In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53274 through 53276), we completed the prospective portion of the adjustment required under section 7(b)(1)(A) of Public Law 110–90 by finalizing a −1.9 percent adjustment to the standardized amount for FY 2013. We stated that this adjustment would remove the remaining effect of the documentation and coding changes that do not reflect real changes in case-mix that occurred in FY 2008 and FY 2009. We believed that it was imperative to implement the full remaining adjustment, as any further delay would result in an overstated standardized amount in FY 2013 and any future fiscal years until a full adjustment was made.

We noted again that delaying full implementation of the prospective portion of the adjustment required under section 7(b)(1)(A) of Public Law 110–90 until FY 2013 resulted in payments in FY 2010 through FY 2012 being overstated. These overpayments could not be recovered by CMS, as section 7(b)(1)(B) of Public Law 110–90 limited recoupments to overpayments made in FY 2008 and FY 2009.

5. Recoupment or Repayment Adjustment Authorized by Section 7(b)(1)(B) of Public Law 110–90

Section 7(b)(1)(B) of Public Law 110–90 requires the Secretary to make an adjustment to the standardized amounts under section 1886(d) of the Act to offset the estimated increase or decrease in aggregate payments for FY 2008 and FY 2009 (including interest) resulting from the difference between the estimated actual documentation and coding effect and the documentation and coding adjustments applied under section 7(a) of Public Law 110–90. This determination must be based on a retrospective evaluation of claims data. Our actuaries estimated that there was a 5.8 percentage point difference resulting in an increase in aggregate payments of approximately $6.9 billion. Therefore, as discussed in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50062 through 50067), we determined that an aggregate adjustment of −5.8 percent in FYs 2011 and 2012 would be necessary in order to meet the requirements of section 7(b)(1)(B) of Public Law 110–90 to adjust the standardized amounts for discharges occurring in FYs 2010, 2011, and/or 2012 to offset the estimated amount of the increase in aggregate payments (including interest) in FYs 2008 and 2009.

It is often our practice to phase in payment rate adjustments over more than one year in order to moderate the effect on payment rates in any one year. Therefore, consistent with the policies that we have adopted in many similar cases, in the FY 2011 IPPS/LTCH PPS final rule, we made an adjustment to the standardized amount of −2.9 percent, representing approximately half of the aggregate adjustment required under section 7(b)(1)(B) of Public Law 110–90, for FY 2011. An adjustment of this magnitude allowed us to moderate the effects on hospitals in one year while simultaneously making it possible to implement the entire adjustment within the timeframe required under section 7(b)(1)(B) of Public Law 110–90 (that is, no later than FY 2012). For FY 2012, in accordance with the timeframes set forth by section 7(b)(1)(B) of Public Law 110–90, and consistent with the discussion in the FY 2011 IPPS/LTCH PPS final rule, we completed the recoupment adjustment by implementing the remaining −2.9 percent adjustment, in addition to removing the effect of the −2.9 percent adjustment to the standardized amount finalized for FY 2011 (76 FR 51489 and 51498). Because these adjustments, in effect, balanced out, there was no year-to-year change in the standardized amount due to this recoupment adjustment for FY 2012. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53276), we made a final +2.9 percent adjustment to the standardized amount, completing the recoupment portion of section 7(b)(1)(B) of Public Law 110–90. We note that with this positive adjustment, according to our estimates, all overpayments made in FY 2008 and FY 2009 have been fully recaptured with appropriate interest, and the standardized amount has been returned to the appropriate baseline.

6. Recoupment or Repayment Adjustment Authorized by Section 631 of the American Taxpayer Relief Act of 2012 (ATRA)

Section 631 of the ATRA amended section 7(b)(1)(B) of Public Law 110–90 to require the Secretary to make a recoupment adjustment or adjustments totaling $11 billion by FY 2017. This adjustment represents the amount of the increase in aggregate payments as a result of not completing the prospective adjustment authorized under section 7(b)(1)(A) of Public Law 110–90 until FY 2013. As discussed earlier, this delay in implementation resulted in overstated payment rates in FYs 2010, 2011, and 2012. The resulting overpayments could not have been recovered under Public Law 110–90.

Similar to the adjustments authorized under section 7(b)(1)(B) of Public Law 110–90, the adjustment required under section 631 of the ATRA is a one-time recoupment of a prior overpayment, not a permanent reduction to payment rates. Therefore, we anticipated that any adjustment made to reduce payment rates in one year would eventually be offset by a positive adjustment in 2018, once the necessary amount of overpayment was recovered. However, section 414 of the Medicare Access and CHIP Reauthorization Act (MACRA) of 2015, Public Law 114–10, enacted on April 16, 2015, replaced the single positive adjustment we intended to make in FY 2018 with a 0.5 percent positive adjustment for each of FYs 2018 through 2023. We stated in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49345) that we will address this MACRA provision in future rulemaking.

As we stated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50515 through 50517), our actuaries estimated that a −9.3 percent adjustment to the standardized amount would be necessary if CMS were to fully recover the $11 billion recoupment required by

section 631 of the ATRA in FY 2014. It is often our practice to phase in payment rate adjustments over more than one year, in order to moderate the effect on payment rates in any one year. Therefore, consistent with the policies that we have adopted in many similar cases, and after consideration of the public comments we received, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50515 through 50517), we implemented a −0.8 percent recoupment adjustment to the standardized amount in FY 2014. We stated that if adjustments of approximately −0.8 percent are implemented in FYs 2014, 2015, 2016, and 2017, using standard inflation factors, we estimate that the entire $11 billion will be accounted for by the end of the statutory 4-year timeline. As estimates of any future adjustments are subject to slight variations in total savings, we did not provide for specific adjustments for FYs 2015, 2016, or 2017 at that time. We stated that we believed that this level of adjustment for FY 2014 was a reasonable and fair approach that satisfies the requirements of the statute while mitigating extreme annual fluctuations in payment rates.

Consistent with the approach discussed in the FY 2014 rulemaking for recouping the $11 billion required by section 631 of the ATRA, in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49874) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49345), we implemented additional −0.8 percent recoupment adjustments to the standardized amount in FY 2015 and FY 2016, respectively. We estimated that these adjustments, combined with leaving the prior −0.8 percent adjustments in place, would recover up to $2 billion in FY 2015 and another $3 billion in FY 2016. When combined with the approximately $1 billion adjustment made in FY 2014, we estimated that approximately $5 to $6 billion would be left to recover under section 631 of the ATRA by the end of FY 2016.

However, as indicated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24966), due to lower than previously estimated inpatient spending, we determined that an adjustment of −0.8 percent in FY 2017 would not recoup the $11 billion under section 631 of the ATRA. Based on the FY 2017 President's Budget, our actuaries estimated for the proposed rule that FY 2014 through FY 2016 spending subject to the documentation and coding recoupment adjustment in the absence of the −0.8 percent adjustments made in FYs 2014 through 2016 would have been $123.783 billion in FY 2014, $124.361 billion in FY 2015, and $127.060 billion in FY 2016. As shown in the following table, the amount recouped in each of those fiscal years is therefore calculated as the difference between those amounts and the amounts determined to have been spent in those years with the −0.8 percent adjustment applied, namely $122.801 billion in FY 2014, $122.395 billion in FY 2015, and $124.059 billion in FY 2016. This yields an estimated total recoupment through the end of FY 2016 of $5.950 billion.

RECOUPMENT MADE UNDER SECTION 631 OF THE AMERICAN TAXPAYER RELIEF ACT OF 2012

[ATRA]

	IPPS Spending* (billions)	Cumulative adjustment factor	Adjusted IPPS spending (billions)	Recoupment amount (billions)
FY 2014	$122.801	1.00800	$123.783	$0.98
FY 2015	122.395	1.01606	124.361	1.97
FY 2016	124.059	1.02419	127.060	3.00
Total				5.95

*Based on FY 2017 President's Budget, including capital, IME, and DSH payments.

These estimates and the estimate of FY 2017 spending subject to the documentation and coding recoupment adjustment also are included in a memorandum from the Office of the Actuary that we made publicly available on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS* on the FY 2017 IPPS Proposed Rule Home Page. A description of the President's Budget for FY 2017 is currently available on the OMB Web site at: *https://www.whitehouse.gov/omb/budget.*

For the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24967), our actuaries estimated that the FY 2017 spending subject to the documentation and coding recoupment adjustment (including capital, IME, and DSH payment) would be $129.625 billion in the absence of any documentation and recoupment adjustments from FY 2014 through FY 2017. Therefore, at the time of issuance of the FY 2017 proposed rule, our actuaries estimated that, to the nearest tenth of a percent, the FY 2017 documentation and coding adjustment factor that will recoup as closely as possible $11 billion from FY 2014 through FY 2017 without exceeding this amount is −1.5 percent. This adjustment factor yields an estimated spending amount in FY 2017 of $124.693 billion, calculated as $129.625/(1.008*1.008*1.008*1.015). We indicated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24967) that this estimated proposed −1.5 percent adjustment factor would be updated for the final rule based on the FY 2017 President's Budget Midsession Review. We noted that, based on updated estimates, the necessary adjustment factor to the nearest tenth of a percent could be different than our actuaries' estimate of −1.5 percent.

Comment: MedPAC reiterated its previous support for the recovery of past overpayments due to documentation and coding. MedPAC stated that the law stipulates the amount of the recovery and the timing of the recovery. MedPAC also stated that CMS has little discretion and is proceeding as required by law.

Response: We appreciate MedPAC's support for our proposal.

Comment: The vast majority of commenters urged CMS to use its older estimate of the required adjustment for FY 2017 of −0.8 percentage point, rather than its updated proposed estimate of −1.5 percentage points. Commenters argued that the ATRA does not require CMS to update the initial FY 2017 estimate discussed in the FY 2014 final rule with more recent data, that the law allows CMS to continue using the older analysis, and that revisiting the actual recoupments for the preceding fiscal years is not consistent with the ATRA. The commenters' bases for this argument included that it would be a better interpretation of the statute and it is more consistent with CMS' approach regarding its use of estimates for outlier payments. The commenters also stated

that CMS should take into account any savings in Medicare Advantage (MA) payments when determining the $11 billion recoupment or otherwise adjust the $11 billion for policies that have been implemented since the passage of the ATRA. Many commenters also believed that the proposed −1.5 percent adjustment was inconsistent with Congressional intent in the ATRA and the MACRA, which they asserted reflected Congress' expectation that the final reduction would be 0.8 percentage points or at least statutorily limited the difference between the negative recoupment adjustments under the ATRA and the positive adjustments under the MACRA. Commenters further stated that if CMS does finalize its proposed adjustment under the ATRA for FY 2017, it should make an offsetting adjustment in FY 2018 to address the difference between the FY 2017 adjustment and the positive adjustments provided for under the MACRA.

Response: We believe our proposed adjustment for FY 2017 is most consistent with the requirement under section 631 of the ATRA to make an adjustment to ''fully offset'' $11 billion by FY 2017. While we recognize that the commenters have advocated for alternative interpretations of the legislation, we believe the most straightforward reading is that the ATRA requires us to make a recoupment adjustment or adjustments totaling $11 billion by FY 2017. If we were to use the older estimate of a −0.8 percent adjustment for FY 2017, we would only recoup an estimated $10.1 billion, which we do not believe would be consistent with the requirement under the ATRA to offset $11 billion by FY 2017. As we explained in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49345) and prior rules, because estimates of future adjustments were subject to variations in total estimated savings, we did not address the specific amount of the final adjustment required under section 631 of the ATRA for FY 2017 at that time.

In response to comments that we should take into account any savings in MA payments when determining the $11 billion recoupment or otherwise adjust the $11 billion for policies that have been implemented since the passage of the ATRA, we note that our approach for estimating the FY 2017 adjustment is consistent with our historic approach for estimating adjustments to address documentation and coding effects. There is no evidence in the legislative language that, in determining the adjustments necessary to achieve the $11 billion offset required under the ATRA, CMS should include impacts on MA payments or make adjustments for policies that have been implemented since the passage of the ATRA. We also believe that the commenters' suggestion should be evaluated in the context of MedPAC's comment and prior comments on this issue that we should recover past overpayments due to changes in documentation and coding. As stated previously, the $11 billion recoupment under the ATRA represents the amount of the increase in aggregate payments as a result of not completing the prospective adjustment authorized under section 7(b)(1)(A) of Public Law 110–90 until FY 2013. Adopting an interpretation that reduces the amount of our proposed FY 2017 adjustment creates a greater differential by the end of FY 2017 between the payment increases that occurred due to documentation and coding and the amount recovered. We do not believe increasing this differential would be an appropriate policy. We also note that it has been our consistent practice in implementing the ATRA to not account for MA discharges or savings and find no indication or expectation under the MACRA to change this approach.

With respect to the additional issues of Congressional intent raised by commenters, we disagree that the ATRA and the MACRA, in conjunction, somehow ratify a −0.8 percent adjustment for FY 2017 or statutorily limit the difference between the adjustments under the ATRA and adjustments under the MACRA. As commenters have noted, even if we did adopt an adjustment of −0.8 percent for FY 2017, the cumulative effect of our ATRA adjustment would be −3.2 percentage points, while the MACRA only requires cumulative positive adjustments of +3.0 percent, leaving a −0.2 percent gap between our ATRA adjustments and the MACRA adjustments. It is not clear to us that the MACRA provision was intended to augment or limit CMS' separate obligation, pursuant to the ATRA, to fully offset $11 billion by FY 2017 under section 7(b)(1)(A)(ii) of the TMA, when that language was not changed by the MACRA and, as noted, the MACRA would not fully restore even an estimated −3.2 percent adjustment. Moreover, limiting the ATRA adjustment in this manner would create a greater differential by the end of FY 2017 between the payment increases that occurred due to documentation and coding and the amount recovered.

With regard to the comments stating that if CMS finalizes its proposed adjustment under ATRA for FY 2017, it should make an offsetting adjustment in FY 2018, as we indicated in the proposed rule, we will address the adjustments for FY 2018 and later years in future rulemaking.

Comment: One commenter objected to CMS' use of actuarial assumptions as the basis for determining the level of adjustment required under ATRA. The commenter questioned the variance in the figures for OACT's 2013 and 2016 estimates and stated that OACT's most recent estimate could not be externally replicated. The commenter stated that there should be much greater certainty in the estimate before imposing the higher adjustment proposed for FY 2017. Other commenters requested that CMS reexamine the assumption and estimates made by OACT.

Response: While the OACT memorandum containing the estimates acknowledges the uncertainty in the estimates, it also states that the results shown are OACT's latest and best estimates for Medicare payments for FYs 2014–2017, and that OACT believes that the spending estimates presented, as well as the assumptions used to develop the estimates, are reasonable. We also note that, as explained in OACT's memorandum and the proposed rule, the estimate from the proposed rule was based on the FY 2017 President's Budget, subject to certain adjustments. As discussed in the memorandum, the major changes in the projections were due to lower updates to hospital payments than were assumed in 2013, mostly due to the lower than expected market basket adjustments and a lower number of discharges than assumed in 2013. These changes caused the spending levels to be lower than the 2013 projections. However, in 2013, when CMS made the original projections, everything that was included for 2014 through 2017 was a projection (except for the 2014 update). Now when we make the current projection, we have actual updates for the whole period through 2017, and we have complete data for the number of discharges for 2014 and 2015 and for part of 2016. For that reason, the current projections of spending for 2014 through 2017 are calculated with greater precision than the projections that were done in 2013. For additional information on the specific economic assumptions used in the President's FY 2017 Budget, we refer readers to the OMB Web site at: *https://www.whitehouse.gov/omb/budget*. The estimates for this final rule are similarly based on the Midsession Review of the President's FY 2017 Budget. For additional information on the specific economic assumptions used in the

Midsession Review of the President's FY 2017 Budget, we refer readers to the ''Midsession Review of the President's FY 2017 Budget'' available on the OMB Web site at: *https://www.whitehouse.gov/sites/default/files/omb/budget/fy2017/assets/17msr.pdf*, under ''Economic Assumptions.'' For a general overview of the principal steps involved in projecting future costs and utilization, we refer readers to the ''2016 Annual Report of the Boards of Trustees of the Federal Hospital Insurance and Federal Supplementary Medical Insurance Trust Funds'' available on the CMS Web site at: *https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/ReportsTrustFunds/index.html?redirect=/reportstrustfunds/* under ''Downloads.'' As we did with the proposed adjustment, we are making available on the CMS Web site a memorandum containing our actuaries' estimates relating to our finalized adjustment (*https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS* on the FY 2017 IPPS Final Rule Home Page).

After consideration of the public comments we received, we are finalizing our proposal without modification. For this final rule, based on updated estimates by the Office of the Actuary using the Midsession Review of the President's FY 2017 Budget, we are making an −1.5 percent adjustment as the final adjustment required under section 631 of the ATRA, and when combined with the effects of previous adjustments made in FY 2014, FY 2015, and FY 2016, we estimate will satisfy the recoupment under section 631 of the ATRA. In other words, our actuaries currently estimate that, to the nearest tenth of a percent, the FY 2017 documentation and coding adjustment factor that will recoup as closely as possible $11 billion from FY 2014 through FY 2017 without exceeding this amount is −1.5 percent. As we stated earlier, the estimates by our actuaries related to this finalized adjustment are included in a memorandum that we are making publicly available on the CMS Web site.

The updated table from our actuaries based on the Midsession Review of the President's FY 2017 Budget is below. The interpretation of the table and the calculations are the same as those described in the proposed rule (81 FR 24966 through 24967), except for the update from the FY 2017 President's Budget to the FY 2017 President's Budget Midsession Review.

RECOUPMENT MADE UNDER SECTION 631 OF THE AMERICAN TAXPAYER RELIEF ACT OF 2012

[ATRA]

	IPPS Spending* (billions)	Cumulative adjustment factor	Adjusted IPPS spending (billions)	Recoupment amount (billions)
FY 2014	$122.84	1.00800	$123.82	$0.98
FY 2015	122.48	1.01606	124.45	1.97
FY 2016	124.02	1.02419	127.02	3.00
FY 2017	126.40	1.03956	131.40	5.00
Total				10.95

*Based on FY 2017 President's Budget Midsession Review, including capital, IME, and DSH payments.

For this FY 2017 IPPS/LTCH PPS final rule, our actuaries estimate that the FY 2017 spending subject to the documentation and coding recoupment adjustment (including capital, IME, and DSH payment) would be $131.40 billion in the absence of any documentation and recoupment adjustments from FY 2014 through FY 2017 based on the FY 2017 President's Budget Midsession Review. Therefore our actuaries estimated that, to the nearest tenth of a percent, the FY 2017 documentation and coding adjustment factor that will recoup as closely as possible $11 billion from FY 2014 through FY 2017 without exceeding this amount is −1.5 percent. This adjustment factor yields an estimated spending amount in FY 2017 of $126.4 billion, calculated as $131.4/(1.008*1.008*1.008*1.015).

As stated in the proposed rule, once the recoupment was complete, we had anticipated making a single positive adjustment in FY 2018 to offset the reductions required to recoup the $11 billion under section 631 of the ATRA. However, section 414 of the MACRA replaced the single positive adjustment we intended to make in 2018 with a 0.5 percent positive adjustment for each of FYs 2018 through 2023. The provision under section 414 of the MACRA does not impact our FY 2017 adjustment, as discussed above. As noted previously, while we received public comments on adjustments for FY 2018 and later fiscal years, we will address these adjustments in future rulemaking as we indicated in the proposed rule.

E. Refinement of the MS–DRG Relative Weight Calculation

1. Background

Beginning in FY 2007, we implemented relative weights for DRGs based on cost report data instead of charge information. We refer readers to the FY 2007 IPPS final rule (71 FR 47882) for a detailed discussion of our final policy for calculating the cost-based DRG relative weights and to the FY 2008 IPPS final rule with comment period (72 FR 47199) for information on how we blended relative weights based on the CMS DRGs and MS–DRGs.

As we implemented cost-based relative weights, some public commenters raised concerns about potential bias in the weights due to ''charge compression,'' which is the practice of applying a higher percentage charge markup over costs to lower cost items and services, and a lower percentage charge markup over costs to higher cost items and services. As a result, the cost-based weights would undervalue high-cost items and overvalue low-cost items if a single cost-to-charge ratio (CCR) is applied to items of widely varying costs in the same cost center. To address this concern, in August 2006, we awarded a contract to the Research Triangle Institute, International (RTI) to study the effects of charge compression in calculating the relative weights and to consider methods to reduce the variation in the CCRs across services within cost centers. For a detailed summary of RTI's findings, recommendations, and public comments that we received on the report, we refer readers to the FY 2009 IPPS/LTCH PPS final rule (73 FR 48452 through 48453). In addition, we refer readers to RTI's July 2008 final report titled ''Refining Cost to Charge Ratios for Calculating APC and MS–DRG Relative Payment Weights'' (available at: *http://www.rti.org/reports/cms/HHSM-*

500-2005-0029I/PDF/Refining_Cost_to_Charge_Ratios_200807_Final.pdf).

In the FY 2009 IPPS final rule (73 FR 48458 through 48467), in response to the RTI's recommendations concerning cost report refinements, we discussed our decision to pursue changes to the cost report to split the cost center for Medical Supplies Charged to Patients into one line for ''Medical Supplies Charged to Patients'' and another line for ''Implantable Devices Charged to Patients.'' We acknowledged, as RTI had found, that charge compression occurs in several cost centers that exist on the Medicare cost report. However, as we stated in the FY 2009 IPPS final rule, we focused on the CCR for Medical Supplies and Equipment because RTI found that the largest impact on the MS–DRG relative weights could result from correcting charge compression for devices and implants. In determining the items that should be reported in these respective cost centers, we adopted the commenters' recommendations that hospitals use revenue codes established by the AHA's National Uniform Billing Committee to determine the items that should be reported in the ''Medical Supplies Charged to Patients'' and the ''Implantable Devices Charged to Patients'' cost centers. Accordingly, a new subscripted line for ''Implantable Devices Charged to Patients'' was created in July 2009. This new subscripted cost center has been available for use for cost reporting periods beginning on or after May 1, 2009.

As we discussed in the FY 2009 IPPS final rule (73 FR 48458) and in the CY 2009 OPPS/ASC final rule with comment period (73 FR 68519 through 68527), in addition to the findings regarding implantable devices, RTI found that the costs and charges of computed tomography (CT) scans, magnetic resonance imaging (MRI), and cardiac catheterization differ significantly from the costs and charges of other services included in the standard associated cost center. RTI also concluded that both the IPPS and the OPPS relative weights would better estimate the costs of those services if CMS were to add standard cost centers for CT scans, MRIs, and cardiac catheterization in order for hospitals to report separately the costs and charges for those services and in order for CMS to calculate unique CCRs to estimate the costs from charges on claims data. In the FY 2011 IPPS/LTCH PPS final rule (75 FR 50075 through 50080), we finalized our proposal to create standard cost centers for CT scans, MRIs, and cardiac catheterization, and to require that hospitals report the costs and charges for these services under new cost centers on the revised Medicare cost report Form CMS–2552–10. (We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50075 through 50080) for a detailed discussion of the reasons for the creation of standard cost centers for CT scans, MRIs, and cardiac catheterization.) The new standard cost centers for CT scans, MRIs, and cardiac catheterization are effective for cost reporting periods beginning on or after May 1, 2010, on the revised cost report Form CMS–2552–10.

In the FY 2009 IPPS final rule (73 FR 48468), we stated that, due to what is typically a 3-year lag between the reporting of cost report data and the availability for use in ratesetting, we anticipated that we might be able to use data from the new ''Implantable Devices Charged to Patients'' cost center to develop a CCR for ''Implantable Devices Charged to Patients'' in the FY 2012 or FY 2013 IPPS rulemaking cycle. However, as noted in the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43782), due to delays in the issuance of the revised cost report Form CMS 2552–10, we determined that a new CCR for ''Implantable Devices Charged to Patients'' might not be available before FY 2013. Similarly, when we finalized the decision in the FY 2011 IPPS/LTCH PPS final rule to add new cost centers for CT scans, MRIs, and cardiac catheterization, we explained that data from any new cost centers that may be created will not be available until at least 3 years after they are first used (75 FR 50077). In preparation for the FY 2012 IPPS/LTCH PPS rulemaking, we checked the availability of data in the ''Implantable Devices Charged to Patients'' cost center on the FY 2009 cost reports, but we did not believe that there was a sufficient amount of data from which to generate a meaningful analysis in this particular situation. Therefore, we did not propose to use data from the ''Implantable Devices Charged to Patients'' cost center to create a distinct CCR for ''Implantable Devices Charged to Patients'' for use in calculating the MS–DRG relative weights for FY 2012. We indicated that we would reassess the availability of data for the ''Implantable Devices Charged to Patients'' cost center for the FY 2013 IPPS/LTCH PPS rulemaking cycle and, if appropriate, we would propose to create a distinct CCR at that time.

During the development of the FY 2013 IPPS/LTCH PPS proposed and final rules, hospitals were still in the process of transitioning from the previous cost report Form CMS–2552–96 to the new cost report Form CMS–2552–10. Therefore, we were able to access only those cost reports in the FY 2010 HCRIS with fiscal year begin dates on or after October 1, 2009, and before May 1, 2010; that is, those cost reports on Form CMS–2552–96. Data from the Form CMS–2552–10 cost reports were not available because cost reports filed on the Form CMS–2552–10 were not accessible in the HCRIS. Further complicating matters was that, due to additional unforeseen technical difficulties, the corresponding information regarding charges for implantable devices on hospital claims was not yet available to us in the MedPAR file. Without the breakout in the MedPAR file of charges associated with implantable devices to correspond to the costs of implantable devices on the cost report, we believed that we had no choice but to continue computing the relative weights with the current CCR that combines the costs and charges for supplies and implantable devices. We stated in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53281 through 53283) that when we do have the necessary data for supplies and implantable devices on the claims in the MedPAR file to create distinct CCRs for the respective cost centers for supplies and implantable devices, we hoped that we would also have data for an analysis of creating distinct CCRs for CT scans, MRIs, and cardiac catheterization, which could then be finalized through rulemaking. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53281), we stated that, prior to proposing to create these CCRs, we would first thoroughly analyze and determine the impacts of the data, and that distinct CCRs for these new cost centers would be used in the calculation of the relative weights only if they were first finalized through rulemaking.

At the time of the development of the FY 2014 IPPS/LTCH PPS proposed rule (78 FR 27506 through 27507), we had a substantial number of hospitals completing all, or some, of these new cost centers on the FY 2011 Medicare cost reports, compared to prior years. We stated that we believed that the analytic findings described using the FY 2011 cost report data and FY 2012 claims data supported our original decision to break out and create new cost centers for implantable devices, MRIs, CT scans, and cardiac catheterization, and we saw no reason to further delay proposing to implement the CCRs of each of these cost centers. Therefore, beginning in FY 2014, we proposed a policy to calculate the MS–DRG relative weights using 19 CCRs,

creating distinct CCRs from cost report data for implantable devices, MRIs, CT scans, and cardiac catheterization.

We refer readers to the FY 2014 IPPS/LTCH PPS proposed rule (78 FR 27507 through 27509) and final rule (78 FR 50518 through 50523) in which we presented data analyses using distinct CCRs for implantable devices, MRIs, CT scans, and cardiac catheterization. The FY 2014 IPPS/LTCH PPS final rule also set forth our responses to public comments we received on our proposal to implement these CCRs. As explained in more detail in the FY 2014 IPPS/LTCH PPS final rule, we finalized our proposal to use 19 CCRs to calculate MS–DRG relative weights beginning in FY 2014—the then existing 15 cost centers and the 4 new CCRs for implantable devices, MRIs, CT scans, and cardiac catheterization. Therefore, beginning in FY 2014, we calculate the IPPS MS–DRG relative weights using 19 CCRs, creating distinct CCRs for implantable devices, MRIs, CT scans, and cardiac catheterization.

2. Discussion of Policy for FY 2017

Consistent with our established policy, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24968), we stated that we calculated the proposed MS–DRG relative weights for FY 2017 using two data sources: the MedPAR file as the claims data source and the HCRIS as the cost report data source. We adjusted the charges from the claims to costs by applying the 19 national average CCRs developed from the cost reports. The description of the calculation of the 19 CCRs and the MS–DRG relative weights for FY 2017 is included in section II.G. of the preamble of this final rule.

Comment: One commenter recommended that CMS work with stakeholders to update cost reporting instructions and improve the accuracy and validity of the national average CCRs. The commenter expressed concern that the differences between hospitals' use of nonstandard cost center codes and CMS' procedures for mapping and rolling up nonstandard codes to the standard cost centers will continue to result in invalid CCRs and inaccurate payments. The commenter stressed the need for flexibility in cost reporting, to accommodate any new or unique services that certain hospitals may provide, which may not be easily captured through the cost reporting software. Finally, the commenter again recommended, as it had done in response to prior IPPS rules, that CMS pay particular attention to data used for CT scanand MRI cost centers; the commenter believed that the hospital payment rates established by CMS from the CT scan and MRI CCRs simply do not correlate with resources used for these capital-intensive services.

Response: We appreciate the commenter's desire to increase the accuracy and validity of the CCRs. As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49347 through 49350), we noticed inconsistencies in hospital cost reporting of nonstandard cost centers and were concerned about the implication that some of these discrepancies might have on the aspects of the IPPS that rely on CCRs. While we did not propose any changes to the methodology or data sources for the FY 2016 CCRs and relative weights, we stated in that final rule that we would continue to explore ways in which we can improve the accuracy of the cost report data and calculated CCRs used in the cost estimation process and that, to the extent possible, we will continue to seek stakeholder input in efforts to limit the impact on providers. We also note that the concern regarding hospitals' use of nonstandard cost center codes and CMS' procedures for mapping and rolling up nonstandard codes to the standard cost centers does not specifically apply to the standard CT scan and MRI cost centers. Although these centers were previously nonstandard cost centers, they were implemented as standard cost centers in Form CMS–2552–10. Therefore, many of the issues relating to inconsistent coding and issues with information ''rollup'' would not be specifically relevant for the CT scan and MRI standard cost centers. We have previously addressed stakeholder concerns related to the flexibility of cost reporting and accuracy of the CT scan and MRI standard cost centers in setting the IPPS relative weights. For a detailed discussion of the CT scan and MRI standard cost centers, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50520 through 50523), and the FY 2011 IPPS/LTCH PPS final rule (7 FR 50077 through 50079).

Consistent with our established policy, we calculated the final MS–DRG relative weights for FY 2017 using two data sources: the MedPAR file as the claims data source and the HCRIS as the cost report data source. We adjusted the charges from the claims to costs by applying the 19 national average CCRs developed from the cost reports. As we did with the FY 2016 IPPS/LTCH PPS final rule, we are providing the version of the HCRIS from which we calculated these 19 CCRs on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. Click on the link on the left side of the screen titled, ''FY 2017 IPPS Final Rule Home Page'' or ''Acute Inpatient Files for Download.''

F. Changes to Specific MS–DRG Classifications

1. Discussion of Changes to Coding System and Basis for MS–DRG Updates

a. Conversion of MS–DRGs to the International Classification of Diseases, 10th Revision (ICD–10)

As of October 1, 2015, providers use the International Classification of Diseases, 10th Revision (ICD–10) coding system to report diagnoses and procedures for Medicare hospital inpatient services under the MS–DRG system instead of the ICD–9–CM coding system, which was used through September 30, 2015. The ICD–10 coding system includes the International Classification of Diseases, 10th Revision, Clinical Modification (ICD–10–CM) for diagnosis coding and the International Classification of Diseases, 10th Revision, Procedure Coding System (ICD–10–PCS) for inpatient hospital procedure coding, as well as the Official ICD–10–CM and ICD–10–PCS Guidelines for Coding and Reporting. The ICD–10 coding system was initially adopted for transactions conducted on or after October 1, 2013, as described in the Health Insurance Portability and Accountability Act of 1996 (HIPAA) Administrative Simplification: Modifications to Medical Data Code Set Standards to Adopt ICD–10–CM and ICD–10–PCS Final Rule published in the **Federal Register** on January 16, 2009 (74 FR 3328 through 3362) (hereinafter referred to as the ''ICD–10–CM and ICD–10–PCS final rule''). However, the Secretary of Health and Human Services (the Secretary) issued a final rule that delayed the compliance date for ICD–10 from October 1, 2013, to October 1, 2014. That final rule, entitled ''Administrative Simplification: Adoption of a Standard for a Unique Health Plan Identifier; Addition to the National Provider Identifier Requirements; and a Change to the Compliance Date for ICD–10–CM and ICD–10–PCS Medical Data Code Sets,'' CMS–0040–F, was published in the **Federal Register** on September 5, 2012 (77 FR 54664) and is available for viewing on the Internet at: *http://www.gpo.gov/fdsys/pkg/FR-2012-09-05/pdf/2012-21238.pdf*. On April 1, 2014, the Protecting Access to Medicare Act of 2014 (PAMA) (Pub. L. 113–93) was enacted, which specified that the Secretary may not adopt ICD–10 prior to October 1, 2015. Accordingly, the U.S. Department of Health and Human

Services released a final rule in the **Federal Register** on August 4, 2014 (79 FR 45128 through 45134) that included a new compliance date that required the use of ICD–10 beginning October 1, 2015. The rule also required HIPAA-covered entities to continue to use ICD–9–CM through September 30, 2015.

The anticipated move to ICD–10 necessitated the development of an ICD–10–CM/ICD–10–PCS version of the MS–DRGs. CMS began a project to convert the ICD–9–CM-based MS–DRGs to ICD–10 MS–DRGs. In response to the FY 2011 IPPS/LTCH PPS proposed rule, we received public comments on the creation of the ICD–10 version of the MS–DRGs to be implemented at the same time as ICD–10 (75 FR 50127 and 50128). While we did not propose an ICD–10 version of the MS–DRGs in the FY 2011 IPPS/LTCH PPS proposed rule, we noted that we have been actively involved in converting current MS–DRGs from ICD–9–CM codes to ICD–10 codes and sharing this information through the ICD–10 (previously ICD–9–CM) Coordination and Maintenance Committee. We undertook this early conversion project to assist other payers and providers in understanding how to implement their own conversion projects. We posted ICD–10 MS–DRGs based on Version 26.0 (FY 2009) of the MS–DRGs. We also posted a paper that describes how CMS went about completing this project and suggestions for other payers and providers to follow. Information on the ICD–10 MS–DRG conversion project can be found on the ICD–10 MS–DRG Conversion Project Web site at: *http://cms.hhs.gov/Medicare/Coding/ICD10/ICD-10-MS-DRG-Conversion-Project.html*. We have continued to keep the public updated on our maintenance efforts for ICD–10–CM and ICD–10–PCS coding systems, as well as the General Equivalence Mappings that assist in conversion through the ICD–10 (previously ICD–9–CM) Coordination and Maintenance Committee. Information on these committee meetings can be found on the CMS Web site at: *http://www.cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/index.html*.

During FY 2011, we developed and posted Version 28.0 of the ICD–10 MS–DRGs based on the FY 2011 MS–DRGs (Version 28.0) that we finalized in the FY 2011 IPPS/LTCH PPS final rule on the CMS Web site. This ICD–10 MS–DRGs Version 28.0 also included the CC Exclusion List and the ICD–10 version of the hospital-acquired conditions (HACs), which was not posted with Version 26. We also discussed this update at the September 15–16, 2010 and the March 9–10, 2011 meetings of the ICD–9–CM Coordination and Maintenance Committee. The minutes of these two meetings are posted on the CMS Web site at: *http://www.cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/index.html*.

We reviewed comments on the ICD–10 MS–DRGs Version 28 and made updates as a result of these comments. We called the updated version the ICD–10 MS–DRGs Version 28–R1. We posted a Definitions Manual of ICD–10 MS–DRGs Version 28–R1 on our ICD–10 MS–DRG Conversion Project Web site. To make the review of Version 28–R1 updates easier for the public, we also made available pilot software on a CD–ROM that could be ordered through the National Technical Information Service (NTIS). A link to the NTIS ordering page was provided on the CMS ICD–10 MS–DRGs Web site. We stated that we believed that, by providing the ICD–10 MS–DRGs Version 28–R1 Pilot Software (distributed on CD–ROM), the public would be able to more easily review and provide feedback on updates to the ICD–10 MS–DRGs. We discussed the updated ICD–10 MS–DRGs Version 28–R1 at the September 14, 2011 ICD–9–CM Coordination and Maintenance Committee meeting. We encouraged the public to continue to review and provide comments on the ICD–10 MS–DRGs so that CMS could continue to update the system.

In FY 2012, we prepared the ICD–10 MS–DRGs Version 29, based on the FY 2012 MS–DRGs (Version 29.0) that we finalized in the FY 2012 IPPS/LTCH PPS final rule. We posted a Definitions Manual of ICD–10 MS–DRGs Version 29 on our ICD–10 MS–DRG Conversion Project Web site. We also prepared a document that describes changes made from Version 28 to Version 29 to facilitate a review. The ICD–10 MS–DRGs Version 29 was discussed at the ICD–9–CM Coordination and Maintenance Committee meeting on March 5, 2012. Information was provided on the types of updates made. Once again the public was encouraged to review and comment on the most recent update to the ICD–10 MS–DRGs.

CMS prepared the ICD–10 MS–DRGs Version 30 based on the FY 2013 MS–DRGs (Version 30) that we finalized in the FY 2013 IPPS/LTCH PPS final rule. We posted a Definitions Manual of the ICD–10 MS–DRGs Version 30 on our ICD–10 MS–DRG Conversion Project Web site. We also prepared a document that describes changes made from Version 29 to Version 30 to facilitate a review. We produced mainframe and computer software for Version 30, which was made available to the public in February 2013. Information on ordering the mainframe and computer software through NTIS was posted on the ICD–10 MS–DRG Conversion Project Web site. The ICD–10 MS–DRGs Version 30.0 computer software facilitated additional review of the ICD–10 MS–DRGs conversion.

We provided information on a study conducted on the impact of converting the MS–DRGs to ICD–10. Information on this study is summarized in a paper entitled ''Impact of the Transition to ICD–10 on Medicare Inpatient Hospital Payments.'' This paper was posted on the CMS ICD–10 MS–DRGs Conversion Project Web site and was distributed and discussed at the September 15, 2010 ICD–9–CM Coordination and Maintenance Committee meeting. The paper described CMS' approach to the conversion of the MS–DRGs from ICD–9–CM codes to ICD–10 codes. The study was undertaken using the ICD–9–CM MS–DRGs Version 27.0 (FY 2010), which was converted to the ICD–10 MS–DRGs Version 27.0. The study estimated the impact on aggregate payment to hospitals and the distribution of payments across hospitals. The impact of the conversion from ICD–9–CM to ICD–10 on Medicare MS–DRG hospital payments was estimated using FY 2009 Medicare claims data. The study found a hospital payment increase of 0.05 percent using the ICD–10 MS–DRGs Version 27.

CMS provided an overview of this hospital payment impact study at the March 5, 2012 ICD–9–CM Coordination and Maintenance Committee meeting. This presentation followed presentations on the creation of ICD–10 MS–DRGs Version 29.0. A summary report of this meeting can be found on the CMS Web site at: *http://www.cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/index.html*. At this March 2012 meeting, CMS announced that it would produce an update on this impact study based on an updated version of the ICD–10 MS–DRGs. This update of the impact study was presented at the March 5, 2013 ICD–9–CM Coordination and Maintenance Committee meeting. The study found that moving from an ICD–9–CM-based system to an ICD–10 MS–DRG replicated system would lead to DRG reassignments on only 1 percent of the 10 million MedPAR sample records used in the study. Ninety-nine percent of the records did not shift to another MS–DRG when using an ICD–10 MS–DRG system. For the 1 percent of the records that shifted, 45 percent of the shifts were to a higher-weighted MS–DRG, while 55 percent of the shifts were

to lower-weighted MS–DRGs. The net impact across all MS–DRGs was a reduction by 4/10000 or minus 4 pennies per $100. The updated paper is posted on the CMS Web site at: *http://cms.hhs.gov/Medicare/Coding/ICD10/ICD-10-MS-DRG-Conversion-Project.html* under the ''Downloads'' section. Information on the March 5, 2013 ICD–9–CM Coordination and Maintenance Committee meeting can be found on the CMS Web site at: *http://cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/ICD-9-CM-C-and-M-Meeting-Materials.html*. This update of the impact paper and the ICD–10 MS–DRG Version 30 software provided additional information to the public who were evaluating the conversion of the MS–DRGs to ICD–10 MS–DRGs.

CMS prepared the ICD–10 MS–DRGs Version 31 based on the FY 2014 MS–DRGs (Version 31) that we finalized in the FY 2014 IPPS/LTCH PPS final rule. In November 2013, we posted a Definitions Manual of the ICD–10 MS–DRGs Version 31 on the ICD–10 MS–DRG Conversion Project Web site at: *http://www.cms.hhs.gov/Medicare/Coding/ICD10/ICD-10-MS-DRG-Conversion-Project.html*. We also prepared a document that described changes made from Version 30 to Version 31 to facilitate a review. We produced mainframe and computer software for Version 31, which was made available to the public in December 2013. Information on ordering the mainframe and computer software through NTIS was posted on the CMS Web site at: *http://cms.hhs.gov/Medicare/Coding/ICD10/ICD-10-MS-DRG-Conversion-Project.html* under the ''Related Links'' section. This ICD–10 MS–DRGs Version 31.0 computer software facilitated additional review of the ICD–10 MS–DRGs conversion. We encouraged the public to submit to CMS any comments on areas where they believed the ICD–10 MS–DRGs did not accurately reflect grouping logic found in the ICD–9–CM MS–DRGs Version 31.

We reviewed public comments received and developed an update of ICD–10 MS–DRGs Version 31, which we called ICD–10 MS–DRGs Version 31–R. We posted a Definitions Manual of the ICD–10 MS–DRGs Version 31–R on the ICD–10 MS–DRG Conversion Project Web site at: *http://www.cms.hhs.gov/Medicare/Coding/ICD10/ICD-10-MS-DRG-Conversion-Project.html*. We also prepared a document that describes changes made from Version 31 to Version 31–R to facilitate a review. We continued to share ICD–10 MS–DRG conversion activities with the public through this Web site.

CMS prepared the ICD–10 MS–DRGs Version 32 based on the FY 2015 MS–DRGs (Version 32) that we finalized in the FY 2015 IPPS/LTCH PPS final rule. In November 2014, we made available a Definitions Manual of the ICD–10 MS DRGs Version 32 on the ICD–10 MS–DRG Conversion Project Web site at: *http://www.cms.gov/Medicare/Coding/ICD10/ICD-10-MS-DRG-Conversion-Project.html*. We also prepared a document that described changes made from Version 31–R to Version 32 to facilitate a review. We produced mainframe and computer software for Version 32, which was made available to the public in January 2015. Information on ordering the mainframe and computer software through NTIS was made available on the CMS Web site at: *http://www.cms.gov/Medicare/Coding/ICD10/ICD-10-MS-DRG-Conversion-Project.html* under the ''Related Links'' section. This ICD–10 MS–DRGs Version 32 computer software facilitated additional review of the ICD–10 MS–DRGs conversion. We encouraged the public to submit to CMS any comments on areas where they believed the ICD–10 MS–DRGs did not accurately reflect grouping logic found in the ICD–9–CM MS–DRGs Version 32. We discussed five requests from the public to update the ICD–10 MS–DRGs Version 32 to better replicate the ICD–9–CM MS–DRGs in section II.G.3., 4., and 5. of the preamble of the FY 2016 IPPS/LTCH PPS final rule. In the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24351), we proposed to implement the MS–DRG code logic in the ICD–10 MS–DRGs Version 32 along with any finalized updates to the ICD–10 MS–DRGs Version 32 for the final ICD–10 MS–DRGs Version 33. In the proposed rule, we proposed the ICD–10 MS–DRGs Version 33 as the replacement logic for the ICD–9–CM based MS–DRGs Version 32 as part of the proposed MS–DRG updates for FY 2016. We invited public comments on how well the ICD–10 MS–DRGs Version 32 replicated the logic of the MS–DRGs Version 32 based on ICD–9–CM codes.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49356 through 49357 and 49363 through 49407), we addressed the public comments we received on the replication in the ICD–10 MS–DRGs Version 32 of the logic of the MS–DRGs Version 32 based on ICD–9–CM codes. We refer readers to that final rule for a discussion of the changes we made in response to public comments.

b. Basis for FY 2017 MS–DRG Updates

CMS encourages input from our stakeholders concerning the annual IPPS updates when that input is made available to us by December 7 of the year prior to the next annual proposed rule update. For example, to be considered for any updates or changes in FY 2017, comments and suggestions should have been submitted by December 7, 2015. The comments that were submitted in a timely manner for FY 2017 are discussed in this section of the final rule. Interested parties should submit any comments and suggestions for FY 2018 by December 7, 2016, via the new CMS MS–DRG Classification Change Requests Mailbox located at: *MSDRGClassification Change@cms.hhs.gov*.

Following are the changes we proposed to the MS–DRGs for FY 2017 in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24971 through 25016). We invited public comment on each of the MS–DRG classification proposed changes as well as our proposals to maintain certain existing MS–DRG classifications discussed in the proposed rule. In some cases, we proposed changes to the MS–DRG classifications based on our analysis of claims data. In other cases, we proposed to maintain the existing MS–DRG classification based on our analysis of claims data. For the FY 2017 proposed rule, our MS–DRG analysis was based on claims data from the December 2015 update of the FY 2015 MedPAR file, which contains hospital bills received through September 30, 2015, for discharges occurring through September 30, 2015. In our discussion of the proposed MS–DRG reclassification changes, we referred to our analysis of claims data from the ''December 2015 update of the FY 2015 MedPAR file.''

In this FY 2017 IPPS/LTCH PPS final rule, we summarize the public comments we received on our proposals, present our responses, and state our final policies. For this FY 2017 final rule, we did not perform any further MS–DRG analysis of claims data. Therefore, all of the data analysis is based on claims data from the December 2015 update of the FY 2015 MedPAR file, which contains hospital bills received through September 30, 2015, for discharges occurring through September 30, 2015.

As explained in previous rulemaking (76 FR 51487), in deciding whether to propose to make further modification to the MS–DRGs for particular circumstances brought to our attention, we consider whether the resource consumption and clinical characteristics of the patients with a given set of conditions are significantly different than the remaining patients in the MS–DRG. We evaluate patient care costs using average costs and lengths of stay

and rely on the judgment of our clinical advisors to decide whether patients are clinically distinct or similar to other patients in the MS–DRG. In evaluating resource costs, we consider both the absolute and percentage differences in average costs between the cases we select for review and the remainder of cases in the MS–DRG. We also consider variation in costs within these groups; that is, whether observed average differences are consistent across patients or attributable to cases that are extreme in terms of costs or length of stay, or both. Further, we consider the number of patients who will have a given set of characteristics and generally prefer not to create a new MS–DRG unless it would include a substantial number of cases.

In our examination of the claims data, we apply the following criteria established in FY 2008 (72 FR 47169) to determine if the creation of a new complication or comorbidity (CC) or major complication or comorbidity (MCC) subgroup within a base MS–DRG is warranted:

- A reduction in variance of costs of at least 3 percent.
- At least 5 percent of the patients in the MS–DRG fall within the CC or MCC subgroup.
- At least 500 cases are in the CC or MCC subgroup.
- There is at least a 20-percent difference in average costs between subgroups.
- There is a $2,000 difference in average costs between subgroups.

In order to warrant creation of a CC or MCC subgroup within a base MS–DRG, the subgroup must meet all five of the criteria.

We note that some of the issues evaluated for the FY 2017 MS–DRGs update continue to relate to the need for the ICD–10 MS–DRGs to accurately replicate the logic of the ICD–9–CM based version of the MS–DRGs. Replication is important because both the logic for the MS–DRGs and the data source used to calculate and develop proposed relative payment weights are based on the same MedPAR claims data. In other words, as the logic for the proposed and final FY 2017 ICD–10 MS–DRGs is based upon the FY 2015 ICD–9–CM MedPAR claims data, the data source used to calculate and develop the proposed and final FY 2017 relative payment weights is also based on the FY 2015 ICD–9–CM MedPAR claims data, including any MS–DRG classification changes discussed in the proposed rule and this final rule. This is consistent with how the current FY 2016 relative payment weights are based on the ICD–9–CM diagnosis and procedure codes from the FY 2014 MedPAR claims data that were grouped through the ICD–9–CM version of the FY 2016 GROUPER Version 33. We note that we made the MS–DRG GROUPER and Medicare Code Editor (MCE) ICD–9–CM Software Version 33 available to the public for use in analyzing ICD–9–CM data to create relative payment weights using ICD–9–CM data on our CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page.html?DLSort=0&DLEntries=10&DLPage=1&DLSortDir=ascending*. Therefore, as discussed in section II.G. of the preamble of this final rule, ICD–9–CM data were used for computing the proposed and final FY 2017 MS–DRG relative payment weights. As we did for FY 2016, we note that, for FY 2017, we have made the MS–DRG GROUPER and Medicare Code Editor (MCE) ICD–9–CM Software Version 34 available to the public for use in analyzing ICD–9–CM data to create relative payment weights using ICD–9–CM data on our CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2017-IPPS-Final-Rule-Home-Page.html*. If the ICD–9 and ICD–10 versions of MS–DRGs cease to be replications of each other, the relative payment weights computed using the ICD–9 claims data and MS–DRGs would be inconsistent with the relative payment weights assigned for the ICD–10 MS–DRGs, causing unintended payment redistributions. Thus, if the findings of our data analyses and the recommendations of our clinical advisors supported modifications to the current ICD–10 MS–DRG structure, prior to proposing any changes, we first evaluated whether the requested change could be replicated in the ICD–9–CM MS–DRGs. If the answer was ''yes,'' from a replication perspective, the change was considered feasible. If the answer was ''no,'' we examined whether the change in the ICD–10 MS–DRGs was likely to cause a significant number of patient cases to change or ''shift'' ICD–10 MS–DRGs. If relatively few patient cases would be impacted, we evaluated if it would be feasible to propose the change even though it could not be replicated by the ICD–9 MS–DRGs because it would not cause a material payment redistribution. For the ICD–10 MS–DRG classification change requests that could not be replicated in ICD–9–CM and that would cause a significant number of patient cases to shift MS–DRG assignment, we considered other alternatives.

Comment: Some commenters requested that CMS make the FY 2017 finalized MS–DRG GROUPER logic proposals retroactive to October 1, 2015 for current FY 2016 claims. One commenter stated that if the corrected replication issues were retroactive to October 1, 2015, private payers would be able to appropriately adjust claims that had an inappropriate MS–DRG assignment.

Response: We acknowledge the commenters' request. However, we note that, in accordance with section 1886(d)(4)(C) of the Act, we adjust the DRG classifications and relative weights at least annually. The FY 2016 ICD–10 MS–DRGs Version 33 were subject to review and comment by the public as part of the FY 2016 IPPS/LTCH PPS proposed and final rulemaking process. We encouraged the public to submit any comments on areas where they believed the ICD–10 MS–DRGs did not accurately reflect the GROUPER logic found in the ICD–9–CM MS–DRGs (80 FR 49356), and discussed in the FY 2016 rulemaking the requests we received to update the ICD–10 MS–DRGs to better replicate the ICD–9 MS–DRGs. In the FY 2017 IPPS/LTCH PPS proposed rule, we proposed further updates to the MS–DRG GROUPER logic, to be effecive October 1, 2016.

With regard to the ability of private payers to adjust claims affected by replication issues, as noted in the FY 2008 IPPS final rule (72 FR 47152), we have stated many times in the past that we encourage private insurers and other non-Medicare payers to make refinements to Medicare's DRG system to better suit the needs of the patients they serve. Consistent with our general approach for implementing updates to the MS–DRGs, the proposals adopted as final policy in this FY 2017 IPPS/LTCH PPS final rule will apply beginning with the FY 2017 MS–DRGs.

2. Pre-Major Diagnostic Category (Pre-MDC): Total Artificial Heart Replacement

An ICD–10 MS–DRG replication issue regarding the assignment of two ICD–10–PCS procedure codes was identified after the October 1, 2015 implementation of the Version 33 ICD–10 MS–DRGs. ICD–10–PCS procedure codes 02RK0JZ (Replacement of right ventricle with synthetic substitute, open approach) and 02RL0JZ (Replacement of left ventricle with synthetic substitute, open approach), when reported together, describe a biventricular heart replacement (artificial heart). Under the Version 32 ICD–9–CM based MS–DRGs, this procedure was described by ICD–9–CM procedure code 37.52 (Implantation

of total internal biventricular heart replacement system) and grouped to MS–DRGs 001 and 002 (Heart Transplant or Implant of Heart Assist System with and without MCC, respectively).

As discussed in section II.F.1.a. of the preamble of the proposed rule and this final rule, to assist in the conversion from the ICD–9–CM based MS–DRGs to ICD–10, beginning in FY 2011, draft versions of the ICD–10 based MS–DRGs were developed and made available for public comment. The two ICD–10–PCS procedure codes (02RK0JZ and 02RL0JZ) were assigned as a ''cluster'' to the draft ICD–10 based MS–DRGs 001 and 002 in prior draft versions of the ICD–10 MS–DRGs. In ICD–10–PCS, a cluster is the term used to describe when a combination of ICD–10–PCS procedure codes are needed to fully satisfy the equivalent meaning of an ICD–9–CM procedure code for it to be considered a plausible translation. Upon review of prior draft versions of the ICD–10 MS–DRGs, it was determined that Version 30 was the last version to include ICD–10–PCS procedure codes 02RK0JZ and 02RL0JZ as a code cluster (from ICD–9–CM procedure code 37.52) that grouped to the draft ICD–10 based MS–DRGs 001 and 002. Subsequent draft versions of the ICD–10 MS–DRGs inadvertently omitted this code cluster from those MS–DRGs.

Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24971 through 24972), for FY 2017, we proposed to assign ICD–10–PCS procedure codes 02RK0JZ and 02RL0JZ as a code cluster to ICD–10 Version 34 MS–DRGs 001 and 002 (Heart Transplant or Implant of Heart Assist System with and without MCC, respectively) to accurately replicate the Version 32 ICD–9–CM based MS–DRG logic of procedure code 37.52. We invited public comments on our proposal.

Comment: Commenters supported the proposal to assign ICD–10–PCS procedure codes 02RK0JZ and 02RL0JZ as a code cluster to ICD–10 Version 34 MS–DRGs 001 and 002. The commenters noted that this code cluster assignment is crucial to assure that all consumers who require a heart replacement with a total artificial heart will have access to care, regardless of whether they are a Medicare beneficiary, a Medicaid recipient, or a privately insured individual. Other commenters noted the proposal was reasonable, given the data, the ICD–10–PCS codes, and the information provided.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to assign ICD–10–PCS procedure codes 02RK0JZ (Replacement of right ventricle with synthetic substitute, open approach) and 02RL0JZ (Replacement of left ventricle with synthetic substitute, open approach) as a code cluster to MS–DRGs 001 and 002 (Heart Transplant or Implant of Heart Assist System with and without MCC, respectively) effective October 1, 2016 for ICD–10 MS–DRGs Version 34.

3. MDC 1 (Diseases and Disorders of the Nervous System)

a. Endovascular Embolization (Coiling) or Occlusion of Head and Neck Procedures

We received a repeat request to change the MS–DRG assignment for procedure codes describing endovascular embolization (coiling) or occlusion of the head and neck. This topic was discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28005 through 28007); the FY 2015 IPPS/LTCH PPS final rule (79 FR 49883 through 49886); the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24351 through 24356); and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49358 through 49363). For these 2 fiscal years, we did not change the MS–DRG assignment for procedure codes describing endovascular embolization (coiling) or occlusion of the head and neck for the reasons discussed in these proposed and final rules.

For FY 2017, the requestor again asked that CMS change the MS–DRG assignment for procedure codes describing endovascular embolization or occlusion of the head and neck as well as several other codes describing endovascular procedures of the head and neck.

The ICD–10–PCS procedure codes listed in the following table capture endovascular embolization or occlusion of the head and neck procedures that are assigned to the following MS–DRGs in ICD–10 Version 33 MS–DRGs: MS–DRG 020 (Intracranial Vascular Procedures with Principal Diagnosis of Hemorrhage with MCC); MS–DRG 021 (Intracranial Vascular Procedures with Principal Diagnosis of Hemorrhage with CC); MS–DRG 022 (Intracranial Vascular Procedures with Principal Diagnosis of Hemorrhage without CC/MCC); MS–DRG 023 (Craniotomy with Major Device Implant/Acute Complex CNS Principal Diagnosis with MCC or Chemo Implant); MS–DRG 024 (Craniotomy with Major Device Implant/Acute Complex CNS Principal Diagnosis without MCC); MS–DRG 025 (Craniotomy and Endovascular Intracranial Procedures with MCC); MS–DRG 026 (Craniotomy and Endovascular Intracranial Procedures with CC); and MS–DRG 027 (Craniotomy and Endovascular Intracranial Procedures without CC/MCC):

ICD–10–PCS Codes for Endovascular Embolization or Occlusion of the Head and Neck Procedures Assigned to MS–DRGs 020 Through 027 in ICD–10 MS–DRGs Version 33

ICD–10–PCS code	Code description
03LG3BZ	Occlusion of intracranial artery with bioactive intraluminal device, percutaneous approach.
03LG3DZ	Occlusion of intracranial artery with intraluminal device, percutaneous approach.
03LG4BZ	Occlusion of intracranial artery with bioactive intraluminal device, percutaneous endoscopic approach.
03LG4DZ	Occlusion of intracranial artery with intraluminal device, percutaneous endoscopic approach.
03LH3BZ	Occlusion of right common carotid artery with bioactive intraluminal device, percutaneous approach.
03LH3DZ	Occlusion of right common carotid artery with intraluminal device, percutaneous approach.
03LH4BZ	Occlusion of right common carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03LH4DZ	Occlusion of right common carotid artery with intraluminal device, percutaneous endoscopic approach.
03LJ3BZ	Occlusion of left common carotid artery with bioactive intraluminal device, percutaneous approach.
03LJ3DZ	Occlusion of left common carotid artery with intraluminal device, percutaneous approach.
03LJ4BZ	Occlusion of left common carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03LJ4DZ	Occlusion of left common carotid artery with intraluminal device, percutaneous endoscopic approach.
03LK3BZ	Occlusion of right internal carotid artery with bioactive intraluminal device, percutaneous approach.
03LK3DZ	Occlusion of right internal carotid artery with intraluminal device, percutaneous approach.
03LK4BZ	Occlusion of right internal carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.

ICD–10–PCS CODES FOR ENDOVASCULAR EMBOLIZATION OR OCCLUSION OF THE HEAD AND NECK PROCEDURES ASSIGNED TO MS–DRGS 020 THROUGH 027 IN ICD–10 MS–DRGS VERSION 33—Continued

ICD–10–PCS code	Code description
03LK4DZ	Occlusion of right internal carotid artery with intraluminal device, percutaneous endoscopic approach.
03LL3BZ	Occlusion of left internal carotid artery with bioactive intraluminal device, percutaneous approach.
03LL3DZ	Occlusion of left internal carotid artery with intraluminal device, percutaneous approach.
03LL4BZ	Occlusion of left internal carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03LL4DZ	Occlusion of left internal carotid artery with intraluminal device, percutaneous endoscopic approach.
03LM3BZ	Occlusion of right external carotid artery with bioactive intraluminal device, percutaneous approach.
03LM3DZ	Occlusion of right external carotid artery with intraluminal device, percutaneous approach.
03LM4BZ	Occlusion of right external carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03LM4DZ	Occlusion of right external carotid artery with intraluminal device, percutaneous endoscopic approach.
03LN3BZ	Occlusion of left external carotid artery with bioactive intraluminal device, percutaneous approach.
03LN3DZ	Occlusion of left external carotid artery with intraluminal device, percutaneous approach.
03LN4BZ	Occlusion of left external carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03LN4DZ	Occlusion of left external carotid artery with intraluminal device, percutaneous endoscopic approach.
03LP3BZ	Occlusion of right vertebral artery with bioactive intraluminal device, percutaneous approach.
03LP3DZ	Occlusion of right vertebral artery with intraluminal device, percutaneous approach.
03LP4BZ	Occlusion of right vertebral artery with bioactive intraluminal device, percutaneous endoscopic approach.
03LP4DZ	Occlusion of right vertebral artery with intraluminal device, percutaneous endoscopic approach.
03LQ3BZ	Occlusion of left vertebral artery with bioactive intraluminal device, percutaneous approach.
03LQ3DZ	Occlusion of left vertebral artery with intraluminal device, percutaneous approach.
03LQ4BZ	Occlusion of left vertebral artery with bioactive intraluminal device, percutaneous endoscopic approach.
03LQ4DZ	Occlusion of left vertebral artery with intraluminal device, percutaneous endoscopic approach.
03LR3DZ	Occlusion of face artery with intraluminal device, percutaneous approach.
03LR4DZ	Occlusion of face artery with intraluminal device, percutaneous endoscopic approach.
03LS3DZ	Occlusion of right temporal artery with intraluminal device, percutaneous approach.
03LS4DZ	Occlusion of right temporal artery with intraluminal device, percutaneous endoscopic approach.
03LT3DZ	Occlusion of left temporal artery with intraluminal device, percutaneous approach.
03LT4DZ	Occlusion of left temporal artery with intraluminal device, percutaneous endoscopic approach.
03VG3BZ	Restriction of intracranial artery with bioactive intraluminal device, percutaneous approach.
03VG3DZ	Restriction of intracranial artery with intraluminal device, percutaneous approach.
03VG4BZ	Restriction of intracranial artery with bioactive intraluminal device, percutaneous endoscopic approach.
03VG4DZ	Restriction of intracranial artery with intraluminal device, percutaneous endoscopic approach.
03VH3BZ	Restriction of right common carotid artery with bioactive intraluminal device, percutaneous approach.
03VH3DZ	Restriction of right common carotid artery with intraluminal device, percutaneous approach.
03VH4BZ	Restriction of right common carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03VH4DZ	Restriction of right common carotid artery with intraluminal device, percutaneous endoscopic approach.
03VJ3BZ	Restriction of left common carotid artery with bioactive intraluminal device, percutaneous approach.
03VJ3DZ	Restriction of left common carotid artery with intraluminal device, percutaneous approach.
03VJ4BZ	Restriction of left common carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03VJ4DZ	Restriction of left common carotid artery with intraluminal device, percutaneous endoscopic approach.
03VK3BZ	Restriction of right internal carotid artery with bioactive intraluminal device, percutaneous approach.
03VK3DZ	Restriction of right internal carotid artery with intraluminal device, percutaneous approach.
03VK4BZ	Restriction of right internal carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03VK4DZ	Restriction of right internal carotid artery with intraluminal device, percutaneous endoscopic approach.
03VL3BZ	Restriction of left internal carotid artery with bioactive intraluminal device, percutaneous approach.
03VL3DZ	Restriction of left internal carotid artery with intraluminal device, percutaneous approach.
03VL4BZ	Restriction of left internal carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03VL4DZ	Restriction of left internal carotid artery with intraluminal device, percutaneous endoscopic approach.
03VM3BZ	Restriction of right external carotid artery with bioactive intraluminal device, percutaneous approach.
03VM3DZ	Restriction of right external carotid artery with intraluminal device, percutaneous approach.
03VM4BZ	Restriction of right external carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03VM4DZ	Restriction of right external carotid artery with intraluminal device, percutaneous endoscopic approach.
03VN3BZ	Restriction of left external carotid artery with bioactive intraluminal device, percutaneous approach.
03VN3DZ	Restriction of left external carotid artery with intraluminal device, percutaneous approach.
03VN4BZ	Restriction of left external carotid artery with bioactive intraluminal device, percutaneous endoscopic approach.
03VN4DZ	Restriction of left external carotid artery with intraluminal device, percutaneous endoscopic approach.
03VP3BZ	Restriction of right vertebral artery with bioactive intraluminal device, percutaneous approach.
03VP3DZ	Restriction of right vertebral artery with intraluminal device, percutaneous approach.
03VP4BZ	Restriction of right vertebral artery with bioactive intraluminal device, percutaneous endoscopic approach.
03VP4DZ	Restriction of right vertebral artery with intraluminal device, percutaneous endoscopic approach.
03VQ3BZ	Restriction of left vertebral artery with bioactive intraluminal device, percutaneous approach.
03VQ3DZ	Restriction of left vertebral artery with intraluminal device, percutaneous approach.
03VQ4BZ	Restriction of left vertebral artery with bioactive intraluminal device, percutaneous endoscopic approach.
03VQ4DZ	Restriction of left vertebral artery with intraluminal device, percutaneous endoscopic approach.
03VR3DZ	Restriction of face artery with intraluminal device, percutaneous approach.
03VR4DZ	Restriction of face artery with intraluminal device, percutaneous endoscopic approach.
03VS3DZ	Restriction of right temporal artery with intraluminal device, percutaneous approach.
03VS4DZ	Restriction of right temporal artery with intraluminal device, percutaneous endoscopic approach.
03VT3DZ	Restriction of left temporal artery with intraluminal device, percutaneous approach.
03VT4DZ	Restriction of left temporal artery with intraluminal device, percutaneous endoscopic approach.
03VU3DZ	Restriction of right thyroid artery with intraluminal device, percutaneous approach.

ICD–10–PCS CODES FOR ENDOVASCULAR EMBOLIZATION OR OCCLUSION OF THE HEAD AND NECK PROCEDURES ASSIGNED TO MS–DRGS 020 THROUGH 027 IN ICD–10 MS–DRGS VERSION 33—Continued

ICD–10–PCS code	Code description
03VU4DZ	Restriction of right thyroid artery with intraluminal device, percutaneous endoscopic approach.
03VV3DZ	Restriction of left thyroid artery with intraluminal device, percutaneous approach.
03VV4DZ	Restriction of left thyroid artery with intraluminal device, percutaneous endoscopic approach.

Cases reporting any of the ICD–10–PCS procedures codes listed in the table above that are assigned to MS–DRGs 020, 021, and 022 under MDC 1 require a principal diagnosis of hemorrhage. Cases reporting any of the ICD–10–PCS procedure codes listed in the table above that are assigned to MS–DRGs 023 and 024 require the insertion of a major implant or an acute complex central nervous system (CNS) principal diagnosis. Cases reporting any of the ICD–10–PCS procedure codes listed in the table above that are assigned to MS–DRGs 025, 026, and 027 do not have a principal diagnosis of hemorrhage, an acute complex CNS principal diagnosis, or a major device implant.

The requestor expressed concerns about the appropriateness of the MS–DRG assignment for the endovascular embolization or occlusion of head and neck procedures. The requestor stated that past data demonstrated that the cost of cases involving endovascular coils exceeds the average cost of all cases within each of the MS–DRGs to which these procedures are assigned. The requestor pointed out that these procedures were formerly captured by the following ICD–9–CM codes that were assigned to MS–DRGs 020 through 027:

- 39.72 (Endovascular (total) embolization or occlusion of head and neck vessels);
- 39.75 (Endovascular embolization or occlusion of vessel(s) of head or neck using bare coils); and
- 39.76 (Endovascular embolization or occlusion of vessel(s) of head or neck using bioactive coils).

The commenter also expressed concern about the appropriateness of the current ICD–10 MS–DRG assignment of the following ICD–9–CM codes that describe other endovascular procedures of head and neck that were previously assigned to MS–DRGs 023 through 027 in the ICD–9–CM MS–DRGs Version 32. The commenter stated that these procedures are more clinically complex than other procedures assigned to these MS–DRGs.

- 00.62 (Percutaneous angioplasty of intracranial vessels(s));
- 39.74 (Endovascular removal of obstruction from head and neck vessel(s)); and
- 39.79 (Other endovascular procedures on other vessels).

As we discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24972 through 24976), we examined claims data from the December 2015 update of the FY 2015 MedPAR file for the endovascular embolization or occlusion of the head and neck procedures or other endovascular procedures reported under ICD–9–CM procedure codes 00.62, 39.72, 39.74, 39.75, 39.76, and 39.79 in MS–DRGs 020 through 027. The table below shows our findings.

ENDOVASCULAR EMBOLIZATION OR OCCLUSION OF THE HEAD AND NECK PROCEDURES AND OTHER ENDOVASCULAR PROCEDURES

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 020—All cases	1,213	16.44	$70,716
MS–DRG 020—Cases with procedure code 00.62, 39.72, 39.74, 39.75, 39.76, or 39.79	895	16.15	72,357
MS–DRG 021—All cases	350	13.74	53,289
MS–DRG 021—Cases with procedure code 00.62, 39.72, 39.74, 39.75, 39.76, or 39.79	272	13.21	53,478
MS–DRG 022—All cases	84	7.83	33,598
MS–DRG 022—Cases with procedure code 00.62, 39.72, 39.74, 39.75, 39.76, or 39.79	63	7.27	33,606
MS–DRG 023—All cases	6,360	10.63	38,204
MS–DRG 023—Cases with procedure code 00.62, 39.72, 39.74, 39.75, 39.76, or 39.79	2,183	8.57	38,935
MS–DRG 024—All cases	2,376	5.52	28,270
MS–DRG 024—Cases with procedure code 00.62, 39.72, 39.74, 39.75, 39.76, or 39.79	1,402	5.46	28,543
MS–DRG 025—All cases	17,756	9.19	29,657
MS–DRG 025—Cases with procedure code 00.62, 39.72, 39.74, 39.75, 39.76 or 39.79	671	9.20	47,579
MS–DRG 026—All cases	7,630	5.80	21,441
MS–DRG 026—Cases with procedure code 00.62, 39.72, 39.74, 39.75, 39.76, or 39.79	825	3.11	27,429
MS–DRG 027—All cases	9,628	2.99	17,158
MS–DRG 027—Cases with procedure code 00.62, 39.72, 39.74, 39.75, 39.76 or 39.79	1,847	1.62	22,845

As can be seen from the table, most of the cases of endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures reported with procedure codes 00.62, 39.72, 39.74, 39.75, 39.76, and 39.79 occur in MS–DRGs 023, 024, and 027. There were 2,183 of these procedure cases reported in MS–DRG 023 with an average length of stay of 8.57 days and average costs of $38,935, compared to an average length of stay of 10.63 days and average costs of $38, 204 for all 6,360 cases reported in MS–DRG 023. There were 1,402 of these cases reported in MS–DRG 024 with an average length of stay of 5.46 days and average costs of $28,543, compared to an average length of stay of 5.52 days and average costs of $28,270 for all 2,376 cases reported in MS–DRG 024. There were 1,847 of these cases reported in MS–DRG 027 with an average length of stay of 1.62 days and average costs of $22,845, compared to an average length of stay of 2.99 days and average costs of $17,158 for all

9,628 cases reported in MS–DRG 027. The average costs for endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures cases reported in MS–DRGs 023 and 024 are not significantly different from the average costs for all cases reported in MS–DRGs 023 and 024. The average costs for endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures cases reported in MS–DRG 027 are higher ($22,845) than the average costs of all cases reported in MS–DRG 027 ($17,158). However, average costs are not significantly different for the endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures cases reported in MS–DRG 020 ($72,357) compared to the average costs for all cases ($70,716) reported in MS–DRG 020; for the endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures cases reported in MS–DRG 021 ($53,478) compared to the average costs for all cases ($53,289) reported in MS–DRG 021; and for the endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures cases reported in MS–DRG 022 ($33,606) compared to the average costs for all cases ($33,598) reported in MS–DRG 022.

Average costs were higher for the 671 endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures cases reported in MS–DRG 025 ($47,579) compared to the average costs for all 17,756 cases ($29,657) reported in MS–DRG 025. The average costs also were higher for the 825 endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures cases reported in MS–DRG 26 ($27,429) compared to the average costs for all 7,630 cases ($21,441) reported in MS–DRG 26. Given that average costs are similar for most endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures cases reported in MS–DRGs 020, 021, 022, 023, 024, 025, 026, and 027, we stated in the proposed rule that we did not believe that all endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures should be reassigned from these eight MS–DRGs.

We also examined the average costs for each specific ICD–9–CM code compared to the average costs of all cases within each of the eight MS–DRGs. The following table shows our findings.

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 020—All cases	1,213	16.44	$70,716
MS–DRG 020—Cases with code 00.62	11	16.09	95,422
MS–DRG 020—Cases with code 39.72	422	16.31	74,951
MS–DRG 020—Cases with code 39.74	9	16.78	71,478
MS–DRG 020—Cases with code 39.75	424	15.79	69,081
MS–DRG 020—Cases with code 39.76	39	18.26	71,630
MS–DRG 020—Cases with code 39.79	25	16.64	73,043
MS–DRG 021—All cases	350	13.74	53,289
MS–DRG 021—Cases with code 00.62	1	11.00	75,492
MS–DRG 021—Cases with code 39.72	130	13.12	54,715
MS–DRG 021—Cases with code 39.74	1	11.00	75,492
MS–DRG 021—Cases with code 39.75	133	13.46	52,819
MS–DRG 021—Cases with code 39.76	7	10.57	48,749
MS–DRG 021—Cases with code 39.79	3	12.00	40,458
MS–DRG 022—All cases	84	7.83	33,598
MS–DRG 022—Cases with code 00.62	0	0	0
MS–DRG 022—Cases with code 39.72	40	6.43	32,598
MS–DRG 022—Cases with code 39.74	0	0	0
MS–DRG 022—Cases with code 39.75	21	8.81	32,690
MS–DRG 022—Cases with code 39.76	3	10.00	62,417
MS–DRG 022—Cases with code 39.79	0	0	0
MS–DRG 023—All cases	6,360	10.63	38,204
MS–DRG 023—Cases with code 00.62	67	9.30	43,741
MS–DRG 023—Cases with code 39.72	56	11.14	52,589
MS–DRG 023—Cases with code 39.74	2,016	8.30	38,047
MS–DRG 023—Cases with code 39.75	20	12.65	53,837
MS–DRG 023—Cases with code 39.76	3	23.00	84,947
MS–DRG 023—Cases with code 39.79	71	13.08	50,720
MS–DRG 024—All cases	2,376	5.52	28,270
MS–DRG 024—Cases with code 00.62	76	6.74	32,415
MS–DRG 024—Cases with code 39.72	31	6.35	29,977
MS–DRG 024—Cases with code 39.74	1,284	5.35	28,268
MS–DRG 024—Cases with code 39.75	8	6.50	50,333
MS–DRG 024—Cases with code 39.76	2	1.50	19,567
MS–DRG 024—Cases with code 39.79	27	6.74	28,019
MS–DRG 025—All cases	17,756	9.19	29,657
MS–DRG 025—Cases with code 00.62	17	5.88	29,036
MS–DRG 025—Cases with code 39.72	380	9.46	51,082
MS–DRG 025—Cases with code 39.74	55	9.87	45,895
MS–DRG 025—Cases with code 39.75	139	8.94	52,188
MS–DRG 025—Cases with code 39.76	25	5.84	38,654
MS–DRG 025—Cases with code 39.79	82	11.04	39,839
MS–DRG 026—All cases	7,630	5.80	21,441
MS–DRG 026—Cases with code 00.62	31	3.48	25,611
MS–DRG 026—Cases with code 39.72	481	3.00	27,180
MS–DRG 026—Cases with code 39.74	16	4.69	27,519

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 026—Cases with code 39.75	253	2.77	26,863
MS–DRG 026—Cases with code 39.76	31	3.32	27,891
MS–DRG 026—Cases with code 39.79	45	5.42	37,410
MS–DRG 027—All cases	9,628	2.99	17,158
MS–DRG 027—Cases with code 00.62	61	2.23	21,337
MS–DRG 027—Cases with code 39.72	1,159	1.58	22,893
MS–DRG 027—Cases with code 39.74	13	1.62	69,081
MS–DRG 027—Cases with code 39.75	580	1.63	23,296
MS–DRG 027—Cases with code 39.76	61	1.74	27,403
MS–DRG 027—Cases with code 39.79	30	1.53	17,740

As can be seen from the table above, there were a large number of cases reporting procedure code 39.74 in MS–DRGs 023 and 024. There were 2,016 cases that reported procedure code 39.74 in MS–DRG 023 compared to 6,360 total cases reported in the MS–DRG. The cases that reported procedure code 39.74 in MS–DRG 023 had an average length of stay of 8.30 days and average costs of $38,047, compared to an average length of stay of 10.63 days and average costs of $38,204 for all cases reported in MS–DRG 023. There were 1,284 cases that reported procedure code 39.74 in MS–DRG 024 compared to 2,376 total cases reported in MS–DRG 024. The cases that reported procedure code 39.74 in MS–DRG 024 had an average length of stay of 5.35 days and average costs of $28,268, compared to an average length of stay of 5.52 days and average costs of $28,270 for all cases reported in MS–DRG 024. The average length of stay and average costs for cases that reported procedure code 39.74 are very similar to the average length of stay and average costs for all cases reported in MS–DRGs 023 and 024. The only other group of endovascular embolization or occlusion of the head and neck procedures and other endovascular procedures cases that exceeded 1,000 in number was reported in MS–DRG 027. There were 1,159 cases that reported procedure code 39.72 in MS–DRG 027, compared to 9,628 total cases reported in MS–DRG 027. The cases that reported procedure code 39.72 in MS–DRG 027 had an average length of stay of 1.58 days and average costs of $22,893, compared to an average length of stay of 2.99 days and average costs of $17,158 for all cases reported in MS–DRG 027. In other words, the cases that reported procedure code 39.72 in MS–DRG 027 had a shorter average length of stay and average costs that were $5,735 higher than the average costs for all cases reported in MS–DRG 027. The cases that reported procedure code 39.72 in MS–DRG 020 had a shorter average length of stay and average costs that were $4,235 higher than the average costs for all cases reported in MS–DRG 020. However, the average costs for the cases that reported procedure code 39.72 in MS–DRGs 021, 022, and 024 were close to the average costs for all cases reported in the three MS–DRGs ($54,715 compared to $53,289 in MS–DRG 021; $32,598 compared to $33,598 in MS–DRG 022; and $29,997 compared to $28,270 in MS–DRG 024).

Our clinical advisors reviewed this issue and advised us that the endovascular embolization or occlusion of head and neck procedures and other endovascular procedures currently are appropriately assigned to MS–DRGs 020 through 027. They did not support reassigning these procedures from MS–DRGs 020 through 027 to another MS–DRG or creating a new MS–DRG for these procedures. Our clinical advisors stated that these procedures are all clinically similar to other procedures in these MS–DRGs. In addition, they stated that the surgical techniques are all designed to correct the same clinical problem and advised us against reassigning the procedures from MS–DRGs 020 through 027.

Based on the findings from our data analyses and the recommendations from our clinical advisors, in the FY 2017 IPPS/LTCH PPS proposed rule, we did not propose to reassign the cited endovascular embolization or occlusion of head and neck procedures and other endovascular procedures from MS–DRGs 020 through 027 to another MS–DRG or to create a new MS–DRG for these procedures for FY 2017. We invited public comments on our proposal to maintain the current MS–DRG assignments of these procedures in MS–DRGs 020 through 027.

Comment: Commenters supported the proposal to maintain the current MS–DRG assignments of endovascular embolization or occlusion of head and neck procedures and other endovascular procedures in MS–DRGs 020 through 027. The commenters did not support reassigning these procedures from MS–DRGs 020 through 027 to another MS–DRG or creating a new MS–DRG for these procedures. The commenters stated that the proposal was reasonable, given the data, the ICD–10–PCS codes, and the information provided. One commenter believed that the cost data and clinical profile of endovascular embolization procedures support MS–DRG refinements. This commenter requested that CMS reexamine the issue when ICD–10 claims data become available.

Response: We appreciate the commenters' support. We will review this and other related MS–DRG assignments once ICD–10 claims data become available.

After consideration of the public comments we received, we are finalizing our proposal to maintain the current MS–DRG assignments for endovascular embolization or occlusion of head and neck procedures and other endovascular procedures in MS–DRGs 020 through 027.

b. Mechanical Complication Codes

We received a request to reassign the following four ICD–10–CM diagnosis codes from MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs) under MS–DRGs 919, 920, and 921 (Complications of Treatment with MCC, with CC, and without CC/MCC, respectively) to MDC 1 (Diseases and Disorders of the Nervous System) under MS–DRGs 091, 092, and 093 (Other Disorders of the Nervous System with MCC, with CC, and without CC/MCC, respectively):

- T85.610A (Breakdown (mechanical) of epidural and subdural infusion catheter, initial encounter);
- T85.620A (Displacement of epidural and subdural infusion catheter, initial encounter);
- T85.630A (Leakage of epidural and subdural infusion catheter, initial encounter); and
- T85.690A (Other mechanical complication of epidural and subdural infusion catheter, initial encounter).

The requestor stated that these ICD–10–CM diagnosis code titles clearly describe mechanical complications of nervous system devices, implants, or grafts and are unquestionably nervous system codes. Therefore, the requestor recommended that these diagnosis codes be reassigned to MDC 1 under MS–DRGs 091, 092, and 093.

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24976), we examined ICD–10–CM diagnosis codes T85.610A, T85.620A, T85.630A, and T85.690A that are currently assigned to MDC 21 under MS–DRGs 919, 920, and 921. We noted that the predecessor ICD–9–CM diagnosis code for these four ICD–10–CM diagnosis codes was diagnosis code 996.59 (Mechanical complication due to other implant and internal device, not elsewhere classified), which also was assigned to MDC 21 under MS–DRGs 919, 920, and 921. ICD–9–CM diagnosis code 996.59 did not describe the location of the device. However, ICD–10–CM diagnosis codes T85.610A, T85.620A, T85.630A, and T85.690A provide additional detail that describes the location of the mechanical complication as being within the nervous system.

Based on the results of our examination, we agreed with the requestor that ICD–10–CM diagnosis codes T85.610A, T85.620A, T85.630A, and T85.690A describe conditions occurring within the nervous system. Within the ICD–9–CM MS–DRGs, codes describing nervous system disorders were assigned to MDC 1. The prior ICD–9–CM codes for mechanical complications did not indicate the type of complication and therefore could not be assigned to a specific MDC. Therefore, the nonspecific complication codes were assigned to MDC 21. These new ICD–10–CM diagnosis codes describe concepts not previously captured by the ICD–9–CM codes and capture nervous system conditions. Therefore, ICD–10–CM diagnosis codes T85.610A, T85.620A, T85.630A, and T85.690A should be reassigned from MDC 21 under MS–DRGs 919, 920, and 921 to MDC 1 under MS–DRGs 091, 092, and 093. Our clinical advisors reviewed this issue and also agree that the four ICD–10–CM diagnosis codes describe conditions occurring within the nervous system and therefore should be reassigned from MDC 21 to MDC 1. Based on the results of our analysis and the recommendations of our clinical advisors, in the FY 2017 IPPS/LTCH PPS proposed rule, we proposed to reassign ICD–10–CM diagnosis codes T85.610A, T85.620A, T85.630A, and T85.690A from MDC 21 under MS–DRGs 919, 920, and 921 to MDC 1 under MS–DRGs 091, 092, and 093.

We invited public comments on our proposal.

Comment: Commenters supported the proposal to reassign ICD–10–CM diagnosis codes T85.610A, T85.620A, T85.630A, and T85.690A from MDC 21 under MS–DRGs 919, 920, and 921 to MDC 1 under MS–DRGs 091, 092, and 093.

One commenter who supported the proposal suggested that the proposed MS–DRG assignment for 18 additional diagnosis codes describing similar conditions affecting the nervous system is inaccurate, both clinically and in terms of MS–DRG grouping principles. Specifically, the commenter requested that the 18 ICD–10–CN diagnosis codes in the following table be reassigned from MDC 21 under DRGs 919, 920 and 921, as currently proposed, to MDC 1 under MS–DRGs 091, 092, and 093.

ICD–10–CM DIAGNOSIS CODES RECOMMENDED BY COMMENTER FOR REASSIGNMENT FROM MDC 21 TO MDC 1

T85.615A (Breakdown (mechanical) of other nervous system device, implant or graft, initial encounter).
T85.625A (Displacement of other nervous system device, implant or graft, initial encounter).
T85.635A (Leakage of other nervous system device, implant or graft, initial encounter).
T85.695A (Other mechanical complication of other nervous system device, implant or graft, initial encounter).
T85.730A (Infection and inflammatory reaction due to ventricular intracranial (communicating) shunt, initial encounter).
T85.731A (Infection and inflammatory reaction due to implanted electronic neurostimulator of brain, electrode (lead), initial encounter).
T85.732A (Infection and inflammatory reaction due to implanted electronic neurostimulator of peripheral nerve, electrode (lead), initial encounter).
T85.733A (Infection and inflammatory reaction due to implanted electronic neurostimulator of spinal cord, electrode (lead), initial encounter).
T85.734A (Infection and inflammatory reaction due to implanted electronic neurostimulator, generator, initial encounter).
T85.735A (Infection and inflammatory reaction due to cranial or spinal infusion catheter, initial encounter).
T85.738A (Infection and inflammatory reaction due to other nervous system device, implant or graft, initial encounter).
T85.810A (Embolism due to nervous system prosthetic devices, implants and grafts, initial encounter).
T85.820A (Fibrosis due to nervous system prosthetic devices, implants and grafts, initial encounter).
T85.830A (Hemorrhage due to nervous system prosthetic devices, implants and grafts, initial encounter).
T85.840A (Pain due to nervous system prosthetic devices, implants and grafts, initial encounter).
T85.850A (Stenosis due to nervous system prosthetic devices, implants and grafts, initial encounter).
T85.860A (Thrombosis due to nervous system prosthetic devices, implants and grafts, initial encounter).
T85.890A (Other specified complication of nervous system prosthetic devices, implants and grafts, initial encounter).

Response: We appreciate the commenters' support of our proposal. We also appreciate the commenter's recommendation to reassign the additional 18 ICD–10–CM diagnosis codes describing procedures performed on the nervous system from MDC 21 under MS–DRGs 919, 920, and 921 to MDC 1 under MS DRGs 091, 092, and 093. Our clinical advisors agree that these 18 diagnosis codes also should be reassigned from MDC 21 under MS–DRGs 919, 920 and 921 to MDC1 under MS–DRGs 091, 092 and 093.

After consideration of the public comments we received, we are finalizing our proposal to reassign ICD–10–CM diagnosis codes T85.610A, T85.620A, T85.630A, and T85.690A from MDC 21 under MS–DRGs 919, 920, and 921 to MDC 1 under MS–DRGs 091, 092, and 093. The official code titles for these four codes were revised after publication of the proposed rule. Effective October 1, 2016, the revised code titles are as follows (and are reflected in Table 6E associated with this final rule, which is available via the Internet on the CMS Web site):

- T85.610A (Breakdown (mechanical) of cranial or spinal infusion catheter, initial encounter);
- T85.620A (Displacement of cranial or spinal infusion catheter, initial encounter);
- T85.630A (Leakage of cranial or spinal infusion catheter, initial encounter); and
- T85.690A (Other mechanical complication of cranial or spinal infusion catheter, initial encounter).

We also are reassigning the 18 ICD–10–CM diagnosis codes listed in the table above that were recommended by the commenter from MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs) under MS–DRGs 919, 920, and 921 (Complications of Treatment with MCC, with CC, and without CC/MCC, respectively) to MDC 1 (Diseases and Disorders of the Nervous System) under MS–DRGs 091, 092, and 093 (Other Disorders of the Nervous System with MCC, with CC, and without CC/MCC, respectively) effective October 1, 2016. These 18 codes also are reflected in Table 6E associated with this final rule, which is available via the Internet on the CMS Web site.

4. MDC 4 (Diseases and Disorders of the Ear, Nose, Mouth and Throat)

a. Reassignment of Diagnosis Code R22.2 (Localized Swelling, Mass and Lump, Trunk)

We received a request to reassign ICD–10–CM diagnosis code R22.2 (Localized swelling, mass and lump, trunk) from MDC 4 (Diseases and Disorders of the Respiratory System) to MDC 9 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast). The requestor stated that this code is used to capture a buttock mass. The requestor pointed out that the ICD–10–CM index for localized swelling and localized mass directs the coder to diagnosis code R22.2 for both the chest and the trunk as sites.

We reviewed this issue and note that diagnosis code R22.2 is included in a category of ICD–10–CM codes describing symptoms and signs involving the skin and subcutaneous tissue (categories R20 through R23). Diagnosis code R22.2 is clearly designated within the ICD–10 coding system as a code that describes a condition of the skin and subcutaneous tissue. Therefore, we agree with the requester that ICD–10–CM diagnosis code R22.2 should be reassigned from MDC 4 to MDC 9. One of the predecessor ICD–9–CM codes for ICD–10–CM diagnosis code R22.2 was diagnosis code 782.2 (Localized superficial swelling, mass, or lump), which is assigned to MS–DRG 606 and 607 (Minor Skin Disorders with and without MCC, respectively). Our clinical advisors reviewed this issue and agree that ICD–10–CM diagnosis code R22.2 captures a skin diagnosis. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24976), for FY 2017, we proposed to reassign ICD–10–CM diagnosis code R22.2 from MDC 4 to MDC 9 under MS–DRGs 606 and 607 (Minor Skin Disorders with and without MCC, respectively).

We invited public comments on our proposal to reassign ICD–10–CM diagnosis code R22.2 from MDC 4 to MDC 9 under MS–DRGs 606 and 607.

Comment: Commenters supported the proposal to reassign ICD–10–CM diagnosis code R22.2 from MDC 4 to MDC 9 under MS–DRGs 606 and 607.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to reassign ICD–10–CM diagnosis code R22.2 from MDC 4 to MDC 9 under MS–DRGs 606 and 607 (Minor Skin Disorders with and without MCC, respectively).

b. Pulmonary Embolism With tPA or Other Thrombolytic Therapy

We received a request to create a new MS–DRG or to reassign cases with a principal diagnosis of pulmonary embolism where tPA or other thrombolytic therapy was administered from MS–DRGs 175 and 176 (Pulmonary Embolism with and without MCC, respectively) to a higher paying MS–DRG. The requestor suggested that CMS review cases reporting the following ICD–9–CM diagnosis codes describing pulmonary embolism: 415.11 (Iatrogenic pulmonary embolism and infarction), 415.12 (Septic pulmonary embolism), 415.13 (Saddle embolus of pulmonary artery), and 415.19 (Other pulmonary embolism and infarction), when reported in combination with ICD–9–CM procedure code 99.10 (Injection or infusion of thrombolytic agent), to identify that thrombolytic therapy was administered.

The comparable ICD–10–CM diagnosis code translations for the ICD–9–CM pulmonary embolism diagnosis codes to which the requestor cited consist of the following:

ICD–10–CM diagnosis code	Description
I26.01	Septic pulmonary embolism with acute cor pulmonale.
I26.02	Saddle embolus of pulmonary artery with acute cor pulmonale.
I26.09	Other pulmonary embolism with acute cor pulmonale.
I26.90	Septic pulmonary embolism without acute cor pulmonale.
I26.92	Saddle embolus of pulmonary artery without acute cor pulmonale.
I26.99	Other pulmonary embolism without acute cor pulmonale.

Thrombolytic therapy is identified with the following ICD–10–PCS procedure codes:

ICD–10–PCS procedure code	Description
3E03017	Introduction of other thrombolytic into peripheral vein, open approach.
3E03317	Introduction of other thrombolytic into peripheral vein, percutaneous approach.
3E04017	Introduction of other thrombolytic into central vein, open approach.
3E04317	Introduction of other thrombolytic into central vein, percutaneous approach.
3E05017	Introduction of other thrombolytic into peripheral artery, open approach.
3E05317	Introduction of other thrombolytic into peripheral artery, percutaneous approach.
3E06017	Introduction of other thrombolytic into central artery, open approach.
3E06317	Introduction of other thrombolytic into central artery, percutaneous approach.

A pulmonary embolism is an obstruction of pulmonary vasculature most commonly caused by a venous thrombus, and less commonly by fat or tumor tissue or air bubbles or both. Risk factors for a pulmonary embolism include prolonged immobilization from any cause, obesity, cancer, fractured hip or leg, use of certain medications such as oral contraceptives, presence of certain medical conditions such as heart failure, sickle cell anemia, or certain congenital heart defects. Common symptoms of pulmonary embolism include shortness of breath with or without chest pain, tachycardia, hemoptysis, low grade fever, pleural effusion, and depending on the etiology of the embolus, might include lower extremity pain or swelling, syncope, jugular venous distention, and finally a pulmonary embolus could be asymptomatic.

As we discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24977 through 24979), we examined the claims data from the December 2015 update of the FY 2015 MedPAR file for ICD–9–CM MS–DRGs 175 and 176 for cases with a principal diagnosis of pulmonary embolism where tPA or other thrombolytic therapy (procedure code 99.10) was administered and cases of a principal diagnosis of pulmonary embolism where no tPA or other thrombolytic therapy was administered. Our findings are shown in the table below.

PRINCIPAL DIAGNOSIS OF PULMONARY EMBOLISM WITH AND WITHOUT tPA OR OTHER THROMBOLYTIC THERAPY ADMINISTERED

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 175—All MCC cases	19,274	5.76	$10,479
MS–DRG 175—MCC cases with principal diagnosis of pulmonary embolism with tPA or other thrombolytic therapy administered	630	6.31	19,419
MS–DRG 175—MCC cases with principal diagnosis of pulmonary embolism without tPA or other thrombolytic therapy administered	18,529	5.74	10,181
MS–DRG 176—All Without MCC cases	33,565	3.81	6,645
MS–DRG 176—Without MCC cases with principal diagnosis of pulmonary embolism with tPA or other thrombolytic therapy administered	544	5.07	16,345
MS–DRG 176—Without MCC cases with principal diagnosis of pulmonary embolism without tPA or other thrombolytic therapy administered	32,789	3.79	6,483

As shown in the table above, for MS–DRG 175, there were a total of 19,274 cases with an average length of stay of 5.76 days and average costs of $10,479. Of the 19,274 cases in MS–DRG 175, there were 630 cases that reported a principal diagnosis of pulmonary embolism where tPA or other thrombolytic therapy was also reported with an average length of stay of 6.31 days and average costs of $19,419. For MS–DRG 176, there were a total of 33,565 cases with an average length of stay of 3.81 days and average costs of $6,645. Of the 33,565 cases reported in MS–DRG 176, there were 544 cases that reported a principal diagnosis of pulmonary embolism where tPA or other thrombolytic therapy also was reported with an average length of stay of 5.07 days and average costs of $16,345.

To address the request we received to create a new MS–DRG, we reviewed the data for the 1,174 total cases (630 and 544, respectively) that reported a principal diagnosis of pulmonary embolism that received tPA or other thrombolytic therapy in MS–DRGs 175 and 176. As shown in the table above, our data analysis demonstrates the average costs for these cases are higher ($19,419 compared to $10,479 for MS–DRG 175, and $16,345 compared to $6,645 for MS–DRG 176) and the length of stay is slightly longer (6.31 days compared to 5.76 days for MS–DRG 175, and 5.07 days compared to 3.81 days for MS–DRG 176) compared to all cases reported in MS–DRGs 175 and 176. Out of a total of 52,492 cases (630 + 18,529 +544 + 32,789) in MS–DRGs 175 and 176 reporting a principal diagnosis of pulmonary embolism, 1,174 (2.24 percent) of these cases also received tPA or other thrombolytic therapy. While we recognize the differences in average costs and length of stay for these cases, the volume of these cases as well as the potential creation of a new MS–DRG for this subset of patients raised some concerns with our clinical advisors. We present our clinical advisors' concerns following the additional data analysis discussions below.

We then conducted additional data analyses to determine if reassignment of cases with a principal diagnosis of pulmonary embolism where tPA or other thrombolytic therapy was administered to a higher paying MS–DRG was supported. As displayed in the data findings in the tables below, we explored reassigning cases with a principal diagnosis of pulmonary embolism that received tPA or other thrombolytic therapy from MS–DRG 176 to the higher severity level MS–DRG 175. The data do not adequately support this reassignment, as the cases with a principal diagnosis of pulmonary embolism where tPA or other thrombolytic therapy is administered would continue to be underpaid.

As shown in the data findings in the table below, the initial data analysis for MS–DRG 175 found the average costs for cases that reported a principal diagnosis of pulmonary embolism that received tPA or other thrombolytic therapy were $19,419, and for MS–DRG 176, the average costs for these cases were $16,345.

PRINCIPAL DIAGNOSIS OF PULMONARY EMBOLISM WITH tPA OR OTHER THROMBOLYTIC THERAPY ADMINISTERED

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 175—All MCC cases	19,274	5.76	$10,479

PRINCIPAL DIAGNOSIS OF PULMONARY EMBOLISM WITH tPA OR OTHER THROMBOLYTIC THERAPY ADMINISTERED—Continued

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 175—MCC cases with principal diagnosis of pulmonary embolism with tPA or other thrombolytic therapy administered	630	6.31	19,419
MS–DRG 176—All without MCC cases	33,565	3.81	6,645
MS–DRG 176—Without MCC cases with principal diagnosis of pulmonary embolism with tPA or other thrombolytic therapy administered	544	5.07	16,345

As displayed in the table below, if we reassigned the 544 cases with a principal diagnosis of pulmonary embolism where tPA or other thrombolytic therapy is administered from the ''without MCC'' level, MS–DRG 176, to the ''with MCC'' severity level, MS–DRG 175, the average costs for all cases in MS–DRG 175 would be approximately $10,640. This figure continues to result in a difference of approximately $9,000 for the MCC cases and $6,000 for the without MCC cases when compared to findings for the average costs of these cases from the initial data analysis ($19,419 − $10,640 = $8,779 and $16,345 − $10,640 = $5,705, respectively). In addition, our clinical advisors had concerns about the prospect of moving the subset of 544 patients from the ''without MCC'' level to the ''with MCC'' level. We present these concerns following the additional data analysis discussion below.

OPTION OF REASSIGNMENT OF CASES OF PRINCIPAL DIAGNOSIS OF PULMONARY EMBOLISM WITH AND WITHOUT tPA

MS–DRG 175—Cases with pulmonary embolism with MCC or tPA or other thrombolytic therapy	19,818	5.74	$10,640
MS–DRG 176—Cases with pulmonary embolism without MCC	33,021	3.79	6,486

We also reviewed claims data in considering the option of adding another severity level to the current structure of MS–DRGs 175 and 176 and assigning the cases with a principal diagnosis of pulmonary embolism that receive tPA or other thrombolytic therapy to the highest level. This option would involve modifying the current 2-way severity level split of ''with MCC'' and ''without MCC'' to a 3-way severity level split of ''with MCC or tPA, with CC, and without CC/MCC.'' Therefore, it would include proposing new MS–DRGs if the data and our clinical advisors supported creation of new MS–DRGs. However, as displayed in the data findings in the table below, the data did not support this option. In addition to similar results from the previous option's discussion regarding continued differences in average costs for these cases, the data failed to meet the criterion that there be at least a $2,000 difference between the ''with CC'' and ''without CC/MCC'' subgroups. Our data analysis shows the average costs in the hypothetical ''with CC'' subgroup of $6,932 and the average costs in the hypothetical ''without CC/MCC'' subgroup of $5,309. The difference only amounts to $1,623 ($6,932 minus $5,309 = $1,623).

PRINCIPAL DIAGNOSIS OF PULMONARY EMBOLISM WITH AND WITHOUT tPA OR OTHER THROMBOLYTIC THERAPY

Optional new MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG XXX—Pulmonary embolism with MCC or tPA or other thrombolytic therapy	19,819	5.74	$10,641
MS–DRG XXX—Pulmonary embolism with CC	23,929	4.04	6,932
MS–DRG XXX—Pulmonary embolism without CC/MCC	9,091	3.13	5,309

Lastly, we explored reassigning cases with a principal diagnosis of pulmonary embolism that receive tPA or other thrombolytic therapy to other MS–DRGs within MDC 4. However, our review did not support reassignment of these cases to any other medical MS–DRGs as these cases would not be clinically coherent with the cases assigned to those other MS–DRGs.

In addition to the results of the various data analyses we performed for creating a new MS–DRG or for reassignment of cases of pulmonary embolism with tPA or other thrombolytic therapy to another higher paying MS–DRG, our clinical advisors also expressed a number of concerns. They pointed out that all patients with a diagnosis of pulmonary embolism are considered high risk and the small subset of patients receiving thrombolytic therapy does not necessarily warrant a separate MS–DRG or reassignment at this time. Our clinical advisors noted that it is unclear if: (1) The higher costs associated with receiving tPA or other thrombolytic therapy are due to a different subset of patients or complications; (2) if those patients treated with tPA or other thrombolytic therapy for pulmonary embolism are indeed sicker patients; (3) if the cost of tPA or other thrombolytic therapy for patients with pulmonary embolism is the reason for the higher costs seen with these cases; or (4) if the increased average costs for cases of pulmonary embolism with tPA or other thrombolytic therapy is a combination of numbers (1) through (3). They recommended maintaining the current structure of MS–DRGs 175 and 176.

As a result of the data analysis and the concerns expressed by our clinical advisors, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24977 through 24979), we did not propose to create a new MS–DRG or to reassign cases with a principal diagnosis of pulmonary embolism with tPA or other

thrombolytic therapy for FY 2017. We invited public comment on our proposal.

Comment: Commenters supported the proposal to not create a new MS–DRG or to reassign cases with a principal diagnosis of pulmonary embolism with tPA or other thrombolytic therapy. The commenters stated that the proposal was reasonable, given the data, the ICD–10–CM/PCS codes, and information provided.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to not create a new MS–DRG or to reassign cases with a principal diagnosis of pulmonary embolism with tPA or other thrombolytic therapy for FY 2017. The current structure of MS–DRGs 175 and 176 (Pulmonary Embolism with and without MCC, respectively) is maintained in the ICD–10 MS–DRGs Version 34 effective October 1, 2016.

5. MDC 5 (Diseases and Disorders of the Circulatory System)

a. Implant of Loop Recorder

We received a request to examine a potential ICD–9 to ICD–10 replication issue for procedures describing implantation or revision of loop recorder that were reported using ICD–9–CM procedure code 37.79 (Revision or relocation of cardiac device pocket). A loop recorder is also known as an implantable cardiac monitor. It is indicated for patients who experience episodes of unexplained syncope (fainting), heart palpitations, or patients at risk for various types of cardiac arrhythmias, such as atrial fibrillation or ventricular tachyarrhythmia. Loop recorders function by detecting and monitoring potential episodes of these kinds of conditions. The requestor acknowledged that these implantation procedures are frequently performed in the outpatient setting. However, the requestor also noted that the implantation procedures are often performed in the inpatient setting and suggested that they be recognized under the ICD–10 MS–DRGs as they had been under the ICD–9–CM based MS–DRG logic.

The requestor stated that, under the ICD–9–CM based MS–DRGs, procedure code 37.79 was designated as an operating room (O.R.) procedure in the Definitions Manual under Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index and grouped to MS–DRGs 040, 041, and 042 (Peripheral, Cranial Nerve and Other Nervous System Procedures with MCC, with CC or peripheral neurostimulator, and without CC/MCC, respectively); MS–DRGs 260, 261, and 262 (Cardiac Pacemaker Revision Except Device Replacement with MCC, with CC, and without CC/MCC, respectively); MS–DRGs 579, 580, and 581 (Other Skin, Subcutaneous Tissue and Breast Procedures with MCC, with CC and without CC/MCC, respectively); MS–DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively); and MS–DRGs 957, 958, and 959 (Other O.R. Procedures for Multiple Significant Trauma with MCC, with CC, and without CC/MCC, respectively).

Under the current Version 33 ICD–10 MS–DRGs, there are two comparable ICD–10–PCS code translations for ICD–9–CM code 37.79. They are procedure codes 0JWT0PZ (Revision of cardiac rhythm related device in trunk subcutaneous tissue and fascia, open approach) and 0JWT3PZ (Revision of cardiac rhythm related device in trunk subcutaneous tissue and fascia, percutaneous approach), which are designated as O.R. procedures and group to the above listed MS–DRGs.

According to the requestor, the following six ICD–10–PCS procedure codes identify the implantation or revision of a loop recorder and were not replicated appropriately because they are currently designated as nonoperating room (non-O.R.) procedures under the ICD–10 MS–DRGs. The requestor suggested that these codes be designated as O.R. procedures and assigned to the same MS–DRGs as the former ICD–9–CM procedure code 37.79:

ICD–10–PCS procedure code	Description
0JH602Z	Insertion of monitoring device into chest subcutaneous tissue and fascia, open approach.
0JH632Z	Insertion of monitoring device into chest subcutaneous tissue and fascia, percutaneous approach.
0JH802Z	Insertion of monitoring device into abdomen subcutaneous tissue and fascia, open approach.
0JH832Z	Insertion of monitoring device into abdomen subcutaneous tissue and fascia, percutaneous approach.
0JWT02Z	Revision of monitoring device in trunk subcutaneous tissue and fascia, open approach.
0JWT32Z	Revision of monitoring device in trunk subcutaneous tissue and fascia, percutaneous approach.

We examined the six ICD–10–PCS procedure codes that the commenter recommended be designated as O.R. procedures and assigned to the same MS–DRGs as ICD–9–CM procedure code 37.79. As discussed in section II.F.1.b. of the preamble of the proposed rule and this final rule, in evaluating requested MS–DRG changes, we determined if they could be replicated in the ICD–9–CM MS–DRGs so as not to affect the FY 2017 relative payment weights. If the answer was ''no,'' we examined whether the change in the ICD–10 MS–DRGs was likely to cause a significant number of patient cases to change or ''shift'' ICD–10 MS–DRGs. If relatively few patient cases would be impacted, we evaluated if it would be feasible to propose the change even though it could not be replicated by the ICD–9 MS–DRGs logic because it would not cause a material payment redistribution.

Under our review, we recognized that the six ICD–10–PCS procedure codes are currently identified as comparable translations of ICD–9–CM procedure code 86.09 (Other incision of skin and subcutaneous tissue), which was designated as a non-O.R. procedure code under the ICD–9–CM based MS–DRGs. Therefore, changing the designation of the six ICD–10–PCS procedure codes from non-O.R. to O.R. for the ICD–10 MS–DRGs cannot be replicated in the ICD–9–CM based MS–DRGs. In other words, we cannot designate ICD–9–CM procedure code 86.09 as an O.R. code. However, we stated in the proposed rule that we believe that if we limit the change in designation to four of the six identified ICD–10–PCS procedure codes from non-O.R. to O.R., the change would not have any impact. We did not include the two ICD–10–PCS procedure codes that describe the insertion of a monitoring device into the abdomen in our proposal because a loop recorder is not inserted into that location and it would not be clinically appropriate.

Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24979 through 24980), for FY 2017, we proposed to designate the following four ICD–10–PCS codes as O.R. procedures

within Appendix E of the Version 34 ICD–10 MS–DRG Definitions Manual:

- 0JH602Z (Insertion of monitoring device into chest subcutaneous tissue and fascia, open approach);
- 0JH632Z (Insertion of monitoring device into chest subcutaneous tissue and fascia, percutaneous approach);
- 0JWT02Z (Revision of monitoring device in trunk subcutaneous tissue and fascia, open approach); and
- 0JWT32Z (Revision of monitoring device in trunk subcutaneous tissue and fascia, percutaneous approach).

We also proposed that the ICD–10 MS–DRG assignment for these four ICD–10–PCS codes replicate the ICD–9–CM based MS–DRG assignment for procedure code 37.79; that is, MS–DRGs 040, 041, 042, 260, 261, 262, 579, 580, 581, 907, 908, 909, 957, 958, and 959 as cited earlier in this section.

We invited public comments on our proposals.

Comment: Commenters supported the proposal to designate the four ICD–10–PCS procedure codes listed in this section that describe the insertion or revision of a monitoring device from non-O.R. to O.R. to better reflect the resources involved with these procedures. The commenters also agreed with the proposed MS–DRG assignments for these procedure codes under the ICD–10 MS–DRGs, stating that the proposal was reasonable, given the data, the ICD–10–PCS codes and information provided. One commenter specifically expressed appreciation with CMS' review of this replication issue and agreed that the codes that were proposed to be changed from non-O.R. to O.R. are accurate and that this change will result in better data on claims. This commenter also commended CMS for the proposed MS–DRG assignments under the ICD–10 MS–DRGs.

Alternatively, another commenter noted that while it agreed with the proposal to change the designation of the four ICD–10–PCS procedure codes from non-O.R. to O.R. and supported the proposed MS–DRG assignments, the commenter believed that the two other ICD–10–PCS procedure codes describing insertion of a monitoring device into the abdomen subcutaneous tissue and fascia (ICD–10–PCS procedure codes 0JH802Z and 0JH832Z) also merit redesignation from non-O.R. to O.R. and assignment to the same corresponding surgical MS–DRGs in order to fully address the ICD–9 to ICD–10 replication issue. According to the commenter, the anatomical location of implants involving loop recorders does not affect the level of effort involved in performing such procedures. The commenter recommended that CMS consider ICD–9–CM procedure code 37.79 (Revision or relocation of cardiac device pocket) and its attributes versus ICD–9–CM procedure code 86.09 (Other incision of skin and subcutaneous tissue) as more appropriate for examining all the comparable ICD–10 code translations and MS–DRG assignments.

Response: We appreciate the commenters' support of our proposals. We agree with the commenters that this modification will better address the resources involved with these procedures.

With regard to the commenter who recommended that we include the two ICD–10–PCS codes describing insertion of a monitoring device into the abdomen subcutaneous tissue and fascia, we are not clear with respect to the commenter's statement that the anatomical location of implants involving loop recorders does not affect the level of effort involved in performing such procedures because loop recorders are not inserted in that area of the abdomen. As we noted in the FY 2017 IPPS/LTCH PPS proposed rule, when we were unable to fully replicate the ICD–9 to ICD–10 MS–DRG logic for a specific request, we sought and proposed an alternative option that would not cause MS–DRG shifts or a material payment distribution. For this particular issue, the request was to change the designation of the six ICD–10–PCS procedure codes from non-O.R. to O.R. and, as described above, we were not able to finalize that specific request. Rather, we finalized an alternative option, which was to change the designation for four of the six codes requested. We also point out that, currently, under the ICD–10 MS–DRGs Version 33, all six ICD–10–PCS procedure codes that were the subject of our specific proposal are designated as non-O.R. procedures affecting the MS–DRG assignment for MS–DRGs 579, 580, and 581 (Other Skin, Subcutaneous Tissue and Breast Procedures with MCC, with CC and without CC/MCC, respectively). Therefore, while we are not finalizing the proposal to change the two ICD–10–PCS procedure codes describing the insertion of a monitoring device into the abdomen (0JH802Z and 0JH832Z) from non-OR to O.R., we note that these two procedure codes will continue to be recognized as non-O.R. procedures affecting MS–DRGs 579, 580, and 581 under the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

After consideration of the public comments we received, we are finalizing our proposal to designate the following four ICD–10–PCS codes as O.R. procedures within Appendix E of the Version 34 ICD–10 MS–DRG Definitions Manual:

- 0JH602Z (Insertion of monitoring device into chest subcutaneous tissue and fascia, open approach);
- 0JH632Z (Insertion of monitoring device into chest subcutaneous tissue and fascia, percutaneous approach);
- 0JWT02Z (Revision of monitoring device in trunk subcutaneous tissue and fascia, open approach); and
- 0JWT32Z (Revision of monitoring device in trunk subcutaneous tissue and fascia, percutaneous approach).

We also are finalizing our proposal that the ICD–10 MS–DRG assignment for the above four ICD–10–PCS procedure codes replicate the ICD–9–CM based MS–DRG assignment for procedure code 37.79; that is, MS–DRGs 040, 041, and 042 (Peripheral, Cranial Nerve and Other Nervous System Procedures with MCC, with CC or peripheral neurostimulator, and without CC/MCC, respectively); MS–DRGs 260, 261, and 262 (Cardiac Pacemaker Revision Except Device Replacement with MCC, with CC, and without CC/MCC, respectively); MS–DRGs 579, 580, and 581 (Other Skin, Subcutaneous Tissue and Breast Procedures with MCC, with CC and without CC/MCC, respectively); MS–DRGs 907, 908, and 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively); and MS–DRGs 957, 958, and 959 (Other O.R. Procedures for Multiple Significant Trauma with MCC, with CC, and without CC/MCC, respectively), effective October 1, 2016.

b. Endovascular Thrombectomy of the Lower Limbs

We received a comment stating that the logic for ICD–10 MS–DRGs Version 33 is not compatible with the ICD–9–CM MS–DRGs Version 32 for the assignment of procedures describing endovascular thrombectomy of the lower limbs. The commenter asked CMS to reconfigure the MS–DRG structure within the ICD–10 MS–DRGs for endovascular thrombectomy of the lower limbs, specifically MS–DRGs 270, 271, and 272 (Other Major Cardiovascular Procedures with MCC, with CC, and without CC/MCC, respectively)). (We note that in the FY 2017 IPPS/LTCH PPS proposed rule, we incorrectly cited the titles for MS–DRGs 270, 271, and 272 as ''(Endovascular Thrombectomy of the Lower Limbs with MCC, with CC, and without CC/MCC, respectively)''. The commenter believed that this requested restructuring would be consistent with the MS–DRG assignments for the other procedures describing lower extremity

thrombectomy, and would accurately replicate the logic of the ICD–9–CM MS–DRGs Version 32. Under the ICD–9–CM, endovascular thrombectomy of the lower limbs is described by procedure code 39.79 (Other endovascular procedures on other vessels). The commenter stated that, with deep vein thrombosis (DVT) or any other circulatory system disorders as the principal diagnosis, cases involving procedures described by procedure code 39.79 grouped to ICD–9–CM MS–DRGs 237 and 238 (Major Cardiovascular Procedures with and without MCC, respectively). However, the commenter pointed out that, for FY 2016, ICD–9–CM MS–DRGs 237 and 238 were deleted and replaced with ICD–10 Version 33 MS–DRGs 268 and 269 (Aortic and Heart Assist Procedures Except Pulsation Balloon with and without MCC, respectively), for the higher complexity procedures, and MS–DRGs 270, 271, and 272 for the lower complexity procedures (80 FR 49389). The commenter stated that ICD–9–CM procedure code 39.79 describes the lower complexity procedures assigned to ICD–10–PCS MS–DRGs 270, 271, and 272. The commenter believed that the comparable ICD–10–PCS procedure codes also should have been assigned to MS–DRGs 270, 271, and 272.

We agreed with the requestor that procedures describing endovascular thrombectomy of the lower limbs should be assigned to ICD–10 MS–DRGs 270, 271, and 272. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24980 through 24981), for implementation October 1, 2016, we proposed to restructure the ICD–10–PCS MS–DRG configuration and add the ICD–10–PCS code translations listed in the following chart (which would capture procedures describing endovascular thrombectomy of the lower limbs) to ICD–10 Version 34 MS–DRGs 270, 271, and 272.

ICD–10–PCS Endovascular Thrombectomy Procedure Codes Proposed To Be Assigned to MS–DRGs 270, 271, and 272 for FY 2017

03C53ZZ	Extirpation of matter from right axillary artery, percutaneous approach.
03C63ZZ	Extirpation of matter from left axillary artery, percutaneous approach.
03C73ZZ	Extirpation of matter from right brachial artery, percutaneous approach.
03C83ZZ	Extirpation of matter from left brachial artery, percutaneous approach.
03C93ZZ	Extirpation of matter from right ulnar artery, percutaneous approach.
03CA3ZZ	Extirpation of matter from left ulnar artery, percutaneous approach.
03CB3ZZ	Extirpation of matter from right radial artery, percutaneous approach.
03CC3ZZ	Extirpation of matter from left radial artery, percutaneous approach.
03CD3ZZ	Extirpation of matter from right hand artery, percutaneous approach.
03CF3ZZ	Extirpation of matter from left hand artery, percutaneous approach.
03CY3ZZ	Extirpation of matter from upper artery, percutaneous approach.
04CK3ZZ	Extirpation of matter from right femoral artery, percutaneous approach.
04CL3ZZ	Extirpation of matter from left femoral artery, percutaneous approach.
04CM3ZZ	Extirpation of matter from right popliteal artery, percutaneous approach.
04CN3ZZ	Extirpation of matter from left popliteal artery, percutaneous approach.
04CP3ZZ	Extirpation of matter from right anterior tibial artery, percutaneous approach.
04CQ3ZZ	Extirpation of matter from left anterior tibial artery, percutaneous approach.
04CR3ZZ	Extirpation of matter from right posterior tibial artery, percutaneous approach.
04CS3ZZ	Extirpation of matter from left posterior tibial artery, percutaneous approach.
04CT3ZZ	Extirpation of matter from right peroneal artery, percutaneous approach.
04CU3ZZ	Extirpation of matter from left peroneal artery, percutaneous approach.
04CV3ZZ	Extirpation of matter from right foot artery, percutaneous approach.
04CW3ZZ	Extirpation of matter from left foot artery, percutaneous approach.
04CY3ZZ	Extirpation of matter from lower artery, percutaneous approach.
05C73ZZ	Extirpation of matter from right axillary vein, percutaneous approach.
05C83ZZ	Extirpation of matter from left axillary vein, percutaneous approach.
05C93ZZ	Extirpation of matter from right brachial vein, percutaneous approach.
05CA3ZZ	Extirpation of matter from left brachial vein, percutaneous approach.
05CB3ZZ	Extirpation of matter from right basilic vein, percutaneous approach.
05CC3ZZ	Extirpation of matter from left basilic vein, percutaneous approach.
05CD3ZZ	Extirpation of matter from right cephalic vein, percutaneous approach.
05CF3ZZ	Extirpation of matter from left cephalic vein, percutaneous approach.
05CG3ZZ	Extirpation of matter from right hand vein, percutaneous approach.
05CH3ZZ	Extirpation of matter from left hand vein, percutaneous approach.
05CL3ZZ	Extirpation of matter from intracranial vein, percutaneous approach.
05CM3ZZ	Extirpation of matter from right internal jugular vein, percutaneous approach.
05CN3ZZ	Extirpation of matter from left internal jugular vein, percutaneous approach.
05CP3ZZ	Extirpation of matter from right external jugular vein, percutaneous approach.
05CQ3ZZ	Extirpation of matter from left external jugular vein, percutaneous approach.
05CR3ZZ	Extirpation of matter from right vertebral vein, percutaneous approach.
05CS3ZZ	Extirpation of matter from left vertebral vein, percutaneous approach.
05CT3ZZ	Extirpation of matter from right face vein, percutaneous approach.
05CV3ZZ	Extirpation of matter from left face vein, percutaneous approach.
05CY3ZZ	Extirpation of matter from upper vein, percutaneous approach.
06C33ZZ	Extirpation of matter from esophageal vein, percutaneous approach.
06CM3ZZ	Extirpation of matter from right femoral vein, percutaneous approach.
06CN3ZZ	Extirpation of matter from left femoral vein, percutaneous approach.
06CP3ZZ	Extirpation of matter from right greater saphenous vein, percutaneous approach.
06CQ3ZZ	Extirpation of matter from left greater saphenous vein, percutaneous approach.
06CR3ZZ	Extirpation of matter from right lesser saphenous vein, percutaneous approach.
06CS3ZZ	Extirpation of matter from left lesser saphenous vein, percutaneous approach.
06CT3ZZ	Extirpation of matter from right foot vein, percutaneous approach.

We invited public comments on our proposal to assign the ICD–10–PCS procedures describing the endovascular thrombectomy of the lower limbs listed in the table above to ICD–10 Version 34 MS–DRGs 270, 271, and 272 for FY 2017.

Comment: Several commenters supported the proposal to assign the ICD–10–PCS procedures describing the endovascular thrombectomy of the lower limbs listed in the table in the proposed rule to ICD–10 Version 34 MS–DRGs 270, 271 and 272 for FY 2017. The commenters noted it is important that endovascular thrombectomy procedures be assigned to the same MS–DRGs as other procedures describing lower extremity thrombectomy. However, some commenters also noted that a subset of the codes listed in the table in the proposed rule describe non-lower limb procedures. The commenters were concerned that moving the 34 non-lower limb procedure codes displayed in the following table would not support clinical and resource use homogeneity in the MS–DRG.

ICD–10–PCS Endovascular Thrombectomy Non-Lower Limb Procedure Codes Identified by Commenters

03C53ZZ	Extirpation of matter from right axillary artery, percutaneous approach.
03C63ZZ	Extirpation of matter from left axillary artery, percutaneous approach.
03C73ZZ	Extirpation of matter from right brachial artery, percutaneous approach.
03C83ZZ	Extirpation of matter from left brachial artery, percutaneous approach.
03C93ZZ	Extirpation of matter from right ulnar artery, percutaneous approach.
03CA3ZZ	Extirpation of matter from left ulnar artery, percutaneous approach.
03CB3ZZ	Extirpation of matter from right radial artery, percutaneous approach.
03CC3ZZ	Extirpation of matter from left radial artery, percutaneous approach.
03CD3ZZ	Extirpation of matter from right hand artery, percutaneous approach.
03CF3ZZ	Extirpation of matter from left hand artery, percutaneous approach.
03CY3ZZ	Extirpation of matter from upper artery, percutaneous approach.
04CT3ZZ	Extirpation of matter from right peroneal artery, percutaneous approach.
04CU3ZZ	Extirpation of matter from left peroneal artery, percutaneous approach.
05C73ZZ	Extirpation of matter from right axillary vein, percutaneous approach.
05C83ZZ	Extirpation of matter from left axillary vein, percutaneous approach.
05C93ZZ	Extirpation of matter from right brachial vein, percutaneous approach.
05CA3ZZ	Extirpation of matter from left brachial vein, percutaneous approach.
05CB3ZZ	Extirpation of matter from right basilic vein, percutaneous approach.
05CC3ZZ	Extirpation of matter from left basilic vein, percutaneous approach.
05CD3ZZ	Extirpation of matter from right cephalic vein, percutaneous approach.
05CF3ZZ	Extirpation of matter from left cephalic vein, percutaneous approach.
05CG3ZZ	Extirpation of matter from right hand vein, percutaneous approach.
05CH3ZZ	Extirpation of matter from left hand vein, percutaneous approach.
05CL3ZZ	Extirpation of matter from intracranial vein, percutaneous approach.
05CM3ZZ	Extirpation of matter from right internal jugular vein, percutaneous approach.
05CN3ZZ	Extirpation of matter from left internal jugular vein, percutaneous approach.
05CP3ZZ	Extirpation of matter from right external jugular vein, percutaneous approach.
05CQ3ZZ	Extirpation of matter from left external jugular vein, percutaneous approach.
05CR3ZZ	Extirpation of matter from right vertebral vein, percutaneous approach.
05CS3ZZ	Extirpation of matter from left vertebral vein, percutaneous approach.
05CT3ZZ	Extirpation of matter from right face vein, percutaneous approach.
05CV3ZZ	Extirpation of matter from left face vein, percutaneous approach.
05CY3ZZ	Extirpation of matter from upper vein, percutaneous approach.
06C33ZZ	Extirpation of matter from esophageal vein, percutaneous approach.

One commenter suggested adding two additional procedure codes describing thrombectomy of the lower limbs (ICD–10–PCS codes 06CV3Z (Extirpation of matter from left foot vein, percutaneous approach) and 06CY3Z (Extirpation of matter from lower vein, percutaneous approach)) to the list of procedure codes to be moved to MS–DRGs 270, 271 and 272.

Response: We appreciate the commenters' support for the assignment of ICD–10–PCS procedure codes describing endovascular thrombectomy of the lower limbs to ICD–10 Version 34 MS–DRGs 270, 271 and 272 for FY 2017. We agree with removing the 34 codes that the commenters identified as not describing endovascular thrombectomy of the lower limbs from the list of codes that were proposed to be reassigned to MS–DRGs 270, 271 and 272. Our clinical advisors reviewed and also agree with removing these 34 non-lower limb procedure codes from the proposed list of codes to be reassigned to MS–DRGs 270, 271 and 272. These 34 non-lower limb procedure codes will remain assigned to MS–DRGs 252, 253, and 254 (Other vascular procedures with MCC, with CC, and without CC/MCC, respectively) for FY 2017.

In addition, our clinical advisors agree with the commenter's recommendation to add procedure codes 06CV3Z and 06CY3Z to the list of lower limb procedure codes to be reassigned to MS–DRGs 270, 271, and 272. Therefore, we are reassigning these two procedure codes from MS–DRG 263 (Vein ligation and stripping) and MS–DRGs 252, 253, and 254 to MS–DRGs 270, 271, and 272 for FY 2017.

After consideration of the public comments we received, we are finalizing our proposal with these modifications. We are finalizing the assignment of the ICD–10–PCS procedure codes describing endovascular thrombectomy of the lower limbs listed in the following table to ICD–10 Version 34 MS–DRGs 270, 271 and 272 for FY 2017 (which reflects the removal of the 34 proposed procedure codes and the addition of the 2 procedure codes discussed in our response above).

ICD–10–PCS ENDOVASCULAR THROMBECTOMY PROCEDURE CODES REASSIGNED TO MS–DRGS 270, 271, AND 272 FOR FY 2017

04CK3ZZ	Extirpation of matter from right femoral artery, percutaneous approach.
04CL3ZZ	Extirpation of matter from left femoral artery, percutaneous approach.
04CM3ZZ	Extirpation of matter from right popliteal artery, percutaneous approach.
04CN3ZZ	Extirpation of matter from left popliteal artery, percutaneous approach.
04CP3ZZ	Extirpation of matter from right anterior tibial artery, percutaneous approach.
04CQ3ZZ	Extirpation of matter from left anterior tibial artery, percutaneous approach.
04CR3ZZ	Extirpation of matter from right posterior tibial artery, percutaneous approach.
04CS3ZZ	Extirpation of matter from left posterior tibial artery, percutaneous approach.

06CS3ZZ	Extirpation of matter from left lesser saphenous vein, percutaneous approach.
06CT3ZZ	Extirpation of matter from right foot vein, percutaneous approach.
06CV3ZZ	Extirpation of matter from left foot vein, percutaneous approach.
06CY3ZZ	Extirpation of matter from lower vein, percutaneous approach.

c. Pacemaker Procedures Code Combinations

We received a request that CMS examine the list of ICD–10–PCS procedure code combinations that describe procedures involving pacemakers to determine if some procedure code combinations were excluded from the ICD–10 MS–DRG assignments for MS–DRGs 242, 243, and 244 (Permanent Cardiac Pacemaker Implant with MCC, with CC, and without CC/MCC). The requestor believed that some ICD–10–PCS procedure code combinations describing procedures involving pacemaker devices and leads are not included in the current list.

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24981 through 24984), we reviewed the list of ICD–10–PCS procedure code combinations describing procedures involving pacemakers assigned to ICD–10 MS–DRGs 242, 243, and 244, and determined that our initial approach of using specified procedure code combinations to identify procedures involving pacemakers and leads was overly complex and may have led to inadvertent omissions of qualifying procedure code combinations. Under our initial approach, we developed a list of possible ICD–10–PCS procedure code combinations that describe procedures involving pacemaker devices and leads as well as ICD–10–PCS procedure code combinations for procedures describing the removal and replacement of pacemaker devices. We stated that we now believe that a more appropriate approach would be to compile a list of all procedure codes describing procedures involving pacemaker devices and a list of all procedure codes describing procedures involving pacemaker leads. If a procedure code from the list of procedure codes describing procedures involving pacemaker devices and a procedure code from the list of procedure codes describing procedures involving pacemaker leads are reported in combination with one another, the case would be assigned to ICD–10 MS–DRGs 242, 243, and 244. We stated that we believe that this more generic approach would capture a wider range of possible reported procedure codes describing procedures involving pacemaker devices and leads. Therefore, we proposed to modify the ICD–10 MS–DRG logic so that if one of the ICD–10–PCS procedure codes describing procedures involving pacemaker devices listed in column 1 of the table below is reported in combination with one of the ICD–10–PCS procedure codes describing procedures involving leads listed in column 3 of the table below, the case would be assigned to MS–DRGs 242, 243, and 244. We stated that we believe that this proposed simplified approach would capture all possible cases reporting procedure code combinations describing procedures involving pacemaker devices and leads to ensure that these cases would be assigned to MS–DRGs 242, 243, and 244.

We invited public comments on our proposal to modify the MS–DRG logic for MS–DRGs 242, 243, and 244 to establish that cases reporting one ICD–10–PCS code from the list of procedure codes describing procedures involving pacemaker devices and one ICD–10–PCS code from the list of procedure codes describing procedures involving pacemaker leads in combination with one another would qualify the case for assignment to MS–DRGs 242, 243, and 244.

Comment: Commenters supported the proposed updates for MS–DRGs 242, 243, and 244. The commenters stated that the proposed logic is simpler than the prior logic. One commenter stated that the proposal was logical and less complicated and appeared to be able to correctly capture procedures involving pacemaker devices. Several commenters recommended that CMS continue to monitor the impact of this change in future years to determine whether further modifications will be necessary.

Response: We appreciate the commenters' support for our proposed updates to MS–DRGs 242, 243, and 244. We agree that this is a simpler approach to the MS–DRG GROUPER logic. We will continue to monitor this and other related MS–DRGs as we receive ICD–10 claims data.

After consideration of the public comments we received, we are finalizing our proposal to modify the MS–DRG logic for MS–DRGs 242, 243, and 244 to establish that cases reporting one ICD–10–PCS code from the list of procedure codes describing procedures involving pacemaker devices and one ICD–10–PCS code from the list of procedure codes describing procedures involving pacemaker leads in combination with one another will qualify the case for assignment to MS–DRGs 242, 243, and 244.

We also examined our GROUPER logic for MS–DRGs 258 and 259 (Cardiac Pacemaker Device Replacement with and without MCC, respectively). Assignments of cases to these MS–DRGs also include qualifying ICD–10–PCS procedure code combinations describing procedures that involve the removal of pacemaker devices and the insertion of new devices. We believe that this logic may also be overly complex. Moreover, we believe that a more simplified approach would be to compile a list of all ICD–10–PCS procedure codes describing procedures involving cardiac pacemaker device insertions. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24983 through 24984), we proposed this approach for FY 2017. Under the proposed approach, if one of the procedure codes describing procedures involving pacemaker device insertions is reported, and there are no other procedure codes describing procedures involving the insertion of a pacemaker lead reported in combination with one of these procedures, the case would be assigned to MS–DRG 258 and 259. We included in the proposed rule the following listing of ICD–10–PCS procedure codes describing procedures involving pacemaker device insertions that would be assigned to MS–DRG 258 and 259.

PROCEDURE CODES DESCRIBING PROCEDURES INVOLVING CARDIAC PACEMAKER DEVICE INSERTIONS REPORTED WITHOUT ANY OTHER PACEMAKER DEVICE PROCEDURE CODE PROPOSED TO BE ASSIGNED TO ICD–10 MS–DRGS 258 AND 259 FOR FY 2017

Procedure code	Description
0JH604Z	Insertion of pacemaker, single chamber into chest subcutaneous tissue and fascia, open approach.
0JH605Z	Insertion of pacemaker, single chamber rate responsive into chest subcutaneous tissue and fascia, open approach.
0JH606Z	Insertion of pacemaker, dual chamber into chest subcutaneous tissue and fascia, open approach.
0JH607Z	Insertion of cardiac resynchronization pacemaker pulse generator into chest subcutaneous tissue and fascia, open approach.
0JH60PZ	Insertion of cardiac rhythm related device into chest subcutaneous tissue and fascia, open approach.

PROCEDURE CODES DESCRIBING PROCEDURES INVOLVING CARDIAC PACEMAKER DEVICE INSERTIONS REPORTED WITHOUT ANY OTHER PACEMAKER DEVICE PROCEDURE CODE PROPOSED TO BE ASSIGNED TO ICD–10 MS–DRGS 258 AND 259 FOR FY 2017—Continued

Procedure code	Description
0JH634Z	Insertion of pacemaker, single chamber into chest subcutaneous tissue and fascia, percutaneous approach.
0JH635Z	Insertion of pacemaker, single chamber rate responsive into chest subcutaneous tissue and fascia, percutaneous approach.
0JH636Z	Insertion of pacemaker, dual chamber into chest subcutaneous tissue and fascia, percutaneous approach.
0JH637Z	Insertion of cardiac resynchronization pacemaker pulse generator into chest subcutaneous tissue and fascia, percutaneous approach.
0JH63PZ	Insertion of cardiac rhythm related device into chest subcutaneous tissue and fascia, percutaneous approach.
0JH804Z	Insertion of pacemaker, single chamber into abdomen subcutaneous tissue and fascia, open approach.
0JH805Z	Insertion of pacemaker, single chamber rate responsive into abdomen subcutaneous tissue and fascia, open approach.
0JH806Z	Insertion of pacemaker, dual chamber into abdomen subcutaneous tissue and fascia, open approach.
0JH807Z	Insertion of cardiac resynchronization pacemaker pulse generator into abdomen subcutaneous tissue and fascia, open approach.
0JH80PZ	Insertion of cardiac rhythm related device into abdomen subcutaneous tissue and fascia, open approach.
0JH834Z	Insertion of pacemaker, single chamber into abdomen subcutaneous tissue and fascia, percutaneous approach.
0JH835Z	Insertion of pacemaker, single chamber rate responsive into abdomen subcutaneous tissue and fascia, percutaneous approach.
0JH836Z	Insertion of pacemaker, dual chamber into abdomen subcutaneous tissue and fascia, percutaneous approach.
0JH837Z	Insertion of cardiac resynchronization pacemaker pulse generator into abdomen subcutaneous tissue and fascia, percutaneous approach.
0JH83PZ	Insertion of cardiac rhythm related device into abdomen subcutaneous tissue and fascia, percutaneous approach.

We invited public comments on our proposal to modify the GROUPER logic for MS–DRGs 258 and 259 to establish that a case reporting one procedure code from the proposed rule list of ICD–10–PCS procedure codes describing procedures involving pacemaker device insertions without any other procedure codes describing procedures involving pacemaker leads reported would be assigned to MS–DRGs 258 and 259.

Comment: Commenters supported the proposed updates to MS–DRGs 258 and 259. The commenters stated that the proposed updates appeared to be logical and less complicated and appeared to be able to correctly capture these circumstances.

Response: We appreciate the commenters' support for our proposed updates to MS–DRGs 258 and 259. We agree this approach is logical and less complicated.

After consideration of the public comments we received, we are finalizing our proposal to modify the MS–DRG logic for MS–DRGs 258 and 259 (Cardiac Pacemaker Device Replacement with and without MCC, respectively) to establish that a case reporting one ICD–10–PCS procedure code describing procedures involving pacemaker device insertions without any other procedure codes describing procedures involving pacemaker leads reported is assigned to MS–DRGs 258 and 259 for FY 2017. We are finalizing the table above (which was included in the proposed rule) that lists the ICD–10–PCS procedure codes describing procedures involving pacemaker device insertions without any other procedure codes describing procedures involving pacemaker leads reported that are assigned to MS–DRGs 258 and 259 for FY 2017.

We also point out that the ICD–10–PCS pacemaker codes listed in the following table are classified as non-operating room (non-O.R.) codes within the MS–DRGs. The GROUPER logic will continue to classify these codes as non-O.R. codes. However, a case reporting one of these non-O.R. procedure codes describing procedures involving pacemaker device insertions without any other procedure codes describing procedures involving pacemaker leads reported is assigned to MS–DRGs 258 and 259 within MDC 5 in our final policy.

ICD–10–PCS code (non–O.R.)	Description
0JH604Z	Insertion of pacemaker, single chamber into chest subcutaneous tissue and fascia, open approach.
0JH605Z	Insertion of pacemaker, single chamber rate responsive into chest subcutaneous tissue and fascia, open approach.
0JH606Z	Insertion of pacemaker, dual chamber into chest subcutaneous tissue and fascia, open approach.
0JH634Z	Insertion of pacemaker, single chamber into chest subcutaneous tissue and fascia, percutaneous approach.
0JH635Z	Insertion of pacemaker, single chamber rate responsive into chest subcutaneous tissue and fascia, percutaneous approach.
0JH636Z	Insertion of pacemaker, dual chamber into chest subcutaneous tissue and fascia, percutaneous approach.
0JH637Z	Insertion of cardiac resynchronization pacemaker pulse generator into chest subcutaneous tissue and fascia, percutaneous approach.
0JH804Z	Insertion of pacemaker, single chamber into abdomen subcutaneous tissue and fascia, open approach.
0JH805Z	Insertion of pacemaker, single chamber rate responsive into abdomen subcutaneous tissue and fascia, open approach.
0JH806Z	Insertion of pacemaker, dual chamber into abdomen subcutaneous tissue and fascia, open approach.
0JH834Z	Insertion of pacemaker, single chamber into abdomen subcutaneous tissue and fascia, percutaneous approach.
0JH835Z	Insertion of pacemaker, single chamber rate responsive into abdomen subcutaneous tissue and fascia, percutaneous approach.
0JH836Z	Insertion of pacemaker, dual chamber into abdomen subcutaneous tissue and fascia, percutaneous approach.

We also examined our GROUPER logic for MS–DRGs 260, 261, and 262 (Cardiac Pacemaker Revision Except Device with MCC, with CC, and without CC/MCC, respectively). Cases assigned to MS–DRGs 260, 261, and 262 also include lists of procedure code combinations describing procedures involving the removal of pacemaker leads and the insertion of new leads, in addition to lists of single procedure codes describing procedures involving the insertion of pacemaker leads, removal of devices, and revision of devices. We stated in the proposed rule that we believe that this logic may also be overly complex. Moreover, we believe that a more simplified approach would be to provide a single list of procedure codes describing procedures involving cardiac pacemaker lead insertions and other related procedures involving device insertions that would be assigned to MS–DRGs 260, 261, and 262. If one of these procedure codes describing procedures involving the insertion of pacemaker leads is reported, and there are no other procedure codes describing procedures involving the insertion of a device reported, the case would be assigned to MS–DRGs 260, 261, and 262. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24984 through 24985), we proposed that the list of ICD–10–PCS procedure codes describing procedures involving pacemaker lead insertion, removal, or revisions and insertion of hemodynamic devices in a table included in the proposed rule (81 FR 24984 through 24985) would be assigned to MS–DRGs 260, 261, and 262. We simply proposed to use a single list of ICD–10–PCS procedure codes to determine the MS–DRG assignment.

We invited public comments on our proposal to modify the GROUPER logic for MS–DRGs 260, 261, and 262 so that cases reporting any one of the ICD–10–PCS procedure codes describing procedures involving pacemakers and related procedures and associated devices listed in the table in the proposed rule would be assigned to MS–DRGs 260, 261, and 262.

Comment: Commenters supported the proposal to modify the GROUPER logic for MS–DRGs 260, 261, and 262 so that cases reporting any one of the ICD–10–PCS procedure codes describing procedures involving pacemakers and related procedures and associated devices listed in the table in the proposed rule would be assigned to MS DRGs 260, 261, and 262. The commenters stated that the proposed updates were logical and less complicated and appeared to be able to correctly capture cardiac pacemaker revisions. However, several of the commenters supporting the proposal pointed out that there were errors in the code titles for codes included in the table labeled ''List of Procedure Codes Proposed to be Assigned to MS–DRGs 260, 261, and 262'' in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24984 through 24985). The commenters stated that the table included errors such as referring to a ''pacemaker'' lead instead of a ''cardiac'' lead in code 02H60MZ (Insertion of Cardiac Lead into Right Atrium, Open Approach) and referring to a ''cardiac'' lead instead of a ''pacemaker'' lead in code 02H63JZ (Insertion of Pacemaker Lead into Right Atrium, Percutaneous Approach). The commenters recommended that CMS correct the code titles to align with the official ICD–10–PCS code titles.

Response: We appreciate the commenter's support for our proposal. In addition, we reviewed the list of codes in the table included in the proposed rule and agree that there were errors in some of the code titles (ICD–10–PCS codes 02H60MZ through 02HN4MZ) in that table. We have corrected these title errors and are finalizing a corrected table below.

After consideration of the public comments we received, we are finalizing our proposal to modify the GROUPER logic for MS–DRGs 260, 261, and 262 so that cases reporting any one of the ICD–10–PCS procedure codes describing procedures involving pacemakers and related procedures and associated devices listed in the corrected table below are assigned to MS DRGs 260, 261, and 262.

LIST OF PROCEDURE CODES ASSIGNED TO MS–DRGS 260, 261, AND 262

Procedure code	Description
02H40JZ	Insertion of pacemaker lead into coronary vein, open approach.
02H40MZ	Insertion of cardiac lead into coronary vein, open approach.
02H43JZ	Insertion of pacemaker lead into coronary vein, percutaneous approach.
02H43MZ	Insertion of cardiac lead into coronary vein, percutaneous approach.
02H44JZ	Insertion of pacemaker lead into coronary vein, percutaneous endoscopic approach.
02H44MZ	Insertion of cardiac lead into coronary vein, percutaneous endoscopic approach.
02H60MZ	Insertion of Cardiac Lead into Right Atrium, Open Approach.
02H63JZ	Insertion of Pacemaker Lead into Right Atrium, Percutaneous Approach.
02H63MZ	Insertion of Cardiac Lead into Right Atrium, Percutaneous Approach.
02H64JZ	Insertion of Pacemaker Lead into Right Atrium, Percutaneous Endoscopic Approach.
02H64MZ	Insertion of Cardiac Lead into Right Atrium, Percutaneous Endoscopic Approach.
02H70JZ	Insertion of Pacemaker Lead into Left Atrium, Open Approach.
02H70MZ	Insertion of Cardiac Lead into Left Atrium, Open Approach.
02H73JZ	Insertion of Pacemaker Lead into Left Atrium, Percutaneous Approach.
02H73MZ	Insertion of Cardiac Lead into Left Atrium, Percutaneous Approach.
02H74JZ	Insertion of Pacemaker Lead into Left Atrium, Percutaneous Endoscopic Approach.
02H74MZ	Insertion of Cardiac Lead into Left Atrium, Percutaneous Endoscopic Approach.
02HK00Z	Insertion of Pressure Sensor Monitoring Device into Right Ventricle, Open Approach.
02HK02Z	Insertion of Monitoring Device into Right Ventricle, Open Approach.
02HK0JZ	Insertion of Pacemaker Lead into Right Ventricle, Open Approach.
02HK0MZ	Insertion of Cardiac Lead into Right Ventricle, Open Approach.
02HK30Z	Insertion of Pressure Sensor Monitoring Device into Right Ventricle, Percutaneous Approach.
02HK32Z	Insertion of Monitoring Device into Right Ventricle, Percutaneous Approach.
02HK3JZ	Insertion of Pacemaker Lead into Right Ventricle, Percutaneous Approach.
02HK3MZ	Insertion of Cardiac Lead into Right Ventricle, Percutaneous Approach.
02HK40Z	Insertion of Pressure Sensor Monitoring Device into Right Ventricle, Percutaneous Endoscopic Approach.
02HK42Z	Insertion of Monitoring Device into Right Ventricle, Percutaneous Endoscopic Approach.
02HK4JZ	Insertion of Pacemaker Lead into Right Ventricle, Percutaneous Endoscopic Approach.
02HK4MZ	Insertion of Cardiac Lead into Right Ventricle, Percutaneous Endoscopic Approach.
02HL0JZ	Insertion of Pacemaker Lead into Left Ventricle, Open Approach.

LIST OF PROCEDURE CODES ASSIGNED TO MS–DRGS 260, 261, AND 262—Continued

Procedure code	Description
02HL0MZ	Insertion of Cardiac Lead into Left Ventricle, Open Approach.
02HL3JZ	Insertion of Pacemaker Lead into Left Ventricle, Percutaneous Approach.
02HL3MZ	Insertion of Cardiac Lead into Left Ventricle, Percutaneous Approach.
02HL4JZ	Insertion of Pacemaker Lead into Left Ventricle, Percutaneous Endoscopic Approach.
02HL4MZ	Insertion of Cardiac Lead into Left Ventricle, Percutaneous Endoscopic Approach.
02HN0JZ	Insertion of cardiac lead into left ventricle, percutaneous endoscopic approach.
02HN0MZ	Insertion of pacemaker lead into pericardium, open approach.
02HN3JZ	Insertion of cardiac lead into pericardium, open approach.
02HN3MZ	Insertion of pacemaker lead into pericardium, percutaneous approach.
02HN4JZ	Insertion of cardiac lead into pericardium, percutaneous approach.
02HN4MZ	Insertion of pacemaker lead into pericardium, percutaneous endoscopic approach.
02PA0MZ	Insertion of cardiac lead into pericardium, percutaneous endoscopic approach.
02PA3MZ	Removal of cardiac lead from heart, open approach.
02PA4MZ	Removal of cardiac lead from heart, percutaneous approach.
02PAXMZ	Removal of cardiac lead from heart, percutaneous endoscopic approach.
02WA0MZ	Revision of cardiac lead in heart, open approach.
02WA3MZ	Revision of cardiac lead in heart, percutaneous approach.
02WA4MZ	Revision of cardiac lead in heart, percutaneous endoscopic approach.
0JH600Z	Insertion of hemodynamic monitoring device into chest subcutaneous tissue and fascia, open approach.
0JH630Z	Insertion of hemodynamic monitoring device into chest subcutaneous tissue and fascia, percutaneous approach.
0JH800Z	Insertion of hemodynamic monitoring device into abdomen subcutaneous tissue and fascia, open approach.
0JH830Z	Insertion of hemodynamic monitoring device into abdomen subcutaneous tissue and fascia, percutaneous approach.
0JPT0PZ	Removal of cardiac rhythm related device from trunk subcutaneous tissue and fascia, open approach.
0JPT3PZ	Removal of cardiac rhythm related device from trunk subcutaneous tissue and fascia, percutaneous approach.
0JWT0PZ	Revision of cardiac rhythm related device in trunk subcutaneous tissue and fascia, open approach.
0JWT3PZ	Revision of cardiac rhythm related device in trunk subcutaneous tissue and fascia, percutaneous approach.

d. Transcatheter Mitral Valve Repair With Implant

As we did for the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28008 through 28010), for FY 2017, we received a request to modify the MS–DRG assignment for transcatheter mitral valve repair with implant procedures. We refer readers to detailed discussions of the MitraClip® System (hereafter referred to as MitraClip®) for transcatheter mitral valve repair in previous rulemakings, including the FY 2012 IPPS/LTCH PPS proposed rule (76 FR 25822) and final rule (76 FR 51528 through 51529) and the FY 2013 IPPS/LTCH PPS proposed rule (77 FR 27902 through 27903) and final rule (77 FR 53308 through 53310), in response to requests for MS–DRG reclassification, as well as the FY 2014 IPPS/LTCH PPS proposed rule (78 FR 27547 through 27552), under the new technology add-on payment policy. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50575), the application for a new technology add-on payment for MitraClip® was unable to be considered further due to lack of FDA approval by the July 1, 2013 deadline.

In the FY 2015 IPPS/LTCH PPS final rule, we finalized our proposal to not create a new MS–DRG or to reassign cases reporting procedures involving the MitraClip® to another MS–DRG (79 FR 49890 through 49892). Under a separate process, the request for a new technology add-on payment for the MitraClip® System was approved (79 FR 49941 through 49946). As discussed in section II.I.4.e. of the preamble of the proposed rule and this final rule, we proposed to discontinue the new technology add-on payment for MitraClip® for FY 2017 and are finalizing our proposal in this final rule.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49371), we finalized a modification to the MS–DRGs to which the procedure involving the MitraClip® System was assigned. For the ICD–10 based MS–DRGs to fully replicate the ICD–9–CM based MS–DRGs, ICD–10–PCS code 02UG3JZ (Supplement mitral valve with synthetic substitute, percutaneous approach), which identifies the use of the MitraClip® technology and is the ICD–10–PCS code translation for ICD–9–CM procedure code 35.97 (Percutaneous mitral valve repair with implant), was assigned to new MS–DRGs 273 and 274 (Percutaneous Intracardiac Procedures with and without MCC, respectively) and continued to be assigned to MS–DRGs 231 and 232 (Coronary Bypass with PTCA with MCC and without MCC, respectively). According to the requestor, there are substantial clinical and resource differences between the transcatheter mitral valve repair procedure and other procedures currently grouping to MS–DRGs 273 and 274, which are the focus of the request.

The requestor submitted three options for CMS to consider for FY 2017. The first option was to create a new MS–DRG for endovascular cardiac valve repair with implant; the second option was to reassign cases for the MitraClip® implant from MS–DRGs 273 and 274 to MS–DRGs 266 and 267 (Endovascular Cardiac Valve Replacement with and without MCC, respectively); and the third option was to reassign cases involving the MitraClip® system to another higher paying MS–DRG.

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule, we analyzed claims data from the December 2015 update of the FY 2015 MedPAR file on reported cases of percutaneous mitral valve repair with implant (ICD–9–CM procedure code 35.97) in MS–DRGs 273 and 274. Our findings are shown in the table below.

PERCUTANEOUS MITRAL VALVE REPAIR WITH IMPLANT

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 273—All cases	6,620	8.01	$27,625
MS–DRG 273—Cases with procedure code 35.97	457	7.57	50,560
MS–DRG 274—All cases	14,220	3.46	19,316
MS–DRG 274—Cases with procedure code 35.97	693	2.67	37,686

As shown in the table, the total number of cases reported in MS–DRG 273 was 6,620 and had an average length of stay of 8.01 days and average costs of $27,625. The number of cases reporting the ICD–9–CM procedure code 35.97 in MS–DRG 273 totaled 457 and had an average length of stay of 7.57 days and average costs of $50,560. For MS–DRG 274, there were a total of 14,220 cases with an average length of stay of 3.46 days and average costs of $19,316. There were a total of 693 cases in MS–DRG 274 that reported procedure code 35.97; these cases had an average length of stay of 2.67 days and average costs of $37,686. We recognize that the cases reporting procedure code 35.97 had a shorter length of stay and higher average costs in comparison to all the cases within MS–DRGs 273 and 274.

As stated above, the first option of the requestor was that we create a new MS–DRG for endovascular cardiac valve repair with implant procedures for all cardiac valve repairs. We reviewed the following list of ICD–10–PCS procedure codes that the requestor submitted to comprise this proposed new MS–DRG.

ICD–10–PCS code	Description
02UF37Z	Supplement aortic valve with autologous tissue substitute, percutaneous approach.
02UF38Z	Supplement aortic valve with zooplastic tissue, percutaneous approach.
02UF3JZ	Supplement aortic valve with synthetic substitute, percutaneous approach.
02UF3KZ	Supplement aortic valve with nonautologous tissue substitute, percutaneous approach.
02UG37Z	Supplement mitral valve with autologous tissue substitute, percutaneous approach.
02UG38Z	Supplement mitral valve with zooplastic tissue, percutaneous approach.
02UG3JZ	Supplement mitral valve with synthetic substitute, percutaneous approach.
02UG3KZ	Supplement mitral valve with nonautologous tissue substitute, percutaneous approach.
02UH37Z	Supplement pulmonary valve with autologous tissue substitute, percutaneous approach.
02UH38Z	Supplement pulmonary valve with zooplastic tissue, percutaneous approach.
02UH3JZ	Supplement pulmonary valve with synthetic substitute, percutaneous approach.
02UH3KZ	Supplement pulmonary valve with nonautologous tissue substitute, percutaneous approach.
02UJ37Z	Supplement tricuspid valve with autologous tissue substitute, percutaneous approach.
02UJ38Z	Supplement tricuspid valve with zooplastic tissue, percutaneous approach.
02UJ3JZ	Supplement tricuspid valve with synthetic substitute, percutaneous approach.
02UJ3KZ	Supplement tricuspid valve with nonautologous tissue substitute, percutaneous approach.

The above list of ICD–10–PCS procedure codes are currently assigned to MS–DRGs 216 through 221 (Cardiac Valve and Other Major Cardiovascular Procedures with and without Cardiac Catheterization with MCC, with CC, and without CC/MCC, respectively), with the exception of procedure code 02UG3JZ, which is assigned to MS–DRGs 273 and 274, as noted earlier in this section.

All 16 of the ICD–10–PCS procedure codes submitted by the requester are comparable translations of ICD–9–CM procedure code 35.33 (Annuloplasty), which also grouped to MS–DRGs 216 through 221. However, ICD–10–PCS procedure code 02UG3JZ (Supplement mitral valve with synthetic substitute, percutaneous approach) is the comparable translation for both ICD–9–CM procedure code 35.33 and ICD–9–CM procedure code 35.97 (Percutaneous mitral valve repair with implant), which group to MS–DRGs 273 and 274 as mentioned previously.

Upon review of the 16 ICD–10–PCS procedure codes submitted for consideration by the requestor, we stated in the proposed rule that we determined that we could not propose the suggestion of a new MS–DRG because the resulting ICD–10 MS–DRG logic would not be an accurate replication of the ICD–9–CM based MS–DRG logic. Specifically, it is not possible to replicate reassigning the percutaneous annuloplasty codes from ICD–9–CM based MS–DRGs 216 through 221 to a new MS–DRG because we cannot isolate those cases from procedure code 35.33. Under ICD–9–CM, procedure code 35.33 does not differentiate the specific type of approach used to perform the procedure. This is in contrast to the 60 comparable ICD–10 code translations that do differentiate among various approaches (open, percutaneous, and percutaneous endoscopic).

As stated previously, if the ICD–9–CM and ICD–10 versions of the MS–DRGs cease to be replications of each other, the relative payment weights (computed using the ICD–9–CM based MS–DRGs) would be inconsistent with the ICD–10 MS–DRG assignment, which may cause unintended payment redistribution. Therefore, we did not propose to create a new MS–DRG for transcatheter mitral valve repair with implant procedures for FY 2017.

The second option in the request was to evaluate reassigning cases involving the MitraClip® to MS–DRGs 266 and 267. This option is not supported for the same reasons provided in previous rulemaking regarding differences between valve replacements and valve repairs. Our clinical advisors did not believe that these procedures are clinically coherent or similar in terms of resource consumption because the MitraClip® technology is utilized for a percutaneous mitral valve *repair,* while the other technologies assigned to MS–DRGs 266 and 267 are utilized for transcatheter/endovascular cardiac valve *replacements.* In addition, if cases involving the MitraClip® were

reassigned to MS–DRGs 266 and 267, they would be overpaid by approximately $10,000 as shown in the table below. Our clinical advisors agreed that we should not propose to reassign endovascular cardiac valve repair procedures to the endovascular cardiac valve replacement MS–DRGs.

ENDOVASCULAR CARDIAC VALVE REPLACEMENT WITH AND WITHOUT MCC

MS–DRG 266—All cases	7,436	8.54	$59,675
MS–DRG 267—All cases	8,480	4.45	47,013

Next, for the proposed rule, we analyzed claims data from the December 2015 update of the FY 2015 MedPAR file relating to the possible reassignment of cases involving the MitraClip® (identified by ICD–9–CM procedure code 35.97) to MS–DRGs 228, 229, and 230 (Other Cardiothoracic Procedures with MCC, with CC, and without CC/MCC, respectively). However, as shown in the findings in the table below, the claims data did not support this option under the current 3-way severity level split. That is, the data findings based on reassignment of MitraClip® cases (ICD–9–CM procedure code 35.97) to MS–DRGs 228, 229, and 230 did not support the required criterion that there be at least a $2,000 difference between subgroups. A reassignment would not meet the requirement for the ''with CC'' and ''without CC/MCC'' subgroups ($34,461 minus $33,216 = $1,245).

OTHER CARDIOTHORACIC PROCEDURES (WITH PROCEDURE CODE 35.97)

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 228—with MCC	1,966	11.53	$51,634
MS–DRG 229—with CC	2,318	6.28	34,461
MS–DRG 230—without CC/MCC	709	3.76	33,216

We then performed additional analysis consisting of the base DRG report for MS–DRGs 228, 229 and 230. As shown in the table below, the average costs between the ''with CC'' and the ''without CC/MCC'' subgroups no longer meet the criterion that there be at least a 20-percent difference in average costs between subgroups. These data findings support collapsing MS–DRGs 228, 229, and 230 from a 3-way severity level split into a 2-way severity level split (with MCC and without MCC) based on 2 years (FY 2014 and FY 2015) of MedPAR data. This option would involve the deletion of an MS–DRG.

OTHER CARDIOTHORACIC PROCEDURES

MS–DRG	Number of cases FY 2015	Average length of stay FY 2015	Average costs FY 2015	Number of cases FY 2014	Average length of stay FY 2014	Average costs FY 2014
MS–DRG 228—with MCC	1,509	12.73	$51,960	1,486	12.75	$50,688
MS–DRG 229—with CC	1,835	7.16	33,786	1,900	7.46	33,277
MS–DRG 230—without CC/MCC	499	4.52	30,697	443	4.84	31,053

In the additional analysis, we evaluated if reassignment of cases reporting ICD–9–CM procedure code 35.97 to this proposed 2-way severity split was supported. We confirmed that the reassignment of ICD–9–CM procedure code 35.97 could be replicated under the ICD–9 MS–DRGs. We believe that deleting MS–DRG 230, revising MS–DRG 229, and reassigning cases with procedure code 35.97 from MS–DRGs 273 and 274 to this new structure would reflect these procedures more accurately in the ICD–10 MS–DRGs. Our clinical advisors agreed with a proposal to delete MS–DRG 230 and reassign cases involving percutaneous mitral valve repair with implant (MitraClip®) to MS–DRG 228 and revised MS–DRG 229. We believe that this approach would maintain clinical coherence for these MS–DRGs and reflect more appropriate payment for procedures involving percutaneous mitral valve repair. The proposed revisions to the MS–DRGs, which include the MitraClip® cases, are shown in the table below.

OTHER CARDIOTHORACIC PROCEDURES

Proposed revised MS–DRGs	Number of cases	Average length of stay	Average costs
MS–DRG 228—with MCC	1,966	11.53	$51,634
MS–DRG 229—without MCC	3, 027	5.69	34,169

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24987 through 24988), for FY 2017, we proposed to collapse MS–DRGs 228, 229, and 230 from three severity levels to two severity levels by deleting MS–DRG 230 and revising MS–DRG 229. We also proposed to reassign ICD–9–CM procedure code 35.97 and the cases

reporting ICD–10–PCS procedure code 02UG3JZ (Supplement mitral valve with synthetic substitute, percutaneous approach) from MS–DRGs 273 and 274 to MS–DRG 228 and proposed revised MS–DRG 229. The title of MS–DRG 229 would be modified as follows to reflect the ''without MCC'' designation. The title of proposed revised MS–DRG 229 would be ''Other Cardiothoracic Procedures without MCC''. The title for MS–DRG 228 would remain the same: MS–DRG 228 (Other Cardiothoracic Procedures with MCC). We invited public comments on our proposals.

We also note that, as discussed earlier in this section of the proposed rule and this final rule, in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49371), ICD–10–PCS code 02UG3JZ (Supplement mitral valve with synthetic substitute, percutaneous approach) was assigned to MS–DRGs 231 and 232 (Coronary Bypass with PTCA with MCC and without MCC, respectively), in addition to new MS–DRGs 273 and 274, to fully replicate the ICD–9–CM based MS–DRG logic for ICD–9–CM procedure code 35.97. We stated that if our proposal in the FY 2017 proposed rule to reassign ICD–10–PCS code 02UG3JZ to MS–DRG 228 and proposed revised MS–DRG 229 was finalized in this FY 2017 IPPS/LTCH PPS final rule, it would eliminate the need to continue having ICD–10–PCS code 02UG3JZ and ICD–9–CM code 35.97 group to MS–DRGs 231 and 232. This is due to the fact that, currently, MS–DRGs 228, 229, and 230 are listed higher than MS–DRGs 231 through 236 in the surgical hierarchy, as shown in the ICD–9 and ICD–10 MS–DRGs Definitions Manual Files in Appendix D—MS–DRG Surgical Hierarchy by MDC and MS–DRG, which is available via the Internet on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Data-Files.html?DLPage=1&DLEntries=10&DLSort=0&DLSortDir=ascending*. Therefore, we stated in the proposed rule that if the proposal is finalized for FY 2017, cases reporting ICD–10–PCS procedure code 02UG3JZ will group to MS–DRG 228 and revised MS–DRG 229 versus MS–DRGs 231 and 232 because of the surgical hierarchy GROUPER logic.

As a result, in the FY 2017 IPPS/LTCH PPS proposed rule, we proposed to remove ICD–10–PCS procedure code 02UG3JZ and ICD–9–CM procedure code 35.97 from the PTCA list in MS–DRGs 231 and 232 (Coronary Bypass with PTCA with MCC and without MCC, respectively) for FY 2017 if the proposal to reassign ICD–9–CM procedure code 35.97 and the cases reporting ICD–10–PCS procedure codes 02UG3JZ from MS–DRGs 273 and 274 to MS–DRG 228 and proposed revised MS–DRG 229 is finalized. We invited public comments on our proposals.

Comment: A large number of commenters supported the proposal to reassign ICD–9–CM procedure code 35.97 and ICD–10–PCS procedure code 02UG3JZ, which describe a mitral valve repair procedure involving the MitraClip®, from MS–DRGs 273 and 274 to MS–DRG 228 and proposed revised MS–DRG 229. Commenters stated that patient access to the procedure has been very restricted at their institutions due to the financial hardship that results from the current payment inadequacies. Several commenters noted that mitral valve interventions are an integral part of their organizations structural heart disease programs and stated that, with the expiration of the new technology add-on payment effective September 30, 2016, the insufficient payment amount and issues with patient access would only increase.

Other commenters reported that these high-risk degenerative mitral valve patients have no alternative options, are not surgical candidates for open procedures, are generally older, more complex to treat and require greater resources by a multidisciplinary heart team; therefore, the commenters urged CMS to finalize the proposal. According to the commenters, the procedure is labor and time intensive with a higher complexity than traditional percutaneous procedures. Commenters also stated the proposed modifications to the MS–DRG structure will enable more patients to have an improved quality of life. These commenters stated that, for the patients who actually receive a mitral valve repair procedure with the MitraClip®, they have witnessed improved clinical outcomes, such as improvements in their NYHA class designation and walk distances. Other commenters described how patients' families shared the impact of what it meant for their family member to have a new outlook on life after having undergone the procedure. A number of commenters also pointed out the cost savings to Medicare with the procedure, which they stated were evidenced by reduced lengths of stay and decreased heart failure readmissions.

Conversely, a few commenters opposed the proposal to modify the structure of MS–DRGs 228, 229, and 230. These commenters recommended that the only changes made should be for replication of the ICD–9–CM MS–DRG logic. These commenters suggested that, because FY 2016 is the first year of implementation in which CMS will have ICD–10 claims data, CMS allow the data to stabilize prior to evaluating for any proposed changes. The commenters stated that replication is important because both the logic for the proposed MS–DRGs and the data source used to calculate and develop the proposed relative payment weights are based on the same ICD–9–CM MedPAR claims data.

Response: We appreciate the commenters' support of our proposal. With regard to the commenters who opposed the proposal to modify the structure of MS–DRGs 228, 229, and 230 and recommended that the only changes made should be for replication of the ICD–9–CM MS–DRG logic as noted and illustrated in the tables above, the proposal to revise the structure of MS–DRGs 228, 229, and 230 was based on the analysis of claims data from the December 2015 update of the FY 2015 MedPAR file on reported cases of percutaneous mitral valve repair with implant (ICD–9–CM procedure code 35.97) in the ICD–9 based MS–DRGs 273 and 274. The ICD–9–CM data and our clinical advisors supported the reassignment of ICD–9–CM procedure code 35.97 from ICD–9–CM MS–DRGs 273 and 274 to restructured ICD–9–CM MS–DRGs 228 and 229. Therefore, the proposal for restructuring the ICD–10 MS–DRGs is in fact replicating the ICD–9–CM MS–DRG logic that was finalized.

Consistent with how the current FY 2016 relative payment weights are based on the ICD–9–CM diagnosis and procedure codes from the FY 2014 MedPAR claims data that were grouped through the ICD–9–CM version of the FY 2016 GROUPER Version 33, the FY 2017 relative payment weights are based on the ICD–9–CM diagnosis and procedure codes from the FY 2015 MedPAR claims data that were grouped through the ICD–9–CM version of the FY 2017 GROUPER Version 34. We note that we have made the MS–DRG GROUPER and MCE ICD–9–CM Software Version 34 available to the public for use in analyzing ICD–9–CM data to create relative payment weights using ICD–9–CM data on our CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page.html?DLSort=0&DLEntries=10&DLPage=1&DLSortDir=ascending*.

After consideration of the public comments we received, we are finalizing our proposal to collapse MS–DRGs 228, 229, and 230 from three severity levels to two severity levels by

deleting MS–DRG 230 and revising MS–DRG 229. We also are finalizing our proposal to reassign ICD–9–CM procedure code 35.97 and the cases reporting ICD–10–PCS procedure code 02UG3JZ (Supplement mitral valve with synthetic substitute, percutaneous approach) from MS–DRGs 273 and 274 to MS–DRG 228 and revised MS–DRG 229. The title of revised MS–DRG 229 is finalized as follows to reflect the ''without MCC'' designation, ''Other Cardiothoracic Procedures without MCC''. The title for MS–DRG 228 is finalized as ''MS–DRG 228 (Other Cardiothoracic Procedures with MCC)''. In addition, we are finalizing our proposal to remove ICD–10–PCS procedure code 02UG3JZ and ICD–9–CM procedure code 35.97 from the PTCA list in MS–DRGs 231 and 232 (Coronary Bypass with PTCA with MCC and without MCC, respectively) for FY 2017. All of these finalized modifications are effective October 1, 2016.

e. MS–DRG 245 (AICD Generator Procedures)

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49369), we stated that we would continue to monitor MS–DRG 245 (AICD Generator Procedures) to determine if the data supported subdividing this base MS–DRG into severity levels. As displayed in the table below, the results of the FY 2015 data analysis showed there were a total of 1,464 cases, with an average length of stay of 5.5 days and average costs of $34,564 for MS–DRG 245.

AICD Generator Procedures

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 245	1,464	5.5	$34,564

We applied the five criteria established in the FY 2008 IPPS final rule (72 FR 47169), as described in section II.F.1.b. of the preamble of the proposed rule and this final rule to determine if it was appropriate to subdivide MS–DRG 245 into severity levels. The table below illustrates our findings.

AICD Generator Procedures

MS–DRG by suggested severity level	Number of cases	Average length of stay	Average costs
MS–DRG 245—with MCC	449	8.37	$40,175
MS–DRG 245—with CC	861	4.59	32,518
MS–DRG 245—without CC/MCC	154	2.86	29,646

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24988 through 24989), based on our analysis of claims data from the December 2015 update of the FY 2015 MedPAR file, the data findings did not support creating new severity levels. The findings showed that the data do not meet the criteria for a 3-way severity level split as the criterion that there be at least a 20-percent difference in average costs between subgroups is not met for the ''with CC'' and ''without CC/MCC'' severity levels. We also looked at the prospect of a 2-way severity level split.

AICD Generator Procedures

MS–DRG by suggested severity level	Number of cases	Average length of stay	Average costs
MS–DRG 245—with MCC	449	8.37	$40,175
MS–DRG 245—without MCC	1,015	4.33	32,081

The findings did show that the data are close to meeting the criteria for a 2-way severity level split of ''with MCC and without MCC.'' However, the required criterion that there must be at least 500 cases in the MCC group is not met.

Therefore, for FY 2017, we did not propose to subdivide MS–DRG 245 into severity levels. We invited public comments on our proposal to maintain the current structure for MS–DRG 245.

Comment: Commenters supported the proposal not to subdivide MS–DRG 245 into severity levels. One commenter agreed that volumes were not sufficient to justify a three-way split in the AICD generator procedures, but neared meeting the levels required for a two-way split (with MCC and without MCC). The commenter requested that we examine the issue for a two-way split again next year.

Response: We appreciate the commenters' support. We agree that the criteria were not met to support the subdivision of MS–DRG 245 into severity levels for FY 2017. We will continue to monitor MS–DRG 245 claim data as we analyze issues for the FY 2018 IPPS/LTCH PPS proposed rule.

After consideration of the public comments we received, we are finalizing our proposal to maintain the current structure of MS–DRG 245 (AICD Generator Procedures) for FY 2017.

6. MDC 6 (Diseases and Disorders of the Digestive System): Excision of Ileum

We received a request to analyze an MS–DRG replication issue from the ICD–9–CM based MS–DRGs to the ICD–10 based MS–DRGs for excision procedures performed on the ileum. Under ICD–9–CM, procedure code 45.62 (Other partial resection of small intestine) was assigned to MS–DRGs 329, 330 and 331 (Major Small and Large Bowel Procedures with MCC, with CC, and without CC/MCC, respectively). Under the current ICD–10 MS–DRGs

Version 33, ICD–10–PCS procedure code 0DBB0ZZ (Excision of ileum, open approach) is assigned to MS–DRGs 347, 348, and 349 (Anal and Stomal Procedures with MCC, with CC, and without CC/MCC, respectively). The requestor indicated that, despite the variation in terms for ''excision'' and ''resection'' between the two code sets, the surgical procedure to remove a portion of the small intestine, whether it is the ileum, duodenum, or jejunum, has not changed and should not result in different MS–DRG assignments when translated from ICD–9–CM to ICD–10.

We agree that this is a replication error. In addition to ICD–10–PCS code 0DBB0ZZ, we also reviewed the MS–DRG assignments for ICD–10–PCS code 0DBA0ZZ (Excision of jejunum, open approach) and determined the MS–DRG assignment for this code resulted in the same replication error. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24989), we proposed to reassign ICD–10–PCS codes 0DBB0ZZ and 0DBA0ZZ from MS–DRGs 347, 348, and 349 to MS–DRGs 329, 330, and 331, effective with the ICD–10 MS–DRGs Version 34 on October 1, 2016.

We invited public comments on our proposal.

Comment: Many commenters supported our proposal to reassign two ICD–10–PCS procedure codes that identify excision procedures performed on the ileum and jejunum. The commenters believed that the proposal was reasonable, given the data, the ICD–10–PCS codes, and the information provided. One commenter recommended that CMS reassign ICD–10–PCS procedure code 0DB90ZZ (Excision of duodenum, open approach) to ICD–10 MS–DRGs 329, 330, and 331, noting that, as stated in the proposed rule, the requester indicated the surgical procedure to remove a portion of the small intestine, whether it is the ileum, duodenum, or jejunum, has not changed and should not result in different MS–DRG assignments when translated from ICD–9–CM to ICD–10.

Response: We appreciate the commenters' support of our proposal. In response to the commenter's recommendation that we also reassign ICD–10–PCS procedure code 0DB90ZZ to ICD–10 MS–DRGs 329, 330, and 331, we note that, under ICD–9–CM, procedure code 45.31 (Other local excision of lesion of duodenum) is the comparable translation and was assigned to ICD–9 based MS–DRGs 326, 327, and 328 (Stomach, Esophageal and Duodenal Procedures with MCC, with CC and without CC/MCC, respectively). We did not include ICD–10–PCS procedure code 0DB90ZZ in our proposal because, upon review, we determined that this code is currently assigned to ICD–10 MS–DRGs 326, 327, and 328 (Stomach, Esophageal and Duodenal Procedures with MCC, with CC and without CC/MCC, respectively), and therefore, is accurately replicating the ICD–9 based MS–DRG logic.

After consideration of the public comments we received, we are finalizing our proposal to reassign ICD–10–PCS procedure codes 0DBB0ZZ (Excision of ileum, open approach) and 0DBA0ZZ (Excision of jejunum, open approach) from MS–DRGs 347, 348, and 349 (Anal and Stomal Procedures with MCC, with CC, and without CC/MCC, respectively) to MS–DRGs 329, 330, and 331 (Major Small and Large Bowel Procedures with MCC, with CC, and without CC/MCC, respectively) effective with the ICD–10 MS–DRGs Version 34 on October 1, 2016.

7. MDC 7 (Diseases and Disorders of the Hepatobiliary System and Pancreas): Bypass Procedures of the Veins

We received a request to assign ICD–10–PCS code 06183DY (Bypass portal vein to lower vein with intraluminal device, percutaneous approach) to MDC 7 (Diseases and Disorders of the Hepatobiliary System and Pancreas) under MS–DRGs 405, 406, and 407 (Pancreas Liver and Shunt Procedures with MCC, with CC, and without CC/MCC, respectively). The requestor described this code as capturing a transjugular intrahepatic portosystem shunt procedure. The requestor stated that, under ICD–9–CM, when a procedure for cirrhosis of the liver was performed, the procedure was assigned to ICD–9–CM code 39.1 (Intra-abdominal venous shunt). The requestor noted that when ICD–9–CM procedure code 39.1 is reported with a principal diagnosis of cirrhosis of the liver, the procedure was assigned to MS–DRG 405, 406, or 407 in the ICD–9–CM MS–DRGs.

Currently, ICD–10–PCS procedure code 06183DY is assigned to only MDC 5 (Diseases and Disorders of the Circulatory System) and MS–DRGs 270, 271, and 272 (Other Major Cardiovascular Procedures with MCC, with CC, and without CC/MCC, respectively) under ICD–10 MS–DRGs Version 33. The requestor stated that ICD–10–PCS procedure code 06183DY should also be assigned to MDC 7 and MS–DRGs 405, 406, and 407 to be consistent with the ICD–9–CM MS–DRGs Version 32.

We analyzed this issue and agreed that the ICD–10 MS–DRGs do not fully replicate the ICD–9–CM MS–DRGs. We agree that ICD–10–PCS procedure code 06183DY should be assigned to MDC 7 and MS–DRGs 405, 406, and 407 to replicate the ICD–9–CM MS–DRGs. Our clinical advisors reviewed this issue and also agreed that ICD–10–PCS procedure code 06183DY should be assigned to MDC 7 and MS–DRGs 405, 406, and 407. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24989), we proposed to assign ICD–10–PCS procedure code 06183DY to MDC 7 and MS–DRGs 405, 406, and 407 for FY 2017.

We invited public comments on our proposal.

Comment: Commenters supported the proposal to assign ICD–10–PCS procedure code 06183DY to MDC 7 under MS–DRGs 405, 406, and 407. One commenter stated that the proposed change to MDC 7 and MS–DRGs 405, 406, and 407 is a more appropriate fit for ICD–10–PCS procedure code 06183DY.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to assign ICD–10–PCS code 06183DY (Bypass portal vein to lower vein with intraluminal device, percutaneous approach) to MDC 7 (Diseases and Disorders of the Hepatobiliary System and Pancreas) under MS–DRGs 405, 406, and 407 (Pancreas Liver and Shunt Procedures with MCC, with CC, and without CC/MCC, respectively).

8. MDC 8 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue)

a. Updates to MS–DRGs 469 and 470 (Major Joint Replacement or Reattachment of Lower Extremity With and Without MCC, Respectively)

(1) Total Ankle Replacement (TAR) Procedures

We received a request to create a new MS–DRG for total ankle replacement (TAR) procedures, which are currently assigned to MS–DRGs 469 and 470 (Major Joint Replacement or Reattachment of Lower Extremity with and without MCC, respectively). We previously discussed requested changes to the MS–DRG assignment for TAR procedures in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28013 through 28015) and in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49896 through 49899). For FY 2015, we did not change the MS–DRG assignment for total ankle replacements. The requestor stated that reassigning total ankle replacement procedures from MS–DRGs 469 and 470 to a new MS–DRG would have an important benefit for the new

Medicare Comprehensive Care for Joint Replacement (CJR) model. The commenter noted that because total ankle replacement cases currently are assigned to MS–DRGs 469 and 470, they are included in the model.

Ankle replacement procedures were captured by ICD–9–CM code 81.56 (Total ankle replacement). As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24989 through 24990), we examined claims data for total ankle procedures using the December 2015 update of the FY 2015 MedPAR file. Our findings are displayed in the table below.

TOTAL ANKLE REPLACEMENT CASES REPORTED IN MS–DRGS 469 AND 470

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 469—All cases	25,729	6.92	$22,358
MS–DRG 469—Total ankle replacement cases	30	5.40	34,889
MS–DRG 470—All cases	421,149	2.92	14,834
MS–DRG 470—Total ankle replacement cases	1,626	1.94	20,019

As the total ankle replacement claims data analysis showed, these procedures represent a small fraction of the total number of cases reported in MS–DRGs 469 and 470. There were 30 total ankle replacement cases reported in MS–DRG 469 and 1,626 total ankle replacement cases in MS–DRG 470, compared to 25,729 total cases reported in MS–DRG 469 and 421,149 total cases reported in MS–DRG 470. The average length of stay for total ankle replacement cases was 5.40 days and average costs for total ankle replacement cases were $34,889 reported in MS–DRG 469, compared to average length of stay of 6.92 days and average costs of $22,358 for all cases reported in MS–DRG 469. The average length of stay for total ankle replacement cases was 1.94 days and average costs of total ankle replacement cases were $20,019 reported in MS–DRG 470, compared to an average length of stay of 2.92 days and average costs of $14,834 for all cases reported in MS–DRG 470.

Given the low volume of cases, we stated in the proposed rule that we believe these cost data may not be a complete measure of actual differences in inpatient resource utilization for beneficiaries receiving total ankle replacements. In addition, these total ankle replacement cases may have been impacted by other factors such as complication or comorbidities. Several expensive cases could impact the average costs for a very small number of patients. The average cost of total ankle replacement cases reported in MS–DRG 469 was $12,531 higher than all cases reported in MS–DRG 469 ($34,889 compared to $22,358 for all reported cases), but there were only 30 cases compared to a total of 25,729 cases reported in MS–DRG 469. The average cost of total ankle replacement cases reported in MS–DRG 470 was $5,185 higher than all cases reported in MS–DRG 470. There were 1,626 total ankle replacement cases out of a total of 421,149 cases reported in MS–DRG 470. The average costs of the total ankle replacement cases were higher than those for all cases reported in MS–DRG 469 and 470. However, some cases have higher and some cases have lower average costs within any MS–DRG. MS–DRGs are groups of clinically similar cases that have similar overall costs. Within a group of cases, one would expect that some cases have costs that are higher than the overall average and some cases have costs that are lower than the overall average.

The data did not support creating a new total ankle replacement MS–DRG for this small number of cases. Also, our clinical advisors pointed out that creating a new MS–DRG for total ankle replacements would result in combining cases reporting an MCC with an average length of stay of 5.40 days and cases not reporting an MCC with an average length of stay of 1.94 days. Our clinical advisors did not recommend the creation of a new MS–DRG for this single procedure with such a small number of cases. They also stated that patients undergoing total ankle replacement have similar clinical features compared to other patients undergoing procedures included in MS–DRGs 469 and 470. Furthermore, we believe that the volume of total ankle replacement procedures performed relative to hip and knee replacement procedures minimizes the benefit that a new MS–DRG would have on the Medicare CJR model. Our clinical advisors determined that the cases involving total ankle replacements are more appropriately assigned to MS–DRGs 469 and 470 with the two severity levels.

Based on the findings from our data analysis and the recommendations from our clinical advisors, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24989 through 24990), we did not propose to create a new MS–DRG for total ankle replacement procedures. We proposed to maintain the current MS–DRG structure for MS–DRGs 469 and 470.

We invited public comments on this proposal.

Comment: Some commenters supported the proposal to maintain the current MS–DRG structure for revision of total ankle replacement procedures within MS–DRGs 469 and 470 and not create a new MS–DRG for total ankle replacements. Several of the commenters stated that the proposal was reasonable, given the data, the ICD–10–PCS codes, and the information provided.

Response: We appreciate the commenters' support for our proposal.

Comment: Several commenters disagreed with the proposal not to create a new MS–DRG for total ankle replacement procedures and to maintain the current MS–DRG structure for MS–DRGs 469 and 470 for total ankle replacement procedures. The commenters stated that the current MS–DRG assignment for TAR procedures was inadequate to reflect the actual cost and complexity of these procedures. The commenters stated that the combined total ankle replacement cases in MS–DRGs 469 and 470 exceeds the minimum number of cases (500) in the criterion which CMS established for consideration of a distinct MS–DRG group. Therefore, the commenters believed that CMS should create a new MS–DRG for total ankle replacements.

The commenters stated that the MS–DRG assignment was impacting Medicare beneficiary access to total ankle replacement as an alternative to an arthrodesis (fusion) of the ankle joint. The commenters further stated that there were significant dissimilarities in the inpatient hospital costs and length of stay, and different postoperative and postdischarge care and rehabilitation protocols for total ankle replacement procedures.

One commenter objected to CMS' comparison of the volume of total ankle replacement cases to total hip and knee cases within MS–DRG 469 and 470 and the statement that, within the inpatient prospective payment system framework, some cases have higher and some cases have lower average costs within any MS–DRG. The commenter stated that CMS' statements about possible explanations for the higher costs of total ankle replacement cases within MS–DRGs 469 and 470 does not change the fact that the total ankle replacement cases have higher costs than all cases within MS–DRGs 469 and 470. The commenter stated that total ankle replacement cases have a greater clinical complexity compared to other procedures within MS–DRGs 469 and 470. The commenter stated that a total ankle replacement procedure was a complicated surgery that involved the replacement of the damaged parts of the three bones that make up the ankle joint, as compared to two bones in hip and knee replacement procedures. Furthermore, as the smallest weight-bearing large joint in the body, the commenter stated that total ankle replacement demanded a complexity of implant device design, engineering, and manufacture to exacting functional specifications that is vastly different from that of total hip and total knee replacement devices. In addition, the commenter stated that the unique anatomical characteristics and function of the ankle joint requires a specialized surgical skill set, operative technique, and level of operating room resource utilization that is vastly dissimilar from that of total hip and total ankle replacement procedures.

Another commenter stated that accurate representation of patients within each MS–DRG is an important step for fair payment and analysis. The commenter believed that reassigning fractures and ankle procedures from MS–DRGs 469 and 470 would help to accomplish that purpose. Another commenter asked that CMS reexamine the appropriate MS–DRG assignment for total ankle replacement procedures once ICD–10 claims data are available.

Response: We disagree with the commenters' statement that the number of total ankle replacement cases in MS–DRGs 469 and 470 justifies the creation of a new MS–DRG based on the criterion of there being more than 500 cases. The criterion the commenters mentioned is part of criteria established in FY 2008 (72 FR 47169) to determine if the creation of a new CC or MCC subgroup within a base MS–DRG was warranted (which was discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24971)), but is not determinative of whether a new MS–DRG should be created.

As stated earlier, the data showed that the average costs of total ankle replacement cases were higher than the average costs for all cases reported in MS–DRG 469 and 470. We found that the average costs of total ankle replacement procedures were higher in MS–DRG 469 ($34,889 compared to $22,358 for all cases) and in MS–DRG 470 ($20,019 compared to $14,834 for all cases). However, there were only 30 total ankle replacement cases in MS–DRG 469 out of 25,729 total cases. There were only 1,626 cases in MS–DRG 470 out of 421,149 cases.

As we explained in the proposed rule, given the low volume of cases, we believe that these cost data may not be a complete measure of actual differences in inpatient resource utilization for beneficiaries receiving total ankle replacements. Several expensive cases could impact the average costs for a very small number of patients. MS–DRGs are groups of clinically similar cases that have similar overall costs. Within a group of cases, one would expect that some cases have costs that are higher than the overall average and some cases have costs that are lower than the overall average. While the commenters disagreed with this approach to classifying similar procedures within a set of MS–DRGs, our clinical advisors reviewed the procedures assigned within MS–DRGs 469 and 470 and determined that patients undergoing total ankle replacement have similar clinical features compared to other patients undergoing procedures included in MS–DRGs 469 and 470. The clinical differences are not great enough to justify the creation of a new MS–DRG. While the ankle may be the smallest weight-bearing joint in the body and the devices used may be more costly, the joint repairs of the lower extremity are clinically similar. The clinical expertise used by surgeons performing ankle procedures versus the clinical expertise required to perform other lower joint procedures does not justify creating a new MS–DRG. Our clinical advisors determined that the cases involving total ankle replacements are appropriately assigned to MS–DRGs 469 and 470 with the two severity levels.

In response to the commenter's request that CMS reexamine the appropriate MS–DRG assignment for total ankle replacement procedures once ICD–10 claims data are available, we encourage requests for MS–DRG updates to be submitted by December 7 of each year via the new CMS MS–DRG Classification Change Requests Mailbox located at: *MSDRGClassification Change@cms.hhs.gov.* Once ICD–10 claims dara are received, we will use these data to evaluate MS–DRG assignments.

After consideration of the public comments we received, we are finalizing our proposal to maintain the current MS–DRG assignment for total ankle replacements in MS–DRGs 469 and 470 and not create a new MS–DRG for total ankle replacements.

(2) Hip Replacement Procedures With Principal Diagnosis of Hip Fracture

We received several requests to remove hip replacement procedures with a principal diagnosis of hip fracture from MS–DRGs 469 and 470 (Major Joint Replacement or Reattachment of Lower Extremity with and without MCC, respectively) and to create a new MS–DRG for assignment of these hip replacement procedures. One requestor suggested that if such a new MS–DRG could not be created, CMS consider reassigning all hip replacement procedures with a principal diagnosis of hip fracture only to MS–DRG 469, even if there were no reported MCC.

The requestors stated that hip replacement procedures performed on patients with hip fractures involve a more fragile population of patients than the typical patient population who undergo elective hip or knee replacement and that these more fragile patient cases also are assigned to MS–DRGs 469 and 470. The requestors stated that cases of patients who have hip replacements with hip fractures may have significant comorbidities not present in patients who undergo elective hip replacements. One requestor stated that the absolute number of hospitalizations for hip fractures in the United States is currently more than 350,000 and the number is rising. The requestor stated that 90 percent of hip fractures result from a simple fall, and that hip fracture rates increase with age. According to the requestor, the 1-year mortality rate for patients who undergo hip replacement procedures after a hip fracture was approximately 20 percent, and the 3-year mortality rate was up to 50 percent. The requestor also stated that one out of three adults who lived independently before their hip fracture remains in a nursing home for at least a year after the hip fracture. In contrast, the requestor noted that patients under elective hip replacement procedures for arthritis have fewer comorbidities, improved health after the procedure, low rates of readmission, and less postacute needs. The requestor believed that there are

many factors that impact the outcome of hip replacements for hip fractures, including patient factors, fracture type, surgeon and hospital factors, treatment decisions, complication rates, and rehabilitation factors/access. The requestor added that, despite the commitment to standardization, the use of protocol-driven care, early surgery (< 24 hours) after surgical optimization, prevention of recurrent fractures, and comanagement with medical/surgical teams, many patients who undergo hip replacement procedures for hip fractures have serious renal, cardiovascular, and liver disease, as well as multiple medical comorbidities. The rates of postoperative infections, readmissions, and postacute care for the patients who undergo hip replacements for hip fractures are higher than for patients who undergo elective hip replacement. Some requestors referenced the Bundled Payments for Care Improvement Initiative (BPCI) and believed that their requested changes to MS–DRGs 469 and 470 would support this effort. The requestors stated that the MS–DRG assignment for the hip replacement procedures with hip fractures has tremendous implications for successful participation in the BPCI because the BPCI's clinical episodes track to MS–DRG assignment, and the Major Joint Replacement of the Lower Extremity Clinical Episode encompasses procedures assigned to MS–DRGs 469 and 470. Alternatively, the requestors suggested that CMS reassign all cases of hip replacement procedures with a principal diagnosis of hip fracture to MS–DRG 469 to recognize the more significant adverse health profile of these types of cases.

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24990 through 24992), we examined claims data for cases reporting hip replacement procedures for patients admitted with hip fractures under MS–DRGs 469 and 470 in the December 2015 update of the FY 2015 MedPAR file. We used the following list of ICD–9–CM diagnosis codes to identify cases representing hip replacements for hip fractures:

ICD–9–CM Diagnosis Codes Reviewed for Cases Representing Hip Replacement for Hip Fractures

ICD–9–CM diagnosis code	Descriptions
733.14	Pathological fracture of neck of femur.
733.15	Pathological fracture of other specified part of femur.
733.81	Malunion of fracture.
733.82	Nonunion of fracture.
733.96	Stress fracture of femoral neck.
808.0	Closed fracture of acetabulum.
808.1	Open fracture of acetabulum.
820.8	Fracture of unspecified part of neck of femur closed.
820.9	Fracture of unspecified part of neck of femur open.
820.00	Fracture of unspecified intracapsular section of neck of femur closed.
820.01	Fracture of epiphysis (separation) (upper) of neck of femur closed.
820.02	Fracture of midcervical section of femur closed.
820.03	Fracture of base of neck of femur closed.
820.09	Other transcervical fracture of femur closed.
820.10	Fracture of unspecified intracapsular section of neck of femur open.
820.11	Fracture of epiphysis (separation) (upper) of neck of femur open.
820.12	Fracture of midcervical section of femur open.
820.13	Fracture of base of neck of femur open.
820.19	Other transcervical fracture of femur open.
820.20	Fracture of unspecified trochanteric section of femur closed.
820.21	Fracture of intertrochanteric section of femur closed.
820.22	Fracture of subtrochanteric section of femur closed.
820.30	Fracture of unspecified trochanteric section of femur open.
820.31	Fracture of intertrochanteric section of femur open.
820.32	Fracture of subtrochanteric section of femur open.

Our findings from our examination of the data are shown in the table below.

Cases of Hip Replacements With and without Principal Diagnosis of Hip Fracture

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 469—All cases	25,729	6.9	$22,358
MS–DRG 469—Hip replacement cases with hip fractures	14,459	7.9	22,852
MS–DRG 469—Hip replacement cases without hip fractures	4,714	5.7	22,430
MS–DRG 470—All cases	421,149	2.9	14,834
MS–DRG 470—Hip replacement cases with hip fractures	49,703	4.7	15,795
MS–DRG 470—Hip replacement cases without hip fractures	125,607	2.6	14,870

For MS–DRG 469, the average costs of all 25,729 reported cases were $22,358 and the average length of stay was 6.9 days. Within MS–DRG 469, there were 14,459 cases of hip replacements with hip fractures reported, with average costs of $22,852 and an average length of stay of 7.9 days. Within MS–DRG 469, there were 4,714 cases of hip replacements without hip fractures reported, with average costs of $22,430 and an average length of stay of 5.7

days. The average costs of reported cases of hip replacements with hip fractures are similar to the average costs of all cases reported within MS–DRG 469 ($22,852 compared to $22,358), and to the average costs of reported cases of hip replacements without hip fractures ($22,852 compared to $22,430). However, the average length of stay for cases of hip replacements with hip fractures reported in MS–DRG 469 is higher than the average length of stay for all cases reported in MS–DRG 469 and for cases of hip replacements without hip fractures reported in MS–DRG 469 (7.9 days compared to 6.9 days and 5.7 days, respectively.)

For MS–DRG 470, the average costs of all 421,149 cases reported were $14,834 and the average length of stay was 2.9 days. Within MS–DRG 470, there were 49,703 reported cases of hip replacements with hip fractures, with average costs $15,795 and an average length of stay of 4.7 days. Within MS–DRG 470, there were 125,607 cases of hip replacements without hip fractures reported, with average costs of $14,870 and an average length of stay of 2.6 days. However, the average length of stay for cases of hip replacements with hip fractures reported in MS–DRG 470 was higher than the average length of stay for all cases and for cases of hip replacements without hip fractures reported in MS–DRG 470 (4.7 days compared to 2.9 days and 2.6 days, respectively). Therefore, the average costs of cases of hip replacements with hip fractures were similar for both MS–DRG 469 and MS–DRG 470 ($22,852 compared to $22,358 and $15,795 compared to $14,834, respectively). However, the average lengths of stay are longer for cases of hip replacements with hip fractures compared to all cases reported in both MS–DRGs 469 and 470 (7.9 days compared to 6.9 days and 4.7 days compared to 2.9 days, respectively).

The claims data did not support creating a new MS–DRG for the assignment of cases of hip replacements with hip fractures. As discussed earlier, the average costs for cases of hip replacements with hip fractures reported in MS–DRG 469 and MS–DRG 470 are similar to the average costs for all cases reported in MS–DRG 469 and MS–DRG 470. While the average length of stay is longer for cases of hip replacements with hip fractures than for cases of hip replacements without hip fractures reported within MS–DRGs 469 and 470, the increased length of stay did not impact the average costs of reported cases in either MS–DRG 469 or 470. The data showed that cases of hip replacement procedures are clearly influenced by the presence of an MCC. The average costs of all cases reported in MS–DRG 469, which identifies an MCC, were $22,358, compared to average costs of $14,834 for all cases reported in MS–DRG 470, which did not identify an MCC. The data showed that the presence of a principal diagnosis of a hip fracture did not impact the average costs of cases reported in either MS–DRG 469 or MS–DRG 470.

We also examined the data in relation to the request to reassign all procedures of hip replacement with hip fractures from MS–DRG 470 to MS–DRG 469, even if there is no MCC present. The data showed that the 49,703 cases of hip replacements with hip fractures reported in MS–DRG 470 have average costs of $15,795 and an average length of stay of 4.7 days. The 25,729 total cases of hip replacements reported in MS–DRG 469 have average costs of $22,358 and an average length of stays of 6.9 days. Therefore, the data for average costs and average length of stay for all cases involving hip replacement procedures with hip fractures reported in MS–DRG 470 do not support reassigning all cases of hip replacement procedures with hip fractures to MS–DRG 469, even if there is no MCC present.

Our clinical advisors reviewed this issue and agreed that the hip replacement procedures performed for patients with hip fractures are appropriately assigned to MS–DRGs 469 and 470. They did not support reassigning these procedures from MS–DRGs 469 and 470 to a new MS–DRG or reassigning all cases of hip replacement procedures with hip fractures to MS–DRG 469, even if the case does not have an MCC. Our clinical advisors stated that the surgical techniques used for hip replacements are similar for all patients. They advised that the fact that some patients also had a hip fracture would not justify creating a new MS–DRG or reassigning all cases of hip replacement procedures with hip fractures to MS–DRG 469. Our clinical advisors noted that the costs of cases of hip replacements are more directly impacted by the presence or absence of an MCC than the presence or absence of a hip fracture.

Based on the findings from our data analyses and the recommendations from our clinical advisors, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24990 through 24992), we did not propose to create a new MS–DRG for the assignment of procedures involving hip replacement in patients who have hip fractures or to reassign all procedures involving hip replacements with hip fractures to MS–DRG 469 even if there is no MCC present. We proposed to maintain the current MS–DRG structure for MS–DRGs 469 and 470.

We invited public comments on our proposals.

Comment: Several commenters supported the proposal to maintain the current MS–DRG structure for hip replacement procedures with a principal diagnosis of hip fractures within MS–DRGs 469 and 470. They did not support the creation of a new MS–DRG for hip replacement procedures with a principal diagnosis of hip fractures. The commenters stated that the proposal was reasonable, given the data, the ICD–10–CM and ICD–10–PCS codes, and the information provided.

Response: We appreciate the commenters' support for the proposal.

Comment: Several commenters expressed concern with the current MS–DRG assignment for hip replacement procedures with a principal diagnosis of hip fractures. One commenter recommended that CMS consider creating an MS–DRG or reassigning all hip replacement procedures with a principal diagnosis of hip fracture only to MS–DRG 469, even if there were no reported MCC. The commenter recognized that the claims data presented in the proposed rule did not show significantly different average costs for hip replacement procedures with a principal diagnosis of hip fractures. However, the commenter stated that the average length of stay and the patient profile are different for hip replacement procedures with a principal diagnosis of hip fractures.

Response: We agree with the commenter that the claims data do not show significant differences between the average costs for hip replacement procedures with a principal diagnosis of hip fractures and those without a hip fracture. For this reason and the reasons stated in the proposed rule, the claims data did not support creating a new MS–DRG for the assignment of cases of hip replacements with hip fractures. As discussed in the proposed rule and earlier in this final rule, the average costs for cases of hip replacements with hip fractures reported in MS–DRG 469 and MS–DRG 470 are similar to the average costs for all cases reported in MS–DRG 469 and MS–DRG 470. While the average length of stay is longer for cases of hip replacements with hip fractures than for cases of hip replacements without hip fractures reported within MS–DRGs 469 and 470, the increased length of stay did not impact the average costs of reported cases in either MS–DRG 469 or 470. In response to the commenter's recommendation that CMS consider

reassigning all hip replacement procedures with a principal diagnosis of hip fracture only to MS–DRG 469, even if there is no reported MCC, we also examined the data in relation to the request to reassign all procedures of hip replacement with hip fracture to MS–DRG 469, even if there is no reported MCC. As discussed in the proposed rule and earlier in this final rule, the data for average costs and average length of stay for all cases involving hip replacement procedures with hip fractures reported in MS–DRG 470 do not support reassigning all cases of hip replacement procedures with hip fractures to MS–DRG 469, even if there is no MCC present.

After consideration of the public comments we received, we are finalizing our proposal to maintain the MS–DRG assignment for hip replacements with a principal diagnosis of hip fractures in MS–DRGs 469 and 470 and not create a new MS–DRG for hip replacements with a principal diagnosis of hip fractures.

b. Revision of Total Ankle Replacement Procedures

(1) Revision of Total Ankle Replacement Procedures

We received a request to modify the MS–DRG assignment for revision of total ankle replacement procedures. Currently, these procedures are assigned to MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue O.R. Procedures with MCC, with CC and without CC/MCC, respectively). This topic was discussed in the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28013 through 28015) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 49896 through 49899). However, at that time, we did not change the MS–DRG assignment for revisions of total ankle replacement procedures.

The requestor presented two options for consideration for modifying the MS–DRG assignment for the revisions of total ankle replacement procedures. The requestor's first option was to create a new MS–DRG for the assignment of revision of total ankle replacement procedures. The requestor believed that a new MS–DRG would be justified based on the distinct costs, resources, and utilization associated with ankle joint revision cases. The requestor's second option was to reassign revision of total ankle replacement procedures to MS–DRGs 466, 467, and 468 (Revision of Hip or Knee Replacement with MCC, with CC, and without CC/MCC, respectively) and rename MS–DRGs 466, 467, and 468 as ''Revision of Hip, Knee, or Ankle with MCC, with CC, and without CC/MCC'', respectively. The requestor believed that this second option would be justified because it is a reasonable, temporary approach until CMS has sufficient utilization and cost data for revision of total ankle replacement procedures based on the reporting of the new and more specific ICD–10–PCS procedure codes. The requestor pointed out that the following more specific ICD–10–PCS procedure codes were implemented effective October 1, 2015, with the implementation of ICD–10. The requestor stated that these new codes will provide improved data on these procedures that can be analyzed for future MS–DRG updates.

ICD–10–PCS procedure code	Description
0SWF0JZ	Revision of synthetic substitute in right ankle joint, open approach.
0SWF3JZ	Revision of synthetic substitute in right ankle joint, percutaneous. approach.
0SWF4JZ	Revision of synthetic substitute in right ankle joint, percutaneous endoscopic approach.
0SWFXJZ	Revision of synthetic substitute in right ankle joint, external approach.
0SWG0JZ	Revision of synthetic substitute in left ankle joint, open approach.
0SWG3JZ	Revision of synthetic substitute in left ankle joint, percutaneous approach.
0SWG4JZ	Revision of synthetic substitute in left ankle joint, percutaneous endoscopic approach.
0SWGXJZ	Revision of synthetic substitute in left ankle joint, external approach.

We agree with the requestor that the previous code used to identify revisions of total ankle replacement procedures, ICD–9–CM procedure code 81.59 (Revision of joint replacement of lower extremity, not elsewhere classified), is not as precise as the new ICD–10–PCS procedure codes that were implemented on October 1, 2015. As discussed in the FY 2015 IPPS/LTCH PPS proposed rule and final rule, ICD–9–CM procedure code 81.59 included procedures involving revisions of joint replacements of a variety of lower extremity joints, including the ankle, foot, and toe. Therefore, the ICD–9–CM procedure code does not provide precise information on the number of revisions of total ankle replacement procedures as do the ICD–10–PCS procedure codes listed above. We also agree that the ICD–10–PCS procedure codes will provide more precise data on revisions of ankle replacements.

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24992 through 24993), we examined claims data from the December 2015 update of the FY 2015 MedPAR file on cases reporting procedure code 81.59 in MS–DRGs 515, 516, and 517. The table below shows our findings.

REVISIONS OF JOINT REPLACEMENTS PROCEDURES

MS–DRG	Number of cases	Average length of stay	Average costs
MS–DRG 515—All cases	3,852	8.54	$21,900
MS–DRG 515—Cases reporting procedure code 81.59	2	7.00	36,983
MS–DRG 516—All cases	8,567	5.24	14,839
MS–DRG 516—Cases reporting procedure code 81.59	19	3.74	14,957
MS–DRG 517—All cases	5,664	3.20	12,979
MS–DRG 517—Cases reporting procedure code 81.59	47	1.89	16,524

As can be seen from the data in the above table, there were only 68 total cases reported with procedure code 81.59 among MS–DRGs 515, 516, and 517: 2 cases in MS–DRG 515; 19 cases in MS–DRG 516; and 47 in MS–DRG 517. We point out that while there were 68 total cases reported with procedure code 81.59 in MS–DRGs 515, 516, and 517, we are unable to determine how many of these cases were actually revisions of ankle replacements versus other revisions of joint replacement of lower extremities such as those of the foot or toe. This small number of cases does not justify creating a new MS–DRG as suggested by the requestor in its first option.

While the average costs of cases reporting procedure code 81.59 in MS–DRG 515 were $36,983, compared to $21,900 for all cases reported in MS–DRG 515, there were only 2 cases reporting procedure code 81.59 in MS–DRG 515, of the 3,852 total cases reported in MS–DRG 515. In MS–DRG 516, the average costs of the 19 cases reporting procedure code 81.59 were $14,957, which is very close to the average costs of $14,839 for all 8,567 cases reported in MS–DRG 516. The average costs for cases reporting procedure code 81.59 in MS–DRG 517 were higher than the average costs for all cases reported in MS–DRG 517 ($16,524 for cases reporting procedure code 81.59 compared to $12,979 for all cases reported in MS–DRG 517). While the average costs for cases reporting procedure code 81.59 were $3,545 higher than all cases reported in MS–DRG 517, we point out that there were only 47 cases that reported procedure code 81.59 out of the 5,664 total cases reported in MS–DRG 517. The relatively small number of cases may have been impacted by other factors. Several expensive cases could impact the average costs for a very small number of patients.

As stated by the requestor, we do not yet have data using the more precise ICD–10–PCS revisions of total ankle replacement procedure codes that were implemented on October 1, 2015. These new codes will more precisely identify the number of patients who had a revision of total ankle replacement procedure and the number of patients who had revisions of other lower joint replacement procedures such as the foot or toe. The available clinical data from the December 2015 update of the FY 2015 MedPAR file do not support the creation of a new MS–DRG for the assignment of revisions of total ankle replacement procedures or the reassignment of these cases to other MS–DRGs, such as MS–DRGs 466, 467, and 468, because there were so few cases and because we could not determine how many of these cases were revisions of ankle replacements. Claims data on the ICD–10–PCS codes will not be available until 2 years after the implementation of the codes, which was October 1, 2015.

Our clinical advisors reviewed this issue and determined that the revision of total ankle replacement procedures are appropriately classified within MS–DRGs 515, 516, and 517 along with other orthopedic procedures captured by nonspecific codes. They did not support reassignment of the procedures to MS–DRGs 466, 467, and 468 until such time as detailed data for ICD–10–PCS claims are available to evaluate revision of total ankle replacement procedures. Therefore, based on the findings of our analysis of claims data and the advice of our clinical advisors, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24992 through 24993), we proposed to maintain the current MS–DRG assignment for revision of total ankle replacement procedures for FY 2017.

We invited public comments on our proposal.

Comment: Commenters supported the proposal to maintain the current MS–DRG structure for revision of total ankle replacement procedures within MS–DRGs 515, 516, and 517. The commenters stated that the proposal was reasonable, given the data, the ICD–10–PCS codes, and the information provided.

Response: We appreciate the commenters' support for the proposal.

Comment: One commenter expressed appreciation for CMS' analysis of the MS–DRG assignment for revision of total ankle replacement procedures within MS–DRGs 515, 516, and 517. The commenter agreed that these procedures were previously assigned to code 81.59 (Revision of joint replacement of lower extremity, not elsewhere classified), which includes toe and foot joint revision procedures as well as revisions of total ankle replacements. The commenter agreed that this nonspecific ICD–9–CM code did not allow CMS to determine how many cases were actually revisions of total ankle replacements. The commenter also agreed that ICD–10–PCS provides greater detail and will provide information on revisions of total ankle replacement. The commenter acknowledged that CMS does not yet have ICD–10 claims data to analyze this issue.

The commenter urged CMS to accelerate the incorporation of ICD–10 claims data to examine the issue of revision of total ankle replacements. The commenter urged CMS to consider the following three options when these data become available:

- Map the new ICD–10–PCS ankle revision procedure codes to MS–DRGs 466, 467, and 468 and rename these MS–DRGs Revision of Hip, Knee or Ankle with MCC, with CC, and without CC/MCC, respectively;
- Map the new ICD–10–PCS ankle revision procedure codes to MS–DRG 469 to more appropriately recognize higher hospital procedure costs associated with revision of TAR; or
- Establish a new MS–DRG for the new ICD–10–PCS ankle revision codes and ankle joint revision cases.

The commenter requested that CMS consider one of these three options in FY 2017 if these data were available, but if these data are not available, the commenter requested that CMS use ICD–10 claims data to revise the MS–DRG assignment for revision of total ankle replacement procedures in FY 2018.

Another commenter also recommended that CMS review this MS–DRG assignment again once ICD–10 claims data are available.

Response: We agree with the commenter that ICD–10–PCS claims data will provide more detail to evaluate the MS–DRG assignment for revision of total ankle replacement procedures. Once ICD–10 claims data become available, we will use these claims data to evaluate this and other MS–DRG updates.

After consideration of the public comments we received, we are finalizing our proposal to maintain the current MS–DRG assignment for revision of total ankle replacement procedures.

(2) Combination Codes for Removal and Replacement of Knee Joints

We received several requests asking CMS to examine whether additional combinations of procedure codes for the removal and replacements of knee joints should be added to MS–DRGs 466, 467, and 468 (Revision of Hip or Knee Replacement with MCC, with CC, and without CC/MCC, respectively). This topic was discussed in the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24379 through 24395) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49390 through 49406). One requestor stated that the procedure codes in the following table were not included in the code pairs that group to MS–DRGs 466, 467, and 468 in the ICD–10 MS–DRGs Version 33.

ICD–10–PCS procedure code	Description
0SPD08Z	Removal of spacer from left knee joint, open approach.
0SPD38Z	Removal of spacer from left knee joint, percutaneous approach.
0SPD48Z	Removal of spacer from left knee joint, percutaneous endoscopic approach.
0SPC08Z	Removal of spacer from right knee joint, open approach.
0SPC38Z	Removal of spacer from right knee joint, percutaneous approach.
0SPC48Z	Removal of spacer from right knee joint, percutaneous approach.

Other requestors stated that the procedure codes in the following table are not included in the list of combinations that group to MS–DRGs 466, 467, and 468 when reported in conjunction with an ICD–10–PCS code for the removal of synthetic substitute from the joint in the ICD–10 MS–DRGs Version 33.

ICD–10–PCS Procedure code	Description
0SRC0J9	Replacement of right knee joint with synthetic substitute, cemented, open approach.
0SRC0JA	Replacement of right knee joint with synthetic substitute, uncemented, open approach.
0SRC0JZ	Replacement of right knee joint with synthetic substitute, open approach.
0SRC07Z	Replacement of right knee joint with autologous tissue substitute, open approach.
0SRC0KZ	Replacement of right knee joint with nonautologous tissue substitute, open approach.

We agree that the joint revision cases involving the removal of a spacer and subsequent insertion of a new knee joint prosthesis should be assigned to MS–DRGs 466, 467, and 468. We examined knee joint revision combination codes that are not currently assigned to MS–DRGs 466, 467, and 468 in ICD–10 MS–DRGs Version 33 and identified 58 additional combinations that also should be included so that the same logic is used in the ICD–10 version of the MS–DRGs as is used in the ICD–9–CM version. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24993 through 24996), we proposed to add the following 58 new code combinations that capture the joint revisions to the Version 34 MS DRG structure for MS–DRGs 466, 467, and 468, effective October 1, 2016.

ICD–10–PCS Code Pairs Proposed To Be Added to Version 34 ICD–10 MS–DRGs 466, 467, and 468: Proposed New Knee Revision ICD–10–PCS Combinations

Code	Code description		Code	Code description
0SPC08Z	Removal of Spacer from Right Knee Joint, Open Approach.	and	0SRC0J9	Replacement of Right Knee Joint with Synthetic Substitute, Cemented, Open Approach.
0SPC08Z	Removal of Spacer from Right Knee Joint, Open Approach.	and	0SRC0JA	Replacement of Right Knee Joint with Synthetic Substitute, Uncemented, Open Approach.
0SPC08Z	Removal of Spacer from Right Knee Joint, Open Approach.	and	0SRC0JZ	Replacement of Right Knee Joint with Synthetic Substitute, Open Approach.
0SPC08Z	Removal of Spacer from Right Knee Joint, Open Approach.	and	0SRT0J9	Replacement of Right Knee Joint, Femoral Surface with Synthetic Substitute, Cemented, Open Approach.
0SPC08Z	Removal of Spacer from Right Knee Joint, Open Approach.	and	0SRT0JA	Replacement of Right Knee Joint, Femoral Surface with Synthetic Substitute, Uncemented, Open Approach.
0SPC08Z	Removal of Spacer from Right Knee Joint, Open Approach.	and	0SRT0JZ	Replacement of Right Knee Joint, Femoral Surface with Synthetic Substitute, Open Approach.
0SPC08Z	Removal of Spacer from Right Knee Joint, Open Approach.	and	0SRV0J9	Replacement of Right Knee Joint, Tibial Surface with Synthetic Substitute, Cemented, Open Approach.
0SPC08Z	Removal of Spacer from Right Knee Joint, Open Approach.	and	0SRV0JA	Replacement of Right Knee Joint, Tibial Surface with Synthetic Substitute, Uncemented, Open Approach.
0SPC08Z	Removal of Spacer from Right Knee Joint, Open Approach.	and	0SRV0JZ	Replacement of Right Knee Joint, Tibial Surface with Synthetic Substitute, Open Approach.
0SPC38Z	Removal of Spacer from Right Knee Joint, Percutaneous Approach.	and	0SRC0J9	Replacement of Right Knee Joint with Synthetic Substitute, Cemented, Open Approach.
0SPC38Z	Removal of Spacer from Right Knee Joint, Percutaneous Approach.	and	0SRC0JA	Replacement of Right Knee Joint with Synthetic Substitute, Uncemented, Open Approach.
0SPC38Z	Removal of Spacer from Right Knee Joint, Percutaneous Approach.	and	0SRC0JZ	Replacement of Right Knee Joint with Synthetic Substitute, Open Approach.
0SPC38Z	Removal of Spacer from Right Knee Joint, Percutaneous Approach.	and	0SRT0J9	Replacement of Right Knee Joint, Femoral Surface with Synthetic Substitute, Cemented, Open Approach.

ICD–10–PCS CODE PAIRS PROPOSED TO BE ADDED TO VERSION 34 ICD–10 MS–DRGS 466, 467, AND 468: PROPOSED NEW KNEE REVISION ICD–10–PCS COMBINATIONS—Continued

Code	Code description		Code	Code description
0SPC38Z	Removal of Spacer from Right Knee Joint, Percutaneous Approach.	and	0SRT0JA	Replacement of Right Knee Joint, Femoral Surface with Synthetic Substitute, Uncemented, Open Approach.

0SPC4JZ	Removal of Synthetic Substitute from Right Knee Joint, Percutaneous Endoscopic Approach.	and	0SRV0JZ	Replacement of Right Knee Joint, Tibial Surface with Synthetic Substitute, Open Approach.
0SPD08Z	Removal of Spacer from Left Knee Joint, Open Approach.	and	0SRD0J9	Replacement of Left Knee Joint with Synthetic Substitute, Cemented, Open Approach.
0SPD08Z	Removal of Spacer from Left Knee Joint, Open Approach.	and	0SRD0JA	Replacement of Left Knee Joint with Synthetic Substitute, Uncemented, Open Approach.
0SPD08Z	Removal of Spacer from Left Knee Joint, Open Approach.	and	0SRD0JZ	Replacement of Left Knee Joint with Synthetic Substitute, Open Approach.
0SPD08Z	Removal of Spacer from Left Knee Joint, Open Approach.	and	0SRU0JA	Replacement of Left Knee Joint, Femoral Surface with Synthetic Substitute, Cemented, Open Approach.
0SPD08Z	Removal of Spacer from Left Knee Joint, Open Approach.	and	0SRU0JA	Replacement of Left Knee Joint, Femoral Surface with Synthetic Substitute, Uncemented, Open Approach.
0SPD08Z	Removal of Spacer from Left Knee Joint, Open Approach.	and	0SRU0JZ	Replacement of Left Knee Joint, Femoral Surface with Synthetic Substitute, Open Approach.
0SPD08Z	Removal of Spacer from Left Knee Joint, Open Approach.	and	0SRW0J9	Replacement of Left Knee Joint, Tibial Surface with Synthetic Substitute, Cemented, Open Approach.
0SPD08Z	Removal of Spacer from Left Knee Joint, Open Approach.	and	0SRW0JA	Replacement of Left Knee Joint, Tibial Surface with Synthetic Substitute, Uncemented, Open Approach.
0SPD08Z	Removal of Spacer from Left Knee Joint, Open Approach.	and	0SRW0JZ	Replacement of Left Knee Joint, Tibial Surface with Synthetic Substitute, Open Approach.
0SPD38Z	Removal of Spacer from Left Knee Joint, Percutaneous Approach.	and	0SRD0J9	Replacement of Left Knee Joint with Synthetic Substitute, Cemented, Open Approach.
0SPD38Z	Removal of Spacer from Left Knee Joint, Percutaneous Approach.	and	0SRD0JA	Replacement of Left Knee Joint with Synthetic Substitute, Uncemented, Open Approach.
0SPD38Z	Removal of Spacer from Left Knee Joint, Percutaneous Approach.	and	0SRD0JZ	Replacement of Left Knee Joint with Synthetic Substitute, Open Approach.
0SPD38Z	Removal of Spacer from Left Knee Joint, Percutaneous Approach.	and	0SRU0JA	Replacement of Left Knee Joint, Femoral Surface with Synthetic Substitute, Cemented, Open Approach.

ICD–10–PCS CODE PAIRS PROPOSED TO BE ADDED TO VERSION 34 ICD–10 MS–DRGS 466, 467, AND 468: PROPOSED NEW KNEE REVISION ICD–10–PCS COMBINATIONS—Continued

Code	Code description		Code	Code description
0SPD38Z	Removal of Spacer from Left Knee Joint, Percutaneous Approach.	and	0SRU0JA	Replacement of Left Knee Joint, Femoral Surface with Synthetic Substitute, Uncemented, Open Approach.
0SPD38Z	Removal of Spacer from Left Knee Joint, Percutaneous Approach.	and	0SRU0JZ	Replacement of Left Knee Joint, Femoral Surface with Synthetic Substitute, Open Approach.
0SPD38Z	Removal of Spacer from Left Knee Joint, Percutaneous Approach.	and	0SRW0J9	Replacement of Left Knee Joint, Tibial Surface with Synthetic Substitute, Cemented, Open Approach.
0SPD38Z	Removal of Spacer from Left Knee Joint, Percutaneous Approach.	and	0SRW0JA	Replacement of Left Knee Joint, Tibial Surface with Synthetic Substitute, Uncemented, Open Approach.
0SPD38Z	Removal of Spacer from Left Knee Joint, Percutaneous Approach.	and	0SRW0JZ	Replacement of Left Knee Joint, Tibial Surface with Synthetic Substitute, Open Approach.
0SPD48Z	Removal of Spacer from Left Knee Joint, Percutaneous Endoscopic Approach.	and	0SRD0J9	Replacement of Left Knee Joint with Synthetic Substitute, Cemented, Open Approach.
0SPD48Z	Removal of Spacer from Left Knee Joint, Percutaneous Endoscopic Approach.	and	0SRD0JA	Replacement of Left Knee Joint with Synthetic Substitute, Uncemented, Open Approach.
0SPD48Z	Removal of Spacer from Left Knee Joint, Percutaneous Endoscopic Approach.	and	0SRD0JZ	Replacement of Left Knee Joint with Synthetic Substitute, Open Approach.
0SPD48Z	Removal of Spacer from Left Knee Joint, Percutaneous Endoscopic Approach.	and	0SRU0JA	Replacement of Left Knee Joint, Femoral Surface with Synthetic Substitute, Cemented, Open Approach.
0SPD48Z	Removal of Spacer from Left Knee Joint, Percutaneous Endoscopic Approach.	and	0SRU0JA	Replacement of Left Knee Joint, Femoral Surface with Synthetic Substitute, Uncemented, Open Approach.
0SPD48Z	Removal of Spacer from Left Knee Joint, Percutaneous Endoscopic Approach.	and	0SRU0JZ	Replacement of Left Knee Joint, Femoral Surface with Synthetic Substitute, Open Approach.
0SPD48Z	Removal of Spacer from Left Knee Joint, Percutaneous Endoscopic Approach.	and	0SRW0J9	Replacement of Left Knee Joint, Tibial Surface with Synthetic Substitute, Cemented, Open Approach.
0SPD48Z	Removal of Spacer from Left Knee Joint, Percutaneous Endoscopic Approach.	and	0SRW0JA	Replacement of Left Knee Joint, Tibial Surface with Synthetic Substitute, Uncemented, Open Approach.
0SPD48Z	Removal of Spacer from Left Knee Joint, Percutaneous Endoscopic Approach.	and	0SRW0JZ	Replacement of Left Knee Joint, Tibial Surface with Synthetic Substitute, Open Approach.
0SPD4JZ	Removal of Synthetic Substitute from Left Knee Joint, Percutaneous Endoscopic Approach.	and	0SRU0JZ	Replacement of Left Knee Joint, Femoral Surface with Synthetic Substitute, Open Approach.

We invited public comments on our proposal to add the joint revision code combinations listed above to the ICD–10 Version 34 MS–DRGs 466, 467, and 468.

Comment: A number of commenters supported the proposal to add the joint revision code combinations listed in the table in the proposed rule to the ICD–10 Version 34 MS–DRGs 466, 467, and 468. Several commenters stated that these proposed updates better replicate the logic of the prior ICD–9–CM version of the MS–DRGs. Another commenter stated that adding the 58 new combinations of procedure codes for the removal and replacement of knee joints to MS–DRGs 466, 467, and 468 improves the alignment of these cases under the ICD–10 MS–DRGs. One commenter stated that it appreciated CMS' proposed updates to MS–DRGs 466, 467, and 468. Several of the commenters requested that the update be made retroactive to FY 2016 because this was a replication error of the ICD–9–CM MS–DRGs.

Response: We appreciate the commenters' support for our proposal. We agree that this addition better replicates the prior ICD–9–CM MS–DRGs. The FY 2016 MS–DRGs were subject to review and comment by the public as part of the FY 2016 IPPS/LTCH PPS rulemaking. As stated earlier, this topic was discussed in the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24379 through 24395) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49390 through 49406). We proposed to add the 58 new combinations of procedure codes for the removal and replacement of knee joints to MS–DRGs 466, 467, and 468 in the FY 2017 IPPS/LTCH PPS proposed rule for the FY 2017 MS–DRGs, effective October 1, 2016. Therefore, consistent with our general approach for implementing updates to the MS–DRGs, these updates apply beginning with the FY 2017 MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add the 58 new code combinations listed above that capture the joint revisions to the Version 34 MS DRG structure for MS–DRGs 466, 467, and 468, effective October 1, 2016.

c. Decompression Laminectomy

Currently, under ICD–10–PCS, the procedure describing a decompression laminectomy is coded for the ''release'' of a specified area of the spinal cord. These decompression codes are assigned to MS–DRGs 028, 029, and 030 (Spinal Procedures with MCC, with CC or Spinal Neurostimulators, or without CC/MCC, respectively) and to MS–DRGs 518, 519, and 520 (Back and Neck Procedures Except Spinal Fusion with MCC or Disc Device or Neurostimulator, with CC, or without CC/MCC, respectively) in the ICD–10 MS–DRGs Version 33. A commenter brought to our attention that codes describing release of specific peripheral nerve are assigned to MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue O.R. Procedures with MCC, with CC, and without CC/MCC, respectively). The commenter suggested that a subset of these codes also be assigned to MS–DRGs 028 through 030 and MS–DRGs 518 through 520 for clinical coherence purposes. The commenter stated, for example, that ICD–10–PCS procedure code 00NY0ZZ (Release lumbar spinal

cord, open approach) is assigned to MS–DRGs 028 through 030 and MS–DRGs 518 through 520. However, ICD–10–PCS procedure code 01NB0ZZ (Release lumbar nerve, open approach) is assigned to MS–DRGs 515 through 517.

We stated in the FY 2017 IPPS/LTCH PPS proposed rule that we agreed with the commenter's suggestion. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24996), for FY 2017, we proposed to reassign the ICD–10–PCS procedure codes listed in the following table from MS–DRGs 515 through 517 to MS–DRGs 028 through 030 and MS–DRGs 518 through 520 under the ICD–10 MS–DRGs Version 34.

ICD–10–PCS procedure code	Description
01N00ZZ	Release cervical plexus, open approach.
01N03ZZ	Release cervical plexus, percutaneous approach.
01N04ZZ	Release cervical plexus, percutaneous endoscopic approach.
01N10ZZ	Release cervical nerve, open approach.
01N13ZZ	Release cervical nerve, percutaneous approach.
01N14ZZ	Release cervical nerve, percutaneous endoscopic approach.
01N80ZZ	Release thoracic nerve, open approach.
01N83ZZ	Release thoracic nerve, percutaneous approach.
01N84ZZ	Release thoracic nerve, percutaneous endoscopic approach.
01N90ZZ	Release lumbar plexus, open approach.
01N93ZZ	Release lumbar plexus, percutaneous approach.
01N94ZZ	Release lumbar plexus, percutaneous endoscopic approach.
01NA0ZZ	Release lumbosacral plexus, open approach.
01NA3ZZ	Release lumbosacral plexus, percutaneous approach.
01NA4ZZ	Release lumbosacral plexus, percutaneous approach.
01NB0ZZ	Release lumbar nerve, open approach.
01NB3ZZ	Release lumbar nerve, percutaneous approach.
01NB4ZZ	Release lumbar nerve, percutaneous endoscopic approach.

We invited public comments on our proposal.

Comment: Several commenters supported the proposal to reassign the ICD–10–PCS procedure codes listed in the table in the proposed rule from MS–DRGs 515, 516 and 517 to MS–DRGs 028, 029, 030 and MS–DRGs 518, 519 and 520 under the ICD–10 MS–DRGs Version 34.

One commenter recommended that CMS delay reassigning the codes listed in the table in the proposed rule from MS–DRGs 515, 516 and 517 to MS–DRGs 028, 029, 030 and MS–DRGs 518, 519 and 520 until the FY 2016 MedPAR data are available, which would include ICD–10 coded claims. According to the commenter, it was difficult to assess the impact of the proposal in the absence of ICD–10 claims data. The commenter conducted its own data analysis of ICD–9–CM procedure code 04.49 (Other peripheral nerve or ganglion decompression or lysis of adhesions), which is a comparable translation of the ICD–10–PCS codes listed in the table in the proposed rule. The commenter stated that under Version 32 of the ICD–9–CM MS–DRGs, procedure code 04.49 grouped to MS–DRGs 515, 516, and 517. Based on its analysis, the commenter suggested that *if* CMS were to proceed with this proposal without ICD–10 claims data, CMS consider reassigning the entire list of ICD–10–PCS codes in the 01N (Release/Peripheral Nervous System) category to ICD–10 MS–DRGs 028, 029, and 030 for length of stay and average cost alignment purposes. The commenter did not make any recommendation for reassignment of the listed ICD–10–PCS procedure codes to MS–DRGs 518, 519, and 520.

Response: We appreciate the commenters' support of our proposal. With regard to the commenter who did not support the proposal and recommended we not finalize it in the absence of ICD–10 claims data, we acknowledge that it can be somewhat challenging to fully assess the impact of a proposal without the coded data to analyze. We note that the proposal was based on clinical coherence of the listed ICD–10–PCS codes with other codes describing procedures on the neck and spine currently assigned to MS–DRGs 028, 029, 030 in MDC 1 (Diseases and Disorders of the Nervous System) and MS–DRGs 518, 519, and 520 in MDC 8 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue). We also note that the ICD–9–CM code 04.49 lacks the detail and specificity of the corresponding ICD–10–PCS codes proposed for reassignment. For example, the ICD–9–CM code does not specify which peripheral nerve is being treated or what approach was utilized. Therefore, we cannot fully evaluate and rely upon the commenter's analysis results for the ICD–9–CM data to accurately determine the impact of reassigning all the cited ICD–10–PCS codes, which do specify the nerve being treated, and the approach that was used to MS–DRGs 028, 029, and 030. In addition, it is not clear which list of ICD–10–PCS codes the commenter was requesting us to consider for reassignment to MS–DRGs 028, 029, and 030 based on its submitted comment. It is unclear if the commenter was suggesting that we reassign the entire list of ICD–10–PCS codes that appeared in the proposed rule or if the commenter was suggesting that we reassign the entire list of available code options in Table 01N (Release/Peripheral Nervous System) of the ICD–10–PCS classification because the commenter's languge referred to the 01N ''category'' and that is not a standard term used in ICD–10–PCS.

Therefore, we agree that we should delay this proposed change until the ICD–10 claims data are available, because we will have the ability to better analyze the impact of reassigning the specified codes according to their anatomic location, as well as receive clarification regarding which specific codes should be taken under consideration for reassignment. Our clinical advisors reviewed this issue and recommended maintaining the current structure of MS–DRGs 515, 516, and 517 for FY 2017. They agreed that we should not finalize our proposal to reassign the ICD–10–PCS codes discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24996 through 24997) to MS–DRGs 028, 029, and 030 and MS–DRGs 518, 519, and 520 until ICD–10–PCS data are available for analysis because we will have the opportunity to examine the detailed ICD–10–PCS codes and assess their impact on MS–DRGs 028, 029, and 030 and determine the specific codes

that were suggested for reassignment (the list of ICD–10–PCS codes displayed in the proposed rule and this final rule above or the entire list of codes available from Table 01N of the ICD–10–PCS classification). We also will have the coded claims data to assess the impact for MS–DRGs 518, 519, and 520 to better evaluate if that reassignment is supported.

After consideration of the public comments we received and based on the recommendations from our clinical advisors, we are not finalizing our proposal to reassign the ICD–10–PCS procedure codes listed in the table in the proposed rule and above from MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue O.R. Procedures with MCC, with CC and without CC/MCC) to MS–DRGs 028, 029, 030 (Spinal Procedures with MCC, with CC or Spinal Neurostimulators and without CC/MCC, respectively) and MS–DRGs 518, 519, and 520 (Back and Neck Procedures Except Spinal Fusion with MCC or Disc Device or Neurostimulator, with CC and without CC/MCC, respectively) under the ICD–10 MS–DRGs Version 34. The ICD–10–PCS codes that were listed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24996 through 24997) will remain in their current assignment to MS–DRGs 515, 516, and 517.

d. Lordosis

An ICD–10 replication issue involving four diagnosis codes related to lordosis (excessive curvature of the lower spine) was discovered in MS–DRGs 456, 457, and 458 (Spinal Fusion Except Cervical with Spinal Curvature or Malignancy or Infection or Extensive Fusions with MCC, with CC, and without CC/MCC). These MS–DRGs contain specific logic that requires a principal diagnosis describing a spinal curvature, a malignancy, or infection or a secondary diagnosis that describes a spinal curvature disorder related to another condition.

Under the ICD–10 MS–DRGs Version 33, the following diagnosis codes were listed on the principal diagnosis list and the secondary diagnosis list for MS–DRGs 456, 457, and 458:

- M40.50 (Lordosis, unspecified, site unspecified);
- M40.55 (Lordosis, unspecified, thoracolumbar region);
- M40.56 (Lordosis, unspecified, lumbar region); and
- M40.57 (Lordosis, unspecified, lumbosacral region).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24997), we proposed to remove the above four diagnosis codes from the secondary diagnosis list. We also proposed to maintain these same four codes in the logic for the principal diagnosis list. We proposed that this proposed change for MS–DRGs 456, 457, and 458 would be effective October 1, 2016, in the ICD–10 MS–DRGs Version 34.

We invited public comments on our proposals.

Comment: Commenters supported the proposal to remove diagnoses codes M40.50, M40.55, M40.56, and M40.57 from the secondary diagnosis list for MS DRGs 456, 457, and 458. Commenters also supported the proposal to maintain these same four codes in the logic for the principal diagnosis list for MS–DRGs 456, 457, and 458.

Response: We appreciate the commenters' support of our proposal to remove the above four diagnosis codes from the secondary diagnosis list and to maintain these same four codes in the logic for the principal diagnosis list for MS DRGs 456, 457, and 458.

After consideration of the public comments we received, we are finalizing our proposal to remove diagnoses codes M40.50 (Lordosis, unspecified, site unspecified); M40.55 (Lordosis, unspecified, thoracolumbar region); M40.56 (Lordosis, unspecified, lumbar region); and M40.57 (Lordosis, unspecified, lumbosacral region) from the secondary diagnosis list for MS DRGs 456, 457, and 458. These four codes are retained in the logic for the principal diagnosis list. This change for MS–DRGs 456, 457, and 458 (Spinal fusion except cervical with spinal curvature or malignancy or infection or extensive fusions with MCC, with CC and without CC/MCC) is effective October 1, 2016, in the ICD–10 MS–DRGs Version 34.

9. MDC 13 (Diseases and Disorders of the Female Reproductive System): Pelvic Evisceration

In the ICD–10 MS–DRG Definitions Manual Version 33, the GROUPER logic for ICD–10 MS–DRGs 332, 333, and 334 (Rectal Resection with MCC, with CC and without CC/MCC, respectively) under MDC 6 (Diseases and Disorders of the Digestive System) and the GROUPER logic for MS–DRGs 734 and 735 (Pelvic Evisceration, Radical Hysterectomy and Radical Vulvectomy with CC/MCC and without CC/MCC, respectively) under MDC 13 (Diseases and Disorders of the Female Reproductive System) include a ''cluster'' of ICD–10–PCS procedure codes that describe pelvic evisceration. A ''cluster'' is the term used to describe a circumstance when a combination of ICD–10–PCS procedure codes is needed to fully satisfy the equivalent meaning of an ICD–9–CM procedure code for it to be considered a plausible code translation. The code cluster in MS–DRGs 332, 333, and 334 and MS–DRGs 734 and 735 is shown in the table below.

ICD–10–PCS procedure code in cluster	Description
0TTB0ZZ	Resection of bladder, open approach.
0TTD0ZZ	Resection of urethra, open approach.
0UT20ZZ	Resection of bilateral ovaries, open approach.
0UT70ZZ	Resection of bilateral fallopian tubes, open approach.
0UT90ZZ	Resection of uterus, open approach.
0UTC0ZZ	Resection of cervix, open approach.
0UTG0ZZ	Resection of vagina, open approach.

Pelvic evisceration (or exenteration) is a procedure performed to treat gynecologic cancers (cervical, uterine, vulvar, and vaginal, among others) and involves resection of pelvic structures such as the procedures described by the cluster of procedure codes listed above.

Under the ICD–9–CM MS–DRGs Version 32, procedure code 68.8 (Pelvic evisceration) was used to report pelvic evisceration. ICD–9–CM procedure code 68.8 also was assigned to ICD–9–CM MS–DRGs 332, 333, and 334 and MS–DRGs 734 and 735 in MDCs 6 and 13, respectively. The inclusion term in the ICD–9–CM Tabular List of Diseases for pelvic evisceration (procedure code 68.8) was ''Removal of ovaries, tubes, uterus, vagina, bladder, and urethra (with removal of sigmoid colon and rectum).'' In the ICD–9–CM Tabular List, the terms shown in parentheses are called a ''non-essential modifier''. A ''non-essential modifier'' is used in the classification to identify a supplementary word that may, or may not, be present in the statement of a disease or procedure. In other words, the terms in parentheses do not have to be documented to report the code.

Because the removal of sigmoid colon and the removal of rectum were classified as non-essential modifiers under ICD–9–CM, documentation that identified that removal of those body sites occurred was not required to report the procedure code describing pelvic evisceration (procedure code 68.8). In other words, when a pelvic evisceration procedure was performed and included removal of other body sites (ovaries and tubes, among others) listed in the inclusion term, *absent* the terms in parentheses, procedure code 68.8 could

be reported and grouped appropriately to MDC 13 under MS–DRGs 734 and 735. When a pelvic evisceration procedure was performed and removal of the body sites listed in the inclusion term occurred, *including* the terms in parentheses, procedure code 68.8 could be reported and grouped appropriately to MDC 6 under MS–DRGs 332 through 334.

Under ICD–10–PCS, users are instructed to code separately the organs or structures that are actually removed and for which there is a distinctly defined body part. Therefore, the case of a patient who undergoes a pelvic evisceration (exenteration) that involves the removal of the sigmoid colon and rectum would have each of those procedure sites (sigmoid colon and rectum) coded and reported separately (in addition to the procedure codes displayed in the cluster). In this scenario, if the principal diagnosis is a condition from the MDC 6 diagnosis list, the case would group to MS–DRGs 332, 333, and 334, regardless of the code cluster. In other words, it would not be necessary to retain the code cluster describing procedures performed on female pelvic organs in MDC 6.

Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24997 through 24998), for FY 2017, we proposed to remove the procedure code cluster for pelvic evisceration procedures from MDC 6 under the ICD–10 MS–DRGs Version 34. The cluster would remain in ICD–10 MDC 13 under MS–DRGs 734 and 735 only. We invited public comments on our proposal.

Comment: Commenters supported the proposal to remove the procedure code cluster for pelvic evisceration procedures currently under MDC 6 in ICD–10 MS–DRGs 332, 333, and 334 for the ICD–10 MS–DRGs Version 34. The commenters stated the proposal was reasonable, given the data, the ICD–10–PCS codes, and the information provided.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to remove the following procedure codes currently listed as a ''cluster'' in MDC 6 under MS–DRGs 332, 333, and 334 effective October 1, 2016 under the ICD–10 MS–DRGs Version 34. The codes will remain as a cluster in MDC 13 under MS–DRGs 734 and 735 (Pelvic Evisceration, Radical Hysterectomy and Radical Vulvectomy with CC/MCC and without CC/MCC, respectively)

ICD–10–PCS procedure code in cluster	Description
0TTB0ZZ	Resection of bladder, open approach.
0TTD0ZZ	Resection of urethra, open approach.
0UT20ZZ	Resection of bilateral ovaries, open approach.
0UT70ZZ	Resection of bilateral fallopian tubes, open approach.
0UT90ZZ	Resection of uterus, open approach.
0UTC0ZZ	Resection of cervix, open approach.
0UTG0ZZ	Resection of vagina, open approach.

10. MDC 19 (Mental Diseases and Disorders): Proposed Modification of Title of MS–DRG 884 (Organic Disturbances and Mental Retardation)

We received a request to change the title of MS–DRG 884 (Organic Disturbances and Mental Retardation) under MDC 19 (Mental Diseases and Disorders) to ''MS–DRG 884 (Organic Disturbances and Intellectual Disability)'' to reflect more recent terminology used to appropriately describe the latter medical condition in the MDC.

We agree with the requestor that the reference to the phrase ''Mental Retardation'' should be changed to ''Intellectual Disability'', to reflect the current terminology used to describe the condition. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24988), we proposed to change the title of MS–DRG 884 as requested by the requestor.

We invited public comments on our proposal to change the title of MS–DRG 884 from ''Organic Disturbances and Mental Retardation'' to ''Organic Disturbances and Intellectual Disability'', effective October 1, 2016, in the ICD–10 MS–DRGs Version 34.

Comment: Commenters supported the proposal to modify the title for ICD–10 MS–DRG 884. The commenters stated that the proposal was reasonable, given the data and information provided.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to modify the title for ICD–10 MS–DRG 884. The finalized title for MS–DRG 884 for the FY 2017 ICD–10 MS–DRGs Version 34 is ''MS–DRG 884 (Organic Disturbances and Intellectual Disability),'' effective October 1, 2016.

11. MDC 23 (Factors Influencing Health Status and Other Contacts With Health Services): Logic of MS–DRGs 945 and 946 (Rehabilitation With and Without CC/MCC, Respectively)

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24998 through 25000), we received several requests to examine the MS–DRG logic for MS–DRGs 945 and 946 (Rehabilitation with CC/MCC and without CC/MCC, respectively). The requestors were concerned that ICD–9–CM codes that clearly identify an encounter for rehabilitation services such as diagnosis codes V57.89 (Care involving other specified rehabilitation procedure) and V57.9 (Care involving unspecified rehabilitation procedure) were not included in ICD–10–CM Version 33. In addition, the requestors pointed out that ICD–10–CM has significantly changed the guidelines for coding of admissions/encounters for rehabilitation. The requestors pointed out that under ICD–9–CM, Section I.B.15. of the Official Guidelines for Coding and Reporting indicates that ''when the purpose for the admission/encounter is rehabilitation, sequence the appropriate V code from category V57, Care involving use of rehabilitation procedures, as the principal/first listed diagnosis.'' The requestors stated that the concept of the ICD–9–CM category V57 codes is no longer valid in ICD–10–CM and the guidelines have been revised to provide greater specificity. Instead, the requestors added, the ICD–10–CM guidelines state in Section II.K., ''When the purpose for the admission/encounter is rehabilitation, sequence first the code for the condition for which the service is being performed. For example, for an admission/encounter for rehabilitation for right-sided dominant hemiplegia following a cerebrovascular infarction, report code I69.351, Hemiplegia and hemiparesis following cerebral infarction affecting right dominant side, as the first-listed or principal diagnosis.''

Given this lack of ICD–10–CM codes to indicate that the reason for the encounter was for rehabilitation, some requesters asked that CMS review ICD–10–CM codes for conditions requiring rehabilitation (such as codes from category I69) and add them to MS–DRGs 945 and 946 when rehabilitation services are provided in order to replicate the logic found in the ICD–9–CM MS–DRG GROUPER. The requestors did not suggest any specific ICD–10–CM codes to add to MS–DRGs 945 and 946.

One requestor made a specific recommendation for updating MS–DRGs 945 and 946. The requestor previously

recommended that CMS review diagnosis codes in ICD–10–CM category I69 for possible addition to MS–DRGs 945 and 946. The requestor stated that, upon further review, it believed that a great number of diagnosis codes beyond sequelae of stroke (ICD–10–CM category I69) would need to be added in order to replicate the logic of the ICD–9–CM MS–DRGs. Therefore, the requestor modified its recommendation as follows:

- Designate MS–DRGs 945 and 946 as pre-major diagnostic categories (Pre-MDC) MS–DRGs so that cases are grouped to these MS–DRGs on the basis of the procedure code rather than the principal diagnosis. The requestor stated that the ICD–10–PCS rehabilitation codes (Section F, Physical Rehabilitation and Diagnostic Audiology, Body system 0, Rehabilitation) should be used to group cases to MS–DRGs 945 and 946 similar to how the MS–DRG GROUPER logic currently treats lung transplants and tracheostomies. This would ensure that the rehabilitation procedure codes drive the MS–DRG assignment.
- Revise ICD–10–PCS Official Guidelines for Coding and Reporting and designate that the ICD–10–PCS rehabilitation codes be used only for admissions for rehabilitation therapy.

We acknowledge that ICD–10–CM does not have clear diagnosis codes that indicate the reason for the encounter was for rehabilitation services. For that reason, CMS had to modify the MS–DRG logic using ICD–10–PCS procedure codes to assign these cases to MS–DRGs 945 and 946. The logic used in MS–DRGs 945 and 946 is shown in the Definitions Manual Version 33, which is posted on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Data-Files.html?DLPage=1&DLEntries=10&DLSort=0&DLSortDir=ascending*. We also posted a Frequently Asked Question section to explain how inpatient admissions are assigned to MS–DRGs 945 and 946, which is posted on the CMS Web site at: *https://questions.cms.gov/faq.php?id=5005&faqId=12548*. As indicated in the Frequently Asked Question section, the ICD–10–CM codes required a different approach to make sure the same cases captured with ICD–9–CM codes would be captured with ICD–10–CM codes. As stated earlier, ICD–10–CM does not contain specific codes for encounters for rehabilitation such as ICD–9–CM procedure codes V57.89 and V57.9. In order to replicate the ICD–9–CM MS–DRG logic using ICD–10–CM and ICD–10–PCS codes, CMS developed the new logic included in the MS–DRG Version 33 Definitions Manual.

The Frequently Asked Question section explains that, in order to be assigned to ICD–10 MS–DRG 945 or 946, a case must first have a principal diagnosis from MDC 23 (Factors Influencing Health Status and Other Contacts with Health Services), where MS–DRGs 945 and 946 are assigned. This is currently the logic with the ICD–9–CM MS–DRGs Version 33 where one would first have to have a MDC 23 principal diagnosis. A complete list of ICD–10–CM principal diagnoses for MDC 23 can be found in the ICD–10 MS–DRGs Version 33 Definitions Manual which is posted on the FY 2016 IPPS Final Rule Home Page under the link for the FY 2016 Final Rule Data Files at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Data-Files.html*. Look under the Related Links section and select the ICD–10–CM/PCS MS–DRG v33 Definitions Manual Table of Contents Full Titles HTML Version file. Open this file and the Table of Contents page will appear. Click on the link for MDC 23 (Factors Influencing Health Status and Other Contacts with Health Services). On the next page that opens (MDC 23), click on the link titled ''MDC 23 Assignment of Diagnosis Codes'' on the upper left side of the screen. By using the navigation arrows at the top right hand side of the page, users can review the 24 pages listing all of the principal diagnosis codes assigned to MDC 23, including many injury codes for subsequent encounters.

Under the GROUPER Logic, cases are assigned to MS–DRGs 945 and 946 in one of two ways as described in the Definitions Manual as follows:

- The encounter has a principal diagnosis code Z44.8 (Encounter for fitting and adjustment of other external prosthetic devices) or Z44.9 (Encounter for fitting and adjustment of unspecified external prosthetic device). Both of these codes are included in the list of principal diagnosis codes assigned to MDC 23.
- The encounter has an MDC 23 principal diagnosis code and one of the rehabilitation procedure codes listed under MS–DRGs 945 and 946.

If the case does not have a principal diagnosis code from the MDC 23 list, but does have a procedure code from the list included under the Rehabilitation Procedures for MS–DRGs 945 and 946, the case will not be assigned to MS–DRGs 945 or 946. The case will instead be assigned to a MS–DRG within the MDC where the principal diagnosis code is found.

Example: The encounter has a principal diagnosis code of S02119D (Unspecified fracture of occiput, subsequent encounter for fracture with routine healing). This code is included in MDC 8. Therefore, diagnosis code S02119D and a procedure code from the MS–DRG 945 and 946 Rehabilitation Procedure list, such as procedure code F0706GZ (Therapeutic Exercise Treatment of Neurological System—Head and Neck using Aerobic Endurance and Conditioning Equipment) would not lead to assignment of the case to MS–DRGs 945 and 946 because the principal diagnosis code is not included in MDC 23.

Diagnosis code S02119D is included in MDC 8 as was the ICD–9–CM predecessor code, V54.19 (Aftercare for healing traumatic fracture of other bone). Therefore, these cases would be assigned to MS–DRGs 559, 560, and 561 (Aftercare, Musculoskeletal System and Connective Tissue with MCC, with CC, and without MCC/CC, respectively) within MDC 8.

At the time of development of the proposed rule, we did not have any claims data that indicate how well this MS–DRG logic is working. We stated in the proposed rule that we were hesitant to simply add more codes from category I69 without evaluating the impact of doing so using claims data. We also did not have claims data to indicate whether or not there have been changes in the types or numbers of cases assigned to MS–DRGs 945 and 946. We welcomed specific suggestions of codes to be added to MS–DRGs 945 and 946 based on hospitals' experience in coding these cases. We stated that we would evaluate these suggestions once we have claims data to study the impact. Based on the lack of ICD–10 claims data, we proposed to maintain the current logic of MS–DRGs 945 and 946 and not make updates until these claims data become available.

Comment: A number of commenters supported the proposal to maintain the current structure of MS–DRGs 945 and 946 and reconsider the issue when ICD–10 claims data become available and prior to proposing any updates. Several commenters who agreed with this proposal stated that additional analysis should be undertaken in order to fully understand the industry impact of the current logic of MS–DRGs 945 and 946. The commenters stated that it was not clear to what extent the current logic for these MS–DRGs has created actual payment issues or what the nature of any identified problems might be.

One commenter suggested that if an analysis of ICD–10 claims data indicate that the current logic of MS–DRGs 945 and 946 is creating significant payment issues, CMS consider reclassifying MS–DRGs 945 and 946 as pre-MDC MS–DRGs as a possible solution.

Response: We agree with the commenters that, without ICD–10 claims data, it is not possible to evaluate the impact of the logic using ICD–10 codes within MS–DRGs 945 and 946. We agree that it is appropriate to wait for the claims data prior to proposing any MS–DRG updates.

We stated in the proposed rule that we have major concerns about the recommendation to revise the ICD–10–PCS Official Guidelines for Coding and Reporting and designate that the ICD–10–PCS rehabilitation codes be assigned and reported only for admissions for rehabilitation therapy. This would be a major and new process for developing coding and reporting guidelines based on one specific payer's payment polices, in this case Medicare inpatient acute care prospective payment system policies. Hospitals would need to know who the payer was prior to knowing whether or not they could assign a code for a rehabilitation service that they provided. If those payment policies change, the hospital coder would need to be aware of those changes in order to determine whether or not they could submit a code that captures the fact that a rehabilitation service was provided. CMS has worked with the Centers for Disease Control and Prevention (CDC), the American Hospital Association (AHA), and the American Health Information Management Association (AHIMA) to make ICD–10–PCS guidelines generic and applicable to all types of inpatient facilities and for all payer types. The current ICD–10–PCS Guidelines for Coding and Reporting do not support this recommendation that rehabilitation services could only be coded and reported if the admission was specifically for rehabilitation therapy. The ICD–10–PCS codes were created to accurately capture services provided.

We also have concerns about designating MS–DRGs 945 and 946 as pre-MDCs so that cases are grouped to these MS–DRGs on the basis of a rehabilitation procedure code rather than a principal diagnosis. Pre-MDCs were an addition to Version 8 of the Diagnosis Related Groups. This was the first departure from the use of principal diagnosis as the initial variable in DRG and subsequently MS–DRG assignment. For Pre-MDC DRGs, the initial step in DRG assignment was not the principal diagnosis, but was instead certain surgical procedures with extremely high costs such as heart transplant, liver transplant, bone marrow transplant, and tracheostomies performed on patients on long-term ventilation. These types of services were viewed as being very resource intensive. Recognizing these resource intensive services and assigning them to one of the high-cost MS–DRGs assures appropriate payment even if the patient is admitted for a variety of principal diagnoses. We believe it is inappropriate to consider rehabilitation services in the same group as high-cost procedures such as heart transplants. There is the significant potential of patients being classified out of higher paying surgical MS–DRGs in other MDCs and into the lower paying MS–DRGs 945 and 946 based on the reporting of a rehabilitation procedure code if these MS–DRGs are moved to the Pre-MDCs. We examined claims data for cases reporting a rehabilitation therapy code and found cases assigned to a wide variety of both medical and surgical MS–DRGs. The current coding and reporting of rehabilitation procedure codes for services provided suggest the potential of significant payment problems if MS–DRGs 945 and 946 were assigned to the Pre-MDC section and the reporting of cases with a rehabilitation code led to an inappropriate reassignment to the lower paying medical MS–DRGs 945 and 946.

The following are only a few examples of current claims data that showed the hospital reported a rehabilitation therapy procedure code for services provided which did not impact the MS–DRG assignment. Under the suggested approach of making MS–DRGs 945 and 946 a Pre-MDC, these cases would move from the appropriately assigned MS–DRGs which may have significantly higher average costs, to MS–DRGs 945 and 946, which have much lower average costs. Based on claims data from the December 2015 update of the FY 2015 MedPAR file, the average costs for cases reported in MS–DRGs 945 and 946 were $8,531 and $8,411, respectively.

Examples of cases reporting a rehabilitation therapy code that would move to MS–DRGs 945 and 946 based on the suggested logic change are as follows:

- An MS–DRG 460 (Spinal Fusion Except Cervical with MCC) case with average costs of $42,390;
- An MS–DRG 464 (Wound Debridement and Skin Graft Excluding Hand, for Musculoskeletal Tissue Disease with CC) case with average costs of $55,633;
- An MS–DRG 579 (Other Skin, Subcutaneous Tissue and Breast Procedure with MCC) case with average costs of $63,834;
- An MS–DRG 854 (Infectious and Parasitic Diseases with O.R. procedure with MCC) case with average costs of $62,455; and
- An MS–DRG 021 (Intracranial Vascular Procedures with Principal Diagnosis of Hemorrhage with CC) case with average costs of $90,522.

Our clinical advisors reviewed this issue and agreed that we should wait for ICD–10 claims data to become available prior to proposing updates to MS–DRGs 945 and 946. They did not support adding MS–DRGs 945 and 946 to the Pre-MDCs because the rehabilitation services are not as resource intensive as are the other MS–DRGs in the Pre-MDC section.

Considering these ICD–10–PCS guideline concerns, the structure of the pre-MDC section, and the lack of any ICD–10 claims data for MS–DRGs 945 and 946, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24998 through 25000), we proposed to maintain the current structure of MS–DRGs 945 and 946 and reconsider the issue when ICD–10 claims data become available and prior to proposing any updates.

We invited public comments on our proposal to maintain the current structure of MS–DRGs 945 and 946.

Comment: One commenter agreed with CMS that, given there is no ICD–10–CM code describing encounters for rehabilitation, it was reasonable that identification of admissions for rehabilitation had to rely on ICD–10–PCS procedure codes. One commenter believed that it was not appropriate for the MS–DRG logic to require a principal diagnosis from MDC 23 to be assigned to MS–DRGs 945 and 946 because most admissions for rehabilitation would appropriately have any number of diagnosis codes sequenced as the principal diagnosis rather than a diagnosis code from MDC 23. The commenter did not believe it was feasible to identify all of the ICD–10–CM codes for which rehabilitation services might be provided, due to the range and number of diagnoses that could potentially be involved.

Response: We agree with the commenter that there is no ICD–10–CM code describing encounters for rehabilitation. Given this lack of an ICD–10–CM code describing encounters for rehabilitation, we used ICD–10–PCS procedure codes as a means of identifying these cases. Therefore, the ICD–10 MS–DRG logic cannot be the same as the ICD–9–CM code logic. We also agree with the commenter that it is not feasible to identify all of the ICD–10–CM codes for which rehabilitation

services might be provided, due to the range and number of diagnoses that could potentially be involved. Therefore, it is necessary to wait for ICD–10 claims data in order to evaluate and propose MS–DRG updates.

Comment: One commenter disagreed with CMS' proposal to maintain the current structure of MS–DRGs 945 and 946 and to only reconsider the issue when ICD–10 claims data become available. The commenter stated that further research of claims data was not necessary as there was enough evidence and clinical knowledge to identify the majority of appropriate principal diagnoses that frequently require an inpatient admission for rehabilitation. The commenter advised adding the codes and code categories in the following table to MDC 23.

CODE/CODE CATEGORY AND DESCRIPTION
G20 Parkinson's disease.
G21.0 Malignant neuroleptic syndrome.
G21.11 Neuroleptic induced parkinsonism.
G21.19 Other drug induced secondary parkinsonism.
G21.2 Secondary parkinsonism due to other external agents.
G21.3 Postencephalitic parkinsonism.
G21.4 Vascular parkinsonism.
G21.8 Other secondary parkinsonism.
G21.9 Secondary parkinsonism, unspecified.
G31.84 Mild cognitive impairment, so stated.
G35 Multiple sclerosis.
G37.3 Acute transverse myelitis in demyelinating disease of central nervous system.
G61.0 Guillain-Barre syndrome.
G61.81 Chronic inflammatory demyelinating polyneuritis.
G62.81 Critical illness polyneuropathy.
G62.9 Polyneuropathy, unspecified.
G65.0 Sequelae of Guillain-BarrÃ© syndrome.
G70.00 Myasthenia gravis without (acute) exacerbation.
G70.01 Myasthenia gravis with (acute) exacerbation.
G72.81 Critical illness myopathy.
G91.0 Communicating hydrocephalus.
G91.1 Obstructive hydrocephalus.
G91.2 (Idiopathic) normal pressure hydrocephalus.
G91.3 Post-traumatic hydrocephalus, unspecified.
G91.4 Hydrocephalus in diseases classified elsewhere.
G91.8 Other hydrocephalus.
G91.9 Hydrocephalus, unspecified.
G92 Toxic encephalopathy.
G93.1 Anoxic brain damage, not elsewhere classified.
G93.40 Encephalopathy, unspecified.
G93.41 Metabolic encephalopathy.
G93.49 Other encephalopathy.
I50.22 Chronic systolic (congestive) heart failure.
I50.23 Acute on chronic systolic (congestive) heart failure.
I50.32 Chronic diastolic (congestive) heart failure.
I50.33 Acute on chronic diastolic (congestive) heart failure.
I50.42 Chronic combined systolic (congestive) and diastolic (congestive) heart failure.
I50.43 Acute on chronic combined systolic (congestive) and diastolic (congestive) heart failure.
I50.9 Heart failure, unspecified.
M62.81 Muscle weakness (generalized).
M62.82 Rhabdomyolysis.
R26.0 Ataxic gait.
R26.1 Paralytic gait.
R26.2 Difficulty in walking, not elsewhere classified.
R26.81 Unsteadiness on feet.
R26.89 Other abnormalities of gait and mobility.
R26.9 Unspecified abnormalities of gait and mobility.
R27.0 Ataxia, unspecified.
R27.8 Other lack of coordination.
R27.9 Unspecified lack of coordination.
R41.84 Cognitive communication deficit.
R41.842 Visuospatial deficit.
R41.843 Psychomotor deficit.
R41.844 Frontal lobe and executive function deficit.
R41.89 Other symptoms and signs involving cognitive functions and awareness.
Z47.1 Aftercare following joint replacement surgery.
Z47.81 Encounter for orthopedic aftercare following surgical amputation.
Z47.89 Encounter for other orthopedic aftercare.
Z48.21 Encounter for aftercare following heart transplant.
Z48.22 Encounter for aftercare following kidney transplant.
Z48.23 Encounter for aftercare following liver transplant.
Z48.24 Encounter for aftercare following lung transplant.
Z48.280 Encounter for aftercare following heart-lung transplant.
Z48.288 Encounter for aftercare following multiple organ transplant.

CODE/CODE CATEGORY AND DESCRIPTION—Continued

Z48.290 Encounter for aftercare following bone marrow transplant.
Z48.298 Encounter for aftercare following other organ transplant.
Z48.3 Aftercare following surgery for neoplasm.
Code categories G81, G82, and G83.
Code Category I69.
Code Category M84.3–M84.6 with 7th digit ''D''.
Code Categories S32.4–S32.9 with 7th digit ''D''.
Code Categories S72.0–S72.3 with 7th digit ''D'', ''E'', or ''F''.

Response: We disagree with the recommendation to add the list of ICD–10–CM codes shown in the table above to MS–DRGs 945 and 946. As stated previously, we do not have claims data to evaluate how this suggested update would impact MS–DRG assignments. We agree with the other commenters who recommended that CMS wait for claims data in order to evaluate updates to MS–DRGs 945 and 946. While this commenter took the position that further research of claims data was not necessary because there is enough evidence and clinical knowledge to identify the majority of principal diagnoses that frequently require an inpatient admission for rehabilitation, and, as noted, submitted the above list of ICD–10–CM codes and code categories to add to MDC 23, we believe that ICD–10 claims data are necessary to evaluate this recommended change; without claims data, we cannot determine the number of cases that might be reassigned and if this reassignment was appropriate.

Comment: Commenters who agreed with waiting until claims data become available to evaluate MS–DRG updates stated that they understood that the current pre-MDC structure is limited to resource-intensive surgical procedures. However, they believed that there are some similarities between the existing pre-MDCs and MS–DRGs 945 and 946. The commenters stated that, similar to the existing pre-MDCs, the driver for the rehabilitation MS–DRGs is a specific type of service, and this service may be provided for a wide variety of principal diagnoses. Therefore, the commenters suggested the creation of a guideline that limits the use of the ICD–10–PCS rehabilitation codes to rehabilitation admissions would address the potential for patient cases to be reassigned from higher paying surgical MS–DRGs in other MDCs to the lower paying MS–DRGs 945 and 946 based on the reporting of a rehabilitation procedure code if these MS–DRGs were reassigned to the pre-MDCs. One commenter stated that, after the establishment of a new ICD–10–PCS coding guideline, the reporting of ICD–10–PCS rehabilitation codes for nonrehabilitation hospitalizations would be considered coding errors and, as with any coding error, could lead to inappropriate MS–DRG assignment. However, the commenter recommended that edits and reminders would likely be needed to minimize this type of coding error.

Response: We agree with the commenters that the issue of any updates to ICD–10–PCS guidelines should be considered along with any proposed MS–DRG updates because updated guidelines may impact code reporting.

We welcome any suggestions on how to update the ICD–10–PCS guidelines. These suggestions should be sent to *ICDProcedureCodeRequest@cms.hhs.gov*. We plan to take any proposed ICD–10–PCS rehabilitation guideline updates to a future meeting of the ICD–10 Coordination and Maintenance Committee so that the public can provide input on any new rehabilitation guideline. We continue to be concerned about creating a new ICD–10–PCS guideline whose purpose is to restrict assignment to certain MS–DRGs. Over time, the MS–DRGs are updated as part of the annual IPPS rulemaking. To create a guideline on a current MS–DRG structure as opposed to a means of capturing national data for all payers is not consistent with past guideline development. However, we look forward to working with the public on examining the need to improve the ICD–10–PCS guidelines for rehabilitation services reporting.

Comment: Other commenters who agreed with CMS' proposal to maintain the current structure of MS–DRGs 945 and 946 until such time as ICD–10 claims data become available recommended that the ICD–10 Coordination and Maintenance Committee address the creation of a single, new ICD–10–CM diagnosis code in Section Z of ICD–10–CM to replicate the ICD–9–CM code category V57 (Care involving use of rehabilitation procedures). The commenters recommended that if the CDC created this new code, the new ICD–10–CM code be added to MS–DRGs 945 and 946 when reported as a secondary diagnosis. The commenters urged CMS to obtain industry input from experts in rehabilitation on possible coding and MS–DRG updates.

Several commenters recommended that the existing ICD–10–CM Official Guidelines for Coding and Reporting be maintained to allow the sequencing of the diagnosis code for the condition for which the service is being performed as the principal diagnosis when the purpose for the admission/encounter is rehabilitation. Several commenters recommended a revision of the ICD–10–CM Official Guidelines for Coding and Reporting if a new ICD–10–CM code for care involving use of rehabilitation procedures were created. Some of the commenters recommended that the new diagnosis code be reported as a secondary diagnosis when the purpose for the admission/encounter was rehabilitation while others recommended that the new code be reported as the principal diagnosis.

One commenter objected to the development of coding guidelines based on Medicare payment policies. However, the commenter stated that any such guideline should be applied to all payers. The commenter stated that creating such a guideline that would restrict the use of these procedure codes such that they could only be used to identify rehabilitation admissions for the purpose of appropriately assigning MS–DRGs 945 and 946 merited serious consideration.

Response: We have referred the requests for a new ICD–10–CM code for care involving the use of rehabilitation procedures to the CDC for consideration at a future ICD–10 Coordination and Maintenance Committee meeting. Requests for ICD–10–CM code updates should be sent to the CDC at *nchsicd10CM@cdc.gov*. Information on submitting proposals for new diagnosis codes can be found on CDC's Web site at *http://www.cdc.gov/nchs/icd/icd10_maintenance.htm*. Should such a new diagnosis code be created, CMS would examine the possibility of using this new diagnosis code in the MS–DRGs 945 and 946 logic, as was the case in the ICD–9–CM version of the MS–DRGs. The public is also encouraged to send any specific recommendations for

updates to the ICD–10–CM coding guidelines to CDC at: *nchsicd10CM@cdc.gov*. Updates that are made to ICD–10–CM, ICD–10–PCS, and the relevant coding guidelines will be considered along with claims data in evaluating any proposed updates to MS–DRGs 945 and 946.

After consideration of the public comments we received, we are finalizing our proposal to maintain the current structure of MS–DRGs 945 and 946. We look forward to working with the public on updates to the ICD–10–PCS guidelines or updates to ICD–10–CM to better capture these services. Once we receive ICD–10 claims data, we will again examine this issue.

12. Medicare Code Editor (MCE) Changes

The Medicare Code Editor (MCE) is a software program that detects and reports errors in the coding of Medicare claims data. Patient diagnoses, procedure(s), and demographic information are entered into the Medicare claims processing systems and are subjected to a series of automated screens. The MCE screens are designed to identify cases that require further review before classification into an MS–DRG.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49409 through 49412), we finalized the ICD–10 Definitions of Medicare Code Edits (ICD–10 MCE) Version 33. ICD–10 MCE Version 33 was based on the FY 2015 ICD–9–CM MCE Version 32 and the draft ICD–10 MCE Version 32 that had been made publicly available for comments in November 2014 on the ICD–10 MS–DRG Conversion Project Web site at: *https://www.cms.gov/Medicare/Coding/ICD10/ICD-10-MS-DRG-Conversion-Project.html*. In August 2015, we posted the finalized FY 2016 ICD–10 MCE Version 33 manual file and an ICD–9–CM MCE Version 33.0A manual file (for analysis purposes only). The links to these MCE manual files, along with the links to purchase the mainframe and computer software for the MCE Version 33 (and ICD–10 MS–DRGs) were posted on the CMS Web site through the FY 2016 IPPS Final Rule Home Page at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page.html?DLSort=0&DLEntries=10&DLPage=1&DLSortDir=ascending*.

After implementation of the ICD–10 MCE Version 33, we received several requests to examine specific code edit lists that the requestors believed were incorrect and that affected claims processing functions. We received requests to review the MCE relating specifically to the Age conflict edit, the Sex conflict edit, the Non-covered procedure edit, and the Unacceptable principal diagnosis code edit. We discuss these code edit issues below. In addition, as a result of new and modified code updates approved after the annual spring ICD–10 Coordination and Maintenance Committee meeting, we routinely make changes to the MCE. In the past, in both the IPPS proposed and final rules, we only provided the list of changes to the MCE that were brought to our attention after the prior year's final rule. We historically have not listed the changes we have made to the MCE as a result of the new and modified codes approved after the annual spring ICD–10 Coordination and Maintenance Committee meeting. These changes are approved too late in the rulemaking schedule for inclusion in the proposed rule. Furthermore, although our MCE policies have been described in our proposed and final rules, we have not provided the detail of each new or modified diagnosis and procedure code edit in the final rule. However, we make available the finalized Definitions of Medicare Code Edits (MCE) file. Therefore, we have made available the FY 2017 ICD–10 MCE Version 34 manual file and an ICD–9–CM MCE Version 34.0A manual file (for analysis purposes only). The links to these MCE manual files, along with the links to purchase the mainframe and computer software for the MCE Version 34 (and ICD–10 MS–DRGs) are posted on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* through the FY 2017 IPPS Final Rule Home Page.

a. Age Conflict Edit

In the MCE, the Age conflict edit exists to detect inconsistencies between a patient's age and any diagnosis on the patient's record; for example, a 5-year-old patient with benign prostatic hypertrophy or a 78-year-old patient coded with a delivery. In these cases, the diagnosis is clinically and virtually impossible for a patient of the stated age. Therefore, either the diagnosis or the age is presumed to be incorrect. Currently, in the MCE, the following four age diagnosis categories appear under the Age conflict edit and are listed in the manual and written in the software program:

- Newborn—Age of 0 years; a subset of diagnoses intended only for newborns and neonates (for example, fetal distress, perinatal jaundice).
- Pediatric—Age is 0–17 years inclusive (for example, Reye's syndrome, routine child health exam).
- Maternity—Age range is 12–55 years inclusive (for example, diabetes in pregnancy, antepartum pulmonary complication).
- Adult—Age range is 15–124 years inclusive (for example, senile delirium, mature cataract).

(1) Newborn Diagnosis Category

Under the ICD–10–CM Official Guidelines for Coding and Reporting (available on the Web site at: *https://www.cms.gov/Medicare/Coding/ICD10/2016-ICD-10-CM-and-GEMs.html*), there are general guidelines and chapter-specific coding guidelines. The chapter-specific guidelines state that diagnosis codes from Chapter 16 (Certain Conditions Originating in the Perinatal Period) may be reported throughout the life of the patient if the condition is still present. The requestors noted that several codes from this Chapter 16 appear on the ICD–10 MCE Version 33 Age conflict edit for the newborn diagnosis category. Codes from this chapter are included in the P00 through P96 code range. Therefore, the requestors believed that because the chapter-specific guidelines state that codes within this chapter may be reported throughout the life of a patient, all codes within this range (P00 through P96) should be removed from the newborn diagnosis category on the Age conflict edit code list.

As we discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25000 through 25001), we examined the newborn diagnosis category on the age conflict edit list in the ICD–9–CM MCE Version 32 in comparison to the ICD–9–CM chapter-specific guidelines. Under ICD–9–CM, Chapter 15 (Certain Conditions Originating in the Perinatal Period) includes codes within the 760 through 779 range. We found that the same chapter-specific guideline under ICD–10 exists under ICD–9–CM: Diagnosis codes from Chapter 15 may be reported throughout the life of the patient if the condition is still present. Similar to the ICD–10 MCE Version 33 newborn diagnosis category in the Age conflict edit code list, we noted that several codes from this Chapter 15 appear on the ICD–9–CM MCE Version 32 Age conflict edit for the newborn diagnosis category.

Because the full definition of the chapter-specific guideline for ''Certain Conditions Originating in the Perinatal Period'' clearly states the codes within the chapter may be reported throughout the life of the patient *if the condition is still present,* we believe that,

historically, under ICD–9–CM, this was the rationale for inclusion of the diagnosis codes that were finalized for the newborn diagnosis category under the Age conflict edit (in code range 760 through 779). For example, under ICD–9–CM, there are four diagnosis codes in the 760.6x series that specifically include the term ''newborn'' in the title. These diagnosis codes are:

- 760.61 (Newborn affected by amniocentesis);
- 760.62 (Newborn affected by other in utero procedure);
- 760.63 (Newborn affected by other surgical operations on mother during pregnancy); and
- 760.64 (Newborn affected by previous surgical procedure on mother not associated with pregnancy).

Under the ICD–9–CM classification, the chapter-specific guidelines in Chapter 15 (Certain Conditions Originating in the Perinatal Period) state that, for coding and reporting purposes, the perinatal period is defined as before birth through the 28th day following birth. As such, for coding and reporting purposes, a patient that is beyond the 28th day of life is no longer considered a newborn. Therefore, we believe that the diagnosis codes listed on the newborn diagnosis category in the Age conflict edit code list are, in fact, appropriate because they identify what the title of Chapter 15 describes (certain conditions specific to beginning in the perinatal period); that is, a newborn. The intent of the diagnosis codes included on the Age conflict edit code list is to identify claims where any one of the listed diagnoses is reported for a patient who is beyond the 28th day of life. If that definition is met according to the patient's date of birth, the edit is correctly triggered in those cases.

Transitioning to the ICD–10 MCE was based on replication of the ICD–9–CM based MCE (in parallel with the transition to the ICD–10 MS–DRGs, which was based on replication of the ICD–9–CM MS–DRGs). Therefore, the diagnosis codes included in the newborn diagnosis category on the Age conflict edit code list in the ICD–10 MCE are a replication of the diagnosis code descriptions included on the newborn diagnosis category on the Age conflict edit code list under the ICD–9–CM MCE. However, the chapter-specific guideline in ICD–10–CM Chapter 16, section C.16.e. (Low birth weight and immaturity status), specifies that codes within category P07 (Disorders of newborn related to short gestation and low birth weight, not elsewhere classified) are for use for a child or adult who was premature or had a low birth weight as a newborn and this condition is affecting the patient's current health status. Therefore, we agree that codes within the range of P07.00 through P07.39 should not be listed under newborn diagnosis category on the Age conflict edit code list in the ICD–10 MCE. It is unclear why this range of codes within category P07 is distinguished separately when under the General Perinatal Rules for Chapter 16 (Certain Conditions Originating in the Perinatal Period), section I.C.16.a.1. states that diagnosis codes from Chapter 16 may be reported throughout the life of the patient if the condition is still present. In addition, the guideline at section I.C.16.a.4. states that ''should a condition originate in the perinatal period, and continue throughout the life of the patient, the perinatal code should continue to be used regardless of the patient's age.'' According to these general guidelines, we could assume that potentially *all* codes within Chapter 16 in the code range of P00 through P96 should be considered for removal from the newborn diagnosis category on the Age conflict edit code list. However, a subsequent section of Chapter 16, section 1.C.16.c.2. (Codes for conditions specified as having implication for future health care needs), instructs users to assign codes for conditions that have been specified by the provider as having implications for future health care needs. Immediately below that instruction is a note which states: ''This guideline should not be used for adult patients.''

The ICD–10–CM Official Guidelines for Coding and Reporting are updated separately from the IPPS rulemaking process. Due to the confusion with the chapter-specific guidelines for codes in Chapter 16 and how they impact the newborn diagnosis category on the Age conflict edit code list, we believe it would be beneficial to fully evaluate the intent of these guidelines with the Centers for Disease Control's (CDC's) National Center for Health Statistics (NCHS) because NCHS has the lead responsibility for the ICD–10–CM diagnosis codes.

In the meantime, to address claims processing concerns related to the newborn diagnosis category on the Age conflict edit code list, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25001), we proposed to remove all the ICD–10–CM diagnoses in the code range of P00 through P96 from the newborn diagnosis category in the Age conflict code edit list for the ICD–10 MCE for FY 2017. We invited public comments on our proposal. We also solicited public comments on the appropriateness of the other diagnosis codes currently listed under the newborn diagnosis category in the Age conflict edit in the ICD–10 MCE Version 33. We refer readers to Table 6P.1a. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) for review of the diagnosis codes we proposed to remove.

In addition, for FY 2017, we indicated that we were examining the need to revise the description for the newborn diagnosis category in the Age conflict edit under the MCE. The current description as written, Newborn—Age of 0 years; a subset of diagnoses intended only for newborns and neonates (*e.g.,* fetal distress, perinatal jaundice), is not consistent with the instructions for reporting the diagnosis codes in Chapter 16. We invited public comments on our proposal to revise the description of the newborn diagnosis category in the Age conflict edit under the MCE.

Comment: Several commenters supported the proposal to remove all the ICD–10–CM diagnoses in the code range of P00 through P96 from the newborn diagnosis category in the Age conflict code edit list. The commenters did not believe the newborn guidelines were in conflict with each other or required any modifications, as the specific references noted in the proposed rule address unrelated reporting issues. However, the commenters indicated that they planned to submit recommendations directly to the CDC to revise an instructional note that appears at the beginning of Chapter 16 which they believe may be a contributing factor to confusion surrounding the proper application of codes within the chapter.

Response: We appreciate the commenters' support. We also appreciate the commenters' review of the newborn guidelines and their plan to submit a recommendation to the CDC regarding the instructional note that appears at the beginning of Chapter 16.

We wish to clarify for the commenters that the focus of our proposal was on the removal of codes from the newborn diagnosis category in the Age conflict code edit list. Our discussion involving the references to the guidelines was to simply note the confusion with the guidelines and how those guidelines impact the codes listed under newborn diagnosis category in the Age conflict code edit list. Following that discussion, we stated our belief that it would be beneficial to discuss the intent of the guidelines with CDC.

Comment: Many commenters supported the proposal for the MCE

changes related to the Age conflict edit description.

Response: We appreciate the commenters' support and believe a revised description of the newborn edit better defines the diagnoses that are subject to it.

After consideration of the public comments we received, we are finalizing our proposal to remove all the ICD–10–CM diagnoses in the code range of P00 through P96 from the newborn diagnosis category in the Age conflict code edit list for the ICD–10 MCE for FY 2017. The procedure codes listed in Table 6P.1a. associated with this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) are the finalized list of procedure codes that will be removed from the newborn diagnosis category in the Age conflict code edit list in the ICD–10 MCE Version 34 effective October 1, 2016.

We also are finalizing our proposal to revise the description of the newborn diagnosis category under the ICD–10 MCE from ''Newborn. Age of 0 years; a subset of diagnoses intended only for newborns and neonates (*e.g.,* fetal distress, perinatal jaundice)'' to ''Perinatal/Newborn. Age 0 years only; a subset of diagnoses which will only occur during the perinatal or newborn period of age 0 (*e.g.,* tetanus neonatorum, health examination for newborn under 8 days old)'' in the ICD–10 MCE Version 34, effective October 1, 2016.

(2) Pediatric Diagnosis Category

Under the ICD–10 MCE Version 33, the pediatric diagnosis category for the Age conflict edit considers the age range of 0 to 17 years inclusive. For that reason, the diagnosis codes on this Age conflict edit list would be expected to apply to conditions or disorders specific to that age group only. The code list for the pediatric diagnosis category in the Age conflict edit currently includes 12 diagnosis codes that fall within the F90 through F98 code range. These codes were included as a result of replication from the ICD–9–CM MCE Version 32 and the draft ICD–10 MCE Version 32.

We received a request to review the 12 ICD–10–CM diagnosis codes listed in the following table because they appear to conflict with guidance in the ICD–10–CM classification.

ICD–10–CM diagnosis code	Description
F93.0	Separation anxiety disorder of childhood.
F93.8	Other childhood emotional disorders.
F93.9	Childhood emotional disorder, unspecified.
F94.1	Reactive attachment disorder of childhood.
F94.2	Disinhibited attachment disorder of childhood.
F94.8	Other childhood disorders of social functioning.
F94.9	Childhood disorder of social functioning, unspecified.
F98.21	Rumination disorder of infancy.
F98.29	Other feeding disorders of infancy and early childhood.
F98.3	Pica of infancy and childhood.
F98.8	Other specified behavioral and emotional disorders with onset usually occurring in childhood and adolescence.
F98.9	Unspecified behavioral and emotional disorders with onset usually occurring in childhood and adolescence.

Under the ICD–10–CM Tabular List of Diseases and Injuries, Chapter 5 (Mental, Behavioral and Neurodevelopmental Disorders) contains a section titled ''Behavioral and emotional disorders with onset usually occurring in childhood and adolescence'' which includes codes for the F90 to F98 code range. At the beginning of this tabular section is an instructional ''note'' that states: ''Codes within categories F90–F98 may be used regardless of the age of a patient. These disorders generally have onset within the childhood or adolescent years, but may continue throughout life or not be diagnosed until adulthood.''

Because the note specifically states that these codes may be used regardless of the age of a patient, we believe they should not be included on the pediatric diagnosis category on the Age conflict edit code list. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25001 through 25002), we proposed to remove the 12 codes that fall within the F90 through F98 code range currently listed for the pediatric diagnosis category on the ICD–10 MCE age conflict edit code list, effective October 1, 2016, for FY 2017. We invited public comments on our proposal.

Comment: Several commenters supported the proposal to address the replication issue for the pediatric diagnosis category on the ICD–10 MCE Age conflict edit code list by removing the 12 ICD–10–CM diagnosis codes in the F90 through F98 code range currently listed.

Response: We appreciate the commenters' support of our proposal. We also agree that removal of the specified ICD–10–CM diagnosis codes from the edit code list will resolve the replication issue and enable proper reporting of the conditions regardless of the patient's age.

After consideration of the public comments we received, we are finalizing our proposal to remove the 12 ICD–10–CM diagnosis codes in the F90 through F98 code range displayed earlier in this section from the pediatric diagnosis category Age conflict edit code list in the ICD–10 MCE Version 34, effective October 1, 2016.

We also received a request to review whether another group of diagnosis codes is clinically incorrect for the ICD–10 MCE Version 33 pediatric diagnosis category in the Age conflict edit. The requestor stated that ICD–10–CM diagnosis codes describing infantile and juvenile cataracts, by their titles, appear to merit inclusion on the pediatric diagnosis category on the Age conflict edit code list. However, according to the requestor, the diagnosis is not constrained to a patient's age, but rather the ''infantile'' versus ''juvenile'' reference is specific to the type of cataract the patient has. These diagnosis codes that are currently listed for the pediatric diagnosis category in the ICD–10 MCE Age conflict edit code list are as follows:

ICD–10–CM diagnosis code	Description
H26.001	Unspecified infantile and juvenile cataract, right eye.
H26.002	Unspecified infantile and juvenile cataract, left eye.
H26.003	Unspecified infantile and juvenile cataract, bilateral.
H26.009	Unspecified infantile and juvenile cataract, unspecified eye.
H26.011	Infantile and juvenile cortical, lamellar, or zonular cataract, right eye.
H26.012	Infantile and juvenile cortical, lamellar, or zonular cataract, left eye.
H26.013	Infantile and juvenile cortical, lamellar, or zonular cataract, bilateral.
H26.019	Infantile and juvenile cortical, lamellar, or zonular cataract, unspecified eye.
H26.031	Infantile and juvenile nuclear cataract, right eye.
H26.032	Infantile and juvenile nuclear cataract, left eye.
H26.033	Infantile and juvenile nuclear cataract, bilateral.
H26.039	Infantile and juvenile nuclear cataract, unspecified eye.
H26.041	Anterior subcapsular polar infantile and juvenile cataract, right eye.
H26.042	Anterior subcapsular polar infantile and juvenile cataract, left eye.
H26.043	Anterior subcapsular polar infantile and juvenile cataract, bilateral.
H26.049	Anterior subcapsular polar infantile and juvenile cataract, unspecified eye.
H26.051	Posterior subcapsular polar infantile and juvenile cataract, right eye.
H26.052	Posterior subcapsular polar infantile and juvenile cataract, left eye.
H26.053	Posterior subcapsular polar infantile and juvenile cataract, bilateral.
H26.059	Posterior subcapsular polar infantile and juvenile cataract, unspecified eye.
H26.061	Combined forms of infantile and juvenile cataract, right eye.
H26.062	Combined forms of infantile and juvenile cataract, left eye.
H26.063	Combined forms of infantile and juvenile cataract, bilateral.
H26.069	Combined forms of infantile and juvenile cataract, unspecified eye.
H26.09	Other infantile and juvenile cataract.

Our clinical advisors reviewed the list of diagnoses presented above and confirmed that these diagnosis codes are appropriate to include in the ICD–10 MCE for the pediatric diagnosis category in the Age conflict edit because the diseases described by these codes are typically diagnosed in early childhood and treated very rapidly to prevent amblyopia. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25002), for FY 2017, we did not propose to remove these codes under the pediatric diagnosis category in the Age conflict edit. We proposed to maintain this list in the ICD–10 MCE Version 34, effective October 1, 2016. We invited public comments on our proposal.

Comment: Commenters supported the proposal to retain the list of ICD–10–CM diagnosis codes describing infantile and juvenile cataracts in the pediatric diagnosis category for the Age conflict edit.

Response: We appreciate the commenters' support.

After consideration of the public comments we received, we are finalizing our proposal to maintain the ICD–10–CM diagnosis codes displayed earlier in this section describing infantile and juvenile cataracts in the pediatric diagnosis category for the Age conflict edit in the ICD–10 MCE Version 34, effective October 1, 2016.

As stated earlier, for the pediatric diagnosis category in the Age conflict edit, the MCE considers the age range of 0 through 17 years inclusive. In the ICD–10 MCE Version 33, there are four diagnosis codes describing the body mass index (BMI) for pediatric patients in the pediatric diagnosis category on the Age conflict edit code list. The four ICD–10–CM diagnosis codes describing the BMI percentiles for pediatric patients are as follows:

ICD–10–CM diagnosis code	Description
Z68.51	Body mass index (BMI) pediatric, less than 5th percentile for age.
Z68.52	Body mass index (BMI) pediatric, 5th percentile to less than 85th percentile for age.
Z68.53	Body mass index (BMI) pediatric, 85th percentile to less than 95th percentile for age.
Z68.54	Body mass index (BMI) pediatric, greater than or equal to 95th percentile for age.

Under the ICD–10–CM Tabular List of Diseases and Injuries, the BMI pediatric diagnosis codes are designated for use in persons 2 through 20 years of age. The percentiles are based on the growth charts published by the CDC. As a result of the age discrepancy between the MCE pediatric diagnosis category in the Age conflict edit (ages 0 through 17) and the Tabular reference for the BMI pediatric codes (ages 2 through 20), in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25003), we proposed to remove ICD–10–CM diagnosis codes Z68.51, Z68.52, Z68.53, and Z68.54 from the ICD–10 MCE pediatric diagnosis category on the Age conflict edit code list for Version 34, effective FY 2017. We invited public comments on our proposal.

Comment: Commenters supported the proposal to remove the four ICD–10–CM diagnosis codes describing body mass index (BMI) for pediatric patients from the pediatric diagnosis category on the Age conflict edit code list in the MCE. The commenters stated that this proposal would enable proper reporting of these codes.

Response: We appreciate the commenters' support. We agree that removal of the specified ICD–10–CM diagnosis codes discussed previously from the edit code list will resolve any age discrepancy issues in the reporting of the conditions regardless of the patient's age.

After consideration of the public comments we received, we are finalizing our proposal to remove the four ICD–10–CM diagnosis codes displayed earlier in this section that identify the body mass index for pediatric patients from the pediatric diagnosis category on the Age conflict

edit code list in the ICD–10 MCE Version 34, effective October 1, 2016.

One requestor also asked that CMS review the ICD–10–CM diagnosis codes currently included in ICD–10–CM category R62 (Lack of expected normal physiological development in childhood and adults) series. Specifically, the requestor noted that there are adult patients diagnosed with the conditions in subcategory R62.5 (Other and unspecified lack of expected normal physiological development in childhood) and that three of these conditions also were listed in the ICD–10 MCE Version 33 pediatric diagnosis category on the Age conflict edit code list. These three diagnosis codes are:

- R62.50 (Unspecified lack of expected normal physiological development in childhood);
- R62.52 (Short stature (child)); and
- R62.59 (Other lack of expected normal physiological development in childhood).

We acknowledge that subcategory R62.5 can be confusing with regard to how to appropriately report a condition diagnosed for an adult when the titles reference the terms ''child'' or ''childhood''. Therefore, we consulted with the ICD–10–CM classification staff at the NCHS to determine the intended use and reporting of the diagnosis codes R62.50, R62.52, and R62.59. The NCHS staff agreed that the three diagnosis codes should not be restricted to the pediatric ages as defined by the MCE. The NCHS staff stated the codes are appropriate to report for adult patients, noting that if a patient is diagnosed with short stature as a child, the patient could very well carry over that diagnosis into adulthood.

During our review of the issue relating to the subcategory R62.5 pediatric diagnosis category on the Age conflict edit code list, we identified another diagnosis code that also appeared appropriate to report for an adult patient. ICD–10–CM diagnosis code Y93.6A (Activity, physical games generally associated with school recess, summer camp and children) is one of several activity codes included in ICD–10–CM Chapter 20 (External Causes of Morbidity). This diagnosis code includes games such as dodge ball and capture the flag, which one can reasonably expect an adult to be engaged in for physical activity.

We discussed this diagnosis code with the NCHS staff to receive their input on the intent for coding and reporting the code. They agreed that ICD–10–CM diagnosis code Y93.6A is applicable for adults as well as children. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25003), for FY 2017, we proposed to remove ICD–10–CM diagnosis codes R62.50, R62.52, and R62.59 in subcategory R62.5 and ICD–10–CM diagnosis code Y93.6A from the ICD–10 MCE pediatric diagnosis category on the Age conflict edit code list. We invited public comment on our proposal.

Comment: Commenters supported the proposal to remove ICD–10–CM diagnosis codes R62.50, R62.52, and R62.59 in subcategory R62.5 and to also remove ICD–10–CM diagnosis code Y93.6A from the ICD–10 MCE pediatric diagnosis category on the Age conflict edit code list.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to remove the following four ICD–10–CM diagnosis codes from the pediatric diagnosis category on the Age conflict edit code list in the ICD–10 MCE Version 34, effective October 1, 2016.

- R62.50 (Unspecified lack of expected normal physiological development in childhood);
- R62.52 (Short stature (child));
- R62.59 (Other lack of expected normal physiological development in childhood); and
- Y93.6A (Activity, physical games generally associated with school recess, summer camp and children).

b. Sex Conflict Edit

In the MCE, the Sex conflict edit detects inconsistencies between a patient's sex and any diagnosis or procedure on the patient's record; for example, a male patient with cervical cancer (diagnosis) or a female patient with a prostatectomy (procedure). In both instances, the indicated diagnosis or the procedure conflicts with the stated sex of the patient. Therefore, the patient's diagnosis, procedure, or sex is presumed to be incorrect.

We received a request to review ICD–10–CM diagnosis code Z79.890 (Hormone replacement therapy (postmenopausal)). This code is listed on the Diagnoses for females only edit code list. Therefore, when the diagnosis is reported for a male patient, the edit will be triggered. However, the requester noted that the term ''postmenopausal'' is enclosed in parentheses and is a ''non-essential modifier.'' A ''non-essential modifier'' is used in the ICD–10–CM classification to identify a supplementary word that may, or may not be present in the statement of a disease or procedure. In other words, the term in parentheses does not have to be documented to report the code. If the medical record documentation states a female patient is undergoing hormone replacement therapy, the documentation supports assignment of the case to ICD–10–CM diagnosis code Z79.890 (Hormone replacement therapy (postmenopausal)). There does not need to be a diagnostic statement that the patient is postmenopausal to assign the code. The requester asked that CMS review why this diagnosis code is being classified as applicable to females only because, in the absence of the non-essential modifier (postmenopausal), the code could also apply to males.

We note that the ICD–9–CM equivalent code, V07.4 Hormone replacement therapy (postmenopausal) has been on the female only edit since October 1, 1992 in the ICD–9–CM MCE. We consulted with the ICD–10–CM classification staff at the NCHS to determine the intended use and reporting of this diagnosis code. The staff at NCHS acknowledged that, historically, the intent of the ICD–9–CM diagnosis code was for females only. However, they agreed that, under ICD–10–CM, the diagnosis code Z79.890 can be reported for both men and women. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25003), we proposed to remove this diagnosis code from the Diagnoses for females only edit code list effective October 1, 2016. We invited public comments on our proposal.

Comment: Commenters supported the proposal to remove the ICD–10–CM diagnosis code describing hormone replacement therapy from the Diagnosis for females only edit code list in the ICD–10 MCE.

Response: We appreciate the commenters' support for our proposal. We agree it is appropriate to allow the reporting of the ICD–10–CM diagnosis code describing hormone replacement therapy for both male and female patients.

After consideration of the public comments we received, we are finalizing our proposal to remove ICD–10–CM diagnosis code Z79.890 (Hormone replacement therapy (postmenopausal)) from the Diagnosis for females only edit code list from the ICD–10 MCE Version 34, effective October 1, 2016.

We also considered the ICD–10–CM diagnosis codes listed in the table below that are included on the Diagnoses for females only edit code list.

ICD–10–CM diagnosis code	Description
Z44.30	Encounter for fitting and adjustment of external breast prosthesis, unspecified breast.
Z44.31	Encounter for fitting and adjustment of external right breast prosthesis.
Z44.32	Encounter for fitting and adjustment of external left breast prosthesis.
Z45.811	Encounter for adjustment or removal of right breast implant.
Z45.812	Encounter for adjustment or removal of left breast implant.
Z45.819	Encounter for adjustment or removal of unspecified breast implant.

These codes describe encounters for breast implants or prostheses. Our clinical advisors and the NCHS staff agree that diagnosis codes Z44.30, Z44.31, Z44.32, Z45.811, Z45.812, and Z45.819 are clinically appropriate to report for male patients and should not be restricted to females. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25004), we proposed to remove these diagnosis codes from the Diagnoses for females only edit code list in the ICD–10 MCE, effective October 1, 2016. We invited public comments on our proposal.

Comment: Commenters agreed that the ICD–10–CM diagnosis codes describing encounters for breast implants or prostheses are appropriate to report for male patients and should not be limited to females.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to remove the six ICD–10–CM diagnosis codes displayed earlier in this section that identify an encounter for fitting or adjustment of a breast implant or prosthesis from the Diagnoses for females only edit code list in the ICD–10 MCE Version 34, effective October 1, 2016.

c. Non-Covered Procedure Edit

In the MCE, the Non-covered procedure edit identifies procedures for which Medicare does not provide payment. Payment is not provided due to specific criteria that are established in the National Coverage Determination (NCD) process. We refer readers to the Web site at: *https://www.cms.gov/Medicare/Coverage/DeterminationProcess/howtorequestanNCD.html* for additional information on this process. In addition, there are procedures that would normally not be paid by Medicare but, due to the presence of certain diagnoses, are paid.

(1) Endovascular Mechanical Thrombectomy

We received several requests to review ICD–10–PCS procedure code 03CG3ZZ (Extirpation of matter from intracranial artery, percutaneous approach) which is currently listed as a non-covered procedure in the ICD–10 MCE Non-covered procedure edit code list. The comparable ICD–9–CM code translations for ICD–10–PCS code 03CG3ZZ are ICD–9–CM codes 17.54 (Percutaneous atherectomy of intracranial vessel(s)) and 39.74 (Endovascular removal of obstruction from head and neck vessel(s)).

The requestors noted that, under ICD–9–CM, endovascular mechanical thrombectomy of a cerebral artery to remove a clot that is causing an ischemic stroke was reported with procedure code 39.74 (Endovascular removal of obstruction from head and neck vessel(s)) and is a well-recognized procedure that has been covered by Medicare. After implementation of ICD–10 on October 1, 2015, claims that were correctly submitted for endovascular mechanical thrombectomy procedures with ICD–10–PCS procedure code 03CG3ZZ were triggering the Non-covered procedure edit. The requestors sought clarification as to whether there was a change in coverage or if there was a replication issue.

Under the ICD–9–CM MCE Version 32, procedure code 00.62 is listed on the Non-covered procedure edit code list. Percutaneous angioplasty of an intracranial vessel procedure (with and without stent) may be reported under ICD–10 with the ICD–10–PCS procedure codes listed in the following table:

ICD–10–PCS procedure code	Description
037G34Z	Dilation of intracranial artery with drug-eluting intraluminal device, percutaneous approach.
037G3DZ	Dilation of intracranial artery with intraluminal device, percutaneous approach.
037G3ZZ	Dilation of intracranial artery, percutaneous approach.
037G44Z	Dilation of intracranial artery with drug-eluting intraluminal device, percutaneous endoscopic approach.
037G4DZ	Dilation of intracranial artery with intraluminal device, percutaneous endoscopic approach.
037G4ZZ	Dilation of intracranial artery, percutaneous endoscopic approach.
057L3DZ	Dilation of intracranial vein with intraluminal device, percutaneous approach.
057L4DZ	Dilation of intracranial vein with intraluminal device, percutaneous endoscopic approach.

We discovered that a replication error occurred due to an outdated ICD–9–CM entry for procedure code 00.62. This error led to ICD–10–PCS procedure codes 03CG3ZZ (Extirpation of matter from intracranial artery, percutaneous approach) and 05CL3ZZ (Extirpation of matter from intracranial vein, percutaneous approach) being listed as comparable translations for ICD–9–CM code 00.62. As a result, ICD–10–PCS procedure code 03CG3ZZ was included on the ICD–10 MCE Version 33 Non-covered procedure edit code list.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25004), for FY 2017, we proposed to remove the ICD–10–PCS procedure codes listed in the following table from the ICD–10 MCE Version 34.0 Non-covered procedure edit code list.

ICD–10–PCS procedure code	Description
03CG3ZZ	Extirpation of matter from intracranial artery, percutaneous approach.
03CG4ZZ	Extirpation of matter from intracranial artery, percutaneous endoscopic approach.

ICD–10–PCS procedure code	Description
05CL3ZZ	Extirpation of matter from intracranial vein, percutaneous approach.
05CL4ZZ	Extirpation of matter from intracranial vein, percutaneous endoscopic approach.

We invited public comments on our proposal.

Comment: Many commenters supported the proposal to remove the four ICD–10–PCS procedure codes describing mechanical thrombectomy from the Non-covered procedure edit code list in the ICD–10 MCE to prevent further claims processing issues. Some commenters also recommended that CMS instruct the MACs to reprocess claims that were denied as a result of the codes being listed in the MCE. Other commenters suggested changes to the National Coverage Determination (NCD) for Intracranial Percutaneous Transluminal Angioplasty (PTA) with Stenting (20.7).

Response: We appreciate the commenters' support for our proposal. We agree that removal of the four ICD–10–PCS procedure codes that describe mechanical thrombectomy procedures from the non-covered procedure edit code list in the ICD–10 MCE will help resolve future claims processing and denial issues associated with the reporting of these codes.

In response to the comment that we instruct the MACs to reprocess any affected claims, we note that contractors began reprocessing affected claims at providers' request in March 2016. We recommend that providers who have experienced claims processing issues work with their local MACs to resolve any outstanding claims.

With regard to the commenters who suggested that changes be made to the NCD for Intracranial PTA with Stenting, we note that we issued instructions with updated changes on June 3, 2016 as a One-Time Notification, Pub. No. 100–20, Transmittal 1672, Change Request 9631, effective October 1, 2016.

After consideration of the public comments we received, we are finalizing our proposal to remove the four ICD–10–PCS procedure codes displayed earlier in this section from the non-covered procedure edit code list in the ICD–10 MCE Version 34, effective October 1, 2016.

(2) Radical Prostatectomy

We received a request to review ICD–10–PCS procedure codes related to a radical prostatectomy. Specifically, the requestor noted that when coding cases where the removal of the vas deferens is also performed, a Non-covered procedure edit is triggered. The requestor suggested that the edit for this procedure may be intended for cases where the removal of the vas deferens is being performed for sterilization (vasectomy) purposes. According to the requester, removal of the vas deferens also may be involved with removing the prostate in the radical prostatectomy procedure. The requestor suggested that CMS address this issue by revising the ICD–10 MCE Non-covered procedure edit code list to reflect noncoverage of the procedure codes when the removal of vas deferens procedure is being performed solely for sterilization (vasectomy) purposes.

Because radical procedures can have different meanings, depending on the procedure, the term ''radical'' is not always reliable information for coding and reporting the procedure. Under ICD–10–PCS, users are instructed to code separately the organs or structures that were actually removed and for which there is a distinctly defined body part. A radical prostatectomy is coded as a ''cluster'' under ICD–10–PCS. A ''cluster'' is the term used to describe the circumstance when a combination of ICD–10–PCS procedure codes are needed to fully satisfy the equivalent meaning of an ICD–9–CM procedure code for it to be considered a plausible translation.

The cluster definition for a radical prostatectomy in ICD–10–PCS currently consists of one of the following codes:

- 0VT00ZZ (Resection of prostate, open approach);
- 0VT04ZZ (Resection of prostate, percutaneous endoscopic approach);
- 0VT07ZZ (Resection of prostate, via natural or artificial opening); or
- 0VT08ZZ Resection of prostate, via natural or artificial opening endoscopic; in combination with one of the following codes:
- 0VT30ZZ (Resection of bilateral seminal vesicles, open approach); or
- 0VT34ZZ (Resection of bilateral seminal vesicles, percutaneous endoscopic approach).

As stated earlier, under ICD–10–PCS, users are instructed to code separately the organs or structures that were actually removed and for which there is a distinctly defined body part. Therefore, a patient who undergoes a radical prostatectomy that involves removal of the vas deferens would have this procedure reported separately, in addition to the options displayed in the ''cluster.''

The ICD–10–PCS procedure codes that may be reported for sterilization and involve the bilateral vas deferens include the following:

ICD–10–PCS procedure code	Description
0V5Q0ZZ	Destruction of bilateral vas deferens, open approach.
0V5Q3ZZ	Destruction of bilateral vas deferens, percutaneous approach.
0V5Q4ZZ	Destruction of bilateral vas deferens, percutaneous endoscopic approach.
0VBQ0ZZ	Excision of bilateral vas deferens, open approach.
0VBQ3ZZ	Excision of bilateral vas deferens, percutaneous approach.
0VBQ4ZZ	Excision of bilateral vas deferens, percutaneous endoscopic approach.
0VTQ0ZZ	Resection of bilateral vas deferens, open approach.
0VTQ4ZZ	Resection of bilateral vas deferens, percutaneous endoscopic approach.

The eight procedure codes listed above describing various methods to remove the bilateral vas deferens are currently listed on the ICD–10 MCE Version 33 Non-covered procedure edit code list.

The requester is correct in stating that the codes related to removal of the bilateral vas deferens are included on the ICD–10 MCE Version 33 Non-covered procedure edit code list to reflect a sterilization procedure. While the vast majority of sterilization procedures will involve reporting the

bilateral procedure codes, there are instances where one vas deferens may have been previously removed for other reasons and the remaining vas deferens requires sterilization. Therefore, the procedure codes describing removal of a unilateral vas deferens are also included on the ICD–10 MCE Version 33 Non-covered procedure edit code list to reflect a sterilization procedure. We agree that revising the language in the edit will resolve the issue of covered procedures being inappropriately subject to the edit.

In addition, while reviewing the Non-covered procedure edit list of codes that may be reported to identify sterilization procedures for males, we considered the procedure codes that may be reported to identify sterilization procedures for females. We examined the list of ICD–10–PCS procedure codes included on the ICD–10 MCE Version 33 Non-covered procedure edit code list that could reflect female sterilization (removal of fallopian tubes) and determined those codes also could be reported for other conditions and could be inappropriately subject to the current edit as well.

Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25005), for FY 2017, we proposed to create a new ICD–10 MCE Version 34 Non-covered procedure edit to reflect that procedures performed on males involving the unilateral or bilateral vas deferens and procedures performed on females involving the fallopian tubes are not covered procedures for sterilization purposes. The proposed new ICD–10 MCE Version 34 Non-covered procedure edit would be displayed as follows: ''G. Non-covered procedure. The procedure codes shown below are identified as non-covered procedures *only* when ICD–10–CM diagnosis code Z30.2 (Encounter for sterilization) is listed as the principal diagnosis.''

We referred readers to Table 6P.1b. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) to review the proposed list of noncovered procedure codes describing sterilization procedures for males and females for this proposed Non-covered procedure edit. We invited public comments on our proposal to create this new Non-covered procedure edit and also invited public comments on the proposed list of codes to describe sterilization procedures for the proposed edit.

Comment: Commenters supported the proposal to create a new ICD–10 MCE Version 34 Non-covered procedure edit to reflect that procedures performed on males involving the unilateral or bilateral vas deferens and procedures performed on females involving the fallopian tubes are not covered procedures for sterilization purposes. One commenter noted that there could be situations in which a patient is admitted for another condition and a sterilization procedure is performed during that episode of care. For example, the commenter stated a female may be admitted for a cesarean section and have a tubal ligation procedure during that same hospitalization. The commenter suggested that the proposed list of procedure codes be considered as non-covered when ICD–10–CM diagnosis code Z30.2 is reported as a principal or secondary diagnosis on the claim.

Response: We appreciate the commenters' support for our proposal. We also agree with the commenter that it is appropriate to list ICD–10–CM diagnosis code Z30.2 (Encounter for sterilization) as a principal or secondary diagnosis for purposes of the non-covered procedure edit.

After consideration of the public comments we received, we are finalizing our proposal to create a new ICD–10 MCE Version 34 Non-covered procedure edit. The new edit will be defined as follows: ''G. Non-covered procedure. The procedure codes shown below are identified as non-covered procedures *only* when ICD–10–CM diagnosis code Z30.2 (Encounter for sterilization) is listed as the principal diagnosis or secondary diagnosis.'' The procedure codes listed in Table 6P.1b. associated with this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) are the finalized list of non-covered procedure codes describing sterilization procedures for males and females for this finalized Non-covered procedure edit in the ICD–10 MCE Version 34, effective October 1, 2016.

d. Unacceptable Principal Diagnosis Edit

In the MCE, there are select codes that describe a circumstance which influences an individual's health status but does not actually describe a current illness or injury. There also are codes that are not specific manifestations but may be due to an underlying cause. These codes are considered unacceptable as a principal diagnosis. In limited situations, there are a few codes on the MCE Unacceptable principal diagnosis edit code list that are considered ''acceptable'' when a specified secondary diagnosis is also coded and reported on the claim.

(1) Liveborn Infant

We received a request to examine ICD–10–CM diagnosis codes Z38.1 (Single liveborn infant, born outside hospital), Z38.4 (Twin liveborn infant, born outside hospital), and Z38.7 (Other multiple liveborn infant, born outside hospital), all of which are currently listed on the Unacceptable principal diagnosis edit code list for the ICD–10 MCE Version 33. The requestor believed that these codes are listed in error and suggested their removal.

The ICD–10–CM diagnosis code descriptions for liveborn infants differ from the ICD–9–CM diagnosis code descriptions for liveborn infants. The ICD–9–CM codes differentiate between a liveborn infant that was born prior to admission and hospitalized versus a liveborn infant that was born prior to admission and *not* hospitalized. The following codes in the ICD–9–CM MCE Version 32 included on the Unacceptable principal diagnosis edit code list are those that describe a liveborn infant that was born outside the hospital and not hospitalized:

ICD–9–CM diagnosis code	Description
V30.2	Single liveborn, born outside hospital and not hospitalized.
V31.2	Twin birth, mate liveborn, born outside hospital and not hospitalized.
V32.2	Twin birth, mate stillborn, born outside hospital and not hospitalized.
V33.2	Twin birth, unspecified whether mate liveborn or stillborn, born outside hospital and not hospitalized.
V34.2	Other multiple birth (three or more), mates all liveborn, born outside hospital and not hospitalized.
V35.2	Other multiple birth (three or more), mates all stillborn, born outside of hospital and not hospitalized.
V36.2	Other multiple birth (three or more), mates liveborn and stillborn, born outside hospital and not hospitalized.
V37.2	Other multiple birth (three or more), unspecified whether mates liveborn or stillborn, born outside of hospital.
V39.1	Liveborn, unspecified whether single, twin or multiple, born before admission to hospital.

ICD–9–CM diagnosis code	Description
V39.2	Liveborn, unspecified whether single, twin or multiple, born outside hospital and not hospitalized.

For replication purposes, the comparable ICD–10–CM diagnosis codes for the above listed codes are: Z38.1 (Single liveborn infant, born outside hospital); Z38.4 (Twin liveborn infant, born outside hospital); and Z38.7 (Other multiple liveborn infant, born outside hospital). There are no other ICD–10–CM diagnosis codes that describe a liveborn infant born outside a hospital.

The liveborn infant codes are an example of where a particular concept involving the place of birth is not the same between the ICD–9–CM and ICD–10–CM classification systems. Because the ICD–10–CM diagnosis codes do not include the same concept as the ICD–9–CM diagnosis codes regarding whether the liveborn infant was hospitalized or not, we agree it would not be appropriate to continue to include the ICD–10–CM diagnosis codes on the Unacceptable principal diagnosis list.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25006), for FY 2017, we proposed to remove ICD–10–CM diagnosis codes Z38.1, Z38.4, and Z38.7 from the Unacceptable principal diagnosis edit in the ICD–10 MCE Version 34. We invited public comments on our proposal.

Comment: Several commenters supported the proposal to remove the three ICD–10–CM diagnosis codes describing a liveborn infant born outside of the hospital from the Unacceptable principal diagnosis edit code list in the ICD–10 MCE.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to remove codes Z38.1 (Single liveborn infant, born outside hospital); Z38.4 (Twin liveborn infant, born outside hospital); and Z38.7 (Other multiple liveborn infant, born outside hospital) from the Unacceptable principal diagnosis edit code list in the ICD–10 MCE Version 34, effective October 1, 2016.

(2) Multiple Gestation

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25006 through 25007), we received a request to review the ICD–10–CM diagnosis codes related to multiple gestation that are currently listed on the ICD–10 MCE Version 33 Unacceptable principal diagnosis edit code list. The requestor expressed concern that these codes were included in the edit and suggested that CMS evaluate further to determine if they were appropriate.

In the ICD–10–CM classification, a single diagnosis code describes a multiple gestation and contains information pertaining to the placenta. This differs from the ICD–9–CM classification, where two diagnosis codes are required to separately report (1) multiple gestation with a delivery or complication and (2) multiple gestation with the status of the placenta.

In the ICD–9–CM MCE Version 32, only the ICD–9–CM diagnosis codes describing the status of the placenta are listed on the Unacceptable principal diagnosis edit code list. These ICD–9–CM diagnosis codes are:

ICD–9–CM diagnosis code	Description
V91.00	Twin gestation, unspecified number of placenta, unspecified number of amniotic sacs.
V91.01	Twin gestation, monochorionic/monoamniotic (one placenta, one amniotic sac).
V91.02	Twin gestation, monochorionic/diamniotic (one placenta, two amniotic sacs).
V91.03	Twin gestation, dichorionic/diamniotic (two placentae, two amniotic sacs).
V91.09	Twin gestation, unable to determine number of placenta and number of amniotic sacs.
V91.10	Triplet gestation, unspecified number of placenta and unspecified number of amniotic sacs.
V91.11	Triplet gestation, with two or more monochorionic fetuses.
V91.12	Triplet gestation, with two or more monoamniotic fetuses.
V91.19	Triplet gestation, unable to determine number of placenta and number of amniotic sacs.
V91.20	(Quadruplet gestation, unspecified number of placenta and unspecified number of amniotic sacs.
V91.21	Quadruplet gestation, with two or more monochorionic fetuses.
V91.22	Quadruplet gestation, with two or more monoamniotic fetuses.
V91.29	Quadruplet gestation, unable to determine number of placenta and number of amniotic sacs.
V91.90	Other specified multiple gestation, unspecified number of placenta and unspecified number of amniotic sacs.
V91.91	Other specified multiple gestation, with two or more monochorionic fetuses.
V91.92	Other specified multiple gestation, with two or more monoamniotic fetuses.
V91.99	Other specified multiple gestation, unable to determine number of placenta and number of amniotic sacs.

There are 68 ICD–10–CM diagnosis codes included on the ICD–10 MCE Version 33 Unacceptable principal diagnosis edit code list as comparable translations that describe multiple gestation and status of the placenta. The list of these codes was included in Table 6P.1c. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*).

Because only one, and not both, concepts from the ICD–9–CM classification was considered to be an unacceptable principal diagnosis (status of placenta) in the ICD–9–CM MCE, we agree this was a replication error that incorrectly included the ICD–10–CM diagnosis codes that identify both concepts (multiple gestation and status of placenta) in a single code on the ICD–10 MCE. The edit cannot isolate the status of placenta for the ICD–10 MCE because it is reported in combination with the multiple gestation as a single code. Therefore, it is inappropriate to include these codes on the Unacceptable principal diagnosis edit code list.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25007), for FY 2017, we proposed to remove the ICD–10–CM diagnosis codes listed in Table 6P.1c. associated with the proposed rule (which is available via Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) from the ICD–10 MCE

Version 34 Unacceptable principal diagnosis list. We invited public comments on our proposal.

Comment: Commenters supported the proposal to remove the ICD–10–CM diagnosis codes listed describing multiple gestation from the Unacceptable principal diagnosis edit code list in the ICD–10 MCE.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to remove the ICD–10–CM diagnosis codes listed in Table 6P.1c. associated with this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) from the ICD–10 MCE Version 34 Unacceptable principal diagnosis list, effective October 1, 2016.

(3) Supervision of High Risk Pregnancy

We received a request to review the ICD–10–CM diagnosis codes related to supervision of high risk pregnancy (elderly primigravida and multigravida) that are currently listed on the ICD–10 MCE Version 33 Unacceptable principal diagnosis edit code list. The requestor stated that these codes were not included in the edit under the ICD–9–CM MCE. According to the requester, the codes describing these conditions should be allowed for reporting as a principal diagnosis based on the ICD–10–CM Tabular List of Diseases instructions for Chapter 15 (Certain Conditions Originating in the Perinatal Period). The chapter-specific guidelines for ICD–10–CM state that ''diagnosis code O80 (Encounter for full-term uncomplicated delivery) should be assigned when a woman is admitted for a full-term normal delivery and delivers a single, healthy infant without any complications antepartum, during the delivery, or postpartum during the delivery episode. Code O80 is always a principal diagnosis. It is not to be used if any other code from Chapter 15 is needed to describe a current complication of the antenatal, delivery, or perinatal period.'' The requestor stated that obstetric patients admitted as inpatients often meet the definition of an elderly primigravida or elderly multigravida,[1] which is the appropriate condition to be reported as the principal diagnosis. However, because the codes describing this condition are listed on the Unacceptable principal diagnosis edit code list, they are unable to be reported.

The diagnosis codes describing high-risk patients admitted for delivery differ between the ICD–10–CM and ICD–9–CM classifications. Under ICD–9–CM, two diagnosis codes are required to separately report concept 1 of elderly primigravida or elderly multigravida and whether a delivery occurred and concept 2 of supervision of high-risk pregnancy with elderly primigravida or elderly multigravida. We display the codes that correspond to these concepts below and titled them as Code List 1 and Code List 2. A code from each list would be reported to fully describe the circumstances of the admission and the patient.

Code List 1—We note that the following codes are listed on the ICD–9–CM MCE Version 32 Unacceptable principal diagnosis edit code list:

ICD–9–CM diagnosis code	Description
V23.81	Supervision of high-risk pregnancy with elderly primigravida.
V23.82	Supervision of high-risk pregnancy with elderly multigravida.

Code List 2—We note that the following codes are *not* listed on the ICD–9–CM MCE Version 32 Unacceptable principal diagnosis edit code list. However, we display them here for the benefit of the reader in the discussion that follows.

ICD–9–CM diagnosis code	Description
659.50	Elderly primigravida, unspecified as to episode of care or not applicable.
659.51	Elderly primigravida, delivered, with or without mention of antepartum condition.
659.53	Elderly primigravida, antepartum condition or complication.
659.60	Elderly multigravida, unspecified as to episode of care or not applicable.
659.61	Elderly multigravida, delivered with or without mention of antepartum condition.
659.63	Elderly multigravida, antepartum condition or complication.

As noted above, in the ICD–9–CM MCE Version 32, only the ICD–9–CM diagnosis codes describing the supervision of high-risk pregnancy are listed on the Unacceptable principal diagnosis edit code list.

There are eight ICD–10–CM diagnosis codes included on the ICD–10 MCE Version 33 Unacceptable principal diagnosis edit code list that describe the concept of elderly primigravida or elderly multigravida and supervision of high-risk pregnancy, in a *single* code. As shown below, the concept of whether a delivery occurred is not included in the code description for the eight codes.

ICD–10–CM diagnosis code	Description
O09.511	Supervision of elderly primigravida, first trimester.
O09.512	Supervision of elderly primigravida, second trimester.
O09.513	Supervision of elderly primigravida, third trimester.
O09.519	Supervision of elderly primigravida, unspecified trimester.

[1] The ICD–10–CM classification defines an elderly primigravida or elderly multigravida as a complication of the pregnancy since the management and care of the expectant mother is affected by the fact they are an older patient.

ICD–10–CM diagnosis code	Description
O09.521	Supervision of elderly multigravida, first trimester.
O09.522	Supervision of elderly multigravida, second trimester.
O09.523	Supervision of elderly multigravida, third trimester.
O09.529	Supervision of elderly multigravida, unspecified trimester.

Because the concepts and coding guidelines between the ICD–9–CM and ICD–10–CM classifications differ greatly in how they define this subset of patients, in the FY 2017 IPPS/LTCH PPS proposed rule, we acknowledged that the eight ICD–10–CM diagnosis codes listed above should be removed from the ICD–10 MCE Unacceptable principal diagnosis edit code list to permit the reporting of these codes as principal diagnosis when the documentation supports such assignment.

We also note that during our analysis of the eight diagnosis codes describing elderly primigravida and elderly multigravida high risk pregnancy patients, we found additional codes on the ICD–10 MCE Version 33 Unacceptable principal diagnosis edit code list related to high-risk pregnancy that we believe should also be removed so as to permit the reporting of these codes as principal diagnosis when the documentation supports such assignment.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25007 through 25008), for FY 2017, we proposed to remove all the ICD–10–CM diagnosis codes related to high-risk pregnancy currently listed in Table 6P.1d. associated with the proposed rule (which is available via Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) from the ICD–10 MCE Version 34 Unacceptable principal diagnosis edit code list. We invited public comment on our proposal.

Comment: Many commenters supported the proposal to remove the ICD–10–CM diagnosis codes related to high-risk pregnancy from the ICD–10 MCE Unacceptable principal diagnosis edit code list. However, some commenters did not support the proposal. The commenters stated their understanding that the codes from category O09, Supervision of high-risk pregnancy, should only be used for routine prenatal outpatient visits.

Response: We appreciate the commenters' support of our proposal. With regard to the commenters who did not support the proposal to remove the diagnosis codes related to high-risk pregnancy from the ICD–10 MCE Unacceptable principal diagnosis edit code list, we note that there is confusion with the correct reporting of these diagnosis codes. For example, in the Alphabetic Index to Diseases, the following entry is displayed:

- Pregnancy (childbirth) (labor) (puerperium) (*see also* Delivery and Puerperal)

□□ complicated by (care of) (management affected by)

□□ elderly

□□□ multigravida O09.52-

□□□ primigravida O09.51-.

Therefore, the classification is defining an elderly multigravida or elderly primigravida as a complication of the pregnancy. This entry could relate to Chapter 15, Section I.C.15.b.3 of the guidelines for episodes when no delivery occurs, which instructs users that the principal diagnosis should correspond to the principal complication of the pregnancy which necessitated the encounter for care. In other words, if an elderly primigravida is admitted to the hospital with no other complications and does not deliver during that admission, the classification appears to allow the reporting of a code from category O09, Supervision of high-risk pregnancy, as a principal diagnosis based on the Index entry. However, in Chapter 15, Section I.C.15.b.2. of the guidelines, the language instructs users that a code from category O90, Supervision of high-risk pregnancy, should be used as the first-listed diagnosis to report prenatal outpatient visits for high-risk patients.

We consulted with the staff at the CDC's NCHS to clarify the intent of the ICD–10–CM Alphabetic Index to Diseases entry and the Chapter 15 guidelines related to these codes. According to the CDC NCHS staff, the ICD–10–CM Guidelines have been updated for FY 2017 to explain the appropriate reporting of category O09 codes. The FY 2017 ICD–10–CM Official Guidelines for Coding and Reporting are available via the Internet on the CDC Web site at: *http://www.cdc.gov/nchs/icd/icd10cm.htm*. We note that, historically, we have not provided coding advice in rulemaking with respect to policy. We collaborate with the American Hospital Association (AHA) through the Coding Clinic for ICD–10–CM and ICD–10–PCS to promote proper coding. In addition, a proposal to revise the ICD–10–CM Alphabetic Index to Diseases will be discussed at the September 13–14, 2016 ICD–10 Coordination and Maintenance Committee meeting.

After consideration of the public comments we received and the updated FY 2017 ICD–10–CM Official Guidelines for Coding and Reporting, we are not finalizing our proposal to remove all the ICD–10–CM diagnosis codes related to high-risk pregnancy currently listed in Table 6P.1d. associated with the proposed rule and this final rule (which is available via Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) from the ICD–10 MCE Version 34 Unacceptable principal diagnosis edit code list. The ICD–10–CM diagnosis codes listed in Table 6P.1d. will continue to be subject to the Unacceptable principal diagnosis edit in the ICD–10 MCE Version 34, effective October 1, 2016.

e. Other MCE Issues

The following MCE discussion, proposals, and final policies are the result of internal review of other MCE issues.

(1) Procedure Inconsistent With Length of Stay Edit

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49411), we finalized a revision for the language of the ICD–10 MCE Version 33 edit for ''Procedure inconsistent with length of stay'' with regard to ICD–10–PCS procedure code 5A1955Z (Respiratory ventilation, greater than 96 consecutive hours). The current description of the code edit reads as follows: ''The following procedure code should only be coded on claims with a length of stay greater than four days.''

As we strive to assist providers with correct coding and reporting of this service, we proposed to further revise the description of this code edit. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25008), for FY 2017, we proposed to modify the edit description to read as follows: ''The following procedure code should only be coded on claims when the respiratory ventilation is provided for greater than

four consecutive days during the length of stay.''

We stated that we believe this proposed modification would further clarify the appropriate circumstances in which ICD–10–PCS code 5A1955Z may be reported. We invited public comments on our proposal.

Comment: Commenters supported the proposal to modify the description for the ''Procedure inconsistent with length of stay'' edit for ICD–10–PCS code 5A1955Z in the ICD–10 MCE.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are adopting as final the proposed revision of the description of the ''Procedure inconsistent with length of stay'' edit for ICD–10–PCS code 5A1955Z (Respiratory ventilation, greater than 96 consecutive hours) under the ICD–10 MCE from ''The following procedure code should only be coded on claims with a length of stay greater than four days'' to ''The following procedure code should only be coded on claims when the respiratory ventilation is provided for greater than four consecutive days during the length of stay'' in the ICD–10 MCE Version 34, effective October 1, 2016.

Also, consistent with the discussion in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49411 through 49412), we believe it would be beneficial to revise the title for ICD–10 MS–DRG 208 (Respiratory System Diagnosis with Ventilator Support <96 Hours). Currently, this ICD–10 MS–DRG title references terminology for mechanical ventilation ''< 96hours'' based on the GROUPER logic for MS–DRG 208, which includes ICD–10–PCS codes 5A1935Z (Respiratory ventilation, less than 24 consecutive hours) and 5A1945Z (Respiratory ventilation, 24–96 consecutive hours). Because ICD–10–PCS code 5A1945Z includes mechanical ventilation up to and including 96 hours, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25008), we proposed to modify the title of MS–DRG 208 by adding an ''equal'' sign (=) after the ''less than'' (<) sign to better reflect the GROUPER logic. We proposed to revise the title of ICD–10 MS–DRG 208 as follows, effective October 1, 2016: MS–DRG 208 (Respiratory System Diagnosis with Ventilator Support <=96 Hours). We invited public comments on our proposal.

Comment: Commenters supported the proposal to revise the title for ICD–10 MS–DRG 208.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to revise the title of MS–DRG 208 by adding an ''equal'' sign (=) after the ''less than'' (<) sign to better reflect the GROUPER logic. The finalized title for MS–DRG 208 (Respiratory System Diagnosis with Ventilator Support <=96 Hours) is included in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(2) Maternity Diagnoses

We identified three ICD–10–CM diagnosis codes that describe conditions related to pregnancy or the puerperium that are not currently listed on the ICD–10 MCE Version 33 Age conflict edit code list for maternity diagnoses. The diagnosis codes include:

- C58 (Malignant neoplasm of placenta);
- D39.2 (Neoplasm of uncertain behavior of placenta); and
- F53 (Puerperal psychosis).

To be consistent with other related conditions currently included on the Age conflict edit code list for maternity diagnoses, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25008), we proposed to add ICD–10–CM diagnosis codes C58 (Malignant neoplasm of placenta), D39.2 (Neoplasm of uncertain behavior of placenta), and F53 (Puerperal psychosis) to the Age conflict edit code list for maternity diagnoses.

We invited public comments on our proposals for changes to the FY 2017 ICD–10 MCE Version 34.

Comment: Many commenters supported the proposal to add ICD–10–CM diagnosis codes C58, D39.2, and F53 to the Age conflict edit code list for maternity diagnosis in the ICD–10 MCE. The commenters stated that the addition of these diagnosis codes is appropriate and consistent with related conditions currently on the edit code list for maternity diagnoses.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to add ICD–10–CM diagnosis codes C58 (Malignant neoplasm of placenta), D39.2 (Neoplasm of uncertain behavior of placenta), and F53 (Puerperal psychosis) to the Age conflict edit code list for maternity diagnosis in the ICD–10 MCE Version 34, effective October 1, 2016.

(3) Manifestation Codes Not Allowed as Principal Diagnosis Edit

Section I.A.13. of the FY 2016 ICD–10–CM Official Guidelines for Coding and Reporting states that certain conditions have both an underlying etiology and multiple body system manifestations due to the underlying etiology. For such conditions, the classification has a coding convention that requires the underlying condition be sequenced first followed by the manifestation. Wherever such a combination exists, there is a ''use additional code'' note at the etiology code, and a ''code first'' note at the manifestation code. These instructional notes indicate proper sequencing order of the codes, etiology followed by manifestation.

We found that in the ICD–10–CM Tabular List of Diseases at category M02 (Postinfective and reactive arthropathies), a ''Code first underlying disease'' note exists. This would indicate that there are codes in that category that are manifestations of an underlying etiology. We then examined the ICD–10 MCE Version 33 to determine if diagnosis codes from that category were included on the Manifestation codes not allowed as principal diagnosis edit code list. Only three ICD–10–CM diagnosis codes from that category were listed:

- M02.88 (Other reactive arthropathies, vertebrae);
- M02.89 (Other reactive arthropathies, multiple sites); and
- M02.9 (Reactive arthropathy, unspecified).

Based on the instructional note at the M02 category level, the title at subcategory M02.8 (Other reactive arthropathies), and the three diagnosis codes listed above on the current ICD–10 MCE Version 33 Manifestation codes not allowed as principal diagnosis edit code list, it seems appropriate that all of the diagnosis codes in subcategory M02.8 should be identified as manifestation codes.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25008 through 25009), we proposed to add the ICD–10–CM diagnosis codes listed in the following table to the ICD–10 MCE Version 34 Manifestation codes not allowed as principal diagnosis edit code list.

ICD–10–CM diagnosis code	Description
M02.80	Other reactive arthropathies, unspecified site.

ICD–10–CM diagnosis code	Description
M02.811	Other reactive arthropathies, right shoulder.
M02.812	Other reactive arthropathies, left shoulder.
M02.819	Other reactive arthropathies, unspecified shoulder.
M02.821	Other reactive arthropathies, right elbow.
M02.822	Other reactive arthropathies, left elbow.
M02.829	Other reactive arthropathies, unspecified elbow.
M02.831	Other reactive arthropathies, right wrist.
M02.832	Other reactive arthropathies, left wrist.
M02.839	Other reactive arthropathies, unspecified wrist.
M02.841	Other reactive arthropathies, right hand.
M02.842	Other reactive arthropathies, left hand.
M02.849	Other reactive arthropathies, unspecified hand.
M02.851	Other reactive arthropathies, right hip.
M02.852	Other reactive arthropathies, left hip.
M02.859	Other reactive arthropathies, unspecified hip.
M02.861	Other reactive arthropathies, right knee.
M02.862	Other reactive arthropathies, left knee.
M02.869	Other reactive arthropathies, unspecified knee.
M02.871	Other reactive arthropathies, right ankle and foot.
M02.872	Other reactive arthropathies, left ankle and foot.
M02.879	Other reactive arthropathies, unspecified ankle and foot.

We invited public comments on our proposal.

Comment: Commenters supported the proposal to add the ICD–10–CM codes in the table included in the proposed rule describing other reactive arthropathies to the Manifestation codes not allowed as principal diagnosis edit code list in the ICD–10 MCE.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to add the diagnosis codes in subcategory M02.8 as displayed in the table in the proposed rule and above to the Manifestation codes not allowed as principal diagnosis edit code list in the ICD–10 MCE Version 34, effective October 1, 2016.

(4) Questionable Admission Edit

In the MCE, some diagnoses are not usually sufficient justification for admission to an acute care hospital. For example, if a patient is assigned ICD–10–CM diagnosis code R03.0 (Elevated blood pressure reading, without diagnosis of hypertension), the patient would have a questionable admission because an elevated blood pressure reading is not normally sufficient justification for admission to a hospital.

Upon review of the ICD–10–CM diagnosis codes listed under the ICD–10 MCE Version 33 Questionable Admission edit, our clinical advisors determined that certain diagnoses clinically warrant hospital admission. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25009), we proposed to remove the following diagnosis codes from the ICD–10 MCE Version 34.0 Questionable admission edit.

- T81.81XA (Complication of inhalation therapy, initial encounter);
- T88.4XXA (Failed or difficult intubation, initial encounter);
- T88.7XXA (Unspecified adverse effect of drug or medicament, initial encounter);
- T88.8XXA (Other specified complications of surgical and medical care, not elsewhere classified, initial encounter); and
- T88.9XXA (Complication of surgical and medical care, unspecified, initial encounter).

We invited public comments on our proposal.

Comment: A number of commenters supported the proposal to remove the ICD–10–CM diagnosis codes listed in the proposed rule from the Questionable admission edit in the ICD–10 MCE.

Response: We appreciate the commenters' support for our proposal.

After consideration of the public comments we received, we are finalizing our proposal to remove the five ICD–10–CM diagnosis codes listed in the proposed rule and above (T81.81XA, T88.4XXA, T88.7XXA, T88.8XXA, and T88.9XXA) from the ICD–10 MCE Questionable admission edit for the ICD–10 MCE Version 34, effective October 1, 2016.

(5) Removal of Edits and Future Enhancement

With the implementation of ICD–10, it is clear that there are several concepts that differ from the ICD–9–CM classification. These differences are evident in the MCE as discussed earlier in this section. Looking ahead to the needs and uses of coded data as the data continue to evolve from the reporting, collection, processing, coverage, payment and analysis aspect, we believe the need to ensure the accuracy of the coded data becomes increasingly significant.

The purpose of the MCE is to ensure that errors and inconsistencies in the coded data are recognized during Medicare claims processing. As shown in the FY 2016 ICD–10 MCE Version 33 manual file and an ICD–9–CM MCE Version 33.0A manual file (developed for analysis only), an edit code list exists according to the definition or criteria set forth for each specified type of edit. Over time, certain edits under the ICD–9–CM MCE became discontinued as they were no longer needed. However, the MCE manual has continued to make reference to these discontinued edits, including through the replication process with transitioning to ICD–10.

Currently, the FY 2016 ICD–10 MCE Version 33 manual file displays the following edits:

- 12. Open biopsy check. Effective October 1, 2010, the Open biopsy check edit was discontinued and will appear for claims processed using MCE Version 2.0–26.0 only.
- 13. Bilateral procedure. Effective with the ICD–10 implementation, the bilateral procedure edit will be discontinued.

Because these edits are no longer valid, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25009), we proposed to remove the reference to them, effective with the ICD–10 MCE manual and software Version 34, for FY 2017. We invited public comments on our proposal.

Comment: Commenters supported the proposal to remove the language referencing discontinued edits for the

open biopsy check and the bilateral procedure edit from the ICD–10 MCE.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to remove the references to the open biopsy check and the bilateral procedure edit from the ICD–10 MCE Version 34, effective October 1, 2016.

As we continue to evaluate the purpose and function of the MCE with respect to the transition to ICD–10, we encourage public input for future discussion. For instance, we recognize a need to further examine the current list of edits and the definitions of those edits. We encourage public comments on whether there are additional concerns with the current edits, including specific edits or language that should be removed or revised, edits that should be combined, or new edits that should be added to assist in detecting errors or inaccuracies in the coded data.

13. Changes to Surgical Hierarchies

Some inpatient stays entail multiple surgical procedures, each one of which, occurring by itself, could result in assignment of the case to a different MS–DRG within the MDC to which the principal diagnosis is assigned. Therefore, it is necessary to have a decision rule within the GROUPER by which these cases are assigned to a single MS–DRG. The surgical hierarchy, an ordering of surgical classes from most resource-intensive to least resource-intensive, performs that function. Application of this hierarchy ensures that cases involving multiple surgical procedures are assigned to the MS–DRG associated with the most resource-intensive surgical class.

Because the relative resource intensity of surgical classes can shift as a function of MS–DRG reclassification and recalibrations, for FY 2017, we reviewed the surgical hierarchy of each MDC, as we have for previous reclassifications and recalibrations, to determine if the ordering of classes coincides with the intensity of resource utilization.

A surgical class can be composed of one or more MS–DRGs. For example, in MDC 11, the surgical class ''kidney transplant'' consists of a single MS–DRG (MS–DRG 652) and the class ''major bladder procedures'' consists of three MS–DRGs (MS–DRGs 653, 654, and 655). Consequently, in many cases, the surgical hierarchy has an impact on more than one MS–DRG. The methodology for determining the most resource-intensive surgical class involves weighting the average resources for each MS–DRG by frequency to determine the weighted average resources for each surgical class. For example, assume surgical class A includes MS–DRGs 001 and 002 and surgical class B includes MS–DRGs 003, 004, and 005. Assume also that the average costs of MS–DRG 001 are higher than that of MS–DRG 003, but the average costs of MS–DRGs 004 and 005 are higher than the average costs of MS–DRG 002. To determine whether surgical class A should be higher or lower than surgical class B in the surgical hierarchy, we would weigh the average costs of each MS–DRG in the class by frequency (that is, by the number of cases in the MS–DRG) to determine average resource consumption for the surgical class. The surgical classes would then be ordered from the class with the highest average resource utilization to that with the lowest, with the exception of ''other O.R. procedures'' as discussed in this rule.

This methodology may occasionally result in assignment of a case involving multiple procedures to the lower-weighted MS–DRG (in the highest, most resource-intensive surgical class) of the available alternatives. However, given that the logic underlying the surgical hierarchy provides that the GROUPER search for the procedure in the most resource-intensive surgical class, in cases involving multiple procedures, this result is sometimes unavoidable.

We note that, notwithstanding the foregoing discussion, there are a few instances when a surgical class with a lower average cost is ordered above a surgical class with a higher average cost. For example, the ''other O.R. procedures'' surgical class is uniformly ordered last in the surgical hierarchy of each MDC in which it occurs, regardless of the fact that the average costs for the MS–DRG or MS–DRGs in that surgical class may be higher than those for other surgical classes in the MDC. The ''other O.R. procedures'' class is a group of procedures that are only infrequently related to the diagnoses in the MDC, but are still occasionally performed on patients with cases assigned to the MDC with these diagnoses. Therefore, assignment to these surgical classes should only occur if no other surgical class more closely related to the diagnoses in the MDC is appropriate.

A second example occurs when the difference between the average costs for two surgical classes is very small. We have found that small differences generally do not warrant reordering of the hierarchy because, as a result of reassigning cases on the basis of the hierarchy change, the average costs are likely to shift such that the higher-ordered surgical class has lower average costs than the class ordered below it.

Based on the changes that we proposed to make for FY 2017, as discussed in section II.F.4.c. of the preamble of the FY 2017 IPPS/LTCH PPS proposed rule, we proposed to maintain the existing surgical hierarchy in MDC 5 for proposed revised MS–DRGs 228 and 229 (Other Cardiothoracic Procedures with MCC and without MCC, respectively) (81 FR 25010).

We invited public comments on our proposal.

Comment: A number of commenters supported the proposal to maintain the current surgical hierarchy in MDC 5 for proposed revised MS–DRGs 228 and 229.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to maintain the current surgical hierarchy in MDC 5 for FY 2017. As discussed in section II.F.5.d. in the preamble of this final rule, we finalized the modification of MS–DRGs 228 and 229 (Other Cardiothoracic Procedures with and without MCC, respectively), effective with the ICD–10 MS–DRGs Version 34 on October 1, 2016.

14. Changes to the MS–DRG Diagnosis Codes for FY 2017

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25010), the tables identifying the proposed additions and deletions to the MCC severity levels list and the proposed additions and deletions to the CC severity levels list for FY 2017 were made available via the Internet on the CMS Web site at: *http://cms.hhs.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* as follows:

- Table 6I.1—Proposed Additions to the MCC List—FY 2017;
- Table 6I.2—Proposed Deletions to the MCC List—FY 2017;
- Table 6J.1—Proposed Additions to the CC List—FY 2017; and
- Table 6J.2—Proposed Deletions to the CC List—FY 2017.

We did not receive any public comments on the proposed additions or deletions to the MCC and CC lists and, therefore, are adopting them as final, effective October 1, 2016. The final version of these four tables for FY 2017 are available via the Internet on the same CMS Web site cited above.

As we stated in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49414), certain ICD–10–CM diagnosis codes express conditions that, when coded in

ICD–9–CM, use two or more ICD–9–CM diagnosis codes. In the interest of ensuring that the ICD–10 MS–DRGs place a patient in the same MS–DRG, regardless of whether the patient claim was to be coded in ICD–9–CM or ICD–10, whenever one of these ICD–10–CM combination codes is used as principal diagnosis, the cluster of ICD–9–CM codes that would be coded on an ICD–9–CM claim is considered. If one of the ICD–9–CM codes in the cluster is a CC or an MCC, the single ICD–10–CM combination code used as a principal diagnosis must also imply that the CC or MCC is present. Appendix J of the ICD–10 MS–DRG Definitions Manual Version 33 includes two lists. Part 1 is the list of principal diagnosis codes where the ICD–10–CM code is its own MCC. Part 2 is the list of principal diagnosis codes where the ICD–10–CM code is its own CC. Appendix J of the ICD–10 MS–DRG Definitions Manual Version 33 is available via the internet on the CMS Web site at: *http://cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*.

For FY 2017, the ICD–10–CM diagnoses for which this implication must be made were listed in Table 6L (Proposed Principal Diagnosis Is Its Own MCC List—FY 2017), Table 6M (Proposed Principal Diagnosis Is Its Own CC List—FY 2017), and Table 6M.1 (Proposed Additions to the Principal Diagnosis is Its Own CC List—FY 2017) associated with the proposed rule, which were made available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*, as described in section VI. of the Addendum to the proposed rule. We note that there were no proposed changes to Table 6L for FY 2017 and the list of ICD–10–CM diagnoses that will act as its own MCC when reported as a principal diagnosis remains unchanged from the FY 2016 list. Therefore, we did not develop Table 6L.1 (Additions to the Principal Diagnosis Is Its Own MCC List) or Table 6L.2 (Deletions to the Principal Diagnosis Is Its Own MCC List) for FY 2017.

As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49414), ICD–9–CM diagnosis code 591 (Hydronephrosis) is classified as a CC. Under ICD–10–CM, hydronephrosis is reported with a combination code if the hydronephrosis is due to another condition, such as with new ICD–10–CM code N13.0 (Hydronephrosis with ureteropelvic junction obstruction), effective October 1, 2016. In ICD–10–CM, this finalized code is classified as a CC and, similar to existing ICD–10–CM codes N13.1 (Hydronephrosis with ureteral stricture, not elsewhere classified) and N13.2 (Hydronephrosis with renal and ureteral calculous obstruction), should be recognized as a principal diagnosis that acts as its own CC. Accordingly, ICD–10–CM code N13.0 (Hydronephrosis with ureteropelvic junction obstruction) was inclujded in Table 6M (Proposed Principal Diagnosis Is Its Own CC List—FY 2017) and Table 6M.1 (Proposed Additions to the Principal Diagnosis Is Its Own CC List—FY 2017), which were made available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. We did not receive any public comments regarding this specific proposal and, therefore, are adopting it as final, effective October 1, 2016.

15. Complications or Comorbidity (CC) Exclusions List

a. Background of the CC List and the CC Exclusions List

Under the IPPS MS–DRG classification system, we have developed a standard list of diagnoses that are considered CCs. Historically, we developed this list using physician panels that classified each diagnosis code based on whether the diagnosis, when present as a secondary condition, would be considered a substantial complication or comorbidity. A substantial complication or comorbidity was defined as a condition that, because of its presence with a specific principal diagnosis, would cause an increase in the length of stay by at least 1 day in at least 75 percent of the patients. However, depending on the principal diagnosis of the patient, some diagnoses on the basic list of complications and comorbidities may be excluded if they are closely related to the principal diagnosis. In FY 2008, we evaluated each diagnosis code to determine its impact on resource use and to determine the most appropriate CC subclassification (non-CC, CC, or MCC) assignment. We refer readers to sections II.D.2. and 3. of the preamble of the FY 2008 IPPS final rule with comment period for a discussion of the refinement of CCs in relation to the MS–DRGs we adopted for FY 2008 (72 FR 47152 through 47171).

b. CC Exclusions List for FY 2017

In the September 1, 1987 final notice (52 FR 33143) concerning changes to the DRG classification system, we modified the GROUPER logic so that certain diagnoses included on the standard list of CCs would not be considered valid CCs in combination with a particular principal diagnosis. We created the CC Exclusions List for the following reasons: (1) To preclude coding of CCs for closely related conditions; (2) to preclude duplicative or inconsistent coding from being treated as CCs; and (3) to ensure that cases are appropriately classified between the complicated and uncomplicated DRGs in a pair. As previously indicated, we developed a list of diagnoses, using physician panels, to include those diagnoses that, when present as a secondary condition, would be considered a substantial complication or comorbidity. In previous years, we made changes to the list of CCs, either by adding new CCs or deleting CCs already on the list.

In the May 19, 1987 proposed notice (52 FR 18877) and the September 1, 1987 final notice (52 FR 33154), we explained that the excluded secondary diagnoses were established using the following five principles:

- Chronic and acute manifestations of the same condition should not be considered CCs for one another;
- Specific and nonspecific (that is, not otherwise specified (NOS)) diagnosis codes for the same condition should not be considered CCs for one another;
- Codes for the same condition that cannot coexist, such as partial/total, unilateral/bilateral, obstructed/unobstructed, and benign/malignant, should not be considered CCs for one another;
- Codes for the same condition in anatomically proximal sites should not be considered CCs for one another; and
- Closely related conditions should not be considered CCs for one another.

The creation of the CC Exclusions List was a major project involving hundreds of codes. We have continued to review the remaining CCs to identify additional exclusions and to remove diagnoses from the master list that have been shown not to meet the definition of a CC. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50541) for detailed information regarding revisions that were made to the CC Exclusion Lists under the ICD–9–CM MS–DRGs.

The ICD–10 MS–DRGs Version 33 CC Exclusion List is included as Appendix C in the ICD–10 MS–DRG Definitions Manual, which is available via the Internet on the CMS Web site at: *http://cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*, and includes two lists identified as Part 1 and Part 2. Part 1 is the list of all diagnosis codes that are defined as a CC or an MCC when

reported as a secondary diagnosis. If the code designated as a CC or an MCC is allowed with all principal diagnoses, the phrase ''NoExcl'' (for no exclusions) follows the CC or MCC designation. For example, ICD–10–CM diagnosis code A17.83 (Tuberculous neuritis) has this ''NoExcl'' entry. For all other diagnosis codes on the list, a link is provided to a collection of diagnosis codes which, when used as the principal diagnosis, would cause the CC or MCC diagnosis to be considered as a non-CC. Part 2 is the list of diagnosis codes designated as an MCC only for patients discharged alive; otherwise, they are assigned as a non-CC.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25011), for FY 2017, we proposed changes to the ICD–10 MS–DRGs Version 34 CC Exclusion List. Therefore, we developed Table 6G.1.—Proposed Secondary Diagnosis Order Additions to the CC Exclusions List—FY 2017; Table 6G.2.—Proposed Principal Diagnosis Order Additions to the CC Exclusions List—FY 2017; Table 6H.1.—Proposed Secondary Diagnosis Order Deletions to the CC Exclusions List—FY 2017; and Table 6H.2.—Proposed Principal Diagnosis Order Deletions to the CC Exclusions List—FY 2017. Each of these principal diagnosis codes for which there is a CC exclusion was shown in Table 6G.2. with an asterisk and the conditions that will not count as a CC are provided in an indented column immediately following the affected principal diagnosis. Beginning with discharges on or after October 1 of each year, the indented diagnoses are not recognized by the GROUPER as valid CCs for the asterisked principal diagnoses. Tables 6G and 6H associated with the proposed rule are available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*.

Comment: Several commenters supported the proposed changes to the CC Exclusion List as displayed in Table 6G.1., Table 6G.2., Table 6H.1., and Table 6H.2. that were associated with the proposed rule and made available via the Internet on the CMS Web site.

Response: We appreciate the commenters' support of our proposals.

We note that, for this FY 2017 IPPS/LTCH PPS final rule, we have developed Table 6K.—Complete List of CC Exclusions, which is available via the Internet at the same CMS Web site as Tables 6G and 6H. Table 6K. corresponds to the Part 1 list of Appendix C in the ICD–10 MS–DRG Definitions Manual as described above.

The complete documentation of the ICD–10 MS–DRG Version 34 GROUPER logic, including the current CC Exclusions List, is available via the Internet on the CMS Acute Inpatient PPS Web page at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*.

To capture new and deleted diagnosis and procedure codes, for FY 2017, we developed Table 6A.—New Diagnosis Codes, Table 6B.—New Procedure Codes, and Table 6C—Invalid Diagnosis Codes to the proposed rule. However, they were not published in the Addendum to the proposed rule but were available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*, as described in section VI. of the Addendum to the proposed rule.

For this final rule, we have developed Table 6D.—Invalid Procedure Codes, to reflect the deletion of 12 ICD–10–PCS procedure codes, effective October 1, 2016, as a result of public comments received after the March 9–10, 2016 ICD–10 Coordination and Maintenance Committee meeting.

We note that while we did not specifically develop a Table 6E.—Revised Diagnosis Code Titles for the proposed rule, a document containing the FY 2017 revised diagnosis code titles, as well as new diagnosis codes that have been finalized to date since implementation of the partial code freeze, was made available in advance in response to requests from the health care industry. During the March 9–10, 2016 ICD–10 Coordination and Maintenance Committee meeting, a discussion regarding this document was presented. Participants were informed that the document titled ''FY 2017 New Released ICD–10–CM Codes'' would contain the information that would otherwise be included for this table. This document has been posted along with the other March 9–10, 2016 ICD–10 Coordination and Maintenance Committee meeting materials on the CDC Web site at: *http://www.cdc.gov/nchs/icd/icd9cm_maintenance.htm*.

In addition, we did not specifically develop a Table 6F.—Revised Procedure Code Titles for the proposed rule. However, a document containing the FY 2017 revised procedure code titles, as well as new procedure codes that have been finalized to date since implementation of the partial code freeze, was made available in advance in response to requests from the health care industry. During the March 9–10, 2016 ICD–10 Coordination and Maintenance Committee meeting, a discussion regarding this document was presented. Participants were informed that the document titled ''FY 2017 New Revised ICD–10–PCS Codes'' would contain the information that would otherwise be included for this table. This document is posted on the CMS Web site at: *https://www.cms.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/ICD-9-CM-C-and-M-Meeting-Materials-Items/2016-03-09-MeetingMaterials.html?DLPage=1&DLEntries=10&DLSort=0&DLSortDir=descending*.

After consideration of the public comments we received, we are making available on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* the following final tables associated with this final rule:

- Table 6A.—New Diagnosis Codes—FY 2017;
- Table 6B.—New Procedure Codes—FY 2017;
- Table 6C.—Invalid Diagnosis Codes—FY 2017;
- Table 6D.—Invalid Procedure Codes—FY 2017;
- Table 6E.—Revised Diagnosis Code Titles—FY 2017;
- Table 6F.—Revised Procedure Code Titles—FY 2017;
- Table 6G.1.—Secondary Diagnosis Order Additions to the CC Exclusions List—FY 2017;
- Table 6G.2.—Principal Diagnosis Order Additions to the CC Exclusions List—FY 2017;
- Table 6H.1.—Secondary Diagnosis Order Deletions to the CC Exclusions List—FY 2017;
- Table 6H.2.—Principal Diagnosis Order Deletions to the CC Exclusions List—FY 2017;
- Table 6I.—Complete MCC List—FY 2017;
- Table 6I.1.—Additions to the MCC List—FY 2017;
- Table 6I.2.–Deletions to the MCC List—FY 2017;
- Table 6J.—Complete CC List—FY 2017;
- Table 6J.1.—Additions to the CC List—FY 2017;
- Table 6J.2.—Deletions to the CC List —FY 2017;
- Table 6K.—Complete List of CC Exclusions—FY 2017;
- Table 6L.—Principal Diagnosis Is Its Own MCC List—FY 2017;
- Table 6M.—Principal Diagnosis Is Its Own CC List—FY 2017; and
- Table 6M.1.—Additions to the Principal Diagnosis Is Its Own CC List—FY 2017

16. Review of Procedure Codes in MS DRGs 981 Through 983; 984 Through 986; and 987 Through 989

Each year, we review cases assigned to MS–DRGs 981, 982, and 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively); MS–DRGs 984, 985, and 986 (Prostatic O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively); and MS–DRGs 987, 988, and 989 (Nonextensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) to determine whether it would be appropriate to change the procedures assigned among these MS–DRGs. MS–DRGs 981 through 983, 984 through 986, and 987 through 989 are reserved for those cases in which none of the O.R. procedures performed are related to the principal diagnosis. These MS–DRGs are intended to capture atypical cases, that is, those cases not occurring with sufficient frequency to represent a distinct, recognizable clinical group. Under ICD–9–CM, MS–DRGs 984 through 986 are assigned to those discharges in which one or more of the following prostatic procedures are performed and are unrelated to the principal diagnosis:

- 60.0 (Incision of prostate);
- 60.12 (Open biopsy of prostate);
- 60.15 (Biopsy of periprostatic tissue);
- 60.18 (Other diagnostic procedures on prostate and periprostatic tissue);
- 60.21 (Transurethral prostatectomy);
- 60.29 (Other transurethral prostatectomy);
- 60.61 (Local excision of lesion of prostate);
- 60.69 (Prostatectomy, not elsewhere classified);
- 60.81 (Incision of periprostatic tissue);
- 60.82 (Excision of periprostatic tissue);
- 60.93 (Repair of prostate);
- 60.94 (Control of (postoperative) hemorrhage of prostate);
- 60.95 (Transurethral balloon dilation of the prostatic urethra);
- 60.96 (Transurethral destruction of prostate tissue by microwave thermotherapy);
- 60.97 (Other transurethral destruction of prostate tissue by other thermotherapy); and
- 60.99 (Other operations on prostate).

Under the ICD–10 MS–DRGs Version 33, the comparable ICD–10–PCS code translations for the above list of codes are available in Table 6P.2. associated with the FY 2017 proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). All remaining O.R. procedures are assigned to MS–DRGs 981 through 983 and 987 through 989, with MS–DRGs 987 through 989 assigned to those discharges in which the only procedures performed are nonextensive procedures that are unrelated to the principal diagnosis.

We refer the reader to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50544 through 50545) for detailed information regarding modifications that were made to the former ICD–9–CM CMS DRG 468 (MS–DRGs 981 through 983), CMS DRG 476 (MS–DRGs 984 through 986), and CMS DRG 477 (MS–DRGs 987 through 989) with regard to the movement of procedure codes. We note that no procedure codes were moved from these DRGs from FY 2008 through FY 2016.

Our review of MedPAR claims data showed that there are no cases that merited movement or should logically be reassigned from ICD–10 MS–DRGs 984 through 986 to any of the other MDCs. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25012), for FY 2017, we did not propose to change the procedures assigned among these MS–DRGs. We invited public comments on our proposal to maintain the current structure of these MS–DRGs.

Comment: Many commenters supported the proposal to maintain the current structure of MS–DRGs 984, 985, and 986 under the ICD–10 MS–DRGs.

Response: We appreciate the commenters' support of our proposal. We note that while the comparable ICD–10–PCS code translations for the above list of ICD–9–CM codes were made available in Table 6P.2. associated with the FY 2017 proposed rule (which is available via the Internet on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*), we wish to clarify that the table was not intended to be a representation of the current ICD–10 MS–DRG GROUPER Version 33 logic. Rather, it was to simply demonstrate what the ICD–9–CM to ICD–10–PCS code translations were for purposes of review and comment. For example, the translations that were listed in Table 6P.2 of the FY 2017 proposed rule included six ICD–10–PCS procedure codes that are not included in the current ICD–10 MS–DRG GROUPER Version 33 logic for MS–DRGs 984, 985, and 986. Although these six ICD–10–PCS procedure codes are considered comparable translations of the corresponding ICD–9–CM procedure codes, these ICD–10–PCS procedure codes are currently designated as non-O.R. codes and, therefore, are not defined as prostatic O.R. codes for purposes of MS–DRG assignment under the ICD–10 MS–DRG Version 33 Definitions Manual under Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index.

In addition, as discussed in section II.F.19.c.1.b. of the FY 2017 proposed rule (81 FR 25025), we proposed to change the status of a number of ICD–10–PCS procedure codes from O.R. to non-O.R. Among the list in Table 6P.4b. associated with the proposed rule were procedures describing the endoscopic/transorifice removal of drainage, infusion, intraluminal or monitoring devices. Four of these codes (which were proposed to change from an O.R. to non-O.R. status) identify procedures performed on the prostate and seminal vesicles and are currently included in the ICD–10 MS–DRG GROUPER Version 33 logic for MS–DRGs 984, 985, and 986. These four procedure codes were also listed in Table 6P.2.—List of ICD–10–PCS code translations for prostatic procedures in MS–DRGs 984, 985, and 986 (Prostatic O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively), are currently designated as O.R. codes, and were proposed to change to a non-O.R. status. As discussed in section II.F.19.c.(1)(b) of the preamble of this final rule, we received public support for changing the status of the codes listed in Table 6P.4b. and are finalizing our proposal.

To reflect our finalized policy to designate these four codes as non-O.R. codes, as discussed in section II.F.19.c.(1)(b) of the preamble of this final rule, and also to remove the six ICD–10–PCS procedure codes that are not included in the current ICD–10 MS–DRG GROUPER Version 33 logic for MS–DRGs 984, 985 and 986, we are removing the following 10 ICD–10–PCS procedure codes from Table 6P.2 (which was associated with the FY 2017 proposed rule and available via the Internet on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-FeeforServicePayment/AcuteInpatientPPS/index.html*):

- 0T7D7ZZ (Dilation of urethra, via natural or artificial opening);
- 0T7D8ZZ (Dilation of urethra, via natural or artificial opening endoscopic);
- 0VB03ZX (Excision of prostate, percutaneous approach, diagnostic);

- 0VB04ZX (Excision of prostate, percutaneous endoscopic approach, diagnostic);
- 0VB07ZX (Excision of prostate, via natural or artificial opening, diagnostic);
- 0VB08ZX (Excision of prostate, via natural or artificial opening endoscopic, diagnostic);
- 0VP470Z (Removal of drainage device from prostate and seminal vesicles, via natural or artificial opening);
- 0VP473Z (Removal of infusion device from prostate and seminal vesicles, via natural or artificial opening);
- 0VP480Z (Removal of drainage device from prostate and seminal vesicles, via natural or artificial opening endoscopic); and
- 0VP483Z (Removal of infusion device from prostate and seminal vesicles, via natural or artificial opening endoscopic).

In addition, we are finalizing the list of ICD–10–PCS procedure codes that are assigned to MS–DRGs 984, 985, and 986 for FY 2017. The list of codes displayed in Table 6P.2 associated with this final rule represents the ICD–10 MS–DRG GROUPER logic for MS–DRGs 984, 985, and 986 (Prostatic O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) for the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

a. Moving Procedure Codes From MS–DRGs 981 Through 983 or MS–DRGs 987 Through 989 Into MDCs

We annually conduct a review of procedures producing assignment to MS–DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) or MS–DRGs 987 through 989 (Nonextensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) on the basis of volume, by procedure, to see if it would be appropriate to move procedure codes out of these MS–DRGs into one of the surgical MS–DRGs for the MDC into which the principal diagnosis falls. The data are arrayed in two ways for comparison purposes. We look at a frequency count of each major operative procedure code. We also compare procedures across MDCs by volume of procedure codes within each MDC.

We identify those procedures occurring in conjunction with certain principal diagnoses with sufficient frequency to justify adding them to one of the surgical MS–DRGs for the MDC in which the diagnosis falls. As we discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25012), upon review of the claims data from the December 2015 update of the FY 2015 MedPAR file, we did not find any cases that merited movement or that should logically be assigned to any of the other MDCs. Therefore, in the proposed rule for FY 2017, we did not propose to remove any procedures from MS–DRGs 981 through 983 or MS–DRGs 987 through 989 into one of the surgical MS–DRGs for the MDC into which the principal diagnosis is assigned. We invited public comments on our proposal to maintain the current structure of these MS–DRGs.

Comment: Several commenters supported our proposal to not move any procedure codes out of MS–DRGs 981, 982, 983, 987, 988, or 989.

Response: We appreciate the commenters' support of our proposal.

After consideration of the public comments we received, we are finalizing our proposal to not move any procedures from MS–DRGs 981, 982, or 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively), or from MS–DRGs 987, 988, or 989 (Nonextensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) into one of the surgical MS–DRGs for the MDC into which the principal diagnosis is assigned for ICD–10 MS–DRGs Version 34, effective October 1, 2016.

b. Reassignment of Procedures Among MS–DRGs 981 Through 983, 984 Through 986, and 987 Through 989

We also reviewed the list of ICD–10–PCS procedures that, when in combination with their principal diagnosis code, result in assignment to MS–DRGs 981 through 983, 984 through 986, or 987 through 989, to ascertain whether any of those procedures should be reassigned from one of those three groups of MS–DRGs to another of the three groups of MS–DRGs based on average costs and the length of stay. We look at the data for trends such as shifts in treatment practice or reporting practice that would make the resulting MS–DRG assignment illogical. If we find these shifts, we would propose to move cases to keep the MS–DRGs clinically similar or to provide payment for the cases in a similar manner. Generally, we move only those procedures for which we have an adequate number of discharges to analyze the data.

As we discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25012), there are no cases representing shifts in treatment practice or reporting practice that would make the resulting MS–DRG assignment illogical, or that merited movement so that cases should logically be assigned to any of the other MDCs. Therefore, for FY 2017, we did not propose to move any procedure codes among these MS–DRGs. We invited public comments on our proposal.

Comment: Several commenters supported our proposal to not move any procedure codes among MS–DRGs 981, 982, 983, 984, 985, 986, 987, 988, or 989.

Response: We appreciate the commenters' support for our proposal.

After consideration of the public comments we received, we are finalizing our proposal to maintain the current structure for MS–DRGs 981, 982, and 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively); MS–DRGs 984, 985, and 986 (Prostatic O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively); and MS–DRGs 987, 988, and 989 (Nonextensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) with regard to not reassigning any procedure codes among these MS–DRGs for FY 2017. As discussed in section II.F.16. of the preamble of this final rule, we are removing four procedure codes from MS–DRGs 984, 985, and 986, as they were included in the codes listed in Table 6P.4b that were finalized to change from being designated as O.R. codes to non-O.R. status in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

c. Adding Diagnosis or Procedure Codes to MDCs

As we discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25012 through 25016), based on the review of cases in the MDCs, we proposed to add multiple diagnosis and procedure codes to MDCs for FY 2017 to address replication issues. We discuss each of these proposals below.

(1) Angioplasty of Extracranial Vessel

In the ICD–9–CM MS–DRGs Version 32, procedures describing angioplasty of an extracranial vessel were assigned to MDC 1 (Diseases and Disorders of the Nervous System) under MS–DRGs 037, 038, and 039 (Extracranial Procedures with MCC, with CC, or without CC/MCC, respectively). Under ICD–9–CM, more than one ICD–9–CM code could be reported for these procedures, depending on the approach that was documented. For example, ICD–9–CM procedure code 00.61 (Percutaneous angioplasty of extracranial vessel(s)) would have been appropriately reported

if the percutaneous approach was documented, and procedure code 39.50 (Angioplasty of other non-coronary vessel(s)) would have been appropriately reported if a specified approach was not documented.

A replication issue for 41 ICD–10–PCS procedure codes describing angioplasty with the open approach was identified after implementation of the ICD–10 MS–DRGs Version 33. In the code translation, these 41 ICD–10–PCS procedure codes were grouped and assigned to ICD–10 MS–DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively). However, these procedure codes should have been grouped to ICD–10 MS–DRGs 037 through 039 when a principal diagnosis was reported under MDC 1.

To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25012 through 25013), we proposed to add the 41 ICD–10–PCS procedure codes listed in the following table to ICD–10 MS–DRGs 037 through 039 under MDC 1.

ICD–10–PCS procedure code	Description
037H04Z	Dilation of right common carotid artery with drug-eluting intraluminal device, open approach.
037H0DZ	Dilation of right common carotid artery with intraluminal device, open approach.
037H0ZZ	Dilation of right common carotid artery, open approach.
037J04Z	Dilation of left common carotid artery with drug-eluting intraluminal device, open approach.
037J0DZ	Dilation of left common carotid artery with intraluminal device, open approach.
037J0ZZ	Dilation of left common carotid artery, open approach.
037K04Z	Dilation of right internal carotid artery with drug-eluting intraluminal device, open approach.
037K0DZ	Dilation of right internal carotid artery with intraluminal device, open approach.
037K0ZZ	Dilation of right internal carotid artery, open approach.
037L04Z	Dilation of left internal carotid artery with drug-eluting intraluminal device, open approach.
037L0DZ	Dilation of left internal carotid artery with intraluminal device, open approach.
037L0ZZ	Dilation of left internal carotid artery, open approach.
037M04Z	Dilation of right external carotid artery with drug-eluting intraluminal device, open approach.
037M0DZ	Dilation of right external carotid artery with intraluminal device, open approach.
037M0ZZ	Dilation of right external carotid artery, open approach.
037N04Z	Dilation of left external carotid artery with drug-eluting intraluminal device, open approach.
037N0DZ	Dilation of left external carotid artery with intraluminal device, open approach.
037N0ZZ	Dilation of left external carotid artery, open approach.
037P04Z	Dilation of right vertebral artery with drug-eluting intraluminal device, open approach.
037P0DZ	Dilation of right vertebral artery with intraluminal device, open approach.
037P0ZZ	Dilation of right vertebral artery, open approach.
037Q04Z	Dilation of left vertebral artery with drug-eluting intraluminal device, open approach.
037Q0DZ	Dilation of left vertebral artery with intraluminal device, open approach.
037Q0ZZ	Dilation of left vertebral artery, open approach.
037Y04Z	Dilation of upper artery with drug-eluting intraluminal device, open approach.
037Y0DZ	Dilation of upper artery with intraluminal device, open approach.
037Y0ZZ	Dilation of upper artery, open approach.
057M0DZ	Dilation of right internal jugular vein with intraluminal device, open approach.
057M0ZZ	Dilation of right internal jugular vein, open approach.
057N0DZ	Dilation of left internal jugular vein with intraluminal device, open approach.
057N0ZZ	Dilation of left internal jugular vein, open approach.
057P0DZ	Dilation of right external jugular vein with intraluminal device, open approach.
057P0ZZ	Dilation of right external jugular vein, open approach.
057Q0DZ	Dilation of left external jugular vein with intraluminal device, open approach.
057Q0ZZ	Dilation of left external jugular vein, open approach.
057R0DZ	Dilation of right vertebral vein with intraluminal device, open approach.
057R0ZZ	Dilation of right vertebral vein, open approach.
057S0DZ	Dilation of left vertebral vein with intraluminal device, open approach.
057S0ZZ	Dilation of left vertebral vein, open approach.
057T0DZ	Dilation of right face vein with intraluminal device, open approach.
057T0ZZ	Dilation of right face vein, open approach.

We invited public comments on our proposal to add the above listed codes to ICD–10 MS–DRGs 037, 038, and 039 (Extracranial Procedures with MCC, with CC, or without CC/MCC, respectively) under MDC 1, effective October 1, 2016, for the ICD–10 MS–DRGs Version 34.

Comment: Several commenters supported the proposal to add the codes listed in the table in the proposed rule to ICD–10 MS–DRGs 037, 038, and 039. The commenters also acknowledged CMS' continued efforts for accurate replication.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze the replication issues between the ICD–9 and ICD–10 based MS–DRGs brought to our attention.

After consideration of the public comments we received, we are finalizing our proposal to add the above listed codes to ICD–10 MS–DRGs 037, 038, and 039 (Extracranial Procedures with MCC, with CC, or without CC/MCC, respectively) under MDC 1 for the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(2) Excision of Abdominal Arteries

In the ICD–9–CM MS–DRGs Version 32, procedures involving excision of a vessel and anastomosis, such as those performed for the treatment of an abdominal artery aneurysm (aneurysmectomy), are identified with procedure code 38.36 (Resection of vessel with anastomosis, abdominal arteries) and are assigned to the following MDCs and MS–DRGs:

- MDC 5 (Diseases and Disorders of the Circulatory System): MS–DRGs 270 through 272 (Other Major Cardiovascular Procedures with MCC,

with CC and without CC/MCC, respectively);

- MDC 6 (Diseases and Disorders of the Digestive System): MS–DRGs 356 through 358 (Other Digestive System O.R. Procedures with MCC, with CC and without CC/MCC, respectively);
- MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract): MS–DRGs 673 through 675 (Other Kidney and Urinary Tract Procedures with MCC, with CC and without CC/MCC, respectively);
- MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs): MS–DRGs 907 through 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively); and
- MDC 24 (Multiple Significant Trauma): MS–DRG 957 through 959 (Other O.R. Procedures for Multiple Significant Trauma with MCC, with CC and without CC/MCC, respectively).

A replication issue for 34 ICD–10–PCS procedure codes describing aneurysmectomy procedures with the open and percutaneous endoscopic approach was identified after implementation of the ICD–10 MS–DRGs Version 33. For example, cases with a principal diagnosis of I72.2 (Aneurysm of renal artery) and procedure code 04BA0ZZ (Excision of left renal artery, open approach) are resulting in assignment to ICD–10 MS–DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) instead of to MDC 11 in MS–DRGs 673 through 675 (Other Kidney and Urinary Tract Procedures with MCC, with CC, and without CC/MCC, respectively).

To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25013 through 25014), we proposed to add the 34 ICD–10–PCS procedure codes listed in the following table that are comparable translations of ICD–9–CM procedure code 38.36 to ICD–10 MDCs 6, 11, 21, and 24. We noted that there is no replication issue related to MDC 5 as the ICD–10–PCS procedure codes listed in the table below group there appropriately.

ICD–10–PCS procedure code	Description
04B10ZZ	Excision of celiac artery, open approach.
04B14ZZ	Excision of celiac artery, percutaneous endoscopic approach.
04B20ZZ	Excision of gastric artery, open approach.
04B24ZZ	Excision of gastric artery, percutaneous endoscopic approach.
04B30ZZ	Excision of hepatic artery, open approach.
04B34ZZ	Excision of hepatic artery, percutaneous endoscopic approach.
04B40ZZ	Excision of splenic artery, open approach.
04B44ZZ	Excision of splenic artery, percutaneous endoscopic approach.
04B50ZZ	Excision of superior mesenteric artery, open approach.
04B54ZZ	Excision of superior mesenteric artery, percutaneous endoscopic approach.
04B60ZZ	Excision of right colic artery, open approach.
04B64ZZ	Excision of right colic artery, percutaneous endoscopic approach.
04B70ZZ	Excision of left colic artery, open approach.
04B74ZZ	Excision of left colic artery, percutaneous endoscopic approach.
04B80ZZ	Excision of middle colic artery, open approach.
04B84ZZ	Excision of middle colic artery, percutaneous endoscopic approach.
04B90ZZ	Excision of right renal artery, open approach.
04B94ZZ	Excision of right renal artery, percutaneous endoscopic approach.
04BA0ZZ	Excision of left renal artery, open approach.
04BA4ZZ	Excision of left renal artery, percutaneous endoscopic approach.
04BB0ZZ	Excision of inferior mesenteric artery, open approach.
04BB4ZZ	Excision of inferior mesenteric artery, percutaneous endoscopic approach.
04BC0ZZ	Excision of right common iliac artery, open approach.
04BC4ZZ	Excision of right common iliac artery, percutaneous endoscopic approach.
04BD0ZZ	Excision of left common iliac artery, open approach.
04BD4ZZ	Excision of left common iliac artery, percutaneous endoscopic approach.
04BE0ZZ	Excision of right internal iliac artery, open approach.
04BE4ZZ	Excision of right internal iliac artery, percutaneous endoscopic approach.
04BF0ZZ	Excision of left internal iliac artery, open approach.
04BF4ZZ	Excision of left internal iliac artery, percutaneous endoscopic approach.
04BH0ZZ	Excision of right external iliac artery, open approach.
04BH4ZZ	Excision of right external iliac artery, percutaneous endoscopic approach.
04BJ0ZZ	Excision of left external iliac artery, open approach.
04BJ4ZZ	Excision of left external iliac artery, percutaneous endoscopic approach.

We stated that adding these procedures to those MDCs in the ICD–10 MS–DRGs Version 34 will result in a more accurate replication for the same procedure under the ICD–9–CM MS–DRGs Version 32. We also proposed that these procedure codes be assigned to the corresponding MS–DRGs in each respective MDC as listed above. We stated that the proposed changes would eliminate erroneous assignment to MS–DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) for these procedures.

We invited public comments on our proposal to add the above listed codes to MDCs 6, 11, 21, and 24 in the corresponding MS–DRGs, effective October 1, 2016, in the ICD–10 MS–DRGs Version 34.

Comment: Several commenters supported the proposal to add the codes listed in the table in the proposed rule to MDCs 6, 11, 21 and 24 in the corresponding ICD–10 MS–DRGs. The commenters also acknowledged CMS' continued efforts for accurate replication.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze the replication issues between the ICD–9 and ICD–10 based MS–DRGs brought to our attention.

After consideration of the public comments we received, we are finalizing our proposal to add the codes

listed in the table in the proposed rule and above to the following MDCs and MS–DRGs for the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

- MDC 6 (Diseases and Disorders of the Digestive System): MS–DRGs 356 through 358 (Other Digestive System O.R. Procedures with MCC, with CC and without CC/MCC, respectively);
- MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract): MS–DRGs 673 through 675 (Other Kidney and Urinary Tract Procedures with MCC, with CC and without CC/MCC, respectively);
- MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs): MS–DRGs 907 through 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively); and
- MDC 24 (Multiple Significant Trauma): MS–DRG 957 through 959 (Other O.R. Procedures for Multiple Significant Trauma with MCC, with CC and without CC/MCC, respectively).

(3) Excision of Retroperitoneal Tissue

In the ICD–9–CM MS–DRGs Version 32, procedures involving excision of a retroperitoneal lesion (or tissue), such as those performed for the treatment of a neoplasm, are identified with procedure code 54.4 (Excision or destruction of peritoneal tissue) and are assigned to a number of MDCs and MS–DRGs across a variety of body systems, some of which include the following:

- MDC 6 (Diseases and Disorders of the Digestive System): MS–DRGs 356 through 358 (Other Digestive System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively);
- MDC 7 (Diseases and Disorders of the Hepatobiliary System and Pancreas): MS–DRGs 423 through 425 (Other Hepatobiliary or Pancreas O.R. Procedures with MCC, with CC, and without CC/MCC, respectively); and
- MDC 10 (Endocrine, Nutritional and Metabolic Diseases and Disorders): MS–DRGs 628 through 630 (Other Endocrine, Nutritional and Metabolic O.R. Procedures with MCC, with CC, and without CC/MCC, respectively).

A replication issue for the ICD–10–PCS procedure codes describing excision of retroperitoneum that involves MDC 6 was identified after implementation of the ICD–10 MS–DRGs Version 33. These procedure codes are ICD–10–PCS codes 0WBH0ZZ (Excision of retroperitoneum, open approach), 0WBH3ZZ (Excision of retroperitoneum, percutaneous approach), and 0WBH4ZZ (Excision of retroperitoneum, percutaneous endoscopic approach). For example, when an ICD–10–CM diagnosis code such as D20.0 (Benign neoplasm of soft tissue of retroperitoneum) is reported with any one of these three ICD–10–PCS procedure codes, the case is assigned to MS–DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively).

To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25014), we proposed to add the three ICD–10–PCS procedure codes to MDC 6 in MS–DRGs 356 through 358 (Other Digestive System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively). We stated that this would result in a more accurate replication of the comparable procedure under the ICD–9–CM MS–DRGs Version 32. The proposed changes also would eliminate erroneous assignment to MS–DRGs 981 through 983 for these procedures.

We invited public comments on our proposal to add the three ICD–10–PCS codes describing excision of retroperitoneum to MDC 6 in MS–DRGs 356 through 358, effective October 1, 2016, in the ICD–10 MS–DRGs Version 34.

Comment: Several commenters supported the proposal to add ICD–10–PCS procedure codes 0WBH0ZZ, 0WBH3ZZ, and 0WBH4ZZ describing excision of retroperitoneum to MDC 6 in MS–DRGs 356 through 358. The commenters also acknowledged CMS' continued efforts for accurate replication.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze the replication issues between the ICD–9 and ICD–10 based MS–DRGs brought to our attention.

After consideration of the public comments we received, we are finalizing our proposal to add ICD–10–PCS codes 0WBH0ZZ (Excision of retroperitoneum, open approach), 0WBH3ZZ (Excision of retroperitoneum, percutaneous approach), and 0WBH4ZZ (Excision of retroperitoneum, percutaneous endoscopic approach) to MDC 6 in MS–DRGs 356 through 358 (Other Digestive System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) for the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(4) Occlusion of Vessels: Esophageal Varices

In the ICD–9–CM MS–DRGs Version 32, procedures including ligation or surgical occlusion of esophageal varices are identified with procedure code 42.91 (Ligation of esophageal varices) and are assigned to MDC 6 (Diseases and Disorders of the Digestive System) under MS–DRGs 326 through 328 (Stomach, Esophageal and Duodenal Procedures with MCC, with CC, and without CC/MCC, respectively) and MDC 7 (Diseases and Disorders of the Hepatobiliary System and Pancreas) under MS–DRGs 423 through 425 (Other Hepatobiliary or Pancreas O.R. procedures with MCC, with CC, and without CC/MCC, respectively).

A replication issue for MDC 7 involving ICD–10–PCS procedure codes 06L30CZ (Occlusion of esophageal vein with extraluminal device, open approach) and 06L30DZ (Occlusion of esophageal vein with intraluminal device, open approach) was identified in the ICD–10 MS–DRGs Version 33 after implementation on October 1, 2015. For instance, when an ICD–10–CM diagnosis code such as K70.30 (Alcoholic cirrhosis of liver without ascites) is reported with either one of the ICD–10–PCS procedure codes, it results in assignment to MS–DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively).

To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25015), we proposed to add the two ICD–10–PCS procedure codes describing occlusion of esophageal vein to MDC 7 under MS–DRGs 423 through 425. We stated that this would result in a more accurate replication of the comparable procedure under the ICD–9–CM MS–DRGs Version 32. We stated that the proposed changes also would eliminate erroneous assignment to MS–DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively) for these procedures.

We invited public comments on our proposal to add ICD–10–PCS procedure codes 06L30CZ and 06L30DZ to MDC 7 under MS–DRGs 423 through 425, effective October 1, 2016, in the ICD–10 MS–DRGs Version 34.

Comment: Several commenters supported the proposal to add ICD–10–PCS procedure codes 06L30CZ and 06L30DZ to MDC 7 under MS–DRGs 423 through 425. The commenters also acknowledged CMS' continued efforts for accurate replication.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze the replication issues between the ICD–9 and ICD–10 based MS–DRGs brought to our attention.

After consideration of the public comments we received, we are finalizing our proposal to add ICD–10–PCS procedure codes 06L30CZ

(Occlusion of esophageal vein with extraluminal device, open approach) and 06L30DZ (Occlusion of esophageal vein with intraluminal device, open approach) to MDC 7 under MS–DRGs 423 through 425 (Other Hepatobiliary or Pancreas O.R. procedures with MCC, with CC, and without CC/MCC, respectively) for the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(5) Excision of Vulva

In the ICD–9–CM MS–DRGs Version 32, procedures involving excision of the vulva are identified with procedure code 71.3 (Other local excision or destruction of vulva and perineum) and are assigned to the following MDCs and MS–DRGs:

- MDC 9 (Diseases & Disorders of the Skin, Subcutaneous Tissue and Breast): MS–DRGs 579 through 581 (Other Skin, Subcutaneous Tissue and Breast Procedures with MCC, with CC, and without CC/MCC, respectively); and
- MDC 13 (Diseases & Disorders of the Female Reproductive System): MS–DRG 746 (Vagina, cervix and vulva procedures with CC/MCC) and MS–DRG 747 (Vagina, Cervix and Vulva procedures without CC/MCC).

A replication issue involving ICD–10–PCS procedure code 0UBMXZZ (Excision of vulva, external approach) was identified after implementation of the ICD–10 MS–DRGs Version 33. For example, when cases with an ICD–10–CM principal diagnosis of code D07.1 (Carcinoma in situ of vulva) are reported with ICD–10–PCS procedure code 0UBMXZZ (Excision of vulva, external approach), they are resulting in assignment to MS–DRGs 981 through 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively).

To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25015), we proposed to add ICD–10–PCS procedure code 0UBMXZZ to MDC 13 under MS–DRGs 746 and 747. We stated that adding procedure code 0UBMXZZ to MDC 13 in MS–DRGs 746 and 747 would result in a more accurate replication of the comparable procedure under the ICD–9–CM MS–DRGs Version 32. The proposed changes also would eliminate erroneous assignment to MS–DRGs 981 through 983 for these procedures. In addition, the proposed changes would be consistent with the assignment of other clinically similar procedures, such as ICD–10–PCS procedure code 0WBNXZZ (Excision of female perineum, external approach). Finally, we noted that there is no replication issue for MDC 9 regarding this procedure code.

We invited public comment on our proposal to add ICD–10–PCS procedure code 0UBMXZZ to MDC 13 in MS–DRGs 746 and 747, effective October 1, 2016, in the ICD–10 MS–DRGs Version 34.

Comment: Several commenters supported the proposal to add ICD–10–PCS procedure code 0UBMXZZ to MDC 13 under MS–DRGs 746 and 747. The commenters also acknowledged CMS' continued efforts for accurate replication.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze the replication issues between the ICD–9 and ICD–10 based MS–DRGs brought to our attention.

After consideration of the public comments we received, we are finalizing our proposal to add ICD–10–PCS procedure code 0UBMXZZ (Excision of vulva, external approach) to MDC 13 under MS–DRG 746 (Vagina, cervix and vulva procedures with CC/MCC) and MS–DRG 747 (Vagina, Cervix and Vulva procedures without CC/MCC) for the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(6) Lymph Node Biopsy

In the ICD–9–CM MS–DRGs Version 32, procedures involving a lymph node biopsy are identified with procedure code 40.11 (Biopsy of lymphatic structure), which may be assigned to several MDCs representing various body systems. Under the ICD–10 MS–DRGs Version 33, this procedure has 114 ICD–10–PCS procedure codes considered to be comparable translations that describe diagnostic drainage or excision of specified lymphatic structures and also warrant assignment to the same MDCs across various body systems.

A replication issue for the lymph node biopsy procedure involving MDC 4 (Diseases and Disorders of the Respiratory System) under the ICD–10 MS–DRGs Version 33 was identified after implementation on October 1, 2015. For example, when a respiratory system diagnosis is reported with the comparable ICD–10–PCS procedure code 07B74ZX (Excision of thorax lymphatic, percutaneous endoscopic approach, diagnostic), the case is assigned to MS–DRGs 987 through 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC/MCC, respectively).

To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25015 through 25016), we proposed to add ICD–10–PCS procedure code 07B74ZX to MDC 4 under MS–DRGs 166 through 168 (Other Respiratory System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) to more accurately replicate assignment of the comparable procedure code under the ICD–9–CM MS–DRGs Version 32.

While reviewing that specific example, we also identified two other comparable ICD–10–PCS procedure code translations of ICD–9–CM procedure code 40.11 (Biopsy of lymphatic structure) describing diagnostic excision of thoracic lymphatic structures that were not replicated consistent with the ICD–9–CM MS–DRGs Version 32. These are ICD–10–PCS procedure codes 07B70ZX (Excision of thorax lymphatic, open approach, diagnostic) and 07B73ZX (Excision of thorax lymphatic, percutaneous approach, diagnostic). Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25015 through 25016), we proposed to add these two ICD–10–PCS procedure codes to MDC 4 in MS–DRGs 166 through 168 as well.

We stated that adding ICD–10–PCS procedure codes 07B74ZX, 07B70ZX, and 07B73ZX that describe diagnostic excision of thoracic lymphatic structures to MDC 4 under MS–DRGs 166 through 168 would result in a more accurate replication of the comparable procedure under ICD–9–CM MS–DRGs Version 32. We also stated that the proposed changes would eliminate erroneous assignment to MS–DRGs 987 through 989 for these procedures.

We invited public comments on our proposal to add ICD–10–PCS procedure codes 07B74ZX, 07B70ZX, and 07B73ZX to MDC 4 under MS–DRGs 166 through 168, effective October 1, 2016, in the ICD–10 MS–DRGs Version 34.

Comment: Several commenters expressed support for our proposal to add ICD–10–PCS procedure codes 07B74ZX, 07B70ZX, and 07B73ZX to MDC 4 under MS–DRGs 166 through 168. The commenters also acknowledged CMS' continued efforts for accurate replication.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze the replication issues between the ICD–9 and ICD–10 based MS–DRGs brought to our attention.

After consideration of the public comments we received, we are finalizing our proposal to add ICD–10–PCS procedure codes 07B74ZX (Excision of thorax lymphatic, percutaneous endoscopic approach, diagnostic), 07B70ZX (Excision of thorax lymphatic, open approach, diagnostic) and 07B73ZX (Excision of

thorax lymphatic, percutaneous approach, diagnostic) to MDC 4 under MS–DRGs 166 through 168 (Other Respiratory System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) for the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(7) Obstetrical Laceration Repair

A replication issue for eight ICD–10–PCS procedure codes describing procedures that may be performed for the repair of obstetrical lacerations was identified after implementation of the ICD–10 MS–DRGs Version 33. These codes are:

ICD–10–PCS procedure code	Description
0DQQ0ZZ	Repair anus, open approach.
0DQQ3ZZ	Repair anus, percutaneous approach.
0DQQ4ZZ	Repair anus, percutaneous endoscopic approach.
0DQQ7ZZ	Repair anus, via natural or artificial opening.
0DQQ8ZZ	Repair anus, via natural or artificial opening endoscopic.
0DQR0ZZ	Repair anal sphincter, open approach.
0DQR3ZZ	Repair anal sphincter, percutaneous approach.
0DQR4ZZ	Repair anal sphincter, percutaneous endoscopic approach.

We discovered that the ICD–10 MDC and MS–DRG assignment are not consistent with other ICD–10–PCS procedure codes that identify and describe clinically similar procedures for the repair of obstetrical lacerations which are coded and reported based on the extent of the tear. For example, ICD–10–PCS procedure code 0DQP0ZZ (Repair rectum, open approach) is appropriately assigned to MDC 14 (Pregnancy, Childbirth and the Puerperium) under MS–DRG 774 (Vaginal Delivery with Complicating Diagnoses). This procedure may be performed in the treatment of a fourth-degree perineal laceration involving the rectal mucosa. In contrast, ICD–10–PCS procedure code 0DQR0ZZ (Repair anal sphincter, open approach), when reported for repair of a perineal laceration, currently results in assignment to MS–DRGs 987 through 989 (Non-Extensive O.R. Procedure Unrelated to Principal Diagnosis).

To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25016), we proposed to add these eight ICD–10–PCS procedure codes to MDC 14 in MS–DRG 774. We stated that the proposed changes would eliminate erroneous assignment to MS–DRGs 987 through 989 for these procedures.

We invited public comments on our proposal to add the eight listed codes to MDC 14 under MS–DRG 774, effective October 1, 2016, in the ICD–10 MS–DRGs Version 34.

Comment: Several commenters supported the proposal to add the eight ICD–10–PCS procedure codes listed in the proposed rule to MDC 14 under MS–DRG 774. The commenters also acknowledged CMS' continued efforts for accurate replication.

One commenter who agreed with the proposal to add the eight ICD–10–PCS procedure codes to MDC 14 under MS–DRG 774 also recommended that CMS consider adding the following six ICD–10–PCS procedure codes to MDC 14 in MS–DRG 774:

- 0UQJ0ZZ (Repair clitoris, open approach);
- 0UQJXZZ (Repair clitoris, external approach);
- 0TQDXZZ (Repair urethra, external approach);
- 0KQM0ZZ (Repair perineum muscle, open approach);
- 0KQM3ZZ (Repair perineum muscle, percutaneous approach); and
- 0KQM4ZZ (Repair perineum muscle, percutaneous endoscopic approach).

The commenter acknowledged that, although procedures involving repair of clitoral and urethral lacerations during delivery are rare, they do occur and require intervention. The commenter noted that its organization observed cases grouping to the Unrelated MS–DRG when reporting any one of these six procedure codes.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze the replication issues between the ICD–9 and ICD–10 based MS–DRGs brought to our attention.

With regard to the recommendation that we consider the addition of ICD–10–PCS procedure codes describing repair of the clitoris, urethra, and perineum muscle to MDC 14 in MS–DRG 774, we note that the code describing repair of the urethra (0TQDXZZ) is currently listed under MDC 14 in MS–DRG 774 as displayed under the list titled ''Third Condition,'' as well as in the ICD–10 MS–DRG Version 33 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index. However, the codes describing repair of the perineum muscle and repair of the clitoris with various approaches are not listed in the two above-mentioned locations. The three codes describing repair of the perineum muscle (0KQM0ZZ, 0KQM3ZZ, and 0KQM4ZZ) are currently assigned to the following MDCs and MS–DRGs:

- MDC 1 (Diseases and Disorders of the Nervous System): MS–DRGs 040 through 042 (Peripheral, Cranial Nerve and Other Nervous System Procedures with MCC, with CC or Peripheral Neurostimulator, and without CC/MCC, respectively);
- MDC 8 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue): MS–DRG 500 through 502 (Soft Tissue Procedures with MCC, with CC and without CC/MCC, respectively);
- MDC 9 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast): MS–DRGs 579 through 581 (Other Skin, Subcutaneous Tissue and Breast Procedures with MCC, with CC, and without CC/MCC, respectively);
- MDC 21 (Injuries, Poisonings and Toxic Effects of Drugs): MS–DRGs 907 through 909 (Other O.R. Procedures for Injuries with MCC, with CC, and without CC/MCC, respectively); and
- MDC 24 (Multiple Significant Trauma): MS–DRG 957 through 959 (Other O.R. Procedures for Multiple Significant Trauma with MCC, with CC and without CC/MCC).

The two ICD–10–PCS procedure codes describing repair of the clitoris (0UQJ0ZZ and 0UQJXZZ) are currently assigned to MDC 13 (Diseases and Disorders of the Female Reproductive System) in MS–DRGs 746 and 747 (Vagina, Cervix and Vulva Procedures with CC/MCC and without CC/MCC, respectively).

As the codes describing repair of the perineum muscle and repair of the clitoris are not currently listed in the Definitions Manual under MDC 14 in MS–DRG 774, it is understandable that, depending on what ICD–10–CM

diagnosis code was entered, a case could accurately result in assignment to one of the Unrelated MS–DRGs based on the current GROUPER logic. Because it is unclear what ICD–10–CM diagnosis codes the commenter entered into the ICD–10 MS–DRG GROUPER along with the specified ICD–10–PCS procedure codes describing repair of the clitoris, urethra or perineum, we were not able to fully duplicate the commenter's exact issue with respect to the Unrelated MS–DRG assignment. We ran test cases through the ICD–10 MS–DRG Version 33 GROUPER software which resulted in an Unrelated MS–DRG assignment for repair of the urethra, while repair of the perineum muscle codes resulted in appropriate assignment to MS–DRG 774 (Vaginal Delivery with Complicating Diagnoses) when a listed diagnosis code from that specific MS–DRG (which is defined as a complicating diagnosis) was entered. Thus, it appears that there may be a discrepancy between the code list in the ICD–10 MS–DRG Version 33 Definitions Manual and the GROUPER software for those specific codes describing repair of the urethra and repair of the perineum muscle. However, we agree that the codes describing repair of urethra and repair of perineum muscle could be performed during an episode of care involving a vaginal delivery and merit assignment to MS–DRG 774.

In our review of the commenter's recommendation to add the two codes describing repair of the clitoris (0UQJ0ZZ and 0UQJXZZ), we examined whether or not these procedures could be performed during the course of an admission involving a delivery. Our medical advisors agreed that, clinically, a tear involving the clitoris may occur during a vaginal delivery and, therefore, it is appropriate to add these procedures to MS–DRG 774.

We note that the code lists as currently displayed in the ICD–10 MS–DRG Version 33 Definitions Manual for MS–DRG 774 require further analysis to clarify what constitutes a vaginal delivery to satisfy the ICD–10 MS–DRG logic. For example, the Definitions Manual currently states that three conditions must be met, the first of which is a vaginal delivery. To satisfy this first condition, codes that describe conditions or circumstances from among three lists of codes must be reported. The first list is comprised of ICD–10–CM diagnosis codes that may be reported as a principal or secondary diagnosis. These diagnosis codes describe conditions in which it is assumed that a vaginal delivery has occurred. The second list of codes are a list of ICD–10–PCS procedure codes that also describe circumstances in which it is assumed that a vaginal delivery occurred. The third list of codes identifies diagnoses describing the outcome of the delivery. Therefore, if any code from one of those three lists is reported, the first condition (vaginal delivery) is considered to be met for assignment to MS–DRG 774.

Our concern with the first list of ICD–10–CM diagnosis codes as currently displayed in the Definitions Manual under the first condition is that not all of the conditions necessarily reflect that a *vaginal* delivery occurred. Several of the diagnosis codes listed could also reflect that a cesarean delivery occurred. For example, ICD–10–CM diagnosis code O10.02 (Pre-existing essential hypertension complicating childbirth) does not specify that a vaginal delivery took place; yet it is included in the list of conditions that may be reported as a principal or secondary diagnosis in the GROUPER logic for a vaginal delivery. The reporting of this code could also be appropriate for a delivery that occurred by cesarean section. Therefore, we plan to conduct further analysis of the diagnosis code lists in MS–DRG 774 for FY 2018.

As noted above, the second list of codes for the first condition are comprised of ICD–10–PCS procedure codes. We acknowledge that the current list of procedure codes in MS–DRG 774 appropriately describe that a vaginal delivery occurred. In addition, there are unique procedure codes in ICD–10–PCS that distinguish a vaginal delivery from a cesarean delivery.

After consideration of the public comments we received, we are finalizing our proposal and the commenters' recommendation to add the list of ICD–10–PCS procedure codes in the following table to MS–DRG 774 effective October 1, 2016, for the ICD–10 MS–DRGs Version 34. We also are clarifying that the procedure codes describing repair of perineum muscle currently group to MS–DRG 774 and will continue this assignment for FY 2017.

ICD–10–PCS procedure code	Description
0DQQ0ZZ	Repair anus, open approach.
0DQQ3ZZ	Repair anus, percutaneous approach.
0DQQ4ZZ	Repair anus, percutaneous endoscopic approach.
0DQQ7ZZ	Repair anus, via natural or artificial opening.
0DQQ8ZZ	Repair anus, via natural or artificial opening endoscopic.
0DQR0ZZ	Repair anal sphincter, open approach.
0DQR3ZZ	Repair anal sphincter, percutaneous approach.
0DQR4ZZ	Repair anal sphincter, percutaneous endoscopic approach.
0TQDXZZ	Repair urethra, external approach.
0UQJ0ZZ	Repair clitoris, open approach.
0UQJXZZ	Repair clitoris, external approach.

17. Changes to the ICD–10–CM and ICD–10–PCS Coding Systems

a. ICD–10 Coordination and Maintenance Committee

In September 1985, the ICD–9–CM Coordination and Maintenance Committee was formed. This is a Federal interdepartmental committee, co-chaired by the National Center for Health Statistics (NCHS), the Centers for Disease Control and Prevention, and CMS, charged with maintaining and updating the ICD–9–CM system. The final update to ICD–9–CM codes was to be made on October 1, 2013. Thereafter, the name of the Committee was changed to the ICD–10 Coordination and Maintenance Committee, effective with the March 19–20, 2014 meeting. The ICD–10 Coordination and Maintenance Committee addresses updates to the ICD–10–CM and ICD–10–PCS coding systems. The Committee is jointly responsible for approving coding changes, and developing errata, addenda, and other modifications to the coding systems to reflect newly developed procedures and technologies and newly identified diseases. The Committee is also responsible for promoting the use of Federal and non-Federal educational programs and other

communication techniques with a view toward standardizing coding applications and upgrading the quality of the classification system.

The official list of ICD–9–CM diagnosis and procedure codes by fiscal year can be found on the CMS Web site at: *http://cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/codes.html*. The official list of ICD–10–CM and ICD–10–PCS codes can be found on the CMS Web site at: *http://www.cms.gov/Medicare/Coding/ICD10/index.html*.

The NCHS has lead responsibility for the ICD–10–CM and ICD–9–CM diagnosis codes included in the Tabular List and Alphabetic Index for Diseases, while CMS has lead responsibility for the ICD–10–PCS and ICD–9–CM procedure codes included in the Tabular List and Alphabetic Index for Procedures.

The Committee encourages participation in the previously mentioned process by health-related organizations. In this regard, the Committee holds public meetings for discussion of educational issues and proposed coding changes. These meetings provide an opportunity for representatives of recognized organizations in the coding field, such as the American Health Information Management Association (AHIMA), the American Hospital Association (AHA), and various physician specialty groups, as well as individual physicians, health information management professionals, and other members of the public, to contribute ideas on coding matters. After considering the opinions expressed at the public meetings and in writing, the Committee formulates recommendations, which then must be approved by the agencies.

The Committee presented proposals for coding changes for implementation in FY 2017 at a public meeting held on September 22–23, 2015, and finalized the coding changes after consideration of comments received at the meetings and in writing by November 13, 2015.

The Committee held its 2016 meeting on March 9–10, 2016. It was announced at this meeting that any new ICD–10–CM/PCS codes for which there was consensus of public support and for which complete tabular and indexing changes would be made by May 2016 would be included in the October 1, 2016 update to ICD–10–CM/ICD–10–PCS. As discussed in earlier sections of this preamble, there are new and deleted ICD–10–CM diagnosis codes and ICD–10–PCS procedure codes that are captured in Table 6A.—New Diagnosis Codes, Table 6B.—New Procedure Codes, and Table 6C.—Invalid Diagnosis Codes for the proposed rule and this final rule, which are available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. Because of the length of these tables, they were not published in the Addendum to the proposed rule or this final rule. Rather, they are available via the Internet as discussed in section VI. of the Addendum to the proposed rule and this final rule.

Live Webcast recordings of the discussions of procedure codes at the Committee's September 22–23, 2015 meeting and March 9–10, 2016 meeting can be obtained from the CMS Web site at: *http://cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/index.html?redirect=/icd9ProviderDiagnosticCodes/03_meetings.asp*. The minutes of the discussions of diagnosis codes at the September 23–24, 2015 meeting and March 9–10, 2016 meeting are found at: *http://www.cdc.gov/nchs/icd/icd9cm_maintenance.html*. These Web sites also provide detailed information about the Committee, including information on requesting a new code, attending a Committee meeting, and timeline requirements and meeting dates.

We encourage commenters to address suggestions on coding issues involving diagnosis codes to: Donna Pickett, Co-Chairperson, ICD–10 Coordination and Maintenance Committee, NCHS, Room 2402, 3311 Toledo Road, Hyattsville, MD 20782. Comments may be sent by Email to: *nchc@cdc.gov*.

Questions and comments concerning the procedure codes should be addressed to: Patricia Brooks, Co-Chairperson, ICD–10 Coordination and Maintenance Committee, CMS, Center for Medicare Management, Hospital and Ambulatory Policy Group, Division of Acute Care, C4–08–06, 7500 Security Boulevard, Baltimore, MD 21244–1850. Comments may be sent by Email to: *ICDProcedureCodeRequest@cms.hhs.gov*.

In the September 7, 2001 final rule implementing the IPPS new technology add-on payments (66 FR 46906), we indicated we would attempt to include proposals for procedure codes that would describe new technology discussed and approved at the Spring meeting as part of the code revisions effective the following October.

Section 503(a) of Public Law 108–173 included a requirement for updating diagnosis and procedure codes twice a year instead of a single update on October 1 of each year. This requirement was included as part of the amendments to the Act relating to recognition of new technology under the IPPS. Section 503(a) amended section 1886(d)(5)(K) of the Act by adding a clause (vii) which states that the Secretary shall provide for the addition of new diagnosis and procedure codes on April 1 of each year, but the addition of such codes shall not require the Secretary to adjust the payment (or diagnosis-related group classification) until the fiscal year that begins after such date. This requirement improves the recognition of new technologies under the IPPS system by providing information on these new technologies at an earlier date. Data will be available 6 months earlier than would be possible with updates occurring only once a year on October 1.

While section 1886(d)(5)(K)(vii) of the Act states that the addition of new diagnosis and procedure codes on April 1 of each year shall not require the Secretary to adjust the payment, or DRG classification, under section 1886(d) of the Act until the fiscal year that begins after such date, we have to update the DRG software and other systems in order to recognize and accept the new codes. We also publicize the code changes and the need for a mid-year systems update by providers to identify the new codes. Hospitals also have to obtain the new code books and encoder updates, and make other system changes in order to identify and report the new codes.

The ICD–10 (previously the ICD–9–CM) Coordination and Maintenance Committee holds its meetings in the spring and fall in order to update the codes and the applicable payment and reporting systems by October 1 of each year. Items are placed on the agenda for the Committee meeting if the request is received at least 2 months prior to the meeting. This requirement allows time for staff to review and research the coding issues and prepare material for discussion at the meeting. It also allows time for the topic to be publicized in meeting announcements in the **Federal Register** as well as on the CMS Web site. Final decisions on code title revisions are currently made by March 1 so that these titles can be included in the IPPS proposed rule. A complete addendum describing details of all diagnosis and procedure coding changes, both tabular and index, is published on the CMS and NCHS Web sites in June of each year. Publishers of coding books and software use this information to modify their products that are used by health care providers. This 5-month time period has proved to be necessary for hospitals and other providers to update their systems.

A discussion of this timeline and the need for changes are included in the

December 4–5, 2005 ICD–9–CM Coordination and Maintenance Committee Meeting minutes. The public agreed that there was a need to hold the fall meetings earlier, in September or October, in order to meet the new implementation dates. The public provided comment that additional time would be needed to update hospital systems and obtain new code books and coding software. There was considerable concern expressed about the impact this new April update would have on providers.

In the FY 2005 IPPS final rule, we implemented section 1886(d)(5)(K)(vii) of the Act, as added by section 503(a) of Public Law 108–173, by developing a mechanism for approving, in time for the April update, diagnosis and procedure code revisions needed to describe new technologies and medical services for purposes of the new technology add-on payment process. We also established the following process for making these determinations. Topics considered during the Fall ICD–10 (previously ICD–9–CM) Coordination and Maintenance Committee meeting are considered for an April 1 update if a strong and convincing case is made by the requester at the Committee's public meeting. The request must identify the reason why a new code is needed in April for purposes of the new technology process. The participants at the meeting and those reviewing the Committee meeting summary report are provided the opportunity to comment on this expedited request. All other topics are considered for the October 1 update. Participants at the Committee meeting are encouraged to comment on all such requests. There were no requests approved for an expedited April l, 2016 implementation of a code at the September 22–23, 2015 Committee meeting. Therefore, there were no new codes implemented on April 1, 2016.

ICD–9–CM addendum and code title information is published on the CMS Web site at: *http://www.cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/index.html?redirect=/icd9ProviderDiagnosticCodes/01overview.asp#TopofPage*. ICD–10–CM and ICD–10–PCS addendum and code title information is published on the CMS Web site at: *http://www.cms.gov/Medicare/Coding/ICD10/index.html*. Information on ICD–10–CM diagnosis codes, along with the Official ICD–10–CM Coding Guidelines, can also be found on the CDC Web site at: *http://www.cdc.gov/nchs/icd/icd10.htm*. Information on new, revised, and deleted ICD–10–CM/ICD–10–PCS codes is also provided to the AHA for publication in the *Coding Clinic for ICD–10.* AHA also distributes information to publishers and software vendors.

CMS also sends copies of all ICD–10–CM and ICD–10–PCS coding changes to its Medicare contractors for use in updating their systems and providing education to providers.

The code titles are adopted as part of the ICD–10 (previously ICD–9–CM) Coordination and Maintenance Committee process. Therefore, although we publish the code titles in the IPPS proposed and final rules, they are not subject to comment in the proposed or final rules.

b. Code Freeze

In the January 16, 2009 ICD–10–CM and ICD–10–PCS final rule (74 FR 3340), there was a discussion of the need for a partial or total freeze in the annual updates to both ICD–9–CM and ICD–10–CM and ICD–10–PCS codes. The public comment addressed in that final rule stated that the annual code set updates should cease l year prior to the implementation of ICD–10. The commenters stated that this freeze of code updates would allow for instructional and/or coding software programs to be designed and purchased early, without concern that an upgrade would take place immediately before the compliance date, necessitating additional updates and purchases.

HHS responded to comments in the ICD–10 final rule that the ICD–9–CM Coordination and Maintenance Committee has jurisdiction over any action impacting the ICD–9–CM and ICD–10 code sets. Therefore, HHS indicated that the issue of consideration of a moratorium on updates to the ICD–9–CM, ICD–10–CM, and ICD–10–PCS code sets in anticipation of the adoption of ICD–10–CM and ICD–10–PCS would be addressed through the Committee at a future public meeting.

The code freeze was discussed at multiple meetings of the ICD–9–CM Coordination and Maintenance Committee and public comment was actively solicited. The Committee evaluated all comments from participants attending the Committee meetings as well as written comments that were received. The Committee also considered the delay in implementation of ICD–10 until October 1, 2014. There was an announcement at the September 19, 2012 ICD–9–CM Coordination and Maintenance Committee meeting that a partial freeze of both ICD–9–CM and ICD–10 codes would be implemented as follows:

- The last regular annual update to both ICD–9–CM and ICD–10 code sets was made on October 1, 2011.
- On October 1, 2012 and October 1, 2013, there were only limited code updates to both ICD–9–CM and ICD–10 code sets to capture new technology and new diseases.
- On October 1, 2014, there were to be only limited code updates to ICD–10 code sets to capture new technology and diagnoses as required by section 503(a) of Public Law 108–173. There were to be no updates to ICD–9–CM on October 1, 2014.
- On October 1, 2015, 1 year after the originally scheduled implementation of ICD–10, regular updates to ICD–10 were to begin.

On May 15, 2014, CMS posted an updated Partial Code Freeze schedule on the CMS Web site at: *http://www.cms.gov/Medicare/Coding/ICD10/ICD-9-CM-Coordination-and-Maintenance-Committee-Meetings.html*. This updated schedule provided information on the extension of the partial code freeze until 1 year after the implementation of ICD–10. As stated earlier, on April 1, 2014, the Protecting Access to Medicare Act of 2014 (PAMA) (Pub. L. 113–93) was enacted, which specified that the Secretary may not adopt ICD–10 prior to October 1, 2015. On August 4, 2014, the Department published a final rule with a compliance date to require the use of ICD–10 beginning October 1, 2015. The final rule also required HIPAA-covered entities to continue to use ICD–9–CM through September 30, 2015. Accordingly, the updated schedule for the partial code freeze was as follows:

- The last regular annual updates to both ICD–9–CM and ICD–10 code sets were made on October 1, 2011.
- On October 1, 2012, October 1, 2013, and October 1, 2014, there were only limited code updates to both the ICD–9–CM and ICD–10 code sets to capture new technologies and diseases as required by section 1886(d)(5)(K) of the Act.
- On October 1, 2015, there were only limited code updates to ICD–10 code sets to capture new technologies and diagnoses as required by section 1886(d)(5)(K) of the Act. There were no updates to ICD–9–CM, as it will no longer be used for reporting.
- On October 1, 2016 (1 year after implementation of ICD–10), regular updates to ICD–10 will begin.

The ICD–10 (previously ICD–9–CM) Coordination and Maintenance Committee announced that it would continue to meet twice a year during the freeze. At these meetings, the public was encouraged to comment on whether

or not requests for new diagnosis and procedure codes should be created based on the need to capture new technology and new diseases. Any code requests that do not meet the criteria will be evaluated for implementation within ICD–10 1 year after the implementation of ICD–10, once the partial freeze is ended.

Complete information on the partial code freeze and discussions of the issues at the Committee meetings can be found on the ICD–10 Coordination and Maintenance Committee Web site at: *http://www.cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/meetings.html.* A summary of the September 19, 2012 Committee meeting, along with both written and audio transcripts of this meeting, is posted on the Web site at: *http://www.cms.hhs.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/ICD-9-CM-C-and-M-Meeting-Materials-Items/2012-09-19-MeetingMaterials.html.*

This partial code freeze dramatically decreased the number of codes created each year as shown by the following information.

TOTAL NUMBER OF CODES AND CHANGES IN TOTAL NUMBER OF CODES PER FISCAL YEAR

ICD–9–CM codes			ICD–10–CM and ICD–10–PCS codes		
Fiscal year	No.	Change	Fiscal year	No.	Change
FY 2009 (October 1, 2008):			FY 2009:		
Diagnoses	14,025	348	ICD–10–CM	68,069	+5
Procedures	3,824	56	ICD–10–PCS	72,589	−14,327
FY 2010 (October 1, 2009):			FY 2010:		
Diagnoses	14,315	290	ICD–10–CM	69,099	+1,030
Procedures	3,838	14	ICD–10–PCS	71,957	−632
FY 2011 (October 1, 2010):					
Diagnoses	14,432	117	ICD–10–CM	69,368	+269
Procedures	3,859	21	ICD–10–PCS	72,081	+124
FY 2012 (October 1, 2011):			FY 2012:		
Diagnoses	14,567	135	ICD–10–CM	69,833	+465
Procedures	3,877	18	ICD–10–PCS	71,918	−163
FY 2013 (October 1, 2012)			FY 2013:		
Diagnoses	14,567	0	ICD–10–CM	69,832	−1
Procedures	3,878	1	ICD–10–PCS	71,920	+2
FY 2014 (October 1, 2013):			FY 2014:		
Diagnoses	14,567	0	ICD–10–CM	69,823	−9
Procedures	3,882	4	ICD–10–PCS	71,924	+4
FY 2015 (October 1, 2014):			FY 2015:		
Diagnoses	14,567	0	ICD–10–CM	69,823	0
Procedures	3,882	0	ICD–10–PCS	71,924	0
FY 2016 (October 1, 2015):			FY 2016:		
Diagnoses	14,567	0	ICD–10–CM	69,823	0
Procedures	3,882	0	ICD–10–PCS	71,924	0
FY 2017(October 1, 2016)			FY 2017:		
Diagnoses	14,567	0	ICD–10–CM	71,486	0
Procedures	3,882	0	ICD–10–PCS	75,789	0

As mentioned previously, the public is provided the opportunity to comment on any requests for new diagnosis or procedure codes discussed at the ICD–10 Coordination and Maintenance Committee meeting. The public has supported only a limited number of new codes during the partial code freeze, as can be seen by previously shown data. We have gone from creating several hundred new codes each year to creating only a limited number of new ICD–9–CM and ICD–10 codes.

At the September 22–23, 2015 and March 9–10, 2016 Committee meetings, we discussed any requests we had received for new ICD–10–CM diagnosis codes and ICD–10–PCS procedure codes that were to be implemented on October 1, 2016. We did not discuss ICD–9–CM codes. Because the partial code freeze will end on October 1, 2016, the public no longer had to comment on whether or not new ICD–10–CM and ICD–10–PCS codes should be created based on the partial code freeze criteria. We invited public comments on any code requests discussed at the September 22–23, 2015 and March 9–10, 2016 Committee meetings for implementation as part of the October 1, 2016 update. The deadline for commenting on code proposals discussed at the September 22–23, 2015 Committee meeting was November 13, 2015. The deadline for commenting on code proposals discussed at the March 9–10, 2016 Committee meeting was April 8, 2016.

18. Replaced Devices Offered Without Cost or With a Credit

a. Background

In the FY 2008 IPPS final rule with comment period (72 FR 47246 through 47251), we discussed the topic of Medicare payment for devices that are replaced without cost or where credit for a replaced device is furnished to the hospital. We implemented a policy to reduce a hospital's IPPS payment for certain MS–DRGs where the implantation of a device that has been recalled determined the base MS–DRG assignment. At that time, we specified that we will reduce a hospital's IPPS payment for those MS–DRGs where the hospital received a credit for a replaced device equal to 50 percent or more of the cost of the device.

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51556 through 51557), we clarified this policy to state that the policy applies if the hospital received a credit equal to 50 percent or more of the cost of the replacement device and issued instructions to hospitals accordingly.

b. Changes for FY 2017

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25019), for FY 2017, we proposed not to add any MS–DRGs to the policy for replaced devices offered without cost or with a credit. We proposed to continue to include the

existing MS–DRGs currently subject to the policy as displayed in the table below.

MDC	MS–DRG	MS–DRG Title
Pre-MDC	001	Heart Transplant or Implant of Heart Assist System with MCC
Pre-MDC	002	Heart Transplant or Implant of Heart Assist System without MCC.
1	023	Craniotomy with Major Device Implant/Acute Complex CNS Principal Diagnosis with MCC or Chemo Implant.
1	024	Craniotomy with Major Device Implant/Acute Complex CNS Principal Diagnosis without MCC.
1	025	Craniotomy & Endovascular Intracranial Procedures with MCC.
1	026	Craniotomy & Endovascular Intracranial Procedures with CC.
1	027	Craniotomy & Endovascular Intracranial Procedures without CC/MCC.
1	040	Peripheral/Cranial Nerve & Other Nervous System Procedure with MCC.
1	041	Peripheral/Cranial Nerve & Other Nervous System Procedure with CC or Peripheral Neurostimulator.
1	042	Peripheral/Cranial Nerve & Other Nervous System Procedure without CC/MCC.
3	129	Major Head & Neck Procedures with CC/MCC or Major Device.
3	130	Major Head & Neck Procedures without CC/MCC.
5	215	Other Heart Assist System Implant.
5	216	Cardiac Valve & Other Major Cardiothoracic Procedure with Cardiac Catheter with MCC.
5	217	Cardiac Valve & Other Major Cardiothoracic Procedure with Cardiac Catheter with CC.
5	218	Cardiac Valve & Other Major Cardiothoracic Procedure with Cardiac Catheter without CC/MCC.
5	219	Cardiac Valve & Other Major Cardiothoracic Procedure without Cardiac Catheter with MCC.
5	220	Cardiac Valve & Other Major Cardiothoracic Procedure without Cardiac Catheter with CC.
5	221	Cardiac Valve & Other Major Cardiothoracic Procedure without Cardiac Catheter without CC/MCC.
5	222	Cardiac Defibrillator Implant with Cardiac Catheter with AMI/Heart Failure/Shock with MCC.
5	223	Cardiac Defibrillator Implant with Cardiac Catheter with AMI/Heart Failure/Shock without MCC.
5	224	Cardiac Defibrillator Implant with Cardiac Catheter without AMI/Heart Failure/Shock with MCC.
5	225	Cardiac Defibrillator Implant with Cardiac Catheter without AMI/Heart Failure/Shock without MCC.
5	226	Cardiac Defibrillator Implant without Cardiac Catheter with MCC.
5	227	Cardiac Defibrillator Implant without Cardiac Catheter without MCC.
5	242	Permanent Cardiac Pacemaker Implant with MCC.
5	243	Permanent Cardiac Pacemaker Implant with CC.
5	244	Permanent Cardiac Pacemaker Implant without CC/MCC.
5	245	AICD Generator Procedures.
5	258	Cardiac Pacemaker Device Replacement with MCC.
5	259	Cardiac Pacemaker Device Replacement without MCC.
5	260	Cardiac Pacemaker Revision Except Device Replacement with MCC.
5	261	Cardiac Pacemaker Revision Except Device Replacement with CC.
5	262	Cardiac Pacemaker Revision Except Device Replacement without CC/MCC.
5	266	Endovascular Cardiac Valve Replacement with MCC.
5	267	Endovascular Cardiac Valve Replacement without MCC.
5	268	Aortic and Heart Assist Procedures Except Pulsation Balloon with MCC.
5	269	Aortic and Heart Assist Procedures Except Pulsation Balloon without MCC.
5	270	Other Major Cardiovascular Procedures with MCC.
5	271	Other Major Cardiovascular Procedures with CC.
5	272	Other Major Cardiovascular Procedures without CC/MCC.
8	461	Bilateral or Multiple Major Joint Procedures Of Lower Extremity with MCC.
8	462	Bilateral or Multiple Major Joint Procedures of Lower Extremity without MCC.
8	466	Revision of Hip or Knee Replacement with MCC.
8	467	Revision of Hip or Knee Replacement with CC.
8	468	Revision of Hip or Knee Replacement without CC/MCC.
8	469	Major Joint Replacement or Reattachment of Lower Extremity with MCC.
8	470	Major Joint Replacement or Reattachment of Lower Extremity without MCC.

We solicited public comments on our proposal to continue to include the existing MS–DRGs currently subject to the policy and to not add any additional MS–DRGs to the policy. We indicated that the final list of MS–DRGs subject to the policy for FY 2017 would be listed in this FY 2017 IPPS/LTCH PPS final rule, as well as issued to providers in the form of a Change Request (CR).

We did not receive any public comments opposing our proposal to continue to include the existing MS–DRGs currently subject to the policy and to not add any additional MS–DRGs. Therefore, we are finalizing the list of MS–DRGs in the table included in the proposed rule and above that will be subject to the replaced devices offered without cost or with a credit policy effective October 1, 2016.

19. Other Policy Changes

a. MS–DRG GROUPER Logic

(1) Operations on Products of Conception

In the ICD–9–CM MS–DRGs Version 32, intrauterine operations that may be performed in an attempt to correct a fetal abnormality are identified by ICD–9–CM procedure code 75.36 (Correction of fetal defect). This procedure code is designated as an O.R. procedure and is assigned to MDC 14 (Pregnancy, Childbirth and the Puerperium) in MS–DRG 768 (Vaginal Delivery with O.R. Procedure Except Sterilization and/or Dilation and Curettage).

A replication issue for 208 ICD–10–PCS comparable code translations that describe operations on the products of conception (fetus) to correct fetal defects was identified during an internal review. These 208 procedure codes were inadvertently omitted from the MDC 14 GROUPER logic for ICD–10 MS–DRG 768. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25020), we proposed to add the 208 ICD–10–PCS procedure codes shown in Table 6P.3a. associated with the proposed rule (which is available via the Internet on the CMS Web site at:

http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index) to MDC 14 in MS–DRG 768, effective October 1, 2016, in ICD–10 MS–DRGs Version 34. We invited public comments on our proposal.

Comment: Commenters supported the proposal to add the 208 ICD–10–PCS procedure codes describing operations to correct fetal defects to MDC 14 in MS–DRG 768. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add the 208 ICD–10–PCS procedure codes shown in Table 6P.3a. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*) to MDC 14 in MS–DRG 768 in ICD–10 MS–DRGs Version 34, effective October 1, 2016.

Separate from the replication issue described above, during our internal review, we also concluded that the proposed MS–DRG logic for these intrauterine procedures under ICD–10 may not accurately represent a subset of the 208 ICD–10–PCS procedure codes (listed in Table 6P.3a.). For example, the GROUPER logic for MS–DRG 768 requires that a vaginal delivery occur during the same episode of care in which an intrauterine procedure is performed. However, this scenario may not be clinically consistent with all pregnant patients who undergo fetal surgery. For example, a pregnant patient whose fetus is diagnosed with a congenital diaphragmatic hernia (CDH) may undergo a fetoscopic endoluminal tracheal occlusion (FETO) procedure in which the pregnant patient does not subsequently deliver during the same hospital stay. The goal of this specific fetal surgery is to allow the fetus to remain in utero until its lungs have developed to increase the chance of survival. Therefore, this scenario of a patient who has fetal surgery but does not have a delivery during the same hospital stay is not appropriately captured in the GROUPER logic. We believe that further analysis is warranted regarding a future proposal for a new MS–DRG to better recognize this subset of patients.

In past rulemaking (72 FR 24700 and 24705), we have acknowledged that CMS does not have the expertise or data to maintain the DRGs in clinical areas that have very low volume in the Medicare population, including for conditions associated with and/or occurring in the maternal-fetal patient population. Additional information is needed to fully and accurately evaluate all the possible fetal conditions that may fall under similar scenarios to the one described above before making a specific proposal. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25020), we solicited public comments on two clinical concepts for consideration for a possible future proposal for the FY 2018 ICD–10 MS–DRGs Version 35: (1) The ICD–10–CM diagnosis codes and ICD–10–PCS procedure codes that describe fetal abnormalities for which fetal surgery may be performed in the absence of a delivery during the same hospital stay; and (2) the ICD–10–CM diagnosis codes and ICD–10–PCS procedure codes that describe fetal abnormalities for which fetal surgery may be performed with a subsequent delivery during the same hospital stay. This second concept is the structure of current MS–DRG 768. We indicated that commenters should submit their code recommendations for these concepts to the following email address *MSDRGClassificationChange@cms.hhs.gov* by December 7, 2016. We encouraged public comments as we consider these enhancements for the FY 2018 ICD–10 MS–DRGs Version 35.

(2) Other Heart Revascularization

In the ICD–9–CM MS–DRGs Version 32, revascularization procedures that are performed to restore blood flow to the heart are identified with procedure code 36.39 (Other heart revascularization). This procedure code is designated as an O.R. procedure and is assigned to MDC 5 (Diseases and Disorders of the Circulatory System) in MS–DRGs 228 through 230 (Other Cardiothoracic Procedures with MCC, with CC, and without CC/MCC, respectively).

A replication issue for 16 ICD–10–PCS comparable code translations that describe revascularization procedures was identified after implementation of the ICD–10 MS–DRGs Version 33. These 16 procedure codes were inadvertently omitted from the MDC 5 GROUPER logic for ICD–10 MS–DRGs 228 through 230. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25021), we noted that, as discussed in section II.F.5.d. of the preamble of the proposed rule, we proposed to delete MS–DRG 230 and revise MS–DRG 229. Accordingly, to resolve this replication issue, we proposed to add the 16 ICD–10–PCS procedure codes listed in the table below to MDC 5 in MS–DRG 228 and proposed revised MS–DRG 229.

ICD–10–PCS procedure code	Description
0210344	Bypass coronary artery, one site from coronary vein with drug-eluting intraluminal device, percutaneous approach.
02103D4	Bypass coronary artery, one site from coronary vein with intraluminal device, percutaneous approach.
0210444	Bypass coronary artery, one site from coronary vein with drug-eluting intraluminal device, percutaneous endoscopic approach.
02104D4	Bypass coronary artery, one site from coronary vein with intraluminal device, percutaneous endoscopic approach.
0211344	Bypass coronary artery, two sites from coronary vein with drug-eluting intraluminal device, percutaneous approach.
02113D4	Bypass coronary artery, two sites from coronary vein with intraluminal device, percutaneous approach.
0211444	Bypass coronary artery, two sites from coronary vein with drug-eluting intraluminal device, percutaneous endoscopic approach.
02114D4	Bypass coronary artery, two sites from coronary vein with intraluminal device, percutaneous endoscopic approach.
0212344	Bypass coronary artery, three sites from coronary vein with drug-eluting intraluminal device, percutaneous approach.
02123D4	Bypass coronary artery, three sites from coronary vein with intraluminal device, percutaneous approach.
0212444	Bypass coronary artery, three sites from coronary vein with drug-eluting intraluminal device, percutaneous endoscopic approach.
02124D4	Bypass coronary artery, three sites from coronary vein with intraluminal device, percutaneous endoscopic approach.
0213344	Bypass coronary artery, four or more sites from coronary vein with drug-eluting intraluminal device, percutaneous approach.
02133D4	Bypass coronary artery, four or more sites from coronary vein with intraluminal device, percutaneous approach.
0213444	Bypass coronary artery, four or more sites from coronary vein with drug-eluting intraluminal device, percutaneous endoscopic approach.
02134D4	Bypass coronary artery, four or more sites from coronary vein with intraluminal device, percutaneous endoscopic approach.

We invited public comments on our proposal to add the above listed ICD–10–PCS procedure codes to MDC 5 in MS–DRG 228 and proposed revised MS–DRG 229 (Other Cardiothoracic Procedures with and without MCC, respectively), effective October 1, 2016, in ICD–10 MS–DRGs Version 34.

Comment: Commenters supported the proposal to add the 16 ICD–10–PCS procedure codes describing revascularization procedures to MDC 5 in MS–DRGs 228 and proposed revised MS–DRG 229. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs. We note that, as discussed in section II.F.15.b. of the proposed rule, we made a document consisting of procedure code updates publicly available. This document included the titles to the above list of codes that were revised in response to public comments received during the partial code freeze. The revised code titles reflect the term ''artery'' where the current term ''site'' is displayed and reflect the term ''arteries'' where the current term ''sites'' is displayed in the table above. A complete list of all the revised ICD–10–PCS procedure code titles is shown in Table 6F.—Revised Procedure Code Titles associated with this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*).

After consideration of the public comments we received, we are finalizing our proposal to add the ICD–10–PCS procedure codes in the proposed rule and above in this final rule, with their revised code titles as shown in Table 6F.—Revised Procedure Code Titles, to MDC 5 in MS–DRGs 228 and 229 (Other Cardiothoracic Procedures with and without MCC, respectively) in ICD–10 MS–DRGs Version 34, effective October 1, 2016. We also note that, as discussed in section II.F.5.d. of this final rule, the proposal to collapse MS–DRGs 228, 229, and 230 from three severity levels into two severity levels was finalized.

(3) Procedures on Vascular Bodies: Chemoreceptors

In the ICD–9–CM MS–DRGs Version 32, procedures performed on the sensory receptors are identified with ICD–9–CM procedure code 39.89 (Other operations on carotid body, carotid sinus and other vascular bodies). This procedure code is designated as an O.R. procedure and is assigned to MDC 5 (Diseases and Disorders of the Circulatory System) in MS–DRGs 252, 253, and 254 (Other Vascular Procedures with MCC, with CC, and without CC/MCC, respectively).

A replication issue for 234 ICD–10–PCS comparable code translations that describe these procedures was identified after implementation of the ICD–10 MS–DRGs Version 33. These 234 procedure codes were inadvertently omitted from the MDC 5 GROUPER logic for ICD–10 MS–DRGs 252 through 254. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25021), we proposed to add the 234 ICD–10–PCS procedure codes listed in Table 6P.3b. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*) to MDC 5 in MS–DRGs 252, 253, and 254, effective October 1, 2016, in ICD–10 MS–DRGs Version 34. We invited public comments on our proposal.

Comment: Commenters supported the proposal to add the 234 ICD–10–PCS procedure codes describing procedures performed on the sensory receptors to MDC 5 in MS–DRGs 252, 253, and 254. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add the 234 ICD–10–PCS procedure codes listed in Table 6P.3b. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*) to MDC 5 in MS–DRGs 252, 253, and 254 (Other Vascular Procedures with MCC, with CC, and without CC/MCC, respectively) in ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(4) Repair of the Intestine

In the ICD–9–CM MS–DRGs Version 32, the procedure for a repair to the intestine may be identified with procedure code 46.79 (Other repair of intestine). This procedure code is designated as an O.R. procedure and is assigned to MDC 6 (Diseases and Disorders of the Digestive System) in MS–DRGs 329, 330, and 331 (Major Small and Large Bowel Procedures with MCC, with CC, and without CC/MCC, respectively).

A replication issue for four ICD–10–PCS comparable code translations was identified after implementation of the ICD–10 MS–DRGs Version 33. These four procedure codes are:

- 0DQF0ZZ (Repair right large intestine, open approach);
- 0DQG0ZZ (Repair left large intestine, open approach);
- 0DQL0ZZ (Repair transverse colon, open approach); and
- 0DQM0ZZ (Repair descending colon, open approach).

These four ICD–10–PCS codes were inadvertently omitted from the MDC 6 GROUPER logic for ICD–10 MS–DRGs 329 through 331. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25021), we proposed to add the four ICD–10–PCS procedure codes to MDC 6 in MS–DRGs 329, 330, and 331, effective October 1, 2016, in ICD–10 MS–DRGs Version 34. We invited public comments on our proposal.

Comment: Commenters supported the proposal to add the four ICD–10–PCS procedure codes describing repair of the intestine to MDC 6 in MS–DRGs 329, 330, and 331. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add ICD–10–PCS procedure codes 0DQF0ZZ, 0DQG0ZZ, 0DQL0ZZ, and 0DQM0ZZ listed in the proposed rule and above in this final rule to MDC 6 in MS–DRGs 329, 330, and 331 (Major Small and Large Bowel Procedures with MCC, with CC, and without CC/MCC, respectively) in ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(5) Insertion of Infusion Pump

In the ICD–9–CM MS–DRGs Version 32, the procedure for insertion of an infusion pump is identified with procedure code 86.06 (Insertion of totally implantable infusion pump), which is designated as an O.R. procedure and assigned to a number of MDCs and MS–DRGs across various body systems. We refer readers to the ICD–9–CM MS–DRG Definitions Manual Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index, which is available on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-*

Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Rule-Data-Files.html, for the complete list of MDCs and MS–DRGs to which procedure code 86.06 is assigned.

A replication issue for 16 ICD–10–PCS comparable code translations was identified after implementation of the ICD–10 MS–DRGs Version 33. These 16 procedure codes are listed in the table below:

ICD–10–PCS procedure code	Description
0JHD0VZ	Insertion of infusion pump into right upper arm subcutaneous tissue and fascia, open approach.
0JHD3VZ	Insertion of infusion pump into right upper arm subcutaneous tissue and fascia, percutaneous approach.
0JHF0VZ	Insertion of infusion pump into left upper arm subcutaneous tissue and fascia, open approach.
0JHF3VZ	Insertion of infusion pump into left upper arm subcutaneous tissue and fascia, percutaneous approach.
0JHG0VZ	Insertion of infusion pump into right lower arm subcutaneous tissue and fascia, open approach.
0JHG3VZ	Insertion of infusion pump into right lower arm subcutaneous tissue and fascia, percutaneous approach.
0JHH0VZ	Insertion of infusion pump into left lower arm subcutaneous tissue and fascia, open approach.
0JHH3VZ	Insertion of infusion pump into left lower arm subcutaneous tissue and fascia, percutaneous approach.
0JHL0VZ	Insertion of infusion pump into right upper leg subcutaneous tissue and fascia, open approach.
0JHL3VZ	Insertion of infusion pump into right upper leg subcutaneous tissue and fascia, percutaneous approach.
0JHM0VZ	Insertion of infusion pump into left upper leg subcutaneous tissue and fascia, open approach.
0JHM3VZ	Insertion of infusion pump into left upper leg subcutaneous tissue and fascia, percutaneous approach.
0JHN0VZ	Insertion of infusion pump into right lower leg subcutaneous tissue and fascia, open approach.
0JHN3VZ	Insertion of infusion pump into right lower leg subcutaneous tissue and fascia, percutaneous approach.
0JHP0VZ	Insertion of infusion pump into left lower leg subcutaneous tissue and fascia, open approach.
0JHP3VZ	Insertion of infusion pump into left lower leg subcutaneous tissue and fascia, percutaneous approach.

These codes were inadvertently omitted from the MDCs and MS–DRGs to which they should be assigned (consistent with the assignment of ICD–9–CM procedure code 86.06) to accurately replicate the ICD–9–CM MS–DRG logic. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25021 through 25022), we proposed to add the 16 ICD–10–PCS procedure codes listed in the table above to the corresponding MDCs and MS–DRGs, as set forth in the ICD–9–CM MS–DRG Definitions Manual—Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as described earlier, effective October 1, 2016, in ICD–10 MS–DRGs Version 34. We invited public comments on our proposal.

Comment: Commenters supported the proposal to add the 16 ICD–10–PCS procedure codes describing insertion of an infusion pump listed in the proposed rule to the corresponding MDCs and MS–DRGs for ICD–9–CM code 86.06. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add the 16 ICD–10–PCS procedure codes describing insertion of an infusion pump listed in the proposed rule and above in this final rule to the corresponding MDCs and MS–DRGs for ICD–9–CM code 86.06, as set forth in the ICD–9–CM MS–DRG Definitions Manual—Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index which is available on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Rule-Data-Files.html* in ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(6) Procedures on the Bursa

In the ICD–9–CM MS–DRGs Version 32, procedures that involve cutting into the bursa are identified with procedure code 83.03 (Bursotomy). This procedure code is designated as an O.R. procedure and is assigned to MDC 8 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue) in MS–DRGs 500, 501, and 502 (Soft Tissue Procedures with MCC, with CC, and without CC/MCC, respectively).

A replication issue for six ICD–10–PCS comparable code translations was identified after implementation of the ICD–10 MS–DRGs Version 33. These six procedure codes are:

- 0M850ZZ (Division of right wrist bursa and ligament, open approach);
- 0M853ZZ (Division of right wrist bursa and ligament, percutaneous approach);
- 0M854ZZ (Division of right wrist bursa and ligament, percutaneous endoscopic approach);
- 0M860ZZ (Division of left wrist bursa and ligament, open approach);
- 0M863ZZ (Division of left wrist bursa and ligament, percutaneous approach); and
- 0M864ZZ (Division of left wrist bursa and ligament, percutaneous endoscopic approach).

These codes were inadvertently omitted from the MDC 8 GROUPER logic for ICD–10 MS–DRGs 500, 501, and 502. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25022), we proposed to add the six ICD–10–PCS procedure codes listed above to MDC 8 in MS–DRGs 500, 501, and 502, effective October 1, 2016, in ICD–10 MS–DRGs Version 34. We invited public comments on our proposal.

Comment: Commenters supported the proposal to add the 6 ICD–10–PCS procedure codes describing procedures that involve cutting into the bursa listed in the proposed rule to MDC 8 in MS–DRGs 500, 501, and 502. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add the six ICD–10–PCS procedure codes listed in the proposed rule and above in this final rule to MDC 8 in MS–DRGs 500, 501, and 502 (Soft Tissue Procedures with MCC, with CC, and without CC/MCC, respectively) in ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(7) Procedures on the Breast

In the ICD–9–CM MS–DRGs Version 32, procedures performed for a simple repair to the skin of the breast may be identified with procedure code 86.59 (Closure of skin and subcutaneous tissue of other sites). This procedure

code is designated as a non-O.R. procedure. Therefore, this procedure code does not have an impact on MS–DRG assignment.

A replication issue for two ICD–10–PCS comparable code translations was identified after implementation of the ICD–10 MS–DRGs Version 33. These two procedure codes are: 0HQVXZZ (Repair bilateral breast, external approach) and 0HQYXZZ (Repair supernumerary breast, external approach). These ICD–10–PCS procedures codes were inadvertently assigned to ICD–10 MS–DRGs 981, 982, and 983 (Extensive O.R. Procedure Unrelated to Principal Diagnosis with MCC, with CC, and without CC, respectively) in the ICD–10 MS–DRG GROUPER logic. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25022), we proposed to remove these two ICD–10–PCS procedure codes from MS–DRGs 981, 982, and 983, to designate them as non-O.R. procedures, effective October 1, 2016, in ICD–10 MS–DRGs Version 34. We invited public comments on our proposal.

Comment: Commenters supported the proposal to designate the two ICD–10–PCS codes (0HQVXZZ and 0HQYXZZ) as non-O.R. procedures. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

One commenter expressed concern with the proposal, noting that the proposed change may result in unintended consequences for other procedures because these ICD–10–PCS codes can also be considered comparable translations of ICD–9–CM procedure code 85.89 (Other mammoplasty), which is designated as an O.R. procedure.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs. We also acknowledge the concerns of the commenter who stated that our proposal could result in unintended consequences. We note that a large number of ICD–9–CM procedure codes that have a fourth digit of 9 (XX.X9) and include the term ''other'' as part of the code title are designated as O.R. procedures under the ICD–9–CM MS–DRGs Version 32. The intent of these codes is to capture procedures that are not able to be identified elsewhere in the classification system with another procedure code. These codes are often very vague and generally do not distinguish what approach is used for a specific anatomic site according to the body system in which it was assigned. Therefore, when these ''other'' ICD–9–CM procedure codes went through the process of the ICD–10 MS–DRG conversion, they understandably satisfied almost every available option (root operation, body part, approach, among others) within the structure of the specified ICD–10–PCS section, respective of the body system.

As such, while we recognize that ICD–10–PCS procedure codes 0HQVXZZ (Repair bilateral breast, external approach) and 0HQYXZZ (Repair supernumerary breast, external approach) can be considered comparable translations of ICD–9–CM procedure code 85.89 (Other mammoplasty), which is designated as an O.R. procedure, we note that, under ICD–10–PCS, there also are more appropriate root operations that could logically be reported to identify that a mammoplasty was performed. For example, a mammoplasty may involve breast augmentation to enhance the appearance, size, or contour of the breast, in which case the ICD–10–PCS root operation ''Alteration'' could be reported. In the case where a mammoplasty was performed for breast reduction purposes, the ICD–10–PCS root operation ''Excision'' could be reported. For cases where mammoplasty is performed for breast reconstruction after mastectomy, the ICD–10–PCS root operations ''Supplement'' or ''Replacement'' could be reported. We believe that, from a clinical perspective, a mammoplasty would not necessarily be coded using the root of Repair with an external approach under ICD–10–PCS.

In addition, we note that the ICD–10–PCS procedure codes describing unilateral repair of the breast with an external approach are currently designated as non-O.R. procedures under the ICD–10 MS–DRGs Version 33. Therefore, the proposal to make bilateral repair of the breast with an external approach non-O.R. would be consistent with those codes.

After consideration of the public comments we received, we are finalizing our proposal to designate ICD–10–PCS procedure codes 0HQVXZZ (Repair bilateral breast, external approach) and 0HQYXZZ (Repair supernumerary breast, external approach) as non-O.R. codes in ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(8) Excision of Subcutaneous Tissue and Fascia

In the ICD–9–CM MS–DRGs Version 32, procedures involving excision of the skin and subcutaneous tissue are identified with procedure code 86.3 (Other local excision of lesion or tissue of skin and subcutaneous tissue). This procedure code is designated as a non-O.R. procedure that affects MS–DRG assignment for MS–DRGs 579, 580, and 581 (Other Skin, Subcutaneous Tissue and Breast Procedures with MCC, with CC and without CC/MCC, respectively) in MDC 9 (Diseases and Disorders of the Skin, Subcutaneous Tissue and Breast).

A replication issue for 19 ICD–10–PCS comparable code translations was identified after implementation of the ICD–10 MS–DRGs Version 33. These 19 procedure codes are listed in the table below.

ICD–10–PCS code	Description
0JB03ZZ	Excision of scalp subcutaneous tissue and fascia, percutaneous approach.
0JB43ZZ	Excision of anterior neck subcutaneous tissue and fascia, percutaneous approach.
0JB53ZZ	Excision of posterior neck subcutaneous tissue and fascia, percutaneous approach.
0JB63ZZ	Excision of chest subcutaneous tissue and fascia, percutaneous approach.
0JB73ZZ	Excision of back subcutaneous tissue and fascia, percutaneous approach.
0JB83ZZ	Excision of abdomen subcutaneous tissue and fascia, percutaneous approach.
0JB93ZZ	Excision of buttock subcutaneous tissue and fascia, percutaneous approach.
0JBB3ZZ	Excision of perineum subcutaneous tissue and fascia, percutaneous approach.
0JBC3ZZ	Excision of pelvic region subcutaneous tissue and fascia, percutaneous approach.
0JBD3ZZ	Excision of right upper arm subcutaneous tissue and fascia, percutaneous approach.
0JBF3ZZ	Excision of left upper arm subcutaneous tissue and fascia, percutaneous approach.
0JBG3ZZ	Excision of right lower arm subcutaneous tissue and fascia, percutaneous approach.
0JBH3ZZ	Excision of left lower arm subcutaneous tissue and fascia, percutaneous approach.
0JBL3ZZ	Excision of right upper leg subcutaneous tissue and fascia, percutaneous approach.
0JBM3ZZ	Excision of left upper leg subcutaneous tissue and fascia, percutaneous approach.

ICD–10–PCS code	Description
0JBN3ZZ	Excision of right lower leg subcutaneous tissue and fascia, percutaneous approach.
0JBP3ZZ	Excision of left lower leg subcutaneous tissue and fascia, percutaneous approach.
0JBQ3ZZ	Excision of right foot subcutaneous tissue and fascia, percutaneous approach.
0JBR3ZZ	Excision of left foot subcutaneous tissue and fascia, percutaneous approach.

These codes were inadvertently omitted from the ICD–10 MS–DRG GROUPER logic for MDC 9 in MS–DRGs 579, 580, and 581. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25022 through 25023), we proposed to add the 19 ICD–10–PCS procedure codes listed in the table above to MDC 9 in MS–DRGs 579, 580, and 581, effective October 1, 2016, in ICD–10 MS–DRGs Version 34. We invited public comments on our proposal.

Comment: Commenters supported the proposal to add the 19 ICD–10–PCS procedure codes describing procedures that involve cutting the subcutaneous tissue and fascia listed in the table in the proposed rule to MDC 9 in MS–DRGs 579, 580, and 581. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add the 19 ICD–10–PCS procedure codes listed in the table in the proposed rule and above in this final rule to MDC 9 in MS–DRGs 579, 580, and 581 (Other Skin, Subcutaneous Tissue and Breast Procedures with MCC, with CC and without CC/MCC, respectively) in ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(9) Shoulder Replacement

In the ICD–9–CM MS–DRGs Version 32, procedures that involve replacing a component of bone from the upper arm are identified with procedure code 78.42 (Other repair or plastic operations on bone, humerus). This procedure code is designated as an O.R. procedure and is assigned to MDC 8 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue) in MS–DRGs 492, 493, and 494 (Lower Extremity and Humerus Procedures Except Hip, Foot and Femur with MCC, with CC, and without CC/MCC, respectively).

A replication issue for two ICD–10–PCS comparable code translations was identified after implementation of the ICD–10 MS–DRGs Version 33. These two procedure codes are: 0PRC0JZ (Replacement of right humeral head with synthetic substitute, open approach) and 0PRD0JZ (Replacement of left humeral head with synthetic substitute, open approach). These two codes were inadvertently omitted from the ICD–10 MS–DRG GROUPER logic for MDC 8 in MS–DRGs 492, 493, and 494. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25023), we proposed to add these two ICD–10–PCS procedure codes to MDC 8 in MS–DRGs 492, 493, and 494, effective October 1, 2016, in ICD–10 MS–DRGs Version 34. We invited public comments on our proposal.

Comment: Commenters supported the proposal to add the two ICD–10–PCS procedure codes describing procedures that involve shoulder replacement listed in the proposed rule to MDC 8 in MS–DRGs 492, 493, and 494. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add ICD–10–PCS codes 0PRC0JZ (Replacement of right humeral head with synthetic substitute, open approach) and 0PRD0JZ (Replacement of left humeral head with synthetic substitute, open approach) to MDC 8 in MS–DRGs 492, 493, and 494 (Lower Extremity and Humerus Procedures Except Hip, Foot and Femur with MCC, with CC, and without CC/MCC, respectively) in ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(10) Reposition

In the ICD–9–CM MS–DRGs Version 32, procedures that involve the percutaneous repositioning of an area in the vertebra are identified with procedure code 81.66 (Percutaneous vertebral augmentation). This procedure code is designated as an O.R. procedure and is assigned to MDC 8 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue) in MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue Procedures with MCC, with CC, and without CC/MCC, respectively).

A replication issue for four ICD–10–PCS comparable code translations was identified after implementation of the ICD–10 MS–DRGs Version 33. These four procedure codes are:

- 0PS33ZZ (Reposition cervical vertebra, percutaneous approach);
- 0PS43ZZ (Reposition thoracic vertebra, percutaneous approach);
- 0QS03ZZ (Reposition lumbar vertebra, percutaneous approach); and
- 0QS13ZZ (Reposition sacrum, percutaneous approach).

These four ICD–10 PCS procedure codes were inadvertently omitted from the ICD–10 MS–DRG GROUPER logic for MDC 8 and MS–DRGs 515, 516, and 517. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25023), we proposed to add these four ICD–10–PCS procedure codes to MDC 8 in MS–DRGs 515, 516, and 517, effective October 1, 2016, in ICD–10 MS–DRGs Version 34. We invited public comments on our proposal.

Comment: Commenters supported the proposal to add the four ICD–10–PCS procedure codes describing repositioning of vertebra listed in the proposed rule to MDC 8 in MS–DRGs 515, 516, and 517. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add ICD–10–PCS codes 0PS33ZZ (Reposition cervical vertebra, percutaneous approach); 0PS43ZZ (Reposition thoracic vertebra, percutaneous approach), 0QS03ZZ (Reposition lumbar vertebra, percutaneous approach), and 0QS13ZZ (Reposition sacrum, percutaneous approach) to MDC 8 in MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue Procedures with MCC, with CC, and without CC/MCC, respectively) in ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(11) Insertion of Infusion Device

In the ICD–9–CM MS–DRGs Version 32, the procedure for insertion of an infusion pump is identified with procedure code 86.06 (Insertion of totally implantable infusion pump) which is designated as an O.R. procedure and assigned to a number of MDCs and MS–DRGs, one of which is MDC 8 (Diseases and Disorders of the Musculoskeletal System and Connective Tissue) in MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue O.R. Procedures with MCC, with CC, and without CC/MCC, respectively).

A replication issue for 49 ICD–10–PCS comparable code translations that describe insertion of an infusion device into a joint or disc was identified after implementation of the ICD–10 MS–DRGs Version 33. These 49 procedure codes appear to describe procedures that utilize a specific type of infusion device known as an infusion pump and were inadvertently omitted from the ICD–10 MS–DRG GROUPER logic for MDC 8. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25023), we proposed to add the 49 ICD–10–PCS procedure codes shown in Table 6P.3c. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*) to MDC 8 in MS–DRGs 515, 516, and 517, effective October 1, 2016, in ICD–10 MS–DRGs Version 34. We invited public comments on our proposal.

Comment: Several commenters supported the proposal to add the 49 ICD–10–PCS procedure codes describing open insertion of an infusion device into a joint or disc to MDC 8 in MS–DRGs 515, 516, and 517. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

One commenter reported that standard surgical practice does not support procedures involving infusion devices (as well as removal of tracheostomy and occlusion of esophageal vein which are discussed in sections II.F.19.c.1.c. and section II.F.19.c.1.j. of the preamble of this final rule) being performed outside of an operating room setting. This commenter asserted that because these types of procedures are complex, necessitate a sterile environment and general anesthesia support, physicians would rarely perform them in a setting other than the operating room.

However, other commenters did not agree that procedures describing the insertion of an infusion device into a joint or disc should be classified the same as ICD–9–CM code 86.06 (Insertion of totally implantable infusion pump). One commenter noted that the 49 ICD–10–PCS procedure codes describe an *infusion device* which the ICD–10–PCS classification categorizes as an *infusion catheter,* and there are separate ICD–10–PCS device values that specifically describe an *infusion device, pump.* This commenter disagreed with the proposal to assign the 49 ICD–10–PCS procedure codes into MS–DRGs 515, 516, and 517, stating that an infusion pump cannot be inserted into a joint, while a catheter can. The commenter noted that, similar to our discussion in section II.F.19.c.1.k. of the preamble of the proposed rule, these ICD–10–PCS procedures codes reasonably correlate to the insertion of a common infusion catheter versus the insertion of a totally implantable infusion pump.

Another commenter expressed concern with the potential coding and payment impacts as a result of the proposal and noted that while an infusion catheter and an infusion pump may be inserted together, they are separate devices with different levels of resource utilization. The commenter stated that implantable infusion pumps are resource-intensive for hospitals and designated appropriately as O.R. procedures in contrast to infusion catheters.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs. It is not clear if the commenter who stated that standard surgical practice does not support procedures involving infusion devices being performed outside of an operating room was referring to procedures involving an infusion pump versus procedures involving an infusion device as classified under ICD–10–PCS. We note that, as stated above, under ICD–9–CM, procedure code 86.06 describes the insertion of a totally implantable infusion pump. Under ICD–10–PCS, the term ''implantable'' is not utilized with the infusion device, pump, or infusion codes.

In response to the commenters who disagreed with our proposal, we acknowledge that the ICD–10–PCS classification categorizes the device values for an *infusion device* (catheter) separately from the device values that describe an *infusion device, pump.* In addition, our clinical advisors support the commenters' observation that an infusion device, pump is not inserted into a joint space, but rather the infusion device, catheter would be inserted into the joint space.

It is understandable that the term ''infusion device'' can be interpreted in different ways because the type of infusion device used is sometimes dependent on whether the prescribed treatment will be administered intermittently (for example, for chemotherapy) or continuously (for example, insulin therapy) and the mechanism used to pump in the drug may vary (for example, battery, electricity, or pressure). Taking these characteristics into account, an ''infusion device'' could be literally implanted in the body or parts of the device could be found outside of the body. For example, a subcutaneously implanted reservoir may function as an infusion device when it is accessed via a needle attached to another catheter that transports the intended drug to the reservoir. Transport of the drug is via an external mechanical pump. In comparison to the aforementioned example of a subcutaneous reservoir with catheter as an ''infusion device'' are the elastomeric pumps which rely on the pressure generated by the elastic constriction created when the pump is filled with the drug to be administered. Elastomeric pumps do not rely upon any electronics or additional sources of energy to maintain the flow rate. Elastomeric pumps are typically single-use and disposable. In view of the different types of pumps used for short-term and long-term treatment purposes and the different interpretations of the infusion device codes, we will continue to analyze if further revisions to these codes are needed in ICD–10–PCS to ensure accurate assignment under the ICD–10 MS–DRGs. We also will continue to work with the AHA through the Coding Clinic for ICD–10–CM and ICD–10–PCS to promote proper coding.

After consideration of the public comments we received, we are not finalizing our proposal to assign the 49 ICD–10–PCS procedure codes describing insertion of an infusion device to MDC 8 in MS–DRGs 515, 516, and 517 (Other Musculoskeletal System and Connective Tissue O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) for FY 2017. Consistent with the discussion in section II.F.19.c.(1)(k) of the preamble of the proposed rule and the same section of this final rule, the 49 ICD–10–PCS procedure codes shown in Table 6P.3c. associated with the proposed rule and updated for this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/*

Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index) will take the attributes of ICD–9–CM procedure code 99.99 (Other miscellaneous procedures), a non-O.R. procedure in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(12) Bladder Neck Repair

In the ICD–9–CM MS–DRGs Version 32, a procedure involving a bladder repair is identified with procedure code 57.89 (Other repair of bladder) which is designated as an O.R. procedure and assigned to MDC 11 (Diseases and Disorders of the Kidney and Urinary Tract) in MS–DRGs 653, 654, and 655 (Major Bladder Procedures with MCC, with CC, and without CC/MCC, respectively) and MDC 13 (Diseases and Disorders of the Female Reproductive System) in MS–DRGs 749 and 750 (Other Female Reproductive System O.R. Procedures with CC/MCC and without CC/MCC, respectively).

A replication issue for five ICD–10–PCS comparable code translations that describe a bladder neck repair was identified after implementation of the ICD–10 MS–DRGs Version 33. These five procedure codes are:

- 0TQC0ZZ (Repair Bladder Neck, Open Approach);
- 0TQC3ZZ (Repair Bladder Neck, Percutaneous Approach);
- 0TQC4ZZ (Repair Bladder Neck, Percutaneous Endoscopic Approach);
- 0TQC7ZZ (Repair Bladder Neck, Via Natural or Artificial Opening); and
- 0TQC8ZZ (Repair Bladder Neck, Via Natural or Artificial Opening Endoscopic).

These five ICD–10–PCS procedure codes were inadvertently omitted from the ICD–10 MS–DRG GROUPER logic for MDC 11 in MS–DRGs 653, 654, and 655 and MDC 13 in MS–DRGs 749 and 750. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25023 through 25024), we proposed to add these five ICD–10–PCS procedure codes to MDC 11 in MS–DRGs 653, 654, and 655 (Major Bladder Procedures with MCC, with CC, and without CC/MCC, respectively) and MDC 13 in MS–DRGs 749 and 750 (Other Female Reproductive System O.R. Procedures with CC/MCC and without CC/MCC, respectively) in ICD–10 MS–DRGs Version 34, effective October 1, 2016. We invited public comments on our proposal.

Comment: Commenters supported the proposal to add the five ICD–10–PCS procedure codes describing bladder neck repair listed in the proposed rule to MDC 11 in MS–DRGs 653, 654 and 655 and to MDC 13 in MS–DRGs 749 and 750. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add the ICD–10–PCS procedure codes 0TQC0ZZ (Repair Bladder Neck, Open Approach), 0TQC3ZZ (Repair Bladder Neck, Percutaneous Approach), 0TQC4ZZ (Repair Bladder Neck, Percutaneous Endoscopic Approach), 0TQC7ZZ (Repair Bladder Neck, Via Natural or Artificial Opening), and 0TQC8ZZ (Repair Bladder Neck, Via Natural or Artificial Opening Endoscopic) to MDC 11 in MS–DRGs 653, 654, and 655 (Major Bladder Procedures with MCC, with CC, and without CC/MCC, respectively) and MDC 13 in MS–DRGs 749 and 750 (Other Female Reproductive System O.R. Procedures with CC/MCC and without CC/MCC, respectively) in ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(13) Future Consideration

We note that commenters have suggested that there are a number of procedure codes that may not appear to be clinically feasible due to a specific approach or device value in relation to a unique body part in a given body system. These commenters have not identified a comprehensive list of codes to be deleted. However, they have suggested that CMS examine these codes further. Due to the multiaxial structure of ICD–10–PCS, the current system allows for multiple possibilities for a given procedure, some of which may not currently be used. As our focus to refine the ICD–10 MS–DRGs continues, for FY 2018, we will begin to conduct an analysis of where such ICD–10–PCS codes may exist. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25024), we welcomed suggestions from the public of code refinements that could address the issue of current ICD–10–PCS codes that capture procedures that would not reasonably be performed. We indicated that commenters should submit their recommendations for these code refinements to the following email address: *MSDRGClassificationChanges@cms.hhs.gov* by December 7, 2016.

We also noted in the proposed rule that any suggestions that are received by December 7, 2016 to update ICD–10–PCS, including creating new codes or deleting existing codes, will be addressed by the ICD–10 Coordination and Maintenance Committee. Proposals to address the modification of any ICD–10–PCS codes are discussed at the ICD–10 Coordination and Maintenance Committee meetings held in March and September of each year. We refer the reader to section II.F.17. of the preamble of the proposed rule and this final rule for information related to this process to request updates to ICD–10–PCS.

b. Issues Relating to MS–DRG 999 (Ungroupable)

Under the ICD–9–CM MS–DRGs Version 32, a diagnosis of complications of an obstetric surgical wound after delivery is identified with diagnosis code 674.32 (Other complications of obstetrical surgical wounds, delivered, with mention of postpartum complication) and is assigned to MDC 14 (Pregnancy, Childbirth and the Puerperium) under MS–DRG 769 (Postpartum and Post Abortion Diagnoses with O.R. Procedure) or MS–DRG 776 (Postpartum and Post Abortion Diagnoses without O.R. Procedure). A replication issue under the ICD–10 MS–DRGs Version 33 for this condition was identified after implementation on October 1, 2015. Under ICD–10–CM, diagnosis code O90.2 (Hematoma of obstetric wound) is the comparable translation for ICD–9–CM diagnosis code 674.32. We discovered that cases where a patient has been readmitted to the hospital after a delivery and ICD–10–CM diagnosis code O90.2 is reported as the principal diagnosis are resulting in assignment to MS–DRG 999 (Ungroupable).

In the ICD–9–CM diagnosis code description, the concept of ''delivery'' is included in the code title. This concept is not present in the ICD–10–CM classification and has led to a replication issue for patients who delivered during a previous stay and are subsequently readmitted for the complication. To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25024), we proposed to add ICD–10–CM diagnosis code O90.2 to MDC 14 under MS–DRGs 769 and 776. This refinement would be consistent with the ICD–9–CM diagnosis code assignment and result in a more accurate replication of the ICD–9–CM MS–DRGs Version 32.

We invited public comments on our proposal to add ICD–10–CM diagnosis code O90.2 to MS–DRG 769 and MS–DRG 776 in MDC 14, effective October 1, 2016, in the ICD–10 MS–DRGs Version 34.

Comment: Commenters supported the proposal to add ICD–10–CM diagnosis code O90.2 (Hematoma of obstetric wound) to MDC 14 in MS–DRGs 769 and 776. The commenters also

expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to add ICD–10–CM diagnosis code O90.2 (Hematoma of obstetric wound) to MDC 14 in MS–DRG 769 (Postpartum and Post Abortion Diagnoses with O.R. Procedure) or MS–DRG 776 (Postpartum and Post Abortion Diagnoses without O.R. Procedure) in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

c. Other Operating Room (O.R.) and Non-O.R. Issues

(1) O.R. Procedures to Non-O.R. Procedures

For the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25024 through 25026), we continued our efforts to address the MS–DRG replication issues between ICD–9–CM logic and ICD–10 that were brought to our attention. As a result of analyzing those specific requests, we identified areas in the ICD–10–PCS classification where additional refinements could further support our replication efforts. We discuss these below.

We evaluated specific groups of ICD–10–PCS procedure codes with respect to their current operating room (O.R.) designation that were determined to be inconsistent with the ICD–9–CM procedure codes from which the designation was initially derived. Our review demonstrated that these ICD–10–PCS procedure codes should instead have the attributes of a more logical ICD–9–CM procedure code translation for MS–DRG replication purposes. As specified below, we proposed to change the status of ICD–10–PCS procedure codes from being designated as O.R. to non-O.R. for the ICD–10 MS–DRGs Version 34. For each group summarized below, the detailed code lists are shown in Tables 6P.4a. through 6P.4k. (ICD–10–CM and ICD–10–PCS Codes for Proposed MCE and MS–DRG Changes—FY 2017) associated with the proposed rule, which are available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html.*

(a) Endoscopic/Transorifice Insertion

We found 72 ICD–10–PCS procedure codes describing an endoscopic/transorifice (via natural or artificial opening) insertion of infusion and monitoring devices into various tubular body parts that, when coded under ICD–9–CM, would reasonably correlate to other noninvasive catheterization and monitoring types of procedure codes versus an ''incision of [body part]'' or ''other operation on a [body part]'' procedure code. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25024 through 25025), we proposed that the 72 ICD–10–PCS procedure codes in Table 6P.4a. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) be assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C would replace the ICD–9–CM procedure codes and descriptions reflected in column D, which are considered less accurate correlations. We invited public comments on this proposal.

Comment: Commenters supported the proposal to change the designation of 72 ICD–10–PCS procedure codes describing an endoscopic/transorifice (via natural or artificial opening) insertion of infusion and monitoring devices into various tubular body parts. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

Comment: One commenter who agreed with our proposal also recommended that CMS remove the following two ICD–10–PCS procedure codes from the O.R. procedure list: 0DH67UZ (Insertion of Feeding Device into Stomach, Via Natural or Artificial Opening); and 0DH68UZ (Insertion of Feeding Device into Stomach, Via Natural or Artificial Opening Endoscopic). According to the commenter, these two ICD–10–PCS procedure codes are comparable translations of ICD–9–CM procedure code 96.6 (Enteral infusion of concentrated nutritional substances), which is designated as a non-O.R. procedure.

Response: We thank the commenter for their support of our proposal. With respect to the commenter's recommendation that we change the designation of the two ICD–10–PCS procedure codes (0DH67UZ and 0DH68UZ), we note that these procedure codes are currently designated as non-O.R. procedures in the ICD–10 MS–DRGs Version 33 Definitions Manual. Therefore, no change is needed. These procedure codes will remain non-O.R. procedures in ICD–10 Version 34.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the 72 ICD–10–PCS procedure codes in Table 6P.4a. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These 72 ICD–10–PCS procedure codes will be assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(b) Endoscopic/Transorifice Removal

We found 155 ICD–10–PCS procedure codes describing an endoscopic/transorifice (via natural or artificial opening) removal of common devices such as a drainage device, infusion device, intraluminal device, or monitoring device from various tubular body parts that, when coded under ICD–9–CM, would reasonably correlate to other nonoperative removal of a wide range of devices/appliances procedure codes versus an ''incision of [body part]'' or ''other operation on a [body part]'' procedure code. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25025), we proposed that the 155 ICD–10–PCS procedure codes in Table 6P.4b. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) be assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C would replace the ICD–9–CM procedure codes and descriptions reflected in column D, which are considered less accurate correlations. We invited public comments on this proposal.

Comment: Commenters supported the proposal to change the designation of 155 ICD–10–PCS procedure codes describing the endoscopic/transorifice (via natural or artificial opening) removal of common devices such as a drainage device, infusion device, intraluminal device, or monitoring device from various tubular body parts. The commenters also expressed

appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the 155 ICD–10–PCS procedure codes in Table 6P.4b. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These 155 ICD–10–PCS procedure codes will be assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(c) Tracheostomy Device Removal

We found five ICD–10–PCS procedure codes describing removal of a tracheostomy device with various approaches such that, when coded under ICD–9–CM, would reasonably correlate to the nonoperative removal of a tracheostomy device procedure code versus an ''incision of [body part]'' or ''other operation on a [body part]'' procedure code. We acknowledge that, under ICD–10–PCS, an ''open'' approach is defined as ''cutting through.'' However, this procedure was designated as non-O.R. under ICD–9–CM. For replication purposes, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25025), we proposed that the five ICD–10–PCS procedure codes in Table 6P.4c. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) be assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C would replace the ICD–9–CM procedure codes and descriptions reflected in column D, which are considered less accurate correlations. We invited public comments on this proposal.

Comment: Several commenters supported the proposal to change the designation of five ICD–10–PCS procedure codes describing the removal of a tracheostomy device with various approaches. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

Comment: One commenter stated that standard surgical practice does not support procedures involving removal of tracheostomy being performed outside of an operating room setting. This commenter also stated that these procedure codes were considered valid O.R. procedures under ICD–9–CM.

Response: We disagree with the commenter's statements. We note that removal of a tracheostomy frequently occurs at the bedside and is performed by nonoperative, manual removal of the tracheostomy tube. As discussed in the FY 2017 IPPS/LTCH PPS proposed rule and above in this final rule, under ICD–9–CM, removal of tracheostomy was designated as a non-O.R. procedure.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the five ICD–10–PCS procedure codes in Table 6P.4c. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These five ICD–10–PCS procedure codes are assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(d) Endoscopic/Percutaneous Insertion

We found 117 ICD–10–PCS procedure codes describing the endoscopic/percutaneous insertion of infusion and monitoring devices into vascular and musculoskeletal body parts that, when coded under ICD–9–CM, would reasonably correlate to other noninvasive catheterization and monitoring types of procedure codes versus an ''incision of [body part]'' or ''other operation on a [body part]'' procedure code. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25025), we proposed that the 117 ICD–10–PCS procedure codes in Table 6P.4d. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) be assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C would replace the ICD–9–CM procedure codes and descriptions reflected in column D, which are less accurate correlations. We invited public comments on this proposal.

Comment: Commenters supported the proposal to change the designation of 117 ICD–10–PCS procedure codes describing the endoscopic/percutaneous insertion of infusion and monitoring devices into vascular and musculoskeletal body parts. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the 117 ICD–10–PCS procedure codes in Table 6P.4d. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These 117 ICD–10–PCS procedure codes are assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(e) Percutaneous Removal

We found 124 ICD–10–PCS procedure codes describing the percutaneous removal of drainage, infusion and monitoring devices from vascular and musculoskeletal body parts that, when coded under ICD–9–CM, would reasonably correlate to the nonoperative removal of a wide range of devices/appliances procedure codes versus an ''incision of [body part]'' or ''other operation on a [body part]'' procedure code. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25025), we proposed that the 124 ICD–10–PCS procedure codes in Table 6P.4e. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) be assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and

descriptions in column C would replace the ICD–9–CM procedure codes and descriptions reflected in column D, which are considered less accurate correlations. We invited public comments on this proposal.

Comment: Commenters supported the proposal to change the designation of 124 ICD–10–PCS procedure codes describing the percutaneous removal of drainage, infusion and monitoring devices from vascular and musculoskeletal body parts. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the 124 ICD–10–PCS procedure codes in Table 6P.4e. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These 124 ICD–10–PCS procedure codes are assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(f) Percutaneous Drainage

We found 518 ICD–10–PCS procedure codes describing the percutaneous therapeutic drainage of all body sites that do not have specific percutaneous drainage codes. The list includes procedure codes for drainage with or without placement of a drainage device. Exceptions to this are cranial, intracranial and the eye where small incisions are the norm and appropriately classified as O.R. These 518 ICD–10–PCS procedures codes, when coded under ICD–9–CM, would reasonably correlate to the nonoperative puncture or drainage of various body sites and other miscellaneous procedures versus an ''incision of [body part]'' procedure code. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25025), we proposed that the 518 ICD–10–PCS procedure codes in Table 6P.4f. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) be assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C would replace the ICD–9–CM procedure codes and descriptions reflected in column D, which are considered less accurate correlations. We invited public comments on this proposal.

Comment: Several commenters supported the proposal to change the designation of 518 ICD–10–PCS procedure codes describing the percutaneous therapeutic drainage of various body sites with or without placement of a drainage device. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

Comment: Other commenters who agreed with our proposal also recommended that CMS change the designation of ICD–10–PCS procedure code 0W9G3ZX (Drainage of Peritoneal Cavity, Percutaneous Approach, Diagnostic) from O.R. to non-O.R. The commenters noted that the nondiagnostic version of the same code (7th character Z) is designated non-O.R. and suggested that ICD–9–CM procedure code 54.91(Percutaneous abdominal drainage) is a more accurate translation for the diagnostic version of the ICD–10–PCS procedure code.

Response: We thank the commenters for their support of our proposal. With respect to the commenters' recommendation that we change the designation of ICD–10–PCS procedure code 0W9G3ZX from O.R. to non-O.R., we note that the comparable translation under ICD–9–CM for replication purposes was procedure code 54.29 (Other diagnostic procedures on abdominal region), which is designated as an O.R. code. However, we agree with the commenters that diagnostic drainage of the peritoneal cavity is more accurately replicated with ICD–9–CM procedure code 54.91 (Percutaneous abdominal drainage) for reporting diagnostic paracentesis procedures and it is designated as a non-O.R. procedure. Therefore, we agree that the designation of ICD–10–PCS procedure code 0W9G3ZX (Drainage of peritoneal cavity, percutaneous approach, diagnostic) should also be changed from O.R. to non-O.R.

Comment: Another commenter who agreed with the proposal also recommended that CMS change the designation of all the diagnostic versions of the ICD–10–PCS procedures codes in Table 6P.4f. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html).*

Response: We acknowledge the commenter's support of our proposal. We note that, due to the volume of 518 ICD–10–PCS procedure codes listed in Table 6P.4f. and the timeframe that we have available to evaluate and assess the impact of additional recommendations submitted in response to proposals, we were not able to analyze all diagnostic versions for the full list of codes for FY 2017. We will review the list as part of our annual update process for FY 2018.

After consideration of the public comments we received, we are finalizing the recommendation to change the designation of ICD–10–PCS procedure code 0W9G3ZX (Drainage of Peritoneal Cavity, Percutaneous Approach, Diagnostic) from O.R. to non-O.R. We also are finalizing our proposal to change the designation of the 518 ICD–10–PCS procedure codes in Table 6P.4f. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These 518 ICD–10–PCS procedure codes are assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(g) Percutaneous Inspection

We found 131 ICD–10–PCS procedure codes describing the percutaneous inspection of body part sites, with the exception of the cranial cavity and brain, whose designation is not consistent with other percutaneous inspection codes. When coded under ICD–9–CM, these procedure codes would reasonably correlate to the ''other nonoperative examinations'' and ''other diagnostic procedures on [body part]'' codes where the approach is not specified and the codes are designated as non-O.R. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25025), we proposed that the 131 ICD–10–PCS procedure codes in Table 6P.4g. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) be

assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C would replace the ICD–9–CM procedure codes and descriptions reflected in column D, which are considered less accurate correlations. We invited public comments on this proposal.

Comment: Commenters supported the proposal to change the designation of 131 ICD–10–PCS procedure codes describing the percutaneous inspection of various body sites. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the 131 ICD–10–PCS procedure codes in Table 6P.4g. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These 131 ICD–10–PCS procedure codes are assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(h) Inspection Without Incision

We found 40 ICD–10–PCS procedure codes describing the inspection of various body sites with endoscopic/transorifice and external approaches. Under ICD–9–CM, these codes would reasonably correlate to ''other diagnostic procedures on [body part]'' codes where the approach is not specified and the codes are designated as non-O.R. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25026), we proposed that the 40 ICD–10–PCS codes in Table 6P.4h. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) be assigned the attributes of the ICD–9–CM code specified in column C. The ICD–9–CM codes and descriptions in column C would replace the ICD–9–CM codes and descriptions reflected in column D, which are considered less accurate correlations. We invited public comments on this proposal.

Comment: Commenters supported the proposal to change the designation of 40 ICD–10–PCS procedure codes describing the inspection of various body sites with endoscopic/transorifice and external approaches. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the 40 ICD–10–PCS procedure codes in Table 6P.4h. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These 40 ICD–10–PCS procedure codes are assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(i) Dilation of Stomach

We found six ICD–10–PCS procedure codes describing the dilation of stomach and pylorus body sites with various approaches whose designation is not consistent with all other gastrointestinal body parts dilation codes. Under ICD–9–CM, where a unique dilation code exists, the approach is not specified and these codes are designated as non-O.R. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25026), we proposed that the six ICD–10–PCS procedure codes in Table 6P.4i. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) be assigned the attributes of the ICD–9–CM code specified in column C. The ICD–9–CM codes and descriptions in column C would replace the ICD–9–CM codes and descriptions reflected in column D, which are considered less accurate correlations. We invited public comments on this proposal.

Comment: Commenters supported the proposal to change the designation of six ICD–10–PCS procedure codes describing the dilation of stomach and pylorus body sites with various approaches. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the six ICD–10–PCS procedure codes in Table 6P.4i. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These six ICD–10–PCS procedure codes are assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(j) Endoscopic/Percutaneous Occlusion

We found six ICD–10–PCS codes describing percutaneous occlusion of esophageal vein with and without a device that, when coded under ICD–9–CM would reasonably correlate to the endoscopic excision or destruction of the vessel versus an open surgical procedure. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25026), we proposed that the six ICD–10–PCS procedure codes in Table 6P.4j. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) be assigned the attributes of the ICD–9–CM code specified in column C. The ICD–9–CM codes and descriptions in column C would replace the ICD–9–CM codes and descriptions reflected in column D, which are considered less accurate correlations. We invited public comments on this proposal.

Comment: Several commenters supported the proposal to change the designation of six ICD–10–PCS procedure codes describing the percutaneous occlusion of esophageal vein with and without a device. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential

replication issues between the ICD–9 and ICD–10 based MS–DRGs.

Comment: One commenter stated that standard surgical practice does not support procedures involving occlusion of the esophageal vein being performed outside of an operating room setting. This commenter also stated that these procedure codes were considered valid O.R. procedures under ICD–9–CM.

Response: We disagree with the commenter's statements. We note that percutaneous occlusion of the esophageal vein does not utilize the resources to be designated as an O.R. procedure. In addition, under ICD–9–CM, the endoscopic excision or destruction of lesion or tissue of esophagus for occlusion of esophageal vein was designated as a non-O.R. procedure.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the six ICD–10–PCS procedure codes in Table 6P.4j. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These six ICD–10–PCS procedure codes are assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(k) Infusion Device

We found 82 ICD–10–PCS codes describing the insertion of an infusion device to various body parts that, when coded under ICD–9–CM, would reasonably correlate to the insertion of a common infusion catheter versus the insertion of a totally implantable infusion pump. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25026), we proposed that the 82 ICD–10–PCS procedure codes in Table 6P.4k. associated with the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index*) be assigned the attributes of the ICD–9–CM code specified in column C. The ICD–9–CM codes and descriptions in column C would replace the ICD–9–CM codes and descriptions reflected in column D, which are considered less accurate correlations. We invited public comments on this proposal.

Comment: Commenters supported the proposal to change the designation of 82 ICD–10–PCS procedure codes describing the insertion of an infusion device to various parts. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the 82 ICD–10–PCS procedure codes in Table 6P.4k. associated with the proposed rule and this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*). These 82 ICD–10–PCS procedure codes are assigned the attributes of the ICD–9–CM procedure code specified in column C. The ICD–9–CM procedure codes and descriptions in column C replace the ICD–9–CM procedure codes and descriptions reflected in column D in the ICD–10 MS–DRGs Version 34, effective October 1, 2016.

(2) Non-O.R. Procedures to O.R. Procedures

(a) Drainage of Pleural Cavity

In the ICD–9–CM MS–DRGs Version 32 Definitions Manual under Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index, procedure code 34.06 (Thoracoscopic drainage of pleural cavity) is designated as an O.R. procedure code and is assigned to MS–DRGs 166 through 168 (Other Respiratory System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively) in MDC 4 (Diseases and Disorders of the Respiratory System).

A replication issue regarding the procedure code designation and MS–DRG assignment for the comparable code translations under the ICD–10 MS–DRGs Version 33 was brought to our attention after implementation on October 1, 2015. The replication issue involves the following four ICD–10–PCS procedure codes:

- 0W9940Z (Drainage of right pleural cavity with drainage device, percutaneous endoscopic approach);
- 0W994ZZ (Drainage of right pleural cavity, percutaneous endoscopic approach);
- 0W9B40Z (Drainage of left pleural cavity with drainage device, percutaneous endoscopic approach); and
- 0W9B4ZZ (Drainage of left pleural cavity, percutaneous endoscopic approach).

In the ICD–10 MS–DRGs Version 33, these four ICD–10–PCS procedure codes are not recognized as O.R. procedures for purposes of MS–DRG assignment. We agree that this was a replication error and the designation and MS–DRG assignment should be consistent with the designation and MS–DRG assignment of ICD–9–CM procedure code 34.06.

To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25026), we proposed to add ICD–10–PCS procedure codes 0W9940Z, 0W994ZZ, 0W9B40Z, and 0W9B4ZZ to the FY 2017 ICD–10 MS–DRGs Version 34 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as O.R. procedures assigned to MS–DRGs 166 through 168 in MDC 4. We invited public comments on our proposal.

Comment: Commenters supported the proposal to change the designation of four ICD–10–PCS procedure codes describing percutaneous endoscopic drainage of the pleural cavity with or without a drainage device. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the four ICD–10–PCS procedure codes describing percutaneous endoscopic drainage of the pleural cavity with or without a drainage device (0W9940Z, 0W994ZZ, 0W9B40Z, and 0W9B4ZZ) from non-O.R. to O.R. These procedure codes are added to the ICD–10 MS–DRGs Version 34 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index and assigned to MS–DRGs 166, 167, and 168 (Other Respiratory System O.R. Procedures with MCC, with CC, and without CC/MCC, respectively), effective October 1, 2016.

(b) Drainage of Cerebral Ventricle

In the ICD–9–CM MS–DRGs Version 32 Definitions Manual under Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index, procedure code 02.22 (Intracranial ventricular shunt or anastomosis) is designated as an O.R. procedure code and is assigned to MS–DRGs 023 through 027, collectively referred to as

the ''Craniotomy'' MS–DRGs, in MDC 1 (Diseases and Disorders of the Nervous System).

A replication issue regarding the procedure code designation and MS–DRG assignment for the comparable code translations under the ICD–10 MS–DRGs Version 33 was brought to our attention after implementation on October 1, 2015. The replication issue involves the following ICD–10–PCS procedure codes:

ICD–10–PCS procedure code	Description
009130Z	Drainage of cerebral meninges with drainage device, percutaneous approach.
00913ZZ	Drainage of cerebral meninges, percutaneous approach.
009140Z	Drainage of cerebral meninges with drainage device, percutaneous endoscopic approach.
00914ZZ	Drainage of cerebral meninges with drainage device, percutaneous endoscopic approach.
009230Z	Drainage of dura mater with drainage device, percutaneous approach.
00923ZZ	Drainage of dura mater, percutaneous approach.
009240Z	Drainage of dura mater with drainage device, percutaneous endoscopic approach.
00924ZZ	Drainage of dura mater, percutaneous endoscopic approach.
009430Z	Drainage of subdural space with drainage device, percutaneous approach.
00943ZZ	Drainage of subdural space, percutaneous approach.
009440Z	Drainage of subdural space with drainage device, percutaneous endoscopic approach.
00944ZZ	Drainage of subdural space, percutaneous endoscopic approach.
009530Z	Drainage of subarachnoid space with drainage device, percutaneous approach.
00953ZZ	Drainage of subarachnoid space, percutaneous approach.
009540Z	Drainage of subarachnoid space with drainage device, percutaneous endoscopic approach.
00954ZZ	Drainage of subarachnoid space, percutaneous endoscopic approach.
00963ZZ	Drainage of cerebral ventricle, percutaneous approach.
00964ZZ	Drainage of cerebral ventricle, percutaneous endoscopic approach.

In the ICD–10 MS–DRGs Version 33, these ICD–10–PCS procedure codes are not recognized as O.R. procedures for purposes of MS–DRG assignment. We agree that this was a replication error and their translation should be consistent with the designation and MS–DRG assignment of ICD–9–CM procedure 02.22.

To resolve this replication issue, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25026 through 25027), we proposed to add the ICD–10–PCS procedure codes listed above to the FY 2017 ICD–10 MS–DRGs Version 34 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index as O.R. procedures assigned to MS–DRGs 023 through 027 in MDC 1. We invited public comments on our proposal.

Comment: Commenters supported the proposal to change the designation of 18 ICD–10–PCS procedure codes describing endoscopic/percutaneous drainage of intracranial sites with or without a drainage device. The commenters also expressed appreciation for CMS' continued efforts towards addressing replication issues.

Response: We appreciate the commenters' support of our proposal and of our efforts to analyze potential replication issues between the ICD–9 and ICD–10 based MS–DRGs.

After consideration of the public comments we received, we are finalizing our proposal to change the designation of the 18 ICD–10–PCS procedure codes listed above describing endoscopic/percutaneous drainage of intracranial sites with or without a drainage device from non-O.R. to O.R. These procedure codes are added to the ICD–10 MS–DRGs Version 34 Definitions Manual in Appendix E—Operating Room Procedures and Procedure Code/MS–DRG Index and assigned to MS–DRGs 023 and 024 (Craniotomy with Major Device Implant or Acute Complex Central Nervous System Principal Diagnosis with MCC or Chemotherapy Implant and without MCC, respectively) and to MS–DRGs 025, 026 and 027 (Craniotomy and Endovascular Intracranial Procedures with MCC, with CC, and without CC/MCC, respectively), effective October 1, 2016.

(3) FY 2018 Refinements

As discussed earlier in this section, for FY 2017, we continued our efforts to address the MS–DRG replication issues between the ICD–9–CM logic and ICD–10 that were brought to our attention. As a result of analyzing specific requests, additional areas in the ICD–10 classification were identified where we proposed modifications to more accurately replicate the logic of ICD–9–CM and to reassign ICD–10 codes based on the different clinical concepts and definitions of the codes under the ICD–10 classification.

In response to some of the proposals set forth in the FY 2017 IPPS/LTCH PPS proposed rule pertaining to changing the designation of an ICD–10–PCS procedure code from O.R. to non-O.R., we received detailed comments and recommendations for consideration that we were not able to fully evaluate for FY 2017. We appreciate the extensive and thorough analysis that the commenters performed and their suggestions for further refinements. As the commenters' recommendations included analysis of over 800 procedure codes for redesignation, we plan to conduct a comprehensive review and analyze these codes for our FY 2018 refinement efforts.

20. Out of Scope Public Comments Received

We received public comments regarding five MS–DRG issues that were outside of the scope of the proposals included in the FY 2017 IPPS/LTCH PPS proposed rule. These comments were as follows:

- Several commenters requested the inclusion of ICD–10–PCS code 02L73ZK (Occlusion of left atrial appendage, percutaneous approach) that describes what is known as the LARIAT procedure in the FY 2017 MS–DRG proposal for the transcatheter mitral valve repair procedure.
- Commenters provided comments on ICD–10–CM diagnosis codes that were not approved at the time of issuance of the proposed rule.
- One commenter requested the creation of new MS–DRGs for the treatment of orphan diseases.
- Comments were submitted regarding the complexity, time commitment, and payment for transesophageal echocardiography services performed for a MitraClip procedure.

We consider these public comments to be outside of the scope of the proposed rule and, therefore, we are not addressing them in this final rule. As stated in section II.F.1.b. of the preamble of this final rule, we encourage individuals with comments about MS–DRG classification to submit these comments no later than December 7 of each year so that they can be considered for possible inclusion in the annual proposed rule and, if included, may be subjected to public review and comment. We will consider these public comments for possible proposals in future rulemaking as part of our annual review process.

G. Recalibration of the FY 2017 MS–DRG Relative Weights

1. Data Sources for Developing the Relative Weights

As we discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25027), in developing the FY 2017 system of weights, we used two data sources: claims data and cost report data. As in previous years, the claims data source is the MedPAR file. This file is based on fully coded diagnostic and procedure data for all Medicare inpatient hospital bills. The FY 2015 MedPAR data used in this final rule include discharges occurring on October 1, 2014, through September 30, 2015, based on bills received by CMS through March 31, 2016, from all hospitals subject to the IPPS and short-term, acute care hospitals in Maryland (which at that time were under a waiver from the IPPS). The FY 2015 MedPAR file used in calculating the relative weights includes data for approximately 9,770,558 Medicare discharges from IPPS providers. Discharges for Medicare beneficiaries enrolled in a Medicare Advantage managed care plan are excluded from this analysis. These discharges are excluded when the MedPAR ''GHO Paid'' indicator field on the claim record is equal to ''1'' or when the MedPAR DRG payment field, which represents the total payment for the claim, is equal to the MedPAR ''Indirect Medical Education (IME)'' payment field, indicating that the claim was an ''IME only'' claim submitted by a teaching hospital on behalf of a beneficiary enrolled in a Medicare Advantage managed care plan. In addition, the March 31, 2016 update of the FY 2015 MedPAR file complies with version 5010 of the X12 HIPAA Transaction and Code Set Standards, and includes a variable called ''claim type.'' Claim type ''60'' indicates that the claim was an inpatient claim paid as fee-for-service. Claim types ''61,'' ''62,'' ''63,'' and ''64'' relate to encounter claims, Medicare Advantage IME claims, and HMO no-pay claims. Therefore, the calculation of the relative weights for FY 2017 also excludes claims with claim type values not equal to ''60.'' The data exclude CAHs, including hospitals that subsequently became CAHs after the period from which the data were taken. We note that the FY 2017 relative weights are based on the ICD–9–CM diagnoses and procedures codes from the FY 2015 MedPAR claims data, grouped through the ICD–9–CM version of the FY 2017 GROUPER (Version 34).

The second data source used in the cost-based relative weighting methodology is the Medicare cost report data files from the HCRIS. Normally, we use the HCRIS dataset that is 3 years prior to the IPPS fiscal year. Specifically, we used cost report data from the March 31, 2016 update of the FY 2014 HCRIS for calculating the FY 2017 cost-based relative weights.

2. Methodology for Calculation of the Final Relative Weights

As we explain in section II.E.2. of the preamble of this final rule, we calculated the FY 2017 relative weights based on 19 CCRs, as we did for FY 2016. The methodology we used to calculate the FY 2017 MS–DRG cost-based relative weights based on claims data in the FY 2015 MedPAR file and data from the FY 2014 Medicare cost reports is as follows:

- To the extent possible, all the claims were regrouped using the FY 2017 MS–DRG classifications discussed in sections II.B. and II.F. of the preamble of this final rule.
- The transplant cases that were used to establish the relative weights for heart and heart-lung, liver and/or intestinal, and lung transplants (MS–DRGs 001, 002, 005, 006, and 007, respectively) were limited to those Medicare-approved transplant centers that have cases in the FY 2015 MedPAR file. (Medicare coverage for heart, heart-lung, liver and/or intestinal, and lung transplants is limited to those facilities that have received approval from CMS as transplant centers.)
- Organ acquisition costs for kidney, heart, heart-lung, liver, lung, pancreas, and intestinal (or multivisceral organs) transplants continue to be paid on a reasonable cost basis. Because these acquisition costs are paid separately from the prospective payment rate, it is necessary to subtract the acquisition charges from the total charges on each transplant bill that showed acquisition charges before computing the average cost for each MS–DRG and before eliminating statistical outliers.
- Claims with total charges or total lengths of stay less than or equal to zero were deleted. Claims that had an amount in the total charge field that differed by more than $10.00 from the sum of the routine day charges, intensive care charges, pharmacy charges, special equipment charges, therapy services charges, operating room charges, cardiology charges, laboratory charges, radiology charges, other service charges, labor and delivery charges, inhalation therapy charges, emergency room charges, blood charges, and anesthesia charges were also deleted.
- At least 92.1 percent of the providers in the MedPAR file had charges for 14 of the 19 cost centers. All claims of providers that did not have charges greater than zero for at least 14 of the 19 cost centers were deleted. In other words, a provider must have no more than five blank cost centers. If a provider did not have charges greater than zero in more than five cost centers, the claims for the provider were deleted.
- Statistical outliers were eliminated by removing all cases that were beyond 3.0 standard deviations from the geometric mean of the log distribution of both the total charges per case and the total charges per day for each MS–DRG.
- Effective October 1, 2008, because hospital inpatient claims include a POA indicator field for each diagnosis present on the claim, only for purposes of relative weight-setting, the POA indicator field was reset to ''Y'' for ''Yes'' for all claims that otherwise have an ''N'' (No) or a ''U'' (documentation insufficient to determine if the condition was present at the time of inpatient admission) in the POA field.

Under current payment policy, the presence of specific HAC codes, as indicated by the POA field values, can generate a lower payment for the claim. Specifically, if the particular condition is present on admission (that is, a ''Y'' indicator is associated with the diagnosis on the claim), it is not a HAC, and the hospital is paid for the higher severity (and, therefore, the higher weighted MS–DRG). If the particular condition is not present on admission (that is, an ''N'' indicator is associated with the diagnosis on the claim) and there are no other complicating conditions, the DRG GROUPER assigns the claim to a lower severity (and, therefore, the lower weighted MS–DRG) as a penalty for allowing a Medicare inpatient to contract a HAC. While the POA reporting meets policy goals of encouraging quality care and generates

program savings, it presents an issue for the relative weight-setting process. Because cases identified as HACs are likely to be more complex than similar cases that are not identified as HACs, the charges associated with HAC cases are likely to be higher as well. Therefore, if the higher charges of these HAC claims are grouped into lower severity MS–DRGs prior to the relative weight-setting process, the relative weights of these particular MS–DRGs would become artificially inflated, potentially skewing the relative weights. In addition, we want to protect the integrity of the budget neutrality process by ensuring that, in estimating payments, no increase to the standardized amount occurs as a result of lower overall payments in a previous year that stem from using weights and case-mix that are based on lower severity MS–DRG assignments. If this would occur, the anticipated cost savings from the HAC policy would be lost.

To avoid these problems, we reset the POA indicator field to ''Y'' only for relative weight-setting purposes for all claims that otherwise have an ''N'' or a ''U'' in the POA field. This resetting ''forced'' the more costly HAC claims into the higher severity MS–DRGs as appropriate, and the relative weights calculated for each MS–DRG more closely reflect the true costs of those cases.

In addition, in the FY 2013 IPPS/LTCH PPS final rule, for FY 2013 and subsequent fiscal years, we finalized a policy to treat hospitals that participate in the Bundled Payments for Care Improvement (BPCI) initiative the same as prior fiscal years for the IPPS payment modeling and ratesetting process without regard to hospitals' participation within these bundled payment models (that is, as if hospitals were not participating in those models under the BPCI initiative). The BPCI initiative, developed under the authority of section 3021 of the Affordable Care Act (codified at section 1115A of the Act), is comprised of four broadly defined models of care, which link payments for multiple services beneficiaries receive during an episode of care. Under the BPCI initiative, organizations enter into payment arrangements that include financial and performance accountability for episodes of care. For FY 2017, as we proposed, we are continuing to include all applicable data from subsection (d) hospitals participating in BPCI Models 1, 2, and 4 in our IPPS payment modeling and ratesetting calculations. We refer readers to the FY 2013 IPPS/LTCH PPS final rule for a complete discussion on our final policy for the treatment of hospitals participating in the BPCI initiative in our ratesetting process. For additional information on the BPCI initiative, we refer readers to the CMS' Center for Medicare and Medicaid Innovation's Web site at: *http://innovation.cms.gov/initiatives/Bundled-Payments/index.html* and to section IV.H.4. of the preamble of the FY 2013 IPPS/LTCH PPS final rule (77 FR 53341 through 53343).

Once the MedPAR data were trimmed and the statistical outliers were removed, the charges for each of the 19 cost groups for each claim were standardized to remove the effects of differences in area wage levels, IME and DSH payments, and for hospitals located in Alaska and Hawaii, the applicable cost-of-living adjustment. Because hospital charges include charges for both operating and capital costs, we standardized total charges to remove the effects of differences in geographic adjustment factors, cost-of-living adjustments, and DSH payments under the capital IPPS as well. Charges were then summed by MS–DRG for each of the 19 cost groups so that each MS–DRG had 19 standardized charge totals. These charges were then adjusted to cost by applying the national average CCRs developed from the FY 2014 cost report data.

The 19 cost centers that we used in the relative weight calculation are shown in the following table. The table shows the lines on the cost report and the corresponding revenue codes that we used to create the proposed 19 national cost center CCRs. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25028), we stated that if stakeholders have comments about the groupings in this table, we may consider those comments as we finalize our policy. However, we did not receive any comments on the groupings in this table, and therefore, we are finalizing the groupings as proposed.

Cost center group name (19 total)	MedPAR charge field	Revenue codes contained in MedPAR charge field	Cost report line description	Cost from HCRIS (Worksheet C, Part 1, Column 5 and line number) Form CMS–2552–10	Charges from HCRIS (Worksheet C, Part 1, Column 6 & 7 and line number) Form CMS–2552–10	Medicare Charges from HCRIS (Worksheet D–3, Column & line number) Form CMS–2552–10

3. Development of National Average CCRs

We developed the national average CCRs as follows:

Using the FY 2014 cost report data, we removed CAHs, Indian Health Service hospitals, all-inclusive rate hospitals, and cost reports that represented time periods of less than 1 year (365 days). We included hospitals located in Maryland because we include their charges in our claims database. We then created CCRs for each provider for each cost center (see prior table for line items used in the calculations) and removed any CCRs that were greater than 10 or less than 0.01. We normalized the departmental CCRs by dividing the CCR for each department by the total CCR for the hospital for the purpose of trimming the data. We then took the logs of the normalized cost center CCRs and removed any cost center CCRs where the log of the cost center CCR was greater or less than the mean log plus/minus 3 times the standard deviation for the log of that cost center CCR. Once the cost report data were trimmed, we calculated a Medicare-specific CCR. The Medicare-specific CCR was determined by taking the Medicare charges for each line item from Worksheet D–3 and deriving the Medicare-specific costs by applying the hospital-specific departmental CCRs to the Medicare-specific charges for each line item from Worksheet D–3. Once each hospital's Medicare-specific costs were established, we summed the total Medicare-specific costs and divided by the sum of the total Medicare-specific charges to produce national average, charge-weighted CCRs.

After we multiplied the total charges for each MS–DRG in each of the 19 cost centers by the corresponding national average CCR, we summed the 19 ''costs'' across each MS–DRG to produce a total standardized cost for the MS–DRG. The average standardized cost for each MS–DRG was then computed as the total standardized cost for the MS–DRG divided by the transfer-adjusted case count for the MS–DRG. The average cost for each MS–DRG was then divided by the national average standardized cost

per case to determine the relative weight.

The FY 2017 cost-based relative weights were then normalized by an adjustment factor of 1.691521 so that the average case weight after recalibration was equal to the average case weight before recalibration. The normalization adjustment is intended to ensure that recalibration by itself neither increases nor decreases total payments under the IPPS, as required by section 1886(d)(4)(C)(iii) of the Act.

The 19 national average CCRs for FY 2017 are as follows:

Group	CCR
Routine Days	0.457
Intensive Days	0.375
Drugs	0.194
Supplies & Equipment	0.297
Implantable Devices	0.331
Therapy Services	0.321
Laboratory	0.120
Operating Room	0.191
Cardiology	0.112
Cardiac Catheterization	0.118
Radiology	0.153
MRIs	0.079
CT Scans	0.038
Emergency Room	0.171
Blood and Blood Products	0.323
Other Services	0.365
Labor & Delivery	0.410
Inhalation Therapy	0.170
Anesthesia	0.089

Since FY 2009, the relative weights have been based on 100 percent cost weights based on our MS–DRG grouping system.

When we recalibrated the DRG weights for previous years, we set a threshold of 10 cases as the minimum number of cases required to compute a reasonable weight. As we proposed, we use that same case threshold in recalibrating the MS–DRG relative weights for FY 2017. Using data from the FY 2015 MedPAR file, there were 8 MS–DRGs that contain fewer than 10 cases. Under the MS–DRGs, we have fewer low-volume DRGs than under the CMS DRGs because we no longer have separate DRGs for patients aged 0 to 17 years. With the exception of newborns, we previously separated some DRGs based on whether the patient was age 0 to 17 years or age 17 years and older. Other than the age split, cases grouping to these DRGs are identical. The DRGs for patients aged 0 to 17 years generally have very low volumes because children are typically ineligible for Medicare. In the past, we have found that the low volume of cases for the pediatric DRGs could lead to significant year-to-year instability in their relative weights. Although we have always encouraged non-Medicare payers to develop weights applicable to their own patient populations, we have received frequent complaints from providers about the use of the Medicare relative weights in the pediatric population. We believe that eliminating this age split in the MS–DRGs will provide more stable payment for pediatric cases by determining their payment using adult cases that are much higher in total volume. Newborns are unique and require separate MS–DRGs that are not mirrored in the adult population. Therefore, it remains necessary to retain separate MS–DRGs for newborns. All of the low-volume MS–DRGs listed are for newborns. For FY 2017, because we do not have sufficient MedPAR data to set accurate and stable cost relative weights for these low-volume MS–DRGs, as we proposed, we compute relative weights for the low-volume MS–DRGs by adjusting their final FY 2016 relative weights by the percentage change in the average weight of the cases in other MS–DRGs. The crosswalk table is shown:

Low–volume MS–DRG	MS–DRG Title	Crosswalk to MS–DRG
768	Vaginal Delivery with O.R. Procedure Except Sterilization and/or D&C.	Final FY 2016 relative weight (adjusted by percent change in average weight of the cases in other MS–DRGs).
789	Neonates, Died or Transferred to Another Acute Care Facility.	Final FY 2016 relative weight (adjusted by percent change in average weight of the cases in other MS–DRGs).
790	Extreme Immaturity or Respiratory Distress Syndrome, Neonate.	Final FY 2016 relative weight (adjusted by percent change in average weight of the cases in other MS–DRGs).
791	Prematurity with Major Problems	Final FY 2016 relative weight (adjusted by percent change in average weight of the cases in other MS–DRGs).
792	Prematurity without Major Problems	Final FY 2016 relative weight (adjusted by percent change in average weight of the cases in other MS–DRGs).
793	Full-Term Neonate with Major Problems	Final FY 2016 relative weight (adjusted by percent change in average weight of the cases in other MS–DRGs).
794	Neonate with Other Significant Problems	Final FY 2016 relative weight (adjusted by percent change in average weight of the cases in other MS DRGs).
795	Normal Newborn	Final FY 2016 relative weight (adjusted by percent change in average weight of the cases in other MS–DRGs).

We did not receive any public comments on our proposals for establishing the relative weights for FY 2017 and are finalizing them as proposed.

H. Add-On Payments for New Services and Technologies for FY 2017

1. Background

Sections 1886(d)(5)(K) and (L) of the Act establish a process of identifying and ensuring adequate payment for new medical services and technologies (sometimes collectively referred to in this section as ''new technologies'') under the IPPS. Section 1886(d)(5)(K)(vi) of the Act specifies that a medical service or technology will be considered new if it meets criteria established by the Secretary after notice and opportunity for public comment. Section 1886(d)(5)(K)(ii)(I) of the Act specifies that a new medical service or technology may be considered for new technology add-on payment if, based on the estimated costs incurred with respect to discharges involving such service or technology, the DRG prospective payment rate otherwise applicable to such discharges under this subsection is inadequate. We note that, beginning with discharges occurring in FY 2008, CMS transitioned from CMS–DRGs to MS–DRGs.

The regulations at 42 CFR 412.87 implement these provisions and specify three criteria for a new medical service or technology to receive the additional payment: (1) The medical service or technology must be new; (2) the medical service or technology must be costly such that the DRG rate otherwise applicable to discharges involving the medical service or technology is determined to be inadequate; and (3) the

service or technology must demonstrate a substantial clinical improvement over existing services or technologies. Below we highlight some of the major statutory and regulatory provisions relevant to the new technology add-on payment criteria, as well as other information. For a complete discussion on the new technology add-on payment criteria, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51572 through 51574).

Under the first criterion, as reflected in § 412.87(b)(2), a specific medical service or technology will be considered ''new'' for purposes of new medical service or technology add-on payments until such time as Medicare data are available to fully reflect the cost of the technology in the MS–DRG weights through recalibration. We note that we do not consider a service or technology to be new if it is substantially similar to one or more existing technologies. That is, even if a technology receives a new FDA approval or clearance, it may not necessarily be considered ''new'' for purposes of new technology add-on payments if it is ''substantially similar'' to a technology that was approved or cleared by FDA and has been on the market for more than 2 to 3 years. In the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43813 through 43814), we established criteria for evaluating whether a new technology is substantially similar to an existing technology, specifically: (1) Whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome; (2) whether a product is assigned to the same or a different MS–DRG; and (3) whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population. If a technology meets all three of these criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments. For a detailed discussion of the criteria for substantial similarity, we refer readers to the FY 2006 IPPS final rule (70 FR 47351 through 47352), and the FY 2010 IPPS/LTCH PPS final rule (74 FR 43813 through 43814).

Under the second criterion, § 412.87(b)(3) further provides that, to be eligible for the add-on payment for new medical services or technologies, the MS–DRG prospective payment rate otherwise applicable to the discharge involving the new medical services or technologies must be assessed for adequacy. Under the cost criterion, consistent with the formula specified in section 1886(d)(5)(K)(ii)(I) of the Act, to assess the adequacy of payment for a new technology paid under the applicable MS–DRG prospective payment rate, we evaluate whether the charges for cases involving the new technology exceed certain threshold amounts. Table 10 that was released with the FY 2016 IPPS/LTCH PPS final rule contains the final thresholds that we used to evaluate applications for new medical service and new technology add-on payments for FY 2017. We refer readers to the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Tables.html* to download and view Table 10.

In the September 7, 2001 final rule that established the new technology add-on payment regulations (66 FR 46917), we discussed the issue of whether the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule at 45 CFR parts 160 and 164 applies to claims information that providers submit with applications for new medical service and new technology add-on payments. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51573) for complete information on this issue.

Under the third criterion, § 412.87(b)(1) of our existing regulations provides that a new technology is an appropriate candidate for an additional payment when it represents an advance that substantially improves, relative to technologies previously available, the diagnosis or treatment of Medicare beneficiaries. For example, a new technology represents a substantial clinical improvement when it reduces mortality, decreases the number of hospitalizations or physician visits, or reduces recovery time compared to the technologies previously available. (We refer readers to the September 7, 2001 final rule for a more detailed discussion of this criterion (66 FR 46902).)

The new medical service or technology add-on payment policy under the IPPS provides additional payments for cases with relatively high costs involving eligible new medical services or technologies while preserving some of the incentives inherent under an average-based prospective payment system. The payment mechanism is based on the cost to hospitals for the new medical service or technology. Under § 412.88, if the costs of the discharge (determined by applying cost-to-charge ratios (CCRs) as described in § 412.84(h)) exceed the full DRG payment (including payments for IME and DSH, but excluding outlier payments), Medicare will make an add-on payment equal to the lesser of: (1) 50 percent of the estimated costs of the new technology or medical service (if the estimated costs for the case including the new technology or medical service exceed Medicare's payment); or (2) 50 percent of the difference between the full DRG payment and the hospital's estimated cost for the case. Unless the discharge qualifies for an outlier payment, the additional Medicare payment is limited to the full MS–DRG payment plus 50 percent of the estimated costs of the new technology or new medical service.

Section 503(d)(2) of Public Law 108–173 provides that there shall be no reduction or adjustment in aggregate payments under the IPPS due to add-on payments for new medical services and technologies. Therefore, in accordance with section 503(d)(2) of Public Law 108–173, add-on payments for new medical services or technologies for FY 2005 and later years have not been subjected to budget neutrality.

In the FY 2009 IPPS final rule (73 FR 48561 through 48563), we modified our regulations at § 412.87 to codify our longstanding practice of how CMS evaluates the eligibility criteria for new medical service or technology add-on payment applications. That is, we first determine whether a medical service or technology meets the newness criterion, and only if so, do we then make a determination as to whether the technology meets the cost threshold and represents a substantial clinical improvement over existing medical services or technologies. We amended § 412.87(c) to specify that all applicants for new technology add-on payments must have FDA approval or clearance for their new medical service or technology by July 1 of each year prior to the beginning of the fiscal year that the application is being considered.

The Council on Technology and Innovation (CTI) at CMS oversees the agency's cross-cutting priority on coordinating coverage, coding and payment processes for Medicare with respect to new technologies and procedures, including new drug therapies, as well as promoting the exchange of information on new technologies and medical services between CMS and other entities. The CTI, composed of senior CMS staff and clinicians, was established under section 942(a) of Public Law 108–173. The Council is co-chaired by the Director of the Center for Clinical Standards and Quality (CCSQ) and the Director of the Center for Medicare (CM), who is also designated as the CTI's Executive Coordinator.

The specific processes for coverage, coding, and payment are implemented by CM, CCSQ, and the local claims-payment contractors (in the case of local coverage and payment decisions). The CTI supplements, rather than replaces, these processes by working to assure that all of these activities reflect the agency-wide priority to promote high-quality, innovative care. At the same time, the CTI also works to streamline, accelerate, and improve coordination of these processes to ensure that they remain up to date as new issues arise. To achieve its goals, the CTI works to streamline and create a more transparent coding and payment process, improve the quality of medical decisions, and speed patient access to effective new treatments. It is also dedicated to supporting better decisions by patients and doctors in using Medicare-covered services through the promotion of better evidence development, which is critical for improving the quality of care for Medicare beneficiaries.

To improve the understanding of CMS' processes for coverage, coding, and payment and how to access them, the CTI has developed an ''Innovator's Guide'' to these processes. The intent is to consolidate this information, much of which is already available in a variety of CMS documents and in various places on the CMS Web site, in a user-friendly format. This guide was published in 2010 and is available on the CMS Web site at: *http://www.cms.gov/CouncilonTechInnov/Downloads/InnovatorsGuide5_10_10.pdf*.

As we indicated in the FY 2009 IPPS final rule (73 FR 48554), we invite any product developers or manufacturers of new medical services or technologies to contact the agency early in the process of product development if they have questions or concerns about the evidence that would be needed later in the development process for the agency's coverage decisions for Medicare.

The CTI aims to provide useful information on its activities and initiatives to stakeholders, including Medicare beneficiaries, advocates, medical product manufacturers, providers, and health policy experts. Stakeholders with further questions about Medicare's coverage, coding, and payment processes, or who want further guidance about how they can navigate these processes, can contact the CTI at *CTI@cms.hhs.gov*.

We note that applicants for add-on payments for new medical services or technologies for FY 2018 must submit a formal request, including a full description of the clinical applications of the medical service or technology and the results of any clinical evaluations demonstrating that the new medical service or technology represents a substantial clinical improvement, along with a significant sample of data to demonstrate that the medical service or technology meets the high-cost threshold. Complete application information, along with final deadlines for submitting a full application, will be posted as it becomes available on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/newtech.html*. To allow interested parties to identify the new medical services or technologies under review before the publication of the proposed rule for FY 2018, the CMS Web site also will post the tracking forms completed by each applicant.

2. Public Input Before Publication of a Notice of Proposed Rulemaking on Add-On Payments

Section 1886(d)(5)(K)(viii) of the Act, as amended by section 503(b)(2) of Public Law 108–173, provides for a mechanism for public input before publication of a notice of proposed rulemaking regarding whether a medical service or technology represents a substantial clinical improvement or advancement. The process for evaluating new medical service and technology applications requires the Secretary to—

- Provide, before publication of a proposed rule, for public input regarding whether a new service or technology represents an advance in medical technology that substantially improves the diagnosis or treatment of Medicare beneficiaries;
- Make public and periodically update a list of the services and technologies for which applications for add-on payments are pending;
- Accept comments, recommendations, and data from the public regarding whether a service or technology represents a substantial clinical improvement; and
- Provide, before publication of a proposed rule, for a meeting at which organizations representing hospitals, physicians, manufacturers, and any other interested party may present comments, recommendations, and data regarding whether a new medical service or technology represents a substantial clinical improvement to the clinical staff of CMS.

In order to provide an opportunity for public input regarding add-on payments for new medical services and technologies for FY 2017 prior to publication of the FY 2017 IPPS/LTCH PPS proposed rule, we published a notice in the **Federal Register** on November 30, 2015 (80 FR 74774), and held a town hall meeting at the CMS Headquarters Office in Baltimore, MD, on February 16, 2016. In the announcement notice for the meeting, we stated that the opinions and presentations provided during the meeting would assist us in our evaluations of applications by allowing public discussion of the substantial clinical improvement criterion for each of the FY 2017 new medical service and technology add-on payment applications before the publication of the FY 2017 IPPS/LTCH PPS proposed rule.

Approximately 76 individuals registered to attend the town hall meeting in person, while additional individuals listened over an open telephone line. We also live-streamed the town hall meeting and posted the town hall on the CMS YouTube Web page at: *https://www.youtube.com/watch?v=dn-R5KGQu-M.* We considered each applicant's presentation made at the town hall meeting, as well as written comments submitted on the applications that were received by the due date of February 26, 2016, in our evaluation of the new technology add-on payment applications for FY 2017 presented in the FY 2017IPPS/LTCH PPS proposed rule.

As indicated earlier in this section, CMS is required to provide, before publication of a proposed rule, for a meeting at which organizations representing hospitals, physicians, manufacturers, and any other interested party may present comments, recommendations, and data regarding whether a new medical service or technology represents a substantial clinical improvement to the clinical staff of CMS. In recent years, CMS has live-streamed the town hall meeting through the CMS YouTube Web page and later posted the recorded version of the town hall meeting, in addition to maintaining an open telephone line. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25033), we proposed to conduct future town hall meetings entirely via teleconference and Webcast using the same technologies. Under that proposal, we would continue to publish a notice informing the public of the date of the meeting, as well as requirements for the submission of presentations. We also would continue to maintain an open telephone line, with an option for participation in the Webcast. The recording of the town hall meeting would continue to be available on the CMS You Tube Web page or other CMS

Web site following the meeting. This recording would include closed captioning of all presentations and comments. In addition to submitting materials for discussion at the town hall meeting, individuals would continue to be able to submit other written comments after the town hall meeting on whether the service or technology represents a substantial clinical improvement. We invited public comments on this proposal in the proposed rule.

Comment: One commenter expressed appreciation for CMS' efforts to organize and host the new technology town hall meetings entirely via teleconference and Webcast, while continuing to maintain an open telephone line with an option for participation through the Webcast and making the recording of the town hall meeting available on the CMS You Tube Web page or other CMS Web site following the meeting. However, the commenter requested that the option for an open face-to-face meeting be maintained in addition to the teleconference and Webcast participation options. The commenter noted that the opportunity to be able to present in an actual face-to-face forum allows attendees and presenters to gauge reaction and foster added awareness of the use of new technologies.

Several commenters disagreed with the proposal to conduct the new technology town hall meetings via phone and video conference only, and to discontinue in-person meetings. The commenters stated that there is considerable value in face-to-face meetings and presentations on new technologies.

Response: We appreciate the commenter's support and have taken into consideration the commenters' concerns. Therefore, in the interim, we will continue to host the new technology town hall meetings in person. However, we encourage the public to utilize the teleconference and Webcast participation options in order to become familiar with the advancing technological options. We will continue to gauge the public's interest in CMS hosting the new technology town hall meetings entirely via teleconference and Webcast in subsequent fiscal years.

In response to the published notice and the February 16, 2016 New Technology Town Hall meeting, we received written comments regarding the applications for FY 2017 new technology add-on payments. We summarized in the proposed rule a general comment that did not relate to a specific application for FY 2017 new technology add-on payments. We also summarized comments regarding individual applications, or, if applicable, indicated that there were no comments received in section II.H.5. of the preamble of the proposed rule at the end of each applicable discussion of the individual applications. We note that we did receive public comments unrelated to the substantial clinical improvement criterion. As stated earlier, the purpose of the new technology town hall meeting is specifically to discuss the substantial clinical improvement criterion in regard to pending new technology add-on payment applications for FY 2017. Therefore, we did not summarize these additional comments in the proposed rule. However, we did invite the commenter to resubmit its comments in response to proposals presented in the proposed rule.

Comment: Commenters provided additional comments during the 60-day comment period for the proposed rule with regard to the newness, cost, and substantial clinical improvement criteria. Some commenters reiterated comments presented at the town hall meeting, including a recommendation that CMS broaden the criteria applied in making substantial clinical improvement determinations to require, in addition to existing criteria, consideration of whether the new technology or medical service meets one or more of the following additional suggested criteria: (1) Results in a reduction of the length of a hospital stay; (2) improves patient quality of life; (3) creates long-term clinical efficiencies in treatment; (4) addresses patient-centered objectives as defined by the Secretary; or (5) meets such other criteria as the Secretary may specify; and a suggestion that an entity submitting an application for new technology add-on payments be entitled to administrative review of an adverse determination made by the Secretary.

Response: We did not propose any policy changes to the criteria applied to new technology applications in the FY 2016 IPPS/LTCH PPS proposed rule. Therefore, we are not addressing these additional comments in this final rule. Similar to our response in the proposed rule, we will take the commenters' recommendation and suggestion into consideration in future rulemaking.

3. ICD–10–PCS Section ''X'' Codes for Certain New Medical Services and Technologies

As discussed in the FY 2016 IPPS/LTCH final rule (80 FR 49434), the ICD–10–PCS includes a new section containing the new Section ''X'' codes, which began being used with discharges occurring on or after October 1, 2015. Decisions regarding changes to ICD–10–PCS Section ''X'' codes will be handled in the same manner as the decisions for all of the other ICD–10–PCS code changes. That is, proposals to create, delete, or revise Section ''X'' codes under the ICD–10–PCS structure will be referred to the ICD–10 Coordination and Maintenance Committee. In addition, several of the new medical services and technologies that have been, or may be, approved for new technology add-on payments may now, and in the future, be assigned a Section ''X'' code within the structure of the ICD–10–PCS. We posted ICD–10–PCS Guidelines on the CMS Web site at: *http://www.cms.gov/Medicare/Coding/ICD10/2016-ICD-10-PCS-and-GEMs.html,* including guidelines for ICD–10–PCS ''X'' codes. We encourage providers to view the material provided on ICD–10–PCS Section ''X'' codes.

Comment: One commenter supported the implementation of Section ''X'' codes, but recommended that CMS, in order to avoid confusion, make it mandatory that requestors of these new Section ''X'' codes also request the creation of new procedure codes in the body of ICD–10–PCS to accommodate the new medical service or technology. Other commenters also supported the creation and implementation of the Section ''X'' codes, but noted the need to gain better understanding of how the new section ''X'' codes will be used and applied. These commenters encouraged CMS to continue to remain transparent in how the agency develops and applies these new codes.

Response: We appreciate the commenters' support of the new ICD–10–PCS codes. These Section ''X'' codes are included in Table 6B associated with this final rule (which is available via the Internet on the CMS Web site). Section ''X'' codes are standalone codes. They are not supplemental codes. Section ''X'' codes fully represent the specific procedure described in the code title and do not require any additional codes from other sections of ICD–10–PCS. When a section ''X'' code contains a code title that describes a specific new technology procedure, only that section ''X'' code is reported for the procedure. There is no need to report a broader, nonspecific code in another section of ICD–10–PCS. Section X of the ICD–10–PCS structure does not introduce any new coding concepts or unusual guidelines for correct coding. We encourage individuals interested in the creation of ICD–10–PCS codes (including Section ''X'' codes) and any recommendations as to whether or not there should be a mandatory requirement that new code requests

include both codes in Section X as well as in other sections of ICD–10–PCS to make this suggestion at future meetings of the ICD–10 Coordination and Maintenance Committee. We encourage participation at these future meetings as well as the presentation of comments during the comment period regarding proposals and approvals for creating and implementing new codes. We refer commenters to the CMS Web site at: *https://www.cms.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/meetings.html* for complete details.

4. FY 2017 Status of Technologies Approved for FY 2016 Add-On Payments

a. Kcentra™

CSL Behring submitted an application for new technology add-on payments for Kcentra™ for FY 2014. Kcentra™ is a replacement therapy for fresh frozen plasma (FFP) for patients with an acquired coagulation factor deficiency due to warfarin and who are experiencing a severe bleed. Kcentra™ contains the Vitamin K dependent coagulation factors II, VII, IX and X, together known as the prothrombin complex, and antithrombotic proteins C and S. Factor IX is the lead factor for the potency of the preparation. The product is a heat-treated, non-activated, virus filtered and lyophilized plasma protein concentrate made from pooled human plasma. Kcentra™ is available as a lyophilized powder that needs to be reconstituted with sterile water prior to administration via intravenous infusion. The product is dosed based on Factor IX units. Concurrent Vitamin K treatment is recommended to maintain blood clotting factor levels once the effects of Kcentra™ have diminished.

Kcentra™ was approved by the FDA on April 29, 2013. Under the ICD–10 coding system, Kcentra™ is uniquely identified by ICD–10–CM procedure code 30283B1 (Transfusion of nonautologous 4-factor prothrombin complex concentrate into vein, percutaneous approach).

After evaluation of the newness, cost, and substantial clinical improvement criteria for new technology add-on payments for Kcentra™ and consideration of the public comments we received in response to the FY 2014 IPPS/LTCH PPS proposed rule, we approved Kcentra™ for new technology add-on payments for FY 2014 (78 FR 50575 through 50580). In the application, the applicant estimated that the average Medicare beneficiary would require an average dosage of 2500 International Units (IU). Vials contain 500 IU at a cost of $635 per vial. Therefore, cases of Kcentra™ would incur an average cost per case of $3,175 ($635 × 5). Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the technology or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum add-on payment for a case of Kcentra™ was $1,587.50 for FY 2014. We refer the reader to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50579) for complete details on the new technology add-on payments for Kcentra™.

As stated above, the new technology add-on payment regulations provide that a medical service or technology may be considered new within 2 or 3 years after the point at which data begin to become available reflecting the ICD–9–CM code assigned to the new service or technology (§ 412.87(b)(2)). Our practice has been to begin and end new technology add-on payments on the basis of a fiscal year, and we have generally followed a guideline that uses a 6-month window before and after the start of the fiscal year to determine whether to extend the new technology add-on payment for an additional fiscal year. In general, we extend add-on payments for an additional year only if the 3-year anniversary date of the product's entry on the market occurs in the latter half of the fiscal year (70 FR 47362).

With regard to the newness criterion for Kcentra™, we considered the beginning of the newness period to commence when Kcentra™ was approved by the FDA on April 29, 2013. Because the 3-year anniversary date for Kcentra™ would occur in the latter half of FY 2016 (April 29, 2016), in the FY 2016 IPPS/LTCH PPS final rule, we continued new technology add-on payments for this technology for FY 2016 (80 FR 49437). However, for FY 2017, the 3-year anniversary date of the entry of Kcentra™ on the U.S. market (April 29, 2016) occurred prior to the beginning of FY 2017. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25034), we proposed to discontinue new technology add-on payments for this technology for FY 2017. We invited public comments on this proposal in the proposed rule.

We did not receive any public comments on our proposal. Therefore, as we proposed, we are discontinuing new technology add-on payments for Kcentra™ for FY 2017. The 3-year anniversary date of the product's entry onto the U.S. market occurred prior to the beginning of FY 2017. Therefore, the technology is not eligible for new technology add-on payments for FY 2017 because the technology will no longer meet the ''newness'' criterion.

b. Argus® II Retinal Prosthesis System

Second Sight Medical Products, Inc. submitted an application for new technology add-on payments for the Argus® II Retinal Prosthesis System (Argus® II System) for FY 2014. The Argus® II System is an active implantable medical device that is intended to provide electrical stimulation of the retina to induce visual perception in patients who are profoundly blind due to retinitis pigmentosa (RP). These patients have bare or no light perception in both eyes. The system employs electrical signals to bypass dead photo-receptor cells and stimulate the overlying neurons according to a real-time video signal that is wirelessly transmitted from an externally worn video camera. The Argus® II implant is intended to be implanted in a single eye, typically the worse-seeing eye. Currently, bilateral implants are not intended for this technology. According to the applicant, the surgical implant procedure takes approximately 4 hours and is performed under general anesthesia.

With regard to the newness criterion, the applicant received a Humanitarian Device Exemption (HDE) approval from the FDA on February 13, 2013. However, in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49924 through 49925), we discussed comments we had received informing CMS that the Argus® II System was not available on the U.S. market until December 20, 2013. The applicant explained that, as part of the lengthy approval process, it was required to submit a request to the Federal Communications Commission (FCC) for a waiver of section 15.209(a) of the FCC rules that would allow the applicant to apply for FCC authorization to utilize this specific RF band. The FCC approved the applicant's waiver request on November 30, 2011. After receiving the FCC waiver of the section 15.209(a) rules, the applicant requested and obtained a required Grant of Equipment Authorization to utilize the specific RF band, which the FCC issued on December 20, 2013. Therefore, the applicant stated that the date the Argus® II System first became available for commercial sale in the United States was December 20, 2013. We agreed with the applicant that, due to the delay, the date of newness for the Argus® II System was December 20, 2013, instead of February 13, 2013.

After evaluation of the new technology add-on payment application and consideration of public comments received, we concluded that the Argus®

II System met all of the new technology add-on payment policy criteria. Therefore, we approved the Argus® II System for new technology add-on payments in FY 2014 (78 FR 50580 through 50583). Cases involving the Argus® II System that are eligible for new technology add-on payments currently are identified when one of the following ICD–10–PCS procedure codes is reported: 08H005Z (Insertion of epiretinal visual prosthesis into right eye, open approach); or 08H105Z (Insertion of epiretinal visual prosthesis into left eye, open approach). In the application, the applicant provided a breakdown of the costs of the Argus® II System. The total operating cost of the Argus® II System is $144,057.50. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the device or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum add-on payment for a case involving the Argus® II System for FY 2014 was $72,028.75.

With regard to the newness criterion for the Argus® II System, we considered the beginning of the newness period to commence when the Argus® II System became available on the U.S. market on December 20, 2013. Because the 3-year anniversary date for the Argus® II System will occur after FY 2016 (December 20, 2016), in the FY 2016 IPPS/LTCH PPS final rule, we continued new technology add-on payments for this technology for FY 2016 (80 FR 49439). However, for FY 2017, the 3-year anniversary date of the entry of the Argus® II System on the U.S. market (December 20, 2016) will occur in the first half of FY 2017. As discussed previously in this section, in general, we extend new technology add-on payments for an additional year only if the 3-year anniversary date of the product's entry on to the U.S. market occurs in the latter half of the fiscal year. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25034 and 25035), we proposed to discontinue new technology add-on payments for this technology for FY 2017. We invited public comments on this proposal in the proposed rule.

We did not receive any public comments on our proposal. Therefore, as we proposed, we are discontinuing new technology add-on payments for the Argus® II System for FY 2017. The 3-year anniversary date of the product's entry onto the U.S. market occurs in the first half of FY 2017. Therefore, the technology is not eligible for new technology add-on payments for FY 2017 because the technology will no longer meet the ''newness'' criterion.

c. CardioMEMS™ HF (Heart Failure) Monitoring System

CardioMEMS, Inc. submitted an application for new technology add-on payment for FY 2015 for the CardioMEMS™ HF (Heart Failure) Monitoring System, which is an implantable hemodynamic monitoring system comprised of an implantable sensor/monitor placed in the distal pulmonary artery. Pulmonary artery hemodynamic monitoring is used in the management of heart failure. The CardioMEMS™ HF Monitoring System measures multiple pulmonary artery pressure parameters for an ambulatory patient to measure and transmit data via a wireless sensor to a secure Web site.

The CardioMEMS™ HF Monitoring System utilizes radiofrequency (RF) energy to power the sensor and to measure pulmonary artery (PA) pressure and consists of three components: An Implantable Sensor with Delivery Catheter, an External Electronics Unit, and a Pulmonary Artery Pressure Database. The system provides the physician with the patient's PA pressure waveform (including systolic, diastolic, and mean pressures) as well as heart rate. The sensor is permanently implanted in the distal pulmonary artery using transcatheter techniques in the catheterization laboratory where it is calibrated using a Swan-Ganz catheter. PA pressures are transmitted by the patient at home in a supine position on a padded antenna, pushing one button which records an 18-second continuous waveform. The data also can be recorded from the hospital, physician's office or clinic.

The hemodynamic data, including a detailed waveform, are transmitted to a secure Web site that serves as the Pulmonary Artery Pressure Database, so that information regarding PA pressure is available to the physician or nurse at any time via the Internet. Interpretation of trend data allows the clinician to make adjustments to therapy and can be used along with heart failure signs and symptoms to adjust medications.

The applicant received FDA approval on May 28, 2014. After evaluation of the newness, costs, and substantial clinical improvement criteria for new technology payments for the CardioMEMS™ HF Monitoring System and consideration of the public comments we received in response to the FY 2015 IPPS/LTCH PPS proposed rule, we approved the CardioMEMS™ HF Monitoring System for new technology add-on payments for FY 2015 (79 FR 49940). Cases involving the CardioMEMS™ HF Monitoring System that are eligible for new technology add-on payments are identified by either ICD–10–PCS procedure code 02HQ30Z (Insertion of pressure sensor monitoring device into right pulmonary artery, percutaneous approach) or ICD–10–PCS procedure code 02HR30Z (Insertion of pressure sensor monitoring device into left pulmonary artery, percutaneous approach). With the new technology add-on payment application, the applicant stated that the total operating cost of the CardioMEMS™ HF Monitoring System is $17,750. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the device or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the CardioMEMS™ HF Monitoring System is $8,875.

With regard to the newness criterion for the CardioMEMS™ HF Monitoring System, we considered the beginning of the newness period to commence when the CardioMEMS™ HF Monitoring System was approved by the FDA on May 28, 2014. Because the 3-year anniversary date of the entry of the CardioMEMS™ HF Monitoring System on the U.S. market will occur in the latter half of FY 2017 (May 28, 2017), in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25035 and 25036), we proposed to continue new technology add-on payments for this technology for FY 2017. We proposed that the maximum payment for a case involving the CardioMEMS™ HF Monitoring System would remain at $8,875 for FY 2017. We invited public comments on our proposal in the proposed rule.

Comment: One commenter, the manufacturer, supported the continuation of new technology add-on payments for the CardioMEMS™ HF Monitoring System in FY 2017. The commenter requested that CMS provide further and more detailed guidance to the various stakeholders, including hospitals, physicians, MACs, and other manufacturers, on the purpose for the additional payment and how the new technology add-on payment is calculated thereafter. The commenter added that when new technology add-on payments are approved, it is ultimately the responsibility of the applicable provider to charge and bill appropriately. The commenter further explained that it is most often the manufacturer that developed the new technology that researches and provides guidance and expertise to the adopting facilities regarding the technology's use. However, the commenter believed that, given the few new medical services or technologies approved for new

technology add-on payments, hospitals often lack the resources or experience to research and understand the payment calculations. The commenter recommended that CMS provide examples or sample calculations of the new technology add-on payment in a similar fashion that CMS has published examples of other payment methodologies, for example, DSH payments.

Response: We appreciate the commenter's support. We note that after the development and publication of each final rule, CMS issues instructions to the MACs informing them of important changes for the upcoming fiscal year. In addition, CMS issues a Medicare Learning Matters (MLN) article for the public in order to provide information regarding changes for the upcoming fiscal year. The instructions for the MACs and the MLN article for the public always include which new technologies are eligible for new technology add-on payments for in the upcoming fiscal year. We refer readers to the CMS Web site at: *https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2015-Transmittals-Items/R3431CP.html* to view the MAC instructions and MLN article issued in conjunction with the FY 2016 IPPS/LTCH final rule. For information regarding how to receive MLN articles, we refer readers to the CMS Web site at: *https://www.cms.gov/Outreach-and-Education/Medicare-Learning-Network-MLN/MLNProducts/Downloads/What_Is_MLNMatters.pdf*. Also, the regulations at 42 CFR 412.88 explain how the new technology add-on payment is made. Further, on December 13, 2002, we issued Change Request 2301, which provides examples of how the new technology add-on payment is made. Change Request 2301 is available for download via the Internet from the CMS Web site at: *https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/downloads/A02124.pdf*. We also educate the public through our conference calls via open door forums. For information on CMS' open door forums, we refer readers to the CMS Web site at: *https://www.cms.gov/Outreach-and-Education/Outreach/OpenDoorForums/index.html*.

After consideration of the public comments we received, we are finalizing our proposal to continue new technology add-on payments for the CardioMEMS™ HF Monitoring System for FY 2017. The maximum new technology add-on payment for a case involving the CardioMEMS™ HF Monitoring System will remain at $8,875 for FY 2017.

d. MitraClip® System

Abbott Vascular submitted an application for new technology add-on payments for the MitraClip® System for FY 2015. The MitraClip® System is a transcatheter mitral valve repair system that includes a MitraClip® device implant, a Steerable Guide Catheter, and a Clip Delivery System. It is designed to perform reconstruction of the insufficient mitral valve for high-risk patients who are not candidates for conventional open mitral valve repair surgery.

With regard to the newness criterion, the MitraClip® System received a premarket approval from the FDA on October 24, 2013. The MitraClip® System is indicated ''for the percutaneous reduction of significant symptomatic mitral regurgitation (MR >= 3+) due to primary abnormality of the mitral apparatus (degenerative MR) in patients who have been determined to be at prohibitive risk for mitral valve surgery by a heart team, which includes a cardiac surgeon experienced in mitral valve surgery and a cardiologist experienced in mitral valve disease, and in whom existing comorbidities would not preclude the expected benefit from reduction of the mitral regurgitation.'' The MitraClip® System became immediately available on the U.S. market following FDA approval. The MitraClip® System is a Class III device, and has an investigational device exemption (IDE) for the EVEREST study (Endovascular Valve Edge-to-Edge Repair Study)—IDE G030061, and for the COAPT study (Cardiovascular Outcomes Assessment of the MitraClip Percutaneous Therapy for Health Failure Patients with Functional Mitral Regurgitation)—IDE G120024. Cases involving the MitraClip® System are identified using ICD–10–PCS procedure code 02UG3JZ (Supplement mitral valve with synthetic substitute, percutaneous approach).

On August 7, 2014, CMS issued a National Coverage Decision (NCD) concerning Transcatheter Mitral Valve Repair procedures. We refer readers to the CMS Web site at: *http://www.cms.gov/medicare-coverage-database/details/nca-tracking-sheet.aspx?NCAId=273* for information related to this NCD.

After evaluation of the newness, costs, and substantial clinical improvement criteria for new technology payments for the MitraClip® System and consideration of the public comments we received in response to the FY 2015 IPPS/LTCH PPS proposed rule, we approved the MitraClip® System for new technology add-on payments for FY 2015 (79 FR 49946). As discussed in the FY 2015 IPPS/LTCH PPS final rule, this approval is on the basis of using the MitraClip® consistent with the NCD. The average cost of the MitraClip® System is reported as $30,000. Under section 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the device or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the MitraClip® System is $15,000 for FY 2015.

With regard to the newness criterion for the MitraClip® System, we considered the beginning of the newness period to commence when the MitraClip® System was approved by the FDA on October 24, 2013. Because the 3-year anniversary date of the entry of the MitraClip® System on the U.S. market (October 24, 2016) will occur after FY 2016, in the FY 2016 IPPS/LTCH PPS final rule, we continued new technology add-on payments for this technology for FY 2016 (80 FR 49442). However, for FY 2017, the 3-year anniversary date of the entry of MitraClip® System on the U.S. market (October 24, 2016) will occur in the first half of FY 2017. As discussed previously in this section, in general, we extend new technology add-on payments for an additional year only if the 3-year anniversary date of the product's entry on to the U.S. market occurs in the latter half of the fiscal year. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25036), we proposed to discontinue new technology add-on payments for this technology for FY 2017. We invited public comments on this proposal in the proposed rule.

We did not receive any public comments on our proposal. Therefore, as we proposed, we are discontinuing new technology add-on payments for the MitraClip® System for FY 2017. The 3-year anniversary of the product's entry onto the U.S. market occurs in the first half of FY 2017. Therefore, the technology is not eligible for new technology add-on payments for FY 2017 because the technology will no longer meet the ''newness'' criterion.

e. Responsive Neurostimulator (RNS®) System

NeuroPace, Inc. submitted an application for new technology add-on payments for FY 2015 for the use of the RNS® System. (We note that the applicant submitted an application for new technology add-on payments for FY 2014, but failed to receive FDA approval prior to the July 1 deadline.) Seizures

occur when brain function is disrupted by abnormal electrical activity. Epilepsy is a brain disorder characterized by recurrent, unprovoked seizures. According to the applicant, the RNS® System is the first implantable medical device (developed by NeuroPace, Inc.) for treating persons diagnosed with epilepsy whose partial onset seizures have not been adequately controlled with antiepileptic medications. The applicant further stated that, the RNS® System is the first closed-loop, responsive system to treat partial onset seizures. Responsive electrical stimulation is delivered directly to the seizure focus in the brain when abnormal brain activity is detected. A cranially implanted programmable neurostimulator senses and records brain activity through one or two electrode-containing leads that are placed at the patient's seizure focus/foci. The neurostimulator detects electrographic patterns previously identified by the physician as abnormal, and then provides brief pulses of electrical stimulation through the leads to interrupt those patterns. Stimulation is delivered only when abnormal electrocorticographic activity is detected. The typical patient is treated with a total of 5 minutes of stimulation a day. The RNS® System incorporates remote monitoring, which allows patients to share information with their physicians remotely.

With regard to the newness criterion, the applicant stated that some patients diagnosed with partial onset seizures that cannot be controlled with antiepileptic medications may be candidates for the vagus nerve stimulator (VNS) or for surgical removal of the seizure focus. According to the applicant, these treatments are not appropriate for, or helpful to, all patients. Therefore, the applicant believed that there is an unmet clinical need for additional therapies for partial onset seizures. The applicant further stated that the RNS® System addresses this unmet clinical need by providing a novel treatment option for treating persons diagnosed with medically intractable partial onset seizures. The applicant received FDA premarket approval on November 14, 2013.

After evaluation of the newness, costs, and substantial clinical improvement criteria for new technology payments for the RNS® System and consideration of the public comments we received in response to the FY 2015 IPPS/LTCH PPS proposed rule, we approved the RNS® System for new technology add-on payments for FY 2015 (79 FR 49950). Cases involving the RNS® System that are eligible for new technology add-on payments are identified using the following ICD–10–PCS procedure code combination: 0NH00NZ (Insertion of neurostimulator generator into skull, open approach) in combination with 00H00MZ (Insertion of neurostimulator lead into brain, open approach). According to the applicant, cases using the RNS® System would incur an anticipated cost per case of $36,950. Under § 412.88(a)(2) of the regulations, we limit new technology add-on payments to the lesser of 50 percent of the average costs of the device or 50 percent of the costs in excess of the MS–DRG payment rate for the case. As a result, the maximum new technology add-on payment for cases involving the RNS® System is $18,475.

With regard to the newness criterion for the RNS® System, we considered the beginning of the newness period to commence when the RNS® System was approved by the FDA on November 14, 2013. Because the 3-year anniversary date of the entry of the RNS® System on the U.S. market (November 14, 2016) will occur after FY 2016, in the FY 2016 IPPS/LTCH PPS final rule, we continued new technology add-on payments for this technology for FY 2016 (80 FR 49443). However, for FY 2017, the 3-year anniversary date of the entry of RNS® System on the U.S. market (November 14, 2016) will occur in the first half of FY 2017. As discussed previously in this section, in general, we extend new technology add-on payments for an additional year only if the 3-year anniversary date of the product's entry on to the U.S. market occurs in the latter half of the fiscal year. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25036 and 25037), we proposed to discontinue new technology add-on payments for this technology for FY 2017. We invited public comments on this proposal in the proposed rule.

Comment: One commenter, the manufacturer, submitted a comment and requested that CMS continue to make new technology add-on payments for the RNS® System in FY 2017. The commenter stated that it recognized that the 3-year anniversary date of the RNS® System's entry onto the U.S. market technically occurs in the first half of FY 2017. However, the commenter believed that CMS should continue to consider the device ''new'' in FY 2017 for purposes of new technology add-on payments because numerous obstacles were encountered before the product began to be sold, resulting in a significant delay in the product's availability on the U.S. market. As a result of these obstacles, the commenter believed that the data used to analyze and compare cost for the limited number of cases reported in the first half of FY 2014 were also hindering and skewed the comparisons. The commenter provided the following reasons why it believed CMS should continue new technology add-on payments for the RNS® System for FY 2017:

- Because of delays encountered during the FDA approval process for the RNS® System, FDA approval for the use of the new technology was not received by July 1, 2013, which disqualified the approval of the FY 2014 new technology add-on payment application for the RNS® System in FY 2014. Although the RNS® System received FDA approval on November 14, 2013, a 30-day notice to replace a component supplier was required to be submitted to FDA following the approval. According to the manufacturer, the delays significantly impacted the product's availability on the U.S. market; prohibiting the ability to market or make the product available on the U.S. market until December 18, 2013.
- As a condition of approval by the FDA, the RNS® System can only be sold to Comprehensive Epilepsy Centers (CECs) that meet specific requirements related to physician expertise and center experience. The FDA does not grant approval for the CECs to purchase and implant the RNS® System. Rather, the manufacturer (NeuroPace) has to verify that the CEC meets certain requirements before it allows the CEC to procure the device. After that verification is completed, the CEC then has to comply with its own internal approval processes, which are quite extensive, before the actual acquisition or purchase of the device and commencing use of the device. The approval process typically involves several different groups within the CEC and occurs in a series of sequential steps. According to the manufacturer, as a result, many CECs were unwilling to adopt the use of the technology initially because they would incur a significant financial loss for each Medicare patient treated in FY 2014 because new technology add-on payments for the RNS® System were not available. In addition, the manufacturer stated that further complications and delays were presented and encountered because a number of CECs were unwilling to proceed with acquisition and use of the new technology until CMS announced approval of new technology add-on payments for the RNS® System in the FY 2015 IPPS/LTCH PPS final rule.
- According to the manufacturer, because the RNS® System can only be sold to CECs, by March 30, 2014 (that

is, during the first half of FY 2014), only six RNS® System commercial implant procedures were performed (which occurred at previous clinical trial sites that allowed the internal approval process to proceed more quickly). Of these cases, only two represented the treatment of Medicare beneficiaries. As a result, the market activity was extremely limited in the first half of that fiscal year. In addition, the manufacturer stated that hospitals incorrectly reported cases involving ICD–9–CM procedure codes 01.20 and 02.93 for non-RNS® System procedures. The manufacturer asserted that, as a result, CMS may have reviewed MedPAR data and may have believed that there were many more RNS® System cases than what actually occurred (including during the first 6 months of FY 2014), which may have negatively impacted how CMS views and applies the criteria regarding continuing new technology add-on payments for the RNS® System for a third year because the MedPAR data does not accurately reflect cases involving treatment using the RNS® System.

• Without the approval for new technology add-on payments in FY 2017, CECs currently offering treatment involving the RNS® System would face the difficult challenge of continuing to provide treatment using the device to Medicare beneficiaries in the face of substantial losses because of an inadequate applicable MS–DRG payment rate.

Response: With regard to the technology's newness, the timeframe that a new technology can be eligible to receive new technology add-on payments ends when data documenting the use and cost of the procedures become available. Section 412.87(b)(2) states that, a medical service or technology may be considered new within 2 or 3 years after the point at which data begin to become available reflecting the ICD–9–CM code assigned to the new service or technology (depending on when a new code is assigned and data on the new service or technology become available for DRG recalibration). Section 412.87(b)(2) also states, after CMS has recalibrated the DRGs, based on available data, to reflect the costs of an otherwise new medical service or technology, the medical service or technology will no longer be considered ''new'' under the applicable criteria. Therefore, as discussed in the FY 2005 IPPS final rule (69 FR 49003), if the costs of the technology are included in the charge data, and the MS–DRGs have been recalibrated using that data, the technology can no longer be considered ''new'' for the purposes of this provision. We further stated in the FY 2005 IPPS final rule that the period of newness does not necessarily start with the FDA approval date for the medical service or technology or the issuance of a distinct procedure code. Instead, the newness period begins with the date of availability of the product on the U.S. market, which is when data become available. We have consistently applied this standard, and believe that it is most consistent with the purpose of new technology add-on payments.

With regard to the RNS® System, while there may have been issues with some CECs meeting specific requirements and delays prohibiting the use of the device, as the commenter noted, the RNS® System was available for acquisition on the U.S. market on or after December 18, 2013. We agree that the newness period for the RNS® System should begin on December 18, 2013. However, because the 3-year anniversary date of the entry of the RNS® System on the U.S. market (December 18, 2016) will still occur in the first half of FY 2017, the RNS® System continues to be ineligible for new technology add-on payments in FY 2017. As noted previously, in general, we extend new technology add-on payments for an additional year only if the 3-year anniversary date of the product's entry on to the U.S. market occurs in the latter half of the fiscal year.

In addition, similar to our discussion in the FY 2006 IPPS final rule (70 FR 47349), we do not believe that case volume is a relevant consideration for making the determination as to whether a product is ''new.'' Consistent with the statute and our implementing regulations, a technology no longer qualifies as ''new'' once it is more than 2 to 3 years old, irrespective of how frequently it has been used in the Medicare population. Therefore, if a product is more than 2 to 3 years old, we consider its costs to be included in the MS–DRG relative weights, whether its use in the Medicare population has been frequent or infrequent.

Therefore, based on all of the reasons stated above, the RNS® System is no longer considered ''new'' for purposes of new technology add-on payments for FY 2017. We are finalizing our proposal to discontinue making new technology add-on payments for the RNS® System for FY 2017.

Comment: Several commenters that had experienced the effects of the correlating illnesses explained the clinical effectiveness of the device and requested the continuation of new technology add-on payments for the RNS® System for FY 2017.

Response: We thank the commenters for their input. However, as stated above, the RNS® System is no longer considered ''new'' for FY 2017 and, therefore, is no longer eligible for new technology add-on payments.

f. Blinatumomab (BLINCYTO®Trade Brand)

Amgen, Inc. submitted an application for new technology add-on payments for FY 2016 for Blinatumomab (BLINCYTO®), a bi-specific T-cell engager (BiTE) used for the treatment of Philadelphia chromosome-negative (Ph-) relapsed or refractory (R/R) B-cell precursor acute-lymphoblastic leukemia (ALL), which is a rare aggressive cancer of the blood and bone marrow. Approximately 6,050 individuals are diagnosed with Ph- R/R B-cell precursor ALL in the United States each year, and approximately 2,400 individuals, representing 30 percent of all new cases, are adults. Ph- R/R B-cell precursor ALL occurs when there are malignant transformations of B-cell or T-cell progenitor cells, causing an accumulation of lymphoblasts in the blood, bone marrow, and occasionally throughout the body. As a bi-specific T-cell engager, the BLINCYTO® technology attaches to a molecule on the surface of the tumorous cell, as well as to a molecule on the surface of normal T-cells, bringing the two into closer proximity and allowing the normal T-cell to destroy the tumorous cell. Specifically, the BLINCYTO® technology attaches to a cell identified as CD19, which is present on all of the cells of the malignant transformations that cause Ph- R/R B-cell precursor ALL and helps attract the cell into close proximity of the T-cell CD3 with the intent of getting close enough to allow the T-cell to inject toxins that destroy the cancerous cell. According to the applicant, the BLINCYTO® technology is the first, and the only, bi-specific CD19-directed CD3 T-cell engager single-agent immunotherapy approved by the FDA.

BLINCYTO® is administered as a continuous IV infusion delivered at a constant flow rate using an infusion pump. A single cycle of treatment consists of 28 days of continuous infusion, and each treatment cycle is followed by 2 weeks without treatment prior to administering any further treatments. A course of treatment would consist of two phases. Phase 1 consists of initial inductions or treatments intended to achieve remission followed by additional inductions and treatments to maintain consolidation; or treatments

given after remission has been achieved to prolong the duration. During phase 1 of a single treatment course, up to two cycles of BLINCYTO® are administered, and up to three additional cycles are administered during consolidation. The recommended dosage of BLINCYTO® administered during the first cycle of treatment is 9 mcg per day for the first 7 days of treatment. The dosage is then increased to 28 mcg per day for 3 weeks until completion. During phase 2 of the treatment course, all subsequent doses are administered as 28 mcg per day throughout the entire duration of the 28-day treatment period.

With regard to the newness criterion, the BLINCYTO® technology received FDA approval on December 3, 2014, for the treatment of patients diagnosed with Ph- R/R B-cell precursor ALL, and the product gained entry onto the U.S. market on December 17, 2014.

After evaluation of the newness, costs, and substantial clinical improvement criteria for new technology payments for BLINCYTO® and consideration of the public comments we received in response to the FY 2016 IPPS/LTCH PPS proposed rule, we approved BLINCYTO® for new technology add-on payments for FY 2016 (80 FR 49449). Cases involving BLINCYTO® that are eligible for new technology add-on payments are identified using one of the following ICD–10–PCS procedure codes: XW03351 (Introduction of Blinatumomab antineoplastic immunotherapy into peripheral vein, percutaneous approach, new technology group 1) or XW04351 (Introduction of Blinatumomab antineoplastic immunotherapy into central vein, percutaneous approach, new technology group 1).

As discussed in the FY 2016 IPPS/LTCH final rule (80 FR 49449), the applicant recommended that CMS consider and use the cost of the full 28-day inpatient treatment cycle as the expected length of treatment when determining the maximum new technology add-on payment for cases involving the BLINCYTO® rather than the average cost of lesser number of days used as other variables. For the reasons discussed, we disagreed with the applicant and established the maximum new technology add-on payment amount for a case involving the BLINCYTO® technology for FY 2016 using the weighted average of the cycle 1 and cycle 2 observed treatment length. Specifically, in the Phase II trial, the most recent data available, 92 patients received cycle 1 for an average length of 21.2 days, and 52 patients received cycle 2 for an average length of 10.2 days. The weighted average of cycle 1 and 2 treatment length is 17 days. We noted that a small number of patients also received 3 to 5 treatment cycles. However, based on the data provided, these cases do not appear to be typical at this point and we excluded them from this calculation. We noted that, if we included all treatment cycles in this calculation, the weighted average number of days of treatment is much lower, 10 days. Using the clinical data provided by the applicant, we stated that we believe that setting the maximum new technology add-on payment amount for a case involving the BLINCYTO® technology for FY 2016 based on a 17-day length of treatment cycle is representative of historical and current practice. We also stated that, for FY 2017, if new data on length of treatment are available, we would consider any such data in evaluating the maximum new technology add-on payment amount. However, we did not receive any new data from the applicant to evaluate for FY 2017.

In the application, the applicant estimated that the average Medicare beneficiary would require a dosage of 9mcg/day for the first 7 days under the first treatment cycle, followed by a dosage of 28mcg/day for the duration of the treatment cycle, as well as all days included in subsequent cycles. All vials contain 35mcg at a cost of $3,178.57 per vial. The applicant noted that all vials are single-use. Therefore, we determined that cases involving the use of the BLINCYTO® technology would incur an average cost per case of $54,035.69 (1 vial/day × 17 days × $3,178.57/vial). Under 42 CFR 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the technology or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment amount for a case involving the use of the BLINCYTO® is $27,017.85 for FY 2016.

With regard to the newness criterion for BLINCYTO®, we considered the beginning of the newness period to commence when the product gained entry onto the U.S. market on December 17, 2014. Because the 3-year anniversary date of the entry of the BLINCYTO® on the U.S. market will occur after FY 2017 (December 17, 2017), in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25038), we proposed to continue new technology add-on payments for this technology for FY 2017. We proposed that the maximum payment for a case involving BLINCYTO® would remain at $27,017.85 for FY 2017. We invited public comments on this proposal in the proposed rule.

Comment: Commenters supported CMS' proposal to continue new technology add-on payments for BLINCYTO® for FY 2017. The manufacturer submitted a comment with regard to the substantial clinical improvement of the BLINCYTO® and stated that recently released results from a randomized, open-label, Phase 3 confirmatory study (the TOWER study) show significant improvements in overall survival (primary endpoint), complete remission, and event-free survival with BLINCYTO® compared to standard of care chemotherapy in adult patients diagnosed with Ph- R/R B-cell precursor ALL. According to the manufacturer, in this study, 405 patients were randomized in a 2:1 ratio to receive BLINCYTO® or one of four standard of care chemotherapeutic regimens chosen by the investigator. The manufacturer noted that the study was ended early based on a prespecified interim analysis from an independent data monitoring committee (DMC), which found a significant overall survival improvement in the BLINCYTO® arm over standard of care chemotherapy. According to the manufacturer, results from the DMC analysis demonstrated a median overall survival (OS) of 7.8 months.

Response: We appreciate the commenters' support for our proposal.

After consideration of the public comments we received, we are finalizing our proposal to continue new technology add-on payments for BLINCYTO® for FY 2017. The maximum new technology add-on payment for a case involving BLINCYTO® will remain at $27,017.85 for FY 2017.

g. Lutonix® Drug Coated Balloon PTA Catheter and In.PACT™ Admiral™ Paclitaxel Coated Percutaneous Transluminal Angioplasty (PTA) Balloon Catheter

Two manufacturers, CR Bard Inc. and Medtronic, submitted applications for new technology add-on payments for FY 2016 for LUTONIX® Drug-Coated Balloon (DCB) Percutaneous Transluminal Angioplasty (PTA) Catheter (LUTONIX®) and IN.PACT™ Admiral™ Paclitaxel Coated Percutaneous Transluminal Angioplasty (PTA) Balloon Catheter (IN.PACT™ Admiral™), respectively. Both of these technologies are drug-coated balloon angioplasty treatments for patients diagnosed with peripheral artery disease (PAD). Typical treatments for patients with PAD include angioplasty, stenting, atherectomy and vascular bypass surgery. PAD most commonly occurs in the femoropopliteal segment of the

peripheral arteries, is associated with significant levels of morbidity and impairment in quality of life, and requires treatment to reduce symptoms and prevent or treat ischemic events.[2] Treatment options for symptomatic PAD include noninvasive treatment such as medication and life-style modification (for example, exercise programs, diet, and smoking cessation) and invasive options which include endovascular treatment and surgical bypass. The 2013 American College of Cardiology and American Heart Association (ACC/AHA) guidelines for the management of PAD recommend endovascular therapy as the first-line treatment for femoropopliteal artery lesions in patients suffering from claudication (Class I, Level A recommendation).[3]

According to both applicants, LUTONIX® and IN.PACT™ Admiral™ are the first drug coated balloons that can be used for treatment of patients who are diagnosed with PAD. In the FY 2016 IPPS/LTCH final rule, we stated that because cases eligible for the two devices would group to the same MS–DRGs and we believe that these devices are substantially similar to each other (that is, they are intended to treat the same or similar disease in the same or similar patient population and are purposed to achieve the same therapeutic outcome using the same or similar mechanism of action), we evaluated both technologies as one application for new technology add-on payment under the IPPS. The applicants submitted separate cost and clinical data, and we reviewed and discussed each set of data separately. However, we made one determination regarding new technology add-on payments that applied to both devices. We believe that this is consistent with our policy statements in the past regarding substantial similarity. Specifically, we have noted that approval of new technology add-on payments would extend to all technologies that are substantially similar (66 FR 46915), and that we believe that continuing our current practice of extending a new technology add-on payment without a further application from the manufacturer of the competing product or a specific finding on cost and clinical improvement if we make a finding of substantial similarity among two products is the better policy because we avoid—

- Creating manufacturer-specific codes for substantially similar products;
- Requiring different manufacturers of substantially similar products from having to submit separate new technology applications;
- Having to compare the merits of competing technologies on the basis of substantial clinical improvement; and
- Bestowing an advantage to the first applicant representing a particular new technology to receive approval (70 FR 47351).

CR Bard, Inc. received FDA approval for LUTONIX® on October 9, 2014. Commercial sales in the U.S. market began on October 10, 2014. Medtronic received FDA approval for IN.PACT™ Admiral™ on December 30, 2014. Commercial sales in the U.S. market began on January 29, 2015.

In accordance with our policy, we stated in the FY 2016 IPPS\LTCH final rule (80 FR 49463) that we believe it is appropriate to use the earliest market availability date submitted as the beginning of the newness period. Accordingly, for both devices, we stated that the beginning of the newness period will be October 10, 2014.

After evaluation of the newness, costs, and substantial clinical improvement criteria for new technology payments for the LUTONIX® and IN.PACT™ Admiral™ technologies and consideration of the public comments we received in response to the FY 2016 IPPS/LTCH PPS proposed rule, we approved the LUTONIX® and IN.PACT™ Admiral™ technologies for new technology add-on payments for FY 2016 (80 FR 49469). Cases involving the LUTONIX® and IN.PACT™ Admiral™ technologies that are eligible for new technology add-on payments are identified using one of the ICD–10–PCS procedure codes in the following table:

ICD–10–PCS code	Code description
047K041	Dilation of right femoral artery with drug-eluting intraluminal device using drug-coated balloon, open approach.
047K0D1	Dilation of right femoral artery with intraluminal device using drug-coated balloon, open approach.
047K0Z1	Dilation of right femoral artery using drug-coated balloon, open approach.
047K341	Dilation of right femoral artery with drug-eluting intraluminal device using drug-coated balloon, percutaneous approach.
047K3D1	Dilation of right femoral artery with intraluminal device using drug-coated balloon, percutaneous approach.
047K3Z1	Dilation of right femoral artery using drug-coated balloon, percutaneous approach.
047K441	Dilation of right femoral artery with drug-eluting intraluminal device using drug-coated balloon, percutaneous endoscopic approach.
047K4D1	Dilation of right femoral artery with intraluminal device using drug-coated balloon, percutaneous endoscopic approach.
047K4Z1	Dilation of right femoral artery using drug-coated balloon, percutaneous endoscopic approach.
047L041	Dilation of left femoral artery with drug-eluting intraluminal device using drug-coated balloon, open approach.
047L0D1	Dilation of left femoral artery with intraluminal device using drug-coated balloon, open approach.
047L0Z1	Dilation of left femoral artery using drug-coated balloon, open approach.
047L341	Dilation of left femoral artery with drug-eluting intraluminal device using drug-coated balloon, percutaneous approach.
047L3D1	Dilation of left femoral artery with intraluminal device using drug-coated balloon, percutaneous approach.
047L3Z1	Dilation of left femoral artery using drug-coated balloon, percutaneous approach.
047L441	Dilation of left femoral artery with drug-eluting intraluminal device using drug-coated balloon, percutaneous endoscopic approach.
047L4D1	Dilation of left femoral artery with intraluminal device using drug-coated balloon, percutaneous endoscopic approach.
047L4Z1	Dilation of left femoral artery using drug-coated balloon, percutaneous endoscopic approach.
047M041	Dilation of right popliteal artery with drug-eluting intraluminal device using drug-coated balloon, open approach.
047M0D1	Dilation of right popliteal artery with intraluminal device using drug-coated balloon, open approach.
047M0Z1	Dilation of right popliteal artery using drug-coated balloon, open approach.
047M341	Dilation of right popliteal artery with drug-eluting intraluminal device using drug-coated balloon, percutaneous approach.
047M3D1	Dilation of right popliteal artery with intraluminal device using drug-coated balloon, percutaneous approach.

047N3Z1	Dilation of left popliteal artery using drug-coated balloon, percutaneous approach.
047N441	Dilation of left popliteal artery with drug-eluting intraluminal device using drug-coated balloon, percutaneous endoscopic approach.
047N4D1	Dilation of left popliteal artery with intraluminal device using drug-coated balloon, percutaneous endoscopic approach.
047N4Z1	Dilation of left popliteal artery using drug-coated balloon, percutaneous endoscopic approach.

As discussed in the FY 2016 IPPS/LTCH final rule (80 FR 49469), each of the applicants submitted operating costs for its DCB. The manufacturer of the LUTONIX® stated that a mean of 1.37 drug-coated balloons was used during the LEVANT 2 clinical trial. The acquisition price for the hospital will be $1,900 per drug-coated balloon, or $2,603 per case (1.37 × $1,900). The applicant projected that approximately 8,875 cases will involve use of the LUTONIX® for FY 2016. The manufacturer for the IN.PACT™ Admiral™ stated that a mean of 1.4 drug-coated balloons was used during the IN.PACT™ Admiral™ DCB arm. The acquisition price for the hospital will be $1,350 per drug-coated balloon, or $1,890 per case (1.4 × $1,350). The applicant projected that approximately 26,000 cases will involve use of the IN.PACT™ Admiral™ for FY 2016.

For FY 2016, we based the new technology add-on payment for cases involving these technologies on the weighted average cost of the two DCBs described by the ICD–10–PCS procedure codes listed above (which are not manufacturer specific). Because ICD–10 codes are not manufacturer specific, we cannot set one new technology add-on payment amount for IN.PACT™ Admiral™ and a different new technology add-on payment amount for LUTONIX®; both technologies will be captured by using the same ICD–10–PCS procedure code. As such, we stated that we believe that the use of a weighted average of the cost of the standard DCBs based on the projected number of cases involving each technology to determine the maximum new technology add-on payment would be most appropriate. To compute the weighted cost average, we summed the total number of projected cases for each of the applicants, which equaled 34,875 cases (26,000 plus 8,875). We then divided the number of projected cases for each of the applicants by the total number of cases, which resulted in the following case-weighted percentages: 25 percent for the LUTONIX® and 75 percent for the IN.PACT™ Admiral™. We then multiplied the cost per case for the manufacturer specific DCB by the case-weighted percentage (0.25 * $2,603 = $662.41 for LUTONIX® and 0.75 * $1,890 = $1,409.03 for the IN.PACT™ Admiral™). This resulted in a case-weighted average cost of $2,071.45 for DCBs. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the device or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum payment for a case involving the LUTONIX® or IN.PACT™ Admiral™ DCBs is $1,035.72.

With regard to the newness criterion for LUTONIX® and IN.PACT™ Admiral™ technologies, we considered the beginning of the newness period to commence when LUTONIX® gained entry onto the U.S. market on October 10, 2014. Because the 3-year anniversary date of the entry of LUTONIX® on the U.S. market will occur after FY 2017 (October 10, 2017), in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25039 and 25040), we proposed to continue new technology add-on payments for both the LUTONIX® and IN.PACT™ Admiral™ technologies for FY 2017. We proposed that the maximum add-on payment for a case involving LUTONIX® and IN.PACT™ Admiral™ would remain at $1,035.72 for FY 2017. We invited public comments on this proposal in the proposed rule.

Comment: Commenters supported CMS' proposal to continue new technology add-on payments for the LUTONIX® and IN PACT™ Admiral™ for FY 2017.

Response: We appreciate the commenters' support for our proposal.

After consideration of the public comments we received, we are finalizing our proposal and continuing new technology add-on payments for both the LUTONIX® and IN PACT™ Admiral™ for FY 2017. The maximum add-on payment for a case involving LUTONIX® and IN.PACT™ Admiral™ remains at $1,035.72 for FY 2017.

5. FY 2017 Applications for New Technology Add-On Payments

We received nine applications for new technology add-on payments for FY 2017. One applicant withdrew its application prior to the issuance of the FY 2017 IPPS/LTCH PPS proposed rule. Another applicant, Andexanet Alfa, withdrew its application prior to the issuance of the FY 2017 IPPS/LTCH PPS final rule.

In addition, in accordance with the regulations under § 412.87(c), applicants for new technology add-on payments must have FDA approval or clearance by July 1 of each year prior to the beginning of the fiscal year that the application is being considered. One applicant, the EDWARDS INTUITY Elite™ Valve System, did not receive FDA approval for their technology by July 1, 2016, and, therefore, it is ineligible for consideration for new technology add-on payments for FY 2017. We are not including the descriptions and discussions of these two applications that were included in the FY 2017 proposed rule in this final rule. We note that we did receive public comments on these two applications. However, because Andexanet Alfa withdrew its application and the EDWARDS INTUITY Elite™ Valve System is ineligible for new technology add-on payments for FY 2017 because it did not receive FDA approval by July 1, 2016, we are not summarizing or responding to public comments on these applications in this final rule. A

discussion of the seven remaining applications is presented below.

a. MAGEC® Spinal Bracing and Distraction System (MAGEC® Spine)

Ellipse Technologies, Inc. submitted an application for new technology add-on payments for FY 2017 for the MAGEC® Spine. According to the applicant, the MAGEC® Spine has been developed for use in the treatment of children diagnosed with severe spinal deformities, such as scoliosis. The system can be used in the treatment of skeletally immature patients less than 10 years of age who have been diagnosed with severe progressive spinal deformities associated with or at risk of Thoracic Insufficiency Syndrome (TIS). The MAGEC® Spine consists of a (spinal growth) rod that can be lengthened through the use of magnets that are controlled by an external remote controller (ERC). The rod(s) can be implanted into children as young as 2 years of age. According to the applicant, use of the MAGEC® Spine has proven to be successfully used in the treatment of patients diagnosed with scoliosis who have not been responsive to other treatments.

The MAGEC® Spine initially received FDA clearance for use of the predicate device, which used a Harrington Rod on February 27, 2014. The applicant verified that, due to manufacturing delays, the MAGEC® Spine was not available for implant until April 1, 2014. Specifically, the complete MAGEC® Spine system was produced and available for shipment for the first implant on April 1, 2014. Therefore, the newness period for the MAGEC® Spine begins on April 1, 2014. Subsequent FDA clearance was granted for use of the modified device, which uses a shorter 70 mm rod on September 18, 2014. After minor modification of the product, the MAGEC® Spine received FDA clearances on March 24, 2015, and May 29, 2015, respectively.

The applicant submitted a request for a unique ICD–10–PCS procedure code and was granted approval for the following procedure codes under New Technology Group 2: XNS0032 (Reposition of lumbar vertebra using magnetically controlled growth rod(s), open approach); XNS0432 (Reposition of lumbar vertebra using magnetically controlled growth rod(s), percutaneous endoscopic approach); XNS3032 (Reposition of cervical vertebra using magnetically controlled growth rod(s), open approach); XNS3432 (Reposition of cervical vertebra using magnetically controlled growth rod(s), percutaneous endoscopic approach); XNS4032 (Reposition of thoracic vertebra using magnetically controlled growth rod(s), open approach); and XNS4432 (Reposition of thoracic vertebra using magnetically controlled growth rod(s), percutaneous endoscopic approach). These new ICD–10–PCS procedure codes are effective on October 1, 2016.

In the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43813 through 43814), we established criteria for evaluating whether a new technology is substantially similar to an existing technology, specifically: (1) Whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome; (2) whether a product is assigned to the same or a different MS–DRG; and (3) whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population. If a technology meets all three of these criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments. For a detailed discussion of the criteria for substantial similarity, we refer readers to the FY 2006 IPPS final rule (70 FR 47351 through 47352), and the FY 2010 IPPS/LTCH PPS final rule (74 FR 43813 through 43814).

With regard to the first criterion, the applicant stated that the MAGEC® Spine's mechanism of action is dependent upon growing rods used for the treatment of patients diagnosed with early onset scoliosis (EOS), and is unique because the technique uses magnetic distraction (lengthening), which does not require the patients to be subjected to the potential and adverse effects of additional surgeries.

The applicant explained that treatment of patients diagnosed with EOS involves the implantation of traditional growth rods (TGRs) followed by surgery every 6 months to distract the rods to accommodate the growing spine until the patient reaches a level of spinal maturity when the spine can then be fused. The average number of distraction surgeries per patient is 12 over the course of 6 years. Once spinal alignment and maturity is reached, the TGRs are surgically and permanently removed. The applicant stated that, while the most recent modification to the MAGEC® Spine's rods accomplish the same goal as the predicate device, Harrington rods, MAGEC® Spine rods achieve the predetermined goal with minimally invasive techniques after implantation, which prevents the patients from being subjected to the potential and adverse effects of numerous lengthening surgeries. The applicant further noted that after the MAGEC® Spine's rod has been implanted, the ERC is placed externally over the patient's spine at the location of the magnet in the MAGEC® Spine's rod. Periodic, noninvasive distraction of the rod is performed to lengthen the spine and to provide adequate bracing during growth. Routine X-ray or ultrasound procedures are used to confirm the position and amount of distraction. The frequency of distraction sessions is customized to the needs of the individual patient by the treating surgeon.

With regard to the first criterion, in the proposed rule (81 FR 25040), we stated that we were concerned that the MAGEC® Spine uses the same mechanism of action, spinal rod distraction, to achieve the same therapeutic outcome of spinal alignment as other currently available technologies and treatment options for Medicare beneficiaries. Specifically, TGRs are implanted and affixed to the immature spine in order to correct spinal deformities. As a child grows, the TGRs must be distracted to accommodate spinal growth. The common denominator between TGRs and the MAGEC® Spine is that they both are devices (rods) that use the same mechanism of action to perform and achieve spinal distraction, the implantation of rods that are later lengthened. While we acknowledged that the applicant noted that the MAGEC® Spine does not require the patient to endure the potential and adverse effects of additional surgeries, we stated that this assertion seems to be a component of substantial clinical improvement rather than a basis to distinguish the mechanism of action.

In consideration of the applicant's statements that the mechanism of action of the MAGEC® Spine, which uses growing rods in the treatment of patients diagnosed with EOS, is unique because the technique of using magnetic distraction (lengthening) does not require patients to endure the potential and adverse effects of additional surgeries, in the proposed rule, we stated that there are other technologies and products currently available that achieve spinal growth without the need to subject patients to potential and adverse effects of additional surgeries. For example, the Shilla growth guidance system, which received FDA clearance in 2014, uses a non-locking set screw at the proximal and distal portions of the construct's rods. This specific feature is designed to allow the rod to slide through the screw heads as a child's spine grows, while still providing correction of the spinal deformity. The Shilla technique also eliminates the

need for scheduled distraction surgeries, as the applicant pointed out are needed with the use of TGRs. Therefore, in the proposed rule, we stated that we believe that the MAGEC® Spine's mechanism of action may be similar to the mechanism of action employed by the Shilla growth guidance system because both technologies achieve the same therapeutic outcome and do not require the patient to endure the potential and adverse effects of additional surgeries.

With regard to the second criterion, cases that may be eligible for treatment involving the MAGEC® Spine map to the following MS–DRGs: 456 (Spinal Fusion Except Cervical With Spinal Curvature or Malignancy or Infection or Extensive Fusions with MCC); 457 (Spinal Fusion Except Cervical with Spinal Curvature or Malignancy or Infection or Extensive Fusions with CC); and 458 (Spinal Fusion Except Cervical with Spinal Curvature or Malignancy or Infection or Extensive Fusions without CC/MCC). All cases involving procedures describing spinal distraction devices, including those that use TGRs and the Shilla growth guidance system, currently map to the same MS–DRGs.

With regard to the third criterion, we believe that the MAGEC® Spine technology involves the treatment of the same or similar type of disease and the same or similar patient population. Although the applicant stated that the MAGEC® Spine was developed for the use in the treatment of children diagnosed with severe spinal deformities, the MAGEC® Spine treats the same patient population as other currently available spinal distraction devices and technologies, including those that use TGRs and the Shilla growth guidance system. Because it appears that the MAGEC® Spine is substantially similar to these other currently available devices used to treat the same or similar types of diseases and the same or similar patient populations, in the proposed rule we stated that we were concerned that the technology may not be considered ''new'' for the purposes of new technology add-on payments (81 FR 25041). We also invited public comments on whether the MAGEC® Spine meets the newness criterion.

Comment: The applicant submitted public comments that responded to CMS' concerns presented in the proposed rule with regard to newness. The applicant provided a working definition of ''mechanism of action'' of spinal distraction systems as: The combined device-technique interaction with tissues that produces a therapeutic effect. The combined device-technique interaction includes the following elements: Initial fusion; device mechanism; spinal growth control; and spinal curvature control.

The applicant distinguished MAGEC® Spine's mechanism of action as distinct from the Shilla system's tissue interaction because the Shilla system provides passive growth guidance and the MAGEC® Spine provides active distraction by noninvasive magnetically controlled lengthening. Furthermore, MAGEC® Spine enables a surgeon to customize or adjust a patient's therapy with more frequent, noninvasive, magnetic external remote controlled sessions. The applicant described the MAGEC® Spine's device mechanism as distinct from the Shilla system in that the MAGEC® Spine system's initial fusion is the cephalad and caudad ends of the spine whereas the Shilla system's initial fusion is at the apex of the spinal curve. The MAGEC® Spine system drives growth with active noninvasive rod distractions whereas the Shilla system provides passive growth guidance with sliding anchors and limited stability.

The applicant further described the MAGEC® Spine's device mechanism as distinct from TGRs in that the MAGEC® Spine system consists of magnetically controlled growing rods and actuators and an external remote, whereas, TGRs device mechanism consists of growing rods and tandem connectors which must be surgically removed and replaced with longer rods to achieve the desired lengthening. The applicant further compared the MAGEC® Spine system's tissue interaction as frequent noninvasive lengthening in an awake patient to control and adapt spine growth to a child's development, with low complication rates and few repeated surgeries. TGRs tissue interactions include manual surgical lengthening under general anesthesia at 6-month intervals.

Response: We appreciate the details and input provided by the applicant in response to our concerns. As the commenter has described above, we agree that the MAGEC® Spine's mechanism of action is distinct from the TGR and the Shilla system. Specifically, the MAGEC® Spine's noninvasive method of distraction is distinct from TGRs surgical distraction and the MAGEC® Spine's active distraction is distinct from the Shilla system's passive distraction. After considering the additional information submitted by the applicant in response to our concerns, which supported the technology's uniqueness in achieving spinal rod distraction, we agree with the applicant that the MAGEC® Spine meets the newness criterion, and we consider the technology to be ''new'' as of April 1, 2014.

With regard to the cost criterion, the applicant maintained that there is an insufficient number of cases in the Medicare claims data to evaluate because of the small number of potential cases and cases reflecting patients who were actually diagnosed with or who experience early onset scoliosis (EOS) requiring the implantation of growing rods. Specifically, the applicant stated that the majority of the Medicare population is 65 years of age and older, while individuals who may be eligible for the MAGEC® Spine are typically less than 10 years of age. Therefore, the applicant estimated the number of EOS cases using internal estimates for de novo cases (<10 year of age), as well as cases that could potentially convert to using the MAGEC® Spine without searching the MedPAR data file or any other data source. The applicant estimated that a total of 2,500 EOS cases may be eligible for treatment using the MAGEC® Spine in FY 2016. According to the applicant, 580 cases would map to MS–DRG 456, 870 cases would map to MS–DRG 457, and 1,050 cases would map to MS–DRG 458. The applicant based the distribution of cases on data from its medical advisors, customers, and reimbursement support team.

The applicant used Medicare and non-Medicare data for six providers that used the MAGEC® Spine during CY 2016. This resulted in an average unstandardized case-weighted charge per case of $243,999. The applicant then removed charges related to the predicate technology. Using the Impact File published with the FY 2016 IPPS/LTCH PPS final rule, the applicant standardized the charges and applied an inflation factor of 10 percent. The applicant computed an average CCR of the six hospitals based on the overall hospitals CCRs in the FY 2016 IPPS/LTCH final rule Impact File. The applicant then computed the charges for the device by dividing the costs of the device by the average CCR and added these charges to determine the inflated average standardized case-weighted charge per case. The applicant noted that the cost of the technology was proprietary information. Based on the FY 2016 IPPS/LTCH PPS Table 10 thresholds, the average case-weighted threshold amount was $105,909. The applicant computed an inflated average standardized case-weighted charge per case of $248,037. Because the inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25041), we stated that we have the following concerns regarding the applicant's cost analysis:

- The applicant did not specify how many cases were the basis for the average standardized case-weighted charges per case. Therefore, we cannot determine if the charges per case represent a statistical sample relative to the projected cases eligible for the MAGEC® Spine for the upcoming fiscal year.
- The applicant did not specify how many cases included in the analysis were Medicare and non-Medicare cases. We typically rely on Medicare data and understand the limitations of this patient population in the Medicare data (as the applicant explained above). However, CMS would still like the details regarding the numerical representation of Medicare and non-Medicare cases the applicant used in its analysis.
- The applicant did not explain the methodology it used to remove the charges for the predicate technology, as well as the type of technology that the charges replaced. Therefore, in the proposed rule, we stated that we were unable to validate the accuracy of the applicant's methodology.
- The applicant did not explain the basis of using a 10-percent inflation factor. Specifically, the applicant used cases from CY 2016 and inflated the costs to FY 2017 using a 10-percent inflation factor. However, the 1-year inflation factor in the FY 2016 IPPS/LTCH final rule (80 FR 49784) is 3.7 percent. Therefore, we do not believe that a 10-percent inflation factor is appropriate.

The applicant used the average overall CCR of the six hospitals to convert the costs of the MAGEC® Spine to charges. However, rather than using an average CCR, to increase the precision of determining the charges of the MAGEC® Spine, the applicant could have instead used each hospital's individual CCR or the implantable device CCR of 0.337 as reported in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49429).

We invited public comments on whether the MAGEC® Spine meets the cost criterion, particularly with regard to the concerns we raised in the proposed rule.

Comment: In response to our concerns, the applicant reported that it had conducted a new cost analysis using the FY 2015 MedPAR data set. Specifically, the applicant searched for cases with patients less than 25 years of age that had the following ICD–9–CM diagnosis codes (737.30, 737.32, 737.34, 737.39, 737.43 or 754.2) that map to MS–DRGs 456, 457, and 458. This resulted in fewer than 11 cases in each of the applicable MS–DRGs (456, 457 and 458); therefore, the applicant suppressed the exact number of cases to protect patient privacy. The applicant stated that the total number of cases across all three MS–DRGs was between 11 and 20. This resulted in average case weighted charge per case of $329,370. The applicant then removed charges for the prior technology (traditional growth rods) and standardized the charges which resulted in a case-weighted standardized charge per case of $228,627. Using the FY 2016 IPPS Table 10 thresholds, the average case-weighted threshold amount was $170,061 (all calculations above were performed using unrounded numbers). Without inflating the charges and adding charges for the device to the standardized case-weighted charge per case, the applicant determined that the standardized case-weighted charge per case exceeds the average case-weighted threshold amount.

Because the MedPAR analysis identified only a few cases, the applicant provided additional charge data to demonstrate it would meet the cost criterion. The applicant explained that patients who receive the MAGEC® Spine technology have an average length of stay of 5 days in the hospital. To compute the average implantation procedure costs for the MAGEC® Spine, the applicant used FY 2015 MedPAR data and determined average implantation procedure costs for MS–DRGs 456, 457, and 458 of $40.932. The applicant noted that 20 percent of cases use a single rod while 80 percent of cases use a dual rod. The applicant then computed an average weighted cost of $43,049 for single and dual rod construct of the device (which includes costs for pedicle and rod screws and hooks as well as some connectors). This resulted in a subtotal of total costs of $83,981 ($40.932 + $43,049). The applicant then deducted $13,845 for total costs related to the previous technology (costs for TGR). This resulted in total costs of $70,136 related to the MAGEC® Spine ($83,981 − $13,845). To convert the total costs to charges, the applicant applied divided the total costs of $70,136 by the national average implantable device CCR of 0.337 from the FY 2016 IPPS/LTCH PPS final rule (80 FR 49429) which resulted in total charges of $208,119. Because the total charges for the MAGEC® Spine technology of $208,119 exceed the average case-weighted threshold amount of $170,061, the applicant maintained that the MAGEC® Spine technology meets the cost criterion.

Response: We thank the applicant for providing these further analyses. We agree that the applicant has demonstrated that the MAGEC® Spine technology meets the cost criterion.

With regard to substantial clinical improvement, the applicant stated that use of the MAGEC® Spinal Bracing and Distraction System significantly improves clinical outcomes for the pediatric patient population with spinal deformities when compared to technologies and treatment options that employ TGRs by decreasing the number of subsequent surgeries and potential adverse effects following implantation. The applicant provided results from a study,[4] which demonstrated that patients receiving treatment using the magnetically controlled growth rods (MCGR) system had 57 fewer surgeries as a whole than those patients receiving treatment options using TGRs. According to the applicant, the results further projected decreased rates of infection and attendant costs because the need for additional distraction (lengthening) surgeries is eliminated. In addition, the applicant stated that 1,500 patients located around the world have been successfully treated with the use of this technology. The applicant indicated that the results from another study [5] cited the following qualitative outcomes: minimal surgical scarring, decreased psychological distress and improved quality of life, improved pulmonary function tests (PFTs), and capabilities to continuously monitor neurological behaviors because the patient is not exposed to anesthesia during follow-up distractions.

We stated in the proposed rule (81 FR 25042) that we were concerned that the applicant's assertions that the MAGEC® Spine technology leads to significantly better clinical outcomes; specifically, decreased rates of infection, when compared to treatment options that use TGRs has not been shown by the results of the studies provided. The results of the studies provided did not compare rates of infection for patients receiving treatment using the MAGEC® Spine versus patients receiving treatment using TGRs or other spinal growth rods. Also, as previously mentioned, there are

[4] Akbarnia BA, Cheung K, Noordeen H et al. Traditional rods versus magnetically controlled growing rods in early onset scoliosis: a case-matched two year study. 2013.

[5] Cheng, KMC, Cheung JPY, Damartzis, D, Mak, KC, Wong, WYC, Akbaria, BA, Luk KDK. Magnetically controlled growing rods for sever spinal curvature in young children. A prospective study. Lancet 379 (830) 26 May–1 June 2012, pp. 1967–1974.

other currently available technologies and devices such as the Shilla growth guidance system that also achieve the same therapeutic outcome and do not require the patient to be subjected to the potential and adverse effects of additional surgery. Therefore, we stated that we were concerned that the MAGEC® Spine may not represent a substantial clinical improvement over existing technologies. We also invited public comments on whether the MAGEC® Spine meets the substantial clinical improvement criterion.

Comment: The applicant submitted public comments that responded to our concerns presented in the proposed rule with regard to substantial clinical improvement. The applicant provided studies which showed frequency of spinal lengthening improves thoracic-sacral spinal growth. The applicant also provided studies which showed improved spinal curve correction, increased spinal height, and decreased complications with the MAGEC® Spine when compared to traditional growth rods.

The applicant maintained that treatment goals for Early Onset Scoliosis (EOS) are not limited to controlling curvature and increasing height, but also include the avoidance of surgical and nonsurgical complications. Specifically, these additional goals include minimizing complications, procedures, hospitalizations, and family burden. The applicant asserted that the use of the MAGEC® Spine system achieves curve correction, increases patient height, results in fewer surgeries/hospitalizations (as compared to TGRs) which leads to fewer complications and better outcomes in a fragile and vulnerable patient population through reduced exposure to anesthesia,[6] reduced exposure to radiation, reduced negative psychosocial outcomes,[7] reduced infections risk due to fewer surgeries,[8] and improved lung development and weight gain.

Several commenters indicated improvements in clinical outcomes and decreased morbidity in this patient population. Other commenters who were parents with children who have converted to the MAGEC® rods from traditional growth rods and body casts considered the MAGEC® rods the best option to eliminate pain and hospitalization. Several other commenters supported approval of new technology add-on payment for the MAGEC® Spine System.

Response: We appreciate the commenters' support and comments addressing our concerns. We agree that the MAGEC® Spine represents a substantial clinical improvement over existing technologies because it avoids surgical complications. Specifically, the MAGEC® Spine rods can be nonsurgically lengthened, eliminating the need for subsequent surgical intervention for revision.

After consideration of the public comments we received, we have determined that the MAGEC® Spinal Bracing Distraction system meets all of the criteria for approval of new technology add-on payments for FY 2017. Cases involving the MAGEC® Spinal Bracing Distraction system that are eligible for new technology add-on payments will be identified by the ICD–10–PCS procedure codes XNS0032, XNS0432, XNS3032, XNS3432, XNS4032, and XNS4432. With the new technology add-on payment application, the applicant stated that the total operating cost of the MAGEC® Spine is $17,500 for a single rod and $35,000 for a dual rod. It is historical practice for CMS to make the new technology add-on payment based on the average cost of the technology and not the maximum. For example, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53358), we approved new technology add-on payments for DIFICID™ based on the average dosage of 6.2 days rather than the maximum 10 day dosage. As noted above, 20 percent of cases use a single rod while 80 percent of cases use a dual rod. As a result, the weighted average cost for a single and dual MAGEC® Spine is $31,500 (((0.2 * $17,500) + (0.8 * $35,000))). We note that the costs for pedicle and rod screws and hooks as well as some connectors are not unique to the MAGEC® Spine as these components are generic to TGR. Therefore, they are not considered new and are not included in the costs above. Under § 412.88(a)(2), new technology add-on payments are limited to the lesser of 50 percent of the average cost of the device or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of the MAGEC® Spinal Bracing Distraction system is $15,750 for FY 2017.

b. MIRODERM Biologic Wound Matrix (MIRODERM)

Miromatrix Medical, Inc. submitted an application for new technology add-on payments for FY 2017 for MIRODERM. MIRODERM is a non-crosslinked acellular wound matrix that is derived from the porcine liver and is processed and stored in a phosphate buffered aqueous solution. MIRODERM is clinically indicated for the management of wounds, including: Partial and full-thickness wounds, pressure ulcers, venous ulcers, chronic vascular ulcers, diabetic ulcers, trauma wounds, drainage wounds, and surgical wounds. Typical decellularization where tissues are immersed in a decellularization solution is a diffusion-based process, and thereby limits the ability to fully decellularize thick, complex tissues such as the liver. MIRODERM uses a perfusion decellularization process that rapidly removes cellular material while maintaining the native architecture, vasculature and tissue structure. Following decellularization, MIRODERM is isolated from partial thickness liver sections following slight compression of the liver. This allows for the retention of the native liver structure, including the vasculature, within MIRODERM. The applicant noted that the MIRODERM is the only acellular skin substitute product that is derived from the liver.

According to the applicant, MIRODERM is positioned to completely contact the entire surface of the wound bed and extend slightly beyond all wound margins. As required, it is securely anchored to the wound site with a physician's preferred fixation method. An appropriate, primary non-adherent wound dressing is then applied over the MIRODERM matrix. A secondary dressing (multi-layer compression bandage system), total contact cast, or other appropriate dressing that will manage the wound exudate should be applied in order to keep the MIRODERM matrix moist and keep all layers securely in place. Additional applications of MIRODERM are applied as needed until the wound closes.

MIRODERM received FDA clearance for its use on January 27, 2015. The applicant submitted a request for an unique ICD–10–PCS procedure code and was granted approval for the following code: XLRPXL2 (Replacement of Skin using Porcine Liver Derived Skin Substitute, External Approach, New Technology Group 2). The new

[6] Matsumoto, W.E., Abnormal psychological scores are observed in patients with EOS. The at-risk patients are younger at the time of their initial scoliosis surgery and the number of repetitive surgeries. *Journal of Pediatric Orthopedics,* 2014, pp. 172–182.

[7] Flynn, E., Psychological Dysfunction in Children Who Require Repetitive Surgery for Early Onset Scoliosis. *Journal of Pediatric Orthopedics,* 2014, pp. 594–599.

[8] Kabirian, et al., Deep Surgical Site Infection Following 2344 Growing-Rod Procedures for Early-Onset Scoliosis: Rick Factors and Clinical Consequences, *Journal of Bone and Joint Surgery,* 2014, pp. 2739–2744.

code is effective on October 1, 2016 (FY 2017).

Comment: One commenter asserted that an unique ICD–10–PCS procedure code for procedures involving the use of the MIRODERM is not necessary because the use of this product should coincide with the same coding used for all cellular and/or tissue-based products (CTPs).

Response: As noted above, an unique ICD–10–PCS procedure code was created for procedures involving the use of the MIRODERM in Section ''X'' of the ICD–10–PCS codes. As discussed in the FY 2016 IPPS/LTCH final rule (80 FR 49434), Section ''X'' of the ICD–10–PCS was created to identify and describe new technologies and medical services for purposes of new technology, or that capture other new technologies that are not currently classified within the ICD–10–PCS. The Section ''X'' codes identify new medical services and technologies that are not usually captured by coders, or that do not usually have the desired specificity within the current ICD–10–PCS structure required to capture the use of these new services and technologies. We believe that the issuance of a unique ICD–10–PCS procedure code in Section ''X'' of the ICD–10–PCS for procedures involving the use of the MIRODERM is an example of why we created Section ''X.''

As discussed earlier, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first substantial similarity criterion, whether the product uses the same or a similar mechanism of action to achieve a therapeutic outcome, the applicant stated in its application that current wound healing therapies are provided in several different modalities, which include hyperbaric oxygen treatment, negative wound pressure therapy, and treatment with other bioengineered skin substitute products. The applicant noted that other products that have been commonly used for similar procedures are Oasis Wound Matrix, Primatrix Dermal Repair, and Theraskin. The applicant asserted that MIRODERM is different from these other products because it is the only product sourced from porcine liver and undergoes a unique, patented process of perfusion decellularization that rapidly removes cellular material, while maintaining the native architecture, vasculature and tissue structure. The applicant explained that MIRODERM is isolated from partial thickness liver sections following slight compression of the liver, which allows for the retention of the native liver structure, including the vasculature, within MIRODERM. The applicant stated that partial thickness allows for one surface of MIRODERM to retain the native liver capsule (an epithelial basement membrane) and the other opposite surface to be comprised of open liver matrix. The applicant further stated that case studies of the MIRODERM demonstrated accelerated healing, which is likely the result of the unique perfusion decellularization technology that retains a 3-dimensional extracellular matrix that includes the vasculature.

With regard to the first criterion, similar to other current wound matrix treatments, the MIRODERM uses a collagen matrix for tissue repair and regeneration. Therefore, we stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25042) that we were concerned that MIRODERM employs the same mechanism of action as other wound matrix treatments. Although the applicant had described how the MIRODERM differs from other wound matrix treatments due to the perfusion decellularization process, and is the first product that is derived from the porcine liver, we stated that we believe that the mechanism of action of MIRODERM may be substantially similar or the same as those employed by other wound treatment matrixes. With regard to the second criterion, whether a product is assigned to the same or a different MS–DRG, cases that may be eligible for treatment using MIRODERM map to the same MS–DRGs as other currently approved or cleared wound treatment matrixes. With regard to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, MIRODERM is used to treat the same patient population as other currently approved or cleared wound treatment matrixes. Because it appeared that the MIRODERM may be substantially similar to currently approved or cleared wound treatment matrixes, we stated that we were concerned the technology may not be considered ''new'' for the purposes of new technology add-on payments. We also invited public comments on whether MIRODERM meets the newness criterion in the proposed rule.

Comment: The applicant commented that, by definition, the native tissue reaction to liver tissue compressed into a biologic mesh will be different than other highly processed tissue sources. According to the applicant, the ''gentleness'' of the unique and patent-protected perfusion decellularization process results in a fully intact decellularized liver matrix, complete with a mix of proteins not contained in matrices decellularized by other means. The applicant further stated that the remaining large vascular structures in the perfusion decellularized liver matrix provide an entirely new and enhanced conduit for revascularization and remodeling.

The applicant noted that MIRODERM is the only wound matrix derived from the porcine liver utilizing perfusion decellularization technology, which has been highly published by numerous leading academic institutions for its ability to decellularize the whole liver while retaining the native architecture and vasculature. The applicant stated that preclinical studies have demonstrated the importance of the preexisting vasculature in cellular migration into the matrix and subsequent revascularization. The vascular density within liver tissue far exceeds that of other tissues that are used to derive acellular skin substitutes including dermis, urinary bladder, pericardial sac and small intestine submucosa. For these reasons, the applicant believed that MIRODERM is unique compared to other currently approved wound treatment matrixes.

One commenter stated that MIRODERM is substantially similar to existing wound matrix treatments because it supplies the wound bed an extracellular matrix (ECM). According to the commenter, treatments using an acellular matrix closely resemble native ECM. The commenter explained the following with regard to wound matrix treatments: While the ECM may act as a scaffold for matrix metalloproteinase (MMPs) to bind to and break down collagen in the product, epithelial cells, fibroblasts and vascular endothelial cells will migrate into the wound and proliferate; having reduced levels of MMPs to be released back into the wound as the collagen matrix breaks down, the ECM rebalances the protease and growth factor levels in the wound, thus allowing wound to heal.

The commenter stated that the source of skin wound matrix treatments is collagen and the only difference between MIRODERM and other wound matrix treatments is the source of the ECM. The commenter noted that recent skin wound matrix products such as Kerecis, an intact fish skin that is rich in naturally occurring Omega3 polyunsaturatedfatty acids and is used to regenerate damaged human tissue, have been approved for use in the treatment of chronic wounds. According to the commenter, when grafted onto

damaged human tissue, such as a diabetic ulcer, the acellular material recruits the body's cells from the wound perimeter and these cells are then incorporated into the fish skin, which is ultimately converted into functional, living tissue. The commenter explained that fish skin structure resembles the native structure of human skin and studies have shown that cells and stem cells proliferate faster in this structure than in other materials such amnion-membrane and other mammalian-sourced materials.

Response: After consideration of the public comments we received, we believe that MIRODERM's mechanism of action is similar to other acellular skin substitutes currently available for wound healing. We note that MIRODERM provides a scaffold of collagen with a mix of matrix proteins, both of which are similar to other acellular skin substitutes. Therefore, although the applicant asserted that MIRODERM's matrix proteins are different from the proteins found in other acellular skin substitutes, the mechanism of wound healing carried out by the body in the presence of the acellular substitutes is the same. We note that the applicant also indicated that the remaining large vascular structures in the perfusion decellularized liver matrix provide an entirely new and enhanced conduit for revascularization and remodeling. However, the applicant did not provide any data illustrating that MIRODERM's acellular porcine liver skin substitute is a conduit for revascularization and remodeling. Therefore, we are unable to verify the applicant's assertion.

We believe that the MIRODERM is substantially similar to currently approved or cleared wound treatment matrixes because it meets all three of the criteria identified above and, therefore, does not meet the newness criterion. Therefore, because the MIRODERM is not considered ''new,'' it is not eligible for new technology add-on payments for FY 2017.

With regard to the cost criterion, the applicant conducted the following analysis. The applicant began by researching the 2014 Medicare Inpatient Hospital Standard Analytical File (SAF) file for cases primarily associated with dermal regenerative grafts that may be eligible for treatment using MIRODERM. The applicant searched for claims that reported ICD–9–CM procedure code 86.67 (Dermal regenerative graft) that mapped to one of the following MS–DRGs: 463, 464, and 465 (Wound Debridement and Skin Graft Except Hand for Musculoskeletal System and Connective Tissue Disorders with MCC, with CC, or without CC/MCC, respectively); 573, 574, and 575 (Skin Graft for Skin Ulcer or Cellulitis with MCC, with CC, or without CC/MCC, respectively); 576, 577, and 578 (Skin Graft Except for Skin Ulcer or Cellulitis with MCC, with CC, or without CC/MCC, respectively); 622, 623, and 624 (Skin Grafts and Wound Debridement for Endocrine, Nutritional and Metabolic Diseases with MCC, with CC or without CC/MCC, respectively); and 904 and 905 (Skin Grafts for Injuries with CC/MCC or without CC/MCC, respectively). As a result, the applicant identified 1,130 cases across the MS–DRGs listed, which resulted in an average case-weighted charge per case of $83,059.

Included in the average case-weighted charge per case were charges for other previously used dermal regenerative grafts. According to the applicant, the MIRODERM would replace the need for other dermal regenerative grafts and, therefore, the applicant removed charges related to the use of other currently used dermal regenerative grafts from the average case-weighted charge per case. Specifically, using the January 2016 CMS Part B Drug Pricing File, the applicant first computed an average cost per square centimeter for currently used dermal regenerative grafts (Apligraf $31.207/cm^2, Oasis $10.676/cm^2, Integra DRT $21.585/cm^2, Dermagraft $32.858/cm^2, Integra skin substitute $35.627/cm^2, Primatrix $37.590/cm^2, and Theraskin $38.474/cm^2), which equaled $29.72/cm^2. To determine the average amount of square centimeters of the other dermal regenerative grafts used for each case within the MS–DRG, given the vast complexity and variation in wounds, the applicant used clinical judgment based on experience, observation and typical sizes and depths of wounds that would present on different parts of the body. For an example, wounds on the hand would typically be smaller than those located on the lower extremities. The applicant also assumed that other dermal regenerative grafts would require three applications to close a wound as opposed to treatment using MIRODERM, which requires only two applications. Based on this assumption, the applicant noted that it assumed that the first application required 100 percent of the amount of skin substitute required to treat the original wound area, the second application required 70 percent, and the third application required 40 percent, totaling 210 percent. To compute the total amount of square centimeters used for each case within the MS–DRG, the applicant multiplied this percentage (210 percent) by the amount of square centimeters used for the first application for each case within the MS–DRG. The applicant then multiplied the average cost of the other previously used dermal regenerative grafts ($29.72/cm^2) by the average amount of centimeters used for each case within the MS–DRG to determine the average cost of the other previously used dermal regenerative grafts for each case within the MS–DRG. To convert the costs to charges, the applicant computed an average CCR for each MS–DRG using CCRs from the FY 2014 Standardizing File of the hospitals indicated on each of the claims for each case within the MS–DRG. The applicant then divided the average cost of the other previously used dermal regenerative grafts for each MS–DRG by the average CCR for each MS–DRG to determine the average charges of the other previously used dermal regenerative grafts for each MS–DRG. The applicant also reduced the charges for the number of days of hospitalization by 30 percent because the applicant believed that MIRODERM heals patients faster than the other currently used dermal regenerative grafts, resulting in a reduction in the average lengths of stay. The applicant then deducted the charges related to the other previously used dermal regenerative grafts and the charges for the reduction in the average lengths of stay from the average case-weighted charge per case and then standardized the charges, which resulted in an average standardized case-weighted charge per case of $34,279. The applicant then inflated the average standardized case-weighted charge per case by 7.7 percent, the same inflation factor used by CMS to update the FY 2016 outlier threshold (80 FR 49784).

After inflating the charges, it was necessary to add the associated charges for the use of MIRODERM. The applicant conducted a similar calculation to compute the charges for MIRODERM. Specifically, the applicant used clinical judgment based on experience, observation, and typical sizes and depths of wounds that would be present on different parts of the body. The applicant stated that because MIRODERM has shown greater efficacy in wound closure based on their case series, the applicant modeled for only two applications with 50 percent closure of the wound after the first application and full closure of the wound after the second application. Based on this assumption, the applicant noted that it assumed that the first application required 100 percent of the

amount of skin substitute required to treat the original wound area and the second application required 50 percent, totaling 150 percent. To compute the total amount of square centimeters used for each MS–DRG, the applicant multiplied this percentage (150 percent) by the amount of square centimeters used for the first application for each MS–DRG. The applicant then multiplied the cost per square centimeter for MIRODERM by the average amount of centimeters used for each case within the MS–DRG to determine the average cost of MIRODERM grafts used for each MS–DRG. Similar to above, to convert the costs to charges, the applicant used the same average CCRs for each MS–DRG and divided the average cost of MIRODERM for each MS–DRG by the average CCR for each MS–DRG to determine the average charges of MIRODERM for each MS–DRG. The applicant then added charges related to the use of MIRODERM to the inflated average standardized charges and determined a final inflated average standardized case-weighted charge per case of $94,009. Using the FY 2016 IPPS Table 10 thresholds, the average case-weighted threshold amount was $67,559 (all calculations above were performed using unrounded numbers). Because the final inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

We invited public comments on whether the MIRODERM technology meets the cost criterion in the proposed rule.

Comment: One commenter stated that the evaluation of the cost criterion using the average standardized case-weighted threshold amount to determine cost savings is not unique to the MIRODERM.

Response: We are not certain what the commenter is referring to with regard to the evaluation of the cost criterion for this technology because the criterion measures and determines whether a new technology is inadequately paid, but does not measure or determine cost savings. Based on the applicant's analysis, it appears that the MIRODERM meets the cost criterion. However, because we believe that the MIRODERM is substantially similar to other wound treatment matrixes for the reasons discussed earlier and, therefore, does not meet the newness criterion, it is not eligible for new technology add-on payments.

With regard to substantial clinical improvement, the applicant believed that the technology represents a substantial clinical improvement over existing technologies because patients treated with the MIRODERM for complicated wounds heal quicker and avoid additional surgeries. To demonstrate that the technology meets the substantial clinical improvement criterion, the applicant submitted the results of two actual case studies of a complicated wound from necrotizing fasciitis that was treated with the MIRODERM. According to the applicant, one case study involved a complicated wound that would typically be treated with a diverting colostomy. The applicant noted that that the patient was discharged with intact anoplasty and good sphincter control after 35 days and four applications for MIRODERM. The applicant further stated that the use of MIRODERM demonstrated rapid healing and likely avoided at least two major debilitating surgeries, as well as the emotional and physical impact of a colostomy for 3 to 6 months. In the second case study, according to the applicant, the attending physician estimated the wound would likely take greater than 90 days to close using traditional wound care matrixes. The applicant stated that after 12 days and two applications of MIRODERM the patient was discharged and after 21 days the wound was sutured closed.

The applicant noted that additional patients have been treated with MIRODERM. According to the applicant, given the recent product launch, the case studies have not been completed, but similar results have been communicated to the applicant.

We stated in the proposed rule (81 FR 25044) that we were concerned that the clinical data the applicant submitted is from a very small sample with no comparisons to other currently approved wound treatment matrixes. Specifically, the applicant submitted data from only two case studies. Also, the applicant compared the use of MIRODERM to the use of other treatments, such as diverting colostomy. While MIRODERM may represent an improvement in treatment options compared to the other treatment options such as diverting colostomy, we stated that we were unable to determine if use of MIRODERM represents a substantial clinical improvement when compared to other wound treatment matrixes of other currently approved treatments. We invited public comments on whether MIRODERM meets the substantial clinical improvement criterion in the proposed rule.

Comment: The applicant submitted additional clinical data, including a case series of seven additional cases that were selected to receive MIRODERM as a treatment for diabetic foot ulcers (DFU). The commenter noted the following: the duration of the preexisting chronic wound prior to MIRODERM treatment ranged from 5 to 48 months and 3 of the 6 patients in the evaluation healed after treatment with MIRODERM within the 12-week study duration. The applicant stated that the results obtained by case series demonstrated a 50-percent closure rate of hard to heal DFUs that had previously failed advanced biologic wound care treatment.

The commenter also submitted one additional case study that had been submitted for presentation at a national wound conference. The patient was a 54-year old male that sustained a myocardial infarction in November 2015. This necessitated a coronary artery bypass graft surgical procedure. A major postoperative complication of the CABG procedure was bilateral pulmonary embolism with respiratory failure. The patient also developed bilateral lower extremity deep venous thrombosis and initiated Heparin therapy. This triggered a Heparin induced thrombocytopenia resulting in bilateral forefoot gangrene and bilateral lower extremity compartment syndrome.

The commenter noted the following: The patient underwent an open transmetatarsal (TMA) of the left forefoot and extensive skin and deep tissue of the plantar foot extending to the distal heel; the wound remained open due to a lack of appropriate plantar soft tissue coverage with exposed muscle and bone; local wound care consisted of negative pressure wound therapy (NPWT) initially which was discontinued due to severe pain; enzymatic debridement with local wound care continued until the initial application of a perfusion decellularized porcine hepatic wound matrix. The patient was healed to a functional outcome.

The commenter further stated that, with regard to perfusion decellularization technology, the MIRODERM encompasses a method to decellularize and recellularize whole or partial organs and tissues. The commenter explained that the technology is based on a proprietary method for removing all cells, while maintaining a non-cellular (called extracellular) matrix or scaffold with its original architecture, mechanical properties, and a vascular network capable of maintaining physiological pressures. The commenter noted that the most widely recognized method of removing cells in use today is ''immersion decellularization,'' in which an organ is soaked in a vat of

harsh detergent, which migrates from the outer surface inward and then back out once the cells are dissolved. The commenter stated that this method damages the organ capsule through mechanical or enzymatic methods, and the cells within the organ begin to break down before being exposed to the detergent, releasing various enzymes that also degrade the surrounding scaffold with the end result a partially degraded scaffold with a compromised vascular network and an outer organ capsule that will not maintain physiological pressures when tested. The commenter further stated that cells will no longer recognize this degraded scaffold as the appropriate environment in which to become functional.

The commenter added that perfusion decellularization technology is in contrast to immersion decellularization and overcomes the hurdles of immersion by facilitating rapid access to the whole organ through the native vasculature by cannulating the vasculature and perfusing (running) a mild detergent solution through the native blood vessels, as opposed to immersing the organ. The commenter stated that scaffolds created with this technology are capable of receiving and incorporating a variety of cell types, depending on the organ scaffold utilized. Moreover, the commenter believed that as cell type discovery continues to grow, the fact that scaffolds created with this technology are of a natural biological design make them an ideal template to support the growth and differentiation of stem cells into functional tissues, organs and bioidentical test beds.

One commenter stated that there are other CTPs with substantiated evidence of a randomized clinical trial that also demonstrate healing in one or two applications (GraftJacket and DermACELL). Additionally, the commenter stated there has been no published randomized clinical trial regarding the use of the MIRODERM in the treatment of chronic wound applications. The commenter concluded that citing two case studies, one involving a diverting colostomy, is not sufficient evidence.

Response: We appreciate the commenters' input. However, because we believe that the MIRODERM is substantially similar to other wound treatment matrixes for the reasons discussed earlier and, therefore, does not meet the newness criterion, it is not eligible for new technology add-on payments.

c. Idarucizumab

Boehringer Ingelheim Pharmaceuticals, Inc. submitted an application for new technology add-on payments for FY 2017 for Idarucizumab; a product developed as an antidote to reverse the effects of PRADAXA® (Dabigatran), which is also manufactured by Boehringer Ingelheim Pharmaceuticals, Inc. (We note that the applicant submitted an application for new technology add-on payments for FY 2016, but failed to obtain FDA approval prior to the July 1 deadline.) Dabigatran is an oral direct thrombin inhibitor currently indicated to: (1) Reduce the risk of stroke and systemic embolism in patients who have been diagnosed with nonvalvular atrial fibrillation (NVAF); (2) treat deep venous thrombosis (DVT) and pulmonary embolism (PE) in patients who have been administered a parenteral anticoagulant for 5 to 10 days; and (3) reduce the risk of recurrence of DVT and PE in patients who have been previously diagnosed with NVAF. Currently, unlike the anticoagulant Warfarin, there is no specific way to reverse the anticoagulant effect of Dabigatran in the event of a major bleeding episode.

Idarucizumab is a humanized fragment antigen binding (Fab) molecule, which specifically binds to Dabigatran to deactivate the anticoagulant effect, thereby allowing thrombin to act in blood clot formation. The applicant stated that Idarucizumab represents a new pharmacologic approach to neutralizing the specific anticoagulant effect of Dabigatran in emergency situations. Idarucizumab was approved by the FDA on October 16, 2015. The applicant noted that Idarucizumab is the only FDA-approved therapy available to neutralize the anticoagulant effect of Dabigatran. Before the FDA approval of Idarucizumab, the approach for the management of the anticoagulant effect of Dabigatran prior to an invasive procedure was to withhold administration of Dabigatran, when possible, for a certain duration of time prior to the procedure to allow sufficient time for the patient's kidneys to flush out the medication. The duration of time needed to flush out the medication prior to the surgical procedure is based on the patient's kidney function. According to the applicant, if surgery cannot be delayed to allow the kidneys the necessary time to flush out the traces of Dabigatran, there is an increased risk of bleeding.

Based on the FDA indication for Idarucizumab, the product can be used in the treatment of patients who have been diagnosed with NVAF and administered Dabigatran to reverse life-threatening bleeding events, or who require emergency surgery or medical procedures and rapid reversal of the anticoagulant effects of Dabigatran is necessary and desired. The applicant received a unique ICD–10–PCS procedure code that became effective October 1, 2015. The approved procedure code is XW03331 (Introduction of Idarucizumab, Dabigatran reversal agent into central vein, percutaneous approach, New Technology Group 1). We invited public comments on whether Idarucizumab meets the newness criterion in the proposed rule.

Comment: Several commenters stated that there is currently no other reversal agent on the U.S. market for patients who are being treated with Dabigatran and experience severe bleeding.

The applicant submitted public comments reiterating its assertion that Idarucizumab satisfies the newness criterion. The applicant emphasized that Idarucizumab was developed as a specific reversal agent to Dabigatran, an anticoagulant that works by directly inhibiting thrombin, thereby blocking the final step of the coagulation cascade. The applicant further defined the potential adverse effects of anticoagulant therapy and the increased risk of bleeding that may be life-threatening or fatal which may require emergent medical and surgical procedures and the need for rapid reversal of an anticoagulation to perform the procedure in a timely manner. The applicant reiterated that Idarucizumab was developed as a specific reversal agent to Dabigatran, and that Idarucizumab was granted FDA approval on October 16, 2015.

Response: We appreciate the details and input provided by the commenters and the applicant on whether Idarucizumab meets the newness criterion. After review of the information provided by the applicant and consideration of the public comments we received, we believe that Idarucizumab meets the newness criterion and we consider the technology to be ''new'' as of October 16, 2015, when the technology received FDA approval.

With regard to the cost criterion, in the proposed rule, we noted that the applicant conducted two analyses. The applicant began by researching claims data in the FY 2014 MedPAR file for cases that may be eligible for Idarucizumab using a combination of ICD–9–CM diagnosis and procedure codes. Specifically, the applicant searched the database for cases

reporting anticoagulant therapy diagnosis code E934.2 (Agents primarily affecting blood constituents, anticoagulants) or V58.61 (Long-term (current) use of anticoagulants) in combination with either current standard of care procedure code 99.03 (Other transfusion of whole blood), 99.04 (Transfusion of packed cells), 99.05 (Transfusion of platelets), 99.06 (Transfusion of coagulation factors), 99.07 (Transfusion of other serum), or 39.95 (Hemodialysis), and Dabigatran indication diagnosis code 427.31 (Atrial fibrillation), 453.40 (Acute venous embolism and thrombosis of unspecified deep vessels of lower extremity), 453.41 (Acute venous embolism and thrombosis of deep vessels of proximal lower extremity), 453.42 (Acute venous embolism and thrombosis of deep vessels of distal lower extremity), 453.50 (Chronic venous embolism and thrombosis of unspecified deep vessels of lower extremity), 453.51 (Chronic venous embolism and thrombosis of deep vessels of proximal lower extremity), 453.52 (Chronic venous embolism and thrombosis of deep vessels of distal lower extremity), 415.11 (Iatrogenic pulmonary embolism and infarction), 415.12 (Septic pulmonary embolism), 415.13 (Saddle embolus of pulmonary artery), 415.19 (Other pulmonary embolism and infarction), 416.2 (Chronic pulmonary embolism), V12.51 (Personal history of venous thrombosis and embolism), or V12.55 (Personal history of pulmonary embolism).

To further target potential cases that may be eligible for Idarucizumab, the applicant also excluded specific cases based on Dabigatran contraindications, including all cases representing patients who have been diagnosed with chronic kidney disease (CKD) stage V (diagnosis code 585.5), end-stage renal disease (diagnosis code 585.6), prosthetic heart valves (diagnosis code V43.3), and cases representing patients who have been diagnosed with both CKD stage IV (diagnosis code 585.4) and either DVT or PE (using the same ICD–9–CM diagnosis codes listed above). As a result, the applicant identified 84,224 cases that mapped to 684 MS–DRGs. The applicant standardized the charges and computed an average standardized case-weighted charge per case of $60,089.

The applicant then identified hospital charges potentially associated with the current treatments to reverse anticoagulation, specifically charges associated with pharmacy services, dialysis services, and laboratory services for blood work. Due to limitations associated with the claims data, the applicant was unable to determine the specific drugs used to reverse anticoagulation and if these cases represented patients who required laboratory services for blood work or dialysis services unrelated to the reversal of anticoagulation. Therefore, the applicant subtracted 40 percent of the charges related to these three categories from the standardized charge per case, based on the estimation that the full amount of charges associated with these services would not be incurred by hospitals when Idarucizumab is administered for use in the treatment of patients who have been diagnosed with NVAF and Dabigatran is administered during treatment. The applicant then inflated the standardized charge per case by 7.665 percent, the same inflation factor used by CMS to update the FY 2016 outlier threshold (80 FR 49784) and added charges for Idarucizumab. This resulted in an inflated average standardized case-weighted charge per case of $67,617. Using the FY 2016 IPPS Table 10 thresholds, the average case-weighted threshold amount across all 684 MS–DRGs is $55,586 (all calculations above were performed using unrounded numbers). Because the inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion under this analysis.

Further, the applicant conducted an additional analysis using the same data from the FY 2014 MedPAR file and variables used in the previous analysis. However, instead of using potentially eligible cases that mapped to 100 percent of the 684 MS–DRGs identified, the applicant used potentially eligible cases that mapped to the top 75 percent of the 684 MS–DRGs identified. By applying this limitation, the applicant identified 63,033 cases that mapped to 87 MS–DRGs. The applicant computed an inflated average standardized case-weighted charge per case of $55,872. Using the FY 2016 IPPS Table 10 thresholds, the average case-weighted threshold amount across all 87 MS–DRGs is $63,323 (all calculations above were performed using unrounded numbers). Because the inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology also meets the cost criterion under this analysis. We invited public comments regarding the applicant's analyses with regard to the cost criterion in the proposed rule.

Comment: The applicant submitted public comments reiterating its costs analysis results. According to the applicant, the standardized case-weighted charge per case exceeds the average case-weighted threshold for Idarucizumab. The applicant stated that CMS' summary in the proposed rule did not accurately reflect the analysis submitted by the applicant with its application. Specifically, the applicant stated that, with regard to the analysis cases that mapped to the top 75 percent of the 684 MS–DRGs identified, CMS listed the inflated average standardized case-weighted charge per case as $55,872 and the average case-weighted threshold amount across all 87 MS–DRGs as $63,323. The commenter stated that the inflated average standardized case-weighted charge per case should have been $63,323 and the average case-weighted threshold amount across all 87 MS–DRGs should have been $52,753.

Response: We agree with the applicant that we inadvertently listed the wrong amounts in the proposed rule. The amounts listed above by the applicant are indeed the correct amounts. Under both analyses provided by the applicant, the inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount. Therefore, we agree that Idarucizumab meets the cost criterion.

With regard to substantial clinical improvement, according to the applicant, aside from Idarucizumab, there are no other FDA-approved antidotes to reverse the anticoagulant effects of Dabigatran. Management of the treatment of patients who have been diagnosed with NVAF and administered Dabigatran and experience bleeding may often include supportive care such as Hemodialysis and the use of fresh frozen plasma, blood factor products such as prothrombin complex concentrates (PCC), activated prothrombin complex concentrates, and recombinant factor VIIa or delayed intervention. Protamine sulfate and Vitamin K are typically used to reverse the effects of Heparin and Warfarin, respectively. However, due to the mechanism of action in Dabigatran, the applicant maintained that the use of protamine sulfate and Vitamin K may not be effective to reverse the anticoagulant effect of Dabigatran.

The applicant provided information regarding the management of major bleeding events experienced by patients who were administered Dabigatran and Warfarin during the RE–LY trial.[9]

[9] Healy, et al.: Periprocedural bleeding and thromboembolic events with dabigatran compared with Warfarin: results from the randomized evaluation of long-term anticoagulation therapy

During this study, most major bleeding events were only managed by supportive care. Patients who were administered 150 mg of Dabigatran were transfused with pack red blood cells more often when compared to patients who were administered Warfarin (61.4 percent versus 49.9 percent, respectively). However, patients who were administered Warfarin were transfused with plasma more often when compared to patients who were administered 150 mg of Dabigatran (30.2 percent versus 21.6 percent, respectively). In addition, the use of Vitamin K in the treatment of patients who were administered Warfarin was more frequent when compared to the frequency of use in the treatment of patients who were administered 150 mg of Dabigatran (27.3 percent versus 10.3 percent, respectively). The use of PCCs, recombinant factor VIIa and other coagulation factor replacements in the treatment of patients who were administered both Warfarin and 150 mg of Dabigatran was minimal, and did not significantly differ in frequency when compared among patients assigned to either group. Hemodialysis was used in a single case.

The applicant reported that, currently, it is recommended that the administration of Dabigatran be discontinued 1 to 2 days (CrCl ≥ 50 ml/min) or 3 to 5 days (CrCl < 50 ml/min), if possible, before invasive or surgical procedures because of the increased risk of bleeding.[10] A longer period of discontinuation time should be considered for patients undergoing major surgery, spinal puncture, or placement of a spinal or epidural catheter or port, if complete hemostasis is required. The applicant stated that delaying emergency medical or surgical procedures can cause urgent conditions to become more severe if intervention is not initiated. The applicant further maintained that delaying emergency medical or surgical procedures for an extended period of time can ultimately lead to negative healthcare outcomes and increased healthcare costs. The applicant asserted that rapidly reversing the anticoagulant effect of Dabigatran administered to patients that require an urgent medical procedure or surgery allows the medical procedure or surgery to be performed in a timely manner, which in turn may decrease complications and minimize the need for more costly therapies.

The applicant also provided interim data from an ongoing Phase III trial [11] [12] in patients who may have life-threatening bleeding, or require emergency procedures. The applicant noted that published results of the interim data based on 90 patients suggested the following: Reversal of the Dabigatran anticoagulant effect, which was evident immediately after administration; reversal was 100 percent in the first 4 hours and greater than 89 percent of patients achieved complete reversal; hemostasis in 35 patients in Group A was restored at a median of 11.4 hours. Also, the 5 gram dose of Idarucizumab was calculated to reverse the total body load of Dabigatran that was associated with the 99th percentile of the Dabigatran levels measured in the RE–LY trial.

The applicant provided safety data from three Phase I studies and interim data from the Phase III study. In the Phase I study, 110 healthy male patients enrolled in the study were administered dosages of Idarucizumab that ranged from 20 mg to 8 grams. In this study, 135 patients received placebo. The applicant reported that adverse events were generally mild in intensity and nonspecific. Healthy human volunteers enrolled in the Phase I study were administered Idarucizumab in dosages of 2 and 4 grams, which resulted in immediate and complete reversal of the anticoagulant effect of Dabigatran that was sustained for several hours. In the Phase III study, five thrombotic events occurred. One occurred 2 days after treatment and the remainder occurred 7, 9, 13, and 26 days after treatment. These patients were not receiving antithrombotic therapy when the events occurred, and complications or adverse effects can be attributed to patients' underlying medical conditions. Twenty-one patients (13 in Group A and 8 in Group B) had a serious adverse event. The most frequently reported adverse reactions in greater than or equal to 5 percent of the patients treated with Idarucizumab were hypokalemia, delirium, constipation, pyrexia, and pneumonia. The applicant concluded that the data from these studies demonstrated that Idarucizumab effectively, safely, and potently reverses the anticoagulant effect of Dabigatran. We invited public comments on whether Idarucizumab meets the substantial clinical improvement criterion in the proposed rule.

Comment: Several commenters supported the substantial clinical improvement criterion for Idarucizumab. Several commenters stated that, aside from Idarucizumab, the only alternative for anticoagulation reversal in patients being treated with Dabigatran is withholding the drug and observing the patient for bleeding. The commenters noted that this approach is not ideal in the case of severe bleeding when rapid reversal is needed for emergent surgical procedures. The applicant also reiterated its assertion that Idarucizumab satisfies the clinical improvement criterion, citing that prior to the approval of Idarucizumab, patients treated with Dabigatran who experienced severe bleeding were often managed by supportive care alone, such as fluid administration and blood transfusions. The applicant stated that Idarucizumab has been shown to reverse the anticoagulant effect of Dabigatran immediately in patients needing rapid reversal of anticoagulation in emergency situations.

Response: We appreciate the comments supporting the substantial clinical improvement criterion for Idarucizumab. We agree that Idarucizumab meets the substantial clinical improvement criterion.

After consideration of the public comments we received, we have determined that Idarucizumab meets all of the criteria for approval of new technology add-on payments. Therefore, we are approving new technology add-on payments for Idarucizumab for FY 2017. Cases involving Idarucizumab that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure code XW03331.

In its application, the applicant estimated that the average Medicare beneficiary would require a dosage of 5 grams for Idarucizumab. According to the applicant, the wholesale acquisition cost for one dose is $3,500. Under 42 CFR 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the technology or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment amount for a case involving the use of Idarucizumab is $1,750 for FY 2017.

d. Titan Spine (Titan Spine Endoskeleton® nanoLOCK™ Interbody Device)

Titan Spine submitted an application for new technology add-on payments for the Titan Spine Endoskeleton® nanoLOCK™ Interbody Device (the Titan Spine nanoLOCK™) for FY 2017. The Titan Spine nanoLOCK™ is a

(RE–LY) randomized trial, Circulation, 2012; 126:343–348.

nanotechnology-based interbody medical device with a dual acid-etched titanium interbody system used to treat patients diagnosed with degenerative disc disease (DDD). One of the key distinguishing features of the device is the surface manufacturing technique and materials, which produce macro, micro, and nano surface textures. According to the applicant, the combination of surface topographies enables initial implant fixation, mimics an osteoclastic pit for bone growth, and produces the nano-scale features that interface with the integrins on the outside of the cellular membrane. Further, the applicant noted that these features generate better osteogenic and angiogenic responses that enhance bone growth, fusion, and stability. The applicant asserted that the Titan Spine nanoLOCK™'s clinical features also reduce pain, improve recovery time, and produce lower rates of device complications such as debris and inflammation.

On October 27, 2014, the Titan Spine nanoLOCK™ received FDA clearance for the use of five lumbar interbody devices and one cervical interbody device: The nanoLOCK™ TA-Sterile Packaged Lumbar ALIF Interbody Fusion Device with nanoLOCK™ surface, available in multiple sizes to accommodate anatomy; the nanoLOCK™ TAS-Sterile Packaged Lumbar ALIF Stand Alone Interbody Fusion Device with nanoLOCK™ surface, available in multiple sizes to accommodate anatomy; the nanoLOCK™ TL-Sterile Packaged Lumbar Lateral Approach Interbody Fusion Device with nanoLOCK™ surface, available in multiple sizes to accommodate anatomy; the nanoLOCK™ TO-Sterile Packaged Lumbar Oblique/PLIF Approach Interbody Fusion Device with nanoLOCK™ surface, available in multiple sizes to accommodate anatomy; the nanoLOCK™ TT-Sterile Packaged Lumbar TLIF Interbody Fusion Device with nanoLOCK™ surface, available in multiple sizes to accommodate anatomy and the nanoLOCK™ TC-Sterile Packaged Cervical Interbody Fusion Device with nanoLOCK™ surface, available in multiple sizes to accommodate anatomy. The applicant received FDA clearance on December 14, 2015, for the nanoLOCK™ TCS-Sterile Package Cervical Stand Alone Interbody Fusion Device with nanoLOCK™ surface, available in multiple sizes to accommodate anatomy. The applicant indicated that, due to manufacturing delays, all of the devices above were not available on the market until July 8, 2016. Therefore, the applicant believes that all of the devices above are new as of July 8, 2016.

The applicant submitted a request for a unique ICD–10–PCS procedure code and was granted approval for the following procedure codes under New Technology Group 2: XRG0092 (Fusion of occipital-cervical joint using nanotextured surface interbody fusion device, open approach); XRG1092 (Fusion of cervical vertebral joint using nanotextured surface interbody fusion device, open approach); XRG2092 (Fusion of 2 or more cervical vertebral joints using nanotextured surface interbody fusion device, open approach); XRG4092 (Fusion of cervicothoracic vertebral joint using nanotextured surface interbody fusion device, open approach); XRG6092 (Fusion of thoracic vertebral joint using nanotextured surface interbody fusion device, open approach); XRG7092 (Fusion of 2 to 7 thoracic vertebral joints using nanotextured surface interbody fusion device, open approach); XRG8092 (Fusion of 8 or more thoracic vertebral joints using nanotextured surface interbody fusion device, open approach); XRGA092 (Fusion of thoracolumbar vertebral joint using nanotextured surface interbody fusion device, open approach); XRGB092 (Fusion of lumbar vertebral joint using nanotextured surface interbody fusion device, open approach); XRGC092 (Fusion of 2 or more lumbar vertebral joints using nanotextured surface interbody fusion device, open approach); and XRGD092 (Fusion of lumbosacral joint using nanotextured surface interbody fusion device, open approach). These new ICD–10–PCS procedure codes are effective on October 1, 2016.

We note that cases reporting procedures involving lumbar and cervical interbody devices map to different MS–DRGs. As discussed in the Inpatient New Technology Add-On Payment Final Rule (66 FR 46915), two separate reviews and evaluations of the technologies are necessary in this instance because cases representing patients receiving treatment for diagnoses associated with lumbar procedures that may be eligible for use of the technology under the first indication are not expected to be assigned to the same MS–DRGs as patients receiving treatment for diagnoses associated with cervical procedures using the technology under the second indication. Specifically, cases representing patients who have been diagnosed with lumbar DDD and received treatment that involved implanting a lumbar device map to MS–DRGs 028 (Spinal Procedures with MCC), 029 (Spinal Procedures with CC or Spinal Neurostimulators), 030 (Spinal Procedures without CC/MCC), 453 (Combined Anterior/Posterior Spinal Fusion with MCC), 454 (Combined Anterior/Posterior Spinal Fusion with CC), 455 (Combined Anterior/Posterior Spinal Fusion without CC/MCC), 456 (Spinal Fusion Except Cervical with Spinal Curvature or Malignancy or Infection or Extensive Fusions with MCC), 457 (Spinal Fusion Except Cervical with Spinal Curvature or Malignancy or Infection or Extensive Fusion without MCC), 458 (Spinal Fusion Except Cervical with Spinal Curvature or Malignancy or Infection or Extensive Fusions without CC/MCC), 459 (Spinal Fusion Except Cervical with MCC), and 460 (Spinal Fusion Except Cervical without MCC), while cases representing patients who have been diagnosed with cervical DDD and received treatment that involved implanting a cervical interbody device map to MS–DRGs 471 (Cervical Spinal Fusion with MCC), 472 (Cervical Spinal Fusion with CC), and 473 (Cervical Spinal Fusion without CC/MCC). Procedures involving the lumbar and cervical interbody devices are assigned to separate MS–DRGs. Therefore, the devices categorized as lumbar devices and the devices categorized as cervical devices must distinctively (each category) meet the cost criterion and the substantial clinical improvement criterion in order to be eligible for new technology add-on payments beginning in FY 2017. We discuss application of these criteria following discussion of the newness criterion.

As discussed previously in this section, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for the purposes of new technology add-on payments. We note that the substantial similarity discussion is applicable to both the lumbar and the cervical devices because all of the devices use the Titan Spine nanoLOCK™ technology.

With regard to the first criterion, whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome, the applicant stated that, for both interbody devices (the lumbar and the cervical interbody device), the Titan Spine nanoLOCK™'s surface stimulates osteogenic cellular response to assist in bone formation during fusion. During the manufacturing process, the surface produces macro, micro, and nano-surface textures. The applicant believed that this unique

combination and use of these surface topographies represents a new approach to stimulating osteogenic cellular response. The applicant asserted that the macro-scale textured features are important for initial implant fixation. The micro-scale textured features mimic an osteoclastic pit for supporting bone growth. The nano-scale textured features interface with the integrins on the outside of the cellular membrane, which generates the osteogenic and angiogenic (mRNA) responses necessary to promote healthy bone growth and fusion. The applicant provided the results from *in vitro* studies, using human mesenchymal cells (MSCs), which showed positive effects on bone growth related to cellular signaling achieved by using the device's surface, and osteoblasts exhibited a more differentiated phenotype and increased bone morphogenetic protein (BMP) production using titanium alloy substrates as opposed to poly-ether-ether-ketone (PEEK) substrates. The applicant stated that Titan Spine's proprietary and unique surface technology, the Titan Spine nanoLOCK™ interbody devices, contain optimized nano-surface characteristics, which generate the distinct cellular responses necessary for improved bone growth, fusion, and stability. The applicant further stated that the Titan Spine nanoLOCK™'s surface engages with the strongest portion of the endplate, which enables better resistance to subsidence because a unique dual acid-etched titanium surface promotes earlier bone in-growth. The Titan Spine nanoLOCK™'s surface is created by using a reductive process of the titanium itself. The applicant asserted that use of the Titan Spine nanoLOCK™ significantly reduces the potential for debris generated during impaction when compared to treatments using PEEK-based implants coated with titanium. According to the results of an *in vitro* study [13] provided by the applicant, which compared angiogenic factor production using PEEK-based versus titanium alloy surfaces, osteogenic production levels were greater with the use of rough titanium alloy surfaces than the levels produced using smooth titanium alloy surfaces. The results of an additional study [14] provided by the applicant examined whether inflammatory microenvironment generated by cells as a result of use of titanium aluminum-vanadium (Ti-alloy, TiAlV) surfaces is effected by surface microtexture, and whether it differs from the effects generated by PEEK-based substrates. The applicant noted that the use of microtextured surfaces has demonstrated greater promotion of osteoblast differentiation when compared to use of PEEK-based surfaces.

With regard to the second criterion, whether a product is assigned to the same or a different MS–DRG, cases that may be eligible for treatment involving the Titan Spine nanoLOCK™ map to the same MS–DRGs as other (lumbar and cervical) interbody devices currently available to Medicare beneficiaries and also are used for the treatment of patients who have been diagnosed with DDD (lumbar or cervical).

With regard to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant stated that the Titan Spine nanoLOCK™ can be used in the treatment of patients diagnosed with similar types of diseases, such as DDD, and for a similar patient population receiving treatment involving both lumbar and cervical interbody devices.

In summary, the applicant maintained that the Titan Spine nanoLOCK™ technology has a different mechanism of action when compared to other spinal fusion devices. Therefore, the applicant did not believe that the Titan Spine nanoLOCK™ technology is substantially similar to existing technologies.

After reviewing the applicant's statements regarding nonsubstantial similarity of its technology with other existing technologies, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25047), we stated that we were still concerned that there are other titanium surfaced devices currently available on the U.S. market. While these devices do not use the Titan Spine nanoLOCK™ technology, their surfaces also are made of titanium. Therefore, we stated that we believe that the Titan Spine nanoLOCK™ interbody devices may be substantially similar to currently available titanium interbody devices.

We invited public comments on whether the Titan Spine Endoskeleton® nanoLOCK™ Interbody Devices are substantially similar to existing technologies and whether these devices meet the newness criterion in the proposed rule.

Comment: One commenter stated the Titan Spine nanoLOCK's rough topography is not unique to Titan Spine's nanoLOCK™ interbody devices. The commenter listed other titanium devices with micro and macro surfaces which also stimulate bone growth. According to the commenter, the studies provided by the Titan Spine applicant show that any roughened surface topography is associated with an increase in the apha2-beta1 integrin mRNA expression, which is favorable to osteogenesis.

Response: We appreciate the commenter's comments regarding the Titan Spine Endoskeleton® nanoLOCK™ Interbody Devices. In the proposed rule, we stated concerns that Titan Spine Endoskeleton® nanoLOCK™ Interbody Devices may be substantially similar to currently available titanium interbody devices. Although Titan Spine Endoskeleton® nanoLOCK™ Interbody Devices employ nanotechnology in their surface manufacturing technique to produce macro, micro, and nano surfaces, there are other titanium devices that also produce porous surfaces which promote an osteogenic response.

After consideration of the public comments we received, we remain concerned that the Titan Spine Endoskeleton® nanoLOCK™ Interbody Devices are substantially similar to other titanium spinal implants and, therefore, as to whether the Titan Spine Endoskeleton® nanoLOCK™ Interbody Devices meet the newness criterion.

(1) Titan Spine Endoskeleton® nanoLOCK™ Interbody Device for Lumbar DDD

As previously mentioned, the Titan Spine nanoLOCK™ received FDA clearance for the use of five lumbar interbody devices on October 27, 2014. To demonstrate that the Titan Spine nanoLOCK™ for Lumbar DDD technology meets the cost criterion, the applicant researched claims data in the FY 2014 MedPAR file for cases assigned to MS–DRGs 028, 029, 030, 453, 454, and 455 reporting any of the ICD–9–CM procedure codes within the code series 81.xx (Repair and plastic operations on joint structures) or code series 084.6x (Replacement of spinal disk), excluding cases reporting the following ICD–9–CM procedure codes describing cervical fusion: 81.01 (Atlas-axis spinal fusion), 81.02 (Other cervical fusion, anterior technique), 81.03 (Other cervical fusion, posterior technique), 81.31 (Refusion of atlas-axis spine), 81.32 (Refusion of other cervical spine, anterior technique), or 81.33 (Refusion of other cervical spine, posterior technique). As a result, the applicant found that all cases potentially eligible for treatment using

[13] Olivares-Navarrete R, Hyzy S, Gittens R. Titanium Alloys Regulate Osteoblast Production of Angiogenic Factors. The Spine Journal, 2013, ep.13. 1563–1570.

[14] Olivares-Navrrete R, Hyzy s, Slosar P, et al. Implant Materials Generate Different Peri-implant Inflammatory Factors. SPINE. 2015: 40:6:339–404.

the technology mapped to MS–DRGs 456, 457, 458, 459, and 460. However, the applicant focused its analyses on MS–DRGs 028 through 030, 453 through 455, and 456 through 460 because these are the MS–DRGs to which cases treated with interbody fusion devices for degenerative disc disease would most likely be assigned. The applicant applied CMS' relative weight filtering process as described in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49424) to ensure the correct claim types were used and the charge details across the cost centers were appropriate.

According to the applicant, 78.03 percent of the 96,281 cases found in the FY 2014 MedPAR file mapped to MS–DRG 460, while the remaining 21.97 percent of cases mapped to MS–DRGs 028 through 030, 453 through 455, and 456 through 459. This resulted in an average case-weighted charge per case of $127,082. The applicant then removed $15,766 for associated charges for other previously used spinal devices. The applicant determined the associated charges to be removed for other previously used devices based on current Titan Spine sales data for the Titan Spine nanolock™ for Lumbar DDD various sizes. The applicant computed the associated charges by multiplying the weighted sales mix by the average sales price for each product in the Titan Spine nanoLOCK™ for Lumbar DDD product line. After the charges for other previously used technologies were removed, the applicant standardized the charges for all cases using the FY 2014 standardizing file posted on the CMS Web site. The applicant excluded all cases without standardized charges, resulting in a total of 96,281 cases. The applicant then inflated the average standardized case-weighted charges from 2014 to 2016 by applying a 2-year rate of inflation factor of 7.7 percent, which is the same inflation factor used by CMS to update the FY 2016 outlier threshold (80 FR 49784).

To calculate the appropriate charges for the Titan Spine nanoLOCK™ for Lumbar DDD, the applicant used a case-weighted charge because the devices implanted are produced and made available in different sizes. To calculate the case-weighted charge for different lumbar device sizes, the applicant determined the average cost to the hospital per device and divided that amount by the national average CCR for implantable devices (0.337) published in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49429). Based on sales data, the applicant then applied a factor of 1.5 per patient to the case-weighted charge by dividing the total number of products sold in the United States by the total invoices generated; with one invoice being the equivalent to one patient and a single surgery. The applicant then added the device-related charges to the inflated average standardized charge per case, which resulted in an inflated average standardized case-weighted charge per case of $167,197. Using the FY 2016 IPPS Table 10 thresholds, the average case-weighted threshold amount was $112,825 (all calculations above were performed using unrounded numbers). Because the final inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

We invited public comments on whether the Titan Spine nanoLOCK™ for Lumbar DDD meets the cost criterion, particularly with regard to the assumptions and methodology used in the applicant's analyses in the proposed rule. We did not receive any public comments concerning costs for Titan Spine nanoLOCK™ for Lumbar DDD. We believe Titan Spine nanoLOCK™ for Lumbar DDD meets the cost criterion.

(2) Titan Spine Endoskeleton® nanoLOCK™ Interbody Device for Cervical DDD

As previously mentioned, Titan Spine received FDA clearance for the use of the nanoLOCK™ TC-Sterile Packaged Cervical Interbody Fusion Device with nanoLOCK™ surface on October 27, 2014, and the nanoLOCK™ TCS-Sterile Package Cervical Interbody Fusion Device with nanoLOCK™ surface on December 14, 2015. To demonstrate that the Titan Spine nanoLOCK™ for Cervical DDD meets the cost criterion, the applicant researched claims data in the FY 2014 MedPAR file for cases assigned to MS–DRGs 028, 029, 030, 453, 454, and 455 reporting any of the following ICD–9–CM cervical fusion procedure codes: 81.01, 81.02, 81.03, 81.32, 81.33. The applicant found that all of the cases mapped to MS–DRGs 471, 472, and 473. However, the applicant focused its analysis on MS–DRGs 028 through 030, 453 through 455, and 471 through 473 because these are the MS–DRGs to which cases treated with the implantation of cervical spinal devices for degenerative disc disease would most likely be assigned. Similar to the sensitivity analysis submitted for the Titan Spine nanoLOCK™ for Lumbar DDD, the applicant applied CMS' relative weight filtering process as described in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49424) to ensure the correct claim types were used and the charge details across the cost centers were appropriate.

According to the applicant, 59.47 percent of the 48,187 cases mapped to MS–DRG 473 and 25.65 percent of the cases mapped to MS–DRG 472, while the remaining 14.88 percent of the cases mapped to MS–DRGs 028 through 030, 453 through 455, and 471. This resulted in an average case-weighted charge per case of $83,841. Using the same methodology described above, the applicant removed $4,423 for associated charges for other previously used technologies from the average case-weighted charge per case using current Titan Spine sales data for cervical device sizes and then standardized the charges. The applicant then inflated the average standardized case-weighted charges from 2014 to 2016 by applying the same 2-year rate of inflation factor used above (7.7 percent). Similar to the methodology described above, the applicant calculated $36,023 for associated device related charges for the Titan Spine nanoLOCK™ for Cervical DDD and added this amount to the inflated average standardized case-weighted charge per case, which resulted in a final inflated average standardized case-weighted charge per case of $114,472. Using the FY 2016 IPPS Table 10 thresholds, the average case-weighted threshold amount was $79,827 (all calculations above were performed using unrounded numbers). Because the final inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

We invited public comments on whether the Titan Spine nanoLOCK™ for Cervical DDD meets the cost criterion in the proposed rule. We did not receive any public comments concerning costs for Titan Spine nanoLOCK™ for Cervical DDD. We believe Titan Spine nanoLOCK™ for Cervical DDD meets the cost criterion.

With regard to the substantial clinical improvement criterion for the Titan Spine Endoskeleton® nanoLOCK™ Interbody Device for Lumbar and Cervical DDD, the applicant asserted that the Titan Spine nanoLOCK™ substantially improves the treatment of Medicare beneficiaries who have been diagnosed with and receive treatment for serious spinal pathologies, such as DDD, compared to the currently available technologies and treatment options, especially in terms of improved fusion, decreased pain, greater stability, faster recovery times, and lower rates of interbody device related complications, such as debris and inflammation.

The applicant noted that the cellular process that occurs after implantation of the Titan Spine nanoLOCK™ induces the body to produce and regulate its own bone morphogenetic proteins (BMP), which help stimulate bone growth naturally in the human body. According to the applicant, this result supports new bone growth without requiring use of exogenous BMP. The applicant explained that exogenous rhBMPs trigger a significant cytokine related anti-inflammatory reaction that has resulted in adverse side effects. The applicant stated that the Titan Spine nanoLOCK™'s proprietary surface and use promotes endogenous production of osteogenic growth factors, such as BMP–2, BMP–4, BMP–7, and TGF–β1.2, which produce only the physiologic amounts necessary for bone production without the concomitant cytokine related to anti-inflammatory reaction.

The applicant also stated that the unique surface of the TitanSpine nanoLOCK™ differentiates the technology from existing interbody devices, which use materials such as PEEK-based or ceramic surfaces. The applicant explained that these materials cause stem cells to flatten on the surface of the implant and primarily differentiate into fibroblasts (fiber-producing cells). This result is avoided by using the Titan Spine nanoLOCK™ because the nano-textured surface promotes differentiation of osteoblasts (bone-forming cells), which increases bone production around the implant site and increases the potential for a faster and more robust fusion. The applicant further stated that use of titanium and titanium alloy surfaces with rough microtopography demonstrate greater bone apposition, but use of macrotextured titanium and titanium alloy surfaces, such as the Titan Spine nanoLOCK™, promotes osteoblast differentiation and productions of factors that favor bone formation, whereas PEEK-based surfaces do not.

As previously noted, the applicant provided results from *in vitro* studies, using human MSCs, which showed positive effects on bone growth related to cellular signaling achieved from use of the device's surface, and osteoblasts exhibited a more differentiated phenotype and increased bone morphogenetic protein BMP production using titanium alloy substrates as opposed to PEEK-based substrates. The applicant believed that the Titan Spine nanoLOCK™ substantially improves the treatment of Medicare beneficiaries diagnosed with and receiving treatment for serious spinal pathologies, such as DDD, compared to currently available technologies and treatment options for Medicare beneficiaries, especially in terms of improved fusion, decreased pain, greater stability, faster recovery times, and lower rates of interbody device related complications, such as debris and inflammation.

We stated in the proposed rule (81 FR 25049) that we were concerned that the results of the *in vitro* studies may not necessarily correlate with the clinical results specified by the applicant. Specifically, because the applicant has only conducted *in vitro* studies without obtaining any clinical data from live subjects during a specific clinical trial, we further stated that we were unable to substantiate the clinical results that the applicant believed the technology achieved from a clinical standpoint based on the results of the studies provided. As a result, we stated that we were concerned that the results of the studies provided by the applicant do not demonstrate that the Titan Spine nanoLOCK™ technologies meet the substantial clinical improvement criterion. We invited public comments on whether the Titan Spine nanoLOCK™ technologies meet the substantial clinical improvement criterion in the proposed rule.

Comment: Several commenters supported that Titan Spine Endoskeleton® nanoLOCK™ Interbody Devices for Lumbar DDD and Cervical DDD represent a substantial clinical improvement over existing technologies. The commenters cited enhanced clinical outcomes with Titan Spine's predicate devices. Commenters cited the success of bench studies which show improved bone growth with nano-textured titanium surfaces. Several commenters have used Titan Spine's predicate devices and stated satisfaction with these predicate devices.

Response: We appreciate the commenters' statements concerning Titan Spine's predicate devices. However, none of the commenters cited actual clinical data that used the Titan Spine Endoskeleton® nanoLOCK™ Interbody Device for Lumbar DDD and Cervical DDD. As mentioned above, the commenters cited data with regard to Titan Spine's predicate devices. Therefore, our concerns stated in the proposed rule are still the same. Due to the lack of actual clinical data using the Titan Spine Endoskeleton® nanoLOCK™ Interbody Device for Lumbar DDD and Cervical DDD, we are unable to determine if Titan Spine Endoskeleton® meets the substantial clinical improvement criterion. Therefore, we are not approving new technology add-on payments for the Titan Spine Endoskeleton® nanoLOCK™ Interbody Device for Lumbar DDD and Cervical DDD for FY 2017. The applicant can reapply in FY 2018 and provide additional clinical data supporting substantial clinical improvement.

e. Defitelio® (Defibrotide)

Jazz Pharmaceuticals submitted an application for new technology add-on payments for FY 2017 for defibrotide (Defitelio®), a treatment for patients diagnosed with hepatic veno-occlusive disease (VOD) with evidence of multi-organ dysfunction. VOD, also known as sinusoidal obstruction syndrome (SOS), is a potentially life-threatening complication of hematopoietic stem cell transplantation (HSCT), with an incidence rate of 8 percent to 15 percent. Diagnoses of VOD range in severity from what has been classically defined as a disease limited to the liver (mild) and reversible, to a severe syndrome associated with multi-organ dysfunction or failure and death. Patients treated with HSCT who develop VOD with multi-organ failure face an immediate risk of death, with a mortality rate of more than 80 percent when only supportive care is used. The applicant asserts that Defitelio® improves the survival rate of patients with VOD with multi-organ failure by 23 percent.

VOD is believed to be the result of endothelial cell damage and hepatocellular injury from high-dose conditioning regimens administered prior to receiving treatment with HSCT. Preclinical data suggest that Defitelio® stabilizes endothelial cells by reducing endothelial cell activation and by protecting endothelial cells from further damage. Defitelio® is administered as a 2-hour intravenous infusion every 6 hours for a minimum of 21 days. The recommended dosage is 6.25 mg/kg body weight (25mg/kg/day). If after 21 days the signs and symptoms associated with hepatic VOD are not resolved, the administration of Defitelio® should be continued until clinical resolution.

In the proposed rule, we noted that the applicant had applied for a unique ICD–10–PCS procedure code to identify the use of Defitelio®. In this final rule, we note that the new ICD–10–PCS procedure codes XW03392 (Introduction of defibrotide sodium anticoagulant into peripheral vein, percutaneous approach) and XW04392 (Introduction of defibrotide sodium anticoagulant into central vein, percutaneous approach) were established in New Technology Group 2 as shown in Table 6B (New Procedure Codes) and will uniquely identify procedures involving the Defitelio® technology. More information on this

request and the approval can be found on the CMS Web site at: *http://www.cms.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/ICD-9-CM-C-and-M-MeetingMaterials.html* and the FY 2016 New ICD–10–PCS Codes can be found at the CMS Web site at: *http://www.cms.gov/Medicare/Coding/ICD10/2016-ICD-10-PCS-and-GEMs.html*.

As stated in the proposed rule, with regard to the newness criterion, according to the manufacturer, Defitelio® received FDA approval on March 30, 2016. We subsequently learned that Defitelio® was granted Orphan Drug Designation for the treatment of VOD in 2003 and for the prevention of VOD in 2007. It has been available to patients as an investigational drug through an expanded access program since 2007. The applicant's New Drug Application (NDA) for Defitelio® received FDA approval on March 30, 2016.

After the proposed rule was issued and after further analysis, we recognized that Defitelio® may no longer be considered ''new'' due to the drug's prior Orphan Drug Designation and availability through an expanded access program. The regulations at § 412.87(b)(2) state that a medical service or technology may be considered new within 2 or 3 years after the point at which data begin to become available reflecting the ICD–9–CM code assigned to the new service or technology (depending on when a new code is assigned and data on the new service or technology become available for DRG recalibration). After CMS has recalibrated the DRGs, based on available data, to reflect the costs of an otherwise new medical service or technology, the medical service or technology will no longer be considered ''new'' under the criterion of this section. As we have indicated in the past, we generally believe that the newness period begins on the date that FDA approval is granted. The FDA approval date is typically the date when new technologies are available on the market and as a result begin to be reflected within the MS–DRGs cost data. As noted above, Defitelio® was first granted Orphan Drug Designation by the FDA in 2003.

The applicant verified that it did not recover the costs of making Defitelio® available under its 2003 Orphan Drug Designation or through its 2007 FDA grant of expanded access. Therefore, the applicant asserted that because cost recovery did not occur until after the NDA approval on March 30, 2016, the drug was not included in the data used to calculate the DRG relative weights, and it is inappropriate to consider prior availability of the drug as constituting an FDA approval in the context of the newness criterion. As we discuss in section II.H.4. and in our discussion of Voraxaze included in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53348), the period of newness does not necessarily start with the FDA approval date for the medical service or technology or the issuance of a distinct procedure code. Instead, the newness period begins with the date of availability of the product on the U.S. market, which is when data become available. The applicant confirmed that Defitelio® was not available on the U.S. market as of the FDA NDA approval date of March 30, 2016, which we believed to be the start of the newness period in the proposed rule. According to the applicant, commercial packaging could not be completed until the label for Defitelio® was finalized with FDA approval, and that commercial shipments of Defitelio® to hospitals and treatment centers began on April 4, 2016. We agree that, based on this information, the newness period for Defitelio® begins on April 4, 2016, the date of its first commercial availability.

As discussed earlier, if a technology meets all three of the criteria for substantial similarity, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether the product uses the same or similar mechanism of action to achieve a therapeutic outcome, in the proposed rule, we stated that the applicant maintained that Defitelio® has a unique mechanism of action that is not shared by any other drug on the market used to treat patients diagnosed with VOD with multi-organ failure. According to the applicant, there are no FDA-approved treatments for VOD other than supportive care. Anticoagulants such as heparin, antithrombin, and tissue plasminogen factor have been used to treat patients diagnosed with VOD, but there is a lack of conclusive evidence that these treatments are effective and they also present a high risk of bleeding. The applicant maintained that Defitelio® addresses the underlying pathology of VOD with evidence of multi-organ failure and its use is effective as a treatment for this form of the disease. According to the applicant, it is speculated that the mechanism of action of the Defitelio® revolves around the stabilization of endothelial cells because endothelial cell damage is believed to be a major contributing factor to the development of VOD. However, we stated in the proposed rule that we were concerned that this mechanism of action is not well understood by the manufacturer and we are unable to determine whether Defitelio® is substantially similar to the other drugs on the market without full understanding of its distinct mechanism of action.

With regard to the second criterion, whether a product is assigned to the same or a different MS–DRG, in the proposed rule, we stated that the applicant maintained that cases potentially eligible for treatment using Defitelio® and representing the target patient population mainly group to two MS–DRGs: MS–DRG 014 (Allogeneic Bone Marrow Transplant) and MS–DRG 016 (Autologous Bone Marrow Transplant with CC/MCC). We believe that these are the same MS–DRGs that identify cases of patients treated with supportive care for VOD with multi-organ failure.

With regard to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, in the proposed rule, we stated that the applicant asserted that there are no FDA-approved treatments for VOD other than supportive care, such as dialysis or ventilation. In addition, the applicant stated that poor outcomes have been reported for patients treated with non-approved pharmacological treatments for VOD. These treatments have largely been discontinued because of the high incidence of hemorrhagic complications, particularly among patients diagnosed with multi-organ failure. According to the applicant, Defitelio® would be the first and only FDA-approved treatment for VOD with evidence of multi-organ failure. However, we stated our concern that the applicant did not include in its application data comparing the outcomes of patients treated with Defitelio® to outcomes of patients treated only for supportive care. We also stated in the proposed rule that we were concerned that Defitelio® may not produce outcomes that are significantly different than the outcomes of patients treated with supportive care.

We invited public comments on whether Defitelio® is substantially similar to existing technologies and whether it meets the newness criterion.

Comment: With regard to our concern that we cannot determine whether Defitelio® is substantially similar to other technologies without a full understanding of its mechanism of action, the applicant provided additional information about the

pathophysiology of VOD and how it is addressed by Defitelio®'s dual mechanism of action consisting of: (1) Endothelial cell protection and stabilization, and (2) enhancement of plasmin enzymatic activity to restore thrombo-fibrinolytic balance. According to the applicant, this two-pronged mechanism of action sets Defitelio® apart from supportive care agents available to treat VOD with multi-organ failure.

The applicant described the damage, detachment, and death of endothelial cells as triggered first by conditioning chemotherapy and/or radiotherapy, a necessary part of the HSCT conditioning regimen, and then by complications related to the HSCT procedure itself. The applicant asserted that progressive deterioration of endothelial cells results in tissue damage characteristic of VOD with multi-organ failure. In particular, clots form at the site of endothelial cell damage and obstruct small veins in the liver. The hepatocellular necrosis and vascular occlusion resulting from endothelial cell damage ultimately leads to liver, pulmonary, and renal failure which can culminate in death.

The applicant provided additional information from numerous clinical studies that demonstrate Defitelo®'s robust and reproducible ability to protect endothelial cells from cell damage, particularly from chemotherapy-induced cell death, as well as its ability to restore the thrombo-fibrinolytic balance, improving blood circulation. The applicant reiterated that Defitelio® is the only FDA-approved treatment for VOD with multi-organ failure and that, prior to this approval, patients only received supportive care. While supportive care agents with anti-coagulant activity are available, they do not have the unique dual mechanism of action that Defitelio® possesses, nor have they been proven to be effective in the treatment of VOD with multi-organ failure.

With regard to our concern that cases eligible for Defitelio® would be assigned to the same MS–DRGs that identify cases of patients treated with supportive care for VOD with multi-organ failure, the applicant noted that, prior to NDA approval of Defitelio®, patients with VOD with multi-organ failure would have received supportive care alone because there were no FDA-approved treatments for VOD. As a result, there are no charges for VOD treatment in MS–DRG 014, MS–DRG 016, or any other MS–DRG to which cases eligible for Defitelio® would map.

With regard to our concern that the applicant did not include in its application data comparing the outcomes of patients treated with Defitelio® to outcomes of patients treated only with supportive care and that Defitelio® may not produce outcomes that are significantly different than the outcomes of patients treated with supportive care, the applicant clarified that it did include such studies, including the Phase 3 Study #2005–01, which enabled a comparison of Defitelio® versus supportive care alone and demonstrated the statistically and clinically significant benefit of Defitelio® over supportive care. The results of Study #2005–01 are described below in our discussion of whether Defitelio® meets the substantial clinical improvement criterion.

Response: We appreciate the applicant's input and the detailed explanation of Defitelio®'s mechanism of action and the pathophysiology of VOD with multi-organ failure. We acknowledge that, as the only FDA-approved treatment for VOD with multi-organ failure, the applicant believed there are no charges for VOD treatment in the MS–DRGs claims data. We also acknowledge that the applicant submitted data from the Phase 3 Study #2005–01 to demonstrate that the improved outcomes among patients treated with Defitelio® compared to patients treated only with supportive care are statistically significant and valid. After considering the additional information submitted by the applicant, we have determined that Defitelio® is not substantially similar to any other technologies currently on the U.S. market for the treatment of VOD with multi-organ failure, and we agree that Defitelio® meets the newness criterion.

With regard to the cost criterion, in the proposed rule, we stated that the applicant conducted sensitivity analyses using claims data from 2012 through 2014 and determined the results in aggregate and by year. The applicant researched 100 percent of the 2012 through 2014 Inpatient Standard Analytic Files (SAFs) for cases eligible for Defitelio®. Because an ICD–9–CM code specific to treatment for VOD does not exist, the applicant used an algorithm to identify cases to use in its sensitivity analyses. The most appropriate ICD–9–CM diagnosis codes were identified based on clinical criteria used to diagnose VOD and were used to identify cohorts of patients diagnosed with VOD and VOD with multi-organ dysfunction. The applicant first identified claims with an ICD–9–CM procedure code indicating an HSCT (Group A) within a 30-day window; VOD most commonly occurs after receipt of HSCT. The applicant then looked for cases with ICD–9–CM diagnosis codes related to liver injury (Group B) or clinical evidence of suspected VOD symptoms based on at least two relevant ICD–9 diagnosis codes (Group C). Lastly, the applicant filtered out cases that did not show clinical evidence of multi-organ dysfunction based on at least one relevant ICD–9–CM code (Group D).

The applicant submitted the following table indicating the ICD–9–CM codes used for each category of the algorithm.

TABLE SUBMITTED BY APPLICANT: ICD–9 CODES USED FOR THE PREMIER VOD ALGORITHM

Group	Title	ICD–9–CM code	Description
A	Hematopoietic Stem Cell Transplant (HSCT) (at least one code).	41.00	Bone marrow transplant, not otherwise specified.
		41.01	Autologous bone marrow transplant without purging.
		41.02	Allogeneic bone marrow transplant with purging.
		41.03	Allogeneic bone marrow transplant without purging.
		41.04	Autologous hematopoietic stem cell transplant without purging.
		41.05	Allogeneic hematopoietic stem cell transplant without purging.
		41.06	Cord blood stem cell transplant.
		41.07	Autologous hematopoietic stem cell transplant with purging.
		41.08	Allogeneic hematopoietic stem cell transplant.
		41.09	Autologous bone marrow transplant with purging.

TABLE SUBMITTED BY APPLICANT: ICD–9 CODES USED FOR THE PREMIER VOD ALGORITHM—Continued

Group	Title	ICD–9–CM code	Description
B	Liver Injury (at least one code)	453.xx	Other venous embolism and thrombosis.
		570.xx	Acute and subacute necrosis of liver.
		573.8	Other specified disorders of liver.
		573.9	Unspecified disorder of liver.
		459.89	Other specified disorders of the circulatory system.
		277.4	Disorders of bilirubin excretion.
C	VOD Symptoms (at least two codes)	782.4	Hyperbilirubinemia.
		789.1	Hepatomegaly.
		783.1	Abnormal weight gain.
		789.5	Ascites.
D	Multi-Organ Dysfunction (at least one code).	518.8x	Acute/Chronic Respiratory Failure.
		786.09	Other respiratory abnormalities (respiratory distress, except that associated with trauma/surgery in adults, or with RDS in newborns).
		799.02	Hypoxemia.
		518.81	Acute respiratory failure.
		V46.2	Other dependence on machines, supplemental oxygen.
		96.7x	Other continuous invasive mechanical ventilation.
		93.90, 93.91, 93.93, 93.99.	Non-invasive mechanical ventilation.
		584.X	Acute renal failure.
		586.X	Renal failure unspecified.
		593.9	Renal Failure.
		39.27, 39.42, 39.95, 54.98.	Dialysis, including hemodialysis, peritoneal dialysis, hemofiltration.

Using the above algorithm, the applicant identified a total of 267 patient cases of VOD with multi-organ dysfunction in the 2012–2014 Inpatient SAFs, with 78 patient cases in 2012, 102 patient cases in 2013, and 87 patient cases in 2014, or an average annual patient case volume of 89. The applicant determined that these cases grouped mainly into two MS–DRGs: 014 and 016. The applicant noted that there were no cases in the data from MS–DRG 017 (Autologous Bone Marrow Transplant without CC/MCC). The applicant further noted that there were no cases from MS–DRG 017 because the ICD–9–CM codes identifying VOD with multi-organ dysfunction include serious medical conditions that are listed on the MCC and CC lists. In total, 38 MS–DRGs were represented in the patient cohort, with 27 percent of cases mapping to MS–DRG 014 and 42 percent of cases mapping to MS–DRG 016. The remaining cases mapped to 1 of the 36 remaining MS–DRGs with fewer than 11 cases.

For results in the aggregate, the applicant calculated an average case-weighted charge per case of $427,440 across 267 cases representing diagnoses of VOD with multi-organ dysfunction from 2012 through 2014. The applicant assumed there would be a reduction in the use of selected drugs as a result of using Defitelio® and removed 50 percent of the estimated charges for heparin, furosemide, and spironolactone. The charges for these drugs were estimated based on pricing taken from the Medispan PriceRx database, whose costs were marked up according to the inverse of CCRs from cost center 07300 (Drugs Charged to Patients) obtained from providers' 2012, 2013, and 2014 cost reports. The applicant matched these CCRs with the provider numbers on each claim. The applicant removed an average of $2,631 in charges for these drugs from the overall unstandardized charges for Defitelio®.

The applicant then standardized the charges and calculated an average standardized case-weighted charge per case of $310,651. To update the charge data to the current fiscal year, the applicant inflated the charges based on the charge inflation factor of 1.048116 in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49779). The 1-year inflation factor was applied four times to FY 2012 claims, three times to FY 2013 claims, and twice to FY 2014 claims to inflate all charges to 2016. The applicant computed an inflated average standardized case-weighted charge per case of $356,015. Using the FY 2016 IPPS Table 10 thresholds, the average case-weighted threshold amount was $157,951 (all calculations above were performed using unrounded numbers). Because the inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion. The applicant noted that it did not include charges for Defitelio® in the inflated average standardized case-weighted charge per case because the inflated average standardized case-weighted charge per case exceeded the average case-weighted threshold amount without charges for Defitelio®.

The applicant provided a similar analysis for each individual year of the SAF data rather than combining all the data from all 3 years into one analysis. Under the other three analyses, the applicant noted that the average standardized case-weighted charge per case exceeded the average case-weighted threshold amount (as shown in the table below) without inflating the charges and without adding any charges for Defitelio®.

SAF Year	Average case-weighted threshold amount	Average standardized case-weighted charge per case
2012	$161,469	$347,910
2013	150,585	326,445

SAF Year	Average case-weighted threshold amount	Average standardized case-weighted charge per case
2014	163,434	404,883

We invited public comments on whether Defitelio® meets the cost criterion in the proposed rule.

Comment: The applicant submitted a technical correction to update its cost criterion analysis. According to the applicant, the 1-year inflation factor from the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24632) was used in the sensitivity analysis included in its application instead of the 1-year inflation factor from the FY 2016 IPPS/LTCH PPS final rule (80 FR 49784). The applicant maintained that, in the revised sensitivity analysis with the updated inflation factor, the average standardized case-weighted charge per case for the applicable MS–DRGs exceeded the average case-weighted threshold amount without adding any charges for Defitelio®. In the applicant's initial analysis using the 1-year inflation factor of 1.048116 from the proposed rule, the average standardized case-weighted charges exceeded the average case-weighted MS–DRG thresholds by an average of $200,323. After applying the updated inflation factor of 1.037616, the average standardized case-weighted charges exceeded the average case-weighted MS–DRG thresholds by an average of $187,776 before adding charges for Defitelio®. The 1-year inflation factor was applied four times for 2012 claims, three times for 2013 claims, and two times for 2014 claims in order to compare 2012 through 2014 claims data to the FY 2016 IPPS/LTCH PPS final rule thresholds.

Response: We appreciate the applicant submitting the additional information. After reviewing the sensitivity analysis included in the original application and subsequent analysis included in the applicant's public comment, we have determined that the Defitelio® meets the cost criterion.

With regard to the substantial clinical improvement criterion, in the proposed rule, we stated that the applicant maintained that Defitelio® is an effective treatment for VOD as an early onset cause of mortality following HSCT. According to the applicant, patients treated with Defitelio® have improved survival and efficacy rates compared to patients who were not treated with Defitelio®. In increasing the chances of post-HSCT survival, Defitelio® affords the transplant patient the opportunity for engraftment, which could be a potential cure for the underlying disease that required HSCT.

The applicant supported these assertions with clinical evidence from pivotal trial 2005–01, a Phase III historical control study in which patients with VOD with multi-organ failure were given Defitelio® in doses of 25/mg/kg/day for the recommended minimum treatment duration of 21 days. Patients in the historical control group were selected by an independent medical review committee (MRC) from a pool of 6,867 medical charts of patients receiving HSCT that were hospitalized from January 1995 through November 2007. The trial consisted of 102 patients in the Defitelio® treated group and 32 patients in the historical control group. The trial used the survival rate and rate of Complete Response (CR) at Day+100 as clinical endpoints. The observed survival rate at Day+100 in the Defitelio® treated group was 38.2 percent compared to 25 percent in the historical control group. Moreover, the rate of CR by Day+100 post-HSCT for the Defitelio® treated group was 25.5 percent compared to 12.5 percent in the historical control group. The applicant conducted additional analyses that showed improvements in survival outcomes among subgroups of patients with baseline prognostic factors related to worse outcomes.

According to the applicant, running a controlled, blinded, and randomized trial in a patient population with high mortality rates would be unethical. We stated in the proposed rule that we are concerned that there are limitations to the historical control group used in pivotal trial 2005–01. We stated that we believe that the discrepancy between the size of the treatment group (N=102) and the historical control group (N=32) may skew the trial results in favor of the treatment group. We also were uncertain, given the small sample size and historical data used, whether the historical control group is representative of patients with VOD with multi-organ failure. According to the applicant, patients in the historical control group were hospitalized between January 1995 and November 2007. Because of advancements in medicine within this timeframe, we were concerned that the patients in the historical control group cannot be appropriately compared to patients in the treatment group. Moreover, we stated that we believe that it is difficult to attribute improved survival and CR rates only to Defitelio® treatment.

We invited public comments on whether Defitelio® meets the substantial clinical improvement criterion in the proposed rule.

Comment: The applicant submitted public comments in response to CMS' concerns presented in the proposed rule, which asserted that the small sample size and nonrandomized trial design of Study #2005–01 is due to the rarity of conditions that require HSCT and the low incidence of severe VOD in patients who have undergone HSCT. In addition to the difficulty of enrolling large numbers of patients in any study of VOD, the high overall mortality rate among patients who develop VOD with multi-organ failure would make a randomized controlled trial that did not allow use of Defitelio® unethical. For these reasons, the applicant chose a study design with a Historical Control group. The applicant ensured that the Defitelio® treatment (n=102) and Historical Control (n=32) groups were comparable in baseline prognostic variables and disease characteristics using a propensity score adjustment based on baseline prognostic factors of survival. The applicant also ensured that the rate of VOD with multi-organ failure observed among patients screened for the Historical Control group in Study #2005–01 was consistent with overall incidence expected and validated from other sources. According to the applicant, the overall incidence of severe VOD in the screened population is estimated to be 1.5 percent, which was comparable to the incidence of 1.3 percent in an independent registry. Overall, the applicant stated that the incidence of VOD with multi-organ failure remains similar across diverse populations, indicating not only a consistently low incidence, but also that the Historical Control group for Study #2005–01 was representative of VOD with multi-organ failure.

With regard to our concern that patients in the Historical Control group cannot be appropriately compared to treatment group patients because of advancements in medicine within the timeframe of the patients in the

historical control group, the applicant asserted that medical advances have only lowered the incidence of VOD with multi-organ failure but have not improved the highly lethal outcome of the disease once it develops. The applicant asserted that increasing utilization of reduced-intensity conditioning regimens have led to a reduction in the incidence of VOD over time; however, they do not improve outcomes for those patients who develop VOD with multi-organ failure. The clinical pattern of VOD following HSCT and its high mortality rate of over 80 percent are the same, regardless of the conditioning regimen the patient receives. The applicant reported that during the period of Study #2005–01, there were no improvements in the treatment of VOD once multi-organ failure developed. Although Defitelio® was available as an orphan drug beginning in 2003, it did not have enough distribution to impact mortality. The Historical Control patients were treated in a functionally similar timeframe to the Defitelio® treatment patients and received similar care with the key exception of the availability of Defitelio® for the treatment group.

Finally, the applicant cited a recently published study describing Study #2005–01, which concluded that Defitelio® use in patients with VOD with multi-organ failure post-HSCT is associated with a 23 percent improvement in survival at Day+100 post-HSCT, as well as a clinically meaningful improvement in the rate of Complete Response by Day+100 compared with the Historical Control.[15] In this respect, the applicant maintained that Defitelio® provides a promising treatment option for patients with a high unmet medical need.

Response: We appreciate the applicant's submittal of the additional information and the explanation of the reasons behind the study design that was chosen. We acknowledge the limitations due to the small population of patients with VOD with multi-organ failure and the high mortality rate of patients who develop the disease and that a Historical Control group is appropriate for purposes of the Phase III trial. We also acknowledge the appropriateness of using propensity scoring to ensure a balanced patient population between the Defitelio® treatment group and Historical Control group and the statistically and clinically significant results of Study #2005–01, which demonstrate that the Defitelio® treated group experienced better survival and complete response rates compared to patients in the Historical Control group.

Comment: One commenter concurred with the applicant that Defitelio® meets the substantial clinical improvement criterion. The commenter cited the pivotal trial for Study #2005–01, which demonstrates that treatment with Defitelio® is associated with higher incidence of VOD resolution and survival than what was observed in a historically controlled cohort of patients with VOD with multi-organ failure.[16] The commenter asserted that, over the past two decades, many supportive care agents have been used to treat VOD with multi-organ failure but that none have been successful in demonstrating superior survival. The commenter reported that, given that supportive care agents have led to disappointing results and that there are no other FDA-approved treatments for VOD with multi-organ failure, Defitelio® is now universally accepted as the only treatment for VOD currently available and should therefore be made available for patients who need it.

Response: We agree with the commenter that Defitelio® represents a substantial clinical improvement over existing technologies in a patient population diagnosed with VOD with multi-organ failure. In particular, we concur with the applicant and the commenter that, because Defitelio® is the only FDA-approved treatment for VOD with multi-organ failure, it represents a substantial clinical improvement for patients afflicted with this disease, whose alternatives include supportive care agents that have not demonstrated improved survival or complete response rates.

After consideration of the public comments we received, we have determined that the Defitelio® meets all of the criteria for approval of new technology add-on payments. Therefore, we are approving new technology add-on payments for Defitelio® for FY 2017. Cases involving Defitelio® that are eligible for new technology add-on payments will be identifiable by ICD–10–PCS procedure codes XW03392 and XW04392.

In its application, the applicant estimated that the average Medicare beneficiary would require a dosage of 25 mg/kg/day for a minimum of 21 days of treatment. The recommended dose is 6.25 mg/kg given as a 2-hour intravenous infusion every 6 hours. Dosing should be based on a patient's baseline body weight, which is assumed to be 70 kg for an average adult patient. All vials contain 200 mg at a cost of $825 per vial. Therefore, we have determined that cases involving the use of the Defitelio® technology would incur an average cost per case of $151,800 (70 kg adult × 25 mg/kg/day × 21 days = 36,750 mg per patient/200 mg vial = 184 vials per patient × $825 per vial = $151,800). Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the technology or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment amount for a case involving the use of Defitelio® is $75,900 for FY 2017.

f. GORE® EXCLUDER® Iliac Branch Endoprosthesis (IBE)

W. L. Gore and Associates, Inc. submitted an application for new technology add-on payments for the GORE® EXCLUDER® Iliac Branch Endoprosthesis (GORE IBE device) for FY 2017. The device consists of two components: The Iliac Branch Component (IBC) and the Internal Iliac Component (IIC). The applicant indicated that each endoprosthesis is pre-mounted on a customized delivery and deployment system allowing for controlled endovascular delivery via bilateral femoral access. According to the applicant, the device is designed to be used in conjunction with the GORE® EXCLUDER® AAA Endoprosthesis for the treatment of patients requiring repair of common iliac or aortoiliac aneurysms. When deployed, the GORE IBE device excludes the common iliac aneurysm from systemic blood flow, while preserving blood flow in the external and internal iliac arteries.

With regard to the newness criterion, the applicant received pre-market FDA approval of the GORE IBE device on February 29, 2016. The applicant submitted a request for a unique ICD–10–PCS procedure code and was granted approval for the following procedure codes: 04VC0EZ (Restriction of right common iliac artery with branched or fenestrated intraluminal device, one or two arteries, open approach); 04VC0FZ (Restriction of right common iliac artery with branched or fenestrated intraluminal device, three or more arteries, open approach); 04VC3EZ (Restriction of right common iliac artery with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach); 04VC3FZ (Restriction of right common iliac artery with branched or fenestrated intraluminal device, three or more

[15] Richardson PG, Riches M, Kernan NA, Brochstein JA, Mineishi S, Termuhlen AM, Phase 3 trial of defibrotide for the treatment of severe veno-occlusive disease and multi-organ failure. Blood. 2016 Mar 31;127(13)1656–65.

[16] Richardson et al. 2016.

arteries, percutaneous approach); 04VC4EZ (Restriction of right common iliac artery with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach); 04VC4FZ (Restriction of right common iliac artery with branched or fenestrated intraluminal device, three or more arteries, percutaneous endoscopic approach); 04VD0EZ (Restriction of left common iliac artery with branched or fenestrated intraluminal device, one or two arteries, open approach); 04VD0FZ (Restriction of left common iliac artery with branched or fenestrated intraluminal device, three or more arteries, open approach); 04VD3EZ (Restriction of left common iliac artery with branched or fenestrated intraluminal device, one or two arteries, percutaneous approach); 04VD3FZ (Restriction of left common iliac artery with branched or fenestrated intraluminal device, three or more arteries, percutaneous approach); 04VD4EZ (Restriction of left common iliac artery with branched or fenestrated intraluminal device, one or two arteries, percutaneous endoscopic approach); and 04VD4FZ (Restriction of left common iliac artery with branched or fenestrated intraluminal device, three or more arteries, percutaneous endoscopic approach). These new ICD–10–PCS procedure codes are effective on October 1, 2016.

As discussed earlier, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether a product uses the same or a similar mechanism of action to achieve a therapeutic outcome, the applicant indicated that the GORE IBE device is based on the same design principles as other endovascular repair devices, and its use differs because of the specific target site for implantation. Consequently, it has a different shape and method of delivery from other endovascular devices. The GORE IBE device is similar to the GORE® EXCLUDER® AAA Endoprosthesis, primarily differing in device dimensions to fit within the iliac artery anatomy. With regard to the first criterion, we expressed concern in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25058) that the GORE IBE device has a similar mechanism of action to other stenting grafts used to treat patients with abdominal aortic aneurysms (AAAs) because it repairs the abdominal aortoiliac aneurysm from the inside and is inserted in a similar manner to other abdominal aortoiliac endovascular aneurysm repair devices.

With regard to the second criterion, whether a product is assigned to the same or a different MS–DRG, the applicant indicated that cases using the GORE IBE device would map to the same MS–DRGs as cases involving other stent-grafts used to treat patients with AAAs. Specifically, similar to cases involving other stent-grafts used to treat AAAs, cases involving the GORE IBE device would be assigned to MS–DRG 268 (Aortic and Heart Assist Procedures except Pulsation Balloon with MCC) and MS–DRG 269 (Aortic and Heart Assist Procedures except Pulsation Balloon without MCC).

With regard to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, the applicant indicated that the GORE IBE device is intended to be used in the treatment of patients requiring repair of common iliac or aortoiliac aneurysms. The applicant stated that this device, if approved, would be the first purpose-built endovascular device for patients whose conditions (common iliac or aortoiliac aneurysm) put them at risk for negative clinical outcomes due to limitations of current treatment methods, which may not preserve internal iliac artery perfusion. The applicant described current repair options for these patients as: (a) Intentional occlusion and coverage of the internal iliac artery; (b) undergoing a more extensive surgical operation to place a bypass graft; or (c) use of combinations of devices in a nonindicated, variable, and inconsistent manner. With regard to the third criterion, we expressed concern that this device appears to treat a similar type of disease to existing stent grafts.

Based on the statements above, the applicant maintained that the GORE IBE device is not substantially similar to other stent-grafts used to treat patients with AAAs. In the FY 2017 IPPS/LTCH PPS proposed rule, (81 FR 25057 through 25059), we invited public comments on whether the GORE IBE device is substantially similar to existing technologies and whether the technology meets the newness criterion.

Comment: The manufacturer of the GORE IBE device commented that several characteristics of the GORE IBE demonstrate that the technology is new, including differentiated delivery mechanisms to allow for effective use in the specific anatomy, use of a technique specific to the iliac bifurcation, facilitation of a unique approach not necessary in other areas of the aortic anatomy, and allowance for the only dedicated and on-label treatment of iliac aneurysms. The manufacturer indicated that the GORE IBE device received premarket approval on February 29, 2016.

With respect to the mechanism of action, the manufacturer indicated that all FDA-approved endovascular aneurysm repair (EVAR) devices designed to treat AAAs share the same fundamental mechanism of action, but that devices must be specifically designed to address anatomical constraints and specific pathophysiology. Another commenter also indicated that the GORE IBE differs from standard EVAR in that it is a bifurcated graft that requires increased work to deploy.

Response: We appreciate the additional information provided to us by the manufacturer and the other commenter. After reviewing the comments, we believe that the GORE IBE is a treatment option for a new patient population because it is the first stent-graft in its class for patients with iliac branch involvement. As a result, there is no other device to which to compare its mechanism of action because the GORE IBE is unique to the patient population that it is approved for use by the FDA. Therefore, the GORE IBE is not substantially similar to any existing technologies because it does not meet all three of the substantial similarity criteria.

After consideration of the public comments we received, we believe that the GORE IBE device meets the newness criterion, and we consider the technology to be ''new'' as of February 29, 2016, the date that the GORE IBE device received premarket approval.

With regard to the cost criterion, the applicant researched the FY 2014 MedPAR claims data to identify patients who may be eligible for treatment using the GORE IBE device. The applicant noted that cases eligible for the GORE IBE device would map to MS–DRGs 268 (Aortic and Heart Assist Procedures Except Pulsation Balloon with MCC) and 269 (Aortic and Heart Assist Procedures Except Pulsation Balloon without MCC). The applicant provided two analyses. The first analysis searched for cases that may be potentially eligible for the GORE IBE device by identifying cases with endovascular aneurysm repair (EVAR) with iliac diagnoses. To identify these cases, the applicant searched for cases that had an ICD–9–CM primary procedure code of 39.71 (Endovascular implantation of other graft in abdominal aorta) in combination with a primary diagnosis code of 441.4 (Abdominal aneurysm without mention

of rupture) or 441.02 (Dissection of aorta, abdominal). The applicant excluded cases with a diagnosis code of 441.3 (Abdominal aneurysm, ruptured), and cases with atherosclerosis of the lower extremities (ICD–9–CM diagnosis code 440.20 through 440.28). The applicant then identified a subset of cases (1,615 cases) with significant iliac involvement (which indicated use of the prior technology as well as disease extent where the new technology could be used) by searching for cases with a secondary ICD–9–CM diagnosis code of 442.2 (Aneurysm of iliac artery) or 443.22 (Dissection of iliac artery). This subset of cases was used in the analysis with 205 cases that mapped to MS–DRG 268 and 1,410 cases that mapped to MS–DRG 269. As discussed below, the remaining cases (11,926 cases) were used to help evaluate and compare subsequent offset charge calculations (base EVAR cases).

Using the 1,615 cases, the applicant calculated an average unstandardized case-weighted charge per case of $121,527. Charges for the prior technology (implants), which would be offset by the new technology were established by subtracting the average implant charge in the 1,615 cases from the average implant charge in the base EVAR sample. The excess implant charge represents current implant charges being used in EVAR cases with iliac involvement, and was subtracted from the average unstandardized case-weighted charge per case.

The applicant compared the average unstandardized O.R. and radiology charges associated with the new technology from the clinical trial data with the unstandardized OR and radiology charges associated with the prior technology from the MedPAR data and noted that O.R. and radiology charges for resources related to the new technology and the prior technology were similar. However, with regard to charges in the intensive care unit (ICU), there was a reduction of 56 percent in ICU associated charges for the new technology. Therefore, the applicant offset the ICU associated charge by 56 percent and deducted this amount from the average unstandardized case-weighted charge per case. The applicant then standardized the charges, but noted that it did not inflate the charges. The applicant added charges for the GORE IBE device by converting the costs of the device to charges using the average CCR for implantable devices (0.337) as reported in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49429). The applicant noted that the cost of the technology was proprietary information. Based on the FY 2016 IPPS/LTCH PPS Table 10 thresholds, the average case-weighted threshold amount was $109,241. The applicant computed an average standardized case-weighted charge per case of $124,129. Because the average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

The second analysis was similar to the first analysis, but searched the MedPAR claims data file for cases with an EVAR with an iliac diagnosis and procedure instead of cases with EVAR and only an iliac diagnosis. The applicant used the same ICD–9–CM procedure and diagnoses codes as used in the first analysis, but used the following ICD–9–CM procedure codes to identify cases that had an iliac procedure: 39.79 (Other endovascular procedures on other vessels) in combination with 39.29 (Other (peripheral) vascular shunt or bypass), 39.79 in combination with 39.90 (Insertion of non-drug-eluting peripheral (non-coronary) vessel stent(s)) without 39.29, 39.90 in combination with 00.41 (Procedure on two vessels), 00.46 (Insertion of two vascular stents), and 00.47 (Insertion of three vascular stents) without 39.79 and 39.29. The applicant noted that the expected distribution of cases for the GORE IBE device is that 20 percent of the cases would map to MS–DRG 268 and 80 percent of the cases would map to MS–DRG 269. Because this analysis represents cases that had an actual iliac procedure, the applicant applied this distribution to the cases. The applicant then followed the same methodology above and removed charges for the prior technology and resources related to the prior technology, standardized the charges, and then added charges related to the GORE IBE device. Based on the FY 2016 IPPS/LTCH PPS Table 10 thresholds, the average case-weighted threshold amount was $113,015. The applicant computed an inflated average standardized case-weighted charge per case of $138,179. Because the inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

With regard to the second analysis, the applicant imputed the distribution of cases. We indicated that we were not sure how the applicant determined which cases would map to MS–DRG 268 or MS–DRG 269, if the distribution was imputed. Also, the applicant did not disclose how many cases were found in the claims data after filtering the case volume using ICD–9–CM procedure codes identifying cases that had an iliac procedure. We invited public comments on whether the GORE IBE device meets the cost criterion, including with regard to the concerns we raised in the proposed rule.

Comment: The manufacturer of the GORE IBE device clarified the basis for the assumption regarding the DRG distribution of cases involving the IBE. According to the manufacturer, its analysis utilized a sample of 100 cases where a combination of the ICD–9 procedure and diagnosis codes strongly suggested the use of current alternative methods, that is, physician-developed methods, for preservation of internal iliac flow in conjunction with EVAR. The manufacturer reported that 80 percent were in the No MCC severity level, while 20 percent were in the MCC severity level. The manufacturer also examined a more conservative distribution of all EVAR cases, in which it found 87 percent with no MCC, and 13 percent with MCC. The manufacturer indicated that, using the conservative assumption, the threshold was still met.

Response: We appreciate the manufacturer's clarification of the basis for the assumption regarding the MS–DRG distribution of cases. After consideration of the public comments we received, we believe that the GORE IBE meets the cost criterion.

With regard to the substantial clinical improvement criterion, the applicant indicated that current treatment approaches have substantial risks of complications that can negatively impact quality of life. Available treatment methods that do not preserve internal iliac artery perfusion increase risks for negative clinical outcomes; compared to methods that preserve the internal iliac artery, those that use contralateral hypogastric embolization result in a higher incidence of buttock claudication (15—55 percent), sexual dysfunction (5—45 percent), ischemia of the colon (2.6 percent), and rarely, ischemia of the spine. The applicant cited the ''12–04'' study,[17] which the applicant suggested showed the GORE IBE device to have 0 percent rates of buttock claudication, new onset erectile dysfunction, colonic ischemia, and spinal cord ischemia. The applicant also suggested that the 12–04 study showed the GORE IBE device to have reduced procedure time, reduced fluoroscopy time, reduced reintervention rates, and increased patency rates. The applicant

[17] DeRubertis BG, Quinones-Baldrich WJ, Greenberg JI, Jimenez JC, Lee JT. Results of a double-barrel technique with commercially available devices for hypogastric preservation during aortoilac endovascular abdominal aortic aneurysm repair. J Vasc Surg 2012;56:1252–1259.

asserted that because the GORE IBE device preserves flow to the internal iliac artery, the risk of complications is reduced, which represents a substantial clinical improvement relative to current treatment approaches. The applicant also stated that, compared with historical data for procedures done using contralateral hypogastric embolization, the GORE IBE device is associated with reduced procedure time, reduced fluoroscopy time, reduced reintervention rates, reduced incidence of aneurysm enlargement, and improved patency rates.

The applicant submitted several research articles with its application, which consisted of a few very small case series of 23 total patients published [18] [19] [20], as well as some abstracts of other case series. These publications describe the procedural results of using the device, with angiographic endpoints, and demonstrate the feasibility of insertion. The applicant also indicated that other treatment approaches, including open surgery, are done infrequently, while other approaches are not approved for this purpose. Therefore, the applicant indicated that it would be impractical to conduct comparative studies.

After reviewing the information provided by the applicant, we stated in the proposed rule that we have the following concerns: We stated that we were concerned about the lack of clinical studies comparing the GORE IBE device with alternative methods of treatment, and noted that the application did not provide data that supported its assertions that the GORE IBE device is associated with reduced procedure time, reduced fluoroscopy time, reduced reintervention rates, reduced incidence of aneurysm enlargement, and improved patency rates. We also noted that the applicant's assertions about decreased rates of complications appear to compare a small number of published cases of the use of the GORE IBE device with complication rates cited in the literature, which does not indicate whether there is a valid basis for comparison. We invited public comments on whether the GORE IBE device meets the substantial clinical improvement criterion in the proposed rule.

Comment: The manufacturer of the GORE IBE device indicated that the FDA-approved study design was appropriate and reflected real-world limitations associated with clinical studies in small, targeted populations. The manufacturer also noted that it was impractical to incorporate off-label alternatives, and that the surgical alternative is not preferred; therefore, neither of these approaches could be used as a comparison arm. However, the manufacturer provided an abstract of the IBE pivotal trial, described in the June 2016 supplement to the *Journal of Vascular Surgery,* which included a built-in control subgroup consisting of those patients that had bilateral aneurysms.[21] According to the manufacturer, these patients received the IBE device on one side, while flow on the other side was either sacrificed via coil or plug, or preserved with surgical bypass. Of the 21 patients in which the flow was sacrificed on one side, 29 percent experienced new-onset claudication on the side where the flow was sacrificed. There were no reports of claudication on the IBE treatment side. The manufacturer stated that this finding supports the benefit of flow preservation.

Another commenter also referred to a Society for Vascular Surgery practice guideline which described the importance of preserving internal iliac flow on at least one side, which supports the benefit of the GORE IBE device in improving quality of life. Another commenter supported the approval of a new technology add-on payment for the GORE IBE in that it allows for higher quality of care and improved quality of life.

Response: We appreciate the manufacturer's explanation of the built-in control subgroup, and we agree that this group represents a good comparison group for the GORE IBE device. We believe that the information presented by the manufacturer and other commenters demonstrates that the GORE IBE device represents a substantial clinical improvement over current treatment approaches.

After consideration of the public comments we received, we have determined that the GORE IBE device system meets all of the criteria for approval of new technology add-on payments for FY 2017. As discussed above, cases involving the GORE IBE device that are eligible for new technology add-on payments will be identified by ICD–10–PCS procedure codes: 04VC0EZ; 04VC0FZ; 04VC3EZ; 04VC3FZ; 04VC4EZ; 04VC4FZ; 04VD0EZ; 04VD0FZ; 04VD3EZ; 04VD3FZ; 04VD4EZ; and 04VD4FZ. In its new technology add-on payment application, the applicant stated that the projected cost of the GORE IBE device is $10,500. Under § 412.88(a)(2), new technology add-on payments are limited to the lesser of 50 percent of the average cost of the device or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment for a case involving the use of the GORE IBE device is $5,250 for FY 2017.

g. Vistogard™ (Uridine Triacetate)

BTG International Inc., submitted an application for new technology add-on payments for the Vistogard™ for FY 2017. Vistogard™ (Uridine Triacetate) was developed as an antidote to Fluorouracil toxicity. Chemotherapeutic agent 5-fluorouracil (5–FU) is used to treat specific solid tumors. It acts upon deoxyribonucleic acid (DNA) and ribonucleic acid (RNA) in the body, as uracil is a naturally occurring building block for genetic material. Fluorouracil is a fluorinated pyrimidine. As a chemotherapy agent, Fluorouracil is absorbed up by cells and causes the cell to metabolize into byproducts that are toxic and used to destroy cancerous cells. The byproducts fluorodoxyuridine monophosphate (F–dUMP) and floxuridine triphosphate (FUTP) are believed to do the following: Reduce DNA synthesis, lead to DNA fragmentation, and disrupt RNA synthesis. Fluorouracil is used to treat a variety of solid tumors such as colorectal, head and neck, breast, and ovarian cancer. With different tumor treatments, different dosages, and different dosing schedules, there is a risk for toxicity in these patients.

Patients may suffer from fluorouracil toxicity/death if 5–FU is delivered in slight excess or at faster infusion rates than prescribed. The cause of overdose can happen for a variety of reasons including: Pump malfunction, incorrect pump programming or miscalculated doses, and accidental or intentional ingestion.

According to the applicant, current treatment for fluorouracil toxicity is supportive care, including discontinuation of the drug, hydration, filgrastim for neutropenia, as well as antibiotics, antiemetics, and treatments that are required for potential

[18] DeRubertis BG, Quinones-Baldrich WJ, Greenberg JI, Jimenez JC, Lee JT. Results of a double-barrel technique with commercially available devices for hypogastric preservation during aortoilac endovascular abdominal aortic aneurysm repair. J Vasc Surg 2012;56:1252–1259.

[20] Schönhofer S, Mansour R, Ghotbi R. Initial results of the management of aortoiliac aneurysms with GORE(R) Excluder(R) iliac branched endoprosthesis. J Cardiovasc Surg 2015;56:883–888.

[21] Schneider, D. B., Matsumura, J., Oderich, G. S., Lee, J. T., Peterson, B. G. (2016). Pivotal Results for the Gore Excluder Iliac Branch Endoprosthesis for Treatment of Aortoiliac Aneurysms in the IBE 12–04 Prospective, Multicenter Study. *Journal of Vascular Surgery, 63, 6S.*

gastrointestinal and cardiovascular compromise. Vistogard ™ is an antidote to Fluorouracil toxicity and is a pro-drug of uridine. Once the drug is metabolized into uridine, it competes with the toxic byproduct FUTP in binding to RNA, thus reducing the impact FUTP has on cell death.

With regard to the newness criterion, in the proposed rule, we stated that Vistogard ™ received FDA approval on December 11, 2015. The applicant noted that Vistogard ™ is the first FDA approved antidote used to reverse fluorouracil toxicity. The applicant submitted a request for a unique ICD–10–PCS procedure code and was granted approval for the following procedure code: XW0DX82 (Introduction of Uridine Triacetate into Mouth and Pharynx, External Approach, New Technology Group 2). The new code is effective on October 1, 2016.

Comment: The manufacturer commented that the start of the newness period for Vistogard ™ should be established as March 2, 2016. The manufacturer explained that the FDA approved Vistogard ™ on December 11, 2015 under Priority Review. The manufacturer stated that this approval was granted approximately 3 months earlier than the PDUFA (Prescription Drug User Fee Act) User Fee goal date of March 10, 2016. Commercial availability of Vistogard ™ occurred March 2, 2016 due to the need for receipt of final labeling, contracting manufacturing schedules, and final packaging.

Response: We agree with the commenter that, due to the delay in availability described above, the date the newness period begins for Vistogard ™ is March 2, 2016, instead of December 11, 2015.

As discussed earlier, if a technology meets all three of the substantial similarity criteria, it would be considered substantially similar to an existing technology and would not be considered ''new'' for purposes of new technology add-on payments.

With regard to the first criterion, whether the product uses the same or a similar mechanism of action to achieve a therapeutic outcome, in the proposed rule, we stated that the applicant explained that Vistogard ™ is the first FDA-approved antidote used to reverse fluorouracil toxicity. The applicant maintained that Vistogard ™ has a unique mechanism of action that is not comparable to any other drug's mechanism of action that is currently available on the U.S. market. The applicant described in technical detail how the novel and unique mechanism of action provides bioavailable uridine, a direct biochemical antagonist of 5–FU toxicity; quickly absorbs into the gastrointestinal tract due to its lipophilic nature; in normal cells, stops the process of cell damage and cell destruction caused by 5–FU and counteracts the effects of 5–FU toxicity; protects normal cells and allows recovery from damage caused by 5–FU, without interfering with the primary antitumor mechanism of 5–FU; and uses uridine derived from Vistogard ™ to convert it into uridine triphosphate (UTP), which competes with FUTP for incorporation into RNA, preventing further cell destruction and dose-limiting toxicities.

With regard to the second criterion, whether the product is assigned to the same or a different MS–DRG, in the proposed rule we stated that the applicant noted that Xuriden (uridine triacetate) was also approved by the FDA on September 4, 2015, as a pyrimidine analog for uridine replacement indicated for the treatment of hereditary orotic aciduria (HOA). According to the applicant, HOA is a rare, potentially life-threatening, genetic disorder in which patients (primarily pediatric patients) lack the ability to synthesize adequate amounts of uridine and consequently can suffer from hematologic abnormalities, failure to thrive, a range of developmental delays, and episodes of crystalluria leading to obstructive uropathy. The applicant stated that, although Xuriden is approved as a chronic, once daily medication (not to exceed 8 grams) that is administered orally in the patient's home and also used to replace uridine, Xuriden is not administered in a hospital setting and cases involving the use of Xuriden would not be assigned to the same MS–DRGs associated with the use of Vistogard ™ in the treatment of patients experiencing 5–FU overdose or severe toxicity. Therefore, the applicant maintained that no other technology similar to Vistogard ™ would map to the same MS–DRGs as cases involving the use of Vistogard ™.

With regard to the third criterion, whether the new use of the technology involves the treatment of the same or similar type of disease and the same or similar patient population, similar to above, in the proposed rule we stated that the applicant maintained that Vistogard ™ is the first FDA approved antidote to reverse fluorouracil toxicity and, therefore, no other technology treats this disease or patient population to reverse fluorouracil toxicity. Therefore, the applicant believed that Vistogard ™ is not substantially similar to any other currently approved technology. We invited public comments on whether Vistogard ™ is substantially similar to existing technologies and whether it meets the newness criterion in the proposed rule.

Comment: The manufacturer reiterated that Vistogard ™ is not substantially similar to any existing technology and that it meets the newness criterion.

Response: After consideration of the information provided by the applicant, we agree that Vistogard ™ is not substantially similar to any existing technology and meets the newness criterion.

With regard to the cost criterion, in the proposed rule, we stated that the applicant searched the claims data from the 2013 and 2014 Inpatient SAFs for cases that may be eligible for treatment involving Vistogard ™. Specifically, the applicant searched for cases reporting a primary ICD–9–CM diagnosis code for colorectal cancer, head and neck cancer, gastric cancers and pancreatic cancer. The applicant further narrowed the potential target patient population by identifying cases reporting toxicity due to an antineoplastic. In order to include only patients diagnosed with severe toxicity that would be eligible for treatment using Vistogard ™, using revenue center codes and ICD–9–CM V codes, the applicant included an additional cohort of cases representing patients admitted from the emergency department, an observation unit, another short-term, acute care hospital, or who have received chemotherapy treatment during the inpatient stay included on the claim. Because 5–FU toxicity is associated with a high mortality rate, the applicant identified a subgroup of patients diagnosed with chemotherapy toxicity who expired during their inpatient visit or within 7 days of discharge. The applicant provided two analyses to determine that the technology meets the cost criterion: One analysis of patients that experienced toxicity with mortality and a second analysis using the broader chemotherapy toxicity cohort, which includes patients who did not expire. The table below provides the diagnosis codes and information the applicant used to identify cases for both of these analyses.

Criterion	ICD–9 code	Description
Colorectal, head and neck, gastric, or pancreatic cancer (at least one code).	153.x	Malignant neoplasm of colon.
	154.x	Malignant neoplasm of rectum, rectosigmoid junction, and anus.
	171.0	Malignant neoplasm of head, face, and neck.
	151.x	Malignant neoplasm of stomach.
	157.x	Malignant neoplasm of pancreas.
Toxicity due to an antineoplastic (at least one code).	963.1	Poisoning by antineoplastic and immunosuppressive drugs.
	E933.1	Antineoplastic and immunosuppressive drugs causing adverse effects in therapeutic use.
Admission to Inpatient Setting. Admitted from ED	Revenue Center	Revenue Center Codes 450, 451, 452, 456, 459.
or observation unit	Revenue Center	Revenue Center Codes 760, 761, 762, 769.
or short-term, acute care hospital	N/A	Source of admission code = ''4''. ''Transfer from hospital (Different facility)''.
or received chemotherapy during inpatient stay	V58.0	Encounter or admission for radiation.
	V58.11	Encounter for antineoplastic chemotherapy.
	V58.12	Encounter for antineoplastic immunotherapy (Must be primary diagnosis on the claim).
Expired during inpatient stay or within seven days of discharge (at least one code) [a].	N/A	Determined by patient discharge status code.
	N/A	If date of death in 100 percent. Denominator File pertaining to the year of the claim was within 7 days of claim discharge date.

[a] Required only for toxicity with mortality cohort. Source: KNG Health analysis of 2013–2014 100% Inpatient Standard Analytic Files and 2013–2014 100% Denominator Files.

Under the first analysis, the applicant found 76 cases with 18.42 percent of those cases mapping to MS–DRG 871 (Septicemia or Severe Sepsis without Mechanical Ventilation >96 hours with MCC), and the remaining number of cases mapping to MS–DRGs with less than 11 cases. According to the applicant, the results of the analysis of the MS–DRGs with less than 11 cases could not be discussed separately because of the small sample sizes. The applicant believed that it was unnecessary to remove any charges for other previously used technologies because although Vistogard™ is singular in its ability to treat 5–FU toxicity, the associated charges for palliative care would continue to be necessary to treat the symptoms of the toxicity, even though it is possible that the use of Vistogard™ may reduce a patient's hospital length of stay. To update the charge data to the current fiscal year, the applicant inflated the charges based on the charge inflation factor of 1.048116 in the FY 2016 IPPS/LTCH proposed rule (80 FR 24632). A 1-year inflation factor was applied three times for FY 2013 claims and two times for FY 2014 claims, inflating all claims to FY 2016. This resulted in an inflated average standardized case-weighted charge per case of $51,451. Using the FY 2016 IPPS Table 10 thresholds, the average case-weighted threshold amount was $46,233 (all calculations above were performed using unrounded numbers). The applicant noted that the inflated average standardized case-weighted charge per case exceeded the average case-weighted threshold amount without including charges for Vistogard™. Therefore, because the inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology meets the cost criterion.

Under the second analysis, the applicant used the same methodology it used in its first analysis, except that the analysis included cases representing patients who did not expire. The applicant found 879 cases with 8.53 percent of those cases mapping to MS–DRG 392 (Esophagitis, Gastroenteritis and Miscellaneous Digestive System Disorders without MCC), and the remaining number of cases spread across several MS–DRGs. The inflated average standardized case-weighted charge per case was $42,708. Using the FY 2016 IPPS Table 10 thresholds, the average case-weighted threshold amount was $42,377 (all calculations above were performed using unrounded numbers). Similar to the results of the first analysis, the applicant noted that the inflated average standardized case-weighted charge per case exceeded the average case-weighted threshold amount without including charges for Vistogard™. Therefore, because the inflated average standardized case-weighted charge per case exceeds the average case-weighted threshold amount, the applicant maintained that the technology also meets the cost criterion under the second analysis.

We noted in the proposed rule that the applicant used the inflation factor of 1.048116 from the FY 2016 IPPS/LTCH proposed rule instead of the inflation factor of 1.037616 from the FY 2016 IPPS/LTCH final rule (80 FR 49784). We stated that we believe that the applicant should use the most recent data available, which is the inflation factor from the final rule. The inflation factor from the FY 2016 IPPS/LTCH final rule is lower than the inflation factor from the proposed rule. However, the difference between these two factors is marginal. Also, as the applicant noted, it did not include charges for Vistogard™ in its analysis. Therefore, we stated that we believe that it is likely that the applicant would still meet the cost criterion under both analyses even if it used the lower inflation factor from the FY 2016 final rule. We invited public comments on whether Vistogard™ meets the cost criterion under both analyses.

Comment: The manufacturer commented that it agreed with our analysis that, regardless of the inflation factor used, Vistogard™ would still meet the cost criterion. The manufacturer supplied revised data with the correct inflation factor that demonstrated that the inflated average standardized case-weighted charge per case exceeded the average case-weighted threshold.

Response: We thank the commenter for providing a revised analysis, and we agree that Vistogard™ meets the cost criterion.

With regard to substantial clinical improvement, the applicant maintained that Vistogard™ represents a substantial clinical improvement. The applicant noted that Vistogard™ is the first and only antidote indicated to treat adult and pediatric patients following a fluorouracil overdose, regardless of the presence of symptoms or whether a patient exhibits early-onset, severe or life-threatening toxicity within 96 hours following the conclusion of fluorouracil

or capecitabine administration. The applicant provided data from two studies (Study 1, an open-label, single arm, multi-center expanded access study and Study 2, an open-label, single arm, multi-center emergency use study), which combined enrolled 135 patients. The applicant noted that 130 patients treated with Vistogard™ survived through the 30-day treatment and observation period (95 percent Confidence Interval: 0.92, 0.99). Of the 135 patients, 30 percent were 65 years old and older, including 11 percent of patients who were 75 years old and older.

According to the applicant, the studies' results demonstrate that Vistogard™ reduced the incidence, severity and virulence of toxicities associated with 5–FU toxicity due to overdose or rapid onset. Specifically, the applicant noted the following results:

- Vistogard™ ameliorated the progression of mucositis, leukopenia and thrombocytopenia; leukopenia and thrombocytopenia were resolved in almost all patients by the 4th week, indicating recovery of the hematopoietic system; mucositis also was resolved in almost all patients within the 30-day observation period with the incidence of serious (Grade 3 or 4) mucositis being very low; and no grade 4 mucositis was observed in any patients who received treatment using Vistogard™ within 96 hours after 5–FU.
- Thirty-eight percent of patients who experienced 5–FU overdose were able to resume chemotherapy treatment in less than 30 days after 5–FU toxicity, with the majority of these patients resuming treatment within 21 days. According to the applicant, 21 percent of the patients who presented with rapid onset of serious toxicities resumed chemotherapy treatment (typically with a different agent than 5–FU) in less than 30 days, with an overall median time to resumption of chemotherapy of 19 days.
- The safety and tolerability profile of Vistogard™ is consistent with what would be expected for patients diagnosed with cancer following 5–FU chemotherapy treatment, but is generally less in severity and incidence when compared to what would be expected with patients who experience a 5–FU overdose. Specifically, during Study 1, there were no patients that discontinued uridine triacetate treatment as a result of adverse events, and during Study 2, three patients discontinued uridine triacetate treatment as a result of adverse events, one of which was considered possibly related to uridine triacetate (nausea and vomiting).

We invited public comments on whether Vistogard™ meets the substantial clinical improvement criterion in the proposed rule.

Comment: The manufacturer reiterated the points described above and asserted that Vistogard™ meets the substantial clinical improvement criterion.

Response: After consideration of the information provided by the applicant, we agree that Vistogard™ meets the substantial clinical improvement criterion. For the reasons described above and after consideration of the public comments we received, we have determined that Vistogard™ meets all of the criteria for approval of new technology add-on payments for FY 2017.

Comment: The manufacturer commented that with the implementation of ICD–10, the following series of codes are expected to be used to distinguish cases with 5–FU overdose or severe toxicities:

- T45.1X1A, T45.1X1D and T45.1X1S (Poisoning by antineoplastic and immunosuppressive drugs, accidental (unintentional) initial encounter, subsequent encounter or sequela). The former ICD–9 code (963.1) has been divided into subcodes.
- T45.1X5A, T45.1X5D, T45.1X5S (Adverse effect of anti neoplastic and immunosuppressive drugs initial encounter, subsequent encounter or sequela).

The commenter explained that because 5–FU toxicity is a rare, unintentional byproduct of chemotherapy with 5–FU, it is expected that the primary code associated with 5–FU overdose or severe toxicity cases will be T45.1X1 with the ''accidental'' designation.

Response: We thank the commenter for explaining the coding with regard to 5–FU overdose or severe toxicities. In order to pay for cases of Vistogard™ consistent with the FDA labeling, cases involving Vistogard™ that are eligible for new technology add-on payments will be identified by any one of ICD–10–PCS diagnosis codes T45.1X1A, T45.1X1D, T45.1X1S, T45.1X5A, T45.1X5D, and T45.1X5S in combination with ICD–10–PCS procedure code XW0DX82. According to the applicant, the wholesale acquisition cost (WAC) of Vistogard™ is $3,750.00 per each 10g packet of oral granules. Recommended adult dosing per the Vistogard™ label is 10g (one packet every 6 hours for a minimum of 20 doses over 5 days). The total cost is 20 packets × WAC of $3,750.00 per packet which equals $75,000 per patient. Under § 412.88(a)(2), we limit new technology add-on payments to the lesser of 50 percent of the average cost of the technology or 50 percent of the costs in excess of the MS–DRG payment for the case. As a result, the maximum new technology add-on payment amount for a case involving the use of Vistogard™ is $37,500 for FY 2017.

III. Changes to the Hospital Wage Index for Acute Care Hospitals

A. Background

1. Legislative Authority

Section 1886(d)(3)(E) of the Act requires that, as part of the methodology for determining prospective payments to hospitals, the Secretary adjust the standardized amounts for area differences in hospital wage levels by a factor (established by the Secretary) reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level. We currently define hospital labor market areas based on the delineations of statistical areas established by the Office of Management and Budget (OMB). A discussion of the FY 2017 hospital wage index based on the statistical areas appears under sections III.A.2. and G. of the preamble of this final rule.

Section 1886(d)(3)(E) of the Act requires the Secretary to update the wage index annually and to base the update on a survey of wages and wage-related costs of short-term, acute care hospitals. (CMS collects these data on the Medicare cost report, CMS Form 2552–10, Worksheet S–3, Parts II, III, and IV. The OMB control number for approved collection of this information is 0938–0050.) This provision also requires that any updates or adjustments to the wage index be made in a manner that ensures that aggregate payments to hospitals are not affected by the change in the wage index. The adjustment for FY 2017 is discussed in section II.B. of the Addendum to this final rule.

As discussed in section III.J. of the preamble of this final rule, we also take into account the geographic reclassification of hospitals in accordance with sections 1886(d)(8)(B) and 1886(d)(10) of the Act when calculating IPPS payment amounts. Under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amounts so as to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B), 1886(d)(8)(C), and 1886(d)(10) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions. The budget neutrality adjustment for FY 2017 is discussed in

section II.A.4.b. of the Addendum to this final rule. We also note that, under section III.J.2. of the preamble of this final rule, we are finalizing an April 21, 2016 interim final rule with comment period that addressed modifications to limitations on redesignation by the Medicare Geographic Classification Review Board (MGCRB), and included regulatory changes to codify the application and interpretation of two judicial decisions.

Section 1886(d)(3)(E) of the Act also provides for the collection of data every 3 years on the occupational mix of employees for short-term, acute care hospitals participating in the Medicare program, in order to construct an occupational mix adjustment to the wage index. A discussion of the occupational mix adjustment that we are applying to the FY 2017 wage index appears under sections III.E.3. and F. of the preamble of this final rule.

2. Core-Based Statistical Areas (CBSAs) Revisions for the FY 2017 Hospital Wage Index

The wage index is calculated and assigned to hospitals on the basis of the labor market area in which the hospital is located. Under section 1886(d)(3)(E) of the Act, beginning with FY 2005, we delineate hospital labor market areas based on OMB-established Core-Based Statistical Areas (CBSAs). The current statistical areas (which were implemented beginning with FY 2015) are based on revised OMB delineations issued on February 28, 2013, in OMB Bulletin No. 13–01. OMB Bulletin No. 13–01 established revised delineations for Metropolitan Statistical Areas, Micropolitan Statistical Areas, and Combined Statistical Areas in the United States and Puerto Rico based on the 2010 Census, and provided guidance on the use of the delineations of these statistical areas using standards published on June 28, 2010 in the **Federal Register** (75 FR 37246 through 37252). We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 49951 through 49963) for a full discussion of our implementation of the new OMB labor market area delineations beginning with the FY 2015 wage index.

Generally, OMB issues major revisions to statistical areas every 10 years, based on the results of the decennial census. However, OMB occasionally issues minor updates and revisions to statistical areas in the years between the decennial censuses. As we discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25062), on July 15, 2015, OMB issued OMB Bulletin No. 15–01, which provides updates to and supersedes OMB Bulletin No. 13–01 that was issued on February 28, 2013. The attachment to OMB Bulletin No. 15–01 provides detailed information on the update to statistical areas since February 28, 2013. The updates provided in OMB Bulletin No. 15–01 are based on the application of the 2010 Standards for Delineating Metropolitan and Micropolitan Statistical Areas to Census Bureau population estimates for July 1, 2012 and July 1, 2013. The complete list of statistical areas incorporating these changes is provided in the attachment to OMB Bulletin No. 15–01. According to OMB, ''[t]his bulletin establishes revised delineations for the Nation's Metropolitan Statistical Areas, Micropolitan Statistical Areas, and Combined Statistical Areas. The bulletin also provides delineations of Metropolitan Divisions as well as delineations of New England City and Town Areas.'' A copy of this bulletin may be obtained on the Web site at: *https://www.whitehouse.gov/omb/bulletins_default.*

OMB Bulletin No. 15–01 made the following changes that are relevant to the IPPS wage index:

- Garfield County, OK, with principal city Enid, OK, which was a Micropolitan (geographically rural) area, now qualifies as an urban new CBSA 21420 called Enid, OK.
- The county of Bedford City, VA, a component of the Lynchburg, VA CBSA 31340, changed to town status and is added to Bedford County. Therefore, the county of Bedford City (SSA State county code 49088, FIPS State County Code 51515) is now part of the county of Bedford, VA (SSA State county code 49090, FIPS State County Code 51019). However, the CBSA remains Lynchburg, VA 31340.
- The name of Macon, GA, CBSA 31420, as well as a principal city of the Macon-Warner Robins, GA combined statistical area, is now Macon-Bibb County, GA. The CBSA code remains as 31420.

We believe that it is important for the IPPS to use the latest labor market area delineations available as soon as is reasonably possible in order to maintain a more accurate and up-to-date payment system that reflects the reality of population shifts and labor market conditions (79 FR 28055). Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25062), we proposed to implement these revisions, effective October 1, 2016, beginning with the FY 2017 wage indexes. We proposed to use these new definitions to calculate area wage indexes in a manner that is generally consistent with the CBSA-based methodologies finalized in the FY 2005 and the FY 2015 IPPS final rules. For FY 2017, Tables 2 and 3 for the proposed rule and the County to CBSA Crosswalk File and Urban CBSAs and Constituent Counties for Acute Care Hospitals File posted on the CMS Web site reflected these CBSA changes. We invited public comments on these proposals.

We did not receive any public comments on our proposal to implement the revisions to the CBSAs effective October 1, 2016, beginning with the FY 2017 hospital wage index, as proposed in the FY 2017 IPPS/LTCH PPS proposed rule. Therefore, we are finalizing our proposal without modification. Tables 2 and 3 for this final rule and the County to CBSA Crosswalk File and Urban CBSAs and Constituent Counties for Acute Care Hospitals File posted on the CMS Web site reflect these CBSA changes.

B. Worksheet S–3 Wage Data for the FY 2017 Wage Index

The FY 2017 wage index values are based on the data collected from the Medicare cost reports submitted by hospitals for cost reporting periods beginning in FY 2013 (the FY 2016 wage indexes were based on data from cost reporting periods beginning during FY 2012).

1. Included Categories of Costs

The FY 2017 wage index includes all of the following categories of data associated with costs paid under the IPPS (as well as outpatient costs):

- Salaries and hours from short-term, acute care hospitals (including paid lunch hours and hours associated with military leave and jury duty);
- Home office costs and hours;
- Certain contract labor costs and hours, which include direct patient care, certain top management, pharmacy, laboratory, and nonteaching physician Part A services, and certain contract indirect patient care services (as discussed in the FY 2008 final rule with comment period (72 FR 47315 through 47317)); and
- Wage-related costs, including pension costs (based on policies adopted in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51586 through 51590)) and other deferred compensation costs.

2. Excluded Categories of Costs

Consistent with the wage index methodology for FY 2016, the wage index for FY 2017 also excludes the direct and overhead salaries and hours for services not subject to IPPS payment, such as skilled nursing facility (SNF) services, home health services, costs related to GME (teaching physicians and

residents) and certified registered nurse anesthetists (CRNAs), and other subprovider components that are not paid under the IPPS. The FY 2017 wage index also excludes the salaries, hours, and wage-related costs of hospital-based rural health clinics (RHCs), and Federally qualified health centers (FQHCs) because Medicare pays for these costs outside of the IPPS (68 FR 45395). In addition, salaries, hours, and wage-related costs of CAHs are excluded from the wage index for the reasons explained in the FY 2004 IPPS final rule (68 FR 45397 through 45398).

3. Use of Wage Index Data by Suppliers and Providers Other Than Acute Care Hospitals Under the IPPS

Data collected for the IPPS wage index also are currently used to calculate wage indexes applicable to suppliers and other providers, such as SNFs, home health agencies (HHAs), ambulatory surgical centers (ASCs), and hospices. In addition, they are used for prospective payments to IRFs, IPFs, and LTCHs, and for hospital outpatient services. We note that, in the IPPS rules, we do not address comments pertaining to the wage indexes of any supplier or provider except IPPS providers and LTCHs. Such comments should be made in response to separate proposed rules for those suppliers and providers.

C. Verification of Worksheet S–3 Wage Data

The wage data for the FY 2017 wage index were obtained from Worksheet S–3, Parts II and III of the Medicare cost report (Form CMS–2552–10, OMB control number 0938–0050) for cost reporting periods beginning on or after October 1, 2012, and before October 1, 2013. For wage index purposes, we refer to cost reports during this period as the ''FY 2013 cost report,'' the ''FY 2013 wage data,'' or the ''FY 2013 data.'' Instructions for completing the wage index sections of Worksheet S–3 are included in the Provider Reimbursement Manual (PRM), Part 2 (Pub. No. 15–2), Chapter 40, Sections 4005.2 through 4005.4. The data file used to construct the FY 2017 wage index includes FY 2013 data submitted to us as of June 28, 2016. As in past years, we performed an extensive review of the wage data, mostly through the use of edits for reasonableness designed to identify aberrant data.

We asked our MACs to revise or verify data elements that result in specific edit failures. For the proposed FY 2017 wage index, we identified and excluded 62 providers with aberrant data that should not be included in the wage index. We stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25063) that, of these 62 providers that we excluded from the proposed wage index, 47 have data that we did not expect to change such that the data would be included in the final wage index (for example, among the reasons these providers were excluded are the following: they are low Medicare utilization providers, they closed and failed edits for reasonableness, or they have extremely high or low average hourly wages that are atypical for their CBSAs). We stated in the proposed rule that if data elements for some of these providers were corrected, we intend to include those providers in the calculation of the final FY 2017 wage index (81 FR 25063). We also adjusted certain aberrant data and included these data in the proposed wage index. For example, in situations where a hospital did not have documentable salaries, wages, and hours for housekeeping and dietary services, we imputed estimates, in accordance with policies established in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49965 through 49967).

In constructing the proposed FY 2017 wage index, we included the wage data for facilities that were IPPS hospitals in FY 2013, inclusive of those facilities that have since terminated their participation in the program as hospitals, as long as those data did not fail any of our edits for reasonableness. We believed that including the wage data for these hospitals is, in general, appropriate to reflect the economic conditions in the various labor market areas during the relevant past period and to ensure that the current wage index represents the labor market area's current wages as compared to the national average of wages. However, we excluded the wage data for CAHs as discussed in the FY 2004 IPPS final rule (68 FR 45397 through 45398). For the proposed rule, we removed 3 hospitals that converted to CAH status on or after February 5, 2015, the cut-off date for CAH exclusion from the FY 2016 wage index, and through and including January 22, 2016, the cut-off date for CAH exclusion from the FY 2017 wage index. After removing hospitals that converted to CAH status, we calculated the proposed FY 2017 wage index based on 3,345 hospitals.

Comment: One commenter expressed appreciation for CMS' efforts over the past 2 years to ''refine and augment its area wage index audit protocols to ensure more consistency across the MACs,'' and observed that this has resulted in fewer hospitals being excluded from the final wage index. The commenter stated that several member hospitals had a ''very positive experience in working with their MACs, despite a very challenging timeline.'' For those hospitals that are excluded due to a higher than average average hourly wage, the commenter requested that CMS make transparent the audit thresholds it uses to exclude these hospitals, as hospitals remain concerned that, in some instances, having a higher than average average hourly wage will remain unacceptable to CMS.

Response: We appreciate the commenter's acknowledgement of the efforts we and the MACs invest in the wage index review process, and recognize the improved collaboration between hospitals and the MACs. As part of our efforts to assure that hospitals are aware of whether or not their wage data are excluded from the development of the wage index, we note that, for the FY 2017 wage index development cycle, we have added additional tabs to the Public Use Files (PUFs) that we post on our Web site. These tabs specifically list the hospitals and their respective wage data and occupational mix data that have been removed from the wage index (the various FY 2017 PUFs are available at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2017-Wage-Index-Home-Page.html*). As we explained in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49490 through 49491), section 1886(d)(3)(E) of the Act requires the Secretary to adjust the proportion of hospitals' costs attributable to wages and wage-related costs for area differences reflecting the relative hospital wage level in the geographic areas of the hospital compared to the national average hospital wage level. We believe that, under this section of the Act, we have discretion to remove aberrant hospital data from the wage index PUFs to help ensure that the costs attributable to wages and wage-related costs in fact reflect the relative hospital wage level in the hospitals' geographic area. We appreciate that hospitals remain concerned that, in some instances, having a higher than average average hourly wage might be unacceptable to CMS, depending on the circumstances, but reasonableness and relativity to each area's average hourly wages have been longstanding tenets of the wage index development process that CMS has articulated in rulemaking. Therefore, for the FY 2017 wage index, as we have done in previous years, we have exercised our discretion to remove certain hospitals from the wage index that have unusually high or unusually low average hourly wages relative to the

average hourly wages of the hospitals in the same geographic area. We note that it has never been CMS' policy to disclose audit protocol; the protocol is for CMS and MAC internal use only. In addition, we note that foreknowledge of an audit threshold should not in any way influence the wages and hours that hospitals report on Worksheet S–3; as with all cost report data, hospitals must attest to the accuracy of what they report on the Medicare cost reports, without regard to whether or not their data will be subjected to an audit.

Since the development of the FY 2017 proposed wage index, as a result of further review by the MACs and the April and May appeals processes, we received improved data for 11 hospitals. Therefore, we are including the wage data of these 11 hospitals in the final wage index. However, we also have deleted the wage data of 2 additional hospitals whose data were determined to be aberrant, and the hospitals were not responsive to requests by the MAC to provide supporting documentation. For this final rule, we learned of an additional 4 hospitals that converted to CAH status on or after February 5, 2015, and through and including January 22, 2016, the cut-off date for CAH exclusion from the FY 2017 wage index. Thus, for this final rule, we removed 7 hospitals that converted to CAH status on or after February 5, 2015, and through and including January 22, 2016 (3 CAHs removed for the proposed rule, and 4 additional CAHs removed for this final rule). Hospitals that are excluded from the wage index remain excluded for a variety of reasons, such as, but not limited to, unresponsiveness to requests for documentation or insufficiently documented data, terminated hospitals' failed edits for reasonableness, or low Medicare utilization. Accordingly, the final FY 2017 wage index is based on the wage data of 3,350 hospitals (3,345 + 11 − 2 − 4 = 3,350).

For the final FY 2017 wage index, we allotted the wages and hours data for a multicampus hospital among the different labor market areas where its campuses are located in the same manner that we allotted such hospitals' data in the FY 2016 wage index (80 FR 49489 through 49491). Table 2, which contains the final FY 2017 wage index associated with this final rule (available via the Internet on the CMS Web site), includes separate wage data for the campuses of 9 multicampus hospitals.

D. Method for Computing the FY 2017 Unadjusted Wage Index

The method used to compute the FY 2017 wage index without an occupational mix adjustment follows the same methodology that we used to compute the FY 2012, FY 2013, FY 2014, FY 2015, and FY 2016 final wage indexes without an occupational mix adjustment (76 FR 51591 through 51593, 77 FR 53366 through 53367, 78 FR 50587 through 50588, 79 FR 49967 and 80 FR 49491 through 49492, respectively).

Comment: One commenter requested CMS to consider developing a process for determining a wage index that would reward hospitals that invest in the workforce and raise the wages of the lowest paid workers, rather than relying primarily on the average hourly wages of the labor market area as a whole.

Response: Section 1886(d)(3)(E) of the Act requires the Secretary to adjust for area differences in hospital wage levels by a factor reflecting the relative hospital wage level in the geographic area of the hospital compared to the national average hospital wage level. The statute does not direct the Secretary to develop a wage index that rewards hospitals for workforce investment or other labor initiatives.

Comment: One commenter requested that CMS establish a floor wage index for providers in Puerto Rico that is not lower than the ratio of Puerto Rico nonhealth care wages to U.S. nonhealth care wages, using data from the Occupational Employment Statistics (OES) of the U.S. Bureau of Labor Statistics (BLS).

Response: We appreciate this comment. However, we consider it to be outside the scope of the FY 2017 IPPS/LTCH PPS proposed rule. Therefore, we are not responding to the comment at this time.

As discussed in the FY 2012 IPPS/LTCH PPS final rule, in ''Step 5,'' for each hospital, we adjust the total salaries plus wage-related costs to a common period to determine total adjusted salaries plus wage-related costs. To make the wage adjustment, we estimate the percentage change in the employment cost index (ECI) for compensation for each 30-day increment from October 14, 2012, through April 15, 2014, for private industry hospital workers from the BLS' *Compensation and Working Conditions.* We have consistently used the ECI as the data source for our wages and salaries and other price proxies in the IPPS market basket, and as discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25063 through 25064), we did not propose any changes to the usage for FY 2017, nor have received any public comments on this issue. Therefore, for FY 2017, we used the ECI as the data source for our wages and salaries and other price proxies in the IPPS market basket. The factors used to adjust the hospital's data were based on the midpoint of the cost reporting period, as indicated in the following table.

MIDPOINT OF COST REPORTING PERIOD

After	Before	Adjustment factor
10/14/2012	11/15/2012	1.02321
11/14/2012	12/15/2012	1.02183
12/14/2012	01/15/2013	1.02040
01/14/2013	02/15/2013	1.01894
02/14/2013	03/15/2013	1.01743
03/14/2013	04/15/2013	1.01592
04/14/2013	05/15/2013	1.01443
05/14/2013	06/15/2013	1.01297
06/14/2013	07/15/2013	1.01152
07/14/2013	08/15/2013	1.01006
08/14/2013	09/15/2013	1.00859
09/14/2013	10/15/2013	1.00711
10/14/2013	11/15/2013	1.00561
11/14/2013	12/15/2013	1.00408
12/14/2013	01/15/2014	1.00260
01/14/2014	02/15/2014	1.00124
02/14/2014	03/15/2014	1.00000
03/14/2014	04/15/2014	0.99878

For example, the midpoint of a cost reporting period beginning January 1, 2013, and ending December 31, 2013, is June 30, 2013. An adjustment factor of 1.01152 would be applied to the wages of a hospital with such a cost reporting period.

Using the data as previously described, the FY 2017 national average hourly wage (unadjusted for occupational mix) is $41.1982.

Previously, we also would provide a Puerto Rico overall average hourly wage. As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25076) and in section IV.A. of the preamble of this final rule, prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we calculated a Puerto Rico-specific wage index that was applied to the labor share of the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. As we stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25064), because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount as of January 1, 2016, under section 1886(d)(9)(E) of the Act, as

amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need to calculate a Puerto Rico-specific average hourly wage and wage index. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the national average hourly wage (unadjusted for occupational mix) (which is $41.1982 for this FY 2017 final rule) and the national wage index, which is applied to the national labor share of the national standardized amount. We did not receive any public comments on this issue. Accordingly, for FY 2017, as we proposed (81 FR 25064), we are not establishing a Puerto Rico-specific overall average hourly wage or wage index.

E. Occupational Mix Adjustment to the FY 2017 Wage Index

As stated earlier, section 1886(d)(3)(E) of the Act provides for the collection of data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program, in order to construct an occupational mix adjustment to the wage index, for application beginning October 1, 2004 (the FY 2005 wage index). The purpose of the occupational mix adjustment is to control for the effect of hospitals' employment choices on the wage index. For example, hospitals may choose to employ different combinations of registered nurses, licensed practical nurses, nursing aides, and medical assistants for the purpose of providing nursing care to their patients. The varying labor costs associated with these choices reflect hospital management decisions rather than geographic differences in the costs of labor.

1. Use of 2013 Occupational Mix Survey for the FY 2017 Wage Index

Section 304(c) of Public Law 106–554 amended section 1886(d)(3)(E) of the Act to require CMS to collect data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program. We collected data in 2013 to compute the occupational mix adjustment for the FY 2016, FY 2017, and FY 2018 wage indexes. A new measurement of occupational mix is required for FY 2019.

The 2013 survey included the same data elements and definitions as the previous 2010 survey and provided for the collection of hospital-specific wages and hours data for nursing employees for calendar year 2013 (that is, payroll periods ending between January 1, 2013 and December 31, 2013). We published the 2013 survey in the **Federal Register** on February 28, 2013 (78 FR 13679 through 13680). This survey was approved by OMB on May 14, 2013, and is available on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/Medicare-Wage-Index-Occupational-Mix-Survey2013.html*. The 2013 Occupational Mix Survey Hospital Reporting Form CMS–10079 for the Wage Index Beginning FY 2016 (in Excel format) is available on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/Medicare-Wage-Index-Occupational-Mix-Survey2013.html*. Hospitals were required to submit their completed 2013 surveys to their MACs by July 1, 2014. The preliminary, unaudited 2013 survey data were posted on the CMS Web site on July 11, 2014. As with the Worksheet S–3, Parts II and III cost report wage data, we asked our MACs to revise or verify data elements in hospitals' occupational mix surveys that result in certain edit failures.

2. Development of the 2016 Medicare Wage Index Occupational Mix Survey for the FY 2019 Wage Index

As stated earlier, section 304(c) of Public Law 106–554 amended section 1886(d)(3)(E) of the Act to require CMS to collect data every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program. We collected data in 2013 to compute the occupational mix adjustment for the FY 2016, FY 2017, and FY 2018 wage indexes. A new measurement of occupational mix is required for FY 2019. The FY 2019 occupational mix adjustment will be based on a new calendar year (CY) 2016 survey. The CY 2016 survey (CMS Form CMS–10079) is currently awaiting approval by OMB, and can be accessed at *http://www.reginfo.gov/public/do/PRAViewICR?ref_nbr=201512-0938-011*.

3. Calculation of the Occupational Mix Adjustment for FY 2017

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25065), for FY 2017, we proposed to calculate the occupational mix adjustment factor using the same methodology that we used for the FY 2012, FY 2013, FY 2014, FY 2015, and FY 2016 wage indexes (76 FR 51582 through 51586, 77 FR 53367 through 53368, 78 FR 50588 through 50589, 79 FR 49968, and 80 FR 49492 through 49493, respectively) and to apply the occupational mix adjustment to 100 percent of the FY 2017 wage index. Because the statute requires that the Secretary measure the earnings and paid hours of employment by occupational category not less than once every 3 years, all hospitals that are subject to payments under the IPPS, or any hospital that would be subject to the IPPS if not granted a waiver, must complete the occupational mix survey, unless the hospital has no associated cost report wage data that are included in the FY 2017 wage index. For the proposed FY 2017 wage index, we used the Worksheet S–3, Parts II and III wage data of 3,345 hospitals, and we used the occupational mix surveys of 3,143 hospitals for which we also have Worksheet S–3 wage data, which represented a ''response'' rate of 94 percent (3,143/3,345). For the proposed FY 2017 wage index, we applied proxy data for noncompliant hospitals, new hospitals, or hospitals that submitted erroneous or aberrant data in the same manner that we applied proxy data for such hospitals in the FY 2012 wage index occupational mix adjustment (76 FR 51586).

Comment: One commenter stated that all hospitals should be obligated to submit the occupational mix survey because failure to complete the survey jeopardizes the accuracy of the wage index. The commenter suggested that a penalty be instituted for nonsubmitters. This commenter also requested that, pending CMS' analysis of the Commuting Based Wage Index and given the Institute of Medicine's study on geographic variation in hospital wage costs, CMS eliminate the occupational mix survey and the significant reporting burden it creates.

Response: We appreciate the commenter's concern about the accuracy of the wage index. We have continually requested that all hospitals complete and submit the occupational mix surveys. We did not establish a penalty for hospitals that did not submit the 2013 occupational mix survey. However, we are continuing to consider for future rulemaking various options for ensuring full compliance with future occupational mix surveys. Regarding the commenter's request that CMS eliminate the occupational mix survey, this survey is necessary to meet the provisions of section 1886(d)(3)(E) of the Act, which requires us to measure the earnings and paid hours of employment by occupational category.

After consideration of the public comments we received, for FY 2017, we are adopting as final our proposal to calculate the occupational mix adjustment factor using the same methodology that we have used since

the FY 2012 wage index. For the final FY 2017 wage index, we are using the Worksheet S–3, Parts II and III wage data of 3,350 hospitals, and we are using the occupational mix surveys of 3,149 hospitals for which we also have Worksheet S–3 wage data, which represents a ''response'' rate of 94 percent (3,149/3,350). For the final FY 2017 wage index, we applied proxy data for noncompliant hospitals, new hospitals, or hospitals that submitted erroneous or aberrant data in the same manner that we applied proxy data for such hospitals in the FY 2012 wage index occupational mix adjustment (76 FR 51586). As a result of applying this methodology, the FY 2017 occupational mix adjusted national average hourly wage is $41.1615.

F. Analysis and Implementation of the Occupational Mix Adjustment and the FY 2017 Occupational Mix Adjusted Wage Index

As discussed in section III.E. of the preamble of this final rule, for FY 2017, we are applying the occupational mix adjustment to 100 percent of the FY 2017 wage index. We calculated the occupational mix adjustment using data from the 2013 occupational mix survey data, using the methodology described in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51582 through 51586).

Using the occupational mix survey data and applying the occupational mix adjustment to 100 percent of the FY 2017 wage index results in a national average hourly wage of $41.1615. Previously, we would also provide a Puerto Rico overall average hourly wage. As discussed in the proposed rule (81 FR 25076) and in section IV.A. of the preamble of this final rule, prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we calculated a Puerto Rico-specific wage index that was applied to the labor-related share of the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount as of January 1, 2016 under section 1886(d)(9)(E) of the Act, as amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need to calculate a Puerto Rico-specific average hourly wage and wage index. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the national average hourly wage (adjusted for occupational mix) (which is $41.1615 for this FY 2017 final rule) and the national wage index, which is applied to the national labor share of the national standardized amount. Accordingly, for FY 2017, we did not propose a Puerto Rico-specific overall average hourly wage or wage index in the proposed rule (81 FR 25065), nor are we establishing such for this final rule.

The FY 2017 national average hourly wages for each occupational mix nursing subcategory as calculated in Step 2 of the occupational mix calculation are as follows:

Occupational mix nursing subcategory	Average hourly wage
National RN	$38.83416971
National LPN and Surgical Technician	22.73766832
National Nurse Aide, Orderly, and Attendant	15.95353295
National Medical Assistant	18.04809696
National Nurse Category	32.8589243

The national average hourly wage for the entire nurse category as computed in Step 5 of the occupational mix calculation is $32.8589243. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of greater than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of less than 1.0. Hospitals with a nurse category average hourly wage (as calculated in Step 4) of less than the national nurse category average hourly wage receive an occupational mix adjustment factor (as calculated in Step 6) of greater than 1.0.

Based on the 2013 occupational mix survey data, we determined (in Step 7 of the occupational mix calculation) that the national percentage of hospital employees in the nurse category is 42.6 percent, and the national percentage of hospital employees in the all other occupations category is 57.4 percent. At the CBSA level, the percentage of hospital employees in the nurse category ranged from a low of 25.7 percent in one CBSA to a high of 80.5 percent in another CBSA.

We compared the FY 2017 occupational mix adjusted wage indexes for each CBSA to the unadjusted wage indexes for each CBSA. As a result of applying the occupational mix adjustment to the wage data, the final wage index values for 221 (54.2 percent) urban areas and 24 (51.1 percent) rural areas will increase. The final wage index values for 104 (25.5 percent) urban areas will increase by greater than or equal to 1 percent but less than 5 percent, and the final wage index values for 6 (1.5 percent) urban areas will increase by 5 percent or more. The final wage index values for 10 (21.3 percent) rural areas will increase by greater than or equal to 1 percent but less than 5 percent, and no rural areas' final wage index values will increase by 5 percent or more. However, the wage index values for 186 (45.6 percent) urban areas and 23 (48.9 percent) rural areas will decrease. The final wage index values for 89 (21.8 percent) urban areas will decrease by greater than or equal to 1 percent but less than 5 percent, and no urban areas' final wage index value will decrease by 5 percent or more. The final wage index values of 7 (14.9 percent) rural areas will decrease by greater than or equal to 1 percent and less than 5 percent, and no rural areas' final wage index values will decrease by 5 percent or more. The largest positive impacts will be 17.4 percent for an urban area and 2.9 percent for a rural area. The largest negative impacts will be 4.9 percent for an urban area and 2.1 percent for a rural area. One urban area's wage index, but no rural area wage indexes, will remain unchanged by application of the occupational mix adjustment. These results indicate that a larger percentage of urban areas (54.2 percent) will benefit from the occupational mix adjustment than will rural areas (51.1 percent).

G. Transitional Wage Indexes

1. Background

In the FY 2015 IPPS/LTCH PPS proposed rule and final rule (79 FR 28060 and 49957, respectively), we stated that, overall, we believed implementing the new OMB labor market area delineations would result in wage index values being more representative of the actual costs of labor in a given area. However, we recognized that some hospitals would experience decreases in wage index values as a result of the implementation of these new OMB labor market area delineations. We also realized that some hospitals would have higher wage index values due to the implementation of the new OMB labor market area delineations.

The FY 2015 IPPS/LTCH PPS final rule (79 FR 49957) explained the methodology utilized in implementing prior transition periods when adopting

changes that have significant payment implications, particularly large negative impacts. Specifically, for FY 2005, in the FY 2005 IPPS final rule (69 FR 49032 through 49034), we provided transitional wage indexes when the OMB definitions were implemented after the 2000 Census. The FY 2015 IPPS/LTCH PPS final rule (79 FR 49957 through 49962) established similar transition methodologies to mitigate any negative payment impacts experienced by hospitals due to our adoption of the new OMB labor market area delineations for FY 2015.

As finalized in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49957 through 49960) and as discussed below, for FY 2017, we will be in the third and final year of two 3-year transition periods for wage index: (1) For hospitals that, for FY 2014, were located in an urban county that became rural under the new OMB delineations, and had no form of wage index reclassification or redesignation in place for FY 2015 (that is, MGCRB reclassifications under section 1886(d)(10) of the Act, redesignations under section 1886(d)(8)(B) of the Act, or rural reclassifications under section 1886(d)(8)(E) of the Act); and (2) for hospitals deemed urban under section 1886(d)(8)(B) of the Act where the urban area became rural under the new OMB delineations.

2. Transition for Hospitals in Urban Areas That Became Rural

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 49957 through 49959), for hospitals that, for FY 2014, were located in an urban county that became rural under the new OMB delineations, and had no form of wage index reclassification or redesignation in place for FY 2015 (that is, MGCRB reclassifications under section 1886(d)(10) of the Act, redesignations under section 1886(d)(8)(B) of the Act, or rural reclassifications under section 1886(d)(8)(E) of the Act), we adopted a policy to assign them the urban wage index value of the CBSA in which they were physically located for FY 2014 for a period of 3 fiscal years (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied to the area wage index). FY 2017 will be the third year of this transition policy. We did not propose to make any changes to this policy in the FY 2017 IPPS/LTCH PPS proposed rule, and therefore we are not making any changes to this policy in this final rule. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 49957) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49495), we stated our belief that it is appropriate to apply a 3-year transition period for hospitals located in urban counties that would become rural under the new OMB delineations, given the potentially significant payment impacts for these hospitals. We continue to believe that assigning the wage index of the hospitals' FY 2014 area for a 3-year transition is the simplest and most effective method for mitigating negative payment impacts due to the adoption of the new OMB delineations.

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 49959), we noted that there were situations where a hospital could not be assigned the wage index value of the CBSA in which it was geographically located in FY 2014 because that CBSA split and no longer exists and some or all of the constituent counties were added to another urban labor market area under the new OMB delineations. If the hospital could not be assigned the wage index value of the CBSA in which it was geographically located in FY 2014 because that CBSA split apart and no longer exists, and some or all of its constituent counties were added to another urban labor market area under the new OMB delineations, we established that hospitals located in such counties that became rural under the new OMB delineations were assigned the wage index of the urban labor market area that contained the urban county in their FY 2014 CBSA to which they were closest (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied). Any such assignment made in FY 2015 and continued in FY 2016 will continue for FY 2017, except as discussed later in this section. We continue to believe this approach minimizes the negative effects of the change in the OMB delineations.

Under the policy adopted in the FY 2015 IPPS/LTCH PPS final rule, if a hospital for FY 2014 was located in an urban county that became rural beginning in FY 2015 under the new OMB delineations and such hospital sought and was granted reclassification or redesignation for FY 2015 or FY 2016, or such hospital seeks and is granted any reclassification or redesignation for FY 2017, the hospital will permanently lose its 3-year transitional assigned wage index status, and will not be eligible to reinstate it. We established the transition policy to assist hospitals if they experience a negative payment impact specifically due to the adoption of the new OMB delineations in FY 2015. If a hospital chooses to forego this transition adjustment by obtaining some form of reclassification or redesignation, we do not believe reinstatement of this transition adjustment would be appropriate. The purpose of the transition adjustment policy is to assist hospitals that may be negatively impacted by the new OMB delineations in transitioning to a wage index based on these delineations. By obtaining a reclassification or redesignation, we believe that the hospital has made the determination that the transition adjustment is not necessary because it has other viable options for mitigating the impact of the transition to the new OMB delineations.

As we did for FY 2015 (79 FR 49959) and FY 2016 (80 FR 49495), with respect to the wage index computation for FY 2017, we followed our existing policy regarding the inclusion of a hospital's wage index data in the CBSA in which it is geographically located (we refer readers to Step 6 of the method for computing the unadjusted wage index in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51592)). Accordingly, for FY 2017, the wage data of all hospitals receiving this type of 3-year transition adjustment were included in the statewide rural area in which they are geographically located under the new OMB labor market area delineations. After the 3-year transition period, beginning in FY 2018, these formerly urban hospitals will receive their statewide rural wage index, absent any reclassification or redesignation.

In addition, we established in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49959) that the hospitals receiving this 3-year transition because they are in counties that were urban under the FY 2014 CBSA definitions, but are rural under the new OMB delineations, will not be considered urban hospitals. Rather, they will maintain their status as rural hospitals for other payment considerations. This is because our application of a 3-year transitional wage index for these newly rural hospitals only applies for the purpose of calculating the wage index under our adoption of the new OMB delineations.

We did not receive any public comments regarding the 3-year transition policy for hospitals that were located in an urban county that became rural under the new OMB delineations. Fiscal year 2017 is the third and final year of this 3-year transition period. We also remind hospitals that if any affected hospital is approved for any wage index reclassification or redesignation in FY 2017, it will no longer be eligible for the remaining year of this transitional wage index.

3. Transition for Hospitals Deemed Urban Under Section 1886(d)(8)(B) of the Act Where the Urban Area Became Rural Under the New OMB Delineations

As discussed in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49959 through 49960) and FY 2016 IPPS/LTCH PPS final rule (80 FR 49495 through 49496), there were some hospitals that, for FY 2014, were geographically located in rural areas but were deemed to be urban under section 1886(d)(8)(B) of the Act. For FY 2015, some of these hospitals redesignated under section 1886(d)(8)(B) of the Act were no longer eligible for deemed urban status under the new OMB delineations, as discussed in detail in section III.H.3. of the preamble of the FY 2015 IPPS/LTCH PPS final rule. Similar to the policy implemented in the FY 2005 IPPS final rule (69 FR 49059), and consistent with the FY 2015 policy we established for other hospitals in counties that were urban and became rural under the new OMB delineations, we finalized a policy to apply a 3-year transition to these hospitals redesignated to urban areas under section 1886(d)(8)(B) of the Act for FY 2014 that are no longer deemed urban under the new OMB delineations and revert to being rural.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25067), for FY 2017, we did not propose to make any changes to this policy. We will continue the third and final year of the implementation of our policy to provide a 3-year transition adjustment to hospitals that are deemed urban under section 1886(d)(8)(B) of the Act under the FY 2014 labor market area delineations, but are considered rural under the new OMB delineations, assuming no other form of wage index reclassification or redesignation is granted. We assign these hospitals the area wage index value of hospitals reclassified to the urban CBSA (that is, the attaching wage index) to which they were redesignated in FY 2014 (with the rural and imputed floors applied and with the rural floor budget neutrality adjustment applied). If the hospital cannot be assigned the reclassified wage index value of the CBSA to which it was redesignated in FY 2014 because that CBSA was split apart and no longer exists, and some or all of its constituent counties were added to another urban labor market area under the new OMB delineations, such hospitals are assigned the wage index of the hospitals reclassified to the urban labor market area that contained the urban county in their FY 2014 redesignated CBSA to which they were closest. We assign these hospitals the area wage index of hospitals reclassified to a CBSA because hospitals deemed urban under section 1886(d)(8)(B) of the Act are treated as reclassified under current policy, under which such hospitals receive an area wage index that includes wage data of all hospitals reclassified to the area. This wage index assignment will be forfeited if the hospital obtains any form of wage index reclassification or redesignation.

We did not receive any public comments regarding the 3-year transition policy for hospitals deemed urban under section 1886(d)(8)(B) of the Act where the urban area became rural under the new OMB delineations. Fiscal year 2017 is the third and final year of this 3-year transition period. We also remind hospitals that if any affected hospital is approved for any wage index reclassification or redesignation in FY 2017, it will no longer be eligible for the remaining year of this transitional wage index.

4. Budget Neutrality

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50372 through 50373), for FY 2015, and in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49496), for FY 2016, we applied the 3-year transition wage index adjustments in a budget neutral manner. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25067), for FY 2017, we proposed to apply the 3-year transition adjustments in a budget neutral manner. We proposed to make an adjustment to the standardized amount to ensure that the total payments, including the effect of the transition provisions, would equal what payments would have been if we were not providing for any transitional wage indexes under the new OMB delineations. For a complete discussion on the budget neutrality adjustment for FY 2017, we refer readers to section II.A.4.b. of the Addendum to this final rule, where we also address any public comments we received.

We did not receive any public comments on these proposals. In this final rule, for FY 2017, we are applying the 3-year transition adjustments in a budget neutral manner. We are making an adjustment to the standardized amount to ensure that the total payments, including the effect of the transition provisions, will equal what payments would have been if we were not providing for any transitional wage indexes under the new OMB delineations.

H. Application of the Rural, Imputed, and Frontier Floors

1. Rural Floor

Section 4410(a) of Public Law 105–33 provides that, for discharges on or after October 1, 1997, the area wage index applicable to any hospital that is located in an urban area of a State may not be less than the area wage index applicable to hospitals located in rural areas in that State. This provision is referred to as the ''rural floor.'' Section 3141 of Public Law 111–148 also requires that a national budget neutrality adjustment be applied in implementing the rural floor. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25067), based on the proposed FY 2017 wage index associated with the proposed rule (which is available via the Internet on the CMS Web site), we estimated that 371 hospitals would receive an increase in their FY 2017 wage index due to the application of the rural floor.

Comment: Several commenters appreciated CMS' providing a State-specific analysis of impacts in the proposed rule and requested additional long-term analysis of State-specific and aggregate payment distortions produced by nationwide rural floor budget neutrality.

Response: We appreciate the commenters' continued concern regarding rural floor budget neutrality. We are publishing a State-specific rural floor analysis of impacts in Appendix A of this final rule, as we have done in previous rules. However, we question the usefulness of additional long-term analysis of State-specific effects of national rural floor budget neutrality, given that we are currently required by section 3141 of Public Law 111–148 to apply budget neutrality on a national level in implementing the rural floor and the imputed rural floor.

Comment: One commenter expressed concern that the current application of the rural floor does not reflect the needs of rural hospitals, and suggested that CMS include a provision in the final rule that requires States to have at least 5 percent of its IPPS hospitals in federally recognized rural areas before a rural floor can be established in the State.

Response: We appreciate the commenter's input. However, we did not propose such a provision in the proposed rule, and thus we are not adopting such a policy in this final rule. Furthermore, we note that section 4410(a) of Public Law 105–33 requires that, for purposes of section 1886(d)(3)(E) of the Act, for discharges occurring on or after October 1, 1997, the area wage index applicable under

such section to any hospital which is not located in a rural area (as defined in section 1886(d)(2)(D) of such Act) may not be less than the area wage index applicable under such section to hospitals located in rural areas in the State in which the hospital is located.

Comment: Many commenters expressed concern about the decline in the proposed Massachusetts rural wage index, due partially to preliminary audit adjustments made by the MAC to Nantucket Cottage Hospital's FY 2017 wage data, and certain errors identified by Nantucket Cottage Hospital in the FY 2017 wage data it submitted. The commenters stated that an abrupt decline in payment would have a negative impact for Massachusetts hospitals, particularly for hospitals in parts of the State lagging economically. In addition, several commenters noted that because of the calculation of the alternative methodology for the imputed floor, a decline in the Massachusetts rural floor would have a negative payment impact on hospitals in Rhode Island.

The commenters urged CMS to exercise its discretion in this situation to grant wage data correction requests outside of the prescribed FY 2017 Wage Index Timeline and accept Nantucket Cottage Hospital's request to correct its data errors, which were submitted to the MAC after the specified deadline. Many commenters also believed it would be ''sound public policy'' for CMS to use the most accurate data available in order to prevent one hospital's data errors from having a negative effect on Medicare payments of other hospitals. One commenter did not believe CMS should knowingly use the incorrect wage data and cautioned that Massachusetts hospitals' efforts at cost reform may be jeopardized due to the negative financial impact of finalizing the proposed rural wage index.

Several commenters believed that, because the rural floor is subject to a budget neutrality adjustment, the impact of accepting Nantucket Cottage Hospital's wage data correction would be spread across hospitals nationwide and would minimally impact any particular hospital, but the effects of not correcting the data error would be significant for hospitals in Massachusetts.

Conversely, other commenters requested that CMS deny Nantucket Cottage Hospital's request to correct its wage index data, as the request was submitted nearly 2 months after the agency's deadline. The commenters emphasized that Nantucket Cottage Hospital should be held to the same standards as hospitals nationwide. Several commenters stated that CMS would establish a ''troubling'' precedent by disregarding CMS rules and regulations, which provide ample opportunity to correct wage data through the agency's normal review process and deadlines.

Commenters also noted that the redistributive effect of nationwide rural floor budget neutrality would further lower wage index values for hospitals nationwide to pay for additional increases in Massachusetts's rural floor. One commenter requested that CMS deny Nantucket Cottage Hospital's request in order to ensure access to care in rural hospitals in States other than Massachusetts that the commenter stated are struggling in part due to receipt of a wage index that is lower than it would be in the absence of a high Massachusetts rural floor.

Response: We appreciate all of the commenters' concerns about the Massachusetts rural wage index. It is our intent to ensure that the wage index is calculated from the best available data, consistent with our wage index policies and development timeline. We have determined that the corrections requested by Nantucket Cottage Hospital fall outside the applicable deadline set forth in the FY 2017 Wage Index Development Timetable finalized in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49987 through 49990) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49506 through 49507), and available on the CMS Web site at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Downloads/FY2017-WI-Time-Table.pdf*. The annual Wage Index Development Timetable has been established through rulemaking, and plays an important role in maintaining the integrity and fairness of the wage index calculation. We have consistently stated in annual IPPS rulemaking that hospitals that do not meet the procedural deadlines set forth in the IPPS rule will not be afforded a later opportunity to submit wage index data corrections or to dispute the MAC's decision with respect to requested changes (for example, 79 FR 28081, 79 FR 49986, 80 FR 24473, 80 FR 49503, and 81 FR 25073). Therefore, we are not incorporating the adjustments requested by Nantucket Cottage Hospital for the FY 2017 final rule wage index. Separately, we also have determined that the adjustments made by the MAC in this situation could ideally have been made earlier in the process, and we are not incorporating those adjustments for the FY 2017 final rule wage index. We note that the average hourly wage of Nantucket Cottage Hospital that was used in calculating the proposed FY 2017 wage index did not include the MAC's nor the hospital's requested adjustments. Accordingly, we are finalizing Nantucket Cottage Hospital's unadjusted average hourly wage as proposed for the Massachusetts's rural wage index, which is the same unadjusted average hourly wage that was used in the FY 2017 IPPS/LTCH PPS proposed rule wage index (which neither incorporated the MAC audit adjustment nor additional adjustment requests by the hospital).

Comment: Commenters opposed the continued application of a nationwide rural floor budget neutrality adjustment, noting that the policy allows for manipulation of the wage index system so that hospitals in some States benefit at the expense of many hospitals in other States. Commenters pointed to the CY 2012 OPPS/ASC final rule with comment period (76 FR 74192) where CMS expressed concern that a change in hospital status can significantly inflate wage indexes in a State, causing a reduction to all hospital wage indexes as a result of nationwide budget neutrality for the rural floor. One commenter specifically disagreed with what it called the ''political maneuvers'' used to unfairly manipulate the rural floor in Massachusetts and other States. Commenters reiterated that the wage index system is in need of reform to ensure that payments accurately reflect actual wage costs.

Response: We appreciate the commenters' concerns about application of the nationwide rural floor budget neutrality policy. However, for discharges occurring on or after October 1, 2010, for purposes of applying the rural floor and the imputed rural floor, section 3141 of the Affordable Care Act replaced the statewide budget neutrality adjustment policy with the national budget neutrality adjustment policy that was in place during FY 2008. That is, section 3141 required that budget neutrality for the rural and imputed floor be applied ''through a uniform, national adjustment to the area wage index'' instead of within each State beginning in FY 2011 (75 FR 50160). Accordingly, we do not have the authority to calculate rural floor budget neutrality in a State-specific manner.

After consideration of the public comments we received, and based on the final FY 2017 wage index associated with this final rule (which is available via the Internet on the CMS Web site), we estimate that 397 hospitals will receive an increase in their FY 2017 wage index due to the application of the rural or imputed floor.

2. Imputed Floor for FY 2017

In the FY 2005 IPPS final rule (69 FR 49109 through 49111), we adopted the ''imputed floor'' policy as a temporary 3-year regulatory measure to address concerns from hospitals in all-urban States that have argued that they are disadvantaged by the absence of rural hospitals to set a wage index floor for those States. Since its initial implementation, we have extended the imputed floor policy six times, the last of which was adopted in the FY 2016 IPPS/LTCH PPS final rule and is set to expire on September 30, 2016. (We refer readers to further discussions of the imputed floor in the FY 2014, FY 2015, and FY 2016 IPPS/LTCH PPS final rules (78 FR 50589 through 50590, 79 FR 49969 through 49970, and 80 FR 49497 through 49498, respectively) and to the regulations at 42 CFR 412.64(h)(4).) Currently, there are three all-urban States—Delaware, New Jersey, and Rhode Island—with a range of wage indexes assigned to hospitals in these States, including through reclassification or redesignation. (We refer readers to discussions of geographic reclassifications and redesignations in section III.J. of the preamble of this final rule.)

In computing the imputed floor for an all-urban State under the original methodology, which was established beginning in FY 2005, we calculated the ratio of the lowest-to-highest CBSA wage index for each all-urban State as well as the average of the ratios of lowest-to-highest CBSA wage indexes of those all-urban States. We then compared the State's own ratio to the average ratio for all-urban States and whichever is higher is multiplied by the highest CBSA wage index value in the State—the product of which established the imputed floor for the State. As of FY 2012, there were only two all-urban States—New Jersey and Rhode Island—and only New Jersey benefitted under this methodology. Under the previous OMB labor market area delineations, Rhode Island had only one CBSA (Providence-New Bedford-Fall River, RI-MA) and New Jersey had 10 CBSAs. Therefore, under the original methodology, Rhode Island's own ratio equaled 1.0, and its imputed floor was equal to its original CBSA wage index value. However, because the average ratio of New Jersey and Rhode Island was higher than New Jersey's own ratio, this methodology provided a benefit for New Jersey, but not for Rhode Island.

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53368 through 53369), we retained the imputed floor calculated under the original methodology as discussed above, and established an alternative methodology for computing the imputed floor wage index to address the concern that the original imputed floor methodology guaranteed a benefit for one all-urban State with multiple wage indexes (New Jersey) but could not benefit the other all-urban State (Rhode Island). The alternative methodology for calculating the imputed floor was established using data from the application of the rural floor policy for FY 2013. Under the alternative methodology, we first determined the average percentage difference between the post-reclassified, pre-floor area wage index and the post-reclassified, rural floor wage index (without rural floor budget neutrality applied) for all CBSAs receiving the rural floor. (Table 4D associated with the FY 2013 IPPS/LTCH PPS final rule (which is available via the Internet on the CMS Web site) included the CBSAs receiving a State's rural floor wage index.) The lowest post-reclassified wage index assigned to a hospital in an all-urban State having a range of such values then is increased by this factor, the result of which establishes the State's alternative imputed floor. We amended § 412.64(h)(4) of the regulations to add new paragraphs to incorporate the finalized alternative methodology, and to make reference and date changes. In summary, for the FY 2013 wage index, we did not make any changes to the original imputed floor methodology at § 412.64(h)(4) and, therefore, made no changes to the New Jersey imputed floor computation for FY 2013. Instead, for FY 2013, we adopted a second, alternative methodology for use in cases where an all-urban State has a range of wage indexes assigned to its hospitals, but the State cannot benefit under the original methodology.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50589 through 50590), we extended the imputed floor policy (both the original methodology and the alternative methodology) for 1 additional year, through September 30, 2014, while we continued to explore potential wage index reforms.

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 49969 through 49970), for FY 2015, we adopted a policy to extend the imputed floor policy (both the original methodology and alternative methodology) for another year, through September 30, 2015, as we continued to explore potential wage index reforms. In that final rule, we revised the regulations at § 412.64(h)(4) and (h)(4)(vi) to reflect the 1-year extension of the imputed floor.

As discussed in section III.B. of the preamble of that FY 2015 IPPS/LTCH PPS final rule, we adopted the new OMB labor market area delineations beginning in FY 2015. Under the new OMB delineations, Delaware became an all-urban State, along with New Jersey and Rhode Island. Under the new OMB delineations, Delaware has three CBSAs, New Jersey has seven CBSAs, and Rhode Island continues to have only one CBSA (Providence-Warwick, RI-MA). We refer readers to a detailed discussion of our adoption of the new OMB labor market area delineations in section III.B. of the preamble of the FY 2015 IPPS/LTCH PPS final rule. Therefore, under the adopted new OMB delineations discussed in section III.B. of the preamble of the FY 2015 IPPS/LTCH PPS final rule, Delaware became an all-urban State and was subject to an imputed floor as well for FY 2015.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49497 through 49498), for FY 2016, we extended the imputed floor policy (under both the original methodology and the alternative methodology) for 1 additional year, through September 30, 2016. In that final rule, we revised the regulations at § 412.64(h)(4) and (h)(4)(vi) to reflect this additional 1-year extension.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25068), for FY 2017, we proposed to extend the imputed floor policy (under both the original methodology and the alternative methodology) for 1 additional year, through September 30, 2017. We proposed to revise the regulations at § 412.64(h)(4) and (h)(4)(vi) to reflect this proposed additional 1-year extension. We invited public comments on the proposed additional 1-year extension of the imputed floor through September 30, 2017.

Comment: Several commenters supported CMS' proposal to extend the imputed floor for 1 year, stating that it establishes an approach to remedy the competitive disadvantage suffered by all-urban States due to several unique factors common to these areas. However, these commenters urged CMS to make the imputed rural floor policy permanent rather than continue the policy through 1-year extensions, and to reevaluate the imputed floor policy only in the context of broader wage index reform. Other commenters opposed the proposed 1-year extension, stating that this type of floor should apply only when required by statute. One commenter questioned CMS' statutory authority for extending the imputed rural floor.

Response: We appreciate the positions of commenters that both support and oppose the proposal to extend the

imputed floor. We adopted the imputed floor policy to address concerns from hospitals in all-urban States and subsequently extended it through notice-and-comment rulemaking. As we stated in the FY 2005 IPPS final rule (69 FR 49110), we note that the Secretary has broad authority under section 1886(d)(3)(E) of the Act to adjust the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wage and wage-related cost of the DRG prospective payment rates for area differences in hospital wage levels by a factor (established by the Secretary). Therefore, we believe that we do have the discretion to adopt a policy that would adjust wage indexes in the stated manner.

However, we also understand the commenters' opposition to extending the imputed floor. In the FY 2008 IPPS final rule (72 FR 47322) and FY 2009 IPPS final rule (73 FR 48570 through 48574), we expressed our concern that the imputed rural floor creates a disadvantage in the application of the wage index to hospitals in States with rural hospitals but no urban hospitals receiving the rural floor. Therefore, we have not made the imputed rural floor policy permanent. We will give further consideration to all public comments if and when wage index reform is considered.

After consideration of the public comments we received, we are finalizing our proposal without modification to extend the imputed floor policy under both the original methodology and the alternative methodology for an additional year, through September 30, 2017. We also are adopting as final the proposed revisions to §§ 412.64(h)(4) and (h)(4)(vi) to reflect the 1-year extension of the imputed floor. The wage index and impact tables associated with this FY 2017 IPPS/LTCH PPS final rule (which are available on the Internet via the CMS Web site) reflect the continued application of the imputed floor policy at § 412.64(h)(4) and a national budget neutrality adjustment for the imputed floor for FY 2017. There are 18 hospitals in New Jersey that will receive an increase in their FY 2017 wage index due to the continued application of the imputed floor policy under the original methodology, and 10 hospitals in Rhode Island that will benefit under the alternative methodology. In the proposed rule (81 FR 25068), we stated that no providers in Delaware would benefit under the original methodology or the alternative methodology. However, for the final FY 2017 wage index, we have determined that, in fact, 2 hospitals in Delaware will benefit under the alternative methodology. Therefore, for this final rule, we are applying the imputed floor to these hospitals in Delaware using the alternative methodology. Tables 2 and 3 associated with this final rule (which are available via the Internet on the CMS Web site) reflect the application of the imputed floor to 2 hospitals in Delaware.

3. State Frontier Floor for FY 2017

Section 10324 of Public Law 111–148 requires that hospitals in frontier States cannot be assigned a wage index of less than 1.0000 (we refer readers to regulations at 42 CFR 412.64(m) and to a discussion of the implementation of this provision in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50160 through 50161)). In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25068), we did not propose any changes to the frontier floor policy for FY 2017. We stated in the proposed rule that 50 hospitals would receive the frontier floor value of 1.0000 for their FY 2017 wage index in the proposed rule. These hospitals are located in Montana, Nevada, North Dakota, South Dakota, and Wyoming.

We did not receive any public comments on the application of the State frontier floor for FY 2017. In this final rule, 50 hospitals will receive the frontier floor value of 1.0000 for their FY 2017 wage index. These hospitals are located in Montana, Nevada, North Dakota, South Dakota, and Wyoming.

The areas affected by the rural, imputed, and frontier floor policies for the FY 2017 wage index are identified in Table 2 associated with this final rule, which is available via the Internet on the CMS Web site.

I. FY 2017 Wage Index Tables

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49498 and 49807 through 49808), we finalized a proposal to streamline and consolidate the wage index tables associated with the IPPS proposed and final rules for FY 2016 and subsequent fiscal years. Prior to FY 2016, the wage index tables had consisted of 12 tables (Tables 2, 3A, 3B, 4A, 4B, 4C, 4D, 4E, 4F, 4J, 9A, and 9C) that were made available via the Internet on the CMS Web site. Effective beginning FY 2016, with the exception of Table 4E, we streamlined and consolidated 11 tables (Tables 2, 3A, 3B, 4A, 4B, 4C, 4D, 4F, 4J, 9A, and 9C) into 2 tables (Tables 2 and 3). We refer readers to section VI. of the Addendum to this final rule for a discussion of the final wage index tables for FY 2017.

J. Revisions to the Wage Index Based on Hospital Redesignations and Reclassifications

1. General Policies and Effects of Reclassification and Redesignation

Under section 1886(d)(10) of the Act, the Medicare Geographic Classification Review Board (MGCRB) considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. Hospitals must apply to the MGCRB to reclassify not later than 13 months prior to the start of the fiscal year for which reclassification is sought (usually by September 1). Generally, hospitals must be proximate to the labor market area to which they are seeking reclassification and must demonstrate characteristics similar to hospitals located in that area. The MGCRB issues its decisions by the end of February for reclassifications that become effective for the following fiscal year (beginning October 1). The regulations applicable to reclassifications by the MGCRB are located in 42 CFR 412.230 through 412.280. (We refer readers to a discussion in the FY 2002 IPPS final rule (66 FR 39874 and 39875) regarding how the MGCRB defines mileage for purposes of the proximity requirements.) Except as discussed in section III.J.2. of the preamble of this final rule, the general policies for reclassifications and redesignations for FY 2017, and the policies for the effects of hospitals' reclassifications and redesignations on the wage index, are the same as those discussed in the FY 2012 IPPS/LTCH PPS final rule for the FY 2012 final wage index (76 FR 51595 and 51596). In addition, in the FY 2012 IPPS/LTCH PPS final rule, we discussed the effects on the wage index of urban hospitals reclassifying to rural areas under 42 CFR 412.103. Hospitals that are geographically located in States without any rural areas are ineligible to apply for rural reclassification in accordance with the provisions of 42 CFR 412.103.

2. Finalization of Interim Final Rule With Comment Period on Provisions Related To Modification of Limitations on Redesignation by the Medicare Geographic Classification Review Board (MGCRB)

On April 21, 2016, CMS published an interim final rule with comment period (IFC) in the **Federal Register** (81 FR 23428 through 23438) which included provisions amending our regulations to allow hospitals nationwide to reclassify based on acquired rural status, effective with reclassification applications due to the MGCRB on September 1, 2016 for reclassifications first effective for FY

2018. In addition, effective with the display date of the IFC, eligible hospitals with an existing MGCRB reclassification also may seek rural reclassification under § 412.103 for IPPS payment (such as DSH) and other purposes (such as eligibility for the section 340B program), but keep their existing MGCRB reclassification (which would control for wage index purposes). We also finalized and began to apply the policies in the IFC when deciding timely appeals before the Administrator for FY 2017 that were denied by the MGCRB due to the application of the superseded regulations, which did not permit simultaneous rural reclassification and MGCRB reclassifications. These additional regulatory changes were implemented to codify the application and interpretation of the judicial decisions resulting from the adjudication of *Geisinger Community Medical Center* v. *Secretary, United States Department of Health and Human Services,* 794 F.3d 383 (3d Cir. 2015) and *Lawrence + Memorial Hospital* v. *Burwell,* No. 15–164, 2016 WL 423702 (2d Cir. February 4, 2015) in a nationally consistent manner.

We note that, in the April 21, 2016 IFC, we found good cause for waiving notice-and-comment rulemaking and the 60-day delay in effective date, given the decisions of the courts of appeals and the public interest in consistent application of a Federal policy nationwide. We stated that revising the regulation text at § 412.230(a)(5)(ii) and removing the regulation text at § 412.230(a)(5)(iii) through an IFC and subsequent final rule rather than through the normal notice-and-comment rulemaking cycle and waiving the 60-day delay of effective date would ensure a uniform national reclassification policy. By reason of the court decisions, this policy has already been effective since July 23, 2015, in the Third Circuit and February 4, 2016 in the Second Circuit. Absent such a policy, the wage index for acute care hospitals paid under the IPPS would have remained confusingly inconsistent across jurisdictions. Even though we waived notice of proposed rulemaking requirements and issued the provisions on an interim basis with subsequent issuance of a final rule, we provided a 60-day public comment period. In this section of this final rule, we are responding to the public comments that we received on these provisions in the April 21, 2016 IFC and finalizing the interim policies.

a. Background

Hospitals may seek to have their geographic designation reclassified. Under section 1886(d)(8)(E) of the Act, a qualifying inpatient prospective payment hospital located in an urban area may apply for rural status. Specifically, section 1886(d)(8)(E) of the Act states that not later than 60 days after the receipt of an application (in a form and manner determined by the Secretary) from a subsection (d) hospital, the Secretary shall treat the hospital as being located in the rural area (as defined in the statute) of the State in which the hospital is located if certain criteria are met. The regulations governing these geographic redesignations are codified under § 412.103. We also refer readers to the final rule published in the August 1, 2000 **Federal Register** entitled, ''Medicare Program; Provisions of the Balanced Budget Refinement Act of 1999; Hospital Inpatient Payments and Rates and Costs of Graduate Medical Education'' (65 FR 47029 through 47031) for a discussion of the general criteria for reclassifying from urban to rural under this statute. In addition, in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51596), we discussed the effects on the wage index of an urban hospital reclassifying to a rural area of its State, if the urban hospital meets the requirements under § 412.103. Hospitals that are located in States without any geographically rural areas are ineligible to apply for rural reclassification in accordance with the provisions of § 412.103.

In addition, as discussed under section III.J.1. of the preamble of this final rule, under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. Hospitals must apply to the MGCRB to reclassify not later than 13 months prior to the start of the fiscal year for which reclassification is sought (generally by September 1). Generally, hospitals must be proximate to the labor market area to which they are seeking reclassification and must demonstrate characteristics similar to hospitals located in that area. The MGCRB issues its decisions by the end of February for reclassifications that become effective for the following fiscal year (beginning October 1). The regulations applicable to reclassifications by the MGCRB are located in §§ 412.230 through 412.280. (We refer readers to a discussion in the FY 2002 IPPS final rule (66 FR 39874 and 39875) regarding how the MGCRB defines mileage for purposes of the proximity requirements.) The general policies applicable to reclassifications under the MGCRB process are also discussed in the FY 2012 IPPS/LTCH PPS final rule for the FY 2012 final wage index (76 FR 51595 and 51596).

b. Criteria for an Individual Hospital Seeking Redesignation to Another Area (§ 412.103)—Application of Policy Provisions

Our policy in effect prior to the issuance of the April 21, 2016 IFC limited certain redesignations in order to preclude hospitals from obtaining urban to rural redesignation under § 412.103, and then using that obtained rural status to receive an additional reclassification through the MGCRB. In the April 21, 2016 IFC, we referred readers to § 412.230(a)(5)(iii) as it existed at that time, which stated that an urban hospital that has been granted redesignation as rural under § 412.103 cannot receive an additional reclassification by the MGCRB based on this acquired rural status for a year in which such redesignation is in effect. In other words, § 412.230(a)(5)(iii) prohibited a hospital from simultaneously receiving an urban to rural redesignation under § 412.103 and a reclassification under the MGCRB.

As discussed in the April 21, 2016 IFC, on July 23, 2015 the Court of Appeals for the Third Circuit issued a decision in *Geisinger Community Medical Center* v. *Secretary, United States Department of Health and Human Services,* 794 F.3d 383 (3d Cir. 2015). Geisinger Community Medical Center (''Geisinger''), a hospital located in a geographically urban CBSA, obtained rural status under § 412.103, but was unable to receive additional reclassification through the MGCRB while still maintaining its rural status under § 412.230(a)(5)(iii). Under the regulations prior to the April 21, 2016 IFC, to receive reclassification through the MGCRB under existing regulations, *Geisinger* would have had to first cancel its § 412.103 urban-to-rural redesignation and use the proximity requirements for an urban hospital rather than take advantage of the broader proximity requirements for reclassification granted to rural hospitals. (In the April 21, 2016 IFC, we referred readers to § 412.230(b)(1), which states that a hospital demonstrates a close proximity with the area to which it seeks redesignation if the distance from the hospital to the area is no more than 15 miles for an urban hospital and no more than 35 miles for a rural hospital.) *Geisinger* challenged as unlawful the regulation at § 412.230(a)(5)(iii) requiring cancelation of its rural reclassification prior to

applying for reclassification through the MGCRB. In *Geisinger Community Medical Center* v. *Burwell,* 73 F. Supp.3d 507 (M.D. Pa. 2014), the District Court for the Middle District of Pennsylvania upheld the regulation at § 412.230(a)(5)(iii) and granted summary judgment in favor of CMS. The Court of Appeals for the Third Circuit reversed the decision of the District Court, holding that the language of section 1886(d)(8)(E)(i) of the Act is unambiguous in its plain intent that ''the Secretary shall treat the hospital as being located in the rural area,'' inclusive of MGCRB reclassification purposes, thus invalidating the regulation at § 412.230(a)(5)(iii). On February 4, 2016, the Court of Appeals for the Second Circuit issued its decision in *Lawrence + Memorial Hospital* v. *Burwell,* No. 15–164, 2016 WL 423702 (2d Cir. February 4, 2016), essentially following the reasoning of the Third Circuit *Geisinger* decision.

We stated in the IFC that while these decisions currently apply only to hospitals located within the jurisdictions of the Second and Third Circuits, we believed that maintaining the regulations at § 412.230(a)(5)(iii) in other circuits would constitute inconsistent application of the reclassification policy based on jurisdictional regions. In the interest of creating a uniform national reclassification policy, in the IFC, we removed the regulation text at § 412.230(a)(5)(iii). We also revised the regulation text at § 412.230(a)(5)(ii) to allow more than one reclassification for those hospitals redesignated as rural under § 412.103, and simultaneously seeking reclassification through the MGCRB. Specifically, we revised § 412.230(a)(5)(ii) to state that a hospital may not be redesignated to more than one area, except for an urban hospital that has been granted redesignation as rural under § 412.103 and receives an additional reclassification by the MGCRB. Therefore, effective for reclassification applications due to the MGCRB by September 1, 2016, for reclassification first effective for FY 2018, a hospital may apply for a reclassification under the MGCRB while still being redesignated from urban to rural under § 412.103. Such hospitals are eligible to use distance and average hourly wage criteria designated for rural hospitals at § 412.230(b)(1) and (d)(1). In addition, we provided that, effective with the public display date of the IFC, a hospital that has an active MGCRB reclassification and is then approved for redesignation under § 412.103 will not lose its MGCRB reclassification; that is, a hospital with an active MGCRB reclassification can simultaneously maintain rural status under § 412.103, and receive a reclassified urban wage index during the years of its active MGCRB reclassification and will still be considered rural under section 1886(d) of the Act and for other purposes. We also stated that we will apply the policy adopted in the April 21, 2016 IFC when deciding timely appeals before the Administrator under § 412.278 for FY 2017 that were denied by the MGCRB due to existing provisions of § 412.230(a)(5)(ii) and (iii), which did not permit simultaneous § 412.103 and MGCRB reclassifications.

Apart from the direct impact on reclassifying hospitals previously discussed in this section, we also considered how to treat the wage data of hospitals that maintain simultaneous reclassifications under both the § 412.103 and the MGCRB processes. Under the wage index calculation procedures that applied prior to issuance of the IFC, the wage data for a hospital geographically located in an urban area with a § 412.103 redesignation was included in the wage index for its home geographic area. It is also included in its State rural wage index, if including wage data for hospitals with rural reclassification raises the state's rural floor. In addition, the wage data for a hospital located in an urban area, and that is approved by the MGCRB to reclassify to another urban area (or another State's rural area), are included in its home area wage index calculation, and in the calculation for the reclassified ''attaching'' area. In the IFC, we referred readers to the FY 2012 IPPS final rule (76 FR 59595 through 59596) for a full discussion of the effect of reclassification on wage index calculations. Furthermore, as discussed in the FY 2007 IPPS final rule (71 FR 48020 through 48022), hospitals could not simultaneously maintain more than one wage index status (for example, a hospital could not simultaneously maintain a § 412.103 rural redesignation and an MGCRB reclassification, nor could a hospital receive an outmigration adjustment while also maintaining MGCRB or Lugar status). However, as a consequence of the court decisions previously discussed, we revised our regulations and created a rule that applies to all hospitals nationally, regarding the treatment of the wage data of hospitals that have both a § 412.103 redesignation and an MGCRB reclassification. In the IFC, we established that if a hospital with a § 412.103 redesignation is approved for an additional reclassification through the MGCRB process, and the hospital accepts its MGCRB reclassification, the Core-Based Statistical Area (CBSA) to which the hospital is reclassified under the MGCRB prescribes the area wage index that the hospital will receive; the hospital will not receive the wage index associated with the rural area to which the hospital is redesignated under § 412.103. That is, when there is both a § 412.103 redesignation and an MGCRB reclassification, the MGCRB reclassification will control for wage index calculation and payment purposes. Therefore, although we amended our policy with the IFC to allow a hospital to simultaneously have a reclassification under the MGCRB and an urban to rural redesignation under § 412.103, we separately clarified that we will exclude hospitals with § 412.103 redesignations from the calculation of the reclassified rural wage index if they also have an active MGCRB reclassification to another area. In these circumstances, we stated that we believe it is appropriate to rely on the urban MGCRB reclassification to include the hospital's wage data in the calculation of the urban CBSA wage index. Further, we stated that we believe it is appropriate to rely on the urban MGCRB reclassification to ensure that the hospital is paid based on its urban MGCRB wage index. That is, while rural reclassification confers other rural benefits besides the wage index under section 1886(d) of the Act, a hospital that chooses to pursue reclassification under the MGCRB (while also maintaining a rural redesignation under § 412.103) would do so solely for wage index payment purposes.

As previously stated, when there is both a § 412.103 redesignation and an MGCRB reclassification, the MGCRB reclassification will control for wage index calculation and payment purposes. That is, if an application for urban reclassification through the MGCRB is approved, and is not withdrawn or terminated by the hospital within the established timelines, we will consider, as is current practice, the hospital's geographic CBSA and the urban CBSA to which the hospital is reclassified under the MGCRB for the wage index calculation. We indicated that the hospital's geographic CBSA and reclassified CBSA would be reflected accordingly in Tables 2 and 3, associated with the annual IPPS/LTCH PPS proposed and final rules, which are available through the Internet on the CMS Web site.) However, in the absence of an active MGCRB reclassification, if

the hospital has an active § 412.103 redesignation, CMS will treat the hospital as rural under § 412.103 redesignation for IPPS payment and other purposes, including purposes of calculating the wage indices reflected in Tables 2 and 3 of the annual IPPS/LTCH PPS proposed and final rules

Comment: One commenter requested that, as part of the IPPS rulemaking process, CMS release data on the hospitals that have been granted redesignation under § 412.103 and receive an additional reclassification by the MGCRB. The commenter noted that while, in the payment impact file, there is a ''401 hospital'' field that indicates whether a hospital has been redesignated as rural under § 412.103, it appears that hospitals that have both a § 412.103 redesignation and an MGCRB reclassification do not have a ''Yes'' in the ''401 hospital'' field. The commenter requested that this field be labeled ''Yes'' when a hospital with a § 412.103 redesignation also receives an MGCRB reclassification.

Response: We agree with the commenter's request and will include a column in the public use impact file posted on the CMS Web site in conjunction with the IPPS rules to indicate that a hospital has a § 412.103 redesignation when it also has an MGCRB reclassification. This file can be located by visiting the following link *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* and selecting that IPPS regulation's home page on the left side of the screen. The impact files are located under ''Impact File and Data Files''.

Comment: Two commenters noted that the regulations at § 412.103 still require that an urban hospital requesting rural status use the statewide rural wage index for at least a 12-month period before the facility can be reclassified using the rural proximity requirement. The commenters requested that CMS clarify that those hospitals that have already used the rural wage index for one or more previous 12-month periods are allowed to choose to use their home geographic wage index, rather than the § 412.103 rural wage index, for the 12 months prior to receiving a MGCRB reclassification for FY 2018 or years beyond.

Response: We are unsure of the meaning of the commenter's statement ''the regulations at § 412.103 still require that an urban hospital requesting rural status use the statewide rural wage index for at least a 12 month period before the facility can be reclassified using the rural proximity requirement.'' The regulations at § 412.103 do not indicate a time period for using the statewide rural wage index before a hospital can be reclassified using the rural proximity requirement; rather, the 12-month time period referenced at § 412.103 pertains to cancellation of rural reclassification for a hospital classified as a rural referral center based on a § 412.103 reclassification. We also do not understand the commenter's request for clarification that hospitals that have received the rural wage index for 12 months be allowed to use their geographic home wage index prior to receiving an MGCRB reclassification for FY 2018 and after, because the regulations do not address payment at the rural wage index for a period of time in order to receive an MGCRB reclassification based on a § 412.103 redesignation. We reiterate that, as indicated in the IFC, when there is both an MGCRB reclassification and a § 412.103 redesignation, the MGCRB reclassification will control for wage index calculation and payment purposes; the hospital will not receive the wage index associated with the rural area to which the hospital is redesignated under § 412.103. We also reiterate that for any period of time that a hospital has a § 412.103 redesignation but not a MGCRB reclassification, the hospital will be paid using the rural wage index, and not its geographic home wage index.

Comment: One commenter requested clarification as to whether a hospital redesignated as rural under § 412.103 can use that rural status to reclassify to a nearby rural area. The commenter asked that CMS clarify whether a hospital redesignated as rural will be treated as rural for purposes of a rural to rural reclassification application.

Response: We are clarifying that a hospital redesignated as rural under § 412.103 can use that rural status to reclassify via the MGCRB to another rural or urban area, provided it meets the distance and average hourly wage criteria under § 412.230(b)(1), (d)(1)(iii)(C), and (d)(1)(iv)(E).

Comment: One commenter requested clarification on several aspects of the amended regulations. The commenter requested that CMS clarify that—

- The rural distance and average hourly wage criteria will be used for hospitals with a § 412.103 redesignation;
- The hospital's average hourly wage data are to be compared to the average hourly wage data for the State's rural area for purposes of determining whether the hospital meets the criterion in § 412.230(d)(l)(iii)(C);
- A rural redesignated hospital can undergo an MGCRB reclassification back to the CBSA in which it is physically located;
- Hospitals redesignated as rural can have dual MGCRB reclassifications, with the termination or withdrawal of one of the reclassifications after the issuance of the IPPS proposed rule, consistent with § 412.273;
- Hospitals redesignated as rural can still be part of an urban group seeking redesignation to another urban area for the geographic area where they are physically located, in accordance with § 412.234;
- In all future years, hospitals that already have an MGCRB reclassification can receive a § 412.103 redesignation without losing their MGCRB reclassification; and
- If a hospital has both an MGCRB reclassification and a § 412.103 redesignation, the wage data will be included in the urban area to which it is reclassified, rather than the rural area.

Response: The commenter is correct that the rural distance and average hourly wage criteria will be used for hospitals with a § 412.103 redesignation. However, the commenter's statement that the average hourly wage of a hospital with a § 412.103 redesignation is compared to the average hourly wage of hospitals in the State's rural area under § 412.230(d)(1)(iii)(C) is incorrect. Instead, the hospital's average hourly wage would be compared to the average hourly wage of all other hospitals in its urban geographic location using the rural distance and average hourly wage criteria. The commenter is correct that a § 412.103 rural redesignated hospital can undergo an MGCRB reclassification back to the CBSA in which it is physically located if it meets the criteria for use of an urban or other rural area's wage index at § 412.230(d) using the average hourly wage criteria specified for rural hospitals. We are unsure of the meaning of ''dual MGCRB reclassifications'' because a hospital can only have one MGCRB reclassification at a time.

We refer the commenter to the regulations at § 412.273 which describe the policies for withdrawing an MGCRB application, terminating an approved 3-year MGCRB reclassification, or canceling a previous withdrawal or termination. The policies at § 412.273 apply to all MGCRB reclassifications, including those that are held in addition to a § 412.103 redesignation.

The commenter is correct that a geographically urban hospital redesignated as rural under § 412.103 can still apply for group reclassification

with other urban hospitals located in the same geographically urban area to another urban area via the MGCRB, in accordance with § 412.234, and that effective with the IFC display date (April 18, 2016) and for future years, hospitals that already have an MGCRB reclassification can receive a § 412.103 redesignation without losing their MGCRB reclassification. Finally, we are reiterating that wage data for a hospital with both an MGCRB reclassification and a § 412.103 redesignation would be included in the post-reclassified wage index of the area to which it is reclassified under the MGCRB, and not the rural area to which it is reclassified under § 412.103.

Comment: One commenter requested that CMS repeal the provision § 412.103(g)(2) because the new policy has rendered this provision irrelevant. The commenter referenced CMS' discussion of this issue in the FY 2008 IPPS final rule (72 FR 47371 through 47373), and stated that the goal of creating this minimum time period was to disincentivize hospitals to receive a rural redesignation, obtain rural referral center status to achieve favorable MGCRB treatment, and then terminate their rural status. The commenter believed that because hospitals can now be both an urban and a rural referral center, this disincentive is no longer necessary.

Response: We appreciate the commenter's suggestion. The discussion in the FY 2008 IPPS final rule referenced by the commenter addressed a revision to § 412.103(g) to require that, for a hospital that obtains rural referral center status based on acquired rural status under § 412.103, the hospital's cancellation of its acquired rural status under § 412.103 is effective after it has been paid as rural for at least one 12-month cost reporting period, and not until the beginning of a Federal fiscal year following both the request for cancellation and the 12-month cost reporting period. The discussion in the FY 2008 IPPS final rule noted our concerns about hospitals that acquire rural status to become rural referral centers and then cancel acquired rural status after a brief period of time in order to take advantage of special MGCRB reclassification rules, which was the basis for the revisions to the regulation at § 412.103(g). Because we did not propose a change in the regulation regarding the interplay of rural redesignations and rural referral center status in particular, we are not amending these regulations at this time, but may address this issue in future rulemaking.

In summary, for reclassifications effective beginning FY 2018, a hospital may acquire rural status under § 412.103 and subsequently apply for a reclassification under the MGCRB using distance and average hourly wage criteria designated for rural hospitals. In addition, effective with the public display date of the IFC (April 18, 2016), a hospital with an active MGCRB reclassification may also acquire rural status under § 412.103. We stated that we also will apply the policy in the April 21, 2016 IFC when deciding timely appeals before the Administrator under § 412.278 for FY 2017 that were denied by the MGCRB due to then existing provisions of § 412.230(a)(5)(ii) and (iii), which did not permit simultaneous § 412.103 redesignation and MGCRB reclassifications. When there is both an MGCRB reclassification and a § 412.103 reclassification, the MGCRB reclassification will control for wage index calculation and payment purposes. For a discussion regarding budget neutrality adjustments for FY 2017 and subsequent years for hospitals that have a reclassification under § 412.103 and an MGCRB reclassification, we refer readers section II.A.4. of the Addendum to this FY 2017 IPPS/LTCH PPS final rule.

c. Final Rule Provisions

In this final rule, we are finalizing the provisions of the April 21, 2016 IFC without modification. We also are finalizing without modification our removal of § 412.230(a)(5)(iii) and the revisions to § 412.230(a)(5)(ii).

d. Impact

In the April 21, 2016 IFC (81 FR 23436 through 23438), we presented the following impact analysis for the IPPS wage index portion of the IFC. We are not making any changes to this IFC impact analysis in this final rule.

We did not conduct an in-depth impact analysis because our revision to the regulatory text is a consequence of court decisions. The *Geisinger* decision invalidated the regulation at § 412.230(a)(5)(iii), effective July 23, 2015, for hospitals in States within the Third Circuit's jurisdiction, and the *Lawrence + Memorial* decision invalidated the regulation at § 412.230(a)(5)(iii), effective February 4, 2016, for hospitals in States within the Second Circuit's jurisdiction. That is, we did not have a choice to maintain the previously uniform regulations at § 412.230(a)(5)(iii) for hospitals in States within the Second and Third Circuits.

Furthermore, we indicated that we do not believe that we could necessarily estimate the national impact of removing the regulation at § 412.230(a)(5)(iii). We noted that of the 3,586 IPPS hospitals listed on wage index Table 2 associated with the proposed rule and available via the Internet on the CMS Web site, 867 hospitals already had an MGCRB reclassification, and 57 hospitals had a reclassification to a rural area under § 412.103. (This table is discussed in the FY 2017 IPPS/LTCH PPS proposed rule and is available on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*. Click on the link on the left side of the screen titled, ''FY 2017 IPPS Proposed Rule Home Page''.) We could not estimate how many additional hospitals will elect to apply to the MGCRB by September 1, 2016, for reclassification beginning FY 2018, and we could not predict how many hospitals may elect to retain or acquire § 412.103 urban-to-rural reclassification over and above the hospitals that have already reclassified.

In addition, under § 412.64(e)(1)(ii), (e)(2), and (e)(4), increases in the wage index due to reclassification and other wage index adjustments are implemented in a budget neutral manner (that is, wage index adjustments are made in a manner that ensures that aggregate payments to hospitals are unaffected through the application of a wage index budget neutrality adjustment described more fully in the FY 2017 IPPS/LTCH PPS proposed rule). Therefore, as a result of the Third Circuit's decision in *Geisinger,* even though an urban hospital that may or may not already have a reclassification to another urban area under the MGCRB may be able to qualify for a reclassification to a more distant urban area with an even higher wage index, this would not increase aggregate IPPS payments (although the wage index budget neutrality factor applied to IPPS hospitals could be larger as a result of additional reclassifications occurring to higher wage index areas).

However, we noted in the IFC that there are other Medicare payment provisions potentially impacted by rural status, such as payments to disproportionate share hospitals (DSHs), and non-Medicare payment provisions, such as the 340B Drug Pricing Program administered by HRSA, under which payments are not made in a budget neutral manner. We noted that additional hospitals acquiring rural status under § 412.103 could, therefore, potentially increase Federal expenditures. Nevertheless, taking all of these factors into account, we indicated that we could not accurately determine an impact analysis as a result of the

Third Circuit's decision in *Geisinger* and the Second Circuit's decision in *Lawrence + Memorial.*

Comment: One commenter stated that because the 340B Drug Pricing Program is not a government payment program, Federal expenditures would not be expected to increase as a result of this change to CMS' regulations. The commenter noted that other possible impacts on Federal expenditures would be unrelated to the 340B Drug Pricing Program. The commenter requested that CMS clarify that Federal expenditures would not be increased as a result of the 340B Drug Pricing Program.

Response: We agree with the commenter that because the 340B Drug Pricing Program is not a Federal payment program, Federal expenditures would not be expected to increase as a result of any increased eligibility for the 340B Drug Pricing Program resulting from this change to our regulations.

The Regulatory Flexibility Act (RFA) also requires agencies to analyze options for regulatory relief of small entities if a rule has a significant impact on a substantial number of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small governmental jurisdictions. We estimate that most hospitals and most other providers and suppliers are small entities as that term is used in the RFA. The great majority of hospitals and most other health care providers and suppliers are small entities, either by being nonprofit organizations or by meeting the SBA definition of a small business (having revenues of less than $7.5 million to $38.5 million in any 1 year). (For details on the latest standards for health care providers, we refer readers to page 36 of the Table of Small Business Size Standards for NAIC 622 found on the SBA Web site at: *https://www.sba.gov/sites/default/files/files/Size_Standards_Table.pdf.*)

For purposes of the RFA, all hospitals and other providers and suppliers are considered to be small entities. Individuals and States are not included in the definition of a small entity. MACs are not considered to be small entities. We believe that the provisions of this final rule may have an impact on some small entities, but for the reasons previously discussed in this final rule, we cannot conclusively determine the number of such entities impacted. Because we lack data on individual hospital receipts, we cannot determine the number of small proprietary hospitals. Therefore, we are assuming that all hospitals are considered small entities for the purpose of the RFA. Because we acknowledge that many of the potentially affected entities are small entities, the discussion in this section regarding potentially impacted hospitals constitutes our regulatory flexibility analysis.

In addition, section 1102(b) of the Act requires us to prepare a regulatory impact analysis if a rule may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 604 of the RFA. With the exception of hospitals located in certain New England counties, for purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside a metropolitan statistical area and has fewer than 100 beds. Section 601(g) of the Social Security Amendments of 1983 (Pub. L. 98–21) designated hospitals in certain New England counties as belonging to the adjacent urban area. Thus, for purposes of the IPPS and the LTCH PPS, we continue to classify these hospitals as urban hospitals. For this final rule, no geographically rural hospitals are directly affected because only urban hospitals can reclassify to a rural area under § 412.103. However, we note that with regard to the wage index budget neutrality adjustments applied under § 412.64(e)(1)(ii), (e)(2), and (e)(4), rural IPPS hospitals will be affected to the extent that the reclassification budget neutrality adjustment increases, but this impact is no different than on urban IPPS hospitals, as the same budget neutrality factor is applied to all IPPS hospitals.

3. Other MGCRB Reclassification and Redesignation Issues for FY 2017

a. FY 2017 Reclassification Requirements and Approvals

As previously stated, under section 1886(d)(10) of the Act, the MGCRB considers applications by hospitals for geographic reclassification for purposes of payment under the IPPS. The specific procedures and rules that apply to the geographic reclassification process are outlined in regulations under 42 CFR 412.230 through 412.280.

At the time this final rule was constructed, the MGCRB had completed its review of FY 2017 reclassification requests. Based on such reviews, there are 265 hospitals approved for wage index reclassifications by the MGCRB starting in FY 2017. Because MGCRB wage index reclassifications are effective for 3 years, for FY 2017, hospitals reclassified beginning in FY 2015 or FY 2016 are eligible to continue to be reclassified to a particular labor market area based on such prior reclassifications for the remainder of their 3-year period. There were 294 hospitals approved for wage index reclassifications in FY 2015 that will continue for FY 2017, and 258 hospitals approved for wage index reclassifications in FY 2016 that will continue for FY 2017. Of all the hospitals approved for reclassification for FY 2015, FY 2016, and FY 2017, based upon the review at the time of this final rule, 817 hospitals are in a MGCRB reclassification status for FY 2017. We note that the number of hospitals with active reclassifications changed between the proposed rule and the final rule because hospitals had the opportunity to withdraw or terminate their reclassification within 45 days of the publication of the FY 2017 proposed rule.

Under the regulations at 42 CFR 412.273, hospitals that have been reclassified by the MGCRB are permitted to withdraw their applications within 45 days of the publication of a proposed rule. For information about withdrawing, terminating, or canceling a previous withdrawal or termination of a 3-year reclassification for wage index purposes, we refer readers to 42 CFR 412.273, as well as the FY 2002 IPPS final rule (66 FR 39887 through 39888) and the FY 2003 IPPS final rule (67 FR 50065 through 50066). Additional discussion on withdrawals and terminations, and clarifications regarding reinstating reclassifications and ''fallback'' reclassifications, were included in the FY 2008 IPPS final rule (72 FR 47333).

Changes to the wage index that result from withdrawals of requests for reclassification, terminations, wage index corrections, appeals, and the Administrator's review process for FY 2017 are incorporated into the wage index values published in this FY 2017 IPPS/LTCH PPS final rule. These changes affect not only the wage index value for specific geographic areas, but also the wage index value that redesignated/reclassified hospitals receive; that is, whether they receive the wage index that includes the data for both the hospitals already in the area and the redesignated/reclassified hospitals. Further, the wage index value for the area from which the hospitals are redesignated/reclassified may be affected.

Comment: One commenter stated that CMS' policy that hospitals must request to withdraw or terminate MGCRB reclassifications within 45 days of the proposed rule is problematic because a hospital could terminate a reclassification based on information in

the proposed rule, and with the publication of the final rule, discover that its original reclassified status was more desirable. The commenter stated that hospitals cannot make informed decisions concerning their reclassification status based on values in a proposed rule that are likely to change and, therefore, recommended that CMS revise its existing policy to permit hospitals to withdraw or terminate their reclassification status within 45 days of the publication of the final rule.

Several other commenters requested that CMS revise group reclassification rules at § 412.234(a)(3)(iv) so that urban county groups would no longer be required to be within the same CSA or CBSA as the desired labor market area.

Response: We did not make any proposals to change any of the reclassification regulations for FY 2017. Any changes to the reclassification regulations would need to be first proposed through notice-and-comment rulemaking. Consequently, we are not making any changes to address the commenters' concerns at this time. We maintain that information provided in the proposed rule constitutes the best available data to assist hospitals in making reclassification decisions. The values published in the final rule represent the final wage index values reflective of reclassification decisions.

b. Requirements for FY 2018 Applications and Revisions Regarding Paper Application Requirements

Applications for FY 2018 reclassifications are due to the MGCRB by September 1, 2016 (the first working day of September 2016). We note that this is also the deadline for canceling a previous wage index reclassification withdrawal or termination under 42 CFR 412.273(d). Applications and other information about MGCRB reclassifications may be obtained, beginning in mid-July 2016, via the Internet on the CMS Web site at *https://www.cms.gov/Regulations-and-Guidance/Review-Boards/MGCRB/index.html*, or by calling the MGCRB at (410) 786–1174. The mailing address of the MGCRB is: 2520 Lord Baltimore Drive, Suite L, Baltimore, MD 21244–2670.

Under existing regulations at 42 CFR 412.256(a)(1), applications for reclassification must be mailed or delivered to the MGCRB, with a copy to CMS, and may not be submitted through the facsimile (FAX) process or by other electronic means. While existing regulations exclusively require paper applications, we believe this policy to be outdated and overly restrictive. Therefore, to promote ease of application for FY 2018 and subsequent years, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25069), we proposed to revise this policy to require applications and supporting documentation to be submitted via the method prescribed in instructions by the MGCRB, with an electronic copy to CMS. Therefore, we proposed to revise § 412.256(a)(1) to specify that an application must be submitted to the MGCRB according to the method prescribed by the MGCRB, with an electronic copy of the application sent to CMS. We specified that CMS copies should be sent via email to *wageindex@cms.hhs.gov*. We invited public comments on this proposal.

Comment: Commenters supported CMS' proposal to require electronic copies for wage index reclassification materials. Commenters requested that CMS provide email confirmation upon receipt of these copies, and further request CMS to provide additional guidance on how to submit files that may be too large for some email systems.

Response: We appreciate the commenters' support of our proposal, and we are finalizing the regulation change as proposed. We reiterate that MGCRB application requirements will be published separately from this rulemaking process, and paper applications will likely still be required. The MGCRB makes all initial determinations for geographic reclassification requests, but CMS requests copies of all applications to assist in verifying a reclassification status during the wage index development process. We believe that requiring electronic versions would better aid CMS in this process, and would reduce the overall burden upon hospitals. We appreciate the commenters' request for email verification that an application was received in the *wageindex@cms.hhs.gov* mailbox, and we will endeavor to provide such validation in a timely manner. Regarding issues with email size, we believe that a scanned PDF copy of an application should rarely exceed the size limitations of most email systems. In circumstances when this may be an issue, we request that hospitals notify the wage index mailbox to arrange for an alternate delivery method. We also request that all correspondence with the wage index mailbox clearly identify the hospital's CCN (or the county and state for group reclassification requests) in the subject line, and that emails include a name, email address, and phone number of a responsible party at the hospital, should CMS need to contact the hospital to request or clarify certain information.

Comment: Commenters requested additional guidance regarding acceptable materials for a variety of MGCRB application requirements, specifically for documenting proximity requirements.

Response: As discussed previously, MGCRB application instructions are published on the CMS Web site at *https://www.cms.gov/Regulations-and-Guidance/Review-Boards/MGCRB/index.html* separately from the rulemaking process.

We are finalizing our proposal to revise § 412.256(a)(1), without modification, to specify that an application must be submitted to the MGCRB according to the method prescribed by the MGCRB, with an electronic copy of the application sent to CMS. We are specifying that CMS copies should be sent via email to *wageindex@cms.hhs.gov*.

c. Other Policy Regarding Reclassifications for Terminated Hospitals

Under longstanding CMS policy, if a hospital that has an approved reclassification by the MGCRB terminates its CMS certification number (CCN), we terminate the reclassification status for that hospital when calculating the wage index, because the CCN is no longer active, and because the MGCRB makes its reclassification decisions based on CCNs. We believe this policy results in more accurate reclassifications when compiling CBSA labor market wage data, as it is often the case that hospitals that have terminated their CCNs have also terminated operations, and can no longer make timely and informed decisions regarding reclassification statuses, which could have ramifications for various wage index floors and labor market values.

However, as discussed in response to a comment in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49499 through 49500), in the case of a merger or acquisition where the acquiring hospital accepted the Medicare provider agreement of the acquired hospital located in a different market area that has an existing MGCRB reclassification, we do believe that the acquiring hospital should be able to make determinations regarding the reclassification status of the subordinate campus. While the original CCN for the acquired hospital would be considered terminated or ''tied out'' by CMS, in the specific situations where a hospital merges with or acquires another hospital located in a different labor market area to create a ''multicampus''

hospital and accepts the Medicare provider agreement of the acquired hospital, the reclassification status of the subordinate campus remains in effect. The acquired campus (that is, the hospital whose CCN is no longer active) may continue to receive its previously approved reclassification status, and the acquiring hospital is authorized to make timely requests to terminate, withdraw, or reinstate any reclassification for the subordinate campus for any remaining years of the reclassification. We stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25070) that we believe this policy is consistent with existing regulations regarding reclassification status of ''multicampus'' hospitals at § 412.230(d)(2)(v). We further stated that hospitals should take care to review their status on Table 2 associated with the proposed rule (which is available via the Internet on the CMS Web site) and notify CMS if they believe a reclassification for a hospital was mistakenly terminated by CMS.

We did not receive any public comments on our clarification regarding the treatment of reclassifications of terminated hospitals.

4. Redesignation of Hospitals Under Section 1886(d)(8)(B) of the Act

Section 1886(d)(8)(B)(i) of the Act requires the Secretary to treat a hospital located in a rural county adjacent to one or more urban areas as being located in the urban MSA to which the greatest number of workers in the county commute if certain adjacency and commuting criteria are met. The criteria utilize standards for designating MSAs published in the **Federal Register** by the Director of the Office of Management and Budget (OMB) based on the most recently available decennial population data. Effective beginning FY 2015, we use the OMB delineations based on the 2010 Decennial Census data to identify counties in which hospitals qualify under section 1886(d)(8)(B) of the Act to receive the wage index of the urban area. Hospitals located in these counties are referred to as ''Lugar'' hospitals and the counties themselves are often referred to as ''Lugar'' counties. The chart for this FY 2017 final rule with the listing of the rural counties containing the hospitals designated as urban under section 1886(d)(8)(B) of the Act is available via the Internet on the CMS Web site.

We refer readers to section III.J.2. of the preamble of this final rule for discussion and the finalization of the April 21, 2016 IFC (CMS–1664–IFC; 81 FR 23428) in which CMS made regulatory changes in order to implement the decisions in *Geisinger Community Medical Center* v. *Secretary, United States Department of Health and Human Services,* 794 F.3d 383 (3d Cir. 2015) and *Lawrence + Memorial Hospital* v. *Burwell,* No. 15–164, 2016 WL 423702 (2d Cir. Feb. 4, 2015) in a nationally consistent manner. Specifically, the IFC revised the regulations at § 412.230(a)(5)(ii) and removed the regulatory provision at § 412.230(a)(5)(iii) to allow hospitals nationwide to reclassify based on their acquired rural status, effective with reclassifications beginning with FY 2018. The IFC also gave hospitals with an existing MGCRB reclassification the opportunity to seek rural reclassification under § 412.103 and keep their existing MGCRB reclassification.

As a consequence of the regulatory changes in the IFC that allow a hospital to have more than one reclassification simultaneously, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25070), we clarified that a hospital with Lugar status may simultaneously receive an urban to rural reclassification under § 412.103. The IFC provides that when there is both a § 412.103 reclassification and an MGCRB reclassification, the MGCRB reclassification controls for wage index calculation and payment purposes. Similarly, in the FY 2017 proposed rule, we also clarified that we are treating the wage data of hospitals with simultaneous Lugar status and § 412.103 reclassification as Lugar for wage index calculation and wage index payment purposes. We stated that we believe it is appropriate to apply a similar policy for simultaneous MGCRB reclassification and § 412.103 reclassifications, and simultaneous Lugar and § 412.103 reclassifications, because CMS treats Lugar status as a reclassification for purposes of calculating the wage index in accordance with section 1886(d)(8)(C)(iii) of the Act. (Section 1886(d)(8)(C)(iii) of the Act states that the application of section 1886(d)(8)(B) of the Act or a decision of the MGCRB or the Secretary under section 1886(d)(10) of the Act may not result in the reduction of any county's wage index to a level below the wage index for rural areas in the State in which the county is located.) The wage index associated with the Lugar status, and not the wage index associated with the § 412.103 reclassification, is reflected accordingly in Table 2 associated with this final rule (which is available via the Internet on the CMS Web site). We note that, for payment purposes other than the wage index, a hospital with simultaneous § 412.103 status and Lugar reclassification receives payment as a rural hospital.

Comment: Commenters supported the policy to allow Lugar hospitals to retain their reclassified wage index when they obtain a rural reclassification under § 412.103.

Response: We appreciate the commenters' support.

After consideration of public comments we received, we are again clarifying that a hospital with Lugar status may simultaneously receive an urban to rural reclassification under § 412.103. As discussed above, we are assigning hospitals that qualify under section 1886(d)(8)(B) of the Act while simultaneously maintaining rural status obtained under § 412.103 the wage index associated with their Lugar status.

5. Waiving Lugar Redesignation for the Out-Migration Adjustment

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600), we adopted the policy that, beginning with FY 2012, an eligible hospital that waives its Lugar status in order to receive the out-migration adjustment has effectively waived its deemed urban status and, thus, is rural for all purposes under the IPPS, including being considered rural for the DSH payment adjustment, effective for the fiscal year in which the hospital receives the out-migration adjustment. (We refer readers to a discussion of DSH payment adjustment under section IV.F. of the preamble of this final rule.)

In addition, we adopted a minor procedural change in that rule that allows a Lugar hospital that qualifies for and accepts the out-migration adjustment (through written notification to CMS within 45 days from the publication of the proposed rule) to waive its urban status for the full 3-year period for which its out-migration adjustment is effective. By doing so, such a Lugar hospital would no longer be required during the second and third years of eligibility for the out-migration adjustment to advise us annually that it prefers to continue being treated as rural and receive the out-migration adjustment. Therefore, under the procedural change, a Lugar hospital that requests to waive its urban status in order to receive the rural wage index in addition to the out-migration adjustment would be deemed to have accepted the out-migration adjustment and agrees to be treated as rural for the duration of its 3-year eligibility period, unless, prior to its second or third year of eligibility, the hospital explicitly notifies CMS in writing, within the required period (generally 45 days from the publication of the proposed rule),

that it instead elects to return to its deemed urban status and no longer wishes to accept the out-migration adjustment. If the hospital does notify CMS that it is electing to return to its deemed urban status, it would again be treated as urban for all IPPS payment purposes.

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51599 through 51600) for a detailed discussion of the policy and process for waiving Lugar status for the out-migration adjustment.

We did not receive any public comments on this issue. In the FY 2017 IPPS/LTCH PPS proposed rule, we did not propose a change to the rules regarding waiving Lugar designation for the out-migration adjustment. Therefore, the process remains unchanged at this time. However, as a separate matter, we are taking the opportunity to clarify that a request to waive Lugar status, received within 45 days of the publication of the proposed rule, is valid for the full 3-year period for which the hospital's out-migration adjustment is effective. If a hospital wishes to reinstate Lugar status for any fiscal year within this 3-year period, it must send a request to CMS within 45 days of the proposed rule for that particular fiscal year. These requests may be sent electronically to *wageindex@cms.hhs.gov*. CMS will not consider reinstatements of Lugar status for a future fiscal year. For example, if a hospital requests to waive Lugar status for FY 2017 and also to reinstate Lugar status for FY 2018 and 2019, CMS will disregard the reinstatement requests for FY 2018 and FY 2019. Instead, the hospital must request the reinstatement of Lugar status for FY 2018 within 45 days of the FY 2018 IPPS/LTCH PPS proposed rule. If the hospital does this, by default, the hospital would retain Lugar status for FY 2019, although the hospital may once again opt to waive Lugar status for the out-migration adjustment by sending a new request to CMS within 45 days of the FY 2019 IPPS/LTCH PPS proposed rule.

K. Out-Migration Adjustment Based on Commuting Patterns of Hospital Employees for FY 2017

In accordance with section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, beginning with FY 2005, we established a process to make adjustments to the hospital wage index based on commuting patterns of hospital employees (the ''out-migration'' adjustment). The process, outlined in the FY 2005 IPPS final rule (69 FR 49061), provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county but work in a different county (or counties) with a higher wage index.

Section 1886(d)(13)(B) of the Act requires the Secretary to use data the Secretary determines to be appropriate to establish the qualifying counties. When the provision of section 1886(d)(13) of the Act was implemented for the FY 2005 wage index, we analyzed commuting data compiled by the U.S. Census Bureau that were derived from a special tabulation of the 2000 Census journey-to-work data for all industries (CMS extracted data applicable to hospitals). These data were compiled from responses to the ''long-form'' survey, which the Census Bureau used at the time and which contained questions on where residents in each county worked (69 FR 49062). However, the 2010 Census was ''short form'' only; information on where residents in each county worked was not collected as part of the 2010 Census. The Census Bureau worked with CMS to provide an alternative dataset based on the latest available data on where residents in each county worked in 2010, for use in developing a new out-migration adjustment based on new commuting patterns developed from the 2010 Census data beginning with FY 2016.

To determine the out-migration adjustments and applicable counties for FY 2016, we analyzed commuting data compiled by the Census Bureau that were derived from a custom tabulation of the American Community Survey (ACS), an official Census Bureau survey, utilizing 2008 through 2012 (5-Year) Microdata. The data were compiled from responses to the ACS questions regarding the county where workers reside and the county to which workers commute. As we discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49501), the same policies, procedures, and computation that were used for the FY 2012 out-migration adjustment were applicable for FY 2016, and we proposed to use them again for FY 2017. As we stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25071), we have applied the same policies, procedures, and computations since FY 2012, and we believe they continue to be appropriate for FY 2017. We did not receive any comments on these proposals. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49500 through 49502) for a full explanation of the revised data source.

For FY 2017, until such time that CMS finalizes out-migration adjustments based on the next Census, the out-migration adjustment continues to be based on the data derived from the custom tabulation of the ACS utilizing 2008 through 2012 (5-Year) Microdata. For FY 2017, we did not propose any changes to the methodology or data source that we used for FY 2016 (81 FR 25071). (We refer readers to a full discussion of the out-migration adjustment, including rules on deeming hospitals reclassified under section 1886(d)(8) or section 1886(d)(10) of the Act to have waived the out-migration adjustment, in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51601 through 51602).) Table 2 associated with this final rule (which is available via the Internet on the CMS Web site) includes the final out-migration adjustments for the FY 2017 wage index.

L. Notification Regarding CMS ''Lock-In'' Date for Urban to Rural Reclassifications Under § 412.103

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25071 through 25072), under section 1886(d)(8)(E) of the Act, a qualifying prospective payment hospital located in an urban area may apply for rural status for payment purposes separate from reclassification through the MGCRB. Specifically, section 1886(d)(8)(E) of the Act provides that, not later than 60 days after the receipt of an application (in a form and manner determined by the Secretary) from a subsection (d) hospital that satisfies certain criteria, the Secretary shall treat the hospital as being located in the rural area (as defined in paragraph (2)(D)) of the State in which the hospital is located. We refer readers to the regulations at 42 CFR 412.103 for the general criteria and application requirements for a subsection (d) hospital to reclassify from urban to rural status in accordance with section 1886(d)(8)(E) of the Act. The FY 2012 IPPS/LTCH PPS final rule (76 FR 51595 through 51596) includes our policies regarding the effect of wage data from reclassified or redesignated hospitals.

Hospitals must meet the criteria to be reclassified from urban to rural status under § 412.103, as well as fulfill the requirements for the application process. However, under existing § 412.103(b), there is no timeframe requirement as to when hospitals must apply for the urban to rural reclassification. Therefore, a hospital can apply for the urban to rural reclassification at any time, and under § 412.103(d), the effective date of the hospital's rural status, once approved, is the filing date of the application.

There may be one or more reasons that a hospital applies for the urban to

rural reclassification, and the timeframe that a hospital submits an application is often dependent on those reason(s). Because there are no timeframes for when a hospital must submit its application under § 412.103, it is the hospital's prerogative as to when it files the application with the CMS Regional Office. Because the wage index is part of the methodology for determining the prospective payments to hospitals for each fiscal year, we believe there should be a definitive timeframe within which a hospital should apply for rural status in order for the reclassification to be reflected in the next Federal fiscal year's wage data used for setting payment rates. As hospitals are aware, the IPPS ratesetting process that CMS undergoes each proposed and final rulemaking is complex and labor-intensive, and subject to a compressed timeframe in order to issue the final rule each year within the timeframes for publication. Accordingly, CMS must ensure that it receives, in a timely fashion, the necessary data, including, but not limited to, the list of hospitals that are reclassified from urban to rural status under § 412.103, in order to calculate the wage indexes and other IPPS rates.

Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25071 through 25072), we proposed a date by when we would ''lock in'' the list of hospitals that are reclassified from urban to rural status under § 412.103 in order to include them in the upcoming Federal fiscal year's wage index calculation provided for at § 412.64(h) and budget neutrality calculations provided for at §§ 412.64(e)(1)(ii), (e)(2), and (e)(4) that are part of the ratesetting process. The ratesetting process is described in the Addendum of the annual proposed and final rules and includes the budget neutrality adjustments in accordance with the regulations at §§ 412.64(e)(1)(ii), (e)(2), and (e)(4), as well as adjustments for differences in area wage levels provided for at § 412.64(h). We stated in the proposed rule (81 FR 25072) that we believe this proposal would introduce additional transparency and predictability regarding the timing of accounting for urban or rural status in the IPPS ratesetting each Federal fiscal year. We proposed that this date for ''locking in'' the list of hospitals with rural status achieved under § 412.103 would be the second Monday in June of each year. Therefore, if a hospital is applying for an urban to rural reclassification under § 412.103 for the purpose and expectation that its rural status be reflected in the wage index and budget neutrality calculations for setting payment rates for the next Federal fiscal year, the hospital would need to file its application with the CMS Regional Office not later than 70 days prior to the second Monday in June. Because, under § 412.103(c), the CMS Regional Office must notify the hospital of its approval or disapproval of the application within 60 days of the hospital's filing date (the date it is received by the CMS Regional Office, in accordance with § 412.103(b)(5)), we stated that we would expect that the extra 10 days would provide the CMS Regional Office with sufficient processing and administrative time to notify the CMS Central Office of the reclassification status of the applications by the second Monday in June of each year. This is the latest date that CMS would need the information in order to ensure that reclassified hospitals would be included as such in the wage index and budget neutrality calculations for setting payment rates for the next Federal fiscal year. As discussed in the proposed rule, this does not preclude a hospital from applying for reclassification under § 412.103 earlier or later than the proposed deadline. Nor does the proposed deadline change the fact that the rural reclassification is effective as of its filing date, in accordance with § 412.103(d). However, in order to ensure that a reclassification is reflected in the wage index and budget neutrality calculations for setting payment rates for the next Federal fiscal year, applications must be received by the CMS Regional Office (the filing date) by no later than 70 days prior to the second Monday in June of the current Federal fiscal year. If the CMS Central Office is informed of a reclassification status after the second Monday in June, for wage index and budget neutrality purposes, the reclassification would not be reflected in the payment rates until the following Federal fiscal year; that is, the Federal fiscal year following the next Federal fiscal year. We proposed to revise § 412.103(b) by adding a new paragraph (6) to specify that, in order for a hospital to be treated as rural in the wage index and budget neutrality calculations under §§ 412.64(e)(1)(ii), (e)(2), (e)(4), and (h) for payment rates for the next Federal fiscal year, the hospital's filing date must be no later than 70 days prior to the second Monday in June of the current Federal fiscal year and the application must be approved by the CMS Regional Office in accordance with the requirements of § 412.103.

Comment: One commenter believed that the proposal to specify a lock-in date for urban to rural reclassification under § 412.103 for wage index and budget neutrality calculation purposes was reasonable and supported the need to have a ''cutoff'' date. However, the commenter requested clarification that the lock-in date for wage index and ratesetting purposes would have no impact on the timing of payment changes at the hospital-specific level.

Response: We appreciate the commenter's support. We proposed to set a lock-in date by which a hospital must file for urban to rural reclassification under § 412.103 in order to be treated as rural in the upcoming fiscal year's wage index and budget neutrality calculations. Thus, if a hospital wants its rural status to be reflected in the wage index and budget neutrality calculations for setting payment rates for the upcoming fiscal year, the hospital would need to file its reclassification application with the CMS Regional Office not later than 70 days prior to the second Monday in June of the current Federal fiscal year. As we stated in the proposed rule, we did this to introduce additional transparency and predictability regarding the timing of accounting for urban or rural status in the IPPS ratesetting each fiscal year. As the commenter indicated, reclassification under § 412.103 also affects payment at the hospital-specific level. We are clarifying that the lock-in date does not affect the timing of payment changes occurring at the hospital-specific level as a result of reclassification from urban to rural under § 412.103. As we indicated in the proposed rule, this lock-in date does not change the current regulation that allows hospitals that qualify under § 412.103(a) to request, at any time during a cost reporting period, to reclassify from urban to rural. A hospital's rural status and claims payment reflecting its rural status continue to be effective on the filing date of its reclassification application, which is the date the CMS Regional Office receives the application, in accordance with § 412.103(d). The hospital's IPPS claims would be paid reflecting its rural status on the filing date (the effective date) of the reclassification, regardless of when the hospital applies.

After consideration of the public comment we received, we are finalizing, without modification, our proposal that, in order for a hospital that applies for reclassification under § 412.103 to be treated as rural in the wage index and budget neutrality calculations under §§ 412.64(e)(1)(ii), (e)(2), (e)(4), and (h) for payment rates for the next Federal fiscal year, the hospital's filing date

must be no later than 70 days prior to the second Monday in June of the current Federal fiscal year and the application must be approved by the CMS Regional Office in accordance with the requirements of § 412.103. We also are finalizing our proposal to add a paragraph (6) to § 412.103 to specify this new lock-in date.

M. Process for Requests for Wage Index Data Corrections

The preliminary, unaudited Worksheet S–3 wage data files for the proposed FY 2017 wage index were made available on May 15, 2015, and the preliminary CY 2013 occupational mix data files on May 15, 2015, through the Internet on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2017-Wage-Index-Home-Page.html*.

On January 29, 2016, we posted a public use file (PUF) at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2017-Wage-Index-Home-Page.html* containing FY 2017 wage index data available as of January 28, 2016. This PUF contains a tab with the Worksheet S–3 wage data (which includes Worksheet S–3, Parts II and III wage data from cost reporting periods beginning on or after October l, 2012 through September 30, 2013; that is, FY 2013 wage data), a tab with the occupational mix data (which includes data from the CY 2013 occupational mix survey, Form CMS–10079), and new for FY 2017, a tab containing the Worksheet S–3 wage data of hospitals deleted from the January 29, 2016 wage data PUF and a tab containing the CY 2013 occupational mix data (if any) of the hospitals deleted from the January 29, 2016 wage data PUF. In a memorandum dated January 21, 2016, we instructed all MACs to inform the IPPS hospitals that they service of the availability of the January 29, 2016 wage index data PUFs, and the process and timeframe for requesting revisions in accordance with the FY 2017 Wage Index Timetable.

In the interest of meeting the data needs of the public, beginning with the proposed FY 2009 wage index, we post an additional PUF on our Web site that reflects the actual data that are used in computing the proposed wage index. The release of this file does not alter the current wage index process or schedule. We notify the hospital community of the availability of these data as we do with the current public use wage data files through our Hospital Open Door Forum. We encourage hospitals to sign up for automatic notifications of information about hospital issues and about the dates of the Hospital Open Door Forums at the CMS Web site at: *http://www.cms.gov/Outreach-and-Education/Outreach/OpenDoorForums/index.html*.

In a memorandum dated April 30, 2015, we instructed all MACs to inform the IPPS hospitals that they service of the availability of the wage index data files and the process and timeframe for requesting revisions (including the specific deadlines listed later in this section). We also instructed the MACs to advise hospitals that these data were also made available directly through their representative hospital organizations.

If a hospital wished to request a change to its data as shown in May 15, 2015 wage data files and May 15, 2015 occupational mix data files, the hospital was to submit corrections along with complete, detailed supporting documentation to its MAC by September 2, 2015. Hospitals were notified of this deadline and of all other deadlines and requirements, including the requirement to review and verify their data as posted in the preliminary wage index data files on the Internet, through the letters sent to them by their MACs.

November 4, 2015 was the date by when MACs notified State hospital associations regarding hospitals that failed to respond to issues raised during the desk reviews. The MACs notified the hospitals by mid-January 2016 of any changes to the wage index data as a result of the desk reviews and the resolution of the hospitals' revision requests. The MACs also submitted the revised data to CMS by January 22, 2016. CMS published the proposed wage index PUFs that included hospitals' revised wage index data on January 29, 2016. Hospitals had until February 16, 2016, to submit requests to the MACs for reconsideration of adjustments made by the MACs as a result of the desk review, and to correct errors due to CMS' or the MAC's mishandling of the wage index data. Hospitals also were required to submit sufficient documentation to support their requests.

After reviewing requested changes submitted by hospitals, MACs were required to transmit to CMS any additional revisions resulting from the hospitals' reconsideration requests by March 24, 2016. The deadline for a hospital to request CMS intervention in cases where a hospital disagreed with a MAC's policy interpretation was April 5, 2016. We note that, as we did for the FY 2016 wage index, for the FY 2017 wage index, in accordance with the FY 2017 wage index timeline posted on the CMS Web site at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2017-Wage-Index-Home-Page.html*, the April appeals have to be sent via mail and email. We refer readers to the wage index timeline for complete details.

Hospitals were given the opportunity to examine Table 2, which is listed in section VI. of the Addendum to the proposed rule and available via the Internet on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2017-Wage-Index-Home-Page.html*. Table 2 associated with the proposed rule contained each hospital's proposed adjusted average hourly wage used to construct the wage index values for the past 3 years, including the FY 2013 data used to construct the proposed FY 2017 wage index. We noted in the proposed rule (81 FR 25073) that the proposed hospital average hourly wages shown in Table 2 only reflected changes made to a hospital's data that were transmitted to CMS by late February 2016.

We posted the final wage index data PUFs on April 21, 2016 on the Internet at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2017-Wage-Index-Home-Page.html*. The April 2016 PUFs were made available solely for the limited purpose of identifying any potential errors made by CMS or the MAC in the entry of the final wage index data that resulted from the correction process previously described (revisions submitted to CMS by the MACs by March 24, 2016).

After the release of the April 2016 wage index data PUFs, changes to the wage and occupational mix data could only be made in those very limited situations involving an error by the MAC or CMS that the hospital could not have known about before its review of the final wage index data files. Specifically, neither the MAC nor CMS will approve the following types of requests:

- Requests for wage index data corrections that were submitted too late to be included in the data transmitted to CMS by the MACs on or before March 24, 2016.
- Requests for correction of errors that were not, but could have been, identified during the hospital's review of the January 29, 2016 wage index PUFs.
- Requests to revisit factual determinations or policy interpretations

made by the MAC or CMS during the wage index data correction process.

If, after reviewing the April 2016 final wage index data PUFs, a hospital believed that its wage or occupational mix data were incorrect due to a MAC or CMS error in the entry or tabulation of the final data, the hospital was given the opportunity to notify both its MAC and CMS regarding why the hospital believed an error exists and provide all supporting information, including relevant dates (for example, when it first became aware of the error). The hospital was required to send its request to CMS and to the MAC no later than May 23, 2016. Similar to the April appeals, beginning with the FY 2015 wage index, in accordance with the FY 2017 wage index timeline posted on the CMS Web site at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Wage-Index-Files-Items/FY2017-Wage-Index-Home-Page.html*, the May appeals were required to be sent via mail and email to CMS and the MACs. We refer readers to the wage index timeline for complete details.

Verified corrections to the wage index data received timely by CMS and the MACs (that is, by May 23, 2016) were incorporated into the final FY 2017 wage index in this FY 2017 IPPS/LTCH PPS final rule, which is effective October 1, 2016.

We created the processes previously described to resolve all substantive wage index data correction disputes before we finalize the wage and occupational mix data for the FY 2017 payment rates. Accordingly, hospitals that did not meet the procedural deadlines set forth above will not be afforded a later opportunity to submit wage index data corrections or to dispute the MAC's decision with respect to requested changes. Specifically, our policy is that hospitals that do not meet the procedural deadlines set forth above will not be permitted to challenge later, before the PRRB, the failure of CMS to make a requested data revision. We refer readers also to the FY 2000 IPPS final rule (64 FR 41513) for a discussion of the parameters for appeals to the PRRB for wage index data corrections.

Again, we believe the wage index data correction process described earlier provides hospitals with sufficient opportunity to bring errors in their wage and occupational mix data to the MAC's attention. Moreover, because hospitals had access to the final wage index data PUFs by late April 2016, they had the opportunity to detect any data entry or tabulation errors made by the MAC or CMS before the development and publication of the final FY 2017 wage index by August 2016, and the implementation of the FY 2017 wage index on October 1, 2016. Given these processes, the wage index implemented on October 1 should be accurate. Nevertheless, in the event that errors are identified by hospitals and brought to our attention after May 23, 2016, we retain the right to make midyear changes to the wage index under very limited circumstances.

Specifically, in accordance with 42 CFR 412.64(k)(1) of our regulations, we make midyear corrections to the wage index for an area only if a hospital can show that: (1) The MAC or CMS made an error in tabulating its data; and (2) the requesting hospital could not have known about the error or did not have an opportunity to correct the error, before the beginning of the fiscal year. For purposes of this provision, ''before the beginning of the fiscal year'' means by the May deadline for making corrections to the wage data for the following fiscal year's wage index (for example, May 23, 2016 for the FY 2017 wage index). This provision is not available to a hospital seeking to revise another hospital's data that may be affecting the requesting hospital's wage index for the labor market area. As indicated earlier, because CMS makes the wage index data available to hospitals on the CMS Web site prior to publishing both the proposed and final IPPS rules, and the MACs notify hospitals directly of any wage index data changes after completing their desk reviews, we do not expect that midyear corrections will be necessary. However, under our current policy, if the correction of a data error changes the wage index value for an area, the revised wage index value will be effective prospectively from the date the correction is made.

In the FY 2006 IPPS final rule (70 FR 47385 through 47387 and 47485), we revised 42 CFR 412.64(k)(2) to specify that, effective on October 1, 2005, that is, beginning with the FY 2006 wage index, a change to the wage index can be made retroactive to the beginning of the Federal fiscal year only when CMS determines all of the following: (1) The MAC or CMS made an error in tabulating data used for the wage index calculation; (2) the hospital knew about the error and requested that the MAC and CMS correct the error using the established process and within the established schedule for requesting corrections to the wage index data, before the beginning of the fiscal year for the applicable IPPS update (that is, by the May 23, 2016 deadline for the FY 2017 wage index); and (3) CMS agreed before October 1 that the MAC or CMS made an error in tabulating the hospital's wage index data and the wage index should be corrected.

In those circumstances where a hospital requested a correction to its wage index data before CMS calculated the final wage index (that is, by the May 23, 2016 deadline for the FY 2017 wage index), and CMS acknowledges that the error in the hospital's wage index data was caused by CMS' or the MAC's mishandling of the data, we believe that the hospital should not be penalized by our delay in publishing or implementing the correction. As with our current policy, we indicated that the provision is not available to a hospital seeking to revise another hospital's data. In addition, the provision cannot be used to correct prior years' wage index data; and it can only be used for the current Federal fiscal year. In situations where our policies would allow midyear corrections other than those specified in 42 CFR 412.64(k)(2)(ii), we continue to believe that it is appropriate to make prospective-only corrections to the wage index.

We note that, as with prospective changes to the wage index, the final retroactive correction will be made irrespective of whether the change increases or decreases a hospital's payment rate. In addition, we note that the policy of retroactive adjustment will still apply in those instances where a final judicial decision reverses a CMS denial of a hospital's wage index data revision request.

N. Labor Market Share for the FY 2017 Wage Index

Section 1886(d)(3)(E) of the Act directs the Secretary to adjust the proportion of the national prospective payment system base payment rates that are attributable to wages and wage-related costs by a factor that reflects the relative differences in labor costs among geographic areas. It also directs the Secretary to estimate from time to time the proportion of hospital costs that are labor-related and to adjust the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs of the DRG prospective payment rates. We refer to the portion of hospital costs attributable to wages and wage-related costs as the labor-related share. The labor-related share of the prospective payment rate is adjusted by an index of relative labor costs, which is referred to as the wage index.

Section 403 of Public Law 108–173 amended section 1886(d)(3)(E) of the Act to provide that the Secretary must employ 62 percent as the labor-related

share unless this would result in lower payments to a hospital than would otherwise be made. However, this provision of Public Law 108–173 did not change the legal requirement that the Secretary estimate from time to time the proportion of hospitals' costs that are attributable to wages and wage-related costs. Thus, hospitals receive payment based on either a 62-percent labor-related share, or the labor-related share estimated from time to time by the Secretary, depending on which labor-related share results in a higher payment.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50596 through 50607), we rebased and revised the hospital market basket. We established a FY 2010-based IPPS hospital market basket to replace the FY 2006-based IPPS hospital market basket, effective October 1, 2013. In that final rule, we presented our analysis and conclusions regarding the frequency and methodology for updating the labor-related share for FY 2014. Using the FY 2010-based IPPS market basket, we finalized a labor-related share for FY 2014, FY 2015, and FY 2016 of 69.6 percent. In addition, in FY 2014, we implemented this revised and rebased labor-related share in a budget neutral manner (78 FR 51016). However, consistent with section 1886(d)(3)(E) of the Act, we did not take into account the additional payments that would be made as a result of hospitals with a wage index less than or equal to 1.0000 being paid using a labor-related share lower than the labor-related share of hospitals with a wage index greater than 1.0000.

The labor-related share is used to determine the proportion of the national IPPS base payment rate to which the area wage index is applied. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25074), for FY 2017, we did not propose to make any further changes to the national average proportion of operating costs that are attributable to wages and salaries, employee benefits, contract labor, the labor-related portion of professional fees, administrative and facilities support services, and all other labor-related services. Therefore, for FY 2017, we proposed to continue to use a labor-related share of 69.6 percent for discharges occurring on or after October 1, 2016.

We did not receive any public comments on our proposal and are finalizing our proposal, without modification, to continue to use a labor-related share of 69.6 percent for discharges occurring on or after October 1, 2016.

As discussed in section IV.A. of the preamble of the proposed rule (81 FR 25074) and section IV.A. of the preamble of this final rule, prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, we applied the Puerto Rico-specific labor-related share percentage and nonlabor-related share percentage to the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount as of January 1, 2016, under section 1886(d)(9)(E) of the Act as amended by section 601 of the Consolidated Appropriations Act, 2016, there is no longer a need for us to calculate a Puerto Rico-specific labor-related share percentage and nonlabor-related share percentage for application to the Puerto Rico-specific standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the national labor-related share and nonlabor-related share percentages that are applied to the national standardized amount. Accordingly, for FY 2017, we did not propose a Puerto Rico-specific labor-related share percentage or a nonlabor-related share percentage in the proposed rule (81 FR 25074).

Tables 1A and 1B, which are published in section VI. of the Addendum to this FY 2017 IPPS/LTCH PPS final rule and available via the Internet on the CMS Web site, reflect the national labor-related share, which is also applicable to Puerto Rico hospitals. For FY 2017, for all IPPS hospitals (including Puerto Rico hospitals) whose wage indexes are less than or equal to 1.0000, we are applying the wage index to a labor-related share of 62 percent of the national standardized amount. For all IPPS hospitals (including Puerto Rico hospitals) whose wage indexes are greater than 1.000, for FY 2017, we are applying the wage index to a labor-related share of 69.6 percent of the national standardized amount.

O. Public Comments on Treatment of Overhead and Home Office Costs in the Wage Index Calculation as a Result of Our Solicitation

Section III.D. of the preamble of this final rule states that the method used to compute the FY 2017 wage index without an occupational mix adjustment follows the same methodology that we used to compute the FY 2012, FY 2013, FY 2014, FY 2015, and FY 2016 final wage indexes without an occupational mix adjustment (76 FR 51591 through 51593, 77 FR 53366 through 53367, 78 FR 50587 through 50588, 79 FR 49967, and 80 FR 49491 through 49492, respectively).

As discussed in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51592), in ''Step 4'' of the calculation of the unadjusted wage index, for each hospital reporting both total overhead salaries and total overhead hours greater than zero, we allocate overhead costs to areas of the hospital excluded from the wage index calculation. We also compute the amounts of overhead wage-related costs to be allocated to excluded areas. Finally, we subtract the computed overhead salaries, overhead wage-related costs, and hours associated with excluded areas from the total salaries (plus allowable wage-related costs) and hours derived in ''Steps 2 and 3'' of the calculation of the unadjusted wage index. (We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51592) for a description of the calculation of the unadjusted wage index.) As stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25075), we first began to remove from the wage index the overhead salaries and hours allocated to excluded areas beginning with the FY 1999 wage index calculation (63 FR 40971 and 40972). Beginning with the FY 2002 wage index calculation, we estimated and removed overhead wage-related costs allocated to excluded areas in addition to removing overhead salaries and hours allocated to excluded areas (66 FR 39863 and 39864). We began to estimate and remove overhead wage-related costs associated with excluded areas because we realized that without doing so, the formula resulted in large and inappropriate increases in the average hourly wages of some hospitals, particularly hospitals with large overhead and excluded area costs. These findings led us to believe that not all hospitals were fully or consistently allocating their overhead salaries among the lines on Worksheet S–3, Part II, of the hospital cost report for allowable wage-related costs (Worksheet S–3, Part II, lines 13 and 14 on CMS Form 2552–96, and lines 17 and 18 on CMS Form

2552–10), and nonallowable wage-related costs associated with excluded areas (Worksheet S–3, Part II, line 15 on CMS Form 2552–96 and line 19 on CMS Form 2552–10, OMB Control Number 0938–0050). Therefore, we determined that it was necessary to estimate and remove overhead wage-related costs allocated to excluded areas, and we have been doing so in ''Step 4'' of the unadjusted wage index calculation since FY 2002.

With the implementation of CMS Form 2552–10, Worksheet S–3, Part IV was added to the cost report on which hospitals are required to itemize their wage-related costs (formerly reported on Exhibit 6 of CMS Form–339). The total amount of wage-related costs reported on Worksheet S–3, Part II, lines 17 through 25 (CMS Form 2552–10) must correspond to the total core wage-related costs on Worksheet S–3, Part IV, line 24. (We refer readers to the instructions for line 17 of Worksheet S–3, Part II, which state: ''Enter the core wage-related costs from Worksheet S–3, Part IV, line 24.'') Hospitals report wage-related costs associated with excluded areas of the hospital on Worksheet S–3, Part II, line 19. We stated in the proposed rule (81 FR 25075) that we understand that hospitals use an allocation methodology to allocate total wage-related costs to each of lines Worksheet S–3, Part II, lines 17 through 25 respectively, typically based on the ratio of individual line costs to total wage-related costs on lines 17 through 25. Alternatively, we understand that hospitals use the ratio of full-time equivalent (FTE) hours of an individual line to total FTE hours for those lines 17 through 25. Because the wage-related costs of employees who work in overhead areas of the hospital are included in the wage-related costs of the hospital reported on Worksheet S–3, Part IV, and in turn, on Worksheet S–3, Part II, it is possible to conclude that hospitals' own allocation methodologies are properly allocating an accurate amount of wage-related costs for both direct cost centers and overhead areas to line 19 for the excluded areas. Accordingly, the question has been raised whether it continues to be necessary for CMS to estimate and remove the overhead wage-related costs associated with excluded areas from the unadjusted wage index calculation.

We have tested the effect on the average hourly wages of hospitals if we would not estimate and remove the overhead wage-related costs associated with excluded areas from the unadjusted wage index calculation. The results show that the problem manifested in the formula prior to FY 2002 continues to be a concern; that is, while the average hourly wages of all hospitals with excluded areas are impacted, hospitals that have particularly large excluded areas experience large and inappropriate increases to their average hourly wages. For example, one hospital with an excluded area percentage of 95 percent that has an average hourly wage of approximately $32 under our current methodology would have an average hourly wage of $128 under the formula in effect prior to FY 2002 (that is, *without* removal of excluded area overhead wage-related costs). Accordingly, as stated in the proposed rule (81 FR 25075), we believe that, at this point, there is a need for CMS to continue to estimate and remove the overhead wage-related costs associated with excluded areas from the unadjusted wage index calculation. However, in an effort to improve consistency in hospital cost reporting practices and to improve the accuracy of the wage index, we indicated in the proposed rule that we are considering the possibility of future rulemaking or cost reporting changes, or a combination of both, where hospitals would apply a single allocation methodology between Worksheet S–3, Part IV and Worksheet S–3, Part II, lines 17 through 25. For example, one possibility is the modification and expansion of Worksheet S–3, Part IV to add columns that would correspond to each line 17 through 25 of Worksheet S–3, Part II. In addition, Worksheet S–3, Part IV could employ one or two standard statistical allocation methods, facilitating a direct flow of the allocated amounts to each line 17 through 25 of Worksheet S–3, Part II.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25075), we solicited comments from stakeholders to gain a better understanding of the nature of hospitals' reporting of wage-related costs on Worksheet S–3, Part IV, statistical allocation methods that hospitals typically use to allocate their wage-related costs, the treatment of direct versus overhead employee wage-related costs, and suggestions for possible modifications to Worksheet S–3, Parts II and IV respectively, which would preempt the need for CMS to estimate and remove overhead wage-related costs associated with excluded areas from the unadjusted wage index.

Comment: One commenter stated that CMS' ''Step 4'' process for estimating and removing overhead wage-related costs associated with excluded areas is fair and equitable for all hospitals and should continue, as it is clear that in most, if not all cases, hospitals are not self-identifying and removing the excluded area amounts. The commenter noted that while current cost report instructions for line 17 of Worksheet S–3, Part II instruct hospitals that wage-related costs associated with excluded areas be removed, the cost report instructions do not state that hospitals should remove *overhead* wage-related costs associated with excluded areas from Line 17 (CMS emphasis added). The commenter believed that any plan to require hospitals to perform their own calculation to estimate and remove excluded area overhead could create inconsistent results unless very specific cost report instructions are provided and adhered to.

Response: We agree with the commenter that, at this point, there is a need for CMS to continue to estimate and remove the overhead wage-related costs associated with excluded areas from the unadjusted wage index calculation. As we stated in the proposed rule (81 FR 25075), we have tested the effect on the average hourly wages of hospitals if we would not estimate and remove the overhead wage-related costs associated with excluded areas from the unadjusted wage index calculation. The results show that the problem manifested in the formula prior to FY 2002 continues to be a concern; that is, while the average hourly wages of all hospitals with excluded areas are impacted, hospitals that have particularly large excluded areas experience large and inappropriate increases to their average hourly wages. While we believe that existing cost report instructions for lines 17 and 18 for wage-related costs state clearly that lines 17 and 18 must ''not include wage-related costs applicable to the excluded areas reported on lines 9 and 10; instead, these costs are reported on line 19,'' we may consider further specifying that hospitals must also not include on lines 17 and 18 *overhead* wage-related costs applicable to excluded areas. When revising the cost report instructions, we will consider whether more precise and uniform instructions for estimating and removing overhead wage-related costs should be incorporated directly into the cost report for hospitals to complete, rather than CMS estimating and removing the overhead wage-related costs associated with excluded areas from the unadjusted wage index calculation.

Comment: In regard to CMS' solicitation of comments related to reporting of wage-related costs on lines 17 through 25 of Worksheet S–3, Part II, one commenter believed that most hospitals allocate their wage-related cost

on lines 17 through 25 based on salaries, and therefore, this should be the preferred allocation method. The commenter stated that if a hospital wishes to use a wage-related cost allocation method other than one based on salaries, the hospital should be required to document to the MAC that an alternative method would be more accurate than salaries. The commenter added that if CMS chooses to pursue building the ''Step 4'' overhead allocation into the cost report, CMS should simultaneously add lines to the cost report that perform the complete average hourly wage calculation that CMS uses to calculate the unadjusted wage index. The commenter pointed out that the addition of these lines to the cost report should not require extra administrative burden because all the additional data elements would be drawn from existing lines on Worksheet S–3, Parts II and III. However, the commenter noted that the disadvantage to incorporating the complete average hourly wage calculation into the cost report is that the cost report would need to be updated if the wage index calculation is revised.

Response: We appreciate the information provided by the commenter that most hospitals allocate their wage-related cost on lines 17 through 25 based on salaries. We also appreciate the commenter's suggestion regarding adding lines to Worksheet S–3, Part III to incorporate the complete unadjusted average hourly wage calculation (meaning, the average hourly wage unadjusted for occupational mix). We will consider these suggestions further in future rulemaking and/or cost report revisions as appropriate.

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25075 through 25076), another issue about which we are concerned and for which we solicited public comments in the proposed rule relates to inconsistent reporting of home office salaries and wage-related costs. Worksheet S–2, Part I, line 140, requires hospitals to complete Worksheet A–8–1 if they have any related organization or home office costs claimed as defined in the Provider Reimbursement Manual, CMS Pub. 15–1, Chapter 10, Section 1002, and 42 CFR 413.17. Then, line 14 of Worksheet S–3, Part II instructs hospitals to enter the salaries and wage-related costs paid to personnel who are affiliated with a home office and/or related organization, who provide services to the hospital, and whose salaries are *not* included on Worksheet A, Column 1. Because home office salaries and wage-related costs are not included on Worksheet A, Column 1, we are concerned that hospitals are not including home office costs on Worksheet A, Column 2 or Column 6 in the appropriate cost centers on lines 4 through 17, adjusted from Worksheet A–8 or Worksheet A–8–1.[22] Another concern is a hospital's inadvertent inclusion on line 14 of the home office salaries or wage-related costs associated with excluded areas on Worksheet S–3, Part II, lines 9 or 10. In addition, we are concerned about the amalgam of personnel costs that hospitals report on line 14, particularly when another more precise line exists for those personnel costs to be reported. For example, if cafeteria services are provided through the home office, those wages and hours should not be reported on line 14, but instead should be reported on the more specific cost center for Cafeteria, Worksheet S–3, Part II, line 36 (corresponding to Cafeteria on Worksheet A, line 11 [23]). We note that, in the FY 2015 IPPS/LTCH PPS final rule (79 FR 49965 through 49967), we reiterated our requirement that all hospitals must document salaries, wages, and hours for the purpose of reporting this information on Worksheet S–3, Part II, lines 32, 33, 34, and/or 35 (for either directly employed housekeeping and dietary employees on lines 32 and 34, and contract labor on lines 33 and 35). We have learned of instances where housekeeping or dietary services are provided through the home office, and the hospital reported those wages and hours on line 14. This is inconsistent with other hospitals' reporting of housekeeping and dietary services on lines 32 through 35. As stated in the FY 2015 IPPS/LTCH PPS final rule, we have instructed the MACs to impute housekeeping or dietary wages and hours when hospitals have not properly completed those lines 32 through 35. Hospitals whose housekeeping or dietary services (either direct or under contract) are provided through their home office are not exempt from this requirement to report wages and hours on the specific cost centers for housekeeping and dietary. Hospitals should also take care to report housekeeping and dietary services in the appropriate cost centers on Worksheet A, lines 9 and 10 respectively. As stated in the proposed rule (81 FR 25076), because the nature of services provided by home office personnel are for general management or administrative services related to the provision of patient care (CMS Pub. 15–1, Chapter 21, Section 2150), and may be provided to multiple areas of the hospital, we are considering ending reporting of home office costs on line 14 of Worksheet S–3, Part II, and instead we may require reporting of home office costs as part of the overhead lines, possibly by adding lines or columns, or subscripting existing line 27 (Administrative & General), and line 28 (Administrative & General for contract labor). In the FY 2017 proposed rule (81 FR 25076), we solicited public comments to gain a better understanding of hospitals' reporting of home office salaries and wage-related costs for possible future revisions to the cost report instructions and lines.

Comment: One commenter recognized the problem of inconsistent reporting of home office salaries and wage-related costs, and supported the idea of reporting these costs in the overhead lines, as long as the home office salaries and wage-related cost are delineated separately from other overhead costs. The commenter stated that it is important to retain transparency on home office costs versus other hospital-specific overhead costs, and that CMS should also explore the possibility of penalties for the filing of incomplete or inconsistent cost reports to increase compliance.

Response: We appreciate the commenter's support, and acknowledge that it may be useful to separately track home office wages and hours from other overhead wages and hours. We are in favor of measures to increase transparency and accuracy of cost reporting, which we are attempting to do as part of the solicitation of public comments to gain a better understanding of hospitals' reporting practices regarding overhead and home office costs and hours. We will consider the commenter's suggestions in the future as appropriate.

Comment: One commenter stated that most hospitals report home office salaries on Worksheet A–8–1 with an appropriate adjustment in Column 6 of Worksheet A. In addition, the commenter believed that most hospitals report their entire home office salary and hour allocation on line 14 Worksheet S–3 Part II without removing an amount for excluded areas. The

[22] CMS Pub. 15–2, Chapter 40, Section 4013, Worksheet A instructions for column 6: ''Enter on the appropriate lines in column 6 the amounts of any adjustments to expenses indicated on Worksheet A–8, column 2,'' and the note for line 12 of Worksheet A–8, section 4016: ''Worksheet A–8–1 represents the detail of the various cost centers on Worksheet A which must be adjusted.''

[23] CMS Pub. 15–2, Chapter 40, Section 4013, Worksheet A instructions under Line Descriptions: ''The trial balance of expenses is broken down into general service, inpatient routine service, ancillary service, outpatient service, other reimbursable, special purpose, and nonreimbursable cost center categories *to facilitate the transfer of costs to the various worksheets. The line numbers on Worksheet A are used on subsequent worksheets* . . . .'' (emphasis added).

commenter recommended that if CMS decides that an allocation is needed to remove overhead cost associated with excluded areas contained within the home office costs, CMS subscript line 14 into overhead and nonoverhead cost and hours. The overhead portion could then be allocated in the same manner that the hospital overhead cost is currently allocated.

Response: We appreciate the information provided by the commenter, although we are disconcerted to learn that the commenter believes that most hospitals report their entire home office salary and hour allocation on line 14 of Worksheet S–3, Part II, without performing an allocation to remove costs and hours associated with excluded areas. This means that hospitals are inappropriately including wages and hours associated with excluded areas in the wage index. We will take these comments into consideration for future rulemaking and/or cost report revisions as appropriate.

Comment: One commenter disagreed with CMS' suggestion in the proposed rule that it may require reporting of home office cost as part of the overhead lines, instead of line 14 of Worksheet S–3, Part II, because the nature of services provided by home office personnel are for general management or administrative services related to the provision of patient care (81 FR 25076). The commenter stated that the cost report instructions (CMS Pub. 15–2, Chapter 40, Section 4005.2) for Worksheet S–3, Part II, Line 14 do not specify that the home office and/or related party organizations costs need to only be administrative and general costs. The commenter stated that, as a hospital system with multiple hospitals, it reports ancillary services such as physical, occupational, and speech therapy personnel costs on line 14 of Worksheet S–3, Part II, because they are related organizational costs that are not reported on Worksheet A, Column 1 and are adjusted on Worksheet A–8–1. The commenter asserted that because line 14 of Worksheet S–3, Part II, can include costs not related to general management or administrative services, these costs should not be reported on overhead lines.

Response: We appreciate the feedback provided by the commenter. In the proposed rule, we listed several concerns regarding hospitals' reporting on line 14, such as inclusion on line 14 of the home office salaries or wage-related costs associated with excluded areas on Worksheet S–3, Part II, lines 9 or 10, and inclusion of an amalgam of personnel costs, particularly when another more precise line exists for those personnel costs to be reported (81 FR 25076). We acknowledge that, currently, the cost report instructions for line 14 of Worksheet S–3, Part II, do not specify that the home office and/or related party organizations costs need to only be administrative and general costs. However, the fact that the commenter, a hospital system with multiple hospitals, stated that it reports ancillary services such as physical, occupational, and speech therapy personnel costs on Worksheet S–3, Part II, line 14, is evidence of the inconsistent and disparate types of services that hospitals are reporting on line 14. It seems apparent that hospitals are treating line 14 as they would an overhead cost center, supporting the need for CMS to consider ending reporting of home office costs on line 14 and to instead require reporting of home office costs as part of the overhead lines 27 and 28 (Administrative & General). By incorporating the home office costs into new lines that are part of the overhead cost centers, we could systematically remove costs and hours associated with excluded areas from the wages, wage-related costs, and hours associated with home office, as we currently do in ''Step 4'' of the calculation of the unadjusted wage index described above and in the proposed rule (81 FR 25075). We intend to consider such measures for future cost report revisions.

Comment: One commenter suggested that any change in the wage index calculation be evaluated after the additional information is gathered, similar to CMS efforts in relation to the solicitation of comments regarding the overhead allocation. The commenter stated that CMS should disclose its findings and any proposed changes to the wage index calculation through notice-and-comment rule making.

Response: We will take the commenter's suggestions into consideration as appropriate.

Because we did not make specific proposals in the proposed rule regarding treatment of overhead and home office costs in the wage index calculation, that is, we only solicited comments to gain a better understanding of hospitals' reporting practices, we are not making any changes at this time. However, we will take the comments into consideration for future cost reporting changes and/or rulemaking as appropriate.

IV. Other Decisions and Changes to the IPPS for Operating Costs and Direct Graduate Medical Education (GME) and Indirect Medical Education (IME) Costs

A. Changes to Operating Payments for Subsection (d) Puerto Rico Hospitals as a Result of Section 601 of Public Law 114–113

Prior to January 1, 2016, Puerto Rico hospitals were paid with respect to operating costs of inpatient hospital services for inpatient hospital discharges based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. As a result of the amendment made by section 601 of Public Law 114–113, on February 4, 2016, we issued Change Request 9523 which updated the payment rates for subsection (d) Puerto Rico hospitals for discharges occurring on or after January 1, 2016. Change Request 9523 can be downloaded from the CMS Web site at: *https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2016-Transmittals-Items/R3449CP.html*.

For operating costs for inpatient hospital discharges occurring in FY 2017 and subsequent fiscal years, consistent with the provisions of section 1886(d)(9)(E) of the Act as amended by section 601 of Public Law 114–113, subsection (d) Puerto Rico hospitals will continue to be paid based on 100 percent of the national standardized amount.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25076), we proposed to make conforming changes to the regulations at 42 CFR 412.204 to reflect the current law that is effective for discharges occurring on or after January 1, 2016. Specifically, we proposed to add a new paragraph (e) to § 412.204 to reflect that, beginning January 1, 2016, subsection (d) Puerto Rico hospitals are paid based on 100 percent of the national standardized amount. We also proposed to revise paragraph (d) of § 412.204 to specify that subsection (d) Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount for discharges occurring through December 31, 2015.

We did not receive any public comments on our proposed changes to the regulations at § 412.204 and, therefore, are finalizing these proposed changes without modification in this final rule.

B. Changes in the Inpatient Hospital Update for FY 2017 (§ 412.64(d))

1. FY 2017 Inpatient Hospital Update

In accordance with section 1886(b)(3)(B)(i) of the Act, each year we update the national standardized amount for inpatient hospital operating costs by a factor called the ''applicable percentage increase.'' As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25076 through 25077), for FY 2017, we are setting the applicable percentage increase by applying the adjustments listed in this section in the same sequence as we did for FY 2016. Specifically, consistent with section 1886(b)(3)(B) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we are setting the applicable percentage increase by applying the following adjustments in the following sequence. The applicable percentage increase under the IPPS is equal to the rate-of-increase in the hospital market basket for IPPS hospitals in all areas, subject to—

(a) A reduction of one-quarter of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals that fail to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act;

(b) A reduction of three-quarters of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals not considered to be meaningful EHR users in accordance with section 1886(b)(3)(B)(ix) of the Act;

(c) An adjustment based on changes in economy-wide productivity (the multifactor productivity (MFP) adjustment); and

(d) An additional reduction of 0.75 percentage point as required by section 1886(b)(3)(B)(xii) of the Act.

Sections 1886(b)(3)(B)(xi) and (b)(3)(B)(xii) of the Act, as added by section 3401(a) of the Affordable Care Act, state that application of the MFP adjustment and the additional FY 2017 adjustment of 0.75 percentage point may result in the applicable percentage increase being less than zero.

We note that, in compliance with section 404 of the MMA, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50596 through 50607), we replaced the FY 2006-based IPPS operating and capital market baskets with the revised and rebased FY 2010-based IPPS operating and capital market baskets for FY 2014. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 49993 through 49996) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49508 through 49511), we continued to use the FY 2010-based IPPS operating and capital market baskets for FY 2015 and FY 2016 and the labor-related share of 69.6 percent, which was based on the FY 2010-based IPPS market basket. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25077), for FY 2017, we proposed to continue using the FY 2010-based IPPS operating and capital market baskets and a proposed labor-related share of 69.6 percent, which was based on the FY 2010-based IPPS market basket. We did not receive any public comments on these proposals and, therefore, for FY 2017, will continue to use the FY 2010-based IPPS operating and capital markets and the labor-related share of 69.6 percent.

Based on the most recent data available for the FY 2017 IPPS/LTCH PPS proposed rule, in accordance with section 1886(b)(3)(B) of the Act, we proposed to base the FY 2017 market basket update used to determine the applicable percentage increase for the IPPS on IHS Global Insight, Inc.'s (IGI's) first quarter 2016 forecast of the FY 2010-based IPPS market basket rate-of-increase with historical data through fourth quarter 2015, which was estimated to be 2.8 percent (81 FR 25077). We proposed that if more recent data subsequently became available (for example, a more recent estimate of the market basket and the MFP adjustment), we would use such data, if appropriate, to determine the FY 2017 market basket update and the MFP adjustment in the final rule.

Based on the most recent data available for this FY 2017 IPPS/LTCH PPS final rule (that is, IGI's second quarter 2016 forecast of the FY 2010-based IPPS market basket rate-of-increase with historical data through first quarter 2016), we estimate that the FY 2017 market basket update used to determine the applicable percentage increase for the IPPS is 2.7 percent.

For FY 2017, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), there are four possible applicable percentage increases that can be applied to the standardized amount. Based on the most recent data described above, we determined final applicable percentage increases to the standardized amount for FY 2017, as specified in the table that appears later in this section.

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51689 through 51692), we finalized our methodology for calculating and applying the MFP adjustment. As we explained in that rule, section 1886(b)(3)(B)(xi)(II) of the Act, as added by section 3401(a) of the Affordable Care Act, defines this productivity adjustment as equal to the 10-year moving average of changes in annual economy-wide, private nonfarm business MFP (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, calendar year, cost reporting period, or other annual period). The Bureau of Labor Statistics (BLS) publishes the official measure of private nonfarm business MFP. We refer readers to the BLS Web site at *http://www.bls.gov/mfp* for the BLS historical published MFP data.

MFP is derived by subtracting the contribution of labor and capital input growth from output growth. The projections of the components of MFP are currently produced by IGI, a nationally recognized economic forecasting firm with which CMS contracts to forecast the components of the market baskets and MFP. As we discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49509), beginning with the FY 2016 rulemaking cycle, the MFP adjustment is calculated using the revised series developed by IGI to proxy the aggregate capital inputs. Specifically, in order to generate a forecast of MFP, IGI forecasts BLS aggregate capital inputs using a regression model. A complete description of the MFP projection methodology is available on the CMS Web site at: *http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/MedicareProgramRatesStats/MarketBasketResearch.html.* As discussed in the FY 2016 IPPS/LTCH PPS final rule, if IGI makes changes to the MFP methodology, we will announce them on our Web site rather than in the annual rulemaking.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25077), for FY 2017, we proposed an MFP adjustment of 0.5 percentage point. Similar to the market basket update, for the proposed rule, we used the most recent data

available to compute the MFP adjustment. As noted previously, we proposed that if more recent data subsequently became available, we would use such data, if appropriate, to determine the FY 2017 market basket update and MFP adjustment for the final rule. Based on the most recent data available for this final rule, we have determined an MFP adjustment of 0.3 percentage point for FY 2017.

We did not receive any public comments on our proposal to use the most recent available data to determine the final market basket update and the MFP adjustment. Therefore, for this final rule, we are finalizing a market basket update of 2.7 percent and an MFP adjustment of 0.3 percentage point based on the most recent available data.

Based on the most recent data available for this final rule, as described previously, we have determined four applicable percentage increases to the standardized amount for FY 2017, as specified in the following table:

FY 2017 Applicable Percentage Increases for the IPPS

FY 2017	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is NOT a meaningful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a meaningful EHR user
Market Basket Rate-of-Increase	2.7	2.7	2.7	2.7
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0.0	0.0	−0.675	−0.675
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0.0	−2.025	0.0	−2.025
MFP Adjustment under Section 1886(b)(3)(B)(xi) of the Act	−0.3	−0.3	−0.3	−0.3
Statutory Adjustment under Section 1886(b)(3)(B)(xii) of the Act	−0.75	−0.75	−0.75	−0.75
Applicable Percentage Increase Applied to Standardized Amount	1.65	−0.375	0.975	−1.05

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25078), we proposed to revise the existing regulations at 42 CFR 412.64(d) to reflect the current law for the FY 2017 update. Specifically, in accordance with section 1886(b)(3)(B) of the Act, we proposed to add a new paragraph (vii) to § 412.64(d)(1) to reflect the applicable percentage increase to the FY 2017 operating standardized amount as the percentage increase in the market basket index, subject to the reductions specified under § 412.64(d)(2) for a hospital that does not submit quality data and § 412.64(d)(3) for a hospital that is not a meaningful EHR user, less an MFP adjustment and less an additional reduction of 0.75 percentage point.

We did not receive any public comments on our proposed changes to the regulations at § 412.64(d)(1) and, therefore, are finalizing these proposed changes without modification in this final rule.

Section 1886(b)(3)(B)(iv) of the Act provides that the applicable percentage increase to the hospital-specific rates for SCHs and MDHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). Therefore, the update to the hospital-specific rates for SCHs and MDHs also is subject to section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act. We note that section 205 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10, enacted on April 16, 2015) extended the MDH program (which, under previous law, was to be in effect for discharges on or before March 31, 2015 only) for discharges occurring on or after April 1, 2015, through FY 2017 (that is, for discharges occurring on or before September 30, 2017).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25078), for FY 2017, we proposed the updates to the hospital-specific rates applicable to SCHs and MDHs based on IGI's first quarter 2016 forecast of the FY 2010-based IPPS market basket update and the MFP adjustment. We proposed that if more recent data subsequently became available (for example, a more recent estimate of the market basket increase and the MFP adjustment), we would use such data, if appropriate, to determine the update for SCHs and MDHs in the final rule. We did not receive any public comments with regard to our proposal. Therefore, we are finalizing the proposal to determine the update to the hospital-specific rates for SCHs and MDHs in this final rule using the most recent data available.

For this final rule, based on most recent available data, we are finalizing the following updates to the hospital-specific rates applicable to SCHs and MDHs using IGI's second quarter 2016 forecast of the FY 2010-based IPPS market basket update and the MFP adjustment (as described previously in this section): An update of 1.65 percent for a hospital that submits quality data and is a meaningful EHR user; an update of −0.375 percent for a hospital that submits quality data and is not a meaningful EHR user; an update of 0.975 percent for a hospital that fails to submit quality data and is a meaningful EHR user; and an update of –1.05 percent for a hospital that fails to submit quality data and is not a meaningful EHR user.

2. FY 2017 Puerto Rico Hospital Update

As discussed in section IV.A. of the preamble of this final rule, prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. Section 601 of Public Law 114–113 amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount under the amendments to section 1886(d)(9)(E) of the Act, there is no longer a need for us to determine an update to the Puerto Rico standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the same update to the national standardized amount discussed under section IV.B.1. of the preamble of this final rule. Accordingly, in the proposed rule (81 FR 25078), for FY

2017, we determined a proposed applicable percentage increase of 1.55 percent to the standardized amount for hospitals located in Puerto Rico. We note that we did not receive any public comments with regard to our proposal. Based on the most recent data available for this final rule (as discussed in section IV.B.1. of the preamble of this final rule), we are finalizing an applicable percentage increase of 1.65 percent to the standardized amount for hospitals located in Puerto Rico.

We note that section 1886(b)(3)(B)(viii) of the Act, which specifies the adjustment to the applicable percentage increase for ''subsection (d)'' hospitals that do not submit quality data under the rules established by the Secretary, is not applicable to hospitals located in Puerto Rico.

In addition, section 602 of Public Law 114–113 amended section 1886(n)(6)(B) of the Act to specify that Puerto Rico hospitals are eligible for incentive payments for the meaningful use of certified EHR technology, effective beginning FY 2016, and also to apply the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act to Puerto Rico hospitals that are not meaningful EHR users, effective FY 2022. Accordingly, because the provisions of section 1886(b)(3)(B)(ix) of the Act are not applicable to hospitals located in Puerto Rico until FY 2022, the adjustments under this provision are not applicable for FY 2017.

C. Rural Referral Centers (RRCs): Annual Updates to Case-Mix Index and Discharge Criteria (§ 412.96)

Under the authority of section 1886(d)(5)(C)(i) of the Act, the regulations at § 412.96 set forth the criteria that a hospital must meet in order to qualify under the IPPS as a rural referral center (RRC). RRCs receive some special treatment under both the DSH payment adjustment and the criteria for geographic reclassification.

Section 402 of Public Law 108–173 raised the DSH payment adjustment for RRCs such that they are not subject to the 12-percent cap on DSH payments that is applicable to other rural hospitals. RRCs also are not subject to the proximity criteria when applying for geographic reclassification. In addition, they do not have to meet the requirement that a hospital's average hourly wage must exceed, by a certain percentage, the average hourly wage of the labor market area in which the hospital is located.

Section 4202(b) of Public Law 105–33 states, in part, that any hospital classified as an RRC by the Secretary for FY 1991 shall be classified as such an RRC for FY 1998 and each subsequent fiscal year. In the August 29, 1997 IPPS final rule with comment period (62 FR 45999), we reinstated RRC status for all hospitals that lost that status due to triennial review or MGCRB reclassification. However, we did not reinstate the status of hospitals that lost RRC status because they were now urban for all purposes because of the OMB designation of their geographic area as urban. Subsequently, in the August 1, 2000 IPPS final rule (65 FR 47089), we indicated that we were revisiting that decision. Specifically, we stated that we would permit hospitals that previously qualified as an RRC and lost their status due to OMB redesignation of the county in which they are located from rural to urban, to be reinstated as an RRC. Otherwise, a hospital seeking RRC status must satisfy all of the other applicable criteria. We use the definitions of ''urban'' and ''rural'' specified in Subpart D of 42 CFR part 412. One of the criteria under which a hospital may qualify as an RRC is to have 275 or more beds available for use (§ 412.96(b)(1)(ii)). A rural hospital that does not meet the bed size requirement can qualify as an RRC if the hospital meets two mandatory prerequisites (a minimum case-mix index (CMI) and a minimum number of discharges), and at least one of three optional criteria (relating to specialty composition of medical staff, source of inpatients, or referral volume). (We refer readers to § 412.96(c)(1) through (c)(5) and the September 30, 1988 **Federal Register** (53 FR 38513) for additional discussion.) With respect to the two mandatory prerequisites, a hospital may be classified as an RRC if—

- The hospital's CMI is at least equal to the lower of the median CMI for urban hospitals in its census region, excluding hospitals with approved teaching programs, or the median CMI for all urban hospitals nationally; and
- The hospital's number of discharges is at least 5,000 per year, or, if fewer, the median number of discharges for urban hospitals in the census region in which the hospital is located. The number of discharges criterion for an osteopathic hospital is at least 3,000 discharges per year, as specified in section 1886(d)(5)(C)(i) of the Act.

1. Case-Mix Index (CMI)

Section 412.96(c)(1) provides that CMS establish updated national and regional CMI values in each year's annual notice of prospective payment rates for purposes of determining RRC status. The methodology we used to determine the national and regional CMI values is set forth in the regulations at § 412.96(c)(1)(ii). The national median CMI value for FY 2017 is based on the CMI values of all urban hospitals nationwide, and the regional median CMI values for FY 2017 are based on the CMI values of all urban hospitals within each census region, excluding those hospitals with approved teaching programs (that is, those hospitals that train residents in an approved GME program as provided in § 413.75). These values are based on discharges occurring during FY 2015 (October 1, 2014 through September 30, 2015), and include bills posted to CMS' records through March 2016.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25079), we proposed that, in addition to meeting other criteria, if rural hospitals with fewer than 275 beds are to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2016, they must have a CMI value for FY 2015 that is at least—

- 1.6125 (national—all urban); or
- The median CMI value (not transfer-adjusted) for urban hospitals (excluding hospitals with approved teaching programs as identified in § 413.75) calculated by CMS for the census region in which the hospital is located.

The proposed median CMI values by region were set forth in a table in the proposed rule (81 FR 25079). We stated in the proposed rule that we intended to update the CMI values in the FY 2017 final rule to reflect the updated FY 2015 MedPAR file, which would contain data from additional bills received through March 2016.

Based on the latest available data (FY 2015 bills received through March 2016), in addition to meeting other criteria, if rural hospitals with fewer than 275 beds are to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2016, they must have a CMI value for FY 2015 that is at least:

- 1.6111; or
- The median CMI value (not transfer-adjusted) for urban hospitals (excluding hospitals with approved teaching programs as identified in § 413.75) calculated by CMS for the census region in which the hospital is located.

The final CMI values by region are set forth in the following table.

Region	Case-mix index value
1. New England (CT, ME, MA, NH, RI, VT)	1.3633

Region	Case-mix index value
2. Middle Atlantic (PA, NJ, NY)	1.4409
3. South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV) ..	1.5079
4. East North Central (IL, IN, MI, OH, WI)	1.5331
5. East South Central (AL, KY, MS, TN)	1.4472
6. West North Central (IA, KS, MN, MO, NE, ND, SD)	1.5946
7. West South Central (AR, LA, OK, TX)	1.64525
8. Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	1.6944
9. Pacific (AK, CA, HI, OR, WA)	1.6165

A hospital seeking to qualify as an RRC should obtain its hospital-specific CMI value (not transfer-adjusted) from its MAC. Data are available on the Provider Statistical and Reimbursement (PS&R) System. In keeping with our policy on discharges, the CMI values are computed based on all Medicare patient discharges subject to the IPPS MS–DRG-based payment.

2. Discharges

Section 412.96(c)(2)(i) provides that CMS set forth the national and regional numbers of discharges criteria in each year's annual notice of prospective payment rates for purposes of determining RRC status. As specified in section 1886(d)(5)(C)(ii) of the Act, the national standard is set at 5,000 discharges. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25079), we proposed to update the regional standards based on discharges for urban hospitals' cost reporting periods that began during FY 2014 (that is, October 1, 2013 through September 30, 2014), which were the latest cost report data available at the time the proposed rule was developed. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule, we proposed that, in addition to meeting other criteria, a hospital, if it is to qualify for initial RRC status for cost reporting periods beginning on or after October 1, 2016, must have, as the number of discharges for its cost reporting period that began during FY 2014, at least—

- 5,000 (3,000 for an osteopathic hospital); or
- The median number of discharges for urban hospitals in the census region in which the hospital is located. (We refer readers to the table set forth in the FY 2017 IPPS/LTCH PPS proposed rule at 81 FR 25079.) In the proposed rule, we stated that we intended to update these numbers in the FY 2017 final rule based on the latest available cost report data.

Based on the latest discharge data available at this time, that is, for cost reporting periods that began during FY 2015, the final median number of discharges for urban hospitals by census region are set forth in the following table:

Region	Number of discharges
1. New England (CT, ME, MA, NH, RI, VT)	8,090
2. Middle Atlantic (PA, NJ, NY)	10,270
3. South Atlantic (DE, DC, FL, GA, MD, NC, SC, VA, WV) ..	10,309
4. East North Central (IL, IN, MI, OH, WI)	8,090
5. East South Central (AL, KY, MS, TN)	8,359
6. West North Central (IA, KS, MN, MO, NE, ND, SD)	7,748
7. West South Central (AR, LA, OK, TX)	5,167
8. Mountain (AZ, CO, ID, MT, NV, NM, UT, WY)	8,605
9. Pacific (AK, CA, HI, OR, WA)	8,651

We note that the median number of discharges for hospitals in each census region is greater than the national standard of 5,000 discharges. Therefore, under this final rule, 5,000 discharges is the minimum criterion for all hospitals, except for osteopathic hospitals for which the minimum criterion is 3,000 discharges.

We did not receive any public comments on our proposals.

D. Payment Adjustment for Low-Volume Hospitals (§ 412.101)

1. Background

Section 1886(d)(12) of the Act provides for an additional payment to each qualifying low-volume hospital that is paid under IPPS beginning in FY 2005, and the low-volume hospital payment policy is set forth in the regulations at 42 CFR 412.101. Sections 3125 and 10314 of the Affordable Care Act provided for a temporary change in the low-volume hospital payment policy for FYs 2011 and 2012. Specifically, the provisions of the Affordable Care Act amended the qualifying criteria for low-volume hospitals to specify, for FYs 2011 and 2012, that a hospital qualifies as a low-volume hospital if it is more than 15 road miles from another subsection (d) hospital and has less than 1,600 discharges of individuals entitled to, or enrolled for, benefits under Medicare Part A during the fiscal year. In addition, the statute as amended by the Affordable Care Act, provides that the low-volume hospital payment adjustment (that is, the percentage increase) is determined using a continuous linear sliding scale ranging from 25 percent for low-volume hospitals with 200 or fewer discharges of individuals entitled to, or enrolled for, benefits under Medicare Part A in the fiscal year to 0 percent for low-volume hospitals with greater than 1,600 discharges of such individuals in the fiscal year. We revised the regulations governing the low-volume hospital payment adjustment policy at § 412.101 to reflect the changes to the qualifying criteria and the calculation of the payment adjustment for low-volume hospitals according to the provisions of the Affordable Care Act in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50238 through 50275 and 50414).

The temporary changes to the low-volume hospital qualifying criteria and the payment adjustment originally provided for by the Affordable Care Act have been extended by subsequent legislation as follows: Through FY 2013, by the American Taxpayer Relief Act of 2012 (ATRA), Public Law 112–240; through March 31, 2014, by the Pathway for SGR Reform Act of 2013, Public Law 113– 167; through March 31, 2015, by the Protecting Access to Medicare Act of 2014 (PAMA), Public Law 113–93; and most recently through FY 2017, by the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA), Public Law 114–10. For additional details on the implementation of the previous extensions of the temporary changes to the low-volume hospital qualifying criteria and payment adjustment originally provided for by the Affordable Care Act, we refer readers to the following **Federal Register** documents: The FY 2013 IPPS notice (78 FR 14689 through 14691); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50611 through 50612); the FY 2014 IPPS interim final rule with comment period (79 FR 15022 through 15025); the FY 2014 IPPS notice (79 FR 34444 through 34446); the FY 2015 IPPS/LTCH PPS final rule (79 FR 49998 through 50001); and the FY 2016 IPPS interim final rule with comment period (80 FR 49594 through 49595).

2. Low-Volume Hospital Definition and Payment Adjustment for FY 2017

Under section 1886(d)(12) of the Act, as amended by section 204 of the MACRA, the temporary changes in the low-volume hospital payment policy originally provided by the Affordable Care Act and extended through subsequent legislation, are effective through FY 2017. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25080 through 25081), consistent with our historical approach, we proposed to update the discharge data source used to

identify qualifying low-volume hospitals and calculate the payment adjustment (percentage increase) for FY 2017. Under § 412.101(b)(2)(ii), for the applicable fiscal years, a hospital's Medicare discharges from the most recently available MedPAR data, as determined by CMS, are used to determine if the hospital meets the discharge criteria to receive the low-volume payment adjustment in the current year and to determine the applicable low-volume percentage increase for qualifying hospitals. The applicable low-volume percentage increase for FY 2017 is determined using a continuous linear sliding scale equation that results in a low-volume hospital payment adjustment ranging from an additional 25 percent for hospitals with 200 or fewer Medicare discharges to a zero percent additional payment adjustment for hospitals with 1,600 or more Medicare discharges. For FY 2017, consistent with our historical policy, we proposed that qualifying low-volume hospitals and their payment adjustment would be determined using the most recently available Medicare discharge data, which at the time of the proposed rule was from the December 2015 update of the FY 2015 MedPAR file, as these data were the most recent data available at that time. Table 14 listed in the Addendum of the proposed rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) listed the ''subsection (d)'' hospitals with fewer than 1,600 Medicare discharges based on the claims data from the December 2015 update of the FY 2015 MedPAR file and their potential proposed low-volume hospital payment adjustment for FY 2017. Consistent with past practice, we noted in the proposed rule that the list of hospitals with fewer than 1,600 Medicare discharges in Table 14 did not reflect whether or not the hospital meets the mileage criterion. Eligibility for the low-volume hospital payment adjustment for FY 2017 also is dependent upon meeting the mileage criterion specified at § 412.101(b)(2)(ii); that is, the hospital must be located more than 15 road miles from any other IPPS hospital. In other words, eligibility for the low-volume hospital payment adjustment for FY 2017 also is dependent upon meeting (in the case of a hospital that did not qualify for the low-volume hospital payment adjustment in FY 2016) or continuing to meet (in the case of a hospital that did qualify for the low-volume hospital payment adjustment in FY 2016) the mileage criterion specified at § 412.101(b)(2)(ii). Consistent with historical practice, we proposed that if more recent Medicare discharge data became available, we would use that updated data to determine qualifying low-volume hospitals and their payment adjustment in the final rule, and update Table 14 to reflect that updated data.

In order to receive a low-volume hospital payment adjustment under § 412.101 for FY 2017, consistent with our previously established procedure, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25080 through 25081), we proposed that a hospital must notify and provide documentation to its MAC that it meets the discharge and mileage criteria under § 412.101(b)(2)(ii). Specifically, for FY 2017, we proposed that a hospital must make a written request for low-volume hospital status that is received by its MAC no later than September 1, 2016, in order for the applicable low-volume hospital payment adjustment to be applied to payments for its FY 2017 discharges occurring on or after October 1, 2016. Under this procedure, a hospital that qualified for the low-volume hospital payment adjustment in FY 2016 may continue to receive a low-volume hospital payment adjustment for FY 2017 without reapplying if it continues to meet the Medicare discharge criterion established for FY 2017 and the mileage criterion. However, we proposed that the hospital must send written verification that is received by its MAC no later than September 1, 2016, stating that it continues to be located more than 15 miles from any other subsection (d) hospital. This written verification could be a brief letter to the MAC stating that the hospital continues to meet the low-volume hospital mileage criterion as documented in a prior low-volume hospital status request. We also proposed that if a hospital's written request for low-volume hospital status for FY 2017 is received after September 1, 2016, and if the MAC determines that the hospital meets the criteria to qualify as a low-volume hospital, the MAC would apply the applicable low-volume hospital payment adjustment to determine the payment for the hospital's FY 2017 discharges effective prospectively within 30 days of the date of its low-volume hospital status determination, consistent with past practice. (For additional details on our established process for the low-volume hospital payment adjustment, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53408) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50000 through 50001).)

Comment: Commenters supported the actions taken by CMS related to the extension of the modified criteria to qualify for the low-volume hospital adjustment through FY 2017. Commenters also expressed their support for legislative action that would make permanent the criteria that a hospital qualifies as a low-volume hospital if it is more than 15 road miles from another subsection (d) hospital and has less than 1,600 discharges of individuals entitled to or enrolled for benefits under Medicare Part A.

Response: We appreciate the commenters' support of our implementation of the low-volume hospital payment adjustment for FY 2017, which is consistent with the statutory provisions under section 1886(d)(12) of the Act.

After consideration of the public comments we received, we are finalizing our proposals, without modification. Consistent with our proposal to use the most recent Medicare discharge data available for the final rule, we are using data from the March 2016 update of the FY 2015 MedPAR files to determine qualifying low-volume hospitals and their payment adjustment in this final rule, and updating Table 14 to reflect these updated data. Accordingly, Table 14 listed in the Addendum of this final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*) lists the ''subsection (d)'' hospitals with fewer than 1,600 Medicare discharges based on the claims data from the March 2016 update of the FY 2015 MedPAR file and their potential low-volume hospital payment adjustment for FY 2017. Consistent with past practice, we note that this list of hospitals with fewer than 1,600 Medicare discharges in Table 14 does not reflect whether or not the hospital meets the mileage criterion. Eligibility for the low-volume hospital payment adjustment for FY 2017 also is dependent upon meeting the mileage criterion specified at § 412.101(b)(2)(ii); that is, the hospital must be located more than 15 road miles from any other IPPS hospital. In other words, eligibility for the low-volume hospital payment adjustment for FY 2017 also is dependent upon meeting (in the case of a hospital that did not qualify for the low-volume hospital payment adjustment in FY 2016) or continuing to meet (in the case of a hospital that did qualify for the low volume hospital payment adjustment in FY 2016) the mileage criterion specified at § 412.101(b)(2)(ii). As we proposed, in

order to receive a low-volume hospital payment adjustment under § 412.101 for FY 2017, consistent with our previously established procedure, a hospital must notify and provide documentation to its MAC that it meets the discharge and mileage criteria under § 412.101(b)(2)(ii). Specifically, for FY 2017, a hospital must make a written request for low-volume hospital status that is received by its MAC no later than September 1, 2016, in order for the applicable low-volume hospital payment adjustment to be applied to payments for its FY 2017 discharges occurring on or after October 1, 2016. Under this procedure, a hospital that qualified for the low-volume hospital payment adjustment in FY 2016 may continue to receive a low-volume hospital payment adjustment for FY 2017 without reapplying if it continues to meet the Medicare discharge criterion established for FY 2017 and the mileage criterion. However, as we proposed, the hospital must send written verification that is received by its MAC no later than September 1, 2016, stating that it continues to be located more than 15 miles from any other subsection (d) hospital. This written verification could be a brief letter to the MAC stating that the hospital continues to meet the low-volume hospital mileage criterion as documented in a prior low-volume hospital status request. Also, as we proposed, if a hospital's written request for low-volume hospital status for FY 2017 is received after September 1, 2016, and if the MAC determines that the hospital meets the criteria to qualify as a low-volume hospital, the MAC will apply the applicable low-volume hospital payment adjustment to determine the payment for the hospital's FY 2017 discharges effective prospectively within 30 days of the date of its low-volume hospital status determination, consistent with past practice. (As noted above, for additional details on our established process for the low-volume hospital payment adjustment, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53408) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50000 through 50001).)

We note that, in an interim final rule with comment period (IFC) in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49595), we revised the regulations at § 412.101 to conform the text to the provisions of section 204 of the MACRA, which extended the changes to the qualifying criteria and the payment adjustment methodology for low-volume hospitals through FY 2017 (that is, through September 30, 2017). We are finalizing the provisions of that IFC without modification, as discussed in section IV.N. of this final rule.

E. Indirect Medical Education (IME) Payment Adjustment Factor for FY 2017 (§ 412.105)

1. IME Adjustment for FY 2017

Under the IPPS, an additional payment amount is made to hospitals with residents in an approved graduate medical education (GME) program in order to reflect the higher indirect patient care costs of teaching hospitals relative to nonteaching hospitals. The payment amount is determined by use of a statutorily specified adjustment factor. The regulations regarding the calculation of this additional payment, known as the IME adjustment, are located at § 412.105. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51680) for a full discussion of the IME adjustment and IME adjustment factor. Section 1886(d)(5)(B)(ii)(XII) of the Act provides that, for discharges occurring during FY 2008 and fiscal years thereafter, the IME formula multiplier is 1.35. Accordingly, for discharges occurring during FY 2017, the formula multiplier is 1.35. We estimate that application of this formula multiplier for the FY 2017 IME adjustment will result in an increase in IPPS payment of 5.5 percent for every approximately 10 percent increase in the hospital's resident to bed ratio.

Comment: One commenter requested that CMS take into consideration IME costs across all provider settings and correspondingly increase the IPPS payment to account for higher indirect patient costs. The commenter requested that CMS not eliminate or decrease the formula modifier for the FY 2017 IME adjustment.

Response: The IME adjustment factor is set by statute. Therefore, we do not have discretion to make any changes to the formula multiplier.

2. Other Policies Related to IME

We refer readers to section IV.I. of the preamble of this final rule for a discussion of the finalized policy changes for FY 2017 relating to medical residency training programs (specifically, rural training tracks) at urban hospitals that also affect payments for IME.

F. Payment Adjustment for Medicare Disproportionate Share Hospitals (DSHs) for FY 2017 and Subsequent Years (§ 412.106)

1. General Discussion

Section 1886(d)(5)(F) of the Act provides for additional Medicare payments to subsection (d) hospitals that serve a significantly disproportionate number of low-income patients. The Act specifies two methods by which a hospital may qualify for the Medicare disproportionate share hospital (DSH) adjustment. Under the first method, hospitals that are located in an urban area and have 100 or more beds may receive a Medicare DSH payment adjustment if the hospital can demonstrate that, during its cost reporting period, more than 30 percent of its net inpatient care revenues are derived from State and local government payments for care furnished to needy patients with low incomes. This method is commonly referred to as the ''Pickle method.'' The second method for qualifying for the DSH payment adjustment, which is the most common, is based on a complex statutory formula under which the DSH payment adjustment is based on the hospital's geographic designation, the number of beds in the hospital, and the level of the hospital's disproportionate patient percentage (DPP). A hospital's DPP is the sum of two fractions: the ''Medicare fraction'' and the ''Medicaid fraction.'' The Medicare fraction (also known as the ''SSI fraction'' or ''SSI ratio'') is computed by dividing the number of the hospital's inpatient days that are furnished to patients who were entitled to both Medicare Part A and Supplemental Security Income (SSI) benefits by the hospital's total number of patient days furnished to patients entitled to benefits under Medicare Part A. The Medicaid fraction is computed by dividing the hospital's number of inpatient days furnished to patients who, for such days, were eligible for Medicaid, but were not entitled to benefits under Medicare Part A, by the hospital's total number of inpatient days in the same period.

Because the DSH payment adjustment is part of the IPPS, the DSH statutory references (under section 1886(d)(5)(F) of the Act) to ''days'' apply only to hospital acute care inpatient days. Regulations located at § 412.106 govern the Medicare DSH payment adjustment and specify how the DPP is calculated as well as how beds and patient days are counted in determining the Medicare DSH payment adjustment. Under § 412.106(a)(1)(i), the number of beds for the Medicare DSH payment adjustment is determined in accordance with bed counting rules for the IME adjustment under § 412.105(b).

Section 3133 of the Patient Protection and Affordable Care Act, as amended by section 10316 of the same Act and section 1104 of the Health Care and Education Reconciliation Act (Pub. L. 111–152), added a section 1886(r) to the

Act that modifies the methodology for computing the Medicare DSH payment adjustment. (For purposes of this final rule, we refer to these provisions collectively as section 3133 of the Affordable Care Act.) Beginning with discharges in FY 2014, hospitals that qualify for Medicare DSH payments under section 1886(d)(5)(F) of the Act receive 25 percent of the amount they previously would have received under the statutory formula for Medicare DSH payments. This provision applies equally to hospitals that qualify for DSH payments under section 1886(d)(5)(F)(i)(I) of the Act and those hospitals that qualify under the Pickle method under section 1886(d)(5)(F)(i)(II) of the Act.

The remaining amount, equal to an estimate of 75 percent of what otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals under age 65 who are uninsured, is available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. The payments to each hospital for a fiscal year are based on the hospital's amount of uncompensated care for a given time period relative to the total amount of uncompensated care for that same time period reported by all hospitals that receive Medicare DSH payments for that fiscal year.

As provided by section 3133 of the Affordable Care Act, section 1886(r) of the Act requires that, for FY 2014 and each subsequent fiscal year, a subsection (d) hospital that would otherwise receive DSH payments made under section 1886(d)(5)(F) of the Act receives two separately calculated payments. Specifically, section 1886(r)(1) of the Act provides that the Secretary shall pay to such subsection (d) hospital (including a Pickle hospital) 25 percent of the amount the hospital would have received under section 1886(d)(5)(F) of the Act for DSH payments, which represents the empirically justified amount for such payment, as determined by the MedPAC in its March 2007 Report to the Congress. We refer to this payment as the ''empirically justified Medicare DSH payment.''

In addition to this empirically justified Medicare DSH payment, section 1886(r)(2) of the Act provides that, for FY 2014 and each subsequent fiscal year, the Secretary shall pay to such subsection (d) hospital an additional amount equal to the product of three factors. The first factor is the difference between the aggregate amount of payments that would be made to subsection (d) hospitals under section 1886(d)(5)(F) of the Act if subsection (r) did not apply and the aggregate amount of payments that are made to subsection (d) hospitals under section 1886(r)(1) of the Act for each fiscal year. Therefore, this factor amounts to 75 percent of the payments that would otherwise be made under section 1886(d)(5)(F) of the Act.

The second factor is, for FYs 2014 through 2017, 1 minus the percent change in the percent of individuals under the age of 65 who are uninsured, determined by comparing the percent of such individuals who were uninsured in 2013, the last year before coverage expansion under the Affordable Care Act (as calculated by the Secretary based on the most recent estimates available from the Director of the Congressional Budget Office before a vote in either House on the Health Care and Education Reconciliation Act of 2010 that, if determined in the affirmative, would clear such Act for enrollment), and the percent of individuals who were uninsured in the most recent period for which data are available (as so calculated) minus 0.1 percentage point for FY 2014, and minus 0.2 percentage point for FYs 2015 through 2017. For FYs 2014 through 2017, the baseline for the estimate of the change in uninsurance is fixed by the most recent estimate of the Congressional Budget Office before the final vote on the Health Care and Education Reconciliation Act of 2010, which is contained in a March 20, 2010 letter from the Director of the Congressional Budget Office to the Speaker of the House. (The March 20, 2010 letter is available for viewing on the following Web site: *http://www.cbo.gov/sites/default/files/cbofiles/ftpdocs/113xx/doc11379/amendreconprop.pdf.*)

For FY 2018 and subsequent fiscal years, the second factor is 1 minus the percent change in the percent of individuals who are uninsured, as determined by comparing the percent of individuals who were uninsured in 2013 (as estimated by the Secretary, based on data from the Census Bureau or other sources the Secretary determines appropriate, and certified by the Chief Actuary of CMS), and the percent of individuals who were uninsured in the most recent period for which data are available (as so estimated and certified), minus 0.2 percentage point for FYs 2018 and 2019. Therefore, for FY 2018 and subsequent fiscal years, the statute provides some greater flexibility in the choice of the data sources to be used for the estimate of the change in the percent of uninsured individuals.

The third factor is a percent that, for each subsection (d) hospital, represents the quotient of the amount of uncompensated care for such hospital for a period selected by the Secretary (as estimated by the Secretary, based on appropriate data), including the use of alternative data where the Secretary determines that alternative data are available which are a better proxy for the costs of subsection (d) hospitals for treating the uninsured, and the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under section 1886(r) of the Act. Therefore, this third factor represents a hospital's uncompensated care amount for a given time period relative to the uncompensated care amount for that same time period for all hospitals that receive Medicare DSH payments in the applicable fiscal year, expressed as a percent.

For each hospital, the product of these three factors represents its additional payment for uncompensated care for the applicable fiscal year. We refer to the additional payment determined by these factors as the ''uncompensated care payment.''

Section 1886(r) of the Act applies to FY 2014 and each subsequent fiscal year. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50620 through 50647) and the FY 2014 IPPS interim final rule with comment period (78 FR 61191 through 61197), we set forth our policies for implementing the required changes to the Medicare DSH payment methodology made by section 3133 of the Affordable Care Act for FY 2014. In those rules, we noted that, because section 1886(r) of the Act modifies the payment required under section 1886(d)(5)(F) of the Act, it affects only the DSH payment under the operating IPPS. It does not revise or replace the capital IPPS DSH payment provided under the regulations at 42 CFR part 412, subpart M, which were established through the exercise of the Secretary's discretion in implementing the capital IPPS under section 1886(g)(1)(A) of the Act.

Finally, section 1886(r)(3) of the Act provides that there shall be no administrative or judicial review under section 1869, section 1878, or otherwise of any estimate of the Secretary for purposes of determining the factors described in section 1886(r)(2) of the Act or of any period selected by the Secretary for the purpose of determining those factors. Therefore, there is no administrative or judicial review of the estimates developed for purposes of applying the three factors used to determine uncompensated care

payments, or the periods selected in order to develop such estimates.

2. Eligibility for Empirically Justified Medicare DSH Payments and Uncompensated Care Payments

As indicated earlier, the payment methodology under section 3133 of the Affordable Care Act applies to ''subsection (d) hospitals'' that would otherwise receive a DSH payment made under section 1886(d)(5)(F) of the Act. Therefore, hospitals must receive empirically justified Medicare DSH payments in a fiscal year in order to receive an additional Medicare uncompensated care payment for that year. Specifically, section 1886(r)(2) of the Act states that, in addition to the payment made to a subsection (d) hospital under section 1886(r)(1) of the Act, the Secretary shall pay to such subsection (d) hospitals an additional amount. Because section 1886(r)(1) of the Act refers to empirically justified Medicare DSH payments, the additional payment under section 1886(r)(2) of the Act is limited to hospitals that receive empirically justified Medicare DSH payments in accordance with section 1886(r)(1) of the Act for the applicable fiscal year.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50622) and the FY 2014 IPPS interim final rule with comment period (78 FR 61193), we provided that hospitals that are not eligible to receive empirically justified Medicare DSH payments in a fiscal year will not receive uncompensated care payments for that year. We also specified that we would make a determination concerning eligibility for interim uncompensated care payments based on each hospital's estimated DSH status for the applicable fiscal year (using the most recent data that are available). We indicated that our final determination on the hospital's eligibility for uncompensated care payments will be based on the hospital's actual DSH status at cost report settlement for that payment year.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50622) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50006), we specified our policies for several specific classes of hospitals within the scope of section 1886(r) of the Act. We refer readers to those two final rules for a detailed discussion of our policies. In summary, we specified the following:

• *Subsection (d) Puerto Rico hospitals* that are eligible for DSH payments also are eligible to receive empirically justified Medicare DSH payments and uncompensated care payments under the new payment methodology (78 FR 50623 and 79 FR 50006).

• *Maryland hospitals* are not eligible to receive empirically justified Medicare DSH payments and uncompensated care payments under the payment methodology of section 1886(r) of the Act because they are not paid under the IPPS. As discussed in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50007), effective January 1, 2014, the State of Maryland elected to no longer have Medicare pay Maryland hospitals in accordance with section 1814(b)(3) of the Act and entered into an agreement with CMS that Maryland hospitals will be paid under the Maryland All-Payer Model. However, under the Maryland All-Payer Model, Maryland hospitals still are not paid under the IPPS. Therefore, they remain ineligible to receive empirically justified Medicare DSH payments or uncompensated care payments under section 1886(r) of the Act.

• *SCHs that are paid under their hospital-specific rate* are not eligible for Medicare DSH payments. SCHs that are paid under the IPPS Federal rate receive interim payments based on what we estimate and project their DSH status to be prior to the beginning of the Federal fiscal year (based on the best available data at that time) subject to settlement through the cost report, and if they receive interim empirically justified Medicare DSH payments in a fiscal year, they also will receive interim uncompensated care payments for that fiscal year on a per discharge basis, subject as well to settlement through the cost report. Final eligibility determinations will be made at the end of the cost reporting period at settlement, and both interim empirically justified Medicare DSH payments and uncompensated care payments will be adjusted accordingly (78 FR 50624 and 79 FR 50007).

• *MDHs* are paid based on the IPPS Federal rate or, if higher, the IPPS Federal rate plus 75 percent of the amount by which the Federal rate is exceeded by the updated hospital-specific rate from certain specified base years (76 FR 51684). The IPPS Federal rate used in the MDH payment methodology is the same IPPS Federal rate that is used in the SCH payment methodology. Section 205 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA), Public Law 114–10, enacted April 16, 2015, extended the MDH program for discharges on or after April 1, 2015, through September 30, 2017. Because MDHs are paid based on the IPPS Federal rate, for FY 2017, MDHs will continue to be eligible to receive empirically justified Medicare DSH payments and uncompensated care payments if their DPP is at least 15 percent. We will apply the same process to determine MDHs' eligibility for empirically justified Medicare DSH and uncompensated care payments, as we do for all other IPPS hospitals, through September 30, 2017. Moreover, we will continue to make a determination concerning eligibility for interim uncompensated care payments based on each hospital's estimated DSH status for the applicable fiscal year (using the most recent data that are available). Our final determination on the hospital's eligibility for uncompensated care payments will be based on the hospital's actual DSH status at cost report settlement for that payment year. In addition, as we do for all IPPS hospitals, we calculate a numerator for Factor 3 for all MDHs, regardless of whether they are projected to be eligible for Medicare DSH payments during the fiscal year, but the denominator for Factor 3 will be based on the uncompensated care data from the hospitals that we have projected to be eligible for Medicare DSH payments during the fiscal year.

• *IPPS hospitals that have elected to participate in the Bundled Payments for Care Improvement initiative* continue to be paid under the IPPS (77 FR 53342) and, therefore, are eligible to receive empirically justified Medicare DSH payments and uncompensated care payments (78 FR 50625 and 79 FR 50008).

• *Hospitals participating in the Rural Community Hospital Demonstration Program* under section 410A of the Medicare Modernization Act do not receive DSH payments and, therefore, are excluded from receiving empirically justified Medicare DSH payments and uncompensated care payments under the new DSH payment methodology (78 FR 50625 and 79 FR 50008). There are 14 hospitals currently participating in the program; 10 will continue to participate through the end of FY 2016, and 4 will continue to participate through the scheduled end of the program on December 31, 2016. Once a hospital's participation in the demonstration program ends, the hospital will be treated like a subsection (d) hospital and subject to the IPPS. Therefore, once their participation ends, these hospitals could be eligible to receive empirically justified Medicare DSH payments and uncompensated care payments and, if so, will be treated accordingly for interim and final payments. We will apply the same process for determining their eligibility as we do for all other IPPS hospitals, and will make interim and final DSH and uncompensated care payments accordingly.

3. Empirically Justified Medicare DSH Payments

As we have discussed earlier, section 1886(r)(1) of the Act requires the Secretary to pay 25 percent of the amount of the Medicare DSH payment that would otherwise be made under section 1886(d)(5)(F) of the Act to a subsection (d) hospital. Because section 1886(r)(1) of the Act merely requires the program to pay a designated percentage of these payments, without revising the criteria governing eligibility for DSH payments or the underlying payment methodology, we stated in the FY 2014 IPPS/LTCH PPS final rule that we did not believe that it was necessary to develop any new operational mechanisms for making such payments. Therefore, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50626), we implemented this provision by advising MACs to simply adjust the interim claim payments to the requisite 25 percent of what would have otherwise been paid. We also made corresponding changes to the hospital cost report so that these empirically justified Medicare DSH payments can be settled at the appropriate level at the time of cost report settlement. We provided more detailed operational instructions and cost report instructions following issuance of the FY 2014 IPPS/LTCH PPS final rule that are available on the CMS Web site at: *http://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2014-Transmittals-Items/R5P240.html*.

4. Uncompensated Care Payments

As we discussed earlier, section 1886(r)(2) of the Act provides that, for each eligible hospital in FY 2014 and subsequent years, the uncompensated care payment is the product of three factors. These three factors represent our estimate of 75 percent of the amount of Medicare DSH payments that would otherwise have been paid, an adjustment to this amount for the percent change in the national rate of uninsurance compared to the rate of uninsurance in 2013, and each eligible hospital's estimated uncompensated care amount relative to the estimated uncompensated care amount for all eligible hospitals. Below we discuss the data sources and methodologies for computing each of these factors, our final policies for FYs 2014 through 2016, and our proposed and final policies for FY 2017.

a. Calculation of Factor 1 for FY 2017

Section 1886(r)(2)(A) of the Act establishes Factor 1 in the calculation of the uncompensated care payment. Section 1886(r)(2)(A) of the Act states that this factor is equal to the difference between (1) the aggregate amount of payments that would be made to subsection (d) hospitals under section 1886(d)(5)(F) of the Act if section 1886(r) of the Act did not apply for such fiscal year (as estimated by the Secretary); and (2) the aggregate amount of payments that are made to subsection (d) hospitals under section 1886(r)(1) of the Act for such fiscal year (as so estimated). Therefore, section 1886(r)(2)(A)(i) of the Act represents the estimated Medicare DSH payments that would have been made under section 1886(d)(5)(F) of the Act if section 1886(r) of the Act did not apply for such fiscal year. Under a prospective payment system, we would not know the precise aggregate Medicare DSH payment amount that would be paid for a Federal fiscal year until cost report settlement for all IPPS hospitals is completed, which occurs several years after the end of the Federal fiscal year. Therefore, section 1886(r)(2)(A)(i) of the Act provides authority to estimate this amount, by specifying that, for each fiscal year to which the provision applies, such amount is to be estimated by the Secretary. Similarly, section 1886(r)(2)(A)(ii) of the Act represents the estimated empirically justified Medicare DSH payments to be made in a fiscal year, as prescribed under section 1886(r)(1) of the Act. Again, section 1886(r)(2)(A)(ii) of the Act provides authority to estimate this amount.

Therefore, Factor 1 is the difference between our estimates of: (1) The amount that would have been paid in Medicare DSH payments for the fiscal year, in the absence of the new payment provision; and (2) the amount of empirically justified Medicare DSH payments that are made for the fiscal year, which takes into account the requirement to pay 25 percent of what would have otherwise been paid under section 1886(d)(5)(F) of the Act. In other words, this factor represents our estimate of 75 percent (100 percent minus 25 percent) of our estimate of Medicare DSH payments that would otherwise be made, in the absence of section 1886(r) of the Act, for the fiscal year.

As we did for FY 2016, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25084), in order to determine Factor 1 in the uncompensated care payment formula for FY 2017, we proposed to continue the policy established in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50628 through 50630) and in the FY 2014 IPPS interim final rule with comment period (78 FR 61194) of determining Factor 1 by developing estimates of both the aggregate amount of Medicare DSH payments that would be made in the absence of section 1886(r)(1) of the Act and the aggregate amount of empirically justified Medicare DSH payments to hospitals under 1886(r)(1) of the Act. These estimates will not be revised or updated after we know the final Medicare DSH payments for FY 2017.

Therefore, in order to determine the two elements of Factor 1 for FY 2017 (Medicare DSH payments *prior* to the application of section 1886(r)(1) of the Act, and empirically justified Medicare DSH payments *after* application of section 1886(r)(1) of the Act), for the proposed rule, we used the most recently available projections of Medicare DSH payments for the fiscal year, as calculated by CMS' Office of the Actuary using the most recently filed Medicare hospital cost report with Medicare DSH payment information and the most recent Medicare DSH patient percentages and Medicare DSH payment adjustments provided in the IPPS Impact File.

For purposes of calculating Factor 1 and modeling the impact of the FY 2017 IPPS/LTCH PPS proposed rule, we used the Office of the Actuary's March 2016 Medicare DSH estimates, which are based on data from the December 2015 update of the Medicare Hospital Cost Report Information System (HCRIS) and the FY 2016 IPPS/LTCH PPS final rule IPPS Impact file, published in conjunction with the publication of the FY 2016 IPPS/LTCH PPS final rule. Because SCHs that are projected to be paid under their hospital-specific rate are excluded from the application of section 1886(r) of the Act, these hospitals also were excluded from the March 2016 Medicare DSH estimates. Furthermore, because section 1886(r) of the Act specifies that the uncompensated care payment is in addition to the empirically justified Medicare DSH payment (25 percent of DSH payments that would be made without regard to section 1886(r) of the Act), Maryland hospitals participating in the Maryland All-Payer Model that do not receive DSH payments were also excluded from the Office of the Actuary's Medicare DSH estimates. Because the Rural Community Hospital Demonstration program is scheduled to end on December 31, 2016, hospitals that were participating in the program were included in this estimate for FY 2017. However, for the proposed rule, we excluded 25 percent of our estimate of DSH payments that would otherwise be made to the 4 hospitals whose participation in the program will continue through December 31, 2016, as

these hospitals will be excluded from receiving DSH payments until that time. The estimate included the total DSH payments that would be made to the 10 hospitals whose participation in the Rural Community Hospital Demonstration program will continue only through September 30, 2016.

For the proposed rule, using the data sources discussed above, the Office of the Actuary used the most recently submitted Medicare cost report data to identify Medicare DSH payments and the most recent Medicare DSH payment adjustments provided in the IPPS Impact File, and applied inflation updates and assumptions for future changes in utilization and case-mix to estimate Medicare DSH payments for the upcoming fiscal year. The March 2016 Office of the Actuary estimate for Medicare DSH payments for FY 2017, without regard to the application of section 1886(r)(1) of the Act, was approximately $14.227 billion. This estimate excluded Maryland hospitals participating in the Maryland All-Payer Model, SCHs paid under their hospital-specific payment rate, and 25 percent of DSH payments to the 4 hospitals whose participation in the Rural Community Hospital Demonstration program will continue through December 31, 2016. Therefore, based on the March 2016 estimate, the estimate for empirically justified Medicare DSH payments for FY 2017, with the application of section 1886(r)(1) of the Act, was approximately $3.556 billion (or 25 percent of the total amount of estimated Medicare DSH payments for FY 2017). Under § 412.l06(g)(1)(i) of the regulations, Factor 1 is the difference between these two estimates of the Office of the Actuary. Therefore, in the proposed rule, we proposed that Factor 1 for FY 2017 was $10,670,529,595.84, which is equal to 75 percent of the total amount of estimated Medicare DSH payments for FY 2017 ($14,227,372,794.46 minus $3,556,843,198.62).

We invited public comments on our proposed calculation of Factor 1 for FY 2016.

Comment: A number of commenters requested greater transparency in the methodology used by the OACT to estimate aggregate DSH payments that would have been paid absent implementation of the Affordable Care Act, particularly with respect to the calculation of estimated DSH payments for purposes of determining Factor 1. The commenters urged CMS to clarify the methodology and provide additional information on the assumptions used to make these projections. The commenters also requested that this information be provided in advance of the publication of the FY 2017 IPPS/LTCH PPS final rule and in future proposed rules each year. The commenters stated that hospitals do not have sufficient information to understand or replicate the relevant projections and estimates for Factor 1.

Many commenters stated that there is variability in the ''Other'' factors that are used to estimate Medicare DSH expenditures and requested full disclosure of the methodology and the various components used to estimate the catch-all ''Other'' column, such as the factor for Medicaid expansion due to the Affordable Care Act. Specifically, the commenters expressed concern that the value in the ''Other'' column for FY 2016 changed from 1.045 in the FY 2016 IPPS/LTCH PPS final rule to 0.9993 in the FY 2017 IPPS/LTCH PPS proposed rule. Commenters were concerned that such a discrepancy also appeared in the FY 2016 IPPS/LTCH PPS final rule, when CMS used the exact same 0.9993 factor from the ''Other'' column for FY 2014, the first year of the Medicaid expansion; they expressed concern that they believed this was updated to 1.04795 without explanation in the version of the table that appeared in the FY 2017 IPPS/LTCH PPS proposed rule. The commenters requested that CMS provide clarification regarding these changes.

Some commenters asked CMS to explain how Medicaid and CHIP expansion is accounted for in the ''Other'' column used to determine the Factor 1 estimate. The commenters stated that CMS appears to have applied internally inconsistent assumptions as to the effect of Medicaid expansion on Factor 1, with no explanation or support. One commenter stated that the effect of Medicaid expansion on the agency's projection of what the traditional DSH payment would have been for FY 2014, absent of the Affordable Care Act, has varied erratically in the agency's successive rulemakings for FYs 2014 through 2017. Another commenter noted that the most recent Congressional Budget Office report showed a 32-percent increase in Medicaid/CHIP enrollment as a result of Medicaid expansion, and expected that this increase in enrollment would result in a substantial increase in reported DSH payments that is not reflected in OACT's DSH estimate for Factor 1. A second commenter provided its own estimates of how the Medicaid expansion would affect DSH payments, and noted that these estimates do not align with CMS' figures.

Commenters objected to CMS' statement from prior rulemaking that ''the increase due to Medicaid expansion is not as large as commenters contended due to the actuarial assumption that the new enrollees are healthier than the average Medicaid recipient, and, therefore, use fewer hospital services.'' Commenters noted that this assumption has the effect of reducing the estimate of total Medicare DSH spending under prior law, which in turn reduces the estimates of both the empirically justified amount and the amount available to be distributed as uncompensated care payments. Some commenters asserted that there is no solid evidentiary basis for the assumption that new Medicaid enrollees are healthier, and requested that CMS reconsider and discontinue use of this assumption. Some commenters asserted that CMS should by now have accurate information regarding States that have expanded Medicaid, and that CMS should utilize the available enrollment and/or utilization information from Medicaid expansion programs either to support or refute the assumption that the Medicaid expansion population is healthier than the average Medicaid recipient. One commenter stated that, in the FY 2015 IPPS/LTCH PPS final rule, CMS provided a table comparing pre-Affordable Care Act versus post-Affordable Care Act Medicaid enrollment and the corresponding estimated percentage increase in Medicare DSH, but those data were not provided in the FY 2016 IPPS/LTCH PPS proposed and final rule or the FY 2017 IPPS/LTCH PPS proposed rule.

Several commenters believed there was incomplete information in the FY 2017 IPPS/LTCH PPS proposed rule regarding the ''completion factor'' and requested further detail. These commenters suggested that CMS publish the ''completion factor'' used to adjust the FY 2014 and FY 2015 claims data for purposes of the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25085). In addition, the commenters suggested that CMS publish information on the ''preliminary data for 2016'' used by the OACT to determine the discharge figure for FY 2016, as well as the ''assumptions'' used to determine the FY 2017 discharge figure. The commenters requested that CMS also share detailed calculations of the discharge and case-mix values as well as the inflation factor update used for FY 2014 through FY 2017. One commenter noted that, according to the FY 2017 IPPS/LTCH PPS proposed rule, the data source for the change in 2015 case-mix is actual data adjusted for a completion factor, but the value is the same for 2016 and 2017 based on the 2010–2011 Medicare Technical Review Panel

report. The commenter questioned whether a more current data source could be used for this calculation.

Several commenters expressed concern about the sustainability of continued reductions to aggregate uncompensated care payments. The commenters noted that, as insurance coverage increases, the aggregate amount available for uncompensated care payments will decline and thus reduce the amount of payments to be distributed which they believe will help cover the cost of uncompensated care. These commenters believed that it would be appropriate to adjust the ''Other'' column in a manner that supports safety-net hospitals in order to reflect the growing number of hospitals that are becoming eligible for DSH payments. Furthermore, commenters noted that hospitals in States that have not expanded Medicaid are not experiencing a decrease in uncompensated care costs and that reductions in Medicare DSH payments are detrimental to these hospitals. Some commenters noted the reductions in payments they would experience due to CMS' uncompensated care proposal in totality and observed that the hospitals that are disproportionately impacted may not have the resources necessary to successfully transform care, maintain high quality care, and continue in the commitment to meet the needs of patients and communities.

Response: We thank the commenters for their input. As in previous years, we would like to clarify that Factor 1 is not estimated in isolation. The Factor 1 estimates for proposed rules are generally consistent with the economic assumptions and actuarial analysis used to develop the President's Budget estimates under current law, and the Factor 1 estimates for the final rule are generally consistent with those used for the Midsession Review of the President's Budget. For additional information on the development of the President's Budget, we refer readers to the Office of Management and Budget Web site at: *https://www.whitehouse.gov/omb/budget.* For additional information on the specific economic assumptions used in the Midsession Review of the President's FY 2017 Budget, we refer readers to the ''Midsession Review of the President's FY 2017 Budget'' available on the Office of Management and Budget Web site at: *https://www.whitehouse.gov/omb/budget/MSR.* For a general overview of the principal steps involved in projecting future inpatient costs and utilization, we refer readers to the ''2016 Annual Report of the Boards of Trustees of the Federal Hospital Insurance and Federal Supplementary Medical Insurance Trust Funds'' available on the CMS Web site at: *https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/ReportsTrustFunds/index.html?redirect=/reportstrustfunds/* under ''Downloads.''

As we did in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49519), later in this section, we provide additional information regarding the data sources, methods, and assumptions employed by the actuaries in determining the OACT's updated estimate of Factor 1 for FY 2017. We believe that this discussion addresses the methodological concerns raised by commenters regarding the various assumptions used in the estimate, including the ''Other'' and ''Discharges'' assumptions and also provides additional information regarding how we address the Medicaid and CHIP expansion. However, we note that, with regard to the commenters' questions and concerns on the completion factor, the OACT assumed a discharge completion factor of 99 percent for FY 2014 and 98 percent for FY 2015. Similarly, the OACT assumed that case-mix was stabilized at the time of the estimate and no additional completion factor adjustment was needed. These assumptions are consistent with historical patterns of completion factors that were determined for discharge and case-mix numbers.

Regarding the commenters' assertion that Medicaid expansion is not adequately accounted for in the ''Other'' column, we note that, based on data from the Midsession Review of the President's Budget, the OACT assumed per capita spending for Medicaid beneficiaries who enrolled due to the expansion to be 50 percent of the average per capita of the pre-expansion Medicaid beneficiary due to the better health of these beneficiaries. This assumption is consistent with recent internal estimates of Medicaid per capita spending pre-expansion and post-expansion.

In response to the commenters who requested that we adjust the ''Other'' assumption to reflect the growing number of disproportionate share hospitals in a manner that supports safety-net hospitals, particularly in States that do not have a Medicaid or CHIP expansion, we note that our proposed methodology includes assumptions regarding how DSH payments will increase in aggregate, regardless of how many hospitals qualify for DSH payments. The statute is clear that the computation of Factor 1 begins with an aggregate amount of payments that would be made to subsection (d) hospitals under section 1886(d)(5)(F) of the Act if section 1886(r) of the Act did not apply for such fiscal year. In our view, the most appropriate way to estimate this amount is to project, to the best of our ability, how DSH payments will change in aggregate, based on the programs and policies that will be in effect during the fiscal year, rather than focusing on changes in payments to specific hospitals. Thus, there is no need to adjust our estimate of the ''Other'' factors to reflect new DSH hospitals. Furthermore, in response to concerns about the decrease in the amount available to make uncompensated care payments, we believe that the intent of the statute is to reduce the amount available to make uncompensated care payments to reflect the decline in the number of uninsured individuals and the corresponding decrease in the amount of uncompensated care costs.

Comment: In addition to requesting that the methodology and assumptions used for Factor 1 be made public before the publication of the final rule and with the proposed rule each subsequent year, commenters requested that CMS furnish interested parties with advance opportunity to comment on new calculations based on the more recent data that CMS intends ultimately to use for the final rule. One commenter believed that CMS' rulemaking is flawed because different data and calculations are used in the final rule without any opportunity for the hospitals to comment. This commenter requested that CMS make clear that it will use different or updated data to determine DSH payments for uncompensated care in the final rule. The commenter believed that the proposal to determine the amount of hospitals' new DSH payment based on data first released with the final rule and on which hospitals will have no meaningful opportunity to comment violates notice-and-comment rulemaking requirements. As discussed above, several commenters noted the variability in the values of the ''Other'' column as well as in the factor applied to account for Medicaid expansion; one of the commenters called on CMS to explain why these values were allowed to change from one rulemaking to the next when the agency has otherwise taken the position that the estimates used to determine uncompensated care payments should be fixed when made and not be reconciled with data that become available later.

Response: We believe that stakeholders had notice and a full opportunity to comment on methodology that would be used to

determine uncompensated care payments, including the data sources that would be used. As a result, commenters had a full opportunity to raise any concerns regarding the appropriateness of the data generally, even if the actual data were not yet available, consistent with the requirements for notice and comment under the Administrative Procedure Act. With respect to concerns about the variability of the factors used to estimate Factor 1, we note that, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50630), using the discretion afforded in the statute to estimate the aggregate amount of DSH payments that would be made in the absence of section 1886(r) of the Act, we finalized a policy of defining the methodology for calculating Factor 1 using the OACT's biannual Medicare DSH payment projections, which are typically available in February of each year (based on data from December of the previous year) as part of the President's Budget, and in July (based on data from June) as part of the Midsession Review of the President's Budget.

Comment: Some commenters requested that, in light of their concerns about the data sources and methods used to estimate Factor 1, CMS adopt a process of reconciling the initial estimates of Factor 1 with actual data for the payment year in conjunction with the final settlement of hospital cost reports for the applicable year. The commenters believed that a ''true-up approach'' would ensure that Medicare DSH payments are determined using the best data.

Response: We continue to believe that applying our best estimates prospectively is most conducive to administrative efficiency, finality, and predictability in payments (78 FR 50628; 79 FR 50010; and 80 FR 49518). As we noted in the FY 2014 IPPS/LTCH PPS final rule, we do not know the aggregate Medicare DSH payment amount that would be paid for each Federal fiscal year until the time of cost report settlements, which occur several years after the end of the fiscal year. Furthermore, the statute provides that Factor 1 shall be determined based on estimates of the aggregate amount of DSH payments that would be made in the absence of section 1886(r) of the Act and the aggregate amount of empirically justified DSH payments that are made under section 1886(r)(1) of the Act. We believe that, in affording the Secretary the discretion to estimate the amount of these payments and by including a prohibition against administrative and judicial review of those estimates in section 1886(r)(3) of the Act, Congress recognized the importance of finality and predictability in payments and sought to avoid a situation in which the uncompensated care payments would be subject to change over a period of a number of years. Accordingly, we do not agree with the commenters that we should establish a process for reconciling our estimates of Factor 1. We note that, in reviewing the OACT's prior estimates for DSH payments compared to more updated estimate and/or actual experience, from FY 2005 to FY 2017, the original estimates have been higher than either the more updated estimates and/or actual experience for 7 of the 13 years and lower than actual experience in only 6 years.

Comment: Commenters indicated that the estimated DSH payments do not account for the impact of the D.C. Circuit Court decision in *Allina* by excluding Medicare Advantage days from the SSI ratio and including dual eligible Medicare Advantage days in the Medicaid fraction. The commenters believed that this understates the estimate of Factor 1. The commenters stated that CMS cannot use prior year data for its calculations without adjusting that data to reflect what it should have been under binding D.C. Circuit precedent.

Response: We do not believe the *Allina* decision has any bearing on our estimate of Factor 1 for FY 2017. The holding in *Allina* addresses traditional DSH payments made to a group of providers between 2004 and 2010. The *Allina* decision did not address the FY 2014 IPPS/LTCH PPS final rule (78 FR 50614 through 50620) in which we readopted the policy of counting Medicare Advantage days in the SSI ratio for FY 2014 and all subsequent fiscal years. In its estimate of Factor 1 for FY 2017 for the FY 2017 IPPS/LTCH PPS proposed rule, the Office of the Actuary was making an estimate of difference between the aggregate amount of DSH payments that would be made under section 1886(d)(5)(F) of the Act in FY 2017 if section 1886(r) of the Act did not apply and the aggregate amount of empirically justified DSH payments that will be made to hospitals in FY 2017 under section 1886(r)(1) of the Act. Thus, although the Office of the Actuary used the December 2015 update of the Medicare Hospital Cost Report Information System (HCRIS) in making this estimate, it also applied inflation adjustments and assumptions regarding future changes in utilization and case-mix in order to estimate Medicare DSH payments for FY 2017. Because Medicare Advantage days will be counted in the SSI fraction in FY 2017 for purposes of determining empirically justified DSH payments, we believe it is more appropriate to use data that also include Medicare Advantage days in the SSI fraction when determining Factor 1 for FY 2017. Accordingly, consistent with § 412.106(b)(2), as readopted in the FY 2014 IPPS/LTCH PPS final rule, in estimating DSH payments for FY 2017, the OACT did not remove patients enrolled in Medicare Advantage plans from SSI ratios or make any other adjustments to the hospital cost report data from the December 2015 update of the HCRIS database. We believe this methodology is consistent with the statute and our regulations.

After consideration of the public comments we received, we are finalizing, as proposed, the methodology for calculating Factor 1 for FY 2017. Using this methodology, we discuss the resulting Factor 1 amount for FY 2017 below.

To determine Factor 1 and to model the impact of this provision for FY 2017, we used the Office of the Actuary's June 2016 Medicare DSH estimates based on data from the March 2016 update of 2013 cost report data included in the HCRIS and the Impact File published in conjunction with the publication of the FY 2016 IPPS/LTCH PPS final rule. Because SCHs that are projected to be paid under their hospital-specific rate are excluded from the application of section 1886(r) of the Act, these hospitals also were excluded from the June 2016 Medicare DSH estimates. Furthermore, because Maryland hospitals participating in the Maryland All-Payer Model do not receive DSH payments, these hospitals also are excluded from the OACT's Medicare DSH estimates. Because the Rural Community Hospital Demonstration program is scheduled to end on December 31, 2016, hospitals that are participating in the program are included in this estimate for FY 2017. However, for this final rule, we are excluding 25 percent of our estimate of DSH payments that would otherwise be made to the 4 hospitals whose participation in the program will continue through December 31, 2016, as these hospitals will be excluded from receiving DSH payments until that time. The estimate includes the total DSH payments that would be made to the 10 hospitals whose participation in the Rural Community Hospital Demonstration program will continue only through September 30, 2016.

For this final rule, using the data sources discussed above, the Office of the Actuary used the most recently submitted Medicare cost report data for 2013 to identify Medicare DSH

payments and the most recent Medicare DSH payment adjustments provided in the Impact File published in conjunction with the publication of the FY 2016 IPPS/LTCH PPS final rule, and applied inflation updates and assumptions for future changes in utilization and case-mix to estimate Medicare DSH payments for the upcoming fiscal year. The June 2016 Office of the Actuary estimate for Medicare DSH payments for FY 2017, without regard to the application of section 1886(r)(1) of the Act, is approximately $14,396,635,710.16 billion. This estimate excludes Maryland hospitals participating in the Maryland All-Payer Model, SCHs paid under their hospital-specific payment rate, and 25 percent of DSH payments for the 4 hospitals whose participation in the Rural Community Hospital Demonstration program will continue through December 31, 2016. Therefore, based on the June 2016 estimate, the estimate for empirically justified Medicare DSH payments for FY 2017, with the application of section 1886(r)(1) of the Act, is approximately $3,599,158,927.54 billion (or 25 percent of the total amount of estimated Medicare DSH payments for FY 2017). Under § 412.l06(g)(1)(i) of the regulations, Factor 1 is the difference between these two estimates of the Office of the Actuary. Therefore, in this final rule, Factor 1 for FY 2017 is $10,797,476,782.62, which is equal to 75 percent of the total amount of estimated Medicare DSH payments for FY 2017 ($14,396,635,710.16 minus $3,599,158,927.54).

The Office of the Actuary's final estimates for FY 2017 began with a baseline of $12.277 billion in Medicare DSH expenditures for FY 2013. The following table shows the factors applied to update this baseline through the current estimate for FY 2017:

FACTORS APPLIED FOR FY 2014 THROUGH FY 2017 TO ESTIMATE MEDICARE DSH EXPENDITURES USING 2013 BASELINE

FY	Update	Discharge	Case-Mix	Other	Total	Estimated DSH payment (in billions)
2014	1.009	0.9553	1.015	1.0586	1.035688	$12.715
2015	1.014	0.9897	1.005	1.0705	1.079678	13.738
2016	1.009	0.9868	1.025	0.9999	1.020471	14.009
2017	1.0015	1.0084	1.005	1.0125	1.027649	14.397

In this table, the discharge column shows the increase in the number of Medicare FFS inpatient hospital discharges. The figures for FYs 2014 and 2015 are based on Medicare claims data that have been adjusted by a completion factor. The discharge figure for FY 2016 is based on preliminary data for 2016. The discharge figure for FY 2017 is an assumption based on recent trends recovering back to the long-term trend and assumptions related to how many beneficiaries will be enrolled in Medicare Advantage (MA) plans. The case-mix column shows the increase in case-mix for IPPS hospitals. The case-mix figures for FYs 2014 and 2015 are based on actual data adjusted by a completion factor. The FY 2016 increase is based on preliminary data adjusted by a completion factor. The FY 2017 increases are based on the recommendation of the 2010–2011 Medicare Technical Review Panel. The ''Other'' column shows the increase in other factors that contribute to the Medicare DSH estimates. These factors include the difference between the total inpatient hospital discharges and the IPPS discharges, various adjustments to the payment rates that have been included over the years but are not reflected in the other columns (such as the change in rates for the 2-midnight stay policy). In addition, the ''Other'' column includes a factor for the Medicaid expansion due to the Affordable Care Act.

The table below shows the factors that are included in the ''Update'' column of the above table:

FY	Market basket percentage	Affordable Care Act payment reductions	Multifactor productivity adjustment	Documentation and coding	Total update percentage
2014	2.5	−0.3	−0.5	−0.8	0.9
2015	2.9	−0.2	−0.5	−0.8	1.4
2016	2.4	−0.2	−0.5	−0.8	0.9
2017	2.7	−0.75	−0.3	−1.5	0.15

Note: All numbers are based on Midsession Review of FY 2017 President's Budget projections.

b. Calculation of Factor 2 for FY 2017

Section 1886(r)(2)(B) of the Act establishes Factor 2 in the calculation of the uncompensated care payment. Specifically, section 1886(r)(2)(B)(i) of the Act provides that, for each of FYs 2014, 2015, 2016, and 2017, a factor equal to 1 minus the percent change in the percent of individuals under the age of 65 who are uninsured, as determined by comparing the percent of such individuals (1) who were uninsured in 2013, the last year before coverage expansion under the Affordable Care Act (as calculated by the Secretary based on the most recent estimates available from the Director of the Congressional Budget Office before a vote in either House on the Health Care and Education Reconciliation Act of 2010 that, if determined in the affirmative, would clear such Act for enrollment); and (2) who are uninsured in the most recent period for which data are available (as so calculated), minus 0.1 percentage point for FY 2014 and minus 0.2 percentage point for each of FYs 2015, 2016, and 2017.

Section 1886(r)(2)(B)(i)(I) of the Act further indicates that the percent of individuals under 65 without insurance in 2013 must be the percent of such individuals who were uninsured in 2013, the last year before coverage expansion under the Affordable Care Act (as calculated by the Secretary

based on the most recent estimates available from the Director of the Congressional Budget Office before a vote in either House on the Health Care and Education Reconciliation Act of 2010 that, if determined in the affirmative, would clear such Act for enrollment). The Health Care and Education Reconciliation Act (Pub. L. 111–152) was enacted on March 30, 2010. It was passed in the House of Representatives on March 21, 2010, and by the Senate on March 25, 2010. Because the House of Representatives was the first House to vote on the Health Care and Education Reconciliation Act of 2010 on March 21, 2010, we have determined that the most recent estimate available from the Director of the Congressional Budget Office ''*before* a vote in either House on the Health Care and Education Reconciliation Act of 2010 . . .'' (emphasis added) appeared in a March 20, 2010 letter from the director of the CBO to the Speaker of the House. Therefore, we believe that only the estimates in this March 20, 2010 letter meet the statutory requirement under section 1886(r)(2)(B)(i)(I) of the Act. (To view the March 20, 2010 letter, we refer readers to the Web site at: *http://www.cbo.gov/sites/default/files/cbofiles/ftpdocs/113xx/doc11379/amendreconprop.pdf*.)

In its March 20, 2010 letter to the Speaker of the House of Representatives, the CBO provided two estimates of the ''post-policy uninsured population.'' The first estimate is of the ''Insured Share of the Nonelderly Population Including All Residents'' (82 percent) and the second estimate is of the ''Insured Share of the Nonelderly Population Excluding Unauthorized Immigrants'' (83 percent). In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50631), we used the first estimate that includes all residents, including unauthorized immigrants. We stated that we believe this estimate is most consistent with the statute, which requires us to measure ''the percent of individuals under the age of 65 who are uninsured'' and provides no exclusions except for individuals over the age of 65. In addition, we stated that we believe that this estimate more fully reflects the levels of uninsurance in the United States that influence uncompensated care for hospitals than the estimate that reflects only legal residents. The March 20, 2010 CBO letter reports these figures as the estimated percentage of individuals with insurance. However, because section 1886(r)(2)(B)(i) of the Act requires that we compare the percent of individuals who are uninsured in the most recent period for which data are available with the percent of individuals who were uninsured in 2013, in the FY 2014 IPPS/LTCH PPS final rule, we used the CBO insurance rate figure and subtracted that amount from 100 percent (that is the total population without regard to insurance status) to estimate the 2013 baseline percent of individuals without insurance. Therefore, for FYs 2014 through 2017, our estimate of the uninsurance percentage for 2013 is 18 percent.

Section 1886(r)(2)(B)(i) of the Act requires that we compare the baseline uninsurance rate to the percent of such individuals who are uninsured in the most recent period for which data are available (as so calculated). In the FY 2014, FY 2015, and FY 2016 IPPS/LTCH PPS final rules (78 FR 50634, 79 FR 50014, and 80 FR 49522, respectively), we used the same data source, CBO estimates, to calculate this percent of individuals without insurance. In response to public comments, we also agreed that we should normalize the CBO estimates, which are based on the calendar year, for the Federal fiscal years for which each calculation of Factor 2 is made (78 FR 50633). Therefore, for the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 24486), we used the most recently available estimate of the uninsurance rate, which was based on the CBO's March 2015 estimates of the effects of the Affordable Care Act on health insurance coverage (which are available at *http://www.cbo.gov/sites/default/files/cbofiles/attachments/43900-2014-04-ACAtables2.pdf*). The CBO's March 2015 estimate of individuals under the age of 65 with insurance in CY 2016 was 89 percent. Therefore, the CBO's most recent estimate of the rate of uninsurance in CY 2016 was 11 percent (that is, 100 percent minus 89 percent.) Similarly, the CBO's March 2015 estimate of individuals under the age of 65 with insurance in CY 2017 was 90 percent. Therefore, the CBO's most recent estimate of the rate of uninsurance in CY 2017 available for the proposed rule was 10 percent (that is, 100 percent minus 90 percent.)

The calculation of the proposed Factor 2 for FY 2017, employing a weighted average of the CBO projections for CY 2016 and CY 2017, was as follows:

- CY 2016 rate of insurance coverage (March 2015 CBO estimate): 89 percent.
- CY 2017 rate of insurance coverage (March 2015 CBO estimate): 90 percent.
- FY 2017 rate of insurance coverage: (89 percent * .25) + (90 percent * .75) = 89.75 percent.
- Percent of individuals without insurance for 2013 (March 2010 CBO estimate): 18 percent.
- Percent of individuals without insurance for FY 2017 (weighted average): 10.25 percent.

$1 - |((0.1025 - 0.18)/0.18)| = 1 - 0.4306 = 0.5694$ (56.94 percent)

0.5694 (56.94 percent) − .002 (0.2 percentage points for FY 2017 under section 1886(r)(2)(B)(i) of the Act) = 0.5674 or 56.74 percent

0.5674 = Factor 2

Therefore, we proposed that Factor 2 for FY 2017 would be 56.74 percent.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25046), we stated that the FY 2017 Proposed Uncompensated Care amount was $\$10,670,529,595.84 \times 0.5674 = \$6,054,458,492.68$.

Comment: A number of commenters expressed concern about the accuracy and transparency of the methodology used to calculate Factor 2. The commenters questioned whether CMS has accounted for factors that affect the percentage of insured individuals, such as the Supreme Court's ruling on Medicaid expansion in *National Federation of Independent Business* v. *Sebelius*, which resulted in some States not expanding their Medicaid programs. One commenter specifically asserted that CMS' methodology for the uncompensated care component of the Medicare DSH calculation does not account for those States that have not yet expanded Medicaid, resulting in an overstated percentage of insured individuals. Another commenter supported using the most recently available CBO estimates for the uninsured, including any revised estimates issued before the final rule. A third commenter believed the CBO estimates to be within reason. This commenter suggested that CMS true-up the factors based on actual data in order to yield the most accurate determination of the factors and the amount available to make uncompensated care payments.

Response: In the FY 2014 IPPS/LTCH PPS final rule, we finalized a policy to employ the most recent available CBO estimate of the rate of uninsurance in the calculation of Factor 2 for FY 2014. We stated that we believe that this approach is consistent with the language of section 1886(r)(2)(B)(i)(II) of the Act. In addition, it is preferable from a statistical point of view to calculate the percent change in the rate of insurance over time using a consistent data source (78 FR 50632). We also used the most recent CBO estimates in the calculation of Factor 2 for FY 2015 and FY 2016, and we continue to believe

that the CBO projections of the insurance coverage are the most appropriate and consistent basis on which to calculate Factor 2 for FY 2017. We note that CBO's coverage projections for CY 2016 and CY 2017 reflect changes in the rate of uninsurance arising from participation in the health insurance exchanges, Medicaid and CHIP enrollment, and changes in employer-sponsor, nongroup, and other insurance coverage. In addition, the estimate reflects other individuals who choose to remain uninsured, despite being eligible for Medicaid or having access to coverage through an employer, the exchange, or from an insurer. Therefore, the CBO estimates do take into account some uncertainties under the Affordable Care Act, including the decisions by States as to whether to expand their Medicaid programs, the different outcomes of Medicaid expansions and changes in insurance coverage status over time. For detailed explanations outlining the methodology and assumptions used by CBO, we refer readers to the CBO Web site and particularly in the Appendix of the March 2016 Updated Budget Projections: 2016–2026 (which are available at *https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/reports/51384-MarchBaseline.pdf*).

With respect to the commenter's concern about employing actual data to reconcile the projections employed to determine Factor 2, in the FY 2014 IPPS/LTCH PPS final rule, we stated that employing actual data would impose an unacceptable delay in the final determination of uncompensated care payments (78 FR 50632). Actual data on the rates of insurance and uninsurance do not become available until several years after the payment year, and the initial data for a year will continue to be adjusted for several years after that as further data become available. Furthermore, by stating that the Secretary's calculations should be based on ''estimates'' provided by the CBO, the statute clearly contemplates the use of such estimates on a prospective basis without reconciliation. Accordingly, we continue to believe that determining Factor 2 prospectively is consistent with the statute and conducive to administrative efficiency, finality, and predictability in payments.

Comment: Several commenters requested that CMS work with Congress to take steps to mitigate the effect of the reduction in the overall amount available to make uncompensated care payments for FY 2017. Some commenters requested that CMS use its authority to decrease the magnitude of the proposed reduction in uncompensated care payments. One commenter requested that CMS maintain the percentage of uninsurance that it had applied in the 2015 calculation until more accurate projections can be made, accounting for those States that have not yet expanded Medicaid. Several commenters asked CMS to ensure the payment methodology does not harm access to care in rural areas.

Response: We thank the commenters for their alternative suggestions. The statute requires us to implement the uncompensated care payment methodology in its entirety for FY 2014 and each subsequent fiscal year. Therefore, we do not believe there is a statutory basis to delay or modify the implementation of Factor 2. The statute also does not provide us with a basis to use the percentage of uninsurance we applied for FY 2015 because section 1886(r)(2)(B)(i)(II) requires us to use the data on the percent of individuals who are uninsured in the most recent period for which data are available, and such data are available for FY 2017. Finally, although we understand the commenters' concerns regarding access to care in rural areas, the statute does not include any exception to the methodology for computing uncompensated care payments for hospitals by geographic location or geographic classification. Therefore, hospitals in rural areas are subject to the same reductions as hospitals elsewhere in the country.

Comment: Several commenters requested that any proposed changes to the methodology that will be used to calculate Factor 2 for FY 2018 and subsequent years be transparent and open for comment in next year's proposed rule. One commenter asked CMS to elaborate on future changes and questioned whether using the CBO's projections of the rate of uninsurance would still be a viable option for determining Factor 2 for future years.

Response: The statute permits the use of a data source other than the CBO estimates to determine the percent change in the rate of uninsurance beginning in FY 2018. Because we did not make a proposal to change the Factor 2 methodology for FY 2018 and subsequent years in the FY 2017 IPPS/LTCH PPS proposed rule, we do not believe it is appropriate to discuss any potential changes to the methodology or the viability of potential alternative data sources in this final rule. We plan to address this issue in the FY 2018 IPPS/LTCH PPS proposed rule.

After consideration of the public comments we received, we calculated the final Factor 2 as follows:

For this FY 2017 IPPS/LTCH PPS final rule, we used the most recently available estimate of the uninsurance rate, which is based on the CBO's March 2016 estimates of the effects of the Affordable Care Act on health insurance coverage (which are available at *http://www.cbo.gov/sites/default/files/cbofiles/attachments/43900-2014-04-ACAtables2.pdf*). The CBO's March 2016 estimate of individuals under the age of 65 with insurance in CY 2016 is 90 percent. Therefore, the CBO's most recent estimate of the rate of uninsurance in CY 2016 is 10 percent (that is, 100 percent minus 90 percent.) The CBO's March 2016 estimate of individuals under the age of 65 with insurance in CY 2017 is also 90 percent. Therefore, the CBO's most recent estimate of the rate of uninsurance in CY 2017 available for the final rule is 10 percent (that is, 100 percent minus 90 percent.)

The calculation of the final Factor 2 for FY 2017, employing a weighted average of the CBO projections for CY 2016 and CY 2017, is as follows:

- CY 2016 rate of insurance coverage (March 2016 CBO estimate): 90 percent.
- CY 2017 rate of insurance coverage (March 2016 CBO estimate): 90 percent.
- FY 2016 rate of insurance coverage: (90 percent * .25) + (90 percent * .75) = 90 percent.
- Percent of individuals without insurance for 2013 (March 2010 CBO estimate): 18 percent.
- Percent of individuals without insurance for FY 2017 (weighted average): 10 percent.

$1 - |((0.10–0.18)/0.18)| = 1 - 0.4444 =$ 0.5555 (55.56 percent)

0.5556 (55.56 percent) − .002 (0.2 percentage points for FY 2017 under section 1886(r)(2)(B)(i) of the Act) = 0.5536 or 55.36 percent

0.5536 = Factor 2

Therefore, the final Factor 2 for FY 2017 is 55.36 percent.

The FY 2017 Final Uncompensated Care Amount is: $10,797,476,782.62 × 0.5536 = $5,977,483,146.86.

FY 2017 Uncompensated Care Total Available	$5,977,483,146.86

c. Calculation of Factor 3 for FY 2017

Section 1886(r)(2)(C) of the Act defines Factor 3 in the calculation of the uncompensated care payment. As we have discussed earlier, section 1886(r)(2)(C) of the Act states that Factor 3 is equal to the percent, for each subsection (d) hospital, that represents

the quotient of (1) the amount of uncompensated care for such hospital for a period selected by the Secretary (as estimated by the Secretary, based on appropriate data (including, in the case where the Secretary determines alternative data are available that are a better proxy for the costs of subsection (d) hospitals for treating the uninsured, the use of such alternative data)); and (2) the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under section 1886(r) of the Act for such period (as so estimated, based on such data).

Therefore, Factor 3 is a hospital-specific value that expresses the proportion of the estimated uncompensated care amount for each subsection (d) hospital and each subsection (d) Puerto Rico hospital with the potential to receive Medicare DSH payments relative to the estimated uncompensated care amount for all hospitals estimated to receive Medicare DSH payments in the fiscal year for which the uncompensated care payment is to be made. Factor 3 is applied to the product of Factor 1 and Factor 2 to determine the amount of the uncompensated care payment that each eligible hospital will receive for FY 2014 and subsequent fiscal years. In order to implement the statutory requirements for this factor of the uncompensated care payment formula, it was necessary to determine: (1) The definition of uncompensated care or, in other words, the specific items that are to be included in the numerator (that is, the estimated uncompensated care amount for an individual hospital) and the denominator (that is, the estimated uncompensated care amount for all hospitals estimated to receive Medicare DSH payments in the applicable fiscal year); (2) the data source(s) for the estimated uncompensated care amount; and (3) the timing and manner of computing the quotient for each hospital estimated to receive Medicare DSH payments. The statute instructs the Secretary to estimate the amounts of uncompensated care for a period based on appropriate data. In addition, we note that the statute permits the Secretary to use alternative data in the case where the Secretary determines that such alternative data are available that are a better proxy for the costs of subsection (d) hospitals for treating individuals who are uninsured.

In the course of considering how to determine Factor 3 during the rulemaking process for FY 2014, we considered defining the amount of uncompensated care for a hospital as the uncompensated care costs of each hospital and determined that Worksheet S–10 of the Medicare cost report potentially provides the most complete data regarding uncompensated care costs for Medicare hospitals. However, because of concerns regarding variations in the data reported on the Worksheet S–10 and the completeness of these data, we did not propose to use data from the Worksheet S–10 to determine the amount of uncompensated care for FY 2014, the first year this provision was in effect, or for FY 2015 and FY 2016. We instead employed the utilization of insured low-income patients, defined as inpatient days of Medicaid patients plus inpatient days of Medicare SSI patients as defined in § 412.106(b)(4) and § 412.106(b)(2)(i) of the regulations, respectively, to determine Factor 3. We believed that these alternative data, which are currently reported on the Medicare cost report, would be a better proxy for the amount of uncompensated care provided by hospitals. We also indicated that we were expecting reporting on the Worksheet S–10 to improve over time and remained convinced that the Worksheet S–10 could ultimately serve as an appropriate source of more direct data regarding uncompensated care costs for purposes of determining Factor 3. In section IV.F.4.d. of the preamble of the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25089), we explained our belief that since the introduction of the uncompensated care payment in FY 2014, hospitals have been submitting more accurate and consistent data through Worksheet S–10 on the Medicare cost report (OMB control number 0938–0050) and that it would be appropriate to begin incorporating Worksheet S–10 data for purposes of calculating Factor 3 starting in FY 2018. As discussed in greater detail in section IV.F.4.d. of the preamble of the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25089) and in section IV.F.4.d. of this final rule, we proposed a methodology and timeline for incorporating Worksheet S–10 data and invited public comments on that proposal. We address the public comments we received on the proposal to incorporate Worksheet S–10 data for purposes of determining Factor 3 starting in FY 2018 in that section of this final rule.

In the FY 2017 IPPS/LTCH PPS proposed rule, we stated that we believe it remains premature to propose the use of Worksheet S–10 data for purposes of determining Factor 3 for FY 2017 because hospitals were not on notice that Worksheet S–10 would be used for purposes of computing uncompensated care payments prior to FY 2014, which could affect the accuracy and completeness of the information reported on Worksheet S–10. As described more fully below regarding the time period of the data used to calculate Factor 3, for FY 2017, we are using data from hospital cost reports that precede FY 2014 to determine Factor 3 of the uncompensated care payment methodology. Therefore, we indicated that, for FY 2017, we remain concerned about the accuracy and consistency of the data reported on Worksheet S–10 and proposed to continue to employ the utilization of insured low-income patients (defined as inpatient days of Medicaid patients plus inpatient days of Medicare SSI patients as defined in § 412.106(b)(4) and § 412.106(b)(2)(i), respectively) to determine Factor 3 (81 FR 25087). We also proposed to continue the policies that were finalized in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50020) to address several specific issues concerning the process and data to be employed in determining Factor 3 in the case of hospital mergers for FY 2017 and subsequent fiscal years (81 FR 25087).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25087), we also proposed to make a change to the data that will be used to calculate Factor 3 for Puerto Rico hospitals. We received a comment in response to the FY 2016 IPPS/LTCH PPS proposed rule requesting that CMS create a proxy for the SSI days used in the Factor 3 calculation for Puerto Rico hospitals (80 FR 49526). Specifically, commenters were concerned that residents of Puerto Rico are not eligible for SSI benefits. Although we did not have logical outgrowth to adopt any change for FY 2016, we indicated that we planned to address this issue in the FY 2017 IPPS/LTCH PPS proposed rule if we also proposed to continue using inpatient days of Medicare SSI patients as a proxy for uncompensated care in FY 2017. We stated in the proposed rule that because we were proposing to continue using insured low-income patient days as a proxy for uncompensated care in FY 2017, we believed it was important to consider the commenter's request regarding the data used to calculate Factor 3 for Puerto Rico hospitals. Accordingly, we proposed to create a proxy for SSI days for Puerto Rico hospitals for use in the Factor 3 calculation. The commenter specifically mentioned the use of inpatient days for Medicare beneficiaries receiving Medicaid as this proxy. We examined this concept but were unable to identify a systematic source for these data for

Puerto Rico hospitals. Specifically, we noted that inpatient utilization for Medicare beneficiaries entitled to Medicaid is not reported by hospitals on the Medicare cost report. Therefore, we sought an alternative method using publicly available Medicare data for determining a proxy to account for the fact that residents of Puerto Rico are not eligible for SSI, and therefore Puerto Rico hospitals have a relatively low number of Medicare SSI days in the Factor 3 computation. We stated that we believe it is appropriate to use data from the Medicare cost report to develop a Puerto Rico Medicare SSI days proxy because they are publicly available, used for payment purposes, and subject to audit. However, we acknowledged that there are other data sources that could be included to develop such a proxy, in particular the SSI ratios posted on the Medicare DSH Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html*, and therefore solicited public comment on their use.

To develop a Puerto Rico Medicare SSI days proxy using data from the Medicare cost report, our Office of the Actuary examined data from 2013 cost reports and analyzed the relationship between Medicare SSI days (estimated using SSI ratios on the cost report and Medicare days from the same cost report) and Medicaid days (reported by the hospitals in accordance with § 412.106(b)(4)). Nationally, excluding Puerto Rico, the Office of the Actuary found that, on average and across States, for every 100 Medicaid inpatient days, hospitals had 14 Medicare SSI days. In other words, the relationship between Medicare SSI days and Medicaid days reported by hospitals in States, excluding Puerto Rico, was approximately 14 percent. We believe it would be appropriate to extrapolate this relationship to Puerto Rico hospitals to approximate how many patient days for these hospitals would be Medicare SSI days if Puerto Rico residents were eligible to receive SSI. Therefore, to calculate Factor 3 for FY 2017, we proposed to use a proxy for Medicare SSI days for each Puerto Rico hospital equal to 14 percent (or 0.14) of its Medicaid days. In other words, for each Puerto Rico hospital, we would compute a value that is equal to 14 percent of its Medicaid days, where Medicaid days are determined in accordance with § 412.106(b)(4). Because this is a proposed proxy for the Puerto Rico hospital's Medicare SSI days, we stated that this value would replace whatever value would otherwise be computed for the hospital under § 412.106(b)(2)(i). Specifically, we would first remove any Medicare SSI days that a Puerto Rico hospital has from our calculation for purposes of determining the numerator of Factor 3 for the hospital and, if the hospital is projected to be eligible for DSH payments in FY 2017, the denominator of Factor 3. Second, we would add the proxy to the hospital's Medicaid days for purposes of determining the numerator of Factor 3 for the hospital and, if the hospital is projected to be eligible for DSH payments in FY 2017, the denominator of Factor 3. We noted that we continue to encourage Puerto Rico hospitals to report uncompensated care costs on Worksheet S–10 of the Medicare cost report completely and accurately in light of our proposal to begin incorporating data from Worksheet S–10 in the computation of hospitals' uncompensated care payments starting in FY 2018, as described in more detail in section IV.F.4.d. of the preamble of the proposed rule.

In summary, we invited public comments on the proposal to continue to use insured low-income days (that is, to use data for Medicaid and Medicare SSI patient days determined in accordance with § 412.106(b)(2)(i) and (b)(4) as a proxy for uncompensated care, as permitted by statute, including a proxy for Medicare SSI days for Puerto Rico hospitals), to determine Factor 3 for FY 2017. We proposed to codify these proposals in our regulations at § 412.106(g)(1)(iii)(C). We also invited public comments on our proposal to continue the policies concerning the process and data to be employed in determining Factor 3 in the case of hospital mergers.

Comment: Several commenters objected to the proposal to calculate Factor 3 for FY 2017 based on a hospital's share of total Medicaid days and Medicare SSI days as a proxy for measuring a hospital's share of uncompensated care costs. These commenters believed that this method is significantly inaccurate as a measure of a hospital's uncompensated care burden. In particular, the commenters asserted that the low-income insured days proxy does not capture the extent to which low-income patients make up a hospital's overall patient population; that the use of only inpatient days does not capture the significant amount of care hospitals provide to low-income patients in the outpatient setting; and that the use of only inpatient days does not account for the full variation in the amount of resources required to treat low-income patients. One commenter suggested that CMS consider modifications to the low-income insured days proxy that the commenter believed would more accurately measure each hospital's uncompensated care burden. The commenter suggested CMS weight each hospital's SSI and Medicaid days in relation to its total patient days, rather than using the SSI and Medicaid days without any weights.

In addition, many commenters who objected to the proposal to use the low-income insured days proxy for FY 2017 believed that its continued use rewards providers in States where Medicaid has expanded, and it is thus inappropriate as a proxy for uncompensated care costs. One commenter stated that using Medicaid and Medicare SSI days to calculate Factor 3 harms hospitals in States with lower Medicaid income eligibility limits and high uncompensated care costs. As an example, this commenter stated that hospitals in Wisconsin have comparably lower Medicaid days, as the State government lowered Medicaid income eligibility limits to 100 percent of the Federal poverty level, yet losses associated with uninsured or underinsured patients remain high. Another commenter stated that, in using low-income insured days to determine a hospital's disproportionate patient percentage, most of the dollars in empirically justified Medicare DSH payments are distributed to hospitals with high Medicaid shares because in the commenter's view Medicaid days are much more common than Medicare SSI days. The commenter stated that there will be no direct payments for uncompensated care costs in FY 2017 because Medicaid and Medicare SSI days will continue to be used as a proxy for uncompensated care costs. The commenter asserted that the net result is that the Medicare Part A Trust Fund will, in effect, provide significant payments for treating Medicaid patients, which are more numerous in Medicaid expansion States.

Some commenters who opposed the low-income insured days proxy believed that using data from Worksheet S–10, coupled with selective auditing, would lead to better estimates of uncompensated care costs than the low-income insured days proxy. These commenters asserted that the use of Worksheet S–10 to distribute uncompensated care payments, coupled with distributing traditional DSH payments based on the disproportionate patient percentage formula, would create more balance between Medicare support of Medicaid patients and Medicare support of the uninsured. Some commenters recommended that

CMS transition as soon as possible away from the low-income insured days proxy and towards the use of Worksheet S–10 data to determine uncompensated care costs, as any delay would perpetuate current inaccuracies and inequities. However, several commenters who disagreed with the use of the low-income insured days proxy for FY 2017 were also not comfortable using data from Worksheet S–10 until CMS changes the form and instructions to improve the accuracy and consistency of the data it collects. Several commenters who disagreed with continued use of the low-income insured days proxy recommended that CMS use a new data source for obtaining data on uncompensated care costs. Potential data sources identified by commenters included a federally administered DSH survey and proxy data from the Bureau of Labor Statistics.

Response: For the reasons we stated in the FY 2014, FY 2015, and FY 2016 IPPS/LTCH PPS final rules, we believe that data on utilization for insured low-income patients are a reasonable proxy for the treatment costs of uninsured patients in FY 2017. Moreover, due to the concerns that continue to be expressed by a large majority of commenters regarding the accuracy and consistency of the data reported on the Worksheet S–10 in its current form, we continue to believe that these alternative data on utilization for insured low-income patients, which are currently reported on the Medicare cost report, remain a better proxy for the amount of uncompensated care provided by hospitals in FY 2017. However, we remain convinced that Worksheet S–10 can ultimately serve as an appropriate source of more direct data regarding uncompensated care costs for purposes of determining Factor 3, as discussed in section IV.F.4.d of the preamble of this final rule.

As discussed in the FY 2016 IPPS/LTCH PPS final rule, in using Medicaid and Medicare SSI days as a proxy for uncompensated care, we recognize it would be possible for hospitals in States that choose to expand Medicaid to receive higher uncompensated care payments because they may have more Medicaid patient days than hospitals in a State that does not choose to expand Medicaid. We note that the earliest Medicaid expansions pursuant to the Affordable Care Act began in 2014. The data that will be used to determine Factor 3 for FY 2017 are from 2011, 2012, and 2013, and therefore do not reflect the effects of these Medicaid expansions. Thus, for the reasons discussed above, we believe that data on insured low-income days remain the best proxy for uncompensated care costs currently available to determine Factor 3 for FY 2017.

Comment: One commenter requested that CMS consider using a proxy for Puerto Rico hospitals' SSI days in computing the empirically justified DSH payment amount, or 25 percent of the amount that would have been paid for Medicare DSH prior to implementation of Section 3133 of the Affordable Care Act. The commenter stated that the use of a proxy in the traditional Medicare DSH formula is a logically and naturally derived conclusion of the proposal to use the overall national average ratio of Medicare SSI days to Medicaid days as a proxy for SSI days in the calculation of Factor 3 for Puerto Rico hospitals. The commenter stated that there is sufficient precedent and legal support for CMS to use a proxy for SSI days for empirically justified Medicare DSH payments to Puerto Rico. Specifically, the commenter stated that the law requires CMS to apply the formula in the same manner and to the same extent in each jurisdiction. The commenter asserted that by not addressing the ineligibility of beneficiaries in the Territories, including Puerto Rico, to receive SSI, the empirically justified DSH payment formula and its resulting payments are not consistent with the requirement to make these payments in the same manner and to same extent as they apply to subsection (d) hospitals. The commenter stated that the result is that the jurisdiction with the highest proportion of low income beneficiaries gets the lowest disproportionate share payment, within the context of the empirically justified DSH payment.

Another commenter believed that the use of a proxy for SSI days to calculate Factor 3 for Puerto Rico hospitals should be accompanied by a corresponding increase in Factor 1. The commenter stated that the increase in Factor 1 is long overdue. The commenter noted that traditional Medicare DSH payments are based in part on the Medicare/SSI fraction, established under 42 U.S.C. 1395ww(d)(5)(D)(vi)(I), which is the percentage of a hospital's inpatients who were entitled to Medicare Part A benefits and were also entitled to Supplemental Security Income (SSI) benefits under Title XVI of the Social Security Act when they were receiving inpatient services at the hospital. The commenter asserted that the problem for Puerto Rico is that it does not have an SSI program, as Congress did not extend that program to Puerto Rico when enacting the Title XVI SSI program. The commenter further suggested that Congress had addressed Puerto Rico's lack of an SSI program in 42 U.S.C. 1395ww(d)(9)(D), which they interpreted to provide that Puerto Rico hospitals are paid DSH ''in the same manner and to the extent'' as hospitals in the 50 States, and as such, inpatient days should be included for Puerto Rico Medicare beneficiary residents who would qualify for SSI benefits if they were residents of a State. The commenter concluded that CMS' interpretation that only Title XVI SSI program days ''count'' when calculating the DSH payment for Puerto Rico hospitals turns the provision at 42 U.S.C. 1395ww(d)(9)(D) from one that was intended to provide for a DSH payment to Puerto Rico hospitals into one that prohibits such a payment.

Response: In the FY 2017 IPPS/LTCH PPS proposed rule, we did not propose to adopt a proxy for Puerto Rico hospitals' SSI days in the calculation of the empirically justified Medicare DSH payment. Therefore, we consider this comment to be outside the scope of the proposed rule. We note, however, that while section 1886(r)(2)(C)(i) of the Act allows for the use of alternative data as a proxy to determine the costs of subsection (d) hospitals for treating the uninsured for purposes of determining uncompensated care payments, section 1886(r)(1) of the Act requires the Secretary to pay an empirically justified DSH payment that is equal to 25 percent of the amount of the Medicare DSH payment that would otherwise be made under section 1886(d)(5)(F) of the Act to a subsection (d) hospital. Because section 1886(d)(5)(F)(vi) of the Act, which prescribes the disproportionate patient percentage used to determine empirically justified Medicare DSH payments, specifically calls for the use of SSI days in the Medicare fraction and does not allow the use of alternative data, we disagree with the commenter that there is legal support for CMS to use a proxy for Puerto Rico hospitals' SSI days in the calculation of the empirically justified Medicare DSH payment. As a result, there is also no basis for us to change our estimate of Factor 1.

Comment: Several commenters supported the proposal to use 14 percent of Medicaid days as a proxy for Medicare SSI days for Puerto Rico Hospitals. These commenters stated that they appreciated the attention and effort of CMS to develop a fair and appropriate method to estimate SSI days for Puerto Rico, as the SSI program is statutorily unavailable to U.S. citizens residing in the Territories. One commenter believed, however, that using a 50 State average ratio of Medicare SSI days to Medicaid days did

not constitute an appropriate proxy in light of Puerto Rico's current economic crisis.

One commenter recognized the Puerto Rico proxy as a positive step taken by CMS, but reiterated its view that Puerto Rico hospitals have been undercompensated since the beginning of the Medicare program in 1986. This commenter noted that the use of SSI eligibility as an indicator of low-income Medicare patients effectively extends the statutory exclusion of Puerto Rico from the SSI program to other Federal programs from which U.S. citizens residing in the Territories are clearly not excluded by statute. This commenter recommended that CMS examine data to evaluate future proxy alternatives, such as using data for Medicare beneficiaries with Medicaid eligibility (dual beneficiaries). The commenter proposed that CMS initiate a plan to work with hospitals in Puerto Rico to formally review and define cost report data for recent years in relation to the documentation of hospital days for dual beneficiaries. As a second step, the commenter recommended that CMS allow hospitals in Puerto Rico to resubmit the pertinent worksheets of the cost reports for past years, to appropriately document the hospital days for dual beneficiaries, including those in the integrated Medicare Platino program that works through membership in the Medicare Advantage program.

Response: We appreciate the support for our proposal to use 14 percent of a Puerto Rico hospital's Medicaid days as a proxy for SSI days. Because we are continuing to use insured low-income patient days as a proxy for uncompensated care in FY 2017 and residents of Puerto Rico are not eligible for SSI benefits, we believe it is important to create a proxy for SSI days for Puerto Rico hospitals in the Factor 3 calculation. Regarding the comment recommending that we use inpatient days for Medicare beneficiaries receiving Medicaid as this proxy, we have examined this concept and have been unable to identify a systematic source for these data for Puerto Rico hospitals. Specifically, we note that inpatient utilization for Medicare beneficiaries entitled to Medicaid is not reported by hospitals on the Medicare cost report, either within or outside Puerto Rico. We may further address issues related to estimating the amount of uncompensated care for hospitals in Puerto Rico in future rulemaking.

As we have done for every proposed and final rule beginning in FY 2014, in conjunction with the FY 2017 IPPS/LTCH PPS proposed rule, we published on the CMS Web site a table listing Factor 3 for all hospitals that we estimate would receive empirically justified Medicare DSH payments in FY 2017 (that is, hospitals that we projected would receive interim uncompensated care payments during the fiscal year), and for the remaining subsection (d) hospitals and subsection (d) Puerto Rico hospitals that have the potential of receiving a Medicare DSH payment in the event that they receive an empirically justified Medicare DSH payment for the fiscal year as determined at cost report settlement. This table also contained a list of the mergers that we are aware of and the computed uncompensated care payment for each merged hospital. Hospitals had 60 days from the date of public display of the FY 2017 IPPS/LTCH PPS proposed rule to review this table and notify CMS in writing of any inaccuracies. Comments could be submitted to the CMS inbox at *Section3133DSH@cms.hhs.gov.* We have addressed these comments as appropriate in the table that we are publishing on the CMS Web site in conjunction with the publication of this FY 2017 IPPS/LTCH final rule. Hospitals will have until August 31, 2016, to review and submit comments on the accuracy of the table. Comments can be submitted to the CMS inbox at *Section3133DSH@cms.hhs.gov* through August 31, 2016, and any changes to Factor 3 will be posted on the CMS Web site prior to October 1, 2016.

Comment: Some commenters provided detailed information regarding specific merger situations involving their hospitals and requested that CMS consider these mergers in determining Factor 3 for FY 2016. One commenter expressed appreciation for the actions CMS took in the FY 2015 rulemaking to combine the low-income insured days of hospitals that merged, where the surviving hospital has accepted assignment of the provider agreement of the retired provider.

Response: We thank the commenters for their input. We have updated our list of mergers based on information submitted by the MACs as of June 2016. In addition, we have reviewed the commenters' submissions of mergers not previously identified in the proposed rule and have updated our list accordingly.

The statute also allows the Secretary the discretion to determine the time periods from which we will derive the data to estimate the numerator and the denominator of the Factor 3 quotient. Specifically, section 1886(r)(2)(C)(i) of the Act defines the numerator of the quotient as the amount of uncompensated care for such hospital *for a period selected by the Secretary.* Section 1886(r)(2)(C)(ii) of the Act defines the denominator as the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under section 1886(r) of the Act *for such period.* In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50638), we adopted a process of making interim payments with final cost report settlement for both the empirically justified Medicare DSH payments and the uncompensated care payments required by section 3133 of the Affordable Care Act. Consistent with that process, we also determined the time period from which to calculate the numerator and denominator of the Factor 3 quotient in a way that would be consistent with making interim and final payments. Specifically, we must have Factor 3 values available for hospitals that we estimate will qualify for Medicare DSH payments and for those hospitals that we do not estimate will qualify for Medicare DSH payments but that may ultimately qualify for Medicare DSH payments at the time of cost report settlement.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50638) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50018), we finalized a policy of using the most recent available full year of Medicare cost report data for determining Medicaid days and the most recently available SSI ratios to calculate Factor 3. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49528), we held constant the cost reporting years used to determine Medicaid days in the calculation of Factor 3. That is, instead of calculating the numerator and the denominator of Factor 3 for hospitals based on the most recently available full year of Medicare cost report data with respect to a Federal fiscal year, we used data from the more recent of the cost report years (2012/2011) used to determine Medicaid days in FY 2015. We made this change in order to refine the balance between the recency and accuracy of the data used in the Factor 3 calculation. Because we make prospective determinations of the uncompensated care payment without reconciliation, we believed this change would increase the accuracy of the data used to determine Factor 3, and accordingly each eligible hospital's allocation of the overall uncompensated care amount by providing hospitals with more time to submit these data before they are used in the computation of Factor 3. As in prior years, if the more recent of the two cost reporting periods did not reflect data for a 12-month

period, we used data from the earlier of the two periods so long as that earlier period reflected data for a period of 12 months. If neither of the two periods reflected 12 months, we used the period that reflected a longer amount of time. We also finalized a proposal to continue to extract Medicaid days from the most recent HCRIS database update and to use Medicare SSI days from the most recent SSI ratios available to us during the time of rulemaking to calculate Factor 3. In the FY 2016 IPPS/LTCH PPS final rule, we stated that, for subsequent fiscal years, if we propose and finalize a policy of using insured low-income days in computing Factor 3, we would continue to use the most recent HCRIS database extract at the time of the annual rulemaking cycle, and to use the subsequent year of cost reports (that is, to advance the 12-month cost reports by 1 year). In addition, we stated that for any subsequent fiscal years in which we finalize a policy to use insured low-income days to compute Factor 3, our intention would be to continue to use the most recently available SSI ratio data at the time of annual rulemaking to calculate Factor 3. We believed that it was appropriate to state our intentions regarding the specific data we would use in the event Factor 3 was determined on the basis of low-income insured days for subsequent years to provide hospitals with as much guidance as possible so they may best consider how and when to submit cost report information in the future. We noted that we would make proposals with regard to our methodology for calculating Factor 3 for subsequent fiscal years through notice-and-comment rulemaking.

Since the publication of the FY 2016 IPPS/LTCH PPS final rule, we have learned that some members of the hospital community have been disadvantaged by our policy of using only one cost reporting period to determine their share of uncompensated care. Specifically, many hospitals have reported unpredictable swings and anomalies in their low-income insured days between cost reporting periods. These hospitals expressed concern that the use of only one cost reporting period is a poor predictor of their future uncompensated care burden and results in inadequate payments. We stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25089) that, because the data used to make uncompensated care payment determinations are not subject to reconciliation after the end of the fiscal year, we believe that it would be appropriate to expand the time period for the data used to calculate Factor 3 from one cost reporting period to three cost reporting periods. We stated that using data from more than one cost reporting period would mitigate undue fluctuations in the amount of uncompensated care payments to hospitals from year to year and smooth over anomalies between cost reporting periods. Moreover, we believed this policy would have the benefit of supplementing the data of hospitals that filed cost reports that are less than 12 months, such that the basis of their uncompensated care payments and those of hospitals that filed full-year 12-month cost reports would be more equitable. We stated that we believe that computing Factor 3 using data from three cost reporting periods would best stabilize hospitals' uncompensated care payments while maintaining the recency of the data used in the Factor 3 calculation. We indicated that we believe using data from two cost reporting periods would not be as stable while using data from more than three cost reporting periods could result in using overly dated information.

Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25089), we proposed to use an average of data derived from three cost reporting periods instead of one cost reporting period to compute Factor 3 for FY 2017. That is, we would calculate a Factor 3 for each of the three cost reporting periods and calculate the average. We would calculate the average by adding these amounts together, and dividing the sum by three, in order to calculate Factor 3 for FY 2017. Consistent with the policy adopted in the FY 2016 IPPS/LTCH PPS final rule, we proposed to advance the most recent cost report years used to obtain Medicaid days and Medicare SSI days in FY 2017 by one year and to continue to extract Medicaid days data from the most recent update of HCRIS. We note that, in the FY 2017 IPPS/LTCH PPS proposed rule, we inadvertently stated that the most recent update of HCRIS would be the March 2015 update of HCRIS. We clarify here that the most recently available data for purposes of determining Factor 3 for FY 2017 is from the March 2016 update of HCRIS. If the hospital does not have data for one or more of the three cost reporting periods, we proposed to compute Factor 3 for the periods available and average those. In other words, we would divide the sum of the individual Factor 3s by the number of cost reporting periods for which there are data. If two hospitals have merged, we would combine data from both hospitals for the cost reporting periods in which the merger is not reflected in the surviving hospital's cost report data to compute Factor 3 for the surviving hospital. Moreover, to further reduce undue fluctuations in a hospital's uncompensated care payments, if a hospital filed multiple cost reports beginning in the same fiscal year, we proposed to combine data from the multiple cost reports so that a hospital may have a Factor 3 calculated using more than one cost report within a cost reporting period. We invited public comments on this proposal, which we describe more fully below.

For the FY 2016 IPPS/LTCH PPS final rule, we used the most recent of hospitals' 12-month 2012 or 2011 cost reports and 2012 cost report data submitted to CMS by IHS hospitals to obtain the Medicaid days to calculate Factor 3. In addition, we used Medicare SSI days from the FY 2013 SSI ratios published on the following CMS Web site to calculate Factor 3: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html*.

Under our proposal to calculate Factor 3 for FY 2017 using data from three cost reporting periods, we proposed to use data from hospitals' FY 2011, FY 2012, and FY 2013 cost reporting periods extracted from the most recent update of the hospital cost report data in the HCRIS database and the FY 2011 and FY 2012 cost report data submitted to CMS by IHS hospitals to obtain the Medicaid days to calculate Factor 3. (We note that, starting with the FY 2013 cost reports, data for IHS hospitals will be included in the HCRIS database and will no longer be submitted separately.) In addition, to calculate Factor 3 for FY 2017, we anticipated that, under our proposal discussed earlier to use the most recent available 3 years of data on Medicare SSI utilization, we would obtain Medicare SSI days from the FY 2012, FY 2013, and FY 2014 SSI ratios (or, for Puerto Rico hospitals, substitute Medicare SSI days with a proxy as described earlier). We indicated that we expected the FY 2014 SSI ratios to be published on the CMS Web site when available at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html*. Under this proposal, we would calculate Factor 3 as follows:

Step 1: Calculate Factor 3 for FY 2011 by summing a hospital's FY 2011 Medicaid days and FY 2012 SSI days and dividing by all DSH eligible hospitals' FY 2011 Medicaid days and FY 2012 SSI days.

Step 2: Calculate Factor 3 for FY 2012 by summing a hospital's FY 2012 Medicaid days and FY 2013 SSI days

and dividing by all DSH eligible hospitals' FY 2012 Medicaid days and FY 2013 SSI days.

Step 3: Calculate Factor 3 for FY 2013 by summing a hospital's FY 2013 Medicaid days and FY 2014 SSI days and dividing by all DSH eligible hospitals' FY 2013 Medicaid days and FY 2014 SSI days.

Step 4: Sum the Factor 3 calculated for FY 2011, FY 2012, and FY 2013 and divide by the number of cost reporting periods with data to compute an average Factor 3.

For illustration purposes, in Table 18 associated with the FY 2017 IPPS/LTCH PPS proposed rule (which is available via the Internet on the CMS Web site), we computed Factor 3 using hospitals' FY 2011, FY 2012, and FY 2013 cost reports from the December 2015 update of HCRIS to obtain Medicaid days and the FY 2012 and FY 2013 SSI ratios published on the following CMS Web site to determine Medicare SSI days: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html*. As discussed in the proposed rule (81 FR 25089), the FY 2014 SSI ratios were not available in time to be used in the proposed rule. Therefore, for the proposed rule, we computed Factor 3 for FY 2013 using FY 2013 Medicaid days and FY 2013 SSI days. However, we noted that we expected the FY 2014 SSI ratios to be available to calculate Factor 3 for the FY 2017 IPPS/LTCH PPS final rule.

For subsequent years, we proposed to continue to use the most recent HCRIS database extract at the time of the annual rulemaking cycle and to advance the three cost reporting periods used to determine Factor 3 by 1 year as appropriate. For instance, if we were to finalize a proposal to continue using the proxy in FY 2018, we would use FY 2012, FY 2013, and FY 2014 cost reports from the most recent available extract of HCRIS for Medicaid days and FY 2013, FY 2014, and FY 2015 SSI ratios to obtain the Medicare SSI days and follow the same methodology outlined earlier to determine Factor 3. However, we also stated that we believed that it would be possible to begin incorporating data from Worksheet S–10 into the computation of Factor 3 starting in FY 2018 and outlined a proposal for doing so using data from three cost reporting periods in section IV.F.4.d. of the preamble of the proposed rule.

Comment: Many commenters supported the proposal to expand the time period for the data used to calculate hospitals' Medicaid and Medicare Supplemental Security Income (SSI) inpatient days from one year to three years, and specifically to use an average of data derived from three cost reporting periods instead of one cost reporting period to compute Factor 3 for FY 2017. The commenters believed that using 3 years of data would provide assurance that hospitals' uncompensated care payments remain stable and predictable, and would not be subject to unpredictable swings and anomalies in a hospital's low-income insured days.

Response: We thank the commenters for their input. We appreciate the commenters' support for the use of a 3-year blend in the low-income insured days proxy methodology.

Comment: Several commenters expressed concern about the method CMS has proposed to attribute data to each year when performing the calculation of Factor 3 in the three-year proxy model for FY 2017. Commenters noted that the proposed methodology could pose a problem for some hospitals that file multiple cost reports in a single fiscal year. One commenter stated, for example, that a hospital might file a 6-month cost report and an 18-month cost report as the result of a merger midway through the cost reporting period. The commenter noted that this keeps the data separate for the individual and merged facilities but also enables them to preserve the surviving hospital's cost-reporting period in the future. The commenter believed that, in such an instance, the proposed methodology would attribute 2 years of data to a single year and no data to the following year. Thus, the commenter asserted that, under the 3-year average methodology, the hospital's data would be overstated because 3 years of data would be used to calculate two Factor 3s that would then be averaged together to determine the final Factor 3. Conversely, the commenter noted that if a hospital has only a short cost reporting period beginning in a year, the hospital could be disadvantaged by the calculation. This commenter asked CMS to modify its proposal to appropriately attribute portions of the cost reporting period to the period for which it is calculating a Factor 3.

Another commenter opposed the use of multiple cost reporting periods if it would result in a hospital having more than 12 months of data in the Factor 3 calculation for a year, and recommended that CMS prorate the data down to a 12-month period. Similarly, commenters recommended that CMS annualize cost report data for any cost reporting period that is less than 12 months that began during the fiscal year from which the data is taken. One commenter suggested that if a hospital has two cost reporting periods that began during the same fiscal year and one of those cost reporting periods is a 12-month cost reporting period, only the 12-month cost reporting period should be utilized.

One commenter questioned whether the rules pertaining to ''New Hospitals'' adopted in previous rules apply to FY 2017. This commenter asked specifically whether new hospitals will be paid through an alternative methodology if full 12-month cost reports are not available for one or more of the three cost reporting periods used to calculate Factor 3. The commenter believed that using a partial cost reporting period under this averaging methodology will harm new facilities, and suggested that for new hospitals a partial cost reporting year should be removed from the calculation. The commenter stated that this methodology would be the most consistent with the payment it has received through the Medicare Cost Report filing calculations related to ''New Hospitals'' in the past.

Response: We appreciate the commenters raising these data concerns and areas of needed clarification. We are finalizing our proposal to calculate Factor 3 for FY 2017 using the average of data from three cost reporting periods. To further reduce undue fluctuations in a hospital's uncompensated care payments, if a hospital filed multiple cost reports beginning in the same fiscal year, we also are finalizing our proposal to combine data from the multiple cost reports so that a hospital may have a Factor 3 calculated using more than one cost report within a cost reporting period. We are clarifying that if the hospital does not have data for one or more of the three cost reporting periods, we will compute Factor 3 for the periods available and average those. In other words, we will divide the sum of the individual Factor 3s by the number of cost reporting periods for which there are data. For new hospitals that do not have data for any of the three cost reporting periods used in the proposed Factor 3 calculation, we will apply the new hospital policy finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50643). That is, the hospital will not receive either interim empirically justified Medicare DSH payments or interim uncompensated care payments; however, if it is later determined to be eligible to receive empirically justified Medicare DSH payments based on its FY 2017 cost report, the hospital will also receive an uncompensated care payment calculated using a Factor 3, where the numerator is the sum of Medicaid days and Medicare SSI days

reported on the hospital's FY 2017 cost report. We did not make a proposal to annualize cost reports to calculate Factor 3 in the FY 2017 IPPS/LTCH PPS proposed rule. We note that section 1886(r)(2)(c) of the Act specifies that Factor 3 is equal to the percent that represents the amount of uncompensated care for such hospital for a period selected by the Secretary (as estimated by the Secretary, based on appropriate data) divided by the aggregate amount of uncompensated care for all subsection (d) hospitals that receive a payment under this subsection for such period (as so estimated). In implementing this provision, we believe it is appropriate to first select the period—in this case, 3 separate years of data—and then to utilize data from all cost reports that align with these periods. However, we acknowledge that the situations presented by commenters, including both long and short cost reporting periods, pose unique challenges in the context of estimating Factor 3. As a result, this is an issue that we intend to consider further and may address in future rulemaking.

Comment: One commenter expressed concern about our policy of distributing uncompensated care payments as a per-discharge add-on. The commenter believed this policy is problematic because the per-discharge add-on varies widely from hospital to hospital. The commenter noted that the variability of the add-on payments in turn distorts the MS–DRG prices and creates problematic incentives for MA plans. Therefore, the commenter believed that it would be better to make a uniform interim add-on payment to all DSH hospitals in a county, and any underpayments or overpayments to an individual hospital could be corrected at year-end settlement or on an interim basis during the year (as is already necessary under the current system). Alternatively, the commenter suggested that DSH payments be distributed to hospitals on a periodic basis for their FFS and MA patients.

Response: We consider this comment to be outside the scope of the proposed rule, as we did not propose any revision in our method of making interim payments for uncompensated care. However, we would like to make two observations in response to this recommendation. The first observation is that we have received very few comments from the hospital industry indicating that the problem cited by this commenter actually exists. We would expect that, if hospitals were truly disadvantaged in the manner cited by these commenters by our methodology for making interim payment uncompensated care payments, we would have received many more comments to that effect. The second observation is that adopting the recommendation may pose, for some hospitals, serious problems that may conceivably exceed the problem that the recommendation is designed to solve. For example, reducing the interim uncompensated care payments to high DSH hospitals to a countywide average payment might cause serious cash flow problems during the period before the interim payments could be adjusted or settled. Similarly, low DSH hospitals might receive significantly higher interim payments than would be warranted by their actual uncompensated care data. As a result, these hospitals would have to take financial management steps to ensure that they are capable of making significant repayments when interim payments are adjusted or settled.

Comment: One commenter stated that some of the participants in the *Allina* litigation have been advised to include beneficiaries that are enrolled in Medicare Part C and eligible for Medicaid on their cost report as Medicaid days. However, the commenter noted that, rather than reporting dually eligible MA days as Medicaid days in their cost report, some providers are protesting these days and are not including them when they file their filed cost reports. The commenter believed that those providers who are protesting these days rather than including them as Medicaid days are being harmed compared to the providers that include them. The commenter requested that CMS clarify its policy and adjust the days that are reported on Worksheet S–2 as necessary for use in uncompensated care payment calculations. The commenter asserted that hospitals are not being fairly paid for uncompensated care because some providers are including dually eligible MA days in their Medicare cost report.

Response: If hospitals are inappropriately reporting dually eligible MA claims in the cost report as Medicaid days, the commenter is correct that, absent review and/or adjustment by the MAC, it would result in Factor 3 overstating the amount of uncompensated care provided by those hospitals relative to other hospitals. We reiterate our policy that MA beneficiaries who are also eligible for Medicaid are patients entitled to Medicare Part A. Accordingly, their patient days are included in the Medicare SSI ratio and therefore should not be reported in the cost report as Medicaid days. Hospitals that exclude the MA days of patients who are also eligible for Medicaid from Worksheet S–2 are reporting these days appropriately.

After consideration of the public comments we received, we continue to believe that using low-income insured days as a proxy for uncompensated care costs provides a reasonable basis to determine Factor 3 for FY 2017, as we work to improve Worksheet S–10 to accurately and consistently capture uncompensated care costs. Accordingly, in this final rule, we are finalizing for FY 2017 the policy that we originally adopted in the FY 2014 IPPS/LTCH PPS final rule, of employing the utilization of insured low-income patients, defined as inpatient days of Medicaid patients plus inpatient days of Medicare SSI patients as defined in § 412.106(b)(4) and § 412.106(b)(2)(i), respectively, to determine Factor 3 for FY 2017. We also are finalizing our proposal to use 14 percent of Medicaid days as a proxy for SSI days for Puerto Rico hospitals when determining Factor 3 for FY 2017; our proposal to continue the policies concerning the process and data to be employed in determining Factor 3 in the case of hospital mergers; our proposal to expand the time period of the data used to determine Factor 3 from one cost reporting period to three cost reporting periods as well as the accompanying methodology; and our proposal to combine cost reports for hospitals with more than one cost report within a cost reporting period. We are codifying these changes for FY 2017 by amending the regulation at § 412.106(g)(1)(iii)(C).

d. Calculation of Factor 3 for FY 2018 and Subsequent Years

(1) Background

In response to commenters' requests for a timeline and transition for introducing Worksheet S–10 data into the calculation of Factor 3 (for example, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49524)), in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25089 through 25094), we discussed our proposed plans for how to begin incorporating hospitals' Worksheet S–10 data into the calculation of Factor 3, in order to allocate payments based on a hospital's share of overall uncompensated care costs reported on Worksheet S–10. When we first discussed using Worksheet S–10 to allocate hospitals' shares of uncompensated care costs in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50638), we explained why we believed that it was premature to use uncompensated care costs reported on Worksheet S–10 for FY 2014. Specifically, at that time, the most recent available cost reports would have

been from FYs 2010 and 2011, which were submitted on or after May 1, 2010, when the new Worksheet S–10 went into effect. We believed that ''[c]oncerns about the standardization and completeness of the Worksheet S–10 data could be more acute for data collected in the first year of the Worksheet's use'' (78 FR 50635). In addition, we believed that it would be most appropriate to use data elements that have been historically publicly available, subject to audit, and used for payment purposes (or that the public understands will be used for payment purposes) to determine the amount of uncompensated care for purposes of Factor 3 (78 FR 50635). At the time we issued the FY 2014 IPPS/LTCH PPS final rule, we did not believe that the available data regarding uncompensated care from Worksheet S–10 met these criteria and, therefore, we believed they were not reliable enough to use for determining FY 2014 uncompensated care payments. Accordingly, for FY 2014, we concluded that utilization of insured low-income patients would be a better proxy for the costs of hospitals in treating the uninsured. For FYs 2015, 2016, and 2017, the cost reports used for calculating uncompensated care payments (that is, FYs 2011, 2012, and 2013) were also submitted prior to the time that hospitals were on notice that Worksheet S–10 could be the data source for calculating uncompensated care payments. Therefore, we believe it is also appropriate to use proxy data to calculate Factor 3 for these years.

We stated in the proposed rule that we believe that, for FY 2018, many of these concerns would no longer be relevant. That is, as described more fully below regarding the use of Worksheet S–10 from FY 2014, hospitals were on notice as of FY 2014 that Worksheet S–10 could eventually become the data source for CMS to calculate uncompensated care payments. Hospitals' cost reports from FY 2014 have been publically available for some time now. Furthermore, MedPAC has provided analyses that found that current Worksheet S–10 data are a better proxy for predicting audited uncompensated care costs than Medicaid/Medicare SSI days. Specifically, MedPAC submitted a public comment discussed in the FY 2016 IPPS/LTCH PPS final rule that cited its 2007 analysis of data from the Government Accountability Office (GAO) and data from the American Hospital Association (AHA), which suggests that Medicaid days and low-income Medicare days are not a good proxy for uncompensated care costs (80 FR 49525). Analysis performed by MedPAC showed that the correlation between audited uncompensated care data from 2009 and the data from the FY 2011 Worksheet S–10 was over 0.80, as compared to a correlation of approximately 0.50 for 2011 Medicare SSI and Medicaid days. MedPAC concluded that use of Worksheet S–10 data was already better than using Medicare SSI and Medicaid days as a proxy for uncompensated care costs, and that the data on Worksheet S–10 would improve over time as the data are actually used to make payments.

As we discussed in the FY 2017 IPPS/LTCH PPS proposed rule, we also have undertaken an extensive analysis of the Worksheet S–10 data, benchmarking it against the data on uncompensated care costs reported to the Internal Revenue Service (IRS) on Form 990 by not-for-profit hospitals. The purpose of this analysis, performed by Dobson DaVanzo & Associates, LLC, under contract to CMS, was to determine if Worksheet S–10 uncompensated care data are becoming more stable over time. (This analysis, included in a report entitled ''Improvements to Medicare Disproportionate Share Hospital (DSH) Payments Report: Benchmarking S–10 Data Using IRS Form 990 Data and Worksheet S–10 Trend Analyses,'' is available on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html* under the Downloads section.) Although we acknowledge that the analysis was limited to not-for-profit hospitals, we believe it is relevant to our assessment of the overall quality of the data reported on Worksheet S–10. Because many not-for-profit hospitals are eligible for empirically justified Medicare DSH payments and, therefore, uncompensated care payments, they represent a suitable standard of comparison. We conducted an analysis of 2010, 2011, and 2012 Worksheet S–10 data and IRS Form 990 data from the same years. Using IRS Form 990 data for tax years 2010, 2011, and 2012 (the latest available years) as a benchmark, we compared key variables derived from Worksheet S–10 and IRS Form 990 data, such as charity care and bad debt. The analysis was completed using data from hospitals that had completed both Worksheet S–10 and IRS Form 990 across all study years, yielding a sample of 788 not-for-profit hospitals (representing 668 unique Taxpayer Identification Numbers). Because Factor 3 is used to determine the Medicare uncompensated care payment amount for each hospital, we calculated the amounts for Factor 3 for the matched hospitals using charity care and bad debt, and compared the Factor 3 distributions calculated using data from IRS Form 990 and Worksheet S–10. Key findings indicate that the amounts for Factor 3 derived using the IRS Form 990 and Worksheet S–10 data are highly correlated. In addition, the correlation coefficient between the amounts for Factor 3 calculated from the IRS Form 990 and Worksheet S–10 has increased over time, from 0.71 in 2010 to 0.80 in 2012, suggesting some convergence in the data sources over time. In the proposed rule, we stated that this strong correlation indicates that Worksheet S–10 data would be a statistically valid source to use as part of the calculation of the uncompensated care payments in FY 2018.

Accordingly, because hospitals have been on notice since the FY 2014 rulemaking that CMS intended eventually to use Worksheet S–10 as the data source for calculating uncompensated care payments, and in light of growing evidence that Worksheet S–10 data are improving over time, at the time of development of the proposed rule, we believed it would be appropriate to use Worksheet S–10 as a data source for determining Factor 3 starting in FY 2018. We discuss below our proposed methodology for how we would begin to incorporate Worksheet S–10 data into the calculation of Factor 3 of the uncompensated care payment methodology.

(2) Data Source and Time Period for FY 2018 and Subsequent Years, Including Methodology for Incorporating Worksheet S–10 Data

For the reasons explained in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR25090), we believed that it would be appropriate to begin to incorporate Worksheet S–10 data into the computation of Factor 3 and the allocation of uncompensated care payments, starting with Worksheet S–10 data reported for FY 2014. Below is a description of the proposal set forth in the proposed rule. Specifically, we proposed to continue to use low-income insured patient days as a proxy for uncompensated care for cost reporting periods before FY 2014 and to use Worksheet S–10 data for FY 2014 and subsequent fiscal years to calculate uncompensated care payments for FY 2018 and subsequent fiscal years, which, when combined with our proposal to use data from three cost reporting periods to calculate Factor 3 starting in FY 2017, would have the effect of transitioning toward exclusive

use of Worksheet S–10 data. Under this proposed approach, we would use only Worksheet S–10 data to calculate Factor 3 for FY 2020 and subsequent fiscal years.

As discussed previously, for FY 2017, we proposed and are finalizing a policy of calculating a hospital's share of uncompensated care based on the proxy of its share of low-income insured days using a time period that includes three cost reports (that is, FY 2011, FY 2012, and FY 2013 cost reports). For the reasons we described earlier, we believe it would not be appropriate to use Worksheet S–10 data for periods prior to FY 2014. For cost reporting periods prior to FY 2014, we believe it is appropriate to continue to use low-income insured days for the reasons we have previously described. Accordingly, to determine Factor 3 for FY 2018, with a time period that includes three cost reporting periods consisting of FY 2014 and two preceding periods, we proposed to use Worksheet S–10 data for the FY 2014 cost reporting period and the low-income insured days proxy data for the two earlier cost reporting periods, drawing three sets of data from the most recently available HCRIS extract. That is, for FY 2018, to compute Factor 3, we proposed to continue to advance the 3-year time period we are using by 1 year and therefore to use FY 2012, FY 2013, and FY 2014 cost report data from the most recent update of HCRIS. In addition, for FY 2018, we proposed to use Medicaid days from FY 2012 and FY 2013 cost reports and FY 2014 and FY 2015 SSI ratios. We stated our belief that this approach would have a transitioning effect of incorporating data from Worksheet S–10 into the calculation of Factor 3 starting in FY 2018.

Consistent with our proposal to determine Factor 3 using data over a period of 3 cost reporting periods, we proposed to calculate a Factor 3 for each of the three cost reporting periods. Specifically, we proposed to calculate Factor 3 for FY 2018 based on an average of Factor 3 calculated using low-income insured days (proxy data) determined using Medicaid days from FY 2012 and FY 2013 cost reports and FY 2014 and FY 2015 SSI ratios, and Factor 3 calculated using uncompensated care data based on FY 2014 Worksheet S–10. We proposed to compute this average for each hospital by—

- Step 1: Calculating Factor 3 using the low-income insured days proxy based on FY 2012 cost report data and the FY 2014 SSI ratio;
- Step 2: Calculating Factor 3 using the insured low-income days proxy based on FY 2013 cost report data and the FY 2015 SSI ratio;
- Step 3: Calculating Factor 3 based on the FY 2014 Worksheet S–10 data; and
- Step 4: Averaging the Factor 3 values that are computed in Steps 1, 2, and 3; that is, adding the Factor 3 values from FY 2012, FY 2013, and FY 2014 for each hospital, and dividing that amount by the number of cost reporting periods with data to compute an average Factor 3.

The denominator would be the sum of the averages of the FY 2012, FY 2013, and FY 2014 amounts from Step 4 for each hospital that is estimated to be eligible for Medicare DSH payments in FY 2018. For example, assuming there are only three hospitals in the IPPS and Hospitals A and B are estimated to be eligible for Medicare DSH payments in FY 2018, while Hospital C is estimated as ineligible for Medicare DSH payments in FY 2018, each hospital's proposed share of the overall amount available for uncompensated care payments would be calculated as follows:

[(Hospital A FY 2012 Factor 3 proxy) + (Hospital A FY 2013 Factor 3 proxy) + (Hospital A FY 2014 Factor 3 S–10)]/3 = X

[(Hospital B FY 2012 Factor 3 proxy) + (Hospital B FY 2013 Factor 3 proxy) + (Hospital B FY 2014 Factor 3 S–10)]/3 = Y

[(Hospital C FY 2012 Factor 3 proxy) + (Hospital C FY 2013 Factor 3 proxy) + (Hospital C FY 2014 Factor 3 S–10)]/3 = Z

Hospital A's Factor 3 or proposed share of the overall uncompensated care amount in FY 2018 would be equal to (X)/(X+Y).

Hospital B's Factor 3 or proposed share of the overall uncompensated care amount in FY 2018 would be equal to (Y)/(X+Y).

Hospital C's Factor 3 or proposed share of the overall uncompensated care amount in FY 2018 would be equal to (Z)/(X+Y).

We noted that, under this proposal, the methodology for calculating Factor 3 for each subsequent year would remain unchanged (such as using all cost reports for eligible hospitals that begin during the relevant cost reporting years, including cost reporting periods that are not 12 months in length, and using a proxy for Medicare SSI days for hospitals in Puerto Rico, as described earlier for the calculation of Factor 3 for FY 2017). With regard to FY 2019 and subsequent years, we stated our belief that it would continue to be appropriate to advance the 3-year time period used to compute Factor 3 by one year. Accordingly, we proposed to use FY 2013, FY 2014, and FY 2015 cost report data from the most recent available update of HCRIS to compute Factor 3 and allocate uncompensated care payments for FY 2019. As we stated earlier, with regard to the data used to compute Factor 3, we believed that it would be appropriate to use Worksheet S–10 data from FY 2014 and subsequent periods to calculate Factor 3 and hospitals' uncompensated care payments for FY 2018 and subsequent fiscal years. Because we proposed to use FY 2013, FY 2014, and FY 2015 cost reports to determine Factor 3 for FY 2019, we proposed to calculate Factor 3 with a proxy calculated based on FY 2013 cost report data and FY 2015 SSI ratios and based on Worksheet S–10 uncompensated care costs from FY 2014 and FY 2015 cost reports. We proposed to calculate Factor 3 for FY 2019 based on an average of Factor 3 amounts calculated using data from the three cost reporting periods in the manner described earlier for FY 2018. For FY 2020, we proposed to continue to advance the three cost reports used by 1 year, and we proposed to calculate Factor 3 using only data from the Worksheet S–10, from cost reports from FY 2014, FY 2015, and FY 2016. For FY 2021 and subsequent fiscal years, we proposed to continue to base our estimates of the amount of hospital uncompensated care on uncompensated care costs, using three cost reporting periods from the most recently available HCRIS database, and in each fiscal year, the cost reporting periods would be advanced forward by 1 year (for example, for FY 2021, FY 2015, FY 2016, and FY 2017 cost reports would be used). We solicited comments on the proposed data sources, time periods, and method for calculating uncompensated care costs in FY 2018 and subsequent years.

Although we proposed to calculate Factor 3 for FY 2018 based on an average of the Factor 3 amounts calculated using 2 years of proxy data and 1 year of data from the FY 2014 Worksheet S–10, we stated that readers might find it useful to review a file posted on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html* under the Downloads section, which shows preliminary uncompensated care costs calculated by hospital using only Worksheet S–10 data from FY 2014 cost reports extracted from the December 2015 update of HCRIS. To the extent that hospitals had either not submitted

a Worksheet S–10 with their FY 2014 cost report or found errors on a submitted Worksheet S–10, we encouraged hospitals to work with MACs to complete and revise, as appropriate, their FY 2014 Worksheet S–10 as soon as possible.

Comment: A few commenters supported CMS' proposal to transition to the use of Worksheet S–10 to derive uncompensated care costs for the calculation of Factor 3. MedPAC stated that using Worksheet S–10 data, in conjunction with select auditing of cost reports of hospitals reporting the highest levels of uncompensated care, would lead to better estimates of uncompensated care costs than the continued use of the current proxy of Medicaid and SSI days. Several commenters including MedPAC supported using Worksheet S–10 beginning in FY 2018 with a 3-year phase in. Other commenters recommended accelerating the timeline for implementation of Worksheet S–10, for example, beginning the transition in FY 2017 or shortening the phase in period. These commenters noted that the metrics from Worksheet S–10 appear to provide a better assessment of a hospital's uncompensated care costs than the current metrics used, which assess low-income insured days.

Response: We appreciate the support for our proposal to begin to incorporate Worksheet S–10 data into the computation of Factor 3 for FY 2018. However, as explained in more detail in response to comments below, after considering the overwhelming amount of comments urging additional delay in implementation of Worksheet S–10 data, we are not finalizing our proposal to begin to incorporate Worksheet S–10 data into the computation of Factor 3 for FY 2018. Instead, we believe it is important that we have the opportunity to consider further the concerns raised by commenters regarding the use of Worksheet S–10 data to determine Factor 3. We expect to re-propose a policy of incorporating Worksheet S–10 data into the computation of Factor 3 no later than FY 2021, as explained further below.

Comment: Many commenters opposed the use of Worksheet S–10 to compute Factor 3 and allocate uncompensated care costs beginning in FY 2018. Commenters believed that the form does not measure the amount of uncompensated care that section 3133 of the Affordable Care Act is designed to compensate. These commenters stated that in their view, data from Worksheet S–10 are not presently a reliable and accurate reflection of uncompensated care costs. Many commenters expressed concern about the lack of accurate and consistent data being reported on Worksheet S–10, primarily due to what they perceive as a lack of clear and concise line level instructions. Commenters stated that significant modifications should be made to Worksheet S–10 and the corresponding instructions as to how to report information for each line to clarify the intent.

Commenters also called for audits of Worksheet S–10 and audit guidelines for charity care and bad debt. These commenters supported the transition through a phase-in approach once CMS ensures the accuracy and consistency of the data from Worksheet S–10. One commenter noted that CMS may wish to monitor changes in hospital-specific data from Worksheet S–10 from year to year to determine if further guidance is needed regarding how to accurately complete the form and monitor Worksheet S–10 data for accuracy.

Many commenters cited the report from Dobson DaVanzo, ''Improvements to Medicare Disproportionate Share Hospital (DSH) Payments Report: Benchmarking S–10 Data Using IRS Form 990 Data and Worksheet S–10 Trend Analyses,'' which concluded that hospitals are doing a better job of reporting their uncompensated care data on Worksheet S–10 than they did a few years ago. However, these commenters disagreed with CMS about the significance of this observation. One commenter stated that even if it is true in the aggregate that hospitals are reporting data more accurately on Worksheet S–10, the zero-sum nature of the calculation of uncompensated care payments is such that the remaining inaccuracy and lack of uniformity in the data reported can have a very large impact on hospitals. The commenter asserted that if hospitals, for whatever reason, over-report their uncompensated care, they benefit financially from doing so, while those that do not aggressively report suffer financial harm. The commenter concluded that, for this reason, the possibility that some hospitals are generally ''doing better'' with reporting data is not good enough. All hospitals must do better, and until they do, the commenter believed that data from Worksheet S–10 are not accurate enough for public policymaking purposes. Other commenters asserted that the Dobson/DaVanzo study does not illustrate or even evaluate whether data from Worksheet S–10 are a reasonable proxy for the costs hospitals incur in providing care to the uninsured. These commenters pointed out that their own analyses indicate that the most notable aberrations in Worksheet S–10 data reporting occur among public hospitals, which do not file a Form 990 and are therefore missing from the Dobson/DaVanzo analysis.

Many commenters shared observations regarding concerns and anomalies they identified in data from Worksheet S–10. A number of commenters shared their own analyses that looked at the small proportion of hospitals receiving a large share of uncompensated care payments, and the proportion of hospitals that reported aberrant data relating to uncompensated care costs. Along those lines, some commenters noted that the current Worksheet S–10 can result in negative uncompensated care values for some hospitals.

One commenter noted that it has been monitoring how hospitals have been reporting data from Worksheet S–10 for the last 5 years and has concluded that there is no single, uniform manner in which hospitals report their uncompensated care. The commenter stated that the aberrant numbers reported by some hospitals illustrate some combination of misinterpretation of Worksheet S–10 instructions, the lack of clarity of those instructions, and the possible attempts from providers to maximize their Medicare DSH dollars.

Because many commenters were concerned that unclear reporting instructions on Worksheet S–10 would result in inconsistent and inaccurate reporting of data, commenters overwhelmingly requested that, after more precise instructions are provided, CMS apply a strict auditing process for information reported on the Worksheet S–10 before it is used to determine uncompensated care costs. They believed that simply tying information reported on Worksheet S–10 to payment and requiring its regular use will not improve the accuracy of the data. Other commenters indicated that if CMS finalizes a FY 2018 start date, audits with the existing instructions and interpretation would need to commence immediately. In addition, commenters requested that CMS ensure that its contractors administer an auditing process consistently and make the instructions for such an audit public. Some commenters requested that instructions be provided to MACs on how to update hospitals' 2014 Worksheet S–10 data, and that CMS provide guidance and documentation to MACs clarifying that CMS expects MACs to accept amended and/or corrected cost reports. They suggested that CMS look to the process used to audit and review the data used for the Medicare wage index annually.

Specifically, the commenters requested that CMS develop timetables for the cut-off of submissions or changes to the data; validate reporting against hospital policies; create a separate audit protocol for all-inclusive rate providers (AIRPs) in order to ensure uncompensated care costs are adequately captured; address the appropriateness of reporting variability from year to year; and that MACs be engaged to audit these data to ensure validity. A commenter also suggested that CMS institute a fatal edit in the cost report audit process for negative or zero uncompensated care costs, or consider including Level 1 cost report edit checks in the cost report software to flag unusual and missing data. Similarly, commenters requested that CMS provide hospitals with FAQs and host educational events to ensure proper cost reporting, while also providing a means to appeal adjustments to the Worksheet S–10.

One commenter added that, currently, there are no published audit instructions for Medicare contractors to follow when reviewing non-Medicare charity care and non-Medicare bad debt. The commenter stated that it had undergone ''meaningful use audits'' in which the Medicare contractor disallowed charity care costs, and that, based on its experience, this commenter believed that an FY 2018 start date would not provide sufficient time for hospitals to improve their Worksheet S–10 reporting. In addition, commenters recommended that CMS perform an in-depth review of the FY 2014 data for a limited number of hospitals to identify key issues for a full review of FY 2015 and later data. The commenters believed that such a review should be performed by a single MAC for consistency and should include: hospitals with unusual data on Worksheet S–10, including CCRs and different charges as compared to Worksheet C; selective auditing of cost reports of hospitals reporting the highest levels of uncompensated care; and a random mix of other hospitals by type location, or other criteria as applicable.

Commenters requested that CMS implement a process for providing hospitals an opportunity to comment on proposed revisions to clarify the instructions for the completion of Worksheet S–10 to ensure that hospitals receive clear guidance on how to report uncompensated care costs. One commenter suggested that CMS institute a supplemental data collection because CMS chose to use a time period that already has passed as the Worksheet S–10 reporting period for the Factor 3 calculation for FY 2018.

Another commenter suggested that CMS change the instruction for line 22 of Worksheet S–10 from ''Enter payments received or expected for services delivered during this cost report period'' to ''Payments received during the period covered by the cost report.''

Response: In previous rulemaking cycles, commenters both in favor of and opposed to use of a proxy for calculation of Factor 3, requested that CMS provide a timeline and implementation process for when and how the Worksheet S–10 would be used for determining uncompensated care costs (for example, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49524)). In response to those requests, and based on what appeared to be growing evidence that Worksheet S–10 was improving over time, and based on the fact that hospitals were made aware as of FY 2014 that Worksheet S–10 could eventually become the data source for computing Factor 3, we proposed starting to incorporate Worksheet S–10 data from FY 2014 cost reports into the calculation of Factor 3 for FY 2018. Specifically, using a timeframe that includes three cost reports (that is, FY 2012, FY 2013, and FY 2014) to compute Factor 3 for FY 2018 based on a 3-year average, we proposed to use low-income insured patient days from FY 2012 and FY 2013 cost reports as a proxy for uncompensated care costs, and Worksheet S–10 data from the FY 2014 cost report. We stated that this averaging approach would have a transitioning effect by incorporating data from Worksheet S–10 into the calculation of Factor 3 starting in FY 2018 (81 FR 25091).

However, after reviewing and considering all comments, we believe it would be appropriate to institute certain additional quality control and data improvement measures prior to moving forward with incorporating Worksheet S–10 data into the calculation of Factor 3. Consequently, we are not finalizing our proposal to begin to incorporate Worksheet S–10 data into the computation of Factor 3 for FY 2018 at this time. Instead, our intent is to begin to incorporate Worksheet S–10 data into the computation of Factor 3 once these additional measures are in place, and no later than FY 2021. We believe additional time may be needed to make certain modifications and clarifications to the cost report instructions for Worksheet S–10, as well as explore suggestions made by the commenters for ensuring universal submission of Worksheet S–10 by hospitals when filing their cost reports (such as software edits to flag negative, unusual, or missing data or a missing worksheet S–10). As commenters recommended, we will consider issuance of FAQs and hosting of educational seminars for hospitals and MACs as appropriate, coinciding with the issuance of revised cost report instructions. We also intend to explore development of more specific instructions and more uniform review protocols for Worksheet S–10 data. We believe that postponing the final decision as to how and when to incorporate Worksheet S–10 data into the calculation of Factor 3 is necessary, given the significant concerns expressed by commenters regarding the Worksheet S–10 data. Substantive cost report changes may not realistically be implemented in time for FY 2018, as originally proposed. Furthermore, after we complete the substantive work to revise and issue cost report revisions and attending policy clarifications, we would prefer to provide sufficient time for hospitals to report data using the revised instructions and for the results of cost report changes and MAC reviews to be reflected in the data reported on Worksheet S–10. Under normal circumstances, commenters are aware that there is typically a 3- to 4-year lag between the ratesetting year and the cost report data that CMS is using to develop those rates. For example, to develop the FY 2017 wage index, we are using FY 2013 cost report data. Accordingly, there could be a 4-year lag before prospective changes to Worksheet S–10 would result in data that could be used to calculate Factor 3. That is, we would need time to draft and implement cost report revisions, hospitals would need time to file cost reports reflecting those new cost report revisions, and the MACs would need time to review those cost reports. While some cost report clarifications could apply retroactively, some revisions to Worksheet S–10 must apply prospectively to ensure consistent application to other policies impacted by Worksheet S–10, such as EHR or Medicare bad debt payments. Accordingly, we believe that cost reporting periods beginning during FY 2017 would be the first cost reports available that would reflect revised Worksheet S–10 data. Thus, we anticipate that the revised Worksheet S–10 data, as first reflected for cost reporting periods starting during FY 2017, would be available for use in determining uncompensated care costs no later than in FY 2021. We will consider further whether the current Worksheet S–10 data or a proxy should be used to calculate Factor 3 for years

between FY 2017 and FY 2021 in future rulemaking.

With regard to the commenters' request for additional information about the review process that we will instruct the MACs to institute, it may not be identical to the annual desk review process for the IPPS wage index that many commenters have recommended, but we intend to provide standardized instructions to the MACs to guide them in determining when and how often a hospital's Worksheet S–10 should be reviewed. Although it may be relatively simple to provide guidance to MACs to flag and review negative or missing data on the Worksheet S–10, we intend to give consideration to establishment of measures to identify ''aberrant'' data for further review, such as, but not necessarily limited to, hospitals with unusual data on Worksheet S–10, including different CCRs and charges as compared to Worksheet C. In addition, we will consider the commenters' recommendation that we instruct MACs to audit selectively the cost reports of hospitals reporting the highest levels of uncompensated care, as well as a random mix of other hospitals by type location or other criteria as appropriate. Accordingly, the instructions for the MACs for review of Worksheet S–10 will include not only general guidance for review, but also, where appropriate, special instructions for review of certain unique categories of hospitals, such as the All Inclusive Rate Providers (AIRPs), and other mostly government-owned hospitals with unique charity care or charging practices (CMS Pub 15–1, Section 2208.1 describes AIRPs as ''hospitals having an all-inclusive rate (one charge covering all services) or a no-charge structure,'' for whom the ''approved methods for apportioning allowable cost between Medicare and non-Medicare patients'' are not readily adaptable, and therefore, provides for ''alternative methods of apportionment'' for these facilities.). However, we will not make the MACs' review protocol public, as commenters have requested. All CMS desk review and audit protocols are confidential and are for CMS and MAC use only. We also refer readers to Change Request 9648, Transmittal 1681, titled ''The Supplemental Security Income (SSI)/ Medicare Beneficiary Data for Fiscal Year 2014 for Inpatient Prospective Payment System (IPPS) Hospitals, Inpatient Rehabilitation Facilities (IRFs), and Long Term Care Hospitals (LTCH),'' issued on July 15, 2016 (available at *https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2016-Transmittals-Items/R1681OTN.html*). In this transmittal, as a first step in the process of ensuring complete submission of Worksheet S–10 by all eligible DSH hospitals, we instruct MACs to accept amended Worksheets S–10 of FY 2014 cost reports submitted by hospitals (or initial submissions of Worksheet S–10 if none have been submitted previously) and to upload them to the Health Care Provider Cost Report Information System (HCRIS) in a timely manner. The transmittal states that, for revisions to be considered, hospitals must submit their amended FY 2014 cost report containing the revised Worksheet S–10 (or a completed Worksheet S–10 if no data were included on the previously submitted cost report) to the MAC no later than September 30, 2016.

The issuance of these special instructions in CR 9648 is one of multiple steps we intend to take over the next several years to ensure more accurate and uniform reporting of uncompensated care costs on Worksheet S–10. As a result of taking these steps and instituting Worksheet S–10 modifications, clarifications, and MAC reviews, we believe that revised Worksheet S–10 data will be available for use in the calculation of Factor 3 in the near future, and no later than FY 2021. With regard to how Factor 3 will be computed in FY 2018 and subsequent years, we intend to explore whether there is an appropriate proxy for uncompensated care that could be used to calculate Factor 3 until we determine that data from the revised Worksheet S–10 can be used for this purpose. We will undertake notice-and-comment rulemaking to address the issue of the appropriate data to use to determine Factor 3 for FY 2018 and subsequent fiscal years. We also anticipate proposing to continue to use data from three cost reports, as we are doing to calculate Factor 3 for FY 2017, which would have a transitioning effect as we described in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25091).

Comment: Many commenters stated that the proposed 3-year phase in period for Worksheet S–10 is not long enough, and requested that CMS consider alternative lengths. Commenters suggested a variety of lengths for a transition, such as 5 years or 10 years, to mitigate wide swings in hospital payments from year to year and to allow hospitals more time to ensure accurate reporting based on any revised instructions CMS may issue.

Some commenters suggested alternative schedules and methods for the phase in of data from Worksheet S–10 to calculate Factor 3. Summaries that illustrate the breadth of commenters' suggestions for alternative schedules and methods for transitioning to Worksheet S–10 are presented below.

- Commenters cited the 10-year transition to the capital PPS, the 4-year transition for indirect medical education reduction in the Balanced Budget Act, and the 5-year transition of certain data elements out of the wage index calculation as examples that could be used as a model for the transition to Worksheet S–10 data.
- One commenter suggested a 5-year phase in period in which S–10 data would be used to allocate 20 percent of the payments in 2018, 40 percent in 2019, 60 percent in 2020, 80 percent in 2021, and would account for 100 percent of payments in 2022. This transition would involve using 3 years of Medicare SSI days and Medicaid days in each year, and transitioning to using 3 years of S–10 data over the 5-year phase-in. Specifically, under a 5-year phase-in approach, 2018 would use 2014 S–10 cost report data, 2019 would use 2014 and 2015 S–10 cost report data, 2020 would use 2014, 2015, and 2016, and so forth.
- Another commenter suggested a 6-year transition beginning in FY 2019 with Worksheet S–10 data accounting for 5 percent of the Factor 3 for each hospital in FY 2019, and then doubling each year, to 10, 20, 40, and 80 percent, and finally full adoption of Worksheet S–10 data in 2024. The commenter argued that this transition would allow time for initial revisions to the Worksheet S–10 form and instructions and further revisions based on reporting and audit experience before the Worksheet S–10 data become the sole source for the Factor 3 calculation. The commenter added that it would also provide States more time to expand their Medicaid programs.
- Several commenters suggested adopting a stop-loss policy that mitigates losses to those most negatively impacted by the incorporation of Worksheet S–10 data, using percentiles or other statistical measures to define and cap losses to certain hospitals in a budget-neutral manner.
- One commenter suggested CMS consider a series of transition policies such that no hospital sees more than a 5-percent change in overall uncompensated care payments in any given year, and one commenter requested that CMS implement a maximum cap of 10 percent on any redistribution of uncompensated care funds for a minimum of 10 years.
- One commenter stated that CMS should commit to smoothing variability by using no fewer than 2 years' worth of Worksheet S–10 data, as opposed to

beginning the Worksheet S–10 data phase-in by combining 1 year of Worksheet S–10 data with 2 years of patient-day data.

Several commenters suggested that CMS consider using a hybrid methodology that includes both a hospital's low-income insured days and uncompensated care costs from Worksheet S–10 to calculate Factor 3. For example, one commenter recommended that, beginning in FY 2020, when CMS proposed to transition entirely to Worksheet S–10 data, CMS instead use a weighted average of low-income insured days and uncompensated care costs from Worksheet S–10, with the low-income insured days weighted 25 percent and the Worksheet S–10 data weighted 75 percent. Other commenters urged CMS to consider a permanent blend of the current proxy of Medicaid days and SSI days, and Worksheet S–10 data, weighted equally in the calculation of Factor 3 for distribution of uncompensated care payments to begin at a future date.

Several commenters believed that there is a need to develop alternative methods or data sources for calculating Factor 3. One commenter suggested a new Factor 3 calculation that would be equal to the quotient of a hospital's cost-adjusted discharges attributable to uninsured patients for a base year divided by the average cost-adjusted discharges in the base year for all hospitals eligible for Medicare DSH uncompensated care payments in the payment year. The commenter believed that this approach would create a single, auditable data source for determining hospitals' uncompensated care for use in calculating hospitals' Medicare DSH uncompensated care payments. This commenter also stated that this would require revising Worksheet S–10 to require hospitals to report the number of discharges and outpatient visits attributable to uninsured individuals. The commenter added that the revised form would require hospitals to report four values associated with services delivered to this population: The number of discharges, outpatient claims, charges, and payments. This information would be reported separately for patients who are and who are not covered by State or local indigent care programs. The commenter believed that the new Factor 3 would be equal to the quotient of a hospital's cost-adjusted discharges attributable to uninsured patients for a year divided by the average cost-adjusted discharges in the base year for all hospitals eligible for Medicare DSH uncompensated care payments in the payment year. The commenter stated that its suggested 10-step process to determine hospitals' Medicare DSH uncompensated care payments would offer four advantages over the proposed regulation for FY 2018: It would maintain the incentives under the IPPS for the efficient and high-quality delivery of health care services; it would avoid the use of CCRs; it would better align Medicare and Medicaid DSH; and it would better reflect the costs for which the Factor 3 data are intended to be a proxy, as defined in the statute.

Response: We appreciate the comments regarding alternative transition timelines to incorporating Worksheet S–10 data into the calculation of Factor 3 and alternative methods for computing proxies for uncompensated care costs. However, as we have noted above, we are not finalizing our proposal to begin to incorporate Worksheet S–10 data into the computation of Factor 3 in FY 2018 at this time. Instead, we expect to begin to incorporate Worksheet S–10 data into the computation of Factor 3 by FY 2021 once we have taken certain quality control and data improvement measures and also implemented an audit process, as we described above. We believe that postponing our decision regarding when to begin incorporating data from the Worksheet S–10 is necessary to allow us time to consider what changes to the cost report may be necessary and to implement an audit process. When we have determined that it is appropriate to use Worksheet S–10 data, we anticipate proposing to continue to use data from three cost reports, as we are doing for the calculation of Factor 3 for FY 2017, which would have a transitioning effect as we described in the proposed rule (81 FR 25091). At this time, we do not expect that a longer transition will be necessary. With regard to how Factor 3 will be computed in FY 2018 and the intervening years until data from the revised Worksheet S–10 are available, we intend to explore whether there is an appropriate proxy for uncompensated care that could be used to calculate Factor 3 until we determine that revised Worksheet S–10 data can be used for this purpose. We will undertake further notice-and-comment rulemaking to address the issue of the appropriate data to use to determine Factor 3 for FY 2018 and subsequent fiscal years.

Comment: As noted previously, several commenters expressed concern over the proposal to combine data from the multiple cost reports so that a hospital may have a Factor 3 calculated using more than one cost report that begins during a given Federal fiscal year. One commenter found that 39 hospitals included Worksheet S–10 data from multiple cost reporting periods within their FY 2014 Worksheet S–10 data. Some of these cost reporting periods represent more than 12 months of data. In the commenter's view, individual hospital data on the Worksheet S–10 need to represent a 12-month period so that the data are evenly weighted among all DSH hospitals for purposes of determining Factor 3. The commenter believed that inconsistencies in the length of cost report periods would result in erroneous uncompensated care payment allocations. The commenter suggested that, to resolve this, CMS could prorate the data down to an equivalent 12-month period.

Response: As we stated in the proposed rule (81 FR 25089), we believe that using data from more than one cost reporting period, instead of prorating short or long cost report data to 12 month equivalents, mitigates undue fluctuations in the amount of uncompensated care payments to hospitals from year to year and provides a stabilizing effect from one year to the next. In addition, as discussed above in the section related to the calculation of Factor 3 for FY 2017, in the instance where a hospital has more than one cost reporting period starting within a fiscal year, we are finalizing our proposal to combine data from multiple cost reports so that a hospital would have a Factor 3 calculated using more than one cost report starting within the fiscal year, as doing so would provide the most complete dataset for the hospital for that fiscal year, and would smooth out fluctuations in the data. At this point, we expect to propose to continue to use three cost reports of data to calculate Factor 3 in FY 2018 and subsequent years, although we may reevaluate this approach if warranted.

In summary, we are not finalizing our proposal to begin to incorporate Worksheet S–10 data into the computation of Factor 3 for FY 2018, and we are not finalizing the proposed regulations text changes at § 412.106(g)(C)(*4*) through (*7*) regarding FY 2018 and subsequent fiscal years. In light of the significant concerns expressed by commenters, we are postponing the decision regarding when to begin incorporating data from Worksheet S–10 and proceeding with revisions to the cost report instructions to address the commenters' concerns in an appropriate manner. We believe that revised Worksheet S–10 data will be available to use in the calculation of Factor 3 in the near future, and no later than FY 2021. With regard to how Factor 3 will be computed in FY 2018

and subsequent years, we intend to explore whether there is an appropriate proxy for uncompensated care that could be used to calculate Factor 3 until we determine that data from the revised Worksheet S–10 data can be used for this purpose. We will undertake further notice-and-comment rulemaking to address the issue of the appropriate data to use to determine Factor 3 for FY 2018 and subsequent fiscal years. We also anticipate proposing to continue to use data from three cost reports to calculate Factor 3, as we are doing for the calculation of Factor 3 for FY 2017, which would have a transitioning effect as we described in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25091).

(3) Definition of Uncompensated Care for FY 2018 and Subsequent Fiscal Years

In the FY 2014 IPPS/LTCH PPS rulemaking, we considered three potential definitions of uncompensated care: Charity care; charity care + bad debt; and charity care + bad debt + Medicaid shortfalls. As we explained in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50634), we considered proposing to define the amount of uncompensated care for a hospital as the uncompensated care costs of that hospital and considered potential data sources for those costs. We examined the literature on uncompensated care and the concepts of uncompensated care used in various public and private programs, and considered input from stakeholders and public comments in various forums, including the national provider call that we held in January 2013. Our review of the information from these sources indicated that there is some variation in how different States, provider organizations, and Federal programs define ''uncompensated care.'' However, a common theme of almost all these definitions is that they include both ''charity care'' and ''bad debt'' as components of ''uncompensated care.'' Therefore, a definition that incorporates the most commonly used factors within uncompensated care as reported by stakeholders would include charity care costs and bad debt costs. Worksheet S–10 employs the definition of charity care plus non-Medicare bad debt. Specifically:

Cost of charity care ..... + Cost of non-Medicare bad debt expense.	(line 23) (line 29)
Cost of non-Medicare uncompensated care.	(line 30)

Where:

- Cost of charity care = Cost of initial obligation of patients approved for charity care (line 21) minus partial payment by patients approved for charity care (line 22).
- Cost of non-Medicare bad debt expense = Cost to charge ratio (line 1) times non-Medicare and nonreimbursable bad debt expense (line 28).

As we stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25092), we believe a definition that incorporates the most commonly used factors within uncompensated care as reported by stakeholders would include charity care costs and non-Medicare bad debt costs which correlates to line 30 of Worksheet S–10. Therefore, we proposed that, for purposes of calculating Factor 3 and uncompensated care costs beginning in FY 2018, ''uncompensated care'' would be defined as the amount on line 30 of Worksheet S–10, which is the cost of charity care and the cost of non-Medicare bad debt.

In the FY 2017 IPPS/LTCH PPS proposed rule, we discussed that we have received many comments and questions from hospitals and hospital associations regarding whether Medicaid payment shortfalls should be included in the definition of uncompensated care. Some stakeholders argue that such payment shortfalls are unreimbursed care for low-income patients and that the definition of uncompensated care should be consistent across Medicare and Medicaid (where the longstanding Medicaid definition of uncompensated care used for Medicaid hospital-specific DSH limits includes Medicaid payment shortfalls). Proponents of including Medicaid shortfalls advance two arguments:

- Medicaid payment shortfalls represent noncovered care; therefore, hospitals have unmet costs when treating these patients.
- The goal of Medicare DSH payments is to provide partial relief from charity care that is provided to (primarily) low-income patients. Because Medicaid enrollees are low-income persons, the underpayments associated with their care are a form of charity care.

In contrast, there are several arguments to support excluding Medicaid shortfalls from the definition of uncompensated care:

- Several government agencies and key stakeholders define uncompensated care as bad debt plus charity care, without consideration for Medicaid payment shortfalls. Specifically, MedPAC, GAO, and the AHA exclude Medicaid underpayments from the definition of uncompensated care.
- Including Medicaid shortfalls in the calculation of Medicare uncompensated care payments would represent a form of cross-subsidization from Medicare to cover Medicaid costs. In the past, CMS and MedPAC have not supported such action.
- Excluding Medicaid shortfalls from the uncompensated care definition allows Medicare DSH payments to better target hospitals with a disproportionate share of uncompensated care for patients with no insurance coverage.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25092), we stated that we believe these arguments for excluding Medicaid shortfalls from the definition of uncompensated care are compelling. In addition, we stated that we believe that it is advisable to adopt a definition that is used by several government agencies and key stakeholders. Therefore, we proposed that, for purposes of calculating Factor 3 and the amount of uncompensated care for a hospital beginning in FY 2018, ''uncompensated care'' would be defined as the cost of charity care and the cost of non-Medicare bad debt. We also proposed to exclude Medicaid shortfalls reported on Worksheet S–10 from the definition of uncompensated care for purposes of calculating Factor 3. We proposed to codify this definition in the regulation at § 412.106(g)(1)(iii)(C) and invited public comment on our proposed definition. We stated that we believe that uncompensated care costs as reported on line 30 of Worksheet S–10 best reflect our proposed definition of uncompensated care, but we welcomed public input on this issue.

Comment: Many commenters provided a broad range of detailed suggestions related to reporting requirements for specific lines of Worksheet S–10. Commenters suggested the following general modifications to the manner in which uncompensated care costs are captured on Worksheet S–10:

- A number of commenters observed that the instructions for Worksheet S–10 are inconsistent with generally accepted accounting principles (GAAP) and differ from the accounting practices of the majority of hospitals. Therefore, the commenters requested that CMS amend the cost reporting instructions to require hospitals to report amounts based on GAAP. Commenters suggested that the Worksheet S–10 instructions be amended to require hospitals to report the same bad debt and charity care amounts they report on their financial

statements, which are GAAP appropriate.

• Commenters noted that because Worksheet S–10 is derived from data reported on the Medicare cost report, charges and payments for physician services are currently excluded. However, the commenters stated that hospitals provide physician services to patients with little or no access to private physicians. They noted that safety-net hospitals in low-income communities particularly provide these services. The commenters believed that establishing an uncompensated care cost methodology that takes these services into account would encourage providers to furnish these services.

• Commenters requested clarification of whether charity care charges should be reported for inpatient hospital services, outpatient hospital services, or both. They requested the ability to report these charges on separate lines and to apply separate CCRs to these separate sets of costs.

• Commenters noted that the instructions for line 26 include Medicare bad debts for services provided beyond the inpatient and outpatient setting, and interpreted this to mean that hospitals should include non-Medicare bad debts for services provided in the following settings for which expenses are included on the hospital cost report: Skilled nursing beds (both swing beds and distinct part facilities), distinct part inpatient rehabilitation units, distinct part LTCHs, distinct part psychiatric units, dialysis centers, CMHCs, RHCs and FQHCs. The commenters asked CMS to confirm in the final rule that this interpretation is correct.

• Similarly, commenters requested that CMS define any additional distinct part units or services that are not listed in the instructions for line 26 but should be included in that line when reporting non-Medicare bad debt. As an example, one commenter noted that there is no cost sharing for home health services in the Medicare benefit design and therefore it is not listed as an item/service to include in line 26. However, if CMS truly intends for the bad debt expense to represent the ''entire hospital complex,'' the commenter stated that distinct part home health agencies should be included, as a hospital could still accrue related bad debt from home health services furnished to the uninsured or underinsured.

• Commenters advised requiring Medicaid DSH payments and Medicaid supplemental payment information to be reported on separate lines, and to offset all of these payments against Medicaid costs reported on Worksheet S–10. Commenters requested separate reporting of a number of payments, including direct payments to hospitals, Medicaid DSH, and supplementary payments including upper payment limits, intergovernmental transfers, certified government expenditures, provider taxes, other government payments, and payments for local or state indigent care.

• One commenter suggested that CMS integrate payer mix into Worksheet S–10, as providers with a substantial commercial payer mix often have operating margins that help offset uncompensated care costs. The commenter recommended that CMS examine methods to adjust the uncompensated care amount for payer mix.

• One commenter noted that CCRs in Worksheet S–10 are reported with Reasonable Compensated Equivalency (RCE) limits applied. The commenter cited the discussion in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50161), which states that RCE limits have no effect on IPPS provider payments. Therefore, the commenter believed that if the CCR in Worksheet S–10 is used, IPPS hospital's payments would be affected by RCE limits, and RCE disallowances should therefore be removed from the CCR on Line 1 of Worksheet S–10.

• Commenters observed that CCRs for ''parts of hospitals'' such as facility-based skilled nursing facilities and inpatient rehabilitation facilities are very different from the CCRs for acute care hospitals paid under the IPPS. The commenters questioned the appropriateness of including parts of hospitals in the CCR in Worksheet S–10.

Response: Some of the commenters express concerns and raise questions that have not been raised before, while others have been raised in previous rulemaking. We intend to address many of these comments as part of our planned clarifications and revisions to Worksheet S–10. As mentioned above in response to previous comments, at this time, we are not finalizing the proposed regulations text changes at § 412.106(g)(C)(*4*) through (*7*) regarding the data that would be used to estimate the amount of hospital uncompensated care for FY 2018 and subsequent fiscal years. In these proposed regulation text changes, we had proposed to define uncompensated care costs for FY 2018 and subsequent years to mean charity care costs plus non-Medicare bad debt costs. Our intent is still to begin to incorporate Worksheet S–10 data into the computation of Factor 3 in the near future, and no later than FY 2021. When we undertake rulemaking to propose to incorporate Worksheet S–10 data, we also expect to propose the same definition of uncompensated care costs—charity care costs plus non Medicare bad debt costs, because we believe it is advisable to adopt a definition that is used by several government agencies and key stakeholders.

With regard to the comments asking whether Worksheet S–10 data should reflect inpatient or outpatient services, or both, we note that the cost report instructions at Section 4012 of the PRM–II, Pub. 15–2, state: ''Worksheet S–10—Hospital Uncompensated and Indigent Care Data—Section 112(b) of the Balanced Budget Refinement Act (BBRA) requires that short-term acute care hospitals (§ 1886(d) of the Act) submit cost reports containing data on the cost incurred by the hospital for providing *inpatient and outpatient hospital services* for which the hospital is not compensated'' (emphasis added). In a similar vein, the CCR used on Worksheet S–10, line 1 is from Worksheet C, Part I, line 202. This CCR reflects costs and charges of all hospital inpatient departments and outpatient department and clinics. Thus, Worksheet S–10 is designed to capture uncompensated care costs associated with the hospital under all of the hospital's Medicare provider agreements, including provider-based facilities. However, Worksheet S–10 is not intended to capture uncompensated care related to physician services. We note that at various points on Worksheet S–10, the instructions state, ''Include payments for all covered services *except physician or other professional services''* (emphasis added).

Finally, with regard to the comment that the CCRs on Worksheet S–10 are reported with the RCE limits applied, we believe the commenter is mistaken. Line 1 of Worksheet S–10 instructs hospitals to compute the CCR by dividing the costs from Worksheet C, Part I, line 202, *column 3,* by the charges on Worksheet C, Part I, line 202, column 8. The RCE limits are applied in column 4, not in column 3; thus, the RCE limits do not affect the CCR on line 1 of Worksheet S–10.

Comment: Many commenters expressed concerns relating to, and provided suggestions for, calculating charity care and bad debt as captured on Worksheet S–10:

• Commenters expressed confusion about what is identified as an indigent care program, and when charity care and Medicaid noncovered charges are components of charity care. These commenters stated that the instructions for line 20 in Worksheet S–10 provide

that ''Charges for non-covered services provided to patients eligible for Medicaid or other indigent care program . . . can be included, if such inclusion is specified in the hospital's charity care policy and the patient meets the hospital's charity care criteria.'' Commenters believed that government providers are misreporting data related to charity care by including all charges for their indigent care/general relief patient populations in the definition while not accounting for offsetting payments. The commenters expressed their view that these programs are not uncompensated, but are funded through State and local tax assessments. Therefore, the commenters requested that CMS require that patient charges cannot be included in the cost of charity care unless the related services are not covered by an indigent care program.

- Commenters raised a similar concern about line 20 regarding a possible discrepancy between considering noncovered charges for Medicaid patients as eligible for charity care, but not allowing noncovered charges for patients that have some commercial coverage to be considered charity care. Some commenters believed that this approach understates charity care costs for patients who participate in high deductible plans, which is becoming more common.
- One commenter stated that CMS' instructions for reporting charity care on Worksheet S–10 are inconsistent with the instructions given by other State and Federal programs which instruct hospitals to report charity care based upon the hospital's financial policy and consistent with its mission statement, financial ability, and other circumstances. Another commenter stated that because section 501(r) of the Internal Revenue Code requires hospitals to establish financial assistance policies and to reduce charges for services furnished to individuals who qualify for assistance under those policies as a requirement for tax-exemption as a charitable hospital organization, those policies, including the eligibility criteria established under those policies, necessarily must be regarded as the hospital's ''charity care criteria'' for purposes of Worksheet S–10, to ensure consistency in reporting.
- Commenters stated that hospitals report charity care amounts for patients that qualify for partial charity inconsistently, and requested that CMS clarify how amounts should be reported for patients that qualify for partial charity care, for both an uninsured individual as well as a patient with financial responsibility after his or her insurance pays.
- Many commenters believed that the definition of bad debt is unclear and that the methodology CMS uses to arrive at the cost of bad debt significantly understates the uncompensated care expense that hospitals incur as a result of uncollectable amounts. For example, commenters requested that CMS clarify whether recoveries received during the cost reporting period should be deducted from the non-Medicare bad debt claimed on line 26.
- In addition, commenters expressed their view that line 26 comingles bad debt for both uninsured patients and patients who have some form of insurance but are not able to meet their cost sharing responsibility. Commenters stated that applying a CCR to calculate cost is not accurate when the amounts have already been reduced from gross charges. These commenters believed that applying the hospital's CCR to the amount on line 26 understates the costs associated with deductibles and coinsurance for insured patients written off to bad debt. They noted that, given the increased cost sharing many insured individuals currently face, a growing portion of a hospital's bad debt is related to unpaid deductibles, coinsurance, and copayments. The commenters recommended that CMS revise Worksheet S–10 to require separate reporting for bad debt written off for the uninsured and for those who are insured but cannot afford their cost sharing, similar to the instructions for line 20.

Response: The commenters have raised various issues that directly relate to reporting of charity care and bad debt costs on Worksheet S–10. We intend to consider these issues as we review Worksheet S–10 and will make clarifications or revisions to the Worksheet S–10 instructions, as appropriate, to address these concerns.

Comment: Commenters noted that using data from Worksheet S–10 to calculate Factor 3, as opposed to using the current low-income insured days proxy, has serious implications for entire States. One commenter stated that the proposed policy to transition to Worksheet S–10 would result in a $3 billion shift in Medicare DSH funding across providers and States. This commenter believed that the reductions in payments resulting from this redistribution would have a significant deleterious impact on hospitals in parts of the country that have relied on DSH funding to support services for vulnerable populations. The commenter stated that, given unforeseeable factors that have affected Medicaid and insurance expansion across States, these massive funding redistributions are not aligned with the goals of the Affordable Care Act and could not have been predicted or intended by Congress. Another commenter provided specific examples from its own analysis of how the use of Worksheet S–10 data to estimate hospital uncompensated care costs would reward hospitals in States that have chosen not to expand their Medicaid programs and punish those that have done so. Many commenters noted that the States losing DSH dollars are States that have expanded their Medicaid programs, as the current proxy captures Medicaid days and Worksheet S–10 does not. Meanwhile, the commenters stated, States that would likely gain the most Medicare uncompensated care dollars are those States that have not expanded their Medicaid programs, and as a result their uncompensated care is relatively high. Many commenters generally believed it should not be public policy to harm States that have responded positively to new opportunities created through legislation and to reward those that have rejected them.

Response: We understand the commenters' concerns regarding the effects on hospitals' payments of moving from calculating Factor 3 using a proxy based on low-income days to the use of uncompensated care data from Worksheet S–10. We believe that postponing the decision regarding when to begin incorporating data from Worksheet S–10 data into the calculation of Factor 3 will allow us time to consider what revisions to the cost reporting instructions may be necessary to ensure that uncompensated care cost data are reported appropriately and consistently.

Comment: Many commenters expressed opinions regarding the definition of uncompensated care as captured by Worksheet S–10. Numerous commenters believed that shortfall from Medicaid underpayment should be included in the definition of uncompensated care. These commenters argued that from a policy perspective, it is vitally important to include Medicaid losses to ensure that hospitals in Medicaid-expansion states are not disadvantaged vis-à-vis hospitals in non-expansion States, as noted by commenters that described the differential impact of the use of Worksheet S–10 data in States that have expanded Medicaid compared to States that have not. The commenters stated that including Medicaid losses in the definition of uncompensated care would align with the Medicaid DSH program and the IRS method of calculating the

community benefit provided by nonprofit hospitals. Other commenters requested that, in addition to Medicaid shortfall, shortfall from SCHIP and State and local indigent care programs should be included in uncompensated care costs.

However, other commenters supported the exclusion of Medicaid shortfalls from the definition of uncompensated care. These commenters believed that section 3133 does not allow for the inclusion of Medicaid shortfalls in the Factor 3 calculation, based on the statutory language at section 1886(r)(2)(C)(i) of the Act, which refers to the costs of hospitals treating the ''uninsured.'' One commenter noted that, under section 3133, Congress required that the Factor 2 calculation include a reduction of the amount determined under Factor 1 (that is, the amount by which the aggregate amount of DSH payments that would have been made under section 1886(d)(5)(F) of the Act for the fiscal year exceeds the aggregate amount of empirically justified DSH payments under section 1886(r)(1) for that fiscal year) equal to the growth in the insured population from a base year, and it does so by reference to specific CBO estimates of the insured patient rate. The commenter stated that Congress was well aware that the CBO includes the growth in the Medicaid population within the insured rate, and therefore Congress did not intend that Medicaid patients would be considered uninsured for purposes of determining Factor 3. Another commenter believed that it is inappropriate for Medicare to include Medicaid shortfall when estimating uncompensated care costs because the ''shortfall'' will depend on a specific hospital's cost structure and the Medicaid payments they receive. In addition, the commenter stated that computing losses for Medicaid patients is operationally problematic for several reasons. The commenter indicated that one operational complexity stems from Medicaid paying hospitals a single DSH payment that in part covers costs of the uninsured and in part covers estimates of a hospital's Medicaid ''shortfall,'' and it is not clear how CMS would determine how much Medicaid ''shortfall'' is left after the Medicaid DSH payments are made. In addition, the commenter noted that hospitals in some states return a portion of their Medicaid revenue to the state through provider taxes. The commenter stated that it would be difficult for CMS to arrive at a net ''shortfall'' figure, given the lack of reported data on the net value of Medicaid DSH payments less provider taxes. Commenters also noted that compensating hospitals for Medicaid shortfalls as part of a Medicare payment could provide an incentive for Medicaid to underpay hospitals for services provided to Medicaid patients.

In addition to comments about Medicaid shortfalls, commenters stated that the Affordable Care Act directed that the uncompensated care payments should account for uncompensated care costs for the uninsured, and argued that the data reported on the Worksheet S–10 do not include all costs for treating the uninsured. One of these commenters stated that Worksheet S–10 needs to be amended to allow for reporting discounts provided to the uninsured as part of the total uncompensated care costs. The commenter noted that on Worksheet S–10, uncompensated care costs are specifically defined to ''not include courtesy allowances or discounts given to patients'' (the cost report instructions at CMS Pub. 15–2, Section 4012). The commenter stated that this definition has created confusion, and it is unclear if ''courtesy'' applies to both ''allowance'' and ''discounts,'' or whether the term ''discounts'' is unmodified by ''courtesy.'' Commenters observed that States differ in how they define uncompensated care costs, and that not all costs incurred by hospitals in treating the uninsured are categorized as charity care and bad debt, such as discounts to the uninsured who are unable to pay or unwilling to provide income information. The commenters requested that all costs related to treating the uninsured be included in the definition of uncompensated care costs, including discounts to the uninsured, regardless of whether they are officially called ''discounts.'' Commenters noted that Worksheet S–10 does not distinguish discounts to the uninsured from charity care and bad debt and expressed concern that hospitals that attempt to collect on a full debt with no discount receive the same or higher uncompensated care total as hospitals that provide discounts. One commenter provided examples that it asserted demonstrate that excluding the cost of discounts to uninsured patients ''favors'' hospitals unwilling to discount care over those that do. Specifically, in the examples, the cost of uncompensated care for a particular uninsured patient is the same at each hospital. However, the commenter asserted that as a result of the current Worksheet S–10 instructions to exclude discounts given to the uninsured, the cost of uncompensated care at one of the hospitals in the example is undercounted. The commenter believed that this policy ''favors hospitals unwilling to discount care over those that do,'' and could create a disincentive for hospitals to ''maintain generous uninsured discount programs.''

Commenters noted that section 3133 of the Affordable Care Act does not mention charity care or even gross non-Medicare bad debt; it simply focuses on the uncompensated care costs of the uninsured. These commenters noted that the instructions of Worksheet S–10 appear to exclude uninsured status explicitly: ''Do not include charges for . . . uninsured patients given discounts without meeting the hospital's charity care criteria.'' The commenters believed that because the instructions to Worksheet S–10 state that ''this worksheet does not produce the estimate of the cost of treating uninsured patients required for disproportionate share payments under the Medicaid program'' (the instructions at the beginning of Worksheet S–10, section 4012 of CMS Pub. 15–2), this indicates that Worksheet S–10 does not capture the information relevant to the purposes of section 3133 of the Affordable Care Act.

Response: In general, we will endeavor to address commenters' concerns in future cost report clarifications so as to ensure that Worksheet S–10 is an appropriate instrument to use to implement section 3133 of the Affordable Care Act. With regard to the comments regarding Medicaid shortfalls, as we stated in the proposed rule (81 FR 25092), we believe there are compelling arguments for excluding Medicaid shortfalls from the definition of uncompensated care, including the fact that several key stakeholders do not consider Medicaid shortfalls in their definition of uncompensated care, and that it is best to allow Medicare uncompensated care payments to target hospitals that have a disproportionate share of uncompensated care for patients with no insurance coverage. Accordingly, as discussed above in response to previous comments, we anticipate re-proposing through rulemaking a definition of uncompensated care costs that includes charity care and non-Medicare bad debt as part of our intent to begin to incorporate Worksheet S–10 data into the computation of Factor 3, no later than FY 2021. With regard to the comments that States differ in how they define uncompensated care costs, and that hospitals' costs of treating the uninsured are not always categorized as charity care and bad debt, such as discounts to the uninsured who are

unable to pay or unwilling to provide income information, we believe the commenters are referring to the Worksheet S–10 instructions for Line 20, which state, in part, ''Do not include charges for either uninsured patients given discounts without meeting the hospital's charity care criteria or patients given courtesy discounts.'' We believe that hospitals have the discretion to design their charity care policies as appropriate, and may include discounts offered to uninsured patients as ''charity care.'' However, we will also further consider the concern raised by the commenter as to whether inadvertent disincentives may be occurring under CMS' current instructions, and we may consider revisions to the instructions on line 20 of Worksheet S–10 to further clarify when patient discounts would be considered charity care versus bad debt.

(4) Other Methodological Considerations for FY 2018 and Subsequent Fiscal Years

In the past several years, we have received technical comments from stakeholders regarding the timing of reporting charity care and the CCRs used in determining uncompensated care costs. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25093), we discussed these issues and how we proposed to incorporate them into the calculation of uncompensated care costs for purposes of determining uncompensated care payments for FY 2018 and subsequent fiscal years as follows:

• *Timing of Reporting Charity Care.* The determination and write-off of charity care often happens outside of the hospital fiscal year in which the services are provided. Some commenters have requested that the charity care captured on Line 20 of Worksheet S–10 include only the charity care that was written off in the particular cost reporting year, regardless of when the services were provided, consistent with charity write-offs that hospitals report in accordance with GAAP. In addition, hospitals currently report non-Medicare bad debt without regard to when the services were provided. The current Worksheet S–10 does not follow this hospital practice, and specifies that charity care provided (not necessarily written off) during the period should to be recorded on Line 20. (Instructions for Line 20 of Worksheet S–10 of the Medicare cost report CMS-Form-2552–10, ''Enter the total initial payment obligation of patients who are given a full or partial discount based on the hospital's charity care criteria (measured at full charges), for care delivered *during this cost reporting period* for the entire facility . . .'' (emphasis added) are included in CMS Pub. 15–2, Chapter 40, Section 4012.) While these differences in reporting should average out over time for a hospital, consistency in reporting has been requested by some stakeholders. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25093), we acknowledged these concerns, and stated that we intend to revise the current Worksheet S–10 cost report instructions for Line 20 concerning the timing of reporting charity care, such that charity care will be reported based on date of write-off, and not based on date of service.

Comment: Many commenters supported the proposal to revise the current Worksheet S–10 cost report instructions for line 20 concerning the timing of reporting charity care, such that charity care will be reported based on date of write-off, and not based on date of service. Commenters requested clarification about how CMS intends to implement the change. One commenter asked whether the revision to Worksheet S–10 to report charity care based on the date of the write-off would be a prospective change, or whether it would change previously filed reports from 2014, 2015, or 2016. Another commenter requested that CMS clarify whether charity care should exclude accounts reported in previously filed cost reports to avoid a double reporting of charity care costs. Commenters noted that providers will need additional time to implement this change, as hospitals will need to revisit numbers reported in 2012 and 2013 to accurately report 2014 costs.

Response: We will revise line 20 of Worksheet S–10 to instruct hospital to report the payment obligation for care ''that was written off during this cost reporting period, regardless of when the services were provided.'' This change must be effective prospectively for cost reporting periods beginning on or after October 1, 2016, because line 20 as it currently exists is used to calculate EHR incentive payments (in accordance with the policy stated in the final rule for the Electronic Health Record Incentive Program (75 FR 44456), and instituting a change to the instructions on line 20 without a prospective effective date would constitute retroactive rulemaking. Additional clarifications regarding charity care exclusions reported in previously filed cost reports may be forthcoming.

• *Revisions to the CCR on Line 1 of Worksheet S–10.* Many commenters have requested that the CCR used to convert charges to costs should include the cost of training residents (direct GME costs). The CCR on line 1 of Worksheet S–10 currently does not include GME costs, while the charges of teaching hospitals do include charges for GME. Thus, the CCR excludes GME costs in the cost component (or numerator), but includes GME costs in the charge component (or denominator). In the FY 2017 IPPS/LTCH PPS proposed rule, we noted that commenters have requested that CMS consider using the GME costs reported in Worksheet B Part I (column 24, line 118) to capture these additional costs. Unless these GME costs are included, commenters have maintained that the CCRs of teaching hospitals are artificially low, not capturing true uncompensated care costs, thereby disadvantaging teaching hospitals in the calculation of their uncompensated care costs.

Using data from FY 2011 and 2012 cost reports, we analyzed the effect on all hospitals' uncompensated care costs when GME costs are included in the numerator. Specifically, instead of calculating the CCRs as specified currently on line 1 of Worksheet S–10 (which pulls the CCR from Worksheet C, Part I, column 3, line 202/Worksheet C, column 8, line 202), we calculated the CCRs using Worksheet B, Part I, column 24, line 118/Worksheet C, Part I, column 8, line 202. As can be seen on the file posted on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html* under the Downloads section, and as expected, including GME costs in the numerator of the CCR results in an increased share of uncompensated care payments being made to teaching hospitals. Of the more than 1,000 teaching hospitals included in the analysis, the CCRs of 830 hospitals increase by less than 5 percent, 178 hospitals' CCRs increase by more than 5 percent but less than 10 percent, and 71 hospitals' CCRs increase by 10 percent or more. Thirty-three hospitals experience a decrease in their CCRs, with 32 hospitals experiencing a decrease of less than 5 percent, and 1 hospital experiencing a decrease of more than 5 percent, but less than 10 percent. As we have stated previously in response to this issue, we believe that the purpose of uncompensated care payments is to provide additional payment to hospitals for treating the uninsured, not for the costs incurred in training residents. In addition, because the CCR on line 1 of Worksheet S–10 pulled from Worksheet C, Part I, is also used in other IPPS ratesetting contexts (such as high-cost outliers and the

calculation of the MS–DRG relative weights) from which it is appropriate to exclude GME because GME is paid separately from the IPPS, we are hesitant to adjust the CCRs in the narrower context of calculating uncompensated care costs. Therefore, in the proposed rule, we stated that we do not believe it is appropriate at this time to modify the calculation of the CCR on line 1 of Worksheet S–10 to include GME costs in the numerator.

Comment: Commenters noted that the CCR used on Worksheet S–10 to convert charges to costs implicitly includes direct GME charges in the denominator, and therefore requested that the CCR on Worksheet S–10 be revised to include direct GME payments in the cost numerator. One commenter noted that because GME costs are a significant component of inpatient and outpatient services at teaching hospitals, not including GME in the numerator of the CCR significantly understates the cost of care and thus the losses incurred by these hospitals as a result of uncompensated care. The commenter pointed out that Medicare and State Medicaid programs contribute their share of GME costs, and CMS permits teaching hospitals to revise their CCRs to include GME costs under the Medicaid DSH program because Medicaid payments cover GME. Finally, the commenter stated that Schedule H of IRS Form 990 specifically includes GME losses as a component of uncompensated care. Several commenters suggested using the costs from Worksheet B, Part I, column 24, Line 118 in the numerator of the CCR, while another commenter recommended that, for accuracy of the data, CMS should limit the use of the Worksheet B to determine CCRs to teaching hospitals that report GME FTEs.

Response: As described in the proposed rule (81 FR 25093), we have analyzed the effect on all hospitals' uncompensated care costs when GME costs are included in the numerator of the CCR using data from FY 2011 and 2012 cost reports. As can be seen on the file posted on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html* under the ''Downloads'' section, and as expected, we found that including GME costs in the numerator of the CCR results in an increased share of uncompensated care payments being made to teaching hospitals. As we have stated previously in response to this issue, we believe that the purpose of uncompensated care payments is to provide additional payment to hospitals for treating the uninsured, not for the costs incurred in training residents. In addition, because the CCR on line 1 of Worksheet S–10 pulled from Worksheet C, Part I, is also used in other IPPS rate-setting contexts (such as high-cost outliers and the calculation of the MS–DRG relative weights) from which it is appropriate to exclude GME because GME is paid separately from the IPPS, we hesitate to adjust the CCRs in the narrower context of calculating uncompensated care costs. Therefore, we continue to believe that it is not appropriate at this time to modify the calculation of the CCR on line 1 of Worksheet S–10 to include GME costs in the numerator. Accordingly, we do not anticipate proposing to include GME costs in the numerator of the CCR when we begin to incorporate Worksheet S–10 data into the calculation of Factor 3.

- *Trims to Apply to CCRs on Line 1 of Worksheet S–10.* In the FY 2017 IPPS/LTCH PPS proposed rule, we noted that commenters also have suggested that uncompensated care costs reported on Worksheet S–10 should be audited due to the extremely high values consistently reported by some hospitals. We believe that, just as we apply trims to hospitals' CCRs used to calculate high-cost outlier payments to eliminate anomalies in payment determinations (§ 412.84(h)(3)(ii)), it is appropriate to apply statistical trims to the CCRs that are considered anomalies on Worksheet S–10, Line 1. Specifically, § 412.84(h)(3)(ii) states that the Medicare contractor may use a statewide CCR for hospitals whose operating or capital CCR is in excess of 3 standard deviations above the corresponding national geometric mean (that is, the CCR ''ceiling''). This mean is recalculated annually by CMS and published in the proposed and final IPPS rules each year. To control for data anomalies, we stated in the proposed rule that we are considering proposals that would trim hospitals' CCRs to ensure reasonable CCRs are used to convert charges to costs for purposes of determining uncompensated care costs.

One approach we considered as a possible proposal for FY 2018 and subsequent years would be a ''double trim'' methodology as follows:

First Trim

Step 1: Prior to calculating the statewide average CCRs, all hospitals with a CCR reported on Worksheet S–10, line 1, of greater than the corresponding CCR ''ceiling'' (that is, the CCR ''ceiling'' published in the final rule for the fiscal year that is contemporaneous to the particular Worksheet S–10 data) would be removed from the calculation. We proposed to remove the hospitals with a CCR of greater than 3 standard deviations above the corresponding national geometric mean in order to calculate the statewide average CCRs so that these aberrant CCRs do not skew the statewide average CCR.

Step 2: Using the CCRs for the remaining hospitals in Step 1, determine the statewide average CCRs using line 1 of Worksheet S–10 for hospitals within each State (including non-DSH eligible hospitals).

Step 3: Calculate the simple average CCR (not weighted by hospital size) for each State.

Step 4: First CCR Trim—Assign the statewide average CCR calculated in Step 3 to all hospitals with a CCR greater than 3 standard deviations above the corresponding national geometric mean (that is, the CCR ''ceiling'').

Second Trim

Step 5: Calculate the natural logarithm of the CCR for all hospitals (including those with replaced CCRs and those not eligible for Medicare DSH payments).

Step 6: Calculate the geometric mean and standard deviation of the log values across all hospitals (including those not eligible for Medicare DSH payments).

Step 7: Second CCR Trim—Assign the statewide average CCR calculated in Step 3 to each Medicare DSH eligible hospital with a CCR greater than 3.0 standard deviations above the geometric mean. All hospitals not eligible for Medicare DSH payments should be excluded from further analyses.

The analysis that we performed under this ''double trim'' approach was based on CCRs from FY 2012 Worksheet S–10, Line 1. Under Step 1, we used the FY 2013 CCR ''ceiling'' of 1.146 published in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53697). (We used the FY 2013 CCR ''ceiling'' because it was computed from the March 2012 update of the Provider Specific File, which contained CCRs that are relatively contemporaneous to the CCRs in the FY 2012 cost reports.) Our analysis showed that 27 hospitals would receive their respective statewide average CCR. (We refer readers to our analysis posted on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/dsh.html* under the Downloads section.)

Alternatively, we considered proposing for FY 2018 and subsequent years to use the same trim process that is used for high-cost outliers under § 412.84(i), under which we calculate separate urban and rural average CCRs for each state. Thus, the CCR of an

urban or rural hospital above the applicable CCR ''ceiling'' for a given fiscal year would be replaced by its respective urban or rural statewide average CCR. As a reference, the FY 2013 IPPS statewide average urban and rural CCRs are in Table 8A included on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/Acute-Inpatient-Files-for-Download-Items/FY2013-FinalRule-CorrectionNotice-Files.html*.

After applying the applicable trims to a hospital's CCR as appropriate, we would calculate a hospital's uncompensated care costs as being equal to line 30, which is the sum of line 23 and line 29, as follows:

Hospital Uncompensated Care Costs = line 30 (=line 23 + line 29), which is equal to—

[(Line 1 CCR *adjusted by trim if applicable* x charity care line 20)—(Payments received for charity care line 22)]

+

[(Line 1 CCR *adjusted by trim if applicable* x Non-Medicare and non-reimbursable Bad Debt line 28)].

Comment: Several commenters supported CMS' proposal to trim hospitals' CCRs to ensure reasonable CCRs are used to convert charges to costs for purposes of determining uncompensated care costs. These commenters agreed with CMS that this trim will prevent some of the large variance outliers from artificially influencing the distribution percentages.

While some commenters agreed that identifying aberrant CCRs through an edit is appropriate, many commenters objected to the ''double trim'' methodology outlined in the FY 2017 IPPS/LTCH PPS proposed rule for FY 2018 and subsequent years. One commenter recommended that hospitals with extremely high CCRs be audited and an appropriate CCR determined, versus arbitrarily trimming these high CCRs to a statewide average. Several commenters expressed concern over the proposed CCR trim methodology because hospitals that are considered ''all-inclusive rate providers'' are not required to complete Worksheet C, Part I, which is used for reporting CCR on Line 1 of Worksheet S–10. Commenters expressed their view that the proposed CCR trim methodology inappropriately modifies the uncompensated care costs for these hospitals, and that a high CCR could be accurate if the hospital's charges are close to costs, as is usually the case for ''all-inclusive rate providers.'' Commenters believed that CMS should correct the methodology to ensure these hospitals are not inappropriately captured in this double trim methodology. Similarly, commenters recommended that CMS not apply a trim to hospital CCRs until it identifies the reasons for variations in CCRs and gives hospitals that have legitimate reasons for having higher CCRs adequate time to produce CCRs that are usable for converting costs to charges on the cost report. One commenter suggested that, instead of applying a trim, CMS evaluate CCRs on cost reports to identify misreported, erroneous values and not penalize hospitals that are accurately reporting information under a CMS-sanctioned methodology. The commenter recommended that if CMS intends to require that hospitals revise their charge structures and cost apportionment methodologies, CMS provide hospitals sufficient lead time to bring their systems in line with these requirements.

Several commenters provided alternative approaches to the CCR trim methodology. These commenters recommended using the ceiling derived from the 2014 CCRs, which was published in the FY 2015 IPPS/LTCH PPS final rule. Commenters also recommended that CMS use the sum of the operating and capital CCR ceilings because the CCRs derived in Worksheet C are based on both operating and capital costs. Under this methodology, the commenter-recommended ceiling for the first trim was 1.402 instead of 1.146 as proposed. Commenters also suggested that CMS truncate CCRs at the second trim ceiling unless a hospital's MAC validates the reported CCR.

Response: We appreciate the support and additional information provided by the commenters related to applying trims to the CCRs. We intend to further explore which trims are appropriate to apply to the CCRs on line 1 of Worksheet S–10, including whether it is appropriate to apply a unique trim to certain subsets of hospitals, such as All Inclusive Rate Providers. With regard to the comment recommending that CMS use the sum of the operating and capital CCR ceilings because the CCRs derived in Worksheet C are based on both operating and capital costs, after considering this matter, we agree that Worksheet C CCRs do reflect both the operating and capital costs of a hospital, and it may be appropriate to apply a CCR ceiling that is the sum of both the operating and capital CCRs. We intend to consider this recommendation further when preparing to use Worksheet S–10 data to compute Factor 3, and will undertake rulemaking in advance on this matter.

Other Related Comments

Comment: Several commenters expressed concern that the use of data from Worksheet S–10 to calculate uncompensated care costs does not take into account the Indian Health Service's (IHS') unique funding structure and therefore may jeopardize all of IHS's uncompensated care payments. The commenters stated that CMS has indicated that due to their unique funding structure, Indian Health Care Providers (IHCPs) do not have uncompensated care costs under Worksheet S–10. The commenters indicated that because funding for the costs of patient care is provided through congressional appropriations, all care is considered compensated, even though appropriations fund only approximately 59 percent of the health care needs for American Indians/Alaska Natives. The commenters also stated that many Tribes and Tribal organizations invest non-Federal resources in their health care programs to furnish care that could easily be classified as uncompensated care because IHCPs may not charge beneficiaries to receive care and thus, may not have the accounting methods to track these costs. As a result, the commenters stated that IHCP hospitals are currently unable to support charity care and non-Medicare bad debt consistent with the proposed definition of uncompensated care in the proposed rule. The commenters estimated that if the proposals in the proposed rule are finalized, they will decrease IHS's collections significantly, negatively impacting an already underfunded health system and leading to reduced quality of care and the loss of life.

Commenters acknowledged a previous conversation with CMS and IHS to attempt to resolve these issues, but requested that CMS engage in further analysis and meaningful Tribal consultation before issuing the final rule. The commenters stated that comments on the rulemaking process are not considered meaningful consultation per Executive Order 13175 or in CMS Tribal consultation policy approved December 5, 2015, and that additional Tribal consultation is necessary.

Response: We appreciate these comments and acknowledge that the use of data from Worksheet S–10 to calculate uncompensated care costs does not take into account the unique funding structure of IHS hospitals and therefore using these data to determine Factor 3 may have an unintended impact on the uncompensated care payments to these hospitals. We intend to continue working with IHS and

Tribal stakeholders to devise an appropriate solution for estimating uncompensated care for these facilities and will undertake further rulemaking as appropriate to address this issue.

Comment: One commenter requested that Puerto Rico hospitals be excluded from the use of Worksheet S–10 to calculate uncompensated care costs. The commenter noted that Puerto Rico's socioeconomic reality and the statutory treatment of its hospitals under Medicaid and Medicare Part A may result in an unintended penalty for its providers, and standard forms, data collections or categories may not be appropriate in Puerto Rico. As an alternative, the commenter supported delaying the use of Worksheet S–10 data to calculate Factor 3 for hospitals in Puerto Rico until disparities are corrected. The commenter requested that CMS work with Puerto Rico hospitals to conduct a specific study of uncompensated versus undercompensated care before moving away from the current uncompensated care formula.

Response: We understand the unique challenges faced by hospitals in Puerto Rico with regard to calculating uncompensated care costs. We note that we are finalizing our proposal to use a proxy for Medicare SSI days for hospitals in Puerto Rico for FY 2017. In the event that we continue to use Medicare SSI days as a proxy for uncompensated care in subsequent years, we anticipate that we would propose to continue to employ this proxy for Puerto Rico.

In summary, we are not finalizing our proposal to begin to incorporate Worksheet S–10 data into the computation of Factor 3 for FY 2018, and we are not finalizing the proposed regulations text changes at § 412.106(g)(C)(*4*) through (*7*) regarding FY 2018 and subsequent fiscal years. In light of the significant concerns expressed by commenters, we are postponing the decision regarding when to begin incorporating data from Worksheet S–10 and proceeding with revisions to the cost report instructions to address the commenters' concerns in an appropriate manner. We believe that revised Worksheet S–10 data will be available to use in the calculation of Factor 3 in the near future, and no later than FY 2021. With regard to how Factor 3 will be computed in FY 2018 and subsequent fiscal years, we intend to explore whether there is an appropriate proxy for uncompensated care that could be used to calculate Factor 3 until we determine that revised Worksheet S–10 data can be used for this purpose. We will undertake further notice-and-comment rulemaking to address the issue of the appropriate data to use to determine Factor 3 for FY 2018 and subsequent fiscal years. We also anticipate proposing to continue to use data from three cost reports to calculate Factor 3, as we are doing for the calculation of Factor 3 for FY 2017, which would have a transitioning effect as we described in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25091).

G. Hospital Readmissions Reduction Program: Updates and Changes (§§ 412.150 Through 412.154)

1. Statutory Basis for the Hospital Readmissions Reduction Program

Section 3025 of the Affordable Care Act, as amended by section 10309 of the Affordable Care Act, added section 1886(q) to the Act, which establishes the ''Hospital Readmissions Reduction Program'' effective for discharges from ''applicable hospitals'' beginning on or after October 1, 2012. Under the Hospital Readmissions Reduction Program, payments to applicable hospitals may be reduced to account for certain excess readmissions. We refer readers to section IV.E.1. of the FY 2016 IPPS/LTCH PPS final rule (80 FR 49530 through 49531) for a detailed discussion and additional information on of the statutory history of the Hospital Readmissions Reduction Program.

2. Regulatory Background

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51660 through 51676), we addressed the issues of the selection of readmission measures and the calculation of the excess readmissions ratio, which are used, in part, to calculate the readmissions adjustment factor. Specifically, in that final rule, we finalized policies that relate to the portions of section 1886(q) of the Act that address the selection of and measures for the applicable conditions, the definitions of ''readmission'' and ''applicable period,'' and the methodology for calculating the excess readmissions ratio. We also established policies with respect to measures for readmission for the applicable conditions and our methodology for calculating the excess readmissions ratio.

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53374 through 53401), we finalized policies that relate to the portions of section 1886(q) of the Act that address the calculation of the hospital readmission payment adjustment factor and the process by which hospitals can review and correct their data. Specifically, in that final rule, we addressed the base operating DRG payment amount, aggregate payments for excess readmissions and aggregate payments for all discharges, the adjustment factor, applicable hospital, limitations on review, and reporting of hospital-specific information, including the process for hospitals to review readmission information and submit corrections. We also established a new Subpart I under 42 CFR part 412 (§§ 412.150 through 412.154) to codify rules for implementing the Hospital Readmissions Reduction Program.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50649 through 50676), we finalized our policies that relate to refinement of the readmissions measures and related methodology for the current applicable conditions, expansion of the ''applicable conditions'' for FY 2015 and subsequent fiscal years, and clarified the process for reporting hospital-specific information, including the opportunity to review and submit corrections. We also established policies related to the calculation of the adjustment factor for FY 2014.

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50024 through 50048), we made refinements to the readmissions measures and related methodology for applicable conditions for FY 2015 and subsequent fiscal years, discussed the maintenance of technical specifications for quality measures, and described a waiver from the Hospital Readmissions Reduction Program for hospitals formerly paid under section 1814(b)(3) of the Act (§ 412.154(d)). We also specified the ''applicable period'' for FY 2015 and made changes to the calculation of the aggregate payments for excess readmissions to include two additional applicable conditions for the FY 2015 payment determination. Finally, we expanded the list of applicable conditions for the FY 2017 payment determination to include the Hospital-Level, 30-Day, All-Cause, Unplanned Readmission Following Coronary Artery Bypass Graft (CABG) Surgery measure.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49530 through 49543), we made a refinement to the pneumonia readmissions measure that expanded the measure cohort for the FY 2017 payment determination and subsequent years (80 FR 49532 through 49536); adopted an extraordinary circumstance exception policy to address hospitals that experience a disaster or other extraordinary circumstance beginning in FY 2016 and for subsequent years (80 FR 49542 through 49543); and specified the calculation of aggregate payments for excess readmissions for FY 2016 (80 FR 49537 through 49542).

3. Policies for the FY 2017 Hospital Readmissions Reduction Program

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25094 through 25098), we:

- Proposed that the public reporting of excess readmission ratios be posted on an annual basis to the *Hospital Compare* Web site as soon as is feasible following the preview period.
- Discussed the methodology to include the addition of the CABG applicable condition in the calculation of the readmissions payment adjustment for FY 2017.

We note that, during the comment period for the FY 2017 IPPS/LTCH PPS proposed rule, we received public comments that were not related to our specific proposals for the Hospital Readmissions Reduction Program and therefore considered out of the scope of the proposed rule. Some of the out of scope comments were related to a wide range of aspects of the Hospital Readmissions Reduction Program and its readmissions measures. For example, there were recommendations that we risk-adjust for socioeconomic and sociodemographic status; that statutory changes be made to the program payment structure and previously finalized program definitions; and that we consider adjusting for skilled nursing facilities' (SNF) quality in calculating scores under the Hospital Readmissions Reduction Program. While we appreciate the commenters' feedback, we consider these topics to be out of the scope of the proposed rule. Therefore, we are not addressing most of these comments in this final rule.

Comment: Several commenters appreciated that CMS did not propose new conditions or make substantial changes to the program in this year's rule and suggested that this may be an indication that further improvements in aggregate readmission rates may not be achievable.

Response: We appreciate the input and will take this feedback into consideration in future measure selection and rulemaking.

4. Maintenance of Technical Specifications for Quality Measures

We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50039) for a discussion of the maintenance of technical specifications for quality measures for the Hospital Readmissions Reduction Program. Technical specifications of the readmission measures are provided on our Web site in the Measure Methodology Reports at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.* Additional resources about the Hospital Readmissions Reduction Program and measure technical specifications are on the QualityNet Web site on the Resources page at: *http://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228772412995.*

We want to remind readers that, in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49532), we discussed our policies regarding the use of sociodemographic factors in quality measures. We understand the important role that socioeconomic and sociodemographic status (SES/SDS) plays in the care of patients. However, we continue to have concerns about holding hospitals to different standards for the outcomes of their patients of diverse sociodemographic status because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. We routinely monitor the impact of sociodemographic status on hospitals' results on our measures.

The National Quality Forum (NQF) is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF will issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial. CMS, in compliance with NQF's guidance, has tested sociodemographic factors in the measures' risk models and made recommendations about whether or not to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our outcome measures.

Furthermore, the Office of the Assistant Secretary for Planning and Evaluation (ASPE) is conducting research to examine the impact of sociodemographic status on quality measures, resource use, and other measures under the Medicare program as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how they apply to our quality programs at such time as they are available.

5. Applicable Period for FY 2017

Under section 1886(q)(5)(D) of the Act, the Secretary has the authority to specify the applicable period with respect to a fiscal year under the Hospital Readmissions Reduction Program. In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51671), we finalized our policy to use 3 years of claims data to calculate the readmission measures. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53675), we codified the definition of ''applicable period'' in the regulations at 42 CFR 412.152 as the 3-year period from which data are collected in order to calculate excess readmissions ratios and adjustments for the fiscal year, which includes aggregate payments for excess readmissions and aggregate payments for all discharges used in the calculation of the payment adjustment.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49537), for FY 2016, consistent with the definition specified at § 412.152, we established an ''applicable period'' for the Hospital Readmissions Reduction Program of the 3-year period from July 1, 2011 through June 30, 2014. In other words, the excess readmissions ratios and the payment adjustment (including aggregate payments for excess readmissions and aggregate payments for all discharges) for FY 2016 were determined using data from the 3-year time period of July 1, 2011 through June 30, 2014.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25095), for FY 2017, consistent with the definition specified at § 412.152, we proposed that the ''applicable period'' for the Hospital Readmissions Reduction Program will be the 3-year period from July 1, 2012 through June 30, 2015. In other words, we proposed that the excess readmissions ratios and the payment adjustment (including aggregate payments for excess readmissions and aggregate payments for all discharges) for FY 2017 would be calculated using data from the 3-year time period of July 1, 2012 through June 30, 2015.

We did not receive public comments related to this proposal. Therefore, we are finalizing as proposed, without modification, the applicable period of the 3-year time period of July 1, 2012 to June 30, 2015 to calculate the excess readmission ratios and the readmission payment adjustment factors for FY 2017

under the Hospital Readmissions Reduction Program.

6. Calculation of Aggregate Payments for Excess Readmissions for FY 2017

Section 1886(q)(3)(B) of the Act specifies the ratio used to calculate the adjustment factor under the Hospital Readmissions Reduction Program. It states that the ratio is equal to 1 minus the ratio of—(i) the aggregate payments for excess readmissions and (ii) the aggregate payments for all discharges. The definition of ''aggregate payments for excess readmissions'' and ''aggregate payments for all discharges,'' as well as a methodology for calculating the numerator of the ratio (aggregate payments for excess readmissions) and the denominator of the ratio (aggregate payments for all discharges) are codified at § 412.154(c)(2).

Section 1886(q)(4) of the Act sets forth the definitions of ''aggregate payments for excess readmissions'' and ''aggregate payments for all discharges'' for an applicable hospital for the applicable period. The term ''aggregate payments for excess readmissions'' is defined in section 1886(q)(4)(A) of the Act and § 412.152 of our regulations as, for a hospital for an applicable period, the sum, for applicable conditions of the product, for each applicable condition, of: (i) The base operating DRG payment amount for such hospital for such applicable period for such condition; (ii) the number of admissions for such condition for such hospital for such applicable period; and (iii) the excess readmissions ratio for such hospital for such applicable period minus 1.

The excess readmissions ratio is a hospital-specific ratio calculated for each applicable condition. Specifically, section 1886(q)(4)(C) of the Act defines the excess readmissions ratio as the ratio of ''risk-adjusted readmissions based on actual readmissions'' for an applicable hospital for each applicable condition, to the ''risk-adjusted expected readmissions'' for the applicable hospital for the applicable condition. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51673) for additional information on the methodology for the calculation of the excess readmissions ratio. ''Aggregate payments for excess readmissions'' is the numerator of the ratio used to calculate the adjustment factor under the Hospital Readmissions Reduction Program.

The term ''aggregate payments for all discharges'' is defined at section 1886(q)(4)(B) of the Act as for a hospital for an applicable period, the sum of the base operating DRG payment amounts for all discharges for all conditions from such hospital for such applicable period. We codified this definition of ''aggregate payments for all discharges'' under the regulations at § 412.152. ''Aggregate payments for all discharges'' is the denominator of the ratio used to calculate the adjustment factor under the Hospital Readmissions Reduction Program.

The Hospital Readmissions Reduction Program currently includes the following five applicable conditions: Acute myocardial infarction (AMI), heart failure (HF), pneumonia (PN), total hip arthroplasty/total knee arthroplasty (THA/TKA), and chronic obstructive pulmonary disease (COPD). In the FY 2015 IPPS/LTCH PPS final rule effective for FY 2017 (79 FR 50033 through 50039), we finalized the inclusion of an additional applicable condition, Hospital-Level, 30-Day, All-Cause, Unplanned Readmission Following Coronary Artery Bypass Graft (CABG) Surgery.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25095 through 25098), we discussed the proposed methodology to include this additional measure in the calculation of the readmissions payment adjustment for FY 2017. Specifically, we proposed how the addition of CABG applicable conditions would be included in the calculation of the aggregate payments for excess readmissions (the numerator of the readmissions payment adjustment). We note that this proposal does not alter our established methodology for calculating aggregate payments for all discharges (that is, the denominator of the ratio).

When calculating the numerator (aggregate payments for excess readmissions), we determine the base operating DRG payments for the applicable period. ''Aggregate payments for excess readmissions'' (the numerator) is defined as the sum, for applicable conditions, of the product, for each applicable condition, of: (i) The base operating DRG payment amount for such hospital for such applicable period for such condition; (ii) the number of admissions for such condition for such hospital for such applicable period; and (iii) the excess readmissions ratio for such hospital for such applicable period minus 1.

When determining the base operating DRG payment amount for an individual hospital for such applicable period for such condition, we use Medicare inpatient claims from the MedPAR file with discharge dates that are within the same applicable period to calculate the excess readmissions ratio. We use MedPAR claims data as our data source for determining aggregate payments for excess readmissions and aggregate payments for all discharges, as this data source is consistent with the claims data source used in IPPS rulemaking to determine IPPS rates.

For FY 2017, we proposed to use MedPAR claims with discharge dates that are on or after July 1, 2012, and no later than June 30, 2015, consistent with our historical use of a 3-year applicable period. Under our established methodology, we use the update of the MedPAR file for each Federal fiscal year, which is updated 6 months after the end of each Federal fiscal year within the applicable period, as our data source (that is, the March updates of the respective Federal fiscal year MedPAR files) for the final rules.

The FY 2012 through FY 2015 MedPAR data files can be purchased from CMS. Use of these files allows the public to verify the readmissions adjustment factors. Interested individuals may order these files through the CMS Web site at: *http://www.cms.hhs.gov/LimitedDataSets/* by clicking on MedPAR Limited Data Set (LDS)-Hospital (National). This Web page describes the files and provides directions and detailed instructions for how to order the data sets.

In the proposed rule, for FY 2017, we proposed to determine aggregate payments for excess readmissions and aggregate payments for all discharges using data from MedPAR claims with discharge dates that are on or after July 1, 2012, and no later than June 30, 2015. However, we noted that, for the purpose of modeling the proposed FY 2017 readmissions payment adjustment factors for the proposed rule, we used excess readmissions ratios for applicable hospitals from the FY 2016 Hospital Readmissions Reduction Program applicable period. For this FY 2017 IPPS/LTCH PPS final rule, applicable hospitals have had the opportunity to review and correct data from the proposed FY 2017 applicable period of July 1, 2012 to June 30, 2015, before they are made public under our policy regarding the preview and reporting of hospital-specific information, which we discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53374 through 53401).

For FY 2017, we proposed to use MedPAR data from July 1, 2012 through June 30, 2015. Specifically, for the proposed rule, we used the March 2013 update of the FY 2012 MedPAR file to identify claims within FY 2012 with discharges dates that are on or after July 1, 2012, the March 2014 update of the FY 2013 MedPAR file to identify claims within FY 2013, the March 2015 update of the FY 2014 MedPAR file to identify

claims within FY 2014, and the December 2015 update of the FY 2015 MedPAR file to identify claims within FY 2015 with discharge dates no later than June 30, 2015. For this final rule, as we proposed, we used the same MedPAR files as listed above for claims within FY 2012, FY 2013 and FY 2014, and for claims within FY 2015, we used the March 2016 update of the FY 2015 MedPAR file.

For a discussion of how we identified the applicable conditions to calculate the aggregate payments for excess readmissions for FY 2016, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49538 through 49541). For FY 2017, with the addition of the CABG measure to the applicable conditions under the Hospital Readmissions Reduction Program, we proposed to follow this same approach.

In the proposed rule, for FY 2017, we proposed to continue to apply the same exclusions to the claims in the MedPAR file as we applied for FY 2016 for the AMI, HF, PN, THA/TKA, and COPD applicable conditions. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49539) for a list of these exclusions. Updates to these exclusions will be posted on the QualityNet Web site at: *http://www.QualityNet.org* > Hospital-Inpatient > Claims-Based Measures > Readmission Measures > Measure Methodology.

In addition to the exclusions described above, for FY 2017, we proposed the following steps to identify admissions specifically for CABG for the purposes of calculating aggregate payments for excess readmissions. These exclusions were previously finalized in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50037):

- Admissions for patients who are discharged against medical advice (excluded because providers do not have the opportunity to deliver full care and prepare the patient for discharge);
- Admissions for patients who die during the initial hospitalization (these patients are not eligible for readmission);
- Admissions for patients with subsequent qualifying CABG procedures during the measurement period (a repeat CABG procedure during the measurement period very likely represents a complication of the original CABG procedure and is a clinically more complex and higher risk surgery; therefore, we select the first CABG admission for inclusion in the measure and exclude subsequent CABG admissions from the cohort); and
- Admissions for patients without at least 30 days post-discharge enrollment in Medicare FFS (excluded because the 30-day readmission outcome cannot be assessed in this group).

As noted previously, these exclusions are consistent with our current methodology, and any updates to these exclusions will be posted on the QualityNet Web site at: *http://www.QualityNet.org* > Hospital-Inpatient > Claims-Based Measures > Readmission Measures > Measure Methodology.

Furthermore, under our proposal, we would only identify Medicare FFS claims that meet the criteria (that is, claims paid for under Medicare Part C, Medicare Advantage, would not be included in this calculation), consistent with the methodology to calculate excess readmissions ratios based solely on admissions and readmissions for Medicare FFS patients. Therefore, consistent with our established methodology, for FY 2017, we proposed to continue to exclude admissions for patients enrolled in Medicare Advantage as identified in the Medicare Enrollment Database. This policy is consistent with how admissions for Medicare Advantage patients are identified in the calculation of the excess readmissions ratios under our established methodology.

In order to identify the admissions for each applicable condition for FY 2017 to calculate the aggregate payments for excess readmissions for an individual hospital, we proposed to identify each applicable condition, including the CABG condition, using the appropriate ICD–9–CM codes. (Although the compliance date for the ICD–10–CM and ICD–10–PCS code sets was October 1, 2015, the proposed policies apply to data submitted prior to this compliance date.) Under our existing policy, we identify eligible hospitalizations and readmissions of Medicare patients discharged from an applicable hospital having a principal diagnosis for the measured condition in an applicable period (76 FR 51669). The discharge diagnoses for each applicable condition are based on a list of specific ICD–9–CM codes for that condition. The ICD–9–CM codes for the AMI, HF, PN, THA/TKA, COPD, and CABG applicable conditions can be found on the QualityNet Web site at: *http://www.QualityNet.org* > Hospital-Inpatient > Claims-Based Measures > Readmission Measures > Measure Methodology. Consistent with our established policy (76 FR 51673 through 51676), we proposed to use the ICD–9–CM codes to identify the applicable conditions in calculation of the excess readmissions ratios, which are provided in the measure methodology reports on the QualityNet Web site, to identify each applicable condition to calculate the aggregate payments for the excess readmissions ratios for FY 2017. For a complete list of the ICD–9–CM codes we proposed to use to identify the applicable conditions, we refer readers to the following tables of those reports:

- 2015 Measure Updates: AMI, HF, Pneumonia, COPD, Stroke Readmission (*AMI—Version 8.0, HF—Version 8.0, Pneumonia—Version 8.0, COPD—Version 4.0, and Stroke—Version 4.0: 2015 Condition-Specific Readmission Measures Updates and Specifications Report*)—

++ Table D.1.1—ICD–9–CM Codes for AMI Cohort (page 74).
++ Table D.2.1—ICD–9–CM Codes for HF Cohort (page 78).
++ Table D.3.1—ICD–9–CM Codes for Pneumonia Cohort (page 82).
++ Table D.4.1—ICD–9–CM Codes for COPD Cohort (page 87).

- 2015 Measure Updates: THA/TKA and CABG Readmission (*THA and/or TKA—Version 4.0, CABG—Version 2.0: 2015 Procedure-Specific Readmission Measures Updates and Specifications Report*)—

++ Table D.1.1—ICD–9–CM Codes Used to Identify Eligible THA/TKA Procedures (page 45).
++ Table D.2.1—ICD–9–CM Codes Used to Identify Eligible CABG Procedures (page 53).

For FY 2017, we proposed to calculate aggregate payments for excess readmissions, using MedPAR claims from July 1, 2012 to June 30, 2015, to identify applicable conditions based on the same ICD–9–CM codes used to identify the conditions for the readmissions measures, and to apply the proposed exclusions for the types of admissions (as previously discussed). To calculate aggregate payments for excess readmissions for each hospital, we proposed to calculate the base operating DRG payment amounts for all claims in the 3-year applicable period for each applicable condition (AMI, HF, PN, COPD, THA/TKA, and CABG) based on the claims we have identified as described above. Once we have calculated the base operating DRG amounts for all the claims for the six applicable conditions, we proposed to sum the base operating DRG payments amounts by each condition, resulting in six summed amounts, one amount for each of the six applicable conditions. We proposed to then multiply the amount for each condition by the respective excess readmissions ratio minus 1 when that excess readmissions ratio is greater than 1, which indicates that a hospital has performed, with respect to readmissions for that

applicable condition, worse than the average hospital with similar patients. Each product in this computation represents the payments for excess readmissions for that condition. We proposed to then sum the resulting products which represent a hospital's proposed ''aggregate payments for excess readmissions'' (the numerator of the ratio). Because this calculation is performed separately for each of the six conditions, a hospital's excess readmissions ratio must be less than or equal to 1 on each measure to avoid CMS' determination that there were payments made by CMS for excess readmissions (resulting in a payment reduction under the Hospital Readmissions Reduction Program). In other words, in order to avoid a payment reduction a hospital's excess readmissions ratio must be less than or equal to 1 on each measure. We note that we did not propose any changes to our existing methodology to calculate ''aggregate payments for all discharges'' (the denominator of the ratio).

Section 1886(q)(3)(A) of the Act defines the ''adjustment factor'' for an applicable hospital for a fiscal year as equal to the greater of: (i) The ratio described in subparagraph (B) for the hospital for the applicable period (as defined in paragraph (5)(D)) for such fiscal year; or (ii) the floor adjustment factor specified in subparagraph (C). Section 1886(q)(3)(B) of the Act, in turn, describes the ratio used to calculate the adjustment factor. Specifically, it states that the ratio is equal to 1 minus the ratio of—(i) the aggregate payments for excess readmissions and (ii) the aggregate payments for all discharges. The calculation of this ratio is codified at § 412.154(c)(1) of the regulations and the floor adjustment factor is codified at § 412.154(c)(2) of the regulations. Section 1886(q)(3)(C) of the Act specifies the floor adjustment factor at 0.97 for FY 2015 and subsequent fiscal years.

Consistent with section 1886(q)(3) of the Act, codified at § 412.154(c)(2), for FY 2017, the adjustment factor is either the greater of the ratio or the floor adjustment factor of 0.97. Under our established policy, the ratio is rounded to the fourth decimal place. In other words, for FY 2017, a hospital subject to the Hospital Readmissions Reduction Program will have an adjustment factor that is between 1.0 (no reduction) and 0.9700 (greatest possible reduction).

We proposed the following methodology for FY 2017 as displayed in the chart below.

FORMULAS TO CALCULATE THE READMISSIONS ADJUSTMENT FACTOR FOR FY 2017

AGGREGATE PAYMENTS FOR EXCESS READMISSIONS = [sum of base operating DRG payments for AMI × (Excess Readmissions Ratio for AMI − 1)] + [sum of base operating DRG payments for HF × (Excess Readmissions Ratio for HF − 1)] + [sum of base operating DRG payments for PN × (Excess Readmissions Ratio for PN − 1)] + [sum of base operating DRG payments for COPD) × (Excess Readmissions Ratio for COPD − 1)] + [sum of base operating DRG payments for THA/TKA × (Excess Readmissions Ratio for THA/TKA − 1)] + [sum of base operating DRG payments for CABG × (Excess Readmissions Ratio for CABG − 1)].

* We note that if a hospital's excess readmissions ratio for a condition is less than/equal to 1, there are no aggregate payments for excess readmissions for that condition included in this calculation.

AGGREGATE PAYMENTS FOR ALL DISCHARGES = sum of base operating DRG payments for all discharges.

RATIO = 1 − (Aggregate payments for excess readmissions/Aggregate payments for all discharges).

Proposed Readmissions Adjustment Factor for FY 2017 is the higher of the ratio or 0.9700.

* Based on claims data from July 1, 2012 to June 30, 2015 for FY 2017.

We invited public comment on these proposals.

Comment: Commenters supported the proposed calculation for the new CABG readmission measure, and program efforts to maintain focus on cardiology and cardiovascular care. Another commenter noted that the proposed calculation will include the CABG readmission measure in the payment formula in alignment with other program measures. One commenter expressed concern that the addition of the CABG measure may result in double counting of cases under both CABG and AMI, and recommended that cases should only count under either AMI or CABG to prevent double counting.

Response: We appreciate the commenters' support and will continue to monitor and analyze the impact of our measure selection for further adjustments to the Hospital Readmissions Reduction Program. We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53376) for further discussion on preventing double counting.

We are finalizing, as proposed and without modification, the methodology to include the addition of the CABG applicable condition in the calculation of the readmissions payment adjustment for FY 2017.

7. Extraordinary Circumstance Exception Policy

We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49542 through 49543) for a detailed discussion of our Extraordinary Circumstance Exception policy for the Hospital Readmissions Reduction Program.

During the review of a hospital's request for an extraordinary circumstance exception, we maintain the general principle that providing high quality of care and ensuring patient safety is of paramount importance. We intend to provide relief only for hospitals whose ability to accurately or timely submit all of their claims (from which readmission measures data are derived) has been negatively impacted as a direct result of experiencing a significant disaster or other extraordinary circumstance beyond the control of the hospital. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49542 through 49543) we finalized that the request process for an extraordinary circumstance exception begins with the submission of an extraordinary circumstance exception request form by a hospital within 90 calendar days of the natural disaster or other extraordinary circumstance. Under this policy, a hospital is able to request a Hospital Readmissions Reduction Program extraordinary circumstance exception at the same time it may request a similar exception under the Hospital IQR Program, the Hospital VBP Program, and the HAC Reduction Program. The extraordinary circumstance exception request form is available on the QualityNet Web site.

The following information is required to submit the request:

- Hospital CCN;
- Hospital name;
- Hospital Chief Executive Officer (CEO) and any other designated personnel contact information, including name, email address, telephone number, and mailing address (must include a physical address; a post office box address is not acceptable);
- Hospital's reason for requesting an exception, including:

++ CMS program name (for example, the Hospital Readmissions Reduction

Program, the Hospital VBP Program, or the Hospital IQR Program);

++ The measure(s) and submission quarters affected by the extraordinary circumstance that the hospital is seeking an exception for should be accompanied with the specific reasons why the exception is being sought; and

++ How the extraordinary circumstance negatively impacted performance on the measure(s) for which an exception is being sought;

• Evidence of the impact of the extraordinary circumstances, including but not limited to, photographs, newspaper, and other media articles; and

• The request form must be signed by the hospital's CEO or designated non-CEO contact and submitted to CMS.

The same set of information is currently required under the Hospital IQR Program and the Hospital VBP Program on the request form from a hospital seeking an extraordinary circumstance exception with respect to these programs. The specific list of required information is subject to change from time to time at the discretion of CMS.

Following receipt of the request form, CMS will: (1) Provide a written acknowledgement of receipt of the request using the contact information provided in the request form to the CEO and any additional designated hospital personnel; and (2) provide a formal response to the CEO and any additional designated hospital personnel using the contact information provided in the request notifying them of our decision. We review each request for an extraordinary circumstance exception on a case-by-case basis at our discretion. To the extent feasible, we also review requests in conjunction with any similar requests made under other IPPS quality reporting and payment programs, such as the Hospital IQR Program and the Hospital VBP Program.

This policy does not preclude CMS from granting extraordinary circumstance exceptions to hospitals that do not request them if we determine at our discretion that a disaster or other extraordinary circumstance has affected an entire region or locale. If CMS makes such a determination to grant an extraordinary circumstance exception to hospitals in an affected region or locale, we would convey this decision through routine communication channels to hospitals, vendors, and QIOs, including, but not limited to, issuing memos, emails, and notices on the QualityNet Web site. This provision aligns with the Hospital IQR Program's extraordinary circumstances extensions or exemptions policy.

8. Timeline for Public Reporting of Excess Readmission Ratios on *Hospital Compare* for the FY 2017 Payment Determination

Section 1886(q)(6) of the Act requires the Secretary to make information available to the public regarding readmission rates of each subsection (d) hospital under the program, and states that such information shall be posted on the *Hospital Compare* Internet Web site in an easily understandable format. Accordingly, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53401), we indicated that public reporting for excess readmission ratios could be available on the *Hospital Compare* Web site as early as mid-October. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25098), we clarified that public reporting of excess readmission ratios will be posted on an annual basis to the *Hospital Compare* Web site as soon as is feasible following the review period. This may occur as early as October, but it could occur later for a particular year in order to streamline reporting and align with other hospital quality reporting and performance programs.

Comment: Numerous commenters urged CMS to continue to ensure there is an adequate period of at least 30 days for hospitals to review their rate calculations and make necessary corrections before the rates are publicly displayed. One commenter supported the opportunities to allow hospitals to review their readmission data in a timelier fashion as part of the formal review period. Several commenters requested that CMS calculate and more frequently report to hospitals their performance on the readmission measures.

Response: We appreciate the commenters' input and support. In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51672 through 51673), we adopted the same preview and correction process and timeframe used for subsection (d) hospitals for the rates calculated for the Hospital Readmissions Reduction Program. That is, we provide hospitals with an opportunity to preview their readmission rates for 30 days prior to posting them on the *Hospital Compare* Web site. We note that hospitals have the opportunity to correct the rate calculations and not the underlying data. This process meets the statutory requirement in section 1886(q)(6)(B) of the Act which requires the Secretary to ensure that a subsection (d) hospital has the opportunity to review and submit corrections before the information is made public. In addition to the statutory requirements, we also considered hospitals' experience with the measure and the data production timeline when proposing the 30-day preview period. While the Hospital Readmissions Reduction Program is fairly new, subsection (d) hospitals are already familiar with the three 30-day risk-standardized readmission measures that the program uses to determine payment adjustment. Because hospitals are working with measures in which they have prior experience from the Hospital IQR Program, we believe that a 30-day preview period is sufficient for hospitals to review and correct their excess readmission ratios.

Due to the complexity of these measures and the need for bootstrapping in measure calculations, significant programming resources are required. It takes several months to complete the production and extensive quality assurance procedures needed to calculate results for more than 3,500 hospitals. As a result, we will not be able to begin the preview period earlier than late June. Also, we will not be able to extend the preview period to more than 30 days. This is because if hospitals find data problems that we determine to be attributable to our calculation or programming errors, we will need adequate time between mid-July and the end of September to: (1) Recalculate the excess readmission ratios; (2) regenerate and redisseminate corrected results to hospitals in time for payment adjustment in early October (the beginning of the subsequent fiscal year); and (3) publicly report the excess readmission ratios on the *Hospital Compare* Web site to meet the statutory reporting requirements under section 1886(q)(6) of the Act.

Comment: A few commenters asked that CMS establish a regular deadline for the release of annual data on hospital excess readmission ratios and also make clear when the data will be made available to the public on the *Hospital Compare* Web site. One commenter specifically requested that excess readmission ratios be posted to the *Hospital Compare* Web site more often than annually and prior to October.

Response: We appreciate the commenters' feedback. The public reporting of excess readmission ratios will be posted on an annual basis to the *Hospital Compare* Web site as soon as is feasible following the review period. This may occur as early as October, but it could occur later for a particular year in order to streamline reporting and align with other hospital quality reporting and performance programs.

After consideration of the public comments we received, we are finalizing the clarification that the public reporting of excess readmission ratios will be posted on an annual basis to the *Hospital Compare* Web site as soon as is feasible following the preview period.

H. Hospital Value-Based Purchasing (VBP) Program: Policy Changes for the FY 2018 Program Year and Subsequent Years

1. Background

a. Statutory Background and Overview of Past Program Years

Section 1886(o) of the Act, as added by section 3001(a)(1) of the Affordable Care Act, requires the Secretary to establish a hospital value-based purchasing program (the Hospital VBP Program) under which value-based incentive payments are made in a fiscal year to hospitals that meet performance standards established for a performance period for such fiscal year. Both the performance standards and the performance period for a fiscal year are to be established by the Secretary.

For more of the statutory background and descriptions of our current policies for the Hospital VBP Program, we refer readers to the Hospital Inpatient VBP Program final rule (76 FR 26490 through 26547); the FY 2012 IPPS/LTCH PPS final rule (76 FR 51653 through 51660); the CY 2012 OPPS/ASC final rule with comment period (76 FR 74527 through 74547); the FY 2013 IPPS/LTCH PPS final rule (77 FR 53567 through 53614); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50676 through 50707); the CY 2014 OPPS/ASC final rule (78 FR 75120 through 75121); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50048 through 50087); and the FY 2016 IPPS/LTCH PPS final rule with comment period (80 FR 49544 through 49570).

We also have codified certain requirements for the Hospital VBP Program at 42 CFR 412.160 through 412.167.

b. FY 2017 Program Year Payment Details

Section 1886(o)(7)(B) of the Act instructs the Secretary to reduce the base operating DRG payment amount for a hospital for each discharge in a fiscal year by an applicable percent. Under section 1886(o)(7)(A) of the Act, the sum total of these reductions in a fiscal year must equal the total amount available for value-based incentive payments for all eligible hospitals for the fiscal year, as estimated by the Secretary. We finalized details on how we would implement these provisions in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53571 through 53573) and refer readers to that rule for further details.

Under section 1886(o)(7)(C)(iv) of the Act, the applicable percent for the FY 2017 program year is 2.00 percent. Using the methodology we adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53571 through 53573), we estimate that the total amount available for value-based incentive payments for FY 2017 is approximately $1.8 billion, based on the March 2016 update of the FY 2015 MedPAR file.

As finalized in the FY 2013 IPPS/LTCH PPS final rule, we will utilize a linear exchange function to translate this estimated amount available into a value-based incentive payment percentage for each hospital, based on its Total Performance Score (TPS) (77 FR 53573 through 53576). We will then calculate a value-based incentive payment adjustment factor that will be applied to the base operating DRG payment amount for each discharge occurring in FY 2017, on a per-claim basis. We are publishing proxy value-based incentive payment adjustment factors in Table 16A associated with this final rule (which is available via the Internet on the CMS Web site). The proxy factors are based on the TPSs from the FY 2016 program year. These FY 2016 performance scores are the most recently available performance scores that hospitals have been given the opportunity to review and correct. The updated slope of the linear exchange function used to calculate those proxy value-based incentive payment adjustment factors is 2.7717318150. This slope, along with the estimated amount available for value-based incentive payments, is also published in Table 16A.

After hospitals have been given an opportunity to review and correct their actual TPSs for FY 2017, we will add Table 16B (which will be available via the Internet on the CMS Web site) to display the actual value-based incentive payment adjustment factors, exchange function slope, and estimated amount available for the FY 2017 program year. We expect that Table 16B will be posted on the CMS Web site in October 2016.

2. PSI 90 Measure in the FY 2018 Program and Future Program Years

a. PSI 90 Measure Performance Period Change for the FY 2018 Program Year

We previously finalized the performance period for the PSI 90: Patient Safety for Selected Indicators (Composite Measure) (then referred to as both the ''PSI 90 measure'' and the ''AHRQ PSI Composite Measure'') for the FY 2018 program year (78 FR 50694). We have calculated and finalized performance standards for the FY 2018 program year based on a baseline period that uses ICD–9–CM claims data. The previously finalized performance period for the FY 2018 program year runs from July 1, 2014 through June 30, 2016. Because hospitals began ICD–10–CM/PCS implementation on October 1, 2015, the performance period as currently finalized for the FY 2018 program year would necessitate using both ICD–9 and ICD–10 claims data to calculate performance standards for the PSI 90 measure.

Since the ICD–10 transition was implemented on October 1, 2015, we have been monitoring our systems, and claims are processing normally. Currently, the measure steward, AHRQ, is reviewing any potential issues related to ICD–10 conversion of coded operating room procedures (*https://www.cms.gov/icd10manual/fullcode_cms/P1616.html*), which directly impact the AHRQ PSI 90 component indicators. Nevertheless, given the complexity of converting the PSI 90 component indicators from ICD–9 to ICD–10 and considering that there are approximately 70,000 [24] ICD–10 codes, the measure steward has recommended against combining measure performance data that use both ICD–9 and ICD–10 data at this time. In addition, to meet program requirements and implementation schedules, our system requires an ICD–10 risk-adjusted version of the AHRQ QI PSI software [25] by December 2016 for use in the FY 2018 payment year. However, AHRQ needs a full year of nationally representative ICD–10 coded data before it can complete development of risk-adjusted models based on a national reference population. At this time, a risk adjusted ICD–10 version of the modified PSI 90 software is not expected to be available until late CY 2017. We refer readers to section VIII.A.6.b. of the preamble of this final rule relating to the Hospital IQR Program for a discussion of the modified PSI 90 measure update.

To address the above issues, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25099 through 25100), we proposed to shorten the performance period for the FY 2018 program year. We proposed

[24] International Classification of Diseases (ICD–10–CM/PCS) Transition—Background. Available at: *http://www.cdc.gov/nchs/icd/icd10cm_pcs_background.htm*.

[25] The AHRQ QI Software is the software used to calculate PSIs and the composite measure. More information is available at: *http://www.qualityindicators.ahrq.gov/Downloads/Resources/Publications/2015/Empirical_Methods_2015.pdf*.

to use a 15-month performance period from July 1, 2014 through September 30, 2015 for the FY 2018 program year. The 15-month performance period would only apply to the FY 2018 program year and would only use ICD–9 data. For the FY 2018 program year, the performance standards that were previously established and announced in past rules would not change because they were calculated based on the baseline period of July 1, 2010 through June 30, 2012, which would remain the same. In order to align the use of this measure with other hospital quality programs, we proposed (and are finalizing) similar modifications to the FY 2018 reporting period for the PSI 90 measure for the HAC Reduction Program, as discussed in section IV.I.3.b. of the preamble of this final rule, and for the Hospital IQR Program, as discussed in section VIII.A.6.b.(4) of the preamble of this final rule.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25100), we discussed that we are aware that the FY 2019 program year also has a performance period that contains ICD–9 and ICD–10 data and that we would continue to review our options for calculating the performance period for the FY 2019 program year and further address this in next year's rulemaking. Because an ICD–10 version of the current PSI 90 is not being developed, we intend to propose to remove the PSI 90 measure from the Hospital VBP Program beginning with the FY 2019 program year in next year's rulemaking.

We noted that in proposing a shortened performance period for the PSI 90 measure, a prior reliability analysis of the PSI 90 measure showed that the majority of hospitals attain a moderate or high level of reliability for the PSI 90 measure after a 12-month period.[26] Further, this reliability analysis is based on older data that does not include improvements in present on admission (POA) coding, which is likely to improve reliability. We believe that the data we will collect is likely to be reliable during a 15-month performance period. We do not anticipate any delay for hospitals to review their TPSs for the FY 2018 program year during the review and correction period.

Prior to deciding to propose an abbreviated performance period for the FY 2018 program year, we took several factors into consideration, including the recommendations of the measure steward, the feasibility of using a combination of ICD–9 and ICD–10 data without the availability of the appropriate measure software, minimizing provider burden, program implementation timelines, and the reliability of using shortened performance periods, as well as the importance of continuing to publicly report this measure. We stated our belief that using a 15-month performance period for FY 2018 best serves the need to provide important information on hospital patient safety and adverse events by allowing sufficient time to process the claims data and calculate the measures, while minimizing the reporting burden and program disruption.

Furthermore, we stated that we plan to propose to adopt the modified PSI 90 measure, which includes several substantive measure updates, for the Hospital VBP Program in subsequent rulemaking, as soon as it is feasible. We discussed this future proposed adoption in section IV.H.2.b. of the preamble of the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25100) and reaffirm this intention in section IV.H.2.b. of the preamble of this final rule.

We invited public comments on this proposed plan to shorten the performance period for the PSI 90 measure for the FY 2018 program year.

Comment: A few commenters supported the proposal to adopt a 15-month performance period for FY 2018 to account for the transition from ICD–9–CM to ICD–10–CM/PCS.

Response: We thank the commenters for their support.

Comment: Many commenters did not support the proposal to shorten the performance period for PSI 90 in the FY 2018 program year to 15 months of data because commenters are concerned that shortening the performance period will degrade the measure's reliability. In addition, several commenters were concerned that only 81 percent of hospitals achieve median reliability with 12 months of data and 86 percent achieve median reliability with 18 months of data. Many commenters recommended suspending or removing the use of PSI 90 in the Hospital VBP Program beginning with the FY 2018 program year. Some commenters also recommended suspending or removing the measure for at least the FY 2018 and FY 2019 program years because of the inability to calculate the measure using ICD–10 data. One commenter recommended that CMS change the PSI 90 performance period to a 24-month performance period (October 1, 2013 through September 30, 2015) because this commenter believed that 24 months would ensure the measure results are more reliable and enable the use of only ICD–9–CM data.

Response: We note that the measure reliability analysis the commenters have cited does not apply a case minimum threshold like the one the Hospital VBP Program applies. Thus, we believe that a 15-month performance period is sufficiently reliable, particularly in light of the case minimum of three cases for any of the underlying PSI 90 indicators as finalized in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53609). Because we believe the measure is sufficiently reliable with 15 months of data, we do not believe we need to suspend or remove the measure or extend the measure's performance period for the FY 2018 program year. We appreciate the commenter's suggestion that we use October 1, 2013 to September 30, 2015 as a 24-month performance period for the PSI 90 measure in the FY 2018 program year, but it overlaps substantially with the performance period for the PSI 90 measure in the FY 2017 program year (which runs from October 1, 2013 to June 30, 2015 (78 FR 50692)).

Comment: Many commenters did not support shortening the performance period for the FY 2018 program year because commenters believe there are numerous flaws in the measure, including gaming, selective reporting, and surveillance/ascertainment bias. Several commenters recommended that CMS remove the PSI 90 measure from the program and replace it with more reliable measures of patient safety. One commenter recommended that if CMS retains the PSI 90 measure in the FY 2018 program year, CMS change the measure so that the PSI 07 Central Venous Catheter-related Bloodstream Infection Rate excludes cases with a length of stay of less than 2 days. This commenter further recommended extending the length of stay exclusion criterion for PSI 07 Central Venous Catheter-related Bloodstream Infection Rate to 4 days to remain consistent with the length of stay outlined in other PSI components.

Response: We thank the commenters for their suggestions, but we do not believe the PSI 90 measure is flawed. The PSI 90 measure was developed using a scientifically rigorous process that involved the input of technical experts and stakeholders. Further, AHRQ has supported a series of validation studies, based on detailed abstraction of medical records, that have informed AHRQ's PSI development process, including making further refinements to indicators and working

[26] Mathematica Policy Research (November 2011). Reporting period and reliability of AHRQ, CMS 30-day and HAC Quality Measures—Revised. Available at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/hospital-value-based-purchasing/Downloads/HVBP_Measure_Reliability-.pdf.*

with others to improve coding practices. We refer commenters to the AHRQ PSI Development zip file and AHRQ Composite Measures Workgroup document available at: *http://www.qualityindicators.ahrq.gov/modules/psi_resources.aspx.* We believe that the PSI 90 measure in its current form is reliable, valid, and appropriate to retain in the Hospital VBP Program for the FY 2018 program year because it appropriately encourages robust hospital attention to patient safety. We also believe that the length of stay exclusion criterion of 2 days in the PSI 07 Central Venous Catheter-related Bloodstream Infection Rate is adequate because positive blood cultures within the first 2 days of admission are likely to reflect a bloodstream infection that was present on admission, rather than a bloodstream infection associated with care provided by the hospital. We note that the modified PSI 90 no longer includes PSI 07 Central Venous Catheter-related Bloodstream Infection Rate. However, AHRQ plans to maintain PSI 07 Central Venous Catheter-related Bloodstream Infection Rate as a separate PSI and it is included in an 11-indicator version of PSI 90 that is not NQF-endorsed. Suggestions regarding potential PSI measure revisions can be made directly to: *QISupport@ahrq.hhs.gov.*

Comment: A few commenters did not support the continued use of the PSI 90 measure in the Hospital VBP Program for the FY 2018 and FY 2019 program years because the Hospital VBP Program will be misaligned with the Hospital IQR Program and the HAC Reduction Program, which have both proposed to adopt the modified PSI 90 measure in the FY 2017 IPPS/LTCH PPS proposed rule. A few commenters recommended that CMS adopt the modified PSI 90 measure in the Hospital VBP Program beginning with the FY 2018 program year.

Response: We thank the commenters for their suggestions, but we note that we are unable to adopt the modified PSI 90 measure beginning with the FY 2018 program year due to certain statutory requirements in the Hospital VBP Program that are not required in the Hospital IQR Program or the HAC Reduction Program. As we noted in the proposed rule, section 1886(o)(2)(A) of the Act requires the Hospital VBP Program to select measures that have been specified for the Hospital IQR Program. The Hospital IQR Program is finalizing the modified PSI 90 measure in this FY 2017 IPPS/LTCH PPS final rule (see section VIII.A.6.b. of the preamble of this final rule). In addition, section 1886(o)(2)(C)(i) of the Act requires the Hospital VBP Program to refrain from beginning the performance period for a new measure until data on the measure have been posted on *Hospital Compare* for at least one year. The Hospital IQR Program is finalizing the modified PSI 90 measure in this final rule but measure data have not yet been posted on *Hospital Compare,* and we are required to wait one full year after data has been posted before that measure's performance period may begin in the Hospital VBP Program. Finally, section 1886(o)(3)(C) of the Act requires that the Hospital VBP Program establish performance standards for each measure not later than 60 days prior to the beginning of the performance period. We anticipate adopting the modified PSI 90 measure in future rulemaking as soon as we have met the statutory requirements laid out in the Act.

Comment: One commenter expressed concern with the currently adopted PSI 90 measure because it may penalize hospitals that have a robust surveillance program or that have strict policies on what physicians include in their notes.

Response: We acknowledge commenter's concerns regarding the currently adopted PSI 90, but note that there is little evidence that hospitals that may have a less robust surveillance program underreport diagnoses for the PSI 90 indicators. Further, there is high degree of sensitivity (true positives) with respect to indicator diagnoses among hospitals.

Comment: Numerous commenters requested that we remove the currently adopted version of the PSI 90 measure. Specifically, many commenters noted that using the currently adopted version of the measure in the Hospital VBP Program would not align with the Hospital IQR Program and the HAC Reduction Program, both of which are using the modified PSI 90 measure in their programs.

Response: While we understand commenters' concerns, we have decided to retain the currently adopted version of the PSI 90 measure for the FY 2018 program year because we have the option to shorten the performance period so that performance standards can be calculated using the ICD–9 AHRQ QI software. We believe that this measure meets the program goal of providing important information on hospital performance on patient safety and adverse events. We recognize that the performance period for the current PSI 90 measure cannot be shortened in the FY 2019 program year because ICD–10 AHRQ QI software for the currently adopted measure will not be available. In light of this, we intend to propose to remove the PSI 90 measure from the Hospital VBP Program beginning with the FY 2019 program year in next year's rulemaking. We also intend to propose to adopt the modified PSI 90 measure for the Hospital VBP Program in future rulemaking as soon as it is feasible, which we discuss further in section IV.H.2.b. of the preamble of this final rule.

After consideration of the public comments we received, we are finalizing the proposal to shorten the performance period for the PSI 90 measure for the FY 2018 program so that it runs from July 1, 2014 through September 30, 2015 as proposed.

b. Intent To Propose in Future Rulemaking To Adopt the Modified PSI 90 Measure

The PSI 90 measure underwent NQF maintenance review in 2014. The 2014 NQF maintenance review process led to several measure changes.[27] Due to statutory requirements [28] in the Hospital VBP Program, we would not be able to adopt the NQF-endorsed modified PSI 90 measure, now known as Patient Safety and Adverse Events Composite, until a future program year. We refer readers to section VIII.A.6.b. of the preamble of this final rule relating to the Hospital IQR Program for a discussion of the modified PSI 90 measure update.

Comment: Several commenters supported CMS' intent to propose to adopt the modified PSI 90 measure. One commenter specifically supported the modified specification of component indicators PSI 12 Perioperative Pulmonary Embolism (PE) or Deep Vein Thrombosis (DVT) Rate and PSI 15 Unrecognized Abdominopelvic Accidental Puncture/Laceration Rate as well as the removal of PSI 07 Central Venous Catheter-related Bloodstream Infection Rate. One commenter encouraged CMS to adopt the modified PSI 90 measure as soon as possible because this measure has been reendorsed by the NQF following modification. One commenter noted

[27] National Quality Forum QPS Measure Description for ''Patient Safety for Selected Indicators (modified version of PSI90) (Composite Measure)'' found at: *https://www.qualityforum.org/QPS/MeasureDetails.aspx?standardID=321&print=0&entityTypeID=3.*

[28] First, section 1886(o)(2)(A) of the Act requires the Program to select measures that have been specified for the Hospital IQR Program. Second, section 1886(o)(2)(C)(i) of the Act requires the Hospital VBP Program to refrain from beginning the performance period for a new measure until data on the measure have been posted on *Hospital Compare* for at least one year. Finally, section 1886(o)(3)(C) of the Act requires that the Hospital VBP Program establish performance standards for each measure not later than 60 days prior to the beginning of the performance period.

that the modifications to the measure identify harmful healthcare events that are potentially preventable. One commenter believed that the modified measure addresses prior concerns including the weighting of components, issues with public reporting, and biases in the distribution of incentive payments.

Response: We thank commenters for their support of our intent to propose the modified PSI 90 in future rulemaking.

Comment: Several commenters expressed concern that the software hospitals use to monitor and assess their performance has not yet been updated to reflect ICD–10 coding, which hinders hospitals' ability to monitor performance and continually improve their quality of care. The commenter urged CMS to work with AHRQ to update the software as soon as possible.

Response: We acknowledge the comments received and are working with AHRQ to have the ICD–10 measure software available as soon as possible.

Comment: Several commenters recommended that CMS reevaluate the PSI 90 measure for appropriateness in the program because it is susceptible to surveillance bias, measures components that may not be preventable through evidence-based practices, lacks appropriate and necessary exclusions associated primarily with large academic centers, and is based on administrative claims data that do not capture the full scope of patient-level risk factors. The commenters also believe that it may disproportionately impact teaching hospitals because they tend to have a larger volume of surgical cases.

Response: While we acknowledge commenters' preference for chart-abstracted measures, administrative claims data are valid for quality measurement and significantly less burdensome on hospitals for quality reporting. Many teaching hospitals do as well or better on the measure than non-teaching hospitals, and many of the PSI components are preventable through evidenced-based practices. We have previously addressed commenters' concerns regarding the use of administrative claims, coding issues, and the impact on academic hospitals. We refer commenters to this discussion in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50684) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50064).

Comment: One commenter did not support CMS' intent to propose to adopt the modified PSI 90 measure because this commenter believed the measure, despite modifications, continues to lack the level of accuracy, reliability, and validity necessary to ascertain high-performing facilities.

Response: We acknowledge commenter's concerns and will consider them when we consider a future proposal to adopt the modified PSI 90 measure for the Hospital VBP Program. We refer the commenter to section VIII.A.6.b. of the preamble of this final rule where we discuss the modified PSI 90 and similar concerns in the context of the Hospital IQR Program, including why we believe the modified PSI 90 is sufficiently accurate, reliable, and valid, and section IV.I.3.a. of the preamble of this final rule in the context of the HAC Reduction Program.

Comment: One commenter did not support CMS' intent to propose to adopt the modified PSI 90 measure because the commenter believed that the modified measure does not take into account clinical considerations involved in transplant surgery. The commenter noted that the risk adjustment methodology is not specific to transplantation and lacks adjustments for severity of illness and donor characteristics. Specifically, the commenter stated that the PSI 09 Postoperative Hemorrhage or Hematoma Rate component indicator of the measure does not properly exclude transplant patients, which is inappropriate because perioperative hemorrhage or hematoma is common after liver, kidney, and many other transplants despite high quality care. Further, the commenter stated that the PSI 10 Postoperative Acute Kidney Injury Rate component indicator inappropriately includes liver transplant patients, many of whom develop acute renal failure after a transplant despite high quality care.

The commenter stated that the PSI 11 Postoperative Respiratory Failure Rate component indicator inappropriately includes liver and kidney transplant patients, many of whom have high incidences of acute respiratory failure, mechanical ventilation, and reintubation after a transplant despite high quality care. Finally, the commenter stated that the PSI 12 Perioperative PE or DVT Rate component indicator inappropriately includes liver and kidney transplant patients, many of whom develop deep vein thrombosis despite high quality care.

Response: We acknowledge commenter's concerns and will share the feedback with the measure steward, AHRQ, as well as take the concerns into consideration when we consider a future proposal to adopt the modified PSI 90 measure for the Hospital VBP Program. We refer the commenter to section VIII.A.6.b. of the preamble of this final rule where we discuss the modified PSI 90 and similar concerns in the context of the Hospital IQR Program and section IV.I.3.a. of the preamble of this final rule in the context of the HAC Reduction Program.

Comment: One commenter did not support CMS' intent to propose to adopt the modified PSI 90 measure in the Hospital VBP Program because the underlying PSIs rely on administrative claims data and are inaccurate in assessing postoperative complications. The commenter believed the component indicators of the modified PSI 90 are flawed by gaming, selective reporting, and surveillance/ascertainment bias.

Specifically, the commenter did not support PSI 12 Perioperative PE or DVT Rate because the commenter believed it is susceptible to surveillance bias and not a valid measure of quality. The commenter suggested using a comprehensive prophylaxis measure because it is a better measure of quality in VTE prevention and more widely used. While the commenter supported the decreased weighting of PSI 12 Perioperative PE or DVT Rate and PSI 15 Unrecognized Abdominopelvic Accidental Puncture/Laceration, commenter expressed concern that they were still weighted too high and that high-quality hospitals may be unfairly deemed poor performers due to methodological flaws in the weighting. The commenter did not support the continued inclusion of PSI 15 Unrecognized Abdominopelvic Accidental Puncture/Laceration because no large-scale assessment has been done to assess the validity of the component indicator and it is difficult to determine if a reoperation was directly related to the accidental puncture/laceration.

The commenter recommended that the exclusion criteria in PSI 04 Stratum 4A be broadened to include diagnoses that reflect a hypercoagulable state. The commenter recommended broadening the exclusion criteria in Stratum 4B to include cases that started in Major Diagnostic Category (MDC) 4 but advanced to Pre-MDC. The commenter recommended broadening the exclusion criteria in Stratum 4C to include sepsis diagnosis codes that are present on admission. The commenter recommended broadening the exclusion criteria of Stratum 4D to include cases that started in MDC 4 or 5 but advanced to Pre-MDC and cases that are present on admission. The commenter recommended removing the inclusion criterion of K92.1 melena in Stratum 4E. The commenter also recommended broadening the exclusion criteria for

Stratum 4E to focus on the Present on Admission Indicator rather than the principal diagnosis position and also exclude Pre-MDC.

The commenter recommended broadening the exclusion criteria of PSI 03 Pressure Ulcer Rate to include those from Appendix I-Immunocompromised State Diagnosis and Procedure Code in the PSI Technical Specifications Update manual. The commenter recommended broadening PSI 06 Iatrogenic Pneumothorax Rate to include pneumothorax related to CPR. The commenter recommended broadening the exclusion criteria of PSI 07 Central Venous Catheter-related Blood Stream Infection Rate to include cases with a length of stay of less than 2 days. The commenter recommended broadening the exclusion criteria of PSI 08 In-Hospital Fall with Hip Fracture Rate to include anything falling within Appendix H: Cancer Diagnosis Codes regardless of metastasis and regardless of Present on Admission status. The commenter recommended broadening the exclusion criteria of PSI 09 Postoperative Hemorrhage and Hematoma Rate to include Abnormal Coagulation Profile R79.1 as an exclusion criterion with present on admission, and creating a new seroma ICD–10 code. The commenter recommended changing the exclusion criteria of PSI 10 Postoperative Acute Kidney Injury Rate to a time based element in hours as opposed to the number of postoperative days and including sinus bradycardia and sinus tachycardia cardiac arrhythmias in the exclusion criteria.

The commenter recommended changing the numerator inclusion criteria of the PSI 11 Postoperative Respiratory Failure Rate to vent time, reintubation criteria, and broadening the exclusion criteria to include cases that started in MDC 4 or 5 but advanced to the Pre-MDC. The commenter recommended broadening the exclusion criteria of PSI 12 Perioperative PE or DVT Rate to include inheritable hypercoagulable conditions, acquired hypercoagulable conditions, and present on admission status. The commenter also recommended that PSI 12 Perioperative PE or DVT Rate be excluded from public reporting and pay-for-performance programs. The commenter recommended modifying PSI 13 Postoperative Sepsis Rate to delete the inclusion criteria for post-procedural shock. The commenter recommended extending the exclusion criteria of PSI 14 Postoperative Wound Dehiscence Rate to a length of stay of 4 days. The commenter recommended excluding from PSI 12 Perioperative PE or DVT Rate inheritable hypercoagulable conditions: Factor V Leiden, Factor VIII, Factor IX, Factor XI, and the acquired hypercoagulable conditions: Cancer, recent trauma or surgery, central venous catheter placement, obesity, supplemental estrogen use including oral contraceptives, hormone replacement therapy, prolonged bed rest or immobility, heparin induced thrombocytopenia, previous history of DVT/PE, myeloproliferative disorders such as polycythemia vera or essential thrombocytosis, inflammatory bowel syndrome, HIV/AIDS, and nephrotic syndrome. For PSI 13 Postoperative Sepsis Rate, the commenter recommended deleting the inclusion criteria of post-procedural shock, unspecified T811OXA as it may not be related to sepsis and does not reflect the true spirit of the measure. For PSI 14 Postoperative Wound Dehiscence, the commenter recommended extending the exclusion criteria to a length of stay of 4 days to remain consistent with criteria in other PSI components.

Response: We thank the commenter for the suggestions, especially with regard to measure specifications, such as weighting of components and inclusion and exclusion criteria, and we will share them with the measure steward, AHRQ. We acknowledge commenter's concerns and will consider them when we consider a future proposal to adopt the modified PSI 90 for the Hospital VBP Program. We refer the commenter to section VIII.A.6.b. of the preamble of this final rule where we discuss the modified PSI 90 and similar concerns in the context of the Hospital IQR Program and section IV.I.3.a. of the preamble of this final rule in the context of the HAC Reduction Program.

Comment: A few commenters did not support CMS' intent to propose to adopt the modified PSI 90 measure because the commenters stated that all measures should be publicly reported for at least one year before being proposed for a performance program.

Response: We agree that all measures should be publicly reported for at least one year before being used in the Hospital VBP Program, and we are required to do so by statute. We intend to propose to adopt the modified PSI 90 measure in a manner that complies with all the statutory requirements, including the public reporting requirement.

Comment: A few commenters supported CMS' intent to propose to adopt the modified PSI 90 measure to replace the current PSI 90 measure, but would prefer that neither version of the measure be used in the program because of major concerns with the components of the measure. One commenter believed the PSI 90 measure is reliable for internal quality improvement efforts, but not as a basis for comparing hospital quality. Another commenter requested that CMS improve the NHSN measures' methodology so that it can be relied upon as the best source of safety measurement.

Response: We acknowledge commenter's concerns and will consider them when we consider a future proposal to adopt the modified PSI 90 for the Hospital VBP Program; however, as we noted above, the PSI 90 measure was developed using a scientifically rigorous process that involved the input of technical experts and stakeholders. We refer the commenter to section VIII.A.6.b. of the preamble of this final rule where we discuss the modified PSI 90 and similar concerns in the context of the Hospital IQR Program and section IV.I.3.a. of the preamble of this final rule in the context of the HAC Reduction Program.

Comment: One commenter did not support the use of the modified PSI 90 measure in the program as a composite measure because the commenter believed each of the component indicators should be reported separately, which will increase transparency for consumers and providers.

Response: We appreciate commenter's suggestion. However, since we have adopted the composite measure for the Hospital VBP Program, we believe it is appropriate to publish hospitals' performance on that measure as a composite score, rather than its individual components, as a reflection of performance measured and scored under the Hospital VBP Program. The composite measure is the basis for awarding achievement and improvement points, not its underlying indicators, and we believe it is appropriate to focus the public reporting of Hospital VBP Program scores on the measures that receive points. We note that hospital performance on the individual component indicators of PSI 90 as calculated in the Hospital IQR Program are publicly available in downloadable datasets located at: *https://data.medicare.gov/data/hospital-compare* because we agree with the commenter about the importance of this information to consumers and providers.

3. Retention Policy, Domain Name Change, and Updating of Quality Measures for the FY 2019 Program Year

a. Retention of Previously Adopted Hospital VBP Program Measures

Since the FY 2013 IPPS/LTCH PPS final rule (77 FR 53592), we have retained measures from prior program years for each successive program year, unless otherwise proposed and finalized. We are not proposing any changes to this policy.

b. Domain Name Change

We strive to align quality measurement and value-based purchasing programs with the NQS priority and the CMS Quality Strategy. Value-based purchasing programs in particular allow us to link the CMS Quality Strategy with Medicare payments to providers and suppliers on a national scale. Given this objective, as well as our objective to focus quality measurement on the patient-centered outcome of interest to the extent possible, we reclassified the Hospital VBP Program measures into domains based on the 6 priorities of the CMS Quality Strategy. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50702), we combined the priorities of Care Coordination and Patient- and Caregiver-Centered Experience of Care into one domain for purposes of aligning the Hospital VBP Program domains with the CMS Quality Strategy. The domain name is often shortened to say PCCEC/CC. The HCAHPS measure, which includes the care transitions measure (CTM–3), currently comprises the Patient- and Caregiver-Centered Experience of Care/Care Coordination domain.

This domain name has proven to be long and unwieldy. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25100 through 25101), we proposed to change the domain name from Patient- and Caregiver-Centered Experience of Care/Care Coordination to, more simply, Person and Community Engagement beginning with the FY 2019 program year. We stated our belief that this domain name captures 2 goals of the CMS Quality Strategy, as shown in the table below:

Hospital VBP program domain	CMS quality strategy goal
Safety	Make Care Safer by Reducing Harm Caused in the Delivery of Care.
Efficiency and Cost Reduction.	Make Care Affordable.
Clinical Care	Promote Effective Prevention and Treatment of Chronic Disease.
	Promote Effective Communication and Coordination of Care.
Person and Community Engagement.	Strengthen Persons and Their Families as Partners in Their Care.
	Work with Communities to Promote Best Practices of Healthy Living.
N/A.	

We invited public comments on this proposal.

Comment: Several commenters supported renaming the Patient- and Caregiver-Centered Experience of Care/Care Coordination domain to the Person and Community Engagement domain because it simplifies the domain reference and aligns with the CMS Quality Strategy. One commenter noted that the name change accurately represents the purpose of the measures included in the domain.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing the proposed domain name change from the Patient- and Caregiver-Centered Experience of Care/Care Coordination to the Person and Community Engagement domain. We will begin referring to the domain by its new name beginning with the FY 2019 program year.

c. Inclusion of Selected Ward Non-Intensive Care Unit (ICU) Locations in Certain NHSN Measures Beginning With the FY 2019 Program Year

The Hospital VBP Program has used the CLABSI measure since the FY 2015 program year and has used the CAUTI measure since the FY 2016 program year. Both measures use adult, pediatric, and neonatal intensive care unit (ICU) data to calculate performance standards and measure scores (79 FR 50061). In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50787), we expanded the CAUTI and CLABSI measures to selected ward (non-ICU) settings for the Hospital IQR Program, effective January 1, 2015 (78 FR 50787). Data were first posted on *Hospital Compare* in December 2015. Selected ward (non-ICU) locations are defined as adult or pediatric medical, surgical, and medical/surgical wards (78 FR 50787; 79 FR 50061). More information on the CLABSI and CAUTI measures can be found at: *http://www.cdc.gov/nhsn/pdfs/pscmanual/4psc_clabscurrent.pdf* and *http://www.cdc.gov/nhsn/pdfs/pscmanual/7psccauticurrent.pdf,* respectively.

In the FY 2015 and FY 2016 IPPS/LTCH PPS final rules, we discussed our intent to consider using data from selected ward (non-ICU) locations for the Hospital VBP Program beginning in the FY 2019 program year for purposes of calculating performance standards for the CAUTI and CLABSI measures (79 FR 50061; 80 FR 49556). Several public commenters supported our proposal to include performance data from non-ICU locations in the CLABSI and CAUTI measures beginning in the FY 2019 program year, noting that CLABSI and CAUTI measures are important targets for dedicated surveillance and prevention efforts outside the ICU setting (80 FR 49566).

Based on the public comments we have received in prior rulemaking, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25101), we proposed to include the selected ward (non-ICU) locations in the CAUTI and CLABSI measures for the Hospital VBP Program beginning with the FY 2019 program year, with a baseline period of January 1, 2015 through December 31, 2015 and a performance period of January 1, 2017 through December 31, 2017. This expansion of the CAUTI and CLABSI measures aligns with the Hospital IQR Program. It also aligns with the HAC Reduction Program, which adopted the expansion of the CAUTI and CLABSI measures beginning with its FY 2018 program year (80 FR 49576 through 49578). This expansion is also consistent with the NQF reendorsement update to these measures, which allows application of the measures beyond ICU locations (78 FR 50787). The MAP conditionally supported the expansion of the CAUTI (MUC–S0138) and CLABSI (MUC–S0139) measures for the Hospital VBP Program on the condition of gaining experience publicly reporting these measure data, as detailed in the ''Spreadsheet of MAP 2015 Final Recommendations.'' [29] We continue to believe this expansion of the measures would allow all hospitals, including hospitals that do not have ICU locations, to use the tools and resources of the

[29] ''Spreadsheet of MAP 2015 Final Recommendations'' available at: *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=78711* and ''Process and Approach for MAP Pre-Rulemaking Deliberations 2015'' available at: *http://www.qualityforum.org/Publications/2015/01/Process_and_Approach_for_MAP_Pre-Rulemaking_Deliberations_2015.aspx.*

NHSN for quality improvement and public reporting efforts.

We invited public comments on this proposal.

Comment: Many commenters supported the inclusion of selected ward non-ICU locations for the CAUTI and CLABSI measures beginning with the FY 2019 program year. Several commenters noted that the expansion will reduce confusion by aligning these measures with the Hospital IQR Program. Several commenters believed the expansion will encourage system-wide adoption of infection prevention protocols and allow hospitals that do not have ICU locations to use NHSN tools and resources in their quality improvement efforts. One commenter noted that a significant proportion of community hospitals have smaller ICUs, meaning lower total number of device days, which can lead to the inability to calculate standardized infection ratios because the expected number of infection events is < 1. The commenter believed that the inclusion of ward (non-ICU) locations will lessen this limit in calculation of this measure.

Response: We thank the commenters for their support.

Comment: One commenter recommended that, before implementing these measures in selected ward (non-ICU) locations, CMS provide these locations with the mechanisms to begin voluntarily collecting data in order to use that data in calculating performance standards for subsequent years of the program.

Response: The refined NHSN CAUTI and CLABSI measures that include select ward locations were finalized in the Hospital IQR Program in the FY 2014 IPPS/LTCH PPS final rule and data collection began on January 1, 2015 (78 FR 50787). Because the Hospital VBP Program uses Hospital IQR Program data, and hospitals have been publicly reporting on this measure for greater than one year, we do not believe additional voluntary reporting is necessary.

After consideration of the public comments we received, we are finalizing the proposal to expand the NHSN CAUTI and CLABSI measures to include the selected ward (non-ICU) locations beginning with the FY 2019 program year.

d. Summary of Previously Adopted Measures and Newly Finalized Measure Refinements for the FY 2019 Program Year

In summary, for the FY 2019 program year, we are adopting the following measure set:

PREVIOUSLY ADOPTED MEASURES AND NEWLY FINALIZED MEASURE REFINEMENTS FOR THE FY 2019 PROGRAM YEAR ±

Short name	Domain/measure name	NQF #
	Person and Community Engagement Domain*	
HCAHPS	HCAHPS + 3-Item Care Transition Measure	0166 0228
	Clinical Care Domain	
MORT–30–AMI	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0230
MORT–30–HF	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Heart Failure (HF) Hospitalization.	0229
MORT–30–PN	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia Hospitalization.	0468
THA/TKA	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	1550
	Safety Domain	
CAUTI**	National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure.	0138
CLABSI**	National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure.	0139
Colon and Abdominal Hysterectomy SSI	American College of Surgeons—Centers for Disease Control and Prevention (ACS–CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	0753
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure.	1716
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure.	1717
PSI 90	Patient Safety for Selected Indicators (Composite Measure)	0531
PC–01	Elective Delivery	0469
	Efficiency and Cost Reduction Domain	
MSPB	Payment-Standardized Medicare Spending Per Beneficiary (MSPB)	2158

± We are changing some of the short names for measures from previous years' rulemakings to align these names with the usage in the Hospital IQR Program, and we are changing some measure names from previous years' rulemakings to use complete NQF-endorsed measure names.

* In section IV.H.3.b. of the preamble of this final rule, we finalized changing the name of this domain from Patient- and Caregiver-Centered Experience of Care/Care Coordination domain to Person and Community Engagement domain beginning with the FY 2019 program year.

** As discussed in section IV.H.3.c. of the preamble of this final rule, we are finalizing inclusion of selected ward (non-ICU) locations in the measure.

4. Finalized Measures and Measure Refinements for the FY 2021 Program Year and Subsequent Years

We consider measures for adoption based on the statutory requirements, including specification under the Hospital IQR Program, posting dates on the *Hospital Compare* Web site, and our priorities for quality improvement as outlined in the current CMS Quality Strategy, available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityInitiativesGenInfo/CMS-Quality-Strategy.html*.

Due to the time necessary to adopt measures, we often adopt policies for the Hospital VBP Program well in advance of the program year for which they will be applicable (for example, 76 FR 26490 through 26547; 76 FR 51653 through 51660; 76 FR 74527 through 74547; 77 FR 53567 through 53614; 78 FR 50676 through 50707; 78 FR 75120 through 75121; 79 FR 50048 through 50087; 80 FR 49556 through 49559).

a. Condition-Specific Hospital Level, Risk-Standardized Payment Measures

Providing high-value care is an essential part of our mission to provide better health care for individuals, better health for populations, and lower healthcare costs. Our aim is to encourage higher value care where there is the most opportunity for improvement, the greatest number of patients to benefit from improvements, and the largest sample size to ensure reliability. In order to incentivize innovation that promotes high-quality care at high value, we believe it is critical to examine measures of resource use, efficiency, and cost reduction.

In prior rules we have discussed our interest in expanding the Hospital VBP Program's Efficiency and Cost Reduction domain to include condition-specific or treatment-specific Medicare payment measures, and we have sought public comments (78 FR 50688; 79 FR 50066). In response to comments, we have stated that risk-adjusted standardized Medicare payments, viewed in light of other quality measures in a program, are an appropriate indicator of efficiency because they allow us to compare hospitals without regard to factors such as geography and teaching status. This comparison is particularly important with clinically coherent episodes because it distinguishes the degree to which practice pattern variation influences the cost of care. In addition, we have stated that the granularity of condition-specific or treatment-specific payment measures may provide specific actionable feedback to hospitals to implement targeted improvements. The observed differences in episode payments revealed by these measures may also encourage hospitals to assess local, postacute health care services (for example, SNF and home health services) to ensure that efficient services are available to all patients. Given these factors, we believe that the addition of condition-specific or treatment-specific payment measures to the Hospital VBP Program is necessary not only to facilitate a better understanding of service utilization and costs associated with conditions or treatments, but also as an important next step in the evolution of value-based purchasing to transform how Medicare pays for care and services.

We recognize that high or low payments to hospitals are difficult to interpret in isolation. Some high payment hospitals may produce better clinical outcomes when compared with low payment hospitals, while other high payment hospitals may not produce better outcomes. For this reason, payment measure results viewed in isolation are not necessarily an indication of quality. However, by viewing such information along with quality measure results, we believe that consumers, payers, and providers would be able to better assess the value of care. We believe that adopting condition-specific or treatment-specific payment measures for the Hospital VBP Program that can be more directly paired with clinical outcome measures, aligned by comparable populations, performance periods, or risk-adjustment methodologies, help move toward achievement of this goal. We also believe that adopting condition-specific or treatment-specific payment measures would create stronger incentives for appropriately reducing practice pattern variation to achieve the aim of lowering the cost of care and creating better coordinated care for Medicare beneficiaries.

In the Hospital VBP Program, we adopted the MSPB measure beginning with the FY 2015 program year to incentivize hospitals to redesign care systems in order to provide coordinated, high-quality, and cost-efficient care (77 FR 53590). Currently, the Hospital VBP Program measures efficiency by weighting and combining the MSPB measure with other quality measures in order to calculate each hospital's TPS. However, we have previously expressed our interest in expanding the Efficiency and Cost Reduction domain and continue to believe that additional supplemental measures would create incentives for greater coordination between hospitals and physicians to optimize the care they provide to Medicare beneficiaries (78 FR 50688; 79 FR 50066).

We believe that when examining variation in payments, an episode-of-care triggered by admission is meaningful for several reasons. First, hospitalizations represent brief periods of illness that require ongoing management postdischarge, and decisions made at the admitting hospital affect payments for care in the immediate postdischarge period. Second, attributing payments for a continuous episode-of-care to admitting hospitals may reveal variations in care decision-making and resource utilization. Third, an episode-of-care with a specified time period (30 days in the case of the measures discussed below) provides a standard observation period by which to compare all hospitals. For all of the reasons described above, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25102 through 25105), we proposed to add 2 condition-specific payment measures in the Hospital VBP Program that can be directly paired with existing clinical outcome measures in the program.

We invited public comments on the proposed measures as detailed below. We further invited public comment on the addition of other condition-specific or treatment-specific payment measures that are directly paired with quality measures, as well as episode-based payment measures not directly paired with quality measures, for future program years.

Comment: Several commenters supported the continued use of the MSPB measure in the Hospital VBP Program and the development of additional measures to add to the Efficiency and Cost Reduction domain to create incentives for greater coordination between hospitals and physicians. One commenter recommended that CMS seek to broaden the scope of its efficiency measures for the FY 2018 rulemaking cycle. One commenter recommended that CMS adopt additional cost and efficiency measures and that any new cost and efficiency measures be paired with corresponding quality measures because they provide a link to balance cost and quality. Another commenter recommended that CMS consider adopting other macro-level measures of efficiency and cost reduction, such as: (1) Total Medicare cost per capita; (2) Medicare spending per beneficiary in the last 2 years of life; and (3) Medicare spending per beneficiary in the last 6 months of life.

Commenters noted that the proposed payment measures, when paired with the mortality measures, can help to incentivize incorporation of evidence-based processes of care to reduce cost-per-episode while improving quality of care, potentially through improved patient monitoring and management. One commenter believed the proposed measures are appropriate indicators of efficiency since they allow for clinical comparisons without external factors like age and comorbidities. One commenter believed these measures may encourage the use of innovative technologies that assist in providing high quality care while reducing overall costs. One commenter believed these measures allow for specific actionable feedback to hospitals to implement improvements. One commenter believed these measures increase incentives for hospitals to better manage patients' chronic conditions after discharge and avoid subsequent visits to the emergency department and readmissions.

Response: We appreciate the commenters' support. We note that we are unable to adopt any additional efficiency measures for the FY 2018 program year due to statutory restrictions. We thank the commenters for the suggestions of future measures to adopt for the domain, and we will take that into account for future measure development and rulemaking. We encourage commenters to submit any fully developed measures for consideration for the Measures Under Consideration List as part of the pre-rulemaking process (details available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/Pre-Rule-Making.html*).

Comment: One commenter recommended that CMS take advantage of the agency's development of episode groupers, which are intended to assign specific services to a particular episode, when implementing any measure of episode costs.

Response: The episode groupers define episodes by DRGs and not ICD–10–CM codes. The goal of the AMI Payment and HF Payment measures is to provide information on the value of care by comparing payments for an episode of care with performance on quality measures, like CMS' 30-day mortality measures. Thus, it is important that the patient cohorts are as closely aligned as possible between payment and quality measures. This would not be possible if we used the AMI or HF episode grouper.

Comment: One commenter supported expansion of the domain to include condition-specific payment measures but recommended that CMS standardize the process for validating elements on claims submitted for the purpose of quality reporting because, without a standardized validation process, observed differences in performance rates cannot be assumed to reflect differences in care alone.

Response: We appreciate commenter's support of the payment measures. We interpret the commenter's recommendation regarding validating elements on claims to refer to the claims review process. All claims data submitted by hospitals for the Hospital VBP Program are reviewed by Medicare Claims Review Programs, which are a collection of initiatives responsible for reviewing claims according to Medicare rules and regulations.

(1) New Measure for the FY 2021 Program Year: Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI) (NQF #2431)

Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for AMI (NQF #2431) (AMI Payment) is an NQF-endorsed measure assessing hospital risk-standardized payment associated with a 30-day episode-of-care for AMI. We adopted this measure in the Hospital IQR Program in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50802 through 50805). The measure includes Medicare FFS patients aged 65 or older admitted for an AMI and calculates payments for these patients over a 30-day episode-of-care, beginning with the index admission, using administrative claims data. In general, the measure uses the same approach to risk-adjustment as our 30-day outcome measures previously adopted for the Hospital VBP Program, including the AMI mortality measure. Initial measure data were posted on *Hospital Compare* in December 2014 and the full measure specifications are available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.*

AMI remains a high-volume condition that is one of the top 20 conditions contributing to Medicare costs.[30] There is evidence of variation in payment for AMI patients among hospitals; median 30-day risk-standardized payment (in 2013 dollars) for AMI was $21,620 and ranged from $12,862 to $29,802 for the July 2011 through June 2014 reporting period in the Hospital IQR Program.[31] This variation in payment suggests there is opportunity for improvement.

We believe it is important to adopt the AMI Payment measure because variation in payment may reflect differences in care decision-making and resource utilization (for example, treatment, supplies, or services) for patients with AMI both during hospitalization and immediately postdischarge. The AMI Payment measure also addresses the NQS priority and CMS Quality Strategy goal to make quality care more affordable. Lastly, the AMI Payment measure is intended to be paired with our 30-day AMI mortality measure, MORT–30–AMI (NQF #0230), thereby directly linking payment to quality by the alignment of comparable populations and risk-adjustment methodologies to facilitate the assessment of efficiency and value of care.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25103), we proposed to adopt the AMI Payment measure beginning with the FY 2021 program year. The AMI Payment measure would be added to the Efficiency and Cost Reduction domain. The proposed measure fulfills all statutory requirements for the Hospital VBP Program based on our adoption of the measure in the Hospital IQR Program, and our posting of measure data on *Hospital Compare* for at least one year before the beginning of the performance period. The AMI Payment measure (MUC15–369) was reviewed by the MAP in December 2015 and did not receive support for adoption into the Hospital VBP Program.[32] The result of the MAP vote was 27 percent support, 15 percent conditional support, and 58 percent do not support. MAP members expressed concern that treatment-specific or condition-specific payment measures may overlap and double count services that are already captured in the MSPB measure. In addition, stakeholders expressed a desire to have

[30] Torio, C.M. and Andrews, R.M., 2013. National inpatient hospital costs: the most expensive conditions by payer, 2011. In Agency for Healthcare Research and Quality, Healthcare Cost and Utilization Project Statistical Brief# 160. Available at: *https://www.hcup-us.ahrq.gov/reports/statbriefs/sb160.pdf.*

[31] 2015 Condition-Specific Measure Updates and Specifications Report Hospital-Level 30-Day Risk Standardized Payment Measures. AMI, HF, PN Payment Updates (zip file). Available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.*

[32] ''Spreadsheet of MAP 2015–2016 Final Recommendations'' available at: *http://www.qualityforum.org/map/* and ''Process and Approach for MAP Pre-Rulemaking Deliberations 2016'' found at: *http://www.qualityforum.org/Publications/2016/02/Process_and_Approach_for_MAP_Pre-Rulemaking_Deliberations.aspx.*

more experience with the measure in the Hospital IQR Program to understand whether there may be unintended consequences or a need to adjust for sociodemographic status (SDS) factors.

With respect to MAP stakeholder concerns that treatment-specific or condition-specific payment measures may overlap and double count services, we noted that these measures cover topics of critical importance to quality improvement in the inpatient hospital setting. As discussed above, we selected these measures because we believe that it is appropriate to provide stronger incentives for hospitals to provide high-value and efficient care. We believe that even if some services were double counted, hospitals that offer quality service and maintain better results on the MSPB and condition-specific payment measures relative to other hospitals in the Hospital VBP Program could receive an increased benefit by performing well on both quality measures and payment measures. Furthermore, because hospitals would have bigger financial incentives, they would strive to perform better, which would lead to better quality. At the same time, however, we proposed that the Efficiency and Cost Reduction domain remain weighted at 25 percent of the TPS even as additional payment measures may be adopted for this domain in the FY 2021 program year; therefore, the impact of poor performance on the MSPB measure or on any other particular payment measure would be reduced.

In regard to MAP stakeholder concerns regarding the need to adjust for SDS, we noted that the AMI Payment measure already incorporates a risk-adjustment methodology that accounts for age and comorbidities. We understand the important role that SDS plays in the care of patients. However, we continue to have concerns about holding hospitals to different standards for the outcomes of their patients of diverse SDS because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. We routinely monitor the impact of SDS on hospitals' results on our measures; however, we remain committed to monitoring for unintended consequences.

We invited public comments on this proposal.

Comment: A few commenters supported the addition of the AMI Payment measure. Two commenters noted it will be linked to the MORT–30–AMI measure, which will allow CMS to begin comparing quality and efficiency in treating this condition. One commenter supported the measure because it is NQF-endorsed and addresses a condition that is a significant driver of cost for the Medicare program.

Response: We thank the commenters for their support.

Comment: One commenter did not support the addition of the AMI Payment measure because patients can have different types of AMI which would be treated differently with varying costs. The commenter noted that the measure specifications do not delineate between the 2 types of AMI admissions, and therefore will not provide hospitals with information on whether the hospital successfully managed resource utilization with respect to the treatment received.

Response: While we recognize there are subtypes of myocardial infarction, the goal of the AMI Payment measure is to provide information on the value of care for a specific-condition rather than subtypes of a condition. This measure is meant to be paired with the MORT–30–AMI measure in order to gain a better understanding of the value of care for a hospital's patients.

Comment: One commenter did not support adding the AMI Payment measure to the Hospital VBP Program because AMI is a high-volume condition that commenter believed, particularly with the overlap in the MSPB measure, would disproportionately impact hospital performance in the Efficiency and Cost Reduction domain and mask performance around other conditions.

Response: While performance on the MSPB measure may correlate with performance on the condition-specific payment measures for some hospitals, we continue to believe that the AMI Payment measure will provide condition-specific information to hospitals that can be interpreted in the context of overall payment and incentivize targeted improvements in care. Though the adoption of the AMI Payment and HF Payment measures will dilute the weight of the MSPB measure in the Efficiency and Cost Reduction domain (from 25 percent of the TPS to 8.33 percent of the TPS), we continue to believe they are important new measures for the Hospital VBP Program.

Comment: One commenter did not support adding the AMI Payment measure to the Hospital VBP Program because this commenter believed the predictive models used in developing the measure do not apply equally well to hospitals providing complex services, such as advanced heart failure care.

Response: We appreciate the commenter's concern about complex patient factors, such as advanced heart failure, that may contribute to the cost of care. The payment measures are risk-adjusted in order to account for differences in case-mix, or patient complexity, between hospitals. For each patient, the claims for the 12 months prior to the measured hospitalization are examined to identify additional clinical conditions that patients may have which could contribute to costs of care. These conditions are included in the risk-model for the measure to ensure that all hospitals are assessed fairly and avoid putting hospitals at risk of appearing to have patient costs that are higher than other hospitals due to the clinical complexity of their patients.

We also received several comments that applied to both the AMI Payment and HF Payment measures:

Comment: Many commenters did not support the addition of the payment measures because they are not risk-adjusted for SDS factors. One commenter believed that the current risk adjustment for patient age, prior procedures, and comorbidities is insufficient to fully capture what influences resource use. Another commenter requested that CMS clearly articulate the risk adjustment methodology for the AMI Payment and HF Payment measures because risk adjustment will help ensure hospitals are not inadvertently penalized for treating sick and more complex patients. One commenter recommended that CMS exclude hospitals operating in health professional shortage areas from the payment measures in order to mitigate the impact of operating in a health professional shortage area. One commenter believed the condition-specific payment measures should include risk adjustment or stratification for SDS factors because otherwise hospitals caring for at-risk patients may be unfairly penalized.

Response: As we noted in the FY 2017 IPPS/LTCH PPS proposed rule, the NQF is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF will issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures

developed by CMS have been brought to NQF since the beginning of the trial. CMS, in compliance with NQF's guidance, has tested sociodemographic factors in the measures' risk models and made recommendations about whether or not to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our outcome measures.

Furthermore, ASPE is conducting research to examine the impact of sociodemographic status on quality measures, resource use, and other measures under the Medicare program as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how they apply to our quality programs at such time as they are available.

For more details regarding risk adjustment of the AMI Payment and HF Payment measures, we refer the commenters to the measure methodology reports and measure risk adjustment statistical model available in the AMI, HF, and PN Payment Updates zip file at *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

Comment: Many commenters did not support the addition of the condition-specific payment measures because they will overlap with the MSPB measure in the Efficiency and Cost Reduction domain. Several commenters recommended that we remove episodes of AMI Payment and HF Payment from the MSPB calculation, such as excluding costs associated with episode-based payment measures from broader payment measures. Several other commenters recommended removing the MSPB measure if CMS adopts the condition-specific payment measures. One commenter believed the overlap between these condition-specific measures and the MSPB measure may lead to unnecessary confusion among hospitals, sending mixed signals to hospitals about their resource use performance, rather than facilitating a meaningful assessment of resource use. One commenter also noted that it will be possible for hospitals to score well on the MSPB measure, but poorly on the AMI Payment or HF Payment measures, even though the measures will capture many of the same services.

Response: While we acknowledge that there may be some overlap between the MSPB and these condition-specific payment measures, we believe that the condition-specific measures are of critical importance to improving efficiency of care. Including condition-specific measures alongside the MSPB measure provides hospitals with actionable feedback that will better equip them to implement targeted improvements, in comparison to an overall payment measure alone. Moreover, these condition-specific measures will allow consumers, providers, and payers to make a more fully informed assessment of value of care.

Comment: Many commenters did not support the addition of condition-specific payment measures because the commenters believed the measures inappropriately assign costs to the hospitals. A few commenters believed it is physicians that control the majority of decisions that impact spending across an episode of care and it will be difficult to isolate and ascribe responsibility for a beneficiary's overall spending to a given hospital. Another commenter noted that the measures capture all costs associated with the patient, including postdischarge care, which may be outside the scope of the admitting hospital. One commenter noted that hospitals have little control over spending during the defined episode with the exception of preventable readmissions. A few commenters recommended CMS work with the hospital community to develop and implement efficiency metrics of spending that hospitals directly influence. Other commenters recommended limiting inclusion of payments used in the calculation of the measures to only payment directly related to the condition-specific index admission, because commenters believed this would be a more accurate proxy for factors within a hospital's control than all spending over a 30-day period.

Response: We continue to believe that hospitals that provide quality inpatient care and conduct appropriate discharge planning can work with providers and suppliers in coordinating efficient follow-up care. When examining variation in payments, consideration of the episode-of-care triggered by admissions is meaningful for several reasons. First, hospitalizations represent a brief period of illness that require ongoing management postdischarge, and decisions made at the admitting hospital affect payments for care in the immediate postdischarge period. Second, attributing payments for a continuous episode-of-care to admitting hospitals may reveal practice variations in the full care of the illness that can result in increased payments. Third, a 30-day preset window provides a standard observation period by which to compare all hospitals. Lastly, the AMI Payment and HF Payment measures are meant to be paired with the MORT–30–AMI measure and the MORT–30–HF measure, respectively, to capture payments for Medicare patients across all care settings, services, and supplies, except for Medicare Part D (that is, inpatient, outpatient, skilled nursing facility, home health, hospice, physician/clinical laboratory/ambulance services, durable medical equipment, prosthetics/orthotics, and supplies).

We thank commenters for the recommendations and note that we have developed, and will continue to develop, efficiency measures in consultation with clinical and measurement experts, key stakeholders (including the hospital community), and the public. We disagree with commenters that all payment measures should be limited to only payments directly related to the index admission because, as noted above, we continue to believe that inclusion of payments on a broad range of services does incentivize quality care and care coordination. Transitions to outside facilities and readmissions to the hospitals may be the result of quality failures that have led to poor clinical outcomes.

Comment: A few commenters expressed concern about adding the condition-specific payment measures into the Hospital VBP Program because the commenters believe these measures do not capture quality of care, despite directly pairing with the mortality measures, and will not provide hospitals with actionable data for quality improvement efforts. One commenter did not believe the payment measures are appropriately aligned by comparable populations/performance periods/risk-adjusted methodologies.

Response: We disagree with the commenters that the condition-specific payment measures will not provide hospitals with actionable data for quality improvement efforts. By adopting condition-specific payment measures and viewing results alongside quality measure results, we believe that consumers, payers, and providers will be able to better assess the overall value of care. We believe that adopting condition-specific payment measures for the Hospital VBP Program that are directly paired with clinical outcome measures, aligned by comparable populations, performance periods, or risk-adjustment methodologies, helps move toward achievement of this goal. We also believe that adopting condition-specific payment measures will create stronger incentives for appropriately reducing practice pattern variation to

achieve the aim of lowering the cost of care and creating better coordinated care for Medicare beneficiaries.

In regard to the commenter who did not believe the payment measures are appropriately aligned, we note that the AMI Payment and HF Payment measures do have populations, outcome timeframes, and approaches to risk adjustment that are comparable with the MORT–30–AMI and MORT–30–HF outcome measures. We refer the commenter to the measure methodology reports in the AMI, HF, PN, COPD, and Stroke Mortality Update zip file and the AMI, HF, and PN Payment Updates zip file at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

Comment: A few commenters recommended that CMS adjust the Efficiency and Cost Reduction domain to mitigate the impact of quality of care in SNFs and other postacute settings on the hospitals' performance in the Efficiency and Cost Reduction domain because hospitals are not able to proactively steer beneficiaries to high-quality SNFs. The commenters also noted that receiving patients from low-quality postacute care settings may impact hospitals' performance on the Efficiency and Cost Reduction domain.

Response: We disagree with commenters' recommendation to adjust the Efficiency and Cost Reduction domain to mitigate the potential impact of low quality SNFs or other postacute care settings. Payment measures are not risk-adjusted for patients' admission source (for example, SNFs) because admission source factors are associated with the structure of the healthcare system, rather than solely patients' clinical comorbidities. The payment measures are, however, appropriately risk-adjusted for patient comorbidities that are clinically relevant and have a strong relationship with the outcome. Further, we have established several postacute care quality programs, including SNF, IRF, and Home Health Quality Reporting Programs, as well as a SNF VBP Program, to assist hospitals and the public in identifying high-value postacute care providers. We continue to believe that hospitals that are committed to providing quality inpatient care can work with SNFs and other postacute care providers and suppliers to ensure efficient postdischarge care for the patients they serve.

Comment: A few commenters did not support the use of condition-specific payment measures in the program because commenters believe that hospitals should only be rewarded or penalized based on a broad all-condition, 30-day payment measure, like the MSPB measure, which evaluates both quality of care and cost of care.

Response: We disagree with the commenter that the condition-specific payment measures would not evaluate both quality and cost of care because we believe the payment measures, in light of other quality measures in the program, are an appropriate indicator of efficiency. We further note that the condition-specific payment measures align with the condition-specific mortality measures to provide specific feedback to hospitals to implement targeted improvements. We continue to believe that an episode-of-care triggered by admission is meaningful to the program.

Comment: A few commenters did not support the condition-specific measures because they took issue with the NQF endorsement of the measures. One commenter believed the condition-specific payment measures are not endorsed by NQF. Another commenter did not support the addition of the condition-specific measures because the commenter and others have appealed the measures' NQF endorsement on the grounds that the NQF measure review committee did not consider appropriate risk adjustment for SDS factors. These commenters recommended that CMS not adopt condition-specific measures in the Hospital VBP Program, but instead provide condition-specific cost of care data to hospitals to help them understand what is driving MSPB performance.

Response: The AMI Payment (NQF #2431) and HF Payment (NQF #2436) measures are NQF-endorsed as reliable and valid as of 2014. We continue to believe it is important to publicly report this data in order to allow consumers, providers, and payers to make a more fully informed assessment of value of care.

Comment: One commenter recommended that CMS reach out to stakeholders for feedback during the development of payment measures.

Response: We routinely solicit public comment on our payment measures and other measures under development. For current and future opportunities, we encourage the commenter to visit the CMS Quality Measures Public Comment page at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/CallforPublicComment.html*. In addition, there are also opportunities for stakeholders to serve on Technical Expert Panels and provide technical input to CMS and the measure contractors on the development, selection, and maintenance of measures. We refer the commenter to the following Web site for more information: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/TechnicalExpertPanels.html*.

Comment: One commenter expressed concern that condition-specific measures do not capture all outcomes relevant to understanding the care that patients received, such as readmissions and subsequent cardiac events.

Response: We disagree that the condition-specific measures do not capture all outcomes like readmissions and subsequent cardiac events. The condition-specific payment measures do capture payments for all care, including readmissions and subsequent cardiac events, across multiple care settings, services, and supplies during the 30-day episode of care.

Comment: One commenter recommended that instead of adding condition-specific payment measures to the Hospital VBP Program now, CMS should first examine methods of pairing cost and payment measures so that they signal value to beneficiaries.

Response: We believe that adding the AMI Payment and HF Payment measures now will provide actionable feedback to hospitals on the overall value of their services to beneficiaries.

After consideration of the public comments we received, we are finalizing the proposal to add the AMI Payment measure to the Hospital VBP Program beginning with the FY 2021 program year.

(2) New Measure for the FY 2021 Program Year: Hospital-Level, Risk-Standardized Payment Associated With a 30-Day Episode-of-Care for Heart Failure (HF) (NQF #2436)

Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for HF (NQF #2436) (HF Payment) is an NQF-endorsed measure assessing hospital risk-standardized Medicare payment associated with a 30-day episode-of-care for heart failure. The measure includes Medicare FFS patients aged 65 or older admitted for heart failure and calculates payments for these patients over a 30-day episode-of-care, beginning with the index admission, using administrative claims data. In general, the measure uses the same approach to risk-adjustment as our 30-day outcome measures previously adopted for the Hospital VBP Program, including the HF mortality measure. We adopted this measure in the Hospital IQR Program in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50231 through 50235). Initial measure data were posted

on *Hospital Compare* in July 2015 and the full measure specifications are available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

Heart failure is one of the leading causes of hospitalization for Americans 65 and over and costs roughly $34 billion annually.[33] [34] There is evidence of variation in Medicare payments at hospitals for heart failure patients; median 30-day risk-standardized payment (in 2013 dollars) among Medicare FFS patients aged 65 or older was $15,139, and ranged from $11,086 to $21,867 for the July 2011 through June 2014 reporting period in the Hospital IQR Program.[35] This variation in payment suggests there is opportunity for improvement.

We believe it is important to adopt the HF Payment measure because variation in payment may reflect differences in care decision-making and resource utilization (for example, treatment, supplies, or services) for patients with heart failure both during hospitalization and immediately postdischarge. The HF Payment measure also addresses the NQS priority and CMS Quality Strategy goal to make quality care more affordable. Lastly, the HF Payment measure is intended to be paired with our 30-day HF mortality measure, MORT–30–HF, thereby directly linking payment to quality by the alignment of comparable populations and risk-adjustment methodologies to facilitate the assessment of efficiency and value of care.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25104), we proposed to adopt the HF Payment measure beginning with the FY 2021 program year. The HF Payment measure would be added to the Efficiency and Cost Reduction domain. The measure fulfills all statutory requirements for the Hospital VBP Program based on our adoption of the measure in the Hospital IQR Program and our posting of measure data on *Hospital Compare* for at least one year before the beginning of the performance period for this measure. The HF Payment measure (MUC15–322) was reviewed by the MAP in December 2015 and did not receive support for adoption into the Hospital VBP Program, due to the same concerns that we noted in our discussion of the AMI Payment measure.[36] The result of the MAP vote was 27 percent support, 8 percent conditional support, and 65 percent do not support. Although the final MAP decision was ''do not support,'' we continue to believe that the NQF-endorsed HF Payment measure provides beneficiaries and hospitals with valuable information about relative value for an episode-of-care. We support the HF Payment measure for the same reasons that we noted in our general discussion of condition-specific payment measures in section IV.H.4.a. of the preamble of this final rule and in our discussion of the AMI Payment measure in section IV.H.4.a.(2) of the preamble of this final rule.

We noted that some MAP members did express support for the HF Payment measure and other condition-specific payment measures. Members agreed that the increased granularity provided by condition-specific payment measures will provide valuable feedback to hospitals for targeted improvement. In addition, we believe that the condition-specific payment measures we are proposing, which directly pair with clinical outcome measures already in the Hospital VBP Program, follow the recommended approach outlined in the NQF white paper on how best to measure efficiency.[37] Based on our analysis of the issues surrounding condition-specific payment measures, we believe that the benefits of adopting this measure into the Hospital VBP program outweigh any potential risks. However, we remain committed to monitoring for unintended consequences.

We invited public comments on this proposal.

Comment: Several commenters supported the addition of the HF Payment measure. One commenter supported the addition of the HF Payment measure because it links the HF Payment measure to the MORT–30–HF (NQF #0229) measure and will allow CMS to begin comparing quality and efficiency in treating this condition. One commenter supported the measure because it is NQF-endorsed and addresses conditions that are significant drivers of cost for the Medicare program.

Response: We thank the commenters for their support.

Comment: One commenter supported the use of a 3-year baseline period for the HF Payment measure because a longer baseline period can account for the longer-term predictive value of health events such as HF better than a 1-year baseline period.

Response: We thank the commenter for its support. We note that the HF Payment measure will only have a 24-month performance period for its first year in the program, but we are adopting a 36-month performance period for future program years in section IV.H.6.c.(2) of this final rule.

Comment: One commenter expressed general concern about the HF Payment measure's risk adjustment methodology and requested additional information regarding the discrimination and calibration for the measure's predictive models.

Response: We note that the HF Payment measure was submitted before NQF, which endorsed the measure with the current risk adjustment methodology. For more information regarding the risk adjustment methodology, we refer readers to the AMI, HF, PN, and Hip and Knee Arthroplasty Payment Updates zip file available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

Comment: One commenter asked CMS to clarify whether patients in advanced states discharged into palliative or hospice care are excluded from the HF Payment measure's denominator.

Response: The HF Payment measure does not exclude heart failure patients discharged into palliative care or hospice care or who transition to hospice or palliative care during the index admission. Instead, the measure excludes index admissions for patients enrolled in the Medicare hospice program any time in the 12 months prior to the index admission, including the first day of the index admission. We adopted this policy because the transition of patients to hospice or palliative care during the admission may be the result of quality failures that have led to poor clinical outcomes.

After consideration of the public comments we received, we are finalizing the proposal to add the HF

Payment measure to the Hospital VBP Program beginning with the FY 2021 program year.

(3) Finalized Scoring Methodology for the AMI Payment and HF Payment Measures

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25105 through 25106), we proposed to score the proposed AMI Payment and HF Payment measures using the same methodology we use to score the MSPB measure, so that all measures in the Efficiency and Cost Reduction domain are scored in the same manner and have the same case minimum threshold.

For achievement points, we proposed to calculate a spending ratio of AMI spending and HF spending for each hospital to the median AMI spending and median HF spending, respectively, across all hospitals during the performance period. We would then use each hospital's AMI spending ratio and HF spending ratio to calculate between 0 and 10 achievement points. We proposed to set the achievement thresholds at the median AMI spending ratio and HF spending ratio across all hospitals during the performance period. We proposed to set the benchmarks at the mean of the lowest decile of the AMI spending ratios and the HF spending ratios during the performance period. Therefore, a hospital whose individual AMI spending or HF spending ratios fall above the achievement threshold would score 0 achievement points on the measure. A hospital whose individual AMI spending or HF spending ratios fall at or below the benchmark would score the maximum 10 achievement points on the measure. A hospital whose individual AMI spending or HF spending ratios fall at or below the achievement threshold but above the benchmark would score between 1 and 9 points according to the following formula:

[9 * ((achievement threshold − Hospital's performance period ratio)/(achievement threshold − benchmark))] + 0.5

For improvement points, we proposed to calculate a spending ratio of AMI spending and HF spending for each hospital to the median AMI spending and median HF spending, respectively, across all hospitals during the performance period. We would then use each hospital's AMI spending ratio and the HF spending ratio to calculate between 0 and 9 improvement points by comparing each hospital's ratio to its own performance during the baseline period. We proposed to set the improvement benchmark as the mean of the lowest decile of AMI spending and HF spending ratios across all hospitals. Therefore, a hospital whose AMI spending or HF spending ratios are equal to or higher than its baseline period ratios would score 0 improvement points on the measure. If a hospital's score on the measure during the performance period is less than its baseline period score but above the benchmark, the hospital would receive a score of 0 to 9 according to the following formula:

[10 * ((Hospital baseline period ratio − Hospital performance period ratio)/(Hospital baseline period ratio − benchmark))] − 0.5

For more information about the proposed scoring methodology for the AMI Payment and HF Payment measures, we referred readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51654 through 51656) and to 42 CFR 412.160 where we discussed the MSPB measure's identical scoring methodology in detail.

In order to codify this scoring methodology for the proposed payment measures, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25105 through 25106), we proposed to amend our regulations at 42 CFR 412.160 to revise the definitions of ''Achievement threshold'' and ''Benchmark'' to reflect this methodology, not just for the MSPB measure, but more generally for all measures in the Efficiency and Cost Reduction domain.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25106), we also considered and sought public feedback on scoring the AMI Payment and HF Payment measures using the same methodology that we use to score most other measures, including the MORT–30–AMI and MORT–30–HF measures. Under that scoring methodology, hospitals receive achievement points along an achievement range, which is a scale between the achievement threshold (the minimum level of hospital performance required to receive achievement points) and the benchmark (the mean of the top decile of hospital performance during the baseline period). A hospital receives improvement points for a measure if the hospital improves upon its measure score from its own baseline period measure score (76 FR 26514). We stated that we decided to propose the scoring methodology that more closely aligns with the MSPB measure because we believe it would be helpful for hospitals to be compared against performance standards constructed from more current performance period data, given potential changes in Medicare payment policy, changes in market forces, and changes in utilization practices.

We invited public comment on the proposed scoring methodology in the calculation of achievement and improvement points for the AMI Payment and HF Payment measures beginning with the FY 2021 program year.

Comment: Several commenters did not support the addition of the AMI Payment and HF Payment measures because few conditions have large enough volume to support a reliable metric. The commenters recommended that CMS use condition-specific cost measures broadly and that CMS not base financial incentives on them. One commenter asserted that because not all hospitals will have sufficient volume to be scored on each condition-specific measure, the statistical reliability of the condition-specific measures is likely to be weaker than the MSPB measure.

Response: We disagree with the commenter that hospitals will not be able to report statistically reliable information on the condition-specific payment measures because, as we proposed in the FY 2017 IPPS/LTCH PPS proposed rule, hospitals must report a minimum number of 25 cases to receive a payment measure score (81 FR 25117). We believe the case minimum will ensure that each hospital's payment measure rate is sufficiently reliable to generate a score that meaningfully distinguishes hospital performance on the measures. We also disagree with the commenter's assertion that the statistical reliability of the condition-specific payment measures is likely to be weaker than the MSPB measure. The statistical model that CMS uses to calculate the payment measures allows for the inclusion of hospitals with relatively few cases by taking into account the uncertainty associated with sample size.

Comment: A few commenters did not support the proposed scoring methodology for the payment measures because half of hospitals will receive no achievement points on these measures. The commenters recommended that CMS score the payment measures the same way that other quality measures are scored, with the achievement threshold set based on the median during the baseline period.

Response: While we acknowledge the commenter's concerns regarding the potential to achieve maximum achievement points, we believe scoring the payment measures in the same way as the MSPB measure is appropriate. We continue to believe it is more helpful for hospitals to be compared against

performance standards constructed from more current performance period data, rather than baseline period data, given potential changes in Medicare payment policy, changes in market forces, and changes in utilization practices.

Comment: One commenter expressed concern that the current structure does not provide hospitals with meaningful information to improve efficiency because it does not allow for interpretation of cost and quality measures in tandem.

Response: We are aware that the quality measures and payment measures are not scored in tandem at this moment, but we believe the information provided by the payment measures provides more granular information to hospitals that can be interpreted in the context of overall payment and in conjunction with their performance on the mortality measures.

After consideration of the public comments we received, we are finalizing the proposal to score the AMI Payment and HF Payment measures using the same scoring methodology as the MSPB measure and to amend our regulations at 42 CFR 412.160 to reflect this policy.

In addition, we are considering adopting a scoring methodology for a future program year that would assess quality measures and efficiency measures in tandem to produce a composite score reflective of value. To support the goals of value-based purchasing and to provide consumers and purchasers with information about value of care provided by hospitals, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 21505), we solicited public comments on ways we can incorporate scoring value into the Hospital VBP Program. The concept of value reflects highest quality achieved with most efficiency or least costs. Currently, the Hospital VBP Program assesses quality and efficiency separately through distinct performance measures and domains. Because each domain is weighted and combined to determine each hospital's TPS, a hospital could earn a higher payment adjustment relative to other hospitals by performing well on the quality-related domains but without performing well in the Efficiency and Cost Reduction domain, or vice versa. Without a measure or score for value that reflects both quality and costs, our ability to assess value is limited.

There are various different ways value could be incorporated into the Hospital VBP Program. We sought public comments on 2 general approaches. First, specific measures of value could be developed by measure developers and incorporated into the Hospital IQR Program and then the Hospital VBP Program through the measure development process. This may be a lengthy process and will depend upon interest from measure developers. However, specific measures of value could be more interpretable by consumers, and would have rates that could be trended, benchmarked, and scored using the current Hospital VBP Program scoring methodology for assessing achievement and improvement.

A second potential approach is for the Hospital VBP Program to use the Program's scoring methodology to incorporate value based on the performance of hospitals by either: (a) Comparing scores on specific quality and cost measures; or (b) comparing quality and efficiency domain scores. First, the measure-specific approach could target high-cost, high clinical-impact conditions by pairing condition-specific quality and cost measures, such as by assessing a ratio of a hospital's reported quality over costs. A value score based on the paired clinical outcome and cost measures could be incorporated into the existing Efficiency and Cost Reduction domain (or Clinical Care or Safety domains) or included in a separate new 'Value' domain. Alternatively, a domain-based value scoring approach could be similar to the current quality/cost tiering approach in the Physician Value-Based Modifier Program, which tiers providers into 9 high, average, or low cost and quality (or ''value'') categories to determine payments. The domain-based value score could be weighted and incorporated into the calculation of a hospital's overall Hospital VBP Program TPS along with the other existing domains, or potentially as a multiplier or adjuster to additionally reward higher value hospitals.

We welcomed the public's feedback and suggestions on how to appropriately incorporate the concept of value in the Hospital VBP Program, and we invited specific suggestions on how to measure or score value that will be meaningful to consumers, purchasers, and providers.

Comment: Several commenters supported CMS' intent to explicitly assess value of care. A few commenters further supported CMS' proposal to develop and implement specific measures of value because commenters believe it will result in a program that is simple, uncomplicated, and easily understood by consumers and providers. One commenter recommended that CMS resolve issues regarding SDS factors before implementing value scoring into the program.

Response: We thank the commenters for their suggestions, and we will take them into consideration in the future if we choose to propose to adopt value scoring.

Comment: One commenter recommended that CMS develop a value scoring methodology that would not reward hospitals with high mortality rates and low spending per patient. The commenter recommended that CMS use performance and baseline periods to score the value measures.

Response: We thank the commenter for its suggestions and will take them into consideration for future rulemaking.

Comment: A few commenters did not support CMS' proposed approach to measuring value by creating a ratio using paired condition-specific quality and cost measures. One commenter noted that this would further complicate the Hospital VBP Program's structure and could result in hospitals diverting more resources toward analyzing performance rather than focusing on improvement. A few commenters believe that such an approach could incentivize the provision of care that unintentionally leads to longer-term negative outcomes: Use of lower-cost/lower-quality implants; decreased length of stay; and insufficient use of physical therapy or home health care. A few commenters noted that the existing measures are limited in scope and were not designed to measure value; for example, THA/TKA is too narrow to capture the value of the underlying procedure, which should include factors like quality of life, duration of implant, and other issues beyond the 90-day timeframe of the THA/TKA measure. One commenter recommended CMS develop a measure that draws from patient-reported outcome measures, the American Joint Replacement Registry, and other sources to capture the value to the patient of the full life of a joint implant. These commenters generally suggested that if CMS implements value scoring, that CMS develop new value measures.

Response: We thank the commenters for their suggestions, and we will take them into consideration for future rulemaking.

Comment: A few commenters expressed general support for adopting a scoring methodology using composite ''value'' scores and recommended that CMS submit any newly developed composite measures to NQF for endorsement, as well as use them in the Hospital IQR Program before adding them to the Hospital VBP Program.

Response: We thank the commenters for their suggestions, and we note that any new measures the Hospital VBP Program considers for adoption, including any composite measures of ''value,'' will be submitted to the MAP and adopted into the Hospital IQR Program before we adopt it in the Hospital VBP Program, as required by statute.

Comment: A few commenters recommended that CMS explore using a scoring methodology that provides tandem scores for quality and cost measures, but they noted that implementing such a methodology would require additional work to identify and adopt quality and cost measures that can be aggregated into value scores. A few commenters would not support using a scoring methodology resembling the Physician Value-Based Payment Modifier in the Hospital VBP Program because the Physician Value-Based Payment Modifier uses broad categories to assess performance, which commenters believed would not capture hospital performance as precisely as the current linear-based methodology. One commenter expressed concern with value scoring in the program because CMS will have difficulty identifying controllable expenses for the denominator and defining meaningful quality metrics for the numerator.

Response: We thank all of the commenters for their suggestions, and we will take them into consideration in the future if we choose to propose to adopt a new value scoring methodology or otherwise modify the existing scoring methodology of the Hospital VBP Program.

b. Finalized Update to an Existing Measure for the FY 2021 Program Year: Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia Hospitalization (NQF #0468) (Updated Cohort)

The Hospital 30-Day, All-Cause, RSMR Following Pneumonia Hospitalization (NQF #0468) (MORT–30–PN (updated cohort)) measure is a risk-adjusted, NQF-endorsed mortality measure monitoring mortality rates following pneumonia hospitalizations. As part of the CMS measure reevaluation process, the MORT–30–PN measure underwent a substantive revision, which expanded the measure cohort to include: (1) Patients with a principal discharge diagnosis of pneumonia (the current reported cohort); (2) patients with a principal discharge diagnosis of aspiration pneumonia; and (3) patients with a principal discharge diagnosis of sepsis (excluding severe sepsis) with a secondary diagnosis of pneumonia coded as present on admission. For the purposes of describing the refinement of this measure, we note that ''cohort'' is defined as the hospitalizations, or ''index admissions,'' that are included in the measure and evaluated to ascertain whether the patient subsequently died within 30 days of the index admission. This cohort is the set of hospitalizations that meet all of the inclusion and exclusion criteria.

The Hospital IQR Program adopted this measure refinement of MORT–30–PN (updated cohort) in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49653 through 49660), with initial MORT–30–PN (updated cohort) data to be posted on *Hospital Compare* on or around July 21, 2016 (now on or about July 27, 2016). The MORT–30–PN (updated cohort) measure (MUC–E0468) was included on the ''List of Measures Under Consideration for December 1, 2014'' and received conditional support from the MAP, pending NQF endorsement of the updated cohort as detailed in the ''Spreadsheet of MAP 2015 Final Recommendations.'' [38] The full measure specifications are available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

This refinement to the MORT–30–PN measure was adopted to more accurately reflect quality and outcomes for patients with pneumonia. Recent evidence has shown an increase in the use of sepsis as a principal diagnosis code among patients hospitalized with pneumonia.[39] In response to this emerging evidence, we examined coding patterns across hospitals caring for Medicare patients and sought to forecast the impact of enhancing or broadening the measure cohort to include the complete patient population, at each hospital, who are receiving clinical management and treatment for pneumonia. Our findings were consistent with a published study.[40] That is, our results suggested that there is: (1) An increasing use of sepsis as a principal discharge diagnoses for pneumonia patients; and (2) wide variation across hospitals in the use of these codes. These published studies and CMS analyses also show that hospitals that use sepsis codes for the principal diagnosis frequently have better performance on the currently adopted MORT–30–PN measure. This coding practice improves performance on the measure because patients with greatest severity of illness (for example, those with sepsis) are systematically excluded from the measure under current measure specifications, leaving only patients with less severity of illness in the cohort.

In addition to assessing the use of the principal diagnosis codes of sepsis, we also analyzed coding patterns and the impact of expanding the pneumonia measure to include patients with the principal diagnosis of aspiration pneumonia. We noted after our analyses that aspiration pneumonia: (1) Is a common reason for pneumonia hospitalization, particularly among the elderly; (2) is currently not included in the CMS hospital outcome measure specifications for pneumonia patients; and (3) appears to be similarly subject to variation in diagnosis, documentation, and coding. The findings of published studies and CMS analyses suggested that a MORT–30–PN measure with an enhanced or broader cohort would ensure that the population of patients with pneumonia is more complete and comparable across hospitals.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25106 through 25107), we proposed this measure refinement for the Hospital VBP Program based on our adoption of the measure refinement in the Hospital IQR Program, and our posting of measure data on *Hospital Compare* for at least one year prior to the start of the measure performance period. In addition, the MORT–30–PN (updated cohort) measure addresses a high volume, high cost condition. The measure aligns with the NQS priority and CMS Quality Strategy Goal of ''Effective Prevention and Treatment of Chronic Disease.'' Based on the continued high risk of mortality after pneumonia hospitalizations, we proposed to add it to the Clinical Care domain beginning with the FY 2021 program year.

We invited public comments on this proposal.

Comment: Several commenters supported CMS' proposal to expand the

[40] Rothberg MB, Pekow PS, Priya A, Lindenauer PK. Variation in diagnostic coding of patients with pneumonia and its association with hospital risk-standardized mortality rates: A cross-sectional analysis. Annals of Internal Medicine. Mar 18 2014; 160(6):380–388.

MORT–30–PN measure because this update will align the Hospital VBP Program and Hospital IQR Program measures. One commenter noted that the expansion addresses coding variations and will ensure better collection of complete and comparable data across hospitals.

Response: We thank the commenters for their support.

Comment: One commenter recommended that CMS have the American Hospital Association ICD–10 clinic review pneumonia coding for ICD–10 to see if changes are needed in these codes to capture coding variation for causes of aspiration pneumonia.

Response: We thank commenter for the recommendation and note that CMS is currently updating all measures from ICD–9 to ICD–10 through a systematic process of assessing the changes in all codes used in measure cohorts to ensure that the cohorts remain valid and capture the intended conditions. For those individuals who are interested in participating in future ICD–10 Coordination and Maintenance Committee meetings, information on the Committee can be found on the CMS Web site at: *https://www.cms.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/ICD-9-CM-C-and-M-Meeting-Materials.html*. We encourage public participation at these meetings either in person, by conference lines, or by the livestream provided by CMS.

Comment: Many commenters did not support the addition of the MORT–30–PN updated measure because it is not NQF-endorsed. These commenters believe the endorsement process will allow the field to better understand the potential causes of coding differences. Specifically, many commenters are concerned that the inclusion of: (1) Patients with a principal discharge diagnosis of aspiration pneumonia; and (2) patients with a principal discharge diagnosis of sepsis (excluding severe sepsis) with a secondary diagnosis of pneumonia coded as present on admission may inadvertently conflate pneumonia as a discrete medical event with other underlying disease conditions.

Response: The MORT–30–PN measure with the expanded cohort was submitted to the NQF Pulmonary and Critical Care Project 2015–2016, with information on the project available at: *http://www.qualityforum.org/Projects/n-r/Pulmonary_and_Critical_Care_Measures/Pulmonary_and_Critical_Care_Project.aspx*. The MAP conditionally supported the measure, pending NQF endorsement. Because the original measure was previously endorsed and the intent of the measure has not changed, we anticipate the measure will be reendorsed with the expanded cohort.

We agree with commenters that aspiration pneumonia may be the result of a range of potential causes. We expanded the cohort to include the aspiration pneumonia population to more fully capture the complete population of hospital patients receiving management and treatment for pneumonia, and thereby capture the morbidity and mortality of this important cohort. We appreciate the commenters' concerns that community acquired pneumonia and aspiration pneumonia have different causes and associated risks (for example, recurrent aspiration due to other comorbidities).

While the pathological causes of aspiration pneumonia are slightly different from the causes of community acquired pneumonia, in routine clinical practice, evidence shows it can be very challenging for physicians to differentiate aspiration syndromes, including pneumonitis and pneumonia, from other types of pneumonia included in the measure. This is reflected in the tremendous variation across hospitals in the use of aspiration pneumonia diagnosis codes. This variation suggests that hospitals are not consistently distinguishing between these conditions as distinct subtypes regardless of patients' comorbid conditions. Thus, we continue to believe the modified expanded cohort for the measure balances the need to be more clinically comprehensive while also accurately capturing pneumonia mortality.

Comment: Several commenters did not support the inclusion of the MORT–30–PN update in the Hospital VBP Program because it does not adjust for differences in patient population.

Response: We disagree with commenters that the updated MORT–30–PN measure does not adjust for differences in patient population. The risk adjustment model adequately accounts for the varying severity and comorbidities of patients across the modified cohort; therefore, we believe that hospitals will not be unfairly penalized for treating sicker patients. We refer the commenter to the measure methodology report and measure risk adjustment statistical model in the AMI, HF, PN, COPD, and Stroke Mortality Update zip file at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

Comment: One commenter did not support the MORT–30–PN expansion because commenter believed that it moves beyond the measure's original scope of community-acquired pneumonia and because hospitals that are successful in preventing the progression from pneumonia to sepsis will appear worse than hospitals with more septic patients.

Response: The purpose of expanding the MORT–30–PN measure cohort was to more fully capture patients that were previously excluded due to the variation in the use of sepsis codes, which systematically excluded these patients from the measure population. We believe that the MORT–30–PN (updated cohort) achieves this purpose by capturing patients with pneumonia who may progress to sepsis by expanding the measure cohort to include patients with a principal discharge diagnosis of sepsis (excluding severe sepsis) with a secondary diagnosis of pneumonia coded as present on admission. This ensures that patients with a principal discharge diagnosis code of sepsis, who also presented with pneumonia, will be included at all hospitals allowing for a more consistent cohort across hospitals. This expansion should not therefore hurt the performance of hospitals successful in preventing sepsis.

Comment: A few commenters did not support the MORT–30–PN update because the impact of the update has not yet been publicly reported. The commenters noted that the measure developer indicated that an increase in mortality rates may be attributed to the expanded cohort, but no information is available about how specific hospitals perform. The commenters suggested waiting to adopt the new measure until hospitals have had sufficient time to review and analyze their performance on the expanded measure. One commenter recommended that CMS implement a phased-in approach to the expanded measure that would first allow for public reporting before implementing the expanded measure in the Hospital VBP Program.

Response: We acknowledge that hospitals will not have an opportunity to review publicly reported data before the measure is finalized in the Hospital VBP Program; however, the measure has been refined to more fully capture the mortality of patients with pneumonia, which we believe is important to capture in the Hospital VBP Program as soon as possible.

We also note that hospitals will have time to review and analyze their performance on the expanded measure prior to the FY 2021 program year because the update to the MORT–30–PN measure was implemented by the Hospital IQR Program before we are finalizing it in the Hospital VBP

Program. The updated MORT–30–PN measure data will be first posted on *Hospital Compare* on or around July 27, 2016. Because the performance period for the updated MORT–30–PN measure will not begin until September 1, 2017 (instead of August 1, 2017, discussed in more detail below), hospitals will have one full year to review and assess their performance on the expanded measure prior to the beginning of the performance period.

Comment: A few commenters did not support the MORT–30–PN measure's expansion to include aspiration pneumonia because commenters believe the majority of patients with aspiration pneumonia are medically frail patients with comorbidities that predispose them to recurrent aspiration events and therefore represent a higher risk for complications, readmissions, and death despite evidence-based treatment and prevention strategies. The commenters also noted that the measure will capture different cohorts of patients with different baseline factors that influence morbidity and mortality, such as patients with psychiatric and substance abuse comorbidities, and commenter believed penalizing hospitals treating these patients may impact availability of services for these patients.

Response: We appreciate the commenters' concerns about the extent of the refinement of this measure and the inclusion of patients with greater illness severity. In particular, we understand commenters' concerns that aspiration pneumonia can have different causes and associated risks (for example, recurrent aspiration due to other comorbidities). However, while the pathological causes of aspiration pneumonia are slightly different from the causes of community acquired pneumonia, in routine clinical practice, evidence shows it can be very challenging for physicians to differentiate aspiration syndromes including pneumonitis and pneumonia, from other types of pneumonia included in the measure. This is reflected in the tremendous variation across hospitals in the use of aspiration pneumonia diagnosis codes. This variation suggests that hospitals are not consistently distinguishing between these conditions as distinct subtypes regardless of patients' comorbid conditions. Expanding the measure cohort would ensure that the measure is clinically comprehensive.

Moreover, the treatment of patients hospitalized for pneumonia, aspiration pneumonia, or sepsis due to pneumonia is very similar and involves treatment with antibiotics, IV fluids, and symptom management. In addition, although some patients with aspiration pneumonia, such as medically frail patients, have a higher predicted mortality risk, many of the associated comorbidities are captured in the MORT–30–PN (updated cohort) measure's risk-adjustment methodology. Of note, due to the increased number of patients that are included in the expanded cohort, we reselected risk-adjustment variables to ensure that the measure does not bias hospital performance as well as accounts for the differences in risk among the subgroup of patients. For example, the risk model includes clinical history of stroke, as well as conditions associated with frailty, such as neuromuscular disease, and dementia. We refer readers to the measure methodology report and measure risk adjustment statistical model, Condition-Specific Measures Updates and Specifications Report Hospital-Level 30-Day Risk-Standardized Mortality Measures—Pneumonia Mortality Version 10, in the AMI, HF, PN, COPD, and Stroke Mortality Update zip file available at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

After consideration of the public comments we received, we are finalizing the proposal to add the MORT–30–PN (updated cohort) to the Hospital VBP Program beginning with the FY 2021 program year.

5. New Measure for the FY 2022 Program Year: Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery (NQF #2558)

The Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following CABG Surgery (NQF #2558) (MORT–30–CABG) measure is a risk-adjusted, NQF-endorsed mortality measure monitoring mortality rates following CABG hospitalizations. This measure includes Medicare FFS patients aged 65 or older who receive a qualifying CABG procedure and assesses hospitals' 30-day, all-cause risk-standardized rate of mortality, beginning with the date of the index procedure. The measure is calculated using administrative claims data. In general, the measure uses the same approach to risk adjustment as our 30-day outcome measures previously adopted for the Hospital VBP Program. We adopted this measure in the Hospital IQR Program in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50224 through 50227). Initial measure data were posted on *Hospital Compare* in July 2015 and the full measure specifications are available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

CABG is a priority area because it is a common procedure associated with considerable morbidity, mortality, and healthcare spending. In the United States, over 200,000 CABG procedures are performed annually, and the majority of procedures are performed on Medicare beneficiaries.[41] In 2012, Medicare beneficiaries had 121,744 CABG surgery admissions, with or without percutaneous coronary intervention or valve surgery.[42] CABG surgeries are costly procedures that account for a large percentage of cardiac surgeries performed nationally. For example, isolated CABG surgeries accounted for almost half (40.02 percent) of all cardiac surgery hospital admissions in Massachusetts in FY 2012.[43] This provides an example of the frequency in which a CABG is performed for a patient admitted for cardiac surgery. The average Medicare payment was $32,564 for CABG without valve and $48,461 for CABG plus valve surgeries in 2011.[44]

Mortality rates following CABG surgery are not insignificant and vary across hospitals. For the July 2011 through June 2014 Hospital IQR Program reporting period, the median hospital-level risk-standardized mortality rate after CABG was 3.1 percent and ranged from 1.6 percent to 9.2 percent.[45] Variation in mortality rates following CABG surgery can be seen not only nationally, but also within a single State. Within the State of New York, the risk-adjusted mortality rate

among patients who were discharged after CABG surgery (without any other major heart surgery earlier in the hospital stay) ranged from 0.0 percent to 4.58 percent in 2011.[46] Variation in risk-standardized mortality rates among U.S. hospitals suggests that there is room for improvement.

An all-cause, risk-adjusted mortality measure for patients who undergo CABG surgery would provide hospitals with an incentive to reduce mortality through improved coordination of perioperative care and discharge planning. This is further supported by the success of registry-based mortality measures in reducing CABG mortality rates. For example, CABG mortality in California declined from 2.9 percent in 2003, the first year that the State implemented a mandatory CABG mortality reporting measure, to 2.1 percent in 2012.[47]

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25107), we proposed the MORT–30–CABG measure for the Hospital VBP Program beginning with the FY 2022 program year because it addresses a high-volume, high-cost procedure with variation in performance. The measure also aligns with the CMS Quality Strategy Goal of Effective Prevention and Treatment of Chronic Disease. The measure fulfills all statutory requirements for the Hospital VBP Program based on our adoption of the measure in the Hospital IQR Program and our posting of measure data on *Hospital Compare* for at least one year before the beginning of the measure performance period. The MAP supported the inclusion of the MORT–30–CABG measure (MUC15–395) in the Hospital VBP Program as detailed in the ''Spreadsheet of MAP 2016 Final Recommendations.'' [48] Based on the continued high risk of mortality after CABG hospitalizations, we proposed to add this measure to the Clinical Care domain beginning with the FY 2022 program year.

We invited public comments on this proposal.

Comment: Many commenters supported the MORT–30–CABG measure because it is NQF-endorsed and MAP-supported, noting that the measure addresses a high-volume, high-cost procedure with performance variation and including the measure will reduce mortality through improved coordination and planning. One commenter noted that an all-cause, risk-adjusted mortality measure for patients who undergo CABG surgery will provide hospitals with an incentive to reduce mortality through improved coordination of perioperative care and discharge planning. One commenter supported adding the MORT–30–CABG measure because the commenter believed the measure increases incentives for hospitals to better manage patients' chronic conditions after discharge.

Response: We thank the commenters for their support.

Comment: One commenter did not support the addition of the MORT–30–CABG measure because it captures mortality that could be unrelated to the procedure and beyond the hospital's control. The commenter suggested adding language excluding cases where patients die from causes unrelated to the CABG procedure.

Response: The measure assesses all-cause mortality rather than CABG-specific mortality for several reasons. First, limiting the measure to CABG-related mortalities may limit the focus of efforts to improve care to a narrow set of approaches as opposed to encouraging broader initiatives and innovative approaches aimed at improving the overall in-hospital care. Second, cause of death may be unreliably recorded and it is often not possible to exclude quality issues and accountability based on the documented cause of mortality.

Comment: Several commenters did not support the addition of the MORT–30–CABG for the FY 2022 program year. Commenters expressed concern that the MORT–30–CABG measure's reliability is inadequate and depends heavily upon whether a hospital has a sufficient volume of eligible patients. One commenter stated the measure is not NQF-endorsed. One commenter believed the data the MORT–30–CABG measure captures will overlap with the MORT–30–AMI measure.

Response: We disagree with commenters that the MORT–30–CABG measure is not reliable. We note that the NQF has endorsed the measure as reliable and valid (NQF #2558). For more information regarding measure reliability, we refer the commenter to the version 1.0 measure methodology report in CABG Mortality zip file at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.*

Further, while we acknowledge commenter's concern regarding the overlap between the MORT–30–AMI and MORT–30–CABG measures, we believe it is important that both measures represent the full spectrum of admissions eligible for the cohort for each individual measure to ensure the validity of the individual measures as endorsed by the NQF. We also find that the overlap is minimal between the measures, with prior analysis showing less than 7 percent of the AMI cohort included in the CABG measure cohort.

Comment: Some commenters recommended that CMS include adequate risk-adjustment modifications to the measure that addresses both SDS and clinical factors.

Response: The NQF is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF will issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial. CMS, in compliance with NQF's guidance, has tested sociodemographic factors in the measures' risk models and made recommendations about whether or not to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our outcome measures.

Furthermore, ASPE is conducting research to examine the impact of sociodemographic status on quality measures, resource use, and other measures under the Medicare program as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how

[48] ''Spreadsheet of MAP 2015–2016 Final Recommendations'' available at: *http://www.qualityforum.org/map/* and ''Process and Approach for MAP Pre-Rulemaking Deliberations 2016'' found at: *http://www.qualityforum.org/Publications/2016/02/Process_and_Approach_for_MAP_Pre-Rulemaking_Deliberations.aspx.*

they apply to our quality programs at such time as they are available.

Comment: A few commenters expressed concern that the MORT–30–CABG measure, as well as other previously finalized measures, does not exclude patients that desire comfort care, such as hospice services, because these patients have been found to impact mortality measure data and hospital performance for patients with pneumonia. One commenter recommended that CMS modify the measure to exclude patients that desire comfort care rather than treatment. Likewise, another commenter recommended that CMS exclude hospice patients from all mortality measures.

Response: The MORT–30–CABG measure does not exclude patients who transition to hospice care following the index admission because such transitions may be the result of quality failures that have led to poor clinical outcomes. However, all mortality measures proposed and finalized for the Hospital VBP Program, except for the MORT–30–CABG measure, do exclude index admissions for patients enrolled in the Medicare hospice program any time in the 12 months prior to the index admission, including the first day of the index admission, because these patients are likely continuing to seek comfort care only; thus, mortality is not necessarily an adverse outcome or signal of poor quality care for these patients. We note, however, that the MORT–30–CABG measure does not exclude hospice patients because any patient undergoing CABG surgery likely has survival as the primary goal.

After consideration of the public comments we received, we are finalizing the proposal to add the MORT–30–CABG measure beginning with the FY 2022 program year.

6. Previously Adopted and Newly Finalized Baseline and Performance Periods

a. Background

Section 1886(o)(4) of the Act requires the Secretary to establish a performance period for the Hospital VBP Program that begins and ends prior to the beginning of such fiscal year. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49561 through 49562) for the baseline and performance periods for the Clinical Care, Person and Community Engagement, Safety, and Efficiency and Cost Reduction domains that we have adopted for the FY 2018 program year. In past final rules, we have proposed and adopted a new baseline and performance period for each program year for each domain in each final rule. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25107 through 25108), we proposed to adopt the following baseline and performance periods for all future program years, unless otherwise noted in future rulemaking.

b. Patient- and Caregiver-Centered Experience of Care/Care Coordination Domain (Person and Community Engagement Domain Beginning With the FY 2019 Program Year)

Since the FY 2015 program year, we have adopted a 12-month baseline period and a 12-month performance period for measures in the re-named Person and Community Engagement domain (previously referred to as the Patient- and Caregiver-Centered Experience of Care/Care Coordination domain) (77 FR 53598; 78 FR 50692; 79 FR 50072; 80 FR 49561). We continue to believe that a 12-month period provides us sufficient data on which to score hospital performance.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25108), we proposed to adopt this baseline and performance period length for the FY 2019 program year and all future program years, unless otherwise noted in future rulemaking. Therefore, for the FY 2019 program year and future program years, we proposed to adopt a performance period that runs on the calendar year 2 years prior to the applicable program year. We proposed to adopt a baseline period that runs on the calendar year 4 years prior to the applicable program year. Applying these new policies, for the FY 2019 program year, the baseline period for the re-named Person and Community Engagement domain would run from January 1, 2015 through December 31, 2015. The performance period would run from January 1, 2017 through December 31, 2017.

We received no public comments on this proposal. Therefore, we are finalizing the proposal to adopt a performance period for the Person and Community Engagement domain that runs on the calendar year 2 years prior to the applicable program year and to adopt a baseline period that runs on the calendar year 4 years prior to the applicable program year, for the FY 2019 program year and all future program years.

c. Efficiency and Cost Reduction Domain

(1) MSPB Measure

Since the FY 2016 program year, we have adopted a 12-month baseline period and a 12-month performance period for the MSPB measure in the Efficiency and Cost Reduction domain (78 FR 50692; 79 FR 50072; 80 FR 49562). We continue to believe that a 12-month period for this measure provides sufficient data on which to score hospital performance. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25108), we proposed to adopt this baseline and performance period length for the FY 2019 program year and all future program years, unless otherwise noted in future rulemaking.

Therefore, for the FY 2019 program year and future program years, we proposed to adopt a performance period that runs on the calendar year 2 years prior to the applicable program year. We proposed to adopt a baseline period that runs on the calendar year 4 years prior to the applicable program year. Applying these new policies, for the FY 2019 program year, the baseline period for the MSPB measure would run from January 1, 2015 through December 31, 2015. The performance period would run from January 1, 2017 through December 31, 2017.

We received no public comments on this proposal. Therefore, we are finalizing the proposal to adopt a performance period for the MSPB measure that runs on the calendar year 2 years prior to the applicable program year and to adopt a baseline period that runs on the calendar year 4 years prior to the applicable program year, for the FY 2019 program year and all future program years.

(2) AMI Payment and HF Payment Measures in the FY 2021 Program Year

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25103 through 25105), we also proposed to adopt the AMI Payment and HF Payment measures as 2 new measures for the Efficiency and Cost Reduction domain beginning in the FY 2021 program year. In order to adopt the measures as early as feasible into the Hospital VBP Program, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25108 through 25109), we proposed to adopt a 36-month baseline period and a 24-month performance period. Therefore, for the FY 2021 program year, we proposed to adopt a 24-month performance period that runs from July 1, 2017 to June 30, 2019. We proposed to adopt a 36-month baseline period that runs from July 1, 2012 to June 30, 2015.

We believe that using a 24-month performance period for the AMI Payment and HF Payment measures, rather than a 36-month performance period, in the FY 2021 program year would accurately assess the quality of

care provided by hospitals and would not substantially change hospitals' performance on the measure. To determine the viability of using a 24-month performance period to calculate the AMI Payment and HF Payment measures' scores, we compared the measure score reliability for a 24-month and 36-month performance period. We calculated the Intraclass Correlation Coefficient (ICC) to determine the extent to which assessments of a hospital using different but randomly selected subsets of patients produces similar measures of hospital performance.[49] We calculated the risk-standardized payment (RSP) using a random split-sample of a 36-month performance period (we used July 1, 2012 through June 30, 2015).

For both the 36-month and the 24-month performance periods, we obtained 2 RSPs for each hospital, using an entirely distinct set of patients from the same time period. If the RSPs for both the 36-month and the 24-month performance periods agree, we can demonstrate that the measure assesses the quality of the hospital rather than the types of patients treated. To calculate agreement between these measure subsets, we calculated the ICC (2,1)[50] for both the 36-month and 24-month performance periods.

For the AMI Payment measure, there were 459,874 index admissions and 2,342 hospitals that met the minimum threshold for reporting a measure result (at least 25 cases) in the 36-month performance period. We also calculated the RSP using a random split-sample of the combined 24-month performance period (we used July 1, 2012 through June 30, 2014). There were 309,067 index admissions and 2,141 hospitals that met the minimum threshold for reporting a measure result in the 24-month performance period.

For the 36-month performance period, the ICC for the 2 independent assessments of each hospital was 0.775. For the 24-month performance period, the ICC for the 2 independent assessments of each hospital was 0.742. Therefore, the data subsets showcase ''substantial'' agreement of hospital performance, and we can demonstrate that, even with a 24-month performance period, the measure assesses the quality of care provided at the hospital rather than the types of patients that these hospitals treat.[51]

To assess whether using 24 months of data instead of 36 months of data changes the performance in the same hospital, we compared the percent change in a hospital's predicted/expected (P/E) ratio. For hospitals that met the minimum case threshold in the 24-month performance period, the median percent change was −0.06 percent (with an interquartile range of −1.7 percent to 1.5 percent). These results suggest minimal difference in same-hospital performance when using a 24-month measurement period.

To determine the viability of using a 24-month performance period to calculate the HF Payment measure's score, we assessed reliability and change in hospital performance for a 24-month and 36-month performance period using the same process as the AMI Payment measure. For the HF Payment measure, there were 877,856 index admissions and 2,981 hospitals that met the minimum threshold for reporting a measure result (at least 25 cases) in the 36-month performance period. We also calculated the RSP using a random split-sample of a 24-month performance period (we used July 1, 2012 through June 30, 2014). There were 580,741 index admissions and 2,883 hospitals that met the minimum threshold for reporting a measure result in the 24-month performance period.

For the 36-month performance period, the ICC for the 2 independent assessments of each hospital was 0.83. For the 24-month performance period, the ICC for the 2 independent assessments of each hospital was 0.81. Therefore, the data subsets showcase ''almost perfect'' agreement of hospital performance, and we can demonstrate that, even with a 24-month performance period, the measure assesses the quality of care provided at the hospital rather than the types of patients that these hospitals treat.[52]

To assess whether using a 24-month performance period instead of a 36-month performance period changes the performance in the same hospital, we compared the percent change in a hospital's P/E ratio. For hospitals that met the minimum case threshold in the 24-month performance period, the median percent change for hospitals' P/E ratio using 24-month performance periods compared with 36-month performance periods was −0.02 percent (with an interquartile range of −1.9 percent to 1.8 percent). These results suggest minimal difference in same-hospital performance when using a 24-month measurement period.

Therefore, we believe that using a 24-month performance period rather than a 36-month performance period would not substantially change hospitals' performance on the AMI Payment and HF Payment measures. In sum, based on the analyses described earlier, we believe that using 24-month performance periods, rather than 36-month performance periods, for the initial performance period for this measure would accurately assess the quality of care provided by that hospital and would not substantially change that hospital's performance on the measure.

Comment: A few commenters did not support the proposal to adopt the AMI Payment and HF Payment measures with a 24-month performance period in the FY 2021 program year because commenters believe the measures should have consistent baseline and performance periods across program years in order to fairly and accurately compare performance from program year to program year. Several commenters recommended that CMS delay adoption of the AMI Payment and HF Payment measures until the FY 2022 program year when CMS can adopt 36-month performance periods. One commenter supported the use of a three-year baseline period because a longer baseline period can account for the longer-term predictive value of health events such as AMI or HF better than a one-year baseline period.

Response: We note that the AMI Payment and HF Payment measures will only have a 24-month performance period for the FY 2021 program year, the first year these measures are in the program, but we are adopting a 36-month performance period for the FY 2022 program year, as detailed in the next section below. We continue to believe that the 24-month performance period for FY 2021 is sufficiently reliable to accurately assess the resource use by hospitals and would not substantially change hospitals' performance on the measure.

After consideration of the public comments we received, we are finalizing the proposal to adopt a 24-month performance period and 36-month baseline period for both the AMI Payment and HF Payment measures for the FY 2021 program year.

(3) AMI Payment and HF Payment Measures in the FY 2022 Program Year

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25109), for the FY 2022 program year, we proposed to adopt a 36-month performance period and a 36-month baseline period for the

[49] Shrout P, Fleiss J. Intraclass Correlations: Uses in Assessing Rater Reliability. Pyschol Bull. Mar 1979;86(2):420–428.

[50] Ibid.

[52] Landis J, Koch G. The Measurement of Observer Agreement for Categorical Data. *Biometrics*. Mar 1997 1977;33(1):159–174.

AMI Payment and HF Payment measures. We have stated in past rules that we would strive to adopt 36-month performance periods and baseline periods when possible to accommodate the time needed to process measure data and to ensure that we collect enough measure data for reliable performance scoring for all mortality measures (80 FR 49588; 79 FR 50057; 78 FR 50074). Therefore, for the FY 2022 program year, we proposed to adopt a 36-month performance period that runs from July 1, 2017 to June 30, 2020. We proposed to adopt a 36-month baseline period that runs from July 1, 2012 to June 30, 2015.

After consideration of the public comments we received, we are finalizing the proposal to adopt a 36-month performance period and 36-month baseline period for the AMI Payment and HF Payment for the FY 2022 program year.

d. Safety Domain

Since the FY 2016 program year, we have adopted a 12-month baseline period and 12-month performance period for all measures in the Safety domain, with the exception of the PSI 90 measure (78 FR 50692; 79 FR 50071; 80 FR 49562). We continue to believe that a 12-month period for these measures provides us sufficient data on which to score hospital performance.

Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25109), we proposed to adopt a 12-month baseline period and a 12-month performance period for all measures in the Safety domain for the FY 2019 program year and all future program years, unless otherwise noted in future rulemaking. Under this proposed policy, for the FY 2019 program year and future program years, we proposed to adopt a performance period that runs on the calendar year 2 years prior to the applicable program year. We proposed to adopt a baseline period that runs on the calendar year 4 years prior to the applicable program year. Applying these new policies, for the FY 2019 program year, the baseline period for all measures in the Safety domain would run from January 1, 2015 through December 31, 2015. The performance period would run from January 1, 2017 through December 31, 2017.

We received no public comments on this proposal. Therefore, we are finalizing the proposal to adopt a performance period for all remaining measures in the Safety domain (we refer readers to the discussion below regarding the PSI 90 measure) that runs on the calendar year 2 years prior to the applicable program year and to adopt a baseline period that runs on the calendar year 4 years prior to the applicable program year, for the FY 2019 program year and all future program years.

As discussed in section IV.H.2.a. of the preamble of this final rule, we are finalizing our proposal to adopt a shortened performance period for the PSI 90 measure in the FY 2018 program year, which will be July 1, 2014 through September 30, 2015. As stated earlier, the baseline period for the PSI 90 measure for FY 2018 that we previously established would not change.

e. Clinical Care Domain

(1) Currently Adopted Measures in the Clinical Care Domain

For the FY 2019, FY 2020, and FY 2021 program years, we have adopted a 36-month baseline period and a 36-month performance period for currently adopted measures in the Clinical Care domain (78 FR 50692 through 50694; 79 FR 50073; 80 FR 49563).[53] In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25109), for the FY 2022 program year, we proposed to adopt a 36-month performance period and a 36-month baseline period for each of the other measures in the Clinical Care domain, the MORT–30–AMI, MORT–30–HF, and MORT–30–COPD measures, as well as the new MORT–30–CABG measure. The performance periods for these measures would run for 36-months from July 1, 2017 through June 30, 2020. The baseline period would run from July 1, 2012 through June 30, 2015. We proposed that the THA/TKA measure performance period would run from April 1, 2017 through March 31, 2020. The baseline period would run from April 1, 2012 through March 31, 2015.

We received no public comments on this proposal. Therefore, we are finalizing the proposal to adopt a 36-month performance period and 36-month baseline period for the FY 2022 program year for the measures currently adopted in the Clinical Care domain.

(2) MORT–30–PN (Updated Cohort) Measure in the FY 2021 Program Year

In order to adopt the new MORT–30–PN (updated cohort) measure into the Hospital VBP Program as early as feasible, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25110), we proposed to adopt a 36-month baseline period and a 23-month performance period for the FY 2021 program year. We proposed to adopt a 23-month performance period because the measure will not have been posted on *Hospital Compare* for one year until July 21, 2017 (now on or about July 27, 2017). We proposed to begin the performance period on August 1, 2017 to accommodate this statutory requirement.

We believe that using a 23-month performance period for the MORT–30–PN (updated cohort) measure, rather than a 36-month performance period, in the FY 2021 program year would accurately assess the quality of care provided by hospitals and would not substantially change hospitals' performance on the measure. To determine the viability of using a 23-month performance period to calculate the MORT–30–PN (updated cohort) measure's score, we compared the measure score reliability for a 23-month and a 36-month performance period. We calculated the ICC to determine the extent to which assessments of a hospital using different but randomly selected subsets of patients produces similar measures of hospital performance. We calculated the RSMR using a random split-sample of the combined 36-month performance period (we used July 1, 2012 through June 30, 2015). There were 1,292,701 index admissions and 3,103 hospitals that met the minimum threshold for reporting a measure result (at least 25 cases) in the 36-month performance period. We also calculated the RSMR using a random split-sample of the combined 23-month performance period (we used July 1, 2012 through May 31, 2014). There were 798,746 index admissions and 3,043 hospitals that met the minimum threshold for reporting a measure result in the 23-month performance period.

For both the 36-month data and the 23-month performance periods, we obtained 2 RSMRs for each hospital, using an entirely distinct set of patients from the same time period. If the RSMRs for both the 36-month subset and the 23-month performance periods agree, we can demonstrate that the measure assesses the quality of the hospital rather than the types of patients treated. To calculate agreement between these measure subsets, we calculated the ICC for both the 36-month and 23-month performance periods.

For the 36-month data performance period, the agreement between the 2 independent assessments of each hospital was 0.69. For the 23-month data performance period, the agreement

[53] The currently adopted measures in the Clinical Care domain include: MORT–30–AMI, MORT–30–HF, MORT–30–PN, and THA/TKA. The THA/TKA measure was added for the FY 2019 program year with a 36-month baseline period and a 24-month performance period (79 FR 50072), but we have since adopted 36-month baseline and performance periods for the FY 2021 program year (80 FR 49563). We intend to continue having 36-month baseline periods and 36-month performance periods in the future for all measures in the Clinical Care domain.

between the 2 independent assessments of each hospital was 0.58. Therefore, the data subsets showcase ''moderate'' agreement of hospital performance, and we can demonstrate that, even with a 23-month performance period, the measure moderately assesses the quality of care provided at the hospital rather than the types of patients that these hospitals treat.[54]

To assess whether using a 23-month performance period instead of a 36-month performance period changes the performance in the same hospital, we compared the percent change in a hospital's RSMR. In some cases, changing the performance period from 36 months to 23 months resulted in hospitals failing to meet the case threshold to report a measure score; therefore, these hospitals were removed from the measure. For the remaining hospitals, the median percent change was 1.52 percent (with an interquartile range of 2.32 percent to 5.32 percent). These results suggest minimal difference in hospital performance when using a 23-month measurement period.

Therefore, we believe that using 23 months of data rather than 36 months of data would not substantially change hospitals' performance on this measure. In summary, based on the analyses described earlier, we believe that using 23 months of data, rather than 36 months of data, for the initial performance period for this measure would, with moderate accuracy, assess the quality of care provided by that hospital. In addition, it would not substantially change that hospital's performance on the measure.

Further, adopting this performance period will enable us to include the updated measure cohort in the FY 2021 Hospital VBP Program, which would ensure that MORT–30–PN more accurately reflects quality and outcomes for patients with pneumonia. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25110), for the MORT–30–PN (updated cohort) measure, we proposed a performance period that would run from August 1, 2017 through June 30, 2019 for the FY 2021 program year. The baseline period would run from July 1, 2012 through June 30, 2015.

Comment: One commenter supported our inclusion of the MORT–30–PN measure for the FY 2021 program year with a 23-month performance period.

Response: We thank the commenter for its support.

Comment: A few commenters did not support the 23-month performance period for the MORT–30–PN measure in the FY 2021 program year because commenters believed the measure is only moderately reliable, which is insufficient for a payment program. One commenter did not believe CMS has proven that the measure is reliable with a shorter performance period, and the commenter recommended that CMS refrain from pushing to adopt measures for the Hospital VBP Program when doing so would require using shortened performance periods.

Response: As we note in the proposed rule (81 FR 25108), we calculated the Intraclass Correlation Coefficient (ICC) to determine the extent to which assessments of a hospital using different but randomly selected subsets of patients produces similar measures of hospital performance.[55] For the 23-month performance period the ICC was 0.58, which is consistent with other NQF-endorsed claims-based measures in the Hospital VBP Program. Therefore, we believe the measure is sufficiently reliable to include in the program.

Since publication of the FY 2017 IPPS/LTCH PPS proposed rule, we have become aware of operational issues that may delay publication of MORT–30–PN measure data on *Hospital Compare* by 1–2 weeks but past August 1, 2016. Under section 1886(o)(2)(C)(i) of the Act, the Hospital VBP Program must refrain from beginning the performance period for a new measure until data on the measure have been posted on *Hospital Compare* for at least one year. As a result, we believe it is necessary to delay the beginning of the performance period for the MORT–30–PN measure one additional month, from August 1, 2017 to September 1, 2017. We continue to believe the MORT–30–PN measure will be sufficiently reliable using 22 months of data because this is not a significant reduction in the amount of data used to calculate performance scores under the measure, and finalizing MORT–30–PN with the updated cohort will substantially increase the denominator of this measure. For these reasons, we are finalizing that instead of beginning the performance period for the MORT–30–PN measure for FY 2021 on August 1, 2017, the performance period will begin on September 1, 2017.

After consideration of the public comments we received, we are finalizing our proposal to adopt the MORT–30–PN (updated cohort) measure with a 22-month performance period and 36-month baseline period for the FY 2021 program year.

(3) MORT–30–PN (Updated Cohort) Measure in the FY 2022 Program Year

For the FY 2022 program year and subsequent years, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25110), we proposed to lengthen the MORT–30–PN (updated cohort) performance period to nearly a 36-month performance period (35 months) and continue to adopt a 36-month baseline period. For the FY 2022 program year, we proposed a performance period that would run from August 1, 2017 through June 30, 2020. The baseline period would run from July 1, 2012 through June 30, 2015.

Comment: A few commenters did not support the 35-month performance period for the MORT–30–PN measure in the FY 2022 program year because the commenters believe that CMS has not demonstrated that the measure is highly accurate.

Response: Since the MORT–30–PN measure was found to be statistically reliable at 23 months, we believe that the measure will be even more reliable at 35 months. As noted above, due to operational concerns associated with timely publication of MORT–30–PN data on *Hospital Compare,* we are delaying the start of the FY 2021 performance period by one month, to September 1, 2017. For these same reasons, we are finalizing that instead of beginning the performance period for the MORT–30–PN measure for FY 2022 on August 1, 2017, the performance period will begin on September 1, 2017. We do not believe shortening the FY 2022 MORT–30–PN performance period by one month will affect the reliability of the measure because it will not significantly impact the amount of data used to calculate performance scores under the measure.

After consideration of the public comments we received, we are finalizing our proposal to adopt the MORT–30–PN (updated cohort) measure with a 34-month performance period and 36-month baseline period for the FY 2022 program year. In the FY 2023 program year and subsequent years, we intend to lengthen the MORT–30–PN (updated cohort) performance period to a full 36-month performance period beginning in July, instead of September.

f. Summary of Previously Adopted and Newly Finalized Baseline and Performance Periods for the FY 2018, FY 2019, FY 2020, FY 2021, and FY 2022 Program Years

The tables below summarize the baseline and performance periods that

[54] Landis J, Koch G. The Measurement of Observer Agreement for Categorical Data. *Biometrics*. Mar 1997 1977;33(1):159–174.

[55] Shrout P, Fleiss J. Intraclass Correlations: Uses in Assessing Rater Reliability. Pyschol Bull. Mar 1979;86(2):420–428.

we are adopting in this final rule (and include previously adopted baseline and performance periods for the Clinical Care domain).

NEWLY FINALIZED BASELINE AND PERFORMANCE PERIODS FOR THE FY 2018 PROGRAM YEAR

Domain	Baseline period	Performance period
Safety		
• PSI 90 *	July 1, 2010–June 30, 2012	July 1, 2014–September 30, 2015.

* We are adopting a shortened performance period for the PSI 90 measure for the FY 2018 program year, as discussed in section IV.H.2.a. of the preamble of this final rule.

7. Immediate Jeopardy Policy Changes

a. Background

Section 1886(o)(1)(C) of the Act states that the Hospital VBP Program applies to subsection (d) hospitals (as defined in section 1886(d)(1)(B) of the Act), but excludes from the definition of the term ''hospital'' with respect to a fiscal year a hospital ''for which, during the performance period for such fiscal year, the Secretary has cited deficiencies that pose immediate jeopardy to the health or safety of patients.''

In 42 CFR 412.160 of our Hospital VBP Program regulations, we defined the term ''Cited for deficiencies that pose immediate jeopardy'' to mean that ''during the applicable performance period, the Secretary cited the hospital for immediate jeopardy on at least 2 surveys using the Form CMS–2567, Statement of Deficiencies and Plan of Correction'' (OMB Control Number 0938–0391). In 42 CFR 412.160, we also adopted the definition of ''immediate jeopardy'' found in 42 CFR 489.3 of our regulations.

Our current interpretation of the Hospital VBP Program's statute is that a hospital cited for deficiencies that pose immediate jeopardy during any part of the finalized performance period for the applicable program year does not meet the definition of the term ''hospital,'' and thus is excluded from the Hospital VBP Program for that program year. Because the Hospital VBP Program currently uses measures with 12-month, 24-month, and 36-month performance periods, a hospital's immediate jeopardy citations could result in its exclusion from the Hospital VBP Program for multiple program years.

b. Increase of Immediate Jeopardy Citations From Two to Three Surveys

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25111 through 25112), we proposed to amend our regulations at 42 CFR 412.160 to change the definition of the term ''Cited for deficiencies that pose immediate jeopardy'' to increase the number of surveys where a hospital must be cited for immediate jeopardy before being excluded from the Hospital VBP Program pursuant to section 1886(o)(1)(C) of the Act from 2 to 3. In other words, we proposed that a hospital must be cited on Form CMS–2567, Statement of Deficiencies and Plan of Correction, for immediate jeopardy on at least three surveys during the performance period in order to meet the standard for exclusion from the Hospital VBP Program under section 1886(o)(1)(C)(ii)(II) of the Act. Beginning on the effective date of this change, hospitals would be excluded from the Hospital VBP Program for a particular program year if, during the performance period for that fiscal year, they were cited three times by the Secretary for deficiencies that pose immediate jeopardy to the health or safety of patients. Because we expect that the effective date of this change will be October 1, 2016 (the first day of the FY 2017 Hospital VBP program year), only hospitals that were cited 3 times during the performance period that applies to the FY 2017 program year would be excluded from the Hospital VBP Program. Hospitals that were, as of October 1, 2016, cited for immediate jeopardy on 2 surveys during the performance period that applies to the FY 2017 program year could participate in the Hospital VBP Program for the FY 2017 program year.

We proposed this change to be more inclusive of hospitals and to ensure that we are not too quickly excluding a hospital from participation in the Hospital VBP Program. After reviewing the survey and certification data, we have determined that limiting exclusion to those hospitals that have been cited for immediate jeopardy 3 or more times during the applicable performance period, rather than 2, would continue to appropriately exclude hospitals that are cited for jeopardizing patient safety while allowing hospitals with a lower number of immediate jeopardy citations over significantly longer performance periods to continue to participate in the Hospital VBP Program. Many immediate jeopardy citations involve systematic issues of patient safety, and we believe that hospitals that are, during the performance period, cited by the Secretary for 3 or more deficiencies that pose immediate jeopardy should be excluded from the Hospital VBP Program. We stated in the proposed rule that this proposal would ensure that we continue to assure high quality care while being as inclusive of hospitals as possible.

We invited public comments on this proposal.

Comment: Many commenters supported CMS' proposal to increase the number of immediate jeopardy citations required to trigger Hospital VBP Program exclusion from 2 to 3 during the applicable performance period because hospitals should be encouraged to participate in the program and because such citations could result in excluding a hospital from the program for several program years. One commenter supported the proposal to increase the number of citations, and noted that an immediate jeopardy citation could be too broad and far-reaching under the current policy.

Response: We thank the commenters for their support.

Comment: One commenter did not support the proposal to increase the number of citations before being excluded from the program because it sets a low bar so that hospitals that average 1 immediate jeopardy citation per year or less can participate in the Hospital VBP Program. The commenter noted that an immediate jeopardy situation is a serious citation for a hospital to receive.

Response: We agree with the commenter that an immediate jeopardy citation should be considered seriously. Many immediate jeopardy citations have involved systematic issues of patient safety. However, they can also vary by level of patient safety risk and by location. We therefore believe that limiting exclusion from the Hospital VBP Program to those hospitals that have been cited for immediate jeopardy 3 or more times during the applicable performance period, rather than 2, would continue to appropriately

exclude hospitals that are cited for jeopardizing patient safety without excluding a hospital from participation in the Hospital VBP Program prematurely. In addition, when the immediate jeopardy policy was initially implemented in the Hospital VBP Program, the performance periods were shorter. Now, with significantly longer performance periods (up to 36 months), we believe it is more appropriate to allow hospitals with up to 3 immediate jeopardy citations to continue to participate in the Hospital VBP Program.

Comment: One commenter recommended that CMS limit ineligibility for hospitals cited for deficiencies that pose immediate jeopardy to one fiscal year at most because commenter believed this reflects Congress' statutory intent in the Act.

Response: In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53611), we interpreted the statute to mean that a hospital that meets the definition of ''cited for deficiencies that pose immediate jeopardy'' during any of the finalized performance periods for any measure in a given program year would be excluded from participating in that program year. Several commenters objected to the interpretation of the statute based on the possibility of immediate jeopardy citations during a relatively wide date range, resulting in hospitals being excluded from several program years (77 FR 53614). We responded by stating in that final rule (77 FR 53614) that ''we believe that we must exclude hospitals so cited during any finalized performance period for a fiscal year regardless of the length of the applicable performance period.'' We continue to believe that is the correct interpretation of section 1886(o)(1)(C) of the Act.

Comment: One commenter recommended several additional policies for CMS to consider with regard to the immediate jeopardy policy in the Hospital VBP Program. First, commenter recommended that CMS adopt an immediate jeopardy appeals process through which hospitals can appeal citations before an objective entity outside of HHS without being excluded from Medicare or the Hospital VBP Program because commenter believed this reflects Congress' statutory intent in the Act. Second, commenter requested that CMS interpret and change the regulatory definitions at 42 CFR 412.160 such that the word ''cited'' would mean after appeal rights have been exhausted and the citation has been upheld as valid. The commenter also requested that appeal rights be guaranteed separate from any appeal rights under the Medicare condition of participation (CoP) and EMTALA. Third, commenter requested that when a hospital is issued multiple immediate jeopardy citations for the same factual findings, that is, the same patient issues, they be counted as one immediate jeopardy citation.

Response: We thank the commenter for its suggestions and we will take them into consideration if we decide to make additional changes to the immediate jeopardy policies in the future.

After consideration of the public comments we received, we are finalizing our proposal to amend our regulations at 42 CFR 412.160 to change the definition of the term ''Cited for deficiencies that pose immediate jeopardy'' to increase the number of surveys where a hospital must be cited for immediate jeopardy before being excluded from the Hospital VBP Program pursuant to section 1886(o)(1)(C) of the Act from 2 to 3.

c. EMTALA-Related Immediate Jeopardy Citations

Hospitals are often alerted to immediate jeopardy situations when a surveyor or team of surveyors is in the process of conducting a survey of compliance with the Medicare CoP at the hospital and identifies those situations that immediately jeopardize the health and safety of patients (77 FR 53610). Following the survey, the Form CMS–2567, Statement of Deficiencies and Plan of Correction, is sent to the hospital, which contains the survey findings, including any immediate jeopardy situations. For EMTALA-related immediate jeopardy situations, however, the CMS Regional Office determines whether there was an EMTALA violation after reviewing the State Survey Agency's report and an expert physician review's findings, and, if so, whether it constituted an immediate jeopardy (77 FR 53610). The CMS Regional Office then sends the Form CMS–2567 to the hospital. Currently, the Automated Survey Processing Environment (ASPEN) system, an electronic system that supports our survey and certification activity, catalogs deficient practices (that is, noncompliance) identified during a survey and generates the Form CMS–2567 that is sent to the hospital after the survey. The survey end date generated in ASPEN is currently used as the date for assignment of the immediate jeopardy citation to a particular performance period (77 FR 53613). The additional processes for EMTALA-related immediate jeopardy citations can result in significant notification delays to hospitals (often several months or longer).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25112), in the case of EMTALA-related immediate jeopardy citations only, we proposed to change our policy regarding the date of the immediate jeopardy citation for possible exclusion from the Hospital VBP Program from the survey end date generated in ASPEN to the date of CMS' final issuance of Form CMS–2567 to the hospital. Form CMS–2567 is not considered final until it is transmitted to the healthcare facility, either by the State Survey Agency, or, in all EMTALA cases and certain other cases, by the CMS Regional Office. The date of final issuance is also tracked in ASPEN. The date the Form CMS–2567 is sent by the CMS Regional Office to the hospital (via mail, electronically, or both) is the date of final issuance recorded in ASPEN. We believe this change would accurately reflect the date hospitals receive official notification of an immediate jeopardy citation based on the issuance date of Form CMS–2567 as this date will be weeks, if not months, after the survey end date. Hospitals may continue to receive preliminary notice during the onsite EMTALA investigation survey that they may receive an immediate jeopardy citation based on survey findings. However, because the decision-making responsibility in EMTALA investigations always rests with the CMS Regional Office, the final determination and notification of immediate jeopardy citations will always be delayed. The Form CMS–2567 constitutes the official notice to a healthcare facility of the survey findings.

Finally, in instances where one onsite hospital survey resulted in both hospital CoP immediate jeopardy citation(s) as well as EMTALA immediate jeopardy citation(s), the survey end date would be the default date for potential exclusion from the Hospital VBP Program. We recognize the hospital will receive notification of the EMTALA immediate jeopardy citation(s) at a later date than the CoP immediate jeopardy citation(s). However, because the hospital was notified of the CoP immediate jeopardy citation(s) at the time of survey, this date will be used for the performance period for potential exclusion from the Hospital VBP Program. Even though there may be separate enforcement actions resulting from the same survey, we will consider each Form CMS–2567 with immediate jeopardy findings to be one citation for purposes of the Hospital VBP Program (77 FR 53613).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25112), we proposed to revise our regulations at 42 CFR 412.160 to reflect the above proposal and specify use of the date of CMS' final issuance of Form CMS–2567 to the hospital for EMTALA immediate jeopardy citation(s). We also proposed to specify that in instances where one onsite hospital survey resulted in both hospital CoP immediate jeopardy citation(s) as well as EMTALA immediate jeopardy citation(s), the survey end date would be the default date for potential exclusion from the Hospital VBP Program.

We invited public comments on this proposal.

We did not receive any public comments on this proposal. Therefore, we are finalizing our proposal to amend our regulations at 42 CFR 412.160 to change our policy regarding the date of the immediate jeopardy citation for possible exclusion from the Hospital VBP Program from the survey end date generated in ASPEN to the date of CMS' final issuance of Form CMS–2567 to the hospital. We are also finalizing our proposal to use the survey end date as the default date for potential exclusion from the Hospital VBP Program when one onsite hospital survey results in both hospital CoP immediate jeopardy citation(s) as well as EMTALA immediately jeopardy citations(s).

8. Performance Standards for the Hospital VBP Program

a. Background

Section 1886(o)(3)(A) of the Act requires the Secretary to establish performance standards for the measures selected under the Hospital VBP Program for a performance period for the applicable fiscal year. The performance standards must include levels of achievement and improvement, as required by section 1886(o)(3)(B) of the Act, and must be established no later than 60 days before the beginning of the performance period for the fiscal year involved, as required by section 1886(o)(3)(C) of the Act. We refer readers to the Hospital Inpatient VBP Program final rule (76 FR 26511 through 26513) for further discussion of achievement and improvement standards under the Hospital VBP Program.

In addition, when establishing the performance standards, section 1886(o)(3)(D) of the Act requires the Secretary to consider appropriate factors, such as: (1) Practical experience with the measures, including whether a significant proportion of hospitals failed to meet the performance standard during previous performance periods; (2) historical performance standards; (3) improvement rates; and (4) the opportunity for continued improvement.

We refer readers to the FY 2013, FY 2014, and FY 2015 IPPS/LTCH PPS final rules (77 FR 53604 through 53605; 78 FR 50694 through 50698; and 79 FR 50077 through 50079) for a more detailed discussion of the general scoring methodology used in the Hospital VBP Program.

We note that the performance standards for the following measures are calculated with lower values representing better performance:

- The NHSN measures (the CLABSI, CAUTI, CDI, Colon and Abdominal Hysterectomy SSI, and MRSA Bacteremia measures);
- The PSI 90 measure;
- The THA/TKA measure;
- The PC–01 measure;
- The MSPB measure; and
- The HF and AMI Payment measures.

This distinction is made in contrast to other measures for which higher values indicate better performance. As discussed further in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50684), the performance standards for the Colon and Abdominal Hysterectomy SSI measure are computed separately for each procedure stratum, and we first award achievement and improvement points to each stratum separately, then compute a weighted average of the points awarded to each stratum by predicted infections.

The numerical values for the performance standards displayed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25113 through 25116) represented estimates based on the most recently available data, and we have updated the numerical values in this final rule to reflect new data in the charts below.

Comment: A few commenters did not support the PC–01 benchmark of 0 because The Joint Commission states that 2 to 4 percent is an expected rate for early elective delivery and commenters believed that some hospitals (such as academic medical centers and obstetric hospitals) experience a higher number of uncommon or rare conditions justifying the need for early-term elective delivery and are, therefore, unable to meet the current benchmark.

Response: As stated in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49549), in response to similar comments, we disagree with the assertion that the benchmark of 0 percent is unrealistic because not all justifications for an elective delivery are included in the ICD–10–CM Justification Table. As we previously noted, the benchmark is intended to represent a level of excellent performance to which hospitals generally should aspire. While no measure can account for every possible situation, the measure specifications (available at: *https://manual.jointcommission.org/releases/TJC2015B2/MIF0166.html*) provide a large number of ICD–10–CM Principal Diagnosis Code or Other Diagnosis Codes for conditions possibly justifying elective delivery prior to 39 weeks gestation. Furthermore, the 0 percent benchmark for PC–01 was calculated from the mean of the top 10 percent for all hospitals during the baseline period; therefore, attaining this benchmark is not unrealistic. We continue to believe that hospitals should aspire to prevent elective deliveries from being performed before the gestational age of 39 weeks without a medical indication.

b. Previously Adopted and Newly Finalized Performance Standards for the FY 2019 Program Year

In accordance with our finalized methodology for calculating performance standards (discussed more fully in the Hospital Inpatient VBP Program final rule (76 FR 26511 through 26513)), in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25113), we proposed to adopt the following additional performance standards for the FY 2019 program year. We noted that the numerical values for the performance standards displayed in the proposed rule represented estimates based on the most recently available data, and that we intended to update the numerical values in this final rule. We noted further that the MSPB measure's performance standards are based on performance period data; therefore, we are unable to provide numerical equivalents for the standards at this time. The table below has been updated from the FY 2017 IPPS/LTCH PPS proposed rule and represents the most recently available data.

PREVIOUSLY ADOPTED AND NEWLY FINALIZED PERFORMANCE STANDARDS FOR THE FY 2019 PROGRAM YEAR: SAFETY, CLINICAL CARE, AND EFFICIENCY AND COST REDUCTION MEASURES

Measure ID	Description	Achievement threshold	Benchmark
Safety Measures			
CAUTI *	National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.	0.464	0.000
CLABSI *	National Healthcare Safety Network (NHSN) Central line-associated Bloodstream Infection (CLABSI) Outcome Measure.	0.427	0.000
CDI *	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium Difficile* Infection (CDI) Outcome Measure.	0.816	0.012
MRSA Bacteremia *	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure.	0.823	0.000
Colon and Abdominal Hysterectomy SSI **.	American College of Surgeons—Centers for Disease Control and Prevention (ACS–CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	• 0.832 • 0.698	• 0.000 • 0.000
PC–01 *	Elective Delivery	0.010038	0.000000
PSI 90 *±	Patient Safety for Selected Indicators (Composite)	0.840335	0.589462
Clinical Care Measures			
MORT–30–AMI ±	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0.850671	0.873263
MORT–30–HF ±	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Heart Failure (HF) Hospitalization.	0.883472	0.908094
MORT–30–PN ±	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia Hospitalization.	0.882334	0.907906
THA/TKA *±	Hospital-Level Risk-Standardized Complication Rate (RSMR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	0.032229	0.023178
Efficiency and Cost Reduction Measure			
MSPB *	Payment-Standardized Medicare Spending Per Beneficiary (MSPB)	Median Medicare Spending Per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending Per Beneficiary ratios across all hospitals during the performance period.

* Lower values represent better performance.
± Previously adopted performance standards.

In the past, we have used the ''normalization'' approach to scoring the Patient- and Caregiver-Centered Experience of Care/Care Coordination domain (which we are renaming the Person and Community Engagement domain beginning with the FY 2019 program year, as discussed in section IV.H.3.b. of the preamble of this final rule). The 9 dimensions of the HCAHPS measure, one of which is the CTM–3 measure, are calculated to generate the HCAHPS Base Score. For each of the 9 dimensions, Achievement Points (0–10 points) and Improvement Points (0–9 points) are calculated, the larger of which is summed across the 9 dimensions to create a prenormalized HCAHPS Base Score (0–90 points). The prenormalized HCAHPS Base Score is then multiplied by 8/9 (0.88888) and rounded according to standard rules (values of 0.5 and higher are rounded up, values below 0.5 are rounded down) to create the normalized HCAHPS Base Score. Each of the 9 dimensions is of equal weight, so that the normalized HCAHPS Base Score would range from 0 to 80 points. HCAHPS Consistency Points are then calculated and range from 0 to 20 points. The Consistency Points consider scores across all 9 of the Person and Community Engagement dimensions. The final element of the scoring formula is the sum of the HCAHPS Base Score and the HCAHPS Consistency Points and ranges from 0 to 100 points. The table below has been updated from the FY 2017 IPPS/LTCH PPS proposed rule and represents the most recently available data.

PERFORMANCE STANDARDS FOR THE FY 2019 PROGRAM YEAR
PERSON AND COMMUNITY ENGAGEMENT DOMAIN *

HCAHPS survey dimension	Floor (percent)	Achievement threshold (percent)	Benchmark (percent)
Communication with Nurses	28.10	78.69	86.97

PERFORMANCE STANDARDS FOR THE FY 2019 PROGRAM YEAR—Continued
PERSON AND COMMUNITY ENGAGEMENT DOMAIN *

HCAHPS survey dimension	Floor (percent)	Achievement threshold (percent)	Benchmark (percent)
Communication with Doctors	33.46	80.32	88.62
Responsiveness of Hospital Staff	32.72	65.16	80.15
Pain Management **	22.31	70.01	78.53
Communication about Medicines	11.38	63.26	73.53
Hospital Cleanliness & Quietness	22.85	65.58	79.06
Discharge Information	61.96	87.05	91.87
3-Item Care Transition	11.30	51.42	62.77
Overall Rating of Hospital	28.39	70.85	84.83

* We are finalizing the re-naming of this domain from Patient- and Caregiver-Centered Experience of Care/Care Coordination domain to Person and Community Engagement domain beginning with the FY 2019 program year, as discussed in section IV.H.3.b. of the preamble of this final rule.

** For more information on the Pain Management dimension, please refer to the Hospital VBP Program proposal in the CY 2017 OPPS/ASC PPS proposed rule (81 FR 45755 through 45757).

We invited public comments on the proposed HCAHPS performance standards.

Comment: One commenter recommended reweighting the Communication about Medicines dimension of the proposed performance standards within the HCAHPS Survey because this commenter believed that medication mix-ups with opioid drugs are a leading cause of readmissions of senior citizens after a hospital stay.

Response: We disagree with the commenter that we should reevaluate the weighting of the Communication about Medicines dimension within the HCAHPS Survey because we do not believe there is a link between the three questions on the HCAHPS Survey that comprise the Communication about Medicines dimension and the rate of senior citizens' readmission to hospitals. The three questions include: ''During this hospital stay, were you given any medicine that you had not taken before?;'' ''Before giving you any new medicine, how often did hospital staff tell you what the medicine was for?;'' and ''Before giving you any new medicine, how often did hospital staff describe possible side effects in a way you could understand?'' We believe that asking questions on communications about medicines will encourage hospitals to ensure their staff are properly communicating medication information to patients. Patients' understanding of their medication is critical to reducing medication errors and improving quality and safety.

Comment: One commenter expressed concern about the HCAHPS Survey's ability to form a valid assessment of patient experience, based in part on its low response rate.

Response: Hospitals must report a minimum number of 100 completed HCAHPS surveys for a hospital to receive a Patient and Community Engagement domain score (see section IV.H.9.b. of the preamble of this final rule). We continue to believe that this requirement appropriately balances our desire to enable as many hospitals as possible to participate in the Hospital VBP Program and the need for the TPSs to be sufficiently reliable to provide meaningful distinction between hospitals' performance on quality measures.

Comment: Several commenters recommended disassociating the Pain Management dimension questions from the HCAHPS Survey because commenters believe it is linked to the over-prescription of pain medication in the United States. One commenter suggested modifying the question based on the Emergency Department Patient Experience of Care (ED PEC) survey tool (currently being developed) which allows for different levels of pain and discomfort.

Response: With regard to comments related to the Pain Management dimension in the Hospital VBP Program, we refer readers to the Hospital VBP Program proposal in the CY 2017 OPPS/ASC PPS proposed rule (81 FR 45755 through 45757) and request that they resubmit their comments to that proposed rule before the comment period closes on September 6, 2016. For more details on that proposal and on how to submit comments for CMS' consideration, we refer readers to that proposed rule (81 FR 45755 through 45757).

c. Previously Adopted Performance Standards for Certain Measures for the FY 2020 Program Year

As discussed above, we have adopted certain Safety and Clinical Care domain measures for future program years in order to ensure that we can adopt baseline and performance periods of sufficient length for performance scoring purposes. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50062 through 50065), we adopted the PSI 90 measure in the Safety domain and the THA/TKA measure in the Clinical Care domain for the FY 2019 program year and subsequent years. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50077), we adopted performance standards for the MORT–30–AMI, MORT–30–HF, MORT–30–PN, and THA/TKA for the FY 2020 program year. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49566), we also adopted performance standards for the PSI 90 measure.

PREVIOUSLY ADOPTED PERFORMANCE STANDARDS FOR CERTAIN CLINICAL CARE DOMAIN AND SAFETY DOMAIN MEASURES FOR THE FY 2020 PROGRAM YEAR

Measure ID	Description	Achievement threshold	Benchmark
Safety Domain			
PSI 90 *	Patient Safety for Selected Indicators (Composite)	0.778761	0.545903

PREVIOUSLY ADOPTED PERFORMANCE STANDARDS FOR CERTAIN CLINICAL CARE DOMAIN AND SAFETY DOMAIN MEASURES FOR THE FY 2020 PROGRAM YEAR—Continued

Measure ID	Description	Achievement threshold	Benchmark
Clinical Care Domain			
MORT–30–AMI	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0.853715	0.875869
MORT–30–HF	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Heart Failure (HF) Hospitalization.	0.881090	0.906068
MORT–30–PN	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia Hospitalization.	0.882266	0.909532
THA/TKA *	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	0.032229	0.023178

* Lower values represent better performance.

d. Previously Adopted and Newly Finalized Performance Standards for Certain Measures for the FY 2021 Program Year

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49567), we adopted performance standards for the FY 2021 program year for the Clinical Care domain measures (THA/TKA, MORT–30–HF, MORT–30–AMI, MORT–30–PN, and MORT–30–COPD). In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25103 through 25105), we proposed to add 2 measures, AMI Payment and HF Payment, beginning with the FY 2021 program year, which we are adopting as discussed in section IV.H.4.a. of the preamble of this final rule. The table below has been updated from the FY 2017 IPPS/LTCH PPS proposed rule and represents the most recently available data. The previously adopted and newly finalized performance standards for these measures are set out below.

PREVIOUSLY ADOPTED AND NEWLY FINALIZED PERFORMANCE STANDARDS FOR THE FY 2021 PROGRAM YEAR

Measure ID	Description	Achievement threshold	Benchmark
Clinical Care Measures			
MORT–30–AMI ±	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0.860355	0.879714.
MORT–30–HF ±	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Heart Failure (HF) Hospitalization.	0.883803	0.906144.
MORT–30–PN ±	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia Hospitalization.	0.886443	0.910670.
MORT–30–COPD ±	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	0.923253	0.938664.
THA/TKA *±†	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	0.031157	0.022418.
Efficiency and Cost Reduction Measures			
AMI Payment *#	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI).	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.
HF Payment *#	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Heart Failure (HF).	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.

± Previously adopted performance standards.
* Lower values represent better performance.

† After publication of the FY 2016 IPPS/LTCH PPS final rule, we determined there was a display error in the performance standards for this measure. We have since undertaken a technical update for these performance standards in order to ensure that hospitals have the correct performance standards for the applicable performance period. The corrected performance standards are displayed here.
# Finalized to be scored the same as the MSPB measure, as discussed in section IV.H.4.a.(3) of the preamble of this final rule.

We did not receive any public comments on the proposed performance standards for the FY 2021 program year. Therefore, we are adopting the performance standards listed above.

e. Performance Standards for Certain Measures for the FY 2022 Program Year

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25116), we proposed the following performance standards for the FY 2022 program year for the Clinical Care domain measures (THA/TKA, MORT–30–AMI, MORT–30–HF, MORT–30–PN, MORT–30–COPD), and the proposed MORT–30–CABG, which we are adopting as discussed in section IV.H.5. of the preamble of this final rule. The table below has been updated from the FY 2017 IPPS/LTCH PPS proposed rule and represents the most recently available data.

NEWLY FINALIZED PERFORMANCE STANDARDS FOR THE FY 2022 PROGRAM YEAR

Measure ID	Description	Achievement threshold	Benchmark
Clinical Care Measures			
MORT–30–AMI	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following (RSMR) Acute Myocardial Infarction (AMI) Hospitalization.	0.861793	0. 881305.
MORT–30–HF	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Heart Failure (HF) Hospitalization.	0.879869	0.903608.
MORT–30–PN (updated cohort).	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia Hospitalization.	0.836122	0.870506.
MORT–30–COPD	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	0.920058	0.936962.
THA/TKA *	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	0.029833	0.021493.
MORT–30–CABG	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery.	0.979000	0.968210.
Efficiency and Cost Reduction Measures			
AMI Payment *#	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI).	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.
HF Payment *#	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Heart Failure (HF).	Median Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.	Mean of the lowest decile Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care across all hospitals during the performance period.

* Lower values represent better performance.
# Finalized to be scored the same as the MSPB measure, as discussed in section IV.H.4.a.(3) of the preamble of this final rule.

We did not receive any public comments on the proposed FY 2022 performance standards. Therefore, we are finalizing our proposal to adopt the performance standards listed above.

9. FY 2019 Program Year Scoring Methodology

a. Domain Weighting for the FY 2019 Program Year for Hospitals That Receive a Score on All Domains

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49568 through 49570), we adopted equal weight of 25 percent for each of the 4 domains in the FY 2018 program year for hospitals that receive a score in all domains. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25117), for the FY 2019 program year, we noted that we did not propose to remove any measures nor did we propose to adopt any new measures. We

also did not propose any changes to the domain weighting for hospitals receiving a score on all domains.

DOMAIN WEIGHTS FOR THE FY 2019 PROGRAM YEAR FOR HOSPITALS RECEIVING A SCORE ON ALL DOMAINS

Domain	Weight (percent)
Safety	25
Clinical Care	25
Efficiency and Cost Reduction	25
Person and Community Engagement*	25

*We are finalizing the re-naming of this domain from Patient- and Caregiver-Centered Experience of Care/Care Coordination domain to Person and Community Engagement domain beginning with the FY 2019 program year, as discussed in section IV.H.3.b. of the preamble of this final rule.

Comment: One commenter supported CMS' weighting of the Efficiency and Cost Reduction domain in the scoring methodology.

Response: We thank the commenter for its support.

Comment: A few commenters did not support the proposed weighting of the Person and Community Engagement domain for the FY 2018 program year because evidence has shown significant variation in scores due to differences in acuity level and region of the country and because one study found that patient satisfaction was independent of hospital compliance with quality of care processes and safety culture. The commenters recommended that CMS conduct a patient-level study to better understand the relationship between HCAHPS scores and outcomes, looking at factors like patient severity, SDS factors, and region.

Response: We disagree that the Person and Community Engagement domain is weighted too heavily in hospitals' TPSs because we believe this domain measures important elements of the patient's experience of inpatient care. We have adjusted HCAHPS scores for certain patient-level factors that are beyond the hospital's control but which affect survey responses. These factors include patient severity, as indicated by self-reported overall health, and patient's highest level of education, considered the most accurate single measure of socioeconomic status for older adults. Meterko, Wright et al. found that clinical measures of severity mattered little in adjusting patient experience scores that already accounted for standard HCAHPS adjustors.[56] Because valid adjustors must vary within hospitals, it is not possible to adjust for region without removing true regional variation in quality.[57] More information about HCAHPS patient-mix adjustment can be found on the official HCAHPS Web site at: *http://www.hcahpsonline.org/modeadjustment.aspx*. HCAHPS scores are not adjusted for hospital-level factors. While we have conducted and published research on the relationship between HCAHPS scores and hospital-level factors, patient outcomes cannot be directly assessed because the HCAHPS surveys submitted to CMS are not patient-identifiable.

Comment: One commenter recommended that, in the future, CMS increase the weight of the Efficiency and Cost Reduction domain to equal that of the Clinical Care and Safety domains because the commenter believed doing so would balance the Hospital VBP Program's focus on cost and quality equally.

Response: We appreciate the commenter's suggestion and will take that into consideration in future rulemaking. For the FY 2019 program year, we believe that the Efficiency and Cost Reduction domain at 25 percent of hospitals' TPSs appropriately weights cost and quality in the Hospital VBP Program.

Comment: One commenter did not support the 25 percent weight for the Efficiency and Cost Reduction domain because it overlaps with the HAC Reduction Program's penalties. The commenter expressed concern that the high weighting of the domain may encourage hospitals to avoid taking high-risk patients or to sacrifice quality of care following discharge by placing patients in a lower cost postacute care setting.

Response: We disagree with the commenter that the weighting of the Efficiency and Cost Reduction domain is too high. We believe the HAC Reduction Program and the Hospital VBP Program are both important quality programs but have different objectives. We do not have reason to believe that the weighting of the domain has caused hospitals to avoid high-risk patients or sacrifice quality of care in order to improve their score on the MSPB measure.

Comment: A few commenters recommended that CMS reallocate domain weights to emphasize the importance of measures of patient outcomes, which is where hospitals have the greatest ability to control and effectuate change. The commenters specifically recommended reducing the weight of the Efficiency and Cost Reduction domain because the current 25 percent weighting assigns a high amount of weight to a single measure, MSPB, which does not directly address patient outcomes. One commenter noted that the Efficiency and Cost Reduction domain can sometimes be driven more by the physician's orders and the Person and Community Engagement domain can fluctuate based on trivial matters not related to healthcare delivery.

Response: While we agree that the Hospital VBP Program should encourage providers to improve patient outcomes, we believe that equally weighting the 4 domains is appropriate for the FY 2019 program year based on the distribution of the measures we are finalizing in this final rule. We believe the Efficiency and Cost Reduction domain is appropriately weighted, despite not directly addressing patient outcomes, because it encourages hospitals to assess cost in conjunction with quality of care. We note that we are adopting the AMI and HF Payment measures, as discussed in section IV.H.4. of the preamble of this final rule, so that beginning with the FY 2021 program year, MSPB will no longer be the only measure in the Efficiency and Cost Reduction domain. We believe expanding the number of measures in this domain will further improve the link between payment and patient health outcomes as the program moves towards value scoring. We also believe that hospitals can effect change through the measures in each of the four domains in the Hospital VBP Program.

b. Domain Weighting for the FY 2019 Program Year and Future Years for Hospitals Receiving Scores on Fewer Than Four Domains

For the FY 2017 program year and subsequent years, we adopted a policy that hospitals must receive domain scores on at least 3 of 4 quality domains in order to receive a TPS, and hospitals with sufficient data on only 3 domains will have their TPSs proportionately reweighted (79 FR 50084 through 50085). We did not propose any changes in the FY 2017 IPPS/LTCH PPS proposed rule.

Under these policies, in order to receive a TPS for the FY 2019 program year and future years:

[56] ''Mortality among Patients with Acute Myocardial Infarction: The Influences of Patient-Centered Care and Evidence-Based Medicine.'' M. Meterko, S. Wright, H. Lin, E. Lowy, and P.D. Cleary. Health Services Research, 45 (5): 1188–1204. 2010.

[57] The Effects of Survey Mode, Patient Mix, and Nonresponse on CAHPS Hospital Survey Scores.'' M.N. Elliott, A.M. Zaslavsky, E. Goldstein, W. Lehrman, K. Hambarsoomian, M.K. Beckett and L. Giordano. Health Services Research, 44 (2): 501–518. 2009.

• Hospitals must report a minimum number of 100 completed HCAHPS surveys for a hospital to receive a Patient- and Caregiver-Centered Experience of Care/Care Coordination domain score (which, in section IV.H.3.b. of the preamble of this final rule, we are renaming to the Person and Community Engagement domain beginning with the FY 2019 program year).

• Hospitals must meet the requirements to receive a MSPB measure score in order to receive an Efficiency and Cost Reduction domain score. Hospitals must report a minimum number of 25 cases for the MSPB measure (77 FR 53609 through 53610) and the AMI Payment and HF Payment measures.

• Hospitals must receive a minimum of 2 measure scores within the Clinical Care domain. Hospitals must report a minimum number of 25 cases for each of the mortality measures (77 FR 53609 through 53610) and the THA/TKA measure.

• Hospitals must receive a minimum of 3 measure scores within the Safety domain.

++ Hospitals must report a minimum of 3 cases for any underlying indicator for the PSI 90 measure based on AHRQ's measure methodology (77 FR 53608 through 53609).

++ Hospitals must report a minimum of 1 predicted infection for NHSN-based surveillance measures based on CDC's minimum case criteria (77 FR 53608 through 53609).

++ Hospitals must report a minimum of 10 cases for the PC–01 measure (76 FR 26530).

We did not propose any changes to the minimum numbers of domain scores, cases, and measures outlined above. We continue to believe that these requirements appropriately balance our desire to enable as many hospitals as possible to participate in the Hospital VBP Program and the need for TPSs to be sufficiently reliable to provide meaningful distinctions between hospitals' performance on quality measures.

I. Changes to the Hospital-Acquired Condition (HAC) Reduction Program

1. Background

We refer readers to section V.I.1.a. of the FY 2014 IPPS/LTCH PPS final rule (78 FR 50707 through 50708) for a general overview of the HAC Reduction Program. For a detailed discussion of the statutory basis of the HAC Reduction Program we refer readers to section V.I.2. of the FY 2014 IPPS/LTCH PPS final rule (78 FR 50708 through 50709). For a further description of our policies for the HAC Reduction Program, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50707 through 50729), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50087 through 50104) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49570 through 49581). These policies describe the general framework for implementation of the HAC Reduction Program, including: (a) The relevant definitions applicable to the program; (b) the payment adjustment under the program; (c) the measure selection and conditions for the program, including a risk-adjustment and scoring methodology; (d) performance scoring; (e) the process for making hospital-specific performance information available to the public, including the opportunity for a hospital to review the information and submit corrections; and (f) limitation of administrative and judicial review.

We also have codified certain requirements of the HAC Reduction Program at 42 CFR 412.170 through 412.172.

2. Implementation of the HAC Reduction Program for FY 2017

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717), we finalized the following measures for use in the FY 2017 program: PSI 90 measure for Domain 1 and the CDC NHSN measures CLABSI, CAUTI, Colon and Abdominal Hysterectomy SSI, MRSA Bacteremia, and CDI for Domain 2. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25117 through 25118), we did not propose any changes to this measure set for FY 2017. We also did not propose to make any changes to the measures that were finalized for use in the FY 2016 program (CAUTI, CLABSI, and Colon and Abdominal Hysterectomy SSI) or the FY 2017 program (MRSA Bacteremia and CDI).

HAC Reduction Program Measures for FY 2017

Short name	Measure name	NQF No.
Domain 1		
PSI 90	Patient Safety for Selected Indicators (Composite Measure)	0531
Domain 2		
CAUTI	National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.	0138
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure.	1717
CLABSI	National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure.	0139
Colon and Abdominal Hysterectomy SSI.	American College of Surgeons—Centers for Disease Control and Prevention (ACS–CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	0753
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure.	1716

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717), we finalized and codified at 42 CFR 412.170 a 2-year period during which we collect data used to calculate the Total HAC Score. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49574), we finalized the 2-year time periods for the calculation of HAC Reduction Program measure results for FY 2017. For the Domain 1 measure (PSI 90 measure), we will use the data collected during the 24-month period from July 1, 2013 through June 30, 2015. Claims for all Medicare FFS beneficiaries discharged during this period would be included in the calculations of measure results for FY 2017. For the CDC NHSN measures previously finalized for use in the FY 2017 HAC Reduction Program (CLABSI, CAUTI, Colon and Abdominal Hysterectomy SSI, MRSA Bacteremia, and CDI), we are using data collected during CYs 2014 and 2015.

We anticipate we will be able to provide hospitals with their confidential hospital-specific reports and discharge level information used in the calculation of their FY 2017 Total HAC Score in late summer 2016 via the QualityNet Secure Portal.[58] In order to access their hospital-specific reports, hospitals must register for a QualityNet Secure Portal account. We did not make any changes to the review and correction policies for FY 2016. Hospitals have a period of 30 days after the information is posted to the QualityNet Secure Portal to review and submit corrections for the calculation of their HAC Reduction Program measure scores, domain scores, and Total HAC Score for the fiscal year.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25118 through 25119), for FY 2017, we proposed updates to the following HAC Reduction Program policies: (1) A proposal to clarify data requirements for Domain 1; and (2) a proposal for NHSN CDC HAI data submission requirements for newly opened hospitals. Each policy is described in more detail below.

We note that we received public comments on the design of the HAC Reduction Program, requests to modify the payment adjustment computation, and for CMS to work with Congress to amend the law to create a phased-in or sliding-scale penalty. While we appreciate the commenters' feedback, we consider these topics to be out of the scope of the proposed rule. Therefore, we are not addressing most of them in this final rule. All other topics out of scope of the proposed rule will be taken into consideration when developing policies and program requirements for future years.

a. Clarification of Complete Data Requirements for Domain 1

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50722) we finalized our plan to use the PSI 90 measure for Domain 1. Because hospitals may not have complete data for every AHRQ indicator in the PSI 90 measure, we decided to use the same methodology used for the Hospital VBP Program to determine the minimum number of indicators with complete data to be included in the calculation of the Domain 1 measure. In addition, we finalized the following rules to determine the number of AHRQ indicators to be included in the calculation for a hospital's Domain 1 score. For Domain 1, we defined ''complete data'' as whether a hospital has enough eligible discharges to calculate a rate for a measure. In order to have complete data for the PSI 90 measure, a hospital must have three or more eligible discharges for at least one component indicator.

In establishing the performance period for the PSI 90 measure, we relied upon an analysis by Mathematica Policy Research, a CMS contractor, which found the measure was most reliable with a 24-month performance period. This analysis also indicated the measure was unreliable with a performance period of less than 12 months.[59] We have since determined that the current definition for ''complete data'' may result in facilities with less than 12 months of data being eligible to receive a score on the PSI 90 measure, and that the resulting score may not be reflective of the hospital's clinical performance. While the PSI 90 measure continues to play a vital role in patient safety and is an integral part of the HAC Reduction Program, we believe that reliable data is a critical component of accurately assessing hospital performance.

To address this concern, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25118 through 25119), we proposed to clarify the term ''complete data'' for the PSI 90 measure within Domain 1 to require that hospitals have three or more eligible discharges for at least one component indicator and 12 months or more of data to receive a Domain 1 score. Under this proposal, hospitals with less than 12 months of PSI 90 data would not receive a Domain 1 score, regardless of the number of eligible discharges at the hospital. If a hospital has 12 months or more of PSI 90 data, the hospital would need to have three or more eligible discharges for at least one component indicator to receive a Domain 1 score. We believe this is the most favorable method for scoring measure results for hospitals.

We believe, after weighing the considerations, that this additional policy should be incorporated into the HAC Reduction Program for FY 2017 and subsequent years, primarily because this approach greatly improves the measure's assessment of quality and, therefore, its implementation should not be unnecessarily delayed. This clarification would be a change to the Domain 1 criteria and would not change our current scoring policy for Domain 2. As previously finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50722 through 50723), if a hospital does not have enough data to calculate the PSI 90 measure score for Domain 1 but has ''complete data'' for at least one measure in Domain 2, its Total HAC Score will depend entirely on its Domain 2 score. Similarly, if a hospital has ''complete data'' to calculate the PSI 90 measure score in Domain 1 but none of the measures in Domain 2, its Total HAC Score will be based entirely on its Domain 1 score. If a hospital does not have ''complete data'' to calculate the PSI 90 measure score for Domain 1 or any of the measures in Domain 2, we will not calculate a Total HAC Score for this hospital. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50722 through 50723) for a detailed discussion of Domain 2 scoring.

We invited public comments on our proposal to require that hospitals have three or more eligible discharges for at least one component indicator and 12 months or more of data to receive a Domain 1 score beginning in the FY 2017 HAC Reduction Program.

Comment: Many commenters supported the proposal to clarify the term ''complete data'' and agreed that using less than 12 months of measure data may not provide a statistically valid reflection of hospital performance. Commenters commended CMS' efforts to ensure data reliability as a critical component of accurately assessing performance. One commenter recommended that complete data should require at least 24 months of data. Commenters noted that in the proposed rule, CMS stated that the PSI 90 measure was most reliable with a 24-month performance period.

Response: We understand that reliable data is a critical component of accurately assessing hospital performance and thank commenters for their support. We note that the analysis performed by Mathematica showed that PSI composite achieves moderate reliability at a majority of hospitals for reporting periods of 6 months or longer. We further note that the proposed data requirements establish a minimum data requirement of at least 12 months.[60] We believe the proposed requirements balance the needs of the program and allows the composite measure to continue to play a vital role in ensuring patient safety and provide alignment across our value-based and quality reporting programs.

After consideration of the public comments we received, we are finalizing the definition of complete data discussed above as proposed.

b. Clarification of NHSN CDC HAI Data Submission Requirements for Newly Opened Hospitals

We have encountered issues with some newly opened hospitals that do not appear to understand that they must submit CDC NHSN HAI data for the HAC Reduction Program, even when they may not be required to report under the Hospital IQR Program. As set forth in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50098), a hospital that does not have an ICU waiver *or other waiver* for the CDC NHSN HAI measures and does not submit data will receive the maximum of 10 points for that measure. We noted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50723) that, for Domain 2, we will obtain measure results that hospitals submitted to the CDC NHSN from the Hospital IQR Program.[61] However, we note that participation in the Hospital IQR Program is voluntary, while participation in the HAC Reduction Program is mandatory for almost all IPPS hospitals (we refer readers to section 1886(d)(1)(B) of the Act; 42 CFR 412.170 (definition of the term ''applicable hospital''); and 42 CFR 412.172(e)). The HAC Reduction Program does not apply to hospitals and hospital units that are excluded from the IPPS, such as LTCHs, cancer hospitals, children's hospitals, IRFs, IPFs, CAHs, and Puerto Rico hospitals (79 FR 50087 through 50088).

We believe that it is important to establish data submission requirements for all applicable hospitals under the HAC Reduction Program. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25119), we proposed the following requirements for newly opened hospitals for CDC NHSN HAI data submissions. We note that these requirements do not affect any requirements for facilities in States that are required by law to report HAI data to NHSN.

- If a hospital files a notice of participation (NOP) with the Hospital IQR Program within 6 months of opening, the hospital would be required to begin submitting data for the CDC NHSN HAI measures no later than the first day of the quarter following the NOP.
- If a hospital does not file a NOP with the Hospital IQR Program within 6 months of opening, the hospital would be required to begin submitting data for the CDC NHSN HAI measures on the first day of the quarter following the end of the 6-month period to file the NOP.

For example, if a subsection (d) hospital opened on January 1 and it intended to participate in the Hospital IQR Program, the hospital would be required to file a Hospital IQR Program NOP no later than July 1, and begin submitting data to NHSN no later than October 1. If a subsection (d) hospital opened on January 1 and it did not intend to participate in the Hospital IQR Program (that is, no NOP is filed), it would have to begin submitting data to NHSN no later than July 1 of that year. We believe that these data submission requirements are clear, align with the Hospital IQR Program, and are fair and equitable for all newly opened hospitals. Hospitals that are not required to submit data within the respective HAC Reduction Program year will not receive a score. These hospitals will receive a designation of ''NEW,'' and will not receive any points for CDC NHSN HAI measures.

We further note that this clarification does not affect the narrative rules used in calculation of the Domain 2 Score. We will continue to follow all Domain 2 scoring procedures as previously finalized, and we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49575) for further discussion of the narrative rules used in calculation of the Domain 2 Score. We believe that this proposal should be incorporated into the HAC Reduction Program for FY 2017 and subsequent years.

We invited public comments on our proposal to adopt these policies related to the data submission requirements beginning in the FY 2017 HAC Reduction Program.

Comment: Commenters supported and applauded CMS for establishing a reasonable deadline for beginning the submission of measure data following the opening of a new hospital. Commenters noted that clarifying and establishing a process for new hospitals affords patients who receive care at those facilities the same benefits to transparent quality data that has been available in long established facilities. One commenter recommended that CMS establish a single date under which HAC Reduction Program reporting must begin, regardless of a hospital's decision about participation in the Hospital IQR Program.

Response: We thank commenters for their input and support. We believe these submission requirements support our continued goal of aligning our value-based and quality reporting programs in order to minimize provider burden and incentivize high-quality care. We note that the intention of the submission requirements is to make use of the available data for each hospital and encourage hospitals to report HAI data to CDC NHSN.

After consideration of the public comments we received, we are finalizing the data submission requirements discussed above as proposed.

3. Implementation of the HAC Reduction Program for FY 2018

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25119 through 25123), for FY 2018, we proposed the following HAC Reduction Program policies: (1) Adoption of the modified version of the NQF-endorsed PSI 90: Patient Safety and Adverse Events Composite; (2) defining the applicable time periods for the FY 2018 HAC Reduction Program and the FY 2019 HAC Reduction Program; (3) changes to the scoring methodology; and (4) a request for comments on additional measures for potential future adoption.

a. Adoption of Modified PSI 90: Patient Safety and Adverse Events Composite (NQF #0531)

(1) Background

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25119 through 25121) we proposed to adopt refinements to the Agency for Healthcare Research and Quality (AHRQ) Patient Safety and Adverse Events Composite (NQF #0531) for the HAC Reduction Program beginning with the FY 2018 payment determination and subsequent years. In summary, the PSI 90 measure was refined to reflect the relative importance and harm associated with each component indicator to provide a more reliable and valid signal of patient safety events. We believe the modified PSI 90 will provide strong incentives for hospitals to ensure that patients are not harmed by the medical care they receive, a critical consideration in quality improvement.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50712 through 50717), we adopted the PSI 90 measure (NQF #0531) in the HAC Reduction Program as an important measure of patient safety and adverse events. As previously adopted, PSI 90 consisted of eight component indicators: (1) PSI 03 Pressure Ulcer Rate; (2) PSI 06 Iatrogenic Pneumothorax Rate; (3) PSI 07 Central Venous Catheter-Related Blood Stream Infections Rate; (4) PSI 08 Postoperative Hip Fracture Rate; (5) PSI 12 Perioperative Pulmonary Embolism/Deep Vein Thrombosis Rate; (6) PSI 13 Postoperative Sepsis Rate; (7) PSI 14 Postoperative Wound Dehiscence Rate;

[61] For a further discussion of CDC NHSN HAI Data submission requirements for the Hospital IQR Program, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53536) and 42 CFR 412.140(a)(3)(i) and 412.140(b).

and (8) PSI 15 Accidental Puncture and Laceration Rate.[62]

The currently adopted eight-indicator version of the measure underwent extended NQF maintenance reendorsement in the 2014 NQF Patient Safety Committee due to concerns with the underlying component indicators and their composite weights. In the NQF-Endorsed Measures for Patient Safety, Final Report,[63] the NQF Patient Safety Committee deferred its final decision for the PSI 90 measure until the following measure evaluation cycle. In the meantime, AHRQ worked to address many of the NQF stakeholders' concerns about PSI 90, which subsequently completed NQF maintenance re-review and received reendorsement on December 10, 2015.

The PSI 90 measure's extended NQF reendorsement led to several changes to the measure.[64] First, the name of the PSI 90 measure has changed to ''Patient Safety and Adverse Events Composite'' (NQF #0531) (herein referred to as the ''modified PSI 90''). Second, the modified PSI 90 measure includes three new indicators: (1) PSI 09 Perioperative Hemorrhage or Hematoma Rate; (2) PSI 10 Postoperative Acute Kidney Injury Requiring Dialysis Rate (formerly titled ''Physiologic and Metabolic Derangement Rate''); and (3) PSI 11 Postoperative Respiratory Failure Rate. Third, the measure PSI 12 Perioperative Pulmonary Embolism (PE) or Deep Vein Thrombosis (DVT) Rate and PSI 15 Accidental Puncture or Laceration Rate have been respecified in the modified PSI 90. Fourth, PSI 07 Central Venous Catheter-Related Blood Stream Infection Rate has been removed in the modified PSI 90. Fifth, the weighting of component indicators in the modified PSI 90 is based not only on the volume of each of the patient safety and adverse events, but also the harms associated with the events.

We consider these changes to the modified PSI 90 to be substantive changes to the measure. Therefore, we proposed to adopt the modified PSI 90 for the HAC Reduction Program beginning with the FY 2018 payment determination and subsequent years. We explain the modified PSI 90 more fully below, and also refer readers to the measure description on the NQF Web site at: *https://www.qualityforum.org/QPS/MeasureDetails.aspx?standardID=321&print=0&entityTypeID=3*.

We note that the proposed modified PSI 90 (MUC ID 15–604) was included on a publicly available document entitled ''2015 Measures Under Consideration for December 1, 2015'' [65] in compliance with section 1890A(a)(2) of the Act, and was reviewed by the Measures Application Partnership (MAP). The MAP supported this measure, stating that ''the PSI measures were developed to identify harmful healthcare related events that are potentially preventable. Three additional PSIs have been added to this updated version of the measure. PSIs were better linked to important changes in clinical status with 'harm weights' that are based on diagnoses that were assigned after the complication. This is intended to allow the measure to more accurately reflect the impact of the events.'' [66] The measure received support for inclusion in the HAC Reduction Program as referenced in the MAP Final Recommendations Report.[67]

(2) Overview of the Measure Changes

First, the name of the PSI 90 measure has changed from the ''Patient Safety for Selected Indicators Composite Measure'' to the ''Patient Safety and Adverse Events Composite'' (NQF #0531) to more accurately capture the indicators included in the measure.

Second, the PSI 90 measure has expanded from 8 to 10 component indicators. The modified PSI 90 is a weighted average of the following 10 risk-adjusted and reliability-adjusted individual component PSI rates:

- PSI 03 Pressure Ulcer Rate;
- PSI 06 Iatrogenic Pneumothorax Rate;
- PSI 08 In-Hospital Fall With Hip Fracture Rate; [68]
- PSI 09 Perioperative Hemorrhage or Hematoma Rate; *
- PSI 10 Postoperative Acute Kidney Injury Requiring Dialysis Rate; * [69]
- PSI 11 Postoperative Respiratory Failure Rate; *
- PSI 12 Perioperative Pulmonary Embolism (PE) or Deep Vein Thrombosis (DVT) Rate;
- PSI 13 Postoperative Sepsis Rate;
- PSI 14 Postoperative Wound Dehiscence Rate; and
- PSI 15 Unrecognized Abdominopelvic Accidental Puncture/Laceration Rate.[70] [71]

(* Denotes new component for the modified PSI 90 measure.)

As stated above, the modified PSI 90 measure also removed PSI 07, Central Venous Catheter-Related Blood Stream Infection Rate, because of potential overlap with the CLABSI measure (NQF #0139) which has been included in the Hospital IQR Program since the FY 2011 IPPS/LTCH PPS final rule (75 FR 50201 through 50202), the HAC Reduction Program since the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717), and the Hospital VBP Program since the FY 2013 IPPS/LTCH PPS final rule (77 FR 53597 through 53598).

In response to stakeholder concerns, highlighted in the NQF 2014 Patient Safety Report,[72] the modified PSI 90 also respecified two component indicators, PSI 12 and PSI 15. Specifically, for PSI 12 Perioperative PE or DVT rate, the NQF received public comments concerning the inclusion of: (1) Extracorporeal membrane oxygenation (ECMO) procedures in the denominator; and (2) intra-hospital variability in the documentation of calf vein thromboses (which have uncertain clinical significance). As such, the revised PSI 12 component indicator no longer includes ECMO procedures in the denominator or isolated deep vein thrombosis of the calf veins in the numerator. PSI 15 was also respecified further to focus on the most serious intraoperative injuries—those that were unrecognized until they required a subsequent reparative procedure. The modified denominator of PSI 15 now is limited to discharges with an abdominal/pelvic operation, rather than including all medical and surgical discharges. In addition, to identify events that are more likely to be clinically significant and preventable, the PSI 15 numerator was modified to require both: (1) A diagnosis of an accidental puncture and/or laceration; and (2) an abdominal/pelvic reoperation one or more days after the index surgery.

Finally, the NQF Patient Safety Review Committee raised concerns about the weighting scheme of the component indicators. In prior versions of the measure, the weights of each component PSI were based solely on volume (numerator rates). In the modified PSI 90, the rates of each component PSI are weighted based on statistical and empirical analyses of volume, level of excess clinical harm associated with the PSI, and disutility (the measure of the severity of the adverse events associated with each of the harms, that is, outcome severity, or least preferred states from the patient perspective). The final weight for each component indicator is the product of harm weights and volume weights (numerator weights). Harm weights are calculated by multiplying empirical estimates of excess harms associated with the patient safety event by utility weights linked to each of the harms. Excess harms are estimated using statistical models comparing patients with a safety event to those without a safety event in a Medicare FFS sample. Volume weights are calculated based on the number of safety events for the component indicators in an all-payer reference population.

For more information on the modified PSI 90 measure and component indicators, we refer readers to the Quality Indicator Empirical Methods available online at: *www.qualityindicators.ahrq.gov*.

(3) Risk Adjustment

The risk adjustment and statistical modeling approaches of the models remain unchanged in the modified PSI 90. In summary, the predicted value for each case is computed using a modeling approach that includes, but is not limited to, applying a Generalized Estimating Equation (GEE) hierarchical model (logistic regression with hospital random effect) and covariates for gender, age, Modified MS–DRG (MDRG), Major Diagnostic Category, transfer in, point of origin not available, procedure days not available, and AHRQ Elixhauser Comorbidity Software (COMORB).

The expected rate for each of the indicators is computed as the sum of the predicted value for each case divided by the number of cases for the unit of analysis of interest (that is, hospital). The risk-adjusted rate for each of the indicators is computed using indirect standardization as the observed rate divided by the expected rate, multiplied by the reference population rate. For more details about risk adjustment, we refer readers to: *http://www.qualityindicators.ahrq.gov/Downloads/Resources/Publications/2015/Empirical_Methods_2015.pdf*.

(4) Adoption of the NQF-Endorsed Version of the Modified PSI 90

In summary, the PSI 90 measure was revised to reflect the relative importance and harm associated with each component indicator to provide a more reliable and valid signal of patient safety events. We believe that adopting the modified PSI 90 would continue to provide strong incentives for hospitals to ensure that patients are not harmed by the medical care they receive, which is a critical consideration in quality improvement. We proposed to adopt the modified PSI 90 for the HAC Reduction Program for FY 2018 and subsequent years. We will continue to use the currently adopted eight-indicator version of the PSI 90 measure for the HAC Reduction Program for FY 2017. We invited public comment on our proposal to adopt the modified PSI 90 measure (NQF #0531) for the HAC Reduction Program for FY 2018.

Comment: Many commenters supported adopting the modified measure, noting that the modified PSI 90 measure was recently endorsed by NQF, addresses past measure concerns, and reflects events within the hospital's control. Commenters appreciated that the measure was modified to incorporate harms associated with safety events into the weighting of the component indicators. Commenters also noted that the components currently include significant indicators of patient safety events that hospitals could prevent through incorporation of evidence-based processes including enhanced patient monitoring. Finally, commenters stated that this modified version is an improvement and strongly supported its use as a component for evaluation of safety and payment incentives for the reduction of medical harm.

Response: We thank commenters for their support and continue to believe that the HAC Reduction Program encourages improvement in patient safety over the long-term for all hospitals. HACs are often preventable conditions like central line associated bloodstream infections, catheter associated urinary tract infections, and other complications or conditions that arise after a patient was admitted to the hospital for the treatment of another condition. These conditions cost Medicare and the private sector billions of dollars each year and take a significant toll on patients and families. In most cases, hospitals can prevent HACs when they follow protocols, procedures and evidenced-based guidelines. We base our measure selection decisions for the HAC Reduction Program on measures currently available, risk adjusted, and reflective of hospital performance. Factors such as endorsement by the NQF and support by the NQF-convened MAP, which represents stakeholder groups, are also taken into account in deciding which measures to adopt. All the measures finalized for inclusion in the HAC Reduction Program are NQF-endorsed and were recommended for inclusion in the program by the MAP. We have identified patient safety and the reduction of HACs as a high priority through our CMS and National Quality Strategies.

Comment: One commenter thanked CMS for the proposed removal of PSI 07 from the PSI 90 measure.

Response: We thank the commenter for its support.

Comment: Commenters appreciated that the revised measure re-weights individual component PSIs to better reflect the importance and preventability of particular safety events. However, numerous commenters stated that these updates do not address the serious deficiencies with the measure noted by MedPAC and academic researchers. Commenters also expressed concern that CMS continues to use claims data to determine payment adjustments. Commenters specifically noted that claims-based measures are risk-adjusted based on diagnostic codes and specificity of coding on an administrative claim, not on any clinical data related to a patient. These commenters stated that claims data cannot and do not fully reflect the details of a patient's history, course of care and clinical risk factors. As a result, the commenters stated that the rates derived from the measures are highly inexact. Commenters stated that PSI data may assist hospitals in identifying patients whose particular cases merit deeper investigation, but that they are poorly suited to drawing meaningful conclusions about hospital performance on safety issues. These commenters stated that the measure does not drive quality improvement. Commenters recommended that CMS review this measure to determine the appropriateness of both the current and modified measures in the performance programs moving forward and strongly urged CMS to phase the measure out of the HAC Reduction Program and other programs.

Response: We continue to believe the PSI 90 measure is an important measure of patient safety and these modifications help to broaden and strengthen the measure. We disagree with commenters

that claims-based measures in general and PSIs in particular have not demonstrated that they are accurate, reliable, and valid indicators of quality and safety of care. Regarding the administrative data elements of PSI 90, we note that there are previously conducted studies that validate the relationship between administrative claims data and medical records.[73] These studies demonstrate that administrative claims data can provide sufficient clinical information to assess patient safety. We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50091) for a further discussion of this issue. Further, over the past decade, AHRQ has supported a series of validation studies based on detailed abstraction of medical records.[74] These studies informed AHRQ's PSI development process, including further refinements to indicators, working with others to improve coding practices, and retirement of a few indicators.

We disagree with commenters that the PSIs are not are accurate, reliable, and valid indicators of quality and safety of care. Many of these claims-based indicators have been endorsed by the NQF, which includes a review process that assesses reliability and validity.[75] We note that NQF endorsed the modified PSI 90, including the risk-adjustment methodology of the component indicators, as reliable and valid (NQF #0531).[76] Further, we believe the modified PSI 90 does provide actionable information and specific direction for prevention of patient safety events, because hospitals can track and monitor individual PSI rates and develop targeted improvements to improve patient safety. For further guidance on PSI monitoring and strategies for applying quality improvements to PSI data, we refer readers to the Toolkit for Using the AHRQ quality indicators available at: *http://www.ahrq.gov/professionals/systems/hospital/qitoolkit/index.html*.

We emphasize that improving patient safety is our primary objective for the HAC Reduction Program

Comment: One commenter noted that a recent study published in Medical Care[77] found there was limited validity for the AHRQ PSI and HAC Reduction Program measures when measured against the reference standard of a medical chart review. Commenters stated that only 5 of the measures had sufficient data for pooled meta-analysis. These commenters stated that only PSI 15 (Accidental Puncture and Laceration) met the proposed threshold for validity, based on a positive predictive value (PPV) of 0.80 and higher. Commenters also stated that coding errors were found to be the most common reasons for discrepancies between the medical record review and administrative databases. Commenters requested that CMS reevaluate the appropriateness of including the PSI 90 measure for use in its future public reporting and pay-for-performance programs.

Response: We appreciate the commenters' input and would like to emphasize that improving patient safety is our primary objective for the HAC Reduction Program. We note that NQF endorsed the modified PSI 90 measure as a valid measure (NQF #0531); further, experts agree that this measure is scientifically rigorous. We also note that NQF reviewed the risk-adjustment methodology of the component indicators during its last cycle of NQF endorsement, and endorsed the modified PSI 90 measure as valid and reliable. We continue to work with the measure steward to improve the measure. We also continually review alternative measures, related to patient safety, to determine their appropriateness for inclusion in the HAC Reduction Program. We also refer readers to the AHRQ Quality Improvement Toolkit for additional guidance to facilitate improvements to documentation and coding at: *http://www.ahrq.gov/sites/default/files/wysiwyg/professionals/systems/hospital/qitoolkit/b4-documentationcoding.pdf*.

Comment: Commenters recommended that use of the modified PSI 90 measure in any of the CMS pay-for-performance programs start no sooner than October 1, 2016, noting that this timeline will give organizations time to understand and prepare for the newly revised measure. Commenters further noted that the software which AHRQ has made available to hospitals for the purpose of monitoring performance has not been updated to reflect ICD–10 coding. Commenters expressed concern about the proposed performance period, claiming that adding indicators after the performance period has ended do not allow for concurrent coding correction or concurrent process improvement. Commenters recommended CMS work with AHRQ to make this software available as soon as possible so that hospitals are able to monitor performance in an ongoing way in order to provide for continuous quality improvement. Commenters further recommended that CMS temporarily remove this measure from public reporting and inclusion in any pay-for-performance scoring and reimbursement until the ICD–10 version of PSI 90 is available.

Response: We understand that there are concerns regarding the transition to ICD–10. However, we disagree that the use of the modified PSI 90 measure should start no sooner than October 1, 2016. Hospitals and other healthcare facilities have known about ICD–10 coding for some time and have had the opportunity to implement ICD–10 coding procedures. All measure specifications have been translated to and updated for corresponding ICD–10 code specifications and we were fully prepared to accept ICD–10-based claims data beginning October 1, 2015 in accordance with established program timelines. AHRQ originally sought public comment in the **Federal Register** on November 26, 2013 (78 FR 70558 through 70559) on the proposed conversion of the AHRQ QIs to ICD–10 CM/PCS codes. At that time, the proposed ICD–10 CM/PCS mappings and specifications were posted on the AHRQ QI Web site for review at: *http://www.qualityindicators.ahrq.gov/icd10/default.aspx*. Since that time, the AHRQ QIs and the ICD–10 mappings have been continuously updated and refined, as new ICD–10 codes are released and CMS' MS–DRG classification of ICD–10 codes is refined.

We further note that we are finalizing the proposal to use only ICD–9 claims data for FY 2018. This will provide the necessary time for AHRQ to develop a

risk adjusted software version capable of using ICD–10 claims data for FY 2019. One of the factors in the decision to delay the use of ICD–10 claims data until FY 2019 was to allow for the necessary one year of ICD–10 data collection required for AHRQ to create a risk adjusted software version. We will also monitor and assess measure specifications with respect to ICD–10 code specifications and potential impacts on measure performance and payment incentive programs.

Comment: Commenters recommended that CMS revise ICD–10 codes to more appropriately capture PSI measures. For PSI 12, commenters noted that ICD–10 codes do not currently exist to appropriately code DVT in the soleal vein or peroneal vein. Commenters recommended the addition of codes for the appropriate capture of PSI 12. For PSI 13, commenters noted the Third International Consensus Definition Task Force published a recommended new definition of sepsis in March 2016.[78] These commenters recommended that, as this new definition is adopted as a medical standard, revised ICD–10 codes be developed that reflect the new definition, to appropriately capture and report PSI 13.

Response: Many claims-based measures have updated ICD–10 codes contained in the Measure Information Forms (MIFs) on the NQF Web site. We also note that AHRQ's proposed changes for ICD–10–CM/PCS conversion of its quality indicators are available at: *http://www.qualityindicators.ahrq.gov/icd10/default.aspx*. AHRQ reviews all ICD–10–CM/PCS coding updates and integrates new codes regularly. AHRQ is also working with CMS to align coding classification systems.

Comment: One commenter expressed concern with the inclusion of PSI 03. Commenters noted that the measure is inconsistent with recent work completed by the National Pressure Ulcer Advisory Panel (NPUAP) in April 2016 and may be providing misleading information to the public if not corrected. In addition, commenters stated that the reporting of data is further complicated by inconsistencies between existing ICD codes and current practice, making it difficult to report accurately. Commenters believed that it would be a serious error to continue to collect misleading information, which arbitrarily skews reports and can hinder rather than facilitate patient understanding in their review of this measure. Commenters requested CMS suspend data collection for PSI 03 until such time this measure can be brought in line with NPUAP's definitions. Commenters further requested CMS request of AHRQ the following: Modification of PSI 03 to include only stage III and IV pressure injuries (ulcers); modification of pressure injuries (ulcers) to be consistent with the April 2016 NPUAP definitions, in particular, the consideration that not all deep tissue pressure injury (DTP) wounds evolve into a significant tissue injury; and that DPTI should be generally excluded from the PSI 03 measure definition and only included once they reveal the actual extent of pressure injury.

Response: As noted in the technical specifications (*http://www.qualityindicators.ahrq.gov/Modules/PSI_TechSpec.aspx* and *http://www.qualityindicators.ahrq.gov/Modules/PSI_TechSpec_ICD10.aspx*), PSI 03 is currently limited to stage III and IV pressure injuries as well as unstageable injuries (which are considered clinically equivalent to stage III or IV, because they represent ''obscured full-thickness skin and tissue loss''). We appreciate the suggestion to review the April 2016 revisions by the NPUAP. AHRQ has already considered the revisions and its potential impact on PSI 03 with ICD–10 coding guidelines. At this time, we do not believe the revisions have a material impact on the incidence of PSI 03. Because it is not yet clear whether all deep tissue pressure injuries (DTPI) should be counted in quality measurement programs, or only those that evolve into ulcers, and NPUAP noted that DPTI ''results from intense and/or prolonged pressure and shear forces at the bone-muscle interface,'' AHRQ believes that it is still appropriate to count DPTI as a significant pressure-related soft tissue injury and to capture it in PSI 03 based on current ICD–10 indexing. All of the PSIs are reviewed, refined, and updated annually. AHRQ will continue to monitor the coding guidelines with respect to the NPUAP revisions and its potential impact on the technical specifications of PSI 03.

Comment: One commenter recommended that the exclusion criteria of PSI 04 Stratum 4A be broadened to include diagnoses that reflect a hypercoagulable state. The commenter recommended broadening the exclusion criteria in Stratum 04B to include cases that started in MDC 4, but advanced to the Pre-MDC. The commenter recommended broadening the exclusion criteria in Stratum 4C to include sepsis diagnosis codes that are present on admission. The commenter also recommended broadening the exclusion criteria of Stratum 4D to include cases that started in MDC 4 or 5 but advanced to the Pre-MDC and cases that are present on admission. In addition, the commenter recommended removing inclusion criteria of K921 melena in Stratum 04E. The commenter also recommended broadening the exclusion criteria for Stratum 04E to focus on the Present on Admission Indicator rather than the principal diagnosis position and also excluding Pre-MDC.

Response: We will continue to monitor and analyze the impact of our measure selection for further adjustments to the HAC Reduction Program. Suggestions regarding potential PSI measure revisions can be made directly to *QIsupport@ahrq.hhs.gov*.

Comment: One commenter supported the inclusion of PSI 09 in the modified PSI 90 measure. This commenter noted that perioperative hemorrhage is a high-volume condition, with up to five percent of cardiac surgery patients potentially requiring additional surgery to control bleeding. The commenter also noted that perioperative hemorrhage is a high-cost condition, with complications that require an increased hospital length of stay and longer ICU time resulting in an increased economic burden relative to patients without these events. The commenter stated that in many instances these conditions can be prevented in many surgeries through appropriate use of a flowable hemostatic matrix which will help to improve patient safety and reduce the costs of care.

Response: We thank the commenter for its feedback and we continue to believe that the HAC Reduction Program encourages improvement in patient safety over the long-term for all hospitals.

Comment: Commenters expressed concern that the PSI 09 component may apply to a number of transplant patients. Commenters indicated that perioperative hemorrhage or hematoma is normal after liver transplant, and is frequent after kidney transplant, and the repercussions of these and other transplantation procedures are not indicative of poor quality care. Commenters further noted that liver transplants result in significant blood loss in nearly every case, and poor performance on this measure can be driven by the number of liver transplants performed. Commenters recommend that transplantation should be added to the exclusion list a priori

[78] Singer M, Deutschman CS, Seymour CW, et al: The Sepsis Definitions Task Force The Third International Consensus Definitions for Sepsis and Septic Shock (Sepsis-3). Journal of the American Medical Association (JAMA, Feb 22, 2016). Accessed at: *http://jama.jamanetwork.com/article.aspx?articleid=2492881#Abstract*.

and requested that that liver transplant patients be excluded from the PSI 09 denominator.

Response: We do not agree with the commenters' recommendation that liver transplant patients should be excluded from the PSI 09 denominator. While we appreciate commenters' observation that transplant patients may have an elevated risk of hemorrhage or hematoma, we note that the risk-adjustment model for PSI 09 explicitly accounts for the increased risk associated with solid organ transplantation. For more information on the PSI 09 risk model, we refer readers to: *http://www.qualityindicators.ahrq.gov/Downloads/Modules/PSI/V50/Parameter_Estimates_PSI_50.pdf*).

Comment: One commenter expressed concern that the PSI 10 component of the measure is inappropriate for liver transplantation. The commenter stated that while the measure excludes patients with preoperative renal failure, many liver transplant patients with relatively normal baseline renal function get Acute Renal Failure after transplant despite high quality care, due to hemodynamic factors and the nature of the drugs involved in the performance of the procedure and its aftermath. The commenter recommended that liver transplantation be added to the exclusion list.

Response: We do not agree with commenter that liver transplant patients should be excluded from the PSI 10 denominator. While we appreciate commenter's observation that liver transplant patients may have an elevated risk of acute kidney failure, we note that the risk-adjustment model for PSI 10 explicitly accounts for the increased risk associated with hepatic failure. For more information on the PSI 10 risk model, we refer the commenter to: *http://www.qualityindicators.ahrq.gov/Downloads/Modules/PSI/V50/Parameter_Estimates_PSI_50.pdf*.

Comment: One commenter expressed concern with the PSI 11 component of the measure because acute respiratory failure, mechanical ventilation, and reintubation are fairly common for both liver and kidney procedures and do not suggest poor quality of care. This commenter stated that transplants have high incidences of acute respiratory failure, mechanical ventilation, and reintubation meeting the specifications set forth in this measure, due to the fluid shifts, medication, neurological status, and potential for infection involved in this complex surgery. The commenter recommend that liver and kidney transplantation should be added to the exclusion list for this measure.

Response: We understand commenter's concerns, however, we disagree with the commenter that liver and kidney transplantation should be added to the exclusion list. We note that the risk-adjustment model for PSI 11 explicitly accounts for the increased risk associated with solid organ transplantation. Liver transplantation (MDRG 7702) is associated with an adjusted odds ratio of 48.3 in AHRQ's v5.0 risk model for PSI 11, whereas kidney transplantation (MDRG 1101) is not empirically associated with increased odds of PSI 11. For more information, we refer the commenter to: *http://www.qualityindicators.ahrq.gov/Downloads/Modules/PSI/V50/Parameter_Estimates_PSI_50.pdf*.

Comment: Commenters thanked CMS for the proposed changes to PSI 12 and appreciated that the modified weighting methodology that accounts for patient harm dropped from 34 to 18 percent. However, commenters expressed concern about the vulnerability of PSI 12 to surveillance bias. Commenters noted that studies have shown that hospitals with increasing numbers of structural quality characteristics (that is, larger hospitals with more accreditations, more complex patients, and engagement in quality initiatives that typically suggest high quality care) have better venous thromboembolism (VTE) prophylaxis, but actually have higher VTE rates, or an increase in PSI 12 event rates.[79] Commenters stated that hospitals with more sophisticated tools and technology used to track VTE show higher rates of VTE and are being penalized for doing a better job at detection. Commenters stated that performance on PSI 12 may reflect differences in VTE imaging use rather than differences in quality of care, and the inclusion of PSI 12 could unfairly penalize hospitals with increased vigilance in VTE detection. One commenter recommended that PSI 12 be removed from pay-for-performance programs.

Response: CMS and AHRQ recognize the commenters' concerns about surveillance bias for PSI 12 Perioperative PE or DVT Rate and the issue was addressed in the NQF Patient Safety Steering Committee in 2015. Surveillance bias is a non-random type of systemic bias where a diagnosis is more likely to be observed the more vigilant one is in looking for it. In the case of DVT or PE, hospitals may underdiagnose or over diagnose DVT or PE depending how often they screen or perform diagnostic testing to look for these diagnoses. Several research teams have examined DVT and PE rates and surveillance bias.[80] However, studies have not specifically examined whether the observed rates reflect underdiagnoses of DVT or PE at low-testing hospitals, over diagnosis of DVT or PE at high-testing hospitals, or the underlying true incidence of symptomatic DVT or PE.

While some hospitals might hypothesize that increased surveillance is desirable, there is no evidence to support the hypothesis that ''increased vigilance in DVT or PE detection'' is desirable, from the perspective of patients and their families. Over diagnosis of DVT or PE among patients may lead to overtreatment, and overtreatment is not inconsequential as there are known adverse effects associated with treatment of DVT and PE. Thus, while we acknowledge commenter's concerns regarding surveillance bias, we believe that PSI 12 is an important component indicator of the modified PSI 90 measure, because it encourages hospitals not only to prevent DVT or PE, but also to appropriately assess a patient's risk for DVT and PE to prevent over diagnosis and underdiagnoses. Because of the negative economic and health consequences associated with DVT or PE diagnosis, we believe that preventing underdiagnoses and over diagnosis is critical to improving patient safety.

Lastly we disagree with commenter that PSI 12 Perioperative PE or DVT Rate lacks appropriate exclusions. Measure exclusions were reviewed by the NQF Patient Safety Steering Committee in 2015 and the measure was re-endorsed as reliable and valid. We note that AHRQ removed isolated thrombosis of calf veins (ICD–9–CM

Predictors of posttraumatic deep vein thrombosis (DVT): Hospital practice versus patient factors-an analysis of the National Trauma Data Bank (NTDB). The Journal of trauma. 2009;66(4):994–9.

453.42) from the version 6.0 specification reviewed by the NQF Patient Safety Steering Committee in 2015 in order to minimize the impact of clinically unimportant distal thromboses on hospital-specific PSI 12 rates. However, suggestions regarding potential PSI measure revisions can be made directly to: *QIsupport@ahrq.hhs.gov*.

Comment: One commenter suggested using a comprehensive prophylaxis measure because it is a better measure of quality in VTE prevention and more widely used.

Response: CMS and external stakeholders believe measures in the hospital reporting programs should focus on the outcomes of care rather than processes of care, which is consistent with PSI 12. The AHRQ PSIs are based on actual clinical events or outcomes rather than processes of care. Focusing on outcomes has the advantages of representing clinically meaningful events that: Affect the care and outcomes of hospitalized patients, often leading to lost time from work, school, or family responsibilities (or even death); have significant public health and economic implications, require additional resources for treatment and follow-up care; are better aligned with the preferences and values of patients and families; and are sensitive to a variety of different care processes and ''bundles'' of processes, not just pharmacologic prophylaxis.

Comment: One commenter expressed concern regarding the PSI 12 respecifications and noted that it is important within these specifications to identify the exact ICD–10 codes that represent ''isolated deep venous thrombosis of calf veins.'' The commenter noted that, in ICD–10, there are codes for deep venous thrombosis of distal lower extremity, calf veins, and tibial vein, all of which are considered ''calf veins.'' The commenter recommend that CMS consider these codes in PSI 12.

Response: CMS and AHRQ are aware of the issue and are working to clarify the diagnosis codes for DVT involving distal deep veins of the lower extremity in ICD–10–CM coding. In the meantime, we note that version 6.0 of PSI 12 excludes the following ICD–10–CM diagnosis codes from the numerator specification: I82.441–I82.443, I82.449, I82.491–I82.493, I82.499, I82.4Z1–I82.4Z3 and I82.4Z9 (acute embolism and thrombosis of the tibial vein and deep vein of the lower extremity).

Comment: One commenter expressed concern that changes in coagulation in the early postoperative period may lead to increased incidence of clotting disorders including DVT after transplant procedures and also may be caused by large bore IVs.[81] In addition, transplant patients often get products that promote clotting due to inherent coagulopathy, and some patients have clotting disorders that cause hypercoagulability. The commenter noted that this measure excludes surgeries involving interruption of the vena cava, and stated that all liver transplants involve such interruption. This commenter recommended that liver and kidney transplant be added to the exclusion list because DVT is not indicative of poor quality care for these procedures due to the frequency of DVT in transplantation.

Response: We appreciate commenter's observation that PSI 12 excludes cases where a procedure for interruption of the vena cava occurs before or on the same day of the first operating room procedure; cases meeting this criterion should be excluded, because inferior vena cava (IVC) filter placement (which is by far the most common example of surgical interruption of the vena cava) is appropriate only for patients who cannot tolerate, or have already failed, conventional pharmacologic prophylaxis. IVC filters are placed in high-risk patients with the knowledge that they increase the risk of deep vein thrombosis distal to the device while decreasing the risk of embolization to the pulmonary circulation.

We disagree with commenter that liver and/or kidney transplants must be placed on the exclusion list, just because these patients have an elevated risk of thrombosis. We note that the risk-adjustment model for PSI 12 explicitly accounts for the increased risk associated with solid organ transplantation. For example, liver transplantation (MDRG 7702) is associated with an adjusted odds ratio of 3.2 in AHRQ's v5.0 risk model for PSI 12. For more information, we refer the commenter to: *http://www.qualityindicators.ahrq.gov/Downloads/Modules/PSI/V50/Parameter_Estimates_PSI_50.pdf*.

Comment: One commenter requested that CMS add an exclusion for any patient who has a tracheostomy. The commenter noted that it is not the surgery that puts that patient at risk for PE or DVT, it is the medical problem that leads to the patient needing a tracheostomy that puts the patient at increased risk for PE or DVT.

Response: We will continue to monitor and analyze the impact of our measures selection for further adjustments to the HAC Reduction Program. We agree that some medical conditions which lead to a tracheostomy [82] may also increase patients' risk for PE or DVT. However, we do not believe that just because a patient has a tracheostomy they are at increased risk for PE or DVT and should be excluded. We note that most of the medical conditions that can lead to tracheostomy are already captured by the extensive set of risk factors variables used in the risk adjustment for PSI 12. Further suggestions regarding potential PSI measure revisions can be made directly to: *QIsupport@ahrq.hhs.gov*.

Comment: Commenters appreciated the modifications to PSI 15, but requested that CMS update its guidance regarding the correct coding of PSI 15 to ensure that abdominopelvic punctures or lacerations inherent to a surgery are not incorrectly coded as accidental.

Response: Suggestions regarding potential PSI measure revisions can be made directly to: *QIsupport@ahrq.hhs.gov*.

Comment: One commenter did not support PSI 15 because no large-scale assessment has been done to assess the validity of the measure component, and it is difficult to determine if a reoperation was directly related to the accidental puncture/laceration. The commenter recommended that PSI 15 (Accidental Puncture or Laceration) be improved considerably by adding the requirement for a reoperation to occur that is related to the accidental puncture or laceration.

Response: We thank the commenter for its feedback. Suggestions regarding potential PSI measure revisions can be made directly to: *QIsupport@ahrq.hhs.gov*.

Comment: One commenter recommended broadening the PSI 03 Pressure Ulcer Rate exclusion criteria to include those from Appendix I-Immunocompromised State Diagnosis and Procedure Code; broadening the PSI 06 Iatrogenic Pneumothorax Rate to include pneumothorax related to CPR; broadening the PSI 07 CVC Related Blood Stream Infection Rate exclusion criteria to include cases with a length of stay of less than 2 days; broadening the PSI 08 Post Op Hip Fracture exclusion criteria to include anything falling within Appendix H: Cancer Diagnosis Codes regardless of metastasis and regardless of Present on Admission status; broadening the PSI 09

[81] Bore refers to the size of a needle use for an IV.

[82] A tracheotomy or a tracheostomy is an opening surgically created through the neck into the trachea (windpipe) to allow direct access to the breathing tube and is commonly done in an operating room under general anesthesia. Definition obtained from: *http://www.hopkinsmedicine.org/tracheostomy/about/what.html*.

Perioperative Hemorrhage and Hematoma Rate exclusion criteria to include Abnormal Coagulation Profile R79.1 as an exclusion criterion with present on admission and creating a new seroma ICD–10 code; changing the exclusion criteria of PSI 10 Postoperative Physiologic and Metabolic Derangement Rate to a time based element in hours as opposed to the number of postoperative days and including Sinus Bradycardia and Sinus Tachycardia cardiac arrhythmias in the exclusion criteria; changing the inclusion criteria of the PSI 11 Postoperative Respiratory Failure Rate in the numerator inclusion criteria, vent time, reintubation criteria and broadening the exclusion criteria to include cases that started in MDC 4 or 5 but advanced to the Pre-MDC; broadening the PSI 12 Perioperative Pulmonary Embolism or Deep Vein Thrombosis exclusion criteria to include inheritable hypercoagulable conditions, acquired hypercoagulable conditions, present on admission status; excluding PSI 12 from public reporting and pay-for-performance programs; modifying the PSI 13 Postoperative Sepsis Rate to delete the inclusion criteria for post-procedural shock; and extending the exclusion criteria of PSI 14 Postoperative Wound Dehiscence Rate to a length of state of four days.

Response: We thank the commenter for its feedback. Suggestions regarding potential PSI measure revisions can be made directly to: *QIsupport@ahrq.hhs.gov*.

After consideration of the public comments we received, we are finalizing the adoption of the modified PSI 90: Patient Safety and Adverse Events Composite (NQF #0531) discussed above as proposed.

b. Applicable Time Periods for the FY 2018 HAC Reduction Program and the FY 2019 HAC Reduction Program

Section 1886(p)(4) of the Act gives the Secretary the statutory authority to determine the ''applicable period'' during which data are collected for the HAC Reduction Program. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717), we finalized and codified at 42 CFR 412.170 that we would use a 2-year time period of performance data to calculate the Total HAC Score. We believe the 24-month performance period provides hospitals and the public with the most current data available, while allowing sufficient time to complete the complex calculation process for these measures. The 24-month performance period was chosen because it tended to show that between 50 to 90 percent of hospitals attained a moderate or high level of reliability for AHRQ measures (78 FR 50717). Although we believe the 24-month time is the preferred length of time for performance data, there may be situations, discussed in more detail below, where the collection of 24 months of data is not operationally feasible.

Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25121 through 25122), we proposed, beginning in FY 2017 and for subsequent years, to permit flexibility to use a period other than 2 years from which data are collected in order to calculate the Total HAC Score under the HAC Reduction Program. We also proposed to change the definition of ''applicable period,'' in 42 CFR 412.170, to reflect this proposed change.

Since the ICD–10 transition was implemented on October 1, 2015, we have been monitoring our systems and so far claims are processing normally. The measure steward, AHRQ, has been reviewing the measure for any potential issues related to the conversion of approximately 70,000 ICD–10 coded operating room procedures [83] (*https://www.cms.gov/icd10manual/fullcode_cms/P1616.html*), which could directly affect the modified PSI 90 component indicators. In addition, to meet program requirements and implementation schedules, our system would require an ICD–10 risk-adjusted version of the AHRQ QI PSI software [84] by December 2016 for the FY 2018 payment determination year. At this time, a risk-adjusted ICD–10 version of the PSI 90 Patient Safety and Adverse Events Composite software is not expected to be available until late CY 2017. A full year of nationally representative ICD–10 coded data must be available for the development risk-adjusted models based on a national reference population.

To address these issues, for the current Domain 1 measure (PSI 90 Patient Safety and Adverse Events Composite), we proposed to use the 15-month performance period from July 1, 2014 through September 30, 2015, for the FY 2018 HAC Reduction Program. This 15-month performance period would utilize only ICD–9–CM data and only apply to the FY 2018 payment year. The claims for all Medicare FFS beneficiaries discharged during this period would be included in the calculations of measure results for FY 2018. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25121), we erroneously referenced the incorrect date for the end of the FY 2019 performance period. We had stated that ''For the FY 2019 HAC Reduction Program, we proposed to use the 21-month performance period from October 1, 2015 through September 30, 2017.'' Accordingly, we issued a correction notice (81 FR 37176). The 21-month performance period should be October 1, 2015 through June 30, 2017. This 21-month performance period would utilize only ICD–10 data and only apply to the FY 2019 payment year. The claims for all Medicare FFS beneficiaries discharged during this period would be included in the calculations of measure results for FY 2019.

Prior to deciding to propose abbreviated data collection periods for the FY 2018 and the FY 2019 payment determinations, we took several factors into consideration. These included the recommendations of the measure steward, the feasibility of using a combination of ICD–9 and ICD–10 data, the impact of suspending the measure, minimizing provider burden, program implementation timelines, and the reliability of using shortened data collection periods, as well as the importance of continuing to publicly report this measure. We believe that using a 15-month data collection period for FY 2018 and a 21-month data collection period for FY 2019 best serve the need to provide important information on hospital patient safety and adverse events by allowing sufficient time to process the claims data and calculate the measures, while minimizing reporting burden and program disruption.

Because this issue only impacts the PSI 90 Patient Safety and Adverse Events Composite in Domain 1, for the CDC NHSN measures previously finalized for use in the FY 2017 HAC Reduction Program (CLABSI, CAUTI, Colon and Abdominal Hysterectomy SSI, MRSA Bacteremia, and CDI), we would use the 24-month performance period from January 1, 2015 through December 31, 2016 (CYs 2015 and 2016) for the FY 2018 HAC Reduction Program. For the FY 2019 HAC Reduction Program, we proposed to use the 24-month performance period from January 1, 2016 through December 31, 2017 (CYs 2016 and 2017).

We believe that using a 15-month (FY 2018 only) and a 21-month (FY 2019

[83] International Classification of Diseases, (ICD–10–CM/PCS) Transition—Background. Available at: *http://www.cdc.gov/nchs/icd/icd10cm_pcs_background.htm*.

[84] The AHRQ QI Software is the software used to calculate PSIs and the composite measure. More information is available at: *http://www.qualityindicators.ahrq.gov/Downloads/Resources/Publications/2015/Empirical_Methods_2015.pdf*.

only) performance period for Domain 1 and a 24-month performance period for Domain 2 balances the needs of the HAC Reduction Program and allows sufficient time to process the claims data and calculate the measures. We will continue to test ICD–10 data that are submitted in order to ensure the accuracy of measure calculations and to monitor and assess the translation of measure specifications to ICD–10, potential coding variation, and impacts on measure performance and payment incentive programs.

We invited public comment on the proposals to update the definition of ''applicable period'' codified at 42 CFR 412.170 for FY 2017 and subsequent years and to use these updated performance periods for calculation of measure results for the FY 2018 and the FY 2019 HAC Reduction Programs.

Comment: Many commenters supported the proposal to limit the performance periods. Commenters stated that although many hospitals typically benefit from a longer reporting period, in this case they recognize that combining ICD–9 and ICD–10 data would create confusion. One commenter recommended that CMS transition quality measures to full ICD–10 and not rely upon ICD–9 codes in the new performance periods.

Response: We thank commenters for their feedback and agree that combining ICD–9 and ICD–10 data would create confusion. We believe this policy best serves the need to provide important information on hospital patient safety and adverse events by allowing sufficient time to process the claims data and calculate the measures, while minimizing reporting burden and program disruption.

Comment: Many commenters expressed concern that reducing the performance period to 15 months in FY 2018 will undermine the reliability of the results. Commenters supported CMS' decision of not combining claims data for ICD–9 and ICD–10. However, commenters believe that all measures should be reported first in the Hospital IQR Program for one year before the performance period in a payment program begins. Commenters stated that reporting measures in the Hospital IQR Program provides transparency, allows stakeholders to gain experience submitting measures, and allows time to identify errors and unintended consequences. Commenters recommended that CMS suspend PSI 90 from inclusion in calculating scores for the Hospital VBP Program and HAC Reduction Program and suspend it from public reporting on *Hospital Compare* until a 24-month performance period can be re-established, or until AHRQ has satisfactorily demonstrated that the shorter performance period will produce equitable results.

Response: We understand stakeholder concerns about the potential impacts to hospital performance on quality measures when ICD–10 was implemented on October 1, 2015, as well as suggestions for more extensive testing to understand the impacts before any payments or penalties are implicated. As part of the ICD–10 transition planning that has taken place over the past several years, we have performed testing and analyses across the agency with respect to system readiness and claims payment, and continue to provide extensive education and outreach to providers, vendors, and other payers through the CMS ICD–10 Web site.[85] All measure specifications have been translated to and updated for corresponding ICD–10 code specifications and we were fully prepared to accept ICD–10-based claims data beginning October 1, 2015 in accordance with established program timelines.

In response to commenters' specific concerns regarding PSI 90, we note that the NQF found the modified PSI 90 to be reliable using 12 months of data.[86] We further note that we base our measure selection decisions for the HAC Reduction Program on measures currently available, risk adjusted, and reflective of hospital performance. We also take NQF endorsement and support by the MAP into account in deciding which measures to adopt. All the measures finalized for inclusion in the HAC Reduction Program are NQF-endorsed and were recommended for inclusion in the HAC Reduction Program by the MAP.

We further note that the HAC Reduction Program and the other value-based and quality reporting programs are separate programs with different purposes and policy goals. We note that the PSI 90 measure covers topics of critical importance to quality improvement in the inpatient hospital setting and to patient safety. We selected this quality measure because we believe that hospital acquired conditions comprise some of the most critical patient safety areas, therefore justifying the use of the measure in more than one program. Although the measure exists in more than one program, the measure is used and calculated for very distinct purposes. Accordingly, we believe that the critical importance of this measure to patient safety warrants inclusion in the HAC Reduction Program.

Comment: One commenter noted that the reduced performance period of 21 months for FY 2019 payment determination listed in the proposed rule indicates the period October 1, 2015 through September 30, 2017, which is a total of 24 months. The commenter requested that CMS provide clarification as to which months will be used to determine performance for FY 2019.

Response: In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25121), we erroneously referenced the incorrect date for the end of the FY 2019 performance period. Accordingly, we issued a correction notice updating September 30, 2017 to read June 30, 2017 (81 FR 37176). We are confirming that the FY 2019 HAC Reduction Program will use the 21-month performance period from October 1, 2015 through June 30, 2017.

Comment: Commenters requested that CMS continue working with hospitals, measure developers and all other stakeholders to address the potential unintended consequences of combining measure data collected under ICD–9 and ICD–10. Commenters recommended that CMS undertake an analysis of any performance differences resulting from the transition to ICD–10 for all of the measures used in the pay-for-performance program, with the results of those analyses be made publicly available. Commenters noted that such data would help inform about any potential unintended biases and measure performance changes resulting from the use of the new codes.

Response: We will continue to work with stakeholders during the ICD–10 transition to monitor and assess impacts and to address any potential issues that may occur. We continue to publish comprehensive documentation of all ICD–10 resources by quality program and/or measure type. We also plan to continue to conduct national provider calls and other presentations to help stakeholders understand the potential impact of ICD–10 on their measure performance. We encourage stakeholders to subscribe to our listserv titled ''Hospital Inpatient Value-Based Purchasing (HVBP) and Improvement'' to receive notification of scheduled events. Stakeholders may join at: *https://www.qualitynet.org/dcs/ContentServer?pagename=QnetPublic/ListServe/Register*. For those individuals

who are interested in participating in future ICD–10 Coordination and Maintenance Committee meetings, information on the Committee can be found on the CMS Web site at: *https://www.cms.gov/Medicare/Coding/ICD9ProviderDiagnosticCodes/ICD-9-CM-C-and-M-Meeting-Materials.html*. We encourage public participation at these meetings either in person, by conference lines, or by the livestream provided by CMS.

After consideration of the public comments we received, we are finalizing the definition of applicable period at 42 CFR 412.170 and the 15-month FY 2018 performance period discussed above as proposed. We are finalizing the FY 2019 performance period as the 21-month performance period October 1, 2015 through June 30, 2017.

c. Changes to the HAC Reduction Program Scoring Methodology

(1) Current Scoring Policy

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50721), we finalized a scoring methodology that aligns with the achievement scoring methodology currently used in the Hospital VBP Program. Our intent was to reduce confusion associated with multiple scoring methodologies by aligning the scoring for the Hospital VBP Program and the HAC Reduction Program. We note that alignment benefits the hospital stakeholders who have prior experience with the Hospital VBP Program. Accordingly, we implemented a methodology for assessing the top quartile of applicable hospitals for HACs based on performance standards.

We indicated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50720 through 50725) that points will be assigned to hospitals' performance for each measure. We finalized a decile-based methodology for assigning points, depending on the specific measures.

- For Domain 1, point assignment is based on a hospital's score for the PSI 90 measure.
- For the Domain 1 score, 1 to 10 points are assigned to the hospital.
- For the measures in Domain 2, point assignment for each measure is based on the SIR for that measure.
- For each SIR, 1 to 10 points are assigned to the hospital for each measure.
- The Domain 2 score consists of the average of points assigned to each measure.

To calculate a Total HAC Score for each hospital, we multiply each domain score by a weighting and add together the weighted domain scores to determine the Total HAC Score (§ 412.172(e)(3)). We use each hospital's Total HAC Score to determine the top quartile of subsection (d) hospitals that are subject to the payment adjustment beginning with discharges on or after October 1, 2014.

(2) Program Evaluation Efforts

As part of our ongoing efforts to evaluate the HAC Reduction Program, we recently conducted a review of our scoring methodology and assessed opportunities to strengthen the program. As part of that review, our Hospital Quality Reporting Program Support (HQRPS) contractors convened a technical expert panel (TEP) on October 19–20, 2015, with a follow-up call on December 11, 2015. The TEP examined multiple areas of the HAC Reduction Program and focused on identifying a scoring methodology that provides an incentive to hospitals to reduce HACs and distinguishes top performers from low performers. The TEP identified concerns with the current decile-based scoring methodology that included: Ties at the penalty threshold; hospitals with a limited amount of data being identified as poor performers; and situations in which hospitals with no adverse events and no Domain 2 data nonetheless become eligible for penalty.

During the FY 2016 HAC Reduction Program, a small subset of hospitals that had zero adverse events in Domain 1 and no Domain 2 score were identified as part of the worst-performing quartile. These hospitals received Domain 1 scores of 7.0, meaning they were in the 7th decile of hospitals for the PSI 90 measure despite being close to the PSI 90 measure mean value. As this subset of hospitals had no Domain 2 scores, they received a Total HAC Score equal to their Domain 1 score of 7.0. This Total HAC Score was greater than the 75th percentile cutoff for penalty determination of 6.75. CMS waived the penalty for these zero adverse event hospitals so they would not be treated as poor performers. These hospitals were potentially disadvantaged because their Total HAC Scores were determined solely on their Domain 1 Score. Because Domain 2 scores tend to be lower on average than Domain 1 scores,[87] other hospitals without Domain 2 scores are potentially treated the same as low performers in the same decile.

In addition, scoring using deciles can make it more difficult to distinguish top performers from low performers by creating a large number of ties on measure scores. For example, two hospitals with meaningfully different measure results may fall into the same decile bin and therefore be ultimately indistinguishable under the current scoring methodology. Conversely, two hospitals with performance that is not statistically distinguishable may fall into different decile bins. Furthermore, ties at the penalty threshold complicate the adjudication of payment adjustments; in both the FY 2015 and FY 2016 programs, less than 25 percent of all hospitals had Total HAC Scores above the threshold for penalties. Specifically, only 21.9 percent of hospitals in FY 2015 and 23.7 percent of hospitals in FY 2016 were subject to a payment adjustment.

To address stakeholder concerns regarding the current scoring methodology, we evaluated a number of alternatives and recommendations from the TEP. We refer readers to the Project Title: Hospital-Acquired Condition (HAC) Reduction Program Scoring Methodology Reevaluation located at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/TechnicalExpertPanels.html* for a summary of the TEP's discussion. These alternatives included replacement of the current decile-based scoring approach with the use of Winsorized [88] z-scores. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25122 through 25123), we proposed to use Winsorized z-scores for FY 2018.

(3) Winsorized Z-Score Method

The Winsorized z-score method (z-score) uses a continuous measure score rather than forcing measure results into deciles. Z-scores represent a hospital's distance from the national mean for a measure in units of standard deviations. Under the z-score approach, poor-performing hospitals earn a positive z-score, reflecting measure values above the national mean, and better-performing hospitals earn a negative z-score, reflecting measure values below

[87] This is because hospitals are assigned the minimum of one point for any measure for which they have a measure result of zero. For example, for the CAUTI measure, if 13 percent of hospitals have an SIR of zero, one point is assigned to each of these hospitals, even though the decile approach is intended to assign 10 percent of hospitals to each decile. Two points would be assigned to the remaining seven percent of hospitals that would fall in the second decile. This phenomenon does not affect Domain 1 scores, since the reliability-adjusted PSI 90 measure result is not equal to zero in any hospital.

[88] Winsorized measure results are truncated to the 5th and 95th percentiles, replacing values between the minimum and the 5th percentile with the 5th percentile value and replacing values between the 95th percentile and the maximum with the 95th percentile value. Z-scores are then calculated based on these values.

the national mean. For each measure, a hospital's z-score is based on the following equation that expresses the hospital's measure value minus the average value for that measure, divided by the standard deviation of the measure values across all hospitals:

Z-Score = (Hospital's Measure Performance—Mean Performance for All Hospitals) Standard Deviation for All Hospitals

To form the Total HAC Score, we would use the z-scores as hospitals' measure scores. In accordance with the current scoring methodology, we would then average the z-scores across measures within Domain 2 and assign the z-score for PSI 90 for Domain 1 to determine the domain scores. We would then multiply each domain score by the appropriate weighting and add together the weighted domain scores to determine the Total HAC Score. We would use each hospital's Total HAC Score to determine the top quartile of subsection (d) hospitals that are subject to the payment adjustment.

(4) Impact and Implementation

This z-score approach is straightforward to implement, easily adapted as measures are added or removed from the HAC Reduction Program, transparent, and familiar to a wide range of stakeholders. Continuous values address the limitations of decile scoring and preserve the magnitude of differences among hospitals' measure results. Thus, hospitals that differ meaningfully on their measure results will also differ meaningfully on their Total HAC Scores. Unlike the decile approach, continuous measure scores would substantially reduce ties of Total HAC Scores, which have prevented CMS from penalizing exactly 25 percent of hospitals in previous program years. The use of z-scores also improves alignment between Domains 1 and 2 and creates a more level playing field for hospitals with data in only Domain 1.

Based on FY 2016 data supplemented with MRSA Bacteremia and CDI results,[89] the z-score approach affects the penalty status of slightly more than 200 hospitals, relative to the decile approach. This approach brings 114 hospitals into the penalty zone and 103 hospitals out of the penalty zone and reduces the HAC Reduction Program's impact on the largest and smallest hospitals. Most importantly, because of the improvements in precision and standardization gained by implementing this approach, there is no penalization of hospitals that had zero adverse events and no Domain 2 score in either the actual results from FY 2016 or in the results based on the FY 2016 data supplemented with MRSA Bacteremia and CDI results.

Among the 184 hospitals with fewer than 25 beds, the proportion of hospitals penalized would fall from 33 percent to 18 percent. Among the 213 hospitals with more than 500 beds, the proportion of hospitals penalized would fall from 50 percent to 42 percent. The approach leaves the proportion of teaching, urban, and high-DSH hospitals penalized largely unchanged, with one exception. The z-score approach slightly increases the penalization rate among moderately high (50 to 64 percent) DSH hospitals, from 28 percent to 35 percent. Only 172 hospitals fall into this group; therefore, the increase reflects only 11 additional hospitals in that group being penalized.

We believe that differences in performance scores must reflect true differences in performance. In addition, hospitals must be able to clearly understand performance scoring methods and performance expectations to maximize their quality improvement efforts. Therefore, we invited public comments on our proposal to adopt the z-score method for calculating measure results beginning in the FY 2018 HAC Reduction Program.

Comment: Many commenters commended CMS' willingness to consider changes to the underlying scoring methodology. Commenters noted that the shift away from the decile-based scoring approach to a Winsorized z-score more accurately represents a hospital's performance in relation to the national mean, rather than forcing scores into deciles. Commenters stated that this transition promotes a better statistical methodology, resulting in a smoother distribution of scores and avoiding unintended anomalies that result from the current decile-based scoring method.

Response: We thank commenters for their support and agree that the transition promotes a better statistical methodology.

Comment: Commenters recommended that CMS closely monitor the effects the new scoring methodology may have among essential hospitals that serve a larger volume of vulnerable patients and to evaluate whether any particular category of hospital is disproportionately impacted by the change.

Response: We understand commenters' concerns and we believe these improvements mark progress towards enhancing our ability to distinguish hospital performance and we will continue to monitor the impacts of the scoring change.

Comment: Commenters requested that CMS provide robust guidance and support to hospitals to avoid confusion as the agency implements its new methodology. Commenters also requested CMS provide hospitals with the ability to compare their current performance scoring with the proposed methodology. One commenter asked if the z-scores would be publicly reported and how hospitals will receive their scores.

Response: We thank commenters for their input and note that we plan to provide education and outreach as we work with hospitals to inform them about the new methodology and any potential impacts of the scoring change. We note that each hospital will receive a Hospital-Specific Report (HSR) containing its results prior to public reporting. We will work to ensure that the HSRs and accompanying documents contain the information hospitals need to understand their performance in the program. The results will be publicly reported on *Hospital Compare* according to already established timelines. We appreciate commenters' suggestion of providing hospitals with the ability to compare their results under the current performance scoring and the proposed scoring and we will work to determine the feasibility of providing these data.

Comment: Commenters recommended that CMS reevaluate the scoring of Domain 2. Commenters stated they would like to see the same process used in Domain 2 as is used in Domain 1 if there are zero adverse events. Commenters noted that the current scoring of Domain 2 is ignoring perfect performance and puts some hospitals at an unfair advantage.

Response: We thank commenters for their input. We believe the z-score methodology further improves alignment between the HAC Reduction Program scoring domains by making the distributions of domain scores more comparable and placing them on the same scale. Neither the current nor the proposed methodology ignore hospitals with zero observed infections; in both cases they would receive a measure score of zero unless they have insufficient data. Under Domain 2, hospitals are considered to have insufficient data when they have less than one predicted infection for a given measure and do not receive a measure score in this scenario. We believe this criterion is comparable to the

[89] Results are a based on actual FY 2016 measure data with the addition of MRSA Bacteremia and CDI data for the reporting period spanning October 2012 through December 2014.

insufficient data requirements in Domain 1.

Comment: Commenters supported the proposal to change the scoring methodology. However, commenters expressed concern that this new methodology increases the penalization rate among moderately high DSH hospitals (50 to 64 percent) from 28 percent to 35 percent. Commenters noted that while this increase may only affect 11 additional hospitals, it shifts the penalties for this program towards academic hospitals, which are already at a disadvantage in other value-based programs.

Response: We appreciate commenters' concerns and note that rather than reducing the penalty burden on any particular category of hospitals, the proposed scoring change aims to correct an identified limitation in the HAC Reduction Program: The penalization of hospitals with no Domain 2 score and zero adverse events in Domain 1. Hospitals with only Domain 1 data received higher Total HAC Scores than hospitals contributing data in both domains contributing to a misalignment. We believe that the proposed scoring approach corrects this misalignment and along with previously finalized modifications to Domain 2, including additional measures, expansion of patient care locations, and re-baselining, will substantially reduce the number of hospitals with no Domain 2 score moving forward.

Comment: Some commenters did not support the use of Winsorized z-scores and expressed concern that neither the proposed z-score approach nor the current decile-based scoring is adequate to identify meaningful differences in performance across hospitals. These commenters stated that an AHA-commissioned analysis estimating the impact of the proposed scoring changes and comparing them to the current decile-based approach found that the percentages of large hospitals, high-DSH payment hospitals, and teaching hospitals penalized under the z-score method are minimally different from the current scoring method.

Commenters further conducted a simulation analysis to determine whether hospitals in particular performance categories had Total HAC Scores that are statistically different from the payment penalty threshold score. These commenters placed hospitals into ventiles (that is, division of the population into 20 approximately equal groups) (with higher ventiles indicating worse performance) of Total HAC Scores. Commenters then calculated the percentage of hospitals whose performance was statistically different from the penalty threshold score in each ventile. Commenters found that as the performance ventile increased, the percentage of hospitals whose performance scores are statistically different from the performance threshold score declined. In some cases, (that is, the 15th and 16th ventiles under the decile scoring method and the 17th ventile under the z-score method), virtually no hospitals had Total HAC Scores that were statistically different from the payment penalty threshold score.

Commenters also stated that it does not appear that the z-score approach would make it any more likely that CMS would penalize 25 percent of hospitals. Commenters stated their analysis showed that under either method, 25 percent of hospitals would be penalized in FY 2017. Commenters recommend that CMS consider adopting a scoring methodology that recognizes both improvement and achievement but noted that the current legislative language does not permit that kind of flexibility. Commenters stated they saw little merit to changing the scoring approach at this time, given that hospitals have gained an understanding of the decile-based scoring approach and that there are minimal differences in the distribution of penalties.

Response: We thank commenters for their input and note that a TEP convened in late 2015 and early 2016 supported this approach. Rather than reducing the penalty burden on any particular category of hospitals, the proposed scoring change aims to correct an identified limitation in the HAC Reduction Program: The penalization of hospitals with no Domain 2 score and zero adverse events in Domain 1. We note that under decile-based scoring, hospitals with insufficient data to calculate a Domain 2 score received higher Total HAC Scores due to only having a Domain 1 score. The proposed scoring change aims to correct this problem by applying Winsorized z-scores, a continuous scoring approach that brings the domains into alignment. The proposed approach essentially eliminates ties in Total HAC Scores, reduces effects on outliers, and enhances the ability to distinguish among hospitals of varying quality and ensuring consistent penalization of exactly 25 percent of hospitals. This approach also enhances our ability to distinguish among hospitals of varying quality, unlike deciles, where two hospitals with very different scores might be in the same decile. Coupled with Winsorization, which diminishes the impact of outlying measure scores on the program while preserving information about hospitals' relative performance, the proposed methodology represents a substantial improvement in the HAC Reduction Program.

Comment: Some commenters recommended that CMS explore additional scoring methods that could adjust for skewed distributions and avoid penalizing hospitals with no adverse events. Commenters agreed with CMS that the z-score will reduce ties. However, commenters noted that z-scores are best used with a normal distribution and are not appropriate for the CDC NHSN measures in Domain 2, which are skewed to the left (that is, many hospitals have low infection rates), unlike Domain 1, which has an approximately normal distribution. Commenters recommend CMS consider scoring methods that account for the skew in the distribution and do not penalize hospitals with zero adverse events, including p-values for the CDC NHSN measures in Domain 2.

Response: We thank commenters for their input and recommendations. Although Winsorized z-scores do not directly account for this skew, the methodology preserves information about hospitals' relative performance and reduces the likelihood of penalization for hospitals with zero adverse events. We note that Winsorization is not intended to produce a symmetric distribution; rather, it aims to reduce the impact of extreme values. We will continue to monitor the HAC Reduction Program and take the commenters' concerns under consideration as we strive to improve the Program.

Comment: Commenters expressed concern that the program's scoring methodology is extremely complex and requires a greater degree of transparency so hospitals can understand how this potential change could impact their Medicare payments as well as how they benchmark against peer hospitals. Commenters requested that CMS perform additional analysis on the proposed scoring methodology to determine whether certain types of hospitals are disproportionately impacted under the new approach. Commenters noted that grouping all hospitals into one population to be analyzed is not statistically sound. Commenters stated that there are simply too many differences between hospitals across the nation to perform accurate risk adjustments so that all hospitals are evaluated and scored fairly. Commenters recommend that CMS utilize peer cohorts, groupings, or stratification and compare only hospitals with similar volumes and demographics. One commenter

requested that CMS release a public use file showing the impact of the switch to the Winsorized z-score to allow hospitals to prepare for financial impacts.

Response: We understand commenters' concerns, however, we disagree with commenters' argument that the scoring methodology is extremely complex. We note that TEP members emphasized the proposed methodology offers ease of implementation, transparency, and familiarity to a wide range of stakeholders given their use in other quality measurement initiatives. We also note that the Five-Star Quality Rating System has already adopted Winsorization as part of its rating methodology. To address commenters' specific concerns about peer cohorts, groupings, or stratification, we remind readers that we discussed the ongoing work of NQF, ASPE, MedPAC and other stakeholders regarding risk adjustment in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49572). We will closely examine their findings and recommendations and consider how they apply to our quality programs.

Comment: Commenters expressed concern about the continuing shifts in all of the three performance-based programs due to measures moving in and out of the programs, changing domain weights, and performance and base years. Commenters noted that hospitals are overwhelmed with competing methodologies, varying target rates, and multiple confusing and mixed messages that these measures present when applied under different programs.

Response: We understand commenters' concerns and note that we work to provide education and outreach, as well as public materials, to assist stakeholders with understanding each program. We strive to make the HAC Reduction Program as transparent and straightforward as possible and note that the HAC Reduction Program, the Hospital VBP Program, and the Hospital Readmission Reduction Program have different policy goals. The measures and methodology selected for the HAC Reduction Program cover topics of critical importance to quality improvement in the inpatient hospital setting and to patient safety.

After consideration of the public comments we received, we are finalizing the changes to the scoring methodology discussed above as proposed.

4. Comments on Additional Measures for Potential Future Adoption

We view the addition of other quality measures as a critical component of value-based purchasing, and we are seeking public comments on what additional measures we should consider adopting in the future. We believe that our continued efforts to reduce HACs are vital to improving patients' quality of care and reducing complications and mortality, while simultaneously decreasing costs. The reduction of HACs is an important marker of quality of care and has a positive impact on both patient outcomes and cost of care. Our goal for the HAC Reduction Program is to heighten the awareness of HACs and reduce the number of incidences that occur. We seek to adopt measures for the HAC Reduction Program that promote better, safer, and more efficient care. Our overarching purpose is to support the NQS' three-part aim of better health care for individuals, better health for populations, and lower costs for health care.

To the extent practicable, all HAC Reduction Program measures should be nationally endorsed by a multi-stakeholder organization. Measures should be aligned with best practices among other payers and the needs of the end users of the measures. Measures should take into account widely accepted criteria established in medical literature. We note that all measures proposed for the HAC Reduction Program should follow the criteria established by the DRA of 2005 in that they consist of high-volume or high-cost conditions that could be prevented by the use of evidence-based guidelines.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25123), we welcomed public comment and suggestions for additional HAC Reduction Program measures that will help achieve the program goals in these or other measurement areas.

Comment: Commenters recommended that CMS not include measures based solely on current availability, but rather to include measures that: (1) Have standardized data collection processes; (2) external data validation programs to ensure the accuracy of the data; and (3) have support and endorsement of providers as valid measures to assess quality and cost of care. Commenters noted that by including measures that meet this criteria, CMS will ensure provider engagement and implement a process of assessing quality, cost, and value of care that is transparent. Commenters noted that quality measurement should become more focused on a small number of metrics that emphasize patient-reported and patient-generated data.

Commenters encouraged CMS to add additional measures that address adverse drug events, ventilator-associated events, diagnostic errors, and a broader scope of surgical site infections. One commenter believes that more can be done to improve the early detection and treatment of sepsis in the inpatient setting. One commenter recommended that CMS should add the Severe Sepsis and Septic Shock Management Bundle (NQF #0500) to the HAC Reduction Program. One commenter recommended CMS include measures that incorporate appropriate imaging technology. One commenter noted that there are numerous guidelines regarding the use of ultrasound and a reduction in HACs such as punctures, ruptures, pneumothorax, excessive bleeding, lacerations.

One commenter requested that CMS encourage quality-related activities around blood management and urged CMS to adopt a blood and blood products quality strategy that recognizes blood as a valuable resource that should be preserved through blood management and monitored via quality measures. One commenter requested that CMS adopt quality measures that pertain to wound care in general and continue to work with healthcare professionals and industry in the development of new wound care measures. One commenter stated that the U.S. Wound Registry would serve as an excellent resource in this regard, as it includes numerous wound care measures, some of which could be adopted for inpatient hospital quality programs with little or no modifications to the specifications. One commenter believed that the HAC Reduction Program should include an additional option for Domain 1 that would provide hospitals the ability to report an electronic measure of patient harm derived from electronic health records (EHRs). Finally, one commenter recommended that CMS create a quality measure on Surgical Site Infection (SSI) rates following C-section because it would further drive hospitals to boost their quality of care initiatives around this high-volume surgery.

Response: We thank the public for these views and we will consider them as we develop future policy.

5. Maintenance of Technical Specifications for Quality Measures

Technical specifications for AHRQ's PSI 90 measure in Domain 1 can be found at AHRQ's Web site at: *http://qualityindicators.ahrq.gov/Modules/PSI_TechSpec.aspx.* Technical specifications for the CDC NHSN HAI measures in Domain 2 can be found at CDC's NHSN Web site at: *http://www.cdc.gov/nhsn/acute-care-hospital/*

index.html. Both Web sites provide measure updates and other information necessary to guide hospitals participating in the collection of HAC Reduction Program data.

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50100), we described a policy under which we use a subregulatory process to make nonsubstantive updates to measures used for the HAC Reduction Program. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25123), we did not propose any changes to this policy at this time.

6. Extraordinary Circumstance Exception Policy for the HAC Reduction Program Beginning in FY 2016 and for Subsequent Years

We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49579 through 49581) for a detailed discussion of the exception policy for hospitals located in areas that experience disasters or other extraordinary circumstances for the HAC Reduction Program. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25123 through 25124), we did not propose any changes to this policy for FY 2017.

J. Payment for Graduate Medical Education (GME) and Indirect Medical Education (IME) Costs (§§ 412.105 and 413.75 Through 413.83)

1. Background

Section 1886(h) of the Act, as added by section 9202 of the Consolidated Omnibus Budget Reconciliation Act (COBRA) of 1985 (Pub. L. 99–272) and as currently implemented in the regulations at 42 CFR 413.75 through 413.83, establishes a methodology for determining payments to hospitals for the direct costs of approved graduate medical education (GME) programs. Section 1886(h)(2) of the Act sets forth a methodology for the determination of a hospital-specific base-period per resident amount (PRA) that is calculated by dividing a hospital's allowable direct costs of GME in a base period by its number of full-time equivalent (FTE) residents in the base period. The base period is, for most hospitals, the hospital's cost reporting period beginning in FY 1984 (that is, October 1, 1983 through September 30, 1984). The base year PRA is updated annually for inflation. In general, Medicare direct GME payments are calculated by multiplying the hospital's updated PRA by the weighted number of FTE residents working in all areas of the hospital complex (and at nonprovider sites, when applicable), and the hospital's Medicare share of total inpatient days.

Section 1886(d)(5)(B) of the Act provides for a payment adjustment known as the indirect medical education (IME) adjustment under the IPPS for hospitals that have residents in an approved GME program, in order to account for the higher indirect patient care costs of teaching hospitals relative to nonteaching hospitals. The regulations regarding the calculation of this additional payment are located at 42 CFR 412.105. The hospital's IME adjustment applied to the DRG payments is calculated based on the ratio of the hospital's number of FTE residents training in either the inpatient or outpatient departments of the IPPS hospital to the number of inpatient hospital beds.

The calculation of both direct GME payments and the IME payment adjustment is affected by the number of FTE residents that a hospital is allowed to count. Generally, the greater the number of FTE residents a hospital counts, the greater the amount of Medicare direct GME and IME payments the hospital will receive. In an attempt to end the implicit incentive for hospitals to increase the number of FTE residents, Congress, through the Balanced Budget Act of 1997 (Pub. L. 105–33), established a limit on the number of allopathic and osteopathic residents that a hospital may include in its FTE resident count for direct GME and IME payment purposes. Under section 1886(h)(4)(F) of the Act, for cost reporting periods beginning on or after October 1, 1997, a hospital's unweighted FTE count of residents for purposes of direct GME may not exceed the hospital's unweighted FTE count for direct GME in its most recent cost reporting period ending on or before December 31, 1996. Under section 1886(d)(5)(B)(v) of the Act, a similar limit based on the FTE count for IME during that cost reporting period is applied, effective for discharges occurring on or after October 1, 1997. Dental and podiatric residents are not included in this statutorily mandated cap.

The Affordable Care Act made a number of statutory changes relating to the determination of a hospital's FTE resident limit for direct GME and IME payment purposes and the manner in which FTE resident limits are calculated and applied to hospitals under certain circumstances.

Section 5503(a)(4) of the Affordable Care Act added a new section 1886(h)(8) to the Act to provide for the reduction in FTE resident caps for direct GME under Medicare for certain hospitals training fewer residents than their caps, and to authorize the redistribution of the estimated number of excess FTE resident slots to other qualified hospitals. In addition, section 5503(b) amended section 1886(d)(5)(B)(v) of the Act to require the application of the section 1886(h)(8) of the Act provisions in the same manner to the IME FTE resident caps. The policy implementing section 5503 of the Affordable Care Act was included in the November 24, 2010 CY 2011 OPPS/ASC final rule with comment period (75 FR 72147 through 72212) and the FY 2013 IPPS/LTCH PPS final rule (77 FR 53424 through 53434). Section 5506(a) of the Affordable Care Act amended section 1886(h)(4)(H) of the Act to add a new clause (vi) that instructs the Secretary to establish a process by regulation under which, in the event a teaching hospital closes, the Secretary will permanently increase the FTE resident caps for hospitals that meet certain criteria up to the number of the closed hospital's FTE resident caps. The policy implementing section 5506 of the Affordable Care Act was included in the November 24, 2010 CY 2011 OPPS/ASC final rule with comment period (75 FR 72212 through 72238), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53434 through 53448), and the FY 2015 IPPS/LTCH final rule (79 FR 50122–50140).

2. Change in New Program Growth From 3 Years to 5 Years

a. Urban and Rural Hospitals

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25124), section 1886(h)(4)(H)(i) of the Act requires CMS to establish rules for calculating the direct GME caps of teaching hospitals training residents in new programs established on or after January 1, 1995. Under section 1886(d)(5)(B)(viii) of the Act, these rules also apply to the establishment of a hospital's IME cap. CMS implemented these statutory requirements in the August 29, 1997 **Federal Register** (62 FR 46005) and in the May 12, 1998 **Federal Register** (63 FR 26333). Generally, when CMS (then HCFA) implemented the regulations at 42 CFR 413.79(e)(1) and 42 CFR 412.105(f)(1)(vii), these regulations provided that if a hospital did not train any allopathic or osteopathic residents in its most recent cost reporting period ending on or before December 31, 1996, and it begins to participate in training residents in a new residency program (allopathic or osteopathic) on or after January 1, 1995, the hospital's unweighted FTE resident cap (which would otherwise be zero) may be adjusted based on the sum of the product of the highest number of FTE residents in any program year during

the third year of the first new program, for each new residency training program established during that 3-year period, and the minimum accredited length for each type of program. This 3-year period, which we refer to as the ''3-year window'' for ease of reference in the proposed rule and this final rule, started when a new program began, and the teaching hospital first began to train residents for the first time in that new program, typically on July 1, and ending when the third program year of that first new program ends.

Prior to development of the FY 2013 IPPS/LTCH PPS proposed rule, the teaching hospital community expressed concerns that 3 years do not provide for a sufficient amount of time for a hospital to ''grow'' its new residency programs and to establish FTE resident caps that are properly reflective of the number of FTE residents that it will actually train, once the programs are fully grown. Hospitals explained that 3 years is an insufficient amount of time primarily because a period of 3 years is not compatible with program accreditation requirements, particularly in instances where the qualifying teaching hospital wishes to start more than one new program. Therefore, in the FY 2013 IPPS/LTCH PPS proposed rule and final rule, we proposed and finalized changes to the regulations at 42 CFR 413.79(e) for direct GME and at 42 CFR 412.105(f)(1)(vii) for IME that revised the ''3-year window'' to a ''5-year window,'' for a new teaching hospital to establish and grow a new program, and thus begin training residents for the first time in new programs that are started on or after October 1, 2012. Thus, for urban hospitals that begin to train residents in a new medical residency training program for the first time on or after October 1, 2012, the cap will not be adjusted for new programs established more than 5 years after residents begin training in the first new program. However, rural hospitals are permitted to receive new cap adjustments for participating in training residents in new medical residency training programs at any time, and therefore, under § 413.79(e)(3), if a rural hospital participates in new medical residency training programs on or after October 1, 2012, the hospital's cap is adjusted for each new program based on a 5-year growth window. We refer readers to the FY 2013 IPPS/LTCH PPS final rule for more details on this change in the regulations regarding the 5-year window for urban hospitals training residents in new medical residency training programs for the first time and for rural hospitals participating in new medical residency training programs (77 FR 53416 through 53424).

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50111), we changed our policy regarding implementation of the FTE resident caps for new programs to be effective with the beginning of the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year of the first new program started for hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(1), and beginning with the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year of each individual new program started for rural hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(3). In the same final rule, we also made the effective dates of the 3-year rolling average and IME IRB ratio cap consistent with the effective date of the new program FTE resident caps. That is, beginning with the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year of the first new program started for hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(1), and beginning with the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year of each individual new program started for rural hospitals for which the FTE cap may be adjusted in accordance with § 413.79(e)(3), FTE residents participating in new medical residency training programs are included in the hospital's IRB ratio cap and the 3-year rolling average.

b. Policy Changes Relating to Rural Training Tracks at Urban Hospitals

To encourage the training of residents in rural areas, section 407(c) of the Medicare, Medicaid, and SCHIP Balanced Budget Refinement Act of 1999 (Pub. L. 106–113) amended section 1886(h)(4)(H) of the Act to add a provision (subsection (iv)) that, in the case of a hospital that is not located in a rural area (an urban hospital) that establishes separately accredited approved medical residency training programs (or rural tracks) in a rural area or has an accredited training program with an integrated rural track, the Secretary shall adjust the urban hospital's cap on the number of FTE residents under subsection (F), in an appropriate manner in order to encourage training of physicians in rural areas. Section 407(c) of Pub. L. 106–113 was made effective for direct GME payments to hospitals for cost reporting periods beginning on or after April 1, 2000, and for IME payments applicable to discharges occurring on or after April 1, 2000. We refer readers to the August 1, 2000 interim final rule with comment period (65 FR 47033 through 47037) and the FY 2002 IPPS final rule (66 FR 39902 through 39909) where we implemented section 407(c) of Pub. L. 106–113. The regulations for establishing rural track FTE limitations are located at 42 CFR 413.79(k) for direct GME and at 42 CFR 412.105(f)(1)(x) for IME.

In the August 1, 2003 IPPS final rule (68 FR 45456 through 45457), we clarified our existing policy that although the rural track provision allows an increase to the urban hospital's FTE cap, sections 1886(h)(4)(H)(iv) and 1886(d)(5)(B) of the Act do not provide for an exclusion from the rolling average for the urban hospital for those FTE residents training in a rural track. These provisions are interpreted to mean that, except for new rural track programs begun by urban teaching hospitals that are establishing an FTE cap for the first time, when an urban hospital with an FTE resident cap establishes a new rural track program or expands an existing rural track program, FTE residents in the rural track that are counted by the urban hospital are included in the hospital's rolling average calculation immediately. This policy is reflected in the regulation at § 412.105(f)(1)(v)(F) for IME and § 413.79(d)(7) for direct GME, and applies for IME and direct GME to cost reporting periods beginning on or after April 1, 2000.

We received questions asking whether the change in the 3-year window to the 5-year window for new programs also applies to the establishment of rural training tracks. In the FY 2013 IPPS/LTCH PPS final rule, when we amended the regulations to provide for a 5-year new program growth window at § 413.79(e) for direct GME and at § 412.105(f)(1)(vii) for IME, and in the FY 2015 IPPS/LTCH PPS final rule when we made the FTE resident caps of new programs to be effective with the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year, we inadvertently did not also change the growth window and effective date of FTE limitations for rural training tracks, which, under existing § 413.79(k) for direct GME and § 412.105(f)(1)(x) for IME, is 3 program years, and is effective after 3 program years, respectively.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25125), we proposed to revise the regulations at § 413.79(k) (and which, in turn, would

affect IME adjustments under § 412.105(f)(1)(x)) to permit that, in the first 5 program years (rather than the first 3 program years) of the rural track's existence, the rural track FTE limitation for each urban hospital would be the actual number of FTE residents training in the rural training track at the urban hospital, and beginning with the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural training track's existence, the rural track FTE limitation would take effect. This proposed change addresses concerns expressed by the hospital community that rural training tracks, like any program, should have a sufficient amount of time for a hospital to ''grow'' and to establish a rural track FTE limitation that reflects the number of FTE residents that it will actually train, once the program is fully grown.

However, as stated above, due to the statutory language at sections 1886(d)(5)(B) and 1886(h)(4)(H)(iv) of the Act as implemented in our regulations at §§ 412.105(f)(1)(v)(F) and 413.79(d)(7), except for new rural track programs begun by urban teaching hospitals that are establishing an FTE cap for the first time, FTE residents in a rural track training program at the urban hospital are subject immediately to the 3-year rolling average for direct GME and IME. In addition, under the regulations at § 412.105(a)(1)(i), no exception to the IME intern- and resident-to-bed (IRB) ratio cap is provided for residents in a rural track training program (except for new rural track programs begun by urban teaching hospitals that are establishing an FTE cap for the first time). Accordingly, while we proposed that the urban hospital's rural track FTE limitation would first be effective beginning with the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track training program's existence, the rural track training program's FTEs are included in the 3-year rolling average and are subject to the IME IRB ratio cap for hospitals with established FTE caps, even within the first 5 program years prior to the beginning of the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track training program's existence.

We note that, for programs with cost reporting periods beginning on or after October 1, 2003, our regulations at §§ 413.79(k)(1) through (k)(4) are divided between rural track FTE limitation adjustments for urban hospitals where the residents rotate to a rural area for more than one half of the duration of the program (§§ 413.79(k)(1) and (k)(2)), and where the residents rotate to a rural area for less than one-half of the duration of the program (§§ 413.79(k)(3) and (k)(4)). As we explained in the August 1, 2003 IPPS final rule (68 FR 45456 through 45458), ''duration of the program'' refers to the minimum accredited length of the particular specialty of the rural track training program. We clarified under the proposal that, although the urban hospital's rural track FTE limitation would not be effective until the beginning of the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track training program's existence, the rural track FTE limitation that would be provided, if any, is still subject to whether or not the urban hospital rotates the residents in the rural track training program to a rural area(s) for more than one-half of the ''duration of the program,'' and whether or not the urban hospital complies with existing §§ 413.79(k)(5) and (k)(6), and the proposed revised § 413.79(k)(7). In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25126), we proposed to revise § 413.79(k)(7), which specifies the effect on rural track FTE limitations when previously rural areas become urban areas due to updates in the OMB standards for delineating urban and rural areas, because the existing paragraphs under § 413.79(k)(7) discuss the ''3-year'' growth period. Consequently, we stated in the proposed rule that we need to make conforming changes by revising paragraphs (k)(7)(ii) and (iii) to account for rural track training programs started prior to October 1, 2012. (For more information regarding the effect on rural track FTE limitations when OMB makes changes to its standards for delineating statistical areas, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50113 through 50117).)

c. Effective Date

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50111), when we provided that the policy regarding the effective dates of the FTE residency caps, the 3-year rolling average, and the IRB ratio cap for FTE residents in new medical residency training programs would be effective with the applicable hospital's cost reporting period that coincides with or follows the start of the sixth program year of the first new program started, we stated that this policy would be effective for urban hospitals that first begin to participate in training residents in their first new medical residency training program, and for rural hospitals, on or after October 1, 2012. We finalized this as the effective date because the policy providing a 5-year growth period for establishing the FTE resident caps (§§ 413.79(e)(1) and (e)(3)) was also effective for new programs started on or after October 1, 2012. Because we inadvertently did not also amend the separate regulations at § 412.105(f)(1)(x) and § 413.79(k) regarding the growth window and effective date of FTE limitations for rural track training programs when we amended the regulations regarding the 5-year growth window in the FY 2013 IPPS/LTCH PPS final rule and regarding the additional changes we made in the FY 2015 IPPS/LTCH PPS final rule, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25126), we proposed that the effective date regarding the change in the growth window for rural track training programs from 3 years to 5 years also be effective for rural track training programs started on or after October 1, 2012. We acknowledged that there could be urban hospitals that started a rural track training program after October 1, 2012 (likely on July 1, 2013) for which rural track FTE limitations would become effective under current policy after 3 years (likely on July 1, 2016). We proposed that, if our proposal is finalized, we would not actually apply the rural track FTE limitations that would have become effective for these hospitals after 3 program years. Instead, the rural track FTE limitations for these hospitals would be the actual number of FTE residents training in the rural track (subject to the rolling average at § 413.79(d)(7) and the IME IRB ratio cap at § 412.105(a)(1)(i), if applicable) for an additional 2 years (from July 1, 2016 through June 30, 2018), and the rural track FTE limitations would become effective with the cost reporting period that coincides with or follows the start of the sixth program year, which in this example would be July 1, 2018.

In summary, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25126), we proposed to revise the direct GME regulations at § 413.79(k) (and which, in turn, would affect IME adjustments under § 412.105(f)(1)(x)) to permit that, effective with rural track training programs started on or after October 1, 2012, in the first 5 program years of the rural track's existence, the rural track FTE limitation for each urban hospital would be the actual number of FTE residents (subject to the rolling average at § 413.79(d)(7) and the IME IRB ratio cap at § 412.105(a)(1)(i), if applicable), training in the rural track training program at the urban hospital, and the rural track FTE limitation would take

effect beginning with the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track training program's existence.

We invited public comment on this proposal.

Comment: Commenters supported the policy changes as proposed.

Response: We appreciate the commenters' support.

Comment: Some commenters objected to the fact that CMS did not exempt rural training track programs from the 3-year rolling average and the IME IRB ratio cap in the proposal. These commenters claimed that immediate implementation of the rolling average and the IME IRB ratio cap are ''extremely detrimental'' to hospitals' ability to establish new rural tracks, as the training costs would not be fully paid in the initial years of the program's establishment.

Response: We understand the payment concerns resulting from immediate application of the rolling average and IRB cap to rural track programs. However, we note that we did not propose any changes with regard to these policies. Rather, we reiterated our current policy, as reflected in the regulations at § 412.105(f)(1)(v)(F) for IME and § 413.79(d)(7) for direct GME, effective for cost reporting periods beginning on or after April 1, 2000. In the FY 2017 IPPS/LTCH proposed rule (81 FR 25125), we referred to the August 1, 2003 IPPS final rule (68 FR 45456 through 45457), where we clarified our existing policy that sections 1886(h)(4)(H)(iv) and 1886(d)(5)(B) of the Act do not provide for an exclusion from the rolling average for the urban hospital for those FTE residents training in a rural track. These provisions are interpreted to mean that, except for new rural track programs begun by urban teaching hospitals that are establishing an FTE cap for the first time, when an urban hospital with an FTE resident cap establishes a new rural track program or expands an existing rural track program, FTE residents in the rural track that are counted by the urban hospital are included in the hospital's rolling average calculation immediately.

Comment: One commenter requested that CMS confirm that a FTE resident cap adjustment for a rural teaching hospital participating in the rural track is only permitted in those cases where the approved residency program meets the CMS criteria for being a newly established program.

Response: We confirm the commenter's statement. Section 1886(h)(4)(H)(iv) of the Act provides for a FTE resident cap adjustment for an urban hospital that establishes separately accredited rural tracks; the statute does not provide for a similar adjustment to rural hospitals participating in rural tracks. Accordingly, only if the program is considered new for Medicare payment purposes can the rural teaching hospital also receive a resident cap adjustment for the program. Under § 413.79(e)(3), any time that a rural hospital participates in training residents in a new program, the rural hospital may receive an increase to its FTE resident caps. We refer readers to the FY 2010 IPPS/LTCH PPS final rule for the criteria identifying a new program for Medicare payment purposes (74 FR 43908 through 43917).

Comment: Many commenters expressed concern about the future of primary care and family practice in rural areas of the country. The commenters requested that CMS make additional policy changes that result in greater numbers of primary care physicians. One commenter specifically requested changes that would facilitate increased training of residents in emergency medicine. The commenters also requested that CMS allow additional opportunities through which rural hospitals, as well as urban hospitals that form rural training track programs, can increase their FTE resident caps and direct GME PRAs. Along those lines, some commenters requested that CMS revise its definition of a teaching hospital so that hospitals can choose to train residents but remain exempt from limits like FTE resident caps and PRAs. A number of commenters suggested that CMS relax its definition of ''newly established program'' to allow urban hospitals to establish new rural tracks that can establish their own cap limits. Another commenter requested that CMS allow any approved residency program in any specialty that meets the definition of ''rural track or integrated rural track'' at § 413.75 to be treated as such, even if it does not have approval as a rural track from the relevant accrediting body.

Response: We believe that these comments are outside of the scope of our proposal. The proposal was limited to conforming the window in which rural training track programs can establish their rural track FTE limitation to the 5-year window in which a new teaching hospital can establish new FTE resident caps, as described in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53416 through 53424). Therefore, we are not addressing these comments in this final rule.

Comment: Commenters asked CMS to clarify the circumstances under which rural hospitals can increase their FTE resident caps.

Response: Rural hospitals are permitted to receive cap adjustments for participating in training residents in new medical residency training programs at any time. Therefore, under § 413.79(e)(3), if a rural hospital participates in new medical residency training programs on or after October 1, 2012, the hospital's cap is adjusted for each new program based on a 5-year growth window. We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53416 through 53424) for more details on this change in the regulations regarding the 5-year window for urban hospitals training residents in new medical residency training programs for the first time and for rural hospitals participating in new medical residency training programs. In addition, to determine if a program is a new medical residency training program for which a rural hospital could receive cap adjustments, as opposed to an expansion of an existing program, we refer readers to the discussion and criteria in the FY 2010 IPPS/LTCH PPS final rule (74 FR 43908 through 43917). In that final rule, we explained that in order to determine whether a program is new and whether, as a result, a hospital qualifies for an FTE cap adjustment, the supporting factors that a hospital should consider are (but not limited to) as follows:

- Is the program director new?
- Is the teaching staff new?
- Are there new residents?

In determining whether a particular program is a newly established one, it may also be necessary to consider factors such as the relationship between hospitals (for example, common ownership or a shared medical school or teaching relationship) and the degree to which the hospital with the original program continues to operate its own program in the same specialty. In addition, the following factors could also be considered:

- Has this program been relocated from a hospital that closed?
- If so, was this program part of the closed hospital's FTE cap determination?
- More generally, is this program part of any existing hospital's FTE cap determination?

We would not consider a transferred program to be new in the case where the program director, teaching staff, and residents are the same as another program that closed in another hospital and the first hospital remains open, or when an FTE cap that was associated with the first program is still available for use by an existing provider.

Comment: One commenter requested that CMS provide a detailed example of how the urban cap adjustment and (if applicable) the rural cap adjustment are calculated at the start of the sixth year of the rural training track. The commenter requested that the example specify how the cap calculation is impacted by time spent by residents in the urban training site versus the rural training site.

Response: We appreciate the commenter's request for a detailed example of the calculation of the urban (and rural, if applicable) FTE resident caps adjustments after the close of the fifth program year of the rural track, as it provides the opportunity to clarify this calculation in the context of rural tracks, which we did not do in the proposed rule. The rural track FTE limitation for the urban hospital, and the FTE resident cap adjustment for the rural hospital (if the rural track is a new program), would be calculated in the same manner as the FTE resident caps are calculated for urban hospitals first participating in training residents in new programs and rural hospitals participating in new programs at §§ 413.79(e)(1) and (e)(3). Because the goal of our proposal was to conform the policies for calculating the rural track FTE limitation and FTE resident cap adjustment to those adopted in FYs 2013 and 2015, effective for rural track training programs started on or after October 1, 2012, we are conforming the methodology for calculating the rural track FTE limitations at § 413.79(k) to the methodology that is already at §§ 413.79(e)(1) and (c)(3) for calculating the FTE resident caps of new teaching hospitals. The regulations at §§ 413.79(e)(1) and (e)(3) state that the FTE resident cap adjustment is the sum of the product of 3 factors: (1) The highest total number of FTE residents trained in any program year, during the fifth year of the first new program's existence at all of the hospitals to which the residents in that program rotate; (2) the number of years in which residents are expected to complete the program, based on the minimum accredited length for each type of program; and (3) the ratio of the number of FTE residents in the new program that trained at the hospital over the entire 5-year period to the total number of FTE residents that trained at all hospitals over the entire 5-year period. This methodology accounts for the common scenario where residents spend time training at more than one hospital (and also nonprovider settings) during the 5-year growth window, and apportions the total FTE resident caps between or among the participating hospitals. The FY 2015 IPPS/LTCH PPS final rule (79 FR 50106 through 50107) contains an example of how the FTE resident caps are calculated after 5 years, and are apportioned between participating hospitals, one hospital being a new teaching hospital that qualifies for FTE resident cap adjustments, and one being an existing teaching hospital with an already established FTE resident caps. The formula requires determining the share of the overall FTE resident caps at both hospitals to ensure proper apportionment. Therefore, this methodology is used to determine and apportion the FTE resident caps of the urban hospital, when the rural track is not a new program, or the urban and rural hospitals, when the rural track program is a new program. Although the example in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50106 through 50107) illustrates the methodology, we are providing an additional example where residents train at an urban hospital, a rural hospital, and at a rural nonprovider site. Under § 413.78(g), if a hospital (or hospitals, urban or rural) incurs the cost of the resident's salary and fringe benefits while training at the nonprovider site and meets the other conditions set forth in the regulations, the hospital may count that FTE training time for IME and direct GME purposes, on the hospital's cost report in the current training year, but also when determining the hospital's share of the new program FTE resident cap adjustments. Following is the example:

Urban Hospital and Rural Hospital jointly sponsor a separately accredited rural track program. The program is in family medicine (3 years minimum accredited length), and is accredited for a total of 6 residents, 2 in each program year (PGY). The Urban Hospital and Rural Hospital do have previously existing FTE resident caps; however, neither trains residents in an existing family medicine program. The family medicine rural track is newly created, and meets the newness criteria as described in the FY 2010 IPPS/LTCH PPS final rule (74 FR 43908 through 43917) and other applicable requirements at § 413.78(g). Therefore, Rural Hospital may receive an increase to its FTE resident caps for the rural track program. In addition, Urban Hospital complies with the criteria at § 413.79(k)(5). The residents spend PGY1 at Urban Hospital, and then the PGY2s and PGY3s rotate to a rural area, to train at both Rural Hospital and Rural Clinic (a nonprovider site). The PGY2 and PGY3 residents, while mostly assigned to the rural area, do come back to the Urban Hospital for some required training. However, the residents spend more than 50 percent of the duration of the 3 year program in the rural area. Therefore, Urban Hospital qualifies to receive a rural track FTE limitation. Rural Hospital incurs the cost of the salaries and fringe benefits of the residents for the time spent training at Rural Clinic and meets other applicable requirements at § 413.78(g) to be able to count the time residents spend training at the Rural Clinic. The rotations and the cap calculation are as follows:

Year 1	Year 2	Year 3	Year 4	Year 5
PGY1 2.0 Urban Hospital ..	PGY1 2.0 Urban Hospital	PGY1 2.0 Urban Hospital	PGY1 2.0 Urban Hospital	PGY1 2.0 Urban Hospital.
PGY2 0	PGY2 2 @.90 Rural Hospital and Rural Clinic (1.8), 2 @.10 Urban Hospital (.20).	PGY2 2 @.90 Rural Hospital and Rural Clinic (1.8), 2 @.10 Urban Hospital (.20).	PGY2 2 @.90 Rural Hospital and Rural Clinic (1.8), 2 @.10 Urban Hospital (.20).	PGY2 2 @.90 Rural Hospital and Rural Clinic (1.8), 2 @.10 Urban Hospital (.20).
PGY3 0	PGY3 0	PGY3 2 @.95 Rural Hospital and Rural Clinic (1.9), 2 @.05 Urban Hospital (.10).	PGY3 2 @.95 Rural Hospital and Rural Clinic (1.9), 2 @.05 Urban Hospital (.10).	PGY3 2 @.95 Rural Hospital and Rural Clinic (1.9), 2 @.05 Urban Hospital (.10).
TOTAL 2.0	TOTAL 4.0	TOTAL 6.0	TOTAL 6.0	TOTAL 6.0 5 Year Total = 24.

Urban Hospital's 5 YEAR FTE TOTAL = 11.1.

Rural Hospital's 5 YEAR FTE TOTAL (includes time at Rural Clinic) = 12.9.

5 Year FTE Total = 24.

Step 1: Highest number of FTE residents training in any program year

during fifth year across all participating hospitals is 2.0:

PGY 1s = 2.0.
PGY 2s = 2.0.
PGY 3s = 2.0.

Step 2: 2.0 × 3 (minimum accredited length) = 6.

Step 3: Urban Hospital's cap adjustment is based on the ratio of training at Urban Hospital over all 5 years to the total training that is occurring at all sites over all 5 years: 6 × [11.1/(24)] = 2.76.

Step 4: Rural Hospital's cap adjustment is based on the ratio of training at Rural Hospital and Rural Clinic over all 5 years to the total training that is occurring at all sites over all 5 years: 6 × [12.9/(24)] = 3.24.

2.76 + 3.24 = 6.0, the total cap assignment does not exceed the total number of accredited slots. Urban Hospital's rural track FTE limitation is 2.76. Rural Hospital's FTE cap adjustment is 3.24. (We note that this calculation is done separately for IME and direct GME caps respectively.)

We also proposed to amend the regulations at § 413.79(k) (and which, in turn, would affect IME adjustments under § 412.105(f)(1)(x)) to reflect that, effective with rural track programs started on or after October 1, 2012, the rural track FTE limitation is calculated consistent with the methodology for new programs at § 413.79(e)(1) for urban hospitals and (e)(3) for rural hospitals.

After consideration of the public comments we received, we are finalizing our proposed revision of the regulations at § 413.79(k) (and which, in turn, will affect IME adjustments under § 412.105(f)(1)(x)), with the technical corrections described below, to permit that, in the first 5 program years (rather than the first 3 program years) of the rural track's existence, the rural track FTE limitation for each urban hospital will be the actual number of FTE residents training in the rural training track at the urban hospital (subject to the rolling average at § 413.79(d)(7) and the IME ratio cap at § 412.105(a)(1)(i), if, applicable), and beginning with the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural training track's existence, the rural track FTE limitation will take effect.

In finalizing the proposed revisions to § 413.79, we reviewed the regulatory text as a whole and are making some technical corrections to the regulations text throughout § 413.79(k) as follows:

- At § 413.79(k)(1)(ii), we are removing the phrase ''or the rural hospital(s)'' from this paragraph because it is technically inaccurate; § 413.79(k)(1) specifies what the urban hospital may include in its FTE count and the regulation text at § 413.79(k)(1)(ii) inadvertently references training at the rural hospital, which cannot be included. Therefore, we are revising the regulation text by removing the phrase ''or the rural hospital(s)''. The provision now specifies that, for rural track programs started prior to October 1, 2012, beginning with the fourth year of the rural track's existence, the rural track FTE limitation is equal to the product of the highest number of residents, in any program year, who during the third year of the rural track's existence are training in the rural track at the urban hospital and are designated at the beginning of their training to be rotated to the rural hospital(s) for at least two-thirds of the duration of the program for cost reporting periods beginning on or after April 1, 2000, and before October 1, 2002, or for more than one-half of the duration of the program effective for cost reporting periods beginning on or after October 1, 2003, and the number of years those residents are training at the urban hospital.
- Throughout § 413.79(k), we are replacing the term ''nonhospital'' site with ''nonprovider'' site, consistent with section 5504 of the Affordable Care Act, titled ''Counting Resident Time in Non-Provider Settings,'' which refers to ''nonprovider setting[s]'' instead of ''nonhospital setting.''
- At § 413.79(k)(4), we are updating and correcting the reference to counting time in nonprovider settings from ''§ 413.78(d)'' to ''§ 413.78(d) through (g)''.
- At § 413.79(k)(4)(ii)(B)(*2*), we are inserting the italicized language to clarify the mathematical calculation, as follows: The *ratio of the* length of time in which the residents are training at the rural nonprovider site(s) only *to the total duration of the program.* The inserted italized language clarifies the precise ratio by which to apportion the urban hospital's rural track FTE limitation to reflect the amount of time the FTE residents spend at the rural nonprovider site. (We note that we had proposed to revise § 413.79(k)(4)(ii) as part of our proposal that, effective with rural track training programs started on or after October 1, 2012, the rural track FTE limitation would take effect beginning with the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track training program's existence. In addition to this proposed change to the regulations text that we are finalizing, we are finalizing, with modification, § 413.79(k)(4)(ii)(B)(*2*) to insert the italicized language above to clarify the mathematical calculation.)

3. Notice of Closure of Teaching Hospital and Opportunity To Apply for Available Slots

a. Background

Section 5506 of the Patient Protection and Affordable Care Act (Pub. L. 111–148), as amended by the Health Care and Education Reconciliation Act of 2010 (Pub. L. 111–152) (collectively, the ''Affordable Care Act''), ''Preservation of Resident Cap Positions from Closed Hospitals,'' authorizes the Secretary to redistribute residency slots after a hospital that trained residents in an approved medical residency program closes. Specifically, section 5506 of the Affordable Care Act amended the Act by adding subsection (vi) to section 1886(h)(4)(H) of the Act and modifying language at section 1886(d)(5)(B)(v) of the Act, to instruct the Secretary to establish a process to increase the FTE resident caps for other hospitals based upon the FTE resident caps in teaching hospitals that closed ''on or after a date that is 2 years before the date of enactment'' (that is, March 23, 2008). In the November 24, 2010 CY 2011 Outpatient Prospective Payment System (OPPS) final rule (75 FR 72212), we established regulations and an application process for qualifying hospitals to apply to CMS to receive direct graduate medical education (GME) and indirect medical education (IME) FTE resident cap slots from the hospital that closed. We made certain modifications to those regulations in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53434), and we made changes to the Section 5506 application process in the FY 2015 IPPS/LTCH final rule (79 FR 50122 through 50134). The procedures we established apply both to teaching hospitals that closed on or after March 23, 2008, and on or before August 3, 2010, and to teaching hospitals that closed after August 3, 2010.

b. Notice of Closure of the Pacific Hospital of Long Beach, CA and Application Process—Round 8

CMS has learned of the closure of Pacific Hospital of Long Beach, Long Beach, CA (CCN 050277). The purpose of this notice is to notify the public of the closure of this teaching hospital, and to initiate another round of the application and selection process described in section 5506 of the Affordable Care Act. This round will be the eighth round (''Round 8'') of the application and selection process. The table below contains the identifying information and IME and direct GME

caps for the closed teaching hospital, which is part of the Round 8 application process under section 5506 of the Affordable Care Act.

CCN	Provider name	City and state	CBSA code	Terminating date	IME cap (including +/− MMA Sec. 422 [1] adjustments)	Direct GME cap (including +/− MMA Sec. 422 [1] adjustments)
050277	Pacific Hospital of Long Beach.	Long Beach, CA ..	31084	August 1, 2013	14.47 + 6.00 section 422 increase = 20.47 [2].	19.92 + 6.00 section 422 increase = 25.92.[3]

[1] Section 422 of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA), Pub. L. 108–173, redistributed unused IME and direct GME residency slots effective July 1, 2005.

[2] Pacific Hospital's 1996 IME FTE cap is 14.47. Under section 422 of the MMA, the hospital received an increase of 6 to its IME FTE cap: 14.47 + 6.00 =20.47. We note that, under 42 CFR 412.105(d)(4), IME cap slots associated with an increase received under section 422 of the MMA are to be paid with a multiplier of 0.66.

[3] Pacific Hospital's 1996 direct GME FTE cap is 19.92. Under section 422 of the MMA, the hospital received an increase of 6 to its direct GME FTE cap: 19.92 + 6.00 =25.92. We note that under 42 CFR 413.77(g), direct GME FTE cap slots associated with an increase received under section 422 of the MMA are to be paid using the appropriate locality-adjusted national average PRA.

c. Notice of Closure of the Huey P. Long Medical Center, Pineville, LA and Application Process—Round 9

CMS has learned of the closure of Huey P. Long Medical Center, Pineville, LA (CCN 190009). The purpose of this notice is to notify the public of the closure of this teaching hospital, and to initiate another round of the application and selection process described in section 5506 of the Affordable Care Act. This round will be the ninth round (''Round 9'') of the application and selection process. The table below contains the identifying information and the IME and direct GME caps for the closed teaching hospital, which is part of the Round 9 application process under section 5506 of the Affordable Care Act:

CCN	Provider name	City and state	CBSA code	Terminating date	IME Cap (including +/− ACA Sec. 5503 [1] adjustments)	Direct GME Cap (including +/− ACA Sec. 5503 [1] adjustments)
190009	Huey P. Long Medical Center.	Pineville, LA	10780	June 30, 2014	13.00 − 1.96 section 5503 reduction = 11.04 [2].	13.00 − 1.96 section 5503 reduction = 11.04.[3]

[1] Section 5503 of the Affordable Care Act of 2010 (ACA), Public Laws 111–148 and 111–152, redistributed unused IME and direct GME residency slots effective July 1, 2011.

[2] Huey P. Long Medical Center's 1996 IME FTE cap is 13.00. Under section 5503 of the ACA, the hospital received a reduction of 1.96 to its IME FTE cap: 13.00 − 1.96 = 11.04.

[3] Huey P. Long Medical Center's 1996 direct GME FTE cap is 13.00. Under section 5503 of the ACA, the hospital received a reduction of 1.96 to its direct GME FTE cap: 13.00 − 1.96 = 11.04.

d. Notice of Closure of St. Joseph's Hospital, Philadelphia, PA and Application Process—Round 10

CMS has learned of the closure of St. Joseph's Hospital, Philadelphia, PA (CCN 390132). The purpose of this notice is to notify the public of the closure of this teaching hospital, and to initiate another round of the application and selection process described in section 5506 of the Affordable Care Act. This round will be the 10th round (''Round 10'') of the application and selection process. The table below contains the identifying information and the IME and direct GME caps for the closed teaching hospital, which is part of the Round 10 application process under section 5506 of the Affordable Care Act:

CCN	Provider name	City and state	CBSA code	Terminating date	IME Cap (including +/− MMA Sec. 422 [1] and ACA Sec. 5503 [2] adjustments)	Direct GME Cap (including +/− MMA Sec. 422 [1] and ACA Sec. 5503 [2] adjustments)
390132	St. Joseph's Hospital.	Philadelphia, PA ...	37964	March 13, 2016 ...	9.51 − 0.43 section 422 reduction − 0.73 section 5503 reduction = 8.35 [3].	9.51 − 0.43 section 422 reduction − 0.73 section 5503 reduction = 8.35.[4]

[1] Section 422 of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA), Pub. L. 108–173, redistributed unused IME and direct GME residency slots effective July 1, 2005.

[2] Section 5503 of the Affordable Care Act of 2010 (ACA), Public Laws 111–148 and 111–152, redistributed unused IME and direct GME residency slots effective July 1, 2011.

[3] St. Joseph's Hospital's 1996 IME FTE cap is 9.51. Under section 422 of the MMA, the hospital received a reduction of 0.43 to its IME FTE cap, and under section 5503 of the ACA, the hospital received a reduction of 0.73 to its IME FTE cap: 9.51 − 0.43 − 0.73 = 8.35.

[4] St. Joseph's Hospital's 1996 direct GME FTE cap is 9.51. Under section 422 of the MMA, the hospital received a reduction of 0.43 to its direct GME FTE cap, and under section 5503 of the ACA, the hospital received a reduction of 0.73 to its direct GME FTE cap: 9.51 − 0.43 − 0.73 = 8.35.

e. Application Process for Available Resident Slots

The application period for hospitals to apply for slots under section 5506 is 90 days following notification to the public of a hospital closure. Therefore, hospitals wishing to apply for and receive slots from the above hospitals' FTE resident caps must submit applications directly to the CMS Central Office no later than October 31, 2016. The mailing address for the CMS Central Office is included on the application form. Applications must be received by the October 31, 2016 deadline date. It is *not* sufficient for applications to be postmarked by this date.

We note that an applying hospital may apply for any or all of the three rounds of section 5506 applications that were announced in this final rule. However, a separate application must be submitted for each round for which a hospital wishes to apply.

After an applying hospital sends a hard copy of a section 5506 application to the CMS Central Office mailing address, it must also send an email to: *ACA5506application@cms.hhs.gov.* In the email, the hospital should state: ''On behalf of [insert hospital name and Medicare CCN#], I, [insert your name], am sending this email to notify CMS that I have mailed to CMS a hard copy of a section 5506 application under Round [8, or 9, or 10] due to the closure of [Pacific Hospital of Long Beach, or Huey P. Long Medical Center, or St. Joseph's Hospital]. If you have any questions, please contact me at [insert phone number] or [insert your email address].'' An applying hospital should not attach an electronic copy of the application to the email. The email will only serve to notify the CMS Central Office to expect a hard copy application, which should be mailed to the CMS Central Office.

In the CY 2011 OPPS/ASC final rule with comment period, we did not establish a deadline by when CMS will issue the final determinations to hospitals that receive slots under section 5506 of the Affordable Care Act. However, we review all applications received by the deadline, and notify applicants of our determinations as soon as possible.

We refer readers to the CMS Web site at *http://www.cms.gov/Medicare/Medicare-Fee-for-ServicePayment/AcuteInpatientPPS/dgme.html* to download a copy of the application form (Section 5506 CMS Application Form) that hospitals are to use to apply for slots under section 5506. We also refer readers to this same Web site to access a copy of the FY 2015 IPPS/LTCH PPS final rule (79 FR 50122 through 50140) and a list of additional section 5506 guidelines for an explanation of the policy and procedures for applying for slots, and the redistribution of the slots under sections 1886(h)(4)(H)(vi) and 1886(d)(5)(B)(v) of the Act.

K. Rural Community Hospital Demonstration Program

1. Background

Section 410A(a) of Pub. L. 108–173 required the Secretary to establish a demonstration program to test the feasibility and advisability of establishing ''rural community'' hospitals to furnish covered inpatient hospital services to Medicare beneficiaries. The demonstration pays rural community hospitals under a reasonable cost-based methodology for Medicare payment purposes for covered inpatient hospital services furnished to Medicare beneficiaries. A rural community hospital, as defined in section 410A(f)(1), is a hospital that—

- Is located in a rural area (as defined in section 1886(d)(2)(D) of the Act) or is treated as being located in a rural area under section 1886(d)(8)(E) of the Act;
- Has fewer than 51 beds (excluding beds in a distinct part psychiatric or rehabilitation unit) as reported in its most recent cost report;
- Provides 24-hour emergency care services; and
- Is not designated or eligible for designation as a CAH under section 1820 of the Act.

Section 410A(a)(4) of Pub. L. 108–173 specified that the Secretary was to select for participation no more than 15 rural community hospitals in rural areas of States that the Secretary identified as having low population densities. Using 2002 data from the U.S Census Bureau, we identified the 10 States with the lowest population density in which rural community hospitals were to be located in order to participate in the demonstration: Alaska, Idaho, Montana, Nebraska, Nevada, New Mexico, North Dakota, South Dakota, Utah, and Wyoming (Source: U.S. Census Bureau, Statistical Abstract of the United States: 2003).

CMS originally solicited applicants for the demonstration in May 2004; 13 hospitals began participation with cost reporting periods beginning on or after October 1, 2004. In 2005, 4 of these 13 hospitals withdrew from the program and converted to CAH status. This left 9 hospitals participating at that time. In 2008, we announced a solicitation for up to 6 additional hospitals to participate in the demonstration program. Four additional hospitals were selected to participate under this solicitation. These 4 additional hospitals began under the demonstration payment methodology with the hospital's first cost reporting period starting on or after July 1, 2008. At that time, 13 hospitals were participating in the demonstration.

Five hospitals (3 of the hospitals were among the 13 hospitals that were original participants in the demonstration program and 2 of the hospitals were among the 4 hospitals that began the demonstration program in 2008) withdrew from the demonstration program during CYs 2009 and 2010. (Three of these hospitals indicated that they would be paid more for Medicare inpatient hospital services under the rebasing option allowed under the SCH methodology provided for under section 122 of the Medicare Improvements for Patients and Providers Act of 2008 (Pub. L. 110–275). One hospital restructured to become a CAH, and one hospital closed.) In CY 2011, one hospital that was among the original set of hospitals that participated in the demonstration withdrew from the demonstration. These actions left seven of the originally participating hospitals (that is, hospitals that were selected to participate in either 2004 or 2008) participating in the demonstration program as of June 1, 2011.

Sections 3123 and 10313 of the Affordable Care Act (Pub. L. 111–148) amended section 410A of Pub. L. 108–173, changing the rural community hospital demonstration program in several ways. First, the Secretary is required to conduct the demonstration program for an additional 5-year period, to begin on the date immediately following the last day of the initial 5-year period. Further, the Affordable Care Act requires, in the case of a rural community hospital that is participating in the demonstration program as of the last day of the initial 5-year period, the Secretary to provide for the continued participation of such rural hospital in the demonstration program during the 5-year extension period, unless the hospital makes an election to discontinue participation.

In addition, the Affordable Care Act provides that, during the 5-year extension period, the Secretary shall expand the number of States with low population densities determined by the Secretary to 20. Further, the Secretary is required to use the same criteria and data that the Secretary used to determine the States for purposes of the initial 5-year period. The Affordable Care Act also allows not more than 30

rural community hospitals in such States to participate in the demonstration program during the 5-year extension period.

We published a solicitation for applications for additional participants in the rural community hospital demonstration program in the **Federal Register** on August 30, 2010 (75 FR 52960). Applications were due on October 14, 2010. The 20 States with the lowest population density that were eligible for the demonstration program are: Alaska, Arizona, Arkansas, Colorado, Idaho, Iowa, Kansas, Maine, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, and Wyoming (Source: U.S. Census Bureau, Statistical Abstract of the United States: 2003). We approved 19 new hospitals for participation in the demonstration program. We determined that each of these new hospitals would begin participating in the demonstration with its first cost reporting period beginning on or after April 1, 2011.

Three of these 19 hospitals declined participation prior to the start of the cost reporting periods for which they would have begun the demonstration. In addition to the 7 hospitals that were selected in either 2004 or 2008, the new selection led to a total of 23 hospitals in the demonstration. During CY 2013, one additional hospital among the set selected in 2011 withdrew from the demonstration, similarly citing a relative financial advantage to returning to the customary SCH payment methodology, which left 22 hospitals participating in the demonstration, effective July 1, 2013. In October 2015, another hospital among those selected in 2011 closed, leaving 14 among this cohort still participating. (By this date, as described below, the 7 hospitals that were selected in either 2004 or 2008 had completed the 5-year extension period mandated by the Affordable Care Act.)

Section 410A(c)(2) of Public Law 108–173 required that, in conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration program under this section was not implemented. This requirement is commonly referred to as ''budget neutrality.'' Generally, when we implement a demonstration program on a budget neutral basis, the demonstration program is budget neutral in its own terms; in other words, the aggregate payments to the participating hospitals do not exceed the amount that would be paid to those same hospitals in the absence of the demonstration program. Typically, this form of budget neutrality is viable when, by changing payments or aligning incentives to improve overall efficiency, or both, a demonstration program may reduce the use of some services or eliminate the need for others, resulting in reduced expenditures for the demonstration program's participants. These reduced expenditures offset increased payments elsewhere under the demonstration program, thus ensuring that the demonstration program as a whole is budget neutral or yields savings. However, the small scale of this demonstration program, in conjunction with the payment methodology, makes it extremely unlikely that this demonstration program could be viable under the usual form of budget neutrality.

Specifically, cost-based payments to participating small rural hospitals are likely to increase Medicare outlays without producing any offsetting reduction in Medicare expenditures elsewhere. Therefore, a rural community hospital's participation in this demonstration program is unlikely to yield benefits to the participant if budget neutrality were to be implemented by reducing other payments for these same hospitals. In the past 12 IPPS final rules, spanning the period for which the demonstration program has been implemented, we have adjusted the national inpatient PPS rates by an amount sufficient to account for the added costs of this demonstration program, thus applying budget neutrality across the payment system as a whole rather than merely across the participants in the demonstration program. As we discussed in the FYs 2005 through 2016 IPPS final rules (69 FR 49183; 70 FR 47462; 71 FR 48100; 72 FR 47392; 73 FR 48670; 74 FR 43922, 75 FR 50343, 76 FR 51698, 77 FR 53449, 78 FR 50740, 77 FR 50145, and 80 FR 49585, respectively), we believe that the language of the statutory budget neutrality requirements permits the agency to implement the budget neutrality provision in this manner.

2. Budget Neutrality Offset Adjustments: Fiscal Years 2005 Through 2016

a. Fiscal Years 2005 Through 2013

In general terms, in each of these previous years from FYs 2005 through 2016, we used available cost reports for the participating hospitals to derive an estimate of the additional costs attributable for the demonstration. For FYs 2005 through 2012, we used finalized, or settled, cost reports, as available, and ''as submitted'' cost reports for hospitals for which finalized cost reports were not available to derive this estimate of the additional costs attributable to the demonstration. Annual market basket percentage increase amounts provided by the CMS Office of the Actuary reflecting the growth in the prices of inputs for inpatient hospitals were applied to cost amounts obtained from these cost reports. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53452), we initiated two general changes to the methodology for estimating the costs of the demonstration (which we have continued to apply through FY 2016). First, we used ''as submitted'' cost reports for each hospital participating in the demonstration in estimating the costs of the demonstration (for FY 2013, we used cost reports for cost reporting periods ending in CY 2010). Second, in FY 2013, we incorporated different update factors (the market basket percentage increase and the applicable percentage increase, as applicable, to several years of data as opposed to solely using the market basket percentage increase) for the calculation of the budget neutrality offset amount. We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53449 through 53453) for a detailed discussion of the methodology initiated in FY 2013.

In each of these fiscal years, an annual update factor provided by the CMS Office of the Actuary reflecting growth in the volume of inpatient operating services was also applied to update the estimated costs. For the budget neutrality calculations in the IPPS final rules for FYs 2005 through 2011, the annual volume adjustment applied was 2 percent; for the IPPS final rules for FYs 2012 through 2016, it was 3 percent. For a detailed discussion of our budget neutrality offset calculations, we refer readers to the IPPS final rule applicable to the fiscal year involved.

In general, for FYs 2005 through 2013, we based the budget neutrality offset estimate on the estimated cost of the demonstration in an earlier given year. For these periods, we derived that estimated cost by subtracting the estimated amount that would otherwise be paid without the demonstration in an earlier given year from the estimated amount for the same year that would be paid under the demonstration under the reasonable cost-based methodology authorized by section 410A of Public Law 108–173. (We ascertained the estimated amount that would be paid in an earlier given year under the reasonable cost methodology and the estimated amount that would otherwise be paid without the demonstration in an

earlier given year from finalized or ''as submitted'' cost reports as discussed earlier.) For FYs 2005 through 2012, we then updated the estimated costs described earlier to the upcoming year by multiplying them by the market basket percentage increases applicable to the years involved and the applicable annual volume adjustment. Beginning in FY 2013, as discussed earlier, we began incorporating different update factors—we used the IPPS market basket percentage increases applicable to the years involved to update the estimated amount that would be paid under the demonstration under the reasonable cost-based methodology, and the applicable percentage increases applicable to the years involved to update the amounts that would otherwise be paid without the demonstration. We continued to apply the annual volume adjustment as discussed earlier.

For the FY 2010 IPPS/RY 2010 LTCH PPS final rule, data from finalized cost reports reflecting the participating hospitals' experience under the demonstration were available. Specifically, the finalized cost reports for the first 2 years of the demonstration, that is, cost reports for cost reporting years beginning in FYs 2005 and 2006 (CYs 2004, 2005, and 2006) were available. These data showed that the actual costs of the demonstration for these years exceeded the amounts originally estimated in the respective final rules for the budget neutrality adjustment. In the FY 2010 IPPS/RY 2010 LTCH PPS final rule, we included an additional amount in the budget neutrality offset amount in that fiscal year. This additional amount was based on the amount that the costs of the demonstration for FYs 2005 and 2006 exceeded the budget neutrality offset amounts finalized in the IPPS rules applicable for those years.

In the final rules for FYs 2011 through 2013, we continued to use a methodology for calculating the budget neutrality offset amount consisting of two components: (1) The estimated demonstration costs in the upcoming fiscal year; and (2) the amount by which the actual demonstration costs corresponding to an earlier, given year (which would be known once finalized cost reports became available for that year) exceeded the budget neutrality offset amount finalized in the corresponding year's IPPS final rule. However, we noted in the FYs 2011, 2012, and 2013 IPPS final rules that, because of a delay affecting the settlement process for cost reports for IPPS hospitals occurring on a larger scale than merely for the demonstration, we were unable to finalize this component of the budget neutrality offset amount accounting for the amount by which the actual demonstration costs in an earlier given year exceeded the budget neutrality offset amount finalized in the corresponding year's IPPS final rule for cost reports of demonstration hospitals dating to those beginning in FY 2007.

b. Fiscal Years 2014 and 2015

In the final rules for FYs 2014 and 2015, we continued to apply the general methodology discussed earlier (with the modifications initiated in FY 2013) in estimating the costs of the demonstration for the specific fiscal year, using the set of ''as submitted'' cost reports from the most recent calendar year for which they are available (cost reporting periods ending in 2011 and 2012, respectively), and updating the cost amounts according to the factors discussed earlier. In addition, in these final rules, because finalized cost reports for FYs 2007 and 2008 had become available, we were able to include in the budget neutrality offset adjustment the amount by which the actual demonstration costs in each of those years exceeded the budget neutrality offset amounts finalized in the IPPS final rules for these years.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50742 through 50744), we determined the final budget neutrality offset amount to be applied to the FY 2014 IPPS rates to be $52,589,741. This amount was comprised of the two distinct components identified earlier: (1) The final resulting difference between the total estimated FY 2014 reasonable cost amount to be paid under the demonstration to the 22 participating hospitals for covered inpatient hospital services, and the total estimated amount that would otherwise be paid to such hospitals without the demonstration (this amount was $46,549,861); and (2) the amount by which the actual costs for the demonstration for FY 2007 (as shown in the finalized cost reports for cost reporting periods beginning in FY 2007 for the nine hospitals that participated in the demonstration during FY 2007) exceeded the budget neutrality offset amount that was finalized in the FY 2007 IPPS final rule (this amount was $6,039,880).

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50141 through 50145), we determined the final budget neutrality offset amount to be applied to the FY 2015 IPPS rates to be $64,566,915. This amount was also comprised of the two earlier referenced components: (1) The final resulting difference between the total estimated FY 2015 reasonable cost amount to be paid under the demonstration to the 22 participating hospitals for covered inpatient hospital services, and the total estimated amount that would otherwise be paid to such hospitals in FY 2015 without the demonstration (this amount was $54,177,144); and (2) the amount by which the actual costs of the demonstration for FY 2008 (as shown in the finalized cost reports for the hospitals that participated in the demonstration during FY 2008) exceeded the budget neutrality offset amount that was finalized in the FY 2008 IPPS final rule (this amount was $10,389,771).

c. Fiscal Year 2016

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49586 through 49591), we continued to apply the general methodology discussed earlier for FYs 2014 and 2015 in estimating the costs of the demonstration for FY 2016, with some modifications. For FY 2016, we used the set of ''as submitted'' cost reports from the most recent calendar year for which they were available (cost reporting periods ending in CY 2013), and updated the cost amounts using the IPPS market basket percentage increase and applicable percentage increase applicable to the years involved as discussed earlier. Although the methodology for FY 2016 was similar to that for the previous several rules, because the demonstration began to phase out prior to the beginning of FY 2016, appropriate changes to the calculations were made. The 7 ''originally participating hospitals,'' that is, those hospitals that were selected for the demonstration in either 2005 or 2008, were scheduled to end their participation in the 5-year extension period authorized by the Affordable Care Act prior to the start of FY 2016. Therefore, we did not include the financial experience of these hospitals in the calculation of either the estimated reasonable cost amount or the estimated amount that otherwise would be paid without the demonstration for FY 2016. In addition, 8 hospitals that entered the demonstration in 2011 and 2012 through the solicitation that followed the Affordable Care Act amendments expanding the demonstration, and that were still participating in the demonstration at the time of the FY 2016 IPPS/LTCH PPS final rule, were scheduled to end their participation on a rolling basis before September 30, 2016. As discussed in the FY 2016 IPPS/LTCH PPS final rule, for these 8 hospitals, the estimated reasonable cost amount and the estimated amount that

would otherwise be paid without the demonstration were prorated according to the ratio of the number of months between October 1, 2015, and the end of the hospital's cost reporting period in relation to the entire 12-month period. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49586 through 49588) for a discussion of these additional calculations.

The resulting estimate of costs of the demonstration for FY 2016 for the 15 hospitals participating in the demonstration for FY 2016 was $26,044,620.

In addition, in the FY 2016 IPPS/LTCH PPS final rule, we were able to finalize the amounts by which the actual demonstration costs for FYs 2009 and 2010 differed from the budget neutrality offset amount finalized in the corresponding final rules for these years using the approach described below.

We identified the difference between the actual cost of the demonstration for FY 2009 as indicated in the finalized cost reports for hospitals that participated in FY 2009 and that had cost reporting periods beginning in FY 2009 (this amount was $14,332,936), and the budget neutrality offset amount that was identified in the FY 2009 IPPS final rule (73 FR 48671) (this amount was $22,790,388). Analysis of this set of cost reports showed that the budget neutrality offset amount that was finalized to account for the demonstration costs in FY 2009 (as set forth in the FY 2009 IPPS final rule) exceeded the actual cost of the demonstration for FY 2009 by $8,457,452.

We included the amount by which the actual costs of the demonstration for FY 2010 (as shown in the finalized cost reports for the nine hospitals that completed a cost reporting period beginning in FY 2010) ($16,817,922) differed from the amount that was finalized as the costs of the demonstration for FY 2010 as set forth in the FY 2010 IPPS/RY 2010 LTCH PPS final rule and the FY 2011 IPPS/LTCH PPS final rule ($21,569,472). Analysis of this set of cost reports showed that the budget neutrality offset amount that was finalized to account for the demonstration costs in FY 2010 (as set forth in the FY 2010 IPPS/RY 2010 LTCH PPS final rule and the FY 2011 IPPS/LTCH PPS final rule) exceeded the actual cost of the demonstration for FY 2010 by $4,751,550.

Unlike in previous years, because the budget neutrality offset amount identified in the corresponding final rules for each of FYs 2009 and 2010 exceeded the actual costs of the demonstration, we subtracted the differences between these amounts for each fiscal year (that is, $8,457,452 applicable to FY 2009 and $4,751,550 applicable to FY 2010) from the estimated amount of the costs of the demonstration for FY 2016 (that is, $26,044,620). Thus, the final budget neutrality offset amount for which the adjustment to the national IPPS rates was calculated was $12,835,618.

3. Budget Neutrality Methodology for FY 2017 and Reconciliation for FYs 2011 Through 2016

As described earlier, we have generally incorporated two components into the budget neutrality offset amounts identified in the final IPPS rules in previous years. First, we have estimated the costs of the demonstration for the upcoming fiscal year, generally determined from historical, ''as submitted'' cost reports for the hospitals participating in that year. Update factors representing nationwide trends in cost and volume increases have been incorporated into these estimates, as specified in the methodology described in the final rule for each fiscal year. Second, as finalized cost reports have become available, we have determined the amount by which the actual costs of the demonstration for an earlier, given year differed from the estimated costs for the demonstration set forth in the final IPPS rule for the corresponding fiscal year, and we incorporated that amount into the budget neutrality offset amount for the upcoming fiscal year. If the actual costs for the demonstration for the earlier fiscal year exceeded the estimated costs of the demonstration identified in the final rule for that year, this difference was added to the estimated costs of the demonstration for the upcoming fiscal year when determining the budget neutrality adjustment for the upcoming fiscal year. Conversely, if the estimated costs of the demonstration set forth in the final rule for a prior fiscal year exceeded the actual costs of the demonstration for that year, this difference was subtracted from the estimated cost of the demonstration for the upcoming fiscal year when determining the budget neutrality adjustment for the upcoming fiscal year. We note that we have calculated this difference between the actual costs of the demonstration for FYs 2005 through 2010, as determined from finalized cost reports once available, and estimated costs of the demonstration as identified in the applicable IPPS final rules for these years.

a. Budget Neutrality Methodology for FY 2017

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25130), we proposed a different methodology as compared to previous years for analyzing the costs attributable to the demonstration for FY 2017. We noted that the demonstration will have substantially phased out by the beginning of FY 2017. The 7 ''originally participating hospitals,'' that is, those that were selected for the demonstration in 2004 and 2008, ended their participation in the 5-year extension period authorized by the Affordable Care Act prior to the start of FY 2016. In addition, we stated in the proposed rule that the participation period for the 14 hospitals that entered the demonstration following the mandate of the Affordable Care Act and that were still participating was to end on a rolling basis according to the end dates of the hospitals' cost report periods, respectively, from April 30, 2016 through December 31, 2016. (As noted earlier, 1 hospital among this cohort closed in October 2015.) Of these 14 hospitals, 10 will end participation on or before September 30, 2016, leaving 4 hospitals participating for the last 3 months of CY 2016 (that is, the first 3 months of FY 2017). As discussed in the proposed rule, we believe that, given the small number of participating hospitals and the limited time of participation for such hospitals during FY 2017, a revised methodology is appropriate for determining the costs of the demonstration during this period as discussed below.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25130), we noted that estimating the costs of the demonstration for these 4 hospitals for their extent of participation in the demonstration in FY 2017 would entail a prorating calculation if we followed the methodology we used for FY 2016 as described earlier, as well as application of update factors to project increases in cost. We further noted that, for the 4 hospitals that will end their participation in the demonstration effective December 31, 2016, the financial experience of the last 3 months of the calendar year (that is, the first 3 months of FY 2017) will be included in the finalized cost reports for FY 2016. (Consistent with the methodology used for the final rules for previous years, a hospital's cost report is included in the analysis of a given fiscal year if the cost reporting period begins in that fiscal year.) We believe that examining the finalized cost reports for FY 2016 for these hospitals would lead to a more

accurate and administratively feasible calculation of budget neutrality for the demonstration in FY 2017 than conducting an estimate of the costs of the demonstration for this 3-month period based on ''as submitted cost reports'' (as would occur according to the budget neutrality methodology currently in effect).

In addition, as we stated in the proposed rule, given that the extent of covered services for FY 2017 subject to the payment methodology under the demonstration is a small fraction of that in previous fiscal years, we believe that it is appropriate to forego the process of estimating the costs attributable to the demonstration for FY 2017 and to instead analyze the set of finalized cost reports for cost reporting periods beginning in FY 2016, which will reflect the actual cost of the demonstration, when they become available. Such an approach also would eliminate the need to perform for FY 2017 the second component of the budget neutrality methodology discussed earlier (that is, determining the amount by which the actual costs of the demonstration for the fiscal year, as determined in finalized cost reports once available, differed from the estimated costs for the demonstration set forth in the final IPPS rule for the corresponding fiscal year). Thus, for the reasons discussed earlier, we proposed to calculate the costs of the demonstration and the resulting budget neutrality adjustment factor for the demonstration for FY 2017 once the finalized cost reports for cost reporting periods beginning in FY 2016 become available. We invited public comments on this proposal.

We did not receive any public comments on this proposal. Therefore, in this final rule, we are finalizing, without modification, our proposal as described above to forego the process of estimating the costs attributable to the demonstration for FY 2017, and to instead calculate the actual costs of the demonstration and any resulting budget neutrality adjustment factor for FY 2017 once the finalized cost reports for cost reporting periods beginning in FY 2016 become available.

b. Budget Neutrality Offset Reconciliation for FYs 2011 Through 2016

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49591), we stated that we intended to discuss in the FY 2017 IPPS/LTCH PPS proposed rule how we would reconcile the budget neutrality offset amounts identified in the IPPS final rules for FYs 2011 through 2016 with the actual costs of the demonstration for those years, considering the fact that the demonstration will end December 31, 2016. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25130), we stated that we believe it would be appropriate to conduct this analysis for FYs 2011 through 2016 at one time, when all of the finalized cost reports for cost reporting periods beginning in FYs 2011 through 2016 are available. Such an aggregate analysis encompassing the cost experience through the end of the period of performance of the demonstration represents an administratively streamlined method, allowing for the determination of any appropriate adjustment to the IPPS rates and obviating the need for multiple fiscal-year-specific calculations and regulatory actions. Given the general lag of 3 years in finalizing cost reports, we expect any such analysis to be conducted in FY 2020.

We did not receive any public comments on this proposal. Therefore, in this final rule, we are finalizing our proposal, without modification, to reconcile, at one time, the budget neutrality offset amounts identified in the IPPS final rules for FYs 2011 through 2016 with the actual costs of the demonstration for those years, when all of the finalized cost reports for cost reporting periods beginning in FYs 2011 through 2016 are available.

As discussed in the proposed rule, we also note that, in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49591), we indicated that we were considering whether to propose in future rulemaking that the calculation of the final costs of the demonstration for a fiscal year reflect that some of the participating hospitals would otherwise have been eligible for the payment adjustment for low-volume hospitals in that fiscal year if they had not participated in the demonstration. Our policy under the demonstration is that hospitals participating in the demonstration are not able to receive the low-volume adjustment in addition to the reasonable cost-based payment authorized by section 410A of Public Law 108–173. We refer readers to Change Request 7505 dated July 22, 2011, available on the CMS Web site at: *http://www.cms.gov*. Section 1886(d)(12) of the Act provides for a payment adjustment to account for the higher costs per discharge for low-volume hospitals under the IPPS, effective FY 2005 (69 FR 49099 through 49102). We note that sections 3125 and 10314 of the Affordable Care Act provided for temporary changes in the qualifying criteria and payment adjustment for low-volume hospitals for FYs 2011 and 2012, which have been extended through subsequent legislation: Through FY 2013, by the American Taxpayer Relief Act of 2012 (ATRA) (Pub. L. 112–240) (78 FR 50610 through 50613), through March 31, 2014, by the Pathway for SGR Reform Act (Pub. L. 113–67) (79 FR 15022 through 15025); through March 21, 2015, by the Protecting Access to Medicare Act of 2014 (Pub. L. 113–93) (79 FR 49998 through 50001); and most recently through September 30, 2017, by section 204 of the Medicare Access and CHIP Reauthorization Act of 2015 (Pub. L. 114–110). These temporary changes have increased the number of hospitals that are eligible to receive the low-volume hospital payment adjustment.

We further stated in the FY 2016 IPPS/LTCH PPS final rule that taking the low-volume hospital payment adjustment into account in determining the costs of the demonstration would require detailed consideration of the data sources and methodology that would be used to determine which among the demonstration hospitals would have otherwise been eligible for the low-volume payment adjustment and to estimate the amount of the adjustment. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 24521), we invited public comments on this issue.

We stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25131) that we are continuing to examine this issue and are considering whether to incorporate the low-volume payment adjustment amounts that would have otherwise been made into the calculation of the difference between the actual costs of the demonstration and budget neutrality offset amounts for FYs 2011 through 2016. We note that applying such a methodology may lower the calculated amounts of the actual costs of the demonstration compared to not applying such a methodology, making it more likely that the actual costs of the demonstration for a year will not exceed the estimated costs of the demonstration identified in the final rule for that year. We again invited public comments on this issue.

We did not receive any public comments on this issue. We will continue to examine this issue.

L. Hospital and CAH Notification Procedures for Outpatients Receiving Observation Services

1. Background

a. Statutory Authority

On August 6, 2015, the Notice of Observation Treatment and Implication for Care Eligibility Act (the NOTICE Act), Public Law 114–42 was enacted. Section 2 of the NOTICE Act amended

section 1866(a)(1) of the Act by adding new subparagraph (Y) that requires hospitals and critical access hospitals (CAHs) to provide written notification and an oral explanation of such notification to individuals receiving observation services as outpatients for more than 24 hours at such hospitals or CAHs. Section 1866(a)(1) of the Act lists requirements for providers of services to participate in the Medicare program and be eligible for payments under Medicare pursuant to provider agreements.

Section 1866(a)(1)(Y) of the Act, as added by section 2 of the NOTICE Act, specifies that the notification process must consist of a written notification as specified by the Secretary through rulemaking and containing such language as the Secretary prescribes consistent with the statutory provision, and an oral explanation of the written notification and documentation of the provision of the explanation, as the Secretary determines to be appropriate. Notification to each individual who receives observation services as an outpatient for more than 24 hours must be provided no later than 36 hours after observation services are initiated (or sooner, if upon release from the hospital or CAH). Section 1866(a)(1)(Y)(ii) of the Act provides that the written notice must explain that the individual is an outpatient receiving observation services, and is not an inpatient of a hospital or CAH. In addition, the written notice must include the reason(s) the individual is an outpatient receiving observation services and must explain the implications of being an outpatient receiving observation services, such as cost-sharing requirements and post-hospitalization eligibility for coverage of skilled nursing facility (SNF) services under Medicare. The written notification also must include any additional information as deemed appropriate by the Secretary. Moreover, the written notification must be signed by either the individual receiving observation services as an outpatient, or a person acting on the individual's behalf, to acknowledge receipt of the notification. In cases where a signature by the individual or the person acting on the individual's behalf is refused, section 1866(a)(1)(Y)(ii)(IV)(bb) of the Act stipulates that the notification be signed by the staff member of the hospital or CAH who presented the written notification and include the name and title of the staff member, a certification statement that the notification was presented, and the date and time that the notification was presented. Finally, section 1866(a)(1)(Y)(ii)(V) of the Act provides that the notification be written and formatted using plain language and is made available in appropriate languages as determined by the Secretary.

b. Effective Date

As discussed in the proposed rule (81 FR 25131), section 2 of the NOTICE ACT provides the effective date for this notification requirement as effective beginning 12 months after the date of enactment of the NOTICE Act; that is, effective on August 6, 2016. Since the date the NOTICE Act was enacted, CMS has been working to implement the statutory requirement in a timely manner. On December 14, 2015, CMS released an electronic mailbox address for individuals who wished to submit email comments on the provisions of the NOTICE Act. In addition, CMS held a listening session on December 21, 2015, to provide stakeholders further opportunity to provide comment on the NOTICE Act. We thank those individuals who shared their input. The agency reviewed all comments submitted, as well as those comments provided during the public listening session in developing the provisions of the proposed rule. This final rule is effective as specified in the ''Effective Date'' section of this final rule. The standardized notice, the MOON, is going through the PRA approval process and is subject to a 30-day public comment period that begins on the date of publication of this final rule. Following review of comments and final approval of the MOON under the PRA process, hospitals and CAHs must fully implement use of the MOON no later than 90 calendar days from the date of PRA approval of the MOON.

2. Implementation of the NOTICE Act Provisions

a. Notice Process

We proposed to implement section 1866(a)(1)(Y) of the Act by revising the requirements that providers agree to as part of participating in Medicare under a provider agreement, by establishing regulations (at proposed 42 CFR 489.20(y)) that would specify a process for hospitals and CAHs to notify an individual, orally and in writing, of the individual's receipt of observation services as an outpatient and the implications of receiving such services as set forth below. Under this proposed process, hospitals and CAHs would be required to furnish notice to such an individual entitled to Medicare benefits if the individual receives observation services as an outpatient for more than 24 hours. We proposed the use of a standardized notice, referred to as the Medicare Outpatient Observation Notice (MOON), to be used by all applicable hospitals and CAHs. The MOON would include all of the informational elements required by section 1866(a)(1)(Y)(ii) of the Act to fulfill the written notice requirement of the NOTICE Act.

Comment: One commenter stated the NOTICE Act and MOON will continue to increase the cost of care and suggested that CMS require hospitals and CAHs to provide the information required by the NOTICE Act to patients in a lower cost environment. The commenter recommended that patients receive the NOTICE Act required information when signing up for Medicare, or as part of an annual visit.

Response: We appreciate the commenter's recommendation and interest in providing the notice required by the NOTICE Act in a less costly setting. The NOTICE Act specifically requires hospitals and CAHs to deliver both a written notice and an oral explanation of the notice to individuals who receive observation services as an outpatient for more than 24 hours. The statute does not afford an alternative method of delivering the required notice, for example, during an annual wellness or other visit to a doctor, or to beneficiaries when signing up for Medicare. Consistent with the NOTICE Act, we believe that furnishing information related to being an outpatient receiving observation services when those services are furnished will have the most impact.

After consideration of the public comments we received, we are finalizing the notification process provisions of the proposed rule with respect to the method of delivery without modification.

b. Notification Recipients

Section 1866(a)(1)(Y) of the Act requires hospitals and CAHs to furnish notice to each individual who receives observation services as an outpatient at such hospital or CAH for more than 24 hours. Throughout section 1866 of the Act, ''individual'' generally refers to a person entitled to have payment made for services under Title XVIII of the Act, or a person not entitled to have payment made for services under Title XVIII if certain conditions are met. The provisions of the NOTICE Act specify that notice must be provided to individuals receiving observation services as an outpatient for more than 24 hours; the provisions do not specify qualifications related to payment for such services as a condition of notice. Accordingly, we proposed under the

new § 489.20(y) that the notification required by section 1866(a)(1)(Y) of the Act must be provided to individuals entitled to benefits under Title XVIII of the Act, whether or not the services furnished are payable under Title XVIII, when individuals receive observation services as an outpatient for more than 24 hours. For example, an individual receiving Medicare Part A benefits who has not enrolled in Medicare Part B would still receive notice even though the observation services received as an outpatient fall under the Part B benefit and would not be covered or payable by Medicare for that person.

A beneficiary enrolled in a Medicare Advantage (MA) or other Medicare health plan would receive the required notice under the existing rules that apply to hospitals and CAHs under a provider agreement governed by the provisions of section 1866(a)(1)(Y) of the Act. MA regulations related to selection and credentialing of contract providers at § 422.204(b)(3) require that, with respect to providers that meet the definition of ''provider of services'' as defined in section 1861(u) of the Act, basic benefits may only be provided by these providers if they have a provider agreement with CMS permitting them to provide services under original Medicare. Under section 1861(u) of the Act, the term ''provider of services'' means a hospital, CAH, skilled nursing facility, comprehensive outpatient rehabilitation facility, home health agency, hospice program, or, for purposes of section 1814(g) and section 1835(e) of the Act, a fund.

Observation services are required to be provided under a physician's order that specifies the initiation of observation services. As a general matter, hospital observation services are defined in the Medicare Benefits Policy Manual (Pub. 100–02), Chapter 6, Section 20.6, as services that are medically reasonable and necessary, specifically ordered by a physician or other nonphysician practitioner authorized by State licensure law and hospital staff bylaws to admit patients to the hospital or to order outpatient services, and meet other published Medicare criteria for payment. The term ''physician'' encompasses these authorized qualified nonphysician practitioners for the purposes of our proposed and final policy regarding implementation of the NOTICE Act provisions in the proposed and final rules. Individuals receiving observation services must be registered as outpatients; however, not all outpatients receive observation services. ''Outpatient,'' as defined in the Medicare Claims Processing Manual (Pub. 100–04), Chapter 1, Section 50.3.1, means ''a person who has not been admitted as an inpatient but who is registered in the hospital or critical access hospital (CAH) records as an outpatient and receives services (rather than supplies alone) directly from the hospital or CAH.'' We proposed that the provisions in the proposed rule would apply to the subset of individuals entitled to benefits under Title XVIII of the Act who are receiving treatment as outpatients and are receiving observation services for more than 24 hours. For outpatients who are not receiving observation services, or who are receiving observation services but not for more than 24 hours, hospitals and CAHs would not be required to deliver notice.

Comment: Many commenters suggested that CMS expand delivery of the MOON beyond Medicare beneficiaries who receive observation services as an outpatient at hospitals or CAHs for more than 24 hours. A few commenters requested clarification of who was required to receive a notice. In terms of expanding the delivery requirements, some commenters suggested that CMS require hospitals and CAHs to provide the MOON to all Medicare beneficiaries in outpatient status. Other commenters suggested that CMS require delivery of the MOON to any outpatient who has spent a night in the hospital, is in the hospital over 24 hours, and has not been admitted or had a long stay.

One commenter requested clarification about whether the NOTICE Act requires delivery of the MOON to a patient in extended outpatient recovery requiring an overnight stay, which the commenter explained were not observation services. Similarly, another commenter requested that CMS clarify that the NOTICE Act provisions do not apply to outpatients without an order for observation services.

Response: We appreciate all of the recommendations submitted by the commenters. The NOTICE Act explicitly states that hospitals and CAHs are required to furnish notice to an individual who receives observation services as an outpatient at such hospital or CAH for more than 24 hours, and we proposed to implement this provision (delivery of the MOON) requiring hospitals and CAHs to provide the required notice to just that population of notification recipients. We do not believe it would be appropriate to expand the population of notification recipients, as the statute expressly provides the scope of that population. Therefore, we do not require hospitals and CAHs to furnish the MOON to outpatients other than those who have received observation services as outpatients for more than 24 hours, as set forth in the statute. However, as we explain below, hospitals and CAHs may deliver the MOON to individuals receiving observation services as an outpatient before such individuals have received more than 24 hours of observation services, and be in compliance with the written delivery requirements set forth in the NOTICE Act.

Comment: One commenter noted that several States require that a notice similar to the MOON be delivered to a different population than that specified under the NOTICE Act; for example, some States require notice be furnished to all outpatients, regardless of whether they received observation services. The commenter stated it would be beneficial to allow hospitals and CAHs flexibility to deliver the MOON to a broader population of Medicare beneficiaries to minimize confusion among beneficiaries, administrative complexity for providers, and in recognition that the financial implications for beneficiaries start once services begin. The commenter recommended that CMS allow broader distribution of the MOON to include outpatients in general to accommodate both State and Federal laws. Several other commenters made similar recommendations.

Response: We appreciate the recommendations and acknowledge that, in some States, notice of outpatient status is required for all outpatients, regardless of the payer and irrespective of whether the patient has received observation services. We understand the commenters' interest in minimizing duplication of effort and information provided to a Medicare beneficiary who requires care in a hospital or CAH. However, the NOTICE Act specifically requires hospitals and CAHs to deliver notice (written and oral), as prescribed by the Secretary, to Medicare beneficiaries who receive observation services as an outpatient for more than 24 hours. The MOON satisfies the written NOTICE Act requirement for a designated population of Medicare beneficiaries receiving a specific set of services, as provided for at section 1866(a)(1)(Y) of the Act. In some cases, delivering the MOON may also fulfill State notice requirements for the Medicare population. Hospitals and CAHs will need to make that determination on a State-by-State basis. Where State law, in pertinent part, requires notification to Medicare beneficiaries who receive observation services as an outpatient for more than 24 hours and requires such notice to

contain content that is not included in the MOON, hospitals may utilize the free text field in the MOON's ''Additional Information'' section for communicating such additional content. Hospitals and CAHs will need to determine whether providing such additional information in this field of the MOON will satisfy State law requirements. Hospitals and CAHs subject to State law notice requirements may also attach an additional page to the MOON to supplement the ''Additional Information'' section in order to communicate additional content required under State law, or may attach the notice required under State law to the MOON. Nevertheless, we do not believe it would be appropriate to require hospitals and CAHs to deliver the MOON, or an amended version of the MOON, to patients who have not received observation services and who are not entitled to benefits under the Medicare program because the NOTICE Act was not aimed at some other, larger patient population. The MOON contains information specific to individuals entitled to receive benefits through Medicare that receive observation services in the hospital outpatient setting. Therefore, we are not accepting the commenters' recommendation.

Comment: One commenter asserted that proposed § 489.20(y) requiring hospitals and CAHs to deliver notice (the MOON) to individuals receiving observation services as an outpatient for more than 24 hours, even if the individual is subsequently admitted as an inpatient, violates the intent of the NOTICE Act. The commenter stated that requiring hospitals and CAHs to provide the MOON to an individual subsequently admitted as an inpatient is unduly burdensome, serves no purpose, and provides no informational benefit to beneficiaries or their families. Another commenter agreed with CMS' proposal to require hospitals and CAHs to deliver notice to individuals receiving observation services as an outpatient for more than 24 hours, even if the individual is subsequently admitted as an inpatient, because the time as an outpatient receiving observation services does not count toward the 3 consecutive day inpatient hospital stay requirement for coverage of post-hospital SNF care. However, the commenter stated that the MOON did not adequately explain the implications on cost-sharing and coverage of post-hospital SNF care in such a situation.

Response: We appreciate these comments. However, we disagree with the suggestion that providing the MOON to an individual who is subsequently admitted as an inpatient serves no purpose and provides no informational benefit to beneficiaries or their families. We agree with the commenter who asserted that it is important to provide the MOON to individuals who are subsequently admitted as an inpatient because the time the individual spent as an outpatient receiving observation services does not count toward the 3 consecutive day inpatient hospital stay requirement for coverage of post-hospital SNF care. While not all patients who are admitted ultimately receive post-hospital SNF care following discharge, the implications of receiving observation services on an outpatient basis for individuals who eventually receive such care can be significant, which is why information is required to be included in the notice to beneficiaries (that is, written notification that explains the implications of such status on subsequent eligibility for coverage for services furnished by a SNF, as specified in section 1866(a)(1)(Y)(ii)(II) of the Act). Moreover, we believe the NOTICE Act requires hospitals and CAHs to deliver notice to individuals who receive more than 24 hours of observation services, and are subsequently admitted as an inpatient.

We acknowledge that cost-sharing for an individual receiving observation services as an outpatient will change if the individual is subsequently admitted as an inpatient. Related outpatient services directly preceding an inpatient admission may fall under the payment window for outpatient services for which the costs are treated as costs of inpatient services (also known as the 3-day payment window), as discussed in the Medicare Claims Processing Manual (Pub. 100–4), Chapter 3, Section 40.3 and Chapter 4, Section 10.12. Outpatient services that fall under the 3-day payment window prior to an inpatient admission will be subject to Part A cost-sharing rules. We expect that this information will be communicated by hospital staff to the individual during the oral explanation of the notification. In addition, if an individual who receives more than 24 hours of observation services as an outpatient is admitted as an inpatient prior to the delivery of the MOON, in the ''Additional Information'' section of the MOON the hospital should explain that, as an inpatient, the individual may have Part A cost-sharing responsibilities. Therefore, we are not accepting the recommendations of the commenters suggesting that the hospitals and CAHs be able to forego the delivery of the MOON in cases where individuals receiving observation services as outpatients are later admitted as inpatients.

Comment: Several commenters noted that it will be difficult and/or unnecessary to provide the MOON to MA enrollees and requested that CMS consider eliminating the proposed requirement that MOON delivery include MA enrollees. According to one commenter, MA plans often deny an inpatient admission after the patient is discharged from the hospital and will only approve the stay as outpatient observation following the individual's discharge from the inpatient hospital stay. Another commenter believed it was unnecessary to include the managed Medicare population in the proposed requirement because this population is not affected by the same coverage guidelines as original Medicare beneficiaries, such as the requirement for a 3-day qualifying inpatient hospital stay for coverage of post-hospitalization SNF care. Commenters believed that providing the MOON to enrollees in MA plans will result in confusion if the information related to coverage and cost sharing is not applicable to an MA enrollee and that it adds an unnecessary burden on the hospital staff.

Response: We recognize that MA plans may have certain rules that differ from original Medicare and that these variances may result in some of the information in the MOON being inapplicable to some MA enrollees. For example, under an MA plan's benefit structure, the enrollee may not need to have a 3-day qualifying inpatient hospital stay in order to qualify for coverage of post-hospital SNF care. However, we do not believe it would be appropriate to exclude MA enrollees from the requirement that a hospital or CAH deliver the MOON to any beneficiary who receives observation services as an outpatient for more than 24 hours. In developing the MOON, we have attempted to mitigate the potential variation between original Medicare and MA by directing MA enrollees who receive the MOON to contact their plans for specific information that may be relevant to the receipt of outpatient observation services. As described in the proposed rule, the MOON must be delivered while the individual is in the hospital receiving outpatient observation services. Specifically, section 1866(a)(1)(Y) of the Act and under proposed new § 489.20(y), hospitals and CAHs must provide notice to an individual who receives observation services as an outpatient for more than 24 hours, and such notice must be furnished no later than 36 hours after observation services are

initiated, or sooner if the individual is transferred, discharged, or admitted as an inpatient. If, as described in the commenter's example, the individual is initially admitted to a hospital or CAH as an inpatient, the requirement to deliver the MOON does not apply (in cases where the individual receives outpatient observation services for fewer than 24 hours prior to the inpatient admission), notwithstanding any later determination by the MA plan (following the individual's discharge) related to the inpatient hospital admission. It is our expectation that a contracted hospital and the MA plan coordinate and communicate regarding the appropriate level of care while the enrollee is receiving care in the contracted hospital in accordance with the requirements at § 422.112 related to continuity of care and integration of services.

As noted in the preamble to the proposed rule, a beneficiary enrolled in a MA or other Medicare health plan would receive the required notice under the existing rules that apply to hospitals and CAHs under a provider agreement governed by the provisions of section 1866(a)(1)(Y) of the Act. The MA regulations related to selection and credentialing of contract providers at § 422.204(b)(3) require that, with respect to providers that meet the definition of ''provider of services'' as defined in section 1861(u) of the Act, basic benefits may only be provided by these providers if they have a provider agreement with CMS permitting them to provide services under original Medicare. Under section 1861(u) of the Act, the term ''provider of services'' means a hospital, critical access hospital, skilled nursing facility, comprehensive outpatient rehabilitation facility, home health agency, hospice program, or, for purposes of section 1814(g) and section 1835(e) of the Act, a fund. Given the statutory language in section 1866 of the Act and the regulatory requirements in 42 CFR part 422 related to provider agreements, we do not agree with commenters, and do not believe it would be appropriate to exclude hospitals and CAHs from the NOTICE Act requirements with respect to MA enrollees. Therefore, hospitals and CAHs must furnish the MOON to MA enrollees who receive observation services as an outpatient for more than 24 hours as set forth in this final rule.

Comment: One commenter requested that CMS remove the requirement that hospitals and CAHs deliver the MOON to Medicare beneficiaries who are not enrolled in Medicare Part B. The commenter believed it would be inappropriate to provide information on the rules for insurance coverage to individuals who do not have that coverage.

Response: We appreciate the commenter's suggestion. However, one intent of the NOTICE Act is to inform beneficiaries of costs they might not otherwise be aware of relating to their classification as either an outpatient receiving observation services or an inpatient. A beneficiary who receives observation services as an outpatient (which are covered under Medicare Part B), who is enrolled in Medicare Part A, but does not have Part B coverage, may be unaware that he or she may be financially responsible for the full cost of the services he or she is receiving, due to lack of Part B coverage. We believe providing the MOON to beneficiaries who do not have Part B coverage will serve to inform such beneficiaries of the financial consequences consistent with the NOTICE Act. Therefore, we are not adopting the commenter's recommendation.

Comment: One commenter requested that CMS explain whether hospitals and CAHs must deliver the MOON when the primary payer is a commercial plan and the secondary payer is Medicare or MA.

Response: The provisions of the NOTICE Act amended section 1866 of the Act and apply to hospitals and CAHs furnishing services to individuals entitled to benefits under Title XVIII of the Act, whether or not the services are payable under Title XVIII. If an individual is entitled to benefits under Title XVIII (and receives observation services as an outpatient for more than 24 hours), the notice requirement applies, regardless of whether Medicare is the secondary payer. The applicability of the notice requirement depends on whether the individual is entitled to benefits under Title XVIII, not on whether Medicare makes payment (primary or otherwise).

After consideration of the public comments we received, we are finalizing the notification recipients provisions of the proposed rule without modification.

c. Timing of Notice Delivery

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25132), and as provided at section 1866(a)(1)(Y) of the Act, we proposed under proposed new § 489.20(y) that hospitals and CAHs must provide notice to an individual who receives observation services as an outpatient for more than 24 hours and that such notice must be furnished no later than 36 hours after observation services are initiated, or sooner if the individual is transferred, discharged, or admitted as an inpatient.

For purposes of our proposed and final policy regarding implementation of the NOTICE Act provisions in the FY 2017 IPPS/LTCH PPS proposed and final rules, consistent with existing billing rules, observation services are initiated when a physician orders such services. According to the Medicare Claims Processing Manual (Pub. 100–04), Chapter 4, Section 290.2.2, hospital reporting for observation services ''begins at the clock time documented in the patient's medical record, which coincides with the time that observation services are initiated in accordance with a physician's order.'' Because valid medical documentation for observation services will always contain the time when observation services are initiated, we believe hospitals and CAHs will be able to readily determine the timeframe within which the notice must be delivered. We expect that there will be cases where an individual receives more than 24 hours of observation services and has not yet received the MOON, but there are imminent plans for discharge to home or another facility, transfer to another unit or facility to receive care that does not include observation services, or admission to the hospital or another facility as an inpatient. In these cases, pursuant to section 1866(a)(1)(Y) of the Act, which provides that notice be provided not later than 36 hours after the time such an individual begins receiving such services (or, if sooner, upon release), we proposed that the MOON must be given sooner than the 36-hour time limit for delivery because the MOON must be delivered before the individual is discharged, transferred, or admitted. When there are no plans to transfer, discharge, or admit an individual who receives observation services for more than 24 hours, we proposed that the MOON must be provided within 36 hours of the initiation of observation services.

In rare circumstances where a physician initially orders inpatient services, but following internal utilization review (UR) performed while the patient is hospitalized, the hospital determines that the services do not meet its inpatient criteria and the physician concurs with UR and orders the discontinuation of inpatient services and initiation of outpatient observation services (that is, a Condition Code 44 situation), we stated in the proposed rule that the MOON would be delivered as required by the NOTICE Act (when outpatient observation services have been ordered and furnished for more than 24 hours). If observation services are ordered when Condition Code 44

applies, the 24-hour time period for observation notification commences at the same time that observation services are initiated under a physician's order, consistent with existing policy for observation services furnished to outpatients. (We refer readers to the Medicare Claims Processing Manual (Pub. 100–04), Chapter 1, Section 50.3.)

As discussed in the proposed rule and as stated in the notice announcing CMS Ruling CMS–1455–R (78 FR 16614), the Part B Inpatient Billing Ruling, in cases where reviewers find that an inpatient admission was not medically reasonable and necessary after the beneficiary is discharged, and thus, not appropriate for payment under Medicare Part A, the beneficiary's patient status remains ''inpatient'' as of the time of the inpatient admission. The patient's status is not changed to outpatient because the beneficiary was formally admitted as an inpatient, and there is no provision to change a beneficiary's status after he or she is discharged from the hospital. Where CMS denies a claim after the beneficiary has been discharged because the inpatient admission was not medically reasonable and necessary, there would be no need to issue the MOON because the individual's status remains inpatient, despite the fact that the inpatient admission was improper. Similarly, where a hospital determines through UR after a beneficiary is discharged that his or her inpatient admission was not reasonable and necessary and the hospital bills the services that were provided on a Medicare Part B claim, the NOTICE Act notification requirements would not apply for these individuals because their status would also remain inpatient.

Comment: Several commenters indicated that it would be difficult from an operational perspective to deliver the MOON within a narrow window of 12 hours following the beneficiary's receipt of more than 24 hours of observation services and the requirement that the notice be furnished within 36 hours of the initiation of observation services. Some commenters recommended the notice be furnished within 24 hours or 48 hours following the initiation of observation services as an outpatient. Other commenters indicated that if State regulations require notice of observation services as an outpatient be furnished to patients within 24 hours of the initiation of observation services as an outpatient, the State policy should be followed in order to provide the most protection possible to the consumer. Another commenter requested that CMS clarify whether there are consequences for having the MOON delivered and signed before 24 hours of observation services are furnished. The commenters urged CMS to use its regulatory discretion and create flexibility on the timing of delivery of the notice and to establish clear standards for consistent implementation across State lines.

One commenter opined that the statute provides latitude for CMS to permit an earlier delivery of the MOON to the Medicare beneficiary. The commenter explained that the NOTICE Act requires delivery of notice to outpatients who receive observation services for more than 24 hours, but does not preclude a hospital or CAH from voluntary delivery of the notice prior to an individual's receipt of 24 hours of observation services. The commenter further explained, given that some of the implications to be explained in the notice are present from the initiation of observation services, it may be beneficial for beneficiaries to receive the notice earlier. Earlier delivery of the notice, in the commenter's opinion, would provide flexibility for hospitals and CAHs in States with conflicting laws to satisfy both Federal and State requirements, while minimizing provider burden. The commenter recommended that CMS allow hospitals and CAHs to provide the MOON to a patient prior to furnishing 24 hours of observation services, but no later than 36 hours following the initiation of observation services. Several other commenters made a similar recommendation.

Response: We appreciate the many comments submitted on the issue of the timing of delivery of notice under the NOTICE Act. Section 1866(a)(1) of the Act, as amended by the NOTICE Act, requires hospitals and CAHs to deliver notice, consisting of a written notice (as specified by the Secretary of HHS following promulgation of rules) and an oral explanation of the notice, to each individual who receives observation services as an outpatient for more than 24 hours. Under the statute, the notice and explanation must be delivered no later than 36 hours after the time such individual begins receiving observation services (or, if sooner, upon release). We specified in proposed § 489.20(y) that the notification required by section 1866(a)(1)(Y) of the Act must be provided to individuals entitled to benefits under Title XVIII of the Act, whether or not the services furnished are payable under Title XVIII, when individuals receive observation services as an outpatient for more than 24 hours. As we stated in the proposed rule, for outpatients who are receiving observation services but not for more than 24 hours, hospitals and CAHs would not be required to deliver notice (81 FR 25132).

We agree with the commenter who suggested that the statute provides latitude to permit a hospital or CAH to voluntarily deliver notice prior to an individual's receipt of more than 24 hours of observation services as an outpatient. The NOTICE Act requires notice to individuals receiving more than 24 hours of observation services as an outpatient. While hospitals are not required to deliver notice to an individual who has not received more than 24 hours of observation services as an outpatient, nothing in the statute precludes hospitals and CAHs from delivering notice before an individual has received more than 24 hours of observation services as an outpatient, provided the information contained in the notice is accurate. Hospitals and CAHs that are subject to State laws requiring written notice to outpatients receiving observation services within 24 hours of the initiation of services, for example, may deliver the MOON to those individuals it believes will trigger the required notice under the NOTICE Act during the State-mandated timeframes and still be in compliance with the timing of notice delivery requirement of the NOTICE Act (provided the MOON is delivered not later than 36 hours after the time such individual begins receiving outpatient observation services, or, if sooner, upon release (that is, sooner, if transferred, discharged, or admitted as an inpatient)). Accordingly, we are revising proposed § 489.20(y) to clarify that hospitals and CAHs may deliver the MOON before an individual has received more than 24 hours of observation services as an outpatient.

However, we reiterate that the notice required by the NOTICE Act must be delivered within the timeframe established in statute; that is, no later than 36 hours after the time an individual begins receiving observation services as an outpatient, or if sooner, upon release. As specified in proposed § 489.20(y), the notice must be provided to the individual not later than 36 hours after observation services are initiated or sooner if the individual is transferred, discharged, or admitted. Delivering notice after this timeframe (for example, within 48 hours of the initiation of observation services, as suggested by one commenter) would not comply with the NOTICE Act requirement for timing of notice delivery. Therefore, we are not accepting the commenters' recommendations to allow hospitals and CAHs to deliver the notice as required by the NOTICE Act later than 36 hours after the individual entitled to notice

begins receiving observation services as an outpatient.

While, as previously stated, nothing in the statute precludes hospitals and CAHs from delivering notice before an individual has received more than 24 hours of observation services as an outpatient, provided the information contained in the notice is accurate, we note that we do not encourage hospitals and CAHs to deliver the MOON at the initiation of outpatient observation services. Routine and systematic delivery of the MOON by a hospital or CAH at the initiation of observation services would, in effect, render the MOON a notice of receiving outpatient observation services, as all patients receiving observation services would be given the MOON independent of the length of time they received observation services. In addition, at the initiation of outpatient observation services, patients may be completely preoccupied with concern for their safety and well-being, as they may be unsure of their diagnosis at a time when the signs and symptoms of their presenting condition(s) may be at the height of their clinical acuity. At the initiation of outpatient observation services, patients also may be overwhelmed and confused by notices and hospital paperwork that are presented at the time, often simultaneously. For these reasons, we reiterate that the NOTICE Act requires notice be provided to individuals who receive observations services as an outpatient for more than 24 hours, not later than 36 hours after the time the individual begins receiving such services, or, if sooner, upon release, but that the statute does not preclude earlier delivery, and that we encourage hospitals and CAHs to not deliver the MOON at the initiation of outpatient observation services.

Comment: Several commenters requested that CMS clarify when the 24 hour timeframe for receiving observation services as an outpatient begins. The commenters requested clarification as to whether the timeframe starts: (1) After services begin following the written order for observation services; (2) when related services commence if such services commence before the written order was executed and the patient occupies an outpatient bed count; or (3) based on the documentation of when nursing care began. Several commenters requested that CMS clarify, in situations where a resident orders observation services, whether the commencement of the 24-hour period for determining eligibility for the MOON begins when the resident writes the order or when the attending physician ''confirms'' that order.

Response: We appreciate the commenters' request for clarification regarding the time at which outpatient observation services are initiated for the purpose of determining when more than 24 hours of outpatient observation services have been received. In the proposed rule, we stated, ''For purposes of this proposed rule, consistent with existing billing rules, observation services are initiated when a physician orders such services'' (81 FR 25132). We then explained our existing billing rules contained in the CMS Internet Only Manual (IOM). ''According to the Medicare Claims Processing Manual (Pub. 100–04), Chapter 4, Section 290.2.2, hospital reporting for observation services 'begins at the clock time documented in the patient's medical record, which coincides with the time that observation services are initiated in accordance with a physician's order.' ''

As the commenters noted, there may be times when an individual is subject to an order for observation services, but is not actually receiving observation services. For example, following an order for observation services in an emergency department, a hospital may need to wait to begin furnishing observation services until a bed is available for the patient. In this situation, services are considered initiated when observation services commence.

In this final rule, we are clarifying our explanation in the preamble of the proposed rule that the start of observation services, for the purposes of determining when more than 24 hours of observation services have been received, is the clock time as documented in the patient's medical record at which observation services are initiated (furnished to the patient) in accordance with a physician's order.

With respect to the request for clarification of the effect of a resident's order for services on the counting of hours of observation care, we stated the following in our proposed rule that ''hospital observation services are defined in the Medicare Benefits Policy Manual (Pub. 100–02), Chapter 6, Section 20.6, as services that are medically reasonable and necessary, specifically ordered by a physician or other nonphysician practitioner authorized by State licensure law and hospital staff bylaws to admit patients to the hospital or to order outpatient services, and meet other published Medicare criteria for payment. The term 'physician' will encompass these authorized qualified nonphysician practitioners for the purposes of this proposed rule'' (81 FR 25132). Therefore, to the extent that a resident is authorized by State licensure law and hospital staff bylaws to order outpatient services, once observation services are initiated in accordance with the resident's order, the 24 hour time period will commence.

Comment: One commenter stated that, for the purpose of determining when a hospital or CAH must notify a patient under the NOTICE Act, that is, when an individual receives observation services as an outpatient for more than 24 hours, the counting of hours to trigger the notification requirement could be interpreted as elapsed or clock time (meaning starting the 24-hour clock at the time of the physician's order for observation services as an outpatient and ending with the discharge order from observation), or billable time (meaning tracking and counting only those hours which would be billable as outpatient observation services upon claim submission). The commenter recommended that CMS require hospitals and CAHs to use billable time when counting the hours of observation services received for the purpose of triggering the notification requirement. Another commenter recommended that CMS use elapsed time and not billable observation hours to determine when an individual has received 24 hours of observation services.

Response: We appreciate the comments and recommendations submitted on this issue. The NOTICE Act requires hospitals and CAHs to deliver notice to an individual who receives observation services as an outpatient for more than 24 hours, and requires delivery of the notice no later than 36 hours after the time such individual begins receiving observation services (or, if sooner, upon release). We believe using elapsed time rather than billed time is more consistent with the plain language of the statute for the purpose of determining when an individual is required to receive notice and when such notice must be delivered. Therefore, for purposes of identifying the 24-hour timeframe for which an individual has received observation services, and thus is required by the NOTICE Act to receive notice by the hospital or CAH, observation time will be measured as the elapsed time in hours beginning at the clock time documented in the patient's medical record, which coincides with the time that observation care is initiated in accordance with a physician's order. For example, an individual for whom observation services are initiated, in accordance with a physician order at 3:19 p.m. on Monday would meet the more than 24-

hour threshold to require delivery of notice, after 3:19 p.m. the following day (Tuesday), and delivery of the notice would be required by 3:19 a.m. on the subsequent day (Wednesday), or sooner, if the individual is discharged, transferred, or admitted.

Comment: One commenter requested that CMS clarify when the 24-hour time period ends for the purposes of determining whether a patient has received more than 24 hours of observation services as an outpatient, when the physician orders the discharge of the patient or when the patient leaves the building.

Response: Observation time ends when all medically necessary observation services are completed. To be clear, this could be before discharge when the need for observation services has ended, but other medically necessary services not meeting the definition of hospital observation services are provided (in which case, the additional medically necessary services received after the completion of observation services would be billed separately or be included as part of the emergency department or clinic visit). Alternatively, the end time of observation services may coincide with the time the patient is actually discharged from the hospital or admitted as an inpatient.

Comment: One commenter requested CMS to clarify how the MOON will work with the 2-midnight policy.

Response: The NOTICE Act requirements regarding delivery of notice to an individual who receives observation services as an outpatient for more than 24 hours, and no later than 36 hours after the time such individual begins receiving observation services (or, if sooner, upon release), do not impact or change the current requirements and guidance related to the 2-midnight policy previously issued by CMS. Hospitals will be required to adhere to all existing requirements of the 2-midnight policy, as well as adhere to the requirements set forth by the NOTICE Act. We remind commenters that the 2-midnight policy has been put forth by CMS to give hospitals and physicians guidance as to when an inpatient admission is eligible for Part A payment. The NOTICE Act requires hospitals to inform patients who have remained outpatients of the hospital and received observation services for more than 24 hours that they are not hospital inpatients and are subject to potentially different cost-sharing requirements and postacute care benefits than someone who has been admitted as an inpatient. We note that a scenario could arise whereby a patient is admitted to the hospital immediately after being a hospital outpatient receiving observation services for greater than 24 hours. In such a scenario, the inpatient admission may be payable under Medicare Part A under the 2-midnight policy and, as stated earlier, the hospital or CAH would still be required to furnish the MOON to the patient within 36 hours after the time the individual begins receiving observation services.

Comment: One commenter recommended that CMS require delivery of notice before the initiation of observation services, similar to the Advance Beneficiary Notice of Noncoverage (ABN), so that a patient can decide prior to incurring financial liability whether to receive the services or leave the hospital. The commenter believed that if the hospital does not notify the patient in advance of the initiation of observation services, the patient should be relieved of financial liability.

Response: We appreciate the recommendations of the commenter. However, the NOTICE Act established a requirement for notice specifically to an individual who receives observation services as an outpatient for more than 24 hours. We are not adopting the commenter's recommendation.

Comment: One commenter indicated that CMS significantly misstated when and how observation status is used. The commenter stated that use of Condition Code 44 is not rare and despite the 2-midnight policy, patients who remain in the hospital for multiple days often are coded as outpatients.

Response: As we have previously stated in Chapter 1, Section 50.3 of the Medicare Claims Processing Manual, CMS set the policy for the use of Condition Code 44 to address those relatively infrequent occasions, such as a late-night weekend admission when no case manager is on duty to offer guidance, when internal review subsequently determines that an inpatient admission does not meet hospital criteria and that the patient would have been registered as an outpatient under ordinary circumstances. Use of Condition Code 44 is not intended to serve as a substitute for adequate staffing of utilization management personnel or for continued education of physicians and hospital staff about each hospital's existing policies and admission protocols. As education and staffing efforts continue to progress, the need for hospitals to correct inappropriate admissions and to report Condition Code 44 should become increasingly rare.

After consideration of the public comments we received, we are finalizing the provisions of the proposed rule for timing of notice delivery with modifications as noted above.

d. Requirements for Written Notice

In the proposed rule (81 FR 25133), we proposed to implement section 1866(a)(1)(Y)(ii) of the Act, the requirement for written notification, under proposed new § 489.20(y)(1) by proposing the basic requirements for the written notice that hospitals and CAHs must use to notify individuals receiving outpatient observation services. Specifically, we proposed that hospitals and CAHs would be required to use a proposed standardized notice (the MOON) for written notification to an individual who receives observation services as an outpatient under the appropriate circumstances. By requiring use of a standardized notice, hospitals and CAHs would be assured that they are providing all of the statutorily required elements in a manner that is understandable to individuals receiving the notice. As provided at section 1866(a)(1)(Y)(ii)(I) of the Act, we proposed at § 489.20(y)(1)(i) that the MOON would explain to individuals that they are outpatients receiving observation services and not inpatients of the hospital or CAH, and the reason(s) for such status as an outpatient receiving observation services. By definition (as specified in the Medicare Benefits Policy Manual (Pub. 100–02), Chapter 6, Section 20.6), the reason for ordering observation services will always be the result of a physician's decision that the individual does not currently require inpatient services and observation services are needed for the physician to make a decision regarding whether the individual needs further treatment as a hospital inpatient or if the individual is able to be discharged from the hospital. We proposed at § 489.20(y)(1)(ii) that the proposed MOON also would provide an explanation of the implications of receiving observation services furnished by a hospital or CAH as an outpatient, including services furnished on an inpatient basis, such as those related to cost-sharing requirements for the patient under Medicare, and post-hospitalization eligibility for Medicare-covered SNF care, in standardized language to ensure that all Medicare eligible individuals receive accurate information. We proposed the inclusion of a blank ''Additional Information'' section on the MOON so that hospitals and CAHs may include additional information. Finally, as required by section 1866(a)(1)(Y)(ii)(V) of the Act,

the proposed MOON would include this information in plain language written for beneficiary comprehension.

Comment: Numerous commenters submitted comments regarding the general formatting and readability of the MOON. Several commenters expressed concern that the MOON was too complex for patients to have a full understanding of the issues included in the notice and the implications of being an outpatient receiving observation services. Some commenters did not consider the MOON to be written in ''plain language.'' Some commenters suggested the reading level of the MOON was too advanced for the typical beneficiary. Another commenter noted that the MOON is written at a 12.1 grade level and cited a study that claims that the average American's reading level proficiency is generally to be considered to be 5th to 7th grade level. Some commenters made suggestions on how the MOON could be reordered and simplified to improve understandability and effectiveness. Commenters also believed there were duplicative time and date fields as well as unnecessary fields for physician and hospital names when that information can be found in the beneficiary's medical record, or can be otherwise printed on the top of the notice, in the case of the hospital name. One commenter requested that the MOON have more room for the beneficiary's name and date of birth, while another commenter requested that the MOON be limited to one page. Another commenter provided copies of State-issued observation notices as examples that CMS may wish to consider during this notice development process. Other commenters suggested specific language for revising the notice. One commenter proposed incorporating a question and answer format on the MOON. Some commenters were concerned with which physician (admitting or attending) name should be included on the MOON. Other commenters did not want a requirement to include a physician name on the notice, as many physicians at a hospital can be involved with a beneficiary's outpatient care.

Response: We agree with the commenters that some fields are unnecessary when the information is contained in the patient's medical record. To that end, we have reduced the number of fillable fields on the MOON. Specifically, the fields for physician name and the date and time observation services began are no longer on the notice. In addition, we removed the field for the hospital name. Consistent with requirements for current beneficiary notices, and as will be detailed in future guidance, hospitals will be permitted to preprint the MOON to include their hospital name and logo at the top of the notice.

In response to the suggestion to condense the MOON into a single page, we are unable to do so, as condensing the notice, as suggested, would negatively affect its readability; for example, reducing the notice to one page would require use of an extremely small font size. However, we note that hospitals may print the MOON as two sides of a single page. Finally, we have drafted the MOON to contain all of the elements of notice we believe are required under the NOTICE Act. We have taken commenters' suggestions for specific wording changes under advisement and note that CMS' Office of Communications has performed a plain language review, and we have incorporated appropriate changes, wherever possible. The MOON has been revised and the updated draft is subject to a 30-day comment period in accordance with the requirements of the Paperwork Reduction Act (PRA). This revised MOON will not be final until any public comments have been received and considered. We do not routinely use specific readability tests on beneficiary publications. We appreciate the commenters' concerns and have made changes to the MOON, as discussed above, in order to help ensure maximum readability and comprehension. We believe the notice is now more streamlined and easier to comprehend. In addition to these revisions, as with most beneficiary notices, we expect that the MOON will be updated periodically based on our continued experience with the notice, through the PRA renewal process, which requires reapproval every 3 years.

Comment: Numerous commenters submitted comments related to the notice section containing contact information to express quality of care concerns to QIOs. Some commenters suggested moving this section further down or to the end of the notice. Other commenters suggested removing this information entirely. Some commenters explained that inclusion of this contact information would be confusing to beneficiaries and could mislead them as to the purpose of this notice. One commenter recommended revising the language to specifically state that QIOs do not have the authority to change a patient's status from outpatient to inpatient. Some commenters believed that the inclusion of QIO contact information may encourage calls to the QIO expressing that the beneficiary should be an inpatient, rather than outpatient, and regard the outpatient status as a quality of care issue, rather than a level of service issue. Another commenter suggested that CMS amend the QIO scope of work to account for additional inquiries that may result when required MOON delivery begins. One commenter believed the information about filing complaints about quality of care with MA plans is unnecessary. That commenter expressed concern that because outpatient status is not appealable, this contact information may cause unnecessary confusion.

Response: We agree with the commenters' suggestion to keep the focus of the MOON on status as an outpatient and related coverage and cost-sharing implications. Therefore, we have removed the QIO contact section from the MOON.

Comment: One commenter suggested that CMS remove the requirement directing a patient to contact 1–800–MEDICARE with questions, and replace that entire paragraph with hospital contact information. The commenter reasoned that because hospitals provide robust financial counseling services, physician advisors, care management teams, among others, they can better answer beneficiary questions in a friendly, in-person manner. Conversely, another commenter recommended removing the language referring beneficiaries with questions to hospital staff and physicians. This commenter believed that beneficiary questions regarding coverage and financial responsibility for receiving observation services as an outpatient are more appropriately directed to 1–800–MEDICARE. Another commenter suggested that CMS establish a point of contact in addition to 1–800–MEDICARE for questions related to the MOON.

Response: We disagree with the comments summarized above. The inclusion on the MOON of 1–800–Medicare contact information is consistent with other beneficiary notices. In addition to observation stay questions, beneficiaries may have other concerns related to Medicare billing, coverage, and associated issues.

We are maintaining the MOON's direction of patients to hospital personnel, in general, rather than to specific hospital contacts, to afford hospitals flexibility in the contact information they provide. However, hospitals may use the ''Additional Information'' section to specify particular hospital staff members and their contact information.

Finally, we believe that beneficiary information needs are satisfied by the existing options of using 1–800–Medicare as well as using hospital staff.

Beneficiaries have access to broad benefit and coverage information through 1–800–Medicare, and case-specific information from their hospitals. Therefore, we do not believe an additional point of contact is not necessary.

Comment: Several commenters explained that the MOON does not clearly state that the patient is not an inpatient for the purposes of meeting the 3 consecutive day inpatient hospital qualifying stay for coverage of post-hospital SNF care. One commenter suggested that the MOON explain the potential financial implications of being classified as an outpatient, rather than an inpatient, in simple, easy to understand terms. Another commenter noted that the MOON includes complex phrases such as ''observation stay'' and ''prior qualifying inpatient hospital stay'' without explanation. The commenter stated if these specific terms must be used, they should be defined in the notice. Many commenters suggested clarifying Part B coverage information and moving that language up in the ordering of the notice. One commenter suggested specific language to more clearly convey the information contained in this section.

Response: We agree with the commenters that this important information regarding coverage of post-hospital SNF care and Part B coverage should be more clearly stated and prominently displayed on the notice. To that end, we have simplified this language as part of the MOON's plain language changes and moved it near the top of the MOON.

Comment: Several commenters indicated that the NOTICE Act requires hospitals to explain the reason patients are classified as outpatients rather than inpatients. The commenters recommended that the MOON include a section for physicians to indicate the reason for outpatient status. Another commenter suggested that the MOON contain standard language explaining that the decision to classify a beneficiary as an outpatient, rather than admit as an inpatient, is based on Medicare regulations, without regard to cost-sharing responsibilities or skilled nursing facility eligibility. One commenter requested that CMS provide standard narratives to be used by hospitals when explaining the possible reasons for outpatient classification. Conversely, another commenter was satisfied with the MOON's standard language regarding the ''reason'' for observation services. However, this commenter believed this language was not clearly and prominently communicated on the notice.

Response: We agree with the commenters who suggested that the MOON should contain a field where a hospital will be required to state the specific reason a beneficiary is an outpatient, rather than inpatient. We believe this recommendation is consistent with the statute, specifically section 1866(a)(1)(Y)(ii)(I) of the Act. The MOON now contains a free text field where the specific reason for receiving observation services as an outpatient shall be completed by the hospital or CAH. We may consider, in the future, the other suggestions commenters made to improve the MOON, such as checkboxes with common reasons for the patient's outpatient status or suggested narratives for insertion in this section.

Comment: Several commenters asked that CMS clarify what additional information is expected to be included in the ''Additional Information'' section on the MOON.

Response: We generally do not specify expected language for the additional information sections of beneficiary notices. However, we believe hospitals and CAHs may use this section to include information such as unique circumstances regarding the particular patient (such as Medicare Accountable Care Organization (ACO) information), notation that a beneficiary refused to sign the MOON, hospital waivers of the beneficiary's responsibility for the cost of self-administered drugs, Part A cost sharing responsibilities if the beneficiary is subsequently admitted as an inpatient, or specific information for contacting hospital staff.

Comment: Several commenters urged CMS to clarify whether hospitals and CAHs will be required to provide the MOON to Medicare beneficiaries in States that already have a requirement to notify all patients of their status as an outpatient receiving observation services. The commenters expressed concern that furnishing two separate notices to beneficiaries would be counterproductive, burdensome on providers, and potentially confusing for patients. Some commenters requested CMS provide flexibility to hospitals to create their own notice that would comply with the requirements of the NOTICE Act. Some commenters requested CMS to address whether a hospital that complies with substantially equivalent requirements imposed under State law could be considered to be in compliance with the requirements of the NOTICE Act when furnishing a State-mandated notice. Some commenters recommended that where a hospital meets applicable State requirements related to observation notification, CMS deem the hospital to have met the NOTICE Act requirements. One commenter requested that where there is an existing State law that overlaps the requirements of the NOTICE Act, CMS clarify which requirements take precedence and expressly preempt the State law.

Response: The NOTICE Act requires hospitals and CAHs to furnish written notice specified by the Secretary pursuant to rulemaking, containing such language as the Secretary prescribes, consistent with the statute. Given the statutory language of the NOTICE Act, we believe the Federal standardized notice (the MOON) must be delivered to Medicare beneficiaries entitled to notice under the NOTICE Act, consistent with the provisions of this final rule, notwithstanding any similar notice that hospitals may previously had to deliver to such patients under State law or otherwise. In some cases, delivering the MOON may also fulfill State notice requirements for the Medicare population. Hospitals and CAHs will need to make that determination on a State-by-State basis. As we previously explained, where State law requires content that is not included in the MOON, hospitals may utilize the free text field in the MOON (''Additional Information'') for communicating such additional content. Hospitals and CAHs subject to State law notice requirements may also attach an additional page to the MOON to supplement the free text field in order to communicate additional content required under State law, or may attach the notice required under State law to the MOON. To the extent that there are requirements in a State law that directly conflict with or contradict requirements in the NOTICE Act, we will expect to address those issues of preemption as they are brought to our attention. However, at this time, we are not aware of any such State laws that contradict or conflict with the provisions of the NOTICE Act.

We believe the delivery of the MOON, an OMB standardized notice with consistent language, to all Medicare beneficiaries entitled to notice under the NOTICE Act best fulfills the requirements of the statute. Requiring the use of an OMB standardized notice ensures that all required statutory language is included, that the notice is written and formatted to be easily understandable to beneficiaries, and that the specific notice has been subject to public comment and input through the PRA process. Therefore, we are not adopting the commenters' recommendations.

Comment: One commenter asked whether hospitals that provide their

own notice to all patients receiving observation services as outpatients would still need to provide the MOON to Medicare beneficiaries who have received 24 hours of observation services as an outpatient.

Response: We recognize that some hospitals may voluntarily issue a notice to outpatients, or in some cases to outpatients who have received observation services, informing patients of the implications of being an outpatient on cost-sharing and benefits. However, the NOTICE Act requires hospitals and CAHs to furnish written notice specified by the Secretary through rulemaking, containing such language as the Secretary prescribes consistent with the statute. Given the statutory language and intent of the NOTICE Act, we believe the Federal standardized notice (the MOON) must be delivered to Medicare beneficiaries entitled to notice under the NOTICE Act, consistent with the provisions of this final rule, notwithstanding any similar notice that hospitals may previously have had to deliver to such patients pursuant to State law or otherwise.

Comment: One commenter recommended that, if an inpatient admission occurs prior to delivery of the MOON, the MOON be annotated with date and time of the inpatient admission so the patient is aware that outpatient status has ended and inpatient status has begun.

Response: We agree with the commenter that, if an inpatient admission occurs prior to delivery of the MOON, the MOON should be annotated with date and time of the inpatient admission. Therefore, we are requiring that, in the event that a patient is subsequently admitted as a hospital inpatient directly after receiving observation services for more than 24 hours, and the inpatient admission occurs prior to delivery of the MOON, the MOON be annotated with the date and time of the inpatient admission. Additional guidance regarding elements for the free text field of the MOON will be provided in the CMS Internet Only Manual.

Comment: One commenter indicated that the MOON does not include language specific to beneficiaries aligned with certain Medicare Accountable Care Organizations (ACO), such as Pioneer and Next Generation, where certain eligibility requirements for post-hospital SNF care may have been waived. The commenter recommended that CMS clarify that, in these situations, it is not necessary to include information related to post-hospital SNF care coverage implications of outpatient status where the 3 consecutive day inpatient hospital stay requirement has been waived.

Response: We appreciate the information from the commenter. As required by the NOTICE Act, we have created a notice that includes statutorily required information and other information needed for patients to understand their status as an outpatient, the distinction between being an outpatient and an inpatient, and the implications for being an outpatient receiving observation services. In addition, the NOTICE Act requires hospital and CAH staff to provide an oral explanation of the information contained in the written notice. We expect that, as part of the oral explanation, hospital staff will be available to answer questions that patients may have to assist them in understanding these concepts and the effects on their financial responsibility. Where there are exceptions to general rules for a very limited beneficiary population, such as waivers of the 3 consecutive day inpatient hospital stay requirement for beneficiaries aligned with particular ACOs, we would expect this information to be conveyed as part of the oral explanation or included in the ''Additional Information'' section of the MOON if the hospital or CAH is aware of the applicable exception. Because the MOON is a standard form approved by OMB, hospitals and CAHs will not be permitted to alter the included language, only the information to be included in the free text fields. To the extent that waivers of the post-hospital SNF coverage requirements become more prevalent and apply to a broader segment of the Medicare population, we will reconsider including such information in the MOON.

Comment: Several commenters suggested that the MOON be revised to reflect a recent policy statement issued by the HHS Office of Inspector General (OIG) regarding hospitals that discount or waive amounts owed by Medicare beneficiaries for self-administered drugs dispensed in outpatient settings. Other commenters suggested any language related to costs owed by beneficiaries for self-administered drugs dispensed in an outpatient setting be removed in light of the OIG policy statement. The OIG policy statement is located at: *http://oig.hhs.gov/compliance/alerts/guidance/policy-10302015.pdf*. The OIG policy statement assures hospitals that they will not be subject to OIG administrative sanctions if they discount or waive amounts that Medicare beneficiaries owe for self-administered drugs they receive in outpatient settings when those drugs are not covered by Part B, subject to certain specified conditions.

Response: We appreciate the commenters' recommendation. While we disagree that the language in the MOON should be omitted based on the referenced OIG policy permitting hospitals to discount or waive amounts owed by Medicare beneficiaries for self-administered drugs dispensed in outpatient settings, we agree that revisions to the MOON instructions are needed. Hospitals have discretion to take such actions based on the OIG policy statement, and the information on self-administered drugs that we proposed to be included in the MOON will be relevant for beneficiaries receiving care in hospitals that have not elected to waive or discount such amounts. In circumstances where the hospital does waive or discount costs for self-administered drugs, the hospital can include an explanation in the free-text field of the MOON (''Additional Information'') and/or provide an oral explanation to the individual. However, this is not required by the NOTICE Act. We have added language to the MOON instructions indicating that the hospital waiving or discounting the beneficiary's responsibility for the cost of self-administered drugs is an appropriate use of the ''Additional Information'' free text field of the MOON.

Comment: Several commenters requested specification on whether it was necessary for hospitals to retain a signed copy of the completed MOON in the patient's medical record and the requirements for doing so. One commenter asked whether hospitals could document in the medical record that the MOON was provided to the patient and an oral explanation was furnished without retaining a copy of the notice. Another commenter requested that CMS clarify hospitals can obtain an electronic signature and retain the MOON only in electronic form. One commenter requested CMS to clarify if there is a mechanism for hospitals to provide, when necessary, evidence the notice was delivered to the patient.

Response: Consistent with longstanding practice in implementing beneficiary notices, we will require that hospitals and CAHs retain a signed copy of the MOON. Such a practice assures both hospitals and CAHs and surveyors that the appropriate notices have been delivered as required. However, in the past, we have permitted providers to determine the method of storage. This same flexibility will be afforded to hospitals and CAHs delivering the MOON. Hospitals and CAHs may

choose to retain a signed notice as a hard copy or electronically.

After consideration of the public comments we received, we are finalizing the proposed requirements for written notice without modification.

e. Outpatient Observation Services and Beneficiary Financial Liability

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25133 through 25134), Section 20.6, Chapter 6, of the Medicare Benefit Policy Manual (Pub. 100–2) specifies that observation services furnished by hospitals and CAHs are ''a well-defined set of specific, clinically appropriate services, which include ongoing short-term treatment, assessment, and reassessment before a decision can be made regarding whether patients will require further treatment as hospital inpatients or if they are able to be discharged from the hospital.'' Typically, observation services are ordered for individuals who present to the emergency department (ED) and who then require a significant period of treatment and monitoring to determine whether or not their condition warrants inpatient admission or discharge. Individuals also may receive outpatient observation services in other areas of a hospital or CAH when necessary. For example, a patient who receives a drug infusion in a hospital's outpatient infusion center and then experiences post-infusion hypertension may require observation services. In the majority of cases, the decision whether to discharge a patient from the hospital following resolution of the reason for the observation care or to admit the patient as an inpatient can be made in less than 48 hours, and usually in less than 24 hours. In only rare and exceptional cases do reasonable and necessary outpatient observation services span more than 48 hours. All hospital observation services, regardless of duration of care, that are medically reasonable and necessary are covered by Medicare.

In some cases, Medicare beneficiaries receiving observation services while in a hospital or CAH may not be aware of their status as an inpatient or an outpatient, and thus may not be aware that there are significant differences in financial liability between inpatient status and outpatient status. CMS has published educational materials for Medicare beneficiaries to help inform them of financial and coverage liabilities associated with inpatient and outpatient services.[90] As an outpatient receiving observation services, a beneficiary may incur financial liability for Medicare Part B copayments,[91] the cost of self-administered drugs that are not covered under Part B, and the cost of post-hospital SNF care because section 1861(i) of the Act requires a prior 3-day hospital inpatient consecutive stay to be eligible for coverage of post-hospital SNF care under Medicare Part A. In contrast, as a hospital inpatient under Medicare Part A, a beneficiary pays an annual deductible ($1,288 in CY 2016) for all inpatient services provided during the first 60 days in the hospital of each benefit period for the year. Cost-sharing requirements for individuals enrolled in Medicare Part C, known as MA health plans, are dependent on the particular plan's policies. In addition, Medicare beneficiaries qualified through their State Medicaid program (QMBs) have different cost-sharing rules. For example, QMBs cannot be billed for Medicare Part A or Part B deductibles, coinsurance, or copayments and may have different rules regarding qualifying for SNF services. CMS has produced informational publications for beneficiaries that advise Medicare Advantage enrollees to check with their plans for information on coverage of observation services furnished to an outpatient.

As mentioned earlier, a beneficiary's liability for medication costs also is likely affected by whether the individual is hospitalized as an inpatient or receiving care as an outpatient. When an individual is hospitalized under a covered Medicare Part A inpatient stay, payment for medically reasonable and necessary medications that are provided by the hospital are covered under Medicare Part A. Generally, Medicare Part B covers drugs that are usually not self-administered. Based on the statutory prohibition at section 1861(s)(2) of the Act and its implementing regulation at § 410.29(a), Medicare Part B generally does not cover or pay for any drug or biological that can be self-administered. ''Self-administered drugs'' are considered prescription and over-the-counter medications that beneficiaries routinely take on their own. For safety reasons, many hospitals do not allow patients to take medications brought from home. Medicare prescription drug plans (Part D) may help pay for drugs provided by the hospital. Individuals with Medicare Part D will likely need to pay out-of-pocket costs to the hospital for these drugs and request reimbursement from their Part D plan.

In addition, whether an individual is receiving treatment or care as an inpatient admitted to the hospital or is receiving observation services as an outpatient pursuant to a doctor's orders may impact Medicare coverage for post-hospital SNF services. Section 1861(i) of the Act requires a beneficiary to be an inpatient of a hospital for not less than 3 consecutive days before discharge from the hospital in order to be eligible for coverage of post-hospital extended care services in a SNF under Medicare. For purposes of Medicare SNF coverage, the time spent receiving observation services as an outpatient does not count towards the requirement of a 3-day hospital inpatient stay because these services are outpatient.

Comment: Several commenters suggested that CMS revise language on the MOON regarding cost-sharing to reflect the fact that claims for most patients who receive observation services as an outpatient for 24 hours will be paid under a comprehensive APC (C–APC) under the OPPS that imposes a single copayment rather than a copayment for every service received. Other commenters also recommended that CMS remove or simplify the language included in the MOON regarding Part B cost-sharing for doctor services as the copayment requirement for doctor services are not affected by the decision to admit the patient as an inpatient or order observation services as an outpatient.

Response: The commenters are correct that, effective January 1, 2016, CMS established a C–APC for comprehensive observation services (C–APC 8011). To qualify for the C–APC payment, beneficiaries must have received 8 or more hours of hospital observation services in conjunction with a qualifying hospital visit, during a nonsurgical encounter. Under the C–APC payment policy, we note that, instead of paying copayments for a number of separate services that are generally individually subject to the copayment liability cap at section 1833(t)(8)(C)(i) of the Act, beneficiaries can expect to pay a single copayment for the comprehensive service that would be subject to the copayment liability cap. As a result, we expect that this

[90] ''Are You a Hospital Inpatient or Outpatient? If You Have Medicare—Ask!'' CMS Product No. 11435. May 2014.

[91] A beneficiary who receives hospital outpatient services typically pays 20 percent of the Medicare payment amount for outpatient items and services after paying the annual Part B deductible ($166 in CY 2016). The coinsurance amount for an outpatient CAH service is based on 20 percent of charges. In most cases, the cost-sharing for each individual outpatient service should not be more than the inpatient deductible. However, Medicare beneficiaries who receive several separately payable outpatient services, or are treated for extended periods of time as hospital outpatients, may have greater cost-sharing liabilities as an outpatient under observation than they may have if they were admitted as an inpatient to the hospital.

policy likely reduces the possibility that the overall beneficiary liability exceeds the copayment liability cap for most of these outpatient encounters involving observation services. Observation services that do not meet the criteria for payment under C–APC 8011 will not be paid under the C–APC and cost-sharing requirements for each individual separately payable service (up to the copayment liability cap at section 1833(t)(8)(C)(i) of the Act) will apply.

While Part B cost-sharing amounts for physician services do not differ based on the inpatient or outpatient status of the beneficiary, we still believe it is required to include information about the Part B cost-sharing for physician services as it is part of the total cost-sharing for which the beneficiary is responsible.

Comment: One commenter referenced the statement in the preamble of the proposed rule that CMS has produced informational publications for beneficiaries that advise MA enrollees to check with their plans for information on coverage of outpatient observation services. The commenter recommended that hospitals and CAHs be required to distribute copies of this publication to beneficiaries as part of the standard notice procedures.

Response: The MOON contains language advising MA enrollees to contact their plan for specific information on coverage for outpatient observation services. The language in the MOON was based on the language used in the referenced CMS publication on observation services (''*Are You a Hospital Inpatient or Outpatient*?''). As such, we do not believe there is value in requiring hospitals and CAHs to assume the burden of distributing a CMS publication that is readily available to Medicare beneficiaries and which includes the same instruction as the MOON regarding the importance of contacting the individual's plan for specific coverage information. Therefore, we are not accepting the commenter's suggestion.

f. Delivering the Medicare Outpatient Observation Notice

As discussed in the proposed rule (81 FR 25134), an English language version of the proposed MOON was submitted to OMB for approval. We stated in the proposed rule that once we receive OMB approval, a Spanish language version of the MOON will be made available. If the individual receiving the notice is unable to read its written contents and/or comprehend the required oral explanation, we expect hospitals and CAHs to employ their usual procedures to ensure notice comprehension. (We refer readers, for example, to the Medicare Claims Processing Manual (Pub. 100–4), Chapter 30, Section 40.3.4.3., for similar existing procedures related to notice comprehension for the Advance Beneficiary Notice of Noncoverage (ABN).) Usual procedures may include, but are not limited to, the use of translators, interpreters, and assistive technologies. Hospitals and CAHs are reminded that recipients of Federal financial assistance have an independent obligation to provide language assistance services to individuals with limited English proficiency (LEP) consistent with section 1557 of the Affordable Care Act and Title VI of the Civil Rights Act of 1964. In addition, recipients of Federal financial assistance have an independent obligation to provide auxiliary aids and services to individuals with disabilities free of charge, consistent with section 1557 of the Affordable Care Act and section 504 of the Rehabilitation Act of 1973

Comment: A number of commenters recommended that CMS provide the MOON in additional languages other than English and Spanish. Some commenters specifically requested that the MOON be provided in languages spoken by the lower of 5 percent or 1,000 Medicare beneficiaries. Other commenters recommended that CMS provide translation of the document into at least the top 15 languages nationally. Some commenters more generally requested that CMS make the notice available in additional languages over time.

Response: We appreciate commenters' concerns that beneficiaries have access to the MOON in a language they understand. As stated above and in the proposed rule, we will provide the MOON in both English and Spanish. We believe hospitals and CAHs already have in place various procedures to ensure that beneficiaries are able to understand notices and information delivered to them, and we expect they can further utilize those procedures to deliver the MOON. In addition, we believe that the requirements under section 1557 of the Affordable Care Act and Title VI of the Civil Rights Act of 1964, as listed above, mandate that hospitals and CAHs have the responsibility to provide language assistance to LEP individuals, and that these requirements apply to delivery of the MOON. Therefore, we are not accepting the commenters' recommendations.

Comment: Some commenters recommended that CMS allow hospitals and CAHs to provide solely oral interpretation of the English-based version of the MOON for at least 6 months after the MOON is finalized for more common languages (except Spanish once the Spanish-based version is finalized) and permanently for less common languages.

Response: As noted above and in the proposed rule, we expect hospitals and CAHs to employ their usual procedures to ensure beneficiaries are able to comprehend language included in the MOON. We understand that these procedures may include use of oral interpretation using translators. We believe it is the responsibility of hospitals and CAHs to ensure they are fulfilling statutory requirements regarding the provision of the notice.

Comment: Numerous commenters expressed concern that hospitals and CAHs will not have sufficient time to prepare for MOON implementation. The commenters recommended that CMS provide transition time for hospitals to implement the provisions of this final rule; recommended implementation periods ranged from at least 3 to more than 6 months. Several commenters requested that CMS delay monitoring and enforcement until the MOON is translated into the requisite number of foreign languages to meet anti-discrimination requirements for individuals with limited English proficiency. One commenter requested that CMS specify the date when MOON delivery must begin. In addition, the commenter requested clarification of whether a hospital would be required to deliver the notice only to outpatients whose observation services begin on or after the implementation date, or if hospitals must also include patients already receiving outpatient services as of the implementation date.

Response: We are clarifying that the MOON is on a separate approval track from this implementing regulation, as discussed above. The MOON is following the established OMB notice approval process under the PRA and is being published for the 30-day comment period along with this final rule as part of the PRA process.

We expect final PRA approval of the MOON around the time the implementing regulations are effective. Therefore, the implementation period for hospitals and CAHs will begin sometime after the effective date of this final rule and will be announced on the CMS Beneficiary Notices Initiative Web site at: *https://www.cms.gov/Medicare/Medicare-General-Information/BNI/index.html* and in an HPMS memorandum to MA plans. During this implementation period, hospitals and CAHs will have time to prepare for

implementation, consistent with past implementation practices for beneficiary notices. Hospitals and CAHs will be required to deliver the MOON to applicable patients who begin receiving observation services as outpatients on or after the notice implementation date. As we stated in the proposed rule, we have been working toward implementation since the NOTICE Act was passed. We recognize that the effective date of this final rule will be at some date after the statutory implementation date of August 6, 2016, has passed. We are striving to balance the statutory requirements to provide notice to the specified population with the desire to provide the affected industry sufficient time to put systems and business processes in place to implement the NOTICE Act requirements. Under the PRA approval process, the public will have 30 days to comment on the revised MOON following publication of this final rule and, OMB will review the MOON after the comment period. Once the MOON has been approved, hospitals and CAHs must fully implement use of the MOON and comply with all of the NOTICE Act requirements no later than 90 calendar days from the date of PRA approval of the MOON. This implementation schedule takes into consideration the statutory requirements of the NOTICE Act, as well as our longstanding experience in developing implementation schedules for new beneficiary notices.

Comment: Many commenters requested a delay in monitoring and enforcement of MOON delivery. Several commenters recommended graduated enforcement. One commenter requested that CMS explain the repercussions for a hospital failing to provide proper notice to Medicare beneficiaries, and whether failure to provide this notification would result in termination of the hospital from participation in the Medicare program. The commenter recommended that CMS only sanction hospitals for a pattern of notice delivery failure, and follow the same process currently in place for conditions of participation enforcement regarding substantial condition level violations. One commenter requested clarification of the consequences for failure to obtain or retain a signed notification prior to the patient being discharged. Several commenters suggested that CMS impose a graduated enforcement scheme beginning with notice and education of regulatory requirements and potential noncompliance so the hospital or CAH may develop and carry out a corrective action plan. Another commenter recommended that CMS establish a clear standard—developing consistent implementation across State lines and providing necessary audit protocols to surveyors. One commenter recommended that in cases where the MOON was not delivered to an individual as required, the beneficiary receive covered inpatient care paid under Medicare Part A. Finally, one commenter requested auditing guidelines published before the end of a ''grace period'' prior to the implementation date.

Response: We appreciate the commenters' interest in the oversight of MOON delivery. All monitoring and enforcement of the MOON will be consistent with our oversight procedures for other hospital delivered notices. We are reviewing our surveying protocols to identify changes that may be needed to facilitate effective monitoring and enforcement of these requirements. These revised procedures will be developed and implemented in the normal course of business.

Comment: One commenter noted that CMS did not provide guidance in the proposed rule specifying the hospital or CAH staff responsible for MOON delivery. The commenter believed that hospitals and CAHs should be responsible for this determination. Another commenter requested that CMS clarify what staff would be appropriate for delivering the MOON. One commenter believed that any trained member of the hospital staff should be permitted to deliver the MOON, but stated that the CMS burden estimate in the proposed rule appears to anticipate that it will be a nurse. The commenter explained that, in its experience, hospitals are more likely to use social workers, discharge planners, or administrative staff.

Response: We generally do not prescribe what staff must deliver a notice to a beneficiary. We agree with the commenter that the hospital or CAH is in the best position to determine the appropriate staff member to deliver the MOON. We clarify that inclusion of a particular occupation in a burden estimate reflects our attempts to best approximate, while not underestimating, the anticipated costs of notice delivery. This occupation choice does not serve as a notice delivery staff requirement.

After consideration of the public comments we received, we are finalizing the proposed provisions for delivering the MOON without modification.

g. Oral Notice

In the proposed rule (81 FR 25134), pursuant to the statutory requirement at section 1866(a)(1)(Y)(i) of the Act, we proposed under proposed new regulation at § 489.20(y)(2) that hospitals and CAHs provide an oral explanation of the written notice furnished to individuals who receive observation services as outpatients. We stated in the proposed rule that we will provide guidance for oral notification in our forthcoming Medicare manual provisions. Hospitals and CAHs are familiar with providing oral explanations of written notices (for example, surgical and procedural consent notices and the Important Message from Medicare), and we expect that oral notification will occur in conjunction with delivery of the MOON. Again, hospitals and CAHs are reminded that recipients of Federal financial assistance have an independent obligation to provide language assistance services to individuals with LEP consistent with section 1557 of the Affordable Care Act and Title VI of the Civil Rights Act of 1964. In addition, recipients of Federal financial assistance have an independent obligation to provide auxiliary aids and services to individuals with disabilities free of charge, subject to section 1557 of the Affordable Care Act and section 504 of the Rehabilitation Act of 1973.

Comment: Some commenters questioned how hospitals should handle and document the oral explanation required by the NOTICE Act. One commenter requested that CMS allow public comment on any guidance issued on the oral explanation in CMS operating manuals. This commenter questioned if the oral component is required, and whether the patient's signature on the MOON would be considered sufficient documentation that the oral notice was given and understood by the patient or the patient's representative. Another commenter stated that delivery of the MOON is unnecessary and suggested that the intent of the notice requirement should be satisfied by the oral explanation by the hospital staff followed by documentation and confirmation of the explanation in the patient's electronic medical record. One commenter recommended that CMS allow hospitals to deliver the oral explanation with a video presentation. The commenter indicated that staff would be present to answer questions and provide additional explanation where necessary, in addition to the video explanation.

Response: The statute requires that there be an oral explanation of the written notification, or MOON. We believe it is essential that hospital staff

are available to provide a verbal explanation and answer questions in the interest of beneficiaries fully understanding the MOON. A video presentation of the MOON is acceptable if an individual is available to answer questions. Finally, the NOTICE Act requires hospitals and CAHs to deliver both a written notice and an oral explanation of the notice when notice delivery is required. Therefore, we do not believe providing only an oral notice is permissible under the statute.

Comment: One commenter expressed concern that hospitals [and CAHs] would be required to maintain around the clock staff who are trained to deliver the MOON. The commenter stated that it would place an enormous burden on hospitals [and CAHs] and would be costly to implement.

Response: We believe that hospitals and CAHs furnishing observation services are sufficiently staffed to furnish such observation services and that hospitals and CAHs would appropriately train the staff that furnishes observation services to deliver the MOON, as required, in the applicable cases.

After consideration of the public comments we received, we are finalizing the proposed provisions for oral notice without modification.

h. Signature Requirements

As specified in the proposed rule (81 FR 25134), as set forth at section 1866(a)(1)(Y)(ii)(IV) of the Act, the written notification must be either signed by the individual receiving observation services as an outpatient or a person acting on such individual's behalf to acknowledge receipt of notification. Moreover, the statute provides that if such individual or person refuses to provide a signature, the written notification is to be signed by the staff member of the hospital or CAH who presented the written notification and certain information needs to be included with such signature. Accordingly, we proposed under proposed new § 489.20(y)(3), that the written notice be signed, as described above, in order to acknowledge receipt and understanding of the notice. The MOON would include a dedicated signature area for this purpose. In cases where the individual receiving the MOON refuses to sign the notice, we proposed that the MOON must be signed by the staff member who presents the notice to the individual. The staff signature would include the staff member's name and title, a certification statement that the notice was presented, and the date and time that the notice was presented.

Comment: Several commenters requested that CMS clarify procedures for obtaining a signature when a patient is unable to sign the MOON due to a medical or mental condition or when someone is under duress and no representative is available. One commenter found the MOON to be unclear with respect to how providers can determine when it is appropriate to seek alternative signatures and who (patient family member or other caregiver) should be engaged to sign the MOON. Some commenters recommended that CMS allow a hospital representative to annotate the notice to indicate the patient was unable to sign and that no patient representative was available, in the same manner CMS proposed to permit staff to sign and date the MOON when a beneficiary refuses to sign. Other commenters believed that a notice that is not understandable is defective. Several commenters recommended that CMS require that a hospital or CAH deliver the MOON only to a patient able to comprehend it, and, if not, provide the notice to a representative able to do so. The commenters suggested that failure to do so will result in a defective notice. Another commenter recommended that hospitals be required to provide written and oral notification to the patient's family member, caregiver, or power of attorney, similar to existing procedures related to notice delivery and comprehension for the ABN. One commenter expressed concern that the proposed rule did not set standards for assuring competency of the patient who is given the notice and ''acknowledges receipt.'' The commenter explained that patients who have diminished capacity due to pain or medication or other conditions may not understand either the notice or its implications, and recommended that CMS address competency and assuring that the patient understands the notice in the final rule.

Response: The NOTICE Act requires hospitals and CAHs to deliver written notice to an individual who has received more than 24 hours of observation services as an outpatient, and requires hospitals and CAHs to document acknowledgment of receipt of the notice by obtaining a signature of the individual or the person acting on the individual's behalf. The NOTICE Act also provides a mechanism for hospitals and CAHs to comply with the acknowledgment requirement if the individual or person acting on behalf of the individual refuses to sign the written notice. To the extent that additional guidance related to delivery of notice is necessary, we will issue instructions in the CMS Internet Only Manual.

Comment: One commenter stated that requiring a signature of the hospital staff when a patient refuses to sign the MOON raises ethical concerns for physicians and other hospital providers who may believe they do not have the right to sign a document when they are not financially responsible for, or legally acting on the patient's behalf. The commenter recommended that CMS instead include a check or initial box to indicate that a patient or caregiver refused to sign.

Response: We appreciate the concerns raised by the commenter. However, the NOTICE Act expressly requires that if such individual entitled to notice or person acting on such individual's behalf refuses to provide signature, the MOON be signed by the staff member of the hospital or CAH who presented the written notification and includes the name and title of such staff member, a certification that the notification was presented, and the date and time the notification was presented (in accordance with section 1866(a)(1)(Y)(ii)(IV)(bb) of the Act). We believe accepting something in lieu of signature of the individual, person acting on individual's behalf, or relevant staff member would not be appropriate. Therefore, we are maintaining this proposed signature requirement in this final rule.

Comment: Several commenters suggested that the signature of a beneficiary reflect notice comprehension as well as receipt of the notice.

Response: We clarify that a notice signature will reflect notice receipt as well as comprehension, consistent with statutory requirements that the notice be written and formatted using plain language, be made available in appropriate languages, and be accompanied by an oral explanation. The MOON makes clear that the signature attests to both receipt and understanding of the notice. We will be publishing guidance, pursuant to our usual approval process, to further guide hospitals and CAHs in delivery of the MOON. We plan for this guidance to be available to hospitals and CAHs before notice delivery is required, which will be at the end of the implementation period after the MOON receives final approval.

After consideration of the public comments we received, we are finalizing the proposed signature requirements without modification.

i. No Appeal Rights Under the NOTICE Act

As indicated in the proposed rule (81 FR 25134), section 1866(a)(1)(Y) of the Act, as added by the NOTICE Act, does not afford appeal rights to beneficiaries regarding the notice provided pursuant to that statutory provision. To provide clarity to this point, we proposed to amend the regulations at § 405.926 relating to actions that are not initial determinations, by adding new paragraph (u) to explain that issuance of the MOON by a hospital or CAH does not constitute an initial determination and therefore does not trigger appeal rights under 42 CFR part 405, subpart I.

Comment: Several commenters submitted comments regarding appeal rights and the MOON. One commenter expressed concern that the proposed rule explicitly prevents Medicare beneficiaries from appealing their ''observation status determination.'' The commenter stated that the proposed MOON is the only instance in which Medicare beneficiaries receiving a notice of denial of coverage are not given a process to appeal the determination, and further stated that delivery of the MOON corresponds with noncoverage of post-hospital SNF care upon hospital discharge and impacts coverage of care while in the hospital. The commenter recommended CMS remove proposed regulatory language in § 405.926(u) that states Medicare beneficiaries receiving the MOON do not have appeal rights. Another commenter believed that the MOON should inform beneficiaries of their right to appeal observation services received as an outpatient. Another commenter believed that the MOON should explain that a patient does not have an immediate right to appeal their status as an outpatient receiving observation services as well as the fact that their physician does not have the authority to change their status. One commenter recommended that CMS clarify why beneficiaries may not challenge their status as an outpatient and the provision of observation services.

Response: We thank the commenters for the recommendations. However, we believe that the comments reflect concerns outside the scope of the NOTICE Act or a misunderstanding of the nature of the notice required under the legislation. We disagree with the commenter's assertion that delivery of the MOON constitutes a determination of noncoverage of post-hospital SNF care. We also disagree with the commenter's characterization of the proposed MOON constituting a notice of denial of coverage in general. Finally, we do not believe the MOON is the appropriate document to communicate appeal rights; the Medicare Summary Notice (MSN) fulfills that purpose. Therefore, we are not accepting the commenters' recommendations.

The MOON is a required informational/educational notice regarding patient status provided by a hospital or CAH when the beneficiary is still in the hospital or CAH and receives observation services as an outpatient for more than 24 hours. The MOON explains the current status of the patient as an outpatient and not an inpatient, in addition to the implications of being an outpatient receiving observation services. As we explained in the proposed rule, delivery of the MOON does not constitute an initial determination issued in response to a claim for benefits, and the MOON itself is not a notice of an initial determination (81 FR 25134). Furthermore, delivery of the MOON by a hospital or CAH does not constitute a denial of coverage of any services, and does not constitute a noncoverage decision with respect to post-hospital SNF care as asserted by the commenter. In fact, generally beneficiaries will still be receiving care when the MOON is delivered and will sometimes be formally admitted as inpatients after delivery of the MOON.

The NOTICE Act does not provide for appeal rights regarding the notice itself, which makes sense given the nature of the document, as explained above. The NOTICE Act also does not afford any new appeal rights beyond those already available (under section 1869 of the Social Security Act), nor does the NOTICE Act limit or restrict currently available appeal rights. Consistent with the legislation, the proposed rule did not propose to expand or limit appeal rights. For the reasons discussed above, we are not adopting the various recommendations with respect to amending the MOON to include appeal rights or an explanation of the lack of appeal rights.

As we have stated repeatedly, the decision to admit a beneficiary as an inpatient is a complex medical decision made by the physician in consideration of various factors, including the beneficiary's age, disease processes, comorbidities, and the potential impact of sending the beneficiary home. It is the responsibility of the physician to make the complex medical determination of whether the beneficiary's risk of morbidity or mortality dictates the need to remain at the hospital because the risk of an adverse event would otherwise be unacceptable under reasonable standards of care, or whether the beneficiary may be discharged. We expect that the NOTICE Act and implementing policies will result in beneficiaries having a better understanding of the care they are receiving.

After consideration of the public comments we received, we are finalizing the proposed revision to § 405.926(u) without modification.

j. Out of Scope Public Comments

We received several comments that were outside the scope of the provisions of the proposed rule, and we are not responding to them in this final rule. These comments were related to (1) defining inpatient care; (2) alternate notification for transition to inpatient status; (3) increased protection for inappropriate placement; (4) beneficiary education and outreach; (5) standardized language for hospitals to use when a beneficiary does not meet inpatient criteria after internal utilization review; (6) requirement for hospital pharmacies to work with MA and Part D plans on an in-network basis; (7) waiver of therapy cap; (8) waiver of functional limitation reporting; and (9) physician education and outreach in regards to handling beneficiary concerns and complaints.

k. Provisions of the Final Regulations

After consideration of the public comments we received, we are finalizing the addition of paragraph (u) to § 405.926 as proposed. The proposed addition of paragraph (y) to § 489.20 is being revised to clarify that hospitals and CAHs may deliver the MOON before an individual has received more than 24 hours of observation services as an outpatient.

M. Technical Changes and Correction of Typographical Errors in Certain Regulations Under 42 CFR Part 413 Relating to Costs to Related Organizations and Medicare Cost Reports

1. General Background

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25134 through 25135), as part of our ongoing review of the Medicare regulations, we have identified a number of technical changes or corrections of typographical errors in 42 CFR part 413 relating to costs to related organizations and Medicare cost reports that need to be made. Below we are summarizing these proposed changes or corrections, with our corresponding final policy decisions.

2. Technical Change to Regulations at 42 CFR 413.17(d)(1) on Cost to Related Organizations

Prior to the enactment of section 911(b) of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (Pub. L. 108–173), a provider had the right to nominate a fiscal intermediary (currently known as a Medicare Administrative Contractor (MAC) and referred to in this section as a ''contractor'') of its choice. Public Law 108–173 repealed the nomination provisions formerly found in section 1816 of the Act and added section 1874A (Contracts with Medicare Administrative Contractors). Currently, a provider will be assigned to the contractor that covers the geographic locale where the provider is located, as specified in the regulations at 42 CFR 421.404(b).

Because a provider is no longer permitted to select a contractor of its choice, and a contractor is now assigned to a provider, the parenthetical language of the regulation text at 42 CFR 413.17(d)(1) referring to a provider's nomination of a contractor is obsolete. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25134), we proposed to revise § 413.17(d)(1) to remove the parenthetical reference to a provider's nomination of a contractor.

We did not receive any public comments regarding this proposal. Therefore, we are finalizing our proposal to revise § 413.17(d)(1) to remove the parenthetical reference to a provider's nomination of a contractor.

3. Changes to 42 CFR 413.24(f)(4)(i) Relating to Electronic Submission of Cost Reports

In § 413.24(f)(4)(i), we incorrectly refer to a ''Federally qualified health clinic.'' The correct entity title under section 1861(aa) of the Act is ''Federally qualified health center.'' In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25135), we proposed to correct this error.

In addition, § 413.200(c)(1)(i) requires a histocompatibility laboratory to file a Medicare cost report in accordance with the regulations at § 413.24(f). For cost reporting periods ending on or after March 31, 2005, organ procurement organizations (OPOs) and histocompatibility laboratories are required to submit Medicare cost reports in a standardized electronic format, but histocompatibility laboratories were inadvertently omitted from the list of providers in the regulations text at § 413.24(f). As evidenced by the reference in the August 22, 2003 **Federal Register** document (68 FR 50720) to the Office of Management and Budget (OMB) approval number 0938–0102 of the Paperwork Reduction Act request for the cost reporting form entitled ''Organ Procurement Agency/Laboratory Statement of Reimbursable Costs,'' histocompatibility laboratories were intended to be included in the regulation text. Both OPOs and histocompatibility laboratories have used that Medicare cost report form to report their statements of reimbursable costs since its approval by OMB for use for cost reporting periods ending on or after March 31, 2005. To correct this omission, we proposed a technical change to § 413.24(f)(4)(i) to add ''histocompatibility laboratories'' to the list of providers required to submit cost reports in a standardized electronic format.

We did not receive any public comments regarding these proposals. Therefore, we are finalizing our proposal to correct the entity title of a ''Federally qualified health center'' in § 413.24(f)(4)(i). We are also finalizing our proposal to add ''histocompatibility laboratories'' to the list of providers required to submit cost reports in a standardized electronic format in § 413.24(f)(4)(i).

4. Technical Changes to 42 CFR 413.24(f)(4)(ii) Relating to Electronic Submission of Cost Reports and Due Dates

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25135), we proposed a technical correction in § 413.24(f)(4)(ii) to the effective date for the submission of Medicare cost reports in a standardized electronic format for skilled nursing facilities (SNFs) and home health agencies (HHAs) from cost reporting periods ending on or after December 31, 1996 to cost reporting periods ending on or after February 1, 1997 to accurately reflect the regulation text finalized in the January 2, 1997 final rule, ''Medicare Program: Electronic Cost Reporting for Skilled Nursing Facilities and Home Health Agencies,'' published in the **Federal Register** at 62 FR 26 through 31.

For the same reasons articulated in section IV.M.3. of the preamble of the proposed rule (81 FR 25135), we also proposed to revise § 413.24(f)(4)(ii) by adding histocompatibility laboratories to the list of providers required to file electronic cost reports. To correct a typographic error, we proposed to remove the duplicate word ''contractor'' from the second sentence of this paragraph.

We did not receive any public comments regarding these proposals. Therefore, we are finalizing our proposal to make a technical correction in § 413.24(f)(4)(ii) to the effective date for the submission of Medicare cost reports in a standardized electronic format for SNFs and HHAs from cost reporting periods ending on or after December 31, 1996 to cost reporting periods ending on or after February 1, 1997, to accurately reflect the regulation text finalized in the January 2, 1997 final rule published in the **Federal Register** at 62 FR 26 through 31. We also are finalizing our proposal to revise § 413.24(f)(4)(ii) by adding histocompatibility laboratories to the list of providers required to file electronic cost reports for the same reasons provided in section IV.M.3. of the preamble of this final rule. In addition, we are correcting a typographic error to § 413.24(f)(4)(ii) by removing the duplicate word ''contractor'' from the second sentence of this paragraph.

5. Technical Changes to 42 CFR 413.24(f)(4)(iv) Relating To Reporting Entities, Cost Report Certification Statement, Electronic Submission and Cost Reports Due Dates

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25135), we proposed to revise § 413.24(f)(4)(iv) to make a technical correction to the effective date for SNFs and HHAs to submit hard copies of a settlement summary, a statement of certain worksheet totals found within the electronic file, and a certifying statement signed by its administrator or chief financial officer, from cost reporting periods ending on or after December 31, 1996, to cost reporting periods ending on or after February 1, 1997, to accurately reflect the regulation text finalized in the January 2, 1997 final rule (62 FR 26 through 31).

We proposed to revise § 413.24(f)(4)(iv) by adding histocompatibility laboratories to the list of providers required to file electronic cost reports for the same reasons provided in section IV.M.3. of the preamble of the proposed rule (81 FR 25135). In addition, we proposed to add histocompatibility laboratories to the list of providers required to submit hard copies of a settlement summary, a statement of certain worksheet totals found within the electronic file, and a certifying statement signed by its administrator or chief financial officer, for cost reporting periods ending on or after March 31, 2005, for the same reasons.

We also proposed to correct a typographical error that occurred in the Medicare cost report certification statement set forth in § 413.24(f)(4)(iv)

by adding the word ''and'' between the words ''Sheet'' and ''Statement'' to denote the two separate financial documents required to be submitted with the cost report; that is, the Balance Sheet and the Statement of Revenue and Expenses. The cost report certification statement historically correctly denoted the two separate and distinct financial forms, the Balance Sheet and the Statement of Revenue and Expenses on Worksheet S (Form CMS–2552–92) of the Medicare cost report since the Worksheet S was first used in 1993. The Medicare cost report certification statement was later incorporated into § 413.24(f)(4)(iv) in a final rule with comment period (59 FR 26964 through 26965) issued in response to public comments received following the Uniform Electronic Cost Reporting System for Hospitals proposed rule (56 FR 41110). A typographical error excluding the word ''and'' occurred during the incorporation of the certification statement into the regulations text at § 413.24(f)(4)(iv).

We did not receive any public comments regarding these proposals. Therefore, we are finalizing our proposals without modification to revise § 413.24(f)(4)(iv) to make a technical correction to the effective date for SNFs and HHAs to submit hard copies of a settlement summary, a statement of certain worksheet totals found within the electronic file, and a certifying statement signed by its administrator or chief financial officer, from cost reporting periods ending on or after December 31, 1996, to cost reporting periods ending on or after February 1, 1997, to accurately reflect the regulation text finalized in the January 2, 1997 final rule (62 FR 26 through 31). We also are finalizing our proposal to revise § 413.24(f)(4)(iv) by adding histocompatibility laboratories to the list of providers required to file electronic cost reports for the same reasons provided in section IV.M.3. of the preamble of this final rule. In addition, we are finalizing our proposal to add histocompatibility laboratories to the list of providers required to submit hard copies of a settlement summary, a statement of certain worksheet totals found within the electronic file, and a certifying statement signed by its administrator or chief financial officer, for cost reporting periods ending on or after March 31, 2005, for the same reasons.

Furthermore, we are finalizing our proposal to correct a typographical error that occurred in the Medicare cost report certification statement set forth in the regulations text at § 413.24(f)(4)(iv) by inserting the word ''and'' between the words ''Sheet'' and ''Statement'' to denote the two separate financial documents required to be submitted with the cost report; that is, the Balance Sheet and the Statement of Revenue and Expenses.

6. Technical Correction to 42 CFR 413.200(c)(1)(i) Relating to Medicare Cost Report Due Dates for Organ Procurement Organizations and Histocompatibility Laboratories

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25135), we proposed to make a technical correction to the reference in § 413.200(c)(1)(i) to the due date for the Medicare cost report for organ procurement organizations (OPOs) and histocompatibility laboratories from ''three months'' to ''5 months'' after the end of the fiscal year. Section 413.200(c)(1)(i) requires independent OPOs and histocompatibility laboratories to file a cost report in accordance with § 413.24(f). In the 1995 final rule (60 FR 33137), we revised § 413.24(f) to extend the Medicare cost report due date for all providers required to file a cost report from 3 months to 5 months after the end of a provider's fiscal year end, but inadvertently neglected to make a conforming change to § 413.200(c)(1)(i), which we proposed to correct in the proposed rule.

We did not receive any public comments regarding these proposals. Therefore, we are finalizing our proposal to make a technical correction to the reference in § 413.200(c)(1)(i) to the due date for the Medicare cost report for organ procurement organizations (OPOs) and histocompatibility laboratories from ''three months'' to ''5 months'' after the end of the fiscal year.

N. Finalization of Interim Final Rule With Comment Period Implementing Legislative Extensions Relating to the Payment Adjustments for Low-Volume Hospitals and the Medicare-Dependent, Small Rural Hospital (MDH) Program

In the interim final rule with comment period (IFC) that appeared in the **Federal Register** on August 17, 2015 (80 FR 49594 through 49597), we addressed the legislative extension of the MDH program as well as certain provisions relating to payment to low-volume hospitals under the IPPS made by the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) Public Law 114–10. (For the remainder of this section, we will refer to this IFC as the ''August 2015 IFC''.) Section 204 of the MACRA extended the temporary changes to the low-volume hospital qualifying criteria and payment adjustment under the IPPS, originally provided for by the Affordable Care Act, for discharges occurring on or after April 1, 2015 through FY 2017 (September 30, 2017). Section 205 of the MACRA extended the MDH program for hospital discharges occurring on or after April 1, 2015 through FY 2017 (September 30, 2017).

In this final rule, we discuss the provisions of the August 2015 IFC, acknowledge the public comments received (which we determined were all outside the scope of the provisions of the IFC), and state the final policy (which we are not modifying from the IFC).

1. Payment Adjustment for Low-Volume Hospitals (§ 412.101)

a. Background

Section 1886(d)(12) of the Act provides for an additional payment to each qualifying low-volume hospital that is paid under IPPS beginning in FY 2005, and the low-volume hospital payment policy is set forth in the regulations at 42 CFR 412.101. Sections 3125 and 10314 of the Affordable Care Act provided for a temporary change in the low-volume hospital payment policy for FYs 2011 and 2012. Specifically, the provisions of the Affordable Care Act amended the qualifying criteria for low-volume hospitals to specify, for FYs 2011 and 2012, that a hospital qualifies as a low-volume hospital if it is more than 15 road miles from another subsection (d) hospital and has less than 1,600 discharges of individuals entitled to, or enrolled for, benefits under Medicare Part A during the fiscal year. In addition, the statute as amended by the Affordable Care Act, provides that the low-volume hospital payment adjustment (that is, the percentage increase) is to be determined using a continuous linear sliding scale ranging from 25 percent for low-volume hospitals with 200 or fewer discharges of individuals entitled to, or enrolled for, benefits under Medicare Part A in the fiscal year to 0 percent for low-volume hospitals with greater than 1,600 discharges of such individuals in the fiscal year. We revised the regulations governing the low-volume hospital policy at § 412.101 to reflect the changes to the qualifying criteria and the payment adjustment for low-volume hospitals according to the provisions of the Affordable Care Act in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50238 through 50275 and 50414).

The temporary changes to the low-volume hospital qualifying criteria and payment adjustment originally provided for by the Affordable Care Act have been extended by subsequent legislation as

follows: Through FY 2013 by the American Taxpayer Relief Act of 2012 (ATRA), Public Law 112–240; through March 31, 2014, by the Pathway for SGR Reform Act of 2013, Public Law 113–167; through March 31, 2015, by the Protecting Access to Medicare Act of 2014 (PAMA), Public Law 113–93; and most recently through FY 2017 by section 204 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA), Public Law 114–10. The extension provided by section 204 of the MACRA is discussed in greater detail in section IV.L.2.b. of the preamble of the August 2015 IFC and this final rule. For additional details on the implementation of the previous extensions, through March 31, 2015, of the temporary changes to the low-volume hospital qualifying criteria and payment adjustment originally provided for by the Affordable Care Act, we refer readers to the following **Federal Register** documents: The FY 2013 IPPS notice (78 FR 14689 through 14691); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50611 through 50612); the FY 2014 IPPS interim final rule with comment period (79 FR 15022 through 15025); the FY 2014 IPPS notice (79 FR 34444 through 34446); and the FY 2015 IPPS/LTCH PPS final rule (79 FR 49998 through 50001).

b. Implementation of Provisions of the MACRA for FY 2015

Section 204 of the MACRA provided for an extension of the temporary changes to the low-volume hospital qualifying criteria and payment adjustment for discharges occurring on or after April 1, 2015, through FY 2017 (that is, for discharges occurring on or before September 30, 2017). As discussed in the August 2015 IFC (80 FR 49594), we addressed the extension of the temporary changes to the low-volume hospital payment policy for the last half of FY 2015, that is, for discharges occurring on or after April 1, 2015, through September 30, 2015, in instructions issued in Change Request 9197, Transmittals 3263 and 3281. Generally, hospitals that were receiving the low-volume hospital payment adjustment for FY 2015 as of March 31, 2015 continued to receive the adjustment for the second half of FY 2015, as long as the hospital continued to meet the applicable qualifying low-volume hospital criteria.

In the instructions issued in Change Request 9197, for discharges occurring on or after April 1, 2015, through September 30, 2015, consistent with the existing regulations at § 412.101(b)(2)(ii), we stated that the same discharge data used for the low-volume adjustment for discharges occurring during the first half of FY 2015 will continue to be used for discharges occurring during the last half of FY 2015, as these data were the most recent available data at the time of the development of the FY 2015 payment rates. Specifically, for FY 2015 discharges occurring on or after April 1, 2015, through September 30, 2015, the low-volume hospital qualifying criteria and payment adjustment (percentage increase) is determined using FY 2013 Medicare discharge data from the March 2014 update of the MedPAR files. These discharge data can be found in Table 14 of the Addendum to the FY 2015 IPPS/LTCH PPS final rule, which is available via the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2015-IPPS-Final-Rule-Home-Page-Items/FY2015-Final-Rule-Tables.html*. We note that, consistent with past practice, Table 14 is a list of IPPS hospitals with fewer than 1,600 Medicare discharges and is not a listing of the hospitals that qualify for the low-volume adjustment for FY 2015; it does not reflect whether or not the hospital meets the mileage criterion (that is, the hospital must also be located more than 15 road miles from any other IPPS hospital). In order to receive the applicable low-volume hospital payment adjustment (percentage increase) for FY 2015 discharges, a hospital must meet both the discharge and mileage criteria. We discussed the conforming changes to the regulations at § 412.101 consistent with the extension of the temporary changes to the low-volume hospital definition and payment adjustment provided by section 204 of the MACRA in section IV.L.2.c. of the preamble of the August 2015 IFC.

c. Low-Volume Hospital Definition and Payment Adjustment for FY 2016

As discussed in the August 2015 IFC (80 FR 49595) and above, under section 1886(d)(12) of the Act, as amended by section 204 of the MACRA, the temporary changes in the low-volume hospital payment policy originally provided by the Affordable Care Act and extended through subsequent legislation, are effective through FY 2017. Under the prior extension, in accordance with section 105 of PAMA, those temporary changes in the low-volume hospital payment policy were to be in effect for discharges on or before March 31, 2015 only. We stated in the August 2015 IFC that, due to the timing of the development of the FY 2016 IPPS/LTCH PPS proposed rule and the enactment of the MACRA, we were unable to address the extension of the changes in the low-volume hospital payment policy for FY 2016 (or the last half of FY 2015, as discussed in section IV.L.2.b. of the preamble of the August 2015 IFC) in that proposed rule. In the August 2015 IFC, we revised the regulations at § 412.101 to conform to the provisions of section 204 of the MACRA.

To implement the low-volume hospital payment adjustment for FY 2016 consistent with provisions of the MACRA, in accordance with existing § 412.101(b)(2)(ii) and consistent with our historical approach, we updated the discharge data source used to identify qualifying low-volume hospitals and calculate the payment adjustment (percentage increase). Under existing § 412.101(b)(2)(ii), for the applicable fiscal years, a hospital's Medicare discharges from the most recently available MedPAR data, as determined by CMS, are used to determine if the hospital meets the discharge criteria to receive the low-volume payment adjustment in the current year. The applicable low-volume percentage increase, as originally provided for by the Affordable Care Act, is determined using a continuous linear sliding scale equation that results in a low-volume hospital payment adjustment ranging from an additional 25 percent for hospitals with 200 or fewer Medicare discharges to a zero percent additional payment adjustment for hospitals with 1,600 or more Medicare discharges. For FY 2016, consistent with our historical policy, qualifying low-volume hospitals and their payment adjustment are determined using the most recently available Medicare discharge data from the March 2015 update of the FY 2014 MedPAR file, as these data are the most recent data available at the time of the development of the FY 2016 IPPS/LTCH PPS final rule and the August 2015 IFC. Table 14 listed in the Addendum of the FY 2016 IPPS/LTCH PPS final rule (which is available via the Internet on the CMS Web site at: *http://www.cms.hhs.gov/AcuteInpatientPPS/01_overview.asp*) listed the ''subsection (d)'' hospitals with fewer than 1,600 Medicare discharges based on the claims data from this FY 2014 MedPAR file and their potential low-volume payment adjustment for FY 2016. Consistent with past practice, we noted that this list of hospitals with fewer than 1,600 Medicare discharges in Table 14 did not reflect whether or not the hospital meets the mileage criterion. Eligibility for the low-volume hospital payment adjustment for FY 2016 also is dependent upon meeting the mileage

criterion specified at § 412.101(b)(2)(ii); that is, the hospital must be located more than 15 road miles from any other IPPS hospital. In other words, eligibility for the low-volume hospital payment adjustment for FY 2016 also is dependent upon meeting (in the case of a hospital that did not qualify for the low-volume hospital payment adjustment in FY 2015) or continuing to meet (in the case of a hospital that did qualify for the low-volume hospital payment adjustment in FY 2015) the mileage criterion specified at revised § 412.101(b)(2)(ii) (that is, the hospital is located more than 15 road miles from any other subsection (d) hospital).

In order to receive a low-volume hospital payment adjustment under § 412.101 for FY 2016, consistent with our previously established procedure, a hospital must notify and provide documentation to its MAC that it meets the discharge and distance requirements under § 412.101(b)(2)(ii), as revised. Specifically, for FY 2016, a hospital must have made a written request for low-volume hospital status that was received by its MAC no later than September 1, 2015, in order for the applicable low-volume hospital payment adjustment to be applied to payments for its FY 2016 discharges occurring on or after October 1, 2015. Under this procedure, a hospital that qualified for the low-volume payment adjustment in FY 2015 may continue to receive a low-volume payment adjustment for FY 2016 without reapplying if it continues to meet the Medicare discharge criterion established for FY 2016 and the mileage criterion. However, the hospital had to send written verification that was received by its MAC no later than September 1, 2015, stating that it continues to be more than 15 miles from any other ''subsection (d)'' hospital. This written verification could be a brief letter to the MAC stating that the hospital continues to meet the low-volume hospital distance criterion as documented in a prior low-volume hospital status request. We stated that if a hospital's written request for low-volume hospital status for FY 2016 was received after September 1, 2015, and if the MAC determines that the hospital meets the criteria to qualify as a low-volume hospital, the MAC will apply the applicable low-volume hospital payment adjustment to determine the payment for the hospital's FY 2016 discharges, effective prospectively within 30 days of the date of its low-volume hospital status determination, consistent with past practice. (For additional details on our established process for the low-volume hospital payment adjustment, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53408) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50000 through 50001).)

In the August 2015 IFC, we made conforming changes to the existing regulations text at § 412.101 to reflect the extension of the changes to the qualifying criteria and the payment adjustment methodology for low-volume hospitals through FY 2017 (that is, through September 30, 2017) in accordance with section 204 of the MACRA. In general, these conforming changes consisted of replacing the phrase ''through FY 2014, and the portion of FY 2015 before April 1, 2015'' with ''through FY 2017'' each place it appears, and replacing the phrase ''the portion of FY 2015 beginning on April 1, 2015, and subsequent fiscal years'' with the phrase ''FY 2018 and subsequent fiscal years'' each place it appears. Specifically, we revised paragraphs (b)(2)(i), (b)(2)(ii), (c)(1), (c)(2), and (d) of § 412.101. Under these revisions to § 412.101, beginning with FY 2018, consistent with section 1886(d)(12) of the Act, as amended, the low-volume hospital qualifying criteria and payment adjustment methodology will revert to that which was in effect prior to the amendments made by the Affordable Care Act and subsequent legislation (that is, the low-volume hospital payment adjustment policy in effect for FYs 2005 through 2010).

2. Medicare-Dependent, Small Rural Hospital (MDH) Program (§ 412.108)

a. Background for MDH Program

Section 1886(d)(5)(G) of the Act provides special payment protections, under the IPPS, to a Medicare-dependent, small rural hospital (MDH). (For additional information on the MDH program and the payment methodology, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51683 through 51684).)

Since the extension of the MDH program through FY 2012 provided by section 3124 of the Affordable Care Act, the MDH program has been extended by subsequent legislation as follows: First, section 606 of the ATRA (Pub. L. 112–240) extended the MDH program through FY 2013 (that is, for discharges occurring before October 1, 2013). Second, section 1106 of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) extended the MDH program through the first half of FY 2014 (that is, for discharges occurring before April 1, 2014). Third, section 106 of the PAMA (Pub. L. 113–93) extended the MDH program through the first half of FY 2015 (that is, for discharges occurring before April 1, 2015). Most recently, section 205 of the MACRA (Pub. L. 114–10) extended the MDH program though FY 2017 (that is, for discharges occurring before October 1, 2017). For additional information on the extensions of the MDH program after FY 2012, we refer readers to the following **Federal Register** documents: The FY 2013 IPPS/LTCH PPS final rule (77 FR 53404 through 53405 and 53413 through 53414); the FY 2013 IPPS notice (78 FR 14689); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50647 through 50649); the FY 2014 interim final rule with comment period (79 FR 15025 through 15027); the FY 2014 notice (79 FR 34446 through 34449); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50022 through 50024); and the August 2015 IFC (80 FR 49596).

b. MACRA Provisions for Extension of the MDH Program

Section 205 of the MACRA provided for an extension of the MDH program for discharges occurring on or after April 1, 2015, through FY 2017 (that is, for discharges occurring on or before September 30, 2017). Specifically, section 205 of the MACRA amended sections 1886(d)(5)(G)(i) and 1886(d)(5)(G)(ii)(II) of the Act by striking ''April 1, 2015'' and inserting ''October 1, 2017''. Section 205 of the MACRA also made conforming amendments to sections 1886(b)(3)(D)(i) and 1886(b)(3)(D)(iv) of the Act.

In the August 2015 IFC (80 FR 49596), we made conforming changes to the regulations at § 412.108(a)(1) and (c)(2)(iii) to reflect the extension of the MDH program provided for by the MACRA. We stated in that IFC that, due to the timing of the development of the FY 2016 IPPS/LTCH PPS proposed rule and the enactment of the MACRA, we were unable to address the extension of the MDH program for FY 2016 (or the last half of FY 2015) in that proposed rule. After the MACRA was enacted, we addressed the extension of the MDH program for the last half of FY 2015 (that is, for discharges occurring on or after April 1, 2015, through September 30, 2015) in instructions issued in Change Request 9197, Transmittals 3263 and 3281.

As explained in Change Request 9197, consistent with the previous extensions of the MDH program and the regulations at § 412.108, generally, a provider that was classified as an MDH as of March 31, 2015, was reinstated as an MDH effective April 1, 2015, with no need to reapply for MDH classification. However, if the MDH had classified as

an SCH or cancelled its rural classification under § 412.103(g) effective on or after April 1, 2015, the effective date of MDH status may not be retroactive to April 1, 2015. For more details regarding MDH status for the second half of FY 2015, we refer the reader to Change Request 9197.

3. Statement of Final Policy

We received 14 timely pieces of correspondence in response to the August 2015 IFC. We have determined that all of this correspondence contains public comments on issues that were outside the scope of the provisions of the IFC. Therefore, we are finalizing the provisions of the August 2015 IFC without modification.

4. Collection of Information Requirements

The August 2015 IFC and this final rule do not impose information collection and recordkeeping requirements. Consequently, it need not be reviewed by the Office of Management and Budget under the authority of the Paperwork Reduction Act of 1995 (44 U.S.C. 35).

5. Impact of Legislative Extensions

In the August 2015 IFC, we presented the estimated effects of the provisions. This impact has not changed. Therefore, below we are presenting the impact as set forth in that IFC.

a. Effects of the Payment Adjustment for Low-Volume Hospitals for FY 2016

Based on the latest available data at the time of the August 2015 IFC, we estimated that approximately 593 hospitals will qualify as a low-volume hospital in FY 2016. We projected that the extension for FY 2016 of the temporary changes to the low-volume hospital definition and the payment adjustment methodology provided for by the MACRA will result in an increase in payments of approximately $322 million in FY 2016 as compared to payments to qualifying hospitals without the extension of the temporary changes to the low-volume hospital definition and the payment adjustment methodology.

b. Effects of the Extension of the MDH Program for FY 2016

Hospitals that qualify as MDHs receive the higher of operating IPPS payments made under the Federal standardized amount or the payments made under the Federal standardized amount plus 75 percent of the amount by which the hospital-specific rate (a hospital-specific cost-based rate) exceeds the Federal standardized amount. Based on the latest available data we had for 163 MDHs at the time of the August 2015 IFC, we projected that 90 MDHs will receive the blended payment (that is, the Federal standardized amount plus 75 percent of the amount by which the hospital-specific rate exceeds the Federal standardized amount) for FY 2016. We estimated that those hospitals will experience an overall increase in payments of approximately $96 million as compared to payments they would have received had the MDH program not been extended for FY 2016.

O. Clarification Regarding the Medicare Utilization Requirement for Medicare-Dependent, Small Rural Hospitals (MDHs) (§ 412.108)

Section 1886(d)(5)(G)(iv) of the Act defines an MDH as a hospital that is located in a rural area, has not more than 100 beds, is not an SCH, and has a high percentage of Medicare discharges (that is, not less than 60 percent of its inpatient days or discharges during the cost reporting period beginning in FY 1987 or two of the three most recently audited cost reporting periods for which the Secretary has a settled cost report were attributable to inpatients entitled to benefits under Part A). The regulations at 42 CFR 412.108 set forth the criteria that a hospital must meet to be classified as an MDH.

The Medicare utilization requirement is set forth at section 1886(d)(5)(G)(iv)(IV) of the Act and implemented by regulation at 42 CFR 412.108(a)(1)(iii). Consistent with the policy noted in the FY 1991 IPPS final rule (55 FR 35995) and further discussed in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50287), in order to not disadvantage hospitals that receive payment from a Medicare Advantage (MA) organization under Medicare Part C for inpatient care provided to Medicare beneficiaries enrolled in Medicare Part C plans, we count the days and discharges for those stays toward the 60-percent Medicare utilization requirement for MDH classification.

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25135 through 25136), in accordance with the regulations at § 412.108(b)(5), MACs evaluate, on an ongoing basis, whether or not a hospital continues to qualify for MDH status. For hospitals that qualify for MDH status under § 412.108(a)(1)(iii)(C) and in accordance with the regulations at § 412.108(b)(5), at each cost report settlement, the MAC will determine whether the hospital has a Medicare utilization of at least 60 percent in at least two of the last three most recent audited cost reporting periods for which the Secretary has a settled cost report by including the newly settled cost report in the evaluation.

Medicare policy requires hospitals that receive certain additional payments such as IME, direct GME, and DSH, to submit claims for services furnished to individuals enrolled in a MA plan under Medicare Part C. Specifically, teaching hospitals that provide services to individuals enrolled in a MA plan under Medicare Part C must submit timely claims in order to receive the supplemental IME and direct GME payments for services provided to these individuals. Likewise, hospitals that operate nursing or allied health education programs and incur costs associated with individuals enrolled in a MA plan under Medicare Part C also must submit timely claims in order to receive the additional payment amount for those MA enrollees. In addition, hospitals that are eligible for DSH payments are required to submit claims in a timely manner for individuals enrolled in a MA plan under Medicare Part C in order for these days to be captured in the DSH calculation. We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53409) for more information and background on the requirements for filing no pay bills for services furnished to individuals enrolled in a MA plan under Medicare Part C.

Consistent with this policy, for a hospital that is eligible for IME, direct GME, or DSH payments, CMS only includes MA days or discharges as reported on the cost report and verified by the properly and timely submitted claims for the services furnished to individuals enrolled in a MA plan under Medicare Part C associated with those days or discharges in calculating Medicare utilization for MDH purposes. CMS verifies the accuracy of the MA days and discharges reported on the cost report using claims data; once verified, the cost report data can then be properly applied in the Medicare utilization calculation.

For a hospital that is not eligible for IME, direct GME, or DSH payments and is not required to submit bills for services furnished to individuals enrolled in a MA plan under Medicare Part C, we clarified in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25136) that CMS will include the MA days or discharges associated with those services in the Medicare utilization calculation, regardless of whether the hospital submitted claims for services associated with those days or discharges

provided that the hospital submits proper documentation, such as provider logs, that allow the MAC to verify the MA days or discharges as reported on the hospital's cost report. However, as we noted in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25136), while not required, timely submission of claims for the services furnished to individuals enrolled in a MA plan under Medicare Part C allows CMS to establish whether the hospital meets the MDH classification criteria in an expeditious and timely manner. We note that we did not receive any public comments on this clarification.

P. Adjustment to IPPS Rates Resulting From 2-Midnight Policy

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50906 through 50954), we adopted the 2-midnight policy, effective for dates of admission on or after October 1, 2013. As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25136 through 25138), under the 2-midnight policy, an inpatient admission is generally appropriate for Medicare Part A payment if the physician (or other qualified practitioner) admits the patient as an inpatient based upon the reasonable expectation that the patient will need hospital care that crosses at least 2 midnights. In assessing the expected duration of necessary care, the physician (or other qualified practitioner) may take into account outpatient hospital care received prior to inpatient admission. If the patient is expected to need less than 2 midnights of care in the hospital, the services furnished should generally be billed as outpatient services. We note that revisions were made to this policy in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70545). Our actuaries estimated that the 2-midnight policy would increase expenditures by approximately $220 million in FY 2014 due to an expected net increase in inpatient encounters. We used our authority under section 1886(d)(5)(I)(i) of the Act to make a reduction of 0.2 percent to the standardized amount, the Puerto Rico standardized amount, and the hospital-specific payment rates, and we used our authority under section 1886(g) of the Act to make a reduction of 0.2 percent to the national capital Federal rate and the Puerto Rico-specific capital rate, in order to offset this estimated $220 million in additional IPPS expenditures in FY 2014. We indicated that although our exceptions and adjustments authority should not be routinely used in the IPPS system, we believed that the systemic and widespread nature of this issue justified an overall adjustment to the IPPS rates and such an adjustment is authorized under section 1886(d)(5)(I)(i) of the Act.

In *Shands Jacksonville Medical Center, Inc.* v. *Burwell,* No. 14–263 (D.D.C.) and related cases, hospitals challenged the 0.2 percent reduction in IPPS rates to account for the estimated $220 million in additional FY 2014 expenditures resulting from the 2-midnight policy. In its Memorandum Opinion, issued September 21, 2015, the Court found that the ''Secretary's interpretation of the exceptions and adjustments provision is a reasonable one'' for this purpose. However, the Court also ordered the 0.2 percent reduction remanded back to the Secretary, without vacating the rule, to correct certain procedural deficiencies in the promulgation of the 0.2 percent reduction and reconsider the adjustment. The Court did not believe it would be appropriate to vacate the rule because such action would, in effect, dictate a substantive outcome based on a procedural error and concluded that the disruptive consequences would be considerable.

In accordance with the Court's order, we published a notice with comment period that appeared in the December 1, 2015 **Federal Register** (80 FR 75107), which discussed the basis for the 0.2 percent reduction and its underlying assumptions and invited comments on the same in order to facilitate our further consideration of the FY 2014 reduction. We received numerous public comments on the notice with comment period.

In considering these public comments, and those on the same topic received in response to the CY 2016 OPPS/ASC proposed rule, we continued to recognize that the 0.2 percent reduction issue is unique in many ways. The underlying question of patient status, which resulted in the creation of the 2-midnight policy, is a complex one with a long history, including large improper payment rates in short-stay hospital inpatient claims, requests to provide additional guidance regarding the proper billing of those services, and concerns about increasingly long stays of Medicare beneficiaries as outpatients due to hospital uncertainties about payment. (For further discussion of this history, we refer readers to the FY 2014 IPPS/LTCH PPS proposed and final rules (78 FR 27644 through 27649 and 78 FR 50906 through 50954, respectively).)

The 2-midnight policy itself and our implementation and enforcement of it have also evolved over time as a result of a combination of statutory, regulatory, and operational changes. For example, as part of our efforts to provide education to stakeholders on the new 2-midnight policy, CMS hosted numerous ''Open Door Forums,'' conducted national provider calls, and shared information and answers to frequently asked questions on the CMS Web site. In addition, we instructed MACs to conduct a ''Probe and Educate'' process for inpatient claims with dates of admission on or after October 1, 2013 through September 30, 2014, to assess provider understanding and compliance with the new 2-midnight policy. We also prohibited Recovery Auditor's post-payment medical reviews of inpatient hospital patient status for claims with dates of admission between October 1, 2013 and September 30, 2014.

On April 1, 2014, the Protecting Access to Medicare Act of 2014 (Pub. L. 113–93) was enacted. Section 111 of Public Law 113–93 permitted CMS to continue medical review activities under the Inpatient Probe and Educate process through March 31, 2015. The same law also extended the prohibition on Recovery Auditor reviews of inpatient hospital patient status for claims with dates of admission through March 31, 2015, absent evidence of systematic gaming, fraud, abuse, or delays in the provision of care by a provider of services. On April 16, 2015, the Medicare Access and CHIP Reauthorization Act of 2015 (Pub. L. 114–10) was enacted. Section 521 of Public Law 114–10 permitted CMS to further extend the medical review activities under the Inpatient Probe and Educate process for inpatient claims through September 30, 2015, and extended the prohibition of Recovery Auditor reviews of inpatient hospital patient status for claims with dates of admission through September 30, 2015. CMS then announced in August 2015 that it would not approve Recovery Auditors to conduct patient status reviews for dates of admission of October 1, 2015 through December 31, 2015.

As we indicated in the CY 2016 OPPS/ASC final rule with comment period, throughout the Probe and Educate process, we saw positive effects and improved provider understanding of the 2-midnight policy. We also discussed in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70545 through 70549) a number of additional changes we had made and were continuing to make to the Recovery Audit Program and changes to the medical review responsibilities for Quality Improvement Organizations (QIOs) in regard to short hospital stay claims.

With respect to the 2-midnight policy itself, in light of stakeholder concerns

and in our continued effort to develop the most appropriate and applicable framework for determining when payment under Medicare Part A is appropriate for inpatient admissions, in the CY 2016 OPPS/ASC final rule with comment period (80 FR 70545), we modified the original ''rare and unusual'' exceptions policy under the 2-midnight policy to allow for Medicare Part A payment on a case-by-case basis for inpatient admissions that do not satisfy the 2-midnight benchmark, if the documentation in the medical record supports the admitting physician's determination that the patient requires inpatient hospital care despite an expected length of stay that is less than 2 midnights.

We also recognized in reviewing the public comments we received on the 0.2 percent reduction in response to the December 1, 2015 notice with comment period and the CY 2016 OPPS/ASC proposed rule that, in addition to the long history of the question of patient status underlying the 2-midnight policy and the statutory, regulatory, and operational changes that have occurred since its initial implementation, the original estimate for the 0.2 percent reduction had a much greater degree of uncertainty than usual. As indicated in the Office of the Actuary's August 19, 2013 memorandum (which was included as Appendix A of the December 1, 2015 notice with comment period (80 FR 75112 through 75114)), the estimate depended critically on the assumed utilization changes in the inpatient and outpatient hospital settings, relatively small changes would have a disproportionate effect on the estimated net costs, the estimate was subject to a much greater degree of uncertainty than usual, and the actual results could differ significantly from the estimate.

Lastly, in reviewing the public comments we received on the December 1, 2015 notice with comment period, we also considered the fact that our actuaries' most recent estimate of the impact of the 2-midnight policy varies between a savings and a cost over the FY 2014 to FY 2015 time period. The memorandum describing this new analysis is available on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html*.

We still believe the assumptions underlying the 0.2 percent reduction to the rates put in place beginning in FY 2014 were reasonable at the time we made them in 2013. Nevertheless, taking all the foregoing factors into account, we stated in the FY 2017 IPPS/LTCH PPS proposed rule that we believe it would be appropriate to use our authority under sections 1886(d)(5)(I)(i) and 1886(g) of the Act to prospectively remove, beginning in FY 2017, the 0.2 percent reduction to the rates put in place beginning in FY 2014. The 0.2 percent reduction was implemented by including a factor of 0.998 in the calculation of the FY 2014 standardized amount, the hospital-specific payment rates, and the national capital Federal rate, permanently reducing the rates for FY 2014 and future years until the 0.998 is removed. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25138), we proposed to permanently remove the 0.998 reduction beginning in FY 2017 by including a factor of (1/0.998) in the calculation of the FY 2017 standardized amount, the hospital-specific payment rates, and the national capital Federal rate.

In addition, taking all the foregoing factors into account, and given the unique nature of this situation, we stated in the proposed rule that we believe it would be appropriate to use our authority under sections 1886(d)(5)(I)(i) and 1886(g) of the Act to temporarily increase the rates, only for FY 2017, to address the effect of the 0.2 percent reduction to the rates in effect for FY 2014, the 0.2 percent reduction to the rates in effect for FY 2015 (recall the 0.998 factor included in the calculation of the FY 2014 rates permanently reduced the rates for FY 2014 and future years until it is removed), and the 0.2 percent reduction to the rates in effect for FY 2016. We believe that the most transparent, expedient, and administratively feasible method to accomplish this is a temporary one-time prospective increase to the FY 2017 rates of 0.6 percent (= 0.2 percent + 0.2 percent + 0.2 percent). Specifically, we proposed to include a factor of 1.006 in the calculation of the standardized amount, the hospital-specific payment rates, and the national capital Federal rate in FY 2017 and then remove this temporary one-time prospective increase by including a factor of (1/1.006) in the calculation of the rates for FY 2018. While we generally do not believe it is appropriate in a prospective system to retrospectively adjust rates, we take this action in the specific context of this unique situation.

In summary, for the reasons described above, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25138), we proposed to include a permanent factor of (1/0.998) and a temporary one-time factor of (1.006) in the calculation of the FY 2017 standardized amount, the hospital-specific payment rates, and the national capital Federal rate. We also proposed to include a factor of (1/1.006) in the calculation of the FY 2018 standardized amount, the hospital-specific payment rates, and the national capital Federal rate to remove the temporary one-time factor of 1.006.

We invited public comments on all aspects of these proposals. As we stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25138), the foregoing discussion and proposals constituted the final notice required by the Court in the *Shands Jacksonville Medical Center, Inc.* v. *Burwell,* No. 14–263 (D.D.C.) and related cases.

Comment: The vast majority of commenters recognized the unique nature of this situation and supported prospectively removing the 0.2 percent reduction to the rates and making a temporary one-time prospective increase to the FY 2017 rates to address the effect of the 0.2 percent reduction to the rates for FYs 2014 through 2016. One commenter suggested that, instead of a temporary one-time prospective increase to the FY 2017 rates, CMS adjust over a 3-year FY 2017–FY 2019 time period because the reduction was in place over the 3-year FY 2014–FY 2016 time period.

Response: We appreciate the commenters' recognition of the unique nature of this situation and their support for prospectively removing, beginning in FY 2017, the 0.2 percent reduction to the rates put in place beginning in FY 2014, and making a temporary one-time prospective increase to the FY 2017 rates to address the effect of the 0.2 percent reduction to the rates for FYs 2014 through 2016. We do not agree with the commenter who suggested that we should adjust over a 3 year FY 2017–FY 2019 time period because the reduction was in place over the 3-year FY 2014–FY 2016 time period. The nearest prospective time period that we can use to address the effect of the 0.2 percent reduction to the rates for FYs 2014 through 2016 is FY 2017. As we stated in the proposed rule, our goal is a transparent, expedient, and administratively feasible method. Delaying addressing the effect for FYs 2014 through 2016 over 3 years rather than the more immediate 1 year method we proposed is not an expedient method of resolving this issue.

Comment: Some commenters raised concerns about the adequacy of the proposed adjustment relative to their estimates of the impact of the 2-midnight policy to date. These commenters included statements that: Stakeholders had provided CMS with data that indicated that the 2-midnight policy had been a net savings with respect to Medicare expenditures; CMS

did not address the utilization shift between inpatient and outpatient cases caused by the 2-midnight policy which CMS referred to in the FY 2014 proposed and final rules and which is in the opposite direction of what CMS assumed; CMS should adopt a rate increase to offset an asserted decline in expenditures resulting from the 2-midnight policy; contrary to CMS' assumptions about the 2-midnight policy, rather than cases shifting between inpatient and outpatient, the entire population of relevant hospital episodes declined over time; and CMS actuary's analysis was flawed for numerous reasons, including because it assumed that the entire deviation from the historical trend line was attributable to the 2-midnight policy.

Response: We believe these commenters are mischaracterizing our proposal. In making our proposal, we were not attempting to determine a new point estimate of the effect of the 2-midnight policy for the purposes of then proposing (1) a prospective adjustment to the rates for the net effect of that new estimate relative to the −0.2 percent adjustment we put in place in FY 2014 and (2) a temporary one-time adjustment to the rates in FY 2017 to address the net effects of that new estimate over the FY 2014–FY 2016 time period. Rather than determine a new point estimate, we proposed to *remove* the −0.2 percent adjustment we did make and address the effect of that adjustment for FYs 2014 through 2016. As we have indicated in prior rulemaking, we were not required by statute to make an adjustment to the rates for the effect of the 2-midnight policy. We chose to do so at the time for the reasons stated in the prior rulemaking. However, for the reasons stated in the proposed rule, we proposed to no longer make *any* adjustment for the 2-midnight policy and address the FY 2014–FY 2016 effects of the adjustment we did make. For many of the reasons commenters presented to us in prior rulemaking, we no longer are confident that the effect of the 2-midnight policy on the number of discharges paid under the IPPS may be measured in this context. As a result, we proposed to make no adjustment (and account for the past effects of the adjustment we had made), not to make a new adjustment.

We currently do not intend to revisit the issue of making an adjustment for the 2-midnight policy in future rulemaking. However, if we were to make a proposal in future rulemaking, we would take into account all of the public comments received to date on the impact of the 2-midnight policy and any public comments received on a future proposal.

Comment: Commenters indicated that a very small number of hospitals would not benefit from the adjustments to the FY 2017 rates. Hospitals that were paid under the IPPS for all or part of FY 2014, 2015, or 2016, but will not be paid under the IPPS for all of FY 2017 (either because they closed or converted to a different type of hospital) would not receive the full benefit of the payment adjustments. The commenters requested that CMS establish an exceptions process to address this issue. One commenter also indicated that new hospitals would receive the benefit of the FY 2017 adjustment even though they were not affected by the −0.2 percent adjustments for FY 2014, 2015, and 2016.

Response: We recognize that for closed, converted, or new hospitals, our proposed prospective method generally has a differential positive or negative impact compared to hospitals that were IPPS hospitals for all of the FY 2014–FY 2017 time period. We generally believe that, given the prospective nature of our method and our goal to adopt a transparent, expedient, and administratively feasible approach, these differential impacts are an appropriate consequence. However, after considering the public comments received, we agree that we should provide a process to address the situation of closed or converted hospitals. Due to the small number of hospitals impacted, we will address closed and converted hospitals as part of the cost report settlement process. These hospitals should identify themselves to their MACs so that the appropriate cost report adjustment can be applied.

Comment: Some commenters stated the multiplicative effect of the FY 2017 0.6 percent adjustment would not fully compensate hospitals for the effect of the −0.2 percent adjustment for FYs 2014 through FY 2016 for reasons that included the recent trend of a decline in inpatient admissions.

Response: We recognize that our proposed method of a prospective 1.006 adjustment for FY 2017 generally may have a differential *positive or negative* impact on an individual hospital relative to an attempt to estimate hospital by hospital the impact of the 2-midnight adjustment for FYs 2014, 2015, and 2016. As stated in the prior response, we generally believe that, given the prospective nature of our method and our goal to adopt a transparent, expedient, and administratively feasible approach, these differential impacts are an appropriate consequence. We also note that attempts to make prospective adjustments to the 1.006 factor would need to rely on estimates of factors that have been objected to by commenters in the prior rulemaking related to the −0.2 percent adjustment, such as estimates regarding projected inpatient utilization levels.

Comment: Some commenters stated that the FY 2017 adjustment to address the effects of the −0.2 percent adjustment for FYs 2014, 2015, and 2016 does not compensate hospitals that are party to the lawsuit for interest and/or all hospitals for the time value of money. Some commenters suggested that CMS refine the 1.006 percent adjustment to account for this or otherwise address the issue.

Response: We will not contest that hospitals that are party to the *Shands Jacksonville Medical Center, Inc.* v. *Burwell,* No. 14–263 (D.D.C.) and other currently pending cases that challenge the −0.2 percent adjustment should receive interest under section 1878(f)(2) of the Act. For these hospitals, we will slightly increase the 1.006 factor by a uniform factor consistent with the interest rates used for this purpose in effect for the relevant time periods for paying interest. We disagree with commenters who indicated that we should pay all hospitals interest or for the time value of money.

After consideration of the public comments we received, we are finalizing our proposal to adjust the FY 2017 IPPS rates through a permanent adjustment of 1.002 and temporary one-time prospective adjustment of 1.006, which will be removed by including a factor of (1/1.006) in the calculation of the FY 2018 rates.

V. Changes to the IPPS for Capital-Related Costs

A. Overview

Section 1886(g) of the Act requires the Secretary to pay for the capital-related costs of inpatient acute hospital services in accordance with a prospective payment system established by the Secretary. Under the statute, the Secretary has broad authority in establishing and implementing the IPPS for acute care hospital inpatient capital-related costs. We initially implemented the IPPS for capital-related costs in the FY 1992 IPPS final rule (56 FR 43358). In that final rule, we established a 10-year transition period to change the payment methodology for Medicare hospital inpatient capital-related costs from a reasonable cost-based payment methodology to a prospective payment

methodology (based fully on the Federal rate).

FY 2001 was the last year of the 10-year transition period that was established to phase in the IPPS for hospital inpatient capital-related costs. For cost reporting periods beginning in FY 2002, capital IPPS payments are based solely on the Federal rate for almost all acute care hospitals (other than hospitals receiving certain exception payments and certain new hospitals). (We refer readers to the FY 2002 IPPS final rule (66 FR 39910 through 39914) for additional information on the methodology used to determine capital IPPS payments to hospitals both during and after the transition period.)

The basic methodology for determining capital prospective payments using the Federal rate is set forth in the regulations at 42 CFR 412.312. For the purpose of calculating capital payments for each discharge, the standard Federal rate is adjusted as follows:

(Standard Federal Rate) × (DRG Weight) × (Geographic Adjustment Factor (GAF)) × (COLA for hospitals located in Alaska and Hawaii) × (1 + Capital DSH Adjustment Factor + Capital IME Adjustment Factor, if applicable).

In addition, under § 412.312(c), hospitals also may receive outlier payments under the capital IPPS for extraordinarily high-cost cases that qualify under the thresholds established for each fiscal year.

B. Additional Provisions

1. Exception Payments

The regulations at 42 CFR 412.348 provide for certain exception payments under the capital IPPS. The regular exception payments provided under §§ 412.348(b) through (e) were available only during the 10-year transition period. For a certain period after the transition period, eligible hospitals may have received additional payments under the special exceptions provisions at § 412.348(g). However, FY 2012 was the final year hospitals could receive special exceptions payments. For additional details regarding these exceptions policies, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725).

Under § 412.348(f), a hospital may request an additional payment if the hospital incurs unanticipated capital expenditures in excess of $5 million due to extraordinary circumstances beyond the hospital's control. Additional information on the exception payment for extraordinary circumstances in § 412.348(f) can be found in the FY 2005 IPPS final rule (69 FR 49185 and 49186).

2. New Hospitals

Under the capital IPPS, the regulations at 42 CFR 412.300(b) define a new hospital as a hospital that has operated (under previous or current ownership) for less than 2 years and lists examples of hospitals that are not considered new hospitals. In accordance with § 412.304(c)(2), under the capital IPPS, a new hospital is paid 85 percent of its allowable Medicare inpatient hospital capital-related costs through its first 2 years of operation, unless the new hospital elects to receive full prospective payment based on 100 percent of the Federal rate. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725) for additional information on payments to new hospitals under the capital IPPS.

3. Changes in Payments for Hospitals Located in Puerto Rico

The existing regulations at 42 CFR 412.374 relating to the capital IPPS provide for the use of a blended payment amount for prospective payments for capital-related costs to hospitals located in Puerto Rico. Accordingly, under the capital IPPS, we have historically computed a separate payment rate specific to Puerto Rico hospitals using the same methodology used to compute the national Federal rate for capital-related costs. The capital-related payment rate for hospitals located in Puerto Rico was derived using only the costs of hospitals located in Puerto Rico, while the national Federal rate for capital-related costs is derived using the costs of all acute care hospitals participating in the IPPS (including hospitals located in Puerto Rico). In general, hospitals located in Puerto Rico are paid a blend of the applicable capital IPPS Puerto Rico rate and the applicable capital IPPS Federal rate. Historically, we have established a capital IPPS blended payment rate structure for hospitals located in Puerto Rico that parallels the statutory calculation of operating IPPS payments to hospitals located in Puerto Rico. Under existing regulations at 42 CFR 412.374, capital IPPS payments to hospitals located in Puerto Rico are computed based on a blend of 25 percent of the capital IPPS Puerto Rico rate and 75 percent of the capital IPPS Federal rate. (For additional details on capital IPPS payments to hospitals located in Puerto Rico, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725).)

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25139), section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) increased the applicable Federal percentage of the operating IPPS payment for hospitals located in Puerto Rico from 75 percent to 100 percent and decreased the applicable Puerto Rico percentage of the operating IPPS payments for hospitals located in Puerto Rico from 25 percent to zero percent, applicable to discharges occurring on or after January 1, 2016. (For additional information on section 601 of the Consolidated Appropriations Act, 2016, we refer readers to section IV.A. of the preamble of this final rule.) As a result of the amendment made by section 601 of Public Law 114–113, on February 4, 2016, we issued Change Request 9523 which updated the payment rates for subsection (d) Puerto Rico hospitals for discharges occurring on or after January 1, 2016. Change Request 9523 can be downloaded from the CMS Web site at: *https://www.cms.gov/Regulations-and-Guidance/Guidance/Transmittals/2016-Transmittals-Items/R3449CP.html*).

Consistent with historical practice, under the broad authority of the Secretary granted under section 1886(g) of the Act, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25139), we proposed to revise the calculation of capital IPPS payments to hospitals located in Puerto Rico to parallel the change in the statutory calculation of operating IPPS payments to hospitals located in Puerto Rico, beginning in FY 2017. Accordingly, we proposed to revise § 412.374 of the regulations to provide that, for discharges occurring on or after October 1, 2016, capital IPPS payments to hospitals located in Puerto Rico would be based on 100 percent of the capital Federal rate; that is, payments would no longer be derived from a blend of the capital Puerto Rico rate and the capital Federal rate.

We did not receive any public comment on this proposal or the proposed revisions to § 412.374. Therefore, we are finalizing our proposal, with one technical correction modification to the proposed revisions to § 412.374. We are making a technical correction to the heading of § 412.374(e) to comport with our finalized policies and the finalized text of paragraph (e). In the proposed rule, we inadvertently stated in the heading of proposed § 412.374(e) that the policies in that paragraph are for FYs 2016 and later, instead of FY 2017 and later. In this final rule, we are revising the heading of § 412.374(e) to read ''FY 2017 and subsequent fiscal years,'' consistent with the effective date of our finalized policies, which are for discharges on or after October 1, 2016 (that is, FY 2017).

As such, under revised § 412.374, for discharges occurring on or after October 1, 2016, capital IPPS payments to hospitals located in Puerto Rico will be based on 100 percent of the capital Federal rate. As we noted in the proposed rule and are noting in this final rule, this change is similar to the changes in capital IPPS payments to hospitals located in Puerto Rico beginning in FY 1998 and FY 2005 that paralleled the corresponding statutory changes in the blended payment amount calculation required for operating IPPS payments to hospitals located in Puerto Rico, as provided by section 4406 of Public Law 105–33 (62 FR 46048) and section 504 of Public Law 108–173 (69 FR 49185), respectively. As discussed in section I.I. of Appendix A (Economic Analyses) of this final rule, this change will result in a slight increase in capital IPPS payments to hospitals located in Puerto Rico because adjusted capital IPPS payments based on the capital Federal rate are generally higher than capital IPPS payments based on the capital Puerto Rico rate.

C. Annual Update for FY 2017

The annual update to the capital PPS Federal rate, as provided for at § 412.308(c), for FY 2017 is discussed in section III. of the Addendum to this final rule. Consistent with our finalized policy discussed under section V.B.3. of the preamble of this final rule to revise the calculation of capital IPPS payments to hospitals located in Puerto Rico to be based on 100 percent of the capital Federal rate (and no longer based on a blend of the capital Puerto Rico rate and the capital Federal rate), we are discontinuing the use of the Puerto Rico capital rate in the calculation of capital IPPS payments to hospitals located in Puerto Rico, effective October 1, 2016 (FY 2017).

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50906 through 50954), we adopted the 2-midnight policy effective for dates of admission on or after October 1, 2013, under which an inpatient admission is generally appropriate for Medicare Part A payment if the physician (or other qualified practitioner) admits the patient as an inpatient based upon the reasonable expectation that the patient will need hospital care that crosses at least 2 midnights. At that time, our actuaries estimated that the 2-midnight policy would increase expenditures by approximately $220 million in FY 2014 due to an expected net increase in inpatient encounters. In that same final rule, consistent with the approach taken for the operating IPPS standardized amount, the Puerto Rico-specific standardized amount, and the hospital-specific payment rates, and using our authority under section 1886(g) of the Act, we made a reduction of 0.2 percent (an adjustment factor of 0.998) to the national capital Federal rate and the Puerto Rico-specific capital rate to offset the estimated increase in capital IPPS expenditures associated with the projected increase in inpatient encounters that was expected to result from the new inpatient admission guidelines (78 FR 50746 through 50747).

As discussed in section IV.O. of the preamble of the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25136 through 25138) and section IV.P. of the preamble of this final rule, in *Shands Jacksonville Medical Center, Inc.* v. *Burwell,* No. 14–263 (D.D.C.) and related cases, hospitals challenged the 0.2 percent reduction in IPPS rates to account for the estimated $220 million in additional FY 2014 expenditures resulting from the 2-midnight policy. In accordance with the Court's order, we published a notice with comment period that appeared in the December 1, 2015 **Federal Register** (80 FR 75107), which discussed the basis for the 0.2 percent reduction and its underlying assumptions and invited comments on the same in order to facilitate our further consideration of the FY 2014 reduction. In section IV.O. of the preamble of the proposed rule (81 FR 25136 through 25138), we discussed that, in considering the public comments we received on that notice with comment period and those on the same topic we received in response to the CY 2016 OPPS/ASC proposed rule, we continued to recognize that the 0.2 percent reduction issue is unique in many ways. As we discussed in that section, the 2-midnight policy itself and our implementation and enforcement of it have also evolved over time as a result of a combination of statutory, regulatory, and operational changes. Finally, in reviewing the public comments received on the December 1, 2015 notice with comment period, we also considered the fact that our actuaries' most recent estimate of the impact of the 2-midnight policy varies between a savings and a cost over the FY 2014 to FY 2015 time period. (For additional details, we refer readers to section IV.O. of the preamble of the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25136 through 25138) and section IV.P. of the preamble of this final rule.)

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25139 through 25140), we still believe the assumptions underlying the 0.2 percent reduction to the rates put in place beginning in FY 2014 were reasonable at the time we made them in 2013. Nevertheless, taking all of these factors into account, consistent with the approach proposed for the operating IPPS rates, we stated that we believe it would be appropriate to use our authority under section 1886(g) of the Act to permanently remove the 0.2 percent reduction to the capital IPPS rate beginning in FY 2017. (As explained in section V.B.3. of the proposed rule, we proposed to discontinue use of the Puerto Rico capital rate in the calculation of capital IPPS payments to hospitals located in Puerto Rico beginning in FY 2017.) Specifically, we proposed to make an adjustment of (1/0.998) to the national capital Federal rate to remove the 0.2 percent reduction, consistent with the proposed adjustment to the operating IPPS standardized amount and the hospital-specific payment rates. In addition, consistent with the approach proposed for the operating IPPS standardized amount and hospital-specific payment rates and for the reasons discussed in section IV.O. of the preamble of the proposed rule, we stated that we believe it would be appropriate to use our authority under section 1886(g) of the Act to adjust the FY 2017 capital IPPS rate to address the effects of the 0.2 percent reduction to the national capital Federal rates in effect for FY 2014, FY 2015, and FY 2016 by proposing a one-time prospective adjustment of 1.006 in FY 2017 to the national capital Federal rate. For FY 2018, we also proposed to remove the effects of this one-time prospective adjustment through an adjustment of (1/1.006) to the national capital Federal rate, consistent with the approach proposed for the operating IPPS standardized amount and hospital-specific payment rates. We invited public comments on these proposals.

In section IV.P. of the preamble of this final rule, we summarize and respond to public comments on our proposals to include a permanent factor of (1/0.998) and a temporary one-time factor of (1.006) in the calculation of the FY 2017 standardized amount, the hospital-specific payment rates, and the national capital Federal rate and to include a factor of (1/1.006) in the calculation of the FY 2018 standardized amount, the hospital-specific payment rates, and the national capital Federal rate to remove the temporary one-time factor of 1.006. After consideration of the public comments and for the reasons described in section IV.P. of the preamble of this final rule, we are finalize these proposals. We note that we did not receive any public comments that

specifically addressed our proposed adjustments to the national capital Federal rate. Accordingly, as stated in section IV.P. of this final rule, we are finalizing our proposal to adjust the FY 2017 national capital Federal rate through a permanent adjustment of 1.002 and temporary one-time prospective adjustment of 1.006, which will be removed by including a factor of (1/1.006) in the calculation of the FY 2018 rates.

As we noted in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25140), in section II.D. of the preamble of that rule, we presented a discussion of the MS–DRG documentation and coding adjustment, including previously finalized policies and historical adjustments, as well as the recoupment adjustment to the standardized amounts under section 1886(d) of the Act that we proposed for FY 2017 in accordance with the amendments made to section 7(b)(1)(B) of Public Law 110–90 by section 631 of the ATRA. Because section 631 of the ATRA requires us to make a recoupment adjustment only to the operating IPPS standardized amount, we did not propose to make a similar adjustment to the capital IPPS rate (or to the operating IPPS hospital-specific rates). This approach is consistent with our historical approach regarding the application of the recoupment adjustment authorized by section 7(b)(1)(B) of Public Law 110–90. We refer readers to section II.D. of the preamble of this final rule for a discussion of the recoupment adjustment to the operating IPPS standardized amount for FY 2017.

VI. Changes for Hospitals Excluded From the IPPS

A. Rate-of-Increase in Payments to Excluded Hospitals for FY 2017

Certain hospitals excluded from a prospective payment system, including children's hospitals, 11 cancer hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) receive payment for inpatient hospital services they furnish on the basis of reasonable costs, subject to a rate-of-increase ceiling. A per discharge limit (the target amount as defined in § 413.40(a) of the regulations) is set for each hospital based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage. For each cost reporting period, the updated target amount is multiplied by total Medicare discharges during that period and applies as an aggregate upper limit (the ceiling as defined in § 413.40(a)) of Medicare reimbursement for total inpatient operating costs for a hospital's cost reporting period. In accordance with § 403.752(a) of the regulations, RNHCIs also are subject to the rate-of-increase limits established under § 413.40 of the regulations discussed previously.

As explained in the FY 2006 IPPS final rule (70 FR 47396 through 47398), beginning with FY 2006, we have used the percentage increase in the IPPS operating market basket to update the target amounts for children's hospitals, cancer hospitals, and RNHCIs. Consistent with §§ 412.23(g), 413.40(a)(2)(ii)(A), and 413.40(c)(3)(viii), we also have used the percentage increase in the IPPS operating market basket to update the target amounts for short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. As we finalized in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50156 through 50157), for FY 2017, we will continue to use the percentage increase in the FY 2010-based IPPS operating market basket to update the target amounts for children's hospitals, cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. Accordingly, for FY 2017, the rate-of-increase percentage to be applied to the target amount for these children's hospitals, cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa is the FY 2017 percentage increase in the FY 2010-based IPPS operating market basket.

For the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25140), based on IHS Global Insight, Inc.'s 2016 first quarter forecast, we estimated that the FY 2010-based IPPS operating market basket update for FY 2017 was 2.8 percent (that is, the estimate of the market basket rate-of-increase). We indicated in the proposed rule that if more recent data became available for the final rule, we would use them to calculate the IPPS operating market basket update for FY 2017. For this FY 2017 IPPS/LTCH PPS final rule, based on IHS Global Insight, Inc.'s 2016 second quarter forecast (which is the most recent data available), we calculated the FY 2010-based IPPS operating market basket update for FY 2017 to be 2.7 percent. Therefore, the FY 2017 rate-of-increase percentage that is applied to the FY 2016 target amounts in order to calculate the FY 2017 target amounts for children's hospitals, cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa is 2.7 percent, in accordance with the applicable regulations at 42 CFR 413.40.

B. Report on Adjustment (Exceptions) Payments

Section 4419(b) of Public Law 105–33 requires the Secretary to publish annually in the **Federal Register** a report describing the total amount of adjustment payments made to excluded hospitals and hospital units by reason of section 1886(b)(4) of the Act during the previous fiscal year.

The process of requesting, adjusting, and awarding an adjustment payment is likely to occur over a 2-year period or longer. First, generally, an excluded hospital must file its cost report for the fiscal year in accordance with § 413.24(f)(2) of the regulations. The MAC reviews the cost report and issues a notice of provider reimbursement (NPR). Once the hospital receives the NPR, if its operating costs are in excess of the ceiling, the hospital may file a request for an adjustment payment. After the MAC receives the hospital's request in accordance with applicable regulations, the MAC or CMS, depending on the type of adjustment requested, reviews the request and determines if an adjustment payment is warranted. This determination is sometimes not made until more than 180 days after the date the request is filed because there are times when the request applications are incomplete and additional information must be requested in order to have a completed request application. However, in an attempt to provide interested parties with data on the most recent adjustment payments for which we have data, we are publishing data on adjustment payments that were processed by the MAC or CMS during FY 2015.

The table below includes the most recent data available from the MACs and CMS on adjustment payments that were adjudicated during FY 2015. As indicated above, the adjustments made during FY 2015 only pertain to cost reporting periods ending in years prior to FY 2015. Total adjustment payments given to excluded hospitals during FY 2015 are $19,959,036. The table depicts for each class of hospitals, in the aggregate, the number of adjustment requests adjudicated, the excess operating costs over the ceiling, and the amount of the adjustment payments.

Class of hospital	Number	Excess cost over ceiling	Adjustment payments
Children's	3	$1,615,731	$779,321
Cancer	1	30,816,372	18,758,695
Religious Nonmedical Health Care Institution (RNHCI)	4	645,819	421,020
Total	8	−33,077,922	19,959,036

C. Critical Access Hospitals (CAHs)

1. Background

Section 1820 of the Act provides for the establishment of Medicare Rural Hospital Flexibility Programs (MRHFPs), under which individual States may designate certain facilities as critical access hospitals (CAHs). Facilities that are so designated and meet the CAH conditions of participation under 42 CFR part 485, subpart F, will be certified as CAHs by CMS. Regulations governing payments to CAHs for services to Medicare beneficiaries are located in 42 CFR part 413.

2. Frontier Community Health Integration Project (FCHIP) Demonstration

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25140 through 25141), section 123 of the Medicare Improvements for Patients and Providers Act of 2008 (Pub. L. 110–275), as amended by section 3126 of the Affordable Care Act of 2010, authorizes a demonstration project to allow eligible entities to develop and test new models for the delivery of health care services in eligible counties in order to improve access to and better integrate the delivery of acute care, extended care and other health care services to Medicare beneficiaries. The demonstration is titled ''Demonstration Project on Community Health Integration Models in Certain Rural Counties,'' and is commonly known as the Frontier Community Health Integration Project (FCHIP) demonstration.

The authorizing statute states the eligibility criteria for entities to be able to participate in the demonstration. An eligible entity, as defined in section 123(d)(1)(B) of Public Law 110–275, as amended, is an MRHFP grantee under section 1820(g) of the Act (that is, a CAH); and is located in a State in which at least 65 percent of the counties in the State are counties that have 6 or less residents per square mile.

The authorizing statute stipulates several other requirements for the demonstration. Section 123(d)(2)(B) of Public Law 110–275, as amended, limits participation in the demonstration to eligible entities in not more than 4 States. Section 123(f)(1) of Public Law 110–275 requires the demonstration project to be conducted for a 3-year period. In addition, section 123(g)(1)(B) of Public Law 110–275 requires that the demonstration be budget neutral. Specifically, this provision states that in conducting the demonstration project, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project under the section were not implemented. Furthermore, section 123(i) of Public Law 110–275 states that the Secretary may waive such requirements of titles XVIII and XIX of the Act as may be necessary and appropriate for the purpose of carrying out the demonstration project, thus allowing the waiver of Medicare payment rules encompassed in the demonstration.

In January 2014, CMS released a request for applications (RFA) for the FCHIP demonstration. We refer readers to the RFA on the CMS Web site at: *https://innovation.cms.gov/initiatives/Frontier-Community-Health-Integration-Project-Demonstration/*. Using 2013 data from the U.S. Census Bureau, CMS identified Alaska, Montana, Nevada, North Dakota, and Wyoming as meeting the statutory eligibility requirement for participation in the demonstration. The RFA solicited CAHs in these five States to participate in the demonstration, stating that participation would be limited to CAHs in four of the States. To apply, CAHs were required to meet the eligibility requirements in the authorizing legislation, and, in addition, to describe a proposal to enhance health-related services that would complement those currently provided by the CAH and better serve the community's needs. In addition, in the RFA, CMS interpreted the eligible entity definition in the statute as meaning a CAH that receives funding through the Rural Hospital Flexibility Program. The RFA identified four intervention prongs, under which specific waivers of Medicare payment rules would allow for enhanced payment for telemedicine, nursing facility, ambulance, and home health services, respectively. These waivers were formulated with the goal of increasing access to care with no net increase in costs.

Since the due date for applications on May 5, 2014, we have assessed the feasibility of the applying CAHs' service delivery proposals, as well as the potential impacts of the payment enhancement interventions on the overall expenditures for Medicare services. In the FY 2017 IPPS/LTCH PPS proposed rule, we indicated that we would be selecting CAHs to participate in the demonstration, with the period of performance for each CAH expected to start August 1, 2016.

In the proposed rule, we indicated that we had specified the payment enhancements for the demonstration, and were basing our selection of CAHs for participation, with the goal of maintaining the budget neutrality of the demonstration on its own terms (that is, the demonstration would produce savings from reduced transfers and admissions to other health care providers, thus offsetting any increase in payments resulting from the demonstration). However, because of the small size of this demonstration and uncertainty associated with projected Medicare utilization and costs, in the proposed rule, we proposed a contingency plan to ensure that the budget neutrality requirement in section 123 of Public Law 110–275 is met. Accordingly, if analysis of claims data for Medicare beneficiaries receiving services at each of the participating CAHs, as well as of other data sources, including cost reports for these CAHs, shows that increases in Medicare payments under the demonstration during the 3-year period are not sufficiently offset by reductions elsewhere, we indicated that we would recoup the additional expenditures attributable to the demonstration through a reduction in payments to all CAHs nationwide. Because of the small scale of the demonstration, we stated that we did not believe it would be feasible to implement budget neutrality by reducing payments to only the participating CAHs. Therefore, in the event that this demonstration is found to result in aggregate payments in excess of the amount that would have been paid if this demonstration were not

implemented, we proposed to comply with the budget neutrality requirement by reducing payments to all CAHs, not just those participating in the demonstration. We stated that we believe it is appropriate to make any payment reductions across all CAHs because the FCHIP demonstration is specifically designed to test innovations that affect delivery of services by the CAH provider category. We believe that the language of the statutory budget neutrality requirement at section 123(g)(1)(B) of Public Law 110–275 permits the agency to implement the budget neutrality provision in this manner. The statutory language merely refers to ensuring that aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project was not implemented, and does not identify the range across which aggregate payments must be held equal.

Based on actuarial analysis using cost report settlements for FYs 2013 and 2014, the demonstration is projected to satisfy the budget neutrality requirement and likely yield a total net savings. For the FY 2017 IPPS/LTCH PPS proposed rule, we estimated that the total impact of the payment recoupment would be no greater than 0.03 percent of CAHs' total Medicare payments within 1 fiscal year (that is, Medicare Part A and Part B). We stated in the proposed rule that the final budget neutrality estimates for the FCHIP demonstration would be based on the demonstration period, which is August 1, 2016 through July 31, 2019. The demonstration is projected to impact payments to participating CAHs under both Medicare Part A and Part B. Therefore, we proposed that, in the event the demonstration is found not to have been budget neutral, any excess costs would be recouped over a period of 3 cost reporting years, beginning in CY 2020. We proposed a 3-year period for recoupment to allow for a reasonable timeframe for the payment reduction and to minimize any impact on CAHs' operations.

Comment: Two commenters supported the FCHIP demonstration, but believed that it is inappropriate to recoup Medicare payments from all CAHs nationwide in order to achieve budget neutrality, especially because such a reduction will apply to CAHs that are not eligible to participate in the demonstration.

Response: We appreciate the commenters' support for the FCHIP demonstration and acknowledge the concerns expressed regarding recoupment of Medicare payments from all CAHs nationwide. We emphasize that the recoupment would apply only as a contingency plan, in the event that the demonstration costs exceed savings. Our actuarial analysis has estimated that the impact would be no greater than 0.03 percent of CAHs' total Medicare payments within 1 fiscal year. In addition, we will conduct any such recoupment over a period of 3 cost reporting years, in order to allow for a reasonable timeframe for any payment reduction and minimize the impact on CAHs' operations.

We refer readers to the CMS Web site at: *https://innovation.cms.gov/initiatives/Frontier-Community-Health-Integration-Project-Demonstration/* for up-to-date information on the FCHIP demonstration. We are finalizing, as proposed, a policy that, in the event we determine that aggregate payments under the demonstration exceed the payments that would otherwise have been made, CMS will recoup payments through reductions of Medicare payments to all CAHs under both Medicare Part A and Part B. Given the 3-year period of performance for the FCHIP demonstration and the time needed to conduct the budget neutrality analysis, in the event the demonstration is found not to have been budget neutral, any excess costs will be recouped over a period of 3 cost reporting years, beginning in CY 2020.

VII. Changes to the Long-Term Care Hospital Prospective Payment System (LTCH PPS) for FY 2017

A. Background of the LTCH PPS

1. Legislative and Regulatory Authority

Section 123 of the Medicare, Medicaid, and SCHIP (State Children's Health Insurance Program) Balanced Budget Refinement Act of 1999 (BBRA) (Pub. L. 106–113) as amended by section 307(b) of the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000 (BIPA) (Pub. L. 106–554) provides for payment for both the operating and capital-related costs of hospital inpatient stays in long-term care hospitals (LTCHs) under Medicare Part A based on prospectively set rates. The Medicare prospective payment system (PPS) for LTCHs applies to hospitals that are described in section 1886(d)(1)(B)(iv) of the Act, effective for cost reporting periods beginning on or after October 1, 2002.

Section 1886(d)(1)(B)(iv)(I) of the Act defines an LTCH as a hospital which has an average inpatient length of stay (as determined by the Secretary) of greater than 25 days. Section 1886(d)(1)(B)(iv)(II) of the Act also provides an alternative definition of LTCHs: Specifically, a hospital that first received payment under section 1886(d) of the Act in 1986 and has an average inpatient length of stay (as determined by the Secretary of Health and Human Services (the Secretary)) of greater than 20 days and has 80 percent or more of its annual Medicare inpatient discharges with a principal diagnosis that reflects a finding of neoplastic disease in the 12-month cost reporting period ending in FY 1997.

Section 123 of the BBRA requires the PPS for LTCHs to be a ''per discharge'' system with a diagnosis-related group (DRG) based patient classification system that reflects the differences in patient resources and costs in LTCHs.

Section 307(b)(1) of the BIPA, among other things, mandates that the Secretary shall examine, and may provide for, adjustments to payments under the LTCH PPS, including adjustments to DRG weights, area wage adjustments, geographic reclassification, outliers, updates, and a disproportionate share adjustment.

In the August 30, 2002 **Federal Register**, we issued a final rule that implemented the LTCH PPS authorized under the BBRA and BIPA (67 FR 55954). For the initial implementation of the LTCH PPS (FYs 2003 through FY 2007), the system used information from LTCH patient records to classify patients into distinct long-term care diagnosis-related groups (LTC–DRGs) based on clinical characteristics and expected resource needs. Beginning in FY 2008, we adopted the Medicare severity long-term care diagnosis-related groups (MS–LTC–DRGs) as the patient classification system used under the LTCH PPS. Payments are calculated for each MS–LTC–DRG and provisions are made for appropriate payment adjustments. Payment rates under the LTCH PPS are updated annually and published in the **Federal Register**.

The LTCH PPS replaced the reasonable cost-based payment system under the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA) (Pub. L. 97–248) for payments for inpatient services provided by an LTCH with a cost reporting period beginning on or after October 1, 2002. (The regulations implementing the TEFRA reasonable cost-based payment provisions are located at 42 CFR part 413.) With the implementation of the PPS for acute care hospitals authorized by the Social Security Amendments of 1983 (Pub. L. 98–21), which added section 1886(d) to the Act, certain hospitals, including LTCHs, were excluded from the PPS for acute care hospitals and were paid their reasonable

costs for inpatient services subject to a per discharge limitation or target amount under the TEFRA system. For each cost reporting period, a hospital-specific ceiling on payments was determined by multiplying the hospital's updated target amount by the number of total current year Medicare discharges. (Generally, in this section of the preamble of this proposed rule, when we refer to discharges, we describe Medicare discharges.) The August 30, 2002 final rule further details the payment policy under the TEFRA system (67 FR 55954).

In the August 30, 2002 final rule, we provided for a 5-year transition period from payments under the TEFRA system to payments under the LTCH PPS. During this 5-year transition period, an LTCH's total payment under the PPS was based on an increasing percentage of the Federal rate with a corresponding decrease in the percentage of the LTCH PPS payment that is based on reasonable cost concepts, unless an LTCH made a one-time election to be paid based on 100 percent of the Federal rate. Beginning with LTCHs' cost reporting periods beginning on or after October 1, 2006, total LTCH PPS payments are based on 100 percent of the Federal rate.

In addition, in the August 30, 2002 final rule, we presented an in-depth discussion of the LTCH PPS, including the patient classification system, relative weights, payment rates, additional payments, and the budget neutrality requirements mandated by section 123 of the BBRA. The same final rule that established regulations for the LTCH PPS under 42 CFR part 412, subpart O, also contained LTCH provisions related to covered inpatient services, limitation on charges to beneficiaries, medical review requirements, furnishing of inpatient hospital services directly or under arrangement, and reporting and recordkeeping requirements. We refer readers to the August 30, 2002 final rule for a comprehensive discussion of the research and data that supported the establishment of the LTCH PPS (67 FR 55954).

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623), we implemented the provisions of the Pathway for Sustainable Growth Rate (SGR) Reform Act of 2013 (Pub. L. 113–67), which mandated the application of the ''site neutral'' payment rate under the LTCH PPS for discharges that do not meet the statutory criteria for exclusion beginning in FY 2016. For cost reporting periods beginning on or after October 1, 2015, discharges that do not meet certain statutory criteria for exclusion are paid based on the site neutral payment rate. Discharges that do meet the statutory criteria continue to receive payment based on the LTCH PPS standard Federal payment rate. For more information on the statutory requirements of the Pathway for SGR Reform Act of 2013, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623).

Section 231 of Consolidated Appropriations Act, 2016 (Pub. L. 114–113) provides for a temporary exception to the application of the site neutral payment rate for certain discharges representing severe wound care cases from specific LTCHs. We refer readers to the interim final rule with comment period (IFC) published in the **Federal Register** (which we will refer to as the April 21, 2016 IFC for the remainder of this preamble) implementing this provision (81 FR 23428). We are responding to public comments and finalizing the provisions of the April 21, 2016 IFC implementing this provision in section VII.A.3. of this final rule.

We received several comments that were outside the scope of the proposed rule requesting modifications to our existing regulations. We appreciate the commenters' feedback, and we will take these comments into consideration as we contemplate future revisions to the LTCH PPS that we would make through the notice-and-comment rulemaking process.

2. Criteria for Classification as an LTCH

a. Classification as an LTCH

Under the regulations at § 412.23(e)(1), to qualify to be paid under the LTCH PPS, a hospital must have a provider agreement with Medicare. Furthermore, § 412.23(e)(2)(i), which implements section 1886(d)(1)(B)(iv)(I) of the Act, requires that a hospital have an average Medicare inpatient length of stay of greater than 25 days to be paid under the LTCH PPS. Alternatively, § 412.23(e)(2)(ii) states that, for cost reporting periods beginning on or after August 5, 1997, a hospital that was first excluded from the PPS in 1986 and can demonstrate that at least 80 percent of its annual Medicare inpatient discharges in the 12-month cost reporting period ending in FY 1997 have a principal diagnosis that reflects a finding of neoplastic disease must have an average inpatient length of stay for all patients, including both Medicare and non-Medicare inpatients, of greater than 20 days (referred to as ''subclause (II)'' LTCHs).

b. Hospitals Excluded From the LTCH PPS

The following hospitals are paid under special payment provisions, as described in § 412.22(c) and, therefore, are not subject to the LTCH PPS rules:

- Veterans Administration hospitals.
- Hospitals that are reimbursed under State cost control systems approved under 42 CFR part 403.
- Hospitals that are reimbursed in accordance with demonstration projects authorized under section 402(a) of the Social Security Amendments of 1967 (Pub. L. 90–248) (42 U.S.C. 1395b–1) or section 222(a) of the Social Security Amendments of 1972 (Pub. L. 92–603) (42 U.S.C. 1395b–1 (note)) (Statewide all-payer systems, subject to the rate-of-increase test at section 1814(b) of the Act).
- Nonparticipating hospitals furnishing emergency services to Medicare beneficiaries.

3. Limitation on Charges to Beneficiaries

In the August 30, 2002 final rule, we presented an in-depth discussion of beneficiary liability under the LTCH PPS (67 FR 55974 through 55975). This discussion was further clarified in the RY 2005 LTCH PPS final rule (69 FR 25676). In keeping with those discussions, if the Medicare payment to the LTCH is the full LTC–DRG payment amount, consistent with other established hospital prospective payment systems, § 412.507 currently provides that an LTCH may not bill a Medicare beneficiary for more than the deductible and coinsurance amounts as specified under §§ 409.82, 409.83, and 409.87 and for items and services specified under § 489.30(a). However, under the LTCH PPS, Medicare will only pay for days for which the beneficiary has coverage until the short-stay outlier (SSO) threshold is exceeded. If the Medicare payment was for a SSO case (§ 412.529), and that payment was less than the full LTC–DRG payment amount because the beneficiary had insufficient remaining Medicare days, the LTCH is currently also permitted to charge the beneficiary for services delivered on those uncovered days (§ 412.507). In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49623), we amended our regulations to limit the charges that may be imposed on beneficiaries whose discharges are paid at the site neutral payment rate under the LTCH PPS.

In section VII.G. of the preamble of the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25173), we proposed to amend the existing regulations relating to the limitation on charges to address

beneficiary charges for LTCH services provided by subclause (II) LTCHs as part of our refinement of the payment adjustment for subclause II LTCHs under § 412.526. We also proposed to amend the regulations under § 412.507 to clarify our existing policy that blended payments made to an LTCH during its transitional period (that is, payment for discharges occurring in cost reporting periods beginning in FY 2016 or 2017) are considered to be a site neutral payment rate payment.

We note that, as discussed in section VII.G. of the preamble of this final rule, we did not receive any public comments in response to these proposals and are finalizing them as proposed, without modification.

4. Administrative Simplification Compliance Act (ASCA) and Health Insurance Portability and Accountability Act (HIPAA) Compliance

Claims submitted to Medicare must comply with both the Administrative Simplification Compliance Act (ASCA) (Pub. L. 107–105), and the Health Insurance Portability and Accountability Act of 1996 (HIPAA) (Pub. L. 104–191). Section 3 of the ASCA requires that the Medicare Program deny payment under Part A or Part B for any expenses incurred for items or services for which a claim is submitted other than in an electronic form specified by the Secretary. Section 1862(h) of the Act (as added by section 3(a) of the ASCA) provides that the Secretary shall waive such denial in two specific types of cases and may also waive such denial in such unusual cases as the Secretary finds appropriate (68 FR 48805). Section 3 of the ASCA operates in the context of the HIPAA regulations, which include, among other provisions, the transactions and code sets standards requirements codified under 45 CFR parts 160 and 162 (generally known as the Transactions Rule). The Transactions Rule requires covered entities, including covered health care providers, to conduct certain electronic health care transactions according to the applicable transactions and code sets standards.

The Department of Health and Human Services (HHS) has a number of initiatives designed to encourage and support the adoption of health information technology (health IT) and promote nationwide health information exchange to improve health care. The Office of the National Coordinator for Health Information Technology (ONC) leads these efforts in collaboration with other agencies, including CMS and the Office of the Assistant Secretary for Planning and Evaluation (ASPE). Through a number of activities, including several open government initiatives, HHS is promoting the adoption of health IT products, including electronic health record (EHR) technology certified under the ONC Health IT Certification Program (*https://www.healthit.gov/policy-researchers-implementers/2015-edition-final-rule*) developed to support secure, interoperable, health information exchange. We believe that the use of certified EHRs by LTCHs (and other types of providers that are ineligible for the Medicare and Medicaid EHR Incentive Programs) can effectively and efficiently help providers improve internal care delivery practices, support the exchange of important information across care partners and during transitions of care, and enable the reporting of electronically specified clinical quality measures (eCQMs) (as described elsewhere in this proposed rule). In 2015, ONC released a document entitled ''Connecting Health and Care for the Nation: A Shared Nationwide Interoperability Roadmap'' (available at: *https://www.healthit.gov/sites/default/files/hie-interoperability/nationwide-interoperability-roadmap-final-version-1.0.pdf*). In the near term, the Roadmap focuses on actions that will enable individuals and providers across the care continuum to send, receive, find and use a common set of electronic clinical information at the nationwide level by the end of 2017. The Roadmap's goals also align with the Improving Medicare Post-Acute Care Transformation Act of 2014 (Pub. L. 113–185) (IMPACT Act), which requires assessment data to be standardized and interoperable to allow for exchange of the data. Moreover, the vision described in the Roadmap significantly expands the types of electronic health information, information sources, and information users well beyond clinical information derived from EHRs. The Roadmap identifies four critical pathways that health IT stakeholders should focus on now in order to create a foundation for long-term success: (1) Improve technical standards and implementation guidance for priority data domains and associated elements; (2) rapidly shift and align Federal, State, and commercial payment policies from fee-for-service to value-based models to stimulate the demand for interoperability; (3) clarify and align Federal and State privacy and security requirements that enable interoperability; and (4) align and promote the use of consistent policies and business practices that support interoperability and address those that impede interoperability, in coordination with stakeholders. To support of the goals of the Roadmap, ONC released the 2016 Interoperability Standards Advisory (ISA) (available at: *https://www.healthit.gov/sites/default/files/2016-interoperability-standards-advisory-final-508.pdf*), which suggests the best available standards and implementation specifications for health IT, terminology, content/structure, and services to enable interoperability. The ISA also includes emerging standards to enable priority health information exchange functions. Providers, payers, and vendors are encouraged to take these ''best available standards'' into account as they implement interoperable health information exchange across the continuum of care. A Draft 2017 Interoperability Standards Advisory will be published this summer, and will have a 60-day public comment period. The Final Interoperability Standards Advisory will be published in December 2016.

B. Modifications to the Application of the Site Neutral Payment Rate (§ 412.522)

1. Background

Section 1206 of Pathway for SGR Reform Act (Pub. L. 113–67) mandated significant changes to the LTCH PPS beginning with LTCH discharges occurring in cost reporting periods beginning on or after October 1, 2015. Specifically, section 1206 required the establishment of a site neutral payment rate (as an alternative to the LTCH PPS standard Federal payment rate) for Medicare inpatient discharges from an LTCH that fails to meet certain statutorily defined criteria. Discharges that meet the statutory criteria for exclusion from the site neutral payment rate continue to be paid based on the LTCH PPS standard Federal payment rate. Discharges that do not meet the statutory criteria for exclusion are paid based on the site neutral payment rate. We implemented the application of the site neutral payment rate in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623) and codified the requirements in the regulations at 42 CFR 412.522. The criteria for exclusion from the site neutral payment rate specified under section 1886(m)(6)(A)(ii) of the Act and as implemented at § 412.522(b) are as follows: (1) The discharge from the LTCH does not have a principal diagnosis relating to a psychiatric diagnosis or to rehabilitation; (2) admission to the LTCH was immediately preceded by discharge

from a subsection (d) hospital; and (3) the immediately preceding stay in a subsection (d) hospital included at least 3 days in an intensive care unit (ICU) (referred to as the ICU criterion) or the discharge from the LTCH is assigned to a MS–LTC–DRG based on the patient's receipt of ventilator services of at least 96 hours (referred to as the ventilator criterion). (We note that, for the remainder of this section of the preamble, the phrase ''LTCH PPS standard Federal payment rate case'' refers to an LTCH PPS case that meets the criteria for exclusion from the site neutral payment rate as specified under § 412.522(a)(2), and the phrase ''site neutral payment rate case'' refers to an LTCH PPS case that does not meet the statutory patient-level criteria as specified under § 412.522(a)(1) and, therefore, is paid the applicable site neutral payment rate.)

In response to the proposed rule, we received several comments related to the specific mechanics of the site neutral payment rate. However, because we did not make any proposals concerning the mechanics of the site neutral payment rate in the proposed rule, we consider these comments to be outside the scope of the proposed rule. We will take these comments under consideration for future rulemaking and provide subregulatory guidance as necessary and appropriate.

2. Technical Correction of Definition of ''Subsection (d) Hospital'' for the Site Neutral Payment Rate (§ 412.503)

In the FY 2016 IPPS/LTCH PPS final rule, we implemented section 1206(a) of Public Law 113–67, which established the new dual payment rate structure under the LTCH PPS that began with LTCH discharges occurring in cost reporting periods beginning on or after October 1, 2015. Section 1206(a) required the establishment of a site neutral payment rate (as an alternate to the LTCH PPS standard Federal payment rate) under the LTCH PPS for Medicare inpatient LTCH discharges that fail to meet certain statutorily defined criteria for exclusion. Discharges that meet the statutory criteria for exclusion from the site neutral payment rate continue to be paid based on the LTCH PPS standard Federal payment rate. Discharges that do not meet the statutory criteria for exclusion are paid based on the new site neutral payment rate. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623), we codified the requirements for the application of the site neutral payment rate under the LTCH PPS under the regulations at § 412.522. The statutory criteria for exclusion from the site neutral payment rate include a criterion that requires that the admission to the LTCH was immediately preceded by discharge from a ''subsection (d) hospital.'' To implement this criterion for purposes of the application of the site neutral payment rate under § 412.522, we added a definition of a ''subsection (d) hospital'' under § 412.503 of the regulations. However, we made an inadvertent cross-reference error under § 412.503 by referencing ''§ 412.526'' (payment provisions regarding subclause (II) LTCH) instead of referencing ''§ 412.522'' (payment provisions regarding the site neutral payment rate) (80 FR 49767). That is, currently § 412.503 specifies that a subsection (d) hospital means ''for purposes of § 412.526,'' when the language should have read ''for purposes of § 412.522''.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25144), we proposed to revise § 412.503 to correct this cross-reference error.

Comment: Several commenters supported our proposed technical correction of the definition of a ''subsection (d) hospital'' in § 412.503. Some commenters further requested that CMS make additional changes, for example, including specific categories of hospitals in addition to hospitals paid under the IPPS, which meet the statutory and regulatory definition of a ''subsection (d) hospital,'' to this definition in order to ensure that all hospitals meeting the regulatory and statutory definition of a ''subsection (d) hospital'' are treated appropriately for purposes of the LTCH PPS. Other commenters requested that CMS make similar changes to a subregulatory transmittal related to this definition.

Response: We appreciate the commenters' support for our proposed technical correction. We believe that our regulations are sufficiently clear to ensure that all hospitals meeting the statutory definition of a ''subsection (d) hospital'' are treated appropriately for purposes of the LTCH PPS, despite the fact that certain categories of hospitals are not expressly mentioned in our regulatory definition and that our regulatory definition of a ''subsection (d) hospital'' in § 412.503, as corrected, is fully consistent with the statutory definition. However, we will take into consideration the commenters' requests as we review and amend, as appropriate, our subregulatory guidance on this issue in order to ensure that we appropriately apply the regulatory and statutory definition of a ''subsection (d) hospital'' when determining LTCH PPS payments under the dual rate payment structure at § 412.522.

After consideration of the public comments we received, we are finalizing the technical correction to the definition of a ''subsection (d) hospital'' in § 412.503 as proposed, without modification.

3. Finalization of Interim Final Rule With Comment Period: Temporary Exception to the Site Neutral Payment Rate Under the LTCH PPS for Certain Severe Wound Discharges From Certain LTCHs

In the interim final rule with comment period (IFC) that appeared in the **Federal Register** on April 21, 2016 (81 FR 23428 through 23438) (referred to as the ''April 21, 2016 IFC'' for the remainder of this section), we implemented the provisions of section 231 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) and amended our regulations at 42 CFR 412.522 to reflect those policies. Section 231 of Public Law 114–113 amended section 1886(m)(6) of the Act by revising subparagraph (A)(i) and adding new subparagraph (E), which established a temporary exception to the site neutral payment rate for certain severe wound care discharges occurring prior to January 1, 2017, from LTCHs identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997 that are located in a rural area (as defined in section 1886(d)(2)(D) of the Act) or treated as being so located pursuant to section 1886(d)(8)(E). Because the statute contained no effective date and required rulemaking to implement, we determined that the issuance of an IFC was the most appropriate mechanism to use to ensure that the affected LTCHs received the longest period of relief under the statute.

In this final rule, we summarize the provisions of the April 21, 2016 IFC relating to the temporary exception to the site neutral payment rate for certain severe wound care discharges from certain LTCHs, summarize the public comments received, present our responses to those public comments, and state the final policies, which reflect limited modifications of the policies set forth in the April 21, 2016 IFC. However, as we did not receive any public comments on our implementing regulation text, and as the limited modifications of our policies in response to public comments do not necessitate any changes to the implementing regulation text, we are finalizing those regulatory provisions without further discussion or modification.

a. Overview of the Policies Implementing Section 231 of Public Law 114–113

As we discussed in our April 21, 2016 IFC, section 231 of Public Law 114–113 limits the temporary exception to LTCHs identified by the amendment made by section 4417(a) of the BBA (which, as we discussed in the IFC, is a phrase that has been defined through prior rulemakings) that are located in a rural area (as defined in section 1886(d)(2)(D) of the Act (providing a geographic definition of ''rural'' based on a hospital's location outside of OMB's Metropolitan Statistical Areas (MSAs)) or treated as being so located pursuant to section 1886(d)(8)(E) of the Act) (referencing IPPS' geographic reclassification rules, which required interpretation to apply it in the LTCH context). Furthermore, the statute limited the temporary exception to discharges in which the individual ''has'' a severe wound, which we interpreted as either discharges for individuals who had been successfully treated for a severe wound while receiving care in the eligible LTCH, or discharges for individuals who were discharged with a severe wound after having been treated for a severe wound while receiving care in the eligible LTCH. Finally, the statute further limited the temporary exception to severe wounds as identified within the categories listed in the statute, some of which required additional interpretation in order to implement.

As set forth in the April 21, 2016 IFC, these interpretations were then codified in amendments to § 412.522 of the LTCH PPS regulations, which, as the statute contained no effective date and as rulemaking was required to implement the statute, became effective on the IFC's publication date. Also as discussed in the IFC, we believed that our use of an IFC as the means of establishing the required interpretations (as opposed to full notice and comment rulemaking) afforded the longest period of relief possible under the authorizing statute, while preserving the opportunity to comment on our implementing policies.

For more detail on the policies adopted in the April 21, 2016 IFC, we refer readers to 81 FR 23428. We address the comments received in response to those policies, and our responses to those comments below.

b. Interpretation of the Phrase ''Identified by the Amendment Made by Section 4417(a) of the Balanced Budget Act of 1997''

As discussed in the April 21, 2016 IFC (81 FR 23428), the phrase ''identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997'' has been interpreted by CMS to mean hospitals within hospitals (HwHs) that were participating in Medicare, but excluded from the hospital IPPS on or before September 30, 1995 (that is, hospitals which are described under § 412.23(e)(2)(i)) that meet the criteria of § 412.22(f) (81 FR 23430 through 23432).

As further discussed in the April 21, 2016 IFC, § 412.22(f) generally requires that, in order to have grandfathered status, an HwH must continue to operate under the same terms and conditions, including, but not limited to, the number of beds. A limited exception to this general policy allowed eligible hospitals to increase beds between October 1, 1995, and September 30, 2003, without loss of their grandfathered status. A second exception allows grandfathered HwHs to increase square footage or decrease the number of beds for cost reporting periods beginning on or after October 1, 2006, while still retaining grandfathered status.

As the phrase ''identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997'' had already been interpreted in this manner, the April 21, 2016 IFC adopted the same meaning of the phrase for purposes of implementing section 231 of Public Law 114–113. For additional information on hospitals ''identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997,'' we refer readers to the April 21, 2016 IFC (81 FR 23431 through 23432).

Comment: While we did not receive any public comments in response to our interpretation ''identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997'' set forth in the April 21, 2016 IFC, one commenter requested clarification as to whether certain hospitals would be considered ''identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997'' (that is, a grandfathered HwH) for the purposes of the 25-percent threshold policy (discussed in section VII.F. of the preamble of this final rule). Specifically the commenter asked whether: (1) An LTCH which changed host hospitals, (2) an LTCH which is no longer co-located, (3) an LTCH which did not increase overall beds, but moved some to a remote location, and (4) an LTCH which did not increase overall beds, but moved some to a satellite location would be considered a grandfathered HwH. The commenter requested CMS to consider all of these hospitals ''grandfathered HwHs'' so long as they did not increase their overall bed capacity.

Response: We appreciate the commenter's support for excluding LTCHs which expanded bed capacity from grandfathered HwHs that are eligible for the temporary exception, consistent with the April 21, 2016 IFC. However, as we explained in that IFC, none of the hospitals described by the commenter would be considered grandfathered HwHs because none of those hospitals would meet the requirements of § 412.22(f) (requiring, with limited exceptions, that the LTCH continue to operate under the same terms and conditions). By changing host hospitals, the hospital described in scenario (1) would have changed the terms and conditions under which it operated and, therefore, does not meet the requirements of § 412.22(f). Furthermore, the LTCHs described in scenarios (2), (3), and (4) would no longer meet the definition of an ''HwH'' LTCH as the LTCHs in scenario (2) would become a freestanding LTCH, and LTCHs in scenarios (3) and (4) would be satellite LTCH facilities, none of which are HwHs. As the requirements of § 412.22(f) can only be met by HwHs, and the LTCH configurations in scenarios (2), (3) and (4) are not HwHs they are not grandfathered HwHs.

After consideration of the public comments we received, we are finalizing our interpretation of the phrase ''identified by the amendment made by section 4417(a) of the Balanced Budget Act of 1997'' as set forth is the April 21, 2016 IFC, without modification.

c. Meaning of the Phrase ''Located in a Rural Area or Treated as Being So Located''

Section 1886(m)(6)(E)(i)(I)(bb) of the Act, as added by section 231 of Public Law 114–113, limits application of the temporary exception to LTCHs that are located in a rural area (as defined in subsection (d)(2)(D)) or ''treated as being so located'' pursuant to subsection (d)(8)(E). As discussed in the April 21, 2016 IFC, section 1886(d)(2)(D) of the Act establishes a geographic definition of ''rural'' based on location outside of OMB's MSAs. This statutory definition of rural area is consistent with the existing definition of rural area under the LTCH PPS set forth at § 412.503. Therefore, in the April 21, 2016 IFC (81 FR 23432), we established that ''located

in a rural area'' in section 1886(m)(6)(E)(i)(I)(bb) of the Act refers to LTCHs which are currently located in a rural area as defined under § 412.503 (81 FR 23432). As discussed in the April 21, 2016 IFC, the phrase ''treated as being so located pursuant to subsection (d)(8)(E)'' required interpretation as section 1886(d)(8)(E) of the Act only applies to subsection (d) hospitals, and LTCHs, by definition at section 1886(b)(1) of the Act, are not subsection (d) hospitals.

Section 1886(d)(8)(B) of the Act, as applied to urban subsection (d) hospitals is implemented at § 412.103, and establishes the procedures by which an urban IPPS hospital may apply for reclassification as a rural hospital, the process for reviewing such applications, and the conditions under which applications will be approved (81 FR 23432). To apply these policies and procedures to LTCHs in the context of the temporary exception, we revised our LTCH regulations at § 412.522(b)(2) to—

- Limit reclassification applications under the LTCH PPS to grandfathered HwHs.
- Limit the application and effect of any reclassifications granted to grandfathered HwHs to the eligibility determination for the temporary exception, and
- Adopt the existing rural IPPS reclassification process and procedures as stated under § 412.103 for the LTCH PPS.

Furthermore, in adopting these policies and procedures, we highlighted that a reclassified grandfathered HwH LTCH will not be treated as rural for any other reason, including, but not limited to, the 25-percent threshold policy and wage index, and that any rural treatment under these LTCH PPS policies and procedures will expire at the same time as the temporary exception (that is, December 31, 2016).

Comment: MedPAC opposed allowing LTCHs to seek rural ''reclassification'' based on the Commission's general opposition to the current wage index system.

Response: As we explained in the April 21, 2016 IFC, we were required to give meaning to an LTCH being ''treated as being so located'' under section 1886(d)(8)(E) of the Act. We achieved this by allowing limited reclassification in the LTCH PPS context, by having it apply solely for the purpose of eligibility for the temporary exception established under section 231 of Public Law 114–113. As implemented, we believe that our policy had no effect on the MedPAC's wage index related reclassification concerns. It merely allows eligible LTCHs to reclassify as rural for the purposes of qualifying for the temporary exception to the site neutral payment rate under the LTCH PPS for certain severe wound care discharges from certain LTCHs. It is not applicable in the LTCH PPS for any other purpose, including but not limited to, the 25-percent threshold policy and the wage index, and such treatment is effective only until the expiration of the temporary exception (that is, December 31, 2016).

Furthermore, as MedPAC offered no alternative that would give meaning to the phrase ''treated as being so located'' under section 1886(d)(8)(E) of the Act, we continue to believe our interpretation to be the most appropriate way to interpret ''treated as being so located'' in this context.

Comment: One commenter supported our interpretation of ''treated as being so located'' under section 1886(d)(8)(E) of the Act in relation to section 231 of Public Law 114–113. Other commenters requested that CMS expand the scope of the temporary exception to either allow additional hospitals or discharges to be excluded from the site neutral payment rate.

Response: We appreciate the commenter's support for our implementation of the phrase ''treated as being so located'' under section 1886(d)(8)(E) of the Act in relation to section 231 of Public Law 114–113. In response to the commenters who requested expansion of the temporary exception beyond the LTCHs and discharges defined in section 231 of Public Law 114–113, as we stated in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49602), we do not have the authority to pay LTCH discharges that fail to meet the patient-level criteria for payment at the LTCH PPS standard Federal payment rate at a rate other than the site neutral payment rate unless the discharge meets the eligibility criteria for the temporary exception for certain severe wound discharges. Therefore, we lack the authority to implement additional exceptions as the commenters suggested.

After consideration of the public comments we received, we are finalizing our implementation of the meaning of the phrases ''located in a rural area'' under section 1886(d)(2)(D) of the Act and ''treated as being so located'' under section 1886(d)(8)(E) of the Act, without change.

d. Interpretation of the Phrase ''Individual Discharged Has a Severe Wound''

Section 1886(m)(6)(E)(i)(II) of the Act, as added by section 231 of Public Law 114–113, provides that the temporary exception for certain discharges from the application of the payment policy for site neutral payment rate cases discharged from certain LTCHs is applicable when the ''individual discharged has a severe wound.'' We stated in the April 21, 2016 IFC (81 FR 23433) that the use of the present tense in regard to the word ''has'' when addressing a severe wound is internally inconsistent. A strict and literal read of the statute would require temporary exception from the application of the payment policies for site neutral payment rate cases only representing an individual who, presently, ''has severe a wound'' at the time of his or her discharge from the LTCH and, therefore, payments for cases representing patients whose wounds are either healed or no longer severe at the time of discharge would be made under our existing regulations (that is, the LTCH would receive payment for the case discharge at the site neutral payment rate unless the discharge met the existing exclusion criteria). As we stated in the April 21, 2016 IFC (81 FR 23433), we interpreted this phrase in the provision of the statute to include discharges for cases representing patients who received treatment for a ''severe wound'' at the LTCH, regardless of whether the wound was present and severe at the time of discharge.

Comment: One commenter supported the interpretation.

Response: We appreciate the commenter's support and are finalizing our interpretation of a patient who ''has'' a severe wound as a patient who ''had'' a severe wound, without modification.

e. Statutory Definition of the Term ''Severe Wound''

Section 1886(m)(6)(E)(ii) of the Act, as added by section 231 of Public Law 114–113, defines a ''severe wound'' as a Stage 3 wound, Stage 4 wound, unstageable wound, non-healing surgical wound, infected wound, fistula, osteomyelitis or wound with morbid obesity as identified in the claim from the LTCH. For purposes of implementing this statutory definition in the April 21, 2016 IFC (81 FR 23433), after consultation with our clinical advisors, we interpreted the term ''wound'' as: An injury, usually involving division of tissue or rupture of the integument or mucous membrane with exposure to the external environment. In that same IFC, we also established that the phase ''as identified in the claim'' to mean as identified based on the ICD–10–CM diagnosis codes reported on the claim where—

• The ICD–10–CM diagnosis codes contain sufficient specificity for this purpose; or

• Through the use of a payer-specific condition code where the ICD–10–CM diagnosis codes lack sufficient specificity for this purpose.

For six of the eight statutory categories included in the statutory definition of ''severe wound'' (Stage 3 wound, Stage 4 wound, unstageable wound, non-healing surgical wound, fistula, and osteomyelitis), we stated that we believe these types of severe wounds can be identified through the use of specific ICD–10–CM diagnosis codes, which are reported on the LTCH claim. We indicated that the list of ICD–10–CM diagnosis codes that we will use to identify severe wounds for this group of six statutory categories can be found in the table entitled ''Severe Wound Diagnosis Codes by Category for Implementation of Section 231 of Public Law 114–113'' posted on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/LongTermCareHospitalPPS/index.html* under the regulation ''CMS–1664–IFC.'' Our clinical advisors compiled this list of codes by reviewing ICD–10–CM diagnosis codes for the statutorily enumerated categories of severe wounds and selecting the codes that satisfied our definition of a ''wound.'' We noted in the April 21, 2016 IFC that under our definition of a wound, the ICD–10–CM diagnosis codes used to identify severe wounds in the osteomyelitis category are also part of the ICD–10-diagnosis codes used to identify severe wounds in the fistula category and, therefore, no separate identification of ICD–10–CM diagnosis codes for osteomyelitis is necessary (81 FR 23433).

The remaining two statutory categories included in the definition of ''severe wound'' (infected wound and wound with morbid obesity), as stated in the April 21, 2016 IFC, lack ICD–10–CM diagnosis codes with sufficient specificity to identify the presence of a ''severe wound.'' This is a result of the number of codes that are used to identify wounds and infections being too numerous to identify and compile such an exhaustive list. We stated that because we cannot specify ICD–10 diagnosis codes to appropriately identify severe wounds classified in these categories, for the purposes of this provision, in the April 21, 2016 IFC, we defined a ''wound with morbid obesity'' as a wound in those with morbid obesity that require complex, continuing care including local wound care occurring multiple times a day, and an ''infected wound'' as a wound with infection requiring complex, continuing care including local wound care occurring multiple times a day. In order to operationalize these definitions in the absence of ICD–10–CM diagnosis codes, we utilize payer-only condition codes on the claim for processing (81 FR 23433).

As we stated we would in the April 21, 2016 IFC, we issued additional operational instructions regarding the use of the designated payer-only condition code in Change Request 9599, Transmittals 1654 and 1675. (We note that Change Request 9599 was originally issued on April 29, 2015 as Transmittal 1654, and reissued on June 16, 2016, as Transmittal 1675 to correct certain technical errors.) We note, as we did in the April 21, 2016 IFC, that while the use of this payer-only condition code is the most expedient operational method we have of implementing the statutory definition provided by the provisions of section 231 of Public Law 114–113 in the timeframe allowed, the continued use of a payer-only condition code may not be feasible if the scope of this provision is expanded. Given the current limitations on the number of LTCHs that meet the requirements to qualify for the exception granted by this provision under the statutory criteria (that is, grandfathered HwHs that are located in a rural area or reclassify as rural, as previously described in this section), the ability to identify the other statutory categories of severe wounds, and the limited timeframe of the exception's duration, we stated that we expected the number of claims necessitating the use of this payer-only condition code will be minimal.

Comment: Several commenters objected to the use of ''including local wound care occurring multiple times a day'' in the definitions of ''infected wound'' and ''wound with morbid obesity.'' These commenters stated that the best clinical practices do not necessarily call for local wound care multiple times a day, and, although severe, in those instances, medically appropriate care for what they believed were ''severe'' wounds would not be considered for a ''severe wound'' under the provisions implementing section 231 of Public Law 114–113. For example, some commenters construed our ''including local wound care occurring multiple times a day'' to require multiple dressing changes as a necessary criterion under these categories, and expressed concern that the use of ''including local wound care occurring multiple times a day'' would exclude discharges that did not involve dressing changes from the definition of a severe wound (and from the exclusion from the site neutral payment rate).

Response: Our use of the phrase ''including local wound care occurring multiple times a day'' was intended to be illustrative, not demonstrative. In other words, it is our intent that ''local wound care occurring multiple times a day'' is an example of a wound with infection or a wound with morbid obesity ''requiring complex, continuing care.'' To address commenters' concerns and alleviate further confusion, we are modifying the definitions of ''infected wound'' and ''wound with morbid obesity'' included in the April 21, 2016 IFC as follows. For the purposes of determining whether a discharge included treatment for a severe wound eligible for the temporary exception provided by section 231 of Public Law 114–113, in this final rule, we are establishing that an ''infected wound'' is ''a wound with infection requiring complex, continuing care'' and a ''wound with morbid obesity'' is ''a wound in those with morbid obesity that requires complex, continuing care.'' Local wound care occurring multiple times a day (which may involve dressing changes) is one way to demonstrate that a wound requires ''complex, continuing care,'' but not the only way.

Comment: Several commenters submitted requests for the inclusion of additional ICD–10 diagnosis codes that they believe qualify as descriptions of severe wounds under the categories of Stage 3 wounds, Stage 4 wounds, unstageable wounds, non-healing surgical wounds, fistula, and osteomyelitis, and, as such, should be added to the list of codes presumptively considered as ''severe wounds'' in our ICD–10 diagnosis code-based automated claims processing implementation approach (that is, they asked us to add the codes they identified to the table of ''Severe Wound Diagnosis Codes by Category for Implementation of Section 231 of Pub. L. 114–113'' posted on the CMS Web site). Several commenters also asserted that the ICD–10 diagnosis codes for necrotizing fasciitis and gangrene should be presumptively considered as ''severe wounds'' under the category of an ''infected wound'' (and, therefore, be added to the table), and should not require the use of the payer-only condition codes to identify such discharges as meeting the exception from payment at the site neutral payment rate.

Response: We reviewed all of the ICD–10 diagnosis codes requested by commenters and found that that some of those codes do meet the definition of a severe wound set forth in the April 21, 2016 IFC. These codes will be added to the final table, which will be posted on

the CMS Web site. Other suggested codes, did not meet the definition of a ''severe wound,'' and will not be added to the final table.

For example, we disagree with commenters' assertions regarding ICD–10 diagnosis codes for necrotizing fasciitis and gangrene. While we acknowledge that necrotizing fasciitis and gangrene may be serious enough to qualify as a ''severe wound'' in some cases, the ICD–10 diagnosis codes for these types of infections do not capture the severity of the wound sufficiently enough to ensure that every use of the code represents a case which would meet our definition of an ''infected wound'' under our implementation of the provisions of section 231 of Public Law 114–113. Therefore, we conclude that the suggested codes for necrotizing fasciitis and gangrene lack sufficient clinical specificity to ensure that their *every* use would be for a wound which meets our definition (which would be required to merit presumptive application of the statutory exception for certain severe wounds). We will continue to apply the payer-only condition code in instances in which wounds associated with necrotizing fasciitis and gangrene (or other infection) do qualify as severe wounds under the category of ''infected wounds.''

Comment: One commenter noted that, under the ICD–10–CM classification system, there are coding conventions that require specific sequencing of codes based on instructional notes, such as ''code first'' and ''use additional code.'' According to the commenter, these diagnosis codes describe conditions that should be reported as the principal diagnosis, followed by the code identifying a severe wound. This commenter recommended the addition of certain ICD–10 codes to account for these coding conventions.

Response: We appreciate the commenter's review of the list of ICD–10–CM diagnosis codes used to identify severe wounds for purposes of implementing section 231 of Public Law 114–113. While coding guidance is outside the scope of this final rule, we note that we collaborate with the American Hospital Association through the Coding Clinic for ICD–10–CM and ICD–10–PCS to promote proper coding. With that said, our implementation of the exception for certain ''severe wounds'' provided by the provisions of section 231 of Public Law 114–113 only requires the presence of an ICD–10 code on the claim. The sequence of the diagnosis codes on the claim is not relevant for purposes of the provision. For these reasons, we are not adopting the commenter's recommendation, but we will continue to encourage LTCHs to follow official ICD–10–CM/PCS Coding Guidelines and conventions, which can be found on the Web sites at: *http://www.cdc.gov/nchs/icd10cm.htm* and *http://www.cms.gov/medicare/coding/icd10/*.

Comment: One commenter believed that CMS was granted no discretion with regard to what constitutes a ''severe wound'' under the statute because the term was defined by the statute. The commenter requested that CMS add every ICD–10 code that identified any of the categories of wounds in our table.

Response: While we agree that the term ''severe wound'' was defined in the statute, that fact did not obviate the need to interpret the terms used by the statute to define ''severe wound.'' While the statute enumerated the universe of categories into which severe wounds would be classified, it did not define how they should be ''identified in the claim.'' Nor did the statute define what a ''wound'' is.
