and Heat Pumps’’ (June 2016 final rule)

Procedures for Central Air Conditioners

rule in the

titled, "Test

Energy published a test procedure final

rule corrects multiple editorial

errors. This

amended the test procedures for central

air conditioners and heat pumps. This

final rule addresses certification of central air

conditioners and heat pumps, and 10

CFR 429.70, which addresses alternate

efficiency determination methods. This

correction addresses editorial errors in

§ 429.16(a)(1), (d)(1), (d)(2), and (e)(4).

Specifically, at § 429.16(a)(1), DOE

included a cross reference to paragraph

(c)(2) that should have referred to

paragraph (b)(2)(i). In § 429.16(d)(1) and

(2), DOE mistakenly transposed the words “less” and “greater.” At

§ 429.16(e)(4), DOE erroneously referred
to cubic feet per minute (cfm) instead of cubic feet per minute of standard air (scfm). At § 429.16(e)(4)(viii), DOE failed to remove regulatory text associated with changes to the test

procedure for variable speed heat

pumps not adopted in the June 2016

final rule that had been proposed on

November 9, 2015 in a supplementary

notice of proposed rulemaking

(‘‘November 2015 SNOPR’’). 80 FR

69278. In order to remedy these errors,

DOE is issuing this final rule correction to revise the text in these sections.

In addition, the June 2016 final rule
revised appendix M to subpart B of 10 CFR part 430 (‘‘appendix M’’), which specifies the “Uniform Test Method for the Measurement the Energy Consumption of Central Air Conditioners and Heat Pumps.” This correction also addresses several editorial errors in appendix M.

In section 3.11.1 of appendix M, “If

using the outdoor air enthalpy method

as the secondary test method,” DOE

erroneously numbered two subsections

with the number “3.11.1.1.” The second

of these two is renumbered to

“3.11.1.2.”

In section 4.1 of appendix M, “Seasonal Energy Efficiency Ratio

(SEER) Calculations,” DOE erroneously numbered subsection 4.1.3.3 as “4.1.2.3,” which propagated errors in numbering from that point through the end of

section 4.1 and created erroneous cross-

references to these sections. Section

4.1.2.3 is renumbered as section “4.1.3,”

and the following section numbers

through the end of section 4.1 are

renumbered accordingly. Additionally,
cross-references to the renumbered

sections are revised.

Sections 2.11 and 3.19 of appendix M
contain errors in the tolerance allowed

between temperature measurements.
The preamble to the June 2016 final rule states that the maximum allowable
temperature difference is 2.0 °F and that

it applies to the average measurements for the test period. 81 FR 36991, 37028

(June 8, 2016). In section 2.11, DOE

erroneously referred to “maximum
difference between readings” rather

than adding the clarification discussed

in the preamble that “readings” referred to

the average temperatures measured during the test period. In section 3.1.9, DOE similarly failed to include the clarifying information on the tolerance and erroneously provided a tolerance of 1.5 °F rather than 2.0 °F. DOE is correcting section 2.11 accordingly and correcting 3.1.9 to refer directly to

section 2.11 rather than correcting the

provided tolerance.

Tables 8, 9, 15, 16, and 17 of appendix M contained various errors in
testing tolerances for external resistance to airflow, airflow nozzle pressure
difference, and electric voltage. In the preamble to the June 2016 Final Rule, DOE explained its intention to maintain the external resistance to airflow tolerance at 0.05 inches of water, to maintain the airflow nozzle pressure difference tolerance at 2.0%, and to maintain the electric voltage tolerance at 2.0%. 81 FR 36991, 37036 (June 8, 2016). However, this was not reflected in tables 8, 9, 15, 16 and 17 of appendix M, and the tables are revised to reflect these corrections.

In section 3.13.1.d of appendix M, $P_2$

was erroneously printed instead of $P_x$

in two instances. This section provides

instructions for measurement of the indoor unit low voltage power $P_x$, which is later subtracted from the measurement of heating season total off mode power ($P_{2x}$) for coil-only split systems and for blower coil split systems for which a furnace or a modular blower is the designated air mover. Instances of $P_x$ in section 3.13.1.d of appendix M are revised to $P_{2x}$.

Finally, many of the instructions in the final rule that indicate that a default cyclic degradation coefficient is to be used if the tests to determine this value are not conducted, but erroneously did
not specify that the default value is to be used if the value determined using the test exceeded the default value. 81 FR 36991, 37033 (June 8, 2016), DOE intended that the default value is to be used if the value determined using the test exceeds the default value for the cyclic degradation coefficient, and is correcting this omission in this final rule correction.

II. Need for Correction

As published, the adopted test procedure text may potentially result in confusion regarding how to correctly conduct DOE’s central air conditioners and heat pumps test procedure.

Because this final rule would simply correct errors in the regulatory text without making substantive changes to the test procedures, the changes addressed in this document are technical in nature. Accordingly, DOE finds that there is good cause under 5 U.S.C. 553(b)(B) to not issue a separate notice to solicit public comment on the changes contained in this document. Issuing a separate notice to solicit public comment would be impracticable, unnecessary, and contrary to the public interest.

III. Procedural Requirements

DOE has concluded that the determinations made pursuant to the various procedural requirements applicable to the June 8, 2016 test procedure final rule remain unchanged for this final rule technical correction. These determinations are set forth in the June 8, 2016 final rule. 81 FR 36992.

List of Subjects

10 CFR Part 429

Administrative practice and procedure, Confidential business information, Energy conservation, Reporting and recordkeeping requirements.

10 CFR Part 430

Issued in Washington, DC, on August 5, 2016.

Kathleen Hogan,
Deputy Assistant Secretary for Energy Efficiency, Energy Efficiency and Renewable Energy.

For the reasons stated in the preamble, DOE amends parts 429 and 430 of chapter II of title 10, Code of Federal Regulations to read as follows:

PART 429—CERTIFICATION, COMPLIANCE, AND ENFORCEMENT FOR CONSUMER PRODUCTS AND COMMERCIAL AND INDUSTRIAL EQUIPMENT

1. The authority citation for part 429 continues to read as follows:

§429.16 [Amended]

2. Section 429.16 is amended:

a. In paragraph (a)(1), in the last row of the table, by removing “(c)(2)” and adding in its place “(b)(2)(i)”;  
b. In paragraph (d)(1) by removing “less” and adding in its place “greater”;  
c. In paragraph (d)(2) by removing “greater” and adding in its place “less”;  
d. In paragraph (e)(4) by:
   i. Adding “of standard air” after “(in cubic feet per minute)”;  
   ii. Removing the two instances of “((cfm))” and adding in its place “((scfm))”; and  
   iii. Removing paragraph (viii).

PART 430—ENERGY CONSERVATION PROGRAM FOR CONSUMER PRODUCTS

3. The authority citation for part 430 continues to read as follows:

§430.1 [Amended]

4. Appendix M to subpart B of part 430 is amended:

a. In section 2.11, first paragraph, last sentence, removing “readings” and adding in its place “average temperatures measured during the test period”;  
b. Revising section 3.1.9;  
c. Revising section 3.2.1, introductory text;  
d. In section 3.2.3.d, adding a sentence after the first sentence;  
e. In section 3.3, paragraph d, revising Table 8;  
f. In section 3.5, paragraph h, revising Table 9 and its footnotes;  
g. In section 3.5.3, adding a sentence after the second sentence;  
h. Revising section 3.6.3.b., introductory text;  
i. In section 3.7, paragraph a, revising Table 15;  
j. In section 3.8.a., removing the sixth sentence;  
k. In section 3.8.1, adding a sentence after the third sentence and revising Table 16;  
l. In section 3.9, paragraph f, revising Table 17;

m. In section 3.11, redesignating the second section 3.11.1.1 (“Official Test”) as section 3.11.1.2;  
n. In section 3.13.1.d, removing the two instances of “P2,” and adding in their places “P’,”;  
o. In section 4.1.1.b, adding a second sentence;  
p. In section 4.1.2.1.c, adding a second sentence;  
q. Redesignating sections 4.1.4.1 and 4.1.4.2 as sections 4.1.5.1 and 4.1.5.2, respectively;  
r. Redesignating section 4.1.4 as section 4.1.5;  
s. Redesigning sections 4.1.3.1, 4.1.3.2, and 4.1.3.3 as sections 4.1.4.1, 4.1.4.2, and 4.1.4.3, respectively;  
t. Redesigning section 4.1.3 as section 4.1.4;  
u. Redesigning section 4.1.2.7 as section 4.1.3.4;  
v. Redesigning section 4.1.2.6 as section 4.1.3.3;  
w. Redesigning section 4.1.2.5 as section 4.1.3.2;  
x. Redesigning section 4.1.2.4 as section 4.1.3.1;  
y. Redesigning section 4.1.2.3 as section 4.1.3;  
z. In newly redesignated section 4.1.3.1, revising the equation and related information immediately before Table 18;  

aa. In newly redesignated section 4.1.4.1, adding a sentence after the last sentence of the section;  
bb. In section 4.2.1, adding the sentence “Evaluate the heating mode cyclic degradation factor C(2)h as specified in section 3.8.1 of this appendix.”, after “Use Equation 4.2–2 to determine BL(Tj). Obtain fractional bin hours for the heating season, nj/N, from Table 19.”; and  

cc. In section 4.2.3.1, adding the sentence “Evaluate the heating mode cyclic degradation factor C(2)h as specified in section 3.8.1 of this appendix.”, after “Δ(Tj) = the low temperature cutoff factor, dimensionless.”.

The revisions and additions read as follows.

Appendix M to Subpart B of Part 430—Uniform Test Method for Measuring the Energy Consumption of Central Air Conditioners and Heat Pumps

3.1.9 Requirement for the Air Temperature Distribution Entering the Outdoor Coil

Monitor the temperatures of the air entering the outdoor coil using air sampling devices and/or temperature sensor grids, maintaining the required tolerances, if applicable, as described in section 2.11 of this appendix.
3.2.1 Tests for a System Having a Single-Speed Compressor and Fixed Cooling Air Volume Rate

This set of tests is for single-speed-compressor units that do not have a cooling minimum air volume rate or a cooling intermediate air volume rate that is different than the cooling full load air volume rate. Conduct two steady-state wet coil tests, the A and B Tests. Use the two optional dry-coil tests, the steady-state C Test and the cyclic D Test, to determine the cooling mode cyclic degradation coefficient, $C_D$. If the two

 optional tests are conducted but yield a tested $C_D$ that exceeds the default $C_D$ or if the two optional tests are not conducted, assign $C_D$ the default value of 0.25 (for outdoor units with no match) or 0.20 (for all other systems). Table 4 specifies test conditions for these four tests.

3.2.2 Tests for a System Having a Single-Speed Compressor and Fixed Heating Air Volume Rate

If the two optional tests are conducted but yield a tested $C_H$ that exceeds the default $C_H$ (k = 2) or if the two optional tests are not conducted, assign $C_H$ (k = 2) the default value. ***

* * * * *

3.2.3 Tests for a Unit Having a Two-Capacity Compressor (See Section 1.2 of This Appendix, Definitions)

* * * * *

3.3.* * *

3.5.3 Cooling-Mode Cyclic-Degradation Coefficient Calculation

** * * * * systems and outdoor units with no match, and 0.20 for all other systems.* * * *

** * * * * * If the two optional tests are conducted but yield a tested $C_D$ (k = 2) that exceeds the default $C_D$ (k = 2) or if the two optional tests are not conducted, assign $C_D$ (k = 2) the default value. ***

1 See section 1.2 of this appendix, Definitions.
2 Only applies during wet coil tests; does not apply during steady-state, dry coil cooling mode tests.
3 Only applies when using the outdoor air enthalpy method.
4 Only applies during the interval when at least one of the following—the compressor, the outdoor fan, or, if applicable, the indoor blower—are operating except for the first 30 seconds after compressor start-up.
5 Only applies when testing non-ducted units.
6 Only applies during wet coil cooling mode tests where the unit rejects condensate to the outdoor coil.
7 Only applies during the interval when at least one of the following—the compressor, the outdoor fan, or, if applicable, the indoor blower—are operating except for the first 30 seconds after compressor start-up.

1 See section 1.2 of this appendix, Definitions.
2 Applies during the interval that air flows through the indoor (outdoor) coil except for the first 30 seconds after flow initiation. For units having a variable-speed indoor blower that ramps, the tolerances listed for the external resistance to airflow apply from 30 seconds after achieving full speed until ramp down begins.
3 Shall at no time exceed a wet-bulb temperature that results in condensate forming on the indoor coil.
4 The test condition shall be the average nozzle pressure difference or velocity pressure measured during the steady-state dry coil test.
5 Applies during the interval when at least one of the following—the compressor, the outdoor fan, or, if applicable, the indoor blower—are operating except for the first 30 seconds after compressor start-up.
6 Only applies during wet coil cooling mode tests where the unit rejects condensate to the outdoor coil.
7 Applies during the interval when at least one of the following—the compressor, the outdoor fan, or, if applicable, the indoor blower—are operating except for the first 30 seconds after compressor start-up.

3.6.3 Tests for a Heat Pump Having a Two-Capacity Compressor (see Section 1.2 of This Appendix, Definitions), Including Two-Capacity, Northern Heat Pumps (see Section 1.2 of This Appendix, Definitions)

** * * * *

b. Conduct the optional high temperature cyclic test (H1C$k$) to determine the heating mode cyclic-degradation coefficient, $C_D$. If
this optional test is conducted but yields a tested \( C_0^h \) that exceeds the default \( C_0^h \) or if the optional test is not conducted, assign \( C_0^h \) the default value of 0.25. If a two-capacity heat pump locks out low capacity operation at lower outdoor temperatures, conduct the high temperature cyclic test (HCT) to determine the high-capacity heating mode cyclic-degradation coefficient, \( C_0^h \) \( (k=2) \). If this optional test at high capacity is conducted but yields a tested \( C_0^h \) \( (k=2) \) that exceeds the default \( C_0^h \) \( (k=2) \) or if the optional test is not conducted, assign \( C_0^h \) the default value. The default \( C_0^h \) \( (k=2) \) is the same value as determined or assigned for the low-capacity cyclic-degradation coefficient, \( C_0^h \) \( [\text{or equivalently, } C_0^h \] \( (k=1) \]. Table 12 specifies test conditions for these nine tests.

DEPARTMENT OF TRANSPORTATION
Federal Aviation Administration

14 CFR Part 440

Reciprocal Waivers of Claims for Licensed or Permitted Launch and Reentry Activities

AGENCY: Federal Aviation Administration (FAA), DOT.

ACTION: Final rule.

SUMMARY: The FAA is amending its commercial space regulations governing reciprocal waivers of claims to require that customers waive claims against all the customers involved in a launch or reentry, including those signing a different set of reciprocal waivers. Also, customers of a customer contracting directly with a licensee or permittee will not have to sign a waiver directly with the licensee or permittee, other customers, or the FAA. The FAA is also adding an appendix to provide permittees with an example of a Waiver of Claims and Assumption of Responsibility for Permitted Activities with No Customer.
