitamin D inadequacy; the relationship of vitamin D to chronic disease risk (*e.g.,* rheumatoid arthritis, multiple sclerosis, and cancers, such as prostate, breast, lung, colon, and colorectal cancers); and the 2005 DGA, which identified vitamin D as a nutrient of concern for certain subpopulations (*e.g.,* older adults, people with dark skin, and those exposed to insufficient ultraviolet band radiation). We also mentioned that the IOM set age and gender specific DRIs (EAR and RDA) for vitamin D at a level that would achieve and maintain serum 25-hydroxy vitamin D (25(OH)D) concentrations above a defined level (40 to 50 nanomoles per liter (nmol)/L) to maintain bone health and how, in 2008, we authorized a health claim for calcium and vitamin D intake and reduced risk of osteoporosis (§ 101.72), signifying vitamin D's critical role in the risk reduction of this chronic disease.

Additionally, the preamble to the proposed rule (79 FR 11879 at 11921) discussed how serum concentration of 25(OH)D is widely considered as a biomarker of total vitamin D nutritional status and is recommended to be used for assessing vitamin D total exposure from all sources, including conventional foods, dietary supplements, synthesis from sun, and conversion of vitamin D from adipose stores in the liver. We explained that our analysis of NHANES 2003–2006 data showed that about 18 percent of the U.S. population 4 years and older (excluding pregnant and lactating women) have serum 25(OH)D levels below the 40 nmol/L (a level set by IOM as equivalent to EAR), which indicates an increased risk of inadequate vitamin D exposure, but that this analysis might underestimate the prevalence of low serum vitamin D levels in the U.S. population (id.). Analysis of NHANES 2005–2008 dietary data showed that, about 94 percent of the U.S. population have usual vitamin D intakes below the EAR from conventional foods only and 62 percent have intakes below the EAR from conventional foods and supplements (table 1). The IOM set the DRIs (*e.g.,* EAR) assuming minimal sun exposure (Ref. 38).

We also noted that approximately 24 percent of the U.S. population ages 4 years and older have serum 25(OH)D concentrations between 30 and 50 nmol/L, levels that indicate risk for inadequacy according to the IOM and CDC (79 FR 11879 at 11921). Approximately 32 percent of the U.S. population has serum 25(OH)D levels below 50 nmol/L (a level set by IOM as equivalent to RDA and associated with optimal benefit for nearly all the population) (id.). We stated that about 8 percent have serum 25(OH)D levels below IOM's cutoff of 30 nmol/L and may be at increased risk of vitamin D deficiency. Vitamin D deficiency results in inadequate bone mineralization or demineralization of the skeleton including rickets, osteomalacia, and osteoporosis. The 2010 DGA, too, highlighted vitamin D as a nutrient of concern for the U.S. population, in general, rather than for specific population groups alone.

Thus, given the benefits of adequate vitamin D intakes on bone health, data indicating inadequate intakes, poor vitamin D status, and high prevalence of osteoporosis and osteopenia among the general U.S. population, we tentatively concluded that vitamin D is a nutrient of ''public health significance,'' and so mandatory declaration of vitamin D is necessary to assist consumers in maintaining healthy dietary practices. Therefore, consistent with the factors we consider for mandatory declaration of non-statutory nutrients, we proposed to amend § 101.9(c)(8)(ii) to require the mandatory declaration of vitamin D on the Nutrition Facts label, and we invited comment on whether there is an appropriate alternative analysis to the application of the factors regarding the mandatory declaration of vitamin D.

(Comment 366) Most comments supported the mandatory declaration of vitamin D on the Nutrition Facts label, but did not explain the reasons for their support.

One comment supported the mandatory declaration of vitamin D declaration on the label, but said that a food or beverage that is not a significant source of vitamin D should declare that fact as part of the ''Not a significant source of (listing the vitamins or minerals omitted)'' statement included at the bottom of the table of nutrient values.

(Response) We agree with the comment. Under our preexisting regulations at § 101.9(c)(8)(iii), if any mandatory essential vitamin or mineral is present in amounts less than 2 percent of the RDI, label declaration of the nutrient(s) is not required if the statement ''Not a significant source of . . . . (Listing the amount of vitamins and minerals)'' is placed at the bottom of the table of nutrient values. No changes to the rule, however, are necessary as a result of this comment, and the final rule requires the mandatory declaration of vitamin D on the Nutrition Facts label.

(Comment 367) Some comments noted that vitamin D is used in fortification and that dietary supplements may be in various forms such as vitamin D_2 (ergocalciferol) or vitamin D_3 (cholecalciferol). The comments said that the form of vitamin D added to foods may be important to vegetarians because the vitamin D_3 commonly used in dietary supplements and in fortified foods is derived from lanolin from sheep's wool and is not considered to be vegan. Some comments said that foods and dietary supplements might list vitamin D without specifying the form. Thus, the comments said that requiring manufacturers to specify the

form of vitamin D would be helpful to vegans and to those who prefer to use a specific form of vitamin D.

Another comment asked whether we consider the main two forms of vitamin D (D_2 and D_3) to be bioequivalent. The comment said it would be helpful if we could either define them as bioequivalent or list a potency conversion factor if we consider one form to be more bioactive than the other.

(Response) We decline to revise the rule as suggested by the comments. We note that our GRAS affirmation regulation (§ 184.1950 (21 CFR 184.1950)) includes both D_2 and D_3 and their resins. The food additive regulations are specific to one form or another (and even more specific, to the crystalline forms or vitamin D_2 baker's yeast) because that is what the petitioner requested. With respect to the Nutrition Facts label, only vitamin D can be used on the food labels (see § 101.9(c)(8)(iv)), but the specific form that is added to a food (*e.g.,* ergocalciferol) must be listed in the ingredient list (§ 101.4). People who are interested in knowing the forms of vitamin D in the food should check the ingredient list.

As for dietary supplements, under the Supplement Facts label requirements at § 101.36(d), the source ingredient may be identified within the nutrition label in parenthesis immediately following or indented beneath the name of a dietary ingredient and preceded by the word ''as'' or ''from.'' When a source ingredient is not identified within the nutrition label, it must be listed in an ingredient statement in accordance with § 101.4(g). However, when a source ingredient is identified in the nutrition label, it will not be listed again in the ingredient statement.

(Comment 368) Some comments objected to the mandatory declaration of vitamin D on the label, although most comments did not explain why they opposed mandatory declaration.

Other comments objecting to the mandatory declaration of vitamin D said there are not very many food sources that contain vitamin D, and they would prefer retaining other vitamins on the Nutrition Facts label instead. The comments noted that most vitamin D is produced by the body with the aid of exposure to the sun.

Other comments suggested not permitting food companies to use statements such as ''fortified with Vitamin D'' or ''good source of Vitamin D'' because, the comments said, vitamin D is a hormone synthesized by the action of sunlight on skin, and so, for this reason alone, it does not belong on the food label.

One comment suggested vitamin D fortification should be viewed as hormone replacement therapy and that it raises questions about efficacy, dose, and side effects that should be asked about all such therapies. The comment said it would be misleading, and possibly harmful, to the public to add this hormone to food and to promote it as something that promotes better health.

(Response) We agree that vitamin D is synthesized by the body via sunlight exposure. However, the IOM set the DRIs for vitamin D based on minimal sun exposure because sun exposure is a risk factor for skin cancer (Ref. 38). Considering the factors for mandatory and voluntary declaration of vitamins and minerals, we determined that vitamin D is a nutrient of public health significance based on its contribution to bone health and because our analysis indicates that intake and status of vitamin D is inadequate in the U.S. population. Therefore, vitamin D met our factors for mandatory declaration, and its inclusion on the label will assist consumers in maintaining healthy dietary practices.

As for the comment regarding vitamin D fortification and hormone replacement therapy, vitamin D is a vitamin (Ref. 198), and its rational addition to foods is allowed under our current food additive (§ 172.380) and GRAS (§ 184.1950) regulations. The use of vitamin D as a food additive is not considered as hormone replacement therapy. Under our preexisting regulations, vitamin D can be added in specific amounts to selected foods such as breakfast cereals, grain products and pastas, fluid milks and milk products, and calcium-fortified juices.

(Comment 369) Some comments objected to the mandatory declaration of vitamin D on the Nutrition Facts label because, according to the comments, mandatory declaration of vitamin D will increase vitamin D fortification of foods because vitamin D is found in few foods and because consumers cannot expect to see a significant vitamin D contribution on the vast majority of food labels. The comments said that if we require the declaration of vitamin D on the Nutrition Facts label, more food manufacturers would make their food sound more nutritious by fortifying with vitamin D and promoting that on the label. Some comments said that a similar outcome occurred with vitamin C and calcium; other comments said that vitamin D can easily reach toxic levels in the diet and that most consumers do not realize this.

(Response) We disagree with the comments. To ensure that vitamin D is not added to the U.S. food supply at levels that could raise safety concerns, we affirmed vitamin D as GRAS with specific limitations as listed in § 184.1950. Under § 184.1(b)(2), an ingredient affirmed as GRAS with specific limitations may be used in food only within such limitations, including the category of food, functional use of the ingredient, and level of use. Any addition of vitamin D to food beyond those limitations set out in § 184.1950 requires either a food additive regulation or an amendment of § 184.1950. A manufacturer would have to submit a petition to amend our regulations. Several food additive petitions for vitamin D have been submitted to FDA, resulting in food additive regulations. (see §§ 172.379, 172.380, and 172.381.)

Furthermore, while vitamin D can be produced in the body via sunlight, and there are a number of foods that can currently be fortified with vitamin D, total usual intakes for vitamin D from food and dietary supplements are below the EAR for the general U.S. population. The total usual intakes do not exceed the UL for any age group at the 90th percentile (Ref. 199). The percentage of the population that consumes vitamin D above the UL is very low (0.1 to 0.4 percent). In addition, the prevalence of high serum 25–OH–D concentration (greater than 125 nmol/L) for the U.S. population aged 1 year and older is 0.9 percent (NHANES 2003–2006) (Ref. 190). The IOM committee indicated that serum 25–OH–D concentration over 125 nmol/L may be reason for concern (Ref. 200). Thus, while some comments said that manufacturers would increase fortification of foods, we are not aware of evidence to support this statement. We do note that, in the preamble to the proposed rule (79 FR 11879 at 11923), we invited comment on whether the mandatory declaration of vitamins and minerals somehow impacts food fortification practices, and we did not receive any data to support an impact. We also do not have any data to determine whether there was an increase in vitamin C or calcium since the time they were first required to be listed on the label. However, we know that both vitamin C and calcium intake are not above the UL set by IOM (Ref. 199). We intend to continue monitoring the nutrients, including vitamin D, on the Nutrition Facts label, their intake, and status of the U.S. population (both deficiency and excess) through the national survey databases. We also intend to continue to monitor the

marketplace to determine if inappropriate fortification is occurring. If we find that there is an inappropriate fortification of foods with vitamin D or any other nutrients, we will take steps to help ensure that fortification does not result in the imbalance of essential nutrients in the diet of the U.S. population.

(Comment 370) One comment objected to mandatory declaration of vitamin D because, according to the comment, vitamin D does not occur naturally in most foods and because other FDA regulations would not allow manufacturers to make a significant impact on the dietary intake of vitamin D.

(Response) Considering the factors for mandatory and voluntary declaration of vitamins and minerals, we determined that vitamin D is a nutrient of public health significance based on its contribution to bone health and because our analysis indicates that intake and status of vitamin D is inadequate in the U.S. population. Therefore, we consider vitamin D to be a nutrient of public health significance and include vitamin D in the list of nutrients in § 101.9(c)(8)(ii) for which a quantitative amount by weight and percent of the RDI are required in nutrition labeling to assist the consumers in maintaining healthy dietary practices.

We note that, under our food additive and GRAS regulations (§ 172.380 and § 184.1950 respectively), vitamin D can be added in specific amounts to various foods such as breakfast cereals, grain products and pastas, fluid milks and milk products, and calcium-fortified juices. In addition vitamin D can be obtained through dietary sources, such as fish (*e.g.,* salmon, rockfish, and tuna) and shellfish, which are the primary natural food sources of vitamin D.

(Comment 371) One comment said the lack of compelling research has permitted vitamin D to become ''trendy,'' such that vitamin D is advertised on boxes of fortified cereals, has its own pro-supplement advocacy group, and generates millions of dollars in dietary supplement sales annually. The comment suggested that, in the absence of stronger evidence for benefit from fortification and some evidence from possible adverse consequences, we should not contribute to further commercialization of ''this misnamed hormone'' by declaring vitamin D on food labels.

(Response) The mandatory declaration of vitamin D on the Nutrition Facts label is not intended to promote or encourage excess fortification of foods with vitamin D. Given the benefits of adequate vitamin D intakes on bone health and calcium absorption, data indicating inadequate intakes, poor vitamin D status, and the high prevalence of osteoporosis and osteopenia (Ref. 201–202) among the general U.S. population, we concluded that this nutrient is a nutrient of public health significance and met the factors for mandatory declaration on the Nutrition Facts label. Furthermore, the 2010 DGA recommends increasing the amount and variety of seafood in place of some meat and poultry (Ref. 30). Fish/seafood is the primary source of naturally occurring vitamin D (Ref. 30). Data show that fish/seafood only provides 9 percent of the total vitamin D intake in the United States. Therefore, we conclude that mandatory declaration of vitamin D on the label would allow consumers to understand the relative significance of the contribution of vitamin D from natural food sources, in addition to fortified foods, in the context of the total daily diet and also is necessary to assist consumers in maintaining healthy dietary practices.

Also, as we stated in our response to comment 368, vitamin D is a vitamin and its rational addition to foods is allowed under our current food additive (§ 172.380) and GRAS (§ 184.1950) regulations.

(Comment 372) One comment stated that, beyond prevention of rickets, the importance of vitamin D and the optimum serum levels or dietary intake for chronic disease risk are hotly debated subjects, and it is premature to focus on this nutrient as being of particular concern. The comment said the U.S. Preventive Services Task Force concluded that the evidence is insufficient to determine how vitamin D supplementation (and, therefore, fortification) affects fracture incidence. The comment also noted that data from the Women's Health Initiative are consistent with largely inconclusive findings about hormone vitamin D supplements and bone health. The comment said that the IOM does not consider deficiency of vitamin D to be a serious problem in the United States, except among certain population groups. Instead, according to the comment, because of widespread fortification and supplementation, the IOM is concerned about the possibility of adverse consequences from over-consumption through supplementation or fortification.

(Response) We disagree with the comment that the association of vitamin D to bone health is inconclusive. The consensus report by IOM set the dietary reference intake for vitamin D based on its role in bone health and calcium absorption and uptake by bones (Ref. 38). The IOM set age and gender specific DRIs (EAR and RDA) for vitamin D to maintain bone health (Ref. 38). Vitamin D deficiency results in inadequate bone mineralization or demineralization of the skeleton including rickets, osteomalacia, and osteoporosis (Ref. 203). In addition, in 2008, we authorized a health claim for calcium and vitamin D intake and reduced risk of osteoporosis (§ 101.72), signifying vitamin D's critical role in the risk reduction of this chronic disease. In view of the benefits of adequate vitamin D intakes on bone health, data indicating inadequate intakes, poor vitamin D status, and high prevalence of osteoporosis and osteopenia among the general U.S. population, we conclude that this nutrient is a nutrient of public health significance and meets our factors for mandatory declaration on the Nutrition Facts label.

As for the comment's claims that fortification will result in adverse consequences, while vitamin D can be produced in the body via sunlight and there are a number of foods that can currently be fortified with vitamin D, current total usual intakes for vitamin D from food and dietary supplements do not exceed the UL for any age group at the 90th percentile (Ref. 199). The percentage of the population that consumes total vitamin D (food and supplement) above the UL is low (0.1 to 0.4 percent). As for fortification, we reiterate that our food additive and GRAS regulations create a regulatory structure that does not allow for unilateral fortification of food; the addition of vitamin D to food beyond those limitations set out in § 184.1950 requires either a food additive regulation or an amendment of § 184.1950. The manufacturer has to formally petition FDA to amend the regulation.

(Comment 373) One comment said that there is inconsistency in vitamin D assays, and individuals may be told that they are deficient when they are not.

(Response) We recognize that there may be inconsistencies in serum vitamin D assays from various laboratories and that this inconsistency may cause variations in an individual's serum vitamin D analysis. However, for purposes of determining the nutrients of public health significance, our data indicating poor vitamin D status (through serum vitamin D analysis) were based on NHANES data. The serum data were analyzed by the same valid vitamin D method for the survey period (Ref. 190).

(Comment 374) One comment opposed the mandatory declaration of vitamin D because, according to the

comment, testing for vitamin D is very challenging and expensive. Other comments supported mandatory declaration of vitamin D, but said that limited data is available on the vitamin D content in many foods and ingredients, so manufacturers will need time and resources to obtain data for purposes of revising their Nutrition Facts labels. Some comments said that an analysis of the 7,189 foods in the USDA National Nutrient Database reveals that approximately one-third of those foods are missing values for vitamin D and that this does not take into account the thousands of other ingredients that are also missing vitamin D values.

(Response) We acknowledge that performing an accurate vitamin D analysis requires some expertise, but there are commercial laboratories with expertise in the analysis. Having quality control food matrix material certified for vitamin D is important, and the National Institute of Standards and Technology (NIST) has worked and continues to work to come up with better standard reference material for quality control of vitamin D analysis. Under our preexisting regulations, declaration of vitamin D was mandatory when vitamin D was added as a nutrient supplement or claims are made about it on the label or labeling. Therefore, manufacturers who have added vitamin D to their products have already been using methods for testing and determining vitamin D content of foods, so, with respect to those manufacturers, additional time and resources to conduct analyses for vitamin D may not be necessary.

As for other products whose manufacturers have not added vitamin D to the food, there is adequate methodology for determining vitamin D in the foods. However, an analysis may not be needed for vitamin D where reliable databases or scientific knowledge establish that a nutrient is not present in the food. For example, there might not be a need to analyze for vitamin D in foods that are not natural sources of vitamin D, and to which our regulations, at § 172.380 and § 184.1950, do not allow vitamin D to be added. Therefore, regarding the analytical burden, if a manufacturer has adequate and reliable reasons to believe that vitamin D is not present, there is no need to analyze for it: It can be declared as zero or the manufacturer can state at the bottom of the nutrition label ''not a significance source of vitamin D.'' Costs associated with nutrition labeling will be contained by not analyzing for a nutrient where there is no reasonable expectation that the nutrient occurs in the food.

We also agree that USDA nutrient databases may be missing vitamin D values for nearly one-third of the products in those databases. Vitamin D occurs naturally in a limited number of foods, such as mushrooms exposed to UV light, egg yolks (often the feed is supplemented with D_3 or 25(OH)D_3), and meats or other animal products. There is usually a minimal amount of vitamin D in milk and cheese unless the food is fortified. Many foods that would be reporting vitamin D on labels greater than zero are fortified (with the exception of foods listed previously or foods that contain them) and already would have declarations. The USDA national nutrient database (standard reference (SR)) provides a complete set of all nutrients (including vitamin D) to use with NHANES database (Ref. 4). However, vitamin D may not be always required to be filled in the SR. USDA is working with various industries to determine the vitamin D values on meats and eggs, and it plans to have these data available in future SR releases. We intend to work with USDA to determine ways to have more values for vitamin D on the SR databases.

b. Potassium. Under our preexisting regulations, at § 101.9(c)(5), the declaration of potassium content is voluntary, except when a claim is made about it. In the preamble to the proposed rule (79 FR 11879 at 11922), we discussed how the scientific evidence regarding potassium had changed, such that we recognized potassium's importance in the risk reduction of certain chronic diseases. We also noted that the 2010 DGA concluded that potassium is a nutrient of concern for the general U.S. population. Given the benefits of adequate potassium intake in lowering blood pressure, reflected in IOM's DRIs, and data indicating low likelihood of potassium adequacy and high prevalence of hypertension among the general population, we tentatively concluded that potassium is a nutrient of public health significance for the general U.S. population and proposed to amend § 101.9(c)(8)(ii) to require the mandatory declaration of potassium.

(Comment 375) Almost all comments supported the mandatory declaration of potassium on the Nutrition Facts label.

Some comments, however, supported mandatory declaration of potassium for different reasons. Many comments would require mandatory declaration of potassium because potassium is important for dialysis and renal patients.

(Response) While mandatory labeling of potassium may help patients with chronic kidney disease, this was not a factor we considered when we proposed the mandatory declaration of potassium on the Nutrition Facts label. As we stated in the preamble to the proposed rule (79 FR 11879 at 11890) and maintain in this final rule, we consider mandatory declaration appropriate for these types of nutrients when there is public health significance and a quantitative intake recommendation that can be used for setting a DV (DRV or RDI), although we also have considered mandatory declaration based, in part, on evidence highlighting the role of a nutrient in a specific relationship to chronic disease risk. For potassium, we concluded that potassium is a nutrient of public health significance for the general U.S. population and its declaration is necessary to assist consumers in maintaining healthy dietary practices. Therefore, the final rule, at § 101.9(c)(8)(ii), requires the mandatory declaration of potassium.

(Comment 376) One comment stated that food manufacturers may start to fortify their foods with potassium in an attempt to offset the sodium content of a food product. The comment said we should monitor how food manufacturers respond to this new requirement. The comment also said that, as part of an overall consumer education campaign, we should encourage consumers to obtain potassium through a diet high in fruits and vegetables and recommend amounts of low-fat/fat-free dairy products rather than obtain potassium from dietary supplements or potassium fortified foods.

(Response) The comment did not provide any evidence to suggest that mandatory declaration of potassium on the Nutrition Facts label will increase fortification of foods; consequently, we are unable to determine whether such fortification is likely or the extent to which it might occur. The final rule requires mandatory labeling of potassium and other essential vitamins and minerals on the Nutrition Facts label to assist consumers in maintaining health dietary practices.

With respect to fortification, we note that we published a policy statement on the rational addition of nutrients to foods (§ 104.20). We urge manufacturers, if they elect to add nutrients to a food, to follow the guidelines stated in the fortification policy for rational addition of nutrient to foods to preserve a balance of nutrients in the diet of the U.S. population. We intend to continue assessing the nutritional status

(inadequacy and excess) of potassium consumption, among other nutrients, in the general healthy U.S. population after the final rule's compliance dates. We also intend to monitor the market to assess fortification practices in response to the revised Nutrition Facts label. With respect to educational activities, we intend to work with other Federal Agencies and organizations to emphasize the changes to the Nutrition Facts label (see part II.B.1). However, consistent with our mission, our educational activities will focus on the Nutrition Facts label rather than fresh produce (*i.e.,* fresh fruits and vegetables). The reason for the mandatory declaration of potassium and other essential vitamins and minerals on the Nutrition Facts label is to assist consumers in maintaining health dietary practices rather than to recommend consumption of specific foods or products.

(Comment 377) Several comments suggested that potassium should appear on the Nutrition Facts label after sodium. The comments said that there is an association between potassium intake and reduced blood pressure in certain individuals, so potassium should appear below sodium. The comments said this placement will help consumers understand that these two nutrients and their respective amounts in a food are related.

(Response) We decline to revise the rule as suggested by the comment. We stated in the preamble to the 1993 final rule (58 FR 2079 at 2106) that, for essential vitamins and minerals, the decisions about mandatory or voluntary declarations were based on public health concerns relative to inadequate dietary intakes as well as the possible association between several of these nutrients and the risk of chronic disease. The main difference between the DRV and RDI nutrients was/is that DRV nutrients are: (1) Nutrients to limit (*e.g.,* sat fat, cholesterol, and *trans* fat); or (2) based on a specific caloric intake (*e.g.,* fat, carbohydrate, protein, and dietary fiber). However, RDIs have been and are being proposed based on age specific RDAs (and now AIs). In 1993, there were not age specific RDAs for potassium. Currently, there are age specific AIs for potassium that are based on chronic disease risk. Thus, because potassium is now being assigned an RDI, rather than a DRV, we are moving it down in the label with the other essential vitamins and minerals that have RDIs. Furthermore, the comment did not provide any evidence to support the claim that having sodium and potassium near each other on the label would help consumers understand that these two nutrients and their respective amounts in a food are related. Consequently, we cannot evaluate the comment's claim regarding placement and consumer understanding.

(Comment 378) One comment said the mandatory declaration of potassium on the Nutrition Facts label will pose challenges for very small packages (because another line in the label would be needed). Additionally, some comments noted that beverages, such as plain unsweetened coffee and tea, are exempt from nutrition labeling (under § 101.9(j)(4)) because they contain insignificant amounts of all nutrients required to be declared on the Nutrition Facts label. According to the comments, plain coffee and tea may have low, but declarable, levels of potassium, so the mandatory declaration of potassium would cause plain coffee and tea to lose their current exemption from nutrition labeling. The comments said we should examine § 101.9(j)(4) and make any necessary adjustments. The comment suggested that, when levels of potassium are less than 5 percent of the DV and on small packs with limited space, declaration of potassium would be voluntary.

(Response) We recognize the discrepancy between the exemption under § 101.9(j)(4) and the labeling that would be required for products that have significant levels of nutrients. In the proposed rule, we did not ask for comments specifically about the continued applicability of this exemption from nutrition labeling provisions in light of what would be a changing level of nutrients that will be considered ''insignificant'' as a result of this rule and the final rule entitled ''Food Labeling: Serving Sizes of Foods That Can Reasonably Be Consumed at One-Eating Occasion; Dual-Column Labeling; Updating, Modifying, and Establishing Certain Reference Amounts Customarily Consumed; Serving Size for Breath Mints; and Technical Amendments'' (Serving Size final rule) published elsewhere in this issue of the **Federal Register**. Therefore, we intend to consider the future applicability of the exemption with respect to mandatory nutrition labeling on products that would have been exempt under § 101.9(j)(4) prior to the effective date of this rule and the Serving Size final rule. After the effective date of this final rule, we intend to consider the exercise of enforcement discretion with respect to the use of mandatory nutrition labeling on such products that would have been exempt under § 101.9(j)(4).

We understand that providing Nutrition Facts labels on packages with limited space may be challenging for manufacturers; thus, our preexisting regulation, at § 101.9(j)(13), provides for special labeling provisions for packages with limited space.

(Comment 379) Several comments said that manufacturers would need more than 2 years to gather nutrition data for potassium and to comply with the mandatory declaration of potassium on the Nutrition Facts label. Some comments said that the data are often lacking in many company and public databases, so time will be needed to collect the data.

(Response) We disagree, in part, with the comments. There are public databases, such as USDA Nutrient Data Database, that can provide information regarding the potassium content of foods. For example, in the USDA Nutrient Data Database for current Standard Reference (SR 27), nearly 8,200 of the approximately 8,600 foods in the database, or approximately 95 percent of the foods, have potassium values.

Additionally, the operations involved and equipment required for the methods for potassium determination are standard in analytical laboratories. Nevertheless, we have revised the compliance dates for the final rule (see part III).

(Comment 380) One comment asked us to clarify the use of potassium in dietary supplement products. The comment said that many dietary supplement companies have been limiting potassium in their formulas to 99 mg per serving and that 99 mg of potassium is not an appreciable fraction of the current (3,500 mg) or proposed (4,700 mg) reference daily intake for potassium. The comment said that this limitation is based on a position we took in 1975 that any capsule or coated tablet of a potassium salt intended for oral ingestion (without prior dilution with an adequate volume of liquid to preclude gastrointestinal injury) should carry a warning statement regarding small-bowel lesions related to the use of oral drug products containing 100 mg or more potassium. The comment said we have not established an upper limit for potassium in dietary supplement formulations, so the comment asked us to clarify how potassium might be used in solid oral dietary supplements.

(Response) We have not established any limits on potency or recommended uses for dietary supplements that contain potassium salts. Under the FD&C Act, a manufacturer or distributor is responsible for ensuring that the dietary supplements are safe and meet other applicable requirements of the FD&C Act and its implementing

regulations. The safety of or need for a warning statement on dietary supplements with certain potencies of potassium are outside the scope of this rulemaking.

(Comment 381) Several comments did not support mandatory declaration of potassium on the Nutrition Facts label. Some comments said that consumers do not know what potassium is, so the declaration of potassium on the label would not be helpful. The comments said it would be better to omit potassium from the label so that the Nutrition Facts label is less cluttered, can be better organized, and be less likely to overwhelm the consumer with information.

(Response) We decline to revise the rule as suggested by the comments. We consider whether a vitamin or mineral is of public health significance to be the key factor in deciding when to require mandatory declaration on the Nutrition Facts label. Available quantitative evidence suggests that the declaration of nutrients of public health significance including vitamins and minerals can help consumers maintain healthy dietary practices. We consider potassium to be a nutrient of public health significance, and the final rule includes potassium in the list of nutrients in § 101.9(c)(8)(ii) for which a quantitative amount by weight and percent of the RDI are required in nutrition labeling to assist the consumers in maintaining healthy dietary practices.

As for the comment's mention of clutter, we consider clutter as a matter of graphic design, but possible clutter is not our basis for omitting or removing a nutrient of public health significance from the Nutrition Facts label.

(Comment 382) One comment suggested that potassium should be a qualifying nutrient for ''Healthy'' claim criteria.

(Response) Issues regarding labeling outside the Nutrition Facts and Supplement Facts labels, such as nutrient content claims, are outside the scope of this rulemaking (see part II.B.4).

4. Other Essential Vitamins and Minerals

Under our preexisting regulations, at § 101.9, several other essential vitamins and minerals, in addition to vitamin D and potassium, may be declared voluntarily on the Nutrition Facts label, *i.e.,* vitamin E, vitamin K, vitamin B_6, vitamin B_{12}, thiamin, riboflavin, niacin, folate, biotin, pantothenic acid, phosphorus, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, and chloride. In the preamble to the proposed rule (79 FR 11879 at 11922 through 11923), we explained how we had considered comments to the 2007 ANPRM recommending mandatory declaration of vitamin E, folate, vitamin B_{12}, magnesium, and phosphorus and how, based on our analysis of available data and using the factors we consider for mandatory and voluntary declaration of non-statutory nutrients, we did not propose any changes to the provisions for voluntary declaration of vitamin E, vitamin K, vitamin B_6, vitamin B_{12}, thiamin, riboflavin, niacin, folate, biotin, pantothenic acid, phosphorus, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, and chloride.

Several comments addressed the voluntary declaration of specific vitamins or nutrients, and we discuss those comments in this section.

a. Phosphorus.

(Comment 383) Most comments asked that we amend our regulations so that declaration of phosphorus is mandatory rather than voluntary.

Most comments said that many people have kidney problems, and patients under dialysis have to watch their intake of phosphorous in addition to potassium and calcium. The comments said that it can be very difficult for individuals who are on a low potassium and phosphorous diet to calculate their daily intake. The comments said that dialysis patients are educated about foods high in phosphorus, but it is difficult to manage one's phosphorus intake when phosphorus is ''in almost everything.'' The comments said that many dialysis patients have neither the motivation nor the resources to be diligent about monitoring phosphorus in their diet. One comment stated that phosphorus can occur naturally in various forms of food, or as a component in commonly used food additives, and that the processing of meat and fish products increases the phosphorus content above the naturally occurring levels in the protein itself. The comment said that the addition of phosphorous to the Nutrition Facts label will help kidney patients to be aware of the high amount of phosphorus in foods. The comment noted that, in determining mandatory or voluntary labeling, FDA considers whether there is evidence of a relationship between the nutrient and a chronic disease, health-related condition, or health-related physiological endpoint and whether there is evidence of a problem related to health in the general U.S population. Thus, the comment said, using these considerations, we should revise the rule to require the mandatory declaration of phosphorus on the Nutrition Facts label.

(Response) While a mandatory phosphorous declaration may aid patients with chronic kidney disease and dialysis patients, the Nutrition Facts label is not targeted to individuals with a particular acute or chronic disease (see part II.B.2). The information on the label is meant for the general healthy U.S. population. For determining the nutrients of public health significance, we considered the factors that were discussed in the proposed rule and determined that phosphorous intakes are generally adequate and not of public health significance in the general, healthy U.S. population (Ref. 204). Furthermore, total intakes (food and supplement) among the general U.S. population were not found to be above the UL (Ref. 199). Based on these factors, we determined that phosphorous is considered a voluntary nutrient for the general healthy U.S. population, and are not making changes to the voluntary declaration of phosphorus in response to this comment. Therefore, manufacturers can declare phosphorus on the Nutrition Facts label voluntarily. However, if phosphorous is added as a nutrient supplement or claims are made about it on the label or in labeling of foods, then it must be declared on the label. All ingredients, including phosphate compounds, must be declared in the ingredient list on the label.

b. Magnesium.

(Comment 384) Several comments would revise the rule so that declaration of magnesium on the Nutrition Facts label would be mandatory instead of voluntary. Several comments stated that magnesium is needed for dialysis patients. One comment said that, instead of paying too much emphasis on calcium for adults, we should pay more attention to magnesium because, according to the comment, nearly 90 percent of dialysis patients are deficient in magnesium.

(Response) We decline to revise the rule as suggested by the comments. As we stated in part II.B.2, the Nutrition Facts label is not targeted to individuals who have a specific acute or chronic disease.

(Comment 385) Some comments said that magnesium is an essential mineral and necessary for maintaining more than 300 essential metabolic reactions in the human body. One comment said that magnesium interacts with calcium and potassium and foods and that dietary supplements are frequently enriched with calcium. The comment

said that magnesium deficiency in the face of a normal calcium intake can lead to soft tissue calcification in animals (Refs. 205–206). The comment said that the most prominent feature of magnesium deficiency is the calcification predominantly of arteries (Refs. 207–209) and that magnesium inhibits the release of calcium ion from the sarcoplasmic reticulum, blocks the influx of calcium ion into the cell by inactivating the calcium channels in the cell membrane, and competes with calcium ions at binding sites on troponin C and myosin, thereby inhibiting the ability of calcium ions to stimulate myocardial tension (Refs. 210–212). The comment noted that magnesium, a calcium antagonist, substitutes itself for the calcium ions on hydroxyapatite, producing more soluble phosphate salts and thus inhibiting bone formation and perhaps aortic valve stenosis (Ref. 213).

One comment stated that the absorption of calcium and magnesium may be altered depending upon the levels and ratio between them. The comment said that emerging evidence indicates that it may be better to optimize one's intake of calcium and magnesium rather than supplementing with either mineral alone. The comment said that the mandatory declaration of magnesium on the Nutrition Facts label will help consumers avoid an imbalance of calcium and magnesium by highlighting to the consumer how inadequate his or her magnesium intake is in relation to the calcium content of packaged foods (which the comment said are frequently supplemented with calcium). The comment also stated that the IOM has said that ''magnesium is necessary for sodium, potassium-ATPase activity, which is responsible for active transport of potassium'' (Ref. 214) and that magnesium regulates the outward movement of potassium in myocardial cells (Ref. 215). The comment further stated that magnesium inadequacy has a variety of other adverse health effects and that dietary magnesium intake was found to be inversely associated with mortality risk in individuals at high risk of cardiovascular disease (Ref. 216). In addition, the comment said, a higher dietary magnesium intake is associated with lower fasting glucose and insulin (Ref. 217), and dietary magnesium intake is inversely associated with plasma concentrations of the inflammation indicator C-reactive protein (CRP).

One comment stated that national survey data indicate that dietary magnesium intake is inadequate in the general U.S. population, particularly among adolescent girls, adult women, and the elderly. One comment stated that the impact of adding another item to the label is minimal compared to overall costs. The comment said that, given that the costs are inevitable, it is better to add all mandatory declarations to the label at one time. In other words, if a manufacturer is already changing the label for potassium for example, there is a minimal incremental cost to add magnesium at the same time.

One comment noted that, from a food processing perspective, given the label desirability of increasing potassium and reducing sodium levels, manufacturers might replace a portion of currently used sodium salts, such as sodium citrate and sodium phosphate, with the potassium salts with equivalent functional characteristics. Thus, the comment said, labeling of magnesium content becomes more important to avoid creating an imbalance of potassium and magnesium.

(Response) We agree that magnesium is an essential nutrient and that it is important in many different pathways and functions of the body (Ref. 218). However, consistent with our consideration of the factors for mandatory and voluntary declaration of vitamins and minerals (see part II.D), while magnesium dietary intake is currently low, the IOM recommended intake is not set based on a public health endpoint (*e.g.,* a chronic disease), and the overt symptoms of magnesium deficiency are rarely seen among general healthy U.S population. Consequently, we do not consider magnesium to be a nutrient of public health significance for the general U.S. population (Ref. 204). We consider whether a vitamin or mineral is of public health significance to be the key factor in deciding when to require mandatory declaration on the Nutrition Facts label, cost consideration was not a factor in determining nutrients of public health significant.

In the case of magnesium, similar to our recommendation, the 2010 DGA and 2015 DGAC did not include magnesium as a nutrient of public health concern for the general U.S. population. (The 2015–2020 DGA also does not include magnesium as a nutrient of public health concern.) Magnesium was considered as a shortfall nutrient. Although some comments cited published articles, most articles cited by the comments are either animal studies, not using valid surrogate endpoints (such as C-reactive protein), or are based on single studies and emerging evidence and the conclusions are not based on the totality of scientific data.

(Comment 386) One comment noted that some manufacturers already include magnesium content on the Nutrition Facts label for their products. The comment said that, for example, Kelloggs includes magnesium content on Raisin Bran cereal (but not on its Corn Flakes), Nestle includes magnesium content on its Instant Breakfast products, and General Mills includes magnesium content on Cheerios cereal. The comment suggested that these steps are to be encouraged and broadened.

(Response) We are not making changes to the voluntary declaration of magnesium in the final rule, and therefore, manufacturers may declare magnesium voluntarily on the Nutrition Facts label. However, if magnesium is added as a nutrient supplement or claims are made about it on the label or in labeling of foods, then it must be declared on the label.

c. Vitamin K.

(Comment 387) Several comments stated that declaration of vitamin K on the Nutrition Facts label is necessary for individuals who are on blood thinners.

(Response) We decline to revise the rule as suggested by the comment, and vitamin K remains a voluntarily declared nutrient in the final rule. While information regarding vitamin K may help patients on blood thinners, as we stated in part II.B.2, the Nutrition Facts label is for the general, healthy U.S. population rather than for individuals with acute or chronic disease.

d. Choline.

(Comment 388) In general, comments regarding the declaration of choline on the Nutrition Facts label supported voluntary declaration.

(Response) Because declaration of choline on the Nutrition Facts label is already voluntary, no changes to the rule are necessary.

e. Vitamin B_{12}.

(Comment 389) One comment stated that fortified foods and dietary supplements are the only reliable way for individuals who avoid all animal products to obtain vitamin B_{12}. The comment said that including the amount of vitamin B_{12} added to fortified foods and dietary supplements would enable these individuals to monitor their intake of this essential vitamin. The comment said that labeling also would help individuals aged 50 years and older who are advised to meet their RDA mainly by consuming foods fortified with crystalline vitamin B_{12} or vitamin B_{12}-containing dietary supplements.

(Response) Declaration of vitamin B_{12} on the Nutrition Facts or Supplement Facts label is mandatory when vitamin B_{12} is added as a nutrient supplement or

when claims are made about it on the label or in labeling of foods. Thus, because the information is already available to consumers under the circumstances described in the comment, no changes to the rule are necessary.

M. Reference Daily Intakes for Vitamins and Minerals

1. Need To Update RDIs

Our preexisting regulations, at § 101.9(c)(8)(iv), set forth RDIs used to calculate the percent DVs for vitamins and minerals that are required or permitted to be declared on the Nutrition Facts label. RDIs are intended as general food labeling reference values and are not intended to represent dietary allowances for individuals. They function as an overall population reference to help consumers judge a food's usefulness in meeting overall daily nutrient requirements or recommended consumption levels and to compare nutrient contributions of different foods.

The preamble to the proposed rule discussed how new information caused us to reconsider the RDIs and our approach to setting RDIs (79 FR 11879 at 11925 through 11928). In brief, the proposed rule would revise the existing RDIs for vitamins and minerals based on the DRIs set by the IOM (1997 to 2010) and would consider the RDAs, when available, as the basis for establishing RDIs, instead of the EAR. Using corresponding RDAs, proposed § 101.9(c)(8)(iv) would update the RDIs for calcium, copper, folate, iodine, iron, magnesium, molybdenum, niacin, phosphorus, riboflavin, selenium, thiamin, vitamins A, B_6, B_{12}, C, D, and E and zinc (see 79 FR 11879 at 11926 through 11927).

2. Approach To Setting RDIs: EAR Versus RDA

In the preamble to the proposed rule (79 FR 11879 at 11926 through 11927), we explained our approach to setting RDIs. In brief, the percent DV advises the consumer how much of the recommended intake of a particular nutrient is provided by the food. The DV for a nutrient is not to be interpreted as a precise recommended intake level for an individual; instead, it is a general guide or a reference value that the consumer can use to help judge a food's usefulness in meeting overall daily nutrient requirements or recommended consumption levels and to compare nutrient contributions of different foods (id. at 11926). Two types of reference values, the Reference Daily Intakes (RDIs) for vitamins and minerals and Daily Reference Values (DRVs) for certain nutrients, are used to declare nutrient contents as percent DVs (id. at 11883, 11926), and the RDIs for vitamins and minerals have been based primarily on RDAs (or on other available quantitative intake recommendations if an RDA has not been established for a particular vitamin or mineral).

The preamble to the proposed rule also stated that the RDA was developed as a target intake level for individuals and is designed to meet the nutrient needs of practically all (97 to 98 percent) individuals within a life stage and gender group (id. at 11926). RDAs are available for calcium, copper, folate, iodine, iron, magnesium, molybdenum, niacin, phosphorus, riboflavin, selenium, thiamin, vitamins A, B_6, B_{12}, C, D, and E, and zinc (id.).

In contrast, the EAR is the median requirement that is most likely to be close to an individual's actual needs within a particular life stage and gender group (id.). The EAR is a quantitative intake recommendation that is used to derive target nutrient intake goals for the planning of diets for groups (such as planning diets in an assisted living facility for senior citizens or planning menus for a school nutrition program), but is not used as a target intake goal for individuals. The EAR is not intended to be a target intake level for individuals because an individual does not know how his or her needs relate to the EAR. Therefore, if the RDI were to be based on the EAR, the RDI would not meet the daily nutrient requirements for some consumers and would understate target intake levels. In contrast, an RDI that is based on a RDA would meet the daily nutrient requirements for most individuals 4 years of age and older. An RDI based on the RDA would mean that a product with 100 percent of the DV would have a higher probability of meeting an individual's nutrient needs than if the RDI was based on the EAR. As a result, in the preamble to the proposed rule (id. at 11927), we stated that RDAs, when available, provide the most appropriate basis for establishing RDIs and, using corresponding RDAs, we proposed, at § 101.9(c)(8)(iv), to update the RDIs for calcium, copper, folate, iodine, iron, magnesium, molybdenum, niacin, phosphorus, riboflavin, selenium, thiamin, vitamins A, B_6, B_{12}, C, D, and E, and zinc.

(Comment 390) Several comments supported using the RDA, rather than the EAR, as the basis for establishing RDIs.

In contrast, one comment opposed using the RDA and supported using the EAR. The comment asserted that we should not dismiss the recommendations of the IOM Labeling report (Ref. 219) to use the EAR as the basis for setting DVs, in favor of the 2003 IOM Planning report (Ref. 220) recommendation to use RDAs to plan diets of individuals. The comment stated that there is no better reference value against which to appraise the nutritional contribution of a product than a DV based on a population weighted EAR and that any other basis for the DV will either understate or overstate the nutritional contribution of a food product when considered in comparison to the population weighted EAR. The comment said that we misinterpreted the purpose of the 2003 IOM Planning report recommendation to use the RDA to plan diets and that there is no reason to assume that the very specific notion of dietary planning for individuals (as described in the 2003 IOM Planning report) is what consumers mean when they say they use the label for planning purposes. The comment further stated that the DVs are not appropriate to use for planning an individual's entire diet because they do not represent the individual's age and sex, and that this nutrition information is only provided on packaged foods (not fresh fruits and vegetables, meat, poultry, fish). The comment also said that this information is only available for nutrients that are mandatory on the Nutrition Facts label.

(Response) We continue to believe that the RDA is the most appropriate reference value to use to establish RDIs, considering the purpose of the DV. As we noted in the preamble to the proposed rule (79 FR 11879 at 11926), the percent DV advises the consumer how much of the recommended intake of that nutrient is provided by the food. While the DV for a nutrient is not to be interpreted as a precise recommended intake level for an individual, it is a general guide or a reference value that the consumer can use to help judge a food's usefulness in meeting overall daily nutrient requirements or recommended consumption levels and to compare nutrient contributions of different foods (*id.*). The EAR is not intended to be a target intake level for individuals because an individual does not know how his or her needs relate to the EAR. While the RDA may not be the best estimate of any given individual's nutrient requirements, which are usually unknown, the RDA was developed as a target intake level for individuals. The RDA is designed to meet the needs of practically all (97 to 98 percent) individuals within a life stage and gender group. If the RDI was

based on the EAR, the RDI would not meet the daily nutrient requirements for some consumers and would understate target intake levels.

We also disagree with the comment's characterization of the 2003 IOM Planning report recommendations. The 2003 IOM Planning report noted that intake goals (*i.e.,* RDAs) should be translated into dietary plans to help individuals choose foods that will make up a healthy diet. The 2003 IOM Planning report gave several examples of dietary plans such as the Nutrition Facts label, the U.S. Food Guide Pyramid, and the Dietary Guidelines for Americans that are intended to help consumers choose foods that are part of a healthful diet (Ref. 220). The 2003 IOM Planning report noted that, when food guides are used, reference standards for nutrients such as the RDAs are implicitly used in planning individual diets (see 79 FR 11879 at 11926). Therefore, we disagree with the comment's suggestion that the 2003 IOM Planning report is somehow at odds with the use of the RDA as a reference value for establishing RDIs. Furthermore, we disagree with the comments' assertion that the DVs are not appropriate to use for planning an individual's entire diet because nutrition information is only provided on packaged foods (and not on fresh fruits and vegetables, meat, poultry, or fish). Retail stores that sell raw fruits, vegetables, and fish participate in the voluntary point-of-purchase nutrition information program (§§ 101.42 through 101.45). Additionally, we have developed posters that provide nutrition information for the 20 most commonly consumed fruits, vegetables and seafood that are available to consumers and industry (Ref. 221). Similarly, USDA requires that retail stores that sell meat and poultry to label products with nutrition information or to post point-of-purchase nutrition information. USDA also has developed posters for nutrition information for meat and poultry that are available for use by consumers and industry (75 FR 82148) (Ref. 222). For these reasons, we are making no changes to the rule based on the comment.

We address comments on specific vitamins and minerals at parts II.M.6 and II.M.7.

3. Approach To Setting RDIs: Adequate Intake

In the preamble to the proposed rule (79 FR 11879 at 11927), we explained that, in the absence of RDAs, AIs represent the best estimate of an adequate daily nutrient intake level based on available science and, as such, they provide an appropriate basis for selecting RDIs for those vitamins and minerals where available data are insufficient to determine RDAs. Consequently, we proposed to use the AI to set RDIs for biotin, chloride, choline, chromium, manganese, pantothenic acid, potassium, and vitamin K.

(Comment 391) Several comments supported using the AI as the basis for establishing RDIs for those vitamins and minerals where data were insufficient to determine a RDA. However, other comments opposed using the AI for potassium to establish an RDI of 4,700 mg and recommended that we retain the current DRV of 3,500 mg. The comments stated that the AI is established at a level assumed to ensure nutritional adequacy in all members of a healthy population when there is insufficient scientific evidence to develop an RDA. The comments said that using a reference value based on inadequate quantity or quality science would be providing inconclusive information to consumers. A few comments noted that there is now additional evidence (Refs. 223–224) that is more reflective of the current state of the science and recognizes the sodium to potassium ratio. Some comments also suggested that the IOM should re-assess the DRI for potassium in light of the new data to determine if the current AI is truly reflective of the actual requirements. One comment suggested that increasing the RDI could result in increased reliance on fortification or use of dietary supplements.

(Response) We agree with the comments that support the use of the AI to set the RDIs for nutrients that do not have a RDA. We disagree that we should not use the AI to set an RDI for potassium and that the existing DV of 3,500 mg should be retained. The existing DV for potassium was set in 1993 based on the 1989 Diet and Health report and no longer represents the most current recommendations for potassium intake. As discussed in the preamble to the proposed rule (79 FR 11879 at 11927), while there is more uncertainty with an AI than an EAR or RDA, in the case of nutrients without established RDAs, the AI reflects the most current scientific recommendations for intake (*id.*). When establishing RDIs, we consider the quantitative intake recommendations from U.S. consensus reports (*e.g.,* the IOM DRI reports) (see 79 FR 11879 at 11890).

We disagree that the sodium and potassium ratio should be used to set a DV for potassium. First, sodium is not presented on the label as a ratio of sodium and potassium. As discussed in part II.L.3.b, the final rule requires the declaration of potassium on the label. Thus, if consumers are interested in the sodium and potassium ratio, they will have both the absolute amounts as well as the percent DV for both nutrients. In addition, the Aburto et al., 2013 systematic review and meta-analysis cited by the comment concluded that daily potassium intakes in the range of 90 to 120 mmol (3,519 mg to 4,700 mg) were associated with lower risk of stroke (Ref. 223). This range is consistent with the AI of 120 mmol (4,700 mg/day) that was based on potassium's ability to blunt the effects of sodium intake on blood pressure and to reduce the risk of kidney stones. Furthermore, Aburto et al. 2013 noted their analysis of randomized trials that examined how sodium intakes influence potassium's effect on blood pressure shows there was no statistically different effect among subgroups based on sodium intake. A majority of the individual studies cited in the Aburto et al., 2013 meta-analysis were reviewed in the 2005 Electrolytes report which concluded that data on the sodium and potassium ratio was insufficient to be used to set requirements (Ref. 223). The other article cited in the comment (Ref. 224) is a review article that does not include the totality of the scientific evidence and does not provide sufficient information for FDA to review. While we recognize that the intakes of sodium and potassium are interrelated, we do not consider the evidence to be sufficient to set an RDI based on the sodium and potassium ratio, and we continue to consider that the AI set by the IOM is appropriate to use for setting the RDI. Additionally, given the extensive reviews already conducted by the IOM, we do not agree that it is necessary to ask the IOM to reevaluate the existing evidence for potassium.

As for the comment regarding fortification, the comment did not provide any evidence, and we are not aware of any evidence, that suggests using the AI would lead to excessive fortification and increased use of dietary supplements. Currently, the adequacy of intakes for potassium is very low (see 79 FR 11879 at 11922). Only 1.9 percent of the general population has usual potassium intake above the AI from conventional foods only, and 2.4 percent have intakes above the AI from conventional foods plus dietary supplements. RDIs which are expressed on the label as a percent DV, give a consumer a general idea how much of a nutrient they should consume. While RDIs may influence the vitamin or

mineral content of foods, FDA's principles of rational fortification are expressed in our fortification policy (§ 104.20). The addition of nutrients to foods is also governed by the requirements established in food standards of identity (21 CFR parts 130 to 169), nutrition quality guidelines (21 CFR part 104), substitute food regulations (§ 101.3(e)), and relevant specifications in food additive and food substance regulations (*e.g.,* folic acid (§ 172.345) and vitamin D (§§ 184.1950 and 172.380)). Consistent with our previous position (58 FR 2206 at 2210), we acknowledge that some manufacturers may fortify products to a specific percentage of the DV (*e.g.,* 25 percent) and, to the extent this practice continues, nutrient levels in these foods would be affected by updated RDI values. Manufacturers must comply with relevant regulations, and we urge them to follow the principles stated in our fortification policy. We conclude that the AIs set by the IOM provide an appropriate basis for selecting RDIs for those vitamins and minerals where available data are insufficient to determine RDAs and will not be making a change as a result of this comment.

4. Approach To Setting RDIs: Tolerable Upper Intake Level

The preamble to the proposed rule (79 FR 11879 at 11928) explained that the UL is the highest average daily intake level likely to pose no risk of adverse health effects for nearly all people in a particular group. As intake increases above the UL, potential risk of adverse effects may increase. The UL can be used to estimate the percentage of the population at potential risk of adverse effects from excess nutrient intake, but it is not intended to be a recommended level of intake for vitamins and minerals where excess intake is not a concern, as there is generally no established benefit for consuming amounts of nutrients above the RDA or AI. Thus, we do not consider the UL to be an appropriate basis for setting RDIs for vitamins and minerals.

We did not receive comments on this topic.

5. Approach To Setting RDIs: Population-Weighted Versus Population-Coverage

In the preamble to the proposed rule (*id.*), we discussed how we considered recommendations of current consensus reports, scientific review articles, and comments to the 2007 ANPRM. We tentatively concluded that RDIs for vitamins and minerals should continue to be based on a population-coverage approach (rather than a population-weighted approach), using the highest RDA and, where an RDA has not been established, the highest AI (79 FR 11879 at 11928). We explained that using a population-coverage approach would avoid a higher risk of nutrient inadequacy among certain segments of the population because the RDA/AI value is not derived from averaging the requirements for populations with lower needs (children and elderly) and those with greater needs (adolescents or adults). We acknowledged that, for some nutrients, the population-coverage RDA approach would result in RDIs that are higher than the nutrient requirements for some consumers, but said that the RDA, by definition, is the target intake goal for nutrient intakes for individuals (*id.*).

We proposed to amend § 101.9(c)(8)(iv) to update RDIs and to present the updated RDIs in a table.

(Comment 392) Several comments supported the use of the population-coverage approach, using the highest RDA or AI to set the RDIs. Other comments, however, said we should use the population-weighted approach. Comments supporting the use of a population-weighted approach asserted that a DV derived from the population-coverage RDA will result in setting target intakes for nutrients above the needs for the majority of the population, that the use of a population-weighted RDA would still result in an increase in the RDIs for calcium, vitamin D, and potassium, and that the RDI for iron would decrease from 18 mg to 11 mg, but that this level would still exceed or meet the RDA for 80 percent of the population.

One comment supporting use of a population-weighted EAR disagreed with our rationale that using a population-coverage approach ensures that vulnerable groups are covered; the comment stated that, with the exception of iron, the highest RDAs are those for young men who are not vulnerable to nutrient inadequacies.

A few comments suggested that using a population-coverage approach would set nutrient targets unnecessarily too high and would make it harder for consumers to meet their nutrient requirements while staying within energy needs. Another comment suggested that using a population-coverage approach might lead to consumer confusion and frustration.

(Response) As we discussed in the preamble to the proposed rule (79 FR 11879 at 11928), using the highest age and gender group RDA/AI value (*i.e.,* a population-coverage approach) would avoid a higher risk of nutrient inadequacy among certain segments of the population because such a value is not derived from averaging the requirements for populations with lower needs (children and elderly) and those with greater needs (adolescents or adults). While incidences of deficiency diseases, such as pellagra, are now rare, intakes and status biomarkers of certain nutrients continue to be inadequate and of public health significance. Furthermore, in addition to iron, the proposed RDIs for calcium and vitamin D were based on vulnerable groups. The RDI for calcium was based on the highest RDA of 1,300 mg/day for 9 to 18 year olds, and the proposed RDI of 20 mcg for vitamin D was based on the RDA for adults 70 years and older. All three nutrients have been identified as nutrients of public health concern (see 79 FR 11879 at 11918 through 11922). We continue to use the population-coverage approach to set RDIs and decline to make a change based on this comment.

As for the comment suggesting that using a population-coverage approach would set nutrient targets unnecessarily too high and would make it harder for consumers to meet their nutrient requirements while staying within energy needs, we acknowledge that, for some nutrients, the population-coverage RDA approach will result in RDIs that are higher than the nutrient requirements for some consumers. However, the RDA, by definition, is the target intake goal for nutrient intakes for individuals. In addition, unlike the population-weighted approach, the population-coverage approach would not be susceptible to changes in age demographics of the population. Therefore, any future revisions to RDIs would be based primarily on new scientific data related to nutrition or new dietary recommendations, and we would not need to revise RDIs solely based on the availability of new census data (see 79 FR 11879 at 11928). Furthermore, because many of the new RDAs and AIs established by the IOM are now lower than the older RDAs or ESADDIs that were used in the past to develop RDIs, the new RDIs established in the final rule based on a population-coverage RDA for many nutrients will be lower. We are not aware of, nor did the comment provide, any evidence to suggest that retaining the population-coverage approach would make it harder for consumers to meet their nutrient requirements while staying within energy needs.

As for the assertion that consumers confusion may result, the comments did not provide any data or information that such difficulties or consumer confusion exists or the extent to which such

difficulties or confusion exists, so we are unable to determine the nature or severity, if any, of such consumer difficulties or confusion. We do note that the current DVs on the label are based on a population-coverage approach, and we are not aware of any data and information that the population-coverage approach, which we have used for decades, has caused consumer confusion.

We conclude that setting RDIs based on a population-coverage approach is more appropriate than a population-weighted approach, and we are not making changes to the rule based on these comments. Thus, the final rule, at § 101.9(c)(8)(iv), updates the RDIs for various nutrients and presents them in table form, although we have, on our own initiative, elected to use non-italicized numbers for RDI values that were italicized in the proposed rule and deleted the footnote regarding the declaration of a percent daily value for ''bolded'' (italicized) nutrients.

(Comment 393) Some comments agreed that using the population-coverage RDA does not lead to excessive intakes of nutrients due to over fortification of foods. The comments noted several recent analyses that support our analysis and conclusions that a population coverage RDA would not lead to excessive intakes of nutrients from fortified foods (Refs. 194–195, 225). One comment pointed out that RDIs would likely reset levels of vitamins and minerals in discretionary enriched/fortified foods as manufacturers adjust absolute levels to maintain current label claims. The comment said that, based on diet modeling done by Murphy et al. that assumes that discretionary enrichment/fortification levels reset, a population-coverage RDA would be likely to result in a greater percentage of Americas meeting their nutrient requirements compared to a population-weighted EAR (Ref. 225). Furthermore, the comment said, the results of diet modeling conducted by Murphy that assumed that discretionary enrichment/fortification levels would reset indicated that using a population-coverage approach would result in less than 1 percent of the total populations 4 years of age and older having intakes above the ULs (Ref. 225).

Some comments suggested that the use of a population-coverage RDA could result in over-fortification of products. One comment noted that intakes of zinc exceed the UL for young children. The comment stated that we should not dismiss this finding by challenging the basis for the UL, because doing so fails to recognize the extent to which many American children's intakes currently exceed the UL. The comment stated that the proposed RDI (11 mg) is more than two times the RDA for children 4 to 8 years (5 mg/day) and almost four times the RDA for children 1 through 3 years (3 mg/day). The comment said that a product with 20 percent of the DV for zinc (*e.g.* 11 mg × 0.20 = 2.2 mg) declared on the label would provide almost 100 percent of the zinc RDA for a young child (3 mg/day).

(Response) We disagree with the comment that stated that the use of a population-coverage RDA would lead to excessive fortification and intakes of nutrients. Instead, we agree with the comments that stated that a population-coverage RDA would not lead to excessive intakes of nutrients from fortified foods. As noted in the preamble to the proposed rule (79 FR 11879 at 11928) and the accompanying memorandum to the file (Ref. 199), intakes of vitamins and minerals generally do not exceed the ULs under current RDIs that are based on a population-coverage RDA approach, except for zinc, vitamin A (preformed), iodine, and folic acid among children 4 to 8 years. In these few instances where total usual intakes of vitamins and minerals by children 4 to 8 years exceed corresponding ULs, we have determined that such intakes are not of public health significance, and for some nutrients, are not as a result of fortification (Ref. 199). Analyses done by other groups also have determined that fortified foods contribute to the nutrient intakes and adequacy of many nutrients without leading to excessive intakes for most vitamins and minerals (Refs. 194–195, 225). Furthermore, because many of the new RDAs and AIs established by the IOM are now lower than the older RDAs or ESADDIs that were used in the past to develop RDIs, the final rule's RDIs, based on population-coverage RDAs for many nutrients, will be lower. We consider that, from a public health perspective, it is more important for the DV of vitamins and minerals to cover the intake needs of most consumers than it is for certain age and gender groups to be covered by the DV based on their proportion of the overall population. As discussed in the 2014 memo to the file, we acknowledge that total usual zinc intakes from conventional foods and dietary supplements exceed the UL for approximately 33 percent of children 4 to 8 years of age. The UL for zinc of 12 mg/day was extrapolated upward from the UL set for infants based on decreased copper absorption (Ref. 226). In addition to intake data, we considered whether there is public health significance to exceeding the UL. As noted in the 2014 memo to the file, no reports on adverse effects of zinc on copper absorption have been reported in children and adolescents (Ref. 199). A dose response intervention study published in 2013 found that supplementation with 5 to 15 mg/day of zinc for 4 months did not alter copper status in healthy Canadian boys aged 6 to 8 years (Ref. 227). Furthermore, the proposed RDI for zinc of 11 mg, which is based on the highest new RDA, decreases by 27 percent from the current RDI of 15 mg. In addition, the proposed RDI for zinc of 11 mg does not exceed the UL for children 4 to 8 years of age. The RDIs are currently intended for adults and children 4 or more years of age and not younger children because children over the age of 4 years consume the same foods that the rest of the population consumes. However, as discussed in part II.O.6.k, we also are establishing a RDI of 3 mg for zinc for younger children 1 through 3 years of age.

(Comment 394) Several comments opposed any revision to the RDIs that would lower the RDIs. The comments stated that Americans need more vitamins and minerals because toxin intake is increasing and nutrient intake is decreasing. The comments suggested that our goal was to harmonize our food laws to Codex standards and guidelines and stated that this has been specifically prohibited by Congress. The comments requested that we obey the law and withdraw the proposal rule for revision and bring it in line with modern science which, according to the comments, shows that we need higher daily intake of vitamin B and other vitamins as well as more minerals such as magnesium and selenium.

(Response) We disagree that the RDIs should not be revised. As we discussed in the preamble to the proposed rule, we are revising the RDIs based on our consideration of the RDA or AI set in the most recent IOM DRI reports that are U.S. consensus reports (see 79 FR 11879 at 11926). The comments did not provide any data, information, or explanation to support the various assertions made, including that Americans need more vitamins and minerals due to increased toxins, that the IOM DRI reports are incorrect, that our proposed actions are not consistent with the law and the proposed rule should be withdrawn, or that our goal is to harmonize food labeling with Codex standards and guidelines. We are unaware of new consensus research that would lead us to change our proposed approach to revise the RDIs. Therefore,

we are not making changes or taking any action in response to these comments.

(Comment 395) Several comments objected to lowering the RDIs for specific nutrients such as biotin, niacin, pantothenic acid, riboflavin, thiamin, vitamin B_6, chromium, copper, molybdenum, selenium, and zinc. One comment suggested that we did not outline our specific reasoning for lowering the RDIs for these particular nutrients. Another comment stated that we should reevaluate more recent science that evaluates the effects of high doses of nutrients from foods and supplements and look at clear differences between synthetic and naturally occurring vitamins. Another comment stated that the proposed changes will lead to consumer confusion and a drop in intake as consumers will now perceive foods and supplements to contain a much larger percentage of these nutrients when, in reality, the nutrient level is the same.

(Response) We disagree that RDIs for biotin, niacin, pantothenic acid, riboflavin, thiamin, vitamin B_6, chromium, copper, molybdenum, selenium, and zinc should not be revised. As discussed in the preamble to the proposed rule (see 79 FR 11879 at 11890), we are revising the RDIs based on our consideration of the RDA or AIs set in the IOM DRI reports that are U.S. consensus reports. We consider the quantitative intake recommendations from these reports when establishing RDIs.

As for the comment suggesting that we consider new more recent science, the comment did not identify any new references for us to consider, and we are unaware of any new consensus from a body of research that would lead us to change the rule. However, with respect to synthetic and naturally occurring nutrients, in establishing RDAs or AIs, the IOM does consider the various sources of nutrients (synthetic and naturally occurring) when establishing the nutrient requirements.

As for possible consumer confusion or lower intakes by consumers, we are not aware of any data or information about that outcome, nor did the comment provide any to support its assertions. Although the final rule lowers many RDIs, using the population-coverage RDA to set the RDIs would cover the needs of most individuals in the population. For these reasons, we are making no further changes to the rule based on these comments.

(Comment 396) One comment stated that the current RDIs which are largely based on preventing deficiency diseases are out of date and do not consider nutrient intakes over the lifespan and do not provide consumers with information on optimal amounts of nutrients for good health. The comment cited a review by McCann and Ames that suggest modest deficiency of selenium my increase the risk of age-associated diseases (Ref. 228).

(Response) We agree that the current RDIs are out of date and should be revised. The RDAs set by the IOM which are the basis for the new RDIs, did consider intakes over the lifespan and to the extent possible based on available data consider the relationship between optimal health and intakes of nutrients. The article cited by the comment was a review article and does not include the totality of the scientific evidence for FDA to review. The RDIs are based on our consideration of the RDA or AIs set in the IOM DRI reports that are U.S. consensus reports and we are not aware of any new consensus from a body of research that would lead us to change our proposed approach to revise the RDI for selenium. Therefore, we are not making changes or taking any action in response to this comment.

(Comment 397) Some comments questioned why we are increasing the DV for vitamin C from 60 mg to 90 mg when we determined that the declaration of vitamin C on the Nutrition Facts or Supplement Facts label should no longer be mandatory. A few comments suggested that increasing the DV for vitamin C may negatively impact the consumer perception of this vitamin and result in consumer confusion. The comments suggested the percent DV declaration will be lower because the DV is higher for vitamin C, and so consumers may perceive that the product has changed when it has not. A few comments also suggested that, if the higher DV for vitamin C is adopted, we should engage in consumer education.

(Response) The preexisting RDI of 60 mg was based on the 1968 RDA which is outdated and does not reflect current recommendations for intake of vitamin C. We disagree that the RDI for vitamin C should not be increased because we are no longer requiring mandatory declaration. As we stated in the preamble to the proposed rule (79 FR 11879 at 11928), we are basing the RDIs for vitamins and minerals, including vitamin C, on the highest RDA set by the IOM. Thus, for vitamin C, we set the RDI at 90 mg. The RDIs, which are expressed on the label through the percent DV, give a consumer a general idea how much of a nutrient they should consume.

We recognize that consumer education on the various changes to the label will be important (see part II.B.1). Furthermore, we are not aware of, nor did the comment provide, any data or information that increasing the RDI for vitamin C will lead to consumer confusion.

6. Declaration of Absolute Amounts of Vitamins and Minerals

Our preexisting regulations, at § 101.9(d)(7)(i), require the declaration of mandatory nutrients and, when declared, voluntary nutrients by their absolute amounts in weight on the Nutrition Facts label, except for vitamins and minerals (other than sodium and potassium). Thus, except when the linear label format is used (§ 101.9(j)(13)(ii)(A)(*2*)), listings for sodium and potassium (when declared) appear above the third bar and include both weight amounts and percent DVs, while vitamins A and C, calcium, and iron appear below the third bar and include percent DVs only. In the case of dietary supplements, both the quantitative amount by weight and percent DV (if available) are required to be declared on the Supplement Facts label (§ 101.36(b)(2)(ii) and (iii)). The proposed rule would require that, similar to the requirement for dietary supplements (§ 101.36(b)(2)(i)(A)), all vitamins and minerals declared on the Nutrition Facts label include their quantitative amounts (in addition to the requirement for corresponding percent DV declaration) (proposed § 101.9(c)(8)). We address the comments to this proposed requirement in part II.Q.9.

The proposed rule also would remove the specific requirements for the declaration of potassium in § 101.9(c)(5) and provide, instead, for the declaration of fluoride. The proposed rule also would require that, when a product contains less than 2 percent of the RDI for a vitamin or mineral, the manufacturer must declare the quantitative amount of the vitamin or mineral and the percent DV in the same manner. For example, if a serving of the product contains less than 2 percent of the RDI for calcium, both the quantitative amount and the percent DV for calcium may be listed as zero or an asterisk (or symbol) directing the consumer to a statement at the bottom of the label may be used in place of both the quantitative amount and the percent DV declaration for calcium. We stated that we saw no reason to provide different declaration increments for the Nutrition Facts label than those that have already been established for the declaration of quantitative amounts of vitamins and minerals on the Supplement Facts label in § 101.36(b)(2)(ii).

We also invited comment on whether quantitative amounts for nutrients with

RDI values that contain three or four digits should be rounded, what the rounding increments should be, and data to support rounding increments (79 FR 11879 at 11930, 11961).

(Comment 398) For conventional foods, we specify in § 101.9(c)(8)(iii) that the percent DV declaration for vitamins and minerals present at less than 2 percent of the RDI is not required for nutrition labeling, but may be declared as zero or by the use of an asterisk (or other symbol) that refers to another asterisk (or symbol) that is placed at the bottom of the table and that is followed by the statement ''Contains less than 2 percent of the Daily Value of this (these) nutrient (nutrients).'' Alternatively, the statement ''Not a significant source of (listing the vitamins or minerals omitted)'' may be placed at the bottom of the table of nutrient values.

One comment said that quantitative amounts less than 2 percent of the DV should be exempt from declaration as such amounts are nutritionally insignificant. Other comments suggested that we should not allow for the amount of a nutrient to be declared as zero. These comments suggested that, if there is even the smallest amount of the nutrient in a serving of the product, the amount should be declared.

(Response) We decline to revise the rule to require the declaration of small, quantitative amounts of vitamins and minerals on the Nutrition Facts label. While it may be desirable to have a precise nutrient value on the label, such precision is impractical. There is variability inherent in the food supply. Nutrients found in foods can vary slightly due to many factors such as the season of the year, soil type, variety (cultivar), and weather conditions. The processing that a food undergoes also can alter its nutrient content. The rounding rules were established to avoid the impression of unwarranted accuracy as well as to make a label easier for the consumer to review and understand.

Furthermore, very small quantities of nutrients in a food product do not contribute significantly to nutrient requirements for the total daily diet. A consumer would most likely exceed their calorie needs trying to obtain the recommended amount of a certain nutrient if their diet is made up of only foods that contribute less than 2 percent of the DV for that nutrient. To obtain the recommend amount of that nutrient for the day, the consumer would need to consume other foods containing larger quantities (at least more than 2 percent of the DV for that nutrient) of the nutrient.

(Comment 399) We proposed to use the same declaration increments for the Nutrition Facts label as those that have already been established for the declaration of quantitative amounts of vitamins and minerals on the Supplement Facts label in § 101.36(b)(2)(ii). The proposed rule, at § 101.9(c)(8)(iii), would require that the quantitative amounts of vitamins and minerals on the Nutrition Facts label, excluding sodium, be the amount of the vitamin or mineral included in one serving of the product, using the units of measure and the levels of significance given in § 101.9(c)(8)(iv), except that zeros following decimal points may be dropped, and additional levels of significance may be used when the number of decimal places indicated is not sufficient to express lower amounts (*e.g.,* the RDI for zinc is given in whole milligrams, but the quantitative amount may be declared in tenths of a milligram).

Several comments would change the rule's declaration increments. Two comments asked us to ensure that there is consistency between the rounded absolute amount and the declared percent DV. One comment stated that any declaration of quantitative amounts of vitamins and minerals should provide for declaration of a quantitative amount that corresponds to the nearest whole number of the percent DV beginning with 2 percent. Another comment said that most consumers will not do the math to convert the absolute amount of the percent DV, but providing both absolute amount and percentages could result in different values for similar products in the marketplace.

(Response) We agree that the rounded absolute amount and the declared percent DV may be slightly inconsistent. For example, if the quantitative amount of the vitamin or mineral is rounded after the rounding rules for the percent DV declaration are applied, it could result in a rounded value that is significantly different than the actual amount of the nutrient in a serving of a food. For example, if a product is determined by analytical methods to have 1,550 mg of potassium per serving, the percent DV declaration would be determined by dividing 1,550 mg by the RDI of 4,700 mg for a value of 33 percent. After application of the rounding requirements for the percent DV declaration, the declared percent DV value would be rounded to 35 percent. If the declared quantitative amount of potassium in a serving of the product is then multiplied by 35 percent by the RDI of 4,700, the declared quantitative amount of would be 1,645 mg of potassium. This is a difference of 95 mg between the value obtained before and after applying the rounding rules for the percent DV declaration.

In addition, requiring a declaration of the amount of the nutrient that corresponds to the nearest whole number of the percent DV calculated before rounding could result in declared quantitative amounts that are different than what has been determined by analytical methods, but still not correspond with the rounded percent DV declaration. For example, if testing is done to determine that a product contains 300 mg of potassium per serving, the calculated percentage of the RDI for potassium of 4,700 is 6.4 percent. If that percentage is then rounded to the nearest whole number of 6 percent and then multiplied by the RDI for potassium, it would result in a declared value of 282 mg, which is different than the value which is determined by analytical methods.

The approaches suggested by comments to make the quantitative amount of a vitamin or mineral declared on the label as close as possible to the quantitative amount calculated from the percent DV declaration would either result in a declared value that is either less accurate or no better that the proposed approach. Therefore, we decline to make changes to our label declaration increments.

(Comment 400) One comment said that nutrients with ''equivalents,'' such as Vitamin A, folate, and niacin, make it impossible to simply convert a numerical value to a percentage and could create consumer confusion.

(Response) We disagree with the comment. For those nutrients with ''equivalents,'' the equivalent amount should already be determined for the purposes of the amount declared on the label. For calculation of the percent DV, the declared amount should be divided by the RDI for that nutrient and multiplied by 100. The equivalent amount should already be determined for the label declaration and would not prevent a manufacturer from determining the percent DV declaration for vitamin A, niacin, folate, or folic acid.

(Comment 401) Some comments suggested that less precision is needed for declaration of quantitative amounts of nutrients declared on the label. One comment suggested that the declared amounts should be rounded to whole numbers because they are easier for consumers to understand.

Another comment suggested that any nutrient in an amount greater than 10 units (*e.g.,* 10 mg or 10 mcg) should be rounded to the nearest 1 (unless a larger increment is specified in the proposed

rule, such as ''Calories from saturated fat '' for which 5 calorie increments are specified for amounts up to and including 50 calories), those in an amount greater than 100 units should be rounded to the nearest 10 units (unless a larger increment is specified in the rule), and those in amounts greater than 1,000 units should be rounded to the nearest 100 (unless a larger increment is specified in the rule). The comment suggested that rounding should be based on the declared quantity of a nutrient rather than on the RDI or DRV for the nutrient.

One comment recommended that numbers ending in ''5'' should be rounded up. The comment suggested that we could consider alternatively allowing for numbers ending in 5 to be rounded to the nearest even number, but said this could be confusing and counterintuitive for most members of industry.

Other comments suggested that more precision is needed for declaration of quantitative amounts of nutrients declared on the label. One comment recommended that quantitative amounts be rounded to the nearest tenth instead of to the nearest integer. The comment indicated that rounding errors can occur when quantitative amounts are rounded to the nearest integer.

Another comment also recommended that nutrients be rounded to the nearest tenth of a gram for quantities under 10 grams per serving.

(Response) We disagree that the same rounding increments should be used for quantitative amounts of all vitamins and minerals. Some nutrients, such as potassium, have a relatively large RDI value (4,700 mg) while others, such as thiamin, have a relatively small RDI value (1.2 mg). The declaration of those nutrients with relatively smaller RDI values requires greater specificity than those with relatively larger RDI values. Furthermore, for some nutrients with relatively larger RDI values, it may not be possible, given current analytical methods, to determine the amount of the nutrient with precision when very small quantities are present (*e.g.,* at a level of less than 1 mg).

The comments recommending specific rounding increments of all nutrients based on the number of units in the RDI or DRV value did not explain why those increments are appropriate so that we might determine if the approaches suggested are merited. By using the levels of significance provided in the RDI table in § 101.9(c)(8)(iv), allowing for zeros following decimal points to be dropped, and allowing for additional levels of significance to be used when the number of decimal places indicated is not sufficient to express lower amounts for those nutrients with small RDI values, we are giving manufacturers some flexibility to determine if the value should be rounded to the nearest whole number or to a fraction of a whole number based on the nutrient and the quantity present in a serving of the food.

We recognize that determining the appropriate value to declare for quantitative amounts of vitamins and minerals could be confusing to manufacturers when the rule provides some flexibility based on the RDI and the quantity of the nutrient present in a serving of food, especially for nutrients with relatively small RDIs. For example, the rounding requirements allow a manufacturer to declare an amount of zinc as 2 mg or 2.4 mg per serving. Additionally, consumers use the information found on the label in different ways. Some may use it to get enough of certain nutrients whereas others may be more concerned with not exceeding a certain calorie level. There has always been built in variability in the label declarations due to variation in the food supply and variance in the analytical methods used to determine the amount of nutrients in a serving of a food. The amount of vitamins and minerals declared on a label is not always the exact amount of the nutrient in a serving of the food. Therefore, we decline to revise the increments used for declaration of quantitative amounts of vitamins and minerals as suggested by the comments.

(Comment 402) One comment said that, if the final rule requires the declaration of quantitative amounts of vitamins and minerals, we should provide sufficient guidance regarding rounding rules and how to quantify amounts of naturally occurring substances that inherently are subject to variability (*e.g.,* vitamins and minerals from plants that are subject to variable growing conditions that affect nutrient content).

(Response) There may be different ways in which manufacturers may want to consider the variability in the foods they produce. Manufacturers should know how much variability to expect in the foods they produce based on adequate sampling. Manufacturers should consider the range of nutrients which may be in a finished food product and determine the label value which they think will best meet the requirements for class II nutrients in § 101.9(g).

(Comment 403) One comment suggested we should test any rounding rules which are adopted to ensure that consumers are not confused.

(Response) We established the rounding rules to provide an accurate representation of the amount of a nutrient in the product so that consumers can determine how the nutrients in a serving of a food contribute to their total daily diet. The rounding rules also allow for natural variability in the nutrient content of foods, analytical variability in test methods, and statistical probability, and we have set practical limits of variation in nutrient levels since 1973 (see 38 FR 2125 at 2128 (January 19, 1973) (final rule titled ''Regulations for the Enforcement of the Federal Food, Drug, and Cosmetic Act and the Fair Packaging and Labeling Act Nutrition Labeling'')). We appreciate the need for consumers to be able to understand the information on a product label, yet the comment did not provide information to show how our rounding rules have confused consumers nor did it suggest how such tests would be done. We do not consider the changes we are making to the rounding rules to require consumer testing.

(Comment 404) Our preexisting regulations, at § 101.9(c), provide for the rounding of quantitative amounts of calories and macronutrients declared on the Nutrition Facts label. The requirements vary based on the nutrient. For example, our regulations state that quantitative amounts in milligrams may be listed on the Nutrition Facts label for only two minerals: Sodium (§ 101.9(c)(4)) and potassium (§ 101.9(c)(5)). Our regulations state that, when a serving contains less than 5 mg of sodium or potassium, the value must be declared as zero; when a serving contains 5 to 140 mg of sodium or potassium, the declared value must be rounded to the nearest 5 milligram increment; and when a serving contains greater than 140 mg of sodium or potassium, the declared value must be rounded to the nearest 10 mg increment.

We did not propose any changes to these requirements.

One comment suggested that the amount of calories in a serving of a product should not be rounded because people who are counting calories need to know exactly how many calories are in the product.

(Response) We disagree with the comment. As with quantitative amounts of nutrients, determining the exact amount of calories in a serving of a specific package of food is not possible or practical. The determination of calories is a somewhat imprecise measure. The exact amount of calories per serving in a given food may vary from package to package. Therefore, providing an exact amount of calories

on a food label would give the consumer the incorrect impression that the declared amount is a precise value. Furthermore, providing an exact amount of calories rather than a rounded value is unlikely to provide consumers who count their calories for weight management purposes more helpful information because consumption of an extra 5 or 10 calories in a given food is unlikely to have a significant impact on body weight when most adults need to consume well over 1,000 calories per day, even when trying to lose weight.

(Comment 405) Our preexisting regulations, at § 101.9(g)(5), state, in part, that a food with a label declaration of calories, sugars, total fat, saturated fat, *trans* fat, cholesterol, or sodium shall be deemed to be misbranded under section 403(a) of the FD&C Act if the nutrient content of the composite is greater than 20 percent in excess of the value for that nutrient declared on the label. The regulation goes on to say ''Provided, That no regulatory action will be based'' on a determination of a nutrient value that falls above this level by a factor less than the variability generally recognized for the analytical method used in that food at the level involved.

The proposed rule would amend § 101.9(g)(5) to insert ''added sugars'' after the word ''sugars'' and delete the words ''Provided, That.''

One comment would revise § 101.9(g)(5) to stipulate that products labeled in accordance with the rounding or increment requirements are not misbranded if the use of such rounding or increments causes the content of calories, sugars, total fat, saturated fat, *trans* fat, cholesterol, or sodium to be understated by more than 20 percent. The comment explained that § 101.9(g)(5) leaves companies vulnerable to lawsuits under state consumer protection laws because a company could be sued for selling a ''misbranded'' product labeled as containing 5 calories per serving when the actual caloric content is just over 6 calories per serving, despite the fact that the product's labeling meets our requirement to express the number of calories to the nearest 5 calories.

(Response) We decline to revise the rule as suggested by the comment. Section 101.9(g)(6) states that reasonable deficiencies of calories under labeled amounts are acceptable within current good manufacturing practice. We continue to consider the variability generally recognized for the analytical method used and reasonable deficiencies of declared amounts acceptable within current good manufacturing practice when evaluating label compliance and making determinations regarding misbranding charges. We also recognize that § 101.9(c)(1) provides several methods for determining calories, which also allows manufacturers flexibility in determining the declared calorie value. Thus, the regulations provide for variability that is acceptable under our regulations.

(Comment 406) One comment recommended that fractions of quantities should be shown per serving for nutrients such as *trans* fat because some people consume multiple servings of a product at the same time and may not realize that they add up to greater than 1 gram per serving.

(Response) We decline to revise the rule as suggested by the comment. We note that the requirements of § 101.9(c) do require the declaration of total fat, saturated fat, *trans* fat, and monounsaturated fat be expressed using fractions, which are the nearest 0.5 gram increment below 5 grams. For many macronutrients, it is not possible for manufacturers to declare fractions of a gram or mg amount on the label due to the level of variability inherent in the analytical methods used to determine the amount of the nutrient.

Similar comments recommended that we require manufacturers to declare amounts of *trans* fat when present at less than 0.5 grams per serving of a food. We address those comments in part II.F.3.d.

(Comment 407) One comment suggested that we allow for grams of dietary fiber to be rounded to the nearest 0.5 grams. The comment noted that the proposed DV for children 1 through 3 years of age is 14 grams. Therefore, the comment said, 10 percent of the DV for that age group would be equivalent to 1.5 grams of dietary fiber, and 20 percent of the DV for that age group would be 2.5 grams. The comment also noted that 10 percent of the current DV for the general population of 25 g would be 2.5 grams. The comment suggested that allowing for fiber to be declared in 0.5 gram increments up to 5 grams could help facilitate consumer communication and help reduce any confusion with respect to claims.

(Response) We decline to revise the rule as suggested by the comment. The declaration of dietary fiber is expressed in increments of 1 gram due to the level of precision of analytical methods for dietary fiber. The level of precision of the methods for determining dietary fiber do not allow for the accurate determination of the amount of dietary fiber in increments of less than 1 gram per serving.

7. Issues Concerning Specific Vitamins and Minerals

The preamble to the proposed rule discussed issues related to RDIs for vitamin K, chloride, potassium, choline, and vitamin B_{12} (79 FR 11879 at 11930).

a. Vitamin K. The preamble to the proposed rule noted that there are three general forms of vitamin K: Phylloquinone (vitamin K_1), menaquinone (vitamin K_2), and menadione (vitamin K_3) (id.). For labeling purposes, there is no specific definition for vitamin K and the AI for vitamin K is based on the intake of phylloquinone, the major form of vitamin K in the diet. The proposed rule, at § 101.9(c)(8)(iv), would establish 120 mcg as the RDI for vitamin K.

(Comment 408) One comment supported using the AI for vitamin K which pertains only to phylloquinone.

Other comments objected to limiting the RDI for vitamin K to phylloquinone (Vitamin K_1). The comments stated that menaquinone contributes to the nutritional requirements for vitamin K and should be included in the definition. One comment stated that inclusion of menaquinone would be in line with other regulatory bodies such as EFSA and Health Canada. One comment also noted that dairy and meat products are important sources of menaquinone and contribute to the daily intake of vitamin K. The comment stated that the bioavailability of menaquinone has been demonstrated using both in vitro and in vivo studies. The comment also stated that menaquinone is rapidly absorbed intact from the gastrointestinal tract (Ref. 229) and is more bioavailable than phylloquinone, which is strongly bound to vegetable fiber (Refs. 229–230). The comment also noted that it has been well-established that dietary intake of phylloquinone meets the nutritional requirements necessary for coagulation through the activation of biochemical pathways in the liver. The comment also noted that menaquinone has similar activity as phylloquinone in the blood coagulation system (Ref. 229), and data also suggest an important role for menaquinone in extra-hepatic processes. The comment stated that menaquinone intake has been shown to have a protective effect against CHD (Ref. 231), helps regulate bone metabolism, and plays a role in reducing the risk of osteoporotic fractures (Refs. 229, 232). The comment pointed out that the USDA database (2014) now includes vitamin K_2. The comment also requested that we include phytonadione, which is an additional

name for vitamin K_1, in the definition of vitamin K.

(Response) We agree that the AI should be used as the basis for the RDI for vitamin K. However, we disagree that the definition of vitamin K should include menaquinones. While the comment referred to actions by Health Canada, we note that Health Canada also is proposing using the AI for the RDI for vitamin K (Ref. 233). Furthermore, the EFSA review cited by the comment was a safety assessment for vitamin K_2 as a source of vitamin K added to foods and was not an assessment of the possible nutritional benefits of vitamin K_2 (Ref. 229). One study (Ref. 232) submitted by a comment was a review article on menaquinone-4 and osteoporosis and did not provide data for us to evaluate. It does not represent the totality of the scientific evidence on menaquinones and does not provide sufficient information for FDA to review. The other two studies, Gast et al., 2009 and Geleijnse et al., 2004, were prospective cohort studies that showed an association of menaquinone intake and reduced risk of CHD. Intakes for menaquinone in these two studies were estimated from food frequency questionnaires and, because food composition data for menaquinones is limited, the results of these studies should be interpreted with caution (Refs. 230–231). As we stated in the preamble to the proposed rule (79 FR 11879 at 11930), the AI for vitamin K does not account for the intake of menaquinone or menadione because: (1) The NHANES data that was used as the basis for the AI only included the phylloquinone content of foods; (2) the contribution of menaquinones, which can be produced by bacteria in the gut, to the maintenance of vitamin K status has not been established; and (3) menadione is a synthetic form of vitamin K that can be converted to a form of menaquinone in animal tissues. In addition, menaquinones are poorly understood in terms of vitamin K absorption and utilization (Refs. 234–236). Unlike phylloquinone, there have been no stable isotope studies conducted with menaquinones that are needed to improve the understanding of menaquinone bioavailability and metabolism (Ref. 235). While the USDA National Nutrient Database for Standard Reference Release 27 includes data on one form of menaquinones (menaquinone-4), there are limited food composition data available (490 foods out of 8,618 or <6 percent in USDA NND SR27) (Ref. 4), and estimates of intakes of menaquinones are very limited. Furthermore, we generally consider U.S. dietary recommendations, consensus reports, and U.S. national survey data to develop our regulations.

While we decline to include menaquinone in a definition of vitamin K, we note that information about menaquinones that might be added to a food may be listed in the ingredient list to alert consumers that other forms of vitamin K are present in the product. We also discuss the labeling of menaquinone as a dietary ingredient in part II.P (Dietary Supplements).

We also disagree that the term phytonadione should be included in the definition for vitamin K. ''Phytonadione'' is U.S. Pharmacopeia Convention's (USP) nomenclature for ''phylloquinone,'' and both have the same structure (Ref. 237). In the Nutrition Facts label, phylloquinone is declared as vitamin K (§ 101.9(c)(8)). Furthermore, for dietary supplements, labeling representations that the source ingredient conforms to an official compendium may be included either in the nutrition label or the ingredient list (*e.g.,* calcium (as calcium carbonate USP) (§ 101.36(d)(3)).

Thus, the final rule establishes, in § 101.9(c)(8)(iv), an RDI for vitamin K of 120 mcg based on the AI that pertains only to phylloquinone. We are making no changes to the rule based on these comments.

b. Chloride. The preamble to the proposed rule (79 FR 11879 at 11930) stated that, under our preexisting regulations, the RDI for chloride is 3,400 mg (§ 101.9(c)(8)(iv)) and is based on the midpoint of the range (1,700 to 5,100 mg/day) of the ESADDI. The proposed rule would have chloride remain a RDI, but based on a population-coverage AI of 2,300 mg/day.

We did not receive comments on the RDI for chloride and have finalized it without change.

c. Potassium. The preamble to the proposed rule (id.) explained that the DRV of 3,500 mg for potassium was established based on its beneficial health effects (*e.g.,* reduction in blood pressure) and that we established a DRV rather than an RDI because an RDA for specific age and gender groups was not established in 1990 (when we issued various regulations related to nutrition information on food labels). However, because potassium is an essential mineral and because age- and gender-specific AIs became available in 2005, we proposed to establish an RDI for potassium, instead of the DRV, and thus revise § 101.9(c)(8)(iv) to set the RDI for potassium at 4,700 mg.

We did not receive comments directly on the RDI for potassium, although some comments opposed using the AI for potassium to establish an RDI of 4,700 mg. We address those comments in part II.M.3 (see comment 391). The final rule, at § 101.9(c)(8)(iv), establishes an RDI of 4,700 mg for potassium.

d. Choline. Our existing regulations do not establish a reference value for choline. The preamble to the proposed rule noted that the IOM established age- and gender-specific AIs for choline based on intakes necessary to maintain liver function and that, in 2001, we received a FDAMA notification under section 403(r)(2)(G) of the FD&C Act for the use of certain nutrient content claims for choline (79 FR 11879 at 11930). The FDAMA notification identified the DV for choline as 550 mg, which was based on the population-coverage AI for choline. Thus, the proposed rule, at § 101.9(c)(8)(iv), would set an RDI of 550 mg for choline based on the population-coverage AI.

(Comment 409) Several comments agreed with the proposed RDI for choline.

(Response) The final rule, at § 101.9(c)(8)(iv), establishes an RDI of 550 mg for choline.

e. Vitamin B_{12}. The proposed rule would lower the RDI for Vitamin B_{12} from 6 mcg/day to 2.4 mcg/day to reflect the population-coverage RDA for Vitamin B_{12} established by the IOM in 2000 (Ref. 238). We acknowledged that lowering the RDI from 6 to 2.4 mcg could result in a reduction of the fortification level in foods, such as ready-to-eat breakfast cereals, thereby decreasing the overall amount of crystalline vitamin B_{12} in the food supply (see 79 FR 11879 at 11930). (The preamble to the proposed rule (id.) also noted that individuals older than 50 years of age meet their RDA mainly by consuming foods fortified with crystalline vitamin B_{12} or vitamin B_{12}-containing supplements.)

(Comment 410) Some comments supported our use of the RDA set by the IOM to revise the RDI for vitamin B_{12}. One comment noted that, if the proposed RDI was adopted, manufacturers of fortified ready-to-eat cereals and other products may adjust fortification levels of vitamin B_{12} to maintain their current DV claim levels, thereby reducing the amount of crystalline vitamin B_{12} in the food supply. However, the comment stated that, based on an analysis by Murphy et al., this change would not lead to a significant increase in the proportion of the population with inadequate dietary intakes of vitamin B_{12}. The comment said that the Murphy study indicated that the difference in the proportion of the total population with usual intakes

of vitamin B_{12} less than the EAR would be about 3 percent regardless of whether the revised RDI was based on a population-weighted EAR or a population-coverage RDA, and this would be within 2 percentage points of the percentage calculated by using the current DV. The comment noted that the results for older adults and teenage girls were a little higher, but similar regardless of the approach. The comment recommended that we continue to promote vitamin B_{12} intake in at-risk subpopulation groups and to continue monitoring population intake.

Other comments opposed lowering the RDI for vitamin B_{12} and said we should retain the RDI of 6 mcg for vitamin B_{12}. The comments expressed concern that a substantial decrease in the RDI would result in lower amounts of crystalline vitamin B_{12} in food and dietary supplements. The comments stated that this decrease would make it more difficult for those at-risk for deficiency, including older adults, vegetarians, and vegans, to achieve adequacy for this nutrient. The comments noted that the IOM and DGA recommended these at-risk groups should consume the crystalline forms.

(Response) The final rule adopts an RDI for vitamin B_{12} of 2.4 mcg based on the RDA. The RDA was established by the IOM in 2000 for all adults and can be met by consuming natural and crystalline forms. While the IOM noted that it is advisable that individuals older than 50 years of age meet their RDA mainly by consuming foods fortified with crystalline vitamin B_{12} or vitamin B_{12}-containing supplements, less than 1 percent of men and 6.4 to 7.5 percent of women older than 50 years of age consume below the EAR for vitamin B_{12}, while only 3 to 5 percent of men and women in this age group have serum vitamin B_{12} levels that are considered to be inadequate (2003–2006 NHANES) (see 79 FR 11879 at 11930). Based on the data provided by the comment in support of lowering the RDI, it is unlikely that lowering the RDI will result in a significant increase in the proportion of the population with inadequate dietary intakes of vitamin B_{12}. If we became aware that foods are formulated as a result of this final rule, leading to lower amounts of crystalline B_{12} are in the food supply, we would consider the need for consumer education, particularly for at-risk individuals who may need to increase intake of certain foods to meet nutrient needs.

N. Units of Measure, Analytical Methods, and Terms for Vitamins and Minerals

The preamble to the proposed rule (79 FR 11879 at 11931) discussed how the IOM set DRIs using new units of measure for vitamin A, vitamin E, and folate and provided recommendations on the use of International Units (IUs) and the expression of weight amounts for sodium, potassium, copper, and chloride. The new units of measure for vitamin A, vitamin E, and folate affect how total amount of each nutrient is measured.

1. General Comments

(Comment 411) While we did not request comment on using teaspoons or tablespoons as units of measure, several comments supported using teaspoons (tsp) and tablespoons (tbsp) in addition to or instead of grams (g) for nutrients. The comments said that consumers use these common household measures in recipes and can visualize them.

In contrast, other comments recommended using only metric units, such as grams, only because they are more precise and used by other countries.

(Response) We address this issue in part II.B.3.

2. Sodium, Potassium, Copper, and Chloride

Our preexisting regulations at § 101.9(c)(9) and (c)(8)(iv) express the units of measurement for sodium, potassium, copper, and chloride in milligrams. Although the preamble to the proposed rule (79 FR 11879 at 11931) discussed IOM recommendations to use grams rather than milligrams (mg) and how comments to the 2007 ANPRM supported retaining mg instead of using grams, we declined to propose any changes to the units of measure for these nutrients.

(Comment 412) Several comments supported retaining the declaration of ''mg'' for sodium and potassium. Other comments recommended the use of ''mg'' for calcium and phosphorus, but did not explain their reasoning.

(Response) For reasons stated in the preamble to the proposed rule (79 FR 11879 at 11931), we agree with retaining ''mg'' for the units of measure for sodium, potassium, copper, and chloride, so the units of measure in § 101.9(c)(8)(iv) and (c)(9) remain unchanged.

As for calcium and phosphorus, we did not propose changing the units of measure, and so the final rule continues to use ''mg'' as the unit of measure for calcium and phosphorus.

3. Folate and Folic Acid

a. Units of measure. Our preexisting regulations, at § 101.9(c)(8)(iv), have the RDI for ''folate'' in micrograms. In the preamble to the proposed rule (79 FR 11879 at 11931 through 11932), we explained how, in 1998, the IOM set the RDA for folate expressed as microgram (mcg) Dietary Folate Equivalents (DFE) and how the IOM Labeling Committee recommended that the use of similar units of measure in nutrition labeling. The preamble to the proposed rule explained how the IOM developed the new term, DFE, to account for the greater bioavailability of synthetic folic acid that is added to fortified foods or dietary supplements than folate that occurs naturally in foods (food folate) and that mcg DFE is equivalent to mcg food folate + (1.7 × mcg synthetic folic acid) (id. at 11932). The proposed rule would amend § 101.9(c)(8)(iv) to use mcg DFE to declare the amount of total folate (food folate and synthetic folic acid) on the Nutrition Facts label. The proposed rule would make a similar change, at § 101.36(b)(2)(ii)(B), with respect to the declaration of folic acid on the Supplement Facts label.

The preamble to the proposed rule (79 FR 11879 at 11932) also stated that we are aware that education efforts should be provided to help consumers understand the new ''equivalent'' units of measurement for folic acid. We said that one option to help ensure consumer understanding would be to allow the declaration of the mcg amount of folic acid in parentheses in addition to declaring the amount of folate in mcg DFE and percent DV based on mcg DFE.

(Comment 413) Although one comment supported using DFEs as the unit of measure, many comments said we should retain the preexisting DV of 400 mcg folate or folic acid and not adopt DFEs as the unit of measure.

Several comments stated that using mcg DFE as the unit of measure will confuse the public, limit the ability to monitor folate/folic acid intake and safety, and could negatively impact birth outcomes. The comments said that entities such as the IOM, the Centers for Disease Control and Prevention, the U.S. Public Health Service (USPHS), and the March of Dimes have educated the public on the importance of women of child-bearing age consuming at least 400 mcg of synthetic folic acid daily to help prevent neural tube defects. The comments said that changing the unit of measure may promote suboptimal intake of the nutrient, especially if women do not understand the difference in the bioavailability of

naturally occurring folate versus synthetic folic acid.

Other comments stated that an educational campaign would be necessary, especially for obstetricians and women of child-bearing age, to teach them how to achieve adequate dietary folate levels if we were to use mcg DFE as the unit of measure. The comments said we should continue to declare the amount of folic acid in micrograms along with the percent of DV (based on the PHS recommendation) in both the Nutrition and Supplement Facts.

(Response) As we stated in the preamble to proposed rule (79 FR 11879 at 11932), the IOM developed the DFEs to reflect the most current recommendation for folate/folic acid for the general healthy U.S. population. The DFE accounts for the differences in bioavailability between food folate (natural folate) and folic acid which is more bioavailable (about 1.7 times more bioavailable). Use of mcg DFE on the label is important to make sure that the consumer is aware of the total amount of folate in a serving of food. For example, assume that the level of total folate in a packaged cereal is approximately 200 mcg folate per serving. If all of the folate in the cereal is added folic acid, then the amount of folate would be 340 mcg DFE (200 mcg $\times$ 1.7) because folic acid is more bioavailable than folate. This value is higher than the RDA set by IOM for children 4 to 8 years of age (200 mcg DFE). Thus, if we retained mcg as the only unit of measure for folate, we would not differentiate between folic acid and food folate in food, and we would underestimate the contribution of fortified foods to the folate requirement; consequently, consumers may think they need more folate/folic acid than they receive from a food that contains both folate and folic acid.

As for the comment suggesting that we allow the use of both mcg and mcg DFE as units of measure, we agree that declaring the amount of folic acid in mcg will provide information that women of childbearing age need in order to understand the unique contribution of synthetic folic acid from a food, given the differences in bioavailability compared to folate and nutrition recommendations for risk reduction of neural tube defects (Ref. 238).

With respect to dietary supplement labeling, if a dietary supplement has added synthetic folate or a claim is made about folate, the manufacturer must include the declaration of folate as a quantitative amount by weight of folate (mcg DFE folate), and the percent DV based on mcg DFE folate in the Supplement Facts label. If a dietary supplement has added folic acid (alone or in combination with natural or synthetic folate), or a claim is made about folic acid, the nutrient declaration must include folate as a quantitative amount by weight of folate (mcg DFE folate), and the percent DV based on mcg DFE folate, in addition to the quantitative amount by weight of folic acid (mcg folic acid) in parentheses. If a dietary supplement has naturally occurring folate (with no folic acid added) and a claim is not made about folate, the manufacturer may voluntarily declare folate as a quantitative amount by weight in mcg DFE and percent DV based on mcg DFE folate.

With respect to conventional food labeling, if a conventional food has naturally occurring folate (with no folic acid added) and there is no claim made about folate, the manufacturer can voluntarily declare folate in the Nutrition Facts label. If the manufacturer voluntarily declares folate, the manufacturer may declare folate followed by the percent DV based on mcg DFE folate, or alternatively, can declare the quantitative amount by weight in mcg DFE folate followed by the percent DV based on mcg DFE folate. If a claim is made about folate, the manufacturer must declare folate either by declaring folate as the percent DV folate based on mcg DFE folate, or as the quantitative amount by weight in mcg DFE folate followed by the percent DV based on mcg DFE folate. If folic acid is added to the conventional food, the manufacturer must declare folate either by declaring folate as the percent DV folate based on mcg DFE, or as the quantitative amount by weight in mcg DFE folate followed by the percent DV based on mcg DFE folate, in addition to the quantitative amount of folic acid in mcg in parentheses. This will provide the needed information about the amount of folic acid in a conventional food or dietary supplement for women who are capable of becoming pregnant. Declaring folate, either as a quantitative amount in mcg DFE followed by the percent DV or only as a percent DV based on mcg DFE, and, mcg folic acid, in circumstances when folic acid is added or claims are made about folic acid, the declaration of folate/folic acid should provide adequate and correct information for the general U.S. population, including the women of childbearing age.

As for the comments regarding the need for an educational campaign, we agree that it is important for changes to the labeling to be accompanied by education efforts to help consumers understand the new labels (see part II.B.1). We intend to coordinate education and outreach efforts with Federal Agencies and other organizations with an interest in nutrition and health to emphasize, among other things, the newly adopted units of measure for folate in mcg DFE, percent DV based on mcg DFE, and mcg of folic acid for the first time on the Nutrition Facts and Supplement Facts labels.

(Comment 414) Several comments were concerned about the removal of mcg folic acid from the food label. Some comments stated that, by only reporting mcg DFE folate on the label, it would no longer be possible to measure the percentage of a subpopulation that consumes in excess of the UL for folic acid. The comments said that intake data is obtained through the NHANES, which uses food labels to collect information on the type and amount of micronutrients (including folic acid) contained in food products.

Other comments stated that limiting the units of measure to mcg DFE would make it difficult for consumers to make an informed decision regarding their actual folic acid intake. The comments said that this is a particular concern for older adults who are at greater risk for developing macrocytic anemia due to a deficiency of vitamin B_{12} and that this condition could be masked by excessive intake of folic acid from fortified foods and/or supplements. Other comments stated that the introduction of mcg DFE as the unit of measure for folic acid may prompt some manufacturers (who currently provide 100 percent of the DV for folic acid) to reduce the amount of folic acid in their products. For example, the manufacturer of a dietary supplement that currently contains 100 percent of DV for folic acid (400 mcg folic acid) may reduce the amount to 235 mcg folic acid or 400 mcg DFE to retain 100 percent DV.

(Response) As stated in our response to comment 413, we are not limiting the units of measure for folic acid to mcg DFE folate on the Nutrition Facts label. If folic acid is added or claims are made about folic acid, the Nutrition Facts label must include the declaration of folic acid as a quantitative amount by weight in mcg folic acid.

With respect to measuring the percentage of a subpopulation that consumes in excess of the UL for folic acid, we note that the rule was not intended nor designed to facilitate such research. The Nutrition Facts label provides information to assist consumers in maintaining healthy dietary practices. By having only mcg DFE or mcg of folic acid on the label,

it would not be possible to determine the percentage of a subpopulation that exceeds the UL for folic acid. To determine the percentage of a subpopulation with folic acid intake in excess of the UL, one would have to perform an analysis using the consumption data from NHANES and the UL set by IOM for various age and gender groups.

As for the comment's statements regarding NHANES, What We Eat in America (WWEIA)/NHANES does not use only food labels to collect information on the type and amount of micronutrients contained in food products. The preexisting Nutrition Facts label declares folate in mcg which represents both natural folate and synthetic folic acid, without taking into account differences in bioavailability factors. The WWEIA/NHANES currently reports the amount of folate consumed as mcg DFE, as well as folic acid (mcg), food folate (mcg), and total folate (mcg). Thus, the Nutrition Facts label is not the sole source of information for folate and folic acid for this database.

As for older adults and the risk of developing macrocytic anemia due to a deficiency of vitamin B_{12}, we disagree that using mcg DFE on the label will put older adults at greater risk. The current Nutrition Facts label does not differentiate between synthetic folic acid and naturally occurring folate in the food label. The folate RDA for individuals 19 years of age and older is 400 mcg DFE, and not 400 mcg folic acid. The DFE accounts for the differences in bioavailability between food folate (natural folate) and folic acid (which is approximately 1.7 times more bioavailable than food folate). Therefore, by declaring folate as mcg DFE and percent DV based on mcg DFE folate, as applicable, on the Nutrition Facts label, the total folate will be reported and will provide the majority of the general, healthy U.S. population (including older individuals) a more accurate amount of their intake. Furthermore, by requiring the mandatory declaration of the amount of folic acid as mcg folic acid in parentheses, when folic acid is added or a claim is made about it, women of childbearing age will have the information they need to understand the unique contribution of synthetic folic acid from a food to adhere to nutrition recommendations to reduce the risk of neural tube defects. In addition, other consumers, such as older adults, can determine how much folic acid is in a serving of food.

With respect to reformulation, the comment did not provide any evidence to suggest that reformulation would occur, and so we have no basis to determine the extent to which reformulation might occur or whether reformulation would present any potential issues with respect to consumption of folate. We note, however, that if manufacturers decrease the amount of folic acid from 400 mcg folic acid to 400 mcg DFE to retain the 100 percent DV, the needs of the majority of the U.S. population will be met. For the majority of U.S. population, the RDA and its unit of measure is mcg DFE folate and not mcg of folic acid. Therefore, reporting total folate as mcg DFE folate and percent DV based on mcg DFE is more accurate.

(Comment 415) Several comments stated that, for a dietary supplement that is ingested on an empty stomach, 1 mcg DFE is equivalent to 0.5 mg folic acid and is therefore subject to the conversion factor of 2.0 not 1.7. The comment said we should clarify this in the final rule if we adopt DFEs as the unit of measure.

(Response) We are not limiting the units of measure to DFEs in the final rule. The IOM defined DFE as follows: 1 mcg DFE = 1 mcg food folate; 1 mcg DFE = 0.6 mcg folic acid from fortified foods or dietary supplements consumed with foods; 1 mcg DFE = 0.5 mcg folic acid from dietary supplements taken on an empty stomach. We do not know how many people take a supplement containing folic acid on an empty stomach or with a meal. To ensure consistency in the labeling of conventional foods fortified with folic acid, dietary supplements containing folic acid, and dietary supplements containing folic acid that may also contribute calories and other nutrients, we conclude that using the conversion factor of 0.6 mcg (multiply by 1.7) for folic acid is appropriate. The final rule requires dietary supplements to include the declaration of the quantitative amount of folic acid, when added or when a claim is made about folic acid, in addition to folate in mcg DFE and percent DV based on mcg DFE. The final rule also states that 1 mcg DFE is equal to 1 mcg naturally occurring folate and equal to 0.6 mcg folic acid.

(Comment 416) Some comments said that mcg DFE fails to take into consideration the higher bioavailability of synthetic folates compared with naturally occurring dietary folate and should not be used on labels. The comments said that added L–5-methyltetrahydrofolate (also known as L–5–MTHF or L–MTHF) would be assigned the same bioavailability as naturally occurring folate and would underestimate the true bioavailability of the folate in the food. The comments noted that both the calcium and glucosamine salts of L–5–MTHF have bioavailabilities similar to folic acid. The comments said we should support a conversion factor equivalent to that for folic acid (× 1.7) for the labeling of these synthetic folates in dietary supplements and conventional foods.

(Response) The use of synthetic folates (*i.e.,* calcium and glucosamine salts of L–MTHF) in dietary supplements, and the appropriate conversion factor for these substances, warrants further review. We are not aware of the use of any synthetic folates, including calcium and glucosamine salts of L–5–MTHF, in conventional food. We note that folic acid is regulated as a food additive under § 172.345; the additive is identified as (N-[4-[[(2-amino-1,4-dihydro-4-oxo-6-pteridinyl) methyl]amino]benzoyl]-L-glutamic acid; CAS Reg. 59–30–3) for use as a nutrient in foods and may be added to conventional foods subject to a standard of identity when the standard provides for the addition of folic acid; to breakfast cereal and corn grits at specified levels; and to infant formula according to applicable regulations (§ 172.345). Conditions of use of folic acid in medical foods, foods for special dietary use, and for meal-replacement products also are included in § 172.345. Additional uses of folic acid as described in § 172.345 would require submission of a food additive petition asking us to amend the regulations to allow for the additional use. Information on submitting a food additive petition is described in § 171.1. Manufacturers of food products that contain other forms of folic acid or synthetic folate, such as calcium and/or glucosamine salts of L–5–MTHF should consult the Office of Food Additive Safety to determine the appropriate regulatory pathway for the lawful use of their products.

Although we asked for comment in the 2007 ANPRM about whether the current DV units for folate (mcg folate) should be consistent with the IOM DRI reports for folate (mcg DFE) (72 FR 62149 at 62170), we did not ask about the use of synthetic folate, such as calcium and/or glucosamine salts of L–5–MTHF in food, including dietary supplements, or invite comment about the conversion factor for synthetic folate compared to that for folic acid. Therefore, we intend to consider the comparability of synthetic folates in dietary supplements and the need for a conversion factor for each in a separate rulemaking. Until such rulemaking is completed, we do not intend to object to a manufacturer using its own established conversation factors, provided that the declaration is truthful and not misleading. We would not

expect a conversion factor to exceed 1.7 (comparable to folic acid) when reporting mcg DFE on the Supplement Facts label. Any declaration of mcg DFE for a dietary supplement that represents in whole or in part the amount of synthetic folate present, for which a conversion factor was applied, must be truthful and not misleading under section 403(a) and 201(n) of the FD&C Act. We will be able to determine the conversion factor used through information obtained from records required by this final rule for natural folate, folic acid, and synthetic folate present in the product and the declared mcg DFE on the label.

(Comment 417) The preamble to the proposed rule also stated that we are aware that education efforts should be provided to help consumers understand the new ''equivalent'' units of measure for folic acid (79 FR 11879 at 11932). We also said that one option to help ensure consumer understanding would be to allow the declaration of the amount of folic acid in parentheses in addition to declaring the amount in mcg DFE, and we invited comment on this option (id.).

Several comments stated that, if DFEs are to be included on food labels, the mcg of folic acid must be included in parentheses. The comments said that the IOM recommended that women who may become pregnant consume 400 mcg of folic acid in addition to the RDA. The comments also said that using mcg DFE alone as the unit of measure will make it difficult for women to discern how much of their daily intake is from folic acid and which foods would be best choices for ensuring a daily intake of 400 mcg folic acid a day. The comments added that this approach could put women at higher risk for having a neural tube defect affecting a pregnancy. Some comments also noted that there may also be conventional foods containing only added folic acid, such as meal replacement foods based on protein concentrates that do not contain significant levels of naturally occurring folate.

(Response) We agree that including the mcg folic acid when added to a food or when a claim is made about folic acid is necessary to help women of childbearing age determine the amount of folic acid in each food. Thus, we have revised § 101.9(c)(8)(iv) and (c)(8)(vii) to require the declaration of folic acid in mcg under such circumstances.

(Comment 418) Some comments stated that we should retain the current DV of 400 mcg as folate or folic acid without adopting a DFE approach, along with the percent DV (based on the PHS recommendation) in both the Nutrition and Supplement Facts labels. One comment suggested that an educational campaign would be necessary, especially for obstetricians and women of child-bearing age, to teach them how to achieve adequate dietary folate levels if we adopt the mcg DFE unit of measure.

(Response) We agree that consumer education regarding the new unit of measure will be helpful (see part II.B.1 for a discussion of educational activities). We disagree that we should retain the DV and the percent DV based on the amount of mcg of folic acid. The DV and the percent DV should be based on mcg DFE, which reflects the most current recommendation for folate/folic acid for the general U.S. population and takes into account the differences in bioavailability between food folate and folic acid which is more bioavailable.

b. Analytical methods. The preamble to the proposed rule (79 FR 11879 at 11932) noted that available analytical methods cannot distinguish between naturally occurring folate in conventional food and folic acid that is added to conventional food products. To calculate DFEs, the preamble to the proposed rule (id.) explained that it is necessary to know both the amount of folate and folic acid in the food product, and so proposed § 101.9(g)(10) would require manufacturers to make and keep records to verify the amount of folic acid added to the food and folate in the finished food, when a mixture of both naturally occurring folate and added folic acid are present in the food.

(Comment 419) We did not receive any comments with respect to scientifically valid methods for determining folate and folic acid separately. However, one comment objected to the proposed recordkeeping requirement.

(Response) We decline to revise the rule to remove the recordkeeping requirement. In the absence of an analytical method that distinguishes between folate and folic acid, records are necessary to demonstrate compliance with the label declaration and include written records of the amount of folic acid added to the food (conventional food or dietary supplement), the amount of synthetic folate, if added to the dietary supplement, and naturally occurring folate in the finished product. Without such records, we would be unable to determine or verify the amounts and also would not be able to determine whether the mcg DFE value listed on the label is correct.

(Comment 420) Proposed § 101.9(g)(10)(vii) would require manufacturers to make and keep written records of the amount of folic acid added to the food and folate in the finished food when a mixture of folate and folic acid is present in that food. One comment would revise § 101.9(g)(10)(vii) to state that, when folic acid and/or purified folate salts (*e.g.,* L-methylfolate) is added to a food, manufacturers must make and keep written records of the amount of folic acid, and/or purified folate salt, added to the food, as well as the amount of naturally occurring folate if present. The comment noted that these records will be necessary any time folic acid or folate salt is added to food to justify the calculation of the declared mcg DFE, even if no naturally occurring folate is present.

(Response) We agree that when folic acid is added to a conventional food or dietary supplement and synthetic folate (*e.g.,* L–5–MTHF) is added to a dietary supplement, manufacturers must keep written records of the amount of synthetic folate added to a dietary supplement and the amount of folic acid added to the conventional food or dietary supplement as well as the amount of naturally occurring folate in the finished conventional food or dietary supplement. We have revised § 101.9(g)(10)(vii) accordingly.

c. Terms to declare folate. Our preexisting regulations identify ''folic acid'' and ''folacin'' as synonyms of folate and allow these terms to be added in parentheses after folate or listed without parentheses in lieu of ''folate'' on the Nutrition Facts label (§ 101.9(c)(8)(v)) or on the Supplement Facts label (§ 101.36(b)(2)(B)(2)).

Consistent with the proposed amendments related to the units of measure for folate that take into account the differences between folate and folic acid, the proposed rule would: (1) Eliminate the synonym ''folacin'' specified in §§ 101.9(c)(8)(v) and 101.36(b)(2)(i)(B)(2); (2) require, in proposed § 101.9(c)(8)(vii), that the term ''folate'' be used in the labeling of conventional foods that contain either folate only or a mixture of folate and folic acid; and (3) require that the term ''folic acid'' be used in the labeling of dietary supplements only. Thus, under the proposed rule, conventional foods would not be permitted to use the term ''folic acid.''

(Comment 421) One comment supported eliminating the term ''folacin'' from the Nutrition Facts and Supplement Facts labels. However, other comments asked that we continue to allow the use of the term ''folate'' on Supplement Facts labels. Several comments stated that the use of the term folate on dietary supplement labels

refers to dietary folates which are members of the folate group that can be found in food, including folinic acid (5-fomryltetrahyrofolate). For some dietary supplements, calcium L-methylfolate (L–5 MTHF), and various other tetrahydrofolates, as synthetic folate, may be added. In comparison, the comments said that folic acid is synthetically produced and refers to only one member of the folate group (pteroylmonoglutamic acid). The comments said it would be scientifically and chemically incorrect and misleading to consumers to refer to the reduced folate forms in dietary supplements as folic acid, given that folic acid represents only the monoglutamic form.

Other comments noted there are a large number of dietary supplements that are ''whole food'' supplements containing naturally occurring folate rather than added folic acid (*e.g.,* multivitamin capsules manufactured using powdered cultured yeast).

(Response) We agree that there are dietary supplements that may contain natural folate from food or synthetic folate (*e.g.,* L–5–MTHF). If synthetic folate is added to a dietary supplement, folate must be declared as mcg DFE folate and percent DV based on DFE. This will result in consistency in the nutrient terms used and units of measure for the declaration of folate on both conventional foods and dietary supplements, which will avoid confusion among consumers. We are not aware of a manufacturer choosing to voluntary declare naturally occurring folate in a dietary supplement ingredient, but if not added for the purpose of supplementation, the manufacturer is not required to declare the quantitative amount or the percent DV for naturally occurring folate. If a manufacturer chooses to voluntary declare naturally occurring folate, the manufacturer must declare both the quantitative amount in mcg DFE and the percent DV. In addition, if folic acid is added to the dietary supplement that has naturally occurring folate present, the quantitative amount of folate, the quantitative amount of folic acid, and the % DV must be declared. The terminology for the units of measure in the Supplement Facts label will be consistent with the terminology in the Nutrition Facts label. Therefore, the final rule removes ''folacin'' from the list of synonyms that may be used for folate in the Nutrition Facts label in § 101.9(c)(8)(v) and the Supplement Facts label in § 101.36(b)(2)(i)(B)(*2*)). In addition, the final rule removes the term ''folic acid'' from the list of synonyms that may be added in parentheses immediately following ''folate'' on the Nutrition Facts label in § 101.9(c)(8)(v) or in place of the term ''folate'' on the Supplement Facts label in § 101.36(b)(2)(i)(B)(*2*) because we are now requiring that both the terms ''folate'' and ''folic acid'' be included, when declared, on both the Nutrition and Supplement Facts label.

(Comment 422) Several comments suggested that not allowing the use of the term ''folate'' on Supplement Facts labels and not considering L–5 MTHF calcium (Metafolin) to be equivalent to folic acid would have devastating, negative effects on industry. The comments said that eliminating the term ''folate'' would prevent dietary supplement manufacturers from being able to use L-methylfolate in their products. Other comments said we should clarify how L–5 MTHF should be labeled.

(Response) The final rule requires the use of the term ''folate'' on Supplement Facts labels and achieves consistency between the Supplement Facts and Nutrition Facts labels.

We also intend to consider the comparability of synthetic folates (*e.g.,* L–5–MTHF calcium (metafolin)) in dietary supplements and the need for a conversion factor for each in a separate rulemaking. In the interim, manufacturers of synthetic folates, such as calcium and/or glucosamine salts of L–5- MTHF may use their established conversation factors (not to exceed 1.7 (comparable to folic acid)) when reporting mcg DFE, and we can determine what conversion factor is being used through information obtained from records required by this final rule for natural folate, folic acid, and synthetic folate present in the product and the declared folate mcg DFE on the label.

(Comment 423) Some comments stated that limiting the use of the term ''folate'' to conventional food only would effectively make drug companies the only source for people who have a genetic polymorphism in the MTHFR gene. Some comments stated that it is important and essential that the labeling of dietary supplements explicitly state the form or forms of folate they contain because many people are not able to convert folic acid to folate. The comments added that, although there is no agreement regarding the number of people whose bodies have difficulty converting folic acid to folate, there is agreement that it is a serious concern for many individuals. The comments said there is much knowledge available regarding defects in two deoxyribonucleic acid (DNA) sequences responsible for producing enzymes needed for the final stage of conversion of folic acid into the active form needed by the human body and that these defects relate to an enzyme called MTHFR and are very common, although the defects vary enormously between ethnic groups and regions. The comments said that the defects can be found in as many as 44 percent of North American Caucasians and over 50 percent of Italians and are more common among those predisposed to diseases such as cancer, heart disease, and autism. The comments said that these estimates do not account for mutations in other genes involved in folate metabolism, such as DHFR, where data have only been emerging recently. For individuals who have mutations impacting MTHFR or other genes relating to folate metabolism, the comments said there is a distinct possibility of building up too much un-metabolized folic acid thereby potentially increasing the risk of cancer, heart disease or stroke. Consequently, a substantial segment of the population needs to consume folate rather than folic acid and would not be able to process dietary supplements containing folic acid.

Several comments stated that requiring dietary supplement labels to use the term ''folic acid,'' when the product only contains folates found in food, would mislabel the product.

(Response) When folic acid is added to conventional food, the final rule requires the declaration of mcg folic acid in addition to the declaration of folate as a percent DV based on mcg DFE or as a quantitative amount by weight in mcg DFE and the percent DV based on mcg DFE. When folic acid is added to dietary supplements, the final rule requires the the quantitative amount by weight for folate (mcg DFE folate) and the percent DV based on mcg DFE for folate, in addition to the mcg folic acid in parentheses. This should address the comments' concerns.

(Comment 424) One comment would revise the rule to state that the term ''folic acid'' should be used in the labeling of dietary supplements, but that the term ''folate'' should be used if the dietary supplement contains folates in food as opposed to folic acid. The comment said that conventional foods would not be permitted to use the term ''folic acid'' unless they are fortified with folic acid. The comment said this result would be consistent with our intent to distinguish between items containing folate and those that primarily contain synthetic folic acid.

Another comment would revise footnote 3 in proposed § 101.9(c)(8)(iv). The proposed footnote would state that

folic acid ''must be used for purpose of declaration in the labeling of dietary supplements'' and ''must also be declared in mcg DFE.'' The comment would revise the footnote to say that folic acid ''must be used for foods that contain this nutrient solely in the form of added folic acid. Foods which supply both folate and folic acid must list the predominant form. Folate and folic acid must both be declared in mcg DFE. Additional information regarding the types(s) or sources(s) of the nutrients (*e.g.,* folate, folic acid, or L5–MTHF) and or/relative amounts where more than one form is present, may be included in parentheses.'' The comment also would revise § 101.9(c)(8)(vii) to require ''folate'' ''for products containing only or predominantly folate'' and ''folic acid'' for ''products containing only or predominantly folic acid.'' (The proposed rule would require, when the amount of folate is declared in the labeling of a conventional food, the use of the name ''folate'' for products containing either folate alone or a mixture of folate and folic acid and the use of the term ''folic acid'' when the nutrient is declared in the labeling of a dietary supplement.) The comment also would revise the rule to say that additional information regarding the types(s) or sources(s) of the nutrients (*e.g.,* folate, folic acid, or L-methylfolate) and or/relative amounts where more than one form is present, may be included in parentheses.

(Response) The final rule requires the use of the term ''folate'' on Supplement Facts labels when folic acid or synthetic folate is added and must be declared and when naturally occurring folate is present and may be declared. The final rule also requires the use of the term ''folic acid'' in mcg folic acid when folic acid is present. This achieves consistency in terminology between the Supplement Facts and Nutrition Facts labels. If folic acid is declared, manufacturers of dietary supplements must also declare the quantitative amount of folate. The mcg DFE reflects the higher bioavailability of folic acid and certain synthetic folate (*e.g.,* L–5–MTHF) than that of food folate and is the basis of DV.

Under the Supplement Facts label requirements at § 101.36(d), the source ingredient may be identified in parentheses immediately following or indented beneath the name of a dietary ingredient and preceded by the word ''as'' or ''from.'' When a source ingredient is not identified within the nutrition label, it must be listed in an ingredient statement in accordance with § 101.4(g). However, when a source ingredient is identified in the nutrition label, we do not require it to be listed again in the ingredient statement. With respect to conventional food, the only form that currently can be added to conventional food is folic acid under § 172.345 and not any other forms. If folic acid is added to a conventional food, folic acid must be listed in the ingredient list (§ 101.4(a)).

(Comment 425) Some comments stated that not allowing the term ''folate'' on dietary supplement labels violates the First Amendment. The comments said we cannot require that labeling to refer to folate as folic acid because, according to the comments, such labeling would then be false.

(Response) The final rule requires the use of the terms ''folate'' and ''folic acid,'' when declared, on Supplement Facts labels and achieves consistency between the terms used and units of measure in the Supplement Facts and Nutrition Facts labels. Therefore, the comments' First Amendment concerns are no longer applicable.

(Comment 426) One comment said that there is sufficient theoretical and circumstantial evidence that could compel the informed consumer to seek dietary supplements containing methyl folate rather than folic acid. Other comments suggested putting the term ''folate'' on conventional foods and dietary supplement labels, and using ''folic acid'' on dietary supplement labels with the source in parentheses (*e.g.,* Folic acid as calcium l-5 methyltetrahyrofolate).

(Response) Under the Supplement Facts label requirements at § 101.36(d), the source ingredient may be identified in parentheses immediately following or indented beneath the name of a dietary ingredient and preceded by the word ''as'' or ''from'' (*e.g.,* ''folate (as L–5–MTHF-calcium)).'' When a source ingredient is not identified within the Nutrition Facts label, it must be listed in an ingredient statement in accordance with § 101.4(g). However, when a source ingredient is identified in the Nutrition Facts label, it will not be listed again in the ingredient statement. For conventional food, under § 172.345, the only form that currently can be added to conventional food is folic acid and not any other forms. If folic acid is added to a conventional food, folic acid must be listed in the ingredient list (§ 101.4(a)).

(Comment 427) One comment stated that it is reasonable not to permit the term folate to be used alone on dietary supplement labels because it is not sufficiently specific. The comment added that if DFE is used for foods, it should be used for dietary supplements as well, but that correct calculation is uncertain. The comment suggested using the term FAE (folic acid equivalent) instead of DFE because FAE is based on a well-defined compound, unlike folate naturally present in unspecified food. Furthermore, the comment said, when the folic acid dose is sufficiently small, the biological availability is much better defined than folate from unspecified food. The calculation of FAE would include contribution from all folates, which would include folic acid and L–5–MTHF salts. The comment also stated that, as understanding of folate naturally occurring in food improved, the calculation of its contribution to FAE can be improved.

(Response) We address the requirements for labeling folate in our response to comment 413.

We disagree that the term FAE should be used on the label instead of DFE. Based on the IOM report (IOM 1998), the correct terminology that is accepted by the scientific community is mcg DFE and not FAE. We will, however, monitor the science in this area and, if there are any major changes based on the future consensus report, we will consider whether further changes are needed.

(Comment 428) One comment stated that, while there is consensus that pure folic acid is more bioavailable than naturally occurring folate in food, there is currently no scientific consensus as to the magnitude of this effect. The comment said that one recent review states that the bioavailability of food folate is commonly estimated at 50 percent of folic acid bioavailability, but said this should be considered a rough estimate because the data on the bioavailability of food folate vary between 30 and 98 percent. The comment noted that, even if a dietary supplement's direction for use specifies taking the products with food or alone, many consumers may not comply. The comment also stated that the more precise estimates (*i.e.,* based on consumption of the nutrient in fortified food or a supplement taken with food vs. supplement taken alone) are not justified by the available data. The comment said that our proposed definition, based on IOM recommendations dating to 1998, no longer represents current knowledge and developments in the formulation of foods and supplements accurately. The comment would revise the definition to assign a value to naturally occurring folate at 50 percent of the value of folic acid (as well as at 50 percent of the value of L–MTHF salts on the equimolar basis to folic acid.

The comment also would revise footnote 4 in § 101.9(c)(8)(iv). As

proposed, the footnote would explain that DFE stands for ''Dietary folate equivalents'' and that 1 DFE equals 1 microgram food folate and equals 0.6 micrograms folic acid from fortified food or as a supplement consumed with food equals 0.5 micrograms of a supplement. The comment would revise the footnote to capitalize the first letters in ''folate equivalents'' and to state that ''1 DFE = 1 mcg naturally occurring folate = 0.5 mcg folic acid (anhydrous basis)* = 0.56 mcg of L-methylfolate calcium salt (anhydrous basis, molecular weight of 497.5))* = 0.93 mcg L-methylfolate glucosamine salt (anhydrous basis, molecular weight of 817.8))*. With respect to the asterisks, the comment said that, because these numbers will often be calculated rather than determined through testing, it is important to specify how water present in the ingredient is to be accounted for in the calculation.

(Response) We disagree that we should assign the value of naturally occurring folate at 50 percent of the value of folic acid (folic acid multiply by 2 instead of 1.7). We agree that the bioavailability of food folate at 50 percent of the bioavailability of folic acid is considered a rough estimate, as data on the bioavailability of food folate may vary between 30 percent and 98 percent. While we recognize that the IOM recommendation dates to 1998, it remains the best scientific consensus report that is available now. We will monitor the science in this area and, if there are any changes based on the future consensus report, we will consider whether to make modifications.

In regard to taking into account the weights of the salts in the formula weights of the available 5–MTHF derivatives, label values and requirements are presented on labels on a weight basis (*e.g.,* mg of calcium, rather than molar equivalents of calcium). Manufacturers are responsible for calculating amounts of the salt forms that, when added, will provide accurate amounts of folate for the label declaration. This is routinely done with other compounds such as minerals (*e.g.,* for calcium, the label states the amount of calcium, not the amount of calcium carbonate that is added).

As for the footnote pertaining to DFE in § 101.9(c)(8)(iv), we have revised it to read as follows: ''DFE = Dietary Folate Equivalents; 1 DFE = 1 mcg naturally occurring folate = 0.6 mcg folic acid.''

4. Vitamins A, D, and E

Our preexisting regulations, at §§ 101.9(c)(8)(iv) and 101.36(b)(2)(ii)(B), require the use of International Units (IUs) for the labeling of vitamins A, D, and E on the Nutrition and Supplements Facts labels. The preamble to the proposed rule (79 FR 11879 at 11932) described how changes in our understanding of vitamin activity, along with the IOM Labeling Committee's recommendation to change the units of measure for these nutrients to be consistent with the units in the new DRI reports, led us to propose amending § 101.9(c)(8)(iv) to replace IUs for the RDIs for vitamin A, vitamin D, and vitamin E with mcg RAE for vitamin A, mcg for vitamin D, and mg α-tocopherol for vitamin E.

a. General comments.

(Comment 429) Several comments supported changing the units of measure for vitamin A, vitamin D, and vitamin E. One comment supported using mg because, the comment asserted, that is how most registered dietitians give recommendations. Another comment cited a study that reported that physicians typically prescribe vitamin and mineral intakes in mg (Ref. 239). Other comments asked us to retain IUs rather than change to mcg RAE, mcg vitamin D, and mg vitamin E. The comments said that consumers are familiar with IUs and would be confused by use of new units for these nutrients. Other comments seeking to retain IUs as the unit of measure for vitamin D noted that IUs are used on dietary supplements and by clinicians. Another comment requested that the unit of measure for vitamin D be consistent for foods and supplements. One comment supporting the continued use of IUs as a unit of measure noted that the IOM uses IUs for vitamin D.

Other comments recommended that we develop an educational campaign to help consumers understand that changes in the units of measure. Some comments suggested that we make a gradual transition to the new units of measure, including a period during which the labels could use IUs in addition to the new units of measure to help consumer understanding.

(Response) We acknowledge that consumers may need some time to adjust to the new units and consider educational activities important to assist consumers to understand the changes made. However, unlike for vitamins A and E, we have further considered the use of IUs for vitamin D and have determined there are good reasons, specific to vitamin D, to permit the voluntary labeling in IUs for vitamin D in addition to requiring the new mcg units. First, although the IOM Labeling Report (Ref. 25) recommended the use of mcg as the unit of measure for vitamin D, some other IOM materials such as the IOM report on calcium and vitamin D (Ref. 200) present both IUs and mcg as the unit of measure. Thus, we agree, in part, with the comment noting that the IOM uses IUs as the unit of measure. Second, we found that the majority of the U.S. population has usual intakes of vitamin D below the EAR from conventional foods alone, and even when combined with dietary supplements (79 FR 11879 at 11922). Moreover, certain segments of the U.S. population are at risk for inadequacy and may be at increased risk of deficiency. Inadequate intakes of vitamin D are associated with osteoporosis and osteopenia (id.). Third, there are not a wide variety of food sources of vitamin D (79 FR 11879 at 11921), and many individuals rely on vitamin D supplements labeled in IUs to achieve an optimal intake, often on the advice and prescription of a clinician. For these reasons, we have determined it is appropriate to permit the voluntary labeling of vitamin D in IUs, in parentheses, alongside the mandatory declaration in mcg units. In this way, the manufacturer can determine whether to include IUs on the label for its products, based on the use of the product and consumers who may be relying on the advice of a clinician who recommends or prescribes vitamin D in IUs alone, or combined with, mcg units. The reasons we provide for the need for voluntary labeling of IUs for vitamin D are not present with respect to vitamin A or E as the IOM is consistent in presenting units of measure for these nutrients and we have determined them not to be nutrients of public health significance. Therefore, we are replacing IUs with mcg which will be consistent with the IOM Labeling Committee's recommendation that the units of measure be consistent with the DRIs. We agree that the unit of measure for vitamin D should be consistent for foods and supplements. We note that the Supplement Facts label reflects the unit of measure for vitamin D required by §§ 101.9(c)(8)(iv) and 101.36(b)(2)(ii)(B) thus will reflect mcg as the unit of measure for both conventional foods and dietary supplements.

Furthermore, we provide for voluntary labeling of vitamin D in IUs on both conventional food and dietary supplements. Because we have determined that vitamin D is a nutrient of public health significance, we consider that voluntary labeling in IUs for vitamin D will assist consumers in maintaining healthy dietary practices. The voluntary listing of the amount of vitamin D in IUs should be listed in

parentheses next to the mcg amount for vitamin D.

As for a transition period to the new units of measure, we note that the final rule has a compliance date of July 26, 2018, although the compliance date for manufacturers with less than $10 million in annual food sales is July 26, 2019. This should give manufacturers and consumers some time to convert to the new units of measure and also give us some time to educate consumers about the change.

(Comment 430) Some comments urged that we use the symbol 'µg' instead of 'mcg'.

(Response) We decline to amend the rule as suggested by the comment. While the abbreviation ''µg'' may also be used for micrograms, the use of ''mcg' instead of ''µg'' may prevent consumers from misinterpreting the prefix µ as m (milli).

b. Specific comments on the units of measure for individual vitamins. Several comments focused on the units of measure for individual vitamins.

(Comment 431) We proposed to change the units of measure for vitamin A in § 101.9(c)(8)(iv) by replacing ''IU'' with ''mcg,'' representing mcg Retinol Activity Equivalents (RAE). The preamble to the proposed rule explained that the IU for vitamin A does not reflect the carotene:retinol equivalency ratio, that the vitamin A activity of provitamin A carotenoids (such as β-carotene) is less than pre-formed vitamin A (retinol), and that RAEs consider 6 mcg of dietary β-carotene to be equivalent to 1 mcg of purified β-carotene in supplements (79 FR 11879 at 11932). We proposed a similar change dietary supplements in proposed § 101.36(b)(2)(i)(B)(3).

Several comments agreed with the change to mcg RAE. However, other comments opposed changing IUs to mcg RAE; the comments said that the change fails to distinguish between synthetic β-carotene and naturally derived β-carotene in foods and supplements and results in less vitamin A declared on supplements.

One comment noted that we provided only RAE conversions for retinol, beta-carotene, alpha-carotene and beta-cryptoxanthin and said it would be incorrect to apply the same conversion factor to naturally occurring, as compared to synthetically derived, β-carotene.

(Response) We agree there is a difference in biological activity between synthetic and naturally derived β-carotene. Information presented in Table 2 of the proposed rule (79 FR 11879 at 11931) inadvertently omitted a conversion for RAE from β-carotene from supplements. The table in § 101.9(c)(8)(iv) of the final rule includes the conversions for mcg RAE to mcg supplemental β-carotene:

1 retinol activity equivalent (mcg RAE) = 1 mcg retinol
2 mcg supplemental β-carotene
12 mcg of dietary β-carotene
24 mcg of other dietary provitamin A carotenoids (α-carotene or β-cryptoxanthin)

(Comment 432) The proposed rule, at § 101.9(c)(8)(iv), would change the units of measure for vitamin E by replacing ''IU'' with ''mg,'' representing mg α-tocopherol. The preamble to the proposed rule (79 FR 11879 at 11932) explained that the new measure of vitamin E activity would account for the difference in activity between naturally occurring and synthetic vitamin E.

Several comments supported the definition of vitamin E as mg α-tocopherol. However, other comments disagreed with mg α-tocopherol and recommended that we include other forms, in addition to α-tocopherol, in the definition of vitamin E. The comments said that other forms of vitamin E have biological activity and that some forms are linked to cancer, stroke, and neurodegeneration. One comment cited several studies to support the assertion that other forms of vitamin E have bioactivities that are important to disease prevention and/or therapy (Refs. 240–245). One comment disagreed with the use of mg α-tocopherol for vitamin E and suggested we include different forms of vitamin E and relative amounts so that the vitamin E declaration is not misleading.

(Response) We decline to include other forms in the definition of vitamin E. As we noted in the preamble to the proposed rule (79 FR 11879 at 11926), RDIs for vitamins and minerals are based on the DRIs set by the IOM that reflect the most current science regarding nutrient requirements. The RDA for vitamin E was established for mg of α-tocopherol because α-tocopherol is the only form of vitamin E that is maintained in blood and has biological activity (79 FR 11879 at 11933). We acknowledge the studies submitted to support the assertion that other forms of vitamin E, such as gamma-tocopherol, have biological activity that may be pertinent to disease prevention and/or therapy. However, these individual studies measured outcomes other than induced human vitamin E deficiency assessed by the correlation between red blood cell lysis and plasma α-tocopherol on which the RDA was based (Ref. 246). Jiang *et al.* 2003 studied gamma tocopherol and its metabolite on markers of inflammation in rats (Ref. 241). Mahabir *et al.* 2008 studied the associations between 4 tocopherols (α-, β-, c-, and d-tocopherol) in human diets and lung cancer risk (Ref. 243). The review article by Wolf discussed the biochemical mechanism by which α-tocopherol influences gamma-tocopherol (Ref. 245). Christen et al. 1997 studied the effects of gamma-tocopherol on lipid peroxidation in vitro (Ref. 240). Jiang et al. 2008 studied the effect of different forms of vitamin E and their metabolites on enzyme reactions involved in the inflammation pathway (cyclooxygenase-catalyzed reactions) in vitro (Ref. 242). The review article by Sen *et al.* 2007 discussed tocotrienols and their biological functions. While these animal studies and review articles may suggest biological activity of other forms of vitamin E, outcomes in humans are lacking, thus a totality of evidence for a role of other forms of vitamin E in human health is lacking (Ref. 246). We consider the totality of evidence, such as what is presented in consensus reports like those issued by the IOM, rather than individual studies, to establish the RDIs. Therefore, based on the information provided in the comment, we do not have a basis to include other forms of vitamin E in our definition.

We note, however, that other forms of vitamin E can be listed in the ingredient statement for foods.

(Comment 433) The proposed rule, at § 101.9(g)(10), would require manufacturers to verify the declared amount of both *all rac*-α-tocopherol acetate and RRR-α-tocopherol in the finished food product. The preamble to the proposed rule (79 FR 11879 at 11933) explained that the RDA for vitamin E is 15 mg/day of α-tocopherol and that α-tocopherol is the only form of vitamin E that is maintained in blood and has biological activity. The preamble to the proposed rule also explained that there are eight stereoisomers of α-tocopherol (RRR, RSR, RRS, RSS, SRR, SSR, SRS, SSS) and that only RRR α-tocopherol occurs naturally in foods. Commercially available vitamin E that is used to fortify foods and used in dietary supplements contains esters of either the natural RRR- or, more commonly, mixtures of the 8 stereoisomers (*e.g., all rac*-α-tocopherol acetate). Four stereoisomers (SRR, SSR, SRS, and SSS) are not maintained in human plasma or tissues, so we proposed to limit the new RDA for vitamin E to the four 2R stereoisomeric forms (RRR, RSR, RRS and RSS) of α-tocopherol. We stated that these four forms of α-tocopherol are found in nonfortified and fortified

conventional foods and dietary supplements and that the *all rac*-α-tocopherol acetate in fortified foods or dietary supplements has one-half the activity of RRR-α-tocopherol naturally found in foods or the 2R stereoisomeric forms of α-tocopherol (id.). However, because AOAC methods cannot individually measure the naturally occurring and synthetic forms of vitamin E, it is necessary to know the amount of both RRR-α-tocopherol and *all rac*-α-tocopherol in a food product to calculate vitamin E activity for declaration as mg α-tocopherol.

One comment suggested that it is more practical for manufacturers of vitamin E esters to ascertain the RRR, RSR, RRS and RSS content in their ingredients and to disclose this information to finished food manufacturers for use in calculating the declared amount of vitamin E, instead of requiring finished food manufacturer to test the finished product to verify the amounts of various forms of vitamin E, especially since valid methods for many food matrices may not be available. The comment was concerned that, even if they can be identified, analytical methods may not be valid for a wide variety of food matrices and may be prohibitively expensive.

Another comment asked that we affirmatively state that, if appropriate new methods become available to distinguish natural and synthetic vitamin E, manufacturers must declare the amount of vitamin E by appropriate and reliable analytical testing.

Another comment disagreed with narrowing the definition of vitamin E to four stereoisomers and said it is burdensome to confirm which stereoisomer is present in synthetic vitamin E additives compared to simply confirming that the additive is, indeed, vitamin E.

(Response) We decline to revise the rule as suggested by the comments.

However, on our own initiative, we are correcting an inadvertent error that we made in the proposed rule. The proposed rule used the term ''*all rac*-α-tocopherol acetate'' when referring to the synthetic form of vitamin E in fortified foods or dietary supplements because esters of synthetic vitamin E are commonly used in fortified foods and dietary supplements. However, the correct term for synthetic vitamin E is *all rac*-α-tocopherol, just as the term for naturally occurring vitamin is *RRR*-α-tocopherol. Esters of synthetic vitamin E are not limited only to ''*all rac*-α-tocopherol acetate'' and also include ''*all rac*-α-tocopheryl succinate.'' We note that the term '*all rac*-α-tocopherol' is the correct term to refer to the synthetic form of vitamin E.

With respect to analytical testing, we decline to speculate on the methods that manufacturers may deem practical to verify the declared amount of both RRR-α-tocopherol and *all rac*-α-tocopherol in finished food products. We acknowledge that it is a new requirement to verify the amount of both RRR-α-tocopherol in the finished food and *all rac*-α-tocopherol added to the food in finished food products when a mixture of both are present in a food. However, without AOAC methods to individually measure these two forms of vitamin E and the inability to determine the amount of RRR-α-tocopherol in a food by subtracting the amount of *all rac*-α-tocopherol from the total amount declared, we need to rely on recordkeeping to verify the amount of vitamin E in a product.

As for the comment's statement that analytical methods may be prohibitively expensive, the practicality or feasibility of using new analytical methods can depend on a variety of factors. For example, a method that uses equipment or technology that is readily available may be less costly compared to a method that uses proprietary equipment or technology. The number of facilities that can use a new analytical method may influence cost. For example, if a large number of facilities are able to use a new analytical method, then testing costs between facilities may become competitive; in contrast, if there are few facilities that can use the analytical method, then testing costs may be less sensitive to competition. Consequently, because we do not know what new analytical methods may exist in the future or the market for those new methods, we cannot say whether those methods will be prohibitively expensive.

We also decline to revise the rule to affirmatively state that manufacturers declare the amounts of vitamin E by appropriate and reliable analytical testing, if appropriate new methods become available. The comment did not explain how manufacturers would be able to determine whether a new method was ''appropriate'' or ''available'' or how differences in opinion as to whether a particular method is ''appropriate'' or ''available'' might be resolved. Current AOAC methods cannot individually measure naturally occurring vitamin E (RRR-α-tocopherol) and synthetic vitamin E (*all rac*-α-tocopherol and its esters) in food products. Nevertheless, we will continue to monitor developments regarding methods to distinguish natural and synthetic vitamin E.

As for the comment objecting to narrowing the definition of vitamin E to four stereoisomers because it is burdensome to confirm which stereoisomer is present in synthetic vitamin E additives, we point out that providing information that a vitamin E additive is only present in a product (rather than confirming the stereoisomers present in the synthetic vitamin E additive) would provide an inaccurate estimation of the vitamin E activity in the body. We reiterate that the RDI for vitamin E is based on the RDA for vitamin E which is limited to the four 2R stereoisomeric forms (RRR, RSR, RRS, and RSS) of α-tocopherol (79 FR 11879 at 11926). Because synthetic vitamin E, also referred to as *all rac*-α-tocopherol, contains both 2R- and 2S-stereoisomers of α-tocopherol and has one-half the activity of the RRR-α-tocopherol naturally found in foods or the other 2R stereoisomers of α-tocopherol, it is necessary to determine the stereoisomers present in a food to determine vitamin E activity.

(Comment 434) One comment noted that the proposed rule did not mention other esters of both natural (d-α-tocopheryl acetate) and synthetic forms of vitamin E (α-tocopheryl succinate) and said we should revise the rule to include these forms.

(Response) We agree that the ester forms of natural and synthetic vitamin E are considered as α-tocopherol forms of vitamin E. The RDA for α-tocopherol is limited to RRR-α-tocopherol (historically and incorrectly labeled d-α-tocopherol) the only form of α-tocopherol that occurs naturally in foods, and the other 2R-stereoisomeric forms of α-tocopherol (RSR-, RRS-, and RSS-α-tocopherol) that are synthesized chemically and found in fortified foods and supplements. Vitamin E compounds include RRR-α-tocopherol (also referred to as d-α-tocopherol or natural) and its esters (*i.e.* RRR-α -tocopheryl acetate, RRR-α -tocopheryl succinate) and *all rac*-α-tocopherol (also referred to as dl-α-tocopherol) and its esters (*i.e., all rac*-α-tocopheryl acetate, *all rac*-α-tocopheryol succinate) (Ref. 247). We note that all of these vitamin E compounds may be present in fortified foods and multivitamins. We have revised the rule to include the ester forms of natural and synthetic vitamin E.

(Comment 435) Another comment requested we provide a conversion in the final rule stating 1 mg α-tocopherol (label claim) = 1 mg RRR-α-tocopherol; 1 mg α-tocopherol (label claim) = 2 mg *all rac*-α-tocopherol.

(Response) We agree with the comment. The final rule provides this

conversion as a footnote in the table in § 101.9(c)(8)(iv): 1 mg α-tocopherol (label claim) = 1 mg α-tocopherol = 1 mg RRR- α-tocopherol = 2 mg *all rac*- α-tocopherol.

(Comment 436) Some comments objected to changing the units of measure for vitamin E. Several comments stated that there are no AOAC international official methods to distinguish between different forms of vitamin E in foods and supplements. One comment objected the change to mg α-tocopherol and said there is a lack of scientifically validated methods capable of individually measuring *all rac*-α-tocopherol acetate and RRR-α-tocopherol.

Another comment said that it is not possible to measure total vitamin E by subtracting *all rac*-α-tocopherol acetate from total vitamin E to determine RRR-α-tocopherol.

(Response) We agree that current AOAC methods cannot individually measure naturally occurring vitamin E (RRR-α-tocopherol) and *all rac*-α-tocopherol in foods. We also agree that it is not possible to measure total vitamin E by subtracting *all rac*-α-tocopherol from total vitamin E to determine RRR-α-tocopherol. For this reason, the final rule, at § 101.9(g)(10)(vi), requires manufacturers to make and keep written records of the amount of *all rac*- α-tocopherol added to the food and RRR-α-tocopherol in the finished food.

We disagree with the comment objecting to changing the unit of measure to mg α-tocopherol because there is a lack of scientifically validated methods capable of individually measuring *all rac*-α-tocopherol and RRR-α-tocopherol. We consider the DRIs that reflect the most current science regarding nutrient requirements as the basis for establishing RDIs and, therefore, the declaration of vitamin E as mg α-tocopherol. The choice of unit of measure for vitamin E is not based on the availability of scientifically validated methods capable of individually measuring *all rac*-α-tocopherol and RRR-α-tocopherol.

5. Niacin

(Comment 437) Our preexisting regulations, at § 101.9(c)(8)(iv), state that the RDI for niacin is 20 mg. The proposed rule would amend § 101.9(c)(8)(iv), in relevant part, by changing the unit of measure from ''mg'' to ''milligrams NE'' where ''NE'' would stand for ''niacin equivalents,'' and a footnote to proposed § 101.9(c)(8)(iv) would explain that 1 milligram NE is equal to 1 milligram niacin or also equal to 60 milligrams of tryptophan. The preamble to the proposed rule discussed updating the RDIs for various nutrients (including niacin) and compared the current RDI of 20 mg against the proposed RDI of 16 mg NE (79 FR 11879 at 11927, 11931).

Several comments supported changing ''mg'' niacin to mg niacin equivalents (NE). The comments said the change would be consistent with the IOM's use of RDAs as the basis for establishing reference values for purposes of food labeling. Another comment referred to the footnote in proposed § 101.9(c)(8)(iv) and noted that ''milligrams NE'' is different from the existing regulation's use of ''milligrams.'' The comment said that it assumed that compliance would be determined by testing the product using AOAC methods for both niacin and tryptophan and that this, if correct, would increase the burden on manufacturers because it will necessitate additional testing.

In contrast, other comments would have us continue to use milligrams as the unit of measure for niacin.

(Response) The RDA for niacin is expressed as niacin equivalents (NE) because the body's niacin requirement is met not only by preformed niacin (nicotinamide, nicotinic acid, and its derivatives) in the diet, but also from conversion from dietary protein containing tryptophan (Ref. 248).

We agree with the comment that compliance with a voluntary declaration of niacin would be determined by analysis, using AOAC methods, for both niacin and tryptophan, or by reference to existing databases for both nutrients. Niacin equivalents would be calculated using the following conversion: NE (niacin equivalents): 1 mg NE = 1 mg preformed niacin = 60 milligrams of tryptophan. While the unit of measurement for the RDI for niacin is listed as mg NE in § 101.9(c)(8)(iv), only the amount ''mg'' will continue to be declared on nutrition and supplement facts labeling.

(Comment 438) One comment asked how compliance will be determined and asked us to clarify whether a declaration of niacin content will be required for products that contain no actual niacin. The comment would revise the rule to include a provision specifying that products containing more than 19 mg of tryptophan (corresponding to 0.32 mg of niacin or 2 percent of the RDI) must declare niacin even if there is no actual niacin present or else the manufacturers of such products might not notice the revised requirements for niacin declaration. Another comment noted that, for many protein-containing products for which there is presently no information on tryptophan required, manufacturers would be required to determine niacin and tryptophan content, either through analytic testing or existing databases.

(Response) The declaration of niacin is voluntary unless it is added as a nutrient supplement to the food or if the label makes a nutrition claim about it. Compliance may be determined by measuring niacin and tryptophan separately. The unit of measure (mg NE) includes both preformed niacin (from nicotinic acid and nicotinamide in the diet or niacin) and niacin resulting from the conversion of tryptophan (Ref. 249), and AOAC methods exist for both niacin and tryptophan. Thus, a declaration of niacin content requires products to include contributions from preformed niacin as well as tryptophan, including those that may not contain preformed niacin.

As for the comment's statement that manufacturers may not notice the revised requirements for niacin declaration, we decline to revise the rule as suggested by the comment. We note that § 101.3(e)(4)(ii) (regarding identity labeling of food in packaged form) states, in relevant part, that a measurable amount of an essential nutrient in a food shall be considered to be 2 percent or more of the Reference Daily Intake (RDI) of any vitamin or mineral listed under § 101.9(c)(8)(iv) per reference amount customarily consumed. We recognize that manufacturers may be unaware of the requirement for niacin declaration in mg and plan to engage in education and outreach explaining the revised changes to units of measurement for vitamins and minerals.

As for the comment that manufacturers would be required to determine niacin and tryptophan content, either through analytic testing or existing databases, we note we have not stated how a company should determine the nutrient content of their product for labeling purposes (Ref. 122). Regardless of its source, a company is responsible for the accuracy and the compliance of the information presented on the label. Use of a database that we have accepted may give manufacturers some assurance in that we have stated that we will work with industry to resolve any compliance problems that might arise for food labeled on the basis of a database that we have accepted. A manual entitled ''FDA Nutrition Labeling Manual: A Guide for Developing and Using Databases'' is available online.

(Comment 439) One comment pointed out that the use of mg NE may not accurately reflect niacin contribution in

foods because the conversion of tryptophan to niacin is highly variable among individuals and because the body uses tryptophan primarily for its role in protein synthesis instead of niacin production. The comment said that using mg NE as the unit of measure could represent an over-estimate of niacin intake in the diet. Another comment was concerned there could be an extra step in food labeling and another potential source of error.

(Response) We disagree that using mg NE may lead to overestimates of niacin intake from foods. We acknowledge that the conversion of tryptophan to niacin may vary among individuals and that tryptophan has a role in protein synthesis. The conversion factor of 1 mg NE = 60 mg tryptophan is the mean of a wide range of individual values from human studies that measured the conversion of tryptophan to urinary niacin metabolites (Ref. 248).

We acknowledge the concern that using mg NE involves an added step of measuring tryptophan, but note that tryptophan is converted to niacin by the body and using mg NE provides a more accurate estimation of available niacin in the body compared to mg of niacin.

(Comment 440) The proposed rule, at § 101.9(c)(8)(iv), would include a footnote stating that ''NE'' means niacin equivalents and that ''1 milligram niacin = 60 milligrams of tryptophan.'' One comment suggested that, for additional clarity and consistency, we should revise footnote 2 to say ''NE = Niacin equivalents, 1 NE = 1 milligram niacin = 60 milligrams of tryptophan.''

(Response) We agree with the comment and have revised the footnote for NE as follows: NE = Niacin equivalents, 1 mg NE = 1 mg niacin = 60 milligrams tryptophan.''

O. Labeling of Foods for Infants, Young Children, and Pregnant or Lactating Women

In the preamble to the proposed rule (79 FR 11879 at 11933), we explained that our general labeling requirements for foods in § 101.9(c) apply to foods for infants, young children, and pregnant and lactating women, with certain exceptions. For example, foods, other than infant formula, represented or purported to be specifically for infants and children less than 4 years of age are not permitted to include declarations of percent DV for the following nutrients: Total fat, saturated fat, cholesterol, sodium, potassium, total carbohydrate and dietary fiber (§ 101.9(j)(5)(ii)(A)). As another example, foods, other than infant formula, represented or purported to be specifically for infants and children less than 2 years of age are not permitted to declare calories from fat, calories from saturated fat, saturated fat, polyunsaturated fat, monounsaturated fat and cholesterol on the Nutrition Facts label (§ 101.9(j)(5)(i)).

The preamble to the proposed rule (79 FR 11879 at 11933) also mentioned that our regulations do not include DRVs or RDIs for nutrients, generally, for infants, children under 4 years of age, or pregnant and lactating women, but there are requirements for a DRV for protein for children 4 or more years of age and RDIs for protein for each of the following subpopulations: (1) Children less than 4 years of age; (2) infants; (3) pregnant women; and (4) lactating women (§ 101.9(c)(7)(iii)).

1. Age Range for Infants and Young Children

Our preexisting regulations, at § 101.9(j)(5), use the age ranges ''less than 2 years of age'' and ''less than 4 years of age'' to establish labeling requirements for foods represented or purported to be specifically for infants and young children. The preamble to the proposed rule (79 FR 11879 at 11933 through 11934) stated that comments to our 2007 ANPRM recommended changing the age categories to infants 7 to 12 months and young children 1 through 3 years (13 through 48 months), consistent with the age ranges used in the IOM's age-specific DRI recommendations. In the preamble to the proposed rule (79 FR 11879 at 11933 through 11934), we discussed why we considered it appropriate to adopt the same age categories as those used in the IOM DRIs for infants and children. In brief, we said:

- Our proposed DVs are based on these age-specific DRIs;
- Infants are transitioning to eating solid foods by 7 through 12 months, and there are a number of foods in the marketplace identified for this age group;
- With respect to children 1 through 3 years of age, using the DRI age range would result in infants no longer being the lower end of the age range in the category of infants and children less than 2 years and less than 4 years of age as specified in § 101.9(j)(5);
- Assigning DVs for children 1 through 3 years of age would ensure consistency with the 1 through 3 year toddler age category established for RACCs specified in § 101.12(a)(2); and
- Because the growth velocity in height is most similar for children 1 through 3 years of age, we consider it appropriate to revise the age range to include children of these ages into a single category for food labeling purposes.

Therefore, we proposed to revise the exceptions for requirements for nutrition labeling provided in § 101.9(j)(5)(i) and the exception to the requirement for the format used for nutrient information on food labeling in § 101.9(d)(1) for foods represented or purported to be specifically for infants and children less than 4 years of age. Specifically, we proposed to replace the current category of infants and children less than 4 years with infants 7 through 12 months and children 1 through 3 years of age.

(Comment 441) Several comments supported providing nutrition information for children less than 4 years because, according to the comments, these subgroups have different nutritional needs. Another comment recommended mandatory nutrition labeling for children less than 12 months and children 1 through 3 years. One comment said that we should continue to allow labeling information on foods for infants less than 7 months, such as infant cereals, or, at a minimum, allow such labeling to remain voluntary.

(Response) We agree, in part, with the comments that recommended mandatory nutrition labeling for infants less than 12 months. We decline to revise the age range for infants to infants less than 12 months because using that age range would leave a 1 month gap as the age for children 1 through 3 years represents 13 through 48 months. We also agree that nutrition labeling on foods represented or purported to be for infants less than 7 months old such as infant cereals should continue to be mandatory. We proposed the age category for labeling of infants 7 through 12 months to be consistent with the age ranges used in the IOM's age-specific DRI recommendations as well as current breastfeeding recommendations for the first 6 months of life (79 FR 11933). Optimally, infants should begin eating complementary foods at around 6 months of age (AAP Section on Breastfeeding 2012, WHO Complementary feeding 2010); however, some infants are being introduced to foods and beverages before then (siega-Riz JADA 2010). To ensure that nutrition labeling includes products for infants and allow for flexibility in timing of complementary food, we have amended § 101.9(j)(5)(i) and (ii) to refer only to ''infants'' as infants through 12 months of age rather than infants less than 12 months (as suggested by the comment) or ''infants 7 through 12 months'' of age as we had proposed. (We have made similar edits in § 101.9(c), (c)(7), (c)(8), (d)(1), (e), and (f) to refer to ''infants through 12 months of age.'')

We note that, while nutrition labeling is mandatory for food for children less than 4 years, we are not establishing DVs for infants less than 7 months of age. Therefore, nutrition information on foods purported for infants less than 7 months would not reflect DVs for that age group.

(Comment 442) One comment said that labeling of foods for infants 7 through 12 months and children 1 through 3 years is overdue and important. The comment said, however, that separate labeling for these two ages is not necessary and could be confusing, so the comment recommended that we use a population approach to set single values for 7 months through 3 years.

Another comment noted that the proposed new age range to set labeling requirements for these foods (infants 7 through 12 months and children 1 through 3 years of age) did not take into account the definition of ''young children'' given in different Codex standards (*e.g.,* 074–1981 Rev. 1–2006) whereby ''young children'' are ''persons from the age of more than 12 months up to the age of 3 years (36 months).''

(Response) We disagree with the comment suggesting an age range of 7 months through 3 years of age. Providing one label for infants and children 7 months through 3 years of age is inappropriate because growth and nutrient needs differ for infants through 12 months of age and children 1 through 3 years of age (beginning at the start of the 13th month through the end of 48th month of age). These differences in growth and development between infants and young children are reflected in the age categories established by the IOM (79 FR 11879 at 11933).

As for the comment noting that we did not take into account the definition of ''young children'' used in certain Codex texts, we note that our age range of children 1 through 3 years of age includes ''persons from the age of more than 12 months up to the age of 36 months.'' We also note that our age range aligns with the age specific category used in the IOM's DRI recommendations for the purposes of establishing DRVs and RDIs for this subpopulation. Our purpose of establishing a DRV or RDI for use in nutrition labeling is distinct from a purpose related to defining the age range when infants and young children are fed processed cereal-based complementary foods (CODEX STAN 074–1981, REV.1–2006). Furthermore, while certain Codex standards such as the Standard for Processed Cereal-based Foods for infants and young children (CODEX STAN 074–1981, REV.1–2006) provide minimum and maximum levels for the composition of processed cereal-based complementary foods, we note that the Codex Guidelines on Nutrition Labelling (CAC/GL 2–1985) (Ref. 121) do not provide Nutrient Reference Value—Requirements that are comparable to our proposed DRVs and RDIs for children 1 through 3 years.

(Comment 443) Some comments asked that we require the declaration of cannabinoid content, nutritional values, and/or health risks pertaining to the consumption of tetrahydrocannabinol (THC) and/or marijuana edibles for all consumers, in particular, children under the age of 4 years as well as pregnant and lactating women.

(Response) We decline to revise the rule as suggested by the comment. We note that section 403(q)(2)(A) of the FD&C Act authorizes the inclusion of nutrients on the label or labeling of food for purposes of providing ''information regarding the nutritional value of such food that will assist consumers in maintaining healthy dietary practices.'' General labeling requirements of products containing THC and/or marijuana edibles is outside the scope of this rule. Therefore, we are making no changes in response to this comment.

2. Mandatory Declaration of Calories and Statutorily Required Nutrients

Currently, foods, other than infant formula, represented or purported to be specifically for infants and children less than 4 years must declare statutorily required nutrients, including calories, calories from fat, total fat, saturated fat, cholesterol, sodium, total carbohydrate, sugars, dietary fiber, and protein. For foods, other than infant formula, represented or purported to be for infants and children less than 2 years, the declaration of certain statutorily required nutrients, which include calories from fat, saturated fat, and cholesterol, is not required or permitted (§ 101.9(j)(5)(i)).

a. Declaration of saturated fat and cholesterol. In the preamble to the proposed rule (79 FR 11879 at 11934), we tentatively concluded that, except for the declaration of calories from fat, the declaration of statutorily required nutrients that include saturated fat and cholesterol on the label of foods represented or purported to be specifically for infants 7 through 12 months and children 1 through 3 years of age should be mandatory because: (1) The declaration of calories and these nutrients is mandated by section 403(q) of the FD&C Act, and we have no basis on which to not require or permit their declaration as discussed previously; and (2) these nutrients are essential in fostering growth and maintaining good health during a critical stage of human development and physiology and, therefore, their mandatory declaration can assist in maintaining healthy dietary practices. We proposed to remove § 101.9(j)(5)(i) and revise and redesignate current § 101.9(j)(5)(ii) as § 101.9(j)(5)(i).

Similarly, foods consumed by pregnant and lactating women must declare statutorily required nutrients, including calories, calories from fat, total fat, saturated fat, cholesterol, sodium, total carbohydrate, sugars, dietary fiber, and protein. Women of reproductive age consume the same foods as the general population and, in general, continue consuming similar foods during pregnancy and lactation. In the preamble to the proposed rule (79 FR 11879 at 11934), we tentatively concluded that, except for the declaration of calories from fat, the declaration of statutorily required nutrients should be mandatory because the declaration of calories and these nutrients is mandated by section 403(q) of the FD&C Act and we have no basis on which to not require or permit their declaration as discussed previously. Thus, we proposed to require the mandatory declaration of calories, and the amount of total fat, saturated fat, *trans* fat, cholesterol, sodium, total carbohydrate, dietary fiber, sugars, and protein for foods represented or purported to be specifically for infants 7 through 12 months of age, children 1 through 3 years of age, and pregnant and lactating women, and permit the declaration of calories from saturated fat such that the declaration of these nutrients on foods for these populations would be subject to the same requirements applicable to foods for the general population.

(Comment 444) Several comments supported the declaration of saturated fat and cholesterol on labeling for infants and children 1 through 3 years old and agreed such labeling will help maintain healthful dietary practices. In response to our request for information on whether consumers may be confused by these changes, one comment said that its products have been labeled for children under 2 years as well as for children less than 4 years of age on the market for many years. The comment noted that these dual label formats include the declaration of both saturated fat and cholesterol and the company has received no comments or concerns about the inclusion of this information on its labels from either consumers or health care professionals. The comment said that declaring saturated fat and cholesterol in addition to *trans* fat on infant foods will be more helpful in

food selection than having *trans* fat alone. The comment said declaring saturated fat, cholesterol, and *trans* fat will provide more information on the fat composition of foods and their relationship to chronic disease risk. The comment also noted that some children as young as 12 months, with a family history of obesity, dyslipidemia, or CVD, may benefit from a diet lower in saturated fat and that having saturated fat on food labels can assist families in choosing foods that are lower in saturated fat while maintaining total fat intakes.

Another comment said we should not finalize the rule until we had conducted appropriate research, including consumer testing, to better understand the impacts of declaring saturated fat and cholesterol on the labels of products represented or purported to be specifically for infants and children 1 through 3 years of age and to determine if an explanatory footnote would assist in improving consumer understanding when accompanying any relative declaration. The comment also noted that relevant empirical research is not available to determine whether the declaration of saturated fat and cholesterol will result in restricted intakes for infants and children ages 1 through 3 years old. One comment would revise the rule to include a voluntary footnote stating that ''total fat should not be limited in the diets of children less than 2 years unless directed by a physician'' or similar wording to provide dietary guidance to parents and other caregivers to help assure total fat is not restricted in the diet of young children.

(Response) We acknowledge that products dual labeled for children under 2 and children less than 4 years of age include the declaration of both saturated fat and cholesterol. We agree that declaration of saturated fat and cholesterol provides more nutrition information and can help consumers make informed choices and maintain a healthy diet, and the final rule requires the declaration of saturated fat and cholesterol on Nutrition Facts labeling for infants and children 1 through 3 years of age.

As for the comment regarding consumer testing, we disagree that consumer testing is necessary before we can require the declaration of saturated fat and cholesterol on Nutrition Facts labels for infants and children 1 through 3 years of age. Section 403(q) of the FD&C Act lists total fat, saturated fat, and cholesterol as nutrients required on nutrition labeling. These nutrients are essential for growth and development, thus their mandatory declaration can assist consumers in maintaining healthy dietary practices (79 FR 11879 at 11934). We considered the Integrated Guidelines for Cardiovascular Health and Risk Reduction in Children and Adolescents which suggest a diet with saturated fat less than 10 percent of calories and cholesterol intake less than 300 mg/day can safely and effectively reduce the levels of total and LDL cholesterol in healthy children (Ref. 250). This type of diet may have similar effects when started in infancy and sustained throughout childhood into adolescence (Ref. 250).

We acknowledge, in general, that total fat should not be limited in the diets of young children less than 2 years of age unless directed by a health professional. In response to the comment noting that research is unavailable on whether declaration of saturated fat and cholesterol will result in restricted intakes for infants and children, we intend to monitor fat and cholesterol intakes in these age groups and will consider whether to revisit our requirements for this labeling, as appropriate.

We also decline to include a voluntary footnote. We intend to monitor fat intakes and educate consumers on changes to the labeling of foods for infants through 12 months of age and children 1 through 3 years of age.

b. Percent DV declaration. In the preamble to the proposed rule (79 FR 11879 at 11935), we explained that, under our preexisting regulations, the percent DV declaration is not permitted on the food label for foods, other than infant formula, represented or purported to be specifically for infants and children less than 4 years (which includes infants and children less than 2 years) for total fat, saturated fat, cholesterol, sodium, potassium, total carbohydrate, and dietary fiber (§ 101.9(j)(5)(ii)). Percent DV is required for protein and vitamin A, vitamin C, iron, and calcium. We tentatively concluded that it is appropriate to require declarations of percent DV for those nutrients for which we are establishing a DRV or RDI for infants 7 through 12 months, for children 1 through 3 years of age, and for pregnant and lactating women (except for a % DV for protein for pregnant and lactating women), and this change would be reflected in redesignated § 101.9(j)(5)(i).

(Comment 445) One comment would retain a requirement for the mandatory declaration of percent DV for protein on infant foods.

In contrast, another comment would not require the mandatory declaration of the percent DV for protein on labels of foods for children aged 1 through 3 years. The comment cited dietary intake data suggesting that protein intakes are above 40 grams per day and from high quality sources. Another comment recommended allowing for the use of the PDCAAS for determining the percent DV for protein for all population groups, including infants. The comment asked us to clarify the acceptability of PDCAAS for determining protein quality for foods for infants and specify the specific amino acid pattern that should be used (*i.e.,* IOM pattern) and to reference the pattern by Table number.

(Response) The final rule requires the mandatory declaration of percent DV for protein on foods for infants though 12 months of age and children 1 through 3 years of age. While the evidence suggests that protein intake is adequate and of high quality, the level and quality of protein present in a food remain an important consideration in food selection for infants because infant diets are derived from a limited number of foods. Calculating the percent DV for protein incorporates a measure of protein quality. Thus, the percent DV declaration is a useful tool to indicate protein quality to the consumer. Because of the importance of adequate high quality protein in the diets of infants and young children, we conclude that the percent DV declaration for protein for infants though 12 months of age and children 1 through 3 years of age should remain mandatory.

We disagree with the comment asking that we allow for the use of the PDCAAS to determine protein quality for infants. The PDCAAS allows evaluation of food protein quality based on the needs of humans as it measures the quality of a protein based on the amino acid requirements (adjusted for digestibility) of a 2- to 5-year-old child (considered the most nutritionally demanding age group), not infants (Ref. 251). Protein quality is important during infancy for growth and development. We established the protein efficiency ratio (PER) as the method of determining protein quality (see 79 FR 7934 at 8022) for infants based on recommendations from the 1991 WHO Protein Quality report. A protein source may contain the necessary amino acids, but they may be in a form that an infant cannot digest and absorb. The PER method, unlike chemical measures of protein composition, provides an estimate of the bioavailability or amount absorbed, of the protein.

(Comment 446) One comment said that, if the percent DV for protein remains mandatory, we should provide

an exemption from the mandatory declaration of percent DV for protein for foods intended for infants and children aged 1 through 3 years that declare less than 1 gram of protein per serving, such as fruits, because these foods contain an insignificant amount of protein and are not expected to contribute meaningfully to protein intake. The comment also would revise the rule to allow the optional declaration of ''0% DV'' instead of the phrase ''not a significant source of protein'' on infant foods with a protein quality of less than 40 percent of casein as measured by PER or less than 40 percent by PDCAAS or other comparable method. The comment explained that these options will help save label space, especially on small packages, while still providing meaningful information on protein quantity relative to the DV.

(Response) We decline to revise the rule as suggested by the comment. While we recognize that the protein quantity of some foods, such as fruits, may be small, we consider the mandatory declaration of percent DV to provide important information on protein quality to the consumer. In establishing mandatory declaration of percent DV for protein on foods intended for infants through 12 months of age and children aged 1 through 3 years and associated statements of ''less than 1 g of protein per serving'' or ''not a significant source of protein,'' we considered that: (1) Protein is of critical importance in maintaining good health because it supplies essential amino acids and is a principal source of calories along with fat and carbohydrate; and (2) calculating the percent DV for protein incorporates a measure of protein quality. Thus, the percent DV declaration is a useful tool to indicate protein quality to the consumer.

While label space on small packages may be a concern, we decline to make the change requested by the comment that would allow the optional declaration of ''0% DV'' instead of the phrase ''not a significant source of protein'' on infant foods with a protein quality of less than 40 percent of casein as measured by PER or less than 40 percent by PDCAAS or other comparable method. As explained in part II.I and in our response to comment 445, we concluded that the PDCAAS was the most suitable pattern for use in the evaluation of dietary protein quality for all age groups, except infants through 12 months of age. We established the PER as the method of determining protein quality for infants because infants cannot digest and absorb all forms of protein; thus, PDCAAS or another comparable method that scores the amino acid profile of the specific food protein after it has been digested is not appropriate.

3. Declaration of Non-Statutory Nutrients Other Than Essential Vitamins and Minerals

In the preamble to the proposed rule (79 FR 11879 at 11935), we stated that foods, other than infant formula, represented or purported to be specifically for infants and children less than 2 years of age are not permitted to declare calories from saturated fat and the amount of polyunsaturated fat and monounsaturated fat (§ 101.9(j)(5)(i)), whereas soluble fiber, insoluble fiber, and sugar alcohols can be declared voluntarily. Polyunsaturated fat, monounsaturated fat, soluble fiber, insoluble fiber, and sugar alcohols can be declared voluntarily on the label of foods represented or purported to be specifically for children 2 through 4 years of age, and pregnant and lactating women.

For foods represented or purported to be specifically for children 1 through 3 years of age and pregnant and lactating women, we considered whether to propose the mandatory or voluntary declaration of non-statutory nutrients. In the preamble to the proposed rule (79 FR 11879 at 11935), we said that most advisory consensus and policy reports on which we rely for the general population apply to children 2 years of age and older and pregnant and lactating women, unless noted otherwise (*e.g.,* 2010 DGAC and health claims (§ 101.14(e)(5)).

a. Voluntary declaration of calories from saturated fat, and the amount of polyunsaturated and monounsaturated fat. Our preexisting regulations, at § 101.9(j)(5)(i), state that foods, other than infant formula, represented or purported to be specifically for infants and children less than 2 years of age must bear nutrition labeling with certain, specific exceptions. Among the exceptions, the label is not to include polyunsaturated fat or monounsaturated fat.

The proposed rule would remove the restriction regarding the declaration of polyunsaturated fat and monounsaturated fat on foods represented or purposed to be specifically for children less than 2 years of age. In the preamble to the proposed rule (79 FR 11879 at 11935 through 11936), we explained that, for infants 7 to 12 months, there are no specific recommendations provided about calories from saturated or polyunsaturated or monounsaturated fat. We also stated there is some evidence to suggest that reduction of total and LDL cholesterol levels can occur with reducing saturated fat intake to less than 10 percent of calories, beginning in infancy and sustained throughout childhood into adolescence, that there is no evidence to suggest that infants 7 through 12 months of age would be different than children 1 through 3 years of age, and that there is no basis to continue to provide an exception that does not permit the declaration of calories from saturated fat, or polyunsaturated and monounsaturated fats on foods represented or purported to be specifically for infants and children less than 2 years of age.

(Comment 447) One comment argued the declaration of alpha linoleic acid (ALA) on foods for infants and children 7 months to 3 years of age should be considered for voluntary labeling using the AI as the basis for a DRV. The comment noted that much of the evidence for a health benefit of n-3 fatty acids derives from studies on infants, and labeling of ALA is consistent with FDA's criteria of encouraging health dietary practices. Another comment recommended that we examine NHANES data for ALA consumption to determine whether there is a public health risk from inadequate dietary intake.

(Response) We decline to amend the rule to permit the voluntary labeling of ALA on labels or labeling for foods intended for infants though 12 months of age and children 1 through 3 years of age and to use the AI for ALA to establish a DRV.

We agree with promoting healthy dietary practices in this subpopulation; however, well-established evidence for ALA and disease risk reduction in adulthood and infancy is lacking (Ref. 29). As discussed in part II.F.4, we decided that, because of the lack of well-established evidence for a role of n-3 or n-6 polyunsaturated fatty acids in chronic disease risk and the lack of a quantitative intake recommendation, the declarations of α-linolenic acid as well as other n-3 and n-6 polyunsaturated fatty acids are not necessary to assist consumers to maintain healthy dietary practices. Because the declaration of ALA is not permitted on labeling, a DRV for this nutrient is unnecessary.

We disagree with the analysis of NHANES data for ALA intake to determine public health risk from inadequate dietary intake. An analysis of dietary intake data alone does not meet our criteria of public health significance. Moreover, an analysis of ALA intakes from NHANES data cannot determine inadequacy of dietary intake

because an EAR has not been established for ALA. EARs, not AIs, are used for assessing the statistical probability of adequacy or nutrient intakes of groups of people (79 FR 11879 at 11885).

(Comment 448) One comment noted that we proposed mandatory labeling of the quantitative amount of some nutrients (*trans* fatty acids for which there is no DRI) on foods for infants aged 7 through 12 months and children aged 1 through 3 years. The comment said we should provide for the voluntary declaration of docosahexaenoic acid (DHA) on these foods to encourage healthy dietary practices.

(Response) We decline to revise the rule as suggested by the comment. Our regulations, at § 101.9(c)(2)(ii), require the declaration of *trans* fat on nutrition labeling for people of all ages because the consumption of *trans* fats may affect their risk of CHD; therefore, the presence or absence of *trans* fat in a food product is a material fact that consumers need to know to make healthy choices and allow them to reduce risk of CHD. *Trans* fat continues to be a nutrient with public health significance because of its well-established role in chronic disease through its effect on blood cholesterol levels (79 FR 11879 at 11896). However, DHA lacks well-established evidence for its role in chronic disease as well as growth or neural development (IOM Macro report). As discussed in part II.F, voluntary labeling of DHA is not permitted because of the lack of well-established evidence for DHA's role in chronic disease risk and lack of a quantitative intake recommendation (79 FR 11879 at 11898).

(Comment 449) One comment cited a 2011 IFIC survey suggesting that 45 percent of consumers were already eating foods containing n-3 fatty acids to benefit cognitive development, especially in children and 39 percent were somewhat likely to begin eating n-3 fatty acids for this health benefit in the next 12 months. The comment said that continued allowance of ALA nutrient content claims, absent a voluntary declaration of DHA, increases the likelihood that consumers may purchase foods for a benefit that the food will not supply. The comment also said that allowing polyunsaturated fat labeling of foods for children younger than 2 years without allowance for labeling of individual polyunsaturated fatty acids creates a scenario where polyunsaturated fat values, inflated by ALA, may mislead consumers actually seeking DHA.

(Response) The comments did not provide, and we are not aware of, data or information to support the claim that consumers seeking to consume DHA would be misled by the voluntary declaration of polyunsaturated fats or an ALA nutrient content claim on labeling for children less than 2 years of age. Therefore, we are not making changes in response to this comment.

We acknowledge the 2011 IFIC survey conclusions suggesting that consumers eating foods containing n-3 fatty acids are somewhat likely to begin eating these foods to benefit cognitive development. We also recognize that total polyunsaturated fats in foods include both n-6 and n-3 polyunsaturated fatty acids and the n-3 polyunsaturated fatty acids content may include ALA and DHA.

However, we are unable to determine, based on the information provided in the comment, if some consumers seeking to consume DHA may be confused or misled by the declaration of total polyunsaturated fats or the ALA nutrient content claim. Furthermore, we are unable to determine if consumers understand that ALA may be converted to DHA. Without knowledge of the conversion from ALA to DHA, consumers would not be able to distinguish between the level and type of n-3 fatty acids in the food.

Thus, the final rule removes the restriction regarding the declaration of calories from saturated fat, polyunsaturated fat, and monounsaturated fat on foods represented or purposed to be specifically for infants through 12 months of age and children 1 through 3 years of age.

b. Voluntary declaration of soluble fiber, insoluble fiber, and sugar alcohols. In the preamble to the proposed rule (79 FR 11879 at 11936), we stated that, while quantitative intake recommendations are lacking for soluble fiber, insoluble fiber, and sugar alcohols, there is well-established evidence for the role of these nutrients in chronic disease risk, risk of a health-related or a beneficial physiological endpoint (*i.e.,* CHD, improved laxation, or dental caries). We also said that there is no evidence to suggest that the role of these nutrients would be different among infants 7 through 12 months, children 1 through 3 years of age, or pregnant and lactating women compared to the general population. As a result, we did not propose any changes to the provisions for the voluntary declaration of soluble fiber, insoluble fiber, and sugar alcohols on the label of foods represented or purported to be specifically for infants 7 to 12 months, children 1 through 3 years of age, or pregnant and lactating women.

We did not receive comments on this topic, so no changes to the rule are necessary.

c. Mandatory declaration of trans fat. In the preamble to the proposed rule (79 FR 11879 at 11936), we stated that *trans* fat must be declared on the Nutrition Facts label and that our regulations do not provide exceptions for foods represented or purported to be specifically for infants, young children, or pregnant and lactating women. We noted that cardiovascular disease is known to begin in childhood (id.). Thus, we tentatively concluded that declaration of *trans* fat continues to be necessary to assist consumers in maintaining health dietary practices, including among infants, young children, and pregnant and lactating women, and we did not propose any changes to the mandatory declaration of *trans* fat on the label of foods represented or purported to be specifically for infants, children 1 through 3 years of age, or pregnant and lactating women.

Trans fat declaration is voluntary when the total fat content of a food is less than 0.5 grams (§ 101.9(c)(2)(ii)). In addition, if a manufacturer does not declare the *trans* fat content because total fat amount is less than 0.5 grams, then the statement ''Not a significant source of *trans* fat'' must be placed at the bottom of the table of nutrient values.

We did not receive comments on this topic and have finalized this provision without change.

d. Mandatory declaration of added sugars. Our preexisting regulations do not provide for the declaration of added sugars on the Nutrition Facts label, but the proposed rule would require the mandatory declaration of added sugars on the Nutrition Facts label. Additionally, in the **Federal Register** of July 27, 2015 (80 FR 44303), we published a supplemental proposed rule that would, among other things, establish a Daily Reference Value (DRV) of 10 percent of total energy intake from added sugars and require the declaration of the percent DV for added sugars on the label.

(Comment 450) Several comments supported mandatory declaration of added sugars. One comment stated that sugar is used as a means to attract children, and this practice should be discouraged.

Another comment opposed the mandatory labeling of added sugars for infants and children aged 1 through 3 years and pregnant and lactating

women. The comment argued that scientific consensus is lacking for the health effects of added sugars alone versus sugars as a whole and recommended careful consideration of the totality of the scientific evidence, as well as consideration of compliance and other technical issues. The comment also noted that consumer testing is also highly important prior to any determination relative to added sugars being made.

(Response) We disagree that added sugars should not be required on the label for infants and children aged 1 through 3 years and pregnant and lactating women. We discuss in part II.H.3 our rationale for requiring the declaration of added sugars on the label for the general population. We are also basing an added sugars declaration on labeling for infants, children 1 through 3 years of age, pregnant women, and lactating women on the need to provide consumers with information to construct a healthy dietary pattern that meets the dietary recommendations for added sugars.

In response to the comment about the totality of evidence for the health effects of added sugars, we discuss in part II.H.3 that rather than basing a declaration of added sugars on an association with risk of chronic disease, a health-related condition, or a physiological endpoint, we are considering a declaration of added sugars in the context of how it can assist consumers in maintaining healthy dietary practices by providing information to help them limit consumption of added sugars, and to consume a healthy dietary pattern. We have established that there is public health significance of added sugars through other evidence related to a healthy dietary pattern low in sugar-sweetened foods and beverages that is associated with reduced risk of CVD, through consumption data showing that Americans are consuming too many calories from added sugars, through evidence showing that it is difficult to meet nutrient needs within calorie limits if one consumes too many added sugars, and through evidence showing that increased intake of sugar-sweetened beverages is associated with greater adiposity in children.

The comment did not explain what compliance and other technical issues merit further consideration. In response to the comment noting the importance for consumer testing of a declaration of added sugars, we have received several comments on this topic and discuss responses in part II.H.3.g.

While the declaration of added sugars is mandatory, we are not establishing a DRV for added sugars for infants through 12 months. Dietary recommendations for infants through 12 months suggest introducing complementary foods such as infant cereal, vegetables, fruits, meat, and other protein-rich foods modified to a texture appropriate (*e.g.,* strained, pureed, chopped, etc.) for the infant's developmental readiness one at a time. A DRV for added sugars for infants through 12 months is not necessary as the infant diet is comprised primarily of breast milk and/or infant formula as well as complementary foods. As the food introduced does not comprise the majority of the infant diet, a DRV is not necessary to compare added sugars in the context of a daily diet. Mandatory declaration of added sugars for infants through 12 months of age can help consumers limit the added sugars in the limited complementary foods that are being introduced individually.

(Comment 451) One comment would modify the definition of added sugars to exclude ingredients that are inherent in the food or are present for purposes other than sweetening the food and that this modified definition should apply for adults and children between 7 months to 3 years of age, and pregnant and lactating women.

(Response) We received many comments on the definition of added sugars and, in part II.H.3.n, discuss ingredients that are inherent in the food, such as naturally occurring sugars, and the intended purpose of sweetening. The comment did not explain why a regulatory definition for added sugars should be different for infants, children 1 through 3 years of age, and pregnant women, and lactating women, so we decline to revise the rule as suggested by the comment.

e. Voluntary declaration of fluoride. Our preexisting regulations do not provide for the declaration of fluoride on the Nutrition Facts label of any foods. The proposed rule would allow voluntary declaration of fluoride on the labeling of foods for the general population, and we also tentatively concluded that the declaration of fluoride on foods represented or purported to be specifically for children 1 through 3 years of age and pregnant and lactating women can assist in maintaining healthy dietary practices. We stated, in the preamble to the proposed rule (79 FR 11879 at 11937 through 11938), that evidence on dental caries is lacking for infants 7 through 12 months of age, but we did not expect the role of fluoride in the protection against dental caries to be different from other age groups. Therefore, proposed § 101.9(c)(5) would permit the voluntary declaration of fluoride on foods represented or purported to be specifically for infants 7 through 12 months of age, children 1 through 3 years of age, and pregnant and lactating women.

We did not receive comments on this topic and have finalized the provision to permit the voluntary declaration of fluoride on foods represented or purported to be specifically for infants through 12 months, children 1 through 3 years of age, pregnant women, and lactating women.

4. Declaration of Essential Vitamins and Minerals

Our preexisting regulations require the declaration of vitamin A, vitamin C, calcium, and iron on the Nutrition Facts label, and there are no specific exceptions to this requirement for foods represented or purported to be specifically for infants and children less than 2 years and children less than 4 years of age, and pregnant and lactating women. In the preamble to the proposed rule (79 FR 11879 at 11937), we explained that the AIs for essential vitamins and minerals (and RDAs for iron and zinc) for infants 7 through 12 months of age are based on the average intake of nutrients that infants consumed from breast milk, complementary foods, and/or supplements with the understanding that these sources provided sufficient amounts of the nutrients to meet the infant's daily needs. The AIs (as well as the RDAs for iron and zinc) for infants were not based on endpoints related to chronic disease risk, or a health-related conditions or health-related physiology. Furthermore, because the AI represents intakes that are considered adequate and are based on average nutrient intakes from breast milk, foods, and/or supplements, the presence of an AI indicates that there is not a public health concern about adequate intake of that nutrient. So, rather than determine public health significance for a nutrient during infancy based on an AI for infants, we considered the importance of the nutrient in establishing healthy dietary practices during infancy for later in life, as well as the relevant available information for children 1 through 3 months of age that may also be applicable to infants. For nutrients with an RDA for infants 7 through 12 months of age (*i.e.,* iron and zinc), we considered the factors for mandatory and voluntary labeling described in section I.C to determine whether to propose mandatory or voluntary labeling for the nutrient.

For the declaration of essential vitamins and minerals for children 1

through 3 years of age and pregnant and lactating women, we said, in the preamble to the proposed rule (79 FR 11879 at 11937) that we would use the same considerations, based on the same rationale as we set forth and proposed for the general population, because scientific and policy considerations are generally the same and the DGA recommendations apply to Americans 2 years of age and older. We also explained that, while NHANES data were collected in lactating women, we did not include these data in our analysis because the sample size of lactating women was small, and we could not reliably estimate mean intake and status of this population (id.). However, we stated that the conclusions made about nutrient inadequacy during pregnancy are applied to lactating women since the needs of essential vitamin and minerals are increased for both pregnant and lactating women, and we proposed to remove the provision in § 101.9(c)(8)(i) that requires separate declaration of percent DVs based on both RDI values for pregnant women and for lactating women in the labeling of foods represented or purported to be for use by both pregnant and lactating women.

We did not receive comment on this topic and are removing the provision in § 101.9(c)(8)(i) regarding separate declaration of percent DVs based on both RDI values for pregnant women and for lactating women in the labeling of foods represented or purported to be for use by both pregnant and lactating women.

a. Mandatory declaration of calcium and iron. We did not propose any changes to the mandatory declaration of calcium on foods for the general population. In the preamble to the proposed rule (79 FR 11879 at 11937), we stated that the AI for calcium for infants 7 through 12 months of age is based on average calcium consumption of these nutrients, rather than chronic disease risk, health related-condition, or physiological endpoints and that, for children 1 through 3 years of age and pregnant and lactating women, the RDAs for calcium are based, in part, on bone health.

Our analysis of NHANES 2003–2006 data estimated that infants ages 7 to 12 months have usual calcium intakes above the AI and that about 12 percent of children 1 through 3 years of age had usual intakes of calcium below the EAR, based on intakes from conventional foods only (see 79 FR 11879 at 11937). We said, in the preamble to the proposed rule (id.), that promoting the development of eating patterns that are associated with adequate calcium intake later in life is important given that calcium intakes are inadequate for the majority of the population. Intakes of calcium, which is necessary for growth and bone development, are inadequate among children. Similar to the general population, approximately 20 percent of pregnant women consumed less than the EAR for calcium from conventional foods as well as from conventional foods and supplements. Consequently, we tentatively concluded that calcium is a nutrient of public health significance for children 1 through 3 years of age and for pregnant and lactating women and that, because calcium is important for growth and development, calcium is of public health significance for infants 7 through 12 months of age.

With respect to iron, we stated, in the preamble to the proposed rule (id.) that, while the EAR and RDA are based on daily iron requirements and not directly on chronic disease risk, iron deficiency is associated with delayed normal infant motor function (*i.e.,* normal activity and movement) and mental function (*i.e.,* normal thinking and processing skills) and that our analysis of NHANES 2003–2006 data estimated that about 18 percent of infants ages 7 through 12 months have usual iron intakes below the EAR, based on intakes from conventional foods only and 4 percent of infants ages 7 through 12 months have usual iron intakes below the EAR based on intakes from conventional foods and supplements. For children 1 through 3 years of age, about 1 percent of children have usual iron intakes below the EAR, based on intakes from conventional foods only and 0.4 percent of children have usual iron intakes below the EAR based on intakes from conventional foods and supplements. While total iron intakes appear adequate, the prevalence of iron deficiency in children ages 1 to 2 years has been reported to be 14.4 percent and the prevalence of iron deficiency anemia in children younger than 5 years has been reported to be 14.9 percent (see 79 FR 11879 at 11937). We also stated that inadequate iron intakes during pregnancy are of public health significance because of the adverse effects for both the mother and the fetus (such as maternal anemia, premature delivery, low birth weight, and increased perinatal infant mortality) and that our analysis of data collected by NHANES 2003–2006 estimated that 5 percent of pregnant women 14 to 50 years of age had usual iron intakes below the EAR based on intakes from conventional foods and 4 percent of pregnant women 14 to 50 years of age had usual iron intakes below the EAR based on intakes from conventional foods and supplements (see 79 FR 11879 at 11937). Among pregnant women aged 12 to 49 years, 25 percent were iron deficient and 13 percent had iron deficiency anemia. While intakes appear adequate for most individuals, the prevalence of iron deficiency and iron deficiency anemia indicates that iron deficiency is of public health significance for pregnant women. Therefore, we tentatively concluded that iron is a nutrient of public health significance for lactating women as well.

Thus, we proposed to amend § 101.9(c)(8)(ii) to require the mandatory declaration of calcium and iron on foods represented or purported to be specifically for infants 7 to 12 months, children 1 through 3 years of age, or pregnant and lactating women.

We did not receive any comments with respect to mandatory declaration of calcium and iron for these populations, and so, other than replacing ''infants 7 to 12 months'' with ''infants through 12 months,'' we have finalized the provisions without change.

b. Mandatory declaration of vitamin D and potassium. We proposed to require the declaration of vitamin D on foods for the general population. With respect to infants, we stated, in the preamble to the proposed rule (79 FR 11879 at 11938), that the AI for vitamin D for infants was based on maintenance of serum 25(OH)D concentrations at a level to achieve and maintain serum 25(OH)D concentrations above a defined level (30 to 50 nmol/L) in order to meet the needs of the majority of the infants and support bone accretion and that DRIs (EAR and RDA) for vitamin D were established at a level to achieve and maintain serum 25(OH)D concentrations above a defined level (40 to 50 nmol/L) to maintain bone health for children 1 through 3 years of age and pregnant women. Although serum 25(OH)D data were not available in NHANES 2003–2006 for infants ages 7 to 12 months, we noted that our analysis of NHANES 2003–2006 dietary data showed that 28.7 and 33.6 percent of infants ages 7 to 12 months have usual vitamin D intakes above the AI from conventional foods and conventional foods plus supplements, respectively (see 79 FR 11879 at 11938).

Our analysis of NHANES 2003–2006 data showed that about 3 percent of children 1 through 3 years of age had serum 25(OH)D levels below 40 nmol/L, while an analysis of NHANES 2005–2008 dietary data showed that, assuming minimal sun exposure, about 82 percent of these children had usual vitamin D intakes below the EAR from

conventional foods only and 66 percent had usual intakes below the EAR from conventional foods and supplements (see 79 FR 11879 at 11938). For pregnant women, 15 percent had serum 25(OH)D levels below 40 nmol/L, while about 88 percent of pregnant women had usual vitamin D intakes below the EAR from conventional foods only and 48 percent had usual intakes below the EAR from conventional foods and supplements (id.). We tentatively concluded that vitamin D has public health significance in children 1 through 3 years of age and pregnant women based on the high prevalence of inadequate intakes of vitamin D and its important role in bone development and health and that vitamin D is of public health significance for infants 7 through 12 months of age based on its importance for growth and development during infancy.

We also proposed, at proposed § 101.9(c)(8)(ii), to require the declaration of potassium on foods for the general population. The AI for the general population is set at a level to maintain blood pressure, reduce the adverse effects of sodium chloride intake on blood pressure, and reduce the risk of recurrent kidney stones, but for infants, the AI is based on average potassium intake from breast milk and/or complementary foods (id.). Our analysis of NHANES 2003–2006 showed that 99 percent of infants ages 7 to 12 months have usual potassium intakes above the AI and that only 7 percent of children 1 through 3 years of age and 4 percent of pregnant women had usual potassium intakes above the AI from conventional foods or conventional foods plus dietary supplements, indicating that the adequacy of intakes is very low. We acknowledged, in the preamble to the proposed rule (79 FR 11879 at 11938) that, as a result of a FDAMA notification for a health claim about potassium, blood pressure, and stroke, foods may bear the following claim ''Diets containing foods that are good sources of potassium and low in sodium may reduce the risk of high blood pressure and stroke,'' on the label or labeling of any food product that meets the eligibility criteria described in the notification and meets the general requirements for a health claim (§ 101.14(e)(6)). This health claim pertains to the general population 2 years of age and older. Thus, because potassium is important in the risk reduction of these chronic diseases for children 2 years of age and older, we tentatively concluded that potassium is of public health significance to children 1 through 3 years of age, pregnant women, and lactating women and that, because of the benefits of adequate potassium intake in lowering blood pressure, data indicating low likelihood of potassium adequacy, and importance of establishing healthy dietary practices for later life, potassium is a nutrient of public health significance for infants 7 through 12 months of age, children 1 through 3 years of age, pregnant women, and lactating women. Thus, we proposed to require the labeling of vitamin D and potassium on foods represented or purported to be specifically for infants 7 through 12 months of age, children 1 through 3 years of age, or pregnant and lactating women based on the quantitative intake recommendations for vitamin D and potassium and the public health significance of these nutrients and did not provide for any exceptions for these subpopulations from the general requirement for declaration of vitamin D and potassium in proposed § 101.9(c)(8)(ii).

We did not receive comments regarding potassium and these subpopulations, so, other than replacing ''infants 7 to 12 months'' with ''infants through 12 months,'' we have finalized those provisions without change.

(Comment 452) One comment questioned the need for mandatory disclosure of vitamin D on the Nutrition Facts panel. The comment cited dietary intake data from food, beverages and supplements that suggests at least 75 percent of children ages 1 through 3 years have adequate intakes of vitamin D, not including sun exposure (Ref. 252). The comment said that mandatory declaration of vitamin D is not of value because relatively few foods have naturally occurring vitamin D, limitations on vitamin D addition to foods already exist, and vitamin D added to foods is already required on labeling. In addition, according to the comment, labeling can not necessarily help consumers achieve adequate intakes of vitamin D because it is not expected that all the required vitamin D will be provided by foods or supplements. Another comment noted that its products have many labels with very little label space and that using this label space for a declaration of 0 percent DV for vitamin D will limit its ability to provide other label information including information on other nutrients present in the products at significant levels.

(Response) We disagree with comments arguing against the mandatory declaration of vitamin D. We have determined that vitamin D is a nutrient of public health significance (79 FR 11879 at 11921 and 11938). The comment cited data that assessed usual intakes using the AI for vitamin D established in 1997 (Ref. 253). The IOM has since established an EAR for vitamin D (Ref. 38). Our analysis of NHANES data compared to the EAR showed 66 percent of children 1 through 3 years of age had inadequate intake of vitamin D from foods and supplements (79 FR 11879 at 11938).

We also disagree that mandatory declaration of vitamin D, including the declaration of zero percent DV, is not of value because few foods have naturally occurring vitamin D. As we discussed in the preamble to the proposed rule (79 FR 11879 at 11938) and part II.L, we identified vitamin D as a nutrient of public health significance for children 1 through 3 years of age based on the high prevalence of inadequate intakes of vitamin D and its important role in bone development and health (Ref. 198). Our analysis also shows that vitamin D intakes and status remain inadequate in the general population (79 FR 11879 at 11922). While limited label space may present challenges, the consideration for the mandatory declaration of vitamin D on the label is whether it will help consumers maintain healthy dietary practices.

While we acknowledge that some, but not all, vitamin D needs can be met by the body's exposure to sunlight, we determined the mandatory declaration of vitamin D based on the high prevalence of inadequate intakes of vitamin D and its important role in bone development and health (see part II.L). The mandatory declaration of vitamin D is intended to help consumers maintain healthy dietary practices and make healthy choices in context of a daily diet. The mandatory declaration of vitamin D also provides information to consumers about what foods are good sources of vitamin D and what foods do not contain vitamin D. Therefore, we have finalized this provision without change.

c. Voluntary declaration of vitamin A and vitamin C. We proposed to no longer require the declaration of vitamin A and vitamin C on foods for the general population. With respect to subpopulations, we noted, in the preamble to the proposed rule (79 FR 11879 at 11939) that our analysis of data from NHANES 2003–2006 showed that less than 2 percent of children 1 through 3 years of age had usual vitamin A intakes below the EAR from conventional foods or conventional foods plus dietary supplements and that, while 36 percent of pregnant women had usual intakes below the EAR from conventional foods and 22 percent had usual intakes below the

EAR for conventional foods plus dietary supplements, only 1 percent of these women had serum vitamin A levels that were considered to be indicative of a vitamin A deficiency. Furthermore, our analysis of data from NHANES 2003–2006 showed that neither vitamin A nor vitamin C is considered to have public health significance for children 1 through 3 years of age and pregnant women. Therefore, we tentatively concluded that vitamin A and vitamin C are not of public health significance among infants 7 through 12 months of age, children 1 through 3 years of age, and pregnant and lactating women, but we proposed to permit, but not require, the declaration of vitamin A and vitamin C on foods represented and purported to be specifically for infants 7 through 12 months, children 1 through 3 years of age, or pregnant and lactating women. As for other voluntary nutrients, the declaration of these nutrients would be required when these nutrients are added as nutrient supplements or claims are made about them (proposed § 101.9(c)(8)(ii)).

We did not receive comments regarding the voluntary declaration of vitamins A and C for subpopulations, so, other than replacing ''infants 7 to 12 months'' with ''infants through 12 months,'' we have finalized that provision without change.

d. Voluntary declaration of other vitamins and minerals. For the general population, we proposed to permit the voluntary declaration of vitamin E, vitamin K, vitamin B_6, vitamin B_{12}, thiamin, riboflavin, niacin, folate, biotin, pantothenic acid, phosphorus, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, chloride, and choline (proposed § 101.9(c)(8)(ii)). In the preamble to the proposed rule (79 FR 11879 at 11939), we said that vitamins and minerals other than iron, calcium, vitamin D and potassium for infants either have DRIs that are not based on chronic disease risk, heath-related conditions, or health-related physiological endpoints or are not shown to have public health significance due to the prevalence of a clinically relevant nutrient deficiency. For infants 7 to 12 months, children 1 through 3 years of age, and pregnant and lactating women, we tentatively concluded that the essential vitamins and minerals, other than iron, calcium, vitamin D and potassium, do not have public health significance and there is no basis for the declaration of these nutrients to be different from that proposed for the general population. Thus, proposed § 101.9(c)(8)(ii) would allow the voluntary declaration of vitamin E, vitamin K, vitamin B_6, vitamin B_{12}, thiamin, riboflavin, niacin, folate, biotin, pantothenic acid, phosphorus, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, chloride, and choline on foods represented or purported to be specifically for infants 7 to 12 months, children 1 through 3 years of age, pregnant women, or lactating women, under the requirements of this section, unless they are added to foods as a nutrient supplement or if the label or labeling makes a claim about them, in which case the nutrients would have to be declared.

We did not receive comments regarding the voluntary declaration of vitamin K, vitamin B_6, vitamin B_{12}, thiamin, riboflavin, niacin, folate, biotin, pantothenic acid, phosphorus, iodine, magnesium, zinc, copper, manganese, chromium, molybdenum, and chloride on foods represented or purported to be specifically for infants through 12 months of age, children 1 through 3 years of age, pregnant women, or lactating women. Therefore, other than replacing ''infants 7 to 12 months'' with ''infants through 12 months,'' we have finalized these provisions without change.

(Comment 453) One comment requested we reconsider mandatory declaration of vitamin E on nutrition labeling for children 1 through 3 years of age. The comment said that about 63 percent of children 12 to 24 months and 37 percent of children 24 to 48 months have vitamin E intakes below the EAR (Ref. 252). The comment also noted that encouraging an adequate intake of vitamin E in the diets of young children may encourage adequate consumption of foods with higher levels of vegetable fat.

(Response) We agree that vitamin E intakes are below the EAR and disagree that mandatory declaration of vitamin E is needed. Our analysis of NHANES data also has shown that intakes of children 1 through 3 years of age are below the EAR (79 FR 11879 at 11944). However, low intakes of vitamin E have not been associated with clinically relevant nutrient deficiency (Ref. 246). Therefore, consistent with the factors for mandatory or voluntary declaration of non-statutory nutrients (79 FR 11879 at 11889 and 11918, and part II.D), we have determined that vitamin E is not a nutrient public health significance for children 1 through 3 years of age and the general population.

The comment did not provide evidence to suggest that mandatory declaration of vitamin E may encourage adequate intake and consumption of foods with higher levels of vegetable fat, and we are not aware of any evidence to support that proposition. Therefore, we are not making changes in response to this comment.

(Comment 454) One comment supported the voluntary declaration of choline for pregnant and lactating women. The comment noted that choline has a role in preventing neural tube defects in infants and high intakes improve placental function and ease babies' response to stress during pregnancy. Another comment suggested that some nutrients should be considered for mandatory labeling, *e.g.,* choline and selenium as public health concerns. The comment also recommended that choline be considered for mandatory labeling on foods for pregnant and lactating women. The comment explained that mandatory labeling on foods in general, should be driven by the interest to reduce the risk of chronic diseases in adulthood, and should be revisited for foods for 7 months through 3 years to emphasize the role of nutrients in development.

(Response) We disagree that the declaration of choline and selenium should be mandatory. As the comment suggested, we have considered the relationship of nutrients and chronic disease risk, health-related conditions, or a health-related physiological endpoints (*i.e.* growth and development) in infants, children, and pregnant and lactating women to determine its mandatory or voluntary declaration on labeling. Based on our analysis of dietary intakes, we found no evidence of inadequate intakes of choline and selenium in these subpopulations. We also found no evidence for a substantial prevalence of chronic disease, health-related condition, or nutrient deficiency with clinical significance linked to choline and selenium in these subpopulations. Therefore, consistent with the factors for mandatory or voluntary declaration of these types of non-statutory nutrients (see part II.D), we have determined that choline and selenium are not nutrients of public health significance for infants through 12 months of age, children 1 through 3 years of age and pregnant and lactating women and have finalized the provision regarding voluntary declaration.

5. DRVs and RDIs for Infants Through 12 Months of Age

Our preexisting regulations do not include DRVs or RDIs for nutrients for infants, except for an RDI of protein of 14 grams. However, the proposed rule would establish a DRV or RDI for certain nutrients, and we explained, in the case

of polyunsaturated fat, monounsaturated fat, insoluble fiber, soluble fiber, added sugars, sugar alcohols, sodium, and fluoride, why we were not proposing to establish a DRV.

a. General comments.

(Comment 455) One comment recommended considering dietary intake data and public health need in addition to quantitative intake recommendations to determine appropriate RDIs for vitamins and minerals to be established for infants 7 months through 12 months of age and children 1 through 3 years of age. Another comment recommended that menu modeling and intake survey data should be a consideration in the establishment of certain DRVs as they provide insight on whether a DV is achievable, without compromising intake of another food group or nutrient and whether they align with dietary recommendations.

(Response) We agree dietary intake data and public health significance are important considerations in determining appropriate RDIs for vitamins and minerals. We consider public health significance in the context of developing RDIs for vitamins and minerals to refer to the existence of ''well-established'' scientific evidence from U.S. consensus reports that there is a relationship between a nutrient and chronic disease risk, a health-related condition, or a health-related physiological endpoint and where the intake of such nutrient is of general importance in the general U.S. population, *e.g.,* where intakes are generally too low or too high among the U.S. population. Thus, we established RDIs for vitamins and minerals based on the DRIs set by the IOM that reflect the most current science regarding nutrient requirements and associated disease risk, health-related condition, or health-related physiological endpoints (79 FR 11879 at 11926). While the DRI reports also consider dietary intake data, we also have analyzed more recent dietary intake data for these age groups (79 FR 11879 at 11944).

We acknowledge the comment suggesting that menu modeling and intake survey data could be a consideration in the establishment of certain DRVs. Dietary recommendations based on menu modeling may aim to achieve nutrient requirements, but are not the sole determining factor for establishing all DRVs. We agree that menu modeling can be considered in choosing a reference point for daily intake that is realistically achievable and practical in light of the current food supply and consumption patterns.

b. Calories. The preamble to the proposed rule (79 FR 11879 at 11939) stated that we have not established a reference calorie intake for infants. We noted that there is no quantitative intake recommendation for calories for infants and that we were not aware of scientific data and information on which we could rely to establish such a level (id.). Thus, we did not propose to establish a reference calorie intake level for infants 7 to 12 months.

We did not receive comments on this issue. Consequently, the final rule does not establish a reference calorie intake for infants though 12 months of age.

c. Total fat. Regarding total fat, the IOM set an AI of 30 grams/day for fat for infants 7 through 12 months of age based on the average intake of human milk and complementary foods. The AI provides a basis on which we can determine an appropriate DRV for total fat for infants 7 through 12 months, so we proposed to amend § 101.9(c)(9) to include a DRV of 30 grams for fat for infants 7 through 12 months of age.

We did not receive comments regarding the proposed DRV for infants, so the final rule establishes a DRV of 30 grams for fat for infants though 12 months of age.

d. Saturated fat, trans fat, cholesterol, dietary fiber, and sugars. Regarding saturated fat, *trans* fat, cholesterol, dietary fiber, and sugars, there are no quantitative intake recommendations from U.S. consensus reports available with respect to infants. Thus, we did not propose to establish DRVs for these nutrients for infants 7 through 12 months of age.

We did not receive comments on our decision not to establish DRVs for saturated fat, *trans* fat, cholesterol, and dietary fiber for infants. Thus, the final rule does not establish DRVs for infants though 12 months of age for these nutrients.

(Comment 456) One comment recommended establishing a DRV for sugars for infants and children and suggested that we work with the IOM to establish a DRV for sugar for this population.

(Response) We decline to establish a DRV for sugars for infants though 12 months of age and children 1 through 3 years of age. As discussed in part II.H.2, we are not aware of data or information related to a quantitative intake recommendation for sugars that we could use as the basis for a DRV for total sugars. The IOM reviewed the evidence on this topic in the Macronutrient report (IOM, 2002) and did not provide quantitative intake recommendations for infants and children.

e. Polyunsaturated fat, monounsaturated fat, insoluble fiber, soluble fiber, added sugars, and sugar alcohols. For polyunsaturated fat, monounsaturated fat, insoluble fiber, soluble fiber, added sugars, and sugar alcohols, there are no quantitative intake recommendations from U.S. consensus reports available with respect to infants. Thus, we did not propose to establish DRVs for these nutrients for infants 7 through 12 months of age.

We did not receive comments on our decision not to establish DRVs for polyunsaturated fat, monounsaturated fat, insoluble fiber, soluble fiber, added sugars, and sugar alcohols. Thus, the final rule does not establish DRVs for infants though 12 months of age for these nutrients.

f. Total carbohydrates. For total carbohydrates, the IOM set an AI of 95 grams/day for carbohydrates for infants 7 through 12 months of age based on the average intake of human milk and complementary foods; the AI provides a basis on which we can determine an appropriate DRV for total carbohydrate for this subpopulation that can assist consumers in maintaining healthy dietary practices among this subpopulation. Therefore, we proposed to amend § 101.9(c)(9) to establish a DRV of 95 grams for total carbohydrate for infants 7 through 12 months of age.

We did not receive comments regarding the proposed DRV of 95 grams for total carbohydrates for infants. Consequently, the final rule adopts the DRV of 95 grams for total carbohydrates for infants though 12 months of age.

g. Protein. For protein, the DV for protein for infants is an RDI, rather than a DRV. The preexisting RDI for infants is 14 grams/day for infants, but, in the preamble to the proposed rule (79 FR 11879 at 11940), we said we would revise the RDI to rely on current quantitative intake recommendations and that, in 2002, the IOM established an RDA for infants 7 through 12 months of 1.2 grams/kilogram/day based on nitrogen balance studies and using a reference body weight of 9 kilograms. The value 1.2 grams/kilogram/day × 9 kg equals 10.8 grams/day or a rounded value of 11 grams/day, yet we also noted that protein intakes are well above the current and proposed RDI. Mean protein intake for infants 6 to 11 months of age was 22 grams/day, well above the RDA of 11 grams/day. Thus, we proposed to revise § 101.9(c)(8)(iv) to establish an RDI of 11 grams for protein for infants 7 through 12 months of age.

We did not receive comments on our proposed RDI of 11 grams for infants, so the final rule, at § 101.9(c)(7)(iii) and (c)(8)(iv), establishes a RDI for protein of 11 grams for infants though 12 months of age.

h. Sodium. For sodium, we noted, in the preamble to the proposed rule (79 FR 11879 at 11940), that the IOM did not set a UL for sodium for infants 7 through 12 months of age due to insufficient data on adverse effects of chronic overconsumption in this age group. Thus, we did not propose a DRV for sodium for infants 7 through 12 months of age.

We did not receive comments regarding a DRV for sodium for infants. Thus, the final rule does not establish a DRV for sodium for infants though 12 months of age.

i. Fluoride. For fluoride, although the IOM set an AI for fluoride, the AI for infants 7 through 12 months is close to the EPA benchmarks for total fluoride intake. Additionally, we did not propose a DRV for fluoride for use in the labeling of foods for the general population because of a concern about excess intakes associated with dental fluorosis, and so, in the proposed rule, we tentatively concluded that a DRV for fluoride is not warranted for infants 7 through 12 months. Thus, we did not propose to establish a DRV for fluoride for infants 7 through 12 months of age.

We did not receive comments regarding establishment of DRVs for fluoride for infants. Thus, the final rule does not establish DRVs for fluoride for infants though 12 months of age.

j. Other vitamins and minerals. For vitamins and minerals, we reviewed current quantitative intake recommendations for vitamins and minerals for infants to determine appropriate RDIs for vitamins and minerals to be established in regulations for infants 7 through 12 months of age. In the preamble to the proposed rule (79 FR 11879 at 11940), we explained that we considered it important to establish RDIs for infants 7 through 12 months of age because infants in this age range transition from a diet of mostly breast milk and infant formula to infant cereal and baby foods, and labeling foods for this subpopulation with percent DV declarations can help parents make nutritious food choices. The DRIs (AIs and RDAs) provide a basis on which to determine RDIs for vitamins and minerals for this subpopulation. We considered it appropriate to use RDAs and, in the absence of RDAs, AIs to determine appropriate micronutrient RDIs for infants. We also stated that the IOM established DRIs based on scientific knowledge that update and supersede previous RDA recommendations. Consequently, we proposed to amend § 101.9(c)(8)(iv) to include a listing of RDIs for vitamin A, vitamin C, vitamin D, vitamin E, vitamin K, vitamin B_{12}, folate, choline, riboflavin, niacin, vitamin B_6, calcium, iron, thiamin, biotin, pantothenic acid, phosphorous, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, chloride, and potassium for infants 7 through 12 months of age.

We did not receive comments regarding our proposed RDIs for vitamin A, vitamin C, vitamin D, vitamin E, vitamin K, vitamin B_{12}, folate, choline, riboflavin, niacin, vitamin B_6, calcium, thiamin, biotin, pantothenic acid, phosphorous, iodine, magnesium, selenium, copper, manganese, chromium, molybdenum, chloride, and potassium for infants. Thus, the final rule adopts these RDIs for infants though 12 months of age without change.

(Comment 457) One comment would have us retain a DV for iron of 15 mg for infants given the importance of adequate iron in the diets of infants and young children and the prevalence of iron deficiency in children. The comment noted that published data reported 12 percent of infants aged 6 to 11 months have iron intakes from food, beverages, and supplements below the EAR (Butte 2010) and our analysis of NHANES data showed that 17.8 percent of infants aged 7 to 12 months have iron intakes from conventional foods only below the EAR.

(Response) We decline to revise the rule as suggested by the comment. We recognize the importance of adequate iron in the diets of infants. We acknowledge the dietary intake data and prevalence of iron deficiency for infants cited by the comment and point out that our analysis of NHANES data showed that 3 percent of infants aged 7 to 12 months have iron intakes below the EAR from food, beverages, and supplements. While we evaluated intakes, we consider that the DRI is the appropriate basis for establishing the DV for iron for infants because the DRI reports and its set of nutrient reference values are comprehensive reviews and applications of nutrition science research (79 FR 11879 at 11885).

(Comment 458) One comment questioned how a decrease in the DV for iron would affect iron fortification of foods for infants. The comment said that such a decrease in the DV could cause manufacturers to reduce iron fortification of products for this population group.

(Response) We disagree with the comment. The comment did not provide, and we are not aware of, any evidence to suggest that decreasing the DV for iron would impact iron fortification of foods for infants. DVs are established based on DRIs set by the IOM that reflect the most current science regarding nutrient requirements, not on potential changes in fortification of products. We recognize the importance of adequate iron intake in the diets of infants and intend to monitor the nutrient adequacy for this population and consider the need for consumer education.

(Comment 459) One comment asked that we use the current DV of 5 mg for zinc for infants as the DV for infants because previous RDA panels have recommended intakes of up to 10 mg for children 1 through 3 years of age and now recommend a RDA of 3 mg for infants and children 1 through 3 years of age. The comment also cited a study by Walravens et al. 1989 (Ref. 254) referenced by the IOM confirming the factorial approach and questioned the IOM's use of the Walraven baseline data minus 2 standard deviations to support for the EAR and suggested that reported dietary intake data, instead of standard deviations, maybe a more appropriate basis for EAR. The comment stated that lowering the DV to 3 mg/day may affect the availability and level of zinc fortification in foods and reduce intake levels without a full understanding of the potential impact in this sensitive population.

(Response) We decline to revise the rule as suggested by the comment. We are changing the DVs to reflect the most recent comprehensive reviews and applications of nutrition science research provided by current DRI reports and its set of nutrient reference values (see 79 FR 11879 at 11885). Modifying the reference value for zinc provided by these consensus reports is not warranted based on the scientific evidence to support the DRI.

We also disagree that using reported dietary intake data may be a more appropriate basis for the EAR infants. We note that the IOM established the EAR for zinc using a factorial approach and did not base the EAR on the growth data from the Walravens study (Ref. 226). We decline to comment on the IOM's rationale for the calculation used in confirming the factorial approach using the growth data cited by the Walraven study. We decline to speculate on how consumers may interpret % DV for zinc resulting from a recommended dietary pattern and whether they may inappropriately limit zinc intake. The comment did not provide, and we are not aware of, any evidence to suggest how consumers will react to the changes in percent DV as a result of changes to the DVs and whether they would inappropriately limit zinc intake. We recognize the importance of adequate zinc intake in

the diets of infants and intend to monitor the nutrient adequacy for this population and consider the need for consumer education.

We also have no evidence to suggest how that decreasing the DV for zinc would impact zinc fortification of foods for infants and decline to speculate on how availability and level of zinc fortification may change. DVs are established based on DRIs set by the IOM that reflect the most current science regarding nutrient requirements and not on potential changes in the fortification of products.

6. DRVs and RDIs for Children 1 Through 3 Years of Age

With respect to children 1 through 3 years of age, our preexisting regulations do not include DRVs or RDIs, except an RDI for protein of 16 grams for children less than 4 years of age. In the preamble to the proposed rule (79 FR 11879 at 11940 through 11941), we explained that we reviewed scientific evidence and current recommendations, as well as comments in response to the 2007 ANPRM to consider establishing DRVs and RDIs for nutrients for this subpopulation and to consider revisions to the current RDI for protein.

a. General comments.

(Comment 460) Several comments supported establishing DVs for children 1 through 3 years (13 through 48 months) that are consistent with the IOM's DRI recommendations for children 1 through 3 years age ranges.

In contrast, one comment suggested setting DVs specific for 4- to 8-year-old children because, according to the comment, setting a single DV that groups 4- to 8-year-old children with adults could lead to excessive intakes of some fortified vitamins and minerals and potentially increase the risk of adverse health effects from ingesting too much. The comment pointed out that the updated DVs for two nutrients, vitamin A and niacin, are the same as or higher than the IOM Tolerable Upper Intake Levels (ULs) for 4-to-8-year-olds.

Other comments suggested establishing RDIs and DRVs for children 4 to 13 years of age because product labeling based on RDIs for adults, in most cases, exceed the nutritional needs for children 4 to 13 years of age. The comments also noted that setting RDIs for children would provide an opportunity for more companies to formulate children's products to age-specific RDAs (rather than adult values which may not be appropriate for children's nutritional needs) and communicate the information to consumers via product labeling. One comment recommended that declarations of percent DV should be required for products targeted to children 4 through 13 years of age that contain nutrients for which this age-specific DRV or RDI is established.

(Response) We decline to revise the rule as suggested by the comments. While we recognize that nutritional needs of children aged 4 to 8 or 4 to 13 years are different from adults, we disagree with establishing RDIs for children aged 4 to 8 or 4 to 13 years due to concerns about excessive intake of nutrients above the UL or recommended intakes for these age groups. As noted in the preamble to the proposed rule (79 FR 11879 at 11928) and the accompanying memorandum to the file rule (Ref. 199), intakes of vitamins and minerals generally do not exceed the ULs under current RDIs that are based on a population coverage approach, except for zinc, vitamin A (preformed), iodine and folic acid among children 4 to 8 years old. In these few instances where total usual intakes of vitamins and minerals by children aged 4 to 8 years exceed corresponding ULs, we have determined that such intakes are not of public health significance.

With respect to the comment regarding niacin, the UL for niacin applies to niacin obtained from fortified foods and/or supplements and is based on flushing (burning, tingling sensation and reddening flush primarily on skin, arms and face) which is not considered a serious adverse effect. The UL for children was set by extrapolating downward from the UL for adults. While niacin intakes from fortified foods and dietary supplements may exceed the UL for children aged 4 to 8 years old (Refs. 194–195), no data were found to suggest that children have increased susceptibility to flushing effects from excess intake (Ref. 249).

We also disagree with establishing RDIs and DRVs for children 4 to 13 years of age and mandatory declaration of percent DV for products targeted to children 4 through 13 years of age to provide an opportunity for companies to formulate children's products to age-specific RDAs rather than adult values which may not be appropriate for children's nutritional needs. We recognize that RDAs for adults may be higher than the RDAs of children 4 through 8 years of age and 9 through 13 years of age. RDIs are intended to help persons to understand the relative significance of nutrients in the context of a total daily diet, to compare foods, and to plan general diets. They are not intended to be used to decide whether a particular individual's consumption of nutrients is appropriate. While RDIs are not precise values for certain age and sex groups, they function as an overall population reference to help consumers judge a food's usefulness in meeting overall daily nutrient requirements or recommended consumption levels and to compare nutrient contributions of different foods.

b. Calories. With respect to calories, we stated, in the preamble to the proposed rule (79 FR 11879 at 11940 through 11941), that several comments to the 2007 ANPRM supported establishing a DV for calories specifically for young children 1 through 3 years of age and that we considered it appropriate to establish a reference calorie intake level for children 1 through 3 years of age because we proposed to set DRVs using quantitative intake recommendations that are based on calories (*e.g.,* total fat, saturated fat, and dietary fiber). Because recommendations from the IOM, AHA, AAP, and the 2010 DGA for caloric intake range from 800 to 900 calories/day for children 1 year old, approximately 1,000 calories/day for children 2 years of age, and from 1,000 to 1,200 calories/day for children 3 years of age, we used an average of the range of these caloric intake recommendations (800 to 1,200 calories/day), *i.e.,* 1,000 calories/day, as a reasonable reference calorie intake level and proposed to amend § 101.9(c)(9) to provide a reference calorie intake level of 1,000 calories/day for children 1 through 3 years of age.

(Comment 461) One comment supported the reference calorie intake of 1,000 calories/day for children 1 through 3 years of age.

(Response) We agree with the reference calorie intake of 1,000 calories/day for labeling represented or purported to be for children 1 through 3 years of age. Thus, the final rule, at § 101.9(c)(9), establishes a reference calorie intake of 1,000 calories/day for children aged 1 through 3 years.

c. Total fat. In the preamble to the proposed rule (79 FR 11879 at 11941), we noted that there is no DRV for total fat for children ages 1 through 3 years, but a comment to the 2007 ANPRM recommended that 35 percent of the recommended 1,050 calories or 41 grams/day of fat be used to as the DRV for fat because it is the midpoint of the AAP/AHA recommendation and the IOM Acceptable Macronutrient Distribution Range (AMDR) for 1 through 3 year olds. We agreed that 35 percent of calories from fat for children 1 through 3 years of age serves as an appropriate basis on which to set the DRV for total fat and would be consistent with AHA and AAP recommendations that 30 to 40 percent

of calories consumed by children 12 to 24 months of age and 30 to 35 percent of calories consumed by children 24 through 48 months of age should come from fat. Therefore, we tentatively concluded that 35 percent of total calories from fat (*i.e.,* 39 grams using the proposed reference calorie intake level of 1,000 calories/day) is an appropriate DRV for total fat for children 1 through 3 years of age, and we proposed to amend § 101.9(c)(9) to establish a DRV of 39 grams for fat for children 1 through 3 years of age.

(Comment 462) One comment would increase the DRV for total fat for children 1 through 3 years of age to 41 grams, given the importance of an adequate intake of total fat in this population for healthy development and growth. The comment noted that this level of total fat would be 37 percent of total calories from fat (based on 1,000 calories/day reference calorie intake level) which is within the AMDR of 30 to 40 percent total calories from fat. The comment cited dietary intake data suggesting that 23 percent (12 to 23 months) and 47 percent (24 to 48 months) of children are below the AMDR. The comment noted that it is important for the total fat DV to help encourage adequate fat intake.

(Response) We decline to increase the DRV for total fat. In the preamble to the proposed rule (79 FR 11879 at 11941), we determined that 35 percent of calories from fat, based on a 1,000 calorie/day reference calorie intake level, is an appropriate basis for the DRV for total fat because it aligns with the AHA and AAP recommendations that 30 to 40 percent of calories consumed by children 12 through 24 months of age and 30 to 35 percent of calories consumed by children 24 through 48 months of age should come from fat and is consistent with our proposed approach to setting the DRV for total fat for the general population (Ref. 255). We acknowledge the dietary intake data suggesting the total fat intake of children is below the AMDR. This calculation yields a DRV of 39 grams.

We disagree that the purpose of the total fat DV is to encourage fat intake. The DVs are intended to help persons to understand the relative significance of nutrients in the context of a total daily diet, to compare foods, and to plan general diets. They are not intended to be used to decide whether a particular individual's consumption of nutrients is appropriate.

Thus, the final rule, at § 101.9(c)(9), establishes a DRV of 39 grams for total fat for children aged 1 through 3 years.

d. Saturated fat, trans fat, and cholesterol. For saturated fat, *trans* fat, and cholesterol, we stated, in the preamble to the proposed rule (79 FR 11879 at 11941), that there are no DRVs for children 1 through 3 years of age. Based on the scientific evidence in the 2010 DGA to support that Americans 2 years of age and older consume less than 10 percent of calories from saturated fat and less than 300 mg/day of cholesterol, we tentatively concluded that it would be appropriate to set a DRV of 10 grams for saturated fat, based on 10 percent of total calories from saturated fat and using the proposed reference calorie intake level of 1,000 calories/day, which equals 11 grams, rounded down to 10 grams, and a DRV of 300 mg for cholesterol for children 1 through 3 years of age. We proposed to amend § 101.9(c)(9) to establish a DRV of 10 grams for saturated fat and a DRV of 300 mg for cholesterol for children 1 through 3 years of age. We declined to propose a DRV for *trans* fat because the scientific evidence from the IOM and the 2010 DGA did not provide any specific appropriate levels of intake.

(Comment 463) One comment recommended using the DRV of 12 grams for saturated fat for children 1 through 3 years of age. The comment noted that this value represents 10.7 percent of calories from saturated fat based on a 1,000 calorie diet and is consistent with the diets of about 25 percent of children between 12 and 47 months, an indication that this level of intake is achievable.

(Response) We decline to change the DRV for saturated fat as suggested by the comment. In establishing the DRV for saturated fat, we considered that cardiovascular disease can begin in childhood and the scientific evidence in the 2010 DGA that support Americans 2 years of age and older consuming less than 10 percent of calories from saturated fat (79 FR 11879 at 11941). We disagree that the DRV for saturated fat should be based on dietary intake data that suggest that a level of 12 grams is achievable. DVs are established based on DRIs set by the IOM that reflect the most current science regarding nutrient requirements, not on levels of intakes that are achievable. Thus, the final rule, at § 101.9(c)(9), establishes a DRV of 10 grams for saturated fat for children aged 1 through 3 years. Additionally, on our own initiative, we have replaced ''saturated fatty acids'' in the table with ''saturated fat'' for consistency in how we refer to saturated fat. We also have replaced ''Unit of measurement'' with ''Unit of measure'' in the table for consistency with the introductory sentence to § 101.9(c)(9).

We did not receive comments regarding our tentative decision not to establish a DRV for *trans* fat or the proposed DRV of 300 mg for cholesterol for children aged 1 through 3 years. Thus, the final rule establishes a DRV of 300 mg for cholesterol for children aged 1 through 3 years and does not establish a DRV for *trans* fat.

e. Polyunsaturated fat, monounsaturated fat, sugars, insoluble fiber, soluble fiber, added sugars, and sugar alcohols. For polyunsaturated fat, monounsaturated fat, sugars, added sugars, insoluble fiber, soluble fiber, and sugar alcohols, we stated, in the preamble to the proposed rule (79 FR 11879 at 11941), that there are no DRVs for children 1 through 3 years of age. We recognized the essential nature of α-linolenic acid in the diet, but we said that, for children 1 through 3 years of age, DRIs or other data and information were not available on which we could rely to establish DRVs for polyunsaturated fat, monounsaturated fat, sugars, added sugars, insoluble fiber, soluble fiber, and sugar alcohols (id.). Therefore, we tentatively concluded that there was no basis for setting DRVs for these nutrients and did not propose DRVs for polyunsaturated fat, including n-3 or n-6 polyunsaturated fatty acids, monounsaturated fat, sugars, added sugars, soluble fiber, insoluble fiber, or sugar alcohols for children 1 through 3 years of age.

We did not receive comments on our tentative decision not to establish DRVs for polyunsaturated fat, monounsaturated fat, sugars, insoluble fiber, soluble fiber, and sugar alcohols. Thus, the final rule does not establish DRVs for children 1 through 3 years of age for these nutrients.

(Comment 464) Some comments agreed with not defining DVs for added sugars. One comment recommended establishing a DRV for added sugar for children.

(Response) We received many comments on defining a DRV for added sugars and explain, in part II.H.3.o, that we are establishing a DRV for added sugars for children and adults 4 years of age and older of no more than 10 percent of total calories, or 50 grams using a 2,000 calorie intake reference amount based on food pattern modeling. For the reasons discussed in part II.H.3.o, we are also establishing a DRV of 25 grams of added sugars for children 1 through 3 years of age based on food pattern modeling. Using the 1,000 calorie intake reference amount for children 1 through 3 years of age and the DRV of no more than 10 percent of total calories, the DRV for children 1 through 3 years of age is 25 grams (1,000

calories × 0.1 = 100 calories and 100 calories ÷ 4 calories per gram for carbohydrates = 25 grams). Thus, the final rule, at § 101.9(c)(9), establishes a DRV of 25 grams for added sugars for children ages 1 through 3 years of age.

f. Total carbohydrates. In the preamble to the proposed rule (79 FR 11879 at 11941), we said that, for total carbohydrates, there is not a DRV for children 1 through 3 years of age. We noted, however, that we were proposing a DRV for total carbohydrate for the general population based on the percentage of calories in a 2,000 calorie diet remaining after the sum of the DRV for fat (30 percent) plus the DRV for protein (10 percent) have been subtracted and that we considered this method to be appropriate for setting a DRV for total carbohydrate for children 1 through 3 years of age (id.). We also stated that total calories (100 percent) minus the proposed DRV for total fat (35 percent of calories) and the proposed DRV for protein (5 percent of calories) equals 60 percent of calories from total carbohydrate. A value of 60 percent of total calories from total carbohydrates also falls within the IOM AMDR recommendation of 45 to 65 percent of calories from carbohydrates for children 1 through 3 years of age. Therefore, we tentatively concluded that an appropriate DRV for total carbohydrate is 60 percent of calories (*i.e.,* 150 grams using the proposed reference calorie intake level of 1,000 calories/day), and we proposed to amend § 101.9(c)(9) to set a DRV of 150 grams for total carbohydrate for children 1 through 3 years of age.

We did not receive comments regarding the proposed DRV of 150 grams for children 1 through 3 years of age, so the final rule adopts this DRV without change.

g. Dietary fiber. In the preamble to the proposed rule (79 FR 11879 at 11941), we stated that there is not a DRV for dietary fiber for children 1 through 3 years of age, but we agreed with a comment to an ANPRM that an AI of 14 grams/1,000 calories for dietary fiber for children 1 through 3 years of age should be used to set a DRV for dietary fiber to be consistent with how other proposed DRVs are being set. Additionally, because we proposed a reference calorie intake level of 1,000 calories/d for this subpopulation, we proposed to amend § 101.9(c)(9) to establish a DRV of 14 grams for dietary fiber for children 1 through 3 years of age.

We did not receive comments regarding the proposed DRV of 14 grams for fiber for children 1 through 3 years of age. Thus, the final rule adopts this DRV without change.

h. Protein. Under our preexisting regulations, at § 101.9(c)(7)(iii), the RDI for protein for children younger than 4 years of age was based on the 1989 RDA for protein of 16 grams/day. Taking into account current recommendations and protein intakes, we noted, in the preamble to the proposed rule (79 FR 11879 at 11942), that protein intakes are well above the current RDI, with the mean protein intake for children 12 to 23 months of age being 44 grams/day, well above the RDA of 13 grams/day, and the midpoint of the AMDR of 5 to 20 percent calories from protein (*i.e.,* 12.5 percent of calories from protein or 31 grams/day). The protein AMDR for children 1 through 3 years of age is 5 to 20 percent of calories, and the RDA is approximately 5 percent of calories. Given the proposed reference calorie intake level and the approaches used for the proposed DRVs for fat and carbohydrate that are based on percent of calories, we tentatively concluded that, as with the general population, the DV for protein for children 1 through 3 years of age should be a DRV, rather than an RDI (using the RDA) and that a DRV for protein should be based on 5 percent of 1,000 calories or 50 calories which equals 12.5 grams or, when rounded up, 13 grams. We proposed to amend § 101.9(c)(7)(iii) and (c)(9) to establish a DRV for protein of 13 grams for children 1 through 3 years of age.

(Comment 465) One comment recommended retaining the current DV of 16 grams for protein or using 10 percent of calories from protein. The comment noted that children 24 to 47 months have 13 to 19 percent of energy intakes from protein, respectively. The comment said that the proposed DV of 13 grams appears to be low relative to the protein that would be expected to be contributed from a diet that supplies the appropriate servings of foods from the recommended food groups, including milk, meat/poultry and beans and other legumes.

(Response) We decline to retain a DV of 16 grams for protein. In the preamble to the proposed rule (79 FR 11879 at 11942), we discussed a comment to the 2007 ANPRM recommending the DV for protein be maintained at 16 grams. We declined to keep the DV for protein at 16 grams, in part, because protein intakes are well above the current RDI. Mean protein intake for children 12 to 23 months of age was 44 grams/day, well above the RDA of 13 grams/day and the midpoint of the AMDR of 5 to 20 percent calories from protein (*i.e.,* 12.5 percent of calories from protein or 31 grams/day, which we rounded up to 13 grams). The protein AMDR for children 1 through 3 years of age is 5 to 20 percent of calories and the RDA is approximately 5 percent of calories. Thus, a DRV for protein should be based on 5 percent of 1,000 calories or 50 calories which equals 12.5 grams or, when rounded up, 13 grams, and the final rule, at § 101.9(c)(7)(iii) and (c)(9), establishes a DRV for protein of 13 grams for children 1 through 3 years of age.

i. Sodium. In the preamble to the proposed rule (79 FR 11879 at 11942), we noted that, for the general population, we proposed to establish a DRV based on the UL for sodium and that there is no DRV for sodium for children 1 through 3 years of age. We also noted that the IOM derived the UL for children 1 through 3 years of age by extrapolation from the adult UL of 2,300 mg/day based on observational studies showing that blood pressure increases with age into adulthood and the recognition that risk factors for CVD, such as high blood pressure and atherosclerosis, occur in childhood (id.). We proposed to amend § 101.9(c)(9) to establish a DRV of 1,500 mg for sodium for children 1 through 3 years of age.

We did not receive comments regarding the DRV of 1500 g for sodium for children 1 through 3 years of age. Thus, the final rule, at § 101.9(c)(9), establishes a DRV of 1,500 mg for sodium for children 1 through 3 years of age.

j. Fluoride. There is not a DV for fluoride for children 1 through 3 years of age. In the preamble to the proposed rule (79 FR 11879 at 11942), we said that, although the IOM recognized fluoride as a trace mineral that is important for public health by setting an AI based on evidence of its role in reducing the risk of dental caries, we tentatively concluded that a DRV should not be established for fluoride. The proposed rule did not contain a DRV for fluoride for children 1 through 3 years of age.

We did not receive comments regarding the establishment of DRVs for fluoride for children 1 through 3 years of age. Thus, the final rule does not establish a DRV for fluoride for children 1 through 3 years of age.

k. Other vitamins and minerals. In the preamble to the proposed rule (79 FR 11879 at 11942 through 11943), we stated that the IOM's quantitative intake recommendations (AIs and RDAs) provide a basis on which to determine RDIs for vitamins and minerals for children 1 through 3 years of age. We explained that the RDA, when available, is the best estimate of an intake level that will meet the nutrient goals of practically all consumers who would use the Nutrition Facts label and that,

while AIs have less certainty than RDAs, AIs represent goals for nutrient intake for individuals and provide the best estimate based on current science for use in setting RDIs for such nutrients (see id.). Therefore, using the RDAs and AIs, we proposed to amend § 101.9(c)(8)(iv) to establish RDIs for vitamin A, vitamin C, vitamin D, vitamin E, vitamin K, vitamin B_{12}, folate, choline, riboflavin, niacin, vitamin B_6, calcium, iron, thiamin, biotin, pantothenic acid, phosphorous, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, chloride, and potassium for children 1 through 3 years of age.

We did not receive comments regarding our proposed RDIs for vitamin A, vitamin C, vitamin D, vitamin E, vitamin K, vitamin B_{12}, folate, choline, riboflavin, niacin, vitamin B_6, calcium, thiamin, biotin, pantothenic acid, phosphorous, iodine, magnesium, selenium, copper, manganese, chromium, molybdenum, and chloride for children 1 through 3 years of age. Thus the final rule adopts these RDIs for children 1 through 3 years of age without change.

(Comment 466) One comment said that a DV for potassium of 3,000 mg for children aged 1 through 3 years is unrealistic and may promote an unbalanced diet. The comment said that the DV for potassium should be calculated using a 1,000 calorie diet instead of the 1,372 calorie factor used by the IOM for 1 through 3 year olds. The comment requested a DV of 2,300 mg given the reference caloric intake of 1,000 for children ages 1 through 3 years.

Another comment expressed concern that, with a DV of 3,000 mg, several foods products would no longer be considered a ''good source'' of potassium.

(Response) We decline to establish a DV of 2,300 mg for potassium, and we disagree with the comment regarding foods that would no longer be considered as a ''good source'' of potassium. In the preamble to the proposed rule (79 FR 11879 at 11942), we discussed how we had considered comments to the 2007 ANPRM suggesting that we use 1,800 or 2,000 mg/day potassium as the basis for the RDI for potassium; we said that it would be inconsistent with the approach for the general population. Selecting a number other than a RDA or AI, when there is one, is inconsistent with our approach for establishing DVs. We rely on the DRI reports and its set of nutrient reference values for establishing the DVs because they are comprehensive reviews and applications of nutrition science research. We acknowledge that current potassium intakes are below the proposed DV of 3,000 mg. However, we disagree that the DV for potassium may promote an unbalanced diet. Dietary sources of potassium are found in all food groups, notably in vegetables and fruits, and milk and milk products (Ref. 30). Promoting the development of healthy eating patterns that will be associated with adequate potassium intake later in life is important because chronic conditions such as elevated blood pressure, bone demineralization, and kidney stones likely result from inadequate potassium intakes over an extended period of time, including childhood (Ref. 256).

We disagree that DVs should be set based on realistic intakes or eligibility to make a nutrient content claim. The DVs are established based on DRIs set by the IOM that reflect the most current science regarding nutrient requirements, not on levels of intakes that are achievable or eligibility to make nutrient content claims.

(Comment 467) One comment would have us retain a DV for iron of 10 mg of children 1 through 3 years given the importance of adequate iron in the diets of infants and young children and the prevalence of iron deficiency in children. The comment noted that dietary intake data in children aged 12 to 24 months suggests that children may be consuming less heme iron than assumed in the determination of the IOM EAR so the EAR may be too low to achieve the requirement of absorbed iron. However, the comment did not provide an amount or percentage of heme iron being consumed from current intakes and also cited data from published and unpublished sources.

(Response) We decline to revise the rule as suggested by the comment. We recognize the importance of adequate iron in the diets of infants and young children. As for the statement that children may be consuming less heme iron than assumed in the IOM's determination of the EAR, as the comment provided data from one published study reflecting dietary intake data from 2002 and did not provide estimates of the heme iron consumed or total iron absorbed, we cannot determine from the information provided by the comment that the EAR may be too low to achieve the requirement of absorbed iron.

Furthermore, selecting a number other than a RDA or AI is inconsistent with our approach for establishing DVs. We rely on the DRI reports and its set of nutrient reference values for establishing the DVs because they are comprehensive reviews and applications of nutrition science research (79 FR 11879 at 11885).

(Comment 468) One comment questioned how a decrease in the DV for iron would affect iron fortification of foods for toddlers. The comment said that such a decrease in the DV could cause manufacturers to reduce iron fortification of products for this population group.

(Response) We disagree with the comment. The comment did not provide, and we are not aware of, any evidence to suggest that decreasing the DV for iron would impact iron fortification of foods for toddlers. DVs are established based on DRIs set by the IOM that reflect the most current science regarding nutrient requirements, not on potential changes in fortification of products. We recognize the importance of adequate iron intake in the diets of young children and intend to monitor the nutrient adequacy for this population and consider the need for consumer education.

(Comment 469) One comment asked that we use the current DV of 5 mg for zinc for infants as the DV for children 1 through 3 years of age because previous RDA panels have recommended intakes of up to 10 mg for children 1 through 3 years of age and now recommend a RDA of 3 mg for infants and children 1 through 3 years of age. The comment also cited a study by Walravens et al. 1989 (Ref. 254) referenced by the IOM confirming the factorial approach and questioned the IOM's use of the Walravens baseline data minus 2 standard deviations to support for the EAR and suggested that reported dietary intake data, instead of standard deviations, maybe a more appropriate basis for EAR. The comment said that the zinc consumption from a recommended dietary pattern for children 1 through 3 years of age would be at least 6 mg, or 200 percent of the proposed DV and that consumers would likely be confused by these high amounts per serving and could take steps to inappropriately limit zinc intake. The comment stated that lowering the DV to 3 mg/day may affect the availability and level of zinc fortification in foods and reduce intake levels without a full understanding of the potential impact in this sensitive population.

(Response) We decline to revise the rule as suggested by the comment. We are changing the DVs to reflect the most recent comprehensive reviews and applications of nutrition science research provided by current DRI reports and its set of nutrient reference values (see 79 FR 11879 at 11885).

We also disagree that using reported dietary intake data may be a more appropriate basis for the EAR children 1 through 3 years of age. We note that the IOM established the EAR for zinc using a factorial approach and did not base the EAR on the growth data from the Walravens study (Ref. 226).

The comment did not provide, and we are not aware of, any evidence to suggest how consumers will react to the changes in percent DV as a result of changes to the DVs and whether they would inappropriately limit zinc intake. We recognize the importance of adequate zinc intake in the diets of young children and intend to monitor the nutrient adequacy for this population and consider the need for consumer education.

We also have no evidence to suggest how that decreasing the DV for zinc would impact zinc fortification of foods for toddlers and decline to speculate on how availability and level of zinc fortification may change. DVs are established based on DRIs set by the IOM that reflect the most current science regarding nutrient requirements and not on potential changes in the fortification of products.

7. DRVs and RDIs for Pregnant Women and Lactating Women

The proposed rule would establish certain DRVs and RDIs for pregnant women and lactating women.

a. Calories. The proposed rule would use the 2,000 reference calorie intake level for setting DRVs for pregnant women and lactating women (§ 101.9(c)(9)). In the preamble to the proposed rule (79 FR 11879 at 11943), we explained that the calorie needs for pregnant women and lactating women are similar to the general population, and few products are purported for pregnant and lactating women. Thus, because the reference calorie intake for the general population is 2,000, we proposed to use the 2,000 reference calorie intake level for setting DRVs for pregnant women and lactating women (§ 101.9(c)(9)).

We did not receive comments on our proposed 2,000 reference calorie intake level for setting DRVs for pregnant women and lactating women. Thus, we have finalized the provision without change on this point. However, on our own initiative, we have made a grammatical change to the rule's mention of ''pregnant and lactating women'' to refer, instead, to ''pregnant women and lactating women.'' We have made this change to clarify that the rule is referring to two groups (pregnant women and lactating women) instead of one group.

b. Total fat, saturated fat, cholesterol, total carbohydrate, sodium, and dietary fiber. For total fat, saturated fat, cholesterol, total carbohydrate, sodium, and dietary fiber, we explained, in the preamble to the proposed rule (79 FR 11879 at 11943), that the quantitative intake recommendations for total fat, saturated fat, cholesterol, total carbohydrate, sodium, and dietary fiber for pregnant and lactating women are generally similar to the general population. Thus, we tentatively concluded that the DRVs for total fat, saturated fat, cholesterol, total carbohydrate, sodium, and dietary fiber for pregnant and lactating women should remain the same as for the general population, and so we proposed to amend § 101.9(c)(9) to establish DRVs for pregnant and lactating women using the proposed DRVs for the general population for total fat, saturated fat, cholesterol, total carbohydrate, sodium, and dietary fiber.

We did not receive comments on our proposal to establish DRVs for total fat, saturated fat, cholesterol, total carbohydrate, sodium, and dietary fiber for pregnant and lactating women based on the DRVs for the general population for total fat, saturated fat, cholesterol, total carbohydrate, sodium, and dietary fiber. Thus, we have finalized these provisions without change.

c. Trans fat, polyunsaturated fat, monounsaturated fat, insoluble fiber, soluble fiber, sugars, added sugars, and sugar alcohols. For *trans* fat, polyunsaturated fat, monounsaturated fat, soluble fiber, insoluble fiber, sugars, added sugars, and sugar alcohols, in the preamble to the proposed rule (79 FR 11879 at 11943), we said that we did not propose DRVs for these nutrients for the general population because of a lack of quantitative intake recommendations. Because quantitative intake recommendations are lacking for these nutrients for pregnant and lactating women, we did not propose to establish DRVs for *trans* fat, polyunsaturated and monounsaturated fat, soluble fiber, insoluble fiber, sugars, added sugars, or sugar alcohols for pregnant and lactating women.

We did not receive comments on our proposal not to establish DRVs for *trans* fat, polyunsaturated and monounsaturated fat, insoluble fiber, soluble fiber, sugars, or sugar alcohols for pregnant and lactating women. Thus, the final rule does not establish DRVs for *trans* fat, polyunsaturated and monounsaturated fat, insoluble fiber, soluble fiber, sugars, or sugar alcohols for pregnant and lactating women.

However, with respect to added sugars, we received many comments on defining a DRV for added sugars for children and adults 4 years of age and older and explain, in part II.H.3.o, that we are establishing a DRV for added sugars for children and adults 4 years of age and older of no more than 10 percent of total calories, or 50 grams using a 2,000 calorie intake reference amount based on food pattern modeling. For the reasons discussed in part II.H.3.o, we also are establishing a DRV for added sugars for pregnant women and lactating women of no more than 10 percent of total calories, or 50 grams using a 2,000 calorie intake reference amount based on food pattern modeling. Thus, the final rule at § 101.9(c)(9), establishes a DRV of 50 grams for added sugars for pregnant women and lactating women.

d. Protein. Our preexisting regulations, at § 101.9(c)(7)(iii), establish RDIs of 60 grams of protein for pregnant women and 65 grams of protein for lactating women based on the highest 1989 RDAs for pregnant and lactating women. In the preamble to the proposed rule (79 FR 11879 at 11943), we noted that the IOM established 71 grams/day protein as the RDA for pregnant and lactating women based on the needs for maternal and fetal development and human milk production. Because the RDA for protein during both pregnancy and lactation is the same, and given that most foods represented or purported to be specifically for pregnant women are also represented or purported to be specifically for lactating women, we tentatively concluded that it would be appropriate to establish a single RDI of 71 grams applicable to both pregnant and lactating women and that the DV for protein for pregnant and lactating women should remain an RDI (using the RDA) instead of a DRV because the DRV approach used to calculate protein for the general population based on 10 percent of 2,000 calories, which equals 50 grams of protein/day, falls short of the recommended protein needs of pregnant and lactating women of 71 grams/day. Thus, we proposed to amend § 101.9(c)(7)(iii) to establish an RDI of 71 grams for protein for pregnant and lactating women.

We did not receive comments on the proposed RDI of 71 grams for protein for pregnant and lactating women. Thus, we have finalized this provision without change.

e. Fluoride. For fluoride, we did not propose to establish a DRV for pregnant or lactating women because we were not proposing a DRV for fluoride in the general population.

We did not receive comments regarding the establishment of a DRV for fluoride for pregnant and lactating

women. Thus, the final rule does not establish a DRV for fluoride for pregnant and lactating women.

f. Vitamins and minerals. For vitamins and minerals, in the preamble to the proposed rule (79 FR 11879 at 11943), we considered it appropriate to establish RDIs for pregnant and lactating women for vitamins and minerals that have DRIs, using population-coverage RDAs and AIs, instead of population-weighted EARs. We proposed to establish a single set of RDIs intended for both pregnant women and lactating women because nutrient needs during pregnancy and lactation are similar. Thus, we proposed to amend § 101.9(c)(8)(iv) to establish RDIs as set forth previously for vitamin A, vitamin C, vitamin D, vitamin E, vitamin K, vitamin B_{12}, folate, choline, riboflavin, niacin, vitamin B_6, calcium, iron, thiamin, biotin, pantothenic acid, phosphorous, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, chloride, and potassium for pregnant and lactating women.

We did not receive comments with respect to these DRVs and RDIs for pregnant and lactating women, and so we have finalized these provisions without change.

P. Dietary Supplements

Our preexisting regulations specific to dietary supplement nutrition labeling appear in § 101.36. Many requirements in § 101.36 are consistent with the requirements for the nutrition labeling of conventional foods in § 101.9, and there are references throughout § 101.36 to requirements established in § 101.9.

The proposed rule would amend both the content and format of the Supplement Facts label to correspond to the Nutrition Facts label.

1. Mandatory Dietary Ingredients

Our preexisting regulations, at § 101.36(b)(2), provide information on dietary ingredients that have an RDI or a DRV as established in § 101.9(c)(8)(ii) and (c)(9). These dietary ingredients are known as the ''(b)(2)-dietary ingredients.'' Of these 15 nutrients, vitamin A, vitamin C, calcium, and iron must be listed in the Supplement Facts label for a dietary supplement when the quantitative amount by weight exceeds the amount that can be declared as zero in the nutrition labeling of foods in accordance with § 101.9(c). Section 101.36(b)(2) states that any (b)(2)-dietary ingredients that are not present, or that are present in amounts that can be declared as zero in § 101.9(c), must not be declared (*e.g.,* amounts corresponding to less than 2 percent of the RDI for vitamins and minerals). The regulation also requires, in § 101.36(b)(2), that calories from saturated fat and polyunsaturated fat, monounsaturated fat, soluble fiber, insoluble fiber, sugar alcohol, other carbohydrate, and § 101.9(c)(8)(iv) or (c)(9) vitamins and minerals other than vitamin A, vitamin C, calcium, and iron may be declared, but they must be declared when they are added to the product for purposes of supplementation, or when a claim is made about them.

We proposed to update the list of (b)(2)-dietary ingredients to maintain consistency with the proposed requirements for nutrition labeling of foods in § 101.9. Therefore, proposed § 101.36(b)(2)(i) would: (1) No longer require declaration of vitamin A, vitamin C, or Calories from fat; (2) require vitamin D and potassium; (3) require the declaration of added sugars; and (4) retain the other (b)(2)-dietary ingredients as mandatory declarations. We also proposed to amend § 101.36(b)(2)(i), (b)(2)(i)(B)(1), and (b)(2)(iii)(G) to remove the requirement for declaration of ''Calories from fat.''

We did not receive comments on these proposed changes to the Supplement Facts label, and so, with the exception of replacing ''sugars'' with ''total sugars'' in § 101.36(b)(2)(i), we have finalized the provisions without change.

We note that we did receive comments, in general, on removing the declaration of vitamins A and C and on requiring the declaration of vitamin D and potassium; we discuss those comments in part II.L.2 and II.L.3. We also received comments on removing the requirement for declaration of ''Calories from fat;'' we discuss those comments in part II.E.1.

2. Folate and Folic Acid

The preamble to the proposed rule (79 FR 11879 at 11947) explained that folate is a nutrient found in conventional foods, whereas folic acid is the synthetic form of folate that is added to fortified conventional foods and dietary supplements. Because of the difference in bioavailability between naturally occurring folate and synthetic folic acid, we proposed to:

- Amend § 101.9(c)(8)(v) such that the term ''folate'' would be used in the labeling of conventional foods that contain either folate alone or a mixture of folate and folic acid;
- amend § 101.36(b)(2)(i)(B) and (b)(2)(i)(B)(2) to specify that ''folic acid'' is the term used to declare folic acid content of dietary supplements; and
- remove ''folate'' and ''folacin'' from the list of synonyms that may be used to declare folic acid on the Supplement Facts label.

(Comment 470) Many comments opposed allowing only the use of the term ''folic acid'' on dietary supplements. The comments said that dietary supplements can contain folate.

(Response) As discussed in part II.N.3.b, the final rule requires that the Supplement Facts label declare folate in mcg DFE, a percent DV based on mcg DFE, and that the mcg of folic acid be stated in parenthesis when folic acid is added as a nutrient supplement to a dietary supplement. In doing so, there will be consistency with the use of the term folate in labeling of both conventional foods and dietary supplements. In addition, the mcg DFE reflects the fact that folic acid is more bioavailable than folate and is the basis of the DV. By requiring the declaration of the mcg DFE folate, a percent DV based on mcg DFE, and the mcg of folic acid in parentheses on dietary supplements when folic acid is added as a nutrient supplement, consumers will be aware of the type and amount of folate or folic acid in the dietary supplement.

The final rule also removes ''folacin'' from the list of synonyms that may be used for folate in the Nutrition Facts label in § 101.9(c)(8)(v) and the Supplement Facts label in § 101.36(b)(2)(i)(B)(2)). In addition, the final rule removes the term ''folic acid'' from the list of synonyms that may be added in parentheses immediately following ''folate'' on the Nutrition Facts label in § 101.9(c)(8)(v) or in place of the term ''folate'' on the Supplement Facts label in § 101.36(b)(2)(B)(2) because we are now requiring that the terms ''folate'' and ''folic acid'' be included, when declared, on both the Nutrition and Supplement Facts label.

3. Units of Measure

The proposed rule would amend § 101.9(c)(8)(iv) to replace ''IU'' for the RDIs for vitamin A, vitamin D, and vitamin E with mcg RAE for vitamin A, mcg for vitamin D, and mg α-tocopherol for vitamin E. The proposed rule would quantify and declare folate and folic acid in ''mcg DFE'' instead of ''mcg.'' For consistency in nutrition labeling of foods and dietary supplements, the proposed rule also would amend § 101.36(b)(2)(i)(B)(3) to require that, when β-carotene is included in parentheses following the percent statement for vitamin A, it should be declared using ''mcg'' (representing mcg RAE) as the unit of measure. In addition, under § 101.36(b)(2)(ii)(B), the

proposed units of measure for vitamin D, vitamin E, and folate in § 101.9(c)(8)(iv) would be used in the declaration of vitamin D, vitamin E, and folic acid in the Supplement Facts label.

(Comment 471) Some comments disagreed with our proposal to replace ''IU'' for the RDIs for vitamin A, vitamin D, vitamin E with mcg RAE for vitamin A, mcg for vitamin D, and mg α-tocopherol for vitamin E.

(Response) We address these comments in part II.N.4. The final rule, at § 101.9(c)(8)(iv), revises the units of measure to be mcg RAE for vitamin A, mcg for vitamin D (with the allowance of voluntary declaration of IUs), and mg α-tocopherol for vitamin E, and § 101.36(b)(2)(ii)(B), therefore, adopts the same units of measure for vitamin D, vitamin E, and folate.

Additionally, we did not receive comments on the proposed changes to the declaration of β-carotene at § 101.36(b)(2)(i)(B)(3), so we have finalized that provision without change.

(Comment 472) One comment said we should adopt a unit of measure for fluoride of mg per liter (mg/L) rather than mg/servings.

(Response) We address this comment in part II.K.3. The final rule does not adopt mg/L as the unit of measure for fluoride.

(Comment 473) The proposed rule, at § 101.36(b)(2)(ii)(A), would state that amounts must be expressed in the increments specified in § 101.9(c)(1) through (c)(7), which includes increments for sodium. One comment said we should permit the use of additional units of measure for dietary ingredients to allow for use of more appropriate units of measure when metric weight is not the most accurate way to express the quantity of the dietary ingredient. The comment gave examples of ''colony forming unit'' (CFU) for probiotics and enzyme assay units (*e.g.* HUT, PC, SU, ALU) for enzymes. Another comment would amend § 101.36(b)(2)(ii)(A) to state ''these amounts shall be expressed in metric or other appropriate units of measure.''

(Response) We decline to permit the use of additional units of measure for dietary ingredients. The comment provided the examples of CFUs for probiotics and enzyme assay units for enzymes; however, the broader change suggested in the comment, by including ''other appropriate units of measure,'' would allow for the use of units of measure for dietary ingredients other than just probiotics and enzyme assay units.

We recognize that manufacturers are using a number of different units of measure for probiotics, enzymes, and other dietary ingredients. We need to fully evaluate each unit of measure for dietary ingredients to determine if it is appropriate for use on the Supplement Facts label, and if there are any implications to allowing for the use of such units of measure on the label. Because of the complexity of these labeling concerns, we plan to issue information related to this subject at a later date. We have, therefore, finalized § 101.36(b)(2)(ii)(A) without change.

4. Order of Nutrients Declared on the Label

For dietary supplements, § 101.36(b)(2)(i)(B) specifies that vitamins and minerals must be declared in a specific order on the Supplement Facts label. The proposed rule would add choline to the list of ordered nutrients in § 101.36(b)(2)(i)(B) and that, when declared, choline must follow potassium on the label.

We proposed to amend § 101.9(c)(5) to provide for the voluntary declaration of fluoride, unless a claim about fluoride, in which case fluoride would be mandatory on the label. We inadvertently did not propose to add fluoride to the list of ordered nutrients for declaration on the Supplement Facts label in § 101.36(b)(2)(i)(B).

We did not receive any comments on the proposed addition of choline to the list of nutrients on the Supplement Facts label. Therefore, the final rule adds choline to the list of nutrients in § 101.36(b)(2)(i)(B) and requires it to appear after pantothenic acid on the label because choline is a vitamin and pantothenic acid is the last vitamin in the list of nutrients provided in § 101.36(b)(2)(i)(B). In addition, the final rule specifies that calcium and iron shall be declared after choline on the label because choline will now be declared after pantothenic acid on the label.

As for fluoride, to enable manufacturers to know where to declare fluoride on the Supplement Facts label, we are adding fluoride to the end of the list of nutrients in § 101.36(b)(2)(i)(B) such that, when it is declared, it should be placed below potassium on the Supplement Facts label.

5. Subpopulations

The preamble to the proposed rule (79 FR 11879 at 11947) indicated that, to maintain consistency with the proposed requirements for nutrition labeling of foods in § 101.9, we would revise portions of § 101.36 pertaining to labeling requirements for foods, other than infant formula, that are represented or purported to be specifically for infants 7 through 12 months, children 1 through 3 years, and pregnant and lactating women. The proposed rule would amend § 101.36(b)(2)(iii) to state that the percent of the DV of all dietary ingredients declared under § 101.36(b)(2)(i) must be listed, except that the percent DV for protein may be omitted as provided in § 101.9(c)(7) and that no percent DV is to be given for subcomponents for which DRVs have not been established.

When the percent DV is declared for total fat, saturated fat, total carbohydrate, dietary fiber, or protein, our existing regulations require that a symbol be placed next to the percent DV declaration for these nutrients that refers the consumer to a statement at the bottom of the label that says ''Percent Daily Values are based on a 2,000 calorie diet.'' This statement is only accurate for products meant for children and adults that are 4 years of age and older. In the preamble to the proposed rule (79 FR 11879 at 11947), we explained that the proposed DRVs for total fat, total carbohydrate, dietary fiber, and protein for children 1 through 3 years of age are based on a 1,000 calorie diet, so, when a product that is represented or purported to be for children 1 through 3 years of age contains a percent DV declaration for total fat, total carbohydrate, dietary fiber, or protein, the proposed rule would require, in § 101.36(b)(2)(iii)(D), that a symbol be placed next to the percent DV declaration that refers the consumer to a statement at the bottom of the label that says ''Percent Daily Values are based on a 1,000 calorie diet.''

The proposed rule also would amend § 101.36(b)(2)(iii)(E) to change the categories of infants and children less than 4 years of age to infants 7 through 12 months of age and children 1 through 3 years of age, and, because we are proposing DRVs for various nutrients for infants 7 through 12 months, children 1 through 3 years, and pregnant and lactating women, amend § 101.36(b)(2)(iii)(F) such that the requirement for an asterisk noting that a DV has not been established would be applicable to foods for these subpopulations only when a DRV has not been established for a nutrient (*i.e.,* for saturated fat, cholesterol, or dietary fiber for dietary supplements that are represented or purported to be for use by infants 7 through 12 months).

We did not receive comments specific to subpopulations and the proposed changes to § 101.36, and so, except as described in our response to comment 474, we have finalized those provisions without change. As discussed in our

response to comment 441, we are using the terminology ''infants through 12 months of age'' throughout § 101.36. As discussed in part II.O.7.a, we also have decided to use the terminology ''pregnant women and lactating women'' rather than ''pregnant and lactating women'' to clarify that the rule is referring to two groups (pregnant women and lactating women) instead of one group.

6. Footnote

The Supplement Facts label can bear a footnote stating that the percent Daily Values are based on a 2,000 calorie diet. In the preamble to the proposed rule (79 FR 11879 at 11947 through 11948), we noted that we intended to modify the footnote on the Nutrition Facts label and to conduct consumer studies related to the footnote on the Nutrition Facts label. We also noted that the footnote for the Supplement Facts label differs from the footnote for Nutrition Facts label, yet we expected that consumers who buy dietary supplements would be more interested in information about the amount of specific micronutrients contained in dietary supplements and would be less focused on the caloric reference value used in determining the percent DV for macronutrients (id.). We said that, based on the results of the consumer study, we would consider whether it is necessary to make corresponding changes to the footnote used on the Supplement Facts label when certain macronutrients are declared, and we invited comment on whether we should change the footnote on the Supplement Facts label to be consistent with the footnote on the Nutrition Facts label.

(Comment 474) One comment said there should be no footnote on the Supplement Facts label. The comment said that consumers do not receive their nutrition solely from a supplement, so, according to the comment, there is no need to refer to total calories. In addition, because all nutrition calculations are being made from the 2,000 calorie total, the comment said that the information provided by the footnote is already standardized across industry, so the footnote is unnecessary.

(Response) We decline to remove the footnote from the Supplement Facts label. Our preexisting regulations, at § 101.36(b)(2)(iii)(D), require manufacturers to declare the footnote ''Percent Daily Values are based on a 2,000 calorie diet'' only when total fat, saturated fat, total carbohydrate, dietary fiber, or protein are declared. The final rule amends § 101.36(b)(2)(iii)(D)) to include added sugars in the list of macronutrients to be consistent with the final requirement to include a declaration for added sugars in the nutrition label. As with the declaration of the footnote statement on the Nutrition Facts label, the footnote statement on the Supplement Facts label provides context for the consumer and enables the consumer to better judge how the nutrients in the supplement contributes towards the total daily diet. Therefore, we decline to remove the footnote statement from the Supplement Facts label.

When the food is purported to be for children 1 through 3 years of age, the final rule requires footnote to state that ''Percent Daily Values are based on a 1,000 calorie diet'' because a 1,000 calorie reference caloric value is used when calculating percent DVs for children 1 through 3 years of age. Therefore, the final rule amends § 101.36(b)(2)(iii)(D) to require the footnote statement ''Percent Daily Values are based on a 2, 000 calorie diet'' on the Supplement Facts label when the percent DV for total fat, saturated fat, total carbohydrate, dietary fiber, protein, or added sugars is declared on the label, and to require the footnote statement ''Percent Daily Values are based on a 1,000 calorie diet'' if the product is represented or purported to be for use by children 1 through 3 years of age and, if the percent DV is declared for total fat, total carbohydrate, dietary fiber, protein, or added sugars.

7. Miscellaneous Comments

Several comments raised other issues regarding dietary supplements and labeling.

(Comment 475) One comment said that the current method of labeling dietary supplements causes confusion regarding which micronutrients, especially vitamins and minerals, are added to a product as opposed to those that are naturally occurring within the product. The comment suggested that the terminology ''naturally occurring'' be used when nutrients are naturally present in ingredients or products, and that other terms, such as ''added,'' be used when ingredients containing micronutrients have been added to a product.

Another comment objected to the nomenclature we proposed for the declaration of certain vitamins and minerals, suggesting the limitations in nomenclature are unconstitutional under the First Amendment (citing *Pearson* v. *Shalala,* 164 F.3d 650 (D.C. Cir. 1999); *reh'g, en banc, denied,* 172 F.3d 72 (D.C. Cir. 1999)) and stating that the nomenclature prevents the dissemination of information helpful to the public in evaluating health implications of supplements. For example, the comment stated that calling tocotrienols vitamin E is not accurate because these forms of vitamin E differ from other forms of vitamin E. The comment also noted that the proposed rule does not distinguish between different forms of vitamin K, selenium, vitamin B_{12}, vitamin B_6, and vitamin B_3 for purposes of identifying on the label the actual ingredient that is contained in a dietary supplement product. The comment suggested that the identification of the actual form of vitamin B_3 that is included in the product is essential because of the physiological differences between these forms. For example, vitamin B_3 could be identified as niacin or niacinamide; and similarly, vitamin B_{12} could be methylcobalamin or cyanocobalamin; vitamin B_6 could be pyridoxal 5-phosphate or pyridoxine; vitamin K could be phylloquinone or menaquione; selenium could be selenomethionine or sodium selenite or selenocysteine. The comment also cited references to suggest selenium in different forms has been reported to have different effects. Furthermore, the comment noted that the name of a nutrient ingredient in a dietary supplement may be a structure/function claim because the form of the molecule determines its function. For example, the comment stated that gamma-tocopherol denotes a particular structure of vitamin E that has a particular function because of its structure.

(Response) With respect to the comment related to added versus naturally occurring micronutrients in dietary supplement products, we decline to revise the rule as suggested by the comment. In dietary supplement products, when terms such as ''naturally occurring'' are used to refer to micronutrients in dietary supplements, they may imply that there is an inherent difference in nutritional quality of the vitamin depending on its source. We are not aware of any evidence that this is the case. Typically, ''added'' nutrients are synthetic forms of the nutrient. As stated in § 101.9(k)(4), a food is misbranded if its labeling suggests or implies that a natural vitamin is superior to an added or synthetic vitamin.

With respect to the comment objecting to the nomenclature we proposed for the declaration of certain vitamins and minerals, the comment seems to misunderstand our requirements for the declaration of vitamins and minerals and for structure or function claims. We provide for the truthful, nonmisleading labeling of

nutrients in their varying forms on dietary supplements in § 101.36(b) and (d) and § 101.9(c). Our regulation (21 CFR 101.36(b)(2)) provides for the labeling on the nutrition label of dietary ingredients with RDIs such as vitamins or minerals listed in § 101.9(c)(8)(iv), with the exception of vitamin B_3. We discussed, in the preamble to the proposed rule (79 FR 11879 at 11925) and also in part II.M (Reference Daily Intakes for Vitamins and Minerals), the reference intakes for vitamins and minerals listed in the Nutrition Facts and Supplement Facts panels that are identified in § 101.9(c)(8)(iv). The RDIs for vitamins and minerals are based on the IOM RDAs or AIs. In some cases, the RDA is based on the form of a vitamin or mineral recognized to meet human requirements (*i.e.,* the α-tocopherol form of vitamin E) and the AI is based on intakes of a specific form of the vitamin or mineral (*i.e.,* phylloquinone form of vitamin K). With the exception of vitamin B_3, we note that § 101.9(c)(8)(iv) lists the common and usual names of vitamins and minerals. The dietary supplement label requirements at § 101.36(d) provide for labeling of the source ingredient that supplies a dietary ingredient (*i.e.* niacin, vitamin $B_{12,}$ vitamin B_6, vitamin K, and selenium) within the nutrition label in parentheses immediately following or indented beneath the name of a dietary ingredient and preceded by the words ''as'' or ''from,'' *e.g.,* ''Calcium (as calcium carbonate).'' When a source ingredient is not identified within the nutrition label, it must be listed in an ingredient statement in accordance with § 101.4(g). In addition, dietary ingredients, such as menaquinone, that are ''other dietary ingredients'' within the meaning of § 101.36(b)(3) must be declared by their common or usual name when they are present in a dietary supplement in accordance with that section. Thus, the forms of vitamins and minerals contained in dietary supplements such as niacinamide; methylcobalamin or cyanocobalamin; pyridoxal 5-phosphate or pyridoxine; phylloquinone or menaquione; and selenomethionine, sodium selenite, or selenocysteine may be identified, as appropriate, in the Nutrition Facts label or the ingredient statement.

Although we do not recognize the term vitamin B_3 and instead list niacin in § 101.9(c)(8)(iv), the term ''vitamin B_3'' if identified in labeling, other than in the Nutrition Facts label, must be truthful and not misleading. Furthermore, we disagree that we are requiring misinformation by calling tocotrienols vitamin E and lumping these forms of vitamin E together. As we discuss in part II.M, we established the RDI for vitamin E based on α-tocopherol § 101.9(c)(8)(iv). In § 101.36, we provide for dietary ingredients, such as tocotrienols for which we have not established RDI's or DRV's and that are not subject to regulation under paragraph (b)(2) of this section, as ''other dietary ingredients'' in § 101.36(b)(3). If other statements are made about ''other dietary ingredients,'' the statements must be consistent with the all applicable statutory and regulatory requirements.

To the extent the comment suggests that our regulations limit the information about the form of a nutrient on the label, we disagree. Although we have specific requirements related to nomenclature for the nutrient declarations, there are ways to convey the source of the nutrient in labeling, and thus, we do not restrict information about the source of the nutrient, provided the information presented is consistent with our statutory and regulatory requirements.

With respect to the comment that the name of a nutrient may be a structure or function claim, a structure or function claim is described in section 403(r)(6)of the FD&C Act. Such a claim is a statement that describes the role of a nutrient or dietary ingredient intended to affect the structure or function in humans or that characterizes the documented mechanism by which a nutrient or dietary ingredient acts to maintain such structure or function (section 403(r)(6)(A) of the FD&C Act). Gamma-tocopherol is a name for a particular form of tocopherol. While the molecular form of a vitamin may result in a particular function, the name of the form does not describe the role of the dietary ingredient in affecting the structure or function in humans nor does it describe a documented mechanism by which the dietary ingredient acts to maintain such structure or function. Thus, structure or function claims are permitted for dietary ingredients provided they meet the applicable statutory and regulatory requirements for such claims.

(Comment 476) One comment said there is confusion whether nutrient declarations on the Supplement Facts label represent only the added nutrients or the total amount of a nutrient based on analysis of the finished product in products where either micronutrients have been added or botanical ingredients are present that are natural sources of particular micronutrients. The comment suggested we could resolve the issue by ensuring that, where micronutrients are listed on the Supplement Facts and/or Nutrition Facts label, the information reflects those micronutrients that are typically present at the end of the shelf-life period in the finished product, taking into account industry-accepted overages/tolerances.

(Response) The Supplement Facts label provides the nutrition information for nutrients that have a RDI or a DRV as established in § 101.9(c). A (b)(2)-dietary ingredient may only be listed if it is a quantitative amount by weight that exceeds the amount that can be declared as zero in § 101.9(c). We are aware that micronutrients are sometimes added to naturally occurring micronutrients. The value declared on the label should be the value that is supported by data that factors in variability generally recognized for the analytical method used for the finished dietary supplement product for the level involved. We disagree that the label declaration should be based on a shelf-life period because the Dietary Supplement Good Manufacturing Practices regulations do not require an expiration date, shelf-life date, or ''best if used by'' date (see 72 FR 34752 at 34912 and 34856). Therefore, not all products would have a shelf-life date that could be used when determining what the final value should be.

(Comment 477) Several comments opposed decreasing the RDIs for vitamins and minerals because of the impact on the dietary supplement industry. The comments also stated that decreasing the RDIs for vitamins and minerals makes it difficult for consumers to get therapeutic dosages of vitamins and minerals in one supplement.

(Response) We address these comments in part II.M.

8. Compliance Requirements for Dietary Supplements

Compliance for dietary supplements is currently determined in accordance with § 101.9(g)(1) through (g)(8), except that the sample for analysis must consist of a composite of 12 subsamples (consumer packages) or 10 percent of the number of packages in the same inspection lot, whichever is smaller, randomly selected to be representative of the lot. The regulation also says that the criteria on class I and class II nutrients given in § 101.9(g)(3) and (g)(4) are applicable to other dietary ingredients.

The proposed rule would require manufacturers to declare added sugars on the Supplement Facts label under § 101.36(b)(2)(i). It would also require manufacturers to make and keep records to verify the amount of dietary fiber,

soluble fiber, insoluble fiber, added sugars, vitamin E, and folate, under certain circumstances for foods (79 FR 11879 at 11956). The proposed rule, at § 101.9(g)(10) and (g)(11), also would establish recordkeeping requirements for foods that contain a mixture of dietary fiber and added non-digestible carbohydrate(s) that does not meet the definition of dietary fiber, foods that contain a mixture of soluble fiber and added non-digestible carbohydrate(s) that does not meet the definition of dietary fiber, foods that contain a mixture of insoluble fiber and added non-digestible carbohydrate(s) that does not meet the definition of dietary fiber, foods that contain a mixture of naturally occurring and added sugars, foods that contain added sugars that are reduced through non-enzymatic browning and/or fermentation, foods that contain a mixture of *all rac*-α-tocopherol and RRR-α-tocopherol, and foods that contain a mixture of folate and folic acid.

The same records requirements in § 101.9(g)(10) and (g)(11) also should apply to dietary supplements. Therefore, the final rule revises § 101.36(f)(1) to include the recordkeeping requirements for specific nutrients under § 101.9(g)(10) and (g)(11).

Manufacturers of dietary supplements may request an alternative means of compliance or additional exemptions under § 101.36(f)(2) when it is technologically feasible, or some other circumstance makes it impracticable, for firms to comply with the requirements of the regulation. This allowance is the similar to what is made for conventional foods under § 101.9(g)(9). Therefore, the final rule, at § 101.36(f)(2), does not refer to § 101.9(g)(9).

Q. Format

Under our preexisting regulations (see, *e.g.,* § 101.9(d) through (f) and (j)), nutrition information must be presented on food labels in a specific format. The elements of format related to the Nutrition Facts label include such features and graphic design principles as the type style (*i.e.,* font) and size of the type (*i.e.,* point); use of boldface, lines, and bars; arrangement of information in one or more columns; column headings; presence of a footnote and use of a symbol (such as an asterisk) to designate a footnote; and whether nutrition information is listed as a percentage or in absolute (*i.e.,* quantitative) amounts. The elements of format also include the alignment of information; whether indentations are used in listing nutrient data; and the use of white space (or negative space) where no image or text exists. The format may differ from package to package according to the amount of space on the package that is available for labeling, as described and detailed in the relevant sections in this document.

The original format of the Nutrition Facts label was informed by a number of factors, including consumer research that we conducted; consideration of the environment in which consumers typically use the label (*i.e.,* grocery stores); the diversity of consumers (*i.e.,* with respect to education, age, socioeconomic status, etc.) for whom the label is intended; and comments and data received on this issue in response to rulemaking activities conducted in the 1990s. Research studies consistently confirmed that simple formats are easier to comprehend and require less consumer effort than complex information formats. A simple format is one that minimizes clutter and best meets the NLEA requirements that nutrition information should enable the public to readily observe and comprehend such information. In addition, a simple format allows consumers to search for accurate nutrition information with minimum effort, and provides information in a succinct manner that maximizes understanding (79 FR 11879 at 11948).

In the preamble to the proposed rule (79 FR 11879 at 11948), we explained that we were not proposing an extensive reformatting of the Nutrition Facts label. We further explained that we were proposing to make changes based on graphic design principles (such as alignment, consistency, repetition, and contrast), highlight key nutrients and key information, and remove or modify parts of the label to assist consumers in maintaining healthy dietary practices. In brief, we proposed the following changes to the format of the Nutrition Facts label: (1) Increasing the prominence of calories and serving size; (2) reversing the order of the ''Serving Size'' declaration and the ''Servings Per Container'' declaration and increasing the prominence of ''Servings Per Container;'' (3) right-justifying the quantitative amounts of the serving size information; (4) changing the phrase ''Amount Per Serving'' to ''Amount Per ____'' with the blank filled in with the serving size; (5) removing the declaration of ''Calories from fat;'' (6) modifying the presentation of the ''% DV'' information by changing its position to the left of the name of the nutrient on certain labels and separating it from the list of nutrients with a vertical line; (7) declaring ''Added Sugars'' as an indented listing directly beneath the listing for ''Sugars''; (8) declaring the quantitative (or absolute) amounts (in addition to percent DVs) of mandatory vitamins and minerals and, when declared, voluntary vitamins and minerals; (9) requiring dual column labeling under certain conditions; (10) modifying the footnote; (11) requiring that all nutrients not currently highlighted in bold or extra bold type be highlighted in a type that is intermediate between bold or extra bold and regular (*i.e.,* semi-bold) type; (12) adding a horizontal line directly beneath the ''Nutrition Facts'' heading; and (13) replacing the listing of ''Total Carbohydrate'' with ''Total Carbs.'' We also invited comments on other issues related to the Nutrition Facts label format, including the use of an alternative format design or requiring the use of a specific font.

The preamble to the proposed rule also discussed certain modifications to be applied to other label formats to maintain consistency with the proposed Nutrition Facts label. These other modifications would pertain to formats for packages of products that contain two or more separately packaged foods that are intended to be eaten individually (*e.g.,* variety packs of cereals and snacks) or that are used interchangeably for the same type of foods (*e.g.,* round ice cream containers (§ 101.9(d)(13)); formats that apply to subpopulations (§ 101.9(e) and (j)(5)); the simplified format (§ 101.9(f)); the tabular display on packages that do not have sufficient continuous vertical space (§ 101.9(d)(11)(iii)); and the tabular display (§ 101.9(j)(13)(ii)(A)(*1*)) and linear display (§ 101.9(j)(13)(ii)(A)(*2*)) for small packages.

Additionally, in the **Federal Register** of July 27, 2015 (80 FR 44303), we proposed text for the footnotes to be used on the Nutrition Facts label and proposed to require the declaration of the percent DV for added sugars on the Nutrition Facts label. In a separate notice published in the **Federal Register** of July 27, 2015 (80 FR 44302), we reopened the comment period for the proposed rule for inviting public comments on two consumer studies: One using an experimental design methodology (the format study) and one using eye-tracking methodology (the eye-tracking study). The purpose of these studies was to examine the combined effects of most of the changes outlined in the proposed rule in their totality; however, both studies also examined certain individual changes, selected on the basis of priorities and resources available at that time.

1. General Comments

To make a determination about the final format for the Nutrition Facts label, we considered many factors including: Comments we received about the proposed label format in response to our proposed rule (79 FR 11879), the supplemental proposed rule (80 FR 44303) and the reopening of the comment period (80 FR 44302); graphic design principles; and results from consumer research conducted by ourselves and others. This is similar to the approach we took when determining the original Nutrition Facts label formats. At that time, our decisions about format elements drew on information collected from a variety of sources including focus groups and a professional package design firm, in addition to label research conducted by FDA and other organizations (57 FR 32060).

(Comment 478) Several comments stated that neither the results of our consumer studies nor those submitted by outside parties support the proposed label changes and that our proposed changes do not improve consumer understanding of nutrition information on the label over the current label format. One comment said that the proposed format changes do not offer ''enhanced value'' to the consumer that would justify a change from the preexisting label format.

(Response) The consumer studies that we conducted focused mainly on comparing the Current, Proposed, and Alternative formats in their totality. We found that overall consumer preferences, understanding, or perceptions of product healthfulness (as indicated by the label) were comparable among the Current, Proposed, and Alternative label formats. In this final rule, we are making minor changes, such as highlighting certain specific features and characteristics of the label, to enhance the information or for other reasons. Our consumer research provided important information and insights about consumer perceptions, judgments, and understanding that will be useful in informing our future consumer education efforts. We acknowledged in our 1993 nutrition labeling final rule that various considerations (*i.e.,* in addition to consumer research) would bear on the selection of a final nutrition label format. We previously said that an essential criterion would be how well a format conveyed information that Congress expected a nutrition label to provide, such as information that would allow people to decide whether to buy a product or to understand the relative significance of the food in the context of the daily diet (58 FR 2079 at 2115). In the consumer studies we conducted to determine the format for the original Nutrition Facts label, no single format emerged as being superior in every aspect that was investigated. We subsequently worked with graphic design experts to develop the new label, drawing on research that considered not only comprehension, but also legibility and literacy (Ref. 257).

(Comment 479) One comment described a study designed to investigate the extent that consumers are able to quickly notice and understand label information, as they would during grocery shopping (Ref. 258). The study compared consumer reactions to FDA's current and proposed versions of four different Nutrition Facts label formats, each portraying a different food product, so that a total of eight different labels were examined. The current and proposed label formats, and the foods depicted, were: Standard format for single-serve yogurt; tabular format for frozen vegetables; dual-column label for breakfast cereal (per serving and with ½ cup skim milk); and a dual-column label for a multi-serving snack mix package (per serving and per container). The comment recommended that we not implement the proposed changes in format for the Nutrition Facts label because, according to the comment, the study indicated that participants perceived few differences between the current and proposed label formats.

(Response) The results of this study are difficult to interpret because a number of details were not provided. Among other things, the comment did not adequately describe or explain the demographic characteristics of the participants, the statistical methods that were used, how the survey instrument was validated, how the participants were selected and the study was administered, and why 90 percent confidence levels were chosen to indicate significant differences rather than the conventional 95 percent confidence interval. In addition, the manner in which some questions were worded could have affected the responses, and the full range of response options was not presented. Furthermore, the proposed snack mix label appeared to be inconsistent in how the ''per serving'' and ''per container'' values were listed for various nutrients. Although the label indicated ''3½ servings per container'' for some nutrients (*e.g.,* calories, carbohydrates, sodium, protein) the amounts that were listed on the label suggested that there were 4 servings per container, and the amount of dietary fiber shown on the label indicated there were only 2½ servings per container. Therefore, we are not able to rely on the results of this study to inform our decisions regarding Nutrition Facts label formats.

(Comment 480) Several comments said that we should not move forward with the proposed nutrition label format changes without conducting further consumer research.

(Response) We disagree with comments suggesting that we should not finalize this rulemaking until we conduct further consumer research (see, also, our response to comment 6). We considered consumer research studies and public comments, and we also relied on graphic design principles (such as contrast, proximity, alignment, consistency, etc.) in deciding how the various Nutrition Facts label formats should appear in finalizing the requirements for the label format.

2. Increasing the Prominence of Calories and Serving Size

The ability to determine the caloric content of packaged foods is important for all consumers, especially those who are trying to control their total caloric intake and manage their weight. Our preexisting regulations require ''Calories'' to be declared in a type size no smaller than 8 point (§ 101.9(d)(1)(iii)) and highlighted in bold or extra bold type or other highlighting (§ 101.9(d)(1)(iv)). While calorie information is mandatory on the Nutrition Facts label, modifying the Nutrition Facts label to give more prominence to calories may benefit consumers in weight control and maintenance, as noted by the OWG in its final report entitled ''Calories Count'' (Ref. 127).

In the preamble to the proposed rule (79 FR 11879 at 11849 and 11948 through 11949), we explained that the OWG recommended, in part, that we issue an ANPRM to solicit comments on how to give more prominence to calories on the food label. The OWG suggested possible changes to the Nutrition Facts label, such as increasing the prominence of ''Calories'' and ''Serving Size,'' providing a percent DV for calories, and eliminating the ''Calories from fat'' declaration, which may detract from the emphasis on total calories. The OWG recommended that we obtain information on the effectiveness of these options on consumer understanding and behavior related to calorie intake (Ref. 127). In response to the 2005 ANPRM, several comments supported increasing the prominence of calories on the Nutrition Facts label. These comments suggested

various approaches for doing so and pointed out the need for additional research to fully understand the effects of potential label changes on consumer understanding and behavior (Ref. 26).

We considered available data from consumer research and comments received in response to the ANPRMs and conducted our own research on food labels. We tentatively concluded that the proposed changes to the number of calories per serving and the number of servings per container would result in these declarations serving as an anchor to the Nutrition Facts label by focusing the reader's attention to this information and therefore would assist consumers to effectively use this information in the Nutrition Facts label (Ref. 259). The proposed rule would revise § 101.9(d) to increase the type size for ''Calories'' and the numeric value for ''Calories'' and also would require the numeric value for calories be highlighted in bold or extra bold type to draw attention to this information, emphasize the importance of calories on the label, and maintain consistency with the bolded declaration for ''Calories.''

We also expressed a tentative view that the Supplement Facts label should have a format similar to the format being proposed for the Nutrition Facts label with respect to increasing the prominence of information for calories. We invited comment on whether any changes we proposed to the Nutrition Facts label also should be required for certain products with Supplement Facts labels, and if so, under what conditions and for which dietary supplement products should such labeling be required.

(Comment 481) Most comments supported our proposal to increase the prominence of the calories declaration, indicating that giving more emphasis to calories on the Nutrition Facts label would likely benefit consumers in helping them to monitor their caloric intake and make healthier food choices. Several comments suggested that increasing the prominence of calories would help focus consumer attention on their total caloric intake because the information on the label would be more visible, readily accessible, and hard to ignore. Many comments noted that the larger, bolder font would draw attention to the calorie content of the product, encourage consumers to consider this information when selecting a product or deciding how much to eat, and help them to grasp the relative significance of a particular food in the context of their daily diet. Other comments said that increasing the prominence of calories also would help consumers compare products when shopping and perhaps encourage them to pay more attention to labels in general. Several comments pointed out that increasing the type size and visibility of calories would be especially helpful to people with impaired vision, including many older adults and diabetics, and even people with normal vision would benefit if shopping in a dimly lit grocery store. The comments said that, although information about other nutrients is important, information on calories is particularly important because of the prevalence of obesity and the association between obesity and chronic diseases and disabilities. The comments agreed that enlarging the calories information and making it bolder would be an important step, not only in fighting obesity, but also in controlling diabetes.

Although most comments acknowledged the importance of calories and supported increasing the prominence to some extent, many comments opposed declaring the calorie information in a type size substantially larger than that of other information on the label. Many comments expressed concerns that the proposed format overemphasized calories at the expense of other nutrients declared on the label, and several comments suggested that the calorie information was ''disproportionately large'' or consumed too much label space. Other comments included suggestions for improving the overall design and balance of the label by adjusting the relative type sizes for ''Calories,'' the numeric value for calories, and other nutrition information on the label, including the ''Nutrition Facts'' heading. A few comments stated that there was no need to increase the prominence of calories because the Nutrition Facts label already provides calorie information and that increasing the prominence may not provide any additional benefits.

Several comments said that there is no convincing data that enlarging the calorie information would help consumers choose healthier products and that additional consumer research would be essential for determining a format that improves consumer understanding of calorie information in the Nutrition Facts label. One comment pointed out that, although the FDA consumer study cited in the proposed rule failed to demonstrate that increasing the font size for calories lead to healthier choices, we nevertheless decided to proceed with our proposal to increase the prominence of calories on the label. The comment further stated that, because FDA's own consumer research suggested that a larger font size does not improve consumer awareness of the calorie information, we must provide another justification to increase the font size.

Many comments also expressed concerns that overemphasizing calories could have the unintended consequence of suggesting that information about calories is much more important than information about other nutrients appearing on the label. For example, some comments said that the proposed Nutrition Facts label could give the impression that calorie counting is the most important consideration in managing health, when, in fact, reducing the risk of chronic diseases and other health-related conditions goes well beyond caloric intake. Other comments said that consumers might evaluate and compare food or beverage products based solely on their caloric content and choose the option having the fewest calories, without considering the product's total nutrient profile. Consequently, this could inadvertently result in consumers avoiding nutrient dense foods as recommended by the Dietary Guidelines for Americans.

Several comments expressed concerns that making the calorie declaration so prominent could affect consumer use and understanding of other information on the Nutrition Facts label. For example, comments suggested that, because the ''Amount per ____ (serving)'' declaration is relatively small compared to the proposed ''Calories'' and ''____servings per container'' declarations, consumers may mistakenly associate the numeric value for ''Calories'' with the contents of the entire container, rather than with only one serving. Several comments emphasized that consumer research is needed to further investigate formats that would facilitate consumer understanding of this label information and ensure that the format does not result in consumers misinterpreting the calories information. One comment suggested that as part of a consumer test, the ''Amount per ____'' (*i.e.,* serving size) listing and the numeric value for ''Calories'' could be shown in equal type sizes.

(Response) We agree that giving more prominence to calories by increasing the type size and bolding of the ''Calories'' declaration and the numeric value for ''Calories'' would emphasize the importance of calories on the Nutrition Facts label.

We disagree with the comments suggesting it is not necessary to increase the prominence of the calorie declaration or that the numeric value for calories should not be larger than the word ''Calories,'' because, as we explain later in this response, emphasizing this

information has potential benefits to consumers who read the label. However, we agree that the 24 point type size that was proposed for the numeric value for ''Calories'' on most label formats (excluding small packages and dual column labels using the tabular format) could be considered too large and that adequate prominence could still be achieved by slightly reducing the type size. Therefore, the final rule, at § 101.9(d)(i)(iii), requires a type size of 22 point for the numerical value for ''Calories,'' (excluding labels for smaller packages that have a total surface area available to bear labeling of 40 square inches or less) and a type size of 16 point for the word ''Calories'' on all label formats (excluding labels on smaller packages, with a total surface area available to bear labeling of 40 square inches or less and all tabular displays) and highlighting both pieces of information in bold or extra bold type. The requirements for smaller packages require a type size of no smaller than 14 point for the numerical value for ''Calories'' for the tabular display for small packages as shown in § 101.9(j)(13)(ii)(A)(*1*) and the linear display as shown in § 101.9(j)(13)(ii)(A)(*2*), a type size of no smaller than 10 point for the word ''Calories'' for the tabular displays as shown in § 101.9(d)(11)(iii) and (e)(6)(ii) and for the tabular display for small packages as shown in § 101.9(j)(13)(ii)(A)(*1*) and the linear display as shown in § 101.9(j)(13)(ii)(A)(*2*). These type sizes will be sufficiently large to emphasize the importance of calories on the label and draw attention to this information while decreasing the size to address issues raised in the comments as well as accommodating size constraints for packages with a total surface available to bear labeling of 40 square inches or less (see our response to comment 517).

We disagree with the comments suggesting that emphasizing calories would detract from information about other nutrients on the label, or would result in consumers avoiding nutrient dense foods. No evidence was submitted in support of these comments, and we are unaware of any data that emphasizing the calories declaration would encourage consumers to always choose the lower calorie option, result in poor nutritional practices, or lead to adverse health consequences. Although we also are unaware of any consumer studies demonstrating that increasing the prominence of calories information on the Nutrition Facts label would either help or hinder consumer use and understanding of this information, we explained in the preamble to the proposed rule (79 FR 11879 at 11949) that existing data from studies on warning label and drug label formats have demonstrated that increasing the prominence of label information such as warning statements increases consumer attention to such information. Furthermore, the OWG report suggested that we consider increasing the font size for calories on the Nutrition Facts label because of the critical importance of caloric balance in relation to overweight and obesity (Ref. 127). Similar to graphic design principles underlying the appearance of warning labels, increasing the prominence of calories would be expected to draw consumer attention to this information. The OWG report recommend mainitaining a healthy body weight and calorie balance is key factor for managing body weight. The OWG report concluded that obesity is positively associated with adult morbidity and mortality and has become a pervasive and urgent public health problem in the United States. The OWG report also emphasized the medical and health related costs that result from high rates of overweight and obesity. Moreover the 2015–2020 DGA does not alter these conclusions and corroborates these findings. We agree with the OWG report's recommendations and conclusions particularly emphasizing calories, but we are sensitive to concerns about over-emphasizing the calories declaration on the label. An important goal in addressing concerns regarding nutrient density is education. Nutrition education, especially around the Nutrition Facts label should be multifactorial and highlight the importance of calories, but also the other nutrients that can affect health and chronic disease. Therefore, the final rule requires a smaller type size for the number of calories on all labels than what we had originally proposed (*i.e.,* 22 point rather than 24 point for all displays except those for smaller packages), and even further decreased type size (14) requirements are permitted for small packages with a total surface area available to bear labeling of 40 square inches of surface area or less as described in § 101.9(j)(13)(ii)(A)(*1*) and (*2*).

(Comment 482) A few comments expressed concerns that excessively focusing on calories and drawing too much attention to the caloric content of a food product would likely have a negative impact on individuals who are at risk for an eating disorder, or who are already struggling with an eating disorder.

(Response) The comments did not submit data or other evidence to show that eating disorders could be triggered or exacerbated by enlarging the ''Calories'' declaration on the Nutrition Facts label. We are unaware of the existence of such an association and remain convinced that the potential public health benefits of increasing the prominence of ''Calories'' would outweigh the risk of a possible negative impact on individuals struggling with eating disorders.

(Comment 483) One comment stated that, because dietary supplement labels often contain a large amount of information on a small label, increasing the prominence of calories information would likely be difficult because of a lack of space. The comment stated that an increased prominence for ''Calories'' on Supplement Facts labels should be required only if consumption of the dietary supplement would make a major contribution to daily caloric intake (*e.g.,* 50 or more calories per serving). However, the comment noted that, in most cases, dietary supplement products contribute insignificant amounts of calories to the overall diet.

(Response) In the preamble to the proposed rule, we invited comments on whether any of the changes being proposed for the Nutrition Facts label should also apply to products with Supplement Facts labels that list calories and/or other macronutrients (79 FR 11879 at 11949). We did not propose increasing the prominence of calories on labels of dietary supplement products and did not display the calories information in a larger and bolder type size in any of the labels illustrated in the proposed rule in § 101.36(e)(11) and § 101.36(e)(12). We agree with the comment that many dietary supplement products may contribute a negligible amount of calories. Therefore, the final rule does not require that information about calories be displayed in a larger type size or be highlighted in bold or extra bold type or other highlighting on any Supplement Facts labels.

(Comment 484) Several comments pointed out that increasing the font size for ''calories'' and ''serving size'' on the Nutrition Facts label would affect the size of the percentage juice declaration that manufacturers are required to make on juice products. Under § 101.30(e)(2), the percent of juice declaration must be in a height not less than the largest type found on the information panel except that used for the brand name, product name, logo, universal product code, or the title for Nutrition Facts. Because information about ''Calories'' is not included among these exceptions, the type size of the juice declaration would have to be at least as large as the type size of the numeric value for ''Calories.''

Therefore, according to the comments, increasing the size of the ''Calories'' information would mean increasing the size of the percent juice declaration significantly. The comments further suggested that we revise § 101.30(e)(2) to clarify that the percent juice declaration does not have to be larger than the information about ''Calories'' or ''Serving size.''

(Response) We inadvertently omitted the corresponding correction to § 101.30(e)(2) to include ''Serving size,'' ''Calories,'' and the numerical value for ''Calories'' in the list of exceptions for declarations in larger type to avoid requiring a type that would be too large for the declaration of the amount of juice. Therefore, we have made a technical correction in the final rule and revised § 101.30(e)(2) to state that the title phrase ''Nutrition Facts, the declaration of ''Serving size,'' ''Calories,'' and the numerical value for ''Calories'' appearing in the nutrition information must be in easily legible boldface print or type in distinct contrast to other printed or graphic matter, in a height not less than the largest type found on the information panel except that used for the brand name, product name, logo, or universal product code.

(Comment 485) One comment said we should not require the calories information listed on labels of food products intended for infants and young children to have the same prominence as the calories information on product labels intended for people 4 or more years of age. The comment stated that decisions about food choices that are made for infants and young children should not be based on the number of calories per portion, but rather on the overall nutrient profile of the food. The comment explained that, by relying too much on a food's caloric content, parents may inadvertently restrict healthful foods or make inappropriate food choices for their young children and infants. The comment also said that, according to nutrition experts, children in this age range should be encouraged to self-regulate caloric intake and that parents and caregivers should feed children in response to the child's hunger and fullness cues rather than on the basis of a preconceived number of calories they believe the child should consume.

(Response) We agree with the comment that food choices for infants through 12 months of age and children 1 through 3 years of age should focus primarily on a food's overall nutrient profile rather than on the number of calories per serving (Refs. 260–261). The IOM report advocated feeding children in response to their hunger and fullness cues, rather than providing foods for children based on the number of calories in a serving of the product. However, the IOM report also emphasized the importance of parents establishing healthful eating habits for their children early in life. The IOM report stated that children who consume a diet that restricts energy-dense foods high in sugar, fat, and salt, but that is rich in nutrient-dense foods, are less likely to become overweight or obese. Thus, although the IOM report did not explicitly recommend restricting children's foods based on calorie content, it suggested that parents and caregivers should at least be aware of the amount of calories (and other nutrients) in the foods they give their children, especially those over 2 years of age, in order to begin establishing good eating habits.

The comment did not provide evidence that parents would restrict foods or make inappropriate food choices for their young children and infants based solely on the food's caloric content. We acknowledge that parents and caregivers would likely consider a variety of factors when making decisions about what to feed their young children and that increasing the prominence of calories information on the labels of foods intended for young children does not necessarily mean that parents would restrict these foods. Therefore, we do not consider it necessary for the calories information on products for infants through 12 months of age and children 1 through 3 years of age to differ from that required on Nutrition Facts label formats for foods intended for individuals 4 years of age and older. To maintain consistency in label formats, the final rule requires that the calories information on labels of foods intended for infants through 12 months of age and children 1 through 3 years of age be displayed prominently, as indicated in the label mockups shown in § 101.9(j)(5)(i) and (ii).

3. Changing the Order of the ''Serving Size'' and ''Servings Per Container'' Declarations and Increasing the Prominence of ''Servings Per Container''

Our preexisting regulations specify that information on serving size, consisting of a statement of the serving size (§ 101.9(d)(3)(i)) and the number of servings per container (§ 101.9(d)(3)(ii)), must immediately follow the identifying heading of ''Nutrition Facts.'' In addition, ''Serving Size'' and ''Servings Per Container'' must be in a type size no smaller than 8 point (§ 101.9(d)(1)(iii)).

In the preamble to the proposed rule (79 FR 11879 at 11949), we explained that, with respect to the Nutrition Facts label, an important consumer need is to identify the number of servings per container of a packaged food. Therefore, we proposed placing ''Servings Per Container'' above ''Serving Size'' to help consumers find the number of servings per container with less effort than is now needed. We also proposed that listing ''____ servings per container'' with the blank filled in with the actual number of servings directly beneath the ''Nutrition Facts'' heading, and highlighting it in bold or extra bold type, would help increase awareness that the information presented in the Nutrition Facts label does not refer to the contents of the entire package when the label indicates that there is more than one serving per container. We explained that listing ''Serving size'' in the same proximity to where the actual nutrient information is located on the label (rather than directly beneath the Nutrition Facts heading as in our preexisting regulations, § 101.9(d)(3)) would help consumers understand that this nutrient information pertains to the particular serving size that is declared. (According to the graphic design principle of proximity, items that are positioned closer together are perceived to be more closely related (Ref. 262)). Thus, we tentatively concluded that reversing the order of the declarations of ''Servings Per Container'' and ''Serving Size'' would help consumers more readily observe and comprehend the nutrition information appearing in the Nutrition Facts label, allow consumers to search for information with a minimum of effort, and assist consumers in their food purchasing decisions and in maintaining healthy dietary practices. We proposed to redesignate § 101.9(d)(3)(i) as § 101.9(d)(3)(ii), redesignate § 101.9(d)(3)(ii) as § 101.9(d)(3)(i), and to make changes in how the serving size information is capitalized on the label so that no capital letters are used, except for the first letter in ''Serving size.'' We also proposed to require that the declaration of ''____servings per container'' (with the blank filled in with the actual number of servings) be highlighted in bold or extra bold type and be in a type size no smaller than 11 point (except for the tabular and linear displays for small packages) (proposed § 101.9(d)(3)(i)), and that the information for ''Serving size'' be in a type size no smaller than 8 point (except for the linear display for small packages) (proposed § 101.9(d)(3)(ii)).

We did not propose similar changes for serving size information for dietary supplements. In the preamble to the

proposed rule (79 FR 11879 at 11950), we said that, when taking dietary supplements, consumers need to know how much of the product to take (*e.g.,* 1 capsule, 2 tablets, 1 packet) and that this information, which is currently provided in the ''Serving Size'' line of the Supplement Facts label, is more important for the consumer to know than the number of servings (*e.g.,* 100 tablets) contained in the package.

(Comment 486) Many comments supported changing the order of the ''Serving Size'' and ''Servings Per Container'' declarations because the comments felt that this change would make the label easier to read and understand. The comments said consumers would be better able to compare products when shopping and make better buying decisions, which could ultimately lead to improved health for themselves and their families. Other comments suggested that the proposed changes could help consumers understand that nutrition information on the label is based on the serving size, which could increase awareness of the amount of food actually being consumed. In addition, comments said that the proposed change could help consumers monitor their caloric and nutrient intakes, compare products more easily, eat more moderate portions, and more easily grasp the relative significance of a food product in the context of their daily diet.

Other comments said that reversing the order of serving size and the number of servings per container, especially in combination with increasing the prominence of information about calories, would make the relationship between the ''Calories'' and ''Serving size'' declarations clearer, lead to a better understanding of the calories information, and improve the flow of the label.

In contrast, several comments opposed changing the order and said we should continue to list ''Serving size'' above ''____ servings per container.'' The comments suggested that information about a product's serving size was more important than the number of servings per container because the label's information is based on the serving size declaration. Many comments that opposed reversing the order of serving size and servings per container expressed a preference for us to increase the prominence of serving size instead. The comments said that putting the ''Serving size'' declaration in bold print and increasing its type size would emphasize its importance and increase awareness that the nutrition information on the label is based on the serving size.

(Response) As we explained in the preamble to the proposed rule (79 FR 11879 at 11949), reversing the order in which ''Serving Size'' and ''Servings Per Container'' are listed would place the serving size information in closer proximity to where the actual nutrient information is located on the Nutrition Facts label. According to graphic design principles (*i.e.,* the principle of ''proximity''), this would increase the perception that the serving size is closely related to the nutrition information that follows directly below it, and thus provide necessary context for helping consumers understand that this nutrition information pertains to the particular serving size that is declared. If the order of the ''Serving Size'' and ''Servings Per Container'' declarations was preserved as in our preexisting regulations and as preferred by some comments, the relationship between the nutrition information and the serving size might be less clear. Although some comments suggested that we put the serving size declaration in bold print rather than shift its position, it is unlikely that bold print, alone, would provide the necessary context for helping consumers to understand the association between serving size and the nutrient information because these pieces of information in the preexisting regulation would be lacking in proximity, and the contrast between the ''Serving size'' declaration and the ''Nutrition Facts'' heading directly above it would be reduced if both were in a bold or extra bold font. We address the comments concerns regarding increased emphasis of ''serving size'' instead of ''servings per container'' in our response to comment 488.

Therefore, the final rule, at § 101.9(d)(3)(ii), requires that ''serving size'' be placed below ''__Servings per container.'' The final rule also requires the information to be highlighted in bold or extra bold and be in a type size no smaller than 10 point, except the type size must not be smaller than 8 point for the information for small packages as shown in § 101.9(j)(13)(ii)(A)(*1*) and (*2*). Displaying both pieces of information related to serving size adjacent to each other should help consumers understand how the serving size relates to the nutrition information on the label and use the label to plan and maintain healthy dietary practices. It is important for consumers to understand the serving size and realize how it relates to the rest of the label's nutrition information.

(Comment 487) Many comments supported inserting the actual number of servings at the beginning of ''servings per container'' statement because this could help consumers identify more readily the number of servings in a package and help consumers decide how many people a particular food item could serve or feed. The comments said that consumers would have a better idea of the total number of calories in the package as well as the number of calories they would actually consume if they eat the entire contents of a multi-serving package.

(Response) We agree with the comments, and so the final rule, at § 101.9(d)(3)(i), requires the actual number of servings at the beginning of the ''servings per container'' statement.

(Comment 488) Many comments agreed that increasing the prominence and visibility of ''servings per container'' would enable consumers to notice and use this information. The comments further stated that individuals who did not previously or regularly use the label might begin to do so and that increasing the prominence of the ''servings per container'' declaration would not only be ''eye catching'' and ''hard to ignore,'' but also would be helpful to people with poor vision or those who shop in dimly lit grocery stores.

Some comments suggested increasing the size and prominence of the ''Serving Size'' declaration, as well as that of ''servings per container.'' One comment acknowledged that one intention of the proposed rule is to help consumers more easily recognize multi-serving packages, but said there was no valid justification for making the ''____ servings per container'' information more prominent than the ''Serving size'' declaration. Another comment suggested that increasing the prominence of both calories and serving size could be especially important on labels of some sugar-sweetened beverages, particularly on products that may contain more than one serving, but are often consumed during one eating occasion.

Several other comments opposed increasing the prominence of ''servings per container'' because, according to the comments, ''serving size'' is the more important piece of information. The comments would emphasize ''Serving size'' in a larger and bolder font. Many comments said that making the serving size information easier for consumers to see and understand was important for properly interpreting the calorie information (in addition to increasing the prominence of ''Calories'') and is also ''what consumers are used to'' seeing. Several comments said that the proposed font size of the ''____ servings per container'' statement was so large

that consumers might mistakenly think that the number of calories listed in the ''Calories'' declaration on the label pertained to the entire package; *i.e.,* to all of the servings that appear in the ''____'' space. Another comment suggested reducing the type size for ''____ servings per container'' to a size smaller than the ''Amount per ____'' statement. One comment suggested that the relative differences in type sizes in the listings for the number of servings per container, the amount per serving, and the numeric value for ''Calories'' could result in consumers mistakenly associating the number of calories with the total package because the ''Amount per ____'' is relatively small compared to the other declarations. One comment said that giving increased prominence to ''Serving size'' would be a reasonable way to implement the recommendations of the OWG's Calories Count report and would be consistent with existing research data suggesting a lack of attention to this listing.

(Response) The comments reflect the need to consider how much emphasis to provide for the ''Serving size'' declaration compared to the ''____ servings per container'' declaration. We agree with the comments that the serving size information was not prominent enough in our proposal and that consumers could potentially associate the calorie and nutrition information on the label with the ''servings per container'' declaration since it was more prominent compared to the serving size declaration. We also agree that the ''servings per container'' declaration should be more prominent and visible than on the preexisting label so consumers will be able to use this information if they consume all or a larger portion of a multi-serving container. Increasing the prominence of the ''Serving size'' information by bolding and slightly increasing the font size will emphasize the importance of the information and, along with its placement, would assist consumers in better understanding how to use the Nutrition Facts label to interpret accurately the calories and nutrient information on the label that is directly below the ''Serving size'' declaration. To provide prominence to ''Serving size,'' however, we need to reduce the prominence of ''servings per container.'' According to graphic design principles (*e.g.,* contrast), alternating a larger and bolder type style with a smaller, regular type style on successive lines of the Nutrition Facts label will provide maximum visibility and optimal highlighting to the information that we wish to emphasize on the label (Ref. 262). Contrast is a graphic design principle that uses opposing elements (such as bolding) to differentiate objects in the same field of view, or to intensify the effect between objects that would otherwise look similar (Ref. 263). Thus, we are providing contrast in the first three lines of the Nutrition Facts label in the final rule (*i.e.,* the Nutrition Facts heading, the ''____ servings per container'' declaration, and the ''Serving size'' declaration) by alternating the use of bold font with non-bold font for this information. We also realize that enlarging the ''____ servings per container'' declaration through bolding may pose space challenges if the word ''about'' is used in this statement, which is allowed under § 101.9(b)(8)(i).

Therefore, the final rule requires that the ''Serving size'' declaration, and the quantitative information associated with this declaration, be listed in a type size no smaller than 10 point (except on labels of smaller packages with a total surface area available to bear labeling of 40 square inches or less and all tabular formats where a type size of 9 point type is permissible due to space constraints) and be highlighted in bold or extra bold type. Additionally, if a product has a ''Serving size'' declaration with too many characters to fit in the provided space allocated for the ''Serving size''declaration, then a type size of 8 point is permissible for any size package (§ 101.9(d)(3)(ii)). To reduce the prominence of the ''____ servings per container'' declaration, we are requiring that ''____ servings per container'' be listed in a regular type in a type size no smaller than 10 point (except on labels of smaller packages with a total surface area available to bear labeling of 40 square inches or less (§ 101.9(j)(13)(ii)(A)(*1*) and (*2*)) where a type size of 9 point is permissible due to space constraints) directly beneath the Nutrition Facts heading, followed directly below by the ''Serving size'' declaration in bolder font.

(Comment 489) One comment referred to a study suggesting that many consumers do not look at serving size information, but otherwise do refer to the Nutrition Facts label and ingredients list, as evidence that the serving size declaration needs to be made more prominent. Other comments suggested that we should more closely review previous consumer research studies or conduct additional studies to determine the effects of displaying ''Serving size'' and ''servings per container'' information more prominently, and determine the potential implications of increasing the prominence and changing the location of the ''____ servings per container'' information on the Nutrition Facts label.

(Response) We disagree with the comment suggesting that many consumers do not look at serving size information, but otherwise do refer to the Nutrition Facts label and ingredients list. The comment apparently misinterpreted a published abstract (Ref. 264) of a study that investigated consumer perceptions and use of the serving size information, ingredient list, health claim information, and the Nutrition Facts label in general, particularly with regards to the extent that each of these impact purchasing decisions. The study, which drew on data from the 2005–2006 and 2007–2008 NHANES, was recently published in its entirety (Ref. 265). In contrast to what the comment said, the abstract stated that the study participants were more likely to use the Nutrition Facts label (in general) and the ingredient list in particular than information about serving size and health claims. In addition, according to data from the NHANES 2009–2010 cycle, approximately 64 percent of respondents (16+ years of age) reported at least ''sometimes'' using the serving size information on the food label when deciding to buy a food product, and 31 percent of the respondents reported that they used the serving size information either ''always'' or ''most of the time'' (Ref. 266).

As for the comments suggesting that we need to evaluate consumer research and conduct further research in regards to switching the order and increasing the prominence of ''Serving size'' and ''servings per container,'' we address these issues in our responses to comments 478 and 480. We also note that we are finalizing the requirement to include, directly below ''Nutrition Facts,'' the ''servings per container'' declaration followed by the ''Serving size'' declaration. As we explain in our response to comment 488, the location of ''Serving size'' to where ''servings per container'' was formerly located places it in closer proximity to the nutrient information that pertains to the serving size of the product.

(Comment 490) One comment said that ''____ servings per container'' is irrelevant information because the nutrition information on the label refers to the amount of nutrients and calories in a single serving. The comment would have the Nutrition Facts label emphasize the size of a serving (*i.e.,* the serving size) rather than the number of servings that are in the container.

(Response) The declaration of ''____ servings per container'' provides important information to the consumer

about how the information on calories and nutrients for one serving of food relate to the entire package of food. Consumers may consume more than one serving and need to know how the portions consumed relate to their total daily dietary intake. Therefore, we decline to revise the rule as suggested by the comment. However, we have revised § 101.9(d)(3) to clarify that both the ''____ servings per container'' and ''Serving size'' declarations are components of the serving size information required on the label.

(Comment 491) Other comments opposed increasing the prominence of ''__ servings per container'' because, in combination with other proposed changes, it would increase the space requirements for the Nutrition Facts label. One comment said that, because of space limitations on the label, we should not require the words ''per container'' to be included in the ''____ servings per container'' statement. The comment further said that ''per container'' is not needed for consumers to identify the number of servings in the package. The comment cited data from an online consumer research study (Ref. 267) to assert that 98 percent of the study participants correctly identified the number of servings per package and the serving size when the label did not include the words ''per container,'' while 92 percent of respondents who viewed the proposed Nutrition Facts label (*i.e.,* ''____ servings per container'') were able to correctly identify this information.

(Response) We note in our response to comment 488 that we are requiring that ''____ servings per container'' be listed in a type size no smaller than 10 point (except on labels of smaller packages with a total surface available for labeling of 40 square inches or less, where the type size will be no smaller than 9 point) and in regular font in order to provide adequate contrast to the prominent information displayed directly above and below it (*i.e.,* the ''Nutrition Facts'' heading and ''Serving size'' information, respectively). We disagree that the words ''per container'' should not be required to be included in the ''____ servings per container'' statement because ''per container'' would provide context and a frame of reference for the number of servings. Furthermore, the comment did not provide adequate details about its study design, methodology, and statistical analyses, and did not include data that would enable us to appropriately evaluate the survey results. Including the words ''per container'' would remove any potential ambiguity between servings per container and the serving size information, which would help clarify the number of servings to which the label refers. Although the survey findings reported in the comment indicated that respondents did not need to see ''per container'' on the label to correctly interpret information about serving size and the number of servings per container, it is difficult to evaluate the results without any data. Therefore, we decline to change our longstanding practice of including ''per container'' as part of the ''servings'' declaration, as this information is intended to help consumers accurately identify the number of servings in a package.

(Comment 492) Many comments suggested that we explain that nutrition information is based on the serving size listed in the Nutrition Facts label or conduct an education program to help consumers understand that the label serving size is not a recommendation but is based on actual food intake data. Some comments also asked us to explain the difference between serving size and portion size. One comment stated that, because some consumers use the terms ''serving size'' and ''portion size'' interchangeably, we should clarify the label by either: (1) Denoting the serving size provided as a ''typical'' serving size; or (2) including a footnote to clarify that ''the serving size is based upon the amount typically consumed, and is not a recommended portion size.'' Other comments said it was important to educate consumers that, if one eats more than one serving of a food product, the amount of calories consumed will increase proportionally.

(Response) We recognize the importance of providing consumers with more in-depth information about the meaning of the serving size and intend to make this a key component of our future nutrition education efforts for consumers. However, we decline to revise the rule to add a footnote to the Nutrition Facts label to indicate that the serving size is based on what is typically consumed, rather than what is recommended. Manufacturers can include a truthful and not misleading statement explaining the meaning of serving size elsewhere on the product label.

4. Right-Justifying the Quantitative Amounts Declared in the ''Serving Size'' Statement

In the preamble to the proposed rule (79 FR 11879 at 11950), we said that we tentatively concluded, based on design considerations, that the label statement for ''Serving size'' in both household units (*e.g.,* cups, tablespoons, teaspoons, pieces or slices, as explained in § 101.9(b)(5)) and gram amounts must be right-justified on the same line that ''Serving size'' is listed. Under our preexisting regulations at § 101.9(d)(12), this numerical information is stated immediately adjacent to the ''Serving Size'' declaration. By keeping the proposed ''Serving size'' declaration left-justified while right-justifying the corresponding numerical values, the proposed change would create white space on the Nutrition Facts label that would result in a less cluttered appearance, heightened focus and emphasis, and improved readability (Ref. 268). This design feature would provide enhanced emphasis to the information about serving size, allowing this information to be more noticeable and thereby facilitating its access and use by consumers.

(Comment 493) Some comments addressed the issue of right-justifying the quantitative amounts declared in the ''Serving size'' statement. One comment suggested that moving the serving size information to the right-hand side of the Nutrition Facts label would help emphasize the information, create white space leading to a less cluttered appearance, and would allow the eye to ''flow across the information.'' Another comment said that the proposed change would make it easier for readers to find the values for calories, serving size, number of servings per container, and percent Daily Values if all of these values were consistently placed in the same right-hand side of the label.

One comment opposed to right-justifying the serving size quantitative information on the Supplement Facts label. The comment said that because the ''Serving size'' declaration must be left-justified, the quantitative information for serving size should appear near this declaration, rather than on the other side of the panel where it would be separated by a large white space. The comment added that this may be a particular concern for dietary supplement products that use dual column labeling (*e.g.,* with columns for ''Per Serving'' and ''Per Day'').

(Response) Keeping the ''Serving size'' declaration left-justified, while requiring the corresponding numerical value be right-justified, provided that adequate space is available, will make this information more noticeable and facilitate its access and use by consumers. Although we did not propose to right-justify quantitative amounts in the ''Serving size'' declaration in the Supplement Facts label, we agree that it would not be appropriate to do this. The ''Supplement Facts'' title in the Supplement Facts label requires more

space than the ''Nutrition Facts'' title in the Nutrition Facts label and (unless impractical) must span the full width of the label (§ 101.36(e)(1)). Also, the Supplement Facts label is less likely than the Nutrition Facts label to be situated on the narrow side panel of a package. Therefore, because Supplement Facts labels are often wider than Nutrition Facts labels, right-justifying the serving size amount might leave too much white space between the words ''Serving size'' and the quantitative amount. It may not be apparent on some Supplement Facts labels that the quantitative amount per serving listed on the far right side of the label would refer to the serving size declaration, which would be left-justified. With dietary supplements in particular, it is important that consumers understand the serving size unit (*e.g.,* 1 tablet, 1 capsule) to minimize the possibility of taking an excessive amount of the product. The serving size amount also is important so that consumers can understand and follow instructions on dietary supplement labels for the suggested use of the product, which explain how, when, or how much of the product to take daily and (if applicable) the amount not to exceed. Therefore, the final rule only requires that quantitative amounts declared in the ''Serving size'' statement be right-justified on Nutrition Facts labels, provided that adequate space is available, and not on Supplement Facts labels.

5. Changing the ''Amount Per Serving'' Statement

Our preexisting regulations require the Nutrition Facts label to include a subheading designated as ''Amount Per Serving'' and to separate this subheading from the serving size information by a bar (§ 101.9(d)(4)) and highlight the subheading in bold or extra bold type or other highlighting (§ 109(d)(1)(iv)). The proposed rule would change the ''Amount Per Serving'' declaration to ''Amount per _____'', with the blank filled in with the actual serving size expressed in household units. We also proposed increasing the type size of this information and, to heighten contrast with the calories information, using semi-bold rather than bold or extra bold highlighting. We explained, in the preamble to the proposed rule (79 FR 11879 at 11950), that these changes would make it easier for label users to understand what the nutrition information in the Nutrition Facts label refers to, because it would eliminate the need to first locate the ''Serving size'' declaration to see what the serving size unit is. Because studies suggest that consumers often find serving size information difficult to interpret (Ref. 9) we stated that specifying the actual serving size in the ''Amount per _____'' declaration would likely help consumers to more readily observe and comprehend the nutrition information that is displayed in the label.

(Comment 494) Some comments supported the proposed change and said that replacing ''Amount Per Serving'' with ''Amount per _____'' would reinforce the concept of serving size and help people realize how many calories are actually in a serving of the product. One comment said it was reasonable for the label to include duplicate information (*i.e.,* in both the ''Serving size'' and ''Amount per _____'' declarations) about what constitutes a serving because it is important for consumers to understand that the nutrition information on the label is based on the serving size. Another comment suggested that both the ''Serving size'' and ''Amount per _____'' declarations should be bolded to increase their visibility.

Many comments disagreed with the proposed change and said it would make the serving size information repetitive, create unnecessary clutter, and impose additional space constraints on the label. One comment said that including duplicative information about serving size would be distracting and ''slow down'' the comprehension process, especially if the serving size is listed as a fraction (*e.g.,* ⅔ cup). Another comment suggested that listing the serving size in the ''Amount per _____'' statement is unnecessary because our proposal to reverse the order of ''Serving size'' and ''Servings Per Container'' and make the ''____ servings per container'' information more prominent already allows the serving size to be more easily identified. The comment said that only the ''Serving size'' declaration should be used to indicate the amount of food contained in a serving, and that doing so would maintain consistency with the current Nutrition Facts label.

Another comment suggested improving the clarity of the label by moving the ''Amount per _____'' declaration directly above the list of percent Daily Values, listing the serving size after ''Calories '' (*i.e.,* ''Calories per _____''), and using the same type size for the ''Serving size'' and ''Amount per _____'' declarations. Another comment said that changing ''Amount Per Serving'' to ''Amount per _____'' should be voluntary for dietary supplement labels, but if the change is made mandatory, then manufacturers should have the option of using the abbreviation ''Amt Per _____'' on Supplement Facts labels when extra space is required for the quantity statement (*e.g.,* ''2 capsules'').

(Response) We recognize there are multiple viewpoints and potential advantages and disadvantages with respect to listing the actual serving size in the blank space of the ''Amount per _____'' declaration. We acknowledge that inserting the serving size in the blank space would essentially repeat the value for serving size that is listed directly above this statement. We further agree that this information would be duplicative and add to the amount of numerical information already present on the label. Therefore, we will retain the preexisting requirement to declare ''Amount per serving'' directly above the ''Calories'' declaration rather than finalize a change to declare ''Amount per _____'' with the blank filled in with the actual serving size expressed in household units. We also will retain the preexisting requirement to list ''Amount per serving'' in bold or extra bold type or other highlighting and in a type size no smaller than 6 point rather than finalize a change in type size and contrast.

With respect to the comment that said changing ''Amount Per Serving'' to ''Amount per _____'' should be voluntary for dietary supplement labels, we did not propose this change for the Supplement Facts label. Consequently, there is no need to provide the option of using the abbreviation ''Amt Per _____'' on Supplement Facts labels as the comment requested.

6. Declaration of ''Calories From Fat''

The proposed rule would eliminate the requirement for declaring ''Calories from fat'' on the label.

Most comments supported removing the requirement for declaring ''Calories from fat,'' and we discuss those comments in part II.E.1.

7. Presentation of Percent DVs

Our preexisting regulations at § 101.9(d)(7) establish the format for listing nutrients with DRVs on the Nutrition Facts label, including the quantitative amount by weight and percent DV. The preamble to the proposed rule (79 FR 11879 at 11950 through 11951) explained that, when we established the requirements for percent DV declaration, we considered that the information would help consumers evaluate the nutrient characteristics of a single product (*e.g.,* how high or low a particular product is in certain nutrients or the extent to which it contributes toward daily nutritional goals) and help

consumers make choices between products. We also explained that consumer research back in 1992 indicated that the percent DV information improved consumers' abilities to make correct dietary judgments about a food in the context of a total daily diet and helped consumers to verify the accuracy of front panel claims (*id.*).

The proposed rule would use ''% DV'' rather than ''% Daily Value'' as the column heading above the nutrient listings to provide consistency among the different label formats and to maintain the alignment of this heading over the DV column. For most labels, the proposed rule also would list percent DVs in a column to the left of the names of the nutrients and their quantitative amounts, with a thin vertical line separating the % DV column from the list of nutrients. On dual column labels and on labels using the aggregate display, we proposed to list the names of nutrients to the left of the % DV columns and the quantitative (weight) amounts of each nutrient to the right of the % DV column, to use thin vertical lines to separate the information in the ''% DV'' column from the information in the column containing the quantitative weights, and to use the same style of thin vertical lines to separate each of the dual columns and aggregate display columns from each other.

We also invited comment on alternative terms that may be more readily understandable than Daily Value, such as Daily Guide or Daily Need; whether the word ''percent'' (or the % symbol) needs to precede whatever term is used in the column heading where the percent DVs are listed or if this would be redundant because the ''%'' symbol is already included next to the numerical values listed in this column; and the appropriate placement of percent DVs in the labeling of foods for infants 7 through 12 months, children 1 through 3 years of age, and pregnant and lactating women (*id.* at 11961).

(Comment 495) Some comments supporting our proposal said that moving the percent DVs to the left would draw attention to this information and help people realize its importance. Some comments said that, because we read from left to right, people would be less likely to skip over the percent DVs. Furthermore, because the information would be more noticeable, consumers might find it more quickly and use it more often to judge the percent DV of a specific nutrient and to compare products when shopping, leading to healthier food choices. Other comments said that shifting the percent DV column to the left would be ''eye catching,'' create a cleaner design, and make the label more logical, better organized, and easier to read and comprehend. It also would improve the simplicity and visual clarity of the label, as recommended by the IOM.

Many comments that opposed placing the percent DV column on the left side of the label said that, because we read from left to right, consumers would see the percent DV before knowing to which nutrient the value referred. The comments said it is more logical to list an item first and then its value. Some comments said that moving the percent DV information to the left of the nutrient name would be counter-intuitive and confusing to consumers. One comment included data from a study it had commissioned; the study indicated that, when the percent DV was on the left side of the label, there was no advantage in consumer comprehension of this information. The study found that a higher percentage of respondents answered a question about Daily Values correctly when the percent DV information was on the right versus the left side of the label (Ref. 269). Another comment noted that the proposed label would be awkward to read because consumers would need to first find the name of the nutrient in the middle of the label.

Several comments agreed with the concern we expressed in the preamble to the proposed rule, that giving more prominence to the percent DV by listing it first could potentially make the Nutrition Facts label appear less user-friendly particularly to frequent users who are accustomed to its current format and could draw attention away from nutrients that do not have a DV (79 FR 11879 at 11951). Another comment said that shifting the percent DV to the left could hinder, rather than assist, individuals with lower levels of health literacy and numeracy in understanding the label.

Several comments said that moving the percent DV information to the left might cause layout problems for certain formats, such as dual-column labels, because of the difficulty in aligning the column headings with the information in the columns, and in differentiating the columns. Other comments expressed concerns that placing percent DVs on the left would be distracting because consumers are mainly interested in the quantitative values of nutrients and tend to look for that information rather than the percent DVs. Other comments said that increasing the focus on percent DVs would be misguided because the percent DVs are not relevant to people who do not eat 2,000 calories per day; moving the percent DVs to the left would make the label look ''foreign'' and would be an unnecessary change having no benefits; and shifting the location of the percent DVs would not help consumers understand the information any better than they currently do. Many comments said that, because people are generally confused by the meaning of percent DV and do not know how to properly use this information, percent DVs should not be given a more prominent placement on the left side of the Nutrition Facts label. Several comments said it was premature to shift the percent DVs to the left based solely on theoretical design principles, and that we should not do this unless research data become available demonstrating that this change would assist consumers in maintaining healthy dietary practices.

(Response) We acknowledge that the conventional way to display data would be to list the percent DV after the name of the nutrient, as shown in the preexisting Nutrition Facts label format, and that shifting the percent DVs to the left might present layout challenges with certain formats. We also note that the results of our consumer research study were equivocal, as we found that no significant benefit was achieved by shifting the percent DV column to the left side of the Nutrition Facts label (Ref. 270).

We have no evidence that the placement of the percent DV information on the left would result in less comprehension by consumers who do not understand the meaning of percent DV, as suggested by some comments. Nevertheless, we have reconsidered how percent DV should be presented and have decided to retain the preexisting requirement to list the percent DV information on the right side of the label.

We anticipate that an increased focus on percent DV through the introduction of a new footnote and enhanced consumer education efforts could help consumers who currently have some difficulty understanding percent DV become more comfortable using the percent DV information. Furthermore, we may study this issue, and other issues involving the DV, in the future.

(Comment 496) Several comments suggested that the term ''Daily Need'' would be more helpful to consumers than ''Daily Value.'' Another comment suggested using the term ''Daily Requirement'' because it would be ''more in keeping with a DRV calculation.'' The comment cautioned that the term ''Need'' may have a

negative perception because it conveys a ''personal tone'' and therefore may be seen as prescriptive or patronizing. An additional comment suggested using ''% Ref'' instead of ''% DV.''

(Response) In the preamble to the proposed rule, we said that we had previously provided our rationale for choosing the term Daily Value in the format final rule (58 FR 2079 at 2124, January 6, 1993) and had explained why we considered ''need'' and ''requirement'' to be misleading terms that might complicate nutrition education efforts. Although one comment suggested the use of the term ''% Ref.'' (which we interpret as meaning % Reference) instead of % DV, the comments, in general, did not suggest alternative terms or provide data or information to support why an alternative term would be more appropriate or preferable. Thus, we continue to believe that the term Daily Value is generally understood by consumers to be a point of reference (see 58 FR 2079 at 2125) and will continue to use Daily Value as an appropriate single term to refer to all reference values in the Nutrition Facts label.

(Comment 497) Many comments opposed the use of the abbreviated term % DV, and suggested that spelling out the term Daily Value would be clearer and easier to comprehend, eliminate possible confusion about the meaning of DV, and not require an explanatory footnote. Some comments stated that, while abbreviating Daily Value would save space, the abbreviation would not be helpful if consumers did not understand the abbreviation, especially when consumer research has shown that the term Daily Value is not well understood. One comment noted that if ''% Daily Value'' was abbreviated to ''% DV,'' we might replace a concept that is already obscure with a shorthand designation that would be even more obscure to consumers.

Another comment suggested that consumer research is needed to evaluate the impact that changing % Daily Value to % DV would have on consumer use and understanding of this information. Some comments supported using ''%'' rather than spelling out ''percent'' because, according to the comments, it would decrease the amount of clutter on the label, and the term ''percent'' requires more label space without providing additional information or benefits to consumers. Another comment questioned whether either ''percent'' or the ''%'' symbol should be used on the label because the comment said that many consumers have difficulty understanding the concept of percent.

(Response) We acknowledge that the term % DV is spelled out on most labels (with the exception of some small packages) and therefore the term ''% Daily Value'' should be familiar to consumers. We also acknowledge that it would be desirable for the Nutrition Facts label to be able to ''stand alone'' as a source of information to assist consumers in maintaining healthy dietary practices, and that the label should be self-explanatory insofar as possible. By spelling out the words Daily Value instead of abbreviating them, the meaning of the nutrition information presented on the Nutrition Facts label would be less ambiguous to consumers, alleviate the need to explain the abbreviation, and improve the ability of the label to stand alone. Therefore, the % Daily Value, rather than % DV, should be used as the column heading for most formats if space is available. In order to provide flexibility to manufacturers when there are space constraints on packages and to facilitate alignment of the % Daily Value column heading with the nutrient information listed beneath it, particularly on formats in which there are multiple columns of information, we are retaining the provision in our preexisting regulations (§ 101.9(d)(6)) that allows for the substitution of ''Percent Daily Value,'' ''Percent DV,'' or ''% DV'' for ''% Daily Value.''

With respect to whether consumers may have difficulty understanding the concept of percent, our public education program will help consumers understand how to use the percent DV information and become more comfortable with the concept of percent. We will continue to use percentages on the Nutrition Facts label for presenting nutrition information because it is useful for assisting consumers in maintaining healthy dietary practices.

(Comment 498) One comment requested clarification with regards to how the percent DV information should be displayed for the nutrients of public health significance when these nutrients are listed either vertically or horizontally in two columns (*i.e.,* the side-by-side arrangement), as permitted in § 101.9(d)(8). The comment said there was a discrepancy in how we described the vertical arrangement of nutrient information for vitamins and minerals in § 101.9(d)(8) and how this information was displayed in the label format shown in proposed § 101.9(d)(12). The comment further suggested that the phrase ''or may be listed in two columns'' should be clarified, particularly with regards to the placement of the nutrient name, the % Daily Value, and the quantitative amounts, and that an example of this label would be helpful.

(Response) The description of the vertical array of vitamins and minerals in § 101.9(d)(8), which the comment said was inconsistent with the associated mockup because the percent Daily Values were listed in parentheses in the regulation, was not meant to be a literal description of what was shown in the label mockup in proposed § 101.9(d)(12). However, we agree with the comment that the phrase ''or may be listed in two columns'' needs to be clarified, particularly with regards to where the percent Daily Values and the absolute amounts are displayed relative to the names of the respective vitamins and minerals. Therefore, we have now stated in § 101.9(d)(8) that the name of the nutrient will be listed first, followed by the absolute amount and then by the percent Daily Value (which will be listed to the right of the absolute amount and without parentheses). Furthermore, as the comment suggested, we have provided a mockup showing the horizontal (*i.e.,* side-by-side) display of the vitamins and minerals in § 101.9(d)(8). However, we also note that mockups are provided as examples of labels, and are meant to serve as illustrations rather than as indications of specific requirements. We have not provided mockups of all possible types of labels and we did not intend to state literally in the regulation what was shown in the various label mockups.

8. Placement of ''Added Sugars''

The proposed rule would require the declaration of added sugars as an indented line item underneath the declaration of total sugars on the Nutrition Facts label. In the **Federal Register** of July 27, 2015 (80 FR 44303), we issued a supplemental proposed rule that would, among other things, establish a DRV of 10 percent of total energy intake from added sugars and require the declaration of the percent DV for added sugars.

We did not receive any comments regarding the indentation of the added sugars declaration. We discuss the requirements for the added sugars declaration in part II.H.3.

9. Declaration of Absolute Amounts of Vitamins and Minerals

The proposed rule would require the declaration of quantitative amounts for all vitamins and minerals listed on the Nutrition Facts label (except on labels of smaller packages with a total surface area available for labeling of 40 square inches or less as described in § 101.9(j)(13)(ii)(A)(*1*) and (*2*)), in addition to maintaining the current

requirement of declaring percent DVs. Because of space limitations, we proposed to require only the percent DV for vitamins and minerals (other than sodium) on labels of foods in small or intermediate-size packages having a total surface area available to bear labeling of 40 or less square inches. As we explained in the preamble to the proposed rule (79 FR 11879 at 11928 through 11929), comments received in response to the 2007 ANPRM, as well as the 2003 IOM report (Ref. 219) supported declaring both the absolute amounts of mandatory and voluntary micronutrients on the Nutrition Facts label in addition to the percent DVs (when they exist). Among other reasons, the IOM report said that listing absolute amounts of all vitamins and minerals would make the Nutrition Facts label internally consistent and more aligned with the current requirements of the Supplement Facts labels (§ 101.36(b)(3)(ii) and (iii)).

We also considered previous research which indicated that both consumers and health professionals have difficulty understanding how percent DVs relate to the absolute amounts of nutrients listed on the Nutrition Facts label (Ref. 239). The previous research indicated that physicians, dietitians, and other health professionals found it easier to refer to absolute amounts of nutrients rather than to the percent DVs when advising patients. The results suggested that declaring both the absolute amount and the percent DV would improve understanding of the label.

(Comment 499) Many comments agreed that we should require the declaration of absolute amounts of all vitamins and minerals on the Nutrition Facts label. Some comments said that people, especially those with low numeracy skills, have difficulty understanding the concept of ''percentage'' (such as percent DV) and would prefer using nutrition information expressed in absolute amounts rather than in percentages to plan diets. The comments also suggested that people who want to follow a health professional's nutrition guidance, such as advice to consume a specific amount of a nutrient (*e.g.,* 500 mg calcium/day), would find quantitative amounts on labels to be more useful than the percent DVs.

Other comments from registered dietitians said they perceived percent DVs to be confusing and cumbersome and preferred to use absolute amounts of nutrients when counseling clients on how to use the Nutrition Facts label to build a healthy diet, compare food products, and establish dietary goals.

In contrast, many comments expressed concerns that declaring absolute amounts of all vitamins and minerals, in addition to the percent DV, would make the label more confusing, cluttered, and difficult to read. The comments said that listing quantitative amounts of all vitamins and minerals would take up valuable label space and add complexity to the label without providing any tangible benefits to consumers. Several comments said that the percent DV listing already provides consumers with the information they need for choosing foods for a healthy diet, so it is not necessary to also list the absolute amounts for all nutrients on the Nutrition Facts label. The comments questioned whether consumers would understand how to use absolute amounts in conjunction with the percent DV and said there was little evidence that declaring absolute amounts on the Nutrition Facts label would help consumers maintain healthful dietary practices. Some comments expressed concerns that, because consumers in general are not familiar with metric system units such as grams, milligrams, and micrograms or the relative magnitude of differences between these units, they may not realize that a quantitative weight listed as a large number, but expressed in micrograms, can actually represent a small amount of the nutrient. Another comment said that, because some high DVs are based on small quantitative amounts and some small DVs are based on high quantitative amounts, the quantitative information could be confusing to consumers.

(Response) In the past, we have stated that we must be selective with regard to the information we require to be listed on the label and that not all vitamins and minerals are of equal public health significance (58 FR 2206 at 2107). We have limited the mandatory declaration of vitamins and minerals to those of particular public health significance. These vitamins and minerals include vitamin D, calcium, iron, and potassium, which are ''shortfall'' nutrients in the general U.S. population that are often consumed in inadequate amounts. In addition, we are requiring the absolute amount for folic acid in mcg to be declared when folic acid is added as a nutrient supplement or claims are made about the vitamin on the label or in labeling of foods (§ 101.9(c)(8)(ii) in the final rule).

As we stated in the preamble to the proposed rule, research suggests that consumers and health professionals have difficulty understanding how percent DVs relate to the absolute amounts of nutrients (79 FR 11879 at 11928 through 11929). We recognize that some consumers, particularly those with low numeracy skills, may be better able to understand and use the listed quantitative amounts of nutrients (*e.g.,* milligrams of calcium) on the label when making dietary choices, rather than relying solely on the percent DV, because they would need to know the calculation for converting percent DV to milligrams. Thus, although some comments would not list absolute amounts because (according to the comments) the percent DV already gives consumers the information they need for choosing foods for a healthy diet, the percent DVs and absolute amounts, particularly for nutrients of public health significance, are useful because consumers receive information on the recommended intake of these vitamins and minerals in quantitative amounts (*i.e.,* the advice is given in milligrams, micrograms, or International Units) through public sources and from health professionals (Refs. 219, 271–272). Furthermore, folic acid intake is related to the risk reduction of neural tube defects, and is generally provided in terms of mcg of folic acid. By requiring the mandatory declaration of folic acid as a quantitative amount by weight in mcg, when folic acid is added or when a claim is made about the vitamin in labeling, women of childbearing age can gain a better understanding of the unique contribution that synthetic folic acid from food provides in reducing the risk of neural tube defects and will have the information they need to improve their ability to adhere to nutrition recommendations with respect to folic acid.

Thus, requiring both the quantitative amount and the percent DV will help to ensure that consumers are fully informed about the content of these products, similar to how these nutrients are declared in dietary supplement product labeling (56 FR 60366; November 27, 1991). Nevertheless, we have decided not to include in the final rule the proposed requirement to include the declaration of absolute amounts for all vitamins and minerals. We clarify, in § 101.9(c)(8)(ii), that the declaration of voluntarily declared vitamins and minerals listed in paragraph (c)(8)(iv) may include the quantitative amount by weight and percent of the RDI. We also revised the preexisting requirement in § 101.9(c)(8) to remove the requirement that the declaration for vitamins and minerals include a statement of the amount per serving as a percent DV. A requirement to compel absolute amounts for all vitamins and minerals could make it

difficult for consumers to use and read the label, particularly on fortified foods such as cereals where many vitamins and minerals may be listed. In addition, the public health need among the general U.S. population is not as great for listing quantitative amounts for voluntary vitamins and minerals, such as thiamin, riboflavin, or niacin, because deficiencies of these vitamins are rare and because enriched bread, rolls, and buns must be fortified with these nutrients. Requiring the declaration of absolute amounts of nutrients of public health significance, and folic acid when added as a nutrient supplement or claims are made about the vitamin, while providing voluntary declaration of absolute amounts for other vitamins and minerals, will provide manufacturers with flexibility in assessing how much voluntary information to provide on the Nutrition Facts label without creating unnecessary clutter. However, if one of these other vitamins or minerals is added as a nutrient supplement or there is a claim made about it, the manufacturer must include a declaration of the nutrient as a percent DV, or alternatively, as a quantitative amount by weight and percent DV (§ 101.9(c)(8)(ii) in the final rule).

With respect to the comment expressing concern that quantitative information could be confusing to consumers, the comment discussed a situation where a product that contains 100 percent DV for vitamin D and lists only 20 mcg (a ''low'' amount) on the label also contains 5 percent DV for potassium, which would correspond to an absolute amount of 235 mg (a ''high'' amount). However, only two of the four nutrients (vitamin D and potassium) are new nutrient declarations under the final rule, and we expect consumers to become familiar with these nutrients as part of the new label. Vitamin D is a shortfall nutrient that many health professionals discuss with their clients or patients as part of a healthy dietary intake. As noted elsewhere in part II.N.4, vitamin D must be listed in micrograms and may be listed voluntarily in International Units. In addition, although only the percent Daily Values for calcium and iron are currently listed on the Nutrition Facts label, consumers who take these nutrients as dietary supplements may be familiar with the corresponding quantitative amounts because these must be declared on Supplement Facts labels. Furthermore, the Nutrition Facts label has included metric units since its inception in 1993, so consumers have had considerable exposure to metric units such as grams and milligrams. To the extent consumers are less likely to be familiar with ''micrograms'' (mcg), we anticipate that consumers will become increasingly familiar and comfortable with this metric unit and others on the Nutrition Facts label. We plan to address the different nutrients of public health concern and their units of measure as part of our education efforts aimed at enhancing consumer understanding of the label.

(Comment 500) Some comments said that for people who have special dietary requirements because of a medical condition, such as chronic kidney disease, the percent DV by itself may be inadequate for making decisions about food selections (*e.g.,* kidney patients who monitor their phosphorus intake would find the phosphorus content expressed in milligrams to be more useful than the % DV of phosphorus).

(Response) While the Nutrition Facts label information has never been, nor is it now, targeted to individuals with acute or chronic disease, consumers may be able to use quantitative information on the label to follow advice they have received from a health care professional concerning their conditions (see part II.B.2).

(Comment 501) Several comments questioning the need for declaring absolute amounts of vitamins and minerals on the Nutrition Facts label said that people who meet their nutritional needs through conventional foods are less likely to be interested in quantitative amounts of vitamins and minerals compared to those who use dietary supplements to supplement their diets with specific amounts of such nutrients. The comments said that labels designed for conventional food products and for dietary supplements are not necessarily analogous because the two types of products have different purposes as reflected in their nutrient composition; *e.g.,* nutrient levels in dietary supplements are often much higher than those in foods and beverages. The comments also noted that, because there is a greater potential for toxicity resulting from the use of dietary supplement products due to overconsumption compared to conventional food products, it is important that nutrient levels on Supplement Facts labels be expressed in absolute amounts so that this information is plainly visible to consumers.

(Response) Requiring the absolute amounts of vitamins and minerals for the nutrients of public health significance and folic acid under the circumstances previously described will help ensure that consumers are fully informed about the content of conventional foods and will achieve parity in labeling for nutrients of public health significance in conventional foods and dietary supplements. We do not consider issues related to potential greater toxicity from consumption of nutrients in dietary supplements to negate the benefits of also providing for conventional foods the information on absolute amounts for these particular nutrients of public health significance that are considered shortfall nutrients.

Requiring absolute amounts of vitamins and minerals of public health significance and folic acid under the circumstances previously described to be listed on the Nutrition Facts label will make it easier for both consumers and health professionals to understand and use the Nutrition Facts label and help consumers in maintaining healthy dietary practices. Furthermore, consumers can use the information to obtain these shortfall nutrients primarily through healthy eating patterns containing nutrient-dense conventional foods, as recommended by the DGA (Ref. 28).

(Comment 502) Several comments expressed concerns that requiring the absolute amounts of all vitamins and minerals to be listed on the Nutrition Facts label would be problematic because FDA's established rounding rules only apply to percent DV declarations, and the proposed rounding rules for declaring quantitative amounts of vitamins and minerals are not clear. The comments said that different products having the same absolute amounts of a nutrient listed on the label may have different percent DVs associated with that nutrient due to rounding. Some comments also said that two different products having the same percent DV for a nutrient may declare different absolute amounts for that nutrient, which would lead to consumer confusion. In addition to such discrepancies, several comments said it is not feasible to require absolute amounts of vitamins and minerals to be listed because analytical assays for obtaining this information lack the necessary precision, resulting in considerable variability in results from assay to assay. Other comments said that levels of nutrients in foods and food products are naturally variable and due to this variability, declaring absolute amounts would imply greater precision than is currently required for the declaration of the percent DV. The comments also said it would be particularly difficult and costly to obtain information on vitamin D levels because this information was not

previously required for most conventional food products.

(Response) The quantitative amount of sodium has always been required to be declared on the Nutrition Facts label, and dietary supplement products have required weight amounts to be declared since 1993. Rounding rules for the Nutrition Facts label have been established for potassium (§ 101.9(c)(5)) and for other vitamins and minerals (§ 101.9(c)(8)(iii)) in the Nutrition Facts label and for vitamins and minerals declared on labels of dietary supplements (§ 101.36(b)(2)(ii)(B) and § 101.36(b)(2)(iii)(B)). We discuss this topic further in part II.M.6. To declare the percent DV for vitamins and minerals on the Nutrition Facts label, manufacturers should already have information about the levels of nutrients in their products. Such information also can be obtained through laboratory analysis or by consulting standard nutrient databases, such as the USDA Nutrient Data Lab Standard Reference (*http://www.ars.usda.gov/Services/docs.htm?docid=8964*). Substituting vitamin D and potassium for vitamin A and vitamin C for the nutrient analysis should not result in a significant difference in cost to the manufacturer. Furthermore, we are not aware of problems in obtaining quantitative data related to variability and precision. Manufacturers already must address these issues to comply with the preexisting nutrition labeling regulations.

(Comment 503) One comment included the results of a consumer study to suggest that it is more important for FDA to gain a better understanding of how consumers use percent DV information rather than understand how consumers would use information on absolute amounts. The comment said that, according to its research, declaring absolute amounts on the label would decrease consumer attention to the percent DV information and would present ''significant implementation challenges.''

(Response) The comment refers to the study which we addressed in our response to comment 184. We are not aware of any evidence that including absolute amounts for the public health nutrients would detract from the percent DV information, and we intend to conduct consumer education on increasing the understanding of the percent DVs.

10. Single and Dual Column Labeling

The preamble to the proposed rule (79 FR 11879 at 11952 through 11953) noted that we have preexisting regulations for voluntary dual column labeling and that dual column labeling is mandatory for products that are promoted on the label, or in advertising, for a use that differs in quantity by twofold or greater from the use upon which the reference amount was based (*e.g.,* liquid cream substitutes promoted for use with breakfast cereals) (§ 101.9(b)(11)). The proposed rule would require (under certain conditions) dual column labeling where nutrition information would be presented based both on the serving size and on the entire package or unit of food.

We respond to comments on single and dual-column labeling in the final serving size rule.

(Comment 504 and Response) We address comments regarding dual column labeling in the final rule on ''Food Labeling: Serving Sizes of Foods That Can Reasonably Be Consumed At One Eating Occasion; Dual-Column Labeling; Updating, Modifying, and Establishing Certain Reference Amounts Customarily Consumed; Serving Size for Breath Mints; and Technical Amendments'' which is published elsewhere in this issue of the **Federal Register**.

11. The Footnote

Our preexisting regulations, at § 101.9(d)(9)(i), require the Nutrition Facts label to bear an asterisk after the ''% Daily Value'' declaration; the asterisk refers to a footnote that reads: ''*Percent Daily Values are based on a 2,000 calorie diet. Your Daily Values may be higher or lower depending on your calorie needs.'' Our preexisting regulations also require, below the footnote, a table that lists DRVs for total fat, saturated fat, cholesterol, sodium, total carbohydrate, and dietary fiber based on 2,000 and 2,500 calorie diets (§ 101.9(d)(9)(i)). However, the preamble to the proposed rule (79 FR 11879 at 11953) explained that the percent DV is not described in the footnote or anywhere else on the Nutrition Facts label, and so we wondered if such a description would help improve consumer understanding of the percent DV information. We also noted that consumers did not understand what was being conveyed in the footnote or the DRV table (id.). Consequently, we proposed to remove the requirement for the footnote table and to reserve a subparagraph (proposed § 101.9(d)(9)) for a future footnote. The preamble to the proposed rule (79 FR 11879 at 11953) also stated our tentative view that a new, simple footnote was needed to help consumers understand the meaning of the percent Daily Value. We said that the new footnote should have a larger type size, be more noticeable than the preexisting footnote, and include a statement that 2,000 calories a day is used for general nutrition advice (id.).

We also stated in the preamble of the proposed rule (id. at 11953 through 11954) that we would continue to conduct research during the rulemaking process to evaluate how variations in label format, including percent DV information in the footnote area, may affect consumer understanding and use of the Nutrition Facts label and that we would make the results of our study available for public review and comment.

In the preamble to the supplemental proposed rule (80 FR 44303 at 44306 and 44309), we described an experimental study on consumer responses to Nutrition Facts labels with various footnote formats. (We summarize the footnote study at part II.B.5.) The supplemental proposed rule would add language to the space reserved in proposed § 101.9(d)(9) to explain that the % Daily Value tells how much a nutrient in a serving of food contributes to a daily diet and that 2,000 calories a day is used for general nutrition advice. The supplemental proposed rule also would create an exemption to the proposed footnote requirement in § 101.9(d)(9) for the foods that can use the terms ''calorie free,'' ''free of calories,'' ''no calories,'' ''zero calories,'' ''without calories,'' ''trivial source of calories,'' ''negligible source of calories,'' or ''dietary insignificant source of calories'' on the Nutrition Facts label or in the labeling of foods as defined in § 101.60(b) because such products would have little to no impact on the average daily 2,000 calorie intake, which the footnote addresses. The supplemental proposed rule also would amend § 101.9(j)(13)(ii)(C) to allow the footnote to be omitted on small or intermediate-size packages (§ 101.9(j)(13)(ii)(A)(*1*) and § 101.9(j)(13)(ii)(A)(*2*)) provided that an abbreviated footnote statement (that % DV = % Daily Value) is used. Although the preamble to the supplemental proposed rule discussed allowing the footnote proposed in § 101.9(d)(9) to be omitted from products that qualify for a simplified format (§ 101.9(f)) (80 FR 44303 at 44309) provided that the abbreviated footnote statement is used, this provision was inadvertently omitted from the codified section of the supplemental proposed rule.

With respect to the Supplement Facts label, our preexisting regulations, at § 101.36(b)(2)(iii)(D), require that, if the percent DV is declared for total fat, saturated fat, total carbohydrate, dietary

fiber, or protein on the Supplement Facts label, a footnote state that ''Percent Daily Values are based on a 2,000 calorie diet.'' The proposed rule would require, for a product that is represented or purported to be for children 1 through 3 years of age and contains a percent DV declaration for total fat, total carbohydrate, dietary fiber, or protein, that a symbol be placed next to the percent DV declaration that refers the consumer to a statement at the bottom of the label that says ''Percent Daily Values are based on a 1,000 calorie diet'' (79 FR 11879 at 11947). We illustrated this footnote in a mockup of a Supplement Facts label depicting a multiple vitamin product for children and adults (§ 101.36(e)(11)(ii)). In the preamble to the proposed rule, we invited comments on whether changes to the footnote statement on the Supplement Facts label should be consistent with any changes that are made to the footnote statement in the Nutrition Facts label (79 FR 11879 at 11948). In the preamble to the supplemental proposed rule, we invited comments on whether we should replace the preexisting footnote in the Supplement Facts label with a footnote comparable to what we would require for the Nutrition Facts label; *i.e.,* ''2,000 calories a day is used for general nutrition advice'' (80 FR 44303 at 44307).

(Comment 505) Many comments supported removing the footnote table listing DRVs for certain nutrients based on 2,000 and 2,500 calorie diets. The comments said that the footnote table is confusing and difficult to read; consumers generally do not understand how to use it and probably derive little value from it; and the footnote occupies valuable label space that could be used for other information. However, other comments favored retaining the footnote table, indicating that it is useful for nutrition education purposes, may help consumers gain a perspective on their daily nutrient intake, and is a convenient reference for consumers who want this information.

Other comments suggested that the footnote should contain additional information beyond what is currently included or proposed. For example, some comments said the footnote should continue to explain that percent DVs are based on a 2,000 calorie diet and that an individual's Daily Values may be higher or lower depending on one's particular calorie needs. Some comments expressed concern that, without context, the public will not know whether 2,000 calories represents too many or too few calories. In addition, some comments said we should require language in the footnote explaining that growing children and adolescents may need more or less than 2,000 calories per day, depending on their age, gender, size, and activity level.

Other comments suggested that, because some consumers may view the label serving size as a recommended portion size, or use these terms interchangeably, we should include a footnote clarifying that ''serving size'' is based on the amount typically consumed and is not a recommended amount.

Another comment said that the Nutrition Facts label should go beyond just providing factual information and be a ''tool'' to help consumers make healthier food and beverage choices. For example, the comment said we should use a footnote to provide consumers with information about nutrients on the label that are ''beneficial'' (such as dietary fiber) or ''harmful'' (such as saturated fat) to their health. Several comments also said that we should consider including a link to a Web page where consumers can find more information about nutrition, health and calorie needs.

Several comments suggested that we seek a broader understanding of how consumers use the footnote. The comments emphasized that any revisions to the footnote should be based on research, and that the results of our consumer research should be made available to the public for review and comment. However, other comments would remove the footnote entirely, and some comments suggested that, as part of our consumer studies, we should evaluate whether a footnote is even needed. Several comments noted that the footnote itself is not an effective means for educating consumers and should not be used as an educational tool.

Several comments said that, regardless of which footnote was ultimately decided upon, the footnote should be succinct, occupy little space, and fit on small packages. Many comments emphasized that, because the proposed rule did not specify the exact footnote text and the amount of space the new footnote would require, it would be difficult to submit meaningful comments until further details were provided.

(Response) We agree with removing the footnote table listing DRVs for certain nutrients based on 2,000 and 2,500 calorie diets. As stated in the proposed rule (79 FR 11879 at 11953), we are aware of research suggesting that consumers do not understand what is being conveyed in the footnote table (Ref. 273). We also recognize that label space is limited and agree that eliminating the footnote table would free up space on the label that could be used for other purposes. Therefore, the final rule does not require the footnote table which lists the DRVs for total fat, saturated fat, cholesterol, sodium, total carbohydrate, and dietary fiber for 2,000 and 2,500 calorie diets.

We disagree with comments suggesting that a footnote be used to explain that calorie needs vary among population groups (including children and adolescents) or to clarify the meaning of ''serving size.'' The footnote area of the label is not an appropriate place for providing this information because of limited space on the label. Furthermore, we do not agree that it would be appropriate to use a footnote to indicate ''beneficial'' or ''harmful'' nutrients that are declared on the label, as the comment suggested. We considered a similar concept in the alternative visual format that was discussed in the preamble to the proposed rule (79 FR 11879 at 11995), but, after reviewing the comments on the proposed rule, indicated that we did not intend to consider the alternative format for the Nutrition Facts label further (see 80 FR 44302).

With respect to comments suggesting that we base revisions of the footnote (including the option of not having any footnote at all) on research and that our research results should be made available to the public for review and comment, we did conduct research on various footnote options and made those results publicly available (see 80 FR 44302; 80 FR 44303).

Finally, we do not agree with the comments stating that we should consider including a link to a Web page where consumers can find more information about nutrition, health and calorie needs. Information on the Nutrition Facts label should be available to the consumer at the time of product purchase or consumption.

(Comment 506) Many comments to the supplemental proposed rule supported FDA's proposed footnote, ''*The percent DV tells you how much a nutrient in a serving of food contributes to a daily diet. 2,000 calories a day is used for general nutrition advice,'' and generally agreed that the footnote should include both a definition of percent DV as well as a reference calorie level. The comments said that the proposed footnote conveys the information that consumers need to understand the significance of the percent DV declaration in the context of a daily diet and highlights factors (*i.e.,* nutrient values and total calorie intake)

that are important in making dietary decisions. Several comments also pointed out that, because the footnote has been condensed (*i.e.,* by removing the footnote table), it would help counterbalance the increased space requirements of the Nutrition Facts label.

Other comments objected to the proposed footnote and suggested alternative footnote text. For example, one comment said that the first sentence in the footnote is confusing grammatically; the second sentence does not flow naturally from the first sentence; it is unclear how the two concepts expressed in the footnote are related; and the proposed footnote text is longer than that of the current footnote and will take up too much valuable label space. The comment suggested an alternative footnote, ''*The % Daily Value (DV) tells you how much a nutrient in a serving of food contributes to a 2,000 calorie daily diet.'' The comment said its suggested footnote is more concise and easier to follow.

Another comment said that the footnote should specify that a 2,000 calorie daily diet pertains to adults and suggested the following footnote text: ''The % Daily Value (DV) tells you how much a nutrient in a serving of food contributes to a daily diet. 2,000 calories a day is used for general nutrition advice for adults.'' Another comment that criticized the proposed footnote for being ''too verbose'' and provided six different, but similar, versions of a ''more succinct'' alternative footnote, with one option reading as: ''* %DV = %Daily Value, how much a nutrient in a serving contributes to a daily 2,000 calorie diet.''

Several other comments either suggested modifications to the proposed footnote (*e.g.,* expanding the term ''food'' to ''food or beverage'' to emphasize that beverages also contribute to one's daily nutrient intake) or opposed the footnote because, according to the comments, the footnote was not tested and was not supported by research. Furthermore, several comments said that, because no significant differences were found among the footnotes in our consumer study, we should give further consideration to some footnotes that were tested, but ultimately rejected. In particular, the comments said we should reconsider the footnote which included the statement, ''5% or less is a little, 20% or more is a lot'' after the % Daily Value description (experimental footnote 2). The comments said that this guideline for what constitutes a ''lot'' or a ''little'' of a nutrient may be helpful to consumers in judging the nutrient content of a particular product. One comment also expressed support for the footnote stating, ''These are nutrients to reduce in your diet,'' with the footnote symbol inserted to the left of the listings for saturated fat, *trans* fat, cholesterol, sodium, and sugars in the Nutrition Facts label (experimental footnote 5). The comment said that this footnote scored well in our consumer study and offers ''real value'' for consumers seeking information on nutrients in the diet that should be reduced.

(Response) We appreciate the suggestions for modifying or refining the footnote. However, the alternative footnote statements do not offer a significant improvement over the footnote text that we have proposed. Furthermore, the comments did not provide any evidence or data indicating that any alternative footnote represented an improvement over the proposed footnote.

The second statement of our proposed footnote, ''2,000 calories a day is used for general nutrition advice,'' is the same as the succinct statement that will be required on menus and menu boards under FDA's menu labeling final rule (79 FR 71156 (December 1, 2014)). Moreover, by including this statement as a separate, stand-alone sentence in the footnote text, we provide consistency between labels on packaged foods and those on foods sold in restaurants. Adding the words ''for adults'' at the end of this sentence, as one comment suggested, would undermine this consistency, take up additional space, and is not needed because the Nutrition Facts label is intended to apply to individuals 4 years of age and older (with the exception of labels on products other than infant formula represented or purported to be specifically for infants through 12 months of age and children 1 through 3 years of age). Furthermore, as we explain in part II.E.3, a 2,000 calorie reference intake level is applicable to the general population and is used as the basis for setting DRVs for total fat, saturated fat, total carbohydrate, dietary fiber, and protein, so there is no need to add the words ''for adults'' in the footnote text.

Regarding the comment suggesting the modified footnote text, ''The % Daily Value (DV) tells you how much a nutrient in a serving of food contributes to a 2,000 calorie daily diet,'' the statement is brief and grammatically correct, but may not be technically correct because the daily values of some declared nutrients, such as sodium and cholesterol, do not depend on the caloric intake. Therefore, it would not be accurate to link the percent DV in a serving ''to a 2,000 calorie daily diet,'' as stated in the modified footnote, rather than ''to a daily diet'' as stated in our footnote.

Although we agree that including ''5% or less is a little, 20% or more is a lot'' after the % Daily Value description (experimental footnote 2) can be helpful in judging the nutrient content of a particular product, we note that our consumer research study did not demonstrate that this footnote performed any better than the other footnotes that we investigated. As we explained in the preamble to the supplemental proposed rule (80 FR 44303 at 44306), our results indicated that none of the modified footnotes we tested significantly affected consumer perceptions of the products or judgments of nutrient levels; all five footnote options elicited similar perceptions and judgments relative to the current footnote and a no-footnote control. We also are concerned that including this qualifying phrase would increase the amount of space required for the footnote. However, as we stated in the preamble to the proposed rule (79 FR 11879 at 11954), the ''5/20 rule'' can be used as a general frame of reference for evaluating the nutrient content of foods. We anticipate that explaining this approach for using the percent DV information will be a part of our future consumer education efforts, so it would not be necessary to include an explanation of the ''5/20 rule'' in the footnote.

As for the comments that favored consideration of the footnote which indicated ''nutrients to reduce in your diet'' (footnote 5), we previously considered this concept in our ''alternative format'' (79 FR 11879 at 11995), but found it offered no clear advantages over the current and proposed formats in helping consumers to identify specific information on the label or to make healthier food choices.

We do not agree with the comment that said our proposed footnote is ''confusing grammatically.'' We deliberately used language that was informal rather than grammatically rigid or technical. Our intent was to make the footnote consumer friendly. We also consider our footnote to be simple and brief in providing a description of the percent Daily Value, which is lacking in the preexisting footnote.

Finally, we decline to include the word ''beverage'' in the footnote. The term ''food'' is defined in section 201(f)(1) of the FD&C Act as including articles used for both ''food or drink.'' Moreover, the Nutrition Facts label has

appeared on beverages for more than 20 years, so consumers should understand that the entire label, including the footnote, applies to foods that are beverages.

We expect that our footnote, which explains the term ''% Daily Value'' and provides a reference calorie level, will assist consumers in better understanding the information on the Nutrition Facts label and in maintaining healthy dietary practices. Therefore, the final rule, at § 101.9(d)(9), requires a footnote stating that, ''* The % Daily Value tells you how much a nutrient in a serving of food contributes to a daily diet. 2,000 calories a day is used for general nutrition advice,'' in all Nutrition Facts label formats except for the exemptions previously noted. The final rule also requires, on labels of products represented or purported to be for children 1 through 3 years of age, that the second sentence of the footnote substitute ''1,000 calories'' for ''2,000 calories,'' so the footnote statement will read: ''* The % Daily Value tells you how much a nutrient in a serving of food contributes to a daily diet. 1,000 calories a day is used for general nutrition advice.''

(Comment 507) Many comments supported the exemption for a footnote on products containing a negligible amount of calories and that can use the term ''calorie free'' or one of its synonyms. The comments agreed that a footnote which addresses a 2,000 calorie intake is not relevant for these products, and the exemption would be a practical way of conserving label space for the nutrient declarations that are required.

However, other comments opposed the exemptions because, according to comments, products that have little or no impact on calorie intake still may contain substantial amounts of nutrients such as vitamins and minerals. As an example, one comment said that fortified beverages may contain significant amounts of electrolytes as well as 100 percent of the DV of certain vitamins. The comment suggested that ''calorie free'' products include the first sentence of the footnote, ''The % Daily Value tells you how much a nutrient in a serving of food contributes to a daily diet'' because it would help consumers understand the vitamin and mineral content of these calorie-free foods.

Other comments supported the use of an abbreviated footnote, such as ''% DV = % Daily Value'' on the simplified format label and on labels of small and intermediate-size packages. Some comments explained that an abbreviated footnote would save label space. However, one comment opposed allowing the abbreviated footnote to be used on small and intermediate-size packages because, according to the comment, such products are often high in added sugars and are routinely marketed to children and adolescents. The comment suggested that consumers would benefit by having the complete footnote appear on these food packages.

(Response) As we explained in the preamble to the supplemental proposed rule (80 FR 44303 at 44309), we are applying the same rationale in this final rule that we used in the 1993 final rule with regards to exempting small and intermediate-size packages from some of the footnote language we required for larger products. The 1993 final rule gave manufacturers flexibility in using the complete footnote on all product labels. We recognized that the benefits of requiring this footnote were not relative to the specific product that carries the information and that the information would be available to consumers if it appeared on a significant percentage of food labels (58 FR 2079 at 2129). Therefore, although the final rule does not require any footnote on these products, we will allow the voluntary use of the first part of the footnote statement, ''* The % Daily Value tells you how much a nutrient in a serving of food contributes to a daily diet'' on products that can use the terms ''calorie free,'' ''free of calories,'' ''without calories,'' ''trivial source of calories,'' ''negligible source of calories,'' or ''dietary insignificant source of calories'' on the label or in the labeling of foods, as defined in § 101.60(b).

We acknowledge that small and intermediate-size packages may be high in added sugars and marketed to children and adolescents. However, both the absolute amount and % DV of added sugars will be declared on labels of small packages, so this information will be available to consumers. We also recognize the need to conserve space on smaller packages, which is why we allow other adjustments, such as not requiring the declaration of absolute amounts of the public health nutrients and the use of the tabular (§ 101.9(j)(13)(ii)(A)(*1*)) and linear (§ 101.9(j)(13)(ii)(A)(*2*)) display on small packages and intermediate-size packages having a total surface area available to bear labeling of 40 or less square inches. Therefore, the final rule does not require the footnote in § 101.9(d)(9) to be used on products in small packages as specified in § 101.9(j)(13)(ii)(A)(*1*) and § 101.9(j)(13)(ii)(A)(*2*), but manufacturers may voluntarily include the abbreviated footnote ''% DV = % Daily Value'' on these packages and in a type size no smaller than 6 point. Furthermore, the final rule does not require the footnote in § 101.9(d)(9) to be used on products that qualify for using the simplified format, as explained in § 101.9(f)(5), provided that the abbreviated footnote ''% DV = % Daily Value'' in a type size no smaller than 6 point is used on these package labels when Daily Value is not spelled out in the column heading.

Finally, in the preamble to the proposed rule (79 FR 11879 at 11953), we recognized that the footnote, by appearing in a small type size at the bottom of the label, may be less noticeable to consumers and of less use than if it had been larger and otherwise more noticeable. Consequently, our tentative view was that increasing the type size of the footnote would assist consumers in using the information, and we requested comments on this issue. We did not receive any comments that supported increasing the type size of the footnote (although comments supported increasing the font size for certain other declarations, *e.g.,* ''Calories'' and ''Serving size''), but some comments supported using as little space as possible for the footnote information. Therefore, the final rule does not affect the pre-existing requirement in § 101.9(d)(1)(iii) that specifies that the information required in § 101.9(d)(9) be in a type size no smaller than 6 point.

(Comment 508) Many comments discussed whether there should be a footnote on the labels of foods represented for infants 7 to 12 months of age or children 1 through 3 years of age. Most comments supported having a footnote on the label of foods intended for these subpopulation groups. For example, one comment said that a voluntary footnote should be permitted for foods specifically marketed to children 1 through 3 years of age and that the footnote should state, ''Percent Daily Values are based on a 1,000 calorie diet.'' Other comments said that both conventional foods and dietary supplement products marketed for these age groups should have a footnote (denoted by an asterisk) indicating the number of calories that the percent DVs listed on the labels is based on. One comment noted that this had already been proposed for dietary supplements (79 FR 11879 at 11947). The comment further suggested that information about percent DVs of nutrients for different age groups be made available online (arranged by age group) so that parents and others interested in nutrition would have ready access to this information.

Another comment suggested that we allow a voluntary footnote stating ''Total fat and cholesterol should not be limited in the diets of children less than 2 years

unless directed by a physician'' to provide dietary guidance to parents and other caregivers to help assure total fat is not restricted in the diet of young children. The comment said that the American Academy of Pediatrics recommends not restricting fat or cholesterol for infants and children younger than 2 years of age, as rapid growth and development occur during this time, necessitating a high energy intake. Another comment said we should not finalize the rule until we had conducted appropriate research, including consumer testing, to better understand the impacts of declaring saturated fat and cholesterol on the labels of products represented or purported to be specifically for infants and children 1 through 3 years of age and if an explanatory footnote would assist in improving consumer understanding when accompanying any relative declaration.

(Response) We recognize that the percent DVs of certain nutrients (*e.g.,* fats, carbohydrates, protein) for foods specifically intended for children 1 through 3 years of age are based on a reference calorie intake of 1,000 calories/day. However, as explained in part II.O (Subpopulations), the IOM's quantitative intake recommendations (AIs and RDAs), rather than a calorie level, provide a basis on which to determine RDIs (and percent DVs) for vitamins and minerals for this subpopulation. Although the comments suggested including the footnote ''Percent Daily Values are based on a 1,000 calorie diet'' on labels of foods specifically intended for children 1 through 3 years of age, this statement would not be accurate for all nutrients. Therefore, as illustrated in the label mockup in § 101.9(j)(5)(ii), the final rule requires the labels of these food products to have a footnote that includes the statement ''1,000 calories a day is used for general nutrition advice;'' this information would parallel the footnote statement used on food labels for the general population (*i.e.,* 4 years of age and older).

With respect to the comment suggesting we allow a voluntary footnote stating that total fat should not be limited in the diets of children less than 2 years unless directed by a physician (or similar wording), we acknowledge, in general, that total fat should not be limited in the diets of young children less than 2 years of age unless directed by a health professional (as previously explained in part II.O, Subpopulations). Because the final rule requires the mandatory declaration of saturated fat and cholesterol on labeling for infants and children, we are continuing to consider how a voluntary footnote explaining that total fat should not be restricted in the diets of children less than 2 years of age may help caregivers maintain healthy dietary practices for these subgroups, and how the information can be conveyed effectively. Although, for this final rule, we decline to allow this voluntary statement to be located within the Nutrition Facts label, manufacturers may place this or a similar statement in another area of the package, provided the statement is truthful and not misleading. We intend to engage in education efforts to explain changes to the Nutrition Facts label and will include labeling of foods for infants and children 1 through 3 years of age in these efforts.

(Comment 509) One comment said that the Supplement Facts label should be similar to the Nutrition Facts label used for conventional foods because different versions of the labels may decrease consumer use, understanding and trust. However, it was not clear if the comment was referring specifically to the footnotes of these labels. Another comment said there should not be a footnote on the Supplement Facts labels because consumers do not receive nutrition solely from these products, so a footnote referring to total calories would be unnecessary. The comment added that, because nutrition calculations are based on 2,000 calories, this information is already standardized across the industry, making the notation unnecessary.

Another comment expressed concern that the statement ''2,000 calories a day is used for general nutrition advice'' on Supplement Facts labels would not be useful to consumers in the absence of additional information. However, the comment said it would be difficult to include additional, explanatory text because of limited space, especially on small packages. Therefore, the comment would retain the preexisting footnote, ''Percent Daily Values are based on a 2,000 calorie diet,'' on Supplement Facts labels.

(Response) We agree that information about calories is not relevant for many dietary supplement products because the products contain only vitamins and minerals and do not contain nutrients that provide calories, such as total fat, saturated fat, total carbohydrate, and protein. Therefore, the footnote in previously required § 101.9(d)(9) would not be appropriate on Supplement Facts labels for products that do not contain these calorie sources. Furthermore, dietary supplements are intended to supplement the diet, and the information in the footnote for conventional foods that references 2,000 calories as a basis for ''general nutrition advice,'' or explains percent DV in the context of what a serving contributes to a daily diet, is for a different use from that of dietary supplements.

Although the intent of the comment regarding the need for consistency between the Nutrition Facts label and Supplement Facts label is not clear, we recognize the necessity of having different footnotes on labels of conventional foods and dietary supplements, consistent with how these products are used. Therefore, the final rule retains the preexisting footnote on Supplement Facts labels and amends the list of macronutrients, for when the footnote is required, to include added sugars. Therefore, the final rule requires a footnote if the percent of Daily Value is declared for total fat, saturated fat, total carbohydrate, dietary fiber, protein, or added sugars), stating that ''Percent Daily Values are based on a 2,000 calorie diet'' (§ 101.36(b)(2)(iii)(D)) because that information is related to the calorie contribution of the calorie-containing ingredients. The footnote statement for Supplement Facts labels does not contain the statement required for conventional foods that states ''The % Daily Value tells you how much a nutrient in a serving of food contributes to a daily diet.'' In addition, if a product declares a percent DV for total fat, saturated fat, total carbohydrate, dietary fiber, protein, or added sugars, and is represented or purported to be for use by children 1 through 3 years of age, the final rule, at § 101.36(b)(2)(iii)(D), requires a footnote statement, ''Percent Daily Values are based on a 1,000 calorie diet.''

(Comment 510) One comment asked us to clarify the footnote's width because the width requirements were not specified. The comment said that this issue would be particularly important when either the tabular format (§ 101.9(d)(11)(iii)) or the dual column tabular format (§ 101.9(e)(6)(ii)) was used because, without a specific width requirement, the footnote text could be wrapped in various ways, resulting in the footnote occupying space varying from being mostly horizontal (*i.e.,* wide and short) to mostly vertical (*i.e.,* narrow and tall). The comment suggested the possibility of specifying a minimum width that would require at least the words ''The % Daily Value'' to fit on a single line.

(Response) Manufacturers have the flexibility, within certain parameters, in how they display the footnote to satisfy the configuration and design constraints of their packages. Therefore, we decline to specify a minimum number of words

per line for the footnote, as the comment suggested. However, we intend to monitor how firms comply with the format requirements, including the footnote display. If we determine that manufacturers are having difficulty fitting the footnote text and other required information within the Nutrition Facts label, we will consider whether further action, including rulemaking, is needed with regard to positioning the footnote.

12. Use of Highlighting With a Type Intermediate Between Bold or Extra Bold and Regular Type

Under our preexisting regulations, only nutrients that are not indented (*i.e.,* ''Calories,'' ''Total Fat,'' ''Cholesterol,'' ''Sodium,'' ''Total Carbohydrate,'' and ''Protein'') on the Nutrition Facts label are required to be highlighted in bold or extra bold type or other highlighting (§ 101.9(d)(1)(iv)). In the preamble to the proposed rule (79 FR 11879 at 11954), we stated that, based on design considerations of using bold type to help differentiate the name of the nutrient from its absolute amount (Ref. 262), all of the other nutrients listed on the Nutrition Facts label, including those that are indented and the vitamins and minerals, should also be highlighted to help set the names of the nutrients apart from other information that appears on the label. The key nutrients that are not indented would still be highlighted in a font that is bolder than the indented nutrients, so the overall style of the Nutrition Facts label would not change. Thus, we proposed to amend § 101.9(d)(1)(iv) to remove the restriction that prohibits any other information on the label to be highlighted and to require that all voluntary nutrients specified in § 101.9(c), including the vitamins and minerals listed in § 101.9(c)(8)(iv), appear in a type intermediate between bold and regular type (if bold type is used) or between extra bold and regular type (if extra bold type is used) on the Nutrition Facts label.

(Comment 511) One comment suggested that if too much information on the Nutrition Facts label was bolded, nothing would stand out. The comment also said that too much bolding would be especially problematic for small packages because it would be difficult to maintain legibility of the printed information. The comment said that small print that is bolded would be even more difficult to read, because the letters would appear to run together even more.

Another comment suggested that, as an alternative to bolding, we might want to reconsider the restriction of using reverse highlighting (*i.e.,* white text printed in a black box, also known as reverse printing) as a method of increasing prominence. The comment stated that since the Nutrition Facts label was introduced in 1993, vast improvements have been made in printing technologies and capabilities, which should help alleviate previous concerns with regards to whether reverse printing could meet minimum printing tolerances.

(Response) We agree that too much bolding may reduce the contrast between information that is intended to be relatively more or less prominent on the Nutrition Facts label and that maintaining adequate resolution of printed information on labels of small packages might be particularly difficult. We also agree that it is more likely that letters or numbers may run together when information is highlighted, especially on labels of small packages, and we note that our preexisting regulations (§ 101.9(d)(1)(ii)(D)) specify that letters on the Nutrition Facts label should never touch. Therefore, based on the graphic design principle of using contrast to distinguish differences between adjacent items that would otherwise appear similar, and the importance of preserving adequate resolution to ensure the sharpness and clarity of the label information, the final rule does not amend the portion of proposed § 101.9(d)(1)(iv) that would require the indented nutrients and the vitamins and minerals (except sodium) to be highlighted in a type intermediate between bold or extra bold type and regular type.

As for the comment suggesting that we reconsider the use of reverse printing, we had concluded in the 1993 final rule (58 FR 2079 at 2137), based on comments and the professional literature at that time, that the use of reverse printing on the Nutrition Facts label would give rise to technical and legibility problems, especially on small containers, and therefore we declined to permit reverse printing as a form of highlighting (§ 101.9(d)(1)(iv)). While advances in technology may have removed some previous barriers that existed with this printing technique, we need to learn more about the technology before we consider revising the rule to address reverse printing.

13. Addition of a Horizontal Line Beneath the Nutrition Facts Heading

Our preexisting regulations, at § 101.9(d)(2), require that the Nutrition Facts heading be set in a type size larger than all other print size in the nutrition label (§ 101.9(d)(2)) but does not require that this heading be set apart from the rest of the label with a horizontal hairline rule, which is a thin line. Horizontal lines are used throughout the Nutrition Facts label as a key graphic element to divide space, direct the eye, and give the label a unique and identifiable look. The proposed rule would require that a thin horizontal line (*i.e.,* a 0.25 point hairline rule) be inserted directly beneath the Nutrition Facts heading with the exception of the linear display for smaller packages in § 101.9(j)(13)(ii)(A)(*2*).

(Comment 512) One comment said that the hairline rule beneath the Nutrition Facts title improves the overall appearance of the Nutrition Facts label and its ''ease of use.'' Another comment said that the use of horizontal lines and other design elements (*e.g.,* white space, bold fonts, etc.) are visual cues that draw attention to important information on the Nutrition Facts label, helping to improve readability and make the information easier to process and remember. Another comment said that a horizontal line beneath the Nutrition Facts heading would help separate the heading from the ''____ servings per container'' declaration, because all of the information in the first two lines of the label was presented in bold type.

(Response) We agree that a thin horizontal line directly beneath the Nutrition Facts heading would make the heading more visually appealing. Our requirement in § 101.9(d)(1)(v) to insert the horizontal line beneath the Nutrition Facts heading for all formats (except the linear display for smaller packages described in § 101.9(j)(13)(ii)(A)(*2*)) is based on graphic design principles and other design considerations previously discussed in the preamble to the proposed rule.

14. Replacing ''Total Carbohydrate'' With ''Total Carbs''

Nutrition information declared on the Nutrition Facts label must be presented using the nutrient names specified in § 101.9(c) or § 101.9(j)(13)(ii)(B). According to § 101.9(c)(6), the nutrient name used for listing information about the carbohydrate content of a product is ''Total Carbohydrate.'' Certain abbreviations, as specified in § 101.9(j)(13)(ii)(B), may be used on the Nutrition Facts label on packages that have a total surface area available to bear labeling of 40 or less square inches.

In the preamble to the proposed rule (79 FR 11879 at 11954), we explained that replacing ''Total Carbohydrate,'' the nutrient name currently required on most formats, with the shorter term ''Total Carbs'' would maximize white space, maintain simplicity, and because

it is a commonly used term, help the public to readily observe and comprehend the nutrition information presented in the Nutrition Facts label.

(Comment 513) Most comments objected to replacing ''Total Carbohydrate'' with ''Total Carbs'' on the Nutrition Facts label. Several comments referred to the term ''Total Carbs'' as being ''jargon,'' ''slang,'' ''sloppy,'' or ''denigrating.'' Other comments stated that ''Total Carbohydrate'' is a term that is familiar to consumers, is frequently used in the media, and has appeared on the Nutrition Facts label for more than 20 years. The comments also noted that ''carbohydrate'' is the correct, scientifically accurate term specified in the FD&C Act and NLEA and is used in the DGA, IOM reports, and other government or scientific documents.

One comment questioned whether any data exist suggesting that consumers are either confused by the word ''carbohydrate'' or would understand the term ''carbs'' any better. Another comment suggested that research is needed to evaluate whether the proposed change would affect consumer use and understanding of the carbohydrate information presented on the label.

Many comments said that listing the total carbohydrate content in a serving of food as ''Total Carbs'' rather than ''Total Carbohydrate'' could have a negative impact on the ability of people with diabetes to accurately assess their carbohydrate intake and thus their ability to manage their disease. The comments explained that diabetics, who monitor their blood glucose levels and adjust their insulin requirements accordingly, must be able to accurately determine the carbohydrate content of their foods, such as through ''carbohydrate counting.'' Several comments pointed out that many diabetics, especially those who are newly diagnosed, recognize the term ''carb choice'' or ''carb serving'' as referring to a serving of food that contains 15 grams of total carbohydrate. The comments noted that, in this context, the word ''carb'' has a specific meaning, and that declaring ''Total Carbs'' on the Nutrition Facts label could cause confusion and result in diabetics taking the wrong dose of insulin.

Other comments suggested that ''carb'' or ''carbs'' frequently carries a negative connotation when it is linked to a ''low carb'' diet, the ''net carbs'' of a product, or to ''carb loading'' before an athletic competition. The comments expressed concerns that the term may be used in a context that does not support healthy dietary practices. One comment noted that the term ''carbs,'' if perceived negatively, could inadvertently challenge advice to consume 65 percent of calories from carbohydrates, as recommended in the 2010 DGA. Another comment questioned why carbohydrates should be treated differently than other nutrients on the Nutrition Facts label because it would be the only abbreviated nutrient on most label formats.

One comment said that, because previous research suggests that consumers have difficulty understanding acronyms and abbreviations, the term ''carbs'' may not be appropriate on the label, and may present an additional challenge on bilingual labels. Another comment indicated that if the final rule uses ''Total Carbs,'' the ''Added Sugars'' declaration would become more prominent, leading to consumer confusion and distracting from an overall focus of reducing calorie consumption from all macronutrient sources.

Some comments supported replacing the term ''Total Carbohydrate'' with ''Total Carbs'' and said that ''carbs'' is a term that is part of the daily vocabulary of many people and the term would ''draw their attention'' which could be beneficial.

(Response) We acknowledge that ''carbohydrate'' is the correct, scientifically accurate term used in government or scientific documents and that ''carbs'' may be perceived as jargon. We further recognize the possibility that some diabetics may have difficulty distinguishing between the terms ''Total Carbs,'' ''carb choice,'' and ''carb serving,'' but note that the Nutrition Facts label, and any associated changes in format resulting from this rulemaking, applies to the general healthy population rather than to those with a specific disease. We are unaware of any data suggesting that consumers would be confused by the abbreviation ''Carbs'' or that this term would adversely affect the ability of consumers to interpret other parts of the Nutrition Facts label, or adversely impact dietary advice, as suggested by some comments. Furthermore, we already permit the abbreviation ''carb.'' (singular) for ''carbohydrate'' on small packages having space constraints, as specified in § 101.9(j)(13)(ii)(B), and we note that the term ''carbohydrate'' is spelled out on the Nutrition Facts label of most food products and therefore is readily observable for consumers who might be confused by the abbreviated term on small packages. However, because ''carbs'' (plural) may be perceived as an informal term and may have a negative connotation for some individuals and because a ''Total Carbs'' declaration may be problematic on some bilingual labels when this term is used instead of ''Total Carbohydrate'' generally, we will continue to require that ''Total Carbohydrate'' be used as the nutrient name for carbohydrates, as specified in § 101.9(c)(6), and that ''Total carb.'' continue to be the abbreviation for this term (*e.g.,* as applicable on small packages) as specified in § 101.9(j)(13)(ii)(B).

15. Alternative Visual Formats/Fonts

We did not propose any changes to the basic format of the Nutrition Facts label, as specified in § 101.9(d)(12), because we were unaware of any evidence that would support an alternative format. However, the preamble to the proposed rule did contain a mockup of an alternative concept for the Nutrition Facts label format (79 FR 11879 at 11955) that categorized nutrient declarations as ''quick facts'' about certain nutrients, nutrients to ''avoid too much'' of, and nutrients to ''get enough of,'' and we invited comment on whether we should require a specific type style for the Nutrition Facts label.

After reviewing the comments on the proposed rule, we tentatively concluded that we did not intend to further consider the alternative format for the Nutrition Facts label (80 FR 44302). Most comments agreed with our tentative conclusion, and other comments raised questions that we may consider if we decide to conduct further research on this issue in the future. A review of the results of FDA's consumer research, which we made available in reopening of the comment period as to specific documents (80 FR 44302), did not provide information to change our tentative conclusion, so we are not giving further consideration to the alternative format as part of this rulemaking.

16. Miscellaneous Comments

a. *Size and space issues.* The preamble to the proposed rule did not invite comments on whether our proposed format changes would affect the ability of small packages to accommodate the Nutrition Facts label. Our intention was to use graphic design principles to improve the overall visual appearance of the Nutrition Facts label formats without altering the labels' dimensions. However, several comments addressed this issue, particularly with regards to the use of the proposed linear format on small and very small food packages.

(Comment 514) Many comments said the proposed Nutrition Facts label formats appeared to be larger than the preexisting label formats and, therefore, would take up too much space on food packages. The comments said that implementing many proposed changes, such as increasing the prominence of ''servings per container and the ''calorie'' information as well as adding a line for ''Added Sugars,'' would necessarily increase label size. One comment suggested that we did not adequately consider how the proposed Nutrition Facts labels would fit on actual food products and asked us to ''verify'' that the proposed formats would not result in larger labels. Several comments said that companies would need to redesign their packages to accommodate the increased amount of space that would be necessary for labels to comply with the proposed format changes and to fit on packages, resulting in significant costs to the industry.

Other comments indicated that, for all of the required information to fit within the boundaries of certain proposed formats, some labels would be cluttered, difficult to read, and challenging for consumers to use. One comment said that the label's overall visual appearance would be dense, complex, cluttered, and contradict FDA's intent to maintain the NLEA requirements. The comment said that the Nutrition Facts label should have a simple format, minimize clutter, and enable consumers to observe and comprehend the information readily.

Several comments emphasized that a larger nutrition label would occupy ''valuable'' package space that could be used for other purposes. One comment said that a larger Nutrition Facts label might reduce the available package space that could be used for marketing and promotional messages, and this would be of particular concern to small firms unable to afford advertising costs. Another comment said that the proposed format changes might limit the amount of space on packages that could be used for product recipes and cooking instructions (*e.g.,* information about proper cooking times and temperature settings) which may be necessary for ensuring food safety.

(Response) We disagree with the comments suggesting that the proposed formats would be significantly larger than the current formats. Each label was specifically designed to occupy the same amount of package space as the preexisting label. While some nutrient information will be declared in a larger font size and style compared to the preexisting format, and the final rule requires the declaration of ''Added Sugars'' information, we are also removing the requirement for the ''Calories from Fat'' declaration and reducing the amount of space that will be necessary for the footnote. In certain cases (*e.g.,* on labels of foods represented or purported to be specifically for infants through 12 months of age or on labels of foods that can use the terms ''calorie free,'' ''free of calories,'' ''no calories,'' ''zero calories,'' ''without calories,'' ''trivial source of calories,'' ''negligible source of calories,'' or ''dietary insignificant source of calories'' on the Nutrition Facts label or in the labeling of foods as defined in § 101.60(b)), we are removing the footnote requirement altogether. We also note that we are reducing the type size of the numerical value for calories, from 24 point to 22 point, and 14 point for the tabular display and linear display for smaller packages with a total surface area available to bear labeling of 40 square inches or less in § 101.9(j)(13)(ii)(A)(*1*) and (*2*). Taken together, these format modifications will not result in a significant change in the size of the labels. Therefore, we decline to ''verify'' that the revised formats will not be larger than the current ones and disagree that manufacturers will need to redesign packages extensively to accommodate the revised Nutrition Facts labels. Also, because we are not requiring that absolute amounts be listed for voluntary nutrients, we do not anticipate that excessive crowding will be problematic on labels with multiple columns, such as those on breakfast cereal packages which list nutrition information for the product as packaged, as served (*e.g.,* with milk), and for a subpopulation (*e.g.,* children less than 4 years of age). Although providing nutrition information for these categories is voluntary, if a manufacturer chooses to use such multiple columns and adequate space is not available on the side panel, the Nutrition Facts label may be placed on the back panel of the package (as provided for in § 101.2(a)(1)) where more space is likely to be available.

With respect to the comment regarding the need for small businesses to have adequate space on packages for promotional and marketing messages, we acknowledge the importance of communicating information about the product. Similarly, we recognize the importance of providing consumers with information about food preparation, recipes, and safety issues relative to the product. However, as specified in § 101.9(j)(17), non-mandatory label information on the package information panel (as described in § 101.2(a)) is not considered to be a factor in determining the sufficiency of available space for the placement of the Nutrition Facts label. Therefore, all manufacturers, regardless of size, who are required to display the Nutrition Facts label on its products must follow the regulations with regards to general food labeling requirements and provisions as discussed in § 101.1 through 101.5.

(Comment 515) Several comments noted that label space, which is already limited, would be further constrained on bilingual labels. The comments suggested that bilingual labels will become increasingly common and that we should provide examples of bilingual labels for further public comment.

(Response) The use of bilingual Nutrition Facts labels is voluntary. We do not agree that our format changes will prevent manufacturers from using a bilingual label, as many options are available regarding where the label is located on a package (*e.g.,* the back panel). We have provided an example of a bilingual Nutrition Facts label in ''A Food Labeling Guide: Guidance for Industry'' (Ref. 122). Manufacturers who use a bilingual label can review this guidance document. We anticipate that future updates will be made to ''A Food Labeling Guide: Guidance for Industry'' to correspond to format changes in the final rule.

(Comment 516) One comment said that, because the standard format requires both percent DV and absolute amounts of mandatory vitamins and minerals to be declared, there would not be enough space on some packages to allow the nutrients of public health concern to be listed side by side in two columns (as specified in § 101.9(d)(8)), which the comment called a ''space saving feature.'' The comment provided an example of a label demonstrating that it is not possible to list micronutrients in two columns because of layout constraints caused by the package's configuration. The comment said that although the proposed Nutrition Facts label changes were intended to have a minimum impact on product packages, layout constraints in some cases would necessitate significant package redesign to comply with the revised format. The comment suggested that we had not adequately considered certain package shapes where changes in format would have ''consequential'' effects on package design.

(Response) We acknowledge there are layout constraints with certain packages, but we have given manufacturers flexibility in how they apply the Nutrition Facts label on

products having significant size and space challenges. The comment's example used certain text sizes and bolding that were initially proposed, but are not included in the final rule, so the comment's example, under the final rule's requirements, would take up less space. In response to concerns of products that have significant size and space constraints we are removing the requirement for the footnote statements in § 101.9(j)(13)(ii)(C) for the tabular format for small packages as shown in § 101.9(j)(13)(ii)(A)(*1*) and the linear format as shown in § 101.9(j)(13)(ii)(A)(*2*), however, the abbreviated footnote ''% DV = % Daily Value'' may be used on these packages. Because we are removing the requirement in § 101.9(j)(13)(ii)(C), we are redesignating § 101.9(j)(13)(ii)(D) as § 101.9(j)(13)(ii)(C). We also are allowing ''vitamin'' to be abbreviated as ''vit.'' and potassium to be abbreviated as ''Potas.'' in § 101.9(j)(13)(ii)(B) which will further conserve space. Although we cannot predict all the different sizes and shapes of packages that may enter the marketplace, we permit various formats of the Nutrition Facts label and allow flexibility in order to accommodate packages having various design features.

(Comment 517) Many comments said that the proposed linear display for small packages (illustrated in § 101.9(j)(13)(ii)(A)(*2*) (79 FR 11879 at 11979)) would not fit on many small packages, such as those for candy, chewing gum, and other confectionery products, because it occupies substantially more space than the current linear display format. Some comments included detailed mockups of complete small product packages demonstrating that, due to their shape or size, some packages would not be able to accommodate the proposed Nutrition Facts labels without obscuring some information on the package or label, even if a minimum legible font size of 6 point was used on the label. Other comments pointed out that the preexisting linear format was specifically designed to be flexible because it allows nutrition information to be presented as a wrapped string of text that can be adapted to fit the specific dimensions of a small package. The comments suggested that the proposed ''linear'' display is not accurate because it has a ''table'' format rather than an arrangement that is linear, and it cannot be displayed as a string of wrapped text. According to the comments, the proposed linear display would not fit on many small packages for which it was intended (*i.e.,* packages that could not otherwise accommodate the tabular display for small packages, as provided in § 101.9(j)(13)(ii)(A)(*1*) (79 FR 11879 at 11979)). Other comments said that the proposed linear format would be especially problematic for products having small labels (*e.g.,* packages with 13 square inches of available labeling space) but that are not small enough to qualify for the complete exemption under § 101.9(j)(13)(i), which exempts nutrition labeling when the total surface area available to bear labeling is less than 12 square inches and no claims are made in labeling or advertising. The comments asked us to propose a revised linear format that would fit on small packages (*i.e.,* <12 square inches) or retain the preexisting linear format as an option when neither of the proposed small label formats would fit on a package. Other comments suggested that we broaden the criteria that would allow more labels to qualify for the linear and tabular formats (as provided in § 101.9(j)(13)(ii)(A)); for example, by increasing the intermediate package size from ≤40 square inches to ≤50 square inches.

(Response) We agree that the proposed linear format for small packages may not be able to fit on many small packages, such as those of confectionery products. We also acknowledge the advantage of the text wrapping feature of the preexisting linear format in providing flexibility for labels on small packages having various shapes and sizes. Consequently, we are not finalizing the requirements for the proposed linear format. Instead, we are retaining the text wrapping feature of the preexisting linear format, but adapting it to maintain consistency with the other format changes we are finalizing, *i.e.,* increasing the prominence of ''Calories'' information, removing the ''Calories from Fat'' declaration, changing ''Sugars'' to ''Total Sugars,'' including an ''Added Sugars'' declaration, modifying the mandatory vitamins and minerals, and making the abbreviated footnote ''% DV = % Daily Value'' optional for small packages. We also are providing that the actual number of servings may be listed after the ''____ servings per container'' declaration and note that ''Servings'' is an acceptable abbreviation for ''____ Servings per container'' (as provided in § 101.9(j)(13)(ii)(B)). Additionally, on our own initiative, we have revised the rule so that ''Incl. Xg added sugars'' is an acceptable abbreviation for ''includes X g of added sugars.''

However, we are concerned that some companies may be using the linear format inappropriately because we have seen the linear format used on packages that could accommodate the tabular display for small packages or on larger-size packages that could accommodate the standard format. Manufacturers should understand that the linear format is only to be used for certain size packages (as described in § 101.9(j)(13)(ii)(A)), and only if the label will not accommodate a tabular display. The linear format is more difficult to read than other formats and is not permitted for larger packages. We consider the use of a linear display as a last resort when the tabular display for small packages cannot be accommodated in the available label space (*e.g.,* when small packages with a total surface area available to bear labeling of less than 12 square inches, or 40 square inches or less and the package shape or size cannot accommodate a standard vertical column or tabular display would otherwise have to take advantage of the exemption allowing use of an address or telephone number in lieu of nutrition information). Consumers would be expected to be more likely to take a few extra moments to read a linear nutrition label than to write a letter or call the manufacturer. We do not want the linear format to be misused, so we intend to monitor the marketplace to ensure that the proper Nutrition Facts label format is used on the correct size package.

We have addressed the size and space concerns expressed in the comments for smaller packages by decreasing the prominence of the calorie declaration from our original proposal, by removing the requirement for a footnote, and permitting the abbreviated footnote ''% DV = % Daily Value'' to be optional, providing acceptable abbreviations for terms, and also permitting the text wrapping feature. Based on these spacing accommodations, we decline to increase the intermediate package size from ≤40 square inches to ≤50 square inches, as the comment suggested, because retaining the preexisting linear format and other space saving requirements would preclude the necessity of doing so.

(Comment 518) One comment stated that because foods in small packages (*i.e.,* less than 12 square inches) must bear the Nutrition Facts label if the food's label makes nutrition claims (*e.g.,* ''sugar-free'' gums), manufacturers need a Nutrition Facts label format that would fit on such packages. Otherwise, manufacturers would be prohibited from making a claim, which the comment suggested might be an unintended consequence of the final rule and adversely affect consumers (because the claim would not be available to them). Alternatively, the

comment suggested that we exempt foods in very small packages from bearing a Nutrition Facts label, even if a nutrient content claim is made or if the nutritional contribution of the food is minimal. The comment urged us to carefully consider the impact that the increase in certain type sizes and the additional ''Added Sugars'' information would have on the ability of the Nutrition Facts label to fit on very small packages.

Several comments also asked us to consider additional label formats that would be appropriate for products in small and very small packages making nutrient content claims or health claims. Some comments offered suggestions that would enable the Nutrition Facts label to fit on small and intermediate-size packages, remain legible when printed with a 6 point font size, and still ''embrace the spirit'' of our proposed rule. Specifically, the comments suggested allowing a proportional reduction of the tabular and linear formats to accommodate certain package shapes or sizes; an abbreviated format that lists fewer nutrients but would still allow a claim to be made (such as ''sugar free'' or ''calorie free''); the declaration of certain information to be voluntary; and either a telephone number, Web site, or mailing address that consumers could use to obtain more complete nutrition information (similar to the provision in § 101.9(j)(13)(i)(A)) for very small packages (*i.e.,* having less than 6 square inches of available space to bear labeling).

(Response) While we appreciate the extensive amount of time and effort that manufacturers devoted to designing alternative labels for small product packages, we disagree that such products, in general, should not be required to display a Nutrition Facts label if claims are made for the product. Depending on the particular claim and product, a variety of information may be required on the label (*e.g.,* a disclosure statement, as described in § 101.13(h)(1)) to prevent the claim from being misleading. The packages described in the comment appear to be hypothetical, as we are not aware that such packages currently exist in the marketplace.

We also decline to exempt foods in small packages that have a total surface area available to bear labeling of less than 12 square inches from bearing a Nutrition Facts label if a nutrition claim is made or if the nutritional contribution of the food is minimal. We also are continuing to allow the preexisting linear format for small packages, as described in § 101.9(j)(13)(ii)(A), which we anticipate will fit on most small confectionery packages. Furthermore, we will retain the preexisting requirement in § 101.9(j)(13)(ii)(A) that stipulates that the linear format may only be used if the label will not accommodate a tabular display.

(Comment 519) Several comments pointed out that the proposed leading requirements (*i.e.,* the vertical space between lines) differ from the preexisting leading requirements so that the proposed labels will take up more space. One comment said we could increase the amount of white space by enlarging the leading requirements. Another comment said that there was a lack of detail about the leading requirements for the information displayed in the Nutrition Facts label format shown in § 101.9(d)(12).

(Response) We agree with the comment and acknowledge an error in § 101.9(d)(1)(ii)(C) in which the leading requirements were increased. This has now been corrected in the final rule so that the original leading requirements are retained, *i.e.,* all information within the nutrition label shall utilize at least one point leading except that at least four points leading shall be utilized for the information required by paragraphs (d)(7) and (d)(8) of this section as shown in paragraph (d)(12). We allow manufacturers some degree of discretion and flexibility with respect to the leading requirements, and the label mockups that we have provided in this final regulation are for the purpose of illustration rather than to provide exact specifications. An underlying purpose of the Nutrition Facts label is to help consumers make healthful food choices, and we expect manufacturers to provide legible labels to help consumers do this.

b. Calorie conversion factors. In the preamble to the proposed rule (79 FR 11879 at 11954), we requested comments and supporting data on the extent that consumers use the caloric conversion information (*i.e.,* ''Calories per gram: Fat 9, Carbohydrate 4, Protein 4'') that may voluntarily be declared at the bottom of the footnote area of the Nutrition Facts label under § 101.9(d)(10). We stated that we may consider deleting this optional requirement in the final rule if we determine the information is not useful (id.).

(Comment 520) Some comments would prohibit the voluntary listing of caloric conversion information. These comments stated that it is too much information for consumers; its purpose in relation to the rest of the Nutrition Facts label is not readily apparent; it would require ''hands-on consumer education'' to be useful or understood; and the information is underused. One comment said that allowing the optional use of this information on the label may lead to consumer confusion because we have proposed new caloric conversion factors for certain carbohydrate subtypes.

Another comment suggested that, if we retain the optional caloric conversion information, there should also be a ''disclaimer'' or ''education statement'' indicating that the calorie values listed for fat, carbohydrate, and protein are not exact. The comment said that a disclaimer or education statement would help consumers understand that, if the grams of fat, carbohydrate, and protein that are listed on the Nutrition Facts label are multiplied by their respective caloric values (*i.e.,* 9, 4 and 4), the total may not necessarily be the same as the number of calories listed near the top of the label in the ''Calories'' declaration. The comment further suggested that such a discrepancy might cause consumer confusion. Another comment suggested the caloric information for fat, carbohydrate, and protein should be provided on a ''per ounce'' basis rather than on a ''per gram'' basis. Finally, one comment said that retaining the caloric conversion information could help consumers adjust their caloric intake if their individual calorie needs were above or below 2,000 calories per day.

(Response) We previously recognized that 9, 4, and 4 calories per gram for fat, carbohydrates, and protein, respectively, are general factors that are applicable to the majority of foods, and displaying them on the label can help consumers better understand and use the nutrition information on the label and to apply the DGA recommendations (58 FR 2079 at 2131). For example, the calorie conversion information might be useful to consumers who want to keep track of the number (or percentage) of calories they consume derived from fat and carbohydrate, or who are following certain dietary recommendations, such as for weight loss or other health reasons. Furthermore, because we are no longer requiring the number of calories from fat to be declared on the label, consumers who want this information can do their own calculations using the caloric conversion factors. We are unaware whether the caloric conversion information is underused by consumers, as suggested by one comment, and disagree that it comprises too much information, as it is displayed succinctly and is listed voluntarily. However, given the comments' concerns related to the need to conserve space on the Nutrition Facts label, we will continue to allow the caloric conversion factors to be listed voluntarily.

We disagree with the comment stating that the proposed caloric conversion factors for carbohydrate sub-types might lead to consumer confusion if the current caloric conversion information is retained. The comment did not explain this assertion. Although we proposed new caloric conversion factors for certain carbohydrate sub-types, including soluble fiber (2 calories per gram) and specific sugar alcohols (ranging from 1.6–3.0 calories per gram), consumers would not be expected to be aware of this information and would have no reason to use it because it is intended for manufacturers to use in developing product labels. Therefore, we disagree that retaining the caloric conversion information on the Nutrition Facts label would lead to consumer confusion. Furthermore, although the general conversion factors may not apply to all foods (but relatively few products would be expected to include caloric values for soluble fiber and sugar alcohols as part of the total calorie calculations), we do not consider that to be a reason to prohibit their use.

We also decline to provide a ''disclaimer'' or ''education statement'' on the label to indicate that the caloric conversion factors are approximations. The reason that multiplying the grams of fat, carbohydrate, and protein listed on the label by 9, 4, and 4 calories per gram, respectively, does not exactly add up to the number of calories listed on the label is due mainly to rounding rules that apply to the Nutrition Facts label. Rather than explain this in a footnote, however, we intend to include information about rounding as part of our planned nutrition education efforts and clarify why the caloric values of individual macronutrients may not add up to the total number of calories listed on the label.

We also do not agree that the caloric conversion factors on the label should be listed on a ''per ounce'' basis, rather than on a ''per gram'' basis, as one comment suggested. The information, if present, must be provided on a per gram basis (§ 101.9(d)(10)), which is consistent with the units that are used for declaring amounts of fat, carbohydrate, and protein on the Nutrition Facts label and therefore most likely to be useful for consumers. Furthermore, the comment did not provide data to show that ounces would be better understood or would be more useful to consumers than grams, and we have no evidence to support listing the conversion factors on a ''per ounce'' basis. We also note that the final rule no longer amends § 101.9(d)(10); we had proposed revising § 101.9(d)(10) as part of the proposed rule when we also proposed removing and reserving § 101.9(d)(9). Our proposed amendment to § 101.9(d)(10) would have removed a cross-reference to § 101.9(d)(9) and referred, instead, to a part of the Nutrition Facts label. In the supplemental proposed rule, however, we suggested text that would become a new § 101.9(d)(9) (thereby eliminating the need to reserve that paragraph). Thus, the proposed amendment to § 101.9(d)(10) is no longer necessary, and the final rule does not amend § 101.9(d)(10). (We have made a similar revision to § 101.9(d)(11) to restore a cross-reference to § 101.9(d)(9).)

With respect to the comment that said retaining the caloric conversion information could help consumers adjust their caloric intake if their individual calorie needs were above or below 2,000 calories per day, we acknowledge this is a reasonable assumption because understanding the relative amount of calories contributed by fat, carbohydrate, and protein may help consumers better comprehend and use the Nutrition Facts label, which may assist them in maintaining healthy dietary practices.

R. Compliance

Section 101.9(g) provides information about how we determine compliance with our nutrition labeling requirements, including the methods of analysis used to determine compliance, reasonable excesses and deficiencies of nutrients, and acceptable levels of variance from declared values.

1. Level of Variance Allowed for the Label Declaration of Specific Nutrients

Under our preexisting regulations, at § 101.9(g)(5), a food with a label declaration of calories, sugars, total fat, saturated fat, *trans* fat, cholesterol, or sodium shall be deemed to be misbranded under section 403(a) of the FD&C Act if the nutrient content of the composite is greater than 20 percent in excess of the value for that nutrient declared on the label. The provision provides that no regulatory action will be based on a determination of a nutrient value that falls above this level by a factor less than the variability generally recognized for the analytical method used in that food at the level involved.

The proposed rule would not change the level of variance allowed in § 101.9(g)(5).

(Comment 521) One comment suggested that we tighten the allowable variance to no more than 10 percent. The comment was concerned that the 20 percent allowable variance could result in inaccurate and misleading information going to consumers. The comment said that modern manufacturing and testing methods should allow food manufacturers to provide a more accurate representation of the nutrient content of foods.

(Response) As we stated in the preamble to the proposed rule (79 FR 11879 at 11955), we received a similar comment to the 2007 ANPRM asking us to reevaluate the level of variance permitted for nutrient content declarations. When initially determining the allowances for variability, we considered the variability in the nutrient content of foods, analytical variability inherent to test methods used to determine compliance, and statistical probability (38 FR 2125 at 2128, January 19, 1973). We also evaluated compliance procedures and found them to be statistically sound and adequate.

The comment provided no information for us to consider, such as information to show that the variability in the nutrient content of foods or analytical variability inherent in test methods used to determine compliance have decreased. Therefore, because we do not have a basis to change the level of variance permitted for the label declaration of nutrients, we decline to revise the rule as suggested by the comment.

2. Methods Used To Determine Compliance

Under our preexisting regulations, at § 101.9(g)(2), a composite of 12 subsamples, each taken from 12 different randomly chosen shipping cases are analyzed by appropriate methods as given in the ''Official Methods of Analysis of the AOAC International,'' 15th Ed. (1990) to determine compliance with the requirements in § 101.9, unless a particular method of analysis is specified in § 101.9(c). If no AOAC method is available or appropriate, we use other reliable and appropriate analytical procedures (see § 101.9(g)(2)).

The proposed rule would amend § 101.9(g)(2) to update the reference to the 19th Edition of the ''Official Methods of Analysis of the AOAC International.'' The preamble to the proposed rule (79 FR 11879 at 11913) explained that the 19th edition published in 2012 and that if a newer edition were published before we issued a final rule, we intended to finalize the rule to refer to the newer edition provided there are no substantive changes in the newer edition requiring additional comment. The Official Methods of Analysis of AOAC International, 20th Edition was

published in 2016. The 20th Edition includes a number of new methods of analysis as well as changes to current methods. We need additional time to consider the additions and changes, and to determine if additional public comment is necessary on the 20th Edition of the AOAC Methods of Analysis. Therefore, the final rule, at § 101.9(g)(2), incorporates by reference the 19th Edition of the Official Methods of Analysis of the AOAC International.

(Comment 522) Some comments supported incorporating the 19th Edition of the AOAC Methods by reference in the final rule. Other comments suggested other alternatives. Some comments suggested that a specific edition of the AOAC Methods should not be incorporated by reference to allow companies to use future editions of the reference to meet compliance requirements. One comment stated that, given the potential limitations of the two AOAC methods for fiber identified in the proposed rule (AOAC 2009.01 and AOAC 2011.25) and the inevitable delays between adoption by AOAC of the most relevant, updated, and appropriate methods, we should incorporate all appropriate, equivalent, and validated methods into the final rule.

(Response) We decline to revise the rule to adopt the alternative approaches suggested by the comments. We note that, under the incorporation by reference regulations issued by the Office of the **Federal Register**, incorporation by reference of publication is limited to a specific edition and ''future amendments or revisions of the publication are not included'' (1 CFR 51.1(f)). Thus, under Federal regulations, we cannot incorporate by reference a specific AOAC method and all future editions of that method.

(Comment 523) Some comments questioned what we mean by ''equivalent AOAC method,'' and whether the terms mean that any other AOAC method is acceptable for determining fiber content.

(Response) We used the terminology ''equivalent AOAC method'' to mean a reliable and appropriate method which can be used for measuring dietary fiber, soluble fiber, and insoluble fiber. For example, the definition of dietary fiber requires that the fiber must contain 3 or more monomeric units. We would consider a reliable and appropriate method for dietary fiber to be one that can measure fibers with 3 or more monomeric units.

(Comment 524) Several comments suggested that AOAC 2009.01 and AOAC 2011.25 do not capture all dietary fibers. Many comments recommended that we allow for the use of all validated AOAC methods for the determination of dietary fiber. (We discuss issues related to AOAC methods in greater detail in our response to comment 299.)

(Response) In proposed § 101.9(c)(6)(i), we stated that dietary fiber content may be determined by subtracting the amount of non-digestible carbohydrates added during processing that do not meet the definition of dietary fiber from the value obtained using AOAC 2009.01, AOAC 2011.25, or an equivalent method of analysis given in the 19th edition of the AOAC methods. We stated, in proposed § 101.9(c)(6)(i)(A), that soluble fiber may be determined using AOAC 2011.25 or an equivalent method of analysis as given in the 19th edition of the AOAC Methods and stated, in proposed § 101.9(c)(6)(i)(B), that insoluble fiber may be determined using AOAC 2011.25 or an equivalent method of analysis given in the 19th edition of the AOAC Methods. Although we intended that the terms ''other equivalent methods'' refer to other AOAC methods and their AACCI counterparts, to provide clarification, the final rule omits the incorporation by reference of the specific AOAC methods in § 101.9(c)(6)(i), (c)(6)(i)(A), and (c)(6)(i)(B). Any dietary fiber declared on the label would have to meet the new definition of dietary fiber and manufacturers can measure the amount of dietary fibers in their product accurately by using a method that can measure lower molecular weight nondigestible oligosaccharides with DP 3–9. We would determine compliance by using appropriate methods, as given in the ''Official Methods of Analysis of the AOAC International,'' 19th Ed. (2012). We consider AOAC 2009.01 and AOAC 2011.25 to be reliable and appropriate methods to measure the amount of dietary fiber in a serving of a product. We consider AOAC 2011.25, as given in the ''Official Methods of Analysis of the AOAC International,'' 19th Ed. (2012), to be a reliable and appropriate method to measure the amount of soluble and insoluble fiber in a serving of a product, if separately declared. There may be other methods which manufacturers may use to measure certain fibers which can provide an accurate and consistent result. We will consider the method to use for purposes of determining compliance consistent with § 101.9(g).

3. Records Requirements

Our preexisting regulations, at § 101.9(g)(2), set forth requirements for composite sampling and analysis to determine compliance with labeling declarations. Specifically, unless a specific analytical method is identified by regulation, composites are analyzed by the appropriate AOAC method or, if no AOAC method is available or appropriate, by other reliable and appropriate analytical procedures.

In the preamble to the proposed rule (79 FR 11879 at 11956), we noted that, for certain nutrients subject to the proposed rule, there is no AOAC official method of analysis or other reliable or appropriate analytical procedure that is available for us to verify the amount of the declared nutrient on the Nutrition Facts label and ensure that the declared nutrient amount is truthful, accurate and complies with all applicable labeling requirements. The preamble to the proposed rule (79 FR 11879 at 11956) stated that there is no suitable analytical procedure available to measure the quantity of: (1) Added sugars (when a food product contains both naturally occurring sugars and added sugars and for specific foods containing added sugars, alone or in combination with naturally occurring sugars, where the added sugars are subject to non-enzymatic browning and/or fermentation); (2) dietary fiber (when a food product contains both non-digestible carbohydrate(s) that meets the proposed definition of dietary fiber and non-digestible carbohydrate(s) that does not meet the definition of dietary fiber); (3) soluble fiber (when a mixture of soluble fiber and added nondigestible carbohydrate(s) that does not meet the definition of dietary fiber are present in a food); (4) insoluble fiber (when a mixture of insoluble fiber and non-digestible carbohydrate(s) that does not meet the definition of dietary fiber are present in a food); (5) vitamin E (when a food product contains both RRR- α-tocopherol and *all rac*-α-tocopherol acetate); and (6) folate (when a food product contains both folate and folic acid).

Under our preexisting regulations, at § 101.9(g)(9), we may permit the use of an alternative means of compliance or additional exemptions when it is not technologically feasible, or some other circumstance makes it impracticable, for firms to comply with the requirements of § 101.9. Under § 101.9(g)(9), firms must submit a written request to us for the use of an alternative means of compliance or for a labeling exemption.

The proposed rule would establish an alternative approach for assessing compliance of the declared amount of certain nutrients when there is no suitable analytical method available to measure the nutrient's quantity as

declared on the label or in labeling. Specifically, the proposed rule, at proposed § 101.9(g)(10) and (g)(11), would require the manufacturer to make and keep records that are necessary to verify the declaration of: (1) The amount of added sugars when both naturally occurring and added sugars are present in a food (in § 101.9(c)(6)(iii)); (2) the amount of added non-digestible carbohydrate(s) that does not meet the proposed definition of dietary fiber when the dietary fiber present in a food is a mixture of non-digestible carbohydrates that do and that do not meet the definition of dietary fiber (in § 101.9(c)(6)(i)); (3) the amount of added soluble non-digestible carbohydrate(s) that does not meet the proposed definition of dietary fiber when the soluble dietary fiber present in a food is a mixture of soluble non-digestible carbohydrates that do and that do not meet the definition of dietary fiber (in § 101.9(c)(6)(i)(A)); (4) the amount of added insoluble non-digestible carbohydrate(s) that does not meet the proposed definition of dietary fiber when the insoluble dietary fiber present in a food is a mixture of insoluble non-digestible carbohydrates that do and that do not meet the definition of dietary fiber (in § 101.9(c)(6)(i)(B)); (5) the amount of *all rac*-α-tocopherol acetate added to the food and RRR-α-tocopherol in the finished food when a mixture of both forms of vitamin E are present in a food (in § 101.9(g)(10)(i)); and (6) and the amount of folic acid added to the food and the amount of folate in the finished food when a mixture of both forms are present in a food (in § 101.9(g)(10)(ii)). In the preamble to the proposed rule (79 FR 11879 at 11956), we explained that the manufacturer is in the best position to know which of its records provide the documentation required under the circumstances described for us to determine compliance. These records could include one or more of the following: Analyses of databases, recipes or formulations, or batch records. We stated that most manufacturers should already have the type of records needed to validate the declared amount of these nutrients and that the proposed records requirements provide flexibility in what records the manufacturer makes available to us to verify the declared amount of these nutrients for a particular marketed product (id.).

The proposed rule, at proposed § 101.9(g)(11), also would require that records be kept for a period of 2 years after introduction or delivery for introduction of the food into interstate commerce and that such records be provided to us upon request during an inspection for official review and copying or other means of reproduction. The proposed rule also stated that records could be kept either as original records, true copies (such as photocopies, pictures, scanned copies, microfilm, microfiche, or other accurate reproductions of the original records), or electronic records in accordance with 21 CFR part 11.

(Comment 525) Many comments agreed with the proposed recordkeeping requirements. However, other comments objected to the proposed recordkeeping requirements. Some comments said that our compliance program for nutrition labeling should be based on the validation of nutrient declarations through analytical methods and not through recordkeeping. Other comments said that compliance should be based on objective, analytical measures to yield consistent labeling practices across the food industry. Others comments said that the proposed recordkeeping requirements could invite unethical manufacturers to provide inaccurate information about the quantity of nutrients in a serving of their product.

(Response) As discussed in the preamble to the proposed rule (79 FR 11879 at 11956), for certain nutrients, there are no official methods of analysis or other reliable or appropriate analytical procedures that are available to verify the amount of the declared nutrient on the Nutrition Facts label. In the absence of such methods, there needs to be some means for determining compliance, and so we proposed recordkeeping as an alternative approach for assessing compliance of the declared amount of certain nutrients. While the amount of most other nutrients in Nutrition Facts can be verified analytically, for those nutrients whose amounts cannot be determined analytically, recordkeeping enables FDA to determine compliance with § 101.9(g). Regarding the potential for encouraging manufacturers to provide inaccurate information to FDA, we note that all nutrient declarations must be truthful and not misleading under sections 403(a)(1) and 201(n) of the FD&C Act. Thus, whether determined analytically or through calculations documented in appropriate records, manufacturers are obligated to provide nutrient information that is not false or misleading.

(Comment 526) Several comments said that it would be very difficult to obtain and retain the information required by FDA. Some comments noted that the number of product formulations can be greater than 20,000 for certain manufacturers and that they would need to create systems and dedicate additional resources to create and maintain appropriate records on a large scale. Other comments said that manufacturers typically get ingredients from suppliers in an extensive supply chain and that many ingredients also contain multiple ingredients themselves. Suppliers may not have the information themselves, or the information for the formulations could be proprietary. Additionally, nutrient information could be provided in ranges, and manufacturers would be unable to determine or verify the specific amounts of certain nutrients analytically.

(Response) Although some manufacturers could have a large number of foods that contain nutrients that would necessitate recordkeeping to verify amounts, we do not agree that determining the nutrient composition of a food and recording that information would present undue difficulty for manufacturers. On the contrary, knowledge of what ingredients and nutrients are in a food and providing that information truthfully to consumers is a basic requirement for food producers. Manufacturers, even those who produce large amounts of food products, have experience with determining nutrient content of the food they produce, and the maintenance of records of nutrient content, either written or electronic. Regarding obtaining information from ingredient suppliers, manufacturers are well suited to work with suppliers to ensure that proper information is communicated throughout the supply chain. Ingredient suppliers are obliged to have knowledge of the contents of ingredients they provide to food manufacturers and this information will need to be properly communicated. Manufacturers may be able to choose suppliers that provide appropriate information as to the contents of their ingredients or be able to ask their ingredient suppliers for nutrient information.

(Comment 527) Some comments suggested that the required approach should be flexible and not mandate a specific type of record. The comments indicated that manufacturers should be able to substantiate using the records they believe best accomplish the validity of nutrient information. The comments stated that we did not need access to manufacturing records and that other methods, such as database information or an explanation from a manufacturer, would suffice.

(Response) Manufacturers will be responsible for the type of records they maintain and are not required to

produce any specific form or document for verification purposes. Records used to verify nutrient content could include various types of batch records providing data on the weight of certain nutrient contributions to the total batch, records of test results conducted by the manufacturer or an ingredient supplier, certificates of analysis from suppliers subject to initial and periodic qualification of the supplier by the manufacturer, or other appropriate verification documentation that provide the needed assurance that a manufacturer has adequately ensured the food or ingredients comply with labeling requirements. The records submitted for inspection by FDA would only need to provide information on the nutrient(s) in question. Information about other nutrients can be redacted if necessary to ensure confidentiality of a food product formulation.

(Comment 528) Several comments addressed our legal authority to require recordkeeping as described in the proposed rule.

(Response) We address these comments in part II.C.4.

(Comment 529) Some comments expressed concern that proprietary information in recipes and formulations could be divulged and said that the ability to retain and claim the proprietary nature of product formulations is essential to staying competitive in the marketplace. Other comments suggested that we clarify that the recordkeeping requirements will not require access to proprietary information, such as recipes and formulations. In addition, the comments recommended that we specify what level of information and types of documents are required to meet the recordkeeping requirements. Several comments requested that manufacturers be permitted to develop a stand-alone document that articulates the basis for the declaration of added sugars in a product. Other comments recommended that, if we finalize the recordkeeping requirements and require the copying of records, we address the security of the information coming from inspections and the protection of confidential information.

(Response) The final rule does not require a specific document to be retained nor does it require information on proprietary recipes or overall formulations. Instead, the recordkeeping requirements seek specific content information for certain nutrients, and this information can be provided in various forms. For example, information in some batch records could include data on the total batch weight of the production of a particular food and also provide data on the weight of certain nutrient contributions to the total batch. With these types of data, calculations can be made to determine nutrient content for individual foods or servings of a food. Documentation of this type would not reveal any proprietary recipes or formulations and would be limited to specific nutrient information. Information about the nutrient content of the ingredients of a food product could be acquired from ingredient suppliers subject to initial qualification and periodic requalification by the manufacturer, and this type of information on quantitative source amounts can be included in the batch records.

Furthermore, even if a manufacturer's records contained confidential commercial information or trade secret information or a manufacturer believes that certain information should be protected from public disclosure, we note that there are safeguards to protect against public disclosure of that information and mechanisms that a manufacturer can use to assert that certain information should be protected from disclosure. As we stated in the preamble to the proposed rule (79 FR 11879 at 11957), we would protect confidential information from disclosure, consistent with applicable statutes and regulations, including 5 U.S.C. 552(b)(4), 18 U.S.C. 1905, and part 20 (21 CFR part 20). For example, our regulations pertaining to disclosure of public information, at part 20, include provisions that protect trade secrets and commercial or financial information which is privileged or confidential. If a manufacturer keeps proprietary recipe information in its records, it should mark the information as such before providing the records to us upon request.

(Comment 530) One comment expressed concerns that allowing for recordkeeping as a way to verify the amount of nutrients such as added sugar in some products would encourage those manufacturers to provide false reporting of the added sugar content of their products.

(Response) We note that having a false declaration on the label is a violation of section 403(a)(1) of the FD&C Act. Providing false information in records to the Agency may also be a potential criminal violation under 18 U.S.C. 1001. Under 18 U.S.C. 1001, whoever, in any matter within the jurisdiction of the executive, legislative, or judicial branch of the Government of the United States, knowingly and willfully: (1) Falsifies, conceals, or covers up by any trick, scheme, or device a material fact; (2) makes any materially false, fictitious, or fraudulent statement or representation; or (3) makes or uses any false writing or document knowing the same to contain any materially false, fictitious, or fraudulent statement or entry may be subject to a fine or imprisonment.

(Comment 531) Some comments disagreed with the proposed requirement to keep records for at least 2 years after a food's introduction into interstate commerce. The comments said manufacturers would have to keep track of an additional data point (the date on which the food is actually shipped) as opposed to the date on which it is manufactured. The comments said that shipping dates can vary, even for foods from the same batches, and could occur months after manufacture, and this could result in extremely divergent record maintenance timeframes for foods.

Furthermore, some comments said that is unclear whether the term ''food'' is intended to refer to a particular batch of food or to an individual food.

Other comments suggested that 2 years is a long time for foods with very short shelf lives. Some comments noted that the Seafood Hazard Analysis and Critical Control Points (HACCP) regulations allow for a 1-year record retention period for refrigerated products and a 2 year period for frozen, preserved, or shelf-stable products. The comments suggested that, similarly, the 2 year requirement for recordkeeping related to nutrition labeling should be limited to frozen, preserved, or shelf-stable products and that a shorter period of 1 year should be allowed for maintenance of records for refrigerated and perishable foods.

(Response) We recognize that there can be a wide variation of manufacturing practices, shipping practices, and shelf lives among packaged foods. We believe, however, that it is more practical to establish a single recordkeeping period rather than establish different recordkeeping periods for different products or for different manufacturing or shipping practices. It would be more difficult for FDA to establish a compliance program for one segment of the regulated industry that starts the recordkeeping process when the food is made and a different compliance program for another segment of the industry that starts the recordkeeping process when the food is shipped. Likewise, for manufacturers who make several food products, it may be easier for them to use the same recordkeeping period for all products rather than use different recordkeeping periods for different products. Therefore, we have designed a

compliance program or strategy that involves a single recordkeeping period.

As for the comment asking whether ''food'' referred to a particular batch or to an individual food, the term food refers to an individual food item, but there are not specific requirements on what type of documentation is required. If the same documentation addresses the declarations on an entire batch of food or an even greater quantity of food, those records may be sufficient.

(Comment 532) Some comments suggested that manufacturers should be allowed to keep records at locations separate from factories (*e.g.,* corporate headquarters) and that we allow a reasonable timeframe (*e.g.,* 72 hours or 15 days) to obtain the records and make them available.

(Response) Records must be made available to us for examination or copying during an inspection upon request; this is consistent with our other recordkeeping regulations (see, *e.g.,* 21 CFR 111.605 and 111.610). The records would need to be reasonably accessible (access to records within 24 hours can be considered reasonable) to FDA during an inspection at each manufacturing facility (even if not stored onsite) to determine whether the food has been manufactured and labeled in compliance with labeling requirements. Records that can be immediately retrieved from another location by electronic means are considered reasonably accessible.

(Comment 533) Some comments said that the recordkeeping requirements could present a barrier to trade. They stated that access to records of manufacturers of imported foods may not be possible unless reciprocal agreements are in place and that such agreements could pose a challenge to trade with certain countries.

(Response) We disagree with the comments. As in the case of domestic manufacturers, foreign manufacturers of food produced for sale in the United States must follow all applicable laws and regulations related to nutrition labeling. The final rule establishes the same recordkeeping requirements for foreign and domestic firms. To the extent records are not available during a foreign facility inspection for imported products, that would certainly inform a determination about the admissibility of the food.

(Comment 534) Several comments addressed recordkeeping as it pertained to added sugars. The comments said the proposed recordkeeping requirements were overreaching, especially when, according to the comments, we acknowledged that added sugars do not pose a safety issue and are not uniquely or directly related to a risk of chronic disease, a health-related condition, or a physiological endpoint. Some comments noted that previous FDA recordkeeping requirements involved pharmaceutical safety or potentially adulterated foods that pose safety hazards. Some comments stated that we have never required recordkeeping to support a mandatory disclosure on the Nutrition Facts label that does not involve risk of disease. A few comments explained that obtaining added sugar information, in particular, from ingredient suppliers is difficult because ingredients do not distinguish between naturally occurring and added sugars and manufacturers are unable to distinguish them analytically.

(Response) We recognize that it may be difficult to determine the quantity of added sugars and intrinsically occurring sugars in a particular ingredient or food, and we stated this several times in the preamble to the proposed rule (see 79 FR 11879 at 11905, 11906, and 11956). The recordkeeping requirement, in the absence of an analytical method that would distinguish between added and intrinsically occurring sugars in a food, is an alternative means of verifying compliance; contrary to the comments' statements regarding added sugars and safety hazards or chronic disease, the recordkeeping requirement was not based on or otherwise dependent on an independent relationship between added sugars and chronic disease. Instead, as we stated in the preamble to the proposed rule (79 FR 11879 at 11956), the information contained in manufacturers' records is an accurate and practical method for assuring that the nutrient declarations comply with section 403(q) of the FD&C Act.

(Comment 535) Some comments suggested that we extend the requirement in proposed § 101.9(g)(10)(v) to all foods declaring added sugar to allow food manufacturers to keep records to demonstrate the amount of added sugars remaining in the finished food when that amount is less than the initial amount of added sugars.

(Response) We decline to revise the rule as suggested by the comment. Section 101.9(g)(10)(v) states that when the amount of added sugars is reduced through non-enzymatic browning and/or fermentation, the manufacturer must make and keep certain data, information, and records to document the differences in added sugar content between the unfinished and finished products. Not all foods undergo non-enzymatic browning and/or fermentation, so extending § 101.9(g)(10)(v) to all foods is unnecessary.

(Comment 536) One comment noted that we have described the new recordkeeping requirement for certain nutrients as analogous. The comment said that the recordkeeping for added sugars is different than those for other nutrients, such as fiber, folate, or vitamin E in that the recordkeeping requirement for added sugars is unavoidable due to the mandatory nature of the added sugars declaration.

(Response) The new recordkeeping requirements are analogous based on the fact that inspection of records is the only method to evaluate compliance with the nutrition labeling regulations for a certain number of nutrients. For certain nutrients there are no AOAC official methods of analysis or other reliable or appropriate analytical procedures that are available for us to verify the amount of the declared nutrient on the Nutrition Facts label and ensure that the declared nutrient amounts are truthful, accurate and complies with all applicable labeling requirements. However, we agree that there are difference as to which manufacturers will need to keep records for nutrient content and which products will necessitate recordkeeping. Some manufacturers who voluntarily declare vitamin E content, for example, will have to keep records for vitamin E content but manufacturers who do not declare vitamin E will not need to maintain any records for vitamin E content. Conversely, most manufacturers will need to maintain records on added sugar content. As discussed in part II.H.3, however, we have concluded that the declaration of added sugars is necessary to assist consumers in maintaining healthy dietary practices. Thus, the added sugars declaration is required and, as is the case for any nutrient that does not have any analytical method available to assess compliance, the records described here will have to be maintained and made available for inspection.

(Comment 537) One comment stated that we have said that requiring recordkeeping could spur reformulation, but also stated that we have not provided any evidence of this.

(Response) We do not cite potential reformulation of food products as a reason for or a benefit resulting from recordkeeping requirements. The recordkeeping requirements are only being created to establish an alternative approach for assessing compliance of the declared amount of certain nutrients when there is no suitable analytical method available to measure the

nutrient's quantity as declared on the label or in labeling.

4. Inclusion of Potassium as a Mineral

Potassium is specified as a Class I and Class II nutrient in our preexisting regulations at § 101.9(g)(4)(i) and (g)(4)(ii), respectively and is the only vitamin or mineral that is specifically listed under the description of both Class I and Class II nutrients. Because the proposed rule (at § 101.9(c)(8)(iv)) would establish an RDI for potassium and require declaration of the absolute amount along with a percent DV on the Nutrition Facts label, we also proposed to not list potassium separately under the description of Class I and Class II nutrients and to remove the term ''potassium'' from § 101.9(g)(4), (g)(4)(i), (g)(4)(ii), and (g)(6). Instead, potassium would be covered under the term ''mineral'' that appears in each section, and any listing of potassium on the Nutrition Facts label would have to meet the specific compliance requirements for minerals under § 101.9(g)(4), (g)(4)(i), (g)(4)(ii), and (g)(6).

We did not receive any comments regarding potassium and § 101.9(g)(4) or (g)(6). Therefore, we have finalized those provisions without change.

5. Requirements for Other Carbohydrate, Soluble and Insoluble Fiber, Added Sugars, and Sugar Alcohols

Our preexisting labeling requirements for Class I and Class II nutrients are at § 101.9(g)(4). Because the proposed rule would revise § 101.9(c)(6)(iv) to remove the provision for voluntary declaration of ''Other carbohydrate,'' we proposed to remove the compliance requirements related to ''Other carbohydrate'' in § 101.9(g)(4) and (g)(6).

We also proposed, when all of dietary fiber in a food product meets the proposed definition of dietary fiber, to include soluble and insoluble fiber as both Class I and Class II nutrients under § 101.9(g)(4); include added sugars within § 101.9(g)(5) such that the label declaration of added sugars will be deemed misbranded under section 403(a) of the FD&C Act if the nutrient composite is greater than 20 percent in excess of the added sugars value declared on the label, and within § 101.9(g)(6) such that reasonable deficiencies of added sugars would be permitted; and include soluble and insoluble fiber and sugar alcohols within § 101.9(g)(6) such that reasonable excesses of these nutrients would be permitted.

We did not receive comments with respect to the removal of other carbohydrate from § 101.9(g)(4) and (6) or on the addition of soluble and insoluble fiber to § 101.(g)(4) and (6), and so we have finalized those provisions without change. We address comments on the compliance requirements for added sugars in part II.H.3; however, we are finalizing the addition of added sugars to the compliance requirements of § 101.9(g)(5) and (g)(6) as proposed.

6. Miscellaneous Comments

Although we did not receive any comments on our proposed revisions to the compliance requirements in § 101.9(g)(4), (g)(5), and (g)(6), we did receive a number of comments related to Class I and Class II nutrients.

(Comment 538) We proposed to amend § 101.9(g)(4)(i) to say that, when a vitamin, mineral, protein, or non-digestible carbohydrate(s) (when the food contains only non-digestible carbohydrates (soluble or insoluble) that meet the definition of dietary fiber) meets the definition of a Class I nutrient, the nutrient content of the composite must be formulated to be at least equal to the value for that nutrient declared on the label. Currently, our preexisting regulations, at § 101.36(f)(1), state that compliance for dietary supplements will be determined in accordance with § 101.9(g)(1) through (g)(8) and that the criteria on Class I and Class II nutrients given in § 101.9(g)(3) and (g)(4) also are applicable to other dietary ingredients.

Two comments would revise the requirements for Class I nutrients in § 101.9(g)(4)(i) and § 101.36(f)(1) such that added nutrients in fortified or fabricated foods must contain at least 90 percent of the declared amount rather than the current requirement of 100 percent of the declared amount. The comments recommended that we allow for fortified and fabricated foods to contain less than the declared amount of a Class I nutrients because degradation of dietary ingredients is anticipated and can occur during the shelf life of the product. The comments said that degradation can occur faster in some nutrients than others with certain matrices. The comments expressed concern that firms may include large excesses (greater than 120 percent of the declared amount) to remain in compliance with requirements for Class I nutrients and other dietary ingredients over the shelf life of the product. One comment stated that a lower limit of 90 percent potency as in the U.S. Pharmacopeia (USP) should be permitted because DSHEA made it clear that Congress' intent was that the compendial standards should be the guiding influence where compendial standards exist and products are represented as complying with those standards (21 U.S.C. 343(s)(2)(D)).

One comment also would revise § 101.36(f)(1) to state that the food is also in compliance if it conforms to the specifications of an official compendium. The comment suggested that reasonable excesses of dietary ingredients over labeled amounts would still be acceptable within current good manufacturing practices.

Another comment noted that jurisdictions outside of the United States, such as Denmark, Korea, and the United Kingdom, recognize a minimum value of 80 to 90 percent of the declared amount for added vitamins and minerals at the end of shelf life. The comment suggested that allowing for a minimum of 90 percent of the declared amount of an added vitamin or mineral in the Class I requirements would promote harmonization with other jurisdictions.

One comment suggested that allowing for a minor loss of strength during the product shelf life for Class I nutrients and other dietary ingredients would be similar to what is allowed in drug monographs.

(Response) We acknowledge the comments' arguments for revising our compliance requirements for Class I nutrients, but decline to revise the rule to allow for less than 100 percent of the amount declared on the label. We note that the USP compendial standards for label claims deviations vary from nutrient to nutrient and even vary with different dietary supplement formulations (*e.g.,* high potency products). This is a complex issue that warrants further consideration. We need to further consider and review the available information and to make a determination whether to propose changes with respect the requirements for Class I nutrients and/or other requirements that may be affected.

(Comment 539) One comment referred to a statement made in the preamble to the proposed rule (79 FR 11879 at 11958) that we expect that, when a food product contains added sugars, added dietary fiber, vitamin E as *all rac*-α-tocopherol acetate, and added folic acid, the declared amount must be at least equal to the amount of the nutrient added to the food. The comment noted that there are instances when the declared amount of vitamin E, fiber, or folic acid could be less than the amount added to the recipe as a result of process losses or losses over shelf life. The comment said it is incorrect to assume that the declared amount would be equal to at least the amount added to the recipe.

(Response) We agree that there could be process losses or losses over shelf life for some nutrients added to a product. Product loss over the shelf-life of a product is a complex issue that warrants further review. We need additional time to review the available information and to make a determination whether to propose changes with respect the requirements for Class I nutrients and/or other requirements that may be affected.

(Comment 540) The proposed rule, at § 101.9(g)(3)(ii), would state that when a nutrient or nutrients are not naturally occurring in an ingredient added to a food, the total amount of such nutrient in the final food product is subject to Class I requirements. One comment supported the rule, but two comments asked us to clarify that this provision is referring to ingredients, such as vitamin premixes, that contribute to, but do not account for, the total declared amount of the nutrient. The comments expressed concern that the rule could be construed to apply to the use of ingredients such as enriched flour or vitamin A fortified milk which may not contribute substantially to the nutrient composition of foods. An example might be a mixed dish containing carrots and a small amount of milk with added vitamin A. Because the naturally occurring vitamin A in the carrots would be the primary source of vitamin A in the product rather than the added vitamin A in the milk, the comment would have us consider vitamin A to be a Class II nutrient.

(Response) We decline to revise the rule to refer to ingredients that contribute to, but do not account for, the total declared amount of the nutrient. There are cases when fortified ingredients contribute significantly to the amount of a nutrient when the same nutrient also occurs naturally in the food. For example, enriched flour containing thiamin could be added to bread containing oats where oats are also a source of thiamin. Our intent in proposing to amend § 101.9(g)(3)(ii) was to clarify, rather than alter, the requirement for manufacturers so that, even if a small amount of a nutrient is added to a food, where the final food product also contains an ingredient with the same nutrient in a naturally occurring form, the final food product is subject to the Class I requirements. Thus, contrary to the comments' interpretation, we would not consider the vitamin A to be a Class II nutrient in the example provided by the comment.

We note that manufacturers can choose to use ingredients that are not fortified when formulating their products. In the example provided in the comment, the manufacturer could use milk that is not fortified with vitamin A in formulating the product. In such case, the vitamin A in the finished food would be from a naturally occurring source, and the food would have to meet the requirements for Class II nutrients rather than Class I nutrients.

S. Technical Amendments

The proposed rule also would make certain technical amendments, such as changing the name of the program office to reflect its current name and making non-substantive edits for purposes of plain language.

1. Changing the Name of the Program Office

The proposed rule would update the name of the program office that is responsible for developing regulations and answering questions related to nutrition labeling as well as for maintaining some references discussed throughout § 101.9. The program office's former name was the Office of Nutritional Products, Labeling and Dietary Supplements; at the time we issued the proposed rule, the program office's name was the Office of Nutrition, Labeling and Dietary Supplements. We proposed to update the name throughout § 101.9.

We did not receive any comments regarding the change in the program office's name. However, since we issued the proposed rule, the program office's name changed again, to be the Office of Nutrition and Food Labeling, and so we have revised § 101.9 accordingly.

2. Changing the Publication Date of Report Incorporated by Reference

Our preexisting regulations, at § 101.9(c)(7)(ii), provide that the protein digestibility-corrected amino acid score must be determined by methods given in sections 5.4.1, 7.2.1, and 8.00 in ''Protein Quality Evaluation, Report of the Joint FAO/WHO Expert Consultation on Protein Quality Evaluation,'' Rome, 1990, except that when official AOAC procedures described in § 101.9(c)(7) require a specific food factor other than 6.25 to be used. We incorporated the ''Report of the Joint FAO/WHO Expert Consultation on Protein Quality Evaluation'' by reference in § 101.9(c)(7)(ii), but § 101.9(c)(7)(ii) incorrectly uses 1990 as the publication date when the report actually was published in 1991. Thus, the proposed rule would change the publication date of the report that is incorporated by reference from 1990 to 1991.

We received no comments regarding this change and have revised § 101.9(c)(7)(ii) by replacing ''1990'' with ''1991.'' However, with respect to this and other references that we incorporated by reference in the final rule, we have revised the incorporation-by-reference language in the final rule to meet the current requirements at 5 CFR part 51. Consequently, much of the incorporation by reference language can be found at a new § 101.9(l).

3. Plain Language Edits

On October 13, 2010, the President signed the Plain Writing Act of 2010 requiring that Federal Agencies use ''clear Government communication that the public can understand and use.'' On January 18, 2011, the President issued Executive Order (E.O.) 13563, ''Improving Regulation and Regulatory Review'' (75 FR 3821 (January 21, 2011)); section 1 of E.O. 13563 sets forth ''General principles of regulation,'' and these principles include ensuring that regulations are ''accessible, consistent, written in plain language, and easy to understand.'' To make the requirements of § 101.9 easier to understand, we proposed editorial changes that would not change the meaning or intent of the language in § 101.9(g)(3)(ii); (g)(4)(i); (g)(4)(ii); (g)(5); and (g)(8). Specifically, the proposed rule would:

- Revise § 101.9(g)(3)(ii) to clarify that when a nutrient or nutrients are not naturally occurring (exogenous) in an ingredient that is added to a food, the total amount of such nutrient(s) in the final food product is subject to Class I requirements rather than Class II requirements. We proposed this change because the existing rule did not explicitly state that such a nutrient would be subject to Class I requirements.
- Remove ''Class I'' and ''Class II'' from § 101.9(g)(4)(i) and (g)(4)(ii), and to state instead that when the list of nutrients provided in those sections meets the definition of a Class I or Class II nutrient provided for in § 101.9(g)(3)(i) and (g)(3)(ii), the declaration of those nutrients must meet certain requirements. We explained that this change was intended to prevent confusion by having two different definitions of a ''Class I'' and ''Class II'' nutrient for compliance with nutrition labeling requirements.
- Remove the words ''Provided, That'' from §§ 101.9(g)(4)(ii) and (g)(5) because the words do not provide further clarification and are unnecessary.
- Add the word ''Alternatively'' at the beginning of § 101.9(g)(8) to indicate that use of an FDA approved database

is an alternative to the type of nutrient analysis described in § 101.9(g)(1) and (g)(2).

(Comment 541) One comment stated that the proposed rule does not meet the requirements of the Plain Writing Act of 2010 (Pub. L. 111–274) and said it should be rewritten at a much lower literacy level.

(Response) Although we strive to use plain language and to draft our regulations in a manner such that they are easy to understand, we disagree with the comment. The comment did not provide any specific examples or suggestions on how we should rewrite the rule, so we do not have an adequate basis to determine which parts of the rule, in the comment's view, should be rewritten or how they should be revised.

We also note that, while we have made every effort to write the rule in plain language and in easily understood terms, the rule imposes requirements on firms who have Nutrition Facts or Supplement Facts labels on their products rather than on laymen. The intended ''audience'' for the rule is an important consideration when it comes to plain language. As the Federal Plain Language Guidelines state:

> One of the most popular plain language myths is that you have to ''dumb down'' your content so that everyone everywhere can read it. That's not true. The first rule of plain language is: Write for your audience. Use language your audience knows and feels comfortable with. Take your audience's current level of knowledge into account. Don't write for an 8th grade class if your audience is composed of Ph.D. candidates, small business owners, working parents, or immigrants. Only write for 8th graders if your audience is, in fact, an 8th grade class.

Federal Plain Language Guidelines, ''Think About Your Audience,'' p. 1 (March 2011).

Consequently, the final rule makes the plain language edits to § 101.9(g)(4)(i), (g)(4)(ii), and (g)(8). However, we have made additional revisions to § 101.9(g)(3)(ii) for clarification. In addition, upon further consideration, we decided to retain the words ''Provided, That'' in §§ 101.9(g)(4)(ii) and (g)(5). Removing the clause would no longer signal to the reader that no regulatory action will be taken based on a determination of a nutrient value that falls above a certain level by a factor less than the variability generally recognized for the analytical method used in that food at the level involved.

4. Correcting § 101.9(c)(8)(iii) To Provide Instructions for Rounding Percent DVs

(Comment 542) One comment noted that the first sentence in proposed § 101.9(c)(8)(iii) did not provide clear instructions for how to declare the percent DVs for vitamins and minerals when the percent daily is between 2 to 10 percent, between 10 to 50 percent, or above 50-percent.

(Response) The text in first sentence in proposed § 101.9(c)(8)(iii) was inadvertently changed, and we did not mean to propose to amend this requirement. The text in the first sentence of § 101.9(c)(8)(iii) should read ''The percentages for vitamins and minerals shall be expressed to the nearest 2-percent increment up to and including the 10-percent level, the nearest 5-percent increment above 10 percent and up to and including the 50-percent level, and the nearest 10-percent increment above the 50-percent level.''

5. Miscellaneous Changes

The final rule also makes several non-substantive changes.

The proposed rule would amend § 101.9(c) to state that the requirements of § 101.9(c) apply to the labeling of food ''for adults and children over the age of 4 years, and on foods (other than infant formula) purported to be specifically for infants through 12 months, children 1 through 3 years of age, and pregnant women and lactating women.'' After further consideration, we have decided not to amend § 101.9(c) as we had proposed because the additional language is not necessary. As discussed part II.O, we have the same requirements for mandatory and voluntary labeling for products represented or purported to be for pregnant women and lactating women because women of reproductive age consume the same foods as the general population and, in general, continue consuming similar foods during pregnancy. Therefore, the requirements for mandatory and voluntary labeling for children and adults 4 years of age and older also apply to products represented or purported to be for pregnant women and lactating women, and there is no reason to mention requirements for pregnant women and lactating women in § 101.9(c). In addition, the requirements for mandatory and voluntary labeling for products purported to be for infants through 12 months of age and children 1 through 3 years of age are provided in § 101.9(j)(5). Therefore, there is no reason to mention requirements for mandatory and voluntary labeling of nutrients on products represented or purported to be for infants through 12 months or children 1 through 3 years in § 101.9(c).

The proposed rule also would make minor conforming changes to § 101.9(c)(1)(i)(D) and (E) by deleting the word ''or'' from the former and adding the word ''or'' to the latter. This change reflected the addition of a new subparagraph (F), such that we needed to move the conjunction to its correct place between the last two subparagraphs in § 101.9(c)(1)(i). The final rule adopts these changes.

T. Miscellaneous Comments

We also received comments on a variety of topics that were unrelated to the proposed rule. In brief, we received comments asking about:

- Declaring the presence of genetically modified organisms (GMOs) or GMO-related issues;
- Ingredient listing, particularly with respect to specific ingredients such as high-fructose corn syrup;
- Front-of-package labeling;
- Labeling of alcoholic beverages by another Federal Agency;
- Declaring whether a product contains caffeine, gluten, allergens, ''toxins'' (particularly from pesticides and food containers);
- Listing the glycemic index of foods and listing whole grains in a food;
- Health claim or nutrient content claim regulations;
- Expiration dates on food labels;
- Whether we should define the term ''natural'' on food labels;
- Issues related to our final rules on menu labeling and vending machine labeling; and
- Listing artificial sweeteners in the Nutrition Facts label.

Generally speaking, these topics are distinct from the Nutrition Facts and Supplement Facts label requirements, and so they are beyond the scope of this rulemaking. We note, however, that we have issued regulations regarding ''gluten-free'' labeling (see 78 FR 47154 (August 5, 2013) (now codified at 21 CFR 101.91), labeling of standard menu items in restaurants and similar retail food establishments (known informally as ''menu labeling'') (see 78 FR 71155 (December 1, 2014)) (now codified at 21 CFR 101.9), calorie labeling of articles of food in vending machines (78 FR 71259 (December 1, 2014) (also codified at 21 CFR 101.9), and Small Entity Compliance Guides for the gluten-free labeling rule and the menu labeling rules (see 79 FR 36322 (June 26, 2014) and 80 FR 13225 (March 13, 2015) respectively).

We also have a longstanding policy for the use of the term ''natural'' on labels of human food (see 56 FR 60421 at 60466 (November 27, 1991) (proposed rule on food labeling, nutrient content claims, and general principles)), and, in the **Federal Register** of November 12,

2015 (80 FR 69905), issued a notice to receive information and comments on the use of the term ''natural'' in the labeling of human food products, including foods that are genetically engineered or contain ingredients produced through the use of genetic engineering and on specific questions we posed in the notice.

III. Effective and Compliance Dates

In the preamble to the proposed rule (79 FR 11879 at 11959), we indicated that a final rule, as well as any final rule resulting from the proposed rule entitled ''Food Labeling: Serving Sizes of Foods That Can Reasonably Be Consumed At One-Eating Occasion; Dual-Column Labeling; Updating, Modifying, and Establishing Certain Reference Amounts Customarily Consumed; Serving Size for Breath Mints; and Technical Amendments,'' would become effective 60 days after the date of the final rule's publication in the **Federal Register** (79 FR 11879 at 11959). We also suggested that a final rule have a compliance date that would be 2 years after the effective date (*id.*). We explained that industry might need some time to analyze products for which there may be new mandatory nutrient declarations, make any required changes to the Nutrition Facts label (which may be coordinated with other planned label changes), review and update records of product labels, and print new labels.

(Comment 543) Several comments asked that we provide for a longer compliance date. Some comments specifically requested more time for small businesses. Some comments said that there are a limited number of label printing facilities and that they anticipated that small firms would have to wait longer to have new labels printed. The comments indicated that printing facilities would work with larger companies before working with small businesses or that the large companies would be able to negotiate more quickly with printing facilities to fill their labeling orders first. Other comments stated that small businesses often order a 2-year supply of labels or packaging, so a 2-year compliance date would force small businesses to discard inventory. One comment said that some manufacturers would need to work with design firms to revise or develop label designs.

Another comment requested a longer compliance date because of other label changes that we or other nations are requiring or anticipated new labeling requirements. The comment mentioned our declaratory order regarding partially hydrogenated oils (80 FR 34650 (June 17, 2015)), a Vermont state law requiring labeling of genetically engineered foods and similar legislation in other States, and a possible change to the Nutrition Facts Table and ingredient statements in Canada. Some comments said that synchronizing compliance dates would reduce the economic impact of food manufacturers or that providing a longer compliance date would reduce the economic impact on manufacturers.

Several comments also said that manufacturers may decide to reformulate products. One comment said that a longer compliance date would make it possible for more manufacturers to reformulate products to reduce added sugars, to qualify for nutrient content claims, or ''otherwise meet FDA's public health objectives.'' Another comment said that a longer compliance period would give companies time to reformulate ''where appropriate.''

Some comments said there would be environmental consequences or impacts if companies had to dispose of labels or could not use existing label stock.

In general, the comments suggested different compliance dates, ranging from 3 to 5 years, and stressed the impact on small businesses.

(Response) After considering the comments, we have maintained the compliance date of 2 years after the effective date, except that manufacturers with less than $10 million in annual food sales have a compliance date of 3 years after the effective date. Because the comments emphasized the rule's potential impact on small businesses, we agree that the impacts to smaller businesses may be more substantial than those on larger businesses, and so we have decided to provide a 3-year compliance date for manufacturers with less than $10 million in annual food sales. Thus, for manufacturers with less than $10 million in annual food sales, the compliance date will be July 26, 2019.

We take no position with respect to the comment's statements on label printing facilities and their interaction with large companies, but agree, generally, that small businesses may have fewer resources (both in terms of personnel and financial resources) to deal with regulatory changes and that an extended compliance date may mitigate the rule's impact on small businesses and reduce the need to dispose of potentially non-compliant labeling stock. Although the comments did not suggest any criteria to decide what constitutes a ''small business,'' for purposes of this rulemaking, we consider a small business to be a manufacturer with less than $10 million in annual sales, which we estimate using Nielsen data that covers approximately 95 percent of all food manufacturers and 48 percent of food UPCs.

We also decline to extend the compliance date for small businesses to 4 or 5 years. We note that the Nutrition Facts label's principal purpose is to assist consumers in maintaining healthy dietary practices. In establishing the compliance date for the rule, we have tried to balance the label's principal purpose against the need for industry to analyze products and to review, update, change, and print labels (see 79 FR 11879 at 11959). If we were to extend the compliance date for small businesses to 4 or 5 years, we may inadvertently create consumer confusion because different versions of the Nutrition Facts label would exist in the market for a longer period of time. The more years that differences exist between label formats on different products due to extended compliance periods, the more concern we would have about these differences frustrating, rather than enhancing, the consumer's ability to maintain healthy dietary practices and potentially undermining public confidence in the Nutrition Facts label.

IV. Economic Analysis of Impacts

We have examined the impacts of this final rule under Executive Order 12866, Executive Order 13563, the Regulatory Flexibility Act (5 U.S.C. 601–612), and the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4).

Executive Orders 12866 and 13563 direct us to assess all costs and benefits of available regulatory alternatives and, when regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity). We are publishing two final rules on nutrition labeling in the **Federal Register**. We have developed one final Regulatory Impact Analysis (RIA) (Ref. 274) that assesses the impacts of the two final rules taken together; the RIA is available at *http://www.regulations.gov* (Docket No. FDA–2012–N–1210) and at *http://www.fda.gov/AboutFDA/ReportsManualsForms/Reports/EconomicAnalyses/*. We believe that the final rules, taken as a whole, are an economically significant regulatory action as defined by Executive Order 12866.

The Regulatory Flexibility Act requires Agencies to analyze regulatory options that would minimize any

significant impact of a rule on small entities. Additional costs per entity from the final rules are small, but not negligible, and as a result we find that the final rules, taken as a whole, will have a significant economic impact on a substantial number of small entities.

The Unfunded Mandates Reform Act of 1995 (Section 202(a)) requires us to prepare a written statement, which includes an assessment of anticipated costs and benefits, before issuing ''any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more (adjusted annually for inflation) in any one year.'' The current threshold after adjustment for inflation is $144 million, using the most current (2014) Implicit Price Deflator for the Gross Domestic Product. These final rules, taken as a whole, would result in an expenditure that meets or exceeds this amount. The analysis that we have performed to examine the impacts of the final rules under Executive Order 12866, Executive Order 13563, the Regulatory Flexibility Act, and the Unfunded Mandates Reform Act of 1995 are included in the RIA (Ref. 274) and is available at *http://www.regulations.gov* (Docket No. FDA–2012–N–1210).

V. Paperwork Reduction Act of 1995

This final rule contains information collection provisions that are subject to review by the OMB under the PRA. The title, description, and respondent description of the information collection provisions are shown in the following paragraphs with an estimate of the annual reporting and recordkeeping burden. Included in the estimate is the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing each collection of information.

Title: Record Retention, Reporting, and Third-Party Disclosure Requirements for the Declaration of Added Sugars, Dietary Fiber, Soluble Fiber, Insoluble Fiber, Vitamin E and Folate/Folic Acid.

A. Recordkeeping Requirements

Description of Respondents: The likely respondents to this information collection are manufacturers of retail food products marketed in the United States, whose products contain: (1) A mixture of naturally occurring and added sugars; or (2) a mixture of non-digestible carbohydrates that do and do not meet the definition of dietary fiber. The likely respondents to this information collection also include manufacturers of retail food products marketed in the United States, whose products contain: (1) Mixtures of different forms of vitamin E; or (2) both folate and folic acid.

Description: The Nutrition Facts label rule requires that, under certain circumstances, manufacturers make and keep certain records to verify the amount of added sugars when a food product contains both naturally occurring sugars and added sugars, isolated or synthetic non-digestible carbohydrates that do not meet the definition of dietary fiber, different forms of vitamin E, and folate/folic acid declared on the Nutrition Facts or Supplement Facts label, which is the amount in the finished food product. Manufacturers are required to provide such records to an appropriate regulatory official upon request during inspection. Manufacturers also are required to maintain the records to verify the label declaration of the aforementioned nutrients for a period of 2 years after introduction or delivery for introduction of the food into interstate commerce. Manufacturers of food products that contain an isolated or synthetic non-digestible carbohydrate that are not listed in the definition of dietary fiber will have the option of submitting a citizen petition to FDA asking us to amend the definition of ''dietary fiber'' to include the carbohydrate as a listed dietary fiber, by demonstrating the physiological benefits of the isolated or synthetic non-digestible carbohydrate to human health. In addition, if the isolated or synthetic non-digestible carbohydrate is the subject of an authorized health claim, FDA would consider the carbohydrate to be a dietary fiber with a beneficial physiological effect to human health and would amend the definition of ''dietary fiber'' to include the carbohydrate as a listed dietary fiber. If the citizen petition is granted, or if the isolated or synthetic non-digestible carbohydrate is the subject of an authorized health claim, then the non-digestible carbohydrate is considered to meet the definition of dietary fiber and the definition would be amended to include the dietary fiber in the listing of dietary fibers that must be included in the total amount of dietary fiber declared on the Nutrition or Supplement Facts label by food manufacturers who manufacture food products that contain the isolated or synthetic non-digestible carbohydrate. The record requirements are necessary because analytical methods are not available that would allow us to differentiate between naturally occurring and added sugars, non-digestible carbohydrates (soluble or insoluble) that do and do not meet the definition of dietary fiber, the various forms of vitamin E, and folate or folic acid in order to quantify the amount of added sugars, dietary fiber, soluble fiber, insoluble fiber, vitamin E, or folate/folic acid in the final food product. For the nutrients described in the preceding sentence for which there are no analytical methods available to verify the label declaration, we must rely on information known only to the manufacturer, *e.g.,* analyses of nutrient databases, the food's formulation or recipe, batch records, or other records, to determine whether their product contains the declared amount of the nutrient and is in compliance with the requirements of §§ 101.9(g) and 101.36(f).

We require that firms make and keep certain records necessary to verify the amount of the nutrients in the finished food product. The Nutrition Facts label rule does not specify what records must be used to verify the amounts of these nutrients, but does specify the information that the records must contain. The Nutrition Facts label rule would require manufacturers to, upon request during an inspection, provide FDA with the records that contain the required information for each of these nutrients to verify the amount of the nutrient declared on the label. These records may include analyses of nutrient databases, recipes or formulations, information from recipes or formulations, batch records, or any other records that contain the required information to verify the nutrient content in the final product.

We estimate the burden of this collection of information as follows:

TABLE 1—ESTIMATED ANNUAL RECORDKEEPING BURDEN [1]

Type of declaration/CFR section	Number of recordkeepers	Number of records per recordkeeper	Total annual records	Average burden per recordkeeping	Total hours
Added Sugars/§ 101.9(c)(6)(iii) [2]	31,283	1	31,283	1	31,283

TABLE 1—ESTIMATED ANNUAL RECORDKEEPING BURDEN [1]—Continued

Type of declaration/CFR section	Number of recordkeepers	Number of records per recordkeeper	Total annual records	Average burden per recordkeeping	Total hours
Dietary Fiber/§ 101.9(c)(6)(i) [2]	31,283	1	31,283	1	31,283
Soluble Fiber/§ 101.9(c)(6)(i)(A) [2]	31,283	1	31,283	1	31,283
Insoluble Fiber/§ 101.9(c)(6)(i)(B) [2]	31,283	1	31,283	1	31,283
Dietary Fiber/§ 101.9(c)(6)(i)	28	1	28	1	28

Folate/Folic Acid/§ 101.9(c)(8) [3]	31,283	1	31,283	1	31,283
Total					187,726
Total Initial Hours					187,726
New Products	216	1	216	1	216
Total Recurring Hours					216
Total Burden Hours					187,942

[1] There are no capital costs or operating and maintenance costs associated with this collection of information.

[2] These estimates are likely to be large overestimates, as not all manufacturers will need to keep records for added sugars, dietary fiber, and soluble and insoluble fiber. Manufacturers will only need to keep records for products with both added and naturally occurring sugars and products with non-digestible carbohydrates (soluble or insoluble) that do and do not meet the definition of dietary fiber.

[3] These estimates are likely to be large overestimates, as not all manufacturers will need to keep records for vitamin E and folate/folic acid. The declaration of vitamin E and folate/folic acid is not mandatory unless a health or nutrient content claim is being made or these nutrients are directly added to the food for enrichment purposes.

Based on our experience with food labeling regulations, we believe that the new records that would be required to be retained by the final rules are records that a prudent and responsible manufacturer uses and retains as a normal part of doing business, *e.g.,* analyses of nutrient databases, recipes or formulations, batch records, or other records. Thus, the recordkeeping burden of the final rules consists of the time required to identify and assemble the records for copying and retention. Based on our previous experience with similar recordkeeping requirements, we estimate the recordkeeping burden of the Nutrition Facts Label rule to be 1 hour per product as estimated in table 1.

Under the Nutrition Facts label rule, the declarations for added sugars, dietary fiber, soluble fiber, and insoluble fiber are mandatory, and we conservatively estimate that all roughly 31,283 food manufacturers would incur this recordkeeping burden and that the required recordkeeping would be 1 hour per manufacturer. We estimate that there are approximately 28 isolated or synthetic non-digestible carbohydrates that do not meet the definition of dietary fiber. Once a citizen petition filed by a manufacturer related to a particular isolated or synthetic non-digestible carbohydrate is granted or denied, or the carbohydrate is the subject of an authorized health claim, and the dietary fiber is listed in the definition of dietary fiber, the use of the dietary fiber as an ingredient in any food product must be included in the total amount of dietary fiber declared in nutrition labeling for such product. Thus, it is estimated that 28 manufacturers would incur a recordkeeping burden associated with filing a citizen petition to amend the listing of dietary fiber related to an isolated and synthetic non-digestible carbohydrate that is not currently listed in the definition of dietary fiber and that the required recordkeeping would be 1 hour per manufacturer. The declaration of vitamin E and folate/folic acid is not mandatory unless a health or nutrient content claim is being made or these nutrients are directly added to the food for enrichment purposes. However, we conservatively estimate that all roughly 31,283 food manufacturers would incur this recordkeeping burden and that the required recordkeeping would be 1 hour per manufacturer.

It is hard to predict with certainty the exact number of newly introduced products that would be covered under the Nutrition Facts label rule each year, but based on the industry growth rate estimated using U.S. Census Bureau Business and Industry data, we estimate that number to be about 216. Thus, we estimate that about 216 new products would be affected by the Nutrition Facts Label rule, and that the required recordkeeping would be 1 hour per product, for an annual recurring recordkeeping burden of 216 hours (216 × 1). Adding the burden from new products to the burden for existing products results in a total of 187,942 recordkeeping burden hours for the covered establishments under the Nutrition Facts Label rule, as reported in table 1.

B. Reporting Requirements

Description of Respondents: The likely respondents to this information collection are manufacturers of retail food products marketed in the United States, whose products contain: (1) A combination of both naturally occurring and added sugars; or (2) a mixture of non-digestible carbohydrates that do and do not meet the definition of dietary fiber, soluble fiber, and insoluble fiber. The likely respondents to this information collection also include manufacturers of retail food products marketed in the United States, whose products contain: (1) Mixtures of different forms of vitamin E; or (2) both folate and folic acid if a health or nutrient content claim is being made or these nutrients are directly added to the food for enrichment purposes.

Description: Under the Nutrition Facts label rule, we require that firms provide records upon request during an inspection that they use to verify the declared amounts of added sugars, dietary fiber, soluble fiber, insoluble fiber, vitamin E, and folate/folic acid on the Nutrition Facts or Supplement Facts label.

The reporting requirement is necessary because, at the present time, analytical methods are not available that would allow us to differentiate between naturally occurring and added sugars, non-digestible carbohydrates that both do and do not meet the definition of dietary fiber, soluble fiber, and insoluble fiber, the various forms of vitamin E, and folate or folic acid in order to quantify the amount of added sugars, dietary fiber, vitamin E, or

folate/folic acid in the final food product. For these foods, we must rely on information known only to the manufacturer to assess compliance with the qualifying amount of nutrient. The food manufacturer would assemble and provide the records to FDA regulatory officials upon request during an inspection. We would review the records to verify the label declaration and assess compliance.

TABLE 2—ESTIMATED ANNUAL REPORTING BURDEN [1]

Type of declaration/CFR section	Number of respondents	Number of responses per respondent	Total annual responses	Average burden per response	Total hours
Added Sugars/§ 101.9(c)(6)(iii) [2]	31,283	1	31,283	1	31,283
Dietary Fiber/§ 101.9(c)(6)(i) [2]	31,283	1	31,283	1	31,283
Soluble Fiber/§ 101.9(c)(6)(i)(A) [2]	31,283	1	31,283	1	31,283
Insoluble Fiber/§ 101.9(c)(6)(i)(B) [2]	31,283	1	31,283	1	31,283
Vitamin E/§ 101.9(c)(8) [3]	31,283	1	31,283	1	31,283
Folate/Folic Acid/§ 101.9(c)(8) [3]	31,283	1	31,283	1	31,283
Total					187,698
Total Initial Hours					187,698
New Products	216	1	216	1	216
Total Recurring Hours					216
Total Burden Hours					187,914

[1] There are no capital costs or operating and maintenance costs associated with this collection of information.

[2] These estimates are likely to be large overestimates, as not all manufacturers will need to keep records for added sugars, dietary fiber, and soluble and insoluble fiber. Manufacturers will only need to keep records for products with both added and naturally occurring sugars and products with non-digestible carbohydrates (soluble or insoluble) that do and do not meet the definition of dietary fiber.

[3] These estimates are likely to be large overestimates, as not all manufacturers will need to keep records for vitamin E and folate/folic acid. The declaration of vitamin E and folate/folic acid is not mandatory unless a health or nutrient content claim is being made or these nutrients are directly added to the food for enrichment purposes.

Based on our experience with food labeling regulations, we believe that the records that would be required to be provided to FDA, upon request, are records that a prudent and responsible manufacturer uses and retains as a normal part of doing business, *e.g.,* analyses of nutrient databases, recipes or formulations, batch records, or other records. Thus, the reporting burden to the food manufacturer consists of the time required to assemble and provide the records to appropriate regulatory officials. Based on our previous experience with similar reporting requirements, we estimate the reporting burden of the Nutrition Facts Label rule to be 1 hour per response, as estimated in table 2.

We do not expect to request records from all covered manufacturers to assess compliance, but for the purpose of this analysis the number of respondents is conservatively estimated to be all covered establishments. We estimate the number of responses per record keeper to be 1 and the hourly burden per response to be 1 hour. Built into the estimate of 1 hour is the range from 0 hours, for some covered manufacturers that do not need to maintain records, to a larger number of hours for some covered manufacturers, such as those who produce fermented foods, which may require more time to gather or produce the necessary records. As shown in table 2, the initial reporting burden for covered establishments is 187,698 hours. Also, in accordance with our previous estimate of the number of newly introduced products that would be covered by the requirements to be 216, we estimate the recurring reporting burden hours to be 216. Adding the burden from new products to the initial hours results in a total of 187,914 reporting burden hours for the covered establishments under the Nutrition Facts Label rule, as estimated in table 2.

C. Third-Party Disclosure Requirements

Description of Respondents: Respondents to this collection of information include manufacturers of food products. We estimate the burden of this collection of information as follows:

TABLE 3—ESTIMATED ANNUAL THIRD-PARTY DISCLOSURE BURDEN [1]

21 CFR section	Number of respondents	Number of disclosures per respondent	Total annual disclosures	Average burden per disclosure	Total hours	Total capital costs (in billions of 2014$)
101.9 and 101.36	31,283	26	813,358	2	1,626,716	$2.47

[1] There are no operating and maintenance costs associated with this collection of information.

We have estimated that the burden associated with the Nutrition Facts Label rule would be a burden created by the need for food manufacturers to revise their nutrition labels. We estimate that the third party disclosure burden would be approximately 2 hours per disclosure, for a total burden of 1,626,716 hours.

D. Third-Party Disclosure Burden for Manufacturers

The incremental time burden for reviewing labels to assess how to bring them into compliance with the requirements of the Nutrition Facts label

rule has been estimated to be 1 hour per label. These requirements do not generate any recurring burden per label because establishments must already print packaging for food products as part of normal business practices, and must disclose required nutrition information under the NLEA.

Each label redesign would require an estimated 1 additional hour, making the total burden hours to be 2 hours in burden per UPC.

We estimate that about 31,283 manufacturers representing about 813,358 UPCs, with an average disclosure of 26 (813,358/31,283), would be covered under the Nutrition Facts label rule. The total number of responses is equal to the total number of UPCs being changed. Multiplying the total number of responses by the hours per response gives the total burden hours (Table 3, Column 6). Based on the RIA, we have estimated the capital cost to be $2.47 billion (2014$).

The information collection provisions in this final rule have been submitted to OMB for review as required by section 3507(d) of the Paperwork Reduction Act of 1995. Before the effective date of this final rule, we will publish a notice in the **Federal Register** announcing OMB's decision to approve, modify, or disapprove the information collection provisions in this final rule.

An Agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number.

VI. Analysis of Environmental Impact

We have carefully considered the potential environmental effects of this action. We have concluded that the action will not have a significant impact on the human environment, and that an environmental impact statement is not required (Refs. 275–276). Our finding of no significant impact and the evidence supporting that finding, contained in an environmental assessment, may be seen in the Division of Dockets Management (HFA–305), Food and Drug Administration, 5630 Fishers Lane, Rm. 1061, Rockville, MD 20852, between 9 a.m. and 4 p.m., Monday through Friday.

VII. Federalism

We have analyzed this proposed rule in accordance with the principles set forth in Executive Order 13132. Section 4(a) of the Executive Order requires Agencies to ''construe * * * a Federal statute to preempt State law only where the statute contains an express preemption provision or there is some other clear evidence that the Congress intended preemption of State law, or where the exercise of State authority conflicts with the exercise of Federal authority under the Federal statute.''

Section 403A of the FD&C Act (21 U.S.C. 343–1) is an express preemption provision. Section 403A(a) of the FD&C Act provides that no State or political subdivision of a State may directly or indirectly establish under any authority or continue in effect as to any food in interstate commerce with respect to any requirement for nutrition labeling of food that is not identical to the requirement of section 403(q) of the FD&C Act.

The express preemption provision of section 403A(a) of the FD&C Act does not preempt any State or local requirement respecting a statement in the labeling of food that provides for a warning concerning the safety of the food or component of the food (section 6(c)(2) of the Nutrition Labeling and Education Act of 1990, Public Law 101–535, 104 Stat. 2353, 2364 (1990)). If this proposed rule is made final, the final rule would create requirements that fall within the scope of section 403A(a) of the FD&C Act.

(Comment 544) One comment argued that our federalism analysis in the proposed rule should have included a discussion of the limits which the First Amendment places on Federal law. The comment also said that section 403A of the FD&C Act is limited to food in interstate commerce.

(Response) It is correct that, as quoted in the proposed rule's Federalism section, section 403A of the FD&C Act applies to food in interstate commerce. We decline to change our Federalism section to include a First Amendment analysis. The Federalism section discusses the limitations on states or political subdivisions of a State with regard to requirements for food labeling.

We address First Amendment arguments in part II.C.1.

List of Subjects in 21 CFR Part 101

Food labeling, Incorporation by reference, Nutrition, Reporting and recordkeeping requirements.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 101 is amended as follows:

PART 101—FOOD LABELING

■ 1. The authority citation for part 101 continues to read as follows:

Authority: 15 U.S.C. 1453, 1454, 1455; 21 U.S.C. 321, 331, 342, 343, 348, 371; 42 U.S.C. 243, 264, 271.

■ 2. In § 101.9:
■ a. Revise paragraphs (c)(1)(i)(A) through (E).
■ b. Add paragraph (c)(1)(i)(F).
■ c. Remove paragraph (c)(1)(ii), redesignate paragraph (c)(1)(iii) as (c)(1)(ii), and revise newly designated paragraph (c)(1)(ii).

■ d. Revise paragraphs (c)(2), (c)(5), (c)(6)(i) through (iv), (c)(7), (c)(8) introductory text, (c)(8)(i), (c)(8)(ii) introductory text, and (c)(8)(iii) through (v).
■ e. Add paragraph (c)(8)(vii).
■ f. Revise paragraphs (c)(9), (d)(1) introductory text, (d)(1)(iii) through (v), (d)(2) through (d)(5), (d)(7) introductory text, (d)(7)(i), (d)(8) through (d)(9), (d)(11)(ii), (d)(11)(iii), (d)(12), (d)(13)(ii), (e), (f) introductory text, (f)(2)(ii), (f)(4) and (5), (g) introductory text, (g)(2), (g)(3)(ii), (g)(4) through (6), and (g)(8).
■ g. Add paragraphs (g)(10) and (11).
■ h. Revise paragraphs (h)(3)(iv), (h)(4) introductory text, (j)(5)(i), (j)(5)(ii) introductory text, and (j)(5)(ii)(A) and (B).
■ i. Remove and reserve paragraphs (j)(5)(ii)(C) through (j)(5)(ii)(E); and
■ j. Add paragraph (j)(5)(iii).
■ k. Revise paragraphs (j)(13)(i), (j)(13)(ii)(A)(*1*) and (*2*), and (j)(13)(ii)(B).
■ l. Remove paragraph (j)(13)(ii)(C) and redesignate paragraph (j)(13)(ii)(D) as (j)(13)(ii)(C).
■ m. Revise paragraph (j)(18)(iv) introductory text.
■ n. Add paragraph (l).

The revisions and additions read as follows:

§ 101.9 Nutrition labeling of food.

* * * * *

(c) * * *

(1) * * *

(i) * * *

(A) Using specific Atwater factors (*i.e.,* the Atwater method) given in table 13, USDA Handbook No. 74 (slightly revised, 1973),

(B) Using the general factors of 4, 4, and 9 calories per gram for protein, total carbohydrate, and total fat, respectively, as described in USDA Handbook No. 74 (slightly revised, 1973) pp. 9–11;

(C) Using the general factors of 4, 4, and 9 calories per gram for protein, total carbohydrate (less the amount of non-digestible carbohydrates and sugar alcohols), and total fat, respectively, as described in USDA Handbook No. 74 (slightly revised, 1973) pp. 9–11. A general factor of 2 calories per gram for soluble non-digestible carbohydrates shall be used. The general factors for caloric value of sugar alcohols provided in paragraph (c)(1)(i)(F) of this section shall be used;

(D) Using data for specific food factors for particular foods or ingredients approved by the Food and Drug Administration (FDA) and provided in parts 172 or 184 of this chapter, or by other means, as appropriate;

(E) Using bomb calorimetry data subtracting 1.25 calories per gram protein to correct for incomplete digestibility, as described in USDA Handbook No. 74 (slightly revised, 1973) p. 10; or

(F) Using the following general factors for caloric value of sugar alcohols: Isomalt—2.0 calories per gram, lactitol—2.0 calories per gram, xylitol—2.4 calories per gram, maltitol—2.1 calories per gram, sorbitol—2.6 calories per gram, hydrogenated starch hydrolysates—3.0 calories per gram, mannitol—1.6 calories per gram, and erythritol—0 calories per gram.

(ii) ''Calories from saturated fat'' or ''Calories from saturated'' (VOLUNTARY): A statement of the caloric content derived from saturated fat as defined in paragraph (c)(2)(i) of this section in a serving may be declared voluntarily, expressed to the nearest 5-calorie increment, up to and including 50 calories, and the nearest 10-calorie increment above 50 calories, except that amounts less than 5 calories may be expressed as zero. This statement shall be indented under the statement of calories as provided in paragraph (d)(5) of this section.

(2) ''Fat, total'' or ''Total fat'': A statement of the number of grams of total fat in a serving defined as total lipid fatty acids and expressed as triglycerides where fatty acids are aliphatic carboxylic acids consisting of a chain of alkyl groups and characterized by a terminal carboxyl group. Amounts shall be expressed to the nearest 0.5 (½) gram increment below 5 grams and to the nearest gram increment above 5 grams. If the serving contains less than 0.5 gram, the content shall be expressed as zero.

* * * * *

(5) ''Fluoride'' (VOLUNTARY): A statement of the number of milligrams of fluoride in a specified serving of food may be declared voluntarily, except that when a claim is made about fluoride content, label declaration shall be required. Fluoride content shall be expressed as zero when the serving contains less than 0.1 milligrams of fluoride, to the nearest 0.1-milligram increment when the serving contains less than or equal to 0.8 milligrams of fluoride, and the nearest 0.2 milligram-increment when a serving contains more than 0.8 milligrams of fluoride. Bottled water that bears a statement about added fluoride, as permitted by § 101.13(q)(8), must bear nutrition labeling that complies with requirements for the simplified format in paragraph (f) of this section.

(6) * * *

(i) ''Dietary fiber'': A statement of the number of grams of total dietary fiber in a serving, indented and expressed to the nearest gram, except that if a serving contains less than 1 gram, declaration of dietary fiber is not required or, alternatively, the statement ''Contains less than 1 gram'' or ''less than 1 gram'' may be used, and if the serving contains less than 0.5 gram, the content may be expressed as zero. Dietary fiber is defined as non-digestible soluble and insoluble carbohydrates (with 3 or more monomeric units), and lignin that are intrinsic and intact in plants; isolated or synthetic non-digestible carbohydrates (with 3 or more monomeric units) determined by FDA to have physiological effects that are beneficial to human health. Except as provided for in paragraph (f) of this section, if dietary fiber content is not required, and as a result not declared, the statement ''Not a significant source of dietary fiber'' shall be placed at the bottom of the table of nutrient values in the same type size. The following isolated or synthetic non-digestible carbohydrate(s) have been determined by FDA to have physiological effects that are beneficial to human health and, therefore, shall be included in the calculation of the amount of dietary fiber: [beta]-glucan soluble fiber (as described in § 101.81(c)(2)(ii)(A)), psyllium husk (as described in § 101.81(c)(2)(ii)(A)(6)), cellulose, guar gum, pectin, locust bean gum, and hydroxypropylmethylcellulose. The manufacturer must make and keep records in accordance with paragraphs (g)(10) and (11) of this section to verify the declared amount of dietary fiber in the label and labeling of food when a mixture of dietary fiber, and added non-digestible carbohydrate(s) that does not meet the definition of dietary fiber, is present in the food.

(A) ''Soluble fiber'' (VOLUNTARY): A statement of the number of grams of soluble dietary fiber in a serving may be declared voluntarily except that when a claim is made on the label or in labeling about soluble fiber, label declaration shall be required. Soluble fiber must meet the definition of dietary fiber in this paragraph (c)(6)(i). The manufacturer must make and keep records in accordance with paragraphs (g)(10) and (11) of this section to verify the declared amount of soluble fiber in the label and labeling of food when a mixture of soluble fiber and added non-digestible carbohydrate(s) that does not meet the definition of dietary fiber is present in the food. Soluble fiber content shall be indented under dietary fiber and expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement ''Contains less than 1 gram'' or ''less than 1 gram''

may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero.''

(B) ''Insoluble fiber'' (VOLUNTARY): A statement of the number of grams of insoluble dietary fiber in a serving may be declared voluntarily except that when a claim is made on the label or in labeling about insoluble fiber, label declaration shall be required. Insoluble fiber must meet the definition of dietary fiber in this paragraph (c)(6)(i). The manufacturer must make and keep records in accordance with paragraphs (g)(10) and (11) of this section to verify the declared amount of insoluble fiber in the label and labeling of food when a mixture of insoluble and added non-digestible carbohydrate(s) that does not meet the definition of dietary fiber is present in the food. Insoluble fiber content shall be indented under dietary fiber and expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement ''Contains less than 1 gram'' or ''less than 1 gram'' may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero.

(ii) ''Total Sugars'': A statement of the number of grams of sugars in a serving, except that the label declaration of sugars content is not required for products that contain less than 1 gram of sugars in a serving if no claims are made about sweeteners, sugars, or sugar alcohol content. Except as provided for in paragraph (f) of this section, if a statement of the total sugars content is not required and, as a result, not declared, the statement ''Not a significant source of total sugars'' shall be placed at the bottom of the table of nutrient values in the same type size. Total sugars shall be defined as the sum of all free mono- and disaccharides (such as glucose, fructose, lactose, and sucrose). Total sugars content shall be indented and expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement ''Contains less than 1 gram'' or ''less than 1 gram'' may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero.

(iii) ''Added Sugars'': A statement of the number of grams of added sugars in a serving, except that label declaration of added sugars content is not required for products that contain less than 1 gram of added sugars in a serving if no claims are made about sweeteners, sugars, added sugars, or sugar alcohol content. If a statement of the added sugars content is not required and, as a result, not declared, the statement ''Not a significant source of added sugars'' shall be placed at the bottom of the table of nutrient values in the same type size. Added sugars are either added during the processing of foods, or are packaged as such, and include sugars (free, mono- and disaccharides), sugars from syrups and honey, and sugars from concentrated fruit or vegetable juices that are in excess of what would be expected from the same volume of 100 percent fruit or vegetable juice of the same type, except that fruit or vegetable juice concentrated from 100 percent juices sold to consumers, fruit or vegetable juice concentrates used towards the total juice percentage label declaration under § 101.30 or for Brix standardization under § 102.33(g)(2) of this chapter, fruit juice concentrates which are used to formulate the fruit component of jellies, jams, or preserves in accordance with the standard of identities set forth in §§ 150.140 and 150.160 of this chapter, or the fruit component of fruit spreads shall not be labeled as added sugars. Added sugars content shall be indented under Total Sugars and shall be prefaced with the word ''Includes'' followed by the amount (in grams) ''Added Sugars'' (''Includes 'X' g Added Sugars''). It shall be expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement ''Contains less than 1 gram'' or ''less than 1 gram'' may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero. When a mixture of naturally occurring and added sugars is present in the food, and for specific foods containing added sugars, alone or in combination with naturally occurring sugars, where the added sugars are subject to fermentation and/or non-enzymatic browning, the manufacturer must make and keep records in accordance with paragraphs (g)(10) and (11) of this section to verify the declared amount of added sugars in the label and labeling of food.

(iv) ''Sugar alcohol'' (VOLUNTARY): A statement of the number of grams of sugar alcohols in a serving may be declared voluntarily on the label, except that when a claim is made on the label or in labeling about sugar alcohol or total sugars, or added sugars when sugar alcohols are present in the food, sugar alcohol content shall be declared. For nutrition labeling purposes, sugar alcohols are defined as the sum of saccharide derivatives in which a hydroxyl group replaces a ketone or aldehyde group and whose use in the food is listed by FDA (*e.g.,* mannitol or xylitol) or is generally recognized as safe (*e.g.,* sorbitol). In lieu of the term ''sugar alcohol,'' the name of the specific sugar alcohol (*e.g.,* ''xylitol'') present in the food may be used in the nutrition label provided that only one sugar alcohol is present in the food. Sugar alcohol content shall be indented and expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement ''Contains less than 1 gram'' or ''less than 1 gram'' may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero.

(7) ''Protein'': A statement of the number of grams of protein in a serving, expressed to the nearest gram, except that if a serving contains less than 1 gram, the statement ''Contains less than 1 gram'' or ''less than 1 gram'' may be used as an alternative, and if the serving contains less than 0.5 gram, the content may be expressed as zero. When the protein in foods represented or purported to be for adults and children 4 or more years of age has a protein quality value that is a protein digestibility-corrected amino acid score of less than 20 expressed as a percent, or when the protein in a food represented or purported to be for children greater than 1 but less than 4 years of age has a protein quality value that is a protein digestibility-corrected amino acid score of less than 40 expressed as a percent, either of the following shall be placed adjacent to the declaration of protein content by weight: The statement ''not a significant source of protein,'' or a listing aligned under the column headed ''Percent Daily Value'' of the corrected amount of protein per serving, as determined in paragraph (c)(7)(ii) of this section, calculated as a percentage of the Daily Reference Value (DRV) or Reference Daily Intake (RDI), as appropriate, for protein and expressed as a Percent of Daily Value. When the protein quality in a food as measured by the Protein Efficiency Ratio (PER) is less than 40 percent of the reference standard (casein) for a food represented or purported to be specifically for infants through 12 months, the statement ''not a significant source of protein'' shall be placed adjacent to the declaration of protein content. Protein content may be calculated on the basis of the factor 6.25 times the nitrogen content of the food as determined by the appropriate method of analysis as given in the ''Official Methods of Analysis of the AOAC International,'' except when official AOAC procedures described in this paragraph (c)(7) require a specific factor other than 6.25, that specific factor shall be used.

(i) A statement of the corrected amount of protein per serving, as determined in paragraph (c)(7)(ii) of this section, calculated as a percentage of the

RDI or DRV for protein, as appropriate, and expressed as Percent of Daily Value, may be placed on the label, except that such a statement shall be given if a protein claim is made for the product, or if the product is represented or purported to be specifically for infants through 12 months or children 1 through 3 years of age. When such a declaration is provided, it should be placed on the label adjacent to the statement of grams of protein and aligned under the column headed ''Percent Daily Value,'' and expressed to the nearest whole percent. However, the percentage of the RDI for protein shall not be declared if the food is represented or purported to be specifically for infants through 12 months and the protein quality value is less than 40 percent of the reference standard.

(ii) The ''corrected amount of protein (gram) per serving'' for foods represented or purported for adults and children 1 or more years of age is equal to the actual amount of protein (gram) per serving multiplied by the amino acid score corrected for protein digestibility. If the corrected score is above 1.00, then it shall be set at 1.00. The protein digestibility-corrected amino acid score shall be determined by methods given in sections 5.4.1, 7.2.1, and 8.00 in ''Report of the Joint FAO/WHO Expert Consultation on Protein Quality Evaluation,'' except that when official AOAC procedures described in paragraph (c)(7) of this section require a specific factor other than 6.25, that specific factor shall be used. For foods represented or purported to be specifically for infants through 12 months, the corrected amount of protein (grams) per serving is equal to the actual amount of protein (grams) per serving multiplied by the relative protein quality value. The relative protein quality value shall be determined by dividing the subject food protein PER value by the PER value for casein. If the relative protein value is above 1.00, it shall be set at 1.00.

(iii) For the purpose of labeling with a percent of the DRV or RDI, a value of 50 grams of protein shall be the DRV for adults and children 4 or more years of age, a value of 11 grams of protein shall be the RDI for infants through 12 months, a value of 13 grams shall be the DRV for children 1 through 3 years of age, and a value of 71 grams of protein shall be the RDI for pregnant women and lactating women.

(8) ''Vitamins and minerals'': The requirements related to including a statement of the amount per serving of vitamins and minerals are described in this paragraph (c)(8).

(i) For purposes of declaration of percent of Daily Value as provided for in paragraphs (d), (e), and (f) of this section, foods represented or purported to be specifically for infants through 12 months, children 1 through 3 years, pregnant women, and lactating women shall use the RDIs that are specified for the intended group. For foods represented or purported to be specifically for both infants through 12 months of age and children 1 through 3 years of age, the percent of Daily Value shall be presented by separate declarations according to paragraph (e) of this section based on the RDI values for infants through 12 months of age and children 1 through 3 years of age. When such dual declaration is used on any label, it shall be included in all labeling, and equal prominence shall be given to both values in all such labeling. The percent Daily Value based on the RDI values for pregnant women and lactating women shall be declared on food represented or purported to be specifically for pregnant women and lactating women. All other foods shall use the RDI for adults and children 4 or more years of age.

(ii) The declaration of vitamins and minerals as a quantitative amount by weight and percent of the RDI shall include vitamin D, calcium, iron, and potassium in that order, for infants through 12 months, children 1 through 3 years of age, pregnant women, lactating women, and adults and children 4 or more years of age. The declaration of folic acid shall be included as a quantitative amount by weight when added as a nutrient supplement or a claim is made about the nutrient. The declaration of vitamins and minerals in a food, as a quantitative amount by weight and percent of the RDI, may include any of the other vitamins and minerals listed in paragraph (c)(8)(iv) of this section. The declaration of vitamins and minerals shall include any of the other vitamins and minerals listed in paragraph (c)(8)(iv) of this section as a statement of the amount per serving of the vitamins and minerals as described in this paragraph, calculated as a percent of the RDI and expressed as a percent of the Daily Value, when they are added as a nutrient supplement, or when a claim is made about them, unless otherwise stated as quantitative amount by weight and percent of the Daily Value. Other vitamins and minerals need not be declared if neither the nutrient nor the component is otherwise referred to on the label or the labeling or advertising and the vitamins and minerals are:

* * * * *

(iii) The percentages for vitamins and minerals shall be expressed to the nearest 2-percent increment up to and including the 10-percent level, the nearest 5-percent increment above 10 percent and up to and including the 50-percent level, and the nearest 10-percent increment above the 50-percent level. Quantitative amounts and percentages of vitamins and minerals present at less than 2 percent of the RDI are not required to be declared in nutrition labeling but may be declared by a zero or by the use of an asterisk (or other symbol) that refers to another asterisk (or symbol) that is placed at the bottom of the table and that is followed by the statement ''Contains less than 2 percent of the Daily Value of this (these) nutrient (nutrients)'' or ''Contains < 2 percent of the Daily Value of this (these) nutrient (nutrients).'' Alternatively, except as provided for in paragraph (f) of this section, if vitamin D, calcium, iron, or potassium is present in amounts less than 2 percent of the RDI, label declaration of the nutrient(s) is not required if the statement ''Not a significant source of—(listing the vitamins or minerals omitted)'' is placed at the bottom of the table of nutrient values. Either statement shall be in the same type size as nutrients that are indented. The quantitative amounts of vitamins and minerals, excluding sodium, shall be the amount of the vitamin or mineral included in one serving of the product, using the units of measurement and the levels of significance given in paragraph (c)(8)(iv) of this section, except that zeros following decimal points may be dropped, and additional levels of significance may be used when the number of decimal places indicated is not sufficient to express lower amounts (*e.g.,* the RDI for zinc is given in whole milligrams, but the quantitative amount may be declared in tenths of a milligram).

(iv) The following RDIs, nomenclature, and units of measure are established for the following vitamins and minerals which are essential in human nutrition:

Nutrient	Unit of measure	RDI			
		Adults and children ≥4 years	Infants [1] through 12 months	Children 1 through 3 years	Pregnant women and lactating women
Vitamin A	Micrograms RAE [2] (mcg)	900	500	300	1,300
Vitamin C	Milligrams (mg)	90	50	15	120
Calcium	Milligrams (mg)	1,300	260	700	1,300
Iron	Milligrams (mg)	18	11	7	27
Vitamin D	Micrograms (mcg) [3]	20	10	15	15
Vitamin E	Milligrams (mg) [4]	15	5	6	19
Vitamin K	Micrograms (mcg)	120	2.5	30	90
Thiamin	Milligrams (mg)	1.2	0.3	0.5	1.4
Riboflavin	Milligrams (mg)	1.3	0.4	0.5	1.6
Niacin	Milligrams NE [5] (mg)	16	4	6	18
Vitamin B_6	Milligrams (mg)	1.7	0.3	0.5	2.0
Folate [6]	Micrograms DFE [7] (mcg)	400	80	150	600
Vitamin B_{12}	Micrograms (mcg)	2.4	0.5	0.9	2.8
Biotin	Micrograms (mcg)	30	6	8	35
Pantothenic acid	Milligrams (mg)	5	1.8	2	7
Phosphorus	Milligrams (mg)	1,250	275	460	1,250
Iodine	Micrograms (mcg)	150	130	90	290
Magnesium	Milligrams (mg)	420	75	80	400
Zinc	Milligrams (mg)	11	3	3	13
Selenium	Micrograms (mcg)	55	20	20	70
Copper	Milligrams (mg)	0.9	0.2	0.3	1.3
Manganese	Milligrams (mg)	2.3	0.6	1.2	2.6
Chromium	Micrograms (mcg)	35	5.5	11	45
Molybdenum	Micrograms (mcg)	45	3	17	50
Chloride	Milligrams (mg)	2,300	570	1,500	2,300
Potassium	Milligrams (mg)	4,700	700	3,000	5,100
Choline	Milligrams (mg)	550	150	200	550
Protein	Grams (g)	N/A	11	N/A	[8] 71

[1] RDIs are based on dietary reference intake recommendations for infants through 12 months of age.

[2] RAE = Retinol activity equivalents; 1 microgram RAE = 1 microgram retinol, 2 microgram supplemental β-carotene, 12 micrograms β-carotene, or 24 micrograms α-carotene, or 24 micrograms β-cryptoxanthin.

[3] The amount of vitamin D may, but is not required to, be expressed in international units (IU), in addition to the mandatory declaration in mcg. Any declaration of the amount of vitamin D in IU must appear in parentheses after the declaration of the amount of vitamin D in mcg.

[4] 1 mg α-tocopherol (label claim) = 1 mg α-tocopherol = 1 mg RRR- α-tocopherol = 2 mg *all rac*-α-tocopherol .

[5] NE = Niacin equivalents, 1 mg NE = 1 mg niacin = 60 milligrams tryptophan.

[6] ''Folate'' and ''Folic Acid'' must be used for purposes of declaration in the labeling of conventional foods and dietary supplements. The declaration for folate must be in mcg DFE (when expressed as a quantitative amount by weight in a conventional food or a dietary supplement), and percent DV based on folate in mcg DFE. Folate may be expressed as a percent DV in conventional foods. When folic acid is added or when a claim is made about the nutrient, folic acid must be declared in parentheses, as mcg of folic acid.

[7] DFE = Dietary Folate Equivalents; 1 DFE = 1 mcg naturally-occurring folate = 0.6 mcg folic acid.

[8] Based on the reference caloric intake of 2,000 calories for adults and children aged 4 years and older, and for pregnant women and lactating women.

(v) The following synonyms may be added in parentheses immediately following the name of the nutrient or dietary component:

Calories—Energy
Vitamin C—Ascorbic acid
Thiamin—Vitamin B_1
Riboflavin—Vitamin B_2

* * * * *

(vii) When the amount of folate is declared in the labeling of a conventional food or a dietary supplement, the nutrient name ''folate'' shall be listed for products containing folate (natural folate, and/or synthetic folate as a component of dietary supplement, such as calcium salt of L–5-MTHF), folic acid, or a mixture of folate and folic acid. The name of the synthetic form of the nutrient ''folic acid'', when added or a claim is made about the nutrient, shall be included in parentheses after this declaration with the amount of folic acid. The declaration must be folate in mcg DFE (when expressed as a quantitative amount by weight in a conventional food or a dietary supplement) and the percent DV based on folate in mcg DFE, or for conventional food, may be expressed as folate and the percent DV based on folate in mcg DFE. When declared, folic acid must be in parentheses, mcg of folic acid as shown in paragraph (d)(12) of this section in the display that illustrates voluntary declaration of nutrition information.

(9) The following DRVs, nomenclature, and units of measure are established for the following food components:

Food component	Unit of measure	Adults and children ≥ 4 years	Infants through 12 months	Children 1 through 3 years	Pregnant women and lactating women
Fat	Grams (g)	[1] 78	30	[2] 39	[1] 78
Saturated fat	Grams (g)	[1] 20	N/A	[2] 10	[1] 20
Cholesterol	Milligrams (mg)	300	N/A	300	300
Total carbohydrate	Grams (g)	[1] 275	95	[2] 150	[1] 275

Food component	Unit of measure	Adults and children ≥ 4 years	Infants through 12 months	Children 1 through 3 years	Pregnant women and lactating women
Sodium	Milligrams (mg)	2,300	N/A	1,500	2,300
Dietary Fiber	Grams (g)	[1] 28	N/A	[2] 14	[1] 28
Protein	Grams (g)	[1] 50	N/A	[2] 13	N/A
Added Sugars	Grams (g)	[1] 50	N/A	[2] 25	[1] 50

[1] Based on the reference caloric intake of 2,000 calories for adults and children aged 4 years and older, and for pregnant women and lactating women

[2] Based on the reference caloric intake of 1,000 calories for children 1 through 3 years of age.

(d)(1) Nutrient information specified in paragraph (c) of this section shall be presented on foods in the following format, as shown in paragraph (d)(12) of this section, except on foods where the tabular display is permitted as provided for in paragraph (d)(11) of this section, on which dual columns of nutrition information are declared as provided for in paragraph (e) of this section, on those food products on which the simplified format is required to be used as provided for in paragraph (f) of this section, on foods for infants through 12 months of age and children 1 through 3 years of age as provided for in paragraph (j)(5) of this section, and on foods in small or intermediate-sized packages as provided for in paragraph (j)(13) of this section. In the interest of uniformity of presentation, FDA strongly recommends that the nutrition information be presented using the graphic specifications set forth in appendix B to part 101.

* * * * *

(iii) Information required in paragraphs (d)(7) and (8) of this section shall be in type size no smaller than 8 point. Information required in paragraph (d)(5) of this section for the ''Calories'' declaration shall be highlighted in bold or extra bold and shall be in a type size no smaller than 16 point except the type size for this information required in the tabular displays as shown in paragraphs (d)(11), (e)(6)(ii), and (j)(13)(ii)(A)(*1*) of this section and the linear display for small packages as shown in paragraph (j)(13)(ii)(A)(*2*) of this section shall be in a type size no smaller than 10 point. The numeric amount for the information required in paragraph (d)(5) of this section shall also be highlighted in bold or extra bold type and shall be in a type size no smaller than 22 point, except the type size for this information required for the tabular display for small packages as shown in paragraph (j)(13)(ii)(A)(*1*) of this section, and for the linear display for small packages as shown in paragraph (j)(13)(ii)(A)(*2*) of this section no smaller than 14 point. The information required in paragraph (d)(9) of this section shall be in a type size no smaller than 6 point. When provided, the information described in paragraph (d)(10) of this section shall be in a type size no smaller than 6 point.

(iv) The headings required by paragraphs (d)(2), (d)(3)(ii), (d)(4), and (d)(6) of this section (*i.e.,* ''Nutrition Facts,'' ''Serving size,'' ''Amount per serving,'' and ''% Daily Value*''), the names of all nutrients that are not indented according to requirements of paragraph (c) of this section (*i.e.,* ''Calories,'' ''Total Fat,'' ''Cholesterol,'' ''Sodium,'' ''Total Carbohydrate'' and ''Protein''), and the percentage amounts required by paragraph (d)(7)(ii) of this section shall be highlighted in bold or extra bold type or other highlighting (reverse printing is not permitted as a form of highlighting) that prominently distinguishes it from other information. No other information shall be highlighted.

(v) A hairline rule that is centered between the lines of text shall separate ''Nutrition Facts'' from the servings per container statement required in paragraph (d)(3)(i) of this section and shall separate each nutrient and its corresponding percent Daily Value required in paragraphs (d)(7)(i) and (ii) of this section from the nutrient and percent Daily Value above and below it, as shown in paragraph (d)(12) of this section and in Appendix B to Part 101.

(2) The information shall be presented under the identifying heading of ''Nutrition Facts'' which shall be set in a type size no smaller than all other print size in the nutrition label except for the numerical information for ''Calories'' required in paragraph (d)(5) of this section, and except for labels presented according to the format provided for in paragraphs (d)(11), (d)(13)(ii), (e)(6)(ii), (j)(13)(ii)(A)(*1*), and (j)(13)(ii)(A)(*2*) of this section, unless impractical, shall be set the full width of the information provided under paragraph (d)(7) of this section, as shown in paragraph (d)(12) of this section.

(3) Information on servings per container and serving size shall immediately follow the heading as shown in paragraph (d)(12) of this section. Such information shall include:

(i) ''____ servings per container'': The number of servings per container, except that this statement is not required on single serving containers as defined in paragraph (b)(6) of this section or on other food containers when this information is stated in the net quantity of contents declaration. The information required in this paragraph shall be located immediately after the ''Nutrition Facts'' heading and shall be in a type size no smaller than 10 point, except the type size for this information shall be no smaller than 9 point in the tabular display for small packages as shown in paragraph (j)(13)(ii)(A)(*1*) of this section and the linear display for small packages as shown in paragraph (j)(13)(ii)(A)(*2*) of this section. For the linear display for small packages as shown in paragraph (j)(13)(ii)(A)(*2*) of this section, the actual number of servings may be listed after the servings per container declaration.

(ii) ''Serving size'': A statement of the serving size as specified in paragraph (b)(7) of this section which shall immediately follow the ''____servings per container'' declaration. The information required in this paragraph shall be highlighted in bold or extra bold and be in a type size no smaller than 10 point, except the type size shall be no smaller than 9 point for this information in the tabular displays as shown in paragraphs (d)(11) and (e)(6)(ii) of this section, the tabular display for small packages as shown in paragraph (j)(13)(ii)(A)(*1*) of this section, and the linear display for small packages as shown in paragraph (j)(13)(ii)(A)(*2*) of this section. The serving size amount must be right justified if adequate space is available. If the ''Serving size'' declaration does not fit in the allocated space a type size of no smaller than 8 point may be used on packages of any size.

(4) A subheading ''Amount per serving'' shall be separated from the serving size information by a bar as shown in paragraph (d)(12) of this section, except this information is not required for the dual column formats

shown in paragraphs (e)(5), (e)(6)(i), and (e)(6)(ii) of this section.

(5) Information on calories shall immediately follow the subheading ''Amount per serving'' and shall be declared in one line. If ''Calories from saturated fat'' is declared, it shall be indented under ''Calories'' and shall be in a type size no smaller than 8 point.

* * * * *

(7) Except as provided for in paragraph (j)(13)(ii)(A)(*2*) of this section, nutrient information for both mandatory and any voluntary nutrients listed in paragraph (c) of this section that are to be declared in the nutrition label, except for folic acid in conventional food and voluntarily declared vitamins and minerals expressed as a statement of the amount per serving calculated as a percent of the RDI and expressed as a percent Daily Value, shall be declared as follows:

(i) The name of each nutrient, as specified in paragraph (c) of this section, shall be given in a column and followed immediately by the quantitative amount by weight for that nutrient appended with a ''g'' for grams, ''mg'' for milligrams, or ''mcg'' for micrograms as shown in paragraph (d)(12) of this section. The symbol ''<'' may be used in place of ''less than.''

* * * * *

(8) Nutrient information for vitamins and minerals (except sodium) shall be separated from information on other nutrients by a bar and may be arrayed vertically as shown in paragraph (d)(12) of this section (*e.g.,* Vitamin D 2 mcg 10%, Calcium 260 mg 20%, Iron 8 mg 45%, Potassium 235 mg 6%) or may be listed horizontally. When listed horizontally in two columns, vitamin D and calcium should be listed on the first line and iron and potassium should be listed on the second line, as shown in paragraph (d)(12) of this section in the side-by-side display. When more than four vitamins and minerals are declared voluntarily as shown in paragraph (d)(12) of this section in the label which illustrates the mandatory plus voluntary provisions of paragraph (d) of this section, they may be declared vertically with percentages listed under the column headed ''% Daily Value.''

(9) A footnote, preceded by an asterisk, shall be placed beneath the list of vitamins and minerals and shall be separated from the list by a bar, except that the footnote may be omitted from foods that can use the terms ''calorie free,'' ''free of calories,'' ''without calories,'' ''trivial source of calories,'' ''negligible source of calories,'' or ''dietary insignificant source of calories'' on the label or in the labeling of foods as defined in § 101.60(b). The first sentence of the footnote: ''The % Daily Value tells you how much a nutrient in a serving of food contributes to a daily diet'' may be used on foods that can use the terms ''calorie free,'' ''free of calories,'' ''without calories,'' ''trivial source of calories,'' ''negligible source of calories,'' or ''dietary insignificant source of calories'' on the label or in the labeling of foods as defined in § 101.60(b). The footnote shall state: ''*The % Daily Value tells you how much a nutrient in a serving of food contributes to a daily diet. 2,000 calories a day is used for general nutrition advice.'' If the food product is represented or purported to be for children 1 through 3 years of age, the second sentence of the footnote shall substitute ''1,000 calories'' for ''2,000 calories.''

* * * * *

(11) * * *

(ii) If the space beneath the mandatory declaration of potassium is not adequate to accommodate any remaining vitamins and minerals to be declared or the information required in paragraph (d)(9) of this section, the remaining information may be moved to the right and set off by a line that distinguishes it and sets it apart from the nutrients and the percent DV information given to the left. The caloric conversion information provided for in paragraph (d)(10) of this section may be presented beneath either side or along the full length of the nutrition label.

(iii) If there is not sufficient continuous vertical space (*i.e.,* approximately 3 in) to accommodate the required components of the nutrition label up to and including the mandatory declaration of potassium, the nutrition label may be presented in a tabular display as shown in the following sample label.

(e) Nutrition information may be presented for two or more forms of the same food (*e.g.,* both ''as purchased'' and ''as prepared'') or for common combinations of food as provided for in paragraph (h)(4) of this section, for different units (*e.g.,* slices of bread or per 100 grams) as provided for in

paragraph (b) of this section, or for two or more groups for which RDIs are established (*e.g.,* both infants through 12 months of age and children 1 through 3 years of age) as shown in paragraph (e)(5) of this section. When such dual labeling is provided, equal prominence shall be given to both sets of values. Information shall be presented in a format consistent with paragraph (d) of this section, except that:

(1) Following the serving size information there shall be two or more column headings accurately describing the amount per serving size of the form of the same food (*e.g.,* ''Per ¼ cup mix'' and ''Per prepared portion''), the combinations of food, the units, or the RDI groups that are being declared as shown in paragraph (e)(5) of this section.

(2) The quantitative information by weight as required in paragraph (d)(7)(i) and the information required in paragraph (d)(7)(ii) of this section shall be presented for the form of the product as packaged and for any other form of the product (*e.g.,* ''as prepared'' or combined with another ingredient as shown in paragraph (e)(5) of this section).

(3) When the dual labeling is presented for two or more forms of the same food, for combinations of food, for different units, or for two or more groups for which RDIs are established, the quantitative information by weight and the percent Daily Value shall be presented in two columns and the columns shall be separated by vertical lines as shown in paragraph (e)(5) of this section.

(4) Nutrient information for vitamins and minerals (except sodium) shall be separated from information on other nutrients by a bar and shall be arrayed vertically in the following order: Vitamin D, calcium, iron, potassium as shown in paragraph (e)(5) of this section.

(5) The following sample label illustrates the provisions of paragraph (e) of this section:

Dual Columns, Two Forms of the Same Food

Nutrition Facts

(f) The declaration of nutrition information may be presented in the simplified format set forth herein when a food product contains insignificant amounts of eight or more of the following: Calories, total fat, saturated fat, *trans* fat, cholesterol, sodium, total carbohydrate, dietary fiber, total sugars, added sugars, protein, vitamin D, calcium, iron, and potassium; except that for foods intended for infants through 12 months of age and children 1 through 3 years of age to which paragraph (j)(5)(i) of this section applies, nutrition information may be presented in the simplified format when a food product contains insignificant amounts of six or more of the following: Calories, total fat, sodium, total carbohydrate, dietary fiber, total sugars, added sugars, protein, vitamin D, calcium, iron, and potassium.

* * * * *

(2) * * *

(ii) Any other nutrients identified in paragraph (f) of this section that are present in the food in more than insignificant amounts; and

* * * * *

(4) If any nutrients are declared as provided in paragraphs (f)(2)(iii), (f)(2)(iv), or (f)(3) of this section as part of the simplified format or if any nutrition claims are made on the label or in labeling, the statement ''Not a significant source of _____'' (with the blank filled in with the name(s) of any nutrient(s) identified in paragraph (f) of this section that are present in insignificant amounts) shall be included at the bottom of the nutrition label.

Not a significant source of cholesterol, dietary fiber, total sugars, added sugars, vitamin D, calcium, iron, and potassium

*%DV = %Daily Value

(5) Except as provided for in paragraphs (j)(5) and (j)(13) of this section, nutrient information declared in the simplified format shall be presented in the same manner as specified in paragraphs (d) or (e) of this section, except that the footnote required in paragraph (d)(9) of this section is not required, and an asterisk shall be placed at the bottom of the label followed by the statement ''% DV = % Daily Value'' when ''Daily Value'' is not spelled out in the heading, as shown in paragraph (f)(4).

(g) Compliance with this section shall be determined as follows:

* * * * *

(2) The sample for nutrient analysis shall consist of a composite of 12 subsamples (consumer units), taken 1 from each of 12 different randomly chosen shipping cases, to be representative of a lot. Unless a particular method of analysis is specified in paragraph (c) of this section, composites shall be analyzed by appropriate methods as given in the ''Official Methods of Analysis of the AOAC International,'' or, if no AOAC method is available or appropriate, by other reliable and appropriate analytical procedures.

(3) * * *

(ii) Class II. Naturally occurring (indigenous) nutrients. When a nutrient is naturally occurring (indigenous) in a food or an ingredient that is added to a food, the total amount of such nutrient in the final food product is subject to class II requirements, except that when an exogenous source of the nutrient is also added to the final food product, the total amount of the nutrient in the final food product (indigenous and

exogenous) is subject to class I requirements.

(4) A food with a label declaration of a vitamin, mineral, protein, total carbohydrate, dietary fiber, soluble fiber, insoluble fiber, polyunsaturated or monounsaturated fat shall be deemed to be misbranded under section 403(a) of the Federal Food, Drug, and Cosmetic Act (the act) unless it meets the following requirements:

(i) When a vitamin, mineral, protein, or dietary fiber meets the definition of a Class I nutrient, the nutrient content of the composite must be formulated to be at least equal to the value for that nutrient declared on the label.

(ii) When a vitamin, mineral, protein, total carbohydrate, polyunsaturated or monounsaturated fat, or dietary fiber meets the definition of a Class II nutrient, the nutrient content of the composite must be at least equal to 80 percent of the value for that nutrient declared on the label. *Provided,* That no regulatory action will be based on a determination of a nutrient value that falls below this level by a factor less than the variability generally recognized for the analytical method used in that food at the level involved.

(5) A food with a label declaration of calories, total sugars, added sugars (when the only source of sugars in the food is added sugars), total fat, saturated fat, *trans* fat, cholesterol, or sodium shall be deemed to be misbranded under section 403(a) of the act if the nutrient content of the composite is greater than 20 percent in excess of the value for that nutrient declared on the label. *Provided,* That no regulatory action will be based on a determination of a nutrient value that falls above this level by a factor less than the variability generally recognized for the analytical method used in that food at the level involved.

(6) Reasonable excesses of vitamins, minerals, protein, total carbohydrate, dietary fiber, soluble fiber, insoluble fiber, sugar alcohols, polyunsaturated or monounsaturated fat over labeled amounts are acceptable within current good manufacturing practice. Reasonable deficiencies of calories, total sugars, added sugars, total fat, saturated fat, *trans* fat, cholesterol, or sodium under labeled amounts are acceptable within current good manufacturing practice.

* * * * *

(8) Alternatively, compliance with the provisions set forth in paragraphs (g)(1) through (6) of this section may be provided by use of an FDA approved database that has been computed following FDA guideline procedures and where food samples have been handled in accordance with current good manufacturing practice to prevent nutrition loss. FDA approval of a database shall not be considered granted until the Center for Food Safety and Applied Nutrition has agreed to all aspects of the database in writing. The approval will be granted where a clear need is presented (*e.g.,* raw produce and seafood). Approvals will be in effect for a limited time, *e.g.,* 10 years, and will be eligible for renewal in the absence of significant changes in agricultural or industry practices. Approval requests shall be submitted in accordance with the provisions of § 10.30 of this chapter. Guidance in the use of databases may be found in the ''FDA Nutrition Labeling Manual—A Guide for Developing and Using Data Bases,'' available from the Office of Nutrition and Food Labeling (HFS–800), Center for Food Safety and Applied Nutrition, Food and Drug Administration, 5100 Paint Branch Pkwy., College Park, MD 20740 or by going to *http://www.fda.gov*.

* * * * *

(10) The manufacturer must make and keep written records (*e.g.,* analyses of databases, recipes, formulations, information from recipes or formulations, or batch records) to verify the declared amount of that nutrient on the Nutrition Facts label as follows:

(i) When a mixture of dietary fiber, and added non-digestible carbohydrate(s) that does not meet the definition of dietary fiber, is present in the food, a manufacturer must make and keep written records of the amount of non-digestible carbohydrate(s) added to the food that does not meet the definition of dietary fiber.

(ii) When a mixture of soluble fiber and added non-digestible carbohydrate(s) that does not meet the definition of dietary fiber is present in the food, a manufacturer must make and keep written records necessary to verify the amount of the non-digestible carbohydrate(s) added to the food that does not meet the definition of dietary fiber.

(iii) When a mixture of insoluble fiber and added non-digestible carbohydrate(s) that does not meet the definition of dietary fiber is present in the food, a manufacturer must make and keep written records necessary to verify the amount of the non-digestible carbohydrate(s) added to the food that does not meet the definition of dietary fiber.

(iv) When a mixture of naturally occurring and added sugars is present in the food, a manufacturer must make and keep written records of the amount of added sugars added to the food during the processing of the food, and if packaged as a separate ingredient, as packaged (whether as part of a package containing one or more ingredients or packaged as a single ingredient).

(v) When the amount of sugars added to food products is reduced through non-enzymatic browning and/or fermentation, manufacturers must:

(A) Make and keep records of all relevant scientific data and information relied upon by the manufacturer that demonstrates the amount of added sugars in the food after non-enzymatic browning and/or fermentation and a narrative explaining why the data and information are sufficient to demonstrate the amount of added sugars declared in the finished food, provided the data and information used is specific to the type of food that is subject to non-enzymatic browning and/or fermentation; or

(B) Make and keep records of the amount of added sugars added to the food before and during the processing of the food, and if packaged as a separate ingredient, as packaged (whether as part of a package containing one or more ingredients or packaged as a single ingredient) and in no event shall the amount of added sugars declared exceed the amount of total sugars on the label; or

(C) Submit a petition, under 21 CFR 10.30, to request an alternative means of compliance. The petition must provide scientific data or other information for why the amount of added sugars in a serving of the product is likely to have a significant reduction in added sugars compared to the amount added prior to non-enzymatic browning and/or fermentation. A significant reduction would be where reduction in added sugars after non-enzymatic browning and/or fermentation may be significant enough to impact the label declaration for added sugars by an amount that exceeds the reasonable deficiency acceptable within good manufacturing practice under paragraph (g)(6) of this section. In addition, the scientific data or other information must include the reason that the manufacturer is unable to determine a reasonable approximation of the amount of added sugars in a serving of their finished product and a description of the process that they used to come to that conclusion.

(vi) When a mixture of *all rac*-α-tocopherol and RRR-α-tocopherol is present in a food, manufacturers must make and keep written records of the amount of *all rac*-α-tocopherol added to the food and RRR-α-tocopherol in the finished food.

(vii) When a mixture of folate and folic acid is present in a food, manufacturers must make and keep written records of the amount of synthetic folate and/or folic acid added to the food and the amount of naturally-occurring folate in the finished food.

(11) Records necessary to verify certain nutrient declarations that are specified in paragraph (g)(10) of this section must be kept for a period of at least 2 years after introduction or delivery for introduction of the food into interstate commerce. Such records must be provided to FDA upon request, during an inspection, for official review and photocopying or other means of reproduction. Records required to verify information on the label may be kept either as original records, true copies (such as photocopies, pictures, scanned copies, microfilm, microfiche, or other accurate reproductions of the original records), or electronic records which must be kept in accordance with part 11 of this chapter. These records must be accurate, indelible, and legible.

Failure to make and keep the records or provide the records to appropriate regulatory authorities, as required by this paragraph (g)(11), would result in the food being misbranded under section 403(a)(1) of the act.

(h) * * *

(3) * * *

(iv) Nutrition information may be provided per serving for individual foods in the package, or, alternatively, as a composite per serving for reasonable categories of foods in the package having similar dietary uses and similar significant nutritional characteristics. Reasonable categories of foods may be used only if accepted by FDA. In determining whether a proposed category is reasonable, FDA will consider whether the values of the characterizing nutrients in the foods proposed to be in the category meet the compliance criteria set forth in paragraphs (g)(3) through (6) of this section. Proposals for such categories may be submitted in writing to the Office of Nutrition and Food Labeling (HFS–800), Center for Food Safety and Applied Nutrition, Food and Drug Administration, 5100 Paint Branch Pkwy., College Park, MD 20740.

* * * * *

(4) If a food is commonly combined with other ingredients or is cooked or otherwise prepared before eating, and directions for such combination or preparations are provided, another column of figures may be used to declare nutrition information on the basis of the food as consumed in the format required in paragraph (e) of this section; *e.g.,* a dry ready-to-eat cereal may be described with the percent Daily Value and the quantitative amounts for the cereal as sold (*e.g.,* per ounce), and the percent Daily Value and the quantitative amounts for the cereal and milk as suggested in the label (*e.g.,* per ounce of cereal and ½cup of vitamin D fortified skim milk); and a cake mix may be labeled with the percent Daily Value and the quantitative amounts for the dry mix (per serving) and the percent Daily Value and the quantitative amounts for the serving of the final cake when prepared, as shown in paragraph (e)(5) of this section: Provided, that, the type and quantity of the other ingredients to be added to the product by the user and the specific method of cooking and other preparation shall be specified prominently on the label.

* * * * *

(j) * * *

(5)(i) Foods, other than infant formula, represented or purported to be specifically for infants through 12 months of age and children 1 through 3 years of age shall bear nutrition labeling. The nutrients declared for infants through 12 months of age and children 1 through 3 years of age shall include calories, total fat, saturated fat, *trans* fat, cholesterol, sodium, total carbohydrates, dietary fiber, total sugars, added sugars, protein, and the following vitamins and minerals: Vitamin D, calcium, iron, and potassium.

(ii) Foods, other than infant formula, represented or purported to be specifically for infants through 12 months of age shall bear nutrition labeling, except that:

(A) Such labeling shall not declare a percent Daily Value for saturated fat, *trans* fat, cholesterol, sodium, dietary fiber, total sugars, or added sugars and shall not include a footnote.

(B) The following sample label illustrates the provisions of paragraph (j)(5)(ii) of this section.

Infants through 12 Months of Age

(iii) Foods, other than infant formula, represented or purported to be specifically for children 1 through 3 years of age shall include a footnote that states: ''*The % Daily Value tells you how much a nutrient in a serving of

food contributes to a daily diet. 1,000 calories a day is used for general nutrition advice.''

(A) The following sample label illustrates the provisions of paragraph (j)(5)(iii) of this section.

(B) Using any of the following abbreviations:

Serving size—Serv size
Servings per container—Servings
Calories from saturated fat—Sat fat cal
Saturated fat—Sat fat
Monounsaturated fat—Monounsat fat
Polyunsaturated fat—Polyunsat fat
Cholesterol—Cholest
Total carbohydrate—Total carb. This abbreviation can also be used on dual-column displays as shown in paragraphs (e)(5), (e)(6)(i), and (e)(6)(ii).
Dietary fiber—Fiber
Soluble fiber—Sol fiber
Insoluble fiber—Insol fiber
Sugar alcohol—Sugar alc
Vitamin—Vit
Potassium—Potas
Includes—Incl. This abbreviation can also be used on dual-column displays as shown in paragraphs (e)(5), (e)(6)(i), and (e)(6)(ii) of this section.

■ 3. In § 101.30, revise paragraph (e)(2) to read as follows:

§ 101.30 Percentage juice declaration for foods purporting to be beverages that contain fruit or vegetable juice.

* * * * *

(e) * * *

(2) In easily legible boldface print or type in distinct contrast to other printed or graphic matter, in a height not less than the largest type found on the information panel except that used for the brand name, product name, logo, universal product code, the title phrase ''Nutrition Facts,'' the declaration of ''Serving size,'' ''Calories'' and the numerical value for ''Calories appearing in the nutrition information as required by § 101.9.

* * * * *

■ 4. In § 101.36:

■ a. Revise paragraphs (b)(2)(i) introductory text, (b)(2)(i)(B), (b)(2)(ii)(A) and (B), (b)(2)(iii) introductory text, (b)(2)(iii)(D) through (G), (b)(3)(ii)(A), (c)(4), (e) introductory text, (e)(8), (e)(11)(i) through (viii), (e)(12), and (f).

■ b. Remove paragraph (i) introductory text.

■ c. Revise paragraph (i)(1).

The revisions read as follows:

§ 101.36 Nutrition labeling of dietary supplements.

* * * * *

(b) * * *

(2) * * * (i) The (b)(2)-dietary ingredients to be declared, that is, total calories, total fat, saturated fat, *trans* fat, cholesterol, sodium, total carbohydrate, dietary fiber, total sugars, added sugars, protein, vitamin D, calcium, iron, and potassium, shall be declared when they are present in a dietary supplement in quantitative amounts by weight that exceed the amount that can be declared as zero in nutrition labeling of foods in accordance with § 101.9(c). Calories from saturated fat, polyunsaturated fat, monounsaturated fat, soluble fiber, insoluble fiber, and sugar alcohol may be declared, but they shall be declared when a claim is made about them. Any (b)(2)-dietary ingredients that are not present, or that are present in amounts that can be declared as zero in § 101.9(c), shall not be declared (*e.g.,* amounts corresponding to less than 2 percent of the RDI for vitamins and minerals). Protein shall not be declared on labels of products that, other than ingredients added solely for technological reasons, contain only individual amino acids.

* * * * *

(B) The names of dietary ingredients that are declared under paragraph (b)(2)(i) of this section shall be presented in a column aligned on the left side of the nutritional label in the order and manner of indentation specified in § 101.9(c), except that calcium and iron shall follow choline, and sodium and potassium shall follow chloride. This results in the following order for vitamins and minerals: Vitamin A, vitamin C, vitamin D, vitamin E, vitamin K, thiamin, riboflavin, niacin, vitamin B_6, folate and folic acid, vitamin B_{12}, biotin, pantothenic acid, choline, calcium, iron, phosphorous, iodine, magnesium, zinc, selenium, copper, manganese, chromium, molybdenum, chloride, sodium, potassium, and fluoride. The (b)(2)-dietary ingredients shall be listed according to the nomenclature specified in § 101.9 or in paragraph (b)(2)(i)(B)(*2*) of this section.

(*1*) When ''Calories'' are declared, they shall be listed first in the column of names, beneath a light bar separating the heading ''Amount Per Serving'' from the list of names. When ''Calories from saturated fat'' are declared, they shall be indented under ''Calories.''

(*2*) The following synonyms may be added in parentheses immediately following the name of these (b)(2)-

dietary ingredients: Vitamin C (ascorbic acid), thiamin (vitamin B_1), riboflavin (vitamin B_2), and calories (energy). Energy content per serving may be expressed in kilojoule units, added in parentheses immediately following the statement of caloric content.

(*3*) Beta-carotene may be declared as the percent of vitamin A that is present as beta-carotene, except that the declaration is required when a claim is made about beta-carotene. When declared, the percent shall be declared to the nearest whole percent, immediately adjacent to or beneath the name vitamin A (*e.g.,* ''Vitamin A (90% as beta-carotene)''). The amount of beta-carotene in terms of micrograms (mcg) may be included in the parentheses following the percent statement (*e.g.,* ''Vitamin A (90% (810 mcg) as beta-carotene)'').

(ii) * * *

(A) The amounts shall be expressed in the increments specified in § 101.9(c)(1) through (7), which includes increments for sodium.

(B) The amounts of vitamins and minerals, excluding sodium and potassium, shall be the amount of the vitamin or mineral included in one serving of the product, using the units of measurement and the levels of significance given in § 101.9(c)(8)(iv), except that zeros following decimal points may be dropped, and additional levels of significance may be used when the number of decimal places indicated is not sufficient to express lower amounts (*e.g.,* the RDI for zinc is given in whole milligrams (mg), but the quantitative amount may be declared in tenths of a mg). The amount of vitamin D may, but is not required to, be expressed in IUs, in addition to the mandatory declaration in mcg. Any declaration of the amount of vitamin D in IUs must appear in parentheses after the declaration of the amount of vitamin D in mcg.

* * * * *

(iii) The percent of the Daily Value of all dietary ingredients declared under paragraph (b)(2)(i) of this section shall be listed, except that the percent Daily Value for protein, when present, shall be calculated using the corrected amount of protein as specified in § 101.9(c)(7)(ii); no percent of the Daily Value shall be given for subcomponents for which DRVs or RDIs have not been established (*e.g.,* total sugars). Additionally, the percentage of the RDI for protein shall be omitted when a food is purported to be for infants through 12 months of age.

* * * * *

(D) If the percent of Daily Value is declared for total fat, saturated fat, total carbohydrate, dietary fiber, or protein, or added sugars, a symbol shall follow the value listed for those nutrients that refers to the same symbol that is placed at the bottom of the nutrition label, below the bar required under paragraph (e)(6) of this section and inside the box, that is followed by the statement ''Percent Daily Values are based on a 2,000 calorie diet.'' If the product is represented or purported to be for use by children 1 through 3 years of age, and if the percent of Daily Value is declared for total fat, total carbohydrate, dietary fiber, or protein, or added sugars, a symbol shall follow the value listed for those nutrients that refers to the same symbol that is placed at the bottom of the nutrition label, below the bar required under paragraph (e)(6) of this section and inside the box, that is followed by the statement ''Percent Daily Values are based on a 1,000 calorie diet.''

(E) The percent of Daily Value shall be based on RDI or DRV values for adults and children 4 or more years of age, unless the product is represented or purported to be specifically for infants through 12 months of age, children 1 through 3 years of age, pregnant women, or lactating women, in which case the column heading shall clearly state the intended group. If the product is for persons within more than one group, the percent of Daily Value for each group shall be presented in separate columns as shown in paragraph (e)(11)(ii) of this section.

(F) For declared subcomponents that have no DRVs or RDIs, a symbol (*e.g.,* an asterisk) shall be placed in the ''Percent Daily Value'' column that shall refer to the same symbol that is placed at the bottom of the nutrition label, below the last heavy bar and inside the box, and followed by a statement ''Daily Value not established.''

(G) When calories or calories from saturated fat are declared, the space under the ''% DV'' column shall be left blank for these items. When there are no other (b)(2)-dietary ingredients listed for which a value must be declared in the ''% DV'' column, the column may be omitted as shown in paragraph (e)(11)(vii) of this section. When the ''% DV'' column is not required, but the dietary ingredients listed are subject to paragraph (b)(2)(iii)(F) of this section, the symbol required in that paragraph shall immediately follow the quantitative amount by weight for each dietary ingredient listed under ''Amount Per Serving.''

(3) * * *

(ii) * * *

(A) These amounts shall be expressed using metric measures in appropriate units.

* * * * *

(c) * * *

(4) The sample label shown in paragraph (e)(11)(v) of this section illustrates one method of nutrition labeling a proprietary blend of dietary ingredients.

* * * * *

(e) Except as provided for small and intermediate sized packages under paragraph (i)(2) of this section, information other than the title, headings, and footnotes shall be in uniform type size no smaller than 8 point. A font size at least two points greater shall be used for ''Calories'' and the heading ''Calories'' and the actual number of calories per serving shall be highlighted in bold or extra bold type. Type size no smaller than 6 point may be used for column headings (*e.g.,* ''Amount Per Serving'' and ''% Daily Value'') and for footnotes (*e.g.,* ''Percent Daily Values are based on a 2,000 calorie diet).

* * * * *

(8) If the product contains two or more separately packaged dietary supplements that differ from each other (*e.g.,* the product has a packet of supplements to be taken in the morning and a different packet to be taken in the afternoon), the quantitative amounts and percent of Daily Value may be presented as specified in this paragraph in individual nutrition labels or in one aggregate nutrition label as illustrated in paragraph (e)(11)(iii) of this section.

* * * * *

(11) * * *

BILLING CODE 4164–01–P

(i) Multiple vitamins (Includes voluntary listing of vitamin D in IUs)

Supplement Facts

Serving Size 1 Gelcap
Servings Per Container 100

	Amount Per Serving	% Daily Value
Vitamin A (as retinyl acetate and 50% as beta-carotene)	900 mcg	100%
Vitamin C (as ascorbic acid)	90 mg	100%
Vitamin D (as cholecalciferol)	20 mcg (800 IU)	100%
Vitamin E (as dl-alpha tocopheryl acetate)	15 mg	100%
Thiamin (as thiamin mononitrate)	1.2 mg	100%
Riboflavin	1.3 mg	100%
Niacin (as niacinamide)	16 mg	100%
Vitamin B_6 (as pyridoxine hydrochloride)	1.7 mg	100%
Folate	400 mcg DFE (240 mcg folic acid)	100%
Vitamin B_{12} (as cyanocobalamin)	2.4 mcg	100%
Biotin	3 mcg	10%
Pantothenic Acid (as calcium pantothenate)	5 mg	100%

Other ingredients: Gelatin, lactose, magnesium stearate, microcrystalline cellulose, FD&C Yellow No. 6, propylene glycol, preservatives (propylparaben and sodium benzoate).

(ii) Multiple vitamins for children and adults (excludes Servings Per Container which is stated in the net quantity of contents declaration)

Iodine (from kelp)	150 mcg	100%			
Magnesium (as magnesium oxide)	63 mg	15%			

* Daily Value not established

Other ingredients: Cellulose, stearic acid, and silica.

(f)(1) Compliance with this section will be determined in accordance with § 101.9(g)(1) through (g)(8), (g)(10), and (g)(11), except that the sample for analysis shall consist of a composite of 12 subsamples (consumer packages) or 10 percent of the number of packages in the same inspection lot, whichever is smaller, randomly selected to be representative of the lot. The criteria on class I and class II nutrients given in § 101.9(g)(3) and (g)(4) also are applicable to other dietary ingredients described in paragraph (b)(3)(i) of this section. Reasonable excesses over labeled amounts are acceptable within current good manufacturing practice.

(2) When it is not technologically feasible, or some other circumstance makes it impracticable, for firms to comply with the requirements of this section, FDA may permit alternative means of compliance or additional exemptions to deal with the situation in accordance with § 101.9(g)(9). Firms in need of such special allowances shall make their request in writing to the Office of Nutrition and Food Labeling (HFS–800), Food and Drug Administration, 5100 Paint Branch Pkwy., College Park, MD 20740.

* * * * *

(i)(1) Dietary supplements are subject to the special labeling provisions specified in § 101.9(j)(5)(i) for foods other than infant formula, represented or purported to be specifically for infants through 12 months of age and children 1 through 3 years of age.

Dated: May 16, 2016.

Leslie Kux,

Associate Commissioner for Policy.

[FR Doc. 2016–11867 Filed 5–20–16; 8:45 am]

BILLING CODE 4164–01–P

DEPARTMENT OF HEALTH AND HUMAN SERVICES

Food and Drug Administration

21 CFR Part 101

[Docket No. FDA–2004–N–0258 (Formerly Docket No. 2004N–0456)]

RIN 0910–AF23

Food Labeling: Serving Sizes of Foods That Can Reasonably Be Consumed At One Eating Occasion; Dual-Column Labeling; Updating, Modifying, and Establishing Certain Reference Amounts Customarily Consumed; Serving Size for Breath Mints; and Technical Amendments

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA or we) is issuing a final rule to define a single-serving container; require dual-column labeling for certain containers; update, modify, and establish several reference amounts customarily consumed (RACCs); amend the label serving size for breath mints; and make technical amendments to various aspects of the serving size regulations. We are taking this action to provide consumers with more accurate and up-to-date information on serving sizes.

DATES: *Effective date:* The final rule becomes effective on July 26, 2016.

Compliance date: The compliance date of this final rule is July 26, 2018, for manufacturers with $10 million or more in annual food sales, and July 26, 2019, for manufacturers with less than $10 million in annual food sales. See Section IV, Effective and Compliance Dates, for more detail.

FOR FURTHER INFORMATION CONTACT: *With regard to the final rule:* Cherisa Henderson, Center for Food Safety and Applied Nutrition (HFS–830), Food and Drug Administration, 5100 Paint Branch Pkwy., College Park, MD 20740, 240–402–1450, *NutritionProgramStaff@fda.hhs.gov.*

With regard to the information collection: Domini Bean, Office of Information Management, Food and Drug Administration, 8455 Colesville Rd., Rm. 14537G, Silver Spring, MD 20903, *domini.bean@fda.hhs.gov.*

SUPPLEMENTARY INFORMATION:

Table of Contents

I. Executive Summary

A. Purpose of the Final Rule

Following the passage of the Nutrition Labeling and Education Act (NLEA) of 1990 (Pub. L. 101–535), which added section 403(q) of the Federal Food, Drug, and Cosmetic Act (the FD&C Act) (21 U.S.C. 343(q)), we issued various regulations related to serving size requirements (see 21 CFR 101.9 and 101.12). Since we established those regulations, there have been developments that have compelled us to reevaluate our regulations on serving sizes and determine whether and what, if any, revisions are needed to ensure that the Nutrition Facts label meets its intended goal of providing consumers information to assist them in maintaining healthy dietary practices. Specifically, such developments include the availability of newer consumption data, research showing that amounts of food consumed by the American public have changed, and the availability of recent consumer research on the use and understanding of the Nutrition Facts label.

In consideration of these new developments, this rule amends our regulations in §§ 101.9 and 101.12. Resulting from our evaluation of the new consumption data, this rule amends the RACCs that are used to determine serving sizes consistent with section 403(q)(1)(A)(i) of the FD&C Act, which states that a serving size is an amount of food customarily consumed. Additionally, in consideration of recent consumption data, research on consumption, and research on consumer understanding of the Nutrition Facts label, this rule amends some of the required procedures used to determine serving sizes, amends the definition of a single-serving container, and requires that certain containers of foods bear an additional column of nutrition information to help consumers understand the nutritional significance of consuming an entire container of certain foods containing multiple servings. Overall, the changes finalized in this rule are designed to ensure that serving sizes are based on current consumption data and to provide consumers with information on the Nutrition Facts label related to the serving size that will assist them in maintaining healthy dietary practices.

B. Summary of the Legal Authority

The NLEA amended the FD&C Act to provide FDA with the authority to require nutrition labeling on most packaged foods we regulate. Specifically, section 403(q)(1)(A)(i) of the FD&C Act requires, with certain exceptions, that food that is intended for human consumption and offered for sale bear nutrition information that provides a serving size that reflects the amount of food customarily consumed and is expressed in a common household measure that is appropriate to the food, and is our primary legal authority to issue the regulations in this final rule. Section 2(b)(1)(B) of the NLEA further requires the Secretary of Health and Human Services to issue regulations ''which establish standards . . . to define serving size.'' Additionally, we are relying on section 2(b)(1)(A) of the NLEA, which states that requirements in regulations issued under the authority of the NLEA, including serving size requirements, shall be ''conveyed to the public in a manner which enables the public to readily observe and comprehend such information and to understand its relative significance in the context of a total daily diet.'' Finally, we are relying on the authorities in sections 701(a), 403(a)(1), and 201(n) of the FD&C Act (21 U.S.C. 371(a), 343(a)(1), and 321(n)) for amendments in this final rule. Under section 701(a) of the FD&C Act, we have authority to issue regulations for the efficient enforcement of the FD&C Act. Under section 403(a) of the FD&C Act, a food is deemed misbranded if its labeling is false or misleading in any particular. Additionally, under section 201(n) of the FD&C Act, in determining whether or not a food is misbranded because its labeling is misleading, we must take into account not only representations made or suggested, but also the extent to which the labeling fails to reveal facts that are material in light of such representations or material with respect to consequences that may result from the use of the food. All of the authorities listed in this paragraph

give us the authority to issue this final rule related to serving size labeling.

C. Summary of the Major Provisions of the Final Rule

1. Single-Serving Containers and Dual-Column Labeling

Over the last 20 years, evidence has accumulated demonstrating that container and unit sizes can influence the amount of food consumed. For containers and units of certain sizes, consumers are likely to eat the entire container or unit in one sitting. For other container and unit sizes, consumers may consume the container or unit in one sitting or may consume the container or unit over multiple sittings or share the container or unit contents with other consumers. To address containers that may be consumed in a single-eating occasion, we are requiring that all containers, including containers of products with ''large'' RACCs (*i.e.,* products with RACCs of at least 100 grams (g) or 100 milliliters (mL)), containing less than 200 percent of the RACC be labeled as a single-serving container. To address containers and units that may be consumed in one or more sittings, or shared, we are requiring that containers and units that contain at least 200 percent and up to and including 300 percent of the RACC be labeled with a column of nutrition information within the Nutrition Facts label that lists the quantitative amounts and percent DVs for the entire container, in addition to the required column listing the quantitative amounts and percent DVs for a serving that is less than the entire container (*i.e.,* the serving size derived from the RACC).

2. Changing the RACCs

We established RACCs in 1993 based, in part, on data from Nationwide Food Consumption Surveys (1977–1978 and 1987–1988) conducted by the U.S. Department of Agriculture (USDA). Over the last decade, there has been general recognition that consumption patterns have changed. To determine changes in serving sizes and whether the RACCs should be updated, we analyzed recent food consumption data from the 2003–2008 National Health and Nutrition Examination Surveys (NHANES) (hereinafter referred to as the NHANES 2003–2008 surveys or NHANES 2003–2008 consumption data, as applicable). Generally, this rule amends RACCs if the NHANES median consumption data have increased or decreased by at least 25 percent compared to the 1993 RACCs. However, consistent with our regulations in § 101.12(a), we have considered other factors, such as designating the same RACCs for products with similar consumption data and similar dietary usage or product characteristics.

In addition, since the final rule on serving sizes published in 1993, we have received requests from manufacturers to modify, establish, and identify appropriate product categories within the tables in § 101.12(b) and change the serving size for various food products. Using the data currently available to us, we are also addressing these requests in this final rule.

D. Technical Amendments

We have been alerted to a number of technical amendments that should be made to the serving size regulations in §§ 101.9 and 101.12. This final rule includes a number of technical amendments to help clarify the serving size requirements in these regulations.

E. Effective and Compliance Dates

We are establishing a compliance date of 2 years after the final rule's effective date for manufacturers with $10 million or more in annual food sales, and 3 years after the final rule's effective date for manufacturers with less than $10 million in annual food sales. (For more details, see Section IV, Effective and Compliance Dates.)

F. Costs and Benefits

We have developed one final regulatory impact analysis (FRIA) for this final rule as well as the final rule entitled ''Food Labeling: Revision of the Nutrition and Supplement Facts Labels'' (the Nutrition Facts final rule). The FRIA discusses key inputs in the estimation of costs and benefits of the changes finalized by the rules and assesses the sensitivity of cost and benefit totals to those inputs. The two nutrition labeling rules—which have a compliance date of 2 years after the final rule's effective date for manufacturers with $10 million or more in annual food sales, and 3 years after the final rule's effective date for manufacturers with less than $10 million in annual food sales—have impacts, including the sign on net benefits, that are characterized by substantial uncertainty. The primary sensitivity analysis shows benefits having the potential to range between $0.2 and $2 or $5 billion, and costs ranging between $0.2, $0.5 and $0.8 billion (annualized over the next 20 years, in 2014 dollars, at seven percent interest).[1]

TABLE 1—SUMMARY OF THE PRIMARY SENSITIVITY ANALYSIS OF THE COSTS AND BENEFITS OF THE FINAL RULES

[in billions of 2014$]

	Benefits (low)	Benefits (mean)	Benefits (high)	Costs (low)	Costs (mean)	Costs (high)
Present Value:						
3%	$2.8	$33.1	$77.7	$2.3	$4.8	$8.6
7%	1.9	22.3	52.5	2.2	4.5	8.3
Annualized Amount:						
3%	0.2	2.2	5.2	0.2	0.3	0.6
7%	0.2	2.1	5.0	0.2	0.4	0.8

Notes: Costs estimates reflect an assumption that the rules have the same compliance date. Compliance period is 36 months for small businesses and 24 months for large businesses. For purposes of this analysis, we consider a small business to be a business with annual food sales of less than $10 million, and a large business to be a business with annual food sales of $10 million or more. Costs include relabeling, record-keeping, fiber study, additional labeling, future UPC growth labeling, and reformulation costs. Annualized Amount = Amount/Annualizing Factor. Three percent annualizing factor = 14.88. Seven percent annualizing factor = 10.59. The annualizing factors are calculated by summing the inverse of 1 plus the discount rate to the power of the year (t = 1 through t = 20).

[1] There is substantial uncertainty regarding the impacts of the two nutrition labeling rules. For a full discussion of the uncertainty, please see the Welfare Estimates—Primary Sensitivity Analysis section of the Regulatory Impact Analysis.

II. Background

A. Serving Size Proposed Rule

In the **Federal Register** of March 3, 2014 (79 FR 11989), we published a proposed rule (the serving size proposed rule or the proposed rule) to amend our serving size regulations, in part, in response to recommendations of the Report of the Working Group on Obesity, ''Calories Count,'' March 12, 2004 (Ref. 1), and our recognition that portion sizes have changed since we first published serving size regulations in 1993 (1993 serving size final rule, 58 FR 2229, January 6, 1993). We also published technical amendments to the 1993 serving size final rule on August 18, 1993 (58 FR 44039). The proposed rule also discussed six citizen petitions. The intended effect of the proposed rule, when finalized, was to provide consumers with more accurate and up-to-date information on serving sizes. In brief, the proposed rule would:

- Amend the definition of a single-serving container to remove the exception for products with large RACCs. Preexisting § 101.9(b)(6), which this rule will replace upon the effective date, required that a product that is packaged and sold individually that contains less than 200 percent of the applicable RACC be considered to be a single-serving container, and that the entire content of the product be labeled as one serving, unless the product contains more than 150 but less than 200 percent of the RACC and has an RACC of 100 g or 100 mL or larger. Under the preexisting regulation, manufacturers of products that contain more than 150 but less than 200 percent of the RACC and have an RACC of 100 g or 100 mL or larger (large-RACC products) are permitted to label the product as containing 1 or 2 servings, at the manufacturer's discretion (§ 101.9(b)(6)). The proposed rule would remove the exception for large-RACC products being labeled as one or two servings so that all products packaged and sold individually and that contain less than 200 percent of the RACC would be required to be labeled as a single-serving container.
- Require an additional column within the Nutrition Facts label to list the quantitative amounts and percent DVs for the entire container, to the right of the preexisting column listing the quantitative amounts and percent DVs for a serving that is less than the entire container (*i.e.,* the serving size derived from the RACC), for products that are packaged and sold individually and contain at least 200 percent and up to and including 400 percent of the applicable RACC.
- Update the RACCs when there is a significant change between the median amount consumed from 2003–2008 NHANES consumption data and the RACCs established in the 1993 serving size final rule.
- Modify and establish RACCs for certain product categories based on manufacturer requests and our initiative.
- Amend the serving size for breath mints.
- Make technical amendments to various aspects of the serving size regulations.

We provided an opportunity to comment on the serving size proposed rule until June 2, 2014. On May 27, 2014, we extended the comment period until August 1, 2014 (79 FR 30056). We received more than 500 comments in response to the proposed rule. Most submissions came from individuals. We also received comments from industry and trade associations, consumer and advocacy groups, academic organizations, State governments, and foreign government agencies.

B. Legal Authority

Our primary legal authority to issue regulations that establish requirements for serving size is derived from section 403(q) of the FD&C Act. Specifically, section 403(q)(1)(A)(i) of the FD&C Act requires, with certain exceptions, that food that is intended for human consumption and offered for sale bear nutrition information that provides a serving size that reflects the amount of food customarily consumed and is expressed in a common household measure that is appropriate to the food.

The NLEA added section 403(q)(1)(A)(i) to the FD&C Act and, under section 2(b)(1)(B) of NLEA, required that we issue regulations that establish standards to define serving size. We established those standards in the 1993 serving size final rule, and we have determined that amendments to those regulations are needed. We have analyzed consumption data for various food products and have determined that the data warrant amending many of the RACCs established in 1993. Additionally, both on our own initiative and in response to various requests, we have analyzed data for products that are not listed in the tables in § 101.12(b), and are establishing additional RACCs. Thus, in accordance with section 403(q)(1)(A)(i) of the FD&C Act, we are amending the RACCs in § 101.12(b) to reflect the current amounts customarily consumed for products already listed in § 101.12(b), as well as products not listed in § 101.12(b). Additionally, under the same authority we are amending related regulations in §§ 101.9 and 101.12 that set forth procedures for determining serving sizes for use on product labels based on the reference amounts. Included among these amendments are revisions to the procedures for determining what products must be labeled as a single serving.

Further, in addition to requiring FDA to issue regulations that establish standards to define serving size, section 2(b)(1)(A) of the NLEA states that the regulations shall require such information to be ''conveyed to the public in a manner which enables the public to readily observe and comprehend such information and to understand its relative significance in the context of a total daily diet.'' Under this authority, we are amending § 101.9 to require that certain products provide an additional column within the Nutrition Facts label that lists the quantitative amounts of the required nutrients and food components, and percent DVs for such nutrients and food components, for the entire container or unit of food as well as the column listing the quantitative amounts and percent DVs for a serving of food that is less than the entire container or unit. Section 2(b)(1)(A) of the NLEA provides authority for this amendment because the additional column of information will help consumers to understand the nutritional significance of consuming an entire container or unit of certain foods containing multiple servings in the context of a total daily diet. As discussed further in section III.C.1., research has shown that package and portion size play a role in influencing the amounts that consumers eat, and that consumers can be confused about the amount of nutrients they consume in packages containing more than one serving but that could be consumed in a single eating occasion. The amendment is intended to help consumers understand the amounts of nutrients in certain containers and units of food, as well as the DVs for those nutrients, so that those amounts can be taken into consideration when evaluating a daily diet.

Other relevant authorities that we are relying on for the amendments in this rule include sections 701(a), 403(a)(1), and 201(n) of the FD&C Act. Under section 701(a) of the FD&C Act, we have authority to issue regulations for the efficient enforcement of the FD&C Act. We may issue regulations for the efficient enforcement of the FD&C Act in order to ''effectuate a congressional objective expressed elsewhere in the Act'' (*Association of American Physicians and Surgeons, Inc.* v. *FDA,*

226 F. Supp. 2d 204, 213 (D.D.C. 2002) (citing *Pharm. Mfrs. Ass'n.* v. *FDA,* 484 F. Sup. 1179, 1183 (D. Del. 1980))). Under section 403(a) of the FD&C Act, a food is deemed misbranded if its labeling is false or misleading in any particular. Additionally, under section 201(n) of the FD&C Act, in determining whether or not a food is misbranded because its labeling is misleading, we must take into account not only representations made or suggested, but also the extent to which the labeling fails to reveal facts that are material in light of such representations or material with respect to consequences that may result from the use of the food. These other authorities, in addition to the authorities described previously in this document, give us the authority to issue this final rule related to serving size labeling.

III. Comments and FDA's Responses

This section discusses the issues raised in the comments on the proposed rule and describes the final rule. For ease of reading, we preface each comment discussion with a numbered ''Comment'' and each response by a corresponding numbered ''Response.'' We have numbered each comment to help distinguish among different topics. The number assigned is for organizational purposes only and does not signify the comment's value, importance, or the order in which it was received.

A. General Comments

(Comment 1) Many comments stated that the labeled serving size represents a recommended amount of food to consume. Other comments stated that we were changing the RACCs from a recommended amount of food to eat to the amount of food that people actually eat. Some comments that thought we were changing the serving size from a recommended amount of food to eat to an amount of food that is customarily consumed supported the change. Some of these comments stated that basing the serving size on the actual amount eaten would make it easier for consumers to understand how many calories and other nutrients they are consuming.

In contrast, other comments asserting that we were changing the serving size from a recommended amount to an amount of food that is customarily consumed opposed the perceived change because, according to those comments, such changes would make it more difficult to use the labeled serving size for diet planning or other dietary practices. Further comments stated that updating the serving size portion of the Nutrition Facts label would increase consumer confusion and encourage excess consumption among those who think that the serving size is based on a recommended amount.

(Response 1) Some of these comments reflect a misunderstanding of the definition of serving size. Under section 403(q)(1)(A)(i) of the FD&C Act, serving size is an amount of food customarily consumed and which is expressed in a common household measure appropriate to the food. Thus, the serving size is not a recommended amount of food to eat and was not described as such in the 1993 serving size final rule.

We acknowledge that some consumers may misconstrue the meaning of the serving size set forth in the FD&C Act. Since the publication of the proposed rule, several studies have been conducted that indicate that some consumers believe serving size specifies a recommended amount of food to eat (Refs. 2, 3, and 4), and we recognize that that such an understanding could lead to increased levels of consumption. In order to help consumers understand issues relating to this final rule, as discussed further in response to comment 2, we intend to conduct nutrition education to help clarify the meaning of the serving size and RACCs.

With regard to the comments that stated that updates to serving sizes would make it difficult to use the serving size for diet planning or other dietary practices, we disagree. Providing the nutrition content of the food based on current consumption amounts informs consumers of the amount of nutrients they are likely to ingest.

(Comment 2) Several comments recommended that we conduct extensive consumer education on the changes in this final rule. Some comments requested that we conduct consumer education in conjunction with the USDA regarding all proposed changes to the Nutrition Facts label and the underlying calculations used to determine the quantities presented on the labels. Several comments asserted that without public education, consumers may not fully understand how to use the Nutrition Facts label so that they can maintain healthy dietary practices.

(Response 2) We agree that an extensive consumer education campaign will serve an important role in continuing to provide information to assist consumers in maintaining healthy dietary practices. Currently, we have available a collection of various educational materials (*e.g.,* videos and an array of other education materials (in English and other languages)) on numerous nutrition topics, including materials on the Nutrition Facts label (*e.g.,* Read the Label, Make Your Calories Count, Using the Nutrition Facts Label) (Ref. 5). These materials are intended for educators, teachers, health professionals (*e.g.,* dietitians, nutritionists), as well as for consumers. Our intent is to update our existing educational materials and create new educational opportunities to explain the overall role of using the label to assist consumers in maintaining healthy dietary practices, with an emphasis on each of the new changes of the label.

We intend to continue to work in collaboration, and create new partnership opportunities, with other Federal government agencies including other parts of the Department of Health and Human Services, USDA, State health departments, health professional organizations, food manufacturers, retailers, and non-profit organizations that have an interest and responsibilities in nutrition education and health promotion. These partnerships will help us to develop and disseminate our educational materials, which will ease the transition to the revised nutrition label and help consumers to use the label to make informed dietary choices. Through our collaboration with both government and non-government entities, our continued goal is to increase consumers' knowledge and effective use of the new food label, and to ensure that consumers have accurate and adequate resource materials and information to assist them in maintaining healthy dietary practices. Furthermore, we intend to continue with a variety of activities, such as conducting and reporting on existing and planned food labeling research, developing education initiatives at the national and local level, holding regularly scheduled meetings to build labeling education exchanges, and integrating food labeling education into the existing programs (*e.g.,* USDA school-based nutrition education programs). We plan to continue to build partnerships capable of developing and evaluating labeling education targeted to the dietary needs of diverse populations, such as low-literacy consumers, those with lower incomes, minorities and various specific subpopulations (*e.g.,* children, older adults, women of childbearing age), as well as to the public at large.

(Comment 3) Several comments requested we require that a footnote be added to the Nutrition Facts label to indicate that the serving size is based on typically consumed, not recommended, servings. The comments stated that the purpose of adding this footnote would be to serve as nutrition education to

make consumers aware of the true meaning of the labeled serving size.

(Response 3) We recognize the importance of providing consumers with more in-depth information about the meaning of the serving size and, as explained in response to comment 2, intend to make this a key component of our future nutrition education efforts for consumers. At this time, however, we decline to establish as part of this rulemaking a requirement to add a footnote to the Nutrition Facts label that would indicate that the serving size is based on what is typically consumed, rather than what is recommended. We would like to consider this issue further before finalizing a provision that would mandate or voluntarily permit the addition of such a footnote to the Nutrition Facts label. We also note that, while no such footnote as requested in this comment can be added to the Nutrition Facts label voluntarily, manufacturers can voluntarily include a truthful and not misleading statement explaining the meaning of serving size elsewhere on the product label.

(Comment 4) Some comments requested that we change the term ''serving size'' to prevent consumers from assuming that the serving sizes are recommended servings. Some terms that the comments suggested we use instead were ''typical serving,'' ''unit,'' or ''quantity.'' Another suggestion was to remove the two lines that mention ''serving'' and add, next to the words ''Amount per ___,'' the fraction of the container that the RACC represents (for example, ''Amount per ⅔ cup (⅛ of container)'').

(Response 4) We decline to revise or remove the terms ''serving'' and ''serving size'' as suggested by the comments. Section 403(q)(1)(A) of the FD&C Act deems food, unless subject to an exception, to be misbranded unless its label or labeling bears the ''serving size.'' Therefore, we will continue to require that the terms ''serving'' and ''serving size'' be used on product labels.

(Comment 5) Some comments stated that the ''serving size'' should be expressed in household measurements or that serving size of similar food products should be based off of the same amount of food.

(Response 5) We agree. Section 403(q)(1)(A) of the FD&C Act requires that the serving size be expressed in a common household measure that is appropriate to the food or, if the use of the food is not typically expressed in a serving size, the common household unit of measure that expresses the serving size of the food. In addition, § 101.12(a)(9) states that products that have similar dietary usage, product characteristics, and customarily consumed amounts should have a uniform reference amount. Section 101.12(a)(9) is not being changed in this final rule and was used as part of the decision making when determining what RACCs to update, modify, and establish in the proposed rule and this final rule.

(Comment 6) Several comments indicated that we should consider a uniform serving size for all food products as is done in some other countries, such as 1 cup or 100 g. The comments stated that having a uniform serving size would allow consumers to be able to make side-by-side comparisons of all products in the grocery store.

(Response 6) We do not agree that a uniform serving size should be used for all foods. Under section 403(q)(1)(A) of the FD&C Act, serving size is defined as the amount of food customarily consumed. As all foods are not customarily consumed in the same amount, establishing a uniform serving size for all foods would not meet this statutory requirement.

B. Single-Serving Containers

Preexisting § 101.9(b)(6) requires that a product that is packaged and sold individually and that contains less than 200 percent of the applicable RACC be labeled as a single serving. This provision, however, does not apply to products that have ''large'' RACCs (*i.e.,* products that have reference amounts of 100 g (or mL) or larger). Under preexisting § 101.9(b)(6), manufacturers of large-RACC products could decide whether a package that contains more than 150 percent but less than 200 percent of the applicable RACC is 1 or 2 servings (§ 101.9(b)(6)). We provided the exception for large-RACC products based on consumption data available at the time the 1993 rule was issued that showed that ''[i]t was much less likely that a person will consume approximately twice the reference amount of a food with a reference amount of 100 g (or mL) or more, than it is that he or she would consume twice the reference amount of a food with a smaller reference amount'' (79 FR 11989 at 12000).

In the preamble to the proposed rule (79 FR 11989 at 12001), we discussed the correlation between the consumption variation and the RACCs for all products containing less than 200 percent of the applicable RACC, including products with large RACCs and products that have RACCs that are less than 100 g (or mL), using combined consumption data from the NHANES 2003–2008 surveys (Refs. 6, 7, and 8). The consumption variation is calculated as the standard deviation of the median consumption amount divided by the median consumption amount and then multiplied by 100 to express the figure as the percent variation from the median consumption amount (Ref. 9). The result shows that the correlation coefficient is 0.13, which means that there is a low correlation between the RACCs and the consumption variation for all products containing less than 200 percent of the RACC, regardless of whether the RACC is large. In other words, it is not less likely that a person would consume approximately twice the reference amount of a food with a reference amount of 100 g (or mL) or more than it is that he or she would consume approximately twice the reference amount of a food with a smaller reference amount. Therefore, in the preamble to the proposed rule we proposed to remove the exemption from the requirement to label a product with a large RACC containing between 150 percent and 200 percent of the applicable RACC as a single-serving container because the exemption is no longer supported by consumption data (79 FR 11889 at 12001).

Additionally, as noted in the preamble to the proposed rule, raising the required cutoff for labeling a product with a large RACC as a single serving may help consumers to more accurately interpret the nutrient amounts in these products (79 FR 11889 at 12001). Research shows that package and portion sizes tend to have a considerable impact on the amount of food consumed (Refs. 10 and 11). Taking into account this research, we stated in the proposed rule that removing the exemption from the requirement to label a product with a large RACC as a single-serving container may help consumers to correctly interpret the nutrient amounts in the food that they are consuming (79 FR 11989 at 12001). In light of this research and the previously discussed analysis on consumption variation, we proposed to remove the large-RACC exemption for single-serving containers.

We also proposed to remove the text in preexisting § 101.9(b)(2)(i)(D), which states that if a unit weighs 200 percent or more of the RACC, the manufacturer may declare one unit as the serving size if the entire unit can reasonably be consumed in one eating occasion, and replace the text with the text in proposed § 101.9(b)(2)(i)(D) (which is discussed in section III.C.).

1. Definition of a Single-Serving Container

(Comment 7) Some comments supported our proposed changes to the definition of a single-serving container. The comments said that labeling foods that are less than 200 percent of the RACC as a single serving would increase consumer understanding of the nutritional content of foods. Some comments also stated that the proposed changes would provide consistency across all food products on the amount that constitutes a single serving. Other comments provided research in support of our proposed changes to the definition of a single-serving container.

(Response 7) The research provided in the comments is the same as the research discussed in the preamble of the proposed rule (79 FR 11989 at 11998). Lando & Labiner-Wolfe (2007) found that many focus group study participants believed that products like a large muffin or a 20 ounce (oz) soda that contain more than one serving, but are often eaten at a single eating occasion, should be labeled as a single serving (Ref. 12). Other studies have shown that some consumers may tend to experience a ''unit bias'' and view intact units/packages of food as a marker of the appropriate amount of food to consume (Ref. 13).

(Comment 8) One comment asked that we raise the cutoff for a single-serving container to include containers with up to 300 percent of the RACC. The comment stated that our proposed amendment for single-serving containers to include anything less than 200 percent of the RACC excludes many foods that can reasonably be consumed by one person in a single eating occasion and that food companies could avoid ''per package'' labeling by simply increasing the container size to slightly more than 200 percent of the RACC.

(Response 8) While we understand the concern that keeping the cutoff for single-serving containers at less than 200 percent may exclude some food products that can reasonably be consumed by one person in a single eating occasion, we decline to increase the definition of a single-serving container to include products containing up to 300 percent of the RACC. Under section 403(q)(1)(A)(i) of the FD&C Act, serving size means the amount customarily consumed. The RACCs we have established are reference amounts of food that are customarily consumed per eating occasion. As such, we do not consider it appropriate to label foods containing 200 percent or more of the applicable RACC as single-serving containers because that would be at least twice the amount we have determined is customarily consumed. However, we agree with these comments that such products may reasonably be consumed by one person in a single eating occasion, and as discussed in section III.B., full-package nutrition information, or per-unit nutrition information, as applicable, for products containing at least 200 percent and up to and including 300 percent of the RACC will be required for certain products through dual-column labeling.

(Comment 9) One comment requested clarification on the meaning of the phrase ''products that are packaged and sold individually.'' The comment noted that it understood the phrase ''products that are packaged and sold individually'' to mean products that consist of a single unit and to exclude products that are divided into discrete units. The comment stated that if the phrase ''products that are packaged and sold individually'' does include products that are divided in discrete units, every product would be a product that is ''packaged and sold individually.'' Accordingly, the comment questioned whether the proposed single-serving and dual-column labeling requirements would apply only to products that consist of a single unit, or whether the requirements would also apply to non-discrete bulk products and products divided into discrete units. The comment also requested clarification on whether a product that is ''packaged and sold individually'' must be considered a single-serving container if it contains less than 200 percent of the RACC, and whether it must provide dual-column labeling if it contains 200 percent to 400 percent of the RACC.

(Response 9) In proposed § 101.9(b)(6) we use the phrase ''products that are packaged and sold individually'' and weighing less than 200 percent of the RACC to describe products for which single-serving container labeling requirements would apply. The phrase ''products that are packaged and sold individually'' was also used in the serving size proposed rule to describe products for which the proposed dual-column labeling requirements would apply, provided that they contained at least 200 and up to and including 400 percent of the RACC. In both of these cases we are using the phrase ''products that are packaged and sold individually'' to describe any package bearing a Nutrition Facts label.

A product that is packaged and sold individually, *i.e.,* a container that bears a Nutrition Facts panel, is considered a single-serving container if it contains less than 200 percent of the RACC. A product that is packaged and sold individually would be required to provide dual-column labeling if it contains at least 200 percent and up to and including 300 percent of the RACC, unless an exception from the requirement applies. The change from 400 percent of the RACC as the upper limit for the dual-column labeling requirements to 300 percent of the RACC as the upper limit for the dual-column labeling requirements is discussed in section III.B. While § 101.9(b)(2)(i) provides requirements for the serving size declaration for multiserving products in discrete units, products that satisfy the requirements of § 101.9(b)(6) (*i.e.,* products that are packaged and sold individually and that contain less than 200 percent of the applicable reference amount) are excepted from § 101.9(b)(2) (see 58 FR 2229 at 2234). There was no proposal to change this provision in the proposed rule, and it has not been amended in this final rule. Therefore, products in discrete units that are packaged and sold individually and that contain less than 200 percent of the applicable reference amount are required to be labeled as a single serving under § 101.9(b)(6). Products that contain discrete units and in which each discrete unit weighs at least 200 percent and up to and including 300 percent of the reference amount are required under § 101.9(b)(2)(i)(D) to bear two columns listing the quantitative amounts and percent DVs: One providing nutrition information for a serving that is less than the unit (*i.e.,* the serving size derived from the reference amount) and one providing nutrition information for the entire unit. Further, products in discrete units that are packaged and sold individually and contain at least 200 percent and up to and including 300 percent of the reference amount are required to comply with the dual-column labeling requirements in § 101.9(b)(12)(i). Similarly, products not in discrete units that are packaged and sold individually and contain at least 200 percent and up to and including 300 percent of the reference amount are required to satisfy the dual-column labeling requirements in § 101.9(b)(12)(i).

(Comment 10) Several comments pertained to multiple individually wrapped units in a single container, for which the combined weight of the units in the larger package is less than 200 percent of the RACC. The comments stated that products containing individual units in a container where the entire container weighs less than

200 percent of the RACC are unlikely to be consumed in a single eating occasion. One comment requested an exemption from the single-serving container requirement in a scenario in which a package weighing less than 200 percent of the RACC contains two discrete stuffed sandwiches, and requested that each sandwich, rather than the entire package, be considered one serving. The comment stated that under the proposed amendments to the definition of a single-serving container, the entire package containing the two stuffed sandwiches would need to be labeled as one serving. The comment stated that labeling each discrete stuffed sandwich as a single serving would be consistent with how consumers use and eat these types of products and asserted that consumers typically eat one individually wrapped unit in a single eating occasion, rather than opening a second unit. Another comment requested that we provide an exemption generally from the definition of single-serving container where a package contains multiple individually wrapped units, and each individual unit is labeled as a serving.

(Response 10) We disagree with comments suggesting that products containing discrete units in a container that weighs less than 200 percent of the RACC should be exempt from the single-serving container requirements, regardless of whether the individual units in the container are wrapped. Products containing discrete units in a container weighing less than 200 percent of the RACC were required to be labeled as a single-serving container under the 1993 requirements, unless the product qualified for the large-RACC exception discussed in section III.B. We did not propose to change this requirement in the proposed rule and are not changing it in the final rule. Other provisions of our regulations permit additional flexibility with respect to how products in discrete units are labeled. As explained in response to comment 12 and as reflected in § 101.9(b)(6), for products that are packaged and sold individually (*i.e.,* products bearing a Nutrition Facts panel) that contain more than 150 percent and less than 200 percent of the applicable reference amount, manufacturers may voluntarily add a second column of nutrition information to the left of the column that provides nutrition information per container that will provide nutrition information per common household measure that most closely approximates the reference amount. This would allow manufacturers of products that are packaged and sold individually and that contain two discrete units weighing more than 75 percent and less than 100 percent of the reference amount to voluntarily provide a second column that provides nutrition information per unit. Additionally, for packages that weigh less than 200 percent of the RACC each and that are contained within a larger outer container, manufacturers have the option of labeling each individual package with a Nutrition Facts panel that states that the individual package or container is one serving, and then labeling the outer container to state the number of servings as the number of individual packages within the outer container (§ 101.9(b)(8)(iv)). Finally, in order to provide additional flexibility to manufacturers that want to list nutrition information per unit of food, this final rule amends § 101.9(b)(10)(ii), which allows manufacturers to provide an additional column of nutrition information ''[p]er one unit if the serving size of a product in discrete units in a multiserving container is more than 1 unit.'' This final rule removes language in § 101.9(b)(10)(ii) limiting the provision to use only with multiserving containers. These amendments will allow single-serving products to voluntarily provide an additional column of nutrition information per unit of a product that is in discrete units.

2. Single-Serving Container Option for Large-RACC Products

(Comment 11) Several comments said that our analysis of the correlation between the consumption variation and the RACCs for all products containing less than 200 percent of the applicable RACC is flawed. The comments stated that we defined the average variability in the analysis as the standard deviation as a percent of the mean and that this represents the standard deviation of individual intakes from one person to the next. The comments stated that the standard deviations of the medians in all tables in our analysis are actually the standard errors of the medians and not the standard deviations of individual intakes as previously described (Ref. 9). The comments stated that because we did not actually conduct the appropriate analysis, no conclusion should be drawn from these reported summaries.

(Response 11) After carefully reexamining the data described in the Memorandum-to-file dated February 11, 2014 (Ref. 9), we agree that the standard deviations of the median are, in fact, the standard errors of the medians. Therefore, we have revised the correlation between the consumption variation and the RACCs for all products.

We disagree, however, that no conclusion should be drawn because of the error. The revised correlation coefficient, after adjusting the standard errors to standard deviations by multiplying with square roots of the sample size, is reduced to 0.13 from 0.18. This means that there is an even lower correlation between the RACCs (whether the reference amount is more than or less than 100 g or mL) and the consumption variation for all products containing less than 200 percent of the RACC, regardless of whether the RACC is ''large.'' In other words, the correct calculation reinforces the conclusion that it is not less likely that a person would consume approximately twice the reference amount of a food with a reference amount of 100 g (or mL) or more than it is that he or she would consume approximately twice the reference amount of a food with a smaller reference amount.

(Comment 12) One comment expressed concern about the impact that removing the exception for large-RACC products in § 101.9(b)(6) would have on products with varying densities. According to the comment, some varieties of the same type of product have serving sizes that are less than 200 percent of the RACC, while other varieties of the same type of product have serving sizes that are 200 percent of the RACC or greater. The comment noted as an example canned soups of different varieties that are often packaged in the same size and type of container, for which the different varieties may have different densities (*e.g.,* a cream-based soup may be heavier than a broth-based soup). According to the comment, under the proposed rule soups containing less than 200 percent of the RACC, or less than 490 g, would be required to be labeled as a single serving, while soups containing 200 to 400 percent of the RACC, or 490 to 980 g, would be labeled with dual-column labeling.

Another comment noted that inconsistencies in nutrition label formats could result from the use of single- and dual-column labeling for similar products which could lead to consumer confusion and make it difficult for consumers to compare identical products that may contain 200 percent or more of the RACC and use a dual-column label with single-serving container products that use a single-column label (*e.g.,* 19 oz, 24 oz, and 40 oz products of identical formulation). The comment said that these products are often merchandised side-by-side in supermarkets and asserted that the

presence of two different serving sizes and two different formats (dual-column labeling for the 19 and 24 oz product versus single-column labeling for 13 and 15 oz products) would confuse the consumer.

We also received a comment requesting that we allow voluntary dual-column labeling for products that contain more than 150 and less than 200 percent of the RACC to present nutrition information per serving and per common household measure closest to the RACC. The comment noted that under the proposed rule, such products would be single-serving containers and would be required to declare nutrition information on a ''per container'' basis (proposed § 101.9(b)(6)). The comment asserted that it would be appropriate to provide nutrition information on a ''per container'' basis for these products but noted that some consumers may not eat the entire container in one sitting. The comment suggested that some consumers would find it helpful to have nutrition information on the label for an amount of food that approximates or is closest to the RACC.

One comment noted that it is a common practice for retailers to create a private label product with a ''slightly lower'' net content. In these instances, consumers would compare a brand name product to a private label product with a slightly lower net content and think the private label brand has a better nutritional profile than the brand name. The comment stated that this is because consumers would fail to understand that the nutritional difference is a result of the difference in net contents between the two products, not the actual nutritional value.

(Response 12) We recognize that certain differences will appear on product labels between the amounts of nutrients per serving listed on products that contain close to, but less than, 200 percent of the RACC, and products that contain 200 percent of the RACC or more. Allowing products that contain less than 200 percent of the RACC to voluntarily display an additional column with nutrition information per common household measure that most closely approximates the reference amount will allow consumers to easily compare the nutrition information of products containing more than 150 percent but less than 200 percent of the RACC with products that contain 200 percent of the RACC or more. Therefore, we are amending § 101.9(b)(6) to add a provision that allows manufacturers of products that contain more than 150 percent and less than 200 percent of the applicable reference amount to voluntarily add a second column of nutrition information to the left of the column that provides nutrition information per container (*i.e.,* per serving) that will provide nutrition information per common household measure that most closely approximates the reference amount. This provision will allow consumers to compare more easily the nutrition information amongst similar products that are packaged in containers that are near 200 percent of the RACC by allowing manufacturers to use a similar dual-column label format. This voluntary labeling provision is not limited to large-RACC products, but is permitted for all products that are packaged and sold individually in containers that are more than 150 percent and less than 200 percent of the RACC.

With regard to the concern that products of nearly identical size could appear to have significantly different amounts of nutrients per serving due to the fact that some products could be required to be labeled as a single serving while similar products could be labeled as having two servings, we note that the dual-column labeling requirements (see section III.C.) will help ensure that consumers have the opportunity to compare the nutritional information for the package as a whole for products containing at least 200 percent and up to and including 300 percent of the RACC with the serving size for those products containing just under 200 percent of the RACC.

To address the comment that stated that a lower net content in some product manufacturing would cause consumers to think that a certain product has a better nutritional profile than another, we note that the nutrition information that is provided on these products would still be accurate. If the net content is lower, the amount of product a person is likely to consume is also lower, which is reflected in the nutrition information on the label.

(Comment 13) We received numerous comments that supported the removal of the exemption for large-RACC products from the definition of a single-serving container. These comments stated that products containing less than 200 percent of the RACC are likely to be consumed in a single eating occasion and should be labeled as a single serving.

Several comments opposed the removal of language from § 101.9(b)(6), which gives manufactures the flexibility to label large-RACC products that contain more than 150 percent but less than 200 percent of the RACC as 1 or 2 servings, or to label packages that contain 200 percent or more of the applicable RACC as a single serving if the contents of the entire package can reasonably be consumed at a single eating occasion. The comments stated that eliminating this option takes away a manufacturer's flexibility and asserted that manufacturers are in the best position to determine if a product should be labeled as one or two servings. Other comments stated that labeling products with less than 200 percent of the RACC as one serving may not be appropriate for all foods. For example, several comments stated that some side dishes, such as frozen potato products, frozen vegetables, and macaroni and cheese kits, are consumed in smaller quantities than entrée items, and a consumer could not reasonably consume an amount close to 200 percent of the RACC.

A few comments objected to requiring products that were previously labeled as two servings to be labeled as one serving and asserted there was no change in consumption data. Other comments did not like the ''one size fits all'' approach and suggested that we look at actual usage of each product category before requiring that a product be labeled as a single serving. One comment noted that labeling products that are regulated by FDA and the USDA, such as chili, soup, stews, and several mixed dishes that often come in 15 oz cans (425 g), as a single serving would be a shift from the industry standard of labeling cans of this size as containing ''about 2 servings.''

(Response 13) We disagree with the comments opposing the removal of the option of large-RACC products (*i.e.,* those products with an RACC of 100 g or 100 mL or larger) that contain more than 150 percent but less than 200 percent of the RACC to be labeled as one or two servings. We also disagree with the assertion that there has been no change in consumption data since 1993. We stated in the 1993 serving size final rule that we agreed with the comments that the 200 percent cutoff level may be too high for some products with large RACCs. Further, we stated that the reference amounts of these products are very large compared to many other products, and examination of food consumption data showed that the average variability (defined as the standard deviation as a percent of the mean) in the amount customarily consumed for foods having a reference amount of 100 g (or mL) or larger is about two-thirds of the variability for foods having a reference amount less than 100 g (58 FR 2229 at 2233). In other words, in 1993, we concluded that it was much less likely that a person would consume approximately twice the reference amount of a food with a

reference amount of 100 g (or mL) or more, than it was that he or she would consume approximately twice the reference amount of a food with a smaller reference amount. Therefore, in the 1993 serving size final rule, we concluded that, for those products that have large RACCs, 150 percent may be a reasonable cutoff for a single-serving container (58 FR 2229 at 2233).

However, as discussed previously in this document, in developing the proposed rule, we examined the correlation between the consumption variation and the RACCs for all products containing less than 200 percent of the applicable RACC, including the products with large RACCs and products that have RACCs that are less than 100 g (or mL), using combined consumption data from the NHANES 2003–2008 surveys (Ref. 9). The result shows that the correlation coefficient is 0.13, which means that there is a low correlation between the RACCs (whether the reference amount is more than or less than 100 g or mL) and the consumption variation for all products containing less than 200 percent of the RACC, regardless of whether the RACC is ''large.'' In other words, it is not less likely that a person would consume approximately twice the reference amount of a food with a large RACC than it is that he or she would consume approximately twice the reference amount of a food with a smaller reference amount. Therefore, we determined that the exemption from the requirement to label a product with a large RACC that contains more than 150 percent but less than 200 percent of the applicable RACC as a single-serving container is no longer warranted. We are also working with USDA to harmonize our regulations.

In response to the comments that stated that we are reducing the flexibility of our regulations, although we work to increase the flexibility of our regulations when appropriate, the purpose of this option was not to allow manufacturers the ability to make a choice, but to allow for foods to be labeled in a way that reflects how much a person is consuming a certain product. Our decision to remove this option is based on the data indicating that consumers are consuming the same amount of large-RACC products in proportion to the RACC as they are of smaller-RACC products in proportion to the RACC.

To address the comments that stated that not all foods that are less than 200 percent of the RACC should be considered a single serving, we reiterate that research demonstrates that package and portion sizes tend to have a considerable impact on the amount of food consumed (Refs. 10 and 11). We also note that we did not propose to change the upper limit for the definition of a single serving container in the serving size proposed rule. Additionally, as explained in comment 12, we are amending § 101.9(b)(6) to allow manufacturers of products that contain more than 150 percent and less than 200 percent of the applicable reference amount to voluntarily add a second column of nutrition information to the left of the column that provides nutrition information per container, which will provide nutrition information per common household measure that most closely approximates the reference amount.

(Comment 14) Some comments stated that requiring products that were previously labeled as two servings to be labeled as one serving would encourage consumers to eat more. One comment asserted that the information on the label of a single-serving container could discourage consumption of a particular food product due to the quantity of a specific nutrient in the container or other information about the product, while on the whole that product could provide valuable nutrients in the diet. The comment gave an example of a frozen entrée that may be high in saturated fat, yet be a good source of protein, dietary fiber, and potassium. The comment stated that, if consumers were to focus only on the saturated fat content of the product, they may choose not to eat the frozen entrée, even though it is a good source of other essential nutrients.

(Response 14) As noted previously, research demonstrates that package and portion sizes tend to have a considerable impact on the amount of food consumed (Refs. 10 and 11). We acknowledge that certain consumers may pay attention to specific, individual nutrients, but one of the main goals of nutrition labeling is to provide consumers with accurate nutrition information to assist them in maintaining healthy dietary practices. If a product is high or low in a specific nutrient for which an individual consumer is looking to either increase or decrease intake, this information is useful to consumers who are interested in the specific nutrient. Consumer education on understanding the Nutrition Facts label and the diet can be used to help explain the benefits and risks associated with the intake of nutrients. Additionally, for products that satisfy the requirements to make a nutrient content claim such as a ''good source'' claim (see 21 CFR 101.54), the product may include such a claim to draw attention to the positive attributes of the product.

C. Dual-Column Labeling

Preexisting § 101.9 provides various provisions for types of voluntary dual-column labeling (*e.g.,* paragraphs (b)(10), (e), and (h)(4)) and one provision for mandatory dual-column labeling under certain circumstances (paragraph (b)(11)). In comment 10 we discuss a revision in this final rule to the voluntary dual-column labeling provision in § 101.9(b)(10)(ii), which broadens the scope of the provision to allow dual-column labeling per unit for single-serving products. Also, in comment 12 we discuss a new voluntary provision for dual-column labeling for products that are packaged in containers that include more than 150 percent but less than 200 percent of the RACC, in § 101.9(b)(6).

In the preamble of the proposed rule (79 FR 11989 at 11998 to 11999), we cited research that shows that dual-column labeling with the nutrition information given per serving and per package may help certain consumers recognize nutrient amounts per package in certain types of packaged foods (Refs. 14 and 15). In the preamble of the proposed rule (79 FR 11989 at 11999), we also discussed consumer research that we conducted to help increase our understanding of whether modifications to the label format may help consumers use the label. Our study compared participants' ability to perform various tasks, such as evaluating product healthfulness and calculating the number of calories and other nutrients per serving and per container, when using the current label versus modified versions of the current label. The main findings from this study are that the availability of single-serving-per-container labels and dual-column labels resulted in more participants correctly identifying the number of calories per container and the amount of other nutrients per container and per serving compared to single-column labels that listed two servings per container.

The proposed rule would require, under certain circumstances, the use of dual-column labeling to provide nutrition information per serving and per container (proposed § 101.9(b)(12)(i)), or per serving and per unit of food (proposed § 101.9(b)(2)(i)(D)). As noted in the preamble of the proposed rule, such dual-column labeling will provide nutrition information for those who consume the entire container in one eating occasion as well as those who consume the container over multiple

eating occasions or share the container with others (79 FR 11989 at 12003).

In the preamble of the proposed rule we stated that to determine an upper limit for the range of package sizes for which dual-column labeling would be required, we looked at food consumption data from NHANES 2003–2008 surveys (Ref. 16) (79 FR 11989 at 12003). The intake distribution per eating occasion for each product showed that for almost all products, regardless of the amount of the RACC, the ratio of the intake at the 90th percentile level to the RACC was 400 percent or less. Therefore, we determined that dual-column labeling for packages containing at least 200 percent of and up to and including 400 percent of the RACC would capture the most frequent consumption habits for almost all product categories. Conversely, the data show that products that contain more than 400 percent of the current RACC are less likely to be consumed in one eating occasion compared to products that contain 400 percent or less of the current RACC. Therefore, we proposed dual-column labeling to be required for all packages that contain at least 200 percent of and up to and including 400 percent of the applicable RACC (proposed § 101.9(b)(12)(i)).

In the preamble of the proposed rule (79 FR 11989 at 12004) we requested comment on exemptions from dual-column labeling for products that require further preparation, such as macaroni and cheese kits, pancake mixes, pasta products, and for products that are commonly consumed in combination with other foods (*e.g.,* cereal and milk), and that contain at least 200 percent and up to and including 400 percent of the applicable RACC. Under our regulations, nutrition information for these types of products may be presented for two or more forms of the same food (*e.g.,* both as ''purchased'' and ''prepared'') (§ 101.9(e)). Some of these products voluntarily contain two columns of nutrition information on the ''as purchased'' and ''as prepared'' forms of the food. Therefore, we tentatively concluded in the proposed rule that these types of products that require further preparation and voluntarily include two columns of nutrition information on the ''as purchased'' and ''as prepared'' forms of the food, and for products that are commonly consumed in combination with other foods (*e.g.,* cereal and skim milk) (§ 101.9(h)(4)) should be exempt from the dual-column labeling requirements.

In § 101.9(b)(12)(ii) we proposed to require that if a health or nutrient content claim is made on the label of a product that uses dual-column labeling, as would be required under proposed § 101.9(b)(12)(i) and (b)(2)(i)(D), the claim would be required to be followed by a statement that sets forth the basis on which the claim is made if the product qualifies for the claim based on the amount of the nutrient per RACC and not the amount in the entire container or unit of food (*e.g.,* for nutrient content claims, ''good source of calcium'' ''a serving of __oz. of this product contains 150 mg of calcium'' or, for health claims, ''A serving of __ ounces of this product conforms to such a diet'').

As noted previously in the introduction to section III.B., we also proposed to remove the text in preexisting § 101.9(b)(2)(i)(D), which states that if a unit weighs 200 percent or more of the RACC, the manufacturer may declare one unit as the serving size if the entire unit can reasonably be consumed in one eating occasion. Proposed § 101.9(b)(2)(i)(D) states that if a unit weighs at least 200 percent and up to and including 400 percent of the applicable reference amount, the manufacturer must provide an additional column within the Nutrition Facts label that lists the quantitative amounts and percent DVs for the individual unit, as well as the preexisting columns listing the quantitative amounts and percent DVs for a serving that is less than the unit (*i.e.,* the serving size derived from the RACC).

1. General Comments on Dual-Column Labeling

(Comment 15) We received several comments in support of the dual-column labeling requirements as proposed. The comments stated that because consumers may eat a full package of food regardless of its serving size, those consumers must be able to easily understand the nutrition content of the full package of food as consumed. A few comments stated that consumers who might otherwise simply assume that the Nutrition Facts label applies to the entire package would see, at a glance, that the nutrition information for the entire package is considerably greater than the serving size. These comments stated that seeing two sets of nutrition information per serving and per container could prompt people to think about the portion size they are consuming.

Some comments mentioned specific food product categories that they thought would be ideal for dual-column labeling because they are sometimes consumed by a single person in one eating occasion and sometimes eaten over multiple meals or by multiple people. The products mentioned in the comments included pints of ice cream, frozen pizzas, main entrées, side dishes, frozen vegetables, bags of chips, large candy bars, snack foods, cookies, and 20 oz sodas.

(Response 15) We agree that dual-column labeling will help consumers more easily understand the contents of a particular package both on a per-serving and per-container basis. As discussed in the introduction to section III.C., research suggests that dual-column labeling helps consumers understand the amount of nutrients in an entire container of food. The foods that were listed in the comments as being appropriate for dual-column labeling are similar to the foods that were mentioned in the April 4, 2005, Advance Notice of Proposed Rulemaking (ANPRM) entitled ''Food Labeling: Serving Sizes of Products that Can Reasonably Be Consumed At One Eating Occasion; Updating of Reference Amounts Customarily Consumed; Approaches for Recommending Smaller Portion Sizes'' as foods that consumers thought were single servings, but were really multiple servings (70 FR 17010 at 17013). To the extent these comments suggest that the requirements relating to dual-column labeling should apply only to certain types of products, we disagree. This issue is addressed in our response to comment 19.

(Comment 16) We received several comments that opposed the additional wording that we proposed to require in § 101.9(b)(12)(ii) if a health or nutrient content claim is made on a product containing a dual-column label. The comments asserted that the proposed statements are too lengthy and unnecessary, would clutter the label and take focus away from information in the claim, and would create inconsistency across package sizes. The comments asserted that there is no consumer research to establish that nutrient content claims on dual-column labels present the potential for consumer confusion (*i.e.,* without the ''basis'' language), that consumers would believe that the claims are based on an entire container in the event dual-column labeling were used, or that the proposed language would assist consumers in understanding the basis for the claim. The comments further questioned whether we had an adequate legal basis for requiring the proposed explanatory statement and noted that there is a current regulation that allows for indicating the basis of a claim if the claim is not based on the RACC. A few comments indicated that if some type of

statement becomes necessary, then it should be very simple and short, such as the addition of ''per serving'' or ''per *X* oz. serving.'' We received one comment in support of the statement as proposed. We received one comment that requested we limit the qualifying statement to nutrient content claims about the absence of a nutrient (*e.g.,* low fat), as when these type of claims are made on products that include a dual-column label, the product would only meet the criteria for the claim on the basis of the RACC and per labeled serving, but not the entire container.

(Response 16) We do not agree that a statement explaining the basis of a nutrient content claim or health claim, as described in proposed § 101.9(b)(12)(ii), is always unnecessary. Because the use of dual-column labeling per serving and per container will become more prevalent on food labels, consumers will more often encounter nutrition claims on foods with dual-column labeling. When consumers encounter a nutrient content claim or health claim (*e.g.,* low fat) and are also presented with two sets of nutrition information (*i.e.,* per serving information and per container information), and the criteria for the claim would only be met based on the set of nutrition information that does not apply to the entire container or unit, as applicable, explanation is needed to avoid consumer deception and clarify which set of nutrition information the claim applies to. When the claim relates to the nutritional information presented in one column, but not the other, the possibility for consumer deception is self-evident. Due to the expected use of nutrient content claims and health claims on products using dual-column labeling, we want to ensure that consumers understand the basis on which the claim is made. We are authorized to prohibit claims that are false or misleading under sections 403(a) and 201(n) of the FD&C Act. *See also Cent. Hudson Gas & Elec. Corp.* v. *Public Serv. Comm'n,* 447 U.S. 557, 593 (1980) (explaining that ''false and misleading commercial speech is not entitled to any First Amendment protection''). Current provisions for claims require a manufacturer to communicate if a product meets the criteria for a nutrient content claim or health claim only on the basis of the reference amount (*e.g.,* a product with a serving size of 2 cookies weighing 35g, but that only meets the criteria for a nutrient content claim based on the 30 g RACC for cookies) (§ 101.12(g)), but there are currently no provisions which require a claim to explain which set of nutrition information it is based on in the context of dual-column labeling. When a nutrient content claim or health claim is made on a package that does not use dual-column nutrition labeling, consumers are provided with only one set of nutrition information (based on the serving size) in the Nutrition Facts label to associate with the claim. In the case of dual-column labeling, however, consumers are presented with two sets of nutrition information and would not be able to determine which set of data to associate with the claim. Therefore, in order to help consumers understand the context of the claim, there is a need for a provision requiring a statement that sets forth the basis on which the claim is made under certain circumstances when dual-column labeling is presented on the product label.

We agree, however, that the proposed statements could be lengthy. The comments provided examples of concise language that could accompany nutrient content claims and still meet the objective of indicating the basis of the claim. We agree that, when possible, shorter clarifying statements on the food label are preferable and that more concise language than that in proposed § 101.9(b)(12)(ii) is available for nutrient content claims. Therefore, for nutrient content claims, § 101.9(b)(12)(ii) requires manufacturers to state that the claim refers to the amount of a nutrient per serving or per reference amount but allows the use of simpler language to explain the basis on which nutrient content claims are made per serving (*e.g.,* ''good source of calcium per serving'' or ''per X [insert unit]__ serving'') or per reference amount (*e.g.,* ''good source of calcium per [insert reference amount (*e.g.,* per 8 ounces)]''), as required based on § 101.12(g). For health claims, no examples of more concise language were provided in comments to the proposed rule, and upon further evaluation of the explanatory statement provided in the proposed rule (*i.e.,* ''A serving of __ ounces of this product conforms to such a diet''), we believe that the statement is as concise as possible to convey the intended message. Health claims, as opposed to nutrient content claims, already frequently require informational statements related to the substance of the claim, the disease condition, and/or the target populations. Therefore, we conclude that the statement related to the basis of the claim, as proposed, is an appropriate statement to include with health claims, is consistent with other types of accompanying statements to health claims, and is as concise as needed for the intended message.

With regard to the assertion that the additional wording that we proposed to require in § 101.9(b)(12)(ii) if a health or nutrient content claim is made on a dual-column label would create inconsistency across package sizes, we note that distinctions already may arise among products of different sizes with regard to which package sizes are eligible to bear a nutrient content or health claim. Claims are typically based on the RACC, but in some cases they are based on both an RACC and a per label serving size. Existing requirements may already result in differences in the eligibility of a food packaged in different forms (*e.g.,* bulk package versus individual serving packages) to bear a specific claim. Likewise, differences exist with regard to the ability of products to make nutrient content or health claims because of the variety of possible size options (*e.g.,* one very large cookie versus an individual serving container of small cookies).

With regard to the comment that suggested the requirement to include the qualifying statement should be limited to nutrient content claims about the absence of a nutrient, we disagree with establishing a limitation based on the specific claim at issue (*e.g.,* low fat) but agree with the comment to the extent that it suggests that the qualifying statement should not be required on product labels when the product would meet the criteria to make the claim at issue based on both columns of nutritional information. We agree, for example, that if a product for which dual-column labeling would be required under § 101.9(b)(12)(i) were to contain sufficient vitamin C per serving to make a ''high'' claim regarding vitamin C content, and the container as a whole were to meet the criteria for a ''high'' in vitamin C claim, consumers are not likely to be misled by the presence of such a claim in the absence of a qualifying statement. The language in proposed § 101.9(b)(12)(ii) already provides an exception from the requirement for products when the nutrient that is the subject of the claim meets the criteria based on the entire container or unit amount. We have modified that language in the final rule to explain that a clarifying statement is not required for products when the nutrient that is the subject of the claim meets the criteria for the claim based on the reference amount for the product and the entire container or the unit amount.

(Comment 17) One comment questioned our legal authority to require dual-column labeling. The comment

stated that section 403(q)(1)(A)(i) of the FD&C Act requires nutrition information to be provided on the basis of an amount customarily consumed and which is expressed in a common household measure that is appropriate to the food. The comment stated that the quantity of nutrients in a package or unit that contains at least 200 percent and up to and including 400 percent of the RACC is not an amount customarily consumed and that none of the exemptions stated in the NLEA give us the authority to require nutrition information to be declared on the basis of an amount other than the serving size.

(Response 17) We disagree with the suggestion that we lack the legal authority to require dual-column labeling. The mandatory dual-column label will continue to provide nutrition information based on the labeled serving size, which is the amount that is customarily consumed. As explained previously in section II.B., the primary legal authority for requirements pertaining to the labeled serving size is derived from section 403(q)(1)(A) of the FD&C Act, with additional authority coming from section 2(b)(1)(B) of the NLEA. Additionally, the legal authority for the second column in a dual-column label is derived from section 2(b)(1)(A) of NLEA, which states that requirements in regulations issued under the authority of the NLEA shall ''be conveyed to the public in a manner which enables the public to readily observe and comprehend such information and to understand its relative significance in the context of a total daily diet'' (79 FR 11989 at 11991). As explained previously in section III.C. and in the preamble to the proposed rule (79 FR 11989 at 11999), consumer research shows that the availability of dual-column labels results in more participants correctly identifying the number of calories per container and the amount of other nutrients per container compared to single-column labels that listed two servings per container. Additional authority for the dual-column labeling requirements includes section 701(a) of the FD&C Act, which provides us with authority to issue regulations for the efficient enforcement of the FD&C Act.

(Comment 18) One comment asserted that we failed to consider certain First Amendment concerns associated with the proposed dual-column labeling requirements. The comment asserted that the purpose of dual-column labeling is to shape consumer behavior rather than to provide purely factual information, and that we justified our proposal to require dual-column labeling based on a study that concluded that dual-column labeling reduces snack food consumption when compared to single-column labeling for people who are not currently dieting. The comment stated that by explaining that we would continue to conduct consumer research throughout the rulemaking process to help enhance our understanding of whether and how much any modifications to the label format may help consumers use the label, we impliedly conceded the insufficiency of our reliance on this study in the proposed rule.

The comment further questioned our asserted reliance on statutory authority granted in section 2(b)(1)(A) of the NLEA in light of our mandate to implement regulations in accordance with the First Amendment. The comment asserted that because dual-column labeling ''is unnecessarily duplicative,'' the dual-column labeling requirement would be subject to analysis under the standard set forth in *Central Hudson Gas & Elec. Corp.* v. *Public Serv. Comm'n,* 447 U.S. 557 (1980), rather than *Zauderer* v. *Office of Disciplinary Counsel of Supreme Court,* 471 U.S. 626 (1985). The comment asserted that the Supreme Court's decision in *Zauderer* and its progeny supports the proposition that the government may require a clarifying disclosure ''to dissipate the possibility of consumer confusion or deception'' after finding that the possibility of deception is ''self-evident,'' *id.* at 652, and that mandatory disclosures are not permitted unless the state demonstrates an actual likelihood that consumers will be misled absent the disclosure.

The comment asserted that we admitted that the dual-column labeling requirement attempts to influence consumer behavior by discouraging consumers from consuming food that is packaged between 200 percent and 400 percent of the RACC. The comment stated that we failed to establish that dual-column labeling would serve a substantial government interest in discouraging consumption of food that is packaged between 200 percent and 400 percent of the RACC. The comment further asserted that we failed to establish in the proposed rule that dual-column labeling would have a discernable effect on consumer behavior and, therefore, that the proposed rule cannot satisfy the third prong of *Central Hudson* in that it did not present evidence that dual-column labeling would directly advance the interest in promoting consumer health and preventing overconsumption of certain foods. The comment stated that we rely in part on study results suggesting that dual-column labeling reduces snack food consumption but asserted that we failed to consider the effect of dual-column labeling on consumption of other categories of food besides snacks. According to the comment, we inexplicably concluded, based on studies of ''junk foods'', that consumption of all foods packaged as RACCs between 200 percent and 400 percent should be discouraged.

The comment asserted that the dual-column labeling requirement as proposed is ''vastly overbroad'' and fails to satisfy *Central Hudson's* reasonable fit test, in part because we acknowledged in the proposed rule that modifying the Nutrition Facts label would require some reeducation on how to read the Nutrition Facts label. The comment asserted that we failed to adequately consider comments that suggested that the dual-column format may be confusing and that we erroneously suggested that the burden is on opponents of the regulation to provide evidence that dual-column labeling may be confusing.

(Response 18) We recognize the importance of the First Amendment protections raised in this comment, and we disagree with the assertion that we neglected to consider such protections in proposing the dual-column labeling requirements. In *Zauderer,* the Supreme Court explained that ''[b]ecause the extension of First Amendment protection to commercial speech is justified principally by the value to consumers of the information such speech provides, [a speaker's] constitutionally protected interest in *not* providing any particular factual information in his advertising is minimal.'' 471 U.S. at 651 (emphasis in original) (internal citations omitted). Requirements ''to make purely factual disclosures related to . . . business affairs, whether to prevent deception or simply to promote informational transparency, have a 'purpose . . . consistent with the reasons for according constitutional protection to commercial speech' . . . [and] facilitate rather than impede the 'free flow of commercial information.' '' *Beeman* v. *Anthem Prescription Mgmt.,* 58 Cal. 4th 329, 356 (Cal. 2013) (quoting *44 Liquormart, Inc.* v. *Rhode Island,* 517 U.S. 484, 501 (1996) and *Va. Pharmacy Bd.* v. *Va. Consumer Council,* 425 U.S. 748, 765 (1976), respectively). As a result, government requirements to disclose factual commercial information are subject to a more lenient constitutional standard than that set forth under the *Central Hudson* framework. *Zauderer,* 471 U.S. at 651. Under *Zauderer,* the government can

require disclosure of factual information in the realm of commercial speech as long as the disclosure provides accurate, factual information; is not unjustified or unduly burdensome; and is ''reasonably relate[d]'' to an adequate interest. *Id.*

Contrary to the comment's assertion, the validity of the dual-column labeling requirements under the First Amendment is properly evaluated under *Zauderer,* 471 U.S. 626, rather than *Central Hudson,* 447 U.S. 557. Courts generally apply *Zauderer*'s rational relationship test, as opposed to intermediate scrutiny under *Central Hudson,* ''in compelled commercial disclosure cases'' because ''mandated disclosure of accurate, factual, commercial information does not offend the core First Amendment values of promoting efficient exchange of information or protecting individual liberty interests.'' *Nat'l Elec. Mfrs. Ass'n* v. *Sorrell,* 272 F.3d 104, 114–15 (2d Cir. 2001) (explaining that the disclosure of accurate, factual commercial information ''furthers, rather than hinders, the First Amendment goal of the discovery of truth''). Case law interpreting *Zauderer* clarifies that the government need not establish that compelled disclosure will prevent consumer deception for the *Zauderer* standard to apply. In *American Meat Institute* v. *USDA,* the court held that ''[t]he language with which Zauderer justified its approach. . .sweeps far more broadly than the interest in remedying deception.'' 760 F.3d 18, 22 (D.C. Cir. 2014) (en banc). In reaching the conclusion that the applicability of *Zauderer* extends beyond regulations in which the government is attempting to mandate a disclosure to remedy deception, the court focused on the ''material differences between disclosure requirements and outright prohibitions on speech,'' *id.* (quoting *Zauderer,* 471 U.S. at 650), the fact that ''the First Amendment interests implicated by disclosure requirements are substantially weaker than those at stake when speech is actually suppressed,'' *id.* (quoting *Zauderer,* 471 U.S. at 652 n.14), and the fact that ''[b]ecause the extension of First Amendment protection to commercial speech is justified principally by the value to consumers of the information such speech provides, [a] constitutionally protected interest in not providing any particular factual information in his advertising is minimal,'' *id.* (citing *Zauderer,* 471 U.S. at 651). The court found that, ''[a]ll told, Zauderer's characterization of the speaker's interest in opposing forced disclosure of such information as 'minimal' seems inherently applicable beyond the problem of deception.'' *Id.* Several other circuits concur. *See Pharm. Care Mgmt. Ass'n* v. *Rowe,* 429 F.3d 294, 297–98, 310, 316 (1st Cir. 2005); *N.Y. State Rest. Ass'n* v. *N.Y. City Bd. of Health,* 556 F.3d 114, 133 (2d Cir. 2009); *Nat'l Elec. Mfrs. Ass'n* v. *Sorrell,* 272 F.3d 104, 115 (2d Cir. 2001) (affirming use of the ''reasonable-relationship'' *Zauderer* standard when ''the compelled disclosure at issue . . . was not intended to prevent 'consumer confusion or deception'''); *Discount Tobacco City & Lottery, Inc.* v. *United States,* 674 F.3d 509, 556 (6th Cir. 2012) (holding that ''*Zauderer*'s framework can apply even if the required disclosure's purpose is something other than or in addition to preventing consumer deception''); *CTIA—The Wireless Ass'n®* v. *City of Berkeley,* No. C–15–2529, 2015 U.S. Dist. LEXIS 126071, at *46 (N.D. Cal. 2015) (holding that *Zauderer* is not ''limited to preventing consumer deception'' and explaining that ''it would make little sense to conclude that the government has greater power to regulate commercial speech in order to prevent deception than to protect public health and safety'').

The dual-column labeling requirements readily satisfy the *Zauderer* test. First, the proposed dual-column labeling provisions, which are being finalized in this rule, require accurate disclosures of factual commercial information. The required disclosure will help facilitate the free flow of commercial information and does not ''prescribe what shall be orthodox in politics, nationalism, religion, or other matters of opinion.'' *Zauderer,* 471 U.S. at 651 (quoting *W. Va. State Bd. of Educ.* v. *Barnette,* 319 U.S. 624, 642 (1943)). The comment did not dispute the accuracy of the information at issue.

Second, the dual-column labeling requirements would not be unduly burdensome. Factual nutrition information is currently required to be provided on packaged foods. While dual-column labeling will require more space on certain packages for factual nutrition information, the majority of the label space on products subject to the dual-column labeling requirements will still be available for product messaging by the manufacturer. We also note that, as discussed in our economic analysis (Ref. 17), the cost to manufacturers is relatively low under the compliance timelines in the final rule which will allow most manufacturers to add dual-column labeling during regularly scheduled label changes for their products. Additionally, this final rule reduces from the proposed rule the amount of products for which dual-column labeling will be required, as we are lowering the upper limit for which dual-column labeling is required from those containers weighing up to 400 percent of the RACC to those containers weighing up to 300 percent of the RACC. Furthermore, certain packages for which dual-column labeling would require a greater proportion of the label space are exempt from these requirements. For example, under § 101.9(b)(12)(i)(A), the dual-column labeling requirements in § 101.9(b)(12) do not apply to products that meet the requirements to present the Nutrition Facts label using the tabular format under current § 101.9(j)(13)(ii)(A)(*1*) or the linear format under current § 101.9(j)(13)(ii)(A)(*2*).

Third, the requirement to provide dual-column labeling is reasonably related to the Government's interests in promoting the public health and providing consumers access to factual information that will help them understand the nutrient content on certain packages that contain more than one serving of food. The factual information could be used to assist consumers in maintaining healthy dietary practices. Recent NHANES data shows that products containing up to and including 300 percent of the RACC could reasonably be consumed in a single eating occasion. Additionally, our research demonstrates that some consumers may have difficulties determining nutrition information per container when a label declares that the package contains more than one serving and is reasonably consumed in a single eating occasion. Our recent format experimental study, however, showed that, in the case of a proposed label with percent DVs listed on the left of the label, dual-column labeling improved the percentage of participants that were able to identify correctly the amount of nutrients in the entire container. In addition, our recent eye-tracking study showed participants both the current and proposed format of the Nutrition Facts labels, with one label showing one serving and the other two servings. Only about half of the participants noticed the number of servings on the label, and less than one third of the participants were able to identify which product contained fewer calories per container (Refs. 18 and 19). These results suggest that some consumers may not correctly recognize the accurate nutrient contents of packages containing more than one serving, including packages that may be consumed in a single eating occasion,

and therefore may not be able to use the label information to assist them in maintaining healthy dietary practices.

The dual-column labeling requirement is reasonably related to the Government's interest in enhancing consumer understanding of nutrient packaging and promoting the public health because it presents nutrition information in a manner that is easy to understand, giving consumers helpful tools to assist them in maintaining healthy dietary practices. As noted previously, our research shows that some consumers have difficulty determining the nutrient amounts in packages that contain more than one serving of food and that do not display the nutrient content of the entire package on the product label. Dual-column labeling helps to ensure that consumers have access to nutrient information for containers of certain sizes that could reasonably be consumed in a single eating occasion and therefore could assist consumers in maintaining healthy dietary practices.

The comment incorrectly asserts that the purpose of the proposed dual-column labeling requirements is to shape consumer behavior by discouraging consumption of food in containers that weigh between 200 percent and 400 percent of the reference amount. As explained in the proposed rule (see 79 FR 11989 at 12003), and as reiterated in this final rule, the purpose of dual-column labeling is not to discourage the consumption of certain foods but rather to increase consumer understanding of the quantity of nutrients in packages and containers of certain sizes that may be reasonably consumed in a single eating occasion. The reference provided in the proposed rule to a study that showed a reduction in snack food consumption amounts was included for the purpose of demonstrating that dual-column labeling could raise contextual awareness of the quantity of nutrients in a given container. While the reduction in the consumption amounts for certain products could potentially be associated with dual-column labeling, such changes in consumption are not the purpose of the requirement. Our findings, both as reported in the proposed rule and as explained previously in this final rule, demonstrate that the presence of dual-column labeling could help consumers understand the quantity of nutrients they are actually consuming if they consume the entire package in one eating occasion. Consumption data further shows that it is reasonably likely that some consumers will consume, in a single eating occasion, the entire container of products containing at least 200 percent and up to and including 300 percent of the RACC. We therefore disagree with the assertion that the dual-column labeling requirement ''is unnecessarily duplicative'' or that our reliance on the statutory authority granted in section 2(b)(1)(A) of NLEA conflicts with our obligation to promulgate regulations consistent with the protections granted by the First Amendment. Additionally, as discussed in the preamble to the proposed rule (79 FR 11989 at 11998), there is evidence that consumers do not correctly calculate nutrient amounts in food products by multiplying the nutrient amount by the number of servings per container, and research shows that dual-column labeling can help consumers more accurately determine the number of calories and nutrients in a food product compared to single-column labeling (Ref. 15). In short, dual-column labeling provides consumers with information that can assist them in maintaining healthy dietary practices.

While we disagree that the *Central Hudson* standard would be applicable to the requirement to provide a second column of nutrition information, the requirement to provide dual-column labeling would nonetheless be Constitutional under the standard set forth in *Central Hudson,* 447 U.S. 557. If the *Central Hudson* standard were applicable to the evaluation of the dual-column labeling requirement, we would be required to identify a ''government interest [that] is substantial,'' establish that ''the regulation directly advances the government interest asserted,'' and show that the regulation ''is not more extensive than is necessary to serve that interest.'' *Id.* at 566. Under the *Central Hudson* test, we have the discretion to ''judge what manner of regulation may best be employed'' to serve the substantial government interest. *See City of Cincinnati* v. *Discovery Network, Inc.,* 507 U.S. 410, 416 n.12 (1993) (citing *Bd. of Trs.* v. *Fox,* 492 U.S. 469, 480 (1989)).

There can be no question that the government has a substantial interest in promoting the health of its citizens. *E.g., Rubin* v. *Coors Brewing Co.,* 514 U.S. 476, 485 (1995). Our asserted interests are in promoting the public health and ensuring consumer access to information that could assist in maintaining healthy dietary practices. These interests are substantial because the consumption of excess and limited amounts of certain nutrients is linked to risk of chronic disease.

Dual-column labeling directly advances our asserted interests in promoting the public health and ensuring that consumers have access to information that could assist in maintaining healthy dietary practices. Our research shows that providing a second column of nutrition information on containers of certain sizes provides consumers information that allows them to understand the nutrient content of packaged foods. We disagree that our decision is based on ''mere speculation or conjecture.'' *See Rubin,* 514 U.S. at 487. Our conclusion that dual-column labeling helps consumers understand the nutrient content of packaged foods when a label declares the package contains more than one serving and is reasonably consumed in a single eating occasion is supported by the consumer research cited throughout this document (Refs. 13 and 17).

Finally, the requirement to provide a second column of nutrition information is no more extensive than necessary to serve its purpose. *See Central Hudson,* 447 U.S. at 566. The standard is not a ''least restrictive means'' test, and instead requires a reasonable fit between the ends and the narrowly tailored means chosen to accomplish those ends. *Lorillard Tobacco Co.* v. *Reilly,* 533 U.S. 525, 556 (2001). The dual-column labeling requirement requires only factual disclosures of information about the nutrient content of products, and the required disclosure is limited to the information that we have determined is necessary to assist consumers in maintaining healthy dietary practices. The required disclosure is confined to one area of the food label and will enable consumers to understand the information in the Nutrition Facts label. Overall, this additional factual disclosure is limited in scope, and there are not ''numerous and obvious less-burdensome alternatives'' to this requirement. *See Discovery Network,* 507 U.S. at 418 n. 13. In our research we looked at labels that provided a second column only for calories. Our research showed that this type of label was not as effective as providing a full second column of information about all nutrients listed on the Nutrition Facts label because different consumers are mindful of distinct nutrients and because the nutritional benefits of a product does not depend on a limited number of nutrients only. For example, some consumers need to ensure adequate consumption of specific vitamins or minerals, while others are concerned about protein intake. Full, dual-column nutritional information is more helpful to consumers and does not suggest that consumers should place greater emphasis only on selected nutrients. We therefore disagree with

the implication that this requirement is more burdensome than necessary because it requires the full set of nutritional information in the second column. Requiring that a second column of nutrition information appear on the label is a limited requirement that would serve the purpose of ensuring that consumers have access to information about the nutrient contents of packages and containers of certain sizes that could assist consumers in maintaining healthy dietary practices.

We disagree with the comment's assertion that the dual-column labeling requirement is ''vastly overbroad,'' which the comment asserts is demonstrated by our intent to conduct consumer education once the rule is finalized. Such education efforts are beneficial any time such a significant change in our regulations is made, and the addition of a second column of nutrition information is not the sole basis for our plan to continue to educate consumers. Additionally, as noted previously, certain packages for which dual-column labeling would require a greater proportion of the label space are exempt from these requirements (see § 101.9(b)(12)(i)(A)).

Because the dual-column labeling requirement supports a government interest that is substantial, directly advances that government interest, and is no more extensive than is necessary to serve that interest, the requirement would pass Constitutional scrutiny under *Central Hudson.* However, as noted previously in this section, case law makes clear that *Zauderer* applies to cases in which the government mandates the disclosure of factual and accurate disclosures of commercial information, *Zauderer,* 471 U.S. at 651, as is the case here.

With regard to other specific issues raised in this comment, we disagree with the assertion that by explaining that we would continue to conduct consumer research throughout the rulemaking process we impliedly conceded the insufficiency of our consumer research cited in the proposed rule. The consumption data and research cited in the proposed rule provides sound justification for dual-column labeling. Additionally, since the publication of the proposed rule, we have conducted an additional study that corroborates the results discussed in the proposed rule, *i.e.,* that consumers were more likely to accurately determine the amount of nutrients shown on a label when dual-column labeling was used (Ref. 19). We continued to conduct research throughout the rulemaking process because the Lando and Lo study used the current format and we wanted to explore whether findings derived from that study would replicate on a different label format as outlined in our proposed rule. The subsequent study did, in fact, replicate the original finding that more consumers were able to accurately identify the amount of total nutrients shown on a product label when using the dual-column label, as compared to a single-column label with multiple servings per container (Ref. 15).

We further disagree with the assertions that we justified our proposal for dual-column labeling based on one study or that our conclusions for dual-column labeling are based solely on a study of snack foods. In addition to the studies discussed in the previous paragraph, we received a citizen petition and many comments to the ANPRM from consumers that said that labeling products that were considered to be single servings as having two or more servings is ''confusing'' and ''misleading.'' We also note that the labels tested in the Lando and Lo study (Ref. 15), which were also cited in the proposed rule, included sample Nutrition Facts labels for frozen meals, which are not considered ''snack foods.'' Dual-column labeling would require certain containers to display easy-to-understand nutrition information for the primary ways in which people consume these products. The studies that were cited in the proposed rule were used as part of the support for the need for dual-column labeling, not as our sole justification for dual-column labeling.

Finally, we disagree that dual-column labeling may be confusing to consumers, that we failed to consider comments that suggested dual-column labeling may be confusing, and that we have suggested that those who are looking to challenge the dual-column labeling requirements have the burden to provide evidence that dual-column labeling may be confusing. As discussed previously in this document, our research has shown that single-serving-per-container labels and dual-column labels resulted in more participants correctly identifying the number of calories per container and the quantity of other nutrients per container and per serving compared to two-serving, single-column labels (such as the current label) (Ref. 19).

2. Dual-Column Labeling Requirements

(Comment 19) We received several comments from manufacturers objecting to 400 percent of the RACC as the upper limit for mandatory dual-column labeling.

Several comments suggested that we consider the type of product at issue in establishing an upper limit. Some of the comments stated that an upper limit of 400 percent of the RACC was not appropriate for all product categories. Other comments stated that dual-column labeling should only be required for certain types of products. A few comments objected to what they called a one-size-fits-all approach to applying the dual-column labeling requirements. One comment stated that we should take into account how people use and consume specific types of food in establishing an upper limit, such as whether the food is a snack, an ingredient, or a center-of-plate food in a main meal, and whether a person is likely to eat more than two servings of food at one time. Another comment suggested that we reanalyze the data to provide category-specific RACC upper thresholds for dual-column labeling.

A few comments stated that we should only require dual-column labeling for product categories of food for which we have data indicating that a consumer can reasonably consume the entire package of a product between 200 percent and up to and including 400 percent of the RACC in one eating occasion. Other comments argued that an upper limit of 400 percent of the RACC would require dual-column labeling on foods that are not likely to be consumed in one eating occasion.

Several other comments requested that we require a lower upper limit for dual-column labeling generally. Some comments stated that dual-column labeling should only be required for packages up to 250 percent of the RACC, while other comments requested that dual-column labeling be required for packages up to 300 percent of the RACC.

We received comments that stated that by setting 400 percent as the upper limit for dual-column labeling, we would create the unintended consequence of establishing a dual-column labeling requirement for some products for which a 90th percentile of intake is much lower than 400 percent of the RACC, meaning that such products would be required to have dual-column labeling on package sizes for which consumption data shows that people do not reasonably consume the entire amount in one eating occasion. One example given in comments was for 100 percent fruit juices such as orange juice. Comments stated that the amount of fruit juice equal to 400 percent of the RACC would be 32 fl ozs, which is inconsistent with data showing that the amount of 100 percent fruit juice consumed at the 90th percentile is 219 percent of the RACC. One comment

noted that, based on NHANES 2003–2006 data, the 75th percentile of 100 percent orange juice consumption by adults is 8.8 fl ozs per day (Ref. 20) and for children age 2 to 18 years is 12.5 fl ozs per day (Ref. 21). Comments argued that requiring a dual-column label on a 32-oz container of orange juice does not represent the amount consumed by the majority of individuals.

Other examples given in comments of products for which a 90th percentile of intake is lower than 400 percent of the RACC were fluid milk and cottage cheese. Comments noted that the intake at the 90th percentile is 205 percent of the RACC for cottage cheese (226 g or 1 cup) and 181 percent of the RACC for milk (444 g or 14.5 fl oz). Some comments stated that a quart of fluid milk and a 16-oz container of cottage cheese are both at 400 percent of the RACC and would be required to have a dual-column label. Comments stated that labeling these two product packaging sizes with dual-column labels is inconsistent with how they are consumed.

Yet another example given in a comment of a product for which the 90th percentile of intake is lower than 400 percent of the RACC was frozen waffles. The comment described a 12.3 oz 8-pack of waffles where two waffles equal a serving based on the 85 g RACC. The comment stated that an 8-pack of waffles would be required to have a dual-column label listing nutrition information per two-waffle serving and per container. The comment stated that the 90th percentile intake for waffles is 168 percent of the RACC (about 3 waffles) and that it is difficult to imagine a consumer eating 8 waffles on one eating occasion.

Other comments asserted the following additional types of foods have consumption amounts at the 90th percentile that are less than 400 percent of the RACC and therefore are not appropriate for dual-column labeling: Beverage product categories, frozen potato products, side dishes, natural cheese in 3.5 oz packages, sausage, nuts, frozen vegetables, frozen oatmeal, frozen pizza, frozen entrées, canned beans, canned vegetables, canned fruits, 100 percent fruit juices, veggie ''burger'' patties, and cereal bars.

A few comments stated that they reviewed our data used to support the decision to use an upper limit of up to and including 400 percent of the RACC and found that in 84 percent of the food categories reviewed, average consumption was 299 percent or less of the RACC, and in 68 percent of categories, average consumption was 250 percent or less of the RACC. These comments stated that only a small number of product categories had consumption greater than 300 percent of the RACC, and those categories, which included wine coolers, fluid cream, lemon and lime juice, horseradish, and mustard, are not commonly consumed categories that should drive labeling changes.

Several comments argued that the 90th percentile was too high of an upper limit to be considered as a reasonably consumed amount and that the basis for our picking this value was unclear. One comment further requested that we provide information about the statistical distribution of these ratios to justify our cutoff of 400 percent. Other comments asserted that our decision to establish 400 percent of the RACC as the cutoff for dual-column labeling is arbitrary, incongruous with most common eating patterns, and could result in consumer confusion and needless changes for food manufacturers. Another comment suggested that we use the proposed RACCs, instead of RACCs from 1993, as the basis to compare to 90th percentile of intake.

(Response 19) In the preamble of the proposed rule (79 FR 11989 at 12003), we stated that our review of the intake distribution per eating occasion for each product showed that for almost all products, regardless of the amount of the RACC, the ratio of the intake at the 90th percentile level to the RACC was 400 percent or less. Use of the 90th percentile of intake distribution allows us to capture the substantial majority of consumption amounts per eating occasion (*i.e.,* 90 percent) for the U.S. population, but this level is not so high as to impose dual-column labeling requirements on most package sizes for which consumption data shows that people do not reasonably consume the entire amount in one sitting.

As noted previously, the purpose of dual-column labeling is to provide nutrition information for multiple ways in which people are likely to consume a product. Consumption data show that while some people eat certain products in a single eating occasion, others eat the product over time or share it. Dual-column labeling provides nutrition information for all of these scenarios. To the extent that comments suggested that dual-column labeling requirements generally would require needless changes to food labeling for manufacturers to comply with the dual-column labeling requirement and that the requirements may result in consumer confusion, we disagree. Dual-column labeling requirements are not intended to be limited to the single most common consumption pattern for a particular product. When determining the criteria for dual-column labeling, we therefore looked at data that shows how the product is consumed in 90 percent of eating occasions, to ensure that the requirements would encompass the distinct ways such products could reasonably be consumed. In the proposed rule we determined that dual-column labeling for products with 400 percent or less of the RACC would capture the most frequent consumption habits for almost all product categories.

We disagree with comments stating that the upper limit for dual-column labeling should be 250 percent. Eighteen percent of products have 90th percentile of consumption between 250 percent and 300 percent of the RACC based on the 1993 RACCs and the proposed RACCs, meaning that establishing an upper limit of 250 percent would eliminate from dual-column labeling requirements a significant proportion of products which data show are reasonably likely to be consumed in a single eating occasion.

In light of information provided in comments, we examined which food products have consumption levels at the 90th percentile between 300 percent and 400 percent of the 1993 RACCs and the proposed RACCs. Our analysis was consistent with those of comments that suggested that a substantial majority of food products (*i.e.,* more than 90 percent) have consumption levels that are 300 percent or less of the RACC at the 90th percentile (Ref.16). We agree with comments to the extent they state that in the substantial majority of the food categories the average consumption was 300 percent or less of the RACC at the 90th percentile and that only a small number of product categories had consumption greater than 300 percent of the RACC at the 90th percentile. We also agree with comments that stated that setting an upper limit for dual-column labeling at 400 percent of the RACC could have the unintended consequence of requiring dual-column labels on packages for which data shows people do not reasonably consume in a single eating occasion, such as a quart of milk, a 32 fl oz bottle of juice, or a 12.3 oz 8-pack of waffles where two waffles equal a serving based on the 85 g RACC.

In consideration of the information provided in comments and further evaluation of relevant consumption data compared with the proposed RACCs, we are lowering the upper limit of dual-column labeling from 400 percent to 300 percent of the RACC. Providing an upper limit at 300 percent of the RACC would ensure that dual-column labeling captures 90 percent of the consumption

habits for about 91 percent of food products and limit the possibility that dual-column labeling will be required for package sizes that are not likely to be consumed in a single eating occasion. As a result of our decision to lower the upper limit for dual-column labeling from 400 percent to 300 percent, certain products about which comments expressed specific concerns—such as a quart of milk, a 32 fl oz container of juice, a 16- oz container of cottage cheese, and a package of waffles containing 4 servings—would not be required to have a dual-column label.

In response to those comments that suggested that we consider the type of product at issue in establishing an upper limit, we decline to apply different upper thresholds for dual-column labeling or to require dual-column labeling only for specific product categories. The use of a uniform upper criterion for all product categories will ensure that consumers are able to compare nutrition information across various product types that are packaged in the sizes that we have determined are reasonably likely to be consumed at one eating occasion or shared with others. For the same reason, we disagree with those comments that suggested that dual-column labeling is not appropriate for certain types of foods and decline to limit the dual-column labeling requirement to certain types of foods.

In response to the comment that recommended that we use the proposed RACCs, instead of RACCs from 1993, as the basis to compare to the 90th percentile of intake, this final rule relies upon both 2003–2008 consumption data and the 1993 RACCs as a basis to determine the 90th percentile of intake when determining an upper threshold for dual-column labeling. While the proposed rule used the 1993 RACCs as the basis to compare to the 90th percentile of intake, we agree that comparison to the proposed RACCs provides useful information. We have now reviewed the 90th percentile of intake for the proposed RACCs that we are finalizing with this rule. A review of this information shows that almost all of the proposed product categories have a 90th percentile of consumption that is less than 300 percent of the RACC. This information is included as a reference to this rule (Ref. 22).

(Comment 20) We received a few comments that stated that dual-column labeling should be voluntary instead of mandatory. Other comments suggested that all packages containing 200 percent or more of the RACC that can be reasonably consumed in a single eating occasion should be labeled as a single serving instead of using dual-column labeling.

(Response 20) We disagree with comments that state that dual-column labeling under § 101.9(b)(12) should be voluntary. As discussed previously in section III.C., we consider the benefits of dual-column labeling to the consumer—in particular, ensuring greater consumer understanding of the package's contents—to be significant enough to require dual-column labeling for products in containers that meet the criteria for dual-column labeling. As discussed in response to comment 8, to address the comment that suggested that we require mandatory listing as a single serving for packages over 200 percent of the RACC that can be reasonably consumed in a single eating occasion in place of dual-column labeling, the purpose of dual-column labeling is to provide label information for products that may be consumed in a single eating occasion, but can also be shared or eaten in multiple eating occasions. If these products are labeled as single-serving containers, then they would not provide nutrition information for all three of these scenarios. Additionally, as explained in detail previously in section II.B., under section 403(q)(1)(A)(i) of the FD&C Act, ''serving size'' means the amount customarily consumed. The RACCs we have established are reference amounts of food that are customarily consumed per eating occasion. As such, we do not consider it appropriate to label foods containing 200 percent or more of the applicable RACC as single-serving containers because that would be twice the amount or more than we have determined is customarily consumed.

(Comment 21) Some comments asserted that a multiserving container would only require dual-column labeling if the individual units contained at least 200 percent and up to and including 400 percent of the RACC, and argued that the relevant factor in establishing whether dual-column labeling is required is not the size of the entire multiserving container, but the size of each individually packaged unit. Therefore, the comments concluded that the proposed dual-column labeling in § 101.9(b)(2)(i)(D) and (b)(12)(i) would be required if a unit in the multiserving container weighs at least 200 percent and up to and including 400 percent of the applicable reference amount. A few comments noted that for a multiserving container, the consumer must in some cases unwrap each unit, and thus would know how many units he or she has eaten. According to these comments, the number of those individual units should represent the number of servings in the multiserving container.

Several comments requested that we clarify that the proposed changes in § 101.9(b)(2)(i)(D) and (12)(i) are not intended to require dual-column labeling on a multiserving retail container comprised of individual discrete units, when the multiserving retail container as a whole contains at least 200 percent and up to and including 400 percent of the RACC. Examples provided in comments of these types of packaging configurations were a four-pack of individually packaged 6 oz yogurt containers, individually wrapped cupcakes, muffins, and breakfast pastries. In the examples given, the multiserving retail container contained at least 200 percent and up to and including 400 percent of the RACC, but each of the individual discrete units contained less than 200 percent of the RACC.

One comment noted we typically do not use the phrase ''packaged and sold individually'' to describe multipack products and, citing to § 101.9(b)(2)(i), stated that we instead refer to the multipack containers as ''packages containing several individual single-serving containers'' and that we refer to units as ''individually packaged products within a multiserving package.'' The comment asked us to clarify that the proposed criteria for mandatory dual-column labeling applies only to those individual units that have between 200 and 400 percent of the RACC and not to the multipack container when the weight of the multipack is between 200 and 400 percent of the RACC. The comment stated that in the proposed rule we specifically identify a ''grab-size bags of chips'' as an example of a product that would be subject to dual-column labeling if it contains 200 percent to 400 percent of the applicable RACC, even though the comment considered chips to appear to be a non-discrete bulk product.

(Response 21) Dual-column labeling with nutrition information listed per serving and per unit is required for each product in discrete units in multiserving containers when the unit weighs at least 200 percent and up to and including 300 percent of the applicable RACC. Section 101.9(b)(2)(i) provides, in part, the requirements for serving sizes for products in discrete units (*e.g.,* muffins, sliced products, such as sliced bread, or individually packaged products within a multiserving package). Under proposed § 101.9(b)(2)(i)(D), if the individual unit within a multiserving container weighs at least 200 percent and up to and including 400 percent of

the applicable RACC, the manufacturer would need to provide an additional column that lists the quantitative amounts and percent DVs for the individual unit, as well as a column listing the quantitative amounts and percent DVs for a serving that is less than the unit (*i.e.,* the serving size derived from the RACC). The first column would be based on the serving size for the product, and the second column would be based on the individual unit. We are amending § 101.9(b)(2)(i)(D) in this final rule to apply to individual units within a multiserving container that weigh at least 200 percent and up to and including 300 percent of the applicable RACC. The reason for the change from 400 percent of the RACC as the upper limit to 300 percent of the RACC as the upper limit is discussed in section III.B. We have also modified the language for clarity.

Under the proposed rule, dual-column labeling would be required on a multiserving retail container comprised of individual discrete units, when the multiserving retail container as a whole contains at least 200 percent and up to and including 400 percent of the RACC. As explained in response to comment 9, a product that is packaged and sold individually (*i.e.,* a container that bears a Nutrition Facts panel) that is comprised of individual discrete units and that as a whole contains at least 200 percent and up to and including 300 percent of the RACC would be subject to the dual-column labeling requirements under § 101.9(b)(12)(i) in this final rule, unless an exemption applies. If, for example, the product at issue is a box containing two individually bottled, 16 oz sodas, and if the box, and not the bottles, were to display the Nutrition Facts label, the multipack container would be required to bear dual-column labeling because the multipack would be packaged and sold individually and would contain at least 200 percent and up to and including 300 percent of the RACC. In contrast, if the product at issue is encased in a clear plastic wrapper and includes two individually bottled, 16 oz sodas for which each bottle is labeled with a Nutrition Facts panel that is visible at the point of sale, the outside wrapper would not be required to bear dual-column labeling even though the combined weight of all bottles would be at least 200 percent and up to and including 300 percent of the RACC. We note that § 101.9(b)(12)(i) pertains to products that are packaged and sold individually and contain at least 200 and up to and including 300 percent of the RACC, regardless of whether the product is in discrete units.

With respect to the comment's request for clarification about whether a ''grab bag'' of chips would be subject to the dual-column labeling requirements, we note that if such a bag of chips were to bear a Nutrition Facts panel and contain at least 200 percent and up to and including 300 percent of the RACC, it would be subject to the dual-column labeling requirements unless an exemption applied. Whether a product contains discrete units or non-discrete bulk food, dual-column labeling is required if the criteria for such labeling is met, and if no exemptions apply. Section 101.9(b)(2)(i)(D) explains when a second column of nutrition information that describes the nutrient content per unit is required, and § 101.9(b)(12)(i) explains when a second column of nutrition information that describes the nutrient content per container is required.

(Comment 22) One comment noted that our rounding rule requirements may present inherent problems because the requirements may cause quantitative amounts and percent DVs to look inconsistent when displayed in a dual-column format per serving and per container. The comment suggested that this result may not satisfy the requirements of section 2(b)(1)(A) of the NLEA if dual-column labeling does not convey information in a manner that ''enables the public to readily observe and comprehend such information and to understand its relative significance in the context of a total daily diet.'' To demonstrate the potential inconsistency, the comment provided an example of a Nutrition Facts label of two different flavors of candy bars which presented nutrition information per two pieces and per one piece. The comment noted that the calories from fat for two pieces is 111.0 g (actual) but is rounded to 110 g using our rounding rules, while the calories from fat for 1 piece is 55.5 g (actual), but rounded to 60 g using our rounding rules. The comment noted that this discrepancy may cause consumer confusion since if the serving size were halved they would expect the declaration of ''Calories from fat'' to be 55 g. The example provided in the comment also demonstrated inconsistencies in the values provided for total fat, sodium, and protein due to our rounding rules. The comment suggested that we permit the use of a footnote such as ''Columns may not add due to rounding'' when such inconsistences exist.

(Response 22) We acknowledge that the use of dual-column labeling per serving and per container could, under certain conditions, cause apparent discrepancies in the nutrition values between the two columns. The discrepancies would result from mathematical rounding procedures and our requirements for the increments in which nutrition values are declared in the Nutrition Facts label under § 101.9(c). We recognize that consumers viewing nutrition information per serving and per container may expect the nutrition values per container to result from multiplying the number of nutrients per serving by the number of servings per container, and that the numbers that may result under existing regulations may not reflect this expectation in all cases. However, under the preexisting nutrition labeling regulations, consumers may have already seen such rounding issues in the labeling of products in discrete units in a multiserving container that are more than 1 unit (§ 101.9(b)(10)(ii)).

While we acknowledge that in some instances apparent discrepancies may occur, we are not proposing to change our requirements for the increments in which nutrition values are declared in the Nutrition Facts label (§ 101.9(c)). Changes to this regulation, such as a requirement that the per-container information be provided by multiplying the nutrients per serving by the number of servings, would likely result in the need to round the information twice. This could result in a requirement to provide nutrition information per container in a way that does not accurately reflect the amount of nutrients in the product. We consider this result to be more problematic than any apparent discrepancies that may result from existing rounding requirements. However, we will monitor this situation as more products are introduced into the marketplace with dual-column labeling per serving and per container.

We disagree with the comment suggesting the need for a footnote such as ''Columns may not add due to rounding.'' The presence of a footnote will require additional space, and we do not believe at this time that any apparent rounding discrepancies are significant enough as to warrant a requirement to include such a footnote or to permit the use of such a footnote voluntarily. We do, however, plan to include information about potential rounding discrepancies as part of our planned nutrition education efforts to clarify why the per-serving and per-container nutrition values appearing on dual-column labels may not appear consistent. We also note that, while no such footnote as requested in this comment can be added to the Nutrition

Facts label, manufacturers can voluntarily include a truthful and not misleading statement explaining how rounding effects dual-column labeling elsewhere on the product label.

3. Exemptions From Dual-Column Labeling

(Comment 23) One comment asserted that we acted arbitrarily in proposing to exempt the following types of products from the dual-column labeling requirement because we determined that labeling of such products with nutrition information based on the entire container would not be consistent with how these products are typically consumed: Bulk products that are used primarily as ingredients (*e.g.,* flour, sweeteners, shortenings, oils), bulk products traditionally used for multipurposes (*e.g.,* eggs, butter, margarine), and multipurpose baking mixes.

(Response 24) After further consideration of this exemption, and as explained in response to comment 19, the use of a uniform upper criterion for all product categories will ensure that consumers are able to compare nutrition information across various product types that are packaged in the sizes that we have determined are reasonably likely to be consumed at one eating occasion or shared with others. We have no consumption data showing that it is reasonably likely that bulk products are consumed differently from non-bulk products. Therefore, we are not finalizing the exemption for bulk products that are used primarily as ingredients, bulk products traditionally used for multipurposes, and multipurpose baking mixes as proposed in § 101.9(b)(12)(i)(B).

(Comment 24) We received comments relating to proposed exemptions from dual-column labeling requirements for products that require further preparation, such as macaroni and cheese kits, pancake mixes, pasta products, and common combinations of food (*e.g.,* cereal and milk) that contain at least 200 percent and up to and including 400 percent of the applicable RACC. Comments we received regarding this exemption were generally supportive of the exemption. A few comments, however, stated that instead of allowing products to be exempt from dual-column labeling, we should instead require dual-column labeling per serving and per container for the as-prepared form of the product and eliminate the as-purchased information altogether.

We received a few comments requesting that we allow an exemption for any product that provides voluntary dual-column labeling as allowed under the preexisting regulations in § 101.9(b)(10)(i) to (iii). Another comment requested that we provide exemptions from dual-column labeling under § 101.9(e) not only for products that provide an additional column of information for two or more forms of the same food ''as purchased'' and ''as prepared'' and for common combinations of food, but also when nutrition information is provided for two or more groups for which Reference Daily Intakes (RDI's) are established (*e.g.,* both infants and children less than 4 years of age) or when nutrition information is provided in different units (*e.g.,* slices of bread or per 100 g).

(Response 24) We agree, in part, with comments that support allowing an exemption to the dual-column labeling requirements if the voluntary provisions provided for in § 101.9(b)(10) are used. The exemptions under § 101.9(b)(10) are for products that provide another column of figures that may be used to declare the nutrient and food component information per 100 g or 100 mL, or per 1 oz or 1 fl oz of the food as packaged or purchased (§ 101.9(b)(10)(i)); per one unit if the serving size of a product in discrete units in a multiserving container is more than 1 unit (§ 101.9(b)(10)(ii)); and per cup popped for popcorn in a multiserving container (§ 101.9(b)(10)(iii)). We agree that providing voluntary dual-column labeling per unit if the serving size of a product in discrete units in a multiserving container is more than 1 unit would provide useful information to those that consume one unit, and therefore are permitting the use of such a second column of information in lieu of a second column that provides per-container information. We also agree that providing voluntary nutrition information per cup of popped popcorn per serving in a multiserving container (§ 101.9(b)(10)(iii)) in an as-consumed form will be more beneficial to consumers than having nutrition information for the ''as purchased'' form on both a per-serving and per-container basis. As explained further in comment 25, while we recognize that popcorn is not consumed in the as-purchased form, the as-purchased nutrition information is still needed. Therefore, we are permitting the label of such products to contain a second column of information for the popped form, in lieu of a second column that provides per-container information.

As noted in the serving size proposed rule, we tentatively concluded that it would be helpful to consumers to have access to nutrition information based on the prepared form of the product in addition to the ''as purchased'' form of the product (79 FR 11989 at 12004). We are reaffirming that conclusion in this final rule. The ''as prepared'' information on labels indicates the nutritional information per serving if a package is prepared according to package directions, which may require the use of additional ingredients. We disagree, however, with those comments that stated we should require dual-column labeling to be done only based on the as-prepared form, per serving and per package. If a consumer does not use the stated directions or uses substitute ingredients, then the information in the as-prepared portion of the label would not be accurate. Therefore it is important that each product include nutrition information for the product as packaged and not just the product as it is prepared. We also noted in the proposed rule that if products that voluntarily included one column of nutrition information for the prepared form of the food per serving and met the requirements for dual-column labeling, they would have to include at least three columns of nutrition information unless the products were subject to an exemption (79 FR 11989 at 12004). We are reaffirming our conclusion from the proposed rule that nutrition information based on the entire container of the unprepared food may be less meaningful to consumers than information based on a serving of the prepared form of the food and are therefore finalizing an exemption from the dual-column labeling requirements in § 101.9(b)(12)(i)(C) for those products that voluntarily include a second column of nutrition labeling for the as-prepared form of the food per serving.

We do not agree with comments that requested an exemption for products that provide an additional column that declares the nutrition information per 100 g or 100 mL, or per 1 oz or 1 fl oz of the food as packaged or purchased. In the introduction to section III.C., we discussed our basis for concluding that per-container information helps certain consumers recognize nutrient amounts per package and that the consumption data shows that consumers are reasonably likely to consume a full package containing at least 200 percent and up to an including 300 percent of the RACC. In contrast, consumers may not be able to readily measure 100 g or 100 mL amounts, so the information may not be useful to them. Because we have determined that nutrition information per serving and per container is more likely to be useful to consumers, and therefore is more

important than voluntary nutrition information given in metric or common household measurements (oz) for the food in the as-purchased form per serving, we decline to establish an exemption when a second column of nutrition information is provided per 100 g or 100 mL, or per 1 oz or 1 fl oz of the food as packaged or purchased. While nutrition information per 100 g or 100 mL cannot be listed in lieu of the information required under § 101.9(b)(2)(i)(D) and (b)(12)(i), § 101.9(b)(10)(i) allows the manufacturer to provide this information in an additional column (*e.g.,* a third column) on a voluntary basis.

We agree with the comment that requested that we expand the exemptions from dual-column labeling to include products that voluntary provide a second column of nutrition information for two or more groups for which RDIs are established (*e.g.,* both infants and children less than 4 years of age). Providing voluntary nutrition information for two or more groups for which RDIs are established provides useful information for the different populations that may consume the food product. Providing nutrition information for two subpopulations, such as infants 7 to 12 months old and children aged 1 through 3, will provide beneficial information to purchasers of these products. Such nutrition information will provide meaningful information about foods that are typically consumed in distinct amounts by distinct subpopulations. This exemption has been added to § 101.9(b)(12)(i)(C) in this final rule.

We note that in this final rule we are also providing an exemption from dual-column labeling for varied-weight products covered under § 101.9(b)(8)(iii), for which dual-column labeling would be less practical given the variation in product sizes.

(Comment 25) We received several comments questioning why popped popcorn needed a dual-column label listing nutrition information with one column for ''as purchased'' unpopped popcorn and another column for ''as prepared popped'' popcorn. The comments noted that no one consumed raw popcorn and that the ''as purchased'' popcorn information is unnecessary. One comment requested that the RACC for popcorn be changed from 30 g unpopped (raw) to 30 g as consumed because variations in hybrids, popping volume and other ingredients can significantly alter the amount of kernels in a single serving based on the household measure (typically tablespoons) for the finished product. The comment requested that we change the current declaration for uncooked popcorn to reflect how the product is actually consumed by the consumer versus ''as packaged.'' The comment noted that providing the nutrition information about unpopped popcorn could be confusing and misleading to the consumer and that no other snack has its raw form as the basis for its nutritional information.

(Response 25) We decline to amend the way in which nutrition information is required to be presented for popcorn, which is that popcorn must provide nutrition information on the ''as packaged'' or ''purchased'' form of the food (*i.e.,* unpopped form), as described in § 101.9(b)(9). We disagree with the assertion that providing nutrition information about popcorn in the ''as packaged'' form is unnecessary and that the ''as packaged'' nutrition information should not be required to appear on the product label if the ''as prepared'' information is provided. The ''as prepared'' information on labels indicates whether a package is prepared according to package directions, which may require the use of additional ingredients. If a consumer does not use the stated directions or uses substitute ingredients, then the information in the as-prepared portion of the label would not be accurate. Therefore it is important that each product include nutrition information for the product as packaged and not just the product as it is prepared. We note, however, that although it is not permitted for popcorn to provide a single-column label containing only as-purchased information, our regulations provide that popcorn products can provide a second column of nutrition information ''per cup popped'' for popcorn in a multiserving container (§ 101.9(b)(10)(iii)); many popcorn products already voluntarily have a second column of nutrition information per serving for the ''as popped'' form. We are not changing this voluntary provision. In addition, we have provided an exemption from the dual-column labeling provisions in § 101.9(b)(12)(i) for products that require further preparation, which would apply to popcorn products that contain at least 200 percent and up to and including 300 percent of the RACC and voluntarily provide an additional column of nutrition information on the ''as popped'' form.

With regard to the comment that stated that listing popcorn on the as-purchased basis would be confusing to consumers, the comment did not explain the basis on which the as-purchased information would be confusing or misleading, and we do not agree that such information would be confusing or misleading. With regard to the assertion that no other snack has its raw form as the basis for its nutritional information, we disagree. All products are required to provide nutritional information for the as-packaged form, so any products that are packaged in their raw form are required to provide nutritional information for the raw form.

We also decline the request to change the RACC of popcorn to 30 g popped per serving ''as consumed.'' In the preamble of the 1993 serving size final rule (58 FR 2229 at 2265 to 2266), we discussed comments that requested that popcorn be able to use a volume-based rather than a weight-based reference amount. We declined to follow the recommendation from those comments because we determined that there is no well-established standard procedure for determining the weight equivalents of the household measures. This is still true today. However, for the benefit of those consumers who consume popcorn on a volume basis, we permit the use of a voluntary dual-column label with the second column of nutrition information being based on a per cup popped basis. Therefore we decline to change the popcorn RACC to an as-consumed amount.

(Comment 26) A few comments requested clarity on whether raw fruits and vegetables would be exempt from dual-column labeling when nutrition labeling is voluntarily provided or when claims are made for such products. An example used in the comment was a medium avocado that has a proposed RACC of 50 g, or about ⅓ of the avocado. According to the comment, the entire avocado would be about 150 g and would require dual-column labeling if nutrition labeling is voluntarily provided or if claims are made for such product in labeling or advertising. Another comment requested that we exempt all fruits and vegetables without added sugar, salt, or fat from dual-column labeling.

(Response 26) Under § 101.9(j)(10), raw fruits, vegetables, and fish are exempt from mandatory nutrition labeling, contingent on the food bearing no nutrition claims or other nutrition information in any context on the label or in labeling or advertising. The labeling of such products is generally done on a voluntary basis, with guidelines for such labeling set forth under § 101.45. Under § 101.45(a)(3)(i), such products are not required to provide information about the number of servings per container. Because the number of servings per container would vary from container to container, we do not expect those selling raw fruit,

vegetables, and fish to be able to provide information about the number of servings for an individual container and therefore do not expect them to be able to provide a second column of information with nutrition information per container. Additionally, when voluntary nutrition information for raw fruits, vegetables, and seafood is provided under § 101.45(a)(1), it should be displayed at the point of purchase by an appropriate means such as by a label affixed to the food or through labeling including shelf labels, signs, posters, brochures, notebooks, or leaflets that are readily available and in close proximity to the foods. The nutrition labeling information that is voluntarily provided may also be supplemented by a video, live demonstration, or other media. Because no information about the number of servings per container is generally required in voluntary labeling, and because the nutrition labeling for such products is often provided in a non-standardized manner, we agree that such products should be exempt from dual-column labeling. Therefore, we will amend § 101.9(b)(12)(i)(B) to provide that raw fruits, vegetables, and seafood will be exempted from the dual-column labeling requirements, regardless of whether voluntary nutrition information is provided for the product, either in labeling or in advertising, or whether nutrition claims are made for the product.

We decline to exempt canned or frozen fruits and vegetables without added sugar, salt, or fat from the dual-column labeling requirements. Unlike raw fruits and vegetables, the presentation of nutrition information, including the number of servings per container, has been established in § 101.9 for canned or frozen fruits and vegetables, regardless of whether they contain added sugar, salt, or fat. It is therefore less difficult for canned or frozen fruits and vegetables to provide dual-column labeling when the applicable dual-column labeling requirements would apply.

(Comment 27) One comment requested that bottled water products be exempt from the requirements of dual-column labeling. Other comments questioned the benefits to consumers of requiring dual-column labeling for bottled water products when most of the values in the two columns would be zero. The comments further noted that many bottled water products are already exempt from the nutrition labeling requirements under § 101.9(j)(4) because they contain insignificant amounts of all nutrients required to be declared in the nutrition facts label, and requested that we amend § 101.9(j)(4) to clarify that such products would be exempt. The comments noted that under the proposed rule, the RACC for bottled water products would increase from 240 mL (8 oz) to 360 mL (12 oz) and that this increase in the RACC would mean that the sodium content per RACC in some bottled water products would exceed the current 5 mg per serving threshold, below which the amount of sodium would be considered insignificant. Therefore, the comment requested that we revise the definition of an insignificant amount in § 101.9(j)(4) to be an ''amount that allows a declaration of zero in nutrition labeling, except that for sodium, it shall be an amount that exceeds a declaration of zero percent of the daily value, and except that for total carbohydrate, dietary fiber, and protein, it shall be an amount that allows a declaration of less than 1 gram.''

(Response 27) We decline to establish an exemption to the dual-column requirements in this final rule for bottled water products. We also decline to amend § 101.9(j)(4) at this time as suggested by the comment. We intend to consider the applicability of an exemption from nutrition labeling requirements in a future rulemaking with respect to certain products. Until such time as we have had the opportunity to consider such matters further, we intend to consider the exercise of enforcement discretion with respect to mandatory nutrition labeling on bottled water products and other products that would have been exempt under § 101.9(j)(4) prior to the effective date of this rule and the Nutrition Facts final rule.

(Comment 28) One comment stated that providing nutrition information on a ''per container'' basis for a consumer who intends to eat some now and some later, or for a consumer who will share the container with others, is not useful information. The comment asserted that consumers have all the nutrition information they need to make food choices in the ''per serving'' declaration.

(Response 28) To the extent that this comment asserts dual-column labeling does not provide additional, useful information to consumers, we disagree. The intent of dual-column labeling is to provide nutrition information for products that may be consumed by one consumer in a single eating occasion, over several eating occasions, or shared among multiple consumers. A dual-column nutrition label provides easy-to-interpret nutrition information for a consumer who may eat the contents of a package in one sitting. Dual-column labeling serves as a contextual cue that there is more than one serving in a package and helps consumers to easily figure out how much is in the entire container.

(Comment 29) We received a comment requesting that we exempt foods specifically represented or marketed to infants or children 1 to 3 years of age. The comments stated that presenting the nutrition information for the entire container could inappropriately communicate that a young child could reasonably consume the entire contents of a container. The comment used juice as an example with an RACC of 4 fl oz and noted that a 16 fl oz juice container marketed for children 1 to 3 years would need to include a column for the entire container under the proposed rule. The comment stated that such labeling could indicate to consumers that juice is recommended to be consumed in greater quantities and would conflict with portion guidance provided to parents regarding limiting juice consumption to no more than 4 fl oz per day.

(Response 29) We decline to exempt foods specifically represented or marketed to infants or children 1 to 3 years of age from mandatory dual-column labeling. The purpose of dual-column labeling is to provide nutrition information for those who consume the entire container in one eating occasion, as well as those who consume the container over multiple eating occasions or share the container with others, and to help consumers more easily understand the contents of a particular package both on a per-serving and per-container basis. In terms of consumers misconstruing the serving size as a recommended amount of food, we noted previously in section III.A. that we will engage in consumer education to help clarify the meaning of the serving size. We note that since we have lowered the upper level of dual-column labeling to 300 percent of the RACC, the example stated in the comment would not occur.

4. Research and Consumer Understanding of Dual-Column Labeling

(Comment 30) We received comments that questioned the research cited in the proposed rule in support of dual-column labeling (Ref. 14). Some comments stated that consumer research should include an evaluation of whether consumers would use the dual-column information to modify dietary choices when provided. Comments stated that the limited amount of research on dual-column labeling was not enough to require mandatory dual-column labeling for all products.

Various comments questioned the format of the dual-column labels used in the studies. Some comments pointed out that both studies cited in the

proposed rule evaluated the current label format with dual columns, rather than the proposed new label format with dual columns. The comments stated that with the proposed label formats, dual-column labeling is not needed because the values consumers need to determine the total calories in the container would already be available to the consumer.

Some comments questioned the results of the study conducted by Antonuk and Block that was cited in the proposed rule. These comments stated that the results of the study are not generalizable because the study was conducted with undergraduate students in a classroom setting. Some comments stated that the study only used labels for snack food products and that the results should not be used to evaluate the effects of dual-column labels on other product categories. Other comments questioned the different results for dieters versus nondieters.

(Response 30) We disagree with the comments that suggest that in order to support the requirement for dual-column labeling, research must demonstrate that dual-column information modifies dietary choices. As noted previously, the purpose of dual-column labeling is to provide nutrition information for multiple ways that people are likely to consume a product that contains at least 200 percent and up to and including 300 percent of the RACC. Consumption data shows that while some people eat such products in a single eating occasion, others eat the product over time or share it. Dual-column labeling provides nutrition information for all of these scenarios.

The comment incorrectly asserts that the studies on which we relied in the proposed rule used only labels for snack food products. The labels tested in the Lando and Lo study (Ref. 15), which were also cited in the proposed rule, included sample Nutrition Facts labels for frozen meals, which are not considered ''snack foods.'' Additionally, since the publication of the proposed rule, we have conducted further research on dual-column labeling. The new study has tested dual-column labels using the proposed label formats, recruited participants from a Web-based panel of English speaking adults, and examined multiple food products (Ref. 19). The results from the research showed that dual-column labeling significantly improved respondents' ability to identify the amount of nutrients in the entire container of a two-serving package compared to both a single-column label and a dual-calorie label. Based on this research, as well as the research cited in the proposed rule, we conclude that consumers can more easily and more accurately comprehend the nutrient contents of an entire package when dual-column labeling is available, and we disagree with those comments that stated that dual-column labeling is not needed.

With respect to comments that questioned whether the results of the study conducted by Antonuk and Block that was cited in the proposed rule are generalizable, we acknowledge the study's limitations as noted in the comments. In spite of the fact that the results are not generalizable, we note that the study suggests that, at least under circumstances that are the same as or similar to those in the study, it is possible that some consumers may behave like the study participants. The finding of this study is consistent with other research that we are aware of; therefore, we are convinced by the totality of the research that dual-column labeling can help consumers better understand the nutrition contents of containers of certain sizes and assist them in maintaining healthy dietary practices.

(Comment 31) Several comments stated that providing nutrition information for the entire package will cause consumer confusion and increase consumption. Some comments argued that consumers would interpret the nutrition information for the entire package to be a recommended amount to eat and consume more of the product than they would have likely consumed without the dual-column label.

(Response 31) These comments did not provide data or other information in support of their assertions. Based on a review of available information, we have seen no indication that dual-column labeling may be confusing to consumers or that dual-column labeling would imply that consumers should eat more of an item.

(Comment 32) We received a comment that included results of a study conducted by the commenter on the proposed Nutrition Facts label formats. The study was designed to investigate the extent to which consumers are able to quickly notice and understand label information, as they would during grocery shopping. The study compared consumer reactions to FDA's current and proposed versions of four different Nutrition Facts label formats, each portraying a different food product, so that a total of eight different labels were examined. The current and proposed label formats, and the foods depicted, were standard format for single-serve yogurt; tabular format for frozen vegetables; dual-column label for breakfast cereal (per serving and with ½ cup skim milk); and a dual-column label for a multiserving snack mix package (per serving and per container). Each participant viewed and reacted to one label.

According to the comment, the study found that, in general, the proposed formats performed no better than the current formats in conveying nutrition information to respondents, but the results varied according to the information on the labels being considered. With respect to the dual-column labels, the comment stated that no differences were found in the ''quick readability'' or in participants' comprehension of the serving size or calories information between the current and proposed formats of both the snack mix and cereal products. The authors also asserted that participant understanding of nutrition information was better with the proposed dual-column cereal label but not with the proposed dual-column snack mix product. Further, the authors stated that respondents found the information for vitamins and minerals to be less confusing on the snack mix label that displayed both the percent DV and the absolute amounts per serving and per container (*i.e.,* the proposed dual-column format) than on the label showing this information only per serving (*i.e.,* the current single-column format). However, according to the study authors, when asked an open-ended question about items that were easy to understand or confusing on the label, a larger percentage of respondents indicated that it was more difficult to understand the percent DV information on the proposed snack mix label than on the current version of this label. The comment stated that the result also suggest that respondents were less likely to initially notice the serving size information on the proposed labels for both the snack mix and cereal products compared to the current formats for these products. The authors postulated that these results were due to the complexity of the proposed dual-column label formats, and they recommended that FDA should not implement the proposed changes in format for the Nutrition Facts label because their study indicated that participants perceived few differences between the current and proposed label formats.

(Response 32) We have significant questions about the methodology and design of this study. Although we acknowledge that this study did not demonstrate a clear advantage to the proposed versus the current format under all experimental conditions, the

results are difficult to interpret because a number of details were not provided. Among other things, the authors did not adequately describe the study's methodology, such as by explaining the demographic characteristics of the participants, the statistical methods that were used, how the participants were selected, how the study was administered, and why 90 percent confidence levels were chosen to indicate significant differences rather than the conventional 95 percent confidence interval. Further, the proposed snack mix label that was used in the study appeared to be inconsistent with the proposed requirements in how the ''per serving'' and ''per container'' values were listed for various nutrients. Although the label indicated ''3½ servings per container,'' the amounts of some nutrients (*e.g.,* calories, carbohydrates, sodium, protein) that were listed on the label suggested that there were 4 servings per container, and the amount of dietary fiber shown on the label indicated there were only 2½ servings per container. Because of these substantial questions about the sufficiency in the study design and the study's methodology, we are not persuaded by this comment.

As noted previously, recent NHANES data shows that consumers are reasonably likely to consume products containing at least 200 percent and up to and including 300 percent of the RACC in a single eating occasion. Our research demonstrates that some consumers may have difficulties determining nutrition information per container when a label declares the package contains more than one serving and is reasonably consumed in a single eating occasion. We are therefore finalizing dual-column labeling requirements in this rule to help consumers better understand the nutrition contents of packaged foods containing at least 200 percent and up to and including 300 percent of the RACC.

5. Dual-Column Labeling Format

(Comment 33) We received several comments regarding the format of dual-column labels relating to whether per-container nutrition information should appear for all nutrients for which information is available on a per-serving basis, whether per-container nutrition information should be limited to calorie content, or whether per-container information should be limited to calories, saturated fat and sodium.

The comments were divided on whether we should require dual-column labeling with per-serving and per-container (or unit, as applicable) information for all nutrients or whether we should require only calorie information per serving and per container with the rest of the nutrition information listed in a single column. Only one comment requested that we consider using the option to provide nutrition information per serving and per container (or unit, as applicable) for calories, saturated fat and sodium only. Although comments were divided on which of the other two formats to use (*i.e.,* per-container information for all nutrients versus per-container information for calories only), many comments stated that the decision on which dual-column label format to use should be based on consumer research on what information would be most useful to consumers in deciding the amount of a food or beverage to consume.

Comments that requested that we use dual-column labeling for all of the nutrition information per serving and per container stated this option would allow consumers to base decisions on the product's overall nutrient profile. A few comments stated that access to the full nutritional information for a serving as well as the entire container is necessary for consumers who are looking for specific nutrition information. The comments stated that individuals have varying nutritional requirements and need to see dual-column nutrition information for all nutrients in order to maintain healthy dietary practices.

Comments that requested that we require dual-column labeling for calories only stated this approach would provide consumers with information they need to accurately identify the number of calories in a product, but would also save space and avoid cluttering the Nutrition Facts label. Comments argued that the issues we were looking to address with dual-column labeling would be alleviated through the proposed formatting changes and, specifically, the larger type size and prominence for calories and servings per container, as proposed in ''Food Labeling: Revision of the Nutrition and Supplement Facts Label'' (79 FR 11880, March 3, 2014). These comments asserted that our proposal to increase the prominence of calories and servings per container would give consumers the piece of information most relevant to a package that might be eaten by a single consumer during a single eating occasion, *i.e.,* the calorie content of the entire container.

One comment stated that full dual-column labeling information is not needed because a consumer that chooses to eat two, three, or four servings of the product can easily calculate the quantity of calories and nutrients consumed through simple math. Another comment noted that in the study we conducted (Ref. 15), a label format with dual listings for calories only had the next highest level of accuracy (total correct) on the broad index of the nutrient content questions posed to study participants compared to the accuracy of the one serving, single-column format and two serving, dual-column formats (Ref. 15). Other comments said dual-column labeling for food packages that contain 200 percent and up to and including 400 percent of the RACC could actually decrease the utility of the Nutrition Facts label by cluttering the label and making it difficult for consumers to read. Another comment questioned whether requiring that information per container be available for consumers so they don't have to do the math by multiplying the per serving values by the number of servings is justified in spite of the additional space this information will occupy. The comment stated that a dual-calorie label, which highlights the calories per serving and per container, is a better and more targeted use of limited label space than a dual-column label for all nutrients.

(Response 33) We agree with the comments that noted that dual-column labeling with information per package and per serving for all nutrients is most useful for consumers who are looking for specific nutrition information. The research cited in the proposed rule has shown that consumers better understand nutrition information when using a dual-column label that shows two columns of nutrition information, per serving and per container, as compared with a label that shows dual information for calories only. Further, because different consumers are interested in different nutrients when evaluating products, providing dual-column labeling for all nutrients would be helpful to more consumers. We are not aware of any studies that have evaluated a Nutrition Facts label with only dual-column information for calories, saturated fat, and sodium per serving and per container.

In response to those comments that requested that we base our decision on which label format to use on consumer research, it is in light of the research findings discussed in section III.C. and in comment 29, as well as the usefulness of full nutrition information for different types of consumers, that we are choosing the option for dual-column labeling per serving and per container (or unit, as applicable) for all nutrition information on the label.

In response to comments that stated that consumers do not need the additional information or that consumers can easily do the math to determine nutrition information per container, the research does not support this assertion. Studies have found that consumers are able to most accurately determine the quantity of nutrients in specific foods when using labels that list full nutrition information for the entire package (Ref. 19). In addition, as discussed in the preamble to the proposed rule (79 FR 11989 at 11998), research suggests that many consumers do not correctly calculate nutrient amounts in food products by multiplying the nutrient amount by the number of servings per container (Refs. 23 and 24). One research study of 200 primary care patients found that many patients, especially those with lower literacy and numeracy skills, had trouble using food labels for performing certain tasks, especially those that involved calculations with serving size information (Ref. 24). Similar results were reported in the ''Calories Count'' report (Ref. 1).

We disagree that consumers do not need the additional information or that consumers can easily do the math to determine nutrition information per container. Our study with 160 consumers showed participants a pair of single-column Nutrition Facts labels, with one label showing a serving size of one and another label a serving size of two and asked them to identify which product contained fewer calories per container (Refs. 18 and 19). The proportion of participants who noticed the calorie declaration or the number of servings declaration did not vary between a single-column current format and a single-column proposed format (Refs. 18 and 19). Neither did the proportions of participants differ with regard to how many could identify which product contained fewer calories per container. The study also showed that while the majority of participants noticed the calorie disclosure, less than one third of the participants were able to identify whether the label with a serving size of one or the label with a serving size of two contained fewer calories per container. These results suggest that some consumers may not notice and use all the information available on a single-column, multiserving label that could reasonably be consumed in a single eating occasion and that some consumers may not accurately use (*e.g.,* as a result of mathematical errors) and correctly recognize a product's nutrient contents if a product contains more than one serving.

We do not agree with the comment that asserted that the proposed changes for increasing the prominence of calories and the serving size information will alleviate issues that we are seeking to address with dual-column labeling. In our study, the proportion of participants who saw the proposed format changes (*i.e.,* increased prominence of calories and the serving size information) and did not notice the number of servings was not different from the proportion of participants who saw the preexisting format and did not notice the number of servings, even though calories and the number of servings were made more prominent on the proposed format (Ref. 18). We are also concerned about ensuring that consumers have access to per-container nutrition information for products that contain at least 200 percent and up to and including 300 percent of the RACC so consumers who eat the entire container in one eating occasion, over multiple eating occasions, or shared with others can accurately identify the information for the entire container.

To address the comment that stated that listing dual-column nutrition information for calories only is a better and more targeted use of limited label space than a dual-column label for all nutrients, we disagree. Findings from a study we conducted after the publication of the proposed rule found that participants were able to better identify total nutrients per container when using the full dual-column label, as compared with the dual-column label for calories only (Ref. 19). Providing dual-column labeling for the entire container gives consumers access to nutrient information for each specific nutrient on the Nutrition Facts label.

(Comment 34) One comment stated that, as grocery shelf space has become increasingly expensive, packages have become narrower and taller, ultimately increasing vertical space to greater than 3 inches in height and making the back panel longer and thinner. The comment stated that, for these types of small or tall and narrow packages with seams down the back, it will be difficult, if not impossible, for manufacturers to fit a dual-column nutrition facts label, which is nearly twice as wide as the current single-column facts panel. The comment requested that we propose additional dual-column options for industry review that account for the constraints associated with different product formats and smaller package sizes.

(Response 34) We recognize the concerns expressed in this comment. Under proposed § 101.9(b)(12)(i)(A), which this rule finalizes without changes, the dual-column labeling requirements in proposed § 101.9(b)(12) would not apply to products that meet the requirements to present the Nutrition Facts label using the tabular format under current § 101.9(j)(13)(ii)(A)(*1*) or the linear format under current § 101.9(j)(13)(ii)(A)(*2*). If a product has limited space and uses a tabular or linear format as described in the regulations, it would not be required to use dual-column labeling. We also recognize that the shape of the container will play a role in the amount of space available to display the Nutrition Facts label and note that information related to placement of information on the information panel is described in § 101.2. An example of a dual-column label using the tabular display format in § 101.9(d)(11)(iii) is being published elsewhere in this issue of the **Federal Register** in the Nutrition Facts final rule.

D. Reference Amounts Customarily Consumed

We proposed to update, modify, or establish RACCs. Updating RACCs refers to amendments to the RACCs for products that are listed in the tables in § 101.12(b) and for which the NHANES 2003–2008 consumption data showed an increase or decrease in consumption of at least 25 percent. Modifying RACCs refers to changes to current RACCs in the tables in § 101.12(b) for which the NHANES 2003–2008 consumption data did not show an increase or decrease in consumption of at least 25 percent for the preexisting product categories. Establishing RACCs refers to the addition of products and the assignment of RACCs for such products that are not listed in preexisting tables in § 101.12(b).

In the proposed rule, we analyzed current food consumption data and determined that, for some product categories listed in the tables in § 101.12(b), the RACCs have changed. Additionally, we recognized that, since 1993, information regarding the RACCs for certain products not currently listed in the tables in § 101.12(b) has become necessary. These factors, combined with findings from the ''Calories Count'' report, information regarding the rise in obesity, increase in package sizes, and requests to establish and modify the RACCs, led us to propose amendments to the RACCs.

When determining when to update, modify, and establish RACCs, we analyzed consumption by combining data from the survey years of the NHANES, 2003–2004, 2005–2006, and

2007–2008 (NHANES 2003–2008 surveys), which provide an indication of the current amount of food being consumed by individuals at one eating occasion (Refs. 6, 7, and 8). Food consumption data from the NHANES surveys are released in 2-year cycles.

When determining whether to update an RACC, we first considered two factors. If both of these factors were not met, we did not consider updating the 1993 RACC. The first factor was to determine whether there was an adequate sample size from the NHANES 2003–2008 consumption data for each product in the 140 product categories. The data collection for NHANES, which is completed by Centers for Disease Control and Prevention (CDC), is used to assess intake by the U.S. population. Because CDC's purpose in collecting NHANES data differed from our purpose in updating RACCs, sample sizes that CDC collected were not always adequate for considering updates to the RACCs. Thus, we retrospectively determined the adequate, minimum required sample size based on the calculated design effect for each product within the product categories with a 90 percent confidence level and 20 percent margin of error. For some products, sample sizes are not large enough to obtain a reliable estimate of consumption. We have determined that for these products there is no compelling evidence (due to an insufficient number of samples) to consider updating the RACCs established in 1993.

The second factor was to determine if, for those products with a sufficient sample size, the median intake estimate from the NHANES 2003–2008 consumption data for the product significantly differed from the 1993 RACC for that product. We chose the value of 25 percent to represent a meaningful change based on our analysis of the data and after evaluating other values for percentage differences (*e.g.,* 5 percent, 10 percent) when applied to the data. To be conservative, we determined if the 25 percent change in intake was significantly different from the 1993 RACC by comparing the upper or lower 95 percent confidence interval for the new median estimates to the either 0.75 or 1.25 times the1993 RACC, respectively. If the new NHANES 2003–2008 consumption median estimate was higher than the 1993 RACC and the 95 percent lower confidence bound of the median estimate was greater than 1.25 times the 1993 RACC, we considered the new median to be significantly greater. If the new NHANES 2003–2008 consumption median estimate was lower than the 1993 RACC and if the 95 percent upper confidence bound of the median estimate was less than 0.75 times the 1993 RACC, we considered the new median to be significantly less (Ref. 12). When the consumption amount calculated from NHANES 2003–2008 surveys increased or decreased by at least 25 percent from the RACCs established in 1993 (*i.e.,* less than 75 percent of the 1993 RACC or more than 125 percent of the 1993 RACC), we concluded that the current consumption amount needed to be updated; otherwise, we did not propose to update the 1993 RACC. In addition to determining whether the consumption amount had increased or decreased at least 25 percent from the 1993 RACC, we considered the skewness of the data. If the intake distribution was skewed and we could not rely on the median intake estimate from the NHANES 2003–2008 consumption data to propose a change in the RACC, we examined the data from the Food and Nutrient Database for Dietary Studies (FNDDS) 4.1 (Ref. 25). The data from FNDDS provides the ''reasonable consumption amount,'' which we used to assist in our decision about whether to propose a change to the RACC. The reasonable consumption amount is a default consumption amount of food that researchers have defined and is used by NHANES when survey participants cannot recall the amount of food that was consumed at one eating occasion (Ref. 25). If the reasonable consumption amount for the product was consistent with the median intake estimate, we considered whether to propose a change to the 1993 RACC on a case-by-case basis. If the median intake estimate from the NHANES 2003–2008 consumption data was not consistent with the reasonable consumption amount for the product, and if a conversion to a common household measure is applicable for the product, we then looked to see if there was a significant difference between the median intake estimates from the NHANES 2003–2008 consumption data for the product, converted to an applicable common household measure, and the 1993 RACC for the product.

We received multiple comments asking for clarification or discussing our proposed amendments to specific RACCs or product categories. In the preamble of the proposed rule (79 11989 at 12005), we invited comment on whether we should propose changes to other product categories, including products identified as products of concern in comments to the ANPRM. Several comments recommended that we change RACCs for some of these additional product categories. We discuss these comments in section III.D.2. Comments relating to changing RACCs for specific product categories appear in alphabetical order, by product category.

1. Methodology Used To Determine When To Change RACCs

(Comment 35) Many comments supported the proposed changes to the RACCs and the methods used to update the RACCs. Many comments were in favor of the 25 percent criterion to determine if a change was statistically significant. One comment stated that the methodology used is consistent with the statutory mandate to base serving sizes on the amount customarily consumed and provides for a consistent approach across all food categories. Another comment stated that the comment analyzed newer NHANES consumption data (NHANES 2009–2010) for certain product categories and found that the results for the product categories analyzed were the same as our results when looking at NHANES 2003–2008 survey data.

Other comments questioned the methodology used to determine when to change the RACCs. Comments questioned why 25 percent was used as the criterion to determine when a change in RACCs was statistically significant. Some comments stated that the 25 percent cutoff is arbitrary and that proposing to update only RACCs with changes of 25 percent or greater neglects some categories that deserve reevaluation due to their impact on public health. Other comments questioned why we only looked at NHANES 2003–2008 data. The comments questioned why we did not consider newer consumption data in our analysis of when to make changes to the RACCs.

(Response 35) We chose the value of 25 percent to represent a meaningful change based on our analysis of the data and after evaluating other values for percentage differences (*e.g.,* 5 percent, 10 percent), when applied to the data. To be conservative, we determined if the 25 percent change of intake was significantly different from the 1993 RACC by comparing the upper or lower 95 percent confidence interval for the new median estimates to the either 0.75 or 1.25 times of the 1993 RACC, respectively. The 95 percent level of confidence is a general benchmark that is widely accepted in statistics and provides a conservative estimate to determine whether the recent nationwide consumption data capture the actual change of the amount being

consumed from the 1993 RACC while taking into account for the variability of the measurement when collecting dietary intake data for the U.S. population. We have not modified our methodology in this final rule.

With regard to why we did not look at newer NHANES consumption data, the nationwide food consumption data are released every 2 years and with 2-year lag time (*e.g.,* the NHANES 2007–2008 consumption data were released in 2010). The current RACCs, which were established in 1993, are based on data from Nationwide Food Consumption Surveys (1977–1978 and 1987–1988) conducted by USDA. The 2007–2008 NHANES data were the most recent consumption data available at the time that we conducted our analysis. We will continue to monitor consumption trends and update RACCs in the future as needed. Any consideration of newer consumption data would be addressed in a future rulemaking.

2. Changing RACCs for Specific Product Categories

(Comment 36) After-dinner confectionaries—We received one comment on the proposed RACC for after-dinner confectionaries. The comment supported the 10 g RACC for this product category, but requested that we provide clarification regarding the description of the product category. Specifically, the comment requested that any product marketed as an ''after-dinner confectionery'' or ''after-dinner mint'' and that is available in units of 10 g or less be included in the ''after-dinner confectionaries'' product category. The comment pointed out that all of these products have similar dietary usage. Examples given of products that should be included in the after-dinner confectionaries product category were: (1) Small chocolate squares that are similar in size to after-dinner mints and intended to be used like mint wafers and (2) ''butter mints'' that are often displayed on restaurant counters for customers to take with them as they leave following a meal. The comment also recommended that we adopt the spelling of confectionaries as ''confectioneries.''

(Response 36) We agree with this comment and agree that, generally, chocolate squares, butter mints, and similar products would be included in the ''after-dinner confectionaries'' product category since these products have similar dietary usage as after-dinner confectionaries. We also agree that confectioneries is the more widely used spelling and are amending table 2 in § 101.12(b) to reflect this spelling.

(Comment 37) Alfredo sauce—One comment opposed placing Alfredo sauce in the ''Minor main entrée sauces (*e.g.,* pizza sauce, pesto sauce, Alfredo sauce), other sauces used as toppings (*e.g.,* gravy, white sauce, cheese sauce), cocktail sauce'' product category. The comment stated that the amount of sauce typically consumed for other sauces in this product category is much less than the typical amount of Alfredo sauce used to coat a serving of pasta. The comment said that several large Italian restaurant chains were contacted and those chains stated that they typically use as much Alfredo sauce as tomato sauce. The comment requested that we keep Alfredo sauce in the ''Major main entrée sauces, *e.g.,* spaghetti sauce'' product category with an RACC of 125 g.

(Response 37) Consumption data for Alfredo sauce is consistent with other products in the minor main entrée sauces product category. While some may use Alfredo sauce in the same manner as tomato sauce, others use Alfredo sauce in the same manner as pesto sauce, which is also in the minor main entrée sauces product category. Because this product can be used in either way, we must rely on consumption data, which shows that people are typically consuming less Alfredo sauce than spaghetti sauce. Therefore, we are finalizing our decision to place Alfredo sauce in the ''Minor main entrée sauces (*e.g.,* pizza sauce, pesto sauce, Alfredo sauce), other sauces used as toppings (*e.g.,* gravy, white sauce, cheese sauce), cocktail sauce'' product category.

(Comment 38) All other candies—We received one comment that supported our proposal to amend the RACC of the ''All other candies'' product category to 30 g. We received no comments that opposed this amendment. The supporting comment noted that the 30 g RACC was consistent with industry analyses of national food consumption data and other data sources, which suggested that Americans typically consume candy in moderation. The comment also indicated that the confectionery industry has been supporting messages that endorse eating candy in moderation, and has been promoting this concept by marketing individually wrapped candy units in moderate portion sizes. Further, the comment expressed concerns that lowering the RACC to 30 g for the ''All other candies'' product category may affect the ability of manufacturers to make nutrient content claims for certain products. The comment requested that we consider updating the requirement that foods with smaller RACCs meet the nutrient criteria per 50 g for the purpose of making nutrient content claims and that we allow public comments on the implications to nutrient content claim requirements that are affected by the proposed rule.

(Response 38) We agree with the comment to the extent that it supports establishing a 30 g RACC for ''All other candies'' and are finalizing the change in RACC to 30 g. We decline, however, to reopen the comment period on the proposed rule or to amend the 50 g criteria for products that have RACCs of 30 g or less. We accepted comment on all issues pertaining to the impact that the RACCs have on nutrient content claims. We believe the comment period on the proposed rule provided a sufficient opportunity to comment on this and other related issues. As discussed in section III. E., once this final rule and the Nutrition Facts final rule are published, we plan to assess the impacts of these rules on claim eligibility. We intend to consider issues such as whether any changes in eligibility for claims continues to help consumers construct healthful diets and whether the criteria for claims, including the 50 g criteria for products that have RACCs of 30 g or less, remain appropriate. However, as we noted in the proposed rule, changes in the eligibility to bear claims may be appropriate for some foods in light of changes in the amounts of food being customarily consumed (79 FR 11989 at 12016).

(Comment 39) Appetizers, hors d'oeuvres, mini mixed dishes, *e.g.,* mini bagel pizzas, breaded mozzarella sticks, egg rolls, dumplings, potstickers, wontons, mini quesadillas, mini quiches, mini sandwiches, mini pizza rolls, potato skins—Some comments supported the new Appetizers product category. The comments stated it is appropriate to establish a separate category for these smaller-sized versions of the current product category ''Not measurable with cup, *e.g.,* burritos, egg rolls, enchiladas, pizza, pizza rolls, quiche, all types of sandwiches'' in the ''Mixed Dishes'' general category because appetizers will be consumed in smaller amounts than the current mixed dishes product category based on their intended use. Some comments stated that this new product category would align with USDA labeling requirements for similar products.

One comment requested that, based on the similarities between the products that qualify for the ''Mixed Dishes'' general category and the new product category for Appetizers, we consider allowing products in the new product category for Appetizers to be eligible for

a ''lean'' claim and requested that we clarify that products in the Appetizer category are eligible for a ''lean'' claim provided they meet the appropriate criteria. The regulations for ''lean'' claims currently permit, in part, products that fall within the product category of ''Mixed dishes not measurable with cup'' to bear the claim, provided they contain less than 8 g total fat, 3.5 g or less saturated fat, and less than 80 mg cholesterol per RACC (§ 101.62(e)(2)).

(Response 39) We agree that establishing a separate product category for appetizer products is necessary. Consumption data shows that appetizers are consumed in smaller amounts than products in the mixed dish product category. The median consumption for mini pizza rolls is 83 g and for meatless egg rolls is 57 g. Appetizers are foods served before a meal, while products in the mixed dish product category are foods primarily used as entrées or main dishes (Ref. 26). We also note that the products in this new product category (*e.g.,* mini pizza rolls) are similar to those found in a category in USDA's Guide to Federal Food Labeling Requirements for Meat and Poultry Products (USDA's Guide) (Ref. 27), which will allow consumers to compare nutrition information across food labels for these types of products. In terms of the ''lean'' claim, we note that while products in the Appetizers product category that were previously in the ''Mixed dishes not measurable with cup'' product category no longer fall under the requirements of § 101.62(e)(2), such products would be permitted to use a ''lean'' claim on their label if the products satisfy the requirements of § 101.62(e)(1).

(Comment 40) Fruits used primarily as ingredients, avocado—Some comments supported updating the RACC for avocado from 30 g to 50 g. The comments stated that updating the ''Fruits used primarily as ingredients, avocado'' product category will give Americans more reasons to choose avocados and increase their fruit and vegetable intake. The comment stated that the change in the avocado RACC will help Americans meet their nutrient needs, including some nutrients identified in the *2010 Dietary Guidelines for Americans* as being of public health concern (*e.g.,* fiber and potassium). The comments said that updating the RACC for fresh avocados to 50 g (*i.e.,* a ⅓ medium avocado serving size) would contribute certain nutrients to the diet.

(Response 40) While this final rule affirms our decision to update the RACC for avocado, our decision to update the RACC was based on consumption data, rather than a desire to promote specific products or product categories.

(Comment 41) Bagel Thins, Mini Bagels—One comment requested that we include bagel thins and mini bagels in the bread product category, with an RACC of 50 g, instead of the new ''Bagels, toaster pastries, muffins (excluding English muffins)'' product category with an RACC of 110 g. The comment stated that bagel thins are a smaller, more calorie-conscious alternative to full-sized bagels and that each bagel thin, which is comprised of two slices, weighs 46 g. The comment further stated that bagel thins are marketed as a perforated unit, like an English muffin, and are typically suggested for use in making sandwiches, so that a consumer can enjoy the taste and texture of a bagel without the full thickness and accompanying calories of a regular bagel. The comment stated that with the new ''Bagels, toaster pastries, muffins (excluding English muffins)'' product category, the serving size for this product would be two separate bagel thins.

The comment also expressed concern with the RACC for mini bagels, which are sold in 40 g servings. The comment stated that under the current RACC for bagels, each serving size is one mini bagel, but the proposed RACC would increase the serving size to three mini bagels. The comment argued that this change could in turn encourage consumers to eat more mini bagels than is recommended under the current RACC and requested that we establish a separate category for these products that takes into account this discrepancy in serving size and different intended use. The comment questioned whether NHANES data used to determine the RACC for bagels included products such as mini bagels and mini muffins as a separate item from their full-size counterparts. The comment requested that if there is separate data for mini bagels and mini muffins, we establish a separate RACC for these mini products and recommended that we consider adopting a similar approach for other innovative foods to avoid the unintended consequence of suggesting a serving size larger than what consumers are likely to consume in a single eating occasion.

(Response 41) We note that bagel thins have a similar dietary usage to sandwich bread—namely, to make sandwiches—rather than that of traditional bagels (*i.e.,* as a breakfast item that is often eaten with cream cheese or other toppings) (Ref. 26). In addition, a review of recipes that used bagel thins as an ingredient reveals that most recipes using bagel thins are recipes for sandwiches that used bagel thins in a comparable manner to bread (Ref. 28). Section 101.12(a)(7) states that ''[t]he reference amount is based on the major intended use of the food. . . .'' The reference amount reflects the major dietary usage of the food because the major usage determines the customarily consumed amount (Ref. 29). Therefore, we would include bagel thins in the ''Breads (excluding sweet quick type), rolls'' product category. The product category name will remain unchanged, but we intend to indicate that this type of product will be in the ''Breads (excluding sweet quick type), rolls'' product category with an RACC of 50 g in future guidance concerning serving sizes.

With regard to mini bagels, we disagree with the comment and are finalizing the placement of mini bagels in the ''Bagels, toaster pastries, muffins (excluding English muffins)'' product category with an RACC of 110 g. RACCs are not recommended amounts; rather, RACCs are based on the amount customarily consumed. The comment argues that increasing the RACC for mini bagels will encourage a consumer to eat more, but the rationale for increasing the RACC is that consumption data shows that consumers are already eating more bagel products. In order to allow consumers to make easy product comparisons we group products with similar dietary usage together. The primary usage of mini bagels, like regular-sized bagels, is as a breakfast item. NHANES does not provide information about mini bagels and mini muffins that is separate from their larger-sized counterparts, and we have identified no other data indicating that consumption levels differ between mini bagels and regular-sized bagels. Further, mini bagels have similar product characteristics to their larger-sized counterparts (*e.g.,* both are doughnut-shaped yeast rolls with a dense, chewy texture and shiny crust) (Ref. 25). Therefore, we decline to establish a separate RACC for mini bagels.

(Comment 42) Coffee Beans, Tea Leaves, and Certain Plain Unsweetened Coffee and Tea Products—Some comments noted that products such as plain unsweetened coffee and tea are exempt from the nutrition labeling requirements under § 101.9(j)(4) because they contain insignificant amounts of all nutrients required to be declared in the Nutrition Facts label. These comments noted that the increased RACC for these products combined with the proposed mandatory declaration of potassium in ''Food Labeling: Revision of the

Nutrition and Supplement Facts Labels'' may cause unsweetened coffee and tea to have low but detectable levels of potassium, which would cause them to lose their current exemption from nutrition labeling. The comments stated that nutrition labeling on these products could pose challenges for Nutrition Facts labels on small packages. Therefore, these comments requested that we reexamine § 101.9(j)(4) and make any necessary adjustments.

(Response 42) We recognize the discrepancy between the explicit exemption from nutrition labeling for certain coffee and tea products under § 101.9(j)(4), and the changes to the RACCs and nutrient declaration requirements that generally subject such products to nutrition labeling requirements. Although we asked for comment in the proposed rule about all issues pertaining to the proposed RACCs, we did not ask for comments specifically about the continued applicability of the exemption from nutrition labeling provisions under § 101.9(j)(4) in light of the proposed changes to the RACCs and the proposed changes to the nutrient declaration requirements under the proposed rule entitled ''Food Labeling: Revision of the Nutrition and Supplement Facts labels.'' We intend to consider the future applicability of the exemption with respect to coffee beans (whole or ground), tea leaves, plain unsweetened coffee and tea, condiment-type dehydrated vegetables, flavor extracts, and food colors in a separate rulemaking. Until such time as we have had the opportunity for any future rulemaking, we intend to consider the exercise of enforcement discretion with respect to the mandatory nutrition labeling on any products that would have been exempt under § 101.9(j)(4) prior to the effective date of this final rule.

We also understand that providing Nutrition Facts labels on packages with limited space may be challenging for manufacturers. We have special labeling provisions for packages with limited space in existing regulations (see § 101.9(j)(13)(i)).

(Comment 43) Canned Fish—One comment discussed the ''Fish, shellfish, or game meat, canned'' product category. The comment opposed the increase in the RACC of fish, shellfish, or game meat, canned from 55 g to 85 g. The comment stated that the most common use for canned seafood was as an ingredient in sandwiches, and that the RACC for the canned fish product category should remain at 55 g. The comment stated that canned fish is comparable with the product category ''Substitute for luncheon meat, meat spreads, Canadian bacon, sausages and frankfurters'' and four product categories for meat and poultry products regulated by USDA (*i.e.,* luncheon meat, luncheon products, canned meats, and canned poultry) (Ref. 27). The comment stated that the common usage for canned fish in recipes reflects a 55 g RACC since canned seafood is typically used as an ingredient to prepare sandwiches, salads and casseroles. The comment also questioned the validity of the ''reasonable consumption amount'' of 85 g. The comment stated that the ''reasonable consumption amount'' is a default value that may be used to indicate the quantity consumed during the dietary recall survey tool when the participant cannot recall the amount consumed and that a typical 5 oz can of tuna will provide the consumer with two, 2 oz (56 g) servings; thus, using 85 g as the default ''reasonable consumption amount'' will inflate the consumption amounts by over 50 percent. The comment stated that the other serving size descriptions for canned tuna and other canned seafoods (*e.g.,* canned salmon) used for the USDA FNDDS need to be updated to reflect current can sizes. For the product ''Tuna canned, non-specified as to oil or water pack,'' two of the size options are a 13 oz can with a drained tuna amount of 321 g and a 6.5 oz can with a drained tuna amount of 160 g. The comment expressed concern that the use of larger-than-available can sizes and default serving size values will artificially inflate the amount of canned seafood that is recorded during diet recall surveys.

The comment further stated that the current RACC allows canned seafood, in particular canned tuna, to be offered in different-sized cans that reflect one or more servings per can. For example, a 3 oz can is a single serving, a 5 oz can has two servings, a 7 oz can has two and a half servings, and a 12 oz can has four and a half servings. The comment stated that with the proposed change to an 85 g RACC and the proposal to require products with less than 200 percent of the RACC to be labeled as a single serving, the 3 oz, 5 oz, and 7 oz can sizes will all be labeled as a single serving but each with different serving sizes.

The comment also stated that there is an inconsistency in the codified table of the proposed rule. The comment stated that the ''Fish, shellfish, or game meat, canned'' product category in the right-hand column lists examples of label statements and that two of the examples correspond to a 55 g RACC rather than the proposed 85 g RACC. The comment noted that the table states, ''2 oz. (56 g/__cup) for products that are difficult to measure the g weight of cup measure (*e.g.,* tuna); 2 oz. (56 g/__pieces) for products that naturally vary in size (*e.g.,* sardines).'' The comment asserted that the examples provided in the table should reflect the finalized RACC.

(Response 43) In response to the comment that expressed concern that increasing the RACC will make the product category ''Fish, shellfish, or game meat, canned'' not easily comparable with the product category ''Substitute for luncheon meat, meat spreads, Canadian bacon, sausages and frankfurters,'' although products in both of these product categories can be used to make sandwiches, the consumption data for the product categories is different enough to warrant different RACCs.

To address the comment that questioned the validity of using the reasonable consumption amount, this comment misunderstands the basis for the proposed RACC. The change in RACC for this product category was based primarily on median consumption data and not the reasonable consumption amount. While we agree that the reasonable consumption amount is a default value that may be used to indicate the quantity consumed during the dietary recall survey tool when a participant cannot recall the amount consumed, this information is not considered relevant to our proposed RACC for ''Fish, shellfish, or game meat, canned.'' The decision to increase the RACC for canned fish products is primarily based on the median consumption NHANES 2003–2008 data of 84 g. Since the reasonable consumption amount did not provide the main basis for which we determined the RACC, we disagree that using 85 g as the default ''reasonable consumption amount'' will inflate the consumption amounts by over 50 percent. The 2003–2008 median consumption is 84 g for fish, shellfish or game meat, canned, which is also similar to the reasonable consumption amount from the currently available FNDDS of 85 g.

To address the comment asserting that the serving size descriptions for canned tuna and other canned seafood used for the USDA FNDDS need to be updated to reflect current can sizes, we note that such data is developed by USDA, and not FDA. To the extent that the comment is asking that we rely on more recent data, the data we used to establish the RACC for canned fish is consistent with our use of data in NHANES as discussed in comment 34.

The fact that the recent data has shown an increase in consumption outweighs the argument that the current 55 g RACC is the amount that is currently used in recipes for sandwiches, salads, and casseroles and that more can sizes will be labeled as a single serving with an increase in the RACC. The data suggest that consumers are consuming larger amounts of canned fish compared to the 1993 RACC of 55 g and that labeling some larger can sizes as a single serving will accurately reflect how consumers are eating the product. In addition, while we recognize the impact that package size has on consumption levels, package sizes are not taken into consideration when determining RACCs, as we cannot predict what package sizes will be in the marketplace. Rather, consumption amount is the primary factor in determining RACCs.

We have addressed the error in the label statement of the new 85 g RACC in the codified section of this rule. The label statement will be changed to ''3 oz. (85 g/__cup)'' and ''3 oz. (85 g/__ pieces).''

(Comment 44) Cereal—We received several comments concerning the RACC for breakfast cereal. Some comments supported the decision to maintain the existing RACC for cereal, yet other comments questioned the decision to keep the RACC for medium weight cereals the same despite a significant increase in consumption when compared to the 1993 RACC. The comments stated that ready-to-eat cereals are a common breakfast food, particularly for children and adolescents, who typically consume more than the RACC. The comments stated that many cereals are high in added sugars, which are particularly concerning for children. Some comments stated that the Children's Food and Beverage Advertising Initiative (CFBAI) has established voluntary criteria for the nutritional quality of cereals marketed to children (Ref. 30). The current CFBAI standard limits the advertising of cereals to ones that contain no more than 10 g of total sugar per serving (Ref. 30). The comments noted that if we increased the RACC for medium-dense cereals, fewer sugary cereals would meet CFBAI's advertising criterion, fewer would be marketed to children, and companies would reduce the sugar content of popular cereals to enable them to be marketed to children.

Other comments questioned why the serving size on the labels of cereals varies so much. For example, a box of one type of cereal may have a serving size of 1 cup, while a box of another cereal may have a serving size of ½ cup. Package serving sizes on cereal labels appear to have greater variation than other product categories.

(Response 44) The 2003–2008 median intake estimates for breakfast cereals, weighing between 20 g and 43 g per cup (mediumweight cereals) is 39 g, which is significantly different from the 1993 RACC of 30 g. However, we did not propose to update the RACC for this product category in order to keep the household measure most closely associated with the reference amount consistent with the product category ''Breakfast cereals, ready-to-eat weighing less than 20 g per cup, *e.g.,* plain puffed cereal grains'' (lightweight cereals) and the product category ''Breakfast cereals, ready-to-eat weighing 43 g or more per cup; biscuit types'' (heavy weight cereals), for which existing RACCs are 15 g and 55 g, respectively (Ref. 31). Although the serving sizes for low, medium, and heavyweight cereals may appear to be varied, they are all based on comparable volumetric amounts. The differences in the density (*e.g.,* grams per cup) of cereals make for the variation in their serving sizes. A consumer would have to eat more of a lightweight cereal to equal the weight of a cup of a heavyweight cereal. For example, the weight of 1 cup of a lightweight cereal, such as a puffed rice cereal, could be equivalent to the weight of a ½ cup of a heavyweight cereal such as an oat bran cereal. The current cereal RACCs correspond to 1 cup of cereal for the various cereal densities. The decision to maintain the current RACC for mediumweight cereals was to be able to maintain the same volumetric serving size of cereal for all three product categories. This way, although it may not appear as such on labels, a consumer is actually comparing similar amounts in terms of volume regardless of the type of cereal.

In light of the comments, and consistent with our evaluation of consumption data, we have decided to update the mediumweight cereal RACC to 40 g (Ref. 32). This amount corresponds to a 1.1 cup equivalent. Mediumweight cereal has the largest sample size of the three cereal product categories. We have determined that ensuring consistency in the RACC for all three breakfast cereal product categories to reflect the current consumption of mediumweight cereal, which has the largest sample size of the three product categories, is more in line with the changes that we made in other product categories. No change to the RACC is needed for low-density breakfast cereals weighing less than 20 g per cup, as the existing reference amount of 15 g continues to correspond to 1.1 cups. To ensure consistency with lightweight and mediumweight cereals, we are updating the RACC for the heavyweight breakfast cereals weighing 43 g or more per cup from 55 g (corresponding to 1 cup) to 60 g (corresponding to 1.1. cups). By making these amendments, the RACCs for all cereals will now correspond to 1.1 cups.

(Comment 45) Cupcake Filling—One comment requested that we establish an RACC for cupcake filling. The comment explained that cupcake filling is frosting, pudding, fruit preserves or other items that are used to fill a cupcake. The comment asserted that cupcake filling is different from cake frosting because it is a product that is made for the purpose of being used inside the cupcake and not on top of a cupcake or cake. According to the commenter, cupcake fillings use less frosting or other filling ingredient than is used to ice a cake, and products from various product categories can be used as cupcake fillings including pie fillings, non-dairy whipped topping, and frosting.

(Response 45) We recognize a need for an RACC for this specific food product as well as for other types of cake or pastry fillings. Cake, pastry, and cupcake fillings include fillings for products such as donuts, cakes, and cupcakes. However, because the proposed rule was silent about an RACC for cupcake filling, and because we intend to provide the opportunity for public comment on this specific issue, we intend to establish an RACC for this product category in future rulemaking and intend to add a suggested RACC of 1 tbsp for this product category distinct from the ''Cake frostings or icings'' product category in a future guidance document.

(Comment 46) Drink Mixes—Some comments discussed the two new drink mix product categories: ''Milk, milk substitute, and fruit based drink mixes (without alcohol) *e.g.,* drink mixers, fruit flavored powdered drink mixes, sweetened cocoa powder)'' and ''Drink mixes (without alcohol): all other types (*e.g.,* flavored syrups and powdered drink mixes).'' The comments were generally in favor of the proposed changes to the drink mix product categories, but requested a revision to the fruit-based drink mixes. The comments requested that the subcategory of ''fruit-based drink mixes,'' which includes fruit-flavored powdered drink mixes, be removed from the ''Milk, milk substitutes, and fruit based drink mixers (without alcohol), *e.g.,* drink mixers, fruit

flavored powdered drink mixes, sweetened cocoa powder)'' product category with an RACC of ''Amount to make 240 mL drink (without ice)'' and added to the ''Drink mixes (without alcohol): all other types (*e.g.,* flavored syrups and powdered drink mixes)'' product category with an RACC of ''Amount to make 360 mL drink (without ice)'' based on its primary use as a mix added to water. The comments stated that the categorization of drink mixes causes inconsistencies. For example, powdered tea mixes are currently in the amount to make 360 mL product category, and non-flavored tea mixes would have an RACC of 360 mL; however, fruit-flavored tea mixes (*e.g.,* raspberry-flavored tea) would have an RACC of 240 mL. The comments stated that this categorization of drink mixes could foster confusion for consumers and lead to unnecessary and unwarranted changes for industry.

One comment asked for clarity on the categorization of liquid concentrate beverage mixes and requested that a subcategory for ''liquid beverage concentrates'' be added to the product category ''Drink mixes (without alcohol): all other types (*e.g.,* flavored syrups and product drink mixes),'' with an RACC of 360 mL (12 fl oz), since this product subcategory is primarily added to water when consumed.

(Response 46) The proposed ''Milk, milk substitutes, and fruit based drink mixers (without alcohol), *e.g.,* drink mixers, fruit flavored powdered drink mixes, sweetened cocoa powder)'' product category is intended to contain drink mixes containing 100 percent fruit-based ingredients, such as fruit juice concentrate, which have similar dietary usages as 100 percent fruit juices or fruit drinks. This product category was not intended to include products that are fruit flavored. Therefore, a fruit-based drink mix with an RACC of 8 fl oz is necessary. However, we understand the issue addressed in the comment and see that it is necessary to create an additional RACC for fruit-flavored drink mixes that have an RACC of 360 mL (12 fl oz). Therefore, we are revising the product category names to reflect the changes. We are clarifying that the 240 mL (8 fl oz) RACC product category is intended for fruit drink mixes that substitute 100 percent juice blends such as frozen fruit juice concentrates and that the 360 mL (12 fl oz) RACC product category is intended for powdered fruit-flavored drink mixes that are comparable to iced tea mixes and other beverages that have an RACC of 360 mL (12 fl oz). Fruit juice concentrates should have an RACC of 240 mL (8 fl oz), consistent with 100 percent fruit juices and fruit drinks. The name for the ''Milk, milk substitutes, and fruit based drink mixers (without alcohol), *e.g.,* drink mixers, fruit flavored powdered drink mixes, sweetened cocoa powder)'' product category is amended in § 101.12(b) to ''Milk, milk substitute, and fruit juice concentrates (without alcohol) (*e.g.,* drink mixers, frozen fruit juice concentrate, sweetened cocoa powder).'' The category name for ''Drink mixes (without alcohol): all other types (*e.g.,* flavored syrups and powdered drink mixes'' will remain the same.

With respect to the comment concerning liquid beverage concentrates, the comment does not describe what a liquid beverage concentrate is. We are unsure if the products referred to are different than the fruit juice concentrates discussed previously. However, if the product is fruit flavored, rather than a fruit juice concentrate, then it should be included in the ''Drink mixes (without alcohol): all other types (*e.g.,* flavored syrups and powdered drink mixes)'' product category with an RACC of 360 mL (12 fl oz).

(Comment 47) Fruit juice—Several comments supported keeping the RACC for fruit juice at 240 mL (8 fl oz). One comment stated that a 240 mL (8 fl oz) RACC is consistent with guidelines established by the American Academy of Pediatrics and the Robert Wood Johnson Foundation (which both recommend 8 oz of juice for adults and older children), in addition to the *2010 Dietary Guidelines for Americans.* The comment requested that all juice beverages have the same 240 mL (8 fl oz) RACC regardless of whether it is manufactured with still water or carbonated water.

(Response 47) Based on our review of the data as described in the proposed rule (79 FR 11989 at 12010), we agree that the RACC for fruit juice should remain at 240 mL (8 fl oz). Products that contain less than 100 percent and more than 0 percent fruit or vegetable juice and that meet the requirements under § 102.33(a) to be labeled as a juice ''beverage,'' ''drink,'' or ''cocktail'' have an RACC of 240 mL (8 fl oz) regardless of whether they are manufactured with still water or carbonated water. We note, however, that drink mixers do not fall within the product category ''Juices, nectars, fruit drinks''; rather, products such as strawberry daiquiri mix and Bloody Mary mix are part of the product category ''Drink mixes (without alcohol): all types (*e.g.,* flavored syrups and powdered drink mixes).''

(Comment 48) Hazelnut spread—We received a comment requesting that we either: (1) Expand the existing product category for ''Honey, jams, jellies, fruit butter, molasses'' to include nut cocoa based spreads, such as hazelnut spread or (2) establish a new RACC of 1 tbsp for nut cocoa based spreads. The comment stated that hazelnut spread is currently in the product category ''other dessert toppings'' because it was considered to be comparable with chocolate syrup at the time of the 1991 proposed rule. The comment indicated that hazelnut spread is currently primarily used on bread or as a spread for snacks, crackers, and fruits. The comment also stated that the mean, median, and mode consumption amounts for hazelnut spread in NHANES are all equal to 1 tbsp.

(Response 48) We recognize a need for an RACC for hazelnut spread outside of the dessert product category. We agree that the primary usage of hazelnut spread is as a spread for bread instead of as a dessert topping. However, because the proposed rule was silent about an RACC for hazelnut spread, and because we intend to provide the opportunity for public comment on this specific issue, we intend to consider whether to move hazelnut spread to a different appropriate product category in a future rulemaking.

(Comment 49) Several comments questioned the regrouping of the ''Ice cream, ice milk, frozen yogurt, sherbet: all types, bulk and novelties (*e.g.,* bars, sandwiches, cones)'' product category and the ''Frozen flavored and sweetened ice and pops, frozen fruit juices: all types, bulk and novelties (*e.g.,* bars, cups)'' product category to the following product categories: ''Ice cream, ice milk, frozen yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juices: all types bulk'' and ''Ice cream, ice milk, frozen yogurt, sherbet, frozen flavored and sweetened ice and pops, frozen fruit juices: all types novelties (*e.g.,* bars, sandwiches, cones, cups).'' The comments stated that the decision to increase the RACC for ice cream was arbitrary and that it is only by proposing to separate the ice cream product category into separate RACCs for bulk ice cream and novelties that we were able to determine that consumption of one of those categories (*i.e.,* ''bulk ice cream'') had increased by more than 25 percent compared to the 1993 RACC.

The comments stated that the separation of the ice cream category into two sub-categories raises an issue of consistency between the two product categories. The comments stated that the exact type of ice cream sold in a ½ cup individual novelty serving can be packaged in a larger bulk container such as a pint or ½ gallon. The comments

stated that although the products will have identical formulations, the differing RACCs between the bulk and novelties package sizes would result in different criteria for the nutrient content claims such as ''low fat,'' ''fat free,'' or ''non-fat.'' This would mean the same ice cream could meet the criteria for ''low fat'' when packaged in a small, novelty-sized cup, but not when it is packaged in a larger container. Similarly, a frozen yogurt or ice cream product may be considered a ''good source'' of calcium when dispensed from a bulk container, but not a good source of calcium when provided in a single-serve cup. One comment asserted that using two different RACCs depending upon the package size (*e.g.,* bulk or single-serve cup) would create consumer confusion through the distinction in nutrient content claims each product would be permitted to make.

One comment requested that we remove the term ice milk from the product category name ''Ice cream, ice milk, frozen yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juices: all types bulk.'' The comment noted that the standard for ice milk was abolished in 1994 when we acted on a citizen petition from the International Ice Cream Association and issued a final rule entitled ''Frozen Desserts: Removal of Standards of Identity for Ice Milk and Goat's Milk Ice Milk; Amendment of Standards of Identity for Ice Cream and Frozen Custard and Goat's Milk Ice Cream'' (59 FR 47072, September 14, 1994).

One comment stated that soft-serve products are distinct from traditional (hard pack) ice cream and frozen desserts. The comment asserted, for example, that a typical soft-serve ice cream has less fat, more milk solids, a lower sugar content, and a lower percent overrun (referring to the amount of air that is whipped into the product), and is generally eaten at a warmer serving temperature compared to a typical hard ice cream. The comment stated that a typical hard ice cream has a density of 1.0 weight ozs per 1.8 fl oz (128 g per cup), while a survey of the soft-serve ice cream industry revealed an average product density of 1.0 weight ozs per 1.25 fl oz (181 g per cup). The comment requested a new product category for soft-serve ice cream named ''Soft serve ice cream, soft serve frozen custard, soft serve gelato: all types bulk'' with an RACC of ½ cup. The comment noted that there is precedent for delineation of products by differences in density—for example, ''Cakes'' are separated into categories of heavyweight, mediumweight, and lightweight; and ''Breakfast cereals'' are separated into categories by density (puffed, medium density, and biscuit type). The comment stated that because of their differences in density, such a separation seems appropriate for frozen dairy desserts as well.

(Response 49) With respect to the comments regarding the reorganization of the two product categories—''Ice cream, ice milk, frozen yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juices: all types bulk'' and ''Ice cream, ice milk, frozen yogurt, sherbet, frozen flavored and sweetened ice and pops, frozen fruit juices: all types novelties (*e.g.,* bars, sandwiches, cones, cups)''—we have reconsidered our position on whether distinct product categories are necessary. Upon further consideration, we agree that bulk frozen dairy products are similar to novelty frozen dairy products, and that bulk frozen fruit flavored products are similar to novelty frozen fruit flavored products, both in terms of dietary usage and in terms of product characteristics. We recognize that the same type of ice cream sold in a ½ cup individual novelty serving can be packaged in a larger bulk container such as a pint or ½ gallon and that these products may have identical formulations. In order to allow for comparable frozen dessert products to be grouped together we are modifying the preexisting RACCs to create one combined product category with the product category name ''Ice cream, frozen yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juices: all types bulk and novelties (*e.g.,* bars, sandwiches, cones, cups).'' This change should also eliminate concerns expressed by comments that using two different RACCs depending upon the package from which the product is dispensed (*e.g.,* bulk or single-serve cup) might be confusing to consumers.

In order to determine the median consumption amount for the product category ''Ice cream, frozen yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juices: all types bulk and novelties (*e.g.,* bars, sandwiches, cones, cups),'' we analyzed the NHANES 2003–2008 intake data for all products in this product category and found that the median consumption of these products is 0.7 cup. Under § 101.9(b)(5)(i), when the use of cups is the appropriate household unit in which to express serving size, the quantity in cups shall be expressed in ¼- or ⅓-cup increments. Under this provision, 0.7 cups rounds to ⅔ of a cup. Therefore, we are creating an RACC for the new product category ''Ice cream, frozen yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juices: all types bulk and novelties (*e.g.,* bars, sandwiches, cones, cups)'' of ⅔ of a cup. The regrouping of these product categories allows for like products to have the same RACCs based on similar dietary usage, product characteristics, and customary consumption amounts.

With respect to the comment that requested that we remove the term ''ice milk'' from the product category ''Ice cream, ice milk, frozen yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juices: all types bulk,'' we agree. Ice milk has not been included in the new frozen desserts product category.

With respect to the comment requesting a separate product category for soft serve ice cream, we decline to make this change. Bulk soft-serve ice cream has similar dietary usage and is consumed in the same manner as non-soft-serve ice cream (Ref. 26). Providing the same RACC for these two types of products allows consumers to easily compare nutrition information between the two products.

(Comment 50) Ice cream—Several comments addressed the change in the RACC for ice cream from ½ cup to 1 cup. Some comments favored the proposed changes to the RACC for ice cream, while others were opposed to it. The comments in favor of the 1 cup RACC for ice cream stated that the new RACC was more reasonable and consistent with the amount that a person typically consumes.

Other comments stated that a ½ cup measure for ice cream is a more practical and realistic reference amount. One comment stated that a ½ cup of ice cream is not misleading. The comment noted that the common household ice cream scoop dispenses 8 servings of ice cream per quart, or exactly a ½ cup of ice cream. The comment further noted that the ½ cup measure is a simple common reference point that consumers clearly understand and that, with ongoing concerns about obesity in America, it is important to have simple tools to help consumers manage their weight. A few comments suggested that if we increased the RACC to 1 cup, consumers might interpret the RACC as an indication that two scoops of ice cream is an appropriate portion.

(Response 50) With respect to the comments stating that the RACC for bulk ice cream should remain at ½ cup because this is the typical amount in a household scoop, the comment did not provide data to confirm that a ½ cup ice cream scoop is the most common household size. There are ice cream scoops that are commercially available to consumers in sizes ranging from 0.5 oz (1 tablespoon (tbsp)) to 5 oz (1 cup)

(Ref. 33). Although it may be common for ice cream scoops to scoop ice cream in the amount of ½ cup, ice cream scoop sizes vary. We also note that the comment provided no support for the assertion that consumers eat one scoop of ice cream. It is less subjective and consistent with FDA's legal authority to base the RACC on the amount customarily consumed. As explained in comment 49, we are finalizing an RACC for the product category ''Ice cream, frozen yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juice: all types bulk and novelties (*e.g.* bars, sandwiches, cones, cups)'' of ⅔ of a cup.

With respect to the comment that stated that increasing the RACC for ice cream would be confusing to consumers and encourage them to eat more, we note that some consumer comments on the ANPRM and the proposed rule suggested strongly that the existing RACC is misleading and requested that the RACC for ice cream be based on a more realistic amount. To help ensure that consumers understand the meaning of changes to the serving size portion of the Nutrition Facts label, we intend to conduct nutrition education to help clarify the meaning of the serving size and RACCs after this rule becomes effective.

(Comment 51) Some comments questioned the density measurements we used when converting from the amount of ice cream consumed, as reported in NHANES data, to the common household measure based on cups in order to determine the RACC for bulk ice cream. One comment stated that a memo to the file for the proposed rule (Ref. 31) states the household units were calculated using the following conversion factors: 1 oz of ice cream or frozen yogurt = 1.5 fl oz; 1 cup = 8 fl oz (citing § 101.9(b)(5)(viii)). The comment agreed with this conversion factor based on the air typically incorporated into ice cream, but did not believe we applied the conversion factor correctly. The comment stated that the median weight for ''Ice cream, bulk, and regular'' from 2003–2008 NHANES is 116 g, but that, in the proposed rule (79 FR 11989 at 12012), we stated that the ''[c]urrent consumption data for bulk ice cream has increased to 0.875 cup, which is closer to 1 cup as compared to the current RACC of ½ cup.'' The comment stated that, if the footnote conversion factor were applied to the median serving size of ice cream expressed by weight, it would result in a lower value of 6.108 fl ozs or 0.767 cup, which would round in household measures to ¾ of a cup (116 g/28.35 g per oz = 4.09 oz × 1.5 = 6.138 fl oz) and that this corresponds to a density value of 151 g per cup for ice cream and frozen yogurt (*i.e.,* (1 oz/1.5 fl oz)(8 fl oz/1 cup)(28.35 g/oz) = 151g/cup)). The comment noted that a ¾ cup household measure for bulk ice cream reflects current consumption data and product composition and said that the comment relied upon used the most current density measurement for ice cream of 148 g per cup, based on NHANES data from 2003–2010, which will result in an RACC of ¾ cup for bulk ice cream. The comment stated that when the 148 g per cup density measurement for ice cream is applied to the 2003–2008 NHANES median amount consumption per eating occasion (116 g), the household measure is calculated at 0.783 cup (6.26 fl oz or ¾ cup). The comment stated that consumers now favor more dense ice creams, and that the ice cream industry has changed processing and formulations to meet consumer expectations. The comment stated that if the 163.5 g density was applied to the 120 g serving size (2003–2010 NHANES) the household measure would also round to ¾ cup (120 g median serving NHANES 2003–2010/163.5 g per cup = 0.736 cup (5.89 fl oz or ¾ cup).

(Response 51) With respect to the comments questioning the density measurements used to calculate the RACCs, the comment used a different procedure to calculate the density measurements than we did in the proposed rule. When we calculate density, the median ice cream consumption in cups is based on the median consumption distribution of all varieties of ice cream using the consumption amount for each individual product (*e.g.,* strawberry ice cream, chocolate ice cream). The consumption amount is then converted from gram weight to volume in cups for each individual product. The method described in the comment, in contrast, looked at the density of the product category as a whole—instead of the consumption amount for each individual product—and converted the median of gram weight amount to the median consumption in cups to determine the median of consumption amount in a household measurement. Therefore, 0.875 cup was the median consumption amount for the bulk ice cream product category discussed in the proposed rule based on consumption distribution when each participant's ice cream consumption has already been converted from gram weight to volume in cups, and there is no further conversion for that median gram weight estimate. We did not consider a ¾ cup RACC for bulk ice cream to be appropriate because the consumption data shows that 0.875 cup (half way between 0.75 cup and 1 cup, therefore, rounding up to 1 cup) is the amount customarily consumed, not 0.736 cup as stated in the comment. As discussed previously in response to comment 34, our calculations relied on 2003–2008 NHANES data rather than 2003–2010 data. As explained in comment 49, we have combined the proposed categories ''Ice cream, ice milk, frozen yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juices: all types bulk'' and ''Ice cream, ice milk, frozen yogurt, sherbet, frozen flavored and sweetened ice and pops, frozen fruit juices: all types novelties (*e.g.,* bars, sandwiches, cones, cups)'' into one product category, ''Ice cream, frozen, yogurt, sherbet, frozen flavored and sweetened ice, frozen fruit juice: all types bulk and novelties (*e.g.,* bars, sandwiches, cones, cups).'' The RACC for the new product category is ⅔ of a cup. The methodology used in determining this reference amount is consistent with the methodology we used in the proposed rule (Ref. 32).

(Comment 52) Foods for Infants and Children 1 through 3 Years of Age—We received one comment that supported changing the RACC for the ''Dinners, dessert, fruits, vegetables or soups, ready-to-serve, strained type'' product category from 60 g to 110 g. The comment noted that the proposed RACC was similar to the consumption amount calculated by the comment after evaluating available data. The comment also requested changes to the product categories for infant and toddler (children 1 through 3 years of age) foods. The comment stated that the number of foods available and specifically marketed to infants and children 1 through 3 years of age has grown significantly since the 1993 RACCs were created, including yogurt, pasta, snacks, breakfast cereal, entrées, and main dish items. The comment stated that many foods now available for infants and young children 1 through 3 years of age do not have specific RACCs, and that more guidance on RACCs for foods for infants and children 1 through 3 years of age should be codified to ensure consistency in serving sizes, labeling and claims for foods marketed for infants and young children. The comment included a table of recommendations for new product categories for foods for infants and children 1 through 3 years of age, along with proposed corresponding RACCs.

(Response 52) We agree more products for infants and children 1 through 3 years of age are currently on the market than were available in 1993.

At the time of publication of the serving size proposed rule, there was limited data for these new types of infants and toddler foods in NHANES. We intend to review the data submitted in the comment and address these additional foods in a separate rulemaking.

(Comment 53) Milk and soy beverages—One comment supported our proposal to modify the product category ''Milk, milk-based drinks, *e.g.,* instant breakfast, meal replacement, cocoa'' to ''Milk, milk-substitute beverages, milk-based drinks, *e.g.,* instant breakfast, meal replacement, cocoa, soy beverage.'' The comment stated that it agreed with the change in name and is gratified to see our acknowledgement and proper use of the term ''soy beverage.''

(Response 53) The final rule uses the new product category name of ''Milk, milk-substitute beverages, milk-based drinks, *e.g.,* instant breakfast, meal replacement, cocoa, soy beverage.'' We note, however, that our adoption of this product category name does not constitute an official ''acknowledgement'' that the term ''soy beverage'' is the sole appropriate descriptor for all beverages containing soy.

(Comment 54) Mixed dishes measurable with cup—We received a comment asking us to change the label statement for mixed dishes measurable with cup in § 101.12(b), table 2 from 1 cup (__ g) to ''__ cup (__ g).'' The comment stated that the current label statement of 1 cup (__ g) is not applicable for fully cooked frozen fried rice that only requires heating to be ready-to-serve. The comment stated that it was requesting a change to the label statement because not all ''almost-ready-to-serve products'' maintain the same density after heating. The comment stated that in order to obtain 1 cup of ready-to-serve cooked rice, it is necessary to measure 1⅓ cups of the frozen rice and that the correct serving size should be 1⅓ cups. The comment requested that the label statement for mixed dishes measurable with a cup be left blank and written as ''__ cup (__ g).''

(Response 54) We disagree with changing the label statement for this product category based on the information provided in the comment. Section 101.12(b), table 2, footnote 2 says that the reference amounts are for the ready-to-serve or almost ready-to-serve form of the product (*e.g.,* heat and serve, brown and serve), and if not listed separately, the reference amount for the unprepared form (*e.g.,* dry mixes, concentrates, dough, batter, fresh and frozen pasta) is the amount required to make the reference amount of the prepared form. This means that although the RACC for mixed-dish products is 1 cup, this amount is for the prepared product. The serving size, however, must represent the product as packaged. Because the weight of the cooked rice depends on the amount of water used in the preparation, the amount required to make one reference amount in cooked form can vary widely. Additionally, as we explained in the 1993 serving size final rule, establishing a reference amount on a cooked basis could allow manipulation of the reference amount for dry rice (58 FR 2229 at 2253). The serving size, therefore, is the amount of the frozen rice, expressed in a household measure, which will make 1 cup when prepared according to package directions.

We also disagree with the assertion in this comment that fully cooked frozen fried rice is an almost ready-to-serve product. Frozen rice is not an almost ready-to-serve product; rather, it is an unprepared product because it is frozen and requires cooking before being consumed. This means that the product should be labeled with the reference amount of 1 cup of rice, using the amount of frozen rice required to make 1 cup of prepared rice to determine the nutrition values on the label.

(Comment 55) One comment supported maintaining the product category ''Not measurable with cup *e.g.,* burritos, egg rolls, enchiladas, pizza, pizza rolls, quiche, all types of sandwiches,'' under the general category ''Mixed Dish'' at the current RACC of 140 g, add 55 g for products with gravy or sauce topping. The comment stated that it analyzed consumption data from NHANES 2003–2010 and found that the median estimated intake for pizza (all crust types) is 169 g, or 21 percent of the current RACC, which is below the amount to be considered significant and does not indicate that the RACC needs to be updated. The comment stated that this supports our assessment that maintaining the current RACC is still an appropriate representation of amounts customarily consumed for this product category.

(Response 55) We agree that no change to the RACC for the ''Not measurable with cup, *e.g.,* burritos, egg rolls, enchiladas, pizza, pizza rolls, quiche, all types of sandwiches'' product category is necessary. We note, however, that our analysis is based on 2003–2008 NHANES consumption data, rather than 2003–2010 consumption data as this comment purported to use.

(Comment 56) Muffins—One comment opposed increasing the RACC for muffins from 55 g to 110 g. The comment questioned whether we included muffins sold in restaurants in the data analysis used to update the muffin RACC. The comment stated that the sizes of packaged muffins sold in the retail store were closer to or less than the current 55 g RACC for muffins. In contrast, the sizes for muffins sold in cafes and restaurants are substantially larger and closer to the proposed RACC of 110 g. The comment stated that 110 g does not reflect the amount of packaged retail muffins customarily consumed in one eating occasion, particularly given that muffins are consumed in discrete units.

The comment also asked for clarification on whether products such as mini-muffins packaged in a multipack of pouches that typically contain about 5 mini muffins per pouch, with a weight of about 47 g per pouch, will be required to declare the serving size on the outer carton of the multipacks of pouches as 2 packs (94 g) instead of 1 pack (47 g). With the increase in the RACC for muffins to 110 g, 2 packs of mini muffins would be the amount that most closely approximates the RACC. The comment suggested that one pouch would be a more appropriate serving size.

(Response 56) The 2003–2008 NHANES consumption data captures all possible sources of the food (*e.g.,* restaurant, vending machine, grocery store). Our analysis considered all sources of food because the data available does not allow us to distinguish consumption at home from consumption in retail stores, restaurants or other eating establishments. We note, however, that only one-third of the food represented in NHANES data is consumed away from home, meaning that the majority of consumption reported is food eaten in the home. Food eaten at home is more likely to be packaged food. The 2003–2008 NHANES data shows an increased consumption for muffins, so we are updating the RACC accordingly. We also note that muffins that are sold in restaurants may be distributed through retail stores.

With regard to the request for clarification on how to label a multipack of pouches of mini muffins, this would depend on a number of factors, including whether the pouches bear Nutrition Fact panels. As discussed in the response to comment 10, manufacturers of packages that weigh less than 200 percent of the RACC each that are contained within a larger container have the option of labeling each individual package with a Nutrition Facts panel, and then labeling the outer container to state the number of servings as the number of individual packages within the outer container in

accordance with § 101.9(b)(8)(iv). As is discussed in the response to comment 9, a product that is packaged and sold individually, *i.e.,* a container that bears a Nutrition Facts panel, is considered a single-serving container if it contains less than 200 percent of the RACC, and would be required to provide dual-column labeling if it contains at least 200 percent to 300 percent of the RACC, unless an exception from the requirement applies.

(Comment 57) Pasta with sauce—Several comments requested that we increase the RACC for pasta with sauce. The comments stated that consumption for pasta with sauce increased by 50 percent to 1.5 cups. One comment noted that we did not propose to increase the RACC for pasta with sauce because the two products with the largest samples sizes in the product category—''Rice, flavored'' (consumed by 3,477 respondents) and ''Mixtures with sauce'' (consumed by 2,919 respondents)—did not increase to more than 1 cup and that pasta with sauce was the third most popular food group (consumed by 2,871 respondents). The comment disagreed with our rationale to keep the entire ''measureable by a cup'' category at 1 cup because it stated that the foods in that product category vary so widely (*e.g.,* pot pies, lasagna and ravioli, casseroles, chili and stew, mixtures with sauce, and mixtures without sauce). The comment requested that we increase the RACC for pasta with sauce to 1.5 cups based on the 2003–2008 NHANES consumption data. The comment stated that lumping pasta with sauce in with other foods in the ''Measurable with cup, *e.g.,* casseroles, hash, macaroni and cheese, pot pies, spaghetti with sauce, stews, etc.'' product category under the ''Mixed Dishes'' general category violates the FD&C Act, which requires RACCs to be based on amounts ''customarily consumed.''

(Response 57) While consumption of pasta with sauce did increase since we established the 1993 RACCs, as the comment noted, consumption for other products in the product category with larger sample sizes did not increase. All of the products in this product category are mixed dishes that are generally used as entrées. Products in this category are mixtures and usually contain starch (*e.g.,* rice, pasta), dried beans and/or animal source ingredients (*e.g.,* cheese, fish, shellfish). They come with or without vegetables (Ref. 34). Thus, all of these products are comparable in that they have similar dietary usage and product characteristics (*e.g.,* they are mixed dishes that are measurable with a cup). Frozen entrées are included in the mixed dishes product category. One manufacturer may have a product line with a variety of frozen meals that includes frozen spaghetti with tomato sauce, frozen lasagna, frozen rice mixture, and frozen macaroni and cheese. We note that it would not be helpful to a consumer who is choosing among the different varieties of the same product line if one box shows a serving size that is based on the RACC of 1 cup, while another box which has similar packaging, and is part of the same product line, shows an RACC of 1.5 cups. It is important that the RACCs of comparable products be similar to help consumers to more easily compare nutrition information on the Nutrition Facts label across similar products.

With respect to the comment asserting that including pasta with sauce in the product category ''Measurable with cup, *e.g.,* casseroles, hash, macaroni and cheese, pot pies, spaghetti with sauce, stews, etc.'' under the ''Mixed Dishes'' general category violates the FD&C Act, we disagree. Products in this category are mixtures that usually contain starch (*e.g.,* rice, pasta), dried beans and/or animal source ingredients (*e.g.,* cheese, fish, and shellfish) (Ref. 34). These products have similar dietary usage and are usually consumed in the same way as an entrée or main dish. Other comparable products in this product category include casserole, lasagna, and macaroni and cheese. The RACC for pasta is based on the amount that is customarily consumed for products in this product category. We disagree with the assertion that grouping foods in such a manner violates the FD&C Act. We followed the methodology used for all products categories when determining the RACC for the ''Measurable with cup, *e.g.,* casseroles, hash, macaroni and cheese, pot pies, spaghetti with sauce, stews, etc.'' product category under the ''Mixed Dishes'' general category. Products with a larger sample size in the product category did not show a significant amount of change; therefore, we did not update the RACC for pasta with sauce.

(Comment 58) We received a comment requesting us to clarify if plant-based beverages with added ingredients are included in the proposed product category for ''Milk, milk-substitute beverages, milk-based drinks, *e.g.,* instant breakfast, meal replacement, cocoa, soy beverage.'' The comment stated that the proposed rule does not discuss the appropriate RACC for plant-based beverages with added ingredients, such as protein, fiber, or fruit, including those that may be positioned as a plant-based ''smoothie.'' The comment argued that plant-based beverages with added ingredients should be included within the RACC for milk and milk-substitute beverages because plant-based beverages with added ingredients are more nutrient dense than a carbonated or non-carbonated beverage like a soda or water, and typically contain higher levels of protein, vitamins, and minerals.

(Response 58) We did not intend plant-based beverages with added ingredients to be included in the proposed product category for ''Milk, milk-substitute beverages, milk-based drinks, *e.g.,* instant breakfast, meal replacement, cocoa, soy beverage,'' and we disagree that plant-based beverages with added ingredients should be included in this product category. Whether or not plant-based beverages with added ingredients are more nutrient dense than a carbonated or non-carbonated beverage like a soda or water depends on the contents of a specific product; however, we do agree that plant-based beverages do not belong in the same product category as carbonated and non-carbonated beverages. A plant-based beverage such as a smoothie is a beverage that is made by blending fruit with yogurt, milk, or ice cream until it is thick and smooth (Ref. 26). Plant-based beverages with added ingredients are otherwise more similar to other items in the product category ''Shakes and shake substitute, *e.g.,* dairy shake mixes, fruit frost mixes'' than to products in the category ''Milk, milk-substitute beverages, milk-based drinks, *e.g.,* instant breakfast, meal replacement, cocoa, soy beverage.'' The comment's description of a plant-based mix includes products with fruit or cocoa as added ingredients. Fruit and cocoa are commonly added ingredients in milkshakes (Ref. 26). Regardless of the distinction between product categories, we note that the RACC for the milk and milk substitute product category is the same as the RACC for the milkshake product category.

(Comment 59) Powdered candies and liquid candies—We received one comment in support of our proposals to add ''powdered candies'' and ''liquid candies'' to the product category currently designated as ''Hard candies, others'' and to establish an RACC of 15 mL for liquid candies and 15 g for powdered candies and all other hard candies. The comment noted that the proposed RACCs are consistent with ''suggested RACCs'' provided in FDA guidance and are consistent with current industry practices. The comment also supported our proposal to rename this product category ''Hard candies, others; powdered candies, liquid candies'' to indicate that

powdered and liquid candies would now be included in this product category.

(Response 59) We agree with this comment. Powdered candies may be dispensed from straws, and liquid candy can be dispensed from small bottles or waxy containers. This final rule establishes an RACC of 15 g for powdered candies and an RACC of 15 mL for liquid candies and includes both in the product category ''Hard candies, others; powdered candies, liquid candies.'' Additionally, the label statement for this category in table 2 of § 101.12(b) will include label statements for powdered candies (''____straw(s) (____g) for powdered candies'') and liquid candies (''____wax bottle(s) (____mL) for liquid candies'').

(Comment 60) Powdered coffee creamer—Some comments requested that we increase the RACC for powdered coffee creamer from the current RACC of 2 g, which is equal to 1 teaspoon (tsp). The comments stated that the NHANES data show that the median consumption of powdered coffee creamer has doubled to 4 g, or 2 tsps. One comment stated that consumers use much more than 2 g or 4 g and suggested that we use 6 g, or 1 tbsp, as the RACC. The comment stated that we should increase the RACC for powdered creamers to 1 tbsp so that it can be the same serving size as is used for liquid creamers.

(Response) The current 1993 RACC for ''Cream or cream substitutes, powder'' is 2 g (or 1 tsp). Although the median 2003–2008 NHANES consumption is 4 g, the data available in 2003–2008 NHANES were insufficient to provide adequate information on which to base a change from the 1993 RACC (Ref. 31). The data available did not meet the criteria to update the RACC from the 1993 RACC of 2 g because there was not an adequate sample size to provide a reliable median intake estimate. Therefore, we did not propose to change the RACC for powdered creamers.

With respect to the comment that suggested we use the same RACC for both liquid and powdered creamers, we disagree. Powdered creamer and liquid creamer have different product characteristics (*e.g.,* powder vs. liquid), and the household measurement for the two types of products is different. A weight measurement is used for powdered creamer, and a volume measurement is used for liquid creamer. Additionally, the consumption amounts for powdered and liquid creamers are not similar. The current RACC for ''Cream or cream substitute, liquid'' did not show a significant increase from the current RACC of 15 mL (or 1 tbsp); therefore, we did not propose to change it.

(Comment 61) Soup—Several comments addressed the ''All varieties'' product category under the ''Soups'' general category. Most comments requested that we update the RACC for canned soup. The comments stated that the current RACC for soups is too small and that many consumers can eat an entire can of soup in one sitting. Some comments referred to a single serving container of soup that is typically 15 oz and lists the serving size as 2 servings.

(Response 61) While we understand the concern that some canned soups that appear to be single-serving containers are being labeled as having more than one serving, consumption data for this product category has not significantly increased. However, we note that under the new requirements for single-serving containers finalized in this rulemaking, products that are packaged and sold individually and that contain less than 200 percent of the RACC will be labeled as single-serving containers. Additionally, under the new dual-column labeling requirements finalized in this rulemaking, products containing at least 200 percent but less than 300 percent of the RACC will be required to provide nutrition information for the full container. Pursuant to this rule, canned soups that are currently labeled as containing ''about 2 servings'' will be required to provide nutrition information for the entire container, either using a single-serving container label or using a voluntary or mandatory dual-column label format.

(Comment 62) Sugar—One comment opposed updating the RACC for sugar. The comment stated that a change in consumption data is not enough to justify a change in the RACC. The comment noted that consumption data used in the 1991 proposed rule also showed that sugar should have an RACC of 8 g, but we nonetheless chose to finalize the RACC at 4 g in 1993. The comment stated that consumption data for sugar is limited and that we should, therefore, take into account other sources of information when determining the RACC. The comment stated that consumers typically add sugar to foods 1 tsp at a time and that the proposed 8 g RACC (2 tsp serving size) is cumbersome for most consumers who do not measure out sugar 2 tsp at a time. The comment also stated that if we update the RACC for sugar, consumers will believe that 2 tsp is the recommended serving size.

(Response 62) The decision to update the RACC for sugar is based on consumption data. The methodology used in the decisionmaking process for updating the RACC for sugar is the same methodology used to determine when to update the RACC for all product categories. While the current RACC for sugar has been used for more than two decades, RACCs are based primarily on the amount that is customarily consumed. Consumption data shows that the amount of sugar that is customarily consumed is 8 g, which is 2 tsp. We further disagree that the amount of consumption data available for sugar was ''limited,'' as the sample size of data available met the criteria set forth in our methodology memo (Ref. 31). Therefore, we are finalizing the RACC for sugar as proposed.

We acknowledge that determining nutrition values on the label when measuring an odd number of teaspoons of sugar (such as 3 tsp, which equals 1½ servings) might be cumbersome for some consumers. Given the data showing a significant increase in consumption, however, we determined it was important for the RACC to reflect current consumption amounts.

The comment is correct in noting that we received no comments in favor of our changes to the RACC for sugar. We do not consider this relevant to our decision, however, as the consumption data is clear with respect to this product category.

To address the statement that updating the RACC for sugar would cause consumers to view the larger serving size as a recommended amount to eat, as discussed in comment 2, we intend to conduct nutrition education to help clarify that the meaning of ''serving size'' is not a recommended amount, but rather is based on an amount customarily consumed.

(Comment 63) Raisins—One comment requested that we add a separate product category for raisins with an RACC of 28/30 g (1 oz). The comment stated that the existing RACC does not represent the quantity of raisins contained in individual packages typically purchased by consumers and, therefore, is not representative of the actual amount customarily consumed per eating occasion. The comment stated that mini raisins boxes are packaged in ½ oz (14.2 g) boxes and sold in bags of various quantities, primarily 12 or 14 minis per bag. The comment also stated that the larger individual snack size products are currently packaged in boxes that are 1 oz (28.3 g) and are sold in packages of six. The comment asserted that the two different individual unit sizes of 14.2 g and 28.3 g are both widely consumed and represent the predominant proportion of industry retail raisin sales

to consumers for out-of-hand snacking. The comment requested a separate RACC for raisins that is in line with the amount of raisins that is in an individual package of raisins. The comment stated that multiple-serving raisin packages are a different category from other dried fruits and are consumed in different ways by different consumers.

(Response 63) We decline to establish a new product category for raisins. Raisins are currently under the product category ''Dried'' under the ''Fruits and Fruit Juices'' general category with an RACC of 40 g. We group together like products with similar dietary usage so consumers can easily compare nutrient information between similar products. Raisins are comparable to other dried fruits such as cranberries and are used in similar ways (*e.g.,* as an ingredient in cookies); other dried fruits, such as cranberries are also consumed as snacks (Ref. 26). It would not be helpful for a consumer if there was a different RACC for raisins than there was for similar products on the market.

RACCs are determined primarily using consumption data, and other factors we consider in grouping products include similarities in dietary usage and product characteristics. Package size, which is not consistent and can change over time, is not a factor we considered in determining RACCs (see § 101.12(a)).

(Comment 64) Spray type fats and oils—Several comments requested that we amend the RACC for the product category ''spray types'' in the general category ''Fats and Oils.'' The comments noted that the current RACC for this product category is 0.25 g. The comments stated that cooking sprays have tiny serving sizes which allow them to make certain claims such as ''zero calorie'' or ''fat free,'' even though they are essentially pure oil. One comment recognized that no intake data were available from NHANES at the time of the proposed rule, but referred to a survey of 15 people that found that consumers spray a pan for 1.6 seconds on average, with the range being 1 to 3 seconds, compared to the one second spray that is found on the label of a common brand of cooking spray oil (Ref). The comments requested that we increase the RACC for spray cooking oils to a 2-second spray so consumers have a better understanding of the calories and fat they are consuming.

(Response 64) We decline to make a change to the RACC for spray oils. There are no data available in NHANES that can be used to update the RACC for cooking spray oils. We also have not identified any other information on consumption of cooking spray oils that we can use as a basis for determining a different RACC. Although one comment referred to a study that it conducted, the comment provided no information about the methodology used and included a small sample size of only 15 people; therefore, this information provides an insufficient basis on which to update the RACC. Additionally, we note that serving size is based on the amount an individual consumes. Spray oils are often used to prepare food for multiple individuals, so even if the typical spray is longer than one second, the amount consumed by each individual may be significantly less.

(Comment 65) Yogurt—Several comments supported the proposed changes to the RACC for yogurt. Some comments asked us to clarify that the proposed 170 g (6 oz) RACC for yogurt applies to all forms of ''yogurt'' (*e.g.,* cup, drinkable, squeezable) that comply with our standard of identity for yogurt. The comments specifically wanted clarification that drinkable yogurts would be subject to the proposed 170 g (6 fl oz) yogurt RACC versus the 240 mL (8 fl oz) RACC for the ''Milk, milk substitutes, and fruit based drink mixers (without alcohol) (*e.g.,* drink mixers, fruit flavored powdered drink mixes, sweetened cocoa powder)'' product category. One comment stated that a product labeled as ''drinkable yogurt'' is ''yogurt'' and must, like cup yogurt, meet one of our standards of identity for yogurt. The comment stated that drinkable yogurts are produced, marketed, and used by consumers as food (not as beverages) and are fundamentally different in both form and use from fluid milk, milk-substitute beverages, and other milk-based drinks.

(Response 65) We agree that drinkable yogurt is more similar to other forms of yogurt than to milk beverages. Drinkable yogurt is a product that is consistent with the standard of identity for yogurt under 21 CFR 131.200 but that is more fluid than other forms of yogurt. Therefore, we are clarifying that the new yogurt RACC applies to all forms of yogurt including drinkable yogurt.

E. Impact of Changes in RACCs on the Eligibility To Make Nutrient Content Claims and Health Claims

We stated in the proposed rule that we were aware that individual foods that currently meet the requirements for certain claims based on existing RACCs may potentially become ineligible to continue to bear such claims if their RACCs change. Also, we recognized that other regulatory requirements for nutrient content claims and health claims are considered on a per-RACC basis, and changes to the RACCs could affect the ability of foods to meet these requirements. We noted that changes in the eligibility to bear claims may be appropriate in light of the changes in the amounts of food being customarily consumed but that it would be difficult to fully understand any potential impacts of changes to the RACCs on the eligibility to bear claims until the rules for both serving sizes and updating the Nutrition Facts label are finalized. We invited comment on any concerns related to changes to current claims used on specific foods that will be affected if the serving size rule is finalized as proposed (79 FR 11989 at 12015 to 12016).

(Comment 66) We received a number of comments in response to our discussion on claim eligibility in the proposed rule agreeing with us that foods could potentially become ineligible to bear a claim based on changes to the RACCs. A number of these comments suggested that we consider potential impacts on claim eligibility and evaluate if resulting changes in eligibility assists consumers in constructing healthful diets. Some comments stated that any changes that will be needed to regulations for nutrient content claims (NCCs) and health claims should be coordinated with the changes to the Nutrition Facts label and serving sizes. A few comments cited examples of specific issues that could affect the foods that the commenters produce. One such example indicated that foods with the terms ''Healthy'' or ''Lean'' in their brand name may become ineligible to bear such claims and could be considered misbranded if the products would continue to bear such claims. Another example discussed the changes to the RACCs that make the RACCs different between bulk and novelty ice cream products and noted that such changes could make identical food products, but of different sizes, unable to bear the same claims. One example discussed changes to the RACC of confections and noted that because of the smaller proposed RACC, some confections would become subject to the NCC criteria for foods with small RACCs and become ineligible to bear some claims.

(Response 66) As we discussed in the proposed rule, we anticipate that there may be changes needed with regard to claims based on the new and updated regulations for Nutrition Facts and serving sizes. We agree with the comments that suggested that we evaluate claim regulations and any change to eligibility for claims. Changes to nutrition labeling is a step-wise

process, and all changes to Nutrition Facts and serving sizes need to become final before we can determine any and all necessary changes to claim regulations. Because it is prudent for us to be fully aware of all final and official changes to the RACCs (and to the information in Nutrition Facts) before determining the scope of all of the changes needed to claim regulations, we are not publishing rules updating claim regulations simultaneously with the publication of the rules for serving sizes and Nutrition Facts. With the publication of this final rule (and the publication of the Nutrition Facts final rule, we can assess the impacts of all of the updates on claim eligibility.

We intend to consider in a future rulemaking issues such as whether any changes in eligibility for claims would assist consumers in constructing healthy diets and whether the criteria for claims remain appropriate. However, as we noted in the proposed rule, changes in the eligibility to bear claims may be appropriate for some foods (79 FR 11989 at 12016). Reformulation of some foods in line with current dietary recommendations may be expected in order to continue to bear claims. Manufacturers will have some time to make necessary changes before the compliance dates for the final rules on serving size and Nutrition Facts. This time will allow manufacturers to update food labels to come into compliance with the new regulations for serving size and Nutrition Facts, and it also allows time to discontinue use of individual voluntary claims that the labeling of certain products may no longer be eligible to make. The time will also allow us to evaluate the existing claim regulations and publish, in a separate rulemaking, any amendments to those claim regulations.

(Comment 67) One comment regarding the changes in the definition of a single-serving container and a product's ability to qualify for ''free'' claims stated that beverages that are routinely sold in single-serving containers for which the labeled serving is less than the RACC may no longer be able to make a calorie ''free'' or other ''free'' claims, even though the caloric or other nutrient content may be trivial in those particular single-serving packages. The comment said this outcome may occur because ''free'' claims are based on the nutrient content for both the labeled serving and the RACC. The comment gave the example of certain energy drink products that are commonly sold in 8 oz, single-serving containers. The comment asserted that the caloric content of these below-RACC, single-serving beverages is insignificant, which supports a calorie-free claim. However, 12 ozs of the product would contain just enough calories to preclude a calorie-free claim. Consequently, even though the single-serving product would not contain any more calories than before the RACCs would be updated, the small, single-serving beverage would be precluded from bearing a calorie-free claim because of the combined effect of the proposed RACC and the requirement that calorie-free claims must be based on both per-labeled-serving and per-RACC nutrient content.

(Response 67) When we established ''free'' claims, we decided to make the basis of the claim on a per-RACC and per-labeled-serving basis (56 FR 60421 and 58 FR 2302). When we developed our general principles on nutrient content claims, we concluded that it would be misleading to allow certain claims to be based only on the RACC, particularly with single-serving containers, since the consumer would be expected to consume the entire labeled serving size. Likewise, we concluded that it would be misleading to allow claims based only on the labeled serving size. This decision was made to prevent potentially misleading claims and to provide a level field for industry. Since that time, consumption patterns have changed so that the RACC for some beverages has increased from 8 oz to 12 oz. Because the consumption amount has increased for certain beverages, such products for which the RACC has increased may appropriately no longer be able to make ''free'' claims. As noted previously, we intend to consider in a future rulemaking issues such as whether any changes in eligibility for claims would assist consumers in constructing healthy diets and whether the criteria for claims remain appropriate.

F. Establishing a New Serving Size for Breath Mints

In the serving size proposed rule, we proposed to establish a new serving size of ''1 unit'' for breath mints while maintaining the current reference amount of 2 g for the product category ''Hard candies, breath mints.'' We proposed this action in response to a petition that suggested the appropriate serving size for small breath mints should be ''one mint'' instead of the number of pieces that is closest to the 2 g RACC. The petitioner had also requested that a separate product category, having an RACC of 0.5 g, should be established for small breath mints weighing 0.5 g or less.

We received one comment that supported a ''1-unit'' serving size for breath mints and no comments that addressed changing the RACC for breath mints. As mentioned in the serving size proposed rule (79 FR 11989 at 12016), we have determined through our analysis of two large commercial databases that 2 g remains an appropriate RACC for the product category ''Hard candies, breath mints.'' Further, because only a limited number of small breath mint products are commercially available, establishing a separate product category for small breath mints weighing 0.5 g or less, as the petitioner requested, is not warranted. Therefore, we will keep 2 g as the single reference amount for the ''Hard candies, breath mints'' product category, which includes breath mints of all sizes. However, we will now require that the label statement for the serving size of all breath mints be 1 unit, rather than declaring the serving size in terms of the number of mints closest to the 2 g RACC. We have indicated this in table 2 of § 101.12(b) by changing footnote 8 (formerly footnote 9) to state, in part, ''Label serving size of ice cream cones, eggs, and breath mints of all sizes will be 1 unit.''

G. Technical Amendments

1. Rounding Rules for Products That Have More Than Five Servings and the Number of Servings Falls Exactly Between Two Values

In the serving size proposed rule (79 FR 11989) we proposed to add the following to § 101.9(b)(8)(i): ''For containers that contain greater than 5 servings, if the number of servings determined from the procedures provided in this section falls exactly halfway between two allowable declarations, the manufacturer must round the number of servings up to the nearest incremental size.'' We made this proposal to provide information to manufacturers who have products that contain five or more servings to round the number of servings up when the number of servings falls exactly between two values.

We received no comments on this topic but are not finalizing the amendment as proposed. Standard rounding rules require numbers that fall exactly half way between two declarations to be rounded up to the nearest incremental size. This rule applies to all provisions where rounding is required and is not unique to rounding required for containers that contain greater than 5 servings. Because this proposed addition to § 101.9(b)(8)(i) is unnecessary, we are not finalizing the proposed amendment.

2. Options for When the Number of Servings per Container Varies

In the serving size proposed rule (79 FR 11989) we proposed to amend § 101.9(b)(8)(iii) by: (1) Defining ''random-weight products'' and (2) eliminating the wording that specifies that the nutrition information is based on the reference amount expressed in ounces. The proposed rule would define random-weight products as ''foods such as cheeses that are sold as random weights that vary in size, such that the net contents for different containers would vary.''

We received no comments on this topic, and will finalize the amendment as proposed. We are also amending the final sentence of this paragraph to read ''in parentheses'' rather than ''in parenthesis.''

3. Minor Corrections to General and Product Category Names

In the serving size proposed rule (79 FR 11989) we proposed to make minor changes to the names of certain general categories and product categories to clarify the products contained in the category, and to correct minor errors in these categories.

We received no comments on this topic, and will make these corrections in table 2 in § 101.12(b).

4. Minor Changes to Footnotes

In the serving size proposed rule (79 FR 11989) we proposed to remove footnote 4 from table 1 in § 101.12(b) to provide clearer guidance on the types of products that can be included in the product categories listed in the tables. We further proposed to renumber footnote 5 as footnote 4 and revise it by removing the first sentence and replacing it with the following: ''The label statements are meant to provide examples of serving size statements that may be used on the label, but the specific wording may be changed as appropriate for individual products.'' In table 2 we proposed to remove footnote 4 and renumber the remaining footnotes. We further proposed to revise renumbered footnote 4 by removing the first sentence and replacing it with the following: ''The label statements are meant to provide examples of serving size statements that may be used on the label, but the specific wording may be changed as appropriate for individual products.'' We also proposed to revise renumbered footnote 5 to include the sentence, ''The serving size for fruitcake is 1½ ounces''; to add renumbered footnote 10 as a superscript to the word ''pimento'' in the ''Vegetables, primarily used for garnish or flavor, *e.g.,* pimento, parsley, fresh or dried)'' product category; and to revise renumbered footnote 12 to state, ''For raw fruit, vegetables, and fish, manufacturers should follow the label statement for the serving size specified in Appendices C and D to part 101 (21 CFR 101) Code of Federal Regulations.''

We received no comments to these minor technical amendments and will make the changes in tables 1 and 2 in § 101.12(b).

In addition to the changes to various footnotes proposed in the proposed rule, we are making several additional technical amendments to table 2 by adding language to footnote 1 explaining that the values have been updated with data from various NHANES surveys, adding renumbered footnote 10 to the product category ''Fruits for garnish or flavor, *e.g.,* maraschino cherries,'' removing the ''(b)'' from the Code of Federal Regulations citation ''101.9(b)(j)(11)'' in renumbered footnote 11, and revising renumbered footnote 12 to state, ''For raw fruit, vegetables, and fish, manufacturers should follow the label statement for the serving size specified in Appendices C and D to part 101 (21 CFR 101) Code of Federal Regulations.''

5. Minor Changes to Table 1 in § 101.12(b)

In the serving size proposed rule (79 FR 11989) we proposed to change the title of table 1 from ''Reference Amounts Customarily Consumed Per Eating Occasion: Infant and Toddler Foods'' to ''Reference Amounts Customarily Consumed Per Eating Occasion: Foods for Infants and Young Children 1 through 3 years of age.'' We also proposed to make other conforming changes in the product category names, by changing the product category name ''Dinners, stews or soups for toddlers, ready-to-serve'' to ''Dinners, stews or soups for young children, ready-to-serve,'' the product category name ''Fruits for toddlers, ready-to-serve'' to ''Fruits for young children, ready-to-serve,'' and the product category name ''Vegetables for toddlers, ready-to-serve'' to ''Vegetables for young children, ready-to-serve.''

We received no comments to these minor technical amendments and will make the changes in table 1 in § 101.12(b).

6. Minor Changes to Table 2 in § 101.12(b)

In the serving size proposed rule (79 FR 11989) we proposed to make some editorial changes to the product category names.

We received no comments to these minor technical amendments and will make the changes in table 2 in § 101.12(b).

7. Reference Amounts for Products That Require Further Preparation

In the serving size proposed rule (79 FR 11989), we proposed to amend § 101.12(c) to change the definition of the reference amount for products that require further preparation in which the entire contents of the package are used to prepare one large discrete unit usually divided for consumption.

We received no comments on this topic, and will finalize this amendment as proposed.

8. Reference Amount for Combined Products Consisting of Two or More Separate Foods That Are Packaged Together and Are Intended To Be Eaten Together and That Have No Reference Amount for the Combined Product

Section 101.12(f) establishes the approach for determining the reference amount for combined products consisting of two or more separate foods, packaged together and intended to be eaten together, that have no established reference amount in the tables for the combined product. In the serving size proposed rule (79 FR 11989) we proposed to amend § 101.9(f)(1) and (2) to change the definition of the RACC for these products consisting of two or more separate foods, packaged together and intended to be eaten together, so that it will not affect the serving size declaration on the label.

We received no comments on this topic, and will finalize the amendment as proposed.

9. Reference Amounts for Varieties or Assortments of Foods in Gift Packages That Have No Appropriate Reference Amount

Section 101.9(h)(3)(ii) establishes the procedure for determining the serving size for varieties or assortments of foods in gift packages when there is no appropriate reference amount. The current language in § 101.9(h)(3)(ii) states that 8 fl ozs may be used as the standard serving size for beverage varieties or assortments in gift packages. Because we are amending the RACCs for some beverages, we proposed conforming amendments to this section to state that 12 fl oz should be used as the standard serving size for beverages, except that the standard serving size for milk, fruit juices, nectars, and fruit drinks will be based on 8 fl ozs.

We received no comments on this topic, and will finalize the amendment

as proposed, with minor edits for clarity.

IV. Effective and Compliance Dates

In the preamble of the proposed rule (79 FR 11989 at 12019), we proposed that any final rule resulting from this rulemaking, as well as any final rule resulting from the proposed rule entitled ''Food Labeling: Revision of the Nutrition and Supplement Facts Labels'' (the Nutrition Facts proposed rule), would become effective 60 days after the date of the final rule's publication in the **Federal Register**. We also proposed that any final rule that resulted would have a compliance date that would be 2 years after the effective date (79 FR 11989 at 12019). We explained that industry might need some time to analyze products for which there may be new mandatory nutrient declarations, make any required changes to the Nutrition Facts label (which may be coordinated with other planned label changes), review and update records of product labels, and print new labels.

After considering comments submitted to the docket for the Nutrition Facts proposed rule regarding the effective and compliance dates, we have maintained the compliance date of 2 years after the effective date, except that for manufacturers with less than $10 million in annual food sales, we are providing a compliance date of 3 years after the effective date. Comments to the Nutrition Facts proposed rule emphasized the rule's potential impact on small businesses. We agree that the impacts to smaller businesses may be more substantial than those on larger businesses; thus, for manufacturers with less than $10 million in annual food sales, the compliance date will be July 26, 2019. Using Nielsen data, we estimate that manufacturers with less than $10 million in annual food sales constitute approximately 95 percent of all food manufacturers and market 48 percent of food UPCs.

V. Analysis of Environmental Impact

We have determined under 21 CFR 25.30(i) and (k) that this action is of a type that does not individually or cumulatively have a significant effect on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement is required.

VI. Economic Analysis of Impacts

We have examined the impacts of the final rule under Executive Order 12866, Executive Order 13563, the Regulatory Flexibility Act (5 U.S.C. 601–612), and the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4). Executive Orders 12866 and 13563 direct us to assess all costs and benefits of available regulatory alternatives and, when regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity). We are publishing two final rules on nutrition labeling in the **Federal Register**. We have developed a comprehensive Regulatory Impact Analysis (RIA) that assesses the impacts of the two final nutrition labeling rules taken together. We believe that the final rules on nutrition labeling, taken as a whole, are an economically significant regulatory action as defined by Executive Order 12866.

The Regulatory Flexibility Act requires us to analyze regulatory options that would minimize any significant impact of a rule on small entities. Additional costs per entity from the final rules are small, but not negligible, and as a result we find that the final rules on nutrition labeling, taken as a whole, will have a significant economic impact on a substantial number of small entities.

The Unfunded Mandates Reform Act of 1995 (section 202(a)) requires us to prepare a written statement, which includes an assessment of anticipated costs and benefits, before issuing ''any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more (adjusted annually for inflation) in any one year.'' The current threshold after adjustment for inflation is $144 million, using the most current (2014) Implicit Price Deflator for the Gross Domestic Product. We have determined that the final rules on nutrition labeling, taken as a whole, would result in an expenditure in any year that meets or exceeds this amount.

The full analysis of economic impacts for the final rules on nutrition labeling is available in the docket for this final rule (Ref. 35) and at *http://www.fda.gov/AboutFDA/ReportsManualsForms/Reports/EconomicAnalyses/*.

VII. Paperwork Reduction Act of 1995

This final rule contains information collection provisions that are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501–3520). A description of these provisions is given in this section with an estimate of the annual third-party disclosure burden. Included in the estimate is the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing each collection of information.

Title: Third-Party Disclosure Requirements for Serving Sizes of Foods That Can Reasonably Be Consumed At One Eating Occasion; Dual-Column Labeling; Updating, Modifying and Establishing Certain RACCs; Serving Size for Breath Mints; and Technical Amendments

Description of Respondents: The respondents to this information collection are manufacturers of retail food products marketed in the United States.

Description: In major part, this final rule revises §§ 101.9 and 101.12 to: (1) Amend the definition of a single serving, (2) require a second column of nutrition information per package for products that contain at least 200 and up to and including 300 percent of the applicable RACCs, as well as per unit for discrete units in multiserving packages in which each unit contains at least 200 percent and up to and including 300 percent of the applicable RACCs, (3) update, modify, and establish RACCs for certain food products, (4) make several technical amendments to the regulations for serving sizes, and (5) change the label serving size for breath mints to ''1 unit.'' These revisions, in many instances, will require changes to the nutrition information that is presented on the Nutrition Facts label of retail food products. Preexisting §§ 101.9 and 101.12 are approved by OMB in accordance with the PRA under OMB control number 0910–0381. This final rule will modify the information collection associated with preexisting §§ 101.9 and 101.12 by adding to the burden associated with the collection by requiring the following manufacturers to make changes to their product labels: Those whose retail food products are labeled with a serving size that is inconsistent with the provisions of the final rule, and those whose retail food products would be required to use dual-column labeling.[2] The nutrient information disclosed on labels of retail food products is necessary to inform purchasers of the nutritional value of the food.

We estimate the burden of this collection of information as follows:

[2] Included in this burden are the labeling costs that result from changes in the eligibility to bear nutrient content claims or health claims (*e.g.,* the cost of removing a claim from labeling or adding a required disclaimer).

TABLE 1—ESTIMATED ANNUAL THIRD PARTY DISCLOSURE BURDEN [1]

21 CFR Section	Number of respondents	Number of disclosures per respondent	Total annual disclosures	Average burden per disclosure	Total hours	Total capital costs (in billions of 2014$)
101.9 and 101.12	13,452	25	336,300	2	672,600	$1.00
Total Initial Hours and Capital Costs					672,600	$1.00
New Products	500	1	500	2	1,000	$0.01
Total Recurring Hours and Capital Costs					1,000	$0.01
Total Burden Hours and Capital Costs					673,600	$1.01

[1] There are no operating and maintenance costs associated with this collection of information.

Under §§ 101.9 and 101.12, some manufacturers of retail food products would need to make a labeling change to modify the serving sizes and other nutrition information based on changes to what products may be or are required to be labeled as a single serving or based on updated, modified, or established RACCs. Additionally, some manufacturers would need to change their product labels to add a second column of nutrition information per package or per discrete unit as part of the Nutrition Facts label. The third-party disclosure burden consists of the setup time required to design a revised label and incorporate it into the manufacturing process. The third-party disclosure burden for this final rule is estimated in table 1.

Based upon our knowledge of food labeling, we estimate that the affected manufacturers would require 2 hours per product to modify the label's Nutrition Facts panel. We estimate that it would take an affected manufacturer 1 hour to review a label to assess how to bring it into compliance with the requirements of this final rule. Each label redesign would require an estimated 1 additional hour per UPC, for a total of 2 hours per UPC.

We estimate that about 13,452 manufacturers would initially be affected by this final rule and that about 336,300 products would initially be required to be relabeled, for an average of 25 (336,300/13,452) products per respondent. The total initial third-party disclosure burden of 672,600 hours is reported in table 1. The final column of table 1 gives the estimated initial capital cost of the relabeling associated with this final rule. Based on the RIA, we estimate the initial capital cost to be approximately $1 billion (2014$).

This final rule generates recurring burdens related to the requirement that some manufacturers undertake an extensive label change due to the effect of the changed definition of a single-serving container on the permissibility of certain health and nutrient content claims and also to the requirement that some manufacturers undertake a major redesign of their labels to include a Nutrition Facts Panel that had not previously been required.[3] We estimate that about 500 new products would be affected by these requirements each year, and that the required third party disclosure burden would be 2 hours per product, for an annual recurring third party disclosure burden of 1,000 hours. Based on the RIA, we estimate the annual recurring capital cost to be approximately $0.01 billion (2014$).

Adding the recurring burden from new products to the initial burden for existing products results in a total of 673,600 third party disclosure burden hours and $1.01 billion (2014$) in capital costs as reported in table 1.

The information collection provisions in this final rule and the Nutrition Facts Label final rule have been submitted to OMB for review as required by section 3507(d) of the PRA of 1995.

Before the effective date of this final rule, we will publish a notice in the **Federal Register** announcing OMB's decision to approve, modify, or disapprove the information collection provisions in this final rule.

An Agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number.

VIII. Federalism

We have analyzed this final rule in accordance with the principles set forth in Executive Order 13132. Section 4(a) of the Executive Order requires agencies to ''construe . . . a Federal statute to preempt State law only where the statute contains an express preemption provision or there is some other clear evidence that the Congress intended preemption of State law, or where the exercise of State authority conflicts with the exercise of Federal authority under the Federal statute.''

Section 403A of the FD&C Act (21 U.S.C. 343–1) is an express preemption provision. Section 403A(a) of the FD&C Act provides that ''. . . no State or political subdivision of a State may directly or indirectly establish under any authority or continue in effect as to any food in interstate commerce. . . (4) any requirement for nutrition labeling of food that is not identical to the requirement of section 403(q) [of the FD&C Act]. . . .''

The express preemption provision of section 403A(a) of the FD&C Act does not preempt any State or local requirement respecting a statement in the labeling of food that provides for a warning concerning the safety of the food or component of the food (section 6(c)(2) of the NLEA).

This final rule will create requirements that fall within the scope of section 403A(a) of the FD&C Act.

List of Subjects in 21 CFR Part 101

Food labeling, Nutrition, Reporting and record keeping requirements.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 101 is amended as follows:

PART 101—FOOD LABELING

■ 1. The authority citation for part 101 continues to read as follows:

Authority: 15 U.S.C. 1453, 1454, 1455; 21 U.S.C. 321, 331, 342, 343, 348, 371; 42 U.S.C. 243, 264, 271.

■ 2. In § 101.9:
■ a. Revise paragraph (b)(2)(i)(D);
■ b. Remove paragraph (b)(2)(i)(E) and redesignate paragraphs (b)(2)(i)(F) through (I) as paragraphs (b)(2)(i)(E) through (H) respectively;
■ c. Revise paragraphs (b)(6), (b)(8)(iii), and (b)(10)(ii);
■ d. Add paragraph (b)(12); and
■ e. Revise paragraph (h)(3)(ii).

The revisions and addition read as follows:

§ 101.9 Nutrition labeling of food.

* * * * *

(b) * * *

(2) * * *

(i) * * *

(D) If a unit weighs at least 200 percent and up to and including 300 percent of the applicable reference amount, the serving size shall be the amount that approximates the reference amount. In addition to providing a column within the Nutrition Facts label that lists the quantitative amounts and percent Daily Values per serving size, the manufacturer shall provide a column within the Nutrition Facts label that lists the quantitative amounts and

percent Daily Values per individual unit. The first column would be based on the serving size for the product and the second column would be based on the individual unit. The exemptions in paragraphs (b)(12)(i)(A), (B), and (C) of this section apply to this provision.

* * * * *

(6) A product that is packaged and sold individually that contains less than 200 percent of the applicable reference amount must be considered to be a single-serving container, and the entire content of the product must be labeled as one serving. In addition to providing a column within the Nutrition Facts label that lists the quantitative amounts and percent Daily Values per serving, for a product that is packaged and sold individually that contains more than 150 percent and less than 200 percent of the applicable reference amount, the Nutrition Facts label may voluntarily provide, to the left of the column that provides nutrition information per container (*i.e.,* per serving), an additional column that lists the quantitative amounts and percent Daily Values per common household measure that most closely approximates the reference amount.

* * * * *

(8) * * *

(iii) For random weight products, manufacturers may declare ''varied'' for the number of servings per container provided the nutrition information is based on the reference amount expressed in the appropriate household measure based on the hierarchy described in paragraph (b)(5) of this section. Random weight products are foods such as cheeses that are sold as random weights that vary in size, such that the net contents for different containers would vary. The manufacturer may provide the typical number of servings in parentheses following the ''varied'' statement.

* * * * *

(10) * * *

(ii) Per one unit if the serving size of a product in discrete units is more than 1 unit.

* * * * *

(12)(i) Products that are packaged and sold individually and that contain at least 200 percent and up to and including 300 percent of the applicable reference amount must provide an additional column within the Nutrition Facts label that lists the quantitative amounts and percent Daily Values for the entire package, as well as a column listing the quantitative amounts and percent Daily Values for a serving that is less than the entire package (*i.e.,* the serving size derived from the reference amount). The first column would be based on the serving size for the product and the second column would be based on the entire contents of the package.

(A) This provision does not apply to products that meet the requirements to use the tabular format in paragraph (j)(13)(ii)(A)(*1*) of this section or to products that meet the requirements to use the linear format in paragraph (j)(13)(ii)(A)(*2*) of this section.

(B) This provision does not apply to raw fruits, vegetables, and seafood for which voluntary nutrition labeling is provided in the product labeling or advertising or when claims are made about the product.

(C) This provision does not apply to products that require further preparation and provide an additional column of nutrition information under paragraph (e) of this section, to products that are commonly consumed in combination with another food and provide an additional column of nutrition information under paragraph (e) of this section, to products that provide an additional column of nutrition information for two or more groups for which RDIs are established (*e.g.,* both infants and children less than 4 years of age), to popcorn products that provide an additional column of nutrition information per 1 cup popped popcorn, or to varied-weight products covered under paragraph (b)(8)(iii) of this section.

(ii) When a nutrient content claim or health claim is made on the label of a product that uses a dual column as required in paragraph (b)(2)(i)(D) or (b)(12)(i) of this section, the claim must be followed by a statement that sets forth the basis on which the claim is made, except that the statement is not required for products when the nutrient that is the subject of the claim meets the criteria for the claim based on the reference amount for the product and the entire container or the unit amount. When a nutrient content claim is made, the statement must express that the claim refers to the amount of the nutrient per serving (*e.g.,* ''good source of calcium per serving'' or ''per X [insert unit]_serving'') or per reference amount (*e.g.,* ''good source of calcium per [insert reference amount (*e.g.,* per 8 ounces)]), as required based on § 101.12(g). When a health claim is made, the statement shall be ''A serving of _ounces of this product conforms to such a diet.''

* * * * *

(h) * * *

(3) * * *

(ii) In the absence of a reference amount customarily consumed in § 101.12(b) that is appropriate for the variety or assortment of foods in a gift package, the following may be used as the standard serving size for purposes of nutrition labeling of foods subject to this paragraph: 1 ounce for solid foods; 2 fluid ounces for nonbeverage liquids (*e.g.,* syrups); 8 ounces for beverages that consist of milk and fruit juices, nectars and fruit drinks; and 12 fluid ounces for other beverages. However, the reference amounts customarily consumed in § 101.12(b) shall be used for purposes of evaluating whether individual foods in a gift package qualify for nutrient content claims or health claims.

* * * * *

■ 3. In § 101.12:

■ a. In paragraph (b), revise tables 1 and 2;

■ b. Revise paragraphs (c) and (f)(1);

■ c. Remove paragraph (f)(2) and redesignate paragraph (f)(3) as paragraph (f)(2); and

■ d. Revise newly redesignated paragraph (f)(2).

The revisions read as follows:

§ 101.12 Reference amounts customarily consumed per eating occasion.

* * * * *

(b) * * *

TABLE 1—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION: FOODS FOR INFANTS AND YOUNG CHILDREN 1 THROUGH 3 YEARS OF AGE [1] [2] [3]

Product category	Reference amount	Label statement [4]
Cereals, dry instant	15 g	__cup (__g)
Cereals, prepared, ready-to-serve	110 g	__cup(s) (__g)
Other cereal and grain products, dry ready-to-eat, e.g., ready-to-eat cereals, cookies, teething biscuits, and toasts.	7 g for infants and 20 g for young children (1 through 3 years of age) for ready-to-eat cereals; 7 g for all others.	__cup(s) (__g) for ready-to-eat cereals; piece(s) (__g) for others
Dinners, deserts, fruits, vegetables or soups, dry mix.	15 g	__tbsp(s) (__g); __cup(s) (__g)

TABLE 1—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION: FOODS FOR INFANTS AND YOUNG CHILDREN 1 THROUGH 3 YEARS OF AGE [1] [2] [3]—Continued

Product category	Reference amount	Label statement [4]
Dinners, desserts, fruits, vegetables or soups, ready-to-serve, junior type.	110 g	__cup(s) (__g); cup(s) (__mL)
Dinners, desserts, fruits, vegetables or soups, ready-to-serve, strained type.	110 g	__cup(s) (__g); cup(s) (__mL)
Dinners, stews or soups for young children, ready-to-serve.	170 g	__cup(s) (__g); cup(s) (__mL)
Fruits for young children, ready-to-serve	125 g	__cup(s) (__g)
Vegetables for young children, ready-to-serve	70 g	__cup(s) (__g)
Eggs/egg yolks, ready-to serve	55 g	__cup(s) (__g)
Juices all varieties	120 mL	4 fl oz (120 mL)

[1] These values represent the amount of food customarily consumed per eating occasion and were primarily derived from the 1977–1978 and the 1987–1988 Nationwide Food Consumption Surveys conducted by the U.S. Department of Agriculture. We further considered data from the National Health and Nutrition Examination Survey, 2003–2004, 2005–2006, and 2007–2008 conducted by the Centers for Disease Control and Prevention, in the U.S. Department of Health and Human Services.

[2] Unless otherwise noted in the reference amount column, the reference amounts are for the ready-to-serve or almost ready-to-serve form of the product (*e.g.,* heat and serve, brown and serve). If not listed separately, the reference amount for the unprepared form (*e.g.,* dry mixes, concentrates, dough, batter, fresh and frozen pasta) is the amount required to make the reference amount of the prepared form. Prepared means prepared for consumption (*e.g.,* cooked).

[3] Manufacturers are required to convert the reference amount to the label serving size in a household measure most appropriate to their specific product using the procedures in 21 CFR 101.9(b).

[4] The label statements are meant to provide examples of serving size statements that may be used on the label, but the specific wording may be changed as appropriate for individual products. The term ''piece'' is used as a generic description of a discrete unit. Manufacturers should use the description of a unit that is most appropriate for the specific product (*e.g.,* sandwich for sandwiches, cookie for cookies, and bar for frozen novelties).

TABLE 2—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION: GENERAL FOOD SUPPLY [1] [2] [3]

Product category	Reference amount	Label statement [4]
Bakery Products:		
Bagels, toaster pastries, muffins (excluding English muffins).	110 g	__piece(s) (__g)
Biscuits, croissants, tortillas, soft bread sticks, soft pretzels, corn bread, hush puppies, scones, crumpets, English muffins.	55 g	__piece(s) (__g)
Breads (excluding sweet quick type), rolls	50 g	__piece(s) (__g) for sliced bread and distinct pieces (e.g., rolls); 2 oz (56 g/__inch slice) for unsliced bread
Bread sticks—see crackers.		
Toaster pastries—see bagels, toaster pastries, muffins (excluding English muffins).		
Brownies	40 g	__piece(s) (__g) for distinct pieces; fractional slice (__g) for bulk
Cakes, heavyweight (cheese cake; pineapple upside-down cake; fruit, nut, and vegetable cakes with more than or equal to 35 percent of the finished weight as fruit, nuts, or vegetables or any of these combinations) [5].	125 g	__piece(s) (__g) for distinct pieces (e.g., sliced or individually packaged products); __fractional slice (__g) for large discrete units
Cakes, mediumweight (chemically leavened cake with or without icing or filling except those classified as light weight cake; fruit, nut, and vegetable cake with less than 35 percent of the finished weight as fruit, nuts, or vegetables or any of these combinations; light weight cake with icing; Boston cream pie; cupcake; eclair; cream puff) [6].	80 g	__piece(s) (__g) for distinct pieces (e.g., cupcake); __fractional slice (__g) for large discrete units
Cakes, lightweight (angel food, chiffon, or sponge cake without icing or filling) [7].	55 g	__piece(s) (__g) for distinct pieces (e.g., sliced or individually packaged products); __fractional slice (__g) for large discrete units
Coffee cakes, crumb cakes, doughnuts, Danish, sweet rolls, sweet quick type breads.	55 g	__piece(s) (__g) for sliced bread and distinct pieces (e.g., doughnut); 2 oz (56 g/visual unit of measure) for bulk products (e.g., unsliced bread)
Cookies	30 g	__piece(s) (__g)
Crackers that are usually not used as snack, melba toast, hard bread sticks, ice cream cones [8].	15 g	__piece(s) (__g)
Crackers that are usually used as snacks	30 g	__piece(s) (__g)
Croutons	7 g	__tbsp(s) (__g); __cup(s) (__g); __piece(s) (__g) for large pieces
Eggroll, dumpling, wonton, or potsticker wrappers.	20 g	__sheet (__g); wrapper (__g)
French toast, crepes, pancakes, variety mixes.	110 g prepaed for French toast, crepes, and pancakes; 40 g dry mix for variety mixes.	__piece(s) (__g); __cup(s) (__g) for dry mix

TABLE 2—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION: GENERAL FOOD SUPPLY [1] [2] [3]—Continued

Product category	Reference amount	Label statement [4]
Grain-based bars with or without filling or coating, e.g., breakfast bars, granola bars, rice cereal bars.	40 g	__piece(s) (__g)
Ice cream cones—see crackers.		
Pies, cobblers, fruit crisps, turnovers, other pastries.	125 g	__piece(s) (__g) for distinct pieces; __fractional slice (__g) for large discrete units
Pie crust, pie shells, pastry sheets, (e.g., phyllo, puff pastry sheets).	the allowable declaration closest to an 8 square inch surface area.	__fractional slice(s) (__g) for large discrete units; __shells (__g); __fractional __sheet(s) (__g) for distinct pieces (e.g., Pastry sheet).
Pizza crust	55 g	__fractional slice (__g)
Taco shells, hard	30 g	__shell(s) (__g)
Waffles	85 g	__piece(s) (__g)
Beverages:		
Carbonated and noncarbonated beverages, wine coolers, water.	360 mL	12 fl oz (360 mL)
Coffee or tea, flavored and sweetened	360 mL prepared	12 fl oz (360 mL)
Cereals and Other Grain Products:		
Breakfast cereals (hot cereal type), hominy grits.	1 cup prepared; 40 g plain dry cereal; 55 g flavored, sweetened cereal.	__cup(s) (__g)
Breakfast cereals, ready-to-eat, weighing less than 20 g per cup, e.g., plain puffed cereal grains.	15 g	__cup(s) (__g)
Breakfast cereals, ready-to-eat, weighing 20 g or more but less than 43 g per cup; high fiber cereals containing 28 g or more of fiber per 100 g.	40 g	__cup(s) (__g)
Breakfast cereals, ready-to-eat, weighing 43 g or more per cup; biscuit types.	60 g	__piece(s) (__g) for large distinct pieces (e.g., biscuit type); __cup(s) (__g) for all others
Bran or wheat germ	15 g	__tbsp(s) (__g); __cup(s) (__g)
Flours or cornmeal	30 g	__tbsp(s) (__g); __cup(s) (__g)
Grains, e.g., rice, barley, plain	140 g prepared; 45 g dry	__cup(s) (__g)
Pastas, plain	140 g prepared; 55 g dry	__cup(s) (__g); __piece(s) (__g) for large pieces (e.g., large shells or lasagna noodles) or 2 oz (56 g/visual unit of measure) for dry bulk products (e.g., spaghetti)
Pastas, dry, ready-to-eat, e.g., fried canned chow mein noodles.	25 g	__cup(s) (__g)
Starches, e.g., cornstarch, potato starch, tapioca, etc.	10 g	__tbsp (__g)
Stuffing	100 g	__cup(s) (__g)
Dairy Products and Substitutes:		
Cheese, cottage	110 g	__cup (__g)
Cheese used primarily as ingredients, e.g., dry cottage cheese, ricotta cheese.	55 g	__cup (__g)
Cheese, grated hard, e.g., Parmesan, Romano.	5 g	__tbsp (__g)
Cheese, all others except those listed as separate categories—includes cream cheese and cheese spread.	30 g	__piece(s) (__g) for distinct pieces; __tbsp(s) (__g) for cream cheese and cheese spread; 1 oz (28 g/visual unit of measure) for bulk
Cheese sauce—see sauce category.		
Cream or cream substitutes, fluid	15 mL	1 tbsp (15 mL)
Cream or cream substitutes, powder	2 g	__tsp (__g)
Cream, half & half	30 mL	2 tbsp (30 mL)
Eggnog	120 mL	½ cup (120 mL); 4 fl oz (120 mL)
Milk, condensed, undiluted	30 mL	2 tbsp (30 mL)
Milk, evaporated, undiluted	30 mL	2 tbsp (30 mL)
Milk, milk-substitute beverages, milk-based drinks, e.g., instant breakfast, meal replacement, cocoa, soy beverage.	240 mL	1 cup (240 mL); 8 fl oz (240 mL)
Shakes or shake substitutes, e.g., dairy shake mixes, fruit frost mixes.	240 mL	1 cup (240 mL); 8 fl oz (240 mL)
Sour cream	30 g	__tbsp (__g)
Yogurt	170 g	__cup (__g)
Desserts:		
Ice cream, frozen yogurt, sherbet, frozen flavored and sweetened ice and pops, frozen fruit juices: all types bulk and novelties (e.g., bars, sandwiches, cones, cups).	⅔ cup—includes the volume for coatings and wafers.	⅔ cup (__g), __piece(s) (__g) for individually wrapped or packaged products
Sundae	1 cup	1 cup (__g)
Custards, gelatin, or pudding	½ cup prepared; amount to make ½ cup prepared when dry.	__piece(s) (__g) for distinct unit (e.g., individually packaged products); ½ cup (__g) for bulk
Dessert Toppings and Fillings:		
Cake frostings or icings	2 tbsp	__tbsp(s) (__g)
Other dessert toppings, e.g., fruits, syrups, spreads, marshmallow cream, nuts, dairy and non-dairy whipped toppings.	2 tbsp	2 tbsp (__g); 2 tbsp (30 mL)

TABLE 2—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION: GENERAL FOOD SUPPLY [1 2 3]—Continued

Product category	Reference amount	Label statement [4]
Pie fillings	85 g	__ cup(s) (__ g)
Egg and Egg Substitutes:		
Egg mixtures, e.g., egg foo young, scrambled eggs, omelets.	110 g	__ piece(s) (__ g) for discrete pieces; __ cup(s) (__ g)
Eggs (all sizes) [8]	50 g	1 large, medium, etc. (__ g)
Egg whites, sugared eggs, sugared egg yolks, and egg substitutes (fresh, frozen, dried).	An amount to make 1 large (50 g) egg	__ cup(s) (__ g); __ cup(s) (__ mL)
Fats and Oils:		
Butter, margarine, oil, shortening	1 tbsp	1 tbsp (__ g); 1 tbsp (15 mL)
Butter replacement, powder	2 g	__ tsp(s) (__ g)
Dressings for salads	30 g	__ tbsp (__ g); __ tbsp (__ mL)
Mayonnaise, sandwich spreads, mayonnaise-type dressings.	15 g	__ tbsp (__ g)
Spray types	0.25 g	About __ seconds spray (__ g)
Fish, Shellfish, Game Meats,[9] and Meat or Poultry Substitutes:		
Bacon substitutes, canned anchovies,[10] anchovy pastes, caviar.	15 g	__ piece(s) (__ g) for discrete pieces; __ tbsp(s) (__ g) for others
Dried, e.g., jerky	30 g	__ piece(s) (__ g)
Entrees with sauce, e.g., fish with cream sauce, shrimp with lobster sauce.	140 g cooked	__ cup(s) (__ g); 5 oz (140 g/visual unit of measure) if not measurable by cup
Entrees without sauce, e.g., plain or fried fish and shellfish, fish and shellfish cake.	85 g cooked; 110 g uncooked [11]	__ piece(s) (__ g) for discrete pieces; __ cup(s) (__ g); __ oz (__ g/visual unit of measure) if not measurable by cup [12]
Fish, shellfish, or game meat [9], canned [10]	85 g	__ piece(s) (__ g) for discrete pieces; __ cup(s) (__ g); 3 oz (85 g/__ cup) for products that are difficult to measure the g weight of cup measure (e.g., tuna); 3 oz (85 g/__ pieces) for products that naturally vary in size (e.g., sardines)
Substitute for luncheon meat, meat spreads, Canadian bacon, sausages, frankfurters, and seafood.	55 g	__ piece(s) (__ g) for distinct pieces (e.g., slices, links); __ cup(s) (__ g); 2 oz (56 g/visual unit of measure) for nondiscrete bulk product
Smoked or pickled fish,[10] shellfish, or game meat [9]; fish or shellfish spread.	55 g	__ piece(s) (__ g) for distinct pieces (e.g., slices, links) or __ cup(s) (__ g); 2 oz (56 g/visual unit of measure) for nondiscrete bulk product
Substitutes for bacon bits—see Miscellaneous.		
Fruits and Fruit Juices:		
Candied or pickled [10]	30 g	__ piece(s) (__ g)
Dehydrated fruits—see snack category.		
Dried	40 g	__ piece(s) (__ g) for large pieces (e.g., dates, figs, prunes); __ cup(s) (__ g) for small pieces (e.g., raisins)
Fruits for garnish or flavor, e.g., maraschino cherries [10].	4 g	1 cherry (__ g); __ piece(s) (__ g)
Fruit relishes, e.g., cranberry sauce, cranberry relish.	70 g	__ cup(s) (__ g)
Fruits used primarily as ingredients, avocado.	50 g	See footnote [12]
Fruits used primarily as ingredients, others (cranberries, lemon, lime).	50 g	__ piece(s) (__ g) for large fruits; __ cup(s) (__ g) for small fruits measurable by cup [12]
Watermelon	280 g	See footnote [12]
All other fruits (except those listed as separate categories), fresh, canned or frozen.	140 g	__ piece(s) (__ g) for large pieces (e.g., strawberries, prunes, apricots, etc.); __ cup(s) (__ g) for small pieces (e.g., blueberries, raspberries, etc.) [12]
Juices, nectars, fruit drinks	240 mL	8 fl oz (240 mL)
Juices used as ingredients, e.g., lemon juice, lime juice.	5 mL	1 tsp (5 mL)
Legumes:		
Tofu,[10] tempeh	85 g	__ piece(s) (__ g) for discrete pieces; 3 oz (84 g/visual unit of measure) for bulk products
Beans, plain or in sauce	130 g for beans in sauce or canned in liquid and refried beans prepared; 90 g for others prepared; 35 g dry.	__ cup (__ g)
Miscellaneous:		
Baking powder, baking soda, pectin	0.6 g	__ tsp (__ g)
Baking decorations, e.g., colored sugars and sprinkles for cookies, cake decorations.	1 tsp or 4 g if not measurable by teaspoon	__ piece(s) (__ g) for discrete pieces; 1 tsp (__ g)
Batter mixes, bread crumbs	30 g	__ tbsp(s) (__ g); __ cup(s) (__ g)
Chewing gum [8]	3 g	__ piece(s) (__ g)
Cocoa powder, carob powder, unsweetened.	1 tbsp	1 tbsp (__ g)
Cooking wine	30 mL	2 tbsp (30 mL)

TABLE 2—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION: GENERAL FOOD SUPPLY [1 2 3]—Continued

Product category	Reference amount	Label statement [4]
Dietary supplements	The maximum amount recommended, as appropriate, on the label for consumption per eating occasion or, in the absence of recommendations, 1 unit, e.g., tablet, capsule, packet, teaspoonful, etc.	__tablet(s), __capsules(s), __packet(s), __tsp(s) (__g), etc.
Meat, poultry, and fish coating mixes, dry; seasoning mixes, dry, e.g., chili seasoning mixes, pasta salad seasoning mixes.	Amount to make one reference amount of final dish.	__tsp(s) (__g); __tbsp(s) (__g)
Milk, milk substitute, and fruit juice concentrates (without alcohol) (e.g., drink mixers, frozen fruit juice concentrate, sweetened cocoa powder).	Amount to make 240 mL drink (without ice)	__fl oz (__mL); __tsp (__ g); tbsp (__g)
Drink mixes (without alcohol): All other types (e.g., flavored syrups and powdered drink mixes).	Amount to make 360 mL drink (without ice)	__fl oz (__mL); __tsp (__g); __tbsp (__g)
Salad and potato toppers, e.g., salad crunchies, salad crispins, substitutes for bacon bits.	7 g	__tbsp(s) (__g)
Salt, salt substitutes, seasoning salts (e.g., garlic salt).	¼ tsp	¼ tsp (__g); __piece(s) (__g) for discrete pieces (e.g., individually packaged products)
Seasoning oils and seasoning sauces (e.g., coconut concentrate, sesame oil, almond oil, chili oil, coconut oil, walnut oil).	1 tbsp	1 tbsp (__g)
Seasoning pastes (e.g., garlic paste, ginger paste, curry paste, chili paste, miso paste), fresh or frozen.	1 tsp	1 tsp (__g)
Spices, herbs (other than dietary supplements).	¼ tsp or 0.5 g if not measurable by teaspoon	¼ tsp (__g); __piece(s) (__g) if not measurable by teaspoons (e.g., bay leaf)
Mixed Dishes:		
Appetizers, hors d'oeuvres, mini mixed dishes, e.g., mini bagel pizzas, breaded mozzarella sticks, egg rolls, dumplings, potstickers, wontons, mini quesadillas, mini quiches, mini sandwiches, mini pizza rolls, potato skins.	85 g, add 35 g for products with gravy or sauce topping.	__piece(s) (__g)
Measurable with cup, e.g., casseroles, hash, macaroni and cheese, pot pies, spaghetti with sauce, stews, etc.	1 cup	1 cup (__g)
Not measurable with cup, e.g., burritos, enchiladas, pizza, pizza rolls, quiche, all types of sandwiches.	140 g, add 55 g for products with gravy or sauce topping, e.g., enchilada with cheese sauce, crepe with white sauce [13].	__piece(s) (__g) for discrete pieces; __fractional slice (__g) for large discrete units
Nuts and Seeds:		
Nuts, seeds and mixtures, all types: Sliced, chopped, slivered, and whole.	30 g	__piece(s) (__g) for large pieces (e.g., unshelled nuts); __tbsp(s) (__g); __cup(s) (__g) for small pieces (e.g., peanuts, sunflower seeds)
Nut and seed butters, pastes, or creams	2 tbsp	2 tbsp (__g)
Coconut, nut and seed flours	15 g	__tbsp(s) (__g); __cup (__g)
Potatoes and Sweet Potatoes/Yams:		
French fries, hash browns, skins, or pancakes.	70 g prepared; 85 g for frozen unprepared French fries.	__piece(s) (__g) for large distinct pieces (e.g., patties, skins); 2.5 oz (70 g/__pieces) for prepared fries; 3 oz (84 g/__pieces) for unprepared fries
Mashed, candied, stuffed or with sauce	140 g	__piece(s) (__g) for discrete pieces (e.g., stuffed potato); __cup(s) (__g)
Plain, fresh, canned, or frozen	110 g for fresh or frozen; 125 g for vacuum packed; 160 g for canned in liquid.	__piece(s) (__g) for discrete pieces; __cup(s) (__g) for sliced or chopped products
Salads:		
Gelatin salad	120 g	__cup (__g)
Pasta or potato salad	140 g	__cup(s) (__g)
All other salads, e.g., egg, fish, shellfish, bean, fruit, or vegetable salads.	100 g	__cup(s) (__g)
Sauces, Dips, Gravies, and Condiments:		
Barbecue sauce, hollandaise sauce, tartar sauce, tomato chili sauce, other sauces for dipping (e.g., mustard sauce, sweet and sour sauce), all dips (e.g., bean dips, dairy-based dips, salsa).	2 tbsp	2 tbsp (__g); 2 tbsp (30 mL)
Major main entree sauces, e.g., spaghetti sauce.	125 g	__cup (__g); __cup (__mL)
Minor main entree sauces (e.g., pizza sauce, pesto sauce, Alfredo sauce), other sauces used as toppings (e.g., gravy, white sauce, cheese sauce), cocktail sauce.	¼ cup	¼ cup (__g); ¼ cup (60 mL)

TABLE 2—REFERENCE AMOUNTS CUSTOMARILY CONSUMED PER EATING OCCASION: GENERAL FOOD SUPPLY [1] [2] [3]—Continued

Product category	Reference amount	Label statement [4]
Major condiments, e.g., catsup, steak sauce, soy sauce, vinegar, teriyaki sauce, marinades.	1 tbsp	1 tbsp (__g); 1 tbsp (15 mL)
Minor condiments, e.g., horseradish, hot sauces, mustards, Worcestershire sauce.	1 tsp	1 tsp (__g); 1 tsp (5 mL)
Snacks:		
All varieties, chips, pretzels, popcorn, extruded snacks, fruit and vegetable-based snacks (e.g., fruit chips), grain-based snack mixes.	30 g	__cup (__g) for small pieces (e.g., popcorn); __piece(s) (__g) for large pieces (e.g., large pretzels; pressed dried fruit sheet); 1 oz (28g/visual unit of measure) for bulk products (e.g., potato chips)
Soups:		
All varieties	245 g	__cup (__g); __cup (__mL)
Dry soup mixes, bouillon	Amount to make 245 g	__cup (__g); __cup (__mL)
Sugars and Sweets:		
Baking candies (e.g., chips)	15 g	__piece(s) (__g) for large pieces; __tbsp(s) (__g) for small pieces; ½ oz (14 g/visual unit of measure) for bulk products
After-dinner confectioneries	10 g	__piece(s) (__g)
Hard candies, breath mints [8]	2 g	__piece(s) (__g)
Hard candies, roll-type, mini-size in dispenser packages.	5 g	__piece(s) (__g)
Hard candies, others; powdered candies, liquid candies.	15 mL for liquid candies; 15 g for all others	__piece(s) (__g) for large pieces; __tbsp(s) (__g) for ''mini-size'' candies measurable by tablespoon; __straw(s) (__g) for powdered candies; __wax bottle(s) (__mL) for liquid candies; ½ oz (14 g/visual unit of measure) for bulk products
All other candies	30 g	__piece(s) (__g); 1 oz (30 g/visual unit of measure) for bulk products
Confectioner's sugar	30 g	__cup (__g)
Honey, jams, jellies, fruit butter, molasses, fruit pastes, fruit chutneys.	1 tbsp	1 tbsp (__g); 1 tbsp (15 mL)
Marshmallows	30 g	__cup(s) (__g) for small pieces; __piece(s) (__g) for large pieces
Sugar	8 g	__tsp (__g); __piece(s) (__g) for discrete pieces (e.g., sugar cubes, individually packaged products)
Sugar substitutes	An amount equivalent to one reference amount for sugar in sweetness.	__tsp(s) (__g) for solids; __drop(s) (__g) for liquid; __piece(s) (__g) (e.g., individually packaged products)
Syrups	30 mL for all syrups	2 tbsp (30 mL)
Vegetables:		
Dried vegetables, dried tomatoes, sun-dried tomatoes, dried mushrooms, dried seaweed.	5 g, add 5 g for products packaged in oil	__piece(s); ⅓ cup (__g)
Dried seaweed sheets	3 g	__piece(s) (__g); __cup(s) (__g)
Vegetables primarily used for garnish or flavor (e.g., pimento,[10] parsley, fresh or dried).	4 g	__piece(s) (__g); __tbsp(s) (__g) for chopped products
Fresh or canned chili peppers, jalapeno peppers, other hot peppers, green onion.	30 g	__piece(s) (__g) [12]; __tbsp(s) (__g); __cup(s) (__g) for sliced or chopped products
All other vegetables without sauce: Fresh, canned, or frozen.	85 g for fresh or frozen; 95 g for vacuum packed; 130 g for canned in liquid, cream-style corn, canned or stewed tomatoes, pumpkin, or winter squash.	__piece(s) (__g) for large pieces (e.g., Brussels sprouts); __cup(s) (__g) for small pieces (e.g., cut corn, green peas); 3 oz (84 g/visual unit of measure) if not measurable by cup
All other vegetables with sauce: Fresh, canned, or frozen.	110 g	__piece(s) (__g) for large pieces (e.g., Brussels sprouts); __cup(s) (__g) for small pieces (e.g., cut corn, green peas); 4 oz (112 g/visual unit of measure) if not measurable by cup
Vegetable juice	240 mL	8 fl oz (240 mL)
Olives [10]	15 g	__piece(s) (__g); __tbsp(s) (__g) for sliced products
Pickles and pickled vegetables, all types [10]	30 g	1 oz (28 g/visual unit of measure)
Pickle relishes	15 g	__tbsp (__g)
Sprouts, all types: Fresh or canned	1/4 cup	¼ cup (__g)
Vegetable pastes, e.g., tomato paste	30 g	__tbsp (__g)
Vegetable sauces or purees, e.g., tomato sauce, tomato puree.	60 g	__cup (__g); __cup (__mL)

[1] These values represent the amount (edible portion) of food customarily consumed per eating occasion and were primarily derived from the 1977–1978 and the 1987–1988 Nationwide Food Consumption Surveys conducted by the U.S. Department of Agriculture and updated with data from the National Health and Nutrition Examination Survey, 2003–2004, 2005–2006 and 2007–2008 conducted by the Centers for Diseases Control and Prevention, in the Department of Health and Human Services.

[2] Unless otherwise noted in the Reference Amount column, the reference amounts are for the ready-to-serve or almost ready-to-serve form of the product (*e.g.,* heat and serve, brown and serve). If not listed separately, the reference amount for the unprepared form (*e.g.,* dry mixes, concentrates, dough, batter, fresh and frozen pasta) is the amount required to make the reference amount of the prepared form. Prepared means prepared for consumption (*e.g.,* cooked).

[3] Manufacturers are required to convert the reference amount to the label serving size in a household measure most appropriate to their specific product using the procedures in 21 CFR 101.9(b).

[4] The label statements are meant to provide examples of serving size statements that may be used on the label, but the specific wording may be changed as appropriate for individual products. The term ''piece'' is used as a generic description of a discrete unit. Manufacturers should use the description of a unit that is most appropriate for the specific product (*e.g.,* sandwich for sandwiches, cookie for cookies, and bar for ice cream bars). The guidance provided is for the label statement of products in ready-to-serve or almost ready-to-serve form. The guidance does not apply to the products which require further preparation for consumption (*e.g.,* dry mixes, concentrates) unless specifically stated in the product category, reference amount, or label statement column that it is for these forms of the product. For products that require further preparation, manufacturers must determine the label statement following the rules in § 101.9(b) using the reference amount determined according to § 101.12(c).

[5] Includes cakes that weigh 10 g or more per cubic inch. The serving size for fruitcake is 1 ½ ounces.

[6] Includes cakes that weigh 4 g or more per cubic inch but less than 10 g per cubic inch.

[7] Includes cakes that weigh less than 4 g per cubic inch.

[8] Label serving size for ice cream cones, eggs, and breath mints of all sizes will be 1 unit. Label serving size of all chewing gums that weigh more than the reference amount that can reasonably be consumed at a single-eating occasion will be 1 unit.

[9] Animal products not covered under the Federal Meat Inspection Act or the Poultry Products Inspection Act, such as flesh products from deer, bison, rabbit, quail, wild turkey, geese, ostrich, etc.

[10] If packed or canned in liquid, the reference amount is for the drained solids, except for products in which both the solids and liquids are customarily consumed (*e.g.,* canned chopped clam in juice).

[11] The reference amount for the uncooked form does not apply to raw fish in § 101.45 or to single-ingredient products that consist of fish or game meat as provided for in § 101.9(j)(11).

[12] For raw fruit, vegetables, and fish, manufacturers should follow the label statement for the serving size specified in Appendices C and D to part 101 (21 CFR part 101) Code of Federal Regulations.

[13] Pizza sauce is part of the pizza and is not considered to be sauce topping.

(c) If a product requires further preparation, *e.g.,* cooking or the addition of water or other ingredients, and if paragraph (b) of this section provides a reference amount for the product in the prepared form, but not the unprepared form, then the reference amount for the unprepared product must be the amount of the unprepared product required to make the reference amount for the prepared product as established in paragraph (b) of this section.

* * * * *

(f) * * *

(1) The reference amount for the combined product must be the reference amount, as established in paragraph (b) of this section, for the ingredient that is represented as the main ingredient (*e.g.,* peanut butter, pancakes, cake) plus proportioned amounts of all minor ingredients.

(2) If the reference amounts are in compatible units, the weights or volumes must be summed (*e.g.,* the reference amount for equal volumes of peanut butter and jelly for which peanut butter is represented as the main ingredient would be 4 tablespoons (tbsp) (2 tbsp peanut butter plus 2 tbsp jelly)). If the reference amounts are in incompatible units, all amounts must be converted to weights and summed, *e.g.,* the reference amount for pancakes and syrup would be 110 g (the reference amount for pancakes) plus the weight of the proportioned amount of syrup.

* * * * *

Dated: May 16, 2016.

Leslie Kux,

Associate Commissioner for Policy.

[Docket No. FHWA–2013–0037]

RIN 2125–AF52; 2132–AB10

Statewide and Nonmetropolitan Transportation Planning; Metropolitan Transportation Planning

AGENCY: Federal Highway Administration (FHWA), Federal Transit Administration (FTA); U.S. Department of Transportation (DOT).

ACTION: Final rule.

SUMMARY: The FHWA and FTA are jointly issuing this final rule to update the regulations governing the development of metropolitan transportation plans (MTP) and programs for urbanized areas, long-range statewide transportation plans and programs, and the congestion management process as well as revisions related to the use of and reliance on planning products developed during the planning process for project development and the environmental review process. The changes reflect the passage of the Moving Ahead for Progress in the 21st Century Act (MAP–21) and the Fixing America's Surface Transportation (FAST) Act. The MAP–21 continues many provisions related to transportation planning from prior laws; however, it introduces transformational changes and adds some new provisions. The FAST Act makes minor edits to existing provisions. The changes make the regulations consistent with current statutory requirements and implement the following: A new mandate for State departments of transportation (hereafter referred to simply as ''States'') and metropolitan planning organizations (MPO) to take a performance-based approach to planning and programming; a new emphasis on the nonmetropolitan transportation planning process, by requiring States to have a higher level of involvement with nonmetropolitan local officials and providing a process for the creation of regional transportation planning organizations (RTPO); a structural change to the membership of the larger MPOs; a new framework for voluntary scenario planning; new authority for the integration of the planning and environmental review processes; and a process for programmatic mitigation plans.

DATES: Effective June 27, 2016.

FOR FURTHER INFORMATION CONTACT: For the FHWA: Mr. Harlan W. Miller, Office of Planning, Environment, and Realty, (202) 366–0847; or Ms. Jennifer Mayo, Office of the Chief Counsel, (202) 366–1523. For the FTA: Ms. Sherry Riklin, Office of Planning and Environment, (202) 366–5407; Mr. Dwayne Weeks, Office of Planning and Environment, (202) 493–0316; or Mr. Christopher Hall, Office of Chief Counsel, (202) 366–5218. Both agencies are located at 1200 New Jersey Avenue SE., Washington, DC 20590. Office hours are from 8:00 a.m. to 4:30 p.m., e.t. for FHWA, and 9:00 a.m. to 5:30 p.m., e.t. for FTA, Monday through Friday, except Federal holidays.

SUPPLEMENTARY INFORMATION:

Electronic Access and Filing

This document, the notices of proposed rulemakings (NPRM) published on June 2, 2014 (79 FR 31784), and September 10, 2014 (79 FR 53673), and all comments received may be viewed online through the Federal eRulemaking portal at *http://www.regulations.gov*. Table of Contents for Supplementary Information

I. Executive Summary

A. Purpose of the Regulatory Action

The MAP–21 transformed the Federal-aid highway program and the Federal transit program by requiring a transition to performance-driven, outcome-based approaches to key areas. With respect to planning, although MAP–21 leaves the basic framework of the planning process largely untouched, the statute introduced critical changes to the planning process by requiring States, MPOs, and operators of public transportation to link investment priorities to the achievement of performance targets that they would establish to address performance measures in key areas such as safety, infrastructure condition, congestion, system reliability, emissions, and freight movement. With respect to planning, the FAST Act left the provisions from MAP–21 intact and made minor revisions to existing provisions.

Accordingly, the final rule establishes that the statewide and metropolitan transportation planning processes must provide for the use of a performance-based approach to decisionmaking in support of the national goals described in 23 U.S.C. 150(b) and the general purposes described in 49 U.S.C. 5301. The final rule requires that States, MPOs, and operators of public transportation establish targets in key national performance areas to document expectations for future performance and that States, MPOs, and operators of public transportation must coordinate the targets that they set for key areas. It further establishes that MPOs must reflect those targets in the MTPs and that States must reflect those targets in their long-range statewide transportation plans. The final rule establishes that the States and MPOs must each describe the anticipated effect of their respective transportation improvement programs toward achieving their targets. As MAP–21 contained new performance-related provisions requiring States, MPOs, and operators of public transportation to develop other performance-based plans and processes, the final rule establishes that States and MPOs must integrate the goals, objectives, performance measures, and targets of those other performance-based plans and processes into their planning processes.

To support the effective implementation of a performance-based planning process, the final rule establishes that every MPO serving an area designated as a transportation management area (TMA) must include on its policy board an official (or officials) who is formally designated to

represent the collective interests of the operators of public transportation in the metropolitan planning area (MPA) and will have equal decisionmaking rights and authorities as other officials on its policy board. It also establishes the option for MPOs to use scenario planning during the development of their MTPs. Scenario planning is an analytical framework to inform decisionmakers about the implications of various investments and policies on transportation system condition and performance.

To continue implementation of the MAP–21 project delivery provisions concerning coordination between the transportation planning process and the environmental review process, the final rule amends the existing planning regulations to add a reference to a new statutory process for integrating planning and the environmental review activities, but preserves other authorities for integration. It also establishes an optional framework for the States and MPOs to develop programmatic mitigation plans as part of the statewide and the metropolitan transportation planning processes.

To support FAST's minor amendments to the planning process, this final rule amends the existing planning regulations to add new planning factors for States and MPOs to consider and implement as part of the planning process. It adds ''takes into consideration resiliency needs'' to the purposes of the statewide and nonmetropolitan and the metropolitan transportation planning processes. It adds new parties that States and MPOs shall provide early and continuous involvement opportunities to in the transportation planning process and that States and MPOs shall allow to comment on the long-range statewide transportation plan and the metropolitan transportation plans. It provides MPO's serving TMA's with an optional framework for developing a congestion management plan, and it adds consideration of the role intercity buses may play to the long-range statewide transportation plan and the metropolitan transportation plan. It also makes reducing the vulnerability of the existing transportation infrastructure to natural disasters a part of the metropolitan transportation plan. It provides structure for the transit representation on MPOs serving TMA areas. It also provides a revised new authority for the use of planning information in the environmental review process that States and MPOs may use. The final rule also contains FAST's requirement that long-range statewide transportation plans shall include a description of performance measures and targets and shall include a system performance report. Previously under MAP–21 this requirement was a ''should.'' These new or revised provisions from the FAST Act have been included in the final rule without changing the language used in the FAST Act.

B. Summary of Major Provisions and Key Changes From NPRM

The final rule retains the major provisions of the NPRM with some changes based on the review and analysis of comments received. In the final rule, FHWA and FTA make the statewide, metropolitan, and nonmetropolitan transportation planning regulations consistent with current statutory requirements. The final rule establishes the following: A new mandate for States and MPOs to take a performance-based approach to planning and programming; a new emphasis on the nonmetropolitan transportation planning process, by requiring States to have a higher level of involvement with nonmetropolitan local officials and providing a process for the creation of RTPOs; a structural change to the membership of the larger MPOs; a new framework for voluntary scenario planning; new authority for the integration of the planning and environmental review processes; and a process for programmatic mitigation plans. Section references below refer to the sections of the regulatory text for title 23 of the Code of Federal Regulations (CFR).

1. Performance-Based Planning and Programming

The MAP–21 transformed the Federal-aid highway program and the Federal transit program by requiring a transition to a performance-driven, outcome-based program that provides for a greater level of transparency and accountability, improved project decisionmaking, and more efficient investment of Federal transportation funds.[1] As part of this new performance-based approach, recipients of Federal-aid highway program funds and Federal transit funds are required to link the investment priorities contained in the Statewide Transportation Improvement Program (STIP) and Transportation Improvement Program (TIP) to achievement of performance targets. In a series of rulemakings, FHWA and FTA will establish national performance measures in key areas, including safety, infrastructure condition, congestion, system reliability, emissions, and freight movement.

Sections 450.206 and 450.306 were amended to establish the requirement that States, MPOs, and operators of public transportation use these measures to establish targets in the key national performance areas to document expectations for future performance.[2] The final rule further establishes that States and MPOs must coordinate their respective targets with each other to ensure consistency to the maximum extent practicable. Although proposed in the NPRM, the final rule does not require that States select and establish performance targets in coordination with Federal Lands Management agencies. The final rule requires that for transit-related targets, States and MPOs must coordinate their selection of targets relating to transit safety and transit state of good repair to the maximum extent practicable with operators of public transportation to ensure consistency with other performance-based provisions applicable to operators of public transportation.

The MAP–21 performance-related provisions also require States, MPOs, and operators of public transportation to develop other performance-based plans and processes or add new requirements on existing performance-based plans and processes. These performance-based plans and processes include the Congestion Mitigation and Air Quality Improvement (CMAQ) Program performance plan, the strategic highway safety plan, the public transportation agency safety plan, the highway and transit asset management plans, and the State freight plan. Sections 450.206 and 450.306 were further amended to establish that States and MPOs integrate the goals, objectives, performance measures, and targets of these other performance plans and processes into their planning process.[3] This integration would help ensure that key performance elements of these other performance plans are considered as part of the investment decisionmaking process. To provide States and MPOs with the needed flexibility to develop their approaches to integrating the performance-based plans into their planning processes as requested by multiple commenters, FHWA and FTA deleted proposed sections that would require the consideration of elements of these plans in the development of the

[1] See, *e.g.,* 23 U.S.C. 150(a).

[2] See 23 U.S.C. 134(h)(2), 23 U.S.C. 135(d)(2), 49 U.S.C. 5303(h)(2), and 49 U.S.C. 5304(d)(2).

[3] See 23 U.S.C. 134(h)(2)(D), 23 U.S.C. 135(d)(2)(C), 49 U.S.C. 5303(h)(2)(D), and 49 U.S.C. 5304(d)(2)(C).

long-range statewide transportation plans,[4] MTPs,[5] TIPs,[6] and STIPs.[7]

Section 450.208 in the NPRM and in the final rule discusses coordination of planning process activities. Section 450.208(e) of the NPRM proposed that, in carrying out the statewide transportation planning process, States shall apply asset management principles and techniques, consistent with the State Asset Management Plan for the National Highway System (NHS), the Transit Asset Management Plan, and the Public Transportation Safety Plan. Because this is not a statutory requirement and the statewide and nonmetropolitan transportation planning process is much broader than an asset management plan, FHWA and FTA changed ''shall'' to ''should'' in this provision. Section 450.208(g) in the NPRM would have required that a State integrate the goals, objectives, performance measures, and targets into the statewide transportation planning process, as appropriate from a specified list of performance-based plans—a requirement that was also listed in section 450.206(c). This requirement remains, however, the paragraph in section 450.208(g) was deleted from the final rule as it duplicates section 450.206(c)(4).

Section 450.210 requires that States shall provide opportunities for public review and comment at key decision points in the transportation planning process and for nonmetropolitan local official participation in the development of the long-range State plan and the STIP. Consistent with the requirement to engage the public in the transportation planning process, FHWA and FTA added section 450.210(a)(3) to the final rule, which states that: ''With respect to the setting of targets, nothing in this part precludes a State from considering comments made as part of the State's public involvement process.''

Section 450.314 was amended to require that MPOs identify how they will cooperatively implement these performance-based planning provisions with States and operators of public transportation. Rather than requiring a reopening of metropolitan planning agreements as proposed in the NPRM, the final rule provides the option documenting it either as part of the metropolitan planning agreements, or documenting it in some other means outside of the metropolitan planning agreements as determined cooperatively by the MPO(s), State(s), and providers of public transportation. Whichever option is selected, section 450.314(h) establishes that the MPO(s), the State(s), and the providers of public transportation must jointly agree upon and document in writing the coordinated processes for the collection of performance data, the selection of performance targets for the metropolitan area, the reporting of metropolitan area targets, and the reporting of actual system performance related to those targets. The documentation must also describe the roles and responsibilities for the collection of data for the NHS. Including this description is critical because of the new requirements for a State asset management plan for the NHS and establishment of performance measures and targets.[8]

Sections 450.216 and 450.324 discuss the development of the long-range statewide transportation plan and the MTP. In the final rule, section 450.324 was amended to establish that, once performance targets are selected by MPOs, MPOs must reflect those targets in their MTPs. As a result of FAST, the amended section 450.216 requires States to do the same. Accordingly, amended section 450.324 establishes [9] that, in their transportation plans, MPOs would need to describe these performance targets, evaluate the condition and performance of the transportation system, and report on progress toward the achievement of their performance targets.[10] Amended section 450.216 requires States to include similar information in their transportation plans.[11] Sections 450.216(n) and 450.324(f)(7) of the NPRM proposed that the long-range statewide transportation plan and the MTP should be informed by the financial plan and the investment strategies from the State asset management plan for the NHS and by the public transit asset management plan(s). As the language is not statutory, and many commented that it could generate confusion and inconsistent enforcement, FHWA and FTA removed these subparagraphs from the final rule. However, FHWA and FTA note that the statute, section 450.206(c)(4), and section 450.306(d)(4) require that States and MPOs integrate the goals, objectives, performance measures, and targets described in other performance-based plans into their planning processes. The final rule will provide States and MPOs the flexibility to determine how to integrate the performance-based plans into their planning processes.

Sections 450.218 and 450.326 were amended to establish that, as part of the State and MPO programs of projects (the STIPs and TIPs, respectively), the States and MPOs must describe, to the maximum extent practicable, the anticipated effect of the investment priorities (or their program of transportation improvement projects) toward achieving the performance targets.[12] As the long-range plans, STIPs, and TIPs direct investment priorities, it is critical to ensure that performance targets are considered during the development of these documents. However, sections 450.218(r) and 450.328(d), which proposed that a STIP (and TIP) should be consistent with the strategies to achieve targets presented in other performance management plans such as the highway and transit asset management plans, the Strategic Highway Safety Plan, the public transportation agency safety plan, the CMAQ performance plan, and the State freight plan (if one exists), are not included in the final rule.

The FHWA and FTA removed this paragraph in the final rule, noting that the statute and sections 450.206(c)(4) and 450.306(d)(4) require that States and MPOs integrate the goals, objectives, performance measures, and targets described in other performance-based plans into their planning processes. The FHWA and FTA wish to provide States and MPOs the flexibility to determine how State asset management plans for the NHS and public transit asset management plans are considered when STIPs and TIPs are being developed.

Finally, proposed section 450.326(n) was changed to 450.326(m) in the final rule. The phrase ''or funds under 49 U.S.C. 5307'' was deleted from this paragraph as it is not consistent with FTA Circular C9030.1E, which permits section 5307 funds to be suballocated according to a formula.

2. New Emphasis on Nonmetropolitan Transportation Planning

This regulation also places a new emphasis on the importance of nonmetropolitan transportation planning. This new emphasis, as proposed in the NPRM, is retained in the final rule without change. The final rule retains sections 450.208–450.210

[4] Proposed section 450.216(n).

[5] Proposed section 450.324((f)(7).

[6] Proposed section 450.218(o) and proposed section 450.218(r).

[8] Federal-aid Highway Risk-Based Asset Management Plan Rule for the National Highway System (NHS) [RIN 2125–AF57].

[9] See proposed sections 450.216, 450.218, 450.324 and 450.326.

[10] See 23 U.S.C. 134(i)(2) and 49 U.S.C. 5303(i)(2).

[11] 23 U.S.C. 135(f)(7) and 49 U.S.C. 5304(f)(7).

[12] See 23 U.S.C. 134(j)(2)(D), 23 U.S.C. 135(g)(4), 49 U.S.C. 5303(j)(2)(D), and 49 U.S.C. 5304(g)(4).

and 450.216, without alteration from the NPRM, in which State ''consultation'' with local officials or RTPOs, if applicable, was changed to ''cooperation'' and States have the option to establish and designate RTPOs to conduct transportation planning in nonmetropolitan areas. Section 450.210(d)(1) provides the option that a State may establish an RTPO which shall be a multijurisdictional organization of nonmetropolitan local officials or their designees who volunteer for such organizations and representatives of local transportation systems who volunteer for such organizations. The FHWA and FTA note that the establishment of an RTPO by a State is optional and that a State can choose to retain its existing rural planning organizations (RPO). However, the final rule affirms that in order to be treated as an RTPO under this regulation, any existing regional planning organization must be established and designated as an RTPO under the provisions of this section. The final rule describes its required structure and responsibilities.

Related to the new emphasis on nonmetropolitan transportation planning, FHWA and FTA did not include the proposed change to the definition of ''consideration'' in section 450.104. Multiple commenters noted that to require States and MPOs to take into account the consequences, in addition to the opinions, actions, and relevant information from other parties when making a decision or determining a course of action, would be extraordinarily burdensome and with limited benefit. The FHWA and FTA also corrected sections 450.216(h) and 450.218(c) to refer to the new requirements for a cooperative process in section 450.210.

3. Additions to the Metropolitan Planning Process

The MAP–21 made two changes specific to the metropolitan planning process to support the effective implementation of performance-based approach to planning and programming. The first change affects the policy board structure of large MPOs. For each MPO serving a TMA, the planning statutes and this final regulation identify a list of government or agency officials that must be on that policy board. The June 2, 2014, FHWA and FTA Guidance on Transit Representation on the TMA MPO [13] is superseded by revisions to section 450.310 in the final rule. Section 450.310(d)(3) in the NPRM became section 450.310(d)(4) in the final rule and is unchanged. The new section 450.310(d)(3) requires that representation by operators of public transportation be added to this list of officials. The final rule establishes that every MPO that serves an area designated as a TMA must include an official (or officials) who is formally designated to represent the collective interests of the operators of public transportation in the MPA and will have equal decisionmaking rights and authorities as other officials on its policy board. Related to this requirement, FHWA and FTA did not include the proposed definitions for ''local official'' and ''major modes of transportation'' in the final rule. As the NPRM already included a definition of ''nonmetropolitan local official,'' and section 450.310 identifies ''local elected official,'' FHWA and FTA deleted the definition of ''local official.'' With respect to ''major modes of transportation,'' FHWA and FTA concur with comments that the definition is overly broad and could be read to include all forms of transportation, including non-major modes, and that MPOs are in the best position to define what constitutes a major mode of transportation in their respective MPAs. The FHWA and FTA will continue to work with each MPO to determine what major modes exist in their MPA so that they are included appropriately in the MPO structure.

The second change in section 450.324 of the final rule provides that MPOs may use scenario planning during the development of their plans. Scenario planning is an analytical framework to inform decisionmakers about the implications of various investments and policies on transportation system condition and performance during the development of their plan.

4. Use of Planning Products in Project Development

In addition to changing the planning statutes, the MAP–21 and FAST made changes to project delivery provisions concerning coordination between the transportation planning process and the environmental review process. The FHWA and FTA have long supported the use of planning products and decisions during the environmental review process, an approach referred to as Planning and Environmental Linkages (PEL). Under PEL, Federal agencies use and rely on planning analyses, studies, decisions, or other information for the project development and environmental review of transportation projects. With PEL, FHWA and FTA may, for example: Establish a project's purpose and need by relying on the goal and objective developed during the planning process; eliminate the need to further consider alternatives deemed to be unreasonable by relying on analyses conducted to evaluate the alternatives during planning; rely on future land use plans as a source of information for the cumulative impacts analysis required under National Environmental Policy Act (NEPA); carry forward suitable mitigation measures and approaches identified through the planning process; or establish the modal choice selections for the consideration of reasonable alternatives to address the identified need, provided that such strategies are consistent with NEPA for the particular project. The final rule explicitly recognizes a variety of PEL methods that may be used to integrate planning with environmental reviews. The PEL provisions are in sections 450.212 and 450.318. Only sections 450.212(d) and 450.318(e) are new provisions, added as a result of the PEL authority created in the MAP–21 and substantially amended in FAST.

In the final rule, sections 450.212(a) and 450.318(a) describe the PEL approach developed by FHWA and FTA, based on NEPA regulations, guidance, and case law. Sections 450.212(b) and 450.318(b) retain the prior rule's provisions on using documents and other source materials through incorporation by reference pursuant to NEPA regulations at 40 CFR 1502.21. Sections 450.212(c), 450.318(c), and 450.318(d) keep language from the prior rule addressing integration by means of agreement of the NEPA lead agencies, including the use of tiering, incorporation of planning corridor or subarea studies into the NEPA document, and other means. Sections 450.212(c) and 450.318(d) retain the prior rule's description of the non-binding guidance in Appendix A to part 450, which discusses the integration of planning and environmental reviews. The FHWA and FTA made minor revisions to Appendix A in the final rule. These revisions include deleting the text in the response to question 16 that describes 49 U.S.C. 5313(b) funds as an eligible source of funds for conducting environmental studies and analyses within transportation planning. This change was made because 49 U.S.C. 5313(b) funds are not an eligible source of planning funds for conducting environmental studies and analyses within transportation planning. In another revision to Appendix A in the final rule, under the response to question 18, FHWA and FTA have

[13] 79 FR 31214.

updated the number of positions that were being funded with Federal and State funds to support focused and accelerated project review by a variety of local, State, and tribal agencies from 246 positions (as of 2003) to over 200 positions (as of 2015). This change was made to update the number of positions funded to accelerate project review at local, State, tribal, and Federal agencies to reflect more recent information. The FHWA and FTA have added language in 450.212(c) and 450.318(d) to clarify that Appendix A applies only to PEL authorities in sections 450.212(a)–(c) and 450.318(a)–(c).

Sections 450.212(d) and 450.318(e) add a reference to the statutory provision, 23 U.S.C. 168, added by MAP–21 and amended by FAST. The numbering for the new provisions is different in the final rule than in the NPRM. This is because sections 450.318(d) of the prior rule was deleted, as proposed in the planning NPRM. In addition, FHWA and FTA replaced the text from the PEL NPRM and in its place inserted references to the section 168 provisions.

5. Programmatic Mitigation

Sections 450.214 and 450.320 discuss an optional framework for developing programmatic mitigation plans as part of the statewide and the metropolitan transportation planning processes. The FHWA and FTA have largely retained the language in the NPRM for these sections, with the exception of a few changes. In sections 450.214 and 450.320, additional language has been added to make it clear that this provision for developing programmatic mitigation plans as part of the statewide or the metropolitan transportation planning process is optional. In sections 450.214(a)(2)(ii) and 450.320(a)(2)(ii), the final rule added archeological resources to the list of examples of resources in the NPRM that may be identified in a programmatic mitigation plan. In the same paragraph, the phrase ''threatened or endangered species critical habitat'' has been corrected from the NPRM to read ''threatened and endangered species and critical habitat'' in the final rule. In sections 450.214(a)(2)(iii) and 450.320(a)(2)(iii), the final rule added stormwater to the list of examples of resource categories described in the NPRM for existing or planned environmental resource banks that may be identified in a programmatic mitigation plan. New language has been added in sections 450.214(f) and 450.320(f) of this section to make it clear that a programmatic mitigation plan may be developed as part of, or separately from, the planning process and that a programmatic mitigation plan developed separately from the planning process under another authority may be adopted in the statewide or metropolitan planning process.

Section 1306 of FAST amends 23 U.S.C. 169(f) to change ''may use'' to ''shall give substantial weight to'' and changes ''any other environmental laws and regulations'' to ''other Federal environmental law'' such that a Federal agency responsible for environmental reviews ''shall give substantial weight to'' the recommendations in the programmatic mitigation plan when carrying out its responsibilities under NEPA or ''other Federal environmental law.'' Sections 450.214(d) and 450.320(d) of the final rule are amended to reflect these changes.

6. Other Changes

The definitions for ''conformity'' and ''consideration'' proposed in the NPRM were amended in the final rule.

7. Changes Resulting From the FAST Act

Sections 450.200 and 450.300 add intermodal facilities that support intercity transportation including intercity bus facilities and commuter van pool providers to the purposes of the statewide and metropolitan transportation planning processes. Sections 450.200 and 450.300 add a new requirement to take into consideration resiliency needs to the purposes of the statewide and nonmetropolitan and the metropolitan transportation planning processes. Sections 450.206(a)(9) and (10) and 450.306(b)(9) and (10) add two new planning factors to the scope of the statewide and nonmetropolitan and the metropolitan transportation planning processes that States and MPOs shall consider and implement: Improve resiliency and reliability of the transportation system and reduce or mitigate stormwater impacts of surface transportation; and enhance travel and tourism.

Section 450.210(a)(1)(i) adds public ports and intercity bus operators to the list of entities that a State shall provide public involvement opportunities to as part of the statewide and nonmetropolitan transportation planning process. Section 450.216(b) adds that the long-range statewide transportation plan shall include consideration of the role of intercity buses may play in reducing congestion, pollution, and energy consumption. In section 450.216(l)(2), public ports has been added to the list of interested parties that a State shall provide a reasonable opportunity to comment on the proposed long-range statewide transportation plan exactly as described in FAST section 1201 (23 U.S.C. 135(f)(3)(A)(ii)). Also, in section 450.216(l)(2), examples of providers of private providers of public transportation have been added to the final rule exactly as described in FAST section 1202 (23 U.S.C. (f)(3)(A)(ii)) including intercity bus operators, employer based cash-out program, shuttle program, or telework program. Sections 450.216(f)(1) and (2) provide that States shall include a description of performance measures and targets and a system performance report in the long-range statewide transportation plan (previously under MAP–21 this was a ''should'').

Section 1306 of FAST amends 23 U.S.C. 169(f) to change ''may use'' to ''shall give substantial weight to'' and changes ''any other environmental laws and regulations'' to ''other Federal environmental law'' such that a Federal agency responsible for environmental reviews ''shall give substantial weight to'' the recommendations in the programmatic mitigation plan when carrying out its responsibilities under NEPA or ''other Federal environmental law.'' Sections 450.214(d) and 450.320(d) of the final rule are amended to reflect these changes exactly as discussed in section 1306 of FAST.

Sections 450.316(a) and (b) provide that MPOs must provide public ports with a reasonable opportunity to comment on the MTP. Section 450.316(b) provides that MPOs should consult with officials responsible for tourism and natural disaster risk reduction when developing MTPs and TIPs. Section 450.322 provides an optional framework for an MPO serving a TMA to develop a congestion management plan (the requirement for a congestion management process for MPOs serving a TMA has been retained). Section 450.324(f)(7) adds a new requirement to assess capital investment and other strategies that reduce the vulnerability of the existing transportation infrastructure to natural disasters to the MTP. Section 450.324(f)(8) adds consideration of the role intercity buses may play in reducing congestion, pollution, and energy consumption as part of the MTP. Section 450.324(j) adds public ports to the list of entities a MPO shall provide opportunity to comment on the MTP and also adds a list of examples of private providers of transportation.

In making the changes to the final rule based on the amendments to 23 U.S.C. 134 and 135 from FAST, FHWA and FTA have used the exact language in the regulations that was used in the Act,

and have included it in the final rule without alteration.

TABLE 1—SUMMARY OF KEY CHANGES FROM THE PLANNING NPRMS TO THE FINAL RULE

Topic	NPRM section(s)	Key changes from NPRMs to final rule
Performance-Based Planning and Programming.	450.206(c)	Coordination of the planning process—the requirement that the State should select and establish performance targets in coordination with Federal Lands Management agencies in section 450.206(c) was deleted.
	450.208(g)	Coordination of the planning process—In section 450.208(g), the requirement that the State shall integrate other performance-based plans into the statewide planning process was deleted as it is already covered in the scope of the planning process in section 450.206(c)(4).
	450.210(a)(3)	Interested parties—In section 450.210(a), additional language was added in section 450.210(a)(3): ''With respect to the setting of targets, nothing in in this part precludes a State from considering comments made as part of the State's public involvement process.''
	450.218(r), 450.328(d)	Development and content of the STIP and TIP—In sections 450.218(r) and 450.328(d), the requirement that the discussion in the STIP and TIP be consistent with the strategies to achieve targets presented in other performance management plans such as the highway and transit asset management plans, the Strategic Highway Safety Plan (SHSP), the public agency safety plan, the CMAQ performance plan, and the State freight plan (if one exists) was deleted.
	450.314(a), (e), and (g)	Metropolitan Planning Agreements —Proposed changes to sections 450.314(a), (e), and (g) were deleted and replaced by new section 450.314(h) which requires States, MPOs, and operators of public transportation to cooperatively develop and include specific provisions for cooperatively developing and sharing information related to transportation performance data, the selection of performance targets, the reporting of performance targets, the reporting of performance, and data collection for the State asset management system for the NHS as part of the metropolitan planning agreement or in some mutually agreed upon and documented means.
Additions to the Metropolitan Planning Process.	450.310 and June 2, 2014 FTA/FHWA Guidance on Transit Representation on a TMA MPO.	The June 2, 2014 FHWA/FTA Guidance on Transit Representation on a TMA MPO published with the NPRM is superseded by revisions to section 450.310 this final regulation.
New Authority for Using Planning Information in the Environmental Review Process.	450.212(d), 450.318(e)	Added a reference to the additional PEL authority in 23 U.S.C. 168.
Programmatic Mitigation Plans	450.214 and 450.320	Language was added to clarify that developing programmatic mitigation plans as part of the statewide or the metropolitan transportation planning process is optional.
	450.214(a)(2)(iii) and 450.320(a)(2)(iii).	Stormwater was added to the list of examples of environmental resource categories described in the NPRM that may be identified in a programmatic mitigation plan.
	450.214(b, d, and f) and 450.320(b, d, and f).	Changed to make it clear that a State or MPO may adopt a programmatic mitigation plan(s) that is developed outside of the planning process.
	450.214(a)(2)(ii and iii) and 450.320(a)(2)(ii and iii).	Archeological resources was added to the list of examples of resources that may be identified in a programmatic mitigation plan. The phrase ''endangered species critical habit'' was corrected to read ''endangered species, and critical habitat.''
Other Changes (Asset Management)	450.208(e)	Coordination of Planning Process Activities—''shall'' was changed to ''should'' (''In carrying out the statewide transportation planning process, States ''should'' apply asset management principles consistent with the NHS Asset Management Plan, the Transit Asset Management plan, and Public Transportation Agency Safety Plan . . .'').
	450.218(o), 450.326(m)	Development and content of the STIP (section 450.218(o)) and TIP (section 450.326(m))—The phrase ''The STIP and TIP should be informed by the financial plan and the investment strategies from the State asset management plan for the NHS and by the public transit asset management plan(s) . . .'' was deleted.
	450.216(n), 450.324(f)(7)	Development and content of the long-range statewide transportation plan (450.216(n)) and Development and content of the MTP (450.324(f)(7))—The phrase ''. . . long-range statewide transportation plans and metropolitan transportation plans should be informed by the financial plan and the investment strategies from the asset management plan for the NHS and investment priorities of the public transit asset management plans(s) . . .'' is deleted from the final rule.
Other Changes (misc.)	450.104	Definitions—The proposed definitions for *local official* and for *major modes of transportation* are deleted from the final rule.
		The proposed definitions for*, conformity,* and *consideration* are amended in the final rule.
	450.324(a)	The word ''minimum'' is added to the phrase a transportation plan addressing no less than a ''minimum'' 20-year planning horizon.
	450.326(n)	Sec. 450.326(n) becomes 450.326(m) in the final rule and the phrase ''or funds under 49 U.S.C. 5307'' is deleted.

TABLE 1—SUMMARY OF KEY CHANGES FROM THE PLANNING NPRMS TO THE FINAL RULE—Continued

Topic	NPRM section(s)	Key changes from NPRMs to final rule
Other Changes (from FAST)	450.200 and 450.300	Intermodal facilities that support intercity transportation, including intercity bus facilities and commuter van pool providers is added to the purpose of the statewide and metropolitan multimodal transportation planning processes.
	450.206(a)(9 and 10) and 450.306(b)(9 and 10).	Adds ''takes into consideration resiliency needs'' to the purpose of the statewide and nonmetropolitan and the metropolitan transportation planning processes.
	450.210(a)(1)(i)	Two new planning factors are added to the scope of the statewide and nonmetropolitan and the metropolitan transportation planning processes: (Improve resiliency and reliability of the transportation system and reduce or mitigate stormwater impacts of surface transportation; and enhance travel and tourism).
	450.212(d) and 450.450.318(e).	Public ports and intercity bus operators are added to the list of entities that a State shall provide early and continuous public involvement opportunities as part of the statewide transportation planning process. New authority for using planning information in the environmental review process, sections 450.212(d) and 450.318(e) are added to reference FAST section 1305 (23 U.S.C. 168).
	450.214(d) and 450.320(d)	Programmatic mitigation plans—changes ''may use'' to ''shall give substantial weight to'' and changes ''any other environmental laws and regulations'' to ''other Federal environmental law''—A Federal agency responsible for environmental reviews ''shall give substantial weight to'' the recommendations in the programmatic mitigation plan when carrying out its responsibilities under the National Environmental Policy Act of 1969 or ''other Federal environmental law.''
	450.216 and 450.324	Development and content of the long-range statewide transportation plan and the metropolitan transportation plan. Section 450.216(b) adds requirement for consideration of the role of intercity buses in reducing congestion, pollution, and energy consumption as part of the long-range statewide transportation plan. Section 450.216(f)(1) and (2) ''should'' becomes ''shall''—The statewide transportation plan ''shall'' include a description of performance measures and targets and shall include a system performance report. Section 450.216(l)(2) adds public ports to the list of entities States shall provide a reasonable opportunity to comment on the plan and adds examples of private providers of transportation. Section 450.324(f)(2) adds public transportation facilities and intercity bus facilities to the list of existing and proposed transportation facilities to be included in the metropolitan transportation plan. Section 450.324(f)(7) adds ''reduce the vulnerability of the existing transportation infrastructure to natural disasters'' to the assessment of capital investment and other strategies to preserve the existing and projected future metropolitan transportation infrastructure in the metropolitan transportation plan. Section 450.324(f)(8) adds consideration of the role intercity buses may play in reducing congestion, pollution, and energy consumption as part of the metropolitan transportation plan. Section 450.324(j) adds public ports to the list of entities that an MPO shall provide a reasonable opportunity to comment on the metropolitan transportation plan. Section 450.324(j) adds a list of examples of private providers of transportation.
	450.310(d)	Describes TMA MPO structure.
	450.316	Interested parties, participation, and consultation. Section 450.316(a)—adds public ports to the list of entities that an MPO shall provide a reasonable opportunity to comment on the metropolitan transportation plan. Section 450.324(j) adds a list of examples of private providers of transportation. Section 450.316(b)—adds officials responsible for tourism and natural disaster risk reduction to the list of agencies and officials that an MPO should consult with in developing metropolitan transportation plans and TIPs.
	450.322	Congestion management process. Adds a list of examples in section 450.322(a) of travel demand reduction strategies. Adds job access projects as a congestion management strategy. Adds new section 450.322(h)—A MPO serving a TMA may develop a congestion management plan.

C. Costs and Benefits

The FHWA and FTA estimated the incremental costs associated with the new requirements in the final rule that represent a change to current planning practices for States, MPOs, and operators of public transportation. The FHWA and FTA derived the costs by assessing the expected increase in the level of effort and costs associated with carrying out several specific transportation planning functions, such as the development of metropolitan and statewide long-range transportation plans, TIPs, and STIPs. The changes in the final rule that are related to environmental reviews are optional and would not have a significant cost impact for States, MPOs, or operators of public transportation. It is anticipated that these optional environmental streamlining provisions could result in costs savings by minimizing the potential duplication of planning and environmental processes and by improved project delivery timeframes.

To estimate the incremental costs associated with the new requirements in the final rule that represent a change to current planning practices, FHWA and FTA assumed that implementing the performance-based planning provisions would increase the costs of preparing State and MPO long-range plans, TIPs, and STIPs by an average of 15 percent, based on an analysis of current costs and discussions with States and MPOs that have implemented a performance-based approach to transportation planning and programming. Following this approach, FHWA and FTA estimate the updated total cost for implementation of the changes to the planning process resulting from the final rule is $30.9 million annually (as compared to the estimate of $30.8 million in the NPRM). To implement the changes in support of a more efficient, performance-based planning process, FHWA and FTA estimate that the aggregate increase in costs attributable to the final rule for all 50 States, the District of Columbia, and Puerto Rico and 409 MPOs is approximately $28.4 million per year (as compared to the estimate of $28.3 million in the NPRM). These costs are primarily attributed to an increase in staff time needed to meet the new requirements. For the estimated 600 operators of public transportation that operate within MPAs, the total cost would be $2.5 million per year to coordinate with MPOs in their selection of performance targets for transit state of good repair and transit safety.

The FHWA and FTA updated the total cost estimate for the changes made from the NPRM to the final rule based on additional information on the number of MPOs that was not available at the time the NPRM was issued. The costs are revised for the final rule because FHWA and FTA assumed in the NPRM that there would be 420 MPOs (210 TMA MPOs and 210 non-TMA MPOs) after the 2010 census. This assumption was based on the fact that there were 384 existing MPOs at the time in addition to 36 new urbanized areas resulting from the 2010 census. The actual number of MPOs has turned out to be slightly lower (201 TMA MPOs and 208 non-TMA MPOs) because several of the new urbanized areas resulting from the 2010 census merged into existing MPOs instead of forming new MPOs. The costs were also adjusted for inflation from 2012 to 2014.

The FHWA and FTA expect that the final rule changes to the planning process will result in some significant benefits, including improved decisionmaking through increased transparency and accountability, and support of the national goals described in 23 U.S.C. 150(b) and the general purposes described in 49 U.S.C. 5301. The final rule would promote transparency by requiring the establishment of performance targets in key areas, such as safety, infrastructure condition, system reliability, emissions, and congestion and by expressly linking investment decisions to the achievement of such targets. This would be documented in plans or programs developed with public review.

The FHWA and FTA expect that the planning process would become more transparent as investments of Federal funds would be based on a decisionmaking process that is focused on transportation system performance, and the specific transportation system performance goals, measures, and targets that drive investment decisions would be known to the public, elected officials, and other interested parties. The proposal would establish accountability through mandating reports on progress toward meeting those targets. In addition, FHWA and FTA expect that these regulatory changes would make the planning process more accountable by having States, MPOs, and operators of public transportation identify desired transportation system performance outcomes related to the national performance areas and that investments made would be more focused on achieving these system performance outcomes. Other elements of the final rule would improve decisionmaking, such as including representation by operators of public transportation on each MPO that serves a TMA, establishing agreements in metropolitan areas identifying roles and responsibilities for performance-based planning, requiring States to have a higher level of involvement with nonmetropolitan local officials, and providing an optional process for the creation of RTPOs.

The FHWA and FTA have not been able to locate data or empirical studies to assist in monetizing or quantifying the benefits of the final rule. Estimates of the benefits of the final rule would be difficult to develop. Therefore, in order to evaluate benefits, FHWA and FTA used a break-even analysis as the primary approach to quantify benefits. The approach determines the point at which benefits from the final rule exceed the annual costs of compliance. The total annual MAP–21 funding programmed through this process in FY 2014 is $37.8 billion in FHWA funds and $10.7 billion in FTA funds. Under FAST, the total annual funding programmed through this process in FY 2016 is $39.7 billion in FHWA funds and $11.7 billion in FTA funds. The annual average cost for implementing this regulation is estimated to be $30.9 million per year. If return on investment increases by at least 0.064 percent of the combined FHWA and FTA annual funding programs, the benefits of the regulation exceed the costs. The total Federal, State, and local cost in FY 2014 of the planning program is $1,493,868,000. Generally, 80 percent of these eligible costs are directly reimbursable through Federal transportation funds allocated for metropolitan planning (23 U.S.C. 104(d) and 49 U.S.C. 5305(f)) and for State planning and research (23 U.S.C. 505 and 49 U.S.C. 5305(f)). States, MPOs, and operators of public transportation have the flexibility to use some FHWA Federal capital funds or some FTA formula program funds for transportation planning (23 U.S.C. 133(b)(1), 49 U.S.C. 5307(a)(1)(B), and 5311(B)(1)(A)). As the cost burden of the final rule is estimated to be 2.5 percent of the total planning program, FHWA and FTA believe the economic impact is minimal and the benefits of implementation outweigh the costs.

The table below is a summary of the costs and benefits calculated for the final rule.

TABLE 2—SUMMARY OF AVERAGE ANNUAL REGULATORY COSTS AND BURDEN HOURS OF EFFORT DUE TO THE CHANGES IN THE REGULATIONS RESULTING FROM MAP–21

[2014 dollars]

Entity	Total additional cost	Non-Federal share (20%)	Average additional person hours per agency
TMA MPOs (201)	$18,141,200	$3,628,200	1,800

TABLE 2—SUMMARY OF AVERAGE ANNUAL REGULATORY COSTS AND BURDEN HOURS OF EFFORT DUE TO THE CHANGES IN THE REGULATIONS RESULTING FROM MAP–21—Continued

[2014 dollars]

Entity	Total additional cost	Non-Federal share (20%)	Average additional person hours per agency
Non-TMA MPOs (208)	3,990,500	798,100	400
States (50), the District of Columbia, and Puerto Rico	6,257,800	1,251,600	2,400
Operators of Public Transportation (600)	2,510,000	502,000	100
Total	30,899,500	6,179,900	.....

III. Background

On June 2, 2014, FHWA and FTA published an NPRM at 79 FR 31784 proposing the following changes to 23 CFR part 450: That the statewide and metropolitan transportation planning processes provide for the use of a performance-based approach to decisionmaking; that each MPO that serves an area designated as a TMA include an official (or officials) who is formally designated to represent operators of public transportation in the MPA on its policy board; that MPOs be given the option to use scenario planning during the development of their MTP; that States work more closely with nonmetropolitan areas; and that States have the option of designating RTPOs to help address the planning needs of the State's nonmetropolitan areas. It also proposed revisions to the existing PEL provisions, and an optional framework for developing programmatic mitigation plans as part of the statewide and the metropolitan transportation planning processes for States and MPOs based on 23 U.S.C. 169 as established by section 1311 of MAP–21. The public comment period for the NPRM was scheduled to close on September 2, 2014. The FHWA and FTA extended the comment period 30 days to October 2, 2014, based on concerns expressed by the American Association of State Highway & Transportation Officials (AASHTO) that the closing date did not provide sufficient time to review and provide comprehensive comments (79 FR 51922).

In addition, on September 10, 2014, FHWA and FTA published a separate ''Section 168 NPRM'' at 79 FR 53673 proposing to add implementing regulations for 23 U.S.C. 168, ''integration of planning and environmental review,'' at 23 CFR 450.212(d)–(f) and 450.318(f)–(h). The regulations would create an additional process for integrating planning and the environmental review activities (planning and environmental linkages) based on 23 U.S.C. 168 as established by section 1310 of MAP–21. The comment period for the section 168 NPRM closed on November 10, 2014. The final rule combines the two rulemakings, covering changes proposed in the Planning NPRM and those proposed in the Section 168 NPRM. The final rule covers the statewide and metropolitan planning processes and includes the integration of planning and environmental review and programmatic mitigation plans as part of the statewide and the metropolitan transportation planning processes for States and MPOs.

A. Introduction to the Planning Process

The Statewide and Nonmetropolitan Transportation Planning program and the Metropolitan Transportation Planning program provide funding to support cooperative, continuous, and comprehensive (3–C) planning for making transportation investment decisions throughout each State, in metropolitan and nonmetropolitan areas. Since the Federal-Aid Highway Act of 1962, Federal authorizing legislation for the expenditure of surface transportation funds has required MTPs, long-range statewide transportation plans, and TIPs to be developed through a 3–C planning process. Over successive reauthorization cycles, including the passage of the MAP–21 in July 2012, Congress has revised and expanded the requirements for 3–C planning.

B. What do the MAP–21 and the FAST do?

While the MAP–21 left the basic framework of the planning process largely unchanged, it introduced transformational changes to increase transparency and accountability. Most significantly, States and MPOs must take a performance-based approach to planning and programming, linking investment decisionmaking to the achievement of performance targets. Along with its emphasis on performance-based planning and programming, MAP–21 emphasized the nonmetropolitan transportation planning process by requiring States to have a higher level of involvement with nonmetropolitan local officials and providing for the optional creation of RTPOs. The MAP–21 also made some structural changes to the membership of the MPOs that serve TMAs. Finally, MAP–21 included voluntary provisions

related to scenario planning, developing programmatic mitigation plans, and the use of planning products in the environmental review process. Many of these non-performance management changes codify existing best planning practices.

The FAST makes minor changes to existing planning provisions. It adds two new planning factors to be considered and implemented in the planning process, it adds new stakeholders to be included in the planning process, and it substantially amends the new authority provided by MAP–21 for using planning products in the environmental review process.

C. Stakeholder Engagement

After the publication of the NPRM on June 2, 2014, FHWA and FTA continued to engage stakeholders during the NPRM comment period. The FHWA and FTA hosted two national webinars with stakeholders on the content of the NPRM. The FHWA and FTA also responded to requests for presentations at regularly scheduled meetings or conferences of national and regional professional, industry, or advocacy organizations during the comment period of the NPRM. Those webinars and meetings provided an opportunity for FHWA and FTA to provide an overview of the NPRM and offer clarifications of selected provisions. Comments were not solicited at those meetings, and attendees were encouraged to submit all comments to the official docket. A summary of those webinars and meetings is included in the docket.

IV. Summary of Comments

The FHWA and FTA received a total of 162 comment letters that were submitted to the docket. Fifty-one of these comment letters were received from MPOs, 36 from States, 27 from advocacy organizations, 18 from regional planning organizations, 16 from associations representing public transportation agencies, 9 from operators of public transportation, 2 from the public, 2 from local governments, and 1 from a Tribal government. Collectively, these comment letters contained a total of approximately 989 individual comments.

In addition, a total of 38 comment letters were submitted to the docket proposing to implement changes to planning and environmental linkages resulting from section 1310 of MAP–21. Fourteen of the comment letters were received from States, 9 from MPOs, 5 from advocacy groups, 4 from the public, 3 from associations representing public transportation agencies, 2 from operators of public transportation, 1 from a regional planning organization, and 1 from a State environmental resource agency. Cumulatively, these comment letters contained over 100 individual comments. After reviewing the comments received in response to the two NPRMs, FHWA and FTA decided to consolidate the Planning rule and the ''Additional Authorities or Planning and Environmental Linkages'' rule into a single final rule. The FHWA and FTA believe that a consolidated final rule will help stakeholders understand the range of options for integrating planning and environmental review, including the pre-existing regulations for integrating planning and environmental review in sections 450.212 and 450.318, and the new section 168 authorities adopted in the final rule.

The FHWA and FTA carefully considered the comments received from the stakeholders. The comments and summaries of analyses and determinations are discussed in the following sections.

A. Selected Topics for Which FHWA and FTA Requested Comments

Performance Target Setting

The FTA and FHWA requested public comment on the following questions relating to target setting: (1) What obstacles do States, MPOs, and operators of public transportation foresee to the coordination among them that is necessary in order to establish targets? (2) What mechanisms currently exist or could be created to facilitate coordination? (3) What role should FHWA and FTA play in assisting States, MPOs, and operators of public transportation in complying with these new target-setting requirements? (4) What mechanisms exist or could be created to share data effectively among States, MPOs, and operators of public transportation? For those States, MPOs, and operators of public transportation that already utilize some type of performance management framework, are there best practices that they can share? Comments were received from at least 25 separate entities on these questions including AASHTO, APTA, ARC, CO DOT, CT DOT, DRCOG, FL MPO Advisory Council, H–GAC, MD DOT, MTC, MI DOT, NACTO, NJ DOT, NYS DOT, NCTCOG/RTC, the Northeast Ohio Areawide Coordinating Agency, the River to Sea Transportation Planning Organization (TPO), SACOG, SANDAG, SCAG, SJCOG, TN DOT, WMATA, and WI DOT.

What obstacles do States, MPO, and operators of public transportation foresee to the coordination among them that is necessary in order to establish targets?

Several commenters noted that the establishment of performance targets will require unprecedented levels of coordination and cooperation between States, MPOs, and operators of public transportation (AMPO, H–GAC, and NCTCOG/RTC). See section IV(B) (Recurring comment themes) for detailed discussion and FHWA and FTA responses to coordination on target setting.

The AMPO and ARC stated that they would prefer a single effective date for all of the MAP–21 performance measures rules to minimize confusion during the implementation of the measures and in the reporting of results. The H–GAC commented that there is potential for confusion between the target setting provisions proposed under 23 CFR 490 and 23 CFR 450. The MI DOT, MTC, SACOG, SANDAG, SCAG, SJCOG, and VA DOT stated that it is difficult to comment on the merits of the performance-based planning framework as the majority of measures and target-setting methodologies have not yet been released. See section IV(B) (Recurring comment themes) for more discussion and responses to these comments.

The MD DOT, NJ DOT, and TN DOT commented that setting performance targets will be a significant challenge in interstate MPOs that have membership in multiple States, since each State differs with respect to legal framework, resource availability, policies, goals, and priorities. The MD DOT and TN DOT indicated that it is not clear who will have the ultimate authority in establishing targets when a State or MPO cannot come to agreement. See section IV(B) (Recurring comment themes) for more discussion of this issue and FHWA and FTA responses.

The MTC, SACOG, SANDAG, SCAG, and SJCOG were concerned that the future Federal performance regulations will overwhelm policymakers by diluting robust processes established on the State or regional level with the addition of more measures and targets. In response, FHWA and FTA believe that States and MPOs should utilize their existing processes to the maximum extent possible. Discussion on the specific measures and target setting under the Federal performance requirements is outside the scope of the final rule.

The AMPO and ARC stated that the transition to performance-based planning will be challenging, in part

because different organizations have different structures and priorities, and in part because of the financial burdens of data collection and analysis. The FHWA and FTA agree that the transition to performance-based planning will be challenging. However, as discussed in section IV(B) (Recurring comment themes), interagency coordination will be key to successful implementation. The financial burdens of data collection and analysis for target setting are outside the scope of the final rule.

Several commenters (ARC, NJ DOT, and TN DOT) stated that it is not uncommon for States, MPOs, and operators of public transportation to have different priorities that may conflict with each other, and that this may lead to conflicts when setting performance targets and trying to achieve them. Several MPOs commented that they have to balance multiple objectives when working with communities and that this may lead to conflicts with their State. Another commenter noted that data collection will be a major challenge that needs to be addressed by the MPOs with their local members, particularly as it relates to data needed on locally owned systems. A few commenters stated that they are concerned as to whether the analytical tools and framework will exist to allow States, MPOs, and operators of public transportation to identify realistic and attainable targets for each required measure. One operator of public transportation (WMATA) commented that there is not a uniform approach to performance management among operators of public transportation, either in setting targets or in tracking progress toward achievement of targets. In response to these comments, FHWA and FTA emphasize the importance of early and ongoing interagency coordination during performance-based planning and programming. The approach used by operators of public transportation for setting targets is outside the scope of this rule. See FHWA and FTA response below to the question on ''What role should FHWA and FTA play in assisting States, MPOs, and operators of public transportation in complying with these new target-setting requirements?'' regarding technical assistance FHWA and FTA plan to provide regarding approaches to tracking progress toward achievement of targets.

What mechanisms currently exist or could be created to facilitate coordination?

The ARC, CO DOT, CT DOT, Florida MPO Advisory Council, MI DOT, NYS DOT, River to Sea Transportation Planning Organization (TPO), and RMAP indicated that they have well-established, long-standing, formal forums or work groups for ongoing discussion and coordination of planning issues and topic areas among the States, MPOs, and operators of public transportation within a particular State, and that these forums typically meet on a regularly scheduled basis (*i.e.,* monthly or quarterly). These same commenters stated that through these forums, they have built relationships between the various planning organizations within their State for successful collaboration and cooperation. The commenters further stated that these established forums are ideal for coordinating the development and implementation of performance management as part of the planning process, including data collection and analysis, performance target setting, use of analytical tools, standards and consistency, and system performance reporting. Several of the commenters stated that they are already using these established forums within their respective States for coordinating planning issues to implement performance-based planning and programming among the States, MPOs, and operators of public transportation. The Florida MPO Advisory Council commented that it has formed alliances of MPOs to address transportation planning issues at a multi-MPO level.

The FHWA and FTA agree that these examples of practice provided by commenters on how to facilitate coordination are good practices and that the development and implementation of ongoing, multiagency, and multidisciplinary forums that meet on a regular basis is an ideal way to establish relationships among the States, and MPOs, and operators of public transportation within a State.

The ARC commented that it has examples of mechanisms to facilitate interagency coordination such as an interagency consultation concept used for air quality planning and MPO technical committees. The FMATS commented that they want the MPO to be required to participate in the development of HSIP projects and the State Asset Management Plan for the NHS. In response to this comment, FHWA and FTA agree that it would be desirable for States to include the MPOs in the development of the projects for the Highway Safety Improvement Program (HSIP) and in the development of the State Asset Management Plan for the NHS because those plans contribute to performance-based planning and programming. However, there are separate NPRMs and rules governing those documents and processes and they are outside the scope of the final rule.

The FMATS also commented that the first round of performance target setting should be a joint process and facilitated by FHWA and FTA. In response, FHWA and FTA note that the final rule requires that States and MPOs coordinate during the target setting process (sections 450.206 and 450.306). The final rule also requires MPOs and operators of public transportation to coordinate target setting on transit performance measures in the metropolitan areas (section 450.306) and States must coordinate with operators of public transportation for target setting on transit performance measures outside of the metropolitan areas (section 450.206).

What role should FHWA and FTA play in assisting States, MPOs, and operators of public transportation in complying with these new target-setting requirements?

The ARC and CO DOT commented that FHWA and FTA could provide technical assistance and best practices or peer review summaries on a regular basis to assist the States, MPOs, and operators of public transportation in complying with the new target setting requirements. The CT DOT suggested that FHWA and FTA could provide guidance to States, MPOs, and operators of public transportation to implement the new target setting requirements. At least one commenter stated that the ability to use Federal funds for the necessary data collection efforts to support performance management is important. The CO DOT, CT DOT, Florida MPO Advisory Council, MI DOT, and NJ DOT suggested that FHWA and FTA could conduct best practices research and share the results in regional and statewide forums and with individual MPOs during transportation planning certification reviews. The Florida MPO Advisory Council and MI DOT also suggested that FHWA and FTA actively participate in established processes to set and implement performance targets in the States.

Others stated that FHWA and FTA already participate in these processes in some States. The MI DOT suggested that FHWA and FTA develop training sessions to ensure that planning agencies are fully aware of all the new requirements and timelines associated with the rules. The WI DOT recommended that FHWA and FTA provide further guidance on best practices related to the coordination process among States, MPOs, and operators of public transportation. The WA State DOT suggested that FHWA

and FTA could provide further guidance and best practices for the coordination of data at a statewide level and that FHWA and FTA could mediate differences between States and MPOs during the target setting process by providing guidance as to the intent of the rules. The MD DOT commented that a consistent presence of FHWA and FTA in MPO meetings to help facilitate performance measures and targets discussions would be helpful. Several commenters suggested that there needs to be substantial collaborative effort by Federal and grantee stakeholders to develop common data collection and reporting processes. The MI DOT was concerned whether the analytical tools and framework exists to allow States, MPOs, and transit agencies to identify realistic and attainable targets for the national performance measures.

In response, FHWA and FTA plan to provide technical assistance to the States, MPOs, and operators of public transportation through a number of means, including the issuance of guidance, conducting peer reviews and workshops, sharing best practices, and conducting training on topics such as target setting, implementation of performance-based planning and programming, interagency coordination, data collection, and performance progress reporting. Performance-based planning and programming will also become a topic of discussion at future TMA planning certification reviews.

The APTA commented that FHWA and FTA should not allow these changes in the planning process to slow project development, and that these changes to the planning process should encourage accelerated project development through more consistent and complete information flow. The FHWA and FTA agree that these changes to the planning process should not slow project development and that, in fact, they may accelerate project development by providing more focus on national goal areas.

The MI DOT, MTC, SACOG, SANDAG, SCAG, and SJCOG suggested that FHWA and FTA should limit the numbers of required measures. The commenters stated that fewer measures are preferable to a large number of measures. The FHWA and FTA respond that the number of performance measures that will be established is outside the scope of the final rule.

What mechanisms exist or could be created to share data effectively amongst States, MPOs, and operators of public transportation?

The ARC, MI DOT, and NACTO suggested that FHWA and FTA could share data nationally as a mechanism to achieve consistency of effort across applications, and to reduce duplication of effort among States, MPOs, and operators of public transportation. A few commenters noted that FHWA and FTA could support the implementation of performance management by providing easy access to national data sources. The ARC commented that joint procurement and sharing of data with States and MPOs and the use of the national transit database could be methods for effectively sharing data among States, MPOs, and operators of public transportation.

See also comments provided under the previous question on ''What mechanisms currently exist or could be created to facilitate coordination?'' for additional examples of mechanisms for sharing data among States, MPOs, and operators of public transportation.

In response to this comment, FHWA and FTA note that sharing data nationally and providing easy access to national data sources to achieve consistency is outside the scope of this rule.

For those States, MPOs, and operators of public transportation that already utilize some type of performance management framework, are there best practices that they can share?

The ARC, DRCOG, MD DOT, MI DOT, MTC, SACOG, SANDAG, SCAG, and SJCOG commented that they have already implemented performance-based planning and programming and have long-standing, successful processes in place for establishing performance measures, performance targets, and reporting on progress toward achievement of performance targets.

The CT DOT stated that it anticipates taking a lead role in an open process working with the MPOs and operators of public transportation on target setting since the State owns an overwhelming majority of the transportation systems affected by the MAP–21 performance measures. The CT DOT stated that it also collects, stores, and analyzes most of the data associated with those systems. The MD DOT commented that the State should have the ultimate responsibility regarding target setting within the State.

The DRCOG commented that targets should be set to encourage continuous improvement rather than a concrete objective goal. The commenter further stated that establishing strict, inflexible targets encourages aiming low to achieve an arbitrary plateau not necessarily linked to quality. The DRCOG advised against project-by-project performance measures, and instead recommended that performance measures and targets should be applied at a system or programmatic level. At least one commenter stated that it will be important that funding is aligned with the performance targets in order to achieve them.

A few commenters said that they look to utilize current database information for tracking performance measures first before developing new systems for data collection. Commenters also suggested that the framework for target setting be flexible enough to allow for an adjustment in targets, strategies, and processes as agencies learn and acquire experience with performance management.

The AASHTO, AMPO, CT DOT, and H–GAC stated that there is a need for flexibility when establishing reasonable and appropriate performance targets. They further commented that it will take time to implement performance management and performance-based planning, and that there is potential for significant conflicts to arise during the development of targets.

The ARC was concerned that there might be misleading comparisons on how performance results might be portrayed and interpreted. Another commenter stated that, when relying on a limited number of high level performance metrics, it may not present a comprehensive picture of the effectiveness of a region's performance. The Florida MPO Advisory Council and MD DOT commented that MPOs should be allowed the flexibility to develop and set targets that suit the unique needs of their specific metropolitan area.

In response to these comments, FHWA and FTA agree that there is a need for flexibility in setting targets. There is flexibility in that States and MPOs are responsible for setting their respective targets for the national performance areas. When setting targets for FHWA performance measures, the final rule requires States and MPOs to coordinate with each other and set targets that are consistent to the maximum extent practical. Operators of public transportation and MPOs are required to coordinate to the maximum extent practicable when setting transit performance targets. As part of coordination when setting targets, States, MPOs, and operators of public transportation should seek to minimize conflicts. This requires close coordination between the States and MPOs in areas such as the collection and use of data, use of analytical tools, setting of targets, and the identification of strategies to achieve the targets. Operators of public transportation are responsible for setting performance

targets for the transit performance measures in metropolitan areas in coordination with the affected MPOs.

Although the final rule provides MPOs up to 180 days to set targets after their State sets performance targets, FHWA and FTA strongly encourage States and MPOs to set performance targets at the same time and in coordination with each other. Transportation planning must be cooperative because no single agency has responsibility for the entire transportation system. For example, some roads that are part of the Interstate System are subject to certain standards and are usually maintained by a State. Others are county arterials or city streets which are designed, operated, and maintained by counties or local municipalities. Transit systems are often built, operated, and maintained by a separate entity. See section IV.(B.) for more discussion on interagency coordination.

States and MPOs may have situations where they need to evaluate competing priorities as they make decisions about setting targets for the national performance areas. Scenario planning is one possible tool that States and MPOs can use to evaluate the effect of various scenarios on system performance in order to develop the metropolitan and statewide long-range transportation plans. The FHWA and FTA also agree with the comment that a limited number of high level performance metrics for the national performance areas may not present a comprehensive picture of the effectiveness of a region's performance. States and MPOs are encouraged, but not required, to develop and implement additional performance measures beyond the required national measures that they feel are appropriate to meet their system planning needs. In setting targets as part of their planning process, the States and MPOs are strongly encouraged to engage many of the same stakeholders that they normally engage as part of their planning process.

Regional Planning Coordination

In the NPRM, FHWA and FTA sought public comment on how regional planning coordination can be further improved in situations where multiple MPOs serve one or several adjacent urbanized areas. The FHWA and FTA also sought public comment on additional mechanisms that could be created to improve regional coordination in situations where there may be multiple MPOs serving a common urbanized area or adjacent urbanized areas.

Comments were submitted to the docket on these questions from nine entities, including AASHTO, ARC, CO DOT, CT DOT, MD DOT, NRDC, NJ DOT, RMAP, and WI DOT.

How can regional planning coordination be further improved in situations where multiple MPOs serve one or several adjacent urbanized areas?

The AASHTO, CT DOT, and MD DOT suggested that FHWA and FTA develop resource documents and best practice guides to support regional planning coordination as it relates to performance management implementation, and that these resources and best practices be made available at a centralized DOT online vehicle. The MD DOT suggested that FHWA, FTA, and the National Highway and Transit Institutes provide training classes on how States and MPOs can execute and implement these requirements. The MD DOT also suggested that FHWA and FTA could provide access to professional experts to address State and MPO staff questions.

The FHWA and FTA agree that training and technical support can improve the coordination of regional planning. As part of FHWA's Every Day Counts initiative, FHWA and FTA are supporting the Regional Models of Cooperation effort, which provides a framework and process for States and MPOs to develop multijurisdictional transportation plans and agreements to improve communication, collaboration, policy implementation, technology use, and performance management across agency boundaries. See *https://www.fhwa.dot.gov/everydaycounts/edc-3/regional.cfm*.

The FHWA and FTA are also in the process of developing a training course on performance-based planning and programming which will be available at the publication of the final rule. The FHWA Office of Transportation Performance Management (TPM) offers support and assistance to States, MPOs, and operators of public transportation implementing MAP–21 performance provisions. Examples of support include workshops on TPM, peer-to-peer exchanges and demonstration workshops, and ''Let's Talk Performance'' Webinars, which can be found at *http://www.fhwa.dot.gov/tpm/resources/presentations.cfm*.

The CT DOT proposed that States and MPOs coordinate the collection and analysis of data regarding travel patterns to, through, and among adjacent MPOs. Examples would include traffic counts, household surveys, big data purchases (*e.g.,* cell phone data) that would be beneficial to all decisionmakers. It further noted that it is coordinating efforts with local officials to reorganize the boundaries of MPOs so that they more closely resemble TMA boundaries and/or major transportation corridors that meet a minimum population threshold. It also supports efforts of MPOs to work on joint projects and studies with other MPOs that share urbanized areas and transportation corridors. The NJ DOT commented that an MPO historically has led numerous multistate coordination efforts and noted that States and MPOs are assessing whether that MPO should be the lead facilitator in coordinating target setting that best serves the needs of the entire metropolitan area.

What additional mechanisms could be created to improve regional coordination in situations where there may be multiple MPOs serving a common urbanized area or adjacent urbanized areas?

The FHWA and FTA received comments from ARC, Florida MPO Advisory Council, and NRDC. The ARC noted that, in complex regions that have multiple urbanized areas and/or MPOs, it will be critical for the Federal partners to build on the Interagency Consultation (IAC) concept used for air quality planning in nonattainment areas. While not suggesting that existing air quality IAC groups be reconstituted and their mission changed, a similar concept could be used to coordinate setting targets for the metropolitan area.

The ARC, which is located in a metropolitan statistical area with multiple urbanized areas, shared that it hosts and facilitates a number of standing technical committees, such as a Technical Coordinating Committee, comprised of staff from cities, counties, and State agencies, and a Transit Operators Subcommittee, which is composed of representatives of all operators of public transportation throughout the region. In addition, it regularly convenes working groups and task forces to meet for a specified period of time to focus on specific issues of a time sensitive nature. For example, it convened a Project Delivery Task Force to address systemic issues related to the implementation of transportation projects in its region. The ARC explained that the these task force meetings have been extremely well attended and have provided a structured and energetic forum for agencies at all levels to discuss challenges, provide constructive criticism, and offer solutions. Based on the success of this initiative, the ARC suggests that MPOs form task forces to discuss the implementation of a performance management approach to planning and programming in metropolitan areas. The NRDC encouraged that MPOs use the

existing consortium framework from the HUD Sustainable Communities Initiative planning process (supported by the Inter-Agency Partnership for Sustainable Communities at HUD, DOT, and EPA).

The FHWA and FTA applaud MPO efforts to coordinate their technical and decisionmaking processes and note that the final rule will provide States, MPOs and operators of public transportation with the flexibility to determine how best they can work together to implement a performance-based approach to planning and programming and the agility to adjust their roles and responsibilities as they implement their approaches. Under section 450.314 (Metropolitan Planning Agreements), MPOs will be required to identify, through either an updated metropolitan planning agreement, an MOU, or adopted operating procedures, the coordinated processes for the collection of performance data, the selection of performance targets for the metropolitan area, the reporting of metropolitan area targets, the reporting of actual system performance related to those targets, and the roles and responsibilities for the collection of data for the NHS. While beyond the scope of this rulemaking, NRDC endorsed the provisions under section 1202 of DOT's GROW AMERICA Act proposal which are intended to align MPO boundaries with metropolitan statistical areas. They noted that this would have multiple benefits in areas where a consolidated planning structure would continue the efficacy of the MPO as it would allow for more coordinated planning, optimize the use of scarce resources for planning, and allow for easier use of data sets due to a match between governance and statistical units of geography.

B. Recurring Comment Themes on Major Provisions of the Rule

This section contains a consolidated summary of comments and FHWA and FTA responses on major provisions of the rule. The key topic areas covered in this section include: State, MPO, and operator of public transportation coordination on performance-based planning and programming; traditionally underserved populations, environmental justice (EJ), Title VI of the Civil Rights Act of 1964 (as amended), equity, and the transportation planning process; asset management and the transportation planning process; common effective date and phase-in of new requirements; and other changes proposed by commenters. This section is written in narrative format with the exception of the discussion on traditionally underserved populations, EJ, Title VI of the Civil Rights Act of 1964 (as amended), equity, and the transportation planning process which, because of the level of detail, specificity, and uniqueness of the individual comments on the topic area, FHWA and FTA have organized in a comment and response format for ease of providing clarity in the responses.

- State, MPO, and Operator of Public Transportation Coordination on Performance-Based Planning and Programming

At least 48 commenters provided comments on the topic of coordination (Albany MPO, AASHTO, AMPO, APTA, ARC, Board of the French Broad River MPO, CALTRANS, Charlotte Regional TPO, CO DOT, CT DOT, DC DOT, DRCOG, DVRPC, FMATS, FL DOT, Florida MPO Advisory Council, HI DOT, H–GAC, IA DOT, MAG, MARC, Miami-Dade MPO, MT DOT, MTC, NACTO, NARC, NJTPA, North Florida TPO, NYMTC, (NYMTA), New York State Association of MPOs, NYS DOT, OR DOT, PA DOT, River to Sea TPO, SACOG, SANDAG, San Luis Obispo Council of Governments (COG), SCCRTC, SCAG, SJCOG, SEMCOG, Transportation for America, TX DOT, WA State DOT, and Wilmington MPO)) as it relates to coordination among States, MPOs, and operators of public transportation on the new requirements for performance-based planning and programming. Twenty-five of the commenters were from MPOs, 13 were from States, 8 were from associations, 1 was from an operator of public transportation, and 1 was from an advocacy organization. The comments were received on several sections in the NPRM, including sections 450.206, 450.208, 459.216, 450.218, 450.306, 450.314, 450.324, and 450.326. These sections include the scope of the statewide and metropolitan planning processes, coordination of the statewide transportation planning process, metropolitan planning agreements, development and content of the STIP and TIP, and development and content of the long-range statewide transportation plan and the MPO MTP.

The Federal-Aid Highway Act of 1962 set forward requirements for a 3–C transportation planning process in metropolitan areas. Subsequent acts required the designation of an MPO by the Governor and local officials in census designated urbanized areas. The 1993 planning regulations that resulted from the 1991 passage of ISTEA added provisions for cooperatively developed, written metropolitan planning agreements that outline the planning roles and responsibilities of the States, MPOs, and operators of public transportation in metropolitan areas. Section 450.306(a) continues the longstanding requirement that MPOs are required to conduct the metropolitan transportation planning process in the metropolitan area, including the development of an MTP and TIP, in cooperation with the State and operators of public transportation and expands the metropolitan planning process to make it performance-driven and outcome-based. States are required to cooperate with MPOs when conducting the statewide planning process, including during the development of the long-range statewide transportation plan and the STIP (sections 450.216(g), 450.218(b)). Cooperation means that the parties involved in carrying out the transportation planning and programming process work together to achieve a common goal or objective (section 450.104). Coordination means the cooperative development of plans, programs, and schedules among agencies and entities with legal standing and adjustment of such plans, programs, and schedules to achieve general consistency, as appropriate (section 450.104).

The final rule includes provisions for coordination on performance-based planning and programming among States, MPOs, and operators of public transportation in metropolitan areas. The new requirement for performance-based planning and programming expands the cooperation and coordination role among States and MPOs in the transportation planning process by requiring coordination on target setting for the FHWA required performance measures. Similarly, the role of operators of public transportation is also expanded as States and MPOs are required to coordinate with operators of public transportation on target setting for the FTA required performance measures. Several commenters emphasized the importance of coordination (H–GAC, MAG, MARC, and NCTCOG/RTC) among all metropolitan planning partners, including the States, MPOs, and operators of public transportation for successful implementation of the new requirements for performance management. The FHWA and FTA agree that coordination of performance management between the States, MPOs, and operators of public transportation is critical to successful implementation of performance management and achievement of targets. Coordination needs to include not only target setting, but also the data collection necessary to

support setting targets, identification of investments and strategies to achieve targets, and reporting of progress toward achieving targets.

The final rule includes the new requirement that the State coordinate with the relevant MPOs when setting FHWA performance targets (section 450.206(c)(2)), and, similarly, that MPOs coordinate with the relevant State (section 450.306(d)(2)(ii)) when the MPO is setting FHWA performance targets. States have up to 1 year from the effective date of each performance management final rule to set performance targets for that performance measure (section 450.206(c)(2)), and the MPOs have 180-days after the State or operator of public transportation sets performance targets to set its own targets (section 450(d)(3)). This final rule requires that, as part of the State and MPO coordination on FHWA target setting, the performance targets be consistent to the maximum extent practicable. Although the final rule allows the MPO up to 180 days to set performance targets after the State sets its targets, FHWA and FTA believe it is important that the State and MPO work together on FHWA target setting and, ideally, the State and MPO should be setting their targets at the same time in coordination with each other to ensure that they are consistent to the maximum extent practicable. The MPOs and operators of public transportation should coordinate to the maximum extent practicable in metropolitan areas on target selection for the public transportation performance targets. The MPOs have up to 180 days to set transit performance targets for the metropolitan area's transit performance measures after operators of public transportation set transit performance targets. State and MPO coordination on target setting will be crucial to successful implementation of performance management and the performance-based planning and programming process that supports performance management.

Although States, MPOs, and operators of public transportation are required to establish performance targets for the federally required performance measures based on the phase-in schedules and timeframes described in the final rule, FHWA and FTA think it is important to note that they coordinate on their target setting in advance of establishing those targets. As such, State, MPO, and operator of public transportation coordination on target setting will need to begin in advance of when the targets are required to be established.

Scope of the Metropolitan and Statewide Transportation Planning Processes (Sections 450.206 and 450.306)

Several comments received on section 450.306(d) emphasized the importance of coordination (H–GAC, MAG, MARC, and NCTCOG/RTC) among all metropolitan planning partners, including the States, MPOs, and operators of public transportation for successful implementation of performance management. The FHWA and FTA agree. Coordination of performance management among the States, MPOs, and operators of public transportation is critical to successful performance management and achievement of targets. Coordination needs to include not only target setting, but also the identification of investments and strategies to achieve those targets.

The WA State DOT commented that there is a need for more explicit explanations on the relationships and roles between the States and MPOs in section 450.306(d). The commenter further stated that it is unclear if MPOs are required to match the targets set by the State. The FHWA and FTA respond that States and MPOs are each required to set performance targets for the federally required performance measures. When setting performance targets for the federally required performance measures, MPOs are not required to match State targets; however, States and MPOs are required to coordinate to ensure consistency to the maximum extent practicable when setting the highway-related performance targets. Similarly, States (in areas not represented by an MPO) and MPOs (in MPAs) are to coordinate the selection of State and MPO transit-related performance targets to the maximum extent practicable with operators of public transportation to ensure consistency with the transit safety and state of good repair targets. No changes have been made to this section as a result of this comment.

The MTC, SACOG, SANDAG, SCAG, and SJCOG commented on the difficulty of coordination on target setting when there are a large number of agencies. The WA State DOT commented that there is a need for more explicit explanations on the relationships and roles between the States and MPOs. The MD DOT, NJ DOT, and TN DOT commented that setting of performance targets will be a significant challenge in interstate MPOs that have membership in multiple States, since each State differs with respect to legal framework, resource availability, policies, goals, and priorities. A few States (MD DOT and TN DOT) indicated that it is not clear who will have the ultimate authority in establishing targets when a State or MPO cannot agree.

The commenters further stated that funding constraints may make it difficult to move in the desired direction for many performance targets. They are also concerned about the implementation costs and resources required of smaller MPOs. The DC DOT and NJTPA commented on the new provisions for performance-based planning in section 450.306(d) because of the difficulty in coordinating target setting in situations where there may be multiple States, MPOs, and/or operators of public transportation involved, such as in bi-State or tri-State metropolitan regions.

In response to these comments, FHWA and FTA note that section 450.314(h) of the rule describes methods for States, MPOs, and operators of public transportation in metropolitan areas to mutually agree upon and document the roles and responsibilities for conducting performance-based planning and programming through the metropolitan planning agreement or by some other means. The FHWA and FTA also note the longstanding requirement in 23 U.S.C. 134(i)(2)(E)(iii) and 49 U.S.C. 5303(i)(2)(E)(iii) which provide that the State, MPO, and operator of public transportation shall cooperatively develop estimates of funds that will be available to support plan and TIP implementation. The availability of funding would certainly influence target setting, and the cooperative development of the funding estimates should help further encourage the States, MPOs, and operators of public transportation to work together. Comments on the costs of implementation and resources for MPOs to undertake these new requirements, including for smaller MPOs, are addressed separately in this document under the section addressing the regulatory impact analysis (RIA) for this rule.

The APTA commented that areas with multiple MPOs should be encouraged to coordinate across urbanized areas through informal means. The FHWA and FTA response to this comment is that the regulations at section 450.314(h) require that the State(s), MPO(s), and operator(s) of public transportation serving a single urbanized area mutually agree upon and document specific written provisions for interagency coordination on performance-based planning and programming, either as part of the metropolitan planning agreement, or by

some other means as mutually agreed upon by the MPO(s), State(s), and operator(s) of public transportation. It is up to the agencies to mutually decide how that coordination will take place.

Sections 450.206(c)(4) and 450.306(d)(4) of the final rule require that the State and the MPOs are required to integrate into the statewide and the metropolitan transportation planning processes, directly or by reference, the goals, objectives, performance, measures, and targets in other State transportation plans and transportation processes, as well as any plans developed pursuant to chapter 53 of title 49 by operators of public transportation in areas not represented by an MPO required as part of a performance-based program. Examples of such plans and processes include the HSIP, SHSP, the State asset management plan for the NHS, the State Freight Plan, the Transit Asset Management Plan, and the Public Transportation Agency Safety Plan.

Several commenters (Albany MPO, AMPO, DVRPC, NARC, New York State Association of MPOs, NYMTC, PA DOT, and San Luis Obispo COG) remarked that this requirement appears to be in conflict with sections 450.306(d)(2)(i), (ii), and (iii), which state that each MPO shall establish performance targets, and the selection of targets shall be coordinated with the State and, to the maximum extent practicable, coordinated with operators of public transportation. The FHWA and FTA response to this comment is that these provisions do not conflict. They reflect the need for close coordination between States, MPOs, and operators of public transportation during the target setting process to ensure that the targets are coordinated and consistent to the maximum extent practicable. This would suggest that State, MPO, and operator of public transportation coordination during the development of other performance-based plans and processes (such as the State asset management plan for the NHS and transit asset management plans, safety plans, freight plans, and congestion plans) is desirable because these plans could affect the performance targets and the investments that support those targets. Early coordination on the development of these other performance-based plans and processes could ease their integration into the statewide and the metropolitan transportation planning processes.

The San Luis Obispo COG and SCCRTC commented on section 450.306, scope of the metropolitan planning process. They felt that decisionmaking for metropolitan projects often lies with the State, and as a result, the ability for an MPO to succeed at performance-based planning and at achieving performance targets is constrained. In response to this comment, FHWA and FTA reiterate the importance of early and ongoing State and MPO coordination on performance-based planning and programming, particularly with target setting and the identification of investments and strategies necessary to achieve targets. The FHWA and FTA note that it is an MPOs responsibility to develop the TIP (23 CFR 450.326), in cooperation with the State(s) and any affected public transportation operator(s), and to review and update the MTP (23 CFR 450.324(c)). The FHWA and FTA note that the State is required to develop the STIP in cooperation with the MPO designated for the metropolitan area (23 CFR 450.218(b)) and the State shall include each metropolitan TIP without changes in the STIP, directly or by reference, after approval of the TIP by the MPO and the Governor (23 CFR 450.218(b)).

Many commenters indicated that they disagreed with the requirement to amend the metropolitan planning agreement, stating that it is inflexible, that there would be a need to update the agreements frequently, and that updates take a long time. In reviewing these comments, FHWA and FTA decided to retain the requirement that there be mutually developed written documentation describing the interagency roles and responsibilities for performance-based planning in a metropolitan area. However, the final rule allows for flexibility, in that it may be documented as part of the metropolitan planning agreement, or in some other form mutually agreed upon by the States, MPOs, and operators of public transportation.

Coordination of Statewide Planning Process Activities (Section 450.208)

Regarding the coordination of planning process activities in section 450.208, NYS DOT commented that in multijurisdictional mega-regions, flexibility is needed to coordinate performance management requirements among States, MPOs, and interstate agencies or authorities. The commenter further stated that this flexibility is needed due to the complexity of transportation facilities and services that may straddle several MPO and State boundaries. The SEMCOG commented that there should be flexibility to allow MPOs to develop cooperative procedures for performance-based planning that are best for the local situation. The FHWA and FTA agree that States, MPOs, and interstate agencies and authorities need the flexibility to determine how best to coordinate their respective transportation planning activities and believe that the final rule provides for flexibility. Section 450.314(h) provides States, MPOs, and operators of public transportation options for mutually identifying the agency roles and responsibilities for performance-based planning and programming in metropolitan areas in writing, either through the metropolitan planning agreements or by some other mutually determined means.

Development and Content of Long-Range Statewide Transportation Plans, MTPs, STIPs, and TIPs (Sections 450.216, 450.218, 450.324, and 450.326)

The FMATS commented that it is essential for States to develop performance targets in full coordination with MPOs and the nonmetropolitan planning areas to ensure that performance targets are considered during the development of TIPs and STIPs, and that investment priorities are tied to targets. The FHWA and FTA agree that State and MPO coordination is a key part of target setting. It is also key that MPOs and operators of public transportation coordinate in metropolitan areas and that States coordinate with rural operators of public transportation as part of target setting for transit measures. The Miami-Dade MPO stated that it is important for States to coordinate the STIP with MPOs and that the STIP be consistent with the metropolitan plans, especially in TMAs. In response to this comment, FHWA and FTA reiterate that the STIP and the TIP must be consistent with the long-range statewide transportation plan (section 450.218(k)) and the MTP (section 450.326(i)), respectively, and that that the STIP must incorporate the TIP without alteration (section 450.218(b)).

Section 450.314 Metropolitan Planning Agreements

Section 450.314 discusses the requirement that States, MPOs, and operators of public transportation serving an MPA cooperatively establish a metropolitan planning agreement. These agreements determine the mutual responsibilities of the parties in carrying out the metropolitan transportation planning process. Forty-three commenters (Albany MPO, AASHTO, AMPO, APTA, ARC, Board of the French Broad River MPO, CALTRANS, Charlotte Regional TPO, CO DOT, CT DOT, DC DOT, DRCOG, DVRPC, FL DOT, Florida MPO Advisory Council,

FMATS, H–GAC, HI DOT, IA DOT, MAG, MARC, Metropolitan Transportation Council MPO, MT DOT, MTC, NACTO, NARC, New York State Association of MPOs, NJTPA, NC DOT, North Florida TPO, NYMTA, NYMTC, NYS DOT, OR DOT, PA DOT, River to Sea TPO, SACOG, SANDAG, SCAG, SJCOG, Transportation for America, TX DOT, and Wilmington MPO) provided comments on this section. Twenty-one of the commenters were from MPOs, 13 were from States, 7 were from transportation associations, 1 was from an operator of public transportation, and 1 was from an advocacy organization.

The requirement to have metropolitan planning agreements is long-standing, dating to the 1993 planning regulations that resulted from the passage of ISTEA in 1991. The metropolitan planning agreements serve as a basis for describing the interagency coordination that is part of the 3–C planning process. In the NPRM, FHWA and FTA proposed to add new provisions in this section to require that the States, MPOs, and operators of public transportation update the metropolitan planning agreements to include new interagency coordination provisions for State, MPO, and operator of public transportation on performance-based planning and programming and on the collection of data for the State asset management plan for the NHS. Specifically, sections 450.314(a), (e), and (g) in the NPRM would have required that the metropolitan planning agreements include specific provisions for cooperatively developing and sharing information related to transportation systems performance data, the selection of performance targets, the reporting of performance targets, the reporting of system performance to be used in tracking progress toward attainment of critical outcomes for the region of the MPO (section 450.306(d)), and the collection of data for the State asset management plan for the NHS.

The NPRM proposed the addition of this new provision to the metropolitan planning agreements for two reasons: (1) To document the coordination necessary to successfully implement performance-based planning in metropolitan areas, and (2) to document coordination on the collection of data for the NHS for the State asset management plan (given that there are NHS highways in metropolitan areas and that some NHS roads are not on the State highway system but instead are under the ownership of local jurisdictions).

Nearly all of the comments on this section focused on the proposed requirements for including specific provisions in the metropolitan planning agreements for cooperatively developing and sharing information related to transportation systems performance data, the selection of performance targets, the reporting of performance targets, the reporting of system performance to be used in tracking progress toward attainment of critical outcomes for the region of the MPO (see section 450.306(d)), and the collection of data for the State asset management plan for the NHS. The commenters near universally stated that it would be difficult, time consuming, expensive, and require extensive review to carry this out and that these changes should not be included in the final rule. They further indicated that including the provision as part of the metropolitan planning agreement creates inflexibility because it would be difficult and time consuming to change the agreements as roles of the agencies might shift over time and the agreements might be subject to frequent change.

Nearly all of the commenters (AASHTO, Albany MPO, AMPO, ARC, Board of the French Broad River MPO, CALTRANS, Charlotte Regional TPO, CT DOT, DC DOT, DRCOG, DVRPC, FL DOT, Florida MPO Advisory Council, H–GAC, HI DOT, IA DOT, Metropolitan Council MPO, MTC, MT DOT, NACTO, NARC, NJTPA, North Florida TPO, NYMTA, NYMTC, OR DOT, PA DOT, River to Sea TPO, Transportation for America, and TX DOT) stated that they did not support these new requirements. These commenters suggested that they should not be included in the final rule, should be made optional, or should be done by more flexible means outside of the metropolitan planning agreement itself because of the difficulty in amending these agreements.

As part of their comments to the docket, many commenters provided examples of locally preferred, less formal methods of documentation for coordination (in place of using the metropolitan planning agreement). The alternative methods of documenting coordination suggested by the commenters include: MPO operating procedures (AASHTO, CT DOT, and TX DOT), Unified Planning Work Program (UPWP) (CT DOT), handshake agreements (ARC), resolution (Board of the French Broad River MPO, Charlotte Regional TPO, and Wilmington Urban Area MPO), and a secondary agreement separate from the metropolitan planning agreement (FMATS). The New York State Association of MPOs suggested documenting coordination methods through addendums or amendments to the existing metropolitan planning agreements without having to open existing agreements. The NYMTA commented that it prefers that the agency roles and responsibilities be identified outside the metropolitan planning agreement in a more informal manner. The CO DOT commented that the metropolitan planning agreement should be flexible, especially for the proposed new elements on performance-based planning. While many commenters (AASHTO, ARC, DVRPC, FMATS, MTC, New York State Association of MPOs, NYMTA, PA DOT, SANDAG, SCAG, SJCOOG, and Transportation for America) further stated that although they disagreed with the proposal requiring that the metropolitan planning agreements be modified, they recognized the importance of ensuring all planning agencies are coordinating and collaborating together on regional planning issues, including performance-based planning.

After reviewing these comments, FHWA and FTA have decided to modify the final rule to make it more flexible while still fulfilling a requirement to jointly agree upon and document mutual responsibilities for coordination in support of performance-based planning. In the final rule, FHWA and FTA have deleted the provisions for documenting the mutual responsibilities for interagency coordination on performance-based planning and for coordination on data collection on the NHS from sections 450.314(a), (e), and (g), and added new section 450.314(h).

The new section 450.314(h) requires that States, MPOs, and operators of public transportation jointly agree upon and develop specific written provisions for cooperatively developing and sharing information related to transportation performance data, the selection of performance targets, the reporting of performance targets, the reporting of performance to be used in tracking progress toward attainment of critical outcomes for the region of the MPO (see section 450.306(d)), and the collection of data for the State asset management plan for the NHS. The provision requiring documentation of mutual responsibilities for State, MPO, and operator of public transportation coordination in the final rule is more flexible than what was proposed in the NPRM in that these provisions for coordination shall be documented either: (1) As part of the metropolitan planning agreements required under sections 450.314(a), (e), and (g), or (2) in some other means outside of the metropolitan planning agreement as determined jointly by the States, MPOs, and operators of public transportation.

Similar to the NPRM, section 450.314(a), (e), and (g), and section 450.314(h) of the final rule requires documentation of responsibilities for coordination in each of the following circumstances: (1) When one MPO serves an urbanized area, (2) when more than one MPO serves an urbanized area, and (3) when an urbanized area that has been designated as a TMA overlaps into an adjacent MPA serving an urbanized area that is not a TMA. As a result, the language for the metropolitan planning agreements, as it relates to performance-based planning and for the data collection for the NHS, is unchanged in the final rule with the exception that it has been made more flexible to provide States, MPOs, and operators of public transportation more options in how they establish written methods for coordination.

In the final rule, FHWA and FTA still require the States, MPOs, and operators of public transportation to mutually identify the roles and responsibilities of each agency for performance-based planning and for collection of data for the NHS in a documented manner. However, the option is provided to jointly agree upon and document the methods for coordination either through amending the existing metropolitan planning agreement or through another mechanism outside of the metropolitan planning agreement. This mechanism can be mutually agreed on by the States, MPOs, and operators of public transportation.

Four commenters (Albany MPO, DVRPC, New York State Association of MPOs, and NYMTC) were concerned that it will be difficult to establish agreements because some of the data and analytical tools necessary for performance-based planning might not yet be available and that several of the other NPRMs establishing performance measures for the performance-based programs have not yet been released. The FHWA and FTA response is that under section 450.340 of the final rule (phase-in of new requirements), MPOs have 2 years from the issuance of the other performance management final rules before they have to comply with the performance-based planning requirements of the final rule, including compliance with the requirement to document the interagency coordination on performance-based planning and data collection for the NHS as required in section 450.314. As a result, FHWA and FTA made no changes to the final rule based on this comment.

Transportation for America commented that it wants stronger local decisionmaking through improved State and MPO coordination regarding NHS within MPO boundaries, and that they would rather have coordination than cooperation. In response to this comment, FHWA and FTA note that section 450.314(h) requires States and MPOs to mutually determine and document the roles and responsibilities of each agency for the collection of data for the NHS in the MPA of the MPO in writing as part of the metropolitan planning agreement, or in some other mutually agreed to format. No changes are made to the final rule based on this comment.

Two commenters (FMATS and MARC) remarked that it is critical to describe and clarify the roles and responsibilities of parties responsible for the collection of data on the NHS because of the new requirements for a State asset management plan for the NHS and the establishment of performance measures and targets. The FMATS further stated that a conflict resolution process should be included as part of the agreement. The MARC commented that MAP–21 added many locally owned and operated principal arterial routes to the NHS and that States should have primary responsibility for data collection on the NHS with the option of providing funding to others to collect. The FHWA and FTA respond that the final rule does not establish who has primary responsibility for data collection for the NHS routes that are off the State system. However, that should be part of what is cooperatively described by the States, MPOs, and operators of public transportation in their documentation prepared to fulfill the requirements of section 450.314(h).

In regards to the FMATS comment about establishing a conflict resolution process, FHWA and FTA respond that States, MPOs, and operators of public transportation are not required to establish a conflict resolution process. However, they may choose to do so. The FHWA and FTA did not make any changes to the final rule as a result of these comments.

The CO DOT and NC DOT commented that FHWA and FTA should provide the States, MPOs, and operators of public transportation the flexibility to determine the specific elements that are appropriate for inclusion in the metropolitan planning agreement. In response to these comments, States, MPOs, and operators of public transportation are provided the flexibility to determine the specific elements that are appropriate for inclusion in the metropolitan planning agreement provided that, at a minimum, they include the requirement elements described in section 450.314. The NJ DOT stated that it already has in place various agreements with its transportation partners that were reached through a collaborative process, and it would rather use these or other less formal documents than the metropolitan planning agreement.

The FHWA and FTA response to this comment is that for the documentation on coordination for performance-based planning and for data collection for the NHS, States, MPOs, and operator of public transportation may collaboratively decide to document their methods for coordination outside of the metropolitan planning agreement as part of other less formal written agreements or through some other means.

The FMATS commented that that when a State updates it long-range statewide transportation plan or other performance-based plans, it is critical that it coordinate with MPOs because the State plans have impacts on the MPOs planning process. The FHWA and FTA response to this comment is that the metropolitan planning agreement, or another cooperatively developed agreement outside of the planning agreement could be a good place for describing this coordination.

The DVRPC stated that a single agreement might not be possible, for example in regions with multiple States. The FHWA and FTA response to this comment is that while a single agreement is preferred, it might not always be realistic, particularly in situations where there are multiple States involved and that, if necessary, there might be more than one agreement.

The NYMTA encouraged FHWA and FTA to provide examples of best practices on State, MPO, and operator of public transportation coordination that MPOs may implement. The APTA commented that FHWA and FTA could support coordination through guidance and technical assistance. The FHWA and FTA agree that sharing best practices on performance-based planning including sharing methods of coordination is useful and would benefit the state of the practice. The FHWA and FTA are already in the process of, and plan to continue developing guidance, workshops, peer exchanges, and other materials as appropriate to help disseminate best practices for performance-based planning and programming, including best practices on interagency coordination.

The MN DOT commented that it would like to see more clarification concerning bi-State MPOs in regards to coordination efforts for target setting in the final rule. The FHWA and FTA

reiterate that, similar to what was required in the NPRM under sections 450.314(a), (e), and (g), section 450.314(h) in the final rule requires documentation of responsibilities for coordination for each of the following circumstances: (1) When one MPO serves an urbanized area, (2) when more than one MPO serves an urbanized area, and (3) when an urbanized area that has been designated as a TMA overlaps into an adjacent MPA serving an urbanized area that is not a TMA. A bi-State MPO could exist in any of these circumstances, because some urbanized areas cross State lines. Under these requirements, a bi-State MPO would have written agreements that include both States. The States, MPOs, and operators of public transportation would mutually identify and document their methods, roles, and responsibilities for coordination on performance-based planning and programming as part of the metropolitan planning agreement or by some other means.

Provisions for target setting for bi-State MPOs that are for specific performance measures are outside the context of the final rule. There are other rules on target setting for the specific federally required performance measures.

In the NPRM, sections 450.314(a), (e), and (g) used the words ''system'' and ''systems'' when referring to transportation systems performance data and when referring to the reporting of system performance. As described previously, FHWA and FTA added new section 450.314(h) instead of revising sections 450.314(a), (e), and (g). At least one commenter (MAG) asked for clarification on what the word ''system'' is referring to. The FHWA and FTA feel that the use of the words in this section is confusing, vague, undefined, and subject to misinterpretation and has removed them from section 450.314(h).

In summary, FHWA and FTA feel strongly that interagency coordination is an important part of successful implementation of the 3–C planning process, including the new requirements for performance-based planning. The requirement for cooperatively documenting the mutual responsibilities for carrying out the 3–C metropolitan transportation planning process has a long history dating back to the 1993 planning regulations. Performance-based planning is the newest addition to the 3–C planning process. Documenting the mutual responsibilities of the States, MPOs, and operators of public transportation in writing, either through the metropolitan planning agreement or through another means, is crucial to the successful implementation of the coordination that is necessary for the successful implementation of performance-based planning. For this reason, the final rule retains the requirement to document the methods for interagency coordination on performance-based planning and for data collection for the State asset management plan for the NHS. However, the final rule provides flexibility in how it may be documented.

The FHWA and FTA reiterate the importance of coordination to the effectiveness of performance-based planning and programming. Consequently, FHWA and FTA intend to initiate a rulemaking that will propose methods for improving MPO coordination in the transportation planning process, which recognizes the critical role that MPOs play in ensuring the economic well-being of a region and in identifying efficient improvements that serve its mobility needs. This targeted rulemaking will address the coordination challenges and inefficiencies that may result where there are multiple MPOs designated within a single urbanized area. The rulemaking may clarify the statutory requirement for the State and MPO to determine whether it is appropriate to designate multiple MPOs within a region, based on the size and complexity of the area. To further a 3–C transportation planning process, it may describe the coordination and collaboration requirements for MPOs already designated in regions with other MPOs. The changes under consideration are intended to enable MPOs to speak with a stronger, more unified voice, to increase efficiencies, to accelerate project delivery, and to improve the extent to which transportation investments reflect the needs and priorities of that region.

To date, FHWA and FTA have conducted numerous workshops, peer exchanges, and best practice studies to provide information and examples of performance-based planning and programming practices for use by the States, MPOs, and operators of public transportation, including information on interagency coordination. These resources are intended to aid the planning agencies in their transition to performance-based planning and programming. Many of these resources include elements of interagency coordination practices. This material is available at: *http://www.fhwa.dot.gov/planning/performance_based_planning/*. The FHWA and FTA plan to continue to develop and share additional resources on performance-based planning and programming in the future, including resources on interagency coordination.

- Traditionally Underserved Populations, Environmental Justice, Title VI of the Civil Rights Act of 1964 (as Amended), Equity, and the Transportation Planning Process

At least 12 commenters discussed the relationships between traditionally underserved populations and the transportation planning process (Community Labor United, Enterprise Community Partners, Front Range Economic Strategy Center, National Association of Social Workers, National Housing Conference, NRDC, Partnership for Active Transportation, Partnership for Working Families, Policy Link, Public Advocates, Sierra Club, and United Spinal Association). The comments focused on two elements: (1) Participation of traditionally underserved populations in the planning process itself, and (2) consideration of traditionally underserved populations in the planning process, including the development of key planning documents such as transportation plans and programs.

Related topic areas on which FHWA and FTA received comments included equity, EJ (Executive Order (E.O.) 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, 1994), and Title VI of the Civil Rights Act of 1964 (as amended, 42 U.S.C. 2000d–1). These comments were submitted on several sections of the planning regulations including scope of the statewide and nonmetropolitan and metropolitan planning processes (sections 450.206 and 450.306) and development and content of the long-range statewide transportation plan, MTP, STIP, and TIP (sections 450.216, 450.218, 450.325, and 450.326). Comments were also received on sections of the NPRM concerning Federal findings and approvals (section 450.220) and self-certifications and Federal certifications (section 450.336).

Given the level of detail, specificity, and uniqueness of the individual comments on this topic area, FHWA and FTA have organized this section in a comment and response format for ease of providing clarity in the responses.

Comment: The Nine to Five National Association of Working Women commented that an equitable transportation system is critical to creating thriving communities of opportunity. The commenter stated that where and how we decide to make transportation investments is critical to communities' access to economic

opportunity. The commenter further stated that low income and minority communities face tremendous barriers in access to transportation that can get them to critical places like school, work, child care, appointments, and grocery stores, and that reducing those barriers will require targeted investments.

Response: The FHWA and FTA agree that the transportation system plays a critical role in connecting Americans to opportunity by providing people with reliable and affordable connections to employment, education, services, other opportunities, creating career pathways into transportation jobs, and revitalizing neighborhoods and regions. The FHWA and FTA emphasize transportation system connectivity to create economic growth and spark community revitalization, particularly for disadvantaged groups like low-income, minority, older adults, or individuals with disabilities. The FHWA and FTA and the Office of the Secretary of Transportation are actively working with States, MPOs, operators of public transportation, and others on an initiative called Ladders of Opportunity. Ladders of Opportunity is an outreach effort that encourages MPOs, States, and operators of public transportation to consider connectivity and access for traditionally underserved populations to employment, health care, healthy food, and other essential services using Geographic Information Systems (GIS) based analysis tools and data. Ladders of Opportunity and connectivity have been part of the planning emphasis areas of the FHWA and FTA for Federal fiscal years 2015 and 2016.

The FHWA and FTA have developed several case study examples of analysis of connectivity and shared it with States and MPOs via Webinars and a workshop. Under the Ladders of Opportunity initiative, the MPOs are being encouraged to include funded work program activities to include an analysis of connectivity gaps with their MTP and TIP development. The FHWA and FTA will continue to conduct outreach and training on this topic and encourage MPOs to include a connectivity analysis as part of their planning process and plan and TIP development.

Comment: The Enterprise Community Partners, NRDC, and National Housing Conference, suggested that there be a requirement to include housing and community development representatives and consider those topics in the in the scope of the statewide and metropolitan planning processes (sections 450.206 and 450.306).

Response: The FHWA and FTA note that under sections 450.206 and 450.306 it is required that the statewide and metropolitan planning process promotes consistency between transportation improvements and State and local planned growth and economic development patterns. The FHWA and FTA also note that under sections 450.210(a) and 450.316(a), States and MPOs are required to provide individuals, affected public agencies, representatives of the disabled, and other interested parties an opportunity to be involved in the statewide and the metropolitan transportation planning processes. The FHWA and FTA believe that these affected public agencies and other interested parties should include housing and community development representatives.

Comment: Several commenters suggested that FHWA and FTA should consider that scenario planning in the development of the MTP be used by MPOs to analyze the impact of investments and policies on the transportation system, including prioritizing the needs of low-income populations, minorities, or people with disabilities.

On section 450.324(i), voluntary use of scenario planning in the development of the metropolitan transportation plan, at least seven advocacy groups (Community Labor United, Front Range Economic Center, National Association of Social Workers, Partnership for Working Families, PolicyLink, Public Advocates, United Spinal Association) suggested that scenario planning be used by MPOs to analyze the impact of investments and policies on the transportation system including prioritizing the needs of low-income populations, minorities, or people with disabilities. One advocacy group (National Housing Conference) suggested that MPOs should consider housing needs when conducting scenario planning.

Response: The FHWA and FTA agree with the commenters that scenario planning could help an MPO conduct an analysis of the impact of investments on low-income, minority, or disabled populations. However, FHWA and FTA reiterate that the use of scenario planning by the MPOs as part of developing the MTP is optional under the final rule (section 450.324(i)). The FHWA and FTA have a long-standing history of working with MPOs on the implementation of EJ into the planning process and Title VI. Similarly, MPOs could choose to evaluate housing needs as part of scenario planning, but are not required. That decision is left to the individual MPOs to decide. Based on these comments, no changes are made to the final rule.

The FHWA and FTA strongly support scenario planning as a best practice for developing the MTP. The NPRM and the final rule provide an optional framework for MPOs to use scenario planning in the development of their MTPs at section 450.324(i). The FHWA and FTA have developed considerable resources, examples of practice, and peer exchanges in support of promoting scenario planning. They are available at: *http://www.fhwa.dot.gov/planning/scenario_and_visualization/scenario_planning/*.

Comment: An EJ, equity, and Title VI analysis should be part of the scope of the statewide and metropolitan planning processes.

Nearly all of the commenters who provided comments on the relationships between traditionally underserved populations and the transportation planning process stated that States and MPOs should conduct an analysis of the impact of transportation plans, STIPs, and TIPs on EJ communities and Title VI in the interest of ensuring that investments are made in ways that help all communities prosper and achieve equitable investments. Several commenters recommended that performance measures be used to prioritize projects and expand equity and access to economic opportunity, public transit, access to jobs, affordable housing, pedestrian safety, and transportation costs for the benefit of traditionally underserved populations.

Others recommended that MTPs should be evaluated by their potential to connect the traditionally underserved to opportunities by providing them with reliable and affordable connections to employment, education, services, and other opportunities; creating career pathways into transportation jobs; and revitalizing neighborhoods and regions. Public Advocates suggested that MPOs should complete a comprehensive study of current conditions of disadvantaged communities as part of an equity analysis. They further stated that MPOs should routinely gather, analyze, and report relevant transit rider and demographic data and disaggregate by race and income. The Center for Social Inclusion stated that MPOs should conduct an equity analysis assessment of the TIP investments because they are short-term, in addition to an analysis of the MTP, which is longer term.

Response: The FHWA and FTA have been working actively with the States and MPOs to implement EJ principles into the statewide and metropolitan transportation planning and project development processes in accordance

with Executive Order 12898. The FHWA and FTA also require States and MPOs to comply with the requirements of Title VI and periodically review their compliance as part of TMA planning certification and through other Title VI reviews. The FHWA and FTA do not prescribe specifically how a State, MPO, or operator of public transportation conducts its analysis of EJ or Title VI. That is left to the specific agencies to decide based on their needs and situations. The FHWA and FTA provide examples of good practice and training that States, MPOs, and operators of public transportation can use to guide their practices.

Comment: The NRDC suggested that FHWA and FTA should establish a framework for MPOs to demonstrate to them and local communities how they are incorporating EO 12898 into their planning process.

Response: The FHWA and FTA typically discuss efforts at integrating EJ into the planning process and EO 12898 during certification reviews of TMAs.

Comment: The Nine to Five National Association of Working Women stated that developing State and metropolitan planning guidance that includes the voices of directly affected communities and prioritizes enhanced mobility and opportunity for the most vulnerable populations, transit investments can go a long way to supporting improved social and economic outcomes in these communities.

Response: The FHWA and FTA note that under section 450.210(a)(1)(vii), the final rule continues the long-standing requirement that States develop and use a documented public involvement process that provides opportunities for public review and comment at key decision points in the statewide and nonmetropolitan transportation planning process. The State's public involvement process is required to include seeking out and considering the needs of those traditionally underserved by existing transportation systems, such as low-income and minority households, who may face challenges accessing employment and other services (section 450.210(a)(1)(viii)).

The MPOs are required to develop a participation plan in consultation with all interested parties. Similar to the State's documented public involvement process, the MPO public participation plan is required to include a process for seeking out and considering the needs of those traditionally underserved by existing transportation systems, such as low-income and minority households, who may face challenges accessing employment and other services (section 450.316(a)(1)(vii)).

Both the States and the MPOs are also required to provide adequate notice of public participation activities and a reasonable opportunity to comment on the long-range transportation plan, STIP, and TIP. The final rule also continues the long-standing requirement that both States and MPOs must hold any public meetings at convenient times and accessible locations, provide the public timely notice and reasonable access to information about transportation issues and process, and demonstrate explicit consideration and response to public input received on the long-range plan, STIP, and TIP (sections 450.210 and 450.316).

Comment: Nearly all of the advocacy groups commented that FHWA and FTA should provide guidance on EJ based on EO 12898. Several commenters suggested that best practices from academic research should be used in equity analysis design and be recommended by FHWA and FTA.

Response: The FHWA and FTA have a longstanding practice of undertaking research studies and identifying best practices and case studies in EJ, including equity analysis. This information is available at: *http://www.fhwa.dot.gov/environment/environmental_justice/*. This site is updated frequently with new resource material. The FHWA and FTA also offer training on EJ and Title VI on request.

Comment: Several advocacy groups (Community Labor United, Front Range Economic Strategy Center, National Association of Social Workers, Partnership for Working Families, PolicyLink, Public Advocaes, The Leadership Conference on Civil and Human Rights, and United Spinal Association) commented that EO 12898 and Title VI of the Civil Rights Act of 1964, as amended, should be part of the State and the MPO self-certification and topics of review in FHWA and FTA TMA transportation planning certification. They suggested that in sections 450.220 and 450.336 States and MPOs should be required to self-certify compliance with EO 12898 and Title VI and that FHWA and FTA should review compliance as part of the TMA transportation planning certification review.

Response: States and MPOs are required by the final rule to certify compliance with Title VI. The FHWA and FTA do not require States and MPOs to self-certify compliance to the EO because it is only intended to improve the internal management of the Executive Branch and is directed to Federal agencies.

Also, as stated in section 6–609 of the EO, it does not create substantive rights. Consistent with this approach, all of the requirements identified in sections 450.220 and 450.336 are based on law, not EOs. However, FHWA and FTA encourage States, MPOs, and operators of public transportation to incorporate EJ principles into the planning processes and documents. The FHWA and FTA consider EJ when making future funding or other approval decisions on a project basis, as required by EO 12898.

The FHWA and FTA further respond that EJ is typically discussed as part of TMA planning certification reviews. The FHWA and FTA have a long-standing history of working with States and MPOs to implement EJ as part of the transportation planning and project development processes. States and MPOs are required by the final rule to certify compliance with Title VI (sections 450.220 and 450.336). The FHWA and FTA typically discuss compliance with Title VI as part of TMA planning certification reviews.

The FHWA and FTA note that Title VI of the Civil Rights Act of 1964 is a Federal law that protects persons from discrimination based on race, color, or national origin in programs and activities that receive Federal financial assistance. These regulations require States to certify that the transportation planning process is being carried out in accordance with all applicable requirements of Title VI (42 U.S.C. 2000d-1) and 49 CFR part 21 at the time that the STIP or STIP amendments are submitted to FHWA and FTA for joint approval (section 450.220(a)(2)). The MPOs must make similar certification concurrent with the submittal of the TIP to FHWA and FTA as part of the STIP approval (section 450.336(a)(3)). The FHWA and FTA typically review compliance with Title VI as part of the planning certification review of TMAs, and also review Title VI complaints as part of other reviews that are outside the scope of the final rule.

Comment: The National Association of Social Workers, NRDC, Policy Link, Sierra Club, and United Spinal Association commented that MPOs should establish governing bodies that are inclusive of the communities they serve, and that the decisionmaking bodies should reflect the diversity of interests based on age, race, ethnicity, disability, and income.

Response: The FHWA and FTA note that the policy board for MPOs that serve TMAs are to be established in accordance with the requirements in the final rule at section 450.310, which is reflective of the law at 23 U.S.C. 134(d) and 49 U.S.C. 5303(d). This section requires specific representation from

local elected officials, officials of public agencies that administer or operate major modes of transportation in the metropolitan area, representation by operators of public transportation, and appropriate State officials. The FHWA and FTA encourage MPOs to seek representation from minority communities as part of meeting the requirements of section 450.310. As discussed elsewhere in this summary, MPOs are required to self-certify compliance with Title VI and FHWA and FTA periodically review this self-certification.

Comment: The Center for Social Inclusion, Community Labor United, Front Range Economic Strategy Center, National Association of Social Workers, Policy Link, Public Advocates, and United Spinal Association commented that FHWA and FTA should collect and share data on travel behavior that is disaggregated by race and income. They also commented that FHWA and FTA should facilitate local and targeted hiring on transportation projects. One commenter suggested that FHWA and FTA should do a comprehensive study on the current condition of targeted communities.

Response: The FHWA and FTA response to these comments is that these requests are outside the scope of this rule.

Comment: Several commenters (United Spinal Association, Public Advocates, Policy Link, Community Labor United, Front Range Economic Strategy Center, National Association of Social Workers, Partnership for Working Families) encouraged FHWA and FTA to consider incentivizing implementation of equity-based performance measures in its Transportation Investment Generating Economic Recovery (TIGER) program. The Center for Social Inclusion suggested that a competitive grant program similar to TIGER should be established to incentivize States, MPOs, and operators of public transportation to coordinate and conduct project level equity analysis.

Response: The FHWA and FTA note that the TIGER grantees work with DOT modal administrations to choose between two and four project-level performance measures from a list of measures that directly relate to the five departmental strategic goals, which include the goal of fostering quality of life for all. This does not preclude any grantee from developing additional performance measures for internal analytic purposes, which could more directly reflect their community's strategic goals and priorities, such as equity-based performance measures. In response to other comments that suggested creating other grant programs similar to TIGER and include equity-based performance measures as part of those programs, FHWA and FTA note that the TIGER grant program is established under appropriations bills and that FHWA and FTA could not establish other grant programs similar to TIGER because it requires specific statutory authority to do so. The FHWA and FTA also note that the TIGER grant program and any other similar programs are outside the scope of the final rule.

Comment: The FHWA and FTA should prepare a quadrennial national report of non-discrimination that includes demographic data, inventory of complaints filed, compliance reviews conducted, an assessment of impediments to non-discrimination, and recommendations for compliance.

Some commenters (National Association of Social Workers, Policy Link, The Leadership Conference on Civil Rights, and United Spinal Association) suggested that FHWA and FTA prepare a quadrennial national report of non-discrimination that includes demographic data, an inventory of complaints filed, compliance reviews conducted, an assessment of impediments to non-discrimination, and recommendations for compliance. These same commenters argued that the information collected would aid FHWA and FTA in monitoring State and MPO progress in prioritizing investments that increase mobility and access to centers of employment.

Response: The FHWA and FTA respond that this comment is outside the scope of the final rule.

Comment: Several commenters suggested specific performance measures be incorporated into the planning process for the purposes of analyzing equity, EJ, and Title VI.

Community Labor United, the Front Range Economic Strategy Center, the National Association of Social Workers, NRDC, Partnership for Working Families, Policy Link, and United Spinal Association suggested that the DOT should incentivize States and MPOs to set performance measures and prioritize projects that expand economic opportunity for low-income and minority communities. Some suggested a number of specific performance measures be incorporated into the planning process such as housing and transportation costs, fatalities and injuries, security (distances police and fire professionals have to travel to the scene of accidents and crimes), system connectivity, energy conservation, system preservation, and person throughput. The Center for Social Inclusion stated that there should be a comprehensive equity performance measure.

Response: The FHWA and FTA note that the final rule does not establish specific performance measures and the discussion of specific performance measures is outside of its scope. There are other FHWA and FTA rulemakings in varying stages of development that will address performance measures. The FHWA notes that 23 U.S.C. 150 prescribes that FHWA and FHWA is expressly limited to establishing performance measures only for areas identified in that statute.

Comment: One commenter (NRDC) stated that FHWA and FTA should consider that the congestion reduction goal should be changed to congestion management to reflect the fact that congestion can sometimes be a symptom of a healthy economy.

Response: Congress specifically established Congestion Reduction as a national goal for the Federal-aid highway program as provided in 23 U.S.C. 150(b)(3). The FHWA and FTA note that these regulations do include a congestion management process requirement for TMAs in section 450.322 as required under 23 U.S.C. 134(k)(3). Based on these comments, FHWA and FTA are not making any changes to the regulations. The FHWA and FTA will continue to make resources, best practices, workshops, peer exchanges, and guidance available to the States, MPOs, and operators of public transportation on these topics (equity, EJ, Title VI, and scenario planning) and work to assist them with implementing these practices into their planning processes.

Comment: At least one commenter (9 to 5, National Association of Working Women), suggested that FHWA and FTA should consider collecting and disseminating best practices and should consider providing technical assistance and funding support for State and MPO public engagement efforts.

Response: The FHWA and FTA collect and disseminate best practices and provide technical support for State and MPO public engagement efforts. Under the Public Transportation Participation Pilot Program, created as part of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA–LU), FTA sponsored applied research to develop innovative approaches to improving public participation in the planning of public transportation. The research focused on improving data collection analysis and transportation access for all users of the public transportation

systems; supporting public participation through the project development phases; using innovative techniques to improve the coordination of transportation alternatives; enhancing the coordination of public transportation benefits and services; contracting with stakeholders to focus on the delivery of transportation plans and programs; and measuring and reporting on the annual performance of the transportation systems. The results of the research can be found at *http://www.fta.dot.gov/12347_5925.html*. Similarly, FHWA has developed material and resources on best practices for public participation that are available at: *http://www.fhwa.dot.gov/planning/public_involvement/*.

The FHWA and FTA note that section 450.308(a) describes funds that are available to MPOs to accomplish the activities described in 23 U.S.C. 134, metropolitan transportation planning, including public participation. Section 450.206(e) describes funds that are available to the States to accomplish the requirements of 23 U.S.C. 135, statewide and nonmetropolitan transportation planning, including public involvement.

The FHWA and FTA appreciate that many commenters shared many examples of best practices which are highlighted below:

- Massachusetts: Community Labor United's Public Transit-Public Good Coalition advocated for the inclusion of comprehensive service assessments in the State transportation funding bill (H3535).
- Washington: King County Metro Transit's Strategic Plan for Public Transportation provides annual goals and assessment of 46 indicators that prioritize social equity.
- California: California's Transportation Alternatives Program includes performance measures that prioritize mobility and safety for bicyclists and pedestrians, especially in disadvantaged communities.
- Georgia: The Atlanta Regional Commission developed Equitable Target Areas for greater outreach and planning attention. That process can be found here *http://www.atlantaregional.com/transportation/community-engagement/social-equity*).
- U.S. Government: HUD's Sustainable Communities Initiative to glean effective strategies for advancing inclusive governance and community engagement.
- Colorado: The Denver Regional Equity Atlas was developed by DRCOG and Mile High Connects. The atlas explores population and demographic characteristics across the region, including jobs, economic development opportunities, transportation mobility, and affordable and quality housing options.
- California: The San Francisco Bay Area undertook a scenario planning and vision process that would produce an integrated long-range transportation and land-use/housing plan for the San Francisco Bay Area. This process resulted in development of the Equity, Environment, and Jobs scenario.
- Louisiana: A survey of low-income riders conducted by the Regional Transit Authority (RTA) in New Orleans revealed that transit-dependent workers with early-morning or late-night shifts were unable to access public transportation to get between work and home.

• Asset Management and the Transportation Planning Process

In section 450.208(e) (coordination of planning process activities), AASHTO, CO DOT, ID DOT, MT DOT, ND DOT, OR DOT, SD DOT, TX DOT, and WY DOT expressed concerns with section 450.208(e) of the NPRM, which stated that, in carrying out the statewide transportation planning process, States shall apply asset management principles and techniques, consistent with the State NHS Asset Management Plan, the Transit Asset Management Plan, and the Public Transportation Safety Plan. The commenters stated that the statewide planning process is much broader than an asset management plan, and that as a requirement, it may have unintended consequences. The commenters suggested that it be deleted or modified. The WI DOT commented that it wants clarification on what section 450.208(e) means.

In response to these comments, FHWA and FTA retained this provision. However, ''shall'' is changed to ''should'' in the final rule. The FHWA and FTA believe that asset management principles and techniques, consistent with the State NHS Asset Management Plan and the Transit Asset Management Plan, and the Public Transportation Safety Plan, should contribute to defining STIP priorities and assessing transportation investment decisions. It is changed from shall to should in the final rule because, as noted in the comments received on the NPRM, it is not a statutory requirement. The FHWA and FTA feel that the use of the word ''shall'' might be implied to mean that strategies, projects, and financial plans resulting from the asset management plans would be required to be included directly in the STIP. The FHWA and FTA feel that by changing ''shall'' to ''should,'' it conveys the message that States should review the asset management plans when developing the STIP, but are not required to incorporate them into the STIP.

The FHWA and FTA retained the provision in section 450.208(f) that for non-NHS highways, States may apply principles and techniques consistent with other asset management plans to the transportation planning and programming process, as appropriate. No comments were received on this provision.

Sections 450.218 and 450.326 describe the development of the STIP and TIP. At sections 450.218(o) and 450.326(m) in the NPRM, FHWA and FTA included the requirement that the STIP and the TIPs should be informed by the financial plan and the investment strategies from the asset management plan for the NHS, and the investment priorities of the public transit asset management plans.

Similarly, in the NPRM at sections 450.216(n) and 450.324(f)(7), FHWA and FTA included the statement that the long-range statewide transportation plan and the MTPs should be informed by the financial plan and the investment strategies from the asset management plan for the NHS and the investment priorities of the public transit asset management plans. These provisions were proposed in the NPRM by FHWA and FTA to better link the State and MPO long-range plans and programs to the federally required State NHS asset management plan and the transit asset management plans.

Numerous comments (DVRPC, AASHTO, ASHTD, ID DOT, MI DOT, MT DOT, ND DOT, SD DOT, SEMCOG, and WY DOT) stated that this requirement was confusing; that it was unclear what FHWA and FTA's expectations were; that it was not based on statute; and that it should be deleted from the final rule. The States further commented that it infringes on their flexibility to determine the content of their long-range transportation plan, including whether to create a policy-or project-based plan. Most commenters stated that it could be interpreted and applied inconsistently.

After reviewing the comments, FHWA and FTA agree that this language is ambiguous regarding what the States and MPOs would be expected to do, and that it would be difficult to implement consistently across all the States and MPOs. The FHWA and FTA also note that, adding to the inconsistency, the financial plans for the MPO MTP, the TIP and the STIP are required to be fiscally constrained, while the financial plans for the asset management plans are not. States may, but are not required to develop a list of projects as part of the

State asset management plan for the NHS. Based on these comments and inconsistencies, FHWA and FTA removed this requirement from the final rule.

However, the final rule retains the language at sections 450.206(c)(4) and 450.306(d)(4) of the NPRM that requires the integration of elements of other State and transit performance-based plans and processes into the Statewide and metropolitan transportation planning processes. These other plans include the federally required State asset management plan for the NHS and the transit asset management plan. Integration of elements of other performance-based plans and processes means that elements of these other plans and processes should be considered by the State and MPOs as they develop the long-range statewide transportation plan, MTP, STIP, and TIP. The FHWA and FTA feel that this provision is sufficient to link the asset management plans into the statewide and metropolitan transportation planning processes, and is consistent with the statutory requirements at 23 U.S.C. 134(h)(2)(D) and 135(d)(2)(C), and 49 U.S.C. 5303(h)(2)(D) and 5304(d)(2)(C).

• Common Effective Date for Performance Related Rules and Phase-In of New Requirements

Common Effective Date

At least 26 commenters (AASHTO, AK DOT, Albany MPO, AMPO, ASHTD, CO DOT, CT DOT, FMATS, GA DOT, H–GAC, IA DOT, MD DOT, MI DOT, MN DOT, MO DOT, NARC, NC DOT, NJ DOT, North Florida TPO, NYS DOT, PSRC, RI DOT, San Luis Obispo COG, SEMCOG, TX DOT, and WA State DOT) commented that all of the new performance management requirements in the final rule should have a single effective date and that the planning requirements should be coordinated with the implementation of the other performance management requirements. They commented that this would ensure that States and MPOs are not establishing different targets for different time periods for different measures and incorporating targets for some measures into their planning processes, but not others.

The TX DOT further commented that having one effective date for all of the performance management rules would enable the States and MPOs to work together and ensure the necessary data and analysis techniques are available. The IA DOT commented that it is concerned that the comment period for the planning NPRM closed before all the other FHWA and FTA performance-related rules were published. The DRCOG and RTD expressed concern that because the other performance rules have not been published, it is not clear on how coordination of all the rules will work out, particularly the relationship of the measures and targets and the requirements of any plans that implement them. The RMAP is concerned with overlapping effective dates for the various performance related rules.

The FHWA and FTA response to this comment is that FHWA proposed in the prior performance management NPRMs to establish one common effective date for its three performance measure final rules. However, due to the length of the rulemaking process, FHWA is now proposing that each of three performance measures rules have individual effective dates. This would allow FHWA and the States to begin implementing some of the performance requirements much sooner than waiting for the rulemaking process to be complete for all the rules.

The first performance measures rule related to the HSIP has been finalized and could be implemented in its entirety before the other two rules. Earlier implementation of this rule is consistent with a DOT priority of improving the safety mission across the DOT.

The FHWA also believes that individual implementation dates will help States transition to performance-based planning. Based on the timing of each individual rulemaking, FHWA would provide additional guidance to stakeholders on how to best integrate the new requirements into their existing processes. Under this approach, FHWA expects that even though the implementation for each rule would occur as that rule was finalized, implementation for the second and the third performance measure final rules would ultimately be aligned through a common performance period. In the second performance management measure NPRM, FHWA proposed that the first 4-year performance period would start on January 1, 2016.

However, FHWA proposes in the third performance management NPRM that the first performance period would begin on January 1, 2018. This would align the performance periods and reporting requirements for the proposed measures in the second and third performance management measure NPRMs. The FHWA intends to place a timeline that illustrates how this transition could be implemented on the docket for the third performance management rule.

Phase-In of New Requirements

Concerning section 450.226 (phase-in of new requirements), IA DOT asked whether the 2-year compliance date also applies to amendments to long-range statewide transportation plans. The FHWA and FTA response to this comment is that it applies to both amendments and to updates to STIPs and to long-range statewide transportation plans. This is described in the regulatory text at 450.226 and is based on 23 U.S.C. 135(l).

For section 450.226, one commenter (DC DOT) suggested that FHWA and FTA consider changing the language in the final rule such that only STIP (and TIP) updates would be required to comply with the performance management requirements after the 2-year transition period instead of requiring compliance with STIP (and TIP) amendments and updates. The commenter stated that this would provide an additional 2 years of transition time during which amendments could be made to the STIPs and TIPs because they only have to be updated at least once every 4 years and that allowing amendments for an additional 2 years would reduce the possibility of delays in project implementation. The FHWA and FTA do not agree with this comment and believe that the 2-year transition provided for by MAP–21 and final rule is adequate.

The FHWA and FTA believe that 23 U.S.C. 135(l) provides for a 2-year transition after the publication of the final planning rule. Title 23 U.S.C. 135(l) provides that States shall reflect changes made to the long-range statewide transportation plan or STIP updates not later than 2 years after the date of issuance of guidance by the Secretary. The FHWA and FTA believe that the issuance of guidance as described in 23 U.S.C. 135(l) means issuance of the final rule by FHWA and FTA. The FHWA and FTA have interpreted this to mean that STIP updates and amendments would have to comply with the MAP–21 requirements, including the performance-based planning requirements of this rule, after the transition period.

The FHWA and FTA note that although States and MPOs have a 2-year transition period for reflecting the performance-based planning requirements in the underlying planning documents, they must set targets on the schedules discussed in sections 450.206(c)(2) and 450.306(d)(3) and below. Also, when setting targets, States and MPOs are required to coordinate as described in the final rule

in sections 450.206(c)(2) and 450.306(d)(3). No changes are made to the final rule based on these comments. The final rule includes similar transition requirements for the MPO MTP and TIP in section 430.340. See the NPRM section by section analysis for section 450.340 for more discussion on why the rule also applies the transition period to MPOs. No changes are made to the final rule based on these comments.

For sections 450.226 and 450.340, one commenter (DRCOG) stated that the phase-in schedule is unclear. The NPRM stated that States have 1 year to establish performance targets, and MPOs have 180-days to set targets after the States set targets (1.5 years total), but the NPRM also referenced a 2 year phase-in period to develop and coordinate targets.

In response to this comment, FHWA and FTA note that it is correct that States must establish targets within 1 year of the effective dates of the performance management rules and MPOs must establish targets within 180-days of when their respective States set targets. While these targets have to be set by the States and the MPOs on this timeframe, these targets and the other performance-based planning requirements of the final rule do not have to be reflected in the long-range statewide transportation plan, MTP, STIP, and TIP until 2 years after the effective dates of this final rule and the performance management rules establishing performance measures under 23 U.S.C. 150(c), 49 U.S.C. 5326, or 49 U.S.C. 5329.

Also concerning section 450.340, two commenters (IA DOT, WFRC) commented that it is unclear if the 2-year compliance date also applies to amending long-range statewide transportation plans and MTPs, or if it applies only to updated plans. The FHWA and FTA response to this comment is that the 2-year compliance date applies to both amended and updated long-range statewide transportation plans and MTPs.

The New York State Association of MPOs and NYMTC commented that FHWA and FTA should not require MPOs to incorporate performance-based planning provisions into their MTPs or TIPs until 2 years after the last final rule related to performance-based planning is published in the **Federal Register**.

The FHWA and FTA response to this comment is that, as described in sections 450.226 and 450.340, the phase-in of the performance-based planning requirements are triggered by the effective date of this final rule and the effective dates for the individual final rules for the other performance management rules. The FHWA and FTA believe that this will not be too burdensome given that this regulation provides a 2-year transition period rule after the effective dates of this rule and the performance management rules for the planning process and the planning documents to reflect the performance-based requirements in this rule. Updates or amendments to the long-range statewide transportation plan and the MTP(s) and the STIP and TIPs that occur on or after the date that is 2 years after the effective date of the performance management rule(s) must be developed according to the performance-based provisions and requirements of this regulation and in such rule(s).

The WA State DOT commented that FHWA and FTA should consider delaying the implementation of the performance management requirements of the final rule from 2 years after the publication date to 2 years after the publication date of the final rule and the issuance of guidance. In response to this comment, FHWA and FTA believe that the final rule and the other performance management final rules are the guidance referred in 23 U.S.C. 135(l). No changes are being made to the final rule as a result of this comment.

The NJ DOT and NARC stated that FHWA and FTA should consider additional flexibility for States, MPOs, and operators of public transportation in complying with the 2-year phase–in requirements for developing and updating their planning documents to the new planning regulations. The commenter is concerned with having as many as five different compliance dates which the commenter felt could cause confusion and make it difficult to coordinate. In response, see the FHWA and FTA responses to comments on one common effective date elsewhere in this section.

The DRCOG and RTD want FHWA and FTA to recognize and reconcile the timing and durations of the long-range statewide transportation plan, the MPO MTP, and the other performance-based plans and processes, such as the federally required transit asset management plans and the State asset management plan for the NHS.

In response to this comment, FHWA and FTA note that Congress established that FHWA and FTA shall not require States to deviate from their established planning update cycle to implement the changes in the final rule (23 U.S.C. 135(l)). The FHWA and FTA extended this same flexibility to the MPOs. The FHWA and FTA reflected this requirement in the phase-in of new requirements under sections 450.226 and 450.340. The FHWA and FTA hope that, after the phase in of these requirements, the States, MPOs, and operators of public transportation within each State will work together to align their processes and procedures, to the extent they deem practicable, for purposes of coordinating performance-based planning and programming and the associated documents such as the various performance related plans, programs, and processes.

Returning to section 450.226, DRCOG and RTD commented that the phase-in schedule is unclear and that it would like for MPOs to have 2 years to set targets after States. The FHWA and FTA believe that Congress established in 23 U.S.C. 134(h)(2)(C) to provide up to 180 days for MPOs to set performance targets after their respective State sets targets. Section 450.306(d)(3) in the final rule reflects that intent.

The IA DOT requested clarification on sections 450.226 and 450.340 as to which final effective date (this rule or the performance measures rules) is being required when discussing the 2-year compliance date for the phase-in period of performance-based planning requirements in the final rule. In response to this comment, FHWA and FTA note that under sections 450.226 and 450.340, States and MPOs have 2 years from the effective date of each performance measures rule, and 2 years from the effective date of this final rule, whichever is later, to meet the performance-based planning and programming requirements.

The MN DOT commented that the effective date should be far enough in the future to provide time for the long-range statewide transportation plan and STIP development to go through appropriate public review. In response to this comment, FHWA and FTA believe that the 2-year phase-in period provided in section 450.226 after the effective date of the final rule is sufficient time for States to undertake appropriate public review as part of updating the long-range statewide transportation plan and STIP.

- Other Changes Proposed by Commenters

Performance Measures

Concerning section 450.206 (scope of the statewide and nonmetropolitan transportation planning process), SFRTA suggested that the final rule should emphasize the development of standardized environmental performance measures into the statewide, metropolitan, and nonmetropolitan transportation

planning processes. The FHWA and FTA response to this comment is that environmental performance measures are not included in the list of performance measures that MAP–21 requires FHWA and FTA to establish. Title 23 U.S.C. 150(c)(2)(C) precludes FHWA from establishing any national performance measures outside those areas identified in 23 U.S.C. 150. The FHWA and FTA also note that the establishment of specific performance measures is outside the scope of the final rule.

The ARTBA provided comments on specific examples of suggested performance measures for consideration by FHWA and FTA, such as freight, safety, and the economic costs of congestion. The FMATS, NRDC, Partnership for Active Transportation, and SFRTA commented on specific performance measures that they felt should be considered by FHWA and FTA in the new performance-based planning and target setting requirements described in subsection 450.306(d).

Concerning sections 450.324 and 450.326 (development and content of the MTP and TIP), the National Housing Conference and the Center for Social Inclusion commented that spending decisions should be linked to performance measures and ensure that those measures promote sustainable development and a more holistic view of how transportation investments can serve the broader community. They also commented that an equity analysis, which includes performance measures specific to equity, should be done on the MTP and the TIP. The FHWA and FTA response to these comments is that recommendations for specific performance measures are outside the scope of the final rule. The federally required performance measures are being established through other FHWA and FTA rulemakings.

Returning to section 450.206, APTA commented that FHWA and FTA should not impose project-by-project performance measures or require project-by-project reporting on performance. On section 450.218(r) of the NPRM (development and content of the STIP), AASHTO, CT DOT, FL DOT, GA DOT, ID DOT, MT DOT, NC DOT, ND DOT, NYS DOT, SD DOT, TriMet, WI DOT, and WY DOT commented that States should not be required to include information on individual projects and should not be required to link individual projects with specific performance measures as part of the discussion on the anticipated effect of the STIP toward achieving the performance targets in the long-range statewide transportation plan (note section 450.218(r) in the NPRM is section 450.218(q) in the final rule).

On section 450.324(f)(4) (development and content of the MTP), several commenters (ARC, DVRPC, NYMTA, NYMTC, and PA DOT) commented that the required system performance report in the MTP should only consider conditions and trends at the system level, and should not be required to conduct a project specific analysis.

On section 450.326(d) (development and content of the TIP), AASHTO, Albany MPO, DVRPC, Florida MPO Advisory Council, H–GAC, IA DOT, MAG, MARC, NARC, North Florida TPO, NYMTA, Orange County Transportation Authority, PA DOT, San Luis Obispo COG, Santa Cruz County RTC, and TriMet commented that the required discussion on the anticipated effect of the TIP toward achieving the performance targets should not be on a project basis. They suggested that it should instead be on the basis of the entire program in the TIP. Transportation for America commented that it wanted a clear statement in the final rule requiring States and MPOs to evaluate projects according to the federally required performance measures.

The FHWA and FTA response to these comments is that that the final rule does not require project-by-project performance measures or reporting of performance at the individual project level. Reporting in the TIP will be on the performance of the program in the TIP. The FHWA and FTA believe that this is clear and that no changes to the final rule are necessary. With regards to any specific requirements for target setting or reporting in other rules or guidance, that is outside the scope of the final rule. The specific performance measures will be established under other FHWA and FTA performance rules or guidance. Based on these comments, no changes have been made to the final rule.

The ARC, MARC, DRCOG, and RTD requested flexibility in reporting and documenting targets for performance measures and progress reporting on meeting targets as required under sections 450.306, 450.324, and 450.326 as part of the MTP and the TIP. The DRCOG and RTD also expressed concern about setting transit targets and want flexibility in how they do it. The NYMTA commented on section 450.306 that there should be flexibility in setting targets. The NYMTA commented that they should be able to set their own targets, and the targets should not be required to be realistic or ''hard.'' The MARC also asked for clarification as to whether the documentation for the system performance plan required in section 450.324(f)(4) for the MTP could be in a separate document and referenced in the plan. The ARC asked if the description of how the TIP helps achieve the performance measures in the MTP (section 450.326(d)) could be documented through a separate document and not directly in the TIP. The GA DOT commented that reporting should be done in a nonburdensome manner. The WI DOT commented on section 450.206(c) that States should have flexibility in setting targets.

The FHWA and FTA response to these comments is that under the final rule, MPOs and operators of public transportation are required to coordinate to the maximum extent practicable when setting transit performance targets. The MPOs must include transit targets as part of the MTP and describe progress toward achieving those targets with each update of the plan. In the TIP and STIP, States and MPOs must describe how those plans make progress toward achievement of targets. The requirements for setting specific, federally required targets for MPOs and operators of public transportation are outside the scope of the final rule.

The FHWA and FTA note that there other rules specific to transit and highway performance targets. The FHWA and FTA plan to issue guidance on the performance-based planning reporting requirements for updates to the STIPs, TIPs, and the long-range statewide transportation plan, and the metropolitan transportation plan after the issuance of the final rule. With regards to the comment requesting clarification as to whether the documentation for the system performance plan required in section 450.324(f)(4) for the MTP could be in a separate document and referenced in the plan, FHWA and FTA respond that it should be included as part of the MTP. Similarly, the documentation for the requirements of section 450.326(d) on the anticipated effect of the TIP toward achieving the performance targets in the MTP should be included directly in the TIP.

The FMATS commented that it wants FHWA and FTA to be flexible in evaluating MPO system performance reports because, for NHS projects, there may be different priorities at the MPO level than at the State level for the NHS. In response, FHWA and FTA note that the final rule requires States and MPOs to coordinate when setting performance targets for the metropolitan area, including those targets that may be associated with the NHS. When reviewing the metropolitan transportation planning process, FHWA

and FTA will be reviewing the State and MPO coordination on target setting in addition to the reporting requirements for the MTP and TIP. The FHWA and FTA reiterate that the final rule requires that the State and MPO performance targets for the metropolitan area should be coordinated and consistent to the maximum extent practicable (sections 450.206 and 450.306).

The ARC commented that it is unlikely that the 4-year TIP will result in meeting targets. In response, FHWA and FTA note that, as described in section 450.326(c), the TIP shall be designed by the MPO such that once implemented, it makes progress toward achieving the performance targets in the MTP. The FHWA and FTA further note that as an MPO sets targets under section 450.306(d)(2), it should select targets that are realistic given available funding.

The MN DOT commented that the rules should explicitly identify who has ultimate authority for establishing the targets in case of conflict. The MT DOT commented that States must retain authority in target setting. In response to these comments, FHWA and FTA note that States are responsible and have authority for establishing State targets as described in section 450.206. The MPOs are responsible for setting MPO targets in metropolitan areas as described in section 450.306. Operators of public transportation are responsible for setting transit targets in metropolitan areas as described in section 450.306. The FHWA and FTA reiterate that, as described in sections 450.206 and 450.306, States and MPOs are required to coordinate when establishing targets to ensure consistency of their targets to the maximum extent practicable. The MPOs and operators of public transportation are to coordinate to the maximum extent practicable when setting targets for a metropolitan area. No one agency has ultimate authority for establishing targets. No changes are made to the final rule as a result of this comment.

The SCVTA commented that both the final rule and the preamble should be clear that operators of public transportation should cooperate with States and MPOs to assist them in their target setting, but States and MPOs have no required role in target setting being done by operators of public transportation. The commenter further noted that proposed sections 450.206 and 450.306 of the NPRM appear to reflect this concept. However, the preamble to the NPRM could cause some to interpret these sections differently.

In response to these comments, FHWA and FTA reiterate that the NPRM and the final rule require States and MPOs to coordinate to ensure consistency to the maximum extent practicable when setting targets for the performance areas described in 23 U.S.C. 150(c) and the measures established under 23 CFR part 490 (sections 450.206(c)(2) and 450.306(d)(2)(ii)). The final rule requires MPOs to coordinate to the maximum extent practicable with operators of public transportation when selecting performance targets that address performance measures described in 49 U.S.C. 5326(c) and 49 U.S.C. 5329(d) (section 450.306(d)(2)(iii)). The final rule also requires that States coordinate to the maximum extent practicable with operators of public transportation in areas not represented by an MPO, when selecting targets for public transportation performance measures, to ensure consistency with the performance targets that operators of public transportation establish under 49 U.S.C. 5326(c) and 49 U.S.C. 5329(d) (section 450.206(c)(3)).

The FL DOT commented that performance measures should not be used for apportioning funds among States. Similarly, the NYMTA commented that there should not be a link between targets and funding. The FHWA and FTA respond that this comment is outside the scope of the final rule. There are other FHWA and FTA rules on the specific performance measures, target setting for those measures, and any consequences for not achieving targets. The FL DOT commented that the requirement for performance reporting of the federally required performance measures as part of the long-range statewide transportation plan and STIP does not extend to other locally determined performance measures outside of the federally required measures. The FHWA and FTA agree with this comment. No changes are made to the final rule as a result of these comments.

The DRCOG and RTD commented that the final rule does not identify the consequences for not making significant progress on meeting performance targets. The FHWA and FTA response to this comment is that it is outside the scope of this final rule. However, FHWA and FTA note that such consequences would be identified in the corresponding MAP–21 rulemakings related to performance management, which will include opportunities for comment.

The ARC commented that they do not want the imposition of overly rigid targets. The FHWA and FTA response to this comment is that under section 450.306(d)(2) of the final rule, each MPO sets its own targets in coordination with the State and operators of public transportation. Other FHWA and FTA performance rules may have more criteria for setting performance targets. However, that is outside the scope of the final rule.

The MARC commented that FHWA and FTA should support target setting through technical assistance. In response to this comment, FHWA and FTA note that this is outside the scope of the final rule and is more appropriate for the other FHWA and FTA performance measures rules that establish the specific performance measures.

The FMATS expressed concern about the timing for target setting, particularly a 1-year target period, and would like targets set based on the MTP schedule and the long-range statewide plan schedule. In response to this comment, FHWA and FTA note that the target update process is in the other performance measures rules and is outside the scope of the final rule. The final rule requires States to initially set targets for the measures identified in 23 U.S.C. 150(c) within 1 year of the effective date for the other DOT final rules on performance measures (section 450.206(c)(2)) (23 U.S.C. 135(d)(2)(B)) in accordance with the appropriate target setting framework established at 23 CFR part 490. The final rule requires MPOs to set targets that address performance measures described in 23 U.S.C. 150(c) and 49 U.S.C. 5326(c)–(d) within 180 days after the completion of same by the State or operator of public transportation (section 450.306(d)(3) (23 U.S.C. 134(h)(2)(C)). The FHWA and FTA believe such a deadline reflects congressional intent in the MAP–21.

The ARTBA commented that it wanted to be clear that the focus of NHPP funds is highway and bridge projects. The ARTBA also commented that, in light of section 1503(c) of the MAP–21 (project approval and oversight), the more information the public has, the more transparent and accountable the process will be. Section 1503(c) of the MAP–21 requires that DOT annually compile and submit a report containing a summary of annual expenditure data for funds made available under title 23 U.S.C. and chapter 53 of title 49 U.S.C. to Congress, and make the report publicly available on the DOT's public Web site. The FHWA and FTA response to these comments is that they are outside the scope of the final rule.

Integration of Other State Performance-Based Plans and Programs Into the Planning Process

Section 450.208 describes coordination of planning process activities. Section 450.206 describes the scope of the statewide and nonmetropolitan transportation planning process. In the NPRM at section 450.208(g), FHWA and FTA included language on the integration of elements of other State performance-based plans and processes into the statewide transportation planning process and listed examples of these other plans and processes.

Concerning section 450.208(g), AASHTO, CT DOT, NJ DOT, and NC DOT requested that FHWA and FTA eliminate redundant references to the integration of goals and objectives into the statewide planning process, as proposed in the NPRM. The commenters stated that this provision in section 450.208(g) is unnecessary because it is duplicative of the requirement in section 450.206(c)(4).

After reviewing the comments, FHWA and FTA agree that section 450.208(g) has the same meaning, essentially repeats section 450.206(c)(4), and is therefore unnecessary. The FHWA and FTA have removed section 450.208(g) from the final rule while retaining section 450.206(c)(4).

The ID DOT, MT DOT, ND DOT, SD DOT, and WY DOT also commented on section 450.308(g). They suggested that FHWA and FTA should remove the list of examples of State performance-based plans and processes listed in this section because it should be left up to the State to decide which plans and processes to integrate into the planning process. The IA DOT expressed concern with section 450.208(g) integrating a large number of plans into its planning process.

In response to these comments, as noted above, FHWA and FTA have eliminated section 450.208(g) because it repeats the requirements of section 450.206(c)(4). Section 450.206(c)(4) retains the requirement to integrate elements from other federally required performance-based plans and processes into the statewide transportation planning process. Section 450.306(d)(4) maintains similar requirements for metropolitan areas. The FHWA and FTA believe that in 23 U.S.C. 134(h)(2)(D) and 135(d)(2)(C), Congress intended for elements of other performance-based plans and processes to be integrated into the statewide and metropolitan transportation planning processes. The FHWA and FTA believe that such intent is reflected in the final rule (sections 450.206(c)(4) and 450.306(d)(4)). The FHWA and FTA also provided specific examples of federally required performance-based plans and processes to provide more clarity in these sections of the rule and reflect Congress's intent. Therefore, no changes are made to the final rule as a result of this comment.

Differences Between State and MPO Requirements in the Final Rule

Concerning section 450.216 (development and content of the long-range statewide transportation plan), FMATS, NARC, NRDC, San Luis Obispo COG, and Transportation for America commented that differences between the State and metropolitan planning sections of the final rule should be reconsidered. Namely that for the regulations governing the long-range statewide transportation plan, the word ''should'' is sometimes used, whereas for the MTP in section 450.324, the word ''shall'' is sometimes used (*e.g.,* with fiscal constraint and the accompanying financial plan). The commenters made a similar comment regarding the inclusion of performance targets in the long-range statewide transportation plans, that States are held to a lower standard (''should'') in the long-range statewide transportation plan, than the MPOs (''shall'') in the MTPs.

On section 450.218 (development and content of the STIP), the NRDC commented that they disapprove of the differences between the sections of the final rule covering STIPs and the sections covering TIPs, particularly the use of the words ''may'' and ''shall,'' and that the provisions in the regulations for the State STIP should mirror those for the MPO TIP. For example, in paragraph (l), the STIP may include a financial plan, whereas in section 450.324(f)(11), the TIP shall include a financial plan. The FHWA and FTA acknowledge that the statewide long-range transportation plan and MTP provisions and the STIP and TIP provisions do not mirror each other with regard to the use of the words ''may,'' ''should,'' and ''shall.''

The FHWA and FTA disagree that the differences between the statewide and metropolitan sections should be reconciled in regards to the usage of those words. The FHWA and FTA note that Congress specifically draws this distinction between the statewide and the MTPs in the statute and the final rule reflects that requirement. The final rule is also historically consistent with how the statute has distinguished between States and MPOs. The FHWA and FTA note that the use of the words ''should'' and ''shall'' in the final rule is consistent with statutory language. The FHWA and FTA note that, in one instance, the FAST Act amended 23 U.S.C. 135(f)(7) and changed the State requirement from ''should'' to ''shall,'' specifically, when requiring a State to include a description of the performance measures and targets and a systems performance report in the long-range statewide transportation plan. This change is made in the final rule in sections 450.216(f)(1) and (2). No other changes are made to the final rule based on these comments.

Integration of Health Into the Transportation Planning Process

The Partnership for Active Transportation and the Sierra Club commented on sections 450.206 and 450.306. They commented that health should be integrated into the planning process and that FHWA and FTA also include performance measures relating to how transportation infrastructure promotes healthy living. The commenters further stated that the final rule does not address safety issues of active transportation users. However, they appreciate that the final rule does contain explicit language on non-motorized transportation facilities, including pedestrian walkways and bicycle facilities. The Sierra Club further commented that the performance metrics that identify the impacts of investments on individual and community health should be more reliably identified on a disaggregated basis in travel modeling.

The FHWA and FTA response to these comments is that FHWA and FTA are actively working with transportation planning stakeholders and undertaking research to identify ways that health can be integrated into the transportation planning process. This research is focused on better consideration of health outcomes in transportation by promoting safety; improving air quality; protecting the natural environment; improving social equity by improving access to jobs, healthcare, and community services; and on opportunities for the positive effects of walking, biking, public transportation, and ride sharing. The results of this research are available online at: *http://www.fhwa.dot.gov/planning/health_in_transportation/*. The FHWA and FTA continue to update this Web site with new material.

The FHWA and FTA do not feel that it is appropriate at this time to include public health within the scope of the final rule, and that it is left up to the States and MPOs to decide whether or not they want to include health considerations in their transportation

planning processes. The FHWA and FTA provide research and examples of best practices to the States and MPOs on this topic area, which can be used in their planning processes and integrated to the degree they feel is appropriate. The discussion of specific performance measures, including measures for health considerations in transportation, is outside the scope of the final rule because this rule does not establish specific performance measures. Based on this comment, the FHWA and FTA made no changes to the final rule.

Integration of Climate Change Into the Transportation Planning Process and Reducing Carbon Dioxide Emissions

The VT DOT recommended incorporating climate resilience as one of the components of the statewide transportation planning process. The FHWA and FTA believe that including climate resilience as a component of the statewide and the metropolitan transportation planning process is a good practice, and have developed resource materials in the form of peer exchanges, workshops, guidebooks, and other references for States, MPOs, and operators of public transportation on this topic that are available on FHWA's climate change Web site at: *http://www.fhwa.dot.gov/environment/climate_change/*. The FHWA and FTA will continue to update this Web site with new material.

It is clear that reducing CO_2 emissions is critical and timely. On-road sources account for over 80 percent of U.S. transportation sector greenhouse gasses (GHG). In an historic accord in Paris, the U.S. and over 190 other countries agreed to reduce GHG emissions, with the goal of limiting global temperature rise to less than 2° C above pre-industrial levels by 2050.

According to the Intergovernmental Panel on Climate Change (IPCC), human activity is changing the earth's climate by causing the buildup of heat-trapping GHG emissions through the burning of fossil fuels and other human processes.[14] Transportation sources globally have been a rapidly increasing source of GHGs. Since 1970, GHGs produced by the transportation sector have more than doubled, increasing at a faster rate than any other end-use sector. The GHGs from total global on-road sources have more than tripled, accounting for more than 80 percent of the increase in total global transportation GHG emissions.[15] In the U.S., GHG emissions from on-road sources represent approximately 23 percent of economy-wide GHGs, but have accounted for more than two-thirds of the net increase in total U.S. GHGs since 1990,[16] during which time vehicle miles traveled (VMT) also increased by more than 30 percent.[17]

A well-established scientific record has linked increasing GHG concentrations with a range of climatic effects, including increased global temperatures that have the potential to result in dangerous and potentially irreversible changes in climate and weather. In December 2015, the Conference of Parties nations recognized the need for deep reductions in global emissions to hold the increase in global average temperature to well below 2 °C above pre-industrial levels, and are pursuing efforts to limit temperature increases to 1.5 °C. To that end, the accord calls on developed countries to take a leadership role in identifying economy-wide absolute emissions reduction targets and implementing mitigation programs. Also, as part of a 2014 bilateral agreement with China, the U.S. pledged to reduce GHG emissions to 26–28 percent below 2005 levels by 2025, with this emissions reduction pathway intended to support economy-wide reductions of 80 percent or more by 2050.

The FHWA recognizes that achieving U.S. climate goals will likely require significant GHG reductions from on-road transportation sources. To support the consideration of GHG emissions in transportation planning and decisionmaking, FHWA has developed a variety of resources to quantify on-road GHG emissions, evaluate GHG reduction strategies, and integrate climate analysis into the transportation planning process. The FHWA already encourages transportation agencies to consider GHG emissions as part of their performance-based decisionmaking, and has developed a handbook to assist State DOTs and MPOs interested in addressing GHG emissions through performance-based planning and programming.[18] The FHWA has developed tools to help State and local transportation agencies address GHG emissions associated with their systems. These include the Energy and Emissions Reduction Policy Analysis Tool (EERPAT),[19] a model that evaluates the impacts of CO_2 reduction policies for surface transportation, and the Infrastructure Carbon Estimator (ICE),[20] a tool that specifically evaluates CO_2 associated with the construction and maintenance of transportation infrastructure. The FHWA is also currently conducting a number of pilots to analyze the potential GHG emission reductions associated with various transportation-related mitigation strategies.[21] Even with these efforts, FHWA recognizes that more will be needed to meet the U.S. climate goals.

The FHWA is considering how GHG emissions could be estimated and used to inform planning and programming decisions to reduce long term emissions. As part of the rulemaking process for the National Performance Measures for Assessing System Performance, CMAQ Congestion, CMAQ On-Road Mobile Source Emissions, and Freight Movement, FHWA is seeking comment on the potential establishment and effectiveness of a measure as a planning, programming, and reporting tool.

The FHWA and FTA note that, in response to amendments to 23 U.S.C. 134 and 135 resulting from the FAST Act, this final rule includes a new planning factor that States and MPOs should consider and implement on improving resiliency and reliability of the transportation system and reduce or mitigate stormwater impacts of surface transportation as part of the statewide and metropolitan planning process (sections 450.206(a)(9) and (10) and sections 450.306(b)(9) and (10)). This final rule in section 450.316(b) adds a new requirement for MPOs to coordinate with officials responsible for natural disaster risk reduction when developing a MTP and TIP. In sections 450.200 and 450.300(a), States and

MPOs are required to take into consideration resiliency needs as part of the metropolitan transportation planning process. Section 450.324(f)(7) adds a requirement to reduce the vulnerability of the existing transportation infrastructure to natural disasters to the assessment of capital investment and other strategies to preserve the existing and projected future metropolitan transportation infrastructure in the metropolitan transportation plan.

The FHWA and FTA will continue to develop and share best practices, research, workshops, and peer exchanges on this topic for use by States and MPOs to aid with the implementation of their planning processes.

Other Topics

The North Central Pennsylvania Regional Planning and Development Commission (RPDC) requested that there be a review of NHS and principle arterials and functional classification systems. The FHWA and FTA response to this comment is that it is outside the scope of the final rule. The North Central Pennsylvania RPDC commented that regional Unified Planning Work Programs (UPWP) are an eligible means to structure planning activities.

The FHWA and FTA response to this comment is that section 450.308 describes the requirements for an MPO UPWP. The UPWP documents metropolitan transportation planning activities performed with funds provided under 23 U.S.C. and 49 U.S.C. chapter 53, in accordance with this section and 23 CFR part 420, and contains a discussion of the planning priorities for the MPA.

The DRCOG and RTD commented that they wanted the final rule to be clearer on how funding will be made available and how funding will be distributed among entities. The FHWA and FTA respond that this comment is outside the scope of the final rule.

The Partnership for Active Transportation stated that planners should be required to collect and aggregate data relating to active transportation infrastructure and its use. The FHWA and FTA response to this comment is that section 450.216(a) requires the State to develop a long-range statewide transportation plan that provides for the development and implementation of a multimodal transportation system for the State, including non-motorized modes. In meeting this requirement, the long-range statewide transportation plan may be a policy plan, so it is up to the individual States to determine the degree to which they collect and aggregate data relating to active transportation infrastructure and use.

In section 450.324(b), MPOs are required to include strategies and actions in their MTPs that provide for the development of an integrated multimodal transportation system, including accessible pedestrian walkways and bicycle transportation facilities. Section 450.324(f)(2) requires that MPOs include existing and planned facilities in the MTP, including nonmotorized transportation facilities. Section 450.324(f)(1) requires that the MTP include the current and projected demand of persons and goods in the MPA over the period of the MTP.

With regards to collecting data on the usage of active transportation, it is up to the individual MPOs to decide what and how much data they need to collect on active transportation usage to meet the MTP requirements in sections 450.324(b), (f)(1), and (f)(2).

The County of Maui, HI commented that it is concerned about a one-size-fits-all final rule, particularly in relation to the smaller MPOs, and that it wants significant reductions to the final rule for small communities that have recently emerged from a rural status. In response to this comment, FHWA and FTA note that section 450.308(d) of the rule provides that an MPO in an urbanized area not designated as a TMA may prepare a simplified statement of work, in cooperation with the State and the operators of public transportation, in lieu of a UPWP.

The FHWA and FTA also note that under section 450.306(i), an MPO in an urbanized area not designated as a TMA but in an air quality attainment area may, taking into account the complexity of the transportation problems in the area, propose and submit for approval to FHWA and FTA a procedure for developing an abbreviated MTP and TIP. The MPO shall develop the simplified procedures in cooperation with the State and the operators of public transportation. The FHWA and FTA believe these provisions provide significant flexibility for MPOs serving non-TMA urbanized areas that are in air quality attainment areas. No changes are made to the final rule based on this comment.

V. Section-by-Section Discussion

The section-by-section discussion of statewide and nonmetropolitan planning and metropolitan planning summarizes the public comments received and the FHWA and FTA responses. It also serves as a summary of any changes to the regulatory text in the NPRMs that are made in the final rule as a result of the comments. For topics on which there are recurring comments in multiple sections, FHWA and FTA have consolidated the comments and responses in section IV(B), leaving references to the comment in this section so the reader can return to review them.

The FHWA and FTA have changed the term ''decisionmaking'' to read ''decision-making'' in the final rule.

In response to a comment from the WI DOT, FHWA and FTA also changed the final rule to refer to the ''long-range statewide transportation plan'' consistently throughout.

The Memphis Urban Area MPO submitted several comments on the NEPA process. The FHWA and FTA note that the NEPA process is outside the scope of the final rule.

The MD DOT made a general comment that FHWA and FTA should limit the rulemaking to what is required by statute. The FHWA and FTA response to this comment is that, when drafting the final rule, FHWA and FTA had an overarching goal of staying as close to the statutory requirements as possible.

The AASHTO commented that it wanted consistent usage, or definitional distinctions, of similar terms such as ''transit operator'' and ''transit provider'' in the final rule. The FHWA and FTA response to this comment is that those terms are meant to mean the same thing. In order to be consistent, FHWA and FTA used the term ''operator of public transportation'' throughout the document.

The AASHTO and the WA State DOT commented that they wanted consistent use of terms for the asset management plan for the NHS. The FHWA and FTA response to this comment is that FHWA and FTA have tried to use the term State asset management plan for the NHS consistently throughout this document.

Subpart A—Transportation Planning and Programming Definitions

Section 450.100 Purpose

No comments were received on this section. The FHWA and FTA did not make any changes in the final rule to the language proposed in the NPRM for this section.

Section 450.102 Applicability

No comments were received on this section. The FHWA and FTA did not make any changes in the final rule to the language proposed in the NPRM for this section.

Section 450.104 Definitions

The FHWA and FTA received 33 comments on proposed changes to terms

and definitions in section 450.104. Commenters included Albany MPO, AASHTO, AMPO, Capital Area MPO, CT DOT, ID DOT, MT DOT, ND DOT, SD DOT, WY DOT, Florida MPO Advisory Council, Houston MPO, IA DOT, ME DOT, MN DOT, MT DOT, NARC, the National Housing Conference, the National Trust for Historic Preservation, NCTCOG/RTC, ND DOT, NRDC, NJ DOT, NYMTA, OK DOT, Portland Metro (a transit operator), Richmond MPO, SCCRTC, TN DOT, TX DOT, WFRC, WA State DOT, Westchester County Department of Public Works and Transportation, and WY DOT. Fifteen of the comments were from States, eight were from MPOs, five were from associations representing public transportation agencies, three were from advocacy groups, one was from a regional planning agency, and one was from a local government. The OK DOT requested that FHWA and FTA ensure that the proposed definitions retain the verbiage in 23 U.S.C. 134 and 23 U.S.C. 135 and that they are clear and serve the intent of the law. The FHWA and FTA concur with this comment and strive to ensure that all definitions proposed are clear and consistent with 23 U.S.C.134 and 135 and 49 U.S.C. 5303 and 5304.

Amendment—Five comments (NARC, NYMTA, SCCRTC, TN DOT, and WFRC) sought clarity with respect to the proposed changes to the definition of the term ''amendment.'' In the NPRM, FHWA and FTA proposed to change the definition of amendment to clarify that a conformity determination is not a criterion for determining the need for an amendment in nonattainment and maintenance areas, and also proposed to add a transit example of a change in design concept or scope to the definition of amendment. The TN DOT stated that the proposed revision to more accurately reflect the relationship of the Clean Air Act's transportation conformity requirements to the planning process was confusing, noting that TIP amendments usually trigger a conformity determination not vice versa.

The FHWA and FTA response to this comment is that, as described in the NPRM's section-by-section analysis, the proposed definition clarifies that a conformity determination is not a criterion for determining the need for an amendment in nonattainment and maintenance areas.

Three commenters (NARC, SCCRTC, and WFRC) requested that FHWA and FTA not include the proposed phrase ''changing the number of stations in the case of fixed guideway transit projects'' to the list of examples of major changes in design concept or design scope as they feel requiring amendments for every time the number of stations changes is too burdensome.

In response to this comment, FHWA and FTA included the phrase ''changing the number of stations in the case of fixed guideway transit projects'' in the final rule, as proposed in the NPRM in order to add a transit example of a change in design concept or design scope to the definition.

The NYMTA commented that the definition of amendment should be revised to note that an amendment to a TIP does not trigger a reassessment of the TIP's impact on achieving performance targets. The FHWA and FTA respond that the commenter is correct, amendments to a TIP do not trigger the requirement in section 450.326(d) to include a description of the anticipated effect of the TIP toward achieving the performance targets. Only an update to the TIP triggers the requirements in section 450.326(d). The FHWA and FTA do not believe it is necessary or desirable to include this as part of the definition of amendment in section 450.104 as it would make the definition lengthy and overly complicated. In response to these comments, FHWA and FTA did not change the definition of amendment in the final rule.

Asset Management—The TX DOT requested that the new definition of the term ''asset management'' references the NHS since 23 U.S.C. 119(e) specifies a risk-based asset management plan for the NHS only. The FHWA and FTA retained the definition as proposed because it is identical to the definition in section 1103 of the MAP–21 (23 U.S.C. 101(a)(2)) and refers to the asset management plan requirements for both the NHS and public transportation agencies. The FHWA and FTA also note that the asset management plan for the NHS may also include non-NHS assets. The IA DOT noted that the lack of definitions for performance measures, performances targets, transit asset management plan, and transit asset management system makes it difficult to interpret the regulations related to these items. In response, FHWA and FTA note that the definitions for performance measures, performance targets, transit asset management plan, and transit asset management system will be provided in the rulemakings on those topics.

Attainment Area—The FHWA and FTA did not propose changing the definition of attainment area in the NPRM or in the final rule. However, FHWA and FTA clarify that a maintenance area that has satisfied the maintenance planning period requirements as stated in section 175A of the Clean Air Act is considered an attainment area for transportation planning purposes. In general, the maintenance planning period extends 20 years from the effective date of the Environmental Protection Agency's (EPA) approval of the 10-year maintenance plan and redesignation of the area to attainment for the NAAQS. For example, a carbon monoxide (CO) area was redesignated as an attainment area and the EPA approved its first 10-year maintenance plan for CO effective April 30, 1993; and the area has a second maintenance plan, effective April 30, 2003. In this example, the CO area would be considered an attainment area for transportation planning purposes after April 30, 2013, if the area is attainment for all other transportation related pollutants.

Conformity—The AASHTO requested that FHWA and FTA edit the proposed definition of conformity by replacing the phrase ''in any area'' with ''in a nonattainment or maintenance area,'' as SIPs also apply to attainment areas, whereas conformity does not. The AMPO commented that it wanted to change ''in any area'' to ''in an adequate or approved SIP in a nonattainment or maintenance area.''

In response to these comments, the definition has been changed to replace ''in any area'' with ''in a nonattainment or maintenance area,'' as suggested by AASHTO and AMPO. The FHWA and FTA do not believe that the additional text suggested by AMPO ''in an adequate or approved SIP'' provides additional clarity. The FHWA and FTA made no changes based on this additional comment. In the final rule, the term conformity means a Clean Air Act (42 U.S.C. 7506(c)) requirement that ensures that Federal funding and approval are given to transportation plans, programs, and projects that are consistent with the air quality goals established by a SSIP. Conformity, to the purpose of the SIP, means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the NAAQS, any required interim emission reductions, or other milestones in a non-attainment or maintenance area. The transportation conformity regulations (40 CFR part 93, subpart A) sets forth policy, criteria, and procedures for demonstrating and assuring conformity of transportation activities.

Consideration—The AASHTO, six States (ID DOT, MT DOT, ND DOT, SD DOT, TX DOT, and WY DOT) and one MPO (H–GAC) requested that FHWA and FTA not include the word

''consequences'' in the proposed definition of ''consideration'' as an item to take into account in the consideration process. They expressed concern that including consequences would complicate the planning process, especially given the considerable workload needed to be done by States and MPOs as they move toward a performance-based planning and programming process. They note that the current definition has been in place for an extended period and that it is fair to believe that the Congress did not contemplate that DOT would be revisiting it at the same time that it works to implement the new provisions in the MAP–21.

The FHWA and FTA agree that to take into account the consequences of a course of action is a vague expectation that could be difficult to define. Consequently, the final rule does not include the term ''consequences'' in the definition of ''consideration.'' In the final rule, consideration means that one or more parties take into account the opinions, action, and relevant information from other parties in making a decision or determining a course of action.

Local Official—Three commenters (Florida MPO Advisory Council, RTC/NCTCOG, and NYMTA) sought additional clarity with respect to the proposed definition of ''local official.'' The FHWA and FTA proposed to add a definition because of the new emphasis under the MAP–21 on nonmetropolitan transportation planning. The FHWA and FTA proposed that ''local official'' would be defined as an elected or appointed official of general purpose local government with responsibility for transportation. In general, the commenters sought clarity on how the definition of local official related to the term ''local elected official'' used in section 450.310(d)(i) as one of the categories of individuals who may serve on an MPO in a designated TMA. As the rule already includes a definition of ''nonmetropolitan local official,'' FHWA and FTA deleted the definition of ''local official.''

Long-range statewide transportation plan—The AASHTO and NJ DOT requested that FHWA and FTA use the term ''long-range statewide transportation plan'' consistently throughout the rule to ensure consistency and clarity. They noted that there are many references in subpart B (450.206(c)(5) and 450.216(f)) that refer to the ''statewide transportation plan'' where those references are intended to refer to the ''long-range statewide transportation plan.'' The FHWA and FTA concur with these comments and will ensure that the term long-range statewide transportation plan is used consistently throughout the final rule.

Major Mode of Transportation—The Albany MPO, AMPO, and NARC requested that FHWA and FTA delete the definition of major modes of transportation because, as proposed, the definition is overly broad and could be interpreted to include all forms of transportation, including non-major modes. They note that MPOs are in the best position to define what constitutes a major mode of transportation in their respective MPAs. The FHWA and FTA agree that the major modes could vary among MPOs and that they are in the best position to decide which are the major modes of transportation that operate in their metropolitan area. The FHWA and FTA deleted the definition in the final rule. The FHWA and FTA will continue to work with each MPO to determine what major modes exist in their region.

Metropolitan Planning Agreement—The MN DOT noted that FHWA and FTA should not use the acronym ''MPA'' when referencing the metropolitan planning agreement as it could also stand for ''metropolitan planning area.'' As these are distinctly different, FHWA and FTA will apply the acronym ''MPA'' to only reference ''metropolitan planning area'' throughout this rule to avoid confusion. Two advocacy organizations (National Trust for Historic Preservation and NRDC) expressed support for the definition since it explicitly requires more structured coordination between public transportation agencies and MPOs.

Scenario planning—Three States (CT DOT, ME DOT, and WA State DOT) and one MPO (Capital Area MPO) submitted comments on the definition of ''scenario planning.'' While two States (ME DOT and WA State DOT) endorsed the definition, another (CT DOT) expressed concern that the proposed definition is not sufficiently descriptive and would be subject to a variety of interpretations. The CT DOT noted that, as written, the definition provides little guidance for making the final decision between the analyzed scenarios, and recommended a more complete definition by including language about choosing the most practical or likely scenario.

In response to this comment, FHWA and FTA note that the definition is intended to be broad and that a more fulsome discussion of ''scenario planning'' is included in section 450.324(i) (Development and content of the metropolitan transportation plan). In addition, the Capital Area MPO requested that the scenario planning definition be revised to mean: ''A planning process that evaluates the effects of alternative policies, plans, and/or programs on the future of a community or region. This activity can provide additional information to decisionmakers as they develop the transportation plan and other programs and policies.'' The FHWA and FTA believe the broad definition of scenario planning, as proposed in the NPRM, reflects the intent of Congress in 23 U.S.C. 134(i)(4)(A) and will retain the definition in the final rule.

Visualization Techniques—The National Trust for Historic Preservation and NJ DOT noted that the proposed definition of visualization techniques is too narrow and requested that the definition include that visualization techniques be searchable and interactive. The FHWA and FTA appreciate that the technology of visualization is rapidly progressing but are sensitive to the fact that not all MPOs have the technical capacity or resources to support higher levels of sophistication. The FHWA and FTA retained the definition of visualization techniques as proposed in the NPRM and will work to increase the technical capacity of MPOs to develop searchable and interactive inventories of transportation facilities and resources.

In addition to comments on the definitions proposed in section 450.104, a number of commenters requested additional definitions. The AASHTO requested that FHWA and FTA provide a discussion on the difference between the definitions of terms such as ''shall'' and ''should.'' In response, FHWA and FTA have stated that ''shall'' denotes a requirement whereas ''should'' is optional.

Subpart B—Statewide and Nonmetropolitan Transportation Planning and Programming

The NPRM proposed a change to the title of subpart B from ''Statewide Transportation Planning and Programming'' to ''Statewide and Nonmetropolitan Transportation Planning'' to reflect statutory changes. The addition of ''Nonmetropolitan'' to the title epitomized the MAP–21's new emphasis on the importance of nonmetropolitan transportation planning. No comments were submitted to the docket on this proposed change. The final rule retains those changes.

Section 450.200 Purpose

Section 450.200 describes the purpose of subpart B (statewide and nonmetropolitan transportation planning and programming). No comments were received on this section.

The FHWA and FTA made no changes to this section based on comments received on the NPRM.

Sections 1202 and 1201 of the FAST Act, codified at 23 U.S.C. 135(a)(2) and 23 U.S.C. 134(a)(1) respectively, added intermodal facilities that support intercity transportation, including intercity bus facilities and commuter van pool providers to the purpose of the statewide and metropolitan multimodal transportation planning processes. The final rule at sections 450.200 and 450.300 is amended to reflect this change.

Section 1201 and 1202 of the FAST Act amends 23 U.S.C. 134(a)(1) and adds ''takes into consideration resiliency needs'' to the purpose of the of the metropolitan transportation planning process and the statewide and nonmetropolitan transportation planning process (23 U.S.C. 135(a)(2)). The final rule at sections 450.300(a) and 450.200 are amended to add this change.

Section 450.202 Applicability

Section 450.202 describes the applicability (to States, MPOs, RTPOs, and operators of public transportation) of subpart B on statewide and nonmetropolitan transportation planning and programming. No comments were received on this section. The FHWA and FTA made no changes to the final rule.

Section 450.204 Definitions

No comments were received on this section. The FHWA and FTA made no changes to the final rule.

Section 450.206 Scope of the Statewide Transportation and Nonmetropolitan Planning Process

Section 450.206 describes the scope of the statewide transportation and nonmetropolitan planning process. Fifty-three commenters (AASHTO, AK DOT, APTA, ARC, ARTBA, California Association for Coordinated Transportation, CALTRANS, CO DOT, Community Labor United, CT DOT, Danville MPO, DC DOT, Enterprise Community Partners, FL DOT, FMATS, Front Range Economic Strategy Center, MARC, MD DOT, ME DOT, MI DOT, Miami-Dade MPO, MN DOT, MO DOT, MTC, NARC, National Association of Social Workers, National Housing Conference, National Trust for Historic Preservation, NC DOT, ND DOT, NJ DOT, North Central Pennsylvania RPDC, NRDC, NYMTC, NYS DOT, OK DOT, Orange County Transportation Authority, PA DOT, Partnership for Active Transportation, Partnership for Working Families, Policy Link, Public Advocates, SACOG, San Luis Obispo MPO, SANDAG,, Santa Cruz MPO, SCAG, SCVTA, SEMCOG, SFRTA, SJCOG, Southeast Alabama RPO, TX DOT, United Spinal Association, VA DOT, VT DOT, WA State DOT, West Piedmont Planning District, WI DO, and WY DOT) submitted comments to the docket on this section. Twenty-four comments were received from State, 12 from advocacy organizations, 10 from MPOs, 5 from operators of public transportation, and 2 from regional planning organizations.

The NYS DOT stated that it is generally supportive of the performance-based approach to the transportation planning process. They further stated that they also agree and support the requirement in the final rule that each State, and the MPOs within the State, must establish performance targets in coordination with each other to ensure consistency to the maximum extent practicable.

The San Luis Obispo COG expressed its concern that the NPRM imposes different requirements on States and MPOs. Namely, that MPOs are required to include performance targets and a system performance report in their MTP. While States may, but are not required to, include these same elements in the long-range statewide transportation plan. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The SFRTA suggested that the final rule should emphasize the development of standardized environmental performance measures into the statewide, metropolitan and nonmetropolitan transportation planning processes. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The APTA commented that FHWA and FTA should not impose project-by-project performance measures or require project-by-project reporting on performance. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The NRDC commented on specific performance measures that FHWA and FTA should consider. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.206(a)

Several advocacy groups (Front Range Economic Strategy Center, Partnership for Working Families, PolicyLink, Public Advocates, and United Spinal Association) commented that the planning process, the use of performance measures, and prioritization of projects by States and MPOs should encourage the States and MPOs to consider expansion of economic opportunity for low-income communities and minority communities through improved transportation. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Sections 1202 and 1201 of the FAST Act amended 23 U.S.C. 134(h)(1) and 23 U.S.C. 135(d)(1) respectively to add two new planning factors to the scope of the statewide and nonmetropolitan and the metropolitan transportation planning processes: improve resiliency and reliability of the transportation system and reduce or mitigate stormwater impacts of surface transportation; and enhance travel and tourism. The final rule at sections 450.206(a)(9) and (10) and 450.306(b)(9) and (10) are amended to reflect these new planning factors.

Section 450.206(b)

The National Trust for Historic Preservation commented that section 450.206(b) should also make reference to historic resources as part of the planning factors to show that historic preservation may be related to the transportation planning process. The FHWA and FTA received a similar comment from the National Trust for Historic Preservation during the development of the NPRM and added language under paragraph (b) in this section that includes section 4(f) properties as defined in 23 CFR 774.17 as one of several examples to consider for establishing the degree of consideration and implementation of the planning factors. This proposed change has been retained in the final rule. Section 450.306(c) retains similar language. Based on this comment, FHWA and FTA made no changes to the final rule.

Section 450.206(c)(2)

The AASHTO, ID DOT, MT DOT, ND DOT, SD DOT, TX DOT, VT DOT, and WY DOT commented that section 450.206(c)(2) should not reference the performance measures and performance target setting framework that will be established for the performance measures identified in 23 U.S.C. 150(c) at 23 CFR part 490 because it is confusing. The FHWA and FTA do not agree with this comment. The FHWA regulations at 23 CFR part 490 establish the performance measures and the performance target setting framework that the States will need to address when setting performance targets for specific performance measures. These

are the same performance targets required of the States under the planning regulations. The targets will address the specific measures established under 23 CFR part 490.

The NJ DOT commented on section 450.206(c)(2) that States should set performance measures, not FHWA and FTA. The FHWA and FTA response to this comment is that under 23 U.S.C. 150, FHWA is required to set the national performance measures described in 23 U.S.C. 150(c). The FHWA and FTA further note that under 23 U.S.C. 135(d)(2)(B)(i)(I), States are required to set performance targets for those national performance measures. States may set additional performance measures outside of those required under 23 U.S.C. 150(c).

The AASHTO, AR DOT, CO DOT, ID DOT, MN DOT, MT DOT, ND DOT, NYS DOT, SD DOT, TX DOT, and WY DOT commented that there is no specific requirement in the MAP–21 for States to coordinate with Federal land management agencies when setting performance targets and that this provision in section 450.206(c)(2) should be removed from the final rule. The FHWA and FTA agree with this comment and removed the provision.

In the final rule, section 450.208(a)(3) requires that, in carrying out the statewide transportation planning process, each State shall consider the concerns of Federal land management agencies that have jurisdiction over land within the boundaries of the State. The FHWA and FTA believe that, given the requirements of section 450.208(a)(3), States should consider the needs of Federal land management agencies that have jurisdiction over land within the boundaries of the State when setting performance targets. The FHWA and FTA note that there was an error in the section-by-section discussion on this topic in the preamble to the NPRM, as opposed to the proposed regulatory text of section 450.206(c)(2) in the NPRM. The NPRM regulatory text stated that each State should select and establish performance targets in coordination with affected Federal land management agencies as appropriate. The section-by-section discussion in the preamble said States would coordinate the establishment of performance targets with affected Federal land management agencies.

In summary, FHWA and FTA removed the requirement in section 450.206(c)(2) that States should select and establish targets in coordination with Federal land management agencies. However, FHWA and FTA note that under section 450.206(c), target setting is part of the statewide transportation planning process, and that under section 450.208(a)(3), States shall consider the concerns of Federal land management agencies when carrying out the statewide transportation planning process (including target setting).

The AASHTO and VT DOT stated that the final rule should avoid changes to the NPRM that would weaken the States authority to set performance targets. The FL DOT and ASHTD stated the final rule should confirm State discretion in target setting and reporting. The FHWA and FTA respond that the final rule does not weaken the authority of States (or MPOs or public operators of public transportation) to set performance targets. The FHWA and FTA intend to issue guidance on sections 450.216(f)(2) and 450.324(f)(4) after this final rule on State and MPO progress reporting as part of the long-range statewide transportation plan and the MTP.

The NC DOT stated that the final rule should make it clear that the States have the flexibility to set their own performance targets and performance measures. The FHWA and FTA agree that States have the flexibility to set their own performance targets. In setting those targets, they will be required to use the performance measures set by FHWA and FTA in the other related performance management rules or guidance. No changes were made to this section based on these comments.

Section 450.206(c)(3)

Section 450.206(c)(3) provides that in areas not represented by MPOs, States would be required to coordinate, to the maximum extent practicable, the selection of the public transportation performance targets with operators of public transportation to ensure consistency. The AASHTO, CO DOT, ID DOT, MT DOT, ND DOT, SD DOT, and WY DOT commented that in section 450.206(c)(3) the word ''areas'' should be replaced with ''urbanized areas.'' The NPRM preamble discussion in the section-by-section analysis for sections 450.206(c)(3) provides an explanation for FHWA and FTA use of the word ''areas'' instead of ''urbanized areas'' in this section.

In the NPRM, FHWA and FTA noted that 23 U.S.C. 135(d)(2)(B)(ii) and 49 U.S.C. 5304(d)(2)(B)(ii), which refer to ''providers of public transportation'' in ''urbanized areas . . . not represented by a metropolitan planning organization,'' would not be carried forward because by statute, all ''urbanized areas'' continue to be represented by an MPO (23 U.S.C. 134(d)(1) and 49 U.S.C. 5303(d)(1)). Because of this discrepancy, FHWA and FTA used the term ''areas not represented by a metropolitan planning organization'' instead of ''urbanized areas'' because States would need to coordinate with operators of public transportation in these areas not represented by a MPO to select performance targets with respect to 49 U.S.C. 5326(c) and 49 U.S.C. 5329(d). Based on this comment, FHWA and FTA made no changes to the final rule.

The CO DOT commented that, although it feels the general principles in section 450.206(c)(3) are sound, the asset management and safety plans for transit agencies need fine-tuning; that one size does not fit all; and that CO DOT is submitting separate comments on the parallel FTA transit performance rulemakings. The FHWA and FTA response to this comment is that it is outside the scope of the final rule. No changes were made to the final rule based on this comment.

Section 450.206(c)(4)

Section 450.206(c)(4) describes the integration of elements of other State performance-based plans into the statewide planning process. The AASHTO, CT DOT, NJ DOT, and NC DOT commented that FHWA and FTA should eliminate redundant references to integration of goals and objectives from other performance-based plans into the statewide planning process, as proposed in the NPRM in sections 450.206(c)(4) and 450.208(g), because both of those sections present similar information.

The ID DOT, MT DOT, ND DOT, SD DOT, and WY DOT further commented that the specific list of examples of plans and process to be integrated should be eliminated and that it should be up to the State to decide which plans and processes should be integrated into the statewide transportation planning process.

In response, FHWA and FTA note that section 450.206(c)(4) is retained. However, FHWA and FTA eliminated section 450.208(g) in the final rule because it repeats the provisions of section 450.206(c)(4). See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The above States further commented that the terms ''long-range statewide transportation plan'' and ''the transportation planning process'' have different meanings and should not be used interchangeably. In response to this comment, FHWA and FTA do not believe that the terms have been used interchangeably in the final rule.

The NRDC noted that it was in favor of the integration of other plans into the

transportation planning process as described in this sections 450.206(c)(4) and 450.306(d)(4). The commenter further stated that it would like to include other plans as well, such as the Federal Emergency Management Agency (FEMA) Hazard Management Plans and existing regional plans. In response to this comment, FHWA and FTA note that as part of the statewide and nonmetropolitan planning and metropolitan planning processes, States and MPOs are required to coordinate their transportation planning activities or consider other related planning activities, as described in sections 450.308 and 450.316.

The CO DOT commented that it is unclear why section 450.206(c)(4) uses the word ''integrate'' while 450.206(c)(5) uses the word ''consider.'' In response to this comment, FHWA and FTA note that these sections serve different purposes. Section 450.206(c)(4) requires that the State integrate into the planning process elements of other performance-based plans and processes, while section 450.206(c)(5) requires the State to consider the performance measures and targets when developing specific planning products (the long-range statewide transportation plan and the STIP).

Section 450.206(c)(5)

Section 450.206(c)(5) provides that a State shall consider the required performance measures and targets under this paragraph when developing policies, programs, and investment priorities reflected in the long-range statewide transportation plan and the STIP. Several commenters (AASHTO, ID DOT, MT DOT, ND DOT, SD DOT, WY DOT, and TX DOT) stated that they would like the phrase ''targets established under this paragraph'' to be replaced with the phrase ''the State's targets.'' In response to this comment, the FHWA and FTA note that ''targets established under this paragraph'' is intended to refer specifically to the targets required under section 450.206(c)(2). The FHWA and FTA do not believe the phrase ''the State's targets'' would retain the same meaning. No changes are made to the final rule based on this comment. If a State chooses to include more targets than required under section 450.206(c)(2), they may do so. However, the final rule does not require it.

Section 450.206(e) describes the funds available to a State to accomplish the activities described in this subpart. The FMATS commented that it is concerned that a State may take metropolitan planning funds and use them for planning activities outside of MPAs. The FMATS further commented that this section should be revised to make it clear that if the States use funds in this manner, they need to first consult with MPOs. In response to this comment, FHWA and FTA note that 23 U.S.C. 104(d) describes conditions under which a State may transfer metropolitan planning funds for use outside of a MPA. The FHWA and FTA believe that these comments are outside the scope of the final rule as it does not address the administration of planning funds. No changes were made to the final rule as a result of this comment.

Other Comments on Section 450.206

The Partnership for Active Transportation commented on this section that health should also be integrated into the planning process. See section IV(B) (recurring comment themes and other changes proposed by commenters) for more discussion on this issue and FHWA and FTA responses.

The North Central Pennsylvania RPDC commented that States should also coordinate targets with RTPOs (similar to MPOs) when setting targets. The FHWA and FTA agree that this would be a good practice and section 450.210(d) provides that a Governor may establish and designate RTPOs to enhance the planning, coordination, and implementation of the long-range statewide transportation plan and STIP. Sections 450.216(h) and 450.218(c) require that States develop the long-range statewide transportation plan and the STIP in cooperation with affected nonmetropolitan local officials or, if applicable, through RTPOs. The FHWA and FTA believe that, as a best practice, this cooperation should include discussion on performance targets. The FHWA and FTA note that unlike with MPOs, the statute does not require RTPOs to establish targets for the performance measures. Consequently, FHWA and FTA have not made this a requirement in the final rule.

The National Housing Conference requested that housing and community development representatives be included throughout the planning process and that the final rule should require it. The FHWA and FTA note that sections 450.210(a)(1) and 450.316(a) require that the State and MPO must establish early and continuous public involvement opportunities that provide timely information about transportation issues and decisionmaking processes to affected public agencies. Further, sections 450.216(l)(2) and 450.314(j) require States and MPOs to give affected public agencies a reasonable opportunity to comment on the proposed long-range statewide transportation plan and MTP. The FHWA and FTA believe that the final rule provides for the inclusion of public agencies, such as housing and community development representatives, throughout the planning process and have not made any changes based on this comment.

Section 450.208 Coordination of Planning Process Activities

Section 450.208 describes the coordination of planning process activities. Forty-two commenters (AASHTO, Addison County Regional Planning Commission (RPC), AMPO, ARC, Boone Count Resource Management, Braxo Valley COG, Buckeye Hills-Hocking Valley Regional Development District (RDD), Capital Area MPO, CO DOT, CT DOT, East Texas Officials RPO, Enterprise Community Partners, FMATS, IA DOT, ID DOT, Meramec RPC, MI DOT, Mid-Region TPO and New Mexico RTPOs, MT DOT, NADO, National Housing Conference, NC Association of RPOs, NC DOT, ND DOT, NJ DOT, North Central Pennsylvania RPDC, Northern Maine Development Commission, Northern Shenandoah Valley Regional Commission, NYS DOT, OR DOT, Pioneer Trails RPC, Region Five Development Commission, Region Nine Development Commission, SEMCOG, SD DOT, South Plains Association of Governments (AOG), Southern Windsor County RPC, Two Rivers-Ottauquechee Regional Commission, TX DOT, Upper Minnesota Valley Regional Development Commission (RDC), WA State DOT, West Central Arkansas Planning and Development District, WI DOT, and WY DOT) submitted comments on this section. Eighteen of the comment letters were received from regional planning organizations, 13 were from States, 4 were from MPOs, 4 were from associations, 2 were from advocacy groups, and 1 was from a local government.

The SEMCOG commented that section 450.208 should be flexible to allow each State and its MPOs to develop procedures that are best for the local situation with regards to the use and implementation of the terms ''cooperation'' and ''coordination'' of planning activities. In response to this comment, FHWA and FTA believe that there is considerable flexibility for the States and MPOs to mutually determine their cooperative relationships and coordination of planning activities. The FHWA and FTA reiterate that the mutually developed and documented metropolitan planning agreement (section 450.314) is an appropriate place

for the States, MPOs, and operators of public transportation to cooperatively determine and document their mutual roles and responsibilities carry out the metropolitan transportation planning process. Section 450.314 identifies the minimum requirements for what is required to be included in the metropolitan planning agreements.

Section 450.208(a)

Addison County RPC, Boone County Resource Management, Brazo Valley COG, Buckeye Hills–Hocking Valley RDD, East Texas Chief Elected Officials RPO, Meramec RPC, Mid-Regional TPO and New Mexico RTPOs, NADO, NARC, North Carolina Association of RPOs, North Central Pennsylvania RPDC, Northern Shenandoah Valley Regional Commission, Pioneer Trails RPC, Region Five Development Commission, Region Nine Development Commission, South Plains AOG, Southern Windsor County RPC, Two Rivers-Ottauquechee Regional Commission, Upper Minnesota Valley RDC, and West Central Indiana Economic Development District (EDD) expressed support that the final rule elevates State involvement with nonmetropolitan local officials from ''consultation'' to ''cooperation'' in the long-range statewide planning process and establishes the option that allows States to recognize RTPOs and a formal framework for a nonmetropolitan transportation planning process.

Section 450.208(a)(4) states that, in carrying out the statewide transportation planning process, each State shall cooperate with affected local and appointed officials with responsibilities for transportation or, if applicable, through RTPOs. The IA DOT commented that in section 450.208(a)(4), FHWA and FTA should clarify whether the shift from consultation to cooperation for nonmetropolitan transportation planning has implications at the NEPA or project development level. The FHWA and FTA response to this comment is that the final rule applies specifically to the transportation planning process and not to the NEPA or project development level. In cases where a State conducts PEL as part of its planning process, a State may want to coordinate PEL with nonmetropolitan local officials.

The CO DOT commented that it is unclear what the change from ''consider'' to ''cooperate'' will mean and that it may be difficult to mandate cooperation. The FHWA and FTA respond that the definitions of the terms ''consider'' and ''cooperate'' are in section 450.104. Those definitions are used when transitioning from ''consider'' to ''cooperate'' with nonmetropolitan affected local elected and appointed officials with responsibility for transportation or, if applicable, through RTPOs. The FHWA and FTA further note that under section 450.210(b), States must have documented processes for cooperating with nonmetropolitan local officials and/or local officials with responsibility for transportation, and that they should be following those processes.

Enterprise Community Partners commented that the transportation planning process should be coordinated with other Federal planning processes. Specifically, State nonmetropolitan and metropolitan transportation planners should be explicitly encouraged to coordinate with all relevant local, regional, and Federal plans and processes, especially Housing and Urban Development (HUD) Consolidated Plans, Sustainable Communities Regional Planning and Community Challenge programs, and FEMA Hazard Mitigation plans.

In response to this comment, FHWA and FTA agree that this coordination is desirable. The FHWA and FTA note that section 450.208(a) identifies broad areas where States shall coordinate as part of the statewide transportation planning process, including metropolitan transportation planning activities, statewide trade and economic development activities, and related multistate planning efforts. The FHWA and FTA also note that section 450.210(d)(3) identifies the duties of an RTPO, if established by the State, which include: Fostering the coordination of local planning, land use, and economic development plans with State, regional, and local transportation plans, and programs; and participating in national, multistate, and State policy and planning development processes to ensure the regional and local input of nonmetropolitan areas. Furthermore, section 450.316(b) requires MPOs to consult with agencies and officials responsible for other planning activities within the MPA that are affected by transportation.

Consequently, FHWA and FTA believe the final rule provides that transportation planning process should be coordinated with other Federal planning processes and will continue to encourage, but not require, States and MPOs to coordinate with these other Federal planning processes. No changes were made to this section based on this comment.

Section 450.208(e)

The AASHTO, CO DOT, ID DOT, MT DOT, ND DOT, OR DOT, SD DOT, TX DOT, and WY DOT expressed concerns with section 450.208(e) in the NPRM. Section 450.208(c) states that, in carrying out the statewide transportation planning process, States shall apply asset management principles and techniques consistent with the State Asset Management Plan for the NHS, the Transit Asset Management Plan, and the Public Transportation Safety Plan. The commenters stated that the statewide planning process is much broader than an asset management plan, and that, as a requirement, it might have unintended consequences. The commenters suggested that it be deleted or modified.

The FHWA and FTA retained this provision. However, the word ''shall'' is changed to ''should'' in the final rule. The FHWA and FTA believe that asset management principles and techniques, consistent with the State Asset Management Plan for the NHS, the Transit Asset Management Plan, and the Public Transportation Safety Plan, should contribute to defining STIP priorities and assessing transportation investment decisions. The word ''shall'' was changed to ''should'' in the final rule because, as noted in the comments received on the NPRM, it is not a statutory requirement. See section IV(B) (recurring comment themes and other changes proposed by commenters) for more discussion on this issue and FHWA and FTA responses.

Section 450.208(g)

The AASHTO, CT DOT, ID DOT, MT DOT, ND DOT, NJ DOT, SD DOT, and WY DOT requested that FHWA and FTA eliminate redundant references to the integration of goals and objectives into the statewide planning process, as proposed in NPRM sections 450.206(c)(4) and 450.208(g). See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The AASHTO commented that section 450.208(g) should state that the integration of other performance-based plans and processes into the statewide transportation planning process can be either direct or by reference. In response to this comment, FHWA and FTA note that section 450.208(g) has been deleted from the final rule based on other comments that are described in the previous paragraph. However, section 450.206(c)(4) retains the requirement to integrate elements of other performance based plans and processes into the statewide transportation planning process and also provides that they may be integrated either directly or by reference. The WY DOT commented that the text in section 450.208(g)

should make it clear that the integration of elements of other performance-based plans and processes into the statewide transportation planning process can be done directly or by reference. The FHWA and FTA reiterate that section 450.208(g) has been removed from the final rule because it is redundant to section 450.206(c)(4). The FHWA and FTA further respond that section 450.206(c)(4) provides for the integration of elements of other performance-based plans and processes into the statewide transportation planning process directly or by reference.

The WA State DOT commented that advancing performance-based planning and programming requires consideration of all modes when linking investment decisions to targets and that the NPRM seems to support this direction.

The NYS DOT commented that, in coordinating performance management requirements in multijurisdictional mega regions, flexibility is needed in the requirement to coordinate among States, MPOs, and interstate agencies or authorities. The commenter further stated that this flexibility is needed due to the complexity of transportation facilities and services that may straddle several MPO and State boundaries.

The SEMCOG commented that there should be flexibility to allow MPOs to develop cooperative procedures for performance based planning that are best for the local situation. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.210 Interested Parties, Public Involvement, and Consultation

Seventy-five entities (AASHTO, Addison County RPC, AK DOT, APTA, Boone County Resource Management, Buckeye Hills-Hocking Valley RDD, Brazo Valley COG, California Association for Coordinated Transportation, CALTRANS, Capital Area MPO, CO DOT, Crystal Hitchings, CT DOT, East Central Iowa COG, East Texas Chief Elected Officials RPO, Enterprise Community Partners, Hunsaker/Region XII COG, IA DOT, ID DOT, Macatawa Area Coordinating Council, MARC, MA DOT, Meramec RPC, MI DOT, Mid-Columbia EDD, Mid-Region TPO and New Mexico RTPOs, MT DOT, NADO, NARC, National Congress of American Indians, National Housing Conference, NC DOT, ND DOT, Nine to Five National Association of Working Women, North Carolina Association of RPOs, North Central Pennsylvania RPDC, Northern Maine Development Commission, Northern Shenandoah Valley Regional Commission, NRDC, NYS DOT, OK DOT, OR DOT, Oregon Chapter of the American Planning Association (APA), Pioneer Trails RPC, Portland Metro, Region Five Development Commission, Region Nine Development Commission, Region XII COG, Rural Counties Task Force, SD DOT, Sierra Club, South Alabama RPC, South Plains AOG, Southeast Alabama RPO, Southern Windsor County RPC, The Leadership Conference on Civil and Human Rights, TN DOT, Two Rivers-Ottauquechee Regional Commission, TX DOT, United Spinal Association, Upper Minnesota Valley RDC, Virginia Association of Planning District Commissions, VT DOT, West Central Arkansas Planning and Development District, West Central Indiana EDD, WA State DOT, WY DOT, and Yurok Tribe Transportation Program) submitted comments on the proposed changes to section 450.210. This section requires States to involve members of the public and nonmetropolitan local officials in the planning process that produces the long-range statewide transportation plan and STIP, described below.

Section 450.210(a)

Section 1202 of FAST amends 23 U.S.C. 135(g)(3) to add public ports and intercity bus operators to the list of entities that a State shall provide early and continuous public involvement opportunities to as part of the statewide transportation planning process. Section 450.210(a)(1)(i) in the final rule is amended to reflect these changes.

Section 450.210(a) provides that the State shall develop and use a documented public involvement process that provides opportunities for review and comment at key decision points. The AASHTO and four States (ID DOT, MT DOT, SD DOT, and WY DOT) commented that the rule would be improved if it were made explicit that a State considers public comment in setting targets. They propose the addition of a new paragraph 450.210(a)(3) to read as follows: ''With respect to the setting of targets, nothing in this part precludes a State from considering comments made as part of the State's public involvement process.'' Section 450.210(a) requires that the public involvement process provide opportunities for review and comment at key decision points in the development of the long-range statewide transportation plan and the STIP.

The FHWA and FTA agree that the establishment of targets is a pivotal decision in the performance-based planning and programming process. The FHWA and FTA concur with this recommendation and amended paragraph (a)(3) in the final rule to emphasize the importance of securing public comment during the target selection process.

The FHWA and FTA also concur with the three advocacy groups (United Spinal Association, National Housing Conference, and Enterprise Community Partners) who highlighted the importance of section 450.210(a)(viii). The section provides that States seek out and consider the needs of the traditionally underserved by existing transportation systems, such as low income and minority households.

The NRDC recommended the creation of a State process for measuring target districts, such as that developed by the Atlanta Regional Council (*http://www.atlantaregional.com/transportation/community-engagement/social-equity*), for greater outreach that can help address gaps in input at both the State and local levels. The CO DOT asked that FHWA and FTA identify other public involvement techniques, particularly electronically accessible ones.

The FHWA and FTA are collecting and disseminating best practices and providing technical support for State and MPO public engagement efforts. As part of the Public Transportation Participation Pilot Program, created as part of the SAFETEA–LU, FTA sponsored applied research to develop innovative approaches to improving public participation in the planning of public transportation. The results of this research can be found at *http://www.fta.dot.gov/12347_5925.html.* Similarly, FHWA has developed material and resources on best practices in public participation that is available at: *http://www.fhwa.dot.gov/planning/public_involvement/.*

Section 450.210(b)

Section 450.210(b) provides that, consistent with MAP–21, the State shall have a documented process for cooperating with nonmetropolitan officials representing units of general purpose local government, and/or local officials with responsibility for transportation, that provides them an opportunity to participate in the development of the long-range statewide transportation plan and the STIP. The change from the term ''consultation'' to ''cooperation'' requires States to work more closely with nonmetropolitan local officials to achieve a common outcome in the development of the long-range statewide transportation plan and STIP.

The NYS DOT expressed support for the requirement to cooperate with

nonmetropolitan local officials in the development of the long-range statewide transportation plan and STIP, noting that this cooperative process will likely require States to reach out to local officials more frequently and on a cooperative basis. However, it believes that the higher level of outreach is achievable with existing resources. One industry organization (NARC) expressed support for the change in this and other sections of the planning NPRM that elevates the relationship between States and nonmetropolitan local officials from consultation to cooperation.

Two industry associations (NADO and NARC) and one MPO (Two Rivers-Ottauquechee Regional Commission) requested that, given the high degree of discretion granted to States as to what constitutes cooperation, additional dialogue from FHWA and FTA would be helpful to understand what the shift to cooperation will mean and how this shift is anticipated to change the planning process. The FHWA and FTA are developing training as to what are the expectations as States and MPOs transition to a more cooperative process.

The AK DOT also sought clarity as to what constitutes cooperation, noting that it found the language addressing cooperation with nonmetropolitan local officials to be vague and confusing. The FHWA and FTA note that cooperation means that the parties involved in carrying out the transportation planning and programming process work together to achieve a common goal or objective (section 450.104).

The MA DOT and TN DOT asked what criteria FHWA and FTA use to determine whether cooperation is taking place if a State elects not to designate RTPOs. In response, FHWA and FTA note that existing section 450.210(b)(1) requires that a State identify the effectiveness of its process to cooperate with nonmetropolitan local officials by soliciting and reviewing comments from nonmetropolitan local officials and other interested parties regarding the effectiveness of the cooperative process, and any proposed changes, at least once every 5 years. While the statute provides that FHWA and FTA shall not review or approve the process, FHWA and FTA will review whether the State has implemented a process to cooperate with the nonmetropolitan local officials through its planning finding as part of the STIP approval process.

The AK DOT noted that sections 450.216(h) and 450.218(c) continue to refer to a State's nonmetropolitan local official consultation process. The commenter is correct in noting that both of these sections refer to the States' ''consultation processes established under 450.210(b).'' To eliminate this confusion, and to emphasize the statutory change from consultative to cooperative, FHWA and FTA revised sections 450.216(h) and 450.218(c) by eliminating the term ''consultation'' to reflect the new requirements for cooperation. The FHWA and FTA do not concur with the commenter's conclusion that the State's existing consultation process with nonmetropolitan local officials satisfies the requirement that States develop and implement a cooperative process, unless it complies with the new requirements provided by MAP–21 and this final rule.

The NRDC, who applauded the focus on greater integration of nonmetropolitan areas into State planning, suggested striking the sentence in 450.210(b) which limits FTA and FHWA authority by explicitly forbidding review or approval of new processes, since Federal agencies should reserve the authority in case State implementation proves inadequate. In response, FHWA and FTA point to 23 U.S.C. 135(f)(2)(B)(ii)[22] and 135(g)(2)(B)(ii),[23] which expressly prohibit the DOT from reviewing or approving a State's consultation process.

Eleven commenters (Crystal Hitchings, Hunsaker/Region XII COG, NADO, North Central Pennsylvania RPO, Pioneer Trails RPC, Region Nine Development Commission, Southeast Alabama RPO, TN DOT, Two Rivers-Ottauquechee Regional Commission, Upper Minnesota Valley RDC, and Virginia Association of Planning District Commissions) asked the DOT to encourage States to establish a timeline for when the shift from consultation to cooperation will occur, and to communicate this to nonmetropolitan stakeholders.

The FHWA and FTA note that section 450.226 provides the schedule for phasing in MAP–21 changes. With respect to the major change that places a new emphasis on nonmetropolitan transportation planning, FHWA and FTA will require that STIPs and long-range statewide transportation plans, adopted on or after a date 2 years after publication of the final rule in the **Federal Register**, must reflect this new emphasis. The FHWA and FTA will only approve STIP amendments or updates that are based on a planning process that incorporates the new emphasis on nonmetropolitan transportation planning, including the development and use of a documented process by the State to provide for cooperation with nonmetropolitan local officials in the development of the statewide long-range plan and STIP. The FHWA and FTA believe this approach is consistent with the MAP–21 requirements (23 U.S.C. 135(l) and 49 U.S.C. 5303(k)) and does not require the State to deviate from its established planning update cycle to implement the MAP–21 changes.

Section 450.210(c)

Section 450.210(c), which concerns areas of States under the jurisdiction of a tribal government, would replace ''Federal land management agencies'' with the ''Department of the Interior'' as the entity with which States must consult when forming the long-range statewide transportation plan and STIP for such areas. One tribal organization (the National Congress of American Indians) expressed concern with this proposed change, asserting that it is very limiting for States and would inhibit the ability of tribes to provide full scale infrastructure planning for their citizens and citizens of surrounding areas. They recommended that the term ''Federal land management agencies'' remain.

The FHWA and FTA note that the Department of the Interior, not the Federal land management agencies, is the Federal agency with responsibility for managing tribal matters and that with this change, tribal governments retain the choice to engage with other Federal entities. The final rule will retain the Department of the Interior as the entity with which States must consult when forming the long-range statewide transportation plan and STIP for such areas. The National Congress of American Indians also reaffirms the requirement in section 450.210(c), which provides that States must, to the maximum extent practicable, develop a documented process that outlines the roles, responsibilities, and key decision points for consulting with tribal governments.

Section 450.210(d)

Section 450.210(d) would provide for an optional formal process for States to establish and designate RTPOs to enhance the planning, coordination, and implementation of the long-range statewide transportation plan and STIP with an emphasis on addressing the needs of nonmetropolitan areas. Fifteen commenters (Addison County RPC, Boone County Resource Management, East Texas Chief Elected Officials RPO, Meramec RPC, NC DOT, North Carolina Association of RPOs, Northern Maine Development Commission, NYS DOT, OK DOT, Portland Metro, Region XII

[22] Also 49 U.S.C. 5304(f)(2)(B)(ii).

[23] Also 49 U.S.C. 5304(g)(2)(B)(ii).

COG, Two Rivers-Ottauquechee Regional Commission, VT DOT, West Central Arkansas Planning and Development District, West Central Indiana EDD) expressed support for this proposal. The MA DOT requested more clarity and direction on the establishment, designation, roles, and responsibilities of RTPOs. The FHWA and FTA offer the following responses to comments on RTPOs to address the request for more clarity and direction.

The MAP–21 provides that States have the authority to establish and designate an RTPO. Section 450.210(d) clarifies that this authority resides in the Governor or the Governor's designee because the Governor is the chief executive of a State. With respect to this section, the OR DOT sought clarification as to the role of the State DOT in the establishment and designation of an RTPO. The FHWA and FTA note that the State DOT could serve as the Governor's designee.

Six commenters (AASHTO, Minnesota Valley Development Commission, CO DOT, IA DOT, Region Five Development Commission, Region Nine Development Commission, and TX DOT) stated that section 450.210(d)(1) appears to indicate that a Governor could establish an RTPO without local agreement and requested FHWA and FTA to clarify that the establishment of an RTPO must include the agreement of the local units of government.

The commenters proposed that the language related to the establishment of RTPOs in section 450.210(d)(1) be changed to be more similar to the language related to the establishment of MPOs in 450.310(b) with respect to the requirement for agreement with units of general purpose local government. The MA DOT questioned the role of nonmetropolitan officials in the establishment of RTPOs.

In response, FHWA and FTA believe that section 450.210(d)(1) is clear that an RTPO shall be a multijurisdictional organization of nonmetropolitan local officials, or their designees who volunteer for such organizations, and representatives of local transportation systems who volunteer for such organizations. The FHWA and the FTA will retain the proposed language in the final rule.

Section 450.210(d) also requires that, if a State and its existing nonmetropolitan planning organizations choose to be established or designated as an RTPO under MAP–21, they must go through the formal process to conform to the structure as described in 450.210(d)(1) and (d)(2). Because an RTPO would conduct planning for a nonmetropolitan region, an RTPO would be a multijurisdictional organization composed of volunteer nonmetropolitan local officials or their designees, and volunteer representatives of local transportation systems. The MT DOT expressed support for the language recognizing that it is at the State's discretion to establish RTPOs.

The MA DOT sought clarification as to the appropriateness of including transit representation on the RTPO if the nonmetropolitan area does not have robust transit service. The FHWA and FTA note that the statute and the final rule provide that an RTPO's policy committee shall include representatives of transportation service operators as appropriate.

The MA DOT also questioned whether the establishment of an RTPO can be reflected in an existing MOU between the State and the nonmetropolitan planning organization. The FHWA and FTA respond that if the State and its existing nonmetropolitan planning organizations choose to be established or designated as an RTPO under the MAP–21, they must go through the formal establishment and redesignation process, and that existing MOUs between them must be updated to reflect the MAP–21 structure, requirements, and duties.

A respondent who works on the Transportation Program for the Yurok Tribe requested that RPTOs: (1) Work with the tribes, individually and through tribal transportation consortiums, to develop performance measures on tribal lands or communities; (2) implement data collection and data management strategies for these performance measures; (3) utilize tribal planning products for developing RTPO planning documents; and (4) partner with tribes on outreach strategies to tribal communities regarding unmet transit needs, the regional planning processes, and projects with regional significance.

In response, FHWA and FTA note that the statute is silent on the inclusion of tribal communities in RTPOs established by the States under 23 U.S.C. 135(l) and 49 U.S.C. 5304(l). Consequently, it would be the decision of the State and local officials as to whether to include tribes on the RTPO. It would be permissible under 23 U.S.C. 135(l)(3) and 49 U.S.C. 5304(l). The FHWA and FTA think it would be a best practice. Furthermore, as the States must develop the long-range statewide transportation plan and STIP in consultation with tribal governments under 23 U.S.C. 135(f)(2)(C), 23 U.S.C.135(g)(2)(C), 49 U.S.C.5304(f)(2)(C), and 49 U.S.C.5304(g)(2)(C), FHWA and FTA would hold the States accountable for consultation with the tribes, regardless of whether tribes were included on the RTPO. In addition, the RTPO's duties require it to consider and share plans and programs with ''neighboring regional transportation planning organizations, metropolitan planning organizations, and, where appropriate, tribal organizations'' (23 U.S.C. 135(m)(4)(G)).

The CALTRANS commented that the shift toward working cooperatively should also take tribal governments into consideration. Doing this will lead to more coordinated efforts and will also allow consultation with tribal governments, as required by this final rule, to be more meaningful. The FHWA and FTA agree.

The OR DOT highlighted that Oregon's Area Commissions on Transportation, which encompass large territories in Oregon that include MPOs and adjacent nonmetropolitan areas and whose functions are generally limited to making recommendations on STIP priorities, overlap the Federal responsibilities of MPOs in a way which produces confusion and redundancies between the State and local governments in the regional planning area. The OR DOT and Portland Metro requested that the final rule clearly define the function of RTPOs as serving areas outside of established MPOs. The Portland Metro also requested that the RTPOs' boundaries be periodically updated to reflect updates to MPO boundaries following the Federal census. Conversely, the WA State DOT noted that its State law provides for a different RTPO structure than described in section 450.210(d)(2). Oregon law allows RTPOs and MPOs to share boundaries and staff, which increases the coordination and decreases the workload. As a result, 37 of the State's 39 counties are in an RTPO.

In response, FHWA and FTA note that the final rule states clearly that an RTPO, established and designated or redesignated under the MAP–21, would conduct planning for the nonmetropolitan areas of the State.

The Oregon Chapter of the APA notes that such a formally structured and recognized rural TPO with broad based representation is essential to the development of coordinated regional transportation plans and projects. However, an individual (Crystal Hitchings), an industry association (NADO), and 24 rural transportation planning organizations (Addison County RPC, Boone County Resources Management, Brazo Valley COG, East TX Chief Elected Officials/RPO, Hunsaker/Region XII COG, Meramec

RPC, Mid-Columbia EDD, Mid-Region TPO, New Mexico RTPOs, North Carolina Association of RPOs, North Central Pennsylvania RPO, Northern Maine Development Commission, Northern Shenandoah Valley Regional Commission, Region Five Development Commission, Region Nine Development Commission, Rural Counties Task, South Alabama RPC, Southern Windsor County RPC, Two Rivers-Ottauquechee Regional Commission, Upper Minnesota Valley RDC, Virginia Association of Planning District Commissions, West Central Arkansas Planning and Development Commission, and West Central Indiana EDD) requested that the final rule provide that the make-up of an RTPOs policy committee remain as flexible as possible so that existing models can continue to operate as is. They cited that, in several States, metropolitan and tribal officials are designated participants on an existing RTPO or rural planning partners governing board because of a region's demographic reach. They requested that these officials continue to qualify under the appropriate category in the list of individuals comprising a RTPO's policy committee under the final rule.

One respondent, who represents 26 rural RTPAs in California (Rural Counties Task Force), requested that FHWA and FTA include language in the final rule saying that California's existing RTPA process is equivalent to that of the RTPOs provided for in the NPRM. The respondent explained that State law established California's RTPAs in the early 1970s and that these agencies perform regional transportation planning and programming for an area that typically covers a county and the cities contained within it. The NC DOT asserted that States should have the ability to define the structure and role of RTPOs within their own planning processes. Similarly, three commenters (CALTRANS, NARC, and WA State DOT) noted that it would helpful if the final rule included language that creates flexibility for already established RTPOs.

In response to these requests to limit or expand flexibility with respect to the establishment and structure of an RTPO, FHWA and FTA note that MAP–21 and the final rule provide that the establishment of an RTPO is optional and that a State can choose to retain its existing RPOs. If the State, nonmetropolitan local governments, and operators of transportation in nonmetropolitan areas choose to designate/re-designate an RTPO under MAP–21 because they believe that it will enable the State to better address the needs of its nonmetropolitan areas, the RTPO must comply with the required structure and responsibilities as provided in MAP–21, proposed in the NPRM, and retained in the final rule.

Portland Metro asked that the final rule create clear incentives for States to establish RTPOs to supersede any existing non-MPO planning structures that may exist. They noted that this would ensure Federal oversight and improve coordination of planning activities across both metropolitan and nonmetropolitan areas. Conversely, an individual (Crystal Hitchings), an industry association (NADO), and 24 rural planning agencies (Addison County RPC, Boone County Resources Management, Brazo Valley COG, Buckeye Hills-Hocking Valley Regional Development District, East Texas Chief Elected Officials/RPO, Hunsaker/Region XII COG, Meramec RPC, North Carolina Association of RPOs, Mid-Columbia EDD, Mid-Region TPO and New Mexico RTPOs, Northern Maine Development Commission, Northern Shenandoah Valley Regional Commission, Pioneer Trails RPC, Region Five Development Commission, Region Nine Development Commission, Region XII COG, Rural Counties Task Force, South Alabama RPC, Southeast Alabama RPO, Southern Windsor County RPC, Two Rivers-Ottauquechee Regional Commission, Upper Minnesota Valley RDC, Virginia Association of Planning District Commissions, West Central Arkansas Planning and Development Commission, and West Central Indiana EDD) requested that FHWA and FTA encourage States to maintain the existing working relationship with their nonmetropolitan transportation planning partners, rather than attempt to establish new relationships with other entities to meet the RTPO requirements.

In response to requests for incentives for States either to retain existing nonmetropolitan planning organizations or to re-establish and re-designate them as RTPOs under the MAP–21, FHWA and FTA believe that the MAP–21 provides States the option to determine, in cooperation with nonmetropolitan local officials and nonmetropolitan transportation officials, if re-designating existing nonmetropolitan planning organizations to conform to the MAP–21 structures and responsibilities of an RTPO would better address the needs of the nonmetropolitan areas of the State. The final rule does not provide additional incentives to make that choice.

Section 450.210(d)(3)

Section 450.210(d)(3) describes the duties of an RTPO, including the development of a regional long-range multimodal transportation plan and a regional TIP; providing a forum for public participation in the statewide and regional transportation planning process; and conducting other activities to support and enhance the statewide planning process. The Southeast Alabama RPO requested that RTPO activities be more than those listed in statute. Multiple rural transportation planning agencies (Addison County RPC, Boone County Resources Management, Brazo Valley COG, Buckeye Hills-Hocking Valley RDD, East Texas Chief Elected Officials/RPO, Meramec RPC, Mid-Columbia EDD, Mid-Region TPO and New Mexico RTPOs, NADO, North Carolina Association of RPOs, North Central Pennsylvania RPDC, Northern Maine Development Commission, Northern Shenandoah Valley Regional Commission, Pioneer Trails RPC, Region XII COG, South Alabama RPC, South Central Alabama RPC, Southern Windsor County RPC, Two Rivers-Ottauquechee Regional Commission, West Arkansas Planning and Development Commission, and West Central Indiana EDD) expressed appreciation that, in listing the duties of an RTPO, MAP–21 and the NPRM make clear that there is no prohibition on an RTPO conducting other transportation planning activities beyond those listed. The California Association for Coordinated Transportation, a State association of RPOs, highlighted that its members perform regional transportation planning and programming for areas that typically cover a county and the cities contained within it. Consistent with MAP–21 and the NPRM, the final rule does not prohibit an RTPO from conducting other transportation planning activities beyond those listed.

The Oregon Chapter of the APA urged the DOT to structure the proposed RTPOs with the same responsibilities and authorities that the MPOs currently exercise. The NC DOT and VT DOT asserted that, due to the nature and area of coverage, RTPOs should not have the same duties defined as those of the metropolitan areas. In response, FHWA and FTA note that MAP–21 and the final rule do not provide RTPOs with the same responsibilities and authorities that an MPO exercises.

One industry organization (NADO) and two MPOs (Hunsaker/Region XII COG and the Two Rivers-Ottauquechee Regional Commission) encouraged FHWA and FTA to include language in the final rule stating that unified regional plans, plans developed by MPOs and RTPOs that are used as a

joint planning document, are an eligible way to structure planning activities, provided that all requirements for metropolitan planning are met through development of the metropolitan portion of the plan. In response, FHWA and FTA note that the final rule states clearly that an RTPO, established and designated or redesignated under MAP–21, would conduct planning for the nonmetropolitan areas of the State.

Multiple rural transportation planning agencies (Addison County RPC, Boone County Resources Management, Brazo Valley COG, East Texas Chief Elected Officials RPO, Meramec RPC, Mid-Region TPO, New Mexico RTPOs, NADO, North Carolina Association of RPOs, North Central Pennsylvania RPDC, Northern Maine Development Commission, Northern Shenandoah Valley Regional Commission, Region XII COG, Rural Counties Task Force, South Alabama RPC Commission, Southeast Alabama RPO, Southern Windsor County RPC, Two Rivers-Ottauquechee Regional Commission, West Central Arkansas Planning and Development Commission, and West Central Indiana EDD) noted that several States already require RTPOs to follow the same guidelines as MPOs in developing their TIPs. They asked that FHWA and FTA clarify in the final rule that these MPO equivalent TIPs should be fully incorporated into the STIP, as are MPO-developed TIPs. Four States (CO DOT, TN DOT, VT DOT, and WA State DOT) also sought clarity with respect to how the State is to treat an RTPO TIP, questioning whether it has the same requirements (*e.g.,* incorporate directly or by reference) as an MPO TIP. The VT DOT explained that its existing rural planning agencies do not develop a regional TIP, but instead develop regional priorities that the State incorporates into its annual statewide project prioritization process. It noted that this approach is more effective at fostering cooperation than asking each rural planning agency to develop what may sometimes evolve into a wish-list of projects for inclusion in a capital program and STIP. The VT DOT noted that the NPRM does not define regional TIPs, which could lead to confusion and may imply that it carries the same weight as an MPO TIP. It recommends that development of a regional TIP be removed as a required duty of an RTPO, or defined sufficiently to ensure it does not create unrealistic expectations.

In response, FHWA and FTA note that, as provided by MAP–21, the final rule states clearly that RTPOs prepare regional TIPs for consideration by the State. It is the option of the State to determine if the regional TIP prepared by an RTPO is to be fully incorporated into the STIP. This is not a Federal requirement. Consequently, addressing the inquiry of AK DOT, the lack of cooperation by one local nonmetropolitan official cannot bring the long-range statewide transportation plan or STIP planning to a halt. With respect to the request of NADO and the Two Rivers-Ottauquechee Regional Commission, FHWA and FTA encourage States to transparently communicate how the RTPO TIP priorities are considered in the STIP.

The MA DOT asked if RTPOs have separate targets from MPOs and are expected to be involved in setting of State and transit targets. In response, FHWA and FTA note that MAP–21 requires States, MPOs, and operators of public transportation to establish performance targets. It does not give that authority to RTPOs. However, MAP–21 and final rule provide that an RTPO's duties include activities such as developing and maintaining regional long-range transportation plans in cooperation with the State, and developing a regional transportation improvement program for consideration by the State. These RTPO duties would support the State in its responsibilities to establish its performance targets and demonstrate substantial progress toward achieving them.

With the additional requirements and duties for RTPOs and no additional Federal funding to cover them, CT DOT commented that it will not be establishing any RTPOs at this time. The AMPO strongly recommended restrictions on diverting metropolitan planning funds (PL) for nonmetropolitan planning requirements. The FHWA and FTA note that planning for nonmetropolitan areas is not an eligible expense for PL funds.

Twenty-six commenters (Addison County RPC, Boone County Resources Management, Brazo Valley COG, Buckeye Hills-Hocking Valley RDD, East Texas Chief Elected Officials RPO, Meramec RPC, Mid-Region TPO and New Mexico RTPOs, NADO, North Carolina Association of RPOs, North Central Pennsylvania RPDC, Northern Maine Development Commission, Northern Shenandoah Valley Regional Commission, Oregon Chapter of the APA, Pioneer Trails RPC, Region Five Development Commission, Region Nine Development Commission, Rural Counties Task Force, Sierra Club, South Plains AOG, Southeast Alabama RPO, Southern Windsor County RPC, Two Rivers-Ottauquechee Regional Commission, Upper Minnesota Valley Regional Development Commission, Virginia Association of Planning District Commissions, West Central Arkansas Planning and Development Commission, and West Central Indiana EDD) also requested that FHWA and FTA provide some discussion of funding options available to RTPOs as MAP–21 provides no dedicated funding for RTPOs. Another respondent, which represents 26 rural regional transportation planning agencies (RTPA) in California (the Rural Counties Task Force), stated that it would be helpful if the rural agencies would also receive Federal funds like the MPOs' PL funds. This would allow the rural agencies to enhance public outreach, performance measurement, maintenance strategies, safety plans, and uniform work programs.

The FHWA and FTA agree that MAP–21 (and FAST) provides no dedicated funding for RTPOs and that eligible funding sources include the State Planning and Research Program and the Surface Transportation Program. The Formula Grants for Rural Areas (49 U.S.C. 5311) funds may also support RTPOs, provided they are in addition to funding awarded to a State under 49 U.S.C. 5305 for planning activities that are directed specifically at the needs of the rural areas in the State.[24]

The AK DOT asked what the State's responsibility is with respect to local officials that are not associated with RTPO. In response, FHWA and FTA cite 23 U.S.C. 135(l)(5) and 49 U.S.C. 5304(l)(5), which provide that, if a State does not choose to establish RTPOs, it must consult with affected nonmetropolitan local officials to determine projects that may be of regional significance.

Section by Section Post FAST

Section 450.212 Transportation Planning Studies and Project Development

FAST Act Impacts

The FAST Act amended 23 U.S.C. 168, streamlining and clarifying the PEL authority added by MAP–21 that was the subject of the Section 168 NPRM. The FAST Act amendments eliminated many of the provisions in the MAP–21 version of 23 U.S.C. 168 that generated comments on the Section 168 NPRM, and established revised requirements for the use of that statutory authority. As a result, after conserving the substantial and detailed amendments made by FAST, FHWA and FTA decided that the best course of action would be for the final rule to reference the statute rather than adopt detailed regulatory language. This approach simplifies the final rule

[24] 49 U.S.C. 5311(b)(1)(A).

and avoids a literal restatement of the statutory provisions, while ensuring the availability of the new authority is recognized by those considering the use of PEL. Thus, this final rule adds a reference to the FAST version of the statute in sections 450.212(d) and 450.318(e) and withdraws the provisions proposed in the Section 168 NPRM. For this reason, FHWA and FTA discuss Section 168 NPRM comments in this notice only to the extent those NPRM comments related to topics other than the NPRM's proposal for the implementation of 23 U.S.C. 168. The FHWA and FTA appreciate the commenters' submission of comments in response to the Section 168 NPRM, but do not believe a discussion of comments that were based on the MAP–21 version of 23 U.S.C. 168 would benefit the general public or entities interested in this rulemaking.

General Comments

The FHWA and FTA received general comments on PEL in response to both the planning NPRM and the Section 168 NPRM. Most commenters (AASHTO, AMPO, APTA, ARTBA, ASHTD, CO DOT, FL DOT, H–GAC, Lackawanna Coalition, MA DOT, MDT, MetroPlan, MO DOT, MTC, NC DOT, NCTCOG/RTC, NJ Transit, NYMTC, NYS DOT, SACOG, SANDAG, SCAG, SJCOG, TCA, TriMet, TX DOT, VA DOT, and WY DOT) indicated their support for PEL objectives and cited the benefits of PEL practices to the project delivery process. The benefits cited included avoiding duplication and reducing the time required to complete the environmental review process. The FHWA and FTA appreciate the comments and the overall support for PEL. No response to these general comments is needed.

Comments on Impact of PEL Regulations on Planning and NEPA Processes

Some commenters expressed concern that PEL regulations would be viewed as imposing general requirements on the transportation planning process, or substituting for the transportation planning process. The CO DOT commented that the final rule should make it clear that PEL provisions apply only when an agency wants to facilitate the use of planning products in the NEPA process, and that other planning products do not need to meet those requirements. The CO DOT also asked FHWA and FTA to clarify that planning studies may be undertaken at any point in the planning process, not only in conjunction with the development of the 20-year statewide transportation plan. The MetroPlan recommended FHWA and FTA consider redrafting the final rule to clearly distinguish between baseline planning analyses and other products flowing from the metropolitan planning process, including more detailed studies such as corridor plans that are intended to advance a specific project. The PA DOT registered concerns about whether the planning forms it now uses would require approval under PEL procedures, and its ability to continue to electronically transfer planning-level data into its automated system for documenting the decisionmaking process for categorical exclusions.

In response, FHWA and FTA note that nothing in the final rule is intended to require a change to existing practices with respect to the use of planning data. Both the NPRM and final rule make it clear that all PEL procedures are optional and serve only as mechanisms for facilitating the use of planning outputs in the NEPA process. The FHWA and FTA do not believe the final rule places any requirement or limitation on the creation, form, timing, or use of planning information and data in the transportation planning process under 23 U.S.C. 134 and 135. Nothing in sections 450.212 and 450.318, appendix A, or elsewhere in the final rule affects the long-standing exemption from applying NEPA to the transportation planning process (see, *e.g.,* 23 CFR 450.222 and 450.336 as in effect prior to this final rule [25]). The FAST provision in 23 U.S.C. 168(f) contains the same exemption for the section 168 authority.

The FHWA and FTA do not view the part 450 PEL procedures as limiting, nor forcing alteration of long-standing practices for using planning data during project development, including environmental reviews. Neither the existence nor the use of part 450 PEL procedures precludes any other appropriate process for using decisions, data, or studies in the NEPA process.

The FHWA and FTA received a few comments that indicated a possible misperception about the relationship between the transportation planning process under 23 U.S.C. 134 and 135 and the NEPA process. The Sierra Club urged FHWA and FTA to require a plan to be the product of an environmental evaluation that fully considers the environmental context in which a transportation improvement would occur. In its comments, the Sierra Club listed a series of environmental concerns it suggested ought to be part of a mandatory environmental evaluation of a transportation plan. The Arizona Department of Fish and Game expressed concern about using planning level documents as the sole source of environmental impact analysis in the NEPA process, and requested early and continuing coordination among the NEPA lead agency and resource agencies.

In response, FHWA and FTA note transportation plans are not subject to NEPA (23 U.S.C. 168(f)(1)–(2); 23 CFR 450.224 and 450.338). However, FHWA and FTA consistently encourage consideration of environmental issues early in the planning process and the final rule continues to include such considerations as a part of transportation planning (*e.g.,* sections 450.206(a)(5), 450.216(c), 450.218(b), and 450.306(b)(5)). The FHWA and FTA note that planning documents brought into the NEPA process through PEL or other authorities will not serve as the sole documentation of environmental impact analysis, unless the planning-level analysis meets NEPA-level evaluation and applicable procedural requirements.

The FL DOT commented that the final rule should be clearer about who decides whether to use PEL and which PEL process to use. The AASHTO suggested revisions to the regulatory language that would give the decision to the project sponsor. In response, FHWA and FTA note each PEL authority described in sections 450.212 and 450.318 includes provisions specifying which entities have decisionmaking authority. Sections 450.212(a)–(c) and 450.318(a)–(d) give decisionmaking authority to the NEPA lead agencies. In the case of sections 450.212(d) and 450.318(e), 23 U.S.C. 168 defines the entities with decisionmaking authority as the relevant agency, which is the NEPA lead agency as defined in 23 U.S.C. 139 and cooperating agencies with jurisdiction over the project.

The FHWA and FTA encourage early and ongoing coordination among all parties involved in the development and review of the planning product, including MPOs. The FHWA and FTA believe early coordination is the method for deciding whether and how to lay the groundwork during planning for carrying a planning product into the NEPA process using part 450 PEL authorities, especially where PEL under 23 U.S.C. 168 is being pursued.

[25] In this final rule, sections 450.222 and 450.336 of the prior regulation are renumbered as sections 450.224 and 450.338, respectively. The final rule also renumbers several other provisions carried over from the prior regulation. All subsequent references in the discussion of sections 450.212 and 450.318 use the numbering adopted in this final rule.

NPRM Comments on Relationship Between Pre-Existing PEL Authorities and Section 168

Several commenters (AASHTO, AMPO, ARC, and OR DOT) indicated the preference to retain the pre-existing PEL provisions in the final rule (sections 450.212 (a)–(c) and 450.318(a)–(d) and appendix A) because of the flexibility the existing authorities provide. Commenters (AASHTO, ARC, FL DOT, IDT, MDT, ND DOT, SD DOT, TX DOT, and WY DOT) emphasized the importance of appendix A, (Linking the Transportation Planning and NEPA Processes to Practitioners), and requested that FHWA and FTA retain appendix A and make it clear that it is non-binding guidance. The AASHTO requested that the final rule expressly state that appendix A to part 450 applies only to the PEL provisions contained in sections 450.212(a)–(c) and 450.318(a)–(d) in the final rule, and not to the PEL provision that implements 23 U.S.C. 168.

A number of commenters (AASHTO, CO DOT, FL DOT, H–GAC, MetroPlan, MDT, NC DOT, NCTCOG/RTC, PA DOT, and TX DOT) expressed concern that the MAP–21 section 168 provisions are more restrictive than the pre-existing PEL regulations, and that they would prove so restrictive as to discourage its use. The FHWA and FTA believe this concern may apply to 23 U.S.C. 168 as revised by the FAST Act because the statute includes a number of specific procedural requirements. The H–GAC, NCTCOG/RTC, and TX DOT expressed concern that the section 168 process would be perceived as the required PEL procedure. Some commenters (AASHTO, AMPO, ARC, CO DOT, FL DOT, H–GAC, MA DOT, MDT, NC DOT, NCTCOG/RTC, NYMTC, NYS DOT, Oregon DOT, and TX DOT) requested that FHWA and FTA make it clear in the final rule that the section 168 process is optional, and that it does not supersede PEL authorities that existed prior to the enactment of section 168 in 2012.

The AASHTO submitted language for insertion into sections 450.212(d) and 450.318(e) to emphasize that the new section 168 provisions have no impact on the ability to use pre-existing PEL authorities. The AASHTO also suggested revisions to the organization of the regulatory text to place the pre-existing PEL authorities in different sections than the new 23 U.S.C. 168 PEL authority, as well as changes to the language to further clarify that section 168 implementing regulations supplement the pre-existing PEL authorities.

The FHWA and FTA agree that pre-existing PEL authorities, whether in the part 450 regulations or outside them, were not altered by the enactment of section 168 or its subsequent amendment. The final rule explicitly retains the authorities contained in sections 450.212 and 450.318 prior to this rulemaking. Sections 450.212(d) and 450.318(e) reference 23 U.S.C. 168, which includes a savings clause provision found in 23 U.S.C. 168(f)(3). The statutory provision states that section 168 ''. . . . shall not be construed to affect the use of planning products in the environmental review process pursuant to other authorities under any other provision of law. . . .''

The FHWA and FTA agree with the comments requesting retention of appendix A and clarification about its applicability. The final rule retains the non-binding guidance in appendix A and explicitly states in sections 450.212(c) and 450.318(d) that the guidance in appendix A applies only to paragraphs 450.212(a)–(c) and 450.318(a)–(c).

The FHWA and FTA have adopted AASHTO's suggestion to add regulatory language to sections 450.212(d) and 450.318(e) to emphasize that the new section 168 provisions have no impact on the ability to use pre-existing PEL authorities. In the final rule, sections 450.212(d) and 450.318(e) contain language referring to 23 U.S.C. 168(f), and stating: ''The statutory authority in 23 U.S.C 168 shall not be construed to limit in any way the continued use of processes established under other parts of this section or under an authority established outside of this regulation, and the use of one of the processes in this section does not preclude the subsequent use of another process in this section or an authority outside of this regulation. . . . The statute does not restrict the initiation of the environmental review process during planning.''

The FHWA and FTA decline to adopt the reorganization of the regulations suggested by AASHTO. The FHWA and FTA believe that a total reorganization of the regulations, as proposed by AASHTO, would be complicated and confusing. However, FHWA and FTA do agree it is important to reduce the potential for confusion about PEL options and requirements. The FHWA and FTA believe their choice to replace detailed regulatory language proposed in the Section 168 NPRM with a short reference to 23 U.S.C. 168 will help accomplish this objective.

With respect to the comments suggesting 23 U.S.C. 168 provisions are too restrictive and will discourage use of its authority, FHWA and FTA point to the changes made by the FAST Act that simplify the applicable procedures for using the authority created in 23 U.S.C. 168. In addition, the final rule is clear that all of the PEL procedures are optional and any PEL authority may be used.

NPRM Comments on Planning NPRM Proposals for Changes to Part 450

In the planning NPRM, FHWA and FTA proposed repealing section 450.318(d) and redesignating the remaining section of 450.318. The language in section 450.318(d), as in effect prior to this final rule, addressed PEL in the context of New Start projects under 49 U.S.C. 5309(d). Under the MAP–21, changes to section 5309 removed the statutory requirement reflected in section 450.318(d). The FHWA and FTA received only one comment on that proposal from the NRDC. The comment supported the repeal. The final rule repeals section 450.318(d) and redesignates 450.318(e) as 450.318(d).

Section 450.214 Development of Programmatic Mitigation Plans

Section 450.214 describes the development of programmatic mitigation plans. The FHWA and FTA received comments from a total of 22 entities on this section, which included 15 States, 3 national non-profit advocacy groups, 2 planning organizations, and 2 industry associations. All commenters were generally supportive of the development and use of programmatic mitigation plans within the transportation planning process.

General Comments

Two States (CALTRANS and NYS DOT) commented on the eligibility for Federal funding for the development of programmatic mitigation plans, noting that without dedicated funding, there may not be enough staff resources to enable the development and review of programmatic mitigation plans. The FHWA and FTA note that the development of programmatic mitigation plans was allowed prior to the enactment of MAP–21 (section 1311) and the inclusion of language on programmatic mitigation plans in the final rule. The availability of Federal funds for such activities would depend on the eligibility requirements for any particular type of Federal funding. However, it is expected that Federal funds normally used for transportation planning activities (such as State Planning and Research and Metropolitan Planning funds) would

likely be potential sources of funding for programmatic mitigation plan development, to be evaluated on a case-by-case basis.

The ARTBA commented on the greater use of programmatic mitigation plans and recommended that FHWA and FTA quantify the benefits of using such plans in terms of time saved. In addition, the group also recommended a clearinghouse for mitigation plans used across the Nation to highlight best practices. The FHWA and FTA acknowledge that programmatic mitigation plans are resourceful tools, but the benefits of such plans cannot be quantified at this time due to insufficient data. A clearinghouse for programmatic mitigation plans is under consideration, and may be developed for use in the future.

The NRDC commended FHWA and FTA for the provisions contained within sections 450.214 and 450.320, noting that early planning can reduce conflicts and delays during environmental reviews performed later in project development. The group specifically noted the preference for requiring the development of programmatic mitigation plans within the transportation planning process. The FHWA and FTA appreciate the comment, but the final rule retains the flexibility in the statutory language (23 U.S.C. 169(a)) by allowing for the development of programmatic mitigation plans within the transportation planning process (pursuant to the framework described in 450.214(a)) or other existing authorities as provided for in 450.214(f)). See discussion under sections 450.214(b) and 450.214(e) for additional information. The NRDC also commented on the appropriate nature of consultation with the resource agencies, making a draft of the mitigation plan available for public review and comment, and addressing the comments in the final plan. The FHWA and FTA concur with the points raised by NRDC for programmatic mitigation plans developed pursuant to the framework in section 450.214(a), and have retained the language in the final rule in section 450.214(b).

The National Mitigation Banking Association, a national non-profit advocacy group, noted that many of the attributes of a programmatic mitigation plan specified in section 450.214 are already in place in mitigation and conservation banks across the Nation, and that it would be prudent public policy to make the acquisition of bank credits from approved mitigation banks a central component of a programmatic mitigation plan element. The group also suggested that the final rule incorporate a reference to existing banks and bank credits as the preferred alternative for offsetting transportation impacts. The FHWA and FTA drafted the final rule to retain the statute's flexibility on how States and MPOs address potential environmental impacts to resources from transportation projects, including the use of mitigation and conservation banks. The FHWA and FTA prefer to retain that flexibility in the final rule.

A planning organization (Mid-America Regional Council) provided a general letter of support on the development and use of programmatic mitigation plans and noted that the final rule should include language indicating that States shall coordinate with MPOs on the development and use of such plans. The FHWA and FTA acknowledge that development of programmatic mitigation plans are complex yet resourceful tools in future environmental reviews. Such plans can only be developed through proper guidance by the agencies involved in carrying out the recommendations of the plan, and with the full cooperation of the agencies with jurisdiction. In an effort to develop such complex plans effectively and efficiently, FHWA and FTA encourage full participation and coordination by all agencies with jurisdiction and special expertise over the resources addressed in the plan, and States and MPOs where such plans take effect.

The CALTRANS commented on two instances of preamble language in the NPRM related to mitigation. The first instance noted that the text describing mitigation be clarified to include the terms ''. . . protecting, preserving, rehabilitating, or creating environmental resources . . .'' The second instance noted that ''minimization should be included'' in the discussion involving mitigation. The FHWA and FTA concur with both interpretations. However, the language in section 450.214(a)(2) of the final rule remains unchanged because the comments do not concern regulatory text, but rather preamble language from the NPRM not carried forward into the final rule.

Section 450.214(a)

Three entities (AASHTO, CT DOT, and H–GAC) commented on the proposed language in section 450.214(a)(2)(ii), stating that the resources addressed in the final rule should not be limited to the examples given. The FHWA and FTA concur that the list of resources mentioned in section 450.214(a)(2)(ii) is not meant to be exhaustive, as the use of the term ''include'' conveys that the list of resources is not limited to those examples set out in the regulatory text. Two of the entities (CT DOT and AASHTO) requested that additional resources be added to the list of examples, including archaeological resources and stormwater banks. The commenters also requested that the term ''threatened and endangered species critical habitat'' be split up into ''threatened and endangered species, and critical habitat,'' recognizing that they are two separate categories of potential impacts.

The FHWA and FTA added stormwater and archaeological resources to the list of examples as they represent common examples, and split the term ''threatened and endangered species'' from ''critical habitat,'' given that they represent different concepts.

Finally, the Partnership for Active Transportation requested that ''an assessment of opportunities to mitigate negative environmental impacts of the transportation infrastructure by expanding access to active transportation facilities and completing active transportation networks'' be added to the list of examples. The FHWA and FTA decline to add the example to the list as it more of a broad concept of environmental impacts rather than a particular impact area. However, expanding access to active transportation facilities and completing active transportation networks will likely be a consideration in the transportation planning process.

The CALTRANS commented on the appropriate scale of the programmatic mitigation plan, and inquired whether MPOs may plan on a scale beyond its MPA boundaries. The scope and scale of the programmatic mitigation plan is outlined within the optional framework of section 450.214(a)(1)(ii), which states that the plan may be developed on a statewide, regional, local, ecosystem, watershed, or any similar scale for which the resource category applies.

Section 450.214(b)

Fifteen entities (AASHTO, CALTRANS, CO DOT, CT DOT, DC DOT, H–GAC, ID DOT, MT DOT, ND DOT, NYS DOT, OR DOT, PA DOT, SD DOT, TX, DOT, and WY DOT) commented on the proposed language in section 450.214(b), which stated: ''If a State chooses to develop a programmatic mitigation plan then it shall be developed as part of the statewide transportation planning process . . .'' These commenters found the text proposed under paragraph (b) to be more restrictive than the text of the statute. Specifically, the commenters stated that paragraph (b) should

preserve the flexibility provided in the statute which allows for States and MPOs to develop programmatic mitigation plans within, or outside, the statewide and metropolitan planning processes.

The FHWA and FTA agree with the commenters and modified the language in paragraph (b) to provide flexibility for States and MPOs to develop programmatic mitigation plans either within the transportation planning process or under another authority, independent of the transportation planning process. Based on comments received on paragraph (b), FHWA and FTA also added a new paragraph (f) to the section to provide additional clarity on the flexibility to develop programmatic mitigation plans outside of the transportation planning process, and then adopt such plans into the transportation planning process.

The CALTRANS inquired about the requirements for public review, and whether the requirement for public review under this authority is congruent to a formal NEPA review. States and MPOs retain the flexibility to adopt a programmatic mitigation plan into the transportation planning process by following the process outlined in paragraph (b). There are no specific timelines involved for public review and comment under the optional framework in the final rule, but FHWA and FTA encourage States and MPOs to utilize public review and comment timelines that are consistent with their transportation planning process. Furthermore, all comments on a programmatic mitigation plan received during the public review and comment period should be considered when developing the final plan.

Section 450.214(d)

The CALTRANS noted appreciation for the support for programmatic mitigation plans, but expressed concerns about acceptance of such plans by Federal and State regulatory agencies. The commenter specifically questioned whether rulemaking to govern the regulatory agencies toward the goal of reaching a higher level of commitment to programmatic mitigation planning activities might be possible.

The FHWA and FTA note that the statutory framework for programmatic mitigation plans that is the subject of this final rule specifically requires consultation with the agency or agencies with jurisdiction over the resource covered by the programmatic mitigation plan (23 U.S.C. 169(b)(4)) and in the regulatory text at 23 CFR 450.214(d) and 320(d). However, the statute does not provide FHWA and FTA with authority to affect the responsibility of resource agencies, which must address their own statutory requirements concerning the resources under their jurisdiction. Consequently, the language found in the NPRM and supported by statute is retained with one exception. In paragraph (d), FHWA and FTA replaced the word ''developed'' with ''adopted,'' to indicate that the adoption process described in paragraph (b) is necessary when utilizing a mitigation plan developed under this authority for use in future environmental reviews. Section 1306 of the FAST Act amends 23 U.S.C. 169(f) to change ''may use'' to ''shall give substantial weight to'' and changes ''any other environmental laws and regulations'' to ''other Federal environmental law'' such that a Federal agency responsible for environmental reviews ''shall give substantial weight to'' the recommendations in the programmatic mitigation plan when carrying out its responsibilities under NEPA or ''other Federal environmental law.'' Sections 450.214(d) and 450.320(d) of the Final Rule are amended to reflect these changes.

Section 450.214(e)

Fifteen entities (AASHTO, CALTRANS, CO DOT, CT DOT, DC DOT, H–GAC, ID DOT, MT DOT, ND DOT, NYS DOT, OR DOT, PA DOT, SD DOT, TX DOT, and WY DOT) commented on preserving the flexibility in the statute for States and MPOs to determine whether to develop programmatic mitigation plans, citing the voluntary nature of programmatic mitigation plans.

The FHWA and FTA concur with the commenters and have edited the language in the NPRM to clarify that the development of the programmatic mitigation plan is entirely optional, as addressed in the introductory language of the regulatory text in section 450.214(a). The FHWA and FTA encourage the development and use of programmatic mitigation plans, but do not require it as part of the transportation planning process. Based on comments received on paragraphs (b) and (e), FHWA and FTA also added a new paragraph (f) to the section to provide additional clarity on the flexibility to develop programmatic mitigation plans outside of the transportation planning process, and then adopt such plans into the transportation planning process.

Section 450.216 Development and Content of the Long-Range Statewide Transportation Plan

Fifty commenters submitted comments on this section (AASHTO, ASHTD, Boone County Resource Mgmt., Braxo Valley COG, Buckeye Hills-Hocking Valley RDD, CO DOT, Crystal Hitchings (private citizen), DC DOT, East TX Chief Elected Officials/RPO, Florida MPO Advisory Council, FMATS, IA DOT, ID DOT, ME DOT, Meramec RPC, MI DOT, Mid-Columbia Economic Development District, Mid-Region Rural Planning Agencies TPO and NM RTPOs, MO DOT, MT DOT, NADO, NARC, National Association of Working Women, National Trust for Historic Preservation, NC DOT, ND DOT, NJ DOT, North Carolina Association of RPOs, North Central Pennsylvania RPDC, Northern Maine Development Commission, Northern Shenandoah Valley Regional Commission, NRDC, NY State Association of MPOs, NYS DOT, OR DOT, Partnership for Active Transportation, Region Five Development Commission, Region Nine Development Commission, SD DOT, South Alabama RPC and RPO, South Plains AOG, Southern Windsor County RPC, TX DOT, Transportation for America, Two Rivers-Ottauquechee Regional Commission, Upper Minnesota Valley RDC, VA DOT, VT DOT, West Central Indiana EDD, WI DOT, and WY DOT). Nineteen of the comment letters were from States, 18 were from regional planning organizations, 8 were from associations representing public transportation agencies, 4 were from advocacy groups, and 1 was from an MPO.

Several RPOs (Boone County Resource Management, Brazo Valley COG, Buckeye Hills-Hocking Valley RDD, East Texas Chief Elected Officials RPO, Meramec RPC, Mid-Columbia EDD, Mid-Region Rural TPO and New Mexico RTPOs, NADO, North Carolina Association of RPOs, Northern Maine Development Commission, Northern Shenandoah Valley Regional Commission, Region Five Development Commission, Region Nine Development Commission, South Alabama RPC and RPO, South Plains AOG, Southern Windsor County RPC, Two Rivers-Ottauquechee Regional Commission, Upper Minnesota Valley RDC, and West Central Indiana EDD) and one citizen (Crystal Hitchings) commented that there are several regional plans that States should consider incorporating (by reference or summary) into their long-range statewide transportation plan, particularly in States where an RTPO framework is not in place to provide regional long-range transportation plans. Specific examples provided include the Comprehensive Economic Development Strategies (CEDS), required for EDDs

recognized by the U.S. Economic Development Administration; and regional sustainability plans, recognized by HUD. The commenters stated that these are examples of plans that provide a regional perspective on transportation and land use that may inform the transportation decisionmaking process and encourage coordinated investment across Federal and other public program funds. In response to these comments, the final rule reflects the statutory provision that requires States to cooperate with nonmetropolitan officials with responsibility for transportation or the RTPOs, if applicable, when developing the long-range statewide transportation plan. The RTPOs or nonmetropolitan officials with responsibilities for transportation are encouraged to share these regional plans with the State during this cooperative process. However, this cooperation does not mean that the State must incorporate these plans or their investment strategies into the long-range statewide transportation plan. That is at the discretion of individual States.

The NRDC commented on the section-by-section analysis of the long-range statewide transportation plan in the NPRM, which states that section 450.216 maintains the opportunity for the long-range statewide transportation plan to be comprised of policies and/or strategies, not necessarily specific projects over the minimum 20-year forecast period. The commenter stated that, in addition to policies and/or strategies, the long-range statewide transportation plan should also include specific projects.

In response to this comment, FHWA and FTA believe that in section 23 U.S.C. 135(f), Congress intended to allow States the flexibility to develop a long-range statewide transportation plan that includes policies and/or strategies and not specific projects. The FHWA and FTA have reflected that intention in section 450.216 of the final rule. States may, at their discretion, include projects in the long-range statewide transportation plan. However, 23 U.S.C. 135(f) and the final rule do not require it. No changes are made to this section as a result of the comment.

Section 450.216(b)

Section 1202 of the FAST Act amends 23 U.S.C. 135(f)(8) such that the long-range statewide transportation plan shall include consideration of the role of intercity buses may play in reducing congestion, pollution, and energy consumption. Section 450.216(b) in the final rule is amended to include this new provision.

Section 450.216(d)

Several commenters (AASHTO, MI DOT, NC DOT, and SEMCOG) objected to section 450.216(d), which states that the long-range statewide transportation plan should integrate the priorities, goals, countermeasures, strategies, or projects contained in the HSIP, including the SHSP, and the Public Transportation Agency Safety Plan. The commenters asked that it be struck from the final rule because it is not specifically in the statute. The basis of this provision predates the MAP–21. The integration of safety and the priorities, goals, countermeasures, and projects of the SHSP into the long-range statewide transportation plan was also part of the previous 2007 planning regulations (23 CFR 250.214(d)).

The FHWA and FTA believe the importance of safety, particularly the early consideration of safety, warrants retaining this provision in the final rule. The FHWA and FTA note that compliance with this provision is not mandatory under the old rule or under this final rule. Lastly, safety is one of the key performance areas identified in MAP–21 for performance management of the transportation system and, consequently, is part of the MAP–21 mandated performance based planning process. The FHWA and FTA therefore left this provision in the final rule as proposed.

The New York Association of MPOs commented that in paragraph (d)(2), the language lacks guidance on when targets should be set and how frequently they should be updated. The FHWA and FTA respond that the timeframe for States and MPOs to set targets is tied to the effective dates of the performance management rules, not the planning rule. In sections 450.226 and 450.340, the planning rule sets the timeframe whereby the performance targets must be reflected in the long-range statewide transportation plan and in the MTPs.

The NYS DOT expressed support for a performance-based approach to the development of the long-range statewide transportation plan, with more emphasis on data driven program outcomes, whereas its previous long-range statewide transportation plans have been policy focused and less quantitative in terms of goal setting. The commenter further commented on the need for flexibility in the timeframe for updating the long-range statewide transportation plan and the necessary coordination with MPO long-range planning.

The FHWA and FTA response to this comment is that the planning NPRM and the final rule, in sections 450.226 and 450.340, consistent with 23 U.S.C. 135(l) and 49 U.S.C. 5304(k) provide for a 2-year transition period after the publication of this final rule for the States and MPOs to bring their planning documents (long-range statewide plan, MTP, STIP, and TIPs) into compliance with these requirements.

Section 450.216(f)

Section 1202 of the FAST Act amends 23 U.S.C. 135(f)(7) to change ''should'' to ''shall'' to note that the statewide transportation plan ''shall'' include a description of performance measures and targets and ''shall'' include a system performance report. Sections 450.216(f)(1) and (2) in the final rule are amended to include this new provision.

Section 450.216(f)(2) states that the statewide transportation plan shall include a system performance report, and subsequent updates, evaluating the condition and performance of the transportation system with respect to the performance targets, including progress achieved by the MPOs in meeting the performance targets in comparison with system performance recorded in previous reports. The Florida MPO Advisory Council commented that it is unclear if the performance targets described in this section relate to those set by the State or those set by the MPO, and that it also is not clear the comparison described in this section is to State or metropolitan area system performance recorded in previous reports.

The FHWA and FTA response to this comment is that this report shall include a description of both State and MPO targets and also a description of State and MPO progress at achieving their respective targets. This requirement is based on 23 U.S.C. 135(f)(7) and 49 U.S.C.(f)(7)(B), which state that the long-range statewide transportation plan shall include a system performance report and subsequent updates evaluating the condition and performance with respect to the performance targets, including progress achieved by the MPO in meeting the performance targets in comparison with system performance recorded in previous reports.

The WI DOT commented that section 450.216(f)(2) does not address the inclusion of performance targets in plans adopted shortly after rule publication. The FHWA and FTA response to this comment is that sections 450.226 and 450.340 provide for a 2-year transition period after publication of the final rule for States and MPOs to bring the long-range statewide transportation plan, MTPs, STIPs, and TIPs into compliance. The

IA DOT commented that it is not clear what subsequent updates refers to in section 450.216(f)(2). In response, FHWA and FTA refer the commenter to a similar comment and response at section 450.324(f)(4).

The ME DOT sought further clarification on the system performance report that must be included with updates to the long-range statewide transportation plan. Specifically, the ME DOT asked what would be the required cycle for subsequent updates of the long-range statewide transportation plan. In response, the MAP–21 and the FAST Act do not establish a cycle for updating the statewide long-range transportation plan. It is at the State's discretion to decide when to undertake an update. However, if a State chooses to update its long-range statewide transportation plan after the regulatory phase-in provisions in sections 450.226 and 450.340, the State must reflect the new requirements in that update.

The FMATS emphasized the necessary coordination among the States, MPOs, and operators of public transportation to establish performance targets. The FHWA and FTA agree that coordination between the State, MPOs, and operators of public transportation will be critical to both setting and achieving performance targets for each of the entities.

The FMATS also pointed out that fundamentally, the State develops a long-range statewide transportation plan that is a policy document, whereas the MPO MTP contains a fiscally constrained project list and policies. This might create a disconnect in State and MPO coordination. The FMATS noted that an MPO has no say in which projects actually are implemented, and that may impact the MPO's performance reporting and ability to achieve performance targets. In response, FHWA and FTA feel strongly that interagency coordination is an important part of successful implementation of the 3–C planning process, including the new requirements for performance-based planning. Section 450.314 of the final rule provides that the States, MPOs, and operators of public transportation must identify and document, either through the metropolitan planning agreement or other means, their mutual responsibilities in the implementing a performance-based approach to planning and programming. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.216(l)

Section 1202 of the Fast Act amends 23 U.S.C. 135(f)(3)(A)(ii) to add adds public ports to the list of entities States shall provide a reasonable opportunity to comment on the plan and adds examples of private providers of transportation. Section 450.216(l)(2) in the final rule is amended to include these new provisions.

Section 450.216(n)

The AASHTO, ASHTD, ID DOT, MI DOT, MT DOT, ND DOT, SD DOT, and WY DOT requested that FHWA and FTA delete the language in section 450.216(n) that states that the long-range statewide transportation plan should be informed by the financial plan and the investment strategies from the State asset management plan for the NHS and by the public transit asset management plans. The commenters argue that it infringes on the States' flexibility to determine the content in their long-range transportation plans, including whether to create a policy- or project-based plan. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The VA DOT recommends that FHWA and FTA specifically require that development of the long-range statewide transportation plan includes consideration or integration of the congestion management plans, performance plans and, where applicable, the CMAQ performance plan. The FHWA and FTA response is that under the final rule at sections 450.206(c)(4) and 450.306(d)(4), the States and MPOs are required to integrate the goals, objectives, and performance measures from other State transportation plans and transportation processes, as well as any plans developed pursuant to chapter 53 of title 49, into the statewide and metropolitan transportation planning processes. Examples of such plans include the HSIP and SHSP, as defined in 23 U.S.C. 148; the State Asset Management Plan for the NHS, as defined in 23 U.S.C. 119(e); the State Freight Plan (if the State has one), as defined in section 1118 of MAP–21; the Transit Asset Management Plan, as defined in 49 U.S.C.; the Public Transportation Agency Safety Plan, as defined in 49 U.S.C. 5329(d); and, for certain MPOs in metropolitan areas, the congestion mitigation and air quality improvement program performance plan as defined in 23 U.S.C. 149(l), as applicable, and the congestion management process, as defined in 23 CFR 450.322, if applicable. Since the congestion mitigation and air quality improvement performance plan and the congestion management process are unique to certain metropolitan areas, FHWA and FTA limited the integration of those plans to the metropolitan transportation planning process in those areas.

The Nine to Five National Association of Working Women commented that an equitable transportation system is critical to creating thriving communities of opportunity. The commenter stated that where and how we decide to make transportation investments is critical to communities' access to economic opportunity. The commenter further stated that low-income and minority communities face tremendous barriers in access to transportation that can get them to critical places (*e.g.,* school, work, child care, appointments, and grocery stores), and that reducing those barriers will require targeted investments. The commenter further stated that by developing State and metropolitan planning guidance that includes the voices of directly affected communities and prioritizes enhanced mobility and opportunity for the most vulnerable populations, transit investments can go a long way to supporting improved social and economic outcomes in these communities. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The National Trust for Historic Preservation commented that additional language should be added under section 450.216(i) to state that State and local resource protection and historic preservation agencies shall be contacted to obtain existing inventories, and the State may fund the preparation or updating of such inventories, pursuant to this Chapter, if inventories are not current or available.

In response to this comment, FHWA and FTA note that at the time the NPRM was under development, language was added to sections 450.206(b) and 450.306(c) to include section 4(f) properties, as defined in 23 CFR 774.17, as one of several examples to consider for establishing the degree of consideration and implementation of the planning factors. Section 4(f) properties include land of a historic site of national, State, or local significance (23 CFR 774.17). The FHWA and FTA also note that under section 450.216(i), it is already provided that the long-range statewide transportation plan shall be developed, as appropriate, in consultation with State, tribal, and local agencies responsible for land use management, natural resources, environmental protection, conservation, and historic preservation. This consultation shall involve comparison of transportation plans to State and

tribal conservation plans or maps, if available, and comparison of transportation plans to inventories of natural or historic resources, if available. The FHWA and FTA agree that if a State seeks to prepare or update local resource protection and/or historic preservation inventories as part of their update to the long-range statewide transportation plan, they may do so, but are not required.

Two advocacy groups (NRDC and Transportation for America) commented that differences between the State and metropolitan planning sections of the proposed rule should be reconsidered. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The NJ DOT commented that similar to the MPO option to use scenario planning, many States also use scenario planning in the development of their long-range statewide transportation plans. The NJ DOT will be considering the use of scenario planning when it undertakes its next update of the long-range statewide transportation plan. The FHWA and FTA encourage other entities, such as the States, to use scenario planning in their transportation planning process as a best practice, particularly as part of developing the long-range statewide transportation plan.

The VT DOT recommended incorporating climate resilience as one of the components of the statewide transportation planning process. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.216(k)

Several commenters (AASHTO, CO DOT, DC DOT, ID DOT, MT DOT, ND DOT, SD DOT, TX DOT, and WY DOT) commented on the requirement in section 450.216(k) that a long-range statewide transportation plan shall include a discussion of potential environmental mitigation activities and potential areas to carry out these activities, and that the State shall develop the discussion in consultation with Federal, State, regional, local, and tribal land management, wildlife, and regulatory agencies. The commenters noted that the consultation referenced in this section is too broad and should only relate to applicable Federal, State, local, and regional agencies and tribes. Specifically, a State's transportation officials should not have to consult on mitigation issues in the southern part of the State with local officials from a distant northern part of the State and that the final rule should be revised to make this clear. The FHWA and FTA agree with this comment and have made this change in section 450.324(f)(10) of the final rule.

The Florida MPO Advisory Council and NARC commented that section 450.216(k) should also include MPOs on the list of entities with which the State must consult when developing the discussion of potential environmental mitigation activities in the long-range statewide transportation plan. The FHWA and FTA response to this comment is that the suggested change is not necessary because States are already required to develop the long-range statewide transportation plan in cooperation with the affected MPOs under section 450.216(g).

The MARC commented that it supports the requirements for State consultation with Federal, State, tribal, regional, and local land management, wildlife, and regulatory agencies when the State is developing discussion on potential environmental mitigation activities for the long-range statewide transportation plan as described in section 450.316(k).

Section 450.216(l)

In section 450.216(l)(2) of the final rule, public ports has been added to the list of interested parties that a State shall provide a reasonable opportunity to comment on the proposed long-range statewide transportation plan exactly as described in the FAST Act section 1201 (23 U.S.C. 135(f)(3)(A)(ii)). Also, in section 450.216(l)(2), examples of providers of private providers of public transportation have been added to the final rule exactly as described in FAST Act section 1202 (23 U.S.C.(f)(3)(A)(ii)) including intercity bus operators, employer based cash-out program, shuttle program, or telework program.

Section 450.216(m)

On sections 450.216(m) (development and content of the long-range statewide transportation plan) and 450.324(f)(11)(iii) (development and content of the MTP), the Partnership for Active Transportation commented that it strongly supports consideration of innovative financing methods in both the long-range statewide transportation plan section and the MTP. The commenter further stated that the proposed revisions in the NPRM should explicitly encourage consideration of innovative financing techniques in the context of active transportation. The commenter also stated that many transportation planners do not currently consider public-private partnerships as a way to finance pedestrian and bicycle projects. The FHWA and FTA believe that the existing language in sections 450.216(m) and 450.324(f)(11)(iii) that encourages an assessment of innovative financing techniques is broad based, and is meant to include all projects in the plan, including the financing of pedestrian and bicycle projects. Therefore, no changes are warranted.

The CO DOT commented that section 450.216(m), which provides that the financial plan for the long-range statewide transportation plan may include an assessment of the appropriateness of innovative finance techniques (for example, tolling, pricing, bonding public-private partnerships, or other strategies) as revenue sources, seems inappropriate and that these financing instruments have been around for a long time. In response to this comment, FHWA and FTA note that even though these techniques might be well-established, this text was included to encourage consideration of financing techniques for projects early on in the planning process (*i.e.,* during the development of the long-range statewide transportation plan). The FHWA and FTA also note that this provision is optional. No changes are made to this section based on this comment.

Section 450.218 Development and Content of the Statewide Transportation Improvement Program

Forty-eight commenters (Addison County RPC, AASHTO, Boone County Resource Management, Brazo Valley COG, Buckeye Hills-Hocking Valley RDD, CT DOT, East Texas Chief Elected Officials RPO, FL DOT, FMATS, GA DOT, Hitchings (private citizen), IA DOT ID DOT, MA DOT, MD DOT, Meramec RPC, Miami-Dade MPO, MI DOT, Mid-Region RTPO and New Mexico RPOs, MN DOT, MT DOT, NADO, NARC, NC DOT, ND DOT, NJ DOT, North Central PA RPDC, Northern Maine Development Commission, NRDC, NYS DOT, OK DOT, Region Five Development Commission, Region Nine Development Commission, RTC and NCTCOG, RI DOT, SD DOT, South Alabama RPC and RPO, Southeast Alabama RPO, SEMCOG, TriMet, Two Rivers-Ottauquechee Regional Commission, TX DOT, Upper Minnesota Valley RDC, US Travel Association, VT DOT, WA State DOT, West Central Arkansas Planning and Development District, West Central Indiana EDD, WI DOT, and WY DOT) submitted comments on this section. Twenty of the comment letters were from States, 17 were from regional planning organizations, 5 were from associations representing transportation agencies, 4 were from MPOs, 1 was from an

operator of public transportation, and one was from an advocacy group.

The NRDC commented that it would like for the FHWA's Federal-aid highway program to be more like the FTA's new starts program. The FHWA and FTA response to this comment is that it is outside the scope of the final rule.

The AASHTO commented that it would like for the final rule to emphasize that the function of the STIP is to provide an annual listing of projects for a period of 4 years to inform the public, partners, and review agencies. In response, FHWA and FTA note that sections 450.218(a)–(q) describe the development and content of the STIP, including requirements to include specific project information, the horizon for the STIP, and State consultation and cooperation with other entities in developing the STIP. Section 450.220 describes FHWA and FTA approvals of the STIP.

Section 450.218(b)

The IA DOT commented on section 450.218(b), seeking clarification if the State's approval of the MPO TIPs constitutes approval or agreement that MPO projects will help make progress toward State and MPO targets. The FHWA and FTA response to this comment is that State (Governor) approval of the MPO TIP does not constitute State approval or agreement that MPO projects in the TIP will help make progress toward State and MPO targets. The FHWA and FTA reiterate that under sections 450.206(c)(2) and 450.306(d)(2)(ii) in the final rule, States and MPOs are required to coordinate State and MPO target setting, and the targets should be consistent to the maximum extent practicable.

Section 450.218(c)

The MN DOT commented that the requirement to develop the STIP in cooperation with affected nonmetropolitan local officials with responsibility for transportation or in cooperation with an RTPO, if applicable, in section 450.218(c) is in conflict with section 450.210(d). Section 450.210(d) provides that an RTPO, if established and designated by the State, shall develop a regional TIP for consideration by the State. The FHWA and FTA do not see this as a conflict. States are required to cooperate with nonmetropolitan local officials or with an RTPO, if applicable, when developing the STIP. However, a State is not required to include an RTPO TIP as part of the STIP.

The OK DOT commented that it does not agree with FHWA and FTA interpretation in section 450.218(c) that the STIP shall be developed in cooperation with affected nonmetropolitan officials with responsibility for transportation or, if applicable, through RTPOs. The OK DOT suggested that development should be in consultation rather than with cooperation, given 23 U.S.C. 135(g)(2)(B)(i).

The FHWA and FTA do not agree with this comment and have explained the rationale for using the word ''cooperation'' in this context in the section-by-section discussion in the NPRM. Specifically, the final rule changed the terms ''consultation'' with ''nonmetropolitan'' officials to ''cooperation'' with ''nonmetropolitan'' officials and added cooperation with RTPOs, if applicable. These changes reflect MAP–21 revisions to 49 U.S.C. 5304(g)(2)(B)(i). Whereas 49 U.S.C. 5304 is nearly the same as 23 U.S.C. 135, this is one instance where changes to the two statutes were inconsistent. The MAP–21 revision to section 135(g)(2)(B)(i) does not change ''consultation'' to ''cooperation.''

In updating the final rule, FHWA and FTA determined that it was appropriate to use the term ''cooperation'' rather than ''consultation'' in this paragraph. To have two different processes (a consultation process for Title 23 actions and a cooperation process for Title 49 actions) is overly burdensome. Using the term ''cooperation'' is consistent with the comparable changes that MAP–21 made to the long-range statewide transportation plan provisions (see section 450.216(h)). Because of the long-standing requirement that the STIP be consistent with the long-range statewide transportation plan (section 450.218(k)), the State should follow a similar coordination process for both of these documents. In addition, as defined for purposes of part 450, cooperation requires States to work more closely with nonmetropolitan local officials and RTPOs, if applicable, than consultation. This change is also consistent with the overall MAP–21 approach to increasing the presence of affected nonmetropolitan local officials and regional planning organizations in the statewide planning process. No changes are made to the final rule based on this comment.

Section 450.218(l)

The AASHTO, ID DOT, MT DOT, ND DOT, SD DOT, SEMCOG, and WY DOT commented that in section 450.218(l), only the cost estimates in the STIP should be shown in year of expenditure dollars and not both cost estimates and revenue projections. See section 450.324(f) for more discussion and FHWA and FTA's responses to this and similar comments on this topic.

The ID DOT, MT DOT, ND DOT, SD DOT, and WY DOT commented that although the financial plan is optional, section 450.218(l) requires too much detail. The FHWA and FTA response to this comment is that this provision provides the State the option of including a financial plan with the STIP, and the details provided in this section are intended to help a State use the financial plan to assess the availability of funding in relation to the costs of implementing the program of projects in the STIP.

Section 450.218(o)

The AASHTO, MI DOT, MT DOT, TX DOT, and WY DOT commented on proposed section 450.218(o). The section states that the STIP should be informed by the financial plan and the investment strategies from the State asset management plan for the NHS and by the public transit asset management plans. The commenters suggested that this language is undefined, confusing, and could potentially be interpreted and applied inconsistently. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The TX DOT commented that the final rule should acknowledge that funding sources other than Federal funds may have a role in helping a State achieve performance targets. The FHWA and FTA have deleted section 450.218(o) from the final rule. The FHWA and FTA agree that funding sources other than Federal funds may have a role in helping a State achieve performance targets. However, FHWA and FTA believe that it would be unnecessarily duplicative to restate this in the final rule.

Section 450.218(p)

The WA State DOT commented that section 450.218(p) should be modified to include the phrase ''or phase of the project'' at the end of this paragraph and state that the STIP shall include a project, or an identified phase of a project, only if full funding can reasonably be anticipated to be available or the project or phase of the project within the time period contemplated for completion of the project. The FHWA and FTA disagree with this comment. The FHWA and FTA believe that in the language in 23 U.S.C. 135(g)(5)(E), Congress intended that the STIP would be fiscally constrained and that projects in the STIP would be fiscally constrained. As a result, FHWA and FTA used the language from 23 U.S.C.

135(g)(5)(E) in this paragraph. This has been a long-standing interpretation. By making the change that the commenter requested, it would change the meaning of the paragraph by allowing States to include project phases in the STIP without demonstrating funding availability for the entire project. The result would be such projects and the STIP itself would not be fiscally constrained. As such, FHWA and FTA are not making changes to the final rule.

Section 450.218(r)

Section 450.218(r) requires that the STIP include, to the maximum extent practicable, a discussion of the anticipated effect of the STIP toward achieving the performance targets identified by the State in the long-range statewide transportation plan or other State performance-based plans linking investment priorities to those performance targets. It further states that this discussion should be consistent with the strategies to achieve targets presented in the long-range statewide transportation plan and other performance management plans such has the highway and transit asset management plans, the SHSP, the public transportation agency safety plan, the CMAQ performance plan, and the State freight plan (if one exists). Several commenters (AASHTO, ID DOT, MT DOT, ND DOT, NY DOT, SD DOT, and WY DOT) objected to the language and suggested instead that this paragraph should track the statutory language.

The FHWA and FTA agree, in part, with this comment and eliminated the list of examples of other performance management plans that was proposed for inclusion in section 450.218(r) because these examples are already listed in section 450.206(c)(4). The FHWA and FTA feel that the provisions in section 450.206(c)(4) are sufficient to ensure the integration of elements of other federally required performance-based plans and processes and so do not need to reiterate. The FHWA and FTA retained the phrase ''or other State performance-based plan(s)'' in this paragraph because, as noted in 23 CFR 450.216(f)(1), a State is not required to include performance targets in the long-range statewide transportation plan. For those States that do not include performance targets in the long-range statewide transportation plan, this provision would make it clear that States are still required to utilize other State performance-based plans for those targets. Section 450.218(r) in the NPRM became section 450.218(q) in the final rule with the changes noted above.

The MN DOT commented that the STIP should not be the identified document for reporting, and that the reporting requirements of section 450.218(r) are too prescriptive. The MN DOT further commented that it would like flexibility in how and where to report.

In response to this comment, FHWA and FTA believe that the intent of Congress in 23 U.S.C. 135(g)(4) is that the STIP will include, to the maximum extent practicable, a discussion of the anticipated effect of the STIP toward achieving the performance targets established in the long-range statewide transportation plan, linking investment priorities to those performance targets. The FHWA and FTA have reflected that intent in section 450.218(r) of the NPRM, which became 450.218(q) in the final rule. As previously discussed, the language in the NPRM at section 450.218(r), which required the State to link this discussion in the STIP to the other State performance-based plans and processes, was removed from the final rule.

Several commenters (AASHTO, CT DOT, FL DOT, GA DOT, ID DOT, MT DOT, NC DOT, ND DOT, NYS DOT, SD DOT, TriMet, WI DOT, and WY DOT) commented on section 450.218(r) in the NPRM that States should not be required to include information on individual projects and should not be required to link individual projects with specific performance measures as part of the discussion on the anticipated effect of the STIP toward achieving the performance targets in the long-range statewide transportation plan or other State performance based plan(s). See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses. Section 450.218(r) in the NPRM and section 450.218(q) in the final rule include requirements for States to include a discussion in the STIP of the anticipated effect of the STIP (as a whole) toward achieving the federally required performance targets identified by the State in the long-range statewide transportation plan or other state performance-based plans, linking investment priorities (at a program level) to those performance targets.

At least one commenter suggested that it is unlikely that the projects within a 4-year program will actually result in a target being met. Another commenter suggested requiring the State, not the MPO, to be responsible for establishing and tracking performance in the MPO TIPs. The FHWA and FTA respond that these comments are outside the scope of the final rule and are more appropriate for the other performance management rules.

The AASHTO, ID DOT, MT DOT, ND DOT, SD DOT, and WY DOT commented on proposed section 450.218(r) that the performance reporting should only be limited to federally required performance measures. The FHWA and FTA agree with this comment but do not believe revisions to the regulatory text are necessary.

The AASHTO, CT DOT, IA DOT, MD DOT, NC DOT, VT DOT, and WI DOT commented on section 450.218(r) that States should have discretion regarding the discussion of the anticipated effect of the STIP toward achieving the performance targets. That this may include references to such documents as performance reports that are more user friendly. The FHWA and FTA agree that States and MPOs should be provided some flexibility in how they craft the discussion in the STIP on the anticipated effect of the STIP toward achieving the performance targets, and that States referencing other reports as part of this discussion would be acceptable.

The IA DOT commented that the phrase ''to the maximum extent practicable'' in section 450.218(r) should be clarified with regard to the level of analysis required to demonstrate that projects in the STIP will help meet performance targets.

Based on these comments, FHWA and FTA will consider developing guidance after this final rule and the other performance management final rules are published to provide assistance to the States and MPOs on how this requirement might be met and to what extent they should demonstrate that the projects (program) in the STIP and MPO TIPs will help meet performance targets. Similar comments were submitted on section 450.326(d).

Two States (MN DOT and NJ DOT) commented on section 450.218(r) that the requirements for States to discuss in the STIP the anticipated effect of the STIP toward achieving performance targets goes too far and is overly prescriptive, even with the use of the phrase ''to the maximum extent practicable.'' The MN DOT further stated that it annually publishes a stand-alone transportation performance report. The response to this comment is that FHWA and FTA believe that the intent of Congress in 23 U.S.C. 135(g)(4) is that the STIP include, to the maximum extent practicable, a discussion of the anticipated effect of the STIP toward achieving the performance targets established in the long-range statewide transportation plan (or other State

performance-based plans), linking investment priorities to those performance targets.

The U.S. Travel Association commented that linking investment to performance measures is imperative to developing efficient transportation networks that provide mobility choices throughout the Nation. In response to this comment, FHWA and FTA note that section 450.218(r) in the NPRM, which became section 450.218(q) in the final rule, expressly states the STIP shall include, to the maximum extent practicable, a discussion of the anticipated effect of the STIP toward achievement of performance targets, linking investment priorities to those priorities.

Several regional planning organizations (Addison County RPC, Boone County Resource Management, Braxo Valley Council of Government, Buckeye Hills-Hocking Valley RDD, East Texas Chief Elected Officials RPO, Meramec RPC, Mid-Region Rural TPO and New Mexico RTPOs, NADO, Northern Maine Development Commission, Region Five Development Commission, Region Nine Development Commission, South Alabama RPC and RPO, Southeast Alabama RPO, Two Rivers-Ottauquechee Regional Commission, West Arkansas Planning and Development District, and West Central Indiana EDD) and one citizen (Crystal Hitchings) commented that in situations where a State has not designated and established RTPOs that would develop a regional TIP, the State should refer to the regional priorities identified in other regional transportation plans when selecting priorities for the STIP (*e.g.,* regional economic development plans).

In response to this comment, in situations where a State has not designated and established an RTPO, the final rule requires the State to cooperate with nonmetropolitan local officials when developing the STIP. This cooperation might include discussion on regional priorities identified in other regional transportation plans (*e.g.,* regional economic development plans). This cooperation does not mean that States have to refer to these other plans as part of the STIP.

The FMATS commented on NPRM section 450.218(r) that it is essential for the States to develop performance targets in full coordination with the MPOs and the nonmetropolitan planning areas to ensure that performance targets are considered during the development of TIPs and STIPs and investment priorities are tied to targets.

The FHWA and FTA agree that State and MPO coordination is a key part of target setting by the States and the MPOs. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses. It is also important that MPOs and operators of public transportation coordinate in metropolitan areas and that States coordinate with rural operators of public transportation as part of target setting.

The Miami-Dade MPO stated that it is important not only for States to coordinate the STIP with MPOs, but also important that the STIP be consistent with metropolitan plans, especially in TMAs. In response to this comment, FHWA and FTA reiterate that the STIP and the TIP must be consistent with the long-range statewide transportation plan (section 450.218(k)) and the MTP (section 450.326(i)), respectively, and that the STIP must incorporate the TIP without alteration (section 450.218(b)).

The MA DOT commented that it supports transparency within the context of the STIP to provide a more useful public document. The FHWA and FTA agree with this comment. The STIP is a key document for identifying the States program of federally funded projects, and through the public involvement process, it provides transparency on the States planned expenditure of Federal funds on projects.

The NRDC commented that they disapprove of the differences between the sections covering STIPs and those covering TIPs, particularly the use of the terms ''may'' and ''shall.'' The NRDC argues that the provisions in the final rule for the State STIP should mirror those for the MPO TIP. For example, in section 450.218(l), the STIP may include a financial plan, whereas in section 450.324(f)(11), the TIP shall include a financial plan. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.218(r) in the NPRM requires that the STIP shall include, to the maximum extent practicable, a discussion of its effect toward achieving the performance targets identified by the State in the long-range statewide transportation plan or other state performance-based plans. The NJ DOT commented that using the STIP as the vehicle for reporting is too prescriptive.

The FHWA and FTA respond that they believe it was the intent of Congress in 23 U.S.C. 135(g)(4) that the STIP shall include, to the maximum extent practicable, a discussion of the anticipated effect of the STIP toward achieving the performance targets established in the statewide transportation plan, linking investment priorities to those performance targets. Therefore, FHWA and FTA included this provision in the final rule at section 450.218(q).

The NJ DOT also stated that the STIP and the final rule should not require States to include performance information on specific projects or link individual projects to specific performance measures. The FHWA and FTA respond that this comment is outside the scope of the final rule and will depend on the specific performance measures identified in the other FHWA and FTA rules or guidance.

The NJ DOT further stated that large portions of the NHS are supported by non-Federal funding sources, such as independent toll authorities, and that projects funded by non-Federal sources may appear in the STIP for information purposes. The commenter further stated that the final rule should acknowledge that funding sources other than Federal funds may have a role in meeting performance targets. The FHWA and FTA agree that funding sources other than Federal funds may be used on the NHS. However, the FHWA and FTA do not feel that it is necessary to mention this specifically in the final rule because section 450.218(g) already states that the STIP is only required to include projects proposed for funding under 23 U.S.C. and 49 U.S.C. Chapter 53.

Section 450.220 Self-Certification, Federal Findings, and Federal Approvals

Seven advocacy groups (Community Labor United, Front Range Economic Strategy Center, National Association of Social Workers, Partnership for Working Families, Policy Link, The Leadership Conference on Civil and Human Rights, and United Spinal Association) provided comments on this section. They provided comments about the relationship of the transportation planning process to traditionally underserved populations, including EJ and Title VI of the Civil Rights Act of 1964. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.222 Project Selection From the STIP

Three commenters (AASHTO, NC DOT, and WA State DOT) submitted comments on this section. The AASHTO requested that the phrase ''with responsibility for transportation'' be removed from the phrase

''nonmetropolitan local officials with responsibility for transportation'' in section 450.222(c) because it is redundant with the definition of the term ''local officials'' that is provided in section 450.104.

The FHWA and FTA response to this comment is that the proposed definition for local officials was removed from the final rule (see discussion under 450.104 in the section by section). However, the final rule retains the long-standing definition for nonmetropolitan local officials. The phrase ''with responsibility for transportation'' means elected and appointed officials of general purpose local government who have responsibility (decisionmaking authority) for transportation either through ownership, operation, maintenance, implementation, or other means.

The NC DOT requested clarification on the definition of a ''nonmetropolitan local official with responsibility for transportation'' in paragraph (c). The FHWA and FTA response is that section 450.104 contains a definition for nonmetropolitan local official. In section 450.104, a nonmetropolitan local official with responsibility for transportation means elected and appointed officials of general purpose local government in a nonmetropolitan area with responsibility for transportation.

The WA State DOT sought clarification on how FHWA or FTA could approve a project or know of the funding for operating assistance if the project is not programmed in the STIP. The commenter recommended clarifying these situations in section 450.222(a).

In response, projects are funded through grant requests that are submitted to FTA by eligible recipients for authorization and requests to authorize projects and obligate funds submitted to FHWA by the States. Section 450.222(a) refers to sections 450.218(g) and 450.220(d), which describe specific situations where projects do not have to be in the STIP. Section 450.220(d) is a long-standing regulatory provision that allows FHWA and FTA to approve operating assistance for specific projects or programs without including a project or program in the STIP. The FHWA and FTA also note that, as described in section 450.218(g), there are also other categories of projects that do not have to be included in the STIP. Based on these comments, FHWA and FTA made no changes to the final rule.

Section 450.224 Applicability of NEPA to Statewide Transportation Plans and Programs

The AASHTO, Boone County Resource Management, Brazo Valley COG, Buckeye Hills-Hocking Valley RDD, Crystal Hitchings, East Texas Chief Elected Officials RPO, Meramec RPC, Mid-Region Rural TPO and New Mexico RTPOs, NADO, North Carolina Association of RPOs, North Central Pennsylvania RPDC, Northern Maine Development Commission, Northern Shenandoah Valley Regional Commission, Region XII COG, South Alabama RPC and RPO, Southern Windsor County RPC, Two Rivers-Ottauquechee Regional Commission, West Central Arkansas Planning and Development District, and West Central Indiana EDD submitted comments on this section to the docket.

The commenters suggested that RTPOs should be mentioned as contributors to the NEPA review process since they may be involved in establishing the purpose and need for subarea corridor plans. In response to this comment, FHWA and FTA feel that RTPOs could contribute to the purpose and need for the NEPA review process given their role in conducting regional planning. However, it is up to the State and the RTPO in their cooperative planning process to determine the role of the RTPO in contributing to purpose and need in NEPA review. Many of the planning products developed thorough an RTPO's regional planning process, such as the regional transportation plan and corridor studies, are potentially helpful toward contributing to the purpose and need for a project. This supports stronger linkages between the planning and environmental processes and provides an opportunity to streamline the project development process.

The FHWA and FTA do not believe that a change is warranted in the final rule because the establishment of RTPOs and their use to contribute to purpose and need for a project is optional. The FHWA and FTA will consider opportunities for including discussion on potential roles for RTPOs in contributing to PEL in future guidance, case studies, and peer exchanges.

The AASHTO commented that the new authority for PEL described in section 1310 of the MAP–21 makes the project development process more complex and cumbersome. The AASHTO recommends that existing authorities for PEL under appendix A to the final rule be retained. The FHWA and FTA response to this comment is that this section 450.224 is not affected by section 1310 of MAP–21. The language in sections 450.212 and 450.318 is affected by the new authorities for PEL that resulted from section 1310 of the MAP–21. See discussion on those sections in the preamble and in the final rule for details. The FHWA and FTA have made no changes to the final rule based on this comment.

Section 450.226 Phase-In of New Requirements

Thirty-six commenters (AASHTO, AK DOT, Albany MPO, ASHTD, California Association for Coordinated Transportation, CO DOT, CT DOT, DC DOT, DRCOG, ID DOT, MT DOT, ND DOT, SD DOT, GA DOT, H–G AC, IA DOT, MD DOT, ME DOT, MI DOT, MN DOT, MO DOT, NADO, NARC, NC DOT, NJ DOT, NYMTA, NYS DOT, OR DOT, PSRC, RI DOT, San Luis Obispo MPO, SEMCOG, TX DOT, WA State DOT, WI DOT, and WY DOT) submitted comments on this section. Twenty-five of the comment letters were from States, six were from MPOs, three were from associations, one was from an operator of public transportation, and one was from an advocacy group.

Many of the commenters (AASHTO, AK DOT, Albany MPO, ASHTD, CO DOT, CT DOT, GA DOT, H–GAC, IA DOT, MD DOT, MI DOT, MN DOT, MO DOT, NARC, NC DOT, NYS DOT, PSRC, RI DOT, San Luis Obispo COG, SEMCOG, and TX DOT) suggested that all of the new performance management requirements final rules should have a single effective date and that the planning requirements should be coordinated with the implementation of the other performance management requirements. The commenters argued that a single effective date would prevent States and MPOs from creating conflicts in establishing and incorporating targets with differing time periods and performance measures during the planning process. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The NYS DOT commented that sections 450.226(a)–(f) should use the phrase ''substantially meets the requirements in this part'' instead of ''meets the requirements in this part.'' In response, FHWA and FTA believe that this clarification would not change the meaning of this section and is not necessary. No changes are made as a result of this comment.

One commenter suggested that FHWA and FTA consider changing the language in the final rule such that only STIP updates would be required to

comply with the performance management requirements after the 2-year transition period instead of requiring compliance with STIP amendments and STIP updates. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

One commenter stated that the phase-in schedule is unclear. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The AASHTO, ID DOT, MT DOT, ND DOT, NJ DOT, NYS DOT, SD DOT, and WY DOT commented that in sections 450.226(e) and 450.226(f), the phrase ''meets the performance based planning requirements'' as part of the larger phrase ''FHWA/FTA will only approve an updated or amended STIP that is based on a statewide transportation planning process that meets the performance based planning requirements in this part and in such a rule,'' is unnecessary and overreaching and should be deleted. See section 450.340 for a detailed discussion and response on this comment.

The IA DOT asked whether the 2-year compliance date also applies to amendments to long-range statewide transportation plans. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The WI DOT questioned how States would demonstrate coordination with nonmetropolitan local officials in the development of the long-range statewide transportation plan and the STIP. In response to this comment, FHWA and FTA note that, as described in section 450.210(b), States must have a documented process for cooperating with nonmetropolitan local officials, that is separate and distinct from the public involvement process, and provides opportunity for nonmetropolitan local official participation in the development of the long-range statewide transportation plan and the STIP. The State is required to review and solicit comments from nonmetropolitan local officials regarding the effectiveness of the cooperative process at least once every 5 years (section 450.210(b)(1)). The FHWA and FTA further note that the final rule defines cooperation in section 450.104. Cooperation means that the State and the nonmetropolitan local officials involved in carrying out the transportation planning and programming processes work together to achieve a common goal or objective. The FHWA and FTA believe that evidence that the State is following its documented process for cooperating with nonmetropolitan local officials helps to demonstrate that the requirement for cooperation with nonmetropolitan local officials in the development of the long-range statewide transportation plan and the STIP is being met.

Subpart C—Metropolitan Transportation Planning and Programming

Section 450.300 Purpose

One comment was received on this section. While the RI DOT agrees with, and supports the performance-based approach to the planning process described in the NPRM, they are concerned with balancing the need for a performance-based approach and public participation. In response, FHWA and FTA acknowledge that public participation is an important part of the statewide and nonmetropolitan and the metropolitan transportation planning processes, and that the use of a performance-based approach to the planning process by the States and the MPOs does add to the complexity of the public participation process. The FHWA and FTA note that States and MPOs should engage the public in the performance-based planning process and consider their input when making decisions about system performance, including when setting performance targets for performance measures and making investment decisions for the statewide long-range transportation plan, MTP, STIP, and TIP.

Sections 1202 and 1201 of the FAST Act, codified at 23 U.S.C. 135(a)(2) and 23 U.S.C. 134(a)(1) respectively, added intermodal facilities that support intercity transportation, including intercity bus facilities and commuter van pool providers to the purpose of the statewide and metropolitan multimodal transportation planning processes. The Final Rule at sections 450.200 and 450.300 is amended to reflect this change.

Section 1201 and 1202 of the FAST Act amends 23 U.S.C. 134(a)(1) and adds ''takes into consideration resiliency needs'' to the purpose of the of the metropolitan transportation planning process and the statewide and nonmetropolitan transportation planning process (23 U.S.C. 135(a)(2)). The Final Rule at sections 450.300(a) and 450.200 are amended to add this change.

Section 450.302 Applicability

Section 450.302 discusses the applicability of subpart C to organizations and entities responsible for the transportation planning and programming processes in MPAs. Subpart C are the provisions for metropolitan transportation planning and programming. No comments were received on this section. The FHWA and FTA did not propose any changes in the NPRM or make any changes in the final rule to this section.

Section 450.304 Definitions

Section 450.304 describes the terms defined and used in this subpart C. No comments were received on this section. The FHWA and FTA did not propose any changes in the NPRM or make any changes in the final rule.

Section 450.306 Scope of the Metropolitan Transportation Planning

Comments were received from Albany MPO, AMPO, APTA, ARTBA, Board of the French Broad River MPO, California Association for Coordinated Transportation, CALTRANS, Capital Area MPO, Charlotte MPO, Community Labor United, CT DOT, DC DOT, DVRPC, Enterprise Community Partners, Florida MPO Advisory Council, FMATS, Front Range Economic Strategy Center, Houston MPO, MAG, MARC, Maui MPO, MD DOT, ME DOT, Memphis MPO, MET Council, MTC, MN DOT, NACTO, NARC, National Association of Social Workers, National Housing Conference, National Trust for Historic Preservation, NCTCOG/RTC, NJ DOT, NJPTA, Northeast Ohio MPO, New York Association of MPOs, NRDC, NYMTA, NYMTC, NYS DOT, OK DOT, PA DOT, Partnership for Active Transportation, Partnership for Working Families, Policy Link, Portland Metro, Public Advocates, River to Sea TPO, SACOG, San Luis Obispo MPO, SANDAG, Santa Cruz County MPO, SCAG, Sierra Club, SJCOG, South Florida MPO, TriMet, TX DOT, United Spinal Association, VA DOT, WA State DOT, Westchester County Department of Public Works, WFRC, Wilmington MPO, and WMATA. Twenty-three comments were received from MPOs, 15 from advocacy organizations, 13 from States, 6 from transportation associations, 4 from operators of public transportation, and 1 from a local government.

Sections 1202 and 1201 of the FAST Act amended 23 U.S.C. 134(h)(1) and 23 U.S.C. 135(d)(1) respectively to add two new planning factors to the scope of the statewide and nonmetropolitan and the metropolitan transportation planning processes: Improve resiliency and reliability of the transportation system and reduce or mitigate stormwater impacts of surface transportation; and enhance travel and tourism. The Final Rule at sections 450.206(a)(9) and (10)

and 450.306(b)(9) and (10) are amended to reflect these new planning factors.

The San Luis Obispo COG and SCCRTC commented about issues with State and MPO coordination on performance based planning and programming. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.306(d)(2) discusses the establishment of performance targets by the MPO. The Memphis Urban Area MPO commented that the final rule should clarify to what extent parties should proceed with harmonized targets. The FHWA and FTA response to this comment is that section 450.306(d)(2)(i) requires States and MPOs to coordinate target setting to ensure consistency, to the maximum extent practicable, for the measures described in 23 U.S.C. 150(c). Section 450.306(d)(2)(iii) requires MPOs to coordinate with public transportation operators, to the maximum extent practicable, when selecting performance targets that address performance measures described in 49 U.S.C. 5326(c) and 5329(d). No changes were made based on these comments.

Section 450.306(d)(4) in the NPRM would require an MPO to integrate into the metropolitan transportation planning process, directly or by reference, the goals, objectives, performance measures, and targets described in other State transportation plans and transportation processes, and any plans developed under 49 U.S.C. chapter 53 by operators of public transportation. Examples of such plans include the State asset management plan for the NHS, described under 23 U.S.C. 119(e); the transit asset management plan, described under 49 U.S.C. 5326; the SHSP, described under 23 U.S.C. 148; and the Public Transportation Agency Safety Plan, described under 49 U.S.C. 5329(d). The Albany MPO, AMPO, DVRPC, NARC, NYMTC, New York State Association of MPOs, PA DOT, and San Luis Obispo COG commented that this requirement appears to be in conflict with sections 450.306(d)(2)(i), (ii), and (iii), which state that each MPO shall establish performance targets and the selection of targets shall be coordinated with the State and, to the maximum extent practicable, operators of public transportation. The FHWA and FTA response to this comment is that these provisions do not conflict. They reflect the need for close coordination among States, MPOs, and operators of public transportation during the target setting process to ensure that the targets are coordinated and consistent to the maximum extent practicable. This would suggest that coordination during the development of other performance-based plans (such as asset management plans, safety plans, freight plans, and congestion plans) is also desirable because these plans could affect the performance targets and the investments that support those targets set by the State, MPO, and the operator of public transportation. Both of these provisions are based on statute.

The AMPO commented on section 450.306(d)(4) that it is concerned about what the integration of other performance-based plans and processes into the metropolitan transportation planning process might mean. The FHWA and FTA response to this comment is that integration of other performance-based plans and processes into the metropolitan transportation planning process means, as described in section 450.306(d)(4), that an MPO integrates the goals, objectives, performance measures, and targets described in State transportation plans and processes, and any plans developed by operators of public transportation under 49 U.S.C. chapter 53, into the metropolitan transportation planning process. The FHWA and FTA believe that this integration means that as MPOs develop the MTP and TIP as part of their metropolitan transportation planning process, they should be considering the goals, objectives, performance measures, and targets that are described in these other performance-based plans and processes. Examples of these performance-based plans and processes are included in section 450.306(d)(4).

The Metropolitan Council MPO commented on section 450.306(d)(4) concerning the required integration of elements of other State performance based plans and processes. It suggested that the MPO should determine which plans should be integrated into its performance-based planning process. In response, FHWA and FTA note that the statutory requirement, at a minimum, is for the integration of elements (goals, objectives, performance measures, and targets) of other federally required performance-based plans and processes developed by the State or recipients of assistance under chapter 53. An MPO would only integrate those elements that are appropriate to the MPA of the MPO. In developing this provision, FHWA and FTA closely followed the statutory provisions. The FHWA and FTA have listed examples of these federally required plans in this section.

One operator of public transportation (WMATA) commented that the agency level plans that are required to be integrated into the planning process under this paragraph have limited direct relevance to the MAP–21's overarching mandate for effective performance management of transportation systems. The WMATA further noted that these plans are relevant at the agency level, but not at the larger transportation system level.

The FHWA and FTA respond that the requirement to integrate elements of other performance-based plans into the transportation planning process is limited to elements of the federally required State transportation plans and processes and any plans developed by operators of public transportation under 49 U.S.C. chapter 53. A list of examples is provided in paragraph (d)(4) of this section.

The AMPO, APTA, Metropolitan Council MPO, and WFRC commented that the use of performance measures and targets should be programmatic and not project specific. The FHWA and FTA response to this comment is that it is outside of the scope of the final rule and more appropriate to other performance management rules. This final rule does not establish performance measures or the target setting process.

Several commenters (AMPO, APTA, Board of the French Broad River MPO, and CALTRANS) commented that, under the performance management regulations, existing data collection and reporting mechanisms should be utilized whenever possible and standards should not be created outside of the existing structure. The commenters suggested that the creation of new data collection and reporting requirements would be expensive, unclear, potentially duplicative, and ultimately counterproductive. The FHWA and FTA response to this comment is that it is outside of the scope of the final rule.

The WA State DOT commented on section 450.306(d)(4) that it is unclear how an MPO can integrate an unconstrained plan into a constrained MTP. The FHWA and FTA response to this comment is that section 450.306(d)(4) does not require an MPO to integrate an unconstrained plan into a constrained MTP. Section 450.306(d)(4) requires an MPO to integrate the goals, objectives, performance measures, and targets described in other State transportation plans and processes, either directly or by reference, into the metropolitan transportation planning process.

The NRDC noted that it was in favor of the integration of other plans into the transportation planning process as described in sections 450.206(c)(4) and

450.306(d)(4). The commenter further stated that it would like to include other plans such as FEMA Hazard Management Plans and existing regional plans. See discussion and the FHWA and FTAs response to this comment in section 450.206(c)(4).

The APTA commented that transit agencies operate with different management structures and operating environments and across varying modes and sizes. The APTA suggested that performance measures that do not take into account these divergent operating situations would risk failure. The APTA further stated that individual agencies must be allowed to set their own targets and that they must be simple, understandable, and high-level to be meaningful to the process. The FHWA and FTA response to this comment is that it is outside the scope of the final rule.

The California Association for Coordinated Transportation stated that it agrees with the new provisions for performance-based planning and programming. However, it is concerned that one size does not fit all as there are great differences between urban and rural communities.

The CALTRANS commented that the final rule should require States to consider the impact of VMT during the development of long-range statewide transportation plans and MTPs. The CALTRANS also commented that FHWA and FTA should coordinate the development of any transit-related performance measures to ensure the identified metrics are comparable to performance measures for other transportation modes. The FHWA and FTA response is that these comments are outside the scope of the final rule.

The CALTRANS stated that FHWA and FTA should specifically require that Tribes be consulted when performance targets are being set due to the lack of data on many Tribal lands. The FHWA and FTA response to this comment is that under section 450.208(a)(5), in carrying out the statewide transportation planning process, States are required to consider the needs of Tribal governments that have jurisdiction over land within the boundaries of the State. Similarly, section 450.316(c) requires MPOs to appropriately involve Tribal governments in the development of the MTP and TIP when the MPA includes Tribal lands. Because MPOs are required to describe targets in the MTP (section 450.324(f)(3)) and report on target achievement in the TIP (section 450.326(d)), FHWA and FTA believe the involvement of Tribal governments should include involvement during the development of federally required performance targets for the national performance measures.

The AMPO and APTA commented that the final rule should recognize the unique timing, durations, and requirements of long-range statewide transportation plans, MTPs, and individual system transit asset management plans and that FHWA and FTA should not attempt to alter those unique processes to somehow make them fit neatly together. The FHWA and FTA agree with this comment. Consistent with MAP–21, FHWA and FTA developed phase-in provisions in the final rule (sections 470.226 and 450.340). The final rule takes into consideration the established planning update cycles for the States and the MPOs. The phase-in does not require a State or MPO to deviate from its established planning update cycle to implement changes made by this section. States and MPO shall reflect the changes made to their transportation plan and to the STIP or TIP not later than 2 years after the date of issuance of the final performance management rules for the performance management requirements.

The APTA commented that performance measures should remain unchanged over a number of years. The APTA commented that these performance targets are unlikely to change significantly from year-to-year so updating should not be necessary on an annual basis. The FHWA and FTA response to this comment is that it is outside of the scope of the final rule.

The ARTBA commented that prior to MAP–21, the mission of the Federal highway program was clouded, and that since MAP–21, the establishment of national performance measures by FHWA and FTA will form the basis for Federal highway investment. In response to this comment, FHWA and FTA reiterate that sections 450.206(c)(1) and 450.306(d)(1) in the final rule provide that the statewide and the metropolitan transportation planning processes shall provide for the establishment and use of a performance-based approach to transportation decisionmaking to support the national goals described in 23 U.S.C. 150(b) and the general purposes described in 49 U.S.C. 5301. The commenter provided specific examples of suggested performance measures for consideration by FHWA and FTA. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The Capital Area MPO suggested that the 180-day deadline required for MPOs to select performance targets after the State and/or operator of public transportation sets performance targets should be changed to 2 years. The DC DOT commented that the 180-day period should be changed to 1 year to account for the fact that there are multiple States (DC DOT, MD DOT, and VA DOT) in the Washington, DC area, each of which may set different performance targets, and the MPO would set performance targets after the States.

The FHWA and FTA do not agree with these comments. The FHWA and FTA believe the final rule should reflect the 180-day statutory requirement and reiterate the importance of interagency coordination during the target setting process to achieve consistency of the State and MPO targets to the maximum extent practicable. In order to achieve the 1-year time frame for setting of State targets and the 180-day requirement for MPOs to set targets after the State sets targets, State and MPO coordination on target setting is critical. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The FMATS commented that after the initial round of State, MPO, and public operator of transportation target setting, it would be helpful for a deadline to be set by the States regarding target updates so that the MPOs and operators of public transportation have a predictable and scheduled deadline for their subsequent target updates. The FHWA and FTA response to this comment is that it is outside the scope of the final rule. The final rule and MAP–21 require coordination between the State, MPOs, and operators of public transportation when setting performance targets for the federally required performance measures.

The TX DOT commented that there should be one effective date for all of the performance management rules to enable the States and MPOs to work together and ensure the necessary data and analysis techniques are available. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The MAG commented that the NPRM does not clearly define the term ''system.'' It would be important to define the term if the measures are to be consistent across the different components of the system. The FHWA and FTA response to this comment is that the definition of the term ''system'' will vary depending on the type of program or performance measure being discussed. For the purposes of this final rule, the definition should remain flexible in order to preserve the

necessary distinctions in subsequent performance measure rules.

Several commenters (H–GAC, MARC, Maricopa Association of Governments, and NCTCOG/RTC) emphasized the importance of coordination among all metropolitan planning partners, including the States, MPOs, and operators of public transportation for successful implementation of performance management. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

At least two commenters (CT DOT and NJ DOT) suggested that FHWA and FTA provide sufficient flexibility such that a State and MPO might establish targets through the coordination process that are either the same or complementary. The FHWA and FTA response to this comment is that State and MPO targets are required to be consistent to the maximum extent practicable (section 450.206(c)(2)).

The NARC commented that the State or local agencies often have a decisive role in determining which projects are constructed. The NARC commented that this leaves MPOs in a difficult position in that they will be held accountable for progressing toward their stated targets, but are in a limited position to decide which projects actually get built.

The FHWA and FTA respond that this comment highlights the need for coordination between the States, MPOs, and operators of public transportation during the target setting process. This coordination should include the process of deciding investment priorities for the MPA that contribute toward achievement of the MPOs performance targets. It also highlights the importance of the MPO MTP and the TIP. When setting targets, MPOs should consider selecting targets in coordination with the State that are reasonable and achievable. The investment priorities that are identified by the MPO in cooperation with its member agencies in the metropolitan transportation plan and the TIP should support the achievement of the MPO's performance targets. As such, the cooperatively developed and adopted MTP and TIP that are prepared by the MPO become key documents for discussing the goals, objectives, performance measures, and targets for a metropolitan region. The projects and strategies in the cooperatively developed MTP and TIP should support achievement of the performance targets. The MPOs and State DOTs are accountable for meeting the performance-based planning and programming process requirements discussed in this final rule and 23 U.S.C. 134 and 135. The FHWA and FTA will periodically review MPO and State DOT accountability for the implementation of the performance-based planning and programming process requirements of this final rule as part of the TMA MPO planning certification reviews required under section 450.336 and the planning finding required under section 450.220. Under these same sections, MPOs and State DOTs are required to self-certify compliance with these performance-based planning and programming requirements as part of the broader requirements for transportation planning under 23 U.S.C. 134 and 135. Through the self-certifications, the certification reviews, and the planning finding, MPOs and States will be held accountable by FHWA and FTA for the implementation of the performance based planning process requirements of this rule.

Many comments were received on the topic of interagency coordination in relation to the new requirements for performance-based planning and programming in section 450.306(d). The DC DOT and the Northern New Jersey Transportation Planning Authority commented on the difficulty of coordinating target setting in situations where there may be multiple States, MPOs, and/or multiple operators of public transportation involved, such as in bi-State or tri-State metropolitan regions. The MTC, SACOG, SANDAG, SCAG, and SJCOG, commented on the difficulty of coordination on target setting when there are a large number of agencies. The MTC, SACOG, SANDAG, SCAG, and SJCOG further stated that funding constraints may make it difficult to move in the desired direction for many performance targets, and that they are concerned about the implementation costs and resources required of smaller MPOs. The WA State DOT commented that there is a need for more explicit explanations on the relationships and roles between the States and MPOs. The commenter further stated that it is unclear if MPOs are required to match the targets set by the State.

The FHWA and FTA respond that States and MPOs are each required to set performance targets for the federally required performance measures. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The Florida MPO Advisory Council and River to Sea TPO expressed their concern about the potential of a direct linkage between project funding and performance-based planning and programming. Specifically, they expressed concern that States that have not performed well in certain areas would receive larger shares of discretionary funding to help them address those areas where they underperform. The FHWA and FTA response to this comment is that neither the NPRM nor the final rule proposed to tie funding allocations for discretionary funding programs to performance.

The TriMet commented that individual transit agencies operate with widely differing conditions and that they must be allowed to set their own targets. The FHWA and FTA response to this comment is that transit agency target setting for specific transit related performance measures will be addressed in separate NPRMs and is outside the scope of the final rule.

The MD DOT commented that the implementation of the final rule, including the performance-based planning and programming provisions, should not undermine the shared goal of reducing project delivery time frames. The FHWA and FTA response to this comment is that the scope of the transportation planning process, as described in 23 U.S.C. 135(d)(2)(B), is supposed to support the national goals described in 23 U.S.C. 150(b) and 49 U.S.C. 5302(c). Reduced project delivery delay is one of the seven national goal areas identified in 23 U.S.C. 150(b). This is reflected in the final rule at section 450.206(c)(1).

The Memphis Urban Area MPO and the NRDC commented that they would like to see the standardization of data collection at the State or Federal level as part of the implementation of performance management. The FHWA and FTA response to this comment is that it is outside the scope of the final rule.

The MN DOT asked if there is a distinction made between MPOs for regions with populations below 200,000 and MPOs for TMAs for coordination efforts on target setting. The FHWA and FTA response to this comment is that all States and all MPOs, regardless of size, are required to set performance targets and coordinate with each other or operators of public transportation when setting performance targets.

Several commenters (NARC, San Luis Obispo COG, SSC RTC, and WFRC) suggested that locally developed goals, performance measures, and targets should also be considered in the metropolitan planning process. The FHWA and FTA agree with this comment. The States and MPOs are encouraged to include locally developed goals, performance measures, and targets as part of the metropolitan transportation planning process.

The River to Sea TPO commented that it is concerned that performance-based planning will limit their decisionmaking and ability to take into account other factors such as economic development and redevelopment. In response, FHWA and FTA encourage, but do not require, States and MPOs to include goals, objectives, and performance measures in their performance-based transportation planning processes that are locally determined; provided that, at a minimum, they include the performance measures that are federally required.

The Westchester County Department of Public Works and Transportation commented that MPOs should have the flexibility to establish their own region-specific targets, and each transportation operator should be afforded the flexibility to address requirements to best suit their unique characteristics. The commenter further observed that the size and scale of a particular transportation system could lend itself to significantly different targets than what another entity might use for a different sized system. The FHWA and FTA response to this comment is that States, MPOs, and operators of public transportation have the flexibility to set their own targets to suit their unique needs for those targets outside of the federally required performance measures. For the federally required measures, this comment is outside the scope of the final rule.

The Wilmington MPO commented that it has concerns about additional burdens being placed on MPO member jurisdictions in terms of data collection for the State Asset Management Plan for the NHS and other aspects of performance-based planning. The FHWA and FTA note that this comment is outside the scope of the final rule.

The Sierra Club commented that it supports the new focus on performance-based planning, but is concerned that it should be implemented in an environmentally sound manner and not used for retribution purposes. They commenter further commented that performance targets and outcomes should be appropriate for the communities served and consistent with the ridership goals of operators of public transportation. The commenter requested an explanation of how FHWA and FTA expect to perform their oversight roles to ensure that the results are truly equitable and will achieve national and State goals.

In response to this comment, FHWA and FTA agree that a performance management based approach to planning should be conducted in an environmentally sound manner. The FHWA and FTA also agree that in a performance-based approach to planning, it is important to support all modes of transportation, including public transportation. With respect to the question on how FHWA and FTA expect to perform oversight for performance-based planning, FHWA and FTA will include consideration of performance-based planning along with the other federally required planning process elements from 23 U.S.C. 134 and 135 and 49 U.S.C. 5303 and 5304 when conducting planning certification reviews of TMAs and when preparing a State planning finding.

The Maui DOT commented that FHWA and FTA may have dramatically underestimated the costs of implementing the final rule for smaller MPOs. The commenter further stated that smaller MPOs often have limited resources and dual roles. The FHWA and FTA note that MPOs do have the option of adopting and supporting State performance targets in lieu of setting their own targets. This might be particularly helpful to the smaller MPOs with limited staff, budgets, and resources. See RIA section for more discussion on this topic.

Several commenters (Community Labor United, Enterprise Community Partners, Front Range Economic Strategy Center, National Association of Social Workers, Partnership for Working Families, PolicyLink, Public Advocates, and United Spinal Association) suggested that the use of performance measures and prioritization of projects should encourage the States and MPOs to consider the transportation needs of traditionally underserved populations and the expansion of economic opportunity for low-income and minority communities and through improved transportation. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The National Trust for Historic Preservation commented that this section should also include historic resources as one of the planning factors to show that that historic preservation may be related to the planning process. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The San Luis Obispo COG is concerned that the NPRM imposes different requirements on the State and MPOs. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The VA DOT commented that the final rule should be led by criteria FHWA and FTA will be developing in response to 23 U.S.C. 135(h). Section 23 U.S.C. 135(h) requires FHWA and FTA to establish criteria to evaluate the effectiveness of the performance-based planning processes of the States and to make a report to Congress evaluating the overall effectiveness of performance-based planning and programming as a tool for guiding transportation investments. The FHWA and FTA response to this comment is that this rule discusses the requirements for States and MPOs to implement a performance-based planning and programming process. The FHWA and FTA criteria for evaluating the effectiveness of the performance-based planning and programming processes of the States and MPOs will be based on the requirements for performance-based planning and programming contained in this final rule.

The Partnership for Active Transportation and Sierra Club stated that health should be integrated into the transportation planning process. In response to this comment, FHWA and FTA conduct research and develop resources on the integration of health into transportation. These resources are available at: *http://www.fhwa.dot.gov/planning/health_in_transportation/*. Based on this comment, no changes have been made to the final rule. See section VI.(B) (recurring comment themes) for more discussion on this topic.

Several commenters suggested specific performance measures that they felt should be considered by FHWA and FTA. See section VI(B) (recurring issues) for more discussion on this topic.

Section 450.308 Funding for Transportation Planning and Unified Planning Work Programs

The Board of the French Broad River MPO, DC DOT, DRCOG, Maui MPO, DRCOG, National Trust for Historic Preservation, NC DOT, North Front Range MPO, NYMTC, Puget Sound Council of Governments (PSCOG), TX DOT, WFRC, and Wilmington MPO provided comments on this section. The Board of the French Broad River MPO, DC DOT, NC DOT, NYMTC, PSRC, WFRC, and Wilmington Urban Area MPO noted that the MPO transition to performance-based planning will be a challenge for MPOs and will require additional staff time without an allocation of additional funding. One commenter correctly noted that in addition to PL funds, metropolitan transportation planning activities undertaken by MPOs, including performance-based planning may be funded through other Federal-aid fund categories such as 23 U.S.C. 104(d), 49

U.S.C. 5305(d), and 49 U.S.C. 5307. As described in section 450.308 of the final rule, the States may provide funds received under 23 U.S.C. 104(b)(2) and 23 U.S.C. 505 to MPOs for metropolitan transportation planning.

The Maui DOT commented that they feel that the FHWA and FTA cost estimates for the implementation of the additional requirements related to performance management may be low. See the RIA section for further discussion on this issue. No changes were made to the final rule based on these comments.

Section 450.310 Metropolitan Planning Organization Designation and Redesignation

The FHWA and FTA received comments from 68 entities (AASHTO, AMPO, APTA, ARC, BART, California Association for Coordinated Transportation, CALTRANS, Charlotte MPO, Community Labor United, CT DOT, DVRPC, Enterprise Community Partners, Florida MPO Advisory Council, FMATS, Front Range Economic Strategy Center, H–GAC, Lincoln MPO, MA DOT, Macatawa Coordinating Council, MARC, Maricopa AOG, MD DOT, MI DOT, Miami-Dade MPO, MO DOT, MTC, NACTO, NARC, National Association of Social Workers, National Housing Conference, National League of Cities, NC DOT, NCTCOG/RTC, New York Association of MPOs, NJ DOT, NJTPA, North Front Range MPO, Northwestern Indiana Regional Planning Commission (NIRPC), NRDC, NYMTC, NYS DOT, PA DOT, Partnership for Working Families, Policy Link, Public Advocates, Richmond Area MPO, River to Sea TPO, SACOG, Safe Routes to School Partnership, SANDAG, San Joaquin Transit, San Luis Obispo MPO, Santa Barbara Metropolitan Transit District, SCAG, Sierra Club, SJCOG, South Florida Regional Transit Authority, Southeast Wisconsin MPO, TN DOT, TriMet, TX DOT, US Travel Association, WA State DOT, Westchester County Department of Public Works and Transportation, WFRC, WI DOT, and WMATA) on the proposed revisions to section 450.310. Section 450.310, consistent with MAP–21 and FAST requirements, would require the structure of an MPO serving a TMA to include representation by operators of public transportation, in addition to the officials identified in the existing regulations; and that each MPO serving a TMA satisfy the structure requirements no later than October 1, 2014. Commenters provided their perspectives and recommendations on a range of issues related to the structure of MPO policy boards that serve an area designated as a TMA. Nine commenters (Community Labor United and the Public Transit-Public Good Coalition, Enterprise Community Partners, Front Range Economic Strategy Center, National Association of Social Workers, NRDC, Partnership for Working Families, Policy Link, Public Advocates, Safe Routes to School Partnership, and the National Housing Conference) recommended that the final rule require that MPO boards be more representative of the economic and racial make-up of the communities they serve to help ensure that transportation planning is sensitive to the needs of all residents.

The FHWA and FTA note that the final rule will continue to require MPOs, through their public participation processes, to seek out and consider the needs of those traditionally underserved by existing transportation systems, such as low-income and minority communities, who may face challenges accessing employment and other services. The final rule requires MPOs to periodically review the effectiveness of the procedures and strategies contained in the participation plan to ensure a full and open participation process. Through certification reviews of MPOs in areas that serve TMAs, FHWA and FTA work to confirm that these MPOs are meeting their public participation requirements.

However, 23 U.S.C. 134(d)(1)(A) and 49 U.S.C. 5303(d)(1)(A) require that MPOs be designated either by agreement between the Governor and units of general purpose local government that together represent at least 75 percent of the affected population (including the largest incorporated city) or by procedures in applicable State or local laws. These sections also provide that each MPO policy board that serves an area designated as a TMA shall consist of local elected officials; officials of public agencies that administer or operate major modes of transportation in the metropolitan area, including representation by operators of public transportation; and appropriate State officials. The FHWA and FTA are fully committed to an inclusive transportation planning process. However, the statute assigns the authority to the Governor and local government officials to decide which local elected officials, officials of public agencies, and appropriate State officials will serve on an MPO policy board; or to procedures established by applicable State or local law.

The U.S. Travel Association requested that each MPO or regional planning board include a representative of the travel industry, noting that it has a deep impact on the Nation's economy and workforce. The data collected by the travel industry provides unique insights into transportation trends and infrastructure needs across the country.

In response, FHWA and FTA reiterate that the statute [26] requires that each MPO that serves an area designated as a TMA must consist of local elected officials; officials of public agencies that administer or operate major modes of transportation in the metropolitan area, including representation by operators of public transportation; and appropriate State officials, except those MPOs that are exempt under 23 U.S.C. 134(d)(3) and 49 U.S.C. 5303(d)(3). The FHWA and FTA note that the final rule does include a new planning factor in sections 450.206(a)(10) and 450.306(b)(10) on enhancing travel and tourism for States and MPOs to consider and implement as part of their transportation planning processes as provided for in FAST sections 1201 and 1202 and in 23 U.S.C. 134(h)(1)(J) and 135(d)(1)(J). It also includes a new requirement in section 450.316(b) that MPOs should consult with agencies and officials responsible for tourism when developing metropolitan transportation plans as described in FAST Act section 1201 and in 23 U.S.C. 134(g)(3)(A).

The WA State DOT recommended revising section 450.310(c) to specify that only urbanized areas with more than 200,000 individuals can be a TMA rather than allowing a Governor and MPO to request that an urbanized area be designated a TMA. In response to this comment, FHWA and FTA note that the statute at 23 U.S.C. 134(k)(1)(B) and 49 U.S.C. 5304(k)(1)(B) provides that the Secretary shall designate any additional area at the request of the Governor and the MPO designated for the area. Consequently, no changes are made to this section based on this comment.

The proposed regulatory language in section 450.310(d) that ''each metropolitan planning organization that serves an area designated as a transportation management area shall consist of local elected officials, officials of public agencies that administer or operate major modes of transportation in the metropolitan area, including representation by providers of public transportation, and appropriate State officials'' replicates the statutory language of 23 U.S.C. 134(d) and 49 U.S.C. 5303(d). The MAP–21 further provides that an MPO may be restructured to meet the requirement of including representation by operators of public transportation without

[26] 23 U.S.C. 134(d)(1)(a) and 49 U.S.C. 5303(d)(1)(a).

undertaking a re-designation (an action that would require an agreement between the Governor and units of general purpose government that together represent at least 75 percent of the existing planning area population including the largest incorporated city). Consequently, the final rule provides that MPOs that serve a TMA must include a formally designated representative of operators of public transportation.

The FHWA and FTA also proposed in the preamble to the NPRM that representatives of operators of public transportation would have equal decisionmaking rights and authorities as other officials who are on the policy board of an MPO that serves a TMA. The BART, CALTRANS, Charlotte RTPO, Enterprise Community Partners, MA DOT, MO DOT, National Housing Conference, NCTCOG/RTC, NRDC, NYMTA, River to the Sea TPO, Santa Barbara Transit, SFRTA, Sierra Club, SJRTD, and WFRC, expressed support for the proposal that a representative of operators of public transportation is both included on MPO policy boards and given equal decisionmaking rights. The MA DOT expressed support for the requirement for public transportation membership on the policy board of an MPO and the equality of decisionmaking rights by transportation officials or their representative staff. The MA DOT also noted that each of the 10 MPOs and 3 RTPOs in the Commonwealth of Massachusetts have active representation and participation of their respective public transportation operators on the boards by regional transit administrators and/or transit staff.

The FHWA and FTA believe that the long-standing requirement to include public transportation representation on each MPO serving a TMA, made explicit in MAP–21 and FAST, supports the new performance requirements for operators of public transportation, including: The coordination of MPO targets with operators of public transportation, the coordination of public transportation operator targets with MPOs, and the integration of public transportation performance plans into the metropolitan transportation planning process. Given these new performance responsibilities, the FHWA and FTA believe that operators of public transportation need to participate in the MPO's decisionmaking process. The FHWA and FTA do not concur with the comment by the DVRPC that there are a number of effective ways for transit agencies to be fully represented in the metropolitan planning process apart from voting membership on the MPO board. Consequently, the final rule provides that, similar to section 1201 of the FAST Act which amends 23 U.S.C. 134(d)(3)(C), the representative of public transportation has responsibilities, actions, duties, voting rights, and any other authority commensurate with other officials described in section 450.310(d)(1).

The MA DOT sought more clarity covering what constitutes a transit provider since there are sometimes a wide range of service providers in a single MPO, including RTAs, TMAs, and health care transit operations. In response, FHWA and FTA note that the final rule defines the term ''public transportation operator'' in section 450.104. According to this definition, a public transportation operator is the public entity or government approved authority that participates in the continuing, cooperative, and comprehensive transportation planning process in accordance with 23 U.S.C. 134 and 135 and 49 U.S.C. 5303 and 5304, and is a recipient of Federal funds under title 49 U.S.C. Chapter 53 for transportation by a conveyance that provides regular and continuing general or special transportation to the public, but does not include sightseeing, school bus, charter, certain types of shuttle service, intercity bus transportation, or intercity passenger rail transportation provided by the National Railroad Passenger Corporation (also known as ''Amtrak'').

The FHWA and FTA stated in the preamble to the NPRM that it is up to the MPO, in cooperation with operators of public transportation, to determine how this representation will be structured and established.

The APTA expressed appreciation for this broad latitude afforded to MPOs as it accounts for varying governance models. However, it requested that FHWA and FTA categorically state that an MPO member based on elective or appointed office that coincidentally sits on a transit board does not fulfill the MAP–21 requirement for representation by operators of public transportation. This position is supported by all other operators of public transportation who submitted comments to the docket (BART, FMATS, NYMTA, Orange County Transit Authority, Santa Barbara Transit Authority, SJCOG, TriMet, and WMATA, and the Sierra Club).

The BART noted that ''While many city and county representatives currently serving on MPOs are sincere in their efforts to incorporate the needs and perspectives of public transit, it is only through direct participation of the providers themselves that MPOs can best understand the complex and technical needs of public transit providers.'' The WMATA noted that it could not easily imagine how the transportation modes in general, and public transportation in particular, can be assured of exercising the equal decisionmaking rights and authorities essential to realizing the MAP–21 intentions if MPO board members are allowed to ''wear two hats.'' However, the statute was changed in the FAST Act to explicitly allow that the representative of an operator of public transportation may simultaneously represent a local municipality. Therefore the final rule in section 450.310(d)(3)(ii) reflects section 1201 of the FAST Act (23 U.S.C. 134(d)(3)(B)) which allows, subject to the bylaws or enabling statute of the MPO, a representative of an operator of public transportation may also serve as a representative of a local municipality.

Thirty-five of the respondents (AAHSTO, ARC, CT DOT, DVRPC, Florida MPO Advisory Council, H–GAC, MA DOT, Macatawa Area Coordinating Council, MARC, MI DOT, Miami-Dade MPO, MTC, NACTO, NARC, National League of Cities, NC DOT, NIRPC, NJTPA, NYMTA, NYMTC, NYS DOT, PA DOT, River to Sea TPO, SACOG, San Luis Obispo COG, SANDAG, Southeastern Wisconsin RPC, Westchester County Department of Public Works and Transportation, and WI DOT) requested that the final rule ensure MPOs have maximum flexibility in determining how they are constituted and operate. Fifteen MPOs (ARC, DVRPC, Florida MPO Advisory Council, H–GAC, Macatawa Area Coordinating Council, MARC, MTC, NIRPC, NJTPA, NYMTC, River to Sea TPO, SACOG, SANDAG, SCAG, SJCOG, and Southeastern Wisconsin RPC), three MPO associations (AMPO, Florida MPO Advisory Council, and NARC), and one State (WI DOT) requested that the final rule provide each MPO with the maximum latitude to determine how operators of public transportation are represented in the decisionmaking process, including allowing a single official to serve in multiple capacities. Five California MPOs (MTC, SACOG, SANDAG, SCAG, and SJCOG) expressed the view that the language included in the MAP 21 provides broad flexibility as to how MPOs may comply with the requirement to include representation by operators of public transportation. They argued that Congress did not prescribe a specific method for representation; require that all or any particular kinds of transit operators serving a region be represented; or require that a seat be dedicated solely to

a board member who is appointed by a transit agency. The government of Westchester County, NY noted its long history of elected officials effectively representing both the county's residents and its transit system on the MPO. It strongly believes that, via a single vote, an elected official can serve in multiple capacities on an MPO. The NYMTC argued against any requirement that would give an MPO member more than one non-independent vote and affirmed that State and local elected officials have effectively represented multiple modes of transportation since the MPO was established. The ARC argued that it would not be appropriate for a staff member of a transit agency governed by a city or county to serve on a policy body with the chief elected official from that same jurisdiction. The ARC argued that it would place the transit representative in a subordinate position, potentially compromising the expertise and knowledge that the operator could bring to policy discussions and votes. The River to Sea TPO argued that requiring transit agency staff to sit as a voting member on an MPO board along with elected officials who are members of their own governing board would potentially create a conflict with Florida's Sunshine Law and make it difficult for staff to brief their policy board on transit matters.

The FHWA and FTA concur that a single official can serve in multiple capacities, which would be particularly appropriate in instances where the local elected official represents a local government that operates a transit system. Therefore, FHWA and FTA revised the final rule to provide that, consistent with the FAST Act's amendment to 23 U.S.C. 134(d)(3)(B), subject to the bylaws or enabling statute of the MPO, a representative of a provider of public transportation may also serve as a representative of a local municipality (section 450.310(d)(3)(ii)). The final rule in section 450.310(d)(3)(i) reflects the revision to 23 U.S.C. 134(d)(3)(A) made by FAST, which provides that the designation or selection of officials or representatives under section 450.310(d)(1) shall be determined by the MPO according to the bylaws or enabling statute of the organization.

Eight MPOs (Miami-Dade MPO, MTC, NIRPC, River to Sea TPO, SACOG, SANDAG, SCAG, and SJCOG) asserted that their governing structures were codified by State law, which would preclude them from changing the structure of their policy board to include voting representation by operators of public transportation. As noted by one industry association, NARC, as many as one-quarter of all MPOs that serve a TMA are created by, and the constitution of their policy board is outlined in, State statute. Thus, to change the structure of the MPO board would require a change in the State enabling legislation, which may result in unintended consequences.

In response, FHWA and FTA agree that a change in State enabling legislation may be necessary to bring an MPO into compliance with the structuring requirements of 23 U.S.C. 134(d)(2), 49 U.S.C. 5303(d)(2), and the final rule. This would be the case if State law would prevent an MPO from satisfying the statutory structure requirement. An exception is available for those MPOs that qualify under the ''grandfathering'' provision in 23 U.S.C. 134(d)(4). Section 134(d)(4) of 23 U.S.C. provides that 23 U.S.C. 134(d) should not be construed to interfere with the authority, under any State law in effect on December 18, 1991, of a public agency with multimodal transportation responsibilities (A) to develop the plans and TIPs for adoption by a metropolitan planning organization; and (B) to develop long-range capital plans, coordinate transit services and projects, and carry out other activities pursuant to State law. The grandfathering provision was first enacted in 1991 and remains relatively unchanged.[27]

Such MPOs may continue to operate without complying with the statutory structure provisions in 23 U.S.C. 134(d)(2), 49 U.S.C. 5303(d)(2), and the final rule. Alternatively, a grandfathered MPO may restructure to meet the statutory requirements without losing its protection under the grandfathering provision if it can do so without a change in State law with respect to the structure or organization of the MPO. The statute (23 U.S.C. 134(d)(6)(2)) and section 450.310(d) of the final rule, explicitly authorize MPOs to restructure to meet the requirements of 23 U.S.C. 134(d)(2) and 49 U.S.C. 5303(d)(2) without undertaking a redesignation. However, FHWA and FTA emphasize that an exempt MPO is still required to provide the officials described in 23 U.S.C. 134(d)(2) an opportunity to actively participate in the decision making processes of the MPO in accordance with 23 U.S.C. 134(i)(6)(A), (j)(1)(B), and (j)(4).

The NARC sought clarification of FHWA and FTA application of the grandfathering exemption. The NARC suggested that the statutory language means that ''any MPO operating under a State statute on [December 18, 1991] is exempt from the requirements of 450.310(d)(1),'' and stated that it has found no evidence of the FHWA and FTA interpretation as presented. The NARC requested that FHWA and FTA clarify that any MPO operating under a State statute on that date is exempt from the requirements of section 450.310(d)(1). Five California MPOs (MTC, SACOG, SANDAG, SCAG, and SJCOG) also took issue with the interpretation that a change to the board structure since December 18, 1991, disqualifies an MPO from falling under the grandfather provision.

In response, FHWA and FTA note the grandfathering provision in 23 U.S.C. 134(d)(4) and 49 U.S.C. 5303(d)(4), was first enacted in 1991 and remains relatively unchanged. As explained in the June 2, 2014 Policy Guidance on Metropolitan Planning Organization (MPO) Representation, 79 FR 31214. The FHWA and FTA have determined that the grandfathering provision does still apply to any MPO that: (1) Operates pursuant to a State law that was in effect on or before December 18, 1991; (2) such State law has not been amended after December 18, 1991, with regard to the structure or organization of the MPO; and (3) the MPO has not been designated or re-designated after December 18, 1991. 79 FR 31216. The agencies reiterated the interpretation in the NPRM for this final rule. Subsequently, Congress enacted the FAST Act, which included amendments to 23 U.S.C. 134 and 49 U.S.C. 5303. The FAST Act clarified requirements relating to an MPO's designation or selection of officials or representatives to an MPO in light of the FHWA/FTA Policy Guidance and NPRM, but did not amend the grandfathering provision. Congress' enactment of these statutory changes while leaving the grandfathering provision intact is a strong indication that Congress concurs with the FHWA and FTA interpretation of that provision. The provision is included in the final rule in section 450.310(d)(4). Because of changes to the structuring requirements of MAP–21 and FAST, FHWA and FTA are including the grandfathering provision in the Final Rule to clarify when the provision may be exercised by an MPO.

The NARC's interpretation of the exemption or grandfather provision would apply incorrectly the December 18, 1991, cutoff date to the MPOs rather than their authorizing statutes, and would grandfather any MPO operating under a State statute as of that date, regardless of subsequent changes in the State law. To the contrary, the grandfather provision's conditional clause ''under any State law in effect on

[27] Section 1024, Public Law 102–240, December 18, 1991. codified at 23 U.S.C. 134(b)(3).

December 18, 1991'' applies the cutoff date to the State law under which an MPO operates, not the MPO itself. A State law or amendment that was enacted after the cutoff date was not in effect on the cutoff date.

At the request of APTA, FHWA and FTA clarified that the structure of MPOs that serve TMAs and were designated or re-designated as an MPO after December 18, 1991, must include representation of local elected officials, officials of agencies that administer or operate major modes or systems of transportation, and appropriate State officials. As of October 2014, the structure of these MPOs must include representation by operators of public transportation.

The APTA also requested that FTA and FHWA require that any claim for this exemption must be publicly documented in order for it to be effective. The APTA stated that some MPOs claim the exemption with no public justification or discussion. The FHWA and FTA agree that an MPO that serves a TMA must provide documentation to support a claim for an exemption to the MPO structure required by statute and regulation. The FHWA and FTA require this documentation to be provided as part of its certification review process.

Multiple respondents from Florida (Florida MPO Advisory Council, Miami-Dade MPO, and SFRTA) highlighted the recent revisions to Florida State Law 339.175, which allows the structure of MPOs in the State to be in alignment with the expectations of the MAP–21, to include ''representation by providers of public transportation.'' The Florida statute expands the maximum voting membership from 19 to 25 apportioned members. It continues to require that voting members of an MPO be elected officials of general-purpose local government and that an MPO may include, as part of its apportioned voting members, an official of an agency that operates or administers a major mode of transportation. Interestingly, the Florida statute addresses the ''two hats'' issues raised by many of the respondents to this docket. It provides that in metropolitan areas in which transportation authorities or agencies have been created by law, the authority may be provided voting membership on the MPO. In instances where the transportation operator is represented by elected officials from general-purpose local governments, the MPO must establish a process to express and convey the collective interests of the public transportation agencies that provide transit service in their MPA.

The MA DOT noted that there are several RTAs within the Commonwealth of Massachusetts that service multiple TMAs in varying capacities. The MA DOT requested that the final rule clearly define the MPO involvement of the public transportation representative in regions that the RTA provides services but is not exclusively located. In response, FHWA and FTA believe that the representative of operators of public transportation needs to express and convey the collective interests of the public transportation agencies that provide transit service in their MPA.

As required by MAP–21, the final rule states that each MPO that serves a TMA must include representation by operators of public transportation no later than October 1, 2014. The NARC sought direction as to what MPOs that serve TMAs must do as of October 1, 2014. Another industry association, AMPO, requested that the final rule recognizes that many MPOs are subject to State laws governing the MPO policy board membership and that compliance may require amendments to State law. The AMPO requested that the final rule include more time for these MPOs to work with their States to adjust policy boards if necessary. In response, FHWA and FTA expect that, at a minimum, each MPO that serves a TMA identify a voting member of their board who represents the collective interests of operators of public transportation in the MPA by October 1, 2014. The final rule supersedes the FHWA and FTA June 2, 2014, Policy Guidance on MPO Representation.

Two commenters (Enterprise Community Partners and Sierra Club) requested that the final rule requires all operators of public transportation in an MPA to be on the board of MPOs that serve TMAs. The MAP–21 provides for representation by operators of public transportation. The FHWA and FTA believe that it is the MPO's decision whether to include all operators of public transportation on its decisionmaking body.

In addition to the representation by providers of public transportation provision, FHWA and FTA sought comments on whether any of the following questions should be addressed in the regulation and, if so, how.

Should the regulations clarify who appropriate officials may be?

Of the thirteen commenters (ARC, CT DOT, Florida MPO Council, H–GAC, Miami-Dade MPO, MTC, NJTPA, NYMTC, NYS DOT, River to Sea TPO, SACOG, SANDAG, SCAG, SJCOG, TX DOT, and WI DOT) who submitted a response to the question, two States (MA DOT and WI DOT) requested that the final rule clarifies who an appropriate official may be. The WI DOT noted that MPOs throughout Wisconsin have approached this issue of including representation by operators of public transportation on their MPO boards differently. Some designate officials that are already on the board and have transit interests as the transit representation while others are working to add additional membership to their MPOs. The WI DOT recommends allowing MPOs the discretion to make these representation decisions at a local level.

The FHWA and FTA concur. The final rule provides MPOs with the flexibility to determine how best to include representation by operators of public transportation. The FHWA and FTA will not specify who appropriate officials may be in the final rule.

Can staff members or other alternates be substituted for the 'officials' identified in paragraph (d)(1)?

Twenty-eight commenters (AASHTO, AMPO, ARC, CT DOT, Florida MPO Advisory Council, FMATS, H–GAC, MD DOT, MI DOT, Miami-Dade MPO, MTC, NARC, NCTCOG/RTC, NJ DOT, NJTPA, NYMTA, NYMTC, NYS DOT, Richmond Area MPO, River to Sea TPO, SANDAG, SCAG, SJCOG, TN DOT, TX DOT, WI DOT, and WMATA) responded to this question. Three MPOs (ARC, FMATS, and NCTCOG/RTC) expressed concern that a staff member or other alternate be substituted for officials on the MPO decisionmaking body.

The ARC stated that it does not believe it is appropriate for staff members of transit agencies to have equal standing on policy committees as elected and appointed officials, asserting that clear lines of demarcation in the decisionmaking hierarchy need to be maintained through committees comprised exclusively of technical staff or elected/appointed policy officials. The NCTCOG/RTC believes that staff members or other non-elected alternates should not be substituted for local elected officials in section 450.310(d)(1) due to the policy making function of the MPO policy board. The NCTCOG and RTC requested that FHWA and FTA carefully consider this question in the context of accountability to the public. They noted that the strength of MPO policy making is a result of its policy board being made up of primarily local elected officials who are directly accountable to the voting public. However, in situations where modal operators are not governed by an elected body, MPO policy boards should have

discretion to determine the appropriate level of representative for these entities. Another MPO, FMATS, noted that as this requirement only applies to TMAs, staff members or alternates should not be allowed to participate because larger MPOs would have sufficient representation from other entities' officials and so additional representation of public transportation would not skew the policy board. The Florida MPO Advisory Council believes that alternates for officials identified in subparagraph (d)(l) should be of the same general background (*i.e.,* a local elected official should act as the alternate for another local elected official) and that any clarifying language should state as such.

Multiple respondents noted that it is their current practice to allow staff members or other alternates to substitute for the officials identified in subparagraph (d)(1). Per an MOU among NYMTC member agencies, all members, including elected officials, may be represented at council meetings by designated substitutes, provided such designation has been made in writing to the Secretary of NYMTC. The NYMTC recommends that FHWA and FTA continue to allow these designees to be substituted for officials identified in subparagraph (d)(1) for purposes of voting on council business. The NYMTA requested that the term ''local official'' refer to elected or appointed officials of general purpose local government with responsibility for transportation, and that this include the elected or appointed official's formally designated proxy.

The TN DOT noted that all MPOs in Tennessee allow for policy board members to appoint a proxy. Not being able to do this would limit the ability of the MPOs to conduct official business requiring a quorum of members. Under the NJTPA by-laws, each elected official may appoint one designated alternate. This requires notification in writing to the NJTPA. The NJTPA notes that this arrangement allows for greater flexibility and participation by the board's member jurisdictions and agencies and should continue to be allowed.

Three respondents (MA DOT, Richmond Area MPO, and WI DOT) sought clarification as to who can serve as an official on the MPO. The MA DOT sought clarity regarding public transportation representative designation and latitude to designate another person who may perform duties on their behalf. The WMATA stated that an official in any of the three statutory MPO board categories should be able to expressly delegate routine duties to qualified staff but suggests that future guidance strongly encourage such officials to commit themselves to attentive and direct engagement with policy-making efforts by their MPO boards. The majority of respondents to this question (AASHTO, AMPO, CT DOT, H–GAC, MD DOT, MI DOT, Miami-Dade MPO, MTC, NARC, NYS DOT, SACOG, SANDAG, SCAG, TX DOT, WI DOT, and WMATA) support the position that the decision whether staff members or other alternates may be substituted for the officials identified in subparagraph (d)(1) should remain local and be resolved at the State or local level.

In response, FHWA and FTA concur with the majority of respondents that the decision as to whether staff members or other alternates may be substituted for the 'officials' identified in subparagraph (d)(1) should remain local and be resolved at the State or local level.

Should the regulations provide more specificity on how each of the officials identified in paragraph (d)(1) should be represented on the MPO?

While the WI DOT indicated that the final rule should provide more specificity on how each of the officials identified in subparagraph (d)(1) (*i.e.,* local elected officials, officials who operate major modes of transportation, and appropriate State officials), the other 21 respondents to this question (AASHTO, ARC, CT DOT, Florida MPO Advisory Council, FMATS, MD DOT, MI DOT, Miami-Dade MPO, MTC, NARC, NJTPA, NYMTC, NYS DOT, River to Sea TPO, SACOG, SANDAG, SCAG, SJCOG, TX DOT, and Westchester County, NY) urged FHWA and FTA to provide MPOs with maximum flexibility as each MPO's circumstances is unique.

The FHWA and FTA concur with these respondents and will not include more specificity on how each of the officials identified in subparagraph (d)(1) should be represented on the MPO in the final rule. However, at the request of WI DOT and CT DOT, FHWA and FTA will provide additional guidance on this topic, separate from this final rule.

Can an official in paragraph (d)(1) serve in multiple capacities on the MPO board (*e.g.,* can a local elected official or State official serve as a representative of a major mode of transportation)?

Thirty-one respondents (AASHTO, APTA, ARC, CT DOT, Florida MPO Advisory Council, FMATS, H–GAC, MARC, MD DOT, MI DOT, Miami-Dade MPO, NARC, NCTCOG/RTC, NJ DOT, North Front Range MPO, NYMTA, NYMTC, River to Sea TPO, SACOG, SANDAG, SCAG, Sierra Club, SJCOG, TN DOT, TriMet, TX DOT, Westchester County, NY, WI DOT, and WMATA) provided their perspectives on the question of whether an official in subparagraph (d)(1) can serve in multiple capacities on the MPO board.

Six respondents (APTA, FMATS, NYMTA, Sierra Club, TriMet, and WMATA) argued definitively that public officials should not be asked, or allowed, to have ''divided loyalties.'' The Sierra Club claimed that such an attempt could well rise to a legal situation of incompatibility of offices. The TriMet, whose general manager has long held a voting seat on the Portland MPO from which it effectively advocates for the interests of operators of public transportation in the region, shared this perspective. It noted that assigning a local official, tasked with representing their jurisdiction on the MPO, to advocate a different, perhaps contrary, position as the representative of public transportation operators creates an inherent conflict of interest. The FMATS also cited the potential for conflict of interest, noting that a city or county mayor may appoint the transportation official which could inhibit the transportation official in making decisions that are truly in the best interest of the operators of public transportation. The North Front Range MPO stated that if the transit agency is a stand-alone entity and not part of a local government that is already a voting member of the MPO, a separate membership with equal voting rights makes sense. The APTA, NYMTA, Sierra Club, TriMet, and WMATA requested that FTA and FHWA categorically state that an MPO member based on elective or appointed office that coincidentally sits on a transit board does not fulfill the MAP–21 requirement. The APTA, NYMTA, Sierra Club, TriMet, and WMATA all supported the position that the transit representative must be a member of the MPO solely as the transit representative.

Eight other respondents (MTC, NYMTC, NYS DOT, SACOG, SANDAG, SCAG, SJCOG, and Westchester County, NY) noted that in their experience, board members who are local elected officials and also sit on independent or municipal transit agencies frequently bring the priorities and perspectives of the transit agency on which they serve to the MPO decisionmaking table. The TN DOT noted that some MPOs have a requirement that only elected officials serve on the policy board, the thinking being that only elected officials, accountable to the voting public, should

set policy. It proposed that in such instances, the MPO may insist that the requirement to have representation for operators of public transportation be fulfilled by an elected official who serves on the governing board of an operator of public transportation, or who oversees one that operates as part of city or county government.

The FHWA and FTA note again that any MPO that serves a TMA that was designated/re-designated after December 18, 1991, shall consist of: Local elected officials; officials of public agencies that administer or operate major modes of transportation in the metropolitan area including representation by operators of public transportation; and appropriate State officials. Both the Florida MPO Advisory Council and the River to Sea TPO cited the Florida statute [28] which specifies that, where representatives of operators of public transportation are to be represented by elected officials from general-purpose local government, the MPO shall establish a process by which the collective interests of such agencies are expressed and conveyed.

The majority of respondents (AASHTO, ARC, CT DOT, H–GAC, MARC, MD DOT, MI DOT, Miami-Dade MPO, MTC, NARC, NCTCOG/RTC, NJ DOT, NYS DOT, River to Sea TPO, SACOG, SANDAG, SCAG, SJCOG, TN DOT, TX DOT, and Westchester County NY) urged FHWA and FTA to provide maximum flexibility to MPOs in designating representation by operators of public transportation.

The FHWA and FTA will provide maximum flexibility to MPOs in designating representation by operators of public transportation. The final rule provides that the official(s) who represents the operators of public transportation in the MPA may be an official of an agency that operates or administers public transportation in the metropolitan area or an elected official from general-purpose local governments.

Should the regulations include more information about MPO structure and governance?

The twenty-four commenters (AASHTO, AMPO, ARC, CT DOT, FMATS, H–GAC, MD DOT, Miami-Dade MPO, MTC, NARC, NJ DOT, NJTPA, North Front Range MPO, NYMTA, NYMTC, NYS DOT, SACOG, SANDAG, SCAG, SJCOG, TX DOT, Westchester County, NY, and WI DOT) who provided a response to this question universally requested that FHWA and FTA not include more information about MPO structure and governance in the final rule. In response, the final rule does not include more information about MPO structure and governance. However, per the request of CT DOT and WI DOT, FHWA and FTA will provide additional guidance on this topic, separate from the final rule.

Section 450.312 Metropolitan Planning Area Boundaries

Section 450.312 discusses MPA boundaries. The WA State DOT provided comments on this section. The commenter was concerned that in situations where there are bi-State MPOs and/or where multiple MPOs straddle State boundaries, each MPO might have a different format for reporting on system performance. The WA State DOT was concerned that it will be difficult to coordinate system performance reporting responses and it will create problems for all involved.

In response to this comment, FHWA and FTA note that section 450.312 strongly encourages the States, MPOs, and operators of public transportation to coordinate transportation planning for the entire multi-State area. Section 450.314(f) of the final rule provides that where the boundaries of the urbanized area or MPA extend across State lines, the States, appropriate MPOs, and operators of public transportation must coordinate transportation planning for the entire multi-State area and may enter into agreements or compacts to do so. See discussion in section 450.314, metropolitan planning agreements, for more specific discussion on State, MPO, and operator of public transportation coordination on performance-based planning. (See also section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.) This would help to ensure consistency when there are multiple MPOs in a multi-State region. The FHWA and FTA have made no changes to the NPRM language for section 450.312 in the final rule.

Section 450.314 Metropolitan Planning Agreements

Section 450.314 discusses the requirement that the States, MPOs, and the operators of public transportation serving an MPA cooperatively establish a metropolitan planning agreement. These agreements determine the mutual responsibilities of the parties in carrying out the metropolitan transportation planning process. Forty-three commenters (AASHTO, Albany MPO, AMPO, APTA, ARC, Board of the French Broad River MPO, CALTRANS, Charlotte Regional TPO, CO DOT, CT DOT, DC DOT, DRCOG, DVRPC, FL DOT, Florida MPO Advisory Council, FMATS, H–GAC, HI DOT, IA DOT, MAG, Metropolitan Transportation Council MPO, MARC, MT DOT, MTC, NACTO, NARC, NC DOT, New York State Association of MPOs, NJTPA, North Florida TPO, NYMTA, NYMTC, NYS DOT, OR DOT, PA DOT, River to Sea TPO, SACOG, SANDAG, SCAG, SJCOG, Transportation for America, TX DOT, and Wilmington MPO) provided comments on sections 450.314(a), (e), and (g). This section concerns the requirement proposed in the NPRM for including performance-based planning and programming and the collection of data for the State asset management plan as part of the metropolitan planning agreement. Twenty-one of the commenters on these sections were from MPOs, 13 from States, 7 from transportation associations, 1 from an operator of public transportation, and 1 from an advocacy organization. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

In the NPRM, FHWA and FTA proposed at section 450.314(b) that the States, MPOs, and the operators of public transportation should periodically review and update the metropolitan planning agreement, as appropriate, to reflect effective changes. Five commenters (AASHTO, FL DOT, MT DOT, NYS DOT, and TX DOT) provided comments on this provision. All five of the commenters stated that the provision was unnecessary and should be deleted. Two commenters (AASHTO and MT DOT) stated that agreements are generally already revised as necessary when changes are made to regulations and when dictated by other circumstances. They further commented that section 450.314(b) would create a new obligation to review agreements even when that review is unnecessary. The FL DOT commented that section 450.314(b) could be interpreted as a new requirement and that periodic review and updating should occur only as appropriate. The NYS DOT and TX DOT commented that section 450.314(b) could be interpreted to set a specific time frame or regular updates for review of the existing agreements, even when it is not needed.

In response, FHWA and FTA included this provision in the NPRM to ensure that States, MPOs, and operators of public transportation are aware that agreements can become outdated and that they need to be periodically reviewed by the States, MPOs, and operators of public transportation to ensure that they are up to date. The FHWA and FTA did not intend for this provision to set a specific time frame for the review and updates to the

[28] Florida Statute 339.175(3).

agreements and have specifically stated in section 450.314(b) that it should be done when it is appropriate to do so. The commenters have pointed out that for those metropolitan regions were the agreements are being kept up to date, this would typically not be an issue. However, FHWA and FTA note that for those regions where agreements have become outdated, this provision is an important reminder that they should be periodically reviewed and updated. The need for updating an agreement might occur for a number of reasons. Examples of reasons for updating the agreements might include: The passage of new national transportation legislation, issuance of new Federal regulations, and changes in the roles and responsibilities of the States, MPOs, and/or operators of public transportation in the metropolitan transportation planning process. The FHWA and FTA believe that it is important that in order to maintain a 3–C planning process for a metropolitan region, States, MPOs, and the operators of public transportation should periodically review and update the metropolitan planning agreement, as appropriate, to reflect effective changes in their responsibilities for conducting the planning process. For these reasons, the provision for periodically updating the metropolitan planning agreement in section 450.314(b), as proposed in the NPRM, is retained by FHWA and FTA in the final rule without alteration.

Section 450.316 Interested Parties, Participation and Consultation

Section 450.316 describes interested parties, participation, and consultation as part of the metropolitan transportation planning process. It requires an MPO to use a documented participation plan to provide individuals, affected public agencies, representatives of public transportation employees, freight shippers, providers of freight transportation services, private providers of transportation, representatives of users of public transportation, representatives of users of pedestrian walkways and bicycle transportation facilities, representatives of the disabled, and other interested parties with reasonable opportunities to be involved in the metropolitan transportation planning process. Eight commenters (Nine to Five Association of Working Women, Denver COG and the RTD, Enterprise Community Partners, National Housing Conference, New York State Association of MPOs, The Leadership Conference on Civil and Human Rights, TX DOT, and United Spinal Association) submitted comments on this section. The Nine to Five Association of Working Women, Enterprise Community Partners, National Housing Conference, and the Leadership Conference on Civil and Human Rights expressed strong support for the requirement that States and MPOs develop participation plans that engage populations ''traditionally underserved by existing transportation systems, such as low-income and minority households.'' The United Spinal Association requested that FHWA and FTA ensure that the required necessary accommodations for traditionally underrepresented organizations and community members are provided.

The FHWA and FTA note that an MPO's public participation process, including efforts to seek out and consider the needs of those traditionally underserved by existing transportation systems, such as low-income and minority households, who may face challenges accessing employment and other services, is reviewed as part of the MPO certification process.

The DRCOG and RTD sought clarification on the requirement that an MPO include, as part of the final MTP and TIP, a summary, analysis, and report on the disposition of significant written and oral comments it receives on the draft MTP and TIP. The FHWA and FTA clarify that the summary and disposition of these comments can be a separate document incorporated by reference or made available on the applicable Web site. The FHWA and FTA have made no changes to section 450.316 in the final rule.

Section 1201 of the FAST Act amends 23 U.S.C. 134(i)(6)(A) to add public ports to the list of entities that an MPO shall provide a reasonable opportunity to comment on the metropolitan transportation plan. This change is amended into the final rule at section 450.316(a). Section 1201 of the FAST Act amends 23 U.S.C. 134(i)(6)(A) to provide a list of examples of private providers of transportation. This change is amended into the final rule at section 450.316(a).

Section 1201 of the FAST Act amends 23 U.S.C. 134(g)(3)(A) to add officials responsible for tourism and natural disaster risk reduction to the list of agencies and officials that an MPO should consult with in developing metropolitan transportation plans and TIPs. This change is amended into the final rule at section 450.316(b).

Section 450.318 Transportation Planning Studies and Project Development

The comments and responses relevant to section 450.318 are discussed under section 450.212, and are incorporated by reference into this section.

Section 450.320 Development of Programmatic Mitigation Plans

Similar to section 450.214, section 450.320 describes the development of programmatic mitigation plans. The FHWA and FTA received comments from a total of 26 entities on this section (AASHTO, AMPO, ARTBA, CALTRANS, CT DOT, DRCOG, DVRPC, Enterprise Community Partners, H–GAC, MARC, MTC, NARC, National Mitigation Banking Association, New York State Association of MPOs, NJ DOT, North Front Range MPO, OR DOT, PA DOT, RTD, SACOG, SANDAG, SCAG, SCCRTC, SJCOG, and TX DOT). All commenters were generally supportive of the development and use of programmatic mitigation plans within the transportation planning process.

The responses to the following comments are provided in section 450.214

General Comments

- Seven organizations (CALTRANS, MTC, SACOG, SANDAG, SCAG, SCCRTC, and SJCOG) commented on the eligibility for Federal funding for the development of programmatic mitigation plans.
- The ARTBA commented on the greater use of programmatic mitigation plans and recommended that FHWA and FTA quantify the benefits of using such plans in terms of time saved. In addition, the group also recommended a clearinghouse for mitigation plans used across the Nation to highlight best practices.
- Enterprise Community Partners and NRDC commended FHWA and FTA for the provisions contained in sections 450.214 and 450.320, noting that early planning can reduce conflicts and delays during environmental reviews performed later in project development. The group specifically noted the preference for requiring the development of programmatic mitigation plans within the transportation planning process.
- The NRDC also commented on the appropriate nature of consultation with the resource agencies, making a draft of the mitigation plan available for public review and comment, and addressing the comments in the final plan. Please see response in Section 450.214.
- The National Mitigation Banking Association noted that many of the attributes of a programmatic mitigation plan specified in section 450.320 are already in place in mitigation and conservation banks across the country. The group also noted that it would be

prudent public policy to make the acquisition of bank credits from approved mitigation banks a central component of a programmatic mitigation plan element. The group also suggested that the final rule incorporate a reference to existing banks and bank credits as the preferred alternative for offsetting transportation impacts.

• The Mid-America Regional Council provided a general letter of support on the development and use of programmatic mitigation plans and suggested that the final rule should include language indicating that States shall coordinate with MPOs on the development and use of such plans.

Section 450.320(a)

• Six entities (AASHTO, CT DOT, H–GAC, NARC, OR DOT, and TXDOT) commented on the proposed language in section 450.320(a)(2)(ii), stating that the resources addressed in the final rule should not be limited to the examples given.

• The CALTRANS and NJ DOT sought further clarification on the scope and scale of the programmatic mitigation plan. Specifically, NJ DOT inquired whether the plan should be restricted to one project (discussing an array of resources) or an array of transportation projects (covering one resource category for discussion). The CALTRANS commented on the appropriate scale of the programmatic mitigation plan and inquired whether MPOs may plan on a scale beyond its MPA boundaries.

Section 450.320(b)

• Nine entities (AASHTO, AMPO, CT DOT, H–GAC, NARC, New York State Association of MPOs, OR DOT, SCCRTC, and TX DOT) commented on the proposed language in section 450.320(b) which they found to be more restrictive than the text of the statute. Specifically, the commenters suggested that paragraph (b) should preserve the flexibility provided in the statute, which allows for States and MPOs to develop programmatic mitigation plans within or outside the statewide and metropolitan planning processes.

Section 450.320(d)

• The CALTRANS expressed appreciation for the support for programmatic mitigation plans, but also concerns about acceptance of such plans by Federal and State regulatory agencies. The commenter specifically questioned whether rulemaking to govern the regulatory agencies toward the goal of reaching a higher level of commitment to programmatic mitigation planning activities might be possible.

The responses to comments not previously raised or addressed in section 450.214 follow:

General Comments

The North Front Range MPO expressed general support for the development and use of programmatic mitigation plans, but noted that the development of such plans would require additional staff time for review. Such a delay in conducting the review would offset any benefits derived from the development of the plan. The organization also noted that the development of programmatic mitigation plans may be a duplicative effort, especially if a NEPA review is necessary or underway.

The FHWA and FTA acknowledge that the development and review of programmatic mitigation plans would likely require additional staff time from resource agencies, States, and MPOs. But FHWA and FTA also note that a programmatic mitigation plan can be integrated with other resource plans including, but not limited to, watershed plans, ecosystem plans, species recovery plans, growth management plans, State wildlife plans, climate change action plans, and land use plans. Integrating the development of programmatic mitigation plans with other resource planning efforts streamlines the process and reduces points of duplication, thereby reducing the overall burden of staff time for review.

Section 450.320(b)

The DRCOG and RTD noted that the analysis of environmental impacts of a project or program under NEPA may result in identification of a different set of impacts and possible mitigation than what is stated in a programmatic mitigation plan. Therefore, the framework for development of such plans and future use within NEPA should be reviewed and approved by the CEQ.

The FHWA and FTA acknowledge that in certain rare instances, a programmatic mitigation plan may not capture the best possible data for impact discussion and possible mitigation. For this reason, this section retains the flexibility for States and MPOs to decide if and when they choose to develop programmatic mitigation plans and how such plans can be used to address the potential impacts of transportation projects. The FHWA and FTA also point out that, as stated in section 450.320(b), early and ongoing coordination with the resource agencies with jurisdiction over the environmental resource is a pragmatic solution to avoiding future conflicts associated with the NEPA process.

Section 450.320(d)

Four entities (DVRPC, NARC, PA DOT, and SCCRTC) commented on the proposed text in section 450.320(d), advocating for stronger language (*i.e.,* the use of the word ''shall'' in the regulatory text in section 450.320(d)) that would require Federal agencies to consider the recommendations developed under a programmatic mitigation plan when conducting future environmental reviews.

The FHWA and FTA can encourage the development and use of programmatic mitigation plans in future NEPA reviews, but cannot interpret the statutory provision (23 U.S.C. 169(f)) in a manner that would make it more restrictive for States and MPOs to utilize effective mitigation efforts, if developed through another authority or during an environmental review for a specific project or program. Furthermore, if a mitigation plan is developed, it may not necessarily be aligned in time with the environmental review of a project or program. In these instances, delaying the environmental review of a project or program for the development and adoption of a programmatic mitigation plan may not be in the best interest of the State or MPO. This final rule retains the language proposed in the NPRM.

Five planning organizations (MTC, SACOG, SANDAG, SCAG, and SJCOG) commented on broadening the scope of paragraph (d) through the removal of the word ''Federal.'' They suggested that this would clarify that any agency may use a programmatic mitigation plan, developed under this authority, that has been adopted for use within the transportation planning process in future environmental reviews.

Paragraph (d) is applicable to any Federal agency responsible for environmental reviews, permits, or approvals for a transportation project. The final rule does not prohibit non-Federal agencies wishing to utilize programmatic mitigation plans developed by States or MPOs under this authority.

Section 1306 of the FAST Act amends 23 U.S.C. 169(f) to change ''may use'' to ''shall give substantial weight to'' and changes ''any other environmental laws and regulations'' to ''other Federal environmental law'' such that a Federal agency responsible for environmental reviews ''shall give substantial weight to'' the recommendations in the programmatic mitigation plan when carrying out its responsibilities under NEPA or ''other Federal environmental law.'' Sections 450.214(d) and

450.320(d) of the final rule are amended to reflect these changes.

Section 450.322 Congestion Management Process in Transportation Management Areas

Seven entities (ARC, DRCOG, Enterprise Community Partners, MARC, National Housing Conference, New York State Association of MPOs, and WA State DOT) submitted comments on this section. One comment was from a State, three from MPOs, two from advocacy organizations, and one from an association.

The DRCOG commented that the term ''acceptable,'' as used in section 450.322(c), related to system performance should be defined in the final rule by describing how and by whom acceptability will be determined. In response, FHWA and FTA note that for the CMP, as described in section 450.322(c), it is the responsibility of State and local transportation officials to determine the level of system performance they deem acceptable. As a result of this comment, no changes to the final rule were made.

Enterprise Community Partners and the National Housing Conference commented that intensive development near transit such as transit oriented development and joint development should be included in the final rule as congestion management strategies. In response, FHWA and FTA note that several examples of congestion management strategies are provided in the NPRM and in the final rule. These strategies are consistent with those suggested in the comment, such as growth management and public transportation improvements. Therefore, no changes were made to the final rule.

The DRCOG commented on section 450.322 that single occupancy vehicles (SOV) projects or facilities do not exclusively serve SOVs. The New York State Association of MPOs commented that decisions about congestion are variable, and that flexibility in defining and addressing congestion is important. The FHWA and FTA agree that SOV facilities might not exclusively serve SOVs and feel the final rule provides MPOs the flexibility to define and address congestion.

The MARC noted that the CMP has a linkage to the performance-based planning process. The FHWA and FTA response to this comment is that the CMP and the performance-based planning and programming processes do have linkages. Specifically, section 450.306(d)(4)(vii) requires that an MPO shall integrate them into the metropolitan transportation planning process, directly or by reference, the goals, objectives, performance measures, and targets from other federally required performance-based plans and process, such as the CMP.

The New York State Association of MPOs commented that they support a coordinated plan for data collection and propose that the last sentence in section 450.322(d)(3) mention that public safety agencies are a potential source of data related to incident management and non-recurring congestion. The FHWA and FTA have reviewed this comment and have decided not to specifically add language that public safety agencies could be a source of safety data because this section does not specifically provide a list of agencies and the data they might provide.

The New York State Association of MPOs noted that intelligent transportation system (ITS) technologies are not a congestion management strategy, and that it is more appropriate to reference the importance of implementing the adopted ITS regional architecture. In response, FHWA and FTA note that the final rule describes ITS technologies as they relate to the regional ITS architecture as a congestion management strategy, and so no change was made.

Section 1201 of the FAST Act amended 23 U.S.C. 134(k)(3)(A) to add a list of examples of travel demand reduction strategies and to add job access projects as a congestion management strategy. The final rule at section 450.322(a) is amended to reflect this change.

Section 1201 of the FAST Act amended 23 U.S.C. 134(k)(3)(C) to allow that an MPO serving a TMA may develop a congestion management plan. The final rule at section 450.322(h)(1) and (2) is amended to reflect this change.

Section 450.324 Development and Content of the Metropolitan Transportation Plan

Fifty-one commenters (AASHTO, Albany MPO, AMPO, ARC, CALTRANS, Community Labor United, CT DOT, DVRPC, DRCOG, Enterprise Community Partners, Florida MPO Advisory Council, FMATS, Front Range Economic Strategy Center, IA DOT, MAG, Macatawa MPO, MARC, Maui MPO, ME DOT, MET Council, MTC, MO DOT, NARC, National Housing Conference, National Trust for Historic Preservation, New York State Association of MPOs, NJ DOT, North Florida MPO, NRDC, NYMTA, NYMTC, PA DOT, Partnership for Active Transportation, Partnership for Working Families, Policy Link, Portland Metro, PSCOG, Public Advocates, SACOG, San Luis Obispo MPO, SANDAG, Santa Cruz County MPO, SCAG, SEMCOG, SJCOG, TX DOT, United Spinal Association, VA DOT, WA State DOT, Westchester County Department of Public Works, WFRC, and WMATA) submitted comments on this section to the docket. Twenty were from MPOs, 11 from States, 12 from advocacy groups, 5 from transportation associations, and 3 from public transit agencies.

Section 450.324(a)

At least three MPOs (Albany MPO, San Luis Obispo COG, and WFRC) commented that in section 450.324(a) the regulations should allow for a MTP that has more than a 20-year planning horizon. The FHWA and FTA respond that these regulations allow for MTPs with a 20-year or greater planning horizon.

The NARC stated that section 450.324(a) is inconsistent, in that it states that the metropolitan transportation plan shall address no less than a 20-year planning horizon as of the effective date. However, section 450.324(a) further states that in formulating the MTP, the MPO shall consider the factors described in section 450.306 as they relate to a 20-year period. The NARC further stated that many MPOs prepare MTPs that forecast beyond a 20-year horizon. This section appears to limit the consideration of factors to only a 20-year horizon, and NARC further suggests inserting the word ''minimum.'' The FHWA and FTA agree with this comment and changed the section to state that the MPO shall consider factors described in section 450.306 as the factors relate to a minimum 20-year forecast period to be consistent with the fact that the MTP horizon may exceed 20 years.

Section 450.324(c)

More than one commenter (DVRPC, NJ DOT, and PA DOT) suggested that FHWA and FTA should consider changing the review and update cycle for MTPs in areas that are classified as air quality nonattainment and maintenance areas from 4 to 5 years. The FHWA and FTA respond to this comment that the statute requires MTPs in nonattainment and maintenance areas to be updated at least every 4 years and as a result, in keeping with the statutory requirement, the final rule requires updates at least once every 4 years.

Section 450.324(f)

The PSRC and WA State DOT asked what the term ''current'' means in section 450.324(f)(1). The WA State DOT further commented that the word

''current'' in this section might mean that the MTP will have to be updated annually. The WA State DOT suggested the use of the word ''baseline'' instead of the word ''current.''

The FHWA and FTA response to these comments is that the word ''current'' means at the time the plan is under development. The use of the word ''current'' is not meant to mean the same as ''baseline.'' The FHWA and FTA further respond that this provision does not mean that MTPs have to be updated annually. The FHWA and FTA reiterate that section 450.324(c) clearly states that the MPO shall review and update the MTP at least every 4 years in air quality nonattainment and maintenance areas and at least every 5 years in attainment areas.

The MARC commented that it wanted clarification in section 450.324(f)(1) on how current demand of persons and goods should be reflected in the plan. The FHWA and FTA response is that it is up to each MPO to determine how to meet this requirement.

The DRCOG and DVRPC commented that the requirement in section 450.324(f)(2) that the MTP includes pedestrian and bicycle facilities is extremely difficult, burdensome, and unclear. In response to this comment, FHWA and FTA believe that Congress intends for a multimodal approach to the transportation planning process. Title 23 U.S.C. 134(b)(2) states that the MTPs and TIPs for each metropolitan area shall provide for the development and integrated management and operation of transportation systems and facilities (including accessible pedestrian walkways and bicycle transportation facilities) that will function as an intermodal transportation system for the MPA and as an integral part of an intermodal transportation system for the State and the United States.

In drafting the NPRM and the final rule, FHWA and FTA fulfilled this intent by requiring that the MTP include, among other things, short- and long-range strategies/actions and existing and proposed transportation facilities that provide for pedestrian walkways and bicycle facilities that function as part of an integrated metropolitan transportation system (23 CFR 450.324(f)(2) and 23 CFR450.324(b)). The FHWA has recently completed the Statewide Pedestrian and Bicycle Planning Handbook, which is available at: *http://www.fhwa.dot.gov/planning/processes/pedestrian_bicycle/pedestrian_bicycle_handbook/fhwahep14051.pdf.* A metropolitan version of the handbook is under development and will be available soon.

The DRCOG and RTD commented that both sections 450.324(f)(2) and 450.324(f)(12) contain references requiring the MPO MTP to include pedestrian walkways and bicycle facilities. The FHWA and FTA response to this comment is that the commenter is correct. Reference to pedestrian walkways and bicycle facilities is included in the two sections for added emphasis, however, the context of each section is slightly different. Section 450.324(f)(2) refers overall to including existing and proposed transportation facilities such as major roadways, transit, multimodal and intermodal facilities, and nonmotorized transportation facilities, including pedestrian walkways and bicycle facilities that should function as an integrated transportation system in the MTP. Section 450.324(f)(12) refers specifically to including pedestrian walkway and bicycle transportation facilities in the MTP. No changes were made as a result of this comment.

Section 1201 of the FAST Act amended 23 U.S.C. 134(i)(2)(A)(i) to add public transportation facilities and intercity bus facilities to the list of existing and proposed transportation facilities to be included in the metropolitan transportation plan. The final rule at section 450.324(f)(2) is amended to reflect this change.

Several commenters (DVRPC, NYMTC, and PA DOT) commented that the system performance report in the MTP (section 450.324(f)(4)) should only consider conditions and trends at the system level, and should not be required to conduct a project specific analysis. The MARC commented that it would like flexibility in how the systems performance report required under section 450.324(f)(4) is integrated into the MTP. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

At least two commenters (IA DOT and New York State Association of MPOs) commented that it is not clear what the term ''subsequent updates'' refers to in sections 450.324(f)(4) and 450.216(f)(2). The FHWA and FTA response is that the term ''subsequent update'' refers to the update of the MTP or the long-range statewide plan and is defined in section 450.104. Update of the MTP or the long-range statewide transportation plan means making a MTP or a long-range statewide transportation plan current through a comprehensive review. Updates require public review and comment; a 20-year horizon for MTPs and long-range statewide plan; a demonstration of fiscal constraint for the MTP; and a conformity determination for MTPs in nonattainment and maintenance areas. Section 450.324(c) requires the MPO to review and update the MTP at least every 4 years in air quality nonattainment and maintenance areas and at least every 5 years in attainment areas.

Section 450.324(f)(4) requires that with the update to the metropolitan plan, and each update thereafter, the MPO also will update the evaluation of the condition and performance of the transportation system with respect to the performance targets described in section 450.306(d) as part of the update of the MTP. Similarly, 405.216(f)(2) means the State will update the evaluation of the condition and performance of the transportation system with respect to the performance targets described in section 450.206(c)(2) as part of the update of the long-range statewide transportation plan. No changes to the final rule are required as a result of this comment.

The NYMTA commented on section 450.324(f)(4) that the cycle for subsequent updates to the system performance report should be clarified. Specifically, it wanted to know if this means each MTP update, or if more frequent updates to the system performance report are required independent of the MTP update. The FHWA and FTA response to this comment is that the system performance report in the MTP has to be updated when the MTP is updated. Update cycles for the MTP are described in section 450.324(c).

The IA DOT commented on section 450.324(f)(4)(ii) that it appears that the analysis of how the preferred scenario has improved the conditions and performance of the transportation system is a requirement, when the use of scenario planning is optional. The FHWA and FTA response to this comment is that for those MPOs that elect the option to conduct scenario planning in the development of their MTPs, the provision in section 450.324(f)(4)(ii) is a requirement (23 CFR 450.324(f)(4)(ii) and 23 U.S.C. 134(i)(2)(C)(ii)).

For section 450.324(f)(4)(ii), the WA State DOT requests revision to clarify that the analysis of how changes in local policies and investments have impacted the costs necessary to achieve the identified performance targets can be a general discussion of broad policy. In response to this comment, FHWA and FTA do not believe that this additional clarification is necessary. As written, the requirement is fairly nonprescriptive

in how it would be carried out. The FHWA and FTA believe that it is up to the MPO, within reason, to decide how to meet this requirement. After publication, FHWA and FTA plan to issue guidance and share best practices on this requirement. No changes were made as a result of this comment.

Section 1201 of the FAST Act amends 23 U.S.C. 134(i)(2)(G) to add ''reduce the vulnerability of the existing transportation infrastructure to natural disasters'' to the assessment of capital investment and other strategies to preserve the existing and projected future metropolitan transportation infrastructure in the metropolitan transportation plan. Section 450.324(f)(7) of this final rule is amended to include this new provision.

Section 1201 of the FAST Act amends 23 U.S.C. 134(i)(2)(H) to add consideration of the role intercity buses may play in reducing congestion, pollution, and energy consumption as part of the metropolitan transportation plan. Section 450.324(f)(8) of this final rule is amended to include this new provision.

The ARC supports the optional provision in section 450.324(f)(11)(iii) for including an assessment of the appropriateness of innovative finance techniques as revenue sources for the projects in the MTP. However, ARC states that it is unclear to what level of detail is expected. In response, FHWA and FTA note that FHWA has previously issued guidance on fiscal constraint, which includes guidance on innovative finance techniques and fiscal constraint.[29]

The Florida MPO Advisory Council commented that this provision is an important step in not only encouraging MPOs to consider new and innovative financing techniques very early in the planning process, but also places emphasis on the feasibility of implementing those financing techniques. The Partnership for Active Transportation commented that the consideration of innovative financing techniques should encourage those techniques in the context of active transportation such as pedestrian and bicycle projects. The FHWA and FTA response is that this provision is intended to be considered for all types of transportation projects, including bicycle and pedestrian projects.

For section 450.324(f)(11)(iii), the WA State DOT recommends the section be revised to clarify that the discussion of strategies for ensuring their availability can be a general discussion of the types of actions that would be necessary to implement new revenue sources. In response to this comment, FHWA and FTA note that they have issued guidance on fiscal constraint that includes information on this specific topic that an MPO can use to understand how to carry out this requirement. No changes were made as a result of this comment.

The ARC suggested that for section 450.324(f)(11)(iv), FHWA and FTA provide guidance on the topic of ''year of expenditure.'' The FHWA and FTA have previously issued guidance on this topic. It is available at: *http://www.fhwa.dot.gov/planning/guidfinconstr_qa.cfm.*

The AASHTO stated that year of expenditure should only apply to costs and not to revenues in the MTP (section 450.324(f)(11)(iv)). Similar comments were received on section 450.218(l) (development and content of the STIP) and section 450.326(j) (development and content of the MTP). The FHWA and FTA disagree with these comments. Year of expenditure is applied to both costs and revenues in the NPRM and final rule for the MTP, TIP, and STIP to provide for consistency and comparability of costs and revenues in these documents. The requirement for adjustment to year of expenditure applies to revenue and cost estimates developed for the STIP (section 450.218(l)), MTP (section 450.324(f)(11)(iv)), and TIP (section 450.326(j)). The FHWA and FTA made no changes to those sections based on the comments. The FHWA and FTA note that this is consistent with the previous regulations (72 FR 7224, 23 CFR 450.216(l), and section 450.324(h)).

Section 450.324(g)

Section 450.324(g) describes MPO consultation with State and local agencies responsible for land use management, natural resources, environmental protection, conservation, and historic preservation concerning the development of the transportation plan. Section 450.324(g)(2) states that the consultation shall involve, as appropriate, the comparison of transportation plans to inventories of natural or historic resources, if available. The National Trust for Historic Preservation commented that section 450.324(g)(2) should include additional language requiring State and local resource protection and historic preservation agencies to be contacted to obtain existing inventories, and that MPOs may fund the preparation or updating of such inventories, pursuant to this chapter, if inventories are not current or available.

In response, FHWA and FTA reiterate that the existing language in section 450.324(g)(2) already requires that the MPO shall consult, as appropriate, with State and local agencies responsible for natural resources, environmental protection, and historic preservation and a comparison of transportation plans to inventories of natural or historic resources, if available. The FHWA and FTA also respond that funding eligibility for activities necessary to support metropolitan transportation planning under the final rule is described in section 450.308. No changes were made as a result of these comments.

Section 450.324(h)

The WAMTA commented on section 450.324(h) that it does not want the safety plans such as the HSIP (including the SHSP required under 23 U.S.C. 148, the Public Transportation Agency Safety Plan required under 49 U.S.C. 5329(d), or an Interim Agency Safety Plan in accordance with 49 CFR part 659, as in effect until completion of the Public Transportation Agency Safety Plan) integrated into the MTP as described in this section. In response to this comment, FHWA and FTA note that the basis for this provision in the regulation predates the final rule. The FHWA and FTA also note that transportation safety is a major priority for DOT. The MAP–21 and the final rule call for the integration of the goals, objectives, performance measures, and targets from the various federally required performance-based plans and processes into the statewide and metropolitan transportation planning processes either directly or by reference, including federally required transportation safety plans (23 U.S.C. 134(h)(2)(D) and 135(d)(2)(C)). No changes were made to the final rule.

Section 450.324(i)

Many MPOs (Albany MPO, AMPO, ARC, Metropolitan Council MPO, Portland Metro, SCCRTC, and WMATA), some States (CALTRANS, CT DOT, and NJ DOT), and one advocacy organization (NRDC) commented that they support the voluntary option for MPOs to utilize scenario planning in the development of an MTP as described in section 450.324(i). A few commenters (DVRPC and PA DOT) commented that scenario planning is already being used in the development of their MTPs. The NRDC stated that they liked the detailed description of scenario planning in this section and the definition of the term ''visualization'' in section 450.104. The

[29] ''Guidance on Financial Planning and Fiscal Constraint for Transportation Plans and Programs, FHWA, April 17, 2009, *http://www.fhwa.dot.gov/planning/guidfinconstr.cfm.*

NRDC and WAMATA further commented that FHWA and FTA should provide detailed training, guidance, and additional resources on scenario planning. The WAMATA also commented that FHWA and FTA should use the final rule to promote scenario planning as a best practice and tie scenario planning to performance measures and targets.

In response, FHWA and FTA note that they have developed guidance, training, peer exchanges, and examples of practice on scenario planning and visualization, which is available at: *http://www.fhwa.dot.gov/planning/scenario_and_visualization/scenario_planning/index.cfm*. The FHWA and FTA regularly update this material. The FHWA and FTA are researching the use of scenario planning with performance-based planning. The FHWA and FTA note that section 450.324(f)(4)(ii) states that MPOs that voluntarily elect to develop multiple scenarios as part of the development of the MTP shall conduct an analysis of how the preferred scenario has improved conditions and performance of the transportation system as part of the system performance report required under section 450.324(f)(4).

Several MPOs (MTC, NARC, SACOG, SANDAG, SCAG, and SJCOG) and the TN DOT suggested changes to the language on scenario planning in this paragraph. The MTC, SACOG, SANDAG, SCAG, and SJCOG stated that they are supportive of scenario planning and its inclusion in the final rule. However, they believe that the language in the NPRM describing what specific scenarios MPOs should analyze is overly prescriptive. They further commented that instead of identifying specific performance-driven scenarios that should be evaluated, the language should be clarified that MPOs should develop a range of reasonable scenarios and carefully consider their performance impacts.

In response to this comment, FHWA and FTA reiterate that the use of scenario planning by MPOs as described in section 450.324(i) is voluntary, and that the examples of scenarios described under section 450.324(i)(1) are only for consideration. No changes were made to the final rule based on this comment.

The ARC commented that since scenario planning is optional, the elements considered when doing scenario planning should also be optional for the MPO in section 450.324(i). In response to this comment, FHWA and FTA reiterate that scenario planning is optional under section 450.324(i) and that it is up to the MPO to determine the elements to be considered when doing scenario planning. However, section 450.324(f)(4)(ii) requires that for MPOs that voluntarily elect to develop multiple scenarios, the metropolitan transportation plan shall include an analysis of how the preferred scenario has improved conditions and performance of the transportation system as part of its systems performance report (23 U.S.C. 134(i)(2)(c)(ii)).

Section 450.324(i) states that an MPO may voluntarily elect to develop multiple scenarios for consideration as part of the development of the MTP. The TN DOT suggested that this language could be strengthened by replacing the phrase ''an MPO may voluntarily elect'' with the phrase ''MPOs are encouraged to develop multiple scenarios.'' In response to this comment, FHWA and FTA believe that Congress intended for the use of scenario planning by MPOs to be voluntary (23 U.S.C. 134(i)(4)(A)) and FTA and FHWA want to convey that intent. No changes were made to the final rule based on this comment.

The NARC suggested that the language concerning scenario planning in section 450.324(i) be changed from ''an MPO may, while fitting the needs and complexity of its community, voluntarily elect to develop multiple scenarios for consideration as part of the development of the metropolitan plan'' to ''an MPO may voluntarily elect to develop multiple scenarios for consideration as part of the development of the MTP.'' In response to this comment, FHWA and FTA believe that an MPO may want to be sensitive to the needs and complexity of its community as it decides whether or not to use scenario planning and the extent to which it might use it as part of developing its MTP. No changes were made to the final rule based on this comment.

The NARC also suggested a change to section 450.324(i)(1)(iv), which states ''a scenario that improves the conditions for as many of the performance measures identified in section 450.306(d) as possible'' be changed to ''a scenario that improves the baseline conditions for one or more of the performance measures identified in section 450.306(d).'' In response to this comment, FHWA and FTA reiterate that an MPO may create scenarios that improve the baseline conditions for one or more of the performance measures identified in section 450.306(d). Section 450.324(i)(1)(iv) encourages that at least once scenario improve the baseline conditions for as many of the performance measures identified in section 450.306(d) as possible. No changes were made to the final rule based on this comment.

The AMPO commented on section 450.324(i) that it does not want scenario planning to be a factor in FHWA and FTA planning certification reviews of TMAs. The FHWA and FTA response to this comment is that, although the use of scenario planning is optional, FHWA and FTA will typically include discussion on scenario planning in planning certification reviews to assess the state of the practice with scenario planning and to promote it as a best practice.

The MARC commented on section 450.324(i)(2) that it supports the provision in this section whereby an MPO may evaluate scenarios developed using locally developed measures in addition to the performance areas identified in 23 U.S.C. 150(c), 49 U.S.C. 5326(c), 49 U.S.C. 5329(d), and 23 CFR part 490.

At least seven advocacy groups (Community Labor United, Front Range Economic Center, National Association of Social Workers, Partnership for Working Families, PolicyLink, Public Advocates, and United Spinal Association) suggested that scenario planning be used by MPOs to analyze the impact of investments and policies on the transportation system including prioritizing the needs of low-income populations, minorities, or people with disabilities. The National Housing Conference suggested that MPOs should consider housing needs when conducting scenario planning. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.324(j)

Section 1201 of the FAST Act amends 23 U.S.C. 134(i)(6)(A) to add public ports to the list of entities that an MPO shall provide a reasonable opportunity to comment on the metropolitan transportation plan and adds a list of examples of private providers of transportation. Section 450.324(j) of this final rule is amended to include these new provisions.

The AMPO commented that States, MPOs, and operators of public transportation should not be subject to financial consequences or additional reporting requirements for not achieving established targets. The FHWA and FTA response is that under the final rule, MPOs, and operators of public transportation are not subject to financial consequences or additional reporting requirements for not achieving established targets. The comment is outside the scope of the final rule. As

there may be consequences for not achieving established targets under the other performance management rules for the States (not the MPOs), the commenter is encouraged to review the other performance management rules. Although there are no consequences for failing to meet established performance targets under this final rule, there may be consequences for not meeting the performance-based planning and programming requirements under this final rule and 23 U.S.C. 134 and 135. The consequences might be identified through the STIP approval and statewide transportation planning finding of the FHWA and FTA (23 CFR 450.220); the planning certification reviews of TMAs (23 CFR 450.336); or other means such as transportation planning certification reviews in TMAs.

Several commenters (FMATS, NARC, and NRDC) suggested that the States and MPOs should be subject to the same requirements. For example, MPOs are required to include federally required performance targets in their MTPs, but due to amendments to 23 U.S.C. 135(f)(7) made by FAST, it is now required that States to include federally required performance targets in the long-range statewide transportation plan. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.326 Development and Content of the Transportation Improvement Program (TIP)

Thirty-five entities (AASHTO, Albany MPO, AMPO, ARC, Center for Social Inclusion, DRCOG, DVRPC, Enterprise Community Partners, Florida MPO Advisory Council, FMATS, French Broad River MPO, H–GAC, IA DOT, KY TC, MAG, MARC, MET Council, MTC, NARC, National Housing Conference, NCTCOG/RTC, New York State Association of MPOs, North Florida MPO, NRDC, NYMTA, NYMTC, Orange County Transit, PA DOT, SACOG, San Luis Obispo MO, SANDAG, Santa Cruz MPO, SCAG, SJCOG, TriMet, TX DOT, WA State DOT, and Wilmington MPO) submitted comments on this section. Eighteen comment letters were submitted by MPOs, 6 by States, 5 by associations representing transportation agencies, 4 by advocacy organizations, and 2 by operators of public transportation.

Section 450.326(a)

The WA State DOT commented on section 450.326(a) that it is unclear why only the investment priorities are singled out as an element that must be reflected in the TIP, as opposed to ensuring that projects in the TIP are consistent with the MTP. The commenter further recommended that section 450.326(a) be rewritten to state that the TIP shall be consistent with the MTP; cover a period of no less than 4 years; be updated at least every 4 years; and be approved by the Governor and the MPO. The WA State DOT recommends deleting the phrase ''that the TIP shall reflect the investment priorities established in the current MTP.''

In response to this comment, FHWA and FTA reiterate that section 450.324(a) states that the TIP shall reflect the investment priorities established in the MTP, shall cover a period of no less than 4 years, and shall be updated at least every 4 years. The FHWA and FTA note also that in 23 U.S.C. 134(j)(1)(ii), Congress specifically stated that the MPO shall develop a TIP for the metropolitan area that reflects the investment priorities established in the current MTP. The FHWA and FTA further state that section 450.326(i) requires that each project or project phase included in the TIP shall be consistent with the approved MTP. Based on this comment, no changes were made to the final rule.

The DVRPC asked what is meant by ''the cycle for updating the TIP must be compatible with the STIP development process in section 450.326(a).'' The DRCOG and RTD questioned why the TIP and STIP cycles must be compatible if the TIP is supposed to be incorporated in the STIP without changes. In response, FHWA and FTA reiterate that the TIP shall include capital and non-capital surface transportation projects within the boundaries of the MPA proposed for funding under 23 U.S.C. and 49 U.S.C. Chapter 53, as described in section 450.326(e). Furthermore, the STIP must include the TIP without change in accordance with section 450.218(b). The provision in section 450.326(a) which states that the cycle for updating the TIP must be compatible with the STIP development process means that the TIP update cycle must be compatible so that the MPO TIP may be incorporated into the STIP by the State, and so that the proposed projects for the STIP may be incorporated into the MPO TIP.

Section 450.326(c)

The DRCOG and RTD stated that it is unclear in section 450.326(c) what is meant by the statement that ''the TIP shall be designed such that once implemented, it makes progress toward achieving the performance targets.'' This sentence means that, as the MPO develops the TIP, the program of projects shall be developed such that the investments in the TIP help achieve the performance targets set by the MPO for the region.

The Enterprise Community Partners and FMATS commented on section 450.326(c) that they support increased accountability in the Federal transportation program by linking spending decisions to performance outcomes. The FHWA and FTA agree that transportation investment decisions should be linked to transportation performance outcomes as described in section 450.326(c) and in 23 U.S.C. 134(j)(1)(A)(iii) and 134(j)(2)(D).

The National Housing Conference and the Center for Social Inclusion commented that spending decisions should be linked to performance measures and ensure that those measures promote sustainable development and a more holistic view of how transportation investments can serve the broader community. The commenters also noted that an equity analysis which includes performance measures specific to equity should be done on the MTP and the TIP. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.326(d)

Several commenters (AASHTO, Albany MPO, DVRPC, Florida MPO Advisory Council, H–GAC, IA DOT, MAG, MARC, NARC, North Florida TPO, Orange County Transportation Authority, PA DOT, San Luis Obispo COG, SCCRTC, and TriMet) commented that the required discussion in section 450.326(d) on the anticipated effect of the TIP toward achieving the federally required performance targets should not be on a project basis. They suggested instead that it should be on the basis of the entire program in the TIP. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The KY TC commented on section 450.326(d) that it feels it will be difficult to have a TIP include a description of the anticipated effect of the TIP toward achieving the performance targets in the plan because it has a short timeframe and includes projects that would not be fully implemented. The KY TC suggested that it would rather see this requirement as part of the MTP.

In response to this comment, FHWA and FTA believe that Congress intended for the TIP to include, to the maximum extent practicable, a discussion of the anticipated effect of the STIP toward achieving the performance targets established in the MTP, linking investment priorities to those

performance targets (23 U.S.C. 134(j)(2)(D)). The FHWA and FTA believe that this requirement is reasonable, given that the TIP implements the first 4 years of the MTP, and the investment priorities of the TIP should be linked to the MTP. The MPOs are encouraged to coordinate with their States and operators of public transportation when developing this discussion. The FHWA and FTA anticipate issuing guidance after the final rule is published to aid States and MPOs in meeting this requirement. The FHWA and FTA note that there is a separate requirement in section 450.324(f)(4) that MPOs include a system performance report in the MTP evaluating the condition and performance of the transportation system with respect to the performance targets described in section 450.306(d) that includes a description of progress achieved by the MPO in meeting the performance targets.

The ARC commented on section 450.326(d) that it is unlikely that the projects within a 4-year program will actually result in a target being met. The FHWA and FTA note that this comment is outside the scope of the final rule.

The IA DOT commented on section 450.326(d) that the definition of ''maximum extent practicable'' is unclear. The term ''to the maximum extent practical'' means capable of being done after taking into consideration the cost, existing technology, and logistics of accomplishing the requirement. The FHWA and FTA note that States and MPOs should include work tasks and funding in their State planning and research and unified planning work programs for carrying out the requirements necessary for the implementation of performance-based planning and programming requirements, including the requirements of this section, in their federally required metropolitan and statewide transportation planning work programs to accomplish the purposes of this part and section. The FHWA and FTA intend to issue guidance on the requirements of section 450.326(d) after the publication of this final rule and the other performance related rules.

One commenter stated that in section 450.326(d), it is unclear what the difference is between TIP investments and investment priorities. In response, TIP investments and investment priorities are the same thing. They are the program of projects in the TIP.

The FMATS stated that as the long-range statewide transportation plan, MTPs, STIPs, and TIPs direct investment priorities, it is critical to ensure that performance targets are considered during the development of these documents. The FHWA and FTA agree with this comment and reiterate that the final rule requires that the TIP be designed such that once implemented, it makes progress toward achieving the performance targets established under section 450.306(d). The final rule also requires that the TIP shall include, to the maximum extent practicable, a description of the anticipated effect of the TIP toward achieving the performance targets identified in the metropolitan plan, linking investment priorities to those performance targets (section 450.326(e)). Similarly, the STIP shall include, to the maximum extent practicable, a discussion of the anticipated effect of the STIP toward achieving the performance targets identified by the State in the long-range statewide transportation plan or other State performance-based plan(s), linking investment priorities to those performance targets (section 450.218(q)).

The NYMTC commented that section 450.326(d) should only apply with updates to the TIP but not to TIP amendments. The FHWA and FTA response to this comment is that the requirements in section 450.326(d) only apply to TIP updates.

Several commenters (Metropolitan Council MPO, NCTCOG/RTC, NYMTC, and Regional Transportation Council) objected to the provision in section 450.326(d) that the discussion of the anticipated effect of the TIP toward achieving the performance targets identified in the MTP should be consistent with the strategies to achieve targets presented in the MTP and other performance management plans such as the highway and transit asset management plans, the SHSP, the public transportation agency safety plan, the CMAQ performance plan, and the State freight plan (if one exists). The commenters stated that this overreaches and that FHWA and FTA should remain within the statutory requirements.

The FHWA and FTA agree with this comment and are eliminating the provision on consistency with the list of other performance management plans that was proposed for inclusion in section 450.326(d). The FHWA and FTA note that under section 450.306(d)(4), MPOs are required to integrate the goals, objectives, performance measures, and targets described in other State plans and processes and any plans developed under 49 U.S.C. chapter 53 by operators of public transportation into the metropolitan transportation planning process. Examples of other plans or processes are listed in section 450.306(d)(4). The FHWA and FTA believe that the provisions in section 450.306(d)(4) are sufficient to ensure the integration of elements of other federally required performance-based plans and processes.

Section 450.326(e)

The KY TC commented that in section 450.326(e)(2) and 450.326(e)(4), FHWA and FTA inadvertently left out reference to NHPP funds, while reference to NHS funds was appropriately deleted. The FHWA and FTA response to this comment is that this was deliberate. Reference to the NHPP funds was not included because planning projects are not eligible for NHPP funds. This was a change in MAP–21, section 1106(a), and 23 U.S.C. 119(d).

On sections 450.326(e)(2) and 450.326(e)(4), KY TC commented that it is not clear to what the term ''metropolitan planning projects'' refers. In response to this comment, FHWA and FTA clarify that metropolitan planning projects are planning projects that fund activities necessary to support the requirements of 23 U.S.C. 134. No changes were made as a result of this comment.

The NYMTC and NYS DOT supported the optional exclusion of emergency relief projects from the TIP, as described in section 450.326(e)(5). The FHWA and FTA retained this provision without changes in the final rule.

The NYS DOT and NY MTA commented that section 450.326(e)(5) should clarify that the repair of damaged assets in an operational right-of-way is not a substantial functional, locational, or capacity change in regards to emergency relief projects. The FHWA and FTA respond that this comment is outside the scope of the final rule.

Section 450.326(j)

The AASHTO suggested that in section 450.326(j), only the cost estimates in the TIP should be subject to an adjustment to be shown in year of expenditure dollars, and not both cost estimates and revenue projections. Another commenter suggested that FHWA and FTA should develop a national inflation rate that all MPOs could use at their option for adjustment of the TIP to year of expenditure. The ARC commented that FHWA and FTA should provide additional guidance on year of expenditure, given that there is considerable variation in assumptions made by MPOs around the Nation regarding inflation rates. See FHWA and FTA responses to similar questions in section 450.324(f) in the section-by-section analysis.

The North Florida TPO commented that the requirement in section

450.326(j) that the TIP contain a financial plan is redundant because funding availability is demonstrated in the MTP. In response, FHWA and FTA note that the requirement to include a financial plan with the TIP is long-standing and specifically required by statute (23 U.S.C. 134(j)(2)(B)). The FHWA and FTA note that the time horizons of the MTP and TIP are different. The financial plan for the TIP demonstrates how the approved TIP, which covers a 4-year period, can be implemented. The MTP covers a 20-year horizon and the financial plan for the metropolitan plan describes how the 20-year MTP can be implemented. Based on this comment, no changes were made to the final rule.

Section 450.326(m)

The TX DOT commented that the language stating that the TIP should be informed by the financial plan and the investment strategies from the State asset management plan for the NHS and by the public transit asset management plan is confusing and could potentially be interpreted and applied inconsistently. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Additional Section 450.326 Comments

The FMATS commented that it is essential for the States and MPOs to develop performance targets in full coordination with each other to ensure that performance targets are considered during the development of STIPs and TIPs, and that investment priorities are tied to targets. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses

The AMPO commented that there should be no financial consequences or additional reporting requirements for not achieving established targets. See section 450.324 in the section-by-section analysis for the FHWA and FTA response to this recurring comment.

The Board of the French Broad River MPO and Wilmington MPO commented that FHWA should encourage the State, rather than the MPOs, to be responsible for establishing and tracking performance in the TIP. In response to this comment, FHWA and FTA reiterate that the final rule requires the States and the MPOs to establish performance targets and to track progress in achieving performance.

The Center for Social Inclusion suggested that FHWA and FTA incentivize States and MPOs by establishing a competitive grant program, similar to TIGER, to assist with coordination, planning, and implementation efforts that aligns and coordinates all agency long- and short-term transportation plans. In response, FHWA and FTA note that the TIGER competitive grant program was specifically established and funded by Congress through statute. Congress has not provided authority for a program similar to the one suggested in the comment.

The NRDC commented that they disapprove of the differences between the sections covering TIPs and the sections covering STIPs, particularly the use of the words ''may'' and ''shall.'' See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Section 450.326(n) of the NPRM discussed procedures or agreements that distribute sub-allocated Surface Transportation Program (STP) funds or funds under 49 U.S.C. 5307 to individual jurisdictions or modes within the MPA by predetermined percentages or formulas inconsistent with the legislative provisions that require the MPO, in cooperation with the State and operator of public transportation, to develop a prioritized TIP. In the final rule, section 450.326(n) became 450.326(m) and the phrase ''or funds under 49 U.S.C. 5307'' was deleted because this provision does not apply to 49 U.S.C. 5307 funds. The FHWA and FTA deleted the phrase ''or funds under 49 U.S.C. 5307'' from the final rule because it is not consistent with FTA Circular C9030.1E, which permits section 5307 funds to be sub-allocated according to a formula.

The FHWA and FTA note that section 450.326(p) in the NPRM became 450.326(o) in the final rule, and is unchanged. Section 450.326(q) became section 450.326(p), and is unchanged.

Section 450.328 TIP Revisions and Relationship to the STIP

The APTA commented that performance targets should be updated when the TIP is updated, and should not require updating when the TIP is amended. In response, FHWA and FTA note that FHWA and FTA are required to establish national performance measures by rulemaking under 23 U.S.C. 150(c), 49 U.S.C. 5326(c), and 49 U.S.C. 5329(d). Each MPO is required to establish performance targets not later than 180 days after the date on which the relevant State or operator of public transportation establishes the performance targets, as provided in section 450.306(d)(3). The performance measures and targets are required to be reflected in the MPO MTP with the next plan update on or after the date that is equal to, or greater than, the date that is 2 years after the performance measures rules are effective, and with each subsequent MTP update (section 450.340).

The final rule and MAP–21 require that the TIP shall include, to the maximum extent practicable, a description of its anticipated effect toward achieving the performance targets identified in the MTP. This requirement applies to each update of the TIP. See section 450.340 for a description of the phase-in of the new requirements for performance-based planning and programming.

The FHWA and FTA made no changes to the final rule.

Section 450.330 TIP Action by FHWA and FTA

The WA State DOT requested that the language in section 450.330(c) be modified to state that the 12-month conformity lapse grace period applies to TIP amendments. The FHWA and FTA response is that section 450.326(p) describes the impacts of the conformity lapse grace period to the TIP. The FHWA also issued guidance on the implications of a conformity lapse grace period in a memorandum dated May 29, 2012.[30] This guidance includes information on the implications of a conformity lapse grace period on the MTP and TIP. There is also information available on the implications of the conformity lapse grace period in the January 24, 2008, amendments to the final rule on transportation conformity.[31] Because section 450.326(p), the guidance, and the amended EPA conformity regulations are available, FHWA and FTA do not believe it is necessary to make changes to section 450.330(c). Based on this comment, no changes were made to this section.

Section 450.332 Project Selection From the TIP

Three commenters (New York Association of MPOs, RTC of Southern Nevada, and Transportation for America) submitted comments on this section. The RTC of Southern Nevada requested that the language that describes project selection procedures

[30] FHWA Memorandum dated May 29, 2012, ''Subject: Information: Frequently Asked Questions on the Transportation Conformity Lapse Grace Period,'' *http://www.fhwa.dot.gov/environment/air_quality/conformity/reference/faqs/lapsegrace.cfm.*

[31] **Federal Register**, Vol. 73, No. 16, January 24, 2008, EPA Final Rule, Transportation Conformity Rule Amendments to Implement Provisions Contained in the 2005 Safe, Accountable, Flexible, Efficient, Transportation Equity Act: A Legacy for Users (SAFETEA–LU), *http://www.gpo.gov/fdsys/pkg/FR-2008-01-24/pdf/E8-597.pdf.*

for projects on the NHS be removed from the final rule. The RTC of Southern Nevada recommended instead that project selection be based on the underlying responsibility (ownership) for the roadway. The commenter's reasoning for their recommendation is that with the expansion of the NHS, many more miles of NHS roadway are now on non-State, locally owned roads, and that the State will now be responsible for selecting projects on roads over which it has no jurisdiction.

In response to this comment, FHWA and FTA believe that Congress intended that States have project selection authority for projects on the NHS. Title 23 U.S.C. 134(k)(4) states that projects carried out on the NHS within the boundaries of an MPA serving a TMA shall be selected for implementation from the approved TIP by the State, in cooperation with the MPO designated for the area. This requirement is long-standing and was continued under the MAP–21 and FAST. The FHWA and FTA made no changes to the final rule based on this comment.

The New York State Association of MPOs and Transportation for America suggested that MPOs that do not serve TMAs should have the same project selection authority as MPOs that serve TMAs. In response, FHWA and FTA believe that it is the intent of Congress that the selection of federally funded projects in metropolitan areas not designated as a TMA shall be carried out by the State for projects funded under title 23 and by the designated recipients of public transportation funding under chapter 53 of title 49 (23 U.S.C. 134(j)(5)). This requirement is long-standing and was continued under the MAP–21 and FAST. Based on these comments, FHWA and FTA made no changes to the final rule.

Section 450.334 Annual Listing of Obligated Projects

This section concerns the requirements for an annual listing of obligated projects in metropolitan areas. Section 450.334 requires that, in MPAs, the States, MPOs, and operators of public transportation cooperatively develop a list of projects for which funds under 23 U.S.C. or chapter 53 of 49 U.S.C. were obligated in the preceding program year. The MARC suggested that the final rule include a requirement that FHWA division offices and FTA regional offices provide information to MPOs from their databases on obligations that could be used in producing this list so that citizens have access to the best information available.

In response to this comment, FHWA and FTA encourage States, MPOs, and operators of public transportation to work with their FHWA division and FTA regional offices to ensure that the information provided on annual listing of obligated projects is accurate. The FHWA and FTA find that no changes to this section are necessary.

Section 450.336 Self-Certifications and Federal Certifications

Nine entities (Community Labor United, DRCOG, Front Range Economic Strategy Center, MARC, National Association of Social Workers, New York State Association of MPOs, Partnership for Working Families, Policy Link, The Leadership Conference on Civil and Human Rights, and United Spinal Association) provided comments on this section. The comments were received from seven advocacy groups and two MPOs.

Several commenters (Community Labor United, Front Range Economic Strategy Center, National Association of Social Workers, Partnership for Working Families, Policy Link, The Leadership Conference on Civil and Human Rights, United Spinal Association) suggested that FHWA and FTA should include EJ as a topic in the Federal certification review process and should require States and MPOs to self-certify compliance with E.O. 12898. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

The MARC suggested that it is a duplication of effort for States and MPOs to self-certify when FHWA and FTA conduct certification reviews of the planning process in TMAs. The FHWA and FTA disagree with this comment. Each of these certification requirements is intended to meet different purposes. The Federal certification of the planning process in TMAs is a Federal review of compliance with the planning requirements in TMAs to ensure that the requirements of 23 U.S.C. 134 are being met. The State and MPO self-certifications are self-assessments on compliance with the requirements of 23 U.S.C. 134 and 135. The FHWA and FTA also make a planning finding on the statewide and metropolitan planning process at the time of STIP approval. This finding assesses compliance of the planning process with 23 U.S.C. 134 and 135.

The first sentence in section 450.336(a) reads as follows: ''For all MPAs, concurrent with the submittal of the entire proposed TIP to the FHWA and the FTA as part of the STIP approval, the State and the MPO shall certify at least every 4 years that the metropolitan transportation planning process is being carried out in accordance with all applicable requirements.'' The DRCOG commented that this sentence is confusing and suggested that it be rewritten as follows: ''. . . concurrent with the submittal of the entire proposed TIP, at a maximum of at least every 4 years, to the FHWA and FTA . . .'' The FHWA and FTA have reviewed the commenter's proposed language and believe that it is unclear and does not provide additional clarity. Based on these comments, no changes were made to the final rule.

The ARC commented on section 450.336 that when FHWA and FTA are conducting certification reviews of the TMAs, they should focus on the requirements of the final rule (*i.e.,* the ''musts'' and ''shalls'') rather than on those things that are not required by the final rule (*i.e.,* the ''should'' and ''mays''). In response, FHWA and FTA note that they focus on the requirements of the final rule when conducting certification reviews in TMAs. However, FHWA and FTA also often review planning practices that are not required under the final rule to glean best practices that can be shared with other MPOs and make recommendations for improvement in priority topic areas.

The Community Labor United, Front Range Economic Strategy Center, and Partnership for Working Families suggested that FHWA and FTA certifications should be conducted every 3 years instead of every 4 years. In response to this comment, FHWA and FTA believe that Congress intended for FHWA and FTA to conduct certification reviews in TMAs on a 4-year cycle (23 U.S.C. 134(k)(5)(A)(ii)) and have reflected that in section 450.336(b). The FHWA and FTA believe that doing certification reviews more frequently than every 4 years would have limited benefits and would place an unnecessary increased burden on MPOs serving TMAs, their respective States and operators of public transportation, and the FHWA and FTA field offices because of the resources involved in preparing for, participating in, and conducting the review. Based on these comments, FHWA and FTA made no changes to the final rule.

Section 450.336(a)(5) has been updated to reflect changes in the statutory citations resulting from FAST; section 1101(b) of MAP–21 and 49 CFR part 26 in this section becomes section 1101(b) of FAST and 49 CFR part 26.

Section 450.338 Applicability of NEPA to Metropolitan Transportation Plans

The AASHTO commented that the new authority for PEL described in the

MAP–21 (section 1310) makes the project development process more complex and cumbersome, and recommended that existing authorities for PEL under appendix A to the final rule be retained. The FHWA and FTA response is that this same comment was received previously on section 450.224. See section 450.224 of the section-by-section analysis for the FHWA and FTA response to this comment. The FHWA and FTA have made no changes to the final rule.

Section 450.340 Phase-In of New Requirements

Section 450.340 describes the phase-in of the new requirements in metropolitan areas. Twenty-eight entities (AASHTO, Albany MPO, AMPO, ARC, Board of the French Broad River MPO, California Association for Coordinated Transportation, CT DOT, FMATS, GA DOT, H–GAC, IA DOT, MD DOT, ME DOT, MET Council, MI DOT, NARC, NYMTA, NJ DOT, North Florida MPO, NYMTC, RMAP, San Luis MPO, SEMCOG, TriMet, TX DOT, WA State DOT, WFRC, and Wilmington MPO) submitted comments on this section. Nine of the comment letters were from States, 14 from MPOs, 3 from associations, 1 from an operator of public transportation, and 1 from an advocacy group.

Several commenters (AASHTO, CT DOT, FMATS, IA DOT, ME DOT, NJ DOT, and NYMTC) commented that they felt the 2-year phase-in period for the final rule is too short and that more time and flexibility is needed. The New York State Association of MPOs stated that the 2-year phase-in period for requiring MPOs to comply with the new rule is adequate. The FHWA and FTA believe that the 2-year phase-in schedule for MPOs is sufficient. The FHWA and FTA rationale for the 2-year phase-in for MPOs was described in the NPRM. It is based on the 2-year phase-in for the States, as provided for in 23 U.S.C. 135(l). The FHWA and FTA made no changes to the final rule based on this comment. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Some commenters (NJ DOT, WA State DOT, and WI DOT) suggested that FHWA and FTA allow for an additional 90-day comment period once all of the performance management related NPRMs are issued to give States and others the opportunity to review and possibly revise their earlier comments. The Sierra Club commented that it liked this comment.

The FHWA and FTA believe that each of the rules has provided an robust comment period sufficien to allow stakeholders to submit comments. No changes were made to the final rule based on the comment.

The WA State DOT commented that FHWA and FTA should consider delaying the implementation of the performance management requirements of the final rule from 2 years after the publication date of the final rule and the issuance of guidance. See section IV(B) (recurring comment themes) for more discussion on this issue and FHWA and FTA responses.

Several commenters (Board of the French Broad River MPO, IA DOT, and Wilmington MPO) requested that FHWA and FTA further clarify the phase-in requirements and processes. Two commenters (California Association for Coordinated Transportation and WA State DOT) suggested that FHWA and FTA make available graphic materials to explain the timelines and relationships of the various new and continuing provisions, programs, and funding sources to make it easier to understand and comply. They further commented that technical assistance from FHWA and FTA will be important. In response, FHWA and FTA intend to provide guidance and technical assistance on the phase-in requirements and processes of the various performance related rulemakings.

Two commenters (IA DOT and WRFC) provided comments on compliance with the 2-year phase-in provisions in this section. See section IV(B) (recurring comment themes, common effective date, and phase-in of new requirements) for additional discussion and responses on this issue.

The NYMTC commented that MPOs should be able to incorporate goals and targets included in agency-specific plans into MTPs by reference because many of these other plans are on a schedule that is not consistent with the publication of the TIP or the MTP. The FTA and FTA response to this comment is that performance measures and targets would only have to be included in the MTP at the time it is updated. The performance measures and targets should be included directly in the MTP at the time it is updated.

The NYMTA and TriMet commented that FHWA and FTA should allow agencies to utilize existing processes and procedures whenever possible. The FHWA and FTA agree that States, MPOs, and operators of public transportation should utilize existing processes and procedures to ease the implementation of performance management when possible.

The Metropolitan Council MPO commented that in sections 450.340(e) and 450.340(f), the phrase ''meets the performance based planning requirements in this part and in such a rule'' is unnecessary and should be deleted. The FHWA and FTA do not agree with this comment and are leaving the phrase unchanged because it delineates that these paragraphs apply specifically to meeting the performance-based planning requirements in this part and in other (performance management) rules.

The RMAP asked for clarification on how FHWA and FTA will evaluate MPOs serving TMAs during Federal TMA planning certification reviews on the progress of incorporating performance measures. The FHWA and FTA respond that after the transition period, they will be evaluating the progress of MPOs serving TMAs in implementing performance management based on the requirements for MPOs in the MAP–21 and the final rule. These requirements include, but are not limited to: Target setting for the federally required performance measures; progress in achieving targets; coordination on target setting among States, MPOs, and operators of public transportation linking the program of investments in the TIP to performance target achievement; and documentation of targets and progress toward achieving targets in the MTP.

Section 771.111, Early Coordination, Public Involvement, and Project Development

The FHWA and FTA received no comments specific to section 771.111. No substantive changes were made in the final rule.

Appendix A to Part 450—Linking the Transportation Planning and NEPA Processes

Appendix A to part 450 is nonbinding information that provides additional discussion on linking the transportation planning and NEPA processes. Fifteen entities provided comments on appendix A. Eleven comments were submitted by States, two by MPOs, one by an association representing public transportation agencies, and one by an advocacy organization.

Several of the States (ID DOT, MT DOT, ND DOT, SD DOT, TX DOT, and WY DOT) and one association representing public transportation agencies (AASHTO) asked that DOT clarify that appendix A is nonbinding guidance. The FHWA and FTA agree that appendix A is nonbinding guidance. The text in the opening paragraph of appendix A states that appendix A is intended to be nonbinding and should not be

construed as a rule of general applicability. This is unchanged from the previous 2007 rule.

The AASHTO and MT DOT stated that the new statutory authority for linking the planning and NEPA processes under section 1310 of the MAP–21 (23 U.S.C. 168) is too complex and cumbersome and may deter States from undertaking planning and environmental linkages. The commenters stated that they would like to retain the ability to use the existing process to adopt analysis and decisions made during the transportation planning process.

The FHWA and FTA response is that the existing authorities to adopt analysis and decisions made during the transportation planning process are retained in the final rule. Appendix A is unaltered by section 1310 of the MAP–21 or the FAST Act changes to 23 U.S.C. 138. See the section-by-section analysis (sections 450.212 and 450.318) for more discussion on the new statutory authority for linking the planning and NEPA processes from the MAP–21 and the retention of the existing authorities for PEL from the 2007 rule.

The ARTBA expressed concerns over the use of the phrase ''significant new information'' in appendix A in determining whether or not an existing planning document may be used during the NEPA review. The FHWA and FTA believe that if there is significant new information since the development of planning document, it should be reviewed to determine if the planning document is still valid or needs updating. That review should be conducted by the State or other entity responsible for preparing the NEPA document in cooperation with the lead Federal agency and other affected entities (*e.g.,* MPOs, local governments, operators of public transportation, and State and Federal resource agencies).

The ARTBA also suggested that FHWA and FTA establish a clearinghouse to share and highlight examples of the successful implementation of planning products into NEPA reviews. The FHWA and FTA response is that FHWA maintains a Web site to share existing practices on planning and environmental linkages. The Web site is accessible at: *http://www.environment.fhwa.dot.gov/integ/*.

The FL DOT suggested that FHWA and FTA provide further clarity on the role of appendix A in order to reduce the risk of misinterpretations in some States and division offices. The FHWA and FTA response is that the use of appendix A is optional and nonbinding. There is additional information on the aforementioned Web site on the use of planning and environmental linkages. It provides examples of effective practices, a checklist, and a guidebook on using PEL as part of a corridor study.

The ARC expressed support for the language in appendix A and recommended no changes.

Several commenters (AASHTO, CT DOT, and OR DOT) requested that the comment period be extended so that there is sufficient overlap with the separate NPRMs on planning and environmental linkages. The FHWA and FTA agreed with this comment and extended the comment period of the planning NPRM for 30 days to provide a 30-day overlap with the PEL NPRM.

Another MPO (SCCRTC) correctly commented that the NPRM does not extend NEPA to MTPs or transportation improvement programs.

In the text of appendix A, FHWA and FTA updated the number of positions funded for long-term, on-call staff that are detailed to an agency for temporary assignments to support focused and accelerated project review by a variety of Federal, State, tribal, and local agencies. The 2003 number of ''246 positions'' has been updated to ''over 200.''

Title 49 CFR part 613, Metropolitan Transportation Planning; Statewide and Nonmetropolitan Transportation Planning

This section is revised to refer to the proposed regulations in 23 CFR part 450. Because FHWA and FTA jointly administer the transportation planning and programming process, the regulations were kept identical.

VI. Regulatory Analyses and Notices

Executive Order 12866 (Regulatory Planning and Review), Executive Order 13563 (Improving Regulation and Regulatory Review) and DOT Regulatory Policies and Procedures

The FHWA and FTA have determined that this rulemaking is a nonsignificant regulatory action within the meaning of EO 12866, and under DOT regulatory policies and procedures. In addition, this action complies with the principles of EO 13563. After evaluating the costs and benefits of these amendments, FHWA and FTA have determined that the economic impact of this rulemaking would be minimal. These changes are not anticipated to adversely affect, in any material way, any sector of the economy. In addition, these changes will not create a serious inconsistency with any other agency's action or materially alter the budgetary impact of any entitlements, grants, user fees, or loan programs. The FHWA and FTA anticipate that the economic impact of this rulemaking will be minimal; therefore, a full regulatory evaluation is not necessary. The changes proposed herein would add new analysis, coordination, and documentation requirements (*e.g.,* performance-based planning and programming; cooperation with local officials responsible for transportation or, if applicable, RTPOs; and new requirements for TMA MPO policy board membership). In preparing this final rule, FHWA and FTA have sought to maintain existing flexibility of operation wherever possible for States, MPOs, and other affected organizations, and to use existing processes to accomplish any new tasks or activities.

The FHWA and FTA have conducted a cost analysis identifying each of the regulatory changes that would have a cost impact for States, MPOs, or operators of public transportation, and have estimated those costs on an annual basis. This cost analysis is included as a separate document titled ''Regulatory Cost Analysis of Final Rule,'' and is available for review in the docket.

Regulatory Cost Assessment and Burden Analysis Response to Comments

The regulatory analysis estimates the economic impact, in terms of costs and benefits, on States, MPOs, and operators of public transportation regulated under this action. The FHWA and FTA estimated the cost burden of this rule to be 2.6 percent of the total planning program. The FHWA and FTA concluded that the economic impact of this rulemaking would be minimal and the benefits of implementing this rulemaking would outweigh the costs.

Sixteen respondents (AASHTO, ARC, AR DOT, CALTRANS, County of Maui DOT, CT DOT, DVRPC, Florida MPO Advisory Council, MD DOT, NJ DOT, North Florida MPO, NYMTC, PA DOT, River to Sea TPO, VA DOT, and WA State DOT) submitted comments to the docket regarding the regulatory burden associated with complying with the proposed rule described in ''Economic Assessment: Statewide and Nonmetropolitan Transportation Planning and Metropolitan Transportation Planning Notice of Proposed Rule Making'' (Docket No. FHWA–2013–0037).

Ten commenters (AASHTO, CT DOT, DVRPC, Florida MPO Advisory Council, MD DOT, NJ DOT, North Florida TPO, River to Sea TPO, VA DOT, and WA State DOT) indicated that the estimated annual burden of $30.8 million documented in the NPRM underestimated the annual costs in terms of both funds and hours. They

commented that complying with the changes proposed in the NPRM and the introduction of performance-based planning and programming will significantly increase the workloads for States and MPOs.

The NJ DOT expressed concern that the estimated 2.6 percent of total planning program funds to carry out the requirements of this NPRM is too low, especially in the short-term implementation phase. The NJ DOT commented that the FHWA and FTA assumption that the additional work will increase the annual cost of preparing a long-range transportation plan, STIP, and TIP by States, MPOs, and operators of public transportation by 15 percent, on average, seems low. The NJ DOT commented that implementation of MAP–21 performance-based planning and programming will require more effort than the additional 2,400 annual burden hours and indicated a large amount of up front work is needed to collect, format, store, and analyze data. States also need to consult, coordinate, and cooperate with many entities when conducting the STIP and statewide planning and provide oversight of MPOs. The ARC and WA State DOT asked that FHWA and FTA explain the assumptions behind these costs and assumed benefits.

In response, FHWA and FTA estimated that the incremental cost of implementing the performance-based planning provisions of the final rule will increase the costs of preparing State and MPO long-range plans, STIPs, and TIPs by an average of 15 percent. This estimate is based on an analysis of current costs of States and MPOs that have implemented a performance-based approach to transportation planning and programming. Based on discussions with three States and three MPOs, FHWA and FTA believe that this assumption is reasonable.

Based on this assumption, the total cost for implementation of changes to the planning process resulting from this final rule is estimated to be $30.9 million annually (as compared to the estimate of $30.8 million in the NPRM). To implement the proposed changes in support of a more efficient, performance-based planning process, FHWA and FTA estimate that the aggregate increase in costs attributable to the final rule for all 50 States, the District of Columbia, and Puerto Rico and 409 MPOs is approximately $28.4 million per year (as compared to the estimate of $28.3 million in the NPRM). These costs are primarily attributable to an increase in staff time needed to meet the new requirements. For the estimated 600 operators of public transportation that operate within MPAs, the cost would be $2.5 million per year to coordinate with MPOs in their selection of performance targets for transit state of good repair and transit safety.

Four commenters (AASHTO, CT DOT, MD DOT, and NJ DOT) requested that FHWA and FTA conduct an analysis to estimate the costs to specific States and MPOs based on local wage rates. The NJ DOT noted that there are wide variations in labor wage rates and overhead rates among States and MPOs. The NJ DOT also noted that some States have a large network of roadways and transit services which will require greater resources to carry out this effort, as will those States that are responsible for the entire roadway network within their State.

In response, FHWA and FTA note that they do not have the information necessary to calculate the incremental cost of the rule by State and MPO as it does not know the current costs of preparing each State and MPO long-range plan, STIP, and TIP. The estimate of 15 percent could be applied by each State or MPO to estimate their respective incremental costs. The FHWA and FTA agree that the estimate is an average and the incremental costs to specific States and MPOs may differ as they vary considerably across agencies, depending on staff resources and priorities, and local political environment.

The WA State DOT questioned the assumption that the average State's cost is similar to the cost to a large MPO. The WA State DOT suggested that FHWA and FTA re-evaluate these costs because the average State incurs more costs than a large MPO for these reasons: (1) The State is required to consult, coordinate, and cooperate with many more entities/individuals than any single MPO would be required; (2) the State has the responsibility for the STIP, MPOs do not; and (3) the State has two roles, statewide planning and providing oversight to MPOs.

In response, FHWA and FTA believe the scope and complexity of the responsibilities of the 54 MPOs that serve an urbanized area with a population greater than 1 million is comparable to the scope and complexity of the responsibilities of a State DOT.[32] The FHWA and FTA agree that the estimate is an average and that the incremental costs to specific States and MPOs may differ.

The County of Maui, HI questioned why FHWA and FTA estimated that the incremental cost of implementing the performance-based planning provisions would increase the costs of preparing State and MPO long-range plans, STIPs, and TIPs by an average of 15 percent based only on discussions with three States and three MPOs. The FHWA and FTA respond that there is limited experience in implementing a performance-based approach to planning and programming and invited States and MPOs to submit comments on this assumption in the NPRM. While three respondents (AASHTO, CT DOT, and NJ DOT) did indicate that the estimate of a 15 percent increase in the cost of preparing State and MPO long-range plans, STIPs, and TIPs was too low, none provided documentation to support a different assumption.

The WA State DOT noted that it is difficult to provide informed comments on costs estimates because not all of the MAP–21 performance management related rules impacting costs are complete. In response, FHWA and FTA note that the estimates of the burden of the final rule focus on the incremental costs of preparing performance-based State and MPO long-range plans, STIPs, and TIPs. However, the burden of some data collection, target setting, and reporting is estimated in other rulemakings that implement the MAP–21 performance management requirements.

The FHWA will estimate the costs of additional data collection, target setting, and reporting through three separate rulemakings for performance measures and other associated requirements (National Performance Management Measures: Highway Safety Improvement Program Final Rule (RIN 2125–AF49), National Performance Management Measures: Assessing Pavement Condition for the National Highway Performance Program and Bridge Condition for the National Highway Performance Program NPRM (RIN 2125–AF53), and National Performance Management Measures: Assessing Performance of the National Highway System, Freight Movement on the Interstate, and the Congestion Mitigation and Air Quality Improvement Program NPRM (RIN 2125–AF52)).

To estimate costs for these rules, FHWA assessed the level of effort, expressed in labor hours and the labor categories needed to comply with each component of the rule. The FHWA derived the costs of each of these components by assessing the expected increase in level of labor effort to standardize and update data collection and reporting systems of States, and the increase in level of labor effort for States

[32] Forty-three of the fifty States have a population greater than 1 million people.

and MPOs to establish and report targets. The incremental annualized costs, discounted at 7 percent and 3 percent, respectively, are: $7.7 million to $7.1 million to implement the HSIP; $21.2 million to $20.3 million to implement the NHPP; and $18.9 million to $18.6 million to assess the performance of the NHS, Freight Movement on the Interstate System, and CMAQ Improvement Program.

Similarly, FTA estimated the burden of data collection, plan preparation, target setting, and reporting through two separate rulemakings: National Transit Asset Management System NPRM (RIN: 2132–AB07) and the Public Transportation Agency Safety Plan NPRM (RIN: 2132–AB23). The estimated costs of the proposed National Transit Asset Management (TAM) System include the cost for the operators of public transportation to assess their assets, develop TAM plans, and report certain information to FTA. The incremental annualized costs, discounted at 7 percent and 3 percent, respectively, are $7.7 million to $7.1 million to implement the National TAM System. To implement the Public Transportation Agency Safety Plan rule, three main cost areas were estimated: (1) Developing and certifying safety plans; (2) implementing and documenting the SMS approach; and (3) associated record keeping. Staff time was monetized using data on wage rates and benefits in the transit industry. Over the 20-year analysis period, total costs are estimated at $976 million in present value (7 percent discount rate), or the equivalent of $92 million per year.

Thus, the total estimated burden of implementing performance-based planning and programming, including the costs estimated in this and other related rulemakings that implement the MAP–21 performance management requirements, ranges from $175 million to $177 million per year. This cost estimate represents 3.6 million labor hours annually at $48.69 per hour.

The WA State DOT anticipates incurring additional costs to provide assistance to rural transit agencies to develop public transportation agency safety plans. The WA State DOT noted that it is unclear if these additional costs are captured in the FHWA and FTA analysis. In response, FHWA and FTA note that those costs are discussed in the Public Transportation Agency Safety Plan NPRM and not within the scope of this rulemaking.

The WA State DOT also noted the uncertainties regarding the expectations for performance reports. There is no required and consistent format and no common method to collect, store, report, and update data.

The FHWA and FTA note that each of the performance rules will identify their respective reporting format and the anticipated costs of reporting. The FHWA and FTA agree that the final rule will increase the level of effort and costs associated with carrying out several specific transportation planning functions, including the development of metropolitan and long-range statewide transportation plans, STIPs, and TIPs. The FHWA and FTA agree that the estimate is an average. The incremental costs to specific States and MPOs may differ. The costs associated with these functions vary considerably across agencies, depending on staff resources and priorities, local political environment, and other considerations. However, while the final rule changes existing processes and procedures, in most cases it does not require completely new activities. Given the experience of States and MPOs that have implemented a performance-based approach to planning, and that the costs of some data collection, data analysis, target setting, and reporting are included in other rulemakings implementing performance-based planning and programming, the FHWA and FTA will continue to assume that implementing the performance-based planning provisions of the final rule will increase the costs of preparing State and MPO long-range plans, STIPs, and TIPs by an average of 15 percent.

The Macatawa Area Coordinating Council commented that the final rule appears to place additional data collection and reporting responsibilities on smaller MPOs without additional funding to collect this data. The Albany MPO stated that the final rule should seek to reduce the cost and labor burden of data collection, analysis, and any related activities wherever possible. The commenter stated that MPOs face very constrained funding, and the final rule (and any subsequent rules) should take this into account.

In response, FHWA and FTA encourage States and MPOs to review and comment on the other rulemakings implementing the MAP–21's performance management framework as they propose scalable approaches to lessen the burden on smaller MPOs and operators of public transportation.

The AMPO pointed out that, in a 2010 report by FHWA, approximately 50 percent of MPOs reported that existing Federal resources were insufficient to complete the current 3–C planning and programming process. The ARC noted that, with regard to the fact that 80 percent of the costs are reimbursable through existing Federal funding programs, those resources are already being fully utilized for other planning efforts directly related to the MPO mission. More than half of the respondents (AASHTO, AR DOT, CT DOT, DVRPC, Macatawa Area Coordinating Council, Maui DOT, MD DOT, NJ DOT, NYMTC, and PA DOT) who submitted comments on the Regulatory Cost Assessment and Burden Analysis requested that FHWA and FTA identify and/or provide additional funding to support new activities related to performance-based planning.

Four commenters (AR DOT, Maui DOT, NYMTC, and WA State DOT) noted that Congress did not provide new or dedicated funding to help States, MPOs, and operators of public transportation cover the administrative burdens associated with performance-based planning as envisioned in the MAP–21. The AMPO stated that, without adequate resources to conduct the performance-based planning expected by Congress and anticipated in the final rule, MPOs may fall short of meeting the intended purpose of the MAP–21. The AMPO commentated that many MPOs are concerned that the final rule will result in an unfunded mandate if it does not provide the commensurate funding, time, and flexibility for MPOs to address its requirements.

In response, FHWA and FTA note that it is Congress that appropriates funds to support the statewide, metropolitan, and nonmetropolitan transportation planning programs. Under MAP–21, Congress authorized and appropriated $995 million for distribution to the States and MPOs in FY 2013 and $1.007 billion for distribution in FY 2014. This represents an increase of 8 percent over SAFETEA–LU funding levels for these programs and supports an additional 20.6 million hours (assuming a salary rate of $48.69 per hour). The FHWA and FTA note that in the FAST Act, Congress authorized $1.240 billion for distribution to the States and MPOs in FY 2016. This represents a 24 percent increase over MAP–21 levels.

The Florida MPO Advisory Council and the River to Sea TPO commented that not all States and MPOs shared equally in the increased MAP–21 funding. State departments of transportation and MPOs in 22 States received a less than 9 percent increase in metropolitan planning and State planning and research funds.

The FHWA and FTA note that States and MPOs have the option to use other program funds that are available to support the development of the performance-based program plans, including data collection. The FTA

section 5307 urbanized area formula grants and section 5311 formula grants for rural areas can be used to support the development of transit asset management plans and transit agency safety plans. The FHWA NHPP, STP, and State Planning and Research and Planning funds can also be used to develop performance-based plans including data collection.

The FHWA and the FTA also invited comments on the following:

The FHWA and FTA assumed that implementing the performance-based planning provisions of the proposed rule will increase the costs of preparing State and MPO long-range plans, STIPs, and TIPs by an average of 15 percent. Based on telephone discussions with three States, and three MPOs, FHWA and FTA believe that this assumption is reasonable. The FHWA and FTA invite States and MPOs to submit comments on this assumption.

While three respondents (AASHTO, CT DOT, and NJ DOT) indicated that the estimate of a 15 percent increase in the cost of preparing State and MPO long-range plans, STIPs, and TIPs was too low, none provided documentation to support a different assumption. The CT DOT stated that it believes the new costs are likely to be much higher and could increase costs as much as 50 percent in some of the larger regions and statewide. The NJ DOT wrote that the FHWA and FTA assumption that the additional work will increase the annual cost of preparing a long-range transportation plan, STIP, and TIP for States, MPOs, and operators of public transportation by 15 percent, on average, seems low.

The potential costs and benefits that might be associated with the option for MPOs to use scenario planning during development of the metropolitan transportation plan.

The North Front Range MPO, commented that preparing and obtaining public comment, and then running the scenarios takes considerable additional time and/or more staff. With only 4 years between plans for nonattainment areas, this adds another requirement into the packed schedule. In response, FHWA and FTA note that the use of scenario planning during the development of the MTP is an optional best practice.

The potential costs and benefits that might be associated with the option for States and MPOs to develop a programmatic mitigation plan as part of the statewide or metropolitan transportation planning process.

No comments were received in response to this request.

The final rule will promote transparency by requiring the establishment of performance targets in key areas, such as safety, infrastructure condition, system reliability, emissions, and congestion and expressly linking investment decisions to the achievement of such targets. This would be documented in plans developed with public review. The final rule will promote accountability through mandating reports on progress toward meeting those targets.

Beyond improved transparency and accountability, there are several other benefits of the final rule. Other elements of the rule may improve decisionmaking, such as representation by operators of public transportation on each MPO that serves a TMA, updating the metropolitan planning agreements, requiring States to have a higher level of involvement with nonmetropolitan local officials, and providing an optional process for the creation of RTPOs.

The final rule will enhance the statewide and nonmetropolitan transportation planning process by requiring States to cooperate with nonmetropolitan local officials or RTPOs, if applicable, when conducting rural transportation planning. This gives local officials or RTPOs a stronger voice in the development of planning products and project selection.

The option for MPOs to use scenario planning in the development of their MTPs provides a framework for improved decisionmaking through comparison of the performance tradeoffs of various locally determined scenarios for transportation investment. Although conducting scenario planning entails costs, savings from improved implementation could offset these costs. These benefits will improve the transportation planning process.

The option for States and MPOs to develop a programmatic mitigation plan as part of the statewide and the metropolitan transportation planning processes provides a framework whereby States and MPOs may identify environmental resources early in the planning process. As a result, they could potentially minimize or avoid impacts to these resources. This has the potential to streamline project development and protect environmental resources, and may have benefits that outweigh the costs of performing the analysis.

With respect to the NPRM on ''Additional Authorities for Planning and Environmental Linkages'' (Docket No. FHWA–2014–0031; FHWA RIN 2125–AF66; FTA RIN 2132–AB21), which proposed revisions to the statewide and nonmetropolitan and metropolitan transportation planning regulations related to the use of, and reliance on, planning products developed during the transportation planning process for project development and the environmental review process, it is anticipated that the economic impact of this rulemaking would be minimal. The changes that this rule proposed are intended to streamline environmental review. These provisions are optional and would not have a significant cost impact for States, MPOs, or operators of public transportation. If used, it is anticipated that these optional provisions could potentially result in cost savings for the States, MPOs, and operators of public transportation by minimizing the duplication of planning and environmental processes and improving project delivery timeframes.

In summary, FHWA and FTA estimate the total cost of this final rule is $30.9 million. Of this total, the estimated costs for all 50 States, the District of Columbia, and Puerto Rico and an estimated 409 MPOs would be approximately $28.4 million per year. Eighty percent of these costs are directly reimbursable through Federal transportation funds allocated for metropolitan planning (23 U.S.C. 104(f) and 49 U.S.C. 5303(h)) and for State planning and research (23 U.S.C. 505 and 49 U.S.C. 5313). The estimated cost to 600 operators of public transportation would be approximately $2.5 million per year. Eighty percent of these costs are directly reimbursable through Federal transportation funds allocated for urbanized area formula grants (4 U.S.C. 5307, 49 U.S.C. 5311).

The FAST increased the mandatory set-aside in Federal funds for metropolitan transportation planning or Statewide Planning and Research funding. The States, MPOs, and operators of public transportation have the flexibility to use other categories of Federal highway funds for transportation planning, such as STP funds, if they so desire. Consequently, the increase in the non-Federal cost burden attributable to the final rule is estimated to be $6.2 million per year. Under FAST, in FY 2016, the total Federal, State, and local cost of the planning program is $1,488 million. As the cost burden of the final rule is estimated to be 2.1 percent of the total planning program, FHWA and FTA believe that the economic impact would be minimal and the benefits of implementation would outweigh the costs.

The FHWA and FTA also conducted a break-even cost analysis as part of the regulatory cost analysis to determine at

what point the benefits from the final rule exceed the annual costs of complying with it. The total annual FAST funding programmed through this process is $39.7 billion in FHWA funds and $11.7 billion in FTA funds in FY 2016. The annual average cost of the final rule is estimated to be $30.9 million per year. If return on investment increases by at least 0.060 percent of the combined FHWA and FTA annual funding programs, the benefits of the final rule exceed the costs.

Information Collection—Paperwork Reduction Act

Under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501 *et seq.*), Federal agencies must obtain approval from the Office of Management and Budget (OMB) prior to conducting or sponsoring a collection of information. The FHWA and FTA have determined that the final rule contains collections of information for the purposes of the PRA. The reporting requirements for metropolitan planning UPWP, transportation plans, and TIPs are currently approved under OMB control number 2132–0529. Separately, FHWA is updating the information reporting requirements for State planning and research work programs, which has been approved by the OMB under control number 2125–0039. These State planning and research work program are governed under a separate regulation at 23 CFR 420. The FHWA is updating 23 CFR 420 and will be issuing a separate NPRM soon. The FTA conducted the analysis supporting this approval on behalf of both FTA and FHWA because the regulations are jointly issued by both agencies. The reporting requirements for statewide transportation plans and programs are also approved under this same OMB control number.

The estimates in this justification include the burden hours and costs developed for the RIA prepared as part of the final rule for the Metropolitan Transportation Planning Program and the Statewide and Nonmetropolitan Planning Program to implement provisions of the MAP–21. To develop the estimates for the RIA, FHWA and FTA first estimated the pre-MAP–21 costs for specific MPO planning functions on the basis of costs identified through a sample of MPO annual work programs. The FHWA and FTA sampled a total of 17 TMA and 12 non-TMA MPOs to calculate costs for States and MPOs. The FHWA and FTA then estimated the average annual burden hours of effort and cost to implement the MAP–21 changes to the MPO planning functions which include: A transition to a performance-based (statewide and metropolitan) planning and programming process; cooperation by the State with local officials or RTPOs, if applicable, when conducting the statewide transportation planning process; and representation by operators of public transportation on MPOs that serve TMAs. The FHWA and FTA assumed that this additional work will increase the annual cost of preparing a long-range transportation plan, STIP, and TIP by the State, MPOs, and operators of public transportation by 15 percent, on average. The paragraphs below describe the burden analysis conducted by FHWA and FTA for the planning requirements in the final regulation, which include the changes introduced by MAP–21.

Historically, FHWA and FTA have used a methodology not based on sampling to estimate the burden hours required of States and MPOs to meet the planning requirements. The historical methodology assumed very limited increase in the costs of developing the planning products.

Burden Analysis for the Planning Requirements in the Final Rule

The UPWP identifies transportation planning activities in metropolitan areas and supports requests for funding under both FHWA and FTA planning programs in metropolitan areas. A similar list of planning activities is prepared on a statewide level as the basis for FHWA and FTA State planning and research (SP&R) funding. The metropolitan plan and statewide plan reflect the long-range goals and objectives determined through the metropolitan and statewide transportation planning processes, respectively, and have a 20-year planning horizon. The STIP and TIP are short-range 4-year listings of highway and transit improvement projects which are consistent with the metropolitan and statewide plans and support the request for Federal transportation funding under 23 U.S.C. and chapter 53 of 49 U.S.C.

The FTA and FHWA jointly carry out the Federal mandate to improve metropolitan and statewide transportation under the authority of 23 U.S.C. and chapter 53 of 49 U.S.C. Title 23 U.S.C. 104(f) and 49 U.S.C. 5305(g) authorize funds to support transportation planning at metropolitan and statewide levels. As a condition to receive this funding, requirements are established for metropolitan and statewide transportation planning under 23 U.S.C. 134 and 135 and 49 U.S.C. 5303 and 5304. These sections call for development of transportation plans and TIPs in all States and metropolitan areas. The information collection activities to prepare federally required plans and programs, and the planning studies proposed for funding in UPWPs and SP&R work programs, are necessary to monitor and evaluate current and projected usage and performance of transportation systems nationwide, statewide, and in each urbanized area.

The MTP and TIP are required by 49 U.S.C. 5303 and 23 U.S.C. 134, which state that ''metropolitan planning organizations, in cooperation with the State, shall develop transportation plans and programs for urbanized areas of the State.'' Title 49 U.S.C. 5304 and 23 U.S.C. 135 require that each ''State shall develop a long-range transportation plan and STIP for all areas of the State.'' Both statutory sections require that ''the process for developing such plans and programs shall provide for consideration of all modes of transportation and shall be continuing, cooperative, and comprehensive.'' The States and MPOs use metropolitan and statewide plans, STIPs, and TIPs as the basis for investing Federal and non-Federal capital funds for transportation infrastructure investments. (Note: PRA requirements for preparation of the STIP are covered by OMB control number 2125–0039.)

Title 23 CFR part 450 implements these statutory requirements. (Note: 23 CFR part 450 is identical to, and cross-referenced by, the equivalent regulation in 49 U.S.C. (49 CFR part 613).) The MPO, together with the State and operators of public transportation, prepares MTPs for each urbanized area. The State develops a long-range statewide transportation plan which, in metropolitan areas, is developed in cooperation with affected MPOs. These plans form the basis for development of STIPs and TIPs, the short-range programming documents for federally funded transportation capital investments.

The UPWP is required by 23 CFR 450.308 for all MPOs in TMAs. The MPOs in urbanized areas with populations of less than 200,000, with prior approval by the State, FHWA, and FTA, may use a simplified statement of work as their planning grant application instead of developing a full UPWP. Details of the required planning processes supported by FHWA and FTA metropolitan planning funds, as required by 23 U.S.C. 134 and 49 U.S.C. 5303, are set forth in 23 CFR part 450. The planning grant application is based upon the UPWP and is the mechanism by which grantees request Federal funding. The information contained in the UPWP is necessary to establish the

eligibility of the activities for which funding is being requested.

Preparation of UPWPs, project listing for SP&R funding, metropolitan and statewide plans, STIPs, and TIPs are essential components of decisionmaking by State and local officials for planning and programming Federal transportation funds to support the priority transportation investment needs of their areas. In addition to serving as the grant application by States for FHWA and FTA planning funds in metropolitan areas, UPWPs are used by FHWA and FTA to establish national out-year budgets and regional program plans; develop policy on using funds; monitor State and local consistency with national planning and technical emphasis areas; respond to congressional inquiries and prepare congressional testimony; and ensure efficiency in the use and expenditure of Federal funds by determining that planning proposals are reasonable, cost effective, and supportive of full compliance with all applicable Federal laws and regulations.

Title 23 U.S.C. 134 and 135 and 49 U.S.C. 5303 and 5304 require the development of plans and programs in entire States and all urbanized areas, respectively. After approval by the Governor and MPO, metropolitan TIPs in attainment areas are to be incorporated directly into the STIP. For nonattainment and maintenance areas, as required by the Clean Air Act Amendments of 1990, FHWA and FTA must make a conformity finding on these plans and TIPs before TIPs are incorporated into STIPs.

The complete STIP is then jointly reviewed and approved by FHWA and FTA. With that action comes a joint determination or finding by FHWA and FTA that metropolitan and statewide planning processes are in compliance with all applicable Federal laws and regulations. These findings, conformity determinations, and approval actions constitute the determination that State and metropolitan area transportation planning processes are complying with Federal law and regulatory requirements as a condition of eligibility for receiving Federal-aid. Without the supporting documents, these findings and planning approvals cannot be made as the basis for making project level grant awards.

Since a STIP and TIP is made up of various types of capital and non-capital surface transportation projects, from equipment acquisition to major highway and transitway construction, it is essential that these projects be identified and described. Because the STIP/TIP is the basis for subsequent programming and obligation of both Federal-aid highway and FTA capital funds, there must be an indication of project cost and Federal funds required (estimated cost). The STIP and TIP is an integrated FHWA and FTA program. Because both agencies have several statutory sources of funds, each with different eligibility requirements, it is necessary to know what projects are proposed to be funded from which fund (source of Federal funds). Because the STIP and TIP is an integrated program of highway and transit improvements, many potential capital grant recipients have projects included in the document (identification of the recipient). For FTA funding, it is necessary that each individual project identify the likely capital grant applicant. The STIP and TIP requirement reduces the burden to potential capital grant applicants by imposing the programming requirements at one point and setting one response to these requirements.

The SP&R program, UPWP, metropolitan and statewide plan, STIP, and TIP are adaptable to computer generation and revision. The FHWA and FTA have extensive technical assistance programs that encourage application of computer techniques. These programs reduce burdens by achieving time savings in technical analysis, report revisions, and clerical activities through automation.

While the transit and highway funding programs for planning and project implementation are unique to FHWA and FTA, they cooperate to avoid duplication of effort. Most visible is the consolidation of statutory requirements for planning through the issuance of joint planning regulations. The States and MPOs prepare a single set of UPWPs, plans, STIPs, and TIPs to satisfy both FHWA and FTA requirements.

The information contained in projects proposed for funding under the SP&R programs, UPWPs, metropolitan and State plans, STIPs, and TIPs are not contained in any other federally required document. However, where this information is already contained in State and local planning documents, FHWA and FTA can accept those documents provided that all their requirements are met, which further reduces duplication and unnecessary burden. The SP&R programs, statewide plans, UPWPs, metropolitan plans, STIPs, and TIPs have been submitted to FHWA and FTA for many years to support funding of the transportation planning and capital improvement programs for urbanized and non-urbanized areas. Continuing contact among FHWA division staff, FTA regional staff, States, MPOs, and grantees provides opportunity for grantees to seek changes. No major problems have developed regarding this requirement. The FHWA and the FTA have not received a petition to establish, amend, or repeal a regulation pursuant to 49 CFR 106.31.

A 60-day **Federal Register** Notice on information collection was published on November 22, 2013 (78 FR 70094), soliciting comments prior to submission to OMB. The DOT received comments from the FL DOT and AASHTO. Both expressed concern that many respondents will exceed the 8,017 burden hours per respondent estimated in the Notice of Request for Revision of an Approved Information Collection. The DOT concurs that some States and MPOs may exceed the estimated 8,017 average burden hours to meet the metropolitan and statewide transportation planning requirements. This is because the burden hour estimate is based upon the average for all States and MPOs. A 30-day **Federal Register** notice was published on January 29, 2014 (79 FR 4808).

Since that time, the estimates have been updated to include the current number of MPOs in urbanized and non-urbanized areas established as a result of the 2010 U.S. Census; a revised number of designated Clean Air Act attainment and non-attainment areas; a 3 percent increase in the labor rates; and the total burden hours and costs to meet the requirements of the final rule. On the basis of these changes, the estimated burden hours per respondent are 9,109 hours.

The following table summarizes the estimated burden hours for the collection of information for the purposes of developing and completing UPWPs, metropolitan and statewide transportation plans, STIPs, and TIPs, as required by the final rule, and provides an explanation of the methodology used to calculate the number of hours required per submission.

UNIFIED PLANNING WORK PROGRAMS (UPWPS)—FINAL RULE

Urbanized area (UZA) population	Total number of entities	Burden annual submissions	Total annual hours per submission	Burden hours
Under 200,000	208	208	200	41,600
Over 200,000	201	201	300	60,300
Total	409	409	.....	101,900

TRANSPORTATION IMPROVEMENT PROGRAMS (TIPS AND STIPS)—FINAL RULE

Entity	Number of entities	Average annual submissions	Burden hours per submission	Total annual burden hours
MPOs in Attainment Areas	276	69	6,026	415,779
MPOs in Nonattainment and Maintenance Areas	133	33	22,230	739,164
States	52	13	20,548	267,042
Total	461	115	.....	1,421,985

TRANSPORTATION PLANS—FINAL RULE

Entity	Number of entities	Average annual submissions	Burden hours per submission	Total annual burden hours
MPOs in attainment areas	276	69	10,886	600,884
MPOs in Nonattainment or Maintenance Areas	133	33	48,861	1,624,612
States	52	13	34,608	449,898
Total	461	115	.....	2,675,394

The respondent's cost is the cost of the State and MPO staff time required to compile and produce the UPWP. The UPWPs must be developed by identifying work activities over the next 1- or 2-year period. Given the complex nature of the planning requirements, we estimate that an average of 300 hours per respondent will be required by MPOs to prepare UPWPs in TMAs and 200 hours per respondent in non-TMAs. Note that although 23 CFR 450.308 allows MPOs in the 208 non-TMAs to prepare simplified statements of work, FHWA and FTA know of no MPOs that are developing such simplified statements. Using a staff salary of $32.59 per hour (based on annual staff salary of $67,732), total respondent cost is estimated at $3,320,921. Assuming a 54 percent overhead rate, the total annualized cost with overhead is estimated to be $5,114,218.

The OMB has previously approved the burden on respondents to develop SP&R work programs under FHWA control number 2125–0039.

Metropolitan TIPs are prepared by MPOs in cooperation with the State and operators of public transportation. The TIPs are required every 4 years. Plans in nonattainment and maintenance areas must be updated and submitted every 4 years and in attainment areas every 5 years. Although the requirements for metropolitan TIPs and plans are complex, particularly in nonattainment and maintenance areas, current burden estimates have been generated from past experiences, informal discussion with FHWA and FTA field staff and respondents, and a comparison of recent trends in the allocation of resources by respondents to meet the requirements. We estimate that MPOs in attainment areas will spend approximately 6,026 person hours in the development of the TIP document. Furthermore, considering the more stringent requirements relating to the implementation of transportation control measures in nonattainment and maintenance areas, and the fact that most of these areas are in the Nation's largest metropolitan areas with the most projects to program, we estimate that an average of 22,230 person hours per submission are required for these TIPs.

The development by States of a STIP draws heavily on the work cooperatively done by States and MPOs in the preparation of metropolitan TIPs. This work burden has already been calculated in this section. However, to the extent that STIPs must reflect the programming of transportation projects in nonmetropolitan areas, there exists some marginal burden in the development of the overall statewide program. We estimate that burden is 20,542 person hours for each STIP. Total respondent burden hours for the STIP/TIP development are estimated to be 1,421,985. Total respondent cost for STIP/TIP development without overhead is estimated to be $46,342,491. Total respondent cost for STIP/TIP development, assuming a 54 percent overhead rate, is estimated to be $71,367,436.

The final rule requires that plans in nonattainment and maintenance areas are updated and submitted to FHWA and FTA every 4 years and that plans in attainment areas are updated every 5 years. We estimate that burden is 48,861 person hours for the preparation of the MTP in a nonattainment area. These plans are updated every 4 years. We estimate that burden is 10,886 person hours for the preparation of the MTP in an attainment area. These plans are updated every 5 years.

The development by States of a long-range statewide transportation plan draws heavily on the work cooperatively done by States and MPOs in the preparation of metropolitan TIPs and plans. This work burden has already been calculated in this section. However, to the extent that statewide plans must reflect the planning of

transportation projects in nonmetropolitan areas, there exists some marginal burden in the development of the overall plan. We estimate that burden is 34,608 person hours for the preparation of the long-range statewide transportation plan. Assuming an average rate of $32.59 per hour, we estimate that the respondent cost for the metropolitan plan is $72,528,915 and $14,662,176 for the statewide plan. Total respondent cost for plan development, assuming a 54 percent overhead rate, is estimated to be $134,274,280.

There are no capital or start-up costs associated directly with the collection of information required by the UPWPs, STIPs, TIPs, and plans. Any capital equipment used to provide this information in most cases would have been purchased to carry out general transportation and air quality planning activities. The total annual overhead (operation and maintenance costs) of providing the requested information is $73,991,049 as calculated in the table below:

TOTAL ANNUAL BURDEN COSTS TO THE STATES AND MPOS

Task	Total costs with overhead (2015$)	Total costs without overhead (2015$)
UPWP	$5,114,218	$3,320,921
TIP	57,964,972	37,639,592
Metropolitan Plans	111,694,529	72,528,915
STIPs	13,402,464	8,702,899
Statewide Plans	22,579,751	14,662,176
Total	210,755,934	136,858,503

TOTAL ANNUAL BURDEN HOURS TO THE STATES AND MPOS

Task	Total burden hours
UPWP	101,900
TIP	1,154,943
Metropolitan Plans	2,225,496
STIPs	267,042
Statewide Plans	449,898
Total	4,199,279

Please note that each State also submits a statewide planning and research work program, which serves as the basis of the State's application for Federal financial assistance for planning and research activities. The information collection requirements of the SP&R work program have been previously approved by OMB under FHWA control number 2125–0039.

Regulatory Flexibility Act

In compliance with the Regulatory Flexibility Act (Pub. L. 96–354; 5 U.S.C. 601–612), FHWA and FTA have determined that States and MPOs are not included in the definition of a small entity, as set forth in 5 U.S.C. 601. Small governmental jurisdictions are limited to representations of populations of less than 50,000. The MPOs, by definition, represent urbanized areas having a minimum population of 50,000. Because the final rule is primarily intended for States and MPOs, FHWA and FTA have determined that the action would not have a significant economic impact on a substantial number of small entities. Therefore, we certify that the action would not have a significant economic impact on a substantial number of small entities.

Unfunded Mandates Reform Act of 1995

The final rule would not impose unfunded mandates as defined by the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4, March 22, 1995, 109 Stat. 48). The final rule would not result in the expenditure of non-Federal funds by State, tribal, and local governments, in the aggregate, or by the private sector, of $155 million in any one year (2 U.S.C. 1532). Eighty percent of the costs attributable to the final rule are directly reimbursable through Federal transportation funds allocated for metropolitan planning (23 U.S.C. 104(f) and 49 U.S.C. 5303(h)) and for SP&R (23 U.S.C. 505 and 49 U.S.C. 5313).

Additionally, the definition of the term ''Federal mandate'' in the Unfunded Mandates Reform Act excludes financial assistance of the type in which State, tribal, or local governments have authority to adjust their participation in the program in accordance with changes made in the program by the Federal Government. The Federal-aid highway program and Federal Transit Act permit this type of flexibility to the States.

Executive Order 13132 (Federalism)

The FHWA and FTA have analyzed this action in accordance with the principles and criteria contained in EO 13132 and have determined that this action would not have sufficient federalism implications to warrant the preparation of a federalism assessment. The FHWA and FTA do not believe that this rulemaking will have substantial, direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. The FHWA and FTA have also determined that this action would not preempt any State law or regulation or affect the States' ability to discharge traditional State governmental functions.

Executive Order 12372 (Intergovernmental Review)

Catalog of Federal Domestic Assistance Program Numbers 20.205, Highway Planning and Construction (or 20.217); 20.500, Federal Transit Capital Improvement Grants; 20.505, Federal Transit Technical Studies Grants; 20.507, Federal Transit Capital and Operating Assistance Formula Grants. The regulations implementing EO 12372 regarding intergovernmental consultation in Federal programs and activities apply to these programs and were carried out as part of the outreach on the federalism implications of this rulemaking. This EO applies because State and local governments would be directly affected by the final rule, which is a condition on Federal-aid highway funding.

National Environmental Policy Act

Federal agencies are required to adopt implementing procedures for NEPA that establish specific criteria for, and identification of, three classes of actions: (1) Those that normally require preparation of an Environmental Impact Statement, (2) those that normally require preparation of an Environmental Assessment, and (3) those that are categorically excluded from further NEPA review (40 CFR 1507.3(b)). This action qualifies for categorical exclusions under 23 CFR 771.117(c)(20) (promulgation of rules, regulations, and

directives) and 771.117(c)(1) (activities that do not lead directly to construction) for FHWA, and 23 CFR 771.118(c)(4) (planning and administrative activities which do not involve or lead directly to construction) for FTA. The FHWA and FTA have evaluated whether the action would involve unusual or extraordinary circumstances and have determined that this action would not.

The final rule provides the policies and requirements for statewide and MTPs and transportation improvement programs. The rule follows closely the requirements in 23 U.S.C. 134 and 135 and 49 U.S.C. 5303 and 5304. In addition, 23 U.S.C. 134(q), 135(k), and 168(f)(1) and 49 U.S.C. 5303(q) and 5304(j) establish that NEPA does not apply to decisions by the Secretary concerning a metropolitan or statewide transportation plan or transportation improvement programs under those sections.

Executive Order 11988 (Floodplain Management)

The FHWA and FTA have evaluated this action under EO 11988 (Floodplain Management). The agencies have determined that this action does not have an adverse impact associated with the occupancy and modification of floodplains and does not provide direct or indirect support of floodplain development. The final rule provides the States and MPOs with the option of developing a programmatic mitigation plan as part of the transportation planning process. Floodplains could be one of the resources evaluated as part of these programmatic mitigation plans to help the States and MPOs avoid or minimize impacts to flood plains by future projects. The final rule also encourages early coordination by States and MPOs with Federal and State environmental resource agencies during the planning process in the interest of avoiding or minimizing impacts. When FHWA and FTA make a future funding or other approval decision on a project basis, they consider floodplain management.

Executive Order 13653 (Climate Preparedness and Resilience)

The FHWA and FTA have evaluated this action under EO 13653 (Climate Preparedness and Resilience). The FHWA and FTA have determined that the final rule provides an option for the States and MPOs to consider the effects of climate change and resilience in the context of the transportation planning process, such as during the development of statewide or MTPs. Scenario planning, which is discussed in the final rule, is another option where MPOs could consider climate change and resilience as part of scenarios evaluated during the development of the MTP. The FHWA and FTA have determined that the final rule provides an option States and MPOs to assess climate change and resilience as part of the transportation planning process.

Executive Order 12988 (Civil Justice Reform)

The final rule meets applicable standards in sections 3(a) and 3(b)(2) of EO 12988 (Civil Justice Reform) to minimize litigation, eliminate ambiguity, and reduce burden.

Executive Order 13045 (Protection of Children)

We have analyzed this action under EO 13045 (Protection of Children from Environmental Health Risks and Safety Risks). The final rule is not an economically significant rule and does not concern an environmental risk to health or safety that may disproportionately affect children.

Executive Order 12630 (Taking of Private Property)

The final rule would not effect a taking of private property or otherwise have taking implications under EO 12630 (Governmental Actions and Interference with Constitutionally Protected Property Rights).

Executive Order 13175 (Tribal Consultation)

The FHWA and FTA have analyzed this action under EO 13175. The FHWA and FTA believe that the final rule would not have substantial direct effects on one or more tribes; would not impose substantial direct compliance costs on tribal governments; and would not preempt tribal laws. The final rule contains requirements for States to consult with tribal governments in the planning process. Tribes are required under 25 CFR part 170 to develop long-range plans and a Tribal Transportation Program (TTP) for programming projects. However, the requirements in 25 CFR part 170 would not be changed by this final rule. Therefore, a tribal summary impact statement is not required.

Executive Order 13211 (Energy Effects)

The FHWA and FTA have analyzed this action under EO 13211 (Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use). The FHWA and FTA have determined that the final rule is not a significant energy action under that EO because, although it is a significant regulatory action under EO 12866, it is not likely to have a significant adverse effect on the supply, distribution, or use of energy. Therefore, a Statement of Energy Effects is not required.

Executive Order 5610.2(a) (Environmental Justice)

The EO 12898 (Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations) and DOT Order 5610.2(a) (77 FR 27534 (available online at *http://www.fhwa.dot.gov/environment/environmental_justice/ej_at_dot/order_56102a/index.cfm*)) require DOT agencies to achieve EJ as part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects, including interrelated social and economic effects, of their programs, policies, and activities on minority and low-income populations. The DOT agencies must address compliance with EO 12898 and the DOT Order in all rulemaking activities.

The FHWA and FTA have issued additional documents relating to administration of EO 12898 and the DOT Order. On June 14, 2012, FHWA issued an update to its EJ order, FHWA Order 6640.23A (FHWA Actions to Address Environmental Justice in Minority Populations and Low Income Populations (available online at *http://www.fhwa.dot.gov/legsregs/directives/orders/664023a.htm*)). On August 15, 2012, FTA's Circular 4703.1 became effective, which contains guidance for States and MPOs to incorporate EJ into their planning processes (available online at *http://www.fta.dot.gov/documents/FTA_EJ_Circular_7.14-12_FINAL.pdf*).

The FHWA and FTA have evaluated the final rule under the EO, the DOT Order, the FHWA Order, and the FTA Circular. The EJ principles, in the context of planning, should be considered when the planning process is being implemented at the State and local level. As part of their stewardship and oversight of the federally aided transportation planning process of the States, MPOs and operators of public transportation, FHWA and FTA encourage these entities to incorporate EJ principles into the statewide and metropolitan planning processes and documents, as appropriate and consistent with the applicable Orders and the FTA Circular. When FHWA and FTA make a future funding or other approval decision on a project basis, they consider EJ.

Nothing inherent in the final rule would disproportionately impact

minority or low-income populations. The final rule establishes procedures and other requirements to guide future State and local decisionmaking on programs and projects. Neither the final rule nor 23 U.S.C. 134 and 135 dictate the outcome of those decisions. The FHWA and FTA have determined that the final rule would not cause disproportionately high and adverse human health and environmental effects on minority or low-income populations.

Regulation Identification Number

A regulation identification number (RIN) is assigned to each regulatory action listed in the Unified Agenda of Federal Regulations. The Regulatory Information Service Center publishes the Unified Agenda in April and October of each year. The RIN contained in the heading of this document can be used to cross-reference this action with the Unified Agenda.

List of Subjects

23 CFR Part 450

Grant programs—transportation, Highway and roads, Mass transportation, Reporting and record keeping requirements.

23 CFR Part 771

Environmental protection, Grant programs—transportation, Highways and roads, Historic preservation, Public lands, Recreation areas, Reporting and record keeping requirements.

49 CFR Part 613

Grant programs—transportation, Highways and roads, Mass transportation.

Issued in Washington, DC, on May 13, 2016, under authority delegated in 49 CFR 1.85 and 1.91.

Gregory G. Nadeau,

Administrator, Federal Highway Administration.

Carolyn Flowers,

Acting Administrator, Federal Transit Administration.

In consideration of the foregoing, FHWA and FTA amend title 23, Code of Federal Regulations, parts 450 and 771, and title 49, Code of Federal Regulations, part 613, as set forth below:

Title 23—Highways

■ 1. Revise Part 450 to read as follows:

PART 450—PLANNING ASSISTANCE AND STANDARDS

Subpart A—Transportation Planning and Programming Definitions

Sec.

Subpart B—Statewide and Nonmetropolitan Transportation Planning and Programming

Sec.

Subpart C—Metropolitan Transportation Planning and Programming

Sec.

Authority: 23 U.S.C. 134 and 135; 42 U.S.C. 7410 *et seq.*; 49 U.S.C. 5303 and 5304; 49 CFR 1.85 and 1.90.

Subpart A—Transportation Planning and Programming Definitions

§ 450.100 Purpose.

The purpose of this subpart is to provide definitions for terms used in this part.

§ 450.102 Applicability.

The definitions in this subpart are applicable to this part, except as otherwise provided.

§ 450.104 Definitions.

Unless otherwise specified, the definitions in 23 U.S.C. 101(a) and 49 U.S.C. 5302 are applicable to this part.

Administrative modification means a minor revision to a long-range statewide or metropolitan transportation plan, Transportation Improvement Program (TIP), or Statewide Transportation Improvement Program (STIP) that includes minor changes to project/project phase costs, minor changes to funding sources of previously included projects, and minor changes to project/project phase initiation dates. An administrative modification is a revision that does not require public review and comment, a redemonstration of fiscal constraint, or a conformity determination (in nonattainment and maintenance areas).

Amendment means a revision to a long-range statewide or metropolitan transportation plan, TIP, or STIP that involves a major change to a project included in a metropolitan transportation plan, TIP, or STIP, including the addition or deletion of a project or a major change in project cost, project/project phase initiation dates, or a major change in design concept or design scope (*e.g.,* changing project termini or the number of through traffic lanes or changing the number of stations in the case of fixed guideway transit projects). Changes to projects that are included only for illustrative purposes do not require an amendment. An amendment is a revision that requires public review and comment and a redemonstration of fiscal constraint. If an amendment involves ''non-exempt'' projects in nonattainment and maintenance areas, a conformity determination is required.

Asset management means a strategic and systematic process of operating, maintaining, and improving physical assets, with a focus on both engineering and economic analysis based upon quality information, to identify a structured sequence of maintenance, preservation, repair, rehabilitation, and

replacement actions that will achieve and sustain a desired state of good repair over the lifecycle of the assets at minimum practicable cost.

Attainment area means any geographic area in which levels of a given criteria air pollutant (*e.g.,* ozone, carbon monoxide, PM_{10}, $PM_{2.5}$, and nitrogen dioxide) meet the health-based National Ambient Air Quality Standards (NAAQS) for that pollutant. An area may be an attainment area for one pollutant and a nonattainment area for others. A ''maintenance area'' (see definition in this section) is not considered an attainment area for transportation planning purposes.

Available funds means funds derived from an existing source dedicated to or historically used for transportation purposes. For Federal funds, authorized and/or appropriated funds and the extrapolation of formula and discretionary funds at historic rates of increase are considered ''available.'' A similar approach may be used for State and local funds that are dedicated to or historically used for transportation purposes.

Committed funds means funds that have been dedicated or obligated for transportation purposes. For State funds that are not dedicated to transportation purposes, only those funds over which the Governor has control may be considered ''committed.'' Approval of a TIP by the Governor is considered a commitment of those funds over which the Governor has control. For local or private sources of funds not dedicated to or historically used for transportation purposes (including donations of property), a commitment in writing (*e.g.,* letter of intent) by the responsible official or body having control of the funds may be considered a commitment. For projects involving 49 U.S.C. 5309 funding, execution of a Full Funding Grant Agreement (or equivalent) or an Expedited Grant Agreement (or equivalent) with the DOT shall be considered a multiyear commitment of Federal funds.

Conformity means a Clean Air Act (42 U.S.C. 7506(c)) requirement that ensures that Federal funding and approval are given to transportation plans, programs and projects that are consistent with the air quality goals established by a State Implementation Plan (SIP). Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the NAAQS or any required interim emission reductions or other milestones in any nonattainment or maintenance area. The transportation conformity regulations (40 CFR part 93, subpart A) sets forth policy, criteria, and procedures for demonstrating and assuring conformity of transportation activities.

Conformity lapse means, pursuant to section 176(c) of the Clean Air Act (42 U.S.C. 7506(c)), as amended, that the conformity determination for a metropolitan transportation plan or TIP has expired and thus there is no currently conforming metropolitan transportation plan or TIP.

Congestion Management Process means a systematic approach required in transportation management areas (TMAs) that provides for effective management and operation, based on a cooperatively developed and implemented metropolitan-wide strategy, of new and existing transportation facilities eligible for funding under title 23 U.S.C., and title 49 U.S.C., through the use of travel demand reduction and operational management strategies.

Consideration means that one or more parties takes into account the opinions, action, and relevant information from other parties in making a decision or determining a course of action.

Consultation means that one or more parties confer with other identified parties in accordance with an established process and, prior to taking action(s), considers the views of the other parties and periodically informs them about action(s) taken. This definition does not apply to the ''consultation'' performed by the States and the Metropolitan Planning Organizations (MPOs) in comparing the long-range statewide transportation plan and the metropolitan transportation plan, respectively, to State and tribal conservation plans or maps or inventories of natural or historic resources (see section 450.216(j) and sections 450.324(g)(1) and (g)(2)).

Cooperation means that the parties involved in carrying out the transportation planning and programming processes work together to achieve a common goal or objective.

Coordinated public transit-human services transportation plan means a locally developed, coordinated transportation plan that identifies the transportation needs of individuals with disabilities, older adults, and people with low incomes, provides strategies for meeting those local needs, and prioritizes transportation services for funding and implementation.

Coordination means the cooperative development of plans, programs, and schedules among agencies and entities with legal standing and adjustment of such plans, programs, and schedules to achieve general consistency, as appropriate.

Design concept means the type of facility identified for a transportation improvement project (*e.g.,* freeway, expressway, arterial highway, grade-separated highway, toll road, reserved right-of-way rail transit, mixed-traffic rail transit, or busway).

Design scope means the aspects that will affect the proposed facility's impact on the region, usually as they relate to vehicle or person carrying capacity and control (*e.g.,* number of lanes or tracks to be constructed or added, length of project, signalization, safety features, access control including approximate number and location of interchanges, or preferential treatment for high-occupancy vehicles).

Designated recipient means an entity designated, in accordance with the planning process under 49 U.S.C. 5303 and 5304, by the Governor of a State, responsible local officials, and publicly owned operators of public transportation, to receive and apportion amounts under 49 U.S.C. 5336 that are attributable to urbanized areas of 200,000 or more in population, or a State or regional authority if the authority is responsible under the laws of a State for a capital project and for financing and directly providing public transportation.

Environmental mitigation activities means strategies, policies, programs, and actions that, over time, will serve to avoid, minimize, rectify, reduce or eliminate impacts to environmental resources associated with the implementation of a long-range statewide transportation plan or metropolitan transportation plan.

Expedited Grant Agreement (EGA) means a contract that defines the scope of a Small Starts project, the Federal financial contribution, and other terms and conditions, in accordance with 49 U.S.C. 5309(h)(7).

Federal land management agency means units of the Federal Government currently responsible for the administration of public lands (*e.g.,* U.S. Forest Service, U.S. Fish and Wildlife Service, Bureau of Land Management, and the National Park Service).

Federally funded non-emergency transportation services means transportation services provided to the general public, including those with special transport needs, by public transit, private non-profit service providers, and private third-party contractors to public agencies.

Financial plan means documentation required to be included with a metropolitan transportation plan and TIP (and optional for the long-range

statewide transportation plan and STIP) that demonstrates the consistency between reasonably available and projected sources of Federal, State, local, and private revenues and the costs of implementing proposed transportation system improvements.

Financially constrained or Fiscal constraint means that the metropolitan transportation plan, TIP, and STIP includes sufficient financial information for demonstrating that projects in the metropolitan transportation plan, TIP, and STIP can be implemented using committed, available, or reasonably available revenue sources, with reasonable assurance that the federally supported transportation system is being adequately operated and maintained. For the TIP and the STIP, financial constraint/fiscal constraint applies to each program year. Additionally, projects in air quality nonattainment and maintenance areas can be included in the first 2 years of the TIP and STIP only if funds are ''available'' or ''committed.''

Freight shippers means any entity that routinely transport cargo from one location to another by providers of freight transportation services or by their own operations, involving one or more travel modes.

Full Funding Grant Agreement (FFGA) means an instrument that defines the scope of a project, the Federal financial contribution, and other terms and conditions for funding New Starts projects as required by 49 U.S.C. 5309(k)(2).

Governor means the Governor of any of the 50 States or the Commonwealth of Puerto Rico or the Mayor of the District of Columbia.

Highway Safety Improvement Program (HSIP) means a State safety program with the purpose to reduce fatalities and serious injuries on all public roads through the implementation of the provisions of 23 U.S.C. 130, 148, and 150 including the development of a Strategic Highway Safety Plan (SHSP), Railway-Highway Crossings Program, and program of highway safety improvement projects.

Illustrative project means an additional transportation project that may be included in a financial plan for a metropolitan transportation plan, TIP, or STIP if reasonable additional resources were to become available.

Indian Tribal government means a duly formed governing body for an Indian or Alaska Native tribe, band, nation, pueblo, village, or community that the Secretary of the Interior acknowledges to exist as an Indian Tribe pursuant to the Federally Recognized Indian Tribe List Act of 1994, Public Law 103–454.

Intelligent Transportation System (ITS) means electronics, photonics, communications, or information processing used singly or in combination to improve the efficiency or safety of a surface transportation system.

Interim metropolitan transportation plan means a transportation plan composed of projects eligible to proceed under a conformity lapse and otherwise meeting all other applicable provisions of this part, including approval by the MPO.

Interim Transportation Improvement Program (TIP) means a TIP composed of projects eligible to proceed under a conformity lapse and otherwise meeting all other applicable provisions of this part, including approval by the MPO and the Governor.

Long-range statewide transportation plan means the official, statewide, multimodal, transportation plan covering a period of no less than 20 years developed through the statewide transportation planning process.

Maintenance area means any geographic region of the United States that the Environmental Protection Agency (EPA) previously designated as a nonattainment area for one or more pollutants pursuant to the Clean Air Act Amendments of 1990, and subsequently redesignated as an attainment area subject to the requirement to develop a maintenance plan under section 175A of the Clean Air Act, as amended (42 U.S.C. 7505a).

Management system means a systematic process, designed to assist decision makers in selecting cost effective strategies/actions to improve the efficiency or safety of, and protect the investment in the nation's infrastructure. A management system can include: Identification of performance measures; data collection and analysis; determination of needs; evaluation and selection of appropriate strategies/actions to address the needs; and evaluation of the effectiveness of the implemented strategies/actions.

Metropolitan Planning Agreement means a written agreement between the MPO, the State(s), and the providers of public transportation serving the metropolitan planning area that describes how they will work cooperatively to meet their mutual responsibilities in carrying out the metropolitan transportation planning process.

Metropolitan Planning Area (MPA) means the geographic area determined by agreement between the MPO for the area and the Governor, in which the metropolitan transportation planning process is carried out.

Metropolitan Planning Organization (MPO) means the policy board of an organization created and designated to carry out the metropolitan transportation planning process.

Metropolitan Transportation Plan means the official multimodal transportation plan addressing no less than a 20-year planning horizon that the MPO develops, adopts, and updates through the metropolitan transportation planning process.

National Ambient Air Quality Standard (NAAQS) means those standards established pursuant to section 109 of the Clean Air Act (42 U.S.C. 7409).

Nonattainment area means any geographic region of the United States that EPA designates as a nonattainment area under section 107 of the Clean Air Act (42 U.S.C. 7407) for any pollutants for which an NAAQS exists.

Nonmetropolitan area means a geographic area outside a designated metropolitan planning area.

Nonmetropolitan local officials means elected and appointed officials of general purpose local government in a nonmetropolitan area with responsibility for transportation.

Obligated projects means strategies and projects funded under title 23 U.S.C. and title 49 U.S.C. Chapter 53 for which the State or designated recipient authorized and committed the supporting Federal funds in preceding or current program years, and authorized by the FHWA or awarded as a grant by the FTA.

Operational and management strategies means actions and strategies aimed at improving the performance of existing and planned transportation facilities to relieve congestion and maximize the safety and mobility of people and goods.

Performance measure refers to ''Measure'' as defined in 23 CFR 490.101.

Performance metric refers to ''Metric'' as defined in 23 CFR 490.101.

Performance target refers to ''Target'' as defined in 23 CFR 490.101.

Project selection means the procedures followed by MPOs, States, and public transportation operators to advance projects from the first 4 years of an approved TIP and/or STIP to implementation, in accordance with agreed upon procedures.

Provider of freight transportation services means any entity that transports or otherwise facilitates the movement of cargo from one location to another for others or for itself.

Public transportation agency safety plan means a comprehensive plan established by a State or recipient of funds under Title 49, Chapter 53 and in accordance with 49 U.S.C. 5329(d).

Public transportation operator means the public entity or government-approved authority that participates in the continuing, cooperative, and comprehensive transportation planning process in accordance with 23 U.S.C. 134 and 135 and 49 U.S.C. 5303 and 5304, and is a recipient of Federal funds under title 49 U.S.C. Chapter 53 for transportation by a conveyance that provides regular and continuing general or special transportation to the public, but does not include sightseeing, school bus, charter, certain types of shuttle service, intercity bus transportation, or intercity passenger rail transportation provided by Amtrak.

Regional ITS architecture means a regional framework for ensuring institutional agreement and technical integration for the implementation of ITS projects or groups of projects.

Regionally significant project means a transportation project (other than projects that may be grouped in the TIP and/or STIP or exempt projects as defined in EPA's transportation conformity regulations (40 CFR part 93, subpart A)) that is on a facility that serves regional transportation needs (such as access to and from the area outside the region; major activity centers in the region; major planned developments such as new retail malls, sports complexes, or employment centers; or transportation terminals) and would normally be included in the modeling of the metropolitan area's transportation network. At a minimum, this includes all principal arterial highways and all fixed guideway transit facilities that offer an alternative to regional highway travel.

Regional Transportation Planning Organization (RTPO) means a policy board of nonmetropolitan local officials or their designees created to carry out the regional transportation planning process.

Revision means a change to a long-range statewide or metropolitan transportation plan, TIP, or STIP that occurs between scheduled periodic updates. A major revision is an ''amendment'' while a minor revision is an ''administrative modification.''

Scenario planning means a planning process that evaluates the effects of alternative policies, plans and/or programs on the future of a community or region. This activity should provide information to decision makers as they develop the transportation plan.

State means any one of the 50 States, the District of Columbia, or Puerto Rico.

State Implementation Plan (SIP) means, as defined in section 302(q) of the Clean Air Act (CAA) (42 U.S.C. 7602(q)), the portion (or portions) of the implementation plan, or most recent revision thereof, which has been approved under section 110 of the CAA (42 U.S.C. 7410), or promulgated under section 110(c) of the CAA (42 U.S.C. 7410(c)), or promulgated or approved pursuant to regulations promulgated under section 301(d) of the CAA (42 U.S.C. 7601(d)) and which implements the relevant requirements of the CAA.

Statewide Transportation Improvement Program (STIP) means a statewide prioritized listing/program of transportation projects covering a period of 4 years that is consistent with the long-range statewide transportation plan, metropolitan transportation plans, and TIPs, and required for projects to be eligible for funding under title 23 U.S.C. and title 49 U.S.C. Chapter 53.

Strategic Highway Safety Plan means a comprehensive, multiyear, data-driven plan, developed by a State DOT in accordance with the 23 U.S.C. 148.

Transit Asset Management Plan means a plan that includes an inventory of capital assets, a condition assessment of inventoried assets, a decision support tool, and a prioritization of investments.

Transit Asset Management System means a strategic and systematic process of operating, maintaining, and improving public transportation capital assets effectively, throughout the life cycles of those assets.

Transportation Control Measure (TCM) means any measure that is specifically identified and committed to in the applicable SIP, including a substitute or additional TCM that is incorporated into the applicable SIP through the process established in CAA section 176(c)(8), that is either one of the types listed in section 108 of the CAA (42 U.S.C. 7408) or any other measure for the purpose of reducing emissions or concentrations of air pollutants from transportation sources by reducing vehicle use or changing traffic flow or congestion conditions. Notwithstanding the above, vehicle technology-based, fuel-based, and maintenance-based measures that control the emissions from vehicles under fixed traffic conditions are not TCMs.

Transportation Improvement Program (TIP) means a prioritized listing/program of transportation projects covering a period of 4 years that is developed and formally adopted by an MPO as part of the metropolitan transportation planning process, consistent with the metropolitan transportation plan, and required for projects to be eligible for funding under title 23 U.S.C. and title 49 U.S.C. Chapter 53.

Transportation Management Area (TMA) means an urbanized area with a population over 200,000, as defined by the Bureau of the Census and designated by the Secretary of Transportation, or any additional area where TMA designation is requested by the Governor and the MPO and designated by the Secretary of Transportation.

Unified Planning Work Program (UPWP) means a statement of work identifying the planning priorities and activities to be carried out within a metropolitan planning area. At a minimum, a UPWP includes a description of the planning work and resulting products, who will perform the work, time frames for completing the work, the cost of the work, and the source(s) of funds.

Update means making current a long-range statewide transportation plan, metropolitan transportation plan, TIP, or STIP through a comprehensive review. Updates require public review and comment, a 20-year horizon for metropolitan transportation plans and long-range statewide transportation plans, a 4-year program period for TIPs and STIPs, demonstration of fiscal constraint (except for long-range statewide transportation plans), and a conformity determination (for metropolitan transportation plans and TIPs in nonattainment and maintenance areas).

Urbanized area (UZA) means a geographic area with a population of 50,000 or more, as designated by the Bureau of the Census.

Users of public transportation means any person, or groups representing such persons, who use transportation open to the general public, other than taxis and other privately funded and operated vehicles.

Visualization techniques means methods used by States and MPOs in the development of transportation plans and programs with the public, elected and appointed officials, and other stakeholders in a clear and easily accessible format such as GIS- or web-based surveys, inventories, maps, pictures, and/or displays identifying features such as roadway rights of way, transit, intermodal, and non-motorized transportation facilities, historic and cultural resources, natural resources, and environmentally sensitive areas, to promote improved understanding of existing or proposed transportation plans and programs.

Subpart B—Statewide and Nonmetropolitan Transportation Planning and Programming

§ 450.200 Purpose.

The purpose of this subpart is to implement the provisions of 23 U.S.C. 135, 23 U.S.C. 150, and 49 U.S.C. 5304, as amended, which require each State to carry out a continuing, cooperative, and comprehensive performance-based statewide multimodal transportation planning process, including the development of a long-range statewide transportation plan and STIP, that facilitates the safe and efficient management, operation, and development of surface transportation systems that will serve the mobility needs of people and freight (including accessible pedestrian walkways, bicycle transportation facilities, and intermodal facilities that support intercity transportation, including intercity bus facilities and commuter van pool providers) and that fosters economic growth and development within and between States and urbanized areas, and take into consideration resiliency needs while minimizing transportation-related fuel consumption and air pollution in all areas of the State, including those areas subject to the metropolitan transportation planning requirements of 23 U.S.C. 134 and 49 U.S.C. 5303.

§ 450.202 Applicability.

The provisions of this subpart are applicable to States and any other organizations or entities (*e.g.,* MPOs, RTPOs and public transportation operators) that are responsible for satisfying the requirements for transportation plans and programs throughout the State pursuant to 23 U.S.C. 135 and 49 U.S.C. 5304.

§ 450.204 Definitions.

Except as otherwise provided in subpart A of this part, terms defined in 23 U.S.C. 101(a) and 49 U.S.C. 5302 are used in this subpart as so defined.

§ 450.206 Scope of the statewide and nonmetropolitan transportation planning process.

(a) Each State shall carry out a continuing, cooperative, and comprehensive statewide transportation planning process that provides for consideration and implementation of projects, strategies, and services that will address the following factors:

(1) Support the economic vitality of the United States, the States, metropolitan areas, and nonmetropolitan areas, especially by enabling global competitiveness, productivity, and efficiency;

(2) Increase the safety of the transportation system for motorized and non-motorized users;

(3) Increase the security of the transportation system for motorized and non-motorized users;

(4) Increase accessibility and mobility of people and freight;

(5) Protect and enhance the environment, promote energy conservation, improve the quality of life, and promote consistency between transportation improvements and State and local planned growth and economic development patterns;

(6) Enhance the integration and connectivity of the transportation system, across and between modes throughout the State, for people and freight;

(7) Promote efficient system management and operation;

(8) Emphasize the preservation of the existing transportation system;

(9) Improve the resiliency and reliability of the transportation system and reduce or mitigate stormwater impacts of surface transportation; and

(10) Enhance travel and tourism.

(b) Consideration of the planning factors in paragraph (a) of this section shall be reflected, as appropriate, in the statewide transportation planning process. The degree of consideration and analysis of the factors should be based on the scale and complexity of many issues, including transportation systems development, land use, employment, economic development, human and natural environment (including Section 4(f) properties as defined in 23 CFR 774.17), and housing and community development.

(c) *Performance-based approach.* (1) The statewide transportation planning process shall provide for the establishment and use of a performance-based approach to transportation decisionmaking to support the national goals described in 23 U.S.C. 150(b) and the general purposes described in 49 U.S.C. 5301.

(2) Each State shall select and establish performance targets in coordination with the relevant MPOs to ensure consistency to the maximum extent practicable. The targets shall address the performance areas described in 23 U.S.C. 150(c), and the measures established under 23 CFR part 490, where applicable, to use in tracking progress toward attainment of critical outcomes for the State. States shall establish performance targets that reflect the measures identified in 23 U.S.C. 150(c) not later than 1 year after the effective date of the DOT final rule on performance measures. Each State shall select and establish targets under this paragraph in accordance with the appropriate target setting framework established at 23 CFR part 490.

(3) In areas not represented by an MPO, the selection of public transportation performance targets by a State shall be coordinated, to the maximum extent practicable, with providers of public transportation to ensure consistency with the performance targets that public transportation providers establish under 49 U.S.C. 5326(c) and 49 U.S.C. 5329(d).

(4) A State shall integrate into the statewide transportation planning process, directly or by reference, the goals, objectives, performance measures, and targets described in this section, in other State transportation plans and transportation processes, as well as any plans developed pursuant to chapter 53 of title 49 by providers of public transportation in areas not represented by an MPO required as part of a performance-based program. Examples of such plans and processes include the HSIP, SHSP, the State Asset Management Plan for the National Highway System (NHS), the State Freight Plan (if the State has one), the Transit Asset Management Plan, and the Public Transportation Agency Safety Plan.

(5) A State shall consider the performance measures and targets established under this paragraph when developing policies, programs, and investment priorities reflected in the long-range statewide transportation plan and statewide transportation improvement program.

(d) The failure to consider any factor specified in paragraph (a) or (c) of this section shall not be subject to review by any court under title 23 U.S.C., 49 U.S.C. Chapter 53, subchapter II of title 5 U.S.C. Chapter 5, or title 5 U.S.C. Chapter 7 in any matter affecting a long-range statewide transportation plan, STIP, project or strategy, or the statewide transportation planning process findings.

(e) Funds provided under 23 U.S.C. 505 and 49 U.S.C. 5305(e) are available to the State to accomplish activities described in this subpart. At the State's option, funds provided under 23 U.S.C. 104(b)(2) and 49 U.S.C. 5307, 5310, and 5311 may also be used for statewide transportation planning. A State shall document statewide transportation planning activities performed with funds provided under title 23 U.S.C. and title 49 U.S.C. Chapter 53 in a statewide planning work program in accordance with the provisions of 23 CFR part 420. The work program should include a discussion of the

transportation planning priorities facing the State.

§ 450.208 Coordination of planning process activities.

(a) In carrying out the statewide transportation planning process, each State shall, at a minimum:

(1) Coordinate planning carried out under this subpart with the metropolitan transportation planning activities carried out under subpart C of this part for metropolitan areas of the State. The State is encouraged to rely on information, studies, or analyses provided by MPOs for portions of the transportation system located in metropolitan planning areas;

(2) Coordinate planning carried out under this subpart with statewide trade and economic development planning activities and related multistate planning efforts;

(3) Consider the concerns of Federal land management agencies that have jurisdiction over land within the boundaries of the State;

(4) Cooperate with affected local elected and appointed officials with responsibilities for transportation, or, if applicable, through RTPOs described in section 450.210(d) in nonmetropolitan areas;

(5) Consider the concerns of Indian Tribal governments that have jurisdiction over land within the boundaries of the State;

(6) Consider related planning activities being conducted outside of metropolitan planning areas and between States; and

(7) Coordinate data collection and analyses with MPOs and public transportation operators to support statewide transportation planning and programming priorities and decisions.

(b) The State air quality agency shall coordinate with the State department of transportation (State DOT) to develop the transportation portion of the State Implementation Plan (SIP) consistent with the Clean Air Act (42 U.S.C. 7401 *et seq.*).

(c) Two or more States may enter into agreements or compacts, not in conflict with any law of the United States, for cooperative efforts and mutual assistance in support of activities under this subpart related to interstate areas and localities in the States and establishing authorities the States consider desirable for making the agreements and compacts effective. The right to alter, amend, or repeal interstate compacts entered into under this part is expressly reserved.

(d) States may use any one or more of the management systems (in whole or in part) described in 23 CFR part 500.

(e) In carrying out the statewide transportation planning process, States should apply asset management principles and techniques consistent with the State Asset Management Plan for the NHS and the Transit Asset Management Plan, and Public Transportation Agency Safety Plan in establishing planning goals, defining STIP priorities, and assessing transportation investment decisions, including transportation system safety, operations, preservation, and maintenance.

(f) For non-NHS highways, States may apply principles and techniques consistent with other asset management plans to the transportation planning and programming processes, as appropriate.

(g) The statewide transportation planning process shall (to the maximum extent practicable) be consistent with the development of applicable regional intelligent transportation systems (ITS) architectures, as defined in 23 CFR part 940.

(h) Preparation of the coordinated public transit-human services transportation plan, as required by 49 U.S.C. 5310, should be coordinated and consistent with the statewide transportation planning process.

§ 450.210 Interested parties, public involvement, and consultation.

(a) In carrying out the statewide transportation planning process, including development of the long-range statewide transportation plan and the STIP, the State shall develop and use a documented public involvement process that provides opportunities for public review and comment at key decision points.

(1) The State's public involvement process at a minimum shall:

(i) Establish early and continuous public involvement opportunities that provide timely information about transportation issues and decisionmaking processes to individuals, affected public agencies, representatives of public transportation employees, public ports, freight shippers, private providers of transportation (including intercity bus operators), representatives of users of public transportation, representatives of users of pedestrian walkways and bicycle transportation facilities, representatives of the disabled, providers of freight transportation services, and other interested parties;

(ii) Provide reasonable public access to technical and policy information used in the development of the long-range statewide transportation plan and the STIP;

(iii) Provide adequate public notice of public involvement activities and time for public review and comment at key decision points, including a reasonable opportunity to comment on the proposed long-range statewide transportation plan and STIP;

(iv) To the maximum extent practicable, ensure that public meetings are held at convenient and accessible locations and times;

(v) To the maximum extent practicable, use visualization techniques to describe the proposed long-range statewide transportation plan and supporting studies;

(vi) To the maximum extent practicable, make public information available in electronically accessible format and means, such as the World Wide Web, as appropriate to afford reasonable opportunity for consideration of public information;

(vii) Demonstrate explicit consideration and response to public input during the development of the long-range statewide transportation plan and STIP;

(viii) Include a process for seeking out and considering the needs of those traditionally underserved by existing transportation systems, such as low-income and minority households, who may face challenges accessing employment and other services; and

(ix) Provide for the periodic review of the effectiveness of the public involvement process to ensure that the process provides full and open access to all interested parties and revise the process, as appropriate.

(2) The State shall provide for public comment on existing and proposed processes for public involvement in the development of the long-range statewide transportation plan and the STIP. At a minimum, the State shall allow 45 calendar days for public review and written comment before the procedures and any major revisions to existing procedures are adopted. The State shall provide copies of the approved public involvement process document(s) to the FHWA and the FTA for informational purposes.

(3) With respect to the setting of targets, nothing in this part precludes a State from considering comments made as part of the State's public involvement process.

(b) The State shall provide for nonmetropolitan local official participation in the development of the long-range statewide transportation plan and the STIP. The State shall have a documented process(es) for cooperating with nonmetropolitan local officials representing units of general purpose local government and/or local officials

with responsibility for transportation that is separate and discrete from the public involvement process and provides an opportunity for their participation in the development of the long-range statewide transportation plan and the STIP. Although the FHWA and the FTA shall not review or approve this cooperative process(es), the State shall provide copies of the process document(s) to the FHWA and the FTA for informational purposes.

(1) At least once every 5 years, the State shall review and solicit comments from nonmetropolitan local officials and other interested parties for a period of not less than 60 calendar days regarding the effectiveness of the cooperative process and any proposed changes. The State shall direct a specific request for comments to the State association of counties, State municipal league, regional planning agencies, or directly to nonmetropolitan local officials.

(2) The State, at its discretion, is responsible for determining whether to adopt any proposed changes. If a proposed change is not adopted, the State shall make publicly available its reasons for not accepting the proposed change, including notification to nonmetropolitan local officials or their associations.

(c) For each area of the State under the jurisdiction of an Indian Tribal government, the State shall develop the long-range statewide transportation plan and STIP in consultation with the Tribal government and the Secretary of the Interior. States shall, to the extent practicable, develop a documented process(es) that outlines roles, responsibilities, and key decision points for consulting with Indian Tribal governments and Department of the Interior in the development of the long-range statewide transportation plan and the STIP.

(d) To carry out the transportation planning process required by this section, a Governor may establish and designate RTPOs to enhance the planning, coordination, and implementation of the long-range statewide transportation plan and STIP, with an emphasis on addressing the needs of nonmetropolitan areas of the State. In order to be treated as an RTPO for purposes of this Part, any existing regional planning organization must be established and designated as an RTPO under this section.

(1) Where established, an RTPO shall be a multijurisdictional organization of nonmetropolitan local officials or their designees who volunteer for such organization and representatives of local transportation systems who volunteer for such organization.

(2) An RTPO shall establish, at a minimum:

(i) A policy committee, the majority of which shall consist of nonmetropolitan local officials, or their designees, and, as appropriate, additional representatives from the State, private business, transportation service providers, economic development practitioners, and the public in the region; and

(ii) A fiscal and administrative agent, such as an existing regional planning and development organization, to provide professional planning, management, and administrative support.

(3) The duties of an RTPO shall include:

(i) Developing and maintaining, in cooperation with the State, regional long-range multimodal transportation plans;

(ii) Developing a regional TIP for consideration by the State;

(iii) Fostering the coordination of local planning, land use, and economic development plans with State, regional, and local transportation plans and programs;

(iv) Providing technical assistance to local officials;

(v) Participating in national, multistate, and State policy and planning development processes to ensure the regional and local input of nonmetropolitan areas;

(vi) Providing a forum for public participation in the statewide and regional transportation planning processes;

(vii) Considering and sharing plans and programs with neighboring RTPOs, MPOs, and, where appropriate, Indian Tribal Governments; and

(viii) Conducting other duties, as necessary, to support and enhance the statewide planning process under § 450.206.

(4) If a State chooses not to establish or designate an RTPO, the State shall consult with affected nonmetropolitan local officials to determine projects that may be of regional significance.

§ 450.212 Transportation planning studies and project development.

(a) Pursuant to section 1308 of the Transportation Equity Act for the 21st Century, TEA–21 (Pub. L. 105–178), a State(s), MPO(s), or public transportation operator(s) may undertake a multimodal, systems-level corridor or subarea planning study as part of the statewide transportation planning process. To the extent practicable, development of these transportation planning studies shall involve consultation with, or joint efforts among, the State(s), MPO(s), and/or public transportation operator(s). The results or decisions of these transportation planning studies may be used as part of the overall project development process consistent with the National Environmental Policy Act (NEPA) of 1969 (42 U.S.C. 4321 *et seq.*) and associated implementing regulations (23 CFR part 771 and 40 CFR parts 1500–1508). Specifically, these corridor or subarea studies may result in producing any of the following for a proposed transportation project:

(1) Purpose and need or goals and objective statement(s);

(2) General travel corridor and/or general mode(s) definition (*e.g.,* highway, transit, or a highway/transit combination);

(3) Preliminary screening of alternatives and elimination of unreasonable alternatives;

(4) Basic description of the environmental setting; and/or

(5) Preliminary identification of environmental impacts and environmental mitigation.

(b) Publicly available documents or other source material produced by, or in support of, the transportation planning process described in this subpart may be incorporated directly or by reference into subsequent NEPA documents, in accordance with 40 CFR 1502.21, if:

(1) The NEPA lead agencies agree that such incorporation will aid in establishing or evaluating the purpose and need for the Federal action, reasonable alternatives, cumulative or other impacts on the human and natural environment, or mitigation of these impacts; and

(2) The systems-level, corridor, or subarea planning study is conducted with:

(i) Involvement of interested State, local, Tribal, and Federal agencies;

(ii) Public review;

(iii) Reasonable opportunity to comment during the statewide transportation planning process and development of the corridor or subarea planning study;

(iv) Documentation of relevant decisions in a form that is identifiable and available for review during the NEPA scoping process and can be appended to or referenced in the NEPA document; and

(v) The review of the FHWA and the FTA, as appropriate.

(c) By agreement of the NEPA lead agencies, the above integration may be accomplished through tiering (as described in 40 CFR 1502.20), incorporating the subarea or corridor planning study into the draft Environmental Impact Statement or Environmental Assessment, or other

means that the NEPA lead agencies deem appropriate. Additional information to further explain the linkages between the transportation planning and project development/NEPA processes is contained in Appendix A to this part, including an explanation that is non-binding guidance material. The guidance in Appendix A applies only to paragraphs (a)–(c) in this section.

(d) In addition to the process for incorporation directly or by reference outlined in paragraph (b) of this section, an additional authority for integrating planning products into the environmental review process exists in 23 U.S.C. 168. As provided in 23 U.S.C. 168(f):

(1) The statutory authority in 23 U.S.C. 168 shall not be construed to limit in any way the continued use of processes established under other parts of this section or under an authority established outside this part, and the use of one of the processes in this section does not preclude the subsequent use of another process in this section or an authority outside of this part.

(2) The statute does not restrict the initiation of the environmental review process during planning.

§ 450.214 Development of programmatic mitigation plans.

(a) A State may utilize the optional framework in this section to develop programmatic mitigation plans as part of the statewide transportation planning process to address the potential environmental impacts of future transportation projects. The State in consultation with FHWA and/or FTA and with the agency or agencies with jurisdiction and special expertise over the resources being addressed in the plan, will determine:

(1) *Scope.* (i) A State may develop a programmatic mitigation plan on a local, regional, ecosystem, watershed, statewide or similar scale.

(ii) The plan may encompass multiple environmental resources within a defined geographic area(s) or may focus on a specific type(s) of resource(s) such as aquatic resources, parkland, or wildlife habitat.

(iii) The plan may address or consider impacts from all projects in a defined geographic area(s) or may focus on a specific type(s) of project(s).

(2) *Contents.* The programmatic mitigation plan may include:

(i) An assessment of the existing condition of natural and human environmental resources within the area covered by the plan, including an assessment of historic and recent trends and/or any potential threats to those resources.

(ii) An identification of economic, social, and natural and human environmental resources within the geographic area that may be impacted and considered for mitigation. Examples of these resources include wetlands, streams, rivers, stormwater, parklands, cultural resources, historic resources, farmlands, archeological resources, threatened or endangered species, and critical habitat. This may include the identification of areas of high conservation concern or value, and thus worthy of avoidance.

(iii) An inventory of existing or planned environmental resource banks for the impacted resource categories such as wetland, stream, stormwater, habitat, species, and an inventory of federally, State, or locally approved in-lieu-of-fee programs.

(iv) An assessment of potential opportunities to improve the overall quality of the identified environmental resources through strategic mitigation for impacts of transportation projects, which may include the prioritization of parcels or areas for acquisition and/or potential resource banking sites.

(v) An adoption or development of standard measures or operating procedures for mitigating certain types of impacts; establishment of parameters for determining or calculating appropriate mitigation for certain types of impacts, such as mitigation ratios, or criteria for determining appropriate mitigation sites.

(vi) Adaptive management procedures, such as protocols or procedures that involve monitoring actual impacts against predicted impacts over time and adjusting mitigation measures in response to information gathered through the monitoring.

(vii) Acknowledgment of specific statutory or regulatory requirements that must be satisfied when determining appropriate mitigation for certain types of resources.

(b) A State may adopt a programmatic mitigation plan developed pursuant to paragraph (a), or developed pursuant to an alternative process as provided for in paragraph (f) of this section through the following process:

(1) Consult with each agency with jurisdiction over the environmental resources considered in the programmatic mitigation plan;

(2) Make available a draft of the programmatic mitigation plan for review and comment by appropriate environmental resource agencies and the public;

(3) Consider comments received from such agencies and the public on the draft plan; and

(4) Address such comments in the final programmatic mitigation plan.

(c) A State may integrate a programmatic mitigation plan with other plans, including, watershed plans, ecosystem plans, species recovery plans, growth management plans, State Wildlife Action Plans, and land use plans.

(d) If a programmatic mitigation plan has been adopted pursuant to paragraph (b), any Federal agency responsible for environmental reviews, permits, or approvals for a transportation project shall give substantial weight to the recommendations in the programmatic mitigation plan when carrying out its responsibilities under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*) (NEPA) or other Federal environmental law.

(e) Nothing in this section limits the use of programmatic approaches for reviews under NEPA.

(f) Nothing in this section prohibits the development, as part of or separate from the transportation planning process, of a programmatic mitigation plan independent of the framework described in paragraph (a) of this section. Further, nothing in this section prohibits the adoption of a programmatic mitigation plan in the statewide and nonmetropolitan transportation planning process that was developed under another authority, independent of the framework described in paragraph (a).

§ 450.216 Development and content of the long-range statewide transportation plan.

(a) The State shall develop a long-range statewide transportation plan, with a minimum 20-year forecast period at the time of adoption, that provides for the development and implementation of the multimodal transportation system for the State. The long-range statewide transportation plan shall consider and include, as applicable, elements and connections between public transportation, non-motorized modes, rail, commercial motor vehicle, waterway, and aviation facilities, particularly with respect to intercity travel.

(b) The long-range statewide transportation plan should include capital, operations and management strategies, investments, procedures, and other measures to ensure the preservation and most efficient use of the existing transportation system including consideration of the role that intercity buses may play in reducing congestion, pollution, and energy

consumption in a cost-effective manner and strategies and investments that preserve and enhance intercity bus systems, including systems that are privately owned and operated. The long-range statewide transportation plan may consider projects and strategies that address areas or corridors where current or projected congestion threatens the efficient functioning of key elements of the State's transportation system.

(c) The long-range statewide transportation plan shall reference, summarize, or contain any applicable short-range planning studies; strategic planning and/or policy studies; transportation needs studies; management systems reports; emergency relief and disaster preparedness plans; and any statements of policies, goals, and objectives on issues (*e.g.,* transportation, safety, economic development, social and environmental effects, or energy), as appropriate, that were relevant to the development of the long-range statewide transportation plan.

(d) The long-range statewide transportation plan should integrate the priorities, goals, countermeasures, strategies, or projects contained in the HSIP, including the SHSP, required under 23 U.S.C. 148, the Public Transportation Agency Safety Plan required under 49 U.S.C. 5329(d), or an Interim Agency Safety Plan in accordance with 49 CFR part 659, as in effect until completion of the Public Transportation Agency Safety Plan.

(e) The long-range statewide transportation plan should include a security element that incorporates or summarizes the priorities, goals, or projects set forth in other transit safety and security planning and review processes, plans, and programs, as appropriate.

(f) The statewide transportation plan shall include:

(1) A description of the performance measures and performance targets used in assessing the performance of the transportation system in accordance with § 450.206(c); and

(2) A system performance report and subsequent updates evaluating the condition and performance of the transportation system with respect to the performance targets described in § 450.206(c), including progress achieved by the MPO(s) in meeting the performance targets in comparison with system performance recorded in previous reports.

(g) Within each metropolitan area of the State, the State shall develop the long-range statewide transportation plan in cooperation with the affected MPOs.

(h) For nonmetropolitan areas, the State shall develop the long-range statewide transportation plan in cooperation with affected nonmetropolitan local officials with responsibility for transportation or, if applicable, through RTPOs described in § 450.210(d) using the State's cooperative process(es) established under § 450.210(b).

(i) For each area of the State under the jurisdiction of an Indian Tribal government, the State shall develop the long-range statewide transportation plan in consultation with the Tribal government and the Secretary of the Interior consistent with § 450.210(c).

(j) The State shall develop the long-range statewide transportation plan, as appropriate, in consultation with State, Tribal, and local agencies responsible for land use management, natural resources, environmental protection, conservation, and historic preservation. This consultation shall involve comparison of transportation plans to State and Tribal conservation plans or maps, if available, and comparison of transportation plans to inventories of natural or historic resources, if available.

(k) A long-range statewide transportation plan shall include a discussion of potential environmental mitigation activities and potential areas to carry out these activities, including activities that may have the greatest potential to restore and maintain the environmental functions affected by the long-range statewide transportation plan. The discussion may focus on policies, programs, or strategies, rather than at the project level. The State shall develop the discussion in consultation with applicable Federal, State, regional, local and Tribal land management, wildlife, and regulatory agencies. The State may establish reasonable timeframes for performing this consultation.

(l) In developing and updating the long-range statewide transportation plan, the State shall provide:

(1) To nonmetropolitan local elected officials, or, if applicable, through RTPOs described in § 450.210(d), an opportunity to participate in accordance with § 450.216(h); and

(2) To individuals, affected public agencies, representatives of public transportation employees, public ports, freight shippers, private providers of transportation (including intercity bus operators, employer-based cash-out program, shuttle program, or telework program), representatives of users of public transportation, representatives of users of pedestrian walkways and bicycle transportation facilities, representatives of the disabled, providers of freight transportation services, and other interested parties with a reasonable opportunity to comment on the proposed long-range statewide transportation plan. In carrying out these requirements, the State shall use the public involvement process described under § 450.210(a).

(m) The long-range statewide transportation plan may include a financial plan that demonstrates how the adopted long-range statewide transportation plan can be implemented, indicates resources from public and private sources that are reasonably expected to be made available to carry out the plan, and recommends any additional financing strategies for needed projects and programs. In addition, for illustrative purposes, the financial plan may include additional projects that the State would include in the adopted long-range statewide transportation plan if additional resources beyond those identified in the financial plan were to become available. The financial plan may include an assessment of the appropriateness of innovative finance techniques (for example, tolling, pricing, bonding, public-private partnerships, or other strategies) as revenue sources.

(n) The State is not required to select any project from the illustrative list of additional projects included in the financial plan described in paragraph (m) of this section.

(o) The State shall publish or otherwise make available the long-range statewide transportation plan for public review, including (to the maximum extent practicable) in electronically accessible formats and means, such as the World Wide Web, as described in § 450.210(a).

(p) The State shall continually evaluate, revise, and periodically update the long-range statewide transportation plan, as appropriate, using the procedures in this section for development and establishment of the long-range statewide transportation plan.

(q) The State shall provide copies of any new or amended long-range statewide transportation plan documents to the FHWA and the FTA for informational purposes.

§ 450.218 Development and content of the statewide transportation improvement program (STIP).

(a) The State shall develop a statewide transportation improvement program (STIP) for all areas of the State. The STIP shall cover a period of no less than 4 years and shall be updated at least

every 4 years, or more frequently if the Governor of the State elects a more frequent update cycle. However, if the STIP covers more than 4 years, the FHWA and the FTA will consider the projects in the additional years as informational. In case of difficulties developing a portion of the STIP for a particular area (*e.g.,* metropolitan planning area, nonattainment or maintenance area, or Indian Tribal lands), the State may develop a partial STIP covering the rest of the State.

(b) For each metropolitan area in the State, the State shall develop the STIP in cooperation with the MPO designated for the metropolitan area. The State shall include each metropolitan TIP without change in the STIP, directly or by reference, after approval of the TIP by the MPO and the Governor. A metropolitan TIP in a nonattainment or maintenance area is subject to a FHWA/FTA conformity finding before inclusion in the STIP. In areas outside a metropolitan planning area but within an air quality nonattainment or maintenance area containing any part of a metropolitan area, projects must be included in the regional emissions analysis that supported the conformity determination of the associated metropolitan TIP before they are added to the STIP.

(c) For each nonmetropolitan area in the State, the State shall develop the STIP in cooperation with affected nonmetropolitan local officials with responsibility for transportation or, if applicable, through RTPOs described in § 450.210(d) using the State's consultation process(es) established under § 450.210(b).

(d) For each area of the State under the jurisdiction of an Indian Tribal government, the STIP shall be developed in consultation with the Tribal government and the Secretary of the Interior.

(e) Tribal Transportation Program, Federal Lands Transportation Program, and Federal Lands Access Program TIPs shall be included without change in the STIP, directly or by reference, once approved by the FHWA pursuant to 23 U.S.C. 201(c)(4).

(f) The Governor shall provide all interested parties with a reasonable opportunity to comment on the proposed STIP as required by § 450.210(a).

(g) The STIP shall include capital and non-capital surface transportation projects (or phases of projects) within the boundaries of the State proposed for funding under title 23 U.S.C. and title 49 U.S.C. Chapter 53 (including transportation alternatives and associated transit improvements; Tribal Transportation Program projects, Federal Lands Transportation Program projects, and Federal Lands Access Program projects; HSIP projects; trails projects; and accessible pedestrian walkways and bicycle facilities), except the following that may be included:

(1) Safety projects funded under 23 U.S.C. 402 and 49 U.S.C. 31102;

(2) Metropolitan planning projects funded under 23 U.S.C. 104(d) and 49 U.S.C. 5305(d);

(3) State planning and research projects funded under 23 U.S.C. 505 and 49 U.S.C. 5305(e);

(4) State planning and research projects funded with Surface Transportation Program funds;

(5) Emergency relief projects (except those involving substantial functional, locational, or capacity changes);

(6) Research, development, demonstration, and deployment projects funded under 49 U.S.C. 5312, and technical assistance and standards development projects funded under 49 U.S.C. 5314;

(7) Project management oversight projects funded under 49 U.S.C. 5327; and

(8) State safety oversight programs funded under 49 U.S.C. 5329.

(h) The STIP shall contain all regionally significant projects requiring an action by the FHWA or the FTA whether or not the projects are to be funded with 23 U.S.C. Chapters 1 and 2 or title 49 U.S.C. Chapter 53 funds (*e.g.,* addition of an interchange to the Interstate System with State, local, and/or private funds, and congressionally designated projects not funded under title 23 U.S.C. or title 49 U.S.C. Chapter 53). For informational and conformity purposes, the STIP shall include (if appropriate and included in any TIPs) all regionally significant projects proposed to be funded with Federal funds other than those administered by the FHWA or the FTA, as well as all regionally significant projects to be funded with non-Federal funds.

(i) The STIP shall include for each project or phase (*e.g.,* preliminary engineering, environment/NEPA, right-of-way, design, or construction) the following:

(1) Sufficient descriptive material (*i.e.,* type of work, termini, and length) to identify the project or phase;

(2) Estimated total project cost or a project cost range, which may extend beyond the 4 years of the STIP;

(3) The amount of Federal funds proposed to be obligated during each program year. For the first year, this includes the proposed category of Federal funds and source(s) of non-Federal funds. For the second, third, and fourth years, this includes the likely category or possible categories of Federal funds and sources of non-Federal funds; and

(4) Identification of the agencies responsible for carrying out the project or phase.

(j) Projects that are not considered to be of appropriate scale for individual identification in a given program year may be grouped by function, work type, and/or geographic area using the applicable classifications under 23 CFR 771.117(c) and (d) and/or 40 CFR part 93. In nonattainment and maintenance areas, project classifications must be consistent with the ''exempt project'' classifications contained in the EPA's transportation conformity regulations (40 CFR part 93, subpart A). In addition, projects proposed for funding under title 23 U.S.C. Chapter 2 that are not regionally significant may be grouped in one line item or identified individually in the STIP.

(k) Each project or project phase included in the STIP shall be consistent with the long-range statewide transportation plan developed under § 450.216 and, in metropolitan planning areas, consistent with an approved metropolitan transportation plan developed under § 450.324.

(l) The STIP may include a financial plan that demonstrates how the approved STIP can be implemented, indicates resources from public and private sources that are reasonably expected to be available to carry out the STIP, and recommends any additional financing strategies for needed projects and programs. In addition, for illustrative purposes, the financial plan may include additional projects that would be included in the adopted STIP if reasonable additional resources beyond those identified in the financial plan were to become available. The State is not required to select any project from the illustrative list for implementation, and projects on the illustrative list cannot be advanced to implementation without an action by the FHWA and the FTA on the STIP. Revenue and cost estimates for the STIP must use an inflation rate to reflect ''year of expenditure dollars,'' based on reasonable financial principles and information, developed cooperatively by the State, MPOs, and public transportation operators.

(m) In nonattainment and maintenance areas, projects included in the first 2 years of the STIP shall be limited to those for which funds are available or committed. Financial constraint of the STIP shall be demonstrated and maintained by year and shall include sufficient financial

information to demonstrate which projects are to be implemented using current and/or reasonably available revenues, while federally supported facilities are being adequately operated and maintained. In the case of proposed funding sources, strategies for ensuring their availability shall be identified in the financial plan consistent with paragraph (l) of this section. For purposes of transportation operations and maintenance, the STIP shall include financial information containing system-level estimates of costs and revenue sources that are reasonably expected to be available to adequately operate and maintain Federal-aid highways (as defined by 23 U.S.C. 101(a)(5)) and public transportation (as defined by title 49 U.S.C. 5302).

(n) Projects in any of the first 4 years of the STIP may be advanced in place of another project in the first 4 years of the STIP, subject to the project selection requirements of § 450.222. In addition, subject to FHWA/FTA approval (see § 450.220), the State may revise the STIP at any time under procedures agreed to by the State, MPO(s), and public transportation operators consistent with the STIP development procedures established in this section, as well as the procedures for participation by interested parties (see § 450.210(a)). Changes that affect fiscal constraint must take place by amendment of the STIP.

(o) The STIP shall include a project, or an identified phase of a project, only if full funding can reasonably be anticipated to be available for the project within the time period contemplated for completion of the project.

(p) In cases where the FHWA and the FTA find a STIP to be fiscally constrained, and a revenue source is subsequently removed or substantially reduced (*i.e.,* by legislative or administrative actions), the FHWA and the FTA will not withdraw the original determination of fiscal constraint. However, in such cases, the FHWA and the FTA will not act on an updated or amended STIP that does not reflect the changed revenue situation.

(q) A STIP shall include, to the maximum extent practicable, a discussion of the anticipated effect of the STIP toward achieving the performance targets identified by the State in the statewide transportation plan or other State performance-based plan(s), linking investment priorities to those performance targets.

§ 450.220 Self-certifications, Federal findings, and Federal approvals.

(a) At least every 4 years, the State shall submit an updated STIP concurrently to the FHWA and the FTA for joint approval. The State must also submit STIP amendments to the FHWA and the FTA for joint approval. At the time the entire proposed STIP or STIP amendments are submitted to the FHWA and the FTA for joint approval, the State shall certify that the transportation planning process is being carried out in accordance with all applicable requirements of:

(1) 23 U.S.C. 134 and 135, 49 U.S.C. 5303 and 5304, and this part;

(2) Title VI of the Civil Rights Act of 1964, as amended (42 U.S.C. 2000d-1) and 49 CFR part 21;

(3) 49 U.S.C. 5332, prohibiting discrimination on the basis of race, color, creed, national origin, sex, or age in employment or business opportunity;

(4) Section 1101(b) of the FAST Act (Pub. L. 114–357) and 49 CFR part 26 regarding the involvement of disadvantaged business enterprises in DOT funded projects;

(5) 23 CFR part 230, regarding implementation of an equal employment opportunity program on Federal and Federal-aid highway construction contracts;

(6) The provisions of the Americans with Disabilities Act of 1990 (42 U.S.C. 12101 *et seq.*) and 49 CFR parts 27, 37, and 38;

(7) In States containing nonattainment and maintenance areas, sections 174 and 176(c) and (d) of the Clean Air Act, as amended (42 U.S.C. 7504, 7506(c) and (d)) and 40 CFR part 93;

(8) The Older Americans Act, as amended (42 U.S.C. 6101), prohibiting discrimination on the basis of age in programs or activities receiving Federal financial assistance;

(9) 23 U.S.C. 324, regarding the prohibition of discrimination based on gender; and

(10) Section 504 of the Rehabilitation Act of 1973 (29 U.S.C. 794) and 49 CFR part 27 regarding discrimination against individuals with disabilities.

(b) The FHWA and the FTA shall review the STIP or the amended STIP, and make a joint finding on the extent to which the STIP is based on a statewide transportation planning process that meets or substantially meets the requirements of 23 U.S.C. 134 and 135, 49 U.S.C. 5303 and 5304, and subparts A, B, and C of this part. Approval of the STIP by the FHWA and the FTA, in its entirety or in part, will be based upon the results of this joint finding.

(1) If the FHWA and the FTA determine that the STIP or amended STIP is based on a statewide transportation planning process that meets or substantially meets the requirements of 23 U.S.C. 135, 49 U.S.C. 5304, and this part, the FHWA and the FTA may jointly:

(i) Approve the entire STIP;

(ii) Approve the STIP subject to certain corrective actions by the State; or

(iii) Under special circumstances, approve a partial STIP covering only a portion of the State.

(2) If the FHWA and the FTA jointly determine and document in the planning finding that a submitted STIP or amended STIP does not substantially meet the requirements of 23 U.S.C. 135, 49 U.S.C. 5304, and this part for any identified categories of projects, the FHWA and the FTA will not approve the STIP.

(c) The approval period for a new or amended STIP shall not exceed 4 years. If a State demonstrates, in writing, that extenuating circumstances will delay the submittal of a new or amended STIP past its update deadline, the FHWA and the FTA will consider and take appropriate action on a request to extend the approval beyond 4 years for all or part of the STIP for a period not to exceed 180 calendar days. In these cases, priority consideration will be given to projects and strategies involving the operation and management of the multimodal transportation system. Where the request involves projects in a metropolitan planning area(s), the affected MPO(s) must concur in the request. If the delay was due to the development and approval of a metropolitan TIP(s), the affected MPO(s) must provide supporting information, in writing, for the request.

(d) Where necessary in order to maintain or establish highway and transit operations, the FHWA and the FTA may approve operating assistance for specific projects or programs, even though the projects or programs may not be included in an approved STIP.

§ 450.222 Project selection from the STIP.

(a) Except as provided in § 450.218(g) and § 450.220(d), only projects in a FHWA/FTA approved STIP are eligible for funds administered by the FHWA or the FTA.

(b) In metropolitan planning areas, transportation projects proposed for funds administered by the FHWA or the FTA shall be selected from the approved STIP in accordance with project selection procedures provided in § 450.332.

(c) In nonmetropolitan areas, with the exclusion of specific projects as described in this section, the State shall select projects from the approved STIP in cooperation with the affected nonmetropolitan local officials, or if applicable, through RTPOs described in § 450.210(e). The State shall select transportation projects undertaken on the NHS, under the Bridge and Interstate Maintenance programs in title 23 U.S.C. and under sections 5310 and 5311 of title 49 U.S.C. Chapter 53 from the approved STIP in consultation with the affected nonmetropolitan local officials with responsibility for transportation.

(d) Tribal Transportation Program, Federal Lands Transportation Program, and Federal Lands Access Program projects shall be selected from the approved STIP in accordance with the procedures developed pursuant to 23 U.S.C. 201, 202, 203, and 204.

(e) The projects in the first year of an approved STIP shall constitute an ''agreed to'' list of projects for subsequent scheduling and implementation. No further action under paragraphs (b) through (d) of this section is required for the implementing agency to proceed with these projects. If Federal funds available are significantly less than the authorized amounts, or where there is significant shifting of projects among years, § 450.332(a) provides for a revised list of ''agreed to'' projects to be developed upon the request of the State, MPO, or public transportation operator(s). If an implementing agency wishes to proceed with a project in the second, third, or fourth year of the STIP, the procedures in paragraphs (b) through (d) of this section or expedited procedures that provide for the advancement of projects from the second, third, or fourth years of the STIP may be used, if agreed to by all parties involved in the selection process.

§ 450.224 Applicability of NEPA to statewide transportation plans and programs.

Any decision by the Secretary concerning a long-range statewide transportation plan or STIP developed through the processes provided for in 23 U.S.C. 135, 49 U.S.C. 5304, and this subpart shall not be considered to be a Federal action subject to review under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*).

§ 450.226 Phase-in of new requirements.

(a) Prior to May 27, 2018, a State may adopt a long-range statewide transportation plan that has been developed using the SAFETEA–LU requirements or the provisions and requirements of this part. On or after May 27, 2018, a State may only adopt a long-range statewide transportation plan that it has developed according to the provisions and requirements of this part.

(b) Prior to May 27, 2018 (2 years after the publication date of this rule), FHWA/FTA may approve a STIP update or amendment that has been developed using the SAFETEA–LU requirements or the provisions and requirements of this part. On or after May 27, 2018, FHWA/FTA may only approve a STIP update or amendment that a State has developed according to the provisions and requirements of this part, regardless of when the State developed the STIP.

(c) On and after May 27, 2018 (2 years after the publication date of this rule), the FHWA and the FTA will take action on an updated or amended STIP developed under the provisions of this part, even if the State has not yet adopted a new long-range statewide transportation plan under the provisions of this part, as long as the underlying transportation planning process is consistent with the requirements in the MAP–21.

(d) On or after May 27, 2018, a State may make an administrative modification to a STIP that conforms to either the SAFETEA–LU requirements or to the provisions and requirements of this part.

(e) Two years from the effective date of each rule establishing performance measures under 23 U.S.C. 150(c), 49 U.S.C. 5326, or 49 U.S.C. 5329, FHWA/FTA will only approve an updated or amended STIP that is based on a statewide transportation planning process that meets the performance-based planning requirements in this part and in such a rule.

(f) Prior to 2 years from the effective date of each rule establishing performance measures under 23 U.S.C. 150(c), 49 U.S.C. 5326, or 49 U.S.C. 5329, a State may adopt a long-range statewide transportation plan that it has developed using the SAFETEA–LU requirements or the performance-based provisions and requirements of this part and in such a rule. Two years on or after the effective date of each rule establishing performance measures under 23 U.S.C. 150(c), 49 U.S.C. 5326, or 49 U.S.C. 5329, a State may only adopt a long-range statewide transportation plan that it has developed according to the performance-based provisions and requirements of this part and in such a rule.

Subpart C—Metropolitan Transportation Planning and Programming

§ 450.300 Purpose.

The purposes of this subpart are to implement the provisions of 23 U.S.C. 134, 23 U.S.C. 150, and 49 U.S.C. 5303, as amended, which:

(a) Set forth the national policy that the MPO designated for each urbanized area is to carry out a continuing, cooperative, and comprehensive performance-based multimodal transportation planning process, including the development of a metropolitan transportation plan and a TIP, that encourages and promotes the safe and efficient development, management, and operation of surface transportation systems to serve the mobility needs of people and freight (including accessible pedestrian walkways, bicycle transportation facilities, and intermodal facilities that support intercity transportation, including intercity buses and intercity bus facilities and commuter vanpool providers) fosters economic growth and development, and takes into consideration resiliency needs, while minimizing transportation-related fuel consumption and air pollution; and

(b) Encourages continued development and improvement of metropolitan transportation planning processes guided by the planning factors set forth in 23 U.S.C. 134(h) and 49 U.S.C. 5303(h).

§ 450.302 Applicability.

The provisions of this subpart are applicable to organizations and entities responsible for the transportation planning and programming processes in metropolitan planning areas.

§ 450.304 Definitions.

Except as otherwise provided in subpart A of this part, terms defined in 23 U.S.C. 101(a) and 49 U.S.C. 5302 are used in this subpart as so defined.

§ 450.306 Scope of the metropolitan transportation planning process.

(a) To accomplish the objectives in § 450.300 and § 450.306(b), metropolitan planning organizations designated under § 450.310, in cooperation with the State and public transportation operators, shall develop long-range transportation plans and TIPs through a performance-driven, outcome-based approach to planning for metropolitan areas of the State.

(b) The metropolitan transportation planning process shall be continuous, cooperative, and comprehensive, and provide for consideration and

implementation of projects, strategies, and services that will address the following factors:

(1) Support the economic vitality of the metropolitan area, especially by enabling global competitiveness, productivity, and efficiency;

(2) Increase the safety of the transportation system for motorized and non-motorized users;

(3) Increase the security of the transportation system for motorized and non-motorized users;

(4) Increase accessibility and mobility of people and freight;

(5) Protect and enhance the environment, promote energy conservation, improve the quality of life, and promote consistency between transportation improvements and State and local planned growth and economic development patterns;

(6) Enhance the integration and connectivity of the transportation system, across and between modes, for people and freight;

(7) Promote efficient system management and operation;

(8) Emphasize the preservation of the existing transportation system;

(9) Improve the resiliency and reliability of the transportation system and reduce or mitigate stormwater impacts of surface transportation; and

(10) Enhance travel and tourism.

(c) Consideration of the planning factors in paragraph (b) of this section shall be reflected, as appropriate, in the metropolitan transportation planning process. The degree of consideration and analysis of the factors should be based on the scale and complexity of many issues, including transportation system development, land use, employment, economic development, human and natural environment (including Section 4(f) properties as defined in 23 CFR 774.17), and housing and community development.

(d) *Performance-based approach.* (1) The metropolitan transportation planning process shall provide for the establishment and use of a performance-based approach to transportation decisionmaking to support the national goals described in 23 U.S.C. 150(b) and the general purposes described in 49 U.S.C. 5301(c).

(2) *Establishment of performance targets by metropolitan planning organizations.* (i) Each metropolitan planning organization shall establish performance targets that address the performance measures or standards established under 23 CFR part 490 (where applicable), 49 U.S.C. 5326(c), and 49 U.S.C. 5329(d) to use in tracking progress toward attainment of critical outcomes for the region of the metropolitan planning organization.

(ii) The selection of targets that address performance measures described in 23 U.S.C. 150(c) shall be in accordance with the appropriate target setting framework established at 23 CFR part 490, and shall be coordinated with the relevant State(s) to ensure consistency, to the maximum extent practicable.

(iii) The selection of performance targets that address performance measures described in 49 U.S.C. 5326(c) and 49 U.S.C. 5329(d) shall be coordinated, to the maximum extent practicable, with public transportation providers to ensure consistency with the performance targets that public transportation providers establish under 49 U.S.C. 5326(c) and 49 U.S.C. 5329(d).

(3) Each MPO shall establish the performance targets under paragraph (d)(2) of this section not later than 180 days after the date on which the relevant State or provider of public transportation establishes the performance targets.

(4) An MPO shall integrate in the metropolitan transportation planning process, directly or by reference, the goals, objectives, performance measures, and targets described in other State transportation plans and transportation processes, as well as any plans developed under 49 U.S.C. chapter 53 by providers of public transportation, required as part of a performance-based program including:

(i) The State asset management plan for the NHS, as defined in 23 U.S.C. 119(e) and the Transit Asset Management Plan, as discussed in 49 U.S.C. 5326;

(ii) Applicable portions of the HSIP, including the SHSP, as specified in 23 U.S.C. 148;

(iii) The Public Transportation Agency Safety Plan in 49 U.S.C. 5329(d);

(iv) Other safety and security planning and review processes, plans, and programs, as appropriate;

(v) The Congestion Mitigation and Air Quality Improvement Program performance plan in 23 U.S.C. 149(l), as applicable;

(vi) Appropriate (metropolitan) portions of the State Freight Plan (MAP–21 section 1118);

(vii) The congestion management process, as defined in 23 CFR 450.322, if applicable; and

(viii) Other State transportation plans and transportation processes required as part of a performance-based program.

(e) The failure to consider any factor specified in paragraph (b) or (d) of this section shall not be reviewable by any court under title 23 U.S.C., 49 U.S.C. Chapter 53, subchapter II of title 5, U.S.C. Chapter 5, or title 5 U.S.C. Chapter 7 in any matter affecting a metropolitan transportation plan, TIP, a project or strategy, or the certification of a metropolitan transportation planning process.

(f) An MPO shall carry out the metropolitan transportation planning process in coordination with the statewide transportation planning process required by 23 U.S.C. 135 and 49 U.S.C. 5304.

(g) The metropolitan transportation planning process shall (to the maximum extent practicable) be consistent with the development of applicable regional intelligent transportation systems (ITS) architectures, as defined in 23 CFR part 940.

(h) Preparation of the coordinated public transit-human services transportation plan, as required by 49 U.S.C. 5310, should be coordinated and consistent with the metropolitan transportation planning process.

(i) In an urbanized area not designated as a TMA that is an air quality attainment area, the MPO(s) may propose and submit to the FHWA and the FTA for approval a procedure for developing an abbreviated metropolitan transportation plan and TIP. In developing proposed simplified planning procedures, consideration shall be given to whether the abbreviated metropolitan transportation plan and TIP will achieve the purposes of 23 U.S.C. 134, 49 U.S.C. 5303, and this part, taking into account the complexity of the transportation problems in the area. The MPO shall develop simplified procedures in cooperation with the State(s) and public transportation operator(s).

§ 450.308 Funding for transportation planning and unified planning work programs.

(a) Funds provided under 23 U.S.C. 104(d), 49 U.S.C. 5305(d), and 49 U.S.C. 5307, are available to MPOs to accomplish activities described in this subpart. At the State's option, funds provided under 23 U.S.C. 104(b)(2) and 23 U.S.C. 505 may also be provided to MPOs for metropolitan transportation planning. At the option of the State and operators of public transportation, funds provided under 49 U.S.C. 5305(e) may also be provided to MPOs for activities that support metropolitan transportation planning. In addition, an MPO serving an urbanized area with a population over 200,000, as designated by the Bureau of the Census, may at its discretion use funds sub-allocated under 23 U.S.C. 133(d)(4) for

metropolitan transportation planning activities.

(b) An MPO shall document metropolitan transportation planning activities performed with funds provided under title 23 U.S.C. and title 49 U.S.C. Chapter 53 in a unified planning work program (UPWP) or simplified statement of work in accordance with the provisions of this section and 23 CFR part 420.

(c) Except as provided in paragraph (d) of this section, each MPO, in cooperation with the State(s) and public transportation operator(s), shall develop a UPWP that includes a discussion of the planning priorities facing the MPA. The UPWP shall identify work proposed for the next 1- or 2-year period by major activity and task (including activities that address the planning factors in § 450.306(b)), in sufficient detail to indicate who (*e.g.,* MPO, State, public transportation operator, local government, or consultant) will perform the work, the schedule for completing the work, the resulting products, the proposed funding by activity/task, and a summary of the total amounts and sources of Federal and matching funds.

(d) With the prior approval of the State and the FHWA and the FTA, an MPO in an area not designated as a TMA may prepare a simplified statement of work, in cooperation with the State(s) and the public transportation operator(s), in lieu of a UPWP. A simplified statement of work shall include a description of the major activities to be performed during the next 1- or 2-year period, who (*e.g.,* State, MPO, public transportation operator, local government, or consultant) will perform the work, the resulting products, and a summary of the total amounts and sources of Federal and matching funds. If a simplified statement of work is used, it may be submitted as part of the State's planning work program, in accordance with 23 CFR part 420.

(e) Arrangements may be made with the FHWA and the FTA to combine the UPWP or simplified statement of work with the work program(s) for other Federal planning funds.

(f) Administrative requirements for UPWPs and simplified statements of work are contained in 23 CFR part 420 and FTA Circular C8100, as amended (Program Guidance for Metropolitan Planning and State Planning and Research Program Grants).

§ 450.310 Metropolitan planning organization designation and redesignation.

(a) To carry out the metropolitan transportation planning process under this subpart, an MPO shall be designated for each urbanized area with a population of more than 50,000 individuals (as determined by the Bureau of the Census).

(b) MPO designation shall be made by agreement between the Governor and units of general purpose local government that together represent at least 75 percent of the affected population (including the largest incorporated city, based on population, as named by the Bureau of the Census) or in accordance with procedures established by applicable State or local law.

(c) The FHWA and the FTA shall identify as a TMA each urbanized area with a population of over 200,000 individuals, as defined by the Bureau of the Census. The FHWA and the FTA shall also designate any urbanized area as a TMA on the request of the Governor and the MPO designated for that area.

(d) TMA structure:

(1) Not later than October 1, 2014, each metropolitan planning organization that serves a designated TMA shall consist of:

(i) Local elected officials;

(ii) Officials of public agencies that administer or operate major modes of transportation in the metropolitan area, including representation by providers of public transportation; and

(iii) Appropriate State officials.

(2) An MPO may be restructured to meet the requirements of this paragraph (d) without undertaking a redesignation.

(3) *Representation.* (i) Designation or selection of officials or representatives under paragraph (d)(1) of this section shall be determined by the MPO according to the bylaws or enabling statute of the organization.

(ii) Subject to the bylaws or enabling statute of the MPO, a representative of a provider of public transportation may also serve as a representative of a local municipality.

(iii) An official described in paragraph (d)(1)(ii) shall have responsibilities, actions, duties, voting rights, and any other authority commensurate with other officials described in paragraph (d)(1) of this section.

(4) Nothing in this section shall be construed to interfere with the authority, under any State law in effect on December 18, 1991, of a public agency with multimodal transportation responsibilities—

(i) To develop the plans and TIPs for adoption by an MPO; and

(ii) To develop long-range capital plans, coordinate transit services and projects, and carry out other activities pursuant to State law.

(e) To the extent possible, only one MPO shall be designated for each urbanized area or group of contiguous urbanized areas. More than one MPO may be designated to serve an urbanized area only if the Governor(s) and the existing MPO, if applicable, determine that the size and complexity of the urbanized area make designation of more than one MPO appropriate. In those cases where two or more MPOs serve the same urbanized area, the MPOs shall establish official, written agreements that clearly identify areas of coordination and the division of transportation planning responsibilities among the MPOs.

(f) Nothing in this subpart shall be deemed to prohibit an MPO from using the staff resources of other agencies, non-profit organizations, or contractors to carry out selected elements of the metropolitan transportation planning process.

(g) An MPO designation shall remain in effect until an official redesignation has been made in accordance with this section.

(h) An existing MPO may be redesignated only by agreement between the Governor and units of general purpose local government that together represent at least 75 percent of the existing metropolitan planning area population (including the largest incorporated city, based on population, as named by the Bureau of the Census).

(i) For the purposes of redesignation, units of general purpose local government may be defined as elected officials from each unit of general purpose local government located within the metropolitan planning area served by the existing MPO.

(j) Redesignation of an MPO (in accordance with the provisions of this section) is required whenever the existing MPO proposes to make:

(1) A substantial change in the proportion of voting members on the existing MPO representing the largest incorporated city, other units of general purpose local government served by the MPO, and the State(s); or

(2) A substantial change in the decisionmaking authority or responsibility of the MPO, or in decisionmaking procedures established under MPO by-laws.

(k) Redesignation of an MPO serving a multistate metropolitan planning area requires agreement between the Governors of each State served by the existing MPO and units of general purpose local government that together represent at least 75 percent of the existing metropolitan planning area population (including the largest incorporated city, based on population, as named by the Bureau of the Census).

(l) The following changes to an MPO do not require a redesignation (as long as they do not trigger a substantial change as described in paragraph (j) of this section):

(1) The identification of a new urbanized area (as determined by the Bureau of the Census) within an existing metropolitan planning area;

(2) Adding members to the MPO that represent new units of general purpose local government resulting from expansion of the metropolitan planning area;

(3) Adding members to satisfy the specific membership requirements described in paragraph (d) of this section for an MPO that serves a TMA; or

(4) Periodic rotation of members representing units of general-purpose local government, as established under MPO by-laws.

(m) Each Governor with responsibility for a portion of a multistate metropolitan area and the appropriate MPOs shall, to the extent practicable, provide coordinated transportation planning for the entire MPA. The consent of Congress is granted to any two or more States to:

(1) Enter into agreements or compacts, not in conflict with any law of the United States, for cooperative efforts and mutual assistance in support of activities authorized under 23 U.S.C. 134 and 49 U.S.C. 5303 as the activities pertain to interstate areas and localities within the States; and

(2) Establish such agencies, joint or otherwise, as the States may determine desirable for making the agreements and compacts effective.

§ 450.312 Metropolitan planning area boundaries.

(a) The boundaries of a metropolitan planning area (MPA) shall be determined by agreement between the MPO and the Governor.

(1) At a minimum, the MPA boundaries shall encompass the entire existing urbanized area (as defined by the Bureau of the Census) plus the contiguous area expected to become urbanized within a 20-year forecast period for the metropolitan transportation plan.

(2) The MPA boundaries may be further expanded to encompass the entire metropolitan statistical area or combined statistical area, as defined by the Office of Management and Budget.

(b) An MPO that serves an urbanized area designated as a nonattainment area for ozone or carbon monoxide under the Clean Air Act (42 U.S.C. 7401 *et seq.*) as of August 10, 2005, shall retain the MPA boundary that existed on August 10, 2005. The MPA boundaries for such MPOs may only be adjusted by agreement of the Governor and the affected MPO in accordance with the redesignation procedures described in § 450.310(h). The MPA boundary for an MPO that serves an urbanized area designated as a nonattainment area for ozone or carbon monoxide under the Clean Air Act (42 U.S.C. 7401 *et seq.*) after August 10, 2005, may be established to coincide with the designated boundaries of the ozone and/or carbon monoxide nonattainment area, in accordance with the requirements in § 450.310(b).

(c) An MPA boundary may encompass more than one urbanized area.

(d) MPA boundaries may be established to coincide with the geography of regional economic development and growth forecasting areas.

(e) Identification of new urbanized areas within an existing metropolitan planning area by the Bureau of the Census shall not require redesignation of the existing MPO.

(f) Where the boundaries of the urbanized area or MPA extend across two or more States, the Governors with responsibility for a portion of the multistate area, the appropriate MPO(s), and the public transportation operator(s) are strongly encouraged to coordinate transportation planning for the entire multistate area.

(g) The MPA boundaries shall not overlap with each other.

(h) Where part of an urbanized area served by one MPO extends into an adjacent MPA, the MPOs shall, at a minimum, establish written agreements that clearly identify areas of coordination and the division of transportation planning responsibilities among and between the MPOs. Alternatively, the MPOs may adjust their existing boundaries so that the entire urbanized area lies within only one MPA. Boundary adjustments that change the composition of the MPO may require redesignation of one or more such MPOs.

(i) The MPO (in cooperation with the State and public transportation operator(s)) shall review the MPA boundaries after each Census to determine if existing MPA boundaries meet the minimum statutory requirements for new and updated urbanized area(s), and shall adjust them as necessary. As appropriate, additional adjustments should be made to reflect the most comprehensive boundary to foster an effective planning process that ensures connectivity between modes, improves access to modal systems, and promotes efficient overall transportation investment strategies.

(j) Following MPA boundary approval by the MPO and the Governor, the MPA boundary descriptions shall be provided for informational purposes to the FHWA and the FTA. The MPA boundary descriptions shall be submitted either as a geo-spatial database or described in sufficient detail to enable the boundaries to be accurately delineated on a map.

§ 450.314 Metropolitan planning agreements.

(a) The MPO, the State(s), and the providers of public transportation shall cooperatively determine their mutual responsibilities in carrying out the metropolitan transportation planning process. These responsibilities shall be clearly identified in written agreements among the MPO, the State(s), and the providers of public transportation serving the MPA. To the extent possible, a single agreement between all responsible parties should be developed. The written agreement(s) shall include specific provisions for the development of financial plans that support the metropolitan transportation plan (see § 450.324) and the metropolitan TIP (see § 450.326), and development of the annual listing of obligated projects (see § 450.334).

(b) The MPO, the State(s), and the providers of public transportation should periodically review and update the agreement, as appropriate, to reflect effective changes.

(c) If the MPA does not include the entire nonattainment or maintenance area, there shall be a written agreement among the State department of transportation, State air quality agency, affected local agencies, and the MPO describing the process for cooperative planning and analysis of all projects outside the MPA within the nonattainment or maintenance area. The agreement must also indicate how the total transportation-related emissions for the nonattainment or maintenance area, including areas outside the MPA, will be treated for the purposes of determining conformity in accordance with the EPA's transportation conformity regulations (40 CFR part 93, subpart A). The agreement shall address policy mechanisms for resolving conflicts concerning transportation-related emissions that may arise between the MPA and the portion of the nonattainment or maintenance area outside the MPA.

(d) In nonattainment or maintenance areas, if the MPO is not the designated agency for air quality planning under section 174 of the Clean Air Act (42

U.S.C. 7504), there shall be a written agreement between the MPO and the designated air quality planning agency describing their respective roles and responsibilities for air quality related transportation planning.

(e) If more than one MPO has been designated to serve an urbanized area, there shall be a written agreement among the MPOs, the State(s), and the public transportation operator(s) describing how the metropolitan transportation planning processes will be coordinated to assure the development of consistent metropolitan transportation plans and TIPs across the MPA boundaries, particularly in cases in which a proposed transportation investment extends across the boundaries of more than one MPA. If any part of the urbanized area is a nonattainment or maintenance area, the agreement also shall include State and local air quality agencies. The metropolitan transportation planning processes for affected MPOs should, to the maximum extent possible, reflect coordinated data collection, analysis, and planning assumptions across the MPAs. Alternatively, a single metropolitan transportation plan and/or TIP for the entire urbanized area may be developed jointly by the MPOs in cooperation with their respective planning partners. Coordination efforts and outcomes shall be documented in subsequent transmittals of the UPWP and other planning products, including the metropolitan transportation plan and TIP, to the State(s), the FHWA, and the FTA.

(f) Where the boundaries of the urbanized area or MPA extend across two or more States, the Governors with responsibility for a portion of the multistate area, the appropriate MPO(s), and the public transportation operator(s) shall coordinate transportation planning for the entire multistate area. States involved in such multistate transportation planning may:

(1) Enter into agreements or compacts, not in conflict with any law of the United States, for cooperative efforts and mutual assistance in support of activities authorized under this section as the activities pertain to interstate areas and localities within the States; and

(2) Establish such agencies, joint or otherwise, as the States may determine desirable for making the agreements and compacts effective.

(g) If part of an urbanized area that has been designated as a TMA overlaps into an adjacent MPA serving an urbanized area that is not designated as a TMA, the adjacent urbanized area shall not be treated as a TMA. However, a written agreement shall be established between the MPOs with MPA boundaries including a portion of the TMA, which clearly identifies the roles and responsibilities of each MPO in meeting specific TMA requirements (*e.g.,* congestion management process, Surface Transportation Program funds suballocated to the urbanized area over 200,000 population, and project selection).

(h)(1) The MPO(s), State(s), and the providers of public transportation shall jointly agree upon and develop specific written provisions for cooperatively developing and sharing information related to transportation performance data, the selection of performance targets, the reporting of performance targets, the reporting of performance to be used in tracking progress toward attainment of critical outcomes for the region of the MPO (see § 450.306(d)), and the collection of data for the State asset management plan for the NHS for each of the following circumstances:

(i) When one MPO serves an urbanized area,

(ii) When more than one MPO serves an urbanized area, and

(iii) When an urbanized area that has been designated as a TMA overlaps into an adjacent MPA serving an urbanized area that is not a TMA.

(2) These provisions shall be documented either:

(i) As part of the metropolitan planning agreements required under (a), (e), and (g) of this section, or

(ii) Documented in some other means outside of the metropolitan planning agreements as determined cooperatively by the MPO(s), State(s), and providers of public transportation.

§ 450.316 Interested parties, participation, and consultation.

(a) The MPO shall develop and use a documented participation plan that defines a process for providing individuals, affected public agencies, representatives of public transportation employees, public ports, freight shippers, providers of freight transportation services, private providers of transportation (including intercity bus operators, employer-based commuting programs, such as carpool program, vanpool program, transit benefit program, parking cash-out program, shuttle program, or telework program), representatives of users of public transportation, representatives of users of pedestrian walkways and bicycle transportation facilities, representatives of the disabled, and other interested parties with reasonable opportunities to be involved in the metropolitan transportation planning process.

(1) The MPO shall develop the participation plan in consultation with all interested parties and shall, at a minimum, describe explicit procedures, strategies, and desired outcomes for:

(i) Providing adequate public notice of public participation activities and time for public review and comment at key decision points, including a reasonable opportunity to comment on the proposed metropolitan transportation plan and the TIP;

(ii) Providing timely notice and reasonable access to information about transportation issues and processes;

(iii) Employing visualization techniques to describe metropolitan transportation plans and TIPs;

(iv) Making public information (technical information and meeting notices) available in electronically accessible formats and means, such as the World Wide Web;

(v) Holding any public meetings at convenient and accessible locations and times;

(vi) Demonstrating explicit consideration and response to public input received during the development of the metropolitan transportation plan and the TIP;

(vii) Seeking out and considering the needs of those traditionally underserved by existing transportation systems, such as low-income and minority households, who may face challenges accessing employment and other services;

(viii) Providing an additional opportunity for public comment, if the final metropolitan transportation plan or TIP differs significantly from the version that was made available for public comment by the MPO and raises new material issues that interested parties could not reasonably have foreseen from the public involvement efforts;

(ix) Coordinating with the statewide transportation planning public involvement and consultation processes under subpart B of this part; and

(x) Periodically reviewing the effectiveness of the procedures and strategies contained in the participation plan to ensure a full and open participation process.

(2) When significant written and oral comments are received on the draft metropolitan transportation plan and TIP (including the financial plans) as a result of the participation process in this section or the interagency consultation process required under the EPA transportation conformity regulations (40 CFR part 93, subpart A), a summary, analysis, and report on the disposition of comments shall be made as part of

the final metropolitan transportation plan and TIP.

(3) A minimum public comment period of 45 calendar days shall be provided before the initial or revised participation plan is adopted by the MPO. Copies of the approved participation plan shall be provided to the FHWA and the FTA for informational purposes and shall be posted on the World Wide Web, to the maximum extent practicable.

(b) In developing metropolitan transportation plans and TIPs, the MPO should consult with agencies and officials responsible for other planning activities within the MPA that are affected by transportation (including State and local planned growth, economic development, tourism, natural disaster risk reduction, environmental protection, airport operations, or freight movements) or coordinate its planning process (to the maximum extent practicable) with such planning activities. In addition, the MPO shall develop the metropolitan transportation plans and TIPs with due consideration of other related planning activities within the metropolitan area, and the process shall provide for the design and delivery of transportation services within the area that are provided by:

(1) Recipients of assistance under title 49 U.S.C. Chapter 53;

(2) Governmental agencies and non-profit organizations (including representatives of the agencies and organizations) that receive Federal assistance from a source other than the U.S. Department of Transportation to provide non-emergency transportation services; and

(3) Recipients of assistance under 23 U.S.C. 201–204.

(c) When the MPA includes Indian Tribal lands, the MPO shall appropriately involve the Indian Tribal government(s) in the development of the metropolitan transportation plan and the TIP.

(d) When the MPA includes Federal public lands, the MPO shall appropriately involve the Federal land management agencies in the development of the metropolitan transportation plan and the TIP.

(e) MPOs shall, to the extent practicable, develop a documented process(es) that outlines roles, responsibilities, and key decision points for consulting with other governments and agencies, as defined in paragraphs (b), (c), and (d) of this section, which may be included in the agreement(s) developed under § 450.314.

§ 450.318 Transportation planning studies and project development.

(a) Pursuant to section 1308 of the Transportation Equity Act for the 21st Century, TEA–21 (Pub. L. 105–178), an MPO(s), State(s), or public transportation operator(s) may undertake a multimodal, systems-level corridor or subarea planning study as part of the metropolitan transportation planning process. To the extent practicable, development of these transportation planning studies shall involve consultation with, or joint efforts among, the MPO(s), State(s), and/or public transportation operator(s). The results or decisions of these transportation planning studies may be used as part of the overall project development process consistent with the National Environmental Policy Act (NEPA) of 1969 (42 U.S.C. 4321 *et seq.*) and associated implementing regulations (23 CFR part 771 and 40 CFR parts 1500–1508). Specifically, these corridor or subarea studies may result in producing any of the following for a proposed transportation project:

(1) Purpose and need or goals and objective statement(s);

(2) General travel corridor and/or general mode(s) definition (*e.g.,* highway, transit, or a highway/transit combination);

(3) Preliminary screening of alternatives and elimination of unreasonable alternatives;

(4) Basic description of the environmental setting; and/or

(5) Preliminary identification of environmental impacts and environmental mitigation.

(b) Publicly available documents or other source material produced by, or in support of, the transportation planning process described in this subpart may be incorporated directly or by reference into subsequent NEPA documents, in accordance with 40 CFR 1502.21, if:

(1) The NEPA lead agencies agree that such incorporation will aid in establishing or evaluating the purpose and need for the Federal action, reasonable alternatives, cumulative or other impacts on the human and natural environment, or mitigation of these impacts; and

(2) The systems-level, corridor, or subarea planning study is conducted with:

(i) Involvement of interested State, local, Tribal, and Federal agencies;

(ii) Public review;

(iii) Reasonable opportunity to comment during the metropolitan transportation planning process and development of the corridor or subarea planning study;

(iv) Documentation of relevant decisions in a form that is identifiable and available for review during the NEPA scoping process and can be appended to or referenced in the NEPA document; and

(v) The review of the FHWA and the FTA, as appropriate.

(c) By agreement of the NEPA lead agencies, the above integration may be accomplished through tiering (as described in 40 CFR 1502.20), incorporating the subarea or corridor planning study into the draft Environmental Impact Statement (EIS) or Environmental Assessment, or other means that the NEPA lead agencies deem appropriate.

(d) Additional information to further explain the linkages between the transportation planning and project development/NEPA processes is contained in Appendix A to this part, including an explanation that it is non-binding guidance material. The guidance in Appendix A applies only to paragraphs (a)–(c) in this section.

(e) In addition to the process for incorporation directly or by reference outlined in paragraph (b) of this section, an additional authority for integrating planning products into the environmental review process exists in 23 U.S.C. 168. As provided in 23 U.S.C. 168(f):

(1) The statutory authority in 23 U.S.C. 168 shall not be construed to limit in any way the continued use of processes established under other parts of this section or under an authority established outside of this part, and the use of one of the processes in this section does not preclude the subsequent use of another process in this section or an authority outside of this part.

(2) The statute does not restrict the initiation of the environmental review process during planning.

§ 450.320 Development of programmatic mitigation plans.

(a) An MPO may utilize the optional framework in this section to develop programmatic mitigation plans as part of the metropolitan transportation planning process to address the potential environmental impacts of future transportation projects. The MPO, in consultation with the FHWA and/or the FTA and with the agency or agencies with jurisdiction and special expertise over the resources being addressed in the plan, will determine:

(1) *Scope.* (i) An MPO may develop a programmatic mitigation plan on a local, regional, ecosystem, watershed, statewide or similar scale.

(ii) The plan may encompass multiple environmental resources within a defined geographic area(s) or may focus on a specific type(s) of resource(s) such as aquatic resources, parkland, or wildlife habitat.

(iii) The plan may address or consider impacts from all projects in a defined geographic area(s) or may focus on a specific type(s) of project(s).

(2) *Contents.* The programmatic mitigation plan may include:

(i) An assessment of the existing condition of natural and human environmental resources within the area covered by the plan, including an assessment of historic and recent trends and/or any potential threats to those resources.

(ii) An identification of economic, social, and natural and human environmental resources within the geographic area that may be impacted and considered for mitigation. Examples of these resources include wetlands, streams, rivers, stormwater, parklands, cultural resources, historic resources, farmlands, archeological resources, threatened or endangered species, and critical habitat. This may include the identification of areas of high conservation concern or value and thus worthy of avoidance.

(iii) An inventory of existing or planned environmental resource banks for the impacted resource categories such as wetland, stream, stormwater, habitat, species, and an inventory of federally, State, or locally approved in-lieu-of-fee programs.

(iv) An assessment of potential opportunities to improve the overall quality of the identified environmental resources through strategic mitigation for impacts of transportation projects which may include the prioritization of parcels or areas for acquisition and/or potential resource banking sites.

(v) An adoption or development of standard measures or operating procedures for mitigating certain types of impacts; establishment of parameters for determining or calculating appropriate mitigation for certain types of impacts, such as mitigation ratios, or criteria for determining appropriate mitigation sites.

(vi) Adaptive management procedures, such as protocols or procedures that involve monitoring actual impacts against predicted impacts over time and adjusting mitigation measures in response to information gathered through the monitoring.

(vii) Acknowledgement of specific statutory or regulatory requirements that must be satisfied when determining appropriate mitigation for certain types of resources.

(b) A MPO may adopt a programmatic mitigation plan developed pursuant to paragraph (a), or developed pursuant to an alternative process as provided for in paragraph (f) of this section through the following process:

(1) Consult with each agency with jurisdiction over the environmental resources considered in the programmatic mitigation plan;

(2) Make available a draft of the programmatic mitigation plan for review and comment by appropriate environmental resource agencies and the public;

(3) Consider comments received from such agencies and the public on the draft plan; and

(4) Address such comments in the final programmatic mitigation plan.

(c) A programmatic mitigation plan may be integrated with other plans, including watershed plans, ecosystem plans, species recovery plans, growth management plans, State Wildlife Action Plans, and land use plans.

(d) If a programmatic mitigation plan has been adopted pursuant to paragraph (b), any Federal agency responsible for environmental reviews, permits, or approvals for a transportation project shall give substantial weight to the recommendations in the programmatic mitigation plan when carrying out its responsibilities under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*) (NEPA) or other Federal environmental law.

(e) Nothing in this section limits the use of programmatic approaches for reviews under NEPA.

(f) Nothing in this section prohibits the development, as part of or separate from the transportation planning process, of a programmatic mitigation plan independent of the framework described in paragraph (a) of this section. Further, nothing in this section prohibits the adoption of a programmatic mitigation plan in the metropolitan planning process that was developed under another authority, independent of the framework described in paragraph (a).

§ 450.322 Congestion management process in transportation management areas.

(a) The transportation planning process in a TMA shall address congestion management through a process that provides for safe and effective integrated management and operation of the multimodal transportation system, based on a cooperatively developed and implemented metropolitan-wide strategy, of new and existing transportation facilities eligible for funding under title 23 U.S.C. and title 49 U.S.C. Chapter 53 through the use of travel demand reduction (including intercity bus operators, employer-based commuting programs such as a carpool program, vanpool program, transit benefit program, parking cash-out program, shuttle program, or telework program), job access projects, and operational management strategies.

(b) The development of a congestion management process should result in multimodal system performance measures and strategies that can be reflected in the metropolitan transportation plan and the TIP.

(c) The level of system performance deemed acceptable by State and local transportation officials may vary by type of transportation facility, geographic location (metropolitan area or subarea), and/or time of day. In addition, consideration should be given to strategies that manage demand, reduce single occupant vehicle (SOV) travel, improve transportation system management and operations, and improve efficient service integration within and across modes, including highway, transit, passenger and freight rail operations, and non-motorized transport. Where the addition of general purpose lanes is determined to be an appropriate congestion management strategy, explicit consideration is to be given to the incorporation of appropriate features into the SOV project to facilitate future demand management strategies and operational improvements that will maintain the functional integrity and safety of those lanes.

(d) The congestion management process shall be developed, established, and implemented as part of the metropolitan transportation planning process that includes coordination with transportation system management and operations activities. The congestion management process shall include:

(1) Methods to monitor and evaluate the performance of the multimodal transportation system, identify the underlying causes of recurring and non-recurring congestion, identify and evaluate alternative strategies, provide information supporting the implementation of actions, and evaluate the effectiveness of implemented actions;

(2) Definition of congestion management objectives and appropriate performance measures to assess the extent of congestion and support the evaluation of the effectiveness of congestion reduction and mobility enhancement strategies for the

movement of people and goods. Since levels of acceptable system performance may vary among local communities, performance measures should be tailored to the specific needs of the area and established cooperatively by the State(s), affected MPO(s), and local officials in consultation with the operators of major modes of transportation in the coverage area, including providers of public transportation;

(3) Establishment of a coordinated program for data collection and system performance monitoring to define the extent and duration of congestion, to contribute in determining the causes of congestion, and evaluate the efficiency and effectiveness of implemented actions. To the extent possible, this data collection program should be coordinated with existing data sources (including archived operational/ITS data) and coordinated with operations managers in the metropolitan area;

(4) Identification and evaluation of the anticipated performance and expected benefits of appropriate congestion management strategies that will contribute to the more effective use and improved safety of existing and future transportation systems based on the established performance measures. The following categories of strategies, or combinations of strategies, are some examples of what should be appropriately considered for each area:

(i) Demand management measures, including growth management, and congestion pricing;

(ii) Traffic operational improvements;

(iii) Public transportation improvements;

(iv) ITS technologies as related to the regional ITS architecture; and

(v) Where necessary, additional system capacity.

(5) Identification of an implementation schedule, implementation responsibilities, and possible funding sources for each strategy (or combination of strategies) proposed for implementation; and

(6) Implementation of a process for periodic assessment of the effectiveness of implemented strategies, in terms of the area's established performance measures. The results of this evaluation shall be provided to decision makers and the public to provide guidance on selection of effective strategies for future implementation.

(e) In a TMA designated as nonattainment area for ozone or carbon monoxide pursuant to the Clean Air Act, Federal funds may not be programmed for any project that will result in a significant increase in the carrying capacity for SOVs (*i.e.,* a new general purpose highway on a new location or adding general purpose lanes, with the exception of safety improvements or the elimination of bottlenecks), unless the project is addressed through a congestion management process meeting the requirements of this section.

(f) In TMAs designated as nonattainment for ozone or carbon monoxide, the congestion management process shall provide an appropriate analysis of reasonable (including multimodal) travel demand reduction and operational management strategies for the corridor in which a project that will result in a significant increase in capacity for SOVs (as described in paragraph (d) of this section) is proposed to be advanced with Federal funds. If the analysis demonstrates that travel demand reduction and operational management strategies cannot fully satisfy the need for additional capacity in the corridor and additional SOV capacity is warranted, then the congestion management process shall identify all reasonable strategies to manage the SOV facility safely and effectively (or to facilitate its management in the future). Other travel demand reduction and operational management strategies appropriate for the corridor, but not appropriate for incorporation into the SOV facility itself, shall also be identified through the congestion management process. All identified reasonable travel demand reduction and operational management strategies shall be incorporated into the SOV project or committed to by the State and MPO for implementation.

(g) State laws, rules, or regulations pertaining to congestion management systems or programs may constitute the congestion management process, if the FHWA and the FTA find that the State laws, rules, or regulations are consistent with, and fulfill the intent of, the purposes of 23 U.S.C. 134 and 49 U.S.C. 5303.

(h) *Congestion management plan.* A MPO serving a TMA may develop a plan that includes projects and strategies that will be considered in the TIP of such MPO.

(1) Such plan shall:

(i) Develop regional goals to reduce vehicle miles traveled during peak commuting hours and improve transportation connections between areas with high job concentration and areas with high concentrations of low-income households;

(ii) Identify existing public transportation services, employer based commuter programs, and other existing transportation services that support access to jobs in the region; and

(iii) Identify proposed projects and programs to reduce congestion and increase job access opportunities.

(2) In developing the congestion management plan, an MPO shall consult with employers, private and nonprofit providers of public transportation, transportation management organizations, and organizations that provide job access reverse commute projects or job-related services to low-income individuals.

§ 450.324 Development and content of the metropolitan transportation plan.

(a) The metropolitan transportation planning process shall include the development of a transportation plan addressing no less than a 20-year planning horizon as of the effective date. In formulating the transportation plan, the MPO shall consider factors described in § 450.306 as the factors relate to a minimum 20-year forecast period. In nonattainment and maintenance areas, the effective date of the transportation plan shall be the date of a conformity determination issued by the FHWA and the FTA. In attainment areas, the effective date of the transportation plan shall be its date of adoption by the MPO.

(b) The transportation plan shall include both long-range and short-range strategies/actions that provide for the development of an integrated multimodal transportation system (including accessible pedestrian walkways and bicycle transportation facilities) to facilitate the safe and efficient movement of people and goods in addressing current and future transportation demand.

(c) The MPO shall review and update the transportation plan at least every 4 years in air quality nonattainment and maintenance areas and at least every 5 years in attainment areas to confirm the transportation plan's validity and consistency with current and forecasted transportation and land use conditions and trends and to extend the forecast period to at least a 20-year planning horizon. In addition, the MPO may revise the transportation plan at any time using the procedures in this section without a requirement to extend the horizon year. The MPO shall approve the transportation plan (and any revisions) and submit it for information purposes to the Governor. Copies of any updated or revised transportation plans must be provided to the FHWA and the FTA.

(d) In metropolitan areas that are in nonattainment for ozone or carbon monoxide, the MPO shall coordinate the development of the metropolitan transportation plan with the process for

developing transportation control measures (TCMs) in a State Implementation Plan (SIP).

(e) The MPO, the State(s), and the public transportation operator(s) shall validate data used in preparing other existing modal plans for providing input to the transportation plan. In updating the transportation plan, the MPO shall base the update on the latest available estimates and assumptions for population, land use, travel, employment, congestion, and economic activity. The MPO shall approve transportation plan contents and supporting analyses produced by a transportation plan update.

(f) The metropolitan transportation plan shall, at a minimum, include:

(1) The current and projected transportation demand of persons and goods in the metropolitan planning area over the period of the transportation plan;

(2) Existing and proposed transportation facilities (including major roadways, public transportation facilities, intercity bus facilities, multimodal and intermodal facilities, nonmotorized transportation facilities (*e.g.,* pedestrian walkways and bicycle facilities), and intermodal connectors) that should function as an integrated metropolitan transportation system, giving emphasis to those facilities that serve important national and regional transportation functions over the period of the transportation plan.

(3) A description of the performance measures and performance targets used in assessing the performance of the transportation system in accordance with § 450.306(d).

(4) A system performance report and subsequent updates evaluating the condition and performance of the transportation system with respect to the performance targets described in § 450.306(d), including—

(i) Progress achieved by the metropolitan planning organization in meeting the performance targets in comparison with system performance recorded in previous reports, including baseline data; and

(ii) For metropolitan planning organizations that voluntarily elect to develop multiple scenarios, an analysis of how the preferred scenario has improved the conditions and performance of the transportation system and how changes in local policies and investments have impacted the costs necessary to achieve the identified performance targets.

(5) Operational and management strategies to improve the performance of existing transportation facilities to relieve vehicular congestion and maximize the safety and mobility of people and goods;

(6) Consideration of the results of the congestion management process in TMAs that meet the requirements of this subpart, including the identification of SOV projects that result from a congestion management process in TMAs that are nonattainment for ozone or carbon monoxide.

(7) Assessment of capital investment and other strategies to preserve the existing and projected future metropolitan transportation infrastructure, provide for multimodal capacity increases based on regional priorities and needs, and reduce the vulnerability of the existing transportation infrastructure to natural disasters. The metropolitan transportation plan may consider projects and strategies that address areas or corridors where current or projected congestion threatens the efficient functioning of key elements of the metropolitan area's transportation system.

(8) Transportation and transit enhancement activities, including consideration of the role that intercity buses may play in reducing congestion, pollution, and energy consumption in a cost-effective manner and strategies and investments that preserve and enhance intercity bus systems, including systems that are privately owned and operated, and including transportation alternatives, as defined in 23 U.S.C. 101(a), and associated transit improvements, as described in 49 U.S.C. 5302(a), as appropriate;

(9) Design concept and design scope descriptions of all existing and proposed transportation facilities in sufficient detail, regardless of funding source, in nonattainment and maintenance areas for conformity determinations under the EPA's transportation conformity regulations (40 CFR part 93, subpart A). In all areas (regardless of air quality designation), all proposed improvements shall be described in sufficient detail to develop cost estimates;

(10) A discussion of types of potential environmental mitigation activities and potential areas to carry out these activities, including activities that may have the greatest potential to restore and maintain the environmental functions affected by the metropolitan transportation plan. The discussion may focus on policies, programs, or strategies, rather than at the project level. The MPO shall develop the discussion in consultation with applicable Federal, State, and Tribal land management, wildlife, and regulatory agencies. The MPO may establish reasonable timeframes for performing this consultation;

(11) A financial plan that demonstrates how the adopted transportation plan can be implemented.

(i) For purposes of transportation system operations and maintenance, the financial plan shall contain system-level estimates of costs and revenue sources that are reasonably expected to be available to adequately operate and maintain the Federal-aid highways (as defined by 23 U.S.C. 101(a)(5)) and public transportation (as defined by title 49 U.S.C. Chapter 53).

(ii) For the purpose of developing the metropolitan transportation plan, the MPO, public transportation operator(s), and State shall cooperatively develop estimates of funds that will be available to support metropolitan transportation plan implementation, as required under § 450.314(a). All necessary financial resources from public and private sources that are reasonably expected to be made available to carry out the transportation plan shall be identified.

(iii) The financial plan shall include recommendations on any additional financing strategies to fund projects and programs included in the metropolitan transportation plan. In the case of new funding sources, strategies for ensuring their availability shall be identified. The financial plan may include an assessment of the appropriateness of innovative finance techniques (for example, tolling, pricing, bonding, public private partnerships, or other strategies) as revenue sources for projects in the plan.

(iv) In developing the financial plan, the MPO shall take into account all projects and strategies proposed for funding under title 23 U.S.C., title 49 U.S.C. Chapter 53 or with other Federal funds; State assistance; local sources; and private participation. Revenue and cost estimates that support the metropolitan transportation plan must use an inflation rate(s) to reflect ''year of expenditure dollars,'' based on reasonable financial principles and information, developed cooperatively by the MPO, State(s), and public transportation operator(s).

(v) For the outer years of the metropolitan transportation plan (*i.e.,* beyond the first 10 years), the financial plan may reflect aggregate cost ranges/cost bands, as long as the future funding source(s) is reasonably expected to be available to support the projected cost ranges/cost bands.

(vi) For nonattainment and maintenance areas, the financial plan shall address the specific financial strategies required to ensure the

implementation of TCMs in the applicable SIP.

(vii) For illustrative purposes, the financial plan may include additional projects that would be included in the adopted transportation plan if additional resources beyond those identified in the financial plan were to become available.

(viii) In cases that the FHWA and the FTA find a metropolitan transportation plan to be fiscally constrained and a revenue source is subsequently removed or substantially reduced (*i.e.,* by legislative or administrative actions), the FHWA and the FTA will not withdraw the original determination of fiscal constraint; however, in such cases, the FHWA and the FTA will not act on an updated or amended metropolitan transportation plan that does not reflect the changed revenue situation.

(12) Pedestrian walkway and bicycle transportation facilities in accordance with 23 U.S.C. 217(g).

(g) The MPO shall consult, as appropriate, with State and local agencies responsible for land use management, natural resources, environmental protection, conservation, and historic preservation concerning the development of the transportation plan. The consultation shall involve, as appropriate:

(1) Comparison of transportation plans with State conservation plans or maps, if available; or

(2) Comparison of transportation plans to inventories of natural or historic resources, if available.

(h) The metropolitan transportation plan should integrate the priorities, goals, countermeasures, strategies, or projects for the metropolitan planning area contained in the HSIP, including the SHSP required under 23 U.S.C. 148, the Public Transportation Agency Safety Plan required under 49 U.S.C. 5329(d), or an Interim Agency Safety Plan in accordance with 49 CFR part 659, as in effect until completion of the Public Transportation Agency Safety Plan, and may incorporate or reference applicable emergency relief and disaster preparedness plans and strategies and policies that support homeland security, as appropriate, to safeguard the personal security of all motorized and non-motorized users.

(i) An MPO may, while fitting the needs and complexity of its community, voluntarily elect to develop multiple scenarios for consideration as part of the development of the metropolitan transportation plan.

(1) An MPO that chooses to develop multiple scenarios under this paragraph (i) is encouraged to consider:

(i) Potential regional investment strategies for the planning horizon;

(ii) Assumed distribution of population and employment;

(iii) A scenario that, to the maximum extent practicable, maintains baseline conditions for the performance areas identified in § 450.306(d) and measures established under 23 CFR part 490;

(iv) A scenario that improves the baseline conditions for as many of the performance measures identified in § 450.306(d) as possible;

(v) Revenue constrained scenarios based on the total revenues expected to be available over the forecast period of the plan; and

(vi) Estimated costs and potential revenues available to support each scenario.

(2) In addition to the performance areas identified in 23 U.S.C. 150(c), 49 U.S.C. 5326(c), and 5329(d), and the measures established under 23 CFR part 490, MPOs may evaluate scenarios developed under this paragraph using locally developed measures.

(j) The MPO shall provide individuals, affected public agencies, representatives of public transportation employees, public ports, freight shippers, providers of freight transportation services, private providers of transportation (including intercity bus operators, employer-based commuting programs, such as carpool program, vanpool program, transit benefit program, parking cashout program, shuttle program, or telework program), representatives of users of public transportation, representatives of users of pedestrian walkways and bicycle transportation facilities, representatives of the disabled, and other interested parties with a reasonable opportunity to comment on the transportation plan using the participation plan developed under § 450.316(a).

(k) The MPO shall publish or otherwise make readily available the metropolitan transportation plan for public review, including (to the maximum extent practicable) in electronically accessible formats and means, such as the World Wide Web.

(l) A State or MPO is not required to select any project from the illustrative list of additional projects included in the financial plan under paragraph (f)(11) of this section.

(m) In nonattainment and maintenance areas for transportation-related pollutants, the MPO, as well as the FHWA and the FTA, must make a conformity determination on any updated or amended transportation plan in accordance with the Clean Air Act and the EPA transportation conformity regulations (40 CFR part 93, subpart A). A 12-month conformity lapse grace period will be implemented when an area misses an applicable deadline, in accordance with the Clean Air Act and the transportation conformity regulations (40 CFR part 93, subpart A). At the end of this 12-month grace period, the existing conformity determination will lapse. During a conformity lapse, MPOs can prepare an interim metropolitan transportation plan as a basis for advancing projects that are eligible to proceed under a conformity lapse. An interim metropolitan transportation plan consisting of eligible projects from, or consistent with, the most recent conforming transportation plan and TIP may proceed immediately without revisiting the requirements of this section, subject to interagency consultation defined in 40 CFR part 93, subpart A. An interim metropolitan transportation plan containing eligible projects that are not from, or consistent with, the most recent conforming transportation plan and TIP must meet all the requirements of this section.

§ 450.326 Development and content of the transportation improvement program (TIP).

(a) The MPO, in cooperation with the State(s) and any affected public transportation operator(s), shall develop a TIP for the metropolitan planning area. The TIP shall reflect the investment priorities established in the current metropolitan transportation plan and shall cover a period of no less than 4 years, be updated at least every 4 years, and be approved by the MPO and the Governor. However, if the TIP covers more than 4 years, the FHWA and the FTA will consider the projects in the additional years as informational. The MPO may update the TIP more frequently, but the cycle for updating the TIP must be compatible with the STIP development and approval process. The TIP expires when the FHWA/FTA approval of the STIP expires. Copies of any updated or revised TIPs must be provided to the FHWA and the FTA. In nonattainment and maintenance areas subject to transportation conformity requirements, the FHWA and the FTA, as well as the MPO, must make a conformity determination on any updated or amended TIP, in accordance with the Clean Air Act requirements and the EPA's transportation conformity regulations (40 CFR part 93, subpart A).

(b) The MPO shall provide all interested parties with a reasonable opportunity to comment on the proposed TIP as required by § 450.316(a). In addition, in

nonattainment area TMAs, the MPO shall provide at least one formal public meeting during the TIP development process, which should be addressed through the participation plan described in § 450.316(a). In addition, the MPO shall publish or otherwise make readily available the TIP for public review, including (to the maximum extent practicable) in electronically accessible formats and means, such as the World Wide Web, as described in § 450.316(a).

(c) The TIP shall be designed such that once implemented, it makes progress toward achieving the performance targets established under § 450.306(d).

(d) The TIP shall include, to the maximum extent practicable, a description of the anticipated effect of the TIP toward achieving the performance targets identified in the metropolitan transportation plan, linking investment priorities to those performance targets.

(e) The TIP shall include capital and non-capital surface transportation projects (or phases of projects) within the boundaries of the metropolitan planning area proposed for funding under 23 U.S.C. and 49 U.S.C. Chapter 53 (including transportation alternatives; associated transit improvements; Tribal Transportation Program, Federal Lands Transportation Program, and Federal Lands Access Program projects; HSIP projects; trails projects; accessible pedestrian walkways; and bicycle facilities), except the following that may be included:

(1) Safety projects funded under 23 U.S.C. 402 and 49 U.S.C. 31102;

(2) Metropolitan planning projects funded under 23 U.S.C. 104(d), and 49 U.S.C. 5305(d);

(3) State planning and research projects funded under 23 U.S.C. 505 and 49 U.S.C. 5305(e);

(4) At the discretion of the State and MPO, metropolitan planning projects funded with Surface Transportation Program funds;

(5) Emergency relief projects (except those involving substantial functional, locational, or capacity changes);

(6) National planning and research projects funded under 49 U.S.C. 5314; and

(7) Project management oversight projects funded under 49 U.S.C. 5327.

(f) The TIP shall contain all regionally significant projects requiring an action by the FHWA or the FTA whether or not the projects are to be funded under title 23 U.S.C. Chapters 1 and 2 or title 49 U.S.C. Chapter 53 (*e.g.,* addition of an interchange to the Interstate System with State, local, and/or private funds and congressionally designated projects not funded under 23 U.S.C. or 49 U.S.C. Chapter 53). For public information and conformity purposes, the TIP shall include all regionally significant projects proposed to be funded with Federal funds other than those administered by the FHWA or the FTA, as well as all regionally significant projects to be funded with non-Federal funds.

(g) The TIP shall include, for each project or phase (*e.g.,* preliminary engineering, environment/NEPA, right-of-way, design, or construction), the following:

(1) Sufficient descriptive material (*i.e.,* type of work, termini, and length) to identify the project or phase;

(2) Estimated total project cost, which may extend beyond the 4 years of the TIP;

(3) The amount of Federal funds proposed to be obligated during each program year for the project or phase (for the first year, this includes the proposed category of Federal funds and source(s) of non-Federal funds. For the second, third, and fourth years, this includes the likely category or possible categories of Federal funds and sources of non-Federal funds);

(4) Identification of the agencies responsible for carrying out the project or phase;

(5) In nonattainment and maintenance areas, identification of those projects that are identified as TCMs in the applicable SIP;

(6) In nonattainment and maintenance areas, included projects shall be specified in sufficient detail (design concept and scope) for air quality analysis in accordance with the EPA transportation conformity regulations (40 CFR part 93, subpart A); and

(7) In areas with Americans with Disabilities Act required paratransit and key station plans, identification of those projects that will implement these plans.

(h) Projects that are not considered to be of appropriate scale for individual identification in a given program year may be grouped by function, work type, and/or geographic area using the applicable classifications under 23 CFR 771.117(c) and (d) and/or 40 CFR part 93. In nonattainment and maintenance areas, project classifications must be consistent with the ''exempt project'' classifications contained in the EPA transportation conformity regulations (40 CFR part 93, subpart A). In addition, projects proposed for funding under title 23 U.S.C. Chapter 2 that are not regionally significant may be grouped in one line item or identified individually in the TIP.

(i) Each project or project phase included in the TIP shall be consistent with the approved metropolitan transportation plan.

(j) The TIP shall include a financial plan that demonstrates how the approved TIP can be implemented, indicates resources from public and private sources that are reasonably expected to be made available to carry out the TIP, and recommends any additional financing strategies for needed projects and programs. In developing the TIP, the MPO, State(s), and public transportation operator(s) shall cooperatively develop estimates of funds that are reasonably expected to be available to support TIP implementation in accordance with § 450.314(a). Only projects for which construction or operating funds can reasonably be expected to be available may be included. In the case of new funding sources, strategies for ensuring their availability shall be identified. In developing the financial plan, the MPO shall take into account all projects and strategies funded under title 23 U.S.C., title 49 U.S.C. Chapter 53, and other Federal funds; and regionally significant projects that are not federally funded. For purposes of transportation operations and maintenance, the financial plan shall contain system-level estimates of costs and revenue sources that are reasonably expected to be available to adequately operate and maintain Federal-aid highways (as defined by 23 U.S.C. 101(a)(6)) and public transportation (as defined by title 49 U.S.C. Chapter 53). In addition, for illustrative purposes, the financial plan may include additional projects that would be included in the TIP if reasonable additional resources beyond those identified in the financial plan were to become available. Revenue and cost estimates for the TIP must use an inflation rate(s) to reflect ''year of expenditure dollars,'' based on reasonable financial principles and information, developed cooperatively by the MPO, State(s), and public transportation operator(s).

(k) The TIP shall include a project, or a phase of a project, only if full funding can reasonably be anticipated to be available for the project within the time period contemplated for completion of the project. In nonattainment and maintenance areas, projects included in the first 2 years of the TIP shall be limited to those for which funds are available or committed. For the TIP, financial constraint shall be demonstrated and maintained by year and shall include sufficient financial information to demonstrate which projects are to be implemented using

current and/or reasonably available revenues, while federally supported facilities are being adequately operated and maintained. In the case of proposed funding sources, strategies for ensuring their availability shall be identified in the financial plan consistent with paragraph (h) of this section. In nonattainment and maintenance areas, the TIP shall give priority to eligible TCMs identified in the approved SIP in accordance with the EPA transportation conformity regulations (40 CFR part 93, subpart A) and shall provide for their timely implementation.

(l) In cases that the FHWA and the FTA find a TIP to be fiscally constrained and a revenue source is subsequently removed or substantially reduced (*i.e.,* by legislative or administrative actions), the FHWA and the FTA will not withdraw the original determination of fiscal constraint. However, in such cases, the FHWA and the FTA will not act on an updated or amended TIP that does not reflect the changed revenue situation.

(m) Procedures or agreements that distribute suballocated Surface Transportation Program funds to individual jurisdictions or modes within the MPA by pre-determined percentages or formulas are inconsistent with the legislative provisions that require the MPO, in cooperation with the State and the public transportation operator, to develop a prioritized and financially constrained TIP and shall not be used unless they can be clearly shown to be based on considerations required to be addressed as part of the metropolitan transportation planning process.

(n) As a management tool for monitoring progress in implementing the transportation plan, the TIP should:

(1) Identify the criteria and process for prioritizing implementation of transportation plan elements (including multimodal trade-offs) for inclusion in the TIP and any changes in priorities from previous TIPs;

(2) List major projects from the previous TIP that were implemented and identify any significant delays in the planned implementation of major projects; and

(3) In nonattainment and maintenance areas, describe the progress in implementing any required TCMs, in accordance with 40 CFR part 93.

(o) In metropolitan nonattainment and maintenance areas, a 12-month conformity lapse grace period will be implemented when an area misses an applicable deadline, according to the Clean Air Act and the transportation conformity regulations (40 CFR part 93, subpart A). At the end of this 12-month grace period, the existing conformity determination will lapse. During a conformity lapse, MPOs may prepare an interim TIP as a basis for advancing projects that are eligible to proceed under a conformity lapse. An interim TIP consisting of eligible projects from, or consistent with, the most recent conforming metropolitan transportation plan and TIP may proceed immediately without revisiting the requirements of this section, subject to interagency consultation defined in 40 CFR part 93. An interim TIP containing eligible projects that are not from, or consistent with, the most recent conforming transportation plan and TIP must meet all the requirements of this section.

(p) Projects in any of the first 4 years of the TIP may be advanced in place of another project in the first 4 years of the TIP, subject to the project selection requirements of § 450.332. In addition, the MPO may revise the TIP at any time under procedures agreed to by the State, MPO(s), and public transportation operator(s) consistent with the TIP development procedures established in this section, as well as the procedures for the MPO participation plan (see § 450.316(a)) and FHWA/FTA actions on the TIP (see § 450.330).

§ 450.328 TIP revisions and relationship to the STIP.

(a) An MPO may revise the TIP at any time under procedures agreed to by the cooperating parties consistent with the procedures established in this part for its development and approval. In nonattainment or maintenance areas for transportation-related pollutants, if a TIP amendment involves non-exempt projects (per 40 CFR part 93), or is replaced with an updated TIP, the MPO and the FHWA and the FTA must make a new conformity determination. In all areas, changes that affect fiscal constraint must take place by amendment of the TIP. The MPO shall use public participation procedures consistent with § 450.316(a) in revising the TIP, except that these procedures are not required for administrative modifications.

(b) After approval by the MPO and the Governor, the State shall include the TIP without change, directly or by reference, in the STIP required under 23 U.S.C. 135. In nonattainment and maintenance areas, the FHWA and the FTA must make a conformity finding on the TIP before it is included in the STIP. A copy of the approved TIP shall be provided to the FHWA and the FTA.

(c) The State shall notify the MPO and Federal land management agencies when it has included a TIP including projects under the jurisdiction of these agencies in the STIP.

§ 450.330 TIP action by the FHWA and the FTA.

(a) The FHWA and the FTA shall jointly find that each metropolitan TIP is consistent with the metropolitan transportation plan produced by the continuing and comprehensive transportation process carried on cooperatively by the MPO(s), the State(s), and the public transportation operator(s) in accordance with 23 U.S.C. 134 and 49 U.S.C. 5303. This finding shall be based on the self-certification statement submitted by the State and MPO under § 450.336, a review of the metropolitan transportation plan by the FHWA and the FTA, and upon other reviews as deemed necessary by the FHWA and the FTA.

(b) In nonattainment and maintenance areas, the MPO, as well as the FHWA and the FTA, shall determine conformity of any updated or amended TIP, in accordance with 40 CFR part 93. After the FHWA and the FTA issue a conformity determination on the TIP, the TIP shall be incorporated, without change, into the STIP, directly or by reference.

(c) If an MPO has not updated the metropolitan transportation plan in accordance with the cycles defined in § 450.324(c), projects may only be advanced from a TIP that was approved and found to conform (in nonattainment and maintenance areas) prior to expiration of the metropolitan transportation plan and meets the TIP update requirements of § 450.326(a). Until the MPO approves (in attainment areas) or the FHWA and the FTA issue a conformity determination on (in nonattainment and maintenance areas) the updated metropolitan transportation plan, the MPO may not amend the TIP.

(d) In the case of extenuating circumstances, the FHWA and the FTA will consider and take appropriate action on requests to extend the STIP approval period for all or part of the TIP in accordance with § 450.220(b).

(e) If an illustrative project is included in the TIP, no Federal action may be taken on that project by the FHWA and the FTA until it is formally included in the financially constrained and conforming metropolitan transportation plan and TIP.

(f) Where necessary in order to maintain or establish operations, the FHWA and the FTA may approve highway and transit operating assistance for specific projects or programs, even though the projects or programs may not be included in an approved TIP.

§ 450.332 Project selection from the TIP.

(a) Once a TIP that meets the requirements of 23 U.S.C. 134(j), 49 U.S.C. 5303(j), and § 450.326 has been developed and approved, the first year of the TIP will constitute an ''agreed to'' list of projects for project selection purposes and no further project selection action is required for the implementing agency to proceed with projects, except where the appropriated Federal funds available to the metropolitan planning area are significantly less than the authorized amounts or where there are significant shifting of projects between years. In this case, the MPO, the State, and the public transportation operator(s) if requested by the MPO, the State, or the public transportation operator(s) shall jointly develop a revised ''agreed to'' list of projects. If the State or public transportation operator(s) wishes to proceed with a project in the second, third, or fourth year of the TIP, the specific project selection procedures stated in paragraphs (b) and (c) of this section must be used unless the MPO, the State, and the public transportation operator(s) jointly develop expedited project selection procedures to provide for the advancement of projects from the second, third, or fourth years of the TIP.

(b) In metropolitan areas not designated as TMAs, the State and/or the public transportation operator(s), in cooperation with the MPO shall select projects to be implemented using title 23 U.S.C. funds (other than Tribal Transportation Program, Federal Lands Transportation Program, and Federal Lands Access Program projects) or funds under title 49 U.S.C. Chapter 53, from the approved metropolitan TIP. Tribal Transportation Program, Federal Lands Transportation Program, and Federal Lands Access Program projects shall be selected in accordance with procedures developed pursuant to 23 U.S.C. 201, 202, 203, and 204.

(c) In areas designated as TMAs, the MPO shall select all 23 U.S.C. and 49 U.S.C. Chapter 53 funded projects (excluding projects on the NHS and Tribal Transportation Program, Federal Lands Transportation Program, and Federal Lands Access Program) in consultation with the State and public transportation operator(s) from the approved TIP and in accordance with the priorities in the approved TIP. The State shall select projects on the NHS in cooperation with the MPO, from the approved TIP. Tribal Transportation Program, Federal Lands Transportation Program, and Federal Lands Access Program projects shall be selected in accordance with procedures developed pursuant to 23 U.S.C. 201, 202, 203, and 204.

(d) Except as provided in § 450.326(e) and § 450.330(f), projects not included in the federally approved STIP are not eligible for funding with funds under title 23 U.S.C. or 49 U.S.C. Chapter 53.

(e) In nonattainment and maintenance areas, priority shall be given to the timely implementation of TCMs contained in the applicable SIP in accordance with the EPA transportation conformity regulations (40 CFR part 93, subpart A).

§ 450.334 Annual listing of obligated projects.

(a) In metropolitan planning areas, on an annual basis, no later than 90 calendar days following the end of the program year, the State, public transportation operator(s), and the MPO shall cooperatively develop a listing of projects (including investments in pedestrian walkways and bicycle transportation facilities) for which funds under 23 U.S.C. or 49 U.S.C. Chapter 53 were obligated in the preceding program year.

(b) The listing shall be prepared in accordance with § 450.314(a) and shall include all federally funded projects authorized or revised to increase obligations in the preceding program year, and shall at a minimum include the TIP information under § 450.326(g)(1) and (4) and identify, for each project, the amount of Federal funds requested in the TIP, the Federal funding that was obligated during the preceding year, and the Federal funding remaining and available for subsequent years.

(c) The listing shall be published or otherwise made available in accordance with the MPO's public participation criteria for the TIP.

§ 450.336 Self-certifications and Federal certifications.

(a) For all MPAs, concurrent with the submittal of the entire proposed TIP to the FHWA and the FTA as part of the STIP approval, the State and the MPO shall certify at least every 4 years that the metropolitan transportation planning process is being carried out in accordance with all applicable requirements including:

(1) 23 U.S.C. 134, 49 U.S.C. 5303, and this subpart;

(2) In nonattainment and maintenance areas, sections 174 and 176(c) and (d) of the Clean Air Act, as amended (42 U.S.C. 7504, 7506(c) and (d)) and 40 CFR part 93;

(3) Title VI of the Civil Rights Act of 1964, as amended (42 U.S.C. 2000d–1) and 49 CFR part 21;

(4) 49 U.S.C. 5332, prohibiting discrimination on the basis of race, color, creed, national origin, sex, or age in employment or business opportunity;

(5) Section 1101(b) of the FAST Act (Pub. L. 114–357) and 49 CFR part 26 regarding the involvement of disadvantaged business enterprises in DOT funded projects;

(6) 23 CFR part 230, regarding the implementation of an equal employment opportunity program on Federal and Federal-aid highway construction contracts;

(7) The provisions of the Americans with Disabilities Act of 1990 (42 U.S.C. 12101 *et seq.*) and 49 CFR parts 27, 37, and 38;

(8) The Older Americans Act, as amended (42 U.S.C. 6101), prohibiting discrimination on the basis of age in programs or activities receiving Federal financial assistance;

(9) Section 324 of title 23 U.S.C. regarding the prohibition of discrimination based on gender; and

(10) Section 504 of the Rehabilitation Act of 1973 (29 U.S.C. 794) and 49 CFR part 27 regarding discrimination against individuals with disabilities.

(b) In TMAs, the FHWA and the FTA jointly shall review and evaluate the transportation planning process for each TMA no less than once every 4 years to determine if the process meets the requirements of applicable provisions of Federal law and this subpart.

(1) After review and evaluation of the TMA planning process, the FHWA and FTA shall take one of the following actions:

(i) If the process meets the requirements of this part and the MPO and the Governor have approved a TIP, jointly certify the transportation planning process;

(ii) If the process substantially meets the requirements of this part and the MPO and the Governor have approved a TIP, jointly certify the transportation planning process subject to certain specified corrective actions being taken; or

(iii) If the process does not meet the requirements of this part, jointly certify the planning process as the basis for approval of only those categories of programs or projects that the FHWA and the FTA jointly determine, subject to certain specified corrective actions being taken.

(2) If, upon the review and evaluation conducted under paragraph (b)(1)(iii) of this section, the FHWA and the FTA do not certify the transportation planning process in a TMA, the Secretary may withhold up to 20 percent of the funds attributable to the metropolitan planning area of the MPO for projects

funded under title 23 U.S.C. and title 49 U.S.C. Chapter 53 in addition to corrective actions and funding restrictions. The withheld funds shall be restored to the MPA when the metropolitan transportation planning process is certified by the FHWA and FTA, unless the funds have lapsed.

(3) A certification of the TMA planning process will remain in effect for 4 years unless a new certification determination is made sooner by the FHWA and the FTA or a shorter term is specified in the certification report.

(4) In conducting a certification review, the FHWA and the FTA shall provide opportunities for public involvement within the metropolitan planning area under review. The FHWA and the FTA shall consider the public input received in arriving at a decision on a certification action.

(5) The FHWA and the FTA shall notify the MPO(s), the State(s), and public transportation operator(s) of the actions taken under paragraphs (b)(1) and (b)(2) of this section. The FHWA and the FTA will update the certification status of the TMA when evidence of satisfactory completion of a corrective action(s) is provided to the FHWA and the FTA.

§ 450.338 Applicability of NEPA to metropolitan transportation plans and programs.

Any decision by the Secretary concerning a metropolitan transportation plan or TIP developed through the processes provided for in 23 U.S.C. 134, 49 U.S.C. 5303, and this subpart shall not be considered to be a Federal action subject to review under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*).

§ 450.340 Phase-in of new requirements.

(a) Prior to May 27, 2018, an MPO may adopt a metropolitan transportation plan that has been developed using the SAFETEA–LU requirements or the provisions and requirements of this part. On or after May 27, 2018, an MPO may not adopt a metropolitan transportation plan that has not been developed according to the provisions and requirements of this part.

(b) Prior to May 27, 2018 (2 years after the publication date of this rule), FHWA/FTA may determine the conformity of, or approve as part of a STIP, a TIP that has been developed using SAFETEA–LU requirements or the provisions and requirements of this part. On or after May 27, 2018 (2 years after the publication date of this rule), FHWA/FTA may only determine the conformity of, or approve as part of a STIP, a TIP that has been developed according to the provisions and requirements of this part, regardless of when the MPO developed the TIP.

(c) On and after May 27, 2018 (2 years after the issuance date of this rule), the FHWA and the FTA will take action (*i.e.,* conformity determinations and STIP approvals) on an updated or amended TIP developed under the provisions of this part, even if the MPO has not yet adopted a new metropolitan transportation plan under the provisions of this part, as long as the underlying transportation planning process is consistent with the requirements in the MAP–21.

(d) On or after May 27, 2018 (2 years after the publication date of this rule), an MPO may make an administrative modification to a TIP that conforms to either the SAFETEA–LU or to the provisions and requirements of this part.

(e) Two years from the effective date of each rule establishing performance measures under 23 U.S.C. 150(c), 49 U.S.C. 5326, and 49 U.S.C. 5329 FHWA/FTA will only determine the conformity of, or approve as part of a STIP, a TIP that is based on a metropolitan transportation planning process that meets the performance based planning requirements in this part and in such a rule.

(f) Prior to 2 years from the effective date of each rule establishing performance measures under 23 U.S.C. 150(c), 49 U.S.C. 5326, or 49 U.S.C. 5329, an MPO may adopt a metropolitan transportation plan that has been developed using the SAFETEA–LU requirements or the performance-based planning requirements of this part and in such a rule. Two years on or after the effective date of each rule establishing performance measures under 23 U.S.C. 150(c), 49 U.S.C. 5326, or 49 U.S.C. 5329, an MPO may only adopt a metropolitan transportation plan that has been developed according to the performance-based provisions and requirements of this part and in such a rule.

(g) A newly designated TMA shall implement the congestion management process described in § 450.322 within 18 months of designation.

Appendix A to Part 450—Linking the Transportation Planning and NEPA Processes

Background and Overview

This Appendix provides additional information to explain the linkage between the transportation planning and project development/National Environmental Policy Act (NEPA) processes. It is intended to be non-binding and should not be construed as a rule of general applicability.

For 40 years, the Congress has directed that federally funded highway and transit projects must flow from metropolitan and statewide transportation planning processes (pursuant to 23 U.S.C. 134–135 and 49 U.S.C. 5303–5306). Over the years, the Congress has refined and strengthened the transportation planning process as the foundation for project decisions, emphasizing public involvement, consideration of environmental and other factors, and a Federal role that oversees the transportation planning process but does not second-guess the content of transportation plans and programs.

Despite this statutory emphasis on transportation planning, the environmental analyses produced to meet the requirements of the NEPA of 1969 (42 U.S.C. 4231 *et seq.*) have often been conducted de novo, disconnected from the analyses used to develop long-range transportation plans, statewide and metropolitan Transportation Improvement Programs (STIPs/TIPs), or planning-level corridor/subarea/feasibility studies. When the NEPA and transportation planning processes are not well coordinated, the NEPA process may lead to the development of information that is more appropriately developed in the planning process, resulting in duplication of work and delays in transportation improvements.

The purpose of this Appendix is to change this culture, by supporting congressional intent that statewide and metropolitan transportation planning should be the foundation for highway and transit project decisions. This Appendix was crafted to recognize that transportation planning processes vary across the country. This document provides details on how information, analysis, and products from transportation planning can be incorporated into and relied upon in NEPA documents under existing laws, regardless of when the Notice of Intent has been published. This Appendix presents environmental review as a continuum of sequential study, refinement, and expansion performed in transportation planning and during project development/NEPA, with information developed and conclusions drawn in early stages utilized in subsequent (and more detailed) review stages.

The information below is intended for use by State departments of transportation (State DOTs), metropolitan planning organizations (MPOs), and public transportation operators to clarify the circumstances under which transportation planning level choices and analyses can be adopted or incorporated into the process required by NEPA. Additionally, the FHWA and the FTA will work with Federal environmental, regulatory, and resource agencies to incorporate the principles of this Appendix in their day-to-day NEPA policies and procedures related to their involvement in highway and transit projects.

This Appendix does not extend NEPA requirements to transportation plans and programs. The Transportation Efficiency Act for the 21st Century (TEA–21) and the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA–LU) specifically exempted transportation plans and programs from

NEPA review. Therefore, initiating the NEPA process as part of, or concurrently with, a transportation planning study does not subject transportation plans and programs to NEPA.

Implementation of this Appendix by States, MPOs, and public transportation operators is voluntary. The degree to which studies, analyses, or conclusions from the transportation planning process can be incorporated into the project development/NEPA processes will depend upon how well they meet certain standards established by NEPA regulations and guidance. While some transportation planning processes already meet these standards, others will need some modification.

The remainder of this Appendix document utilizes a ''Question and Answer'' format, organized into three primary categories (''Procedural Issues,'' ''Substantive Issues,'' and ''Administrative Issues'').

I. Procedural Issues

1. In what format should the transportation planning information be included?

To be included in the NEPA process, work from the transportation planning process must be documented in a form that can be appended to the NEPA document or incorporated by reference. Documents may be incorporated by reference if they are readily available so as to not impede agency or public review of the action. Any document incorporated by reference must be ''reasonably available for inspection by potentially interested persons within the time allowed for comment.'' Incorporated materials must be cited in the NEPA document and their contents briefly described, so that the reader understands why the document is cited and knows where to look for further information. To the extent possible, the documentation should be in a form such as official actions by the MPO, State DOT, or public transportation operator and/or correspondence within and among the organizations involved in the transportation planning process.

2. What is a reasonable level of detail for a planning product that is intended to be used in a NEPA document? How does this level of detail compare to what is considered a full NEPA analysis?

For purposes of transportation planning alone, a planning-level analysis does not need to rise to the level of detail required in the NEPA process. Rather, it needs to be accurate and up-to-date, and should adequately support recommended improvements in the statewide or metropolitan long-range transportation plan. The SAFETEA–LU requires transportation planning processes to focus on setting a context and following acceptable procedures. For example, the SAFETEA–LU requires a ''discussion of the types of potential environmental mitigation activities'' and potential areas for their implementation, rather than details on specific strategies. The SAFETEA–LU also emphasizes consultation with Federal, State, and Tribal land management, wildlife, and regulatory agencies.

However, the Environmental Assessment (EA) or Environmental Impact Statement (EIS) ultimately will be judged by the standards applicable under the NEPA regulations and guidance from the Council on Environmental Quality (CEQ). To the extent the information incorporated from the transportation planning process, standing alone, does not contain all of the information or analysis required by NEPA, then it will need to be supplemented by other information contained in the EIS or EA that would, in conjunction with the information from the plan, collectively meet the requirements of NEPA. The intent is not to require NEPA studies in the transportation planning process. As an option, the NEPA analyses prepared for project development can be integrated with transportation planning studies (see the response to Question 9 for additional information).

3. What type and extent of involvement from Federal, Tribal, State, and local environmental, regulatory, and resource agencies is needed in the transportation planning process in order for planning-level decisions to be more readily accepted in the NEPA process?

Sections 3005, 3006, and 6001 of the SAFETEA–LU established formal consultation requirements for MPOs and State DOTs to employ with environmental, regulatory, and resource agencies in the development of long-range transportation plans. For example, metropolitan transportation plans now ''shall include a discussion of the types of potential environmental mitigation activities and potential areas to carry out these activities, including activities that may have the greatest potential to restore and maintain the environmental functions affected by the [transportation] plan,'' and that these planning-level discussions ''shall be developed in consultation with Federal, State, and Tribal land management, wildlife, and regulatory agencies.'' In addition, MPOs ''shall consult, as appropriate, with State and local agencies responsible for land use management, natural resources, environmental protection, conservation, and historic preservation concerning the development of a long-range transportation plan,'' and that this consultation ''shall involve, as appropriate, comparison of transportation plans with State conservation plans or maps, if available, or comparison of transportation plans to inventories of natural or historic resources, if available.'' Similar SAFETEA–LU language addresses the development of the long-range statewide transportation plan, with the addition of Tribal conservation plans or maps to this planning-level ''comparison.''

In addition, section 6002 of the SAFETEA–LU established several mechanisms for increased efficiency in environmental reviews for project decision-making. For example, the term ''lead agency'' collectively means the U.S. Department of Transportation and a State or local governmental entity serving as a joint lead agency for the NEPA process. In addition, the lead agency is responsible for inviting and designating ''participating agencies'' (*i.e.,* other Federal or non-Federal agencies that may have an interest in the proposed project). Any Federal agency that is invited by the lead agency to participate in the environmental review process for a project shall be designated as a participating agency by the lead agency unless the invited agency informs the lead agency, in writing, by the deadline specified in the invitation that the invited agency:

(a) Has no jurisdiction or authority with respect to the project; (b) has no expertise or information relevant to the project; and (c) does not intend to submit comments on the project.

Past successful examples of using transportation planning products in NEPA analysis are based on early and continuous involvement of environmental, regulatory, and resource agencies. Without this early coordination, environmental, regulatory, and resource agencies are more likely to expect decisions made or analyses conducted in the transportation planning process to be revisited during the NEPA process. Early participation in transportation planning provides environmental, regulatory, and resource agencies better insight into the needs and objectives of the locality. Additionally, early participation provides an important opportunity for environmental, regulatory, and resource agency concerns to be identified and addressed early in the process, such as those related to permit applications. Moreover, Federal, Tribal, State, and local environmental, regulatory, and resource agencies are able to share data on particular resources, which can play a critical role in determining the feasibility of a transportation solution with respect to environmental impacts. The use of other agency planning outputs can result in a transportation project that could support multiple goals (transportation, environmental, and community). Further, planning decisions by these other agencies may have impacts on long-range transportation plans and/or the STIP/TIP, thereby providing important input to the transportation planning process and advancing integrated decision-making.

4. What is the procedure for using decisions or analyses from the transportation planning process?

The lead agencies jointly decide, and must agree, on what processes and consultation techniques are used to determine the transportation planning products that will be incorporated into the NEPA process. At a minimum, a robust scoping/early coordination process (which explains to Federal and State environmental, regulatory, and resource agencies and the public the information and/or analyses utilized to develop the planning products, how the purpose and need was developed and refined, and how the design concept and scope were determined) should play a critical role in leading to informed decisions by the lead agencies on the suitability of the transportation planning information, analyses, documents, and decisions for use in the NEPA process. As part of a rigorous scoping/early coordination process, the FHWA and the FTA should ensure that the transportation planning results are appropriately documented, shared, and used.

5. To what extent can the FHWA/FTA provide up-front assurance that decisions and additional investments made in the transportation planning process will allow planning-level decisions and analyses to be used in the NEPA process?

There are no guarantees. However, the potential is greatly improved for transportation planning processes that address the ''3–C'' planning principles (comprehensive, cooperative, and continuous); incorporate the intent of NEPA through the consideration of natural, physical, and social effects; involve environmental, regulatory, and resource agencies; thoroughly document the transportation planning process information, analysis, and decision; and vet the planning results through the applicable public involvement processes.

6. What considerations will the FHWA/FTA take into account in their review of transportation planning products for acceptance in project development/NEPA?

The FHWA and the FTA will give deference to decisions resulting from the transportation planning process if the FHWA and FTA determine that the planning process is consistent with the ''3–C'' planning principles and when the planning study process, alternatives considered, and resulting decisions have a rational basis that is thoroughly documented and vetted through the applicable public involvement processes. Moreover, any applicable program-specific requirements (*e.g.,* those of the Congestion Mitigation and Air Quality Improvement Program or the FTA's Capital Investment Grant program) also must be met.

The NEPA requires that the FHWA and the FTA be able to stand behind the overall soundness and credibility of analyses conducted and decisions made during the transportation planning process if they are incorporated into a NEPA document. For example, if systems-level or other broad objectives or choices from the transportation plan are incorporated into the purpose and need statement for a NEPA document, the FHWA and the FTA should not revisit whether these are the best objectives or choices among other options. Rather, the FHWA and the FTA review would include making sure that objectives or choices derived from the transportation plan were: Based on transportation planning factors established by Federal law; reflect a credible and articulated planning rationale; founded on reliable data; and developed through transportation planning processes meeting FHWA and FTA statutory and regulatory requirements. In addition, the basis for the goals and choices must be documented and included in the NEPA document. The FHWA/FTA reviewers do not need to review whether assumptions or analytical methods used in the studies are the best available, but, instead, need to assure that such assumptions or analytical methods are reasonable, scientifically acceptable, and consistent with goals, objectives, and policies set forth in long-range transportation plans. This review would include determining whether: (a) Assumptions have a rational basis and are up-to-date and (b) data, analytical methods, and modeling techniques are reliable, defensible, reasonably current, and meet data quality requirements.

II. Substantive Issues

General Issues To Be Considered

7. What should be considered in order to rely upon transportation planning studies in NEPA?

The following questions should be answered prior to accepting studies conducted during the transportation planning process for use in NEPA. While not a ''checklist,'' these questions are intended to guide the practitioner's analysis of the planning products:

- How much time has passed since the planning studies and corresponding decisions were made?
- Were the future year policy assumptions used in the transportation planning process related to land use, economic development, transportation costs, and network expansion consistent with those to be used in the NEPA process?
- Is the information still relevant/valid?
- What changes have occurred in the area since the study was completed?
- Is the information in a format that can be appended to an environmental document or reformatted to do so?
- Are the analyses in a planning-level report or document based on data, analytical methods, and modeling techniques that are reliable, defensible, and consistent with those used in other regional transportation studies and project development activities?
- Were the FHWA and FTA, other agencies, and the public involved in the relevant planning analysis and the corresponding planning decisions?
- Were the planning products available to other agencies and the public during NEPA scoping?
- During NEPA scoping, was a clear connection between the decisions made in planning and those to be made during the project development stage explained to the public and others? What was the response?
- Are natural resource and land use plans being informed by transportation planning products, and vice versa?

Purpose and Need

8. How can transportation planning be used to shape a project's purpose and need in the NEPA process?

A sound transportation planning process is the primary source of the project purpose and need. Through transportation planning, State and local governments, with involvement of stakeholders and the public, establish a vision for the region's future transportation system, define transportation goals and objectives for realizing that vision, decide which needs to address, and determine the timeframe for addressing these issues. The transportation planning process also provides a potential forum to define a project's purpose and need by framing the scope of the problem to be addressed by a proposed project. This scope may be further refined during the transportation planning process as more information about the transportation need is collected and consultation with the public and other stakeholders clarifies other issues and goals for the region.

23 U.S.C. 139(f), as amended by the SAFETEA–LU Section 6002, provides additional focus regarding the definition of the purpose and need and objectives. For example, the lead agency, as early as practicable during the environmental review process, shall provide an opportunity for involvement by participating agencies and the public in defining the purpose and need for a project. The statement of purpose and need shall include a clear statement of the objectives that the proposed action is intended to achieve, which may include: (a) Achieving a transportation objective identified in an applicable statewide or metropolitan transportation plan; (b) supporting land use, economic development, or growth objectives established in applicable Federal, State, local, or Tribal plans; and (c) serving national defense, national security, or other national objectives, as established in Federal laws, plans, or policies.

The transportation planning process can be utilized to develop the purpose and need in the following ways:

(a) Goals and objectives from the transportation planning process may be part of the project's purpose and need statement;

(b) A general travel corridor or general mode or modes (*e.g.,* highway, transit, or a highway/transit combination) resulting from planning analyses may be part of the project's purpose and need statement;

(c) If the financial plan for a metropolitan transportation plan indicates that funding for a specific project will require special funding sources (*e.g.,* tolls or public-private financing), such information may be included in the purpose and need statement; or

(d) The results of analyses from management systems (*e.g.,* congestion, pavement, bridge, and/or safety) may shape the purpose and need statement.

The use of these planning-level goals and choices must be appropriately explained during NEPA scoping and in the NEPA document.

Consistent with NEPA, the purpose and need statement should be a statement of a transportation problem, not a specific solution. However, the purpose and need statement should be specific enough to generate alternatives that may potentially yield real solutions to the problem at-hand. A purpose and need statement that yields only one alternative may indicate a purpose and need that is too narrowly defined.

Short of a fully integrated transportation decision-making process, many State DOTs develop information for their purpose and need statements when implementing interagency NEPA/Section 404 process merger agreements. These agreements may need to be expanded to include commitments to share and utilize transportation planning products when developing a project's purpose and need.

9. Under what conditions can the NEPA process be initiated in conjunction with transportation planning studies?

The NEPA process may be initiated in conjunction with transportation planning

studies in a number of ways. A common method is the ''tiered EIS,'' in which the first-tier EIS evaluates general travel corridors, modes, and/or packages of projects at a planning level of detail, leading to the refinement of purpose and need and, ideally, selection of the design concept and scope for a project or series of projects. Subsequently, second-tier NEPA review(s) of the resulting projects would be performed in the usual way. The first-tier EIS uses the NEPA process as a tool to involve environmental, regulatory, and resource agencies and the public in the planning decisions, as well as to ensure the appropriate consideration of environmental factors in these planning decisions.

Corridor or subarea analyses/studies are another option when the long-range transportation plan leaves open the possibility of multiple approaches to fulfill its goals and objectives. In such cases, the formal NEPA process could be initiated through publication of a NOI in conjunction with a corridor or subarea planning study.

Alternatives

10. In the context of this Appendix, what is the meaning of the term ''alternatives''?

This Appendix uses the term ''alternatives'' as specified in the NEPA regulations (40 CFR 1502.14), where it is defined in its broadest sense to include everything from major modal alternatives and location alternatives to minor design changes that would mitigate adverse impacts. This Appendix does not use the term as it is used in many other contexts (*e.g.,* ''prudent and feasible alternatives'' under Section 4(f) of the Department of Transportation Act or the ''Least Environmentally Damaging Practicable Alternative'' under the Clean Water Act.

11. Under what circumstances can alternatives be eliminated from detailed consideration during the NEPA process based on information and analysis from the transportation planning process?

There are two ways in which the transportation planning process can begin limiting the alternative solutions to be evaluated during the NEPA process: (a) Shaping the purpose and need for the project; or (b) evaluating alternatives during planning studies and eliminating some of the alternatives from detailed study in the NEPA process prior to its start. Each approach requires careful attention, and is summarized below.

(a) Shaping the Purpose and Need for the Project: The transportation planning process should shape the purpose and need and, thereby, the range of reasonable alternatives. With proper documentation and public involvement, a purpose and need derived from the planning process can legitimately narrow the alternatives analyzed in the NEPA process. See the response to Question 8 for further discussion on how the planning process can shape the purpose and need used in the NEPA process.

For example, the purpose and need may be shaped by the transportation planning process in a manner that consequently narrows the range of alternatives that must be considered in detail in the NEPA document when:

(1) The transportation planning process has selected a general travel corridor as best addressing identified transportation problems and the rationale for the determination in the planning document is reflected in the purpose and need statement of the subsequent NEPA document;

(2) The transportation planning process has selected a general mode (*e.g.,* highway, transit, or a highway/transit combination) that accomplishes its goals and objectives, and these documented determinations are reflected in the purpose and need statement of the subsequent NEPA document; or

(3) The transportation planning process determines that the project needs to be funded by tolls or other non-traditional funding sources in order for the long-range transportation plan to be fiscally constrained or identifies goals and objectives that can only be met by toll roads or other non-traditional funding sources, and that determination of those goals and objectives is reflected in the purpose and need statement of the subsequent NEPA document.

(b) Evaluating and Eliminating Alternatives During the Transportation Planning Process: The evaluation and elimination of alternatives during the transportation planning process can be incorporated by reference into a NEPA document under certain circumstances. In these cases, the planning study becomes part of the NEPA process and provides a basis for screening out alternatives. As with any part of the NEPA process, the analysis of alternatives to be incorporated from the process must have a rational basis that has been thoroughly documented (including documentation of the necessary and appropriate vetting through the applicable public involvement processes). This record should be made available for public review during the NEPA scoping process.

See responses to Questions 4, 5, 6, and 7 for additional elements to consider with respect to acceptance of planning products for NEPA documentation and the response to Question 12 on the information or analysis from the transportation planning process necessary for supporting the elimination of an alternative(s) from detailed consideration in the NEPA process.

Development of planning Alternatives Analysis studies, required prior to MAP–21 for projects seeking funds through FTA's Capital Investment Grant program, are now optional, but may still be used to narrow the alternatives prior to the NEPA review, just as other planning studies may be used. In fact, through planning studies, FTA may be able to narrow the alternatives considered in detail in the NEPA document to the No-Build (No Action) alternative and the Locally Preferred Alternative. If the planning process has included the analysis and stakeholder involvement that would be undertaken in a first tier NEPA process, then the alternatives screening conducted in the transportation planning process may be incorporated by reference, described, and relied upon in the project-level NEPA document. At that point, the project-level NEPA analysis can focus on the remaining alternatives.

12. What information or analysis from the transportation planning process is needed in an EA or EIS to support the elimination of an alternative(s) from detailed consideration?

The section of the EA or EIS that discusses alternatives considered but eliminated from detailed consideration should:

(a) Identify any alternatives eliminated during the transportation planning process (this could include broad categories of alternatives, as when a long-range transportation plan selects a general travel corridor based on a corridor study, thereby eliminating all alternatives along other alignments);

(b) Briefly summarize the reasons for eliminating the alternative; and

(c) Include a summary of the analysis process that supports the elimination of alternatives (the summary should reference the relevant sections or pages of the analysis or study) and incorporate it by reference or append it to the NEPA document.

Any analyses or studies used to eliminate alternatives from detailed consideration should be made available to the public and participating agencies during the NEPA scoping process and should be reasonably available during comment periods.

Alternatives passed over during the transportation planning process because they are infeasible or do not meet the NEPA ''purpose and need'' can be omitted from the detailed analysis of alternatives in the NEPA document, as long as the rationale for elimination is explained in the NEPA document. Alternatives that remain ''reasonable'' after the planning-level analysis must be addressed in the EIS, even when they are not the preferred alternative. When the proposed action evaluated in an EA involves unresolved conflicts concerning alternative uses of available resources, NEPA requires that appropriate alternatives be studied, developed, and described.

Affected Environment and Environmental Consequences

13. What types of planning products provide analysis of the affected environment and environmental consequences that are useful in a project-level NEPA analysis and document?

The following planning products are valuable inputs to the discussion of the affected environment and environmental consequences (both its current state and future state in the absence of the proposed action) in the project-level NEPA analysis and document:

- Regional development and growth analyses;
- Local land use, growth management, or development plans; and
- Population and employment projections.

The following are types of information, analysis, and other products from the transportation planning process that can be used in the discussion of the affected environment and environmental consequences in an EA or EIS:

(a) Geographic information system (GIS) overlays showing the past, current, or predicted future conditions of the natural and built environments;

(b) Environmental scans that identify environmental resources and environmentally sensitive areas;

(c) Descriptions of airsheds and watersheds;

(d) Demographic trends and forecasts;

(e) Projections of future land use, natural resource conservation areas, and development; and

(f) The outputs of natural resource planning efforts, such as wildlife conservation plans, watershed plans, special area management plans, and multiple species habitat conservation plans.

However, in most cases, the assessment of the affected environment and environmental consequences conducted during the transportation planning process will not be detailed or current enough to meet NEPA standards and, thus, the inventory and evaluation of affected resources and the analysis of consequences of the alternatives will need to be supplemented with more refined analysis and possibly site-specific details during the NEPA process.

14. What information from the transportation planning process is useful in describing a baseline for the NEPA analysis of indirect and cumulative impacts?

Because the nature of the transportation planning process is to look broadly at future land use, development, population increases, and other growth factors, the planning analysis can provide the basis for the assessment of indirect and cumulative impacts required under NEPA. The consideration in the transportation planning process of development, growth, and consistency with local land use, growth management, or development plans, as well as population and employment projections, provides an overview of the multitude of factors in an area that are creating pressures not only on the transportation system, but on the natural ecosystem and important environmental and community resources. An analysis of all reasonably foreseeable actions in the area also should be a part of the transportation planning process. This planning-level information should be captured and utilized in the analysis of indirect and cumulative impacts during the NEPA process.

To be used in the analysis of indirect and cumulative impacts, such information should:

(a) Be sufficiently detailed that differences in consequences of alternatives can be readily identified;

(b) Be based on current data (*e.g.,* data from the most recent Census) or be updated by additional information;

(c) Be based on reasonable assumptions that are clearly stated; and/or

(d) Rely on analytical methods and modeling techniques that are reliable, defensible, and reasonably current.

Environmental Mitigation

15. How can planning-level efforts best support advance mitigation, mitigation banking, and priorities for environmental mitigation investments?

A lesson learned from efforts to establish mitigation banks and advance mitigation agreements and alternative mitigation options is the importance of beginning interagency discussions during the transportation planning process. Development pressures, habitat alteration, complicated real estate transactions, and competition for potential mitigation sites by public and private project proponents can encumber the already difficult task of mitigating for ''like'' value and function and reinforce the need to examine mitigation strategies as early as possible.

Robust use of remote sensing, GIS, and decision support systems for evaluating conservation strategies are all contributing to the advancement of natural resource and environmental planning. The outputs from environmental planning can now better inform transportation planning processes, including the development of mitigation strategies, so that transportation and conservation goals can be optimally met. For example, long-range transportation plans can be screened to assess the effect of general travel corridors or density, on the viability of sensitive plant and animal species or habitats. This type of screening provides a basis for early collaboration among transportation and environmental staffs, the public, and regulatory agencies to explore areas where impacts must be avoided and identify areas for mitigation investments. This can lead to mitigation strategies that are both more economical and more effective from an environmental stewardship perspective than traditional project-specific mitigation measures.

III. Administrative Issues

16. Are Federal funds eligible to pay for these additional, or more in depth, environmental studies in transportation planning?

Yes. For example, the following FHWA and FTA funds may be utilized for conducting environmental studies and analyses within transportation planning:

- FHWA planning and research funds, as defined under 23 CFR part 420 (*e.g.,* Metropolitan Planning (PL), Statewide Planning and Research (SPR), National Highway System (NHS), STP, and Equity Bonus); and
- FTA planning and research funds (49 U.S.C. 5303), urban formula funds (49 U.S.C. 5307), and (in limited circumstances) transit capital investment funds (49 U.S.C. 5309).

The eligible transportation planning-related uses of these funds may include: (a) Conducting feasibility or subarea/corridor needs studies and (b) developing system-wide environmental information/inventories (*e.g.,* wetland banking inventories or standards to identify historically significant sites). Particularly in the case of PL and SPR funds, the proposed expenditure must be closely related to the development of transportation plans and programs under 23 U.S.C. 134–135 and 49 U.S.C. 5303–5306.

For FHWA funding programs, once a general travel corridor or specific project has progressed to a point in the preliminary engineering/NEPA phase that clearly extends beyond transportation planning, additional in-depth environmental studies must be funded through the program category for which the ultimate project qualifies (*e.g.,* NHS, STP, Interstate Maintenance, and/or Bridge), rather than PL or SPR funds.

Another source of funding is FHWA's Transportation Enhancement program, which may be used for activities such as: conducting archeological planning and research; developing inventories such as those for historic bridges and highways, and other surface transportation-related structures; conducting studies to determine the extent of water pollution due to highway runoff; and conducting studies to reduce vehicle-caused wildlife mortality while maintaining habitat connectivity.

The FHWA and the FTA encourage State DOTs, MPOs, and public transportation operators to seek partners for some of these studies from environmental, regulatory, and resource agencies, non-government organizations, and other government and private sector entities with similar data needs, or environmental interests. In some cases, these partners may contribute data and expertise to the studies, as well as funding.

17. What staffing or organizational arrangements may be helpful in allowing planning products to be accepted in the NEPA process?

Certain organizational and staffing arrangements may support a more integrated approach to the planning/NEPA decision-making continuum. In many cases, planning organizations do not have environmental expertise on staff or readily accessible. Likewise, the review and regulatory responsibilities of many environmental, regulatory, and resource agencies make involvement in the transportation planning process a challenge for staff resources. These challenges may be partially met by improved use of the outputs of each agency's planning resources and by augmenting their capabilities through greater use of GIS and remote sensing technologies (see *http://www.gis.fhwa.dot.gov/* for additional information on the use of GIS). Sharing databases and the planning products of local land use decision-makers and State and Federal environmental, regulatory, and resource agencies also provide efficiencies in acquiring and sharing the data and information needed for both transportation planning and NEPA work.

Additional opportunities such as shared staff, training across disciplines, and (in some cases) reorganizing to eliminate structural divisions between planning and NEPA practitioners may also need to be considered in order to better integrate NEPA considerations into transportation planning studies. The answers to the following two questions also contain useful information on training and staffing opportunities.

18. How have environmental, regulatory, and resource agency liaisons (Federally and State DOT funded positions) and partnership agreements been used to provide the expertise and interagency participation needed to enhance the consideration of environmental factors in the planning process?

For several years, States have utilized Federal and State transportation funds to support focused and accelerated project

review by a variety of local, State, Tribal, and Federal agencies. While Section 1309(e) of the TEA–21 and its successor in SAFETEA–LU section 6002 speak specifically to transportation project streamlining, there are other authorities that have been used to fund positions, such as the Intergovernmental Cooperation Act (31 U.S.C. 6505). In addition, long-term, on-call consultant contracts can provide backfill support for staff that are detailed to other parts of an agency for temporary assignments. At last count (as of 2015), over 200 positions were being funded. Additional information on interagency funding agreements is available at: *http://environment.fhwa.dot.gov/strmlng/igdocs/index.htm.*

Moreover, every State has advanced a variety of stewardship and streamlining initiatives that necessitate early involvement of environmental, regulatory, and resource agencies in the project development process. Such process improvements have: addressed the exchange of data to support avoidance and impact analysis; established formal and informal consultation and review schedules; advanced mitigation strategies; and resulted in a variety of programmatic reviews. Interagency agreements and work plans have evolved to describe performance objectives, as well as specific roles and responsibilities related to new streamlining initiatives. Some States have improved collaboration and efficiency by co-locating environmental, regulatory, and resource and transportation agency staff.

19. What training opportunities are available to MPOs, State DOTs, public transportation operators and environmental, regulatory, and resource agencies to assist in their understanding of the transportation planning and NEPA processes?

Both the FHWA and the FTA offer a variety of transportation planning, public involvement, and NEPA courses through the National Highway Institute and/or the National Transit Institute. Of particular note is the Linking Planning and NEPA Workshop, which provides a forum and facilitated group discussion among and between State DOT; MPO; Federal, Tribal, and State environmental, regulatory, and resource agencies; and FHWA/FTA representatives (at both the executive and program manager levels) to develop a State-specific action plan that will provide for strengthened linkages between the transportation planning and NEPA processes.

Moreover, the U.S. Fish and Wildlife Service offers Green Infrastructure Workshops that are focused on integrating planning for natural resources (''green infrastructure'') with the development, economic, and other infrastructure needs of society (''gray infrastructure'').

Robust planning and multi-issue environmental screening requires input from a wide variety of disciplines, including information technology; transportation planning; the NEPA process; and regulatory, permitting, and environmental specialty areas (*e.g.,* noise, air quality, and biology). Senior managers at transportation and partner agencies can arrange a variety of individual training programs to support learning curves and skill development that contribute to a strengthened link of the transportation planning and NEPA processes. Formal and informal mentoring on an intra-agency basis can be arranged. Employee exchanges within and between agencies can be periodically scheduled, and persons involved with professional leadership programs can seek temporary assignments with partner agencies.

IV. Additional Information on This Topic

Valuable sources of information are FHWA's environment Web site (*http://www.fhwa.dot.gov/environment/index.htm*) and FTA's environmental streamlining Web site (*http://www.environment.fta.dot.gov*). Another source of information and case studies is NCHRP Report 8–38 (Consideration of Environmental Factors in Transportation Systems Planning), which is available at *http://www4.trb.org/trb/crp.nsf/All+Projects/NCHRP+8-38.* In addition, AASHTO's Center for Environmental Excellence Web site is continuously updated with news and links to information of interest to transportation and environmental professionals (*www.transportation.environment.org*).

PART 771—ENVIRONMENTAL IMPACT AND RELATED PROCEDURES

■ 2. The authority citation for part 771 is revised to read as follows:

Authority: 42 U.S.C. 4321 *et seq.;* 23 U.S.C. 106, 109, 128, 138, 139, 168, 315, 325, 326, and 327; 49 U.S.C. 303; 40 CFR parts 1500–1508; 49 CFR 1.81, 1.85; Pub. L. 109–59, 119 Stat. 1144, sections 6002 and 6010; Pub. L. 112–141, 126 Stat. 405, sections 1310, 1315, 1316, 1317, and 1318.

■ 3. Amend § 771.111 as follows:
■ a. Remove footnote 3;
■ b. Redesignate footnotes 4 and 5 as footnotes 3 and 4, respectively;
■ c. Revise paragraph (a)(2) to read as follows:

§ 771.111 Early coordination, public involvement, and project development.

* * * * *

(a) * * *

(2) The information and results produced by, or in support of, the transportation planning process may be incorporated into environmental review documents in accordance with 40 CFR 1502.21, and 23 CFR 450.212(b) or 450.318(b). In addition, planning products may be adopted and used in accordance with 23 CFR 450.212(d) or 450.318(e), which implement 23 U.S.C. 168.

* * * * *

§ 771.139 [Amended]

■ 4. Redesignate footnote 6 as footnote 5.

Title 49—Transportation

■ 5. Revise 49 CFR part 613 to read as follows:

PART 613—METROPOLITAN AND STATEWIDE AND NONMETROPOLITAN PLANNING

Subpart A—Metropolitan Transportation Planning and Programming

Sec.
613.100 Metropolitan transportation planning and programming.

Subpart B—Statewide and Nonmetropolitan Transportation Planning and Programming

Sec.
613.200 Statewide and nonmetropolitan transportation planning and programming.

Authority: 23 U.S.C. 134, 135, and 217(g); 42 U.S.C. 3334, 4233, 4332, 7410 *et seq.;* 49 U.S.C. 5303–5306, 5323(k); and 49 CFR 1.85, 1.51(f) and 21.7(a).

Subpart A—Metropolitan Transportation Planning and Programming

§ 613.100 Metropolitan transportation planning and programming.

The regulations in 23 CFR part 450, subpart C, shall be followed in complying with the requirements of this subpart. The definitions in 23 CFR part 450, subpart A, shall apply.

Subpart B—Statewide and Nonmetropolitan Transportation Planning and Programming

§ 613.200 Statewide and nonmetropolitan transportation planning and programming.

The regulations in 23 CFR part 450, subpart B, shall be followed in complying with the requirements of this subpart. The definitions in 23 CFR part 450, subpart A, shall apply.

Mitigation Strategies To Protect Food Against Intentional Adulteration

AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA or we) is issuing this final rule to require domestic and foreign food facilities that are required to register under the Federal Food, Drug, and Cosmetic Act (the FD&C Act) to address hazards that may be introduced with the intention to cause wide scale public health harm. These food facilities are required to conduct a vulnerability assessment to identify significant vulnerabilities and actionable process steps and implement mitigation strategies to significantly minimize or prevent significant vulnerabilities identified at actionable process steps in a food operation. FDA is issuing these requirements as part of our implementation of the FDA Food Safety Modernization Act (FSMA).

DATES: This rule is effective July 26, 2016. See section VIII for compliance dates.

FOR FURTHER INFORMATION CONTACT: Ryan Newkirk, Center for Food Safety and Applied Nutrition (HFS–005), Food and Drug Administration, 5100 Paint Branch Pkwy., College Park, MD 20740, 240–402–3712, email: *Ryan.Newkirk@fda.hhs.gov*.

SUPPLEMENTARY INFORMATION:

Table of Contents

Executive Summary

Purpose and Coverage of the Rule

This regulation implements three provisions of the FD&C Act, as amended by FSMA, that relate to the intentional adulteration of food. Section 418 of the FD&C Act (21 U.S.C. 350g) addresses intentional adulteration in the context of facilities that manufacture, process, pack, or hold food and are required to register under section 415 of the FD&C Act (21 U.S.C. 350d). Section 419 of the FD&C Act (21 U.S.C. 350h) addresses intentional adulteration in the context of fruits and vegetables that are raw agricultural commodities. Section 420 of the FD&C Act (21 U.S.C. 350i) addresses intentional adulteration in the context of high-risk foods and exempts farms except for farms that produce milk. FDA is implementing the intentional adulteration provisions in sections 418, 419, and 420 of the FD&C Act in this rulemaking.

The purpose of this rule is to protect food from intentional acts of adulteration where there is an intent to cause wide scale public health harm. This rule applies to both domestic and foreign facilities that are required to register under section 415 of the FD&C Act. This rule establishes several exemptions as follows:

- The rule does not apply to a very small business (*i.e.,* a business, including any subsidiaries or affiliates, averaging less than $10,000,000, adjusted for inflation, per year, during the 3-year period preceding the applicable calendar year in both sales of human food plus the market value of human food manufactured, processed, packed, or held without sale, *e.g.,* held for a fee), except that the facility is required to provide for official review, upon request, documentation sufficient to show that the facility qualifies for this exemption.
- This rule does not apply to the holding of food, except the holding of food in liquid storage tanks.
- This rule does not apply to the packing, re-packing, labeling, or re-labeling of food where the container that directly contacts the food remains intact.
- This rule does not apply to activities of a farm that are subject to section 419 of the Federal Food, Drug, and Cosmetic Act (Standards for Produce Safety).
- This rule does not apply with respect to alcoholic beverages at a facility that meets certain conditions.
- This rule does not apply to the manufacturing, processing, packing, or holding of food for animals other than man.
- This rule does not apply to on-farm manufacturing, processing, packing, or holding by a small or very small business of certain foods identified as having low-risk production practices if such activities are the only activities conducted by the business subject to section 418 of the FD&C Act.

Summary of the Major Provisions of the Final Rule

This rule establishes various food defense measures that an owner, operator, or agent in charge of a facility is required to implement to protect against the intentional adulteration of food. Specifically:

- Prepare and implement a written food defense plan that includes a vulnerability assessment to identify significant vulnerabilities and actionable process steps, mitigation strategies, and procedures for food defense monitoring, corrective actions, and verification (§ 121.126).
- Identify any significant vulnerabilities and actionable process steps by conducting a vulnerability assessment for each type of food manufactured, processed, packed, or held at the facility using appropriate methods to evaluate each point, step, or procedure in a food operation (§ 121.130).
- Identify and implement mitigation strategies at each actionable process step to provide assurances that the significant vulnerability at each step will be significantly minimized or prevented and the food manufactured, processed, packed, or held by the facility will not be adulterated. For each mitigation strategy implemented at each actionable process step, include a written explanation of how the mitigation strategy sufficiently minimizes or prevents the significant vulnerability associated with the actionable process step (§ 121.135).
- Establish and implement mitigation strategies management components, as appropriate to ensure the proper implementation of each such mitigation strategy, taking into account the nature of the mitigation strategy and its role in the facility's food defense system (§ 121.138).
- Establish and implement food defense monitoring procedures, for monitoring the mitigation strategies, as appropriate to the nature of the mitigation strategy and its role in the facility's food defense system (§ 121.140).
- Establish and implement food defense corrective action procedures that must be taken if mitigation strategies are not properly implemented, as appropriate to the nature of the actionable process step and the nature of the mitigation strategy (§ 121.145).
- Establish and implement specified food defense verification activities, as appropriate to the nature of the mitigation strategy and its role in the facility's food defense system (§ 121.150).
- Conduct a reanalysis of the food defense plan (§ 121.157).
- Ensure that all individuals who perform required food defense activities are qualified to perform their assigned duties (§ 121.4).
- Establish and maintain certain records, including the written food defense plan (vulnerability assessment, mitigation strategies and procedures for food defense monitoring, corrective actions, and verification) and documentation related to training of personnel. All records are subject to certain general recordkeeping and record retention requirements (§§ 121.301 to 121.330).
- The effective date is 60 days after this final rule is published. However, we are providing for a longer timeline for facilities to come into compliance. Facilities, other than small and very small businesses, have 3 years after the effective date to comply with part 121. Small businesses (*i.e.,* those employing fewer than 500 full-time equivalent employees) have 4 years after the effective date to comply with part 121. Very small businesses (*i.e.,* businesses that have less than $10,000,000, adjusted for inflation, per year, during the 3-year period preceding the applicable calendar year in both sales of human food plus the market value of human food manufactured, processed, packed, or held without sale, *e.g.,* held for a fee) have 5 years after the effective date to comply with § 121.5(a).

As discussed in detail in later sections of the rule, we made several major revisions to the provisions of this rule, mainly in response to comments, to provide for greater flexibility and clarity. These major revisions to the regulatory text include the following:

- We removed the key activity types (KATs); however, the use of the KATs is still permissible to conduct a vulnerability assessment and will be further discussed in guidance.
- We specified three elements that must be evaluated when conducting a vulnerability assessment: (1) The potential public health impact (*e.g.,* severity and scale) if a contaminant were added; (2) the degree of physical access to the product; and (3) the ability of an attacker to successfully contaminate the product.
- We specified that the vulnerability assessment must consider the possibility of an inside attacker.
- We removed the distinction between ''broad'' and ''focused'' mitigation strategies.
- We made the mitigation strategy management components (food defense monitoring, corrective actions, and verification) more flexible by providing that they are required ''as appropriate to ensure the proper implementation of the mitigation strategies, taking into account the nature of each such mitigation strategy and its role in the facility's food defense system.''
- We revised the terminology used for the food defense management components such that monitoring, corrective actions, and verification are now food defense monitoring, food defense corrective actions, and food defense verification.
- We made the requirement to document food defense monitoring more flexible by providing for use of exception records.
- We made the food defense corrective actions requirement more flexible by providing that it is required ''as appropriate to the nature of the actionable process step and the nature of the mitigation strategy.''
- We made the requirement for verifying proper implementation of mitigation strategies more flexible by providing for ''other activities appropriate for verification of proper implementation of mitigation strategies.''
- We exempted records required by this rule from the requirements of 21 Code of Federal Regulations, part 11.
- We provided for the use of existing records if certain conditions are met.
- We removed the term ''qualified facility'' and instead refer to ''very small business'' in the exemption under 121.5(a).
- We established an exemption for certain on-farm manufacturing, processing, packing, or holding by small and very small businesses of certain foods identified as having low-risk production processes.
- We added a new definition for ''qualified individual'' and included new requirements to ensure that all individuals who perform activities required under subpart C are qualified to perform their assigned activities.
- We provided longer timelines for facilities to come into compliance with the rule.

Costs and Benefits

The total cost of the rule, annualized over 10 years at a 7 percent discount rate, is between $280 and $490 million. With a 3 percent discount rate, the annualized cost is between $270 and $480 million. The first-year cost is between $680 and $930 million. Counting only domestic firms, the total annualized costs are between $90 and $150 million, with initial costs of between $220 and $300 million. The average annualized cost per covered facility is between $9,000 and $16,000,

and the average annualized cost per covered firm is between $27,000 and $47,000.

The benefits of the actions required by the rule are a reduction in the possibility of illness and death resulting from intentional adulteration of food. We monetize the damage that various intentional adulteration scenarios might cause, and present a breakeven analysis showing the number of prevented attacks at which the benefits are larger than the costs. For attacks that are similar in impact to acts of intentional adulteration that have happened in the United States in the past, the breakeven threshold, counting only producer costs, is 28 to 48 attacks prevented every year. For attacks causing similar casualties as major historical outbreaks of food-related illness, the breakeven threshold is one or two attacks every year. For catastrophic terrorist attacks causing thousands of fatalities, the breakeven threshold is one attack prevented every 270 to 460 years.

The table shows the approximate, rounded, mean values for various cost components of the rule:

ANNUALIZED COST AND BENEFIT OVERVIEW

All Numbers are USD 2014 (millions), annualized over 10 years	3% Discount	7% Discount
Costs:		
Learning about Rule	$3	$4
Creating Food Defense Plans	10	11
Mitigation Costs	26	28
Monitoring, Corrective Action, Verification	62	62
Employee Training	5	6
Documentation	9	9
Subtotal (Domestic cost)	115	119
Cost to Foreign Firms	247	256
Total	362	375
Benefits:		
Lower Chance of Intentional Adulteration	Unquantified	

I. Background

A. FDA Food Safety Modernization Act

The FDA Food Safety Modernization Act (FSMA) (Pub. L. 111–353), signed into law by President Obama on January 4, 2011, is intended to allow FDA to better protect public health by helping to ensure the safety and security of the food supply. FSMA enables us to focus more on preventing food safety problems rather than relying primarily on reacting to problems after they occur. The law also provides new enforcement authorities to help achieve higher rates of compliance with risk-based, prevention-oriented safety standards and to better respond to and contain problems when they do occur. In addition, the law contains important new tools to better ensure the safety of imported foods and encourages partnerships with State, local, tribal, and territorial authorities. A top priority for FDA are those FSMA-required regulations that provide the framework for industry's implementation of preventive controls and enhance our ability to oversee their implementation for both domestic and imported food. To that end, we proposed the seven foundational rules listed in table 1 and requested comments on all aspects of these proposed rules.

TABLE 1—PUBLISHED FOUNDATIONAL RULES FOR IMPLEMENTATION OF FSMA

Title	Abbreviation	Publication
Current Good Manufacturing Practice and Hazard Analysis and Risk-Based Preventive Controls for Human Food.	2013 proposed human preventive controls rule.	78 FR 3646, January 16, 2013.
Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption.	2013 proposed produce safety rule	78 FR 3504, January 16, 2013.

Foreign Supplier Verification Programs (FSVP) for Importers of Food for Humans and Animals.	2013 proposed FSVP rule	78 FR 45730, July 29, 2013.
Accreditation of Third-Party Auditors/Certification Bodies to Conduct Food Safety Audits and to Issue Certifications.	2013 proposed third-party certification rule.	78 FR 45782, July 29, 2013.
Focused Mitigation Strategies To Protect Food Against Intentional Adulteration.	2013 proposed intentional adulteration rule.	78 FR 78014, December 24, 2013.
Sanitary Transportation of Human and Animal Food	2014 proposed sanitary transportation rule.	79 FR 7006, February 5, 2014.

We also issued a supplemental notice of proposed rulemaking for the rules listed in table 2 and requested comments on specific issues identified in each supplemental notice of proposed rulemaking.

TABLE 2—PUBLISHED SUPPLEMENTAL NOTICES OF PROPOSED RULEMAKING FOR THE FOUNDATIONAL RULES FOR IMPLEMENTATION OF FSMA

Title	Abbreviation	Publication
Current Good Manufacturing Practice and Hazard Analysis and Risk-Based Preventive Controls for Human Food.	2014 supplemental human preventive controls notice.	79 FR 58524, September 29, 2014.
Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption.	2014 supplemental produce safety notice.	79 FR 58434, September 29, 2014.
Current Good Manufacturing Practice and Hazard Analysis and Risk-Based Preventive Controls for Food for Animals.	2014 supplemental animal preventive controls notice.	79 FR 58476, September 29, 2014.
Foreign Supplier Verification Programs (FSVP) for Importers of Food for Humans and Animals.	2014 supplemental FSVP notice ...	79 FR 58574, September 29, 2014.

We have finalized six of the foundational rulemakings, as listed in table 3.

TABLE 3—PUBLISHED FOUNDATIONAL FINAL RULES FOR IMPLEMENTATION OF FSMA

Title	Abbreviation	Publication
Current Good Manufacturing Practice, Hazard Analysis and Risk-Based Preventive Controls for Human Food.	PCHF final rule	80 FR 55908, September 17, 2015.
Current Good Manufacturing Practice, Hazard Analysis and Risk-Based Preventive Controls for Food for Animals.	PCAF final rule	80 FR 56170, September 17, 2015.
Standards for the Growing, Harvesting, Packing, and Holding of Produce for Human Consumption.	Produce final rule	80 FR 74354, November 27, 2015.
Foreign Supplier Verification Programs (FSVP) for Importers of Food for Humans and Animals.	FSVP final rule	80 FR 74226, November 27, 2015.
Accreditation of Third-Party Certification Bodies to Conduct Food Safety Audits and to Issue Certifications.	Third-party final rule	80 FR 74570, November 27, 2015.
Sanitary Transportation of Human and Animal Food	Transport final rule	81 FR 20092, April 6, 2016.

As FDA finalizes these seven foundational rulemakings, we are putting in place a framework for food safety that is modern and brings to bear the most recent science on provisions to enhance food safety and food defense, that is risk-based and focuses effort where the hazards are most significant, and that is flexible and practical given our current knowledge of food safety and food defense practices. To achieve this, FDA has engaged in a great deal of outreach to the stakeholder community to find the right balance in these regulations of flexibility and accountability.

Since FSMA was enacted in 2011, we have been involved in approximately 600 engagements on FSMA and the proposed rules, including public meetings, Webinars, listening sessions, farm tours, and extensive presentations and meetings with various stakeholder groups (Ref. 1) (Ref. 2). As a result of this stakeholder dialogue, FDA decided to issue the four supplemental notices of proposed rulemaking to share our current thinking on key issues and get additional stakeholder input on those issues. As we move forward into the next phase of FSMA implementation, we intend to continue this dialogue and collaboration with our stakeholders, through guidance, education, training, and assistance, to ensure that stakeholders understand and engage in their roles in food safety and food defense. FDA believes these seven foundational final rules, when implemented, will fulfill the paradigm shift toward prevention that was envisioned in FSMA and be a major step forward for food safety and food defense that will protect consumers into the future.

B. Proposed Rule on Intentional Adulteration

In the **Federal Register** of December 24, 2013 (78 FR 78014), we issued a proposed rule to implement the intentional adulteration provisions in sections 103, 105, and 106 of FSMA (proposed rule). We initially requested public comments on the proposed rule by March 31, 2014. We extended the comment period for the proposed rule until June 30, 2014, in response to several requests for an extension.

The proposed rule proposed to require various food defense measures that an owner, operator, or agent in charge of a facility would be required to implement to protect against the intentional adulteration of food, and can be summarized as follows:

- Prepare and implement a written food defense plan that includes actionable process steps, focused mitigation strategies, and procedures for monitoring, corrective actions, and verification (proposed § 121.126).
- Identify any actionable process steps, using one of two procedures. In the proposed rule, we explained that FDA has analyzed vulnerability assessments conducted using the CARVER+Shock methodology and identified four key activity types: Bulk liquid receiving and loading; Liquid storage and handling; Secondary ingredient handling; and Mixing and similar activities. We further explained that FDA has determined that the presence of one or more of these key activity types at a process step (*e.g.,* manufacturing, processing, packing, or holding of food) indicates a significant vulnerability under section 418 of the FD&C Act and that the food is at high risk of intentional adulteration caused by acts of terrorism under section 420 of the FD&C Act. We proposed that facilities may identify actionable process steps using the FDA-identified key activity types as described in proposed § 121.130(a) or conduct their own facility-specific vulnerability assessments as provided in proposed § 121.130(b).
- Identify and implement focused mitigation strategies at each actionable

process step to provide assurances that the significant vulnerability at each step will be significantly minimized or prevented and the food manufactured, processed, packed, or held by the facility will not be adulterated (proposed § 121.135).

- Establish and implement procedures, including the frequency with which they are to be performed, for monitoring the focused mitigation strategies (proposed § 121.140)
- Establish and implement corrective action procedures that must be taken if focused mitigation strategies are not properly implemented (proposed § 121.145).
- Verify that monitoring is being conducted and appropriate decisions about corrective actions are being made; verify that the focused mitigation strategies are consistently implemented and are effectively and significantly minimizing or preventing the significant vulnerabilities; and conduct a reanalysis of the food defense plan (proposed § 121.150).
- Ensure that personnel and supervisors assigned to actionable process steps receive appropriate training in food defense awareness and their respective responsibilities in implementing focused mitigation strategies (proposed § 121.160).
- Establish and maintain certain records, including the written food defense plan; written identification of actionable process steps and the assessment leading to that identification; written focused mitigation strategies; written procedures for monitoring, corrective actions, and verification; and documentation related to training of personnel. All such records are subject to certain recordkeeping requirements, record retention requirements, requirements for official review and public disclosure requirements (proposed §§ 121.301 to 121.325).
- Proposed the effective date as 60 days after this final rule is published. However, we proposed for a longer timeline for facilities to come into compliance. Facilities, other than small and very small businesses, would have 1 year after the effective date to comply with part 121. Small businesses (*i.e.,* those employing fewer than 500 persons) would have 2 years after the effective date to comply with part 121. Very small businesses (*i.e.,* businesses that have less than $10,000,000 in total annual sales of food, adjusted for inflation) would be considered a qualified facility and have 3 years after the effective date to comply with § 121.5(a).

We requested comment on all aspects of the proposed requirements. In addition, we described our thinking and sought comment on other issues, including the framework of the rule; activities that occur on produce farms; transportation carriers; food for animals; acts of disgruntled employees, consumers, or competitors; economically motivated adulteration; low-risk activities at farm mixed-type facilities; activities that occur on dairy farms; and other ways to focus on foods with a high risk of intentional adulteration caused by terrorism.

C. Appendix 4 to Draft Risk Assessment

We issued for public comment an ''Appendix 4 to Draft Qualitative Risk Assessment of Risk of Activity/Food Combinations for Activities (Outside the Farm Definition) Conducted in a Facility Co-Located on a Farm'' (the draft RA Appendix) (78 FR 78064, December 24, 2013). The purpose of the draft RA Appendix was to provide a science-based risk analysis of those foods whose production processes would be considered low risk with respect to the risk of intentional adulteration caused by acts of terrorism. We used the tentative conclusions of the section 103(c)(1)(C) draft RA Appendix to seek comment in the proposed rule on possible exemptions or modified requirements for this final rule (78 FR 78014 at 78029). We are including the final appendix to the risk assessment in the docket established for this document (Ref. 3).

D. Public Comments

We received more than 200 public submissions on the proposed rule, each containing one or more comments. We received submissions from diverse members of the public, including food facilities (including facilities co-located on a farm); farms; cooperatives; coalitions; trade organizations; consulting firms; law firms; academia; public health organizations; public advocacy groups; consumers; consumer groups; Congress, Federal, State, local, and tribal Governments; and other organizations. Some submissions included signatures and statements from multiple individuals. Comments addressed virtually every provision of the proposed rule, including our requests for comment on including additional provisions that we did not include in the proposed regulatory text. In the remainder of this document, we describe these comments, respond to them, and explain any revisions we made to the proposed rule.

Some comments address issues that are outside the scope of this rule. For example, some comments express concern about overregulation in general. Some comments believe the Department of Homeland Security is the Federal Agency that should protect the food supply. Some comments express concern about ''genetically modified organisms'', while other comments express concern about the amount of chemicals in food. Some comments express concern that extreme consolidation of our food system is the main reason that it could be a target for terrorism or other intentional acts aimed at causing widespread human casualties. These comments state that decentralization is the most resilient defense against those who wish to contaminate the food supply. We do not discuss such comments in this document.

II. Legal Authority

The proposed rule contained an explanation of its legal basis under authorities in the FDA Food Safety Modernization Act and section 701 of the FD&C Act. After considering the comments received in response to the proposed rule, FDA made changes in the final rule. The legal authorities relied on in the final rule are the same as those in the proposed rule unless otherwise described in the sections that follow.

A. Section 103 of FSMA

Section 103 of FSMA, Hazard Analysis and Risk-Based Preventive Controls, amends the FD&C Act to create a new section 418, which mandates rulemaking. Section 418(n)(1)(A) of the FD&C Act requires that the Secretary issue regulations ''to establish science-based minimum standards for conducting a hazard analysis, documenting hazards, implementing preventive controls, and documenting the implementation of the preventive controls. . . .'' Section 418(n)(1)(B) of the FD&C Act requires that the regulations define the terms ''small business'' and ''very small business,'' taking into consideration the study of the food processing sector required by section 418(l)(5) of the FD&C Act. Further, section 103(e) of FSMA creates a new section 301(uu) in the FD&C Act (21 U.S.C. 331(uu)) to prohibit ''[t]he operation of a facility that manufactures, processes, packs, or holds food for sale in the United States if the owner, operator, or agent in charge of such facility is not in compliance with section 418 [of the FD&C Act].''

In addition to rulemaking requirements, section 418 contains requirements applicable to the owner, operator, or agent in charge of a facility

required to register under section 415. Section 418(a) is a general provision that requires the owner, operator, or agent in charge of a facility to evaluate the hazards that could affect food manufactured, processed, packed, or held by the facility, identify and implement preventive controls, monitor the performance of those controls, and maintain records of the monitoring. In addition to the general requirements in section 418(a) of the FD&C Act, sections 418(b)–(i) contain more specific requirements applicable to facilities, including several provisions explicitly directed at intentional adulteration. For example, section 418(b)(2) of the FD&C Act specifies that the owner, operator, or agent in charge of a facility shall identify and evaluate hazards that may be intentionally introduced, including by acts of terrorism. Section 418(c)(2) of the FD&C Act specifies that the owner, operator, or agent in charge of a facility shall identify and implement preventive controls to provide assurances that any hazards that relate to intentional adulteration will be significantly minimized or prevented and addressed, consistent with section 420 of the FD&C Act.

Sections 418(j)–(m) of the FD&C Act and sections 103(c)(1)(D) and (g) of FSMA provide authority for certain exemptions and modifications to the requirements of section 418 of the FD&C Act. These include provisions related to seafood and juice hazard analysis critical control point (HACCP), and low-acid canned food (section 418(j)); activities of facilities subject to section 419 of the FD&C Act (Standards for Produce Safety) (section 418(k)); qualified facilities (section 418(l)); facilities that are solely engaged in the production of food for animals other than man, the storage of raw agricultural commodities (other than fruits and vegetables) intended for further distribution or processing, or the storage of packaged foods that are not exposed to the environment (section 418(m)); facilities engaged only in certain low risk on-farm activities on certain foods conducted by small or very small businesses (section 103(c)(1)(D) of FSMA), and dietary supplements (section 103(g) of FSMA). We are issuing all of the provisions of the rule under section 418 of the FD&C Act, except with respect to facilities that are exempt from its coverage.

B. Section 106 of FSMA

Section 106 of FSMA, Protection Against Intentional Adulteration, amends the FD&C Act to create a new section 420, which mandates rulemaking. Section 420 of the FD&C Act requires FDA to issue regulations to protect against the intentional adulteration of food. Section 420(b)(1) of the FD&C Act requires that such regulations are to specify how a person is to assess whether the person is required to implement mitigation strategies or measures intended to protect against the intentional adulteration of food. Section 420(b)(2) of the FD&C Act requires that the regulations specify appropriate science-based mitigation strategies or measures to prepare and protect the food supply chain at specific vulnerable points, as appropriate. Section 420(c) of the FD&C Act provides that such regulations are to apply only to food for which there is a high risk of intentional adulteration and for which such intentional adulteration could cause serious adverse health consequences or death to humans or animals. Section 420(c)(1) provides that such foods are to include those for which FDA has identified clear vulnerabilities. Section 420(d) of the FD&C Act limits applicability on farms to farms that produce milk. Further, section 106(d) of FSMA creates a new section 301(ww) in the FD&C Act to prohibit ''[t]he failure to comply with section 420 [of the FD&C Act].'' We are issuing all of the provisions of the rule under section 420 of the FD&C Act.

C. Intrastate Activities

FDA concludes that the rule should apply to activities that are intrastate in character. Facilities are required to register under section 415 of the FD&C Act regardless of whether the food from the facility enters interstate commerce (§ 1.225(b)). The plain language of section 418 of the FD&C Act applies to facilities that are required to register under section 415 of the FD&C Act (section 418(o)(2)) and does not exclude a facility because food from such a facility is not in interstate commerce. Similarly, the plain language of section 420 of the FD&C Act requires FDA to issue regulations to protect against the intentional adulteration of food and does not include a limitation to interstate commerce. Further, the prohibited act provisions in sections 301(uu) and (ww) of the FD&C Act (21 U.S.C. 331(uu) and (ww)) do not require an interstate commerce nexus. Notably, other subsections in section 301 of the FD&C Act, and section 304 of the FD&C Act (21 U.S.C. 334) demonstrate that Congress has included a specific interstate commerce nexus in the provisions of the FD&C Act when that is its intent. Accordingly, it is reasonable to interpret sections 418, 420, 301(uu), and 301(ww) of the FD&C Act as not limited to those facilities with a direct connection to interstate commerce.

III. General Comments on the Proposed Rule

A. Comments on Overall Framework for the Regulatory Approach

We proposed a HACCP-type approach, like the one proposed for the systematic control of food safety hazards in the PCHF proposed rule, as the most effective means of ensuring that mitigation strategies are consistently applied once the significant vulnerabilities are identified and appropriate mitigation strategies are developed. We requested comment on the appropriateness of a HACCP-type system to ensure that mitigation strategies designed to significantly minimize or prevent intentional adulteration related to terrorism are effective and implemented as intended. We also requested comment about whether there are other approaches that would be more suitable to address intentional adulteration related to terrorism.

In the following paragraphs, we discuss the comments that disagree with, or request changes to, the proposed approach. After considering these comments, we are continuing to require an approach based on an analysis of hazards/vulnerabilities and the implementation of measures to mitigate the identified hazards/vulnerabilities (a HACCP-type approach); however, we are providing for additional flexibility, as requested.

(Comment 1) Some comments state food defense and food safety require different approaches because they are different disciplines. The comments explain that the science is different, that food safety deals with known and identifiable risks whereas food defense deals with unknown, often unidentifiable, and ever changing threats and that food safety risks can be prevented or reduced to an acceptable level but food defense threats only can be mitigated. The comments conclude that regulatory requirements addressing food defense must reflect these key differences between food defense and food safety and use different terminology. Some comments state that FSMA does not require a preventive controls approach for food defense, and a traditional HACCP approach is too rigorous and prescriptive for food defense. Conversely, other comments support regulatory requirements for food defense that are based on the proactive approach found in HACCP, specifically HACCP concepts related to

analyzing problems and devising appropriate solutions.

(Response 1) We disagree that food safety and food defense require entirely different approaches to ensure that food is not adulterated. We agree that there are important, specific differences between food safety and food defense, and these differences require different requirements for particular components of the approaches. However, we believe that food safety and food defense are more similar than they are different. For both food safety and food defense, the framework for preventing adulteration, whether it is intentional or unintentional, is the same: (1) An analysis is needed to identify the hazards for which measures should be taken to mitigate the hazard; (2) appropriate measures must be identified and implemented; and (3) management components are needed to ensure systematically that the measures are functioning as intended. This is the foundation of the HACCP approach, and we continue to believe this approach is appropriate for food defense as well as food safety. In food defense terms, the three elements are as follows: (1) A vulnerability assessment is needed to identify significant vulnerabilities; (2) mitigation strategies must be identified and implemented; and (3) mitigation strategy management components are needed to ensure systematically that the mitigation strategies are functioning as intended. See the proposed rule (78 FR 78014 at 78025) for a discussion of how the hazard analysis/preventive control model is consistent with a vulnerability assessment/mitigation strategy model.

We agree that the nature of the hazards being analyzed for food safety and food defense purposes are different, but we disagree that this means they need a different analytical approach. As discussed more in the responses to Comment 71 and Comment 72, the vulnerabilities considered for food defense, while not as predictable as some food safety hazards, lend themselves to analytical assessment because they have commonalities that would make them attractive to an attacker, particularly an inside attacker. In this rule, we are focusing on preventing the actions of an inside attacker. Our interactions with the intelligence community, as well as the conclusions reached during vulnerability assessments conducted in collaboration with industry, have identified the inside attacker as the highest threat. Though FDA is not aware of any information that points to an imminent, credible threat to the food supply, achieving public health harm through an attack via food remains an advocated option for terrorist groups (Ref. 4). Additionally, recent events have shown a general evolution in terrorist activity away from large, centrally planned attacks to attacks that are locally planned and implemented. These locally planned attacks may be conducted by assailants inspired by terrorist groups but who otherwise have no formal connection to, or regular contact with, a terrorist organization (Ref. 5, 6, 7). Moreover, recent attacks indicate that terrorist groups are adept at responding to protections put in place to harden certain targets and will evolve their thinking toward less-protected targets. Given the potential for wide scale public health harm from intentional adulteration of the food supply, we believe that a comprehensive, systematic approach, such as a HACCP-type approach, is the most appropriate one and is not too rigorous. Further, as an example of what can happen when someone intending harm has inside access, in December 2013 a contract employee at Aqlifoods (a subsidiary of Naruha Nichiro Holdings, Japan's largest seafood company), intentionally adulterated several frozen foods with the pesticide malathion. Japanese authorities believe the assailant brought malathion to the plant and injected it into frozen foods during the manufacturing process (Ref. 8). The employee exploited his access to the food prior to packaging to introduce the agent. The adulteration resulted in at least 2,843 mild foodborne illnesses and a recall of 6.4 million packages of frozen seafood (Ref. 9). Though this assailant was most likely trying to harm the company and not trying to cause massive public health harm, this example indicates the damage that can be done by an inside attacker.

Section 103 of FSMA reflects a Congressional determination that the ''hazard analysis and risk-based preventive controls'' approach is appropriate for food defense. Section 103 directs us to promulgate a framework for intentional adulteration that includes concepts that are similar to those in HACCP. Section 103 of FSMA contains requirements applicable to the owner, operator, or agent in charge of a facility required to register under section 415 of the FD&C Act. Section 103(a) of FSMA is a general provision that requires the owner, operator, or agent in charge of a facility to evaluate the hazards that could affect food manufactured, processed, packed, or held by the facility, identify and implement preventive controls, monitor the performance of those controls, and maintain records of the monitoring. Section 103(a) specifies that the purpose of the preventive controls is to ''prevent the occurrence of such hazards and provide assurances that such food is not adulterated under section 402 [of the FD&C Act] or misbranded under section 403(w) [of the FD&C Act]. . . .'' In addition to the general requirements in section 418(a) of the FD&C Act, sections 418(b)–(i) contain more specific requirements applicable to facilities. These include hazard analyses for both unintentionally and intentionally introduced hazards (section 418(b)(1)(2)), preventive controls for both unintentionally and intentionally introduced hazards (section 418(c)(1)(2)), monitoring (section 418(d)), corrective actions (section 418(e)), verification (section 418(f)), recordkeeping (section 418(g)), a written plan and documentation (section 418(h)), and reanalysis of hazards (section 418(i)). Therefore, we believe that FSMA directs us to take a ''preventive controls approach'' for food defense, as well as food safety.

We agree that, while the regulatory approaches for food defense and food safety fundamentally should be similar, there need to be differences in how the approach is implemented for food defense. We do not agree that a HACCP-type approach is too prescriptive in general for food defense, but additional flexibility is needed in the application of the approach for food defense given the difference in the nature of the potential adulteration and the implementation of mitigation strategies that are not likely to be process-oriented or readily lend themselves to validation. We also agree that differences in terminology are appropriate. (See responses to Comment 2, Comment 45, and Comment 47.)

(Comment 2) While some comments acknowledge that section 103 of FSMA directs us to promulgate a framework for intentional adulteration that includes concepts that are similar to those in HACCP, these comments also request that we provide more flexibility than a traditional HACCP framework, with specific requests for flexibility in the management components of monitoring, corrective actions, and verification.

(Response 2) We agree that the intentional adulteration regulatory framework should provide more flexibility than that of a traditional HACCP approach. We believe there are key disciplinary differences between food safety and food defense that argue for additional flexibility in the intentional adulteration framework. Most significantly, improper implementation of preventive controls is more likely to result in adulterated

food than is improper implementation of mitigation strategies. Preventive controls are more likely to be process-oriented and lend themselves to being scientifically validated. Mitigation strategies are more likely to be implemented to reduce physical access to a point, step, or procedure, and/or reduce the opportunity for an attacker to successfully contaminate the food and, in most instances, do not lend themselves to scientific validation. These differences indicate a need to apply the concepts of the HACCP approach in a more flexible manner for food defense.

Recognizing the differences in the likelihood of adulteration and the differences in mitigation strategies compared to the process-oriented preventive controls, the intentional adulteration corrective actions requirements contain neither provisions for the evaluation of all affected food for safety in the event a corrective action is required nor provisions for unanticipated corrective actions (see § 121.145). Further, the intentional adulteration verification requirement does not contain provisions for validation, calibration, product testing, environmental monitoring, review of records for calibration, testing, or supplier verification (see § 121.150). We believe this more flexible approach for food defense is appropriate and adds flexibility compared to the provisions of the PCHF final rule.

We also have added flexibility to the identification of mitigation strategies similar to the flexibility added to the identification of preventive controls in the PCHF final rule (80 FR 55908 at 56020). Although each facility subject to this rule must prepare and implement a food defense plan, the mitigation strategies that the facility would establish and implement would depend on the facility, the food, and the outcome of the facility's vulnerability assessment to identify actionable process steps (§§ 121.130 and 121.135). For examples of this added flexibility related to mitigation strategies, see the discussion in section V.C.

As requested in comments, we also have changed regulatory text to reflect the inclusion of more flexibility in monitoring, corrective actions, and verification (see §§ 121.138, 121.140, 121.145, and 121.150 and discussed in more detail in the relevant sections later in this document). These changes are similar to those made in the regulatory text for preventive controls management components.

As we have concluded that similar regulatory approaches are appropriate for both food safety and food defense, we have adopted the flexibility included in the PCHF final rule management components regulatory text, as appropriate for these intentional adulteration requirements. The intentional adulteration provisions for mitigation strategies management components make clear that mitigation strategies management components are required as appropriate to ensure the proper implementation of each such mitigation strategy, taking into account the nature of the mitigation strategy and its role in the facility's food defense system, and we have added § 121.138 to reflect this change. Likewise, the provisions for each of the individual mitigation strategies management components (*i.e.,* food defense monitoring, food defense corrective actions and food defense verification) individually provide flexibility, either by specifying that the provisions apply as appropriate to the nature of the mitigation strategy and its role in the facility's food defense system (*i.e.,* for food defense monitoring and food defense verification) or as appropriate to both the nature of the mitigation strategy and the nature of the significant vulnerability (*i.e.,* for food defense corrective actions) (see §§ 121.140, 121.145, and 121.150). For additional discussion of the flexibility added for the mitigation strategies management components, see sections V.E, V.F, and V.G and in particular the responses to Comment 88, Comment 89, Comment 90, Comment 92, Comment 93, and Comment 95.

(Comment 3) Some comments state that the intentional adulteration proposed HACCP approach is ''one size fits all.''

(Response 3) We disagree. The intentional adulteration requirements to conduct a vulnerability assessment to identify actionable process steps, identify and implement mitigation strategies, and use mitigation strategies management components provide significant flexibility, are tailored to the facility and its processes, and are therefore not ''one-size-fits-all.'' Although each facility with significant vulnerabilities is required to identify and implement mitigation strategies, the mitigation strategies that the facility would establish and implement would depend on the facility, the food, and the outcome of the facility's vulnerability assessment (§§ 121.130 and 121.135). In addition, the mitigation strategies management components (*i.e.,* food defense monitoring, food defense corrective actions, and food defense verification) that a facility would establish and implement for its mitigation strategies would be established as appropriate to ensure the proper implementation of the mitigation strategies, taking into account the nature of each such mitigation strategy and its role in the facility's food safety system (§ 121.138).

(Comment 4) Some comments state that management and oversight activities of mitigation strategies should occur if they are ''appropriate'' (suitable for a particular purpose or capable of being applied) and ''necessary'' (taking into account the nature of both the significance of the vulnerability and the particular mitigation strategy) for food defense.

(Response 4) We agree that mitigation strategies management components of the HACCP-type framework should occur if they are appropriate and necessary. As we have concluded that similar regulatory approaches are appropriate for food safety and food defense, we have adopted the flexibility included in the PCHF final rule management components regulatory text (§ 117.140(a)), as appropriate for these intentional adulteration requirements. The intentional adulteration provisions for mitigation strategies management components make clear that mitigation strategies management components are required as appropriate to ensure the proper implementation of the mitigation strategies, taking into account the nature of each such mitigation strategy and its role in the facility's food defense system, and we have revised proposed requirements for monitoring, corrective actions, and verification to reflect these changes (see §§ 121.138, 121.140, 121.145, and 121.150).

(Comment 5) Some comments state that the requirement for the amount of paperwork associated with a HACCP-type approach, and the information contained therein, may be counterproductive to the goal of mitigating or preventing vulnerabilities because individuals or groups interested in conducting these types of attacks may try to access this information.

(Response 5) We disagree. A written food defense plan and its required contents, which include the vulnerability assessment, the identification and implementation of mitigation strategies, and mitigation strategies management components, are essential to significantly minimizing or preventing significant vulnerabilities related to intentional adulteration of food, where the intent of the adulteration is to cause wide scale public health harm. The required documentation of the plan and implementation of the plan are necessary so that both the facility and FDA can ensure that the significant

vulnerabilities are being addressed properly. We encourage facilities covered by this rule to adequately protect food defense plans and associated information and records. For a more detailed discussion related to protecting food defense plan information, see section VI.F.

(Comment 6) One comment disagrees with the HACCP framework, and requests we use a current good manufacturing practice (CGMP) approach. This comment states that such an approach provides facilities with sufficient flexibility to address intentional adulteration. Another comment supports using a HACCP approach in the context of allowing facilities to utilize prerequisite programs.

(Response 6) We disagree that a CGMP approach is the most appropriate approach. We address the appropriateness and flexibility of the HACCP-type approach in responses to Comment 1 and Comment 2. We address the potential to consider pre-existing activities while conducting a vulnerability assessment and identifying and implementing mitigation strategies in Response 72 and Response 83.

We are requiring a HACCP-type approach rather than a CGMP-type approach for several reasons. First, the management components in a HACCP-type approach are the most effective means, as discussed in the response to Comment 1, of ensuring that the mitigation strategies are consistently applied. Second, as with food safety, there are hazards (or in food defense terms, vulnerabilities) that warrant requirements that are more rigorous than general, non-targeted CGMP provisions. The vulnerabilities that warrant such requirements are those that we have concluded are the highest risk, namely intentional adulteration conducted at actionable process steps, including those vulnerabilities associated with an inside attacker, intended to cause wide scale public health harm. It is precisely these attacks at these points that require the most robust and rigorous system to ensure that vulnerabilities are assessed, significant vulnerabilities are identified, and mitigation strategies are properly implemented to reduce these significant vulnerabilities. General, non-targeted CGMP requirements (*e.g.,* restricting access to outsiders) would not necessarily focus on the significant vulnerabilities or ensure that mitigation strategies are implemented to harden the potential targets. Finally, section 418 of the FD&C Act requires that hazards intentionally introduced be addressed in a HACCP-type framework.

(Comment 7) One comment asserts that because we already have required food safety plans for facilities under a separate rulemaking, and because an act of intentional adulteration of food that would cause wide scale public health harm is not likely to occur, a separate food defense plan, and thus this rule, is not necessary.

(Response 7) We disagree. Although it is true that most facilities covered by this rule will also have a food safety or HACCP plan, the focus of those plans is on preventing the contamination of food from hazards that are unintentionally introduced and, therefore, the control points and the measures implemented in those plans differ from those in a food defense plan. It is unlikely that a facility would choose preventive controls under the PCHF final rule that would be sufficient to address vulnerabilities to intentional adulteration. For example, it is unlikely that a facility conducting a hazard analysis would identify the step of holding a liquid, such as a syrup, in a tank in a facility as a hazard requiring a preventive control. In conducting a hazard analysis, the facility would likely be considering whether there are hazards associated with the incoming syrup or ingredients for the syrup or the syrup production process (inadequate heating), but would not likely identify the step of holding the syrup as requiring a preventive control. However, in a vulnerability assessment, the step of holding liquid syrup may be identified as a significant vulnerability if (1) there would be significant public health consequences if a contaminant were added, (2) there is access to the product while being held, and (3) an attacker would be able to successfully contaminate the product.

With regard to the statement that an act of intentional adulteration is not likely to occur, we agree that the likelihood of an incident is low. However, given the potential for a successful intentional adulteration of food to cause wide scale public health harm, it is prudent for the largest facilities to take preventive measures, and it is required by sections 418 and 420 of the FD&C Act that they do so.

B. One Set of Requirements Under Sections 418 and 420 of the FD&C Act

(Comment 8) One comment asserts that the proposed rule blends sections 103 and 106 of FSMA into one set of requirements and disagrees with that approach. The comment states that section 103 requires basic foundational food defense activities, including food defense plans at all registered food facilities. The comment contrasts this with section 106, which it states provides FDA with the authority to designate certain foods as ''high risk,'' and to require certain escalated food defense activities for those foods. The comment asserts that FDA should designate foods as ''high risk'' based on real-time actionable intelligence of a credible threat. The comment acknowledges that section 103 of FSMA does not apply to facilities required to comply with the seafood HACCP program, the juice HACCP program, or the dietary supplement CGMPs, but because none of these regulations address food defense programs, the comment asserts the Agency can use other legal authority to require these food facilities to have food defense programs.

(Response 8) The final rule requires ''basic foundation[al] food defense activities'' as well as providing for ''escalated food defensive activities'' where warranted. To provide for foundational food defense, the rule requires a food defense plan (*i.e.,* a vulnerability assessment, mitigation strategies, and procedures for food defense monitoring, corrective actions, and verification) and associated actions. These requirements are the minimum measures necessary to provide assurances that hazards that relate to intentional adulteration intended to cause wide scale public health harm will be significantly minimized or prevented. Weakening these provisions, such as by eliminating the requirement to implement mitigation strategies to address significant vulnerabilities at each actionable process step, would result in food defense measures inadequate to address the threat of an inside attacker. As discussed in response to Comment 1, our interactions with the intelligence community, as well as the conclusions reached during vulnerability assessments conducted in collaboration with industry, have identified an inside attacker as the highest threat.

Further, the suggested approach would place too much reliance on FDA having real-time actionable intelligence of a credible threat. As discussed in the responses to Comment 11 and Comment 12, there are a number of limitations to this approach. FDA may not receive specific, real-time, credible threat intelligence. Further, rapidly communicating even specific, actionable information to the food industry so that it is received by all of the relevant facilities would present challenges. Although some facilities may be able to identify some or all actionable process steps and implement mitigation strategies within a short

timeframe, many other facilities would not be able to identify and implement the necessary mitigation strategies and the mitigation strategies management components (*e.g.,* food defense monitoring, corrective actions, verification) within the short time period that could be required in the event of a credible threat. In addition, taking action only in the event of a credible threat may not be sufficient to prevent wide scale public health harm. Measures taken after the threat is known may not be sufficient to prevent an attack if the intelligence does not provide enough specific information, such as the food product, contaminant, point of attack in a facility, and geographic location of an attack.

Because the vulnerability assessment identifies the specific foods at specific process steps at greatest risk, it also serves to identify those foods that must be protected against intentional adulteration under section 420. Having one set of requirements for food defense measures helps ensure that the significant vulnerabilities will be significantly minimized or prevented and addressed consistently across sections 418 and 420 (see section 418(c)(2)). Further, as suggested by the comment, the rule provides for escalated food defense activities when necessary. Specifically, § 121.157(b)(4) requires reanalysis of a food defense plan (which could lead to the identification of additional needed mitigation strategies) whenever FDA requires it to respond to new vulnerabilities or credible threats to the food supply.

(Comment 9) One comment asserts that the proposed combination of provisions under sections 418 and 420 of the FD&C Act has created complexity that could be eliminated by removing acts intended to cause massive public health harm from section 418 and covering them solely under section 420. The comment further asserts that although section 418 includes ''acts of terrorism'' within the hazard analysis, Congress did not intend to add this level of complexity to the rule and create new work that is inconsistent with materials previously created to address food defense. Further, the comment states that it appears these new requirements were included in the rule as a consequence of the statutory language rather than to reduce risk.

The comment states that one key difference between sections 418 and 420 is that section 418 requires the facility to identify hazards related to intentional adulteration while section 420 requires FDA to identify vulnerabilities that could result in serious adverse health consequences. The comment asserts that due to the confidentiality of information that serves as the basis for the FDA vulnerability assessments, it would be more appropriate for FDA to perform the assessment for acts that could cause massive public health harm and for the facility to perform a vulnerability assessment for other types of intentional adulteration that may be specific to a facility and are outside of the FDA's vulnerability assessment.

(Response 9) FDA believes that a single unified set of requirements (*i.e.,* this rule) is more clear and less complex than dividing the types of intentional adulteration covered by this rule into two categories with two sets of requirements, as suggested by the comment. It is not clear what would be covered under section 418 if it applied only to ''other types of intentional adulteration that may be specific to a facility,'' as suggested by the comment. Further, we do not believe the provisions of the rule are inconsistent with our current guidance; rather, they are more comprehensive and robust. FDA believes that these new requirements will reduce risk beyond what is contained in our current guidance documents. Our guidance documents mainly focus on assessing vulnerabilities and identifying mitigation strategies, but do not include recommendations for mitigation strategy management components. We believe the management components (part of a HACCP-type framework) are critical to ensuring that any hazards that relate to intentional adulteration intended to cause wide scale public health harm will be significantly minimized or prevented. Further, the confidentiality of vulnerability assessments that FDA conducted is not a barrier to a facility conducting a vulnerability assessment under this rule. The key activity types that FDA has identified were derived from FDA's vulnerability assessments and using key activity types to conduct a vulnerability assessment remains a permissible option under the final rule.

In addition, as recognized by the comment, section 418 explicitly applies to ''acts of terrorism.'' Specifically, 418(b)(2) requires that a hazard analysis identify and evaluate hazards that may be intentionally introduced, including by acts of terrorism. Further, section 418(i) authorizes FDA to require a reanalysis to respond to new hazards including, as appropriate, results from terrorism risk assessments. Generally, acts of terrorism involving the food supply would be committed with the intention to cause wide scale public health harm. Therefore, they are clearly covered by section 418.

(Comment 10) Some comments suggest that FDA require a hybrid approach where all facilities subject to section 103 are required to conduct a vulnerability assessment and develop and implement a basic food defense plan. Under the hybrid approach, if a credible threat is identified, then section 106 would serve as an escalation provision and allow FDA to designate specific food(s) associated with the credible threat as ''high risk.'' Comments suggest that FDA could then require facilities with these high risk foods to reassess their food defense plans and implement appropriate mitigation strategies that FDA may specify to address the threat. Comments argue that if all potential mitigation strategies need to be identified through the vulnerability assessment and are managed in the absence of actionable intelligence of a credible threat, then there is no ability to escalate the plan with respect to certain mitigation strategies when needed.

(Response 10) FDA agrees with the comment in part. As discussed in response to Comment 8, this rule requires facilities to conduct a vulnerability assessment and develop and implement foundational food defense activities. Further, the rule provides a mechanism which serves a similar function to the ''escalation provision'' described in the comment. Specifically, under § 121.157(b)(4), FDA can require facilities to reassess their food defense plans, which could trigger a requirement to implement additional mitigation strategies.

FDA disagrees that the rule requires ''all potential mitigation strategies'' to be identified and managed. We believe we have appropriately balanced the need to provide assurances that hazards associated with intentional adulteration are being prevented with the low likelihood of a successful attack on the food supply. The rule does not mandate specific mitigation strategies be implemented at actionable process steps but rather allows strategies to be tailored to the facility and its procedures. We also disagree that there is ''no ability to escalate the plan with respect to certain mitigation strategies.'' In response to a credible threat involving a specific agent, a covered facility could reanalyze its food defense plan with specific focus on the relevant agent. The facility then could implement specific mitigation strategies to counter this threat (such as processing changes, product testing, or other appropriate measures) that are not currently required by the rule.

C. Require Measures Only in the Event of a Credible Threat

In the proposed rule, we sought comment on whether it would be feasible to require measures to protect against intentional adulteration only in the event of a credible threat. We also sought comment on whether such an approach would be consistent with the intentional adulteration provisions of FSMA and how such requirements would be communicated to industry in a timely and actionable manner.

Many comments agree with the requirements as proposed that measures to protect food against intentional adulteration be required even in the absence of a credible threat but some comments support requirements only in the event of a credible threat. Some comments assert that FDA has the tools available in the Registration of Food Facility database to establish a communications protocol to notify industry if there is a credible threat. A few comments express concern over the difficulty of developing and implementing food defense plans in a timely manner in the event of a credible threat.

In the following paragraphs, we discuss these comments and our responses. After considering the comments, we have revised the regulatory text in § 121.157(b)(4) to include specific language that provides for FDA to require facilities to conduct a reanalysis of their food defense plans to, among other things, respond to credible threats to the food supply.

(Comment 11) Some comments state that this rule should only go into effect in the event of a credible threat. One of these comments argues that the oilseed processing industry that they represent has never been the target of attacks or threats and therefore they are unlikely targets for intentional adulteration and should be exempted from the rule unless there is a credible threat against a facility or industry as a whole.

(Response 11) We disagree with these comments. The fact that the oilseed processing industry and other food industry sectors have not been attacked in the past does not mean that these industry sectors will never be attacked. Nor does it mean that preventive mitigation strategies are unnecessary. As discussed in response to Comment 8, taking action only in the event of a credible threat may not be sufficient to prevent wide scale public health harm.

(Comment 12) Some comments encourage FDA to collaborate with the U.S. Department of Homeland Security (DHS), the Federal Bureau of Investigation (FBI), and other Federal and State Agencies to ensure that the relevant stakeholders of the food industry are notified in a timely manner upon discovery of a credible threat. These comments discuss that alerting the food industry to known credible threat information would be valuable because there may be additional mitigation strategies that could be put into place when there is a threat. The comments further explain that having such knowledge would allow for industry stakeholders with specific, technical knowledge of their products, equipment and plant security to better collaborate and support the efforts of law enforcement. Some comments recommend that we establish and formalize a mechanism and process to communicate credible threat information to relevant stakeholders in industry and that the Food Facility Registration database could help facilitate this. The comments also recommend that we conduct exercises to test this mechanism so that all stakeholders are aware of the established communications process and can make adjustments and improvements as necessary. Several comments recommended that we convene a panel of industry stakeholders annually to discuss threat intelligence at the ''Secret'' level.

(Response 12) We concur with the recommendation that we should collaborate with our Federal and State Agency partners on the discovery and communication of credible threats in a timely manner. Currently, FDA regularly meets and communicates with DHS, FBI, the U.S. Department of Agriculture (USDA), and State and local Agency partners through the Food and Agriculture Sector Government Coordinating Council (GCC) to discuss food defense issues and research activities and introduce new initiatives for mutual evaluation, implementation, and education. FDA's Office of Criminal Investigations (OCI) works closely with the FBI and other Agencies on a regular basis on threats against FDA-regulated products, including food. We also agree that notifying relevant stakeholders within industry of credible threats is essential to protecting the food supply. The Food and Agriculture Sector GCC and Sector Coordinating Council (consisting of private sector members) hold in-person joint meetings twice a year and, when needed, classified meetings at the ''Secret'' level are held to exchange information. As we move towards implementing this rule, we will continue to work with our partners—both in government and the private sector—to include them in discussions regarding communicating credible threat information.

(Comment 13) One comment states that the term ''credible threat'' is not adequately defined in the proposed rule, nor is the relationship between a ''credible threat'' and a ''reasonably foreseeable hazard'' adequately described. The same comment also notes that because the term ''credible threat'' is commonly used to discuss sensitive or classified information, the use of the term may place an unrealistic expectation for sharing of sensitive or classified threat information between government agencies and the private sector. The comment suggests either removing the term ''credible threat'' from the rule or including a definition with an explanation of the mechanism for sharing information about credible threats with the food industry.

(Response 13) We disagree with this comment and decline the request to include a definition for credible threat. It is not possible to identify with precision what constitutes a credible threat. There are many factors to consider in regards to how, what, when, or why those who intend to cause harm may take action. As such, it is not possible to write a definition for credible threat that is neither so broad that it covers potentially any piece of intelligence, nor so narrow that it is unnecessarily limiting. FDA routinely works with other agencies to maintain situational awareness of potential threats to the food supply and will consider that information in determining whether intelligence rises to the level of a credible threat.

Within the context of protecting food against intentional adulteration with the intent to cause wide scale public health harm, we see no direct relationship between a ''credible threat'' and a ''reasonably foreseeable hazard.'' ''Known or reasonably foreseeable hazard'' is defined in the PCHF final rule to mean a biological, chemical (including radiological), or physical hazard that is known to be, or has the potential to be, associated with the facility or the food. We do not use the phrase ''reasonably foreseeable'' within the context of intentional adulteration because it does not apply.

We acknowledge that there will be challenges to sharing sensitive or classified threat information between government agencies and the private sector. That is one of several reasons that we are not making the requirement for mitigation strategies dependent on a particular credible threat. In the event such information was to become known, FDA intends to work with its

government partners to determine the appropriate course of action.

(Comment 14) Some comments recommend that in the event of a credible threat, a facility could conduct a reassessment or reanalysis of its food defense plan so that it could better tailor its mitigation strategies to the threat. Some comments recommend that FDA revise the regulatory text within proposed § 121.150 for reanalysis to require facilities to reassess their food defense plans when the Agency has actionable intelligence of a credible threat of intentional adulteration.

(Response 14) In the proposed rule, we describe that we may require a reanalysis of the food defense plan in the event of a credible threat. However, this was not specifically stated within the regulatory text. Therefore, we have revised § 121.157(b)(4) to provide that reanalysis may be required by FDA to respond to credible threats to the food supply. We did not see the need to include ''actionable intelligence'' in the regulatory text because we believe that ''credible threat to the food supply'' implies a threat that also requires actionable intelligence.

D. General Comments on Implementation and Compliance

We received a substantial number of comments with regard to how the Agency will implement this rule. Many comments focused specifically on the need for inspectors to be provided food defense training to enable them to make informed decisions during inspections and compliance activities. Another issue raised by many comments is that the Agency should make available guidance resources, tools, training, and other information to help facilities comply with the final rule. In the section that follows, comments related to implementation and compliance are discussed.

(Comment 15) Some comments state that existing regulatory inspections should include evaluation of the intentional adulteration rule requirements for the best use of time and resources.

(Response 15) FDA is currently considering the best approach for structuring and conducting food defense inspections. We recognize that inspections require resources from facilities and recognize that some facilities may prefer that food defense inspections be conducted as part of an inspection for other regulatory programs, such as preventive controls for human food. We will consider this when developing our enforcement strategy.

(Comment 16) Some comments express concern about the level of training that will be needed for inspectors. These comments state that the inspectors must be trained specifically on food defense and that FDA should be transparent about the training that we provide the inspectors. Comments emphasize the importance that FDA provide specialized training to ensure consistent compliance and enforcement activity by the Agency.

(Response 16) FDA understands and agrees with comments that state that training for inspectors conducting food defense inspections is critical to a consistent and adequate inspection, compliance, and enforcement system. We agree with the comment that specialized training in food defense will be required for inspection and compliance staff to evaluate a facility's compliance with this rule. FDA has begun the process of assessing its training needs for inspectors on food defense. It is our intention that training provided to our inspection and compliance staff will be consistent with that training for industry that will be provided by the Intentional Adulteration subcommittee organized within the Food Safety Preventive Controls Alliance (see Comment 105) to facilitate consistent implementation of this rule. This strategy is consistent with the other FSMA food safety regulations and training strategies.

(Comment 17) Some comments state that inspections should have a ''big picture'' focus, and focus on the evaluation of the facility's vulnerability assessment. Additionally, comments state that this inspection should not compare the mitigation strategies used at other facilities to the facility being inspected.

(Response 17) We agree. The rule is designed to provide flexibility such that facilities can select appropriate mitigation strategies that are best suited for their operations. FDA investigators will consider a facility's written explanations regarding identification of actionable process steps and selection of mitigation strategies when evaluating a food defense plan to understand a facility's rationale. In addition, we will work to educate industry before and while we regulate to assist industry to gain and maintain compliance with the rule.

(Comment 18) Some comments request that FDA not cite food defense-related items on FDA's Form 483 until the facilities and inspectors learn about compliance with the intentional adulteration rule. Additionally, some comments state concerns about FDA including potentially sensitive information from food defense plans when citing food defense-related items on Form 483.

(Response 18) FDA is currently in the process of developing its inspection and compliance strategy for the intentional adulteration rule and an important part of this strategy development will include methods and processes for information exchange with regulated industry. We recognize that food defense inspections could include evaluation of sensitive information, including vulnerability assessments and mitigation strategies. For a more detailed discussion on how FDA will protect food defense-related information, see section VI.F, Public disclosure.

(Comment 19) Some comments request that FDA include State departments of agriculture in the process to develop and implement inspection and compliance programs.

(Response 19) As mentioned previously, FDA is currently in the process of developing its inspection and compliance strategy for the intentional adulteration rule. FDA's implementation working group for this rule includes representation from State partners, and State partners will continue to play an essential and collaborative role throughout the process.

(Comment 20) Several comments state that an alliance would be beneficial for the implementation of the intentional adulteration rule.

(Response 20) Training alliances have played an important role in facilitating industry compliance with many regulations in the past. We agree with the comment and are in the initial stages of organizing and establishing the Intentional Adulteration subcommittee within the Food Safety Preventive Controls Alliance operated out of the Institute for Food Safety and Health at the Illinois Institute of Technology. We anticipate the Intentional Adulteration training subcommittee will assist industry compliance with this final rule by supporting the development and dissemination of training resources. We further anticipate that the curriculum developed through the Intentional Adulteration subcommittee will form the basis of training for regulators as well.

(Comment 21) Some comments state that equal enforcement of this rule across companies domestically and globally may require FDA to adopt different enforcement mechanisms.

(Response 21) We intend to enforce this rule in a consistent manner with regard to imported and domestically produced foods. FDA is currently in the

process of developing its inspection and compliance strategy, including how facilities will be selected for inspections and how inspections will be conducted for both domestic and foreign facilities. Further, we intend to engage in significant outreach activities—both domestically and internationally—to facilitate industry compliance with this rule and to communicate the Agency's current thinking on inspection, compliance, and enforcement strategies. Additionally, we intend to develop fact sheets, FAQ documents, guidance documents, and other informational materials as needed to support domestic and foreign industry compliance with the rule.

(Comment 22) Several comments recommend that food defense activities conducted under programs, such as the Department of Homeland Security's (DHS) Customs-Trade Partnership Against Terrorism (C–TPAT) and mutually recognized international programs, the Chemical Facility Anti-Terrorism Standards (CFATS), the USDA Food Safety and Inspection Services (FSIS) food defense plan template, should be recognized as meeting the requirements of this rule. Several comments state that there are global food safety schemes that include food defense requirements which could be leveraged in inspections and implementation. Comments suggest that audits and private certifications done under these food safety schemes should be sufficient for meeting the requirements of this rule.

(Response 22) We disagree. The programs identified by comments are not sufficient to substitute for compliance with this rule. For example, they do not require mitigation strategies at all actionable process steps and therefore are not sufficient to significantly minimize or prevent intentional adulteration intended to cause wide scale public health harm. Further, even if currently they were sufficient for compliance for this rule, they could change at any time.

C–TPAT is a voluntary supply-chain security certification program led by U.S. Customs and Border Protection (CBP) that focuses on private companies (including food companies) implementing anti-terrorism measures to protect their supply chains. When companies join C–TPAT, they sign an agreement to work with CBP to identify supply chain security gaps and implement specific security measures and best practices. CBP has found that the security standards of some foreign industry partnership programs are similar to those of the C–TPAT program.

CFATS is a DHS program which regulates high-risk chemical facilities to ensure they have anti-terrorism measures in place to reduce risks associated with the storage and use of these high-risk chemicals. Any facility that possesses ''chemicals of interest,'' as identified by DHS, in certain quantities is considered a covered facility that must meet some or all of the requirements under CFATS. Some agriculture and food facilities are subject to CFATS requirements. Covered chemical facilities are required to prepare Security Vulnerability Assessments that identify facility security vulnerabilities and to develop and implement Site Security Plans that identify measures that satisfy risk-based performance standards. These risk-based performance standards focus on physical security of the chemicals.

Although both CFATS and C–TPAT programs address some of the security concerns related to some food facilities, neither program addresses the unique vulnerabilities associated with the food being manufactured, processed, packed or held at the facility. In general, voluntary security programs such as C–TPAT focus on global supply chain security measures involved in the transportation of goods from location to location. The CFATS program focuses on reducing risks related to chemicals, even in facilities that are mainly geared toward food production. In contrast, vulnerability assessments required by this rule require identification of significant vulnerabilities at discrete processing steps within a facility, where the intent of the attack is to cause wide scale public health harm by contaminating the food supply. Further, a vulnerability assessment must consider the threat stemming from an inside attacker. Once these significant vulnerabilities are identified, mitigation strategies are implemented at or near those most vulnerable processing steps. Given these differences, it is unlikely that facilities would be compliant with this rule were they to rely wholly on assessments and mitigation strategies conducted as part of other programs.

The food defense plan template from USDA FSIS is voluntary for FSIS-regulated facilities, and is organized in four sections: (1) Outside Security Measures, (2) Inside Security Measures, (3) Personnel Security Measures, and (4) Incident Response Security Measures. The template focuses on a facility's physical security measures, which are analogous to recommended, but not required, facility wide security measures in this rule. FSIS-regulated facilities are encouraged to read and sign the template, adopt it as their food defense plan, and then implement, test, and maintain the plan.

There are important similarities between the plan template and some requirements in this rule. For example, some security measures listed in the template are similar to some mitigation strategies included in the FDA Mitigation Strategies Database. The testing of the plan is somewhat similar to food defense monitoring. The plan template also suggests awareness training for employees, which is similar to a food defense awareness training requirement in this rule. The similarities reflect FDA and USDA collaboration on food defense activities for many years as discussed in the proposed rule (78 FR 78014 at 78021).

However, food defense plans developed using the FSIS template would not meet all requirements of this final rule. Specifically, FSIS's food defense plan template does not include a vulnerability assessment of the points, steps, or procedures in a food process, nor does it include implementation of mitigation strategies specific to the vulnerable points. Additionally, the plan template does not include food defense monitoring, food defense corrective action, food defense verification, and some training required by this rule.

In addition, we recognize that there are existing global food safety schemes that include food defense requirements and that many in the food industry have already adopted and implemented these requirements. For example, the Global Food Safety Initiative's (GFSI) Guidance Document Sixth Edition (Ref. 10) addresses food defense. Subsequently, many of the GFSI-recognized schemes include more specific food defense requirements. The Safe Quality Foods (SQF) Code, edition 7.1 is a process and product certification standard that specifies various food defense elements, including that the methods, responsibility, and criteria for preventing food adulteration caused by a deliberate act of sabotage or terrorist-like incident shall be documented, implemented and maintained (Ref. 11). Another example of industry standards that incorporate food defense elements is the International Featured Standards (IFS) Food Version 6 Standard, which specifies that areas critical to security be identified, food defense hazard analysis and assessment of associated risks be conducted annually or upon changes that affect food integrity, and an appropriate alert system be defined and periodically tested for effectiveness (Ref. 12). We recognize that some in the food industry have already voluntarily taken steps to incorporate and implement food

defense measures; however, they are not adequate to substitute for meeting the requirements of this rule.

Although participation with global food safety schemes and other programs administered by our Federal partners are not substitutes for compliance with this rule, we believe that participation in programs such as C–TPAT, CFATS, the use of the FSIS food defense plan template, or international programs granted mutual recognition status as that of C–TPAT, for example, decreases a facility's vulnerability to intentional adulteration and can work in concert with the requirements of the final rule. Additionally, a facility's participation in such programs may be considered by FDA as we prioritize risk-based inspections of facilities subject to the final rule. Further, we note that a facility may use existing records (*e.g.,* records that are kept as part of these other programs) to meet the requirements of this rule, if they contain all of the required information and, facilities may supplement existing records as necessary to include all of the information required by this rule (§ 121.330).

(Comment 23) Some comments state that laws in the European Union currently require food facilities to take necessary measures to prevent intentional adulteration, and it is therefore not justified to request additional safety or security requirements for facilities subject to these laws.

(Response 23) We disagree. This rule contains those measures FDA has determined are necessary to protect food against intentional adulteration. To the extent a facility is already taking actions that are required by this rule, a facility will have to make fewer changes to its operations. These security measures should be evaluated on a case-by-case basis to determine if they qualify as a mitigation strategy under this rule.

(Comment 24) Some comments request that FDA focus on education over enforcement and use discretion during inspections.

(Response 24) As FSMA as a whole is a substantial change in how FDA approaches regulating the food and agriculture sector, we recognize that significant outreach, education, and training will be required to facilitate industry compliance with all FSMA rules. As previously stated by the Agency, one of the guiding principles for implementing FSMA is that the Agency will educate before and while we regulate. This includes a focus on sector-specific guidance, education, outreach, and technical assistance for industry. The intentional adulteration rule implementation will include these efforts to ensure facilities gain understanding and awareness to comply with the rule. In addition, we are providing for a longer timeline for facilities to come into compliance, allowing for more outreach and dialogue with industry. Facilities, other than small and very small businesses, have 3 years after the effective date to comply with part 121. Small businesses (*i.e.,* those employing fewer than 500 full-time equivalent employees) have 4 years after the effective date to comply with part 121. Very small businesses (*i.e.,* businesses that have less than $10,000,000, adjusted for inflation, per year, during the 3-year period preceding the applicable calendar year in both sales of human food plus the market value of human food manufactured, processed, packed, or held without sale, *e.g.,* held for a fee) have 5 years after the effective date to comply with § 121.5(a).

(Comment 25) Some comments recommend that FDA update the Food Defense Plan Builder software tool to capture the elements of a food defense plan required by the final rule, such as monitoring, corrective actions, and verification.

(Response 25) FDA plans to update existing tools and resources, including the Food Defense Plan Builder software, to assist industry with meeting the requirements for the final rule.

(Comment 26) Several comments request that FDA periodically update its online tools and resources for companies to have access to information about broad mitigation strategies, although they are not required under the rule.

(Response 26) FDA intends to publish guidance to support industry compliance with the final rule. This guidance will include information relevant to the required provisions of the final rule and also will likely include helpful information on facility-wide security measures as well as other best practices and recommendations to assist facilities in their development of a comprehensive food defense program. In addition, FDA has a number of tools and resources currently available on our Web site (*http://www.fda.gov/fooddefense*) that were developed for our voluntary food defense program that can assist industry.

E. Comments on Requests for Additional Exemptions

In the proposed rule we specifically requested comments on whether there are other ways in which the coverage of this regulation can be further focused on foods that present a high risk of intentional adulteration caused by acts of terrorism. In this document we discuss comments we received with specific recommendations on foods or activities to exempt from the rule.

(Comment 27) Some comments assert that facilities engaged solely in cooling, holding, handling, packing, repacking, packaging and shipping of raw, intact fresh produce, similar to activities that may be performed on farms, are unlikely to be engaged in any of the key activity types and should be exempt from this rule. The comments describe activities conducted by these facilities, including application of fungicide, food grade wax coating, sorting and placing whole intact produce into boxes for shipping. The comments further state that whole intact produce would not be an attractive or feasible target for an act of intentional adulteration with the intent to cause wide scale public health harm, regardless of where the activities occur.

(Response 27) We decline the requested exemption for facilities engaged solely in cooling, holding, handling, packing, repacking, packaging and shipping of raw, intact fresh produce. We recognize that some of these facilities may not have any significant vulnerabilities; however, some may. For example, packaging may be a significant vulnerability, depending on the degree of access to the food and the characteristics of the packaging area (*e.g.,* in a minimally trafficked area where individuals are working alone for extended periods of time, or if the product is being sprayed with fumigant or fungicide applications that may serve to apply a contaminant onto the food). Therefore, to determine whether any mitigation strategies are needed, each facility must conduct a facility specific vulnerability assessment that considers, at a minimum: (1) The potential public health impact if a contaminant were added (*e.g.,* severity and scale); (2) the degree of physical access to product; and (3) the ability of an attacker to successfully contaminate the product. Any of the activities described in the comments that are otherwise covered by existing exemptions do not need to be considered in the vulnerability assessment. For example, holding of foods other than in liquid storage tanks is exempt from the rule (§ 121.5(b)). Also, packing or re-packing of food where the container that directly contacts the food remains intact is exempt (§ 121.5(c)).

If after conducting a vulnerability assessment, a facility appropriately concludes that it has no actionable process steps, the facility would not be required to implement mitigation strategies. The facility's food defense plan would include the vulnerability

assessment, the conclusion that no actionable process steps are present, and an explanation for this conclusion at each step. In contrast, facilities with actionable process steps are required to implement mitigation strategies and the appropriate mitigation strategies management components.

(Comment 28) One comment suggests that we exempt food additives used in low dosages. The comment asserts that ''the dosage of food additives are approximately 0.01—1 percent of the total food, and the final amount of the food additive absorbed into the human body should be very small, roughly 1/100—1/10,000 of the total food consumed.'' The comment further asserts that if a contaminant is added to a food additive used in low dosages, the risk to public health is very small.

(Response 28) We decline this request. Our vulnerability assessments considered a number of factors when evaluating a product's vulnerability to acts of intentional adulteration and the potential public health consequences of such an act, including a wide variety of threat agents. Our vulnerability assessments concluded that there were situations where an act of intentional adulteration could still result in wide scale public health harm even if the dose of the adulterant were at or below the levels highlighted in this comment. Moreover, the concentration of a food additive in the finished product may vary depending on the nature of the product (*e.g.,* citric acid can be added to a food as a flavor enhancer in relatively low concentrations, or to other foods in higher concentrations as a color retention agent).

(Comment 29) One comment recommends that we exempt production and packaging of food ingredients from the rule. The comment asserts that terrorist groups are more likely to attack finished food production than food ingredient production because they want the publicity associated with seeing the harm that their act causes. The comment further asserts that it may be months or years before a contaminated ingredient reaches consumers, and therefore it would not be a likely or attractive target for terrorists who want to make a more immediate impact. The comment also states that a contaminant can be degraded, inactivated, or destroyed in further processing or prolonged storage if it is added to an ingredient. The comment maintains that it is far easier to select an appropriate contaminant with some knowledge of what types of processing it will have to survive. The comment requests that, at a minimum, we exempt the production and packaging of food ingredients from requirements for focused mitigation strategies and make them subject only to requirements for broad mitigation strategies.

(Response 29) We decline this request. As discussed in section IV.B.3, the rule now refers to ''mitigation strategy'' rather than ''focused mitigation strategy.'' Further, our vulnerability assessments concluded that an act of intentional adulteration could still result in wide scale public health harm even if the adulteration occurred during the production of an ingredient. Ingredients have many different distribution paths. Many ingredients can be sold in bulk to manufacturing facilities for inclusion in processed finished foods or be sold in consumer sized packaging for home use. Some ingredients can be used in later processing as a primary ingredient or as a secondary ingredient added in much lower volumes. In either case, the ingredient manufacturer could be an effective point for an attacker to achieve wide scale public health harm.

(Comment 30) One comment supports our proposed exemption § 121.5(c) applicable to packing, repacking, labeling, or re-labeling of food where the container that directly contacts the food remains intact. The comment would like us to further exempt the transportation and holding of foods in retail packaged form from coverage under this rule.

(Response 30) The holding of food, except for holding of food in liquid storage tanks, is exempt under § 121.5(b). Therefore, the holding of foods in retail packaged form is exempt from this rule. Furthermore, as explained in section III.G.1, transportation carriers are not included in the scope of this rule.

(Comment 31) One comment requests that food gases be considered for an exemption for several reasons. The comment states that food gas containers are extremely difficult to breach. Further, the comment states that food gases may be stored in bulk storage tanks either during manufacture, or prior to containerization (*i.e.,* pressurized cylinders) or transport (*i.e.,* cryogenic tankers) but a person intentionally trying to contaminate the product during storage or transportation would require use and knowledge of specialized equipment that is not readily available. The comment argues therefore that food gases are not at high risk for intentional adulteration. In addition, the comment notes that there are several uses for food gases, such as processing aids (*e.g.,* freezing, chilling, pressure transfer) that will have minimal contact with the food provided to consumers, and whether used as a food additive or an ingredient the gas comprises a very small percentage of the final food product.

(Response 31) We decline the request. The comment identifies that food gases may be stored in bulk storage tanks either during manufacture, or prior to containerization or transport. We recognize at some facilities manufacturing food gas may not have any significant vulnerabilities; however, each covered facility must conduct a facility specific vulnerability assessment, and that assessment must consider, at a minimum: (1) The potential public health impact if a contaminant were added (*e.g.,* severity and scale); (2) the degree of physical access to product; (3) the ability of an aggressor to successfully contaminate the product. The comment mentions that breaching food gas containers would require use and knowledge of specialized equipment that is not readily available. However, the vulnerability assessment must include consideration of an inside attacker, so this information may be available to such an individual. The comment also mentions that gases can be stored or transported in liquid form. Based on our vulnerability assessments, liquids storage and handling has been identified as potentially significantly vulnerable. Therefore, facilities manufacturing food gas would need to evaluate their manufacturing process through a vulnerability assessment. If after conducting a vulnerability assessment, the facility appropriately concludes that there are no actionable process steps in the facility, the facility would not be required to implement mitigation strategies. The food defense plan at this facility would include the vulnerability assessment, the conclusion that no actionable process steps are present, and an explanation for this conclusion at each step.

(Comment 32) Some comments request that FDA exempt research and development (R&D) and pilot plants from the rule. These comments argue that a vulnerability assessment conducted at such a facility would in all likelihood conclude that there are no significant vulnerabilities due to the low volume of product produced, because such products are not typically for retail sale, and because of the narrow scope of consuming individuals, if any.

(Response 32) We decline the request. We note that if food at an R&D facility is not for consumption, the facility is not required to register and would not be subject to this rule. Food processed at R&D facilities may be consumed as samples, distributed at special events, or

may take other routes to public consumption. As with other facilities covered by the rule, it is possible, based on a facility specific vulnerability assessment, that an R&D facility may conclude that it does not contain any significant vulnerabilities. If, after conducting a vulnerability assessment, the facility appropriately concludes that it has no actionable process steps, the facility would not be required to implement mitigation strategies. The facility's food defense plan would include the vulnerability assessment, the conclusion that no actionable process steps are present, and an explanation for this determination at each step. In contrast, an R&D facility with actionable process steps is required to implement mitigation strategies and the appropriate mitigation strategies management components.

F. Other General Comments

(Comment 33) Some comments ask us to publish a revised proposed rule or an interim rule before proceeding to a final rule because of anticipated, significant changes resulting from comments that we received in response to the proposed rule. Some comments state that food defense is a new and evolving area without existing regulatory requirements or a long history of broadly accepted practices and that further substantive dialogue with industry is needed. Some comments state that a reproposal would serve the same purpose as an Advance Notice of Proposed Rulemaking which was FDA's stated intent prior to the imposition of judicial deadlines. Some comments state that because FSMA rules are dependent on one another, some proposed FSMA rules should be issued concurrently so that a concurrent evaluation and comment period may be conducted. Some comments state that industry must first get used to the new food safety regulations and then concentrate on new food defense regulations and believe reproposing at a later date will give industry a chance to comply with all the new regulations.

(Response 33) We decline these requests. These revisions in the final rule more closely align the rule with many current food defense best practices and increase flexibility for facilities to comply. With regard to the suggestion that we should issue the FSMA foundational proposed rules simultaneously for comment, this was not feasible given our judicial deadlines for the seven rules (Ref. 13). We believe that stakeholders were given adequate opportunity to comment on the proposed rules, and we extended many comment periods. With regard to the comments that suggest we repropose this rule to give industry more time to comply, we have addressed this issue by extending the compliance dates by an additional 2 years (see section VIII).

(Comment 34) One comment disagrees with the exemption for holding non-liquid bulk food. The comment asserts that most bulk foods, irrespective of their physical form, are likely to be mixed or blended at some point after receipt by the end-user (*i.e.,* the manufacturer or packager that will convert the bulk food into retail packaged food), and are likely to be processed into a much larger volume of finished food. Thus, the comment maintains that any contamination introduced into a bulk food during storage prior to its use in the preparation of a retail packaged food may affect a large volume of finished food and may thereby cause massive public health harm.

(Response 34) As discussed in the proposed rule, based on an analysis of the vulnerability assessments that FDA has conducted using the CARVER+Shock methodology, we identified four key activity types (Bulk liquid receiving and loading; Liquid storage and handling; Secondary ingredient handling; and Mixing and similar activities) as production processes that require focused mitigation strategies. With the exception of the holding of food in liquid storage tanks, which is not included in the exemption, we are not aware of activities performed during the holding of food that fit within any of these four key activity types (see 78 FR 78014 at 78036). There is no likely way that a contaminant can be homogeneously mixed throughout a non-liquid bulk food during storage. We found in our vulnerability assessments that the potential for uniform distribution of a contaminant into the food is a major factor in elevating vulnerability. Since it is highly unlikely that an inside attacker would be able to evenly distribute a contaminant into a dry bulk ingredient during storage, the vulnerability associated with these steps did not rise to the level associated with the vulnerability associated with the key activity types.

G. Other Issues Discussed in the Proposed Rule

1. Transportation Carriers

In the proposed rule, we tentatively determined that there is a significant vulnerability to intentional adulteration during bulk liquid receiving and loading, one of the four key activity types included in the proposal as an option to identify actionable process steps. We did not identify receiving and loading of other types of foods (*e.g.,* non-bulk liquid, solid, gaseous) as key activity types because we determined through our vulnerability assessments that they do not present the same level of risk. Further, we tentatively concluded that requiring receivers and shippers of bulk liquids to implement mitigation strategies at actionable process steps involving loading and receiving of bulk liquid foods would significantly minimize or prevent the potential for intentional adulteration of these foods during transportation.

Based on our vulnerability assessments, we proposed to require that mitigation strategies to ensure the integrity of food during transport would be implemented by facilities, rather than carriers. Where such measures are implemented by the shippers and receivers of bulk liquids, we tentatively concluded that the food would be sufficiently protected, and that no further actions by a carrier would be needed. For this reason, we did not propose to cover transportation carriers in the proposed rule. We requested comment on our analysis and tentative conclusion.

Some comments agree with the tentative conclusion in the proposed rule to exclude transportation carriers. Some comments oppose this approach. In the following paragraphs, we discuss comments that disagree with the proposed approach. After considering the comments, we are finalizing the rule as proposed with regard to transportation carriers.

(Comment 35) Some comments disagree with our conclusion that implementing mitigation strategies at the receiving and loading steps for bulk liquids will adequately protect food during transportation. Some comments argue that transport of food is one of the most vulnerable stages in a process, as food is not protected by a secure facility and may often be parked at a truck stop or other unsecure locations for extended periods of time which provides the opportunity for an attacker to gain access. One comment states that food shipments have consistently been documented as either the first or second most stolen truckloads on U.S. highways, and if terrorists were to use this mode of attack on the food supply, the result could be a major event for which we were not only unprepared, but for which we could have foreseen the risk.

(Response 35) We disagree with these comments. Based on our vulnerability assessments, we determined that the most practical mitigation strategies to

ensure the integrity of food during transport would be implemented by facilities, rather than by carriers. For example, to significantly minimize or prevent the product from being intentionally adulterated during transport, a shipper may elect to use seals to secure access points, such as doors or hatches, on the transport conveyance. The shipper seals the load prior to departure from its facility by using seals with unique identification numbers. The shipper includes the seal numbers on shipping documentation and transmits the seal numbers to the receiving facility. Once the shipment arrives at the receiving facility, the receiver would verify the seals are in place and that the identification numbers match. This mitigation strategy ensures the food was not accessible during transport. To ensure that the driver cannot exploit his position to gain access and intentionally adulterate the food during transport, the carrier has no role in the seal mitigation strategy. If seals are missing or the identification numbers do not match the shipping documentation, the receiving facility would reject the load and notify the shipper.

Facilities are required to implement mitigation strategies that significantly minimize or prevent significant vulnerabilities associated with actionable process steps. Therefore, if a food operation has a significant vulnerability associated with transportation, the facility must choose a mitigation strategy or combination of strategies to significantly reduce the vulnerability at the receiving or loading step. Mitigation strategies implemented at inbound receiving and outbound shipping would work complementary to each other to protect the food during transport. For example, if the vulnerability assessment concludes that loading is an actionable process step because of a vulnerability during transportation, the facility would implement mitigation strategies to protect its outbound food from intentional adulteration (*e.g.,* sealing the bulk liquid tanker truck access points). Likewise, if the facility receiving the food identifies receiving as an actionable process step because of a vulnerability during transportation, it would implement mitigation strategies to reduce the vulnerability of the food to intentional adulteration during shipping. The mitigations employed at the receiving/unloading step may include procedures to accept only scheduled shipments, verification of shipping documentation, procedures to investigate delayed or missing shipments, inspecting loads prior to receipt, and rejecting damaged or suspect items. These steps together will then work to significantly reduce the significant vulnerabilities associated with the transport of food. With respect to the prevalence of theft of food during transport, such theft is economically motivated; the scope of this rule is limited to acts of intentional adulteration where the intent is to cause wide scale public health harm.

(Comment 36) One comment states that the use of seals or tamper-evident containers is insufficient to protect bulk foods during transportation and/or holding because tamper-evident seals can be defeated and cannot be expected to prevent a determined attacker. The comment further states that tamper-evident containers or seals should be used in combination with other measures.

(Response 36) Mitigation strategies are ''risk-based,'' ''reasonably appropriate measures'' employed to ''significantly minimize or prevent'' significant vulnerabilities. They cannot always eliminate entirely any possibility of intentional adulteration. Furthermore, each facility has some degree of discretion in determining how, and whether, each mitigation strategy is properly implemented, as part of the facility's written explanation of how the mitigation strategy sufficiently minimizes or prevents the significant vulnerability associated with the actionable process step. Facilities are required to implement mitigation strategies that significantly minimize or prevent the significant vulnerability; therefore, if a significant vulnerability is identified, the mitigation strategy or combination of strategies chosen by the facility must be sufficient to reduce the vulnerability to an acceptable level at these steps.

In many cases the use of tamper evident seals may be an appropriate mitigation strategy for limiting access to the product. Additionally, if a tamper evident seal had been circumvented by an attacker, a close inspection of the seal at receiving may reveal suspicious activity or tampering which reduces the likelihood of a successful attack. However if the facility concludes that tamper evident seals are not by themselves sufficient to significantly reduce the vulnerability, they should employ other or additional measures (such as directing carriers to travel directly to the end destination without stop-overs, or requiring teamed drivers to prevent the load from being unsupervised during transport).

(Comment 37) One comment requests clarification of expectations in situations where only one of the entities involved is covered by the intentional adulteration rule (*e.g.,* the shipper is covered, but the receiver is exempt due to size or vice versa) and states that FDA may need to take a closer look into exemption of carriers.

(Response 37) A covered facility may ship food to or receive food from a facility that is not covered by the rule (*e.g.,* it is a very small business). The covered facility is responsible for implementing mitigation strategies to address transportation if it has a significant vulnerability associated with transportation at the receiving or shipping steps. The mitigation strategies used by the covered facility must significantly minimize or eliminate the significant vulnerability at this step. Mitigation strategies are available to protect the food during transport regardless of whether the shipper or receiver is exempt from the rule. If the receiving facility is exempt, the shipping facility can address the vulnerability by implementing mitigation strategies such as those discussed in Response 36. If the shipping facility is exempt, the receiving facility can address the vulnerability by implementing mitigation strategies such as visually inspecting seals and cargo to identify any suspicious activity or tampering, verifying shipping documents are accurate, ensuring only scheduled deliveries are accepted, and investigating delayed or inaccurate shipments. Additionally, we do not believe a shipping and/or receiving facility that qualifies for the very small business exemption is an attractive target for attackers intending to cause wide scale public health harm, as detailed in section IV.B.11.

(Comment 38) Some comments state that covering carriers under this rule may not be the best approach and this component of the food sector may be better addressed in guidance. Some comments ask us to continue to develop materials, guidelines and other tools to promote voluntary compliance of food defense measures by the transportation component of the food sector.

(Response 38) We agree with these comments. As resources allow, we will continue to develop best practices for the transportation industry to assist with voluntary compliance with food defense measures.

2. Other Types of Intentional Adulteration: Disgruntled Employees, Consumers, and Competitors; and Economically Motivated Adulteration

a. Disgruntled Employees, Consumers, and Competitors

In the proposed rule, we explained that when we considered the spectrum of risk associated with intentional adulteration of food, attacks conducted with the intent of causing massive casualties and to a lesser extent, economic disruption, would be ranked as relatively high risk. (Note that to further clarify the rule's focus we have removed the reference to economic disruption from the definition of ''food defense.'') We further explained that attacks by disgruntled employees, consumers, or competitors would be consistently ranked as relatively low risk mainly because their public health and economic impact would be generally quite small. We further stated that disgruntled employees are generally understood to be interested primarily in attacking the reputation of the company and otherwise have little interest in public health harm. Typically, acts of disgruntled employees, consumers, or competitors target food and the point(s) in its production that are convenient (*i.e.,* a point at which they can easily access the food and contaminate it). To minimize or prevent this type of adulteration would require restricting access to nearly all points in the food system. Instead, we proposed to focus on those points in the food system where an attack would be expected to cause massive adverse public health impact.

We received comments supporting the proposed approach; comments stating that measures should be required to protect against acts of terrorism and disgruntled employees; and a comment stating that disgruntled employees can be recruited by terrorist organizations. The final rule is focused on protecting food against intentional adulteration where the intent of the adulteration is to cause wide scale public health harm. In the circumstance described by the comment where a disgruntled employee is recruited by a terrorist organization, the motivation of the employee has changed from harming the reputation of the company to that of the terrorist organization intending to cause wide-scale public health harm. The rule is designed to reduce the likelihood that such an attack would be successful. Further, the protections required by the rule would be effective in minimizing the likelihood of success of a disgruntled employee, consumer, or competitor who attempts an act of intentional adulteration at an actionable process step—even if that act of intentional adulteration is not intended to cause wide-scale public health harm. We continue to believe that an approach that does not focus on preventing wide-scale public health harm, but rather attempts to address intentional acts regardless of their potential severity, would require restricting access to nearly all points in the food system because these types of attacks are typically conducted at areas of convenience and could occur at any point in the food system.

b. Economically Motivated Adulteration

In the proposed rule, we stated that the goal of the perpetrator of economically motivated adulteration is for the adulteration to go undetected so the perpetrator can continue to obtain the desired economic benefit. Unlike with intentional adulteration, where the intent is to cause wide scale public health harm through instances such as acts of terrorism focused on the food supply, occurrences of economically motivated adulteration are expected to be long term, and would not be appropriately viewed as a rare occurrence, but rather as reasonably likely to occur. Because of these reasons, we concluded that the approaches in the PCHF and PCAF final rules are better suited to address economically motivated adulteration. We sought comment on our conclusions.

We received numerous comments related to economically motivated adulteration, including comments suggesting economically motivated adulteration is best addressed in this rule, comments suggesting it is best addressed in the PCHF and PCAF final rules, comments recommending different hazard identification methodologies, comments related to terminology and definitions, and comments requesting postponement of any economically motivated adulteration-associated requirements.

We continue to believe that the approaches in the PCHF and PCAF final rules are better suited to address economically motivated adulteration, and have finalized this rule with no requirements related to economically motivated adulteration for facilities covered by those rules. For further discussion see the PCHF final rule (80 FR 55908 at 56028–56029) and the PCAF final rule (80 FR 56170 at 56243–56246).

In the proposed rule, we also tentatively decided not to require produce farms subject to section 419 of the FD&C Act and farms that produce milk (also referred to in this document as ''dairy farms'') subject to section 420 of the FD&C Act to take measures to address economically motivated adulteration. With regard to produce farms, we tentatively concluded that there are not procedures, processes, or practices that are reasonably necessary to be implemented by these entities to prevent the introduction of known or reasonably foreseeable biological, chemical, or physical hazards that can cause serious adverse health consequences or death as a result of economically motivated adulteration. With regard to farms that produce milk, we tentatively concluded that there are not appropriate science-based strategies or measures intended to protect against economically motivated adulteration that can be applied at the farm. Those tentative conclusions were based on our assessment that preventive controls are suitable to address economically motivated adulteration when it is perpetrated by the entity's supplier, but not when it is perpetrated by the entity itself, and supplier controls are not warranted in this context because of the lack of inputs into the growing, harvesting, packing, or holding of produce or milk (*i.e.,* activities within our farm definition) that could be subject to economically motivated adulteration that could cause serious adverse health consequences or death under sections 419 and 420 of the FD&C Act.

We received one comment suggesting we include requirements related to economically motivated adulteration on produce farms and stating that economically motivated adulteration (*e.g.,* illegal use of dyes and ripening agents) has occurred on foreign produce farms. We continue to believe that preventive controls are suitable to address economically motivated adulteration when it is perpetrated by an entity's supplier, but not by the entity itself. Preventive controls for economically motivated adulteration are not suitable to address the situation where the same farm that would be economically adulterating the food (which is already prohibited) would also be responsible for implementing preventive controls to prevent the adulteration. After considering this comment, we have finalized this rule with no requirements related to economically motivated adulteration on produce and dairy farms.

3. Dairy Farms

In the proposed rule, we stated that FDA-led vulnerability assessments and associated data analyses identified certain categories of points, steps, or

procedures in the food system which scored high on vulnerability scales related to intentional adulteration of food, regardless of the food being assessed. Two of these key activity types, liquid storage and handling, and bulk liquid receiving and loading, are present on dairy farms in areas such as the bulk liquid storage tank. We requested comment on several questions, including whether and how access to the bulk milk storage tank and milk house could be limited; the presence and types of any mitigation strategies currently used on farms; and whether and what mitigation strategies would be appropriate and feasible given current dairy farming practices.

Some comments acknowledge that limiting access to the bulk milk tank and milk house is an important objective; however, these comments describe significant challenges regarding limiting access to milk. These comments state that some State laws require unannounced access to the bulk tank and/or the milk house for food safety inspections. Additionally, comments state that locking only the bulk tank would be ineffective because this would still leave the milk accessible via the milk house. These comments also state that it is common for many dairy farms to leave the bulk tank and the milk house unlocked to facilitate normal day-to-day operations and that any regulation requiring strictly limiting access, such as locking the milk house, would be impractical due to the multiple entry points and the number of personnel needed for these measures to function effectively. Some comments suggest that FDA engage in substantial dialogue with industry to gain a better understanding of current practices and better ascertain the food defense measures that would be effective and appropriate before issuing regulations. Some comments state that FDA should utilize existing programs to identify potential activities to reduce the vulnerability to intentional adulteration on dairy farms because these programs have demonstrated efficacy and have the structures in place to successfully implement new food defense measures.

Some comments state that FDA should not issue requirements for dairy farms because they are not at high risk for intentional adulteration. Some comments describe the willingness of stakeholders to adopt voluntary food defense measures, with specific examples including State-led education efforts and adoption of some elements of existing FDA guidance relating to food defense measures on dairy farms. Some comments state that any requirements should be limited to food defense awareness training while other comments state that such training may be beneficial and is provided on some farms, but more information is needed to identify effective training programs.

Additionally, several comments address procedural matters, with many comments stating that FDA must either allow a full and separate comment period for any potential requirements for dairy farms because there were no requirements related to dairy farms in the proposed rule, or issue a fully separate proposal for dairy farms which will cover the requirements in their entirety independent of the intentional adulteration regulations for facilities that are not farms. Some comments also request that dairy processing facilities be exempt from the requirements of this rule.

Although we believe requiring mitigation strategies that restrict access to milk on dairy farms is warranted based on risk, at this time there are not strategies that limit access to milk that are appropriate and practical to require for all farms. We believe it is important that any mitigation strategies we consider imposing include restricting access to milk while it is on farms. We agree with comments that state that potential mitigation strategies, such as locking the milk tank and milk house, are not currently workable given the realities of milking schedules and the access to the bulk tank needed for food safety inspections and milk collection. We need further dialogue with key stakeholders and collaborative research to develop and identify strategies that are protective and practical; we are aware of technology-mediated advancements that are under development, and are potentially promising for the future in this area. Given the current lack of mitigation strategies that would practically limit access to milk, we agree that working with the Federal-State collaborative program for milk safety, the National Conference on Interstate Milk Shipments (NCIMS), is the most appropriate way to address concerns regarding intentional adulteration on dairy farms in the near term as strategies that can limit access to milk while on farm are developed. We believe NCIMS offers an effective platform for FDA to advance the development and implementation of mitigation strategies for dairy farms because the cooperative program includes key partners, such as the U.S. Public Health Service/FDA, the States, and the dairy industry, and has a central role in helping to ensure the safety of milk and milk products.

We are not exempting Pasteurized Milk Ordinance (PMO) facilities that are not farms (*e.g.,* dairy processing facilities) from complying with this rule. Unlike farms, such facilities have identified effective mitigation strategies available to them. In addition, PMO requirements do not currently address intentional adulteration. Further, unlike farms, these facilities are not exempt from the PCHF rule. We note that the earliest compliance date for this rule (3 years) is the same as the extended compliance date in the PCHF rule, which was chosen to give the NCIMS time to modify the PMO to include the requirements of the PCHF rule.

IV. Subpart A: Comments on Specific Provisions

A. Revisions to Definitions Also Used in Section 415 Registration Regulations (21 CFR Part 1, Subpart H) and Section 414 Recordkeeping Regulations (21 CFR Part 1, Subpart J)

As discussed in the proposed rule (78 FR 78014 at 78030), several terms we proposed have the same definitions as proposed in 21 CFR part 117 (the PCHF proposed rule) and therefore we did not include an extensive discussion in the proposed rule of the following terms: facility, farm, holding, manufacturing/processing, mixed-type facility, and packing. We did not receive specific comments on any of our proposed definitions for these terms, except that many comments state that it is critical for FDA to cross-reference and be consistent with the same terms as finalized in the PCHF final rule. We agree and we have amended each of these terms to be consistent with the definitions as finalized in the PCHF final rule. See section IV. of the PCHF final rule for extensive discussion of the comments received and changes made to these definitions.

1. Facility

We proposed to define the term ''facility'' to mean a domestic facility or a foreign facility that is required to register under section 415 of the FD&C Act (21 U.S.C. 350d), in accordance with the requirements of 21 CFR part 1, subpart H. We have finalized this term as proposed, except that we have made editorial changes by removing the U.S. Code citation and amended the Code of Federal Regulations citation.

2. Farm

We proposed to define the term ''farm'' by reference to the definition of that term in § 1.227 of this chapter. We have finalized this term as proposed. For a detailed discussion of the definition of ''farm,'' see sections IV.A and IV.B of the PCHF final rule.

3. Holding

We proposed to define the term ''holding'' to mean storage of food. In addition, we proposed that holding facilities include warehouses, cold storage facilities, storage silos, grain elevators, and liquid storage tanks. Further, we proposed that for farms and farm mixed-type facilities, holding also includes activities traditionally performed by farms for the safe or effective storage of raw agricultural commodities grown or raised on the same farm or another farm under the same ownership, but does not include activities that transform a raw agricultural commodity (RAC), as defined in section 201(r) of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321), into a processed food as defined in section 201(gg). In this final rule, consistent with the PCHF final rule, we have revised the definition for ''holding'' by removing the distinction for farms and farm mixed-type facilities and added that holding also includes activities performed incidental to storage of a food, but does not include activities that transform a RAC into a processed food and included additional examples of holding activities. For a detailed discussion of the definition of ''holding,'' see section IV.D of the PCHF final rule.

4. Manufacturing/Processing

We proposed to define manufacturing/processing to mean making food from one or more ingredients, or synthesizing, preparing, treating, modifying or manipulating food, including food crops or ingredients. Further, the proposed definition provided that examples of manufacturing/processing activities are cutting, peeling, trimming, washing, waxing, eviscerating, rendering, cooking, baking, freezing, cooling, pasteurizing, homogenizing, mixing, formulating, bottling, milling, grinding, extracting juice, distilling, labeling, or packaging. In addition, the proposed definition provided that for farms and farm mixed-type facilities, manufacturing/processing does not include activities that are part of harvesting, packing, or holding. In this final rule, consistent with PCHF final rule, we have revised the definition of ''manufacturing/processing'' by adding to the list of examples and we have reorganized the listed examples to present them in alphabetical order. For a detailed discussion of the definition of ''manufacturing/processing,'' see section IV.E of the PCHF final rule.

5. Mixed-Type Facility

We proposed to define mixed-type facility to mean an establishment that engages in both activities that are exempt from registration under section 415 of the FD&C Act and activities that require the establishment to be registered. The proposed definition also stated that an example of such a facility is a ''farm mixed-type facility,'' which is an establishment that grows and harvests crops or raises animals and may conduct other activities within the farm definition, but also conducts activities that require the establishment to be registered. In this final rule, consistent with PCHF final rule and as a conforming change associated with the revisions to the ''farm'' definition, we have revised the example of a ''farm mixed-type facility'' to specify that it is an establishment that is a farm, but also conducts activities outside the farm definition that require the establishment to be registered. For a detailed discussion of the definition of ''mixed-type facility,'' see section IV.F of the PCHF final rule.

6. Packing

We proposed to define packing to mean placing food into a container other than packaging the food. Further, the proposed rule provided that for farms and farm mixed-type facilities, packing also includes activities traditionally performed by farms to prepare RACs grown or raised on the same farm or another farm under the same ownership for storage and transport, but does not include activities that transform a RAC, as defined in section 201(r) of the FD&C Act, into a processed food as defined in section 201(gg). In this final rule, consistent with the PCHF final rule, we have revised the definition for ''packing'' by removing the distinction for farms and farm mixed-type facilities and adding that packing includes activities performed incidental to packing a food, but does not include activities that transform a RAC into a processed food. We have also revised the definition to clarify that packing includes ''re-packing.'' For a detailed discussion of the definition of ''packing,'' see section IV.G of the PCHF final rule.

B. Other Definitions That We Proposed To Establish in Part 121

To establish the scope of facilities, activities and food covered by this regulation, we proposed to define key terms. We also proposed to establish that the definitions in section 201 of the FD&C Act apply when used in part 121. We received no comments regarding the use of statutory definitions in section 201 of the FD&C Act, and we are finalizing that provision without change. In this section, we discuss each definition as proposed, related comments, and our responses.

1. Actionable Process Step

We proposed to define the term ''actionable process step'' to mean a point, step, or procedure in a food process at which food defense measures can be applied and are essential to prevent or eliminate a significant vulnerability or reduce such vulnerability to an acceptable level. Although we did not receive comments on the proposed definition for actionable process step, we have revised the definition to improve understanding of the regulatory requirements in § 121.130 (Vulnerability assessment to identify significant vulnerabilities and actionable process steps) and to be consistent with the definition of mitigation strategies. In this final rule, actionable process step is defined to mean a point, step, or procedure in a food process where a significant vulnerability exists and at which mitigation strategies can be applied and are essential to significantly minimize or prevent the significant vulnerability.

2. Contaminant

We proposed to define the term ''contaminant'' to mean any biological, chemical, physical or radiological agent that may be intentionally added to food and that may cause illness, injury or death.

(Comment 39) Some comments assert the proposed language defining ''contaminant'' could be interpreted to include ingredients intentionally added to food that resulted in harm, even if unintentional, such as an unintended allergic or other adverse health response. The comments urge FDA to clarify the meaning to be an ''intentional'' contaminant, for the purpose of this rule, by amending the proposed definition as follows: ''Contaminant means any biological, chemical, physical or radiological agent added to food to intentionally cause illness, injury or death.''

(Response 39) We agree with the possible confusion as pointed out by the comments and have amended the proposed definition. The term ''contaminant'' is used in the context of intentional acts of adulteration with intent to cause wide scale public health harm. We agree that amending the proposed definition for contaminant to make clear that the harm must be intended better reflects how the term is used in this rule.

(Comment 40) One comment asserts the term ''contaminant,'' is used widely in the food and dietary supplement industries and that if FDA were to include a definition for this term, it must employ a definition that is consistent throughout all regulations pertaining to food and dietary supplements. Further, one comment notes that this term is defined differently in the proposed rule (*i.e.,* a contaminant is any agent that may be added to food) than it is in the Codex Alimentarius guidelines (*i.e.,* contaminants are substances that are ''not intentionally added to food or feed''). The comment suggests that FDA take note of this difference and consider revisions with the goal of promoting consistency and common understanding of terminology.

(Response 40) As discussed in the proposed rule (78 FR 78014 at 78031), we based the proposed definition, in part, on the definition of ''contaminant'' used in Codex Alimentarius guidelines, but made modifications to reflect the narrower context that the term is used within this rule. Further, as discussed in response to Comment 39, we are amending the definition of ''contaminant'' to better reflect its limited use in this rule.

3. Focused Mitigation Strategies

We proposed to define the term ''focused mitigation strategies'' to mean those risk-based, reasonably appropriate measures that a person knowledgeable about food defense would employ to significantly minimize or prevent significant vulnerabilities identified at actionable process steps, and that are consistent with the current scientific understanding of food defense at the time of the analysis.

We explained in the proposed rule that a ''mitigation strategy'' is a measure taken by a facility to reduce the potential for intentional adulteration of food. We further explained that FDA divides mitigation strategies into two types, ''broad mitigation strategies'' and ''focused mitigation strategies.'' We explained that broad mitigation strategies are general facility-level measures that are intended to minimize a facility's vulnerability, as a whole, to potential acts of intentional adulteration. We provided some examples of broad mitigation strategies, such as (1) physical security, such as perimeter security fencing, locking exterior doors, penetration alarms; (2) personnel security, such as pre-hire background and reference checks, identification badges, and controlled visitor access; (3) securing hazardous materials, such as cleaning products, laboratory materials, and pesticides; (4) management practices, such as ingredient storage inventory procedures; key security procedures, PINs or passwords; procedures to restrict personal items from all food production areas; procedures requiring IDs and uniforms to be returned when a person's employment ends; and supplier verification or certification procedures; and (5) crisis management planning, such as maintenance of updated emergency contact information, procedures for responding to reported threats, and establishment of a designated food defense leadership team. We further explained that broad mitigation strategies, by nature, are generally applicable to a facility, regardless of the type of food being processed, and, as such, are not targeted to a specific processing step in a food operation.

In contrast, focused mitigation strategies are specific to an actionable process step in a food operation where a significant vulnerability is identified. They represent reasonably appropriate measures that are necessary to reduce the likelihood of intentional adulteration intended to cause wide scale public health harm. Focused mitigation strategies are customized to the processing step at which they are applied, tailored to existing facility practices and procedures, and depend on an evaluation of the significant vulnerability associated with the actionable process step at which they are applied. In the proposal we tentatively concluded, based on our vulnerability assessments, that the implementation of focused mitigation strategies at actionable process steps in a food operation is necessary to minimize or prevent the significant vulnerabilities that are identified in a vulnerability assessment, regardless of the existence of broad mitigation strategies.

We further explained, in contrast to broad mitigation strategies, focused mitigation strategies are targeted to actionable process steps and, therefore, are more effective at countering an attacker who has legitimate access to the facility. Our conclusion was based upon our interactions with the intelligence community and the many vulnerability assessments we conducted with industry, which showed that an act of intentional adulteration by an insider presents significant risk for that adulteration to result in wide scale public health harm and that broad mitigation strategies are not specific enough, for example, to counter the actions of an attacker who has legitimate access to the facility (*i.e.,* insider attack) or an attacker who circumvents perimeter protections (*e.g.,* scaling a fence), with the goal of intentionally contaminating the food.

Although the regulatory text now only refers to ''mitigation strategies,'' we continue to believe that facilities must protect vulnerable points in their operation from acts of intentional adulteration intended to cause wide scale public health harm and that a facility's vulnerability to acts of intentional adulteration by attackers who have achieved access to the facility must be significantly reduced or prevented to protect the food from intentional adulteration intended to cause wide scale public health harm. General, facility-level protections do not sufficiently address the significant vulnerabilities within a facility because they do not address an inside attacker who has obtained access to the facility.

(Comment 41) Some comments state that the distinction between ''broad'' and ''focused'' mitigation strategies is confusing, and request that the distinction be removed. One comment states the line between broad and focused mitigation strategies is often blurry. The comment asks how close ingredient handling needs to be to a gate for the gate to be considered a focused mitigation strategy and not a broad one. The comment further asserts that a mandate for focused mitigation strategies will result in endless debates between facility management and FDA investigators as to whether a particular mitigation strategy is broad or focused and that this potential for difference of opinion between facilities and FDA investigators is of significant concern for industry stakeholders.

(Response 41) The question asked by the comment highlights the nuance and gradation that exists within mitigation strategies. After considering the comments, we agree that many mitigation strategies may not lend themselves to clear categorizations as either ''broad'' or ''focused,'' and we agree that the delineation between broad and focused mitigation strategies, as described in the proposed rule, may be confusing because of the wide diversity of potential mitigations as well as variation as to how a facility chooses to implement a particular strategy. As a result, we have modified the regulatory text throughout the final rule to refer to ''mitigation strategy'' rather than ''focused mitigation strategy.'' For example, § 121.135 now requires ''mitigation strategies for actionable process steps.'' Also, the title of the rule has been modified to reflect this change.

4. Food

We proposed to define the term ''food'' to mean food as defined in section 201(f) of the FD&C Act and include raw materials and ingredients.

(Comment 42) Some comments urged us to clarify that the definition of food does not include food contact substances as defined in section 409(h)(6) of the FD&C Act (21 U.S.C. 348(h)(6)). One comment recommends FDA amend the definition of food to exempt EPA registered antimicrobials/pesticides and food contact substances which have no ongoing intended technical effect in the final finished food.

(Response 42) This rule only applies to facilities required to register with FDA. The registration rule does not include food contact substances and pesticides (21 CFR 1.227(a)(4)(i)). No change to the definition of food in this rule is necessary.

5. Food Defense

We proposed to define the term ''food defense'' to mean the effort to protect food from intentional acts of adulteration where there is an intent to cause public health harm and economic disruption.

(Comment 43) One comment states that references to ''terrorism'' in the preamble to the proposed rule were unnecessarily limiting and confusing and recommends that instead of attempting to narrow the scope of intentional adulteration to ''terrorism,'' FDA should use the definition of ''food defense'' to explain and further clarify the focus of activities covered by the rule.

(Response 43) We agree with this comment and have modified the definition of ''food defense'' in the final rule as follows: ''Food defense means, for purposes of this part, the effort to protect food from intentional acts of adulteration where there is intent to cause wide scale public health harm.'' As discussed in the preamble to the proposed rule, although we referred to the protection of the food supply from ''acts of terrorism'' throughout the proposed rule, we expect our approach would generally address acts intended to cause wide scale public health harm, whether committed by terrorists, terrorist organizations, individuals or groups of individuals. The purpose of this rule is to protect the food supply against individuals or organizations with the intent to cause wide scale public health harm. Further, although economic disruption is likely to occur in any such instance of wide scale public health harm, because the focus of the rule is not the protection against economic disruption we have removed that language from the definition of ''food defense'' for purposes of this rule. In addition, as discussed in section III.G.2, economically motivated adulteration is not addressed in this final rule.

(Comment 44) One comment states that the proposed rule defines ''food defense'' within the scope of the rule and requests that FDA establish a generalized definition of ''food defense'' that can be adopted for the purposes of all FDA activities and subsequently the scope of this rule can then be further elaborated. The comment proposes the following definition of food defense: ''Actions and activities related to prevention, protection, mitigation, response, and recovery of the food system from intentional acts of adulteration. This includes intentional adulteration from both terrorism and criminal activities. Criminal activities include economically motivated adulteration, as well as acts by disgruntled employees, consumers, or competitors intending to cause public health harm or business disruption.''

(Response 44) We decline this request. The purpose of § 121.3 (Definitions) is to define terminology that is used within the regulatory text of the rule. Therefore, the definitions of terms need to be within the context and scope of the rule, rather than a definition to be used by FDA or industry activities not related to the rule in particular.

6. Monitor

We proposed to define the term ''monitor'' to mean to conduct a planned sequence of observations or measurements to assess whether focused mitigation strategies are consistently applied and to produce an accurate record for use in verification.

(Comment 45) Some comments assert that food safety and food defense require different terminology and suggest referring to the activities as ''checking'' instead of ''monitoring.'' These comments go on to suggest that the definition of checking should be ''to observe or otherwise assess whether mitigation strategies or measures are in place and fully implemented.'' The comments also state that ''a planned sequence of observations and measurements'' may not be appropriate for all or any mitigation strategies, and questions what kind of measurements of a mitigation strategy a facility would take.

(Response 45) We agree that using completely different terminology is appropriate when components of a food safety and food defense HACCP-type system differ in important, specific ways. As noted in the Regulatory Approach discussion in section III.A, food safety uses the term ''hazard analysis'' to identify hazards, while food defense uses the term ''vulnerability assessment'' to identify significant vulnerabilities. These terms are completely different because they represent key disciplinary differences which require different methodological considerations related to whether the adulteration is intentional. A hazard analysis has very different considerations than a vulnerability assessment.

However, we disagree that completely different terminology is appropriate for a term that describes the performance of similar activities for both food safety and food defense. Monitoring is conducted to perform a similar function and in similar ways in both a food defense and a food safety framework. In both contexts monitoring is conducted to assess whether control measures are operating as intended, and in accordance with the food safety or food defense plan. However, constant monitoring of some preventive controls is necessary (*e.g.,* time-temperature monitoring for pasteurization), while periodic monitoring is likely to be more appropriate for many mitigation strategies (*e.g.,* checking the lock on an access hatch to a liquid storage tank at the end of the tank cleaning cycle). Therefore, to recognize that the management components for food safety and food defense perform similar activities, but also include some differences, we are changing the term to ''food defense monitoring'' to make clear that the expectations for compliance are different. In additional recognition that the management components for food safety and food defense perform similar activities, we are finalizing the definition of food defense monitoring to mean to conduct a planned sequence of observations or measurements to assess whether mitigation strategies are operating as intended. This definition is similar to the definition of monitoring in the PCHF final rule.

As we have concluded that, in some instances, similar terminology is appropriate for activities that are conducted to perform similar functions for food safety and food defense, incorporation of elements from definitions of internationally recognized standards (*e.g.,* Codex) is appropriate for this rule. A ''planned sequence'' is included in the definition because it is important to thoughtfully and systematically assess whether mitigation

strategies are operating as intended, and the inclusion of ''a planned sequence'' in the definition conveys this importance. For example, a facility may establish and implement written monitoring procedures to include a planned sequence of observations to monitor a lock on an access hatch to occur at the end of every silo cleaning cycle, when there is potential to add a contaminant because the access hatch can be opened without the contents of the silo spilling out. Without planning the sequence of observations of this mitigation strategy, monitoring the strategy may occur in the middle of the cleaning cycle when the access hatch must be open to complete the cleaning process, and would therefore not be able to assess if the mitigation strategy was functioning as intended (*i.e.,* properly locking the access hatch at the end of the cleaning cycle). Additionally, we include the term ''measurements'' not only to align more so with definitions from international standards, but also to reflect a facility's flexibility to choose the most appropriate mitigation strategy and how to monitor that strategy. In many cases, a facility will observe that a mitigation strategy is functioning as intended; however, there are some cases where a facility may measure whether a strategy is functioning as intended. For example, a facility may choose to implement a mitigation strategy that is a thermal-kill step. It would then be necessary for the facility to take measurements of the time and temperature to ensure the thermal-kill step is functioning as intended. Additionally, we have deleted ''consistently applied'' in the proposed definition and added ''operating as intended'' as this more closely aligns with the ISO 22000:2005 and with a similar change made in the PCHF final rule. Finally, we have removed ''and to produce an accurate record for use in verification'' from the proposed definition because the requirement for documenting monitoring records is established by the requirement for monitoring, and not by the definition of monitor. As discussed in Response 89, we have made several revisions to the regulatory text, with associated editorial changes, to clarify that monitoring records may not always be necessary.

7. Significant Vulnerability

We proposed to define the term ''significant vulnerability'' to mean a vulnerability for which a prudent person knowledgeable about food defense would employ food defense measures because of the potential for serious adverse health consequences or death and the degree of accessibility to that point in the food process.

Although we did not receive comments on the proposed definition for significant vulnerability, we have revised the definition to improve understanding of the regulatory requirements in § 121.130 (Vulnerability assessment to identify significant vulnerabilities and actionable process steps). In this final rule, significant vulnerability is defined to mean a vulnerability that, if exploited, could reasonably be expected to cause wide scale public health harm. A significant vulnerability is identified by a vulnerability assessment, conducted by a qualified individual, that includes consideration of the following: (1) Potential public health impact (*e.g.,* severity and scale) if a contaminant were added, (2) degree of physical access to the product, and (3) ability of an attacker to successfully contaminate the product. The assessment must consider the possibility of an inside attacker. For further discussion of the related changes made to the requirement in § 121.130 for a vulnerability assessment to identify significant vulnerabilities and actionable process steps, see section V.B.

8. Significantly Minimize

We proposed to define the term ''significantly minimize'' to mean to reduce to an acceptable level, including to eliminate.

We did not receive comments on the proposed definition for significantly minimize and we are finalizing the definition as proposed.

9. Small Business

We proposed to define the term ''small business'' to mean a business employing fewer than 500 persons. We proposed to establish the same definition for small businesses as that which has been established by the U.S. Small Business Administration under 13 CFR part 121 for most food manufacturers. We did not receive any comments on this definition. We are finalizing the definition as proposed, with several changes for clarity. We are using the term ''500 full-time equivalent employees'' rather than ''500 persons.'' In addition, we are adding a definition of ''full-time equivalent employee'' to the definition section (§ 121.3). We have made these changes because we will base the calculation on ''full-time equivalent employees'' and use the same approach to calculating full-time equivalent employees for the purpose of this rule as we used to calculate full-time equivalent employees in the section 414 recordkeeping regulations (see § 1.328). Under this approach, the number of full-time equivalent employees is determined by dividing the total number of hours of salary or wages paid directly to employees of the business entity claiming the exemption and of all of its affiliates and subsidiaries by the number of hours of work in 1 year, 2,080 hours (*i.e.,* 40 hours × 52 weeks).

In addition, we are adding ''including any subsidiaries and affiliates'' to the definition to provide clarity on how to calculate ''500 full-time equivalent employees'' for purposes of this rule.

10. Verification

We proposed to define the term ''verification'' to mean those activities, other than monitoring, that establish that the system is operating according to the food defense plan.

(Comment 46) One comment suggests ''verification'' be defined as ''the application of methods, procedures, tests and other evaluations, in addition to monitoring, to determine whether a focused mitigation strategy is or has been operating as intended.''

(Response 46) We have revised the definition of food defense verification to more closely align with the Codex definition of verification. The term is now defined as the application of methods, procedures, and other evaluations, in addition to food defense monitoring, to determine whether a mitigation strategy or combination of mitigation strategies is or has been operating as intended according to the food defense plan. ''Methods, procedures, and other evaluations'' better describes the scope of verification than ''activities'' used in the proposal. Although the Codex definition includes ''test'' as a form of verification, we have not included it because the rule does not require verification testing. We believe changing ''that establish the system is operating'' to ''to determine whether a mitigation strategy is or has been operating'' more accurately describes the purpose of food defense verification. We have added ''a combination of mitigation strategies'' to recognize that facilities may use more than one mitigation strategy to significantly minimize or prevent a significant vulnerability. The definition proposed by the comment limits verification to mitigation strategies; it does not require verification of the food defense plan. Verification of the food defense plan reflects the fact that verification is broader than just mitigation strategies; it includes, for example, verification of food defense monitoring and corrective actions.

(Comment 47) Some comments suggest using the term ''evaluation'' instead of verification. These comments suggest that evaluation be defined as ''those activities, in addition to checking, that establish that the facility is implementing a food defense plan.''

(Response 47) We deny this request. As discussed in response to Comment 46, we have revised the definition of food defense verification to include ''evaluation'' because evaluation is an appropriate verification activity. However, we disagree that completely different terminology (in this case, ''evaluation'' rather than ''verification'') is appropriate for a term that describes the performance of similar activities for both food safety and food defense (see Responses 45 and 46). Verification is conducted to perform a similar function and in similar ways in both a food defense and a food safety framework. In both frameworks verification is conducted to determine whether control measures are operating as intended according to the food safety or food defense plan, and these verification activities are in addition to monitoring. At the same time, by using the term ''food defense verification,'' we make clear that verification as required by this rule is not identical to verification required in the preventive controls context.

11. Very Small Business

We proposed to define the term ''very small business'' to mean a business that has less than $10,000,000 in total annual sales for food, adjusted for inflation. In the preamble of the proposed rule we explained our rationale for defining ''very small businesses'' at the $10,000,000 threshold because the purpose of this rule is to protect the food supply against individuals or organizations with the intent to cause wide scale public health harm. We tentatively conclude these individuals or groups would likely target the product of relatively large facilities, especially firms whose brand is nationally or internationally recognizable. Some comments agree with our proposed definition while others disagree. Among the comments that disagree with the definition, some state that the $10,000,000 amount is too high or too low, and several comments suggest alternatives to using dollar amount as the threshold. We further discuss these comments and our response to them in this document.

Some comments submitted to the PCHF proposed rule request that we specify that the monetary threshold for the definition be based on average sales during a 3-year period on a rolling basis because otherwise firms may be subject to significant changes in status from year to year. Those comments also ask us to clarify that the sales are to be evaluated retrospectively, not prospectively. Although we did not receive similar comments to this rule, in an effort to be consistent with the PCHF final rule, we have revised the definition of very small business to specify that it is based on average sales during the 3-year period preceding the applicable calendar year. The applicable calendar year is the year after the 3 calendar years used to determine whether a facility is a very small business.

We also revised the definition to include the market value of human food manufactured, processed, packed, or held without sale (*e.g.,* held for a fee). When there are no sales of human food, market value of the human food manufactured, processed, packed, or held without sale is a reasonable approach to calculating the dollar threshold for a very small business.

(Comment 48) One comment requests that FDA change the definition of ''very small business'' to only apply to $10,000,000 in annual sales of food that is covered under the rule, and not to total annual food sales. The comment asserts that basing the threshold on the sale of food covered by the intentional adulteration rule, rather than all food, would be necessary to be consistent with the fact that covered produce is regulated under the produce rule. Specifically, the comment requests that we exclude the sale of animal foods from the calculation of annual food sales because this rule exempts the manufacturing, processing, packing, or holding of animal foods. The comment further argues that this approach is consistent with the statutory mandate that FDA regulations be flexible in scale and supply chain appropriate and provide special considerations for small and very small businesses.

(Response 48) We have revised the definition of very small businesses to include only the sale of human food plus the market value of human food manufactured, processed, packed, or held without sale (*e.g.,* held for a fee). Under this revised definition, firms that process both human and animal foods will not be required to include sale of animal food in their calculation to determine whether they fall under the $10,000,000 threshold.

(Comment 49) Several comments expressed confusion with the varying business size thresholds across the seven FSMA rules and stated that it will be a significant challenge for the food industry to interpret and decide which rules under FSMA they are required to comply with if the definitions of the size of business are not consistent throughout all FSMA rules. Some comments encourage us to establish a tiered system that clearly outlines coverage under all FSMA rules by business size, while others request that we provide clear guidance to assist firms, especially small and very small businesses, to identify which of the seven FSMA rules are applicable to them.

(Response 49) We recognize that the varying business size thresholds across the FSMA rules may be cause for confusion. However, each of the rules differs in scope and intent, which compels us to establish requirements and exemptions that are specific to and appropriate for each rule. To help small and very small businesses comply with each rule, we plan to issue Small Entity Compliance Guides.

(Comment 50) One comment objected to exempting any facilities from the rule, arguing that this would give terrorists a ''road map'' to those facilities not covered and make them targets for intentional adulteration. The comment recommends that FDA remove the exemptions for very small businesses and qualified facilities completely.

(Response 50) We disagree with this comment. Section 418(l)(2) of the FD&C Act specifies that qualified facilities, which include very small businesses, are not subject to the requirements in sections 418(a) through (i) and (n). We note that section 418(l)(2) requires qualified facilities to submit one of two types of documentation to the Secretary. The PCHF and PCAF rules have requirements reflecting this provision but this rule does not. Section 418(l)(2)(B)(i)(I) requires documentation that demonstrates that the facility has identified potential hazards and is implementing and monitoring the preventive controls. We have concluded that very small businesses are at reduced risk and therefore do not have significant vulnerabilities that require mitigation strategies. Therefore, there is nothing for very small businesses to document under this option. In contrast, a human or animal food facility is not at lesser risk of a food safety problem solely because it is relatively small. Section 418(l)(i)(II) is similarly inapplicable for several reasons. That section requires documentation that a facility is in compliance with State, local, county, or other applicable non-Federal food safety law. First, food safety is traditionally viewed as separate from food defense. Second, no States currently require food defense

measures, and States are unlikely to impose measures different from those in this rule. Therefore, compliance with ''food safety law'' as described in the provision would be irrelevant. In contrast, all States have food safety laws. Further, regulations issued under section 420 of the FD&C Act are to apply to food for which there is a high risk of intentional contamination (section 420(c)). Individuals or groups intending to cause wide scale public health harm are more likely to target the product of relatively large facilities, especially for facilities whose brands are nationally or internationally recognizable, than to target very small businesses. Covering all facilities would be inconsistent with the statutory requirement to limit coverage to foods at high risk. The $10,000,000 threshold for very small businesses still covers 97–98 percent of the market share of manufactured packaged foods (Ref. 14). In addition, section 420(a)(1)(B) of the FD&C Act directs FDA to consider the risks, costs, and benefits associated with protecting food against intentional adulteration. Imposing the full requirements of the rule on all facilities, regardless of size, would almost triple the current cost of the rule while only covering an additional 2–3 percent of the market share of manufactured foods.

(Comment 51) One comment recommends we apply the lower dollar amount used to define ''very small businesses'' in the PCHF proposed rule. Another comment recommends that the threshold be lowered to $3,000,000 because smaller companies are less likely to implement food defense measures unless mandated.

(Response 51) The higher threshold for very small businesses in this rule as compared to the PCHF rule reflects the difference in the nature of risk of intentional adulteration as compared to unintentional adulteration (*i.e.,* traditional food safety). This rule protects food against intentional adulteration caused by individuals or organizations whose goal is to maximize public health harm. An attacker would more likely target the product of relatively large facilities, especially firms whose brand is nationally or internationally recognizable. An attack on such a target would potentially provide the desired wide scale public health consequences and the significant public attention that would accompany an attack on a recognizable brand. Such facilities are likely to have larger batch sizes, potentially resulting in greater human morbidity and mortality. Further, an attack on a well-recognized, trusted brand is likely to result in greater loss of consumer confidence in the food supply and in the government's ability to ensure its safety and, consequently, cause greater economic disruption than a relatively unknown brand that is distributed regionally.

(Comment 52) Several comments argue that the $10,000,000 threshold is too high, is arbitrary and not risk-based, and excludes many suppliers and co-manufacturers to large food companies. The comments state that suppliers who provide ingredients to larger firms would not be covered under the rule and therefore would pose a significant vulnerability to these large, nationally branded food manufacturers that have large consumer exposure. They argue that this high threshold creates a major hole in the industry that may be exploited, and they point out that we identified ''ingredient handling'' as a key activity type having significant vulnerabilities and therefore all ingredient manufacturers need to be covered.

(Response 52) The full name of the key activity type referenced is ''secondary ingredient handling.'' Secondary ingredient handling refers to activity occurring in the production facility where the ingredient is being added; it does not refer to a facility's ingredient supply chain. The potential for incoming ingredients to be intentionally adulterated is addressed by the rule's applicability to ingredient suppliers. As with finished food, not all ingredient suppliers are covered. The rule focuses on those foods at highest risk of intentional adulteration; it does not eliminate all risk.

(Comment 53) Several comments argue that the $10,000,000 threshold is too low and recommend that we increase it to $50,000,000 or $1,000,000,000 in annual sales. One comment states that for an intentional adulteration event to happen, the brand or food must be one that a terrorist or a similarly ill-intentioned person is likely to target, which would encompass only the largest and most well-known food brands. The comment goes on to argue that, ''the top roughly 250 food brands in the Western world are owned by only a handful companies having annual human food revenues from tens of billions of dollars to over 100 billion dollars,'' and therefore, if we are focusing the rule on those at ''high risk,'' as specified under section 420 of the FD&C Act, then there is little benefit to be gained by imposing the requirements of this rule on hundreds of thousands of companies whose products are not likely to be targeted. The comment points out that because we are ''unable to identify any previous act of intentional adulteration intended to cause public health harm that was perpetrated in a setting that would be covered by this rule (*i.e.,* all such previous attacks have involved restaurant or donated food), it would appear that the risk of any such attack occurring is overall quite low, and that only the most attractive targets can conceivably be considered ''high'' risk.''

(Response 53) We decline this request. Although we agree that those intending to cause wide scale public health harm would more likely target the larger well known food brands, we disagree that there is little benefit to be gained by imposing the requirements of this rule on companies under a $50,000,000 or $1,000,000,000 threshold. To identify which facilities to cover under this rule, we assessed risk based on both the likelihood of being a target and the potential impact to public health. If we were to increase the threshold for a very small business to $50,000,000 or $1,000,000,000, a large number of facilities producing large quantities of food, including some well-known brands, would not be covered.

(Comment 54) Several comments state that using annual sales is not indicative of risk and offer alternative ways to define which facilities are covered under the rule. The comments argue that annual sales do not determine the potential consumer exposure as it relates to preventing wide scale public health harm because more expensive products could have higher annual sales but lower consumer exposure. The comments point out that a manufacturer of a premium chocolate bar would sell fewer chocolate bars than a commodity chocolate manufacturer with sales of the same dollar amount. Some comments suggest alternatives to using annual sales, including units of a product sold (*e.g.,* 100,000 retail units), number of servings, volume manufactured, and distribution patterns of the product. Other comments recommend using the shelf life of products or the shelf stableness of product as alternatives.

(Response 54) We use sales and the market value of food manufactured, processed, packed, or held without sale as a proxy for volume. We are aware that dollar amounts can be skewed by product values and, thus, sales are an imperfect proxy for volume. However, we are not aware of a more practical way to identify a threshold based on volume or amount of product that could be applied across all product sectors, and the comments provide no suggestions for how their recommendations could be carried out.

Shelf life and shelf stability are not necessarily good indicators of the speed at which a particular product moves

through the distribution system because many products are sold and consumed months, and even years, before their shelf life expires. The risk of a product for intentional adulteration does not increase based solely on a short shelf life. Similarly, a product that has a longer shelf life is not necessarily at lower risk for intentional adulteration; it could be an attractive target based on the potential to cause wide scale public health harm.

(Comment 55) One comment suggests that we base the very small business definition on the number of full-time employees, similar to how we define ''small business.'' The comment recommends that we define ''very small business'' at 50 full-time employees.

(Response 55) We deny this request. The purpose of the definition of ''very small business'' is to exempt the smallest businesses from the requirements of the rule because they are less likely to be targeted by individuals or organizations intending to cause wide scale public health harm. The consideration of sales is consistent with the other option for being a qualified facility under section 418 of the FD&C Act, which also considers sales (section 418(l)(1)(C)). (As discussed in IV.E.1 of this rule, we have removed the term ''qualified facility'' from the exemption provided in § 121.5(a) for simplicity because any facility that would be a ''qualified facility'' as proposed in § 121.5(a) will also meet the definition for a ''very small business.'')

In contrast, section 418(l) of the FD&C Act does not specify any particular criterion (whether sales or number of employees) for the definition of ''small business,'' other than directing us to consider the results of the Food Processing Sector Study. Basing the definition of ''small business'' on the number of employees is consistent with our approach to defining ''small business'' in many other regulations (see, *e.g.,* the PCHF final rule, Produce final rule, HACCP regulation for juice (§ 120.1(b)(1)), the section 414 recordkeeping regulations (69 FR 71562, December 9, 2004), and our CGMP regulation for manufacturing, packaging, labeling, or holding operations for dietary supplements (72 FR 34752, June 25, 2007)).

(Comment 56) Some comments request that we change the definition of ''very small business'' to only include the total annual sales of food in the United States, adjusted for inflation, for foreign facilities that export food to the United States.

(Response 56) A foreign business that sells more than the threshold dollar amount of food has more resources than the businesses being excluded, even if less than that threshold dollar amount reflects sales to the United States. Likewise, a domestic business that sells more than the threshold dollar amount of food has more resources than the businesses being excluded, even if that domestic business exports some of its food and, as a result, less than that threshold dollar amount reflects sales within the United States. Further, this is consistent with the PCHF final rule.

12. Vulnerability

We proposed to define the term ''vulnerability'' to mean the susceptibility of a point, step, or procedure in a facility's food process to intentional adulteration.

We did not receive comments on the proposed definition of vulnerability and we are finalizing the definition as proposed.

C. Additional Definitions To Clarify Terms Not Defined in the Proposed Rule

1. Adequate

We have defined the term ''adequate'' to mean that which is needed to accomplish the intended purpose in keeping with good public health practices. See section V.E for a detailed discussion of the changes to the requirement for food defense monitoring in § 121.140, including the requirement to monitor the mitigation strategies with ''adequate'' frequency to provide assurances that they are consistently performed.

2. Affiliate and Subsidiary

We have defined the term ''affiliate'' to mean any facility that controls, is controlled by, or is under common control with another facility. We have defined the term ''subsidiary'' to mean any company which is owned or controlled directly or indirectly by another company. These definitions incorporate the definitions in sections 418(l)(4)(A) and (D) of the FD&C Act and would make the meanings of these terms clear when used in the definition of ''very small business.''

3. Full-Time Equivalent Employee

We have established a definition for ''full-time equivalent employee'' as a term used to represent the number of employees of a business entity for the purpose of determining whether the business qualifies as a small business. The number of full-time equivalent employees is determined by dividing the total number of hours of salary or wages paid directly to employees of the business entity and of all of its affiliates by the number of hours of work in 1 year, 2,080 hours (*i.e.,* 40 hours × 52 weeks). If the result is not a whole number, round down to the next lowest whole number. Because the calculation for the number of employees affects the small business definition and extended compliance dates, we are establishing the definition of ''full-time equivalent employees'' in the definitions for this rule and modifying the definition of ''small business'' to use the term ''500 full-time equivalent employees'' rather than ''500 persons.''

4. Qualified Individual

In this final rule, we have defined the term ''qualified individual'' to mean a person who has the education, training, or experience (or a combination thereof) necessary to perform an activity required under subpart C, as appropriate to the individual's assigned duties. A qualified individual may be, but is not required to be, an employee of the establishment. See section V.H. for a detailed discussion of the new requirements in § 121.4—Qualifications of Individuals Who Perform Activities Under Subpart C.

5. You

In this final rule, we have defined the term ''you'' for purposes of this part, to mean the owner, operator, or agent in charge of a facility. We have made conforming changes throughout the regulatory text to replace ''owner, operator, or agent in charge'' with ''you'' for simplicity and consistency with the PCHF and PCAF regulations.

D. Comments Asking FDA To Establish Additional Definitions or Otherwise Clarify Terms Not Defined in the Rule

1. Correction

(Comment 57) Some comments that request the addition of corrections to the requirement related to corrective actions request we define ''correction'' to mean the action to eliminate a non-conformity.

(Response 57) We decline this request. Because we are not providing for corrections and the term ''corrections'' is not in the regulatory text, there is no need to define the term.

2. Defensive Controls or Defensive Control Point

(Comment 58) One comment requests that FDA consider adoption of food defense terminology that is complementary to food safety terminology used in the PCHF final rule, such as ''defensive controls'' or ''defense control point.''

(Response 58) We decline the request to adopt the specific terms of ''defense controls'' or ''defense control point.''

Although the comment did not further explain what terms ''defense controls'' or ''defense control point'' would replace, we believe ''actionable process steps'' and ''mitigation strategies'' appropriately differentiate these terms, related to intentional adulteration, from analogous food safety terms used in the PCHF final rule.

3. Reasonably Foreseeable

(Comment 59) Some comments state FDA should clearly define what constitutes a ''reasonably foreseeable'' threat as it relates to the risk of intentional adulteration.

(Response 59) We decline this request. The term ''reasonably foreseeable'' is not used in the regulatory text of this rule.

4. Supply Chain

(Comment 60) One comment requests that FDA define ''supply chain'' as it relates to food and provides a recommended definition to be included in the rule.

(Response 60) We decline this request. The term ''supply chain'' is not used in the regulatory text of this rule.

5. Validation

(Comment 61) One comment suggests we define ''validation'' as obtaining evidence that a control measure or combination of control measures, if properly implemented, is capable of controlling the hazard to a specified outcome.

(Response 61) We decline this request. The term ''validation'' is not used in the regulatory text of this rule.

6. Miscellaneous

(Comment 62) One comment requests that FDA define certain terms or phrases that are used in some definitions and that the comment suggests will have a wide range of interpretations. The comment cites ''acceptable level'' (used in the definitions of ''actionable process step'' and ''significantly minimize''), ''reasonably appropriate measures'' and ''person knowledgeable about food defense'' (both used in the definition of ''focused mitigation strategies''), and ''prudent person knowledgeable about food defense'' (used in the definition of ''significant vulnerability'').

(Response 62) The terms ''acceptable level'' and ''reasonably appropriate measures'' are meant to be flexible standards. We do not need to define every term used in the definitions. By specifying that a point, step, or procedure in a food process at which food defense measures can be applied and are essential to prevent or eliminate a significant vulnerability or reduce such vulnerability to an acceptable level, the definition for actionable process step provides flexibility for a facility to determine what that level would be in a particular circumstance. We now use ''person knowledgeable about food defense'' without reference to ''prudent'' in the definitions of ''significant vulnerability'' and ''mitigation strategies.'' A person knowledgeable about food defense would meet the requirements of being a Qualified Individual (§ 121.4).

E. Proposed § 121.5—Exemptions

We proposed to establish a series of exemptions from the intentional adulteration requirements. We also sought comments on whether we should exempt on-farm manufacturing, processing, packing, or holding of the food identified as having low-risk production practices identified in Appendix 4 to the Draft Risk Assessment (further discussed in section I.C). We discuss these in the following sections.

1. Proposed § 121.5(a)—Exemption Applicable to a Qualified Facility

We proposed to exempt a qualified facility, except that qualified facilities must, upon request, provide for official review documentation that was relied upon to demonstrate that the facility meets this exemption. We also proposed that such documentation must be retained for 2 years. We proposed to define qualified facility, in part, as a facility that is (1) a very small business; or (2) a facility to which certain circumstances must apply.

We have removed the exemption applicable to a qualified facility and replaced it with a very small business exemption. Revised § 121.5(a) provides that this part does not apply to a very small business, except that a very small business must, upon request, provide for official review documentation sufficient to show that the facility meets the exemption and that such documentation must be retained for 2 years. We have removed the term ''qualified facility'' from the exemption provided in § 121.5(a) to simplify the provision and provide clarity as to the applicability of the exemption. For purposes of this rule, any facility that would be a ''qualified facility'' as proposed in § 121.5(a) will also meet the definition for a ''very small business.'' Further, section 418(l)(3) of the FD&C Act, which provides for withdrawal of an exemption from a ''qualified facility,'' is not relevant because we are also issuing these requirements under section 420 of the FD&C Act.

2. Proposed § 121.5(b)—Exemption Applicable to Holding of Food

We proposed to exempt holding of food, except the holding of food in liquid storage tanks. We received one comment that disagrees with the holding exemption, and have addressed the comment in Response 34. After considering this comment, we are finalizing the exemption as proposed.

3. Proposed § 121.5(c)—Exemption Applicable To Packing, Re-Packing, Labeling, or Re-Labeling of Food Where the Container That Directly Contacts the Food Remains Intact

We proposed to exempt packing, re-packing, labeling, or re-labeling of food where the container that directly contacts the food remains intact. We did not receive comments on the proposed exemption and we are finalizing the exemption as proposed.

4. Proposed § 121.5(d)—Exemption Applicable to Activities of a Facility That Are Subject to Section 419 of the FD&C Act

We proposed to exempt activities of a facility that are subject to section 419 of the FD&C Act (Standards for Produce Safety). We did not receive comments on the proposed exemption and we are finalizing the exemption as proposed.

5. Proposed § 121.5(e)—Exemption With Respect to Alcoholic Beverages

Section 116 of FSMA (21 U.S.C. 2206) (Alcohol-Related Facilities) provides a rule of construction for certain facilities engaged in the manufacturing, processing, packing, or holding of alcoholic beverages and other food. In the proposed rule, we discussed our interpretation of section 116 of FSMA and requested comment on our interpretation. Based on our interpretation, we proposed that part 121 would not apply with respect to alcoholic beverages at facilities meeting two specified conditions (78 FR 78014 at 78037). We also proposed that part 121 would not apply with respect to food other than alcoholic beverages at facilities described in the exemption, provided such food is in prepackaged form that prevents direct human contact with the food and constitutes not more than 5 percent of the overall sales of the facility. No comments disagreed with the exemption of alcoholic beverages, but some comments requested changes or clarifications to the proposed activities covered in the exemption. After reviewing the comments, we are finalizing this exemption as proposed.

(Comment 63) Two comments supported the exemption for alcoholic beverages and FDA's interpretation of

section 116 of FSMA, but one comment requests changing the language from just ''alcoholic beverages'' to ''manufacturing, processing, packing and holding of alcoholic beverages,'' stating that in reducing the words FDA may unintentionally limit the scope of the exemption to facilities holding finished beverage alcohol products.

(Response 63) We agree with the comments that support the exemption as written. We do not believe it is necessary to list the activities in the codified as requested by one comment. Under section 415 of the FD&C Act a facility is required to register as a facility because it is engaged in manufacturing, processing, packing, or holding of one or more alcoholic beverages. Therefore, the language stating ''alcoholic beverages at a facility'' encompasses facilities engaged in the activities listed previously and the regulatory text in § 121.5(e) clearly covers the intended exemption for the ''manufacturing, processing, packing and holding of alcoholic beverages.''

(Comment 64) One comment supports the exemption for alcoholic beverages but requests that we further exempt craft breweries from drying and packaging requirements for disposal of spent grains as cattle feed to small farmers.

(Response 64) The exemption established under the rule of construction in section 116 of FSMA applies to alcoholic beverages, not to any other food (see section 116(c) of FSMA (21 U.S.C. 2206(c)). The by-products described in this comment appear to be products that would be used in food for animals rather than in human food, and we exempt these foods in section § 121.5(f). Since this rule exempts both alcoholic beverages at a facility, provided certain conditions are met, and food for animals, we believe this comment misunderstands the exemptions.

6. Proposed § 121.5(f)—Exemption Applicable To Manufacturing, Processing, Packing, or Holding of Food for Animals Other Than Man

We proposed to exempt manufacturing, processing, packing, or holding of food for animals other than man. Section 418(m) of the FD&C Act authorizes FDA to exempt or modify the requirements for compliance with section 418 with regard to facilities that engage solely in the production of animal food. Further, section 420(c) of the FD&C Act requires that regulations that FDA issues under that section apply only to food for which there is a high risk of intentional contamination. FDA tentatively concluded in the proposed rule that animal food is not at a high risk for intentional contamination because our analysis shows that adulteration of animal food has minimal potential for human morbidity and mortality which would lead to wide scale public health harm. In considering whether to provide an exemption related to animal food, we evaluated three types of possible attack scenarios: (1) Incorporation of a contaminant into feed to be used for muscle meat-producing animals; (2) incorporation of a contaminant into feed to be used for egg-producing or milk producing animals; and (3) incorporation of a contaminant into pet food. With regard to the two former scenarios, we did not identify any contaminants that could be incorporated into feed at levels that would lead to human morbidity or mortality among consumers that subsequently eat the meat, eggs or milk without first showing noticeable clinical signs and/or mortality in the animals. While some contaminants can increase the risk of chronic disease, such as cancer, among consumers, such an outcome is not consistent with our understanding of the goals of terrorist organizations, which include a more immediate impact. Regarding the third attack scenario, adulterants could be incorporated into feed or pet food that result in significant animal morbidity and mortality as well as lead to secondary infections of humans through cross contamination, but this type of intentional adulteration of animal food poses a lower risk because secondary human illness or death is not the primary goal of an attacker with the intent to cause wide scale public health harm. As such, the proposed rule would not apply to the manufacturing, processing, packing, or holding of food for animals other than man. We requested comment on our tentative conclusions. Some comments agreed with our conclusions and support the exemption as proposed. One comment supported the exemption but requested a clarification of exempted activities. Some comments disagreed with our conclusions and assert that animal food is at high risk for intentional adulteration because it has been intentionally contaminated in the past. Some comments state that FDA should protect against intentional adulteration that leads to serious health consequences or death to humans or animals. After reviewing the comments, we are finalizing the exemption as proposed.

(Comment 65) Some comments support our tentative conclusions and agree that animal food would not be at high risk for intentional contamination and lacks a significant potential for human morbidity and mortality. One comment supports the exemption but requests clarification that the exemption of animal feed includes the byproduct of manufactured human food regardless of the small business exemption.

(Response 65) We conclude that animal food, regardless of whether it is produced at a facility solely engaged in the production of animal food or at a facility engaged in the production of both animal and human food, does not involve significant vulnerabilities that require mitigation strategies under section 418 of the FD&C Act, and is not high risk under section 420 of the FD&C Act. Therefore, we are not requiring a vulnerability assessment to determine that there are no actionable process steps present and no mitigation strategies needed. Regarding the requested clarification, the exemption applies to animal food regardless of whether a facility is part of a small business.

(Comment 66) Some comments disagree with our conclusion that animal feed would not be at high risk for intentional contamination for several reasons. Some comments cite the 2007 incident of melamine in animal food that sickened and killed many animals as an example of previous intentional contamination suggesting that animal food is at high risk for intentional contamination. Some comments state that in section 420(c) of the FD&C Act the intent of Congress was for regulations to be issued that addressed hazards that would cause ''serious health consequences or death to humans or animals.'' One comment asserts that pet food and human food supply chains are interconnected, and therefore should be covered by this rule. One comment believes that animal food comes into our homes as pet food therefore can harm families via cross-contamination. One comment asserts that the risk of Foot and Mouth Disease has been the focus of many exercises and discussions with respect to intentional adulteration and asserts that terrorists have attacked livestock in the past.

(Response 66) We disagree with these comments and continue to believe that animal food is not at high risk for intentional adulteration within the context of this rule. While we agree that some animal feed could be intentionally contaminated, our analysis shows only minimal potential for human morbidity and mortality as a result of an attack during, or associated with, animal food production. We analyzed both human and animal food using CARVER+Shock methodology. For human food, our analyses show the potential for

significant human morbidity and mortality should intentional adulteration occur at certain points in a food operation. In contrast, for animal food, our analysis shows only minimal potential for human morbidity or mortality as a result of attacks at points in an animal food operation.

Significantly, our CARVER+Shock vulnerability assessments of animal food have had to focus entirely on economic consequences because of the lack of potential for human morbidity and mortality. As stated in the preamble to the proposed rule (78 FR 78014 at 78037), in considering whether to provide an exemption related to animal food, we evaluated three types of possible attack scenarios: (1) Incorporation of a contaminant into feed to be used for muscle meat-producing animals; (2) incorporation of a contaminant into feed to be used for egg-producing or milk producing animals; and (3) incorporation of a contaminant into pet food. With regard to the two former scenarios, we are not aware of contaminants that could be incorporated into feed at levels that would not produce noticeable clinical signs and/or mortality in animals but would result in significant human morbidity or mortality among consumers that subsequently eat the meat, eggs or milk. While such contaminants can increase the long-term risk of chronic disease, such as cancer, among consumers, such an outcome is not consistent with our understanding of the more-immediate goals of individuals or groups intending to cause wide scale public health harm.

Regarding the third attack scenario, incorporation of a contaminant into pet food, we are aware of contaminants that could be incorporated into feed or pet food that could result in significant animal (including pet) morbidity and mortality, including some which could result in secondary infectious spread of disease (because some infectious agents can be transmitted orally as well as through aerosol). Such attacks could be significant from an economic and societal standpoint. However, the risk that they pose with regard to targeting by individuals or groups intending to cause wide scale public health harm appears to be significantly lower than those involving human morbidity and mortality.

Foot and mouth disease, mentioned in one comment, can lead to animal death and economic consequences, but does not affect human morbidity or mortality. Because foot and mouth disease would not cause wide scale public health harm, it does not change our conclusion that animal food is a less attractive target than human food, when the intent of the adulteration is to cause wide scale public health harm for humans. The event in 2007 involving contamination of wheat flour and wheat gluten with melamine that resulted in pet illnesses and deaths did not affect human health and was motivated by economic gain. That form of intentional adulteration (*i.e.,* economically motivated adulteration) is addressed by the PCHF and PCAF final rules.

7. Exemption for Low-Risk Activities at Farm Mixed-Type Facilities

As discussed in section I.D, we issued for public comment an ''Appendix to Draft Qualitative Risk Assessment of Risk of Activity/Food Combinations for Activities (Outside the Farm Definition) Conducted in a Facility Co-Located on a Farm'' (the draft RA Appendix) (78 FR 78064, December 24, 2013). The draft RA Appendix was conducted to provide a science-based risk analysis to determine which foods' production processes would be considered low risk with respect to the risk of intentional adulteration. Based on the tentative conclusions of the draft RA Appendix, we asked for comment in the proposed rule on possible exemptions or modified requirements for this final rule. In the draft RA Appendix we tentatively concluded that the production processes for the following finished foods are low-risk: Eggs (in-shell); fruits and vegetables other than pods, seeds for direct consumption, and hesperidia (fresh, intact); game meats (whole or cut, not ground or shredded, without secondary ingredients); peanuts and tree nuts (raw, in-shell); and sugarcane and sugar beets (fresh, intact). We sought comment on whether we should exempt on-farm manufacturing, processing, packing, or holding of the foods identified as having low-risk production practices when conducted by a small or very small business if such activities are the only activities conducted by the business that are subject to section 418 of the FD&C Act.

(Comment 67) Several comments agree with the conclusions of the draft RA Appendix and state we should provide exemptions in the regulatory text for those on-farm manufacturing, processing, packing, or holding activities identified as having low-risk production practices when conducted by a small or very small business if such activities are the only activities conducted by the business subject to section 418 of the FD&C Act.

(Response 67) We agree with these comments. In addition, we have conducted a reanalysis of the risk assessment and have identified some foods included in the draft RA Appendix as being out of scope of the final appendix because of the changes to the definition of ''farm'' made by the PCHF rule, including some foods determined to have low risk production practices in the draft appendix. Finished foods that are produced using only activities that fall within the farm definition (*e.g.,* RACs such as fruits and vegetables, grains, and unpasteurized milk) are out of scope for the purposes of this final appendix because this evaluation focuses on the production processes used to produce a finished food and applies only to activities outside the farm definition performed by facilities co-located on farms. Accordingly, we have provided a new exemption in the regulatory text in § 121.5(g) that exempts on-farm manufacturing, processing, packing, or holding of eggs (in-shell, other than RACs, *e.g.,* pasteurized), and game meats (whole or cut, not ground or shredded, without secondary ingredients) when conducted by a small or very small business if such activities are the only activities conducted by the business subject to section 418 of the FD&C Act. This exemption is also appropriate under section 420 of the FD&C Act because such activities are not high risk under that provision.

The draft RA, considered fruits and vegetables other than pods, seeds for direct consumption, and hesperidia, and determined them to be low risk. Because these foods are produced using only activities that fall within the modified farm definition, these finished foods are now out of scope of the RA. Additionally, peanuts, tree nuts (raw, in shell), sugarcane, and sugar beets were also considered and determined to be low risk in the draft RA. These foods similarly are out of scope of the evaluation of risk because these foods are produced using only activities that fall within the modified farm definition. The finished foods mentioned in this paragraph, when produced on farms, are exempt under § 121.5(d).

V. Subpart C: Comments on Food Defense Measures

A. Proposed § 121.126—Requirement for a Food Defense Plan

We proposed that the owner, operator, or agent in charge of a facility must prepare, or have prepared, and implement a written food defense plan which must include: (1) Written identification of actionable process steps; (2) written focused mitigation strategies; (3) written procedures for monitoring; (4) written corrective action

procedures; and (5) written verification procedures.

Some comments agree with the requirements for a food defense plan as proposed. In general, comments support the proposed requirement that facilities develop and maintain food defense plans to protect food against intentional adulteration. In the following paragraphs, we discuss comments that disagree with, or suggest one or more changes to, the proposed requirements. After considering these comments, we are finalizing the provisions as proposed, with editorial and conforming changes as discussed in the other applicable sections of this document.

(Comment 68) Some comments state that facilities should be allowed to develop food defense plans that are tailored to and best meet the needs and unique characteristics of the establishment. Other comments state that the requirements should be adequately broad and provide flexibility so that companies can build on their plans over time based on emerging threats and new mitigation strategies.

(Response 68) We agree with these comments and recognize that there needs to be flexibility within the requirements for a facility to develop a food defense plan that meets its needs and unique characteristics. In the final rule we have added flexibility for management components (see Comment 88, Comment 92, Comment 93, and Comment 95 for a detailed discussion). Additionally, we agree that food defense plans should change over time based on emerging threats and identification of new mitigation strategies. The rule (§ 121.157) requires a reanalysis of the food defense plan as a whole or to the applicable portion of the plan when any of the following circumstances occur: a significant change made in the activities conducted at the facility creates a reasonable potential for a new vulnerability or a significant increase in a previously identified vulnerability; a facility becomes aware of new information about potential vulnerabilities; a mitigation strategy, a combination of mitigation strategies, or the food defense plan as a whole is not properly implemented; or whenever FDA requires reanalysis to respond to new vulnerabilities, credible threats to the food supply, or developments in scientific understanding. See section V.G.2 for more detailed discussion of the reanalysis section.

(Comment 69) Some comments state that many food facilities have already voluntarily developed and implemented food defense plans. The comments express concern that FDA would require companies to completely overhaul their existing food defense plans that are already in place and working properly. These comments argue that existing food defense plans should be adequate to meet the requirements of this rule so long as they were thoughtfully developed.

(Response 69) We recognize that some facilities have already voluntarily developed and implemented food defense plans. These facilities likely have a head start on compliance with this rule. To the extent a food defense plan satisfies elements of this rule, a facility has less to do to meet these requirements. Further, in the final rule we have specified that existing records do not need to be duplicated if they contain all of the required information and satisfy the requirements of part 121, subpart D (§ 121.330).

(Comment 70) Some comments express concern that it is too premature to require that all foreign facilities prepare and implement a food defense plan.

(Response 70) All foreign facilities do not have to prepare and implement a food defense plan. For example, foreign facilities that are not required to register are not subject to this rule. This includes a foreign facility, if food from such a facility undergoes further manufacturing/processing (including packaging) by another facility outside the United States (21 CFR 1.226(a)). In addition, the rule contains exemptions applicable to domestic and foreign facilities (§ 121.5). For example, very small businesses are only required to keep records documenting their status.

B. Proposed § 121.130—Identification of Actionable Process Steps

We proposed to require that the owner, operator, or agent in charge of a facility identify any actionable process steps by either conducting a facility-specific vulnerability assessment or by using the four key activity types we identified. Recognizing that various methodologies may exist to conduct a facility-specific vulnerability assessment, and not wishing to preclude the benefits of future science in this area, we did not propose to require a specific methodology for the facility-specific vulnerability assessment. Further, we proposed that regardless of the method chosen, the identification of actionable process steps and the assessment leading to that identification must be written.

Some comments agree with the requirements as proposed. In the following paragraphs, we discuss comments that suggest one or more changes to, and/or disagree with the proposed requirements. After considering the comments, we have revised this section as follows: (1) Removing from the regulatory text the option to identify actionable process steps by utilizing the four FDA-identified key activity types, (2) adding to the regulatory text the factors that must be considered when conducting a vulnerability assessment, (3) adding to the regulatory text a requirement to explain why each process step was or was not identified as an actionable process step, (4) adding to the regulatory text a requirement that the vulnerability assessment must consider the possibility of an inside attacker, and (5) changing the title of this section to ''Vulnerability Assessment to Identify Significant Vulnerabilities and Actionable Process Steps.''

(Comment 71) Some comments recommend removing from the regulatory text the option for facilities to use the key activity types as a method for identifying actionable process steps, and instead, requiring all facilities to conduct facility-specific vulnerability assessments. Some comments recommend continuing to provide the option to use key activity types but not specifically providing for it in the regulatory text. Under this approach, key activity types would be considered an ''appropriate method'' for identifying actionable process steps with the specific key activity types identified in guidance. These comments express concern that identifying a particular methodology (*i.e.,* key activity types) in the codified indicates there is one ''right'' way to conduct vulnerability assessments. Furthermore, some comments express concern that the key activity types may become the de facto standard for the regulatory inspection of actionable process steps, even if facilities conduct facility-specific vulnerability assessments. Some comments express concerns that including key activity types in the codified would result in mitigation strategies being required at key activity types regardless of the outcome of a facility-specific vulnerability assessment.

(Response 71) The key activity types are based upon the results of over 50 vulnerability assessments which reflect the activities and associated vulnerabilities present in a wide array of manufacturing settings. The vulnerability assessments included consideration of the three elements now required by § 121.130 to be evaluated in any vulnerability assessment: (1) The potential public health impact if a contaminant were added (*e.g.,* severity and scale); (2) the degree of physical access to product; and (3) the ability of

an attacker to successfully contaminate the food. The four identified key activity types are processes, steps, or procedures that consistently ranked as the most vulnerable, regardless of the commodity being assessed, and reflect significant vulnerabilities to intentional adulteration caused by acts intended to cause wide scale public health harm. Therefore, using the key activity types is an appropriate method to conduct a vulnerability assessment. In addition, using key activity types has the benefit of allowing facilities with less technical expertise in conducting food defense vulnerability assessments to leverage their expertise in food processing to identify actionable process steps.

However, in response to comments, we are no longer singling out key activity types in the regulatory text. Importantly, using key activity types remains as one appropriate vulnerability assessment method. We intend to place the key activity types in guidance, which will provide us with greater flexibility to update them in the future, if necessary. The final rule provides firms the flexibility to choose a vulnerability assessment methodology appropriate to their operations, provided that methodology includes the three fundamental elements required by § 121.130(a). We expect that some firms will use key activity types, and some firms will use other methods.

(Comment 72) Some comments recommend that vulnerability assessments should consider the contribution of existing practices, procedures, and programs that may already function to reduce vulnerability.

(Response 72) When conducting facility-specific vulnerability assessments, the role of existing measures (*e.g.,* security practices, procedures, or programs) should be determined on a case-by-case basis. In general, existing measures that are applied to the process (*e.g.,* locks, area access controls, peer or supervisory monitoring) and are not inherent characteristics of a particular process step, should be considered after the vulnerability assessment is completed and actionable process steps have been identified, and should not be considered during the identification of significant vulnerabilities. For example, when evaluating the vulnerability of a mixing tank, a facility would not conclude the tank does not represent a significant vulnerability because the mixing tank lid and sampling ports are routinely locked. Instead, the vulnerability of the mixing tank would be evaluated as if the existing measure (in this case the locks) were not in place. If, in the absence of properly implemented locks, the mixing tank would be significantly vulnerable, then the facility would identify the mixing tank as an actionable process step. The facility may then decide that the existing locks could serve as a mitigation strategy that reduces the significant vulnerability of the mixing tank and evaluate if any other mitigation strategies are necessary. The food defense plan would then capture the mixing tank step as an actionable process step and the locks as the mitigation strategy. As a mitigation strategy, the locks would be subject to mitigation strategy management components (*i.e.,* food defense monitoring, corrective actions, and verification).

There are some instances where it is appropriate to consider existing food defense measures before the vulnerability assessment is completed. For example, the owner of the same facility may assess a second mixing tank that is part of an entirely closed system, with no direct access points into the system, such that an individual attempting to access this mixing tank likely would cause a major disruption to the line, foiling any attempted intentional adulteration. Because this second mixing tank has specific closed properties designed into the system, that are inherent characteristics of the mixing tank, it would be appropriate for the facility to consider these inherent characteristics in the vulnerability assessment. Based on this assessment, the facility may conclude that the inherent characteristics of this mixing tank, in this case its enclosed nature, renders the product inaccessible at this step and, therefore would not identify an actionable process step associated with this mixing tank (in which case, there would also be no requirement to implement a mitigation strategy at this step).

Permanent equipment changes may reduce a significant vulnerability to such an extent that a processing step would no longer be considered an actionable process step. For example, a facility might identify a rotating air dryer as an actionable process step and in the supporting rationale discuss the high degree of accessibility at the point where product is fed from a pneumatic conveyor into the top of the dryer. The facility later installs a permanent, clear plastic shield affixed to, and extending from, the discharge of the pneumatic conveyor to the opening of the dryer. The clear plastic shield enables workers to supervise the product flow into the dryer while serving as an effective barrier to an attacker wishing to introduce a contaminant into the product at the dryer. This engineering improvement would significantly minimize or eliminate access to product in the dryer and thereby significantly minimize or prevent a significant vulnerability at this process step. The implementation of this engineering improvement would be detailed in the facility's food defense plan and, upon reanalysis, the facility may determine that this processing step is no longer an actionable process step.

(Comment 73) Some comments recommend that vulnerability assessments should consider downstream processing steps, the volume of product, shelf life, marketplace turnover, and consumption patterns and that additional details regarding vulnerability assessments should be in the regulatory text. The comments did not provide specifics or recommendations regarding what additional details about vulnerability assessments should be included.

(Response 73) As previously stated, we are not prescribing a specific methodology that facilities must use to conduct vulnerability assessments to identify actionable process steps. In the preamble to the proposed rule, we listed a number of elements to consider when conducting vulnerability assessments (78 FR 78014 at 78042) and did not require particular elements in the regulatory text. However, in light of comments requesting further vulnerability assessment details in the regulatory text, and the removal of key activity types as a separately identified option, we are specifying that three elements must be considered in any vulnerability assessment. These three elements are based on our extensive experience conducting vulnerability assessments and collaborating with stakeholders to refine vulnerability assessment methodology and are critical elements of an acceptable vulnerability assessment methodology. Specifically, we have revised § 121.130 to require that for each processing step under evaluation, the facility must consider, at a minimum: (1) The potential public health impact if a contaminant were added (*e.g.,* severity and scale); (2) the degree of physical access to product; and (3) the ability of an attacker to successfully contaminate the product.

a. *Element 1: The potential public health impact if a contaminant were added (e.g., severity and scale).* This factor includes, for each processing step, consideration of the volume of product impacted, the number of at risk servings generated, and the number of potential exposures. As appropriate, and with sufficient scientific rigor, the facility may also consider other factors such as food velocity (*i.e.,* the speed at which a

particular product moves through the distribution system); potential agents of concern; the infectious or lethal dose of agents of concern; and the morbidity/mortality rate if the intentional adulteration were successful. This element is required in the vulnerability assessment because it enables facilities to focus resources on processing steps with the highest degree of public health impact if the intentional adulteration were successful.

We recognize that some facilities may not have the scientific knowledge to critically identify and evaluate individual agents of concern across their production process. The potential public health impact can also be determined through the consideration of the volume of food at risk should an act of intentional adulteration be successful at each process step. This approach would serve to extrapolate the potential public health impact without the scientifically rigorous examination of specific agents (*e.g.,* consideration of infectious or lethal dose). For example, using this approach, a facility considering the potential public health impact of the intentional adulteration of its primary ingredient storage tank would consider the volume of food in the tank and the servings generated from this volume. If the facility has a 50,000 gallon primary ingredient liquid storage tank that would generate 800,000 one cup servings (50,000*16), the facility would consider all of these 800,000 servings as being at risk. Note that potential servings at risk is not limited to the amount of food being processed at an actionable process step. This is illustrated by a process step that applies a minor ingredient, such as a vitamin mixture applied over toasted cereal as it passes underneath spray nozzles. The facility's metering tank for application to the cereal is 10 gallons. However, these 10 gallons will be sprayed over 100,000 servings of cereal. The facility would conclude that 100,000 servings are at risk if the intentional adulteration were successful at this point.

A number of other factors may also go into the calculations a facility uses to determine the potential public health impact. For example, if a facility has conducted market research and concludes that each distribution unit of 20 servings is typically consumed by four persons, the potential public health impact of that distribution unit could be considered four persons rather than 20.

b. *Element 2: The degree of physical access to product.* This element includes consideration of, at a minimum, the ability of an attacker to conduct the attack at the particular processing step under evaluation; and the openness of the processing step to intentional adulteration, based on the presence of physical barriers such as gates, railings, doors, lids, seals, shields, and other barriers. This element is required in the vulnerability assessment because it enables facilities to prioritize how easy or difficult it is to access product at each processing step, based on the inherent characteristics of the physical environment surrounding the step.

c. *Element 3: The ability of an attacker to successfully contaminate the product.* This element includes, for each processing step, consideration of, at a minimum, the ease of introducing an agent to the product; the ability for an agent to be uniformly mixed or evenly applied; and the ability of an attacker to work unobserved and have sufficient time to introduce the agent. As appropriate, and with sufficient scientific rigor, the facility may also consider: The amount of specific agent required; whether downstream dilution or concentration steps would affect the volume of agent required; whether downstream processing would or would not neutralize the agent(s) under evaluation; and the ability of the attacker to successfully introduce a sufficient volume of agent to the food without being detected or interdicted. This element is required in the vulnerability assessment because it enables facilities to understand whether the amount of agent required at each processing step is feasible and if subsequent processing steps would successfully remove an agent if present.

Taken together, these three required vulnerability assessment elements provide facilities appropriate tools to adequately identify which vulnerabilities should be identified as significant vulnerabilities (*i.e.,* those vulnerabilities, if attacked, could reasonably be expected to cause wide scale public health harm). If the step under evaluation has significant vulnerabilities associated with it and requires the application of mitigation strategies to prevent or eliminate a significant vulnerability or reduce such vulnerability to an acceptable level, the step would be categorized as an actionable process step.

By utilizing these three required elements when conducting a vulnerability assessment, regardless of the vulnerability assessment methodology utilized, facilities are provided with a systematic approach that enables them to move in a logical, step-wise manner to identify actionable process steps. First, a facility would develop a list or flow diagram of each point, step, or procedure in the food process under evaluation, recognizing that each processing step has some associated vulnerability (*i.e.,* the susceptibility of a point, step, or procedure in a facility's food process to intentional adulteration). Second, the facility would identify which vulnerabilities are significant vulnerabilities (by using the three required elements), and third, the facility would identify actionable process steps where significant vulnerabilities are present. We intend to provide further guidance on conducting vulnerability assessments to satisfy these requirements.

As noted previously, some comments suggested that vulnerability assessments should consider downstream processing steps, the volume of product, shelf life, marketplace turnover, and consumption patterns. We have found that shelf life is not necessarily a good indicator of the speed at which a particular product moves through the distribution system (*i.e.,* food velocity), because many products are sold and consumed months, if not years, before their shelf life expires. Marketplace turnover and consumption patterns are captured within the concept of food velocity, which may be considered in a vulnerability assessment as a component of Element 1, detailed previously in this document. Likewise, the potential effect of downstream processing can be considered as a component of Element 3, detailed previously in this document.

(Comment 74) One comment suggests adding laboratory professionals to the list of possible vulnerability assessment team members.

(Response 74) The list of potential members of the vulnerability assessment team discussed in the preamble to the proposed rule is not exhaustive (78 FR 78014 at 78042). The original list included ''personnel working in the areas of security, food safety/quality assurance or control, human resources, operations, maintenance, and other individuals deemed necessary to facilitate the formation of the vulnerability assessment.'' We agree that laboratory professionals can provide important contributions to the vulnerability assessment and can be included as potential team members.

(Comment 75) A few comments seek clarification on what type of justification would be required in the instance where no significant vulnerabilities are identified through a vulnerability assessment.

(Response 75) It has been our experience that most facilities will identify one or more significant vulnerabilities. For a facility to

conclude that it has no significant vulnerabilities and therefore no actionable process steps, the facility would need to determine that none of its production steps present a significant vulnerability for wide scale public health harm from intentional adulteration. In conducting its vulnerability assessment, the facility would need to consider at each step of its process: (1) The potential public health impact if a contaminant were added (*e.g.,* severity and scale); (2) the degree of physical access to the product; and (3) the ability of an attacker to successfully contaminate the product. The written vulnerability assessment, including the accompanying rationale supporting the decision not to identify any significant vulnerabilities would be important for determining if such a facility had complied with § 121.130.

(Comment 76) One comment suggests the term ''vulnerability assessment'' should be clearly defined in the rule.

(Response 76) We deny this request. As discussed in Response 73, § 121.130 has been revised to provide required elements the facility would need to consider at each step of its process when conducting vulnerability assessments: (1) The potential public health impact if a contaminant were added (*e.g.,* severity and scale); (2) the degree of physical access to the product; and (3) the ability of an attacker to successfully contaminate the product. Additionally, the definition for significant vulnerability has been revised to include these three required elements, which underscores the importance of the evaluation that leads to the identification of significant vulnerabilities, which in turn leads to the identification of actionable process steps.

We believe the combination of required vulnerability assessment elements in § 121.130 and a revised definition for significant vulnerability provides a high degree of specificity regarding what constitutes a vulnerability assessment and will provide direction to facilities as they select an appropriate vulnerability assessment methodology.

(Comment 77) One comment suggests that the term ''secondary ingredient handling'' used in a key activity type is confusing because it is not obvious whether ''secondary'' describes ''ingredient'' or ''handling,'' nor what is meant by ''secondary.''

(Response 77) We are removing the key activity types from the regulatory text, although the key activity types are one appropriate method to conduct vulnerability assessments to identify actionable process steps. Consequently, we will consider these comments when developing guidance to support the use of key activity types as an appropriate method to conduct a vulnerability assessment.

(Comment 78) One comment suggests that the definition for ''holding'' used in two key activity types should be modified to account for activities that involve the safe and effective storage of raw agricultural commodities, other than fruits and vegetables, intended for further distribution or processing, but does not include activities that transform a raw agricultural commodity into a processed food. The specific example of mineral oil applied to raw grains and oilseeds for dust control was provided.

(Response 78) In response to the comment, we have conducted an analysis of this activity and believe that the storage of mineral oil and its application onto raw, whole grains or oilseeds in accordance with 21 CFR 172.878 is not a significant vulnerability and facilities engaged in these specific practices are not required to evaluate these processing steps when conducting vulnerability assessments (Ref. 15). Facilities storing and using mineral oil on other food products, such as baked goods, condiments, spices, or confectionery products, are required to evaluate mineral oil storage and use when conducting vulnerability assessments.

Additionally, we are removing the key activity types from the regulatory text, as discussed previously, although the key activity types are one appropriate method to conduct vulnerability assessments to identify actionable process steps. Further, we are revising the definition of ''holding'' in this final rule, as discussed in section IV.A.3, by removing the distinction for farms and farm mixed-type facilities and adding that holding also includes activities performed incidental to storage of a food, but does not include activities that transform a RAC into a processed food and we include additional examples of holding activities. However, the holding of food in liquid storage tanks remains an activity subject to the rule under § 121.5(b).

(Comment 79) Some comments state that when conducting vulnerability assessments, facilities should take different processing steps into consideration, but facilities should not be expected to conduct vulnerability assessments based on product type. Rather, they should be able to conduct a tailored vulnerability assessment based on the best methodology for each facility, either in its entirety or by any appropriate, locally determined methodological approach, such as grouping different production areas or processing steps.

(Response 79) Facilities have the flexibility to choose a vulnerability assessment methodology appropriate to their operations, provided that methodology includes consideration of three fundamental elements (*i.e.,* the evaluation of the potential public health impact if a contaminant were added (*e.g.,* severity and scale), the degree of physical access to the product, and the ability of an attacker to successfully contaminate the product) and is performed by an individual qualified by training and/or experience to conduct vulnerability assessments. A facility must conduct written vulnerability assessments for all of the foods that it manufactures/processes, packs, or holds. We recognize there are instances where facilities are manufacturing very similar products using either the same equipment and/or very similar processes. In such instances, it is appropriate for the facility to conduct vulnerability assessments of like products by grouping these products into one or more processes and conducting vulnerability assessments on these process groupings. However, any product or process-specific differences must be carefully delineated and noted in the vulnerability assessment, and the facility must clearly identify the specific products included in each vulnerability assessment. In some facilities with limited types of products, the written vulnerability assessment may contain a single set of process steps that addresses all of the products produced. For example, a facility making fruit-flavored beverages may be able to conduct a single vulnerability assessment for all of its beverages using a single set of processing steps.

In other facilities, there may not be a practical way to group all products into a single set of process steps, and vulnerability assessments may be needed for multiple groups of products. For example, a facility that makes both ready-to-eat (RTE) entrees and entrees that are not RTE may need to conduct a vulnerability assessment of the RTE entrees and conduct a separate vulnerability assessment for the entrees that are not RTE.

d. Qualified Individual

(Comment 80) Several comments requested more information regarding the requirement that vulnerability assessments must be conducted by individual(s) qualified by experience and/or training using appropriate methods. Specifically, additional clarification was requested regarding

training such individuals must receive (particularly in the absence of FDA standardized curriculum); the process and criteria by which relevant work experience may supplement or substitute for training; and the criteria by which FDA will determine if the individual is adequately qualified to conduct vulnerability assessments. Additionally, several comments believe there is confusion with the use of qualified individuals in this rule compared to other rules and believe the term should be defined.

(Response 80) We agree that further clarification is needed regarding a definition for a qualified individual in the context of this rule and in particular, how it relates to the qualifications necessary to conduct vulnerability assessments. Consequently, in § 121.3 we have defined a *qualified individual* to mean ''a person who has the education, training, or experience (or a combination thereof) necessary to perform an activity required under subpart C, as appropriate to the individual's assigned duties. A qualified individual may be, but is not required to be, an employee of the establishment.'' We have further clarified the qualifications necessary for the conduct of a vulnerability assessment by creating a new section (§ 121.4, Qualifications of Individuals Who Perform Activities Under Subpart C). In § 121.4 we state ''each individual responsible for . . . conducting or overseeing a vulnerability assessment as required in § 121.130'' must (1) have the appropriate education, training, or experience (or a combination thereof) necessary to properly perform the activities; and (2) have successfully completed training for the specific function at least equivalent to that received under a standardized curriculum recognized as adequate by FDA or be otherwise qualified through job experience to conduct the activities. Job experience may qualify an individual to perform these functions if such experience has provided an individual with knowledge at least equivalent to that provided through the standardized curriculum. This new definition and qualifications section has provided more information on what would qualify an individual to perform a vulnerability assessment. We believe that our definition of ''qualified individual'' as well as the qualifications required of those individuals have addressed this need and fulfill the request of the comments. This new approach is consistent with other FSMA rules, including the PCHF final rule, which we believe allows for easier understanding and implementation for the regulated industry.

As stated in the preamble to the proposed rule, we recognize that the task of performing a vulnerability assessment requires an individual with a specific skill set to properly assess and prioritize the various points, steps, or procedures in a food process to characterize their susceptibility to intentional adulteration, to identify significant vulnerabilities and to identify actionable process steps where mitigation strategies are essential to significantly minimize or eliminate the significant vulnerabilities. We also believe that various activities required by this rule may require higher levels of training based on the difficulty and intensity of the task. We believe that a standardized curriculum will be required to ensure clear and consistent training is provided for this activity. The training developed for the purpose of conducting or overseeing a vulnerability assessment will require an in-depth analysis of the functional and thought processes required to properly characterize significant vulnerabilities associated with a facility's points, steps or procedures and the identification of actionable process steps. The process of conducting a vulnerability assessment may be new to much of the industry and the training must take this into consideration. The standardized curriculum for conducting a vulnerability assessment will need to be a comprehensive training that teaches an individual the required components of a vulnerability assessment and provides enough information for an individual to calibrate their decision making based on the scientific analysis required by a vulnerability assessment. We believe that the curriculum designed for this activity will require multiple days and may best be offered in person.

(Comment 81) A few comments believe the key activity type option for identifying actionable process steps should include a requirement that the evaluation be performed by an individual(s) qualified by experience and/or training using appropriate methods.

(Response 81) We agree with the comments and this is reflected in the revised requirements. As explained in Response 71, key activity types have been removed from the regulatory text, but are still considered an appropriate method to conduct a vulnerability assessment. The rule requires that a vulnerability assessment, no matter which methodology is used, must be conducted or overseen by a qualified individual. We note that the requirements to conduct or oversee a vulnerability assessment will differ depending on the type of vulnerability assessment conducted. Using key activity types requires less technical expertise and experience than other methodologies and this would be reflected in the necessary qualifications.

C. Proposed § 121.135—Focused Mitigation Strategies for Actionable Process Steps

We proposed that the owner, operator, or agent in charge of a facility must identify and implement focused mitigation strategies at each actionable process step to provide assurances that the significant vulnerability at each step will be significantly minimized or prevented and the food manufactured, processed, packed, or held by such facility will not be adulterated under section 402 of the FD&C Act (21 U.S.C. 342). As discussed in section IV.B.3, in the final rule we use the term ''mitigation strategies'' and no longer reference focused and broad mitigation strategies.

In addition, we have modified this provision to provide that for each mitigation strategy or combination of strategies implemented at each actionable process step, the facility must include a written explanation of how the mitigation strategy(ies) sufficiently minimizes or prevents the significant vulnerability associated with the actionable process step. In the preamble to the proposed rule, we stated that a justification for how the strategy significantly reduces or eliminates the risk of intentional adulteration at that actionable process step(s) must be documented (see 78 FR 78014 at 78048); however, this was not explicitly included in the regulatory text. We believe that providing additional flexibility in the nature of the mitigation strategies facilities may employ makes it critical that facilities explain their rationale as to how the strategy(ies) are, in fact, protective of the actionable process step. This explanation will include a facility's rationale for selecting its mitigation strategies. This explanation can provide additional benefits to the facility by assisting them in the decision-making process for identifying mitigation strategies as well as identifying the most appropriate mitigation strategies management components for the mitigation strategy(ies).

Based on our vulnerability assessments, we believe that adequate mitigation strategies are designed to minimize or eliminate the chances an attacker would be successful if an act of intentional adulteration were attempted at the actionable process step by either

(1) minimizing the accessibility of the product to an attacker (*e.g.,* physically reducing access to the product by locking storage tanks) or (2) reducing the opportunity for an attacker to successfully contaminate the product (*e.g.,* increasing observation of the area through supervision or use of the buddy system), or a combination of both. Mitigation strategies found within FDA's Mitigation Strategies Database, generally, are designed to address one or both of these concepts. The content of the Mitigation Strategies Database is derived from our experience conducting vulnerability assessments with industry and can serve as a resource for facilities to identify adequate and appropriate mitigation strategies. The explanation of how the mitigation strategy sufficiently minimizes or prevents the significant vulnerability associated with the actionable process step would, generally, address the mitigation strategy's impact on one or both of these outcomes.

For example, a facility seeking to protect its liquid storage tank's access hatch with a lock may conclude that the lock significantly reduces access to the liquid food stored in the tank by rendering the hatch inaccessible and include this explanation in its food defense plan. As another example, a facility may elect to protect its liquid storage tank actionable process step with a policy to require two or more employees to be in the area at all times. The facility's explanation would include the rationale that this ''buddy system'' reduces the opportunity and ability of an attacker to bring a contaminant into the vulnerable production area and introduce the contaminant into the food without being detected by his or her co-workers. These two examples show that the same actionable process step can be protected in a variety of ways. The explanation will clarify the facility's thinking and rationale as to how a mitigation strategy significantly minimizes or prevents a significant vulnerability.

We believe that the explanation accompanying the mitigation strategy(ies) will be highly beneficial to the facility in gauging the proper implementation of the mitigation strategy during required verification activities. In identifying and implementing appropriate mitigation strategies, the facility will need to reason through how and why the mitigation strategy(ies) will be protective of the respective actionable process step in question. This explanation and the monitoring of the mitigation strategy play key roles in enabling the facility to determine if the mitigation strategy is achieving its intended aim and, therefore, is properly implemented.

For example, for a facility that secures its liquid storage tank with a lock, a review of monitoring records may show that the lock is consistently in place and locked, therefore reducing accessibility and significantly reducing the vulnerability associated with the liquid storage tank. By being consistently implemented as intended, the lock is achieving the aim as explained in the food defense plan to reduce access to the liquid food held in the liquid storage tank. In this case, the facility can conclude that this mitigation strategy is properly implemented and is reducing a significant vulnerability.

In contrast, consider a lock on a mixer that is not achieving its intended aim. In this example, the worker at the mixer must routinely open the mixer's lid to determine if the product is being sufficiently mixed. The worker finds the lock to be interfering with his or her responsibilities and frequently does not engage the lock after checking on the product, repeatedly leaving the mixer unsecured. This deviation is documented in monitoring records by the production supervisor. In this case, the facility's explanation as to how the mitigation strategy would be protective of the mixer included the rationale that the lock would reduce access to the product. A component of the facility's corrective action procedure for this mitigation strategy was to retrain the employee on the importance of locking the mixer, but the employee continues to repeatedly leave the mixer unlocked due to its interference with his or her responsibilities. Since the mitigation strategy, as determined through a review of monitoring and corrective action records, was not consistently implemented, it is not achieving the aim as specified in the mitigation strategy's explanation. Therefore, the mitigation strategy cannot be determined to be properly implemented and is not reducing significant vulnerabilities associated with the mixer. Since the facility has found that the mitigation strategy is not properly implemented, the facility must reanalyze this portion of the food defense plan under the requirements of § 121.157(b)(3) and then identify and implement a different mitigation strategy, or combination of strategies, for the mixer that would reduce the likelihood that an act of intentional adulteration would be successful.

Additionally, we believe that the explanation for how the mitigation strategy(ies) are suitable and intended to reduce the significant vulnerability will also be highly beneficial in establishing common understanding and communication between the facility and inspectors during inspections.

(Comment 82) Many comments support our proposed requirement that mitigation strategies be targeted at high vulnerability process steps instead of setting requirements for general facility-level protections. Further, some comments assert that significant vulnerabilities by nature present themselves at particular points in a process and that these individual points, steps, or procedures must be protected. These comments also state that broad mitigation strategies would be far reaching and require significantly more capital investment from industry, while not directly protecting the most vulnerable processes.

(Response 82) We agree with comments supporting the direction of mitigation strategies to those areas where vulnerability is highest. As discussed previously, we now refer to mitigation strategies, rather than broad and focused mitigation strategies. However, we continue to believe that to be sufficient and appropriate mitigation strategies must be specifically tailored to the significant vulnerability and customized to the actionable process step where they are applied rather than applied to the entire facility (*e.g.,* locking exterior doors, or ensuring employees and visitors have identification badges). We would not consider these two examples to be adequate to significantly reduce or prevent a significant vulnerability because they do not address an inside attacker.

However, we believe that many policies or procedures that a facility currently has in place can be modified or altered to provide protection against acts of intentional adulteration without the facility incurring significant costs, or requiring additional capital investment. For example, consider a liquid food storage tank with an inward opening hatch. When the tank is full, the pressure of the liquid prevents the hatch from being opened, rendering the tank inaccessible. However, when the tank is empty, the hatch may be opened and a contaminant added. It may be part of normal facility practice for a supervisor to conduct a visual check of storage tanks after a cleaning cycle to ensure the cleaning has been conducted properly. Rather than incur the cost of installing a lock or other access control on the hatch, the facility may elect to implement a food defense mitigation strategy by altering its visual check procedure so that the visual check by the supervisor is conducted

immediately prior to food being added to the storage tank so that the tank is observed after the tank has been empty and accessible for an extended period of time. Alternatively, the facility could elect to secure the tank's hatch with a tamper-evident seal or tape after the visual inspection. This slight modification of an existing facility practice could be implemented with little, if any, cost to the facility and serve to protect the actionable process step—in this case the storage tank—from an attacker adding a contaminant to the tank while it is empty and accessible after it been cleaned and visually inspected.

(Comment 83) Some comments state that those strategies previously termed as broad mitigation strategies should be considered as being among appropriate mitigation strategies for compliance with the requirements, with the majority of those comments indicating that FDA should not distinguish between focused and broad mitigation strategies in the final rule. Some comments disagree with FDA's statement in the proposed rule that the implementation of focused mitigation strategies at actionable process steps in a food operation is necessary to minimize or prevent the significant vulnerabilities that are identified in a vulnerability assessment regardless of the existence of broad mitigation strategies. These comments contend that mitigation strategies (whether broad or focused) can work in concert with one another and play an important role in a facility's food defense approach. Additionally, some comments state that broad mitigation strategies can sometimes achieve the same results as focused mitigation strategies and some comments state that the differentiation between the two types of strategies is confusing and subjective.

(Response 83) We believe this comment is largely addressed by changing the regulatory text to refer to only mitigation strategies in this final rule. We agree with comments that mitigation strategies exist across a spectrum from those that are very broad and facility-wide in nature to those that are very specific and tailored to unique processing steps and areas. If implemented in a directed manner, a strategy that may tend to be thought of as ''broad'' can be effective at reducing vulnerability associated with a specific actionable process step and could sufficiently minimize the likelihood of a successful act of intentional adulteration at the actionable process step.

Based on the results of our vulnerability assessments, we believe that mitigation strategies implemented at actionable process steps that are customized to the processing step at which they are applied, tailored to existing facility practices and procedures, and consider the actionable process step's vulnerability to an insider attack are sufficient to protect the actionable process step. An insider attack must be considered because an attacker who has achieved access to the facility will have already circumvented the facility's general facility-level protections. During the course of our vulnerability assessments, we determined that if an actionable process step was sufficiently protected against an attack perpetrated by an insider with legitimate access to the facility, it would be similarly protected against the actions of an outside attacker who has circumvented perimeter protections. Facility-wide security measures can support or compliment the mitigation strategy(ies) the facility implements; however the significant vulnerability associated with the actionable process step must be significantly reduced or prevented.

For example, if a facility implements a strategy to restrict access at an actionable process step to only those authorized individuals who work in the area, and the facility leverages identification badges to enforce this strategy, then the strategy becomes much more targeted. In this case, the strategy is simply not about identifying personnel who work anywhere in the facility, but rather, restricting access to a specifically vulnerable area. In this case, the pre-existing badging process the facility had in place to positively identify employees and visitors serves as the foundation upon which the more tailored mitigation strategy is built. However, the badging process itself is not a mitigation strategy sufficient to significantly reduce or prevent a significant vulnerability at the actionable process step because the badging process alone does not restrict access to the actionable process step.

Another example to illustrate how different practices can work in concert with each other to achieve protection is that of vetting employees. In the proposal we described a hypothetical scenario where a facility's secondary ingredient handling area was identified as significantly vulnerable and was, therefore, identified as an actionable process step. In the scenario, the facility elected to mitigate this vulnerability by (1) reducing the time ingredients were open and accessible, (2) entrusting the handling of secondary ingredients to one of the most trusted employees, and (3) increasing observation over the secondary ingredient handling area. To implement the second mitigation strategy (use of most trusted employees), the facility could utilize either senior and/or long-term employees who had earned their trust over time, or the facility could conduct a more detailed background check on specific employees.

Much the same way the Federal government assigns more sensitive tasks to Federal workers based on a multi-layered classification and security clearance process, the facility could require basic level pre-employment screening for most employees, but for those employees working at actionable process steps, a mitigation strategy could be to require a more detailed level of background check. The facility would also conduct periodic review of the background check, as appropriate. By applying a more targeted approach to establishing trust for the employee working in the secondary ingredient handing area, the facility leveraged what was previously described in the proposal as a ''broad'' mitigation strategy in a much more directed and targeted way such that it was specifically addressing the significant vulnerability associated with the secondary ingredient staging area. This example shows how what were ''broad'' and ''focused'' mitigation strategies can work together to protect an actionable process step.

We caution against using background checks as the sole mitigation strategy to reduce significant vulnerabilities at an actionable process step because a background check may not identify all indicators of an insider threat. Additionally, information within a background check may be outdated or missing more recent key information that could be indicators of an insider threat. Background checks should be used in concert with other mitigation strategies to counter the risk of an insider attack. In this example, the facility also mitigated vulnerability at the secondary ingredient staging area by reducing the staging time of ingredients and increasing observation of the area.

Similarly, some other mitigation strategies may not be adequate when used in isolation. For example, ensuring adequate lighting around an actionable process step would generally be a mitigation strategy that must be used in concert with other strategies to significantly reduce the likelihood of, or prevent, successful acts of intentional adulteration at an actionable process step. The increased lighting can support other mitigation strategies (*i.e.,* increased supervision of an actionable process step) but, generally, increased

lighting would not by itself be sufficient to address the significant vulnerability associated with the actionable process step.

(Comment 84) Some comments state that existing facility practices and facility-level measures should be considered when a facility is identifying appropriate mitigation strategies.

(Response 84) We agree. As discussed previously, mitigation strategies should be tailored to existing facility practices and procedures, and take into account the nature of the actionable process step's significant vulnerability. Mitigation strategies can be complemented by or built on top of existing practices or facility-level measures. For example, a facility might prepare secondary ingredients in an area near the process step where they will be added to the product line. The facility weighs and measures ingredients the night before use so they are ready for introduction into the product line in the morning. To identify a suitable and appropriate mitigation strategy, the facility would consider its normal practice of staging ingredients the night before and any other relevant practices the facility engages in regarding its handling of secondary ingredients in this area. The facility might conclude that staging ingredients the night before is unnecessary and elect to implement the mitigation strategy that ingredients will only be handled immediately before their introduction into the product line to prevent them from being open and accessible for extended periods of time. Alternatively, if the facility concludes that their operating practices prevent this approach, it could implement the mitigation strategy to place the ingredients in tamper evident storage containers overnight to prevent an attacker from being able to introduce an agent without indications of tampering with the ingredients. The facility would implement the most appropriate mitigation strategy taking into consideration its existing practices and procedures.

(Comment 85) One comment asserts broad mitigation strategies offer significant protections to the food supply and that focused mitigation strategies are of questionable or at least unproved efficacy. This comment goes on to request that FDA focus requirements only on broad mitigation strategies that limit access to bulk foods prior to and at process steps that may disperse contamination in a large volume of finished food.

(Response 85) During the course of our vulnerability assessments, we found that appropriate mitigation strategies must be specifically tailored to the significant vulnerability they are addressing and customized to the actionable process step where they are applied, while taking into account existing facility practices and procedures. We disagree with the comment's assertion that strategies previously termed as ''focused mitigation strategies'' are questionable or of unproven efficacy. Indeed, we conclude as determined through our vulnerability assessments that mitigation strategies specifically designed to protect the most vulnerable points in a food operation are the most effective at reducing the likelihood that an act of intentional adulteration would be successful. General facility-level security measures have questionable value in protecting actionable processing steps from significant vulnerabilities, especially those significant vulnerabilities associated with attackers with legitimate access to the facility. However, this comment illustrates why we are changing the codified to refer to only ''mitigation strategies.'' We would consider the efforts described by this comment to be focused mitigation strategies as we used that term in the proposed rule. We agree that ''bulk foods prior to and at process steps that may disperse contamination in a large volume of finished food'' would most likely be significantly vulnerable and thus require appropriate mitigation strategies.

(Comment 86) Some comments state that some of the mitigation strategies identified in the preamble of the proposed rule may not be appropriate or suitable in certain circumstances. For example, some comments mention that one-way sample ports as a mitigation strategy may not be appropriate for products that require aseptic sampling. Some comments contend that making engineering enhancements to equipment or repositioning equipment to increase visual observation may be prohibitively costly.

(Response 86) We agree that certain mitigation strategies may not be appropriate or suitable in some situations. Therefore, we are not requiring any specific mitigation strategies in this rule. A facility may identify the most appropriate and suitable mitigation strategies for its facility, the food being processed, the actionable process step being protected, and the nature of the significant vulnerability being mitigated.

(Comment 87) Some comments urge FDA to permit requirements that are already in place by other government agencies to count as mitigation strategies, when appropriate based on a thoughtful vulnerability assessment. In particular, these comments suggest the C–TPAT program has proved successful in requiring that broad mitigation strategies be implemented, including physical security, personnel security, ingredient storage and inventory procedures, and crisis management planning.

(Response 87) As discussed in section III.D, we believe that participation in other security programs, such as C–TPAT or CFATS for example, raises the overall security posture for a facility and can be beneficial along with the requirements of the final rule. In certain circumstances, security measures implemented under other security programs may also prove to be effective mitigation strategies once actionable process steps are identified. These security measures should be evaluated on a case-by-case basis to determine if they significantly reduce or prevent significant vulnerabilities at actionable process steps. If so, the facility may consider these protections as mitigation strategies under § 121.135 and document them in the food defense plan. However, FDA will not consider a facility's participation with other security programs as de facto compliance with this rule.

D. Final § 121.138—Mitigation Strategies Management Components

We have added a new § 121.138 (Mitigation Strategies Management Components) to establish that mitigation strategies required under § 121.135 are subject to the following mitigation strategies management components as appropriate to ensure the proper implementation of the mitigation strategies, taking into account the nature of each such mitigation strategy and its role in the facility's food defense system: (1) Food defense monitoring in accordance with § 121.140; (2) Food defense corrective actions in accordance with § 121.145; and (3) Food defense verification in accordance with § 121.150. We have created this new section to provide clarity and understanding regarding the application of the three management components to the mitigation strategies as required by § 121.135.

E. Proposed § 121.140—Monitoring

1. Proposed § 121.140(a)–(b) Requirement for Written Procedures for and Frequency of Monitoring

We proposed that you must establish and implement written procedures, including the frequency with which they are to be performed, for monitoring the mitigation strategies, and you must monitor the mitigation strategies with

sufficient frequency to provide assurance that they are consistently applied.

Some comments support the proposed requirements. In the following paragraphs, we discuss comments that disagree with the proposed requirements, ask us to clarify the proposed requirements, or suggest one or more changes to the proposed requirements. Some comments request that we provide more flexibility than a traditional HACCP framework, with specific requests for flexibility in the management components, including monitoring.

After considering these comments, we are making three revisions to the requirements for monitoring in § 121.140. First, we are adding the qualification ''as appropriate to the nature of the mitigation strategy and its role in the facility's food defense system,'' to the beginning of the provision. Second, we are changing ''sufficient'' to ''adequate'' in § 121.140(b), which now states that ''you must monitor the mitigation strategies with adequate frequency to provide assurances that they are consistently performed.'' We are substituting the term ''adequate'' for the term ''sufficient'' to be consistent with the PCHF final rule definition for monitoring. We conclude that there is no meaningful difference between ''adequate'' and ''sufficient'' for the purposes of part 121. We have also added a definition for the term ''adequate'' in the regulatory text to mean that which is needed to accomplish the intended purpose in keeping with good public health practice. We also conclude that the regulations will be clearer if we use the single term ''adequate'' throughout the regulations. Third, we are changing ''applied'' to ''performed'' to address comments that state the language was unclear. Section 121.140(b) now states that ''you must monitor the mitigation strategies with adequate frequency to provide assurances that they are consistently performed.''

(Comment 88) Some comments argue that the language of section 418(d) of the FD&C Act is ambiguous, and state that monitoring in section 418(d) does not require that facilities conduct monitoring as described in the National Advisory Committee on Microbiological Criteria for Foods' HACCP Principles and Application Guidelines. These comments state that the statute sets a standard for facilities to ''monitor the effectiveness of the preventive controls.'' The comments state that the statute does not indicate how facilities are to monitor the effectiveness of the mitigation strategies; it does not indicate that each mitigation strategy must be monitored, and it does not specify the frequency at which monitoring must occur. However, the comments agree that facilities should assess whether mitigation strategies are in place and are fully implemented. The comments agree that facilities should have written procedures regarding how, and the frequency at which, observations take place, but also indicate that these procedures and frequencies should be less rigorous than procedures and frequencies for preventive controls.

(Response 88) We agree that facilities must assess whether mitigation strategies are in place. We also agree that facilities must provide written procedures regarding how, and the frequency at which, monitoring occurs. This rule implements section 103 of FSMA, and therefore includes components for monitoring (section 418(d) of the FD&C Act). We agree that monitoring in the intentional adulteration regulatory framework should be more flexible than monitoring as described in the National Advisory Committee on Microbiological Criteria for Foods' HACCP Principles and Application Guidelines. Therefore, we have modified the requirement for monitoring in the regulatory text to include ''as appropriate to ensure the proper implementation of the mitigation strategies, taking into account the nature of each such mitigation strategy and its role in the facility's food defense system'' (see §§ 121.138, 121.140) and to provide for the use of exception records (see § 121.140(c)(2)). These changes allow a facility to select the appropriate rigor and frequency of its monitoring based on its particular circumstances and are similar to those made in the PCHF final rule regulatory text for monitoring in the preventive controls management components.

For example, a facility stages ingredients overnight so the first shift can immediately begin adding ingredients to a hopper. The facility identifies staged ingredient containers as an actionable process step because the overnight staging makes the ingredient containers significantly vulnerable. The facility then identifies a mitigation strategy of reducing ingredient staging time. The facility establishes and implements food defense monitoring procedures to include observations of the staging area to ensure the ingredients are staged immediately prior to addition into the hopper rather than overnight. This monitoring procedure is tailored to the facility's circumstances and is appropriate to the mitigation strategy (*i.e.,* suitable for a particular purpose and capable of being applied) because it allows for the assessment or observation that the ingredient staging time is being reduced. When establishing the monitoring procedure, the facility considered the nature of the mitigation strategy (*i.e.,* an observation would determine if reducing the staging time was being consistently performed) and its role in the facility's food defense system (*i.e.,* the facility deemed it necessary to conduct the monitoring for the mitigation strategy because the reducing the staging time significantly minimized the significant vulnerability associated with the ingredient containers). Additionally, the facility reasoned that monitoring the staging area immediately prior to the addition of the ingredients to the hopper met the requirement for monitoring to be conducted on an adequate frequency because this frequency meets the definition of adequate (*i.e.,* that which is needed to accomplish the intended purpose in keeping with good public health practice) in that monitoring prior to ingredient addition to the hopper ensures that employees will properly implement the reduced staging time and reduce the significant vulnerability.

2. Proposed § 121.140(c)—Requirement for Records

We proposed that all monitoring of focused mitigation strategies in accordance with this section must be documented in records that are subject to verification in accordance with proposed § 121.150(a) and records review in accordance with proposed § 121.150(c).

In the following paragraphs, we discuss comments that disagree with the proposed requirements, ask us to clarify the proposed requirements, or suggest one or more changes to the proposed requirements. After considering these comments, we have revised the regulatory text to provide that exception records may be adequate in some circumstances (see § 121.140(c)(2)).

(Comment 89) Some comments state that a facility will be much more likely to document a deviation from an established mitigation strategy (*i.e.,* a light is broken or turned off) rather than a confirmation that the light was working properly each day. These comments seem to indicate that this could be a potential area where greater flexibility is needed regarding how monitoring is documented.

(Response 89) New § 121.140(c)(2) provides for exception records and states records may be affirmative records demonstrating the mitigation strategy is functioning as intended and

that exception records demonstrating the mitigation strategy is not functioning as intended may be adequate in some circumstances. This revision to the regulatory text was made to clarify that exception records, in certain circumstances, are acceptable. We understand exception reporting as a structure where automated systems are designed to alert operators and management on an exception basis—*i.e.,* only when a deviation from food safety parameter limits are observed by the system.

Exception reporting would be an acceptable monitoring system in some circumstances. A facility must be able to verify that food defense monitoring is being conducted (§ 121.150(a)(1)). This is straightforward with affirmative monitoring records but can be more difficult or impossible with exception records. The following example provides an instance where a facility may choose exception records when monitoring a mitigation strategy. A facility identifies an ingredient storage area as an actionable process step, and identifies and implements a restricted access system that uses electronic swipe/key cards to limit access to the area. The restricted access system is designed to allow authorized personnel to open a door to the area, while also alerting management when the door is left unlocked. While the system would not need to produce a record for every authorized access to the area, the system would produce a record for each instance that the door is left unlocked and alert operators to those instances. In this example, the facility would periodically verify that the restricted access system is working properly, in part, by leaving the door unlocked, and ensuring the system alerts the operator by generating a record that documents the door being unlocked. Exception records are not always appropriate. For example, it would not be appropriate to create a record that indicates adequate lighting is not functioning as intended, rather than documenting adequate lighting is functioning as intended, unless the facility devised an approach that would allow it to verify that food defense monitoring was being conducted as required.

F. Proposed § 121.145—Corrective Actions

1. Proposed § 121.145(a)(1)–(2) Requirement To Establish and Implement Corrective Action Procedures That Must Describe Steps To Be Taken

We proposed that you must establish and implement written corrective action procedures that must be taken if the mitigation strategy is not properly implemented. The corrective action procedures must describe the steps to be taken to ensure that appropriate action is taken to identify and correct a problem with implementation of a mitigation strategy to reduce the likelihood that the problem will recur.

Some comments support the proposed requirements. In the following paragraphs, we discuss comments that disagree with the proposed requirements, ask us to clarify the proposed requirements, or suggest one or more changes to the proposed requirements. Some comments request that the intentional adulteration requirements provide more flexibility than a traditional HACCP framework, with specific requests for flexibility in the management components, including corrective actions. After considering these comments, we are making several revisions to the proposed requirements for corrective actions. First, we are adding the qualification ''as appropriate to the nature of the actionable process step and the nature of the mitigation strategy'' to the beginning of the provision in § 121.145(a). Second, we are separating the requirements to take appropriate action to identify and correct a problem that has occurred from the requirement to take appropriate action, when necessary, to reduce the likelihood that the problem will recur. The separated requirements are now included in the regulatory text as § 121.145(a)(2)(i) and § 121.145(a)(2)(ii), respectively. Similar changes were made to the PCHF final rule regulatory text for corrective actions, as comments related to that rule asserted the proposed corrective action regulatory text could have been misunderstood as a requirement to establish a new preventive control after implementing a corrective action procedure. These comments also asserted that it would be inappropriate to assume that corrective action procedures always correct a problem with the implementation of a new or additional preventive control. We have addressed these comments to the requirement to identify and correct a problem by adding ''that has occurred'' after ''correct a problem'' in § 121.145(a)(2)(i). We have also addressed these comments by qualifying the requirement that the corrective action procedures must describe the steps to be taken to ensure that appropriate action is taken to reduce the likelihood that the problem will recur by inserting ''when necessary'' after ''appropriate action is taken'' in § 121.145(a)(2)(ii).

(Comment 90) A few comments state that greater flexibility is needed to reflect the differences between mitigation strategies and preventive controls and that corrective actions is one potential area in which to increase flexibility. While comments agree that a facility should take action when a mitigation strategy is not properly or fully implemented, these comments further state that detailed, written corrective action procedures should not be required to address every possible deviation for each mitigation strategy. In addition, comments state that facility employees should make corrections, rather than take corrective actions, in some circumstances. These comments provide an example of corrections where a door is simply closed, and the action is not documented, in response to a single, isolated event where a door is propped open.

(Response 90) As described previously, we have modified the provision to provide that corrective action procedures are established and implemented based on the nature of the actionable process step in addition to the nature of the mitigation strategy (see § 121.145(a)). The rule allows for a facility's corrective action procedures to reflect the extent of the deviation. For example, a facility's monitoring indicates that a peer monitoring mitigation strategy is not implemented as intended because one of the employees does not accompany the other employee at the actionable process step. A component of the facility's written corrective action is to retrain the employee on the importance of accompanying the other employee while at the actionable process step. We expect, in most cases, that food defense corrective action procedures will be simple and easy to undertake. Further, we agree that written corrective action procedures need not address every possible deviation, and the rule does not require this. Written corrective action procedures should address circumstances where deviations are likely to occur. The reason to have corrective action procedures is to consider the likely scenarios in advance, rather than react to these scenarios on an ad hoc basis.

We do not agree that certain situations are more appropriate for corrections rather than corrective actions. A ''correction'' does not include, among other things, actions to reduce the likelihood that the problem will recur. The comment describes a situation where a facility is locking the door to serve as the mitigation strategy, and the

monitoring of the mitigation strategy indicates the strategy is not performing as intended (*i.e.,* the door is not locked, and it is propped open). Because monitoring has indicated the mitigation strategy is not properly implemented, a corrective action is required (§ 121.145(a)(1)). While the example includes a corrective action that is quite simplistic and easy to undertake, it is important that a corrective action, and not a correction, be taken because the corrective action includes actions to reduce the likelihood that the problem will recur, while the correction does not. An unlocked door leaves the significant vulnerability unmitigated, and therefore, this seemingly isolated problem directly impacts product vulnerability.

Furthermore, corrections, such as those discussed in the PCHF final rule (*e.g.,* facility observes food residue on ''clean'' equipment prior to production of food, and then cleans the equipment), are appropriate for minor and isolated problems that do not directly impact product safety. An analogous situation does not exist in the context of intentional adulteration where requirements of this rule are designed to reduce significant vulnerabilities associated with an insider attack. Additionally, food defense corrective action requirements are less rigorous and resource-intensive than corrective actions for food safety purposes. Food defense corrective actions do not include requirements to evaluate all affected food for safety, prevent affected food from entering commerce, or include requirements for unanticipated problems.

2. Proposed § 121.145(a)(3)—Documentation

We proposed that all corrective actions taken in accordance with this section must be documented in records that are subject to verification in accordance with proposed § 121.150(b) and records review in accordance with proposed § 121.150(c).

Some comments support the proposed requirements without change. One comment states that documentation would not be needed in a single, isolated event, such as where a door is propped open, and the corrective action would simply result in the door being closed. While the example includes a corrective action that is simple and easy to undertake, it is necessary that it be documented. Without such documentation, verification of proper implementation of the mitigation strategy, as required in § 121.150(a)(3), may not be possible because there are no records to review which reflect failure to implement the mitigation strategy. Further, without documentation, it may not be known whether it was a one-time event or the door was propped up more regularly. Documentation of the corrective actions and review of the documentation to verify proper implementation of mitigation strategies is necessary to identify trends and patterns of implementation of mitigation strategies over time, and is also necessary to ensure appropriate decisions about corrective actions are being made. After considering the comment, we are finalizing these requirements as proposed.

G. Proposed § 121.150—Verification

We proposed to require verification of monitoring, verification of corrective actions, verification of implementation and effectiveness, reanalysis, and documentation of all verification activities. Specifically regarding verification of implementation and effectiveness, (proposed § 121.150(c)), we proposed that you must verify that the focused mitigation strategies are consistently implemented and are effectively and significantly minimizing or preventing the significant vulnerabilities. We proposed that this must include, as appropriate to the facility and the food, review of the monitoring and corrective actions records within appropriate timeframes to ensure that the records are complete, the activities reflected in the records occurred in accordance with the food defense plan, the focused mitigation strategies are effective, and appropriate decisions were made about corrective actions. We also requested comment on whether we should specify the verification activities that must be conducted for verification of monitoring and for verification of corrective actions and, if so, what verification activities should be required.

1. Verification of Monitoring, Corrective Actions and Implementation and Effectiveness

Some comments support the proposed requirements. In the following paragraphs, we discuss comments that disagree with the proposed requirements, ask us to clarify the proposed requirements, or suggest one or more changes to the proposed requirements. Some comments request that the intentional adulteration requirements provide more flexibility than a traditional HACCP framework, with specific requests for flexibility in the management components, including verification. Most of the comments addressing verification activities request clarification specifically related to implementation and effectiveness. One comment requests that we provide for other activities appropriate for verification of implementation and effectiveness. After considering these comments, we are making several changes to the requirements for verification.

First, we are adding text to § 121.150(a) (Food defense verification) to reflect that verification procedures are established and implemented based on the nature of the mitigation strategy and its role in the facility's food defense system. Second, we made edits to reflect new § 121.138. We have changed proposed § 121.150(a) to final § 121.150(a)(1), which now states ''Verification that food defense monitoring is being conducted as required by § 121.138 (and in accordance with § 121.140).'' We have changed proposed § 121.150(b) to final § 121.150(a)(2), which now states ''Verification that appropriate decisions about food defense corrective actions are being made as required by § 121.138 (and in accordance with § 121.145).'' We have changed proposed § 121.150(c) to final § 121.150(a)(3) which requires verification that mitigation strategies are properly implemented and significantly minimizing the significant vulnerabilities.

Third, we have removed the requirement to verify that mitigation strategies are effectively significantly minimizing or preventing significant vulnerabilities in § 121.150(c) because it is more appropriate to verify mitigation strategies are being properly implemented, in accordance with the food defense plan, rather than verifying these strategies are effective. In the food safety context, verification of effectiveness is mainly accomplished via validation and testing, which are not required in this final rule due to the nature of mitigation strategies. Fourth, we are adding a new section § 121.150(a)(3)(ii) to provide for ''other activities appropriate for verification of proper implementation'' to allow for increased flexibility in verifying mitigation strategies are properly implemented beyond what is included in § 121.150(a)(3)(i). Fifth, we added a requirement (§ 121.150(b)), to establish and implement written procedures, including the frequency for which they are performed, for verification activities. This requirement was added because the flexibility, provided in § 121.150(a)(3)(ii), is significant but not unbounded. Written procedures are essential to ensure these activities are occurring in accordance with the food defense plan. Sixth, we moved the more

extensive section for reanalysis (proposed § 121.150(d)) to a new section (final § 121.157) to improve readability and clarity. As a result, we created a new § 121.150(a)(4) (''Verification of Reanalysis in accordance with § 121.157'') to include in § 121.150 the requirement to verify that reanalysis has been conducted. Some of these changes are similar to those made in the PCHF final rule regulatory text for verification and preventive controls management components.

(Comment 91) Some comments request clarification and elaboration for verification activities related to implementation and effectiveness of mitigation strategies (proposed § 121.150(c)).

(Response 91) As mentioned previously, we have removed the requirement to verify the effectiveness of mitigation strategies. As part of food defense verification, a facility must determine if each mitigation strategy is properly implemented and significantly minimizing or preventing significant vulnerabilities. To do this, a facility would determine whether the mitigation strategies are consistently implemented and functioning as intended. Part of this determination would be based on review of monitoring and corrective action records. In addition, as mentioned in section V.D, facilities may use, but are not limited to, two important factors to determine the proper implementation of mitigation strategies to significantly minimize or prevent significant vulnerabilities: (1) The degree of physical access to the product at the actionable process step and (2) the ability of an attacker to successfully contaminate the product at the actionable process step.

For example, if a mitigation strategy is significantly minimizing the degree of physical access to the product at an actionable process step, and the strategy is consistently implemented as determined by record review, the strategy can be considered properly implemented. Likewise, if the mitigation strategy is significantly minimizing the ability of an attacker to successfully contaminate the product at the actionable process step, and the strategy is consistently implemented as determined by record review, the strategy can be considered properly implemented. These factors are the same as two of the factors required to be evaluated in a vulnerability assessment (§ 121.130(a)(2) and (3)).

We are not including the third factor (the potential for public health impact (§ 121.130(a)(1)) because it has been our experience that mitigation strategies either directly reduce access to a point, step, or procedure, or directly reduce the ability of an attacker to contaminate the food at a point, step, or procedure, and in doing so, indirectly reduce the potential public health impact if a contaminant were added at a point, step, or procedure.

As a facility reasons through its explanation of how the mitigation strategy significantly minimizes or prevents the significant vulnerability (§ 121.135(a)), the facility's explanation will most likely include the rationale for how the mitigation strategy reduces, to an acceptable level, either the degree of unauthorized access to the actionable process step or the ability of an attacker to successfully contaminate the product at the actionable process step. When the facility reviews the monitoring and corrective action records to ensure that activities reflected in the records occur as envisioned by the food defense plan (§ 121.135(a)) and are consistently implemented (§ 121.150(a)(3)), the facility can then determine whether the mitigation strategy is properly implemented and is significantly minimizing the significant vulnerability at the actionable process step.

(Comment 92) One comment states that verification methods other than those required by proposed § 121.150(c) may be appropriate, and provides suggestions of such methods, including direct observation of monitoring, such as a supervisor observing monitoring conducted by an employee, and review of monitoring and corrective actions activities during team meetings.

(Response 92) We agree that the rule should provide flexibility for additional activities related to verification of properly implemented mitigation strategies, and have revised the specific requirements to provide for other activities appropriate for verification of proper implementation of mitigation strategies in § 121.150(a)(3)(ii). Providing specific requirements for verification of implementation (§ 121.150(a)(3)(i)), but allowing for other activities appropriate for verification of implementation (§ 121.150(a)(3)(ii)), addresses, in part, comment requests that mitigation strategies management components need to provide more flexibility.

(Comment 93) One comment disagrees with the requirement that, as part of verification, monitoring and corrective action records must be reviewed and further states that the proposed requirement is too prescriptive and not applicable to food defense.

(Response 93) Review of monitoring and corrective action records is a key component of verification in a food defense system. Review of monitoring records is necessary to determine whether mitigation strategies are implemented as intended and are therefore significantly minimizing significant vulnerabilities. For example, review of monitoring records for a mitigation strategy of using a lock to secure an access hatch on top of a silo could indicate that the lock is functioning as intended because the securing mechanism is fully engaged, and the hatch cannot be accessed without a key to the lock. The significant vulnerability has been significantly minimized because the food in the silo is no longer accessible. The facility determines the mitigation strategy is properly implemented because it is functioning as intended and minimizes the significant vulnerability.

Review of corrective action records is necessary to determine whether appropriate decisions are being made to identify and correct any problems with the implementation of a mitigation strategy and whether actions are being taken to reduce the likelihood that a problem would recur. To continue with the example, if the review of monitoring records indicated that the lock was not properly implemented due to employee error, the facility implements the corrective action, which consists of engaging the securing mechanism of the lock on the access hatch, and retraining the employee assigned to this step in how to properly use the securing mechanism. During the review of the corrective action records, the facility determines that appropriate decisions about corrective actions were made because the problem was identified that the lock was not properly implemented due to employee error, the problem was corrected because the facility engaged the securing mechanism of the lock to lock the access hatch, and actions were taken to reduce the likelihood the problem would recur by training the employee on how to successfully engage the securing mechanism of the lock in order to lock the access hatch.

Further, FDA has provided a flexible time period for review, allowing review of monitoring and corrective action records to take place in an ''appropriate timeframe.'' For example, a facility chooses to use several mitigation strategies, including adequate lighting, at the bulk truck unloading bay to protect the actionable process step, and the lighting may be monitored each time a shipment is received or on a weekly basis depending on the facility's determination of the frequency of the monitoring procedures. The review of these monitoring records may occur on

a weekly or monthly basis, depending on the frequency of the monitoring procedures and the role this mitigation strategy plays in a facility's food defense system. We disagree that this requirement is too prescriptive.

(Comment 94) Some comments assert that industry cannot be held to a standard of absolute prevention of intentional adulteration, and given this assertion, one of these comments further states that effectiveness of mitigation strategies should be interpreted reasonably by both FDA and industry. The comment agrees that facilities should be expected to take reasonably appropriate measures to mitigate vulnerabilities and also states that facilities should have discretion to determine how mitigation strategies are effective. This comment goes on to state that facilities should not be expected to employ a certain measure just because the measure is available, particularly when the added benefit might be minimal. Finally, the comment states that, in the context of interpreting effectiveness of mitigation strategies in a reasonable manner, FDA should be mindful of the extremely low likelihood of an intentional adulteration event that may cause massive public health harm or economic disruption.

(Response 94) We acknowledged the low probability of an intentional adulteration event that may cause wide scale public health harm in the proposed rule (78 FR 78014 at 78024). The rule does not create a standard of absolute prevention at every identified actionable process step. Mitigation strategies are, among other things, ''risk-based'' and ''reasonably appropriate measures.'' They are employed to ''significantly minimize or prevent'' significant vulnerabilities.

Furthermore, each facility has some degree of discretion in determining how, and whether, each mitigation strategy is properly implemented, as part of the facility's written explanation of how the mitigation strategy sufficiently minimizes or prevents the significant vulnerability associated with the actionable process step.

Additionally, facilities are not required to employ measures just because they are available or convenient. Rather, facilities are required to identify and implement mitigation strategies that reflect the specific circumstances of the actionable process step and the facility. Because the facility considers these circumstances when identifying and implementing an appropriate mitigation strategy, and provides a written explanation of how the mitigation strategy sufficiently minimizes or prevents the significant vulnerability associated with an actionable process step, a facility may choose a mitigation strategy that it believes provides maximum benefit, regardless of availability or convenience, if it complies with the requirement to significantly minimize, or prevent, the significant vulnerability.

2. Proposed § 121.150(d)—Reanalysis (Final § 121.157)

We proposed that you must conduct a reanalysis of the food defense plan (1) At least once every 3 years; (2) Whenever a significant change in the activities conducted at your facility creates a reasonable potential for a new vulnerability or a significant increase in a previously identified vulnerability; (3) Whenever you become aware of new information about potential vulnerabilities associated with the food operation or facility; (4) Whenever you find that a focused mitigation strategy is ineffective; and (5) Whenever FDA requires reanalysis to respond to new vulnerabilities and developments in scientific understanding including, as appropriate, results from the Department of Homeland Security biological, chemical, radiological, or other terrorism risk assessments. These requirements for reanalysis of the food defense plan were proposed within § 121.150 Verification.

Many comments responded to § 121.150 (Verification) as a whole, without specifically referring to reanalysis as an area needing edits. However, some comments regarding verification potentially apply to reanalysis, and these are addressed in this section. Some comments support the proposed requirements without change and some support the proposed provisions but ask for more flexibility and suggest alternative regulatory text. After considering these comments, to improve clarity and readability and to be consistent with the PCHF final rule with respect to the regulatory text for reanalysis, we have removed reanalysis from § 121.150 and created a new section § 121.157 devoted entirely to requirements for reanalysis. We have revised the regulatory text within this section to clarify which portions of the food defense plan will need reanalysis and how often (*e.g.,* the whole plan needs reanalysis at least every 3 years, and the whole plan or the applicable portions of the plan need reanalysis for all other reasons required in the text), to expand the scope of situations that trigger a reanalysis (*e.g.,* added a reanalysis requirement when required by FDA based on credible threats to the food supply), and we increased clarity for when the reanalysis requires a revision to the food defense plan (*e.g.,* the proposed language stated a revision to the food defense plan is required when a significant change is made, and the text was edited to state that a revision to the food defense plan is required when a significant change in activities conducted at your facility creates a reasonable potential for a new significant vulnerability or a significant increase in a previously identified vulnerability). Also, the new reanalysis section provides more flexibility in the timeframe for when a reanalysis must be completed, and clarifies when a reanalysis requires a revision to the food defense plan.

In the following paragraphs, we discuss comments that suggest one or more changes to the proposed requirements.

(Comment 95) Some comments state that greater flexibility is needed to reflect the differences between mitigation strategies and preventive controls and that verification is one potential area in which to increase flexibility. These comments believe that the oversight burden and the records burden associated with verification could be lessened by adding more flexibility.

(Response 95) We interpreted these comments to include reanalysis in the verification activities mentioned. We agree that the overall regulatory framework for this rule should provide more flexibility than that of a traditional HACCP approach and have described our general thinking in Comment 1 and Comment 2 of this document. To align with this thinking we have made specific changes to the reanalysis requirements. We removed reanalysis from § 121.150 and created a new section § 121.157 devoted entirely to requirements for reanalysis to help clarify activities for the purpose of verification versus activities specific to reanalysis. Within this section we provide for reanalysis of an applicable portion of the food defense plan (rather than the complete food defense plan) in specified circumstances. We have revised the regulatory text to state that when reanalysis is conducted for any reason other than § 121.157(a) (every 3 years), the food defense plan as a whole may need to be reanalyzed, or just the applicable portion of the food defense plan that may be affected by the proposed change or the new information (see § 121.157(a) and 121.157(b)). In the proposed rule, the portions of the plan that required reanalysis were not detailed, and the implication was that the entire plan must be reanalyzed in all cases. Our clarification of this language

allows flexibility for the facility to determine the extent of the required reanalysis based on the nature of the reanalysis trigger. In addition, we made associated editorial changes for the intentional adulteration reanalysis requirements to improve the readability of the requirement to conduct reanalysis ''whenever a mitigation strategy, a combination of mitigation strategies, or the food defense plan as a whole, is not properly implemented'' (see § 121.157(b)(3)). In the proposed rule this requirement applied only to the ineffective nature of a mitigation strategy and did not take into account other areas of the food defense plan that may be contributing to an ineffective food defense plan. We also added new text to the reanalysis requirement to allow FDA to require a reanalysis ''when credible threats are made to the food supply'', as discussed more fully in section III.C.

Further, additional flexibility has been provided with respect to timeframes associated with completing reanalysis. The proposed rule required that reanalysis be completed ''before the change in activities at the facility were operative'' or ''when necessary, during the first 6 weeks of production.'' The new requirement states that the reanalysis must be complete ''before any changes in activities (including any change in mitigation strategy) at the facility is operative,'' or ''when necessary, within 90 days of production'' or ''within a reasonable timeframe, providing a written justification is prepared for a timeframe that exceeds 90 days after production of the applicable food first begins.'' This flexibility in timeframes lessens the burden on the facility. We believe the 90-day timeframe is sufficient for completing the reanalysis but recognize that there may be instances where the 90-day timeframe is exceeded and this is allowed with sufficient written justification.

We lessened the documentation burden by only requiring a revision to the food defense plan ''if a significant change in the activities conducted at your facility creates a reasonable potential for a new significant vulnerability or a significant increase in a previously identified vulnerability.'' The proposed rule required a revision to the food defense plan if ''a significant change was made.'' By stating specifically that revisions are only required if a change is made in activities that affect vulnerabilities, we eliminate the revision requirements for changes that are not directly related to the risk of intentional adulteration. Both the proposed and final rules provide for the option to conclude that a revision to the food defense plan is not needed as long as the basis for that conclusion has been documented.

Many of the changes we made to the reanalysis provisions are similar to changes made in the PCHF final rule, and we believe this consistency will assist with overall understanding and implementation of these rules.

(Comment 96) Some comments ask us to recognize other terminologies suggesting reanalysis could be referred to as ''reassessment.''

(Response 96) We decline this request. We have acknowledged that the terminology used in relation to the concept of ''reanalysis'' varies in current regulations and guidelines for systems such as HACCP (78 FR 3646 at 3759). A facility may choose to use a term such as ''reassessment'' in its records—*e.g.,* if it relies on existing records that use the term ''reassessment'' to satisfy some or all of the requirements of this rule for reanalysis. However, the rule will use a single term to minimize the potential for confusion about whether different terms have a different meaning for the purposes of the rule.

H. Proposed § 121.160—Training (Final § 121.4)

We proposed in § 121.160 to require that (1) Personnel and supervisors assigned to actionable process steps must receive appropriate training in food defense awareness and their respective responsibilities in implementing focused mitigation strategies and (2) All required training must be documented in records. We asked for comment on several questions related to training, including whether we should require that basic food defense awareness training be completed by all employees and whether we should require training to be repeated periodically. We also requested comment on the adequacy of FDA's Food Defense 101 training materials and whether additional FDA training materials are needed. Finally, we requested comment on the feasibility of the proposed training requirements, in light of the current state of food defense awareness in the industry and available training resources.

No comments disagree with the need for training for facilities to be able to properly implement this rule, and many comments acknowledge that training is crucial to creating an effective food defense environment in a facility. Some comments agree with our proposed training approach, and other comments request changes. After considering the comments, we have changed the training requirements by creating a new section, § 121.4 (Qualifications of Individuals Who Perform Activities Under Subpart C), which replaces § 121.160 and defining the term ''qualified individual'' in § 121.3. In summary, the final rule requires all individuals who perform activities under Subpart C to be qualified through training or job experience or a combination thereof. Individuals and their supervisors at actionable process steps are required to take food defense awareness training and individuals who prepare the food defense plan, conduct a vulnerability assessment, identify and explain mitigation strategies and perform reanalysis must have successfully completed training for the specific activity at least equivalent to that received under a standardized curriculum recognized as adequate by FDA or be otherwise qualified through job experience to conduct the activities.

Section 121.4 requires that individuals performing activities under Subpart C have certain qualifications that vary based on the activity performed. Section 121.4(a) requires that you ensure that each individual who performs activities required under Subpart C is a qualified individual. A qualified individual is ''a person who has the education, training, or experience (or a combination thereof) necessary to perform an activity required under Subpart C, as appropriate to the individual's assigned duties. A qualified individual may be, but is not required to be, an employee of the establishment'' (§ 121.3). See section IV.C.4 for further discussion of this definition. Section 121.4(b) requires that each individual assigned to an actionable process step (including temporary and seasonal personnel) or in the supervision thereof must (1) be a qualified individual and (2) receive training in food defense awareness. Section 121.4(c) requires that each individual assigned to (1) the preparation of the food defense plan, (2) the conduct of a vulnerability assessment, (3) the identification and explanation of the mitigation strategies, or (4) the reanalysis of the food defense plan must be a qualified individual and have successfully completed training for the specific activity at least equivalent to that received under a standardized curriculum recognized as adequate by FDA or be otherwise qualified through job experience to conduct the activities. Job experience may qualify an individual to perform any of the activities listed previously if such experience has provided an individual with knowledge at least equivalent to that provided through the standardized

curriculum. Section 121.4(d) requires that responsibility for ensuring compliance by individuals with the requirements be clearly assigned to supervisory personnel with adequate qualifications to supervise the activities. Section 121.4(e) requires that the training required by § 121.4(b) and (c) must be documented in records that include the date of the training, the type of training, and the person trained, and must be established and maintained in accordance with the requirements of subpart D.

In the following paragraphs, we discuss comments that respond to our request for comment regarding the proposed training requirement and comments that request changes to the training requirement as proposed.

(Comment 97) Some comments assert that FDA should require facilities to conduct food defense awareness training for all employees and not just for employees and supervisors who work at actionable process steps. Some comments indicate that, since food defense is a new area of regulation, that training to increase general awareness by all employees would be a useful requirement in gaining familiarity with the risk and mitigation of intentional adulteration. Some comments state that food defense awareness training for all employees is fundamental for creating a food defense culture at a facility and may be the critical element for preventing a successful attack. Alternatively, some comments state that expanding the food defense awareness training requirement to all employees will not advance food defense and could create a generalized approach that may diminish the ability of the facility to effectively train personnel who have significant roles in implementing food defense requirements. Some comments state that the cost of requiring training of all employees would be overly burdensome.

(Response 97) Although we agree that food defense awareness training would be useful for all employees, we believe that the best use of training resources for industry would be to focus the requirement for food defense awareness training on personnel who are assigned to an actionable process step. We do not believe it is necessary to require that facilities provide all employees with awareness training to significantly minimize or prevent significant vulnerabilities. Although we disagree that training all employees could diminish the ability of a facility to effectively train personnel, we agree that concentrating awareness training on certain individuals is less burdensome than a general training requirement. We believe it is the best use of resources to train individuals at actionable process steps in food defense awareness because that is where intentional adulteration, when intended to cause wide scale public health harm, is most likely to occur. Our food defense guidance includes options for increasing general awareness of food defense throughout a facility by incorporating the importance of food defense procedures into routine facility communications, such as brochures, staff meetings, or payroll stuffers. We recommend that facilities encourage all employees to report unusual or suspicious individuals or activities to management.

In addition to requiring food defense awareness training for certain individuals, the rule requires that each individual who performs activities required by subpart C be a qualified individual as that term is defined in § 121.3. In addition, the rule requires individuals performing certain activities, including the preparation of the food defense plan or the conduct of a vulnerability assessment, to have successfully completed training for the specific activity at least equivalent to that received under a standardized curriculum recognized as adequate by FDA or be otherwise qualified through job experience to conduct the activities.

(Comment 98) Some comments express a need for advanced food defense training requirements for individuals conducting higher level food defense activities such as food defense coordinators, individuals who prepare, monitor, verify, or conduct corrective actions associated with food defense plans, managers or quality control personnel or personnel who would be responsible for identification of appropriate mitigation strategies. Some comments assert that these food defense activities require specialized knowledge that would not be covered in food safety training and that qualified individuals should perform these higher level functions.

(Response 98) We agree with these comments and are requiring that each individual engaged in activities in subpart C must be a qualified individual with the appropriate education, training, or experience (or a combination thereof) to perform the activity. Further, the rule requires increased qualifications for individuals responsible for higher level activities, such as preparation of the food defense plan, conducting a vulnerability assessment, identifying and explaining mitigation strategies, and reanalysis (§ 121.4(c)). These individuals must have the appropriate education, training, or experience (or a combination thereof) necessary to properly perform their assigned activities and have successfully completed training at least equivalent to that received under a standardized curriculum recognized as adequate by FDA or be otherwise qualified through job experience to conduct the activities. Job experience may qualify an individual to perform these functions if such experience has provided an individual with knowledge at least equivalent to that provided through the standardized curriculum. We believe the activities listed previously require an additional level of expertise and training than other activities required under subpart C and, therefore, FDA is establishing a standardized curriculum for training which individuals performing these activities must successfully complete (or be otherwise qualified through job experience). This approach is consistent with the PCHF final rule, where additional food safety training is required for individuals who prepare or oversee preparation of the food safety plan, including conducting the hazard analysis (21 CFR 117.126(a)(2)).

We anticipate that the standardized curriculum for activities other than the conduct of a vulnerability assessment will be an approximately 4-hour training that will cover food defense awareness and food defense planning components such as preparing, implementing, and reanalysis of a food defense plan and selecting and explaining mitigation strategies. We plan for the training to be available online.

The training for conducting or overseeing a vulnerability assessment will require in-depth analysis of the functional and thought processes required to properly characterize significant vulnerabilities associated with a facility's points, steps, or procedures and the identification of actionable process steps. The process of conducting a vulnerability assessment may be new to much of the industry and the training will take this into consideration. The standardized curriculum for conducting a vulnerability assessment will need to cover each required component of the vulnerability assessment and provide enough information for an individual to calibrate their decision making based on the scientific analysis required by a vulnerability assessment. We believe that the curriculum designed for this activity will require multiple days and may be best offered in person. Based on the vulnerability assessment method chosen, the length of the standardized curriculum may vary, for example if a

facility is using the key activity types the training could be shorter.

Finally, with regard to comments that suggest that individuals who prepare, monitor, verify, or conduct corrective actions associated with food defense plans receive specialized training, we agree that individuals responsible for these activities should be qualified individuals and may need training to perform such activities. However, we are not standardizing a curriculum for such training and realize that individuals may be qualified through education or experience to do these activities because these concepts are not completely unique to food defense planning and analogous food safety concepts have been in routine practice in many food facilities for the purpose of food safety plans and/or HACCP approaches.

(Comment 99) Some comments state that food defense awareness training should be recognized as a beneficial mitigation strategy within food defense plans to create heightened awareness and that this training can be used to address intentional contamination including insider threats. Other comments state that the only requirement for food defense should be training and that any requirements beyond this approach are not necessary.

(Response 99) We agree that food defense awareness training for employees and supervisors assigned to actionable process steps would increase awareness and could assist with recognizing or thwarting an insider threat; however, the training alone will not protect the food at that actionable process step. It is the properly implemented mitigation strategies, which are designed to reduce the significant vulnerability at that step, which would protect the food against intentional adulteration.

(Comment 100) Some comments recommend that FDA set a requirement for periodic retraining, and some comments suggest the training requirement should specify training intervals such as during an employee ''onboarding'' process and periodically thereafter or when significant changes are made to the food defense plan. One comment did not request a requirement for retraining but stated that it should be understood that education and training are not a one-time occurrence. One comment asked for flexibility for training and retraining frequencies so a facility can take into account facility size, environment, seasonality of employees, and other circumstances.

(Response 100) We agree that training should not be a one-time occurrence and believe that by defining ''qualified individual'' in terms of an ability to perform assigned responsibilities we have provided the flexibility for firms to consider relevant factors in determining how often to perform training. Individuals conducting activities under subpart C must be qualified to successfully implement the food defense measures contained in the food defense plan. If the food defense plan changes, because of a production change resulting in a mitigation strategy change, for example, employees and supervisors may need retraining if their responsibilities under subpart C change. Also, retraining may be needed as a component of corrective action. For example, if during the course of monitoring a facility determines that certain mitigations strategies are not being implemented consistently or appropriately, a component of the corrective action may be to retrain the responsible staff and their supervisors. To ensure that employees remain qualified to perform their duties under subpart C, facilities will need to retrain employees when the food defense plan changes and when a problem has been identified that training would address.

(Comment 101) Some comments commend FDA on the development of a broad range of free training materials that will be efficient and useful to meet training requirements. Some comments suggest updating and expanding these trainings to include options for free, downloadable, and customizable materials to reach a broad range of cultural and language groups, and to include information on how to protect food defense-related documents. One comment recommends that FDA update all of its food defense resources to reflect the requirements ultimately included in this final rule. One comment suggests that FDA develop a ''train-the-trainer'' course that could be effectively utilized by industry to equip management of food companies with the training materials needed to comply with the training requirements.

(Response 101) We agree that many of our trainings and other resources will assist industry in complying with this rule. However, we recognize that many of our existing materials will need to be updated to reflect the provisions of the rule and new training materials will need to be developed. We intend to update our training materials to provide an option to comply with the food defense awareness training requirement, and we will be developing a standardized curriculum for training in accordance with the requirements of § 121.4(c). We anticipate the standardized content of the training will be modular, with certain modules varying based on the difficulty and skill level of the activity being performed, with the vulnerability assessment training module being the most in-depth and lengthy (See Comment 80 and Comment 81).

The training for individuals and supervisors assigned to actionable process steps may require facility-specific information for proper implementation of the mitigation strategy or strategies and, therefore, will need to be developed and administered on the job and will not be developed by FDA.

We will continue to provide food defense training and other materials in as many formats as resources allow, such as online, DVD, and hard copy. FDA currently has some food defense materials in languages other than English, but will work as we are able towards translating more materials in other languages to reach a broader audience.

In response to the development of a ''train the trainer'' course to assist management with meeting the training requirements of this rule, we interpret this comment to mean that we should offer materials so that companies can deliver their own food defense awareness training. Since the requirement for awareness training has inherent flexibility, facilities can deliver their own food defense awareness trainings. We believe the training tools and resources that we intend to update, based on the requirements of this rule, will assist facility management with gaining knowledge necessary for delivering food defense awareness training, and we intend to explore the development of a ''train the trainer'' in consultation with the alliance to meet the needs of the standardized curriculum requirements.

(Comment 102) Some comments request that FDA support the development and distribution of educational and training resources to assist very small facilities exempt from the rule with voluntary compliance. Some comments request that FDA clarify how it will work with retail stakeholders to strengthen education and training for retail facilities that want to take voluntary food defense risk reduction measures.

(Response 102) FDA offers free tools and food defense awareness training, as well as guidance, that we intend to update based on the final requirements which should assist non-covered entities, such as those at the retail level, who wish to voluntarily comply with the final provisions of this rule.

(Comment 103) Some comments support the food defense awareness

training requirement but ask that FDA keep the requirement flexible and make clear that online training or other non-FDA developed trainings are acceptable. One comment asked us to state whether the ''Food Defense 101'' training released in 2013 by FDA is the preferred resource for employee awareness training. Some comments state that it might not be possible to provide the same type of training to all staff at various levels, and that it should be up to the facility to determine which training to provide to which staff, based on their food defense responsibilities.

(Response 103) We agree with the need to avoid rigid requirements with respect to training content for food defense awareness. We recognize that many food defense awareness trainings exist and may already be utilized at facilities, and mandating specific content in trainings may lead to redundancy and additional cost. We intend to update our ''Food Defense 101, Food Defense Awareness for the Front-line Employee'' training such that it would satisfy the requirement for food defense awareness training; however, it is not the only acceptable training. In addition, we believe that there are several existing trainings that would be acceptable for other activities that may require training such as food defense monitoring, food defense corrective actions, and food defense verification.

(Comment 104) Some comments recommend that, because food defense is a new and evolving area, and because this regulation will be the first of its kind worldwide, training and education need to occur at many levels to effectively implement this rule. These comments state that FDA must provide significant outreach and education to both industry and State regulatory Agencies with jurisdiction over the production of human food. These comments emphasize that FDA and State and local inspection personnel will need significant training in conducting food defense inspections and that training developed for FDA investigators should be extended to State and local governments as well as industry to help food facilities understand what is expected and how compliance will be determined.

(Response 104) We appreciate these comments regarding consistency of training between industry and Federal, State, local and tribal regulators, and we agree that this is a novel area of regulation that could benefit from alignment of training between the regulated industry and its regulators. We have addressed the issue of training for the purposes of inspection and compliance in section III.D, but in general, FDA is still in the process of assessing its training needs for inspection and enforcement of this rule.

(Comment 105) Some comments state that Alliances have been successfully used to support implementation of other national requirements, including other FSMA rules, using a partnership model. These comments recommend that FDA consider formation of an Alliance structure for the area of food defense as well. Comments state that Alliances, made up of State and local public health professionals, State and local public health associations, and industry can play an important role in information sharing and outreach and a formal Alliance for food defense is the best way to accomplish the development of standardized food defense training content and effective training tools and resources.

(Response 105) We agree with these comments and have funded the establishment of an Intentional Adulteration Subcommittee under the existing Food Safety Preventive Controls Alliance. We intend to leverage the expertise of State and local public health professionals, State and local public health associations, and industry associations to develop the standardized curriculum needed to meet the training requirement.

(Comment 106) Some comments suggest that FDA establish a technical assistance office based out of the Center for Food Safety and Applied Nutrition (CFSAN) that can answer queries, provide guidance, and release information consistently to both regulators and the covered industry to assist with educating industry and regulators.

(Response 106) FDA has established a FSMA Technical Assistance Network (TAN) to provide technical assistance to industry, regulators, academia, consumers, and others regarding FSMA implementation. Inquiries are answered by FDA Information Specialists or Subject Matter Experts, based on the complexity of the question. To find out more about the FSMA TAN please visit *http://www.fda.gov/food/guidanceregulation/fsma/ucm459719.htm.*

(Comment 107) Some comments request funding from FDA for the training of State, local, tribal, and territorial regulators.

(Response 107) Funding associated with training State, local, tribal, and territorial regulators is outside the scope of this rule.

(Comment 108) One comment asserts that training and compliance incentives must be available at the same time the final regulation is released to give facilities time to learn about, build, and deploy an effective implementation plan.

(Response 108) It is unclear what is meant by training and compliance incentives, but we have established extended compliance dates to allow facilities the time necessary to comply with this training requirement. See section VIII for information on compliance dates.

(Comment 109) One comment suggests that FDA should mandate training on a ''code of ethics'' to prevent economically motivated adulteration.

(Response 109) Acts of intentional adulteration for the purpose of economic gain, *i.e.,* economically motivated adulteration, are outside the scope of the rule and are addressed in the preventive controls for human food rule (80 FR 55907 at 56028–56029) and the preventive controls for animal food final rule (80 FR 56170 at 56244–56246).

VI. Subpart D: Comments on Requirements Applying to Records That Must Be Established and Maintained

We proposed to establish in subpart D requirements that would apply to all records that would be required by the various provisions of proposed part 121, including general requirements related to the content and form of records, additional requirements specific to the food defense plan, requirements for record retention, requirements for official review of records by FDA, and public disclosure.

Some comments generally support requiring records to demonstrate that a food defense plan has been created, is functioning, and is being monitored. However, many comments disagreed with some of the specific requirements that we proposed. In the following paragraphs, we discuss comments that ask us to clarify the proposed requirements, disagree with, or suggest one or more changes to the proposed requirements.

A. Proposed § 121.301—Records Subject to the Requirements of This Subpart D

We proposed that all records required by proposed subpart C (Food Defense Measures) are subject to all requirements of this subpart except that the requirements of § 121.310 apply only to the written food defense plan. We received no comments on this section and are finalizing as proposed.

B. Proposed § 121.305—General Requirements Applying to Records

We proposed that the records must (1) be kept as original records, true copies, or electronic records (and that electronic records must be kept in accordance with

part 11 (21 CFR part 11)); (2) contain the actual values and observations obtained during monitoring; (3) be accurate, indelible, and legible; (4) be created concurrently with performance of the activity documented; (5) be as detailed as necessary to provide history of work performed; and (6) include the name and location of the plant or facility, the date and time of the activity documented, the signature or initials of the person performing the activity, and, where appropriate, the identity of the product and the production code, if any. In the following paragraphs, we discuss comments that ask us to clarify the proposed requirements or that disagree with, or suggest one or more changes to, the proposed requirements.

(Comment 110) Several comments express concern over the proposed requirement that all electronic records be kept in accordance with part 11 and request that FDA exempt electronic records under part 121 from compliance with part 11. Comments argue that while some of the larger companies may have the technologies in place to comply with part 11, many of the covered facilities do not. These comments assert that compliance with part 11 would create the need to redesign and recreate existing systems, thus leading to considerable cost, which was not taken into account in the cost analysis in the preliminary regulatory analysis for the proposed rule. The comments go on to point out that we do not impose these requirements for recordkeeping requirements imposed under section 414 of the FD&C Act, and that this requirement is an added burden and expense that does not have any added benefit to public health.

(Response 110) The final rule does not require compliance with part 11 (§ 121.305 (a)). Similar to the PCHF final rule, we are making a conforming change in part 11 to specify in new § 11.1(o) that part 11 does not apply to records required to be established or maintained under part 121, and that records that satisfy the requirements of part 121, but that also are required under other applicable statutory provisions or regulations, remain subject to part 11. Although we are not specifying that part 11 applies, facilities should take appropriate measures to ensure that records are trustworthy, reliable, and generally equivalent to paper records and handwritten signatures executed on paper.

(Comment 111) One comment asserts that while it is common for certain records to be created concurrently with performance of the activity, some records may require more time for writing, reviewing, editing, or approving. The comment requests that we provide for the creation of records ''in a timely manner following performance of the activity,'' rather than ''concurrently with performance of the activity.''

(Response 111) We decline this request. The comment did not provide any specific examples of activities where concurrent record creation would prove difficult, and we are not aware of any such circumstance. For example, we are not aware of any difficulty complying with longstanding similar requirements associated with our HACCP regulations for seafood and juice (see §§ 123.9(a)(4) and 120.12(b)(4), respectively).

(Comment 112) Some comments assert that for certain production and associated activities documenting the time of activity is not necessary. Specific examples cited include equipment setup, verification of equipment setup, charging an ingredient into a blender, and weighing material for process yield and reconciliation purposes. These comments ask us to modify the proposed requirements so that the records would only be required to include the time of the activity where appropriate for food defense.

(Response 112) The recordkeeping requirements in the rule only apply to records required by subpart C (Food defense measures). It is not clear that all of the activities specified by the comments relate to food defense measures and therefore are subject to the recordkeeping requirements in the rule. For records that are required, we agree that documenting the time of the activity is not always necessary. The rule requires that records must contain ''when appropriate, the time of the activity documented'' (§ 121.305(f)(2)). Monitoring records are an example of when documenting the time of the activity is appropriate because monitoring records are used to determine if a particular mitigation strategy is properly implemented. Without documenting the time the monitoring was conducted, a facility cannot identify patterns over time as to the mitigation strategy's implementation and whether appropriate corrective actions were being made. For mitigations strategies that are not time-dependent (*e.g.,* permanent equipment changes to reduce access to the product, such as permanently affixing a shield to the rotating air drying to prevent access to the food at the point where product is introduced into the dryer from the pneumatic conveyance), facilities are not required to document the time the activity was performed.

(Comment 113) Some comments express concern that we will require records to be kept in English. These comments ask us to limit the documents that must be written in English to reduce translation and records duplication. These comments ask that records related to verification and monitoring should be allowed to be written in languages other than English.

(Response 113) The rule does not require that any records be kept in English.

(Comment 114) One comment seeks clarification on whether the use of checklist-type forms to document monitoring observations would satisfy the requirement in § 121.305(b) that records contain actual values and observations obtained during monitoring. The comment argues that properly developed checklists will allow monitoring records to be accurate, indelible, and legible as required in § 121.305(c) and will lessen the recordkeeping burden. For example, monitoring a mitigation strategy such as adequate lighting at the truck unloading bay could be recorded as a ''yes'' or ''no'' by checking the appropriate box on a checklist.

(Response 114) Although monitoring records must contain the actual values and observations obtained during monitoring, facilities have flexibility to tailor the amount of detail to the nature of the record (§ 121.305(e)). Monitoring for adequate lighting at the truck unloading bay could be recorded as ''yes'' or ''no'' in either a narrative or checklist format. However, in the case of an improperly implemented mitigation strategy, we would recommend that the facility also document the extent to which the strategy was incorrectly applied, because this information would support the identification of previously written corrective actions that could be used to remedy the situation, as well as provide context as to why the mitigation strategy failed in this instance, which would be beneficial information for verification activities. For example, if lighting in the bulk unloading bay was insufficient, the monitoring document may record this instance as ''no'' in a checklist and also may note that half of the lights were inoperative due to a circuit-breaker that failed. This information would be helpful to facility management to determine whether the mitigation strategy is consistently applied and appropriate to the actionable process step in question. In this case, a faulty circuit breaker would be replaced, thereby correcting the deviation in the mitigation strategy. The mitigation strategy could still be determined to be achieving its aim with

this corrective action. Alternatively, if monitoring records document that the lighting was turned off by an employee, a different corrective action may be required, such as retraining of the employee on the importance of maintaining adequate lighting in the area. We note in Response 83 that ensuring adequate lighting around an actionable process step would generally be a mitigation strategy that must be used in concert with other strategies to significantly reduce the likelihood of, or prevent, successful acts of intentional adulteration at an actionable process step.

C. Proposed § 121.310—Additional Requirements Applying to the Food Defense Plan

We proposed that the food defense plan must be signed and dated by the owner, operator, or agent in charge of the facility upon initial completion and upon any modification. We did not receive any comments related to this section, and we are finalizing as proposed.

D. Proposed § 121.315—Requirements for Record Retention

We proposed that (1) All required records must be retained at the facility for at least 2 years after the date they were prepared; (2) The food defense plan must be retained at the facility for at least 2 years after its use is discontinued; (3) Except for the food defense plan, offsite storage of records is permitted after 6 months following the date that the records were made if such records can be retrieved and provided onsite within 24 hours of request for official review; and (4) If the facility is closed for a prolonged period, the records may be transferred to some other reasonably accessible location but must be returned to the plant or facility within 24 hours for official review upon request.

(Comment 115) One comment asserts that a 2-year retention period for monitoring, corrective actions, and verification records for a product with a short shelf life is unnecessary. The comment argues that industry has been following record retention requirements in the Seafood HACCP regulation which requires 1 year records retention for refrigerated products and 2 years records retention for frozen, preserved, or shelf-stable products and requests that we use the same requirements in this rule.

(Response 115) We decline this request. The 2-year record retention period is explicitly provided for by section 418(g) of the FD&C Act. Further, shelf life is more relevant to record retention requirements for the purpose of tracking potentially contaminated food than to record retention requirements for the purpose of evaluating compliance with this rule. Finally, 2 years is the same retention period as required by the PCHF final rule.

(Comment 116) Some comments ask us to exercise flexibility regarding the 2-year record retention requirement because the unique nature of food defense activities and the technologies used in protecting the food supply against intentional adulteration do not typically allow for record retention for such a long period of time. For example, several comments explain that records related to video surveillance cannot be kept for 2 years because it is impractical; industry practice is typically to keep video records for 30 days or less. Comments argue that requiring 2-year retention of video records would be very difficult and costly, and that FDA likely did not include calculations for those added costs in our preliminary regulatory impact analysis for the proposed rule.

(Response 116) The assertion that it is impractical for food defense records cannot be kept for 2 years seems to reflect a misunderstanding of the rule. The rule does not require maintaining video surveillance footage for 2 years. Video surveillance used as part of a mitigation strategy is not a monitoring record. If the video is being sent to a security office for observation, the monitoring record could be a log affirming that a security officer reviewed the video and detected no abnormal activities. If the video is being watched by a security officer in real time, the monitoring record could be the timesheets of the security officer showing he was in the security office performing his duties in observing the video feed.

(Comment 117) Some comments ask us to specify our expectations for record availability and allow companies the flexibility in using technology to meet those expectations. The comments explain that many companies keep important records such as food defense plans at their corporate headquarters or other central locations and not at individual facilities but that the facilities can easily access those records electronically if needed. The comments also assert that 6-month onsite record retention requirement is arbitrary and that FDA should establish a workable requirement that provides for the efficient storage and retrieval of records in a timely manner. Some comments ask us to revise the requirement so that records that can be retrieved and provided onsite within 24 hours would be sufficient.

(Response 117) We have revised the provisions to provide for offsite storage of all records (except the food defense plan), provided that the records can be retrieved and made available to us within 24 hours of a request for official review. We expect that many records will be electronic records that are accessible from an onsite location and, thus, would be classified as being onsite (see § 121.315(c)). As a companion change, we have revised the proposed provision directed to the special circumstance of storing records when a facility is closed for prolonged periods of time so that it only relates to the offsite storage of the food defense plan in such circumstances (see § 121.315(d)). Further, we require records that a facility relies on during the 3-year period preceding the applicable calendar year to support its status as exempt as a very small business must be retained at the facility as long as necessary to support the status of a facility as a very small business during the applicable calendar year (see § 121.315(a)(2)).

(Comment 118) One comment states that records and documentation should not increase costs for farm-based operations, most of whom operate as small businesses. They argue that these businesses already maintain a variety of records but some do not have the technical or financial resources available to maintain an electronic system for records. The comment requests that FDA accept records in formats that are not electronic.

(Response 118) To clarify, we did not propose to require that any records must be kept in electronic format. In addition, this rule does not apply to farms.

E. Proposed § 121.320—Requirements for Official Review

We proposed that all records required by this part must be made promptly available to a duly authorized representative of the Secretary of Health and Human Services upon oral or written request. In the following paragraphs, we discuss comments that ask us to clarify the proposed requirements or that disagree with, or suggest one or more changes to, the proposed requirements.

(Comment 119) Some comments assert that FDA investigators should only review food defense plans on site and that we should not copy, photograph, transmit, or take possession of food defense plans. These comments assert that onsite review of records allows facility staff that is familiar with the documents and recordkeeping

practices to answer any questions or provide clarification to the investigator. Some comments state that we should make it clear that any State investigators must follow the same policy and not copy, photograph, transmit, or take possession of food defense plans. Other comments assert that we should only take possession of food defense plans for compliance reasons or in the event of an emergency or a credible threat.

(Response 119) Some of the issues raised by these comments are similar to issues raised by comments on the PCHF rule (see the discussion at 80 FR 55908 at 56091) and seafood HACCP rule (see the discussion at 60 FR 65096 at 65137–65140, December 18, 1995). During an inspection, we expect that FDA investigators will determine whether to copy records on a case-by-case basis as necessary and appropriate. It may be necessary to copy records when, for example, our investigators need assistance in reviewing a certain record from relevant experts in headquarters. If we are unable to copy records, we would have to rely solely on our investigators' notes and reports when drawing conclusions. In addition, copying records will facilitate follow-up regulatory actions. The public availability of any records that FDA would possess as a result of copying during an inspection would be governed by section 301(j) of the FD&C Act and by the Freedom of Information Act (FOIA) and regulations issued pursuant to it by the Department of Health and Human Services (DHHS) and FDA. Section 301(j) of the FD&C Act expressly prohibits FDA from disclosing trade secret information obtained during the course of an inspection. FDA's disclosure regulations also provide that FDA will not divulge either trade secret or confidential commercial information. See section VI.F. for a further discussion of protecting food defense records from disclosure.

(Comment 120) Some comments assert that FDA investigators should not include details of food defense plans in the Establishment Inspection Reports (EIR) Form 483 and that food defense information should be kept separate from food safety information on FDA reports. The comments argue that if investigators include food defense-related noncompliance on an official report, that report could become public and could increase the risk to public health by disclosing weak points in a facility's food defense plan.

(Response 120) As we do now, FDA would redact any protected information in an EIR or other document before publically releasing the document. See section VI.F for further discussion of protecting food defense records from disclosure.

(Comment 121) One comment asserts that section 106 of FSMA does not give FDA express access to review food defense plans and that FSMA indicates a Congressional intent to limit the distribution of certain materials related to food defense.

(Response 121) The provisions in section 106 of FSMA concerning limited distribution relate to the ability of the Secretary of HHS (and by delegation, FDA) to limit the distribution of certain information already in the Agency's possession. Specifically, section 420(a)(2) of the FD&C Act authorizes FDA to determine the time, manner, and form in which a vulnerability assessment is made publically available. Further, section 420(b)(3) provides for FDA to determine the time, manner, and form in which certain guidance documents are made public. The provisions do not limit FDA's authority to access information in a facility's possession, such as a food defense plan.

Further, the ability of FDA to review food defense plans is necessary for the efficient enforcement of the FD&C Act. The rule requires a food defense plan consisting of a written vulnerability assessment, mitigation strategies, and procedures for food defense monitoring, corrective actions, and verification. Access to food defense plans is necessary for FDA to assess the adequacy of each of these documents and determine compliance with the rule. For example, to assess compliance with § 121.130(a), FDA must review a facility's vulnerability assessment to determine whether it includes an evaluation of the potential public health impact if a contaminant were added, the degree of physical access to the product, and the ability of an attacker to successfully contaminated the product.

In addition to section 420 (added to the FD&C Act by section 106 of FSMA), FDA is issuing this rule under the authority of section 418 of the FD&C Act. Section 418 explicitly provides authority for FDA access to certain documents. Under section 418, the required ''written plan, together with the documentation of [monitoring, instances of nonconformance, the results of testing and other appropriate means of verification, instances where corrective actions were implemented, and the efficacy of preventive controls and corrective actions] shall be made promptly available to [FDA] upon oral or written request.''

(Comment 122) One comment asserts that neither section 103 nor 106 of FSMA expressly provide FDA with the authority to copy food defense plans or records.

(Response 122) As we described in the seafood HACCP rule (60 FR 65096 at 65101, December 18, 1995), to effectuate the broad purposes of the FD&C Act, there may be some circumstances in which access to the records would be meaningless without the opportunity to copy them, and therefore copying records is necessary for the efficient enforcement of the FD&C Act. For further discussion of copying records, see response to Comment 121.

F. Proposed § 121.325—Public Disclosure

We proposed that records required by this part will be protected from public disclosure to the extent allowable under part 20 of this chapter. We received numerous comments expressing concern with protecting food defense plans and records from public disclosure, especially due to the sensitive nature of the content within a food defense plan. One comment fully supports our proposal and believes there is sufficient precedent and need to protect the sensitive documents from public disclosure. In the following paragraphs, we discuss comments that ask us to clarify the proposed requirements or that disagree with, or suggest one or more changes to, the proposed requirements.

(Comment 123) Some comments assert that food defense plans include information that is commercial confidential or trade secret and, therefore, should be exempt from disclosure under FOIA. The comments argue that food defense plans may include information on a facility's food defense-related measures and that disclosure of one facility's food defense plan may adversely affect other facilities and companies that may process similar foods or have similar processing procedures.

(Response 123) FDA protects records from disclosure under Exemption 4 of FOIA to the extent they contain ''trade secrets'' or ''commercial or financial information obtained from a person and privileged or confidential.'' The questions raised in these comments are similar to some of the questions raised during the rulemaking to establish our HACCP regulation for seafood (see the discussion at 60 FR 65096 at 65137–65140). Our experience in conducting CGMP inspections in processing plants, our experience with enforcing our HACCP regulations for seafood and juice, and our understanding from the Regulatory Impact Analysis for this rule make it clear that food defense plans

will take each facility time and money to develop.

There is value in a plan to a company that produces it for no other reason than that it took work to write. The equity in such a product is not readily given away to competitors. We expect that plant configurations will be unique to individual processors, or at least have unique features, as was the case in the seafood industry (Ref. 16). While generic plans will have great utility in many circumstances, they will serve primarily as starting points for facilities to develop their own plans. Facilities will still need to expend time and money to tailor a generic food defense plan to their individual circumstances. Thus, we conclude that food defense plans generally will meet the definition of trade secret, including the court's definition in *Public Citizen Health Research Group* v. *FDA,* 704 F.2d 1280 (D.C. Cir. 1983).

(Comment 124) Some comments ask us to provide assurances that food defense plans and related records will not be made public and assert that protecting these documents from disclosure to the extent allowable under part 20 may not be sufficient. They argue that food defense plans are more sensitive than food safety plans because food defense plans contain specifics on a facility's vulnerabilities and how they protect those vulnerabilities, and as such, could provide a ''road map'' for individuals intending to cause harm. These comments state that FDA should be more protective of food defense plans and argue that due to the sensitivity of information contained in food defense plans, it is too risky to rely on FOIA exemptions alone.

(Response 124) We agree that food defense plans contains information that presents sensitivities not likely to be present in food safety plans. Exemption 7(F) of FOIA allows Agencies to withhold ''records or information compiled for law enforcement purposes . . . to the extent that production of such law enforcement records or information . . . could reasonably be expected to endanger the life or physical safety of any individual.'' Food defense plans are likely to meet the criteria to withhold them from disclosure under exemption 7(F). Food defense plans in FDA's possession would be compiled for law enforcement purposes because they would be collected as part of compliance efforts. Further, production of such records could reasonably be expected to endanger life or physical safety. Specifically, a food defense plan is likely to contain information that could be used to identify weaknesses in a facility's security, to choose targets, and to help plan and execute an attack involving intentional adulteration.

(Comment 125) Some comments state that food defense plans could be classified under Executive Order 13526 because their unauthorized disclosure could reasonably be expected to cause identifiable or describable damage to national security and because food defense plans pertain to ''vulnerabilities or capabilities of systems, installations, infrastructures, projects, plans, or protection services relating to national security.'' These comments acknowledge that classifying food defense plans would be cumbersome and access to the classified documents would be extremely restricted and therefore, they recommend that FDA implement a policy that FDA investigators not copy, photograph, or transmit any food defense plan records or make detailed notes about the food defense plans in the Establishment Inspection Reports that could reveal sensitive information.

(Response 125) See response to Comment 124 for a discussion of FDA handling of food defense plans. We note that FDA cannot classify food defense plans under Executive Order 13526. That executive order provides that information may be originally classified only if several conditions are met, including that the information is owned by, produced by or for, or is under the control of the U.S. Government. A food defense plan that is developed by industry for use by industry is not owned by, produced by or for, or under the control of, the U.S. Government.

(Comment 126) One comment suggests that FDA only allow investigators who have the appropriate national security credentials (*e.g.,* background checks, security clearances) to review the content of a food defense plan. The comment asserts that this will help prevent the risk of a sophisticated insider attack by a potential wrongdoer who has infiltrated the Agency.

(Response 126) All FDA investigators and contracted State investigators are required to undergo background checks by the Federal government prior to employment and periodically thereafter. Food defense plans are not classified, and therefore FDA investigators would not need national security clearances.

(Comment 127) Some comments state that FDA should, at a minimum, be aligned with and apply the same protection for food defense plans and records required under this part as HACCP seafood and juice regulations (see §§ 123.9(d) and 120.12(f), respectively).

(Response 127) We disagree that the proposed provisions governing public disclosure are not aligned with the public disclosure provisions of our HACCP regulations for seafood and juice. Our regulations in part 20 regarding public information apply to all Agency records, regardless of whether a particular recordkeeping requirement says so. In the public disclosure provisions for our HACCP regulations for seafood and juice, we provided specific details about how particular provisions in part 20 (*i.e.,* § 20.61 (Trade secrets and commercial or financial information which is privileged or confidential) and § 20.81 (Data and information previously disclosed to the public)) would apply to the applicable records, because we recognized that such details were of particular interest to the regulated industries and such recordkeeping requirements were relatively new. In this rule, we framed the provisions regarding public disclosure more broadly by referring to all the requirements of part 20, consistent with our more recent approach to public disclosure provisions in regulations (see *e.g.,* 21 CFR 112.167, 117.325).

(Comment 128) Some comments assert that FDA should develop guidance and training for industry on how to protect food defense-related documents because industry is developing these documents to meet an FDA requirement and has a potential to increase the risk to public health.

(Response 128) Our implementation of this rule will involve a broad, collaborative effort to foster awareness and compliance through guidance, education, and technical assistance. We agree that protection of food defense plans—by FDA and by industry—is important; we plan on including information within guidance for industry on best practices for how to protect food defense plans.

G. Proposed § 121.330—Use of Existing Records

We are adding new section § 121.330 (Use of Existing Records) to the final rule to increase recordkeeping flexibility. Section 121.330 specifies that existing records (*e.g.,* records that are kept to comply with other Federal, State, or local regulations) do not need to be duplicated if they contain all of the required information and satisfy the requirements of subpart D. Section 121.330 also provides that existing records may be supplemented as necessary to include all of the required information. Further, § 121.330 clarifies that the information required does not need to be kept in one set of records; if existing records contain some of the required information, any new

information required may be kept either separately or combined with the existing records.

VII. Subpart E: Comments on Compliance—Proposed § 121.401

1. Proposed § 121.401(a)—Failure To Comply With Section 418 of the FD&C Act

We proposed that the operation of a facility that manufactures, processes, packs, or holds food for sale in the United States if the owner, operator, or agent in charge of such facility is required to comply with, and is not in compliance with, section 418 of the FD&C Act or subparts C or D of this part is a prohibited act under section 301(uu) of the FD&C Act.

We did not receive any comments on this provision, and we are finalizing as proposed.

2. Proposed § 121.401(b)—Failure To Comply With Section 420 of the FD&C Act

We proposed that the failure to comply with section 420 of the FD&C Act or subparts C or D of this part is a prohibited act under section 301(ww) of the FD&C Act.

We did not receive any comments on this provision, and we are finalizing as proposed.

VIII. Effective and Compliance Dates

We proposed the effective date would be 60 days after this final rule is published. However, we proposed for a longer timeline for facilities to come into compliance. As proposed, facilities, other than small and very small businesses, would have 1 year after the effective date to comply with part 121. Small businesses (*i.e.,* those employing fewer than 500 persons) would have 2 years after the effective date to comply with part 121. Very small businesses (*i.e.,* businesses that have less than $10,000,000 in total annual sales of food, adjusted for inflation) would have 3 years after the effective date to comply with § 121.5(a).

Some comments express concern that facilities will not have the time or resources to implement requirements for the intentional adulteration rule at the same time they must comply with other FSMA rules. Some comments also state that more time is necessary to comply with this rule because food defense is different from current requirements for food safety. These comments request additional time for compliance.

We agree with the comments and are providing more time for facilities to come into compliance. Facilities, other than small and very small businesses, have 3 years after the effective date to comply with part 121. Small businesses (*i.e.,* those employing fewer than 500 full-time equivalent employees) have 4 years after the effective date to comply with part 121. Very small businesses (*i.e.,* businesses that have less than $10,000,000, adjusted for inflation, per year, during the 3-year period preceding the applicable calendar year in both sales of human food plus the market value of human food manufactured, processed, packed, or held without sale) have 5 years after the effective date to comply with § 121.5(a).

IX. Executive Order 13175

In accordance with Executive Order 13175, FDA has consulted with tribal government officials. A Tribal Summary Impact Statement has been prepared that includes a summary of Tribal officials' concerns and how FDA has addressed them (Ref. 17). Persons with access to the Internet may obtain the Tribal Summary Impact Statement at *http://www.fda.gov/Food/GuidanceRegulation/FSMA/ucm378628* or at *http://www.regulations.gov*. Copies of the Tribal Summary Impact Statement also may be obtained by contacting the person listed under **FOR FURTHER INFORMATION CONTACT**.

X. Final Regulatory Impact Analysis

We have examined the impacts of the final rule under Executive Order 12866, Executive Order 13563, the Regulatory Flexibility Act (5 U.S.C. 601–612), and the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4). Executive Orders 12866 and 13563 direct Agencies to assess all costs and benefits of available regulatory alternatives and, when regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity). We have developed a comprehensive Economic Analysis of Impacts that assesses the impacts of the final rule. We believe that this final rule is a significant regulatory action under Executive Order 12866.

The Regulatory Flexibility Act requires us to analyze regulatory options that would minimize any significant impact of a rule on small entities. The annualized costs per entity due to this rule are about $13,000 for a one-facility firm with 100 employees, and there are about 4,100 small businesses that would be affected by the rule, so we tentatively conclude that the final rule could have a significant economic impact on a substantial number of small entities.

The Small Business Regulatory Enforcement Fairness Act of 1996 (Pub. L. 104–121) defines a major rule for the purpose of congressional review as having caused or being likely to cause one or more of the following: An annual effect on the economy of $100 million or more; a major increase in costs or prices; significant adverse effects on competition, employment, productivity, or innovation; or significant adverse effects on the ability of U.S.-based enterprises to compete with foreign-based enterprises in domestic or export markets. In accordance with the Small Business Regulatory Enforcement Fairness Act, the Office of Management and Budget (OMB) has determined that this rule is a major rule for the purpose of Congressional review.

The Unfunded Mandates Reform Act of 1995 (section 202(a)) requires us to prepare a written statement, which includes an assessment of anticipated costs and benefits, before proposing ''any rule that includes any Federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more (adjusted annually for inflation) in any one year.'' The current threshold after adjustment for inflation is $144 million, using the most current (2014) Implicit Price Deflator for the Gross Domestic Product. This final rule may result in a 1-year expenditure that would meet or exceed this amount.

XI. Paperwork Reduction Act of 1995

This rule contains information collection requirements that are subject to review by the OMB under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501–3521). A description of these provisions is given in this section with an estimate of the annual reporting and recordkeeping burden; there is no third-party disclosure burden associated with the information collection. Included in the estimate is the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing each collection of information.

Title: Mitigation Strategies to Protect Food Against Intentional Adulteration

Description: The Food and Drug Administration (FDA or we) is requiring domestic and foreign food facilities that are required to register under the Federal Food, Drug, and Cosmetic Act to address hazards that may be introduced with the intention to cause wide scale public health harm. These food facilities are required to identify and implement mitigation strategies that significantly minimize or prevent significant

vulnerabilities identified at actionable process steps in a food operation. FDA is promulgating these requirements as part of our implementation of the FDA Food Safety Modernization Act (FSMA). We expect the rule to help protect food from acts of intentional adulteration intended to cause wide scale public health harm.

Description of Respondents: Respondents to the collection are food production facilities with more than $10 million in annual sales. We estimate there are 9,759 such facilities owned by 3,247 firms. We estimate there are 18,080 facilities with less than $10 million in annual sales that will need to show documentation of their exemption status under the rule, upon request.

In the **Federal Register** of December 24, 2013, FDA published a proposed rule including a PRA analysis of the information collection provisions found in the regulations. While FDA did not receive specific comments in response to the four information collection topics solicited, comments in response to the rule are addressed elsewhere in this document. Comments filed in response to the rulemaking are filed under Docket No. FDA–2013–N–1425.

We estimate the burden for this information collection as follows:

Reporting: The rule does not apply to very small businesses, except that ''a very small business'' is required to provide for official review, upon request, documentation that was relied upon to demonstrate that the facility meets this exemption. At this time we estimate there are 18,080 firms with less than $10 million in annual sales, exempting them from the rule. However, these facilities must show documentation upon request to verify their exempt status under the regulations (§ 121.5(a)). We estimate preparing and updating relevant files will require an average of 30 minutes per respondent for a total annual burden of 9,040 hours (30 minutes × 18,080), as reflected in table 4.

TABLE 4—ESTIMATED ANNUAL REPORTING BURDEN [1]

21 CFR Section; activity	Number of respondents	Number of responses per respondent	Total annual responses	Average burden per response	Total hours
§ 121.5; Exemption for food from very small businesses	18,080	1	1	0.50 (30 minutes)	9,040

[1] There are no capital costs, or operating and maintenance costs associated with this collection.

Recordkeeping: Under the rule, the owner, operator, or agent in charge of a facility must prepare, or have prepared, and implement a written food defense plan, including a written vulnerability assessment; written mitigation strategies; written procedures for defense monitoring; written procedures for food defense corrective actions; and written procedures for food defense verification. Table 5 shows the estimated recordkeeping burden associated with these activities, totaling 2,515,258 annual burden hours and 409,486 annual responses. This is a revision from our previous estimate, reflecting a slight decrease in burden hours as a result of finalizing regulatory requirements from the proposed rule and revising the number of estimated respondents.

TABLE 5—ESTIMATED ANNUAL RECORDKEEPING BURDEN [1]

21 CFR Section; activity	Number of recordkeepers	Number of records per recordkeeper	Total annual records	Average burden per recordkeeping	Total hours
Food Defense Plan; § 121.126	3,247	1	3,247	23 hrs	74,681
Vulnerability Assessment; § 121.130	9,759	1	9,759	20 hrs	195,180
Mitigation Strategies; § 121.135(b)	9,759	1	9,759	20 hrs	195,180
Monitoring, Corrective Actions, Verification; § 121.140(a), § 121.145(a)(1), § 121.150(b).	9,759	1	9,759	175 hrs	1,707,825
Training; § 121.4	367,203	1	367,203	0.67 hrs. (40 minutes)	244,802
Records; § 121.305, § 121.310	9,759	1	9,759	10 hrs	97,590
Total			409,486		2,515,258

[1] Costs of compliance are discussed in the Final Regulatory Impact Analysis to this final rule.

We estimate 3,247 firms will need to create a food defense plan under § 121.126, that a one-time burden of 50 hours will be needed to create such a plan, and that a burden of 10 hours will be required to update the plan. We annualize this estimate by dividing the total number of burden hours (70 hours) over a 3-year period, as reflected in table 5, row 1.

Under § 121.130, each of the estimated 9,759 food production facilities will identify and specify actionable process steps for its food defense plan. We estimate that an individual at the level of an operations manager will need 20 hours for this activity, as reflected in table 5, row 2. At the same time we note that this is a one-time burden we expect will have been realized upon implementation of the rule by the affected facilities. In our subsequent evaluation of the burden associated with this information collection provision, we will adjust our estimate accordingly.

Under § 121.135(b), each of the estimated 9,759 facilities must identify and implement mitigation strategies for each actionable process step to provide assurances that any significant vulnerability at each step is significantly minimized or prevented, ensuring that the food manufactured, processed, packed, or held by the facility will not be adulterated. The rule does not specify a specific number or set of mitigation strategies to be implemented. Some of the covered facilities are already implementing mitigation strategies. We estimate it will require an average of 20 hours per facility to satisfy the recordkeeping burden associated with these activities for a total of 195,180 hours, as reflected in table 5, row 3.

We estimate that the recordkeeping activities associated with monitoring,

documenting mitigation strategies, implementing necessary corrective actions, and verification activities will require first-line supervisors or others responsible for quality control an average of 175 hours for each recordkeeper, and that these provisions apply to each of the 9,759 facilities. This results in a total of 1,707,825 annual burden hours, as reflected in table 5, row 4.

We estimate that recordkeeping activities associated with training under § 121.4 total 244,802 annual burden hours, as reflected in table 5, row 5. This figure assumes that there are an estimated 1.2 million employees working at the regulated facilities and that 30 percent of them (367,203) will require training. This figure also assumes that the average burden for the associated recordkeeping activity is approximately 40 minutes (or 0.67 hours) per record.

Finally, we expect each of the estimated 9,759 firms will fulfill the recordkeeping requirements under § 121.305 and § 121.310, and that it will require the equivalent of an operations manager and a legal analyst an average of 5 hours each (10 hours) per record, as reflected in table 5, row 6.

XII. Analysis of Environmental Impact

We previously considered the environmental effects of this rule, as stated in the proposed rule (78 FR 78014). We stated that we had determined under 21 CFR 25.30(h) and 21 CFR 25.30(j) that this action is of a type that does not individually or cumulatively have a significant effect on the human environment such that neither an environmental assessment nor an environmental impact statement is required. We have not received any new information or comments that would affect our previous determination (Ref. 18).

XIII. Federalism

FDA has analyzed this final rule in accordance with the principles set forth in Executive Order 13132. FDA has determined that the rule does not contain policies that have substantial direct effects on the States, on the relationship between the National Government and the States, or on the distribution of power and responsibilities among the various levels of government. Accordingly, the Agency has concluded that the rule does not contain policies that have federalism implications as defined in the Executive order and, consequently, a federalism summary impact statement is not required.

List of Subjects

21 CFR Part 11

Administrative practice and procedure, Computer technology, Reporting and recordkeeping requirements.

21 CFR Part 121

Food packaging, Foods.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR Chapter 1 is amended as follows:

PART 11—ELECTRONIC RECORDS; ELECTRONIC SIGNATURES

■ 1. The authority citation for part 11 continues to read as follows:

Authority: 21 U.S.C. 321–393; 42 U.S.C. 262.

■ 2. In § 11.1, add paragraph (o) to read as follows:

§ 11.1 Scope.

* * * * *

(o) This part does not apply to records required to be established or maintained

by part 121 of this chapter. Records that satisfy the requirements of part 121 of this chapter, but that also are required under other applicable statutory provisions or regulations, remain subject to this part.

■ 3. Add part 121 to read as follows:

PART 121—MITIGATION STRATEGIES TO PROTECT FOOD AGAINST INTENTIONAL ADULTERATION

Sec.

Authority: 21 U.S.C. 331, 342, 350g, 350(i), 371, 374.

Subpart A—General Provisions

§ 121.1 Applicability.

This part applies to the owner, operator or agent in charge of a domestic or foreign food facility that manufactures/processes, packs, or holds food for consumption in the United States and is required to register under section 415 of the Federal Food, Drug, and Cosmetic Act, unless one of the exemptions in § 121.5 applies.

§ 121.3 Definitions.

The definitions and interpretations of terms in section 201 of the Federal Food, Drug, and Cosmetic Act are applicable to such terms when used in this part. The following definitions also apply:

Actionable process step means a point, step, or procedure in a food process where a significant vulnerability exists and at which mitigation strategies can be applied and are essential to significantly minimize or prevent the significant vulnerability.

Adequate means that which is needed to accomplish the intended purpose in keeping with good public health practices.

Affiliate means any facility that controls, is controlled by, or is under common control with another facility.

Calendar day means every day as shown on the calendar.

Contaminant means, for purposes of this part, any biological, chemical, physical, or radiological agent that may be added to food to intentionally cause illness, injury, or death.

Facility means a domestic facility or a foreign facility that is required to register under section 415 of the Federal Food, Drug, and Cosmetic Act, in accordance with the requirements of part 1, subpart H of this chapter.

Farm means farm as defined in § 1.227 of this chapter.

FDA means the Food and Drug Administration.

Food means food as defined in section 201(f) of the Federal Food, Drug, and Cosmetic Act and includes raw materials and ingredients.

Food defense means, for purposes of this part, the effort to protect food from intentional acts of adulteration where there is an intent to cause wide scale public health harm.

Food defense monitoring means to conduct a planned sequence of observations or measurements to assess whether mitigation strategies are operating as intended.

Food defense verification means the application of methods, procedures, and other evaluations, in addition to food defense monitoring, to determine whether a mitigation strategy or combination of mitigation strategies is or has been operating as intended according to the food defense plan.

Full-time equivalent employee is a term used to represent the number of employees of a business entity for the purpose of determining whether the business qualifies as a small business. The number of full-time equivalent employees is determined by dividing the total number of hours of salary or wages paid directly to employees of the business entity and of all of its affiliates and subsidiaries by the number of hours of work in 1 year, 2,080 hours (*i.e.,* 40 hours × 52 weeks). If the result is not a whole number, round down to the next lowest whole number.

Holding means storage of food and also includes activities performed incidental to storage of food (*e.g.,* activities performed for the safe or effective storage of that food, such as fumigating food during storage, and drying/dehydrating raw agricultural commodities when the drying/dehydrating does not create a distinct commodity (such as drying/dehydrating hay or alfalfa)). Holding also includes activities performed as a practical necessity for the distribution of that food (such as blending of the same raw agricultural commodity and breaking down pallets), but does not include activities that transform a raw agricultural commodity into a processed food as defined in section 201(gg) of the Federal Food, Drug, and Cosmetic Act. Holding facilities could include warehouses, cold storage facilities, storage silos, grain elevators, and liquid storage tanks.

Manufacturing/processing means making food from one or more ingredients, or synthesizing, preparing, treating, modifying or manipulating food, including food crops or ingredients. Examples of manufacturing/processing activities include: Baking, boiling, bottling, canning, cooking, cooling, cutting, distilling, drying/dehydrating raw agricultural commodities to create a distinct commodity (such as drying/dehydrating grapes to produce raisins), evaporating, eviscerating, extracting juice, formulating, freezing, grinding, homogenizing, irradiating, labeling, milling, mixing, packaging (including modified atmosphere packaging), pasteurizing, peeling, rendering, treating to manipulate ripening, trimming, washing, or waxing. For farms and farm mixed-type facilities, manufacturing/processing does not include activities that are part of harvesting, packing, or holding.

Mitigation strategies mean those risk-based, reasonably appropriate measures that a person knowledgeable about food defense would employ to significantly minimize or prevent significant vulnerabilities identified at actionable process steps, and that are consistent with the current scientific understanding of food defense at the time of the analysis.

Mixed-type facility means an establishment that engages in both activities that are exempt from registration under section 415 of the Federal Food, Drug, and Cosmetic Act and activities that require the establishment to be registered. An example of such a facility is a ''farm

mixed-type facility,'' which is an establishment that is a farm, but also conducts activities outside the farm definition that require the establishment to be registered.

Packing means placing food into a container other than packaging the food and also includes re-packing and activities performed incidental to packing or re-packing a food (*e.g.,* activities performed for the safe or effective packing or re-packing of that food (such as sorting, culling, grading, and weighing or conveying incidental to packing or re-packing)), but does not include activities that transform a raw agricultural commodity into a processed food as defined in section 201(gg) of the Federal Food, Drug, and Cosmetic Act.

Qualified individual means a person who has the education, training, or experience (or a combination thereof) necessary to perform an activity required under subpart C of this part, as appropriate to the individual's assigned duties. A qualified individual may be, but is not required to be, an employee of the establishment.

Significant vulnerability means a vulnerability that, if exploited, could reasonably be expected to cause wide scale public health harm. A significant vulnerability is identified by a vulnerability assessment conducted by a qualified individual, that includes consideration of the following: (1) Potential public health impact (*e.g.,* severity and scale) if a contaminant were added, (2) degree of physical access to the product, and (3) ability of an attacker to successfully contaminate the product. The assessment must consider the possibility of an inside attacker.

Significantly minimize means to reduce to an acceptable level, including to eliminate.

Small business means, for purposes of this part, a business (including any subsidiaries and affiliates) employing fewer than 500 full-time equivalent employees.

Subsidiary means any company which is owned or controlled directly or indirectly by another company.

Very small business means, for purposes of this part, a business (including any subsidiaries and affiliates) averaging less than $10,000,000, adjusted for inflation, per year, during the 3-year period preceding the applicable calendar year in sales of human food plus the market value of human food manufactured, processed, packed, or held without sale (*e.g.,* held for a fee).

Vulnerability means the susceptibility of a point, step, or procedure in a facility's food process to intentional adulteration.

You means, for purposes of this part, the owner, operator, or agent in charge of a facility.

§ 121.4 Qualifications of individuals who perform activities under subpart C of this part.

(a) *Applicability.* You must ensure that each individual who performs activities required under subpart C of this part is a qualified individual as that term is defined in § 121.3.

(b) *Qualifications of individuals assigned to an actionable process step.* Each individual assigned to an actionable process step (including temporary and seasonal personnel) or in the supervision thereof must:

(1) Be a qualified individual as that term is defined in § 121.3—*i.e.,* have the appropriate education, training, or experience (or a combination thereof) necessary to properly implement the mitigation strategy or combination of mitigation strategies at the actionable process step; and

(2) Receive training in food defense awareness.

(c) *Qualifications of individuals for certain activities described in paragraph (c)(3) of this section.* Each individual assigned to certain activities described in paragraph (c)(3) of this section must:

(1) Be a qualified individual as that term is defined in § 121.3—*i.e.,* have the appropriate education, training, or experience (or a combination thereof) necessary to properly perform the activities; and

(2) Have successfully completed training for the specific function at least equivalent to that received under a standardized curriculum recognized as adequate by FDA or be otherwise qualified through job experience to conduct the activities. Job experience may qualify an individual to perform these functions if such experience has provided an individual with knowledge at least equivalent to that provided through the standardized curriculum. This individual may be, but is not required to be, an employee of the facility.

(3) One or more qualified individuals must do or oversee:

(i) The preparation of the food defense plan as required in § 121.126;

(ii) The conduct of a vulnerability assessment as required in § 121.130;

(iii) The identification and explanation of the mitigation strategies as required in § 121.135; and

(iv) Reanalysis as required in § 121.157.

(d) *Additional qualifications of supervisory personnel.* Responsibility for ensuring compliance by individuals with the requirements of this part must be clearly assigned to supervisory personnel with a combination of education, training, and experience necessary to supervise the activities under this subpart.

(e) *Records.* Training required by paragraphs (b)(2) and (c)(2) of this section must be documented in records, and must:

(1) Include the date of training, the type of training, and the persons trained; and

(2) Be established and maintained in accordance with the requirements of subpart D of this part.

§ 121.5 Exemptions.

(a) This part does not apply to a very small business, except that a very small business must, upon request, provide for official review documentation sufficient to show that the facility meets this exemption. Such documentation must be retained for 2 years.

(b) This part does not apply to the holding of food, except the holding of food in liquid storage tanks.

(c) This part does not apply to the packing, re-packing, labeling, or re-labeling of food where the container that directly contacts the food remains intact.

(d) This part does not apply to activities of a farm that are subject to section 419 of the Federal Food, Drug, and Cosmetic Act (Standards for Produce Safety).

(e)(1) This part does not apply with respect to alcoholic beverages at a facility that meets the following two conditions:

(i) Under the Federal Alcohol Administration Act (27 U.S.C. 201 *et seq.*) or chapter 51 of subtitle E of the Internal Revenue Code of 1986 (26 U.S.C. 5001 *et seq.*) the facility is required to obtain a permit from, register with, or obtain approval of a notice or application from the Secretary of the Treasury as a condition of doing business in the United States, or is a foreign facility of a type that would require such a permit, registration, or approval if it were a domestic facility; and

(ii) Under section 415 of the Federal Food, Drug, and Cosmetic Act the facility is required to register as a facility because it is engaged in manufacturing, processing, packing, or holding one or more alcoholic beverages.

(2) This part does not apply with respect to food that is not an alcoholic beverage at a facility described in paragraph (e)(1) of this section, provided such food:

(i) Is in prepackaged form that prevents any direct human contact with such food; and

(ii) Constitutes not more than 5 percent of the overall sales of the facility, as determined by the Secretary of the Treasury.

(f) This part does not apply to the manufacturing, processing, packing, or holding of food for animals other than man.

(g) This part does not apply to on-farm manufacturing, processing, packing, or holding of the following foods on a farm mixed-type facility, when conducted by a small or very small business if such activities are the only activities conducted by the business subject to section 418 of the Federal Food, Drug, and Cosmetic Act.

(1) Eggs (in-shell, other than raw agricultural commodities, *e.g.,* pasteurized); and

(2) Game meats (whole or cut, not ground or shredded, without secondary ingredients).

Subpart B—Reserved

Subpart C—Food Defense Measures

§ 121.126 Food defense plan.

(a) *Requirement for a food defense plan.* You must prepare, or have prepared, and implement a written food defense plan.

(b) *Contents of a food defense plan.* The written food defense plan must include:

(1) The written vulnerability assessment, including required explanations, to identify significant vulnerabilities and actionable process steps as required by § 121.130(c);

(2) The written mitigation strategies, including required explanations, as required by § 121.135(b);

(3) The written procedures for the food defense monitoring of the implementation of the mitigation strategies as required by § 121.140(a);

(4) The written procedures for food defense corrective actions as required by § 121.145(a)(1); and

(5) The written procedures for food defense verification as required by § 121.150(b).

(c) *Records.* The food defense plan required by this section is a record that is subject to the requirements of subpart D of this part.

§ 121.130 Vulnerability assessment to identify significant vulnerabilities and actionable process steps.

(a) *Requirement for a vulnerability assessment.* You must conduct or have conducted a vulnerability assessment for each type of food manufactured, processed, packed, or held at your facility using appropriate methods to evaluate each point, step, or procedure in your food operation to identify significant vulnerabilities and actionable process steps. Appropriate methods must include, at a minimum, an evaluation of:

(1) The potential public health impact (*e.g.,* severity and scale) if a contaminant were added;

(2) The degree of physical access to the product; and

(3) The ability of an attacker to successfully contaminate the product.

(b) *Inside attacker.* The assessment must consider the possibility of an inside attacker.

(c) *Written vulnerability assessment.* Regardless of the outcome, the vulnerability assessment must be written and must include an explanation as to why each point, step, or procedure either was or was not identified as an actionable process step.

§ 121.135 Mitigation strategies for actionable process steps.

(a) You must identify and implement mitigation strategies at each actionable process step to provide assurances that the significant vulnerability at each step will be significantly minimized or prevented and the food manufactured, processed, packed, or held by your facility will not be adulterated under section 402 of the Federal Food, Drug, and Cosmetic Act. For each mitigation strategy implemented at each actionable process step, you must include a written explanation of how the mitigation strategy sufficiently minimizes or prevents the significant vulnerability associated with the actionable process step.

(b) Mitigation strategies and accompanying explanations must be written.

§ 121.138 Mitigation strategies management components.

Mitigation strategies required under§ 121.135 are subject to the following mitigation strategies management components as appropriate to ensure the proper implementation of the mitigation strategies, taking into account the nature of each such mitigation strategy and its role in the facility's food defense system:

(a) Food defense monitoring in accordance with § 121.140;

(b) Food defense corrective actions in accordance with § 121.145; and

(c) Food defense verification in accordance with § 121.150.

§ 121.140 Food defense monitoring.

As appropriate to the nature of the mitigation strategy and its role in the facility's food defense system:

(a) *Written procedures.* You must establish and implement written procedures, including the frequency with which they are to be performed, for food defense monitoring of the mitigation strategies.

(b) *Food defense monitoring.* You must monitor the mitigation strategies with adequate frequency to provide assurances that they are consistently performed.

(c) *Records*—(1) *Requirement to document food defense monitoring.* You must document the monitoring of mitigation strategies in accordance with this section in records that are subject to verification in accordance with § 121.150(a)(1) and records review in accordance with § 121.150(a)(3)(i).

(2) *Exception records.* Records may be affirmative records demonstrating the mitigation strategy is functioning as intended. Exception records demonstrating the mitigation strategy is not functioning as intended may be adequate in some circumstances.

§ 121.145 Food defense corrective actions.

(a) *Food defense corrective action procedures.* As appropriate to the nature of the actionable process step and the nature of the mitigation strategy:

(1) You must establish and implement written food defense corrective action procedures that must be taken if mitigation strategies are not properly implemented.

(2) The food defense corrective action procedures must describe the steps to be taken to ensure that:

(i) Appropriate action is taken to identify and correct a problem that has occurred with implementation of a mitigation strategy; and

(ii) Appropriate action is taken, when necessary, to reduce the likelihood that the problem will recur.

(b) *Records.* All food defense corrective actions taken in accordance with this section must be documented in records that are subject to food defense verification in accordance with § 121.150(a)(2) and records review in accordance with § 121.150(a)(3)(i).

§ 121.150 Food defense verification.

(a) *Food defense verification activities.* Food defense verification activities must include, as appropriate to the nature of the mitigation strategy and its role in the facility's food defense system:

(1) Verification that food defense monitoring is being conducted as required by § 121.138 (and in accordance with § 121.140);

(2) Verification that appropriate decisions about food defense corrective actions are being made as required by § 121.138 (and in accordance with § 121.145);

(3) Verification that mitigation strategies are properly implemented and are significantly minimizing or preventing the significant vulnerabilities. To do so, you must conduct activities that include the following, as appropriate to the facility, the food, and the nature of the mitigation strategy and its role in the facility's food defense system:

(i) Review of the food defense monitoring and food defense corrective actions records within appropriate timeframes to ensure that the records are complete, the activities reflected in the records occurred in accordance with the food defense plan, the mitigation strategies are properly implemented, and appropriate decisions were made about food defense corrective actions; and

(ii) Other activities appropriate for verification of proper implementation of mitigation strategies; and

(4) Verification of reanalysis in accordance with § 121.157.

(b) *Written procedures.* You must establish and implement written procedures, including the frequency for which they are to be performed, for verification activities conducted according to § 121.150(a)(3)(ii).

(c) *Documentation.* All verification activities conducted in accordance with this section must be documented in records.

§ 121.157 Reanalysis.

(a) You must conduct a reanalysis of the food defense plan, as a whole at least once every 3 years;

(b) You must conduct a reanalysis of the food defense plan as a whole, or the applicable portion of the food defense plan:

(1) Whenever a significant change made in the activities conducted at your facility creates a reasonable potential for a new vulnerability or a significant increase in a previously identified vulnerability;

(2) Whenever you become aware of new information about potential vulnerabilities associated with the food operation or facility;

(3) Whenever you find that a mitigation strategy, a combination of mitigation strategies, or the food defense plan as a whole is not properly implemented; and

(4) Whenever FDA requires reanalysis to respond to new vulnerabilities, credible threats to the food supply, and developments in scientific understanding including, as appropriate, results from the Department of Homeland Security biological, chemical, radiological, or other terrorism risk assessment.

(c) You must complete such reanalysis required by paragraphs (a) and (b) of this section and implement any additional mitigation strategies needed to address the significant vulnerabilities identified, if any:

(1) Before any change in activities (including any change in mitigation strategy) at the facility is operative;

(2) When necessary within 90-calendar days after production; and

(3) Within a reasonable timeframe, providing a written justification is prepared for a timeframe that exceeds 90 days after production of the applicable food first begins.

(d) You must revise the written food defense plan if a significant change in the activities conducted at your facility creates a reasonable potential for a new vulnerability or a significant increase in a previously identified vulnerability or document the basis for the conclusion that no revisions are needed.

Subpart D—Requirements Applying to Records That Must Be Established and Maintained

§ 121.301 Records subject to the requirements of this subpart.

(a) Except as provided by paragraph (b) of this section, all records required by subpart C of this part are subject to all requirements of this subpart.

(b) The requirements of § 121.310 apply only to the written food defense plan.

§ 121.305 General requirements applying to records.

Records must:

(a) Be kept as original records, true copies (such as photocopies, pictures, scanned copies, microfilm, microfiche, or other accurate reproductions of the original records), or electronic records;

(b) Contain the actual values and observations obtained during food defense monitoring;

(c) Be accurate, indelible, and legible;

(d) Be created concurrently with performance of the activity documented;

(e) Be as detailed as necessary to provide history of work performed; and

(f) Include:

(1) Information adequate to identify the facility (*e.g.,* the name, and when necessary, the location of the facility);

(2) The date and, when appropriate, the time of the activity documented;

(3) The signature or initials of the person performing the activity; and

(4) Where appropriate, the identity of the product and the lot code, if any.

(g) Records that are established or maintained to satisfy the requirements of this part and that meet the definition of electronic records in § 11.3(b)(6) of this chapter are exempt from the requirements of part 11 of this chapter. Records that satisfy the requirements of this part, but that also are required under other applicable statutory provisions or regulations, remain subject to part 11 of this chapter.

§ 121.310 Additional requirements applying to the food defense plan.

The owner, operator, or agent in charge of the facility must sign and date the food defense plan:

(a) Upon initial completion; and

(b) Upon any modification.

§ 121.315 Requirements for record retention.

(a)(1) All records required by this part must be retained at the facility for at least 2 years after the date they were prepared.

(2) Records that a facility relies on during the 3-year period preceding the applicable calendar year to support its status as exempt as a very small business must be retained at the facility as long as necessary to support the status of a facility as a very small business during the applicable calendar year.

(b) The food defense plan must be retained for at least 2 years after its use is discontinued.

(c) Except for the food defense plan, offsite storage of records is permitted if such records can be retrieved and provided onsite within 24 hours of request for official review. The food defense plan must remain onsite. Electronic records are considered to be onsite if they are accessible from an onsite location.

(d) If the facility is closed for a prolonged period, the food defense plan may be transferred to some other reasonably accessible location but must be returned to the facility within 24 hours for official review upon request.

§ 121.320 Requirements for official review.

All records required by this part must be made promptly available to a duly authorized representative of the Secretary of Health and Human Services for official review and copying upon oral or written request.

§ 121.325 Public disclosure.

Records required by this part will be protected from public disclosure to the extent allowable under part 20 of this chapter.

§ 121.330 Use of existing records.

(a) Existing records (*e.g.,* records that are kept to comply with other Federal, State, or local regulations, or for any other reason) do not need to be duplicated if they contain all of the required information and satisfy the requirements of this subpart. Existing records may be supplemented as necessary to include all of the required information and satisfy the requirements of this subpart.

(b) The information required by this part does not need to be kept in one set of records. If existing records contain some of the required information, any new information required by this part may be kept either separately or combined with the existing records.

Subpart E—Compliance

§ 121.401 Compliance.

(a) The operation of a facility that manufactures, processes, packs, or holds food for sale in the United States if the owner, operator, or agent in charge of such facility is required to comply with, and is not in compliance with, section 418 of the Federal Food, Drug, and Cosmetic Act or subparts C or D of this part is a prohibited act under section 301(uu) of the Federal Food, Drug, and Cosmetic Act.

(b) The failure to comply with section 420 of the Federal Food, Drug, and Cosmetic Act or subparts C or D of this part is a prohibited act under section 301(ww) of the Federal Food, Drug, and Cosmetic Act.

Dated: May 20, 2016.

Leslie Kux,

Associate Commissioner for Policy.

50 CFR Part 20

Migratory Bird Hunting; Proposed Migratory Bird Hunting Regulations on Certain Federal Indian Reservations and Ceded Lands for the 2016–17 Season; Proposed Rule

DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

50 CFR Part 20

[Docket No. FWS–HQ–MB–2015–0034; FF09M21200–167–FXMB1231099BPP0]

RIN 1018–BA70

Migratory Bird Hunting; Proposed Migratory Bird Hunting Regulations on Certain Federal Indian Reservations and Ceded Lands for the 2016–17 Season

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Proposed rule.

SUMMARY: The U.S. Fish and Wildlife Service (hereinafter, Service or we) proposes special migratory bird hunting regulations for certain Tribes on Federal Indian reservations, off-reservation trust lands, and ceded lands for the 2016–17 migratory bird hunting season.

DATES: You must submit comments on the proposed regulations by June 27, 2016.

ADDRESSES: *Comments:* You may submit comments on the proposals by one of the following methods:

- *Federal eRulemaking Portal: http://www.regulations.gov.* Follow the instructions for submitting comments on Docket No. FWS–HQ–MB–2015–0034.
- *U.S. mail or hand delivery:* Public Comments Processing, Attn: FWS–HQ–MB–2015–0034; Division of Policy, Performance, and Management Programs; U.S. Fish and Wildlife Service; MS: BPHC; 5275 Leesburg Pike; Falls Church, VA 22041–3803.

We will post all comments on *http://www.regulations.gov.* This generally means that we will post any personal information you provide us (see Public Comments, below, for more information).

FOR FURTHER INFORMATION CONTACT: Ron W. Kokel, U.S. Fish and Wildlife Service, Department of the Interior, MS: MB, 5275 Leesburg Pike, Falls Church, VA 22041–3803; (703) 358–1967.

SUPPLEMENTARY INFORMATION: As part of DOI's retrospective regulatory review, we developed a schedule for migratory game bird hunting regulations that is more efficient and will provide dates much earlier than was possible under the old process. This will facilitate planning for the States and all parties interested in migratory bird hunting. Beginning with the 2016–17 hunting season, we are using a new schedule for establishing our annual migratory game bird hunting regulations. We will combine the current early- and late-season regulatory actions into a single process, based on predictions derived from long-term biological information and harvest strategies, to establish migratory bird hunting seasons much earlier than the system we have used for many years. Under the new process, we will develop proposed hunting season frameworks for a given year in the fall of the prior year. We will finalize those frameworks a few months later, thereby enabling the State agencies to select and publish their season dates in early summer. This rulemaking is part of that process.

We developed the guidelines for establishing special migratory bird hunting regulations for Indian Tribes in response to tribal requests for recognition of their reserved hunting rights and, for some Tribes, recognition of their authority to regulate hunting by both tribal and nontribal hunters on their reservations. The guidelines include possibilities for:

(1) On-reservation hunting by both tribal and nontribal hunters, with hunting by nontribal hunters on some reservations to take place within Federal frameworks but on dates different from those selected by the surrounding State(s);

(2) On-reservation hunting by tribal members only, outside of the usual Federal frameworks for season dates and length, and for daily bag and possession limits; and

(3) Off-reservation hunting by tribal members on ceded lands, outside of usual framework dates and season length, with some added flexibility in daily bag and possession limits.

In all cases, the regulations established under the guidelines must be consistent with the March 10 to September 1 closed season mandated by the 1916 Convention between the United States and Great Britain (for Canada) for the Protection of Migratory Birds (Treaty). The guidelines apply to those Tribes having recognized reserved hunting rights on Federal Indian reservations (including off-reservation trust lands) and on ceded lands. They also apply to establishing migratory bird hunting regulations for nontribal hunters on all lands within the exterior boundaries of reservations where Tribes have full wildlife management authority over such hunting or where the Tribes and affected States otherwise have reached agreement over hunting by nontribal hunters on lands owned by non-Indians within the reservation.

Tribes usually have the authority to regulate migratory bird hunting by nonmembers on Indian-owned reservation lands, subject to Service approval. The question of jurisdiction is more complex on reservations that include lands owned by non-Indians, especially when the surrounding States have established or intend to establish regulations governing hunting by non-Indians on these lands. In such cases, we encourage the Tribes and States to reach agreement on regulations that would apply throughout the reservations. When appropriate, we will consult with a Tribe and State with the aim of facilitating an accord. We also will consult jointly with tribal and State officials in the affected States where Tribes wish to establish special hunting regulations for tribal members on ceded lands. Because of past questions regarding interpretation of what events trigger the consultation process, as well as who initiates it, we provide the following clarification.

We routinely provide copies of **Federal Register** publications pertaining to migratory bird management to all State Directors, Tribes, and other interested parties. It is the responsibility of the States, Tribes, and others to notify us of any concern regarding any feature(s) of any regulations. When we receive such notification, we will initiate consultation.

Our guidelines provide for the continued harvest of waterfowl and other migratory game birds by tribal members on reservations where such harvest has been a customary practice. We do not oppose this harvest, provided it does not take place during the closed season defined by the Treaty, and does not adversely affect the status of the migratory bird resource. Before developing the guidelines, we reviewed available information on the current status of migratory bird populations, reviewed the current status of migratory bird hunting on Federal Indian reservations, and evaluated the potential impact of such guidelines on migratory birds. We concluded that the impact of migratory bird harvest by tribal members hunting on their reservations is minimal.

One area of interest in Indian migratory bird hunting regulations relates to hunting seasons for nontribal hunters on dates that are within Federal frameworks, but which are different from those established by the State(s) where the reservation is located. A large influx of nontribal hunters onto a reservation at a time when the season is closed in the surrounding State(s) could result in adverse population impacts on one or more migratory bird species. The guidelines make this unlikely, and we may modify regulations or establish experimental special hunts, after

evaluation of information obtained by the Tribes.

The guidelines provide appropriate opportunity to accommodate the reserved hunting rights and management authority of Indian Tribes while ensuring that the migratory bird resource receives necessary protection. The conservation of this important international resource is paramount. Further, the guidelines should not be viewed as inflexible. In this regard, we note that they have been employed successfully since 1985. They have been tested adequately and, therefore, we made them final beginning with the 1988–89 hunting season (53 FR 31612, August 18, 1988). We should stress here, however, that use of the guidelines is not mandatory and no action is required if a Tribe wishes to observe the hunting regulations established by the State(s) in which the reservation is located.

Regulations Schedule for 2016

On August 6, 2015, we published in the **Federal Register** (80 FR 47388) a proposal to amend 50 CFR part 20. The proposal provided a background and overview of the migratory bird hunting regulations process, and addressed the establishment of seasons, limits, and other regulations for hunting migratory game birds under §§ 20.101 through 20.107, 20.109, and 20.110 of subpart K. Major steps in the 2016–17 regulatory cycle relating to open public meetings and **Federal Register** notifications were also identified in the August 6, 2015, proposed rule.

The August 6 proposed rule also provided detailed information on the proposed 2016–17 regulatory schedule and announced the Service Regulations Committee (SRC) and Flyway Council meetings.

On October 20–21, 2015, we held open meetings with the Flyway Council Consultants, at which the participants reviewed information on the current status of migratory game birds and developed recommendations for the 2016–17 regulations for these species.

On December 11, 2015, we published in the **Federal Register** (80 FR 77088) the proposed frameworks for the 2016–17 season migratory bird hunting regulations. On March 28, 2016, we published in the **Federal Register** (81 FR 17302) a final rule that contained final frameworks for migratory bird hunting seasons from which wildlife conservation agency officials from the States, Puerto Rico, the Virgin Islands, and the Tribes will select hunting dates, hours, areas, and limits. We will publish a subsequent final rule in late May amending subpart K of title 50 CFR part 20 to set hunting seasons, hours, areas, and limits for the 2016–17 hunting seasons.

Population Status and Harvest

Preliminary information on the status of waterfowl and information on the status and harvest of migratory shore and upland game birds was excerpted from various reports and provided in the July 21, 2015, **Federal Register** (80 FR 43266). For more detailed information on methodologies and results, you may obtain complete copies of the various reports at the address indicated under **FOR FURTHER INFORMATION CONTACT** or from our Web site at *http://www.fws.gov/migratorybirds/NewsPublicationsReports.html.*

Hunting Season Proposals From Indian Tribes and Organizations

For the 2016–17 hunting season, we received requests from 23 Tribes and Indian organizations. In this proposed rule, we respond to these requests and also evaluate anticipated requests for six Tribes from whom we usually hear but from whom we have not yet received proposals. We actively solicit regulatory proposals from other tribal groups that are interested in working cooperatively for the benefit of waterfowl and other migratory game birds. We encourage Tribes to work with us to develop agreements for management of migratory bird resources on tribal lands.

The proposed frameworks for flyway regulations were published in the **Federal Register** on December 11, 2015 (80 FR 77088), and the final frameworks published on March 28, 2016 (81 FR 17302). We notified affected Tribes of season dates, bag limits, etc., of the final frameworks. As previously discussed, no action is required by Tribes wishing to observe migratory bird hunting regulations established by the State(s) where they are located. The proposed regulations for the 30 Tribes that meet the established criteria are shown below.

(a) Colorado River Indian Tribes, Colorado River Indian Reservation, Parker, Arizona (Tribal Members and Nontribal Hunters)

The Colorado River Indian Reservation is located in Arizona and California. The Tribes own almost all lands on the reservation, and have full wildlife management authority.

We have yet to hear from the Colorado River Indian Tribes. The Tribes usually request a split dove season, with the early season beginning on September 1 and ending on September 15, 2016. Daily bag limits would be 15 mourning or white-winged doves in the aggregate, of which no more than 10 may be white-winged dove. Possession limit would be 45, of which no more than 30 may be white-winged dove. The Tribes usually request the late season for doves to open November 7 and close December 20, 2016. The daily bag limit would be 15 mourning doves. The possession limit would be 45. Shooting hours would be from one-half hour before sunrise to noon in the early season and until sunset in the late season. Other special tribally set regulations would apply.

The Tribes also usually propose duck hunting seasons. The season would usually open October 17, 2016, and close January 25, 2017. The Tribes usually propose the same season dates for mergansers, coots, and common moorhens. The daily bag limit for ducks, including mergansers, would be seven, except that the daily bag limits could contain no more than two hen mallards, two redheads, two Mexican ducks, two goldeneye, three scaup, one pintail, two cinnamon teal, and one canvasback. The possession limit would be twice the daily bag limit after the first day of the season. The daily bag and possession limit for coots and common moorhens would be 25, singly or in the aggregate. Shooting hours would be from one-half hour before sunrise to sunset.

For geese, the Colorado River Indian Tribes usually propose a season of October 18, 2016, through January 19, 2017. The daily bag limit for geese would be three light geese and three dark geese. The possession limit would be six light geese and six dark geese after opening day. Shooting hours would be from one-half hour before sunrise to sunset.

In 1996, the Tribes conducted a detailed assessment of dove hunting. Results showed approximately 16,100 mourning doves and 13,600 white-winged doves were harvested by approximately 2,660 hunters who averaged 1.45 hunter-days. Field observations and permit sales indicate that fewer than 200 hunters participate in waterfowl seasons. Under the proposed regulations described here and based upon past seasons, we and the Tribes estimate harvest will be similar.

Hunters must have a valid Colorado River Indian Reservation hunting permit and a Federal Migratory Bird Hunting and Conservation Stamp in their possession while hunting. Other special tribally set regulations would apply. As in the past, the regulations would apply both to tribal and nontribal hunters, and nontoxic shot is required for waterfowl hunting.

We propose to approve the Colorado River Indian Tribes regulations for the 2016–17 hunting season, if the seasons'

dates fall within final flyway frameworks (applies to nontribal hunters only) and upon receipt of their proposal.

(b) Confederated Salish and Kootenai Tribes, Flathead Indian Reservation, Pablo, Montana (Tribal and Nontribal Hunters)

For the past several years, the Confederated Salish and Kootenai Tribes and the State of Montana have entered into cooperative agreements for the regulation of hunting on the Flathead Indian Reservation. The State and the Tribes are currently operating under a cooperative agreement signed in 1990, which addresses fishing and hunting management and regulation issues of mutual concern. This agreement enables all hunters to utilize waterfowl hunting opportunities on the reservation.

As in the past, tribal regulations for nontribal hunters would be at least as restrictive as those established for the Pacific Flyway portion of Montana. Goose, duck, and coot season dates would also be at least as restrictive as those established for the Pacific Flyway portion of Montana. Shooting hours for waterfowl hunting on the Flathead Reservation are one-half hour before sunrise to one-half hour after sunset. Steel shot or other federally approved nontoxic shots are the only legal shotgun loads on the reservation for waterfowl or other game birds.

For tribal members, the Tribe proposes outside frameworks for ducks and geese of September 1, 2016, through March 9, 2017. Daily bag and possession limits were not proposed for tribal members.

The requested season dates and bag limits are similar to past regulations. Harvest levels are not expected to change significantly. Standardized check station data from the 1993–94 and 1994–95 hunting seasons indicated no significant changes in harvest levels and that the large majority of the harvest is by nontribal hunters.

We propose to approve the Tribes' request for special migratory bird regulations for the 2016–17 hunting season.

(c) Fond du Lac Band of Lake Superior Chippewa Indians, Cloquet, Minnesota (Tribal Members Only)

Since 1996, the Service and the Fond du Lac Band of Lake Superior Chippewa Indians have cooperated to establish special migratory bird hunting regulations for tribal members. The Fond du Lac's May 26, 2016, proposal covers land set apart for the band under the Treaties of 1837 and 1854 in northeastern and east-central Minnesota and the Band's Reservation near Duluth.

The band's proposal for 2016–17 is essentially the same as that approved last year. The proposed 2016–17 waterfowl hunting season regulations for Fond du Lac are as follows:

Ducks

A. 1854 and 1837 Ceded Territories

Season Dates: Begin September 10 and end November 30, 2016.

Daily Bag Limit: 18 ducks, including no more than 12 mallards (only 3 of which may be hens), 9 black ducks, 9 scaup, 9 wood ducks, 9 redheads, 9 pintails, and 9 canvasbacks.

B. Reservation

Season Dates: Begin September 1 and end November 30, 2016.

Daily Bag Limit: 12 ducks, including no more than 8 mallards (only 2 of which may be hens), 6 black ducks, 6 scaup, 6 redheads, 6 pintails, 6 wood ducks, and 6 canvasbacks.

Mergansers

A. 1854 and 1837 Ceded Territories

Season Dates: Begin September 10 and end November 30, 2016.

Daily Bag Limit: 15 mergansers, including no more than 6 hooded mergansers.

B. Reservation

Season Dates: Begin September 1 and end November 30, 2016.

Daily Bag Limit: 10 mergansers, including no more than 4 hooded mergansers.

Canada Geese

A. 1854 and 1837 Ceded Territories

Season Dates: Begin September 1 and end November 30, 2016.

Daily Bag Limit: 20 geese.

B. Reservation:

Season Dates: Begin September 1 and end November 30, 2016.

Daily Bag Limit: 20 geese.

Sandhill Cranes

1854 and 1837 Ceded Territories Only

Season Dates: Begin September 1 and end November 30, 2016.

Daily Bag Limit: Two sandhill cranes. A crane carcass tag is required prior to hunting.

Coots and Common Moorhens (Common Gallinules)

A. 1854 and 1837 Ceded Territories

Season Dates: Begin September 10 and end November 30, 2016.

Daily Bag Limit: 20 coots and common moorhens, singly or in the aggregate.

B. Reservation

Season Dates: Begin September 1 and end November 30, 2016.

Daily Bag Limit: 20 coots and common moorhens, singly or in the aggregate.

Sora and Virginia Rails

All Areas

Season Dates: Begin September 1 and end November 30, 2016.

Daily Bag Limit: 25 sora and Virginia rails, singly or in the aggregate.

Snipe

All Areas

Season Dates: Begin September 1 and end November 30, 2016.

Daily Bag Limit: Eight snipe.

Woodcock

All Areas

Season Dates: Begin September 1 and end November 30, 2016.

Daily Bag Limit: Three woodcock.

Mourning Dove

All Areas

Season Dates: Begin September 1 and end November 30, 2016.

Daily Bag Limit: 30 mourning doves.

The following general conditions apply:

1. While hunting waterfowl, a tribal member must carry on his/her person a valid Ceded Territory License.

2. Shooting hours for migratory birds are one-half hour before sunrise to one-half hour after sunset.

3. Except as otherwise noted, tribal members will be required to comply with tribal codes that will be no less restrictive than the provisions of Chapter 10 of the Model Off-Reservation Code. Except as modified by the Service rules adopted in response to this proposal, these amended regulations parallel Federal requirements in 50 CFR part 20 as to hunting methods, transportation, sale, exportation, and other conditions generally applicable to migratory bird hunting.

4. Band members in each zone will comply with State regulations providing for closed and restricted waterfowl hunting areas.

5. There are no possession limits for migratory birds. For purposes of enforcing bag limits, all migratory birds in the possession or custody of band members on ceded lands will be considered to have been taken on those lands unless tagged by a tribal or State

conservation warden as having been taken on-reservation. All migratory birds that fall on reservation lands will not count as part of any off-reservation bag or possession limit.

The band anticipates harvest will be fewer than 500 ducks and geese, and fewer than 10 sandhill cranes.

We propose to approve the request for special migratory bird hunting regulations for the Fond du Lac Band of Lake Superior Chippewa Indians.

(d) Grand Traverse Band of Ottawa and Chippewa Indians, Suttons Bay, Michigan (Tribal Members Only)

In the 1995–96 migratory bird seasons, the Grand Traverse Band of Ottawa and Chippewa Indians and the Service first cooperated to establish special regulations for waterfowl. The Grand Traverse Band is a self-governing, federally recognized Tribe located on the west arm of Grand Traverse Bay in Leelanau County, Michigan. The Grand Traverse Band is a signatory Tribe of the Treaty of 1836. We have approved special regulations for tribal members of the 1836 treaty's signatory Tribes on ceded lands in Michigan since the 1986–87 hunting season.

For the 2016–17 season, the Tribe requests that the tribal member duck season run from September 1, 2016, through January 15, 2017. A daily bag limit of 25 would include no more than 6 pintail, 4 canvasback, 3 hooded merganser, 6 black ducks, 6 wood ducks, 5 redheads, and 12 mallards (only 6 of which may be hens).

For Canada and snow geese, the Tribe proposes a September 1, 2016, through January 31, 2017, season. For white-fronted geese and brant, the Tribe proposes a September 20 through December 30, 2016, season. The daily bag limit for Canada and snow geese would be 10, and the daily bag limit for white-fronted geese and including brant would be 5 birds. We further note that, based on available data (of major goose migration routes), it is unlikely that any Canada geese from the Southern James Bay Population will be harvested by the Tribe.

For woodcock, the Tribe proposes a September 1 through November 14, 2016, season. The daily bag limit will not exceed five birds. For mourning doves, snipe, and rails, the Tribe proposes a September 1 through November 14, 2016, season. The daily bag limit would be 10 per species.

For sandhill crane, the Tribe proposes a September 1 through November 14, 2016, season. The daily bag limit would be two birds and a season limit of six birds.

Shooting hours would be from one-half hour before sunrise to one-half hour after sunset. All other Federal regulations contained in 50 CFR part 20 would apply. The Tribe proposes to monitor harvest closely through game bag checks, patrols, and mail surveys. Harvest surveys from the 2013–14 hunting season indicated that approximately 30 tribal hunters harvested an estimated 100 ducks and 45 Canada geese.

We propose to approve the Grand Traverse Band of Ottawa and Chippewa Indians 2016–17 special migratory bird hunting proposal.

(e) Great Lakes Indian Fish and Wildlife Commission, Odanah, Wisconsin (Tribal Members Only)

Since 1985, various bands of the Lake Superior Tribe of Chippewa Indians have exercised judicially recognized, off-reservation hunting rights for migratory birds in Wisconsin. The specific regulations were established by the Service in consultation with the Wisconsin Department of Natural Resources and the Great Lakes Indian Fish and Wildlife Commission (GLIFWC) (GLIFWC is an intertribal agency exercising delegated natural resource management and regulatory authority from its member Tribes in portions of Wisconsin, Michigan, and Minnesota). Beginning in 1986, a Tribal season on ceded lands in the western portion of the Michigan Upper Peninsula was developed in coordination with the Michigan Department of Natural Resources. We have approved regulations for Tribal members in both Michigan and Wisconsin since the 1986–87 hunting season. In 1987, GLIFWC requested, and we approved, regulations to permit Tribal members to hunt on ceded lands in Minnesota, as well as in Michigan and Wisconsin. The States of Michigan and Wisconsin originally concurred with the regulations, although both Wisconsin and Michigan have raised various concerns over the years. Minnesota did not concur with the original regulations, stressing that the State would not recognize Chippewa Indian hunting rights in Minnesota's treaty area until a court with jurisdiction over the State acknowledges and defines the extent of these rights. In 1999, the U.S. Supreme Court upheld the existence of the tribes' treaty reserved rights in *Minnesota* v. *Mille Lacs Band,* 199 S. Ct. 1187 (1999).

We acknowledge all of the States' concerns, but point out that the U.S. Government has recognized the Indian treaty reserved rights, and that acceptable hunting regulations have been successfully implemented in Minnesota, Michigan, and Wisconsin. Consequently, in view of the above, we have approved regulations since the 1987–88 hunting season on ceded lands in all three States. In fact, this recognition of the principle of treaty reserved rights for band members to hunt and fish was pivotal in our decision to approve a 1991–92 season for the 1836 ceded area in Michigan. Since then, in the 2007 Consent Decree the 1836 Treaty Tribes' and Michigan Department of Natural Resources and Environment established court-approved regulations pertaining to off-reservation hunting rights for migratory birds.

For 2016, the GLIFWC proposes off-reservation special migratory bird hunting regulations on behalf of the member Tribes of the Voigt Intertribal Task Force of the GLIFWC (for the 1837 and 1842 Treaty areas in Wisconsin and Michigan), the Mille Lacs Band of Ojibwe and the six Wisconsin Bands (for the 1837 Treaty area in Minnesota), and the Bay Mills Indian Community (for the 1836 Treaty area in Michigan). Member Tribes of the Task Force are: The Bad River Band of the Lake Superior Tribe of Chippewa Indians, the Lac Courte Oreilles Band of Lake Superior Chippewa Indians, the Lac du Flambeau Band of Lake Superior Chippewa Indians, the Red Cliff Band of Lake Superior Chippewa Indians, the St. Croix Chippewa Indians of Wisconsin, and the Sokaogon Chippewa Community (Mole Lake Band), all in Wisconsin; the Mille Lacs Band of Chippewa Indians and the Fond du Lac Band of Lake Superior Chippewa Indians in Minnesota; and the Lac Vieux Desert Band of Chippewa Indians and the Keweenaw Bay Indian Community in Michigan.

The GLIFWC 2016 proposal has four changes from regulations approved last season. In the 1837 and 1842 Treaty Areas, the GLIFWC proposal would allow the use of electronic calls for any open season under a limited and experimental design with up to only 50 Tribal hunters to obtain permits and use electronic calls during any open season. In addition to obtaining a special permit, the Tribal hunter would be required to complete and submit a hunt diary for each hunt where electronic calls were used. In addition, GLIFWC would also like to develop regulations for night hunting of waterfowl, baiting of waterfowl, and trapping migratory birds.

GLIFWC states that the proposed regulatory changes are intended to increase the subsistence opportunities for tribal migratory bird hunters and

provide opportunities for more efficient harvesting. Under GLIFWC's proposed regulations, GLIFWC expects total ceded territory harvest to be approximately 2,000 to 3,000 ducks, 400 to 600 geese, 20 sandhill cranes, and 20 swans, which, with the exception of ducks, is roughly similar to anticipated levels in previous years for those species for which seasons were established. GLIWFC further anticipates that tribal harvest will remain low given the small number of tribal hunters and the limited opportunity to harvest more than a small number of birds on most hunting trips.

Recent GLIFWC harvest surveys (1996–98, 2001, 2004, 2007–08, 2011, and 2012) indicate that tribal off-reservation waterfowl harvest has averaged fewer than 1,100 ducks and 250 geese annually. In the latest survey year for which we have specific results (2012), an estimated 86 hunters took an estimated 1,090 trips and harvested 1,799 ducks (1.7 ducks per trip) and 822 geese. Two sandhill cranes were reported harvested in each of the first three Tribal sandhill crane seasons, and no swans were harvested in 2014. Analysis of hunter survey data over 1996–2012 indicates a general downward trend in both harvest and hunter participation. While we acknowledge that tribal harvest and participation has declined in recent years, we do not believe that allowing the use of electronic calls at this time for tribal waterfowl seasons on ceded lands in Wisconsin, Michigan, and Minnesota for the 2016–17 season is in the best interest of the conservation of migratory birds. We have no issues with extending the mourning dove season. More specific discussion on the use of electronic calls follows below.

Allowing Electronic Calls

As we have stated the last 5 years (76 FR 54676, September 1, 2011; 77 FR 54451, September 5, 2012; 78 FR 53218, August 28, 2013; 79 FR 52226, September 3, 2014; 80 FR 52663, September 1, 2015), the issue of allowing electronic calls and other electronic devices for migratory game bird hunting has been highly debated and highly controversial over the last 40 years, similar to other prohibited hunting methods such as baiting. Electronic calls, *i.e.,* the use or aid of recorded or electronic amplified bird calls or sounds, or recorded or electrically amplified imitations of bird calls or sounds to lure or attract migratory game birds to hunters, were Federally prohibited in 1957 because of their effectiveness in attracting and aiding the harvest of ducks and geese and because they are generally not considered a legitimate component of hunting. In 1999, after much debate, the migratory bird regulations were revised to allow the use of electronic calls for the take of light geese (lesser snow geese and Ross geese) during a light-goose-only season when all other waterfowl and crane hunting seasons, excluding falconry, were closed (64 FR 7507, February 16, 1999; 64 FR 71236, December 20, 1999; 73 FR 65926, November 5, 2008). The regulations were also changed in 2006, to allow the use of electronic calls for the take of resident Canada geese during Canada-goose-only September seasons when all other waterfowl and crane seasons, excluding falconry, were closed (71 FR 45964, August 10, 2006). In both instances, these changes were made in order to significantly increase the take of these species due to either serious population overabundance, depredation issues, or public health and safety issues, or a combination of these.

In our previous responses on this issue, we have discussed available information regarding the use of electronic calls during the special light-goose seasons and our conclusions to its applicability to other waterfowl species. Given available evidence on the effectiveness of electronic calls, we continue to be concerned about the large biological uncertainty surrounding any widespread use of electronic calls. Additionally, given the fact that tribal waterfowl hunting covered by this proposal would occur on ceded lands that are not in the ownership of the Tribes, we remain very concerned that the use of electronic calls to take waterfowl would lead to confusion on the part of the public, wildlife-management agencies, and law enforcement officials in implementing the requirements of 50 CFR part 20. Further, similar to the impacts of baiting, uncertainties concerning the zone of influence attributed to the use of electronic calls could potentially increase harvest from nontribal hunters operating within areas electronic calls are being used during the dates of the general hunt.

Notwithstanding our concerns, we appreciate GLIFWC's latest proposal on the issue. GLIFWC has proposed a limited use of electronic calls under an experimental design with up to only 50 Tribal hunters. Hunters would be required to obtain special permits and complete and submit a hunt diary for each hunt where electronic calls were used. Clearly, GLIFWC has given this issue considerable thought. We also understand GLIFWC's position on this issue; their desire to increase tribal hunter opportunity, harvest, and participation; and the importance that GLIFWC has ascribed to this and other issues. In our recent discussions with them, they have expressed a willingness to work with us to further discuss these issues, all the uncertainties and difficulties surrounding them, and the overall Federal-Tribal process for addressing these and other such issues. However, these discussions are ongoing, and we are not yet at a point that would allow our approval of this proposal, or any such proposal. Further, it would be premature at this time to approve such a measure, or any such measure, until we finalize the Federal-Tribal process, roles, and responsibilities for addressing this and other such issues. It is our hope that over the next year, we can continue these discussions. We remain hopeful that we can reach a mutually agreeable resolution.

Thus, at this time, removal of the electronic-call prohibition, even with the proposed limited and experimental design, would be inconsistent with our long-standing concerns, and we do not support allowing the use of electronic calls in the 1837 and 1842 Treaty Areas for any open season.

The proposed 2016–17 waterfowl hunting season regulations apply to all treaty areas (except where noted) for GLIFWC as follows:

Ducks

Season Dates: Begin September 1 and end December 31, 2016.

Daily Bag Limit: 50 ducks in the 1837 and 1842 Treaty Area; 30 ducks in the 1836 Treaty Area.

Mergansers

Season Dates: Begin September 1 and end December 31, 2016.

Daily Bag Limit: 10 mergansers.

Geese

Season Dates: Begin September 1 and end December 31, 2016. In addition, any portion of the ceded territory that is open to State-licensed hunters for goose hunting outside of these dates will also be open concurrently for tribal members.

Daily Bag Limit: 20 geese in aggregate.

Other Migratory Birds

A. Coots and Common Moorhens (Common Gallinules)

Season Dates: Begin September 1 and end December 31, 2016.

Daily Bag Limit: 20 coots and common moorhens (common gallinules), singly or in the aggregate.

B. Sora and Virginia Rails

Season Dates: Begin September 1 and end December 31, 2016.

Daily Bag and Possession Limits: 20, singly, or in the aggregate, 25.

C. Snipe

Season Dates: Begin September 1 and end December 31, 2016.

Daily Bag Limit: 16 snipe.

D. Woodcock

Season Dates: Begin September 6 and end December 31, 2016.

Daily Bag Limit: 10 woodcock.

E. Mourning Dove

1837 and 1842 Ceded Territories Only

Season Dates: Begin September 1 and end November 29, 2016.

Daily Bag Limit: 15 mourning doves.

F. Sandhill Cranes

1837 and 1842 Ceded Territories Only

Season Dates: Begin September 1 and end December 31, 2016.

Daily Bag Limit: 2 cranes.

G. Swans

1837 and 1842 Ceded Territories Only

Season Dates: Begin November 1 and end December 31, 2016.

Daily Bag Limit: 2 swans. All harvested swans must be registered by presenting the fully-feathered carcass to a tribal registration station or GLIFWC warden. If the total number of trumpeter swans harvested reaches 10, the swan season will be closed by emergency tribal rule.

General Conditions

A. All tribal members will be required to obtain a valid tribal waterfowl-hunting permit.

B. Except as otherwise noted, tribal members will be required to comply with tribal codes that will be no less restrictive than the model ceded-territory conservation codes approved by Federal courts in the *Lac Courte Oreilles* v. *State of Wisconsin (Voigt)* and *Mille Lacs Band* v. *State of Minnesota* cases. Chapter 10 in each of these model codes regulates ceded-territory migratory bird hunting. Both versions of Chapter 10 parallel Federal requirements as to hunting methods, transportation, sale, exportation, and other conditions generally applicable to migratory bird hunting. They also automatically incorporate by reference the Federal migratory bird regulations adopted in response to this proposal.

C. Particular regulations of note include:

1. Nontoxic shot will be required for all waterfowl hunting by tribal members.

2. Tribal members in each zone will comply with tribal regulations providing for closed and restricted waterfowl hunting areas. These regulations generally incorporate the same restrictions contained in parallel State regulations.

3. There are no possession limits, with the exception of 2 swans (in the aggregate) and 25 rails (in the aggregate). For purposes of enforcing bag limits, all migratory birds in the possession and custody of tribal members on ceded lands will be considered to have been taken on those lands unless tagged by a tribal or State conservation warden as taken on reservation lands. All migratory birds that fall on reservation lands will not count as part of any off-reservation bag or possession limit.

4. The baiting restrictions included in the respective section 10.05(2)(h) of the model ceded-territory conservation codes will be amended to include language that parallels the language in place for nontribal members as published at 64 FR 29799, June 3, 1999.

5. There are no shell-limit restrictions.

6. Hunting hours are from 30 minutes before sunrise to 30 minutes after sunset.

We propose to approve the above GLIFWC regulations for the 2016–17 hunting season.

(f) Jicarilla Apache Tribe, Jicarilla Indian Reservation, Dulce, New Mexico (Tribal Members and Nontribal Hunters)

The Jicarilla Apache Tribe has had special migratory bird hunting regulations for tribal members and nonmembers since the 1986–87 hunting season. The Tribe owns all lands on the reservation and has recognized full wildlife-management authority. In general, the proposed seasons would be more conservative than allowed by the Federal frameworks of last season and by States in the Pacific Flyway.

The Tribe proposes a 2016–17 waterfowl and Canada goose season beginning October 8, 2016, and a closing date of November 30, 2016. Daily bag and possession limits for waterfowl would be the same as Pacific Flyway States. The Tribe proposes a daily bag limit for Canada geese of two. Other regulations specific to the Pacific Flyway guidelines for New Mexico would be in effect.

During the Jicarilla Game and Fish Department's 2014–15 season, estimated duck harvest was 83, which is the lowest on record. The species composition included mainly mallards, northern shovelor, gadwall, American wigeon, and teal. The estimated harvest of geese was 7 birds.

The proposed regulations are essentially the same as were established last year. The Tribe anticipates the maximum 2016–17 waterfowl harvest would be around 300 ducks and 30 geese.

We propose to approve the Tribe's requested 2016–17 hunting seasons.

(g) Kalispel Tribe, Kalispel Reservation, Usk, Washington (Tribal Members and Nontribal Hunters)

The Kalispel Reservation was established by Executive Order in 1914, and currently comprises approximately 4,600 acres. The Tribe owns all Reservation land and has full management authority. The Kalispel Tribe has a fully developed wildlife program with hunting and fishing codes. The Tribe enjoys excellent wildlife management relations with the State. The Tribe and the State have an operational memorandum of understanding with an emphasis on fisheries but that also covers wildlife.

The nontribal member seasons described below pertain to a 176-acre waterfowl management unit and 800 acres of reservation land with a guide for waterfowl hunting. The Tribe is utilizing this opportunity to rehabilitate an area that needs protection because of past land-use practices, as well as to provide additional waterfowl hunting in the area. Beginning in 1996, the requested regulations also included a proposal for Kalispel-member-only migratory bird hunting on Kalispel-ceded lands within Washington, Montana, and Idaho.

For the 2016–17 migratory bird hunting seasons, the Kalispel Tribe proposes tribal and nontribal member waterfowl seasons. The Tribe requests that both duck and goose seasons open at the earliest possible date and close on the latest date under Federal frameworks.

For nontribal hunters on Tribally-managed lands, the Tribe requests the seasons open at the earliest possible date and remain open for the maximum amount of open days. Specifically, the Tribe requests a season for ducks on September 10–11, 2016, September 17–18, 2016, and between October 3, 2016, and January 17, 2017. The total number of days would not exceed 107. Hunters should obtain further information on specific hunt days from the Kalispel Tribe.

For nontribal hunters on Tribally managed lands, the Tribe also requests the season for geese run on September 10–11, 2016, September 17–18, 2016, and between October 3, 2016, and

January 17, 2017. The total number of days would not exceed 107. Nontribal hunters should obtain further information on specific hunt days from the Tribe. Daily bag and possession limits would be the same as those for the State of Washington.

The Tribe reports past nontribal harvest of 1.5 ducks per day. Under the proposal, the Tribe expects harvest to be similar to last year, that is, fewer than 100 geese and 200 ducks.

All other State and Federal regulations contained in 50 CFR part 20, such as use of nontoxic shot and possession of a signed migratory bird hunting and conservation stamp, would be required.

For tribal members on Kalispel-ceded lands, the Kalispel Tribe proposes season dates for ducks of October 10, 2016, through January 31, 2017, and for geese of September 10, 2016, through January 31, 2017. Daily bag and possession limits would parallel those in the Federal regulations contained in 50 CFR part 20.

The Tribe reports that there was no tribal harvest. Under the proposal, the Tribe expects harvest to be fewer than 200 birds for the season with fewer than 100 geese. Tribal members would be required to possess a signed Federal migratory bird stamp and a tribal ceded-lands permit.

We propose to approve the regulations requested by the Kalispel Tribe, except for the early duck season dates proposed for nontribal hunters. These mid-September dates do not conform to Federal flyway frameworks for the Pacific Flyway which specify that waterfowl seasons can begin September 24.

(h) Klamath Tribe, Chiloquin, Oregon (Tribal Members Only)

The Klamath Tribe currently has no reservation, per se. However, the Klamath Tribe has reserved hunting, fishing, and gathering rights within its former reservation boundary. This area of former reservation, granted to the Klamaths by the Treaty of 1864, is over 1 million acres. Tribal natural-resource-management authority is derived from the Treaty of 1864, and carried out cooperatively under the judicially enforced Consent Decree of 1981. The parties to this Consent Decree are the Federal Government, the State of Oregon, and the Klamath Tribe. The Klamath Indian Game Commission sets the seasons. The tribal biological staff and tribal regulatory-enforcement officers monitor tribal harvest by frequent bag checks and hunter interviews.

For the 2016–17 season, we have not yet heard from the Tribe; however, the Tribe usually requests proposed season dates of October 1, 2016, through January 31, 2017. Daily bag limits would be 9 for ducks, 9 for geese, and 9 for coot, with possession limits twice the daily bag limit. Shooting hours would be one-half hour before sunrise to one-half hour after sunset. Steel shot is required.

Based on the number of birds produced in the Klamath Basin, this year's harvest would be similar to last year's. Information on tribal harvest suggests that more than 70 percent of the annual goose harvest is local birds produced in the Klamath Basin.

If we receive a proposal that matches the Tribe's usual request, we propose to approve those 2016–17 special migratory bird hunting regulations.

(i) Leech Lake Band of Ojibwe, Cass Lake, Minnesota (Tribal Members Only)

The Leech Lake Band of Ojibwe is a federally recognized Tribe located in Cass Lake, Minnesota. The reservation employs conservation officers to enforce conservation regulations. The Service and the Tribe have cooperatively established migratory bird hunting regulations since 2000.

For the 2016–17 season, the Tribe requests a duck season starting on September 17 and ending December 31, 2016, and a goose season to run from September 1 through December 31, 2016. Daily bag limits for ducks would be 10, including no more than 5 pintail, 5 canvasback, and 5 black ducks. Daily bag limits for geese would be 10. Possession limits would be twice the daily bag limit. Shooting hours are one-half hour before sunrise to one-half hour after sunset.

The annual harvest by tribal members on the Leech Lake Reservation is estimated at 250 to 500 birds.

We propose to approve the Leech Lake Band of Ojibwe's requested 2016–17 special migratory bird hunting season.

(j) Little River Band of Ottawa Indians, Manistee, Michigan (Tribal Members Only)

The Little River Band of Ottawa Indians is a self-governing, federally recognized Tribe located in Manistee, Michigan, and a signatory Tribe of the Treaty of 1836. We have approved special regulations for tribal members of the 1836 treaty's signatory Tribes on ceded lands in Michigan since the 1986–87 hunting season. Ceded lands are located in Lake, Mason, Manistee, and Wexford Counties. The Band proposes regulations to govern the hunting of migratory birds by Tribal members within the 1836 Ceded Territory as well as on the Band's Reservation.

For the 2016–17 season, the Little River Band of Ottawa Indians proposes a duck and merganser season from September 9, 2016, through January 22, 2017. A daily bag limit of 12 ducks would include no more than 2 pintail, 2 canvasback, 3 black ducks, 3 wood ducks, 3 redheads, 6 mallards (only 2 of which may be a hen), and 1 hooded merganser. Possession limits would be twice the daily bag limit.

For white-fronted geese, snow geese, and brant, the Tribe proposes a September 7 through December 4, 2016, season. Daily bag limits would be five geese.

For Canada geese only, the Tribe proposes a September 1, 2016, through February 5, 2017, season with a daily bag limit of five. The possession limit would be twice the daily bag limit.

For snipe, woodcock, rails, and mourning doves, the Tribe proposes a September 1 to November 13, 2016, season. The daily bag limit would be 10 snipe, 5 woodcock, 10 rails, and 10 mourning doves. Possession limits for all species would be twice the daily bag limit.

The Tribe monitors harvest through mail surveys. General conditions are as follows:

A. All tribal members will be required to obtain a valid tribal resource card and 2016–17 hunting license.

B. Except as modified by the Service rules adopted in response to this proposal, these amended regulations parallel all Federal regulations contained in 50 CFR part 20. Shooting hours will be from one-half hour before sunrise to sunset.

C. Particular regulations of note include:

(1) Nontoxic shot will be required for all waterfowl hunting by tribal members.

(2) Tribal members in each zone will comply with tribal regulations providing for closed and restricted waterfowl hunting areas. These regulations generally incorporate the same restrictions contained in parallel State regulations.

D. Tribal members hunting in Michigan will comply with tribal codes that contain provisions parallel to Michigan law regarding duck blinds and decoys.

We plan to approve Little River Band of Ottawa Indians' 2016–17 special migratory bird hunting seasons.

(k) The Little Traverse Bay Bands of Odawa Indians, Petoskey, Michigan (Tribal Members Only)

The Little Traverse Bay Bands of Odawa Indians (LTBB) is a self-governing, federally recognized Tribe located in Petoskey, Michigan, and a signatory Tribe of the Treaty of 1836. We have approved special regulations for tribal members of the 1836 treaty's signatory Tribes on ceded lands in Michigan since the 1986–87 hunting season.

For the 2016–17 season, the Little Traverse Bay Bands of Odawa Indians propose regulations similar to those of other Tribes in the 1836 treaty area. LTBB proposes the regulations to govern the hunting of migratory birds by tribal members on the LTBB reservation and within the 1836 Treaty Ceded Territory. The tribal member duck and merganser season would run from September 1, 2016, through January 31, 2017. A daily bag limit of 20 ducks and 10 mergansers would include no more than 5 hen mallards, 5 pintail, 5 canvasback, 5 scaup, 5 hooded merganser, 5 black ducks, 5 wood ducks, and 5 redheads.

For Canada geese, the LTBB proposes a September 1, 2016, through February 8, 2017, season. The daily bag limit for Canada geese would be 20 birds. We further note that, based on available data (of major goose migration routes), it is unlikely that any Canada geese from the Southern James Bay Population would be harvested by the LTBB. Possession limits are twice the daily bag limit.

For woodcock, the LTBB proposes a September 1 to December 1, 2016, season. The daily bag limit will not exceed 10 birds. For snipe, the LTBB proposes a September 1 to December 31, 2016, season. The daily bag limit will not exceed 16 birds. For mourning doves, the LTBB proposes a September 1 to November 14, 2016, season. The daily bag limit will not exceed 15 birds. For Virginia and sora rails, the LTBB proposes a September 1 to December 31, 2016, season. The daily bag limit will not exceed 20 birds per species. For coots and gallinules, the LTBB proposes a September 15 to December 31, 2016, season. The daily bag limit will not exceed 20 birds per species. The possession limit will not exceed 2 days' bag limit for all birds.

The LTBB also proposes a sandhill crane season to begin September 1 and end December 1, 2016. The daily bag limit will not exceed one bird. The possession limit will not exceed two times the bag limit.

All other Federal regulations contained in 50 CFR part 20 would apply.

Harvest surveys from 2014–15 hunting season indicated that approximately 10 hunters harvested 10 different waterfowl species totaling 69 birds. No sandhill cranes were reported harvested during the 2014–15 season. The LTBB proposes to monitor harvest closely through game bag checks, patrols, and mail surveys. In particular, the LTBB proposes monitoring the harvest of Southern James Bay Canada geese and sandhill cranes to assess any impacts of tribal hunting on the population.

We propose to approve the Little Traverse Bay Bands of Odawa Indians' requested 2016–17 special migratory bird hunting regulations.

(l) Lower Brule Sioux Tribe, Lower Brule Reservation, Lower Brule, South Dakota (Tribal Members and Nontribal Hunters)

The Lower Brule Sioux Tribe first established tribal migratory bird hunting regulations for the Lower Brule Reservation in 1994. The Lower Brule Reservation is about 214,000 acres in size and is located on and adjacent to the Missouri River, south of Pierre. Land ownership on the reservation is mixed, and until recently, the Lower Brule Tribe had full management authority over fish and wildlife via a memorandum of agreement (MOA) with the State of South Dakota. The MOA provided the Tribe jurisdiction over fish and wildlife on reservation lands, including deeded and U.S. Army Corps of Engineers-taken lands. For the 2016–17 season, the two parties have come to an agreement that provides the public a clear understanding of the Lower Brule Sioux Wildlife Department license requirements and hunting season regulations. The Lower Brule Reservation waterfowl season is open to tribal and nontribal hunters.

For the 2016–17 migratory bird hunting season, the Lower Brule Sioux Tribe proposes a nontribal-member duck, merganser, and coot season length of 97 days, or the maximum number of days allowed by Federal frameworks in the High Plains Management Unit for this season. The Tribe proposes a duck season from October 8, 2016, through January 12, 2017. The daily bag limit would be six birds or the maximum number that Federal regulations allow, including no more than two hen mallard and five mallards total, two pintail, two redhead, two canvasback, three wood duck, three scaup, and one mottled duck. The daily bag limit for mergansers would be five, only two of which could be a hooded merganser. The daily bag limit for coots would be 15. Possession limits would be three times the daily bag limits.

The Tribe's proposed nontribal-member Canada goose season would run from October 29, 2016, through February 12, 2017 (107-day season length), with a daily bag limit of six Canada geese. The Tribe's proposed nontribal-member white-fronted goose season would run from October 29, 2016, through January 24, 2017, with a daily bag and possession limits concurrent with Federal regulations. The Tribe's proposed nontribal-member light goose season would run from October 29, 2016, through February 12, 2017, and February 13 through May 1, 2017. The light goose daily bag limit would be 20 or the maximum number that Federal regulations allow with no possession limits.

For tribal members, the Lower Brule Sioux Tribe proposes a duck, merganser, and coot season from September 1, 2016, through March 10, 2017. The daily bag limit would be six ducks, including no more than two hen mallard and five mallards total, two pintail, two redheads, two canvasback, three wood ducks, three scaup, two bonus teal during the first 16 days of the season, and one mottled duck or the maximum number that Federal regulations allow. The daily bag limit for mergansers would be five, only two of which could be hooded mergansers. The daily bag limit for coots would be 15. Possession limits would be three times the daily bag limits.

The Tribe's proposed Canada goose season for tribal members would run from September 1, 2016, through March 10, 2017, with a daily bag limit of six Canada geese. The Tribe's proposed white-fronted goose tribal season would run from September 1, 2016, through March 10, 2017, with a daily bag limit of two white-fronted geese or the maximum number that Federal regulations allow. The Tribe's proposed light goose tribal season would run from September 1, 2016, through March 10, 2017. The light goose daily bag limit would be 20 or the maximum number that Federal regulations allow, with no possession limits.

In the 2013–14 season, non-tribal members harvested 641 geese and 1,616 ducks. In the 2013–14 season, duck harvest species composition was primarily mallard (67 percent), gadwall (5 percent), green-winged teal (7 percent), and wigeon (5 percent).

The Tribe anticipates a duck and goose harvest similar to those of the previous years. All basic Federal regulations contained in 50 CFR part 20, including the use of nontoxic shot,

Migratory Bird Hunting and Conservation Stamps, etc., would be observed by the Tribe's proposed regulations. In addition, the Lower Brule Sioux Tribe has an official Conservation Code that was established by Tribal Council Resolution in June 1982 and updated in 1996.

We plan to approve the Tribe's requested regulations for the Lower Brule Reservation if the seasons' dates fall within final Federal flyway frameworks (applies to nontribal hunters only).

(m) Lower Elwha Klallam Tribe, Port Angeles, Washington (Tribal Members Only)

Since 1996, the Service and the Point No Point Treaty Tribes, of which Lower Elwha Klallam was one, have cooperated to establish special regulations for migratory bird hunting. The Tribes are now acting independently, and the Lower Elwha Klallam Tribe has in recent years established migratory bird hunting regulations for tribal members. The Tribe has a reservation on the Olympic Peninsula in Washington State and is a successor to the signatories of the Treaty of Point No Point of 1855.

For the 2016–17 season, we have yet to hear from the Lower Elwha Klallam Tribe. The Tribe usually requests special migratory bird hunting regulations for ducks (including mergansers), geese, coots, band-tailed pigeons, snipe, and mourning doves. The Lower Elwha Klallam Tribe usually requests a duck and coot season from September 13, 2016, to January 4, 2017. The daily bag limit will be seven ducks, including no more than two hen mallards, one pintail, one canvasback, and two redheads. The daily bag and possession limit on harlequin duck will be one per season. The coot daily bag limit will be 25. The possession limit will be twice the daily bag limit, except as noted above.

For geese, the Tribe usually requests a season from September 13, 2016, to January 4, 2017. The daily bag limit will be four, including no more than three light geese. The season on Aleutian Canada geese will be closed.

For brant, the Tribe usually proposes to close the season.

For mourning doves, band-tailed pigeon, and snipe, the Tribe usually requests a season from September 1, 2016, to January 11, 2017, with a daily bag limit of 10, 2, and 8, respectively. The possession limit will be twice the daily bag limit.

All Tribal hunters authorized to hunt migratory birds are required to obtain a tribal hunting permit from the Lower Elwha Klallam Tribe pursuant to tribal law. Hunting hours would be from one-half hour before sunrise to sunset. Only steel, tungsten-iron, tungsten-polymer, tungsten-matrix, and tin shot are allowed for hunting waterfowl. It is unlawful to use or possess lead shot while hunting waterfowl.

The Tribe typically anticipates harvest to be fewer than 10 birds. Tribal reservation police and Tribal fisheries enforcement officers have the authority to enforce these migratory bird hunting regulations.

The Service proposes to approve the special migratory bird hunting regulations for the Lower Elwha Klallam Tribe upon receipt of their proposal.

(n) Makah Indian Tribe, Neah Bay, Washington (Tribal Members Only)

The Makah Indian Tribe and the Service have been cooperating to establish special regulations for migratory game birds on the Makah Reservation and traditional hunting land off the Makah Reservation since the 2001–02 hunting season. Lands off the Makah Reservation are those contained within the boundaries of the State of Washington Game Management Units 601–603.

The Makah Indian Tribe proposes a duck and coot hunting season from September 24, 2016, to January 29, 2017. The daily bag limit is seven ducks, including no more than five mallards (only two hen mallard), one canvasback, one pintail, three scaup, and one redhead. The daily bag limit for coots is 25. The Tribe has a year-round closure on wood ducks and harlequin ducks. Shooting hours for all species of waterfowl are one-half hour before sunrise to sunset.

For geese, the Tribe proposes that the season open on September 24, 2016, and close January 29, 2017. The daily bag limit for geese is four and one brant. The Tribe notes that there is a year-round closure on Aleutian and dusky Canada geese.

For band-tailed pigeons, the Tribe proposes that the season open September 17, 2016, and close October 23, 2016. The daily bag limit for band-tailed pigeons is two.

The Tribe anticipates that harvest under this regulation will be relatively low since there are no known dedicated waterfowl hunters and any harvest of waterfowl or band-tailed pigeons is usually incidental to hunting for other species, such as deer, elk, and bear. The Tribe expects fewer than 50 ducks and 10 geese to be harvested during the 2016–17 migratory bird hunting season.

All other Federal regulations contained in 50 CFR part 20 would apply. The following restrictions are also usually proposed by the Tribe:

(1) As per Makah Ordinance 44, only shotguns may be used to hunt any species of waterfowl. Additionally, shotguns must not be discharged within 0.25 miles of an occupied area.

(2) Hunters must be eligible, enrolled Makah tribal members and must carry their Indian Treaty Fishing and Hunting Identification Card while hunting. No tags or permits are required to hunt waterfowl.

(3) The Cape Flattery area is open to waterfowl hunting, except in designated wilderness areas, or within 1 mile of Cape Flattery Trail, or in any area that is closed to hunting by another ordinance or regulation.

(4) The use of live decoys and/or baiting to pursue any species of waterfowl is prohibited.

(5) Steel or bismuth shot only for waterfowl is allowed; the use of lead shot is prohibited.

(6) The use of dogs is permitted to hunt waterfowl.

The Service proposes to approve the Makah Indian Tribe's requested 2016–17 special migratory bird hunting regulations.

(o) Navajo Nation, Navajo Indian Reservation, Window Rock, Arizona (Tribal Members and Nontribal Hunters)

Since 1985, we have established uniform migratory bird hunting regulations for tribal members and nonmembers on the Navajo Indian Reservation (in parts of Arizona, New Mexico, and Utah). The Navajo Nation owns almost all lands on the reservation and has full wildlife-management authority.

For the 2016–17 season, the Tribe requests the earliest opening dates and longest duck, mergansers, Canada geese, and coots seasons, and the same daily bag and possession limits allowed to Pacific Flyway States under final Federal frameworks for tribal and non-tribal members.

For both mourning dove and band-tailed pigeons, the Navajo Nation proposes seasons of September 1 through September 30, 2016, with daily bag limits of 10 and 5, respectively. Possession limits would be twice the daily bag limits.

The Nation requires tribal members and nonmembers to comply with all basic Federal migratory bird hunting regulations in 50 CFR part 20 pertaining to shooting hours and manner of taking. In addition, each waterfowl hunter 16 years of age or over must carry on his/her person a valid Migratory Bird Hunting and Conservation Stamp (Duck Stamp), which must be signed in ink

across the face. Special regulations established by the Navajo Nation also apply on the reservation.

The Tribe anticipates a total harvest of fewer than 500 mourning doves; fewer than 10 band-tailed pigeons; fewer than 1,000 ducks, coots, and mergansers; and fewer than 1,000 Canada geese for the 2016–17 season. The Tribe measures harvest by mail survey forms. Through the established Navajo Nation Code, titles 17 and 18, and 23 U.S.C. 1165, the Tribe will take action to close the season, reduce bag limits, or take other appropriate actions if the harvest is detrimental to the migratory bird resource.

We propose to approve those the Navajo Nation's 2016–17 special migratory bird hunting regulations.

(p) Oneida Tribe of Indians of Wisconsin, Oneida, Wisconsin (Tribal Members Only)

Since 1991–92, the Oneida Tribe of Indians of Wisconsin and the Service have cooperated to establish uniform regulations for migratory bird hunting by tribal and nontribal hunters within the original Oneida Reservation boundaries. Since 1985, the Oneida Tribe's Conservation Department has enforced the Tribe's hunting regulations within those original reservation limits. The Oneida Tribe also has a good working relationship with the State of Wisconsin and the majority of the seasons and limits are the same for the Tribe and Wisconsin.

For the 2016–17 season, the Tribe submitted a proposal requesting special migratory bird hunting regulations. For ducks, the Tribe proposal describes the general outside dates as being September 17 through December 4, 2016. The Tribe proposes a daily bag limit of six birds, which could include no more than six mallards (three hen mallards), six wood ducks, one redhead, two pintails, and one hooded merganser.

For geese, the Tribe requests a season between September 1 and December 31, 2016, with a daily bag limit of five Canada geese. If a quota of 500 geese is attained before the season concludes, the Tribe will recommend closing the season early.

For woodcock, the Tribe proposes a season between September 3 and November 6, 2016, with a daily bag and possession limit of two and four, respectively.

For mourning dove, the Tribe proposes a season between September 3 and November 6, 2016, with a daily bag and possession limit of 10 and 20, respectively.

The Tribe proposes shooting hours be one-half hour before sunrise to one-half hour after sunset. Nontribal hunters hunting on the Reservation or on lands under the jurisdiction of the Tribe must comply with all State of Wisconsin regulations, including shooting hours of one-half hour before sunrise to sunset, season dates, and daily bag limits. Tribal members and nontribal hunters hunting on the Reservation or on lands under the jurisdiction of the Tribe must observe all basic Federal migratory bird hunting regulations found in 50 CFR part 20, with the following exceptions: Oneida members would be exempt from the purchase of the Migratory Bird Hunting and Conservation Stamp (Duck Stamp); and shotgun capacity is not limited to three shells.

The Service proposes to approve the 2016–17 special migratory bird hunting regulations for the Oneida Tribe of Indians of Wisconsin.

(q) Point No Point Treaty Council Tribes, Kingston, Washington (Tribal Members Only)

We are establishing uniform migratory bird hunting regulations for tribal members on behalf of the Point No Point Treaty Council Tribes, consisting of the Port Gamble S'Klallam and Jamestown S'Klallam Tribes. The two tribes have reservations and ceded areas in northwestern Washington State and are the successors to the signatories of the Treaty of Point No Point of 1855. These proposed regulations will apply to tribal members both on and off reservations within the Point No Point Treaty Areas; however, the Port Gamble S'Klallam and Jamestown S'Klallam Tribal season dates differ only where indicated below.

For the 2016–17 season, the Point No Point Treaty Council requests special migratory bird hunting regulations for both the Jamestown S'Klallam and Port Gamble S'Klallam Tribes. For ducks, the Jamestown S'Klallam Tribe season would open September 1, 2016, and close March 10, 2017, and coots would open September 13, 2016, and close February 1, 2017. The Port Gamble S'Klallam Tribes duck and coot seasons would open from September 1, 2016, to March 10, 2017. The daily bag limit would be seven ducks, including no more than two hen mallards, one canvasback, one pintail, two redhead, and four scoters. The daily bag limit for coots would be 25. The daily bag limit and possession limit on harlequin ducks would be one per season. The daily possession limits are double the daily bag limits except where noted.

For geese, the Point No Point Treaty Council proposes the season open on September 9, 2016, and close March 10, 2017, for the Jamestown S'Klallam Tribe, and open on September 1, 2016, and close March 10, 2017, for the Port Gamble S'Klallam Tribe. The daily bag limit for geese would be four, not to include more than three light geese. The Council notes that there is a year-round closure on dusky Canada geese. For brant, the Council proposes the season open on November 9, 2016, and close January 31, 2017, for the Port Gamble S'Klallam Tribe, and open on January 10 and close January 25, 2017, for the Jamestown S'Klallam Tribe. The daily bag limit for brant would be two.

For band-tailed pigeons, the Port Gamble S'Klallam Tribe season would open September 1, 2016, and close March 10, 2017. The Jamestown S'Klallam Tribe season would open September 13, 2016, and close January 18, 2017. The daily bag limit for band-tailed pigeons would be two. For snipe, the Port Gamble S'Klallam Tribe season would open September 1, 2016, and close March 10, 2017. The Jamestown S'Klallam Tribe season would open September 13, 2016, and close March 10, 2017. The daily bag limit for snipe would be eight. For mourning dove, the Port Gamble S'Klallam Tribe season would open September 1, 2016, and close January 31, 2017. The Jamestown S'Klallam Tribe would open September 13, 2016, and close January 18, 2017. The daily bag limit for mourning dove would be 10.

The Tribe anticipates a total harvest of fewer than 200 birds for the 2016–17 season. The tribal fish and wildlife enforcement officers have the authority to enforce these tribal regulations.

We propose to approve the Point No Point Treaty Council Tribe's requested 2016–17 special migratory bird seasons.

(r) Saginaw Tribe of Chippewa Indians, Mt. Pleasant, Michigan (Tribal Members Only)

The Saginaw Tribe of Chippewa Indians is a federally recognized, self-governing Indian Tribe, located on the Isabella Reservation lands bound by Saginaw Bay in Isabella and Arenac Counties, Michigan.

In a November 25, 2015, letter, the Tribe proposes special migratory bird hunting regulations. For ducks, mergansers, and snipe, the Tribe proposes outside dates as September 1, 2016, through January 31, 2017. The Tribe proposes a daily bag limit of 20 ducks, which could include no more than five each of the following: Hen mallards; wood duck; black duck; pintail; red head; scaup; and canvasback. The merganser daily bag limit is 10 with no more than 5 hooded

mergansers; the daily bag limit for snipe is 16.

For geese, coot, gallinule, sora, and Virginia rail, the Tribe requests a season from September 1, 2016, to January 31, 2017. The daily bag limit for geese is 20, in the aggregate. The daily bag limit for coot, gallinule, sora, and Virginia rail is 20, in the aggregate.

For woodcock and mourning dove, the Tribe proposes a season between September 1, 2016, and January 31, 2017, with daily bag limits of 10 and 25, respectively.

For sandhill crane, the Tribe proposes a season between September 1, 2016, and January 31, 2017, with a daily bag limit of one.

All Saginaw Tribe members exercising hunting treaty rights are required to comply with Tribal Ordinance 11. Hunting hours would be from one-half hour before sunrise to one-half hour after sunset. All other regulations in 50 CFR part 20 apply, including the use of only nontoxic shot for hunting waterfowl.

The Service proposes to approve the request for 2016–17 special migratory bird hunting regulations for the Saginaw Tribe of Chippewa Indians.

(s) Sault Ste. Marie Tribe of Chippewa Indians, Sault Ste. Marie, Michigan (Tribal Members Only)

The Sault Ste. Marie Tribe of Chippewa Indians is a federally recognized, self-governing Indian Tribe, distributed throughout the eastern Upper Peninsula and northern Lower Peninsula of Michigan. The Tribe has retained the right to hunt, fish, trap, and gather on the lands ceded in the Treaty of Washington (1836).

The Tribe proposes special migratory bird hunting regulations. For ducks, mergansers, and snipe, the Tribe proposes outside dates as September 15 through December 31, 2016. The Tribe proposes a daily bag limit of 20 ducks, which could include no more than 10 mallards (5 hen mallards), 5 wood duck, 5 black duck, and 5 canvasbacks. The merganser daily bag limit is 10 in the aggregate; the daily bag limit for snipe is 16.

For geese, teal, coot, gallinule, sora, and Virginia rail, the Tribe requests a season from September 1 to December 31, 2016. The daily bag limit for geese is 20, in the aggregate. The daily bag limit for coot, teal, gallinule, sora, and Virginia rail is 20, in the aggregate.

For woodcock, the Tribe proposes a season between September 2 and December 1, 2016, with a daily bag and possession limit of 10 and 20, respectively.

For mourning dove, the Tribe proposes a season between September 1 and November 14, 2016, with a daily bag and possession limit of 10 and 20, respectively.

In 2014, the total estimated waterfowl hunters were 266. All Sault Ste. Marie Tribe members exercising hunting treaty rights within the 1836 Ceded Territory are required to submit annual harvest reports including date of harvest, number and species harvested, and location of harvest. Hunting hours would be from one-half hour before sunrise to one-half hour after sunset. All other regulations in 50 CFR part 20, apply including the use of only nontoxic shot for hunting waterfowl.

The Service proposes to approve the request for 2016–17 special migratory bird hunting regulations for the Sault Ste. Marie Tribe of Chippewa Indians.

(t) Shoshone-Bannock Tribes, Fort Hall Indian Reservation, Fort Hall, Idaho (Nontribal Hunters)

Almost all of the Fort Hall Indian Reservation is tribally owned. The Tribes claim full wildlife-management authority throughout the reservation, but the Idaho Fish and Game Department has disputed tribal jurisdiction, especially for hunting by nontribal members on reservation lands owned by non-Indians. As a compromise, since 1985, we have established the same waterfowl hunting regulations on the reservation and in a surrounding off-reservation State zone. The regulations were requested by the Tribes and provided for different season dates than in the remainder of the State. We agreed to the season dates because they would provide additional protection to mallards and pintails. The State of Idaho concurred with the zoning arrangement. We have no objection to the State's use of this zone again in the 2016–17 hunting season, provided the duck and goose hunting season dates are the same as on the reservation.

In a proposal for the 2016–17 hunting season, the Shoshone-Bannock Tribes request a continuous duck (including mergansers and coots) season, with the maximum number of days and the same daily bag and possession limits permitted for Pacific Flyway States under the final Federal frameworks. The Tribes propose a duck and coot season with, if the same number of hunting days is permitted as last year, an opening date of October 8, 2016, and a closing date of January 20, 2017. The Tribes anticipate harvest will be about 7,000 ducks.

The Tribes also request a continuous goose season with the maximum number of days and the same daily bag and possession limits permitted in Idaho under Federal frameworks. The Tribes propose that, if the same number of hunting days is permitted as in previous years, the season would have an opening date of October 8, 2016, and a closing date of January 20, 2017. The Tribes anticipate harvest will be about 5,000 geese.

The Tribes request a snipe season with the maximum number of days and the same daily bag and possession limits permitted in Idaho under Federal frameworks. The Tribes propose that, if the same number of hunting days is permitted as in previous years, the season would have an opening date of October 8, 2016, and a closing date of January 20, 2017.

Nontribal hunters must comply with all basic Federal migratory bird hunting regulations in 50 CFR part 20 pertaining to shooting hours, use of steel shot, and manner of taking. Special regulations established by the Shoshone-Bannock Tribes also apply on the reservation.

We note that the requested regulations are nearly identical to those of last year, and we propose to approve them for the 2016–17 hunting season if the seasons' dates fall within the final Federal flyway frameworks (applies to nontribal hunters only).

(u) Skokomish Tribe, Shelton, Washington (Tribal Members Only)

Since 1996, the Service and the Point No Point Treaty Tribes, of which the Skokomish Tribe was one, have cooperated to establish special regulations for migratory bird hunting. The Tribes have been acting independently since 2005. The Skokomish Tribe has yet to send in a proposal to establish migratory bird hunting regulations for tribal members for the 2016–17 season. The Tribe has a reservation on the Olympic Peninsula in Washington State and is a successor to the signatories of the Treaty of Point No Point of 1855.

The Skokomish Tribe usually requests a duck and coot season from September 16, 2016, to February 28, 2017. The daily bag limit is seven ducks, including no more than two hen mallards, one pintail, one canvasback, and two redheads. The daily bag and possession limit on harlequin duck is one per season. The coot daily bag limit is 25. The possession limit is twice the daily bag limit, except as noted above.

For geese, the Tribe usually requests a season from September 16, 2016, to February 28, 2017. The daily bag limit is four, including no more than three light geese. The season on Aleutian Canada geese is closed. For brant, the

Tribe usually proposes a season from November 1, 2016, to February 15, 2017, with a daily bag limit of two. The possession limit is twice the daily bag limit.

For mourning doves, band-tailed pigeon, and snipe, the Tribe usually requests a season from September 16, 2016, to February 28, 2017, with a daily bag limit of 10, 2, and 8, respectively. The possession limit is twice the daily bag limit.

All Tribal hunters authorized to hunt migratory birds are required to obtain a tribal hunting permit from the Skokomish Tribe pursuant to tribal law. Hunting hours would be from one-half hour before sunrise to sunset. Only steel, tungsten-iron, tungsten-polymer, tungsten-matrix, and tin shot are allowed for hunting waterfowl. It is unlawful to use or possess lead shot while hunting waterfowl.

The Tribe usually anticipates harvest to be fewer than 150 birds. The Skokomish Public Safety Office enforcement officers have the authority to enforce these migratory bird hunting regulations.

We propose to approve the Skokomish Tribe's 2016–17 migratory bird hunting season upon receipt of their proposal.

(v) Spokane Tribe of Indians, Spokane Indian Reservation, Wellpinit, Washington (Tribal Members Only)

The Spokane Tribe of Indians wishes to establish waterfowl seasons on their reservation for its membership to access as an additional resource. An established waterfowl season on the reservation will allow access to a resource for members to continue practicing a subsistence lifestyle.

The Spokane Indian Reservation is located in northeastern Washington State. The reservation comprises approximately 157,000 acres. The boundaries of the Reservation are the Columbia River to the west, the Spokane River to the south (now Lake Roosevelt), Tshimikn Creek to the east, and the 48th Parallel as the north boundary. Tribal membership comprises approximately 2,300 enrolled Spokane Tribal Members.

These proposed regulations would allow Tribal Members, spouses of Spokane Tribal Members, and first-generation descendants of a Spokane Tribal Member with a tribal permit and Federal Migratory Bird Hunting and Conservation Stamp an opportunity to utilize the reservation and ceded lands for waterfowl hunting. These regulations would also benefit tribal membership through access to this resource throughout Spokane Tribal ceded lands in eastern Washington. By Spokane Tribal Referendum, spouses of Spokane Tribal Members and children of Spokane Tribal Members not enrolled are allowed to harvest game animals within the Spokane Indian Reservation with the issuance of hunting permits.

For the 2016–17 season, the Tribe requests to establish duck seasons that would run from September 2, 2016, through January 31, 2017. The tribe is requesting the daily bag limit for ducks to be consistent with final Federal frameworks. The possession limit is twice the daily bag limit.

The Tribe proposes a season on geese starting September 2, 2016, and ending on January 31, 2017. The tribe is requesting the daily bag limit for geese to be consistent with final Federal frameworks. The possession limit is twice the daily bag limit.

Based on the quantity of requests the Spokane Tribe of Indians has received, the tribe anticipates harvest levels for the 2016–17 season for both ducks and geese to be fewer than 100 total birds with goose harvest at fewer than 50. Hunter success will be monitored through mandatory harvest reports returned within 30 days of the season closure.

We propose to approve the Spokane Tribe's requested 2016–17 special migratory bird hunting regulations.

(w) Squaxin Island Tribe, Squaxin Island Reservation, Shelton, Washington (Tribal Members Only)

The Squaxin Island Tribe of Washington and the Service have cooperated since 1995, to establish special tribal migratory bird hunting regulations. These special regulations apply to tribal members on the Squaxin Island Reservation, located in western Washington near Olympia, and all lands within the traditional hunting grounds of the Squaxin Island Tribe.

For the 2016–17 season, we have yet to hear from the Squaxin Island Tribe. The Tribe usually requests to establish duck and coot seasons that would run from September 1, 2016, through January 15, 2017. The daily bag limit for ducks would be five per day and could include only one canvasback. The season on harlequin ducks is closed. For coots, the daily bag limit is 25. For snipe, the Tribe usually proposes that the season start on September 15, 2016, and end on January 15, 2017. The daily bag limit for snipe would be eight. For band-tailed pigeon, the Tribe usually proposes that the season start on September 1, 2016, and end on December 31, 2016. The daily bag limit would be five. The possession limit would be twice the daily bag limit.

The Tribe usually proposes a season on geese starting September 15, 2016, and ending on January 15, 2017. The daily bag limit for geese would be four, including no more than two snow geese. The season on Aleutian and cackling Canada geese would be closed. For brant, the Tribe usually proposes that the season start on September 1 and end on December 31, 2016. The daily bag limit for brant would be two. The possession limit would be twice the daily bag limit.

We propose to approve the Tribe's 2016–17 special migratory bird hunting regulations, upon receipt of their proposal.

(x) Stillaguamish Tribe of Indians, Arlington, Washington (Tribal Members Only)

The Stillaguamish Tribe of Indians and the Service have cooperated to establish special regulations for migratory game birds since 2001. For the 2016–17 season, the Tribe requests regulations to hunt all open and unclaimed lands under the Treaty of Point Elliott of January 22, 1855, including their main hunting grounds around Camano Island, Skagit Flats, and Port Susan to the border of the Tulalip Tribes Reservation. Ceded lands are located in Whatcom, Skagit, Snohomish, and Kings Counties, and a portion of Pierce County, Washington. The Stillaguamish Tribe of Indians is a federally recognized Tribe and reserves the Treaty Right to hunt (*U.S.* v. *Washington*).

The Tribe proposes their duck (including mergansers and coot) and goose seasons run from October 1, 2016, to March 10, 2017. The daily bag limit on ducks (including sea ducks and mergansers) is 10. The daily bag limit for coot is 25. For geese, the daily bag limit is six. The season on brant is closed. Possession limits are totals of these three daily bag limits.

The Tribe proposes the snipe seasons run from October 1, 2016, to January 31, 2017. The daily bag limit for snipe is 10. Possession limits are three times the daily bag limit.

Harvest is regulated by a punch-card system. Tribal members hunting on lands under this proposal will observe all basic Federal migratory bird hunting regulations found in 50 CFR part 20, which will be enforced by the Stillaguamish Tribal law enforcement. Tribal members are required to use steel shot or a nontoxic shot as required by Federal regulations.

The Tribe anticipates a total harvest of 200 ducks, 100 geese, 50 mergansers, 100 coots, and 100 snipe. Anticipated harvest needs include subsistence and

ceremonial needs. Certain species may be closed to hunting for conservation purposes, and consideration for the needs of certain species will be addressed.

The Service proposes to approve the Stillaguamish Tribe's request for 2016–17 special migratory bird hunting regulations.

(y) Swinomish Indian Tribal Community, LaConner, Washington (Tribal Members Only)

In 1996, the Service and the Swinomish Indian Tribal Community began cooperating to establish special regulations for migratory bird hunting. The Swinomish Indian Tribal Community is a federally recognized Indian Tribe consisting of the Swinomish, Lower Skagit, Samish, and Kikialous. The Swinomish Reservation was established by the Treaty of Point Elliott of January 22, 1855, and lies in the Puget Sound area north of Seattle, Washington.

For the 2016–17 season, the Tribal Community requests to establish a migratory bird hunting season on all areas that are open and unclaimed and consistent with the meaning of the treaty. The Tribe proposes their duck (including mergansers and coot) and goose seasons run from September 1, 2016, to March 9, 2017. The daily bag limit on ducks is 20. The daily bag limit for coot is 25. For geese, the daily bag limit is 10. The season on brant runs from September 1, 2016, to March 9, 2017. The daily bag limit is 5.

The Tribe proposes the snipe season run from September 1, 2016, to March 9, 2017. The daily bag limit for snipe is 15. The Tribe proposes the mourning dove season run from September 1, 2016, to March 9, 2017. The daily bag limit for mourning dove is 15. The Tribe proposes the band-tailed pigeon season run from September 1, 2016, to March 9, 2017. The daily bag limit for band-tailed pigeon is 3. The Swinomish Indian Tribal Community requests to have no possession limits.

The Community usually anticipates that the regulations will result in the harvest of approximately 600 ducks and 200 geese. The Swinomish utilize a report card and permit system to monitor harvest and will implement steps to limit harvest where conservation is needed. All tribal regulations will be enforced by tribal fish and game officers.

We propose to approve these 2016–17 special migratory bird hunting regulations.

(z) The Tulalip Tribes of Washington, Tulalip Indian Reservation, Marysville, Washington (Tribal Members Only)

The Tulalip Tribes are the successors in interest to the Tribes and bands signatory to the Treaty of Point Elliott of January 22, 1855. The Tulalip Tribes' government is located on the Tulalip Indian Reservation just north of the City of Everett in Snohomish County, Washington. The Tribes or individual tribal members own all of the land on the reservation, and they have full wildlife-management authority. All lands within the boundaries of the Tulalip Tribes Reservation are closed to nonmember hunting unless opened by Tulalip Tribal regulations.

We have yet to hear from the Tulalip Tribe regarding their 2016–17 season proposal. Migratory waterfowl hunting by Tulalip Tribal members is authorized by Tulalip Tribal Ordinance No. 67. For ducks, mergansers, coot, and snipe, the Tribe usually proposes seasons for tribal members from September 3, 2016, through February 28, 2017. Daily bag and possession limits would be 7 and 14 ducks, respectively, except that for blue-winged teal, canvasback, harlequin, pintail, and wood duck, the bag and possession limits would be the same as those established in accordance with final Federal frameworks. For coot, daily bag and possession limits are 25 and 50, respectively, and for snipe 8 and 16, respectively. Ceremonial hunting may be authorized by the Department of Natural Resources at any time upon application of a qualified tribal member. Such a hunt must have a bag limit designed to limit harvest only to those birds necessary to provide for the ceremony.

For geese, tribal members usually propose a season from September 3, 2016, through February 28, 2017. The goose daily bag and possession limits would be 7 and 14, respectively, except that the bag limits for brant, cackling Canada geese, and dusky Canada geese would be those established in accordance with final Federal frameworks.

All hunters on Tulalip Tribal lands are required to adhere to shooting-hour regulations set at one-half hour before sunrise to sunset, special tribal permit requirements, and a number of other tribal regulations enforced by the Tribe. Each nontribal hunter 16 years of age and older hunting pursuant to Tulalip Tribes' Ordinance No. 67 must possess a valid Federal Migratory Bird Hunting and Conservation Stamp and a valid State of Washington Migratory Waterfowl Stamp. Each hunter must validate stamps by signing across the face.

Although the season length requested by the Tulalip Tribes appears to be quite liberal, harvest information indicates a total take by tribal and nontribal hunters of fewer than 1,000 ducks and 500 geese annually.

We propose to approve the Tulalip Tribe's request for 2016–17 special migratory bird hunting regulations upon receipt of their proposal.

(aa) Upper Skagit Indian Tribe, Sedro Woolley, Washington (Tribal members only)

The Upper Skagit Indian Tribe and the Service have cooperated to establish special regulations for migratory game birds since 2001. The Tribe has jurisdiction over lands within Skagit, Island, and Whatcom Counties, Washington. The Tribe issues tribal hunters a harvest report card that will be shared with the State of Washington.

For the 2016–17 season, the Tribe requests a duck season starting October 1, 2016, and ending February 28, 2017. The Tribe proposes a daily bag limit of 15 with a possession limit of 20. The Tribe requests a coot season starting October 1, 2016, and ending February 15, 2017. The coot daily bag limit is 20 with a possession limit of 30.

The Tribe proposes a goose season from October 1, 2016, to February 28, 2017, with a daily bag limit of 7 geese and a possession limit of 10. For brant, the Tribe proposes a season from November 1 to November 10, 2016, with a daily bag and possession limit of 2.

The Tribe proposes a mourning dove season between September 1 and December 31, 2016, with a daily bag limit of 12 and possession limit of 15.

The anticipated migratory bird harvest under this proposal would be 100 ducks, 5 geese, 2 brant, and 10 coots. Tribal members must have the tribal identification and tribal harvest report card on their person to hunt. Tribal members hunting on the Reservation will observe all basic Federal migratory bird hunting regulations found in 50 CFR part 20, except shooting hours would be 15 minutes before official sunrise to 15 minutes after official sunset.

We propose to approve the Tribe's 2016–17 special migratory bird hunting regulations.

(bb) Wampanoag Tribe of Gay Head, Aquinnah, Massachusetts (Tribal Members Only)

The Wampanoag Tribe of Gay Head is a federally recognized Tribe located on the island of Martha's Vineyard in Massachusetts. The Tribe has

approximately 560 acres of land, which it manages for wildlife through its natural resources department. The Tribe also enforces its own wildlife laws and regulations through the natural resources department.

For the 2016–17 season, we have not yet heard from the Tribe. The Tribe usually proposes a duck season of October 14, 2016, through February 22, 2017. The Tribe usually proposes a daily bag limit of eight birds, which could include no more than four hen mallards, four mottled ducks, one fulvous whistling duck, four mergansers, three scaup, two hooded mergansers, three wood ducks, one canvasback, two redheads, two pintail, and four of all other species not listed. The season for harlequin ducks is usually closed. The Tribe usually proposes a teal (green-winged and blue) season of October 10, 2016, through February 22, 2017. A daily bag limit of six teal would be in addition to the daily bag limit for ducks.

For sea ducks, the Tribe usually proposes a season between October 7, 2016, and February 22, 2017, with a daily bag limit of seven, which could include no more than one hen eider and four of any one species unless otherwise noted above.

For Canada geese, the Tribe usually requests a season between September 4 and September 21, 2016, and between October 28, 2016, and February 22, 2017, with a daily bag limit of 8 Canada geese. For snow geese, the tribe usually requests a season between September 4 to September 21, 2016, and between November 25, 2016, and February 22, 2017, with a daily bag limit of 15 snow geese.

For woodcock, the Tribe usually proposes a season between October 10 and November 23, 2016, with a daily bag limit of three. For sora and Virginia rails, the Tribe usually requests a season of September 2, 2016, through November 10, 2016, with a daily bag limit of 5 sora and 10 Virginia rails. For snipe, the Tribe usually requests a season of September 2, 2016, through December 16, 2016, with a daily bag limit of 8.

Prior to 2012, the Tribe had 22 registered tribal hunters and estimates harvest to be no more than 15 geese, 25 mallards, 25 teal, 50 black ducks, and 50 of all other species combined. Tribal members hunting on the Reservation will observe all basic Federal migratory bird hunting regulations found in 50 CFR part 20. The Tribe requires hunters to register with the Harvest Information Program.

If we receive a proposal that matches the Tribe's usual request, we propose to approve those 2016–17 special migratory bird hunting regulations.

(cc) White Earth Band of Ojibwe, White Earth, Minnesota (Tribal Members Only)

The White Earth Band of Ojibwe is a federally recognized tribe located in northwest Minnesota and encompasses all of Mahnomen County and parts of Becker and Clearwater Counties. The reservation employs conservation officers to enforce migratory bird regulations. The Tribe and the Service first cooperated to establish special tribal regulations in 1999.

For the 2016–17 migratory bird hunting season, the White Earth Band of Ojibwe requests a duck season to start September 10 and end December 18, 2016. For ducks, they request a daily bag limit of 10, including no more than 2 hen mallards, 1 pintail, and 2 canvasback. For mergansers, the Tribe proposes the season to start September 10 and end December 18, 2016. The merganser daily bag limit would be five, with no more than two hooded mergansers. For geese, the Tribe proposes an early season from September 1 through September 23, 2016, and a late season from September 24, 2016, through December 18, 2016. The early season daily bag limit is 12 geese, and the late season daily bag limit is 5 geese.

For coots, the Tribe proposes a September 1 through November 30, 2016, season with daily bag limits of 20 coots. For snipe, woodcock, rail, and mourning dove, the Tribe proposes a September 1 through November 30, 2016, season with daily bag limits of 10, 10, 25, and 25 respectively. Shooting hours are one-half hour before sunrise to one-half hour after sunset. Nontoxic shot is required.

Based on past harvest surveys, the Tribe anticipates harvest of 1,000 to 2,000 Canada geese and 1,000 to 1,500 ducks. The White Earth Reservation Tribal Council employs four full-time conservation officers to enforce migratory bird regulations.

We propose to approve the Tribe's 2016–17 special migratory bird hunting regulations.

(dd) White Mountain Apache Tribe, Fort Apache Indian Reservation, Whiteriver, Arizona (Tribal Members and Nontribal Hunters)

The White Mountain Apache Tribe owns all reservation lands, and the Tribe has recognized full wildlife-management authority. As in past years, the White Mountain Apache Tribe has requested regulations that are essentially unchanged from those agreed to since the 1997–98 hunting year.

The hunting zone for waterfowl is restricted and is described as: The length of the Black River west of the Bonito Creek and Black River confluence and the entire length of the Salt River forming the southern boundary of the reservation; the White River, extending from the Canyon Day Stockman Station to the Salt River; and all stock ponds located within Wildlife Management Units 4, 5, 6, and 7. Tanks located below the Mogollon Rim, within Wildlife Management Units 2 and 3, will be open to waterfowl hunting during the 2016–17 season. The length of the Black River east of the Black River/Bonito Creek confluence is closed to waterfowl hunting. All other waters of the reservation would be closed to waterfowl hunting for the 2016–17 season.

For nontribal and tribal hunters, the Tribe proposes a continuous duck, coot, merganser, gallinule, and moorhen hunting season, with an opening date of October 15, 2016, and a closing date of January 29, 2017. The season on scaup would open November 5, 2016, and end January 29, 2017. The Tribe proposes a daily duck (including mergansers) bag limit of seven, which may include no more than two redheads, two pintail, three scaup (when open), seven mallards (including no more than two hen mallards), and two canvasback. The daily bag limit for coots, gallinules, and moorhens would be 25, singly or in the aggregate.

For geese, the Tribe proposes a season from October 15, 2016, through January 29, 2017. Hunting would be limited to Canada geese, and the daily bag limit would be three.

Season dates for band-tailed pigeons and mourning doves would run from September 1, and end September 15, 2016, in Wildlife Management Unit 10 and all areas south of Y–70 and Y–10 in Wildlife Management Unit 7, only. Proposed daily bag limits for band-tailed pigeons and mourning doves would be 3 and 10, respectively.

Possession limits for the above species are twice the daily bag limits. Shooting hours would be from one-half hour before sunrise to sunset. There would be no open season for sandhill cranes, rails, and snipe on the White Mountain Apache lands under this proposal.

A number of special regulations apply to tribal and nontribal hunters, which may be obtained from the White Mountain Apache Tribe Game and Fish Department.

We plan to approve the White Mountain Apache Tribe's requested 2016–17 special migratory bird hunting regulations.

Public Comments

The Department of the Interior's policy is, whenever possible, to afford the public an opportunity to participate in the rulemaking process. Accordingly, we invite interested persons to submit written comments, suggestions, or recommendations regarding the proposed regulations. Before promulgating final migratory game bird hunting regulations, we will consider all comments we receive. These comments, and any additional information we receive, may lead to final regulations that differ from these proposals.

You may submit your comments and materials concerning this proposed rule by one of the methods listed in **ADDRESSES**. We will not accept comments sent by email or fax. We will not consider hand-delivered comments that we do not receive, or mailed comments that are not postmarked, by the date specified in **DATES**.

We will post all comments in their entirety—including your personal identifying information—on *http://www.regulations.gov.* Before including your address, phone number, email address, or other personal identifying information in your comment, you should be aware that your entire comment—including your personal identifying information—may be made publicly available at any time. While you can ask us in your comment to withhold your personal identifying information from public review, we cannot guarantee that we will be able to do so.

Comments and materials we receive, as well as supporting documentation we used in preparing this proposed rule, will be available for public inspection on *http://www.regulations.gov,* or by appointment, during normal business hours, at the U.S. Fish and Wildlife Service, Division of Migratory Bird Management, 5275 Leesburg Pike, Falls Church, VA 22041–3803.

We will consider, but possibly may not respond in detail to, each comment. As in the past, we will summarize all comments we receive during the comment period and respond to them after the closing date in the preambles of any final rules.

Required Determinations

Based on our most current data, we are affirming our required determinations made in the August 6 proposed rule; for descriptions of our actions to ensure compliance with the following statutes and Executive Orders, see our August 6, 2015, proposed rule (80 FR 47388):

- National Environmental Policy Act (NEPA) Consideration;
- Endangered Species Act Consideration;
- Regulatory Flexibility Act;
- Small Business Regulatory Enforcement Fairness Act;
- Paperwork Reduction Act of 1995
- Unfunded Mandates Reform Act;
- Executive Orders 12630, 12866, 12988, 13132, 13175, 13211, and 13563.

List of Subjects in 50 CFR Part 20

Exports, Hunting, Imports, Reporting and recordkeeping requirements, Transportation, Wildlife.

The rules that eventually will be promulgated for the 2016–17 hunting season are authorized under 16 U.S.C. 703–712 and 16 U.S.C. 742a–j.

Dated: May 19, 2016.

Karen Hyun,

Deputy Assistant Secretary for Fish and Wildlife and Parks.
