Thus, in order to implement the statute, we found it necessary to define ''wound,'' and to give meaning to Congress' use of the phrase ''severe wound'' in the context of the named categories. ''Infected wound'' and ''wound with morbid obesity'' cannot be interpreted in the abstract—they must be read in context, and the context is a provision granting exceptions to certain ''severe wound'' discharges. As we stated in the April 21, 2016 IFC, in order to do that, we implemented a definition of a ''wound'' (as, logically, there must be a wound in order for there to be a severe wound) and that definition must be distinct from the definition of a ''severe wound'' lest the word ''severe'' be rendered superfluous (meaning that we must define a ''wound'' in such a way as to distinguish between ''severe'' wounds, which are to be excluded from the site neutral payment rate, and ''nonsevere'' wounds, which are not to be excluded from the site neutral payment rate). We continue to believe that interpreting the statute so as to require that each of the enumerated categories require a demonstration of the condition being a ''severe'' wound is a reasonable interpretation of the statute. This is particularly important for the infected wounds and wounds with morbid obesity, as these categories lack any clinically standard definition, and represent a gambit of clinical circumstances, from a paper cut on a patient with morbid obesity or an infected cut (either of which meets the definition of a ''wound,'' but neither of which would be expected to require ''complex, continuing care'' or would be labeled ''severe'') to necrotizing fasciitis (which can represent a severe wound which requires complex, continuing care). Therefore, in developing the list of ICD–10 diagnosis codes for identifying, on the LTCH claim, Stage 3 wounds, Stage 4 wounds, unstageable wounds, non-healing surgical wounds, fistula, and osteomyelitis solely based on the presence of an ICD–10 diagnosis code, we include only such codes with sufficient clinical specificity to first, indicate the presence of a ''wound,'' and second, differentiate between severe and non-severe wounds, due to the statutory requirement that we determine what constitutes a ''severe wound'' as ''identified in the claim'' (that is, from information on the LTCH claim). As we are identifying infected wounds and wounds with morbid obesity through the use of a payer-only condition code, we established our regulatory definition of these categories so that all uses identify wounds which are severe. For these reasons, we disagree with the commenter and are not including every ICD–10 code, which could represent one of the statutory categories of wounds. To the extent that any code requested by any commenter was sufficiently specific so as to indicate a severe wound of the types listed, we have added it to our table.

Comment: Several commenters requested that CMS apply the temporary exception to all discharges where the claim includes a code for a body mass index (BMI) that indicates morbid obesity.

Response: As we stated in the April 21, 2016 IFC, the mere presence of ICD–10–CM diagnosis codes for morbid obesity paired with a code for a wound does not provide any information on the severity of the wound; that is, ICD–10 diagnosis codes do not differentiate between a diagnosis that is a ''severe'' wound and a diagnosis that is a ''nonsevere'' wound. As such, we are not making any changes to our approach for identifying wounds with morbid obesity, and will continue to identify severe wounds in the category of ''wounds with morbid obesity'' solely through the use of the payer-only condition code as established in the April 21, 2016 IFC.

After consideration of the public comments we received, as discussed previously in this section, we are revising our definitions of an ''infected wound'' and a ''wound with morbid obesity,'' and including additional ICD–10 diagnosis codes to the listing that identifies codes that will be presumptively considered severe wounds for purposes of our automated

claims processing implementation approach. All other policies implementing the provisions of section 231 of Public Law 114–113 remain the same as implemented in the April 21, 2016 IFC, without modification.

f. Provisions of This Final Rule

In summary, we are finalizing the provisions of the April 21, 2016 IFC with the following modifications: (1) We are revising our definitions of a ''wound with morbid obesity'' and an ''infected wound,'' and adding additional ICD–10 diagnosis codes to our list of such codes to identify cases that meet our established definition of a ''severe wound'' for the six severe wound categories other than the categories of a ''wound with morbid obesity'' and an ''infected wound.'' The provisions implementing section 231 of Public Law 114–113, as set forth in the April 21, 2016 IFC and discussed below, are effective for LTCH discharges from qualifying LTCHs, for discharges on or after April 21, 2016, through December 31, 2016.

g. Waived Proposed Rulemaking and Delay of Effective Date

In the April 21, 2016 IFC (81 FR 23435), we found notice-and-comment rulemaking and a delay in the effective date to be both unnecessary as well as impracticable and contrary to public interest. Section 231 of Public Law 114–113 required revision of the existing regulations to implement the LTCH wound care exception, thereby limiting any discretion we might otherwise have had to immediately implement the statutory mandate as a self-implementing statute. In addition, given the statutory expiration of the provisions of section 231 of Public Law 114–113 on January 1, 2017, we noted that the use of notice-and-comment rulemaking in the face of the congressionally imposed end date of the relief would have significantly limited the qualifying discharges to which the statute applies. We stated that by implementing and codifying the provisions of the statute through an IFC and subsequent final rule rather than full notice-and-comment rulemaking and waiving the usual 60-day delay of effective date requirement, we believed that our implementation of the waiver would ensure the maximum period of relief, consistent with our interpretation of the statute. We found, on these bases, that there was good cause to waive notice-and-comment rulemaking and the delay in effective date that would otherwise be required.

Comment: Several commenters requested that CMS make the effective date of the provision implemented in the April 21, 2016 IFC retroactive to January 1, 2016. One commenter stated that implementing the statute through an IFC is contrary to Congressional intent.

Response: As the statute did not contain an effective date and required rulemaking to implement, having a regulation with an effective date prior to the date of the rulemaking would require retroactive rulemaking. While we have the authority to engage in retroactive rulemaking, that authority is limited to situations where it is necessary to comply with a statutory requirement or for the public interest. Had the statute contained an effective date, we may have been required to perform retroactive rulemaking in order to comply with that requirement. However, as the statute did not contain an effective date, retroactive rulemaking was not required. Additionally, we do not believe that retroactive rulemaking is necessary for the public interest as, by implementing the statutory requirement through an IFC, we were able to provide a meaningful period of relief without engaging in retroactive rulemaking. With respect to the commenter's statement regarding Congressional intent, we note that the commenter provided no evidence of our having violated the Congressional intent of this statutory provision. The materials cited by the commenter, while related to wound care, rural health, and/or the LTCH PPS, were not directly related to section 231 of Public Law 114–113, nor were they Congressionally authored. In implementing section 231 of Public Law 114–113, we reviewed the legislative history and found nothing in that history that provides insight into Congress' intent. Therefore, we believe that we are not required to engage in retroactive rulemaking in implementing section 231 of Public Law 114–113.

h. Collection of Information Requirements

Under the Paperwork Reduction Act of 1995 (the PRA), Federal agencies are required to publish notice in the **Federal Register** concerning each proposed collection of information. Interested persons are invited to send comments regarding our burden estimates or any other aspect of this collection of information, including any of the following subjects: (1) The necessity and utility of the proposed information collection for the proper performance of the agency's functions; (2) the accuracy of the estimated burden; (3) ways to enhance the quality, utility, and clarity of the information to be collected; and (4) the use of automated collection techniques or other forms of information technology to minimize the information collection burden.

However, in the April 21, 2016 IFC (81 FR 23435), we stated that we had requested an emergency review of the information collection referenced later in this section. In compliance with the requirement of section 3506(c)(2)(A) of the PRA, we submitted the following for emergency review to the Office of Management and Budget (OMB). We requested an emergency review and approval under 5 CFR 1320.13(a)(2)(i) of the implementing regulations of the PRA in order to implement the provisions of section 231 of Public Law 114–113 as expeditiously as possible. We stated that public harm was reasonably likely to ensue if the normal clearance procedures were followed because the approval of this information collection is essential to ensuring that otherwise qualifying grandfathered urban HWHs are not unduly delayed in attempting to obtain relief provided by the temporary exception by applying to be treated as rural before the temporary exception expires on December 31, 2016.

We stated in the April 21, 2016 IFC that, for the purposes of implementing subparagraph (E) of section 1886(m)(6) of the Act as provided by Public Law 114–113, we revised our regulations at § 412.522(b)(2)(ii)(B)(*2*) to utilize the same administrative mechanisms used in the existing rural reclassification process for urban subsection (d) hospitals under § 412.103, described later in this section. We also stated that we will allow grandfathered LTCH HwHs (previously defined in that IFC) to apply to their CMS regional office for treatment as being located in a rural area for the sole purpose of qualifying for this temporary exception from the application of the site neutral payment rate.

We stated in the April 21, 2016 IFC that, for urban subsection (d) hospitals, and now temporarily LTCHs, we implemented the rural reclassification provision in the regulations at § 412.103. In general, the provisions of § 412.103 provides that a hospital located in an urban area may be reclassified as a rural hospital if it submits an application in accordance with our established criteria. The hospital must also meet certain conditions, which include being located in a rural census tract of a MSA, or in an area designated by any law or regulation of the State as a rural area, or designated as a rural hospital by State law or regulation. Paragraph (b) of § 412.103 sets forth application

requirements for a hospital seeking reclassification as rural under that section, which includes a written application mailed to the CMS regional office that contains an explanation of how the hospital meets the condition that constitutes the request for reclassification, including data and documentation necessary to support the request. As provided in paragraphs (c) and (d) of § 412.103, the CMS regional office reviews the application and notifies the hospital of its approval or disapproval of the request within 60 days of the filing date, and a hospital that satisfies any of the criteria set forth § 412.103(a) is considered as being located in the rural area of the State in which the hospital is located as of that filing date.

We noted in the April 21, 2016 IFC that this policy only allows grandfathered LTCH HwHs to apply for this reclassification, and the rural treatment will only extend to this temporary exception for certain wound care discharges from the site neutral payment rate (meaning a grandfathered HwH LTCH will not be treated as rural for any other reason, including, but not limited to, the 25-percent threshold policy and wage index policies). We also noted that the any rural treatment under § 412.103 for a grandfathered HwH LTCH expires at the same time as this temporary provision (that is, December 31, 2016).

In the April 21, 2016 IFC (81 FR 23436), we estimated that each application will require 2.5 hours of work from each LTCH (0.5 hours to fill out the application and 2 hours of recordkeeping). Based on the current information we had received from the MACs, out of the approximately 120 current LTCHs that existed in 1995, which is a necessary but not sufficient condition to be a grandfathered HWH, there are approximately 5 hospitals that currently meet the criteria of being a grandfathered HWH and would not be precluded from submitting an application. We noted that as the MACs continue to update the list of grandfathered HWH that the number of potential applicants could increase. Because it is possible that the number of applicants could rise to 10 or more, in an abundance of caution, we treated this information collection as being subject to the PRA. Therefore, we estimated that the aggregate number of hours associated with this request across all currently estimated eligible hospitals will be 12.5 (2.5 hours per hospital for 5 hospitals). We estimated a current, average salary of $29 per hour (based on the ''2015 Median usual weekly earnings (second quartile), Employed full time, Wage and salary workers, Management, professional, and related occupations'' from the Current Population Survey, available at the Web site: *http://www.bls.gov/webapps/legacy/cpswktab4.htm*) plus 100 percent for fringe benefits ($58 per hour). Therefore, we estimated the total one-time costs associated with this request will be $725 (12.5 hours × $58 per hour).

In the April 21, 2016 IFC, we stated that written comments and recommendations from the public would be considered for this emergency information collection request if received by April 28, 2016. We requested OMB review and approval of this information collection request by May 5, 2016, with a 180-day approval period. We gave two access Web sites and a telephone number in the IFC where the public could obtain copies of a supporting statement and any related forms for the proposed collection(s).

We did not receive any public comments in response to this information collection request and, therefore, are finalizing it as it was set forth in the April 21, 2016 IFC, without modification. OMB approved the Emergency PRA package on May 9, 2016, for the aforementioned burden, which is under OMB control number 0938–0907.

i. Regulatory Impact Analysis

We have examined the impact of the April 21, 2016 IFC as required by Executive Order 12866 on Regulatory Planning and Review (September 30, 1993), Executive Order 13563 on Improving Regulation and Regulatory Review (January 18, 2011), the Regulatory Flexibility Act (RFA) (September 19, 1980, Pub. L. 96–354), section 1102(b) of the Social Security Act, section 202 of the Unfunded Mandates Reform Act of 1995 (March 22, 1995, Pub. L. 104–4), Executive Order 13132 on Federalism (August 4, 1999) and the Congressional Review Act (5 U.S.C. 804(2)).

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. A regulatory impact analysis (RIA) must be prepared for major rules with economically significant effects ($100 million or more in any 1 year). In the April 21, 2106 IFC, we projected that two rural LTCHs would qualify for the temporary exception to the site neutral payment rate for certain LTCHs for certain discharges provided by section 231 of Public Law 114–113, based on the best data available at that time. We were not able to determine which, if any, LTCHs may be treated as rural in the future by applying and being approved for a reclassification as rural under the provisions of § 412.103. We stated that, given that LTCHs are generally concentrated in more densely populated areas, we did not expect any LTCHs to qualify under § 412.103. As such, as indicated in the April 21, 2016 IFC (81 FR 23436 through 23436), at that time, our projections related to the temporary exception to the site neutral payment rate for certain LTCHs for certain discharges provided by section 231 of Public Law 114–113, were limited to LTCHs that are geographically located in a rural area. Based on the most recent data for these two LTCHs, including the identification of FY 2014 LTCH discharges with a ''severe wound,'' we estimated the monetary impact of the IFC with respect to that LTCH PPS provision is approximately a $5 million increase in aggregate LTCH PPS payments had this statutory provision not been enacted. This estimate did not reach the economic threshold and this provision did not cause the IFC to be considered a major rule. At this time, we continue to estimate that the implementation of section 231 of Public Law 114–113 will result in approximately a $5 million increase in aggregate LTCH PPS payments had this statutory provision not been enacted, which does not reach the economic threshold and this provision did not cause the IFC to be considered a major rule.

The RFA also requires agencies to analyze options for regulatory relief of small entities if a rule has a significant impact on a substantial number of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small governmental jurisdictions. We estimate that most hospitals and most other providers and suppliers are small entities as that term is used in the RFA. The great majority of hospitals and most other health care providers and suppliers are small entities, either by being nonprofit organizations or by meeting the SBA definition of a small business (having revenues of less than $7.5 million to $38.5 million in any 1 year). (For details on the latest standards

for health care providers, we refer readers to page 36 of the Table of Small Business Size Standards for NAIC 622 found on the SBA Web site at: *https://www.sba.gov/sites/default/files/files/Size_Standards_Table.pdf*).

For purposes of the RFA, all hospitals and other providers and suppliers are considered to be small entities. Individuals and States are not included in the definition of a small entity. We stated that we believe the provisions of the April 21, 2016 IFC may have an impact on some small entities, but for the reasons previously discussed in that IFC and reiterated above, we could not conclusively determine the number of such entities impacted. Because we lack data on individual hospital receipts, we stated in the April 21, 2016 IFC that we could not determine the number of small proprietary LTCHs. Therefore, we assumed that all LTCHs are considered small entities for the purpose of the RFA. MACs are not considered to be small entities. Because we acknowledged that many of the potentially affected entities are small entities, we stated that the discussion in this section regarding potentially impacted hospitals constituted our regulatory flexibility analysis. In stating our final policies in this final rule, we continue to acknowledge that many of the potentially affected entities are small entities and, therefore, the discussion in this section regarding potentially impacted hospitals, constitute our regulatory flexibility analysis.

In addition, section 1102(b) of the Act requires us to prepare a regulatory impact analysis if a rule may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 604 of the RFA. With the exception of hospitals located in certain New England counties, for purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside a metropolitan statistical area and has fewer than 100 beds. Section 601(g) of the Social Security Amendments of 1983 (Pub. L. 98–21) designated hospitals in certain New England counties as belonging to the adjacent urban area. Therefore, for purposes of the IPPS and the LTCH PPS, we will continue to classify these hospitals as urban hospitals.

The provisions of section 231 of Public Law 114–113, for which we are setting forth in this final rule, by definition affect rural LTCHs that qualify, and will result in an increase in payment for those qualifying LTCHs' discharges that meet the definition of a severe wound. However, as discussed in the April 21, 2016 IFC and as previously discussed in this section, based on the data currently available, we estimate there are only two LTCHs that currently meet the criteria. Therefore, we do not believe that the provisions of section 231 of Public Law 114–113 set forth in this final rule will have a significant impact on the operations of a substantial number of small rural LTCHs.

Section 202 of the Unfunded Mandates Reform Act of 1995 also requires that agencies assess anticipated costs and benefits before issuing any rule whose mandates require spending in any 1 year of $100 million in 1995 dollars, updated annually for inflation. In 2016, that threshold is approximately $146 million. The April 21, 2016 IFC did not, and this final rule will not, have any consequential effect on State, local, or tribal governments, nor will they affect private sector costs.

Executive Order 13132 establishes certain requirements that an agency must meet when it promulgates a final rule that imposes substantial direct requirement costs on state and local governments, preempts state law, or otherwise has Federalism implications. Because the IFC and this final rule do not impose any costs on State or local governments, the requirements of Executive Order 13132 are not applicable.

In accordance with the provisions of Executive Order 12866, the April 21, 2016 IFC and this final rule were reviewed by the Office of Management and Budget.

C. Medicare Severity Long-Term Care Diagnosis-Related Group (MS–LTC–DRG) Classifications and Relative Weights for FY 2017

1. Background

Section 123 of the BBRA required that the Secretary implement a PPS for LTCHs to replace the cost-based payment system under TEFRA. Section 307(b)(1) of the BIPA modified the requirements of section 123 of the BBRA by requiring that the Secretary examine the feasibility and the impact of basing payment under the LTCH PPS on the use of existing (or refined) hospital DRGs that have been modified to account for different resource use of LTCH patients.

When the LTCH PPS was implemented for cost reporting periods beginning on or after October 1, 2002, we adopted the same DRG patient classification system utilized at that time under the IPPS. As a component of the LTCH PPS, we refer to this patient classification system as the ''long-term care diagnosis-related groups (LTC–DRGs).'' Although the patient classification system used under both the LTCH PPS and the IPPS are the same, the relative weights are different. The established relative weight methodology and data used under the LTCH PPS result in relative weights under the LTCH PPS that reflect the differences in patient resource use of LTCH patients, consistent with section 123(a)(1) of the BBRA (Pub. L. 106–113).

As part of our efforts to better recognize severity of illness among patients, in the FY 2008 IPPS final rule with comment period (72 FR 47130), the MS–DRGs and the Medicare severity long-term care diagnosis-related groups (MS–LTC–DRGs) were adopted under the IPPS and the LTCH PPS, respectively, effective beginning October 1, 2007 (FY 2008). For a full description of the development, implementation, and rationale for the use of the MS–DRGs and MS–LTC–DRGs, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47141 through 47175 and 47277 through 47299). (We note that, in that same final rule, we revised the regulations at § 412.503 to specify that for LTCH discharges occurring on or after October 1, 2007, when applying the provisions of 42 CFR part 412, subpart O applicable to LTCHs for policy descriptions and payment calculations, all references to LTC–DRGs would be considered a reference to MS–LTC–DRGs. For the remainder of this section, we present the discussion in terms of the current MS–LTC–DRG patient classification system unless specifically referring to the previous LTC–DRG patient classification system that was in effect before October 1, 2007.)

The MS–DRGs adopted in FY 2008 represent an increase in the number of DRGs by 207 (that is, from 538 to 745) (72 FR 47171). The MS–DRG classifications are updated annually. There are currently 758 MS–DRG groupings. For FY 2017, there will be 757 MS–DRG groupings based on the changes discussed in section II.F. of the preamble of this final rule. Consistent with section 123 of the BBRA, as amended by section 307(b)(1) of the BIPA, and § 412.515 of the regulations, we use information derived from LTCH PPS patient records to classify LTCH discharges into distinct MS–LTC–DRGs based on clinical characteristics and estimated resource needs. We then assign an appropriate weight to the MS–LTC–DRGs to account for the difference in resource use by patients exhibiting the case complexity and multiple

medical problems characteristic of LTCHs.

In this section of the final rule, we provide a general summary of our existing methodology for determining the FY 2017 MS–LTC–DRG relative weights under the LTCH PPS.

As we proposed, in this final rule, in general, for FY 2017, we are using our existing methodology to determine the MS–LTC–DRG relative weights (as discussed in greater detail in section VII.C.3. of the preamble of this final rule). As we established when we implemented the dual rate LTCH PPS payment structure codified under § 412.522, beginning with FY 2016, the annual recalibration of the MS–LTC–DRG relative weights are determined: (1) Using only data from available LTCH PPS claims that would have qualified for payment under the new LTCH PPS standard Federal payment rate if that rate were in effect when claims data from time periods before the dual rate LTCH PPS payment structure applies were used to calculate the relative weights; and (2) using only data from available LTCH PPS claims that qualify for payment under the new LTCH PPS standard Federal payment rate when claims data from time periods after the dual rate LTCH PPS payment structure applies are used to calculate the relative weights (80 FR 49624). That is, under our current methodology, the MS–LTC–DRG relative weights are not used to determine the LTCH PPS payment for cases paid at the site neutral payment rate under § 412.522(c)(1) and data from cases paid at the site neutral payment rate or that would have been paid at the site neutral payment rate if the dual rate LTCH PPS payment structure had been in effect are not used to develop the relative weights. For the remainder of this discussion, we use the phrase ''applicable LTCH cases'' or ''applicable LTCH data'' when referring to the resulting claims data set used to calculate the relative weights (as described later in greater detail in section VII.C.3.c. of the preamble of this final rule). In addition, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25145), we proposed to continue to exclude the data from all-inclusive rate providers and LTCHs paid in accordance with demonstration projects, as well as any Medicare Advantage claims from the MS–LTC–DRG relative weight calculations for the reasons discussed in section VII.C.3.c. of the preamble of the proposed rule.

Furthermore, for FY 2017, in using data from applicable LTCH cases to establish proposed MS–LTC–DRG relative weights, we proposed to continue to establish low-volume MS–LTC–DRGs (that is, MS–LTC–DRGs with less than 25 cases) using our quintile methodology in determining the MS–LTC–DRG relative weights because LTCHs do not typically treat the full range of diagnoses as do acute care hospitals. Therefore, for purposes of determining the relative weights for the large number of low-volume MS–LTC–DRGs, we proposed to group all of the low-volume MS–LTC–DRGs into five quintiles based on average charges per discharge. Then, under our existing methodology, we proposed to account for adjustments made to LTCH PPS standard Federal payments for short-stay outlier (SSO) cases (that is, cases where the covered length of stay at the LTCH is less than or equal to five-sixths of the geometric average length of stay for the MS–LTC–DRG), and to make adjustments to account for nonmonotonically increasing weights, when necessary. The methodology is premised on more severe cases under the MS–LTC–DRG system requiring greater expenditure of medical care resources and higher average charges such that, in the severity levels within a base MS–LTC–DRG, the relative weights should increase monotonically with severity from the lowest to highest severity level. (We discuss each of these components of our MS–LTC–DRG relative weight methodology in greater detail in section VII.C.3.g. of the preamble of this final rule.)

Comment: A few commenters expressed concern that a number of MS–LTC–DRGs that historically have the greatest number of LTCH standard Federal rate cases each year would have lower weights for FY 2017 relative to the weights they had in prior fiscal years. The commenters believed this is counterintuitive because they expect relative weights for those MS–LTC–DRGs to increase because they have the largest number of LTCH cases and LTCH discharges are concentrated in a relatively small number of MS–LTC–DRGs. These commenters recommended that CMS analyze and report on the decreasing trend in the relative weights for high-volume MS–LTC–DRGs.

Response: We agree with the commenters that LTCH discharges are concentrated in a relatively small number of MS–LTC–DRGs, and as LTCHs gain experience under the new dual rate LTCH PPS payment structure, the concentration of cases grouped to those ''high volume'' MS–LTC–DRGs will increase based on the types of LTCH PPS standard Federal payment rate cases LTCHs treat under the new statutory patient criteria. However, we disagree with the commenters that there is a direct relationship between an increase in the number of cases in an MS–LTC–DRG and the annual change in the relative weights after recalibration. As provided under § 412.515, each MS–LTC–DRG, is assigned an appropriate weight that reflects the estimated relative cost of hospital resources used within that group compared to discharges classified within other groups. Furthermore, § 412.517(a) requires that the MS–LTC–DRG classifications and weighting factors are adjusted annually to reflect changes in treatment patterns; technology; number of discharges; and other factors affecting the relative use of hospital resources. The MS–LTC–DRG relative weights are designed to reflect the average of resources used to treat representative cases of the discharges within each MS–LTC–DRG. In general, the MS–LTC–DRG relative weights are determined by dividing the average charge for each MS–LTC–DRG by the average charge across all MS–LTC–DRGs. Accordingly, those MS–LTC–DRGs with an increase in average charge of less than the increase in average charge across all MS–LTC–DRGs will experience a reduction in their relative weight because the average charge for each of those MS–LTC–DRGs is being divided by a larger number (that is, the average charge across all MS–LTC–DRGs). (Similarly, MS–LTC–DRGs with an increase in average charge of more than the increase in average charge across all MS–LTC–DRGs will experience an increase in their relative weight because the average charge for each of those MS–LTC–DRGs is being divided by a smaller number.) (70 FR 47335)

In light of the commenters' concern, we reviewed the FY 2015 LTCH claims data used for the proposed rule and found that the average charge for the ''high volume'' MS–LTC–DRGs noted by commenters are increasing between the proposed FY 2017 relative weights as compared to the FY 2016 relative weights. However, many of these MS–LTC–DRGs experienced an increase in average charge that was less than the overall increase in the average charge for all MS–LTC–DRGs. For example, MS–LTC–DRG 207 showed an increase in average charge of 6.6 percent. However, the overall average charge for all MS–LTC–DRGs increased by over 7.5 percent. Thus, because the average charge for MS–LTC–DRG 207 increased less as compared to the increase in the overall average charge, the proposed relative weight for FY 2017 decreased a small amount (approximately 0.7 percent). The comparison of the average charge for an MS–LTC–DRGs to the average charge of all MS–LTC–DRGs

reflects the resources (and costs) used by LTCHs to treat patients in a given MS–LTC–DRG relative to the resources (and costs) used by LTCHs to treat all patients. When updated LTCH claims data for a particular MS–LTC–DRG show either an increase in the average charge of the MS–LTC–DRG that is less than the overall increase in the average charge across all MS–LTC–DRGs or a decrease in the average charge of a particular MS–LTC–DRG, we believe that the decrease in the relative weights for such MS–LTC–DRGs is appropriate because the updated LTCH claims data reflect more recent changes in treatment patterns, technology, number of discharges, and other factors affecting the relative use of hospital resources.

Comment: One commenter questioned the use of the historical LTCH claims data in the ratesetting methodology, including calculation of the MS–LTC–DRG relative weights, given that these data precede the revised dual rate LTCH PPS payment structure.

Response: As we discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49615), we solicited stakeholder input during the FY 2015 rulemaking cycle regarding the calculation of the MS–LTC–DRG relative payment weights under the new dual rate statutory LTCH PPS payment structure. Most commenters recommended that the MS–LTC–DRG relative weights under the new statutory structure should be calculated using only the data from cases that meet the statutory patient-level criteria for exclusion from the site neutral payment rate (or cases that would have qualified for exclusion had the dual rate LTCH PPS payment structure been in effect at the time of discharge). As we discussed in that same final rule, we believe that the costs and resource use for cases paid at the site neutral payment rate in the future may be lower on average than the costs and resource use for LTCH cases in our historical data that would have been paid at the site neutral payment rate if the statutory changes were in place when the discharges occurred, even if the proportion of site neutral payment rate cases in future data remains similar to the historical data. Therefore, we believe that the MS–LTC–DRG relative weights could become distorted over time and could also lead to less stability in the MS–LTC–DRG relative weights. For these reasons, we established our methodology for calculating the FY 2016 MS–LTC–DRG relative weights under the new dual rate LTCH PPS payment structure using only data from cases that would have been LTCH PPS standard Federal payment rate cases had the new LTCH PPS statutory patient-level criteria been in effect at the time of the discharge (80 FR 49615). We proposed to continue to employ this approach to calculate the FY 2017 MS–LTC–DRG relative weights because we continue to believe that computing the MS–LTC–DRG relative weights using only data from LTCH PPS cases that are (or would have been) paid the LTCH PPS standard Federal payment rate will result in the most appropriate payments under LTCH PPS.

After consideration of the public comments we received, we are finalizing our proposals for calculating the MS–LTC–DRG relative weights for FY 2017, without modification.

2. Patient Classifications Into MS–LTC–DRGs

a. Background

The MS–DRGs (used under the IPPS) and the MS–LTC–DRGs (used under the LTCH PPS) are based on the CMS DRG structure. As noted previously in this section, we refer to the DRGs under the LTCH PPS as MS–LTC–DRGs although they are structurally identical to the MS–DRGs used under the IPPS.

The MS–DRGs are organized into 25 major diagnostic categories (MDCs), most of which are based on a particular organ system of the body; the remainder involve multiple organ systems (such as MDC 22, Burns). Within most MDCs, cases are then divided into surgical DRGs and medical DRGs. Surgical DRGs are assigned based on a surgical hierarchy that orders operating room (O.R.) procedures or groups of O.R. procedures by resource intensity. The GROUPER software program does not recognize all ICD–10–PCS procedure codes as procedures affecting DRG assignment. That is, procedures that are not surgical (for example, EKGs), or minor surgical procedures (for example, a biopsy of skin and subcutaneous tissue (procedure code 86.11)) do not affect the MS–LTC–DRG assignment based on their presence on the claim.

Generally, under the LTCH PPS, a Medicare payment is made at a predetermined specific rate for each discharge that varies based on the MS–LTC–DRG to which a beneficiary's discharge is assigned. Cases are classified into MS–LTC–DRGs for payment based on the following six data elements:

- Principal diagnosis;
- Additional or secondary diagnoses;
- Surgical procedures;
- Age;
- Sex; and
- Discharge status of the patient.

Currently, for claims submitted on the 5010 format, up to 25 diagnosis codes and 25 procedure codes are considered for an MS–DRG assignment. This includes one principal diagnosis and up to 24 secondary diagnoses for severity of illness determinations. (For additional information on the processing of up to 25 diagnosis codes and 25 procedure codes on hospital inpatient claims, we refer readers to section II.G.11.c. of the preamble of the FY 2011 IPPS/LTCH PPS final rule (75 FR 50127).)

Under HIPAA transactions and code sets regulations at 45 CFR parts 160 and 162, covered entities must comply with the adopted transaction standards and operating rules specified in Subparts I through S of Part 162. Among other requirements, by January 1, 2012, covered entities were required to use the ASC X12 Standards for Electronic Data Interchange Technical Report Type 3—Health Care Claim: Institutional (837), May 2006, ASC X12N/005010X223, and Type 1 Errata to Health Care Claim: Institutional (837) ASC X12 Standards for Electronic Data Interchange Technical Report Type 3, October 2007, ASC X12N/005010X233A1 for the health care claims or equivalent encounter information transaction (45 CFR 162.1102(c)).

HIPAA requires covered entities to use the applicable medical data code set requirements when conducting HIPAA transactions (45 CFR 162.1000). Currently, upon the discharge of the patient, the LTCH must assign appropriate diagnosis and procedure codes from the most current version of the Internal Classification of Diseases, 10th Revision, Clinical Modification (ICD–10–CM) for diagnosis coding and the International Classification of Diseases, 10th Revision, Procedure Coding System (ICD–10–PCS) for inpatient hospital procedure coding, both of which were required to be implemented October 1, 2015 (45 CFR 162.1002(c)(2) and (3)). For additional information on the implementation of the ICD–10 coding system, we refer readers to section II.F.1. of the preamble of this final rule. Additional coding instructions and examples are published in the AHA's *Coding Clinic for ICD–10–CM/PCS.*

To create the MS–DRGs (and by extension, the MS–LTC–DRGs), base DRGs were subdivided according to the presence of specific secondary diagnoses designated as complications or comorbidities (CCs) into one, two, or three levels of severity, depending on the impact of the CCs on resources used for those cases. Specifically, there are sets of MS–DRGs that are split into 2 or 3 subgroups based on the presence or absence of a CC or a major complication or comorbidity (MCC). We refer readers

to section II.D. of the FY 2008 IPPS final rule with comment period for a detailed discussion about the creation of MS–DRGs based on severity of illness levels (72 FR 47141 through 47175).

MACs enter the clinical and demographic information submitted by LTCHs into their claims processing systems and subject this information to a series of automated screening processes called the Medicare Code Editor (MCE). These screens are designed to identify cases that require further review before assignment into a MS–LTC–DRG can be made. During this process, certain cases are selected for further development (74 FR 43949).

After screening through the MCE, each claim is classified into the appropriate MS–LTC–DRG by the Medicare LTCH GROUPER software on the basis of diagnosis and procedure codes and other demographic information (age, sex, and discharge status). The GROUPER software used under the LTCH PPS is the same GROUPER software program used under the IPPS. Following the MS–LTC–DRG assignment, the Medicare contractor determines the prospective payment amount by using the Medicare PRICER program, which accounts for hospital-specific adjustments. Under the LTCH PPS, we provide an opportunity for LTCHs to review the MS–LTC–DRG assignments made by the MAC and to submit additional information within a specified timeframe as provided in § 412.513(c).

The GROUPER software is used both to classify past cases to measure relative hospital resource consumption to establish the MS–LTC–DRG relative weights and to classify current cases for purposes of determining payment. The records for all Medicare hospital inpatient discharges are maintained in the MedPAR file. The data in this file are used to evaluate possible MS–DRG and MS–LTC–DRG classification changes and to recalibrate the MS–DRG and MS–LTC–DRG relative weights during our annual update under both the IPPS (§ 412.60(e)) and the LTCH PPS (§ 412.517), respectively.

b. Changes to the MS–LTC–DRGs for FY 2017

As specified by our regulations at § 412.517(a), which require that the MS–LTC–DRG classifications and relative weights be updated annually, and consistent with our historical practice of using the same patient classification system under the LTCH PPS as is used under the IPPS, in the FY 2017 IPPS/LTCH PPS proposed rule, we proposed to update the MS–LTC–DRG classifications effective October 1, 2016, through September 30, 2017 (FY 2017), consistent with the proposed changes to specific MS–DRG classifications presented in section II.F. of the preamble of the proposed rule (81 FR 25146). Accordingly, the MS–LTC–DRGs for FY 2017 presented in the proposed rule and this final rule are the same as the MS–DRGs that will be used under the IPPS for FY 2017. In addition, because the MS–LTC–DRGs for FY 2017 are the same as the MS–DRGs for FY 2017, the other changes that affect MS–DRG (and by extension MS–LTC–DRG) assignments under GROUPER Version 34 as discussed in section II.G. of the preamble of this final rule, including the changes to the MCE software and the ICD–10–CM/PCS coding system, also will be applicable under the LTCH PPS for FY 2017. (We note the GROUPER Version 34 is based on ICD–10–CM/PCS diagnoses and procedure codes, consistent with the requirement to use ICD–10 beginning October 1, 2015.)

3. Development of the FY 2017 MS–LTC–DRG Relative Weights

a. General Overview of the Development of the MS–LTC–DRG Relative Weights

One of the primary goals for the implementation of the LTCH PPS is to pay each LTCH an appropriate amount for the efficient delivery of medical care to Medicare patients. The system must be able to account adequately for each LTCH's case-mix in order to ensure both fair distribution of Medicare payments and access to adequate care for those Medicare patients whose care is more costly (67 FR 55984). To accomplish these goals, we have annually adjusted the LTCH PPS standard Federal prospective payment system rate by the applicable relative weight in determining payment to LTCHs for each case. In order to make these annual adjustments under the dual rate LTCH PPS payment structure, beginning with FY 2016, we recalibrate the MS–LTC–DRG relative weighting factors annually using data from applicable LTCH cases (80 FR 49614 through 49617). Under this policy, the resulting MS–LTC–DRG relative weights would continue to be used to adjust the LTCH PPS standard Federal payment rate when calculating the payment for LTCH PPS standard Federal payment rate cases.

The established methodology to develop the MS–LTC–DRG relative weights is generally consistent with the methodology established when the LTCH PPS was implemented in the August 30, 2002 LTCH PPS final rule (67 FR 55989 through 55991). However, there have been some modifications of our historical procedures for assigning relative weights in cases of zero volume and/or nonmonotonicity resulting from the adoption of the MS–LTC–DRGs, along with the change made in conjunction with the implementation of the dual rate LTCH PPS payment structure beginning in FY 2016 to use LTCH claims data from only LTCH PPS standard Federal payment rate cases (or LTCH PPS cases that would have qualified for payment under the LTCH PPS standard Federal payment rate if the dual rate LTCH PPS payment structure were in effect at the time of the discharge). (For details on the modifications to our historical procedures for assigning relative weights in cases of zero volume and/or nonmonotonicity, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47289 through 47295) and the FY 2009 IPPS final rule (73 FR 48542 through 48550).) For details on the change in our historical methodology to use LTCH claims data only from LTCH PPS standard Federal payment rate cases to determine the MS–LTC–DRG relative weights, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49614 through 49617). Under the LTCH PPS, relative weights for each MS–LTC–DRG are a primary element used to account for the variations in cost per discharge and resource utilization among the payment groups (§ 412.515). To ensure that Medicare patients classified to each MS–LTC–DRG have access to an appropriate level of services and to encourage efficiency, we calculate a relative weight for each MS–LTC–DRG that represents the resources needed by an average inpatient LTCH case in that MS–LTC–DRG. For example, cases in an MS–LTC–DRG with a relative weight of 2 would, on average, cost twice as much to treat as cases in an MS–LTC–DRG with a relative weight of 1.

b. Development of the MS–LTC–DRG Relative Weights for FY 2017

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49625 through 49634), we presented our policies for the development of the MS–LTC–DRG relative weights for FY 2016.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25147), we proposed to continue to use our current methodology to determine the MS–LTC–DRG relative weights for FY 2017, including the application of established policies related to: The hospital-specific relative value methodology, the treatment of severity levels in the MS–LTC–DRGs, low-volume and no-volume MS–LTC–DRGs, adjustments for nonmonotonicity, the steps for calculating the MS–LTC–DRG relative

weights with a budget neutrality factor, and only using data from applicable LTCH cases (which includes our policy of only using cases that would meet the criteria for exclusion from the site neutral payment rate (or, for discharges occurring prior to the implementation of the dual rate LTCH PPS payment structure, would have met the criteria for exclusion had those criteria been in effect at the time of the discharge)).

In this section, we present our methodology for determining the MS–LTC–DRG relative weights for FY 2017, and we discuss the effects of our policies concerning the data used to determine the FY 2017 MS–LTC–DRG relative weights on the various components of our existing methodology in the discussion that follows.

c. Data

For this final rule, consistent with our proposals regarding the calculation of the MS–LTC–DRG relative weights for FY 2017, we obtained total charges from FY 2015 Medicare LTCH claims data from the March 2016 update of the FY 2015 MedPAR file, which are the best available data at this time, and we are using Version 34 of the GROUPER to classify LTCH cases. Consistent with our historical practice, we used those data and the Version 34 of the MS–LTC–DRGs in establishing the FY 2017 MS–LTC–DRG relative weights in this final rule. To calculate the FY 2017 MS–LTC–DRG relative weights under the dual rate LTCH PPS payment structure, as we proposed, we are continuing to use applicable LTCH data, which includes our policy of only using cases that meet the criteria for exclusion from the site neutral payment rate (or would have met the criteria had they been in effect at the time of the discharge) (80 FR 49624). Specifically, we began by first evaluating the LTCH claims data in the March 2016 update of the FY 2015 MedPAR file to determine which LTCH cases would meet the criteria for exclusion from the site neutral payment rate under § 412.522(b) had the dual rate LTCH PPS payment structure been in effect at the time of discharge. We identified the FY 2015 LTCH cases that were not assigned to MS–LTC–DRGs 876, 880, 881, 882, 883, 884, 885, 886, 887, 894, 895, 896, 897, 945 and 946, which identify LTCH cases that do not have a principal diagnosis relating to a psychiatric diagnosis or to rehabilitation; and that either—

- The admission to the LTCH was ''immediately preceded'' by discharge from a subsection (d) hospital and the immediately preceding stay in that subsection (d) hospital included at least 3 days in an ICU, as we define under the ICU criterion; or
- The admission to the LTCH was ''immediately preceded'' by discharge from a subsection (d) hospital and the claim for the LTCH discharge includes the applicable procedure code that indicates at least 96 hours of ventilator services were provided during the LTCH stay, as we define under the ventilator criterion. Claims data from the FY 2015 MedPAR file that reported ICD–9–CM procedure code 96.72 were used to identify cases involving at least 96 hours of ventilator services in accordance with the ventilator criterion (as FY 2015 discharges occurred prior to the adoption of ICD–10–CM/PCS). (We note that the corresponding ICD–10–PCS code for cases involving at least 96 hours of ventilation services is 5A1955Z, effective October 1, 2016) (80 FR 49626 through 49627). We note that, for purposes of developing the FY 2017 MS–LTC–DRG relative weights using our current methodology, we did not make any proposals regarding the identification of cases that would have been excluded from the site neutral payment rate under the statutory provision that provided for temporary exception from the site neutral payment rate under the LTCH PPS for certain severe wound care discharges from certain LTCHs provided by Public Law 114–113, had our implementation of that law and the dual rate LTCH PPS payment structure been in effect at the time of the discharge. At this time, it is uncertain how many LTCHs and how many cases in the claims data we are using for this final rule would have met the criteria to be excluded from the site neutral payment rate under that exception (had the dual rate LTCH PPS payment structure been in effect at the time of the discharge). Therefore, for the remainder of this section, when we refer to LTCH claims only from cases that meet the criteria for exclusion from the site neutral payment rate (or would have met the criteria had the applicable statutes been in effect at the time of the discharge), such data do not include any discharges that would have been paid based on the LTCH PPS standard Federal payment rate under the provisions of section 231 of Public Law 114–113, had the exception been in effect at the time of the discharge.

Furthermore, consistent with our historical methodology, as we proposed, we are excluding any claims in the resulting data set that were submitted by LTCHs that are all-inclusive rate providers and LTCHs that are reimbursed in accordance with demonstration projects authorized under section 402(a) of Public Law 90–248 or section 222(a) of Public Law 92–603. In addition, consistent with our historical practice and our proposals, we are excluding any Medicare Advantage (Part C) claims in the resulting data. Such claims were identified based on the presence of a GHO Paid indicator value of ''1'' in the MedPAR files. The claims that remained after these three trims (that is, the applicable LTCH data) were then used to calculate the MS–LTC–DRG relative weights for FY 2017.

In summary, in general, we identified the claims data used in the development of the FY 2017 MS–LTC–DRG relative weights in this final rule, as we proposed, by trimming claims data that would have been paid the site neutral rate had the dual payment rate structure been in effect (except for discharges which would have been excluded from the site neutral payment under the temporary exception for certain severe wound care discharges from certain LTCHs), as well as the claims data of 10 all-inclusive rate providers reported in the March 2016 update of the FY 2015 MedPAR file and any Medicare Advantage claims data. (We note that there were no data from any LTCHs that are paid in accordance with a demonstration project reported in the March 2016 update of the FY 2015 MedPAR file. However, had there been we would trim the claims data from those LTCHs as well, in accordance with our established policy.) We used the remaining data (that is, the applicable LTCH data) to calculate the relative weights for FY 2017.

d. Hospital-Specific Relative Value (HSRV) Methodology

By nature, LTCHs often specialize in certain areas, such as ventilator-dependent patients. Some case types (MS–LTC–DRGs) may be treated, to a large extent, in hospitals that have, from a perspective of charges, relatively high (or low) charges. This nonrandom distribution of cases with relatively high (or low) charges in specific MS–LTC–DRGs has the potential to inappropriately distort the measure of average charges. To account for the fact that cases may not be randomly distributed across LTCHs, consistent with the methodology we have used since the implementation of the LTCH PPS, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25148), we proposed to continue to use a hospital-specific relative value (HSRV) methodology to calculate the MS–LTC–DRG relative weights for FY 2017. We believe that this method removes this hospital-specific source of bias in measuring LTCH average charges (67 FR

55985). Specifically, under this methodology, we reduced the impact of the variation in charges across providers on any particular MS–LTC–DRG relative weight by converting each LTCH's charge for an applicable LTCH case to a relative value based on that LTCH's average charge for such cases.

Under the HSRV methodology, we standardize charges for each LTCH by converting its charges for each applicable LTCH case to hospital-specific relative charge values and then adjusting those values for the LTCH's case-mix. The adjustment for case-mix is needed to rescale the hospital-specific relative charge values (which, by definition, average 1.0 for each LTCH). The average relative weight for an LTCH is its case-mix; therefore, it is reasonable to scale each LTCH's average relative charge value by its case-mix. In this way, each LTCH's relative charge value is adjusted by its case-mix to an average that reflects the complexity of the applicable LTCH cases it treats relative to the complexity of the applicable LTCH cases treated by all other LTCHs (the average LTCH PPS case-mix of all applicable LTCH cases across all LTCHs).

In accordance with our established methodology, for FY 2017, as we proposed, we are continuing to standardize charges for each applicable LTCH case by first dividing the adjusted charge for the case (adjusted for SSOs under § 412.529 as described in section VII.C.3.g. (Step 3) of the preamble of this final rule) by the average adjusted charge for all applicable LTCH cases at the LTCH in which the case was treated. SSO cases are cases with a length of stay that is less than or equal to five-sixths the average length of stay of the MS–LTC–DRG (§ 412.529 and § 412.503). The average adjusted charge reflects the average intensity of the health care services delivered by a particular LTCH and the average cost level of that LTCH. The resulting ratio was multiplied by that LTCH's case-mix index to determine the standardized charge for the case.

Multiplying the resulting ratio by the LTCH's case-mix index accounts for the fact that the same relative charges are given greater weight at an LTCH with higher average costs than they would at a LTCH with low average costs, which is needed to adjust each LTCH's relative charge value to reflect its case-mix relative to the average case-mix for all LTCHs. By standardizing charges in this manner, we count charges for a Medicare patient at an LTCH with high average charges as less resource intensive than they would be at an LTCH with low average charges. For example, a $10,000 charge for a case at an LTCH with an average adjusted charge of $17,500 reflects a higher level of relative resource use than a $10,000 charge for a case at an LTCH with the same case-mix, but an average adjusted charge of $35,000. We believe that the adjusted charge of an individual case more accurately reflects actual resource use for an individual LTCH because the variation in charges due to systematic differences in the markup of charges among LTCHs is taken into account.

e. Treatment of Severity Levels in Developing the MS–LTC–DRG Relative Weights

For purposes of determining the MS–LTC–DRG relative weights, under our historical methodology, there are three different categories of MS–DRGs based on volume of cases within specific MS–LTC–DRGs: (1) MS–LTC–DRGs with at least 25 applicable LTCH cases in the data used to calculate the relative weight, which are each assigned a unique relative weight; (2) low-volume MS–LTC–DRGs (that is, MS–LTC–DRGs that contain between 1 and 24 applicable LTCH cases that are grouped into quintiles (as described later in this section of the proposed rule) and assigned the relative weight of the quintile); and (3) no-volume MS–LTC–DRGs that are cross-walked to other MS–LTC–DRGs based on the clinical similarities and assigned the relative weight of the cross-walked MS–LTC–DRG (as described in greater detail below). For FY 2017, we proposed to continue to use applicable LTCH cases to establish the same volume-based categories to calculate the FY 2017 MS–LTC–DRG relative weights (81 FR 25148).

In determining the FY 2017 MS–LTC–DRG relative weights, when necessary, as we proposed, we made adjustments to account for nonmonotonicity, as discussed in greater detail later in Step 6 of section VII.C.3.g. of the preamble of this final rule. We refer readers to the discussion in the FY 2010 IPPS/RY 2010 LTCH PPS final rule for our rationale for including an adjustment for nonmonotonicity (74 FR 43953 through 43954).

f. Low-Volume MS–LTC–DRGs

In order to account for MS–LTC–DRGs with low-volume (that is, with fewer than 25 applicable LTCH cases), consistent with our existing methodology, we proposed to continue to employ the quintile methodology for low-volume MS–LTC–DRGs, such that we grouped the ''low-volume MS–LTC–DRGs'' (that is, MS–LTC–DRGs that contained between 1 and 24 applicable LTCH cases into one of five categories (quintiles) based on average charges (67 FR 55984 through 55995; 72 FR 47283 through 47288; and 81 FR 25148)). In cases where the initial assignment of a low-volume MS–LTC–DRG to a quintile resulted in nonmonotonicity within a base-DRG, as we proposed, we make adjustments to the resulting low-volume MS–LTC–DRGs to preserve monotonicity, as discussed in detail in section VII.C.3.g. (Step 6) of the preamble of this final rule.

In this final rule, based on the best available data (that is, the March 2016 update of the FY 2015 MedPAR files), we identified 261 MS–LTC–DRGs that contained between 1 and 24 applicable LTCH cases. This list of MS–LTC–DRGs was then divided into one of the 5 low-volume quintiles, each containing 52 MS–LTC–DRGs (260/5 = 52). We assigned the low-volume MS–LTC–DRGs to specific low-volume quintiles by sorting the low-volume MS–LTC–DRGs in ascending order by average charge in accordance with our established methodology. Based on the data available for the proposed rule, the number of MS–LTC–DRGs with less than 25 applicable LTCH cases was not evenly divisible by 5 and, therefore, as proposed, we employed our historical methodology for determining which of the low-volume quintiles contain the additional low-volume MS–LTC–DRG. However, based on the data available for this final rule, the number of MS–LTC–DRGs with less than 25 applicable LTCH cases is evenly divisible by 5. Therefore, we no longer need to employ our historical methodology for determining which of the low-volume quintiles contain the additional low-volume MS–LTC–DRG. Specifically, for this final rule, after organizing the MS–LTC–DRGs by ascending order by average charge, we assigned the first 52 (1st through 52nd) of low-volume MS–LTC–DRGs (with the lowest average charge) into Quintile 1. The 52 MS–LTC–DRGs with the highest average charge cases were assigned into Quintile 5. This results in each of the 5 low-volume quintiles containing 52 MS–LTC–DRGs. Table 13A, listed in section VI. of the Addendum to this final rule and available via the Internet on the CMS Web site, lists the composition of the low-volume quintiles for MS–LTC–DRGs for FY 2017.

In order to determine the FY 2017 relative weights for the low-volume MS–LTC–DRGs, we used the five low-volume quintiles described previously. We determined a relative weight and (geometric) average length of stay for each of the five low-volume quintiles using the methodology described in

section VII.C.3.g. of the preamble of this final rule. We assigned the same relative weight and average length of stay to each of the low-volume MS–LTC–DRGs that make up an individual low-volume quintile. We note that, as this system is dynamic, it is possible that the number and specific type of MS–LTC–DRGs with a low-volume of applicable LTCH cases will vary in the future. Furthermore, we note that we continue to monitor the volume (that is, the number of applicable LTCH cases) in the low-volume quintiles to ensure that our quintile assignments used in determining the MS–LTC–DRG relative weights result in appropriate payment for LTCH cases grouped to low-volume MS–LTC–DRGs and do not result in an unintended financial incentive for LTCHs to inappropriately admit these types of cases.

g. Steps for Determining the FY 2017 MS–LTC–DRG Relative Weights

In this final rule, as we proposed, we are continuing to use our current methodology to determine the FY 2017 MS–LTC–DRG relative weights.

In summary, to determine the FY 2017 MS–LTC–DRG relative weights, we grouped applicable LTCH cases to the appropriate MS–LTC–DRG, while taking into account the low-volume quintiles (as described above) and cross-walked no-volume MS–LTC–DRGs (as described later in this section). After establishing the appropriate MS–LTC–DRG (or low-volume quintile), as proposed, we calculated the FY 2017 relative weights by first removing cases with a length of stay of 7 days or less and statistical outliers (Steps 1 and 2 below). Next, as we proposed, we adjusted the number of applicable LTCH cases in each MS–LTC–DRG (or low-volume quintile) for the effect of SSO cases (Step 3 below). After removing applicable LTCH cases with a length of stay of 7 days or less (Step 1 below) and statistical outliers (Step 2 below), which are the SSO-adjusted applicable LTCH cases and corresponding charges (step 3 below), as proposed, we calculated ''relative adjusted weights'' for each MS–LTC–DRG (or low-volume quintile) using the HSRV method.

Step 1—Remove cases with a length of stay of 7 days or less.

The first step in our calculation of the FY 2017 MS–LTC–DRG relative weights is to remove cases with a length of stay of 7 days or less. The MS–LTC–DRG relative weights reflect the average of resources used on representative cases of a specific type. Generally, cases with a length of stay of 7 days or less do not belong in an LTCH because these stays do not fully receive or benefit from treatment that is typical in an LTCH stay, and full resources are often not used in the earlier stages of admission to an LTCH. If we were to include stays of 7 days or less in the computation of the proposed FY 2017 MS–LTC–DRG relative weights, the value of many relative weights would decrease and, therefore, payments would decrease to a level that may no longer be appropriate. We do not believe that it would be appropriate to compromise the integrity of the payment determination for those LTCH cases that actually benefit from and receive a full course of treatment at an LTCH by including data from these very short stays. Therefore, consistent with our existing relative weight methodology and as proposed, in determining the FY 2017 MS–LTC–DRG relative weights, we removed LTCH cases with a length of stay of 7 days or less from applicable LTCH cases. (For additional information on what is removed in this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 2—Remove statistical outliers.

The next step in our calculation of the FY 2017 MS–LTC–DRG relative weights is to remove statistical outlier cases from the LTCH cases with a length of stay of at least 8 days. Consistent with our existing relative weight methodology, as we proposed, we are continuing to define statistical outliers as cases that are outside of 3.0 standard deviations from the mean of the log distribution of both charges per case and the charges per day for each MS–LTC–DRG. These statistical outliers are removed prior to calculating the relative weights because we believe that they may represent aberrations in the data that distort the measure of average resource use. Including those LTCH cases in the calculation of the relative weights could result in an inaccurate relative weight that does not truly reflect relative resource use among those MS–LTC–DRGs. (For additional information on what is removed in this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.) After removing cases with a length of stay of 7 days or less and statistical outliers, we are left with applicable LTCH cases that have a length of stay greater than or equal to 8 days. In this final rule, we refer to these cases as ''trimmed applicable LTCH cases.''

Step 3—Adjust charges for the effects of SSOs.

As the next step in the calculation of the FY 2017 MS–LTC–DRG relative weights, consistent with our historical approach and as we proposed, we adjusted each LTCH's charges per discharge for those remaining cases (that is, trimmed applicable LTCH cases) for the effects of SSOs (as defined in § 412.529(a) in conjunction with § 412.503). Specifically, we made this adjustment by counting an SSO case as a fraction of a discharge based on the ratio of the length of stay of the case to the average length of stay for the MS–LTC–DRG for non-SSO cases. This has the effect of proportionately reducing the impact of the lower charges for the SSO cases in calculating the average charge for the MS–LTC–DRG. This process produces the same result as if the actual charges per discharge of an SSO case were adjusted to what they would have been had the patient's length of stay been equal to the average length of stay of the MS–LTC–DRG.

Counting SSO cases as full LTCH cases with no adjustment in determining the FY 2017 MS–LTC–DRG relative weights would lower the FY 2017 MS–LTC–DRG relative weight for affected MS–LTC–DRGs because the relatively lower charges of the SSO cases would bring down the average charge for all cases within a MS–LTC–DRG. This would result in an ''underpayment'' for non-SSO cases and an ''overpayment'' for SSO cases. Therefore, as we proposed, we are continuing to adjust for SSO cases under § 412.529 in this manner because it will results in more appropriate payments for all LTCH PPS standard Federal payment rate cases. (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 4—Calculate the FY 2017 MS–LTC–DRG relative weights on an iterative basis.

Consistent with our historical relative weight methodology and as we proposed, we calculated the FY 2017 MS–LTC–DRG relative weights using the HSRV methodology, which is an iterative process. First, for each SSO-adjusted trimmed applicable LTCH case, we calculated a hospital-specific relative charge value by dividing the charge per discharge after adjusting for SSOs of the LTCH case (from Step 3) by the average charge per SSO-adjusted discharge for the LTCH in which the case occurred. The resulting ratio was then multiplied by the LTCH's case-mix index to produce an adjusted hospital-specific relative charge value for the case. We used an initial case-mix index value of 1.0 for each LTCH.

For each MS–LTC–DRG, we calculated the FY 2017 relative weight by dividing the SSO-adjusted average of the hospital-specific relative charge values for applicable LTCH cases for the

MS–LTC–DRG (that is, the sum of the hospital-specific relative charge value from above divided by the sum of equivalent cases from Step 3 for each MS–LTC–DRG) by the overall SSO-adjusted average hospital-specific relative charge value across all applicable LTCH cases for all LTCHs (that is, the sum of the hospital-specific relative charge value from above divided by the sum of equivalent applicable LTCH cases from Step 3 for each MS–LTC–DRG). Using these recalculated MS–LTC–DRG relative weights, each LTCH's average relative weight for all of its SSO-adjusted trimmed applicable LTCH cases (that is, its case-mix) was calculated by dividing the sum of all the LTCH's MS–LTC–DRG relative weights by its total number of SSO-adjusted trimmed applicable LTCH cases. The LTCHs' hospital-specific relative charge values (from previous) were then multiplied by the hospital-specific case-mix indexes. The hospital-specific case-mix adjusted relative charge values were then used to calculate a new set of MS–LTC–DRG relative weights across all LTCHs. This iterative process continued until there was convergence between the relative weights produced at adjacent steps, for example, when the maximum difference was less than 0.0001.

Step 5—Determine a FY 2017 relative weight for MS–LTC–DRGs with no applicable LTCH cases.

Using the trimmed applicable LTCH cases, consistent with our historical methodology and as we proposed, we identified the MS–LTC–DRGs for which there were no claims in the March 2016 update of the FY 2015 MedPAR file and, therefore, for which no charge data was available for these MS–LTC–DRGs. Because patients with a number of the diagnoses under those proposed MS–LTC–DRGs may be treated at LTCHs, consistent with our historical methodology, we generally assigned a relative weight to each of the no-volume MS–LTC–DRGs based on clinical similarity and relative costliness (with the exception of ''transplant'' MS–LTC–DRGs, ''error'' MS–LTC–DRGs, and MS–LTC–DRGs that indicate a principal diagnosis related to a psychiatric diagnosis or rehabilitation (referred to as the ''psychiatric or rehabilitation'' MS–LTC–DRGs), as discussed later in this section of the final rule). (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55991 and 74 FR 43959 through 43960.)

We cross-walked each no-volume MS–LTC–DRG to another MS–LTC–DRG for which we calculated a relative weight (determined in accordance with the methodology described above). Then, the ''no-volume'' MS–LTC–DRG was assigned the same relative weight (and average length of stay) of the MS–LTC–DRG to which it was cross-walked (as described in greater detail in this section of the final rule).

Of the 757 MS–LTC–DRGs for FY 2017, we identified 357 MS–LTC–DRGs for which there are no trimmed applicable LTCH cases (the number identified includes the 8 ''transplant'' MS–LTC–DRGs, the 2 ''error'' MS–LTC–DRGs, and the 15 ''psychiatric or rehabilitation'' MS–LTC–DRGs, which are discussed below). We assigned relative weights to each of the 357 no-volume MS–LTC–DRGs that contained trimmed applicable LTCH cases based on clinical similarity and relative costliness to 1 of the remaining 400 (757 − 357 = 400) MS–LTC–DRGs for which we calculated relative weights based on the trimmed applicable LTCH cases in the FY 2015 MedPAR file data using the steps described previously. (For the remainder of this discussion, we refer to the ''cross-walked'' MS–LTC–DRGs as the MS–LTC–DRGs to which we cross-walked 1 of the 334 ''no volume'' MS–LTC–DRGs.) Then, we generally assigned the 334 no-volume MS–LTC–DRGs the relative weight of the cross-walked MS–LTC–DRG. (As explained below in Step 6, when necessary, we made adjustments to account for nonmonotonicity.)

We cross-walked the no-volume MS–LTC–DRG to an MS–LTC–DRG for which we calculated relative weights based on the March 2016 update of the FY 2015 MedPAR file, and to which it is similar clinically in intensity of use of resources and relative costliness as determined by criteria such as care provided during the period of time surrounding surgery, surgical approach (if applicable), length of time of surgical procedure, postoperative care, and length of stay. (For more details on our process for evaluating relative costliness, we refer readers to the FY 2010 IPPS/RY 2010 LTCH PPS final rule (73 FR 48543).) We believe in the rare event that there would be a few LTCH cases grouped to one of the no-volume MS–LTC–DRGs in FY 2017, the relative weights assigned based on the cross-walked MS–LTC–DRGs will result in an appropriate LTCH PPS payment because the crosswalks, which are based on clinical similarity and relative costliness, are expected to generally require equivalent relative resource use.

We then assigned the relative weight of the cross-walked MS–LTC–DRG as the relative weight for the no-volume MS–LTC–DRG such that both of these MS–LTC–DRGs (that is, the no-volume MS–LTC–DRG and the cross-walked MS–LTC–DRG) have the same relative weight (and average length of stay) for FY 2017. We note that, if the cross-walked MS–LTC–DRG had 25 applicable LTCH cases or more, its relative weight (calculated using the methodology described in Steps 1 through 4 above) was assigned to the no-volume MS–LTC–DRG as well. Similarly, if the MS–LTC–DRG to which the no-volume MS–LTC–DRG was cross-walked had 24 or less cases and, therefore, was designated to 1 of the low-volume quintiles for purposes of determining the relative weights, we assigned the relative weight of the applicable low-volume quintile to the no-volume MS–LTC–DRG such that both of these MS–LTC–DRGs (that is, the no-volume MS–LTC–DRG and the cross-walked MS–LTC–DRG) have the same relative weight for FY 2017. (As we noted previously, in the infrequent case where nonmonotonicity involving a no-volume MS–LTC–DRG resulted, additional adjustments as described in Step 6 are required in order to maintain monotonically increasing relative weights.)

For this final rule, a list of the no-volume MS–LTC–DRGs and the MS–LTC–DRGs to which each was cross-walked (that is, the cross-walked MS–LTC–DRGs) for FY 2017 is shown in Table 13B, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS Web site.

To illustrate this methodology for determining the relative weights for the FY 2017 MS–LTC–DRGs with no applicable LTCH cases, we are providing the following example, which refers to the no-volume MS–LTC–DRGs crosswalk information for FY 2017 provided in Table 13B.

Example: There were no trimmed applicable LTCH cases in the FY 2015 MedPAR file that we are using for this final rule for MS–LTC–DRG 061 (Acute Ischemic Stroke with Use of Thrombolytic Agent with MCC). We determined that MS–LTC–DRG 070 (Nonspecific Cerebrovascular Disorders with MCC) is similar clinically and based on resource use to MS–LTC–DRG 061. Therefore, we assigned the same relative weight (and average length of stay) of MS–LTC–DRG 70 of 0.9098 for FY 2017 to MS–LTC–DRG 061 (we refer readers to Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS Web site).

Again, we note that, as this system is dynamic, it is entirely possible that the number of MS–LTC–DRGs with no volume will vary in the future.

Consistent with our historical practice, we used the most recent available claims data to identify the trimmed applicable LTCH cases from which we determined the relative weights in this final rule.

For FY 2017, consistent with our historical relative weight methodology and as we proposed, we are establishing a relative weight of 0.0000 for the following transplant MS–LTC–DRGs: Heart Transplant or Implant of Heart Assist System with MCC (MS–LTC–DRG 001); Heart Transplant or Implant of Heart Assist System without MCC (MS–LTC–DRG 002); Liver Transplant with MCC or Intestinal Transplant (MS–LTC–DRG 005); Liver Transplant without MCC (MS–LTC–DRG 006); Lung Transplant (MS–LTC–DRG 007); Simultaneous Pancreas/Kidney Transplant (MS–LTC–DRG 008); Pancreas Transplant (MS–LTC–DRG 010); and Kidney Transplant (MS–LTC–DRG 652). This is because Medicare only covers these procedures if they are performed at a hospital that has been certified for the specific procedures by Medicare and presently no LTCH has been so certified. At the present time, we include these eight transplant proposed MS–LTC–DRGs in the GROUPER program for administrative purposes only. Because we use the same GROUPER program for LTCHs as is used under the IPPS, removing these MS–LTC–DRGs would be administratively burdensome. (For additional information regarding our treatment of transplant MS–LTC–DRGs, we refer readers to the RY 2010 LTCH PPS final rule (74 FR 43964).) In addition, consistent with our historical policy and as we proposed, we are establishing a relative weight of 0.0000 for the 2 ''error'' MS–LTC–DRGs (that is, MS–LTC–DRG 998 (Principal Diagnosis Invalid as Discharge Diagnosis) and MS–LTC–DRG 999 (Ungroupable)) because applicable LTCH cases grouped to these MS–LTC–DRGs cannot be properly assigned to an MS–LTC–DRG according to the grouping logic.

In this final rule, for FY 2017, as we proposed, we are establishing a relative weight equal to the respective FY 2015 relative weight of the MS–LTC–DRGs for the following ''psychiatric or rehabilitation'' MS–LTC–DRGs: MS–LTC–DRG 876 (O.R. Procedure with Principal Diagnoses of Mental Illness); MS–LTC–DRG 880 (Acute Adjustment Reaction & Psychosocial Dysfunction); MS–LTC–DRG 881 (Depressive Neuroses); MS–LTC–DRG 882 (Neuroses Except Depressive); MS–LTC–DRG 883 (Disorders of Personality & Impulse Control); MS–LTC–DRG 884 (Organic Disturbances & Mental Retardation); MS–LTC–DRG 885 (Psychoses); MS–LTC–DRG 886 (Behavioral & Developmental Disorders); MS–LTC–DRG 887 (Other Mental Disorder Diagnoses); MS–LTC–DRG 894 (Alcohol/Drug Abuse or Dependence, Left Ama); MS–LTC–DRG 895 (Alcohol/Drug Abuse or Dependence, with Rehabilitation Therapy); MS–LTC–DRG 896 (Alcohol/Drug Abuse or Dependence, without Rehabilitation Therapy with MCC); MS–LTC–DRG 897 (Alcohol/Drug Abuse or Dependence, without Rehabilitation Therapy without MCC); MS–LTC–DRG 945 (Rehabilitation with CC/MCC); and MS–LTC–DRG 946 (Rehabilitation without CC/MCC). As we discussed when we implemented the dual rate LTCH PPS payment structure, LTCH discharges that are grouped to these 15 ''psychiatric and rehabilitation'' MS–LTC–DRGs do not meet the criteria for exclusion from the site neutral payment rate. As such, under the criterion for a principal diagnosis relating to a psychiatric diagnosis or to rehabilitation, there are no applicable LTCH cases to use in calculating a relative weight for the ''psychiatric and rehabilitation'' proposed MS–LTC–DRGs. In other words, any LTCH PPS discharges grouped to any of the 15 ''psychiatric and rehabilitation'' MS–LTC–DRGs will always be paid at the site neutral payment rate, and, therefore, those MS–LTC–DRGs will never include any LTCH cases that meet the criteria for exclusion from the site neutral payment rate. However, section 1886(m)(6)(B) of the Act establishes a transitional payment method for cases that would be paid at the site neutral payment rate for LTCH discharges occurring in cost reporting periods beginning during FY 2016 or FY 2017. Under the transitional payment method for site neutral payment rate cases, for LTCH discharges occurring in cost reporting periods beginning on or after October 1, 2016, and on or before September 30, 2017, site neutral payment rate cases are paid a blended payment rate, calculated as 50 percent of the applicable site neutral payment rate amount for the discharge and 50 percent of the applicable LTCH PPS standard Federal payment rate. Because the LTCH PPS standard Federal payment rate is based on the relative weight of the MS–LTC–DRG, in order to determine the transitional blended payment for site neutral payment rate cases grouped to one of the ''psychiatric or rehabilitation'' MS–LTC–DRGs in FY 2017, as we proposed, we assigned a relative weight to these MS–LTC–DRGs for FY 2017 that is the same as the FY 2015 relative weight (which is also the same as the FY 2016 relative weight). We believe that using the respective FY 2015 relative weight for each of the ''psychiatric or rehabilitation'' MS–LTC–DRGs results in appropriate payments for LTCH cases that are paid at the site neutral payment rate under the transition policy provided by the statute because there are no clinically similar MS–LTC–DRGs for which we were able to determine relative weights based on applicable LTCH cases in the FY 2015 MedPAR file data using the steps described above. Furthermore, we believe that it would be administratively burdensome and introduce unnecessary complexity to the MS–LTC–DRG relative weight calculation to use the LTCH discharges in the MedPAR file data to calculate a relative weight for those 15 ''psychiatric and rehabilitation'' MS–LTC–DRGs to be used for the sole purpose of determining half of the transitional blended payment for site neutral payment rate cases during the transition period (80 FR 49631 through 49632).

In summary, for FY 2017, we are establishing a relative weight (and average length of stay thresholds) equal to the respective FY 2015 relative weight of the MS–LTC–DRGs for the 15 ''psychiatric or rehabilitation'' MS–LTC–DRGs listed previously (that is, MS–LTC–DRGs 876, 880, 881, 882, 883, 884, 885, 886, 887, 894, 895, 896, 897, 945, and 946). Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS Web site, reflects this final policy.

Step 6—Adjust the FY 2017 MS–LTC–DRG relative weights to account for nonmonotonically increasing relative weights.

The MS–DRGs contain base DRGs that have been subdivided into one, two, or three severity of illness levels. Where there are three severity levels, the most severe level has at least one secondary diagnosis code that is referred to as an MCC (that is, major complication or comorbidity). The next lower severity level contains cases with at least one secondary diagnosis code that is a CC (that is, complication or comorbidity). Those cases without an MCC or a CC are referred to as ''without CC/MCC.'' When data do not support the creation of three severity levels, the base MS–DRG is subdivided into either two levels or the base MS–DRG is not subdivided. The two-level subdivisions may consist of the MS–DRG with CC/MCC and the MS–DRG without CC/MCC. Alternatively, the other type of two-level subdivision may consist of the MS–DRG with MCC and the MS–DRG without MCC.

In those base MS–LTC–DRGs that are split into either two or three severity levels, cases classified into the ''without CC/MCC'' MS–LTC–DRG are expected to have a lower resource use (and lower costs) than the ''with CC/MCC'' MS–LTC–DRG (in the case of a two-level split) or both the ''with CC'' and the ''with MCC'' MS–LTC–DRGs (in the case of a three-level split). That is, theoretically, cases that are more severe typically require greater expenditure of medical care resources and would result in higher average charges. Therefore, in the three severity levels, relative weights should increase by severity, from lowest to highest. If the relative weights decrease as severity increases (that is, if within a base MS–LTC–DRG, an MS–LTC–DRG with CC has a higher relative weight than one with MCC, or the MS–LTC–DRG ''without CC/MCC'' has a higher relative weight than either of the others), they are nonmonotonic. We continue to believe that utilizing nonmonotonic relative weights to adjust Medicare payments would result in inappropriate payments because the payment for the cases in the higher severity level in a base MS–LTC–DRG (which are generally expected to have higher resource use and costs) would be lower than the payment for cases in a lower severity level within the same base MS–LTC–DRG (which are generally expected to have lower resource use and costs). Therefore, in determining the FY 2017 MS–LTC–DRG relative weights, consistent with our historical methodology and as we proposed, we are continuing to combine MS–LTC–DRG severity levels within a base MS–LTC–DRG for the purpose of computing a relative weight when necessary to ensure that monotonicity is maintained. For a comprehensive description of our existing methodology to adjust for nonmonotonicity, we refer readers to the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43964 through 43966). Any adjustments for nonmonotonicity that were made in determining the FY 2017 MS–LTC–DRG relative weights in this final rule by applying this methodology are denoted in Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS Web site.

Step 7—Calculate the FY 2017 MS–LTC–DRG reclassification and recalibration budget neutrality factor.

In accordance with the regulations at § 412.517(b) (in conjunction with § 412.503), the annual update to the MS–LTC–DRG classifications and relative weights is done in a budget neutral manner such that estimated aggregate LTCH PPS payments would be unaffected, that is, would be neither greater than nor less than the estimated aggregate LTCH PPS payments that would have been made without the MS–LTC–DRG classification and relative weight changes. (For a detailed discussion on the establishment of the budget neutrality requirement for the annual update of the MS–LTC–DRG classifications and relative weights, we refer readers to the RY 2008 LTCH PPS final rule (72 FR 26881 and 26882).)

The MS–LTC–DRG classifications and relative weights are updated annually based on the most recent available LTCH claims data to reflect changes in relative LTCH resource use (§ 412.517(a) in conjunction with § 412.503). To achieve the budget neutrality requirement at § 412.517(b), under our established methodology, for each annual update, the MS–LTC–DRG relative weights are uniformly adjusted to ensure that estimated aggregate payments under the LTCH PPS would not be affected (that is, decreased or increased). Consistent with that provision and as we proposed, we are updating the MS–LTC–DRG classifications and relative weights for FY 2017 based on the most recent available LTCH data for applicable LTCH cases, and continuing to apply a budget neutrality adjustment in determining the FY 2017 MS–LTC–DRG relative weights.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25152 through 25153), to ensure budget neutrality in the update to the MS–LTC–DRG classifications and relative weights under § 412.517(b), we proposed to continue to use our established two-step budget neutrality methodology.

Comment: One commenter questioned how the low-volume MS–LTC–DRGs or MS–LTC–DRGs with no applicable LTCH cases impact the budget neutrality process.

Response: Under our established two-step budget neutrality methodology, we first calculated and applied a normalization factor to the recalibrated relative weights; and then we calculated and applied a budget neutrality adjustment factor. Under both of these steps, the low-volume MS–LTC–DRGs are reflected in the budget neutrality calculation, and generally MS–LTC–DRGs with no applicable LTCH cases are not reflected in the budget neutrality calculation, as explained below.

As described in the proposed rule (81 FR 25153), to calculate the proposed normalization factor for FY 2017, we grouped applicable LTCH cases using the proposed FY 2017 Version 34 GROUPER, and the recalibrated proposed FY 2017 MS–LTC–DRG relative weights to calculate the average case-mix index (CMI); we grouped the same applicable LTCH cases using the FY 2016 GROUPER Version 33 and MS–LTC–DRG relative weights and calculated the average CMI; and computed the ratio by dividing the average CMI for FY 2016 by the average CMI proposed for FY 2017. That ratio was the proposed normalization factor. Because the calculation of the normalization factor involves the relative weights for the MS–LTC–DRGs that contained applicable LTCH cases to calculate the average CMIs, any low-volume MS–LTC–DRGs are included in the calculation (and the MS–LTC–DRGs with no applicable LTCH cases are not included in the calculation).

As described in the proposed rule (81 FR 25153), to calculate the budget neutrality adjustment factor, we simulated estimated total FY 2017 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the proposed FY 2017 normalized relative weights and GROUPER Version 34; simulated estimated total FY 2016 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the FY 2016 MS–LTC–DRG relative weights and the FY 2016 GROUPER Version 33; and calculated the ratio of these estimated total payments by dividing the simulated estimated total LTCH PPS standard Federal payment rate payments for FY 2016 by the simulated estimated total LTCH PPS standard Federal payment rate payments for FY 2017. The resulting ratio was the proposed budget neutrality adjustment factor. The calculation of the budget neutrality factor involves the relative weights for the LTCH cases used in the payment simulation, which includes any cases grouped to low-volume or to MS–LTC–DRGs with no applicable LTCH cases, and generally does not include payments for cases MS–LTC–DRG with no applicable LTCH cases. (Occasionally, a few LTCH cases (that is, those with a covered length of stay of 7 days or less, which are removed from the relative weight calculation in step 2) that are grouped to an MS–LTC–DRG with no applicable LTCH cases are included in the payment simulations used to calculate the budget neutrality factor. However, the number and payment amount of such cases have a negligible impact on the budget neutrality factor calculation).

In this final rule, to ensure budget neutrality in the update to the MS–LTC–DRG classifications and relative weights under § 412.517(b), as we proposed, we are continuing to use our established

two-step budget neutrality methodology. Therefore, in this final rule, in the first step of our MS–LTC–DRG budget neutrality methodology, for FY 2017, as we proposed, we calculated and applied a normalization factor to the recalibrated relative weights (the result of Steps 1 through 6 discussed previously) to ensure that estimated payments are not affected by changes in the composition of case types or the changes to the classification system. That is, the normalization adjustment is intended to ensure that the recalibration of the MS–LTC–DRG relative weights (that is, the process itself) neither increases nor decreases the average case-mix index.

To calculate the normalization factor for FY 2017 (the first step of our budget neutrality methodology), we used the following three steps: (1.a.) Used the most recent available applicable LTCH cases from the most recent available data (that is, LTCH discharges from the FY 2015 MedPAR file) and grouped them using the FY 2017 GROUPER (that is, Version 34 for FY 2017) and the recalibrated FY 2017 MS–LTC–DRG relative weights (determined in Steps 1 through 6 above) to calculate the average case-mix index; (1.b.) grouped the same applicable LTCH cases (as are used in Step 1.a.) using the FY 2016 GROUPER (Version 33) and FY 2016 MS–LTC–DRG relative weights and calculated the average case-mix index; and (1.c.) computed the ratio of these average case-mix indexes by dividing the average CMI for FY 2016 (determined in Step 1.b.) by the average case-mix index for FY 2017 (determined in Step 1.a.). As a result, in determining the MS–LTC–DRG relative weights for FY 2017, each recalibrated MS–LTC–DRG relative weight was multiplied by the normalization factor of 1.28408 (determined in Step 1.c.) in the first step of the budget neutrality methodology, which produced ''normalized relative weights.''

In the second step of our MS–LTC–DRG budget neutrality methodology, as we proposed, we calculated a second budget neutrality factor consisting of the ratio of estimated aggregate FY 2017 LTCH PPS standard Federal payment rate payments for applicable LTCH cases (the sum of all calculations under Step 1.a. mentioned previously) after reclassification and recalibration to estimated aggregate payments for FY 2017 LTCH PPS standard Federal payment rate payments for applicable LTCH cases before reclassification and recalibration (that is, the sum of all calculations under Step 1.b. mentioned previously).

That is, for this final rule, for FY 2017, under the second step of the budget neutrality methodology, we determined the budget neutrality adjustment factor using the following three steps: (2.a.) Simulated estimated total FY 2017 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the normalized relative weights for FY 2017 and GROUPER Version 34 (as described above); (2.b.) simulated estimated total FY 2016 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the FY 2016 GROUPER (Version 33) and the FY 2016 MS–LTC–DRG relative weights in Table 11 of the FY 2016 IPPS/LTCH PPS final rule available on the Internet, as described in section VI. of the Addendum of that final rule; and (2.c.) calculated the ratio of these estimated total payments by dividing the value determined in Step 2.b. by the value determined in Step 2.a. In determining the FY 2017 MS–LTC–DRG relative weights, each normalized relative weight was then multiplied by a budget neutrality factor of 1.0011126 (the value determined in Step 2.c.) in the second step of the budget neutrality methodology to achieve the budget neutrality requirement at § 412.517(b).

Accordingly, in determining the FY 2017 MS–LTC–DRG relative weights in this final rule, consistent with our existing methodology, we applied a normalization factor of 1.28408 and a budget neutrality factor of 1.0011126. Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the Internet on the CMS Web site, lists the MS–LTC–DRGs and their respective relative weights, geometric mean length of stay, five-sixths of the geometric mean length of stay (used to identify SSO cases under § 412.529(a)), and the ''IPPS Comparable Thresholds'' (used in determining SSO payments under § 412.529(c)(3)), for FY 2017.

D. Rebasing of the LTCH Market Basket

1. Background

The input price index (that is, the market basket) that was used to develop the LTCH PPS for FY 2003 was the ''excluded hospital with capital'' market basket. That market basket was based on 1997 Medicare cost report data and included data for Medicare-participating IRFs, IPFs, LTCHs, cancer hospitals, and children's hospitals. Although the term ''market basket'' technically describes the mix of goods and services used in providing hospital care, this term is also commonly used to denote the input price index (that is, cost category weights and price proxies combined) derived from that mix. Accordingly, the term ''market basket,'' as used in this section, refers to an input price index.

Beginning with RY 2007, LTCH PPS payments were updated using a 2002-based market basket reflecting the operating and capital cost structures for IRFs, IPFs, and LTCHs (hereafter referred to as the rehabilitation, psychiatric, and long-term care (RPL) market basket). We excluded cancer and children's hospitals from the RPL market basket because their payments are based entirely on reasonable costs subject to rate-of-increase limits established under the authority of section 1886(b) of the Act, which are implemented in regulations at 42 CFR 413.40. Those types of hospitals are not paid under a PPS. Also, the 2002 cost structures for cancer and children's hospitals are noticeably different from the cost structures for freestanding IRFs, freestanding IPFs, and LTCHs. A complete discussion of the 2002-based RPL market basket can be found in the RY 2007 LTCH PPS final rule (71 FR 27810 through 27817).

In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51756), we finalized the rebasing and revising of the 2002-based RPL market basket by creating and implementing a 2008-based RPL market basket. We also discussed the creation of a stand-alone LTCH market basket and received several public comments, all of which supported deriving a stand-alone LTCH market basket (76 FR 51756 through 51757). In the FY 2013 IPPS/LTCH PPS final rule, we finalized the adoption of a stand-alone 2009-based LTCH-specific market basket that reflects the cost structures of LTCHs only (77 FR 53467 through 53479).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25153 through 25167), we proposed to rebase and revise the 2009-based LTCH-specific market basket. The proposed LTCH market basket is primarily based on Medicare cost report data for LTCHs for 2013, which are for cost reporting periods beginning on and after October 1, 2012, and before October 1, 2013. We proposed to use data from cost reports beginning in FY 2013 because these data are the latest available complete data for purposes of calculating cost weights for the market basket. In the following discussion, we provide an overview of the proposed LTCH market basket and describe the methodologies we proposed to use for determining the operating and capital portions of the proposed 2013-based LTCH market basket.

2. Overview of the 2013-Based LTCH Market Basket

Similar to the 2009-based LTCH-specific market basket, the proposed 2013-based LTCH market basket is a fixed-weight, Laspeyres-type price index. A Laspeyres price index measures the change in price, over time, of the same mix of goods and services purchased in the base period. Any changes in the quantity or mix (that is, intensity) of goods and services purchased over time are not measured.

The index itself is constructed using three steps. First, a base period is selected (in the proposed rule, we proposed to use 2013 as the base period) and total base period expenditures are estimated for a set of mutually exclusive and exhaustive spending categories, with the proportion of total costs that each category represents being calculated. These proportions are called ''cost weights'' or ''expenditure weights.'' Second, each expenditure category is matched to an appropriate price or wage variable, referred to as a ''price proxy.'' In almost every instance, these price proxies are derived from publicly available statistical series that are published on a consistent schedule (preferably at least on a quarterly basis). Finally, the expenditure weight for each cost category is multiplied by the level of its respective price proxy. The sum of these products (that is, the expenditure weights multiplied by their price levels) for all cost categories yields the composite index level of the market basket in a given period. Repeating this step for other periods produces a series of market basket levels over time. Dividing an index level for a given period by an index level for an earlier period produces a rate of growth in the input price index over that timeframe.

As noted above, the market basket is described as a fixed-weight index because it represents the change in price over time of a constant mix (quantity and intensity) of goods and services needed to furnish hospital services. The effects on total expenditures resulting from changes in the mix of goods and services purchased subsequent to the base period are not measured. For example, a hospital hiring more nurses to accommodate the needs of patients would increase the volume of goods and services purchased by the hospital, but would not be factored into the price change measured by a fixed-weight hospital market basket. Only when the index is rebased would changes in the quantity and intensity be captured, with those changes being reflected in the cost weights. Therefore, we rebase the market basket periodically so that the cost weights reflect a recent mix of goods and services that hospitals purchase (hospital inputs) to furnish inpatient care.

3. Development of the 2013-Based LTCH Market Basket Cost Categories and Weights

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25154), we invited public comments on our proposed methodology for deriving the 2013-based LTCH market basket. We received one general comment regarding our proposed 2013-based LTCH market basket.

Comment: One commenter supported CMS' proposed methodology to revise and rebase the LTCH market basket.

Response: We appreciate the commenter's support.

We summarize and respond to any public comments received regarding the specifics of our proposed methodology under the applicable sections below, and provide final decisions regarding each proposed methodology in the relevant section.

a. Use of Medicare Cost Report Data

The proposed 2013-based LTCH market basket consists of six major cost categories derived from the 2013 LTCH Medicare cost reports (CMS Form 2552–10), including wages and salaries, employee benefits, contract labor, pharmaceuticals, professional liability insurance, and capital. After we calculate these cost categories, we are left with a residual cost category, which reflects all other input costs other than those captured in the six cost categories above. This is the same number of cost categories derived for the 2009-based LTCH-specific market basket using the 2009 Medicare cost report data (CMS Form 2552–96). These 2013 Medicare cost reports include data for cost reporting periods beginning on and after October 1, 2012, and before October 1, 2013. We proposed to use 2013 as the base year because we believed that the 2013 Medicare cost reports represented the most recent, complete set of Medicare cost report data available to develop cost weights for an LTCH market basket. Medicare cost report data include costs for all patients, including Medicare, Medicaid, and private payer.

Because our goal is to measure cost shares for facilities that serve Medicare beneficiaries, and are reflective of case-mix and practice patterns associated with providing services to Medicare beneficiaries in LTCHs, we proposed to limit our selection of Medicare cost reports to those from LTCHs that have a Medicare average length of stay (LOS) that is within a comparable range of their total facility average LOS. We define the Medicare average LOS based on data reported on the Medicare cost report (CMS Form 2552–10) Worksheet S–3, Part I, Line 14. We believe that applying the LOS edit results in a more accurate reflection of the structure of costs for Medicare covered days. For the 2009-based LTCH-specific market basket, we used the cost reports submitted by LTCHs with Medicare average LOS within 15 percent (that is, 15 percent higher or lower) of the total facility average LOS for the hospital.

Based on our analysis of the 2013 Medicare cost reports, for the proposed 2013-based LTCH market basket, we proposed to use the cost reports submitted by LTCHs with Medicare average LOS within 25 percent (that is, 25 percent higher or lower) of the total facility average LOS for the hospital (this edit excludes 6 percent of LTCH providers). Applying the proposed trim resulted in a subset of LTCH Medicare cost reports with an average Medicare LOS of 27 days, average facility LOS of 28 days, and aggregate Medicare utilization (as measured by Medicare inpatient LTCH days as a percentage of total facility inpatient LTCH days) of 66 percent. If we were to apply the same trim as was applied for the 2009-based LTCH-specific market basket, we would exclude 11 percent of LTCH providers, but the results would be very similar with an average Medicare LOS of 27 days, average facility LOS of 27 days, and aggregate Medicare utilization of 66 percent. The 6 percent of providers that were excluded from the proposed 2013-based LTCH market basket have an average Medicare LOS of 29 days, average facility LOS of 77 days, and aggregate Medicare utilization of 12 percent. We stated that we believe that the use of this proposed trim, instead of the trim used to develop the 2009-based LTCH-specific market basket, is a technical improvement because data from more LTCHs are used while still being reflective of case-mix and practice patterns associated with providing services to Medicare beneficiaries.

Comment: One commenter requested that CMS identify whether the 6 percent of total LTCH providers that CMS excluded when applying the LOS edit had any significant characteristics whereby their exclusion could have an impact on the calculation of rates and/or weights. The commenter further inquired whether the exclusion of these providers is creating a biased system.

Response: As stated in the proposed rule, our goal when deriving cost shares for the LTCH market basket is to use Medicare cost reports for those facilities that serve Medicare beneficiaries, and

are reflective of case-mix and practice patterns associated with providing services to Medicare beneficiaries in LTCHs. Therefore, we proposed to limit our selection of Medicare cost reports to those from LTCHs that have a Medicare average LOS that is within a comparable range of their total facility average LOS. We believe that applying the LOS edit results in a more accurate reflection of the structure of costs for Medicare covered days.

In response to the comment, we performed a sensitivity analysis where we recalculated the major cost weights using the Medicare cost report data for all LTCHs, as opposed to our proposed methodology of excluding approximately 6 percent of LTCH providers based on the Medicare and total facility LOS. We found that the effect on the cost weights was small; the difference from the proposed major cost weights ranged from 0.0 percentage point to 0.7 percentage point, in absolute terms, and averaged 0.1 percentage point across the six major cost weights. We then also derived a LTCH market basket using these recalculated cost weights and found that, in any given year of the projection period, there was no difference in the growth rates between this market basket and the proposed market basket (when rounded to the tenth of one percentage point).

In summary, our analysis does not support the commenter's suggestion that the exclusion of those LTCH providers that had a Medicare LOS that was outside a comparable range of their total LOS resulted in estimates that were biased. We believe that these excluded providers are not reflective of case mix and practice patterns associated with providing services to Medicare beneficiaries in LTCHs, and therefore should be excluded as we proposed. Furthermore, the exclusion of these providers does not have a material impact on the cost weights or market basket update.

After consideration of the public comments we received, we are adopting our proposed LOS trim methodology as final.

Using the resulting set of Medicare cost reports, we proposed to calculate cost weights for seven major cost categories of the proposed 2013-based LTCH market basket (wages and salaries, employee benefits, contract labor, professional liability insurance, pharmaceuticals, capital, and an ''all other'' residual cost category). The methodology used to develop the proposed 2013-based LTCH market basket cost weights is generally the same methodology used to develop the 2009-based LTCH-specific market basket cost weights. We describe the detailed methodology for obtaining costs for each of these seven cost categories below.

(1) Wages and Salaries Costs

We proposed to derive wages and salaries costs as the sum of inpatient salaries, ancillary salaries, and a proportion of overhead (or general service cost center) salaries as reported on Worksheet A, Column 1. Because overhead salary costs are attributable to the entire LTCH, we proposed to only include the proportion attributable to the Medicare allowable cost centers. Similar to the 2009-based LTCH-specific market basket major cost weights, we define Medicare allowable total costs (routine, ancillary and capital) as costs that are eligible for payment through the LTCH PPS. We proposed to estimate the proportion of overhead salaries that are attributed to Medicare allowable costs centers by multiplying the ratio of Medicare allowable cost centers' salaries to total salaries (Worksheet A, Column 1, Line 200) by total overhead salaries. A similar methodology was used to derive wages and salaries costs in the 2009-based LTCH-specific market basket.

We did not receive any public comments on our proposed methodology for deriving wages and salaries costs. Therefore, we are adopting our proposed methodology as final.

(2) Employee Benefit Costs

Similar to the 2009-based LTCH-specific market basket, we proposed to calculate employee benefit costs using Worksheet S3, Part II. The completion of Worksheet S–3, Part II is only required for IPPS hospitals. However, for 2013, we found that roughly 35 percent of all LTCHs voluntarily reported these data (similar to prior years). We note that this worksheet is only required to be completed by IPPS hospitals. Our analysis of the Worksheet S–3, Part II data submitted by these LTCHs indicates that we have a large enough sample to enable us to produce a reasonable employee benefits cost weight. Specifically, we found that when we recalculated the cost weight after weighting to reflect the characteristics of the universe of LTCHs (type of control (nonprofit, for-profit, and government) and by region), the recalculation did not have a material effect on the resulting cost weight. Therefore, we proposed to use Worksheet S–3, Part II data (as was done for the 2009-based LTCH-specific market basket) to calculate the employee benefit cost weight in the proposed 2013-based LTCH market basket.

We note that, effective with the implementation of CMS Form 2552–10 for cost reporting periods beginning on or after May 1, 2010, CMS began collecting employee benefits and contract labor data on Worksheet S–3, Part V, which is applicable to LTCHs. Only a few LTCHs reported these data and, therefore, we were unable to use such a small sample to accurately reflect these costs. Therefore, we encourage all LTCHs to report employee benefit and contract labor costs on Worksheet S–3, Part V.

We did not receive any public comments on our proposed methodology for deriving employee benefits costs. Therefore, we are adopting our proposed methodology as final.

(3) Contract Labor Costs

Contract labor costs are primarily associated with direct patient care services. Contract labor costs for services such as accounting, billing, and legal are estimated using other government data sources as described below. As was done for the 2009-based LTCH-specific market basket, we proposed to derive the contract labor cost weight for the 2013-based LTCH market basket using voluntarily reported data from Worksheet S–3, Part II. Approximately 48 percent of LTCHs voluntarily reported contract labor cost on the Worksheet S–3, Part II. Our analysis of these data indicates that we have a large enough sample to enable us to produce a reasonable contract labor cost weight. Specifically, we found that when we recalculated the cost weight after weighting to reflect the characteristics of the universe of LTCHs (type of control (nonprofit, for-profit, and government) and by region), the recalculation did not have a material effect on the resulting cost weight. Therefore, as was done for the 2009-based LTCH-specific market basket, we proposed to use Worksheet S–3, Part II to calculate the contract labor cost weight in the proposed 2013-based LTCH market basket.

We did not receive any public comments on our proposed methodology for deriving contract labor costs. Therefore, we are adopting our proposed methodology as final.

(4) Pharmaceutical Costs

We proposed to calculate pharmaceutical costs using costs reported on Worksheet A, Column 7, minus the amount on Worksheet A, Column 1, for the pharmacy cost center (Line 15) and drugs charged to patients

cost center (Line 73). A similar methodology was used for the 2009-based LTCH-specific market basket using the CMS Form 2552–96.

We did not receive any public comments on our proposed methodology for deriving pharmaceutical costs. Therefore, we are adopting our proposed methodology as final.

(5) Professional Liability Insurance Costs

We proposed that professional liability insurance (PLI) costs (often referred to as malpractice costs) be equal to premiums, paid losses and self-insurance costs reported on Worksheet S2, Part I, Line 118.10, Columns 1 through 3. A similar methodology was used for the 2009-based LTCH-specific market basket using the CMS Form 2552–96.

We did not receive any public comments on our proposed methodology for deriving professional liability insurance costs. Therefore, we are adopting our proposed methodology as final.

(6) Capital Costs

We proposed that capital costs be equal to Medicare allowable capital costs as reported on Worksheet B, Part II, Column 26. We proposed to define Medicare allowable costs as cost centers: 30 through 35, 50 through 76 (excluding 52, 61, and 75), 90 through 91 and 93. A similar methodology was used for the 2009-based LTCH-specific market basket using the CMS Form 2552–96.

We did not receive any public comments on our proposed methodology for deriving capital costs. Therefore, we are adopting our proposed methodology as final.

b. Final Major Cost Category Computation

In addition to our policies to derive costs for the major cost categories for each provider using the Medicare cost report data as previously described, we proposed to address outlier cases using the following steps. First, for each provider, we proposed to divide the costs for each of the six categories by the total Medicare allowable costs to obtain cost weights for the universe of LTCH providers. We proposed to define total Medicare allowable costs reported on Worksheet B, Part I, Column 26 for cost centers: 30 through 35, 50 through 76 (excluding 52, 61, and 75), 90 through 91 and 93.

We then proposed to remove those providers whose derived cost weights fall in the top and bottom 5 percent of provider-specific derived cost weights to ensure the removal of costs for outlier cases. This trim was applied after first keeping only those providers that had a cost weight greater than zero and less than 100 percent. After the costs for outlier cases were removed in this manner, we proposed to sum the costs for each category across all remaining providers, and then divided this by the sum of total Medicare allowable costs across all remaining providers to obtain a cost weight for the proposed 2013-based LTCH market basket for the given category. Finally, we proposed to calculate a seventh major cost weight—the residual ''All Other'' cost weight to reflect all remaining costs that are not captured in the previous six cost categories listed. We referred readers to Table VII–1 below for the resulting proposed cost weights for these major cost categories (which, as we indicate later, we are finalizing).

TABLE VII–1—MAJOR COST CATEGORIES AND THEIR RESPECTIVE COST WEIGHTS AS CALCULATED FROM MEDICARE COST REPORTS

Major cost categories	Proposed and final 2013-based LTCH market basket cost weight (percent of total costs)	2009-based LTCH-specific market basket cost weight (percent of total costs)
Wages and Salaries	41.5	40.4
Employee Benefits	6.5	7.0
Contract Labor	5.9	6.9
Professional Liability Insurance (Malpractice)	0.9	0.8
Pharmaceuticals	7.6	8.9
Capital	9.7	9.8
All Other	27.8	26.1

The wages and salaries cost weight calculated from the Medicare cost reports for the proposed 2013-based LTCH market basket was approximately 1 percentage point higher than the wages and salaries cost weight for the 2009-based LTCH-specific market basket, while the contract labor cost weight is approximately 1 percentage point lower. The proposed 2013-based pharmaceuticals cost weight also was roughly 1 percentage point lower than the cost weight for the 2009-based LTCH-specific market basket.

As we did for the 2009-based LTCH market basket, we proposed to allocate the contract labor cost weight to the wages and salaries and employee benefits cost weights based on their relative proportions under the assumption that contract labor costs are comprised of both wages and salaries and employee benefits. The contract labor allocation proportion for wages and salaries is equal to the wages and salaries cost weight as a percent of the sum of the wages and salaries cost weight and the employee benefits cost weight. This rounded percentage was 86 percent. Therefore, we proposed to allocate 86 percent of the contract labor cost weight to the wages and salaries cost weight and 14 percent to the employee benefits cost weight. We referred readers to Table VII–2 below that shows the proposed wages and salaries and employee benefit cost weights after contract labor cost weight allocation for both the proposed 2013-based LTCH market basket (which, as we indicate later, we are finalizing) and the 2009-based LTCH-specific market basket.

TABLE VII–2—WAGES AND SALARIES AND EMPLOYEE BENEFITS COST WEIGHTS AFTER CONTRACT LABOR ALLOCATION

Major cost categories	Proposed and final 2013-based LTCH cost weight (percent of total costs)	2009-based LTCH-specific cost weight (percent of total costs)
Wages and Salaries	46.6	46.3
Employee Benefits	7.3	8.0
Compensation	53.9	54.3

After the allocation of the contract labor cost weight, the proposed 2013-based wages and salaries cost weight was 0.3 percentage point higher, while the employee benefit cost weight was 0.7 percentage point lower, relative to the respective cost weights for the 2009-based LTCH-specific market basket. As a result, in the proposed 2013-based LTCH market basket, the compensation cost weight was 0.4 percentage point lower than the compensation cost weight for the 2009-based LTCH-specific market basket.

We did not receive any public comments on our proposed methodology for deriving the major cost weights for the 2013-based LTCH market basket. Therefore, we are adopting our proposed methodology as final.

c. Derivation of the Detailed Operating Cost Weights

To further divide the ''All Other'' residual cost weight estimated from the 2013 Medicare cost report data into more detailed cost categories, we proposed to use the 2007 Benchmark Input-Output (I–O) ''Use Tables/Before Redefinitions/Purchaser Value'' for NAICS 622000, Hospitals, published by the Bureau of Economic Analysis (BEA). These data are publicly available at the following Web site: *http://www.bea.gov/industry/io_annual.htm.*

The BEA Benchmark I–O data are scheduled for publication every 5 years with the most recent data available for 2007. The 2007 Benchmark I–O data are derived from the 2007 Economic Census and are the building blocks for BEA's economic accounts. Therefore, they represent the most comprehensive and complete set of data on the economic processes or mechanisms by which output is produced and distributed.[92] BEA also produces Annual I–O estimates. However, while based on a similar methodology, these estimates reflect less comprehensive and less detailed data sources and are subject to revision when benchmark data become available. Instead of using the less detailed Annual I–O data, we proposed to inflate the 2007 Benchmark I–O data forward to 2013 by applying the annual price changes from the respective price proxies to the appropriate market basket cost categories that are obtained from the 2007 Benchmark I–O data. We repeated this practice for each year. We then calculated the cost shares that each cost category represents of the 2007 data inflated to 2013. These resulting 2013 cost shares were applied to the ''All Other'' residual cost weight to obtain the detailed cost weights for the 2013-based LTCH market basket. For example, the cost for ''Food: Direct Purchases'' represented 6.5 percent of the sum of the ''All Other'' 2007 Benchmark I–O Hospital Expenditures inflated to 2013. Therefore, the ''Food: Direct Purchases'' cost weight represented 6.5 percent of the proposed 2013-based LTCH market basket's ''All Other'' cost category (27.8 percent), yielding a ''final'' ''Food: Direct Purchases'' proposed cost weight of 1.8 percent in the proposed 2013-based LTCH market basket (0.065 × 27.8 percent = 1.8 percent).

Using this methodology, we proposed to derive 18 detailed LTCH market basket cost category weights from the proposed 2013-based LTCH market basket residual cost weight (27.8 percent). These categories are: (1) Electricity; (2) Fuel, Oil, and Gasoline; (3) Water and Sewerage; (4) Food: Direct Purchases; (5) Food: Contract Services; (6) Chemicals; (7) Medical Instruments; (8) Rubber and Plastics; (9) Paper and Printing Products; (10) Miscellaneous Products; (11) Professional Fees: Labor-Related; (12) Administrative and Facilities Support Services; (13) Installation, Maintenance, and Repair Services; (14) All Other Labor-Related Services; (15) Professional Fees: Nonlabor-Related; (16) Financial Services; (17) Telephone Services; and (18) All Other Nonlabor-Related Services.

We did not receive any public comments on our proposed methodology for deriving the detailed operating cost weights for the 2013-based LTCH market basket. Therefore, we are adopting our proposed methodology as final.

d. Derivation of the Detailed Capital Cost Weights

As described in section VII.D.3.b. of the preamble of this final rule, we proposed a capital-related cost weight of 9.7 percent as calculated from the 2013 Medicare cost reports for LTCHs after applying the proposed trims described above. We proposed to then separate this total capital-related cost weight into more detailed cost categories.

Using 2013 Medicare cost reports, we were able to group capital-related costs into the following categories: Depreciation, Interest, Lease, and Other Capital-Related costs. For each of these categories, we proposed to determine what proportion of total capital-related costs the category represents using the data reported by the LTCH on Worksheet A–7, which is the same methodology used for the 2009-based LTCH-specific market basket.

We also proposed to allocate lease costs across each of the remaining detailed capital-related cost categories as was done in the 2009-based LTCH-specific market basket. This resulted in three primary capital-related cost categories in the proposed 2013-based LTCH market basket: Depreciation, Interest, and Other Capital-Related costs. Lease costs are unique in that they are not broken out as a separate cost category in the proposed 2013-based LTCH market basket. Rather, we proposed to proportionally distribute these costs among the cost categories of Depreciation, Interest, and Other Capital-Related, reflecting the assumption that the underlying cost structure of leases is similar to that of capital-related costs in general. As was done for the 2009-based LTCH-specific market basket, we proposed to assume that 10 percent of the lease costs as a proportion of total capital-related costs (62.3 percent) represents overhead and to assign those costs to the Other Capital-Related cost category accordingly. Therefore, we assumed that approximately 6.2 percent (62.3 percent

[92] *http://www.bea.gov/papers/pdf/IOmanual_092906.pdf.*

× 0.1) of total capital-related costs represent lease costs attributable to overhead, and we proposed to add this 6.2 percent to the 5.9 percent Other Capital-Related cost category weight. We then proposed to distribute the remaining lease costs (56.1 percent, or 62.3 percent − 6.2 percent) proportionally across the three cost categories (Depreciation, Interest, and Other Capital-Related) based on the proportion that these categories comprised of the sum of the Depreciation, Interest, and Other Capital-Related cost categories (excluding lease expenses). For example, the Other Capital-Related capital cost category represented 15.5 percent of all three cost categories (Depreciation, Interest, and Other Capital-Related) prior to any lease expenses being allocated. This 15.5 percent was applied to the 56.1 percent of remaining lease expenses so that another 8.7 percent of lease expenses as a percent of total capital-related costs was allocated to the Other Capital-Related cost category. Therefore, the resulting proposed Other Capital-Related cost weight was 20.8 percent (5.9 percent + 6.2 percent + 8.7 percent). This is the same methodology used for the 2009-based LTCH-specific market basket. The proposed allocation of these lease expenses are shown in Table VII–3.

Finally, we proposed to further divide the Depreciation and Interest cost categories. We proposed to separate the Depreciation cost category into the following two categories: (1) Building and Fixed Equipment and (2) Movable Equipment. We also proposed to separate the Interest cost category into the following two categories: (1) Government/Nonprofit; and (2) For-profit.

To disaggregate the depreciation cost weight, we needed to determine the percent of total depreciation costs for LTCHs (after the allocation of lease costs) that are attributable to building and fixed equipment, which we hereafter refer to as the ''fixed percentage.'' We proposed to use depreciation and lease data from Worksheet A–7 of the 2013 Medicare cost reports, which is the same methodology used for the 2009-based LTCH-specific market basket. Based on the 2013 LTCH Medicare cost report data, we determined that depreciation costs for building and fixed equipment account for 39 percent of total depreciation costs, while depreciation costs for movable equipment account for 61 percent of total depreciation costs. As mentioned above, we proposed to allocate lease expenses among the Depreciation, Interest, and Other Capital cost categories. We determined that leasing building and fixed equipment expenses accounted for 86 percent of total leasing expenses, while leasing movable equipment expenses accounted for 14 percent of total leasing expenses. We proposed to sum the depreciation and leasing expenses for building and fixed equipment, as well as sum the depreciation and leasing expenses for movable equipment. This resulted in the proposed building and fixed equipment depreciation cost weight (after leasing costs are included) representing 73 percent of total depreciation costs and the movable equipment depreciation cost weight (after leasing costs are included) representing 27 percent of total depreciation costs.

To disaggregate the interest cost weight, we needed to determine the percent of total interest costs for LTCHs that are attributable to government and nonprofit facilities, which we hereafter refer to as the ''nonprofit percentage,'' because price pressures associated with these types of interest costs tend to differ from those for for-profit facilities. We proposed to use interest costs data from Worksheet A–7 of the 2013 Medicare cost reports for LTCHs, which is the same methodology used for the 2009-based LTCH-specific market basket. The nonprofit percentage determined using this method was 23 percent.

As we stated in the proposed rule, ultimately, if finalized, these detailed capital cost shares would be applied to the total capital-related cost weight determined in section VII.D.3.b. of the preamble of this final rule to separate the total capital-related cost weight of 9.7 percent into more detailed cost categories and weights.

We did not receive any public comments on our proposed methodology for deriving the detailed capital cost weights for the 2013-based LTCH market basket. Therefore, we are adopting our proposed methodology as final. Table VII–3 below provides the proposed and final detailed capital cost shares obtained from the Medicare cost reports.

TABLE VII–3—DETAILED CAPITAL COST WEIGHTS FOR THE 2013-BASED LTCH MARKET BASKET

Cost categories	Proposed and final cost shares obtained from Medicare cost reports (percent of total costs)	Proposed and final detailed capital cost shares after allocation of lease expenses (percent of total costs)
Depreciation	22.0	54.8
Building and Fixed Equipment	16.1	40.1
Movable Equipment	5.9	14.7
Interest	9.8	24.4
Government/Nonprofit	2.2	5.6
For-profit	7.6	18.8
Lease	62.3	
Other	5.9	20.8

Note: Total may not add to 100 due to rounding.

e. 2013-Based LTCH Market Basket Cost Categories and Weights

Similar to the 2012-based IRF and 2012-based IPF market baskets, the proposed and final 2013-based LTCH market basket does not include separate cost categories for Apparel, Machinery and Equipment, and Postage. Due to the small weights associated with these detailed categories and relatively stable price growth in the applicable price proxy, we proposed to include the Apparel and Machinery and Equipment in the Miscellaneous Products cost category and the Postage in the All-Other Nonlabor-Related Services cost category. We note that the machinery

and equipment expenses are for equipment that is paid for in a given year and not depreciated over the asset's useful life. Depreciation expenses for movable equipment are reflected in the capital-related cost weight of the 2013-based LTCH market basket. For the 2013-based LTCH market basket, we also proposed to include a separate cost category for Installation, Maintenance, and Repair Services in order to proxy these costs by a price index that better reflects the price changes of labor associated with maintenance-related services.

We did not receive any public comments on our proposed detailed operating cost weights for the 2013-based LTCH market basket. Therefore, we are adopting our proposed detailed operating cost weights as final.

Table VII–4 below shows the proposed and final cost categories and weights for the final 2013-based LTCH market basket compared to the 2009-based LTCH-specific market basket.

TABLE VII–4—2013-BASED LTCH COST WEIGHTS COMPARED TO 2009-BASED LTCH COST WEIGHTS

Cost category	Proposed and final 2013-based LTCH cost weight	2009-based LTCH cost weight
Total	100.0	100.0
Compensation	53.9	54.3
Wages and Salaries	46.6	46.3
Employee Benefits	7.3	8.0
Utilities	2.2	1.8
Electricity	1.0	1.4
Fuel, Oil, and Gasoline	1.1	0.3
Water & Sewerage	0.1	0.1
Professional Liability Insurance	0.9	0.8
All Other Products and Services	33.2	33.3
All Other Products	16.3	19.5
Pharmaceuticals	7.6	8.9
Food: Direct Purchases	1.8	3.4
Food: Contract Services	1.1	0.5
Chemicals	0.7	1.3
Medical Instruments	2.4	2.1
Rubber & Plastics	0.6	1.3
Paper and Printing Products	1.2	1.2
Apparel	.....	0.3
Machinery and Equipment	.....	0.1
Miscellaneous Products	0.8	0.4
All Other Services	16.9	13.7
Labor-Related Services	8.3	5.3
Professional Fees: Labor-related	3.5	2.3
Administrative and Facilities Support Services	0.9	0.5
Installation, Maintenance, and Repair Services	2.0	
All Other: Labor-related Services	1.9	2.6
Nonlabor-Related Services	8.6	8.4
Professional Fees: Nonlabor-related	3.6	5.3
Financial services	2.9	1.0
Telephone Services	0.7	0.5
Postage	.....	0.8
All Other: Nonlabor-related Services	1.4	0.7
Capital-Related Costs	9.7	9.8
Depreciation	5.3	5.7
Fixed Assets	3.9	3.8
Movable Equipment	1.4	1.9
Interest Costs	2.4	2.4
Government/Nonprofit	0.5	0.7
For Profit	1.8	1.7
Other Capital-Related Costs	2.0	1.7

Note: Detail may not add to total due to rounding.

4. Selection of Price Proxies

After computing the cost weights for the 2013-based LTCH market basket, it was necessary to select appropriate wage and price proxies to reflect the rate of price change for each expenditure category. With the exception of the proxy for Professional Liability Insurance, all of the proxies that we proposed for the operating portion of the 2013-based LTCH market basket are based on Bureau of Labor Statistics (BLS) data and are grouped into one of the following BLS categories:

- *Producer Price Indexes*—Producer Price Indexes (PPIs) measure price changes for goods sold in markets other than the retail market. PPIs are preferable price proxies for goods and services that hospitals purchase as inputs because PPIs better reflect the actual price changes encountered by hospitals. For example, we proposed to use a PPI for prescription drugs, rather than the Consumer Price Index (CPI) for prescription drugs, because hospitals generally purchase drugs directly from a wholesaler. The PPIs that we proposed to use measure price changes at the final stage of production.

- *Consumer Price Indexes*—Consumer Price Indexes (CPIs) measure change in the prices of final goods and

services bought by the typical consumer. Because they may not represent the price encountered by a producer, we proposed to use CPIs only if an appropriate PPI was not available, or if the expenditures were more like those faced by retail consumers in general rather than by purchasers of goods at the wholesale level. For example, the CPI for food purchased away from home is used as a proxy for contracted food services.

▪ *Employment Cost Indexes*—Employment Cost Indexes (ECIs) measure the rate of change in employee wage rates and employer costs for employee benefits per hour worked. These indexes are fixed-weight indexes and strictly measure the change in wage rates and employee benefits per hour. Appropriately, they are not affected by shifts in employment mix.

We evaluated the price proxies using the criteria of reliability, timeliness, availability, and relevance. Reliability indicates that the index is based on valid statistical methods and has low sampling variability. Timeliness implies that the proxy is published regularly, preferably at least once a quarter. Availability means that the proxy is publicly available. Finally, relevance means that the proxy is applicable and representative of the cost category weight to which it is applied. We believe that the proposed PPIs, CPIs, and ECIs selected met these criteria.

Table VII–7 lists the price proxies that we proposed for the 2013-based LTCH market basket. Below we present a detailed explanation of the price proxies that we proposed for each cost category weight. We note that many of the proxies that we proposed to use for the 2013-based LTCH market basket are the same as those used for the 2009-based LTCH-specific market basket. For further discussion on the 2009-based LTCH market basket, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53467 through 53479).

a. Price Proxies for the Operating Portion of the 2013-Based LTCH Market Basket

(1) Wages and Salaries

We proposed to use the ECI for Wages and Salaries for All Civilian Workers in Hospitals (BLS series code CIU1026220000000I) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(2) Employee Benefits

We proposed to use the ECI for Total Benefits for All Civilian Workers in Hospitals to measure the price growth of this cost category. This ECI is calculated using the ECI for Total Compensation for All Civilian Workers in Hospitals (BLS series code CIU10162200000000I) and the relative importance of wages and salaries within total compensation. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(3) Electricity

We proposed to use the PPI Commodity for Commercial Electric Power (BLS series code WPU0542) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(4) Fuel, Oil, and Gasoline

We proposed to change the proxy used for the Fuel, Oil, and Gasoline cost category. The 2009-based LTCH-specific market basket uses the PPI Industry for Petroleum Refineries (BLS series code PCU32411–32411) to proxy these expenses.

For the proposed 2013-based LTCH market basket, we proposed to use a blend of the PPI Industry for Petroleum Refineries (BLS series code PCU32411–32411) and the PPI Commodity for Natural Gas (BLS series code WPU0531). Our analysis of the Bureau of Economic Analysis' 2007 Benchmark Input-Output data (use table before redefinitions, purchaser's value for NAICS 622000 [Hospitals]), shows that petroleum refineries expenses accounts for approximately 70 percent and natural gas accounts for approximately 30 percent of the fuel, oil, and gasoline expenses. Therefore, we proposed to use a blended proxy of 70 percent of the PPI Industry for Petroleum Refineries (BLS series code PCU32411–32411) and 30 percent of the PPI Commodity for Natural Gas (BLS series code WPU0531). We believe that these two price proxies are the most technically appropriate indices available to measure the price growth of the Fuel, Oil, and Gasoline cost category in the 2013-based LTCH market basket.

(5) Water and Sewage

We proposed to use the CPI for Water and Sewerage Maintenance (All Urban Consumers) (BLS series code CUUR0000SEHG01) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(6) Professional Liability Insurance

We proposed to use proxy price changes in hospital professional liability insurance premiums (PLI) using percentage changes as estimated by the CMS Hospital Professional Liability Index. To generate these estimates, we collected commercial insurance premiums for a fixed level of coverage while holding nonprice factors constant (such as a change in the level of coverage). This is the same price proxy used in the 2009-based LTCH-specific market basket.

(7) Pharmaceuticals

We proposed to use the PPI Commodity for Pharmaceuticals for Human Use, Prescription (BLS series code WPUSI07003) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(8) Food: Direct Purchases

We proposed to use the PPI Commodity for Processed Foods and Feeds (BLS series code WPU02) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(9) Food: Contract Services

We proposed to use the CPI for Food Away From Home (All Urban Consumers) (BLS series code CUUR0000SEFV) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(10) Chemicals

We proposed to continue to use a four-part blended PPI composed of the PPI Industry for Industrial Gas Manufacturing (BLS series code PCU325120325120P), the PPI Industry for Other Basic Inorganic Chemical Manufacturing (BLS series code PCU32518–32518), the PPI Industry for Other Basic Organic Chemical Manufacturing (BLS series code PCU32519–32519), and the PPI Industry for Soap and Cleaning Compound Manufacturing (BLS series code PCU32561–32561). We proposed to update the blended weights using 2007 Benchmark I–O data, which we also proposed to use for the 2013-based LTCH market basket. The 2009-based LTCH-specific market basket included the same blended chemical price proxy, but used the 2002 Benchmark I–O data to determine the weights of the blended chemical price index. The 2007 Benchmark I–O data show more weight for organic chemical products and less weight for inorganic chemical products compared to the 2002 Benchmark I–O data.

Table VII–5 below shows the proposed (which, as we indicate later, we are finalizing) weights for each of the four PPIs used to create the blended PPI.

TABLE VII–5—BLENDED CHEMICAL PPI WEIGHTS

Name	Proposed and final 2013-based LTCH weights (percent)	2009-Based LTCH weights (percent)	NAICS
PPI Industry for Industrial Gas Manufacturing	32	35	325120
PPI Industry for Other Basic Inorganic Chemical Manufacturing	17	25	325180
PPI Industry for Other Basic Organic Chemical Manufacturing	45	30	325190
PPI Industry for Soap and Cleaning Compound Manufacturing	6	10	325610

(11) Medical Instruments

We proposed to use a blend for the Medical Instruments cost category. The 2007 Benchmark Input-Output data show an approximate 50/50 split between Surgical and Medical Instruments and Medical and Surgical Appliances and Supplies for this cost category. Therefore, we proposed to use a blend composed of 50 percent of the PPI Commodity for Surgical and Medical Instruments (BLS code WPU1562) and 50 percent of the PPI Commodity for Medical and Surgical Appliances and Supplies (BLS code WPU1563). The 2009-based LTCH-specific market basket used the single, higher level PPI Commodity for Medical, Surgical, and Personal Aid Devices (BLS series code WPU156). We stated in the proposed rule that we believe that the proposed price proxy better reflects the mix of expenses for this cost category as obtained from the 2007 Benchmark I–O data.

(12) Rubber and Plastics

We proposed to use the PPI Commodity for Rubber and Plastic Products (BLS series code WPU07) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(13) Paper and Printing Products

We proposed to use the PPI Commodity for Converted Paper and Paperboard Products (BLS series code WPU0915) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(14) Miscellaneous Products

We proposed to use the PPI Commodity for Finished Goods Less Food and Energy (BLS series code WPUFD4131) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(15) Professional Fees: Labor-Related

We proposed to use the ECI for Total Compensation for Private Industry Workers in Professional and Related (BLS series code CIU2010000120000I) to measure the price growth of this category. It includes occupations such as legal, accounting, and engineering services. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(16) Administrative and Facilities Support Services

We proposed to use the ECI for Total Compensation for Private Industry Workers in Office and Administrative Support (BLS series code CIU2010000220000I) to measure the price growth of this category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(17) Installation, Maintenance, and Repair Services

We proposed to use the ECI for Total Compensation for All Civilian Workers in Installation, Maintenance, and Repair (BLS series code CIU1010000430000I) to measure the price growth of this new cost category. Previously, these costs were included in the ''All Other: Labor-Related Services'' category and were proxied by the ECI for Total Compensation for Private Industry Workers in Service Occupations (BLS series code CIU2010000300000I). We stated in the proposed rule that we believe that this index better reflects the price changes of labor associated with maintenance-related services and its incorporation represents a technical improvement to the market basket.

(18) All Other: Labor-Related Services

We proposed to use the ECI for Total Compensation for Private Industry Workers in Service Occupations (BLS series code CIU2010000300000I) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(19) Professional Fees: Nonlabor-Related

We proposed to use the ECI for Total Compensation for Private Industry Workers in Professional and Related (BLS series code CIU2010000120000I) to measure the price growth of this category. This is the same price proxy that we are using for the Professional Fees: Labor-related cost category and the same price proxy used in the 2009-based LTCH-specific market basket.

(20) Financial Services

We proposed to use the ECI for Total Compensation for Private Industry Workers in Financial Activities (BLS series code CIU201520A000000I) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(21) Telephone Services

We proposed to use the CPI for Telephone Services (BLS series code CUUR0000SEED) to measure the price growth of this cost category. This is the same price proxy used in the 2009-based LTCH-specific market basket.

(22) All Other: Nonlabor-Related Services

We proposed to use the CPI for All Items Less Food and Energy (BLS series code CUUR0000SA0L1E) to measure the price growth of this cost category. We stated in the proposed rule that we believe that using the CPI for All Items Less Food and Energy avoids double counting of changes in food and energy prices as they are already captured elsewhere in the market basket. This is the same price proxy used in the 2009-based LTCH-specific market basket.

We did not receive any public comments on our proposed price proxies for the operating portion of the 2013-based LTCH market basket. Therefore, we are adopting our proposed price proxies for the operating

portion of the 2013-based LTCH market basket as final.

b. Price Proxies for the Capital Portion of the 2013-Based LTCH Market Basket

(1) Capital Price Proxies Prior to Vintage Weighting

We proposed to apply the same price proxies to the detailed capital-related cost categories as were applied in the 2009-based LTCH-specific market basket, which are described and provided in Table VII–7. We also proposed to continue to vintage weight the capital price proxies for Depreciation and Interest to capture the long-term consumption of capital. This vintage weighting method is the same method that was used for the 2009-based LTCH-specific market basket and is described in section VII.D.4.b.(2) of the preamble of this final rule.

We proposed to proxy the Depreciation: Building and Fixed Equipment cost category by BEA's Chained Price Index for Nonresidential Construction for Hospitals and Special Care Facilities (BEA Table 5.4.4. Price Indexes for Private Fixed Investment in Structures by Type); the Depreciation: Movable Equipment cost category by the PPI Commodity for Machinery and Equipment (BLS series code WPU11); the Nonprofit Interest cost category by the average yield on domestic municipal bonds (Bond Buyer 20-bond index); the For-Profit Interest cost category by the average yield on Moody's Aaa bonds (Federal Reserve); and the Other Capital-Related cost category by the CPI–U for Rent of Primary Residence (BLS series code CUUS0000SEHA). We stated in the proposed rule that we believe that these are the most appropriate proxies for LTCH capital-related costs that meet our selection criteria of relevance, timeliness, availability, and reliability.

We did not receive any public comments on our proposed price proxies for the capital portion of the 2013-based LTCH market basket. Therefore, we are adopting our proposed price proxies for the capital portion of the 2013-based LTCH market basket as final.

(2) Vintage Weights for Price Proxies

Because capital is acquired and paid for over time, capital-related expenses in any given year are determined by both past and present purchases of physical and financial capital. We stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25161) that the vintage-weighted capital-related portion of the 2013-based LTCH market basket is intended to capture the long-term consumption of capital, using vintage weights for depreciation (physical capital) and interest (financial capital). These vintage weights reflect the proportion of capital-related purchases attributable to each year of the expected life of building and fixed equipment, movable equipment, and interest. We proposed to use vintage weights to compute vintage-weighted price changes associated with depreciation and interest expenses.

Capital-related costs are inherently complicated and are determined by complex capital-related purchasing decisions, over time, based on such factors as interest rates and debt financing. In addition, capital is depreciated over time instead of being consumed in the same period it is purchased. By accounting for the vintage nature of capital, we are able to provide an accurate and stable annual measure of price changes. Annual nonvintage price changes for capital are unstable due to the volatility of interest rate changes and, therefore, do not reflect the actual annual price changes for LTCH capital-related costs. The capital-related component of the proposed 2013-based LTCH market basket reflects the underlying stability of the capital-related acquisition process.

To calculate the vintage weights for depreciation and interest expenses, we first needed a time series of capital-related purchases for building and fixed equipment and movable equipment. We found no single source that provides an appropriate time series of capital-related purchases by hospitals for all of the above components of capital purchases. The early Medicare cost reports did not have sufficient capital-related data to meet this need. Data we obtained from the American Hospital Association (AHA) did not include annual capital-related purchases. However, we were able to obtain data on total expenses back to 1963 from the AHA. Consequently, we proposed to use data from the AHA Panel Survey and the AHA Annual Survey to obtain a time series of total expenses for hospitals. We then proposed to use data from the AHA Panel Survey supplemented with the ratio of depreciation to total hospital expenses obtained from the Medicare cost reports to derive a trend of annual depreciation expenses for 1963 through 2013. We separated these depreciation expenses into annual amounts of building and fixed equipment depreciation and movable equipment depreciation as determined earlier. From these annual depreciation amounts, we derived annual end-of-year book values for building and fixed equipment and movable equipment using the expected life for each type of asset category. While data are not available that are specific to LTCHs, we believe that this information for all hospitals serves as a reasonable alternative for the pattern of depreciation for LTCHs. We used the AHA data and methodology to derive the FY 2010-based IPPS capital market basket (78 FR 50604), and the capital components of the 2012-based IRF (80 FR 47062) and 2012-based IPF market baskets (80 FR 46672).

To continue to calculate the vintage weights for depreciation and interest expenses, we also needed to account for the expected lives for building and fixed equipment, movable equipment, and interest for the 2013-based LTCH market basket. We proposed to calculate the expected lives using Medicare cost report data for LTCHs. The expected life of any asset can be determined by dividing the value of the asset (excluding fully depreciated assets) by its current year depreciation amount. This calculation yields the estimated expected life of an asset if the rates of depreciation were to continue at current year levels, assuming straight-line depreciation. Using this proposed method, we determined the average expected life of building and fixed equipment to be equal to 18 years, and the average expected life of movable equipment to be equal to 8 years. For the expected life of interest, we believe that vintage weights for interest should represent the average expected life of building and fixed equipment because, based on previous research described in the FY 1997 IPPS final rule (61 FR 46198), the expected life of hospital debt instruments and the expected life of buildings and fixed equipment are similar. We note that for the 2009-based LTCH-specific market basket, we used 2009 Medicare cost reports for LTCHs to determine the expected life of building and fixed equipment and movable equipment (77 FR 53467 through 53479). The 2009-based LTCH-specific market basket was based on an expected average life of building and fixed equipment of 20 years and an expected average life of movable equipment of 8 years.

Multiplying these expected lives by the annual depreciation amounts results in annual year-end asset costs for building and fixed equipment and movable equipment. We then calculated a time series, beginning in 1964, of annual capital purchases by subtracting the previous year's asset costs from the current year's asset costs.

For the building and fixed equipment and movable equipment vintage

weights, we proposed to use the real annual capital-related purchase amounts for each asset type to capture the actual amount of the physical acquisition, net of the effect of price inflation. These real annual capital-related purchase amounts are produced by deflating the nominal annual purchase amount by the associated price proxy as provided earlier in this final rule. For the interest vintage weights, we proposed to use the total nominal annual capital-related purchase amounts to capture the value of the debt instrument (including, but not limited to, mortgages and bonds). Using these capital-related purchase time series specific to each asset type, we proposed to calculate the vintage weights for building and fixed equipment, for movable equipment, and for interest.

The vintage weights for each asset type are deemed to represent the average purchase pattern of the asset over its expected life (in the case of building and fixed equipment and interest, 18 years, and in the case of movable equipment, 8 years). For each asset type, we proposed to use the time series of annual capital-related purchase amounts available from 2013 back to 1964. These data allow us to derive thirty-three 18-year periods of capital-related purchases for building and fixed equipment and interest, and forty-three 8-year periods of capital-related purchases for movable equipment. For each 18-year period for building and fixed equipment and interest, or 8-year period for movable equipment, we proposed to calculate annual vintage weights by dividing the capital-related purchase amount in any given year by the total amount of purchases over the entire 18-year or 8-year period. This calculation was done for each year in the 18-year or 8-year period and for each of the periods for which we have data. We then calculated the average vintage weight for a given year of the expected life by taking the average of these vintage weights across the multiple periods of data.

We did not receive any public comments on our proposed vintage weights for the 2013-based LTCH market basket. Therefore, we are adopting our proposed vintage weights as final.

The vintage weights for the capital-related portion of the proposed and final 2013-based LTCH market basket and the 2009-based LTCH-specific market basket are presented in Table VII–6 below.

TABLE VII–6—2013-BASED LTCH MARKET BASKET AND 2009-BASED LTCH-SPECIFIC MARKET BASKET VINTAGE WEIGHTS FOR CAPITAL-RELATED PRICE PROXIES

Year [1]	Building and fixed equipment		Movable equipment		Interest	
	2013-Based 18 years	2009-Based 20 years	2013-Based 8 years	2009-Based 8 years	2013-Based 18 years	2009-Based 20 years

Total	1.000	1.000	1.000	1.000	1.000	1.000

Note: Numbers may not add to total due to rounding.

[1] Vintage weight in the last year (for example, year 18 for the 2013-based LTCH market basket) is applied to the most recent data point and prior vintage weights are applied going back in time. For example, year 18 vintage weight is applied to the 2017q3 price proxy level, year 17 vintage weight is applied to the 2016q3 price proxy level, and so forth.

The process of creating vintage-weighted price proxies requires applying the vintage weights to the price proxy index where the last applied vintage weight in Table VII–6 is applied to the most recent data point. We have provided on the CMS Web site an example of how the vintage weighting price proxies are calculated, using example vintage weights and example price indices. The example can be found under the following CMS Web site link: *http://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/MedicareProgramRatesStats/MarketBasketResearch.html* in the zip file titled ''Weight Calculations as described in the IPPS FY 2010 Proposed Rule.''

c. Summary of Price Proxies of the 2013-Based LTCH Market Basket

Table VII–7 below shows both the operating and capital price proxies that we proposed and are using as final for the 2013-based LTCH market basket.

TABLE VII–7—PRICE PROXIES FOR THE 2013-BASED LTCH MARKET BASKET

Cost description	Price proxies	Weight
Total		100.0
Compensation		53.9
Wages and Salaries	ECI for Wages and Salaries for All Civilian Workers in Hospitals	46.6
Employee Benefits	ECI for Total Benefits for All Civilian Workers in Hospitals	7.3
Utilities		2.2
Electricity	PPI Commodity for Commercial Electric Power	1.0
Fuel, Oil, and Gasoline	Blend of the PPI Industry for Petroleum Refineries and PPI Commodity for Natural Gas.	1.1
Water & Sewerage	CPI–U for Water and Sewerage Maintenance	0.1
Professional Liability Insurance		0.9
Malpractice	CMS Hospital Professional Liability Insurance Premium Index	0.9
All Other Products and Services		33.2
All Other Products		16.3
Pharmaceuticals	PPI Commodity for Pharmaceuticals for human use, prescription	7.6
Food: Direct Purchases	PPI Commodity for Processed Foods and Feeds	1.8
Food: Contract Services	CPI–U for Food Away From Home	1.1
Chemicals	Blend of Chemical PPIs	0.7
Medical Instruments	Blend of the PPI Commodity for Surgical and Medical Instruments and PPI Commodity for Medical and Surgical Appliances and Supplies.	2.4
Rubber & Plastics	PPI Commodity for Rubber and Plastic Products	0.6
Paper and Printing Products	PPI Commodity for Converted Paper and Paperboard Products	1.2
Miscellaneous Products	PPI Commodity for Finished Goods Less Food and Energy	0.8
All Other Services		16.9
Labor-Related Services		8.3
Professional Fees: Labor-related	ECI for Total Compensation for Private Industry Workers in Professional and Related.	3.5
Administrative and Facilities Support Services	ECI for Total Compensation for Private Industry Workers in Office and Administrative Support.	0.9
Installation, Maintenance & Repair Services	ECI for Total Compensation for Civilian Workers in Installation, Maintenance, and Repair.	2.0
All Other: Labor-related Services	ECI for Total Compensation for Private Industry Workers in Service Occupations.	1.9
Nonlabor-Related Services		8.6
Professional Fees: Nonlabor-related	ECI for Total Compensation for Private Industry Workers in Professional and Related.	3.6
Financial services	ECI for Total Compensation for Private Industry Workers in Financial Activities.	2.9
Telephone Services	CPI–U for Telephone Services	0.7
All Other: Nonlabor-related Services	CPI–U for All Items Less Food and Energy	1.4
Capital-Related Costs		9.7
Depreciation		5.3
Fixed Assets	BEA chained price index for nonresidential construction for hospitals and special care facilities—vintage weighted (18 years).	3.9
Movable Equipment	PPI Commodity for machinery and equipment—vintage weighted (8 years).	1.4
Interest Costs		2.4
Government/Nonprofit	Average yield on domestic municipal bonds (Bond Buyer 20 bonds)—vintage weighted (18 years).	0.5
For Profit	Average yield on Moody's Aaa bonds—vintage weighted (18 years)	1.8
Other Capital-Related Costs	CPI–U for Rent of Primary Residence	2.0

Note: Sum of the cost weights for the detailed categories may not add to total cost weight for subcategory or total market basket due to rounding.

d. FY 2017 Market Basket Update for LTCHs

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25164), for FY 2017 (that is, October 1, 2016, through September 30, 2017), we proposed to use an estimate of the proposed 2013-based LTCH market basket to update payments to LTCHs based on the best available data. Consistent with historical practice, we estimate the LTCH market basket update for the LTCH PPS based on IHS Global Insight, Inc.'s (IGI's) forecast using the most recent available data. IGI is a nationally recognized economic and financial forecasting firm that contracts with CMS to forecast the components of the market baskets.

Based on IGI's first quarter 2016 forecast with history through the fourth quarter of 2015, the projected market basket update for FY 2017 was 2.7 percent. Therefore, consistent with our historical practice of estimating market basket increases based on the best available data, in the proposed rule, we proposed a market basket update of 2.7 percent for FY 2017. Furthermore, because the proposed FY 2017 annual update was based on the most recent market basket estimate for the 12-month period (2.7 percent) at the time of the proposed rule, we also proposed that if more recent data became subsequently available (for example, a more recent estimate of the market basket), we would use such data, if appropriate, to determine the FY 2017 annual update in the final rule.

Based on IGI's second quarter 2016 forecast with history through the first quarter of 2016, the projected market basket update for FY 2017 is 2.8 percent. Therefore, consistent with our

historical practice of estimating market basket increases based on the best available data, we are finalizing a market basket update of 2.8 percent for FY 2017 based on the 2013-based LTCH market basket. (As discussed in greater detail in section V.A.2. of the Addendum to this final rule, we are establishing an annual update of 1.75 percent to the LTCH PPS standard Federal payment rate for FY 2017 under § 412.523(c)(3)(xiii) of the regulations.)

Using the current 2009-based LTCH-specific market basket and IGI's second quarter 2016 forecast with history through the first quarter of 2016, the FY 2017 market basket update would also be 2.8 percent (before taking into account any statutory adjustment). Table VII–8 below compares the final 2013-based LTCH market basket and the 2009-based LTCH-specific market basket percent changes.

TABLE VII–8—2013-BASED LTCH MARKET BASKET AND 2009-BASED LTCH-SPECIFIC MARKET BASKET PERCENTAGE CHANGES, FY 2011 THROUGH FY 2019

Fiscal Year (FY)	2013-Based LTCH market basket index percent change	2009-Based LTCH market basket index percent change
Historical data:		
FY 2011	2.3	2.6
FY 2012	1.9	2.3
FY 2013	2.0	2.3
FY 2014	1.8	1.9
FY 2015	1.8	2.2
Average 2011–2015	2.0	2.3
Forecast:		
FY 2016	2.0	2.2
FY 2017	2.8	2.8
FY 2018	2.9	2.9
FY 2019	3.1	3.1
Average 2016–2019	2.7	2.8

Note: That these market basket percent changes do not include any further adjustments as may be statutorily required.
Source: IHS Global Insight, Inc. second quarter 2016 forecast.

Over the time period covering 2011 through 2015, the average growth rate of the 2013-based LTCH market basket is roughly 0.3 percentage point lower than the 2009-based LTCH-specific market basket. The lower growth rate is primarily a result of the lower pharmaceutical cost weight in the 2013-based market basket compared to the 2009-based LTCH-specific market basket. Historically, the price growth of pharmaceutical costs has exceeded the price growth rates for most of the other market basket cost categories. Therefore, a lower pharmaceutical cost weight would, all else equal, result in a lower market basket update. As stated above, the pharmaceutical cost weights for the 2013-based LTCH market basket and the 2009-based LTCH-specific market basket are based on the 2013 and 2009 Medicare cost report data for LTCHs, respectively.

e. FY 2017 Labor-Related Share

As discussed in section V.B. of the Addendum to this final rule, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, we established an adjustment to the LTCH PPS payments to account for differences in LTCH area wage levels (§ 412.525(c)). The labor-related portion of the LTCH PPS standard Federal payment rate, hereafter referred to as the labor-related share, is adjusted to account for geographic differences in area wage levels by applying the applicable LTCH PPS wage index.

The labor-related share is determined by identifying the national average proportion of total costs that are related to, influenced by, or vary with the local labor market. As discussed in more detail below and similar to the 2009-based LTCH-specific market basket, we classify a cost category as labor-related and include it in the labor-related share if the cost category is defined as being labor-intensive and its cost varies with the local labor market. As stated in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49798), the labor-related share for FY 2016 was defined as the sum of the FY 2016 relative importance of Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related Services; Administrative and Facilities Support Services (formerly referred to as Administrative and Business Support Services); All Other: Labor-related Services; and a portion of the Capital Costs from the 2009-based LTCH-specific market basket.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25165), we proposed to continue to classify a cost category as labor-related if the costs are labor-intensive and vary with the local labor market. Given this, based on our definition of the labor-related share and the cost categories in the proposed 2013-based LTCH market basket, we proposed to include in the labor-related share for FY 2017 the sum of the FY 2017 relative importance of Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-related Services; and a portion of the Capital-Related cost weight from the proposed 2013-based LTCH market basket. As noted in section VII.D.3.e. of the preamble of this final rule, for the proposed 2013-based LTCH market basket, we proposed and are finalizing the creation of a separate cost category for Installation, Maintenance, and Repair services. These expenses were previously included in the ''All Other Labor-related Services'' cost category in the 2009-based LTCH-specific market basket, along with other services, including, but not limited to, janitorial, waste management, security, and dry cleaning/laundry services. Because these services tend to be labor-intensive and are mostly performed at the facility (and, therefore, unlikely to be purchased in the national market), we continue to believe that they meet our definition of labor-related services.

For the development of the 2009-based LTCH-specific market basket, in an effort to more accurately determine the share of professional fees for services such as accounting and auditing services, engineering services, legal services, and management and

consulting services that should be included in the labor-related share, we used data from a survey of IPPS hospitals regarding the proportion of those fees that go to companies that are located beyond their own local labor market. The results from this survey were then used to separate a portion of the Professional Fees cost category into labor-related and nonlabor-related costs. These results and our allocation methodology are discussed in more detail in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51766). For the proposed 2013-based LTCH market basket, we proposed to apply these survey results using this same methodology to separate the Professional Fees cost category into Professional Fees: Labor-related and Professional Fees: Nonlabor-related cost categories. We stated in the proposed rule that we believe that using the survey results serves as an appropriate proxy for the purchasing patterns of professional services for LTCHs because they also are providers of institutional care.

In addition to the professional services listed above, we proposed to classify expenses under NAICS 55, Management of Companies and Enterprises, into the Professional Fees: Labor-related and Professional Fees: Nonlabor-related cost categories, as was done for the 2009-based LTCH-specific market basket. The NAICS 55 industry is mostly comprised of corporate, subsidiary, and regional managing offices (otherwise referred to as home offices). As stated above, we classify a cost category as labor-related and include it in the labor-related share if the cost category is labor-intensive and if its costs vary with the local labor market. We believe that many of the costs associated with NAICS 55 are labor-intensive and vary with the local labor market. However, data indicate that not all LTCHs with home offices have home offices located in their local labor market. Therefore, we proposed to include in the labor-related share only a proportion of the NAICS 55 expenses based on the methodology described below.

For the 2009-based LTCH-specific market basket, we used data primarily from the Medicare cost reports and a CMS database of Home Office Medicare Records (HOMER) (a database that provides city and State information (addresses) for home offices) and determined that 13 percent of the total number of LTCHs that had home offices had those home offices located in their respective local labor markets—defined as being in the same Metropolitan Statistical Area (MSA). Therefore, we classified 13 percent of these costs into the ''Professional Fees: Labor-related Services'' cost category and the remaining 87 percent into the ''Professional Fees: Nonlabor-related Services'' cost category. For a detailed discussion of this analysis, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53478).

For the proposed 2013-based LTCH market basket, we conducted a similar analysis of home office data. For consistency, we believe that it is important for our analysis on home office data to be conducted on the same LTCHs used to derive the proposed 2013-based LTCH market basket cost weights. The Medicare cost report requires a hospital to report information regarding their home office provider. Approximately 56 percent of LTCHs reported some type of home office information on their Medicare cost report for 2013 (for example, home office number, city, state, zip code, or name). For those providers for which we were able to identify which MSA the LTCH's home office was located, we then compared the home office MSA with the LTCH facility's MSA.

We found that 7 percent of the LTCHs with home offices had those home offices located in the same MSA as their facilities. We then concluded that these providers were located in the same local labor market as their home office. As a result, we proposed to apportion the NAICS 55 expense data by this percentage. Therefore, we proposed to classify 7 percent of these costs into the ''Professional Fees: Labor-related Services'' cost category and the remaining 93 percent of these costs into the ''Professional Fees: Nonlabor-related Services'' cost category.

Using this proposed method and the IGI forecast for the first quarter 2016 of the proposed 2013-based LTCH market basket, the proposed LTCH labor-related share for FY 2017 was the sum of the FY 2017 relative importance of each labor-related cost category.

We did not receive any public comments on our proposed methodology for determining the FY 2017 labor-related share based on the 2013-based LTCH market basket. Therefore, we are finalizing our methodology as proposed.

Consistent with our policy to update the labor-related share with the most recent available data, the labor-related share for this final rule reflects IGI's second quarter 2016 forecast of the 2013-based LTCH market basket. Table VII–9 below shows the FY 2017 relative importance labor-related share using the 2013-based LTCH market basket and the FY 2016 relative importance labor-related share using the 2009-based LTCH-specific market basket.

TABLE VII–9—LTCH LABOR-RELATED SHARE

	FY 2017 Final labor-related share [1]	FY 2017 Proposed labor-related share [2]	FY 2016 Final labor-related share [3]
Wages and Salaries	46.5	46.6	44.6
Employee Benefits	7.3	7.3	8.1
Professional Fees: Labor-Related	3.5	3.5	2.2
Administrative and Facilities Support Services	0.9	0.9	0.5
Installation, Maintenance, and Repair Services [4]	2.1	2.1	
All Other: Labor-Related Services	1.9	1.9	2.5
Subtotal	62.2	62.3	57.9
Labor-related portion of capital (46%)	4.3	4.3	4.1
Total Labor-Related Share	66.5	66.6	62.0

[1] Based on the 2013-based LTCH market basket, IHS Global Insight, Inc. 2nd quarter 2016 forecast.
[2] Based on the proposed 2013-based LTCH market basket, IHS Global Insight, Inc. 1st quarter 2016 forecast.
[3] **Federal Register**, 80 FR 49478.
[4] Installation, Maintenance, and Repair Services costs were previously included in the All Other: Labor-Related Services cost weight of the 2009-based LTCH-specific market basket.

The labor-related share for FY 2017 is the sum of the FY 2017 relative importance of each labor-related cost category, and reflects the different rates of price change for these cost categories between the base year (2013) and FY 2017. The sum of the relative importance for FY 2017 for operating costs (Wages and Salaries, Employee Benefits, Professional Fees: Labor-Related, Administrative and Facilities Support Services, Installation, Maintenance, and Repair Services, All Other: Labor-Related Services) is 62.2 percent, as shown in Table VII–9 above. As we proposed, we established that the portion of capital-related costs that is influenced by the local labor market is estimated to be 46 percent, which is the same percentage applied to the 2009-based LTCH-specific market basket (77 FR 53478). Because the relative importance for capital-related costs is 9.3 percent of the 2013-based LTCH market basket in FY 2017, as we proposed, we are taking 46 percent of 9.3 percent to determine the labor-related share of capital-related costs for FY 2017 (.46 × 9.3). The result is 4.3 percent, which we added to 62.2 percent for the operating cost amount to determine the total labor-related share for FY 2017. Therefore, the labor-related share that we used for the LTCH PPS in FY 2017 is 66.5 percent. This labor-related share is determined using the same methodology as employed in calculating all previous LTCH labor-related shares.

The FY 2017 labor-related share using the 2013-based LTCH market basket is 4.5 percentage points higher than the FY 2016 labor-related share using the 2009-based LTCH-specific market basket. The primary reason for a higher labor-related share, which we describe in more detail below, is a result of the change in the quantity of labor, particularly for professional services, outpacing the change in quantity of products (which are not included in the labor-related share) between 2009 and 2013, which more than offsets the faster relative growth in prices for products.

Roughly three-quarters of the 4.5 percentage points difference is the result of higher base year cost weights for the Professional Fees: Labor-Related, Administrative and Facilities Support Services, All Other: Labor-Related services, and Installation, Maintenance, and Repair services cost categories for the 2013-based LTCH market basket compared to the 2009-based LTCH-specific market basket. We refer to these cost categories collectively as ''Labor-Related Services.'' As stated earlier, installation, maintenance and repair costs were previously classified in the All Other: Labor-Related Services cost category of the 2009-based LTCH-specific market basket.

In aggregate, the base year cost weights for the Labor-Related Services cost categories in the 2013-based LTCH market basket are 3.0 percentage points higher than the 2009-based LTCH-specific market basket cost weights. As described in section VII.D.3.e. of the preamble of this final rule, the detailed cost categories of the LTCH market basket (including the Labor-Related Services cost categories) are derived by multiplying the ''All Other'' residual cost weight (which reflects all remaining costs that are not captured in the six major cost category weights calculated using the LTCH Medicare Cost Report data (Wages and Salaries, Employee Benefits, Contract Labor, Professional Liability Insurance, Pharmaceuticals, and Capital)) by the detailed cost weights calculated from the Benchmark I–O data. Therefore, the differences between the Labor-Related Services cost weights between the 2013-based LTCH market basket and the 2009-based LTCH-specific market basket are a function of the change in the ''All Other'' residual cost category weight and changes to the Benchmark I–O data. Approximately 0.6 percentage point of the 3.0 percentage points difference is attributable to the higher ''All Other'' residual cost category weight of the 2013-based LTCH market basket compared to the 2009-based LTCH-specific market basket, while the remaining 2.4 percentage points is due to the changes in the Benchmark I–O cost weights derived from the 2007 data used in the 2013-based LTCH market basket and the 2002 data used in the 2009-based LTCH-specific market basket.

Roughly one-quarter of the 4.5 percentage points difference between the FY 2017 labor-related share using the 2013-based LTCH market basket and the FY 2016 labor-related share using the 2009-based LTCH-specific market basket is a result of the Compensation cost weight. There are two key factors causing this differential. First, using the 2013 Medicare cost reports, we calculated a Compensation cost weight that is 53.9 percent for the 2013-based LTCH market basket, which reflects both the change in price and change in quantity of compensation. This is 0.9 percentage point higher than the FY 2013 relative importance moving average using the 2009-based LTCH-specific market basket (53.0 percent), which only reflects relative price changes between 2009 and 2013. Second, the relative price growth from FY 2013 to the payment year between the 2009-based LTCH-specific market basket and the 2013-based LTCH market basket also contributes to the difference. For the 2009-based LTCH-specific market basket, the relative importance for compensation decreases from 53.0 percent in FY 2013 to 52.6 percent in FY 2016, a reduction of 0.4 percentage point. For the 2013-based LTCH market basket, the base weight of 53.9 percent in 2013 is 0.1 percentage point lower than the relative importance in FY 2017 (53.8 percent). These two factors combined produce the 1.2 percentage point difference in the relative importance for compensation in FY 2016 and FY 2017 as shown in Table VII–9.

As noted above, the market basket is described as a fixed-weight index because it represents the change in price over time of a constant mix (quantity and intensity) of goods and services needed to furnish hospital services. The effects on total expenditures resulting from changes in the mix of goods and services purchased subsequent to the base period are not measured. Only when the index is rebased would changes in the quantity and intensity be captured, with those changes being reflected in the cost weights. Therefore, we rebase the market basket periodically so that the cost weights reflect recent mix of goods and services that hospitals purchase (hospital inputs) to furnish inpatient care.

E. Changes to the LTCH PPS Payment Rates and Other Changes to the LTCH PPS for FY 2017

1. Overview of Development of the LTCH PPS Standard Federal Payment Rates

The basic methodology for determining LTCH PPS standard Federal prospective payment rates is currently set forth at 42 CFR 412.515 through 412.536. In this section, we discuss the factors that are used to update the LTCH PPS standard Federal payment rate for FY 2017, that is, effective for LTCH discharges occurring on or after October 1, 2016 through September 30, 2017. Under the dual rate LTCH PPS payment structure required by statute, beginning with FY 2016, only LTCH discharges that meet the criteria for exclusion from the site neutral payment rate are paid based on the LTCH PPS standard Federal payment rate specified at § 412.523. (For additional details on our finalized policies related to the dual rate LTCH PPS payment structure required by statute, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623).)

For details on the development of the initial FY 2003 standard Federal rate, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 56027 through 56037). For subsequent updates to the LTCH PPS standard Federal rate as implemented under § 412.523(c)(3), we refer readers to the following final rules: RY 2004 LTCH PPS final rule (68 FR 34134 through 34140); RY 2005 LTCH PPS final rule (68 FR 25682 through 25684); RY 2006 LTCH PPS final rule (70 FR 24179 through 24180); RY 2007 LTCH PPS final rule (71 FR 27819 through 27827); RY 2008 LTCH PPS final rule (72 FR 26870 through 27029); RY 2009 LTCH PPS final rule (73 FR 26800 through 26804); FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 44021 through 44030); FY 2011 IPPS/LTCH PPS final rule (75 FR 50443 through 50444); FY 2012 IPPS/LTCH PPS final rule (76 FR 51769 through 51773); FY 2013 IPPS/LTCH PPS final rule (77 FR 53479 through 53481); FY 2014 IPPS/LTCH PPS final rule (78 FR 50760 through 50765); FY 2015 IPPS/LTCH PPS final rule (79 FR 50176 through 50180) and FY 2016 IPPS/LTCH PPS final rule (80 FR 49634 through 49637).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25167 through 25169), we presented our proposed policies related to the annual update to the LTCH PPS standard Federal payment rate for FY 2017, which includes the annual market basket update. Consistent with our historical practice of using the best data available, we also proposed to use more recent data to determine the FY 2017 annual market basket update to the LTCH PPS standard Federal payment rate in the final rule.

The application of the update to the LTCH PPS standard Federal payment rate for FY 2017 is presented in section V.A. of the Addendum to this final rule. The components of the proposed and final annual market basket update to the LTCH PPS standard Federal payment rate for FY 2017 are discussed below, including the reduction to the annual update for LTCHs that fail to submit quality reporting data for FY 2017 as required by the statute (as discussed in section VII.E.2.d. of the preamble of this final rule). In addition, we are making an adjustment to the LTCH PPS standard Federal payment rate to account for the estimated effect of the changes to the area wage level adjustment for FY 2017 on estimated aggregate LTCH PPS payments, in accordance with § 412.523(d)(4) (as discussed in section V.B. of the Addendum to this final rule).

2. FY 2017 LTCH PPS Standard Federal Payment Rate Annual Market Basket Update

a. Overview

Historically, the Medicare program has used a market basket to account for input price increases in the services furnished by providers. The market basket used for the LTCH PPS includes both operating and capital related costs of LTCHs because the LTCH PPS uses a single payment rate for both operating and capital-related costs. We adopted the 2009-based LTCH-specific market basket for use under the LTCH PPS beginning in FY 2013. For additional details on the historical development of the market basket used under the LTCH PPS, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53467 through 53476). In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25153 through 25167), we proposed to rebase and revise the 2009-based LTCH-specific market basket, primarily based on Medicare cost report data for LTCHs for 2013, which we are adopting in this final rule after consideration of public comments. We refer readers to section VII.D. of the preamble of the proposed rule and this final rule for a complete discussion of the LTCH market basket and a description of the methodologies we used for determining the operating and capital-related portions of the 2013-based LTCH market basket.

Section 3401(c) of the Affordable Care Act provides for certain adjustments to any annual update to the LTCH PPS standard Federal payment rate and refers to the timeframes associated with such adjustments as a ''rate year'' (which are discussed in more detail in section VII.C.2.b. of the preamble of this final rule.) We note that because the annual update to the LTCH PPS policies, rates, and factors now occurs on October 1, we adopted the term ''fiscal year'' (FY) rather than ''rate year'' (RY) under the LTCH PPS beginning October 1, 2010, to conform with the standard definition of the Federal fiscal year (October 1 through September 30) used by other PPSs, such as the IPPS (75 FR 50396 through 50397). Although the language of sections 3004(a), 3401(c), 10319, and 1105(b) of the Affordable Care Act refers to years 2010 and thereafter under the LTCH PPS as ''rate year,'' consistent with our change in the terminology used under the LTCH PPS from ''rate year'' to ''fiscal year,'' for purposes of clarity, when discussing the annual update for the LTCH PPS standard Federal payment rate, including the provisions of the Affordable Care Act, we use ''fiscal year'' rather than ''rate year'' for 2011 and subsequent years.

b. Market Basket Under the LTCH PPS for FY 2017

Under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, we adopted a 2009-based LTCH-specific market basket for use under the LTCH PPS beginning in FY 2013. The 2009-based LTCH-specific market basket is based solely on the Medicare cost report data submitted by LTCHs and, therefore, specifically reflects the cost structures of only LTCHs. For additional details on the development of the 2009-based LTCH-specific market basket, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53467 through 53476).

For FY 2017, as noted earlier, we are rebasing and revising the 2009-based LTCH-specific market basket to reflect a 2013 base year. As explained in section VII.D. of the preamble of this final rule, we used 2013 Medicare cost reports because these represent the most recent, complete set of Medicare cost report data for purposes of calculating cost weights for the LTCH market basket, and we believe that the 2013-based LTCH market basket appropriately reflects the cost structure of LTCHs. In this final rule, we are using the 2013-based LTCH market basket to update the LTCH PPS standard Federal payment rate for FY 2017, as we proposed.

c. Revision of Certain Market Basket Updates As Required by the Affordable Care Act

Section 1886(m)(3)(A) of the Act, as added by section 3401(c) of the Affordable Care Act, specifies that, for rate year 2010 and each subsequent rate year through 2019, any annual update to the LTCH PPS standard Federal payment rate shall be reduced:

- For rate year 2010 through 2019, by the ''other adjustment'' specified in sections 1886(m)(3)(A)(ii) and (m)(4)(F) of the Act; and
- For rate year 2012 and each subsequent year, by the productivity adjustment (which we refer to as ''the multifactor productivity (MFP) adjustment'') described in section 1886(b)(3)(B)(xi)(II) of the Act.

Section 1886(m)(3)(B) of the Act provides that the application of paragraph (3) of section 1886(m) of the Act may result in the annual update being less than zero for a rate year, and may result in payment rates for a rate year being less than such payment rates for the preceding rate year.

Section 1886(b)(3)(B)(xi)(II) of the Act defines the MFP adjustment as equal to the 10-year moving average of changes

in annual economy-wide, private nonfarm business multifactor productivity (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, calendar year, cost reporting period, or other annual period). Under our methodology, the end of the 10-year moving average of changes in the MFP coincides with the end of the appropriate fiscal year update period. In addition, the MFP adjustment that is applied in determining any annual update to the LTCH PPS standard Federal payment rate is the same adjustment that is required to be applied in determining the applicable percentage increase under the IPPS under section 1886(b)(3)(B)(i) of the Act, as they are both based on a fiscal year. (We refer readers to section IV.A.1. of the preamble of FY 2016 IPPS/LTCH PPS final rule for more information on the current MFP adjustment.)

d. Adjustment to the LTCH PPS Standard Federal Payment Rate Under the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

In accordance with section 1886(m)(5) of the Act, as added by section 3004(a) of the Affordable Care Act, the Secretary established the Long-Term Care Hospital Quality Reporting Program (LTCH QRP). The reduction in the annual update to the LTCH PPS standard Federal payment rate for failure to report quality data under the LTCH QRP for FY 2014 and subsequent fiscal years is codified under § 412.523(c)(4) of the regulations. (As previously noted, although the language of section 3004(a) of the Affordable Care Act refers to years 2011 and thereafter under the LTCH PPS as ''rate year,'' consistent with our change in the terminology used under the LTCH PPS from ''rate year'' to ''fiscal year,'' for purposes of clarity, when discussing the annual update for the LTCH PPS, including the provisions of the Affordable Care Act, we use ''fiscal year'' rather than ''rate year'' for 2011 and subsequent years.) The LTCH QRP, as required for FY 2014 and subsequent fiscal years by section 1886(m)(5)(A)(i) of the Act, applies a 2.0 percentage point reduction to any update under § 412.523(c)(3) for an LTCH that does not submit quality reporting data to the Secretary in accordance with section 1886(m)(5)(C) of the Act with respect to such a year (that is, in the form and manner and at the time specified by the Secretary under the LTCH QRP) (§ 412.523(c)(4)(i)). Section 1886(m)(5)(A)(ii) of the Act provides that the application of the 2.0 percentage points reduction may result in an annual update that is less than 0.0 for a year, and may result in LTCH PPS payment rates for a year being less than such LTCH PPS payment rates for the preceding year (§ 412.523(c)(4)(iii)). Furthermore, section 1886(m)(5)(B) of the Act specifies that the 2.0 percentage points reduction is applied in a noncumulative manner, such that any reduction made under section 1886(m)(5)(A) of the Act shall apply only with respect to the year involved, and shall not be taken into account in computing the LTCH PPS payment amount for a subsequent year (§ 412.523(c)(4)(ii)). We discuss the application of the 2.0 percentage point reduction under § 412.523(c)(4)(i) in our discussion of the annual market basket update to the LTCH PPS standard Federal payment rate for FY 2017 in section VII.E.2.e. of the preamble of this final rule. (For additional information on the history of the LTCH QRP, including the statutory authority and the selected measures, we refer readers to section VII.C. of the preamble of this final rule.)

e. Annual Market Basket Update Under the LTCH PPS for FY 2017

Consistent with our historical practice, we estimate the market basket update and the MFP adjustment based on IGI's forecast using the most recent available data. Based on IGI's second quarter 2016 forecast, the FY 2017 full market basket increase for the LTCH PPS using the finalized 2013-based LTCH market basket is 2.8 percent, as discussed in section VII.D.4.d. of the preamble of this final rule. The current estimate of the MFP adjustment for FY 2017 based on IGI's second quarter 2016 forecast is 0.3 percent, as discussed in section VII.E.2.c. of the preamble of this final rule. Consistent with our historical practice, as we proposed, we used a more recent estimate of the market basket increase and the MFP adjustment to determine the FY 2017 market basket update and the MFP adjustment for FY 2017 in this final rule.

For FY 2017, section 1886(m)(3)(A)(i) of the Act requires that any annual update to the LTCH PPS standard Federal payment rate be reduced by the productivity adjustment (''the MFP adjustment'') described in section 1886(b)(3)(B)(xi)(II) of the Act. Consistent with the statute, as we proposed, we reduced the full FY 2017 market basket increase by the FY 2017 MFP adjustment. To determine the market basket update for LTCHs for FY 2017, as reduced by the MFP adjustment, consistent with our established methodology, we subtracted the FY 2017 MFP adjustment from the FY 2017 market basket update. Furthermore, sections 1886(m)(3)(A)(ii) and 1886(m)(4)(F) of the Act requires that any annual update to the LTCH PPS standard Federal payment rate for FY 2017 be reduced by the ''other adjustment'' described in paragraph (4), which is 0.75 percentage point for FY 2017. Therefore, following application of the productivity adjustment, as we proposed, we further reduced the adjusted market basket update (that is, the full market basket increase less the MFP adjustment) by the ''other adjustment'' specified by sections 1886(m)(3)(A)(ii) and 1886(m)(4) of the Act. (For additional details on our established methodology for adjusting the market basket increase by the MFP and the ''other adjustment'' required by the statute, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51771).)

For FY 2017, section 1886(m)(5) of the Act requires that, for LTCHs that do not submit quality reporting data as required under the LTCH QRP, any annual update to an LTCH PPS standard Federal payment rate, after application of the adjustments required by section 1886(m)(3) of the Act, shall be further reduced by 2.0 percentage points. Therefore, the update to the LTCH PPS standard Federal payment rate for FY 2017 for LTCHs that fail to submit quality reporting data under the LTCH QRP, the full LTCH PPS market basket increase, subject to an adjustment based on changes in economy-wide productivity (''the MFP adjustment'') as required under section 1886(m)(3)(A)(i) of the Act and an additional reduction required by sections 1886(m)(3)(A)(ii) and 1886(m)(4) of the Act, will also be further reduced by 2.0 percentage points.

In this final rule, in accordance with the statute, we reduced the FY 2017 full market basket increase of 2.8 percent (based on IGI's second quarter 2016 forecast of the 2013-based LTCH market basket) by the FY 2017 MFP adjustment of 0.3 percentage point (also based on IGI's second quarter 2016 forecast). Following application of the productivity adjustment, the adjusted market basket update of 2.5 percent (2.8 percent minus 0.3 percentage point) was then further reduced by 0.75 percentage point, as required by sections 1886(m)(3)(A)(ii) and 1886(m)(4)(F) of the Act. Therefore, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, we are establishing an annual market basket update under to the LTCH PPS standard Federal payment rate for FY 2017 of 1.75 percent (that is, the most recent estimate of the LTCH PPS market basket

increase of 2.8 percent, less the MFP adjustment of 0.3 percentage point, and less the 0.75 percentage point required under section 1886(m)(4)(F) of the Act). Accordingly, we are finalizing our proposed revision to § 412.523(c)(3) by adding a new paragraph (xiii), which specifies that the LTCH PPS standard Federal payment rate for FY 2017 is the LTCH PPS standard Federal payment rate for the previous LTCH PPS year updated by 1.75 percent, and as further adjusted, as appropriate, as described in § 412.523(d). For LTCHs that fail to submit quality reporting data under the LTCH QRP, under § 412.523(c)(3)(xiii) in conjunction with § 412.523(c)(4), we further reduced the annual update to the LTCH PPS standard Federal payment rate by 2.0 percentage points in accordance with section 1886(m)(5) of the Act. Accordingly, we are establishing an annual update to the LTCH PPS standard Federal payment rate of −0.25 percent (that is, 1.75 percent minus 2.0 percentage points) for FY 2017 for LTCHs that fail to submit quality reporting data as required under the LTCH QRP. As stated above, consistent with our historical practice, we used a more recent estimate of the market basket and the MFP adjustment to establish an annual update to the LTCH PPS standard Federal payment rate for FY 2017 under § 412.523(c)(3)(xiii) in this final rule. (We note that, consistent with historical practice, we also adjusted the FY 2017 LTCH PPS standard Federal payment rate by an area wage level budget neutrality factor in accordance with § 412.523(d)(4) (as discussed in section V.B. of the Addendum to this final rule).)

3. Update Under the Payment Adjustment for ''Subclause (II)'' LTCHs

Under the LTCH PPS payment adjustment for ''subclause (II) LTCHs'' at § 412.526(c)(1)(ii), we established that, for cost reporting periods beginning during fiscal years after FY 2015, the target amount (used to determine the adjusted payment for Medicare inpatient operating costs under reasonable cost-based reimbursement rules) will equal the hospital's target amount for the previous cost reporting period updated by the applicable annual rate-of-increase percentage specified in § 413.40(c)(3) for the subject cost reporting period (79 FR 50197). For FY 2017, in accordance with § 412.526(c)(2)(ii) of the regulations, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25169), we proposed that, for cost reporting periods beginning during FY 2017, the update to the target amount for the payment adjustment for ''subclause (II)'' LTCHs would be 2.8 percent, which was the estimated market basket update for FY 2017 to the rate-of-increase limits for certain hospitals excluded from the IPPS that are paid on a reasonable cost basis (that is, the applicable annual rate-of-increase percentage under § 413.40(c)(3)(viii)), which is discussed in section VI. of the preamble of the proposed rule, is the FY 2017 rate-of-increase percentage estimate for updating the target amounts, and is equal to the estimated percentage increase in the FY 2010-based IPPS operating market basket, in accordance with applicable regulations at § 413.40(c)(3)(viii).

Based on IGI's 2016 first quarter forecast, with historical data through the 2015 fourth quarter, in the proposed rule, we estimated that the FY 2010-based IPPS operating market basket update for FY 2017 was 2.8 percent (that is, the estimate of the market basket rate-of-increase). Therefore, we proposed that the rate-of-increase percentage that would be applied to the FY 2016 target amounts in order to determine the FY 2017 target amounts for ''subclause (II) LTCHs'' under § 412.526(c)(1)(i) was 2.8 percent. This is the same applicable annual rate-of-increase percentage that would be provided for FY 2017 under § 413.40(c)(3), as discussed in section VI. of the preamble of the proposed rule. Consistent with our historical practice of using the best available data, we also proposed we would use a more recent estimate of the market basket increase to determine the FY 2017 rate-of-increase percentage to determine the FY 2017 target amounts for ''subclause (II) LTCHs'' in this final rule.

Comment: Commenters agreed with the proposed rate-of-increase percentage to determine the FY 2017 target amounts for ''subclause (II) LTCHs'' and understood that it was subject to change based on more recent data in the final rule.

Response: We appreciate the commenters' review and agreement with our proposal regarding the rate-of-increase percentage for ''subclause (II) LTCHs'' for FY 2017.

Accordingly, for this final rule, we used IGI's 2016 second quarter forecast, with historical data through the 2016 first quarter, to estimate the final FY 2010-based IPPS operating market basket update for FY 2017 of 2.7 percent (that is, the estimate of the market basket rate-of-increase). Therefore, the rate-of-increase percentage that will apply to the FY 2016 target amounts in order to determine the target amount for cost reporting periods beginning in FY 2017 for ''subclause (II) LTCHs'' under § 412.526(c)(1)(i) is 2.7 percent. As proposed, this rate-of-increase percentage is the same as the estimated market basket update for FY 2017 to the rate-of-increase limits for certain hospitals excluded from the IPPS that are paid on a reasonable cost basis (that is, the applicable annual rate-of-increase percentage under § 413.40(c)(3)(viii)), which is discussed in section VI. of the preamble of this final rule.

F. Modifications to the ''25-Percent Threshold Policy'' Payment Adjustments (§§ 412.534 and 412.536)

The ''25-percent threshold policy'' is a per discharge payment adjustment in the LTCH PPS that is applied to payments for Medicare patient discharges from an LTCH when the number of such patients originating from any single referring hospital is in excess of the applicable threshold for a given cost reporting period (such threshold is generally set at 25 percent, with exceptions for rural and urban single or MSA-dominant hospitals). If an LTCH exceeds the applicable threshold during a cost reporting period, payment for the discharge that puts the LTCH over its threshold and all discharges subsequent to that discharge in the cost reporting period from the referring hospital are adjusted at cost report settlement (discharges not in excess of the threshold are unaffected by the 25-percent threshold policy). Each cost reporting period begins a new threshold determination; therefore, subsequent cost reporting periods are unaffected by exceeding the applicable percentage threshold requirements in a prior period.

The adjusted payment amount for those discharges that are subject to the current 25-percent threshold policy is calculated as the lesser of the applicable LTCH PPS payment amount or the IPPS equivalent amount. We note that the IPPS equivalent amount under the 25-percent threshold policy differs somewhat from the IPPS comparable per diem amount applicable under the site neutral payment rate policy at § 412.522(c)(1)(i) and the short-stay outlier (SSO) policy at § 412.529(d)(4). For a discussion of the calculation of the IPPS comparable per diem amount under § 412.529(d)(4) and the IPPS equivalent amount under existing §§ 412.534(f) and 412.536(e), including details on the differences in the calculations, we refer readers to our response to comments in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50772).

The 25-percent threshold policy was originally established in the FY 2005 IPPS final rule for LTCH hospital-

within-hospitals (HwHs) and satellites (69 FR 49191 through 49214). It addressed patient shifting driven by financial considerations, rather than patient benefit. Specifically, it addressed the negative incentives that may result from the co-location of facilities which can create incentives for behaviors which result in two hospital stays, and two Medicare payments, for what was essentially one episode of patient care—and a financial windfall for both providers, as compared to acute care hospitals that were not co-located with an LTCH. It also addressed statutory limits for LTCHs, namely concerns that these LTCHs were, in essence, behaving as long-term care ''units'' of the co-located hospitals (an arrangement prohibited under section 1886(d)(1)(B) of the Act). In order to discourage such activities, CMS initially established a payment adjustment at § 412.534 for discharges in which the patient was admitted to the LTCH location from a co-located referring hospital in excess of an applicable percentage threshold. Implementation was phased in, but ultimately was generally set at a 25-percent threshold after specified phase-in periods. A full discussion of the original 25-percent threshold policy is contained in the FY 2005 IPPS final rule (69 FR 49191 through 49214).

While initially limited to co-located facilities, in keeping with the suggestions of MedPAC and other commenters, CMS noted that it would continue to monitor claims data for signs that common ownership between hospitals that did not share a location also encouraged discharge and admission decisions based on payment rather than clinical considerations (69 FR 49202 through 19203). This continued monitoring, including analysis of discharge patterns from the FY 2005 MedPAR files, identified additional patterns of patient shifting and worrisome admission practices between LTCHs and referring hospitals that were not co-located that were similar to the patterns identified in the FY 2004 MedPAR files between co-located LTCHs and their host hospitals. In response to these findings, we expanded the 25-percent threshold policy in the RY 2008 LTCH PPS final rule to include all LTCHs and LTCH satellite facilities through the amendment of § 412.534 (including those certain LTCHs which had been grandfathered from the original policy established in the FY 2005 rule) and the addition of § 412.536 (governing patients admitted from hospitals not co-located with the LTCH). A full discussion of this policy can be found in the RY 2008 LTCH PPS final rule (72 FR 26919 through 26944).

The resulting 25-percent threshold policy was to have been phased in over 3 years, and, when fully implemented, the 25-percent threshold policy would have applied to nearly all LTCHs or LTCH satellites and remote locations admitting patients from any hospital, regardless of the location or ownership of the referring hospital. (For the remainder of this section, we refer to the policies under § 412.534 and § 412.536 and new § 412.538 collectively as the ''25-percent threshold policy'' unless otherwise indicated.) However, several laws mandated delayed implementation of the policy, including, most recently, section 1206 of the Pathway for Sustainable Growth Rate (SGR) Reform Act (Pub. L. 113–67). Section 1206(b)(1)(B) provides a permanent exemption from the application of the 25-percent threshold policy for co-located LTCHs that were excluded from the original policy in the FY 2005 IPPS final rule. Section 1206(b)(1)(A) extended prior moratoria on the full implementation of the 25-percent threshold policy until cost reporting periods beginning on or after either July 1, 2016 (for LTCHs subject to 42 CFR 412.534) or October 1, 2016 (for LTCHs subject to 42 CFR 412.536). For more details on the various laws that delayed the full implementation of the 25 percent threshold policy, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50356 through 50357).

With the impending expiration of the most recent statutory delay of the full implementation of the 25-percent threshold policy and the recent implementation of a dual rate payment system for the revised LTCH PPS for cost reporting periods beginning on or after October 1, 2015, we have received many questions concerning the mechanics of the revised payment system, especially in relation to the application of the 25-percent threshold policy under § 412.534 and § 412.536, and how those sections will interact. The questions generally involved how CMS would implement the policy for LTCHs with multiple locations. Other questions included how site neutral payment rate discharges would be treated under the policy and how CMS would determine whether a hospital was located in a rural or MSA-dominant area. As a result of the confusion reflected in those questions, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25169 through 25173), we proposed to revise our existing policies in an effort to simplify the application of the 25-percent threshold policy.

Specifically, we proposed to sunset both §§ 412.534 and 412.536 and adopt a unified 25-percent threshold policy at new § 412.538. We stated in the proposed rule that if finalized, this proposal would apply to payments for discharges occurring on or after October 1, 2016. The applicable percentage thresholds would generally remain at 25 percent. In keeping with our current policy at § 412.534(h) and § 412.536(a)(2), under proposed new § 412.538(a), we proposed that the adjustment would not be applicable to ''subclause (II)'' LTCHs described at section 1886(d)(1)(B)(iv)(II) of the Act and § 412.23(e)(2)(ii) or, consistent with the statute and as codified in the regulations at § 412.534(a) and § 412.536(a)(1)(ii), those HwHs described in § 412.23(e)(2)(i) that meet the criteria in § 412.22(f) (''grandfathered HwHs''). (Section 1206(b)(1)(B) of the Pathway for SGR Reform Act provides for a statutory exclusion from the 25-percent threshold policy for ''grandfathered HwHs,'' which was codified in the regulations at § 412.534(a) and § 412.536(a)(1)(ii) in the FY 2015 IPPS/LTCH PPS final rule at (79 FR 50186).)

In keeping with our current policy at § 412.534(c)(2) and § 412.536(h)(2), we further proposed that LTCH discharges that reached high-cost outlier status at the referring hospital would not be subject to the 25-percent threshold policy (that is, LTCH discharges which had been high-cost outlier cases at the referring hospital would only be included in an LTCH's total Medicare discharges and, therefore, would not count as having been admitted from that referring hospital. In other words, LTCH discharges that were high-cost outlier cases at the referring hospital would not be counted in the numerator (but would be counted in the denominator) when determining whether the LTCH exceeded the applicable percentage threshold from that referring hospital). As we discussed in the FY 2005 IPPS final rule, we continue to believe that it is appropriate to treat high-cost outlier cases as though they had come from a different hospital because a case which reaches high-cost outlier status has received a full complement of services and, therefore, any transfer from a hospital to an LTCH cannot be said to be premature or inappropriate. In addition, consistent with our current policy, under this proposal, both the LTCH PPS standard Federal payment rate cases and the site neutral payment rate cases would be subject to the 25-percent threshold policy at proposed new § 412.538 and, therefore, would be

included in the determination of whether an LTCH has exceeded its applicable threshold. In conjunction with this proposal, we proposed to make conforming changes to § 412.522(c)(2) (adjustments for payments under the site neutral payment rate) and § 412.525(d)(5) (adjustments for payments under the LTCH PPS standard Federal payment rate) to include the proposed adjustment for the limitation on LTCH admissions from referring hospitals (that is, the proposed revised 25-percent threshold policy) under new § 412.538. Lastly, we also proposed that Medicare Advantage (MA) discharges would not be considered under the revised 25-percent threshold policy at proposed new § 412.538, consistent with our current policy. (Consistent with these proposals, for the remainder of this section, when we refer to ''Medicare discharges,'' we mean a hospital's Medicare discharges that were not paid under an MA plan (and in the case of an LTCH, all LTCH PPS discharges, that is, both the LTCH PPS standard Federal payment rate cases and the site neutral payment rate cases).)

Under our proposed revised 25-percent threshold policy at proposed new § 412.538, we proposed to calculate the numerator and denominator for the ''applicable percentage threshold'' by using the CMS Certification Number (CCN) on hospital claims submitted to Medicare. Specifically, we proposed determining whether the applicable percentage threshold was exceeded based on the Medicare discharges from the entire LTCH that were admitted from each referring hospital. The CCN is used on Medicare claims to identify the hospital that discharged the patient and, therefore, we believed that using the CCN to identify the discharging LTCH and the referring hospital is an appropriate and administratively straight-forward process to implement this proposed revision. We stated that we believed that this approach would simplify the application of the 25-percent threshold policy because it would provide transparency in identifying both the discharging LTCH and the referring hospital. Under this proposed approach, an LTCH's percentage of Medicare discharges from a given referring hospital would be determined during settlement of a cost report by dividing the LTCH's total number of Medicare discharges in the cost reporting period (based on the CCN on the claims) that were admitted directly from a given referring hospital (again determined by the CCN on the referring hospital's claims) that did not receive a high-cost outlier payment (based on the referring hospital's claims) by the LTCH's total number of Medicare discharges in the cost reporting period. In other words, at cost report settlement, each LTCH's Medicare discharges from a given referring hospital (that did not receive a high-cost outlier payment) during that cost reporting period would be evaluated chronologically based on the discharge date from the LTCH, such that the Medicare discharge that results in the LTCH exceeding or remaining in excess of its applicable percentage threshold would be subject to the payment adjustment at proposed new § 412.538(c). We proposed that attribution of the Medicare discharge from a specific LTCH and a specific referring hospital would be determined according to the CCN on the Medicare claim submitted by the provider (that is, the LTCH's CCN would be determined from the LTCH's claim; the referring hospital's CCN by its claim), which generally comprises all locations of a single hospital (and for a single LTCH, includes satellite facilities and remote locations, as applicable). For example, the CCN of an LTCH with 3 locations is ''902000'' and the CCN of a specific referring hospital with 2 locations is ''900001.'' During its cost reporting period, LTCH ''902000'' has a total of 60 Medicare discharges (10 discharges from the first location, 20 discharges from the second location, and 30 discharges from the third location). Of those 60 Medicare discharges, 25 Medicare discharges (that did not receive a high-cost outlier payment) came directly from hospital ''900001'' (10 discharges from the first location, and 15 discharges from the second location). LTCH ''902000's'' percentage of Medicare discharges from referring hospital ''900001'' would be calculated as 25 divided by 60, or 41.7 percent. The location of the discharging LTCH and the referring hospital is not relevant, and only the aggregate Medicare discharge counts would be used in the proposed calculation when determining if a payment adjustment under proposed new § 412.538 is applicable at cost report settlement.

Under proposed new §§ 412.538 (b) and (c), we proposed, in general, that payment would be adjusted for LTCH Medicare discharges originating from a single referring hospital during a given cost reporting period when that Medicare discharge results in a percentage of Medicare discharges (that did not receive a high-cost outlier payment) from that referring hospital that exceeds that LTCH's applicable percentage threshold (that is, exceeds ''25 percent'' of that LTCH's total Medicare discharges). In other words, in general, we would continue to calculate separate percentages for each hospital from which an LTCH admits patients, and compare those referring hospitals' percentage of Medicare discharges (excluding those cases that received a high-cost outlier payment) to the LTCH's applicable percentage threshold, and the payment adjustment would then be applied to any of the Medicare discharges that cause the LTCH to exceed or remain in excess of the applicable percentage threshold. Medicare discharges not in excess of the applicable threshold (which includes those that received a high-cost outlier payment at the referring hospital) would continue to be unaffected by the 25-percent threshold policy. As adjusted, the net payment amount to an LTCH for each of its Medicare discharges beyond the applicable percentage threshold would continue to be the lesser of the applicable LTCH PPS payment amount or an IPPS equivalent amount. The IPPS equivalent amount under the current 25-percent threshold policy is set forth in existing regulations at § 412.534(f) and § 412.536(e). As we proposed to sunset these provisions, we proposed to codify the existing definition of ''IPPS equivalent amount'' under our proposed revised 25-percent threshold policy at proposed new § 412.538(f). (For a detailed description of the calculation of the IPPS equivalent amount, we refer readers to the RY 2007 LTCH PPS proposed rule (71 FR 4698 through 4700), which was finalized in the corresponding final rule (71 FR 27875)). As noted previously, the IPPS equivalent amount under the 25-percent threshold policy differs somewhat from the IPPS comparable amount applicable under the site neutral payment rate and the SSO policy (78 FR 50772).

In addition, consistent with our existing policy at § 412.534(d) and § 412.536(c), under proposed new § 412.538(f), we proposed a 50-percent applicable threshold for rural LTCHs (as defined under § 412.503) in lieu of the generally applicable 25-percent threshold. We stated in the proposed rule that if finalized, payment to such LTCHs would not be adjusted unless the rural LTCH's Medicare discharges from a single referring hospital (excluding those that received a high-cost outlier payment), exceeded 50 percent of the LTCH's total Medicare discharges (that is, we would continue to apply an applicable percentage threshold of 50 percent from any single referring hospital to rural LTCHs).

We also proposed to maintain at proposed new § 412.538(e)(3) the current special treatment of an LTCH

located in an MSA with an MSA-dominant hospital at § 412.534(e) and § 412.536(d). As defined in those regulations, an MSA-dominant hospital is a hospital that has discharged more than 25 percent of the total hospital's Medicare discharges in the MSA in which it is located. For LTCHs located in an MSA-dominant area (that is located in an MSA with an MSA-dominant hospital), the LTCH's applicable percentage threshold would continue to be the percentage of total Medicare hospital discharges in the MSA from the MSA-dominant hospital during the LTCH's applicable cost reporting period, but in no case is less than 25 percent or more than 50 percent. (That is, as is the case under our current policy, for an LTCH located in an MSA-dominant area, it would have a single applicable percentage threshold for all of that LTCH's referring hospitals under the special treatment provided under proposed new § 412.538(e)(3).) We proposed to use our existing definition of ''MSA-dominant hospital'' under both § 412.534(e) and § 412.536(d) of the regulations to also define the term under § 412.103. Further, we proposed to codify definitions for the terms ''MSA'' (which we proposed to define as an Metropolitan Statistical Area, as defined by the Executive Office of Management and Budget) and ''MSA-dominant area'' (which we proposed to define as an MSA in which an MSA-dominant hospital is located) under § 412.103. (Information on OMB's MSA delineations based on the 2010 standards can be found at: *http://www.whitehouse.gov/sites/default/files/omb/assets/fedreg_2010/06282010_metro_standards-Complete.pdf*.)

Under this proposed special treatment at §§ 412.538(e)(2) and (3) for LTCHs with multiple locations, we further proposed that all locations of the LTCH paid under the LTCH PPS must be rural or located in an MSA-dominant area (as applicable); otherwise the special treatment would not apply and the applicable percentage threshold would be 25 percent. Under our existing regulations, the applicable percentage threshold for each location is determined independently of any other location of the hospital (meaning that, if an LTCH had one rural and one urban location, the applicable percentage threshold for the rural location would be 50 percent and the applicable percentage threshold for the urban location would be 25 percent). However, under our proposal, the applicable percentage threshold would apply to the LTCH as a whole entity (based on its CCN). Therefore, we stated that we believe that it would be appropriate to apply the rural and MSA-dominant ''special'' applicable percentage thresholds based on the LTCH as a whole as well. Furthermore, we stated that we believe that LTCHs with locations that do not fall in these special treatment categories would have sufficient access across its locations to admit patients from multiple hospitals such that, as a whole, the LTCH should be able to draw from a diverse enough population to meet the proposed 25-percent threshold policy criteria. For these reasons, at that time we did not believe that it would be appropriate or necessary to apply these special percentages unless the LTCH is exclusively rural or located exclusively in an MSA-dominant area (as applicable). Therefore, we proposed to require all locations of an LTCH to be rural or located within an MSA-dominant area in order to qualify for special treatment under proposed new §§ 412.538(e)(2) and (3) (that is, an adjusted applicable percentage threshold).

Comment: MedPAC supported CMS' proposal to continue to apply the 25-percent policy to all discharges, including site neutral payment rate cases. In addition, MedPAC noted that the effect of the new dual rate payment system on LTCHs and their admission practices, including their relationship with referring hospitals, is not yet understood, and therefore it is appropriate to maintain the 25-percent policy and apply it to all discharges.

Response: We appreciate MedPAC's support of our proposal.

Comment: Several commenters requested that CMS rescind the 25-percent policy. Many of these commenters argued that because of the new statutory patient-level criteria in the LTCH PPS, the 25-policy threshold policy is unnecessary. Some commenters stated that CMS indicated in prior rulemakings that the revised LTCH PPS would render the 25-percent threshold policy unnecessary. Other commenters argued that the policy does not specifically aid beneficiaries. Some commenters suggested ''updating'' the policy in light of changes in the statute that occurred after the 25-percent threshold policy was established, such as the IMPACT Act, or to exclude discharges from Centers for Medicare and Medicaid Innovations (Innovation Center) payment models from application of the policy. One commenter stated that repealing the policy was consistent with CMS' decision to exclude grandfathered HwHs from the policy. Some commenters suggested that, as an alternative to repealing the policy, CMS extend the statutory moratorium on the implementation of the policy for an additional 2 years, until the expiration of the moratorium of new LTCHs (under current law, that moratorium expires October 1, 2017), or, in the alternative, until the transition to the application of the site neutral payment rate has been completed and analyzed. Some other commenters stated that CMS had told Congress that CMS would not change the 25-percent threshold policy until the effects of the application of the site neutral payment rate had been analyzed, or until CMS had delivered its Report to Congress on the 25-percent threshold policy.

Response: As we stated both in the proposed rule and many times during our modifications to the 25-percent threshold policy, there is a statutory preclusion on LTCH units under section 1886(d)(1)(B) of the Act. The clinical criteria are not relevant to this preclusion (that is, the patient-level clinical criteria to determine which patients are ''appropriate'' for the LTCH PPS standard Federal payment rate did not change the statutory preclusion on LTCH ''units'' in hospitals). The clinical criteria also are not relevant to preventing two Medicare payments for what is essentially one episode of care. Therefore, we believe that the 25-percent threshold policy is still warranted in order to ensure compliance with this statutory prohibition and to prevent Medicare from making two payments for what is essentially one episode of care. We disagree with commenters' arguments that the 25-percent threshold policy does not aid beneficiaries, given that one of our goals in implementing the 25-percent threshold policy is to protect the Medicare Trust Fund, which will help to ensure access to care for Medicare beneficiaries. Additionally, whether our policies that enforce the statutory preclusion on LTCH units benefits beneficiaries is not relevant to our duty to enforce the preclusion on LTCH units.

With regard to the commenters who requested that we ''update'' the 25-percent threshold policy in light of changes in the statute, none of the changes removed the statutory preclusion on LTCH units or addressed the prevention of two Medicare payments for what is essentially one episode of care. In response to the request to exclude discharges paid under an Innovation Center payment model from the policy, to the extent the payment under the model is based in-part on the LTCH PPS payment rates,

we believe it is appropriate for the LTCH PPS payment rates portion of the payment to be subject to the applicable 25-percent threshold policy. The Innovation Center payment model status is irrelevant to the establishment of PPS payment policy in other contexts as well, for example in IPPS ratesetting. The comment asserting that repeal of the 25-percent threshold policy is consistent with CMS' decision to exclude grandfathered HwHs from that policy is factually inaccurate. As we stated in the proposed rule, CMS implemented the regulatory exclusion for grandfathered HwHs as that exclusion was required by section 1206(b)(1)(B) of the Pathway for SGR Reform Act (Pub. L. 113–67). Aside from subclause (II) LTCHs, no other LTCHs were provided such statutory exclusion. With respect to the comment that CMS indicated we would repeal the policy, we note that we received substantially similar comments in response to the FY 2016 IPPS/LTCH PPS proposed rule. We reiterate what we stated in response to those comments that we did not indicate in prior rulemakings that these policies were unnecessary. We stated that, at that time, the policies may no longer be necessary in light of the intended changes to the LTCH PPS (80 FR 49613).

In regard to the suggestion that we extend the statutory moratorium on the full implementation of the 25-percent threshold policy, we do not believe it is necessary to further delay its application. As discussed previously, we believe the 25-percent threshold policy is still warranted to ensure compliance with this statutory prohibition and to prevent Medicare from making two payments for what is essentially one episode of care. Furthermore, we disagree with commenters that we made any assurances to keep the 25-percent threshold policy unchanged until the transition to the site neutral payment rate had been completed or analyzed. As we stated in the proposed rule, given the impending expiration on the statutory moratorium on the full implementation of the 25-percent threshold policy, we received many questions concerning the mechanics of the revised payment system, especially in relation to the application of the 25-percent threshold policy under § 412.534 and § 412.536, and how those sections will interact. The questions generally involved how CMS would implement the policy for LTCHs with multiple locations. Other questions included how site neutral payment rate discharges would be treated under the policy and how CMS would determine whether a hospital was located in a rural or MSA-dominant area. In light of the widespread confusion expressed by stakeholders, we proposed revisions to our current 25-percent threshold policy that would clarify the policy and would allow for greater ease of understanding and implementation. We continue to believe that such modifications are appropriate and warranted. In regard to the commenter who requested that we wait until the Report to Congress on the 25-percent threshold policy has been delivered to Congress, we note that the referenced report was delivered in June 2015 and is, and has been, available upon request.

Comment: Several commenters requested that CMS exclude either site neutral payment rate or LTCH PPS standard Federal payment rate discharges from the 25-percent threshold policy. Many of the commenters who requested the exclusion of site neutral discharges asserted that applying the 25 percent policy to these discharges would result in ''double penalization,'' while commenters who requested the exclusion of LTCH PPS standard Federal rate payment rate discharges asserted that it was not appropriate to reduce payment for cases meeting the patient-level clinical criteria under the dual rate LTCH PPS payment structure. Some commenters asserted that it may be difficult for LTCHs to admit patients with at least 3 days of ICU treatment without exceeding their applicable percentage thresholds.

Response: As we stated earlier, the patient-level clinical criteria and site neutral payment rate are not relevant to the statutory preclusion on LTCH units. Excluding certain discharges paid under the LTCH PPS from the 25-percent threshold policy would fundamentally undermine the policy. In regard to concerns of ''double penalization'' for site neutral payment rate discharges under the 25-percent threshold policy, under our current regulations, in general, it is not possible for a site neutral payment rate discharge to receive a payment adjustment (that is, a lower payment) due to the 25-percent threshold policy. This is because site neutral payment rate discharges are generally paid the lower of the IPPS comparable amount or the estimated costs of the case, and, should the hospital's applicable percentage threshold be exceeded, the hospital would generally be paid the least of the IPPS equivalent amount, the IPPS comparable amount, or the cost. However, the IPPS equivalent amount and the IPPS comparable amount would generally be expected to be equivalent to one another. As such, we would not expect those paid at the site neutral rate to suffer any consequence as a result of the adjustment under the 25-percent rule policy. We note that we considered excluding site neutral payment rate discharges from both the numerator and denominator of the calculation. However, we did not propose this policy because whether a discharge is paid at the LTCH PPS standard Federal payment rate or the site neutral payment rate is not germane to whether an LTCH is behaving as a unit, and, given this overriding concern, we do not believe it is appropriate to exclude site neutral payment rate discharges from the 25-percent threshold policy. While we understand the concerns of commenters that, in certain areas, one or two IPPS hospitals may account for a disproportionate percentage of ICU days, we note, again, that the clinical criteria did not change the statutory preclusion on LTCH units. Furthermore, such IPPS hospital discharges admitted to the LTCH after receiving a high-cost outlier payment are treated as if they were admitted from another referring hospital for purposes of the 25-percent threshold policy (and therefore would not be counted as a discharge from that referring hospital). In addition, special treatment is provided for rural and MSA-dominant LTCHs, as discussed previously.

Comment: One commenter requested clarification as to why CMS did not include a specific exception under the proposed 25-percent threshold policy at new § 412.538 for LTCHs receiving admissions from urban-single IPPS hospitals, as is provided under the current 25-percent threshold policies at §§ 412.534 and 412.536, along with the proposed continued special treatment for rural and MSA-dominant LTCHs, which allows such LTCHs to have an increased applicable threshold. Other commenters requested that CMS modify the existing definition of ''MSA-dominant hospital'' to allow additional hospitals to qualify for the increased applicable threshold, for example hospitals located in Micropolitan areas or ''distinct regions'' within MSAs to be subject to an increased threshold.

Response: As we stated in the proposed rule, our proposed modification of the 25-percent threshold policy is meant to provide simplicity and clarity. We proposed to maintain the current special treatment of an LTCH located in an MSA with an MSA-dominant hospital at § 412.534(e) and § 412.536(d). As defined in those regulations, an MSA-dominant hospital is a hospital that has discharged more

than 25 percent of the total hospitals' Medicare discharges in the MSA in which it is located. This proposed definition of MSA-dominant hospitals encompass hospitals referred to in the current regulations as ''single urban hospitals'' (that is, the only other hospital in the MSA) because such a hospital, by definition, would have discharged more than 25 percent of the total hospital Medicare discharges in the MSA in that it would have discharged 100 percent of the total hospital Medicare discharges in the MSA. For this reason, we saw no reason to specifically mention urban-single hospitals as a separate category of hospitals subject to special treatment (that is, an increased applicable threshold). Although we are not changing the regulation text in response to this comment, we note that because urban-single hospitals are MSA-dominant hospitals, LTCHs receiving patients from urban-single hospitals will be subject to the same applicable threshold as all MSA-dominant hospitals. With respect to the commenter requesting an increased threshold for Micropolitan statistical areas, we note that these areas are treated as rural for the purposes of the 25-percent threshold policy. With respect to the request to provide an increased threshold for ''distinct regions'' of MSAs, although the commenter provided one anecdotal example of what it believed should be considered a ''distinct region,'' it did not offer a definition of the term or set out criteria for what would be considered a ''distinct region'' within an MSA, and, even if it had, adoption of such a concept is outside the scope of the proposed rule. With that said, as the commenter provided no policy specifics or recommendations, we cannot evaluate the ''distinct region'' suggestion and continue to believe that the use of MSAs is reasonable.

Comment: Several commenters requested that CMS increase the applicable threshold for rural and MSA-dominant LTCHs to 75 percent. These commenters argued that these LTCHs would face difficulty complying with the proposed applicable thresholds. One commenter requested that CMS increase the applicable threshold for all LTCHs.

Response: The proposed applicable thresholds for rural and MSA-dominant LTCHs are consistent with the applicable thresholds under the current 25-percent threshold policy once the statutory moratorium on the full application of that policy expires. While we understand the concerns raised by commenters, we continue to believe the applicable thresholds originally established under the existing 25-percent threshold policy are appropriate because of the statutory prohibition on LTCH units, which does not include an exception for rural or MSA-dominant hospitals. We established the increased applicable threshold in order to acknowledge that these hospitals do not have access to the range of referral sources other hospitals do, while at the same time realizing the need to prevent the existence of LTCH units, which is prohibited by the statute. Similarly, we do not believe it is appropriate to increase the applicable threshold for non-MSA dominant LTCHs. For these reasons, we are not adopting the commenters' suggestions to increase the applicable thresholds from the proposed values.

Comment: Several commenters objected to CMS' proposal to identify LTCHs and referring hospitals based on CCNs, and to apply the policy to all locations operating under a CCN. Some commenters argued that this would make it harder for LTCHs with multiple locations to comply with the policy, while other commenters argued that this disadvantaged hospitals that may have multiple campuses operating under the same CCN because the application of the 25-percent threshold policy on a location-specific basis can allow an LTCH with multiple locations to discharge more patients admitted from a single referring hospital without receiving adjusted payment under the regulations. Other commenters requested that CMS continue applying the policy on a location-specific basis. Some commenters expressed concern for LTCHs with ''one primary referring hospital.''

Response: As we stated in the proposed rule, we believe that identifying LTCHs and their referring hospitals based on CCN rather than individual location or locations would simplify the application of the 25-percent threshold policy because it provides transparency in identifying both the discharging LTCH and the referring hospital, and alleviate confusion in the industry. We proposed these changes in response to questions from the provider community which indicated a great deal of confusion surrounding the intricacy of the interactions between the current 25-percent threshold policies at § 412.534 and § 412.536. By basing the policy on LTCHs and referring hospitals as a whole, we believe that hospitals will more easily understand how a given discharge will be counted in the application of the policy. To the extent that the proposed changes make it ''harder'' for LTCHs to comply with the policy, we note that the goal of the policy is to prevent inappropriate patient shifting and LTCHs behaving as units of referring hospitals. In regard to LTCHs that may have been able to increase their overall admittance of patients from a single referring source under the location-based 25-percent threshold by spreading such admissions across locations, thereby increasing the opportunity for inappropriate patient shifting and allowing the LTCH as a whole to behave as a unit, such arrangements directly contradict our goals, and were a failing of the current policy. For these reasons, we believe that using CCNs rather than location as the basis for the 25-percent threshold policy is more appropriate, given our policy concerns and goals. While we understand that hospitals may operate multiple campuses under the same CCN, as explained previously, we nonetheless believe that application based on CCN is the simplest and generally most accurate way to determine the referral source of an LTCH discharge for both CMS and LTCHs. As for concerns about LTCHs with ''one primary referring hospital,'' we would like to state that this is the exact type of arrangement the 25-percent threshold policy is meant to deter as a way of ensuring the statutory prohibition of LTCH units is followed. Furthermore, we remind commenters that LTCH discharges that reach high cost outlier status at the referring hospital would not be subject to the 25-percent threshold policy (that is, such discharges would only be included in an LTCH's total Medicare discharges and would not count as having been admitted from that referring hospital), and to the extent the LTCH is exclusively located in an MSA-dominant area or rural area, the LTCH would have an increased applicable threshold under proposed special treatment for exclusively MSA-dominant or exclusively rural LTCHs. As no commenters offered an alternative to CCN application (other than a request to maintain the current location-specific approach, which caused considerable confusion and proved problematic for the reasons discussed previously), we are not making changes in response to these comments.

Comment: Several commenters objected to CMS' proposal to require all locations of an LTCH to be rural or MSA-dominant in order for the hospital to be subject to an increased applicable threshold. Many of these commenters stated that if one location of the LTCH was rural or MSA-dominant, the

hospital should be subject to the increased applicable threshold.

Response: The exception for rural and MSA-dominant LTCHs was made to address the reality that LTCHs in those circumstances may not have access to the range of referral sources other LTCHs do while achieving the policy goal of preventing the creation of *de facto* LTCH units. We believe that the increased applicable threshold initially established under the old policy and continued into the streamlined policy strikes the appropriate balance of these competing concerns. As we stated in the proposed rule, we believe that it would be appropriate to apply the rural and MSA-dominant ''special'' applicable percentage thresholds based on the LTCH as a whole because LTCHs with locations that do not fall in these special treatment categories would have sufficient access across its locations to admit patients from multiple hospitals such that, as a whole, the LTCH should be able to draw from a diverse enough population to meet the proposed 25-percent threshold policy criteria. We note that although commenters opposed our proposal to require all locations of an LTCH to be rural or MSA-dominant in order for the hospital to be subject to an increased applicable threshold, they did not offer any direct counter argument against our belief that multisite LTCHs should be able to draw as a whole from a diverse population. For these reasons, we continue to believe that it is appropriate to require all locations of LTCHs to be rural or MSA-dominant for a hospital to be eligible for an increased applicable threshold, and are not adopting the commenters' suggestions to provide for an increased applicable threshold if one location of the LTCH was either rural or MSA-dominant.

Comment: Several commenters objected to CMS' proposal to apply the revised 25-percent threshold policy based on discharge date rather than cost reporting period. Some commenters argued this was inconsistent with the historical application of the 25-percent threshold policy. Other commenters stated that the proposed discharge-based start date of October 1, 2016 is inconsistent with the current statutory moratorium on the full application of the 25-percent threshold policy.

Response: Our intent in proposing to apply the 25-percent threshold policy based on discharge date rather than cost reporting period was to avoid perpetuation of the status quo in which different LTCHs are subject to the existing 25-percent threshold policies under § 412.534 and § 412.536 at different times. By proposing to apply the policy based on discharge date rather than cost reporting period, all LTCHs would be subject to the same policy at the same time, which we believed would provide for greater transparency and administrative simplicity of the policy for both LTCHs and CMS. However, upon review, we agree with commenters who stated that our proposed implementation based solely on discharge date is contrary to the current statutory moratorium on the full implementation of the current 25-percent threshold policy. Therefore, in this final rule, we are revising our regulations to specify that the revised 25-percent threshold policy at § 412.538 is applicable for discharges occurring on or after October 1, 2016, that occur in cost reporting periods beginning on or after July 1, 2016 (for hospitals that had not been subject to § 412.534), or October 1, 2016 (for hospitals that had been subject to § 412.534). This revision will allow us to comply with the current statutory moratorium and apply the new, revised 25-percent threshold policy at § 412.538 consistently to all LTCHs upon its expiration. Therefore, in this final rule, we are revising our regulations to specify that an LTCH will be subject to the revised 25-percent threshold policy at § 412.538 for discharges occurring on or after October 1, 2016, that occur in its cost reporting periods for which it is no longer subject to any statutory moratorium on the full implementation of the current 25-percent threshold policy. In other words, the first time an LTCH will be subject to the adjustment policy at § 412.538 is for its discharges occurring on or after October 1, 2016, that occur in its first cost reporting period that begins after the statutory moratoria on the full implementation of the current 25-percent threshold policy expire for the LTCH.

Specifically, we are revising our regulations to specify that the revised 25-percent threshold policy at § 412.538 is applicable for discharges occurring on or after October 1, 2016, that occur in cost reporting periods beginning on or after July 1, 2016 (for hospitals that had not been subject to § 412.534), or October 1, 2016 (for hospitals that had been subject to § 412.534). This revision will allow us to comply with the current statutory moratorium and apply the new, revised 25-percent threshold policy at § 412.538 consistently to all LTCHs upon the expiration of the current statutory moratorium. The current 25-percent threshold policy at § 412.534 is only applicable to LTCHs (other than ''subclause (II)'' LTCHs) that have at least one co-located location, that is, LTCH HwHs and satellite facilities of LTCHs (except ''grandfathered HwHs'' which are exempt as provided by the statute). The current 25-percent threshold policy at § 412.536 is applicable to all LTCHs (other than ''subclause (II)'' LTCHs and grandfathered HwHs'' which are exempt as provided by the statute).

Considering the two 25-percent threshold policies contemporaneously, LTCHs that are not subject to § 412.534 (that is, LTCHs which do not include a co-located location) are only subject to the adjustments at § 412.536. On the other hand, LTCHs that are subject to the adjustment at § 412.534 also are subject to the adjustment at § 412.536 (that is, they are LTCHs subject to both policies at § 412.534 and § 412.536). Under current law, the moratorium on the full application of the 25-percent threshold policy under § 412.536 expires beginning with LTCH cost reporting periods beginning on or after July 1, 2016, while the moratorium on the full application of the 25-percent threshold policy under § 412.534 expires beginning with LTCH cost reporting periods beginning on or after October 1, 2016. Consequently, although LTCHs that are subject to both policies at § 412.534 and § 412.536 will no longer be under the moratorium on the full application of § 412.536 beginning with their cost reporting periods beginning on or after July 1, 2016, these LTCHs will continue to be under the moratorium on the full application of § 412.534 until their cost reports beginning on or after October 1, 2016. As such, for LTCHs that are subject to both policies at § 412.534 and § 412.536, the provision of new § 412.538 cannot apply to all of such LTCHs' discharges until their cost reports beginning on or after October 1, 2016. Consistent with the premise of our proposal to simplify and consolidate the current 25-percent threshold policies under new § 412.538, we are establishing that, for LTCHs that have been subject to both policies at § 412.534 and § 412.536 (that is, those LTCHs that include co-located locations), § 412.538 will apply for discharges occurring in cost reporting periods beginning on or after October 1, 2016. Under our finalized policy, this means that § 412.536 will apply to all locations of all LTCHs upon the expiration of the LTCH's statutory moratorium, which expires on a rolling cost reporting period basis (that is, an LTCH's first cost reporting period beginning on or after July 1, 2016) until the LTCH becomes subject to the revised policy at § 412.538. For LTCHs that were not subject to the policy at

§ 412.534 (that is, those LTCHs that do not include co-located locations and, therefore, had only been subject to the policy at § 412.536), § 412.538 will apply for discharges occurring on or after October 1, 2016, in cost reporting periods beginning on or after July 1, 2016, which coincides with the statutory expiration on the full application of § 412.536. An LTCH will remain subject to the policies at § 412.534 and/or § 412.536 as applicable until it transitions to the new policy at § 412.538. We also are making conforming changes to our proposed sunset dates for §§ 412.534 and 412.536.

Comment: Several commenters supported the proposal to exclude Medicare Advantage discharges from the calculation of the 25-percent threshold policy.

Response: We appreciate the commenters' support and are adopting our proposal as final, without modification, to exclude Medicare Advantage discharges in the application of the 25-percent threshold policy.

Comment: One commenter stated that paragraphs (g) and (h) of proposed new § 412.538 were missing from the proposed regulation text.

Response: Upon review of the proposed regulation text of § 412.538, we found that in the proposed text of paragraph (e)(3), which would codify the proposed special treatment for LTCHs located in an MSA with an MSA-dominant hospital, we found, as commenters noted, erroneous citations to a definition of ''MSA-dominant hospital'' in ''paragraph (h)(3)(ii) of this section.'' However, our proposal was to add the definition of ''MSA-dominant hospital'' to § 412.503, and new § 412.538 did not include paragraphs (g) or (h). We appreciate the commenter bringing this cross-reference error to our attention, and in this final rule have corrected the text of paragraph (e)(3) of § 412.538 to cite the definition of ''MSA-dominant hospital'' as defined in § 412.503.

Comment: One commenter requested clarification about whether certain LTCHs would be considered grandfathered HwHs (and thus excluded from the 25-percent threshold policy).

Response: We respond to this comment in section VII.B.3. of the preamble of this final rule where we discuss finalization of an IFC (CMS–1664–IFC), which implements the temporary exception from the site neutral payment rate for certain severe wound discharges from certain LTCHs provided by the Consolidated Appropriations Act, 2016.

Out-of-Scope Comments: We note we also received several comments outside the scope of the proposed rule seeking subregulatory guidance which we intend to address in the future as appropriate.

We did not receive any public comments regarding our proposal to add definitions of ''MSA,'' ''MSA-dominant area,'' and ''MSA-dominant hospital'' to § 412.503 and, therefore, are adopting those proposals as final without modification.

After consideration of the public comments we received, we are adopting the new 25-percent threshold policy, as proposed, with one exception. In response to comments, we are revising §§ 412.534, 412.536, and 412.538 to reflect the cost reporting period-based end dates of the moratoria under the current statute, as discussed previously. For hospitals that had not been subject to the policy at § 412.534, the revised policy is effective for discharges occurring on or after October 1, 2016. For hospitals that had been subject to the policy at § 412.534, the revised policy is effective for discharges occurring on or after October 1, 2016, in cost reporting periods beginning on or after October 1, 2016. Prior to transition to the single 25-percent threshold policy, a hospital is subject to both policies at §§ 412.534 and 412.536 to the same extent it would have been absent the revisions to the policy. Under this single 25-percent threshold policy, LTCH PPS payment for LTCH discharges from a single referring hospital in excess of the LTCH's applicable percentage threshold for that referring hospital will be adjusted, unless the LTCH is excepted from the adjustment under § 412.538(a)(2)(3). In addition, as we proposed, we are establishing that the applicable percentage threshold will generally be 25 percent (with special treatment for exclusively rural LTCHs and exclusively MSA-dominant LTCHs). The 25-percent threshold policy will be applicable to all LTCHs except ''subclause (II)'' LTCHs and ''grandfathered HwHs.'' Under these policies, LTCH discharges that reached high-cost outlier status at the referring hospital from which the patient was discharged directly to the LTCH will be treated as though they had come from a different referring hospital and, therefore, will not be counted as a Medicare discharge from that referring hospital. We also are establishing that MA discharges will not be included in this policy. In addition, the revised 25-percent threshold policy will apply to all LTCH PPS discharges (that is, both LTCH PPS standard Federal payment rate and site neutral payment rate cases).

Under this revised policy, we will evaluate the ''applicable percentage threshold'' based on the sum of the locations covered by the LTCH's and referring hospitals' Medicare provider agreement, and implement this policy using the LTCH's and the referring hospitals' CCN. As we proposed, we are establishing that an LTCH's percentage of Medicare discharges from a given hospital will be determined by dividing the LTCH's number of Medicare discharges in the cost reporting period (based on the LTCH's CCN) that were admitted directly from a given referring hospital (based on the hospital's CCN) that did not receive a high-cost outlier payment during the stay at that referring hospital by the LTCH's total number of Medicare discharges in the cost reporting period (based on the LTCH's CCN). Under new § 412.538, as applicable, the LTCH PPS payment will be adjusted at cost report settlement for the LTCH Medicare discharge that caused the LTCH to exceed its applicable threshold and all discharges subsequent to that discharge. Medicare discharges not in excess of the applicable percentage threshold will continue to be unaffected by the 25-percent threshold policy (that is, the payment for such discharges will not be adjusted). As adjusted, the payment amount for an LTCH Medicare discharge that is found to exceed the applicable percentage threshold will continue to receive the lesser of the applicable LTCH PPS payment amount or an IPPS equivalent amount.

G. Refinement to the Payment Adjustment for ''Subclause II'' LTCHs

As part of our FY 2015 IPPS/LTCH PPS rulemaking cycle, under the authority provided by section 1206(d)(2) of the Pathway to SGR Reform Act (Pub. L. 113–67), we adopted an adjustment to the LTCH PPS payment for LTCHs classified under section 1886(d)(1)(B)(iv)(II) of the Act (''subclause (II) LTCHs''), which are described in 42 CFR 412.23(e)(2)(ii). Under this adjustment, subclause (II) LTCHs receive payment under the LTCH PPS that is generally equivalent to an amount determined under the reasonable cost-based payment rules for both operating and capital-related costs under 42 CFR part 413 (that is, an amount generally equivalent to an amount determined under the TEFRA payment system methodology, which could be called a ''TEFRA-like'' methodology). For more information on this adjustment, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50193 through 50197). As initially adopted, this ''TEFRA-like'' payment

adjustment for subclause (II) LTCHs did not incorporate the limitation on charges to Medicare beneficiaries policies under the TEFRA payment system. Alignment of the limitation on charges to beneficiaries and related billing requirements would result in administrative simplification for the cost report submission and settlement process under the payment adjustment for subclause (II) LTCHs specified at § 412.526.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25173), we therefore proposed to revise the limitation on charges to beneficiaries policy and related billing requirements for subclause (II) LTCHs to reflect what is done in the TEFRA payment system context for cost reporting periods beginning on or after October 1, 2016, which would align our beneficiary charge policies (and related billing procedures) with the reasonable cost-based ''TEFRA-like'' payment adjustment under § 412.526. The adjusted LTCH PPS payment to subclause (II) LTCHs under § 412.526 is considered the full LTCH PPS payment (that is, the LTCH PPS standard Federal payment rate or site neutral payment rate, as applicable), and as such, under current policy that payment applies to the LTCH's costs for services furnished until the high-cost outlier threshold is met (existing § 412.507(a)). Under this proposal, for a subclause (II) LTCH, the Medicare payment would only apply to the LTCH's costs incurred for the days used to calculate the Medicare payment (that is, days for which the patient has a benefit day available). Furthermore, in addition to the applicable Medicare deductible and coinsurance amounts (and for items and services as specified under § 489.20(a)), we proposed to specify that the LTCH may only charge the beneficiary for services provided during the stay that were not the basis for the adjusted LTCH PPS payment amount under § 412.526. We stated in the proposed rule that if the proposal is finalized, subclause (II) LTCHs would be treated the same as IPPS-excluded hospitals paid under the TEFRA payment system for purposes of the limitation on charges to beneficiaries and related billing requirements.

In the FY 2017 proposed rule, using the broad authority conferred upon the Secretary under section 123(a)(1) of the BBRA, as amended by section 307(b) of the BIPA, in conjunction with the authority provided under section 1206(d)(2) of Pub. L. 113–67, we proposed to revise § 412.507 to specify the limit on allowable charges to beneficiaries treated at subclause (II) LTCHs as is done under the TEFRA payment system in order to align our beneficiary charge policies with the reasonable cost-based ''TEFRA-like'' payment adjustments under § 412.526. Specifically, we proposed to revise § 412.507 to specify that, for cost reporting periods beginning on or after October 1, 2016, the Medicare payment made to subclause (II) LTCHs (as defined at § 412.23(e)(2)(ii)) only applies to the hospital's costs on the days used to calculate the Medicare payment (that is, days for which the patient has a benefit day available). Furthermore, we proposed under proposed revised § 412.507 to specify that, for cost reporting periods beginning on or after October 1, 2016, the hospital may only charge the Medicare beneficiary for the applicable deductible and coinsurance amounts (under §§ 409.82, 409.83 and 409.87) for items and services as specified under § 489.20(a), and for services provided during the stay that were not the basis for the adjusted LTCH PPS payment amount under § 412.526.

Comment: Two commenters supported the proposal to modify § 412.507 to provide that subclause (II) LTCHs would be subject to the same billing requirements applicable to hospitals that are paid on a reasonable-cost basis under the TEFRA payment system. The commenters also recommended that CMS make conforming changes to the applicable section of the Medicare Claims Processing Manual, the Medicare claims processing system, and cost report instructions.

Response: We appreciate the commenters' support of our proposed changes to align our beneficiary charge policies under § 412.507 with the reasonable cost-based ''TEFRA'' payment adjustments. As we indicated in the proposed rule and noted above, if finalized, subclause (II) LTCHs would be treated the same as PPS-excluded hospitals paid under the TEFRA payment system for purposes of the limitation on charges to beneficiaries and related billing requirements. Furthermore, if adopted, we would make conforming changes to the Medicare claims processing instructions, the Medicare claims processing system, and cost report instructions, as applicable.

After consideration of the public comments we received, we are finalizing our proposed changes to § 412.507 for subclause (II) LTCHs, as proposed, without modification.

VIII. Quality Data Reporting Requirements for Specific Providers and Suppliers

We seek to promote higher quality and more efficient healthcare for Medicare beneficiaries. This effort is supported by the adoption of widely agreed-upon quality measures. We have worked with relevant stakeholders to define quality measures for most settings and to measure various aspects of care for most Medicare beneficiaries. These measures assess structural aspects of care, clinical processes, patient experiences with care, care coordination, and improving patient outcomes.

We have implemented quality reporting programs for multiple care settings, including:

- Hospital inpatient services under the Hospital Inpatient Quality Reporting (IQR) Program (formerly referred to as the Reporting Hospital Quality Data for Annual Payment Update (RHQDAPU) Program);
- Hospital outpatient services under the Hospital Outpatient Quality Reporting (OQR) Program (formerly referred to as the Hospital Outpatient Quality Data Reporting Program (HOP QDRP));
- Care furnished by physicians and other eligible professionals under the Physician Quality Reporting System (PQRS, formerly referred to as the Physician Quality Reporting Program Initiative (PQRI));
- Inpatient rehabilitation facilities under the Inpatient Rehabilitation Facility Quality Reporting Program (IRF QRP);
- Long-term care hospitals under the Long-Term Care Hospital Quality Reporting Program (LTCH QRP) (also referred to as the LTCHQR Program);
- PPS-exempt cancer hospitals under the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program;
- Ambulatory surgical centers under the Ambulatory Surgical Center Quality Reporting (ASCQR) Program;
- Inpatient psychiatric facilities under the Inpatient Psychiatric Facilities Quality Reporting (IPFQR) Program;
- Home health agencies under the home health quality reporting program (HH QRP); and
- Hospice facilities under the Hospice Quality Reporting Program.

We have also implemented the End-Stage Renal Disease Quality Incentive Program, Hospital Readmissions Reduction Program, HAC Reduction Program, and Hospital VBP Program (described further below) that link payment to performance.

In implementing the Hospital IQR Program and other quality reporting programs, we have focused on measures that have high impact and support CMS and HHS priorities for improved quality and efficiency of care for Medicare beneficiaries. Our goal for the future is to align the clinical quality measure requirements of the Hospital IQR Program with various other Medicare and Medicaid programs, including those authorized by the Health Information Technology for Economic and Clinical Health (HITECH) Act, so that the reporting burden on providers will be reduced. As appropriate, we will consider the adoption of clinical quality measures with electronic specifications so that the electronic collection of performance information is a seamless component of care delivery. Establishing such a system will require interoperability between EHRs and CMS data collection systems, additional infrastructure development on the part of hospitals and CMS, and adoption of standards for capturing, formatting, and transmitting the data elements that make up the measures. However, once these activities are accomplished, adoption of measures that rely on data obtained directly from EHRs will enable us to expand the Hospital IQR Program measure set with less cost and reporting burden to hospitals. We believe that in the near future, collection and reporting of data elements through EHRs will greatly simplify and streamline reporting for various CMS quality reporting programs, and that hospitals will be able to switch primarily to EHR-based data reporting for many measures that are currently manually chart-abstracted and submitted to CMS for the Hospital IQR Program.

We also have implemented a Hospital VBP Program under section 1886(o) of the Act, described in the Hospital Inpatient VBP Program final rule (76 FR 26490 through 26547). We most recently adopted additional policies for the Hospital VBP Program in section IV.H. of the preamble of this final rule. Under the Hospital VBP Program, hospitals receive value-based incentive payments based on their performance with respect to performance standards for a performance period for the fiscal year involved. The measures under the Hospital VBP Program must be selected from the measures (other than readmission measures) specified under the Hospital IQR Program as required by section 1886(o)(2)(A) of the Act.

In selecting measures for the Hospital IQR Program, we are mindful of the conceptual framework we have developed for the Hospital VBP Program. Because measures adopted for the Hospital VBP Program must first have been adopted and reported under the Hospital IQR Program, these two programs are linked and the reporting infrastructure for the programs overlap. We view the Hospital VBP Program as the next step in promoting higher quality care for Medicare beneficiaries by transforming Medicare from a passive payer of claims into an active purchaser of quality healthcare for its beneficiaries. Value-based purchasing is an important step to revamping how care and services are paid for, moving increasingly toward rewarding better value, outcomes, and innovations.

We also view the HAC Reduction Program, authorized by section 1886(p) of the Act, as added by section 3008 of the Affordable Care Act, and the Hospital VBP Program, as related but separate efforts to reduce HACs. The Hospital VBP Program is an incentive program that awards payments to hospitals based on quality performance on a wide variety of measures, while the HAC Reduction Program creates a payment adjustment resulting in payment reductions for poorly performing hospitals based on their rates of HACs.

In the FY 2017 IPPS/LTCH PPS proposed rule, we proposed changes to the following Medicare quality reporting systems:

- In section VIII.A. (81 FR 25174 through 25205), the Hospital IQR Program.
- In section VIII.B. (81 FR 25205 through 25213), the PCHQR Program.
- In section VIII.C. (81 FR 25213 through 25238), the LTCH QRP.
- In section VIII.D. (81 FR 25238 through 25244), the IPFQR Program.

In addition, in section VIII.E. of the preamble of the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25244 through 25247), we proposed changes to the Medicare and Medicaid EHR Incentive Programs for eligible hospitals and CAHs.

A. Hospital Inpatient Quality Reporting (IQR) Program

1. Background

a. History of the Hospital IQR Program

We refer readers to the FY 2010 IPPS/LTCH PPS final rule (74 FR 43860 through 43861) and the FY 2011 IPPS/LTCH PPS final rule (75 FR 50180 through 50181) for detailed discussions of the history of the Hospital IQR Program, including the statutory history, and to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50217 through 50249) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49660 through 49692) for the measures we have adopted for the Hospital IQR Program measure set through the FY 2019 payment determination and subsequent years.

b. Maintenance of Technical Specifications for Quality Measures

We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49640 through 49641) for a discussion of the maintenance of technical specifications for quality measures for the Hospital IQR Program. We also refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50202 through 50203) for additional detail on the measure maintenance process.

In addition, we believe that it is important to have in place a subregulatory process to incorporate nonsubstantive updates to the measure specifications for measures we have adopted for the Hospital IQR Program so that these measures remain up-to-date. We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53504 through 53505) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50203) for our policy for using a subregulatory process to make nonsubstantive updates to measures used for the Hospital IQR Program. We recognize that some changes made to measures undergoing maintenance review are substantive in nature and might not be appropriate for adoption using a subregulatory process. We will continue to use rulemaking to adopt substantive updates made to measures we have adopted for the Hospital IQR Program.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25174), we did not propose any changes to our policies on the measures maintenance process or for using the subregulatory process to make nonsubstantive updates to measures used for the Hospital IQR Program.

c. Public Display of Quality Measures

Section 1886(b)(3)(B)(viii)(VII) of the Act was amended by the Deficit Reduction Act (DRA) of 2005. Section 5001(a) of the DRA requires that the Secretary establish procedures for making information regarding measures submitted available to the public after ensuring that a hospital has the opportunity to review its data before they are made public. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50776 through 50778) for a more detailed discussion about public display of quality measures.

The *Hospital Compare* Web site is an interactive Web tool that assists beneficiaries by providing information on hospital quality of care to those who need to select a hospital. For more information on measures reported to *Hospital Compare,* we refer readers to

the Web site at: *http://www.medicare.gov/hospitalcompare.* Other information not reported to *Hospital Compare* may be made available on other CMS Web sites, such as *https://data.medicare.gov.*

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25174 through 25175), we did not propose any changes to these policies.

2. Process for Retaining Previously Adopted Hospital IQR Program Measures for Subsequent Payment Determinations

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53512 through 53513), for our finalized measure retention policy. Pursuant to this policy, when we adopt measures for the Hospital IQR Program beginning with a particular payment determination, we automatically readopt these measures for all subsequent payment determinations unless we propose to remove, suspend, or replace the measures. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25175), we did not propose any changes to this policy.

3. Removal and Suspension of Hospital IQR Program Measures

a. Considerations in Removing Quality Measures From the Hospital IQR Program

As discussed above, we generally retain measures from the previous year's Hospital IQR Program measure set for subsequent years' measure sets except when we specifically propose to remove, suspend, or replace a measure. We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50185) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50203 through 50204) for more information on the criteria we consider for removing quality measures. We refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49641 through 49643) for more information on the additional factors we consider in removing quality measures and the factors we consider in order to retain measures. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50203 through 50204), we also finalized our proposal to clarify the criteria for determining when a measure is ''topped-out.'' In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25175), we did not propose any changes to these policies.

b. Removal of Hospital IQR Program Measures for the FY 2019 Payment Determination and Subsequent Years

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25175 through 25178), we proposed to remove the following 15 measures for the FY 2019 payment determination and subsequent years. Some of these measures we proposed to remove in their entirety; one of these measures, VTE–6 Incidence of Potentially Preventable Venous Thromboembolism, we proposed to remove just in the electronic form as discussed further below:

- AMI–2: Aspirin Prescribed at Discharge for AMI (NQF #0142);
- AMI–7a: Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival;
- AMI–10: Statin Prescribed at Discharge;
- HTN: Healthy Term Newborn (NQF #0716);
- PN–6: Initial Antibiotic Selection for Community-Acquired Pneumonia (CAP) in Immunocompetent Patients (NQF #0147);
- SCIP–Inf–1a: Prophylactic Antibiotic Received Within One Hour Prior to Surgical Incision (NQF #0527);
- SCIP–Inf–2a: Prophylactic Antibiotic Selection for Surgical Patients (NQF #0528);
- SCIP–Inf–9: Urinary Catheter Removed on Postoperative Day 1 (POD1) or Postoperative Day 2 (POD2) with Day of Surgery Being Day Zero;
- STK–4 Thrombolytic Therapy (NQF #0437);
- VTE–3: Venous Thromboembolism Patients with Anticoagulation Overlap Therapy (NQF #0373);
- VTE–4: Venous Thromboembolism Patients Receiving Unfractionated Heparin (UFH) with Dosages/Platelet Count Monitoring by Protocol (or Nomogram);
- VTE–5: Venous Thromboembolism Discharge Instructions;
- VTE–6: Incidence of Potentially Preventable Venous Thromboembolism;
- Participation in a Systematic Clinical Database Registry for Nursing Sensitive Care; and
- Participation in a Systematic Clinical Database Registry for General Surgery.

We received general comments related to the collective removal of these 15 measures (13 eCQMs, including 2 measures in chart form, and 2 structural measures). We discuss these general comments first; comments specific to individual measures are discussed further below.

Comment: The majority of commenters supported the proposed removal of 13 eCQMs from the Hospital IQR Program beginning with the FY 2019 payment determination in an effort to move quality measurement toward outcomes measures. Many commenters stated their belief that these measures were topped out, and that the measures' complexity could not be captured in an electronic form. A number of commenters also stated their belief that the eCQM measure specifications were not feasible to implement. Others noted removing these measures would decrease administrative burden, minimize confusion among providers regarding Hospital IQR Program data submission, and align the Hospital IQR Program with other quality measurement efforts.

Response: We thank the commenters for their support of our proposal to remove 13 eCQMs in an effort to move quality measurement toward outcomes measures.

Comment: Several commenters supported CMS' efforts to reduce reporting burden on hospitals, but expressed concern with the timeline of the proposal to remove 13 eCQMs beginning with the FY 2019 payment determination because hospitals may need time to adjust workflows and work with IT vendors to add support for measures not previously supported and ensure valid eCQMs are submitted. Commenters encouraged CMS to consider the time, effort, and resources expended on reporting these measures when deciding to remove them from the Hospital IQR Program. One commenter noted that EHR vendors will phase out support for these measures and clinicians may become skeptical about benefits to workflow changes related to future measures if measures are continuously added and removed. Another commenter urged CMS to provide more lead time for the removal of measures that hospitals have dedicated so many resources to developing and implementing. Specifically, the commenter requested that for FY 2019, CMS maintain the current requirements of reporting 4 eCQMs out of the current list of 28, and remove the 13 measures proposed for removal for FY 2020 in order to give hospitals more time to plan and prepare for implementation.

Response: We understand the commenters' concern with removing eCQMs that have been previously reported and implemented in an existing EHR workflow, and we acknowledge the time, effort, and resources that hospitals expend on reporting these measures. However, we believe that removal of the 13 eCQMs beginning with the FY 2019 payment determination will be less burdensome to hospitals overall than continuing to keep them in the Hospital IQR Program. Our decision to remove measures from the Hospital IQR Program is an extension of our programmatic goal to continually refine the measure set and

to ensure that it consists of quality performance standards as well as aligns with the Medicare and Medicaid EHR Incentive Program. It is one of our goals to expand electronic reporting in the Hospital IQR Program, which we believe will ultimately reduce burden on hospitals as compared with chart-abstracted data reporting and improve patient outcomes by providing more robust data to support quality improvement efforts. We intend to introduce additional eCQMs into the program as eCQMs that support our program goals become available.

In addition, we believe that the FY 2019 payment determination is the appropriate time to require eCQM reporting because hospitals have had several years to report data electronically for the Medicare and Medicaid EHR Incentive Programs and Hospital IQR Program (3 years of voluntary reporting and 3 years of reporting as part of a pilot). Furthermore, for the CY 2016 reporting period/FY 2018 payment determination, hospitals are required to submit one quarter's worth of data for 4 eCQMs for the Hospital IQR Program (80 FR 49694). As we stated in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49696), we believe that it is appropriate to require reporting and validation of eCQMs given that measures available now and those being developed for the future are increasingly based on electronic standards.

We will continue working to provide hospitals with the education, tools, and resources necessary to help reduce eCQM reporting burden and more seamlessly account for the removal/addition of eCQMs. Further, we will also consider the issues associated with new software, workflow changes, training, et cetera as we continue to improve our education and outreach efforts for eCQM submission and validation. We try to be as proactive as possible in providing lead time about the removal of measures from the Hospital IQR Program measure set. With regard to the measures being removed for the FY 2019 payment determination, we signaled our intent to remove these measures in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49644 through 49645). We refer readers to section VIII.A.8.a. of the preamble of this final rule for a discussion of our final policy regarding the number of eCQMs required for submission for the FY 2019 payment determination and subsequent years.

Comment: A few commenters suggested that topped-out measures not be removed from the Hospital IQR Program measure set. One commenter opposed the proposal to remove the eCQMs that are topped out, stating that the measures should not be retired until the eCQM reporting process and validation have matured. The commenter further stated that allowing hospitals the option to electronically report topped-out measures would provide them with an opportunity to test the accuracy of their EHR reporting systems. Another commenter requested that any topped-out eCQM that is removed from the Hospital IQR Program be kept on reserve so that performance can be monitored as necessary to ensure that performance and/or adherence to best practices do not decline. In addition, the commenter suggested that an alternative use of topped-out measures is inclusion as components of composite measures. Another commenter recommended that CMS implement a periodic auditing system of measures designated as topped-out. The commenter expressed the opinion that such a system would ensure that performance remains satisfactorily high and also detect reductions in the quality of care.

Response: We disagree that measures should not be retired until the eCQM reporting process and validation have matured. While we recognize the benefit of testing the accuracy of EHR reporting systems and performance monitoring to ensure best practices do not decline, we must balance the costs of continued inclusion of these measures in the program and monitoring of successful measures that have high levels of performance with the adoption of other measures which have greater opportunities for improvement in clinical quality.

Comment: One commenter expressed concern that nine out of 15 eCQMs proposed for required reporting in the Hospital IQR Program are ''topped-out'' and suggested that CMS remove the following nine measures: AMI–8a—Primary PCI within 90 minutes of Hospital Arrival; STK–02—Discharged on Antithrombotic Therapy; STK–03—Anticoagulation Therapy for Atrial Fibrillation/Flutter; STK–05—Antithrombotic Therapy by End of Hospital Day 2; STK–06—Discharged on Statin; STK–08—Stroke Education; STK–10—Assessed for Rehab; VTE–01—Venous Thromboembolism Prophylaxis; VTE–02—ICU VTE Prophylaxis. The commenter also expressed concern about the audit requirements for these measures as EHRs are updated and requested clarification of the data field requirements.

Response: While we acknowledge commenter's concern regarding retaining eCQMs that are topped-out in their chart-abstracted form, we note that we take several factors into consideration when retaining or removing measures from the program. We refer readers to the FY 2016 IPPS/LTCH PPS final rule where we discuss our measure removal and retention factors (80 FR 49641). These measures are not being considered for removal in this final rule because we believe that these measures have other valuable factors that warrant retention in the program, such as: Alignment with CMS Quality Strategy goals; alignment with other CMS programs, including other quality reporting programs, or the EHR Incentive Program; and supporting efforts to move facilities towards reporting electronic measures.

With regard to the commenter's concerns regarding ''audit requirements,'' we interpret this to refer to changes in eCQM technical mapping that may need to occur after an EHR is updated/upgraded. All Hospital IQR Program eCQM electronic specifications and technical release notes are readily available at the eCQI (Electronic Clinical Quality Improvement) Resource Center: *https://ecqi.healthit.gov/eh*. We encourage hospitals to test electronic capture of data following updates and upgrades or to work with their vendors to do so. Further, we encourage hospitals to internally test their preparedness to submit eCQM data prior to annual reporting using an available presubmission testing tool for electronic reporting—such as the CMS Pre-Submission Validation Application (PSVA), which can be downloaded for free from the Secure File Transfer (SFT) section of the QualityNet Secure Portal at: *https://cportal.qualitynet.org/QNet/pgm_select.jsp*. We will also continue working to provide hospitals and vendors with education on eCQM data reporting fields and elements.

Comment: A few commenters did not support the removal of any of these 13 eCQMs because it would reduce the number of eCQMs available for hospitals to select for reporting. One commenter indicated that this proposal would reduce hospitals' flexibility in choosing to report measures that are meaningful to them and that align with their internal efforts to improve quality.

Response: We understand the commenters' concerns with respect to allowing hospitals' flexibility to choose to report on measures that are meaningful to internal quality improvement efforts. However, as we stated in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49641), we strive to ensure that our measure set consists of quality standards that align with the

National Quality Strategy and our priorities for quality improvement as outlined in the CMS Quality Strategy, available at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityInitiativesGenInfo/Downloads/CMSQuality-Strategy.pdf*. Our decision to remove measures from the Hospital IQR Program measure set is an extension of our programmatic goal to continually refine the measure set and ensure that it consists of quality performance standards. We again refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49641) for our considerations in removing and retaining measures as well as section VIII.A.8.a. of the preamble of this final rule, where we finalize a policy to require submission of 8 eCQMs out of 15 available eCQMs for the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determination.

Comment: A commenter did not support the removal of measures because it can hinder ongoing measurement and reduce performance improvements. The commenter requested that CMS maintain a library of measures that are not included in the Hospital IQR Program so that hospitals and vendors can still support monitoring and improving these removed measures.

Response: We disagree with commenter that the removal of these measures may hinder measurement and reduce performance improvement. Although hospitals are not publicly reporting data for measures that have been removed from the Hospital IQR Program, hospitals are encouraged to continue to monitor data for continuous quality improvement. We appreciate the commenter's suggestion to maintain a library of eCQMs that have been removed from the Hospital IQR Program and will take it into consideration for the future.

Comments related to removal of specific measures are discussed in more detail below.

(1) Removal of Structural Measures

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25175, we proposed to remove two structural measures for the FY 2019 payment determination and subsequent years: (1) Participation in a Systematic Clinical Database Registry for Nursing Sensitive Care; and (2) Participation in a Systematic Clinical Database Registry for General Surgery, based on removal factor 4—performance on these measures does not result in better patient outcomes (80 FR 49641). These measures were originally adopted in the RHQDAPU Program FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43870 through 43872) to monitor participation in systematic clinical database registries for the Hospital IQR Program. By design, the measures do not provide information on patient outcomes, because hospitals are asked only whether they participate in registries. In the future, we will consider other more effective measures to include in the program. As a result, we believe that the burden to retain these measures outweigh the benefits. Therefore, we proposed to remove these two structural measures from the Hospital IQR Program for the FY 2019 payment determination and subsequent years.

Comment: Many commenters supported the proposed removal of the two structural measures from the Hospital IQR Program because removing these measures ensures that the measure set only includes measures that result in better patient outcomes. A number of commenters asserted that the measures do not provide pertinent information on patient outcomes, do not reflect performance on process or outcomes, and do not add value to the Hospital IQR Program's measure set. Some commenters also noted that removing these measures would decrease the annual reporting burden on hospitals.

Response: We thank the commenters for their support.

Comment: A few commenters supported the proposed removal of the two structural measures from the Hospital IQR Program, but suggested that this removal be implemented for the FY 2018 payment determination, instead of the FY 2019 payment determination.

Response: We thank the commenters for their support and suggestion. However, we will implement the removal of these measures for the FY 2019 payment determination as proposed, because the FY 2019 payment determination is the earliest we can feasibly operationalize the removal.

Comment: One commenter expressed concern with the proposed removal of the Participation in a Systematic Clinical Database Registry for Nursing Sensitive Care measure, because it has seen improvement from this participation. The commenter suggested that any future quality measures should match the registry's quality measures to encourage alignment.

Response: We continue to believe that registries may facilitate valuable quality improvement feedback to hospitals that may be more meaningful beyond the information reported to the Hospital IQR Program as structural measures. However, at this time we are unable to collect this additional quality improvement data since we do not maintain the registries. The structural measures themselves, as part of the Hospital IQR Program, do not provide information on patient outcomes; hospitals are asked only whether they participate in registries. Thus, we believe it is important to consider other measures that provide more meaningful and detailed information regarding quality of care and patient outcomes while balancing program burdens. We note that we are committed to promoting alignment in quality measures when feasible; however, many registry measures are proprietary.

Comment: One commenter opposed the proposed removal of the ''Participation in a Systematic Clinical Database Registry for Nursing Sensitive Care'' because public reporting of this measure is a lever to promote continued hospital participation in a nursing-sensitive data registry. The commenter expressed concern that if this measure were not included in the Hospital IQR Program, the role of nursing professionals would be diminished in the program. The commenter further noted that this measure is low burden to report and urged CMS to retain this measure until nursing sensitive process and outcome measures are developed as eCQMs and reported in the Hospital IQR Program.

Response: We appreciate the commenter's position to retain this measure, however, we note that the main intent of this structural measure was to assess the level of registry participation. Because this measure does not provide information on patient outcomes or quality of care, we believe it is important to remove it from the program at this time in light of the burden of reporting and consider other measures that provide more meaningful and detailed information regarding quality of care and patient outcomes. We believe that hospitals committed to participating in a nursing registry will continue to do so. We agree with the commenter that providing quality care requires all members of the care team, including nurses, and we will continue to consider measures for the Hospital IQR Program that incorporate the importance of communication and coordination among members of the care team. We will also consider the development of nursing sensitive process and outcome measures for the Hospital IQR Program in the future.

Comment: One commenter opposed the proposed removal of the ''Participation in a Systematic Clinical

Database Registry for General Surgery'' from the Hospital IQR Program because it believed that the inclusion of this measure encourages hospital participation in risk-adjusted, audited clinical data registries. Further, the commenter asserted that inclusion of such a measure helps CMS ensure that hospital and physician programs are in alignment.

Response: We note that the main intent of this structural measure was to assess the level of registry participation. When considering measures for the Hospital IQR Program, we attempt to align with other programs whenever feasible, but because this measure does not provide information on patient outcomes or quality of care, we believe it is important to remove it from the program at this time in light of the overall burden of reporting. We do not believe that the removal of this measure will dis-incentivize hospitals committed to participating in registries for quality improvement.

After consideration of the public comments we received, we are finalizing the removal of these two structural measures from the Hospital IQR Program for the FY 2019 payment determination and subsequent years as proposed.

(2) Removal of ''Topped-Out'' Chart-Abstracted Measures

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25175, we proposed to remove two measures in their chart-abstracted forms: (1) STK–4: Thrombolytic Therapy (NQF #0437) and (2) VTE–5: VTE Discharge Instructions, because measure performance among hospitals is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made (''topped-out'' measures)—removal factor 1 (80 FR 49641). The chart-abstracted version of STK–4 was adopted into the program in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51634); and the chart-abstracted version of VTE–5 was adopted into the program in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51636). One factor we consider in determining whether a measure should be retained or removed from the program is whether the measure is ''topped-out.'' We have previously adopted two criteria for determining the ''topped-out'' status of Hospital IQR Program measures: (1) Statistically indistinguishable performance at the 75th and 90th percentiles; and (2) truncated coefficient of variation ≤0.10 (80 FR 49642). These measures meet both of these criteria. We believe that the burdens of retaining these measures outweigh the benefits, and therefore, we proposed to remove the chart-abstracted versions of STK–4 and VTE–5 for the FY 2019 payment determination and subsequent years.

Comment: Many commenters supported the proposal to remove two chart-abstracted measures, STK–4 and VTE–5, on the grounds that these measures are topped-out and offer little room for performance improvement among hospitals. Commenters also noted that removing these measures would reduce administrative burden on hospitals and would move CMS quality measurement efforts away from the use of clinical process measures and more toward outcomes measures.

Response: We thank the commenters for their support of our proposal to remove two chart-abstracted measures in an effort to move quality measurement toward outcomes measures.

Comment: One commenter supported the removal of the topped out chart-abstracted measures, but encouraged CMS to apply new stroke and VTE measures to ensure continual quality improvement.

Response: We thank the commenter for the support. We will consider new stroke and VTE measures for future rulemaking.

Comment: One commenter supported the removal of the STK–4 and VTE–5 chart-abstracted measures, but encouraged us to retain them as eCQMs.

Response: We believe that the burden of retaining both the STK–4 and VTE–5 measures as eCQMs outweighs the benefits. In addition to both measures being topped out, we also considered other factors such as feasibility of data collection and alignment with other programs. In the case of VTE–5, a majority of hospitals do not have the ability to capture the required eCQM data elements needed for VTE–5 and therefore data collection is not feasible. Furthermore, removing these two measures in both chart-abstracted and eCQM forms aligns the Hospital IQR Program measure set with the Medicare and Medicaid EHR Incentive Programs' measure sets. We refer readers to section VIII.E.2.b. of the preamble to this final rule for the Medicare and Medicaid EHR Incentive Programs' measure sets.

Comment: One commenter did not support the proposed removal of VTE–5 because changes in practice patterns, including shorter hospital stays after major surgery, make clear discharge planning around VTE prevention more important moving forward. The commenter expressed the opinion that removing this measure would reduce accountability for appropriate transitions of care for patients at risk of VTE.

Response: Topped-out measures represent care standards that have been widely adopted by hospitals. Measure performance among hospitals is so high and unvarying for VTE–5 that meaningful distinctions and improvements in performance can no longer be made. We believe that hospitals committed to providing quality care will continue to provide good quality care consistent with standard practice. In the past, we have retained the electronic versions of some topped-out measures for reasons such as promoting alignment between programs or to provide an opportunity to monitor topped-out measures for performance decline. In this case, VTE–5 is not only topped-out, but also, as stated above, a majority of hospitals do not have the ability to capture the required eCQM data elements needed for VTE–5. In addition, removing VTE–5 promotes alignment with the Medicare and Medicaid EHR Incentive Programs. Finally, in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50258), we received anecdotal comments about performance level differences between chart-abstracted and eCQM data. We do not have sufficient data to be able to confirm or refute the accuracy of those comments (79 FR 50258), but these comments have prompted us to reconsider our position that topped-out eCQMs provide an opportunity for CMS to meaningfully monitor topped-out measures for performance decline at this time. In consideration of all of these factors, we do not believe that the burden of retaining the electronic version to allow the comparison to old data outweighs the benefit. Therefore, we believe that removal of VTE–5 in both chart-abstracted and eCQM form is appropriate.

Comment: One commenter did not support the removal of the STK–4 chart-abstracted measure because the commenter believes there is still a performance gap among hospitals for this measure, and recent inclusion and exclusion criteria released earlier this year may increase the number of patients eligible for this treatment. The commenter suggested that CMS retain the STK–4 measure.

Response: We disagree with the commenter that a performance gap among hospitals exists. We note that STK–4 is topped-out in its chart-abstracted form, which under our definition means that measure performance among hospitals is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made.

While we acknowledge that revised measure specifications have been submitted to NQF, the revised measure would be required to proceed through the pre-rulemaking process for measure selection before it could be considered for adoption in the Hospital IQR Program. For details regarding the pre-rulemaking process we refer commenter to *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/Pre-Rule-Making.html*.

Comment: One commenter requested that any topped-out chart-abstracted measure that is removed from the Hospital IQR Program be kept on reserve so that performance can be monitored as necessary to ensure that performance and/or adherence to best practices do not decline. In addition, the commenter suggested that an alternative use of topped-out measures could instead be used as components of composite measures.

Response: We currently do not have authority to maintain a ''reserve'' status for quality measures in the Hospital IQR Program. If we interpret the commenter to mean that CMS should retain the measures in the program as is, we disagree, and a new composite measure would be required to proceed through the pre-rulemaking process for measure selection before it could be proposed in formal rulemaking. For details regarding the pre-rulemaking process we refer commenter to *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/Pre-Rule-Making.html*. We believe that topped-out measures represent quality care standards that have been widely adopted by hospitals, and retention of these measures, in the absence of other mitigating factors such as alignment with other programs, independently or as components of a composite measure, is unnecessary because hospitals will continue to perform well on these measures. Further, we must balance the costs and burden of continued reporting and monitoring of a successful measure with high levels of performance with the adoption of other measures where there are greater opportunities for improvement in clinical quality. As stated above, we also considered other factors such as alignment with other programs, and determined that removal of STK–4 and VTE–5 promotes alignment with the Medicare and Medicaid EHR Incentive Programs. However, we will take the commenter's recommendation into consideration for the future if statutory changes are made to the program.

After consideration of the public comments we received, we are finalizing the removal of STK–4: Thrombolytic Therapy (NQF #0437) and VTE–5: VTE Discharge Instructions for the FY 2019 payment determination and subsequent years as proposed.

(3) Removal of Certain eCQMs

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25175, we proposed to remove the electronic versions of AMI–7a, HTN, PN–6, SCIP–Inf–9, VTE–3, VTE–4, VTE–5, VTE–6, STK–4, AMI–2, AMI–10, SCIP–Inf–1a, and SCIP–Inf–2a, beginning with the FY 2019 payment determination. Each measure is discussed in more detail below.

(a) Removal of eCQMs in Alignment With the Medicare and Medicaid EHR Incentive Programs

We proposed to remove 13 eCQMs from both the Hospital IQR Program and the Medicare and Medicaid EHR Incentive Programs in order for hospitals to focus on a smaller, more specific subset of eCQMs while keeping the programs aligned.

We refer readers to sections VIII.A.8.a. and VIII.A.10.d. of the preamble of this final rule for details on eCQM reporting requirements for the Hospital IQR Program in alignment with the Medicare and Medicaid EHR Incentive Programs. We also refer readers to section VIII.A.3.b.(3) of the preamble of this final rule for discussion on the removal of these 13 eCQMs from the Medicare and Medicaid EHR Incentive Programs. We believe that a coordinated reduction in the overall number of eCQMs in both programs would reduce burden on hospitals and improve the quality of reported data by enabling hospitals to focus on a smaller, more specific subset of eCQMs. We proposed these changes in response to public comments for the Hospital IQR Program in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49694), which recommended that CMS adopt a lesser number of eCQMs.

Comment: Many commenters supported the removal of 13 eCQMs from the Hospital IQR Program measure set.

Response: We thank the commenters for their support.

(i) AMI–7a

We proposed to remove the AMI–7a: Fibrinolytic Therapy Received Within 30 minutes of Hospital Arrival eCQM, because performance or improvement on this measure does not result in better patient outcomes—removal factor 4 (80 FR 49641). In the FY 2016 IPPS/LTCH PPS final rule, we removed the chart-abstracted version of AMI–7a because the reporting burden outweighed the benefit of posting very few hospitals' measure rates. This measure's specifications resulted in very high denominator exclusion rates. Consequently, the vast majority of abstracted AMI cases were excluded from AMI–7a measure rates. Most acute myocardial infarction (AMI) patients receive percutaneous coronary intervention (PCI) instead of fibrinolytic therapy (80 FR 49647). We do not believe that the mode of reporting (eCQM versus chart-abstracted) would cause the number of cases reported to differ since most AMI patients would still receive PCI instead of fibrinolytic therapy. In the FY 2016 IPPS/LTCH PPS final rule, we retained the electronic version of this measure for alignment purposes with the Medicare and Medicaid EHR Incentive Programs (80 FR 49644). As discussed above, we proposed to focus on a smaller, more specific subset of eCQMs in both the Hospital IQR and Medicare and Medicaid EHR Incentive Programs. As a result, the burdens related to retaining this measure outweigh the benefits. Therefore, we proposed to remove the AMI–7a eCQM from the Hospital IQR Program for the FY 2019 payment determination and subsequent years.

Comment: A commenter supported the removal of the AMI–7a because most AMI patients receive percutaneous coronary intervention instead of fibrinolytic therapy and the measure does not reflect current clinical practice.

Response: We thank the commenter for its support of our proposal to remove AMI–7a because it does not reflect current clinical practice.

Comment: One commenter did not support the proposal to remove the AMI–7a measure because fibrinolytic therapy is still recommended when PCI cannot be performed within 120 minutes of first medical contact. Because it is still an important process of care, the commenter recommended that CMS find ways to reduce collection burden instead of removing the measure from the Hospital IQR Program. The commenter also expressed concern that removing this measure could cause unintended consequences, particularly for patients in rural settings where there could be prolonged times to transfer a patient to a PCI-capable hospital.

Response: As discussed above, in the FY 2016 IPPS/LTCH PPS final rule, we previously removed the chart-abstracted version of AMI–7a because the reporting burden outweighed the benefit of public reporting on very few hospitals' measure rates. This measure's specifications resulted in very high

denominator exclusion rates, and consequently, the vast majority of abstracted acute myocardial infarction (AMI) cases were excluded from AMI–7a measure rates. Further, most AMI patients receive percutaneous coronary intervention (PCI) instead of fibrinolytic therapy (80 FR 49647). While we acknowledge the commenter's concern regarding unintended consequences, particularly in rural settings, we carefully weighed the benefits and burden of retaining this eCQM in the program. Due to the high exclusion rates, we do not believe that trying to reduce the collection burden of AMI–7a will reduce the exclusion rates or otherwise outweigh the reporting costs to hospitals of retaining the measure in the Hospital IQR Program. As discussed above, we intend to focus on a smaller, more specific subset of eCQMs in both the Hospital IQR Program and the Medicare and Medicaid EHR Incentive Programs. We remain committed to monitoring for unintended consequences, such as changes in AMI patient outcomes over time, by examining the results of other outcome measures in the Hospital IQR Program, specifically MORT–30–AMI and READM–30–AMI. We will revise the measure set through future rulemaking if needed.

After consideration of the public comments we received, we are finalizing the removal of the AMI–7a: Fibrinolytic Therapy Received Within 30 minutes of Hospital Arrival eCQM from the Hospital IQR Program for the FY 2019 payment determination and subsequent years as proposed.

(ii) STK–4, AMI–2, AMI–10, SCIP–Inf–1a, and SCIP–Inf–2a

We proposed to remove the: (1) STK–4: Thrombolytic Therapy (NQF #0437); (2) AMI–2: Aspirin Prescribed at Discharge for AMI (NQF #0142); (3) AMI–10: Statin Prescribed at Discharge; (4) SCIP–Inf–1a: Prophylactic Antibiotic Received Within One Hour Prior to Surgical Incision (NQF #0527); and (5) SCIP–Inf–2a: Prophylactic Antibiotic Selection for Surgical Patients (NQF #0528) eCQMs, because measure performance among hospitals is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made—removal factor 1 (80 FR 49641). We note that the NQF has changed the endorsement designations of the AMI–2, AMI–10, SCIP–Inf–1a, and SCIP–Inf–2a chart-abstracted measures and eCQM versions to either ''reserve status'' or ''endorsement removed'' (available at: *http://www.qualityforum.org/QPS/QPSTool.aspx*), because there is no opportunity for improvement.

We refer readers to section VIII.A.3.b.(2) of the preamble of this final rule for discussion of our proposal also to remove the chart-abstracted form of the STK–4 measure due to ''topped-out'' status. The electronic version of the STK–4 measure was adopted into the Hospital IQR Program in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50784) to promote programmatic alignment, as it was a part of a measure set that was already included in the Medicare and Medicaid EHR Incentive Programs' Electronic Reporting Pilot for Eligible Hospitals and CAHs (75 FR 44418 and 76 FR 74489).

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50781), we removed the chart-abstracted versions of AMI–2 and AMI–10 due to ''topped-out'' status. However, as noted in FY 2015 IPPS/LTCH PPS final rule (79 FR 50245), we readopted these measures, though only in the electronic form, because we believed that we should continue aligning the Hospital IQR Program and the Medicare EHR Incentive Program in order to minimize reporting burden and to facilitate the transition to reporting of eCQMs. We believed that voluntary reporting of these measures would further that aim. In addition, we believed that allowing hospitals the option to electronically report ''topped-out'' measures would provide them with an opportunity to test the accuracy of their EHR reporting systems.

Similarly, in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50208), we removed the chart-abstracted versions of SCIP–Inf–1a and SCIP–Inf–2a, previously referred to as SCIP–Inf–1 and SCIP–Inf–2 respectively, due to their ''topped-out'' status. However, as stated in that rule, we retained the electronic versions of these measures, because we believed this provided us with an opportunity to monitor ''topped-out'' measures for performance decline. It also simplified alignment between the Hospital IQR Program and Medicare EHR Incentive Program for eligible hospitals and provided a more straightforward approach to educate stakeholders on electronic reporting options (79 FR 50208).

As discussed above, we proposed to focus on a smaller, more specific subset of eCQMs for the Hospital IQR Program and both the Medicare and Medicaid EHR Incentive Programs. Therefore, in light of their ''topped out'' status, the burden of retaining these measures outweighs the benefits. Thus, we proposed to remove the STK–4, AMI–2, AMI–10, SCIP–Inf–1a, and SCIP–Inf–2a eCQMs from the Hospital IQR Program for the FY 2019 payment determination and subsequent years.

Comment: A commenter supported the removal of the following eCQMs: SCIP–Inf–1a: Prophylactic Antibiotic Received Within One Hour Prior to Surgical Incision (NQF #0527), SCIP–Inf–2a: Prophylactic Antibiotic Selection for Surgical Patients (NQF # 0528), SCIP–Inf–9: Urinary Catheter Removed on Postoperative Day 2 (POD2) With Day of Surgery Being Day Zero, and PN–6: Initial Antibiotic Selection for Community-Acquired Pneumonia (CAP). The commenter stated that removing these measures from the Hospital IQR Program helps to reduce data collection burden, rid the program of measures that no longer add value, and allow hospitals to focus on measures that demonstrate areas for improvement.

Response: We thank the commenter for its support.

Comment: One commenter expressed concern regarding the proposed removal of the SCIP–Inf–1a: Prophylactic Antibiotic Received Within One Hour Prior to Surgical Incision (NQF #0527) measure due to a concern that the removal of this measure could result in unintended reduction in adherence to appropriate prophylactic antibiotic use prior to surgery. The commenter stated that the prophylactic antibiotic measure (NQF #0527) should be retained to supplement the proposed NHSN measure, since it is the aim of hospitals to minimize antimicrobial use.

Response: We disagree with the commenter that removal of SCIP–Inf–1a, which is topped-out, will result in the unintended reduction in adherence to appropriate prophylactic antibiotic use prior to surgery. Topped-out measures represent care standards that have been widely adopted by hospitals. We believe that hospitals committed to providing quality care will continue to provide good quality care consistent with standard practice. In the past, we have retained the electronic versions of some topped-out measures for reasons such as promoting alignment between programs or to provide an opportunity to monitor topped-out measures for performance decline. In this case, removing SCIP–Inf–1a promotes alignment with the Medicare and Medicaid EHR Incentive Programs. In addition, in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50258), we received anecdotal comments about performance level differences between chart-abstracted and eCQM data. We do not have sufficient data to be able to confirm or refute the accuracy of those comments (79 FR 50258), but these comments have prompted us to reconsider our position

that topped-out eCQMs provide an opportunity for CMS to meaningfully monitor topped-out measures for performance decline at this time. In consideration of these factors, we do not believe that the burden of retaining the electronic version to allow the comparison to chart-abstracted data outweighs the benefit. Therefore, we believe that removal of SCIP–Inf–1a in eCQM form is appropriate.

We wish to clarify that we did not propose the NHSN Antimicrobial Use Measure, but rather sought comments regarding potential inclusion of the measure in the future. We do not agree that we should retain SCIP–Inf–1a to supplement the NHSN Antimicrobial Use measure, because if the NHSN measure is adopted into the Program in future years, surgical prophylactic antibiotic use will be captured by the NHSN measure. However, we applaud the commenter's commitment to antibiotic stewardship and refer readers to the NHSN Antibiotic Use and Resistance Module available at: *http://www.cdc.gov/nhsn/acute-care-hospital/aur/*.

Comment: One commenter supported the removal of the AMI–2 and AMI–10 eCQMs because removal would reduce the administrative burden on hospitals. However, the commenter suggested that these measures be kept on reserve for reimplementation if necessary because they are important processes in cardiovascular care.

Response: We thank the commenter for its support of our proposal to remove the AMI–2 and AMI–10 eCQMs because removal will reduce hospital administrative burden. We note that currently we do not have authority to maintain a ''reserve'' status for quality measures in the Hospital IQR Program. If we interpret the commenter to mean that CMS should retain the eCQMs in the program as is, we disagree. We must balance the costs and burden of continued reporting and monitoring of a successful measure with high levels of performance with the adoption of other measures where there are greater opportunities for improvement in clinical quality. As stated above, we also considered other factors such as alignment with other programs, and determined that removal of AMI–2 and AMI–10 promotes alignment with the Medicare and Medicaid EHR Incentive Programs. If we decide to reimplement these measures in the future, as the commenter suggests, we are required to proceed through the pre-rulemaking process for measure selection before they can be considered for adoption in the Hospital IQR Program. For details regarding the pre-rulemaking process we refer readers to: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityMeasures/Pre-Rule-Making.html*.

Comment: Some commenters did not support the proposal to remove the STK–4 eCQM, and expressed concern that removing this eCQM may lead to poorer performance due to lack of accountability and reporting, as well as send a message that CMS does not consider this an important process of care for patients with ischemic stroke. Two commenters noted that the national averages for the STK–4 measure is only 83 percent, indicating an opportunity for hospitals to improve on this measure. One commenter noted retention of the STK–4 eCQM is necessary because it allows hospitals and CMS to compare the eCQM-reported rates with the historically reported chart-abstracted measure. Another commenter raised concerns with removing the STK–4 measure because it intended to submit this measure as part of the CY 2016 eCQM reporting requirement.

Response: STK–4 meets our topped-out criteria per our analysis of hospitals participating in the Hospital IQR Program. Further, because of the use of structured data fields in eCQMs, eCQM data and chart-abstracted data for the same measure may not always be one hundred percent comparable. We do not believe that removal of STK–4 will lead to poorer performance and accountability. As previously noted, we believe topped-out measures represent care standards that have been widely adopted by hospitals. We believe that hospitals committed to providing quality care will continue to provide quality care consistent with standard practice. In the past, we have retained the electronic versions of some topped-out measures for reasons such as promoting alignment between programs or to provide an opportunity to monitor topped-out measures for performance decline. In this case, removing STK–4 promotes alignment with the Medicare and Medicaid EHR Incentive Programs.

In addition, in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50258), we received anecdotal comments about performance level differences between chart-abstracted and eCQM data. We do not have sufficient data to be able to confirm or refute the accuracy of those comments (79 FR 50258), but these comments have prompted us to reconsider our position that topped-out eCQMs provide an opportunity for CMS to meaningfully monitor topped-out measures for performance decline at this time. In consideration of these factors, we do not believe that the burden of retaining the electronic version to allow the comparison to old data outweighs the benefit. Therefore, we believe that removal of STK–4 in eCQM form is appropriate. In regard to the commenter's concern that it will not be able to submit the STK–4 eCQM as part of the CY 2016 reporting period eCQM requirement, we note that the STK–4 eCQM was proposed (and is being finalized) for removal for the FY 2019 payment determination, which affects the CY 2017 reporting period, not the CY 2016 reporting period. The commenter may still submit the STK–4 eCQM for the CY 2016 reporting period for the FY 2018 payment determination.

Comment: One commenter did not support the removal of AMI–10 and AMI–2 because these measures continue to provide useful data to hospitals.

Response: We refer readers to section VIII.A.3.b.(3)(a)(ii) of the preamble of this final rule where we note that measure performance for AMI–10 and AMI–2 is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made. Therefore, per the Hospital IQR Program removal factor 1 (80 FR 49641), we have decided to remove these measures from the measure set. In addition to both measures being topped out, we also considered other factors such as alignment with other programs and determined that removing these two measures aligns the Hospital IQR Program measure set with the Medicare and Medicaid EHR Incentive Programs' measure sets. We refer readers to section VIII.E.2.b. of the preamble of this final rule for the Medicare and Medicaid EHR Incentive Programs' measure sets.

Further, these measures have had a change in endorsement designation by NQF (available at: *http://www.qualityforum.org/QPS/QPSTool.aspx*). In addition, as discussed above, we intend to focus on a smaller, more specific subset of eCQMs for the Hospital IQR Program and both the Medicare and Medicaid EHR Incentive Programs.

After consideration of the public comments we received, we are finalizing the removal of the STK–4, AMI–2, AMI–10, SCIP–Inf–1a, and SCIP–Inf–2a eCQMs from the Hospital IQR Program for the FY 2019 payment determination and subsequent years as proposed.

(b) HTN

We proposed to remove the HTN: Healthy Term Newborn (NQF #0716) eCQM, because it is no longer feasible to implement the measure

specifications—removal factor 7 (80 FR 49642). In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50249), we added HTN, only as an eCQM, not as a claims-based measure. Although the claims-based version of the HTN measure has never been part of the Hospital IQR Program, the claims-based HTN measure concept was used to develop the HTN eCQM. The measure steward has made substantial revisions to the claims-based version of this measure such that the focus is no longer on the number of healthy term newborns, but the number of unexpected complications in term newborns. The numerator of the revised measure has been restructured to assess the presence of severe or moderate complications after term birth, while the original measure looked for the absence of several types of complications after term birth. For the revised measure specifications, we refer readers to: *https://www.cmqcc.org/focus-areas/quality-metrics/unexpected-complications-term-newborns*. In addition, the measure steward is no longer maintaining the claims-based version of HTN or supporting the maintenance of the original eCQM version of HTN that was developed by CMS and adopted in the Hospital IQR Program. Therefore, it is not feasible to continue to include a measure that is no longer supported by the steward. As a result, we proposed to remove the HTN eCQM from the Program for the FY 2019 payment determination and subsequent years.

Comment: One commenter supported the proposal to remove HTN along with AMI–7a, VTE–3, VTE–4, VTE–5, VTE–6, SCIP–Inf–1a, SCIP–Inf–2a, SCIP–Inf–9, PN–6, and STK–4.

Response: We thank the commenter for its support.

After consideration of the public comment we received, we are finalizing the removal of the HTN: Healthy Term Newborn (NQF #0716) eCQM from the Hospital IQR Program for the FY 2019 payment determination and subsequent years as proposed.

(c) PN–6 and SCIP–Inf–9

We proposed to remove the: (1) PN–6: Initial Antibiotic Selection for Community-Acquired Pneumonia (CAP) in Immunocompetent Patients (NQF #0147) and (2) SCIP–Inf–9: Urinary Catheter Removed on Postoperative Day 1 (POD1) or Postoperative Day 2 ((POD2) with Day of Surgery Being Day Zero) eCQMs, because it is no longer feasible to implement the measure specifications—removal factor 7 (80 FR 49642). While the electronic versions were retained, the chart-abstracted versions of PN–6 and SCIP–Inf–9 were determined to be ''topped-out'' and were removed from the Hospital IQR Program measure set in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50204 through 50208).

These two eCQMs have undergone significant changes to their logic expression during the previous annual update.[93] There are a number of data capture requirements that cannot be represented adequately in the eCQM form due to their conceptual complexity. Specifically, for PN–6, hospital feedback has indicated difficulties with interpreting several critical timing requirements, such as for intensive care unit populations, emergency department and inpatient admission transitions, steroid therapy, and pre-admission medications. In addition, hospitals raised concern about the inability to account for variation in recording of the interpretation of laboratory results. For SCIP–Inf–9, feedback from hospitals has indicated that it is difficult to interpret the appropriate timing of elements associated with both the insertion and removal of a catheter. This is particularly problematic, because of the variety of patient locations encountered before and after surgery, as well as transfers among units. While these variations for both PN–6 and SCIP–Inf–9 can be accounted for through chart-based manual abstraction, we have had great difficulties in translating and maintaining these options for electronic reporting. Therefore, we proposed to remove both the PN–6 and SCIP–Inf–9 eCQMs from the Hospital IQR Program for the FY 2019 payment determination and subsequent years.

Comment: One commenter supported the removal of SCIP-Inf-9: Urinary Catheter Removed on Postoperative Day 2 (POD2) With Day of Surgery Being Day Zero and PN–6: Initial Antibiotic Selection for Community-Acquired Pneumonia (CAP) because removing these measures from the Hospital IQR Program helps to reduce data collection burden, rid the program of measures that no longer add value, and allow hospitals to focus on measures that demonstrate areas for improvement.

Response: We thank the commenter for its support.

After consideration of the public comment received, we are finalizing the removal of both PN–6: Initial Antibiotic Selection for Community-Acquired Pneumonia (CAP) in Immunocompetent Patients (NQF #0147) and SCIP-Inf-9: Urinary Catheter Removed on Postoperative Day 1 (POD1) or Postoperative Day 2 ((POD2) with Day of Surgery Being Day Zero) eCQMs from the Hospital IQR Program for the FY 2019 payment determination and subsequent years as proposed.

(d) VTE–3, VTE–4, VTE–5, and VTE–6

We proposed to remove the four VTE eCQMs: (1) VTE–3: Venous Thromboembolism Patients with Anticoagulation Overlap Therapy (NQF #0373); (2) VTE–4: Venous Thromboembolism Patients Receiving Unfractionated Heparin (UFH) with Dosages/Platelet Count Monitoring by Protocol (or Nomogram); (3) VTE–5: Venous Thromboembolism Discharge Instructions; and (4) VTE–6: Incidence of Potentially Preventable Venous Thromboembolism, because it is no longer feasible to implement the measures specifications—removal factor 7 (80 FR 49642). Many of the chart-abstracted versions of these measures were determined to be ''topped-out.'' While the electronic versions of VTE–3 and VTE–4 were retained, the chart-abstracted versions were determined to be ''topped-out'' and were removed from the Hospital IQR Program measure set in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49643) and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50205), respectively. In addition, as described above in section VIII.A.3.b.(2) of the preamble of this final rule, we proposed to remove the chart-abstracted version of VTE–5 for the FY 2019 payment determination and subsequent years due to its ''topped-out'' status. The electronic version of VTE–5 was adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50784). Finally, the chart-abstracted version of VTE–6, however, continues to be included in the Hospital IQR Program measure set because chart abstractors can manually find required data elements in clinical notes and not in structured data fields.

Nonetheless, a majority of hospitals do not have the ability to capture required data elements, such as diagnostic study results/reports and location of the specific vein in which deep vein thrombosis was diagnosed, in discrete structured data fields to support these eCQMs, because they are often found as free text in clinical notes instead. It is exceedingly difficult for hospitals to implement the measure specifications in the absence of these functional requirements. Furthermore, as discussed above, we proposed to focus on a smaller, more specific subset of eCQMs in the Hospital IQR Program and both the Medicare and Medicaid

[93] Technical Release Notes: 2015 Annual Update of 2014 Eligible Hospitals and Eligible Professionals Electronic Clinical Quality Measures (eCQMs). Available at: *https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/Downloads/EHandEPTRNs.pdf*.

EHR Incentive Programs. Therefore, in light of their ''topped out'' statuses and the infeasibility of implementing the measure specifications, the burden of retaining these measures outweighs the benefits. As a result, we proposed to remove the VTE–3, VTE–4, VTE–5, and VTE–6 eCQMs from the Hospital IQR Program for the FY 2019 payment determination and subsequent years.

Comment: One commenter supported the proposal to remove AMI–7a, VTE–3, VTE–4, VTE–5, VTE–6, SCIP-Inf-1a, SCIP-Inf-2a, SCIP-Inf-9, PN–6, STK–04, and HTN. In addition to the reasons articulated by CMS for removing these eCQMs, the commenter expressed concern that AMI–7a and VTE–3, VTE–4, VTE–5, and VTE–6 require data produced and documented in non-certified radiology systems that lack an automated interface necessary to integrate data into certified EHRs for accurate measurement. As a result, the data must be entered manually and this process is very burdensome for providers and could result in great inaccuracies in measure calculations. Another commenter supported the removal of the VTE measures, because these measures have data elements that cannot be captured by electronic reporting.

Response: We thank the commenters for their support.

Comment: One commenter requested that CMS retain the eCQM version of the VTE–6 measure, stating that if CMS sees value in the chart-abstracted form of the measure, then there should also be value in the eCQM format. The commenter also offered that while many other entities have had difficulty implementing this measure in its electronic form, as noted in the proposed rule, it has had success with this measure.

Response: As we state in section VIII.A.3.b.(3)(d) of the preamble of this final rule, the chart-abstracted version of VTE–6 continues to be included in the Hospital IQR Program measure set because chart abstractors can manually find required data elements in clinical notes and not in structured data fields. While we support the commenter's progress with successful data collection for this measure, a majority of hospitals do not have the ability to capture required data elements in discrete structured data fields to support this eCQM. Therefore, in light of their ''topped out'' statuses and the infeasibility of implementing the measure specifications, the burden of retaining these measures outweighs the benefits.

Comment: One commenter suggested that CMS consider future measures for venous thromboembolism, because it is a common condition for hospitalized patients. The commenter expressed concern that with the removal of VTE eCQMs, almost all of the measures related to VTE will be removed from the Hospital IQR Program and given the prevalence and impact of this condition, CMS should consider including more measures that assess VTE to facilitate a renewed focus on improvement in this area. The commenter is developing a comprehensive set of VTE guidelines and plans to reach out to CMS in the future to discuss their implementation in the context of quality measures.

Response: We recognize the importance of assessing VTE in relation to improved patient outcomes for hospital inpatients and will consider the addition of new measures of VTE in future rulemaking. We encourage the commenter to continue their efforts of developing guidelines related to VTE, and welcome future collaboration in this area of clinical quality measurement.

After consideration of the public comments we received, we are finalizing the removal of: (1) VTE–3: Venous Thromboembolism Patients with Anticoagulation Overlap Therapy (NQF #0373), (2) VTE–4: Venous Thromboembolism Patients Receiving Unfractionated Heparin (UFH) with Dosages/Platelet Count Monitoring by Protocol (or Nomogram), (3) VTE–5: Venous Thromboembolism Discharge Instructions, and (4) VTE–6: Incidence of Potentially Preventable Venous Thromboembolism eCQMs from the Hospital IQR Program for the FY 2019 payment determination and subsequent years as proposed.

(4) Summary of Measures Finalized for Removal

The table below lists the measures we are finalizing for removal. We invited public comment on our proposals to remove these 15 measures (eCQMs, structural, and chart-abstracted) from the Hospital IQR Program for the FY 2019 payment determination and subsequent years. The comments we received are discussed above.

We note that STK–04 and VTE–5 are listed twice—once as an eCQM and again as a chart-abstracted measure.

MEASURES FINALIZED FOR REMOVAL FOR THE FY 2019 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Electronic Clinical Quality Measures:

- AMI–2: Aspirin Prescribed at Discharge for AMI (NQF #0142).
- AMI–7a: Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival.
- AMI–10: Statin Prescribed at Discharge.
- HTN: Healthy Term Newborn (NQF #0716).
- PN–6: Initial Antibiotic Selection for Community-Acquired Pneumonia (CAP) in Immunocompetent Patients (NQF #0147).
- SCIP-Inf–1a: Prophylactic Antibiotic Received within 1 Hour Prior to Surgical Incision (NQF #0527).
- SCIP-Inf–2a: Prophylactic Antibiotic Selection for Surgical Patients (NQF #0528).
- SCIP-Inf–9: Urinary Catheter Removed on Postoperative Day 1 (POD1) or Postoperative Day 2 (POD2) with Day of Surgery Being Day Zero.
- STK–04: Thrombolytic Therapy (NQF #0437).
- VTE–3: Venous Thromboembolism Patients with Anticoagulation Overlap Therapy (NQF #0373).
- VTE–4: Venous Thromboembolism Patients Receiving Unfractionated Heparin (UFH) with Dosages/Platelet Count Monitoring by Protocol (or Nomogram).
- VTE–5: Venous Thromboembolism Discharge Instructions.
- VTE–6: Incidence of Potentially Preventable VTE*.

Structural Measures:

- Participation in a Systematic Clinical Database Registry for Nursing Sensitive Care.
- Participation in a Systematic Clinical Database Registry for General Surgery.

Chart-abstracted Measures:

- STK–4: Thrombolytic Therapy (NQF #0437).
- VTE–5: VTE Discharge Instructions.

* Retained in chart-abstracted form.

4. Previously Adopted Hospital IQR Program Measures for the FY 2018 Payment Determination and Subsequent Years

The Hospital IQR Program has previously finalized 65 measures for the FY 2018 payment determination as outlined in the table below:

PREVIOUSLY ADOPTED HOSPITAL IQR PROGRAM MEASURES FOR THE FY 2018 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Short name	Measure name	NQF #
	NHSN	
CAUTI	National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.	0138
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure.	1717
CLABSI	National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure.	0139
Colon and Abdominal Hysterectomy SSI.	American College of Surgeons—Centers for Disease Control and Prevention (ACS–CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	0753
HCP	Influenza Vaccination Coverage Among Healthcare Personnel	0431
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure.	1716
	Chart-abstracted	
ED–1 *	Median Time from ED Arrival to ED Departure for Admitted ED Patients	0495
ED–2 *	Admit Decision Time to ED Departure Time for Admitted Patients	0497
Imm-2	Influenza Immunization	1659
PC–01 *	Elective Delivery	0469
Sepsis	Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)	0500
STK–04 *	Thrombolytic Therapy	0437
VTE–5 *	Venous Thromboembolism Discharge Instructions	(+)
VTE–6 *	Incidence of Potentially Preventable Venous Thromboembolism	(+)
	Claims-based Outcome	
MORT–30–AMI	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0230
MORT–30–CABG	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery.	2558
MORT–30–COPD	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	1893
MORT–30–HF	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Heart Failure (HF) Hospitalization.	0229
MORT–30–PN	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia Hospitalization.	0468
MORT–30–STK	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Ischemic Stroke.	N/A
READM–30–AMI	Hospital 30-Day All-Cause Risk-Standardized Readmission Rate (RSRR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0505
READM–30–CABG	Hospital 30-Day, All-Cause, Unplanned, Risk-Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery.	2515
READM–30–COPD	Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	1891
READM–30–HF	Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Heart Failure (HF) Hospitalization.	0330
READM–30–HWR	Hospital-Wide All-Cause Unplanned Readmission Measure (HWR)	1789
READM–30–PN	Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Pneumonia Hospitalization.	0506
READM–30–STK	30-Day Risk Standardized Readmission Rate Following Stroke Hospitalization	N/A
READM–30–THA/TKA	Hospital-Level 30-Day, All-Cause Risk-Standardized Readmission Rate (RSRR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	1551
AMI Excess Days	Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction	N/A
HF Excess Days	Excess Days in Acute Care after Hospitalization for Heart Failure	N/A
Hip/knee complications	Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA).	1550
PSI 04	Death Rate among Surgical Inpatients with Serious Treatable Complications	0351
PSI 90	Patient Safety for Selected Indicators (Composite Measure)	0531

PREVIOUSLY ADOPTED HOSPITAL IQR PROGRAM MEASURES FOR THE FY 2018 PAYMENT DETERMINATION AND SUBSEQUENT YEARS—Continued

Short name	Measure name	NQF #
	Claims-based Payment	
AMI payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI).	2431
HF Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care For Heart Failure (HF).	2436
PN Payment	Hospital-Level, Risk-Standardized Payment Associated with a 30-day Episode-of-Care For Pneumonia.	2579
THA/TKA Payment	Hospital-Level, Risk-Standardized Payment Associated with an Episode-of-Care for Primary Elective Total Hip Arthroplasty and/or Total Knee Arthroplasty.	N/A
MSPB	Payment-Standardized Medicare Spending Per Beneficiary (MSPB)	2158
	Electronic Clinical Quality Measures (eCQMs)	
AMI–2	Aspirin Prescribed at Discharge for AMI	0142
AMI–7a	Fibrinolytic Therapy Received Within 30 Minutes of Hospital Arrival	(+)
AMI–8a	Primary PCI Received Within 90 Minutes of Hospital Arrival	0163
AMI–10	Statin Prescribed at Discharge	(+)
CAC–3	Home Management Plan of Care Document Given to Patient/Caregiver	(+)
EHDI–1a	Hearing Screening Prior to Hospital Discharge	1354
ED–1 *	Median Time from ED Arrival to ED Departure for Admitted ED Patients	0495
ED–2 *	Admit Decision Time to ED Departure Time for Admitted Patients	0497
HTN	Healthy Term Newborn	0716
PC–01 *	Elective Delivery	0469
PC–05	Exclusive Breast Milk Feeding **	0480
PN–6	Initial Antibiotic Selection for Community-Acquired Pneumonia (CAP) in Immunocompetent Patients.	0147
SCIP-Inf–1a	Prophylactic Antibiotic Received Within One Hour Prior to Surgical Incision	0527
SCIP-Inf–2a	Prophylactic Antibiotic Selection for Surgical Patients	0528
SCIP-Inf–9	Urinary Catheter Removed on Postoperative Day 1 (POD1) or Postoperative Day 2 (POD2) with Day of Surgery Being Day Zero.	(+)
STK–02	Discharged on Antithrombotic Therapy	0435
STK–03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK–04 *	Thrombolytic Therapy	0437
STK–05	Antithrombotic Therapy by the End of Hospital Day Two	0438
STK–06	Discharged on Statin Medication	0439
STK–08	Stroke Education	(+)
STK–10	Assessed for Rehabilitation	0441
VTE–1	Venous Thromboembolism (VTE) Prophylaxis	0371
VTE–2	Intensive Care Unit Venous Thromboembolism (VTE) Prophylaxis	0372
VTE–3	Venous Thromboembolism Patients with Anticoagulation Overlap Therapy	0373
VTE–4	Venous Thromboembolism Patients Receiving Unfractionated Heparin with Dosages/Platelet Count Monitoring by Protocol (or Nomogram).	(+)
VTE–5*	Venous Thromboembolism Discharge Instructions	(+)
VTE–6*	Incidence of Potentially Preventable Venous Thromboembolism	(+)
	Patient Survey	
HCAHPS	HCAHPS + 3-Item Care Transition Measure (CTM–3)	0166, 0228
	Structural	
Registry for Nursing Sensitive Care.	Participation in a Systematic Clinical Database Registry for Nursing Sensitive Care	N/A
Registry for General Surgery	Participation in a Systematic Clinical Database Registry for General Surgery	N/A
Patient Safety Culture	Hospital Survey on Patient Safety Culture	N/A
Safe Surgery Checklist	Safe Surgery Checklist Use	N/A

* Measure listed twice, as both chart-abstracted and electronic clinical quality measure.
** Measure name has been shortened. Please refer to annually updated measure specifications on the CMS eCQI Resource Center Page for further information: *https://www.healthit.gov/newsroom/ecqi-resource-center*.
+ Endorsement removed.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25180), we did not propose to add or remove any measures for the FY 2018 payment determination.

5. Expansion and Updating of Quality Measures

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53510 through 53512) for a discussion of the considerations we use to expand and update quality measures under the Hospital IQR Program. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25180), we did not propose any changes to these policies.

6. Refinements to Existing Measures in the Hospital IQR Program for the FY 2018 Payment Determination and Subsequent Years

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25180 through 25185), we proposed refinements to two claims-based measures: (1) PN Payment: Hospital-Level, Risk-Standardized 30-Day Episode-of-Care Payment Measure for Pneumonia; and (2) PSI 90: Patient Safety and Adverse Events Composite (previously known as the Patient Safety for Selected Indicators Composite Measure), beginning with the FY 2018 payment determination and subsequent years. We discuss these refinements in more detail below. In addition, we refer readers to section VIII.A.9.a. of the preamble of this final rule where we discuss public comment on our intent to update the MORT–30–STK measure to include the NIH Stroke Scale as a measure of stroke severity in the risk-adjustment in future rulemaking.

a. Expansion of the Cohort for the PN Payment Measure: Hospital-Level, Risk-Standardized Payment Associated With a 30-Day Episode-of-Care for Pneumonia (NQF #2579)

(1) Background

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25180 through 25182), for the FY 2018 payment determination and subsequent years, we proposed a refinement of the CMS hospital-level, risk-standardized payment associated with a 30-day episode-of-care for pneumonia (NQF #2579) (PN Payment). The proposed refinement expands the measure cohort to align with the following Hospital IQR Program measures: (1) Hospital 30-day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia Hospitalization (NQF #0468) (MORT–30–PN); (2) Hospital 30-day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Pneumonia Hospitalization (NQF #0506) (READM–30–PN); and (3) Excess Days in Acute Care After Hospitalization for Pneumonia (an improved measure to the previously developed measure entitled ''30-day Post-Hospital Pneumonia Discharge Care Transition Composite'') (NQF #0707) (PN Excess Days).

The expansion of the measure cohort for the MORT–30–PN and the READM–30–PN was finalized in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49660) and is expected to be publicly reported beginning in July 2016. In addition, we refer readers to section VIII.A.7.b. of the preamble of this final rule where we discuss our adoption of the PN Excess Days measure in the Hospital IQR Program for FY 2019 payment determination and subsequent years.

For the purposes of describing the refinement of this measure, we note that ''cohort'' is defined as the hospitalizations, or ''index admissions,'' that are included in the measure and evaluated to ascertain the total payments made on behalf of the Medicare beneficiary for a 30-day episode-of-care. The cohort is the set of hospitalizations that meets all of the inclusion and exclusion criteria. We proposed an expansion to this set of hospitalizations.

The previously adopted PN Payment measure (79 FR 50227 through 50231) includes hospitalizations for patients with a principal discharge diagnosis of pneumonia using the International Classification of Diseases, 9th Edition, Clinical Modification (ICD–9–CM), which includes viral and bacterial pneumonia. For more cohort details on the measure as previously implemented, we refer readers to the measure methodology report, with the measure risk adjustment statistical model, in the AMI, HF, PN, and Hip/Knee Arthroplasty Payment Updates zip file on our Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

This proposed measure refinement would expand the measure cohort to include hospitalizations for patients with a: (1) Principal discharge diagnosis of pneumonia, including not only viral or bacterial pneumonia, but also aspiration pneumonia; and (2) principal discharge diagnosis of sepsis (but not severe sepsis) with a secondary diagnosis of pneumonia (including viral or bacterial pneumonia and aspiration pneumonia) coded as present on admission (POA). This refinement to the pneumonia cohort was proposed for several reasons, which were previously discussed in the FY 2016 IPPS/LTCH PPS final rule for the MORT–30–PN and READM–30–PN measures (80 FR 49653 through 49660). We believe that refining this measure is appropriate for the following reasons. Recent evidence has shown an increase in the use of sepsis as principal discharge diagnosis codes among patients hospitalized with pneumonia.[94] Pneumonia patients with this principal diagnosis code were not included in the original MORT–30–PN and READM–30–PN measure cohorts, and including them would better capture the complete patient population of a hospital with patients receiving clinical management and treatment for pneumonia. In addition, because patients with a principal diagnosis of sepsis are not included in the original MORT–30–PN and READM–30–PN measure specifications, efforts to evaluate changes over time in pneumonia outcomes could be biased as coding practices change. Lastly, a published article[95] also demonstrated wide variation in the use of sepsis codes as principal discharge diagnosis for pneumonia patients across hospitals, which can potentially bias efforts to compare hospital performance on the MORT–30–PN and READM–30–PN measures.

The proposal to align the PN Payment measure cohort with those of the MORT–30–PN, READM–30–PN, and newly adopted PN Excess Days measures would address the changing coding patterns in which patients with pneumonia are increasingly given a principal discharge diagnosis code of sepsis in combination with a secondary discharge diagnosis of pneumonia that is POA. Moreover, expanding the PN Payment measure cohort would ensure that the measure captures the broader population of patients admitted for pneumonia that may have been excluded from the previously adopted measure. Finally, the expansion of the cohort for the PN Payment measure harmonizes the cohort of this measure with the MORT–30–PN, the READM–30–PN, and the newly adopted PN Excess Days measures.

The proposed PN Payment measure (MUC ID 15–378), which includes this expanded measure cohort was included on a publicly available document entitled ''2015 Measures Under Consideration List'' for December 1, 2015 (available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367*) and has been reviewed by the NQF MAP Hospital Workgroup. The revised measure was conditionally supported pending the examination of sociodemographic status (SDS) factors and NQF review and endorsement of the measure update, as referenced in the MAP 2016 Final Recommendations

[94] Lindenauer PK, Lagu T, Shieh MS, Pekow PS, Rothberg MB. Association of diagnostic coding with trends in hospitalizations and mortality of patients with pneumonia, 2003–2009. Journal of the American Medical Association. Apr 4 2012;307(13):1405–1413.

[95] Rothberg MB, Pekow PS, Priya A, Lindenauer PK. Variation in diagnostic coding of patients with pneumonia and its association with hospital risk-standardized mortality rates: A cross-sectional analysis. Annals of Internal Medicine. Mar 18 2014;160(6):380–388.

Report (available at: *http://www.qualityforum.org/map/*).[96]

In the proposed rule we stated that with regard to MAP stakeholder concerns that the proposed PN Payment measure may need to be adjusted for SDS, we understand the important role that sociodemographic status plays in the care of patients. However, we continue to have concerns about holding hospitals to different standards for the outcomes of their patients of diverse sociodemographic status, because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. We routinely monitor the impact of sociodemographic status on hospitals' results on our measures.

The NQF is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF will issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial. CMS, in compliance with NQF's guidance, has tested sociodemographic factors in the measures' risk models and made recommendations about whether or not to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our outcome measures.

Furthermore, the Office of the Assistant Secretary for Planning and Evaluation (ASPE) is conducting research to examine the impact of sociodemographic status on quality measures, resource use, and other measures under the Medicare program as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how they apply to our quality programs at such time as they are available.

[96] Spreadsheet of MAP 2016 Final Recommendations Available at: *http://www.qualityforum.org/map/*.

The refined PN Payment measure will be submitted to NQF for reendorsement as part of the next Cost and Resource Use project which is expected in the first quarter of 2017. We will work to minimize any potential confusion when publicly reporting the updated measure to ensure that the refined measure would not be confused with the originally adopted measure.

We received general comments related to the efforts underway to determine if risk-adjusting for SDS factors is appropriate for this and other measures in the Hospital IQR Program and would like to address them first.

Comment: Several commenters encouraged CMS to apply SDS factors to quality measures, noting that these factors impact patient outcomes. Further, the commenters stated that SDS factors should be included in quality measures' risk-adjustment models to ensure that hospitals are held accountable only for the factors under their control. In addition, commenters expressed the opinion that accountability programs should include risk adjustment for those SDS factors for which there is a conceptual relationship with outcomes or processes of care and empirical evidence of such an effect, for reasons unrelated to quality of care.

Commenters also indicated that failing to adjust quality measures for SDS factors can result in unintended consequences and can mislead patients, payers, and policymakers who would be otherwise oblivious to community factors that contribute to worsened patient outcomes. Commenters suggested that CMS provide more in depth information related to the current efforts underway to assess the impact of SDS factors on quality measures. Some commenters noted that risk adjustment is of particular importance for measures that are not entirely within the control of the hospital such as resource use, readmissions, and 30-day mortality. However, some commenters stated that measures that are within the control of a hospital stay (that is, process measures) should not be subject to this type of risk adjustment.

One commenter believed that adjusting quality metrics in this way could result in a tiered health care system where consumers could not expect to receive the same quality of care regardless of where they live. A few commenters supported the concept of exploring the implications of risk-adjusting quality measures for SDS factors in the future, but requested that CMS work more readily to account for hospitals that disproportionately treat low-income and more vulnerable patient populations. In addition, the commenters expressed concern about the challenges associated with the feasibility of valid and reliable adjustment for SDS factors and noted that risk adjustment should not be used as an excuse for poor performance or a reason not to improve. The commenters expressed appreciation that CMS is abreast of the efforts underway by NQF and ASPE, but urged CMS to be more proactive with its own efforts to examine SDS factors in quality measures.

Response: With respect to commenters' request that CMS work more readily to account for hospitals that disproportionately treat vulnerable patient populations and concerns about the challenges associated with the feasibility of valid and reliable adjustment for SDS factors, as noted above and in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25208), we continue to have concerns about holding hospitals to different standards for the outcomes of their patients of diverse sociodemographic status, because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. We routinely monitor the impact of SDS on providers' differential performance on our outcome and payment measures.

In response to commenters' suggestion that CMS provide more in depth information related to the current efforts underway to assess the impact of SDS factors on quality measures, as discussed above, the NQF is currently conducting a 2-year trial, in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF is expected to issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial. Under the guidance of NQF, we are making every effort to be proactive in examining SDS factors in quality measures by testing SDS factors in the measures' risk models and making recommendations about whether or not to include these factors in the endorsed measure. We are still awaiting final

recommendations from the NQF and intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for SDS factors in our outcome measures. For more detailed information about measures in the NQF SDS trial period, we refer commenters to: *http://www.qualityforum.org/SES_Trial_Period.aspx*. Furthermore, we are awaiting the findings of an ASPE report on SDS factors in risk-adjustment, which is expected to be available in the fall of 2016. We will share the findings of these trials and reports with the public as soon as they become available. Therefore, we are not currently changing our risk-adjustment methodology with respect to SDS factors. We will continue to consider such factors in our ongoing measure development and maintenance activities.

Comment: One commenter expressed concern that the newly proposed measures are not risk-adjusted for SDS factors, noting that they serve a patient population that is affected by these factors, and without risk adjustment, their hospital will be unfairly penalized under the current program. Commenters also encouraged CMS to adjust readmission measures for SDS factors because hospitals that care for vulnerable populations, who are at higher risk for readmissions, are disadvantaged when these factors are not considered for payment updates.

Response: We appreciate the commenter's concern that newly proposed measures are not risk-adjusted for SDS factors, but we continue to have concerns about holding hospitals to different standards for the outcomes of their patients of diverse sociodemographic status, because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. Moreover, we do not think it is appropriate to include risk-adjustment for SDS factors at this time until more information is learned from the NQF trial period and ASPE's report. However, we will continue to consider such factors in our ongoing measure development and maintenance activities.

With regard to the commenters' concerns about being unfairly penalized or disadvantaged with regard to payment updates, we note that the Hospital IQR Program is a pay for reporting, not a pay for performance, quality program. This means that its payment determinations are based on hospitals meeting all of the reporting requirements, not performance on the measures, and that claims-based measures, such as the newly proposed measures and the existing readmission measures, have no additional reporting burden for hospitals since the data are derived from administrative data.

Comment: One commenter urged CMS not to add any proposed measure until it is appropriately risk adjusted and should suspend or remove other readmission measures until they incorporate appropriate risk-adjustment methodology because SDS factors can skew performance on certain quality measures, such as those for readmissions. The commenter stated that outcome measures do not accurately reflect hospitals' performance if they do not account for SDS factors outside the hospital's control that can complicate care and influence patients' health care outcomes.

Response: We disagree with the commenter that we should not propose any measure until it is risk adjusted for SDS factors. As we have previously noted, we have not risk-adjusted measures for SDS factors because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. However, as noted in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25208), while we are monitoring providers' differential performance on our outcome and payment measures, we are not currently changing our risk-adjustment methodology with respect to SDS factors. We will continue to consider such factors in our ongoing measure development and maintenance activities.

(2) Overview of Measure Change

The proposed measure refinement expands the cohort. As the measure is currently specified, the cohort includes hospitalizations for patients with a principal discharge diagnosis of pneumonia using the ICD–9–CM, which includes viral and bacterial pneumonia (79 FR 50227 through 50231). This refinement would expand the cohort to also include hospitalizations for patients with a: (1) Principal discharge diagnosis of pneumonia, including not only viral or bacterial pneumonia, but also aspiration pneumonia; and (2) principal discharge diagnosis of sepsis (but not severe sepsis) with a secondary diagnosis of pneumonia (including viral or bacterial pneumonia and aspiration pneumonia) coded as POA.

For the ICD–9–CM and ICD–10–CM codes that define the expanded PN Payment cohort, we refer readers to the 2016 Reevaluation and Re-specifications Report of the Hospital-Level 30-Day Risk-Standardized Pneumonia Payment Measure- Pneumonia Payment Version 3.1 in the AMI, HF, PN, and Hip/Knee Arthroplasty Payment Updates zip file on our Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

The data sources, exclusion criteria, assessment of the total payment outcome, and 3 year reporting period all remain unchanged.

(3) Risk Adjustment

The statistical modeling approach as well as the measure calculation remains unchanged from the previously adopted measure. The risk adjustment approach also remains unchanged. However, to maintain model performance, we conducted variable reselection, or reevaluation of the variables used, to ensure the model risk variables are appropriate for the discharge diagnoses included in the expanded cohort.

The previously adopted pneumonia payment risk-adjustment model includes 48 variables.[97] As a result of the variable reselection process, the revised risk-adjustment model includes a total of 57 variables—37 of the same variables that are in the previously adopted model as well as 20 additional variables. There are 11 variables from the previously adopted model that are not included in the revised model. For details on variable reselection and the full measure specifications of the proposed change to the measure, we refer readers to the 2016 Reevaluation and Re-specifications Report of the Hospital-Level 30-Day Risk-Standardized Pneumonia Payment Measure—Pneumonia Payment Version 3.1 in the AMI, HF, PN, and Hip/Knee Arthroplasty Payment Updates zip file on our Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

(4) Estimated Effects of the Cohort Expansion

Using administrative claims data for the FY 2016 payment determination (which included discharges between July 2011 and June 2014), we simulated and analyzed the effects of the proposed cohort refinements on the PN Payment measure (NQF #2579) as if these

[97] Kim N, Ott L, Hsieh A, et al. 2015 Condition-Specific Measure Updates and Specifications Report, Hospital-Level 30-Day Risk-Standardized Payment Measures—Acute Myocardial Infarction (Version 4.0), Heart Failure (Version 2.0), Pneumonia (Version 2.0). Available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*. Accessed Date: March 16, 2016.

changes had been applied for FY 2016 payment determination. We note that these statistics are for illustrative purposes only, and we did not propose to revise measure calculations for the FY 2016 payment determination.

In the FY 2010 IPPS/LTCH PPS final rule (74 FR 43881), we established that if a hospital has fewer than 25 eligible cases combined over a measure's reporting period, we would replace the hospital's data with a footnote indicating that the number of cases is too small to reliably determine how well the hospital is performing. These cases are still used to calculate the measure; however, for hospitals with fewer than 25 eligible cases, the hospital's Risk Standardization Payment (RSP) and RSP interval estimates are not publicly reported for the measure. We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50221), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53537), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50819), and the FY 2016 IPPS/LTCH PPS final rule (80 FR 24588) for details on our sampling and case thresholds for the FY 2016 payment determination and subsequent years. Expanding the measure cohort to include a broader population of patients as proposed would add a large number of patients, as well as additional hospitals (which would now meet the minimum threshold of 25 eligible cases for public display), to the PN Payment measure (NQF #2579). The increase in the size of the measure cohort as proposed is also estimated to change results for some hospitals as detailed below.

The previously adopted PN Payment measure cohort includes 901,764 patients and 4,685 hospitals for the FY 2016 payment determination (administrative claims from July 2011-June 2014). We noted the following effects for the PN Payment measure if the proposed expanded cohort is applied for FY 2016 payment determinations: (1) The cohort would increase to include an additional 386,143 patients across all hospitals (creating a total measure cohort size of 1,287,907 patients); (2) an additional 81 hospitals would meet the minimum 25 patient case volume threshold over the 3-year reporting period and, as a result, would be publicly reported for the measure; and (3) 31.7 percent of the refined measure cohort would consist of patients who fall into the expanded set of hospitalizations.

The expansion of the cohort leads to an overall increase in the mean national payment of $16,116 when compared to the mean national payment of $14,294 for the previously adopted cohort. This leads to an increase in the RSP outcome of $1,822 or 12.7 percent due to the higher mean payments for patients added to the cohort. An individual hospital's average payment category or reclassification of outlier status of ''higher than the U.S. national payment,'' ''no different than the U.S. national payment,'' or ''less than the U.S. national payment'' may change as demonstrated in the 2016 Reevaluation and Re-specifications Report of the Hospital-Level 30-Day Risk-Standardized Pneumonia Payment measure—Pneumonia Payment Version 3.1, which can be found in the AMI, HF, PN, and Hip/Knee Arthroplasty Payment Updates zip file on our Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

Overall, we estimate that 1.4 percent of hospitals included in the previously adopted measure would change categorization from greater than average to average payment, 9.3 percent would change from average to greater than average payment, and 8.5 percent would change from average to less than average payment. Finally, 1.8 percent of hospitals would change from less than average to average payment. Therefore, there would be an increase in the number of hospitals considered outliers and a shift in some hospitals' outlier status classification. We reiterate that these statistics are for illustrative purposes only, and we did not propose to revise measure calculations for the FY 2016 payment determination; our proposal would affect the FY 2018 payment determination and subsequent years.

A detailed description of the refinements to the PN Payment measure (NQF #2579) and the estimated effects of the change are available in the 2016 Reevaluation and Re-specifications Report of the Hospital-Level 30-Day Risk-Standardized Pneumonia Payment Measure—Pneumonia Payment Version 3.1 in the AMI, HF, PN, and Hip/Knee Arthroplasty Payment Updates zip file on our Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

We invited public comment on our proposal to refine the Hospital-Level, Risk-Standardized Payment Associated with a 30-day Episode-of-Care For Pneumonia (NQF #2579) (PN Payment) measure for the FY 2018 payment determination and subsequent years as described above.

Comment: Some commenters supported the proposed expansion of the cohort definition for the PN Payment measure. Commenters noted the proposed measure refinement accommodates differences in coding patterns and aligns the measure cohort and specifications for the pneumonia population across the payment, readmission, and mortality outcome measures, which will mitigate measurement bias. Further, commenters noted that this measure would align the PN Payment measure with the other pneumonia measures used in CMS hospital quality programs. One commenter mentioned it would align the Hospital IQR Program with the Hospital VBP Program.

Response: We thank the commenters for their support. We note that the PN Payment measure is not currently included in the Hospital VBP Program, but we will take feedback on the PN Payment measure for the Hospital VBP Program into consideration for the future.

Comment: Several commenters urged CMS not to finalize the inclusion of the revised Pneumonia Payment measure in the Hospital IQR Program until the updated version has attained NQF endorsement.

Response: We acknowledge stakeholder concerns that these refinements to the PN Payment measure have not yet been endorsed by NQF, but we refer readers to our earlier discussion in section VIII.A.6.a.(1) of the preamble of this final rule that the MAP conditionally supported this refined measure during the 2016 MAP Hospital Workgroup Meeting pending NQF review of the examination of SDS factors and NQF review and endorsement of the measure update. The refined PN Payment measure will be submitted to NQF as part of the next Cost and Resource Use project which is expected to convene in the first quarter of 2017. The original hospital-level, risk-standardized payment associated with a 30-day episode-of-care for pneumonia (NQF #2579) measure was previously NQF-endorsed, and we do not believe the intent of this measure has changed.

Comment: A commenter encouraged CMS to properly risk adjust this measure for SDS factors so that hospitals that serve complex patients do not perform poorly.

Response: We appreciate the commenter's concern that this measure be risk-adjusted so that hospitals that serve complex populations do not perform poorly, but we continue to have concerns about holding hospitals to different standards for the outcomes of

their patients of diverse sociodemographic status because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. Moreover, as described above, we do not think it is appropriate to include risk-adjustment for SDS factors at this time until more information is learned from the NQF trial period and ASPE's report. However, we will continue to consider such factors in our ongoing measure development and maintenance activities.

Comment: Several commenters did not support the inclusion of aspiration pneumonia in the cohort. One commenter stated that the expansion of the measure cohort would capture relatively different cohorts of patients (particularly those with aspiration pneumonia), with different baseline factors that influence recovery times and could impact hospitals' performance on this measure. Commenters noted aspiration pneumonia patients overall are a more complex population with higher mortality rates, and aspiration pneumonia could be attributable to a range of potential causes that are clinically distinct despite the coding variation issue.

Response: We appreciate the commenters' concerns about the extent of the refinement of this measure and the inclusion of patients who are more complex (have greater illness severity). In particular, we understand commenters' concerns that aspiration pneumonia can have different causes and associated risks (for example, recurrent aspiration due to other comorbidities). However, while the pathological causes of aspiration pneumonia are slightly different from the causes of community acquired pneumonia, in routine clinical practice, evidence shows it can be very challenging for physicians to differentiate aspiration syndromes including pneumonitis and pneumonia, from other types of pneumonia included in the measure.[98] [99] This is reflected in the tremendous variation across hospitals in the use of aspiration pneumonia diagnosis codes. This variation suggests that hospitals are not consistently distinguishing between these conditions as distinct subtypes regardless of patients' comorbid conditions. Expanding the measure cohort would ensure that the measure is clinically comprehensive.

Moreover, the treatment of patients hospitalized for pneumonia, aspiration pneumonia, or sepsis due to pneumonia is very similar and involves treatment with antibiotics, IV fluids, and symptom management.[100] In addition, although some patients with aspiration pneumonia, such as medically frail patients, have a higher predicted mortality risk (that is, are more complex), many of the associated comorbidities are captured in the PN Payment measure's risk-adjustment methodology. Of note, due to the increased number of patients that are included in the expanded cohort, we reselected risk-adjustment variables to ensure that the measure does not bias hospital performance and it accounts for the differences in risk among the subgroup of patients. For example, the risk model includes clinical history of stroke, as well as conditions associated with frailty, such as neuromuscular disease, and dementia.

Comment: One commenter indicated that the impact of the cohort expansion on the other pneumonia measures remains unknown, as data is not yet publicly available on Hospital Compare.

Response: The expansion of the cohort for the PN Payment measure aligns this measure with the MORT–30–PN measure, READM–30–PN measure, and the newly adopted PN Excess Days measure. The cohort expansion for the CMS Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) following Pneumonia Hospitalization measure (NQF #0506) and the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia Hospitalization measure were finalized in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49660), and are expected to be publicly reported on *Hospital Compare* beginning in 2016.

The 2016 measure results show that the mean RSMR for the MORT–30–PN measure decreased from 16.3 percent for July 2013–June 2014 to 15.9 percent for July 2014–June 2015. The mean RSMR for READ–30–PN measure decreased from 16.5 percent for July 2013–June 2014 to 16.4 percent for July 2014–June 2015.[101] Additional information on the impact of the cohort change on the measures, including measure results, assessments of the revised model, and the impact of the cohort change on the categorization of hospital performance, can be found in the 2015 Reevaluation and Re-Specification Report of the Hospital-Level 30-Day Risk-Standardized Measures Following Hospitalization for Pneumonia—Version 8.2 (readmission) and 9.2 (mortality) (available in the AMI–HF–PN–COPD-and-Stroke-Readmission Updates zip file at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*). In addition, measure specifications can be found in the 2016 Condition-Specific Measures Updates and Specifications Report Hospital-Level 30-Day Risk-Standardized Mortality Measures—Pneumonia Mortality Version 10.0 (available in the AMI–HF–PN–COPD-and-Stroke-Mortality Updates zip file) and the 2016 Condition-Specific Measures Updates and Specifications Report Hospital-Level 30-Day Risk-Standardized Readmission Measures—Pneumonia Readmission Version 9.0 (available in the AMI–HF–PN–COPD-and-Stroke-Readmission Updates zip file) on our Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*. Finally we note that, as established in the Hospital IQR Program, hospitals have the opportunity to review their data, including their performance on the refined versions of the measures, via their hospital-specific reports (HSRs) during the preview period before public reporting of the measures.

Comment: One commenter expressed concern regarding the significant overlap between the PN Payment measure and Medicare Spending per Beneficiary (MSPB) measure. The commenter acknowledged the potential to create alignment with the physician value-modifier and later merit-based incentive payment system; however, the commenter indicated that there is still a significant need for better alignment between the hospital and physician specifications.

Response: The goal of the PN Payment measure is to complement other quality measures already adopted to provide more holistic and comprehensive information on the value of care provided for the pneumonia condition specifically, while the MSPB measure solely examines total Medicare spending per beneficiary and encompasses all conditions. The PN Payment measure is meant to be considered in conjunction with MORT–30–PN, READM–30–PN, and the newly

[100] Ibid.

[101] Dorsey K, Grady J, et al. *2016 Condition-Specific Measures Updates and Specifications Report, Hospital-Level 30-Day Risk-Standardized Mortality Measures.* 2016. *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.*

adopted PN Excess Days measures in order to gain a better understanding of the value of care for a hospital's patients and the nation as a whole. Moreover, several commenters conveyed support and appreciation for the reporting of the PN Payment measure in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50229), noting that it provided a way to optimally measure care for these patients. Therefore, we believe that the PN Payment measure provides condition-specific feedback to hospitals and can incentivize targeted improvements in care for pneumonia patients.

Lastly, we acknowledge commenters request for better alignment between the hospital and physician specifications. We strive to align specifications across programs when feasible; however, some specifications will remain different to accommodate for the distinctions between quality care programs that focus on hospitals (for example, the Hospital IQR Program) versus eligible professionals (for example, the Physician Value-Based Payment Modifier Program).

After consideration of the public comments we received, we are finalizing the refinement of the Hospital-Level, Risk-Standardized Payment Associated with a 30-day Episode-of-Care For Pneumonia (NQF #2579) (PN Payment) measure for the FY 2018 payment determination and subsequent years as proposed.

b. Adoption of Modified PSI 90: Patient Safety and Adverse Events Composite Measure (NQF #0531)

(1) Background

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25182 through 25285), we proposed to adopt refinements to the Agency for Healthcare Research and Quality (AHRQ) Patient Safety and Adverse Events Composite (NQF #0531) for the Hospital IQR Program beginning with the FY 2018 payment determination and subsequent years. In summary, the PSI 90 measure was refined to reflect the relative importance and harm associated with each component indicator to provide a more reliable and valid signal of patient safety events. We believe refining the PSI 90 measure will provide strong incentives for hospitals to ensure that patients are not harmed by the medical care they receive, a critical consideration in quality improvement.

In the FY 2009 IPPS/LTCH PPS final rule (73 FR 48607 through 48610), we adopted the Complication/Patient Safety for Selected Indicators Composite Measure (NQF #0531) in the Hospital IQR Program beginning with the FY 2010 payment determination as an important measure of patient safety and adverse events. In the FY 2015 IPPS/LTCH PPS final rule, we updated the title of the measure to Patient Safety for Selected Indicators Composite Measure (NQF #0531), to be consistent with the NQF (79 FR 50211). As previously adopted, the PSI 90 measure consisted of eight component indicators: (1) PSI 03 Pressure Ulcer Rate; (2) PSI 06 Iatrogenic Pneumothorax Rate; (3) PSI 07 Central Venous Catheter-Related Blood Stream Infections Rate; (4) PSI 08 Postoperative Hip Fracture Rate; (5) PSI 12 Perioperative Pulmonary Embolism (PE) or Deep Vein Thrombosis (DVT) Rate; (6) PSI 13 Postoperative Sepsis Rate; (7) PSI 14 Postoperative Wound Dehiscence Rate; and (8) PSI 15 Accidental Puncture and Laceration Rate.[102]

The currently adopted eight-indicator version of the measure underwent an extended NQF maintenance reendorsement in the 2014 NQF Patient Safety Committee due to concerns with the underlying component indicators and their composite weights. In the NQF-Endorsed Measures for Patient Safety, Final Report,[103] the NQF Patient Safety Committee deferred their final decision for the PSI 90 measure until the following measure evaluation cycle. In the meantime, AHRQ worked to address many of the NQF stakeholders' concerns about the PSI 90 measure, which subsequently completed NQF maintenance re-review and received reendorsement on December 10, 2015.

The PSI 90 measure's extended NQF reendorsement led to several changes to the measure.[104] First, the name of the PSI 90 measure has changed to ''Patient Safety and Adverse Events Composite'' (NQF #0531) (herein referred to as the ''modified PSI 90''). Second, the modified PSI 90 measure includes the addition of three indicators: (1) PSI 09 Perioperative Hemorrhage or Hematoma Rate ; (2) PSI 10 Postoperative Acute Kidney Injury Requiring Dialysis Rate (formerly titled ''Physiologic and Metabolic Derangement Rate''); and (3) PSI 11 Postoperative Respiratory Failure Rate. Third, PSI 12, Perioperative Pulmonary Embolism (PE) or Deep Vein Thrombosis (DVT) Rate, and PSI 15, Unrecognized Abdominopelvic Accidental Puncture/Laceration Rate, have been respecified in the modified PSI 90 measure. Fourth, PSI 07 Central Venous Catheter-Related Blood Stream Infection Rate has been removed in the modified PSI 90 measure. Fifth, the weighting of component indicators in the modified PSI 90 measure is based not only on the volume of each of the patient safety and adverse events, but also the harms associated with the events. We consider these changes to the modified PSI 90 measure to be substantive changes to the measure. Therefore, we proposed to adopt refinements to the PSI 90 measure for the Hospital IQR Program beginning with the FY 2018 payment determination and subsequent years. We explain the modified PSI 90 measure more fully below, and also refer readers to the measure description on the NQF Web site at: *https://www.qualityforum.org/QPS/MeasureDetails.aspx?standardID=321&print=0&entityTypeID=3*. We also proposed to modify the reporting periods for FYs 2018 and 2019 payment determinations and subsequent years as detailed further below.

We note that the proposed modified PSI 90 measure (MUC ID 15–604) was included on a publicly available document entitled 2015 Measures Under Consideration for December 1, 2015 [105] in compliance with section 1890A(a)(2) of the Act, and was reviewed by the MAP. The MAP supported this measure stating that, ''the PSI measures were developed to identify harmful healthcare related events that are potentially preventable. Three additional PSIs have been added to this updated version of the measure. PSIs were better linked to important changes in clinical status with 'harm weights' that are based on diagnoses that were assigned after the complication. This is intended to allow the measure to more accurately reflect the impact of the events.'' [106] The measure received support for inclusion in the Hospital IQR Program as referenced in the MAP Final Recommendations Report.[107]

(2) Overview of the Measure Changes

First, the name of the PSI 90 measure has changed from the ''Patient Safety for

[102] NQF-Endorsed Measures for Patient Safety, Final Report. Available at: *http://www.qualityforum.org/Publications/2015/01/NQF-Endorsed_Measures_for_Patient_Safety,_Final_Report.aspx*.

[103] NQF-Endorsed Measures for Patient Safety, Final Report available at: *http://www.qualityforum.org/Publications/2015/01/NQF-Endorsed_Measures_for_Patient_Safety,_Final_Report.aspx*.

[104] National Quality Forum QPS Measure Description for ''Patient Safety for Selected Indicators (modified version of PSI90) (Composite measure)'' found at: *https://www.qualityforum.org/QPS/MeasureDetails.aspx?standardID=321&print=0&entityTypeID=3*.

[105] 2015 Measures Under Consideration List Available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367*.

[106] MAP Final Recommendations. Available at: *http://www.qualityforum.org/map/*.

[107] MAP Final Recommendations. Available at: *http://www.qualityforum.org/map/*.

Selected Indicators Composite Measure'' to the ''Patient Safety and Adverse Events Composite'' (NQF #0531) to more accurately capture the indicators included in the measure.

Second, the PSI 90 measure has expanded from eight to 10 component indicators. The modified PSI 90 measure is a weighted average of the following 10 risk-adjusted and reliability-adjusted individual component PSI rates:

- PSI 03 Pressure Ulcer Rate;
- PSI 06 Iatrogenic Pneumothorax Rate;
- PSI 08 In-Hospital Fall With Hip Fracture Rate; [108]
- PSI 09 Perioperative Hemorrhage or Hematoma Rate; *
- PSI 10 Postoperative Acute Kidney Injury Requiring Dialysis Rate; *[109]
- PSI 11 Postoperative Respiratory Failure Rate; *
- PSI 12 Perioperative Pulmonary Embolism (PE) or Deep Vein Thrombosis (DVT) Rate;
- PSI 13 Postoperative Sepsis Rate;
- PSI 14 Postoperative Wound Dehiscence Rate; and
- PSI 15 Unrecognized Abdominopelvic Accidental Puncture/ Laceration Rate.[110] [111]

(* Denotes new component for the modified PSI 90 measure)

As stated above, the modified PSI 90 measure also removed PSI 07 Central Venous Catheter-Related Blood Stream Infection Rate, because of potential overlap with the CLABSI measure (NQF #0139), which has been included in the Hospital IQR Program since the FY 2011 IPPS/LTCH PPS final rule (75 FR 50201 through 50202), the HAC Reduction Program since the FY 2014 IPPS/LTCH PPS final rule (78 FR 50717), and the Hospital VBP Program since the FY 2013 IPPS/LTCH PPS final rule (77 FR 53597 through 53598).

In response to stakeholder concerns, highlighted in the NQF 2014 Patient Safety Report,[112] the modified PSI 90 measure also respecified two component indicators, PSI 12 and PSI 15. Specifically, for PSI 12 Perioperative PE or DVT Rate, the NQF received public comments concerning the inclusion of: (1) Extracorporeal membrane oxygenation (ECMO) procedures in the denominator; and (2) intra-hospital variability in the documentation of calf vein thrombosis (which has uncertain clinical significance). Therefore, the modified PSI 12 component indicator no longer includes ECMO procedures in the denominator or isolated deep vein thrombosis of the calf veins in the numerator. PSI 15 Unrecognized Abdominopelvic Accidental Puncture/ Laceration Rate, was also respecified to focus on the most serious intraoperative injuries—those that were unrecognized until they required a subsequent reparative procedure. The modified denominator of PSI 15 now is limited to discharges with an abdominal/pelvic operation, rather than including all medical and surgical discharges. In addition, to identify events that are more likely to be clinically significant and preventable, the PSI 15 numerator was modified to require both: (1) A diagnosis of an accidental puncture and/or laceration; and (2) an abdominal/ pelvic reoperation one or more days after the index surgery. Based on these new specifications, the PSI 15 indicator name has been changed as note above.

Finally, the NQF Patient Safety Review Committee raised concerns about the weighting scheme of the component indicators. In prior versions of the measure, the weights of each component PSI were based solely on volume (numerator rates). In the modified PSI 90 measure, the rates of each component PSI are weighted based on statistical and empirical analyses of volume, excess clinical harm associated with the PSI, and disutility (individual preference for a health state linked to a harm, such as death or disability). The final weight for each component indicator is the product of harm weights and volume weights (numerator weights). Harm weights are calculated by multiplying empirical estimates of excess harms associated with the patient safety event by the utility weights linked to each of the harms. Excess harms are estimated using statistical models comparing patients with a safety event to those without a safety event in a Medicare fee-for-service sample. Volume weights are calculated based on the number of safety events for the component indicators in an all-payer reference population. For more information on the modified PSI 90 measure and component indicators, we refer readers to Quality Indicator Empirical Methods available online at: *www.qualityindicators.ahrq.gov*.

(3) Risk Adjustment

The risk adjustment and statistical modeling approaches of the models remain unchanged in the modified PSI 90 measure. In summary, the predicted value for each case is computed using a modeling approach that includes, but is not limited to, applying a Generalized Estimating Equation (GEE) hierarchical model (logistic regression with hospital random effect) and covariates for gender, age, Modified MS–DRG (MDRG), Major Diagnostic Category, transfer in, point of origin not available, procedure days not available, and AHRQ comorbidity (COMORB).

The expected rate for each of the indicators is computed as the sum of the predicted value for each case divided by the number of cases for the unit of analysis of interest (that is, the hospital). The risk-adjusted rate for each of the indicators is computed using indirect standardization as the observed rate divided by the expected rate, multiplied by the reference population rate. For more details about risk adjustment, we refer readers to: *http://www.qualityindicators.ahrq.gov/Downloads/Resources/Publications/2015/Empirical_Methods_2015.pdf*. As stated above, we did not propose any changes to the risk adjustment for this measure.

(4) Reporting Periods

The PSI 90 measure is a claims-based measure that has been calculated using 24-months of data. For the FY 2018 and FY 2019 payment determinations, measure rates would be calculated using reporting periods of July 1, 2014 through June 30, 2016 and July 1, 2015 through June 30, 2017, respectively. However, because hospitals began ICD–10–CM/PCS implementation on October 1, 2015, these reporting periods for the FY 2018 and FY 2019 payment determinations would require using both ICD–9 and ICD–10 claims data to calculate measure performance.

Since the ICD–10 transition was implemented on October 1, 2015, we have been monitoring our systems, and claims continue to be processed normally. The measure steward, AHRQ, has been reviewing the measure for any potential issues related to the conversion of approximately 70,000 ICD–10 coded operating room procedures [113] (*https://www.cms.gov/icd10manual/fullcode_cms/P1616.html*), which could directly affect the modified PSI 90 component

[108] Previously titled ''Postoperative Hip Fracture'' prior to v6.0.

[109] Previously titled ''Postoperative Physiologic and Metabolic Derangement'' prior to v6.0.

[110] Previously titled ''Accidental Puncture or Laceration Rate'' prior to v6.0.

[111] *http://www.qualityforum.org/QPS/0531*.

[112] NQF Endorsed Measures for Patient Safety, Final Report. Available at: *http://www.qualityforum.org/Publications/2015/01/NQF-Endorsed_Measures_for_Patient_Safety,_Final_Report.aspx*.

[113] International Classification of Diseases, (ICD–10–CM/PCS) Transition—Background. Available at: *http://www.cdc.gov/nchs/icd/icd10cm_pcs_background.htm*.

indicators. In addition, to meet program requirements and implementation schedules, our system would require an ICD–10 risk-adjusted version of the AHRQ QI PSI software [114] by December 2016 for the FY 2018 payment determination year. At this time, a risk adjusted ICD–10 version of the modified PSI 90 Patient Safety and Adverse Events Composite software is not expected to be available until late CY 2017.

To address the above issues, we proposed to modify the reporting periods for the FYs 2018 and 2019 payment determinations. For the FY 2018 payment determination, we proposed to use a 15-month reporting period spanning July 1, 2014 through September 30, 2015. The 15-month reporting period would only apply to the FY 2018 payment determination and would only use ICD–9 data. For the FY 2019 payment determination, we proposed to use a 21-month reporting period spanning October 1, 2015 through June 30, 2017. The 21-month reporting period would only apply to the FY 2019 payment determination and would only use ICD–10 data. For all subsequent payment determinations after FY 2019, we proposed to use the standard 24-month reporting period, which would only use ICD–10 data. In order to align the modified PSI 90 measure and the use of ICD–9 and ICD–10 data across CMS hospital quality programs, we proposed similar modifications for FYs 2018 and 2019 payment determinations in the HAC Reduction Program, as discussed in section IV.I.3.b. of the preamble of this final rule, and similar modifications to the performance period for the Hospital VBP Program FY 2018 program year, as discussed in section IV.H.2. of the preamble of this final rule.

Prior to deciding to propose abbreviated reporting periods for the FY 2018 and FY 2019 payment determinations, we took several factors into consideration, including the recommendations of the measure steward, the feasibility of using a combination of ICD–9 and ICD–10 data without the availability of the appropriate measure software, minimizing provider burden, program implementation timelines, and the reliability of using shortened reporting periods, as well as the importance of continuing to publicly report this measure. We believe that using a 15-month reporting period for the FY 2018 payment determination and a 21-month reporting period for the FY 2019 payment determination best serves the need to provide important information on hospital patient safety and adverse events by allowing sufficient time to process the claims data and calculate the measures, while minimizing reporting burden and program disruption. We will continue to test ICD–10 data that are submitted in order to ensure the accuracy of measure calculations, to monitor and assess the translation of measure specifications to ICD–10 as well as potential coding variation, and to assess any impacts on measure performance.

We note that a prior reliability analysis of the PSI 90 measure (not the modified PSI 90 measure) showed that the majority of hospitals attain a moderate or high level of reliability after a 12-month reporting period.[115] Although the modified PSI 90 measure has undergone substantial changes since this analysis, we believe that measure scores would continue to be reliable for the above proposed reporting periods, because the NQF, which reendorsed the modified version, found it to be reliable using 12 months of data.[116] In establishing the revised reporting periods for the modified PSI 90 measure, we also relied upon an analysis by Mathematica Policy Research (MPR), a CMS contractor, which found that the measure was most reliable with a 24-month reporting period and unreliable with a reporting period of less than 12 months.[117] While not discussed in the proposed rule, we would like to elaborate on the reliability of the shortened reporting period. We took into account that the findings in the MPR analysis are based on older data (7 months of data from March 2010–September 2010), which do not reflect changes to current inter-hospital variation over time due to quality improvements. The findings also simulate results over a 2 year period based on 7 months of data; and use an older version of the PSIs (analysis uses v4.2; NQF-endorsed uses v6.0) that does not include improvements in POA coding, a composite with 10 component indicators with a revised weighting scheme or refinements to the component indicators. Therefore, we believe that the proposed abbreviated reporting periods for the modified PSI 90 measure would produce reliable data because the reporting periods are still greater than 12 months.

(5) Adoption of the Modified PSI 90 Measure

In summary, the PSI 90 measure was revised to reflect the relative importance and harm associated with each component indicator to provide a more reliable and valid signal of patient safety events. We believe that adopting the modified PSI 90 measure would continue to provide strong incentives for hospitals to ensure that patients are not harmed by the medical care they receive, which is a critical consideration in quality improvement.

We invited public comment on our proposal to adopt the modified PSI 90 measure (NQF #0531) for the Hospital IQR Program beginning with the FY 2018 payment determination. We will continue to use the currently adopted eight-indicator version of the PSI 90 measure in the Hospital IQR Program for the FY 2017 payment determination. We also invited public comment on the proposals to revise the reporting periods for this measure as described above: (1) A 15-month reporting period using only ICD–9 data for the FY 2018 payment determination; (2) a 21-month reporting period using only ICD–10 data for the FY 2019 payment determination; and (3) a 24-month reporting period using only ICD–10 data for the FY 2020 payment determination and subsequent years.

Comment: Several commenters supported the proposed adoption of the modified PSI 90, including the additional PSI components, the removal of PSI components, and the updated weighting convention. Specifically, commenters expressed support for the removal of PSI 07 Central Venous Catheter-Related Blood Stream Infection Rate from the measure because the removal of this indicator eliminates potential overlap with the CLABSI measure (NQF #0139). Commenters also specifically supported the inclusion of PSI 09 Perioperative Hemorrhage or Hematoma Rate and the refinements to the definition of PSI 15 Unrecognized Abdominopelvic Accidental Puncture/ Laceration Rate. Commenters believed that changing the weighting factors that assess harm adds value to the measure. In addition, commenters agreed that mixing ICD–9 and ICD–10 data would

[114] The AHRQ QI Software is the software used to calculate PSIs and the composite measure. More information is available at: *http://www.qualityindicators.ahrq.gov/Downloads/Resources/Publications/2015/Empirical_Methods_2015.pdf.*

[116] ''Patient Safety 2015 Final Report'' is available at: *http://www.qualityforum.org/Publications/2016/02/Patient_Safety_2015_Final_Report.aspx.*

[117] Mathematica Policy Research (November 2011). Reporting period and reliability of AHRQ, CMS 30-day and HAC Quality Measures—Revised. Available at: *http://www.cms.gov/Medicare/*Quality-Initiatives-Patient-Assessment Instruments/hospital-value-based purchasing/Downloads/HVBP_Measure_Reliability-.pdf.

not be favorable for this measure. One commenter supported the proposal to shorten the PSI 90 measure reporting period to account for the transition from ICD–9–CM to ICD–10–CM/PCS. Finally, commenters noted that the inclusion of this modified measure would help align with other hospital quality programs.

Response: We appreciate the commenters' support of the adoption of the modified PSI 90.

Comment: Some commenters suggested adding an exclusion criterion for PSI 12 Perioperative PE or DVT Rate for any patient who has a tracheostomy because it is not the surgery that places the patient at risk for PE or DVT, rather it is the medical problem that leads to tracheostomy that places the patient at increased risk for PE or DVT.

Response: We agree that some medical conditions, which lead to a tracheostomy,[118] may also increase patients' risk for PE or DVT. However, we do not believe that just because a patient has a tracheostomy they are at increased risk for PE or DVT and should be excluded. We note that most of the medical conditions that can lead to tracheostomy are already captured by the extensive set of risk factor variables used in the risk adjustment for PSI 12. For more information on the PSI 12 risk model, we refer readers to: *http://www.qualityindicators.ahrq.gov/Downloads/Modules/PSI/V50/Parameter_Estimates_PSI_50.pdf*. Further suggestions regarding potential PSI measure revisions can be made directly to: *QIsupport@ahrq.hhs.gov*.

Comment: A few commenters encouraged CMS to work with AHRQ to update the software required for monitoring PSI 90 measure performance to account for the conversion to ICD–10–CM/PCS coding. Commenters also expressed concern that the transition to ICD–10–CM/PCS codes has caused inaccuracies in PSI reporting and evaluation. The commenters also noted that some minor procedures are now being categorized as surgical and some organizations are not reporting these minor procedures. Commenters noted that PSI 90 is critical in pay-for-performance programs, thus it is imperative that hospitals are able to monitor performance in an ongoing manner.

Response: We applaud the commenters' commitment to continuous monitoring of performance. We understand that it is imperative for hospitals to monitor performance in an ongoing manner and are working with AHRQ to have the risk-adjusted software available as soon as possible. We note that one of the factors in our decision to delay the use of ICD–10 claims data until FY 2019 was to allow for the necessary one year of ICD–10 data collection required for AHRQ to create a risk adjusted software version. For more information on the release plan for ICD–10 risk adjusted software, we refer commenters to the AHRQ Quality Indicators Software page available at: *http://www.qualityindicators.ahrq.gov/Software/Default.aspx*.

While we acknowledge commenters concerns that the transition to ICD–10–CM/PCS codes has caused inaccuracies in PSI reporting and evaluation, there is no evidence of which we are aware that supports this assertion. However, we are actively monitoring for any potential issues related to ICD–10 conversion. We note that all measure specifications have been translated to and updated for corresponding ICD–10 code specifications. AHRQ's changes for ICD–10–CM/PCS conversion of its patient safety indicators are available at: *http://www.qualityindicators.ahrq.gov/Modules/PSI_TechSpec_ICD10.aspx*.

Lastly, we interpret commenters' concerns regarding ''minor procedures'' to refer to non-operating room (OR) procedures. As noted in the Frequently Asked Questions about using AHRQ Quality Indicators (QIs), *www.qualityindicators.ahrq.gov/FAQs_Support/FAQ_QI.aspx*#, the denominators of the AHRQ Patient Safety Indicators (PSIs) use the list of major OR procedures that is developed and maintained by CMS (see draft ICD–10 MS–DRG v32 definitions, Appendix E, at: *https://www.cms.gov/ICD10Manual/version32-fullcode-cms/fullcode_cms/P0001.html*). We acknowledge that some procedures that were previously classified as a non-OR procedure in the ICD–9–CM MS–DRG list are currently classified as an OR procedure in the draft ICD–10 MS–DRG v28. AHRQ has addressed these discrepancies as they relate to the PSIs going forward. Further, in the mid-July 2016 release of v6.0 ICD–10–CM/PCS software, AHRQ refined the list of major OR procedures. We believe this refined list of major OR procedures provides clear guidance regarding classifying OR procedures and non-OR procedures to ensure accurate reporting by all organizations. AHRQ welcomes input from the user community on AHRQ QI ICD–10–CM/PCS v6.0. Please provide suggestions/comments directly to: *QISupport@ahrq.hhs.gov*.

Comment: Several commenters did not support the proposed adoption of the modified PSI 90 because of the susceptibility of PSI 12 Perioperative PE or DVT Rate to surveillance bias and lack of appropriate measure exclusions.

Response: CMS and AHRQ recognize the commenters' concerns about surveillance bias for PSI 12 Perioperative PE or DVT Rate and the issue was addressed in the NQF Patient Safety Steering Committee in 2015. Surveillance bias is a non-random type of systemic bias where a diagnosis is more likely to be observed the more vigilant one is in looking for it.[119] In the case of DVT or PE, hospitals may underdiagnose or over diagnose DVT or PE depending upon how often they screen or perform diagnostic testing to look for these diagnoses. Several research teams have examined DVT and PE rates and surveillance bias.[120] However, studies have not specifically examined whether the observed rates reflect underdiagnosis of DVT or PE at low-testing hospitals, over diagnosis of DVT or PE at high-testing hospitals, or the underlying true incidence of symptomatic DVT or PE. While some hospitals might hypothesize that increased surveillance is desirable, there is no evidence to support the hypothesis that ''increased vigilance in DVT or PE detection'' is desirable, from the perspective of patients and their families. Over diagnosis of DVT or PE among patients may lead to overtreatment, and overtreatment is not inconsequential as there are known adverse effects associated with treatment of DVT and PE. Thus, while we acknowledge commenter's concerns regarding surveillance bias, we believe that PSI 12 is an important component indicator of the modified PSI 90

[118] A tracheotomy or a tracheostomy is an opening surgically created through the neck into the trachea (windpipe) to allow direct access to the breathing tube and is commonly done in an operating room under general anesthesia. Definition obtained from *http://www.hopkinsmedicine.org/tracheostomy/about/what.html*.

JAMA Surg. 2015;150(6):520–527; Ju MH, Chung JW, Kinnier CV, et al. Association between hospital imaging use and venous thromboembolism events rates based on clinical data. Ann Surg. 2014;260(3):558–566 and Pierce CA, Haut ER, Kardooni S, et al. Surveillance bias and deep vein thrombosis in the national trauma data bank: the more we look, the more we find. The Journal of Trauma. 2008;64(4):932–936; discussion 936–937. Haut ER, Chang DC, Pierce CA, et al. Predictors of posttraumatic deep vein thrombosis (DVT): hospital practice versus patient factors—an analysis of the National Trauma Data Bank (NTDB). The Journal of trauma. 2009;66(4):994–9.

measure, because it encourages hospitals not only to prevent DVT or PE, but also to appropriately assess a patient's risk for DVT and PE to prevent over diagnosis and underdiagnosis. Given the negative economic and health consequences associated with DVT or PE diagnosis, we believe that preventing underdiagnosis and over diagnosis is critical to improving patient safety.

Lastly, we disagree with commenter that PSI 12 Perioperative PE or DVT Rate lacks appropriate exclusions. Measure exclusions were reviewed by the NQF Patient Safety Steering Committee in 2015 and the measure was re-endorsed as reliable and valid. We note that AHRQ removed isolated thrombosis of calf veins (ICD–9–CM 453.42) from the version 6.0 specification reviewed by the NQF Patient Safety Steering Committee in 2015 in order to minimize the impact of clinically unimportant distal thromboses on hospital-specific PSI 12 rates. However, suggestions regarding potential PSI measure revisions can be made directly to: *QIsupport@ahrq.hhs.gov*.

Comment: Several commenters noted that the modifications to the PSI 90 measure do not address the many, well-documented concerns about the reliability of individual claims data elements or the validity of the PSIs. Commenters expressed the opinion that claims-based measures in general, and PSIs in particular, have not demonstrated that they are accurate, reliable, and valid indicators of quality and safety of care. Other commenters cautioned against the measure's use of claims data due to the composite structure because the composite lacks specific direction for prevention strategy focus. Commenters also expressed concern about the utility of the modified measure and its ability to provide actionable information to providers. Lastly, commenters expressed concern that the shortened reporting period will not produce reliable data on hospital performance. Due to the modifications made to the component PSIs and the new weighting scheme, commenters believed that the previous reliability results do not provide sufficient information on the reliability of the modified measure when a shortened 15-month reporting period is used.

Response: We disagree with commenters that claims-based measures in general, and PSIs in particular, have not demonstrated that they are accurate, reliable, and valid indicators of quality and safety of care. Regarding the administrative data elements of PSI 90, we note that there are previously conducted studies that validate the relationship between administrative claims data and medical records.[121] These studies demonstrate that administrative claims data can provide sufficient clinical information to assess patient safety. We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50091) for a further discussion of this issue in the context of the HAC Reduction Program. Further, over the past decade, AHRQ has supported a series of validation studies based on detailed abstraction of medical records.[122] These studies informed AHRQ's PSI development process, including further refinements to indicators, working with others to improve coding practices, and retirement of a few indicators.

Furthermore, many of these claims-based indicators have been endorsed by the NQF, which includes a review process that assesses reliability and validity.[123] We note that NQF endorsed the modified PSI 90, including the risk-adjustment methodology of the component indicators, as reliable and valid (NQF #0531).[124] Further, we believe the modified PSI 90 does provide actionable information and specific direction for prevention of patient safety events, because hospitals can track and monitor individual PSI rates and develop targeted improvements to improve patient safety. For further guidance on PSI monitoring and strategies for applying quality improvements to PSI data, we refer readers to the Toolkit for Using the AHRQ quality indicators available at: *http://www.ahrq.gov/professionals/systems/hospital/qitoolkit/index.html*.

Lastly, while we acknowledge commenters' concerns that the previous reliability results may not provide sufficient information on the reliability of the modified measure for a shortened 15-month reporting period, we note that this reliability analysis does not include the modifications to the PSI 90, such as improvements in POA coding, refinements to the component indicators, or a composite with 10 component indicators with a revised weighting scheme. We believe these refinements and improvements enhance the reliability of the measure. Moreover, we note that the NQF found the modified PSI 90 to be reliable using specifically 12 months of data.[125] We continue to believe the modified PSI 90 measure is a scientifically rigorous measure that provides actionable feedback to hospitals to improve patient safety and quality of care.

Comment: One commenter expressed concern that PSI 09 Perioperative Hemorrhage or Hematoma Rate may apply to a number of transplant patients and recommended that transplantation should be added to the exclusion list a priori and requested that that liver transplant patients be excluded from the PSI 09 denominator. The commenter indicated that perioperative hemorrhage or hematoma is normal after liver transplant, and is frequent after kidney transplant, and the repercussions of these and other transplantation procedures are not indicative of poor quality care. The commenter further noted that liver transplants result in significant blood loss in nearly every case, and poor performance on this measure can be driven by the number of liver transplants performed.

One commenter expressed concern with the PSI 11 Postoperative Respiratory Failure Rate because acute respiratory failure, mechanical ventilation, and reintubation are fairly common for both liver and kidney procedures and do not suggest poor quality of care. This commenter stated that transplant surgeries have a high incidence of acute respiratory failure, mechanical ventilation, and reintubation meeting the specifications set forth in this measure, due to fluid shifts, medications, neurological status, and potential for infection involved in this complex surgery. Another commenter expressed concern that PSI

[124] Measure information is available at: *http://www.qualityforum.org/QPS/0531*.

[125] Modified_Version_of_PSI90_NQF0531_Composite_Measure_Testing_151022.pdf available in the Patient Safety for Selected Indicators (modified version of PSI90) zip file at: *http://www.qualityforum.org/ProjectMeasures.aspx?projectID=77836*.

10 Postoperative Acute Kidney Injury Requiring Dialysis Rate is inappropriate for liver transplantation. The commenter stated that while the measure excludes patients with preoperative renal failure, many liver transplant patients with relatively normal baseline renal function get acute renal failure after transplant despite high quality care, due to hemodynamic factors and the nature of the drugs involved in the performance of the procedure and its aftermath. These commenters recommended that liver and kidney transplantation should be added to the exclusion list for this measure.

Response: We do not agree with the commenters that liver transplant patients should be excluded from the PSI 09, PSI 10, and PSI 11 denominators. While we appreciate one commenter's observation that transplant patients may have an elevated risk of hemorrhage or hematoma, we note that the risk-adjustment model for PSI 09 explicitly accounts for the increased risk associated with solid organ transplantation. For more information on the PSI 09 risk model, we refer readers to: *http://www.qualityindicators.ahrq.gov/Downloads/Modules/PSI/V50/Parameter_Estimates_PSI_50.pdf*.

Similarly, the risk-adjustment models for PSI 10 and PSI 11 explicitly account for the increased risk associated with hepatic failure and solid organ transplantation, respectively. For more information on the PSI 10 risk model, we refer readers to: *http://www.qualityindicators.ahrq.gov/Downloads/Modules/PSI/V50/Parameter_Estimates_PSI_50.pdf*.

Comment: One commenter expressed concern that changes in coagulation in the early postoperative period may lead to increased incidence of clotting disorders including Deep Vein Thrombosis (DVT) after transplant procedures and also may be caused by large bore IVs.[126] In addition, transplant patients often get products that promote clotting due to inherent coagulopathy, and some patients have clotting disorders that cause hypercoagulability. The commenter noted that this measure excludes surgeries involving interruption of the vena cava, and stated that all liver transplants involve such interruption. This commenter recommended that liver and kidney transplant be added to the exclusion list because DVT is not indicative of poor quality care for these procedures due to the frequency of DVT in transplantation.

Response: We appreciate commenter's observation that PSI 12 Perioperative PE or DVT Rate excludes cases where a procedure for interruption of the vena cava occurs before or on the same day of the first operating room procedure. Cases meeting this criterion should be excluded, because inferior vena cava (IVC) filter placement (which is by far the most common example of surgical interruption of the vena cava) is appropriate only for patients who cannot tolerate, or have already failed, conventional pharmacologic prophylaxis. IVC filters are placed in high-risk patients with the knowledge that they increase the risk of deep vein thrombosis distal to the device while decreasing the risk of embolization to the pulmonary circulation.

However, we disagree with commenter that liver and/or kidney transplants must be placed on the exclusion list, just because these patients may have clotting disorders that cause hypercoagulability, get products that promote clotting, or may have large bore IVs. We note that the risk-adjustment model for PSI 12 Perioperative PE or DVT Rate explicitly accounts for the increased risk of thrombosis (clotting) associated with solid organ transplantation. Risk adjustment accounts for differences in patient populations (transplant patients, etc.) to allow for comparisons across providers. For example, liver transplantation (MDRG 7702) is associated with an adjusted odds ratio of 3.2 in AHRQ's v5.0 risk model for PSI 12. PSI 12 is designed to improve surveillance prevention and awareness of perioperative DVT and pulmonary embolism. Because of the morbidity and mortality associated with these conditions, we continue to believe that PSI 12 is important to improving perioperative quality of care and patient safety. For more information on the PSI 12 risk model, we refer readers to: *http://www.qualityindicators.ahrq.gov/Downloads/Modules/PSI/V50/Parameter_Estimates_PSI_50.pdf*.

The measure steward, AHRQ, carefully considers all suggestions of this type, and will consult with clinical experts as the Patient Safety Indicators are updated in the future. Suggestions regarding potential PSI measure revisions can be made directly to: *QISupport@ahrq.hhs.gov*.

After consideration of the public comments we received, we are finalizing the adoption of the modified PSI 90 measure (NQF #0531) for the Hospital IQR Program for the FY 2018 payment determination and subsequent years as proposed. To summarize, we will use: (1) A 15-month reporting period using only ICD–9 data for the FY 2018 payment determination; (2) a 21-month reporting period using only ICD–10 data for the FY 2019 payment determination and; (3) a 24-month reporting period using only ICD–10 data for the FY 2020 payment determination and subsequent years. We will continue to use the previously adopted eight-indicator version of the PSI 90 measure in the Hospital IQR Program for the FY 2017 payment determination.

7. Additional Hospital IQR Program Measures for the FY 2019 Payment Determination and Subsequent Years

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25185 through 25193), we proposed to add four new measures to the Hospital IQR Program for the FY 2019 payment determination and subsequent years. We proposed to adopt three clinical episode-based payment measures:

- Aortic Aneurysm Procedure Clinical Episode-Based Payment (AA Payment) Measure;
- Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment (Chole and CDE Payment) Measure; and
- Spinal Fusion Clinical Episode-Based Payment (SFusion Payment) Measure.

In addition, we proposed to adopt one required outcome measure: Excess Days in Acute Care after Hospitalization for Pneumonia.

The proposed measures were included on a publicly available document entitled ''2015 Measures Under Consideration'' [127] in compliance with section 1890A(a)(2) of the Act, and they were reviewed by the MAP as discussed in its MAP Pre-Rulemaking Report and Spreadsheet of MAP 2016 Final Recommendations.[128]

Below, we discuss each of the above measures in more detail.

a. Adoption of Three Clinical Episode-Based Payment Measures

(1) Background

Clinical episode-based payment measures are clinically coherent groupings of healthcare services that can be used to assess providers' resource use. Combined with other clinical quality measures, they contribute to the overall picture of providers' clinical

[126] Bore refers to the size of a needle used for an IV.

[127] Measure Applications Partnership: List of Measures Under Consideration (MUC) for December 1, 2015. Available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367*.

[128] Spreadsheet of MAP 2016 Final Recommendations Available at: *http://www.qualityforum.org/map/*.

effectiveness and efficiency. Episode-based performance measurement allows meaningful comparisons between providers based on resource use for certain clinical conditions or procedures, as noted in the NQF report for the ''Episode Grouper Evaluation Criteria'' project available at: *http://www.qualityforum.org/Publications/2014/09/Evaluating_Episode_Groupers__A_Report_from_the_National_Quality_Forum.aspx* and in various peer-reviewed articles.[129] We proposed three clinical episode-based payment measures for inclusion in the Hospital IQR Program beginning with the FY 2019 payment determination: (1) Aortic Aneurysm Procedure Clinical Episode-Based Payment (AA Payment) measure; (2) Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment (Chole and CDE Payment) measure; and (3) Spinal Fusion Clinical Episode-Based Payment (SFusion Payment) measure. The proposed measures capture Medicare payment for services related to the episode procedure and take into account beneficiaries' clinical complexity as well as geographic payment differences.

We proposed these clinical episode-based measures to supplement the Hospital IQR Program's Medicare Spending per Beneficiary (MSPB) measure. The proposed measures also support our mission to provide better healthcare for individuals, better health for populations, and lower costs for healthcare. We note that these measures were reviewed by the MAP and did not receive support for adoption into the Hospital IQR Program, as discussed in its MAP Pre-Rulemaking Report and Spreadsheet of MAP 2016 Final Recommendations.[130] The result of the MAP vote for the proposed measures was as follows: (1) Aortic Aneurysm Procedure Clinical Episode-Based Payment measure: 8 percent support, 32 percent conditional support, and 60 percent do not support; (2) Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment measure: 20 percent support, 28 percent conditional support, and 52 percent do not support; and (3) Spinal Fusion Clinical Episode-Based Payment measure: 16 percent support, 36 percent conditional support, and 48 percent do not support. MAP stakeholders expressed concerns that the proposed measures: (1) Overlap with the Medicare Spending per Beneficiary (MSPB) measure;[131] (2) are not NQF-endorsed; (3) may need to be adjusted for SDS; and (4) fail to link outcomes to quality because they do not reflect appropriateness of care.

In response to MAP stakeholder concerns that the clinical episode-based payment measures overlap with the MSPB measure, we note that unlike the overall MSPB measure, the clinical episode-based payment measures assess payment variation at the procedure level and only include services that are clinically related to the named episode procedure (for example, the spinal fusion measure includes inpatient admissions for ''medical back problems'' that occur following the initial spinal fusion procedure since the admission is likely a result of complications from the initial procedure).

With respect to MAP stakeholder concerns that the clinical episode-based payment measures are not NQF-endorsed, section 1886(b)(3)(B)(IX)(bb) of the Act provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We considered other existing measures related to payment that have been endorsed by the NQF and other consensus organizations, but we were unable to identify any NQF-endorsed (or other consensus organization endorsed) payment measures that assess the aortic aneurysm procedure, cholecystectomy and common duct exploration, or spinal fusion. However, these proposed clinical episode-based payment measures will be submitted to NQF for endorsement as part of the next Cost and Resource Use project.

In regard to MAP stakeholder concerns that the clinical episode-based payment measures may need to be adjusted for SDS, we refer readers to section VIII.A.6.a.(1) of the preamble of this final rule for a discussion of our policy on SDS factor risk adjustment. Finally, regarding MAP stakeholder concerns that the clinical episode-based payment measures fail to link outcomes to quality because they do not reflect appropriateness of care, we believe that the proposed measures cover topics of critical importance to quality in the inpatient hospital setting. Hospitals have a significant influence on Medicare spending during the episode surrounding a hospitalization, through the provision of appropriate, high-quality care before and during inpatient hospitalization, and through proper hospital discharge planning, care coordination, and care transitions. While we recognize that high or low payments to hospitals are difficult to interpret in isolation, high payments for services may implicitly be associated with poor quality of care (for example, preventable readmissions, procedure complications, or emergency room usage).

Although the MAP did not support inclusion of these clinical episode-based payment measures in the Hospital IQR Program,[132] stakeholders have requested to have more condition-specific and procedure-specific measures, similar to the MSPB measure included in the Hospital IQR Program, as described in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51623). We believe that including condition- and procedure-specific payment measures will provide hospitals with actionable feedback that will better equip them to implement targeted improvements in comparison to an overall payment measure alone. Further, we believe that supplementing the MSPB measure with condition-specific and procedure-specific measures will provide both overall hospital-level and detailed information on high-cost and high-prevalence conditions and procedures to better inform their future spending plans. Moreover, the payment measures will help consumers and other payers and providers identify hospitals involved in the provision of efficient care for certain procedures.

The three procedures selected for the clinical episode-based payment measures were chosen based on the following criteria: (1) The condition constitutes a significant share of Medicare payments and potential savings for hospitalized patients during and surrounding a hospital stay; (2) there was a high degree of agreement among clinical experts consulted for this project that standardized Medicare payments for services provided during this episode can be linked to the care provided during the hospitalization; (3)

[129] For example: Hussey, P. S., Sorbero, M. E., Mehrotra, A., Liu, H., & Damberg, S. L.: (2009). Episode-Based Performance Measurement and Payment: Making It a Reality. Health Affairs, 28(5), 1406–1417. Doi:10.1377/hlthaff.28.5.1406.

[130] Spreadsheet of MAP 2016 Final Recommendations. Available at: *http://www.qualityforum.org/map/*.

[131] MSPB measure specifications can be found in the ''Medicare Spending Per Beneficiary (MSPB) Measure Overview,'' available at: *http://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228772053996*.

[132] Spreadsheet of MAP 2016 Final Recommendations. Available at: *http://www.qualityforum.org/map/*.

episodes of care for the condition are comprised of a substantial proportion of payments and potential savings for postacute care, indicating episode payment differences are driven by utilization outside of the MS–DRG payment; (4) episodes of care for the condition reflect high variation in postdischarge payments, enabling differentiation among hospitals; and (5) the medical condition is managed by general medicine physicians or hospitalists and the surgical conditions are managed by surgical subspecialists, enabling comparison between similar practitioners. These selection criteria were also used for the three clinical episode-based payment measures finalized in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49664 through 49665).

The measures follow the general construction of episode-based measures previously adopted in the Hospital IQR Program: The NQF-endorsed MSPB measure finalized in the FY 2012 IPPS/LTCH PPS final rule for the Hospital IQR Program (76 FR 51626 through 74529); and the three clinical episode-based payment measures for kidney/UTI, cellulitis, and gastrointestinal hemorrhage finalized in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49674). Similar to these previously adopted measures, the proposed measures include standardized payments for Medicare Part A and Part B services and are risk adjusted for individual patient characteristics and other factors (for example, the MS–DRG of the index inpatient stay). However, unlike the MSPB measure, the clinical episode-based payment measures only include Medicare Part A and Part B services that are clinically related to the named episode procedure. The clinical episode-based payment measures are price-standardized, risk-adjusted ratios that compare a provider's resource use against the resource use of other providers within a reporting period (that is, the measure calculation includes eligible episodes occurring within a 1-year timeframe). Similar to the MSPB measure though, the ratio allows for ease of comparison over time as it obviates the need to adjust for inflation.

Each clinical episode-based payment measure is calculated as the ratio of the Episode Amount for each provider divided by the episode-weighted median Episode Amount across all providers. To calculate the Episode Amount for each provider, one calculates the average of the ratio of the observed episode payment over the expected episode payment (as predicted in risk adjustment), and then multiplies this quantity by the average observed episode payment level across all providers nationally. The denominator for a provider's measure is the episode weighted national median [133] of Episode Amounts across all providers. A clinical episode-based payment measure of less than 1 indicates that a given provider's resource use is less than that of the national median provider during a reporting period. Mathematically, this is represented in equation (A) below.

$$\text{(A)}\ \textit{Episode Measure}_j = \frac{\textit{Episode Amount}_j}{\substack{\textit{Episode-Weighted}\\ \textit{Median of All Providers'}\\ \textit{Episode Amounts}}} = \frac{\frac{\Sigma_{i\in j}(\frac{O_{ij}}{E_{ij}})}{n_j} * \bar{O}_{i\in I}}{\substack{\textit{Episode-Weighted}\\ \textit{Median of All Providers'}\\ \textit{Episode Amounts}}}$$

where

O_{ij} =observed episode payment for episode i in provider j,

E_{ij} =epected episode payment for episode i in provider j,

O_{iEI} =average observed episode payment across all episodes i nationally, and

n_j =total number of episodes for provider j.

Each of the three measures we proposed is described further below, followed by explanations of payment standardization and risk adjustment. For detailed measure specifications, we refer readers to the clinical episode-based payment measures report entitled, ''Measure Specifications: Hospital Clinical Episode-Based Payment Measures for Aortic Aneurysm Procedure, Cholecystectomy and Common Duct Exploration, and Spinal Fusion'' available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447*.

We invited public comment on our proposals to add three clinical episode-based payment measures for the FY 2019 payment determination and subsequent years. General comments related to all three measures are discussed below. Specific comments for each measure are discussed even further below.

Comment: Several commenters supported the adoption of the proposed clinical episode-based payment measures.

Response: We thank the commenters for their support.

Comment: Several commenters expressed concern that hospitals would not be able to report statistically reliable information on such a small number of hospital-specific observations, recommending instead that CMS use condition-specific cost measures broadly and not base financial incentives on them.

Commenters were also concerned that the majority of performance variation reflects differences in services used by patients, but the measures do not provide insight on whether the services were necessary and appropriate, arguing that cost is not indicative of quality of care. Some commenters believed that consumers are likely to associate higher cost with better quality.

Response: We disagree with the commenters that a hospital will not be able to report statistically reliable information on the condition-specific, clinical episode-based payment measures. We note that the conditions for these measures were selected specifically because these conditions are high volume and constitute a significant share of Medicare payments and potential savings, as detailed in the Background sections corresponding to each measure in sections VIII.A.7.a.(2)(a), VIII.A.7.a.(3)(a), and VIII.A.7.a.(4)(a) of the preamble of this final rule. In addition, analysis of 2014 administrative claims data shows that the majority of hospitals achieved moderate reliability (above 0.4) when using 20-episode case minimums for Aortic Aneurysm Procedure and Spinal Fusion Clinical Episode-Based Payment Measure, and a 30-episode case minimum for the Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment Measure. For more details, we refer readers to the measure methodology report available at: *https://www.qualitynet.org/dcs/*

[133] Example of episode weighted median: if there are 2 hospitals and one hospital had an measure score of 1.5 and another had one of 0.5, but the first had 4 episodes and the second only 1, then the episode-weighted median would be 1.5 (that is, 0.5, 1.5, 1.5, 1.5, 1.5).

ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447.

We appreciate the commenter's recommendation not to use episode-based cost measures for financial incentives, but note that the payment incentive in the Hospital IQR Program is for reporting only, therefore, there is no financial incentive associated with performance on these specific measures. We agree with commenters that some consumers may associate higher cost with better quality, and we will continue to explore options to improve the manner in which data is presented on *Hospital Compare* to enable consumers to make informed decisions about their healthcare.

Comment: One commenter noted that the Hospital IQR Program does not currently include appropriate outcome measures for many of these conditions, nor has CMS proposed inclusion of new outcome measures. This commenter urged CMS to identify and employ relevant health outcome measures to provide context for these cost measures, so that the function of the cost measures is not to simply reduce spending, even when the spending is appropriate. Some commenters stated that there are no concurrent outcome measures in the Hospital IQR Program and thus the measures do not offer meaningful insight on whether or not outcomes are better in places where more or fewer services are used.

Response: We interpret the commenters' reference to places where more or fewer services are used to refer to hospital resource use. While we agree that observation of cost alongside quality (outcome measures) is an important concept, we believe that resource use information, even in the absence of a corresponding (concurrent) quality measure, provides useful and valuable information for consumers and other stakeholders as they seek to make informed decisions about facilities involved in the provision of their care. Furthermore, the clinical episode-based payment measures only include costs from services/procedures related to the condition, which would include readmissions that are clinically related to the hospitalization. In that sense, certain outcomes would be captured in these measures through higher resource use. However, we appreciate the commenter's suggestion and will consider it in future measure development.

Comment: One commenter observed that the proposed clinical episode-based payment measures would help supplement the MSBP measure by tracking resource use within these particular episodes of care, but several commenters echoed the MAP's concern that these measures overlap with the MSPB measure. One commenter expressed concern that these measures overlap with other efficiency measures. One commenter requested clarification about whether or not the proposed clinical episode-based payment measures will be used as part of the MSPB measure for the Hospital VBP Program in future payment years, stating that it is important for all stakeholders to be fully aware how cost collection under these measures may impact future quality scores and payment adjustments.

Response: We interpret ''other efficiency measures'' to mean the MSPB measure, and acknowledge that there may be some overlap between the MSPB measure and these three episode-based payment measures. However, unlike the overall MSPB measure, the clinical episode-based payment measures assess payment variation at the procedure level and only include services that are clinically related to the named episode procedure (for example, the spinal fusion measure includes inpatient admissions for ''medical back problems'' that occur following the initial spinal fusion procedure since the admission is likely a result of complications from the initial procedure). We believe that the episode-based measures are of critical importance to improving efficiency of care. Including episode-based measures alongside the MSPB measure provides hospitals with actionable feedback that will better equip them to implement targeted improvements, in comparison to an overall payment measure alone. Moreover, these episode-based measures will allow consumers, providers, and payers to make a more fully informed assessment of value of care. In addition, any proposal to adopt the clinical episode-based payment measures into the Hospital VBP Program would be subject to future rulemaking.

Comment: One commenter expressed concern that claims do not accurately reflect the provider performance across the entire patient population that includes non-Traditional Medicare patients, while some commenters specifically recommended including Medicare Advantage (MA) patients in the measure population since fee-for-service is only a small portion of the total patient population. To that end, some commenters encouraged CMS to validate MA data and to supplement claims data with MA data to assure valid and reliable reports of quality provided to Medicare beneficiaries.

Response: We interpret the commenter's reference to ''non-Traditional Medicare patients'' to refer to beneficiaries enrolled in MA plans. We note that we do not receive claims data for beneficiaries who are enrolled in the MA plans because Medicare pays these plans a fixed amount. Therefore, we cannot include or supplement MA claims data for measure calculation.

Comment: Some commenters did not support the measures because they are not NQF-endorsed, noting that the MAP also recommended that the measures be NQF-endorsed prior to being included in the Hospital IQR Program because the endorsement process identifies needed refinements or problems with measures which should be considered prior to program adoption. Some commenters suggested that the measures have full support of the clinical community prior to being included in the measure set.

Response: We believe the MAP provides valuable insights and we consider and carefully weigh all of their recommendations. When we disagree with these recommendations, we take care to explain our rationale when proposing such measures. We refer readers to section VIII.A.7.a.(1) of the preamble of this final rule for a discussion of our rationale for including the Clinical Episode-Based Payment measures in the Hospital IQR Program measure set. Likewise, we attempt to engage stakeholders in the measure development process as much in possible, including by working with them on TEPs and Environmental Working Groups (EWGs).

Finally, whenever feasible, we adopt measures that are NQF-endorsed, but note that sometimes there are important areas of clinical concern for which NQF-endorsed measures do not exist. Section 1886(b)(3)(B)(IX)(bb) of the Act provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We considered other existing measures related to payment that have been endorsed by the NQF and other consensus organizations, but we were unable to identify any NQF-endorsed (or other consensus organization endorsed) payment measures that assess the aortic aneurysm procedure, cholecystectomy and common duct exploration, or spinal fusion. However, these proposed clinical episode-based payment

measures will be submitted to NQF for endorsement as part of the next Cost and Resource Use project.

Comment: Some commenters noted that the measures reflect the actions of a group of healthcare providers, rather than just hospitals. Other commenters also noted that the measures do not account for national variation in the mix of services and degree of integration in health care markets beyond the hospital's control. Some commenters recommended that inclusion of these measures be delayed in the Hospital IQR Program until all settings of postacute care have similar measures.

Response: We believe these measures reflect the actions of hospitals and the care their patients receive postdischarge. Hospitals providing quality inpatient care, conducting appropriate discharge planning, and working with providers and suppliers on appropriate follow-up care will likely perform well, because the Medicare beneficiaries they serve will have a reduced need for excessive postdischarge services. The risk adjustment methodology used for these measures acknowledge the differences in a given hospital's patient case mix, so that their performance can be compared to a national average. We recognize that the structure of health care markets and practice patterns vary geographically, beyond the variation in patient case mix. However, as mentioned above, we believe that the aforementioned opportunities for hospitals to exert control over postdischarge services exist, regardless of the degree of integration of a health system. In cases where systems are not well-integrated, there may be an even greater opportunity for redesign of care processes to achieve high performance on these measures. We are collaborating with our postacute care quality programs and we will take the commenters' suggestions that similar measures should be incorporated into those programs under consideration. However, we do not believe that it would be appropriate to delay adoption of this measure and the public reporting of this valuable and actionable payment information until such time as any similar, postacute care measures are implemented.

Comment: Some commenters did not believe claims data were adequate to calculate measure scores for these measures. Another commenter stated that the measure should be based on clinical data rather than claims data.

Response: Because all measures in the Hospital IQR Program require clinical data, we interpret the commenter's request that the measure should be based on clinical data rather than claims data to refer to the risk adjustment methodology since payment information must come from a filed claim. We believe that using administrative claims data is a valid approach to risk adjustment that adequately assesses the difference in case-mix among hospitals. However, we also are continuing to explore the use of patient clinical data (core clinical data elements) derived from EHRs for risk adjustment in future measure development (80 FR 49698 through 49704).

Comment: Some commenters cited concerns about the risk adjustment and scoring of these measures. One commenter noted that it is imperative to assess for risk-adjustment factors to ensure that facilities are not financially penalized for serving vulnerable populations and/or worsening care disparities. Another commenter specifically suggested that the measures be SDS risk-adjusted to account for the effects of poverty on the use of healthcare services.

Response: Because the Hospital IQR Program is a quality reporting program and does not score measures for performance, we interpret commenters' concerns regarding scoring to refer to measure calculation. In response to concerns regarding risk adjustment and measure calculation, we note that the steps used to calculate risk-adjusted payments align with the NQF-endorsed MSPB measure (NQF #2158) method as specified in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51624 through 51626). The risk adjustment model adjusts for age, severity of illness, and the MS–DRG of the hospitalization that triggers the episode. The risk adjustment model also includes clinical subtypes that distinguish relatively homogeneous subpopulations of patients whose health conditions significantly influence the form of treatment and the expected postdischarge outcomes and risks.

For each clinical subtype, the risk adjustment model is estimated separately such that the measure compares observed spending for an episode of a given clinical subtype only to expected spending among episodes of that subtype. The Aortic Aneurysm Procedure Clinical Episode-Based Payment Measure includes two clinical subtypes: (1) Abdominal Aortic Aneurysm Procedure; and (2) Thoracic Aortic Aneurysm Procedure. The Spinal Fusion Clinical Episode-Based Payment measure includes five clinical subtypes: (1) Anterior Fusion—Single; (2) Anterior Fusion—2 Levels; (3) Posterior/Posterior-Lateral Approach Fusion—Single; (4) Posterior/Posterior-Lateral Approach Fusion—2 or 3 Levels; and (5) Combined Fusions. In addition, postdischarge episode payment is limited to services that are clinically related to the reason for the initial hospitalization, which removes sources of variation in episode spending that are out of the hospital's control.

The specifications for clinical subtypes and grouping rules for postdischarge services were based on consensus decisions by a team of clinical experts, which included CMS and non-CMS physicians. For a complete list of the clinical experts whose input considered, we refer readers to the report detailing the specifications of the episode-based payment measures, entitled, ''Measure Specifications: Hospital Clinical Episode-Based Payment Measures for Aortic Aneurysm Procedure, Cholecystectomy and Common Duct Exploration, and Spinal Fusion'' available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447*.

In response to the comments about risk-adjustment factors that account for serving vulnerable populations and/or worsening care disparities, as stated in section VIII.A.6.a.(1) of the preamble of this final rule, several measures developed by CMS have been brought to NQF since the beginning of the SDS trial. CMS, in compliance with NQF's guidance, has tested SDS factors in the measures' risk models and made recommendations about whether or not to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for SDS factors in our outcome measures.

Furthermore, ASPE is conducting research to examine the impact of SDS on quality measures, resource use, and other measures under the Medicare program as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how they apply to our quality programs at such time as they are available.

Comment: Despite concerns about these measures, some commenters noted the potential benefit of sharing confidential cost reports to providers, specifically those interested in bundled payments, so that these providers can assess the drivers of high-cost payment episodes and explore interventions. These commenters suggested that CMS provide these cost reports while the measures undergo NQF review. Some commenters suggested conducting a ''dry run'' of the measures in which CMS would provide hospitals with

confidential reports, soliciting feedback on the usefulness of the information. Another commenter requested that CMS publish supplementary data demonstrating cost variations to better inform stakeholders of the appropriateness of tracking these costs and to evaluate whether the data show any evidence that higher quality hospital treatment may yield lower postdischarge payment.

Response: In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49672), we finalized a dry run for similar clinical episode-based payment measures, which will be conducted in the summer of 2017 using CY 2016 data. The purpose of this dry run is to allow hospitals to gain experience with clinical episode-based payment measures through confidential feedback reports. We believe this dry run will enable hospitals to gain experience with clinical episode-based payment measures, including the three payment measures being adopted in this final rule, and therefore another similar dry run is unnecessary.

We thank commenters for their support of the confidential hospital-specific feedback reports. We currently provide confidential hospital-specific feedback reports and supplemental files for the MSPB measure, and we intend to create similar reports and supplemental files for these clinical episode-based payment measures. We will coordinate with measure stewards to try to develop a process for making these reports available while measures are undergoing NQF review. We appreciate the commenter's suggestion that we publish supplementary data of cost variations and will take it into future consideration.

Comment: One commenter encouraged CMS to work collaboratively with stakeholders to ensure that policies allow hospitals to provide the best care for patients in the most appropriate setting as determined by the physician.

Response: We thank the commenter for this suggestion and we will continue to seek and consider stakeholder input as we improve the Hospital IQR Program.

(2) Aortic Aneurysm Procedure Clinical Episode-Based Payment (AA Payment) Measure

(a) Background

Inpatient hospital stays and associated services assessed by the proposed Aortic Aneurysm Procedure Clinical Episode-Based Payment (AA Payment) measure have high payments with substantial variation. In CY 2014, Medicare FFS beneficiaries experienced more than 22,000 aortic aneurysm procedure episodes triggered by related inpatient stays. Payment-standardized, risk-adjusted episode payment for these episodes (payment for the hospitalization plus payment for clinically related services in the episode window) totaled nearly $760 million in CY 2014, with a mean episode payment of over $33,000. There is substantial variation in aortic aneurysm procedure episode payment—ranging from approximately $21,000 at the 5th percentile to approximately $62,000 at the 95th percentile—that is partially driven by variation in postdischarge payment clinically-related to the inpatient hospitalization.[134] These clinically-related postdischarge payments may be an indicator of the quality of care provided during the hospitalization. Specifically, higher quality hospital treatment may yield lower postdischarge payment.

(b) Overview of Measure

The proposed AA Payment measure includes the set of medical services related to a hospital admission for an aortic aneurysm procedure, including treatment, follow-up, and postacute care. The measure includes two clinical subtypes: (1) Abdominal Aortic Aneurysm Procedure; and (2) Thoracic Aortic Aneurysm Procedure. Clinical subtypes are included in the measure construction to distinguish relatively homogeneous subpopulations of patients whose health conditions significantly influence the form of treatment and the expected postdischarge outcomes and risks. The risk adjustment model is estimated separately for each clinical subtype, such that the measure compares observed spending for an episode of a given clinical subtype only to expected spending among episodes of that subtype. This measure, like the NQF-endorsed MSPB measure (NQF #2158), assesses the payment for services initiated during an episode that spans the period immediately prior to, during, and following a beneficiary's hospital stay (the ''episode window,'' discussed in more detail below). In contrast to the MSPB measure, however, this proposed measure includes Medicare payments for services during the episode window only if they are clinically related to the aortic aneurysm procedure that was performed during the index hospital stay.

[134] Statistics based on Acumen's testing of episode definition on Medicare FFS population using Medicare Parts A and B claims.

(c) Data Sources

The proposed AA Payment measure is a claims-based measure. It uses Part A and Part B Medicare administrative claims data from Medicare FFS beneficiaries hospitalized for an aortic aneurysm procedure. The reporting period for the measure is 1 year (that is, the measure calculation includes eligible episodes occurring within a 1-year timeframe). For example, for the FY 2019 payment determination, the reporting period would be CY 2017.

(d) Measure Calculation

The proposed AA Payment measure sums the Medicare payment amounts for clinically related Part A and Part B services provided during the episode window and attributes them to the hospital at which the index hospital stay occurred. Medicare payments included in this episode-based measure are standardized and risk-adjusted. Similar to the MSPB measure's construction, this measure is expressed as a risk-adjusted ratio, which allows for ease of comparison over time, without the need to adjust for inflation. The numerator is the Episode Amount, calculated as the average of the ratios of the observed episode payment over the expected episode payment (as predicted in risk adjustment), multiplied by the average observed episode payment level across all providers nationally. The denominator for a provider's measure is the episode weighted national median of Episode Amounts across all providers. An aortic aneurysm procedure episode begins 3 days prior to the initial (index) admission and extends 30 days following the discharge from the index hospital stay. For detailed measure specifications, we refer readers to the clinical episode-based payment measures report entitled, ''Measure Specifications: Hospital Clinical Episode-Based Payment Measures for Aortic Aneurysm Procedure, Cholecystectomy and Common Duct Exploration, and Spinal Fusion'' and available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447*.

(e) Cohort

The proposed AA Payment measure cohort includes Medicare FFS beneficiaries hospitalized for an aortic aneurysm procedure. Measure exclusions are discussed in more detail in section VIII.A.7.a.(5) of the preamble of this final rule.

We invited public comment on our proposal to adopt the Aortic Aneurysm

Procedure Clinical Episode-Based Payment (AA Payment) measure to the Hospital IQR Program measure set for the FY 2019 payment determination and subsequent years as discussed in this section.

Comment: One commenter specifically opposed the proposed inclusion of the AA Payment measure, noting that the measure is not NQF-endorsed or supported by the MAP.

Response: We refer readers to our response in the section above in which we respond to general comments on the clinical episode-based payment measures.

Comment: One commenter recommended that the measure should be subdivided into several different measures by: Location of the Aortic Aneurysm; Type of Surgery that is performed; and Emergent or Non Emergent Aortic Aneurysm.

Response: We disagree that the measure should be subdivided into several different measures. The measure already risk adjusts for the factors listed by the commenter, including through two clinical subtypes based on the location of the procedure: (1) Abdominal Aortic Aneurysm Procedure, and (2) Thoracic Aortic Aneurysm Procedure. Creating separate measures would substantially reduce hospitals' sample size and limit the number of hospitals included in the measure after an episode case minimum is imposed.

After consideration of the public comments we received, we are finalizing the adoption of the Aortic Aneurysm Procedure Clinical Episode-Based Payment (AA Payment) measure to the Hospital IQR Program for the FY 2019 payment determination and subsequent years as proposed.

(3) Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment (Chole and CDE Payment) Measure

(a) Background

Inpatient hospital stays and associated services assessed by the proposed Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment (Chole and CDE Payment) measure have high payments with substantial variation. In CY 2014, Medicare FFS beneficiaries experienced more than 48,000 cholecystectomy and common duct exploration episodes triggered by related inpatient stays. Payment-standardized, risk-adjusted episode payment for these episodes (payment for the hospitalization plus the payment for clinically related services in the episode window) totaled nearly $690 million in CY 2014, with a mean episode payment of over $14,000. There is substantial variation in cholecystectomy and common duct exploration episode payment—ranging from approximately $11,000 at the 5th percentile to approximately $22,000 at the 95th percentile—that is partially driven by variation in postdischarge payment clinically-related to the inpatient hospitalization.[135] These clinically-related postdischarge payments may be an indicator of the quality of care provided during the hospitalization. Specifically, higher quality hospital treatment may yield lower postdischarge payment.

(b) Overview of Measure

The proposed Chole and CDE Payment measure includes the set of medical services related to a hospital admission for a cholecystectomy and common duct exploration, including treatment, follow-up, and postacute care. This measure, like the NQF-endorsed MSPB measure (NQF #2158), assesses the payment for services initiated during an episode that spans the period immediately prior to, during, and following a beneficiary's hospital stay (the ''episode window,'' discussed in more detail below). In contrast to the MSPB measure, however, this measure includes Medicare payments for services during the episode window only if they are clinically related to the cholecystectomy and common duct exploration that was performed during the index hospital stay.

(c) Data Sources

The proposed Chole and CDE Payment measure is a claims-based measure. It uses Part A and Part B Medicare administrative claims data from Medicare FFS beneficiaries hospitalized for a cholecystectomy and common duct exploration. The reporting period for the measure is 1 year (that is, the measure calculation includes eligible episodes occurring within a 1-year timeframe). For example, for the FY 2019 payment determination, the reporting period would be CY 2017.

(d) Measure Calculation

The proposed Chole and CDE Payment measure sums the Medicare payment amounts for clinically related Part A and Part B services provided during the episode window and attributes them to the hospital at which the index hospital stay occurred. Medicare payments included in this episode-based measure are standardized and risk-adjusted. Similar to the MSPB measure's construction, this measure is expressed as a risk-adjusted ratio, which allows for ease of comparison over time, without need to adjust for inflation. The numerator is the Episode Amount, calculated as the average of the ratios of the observed episode payment over the expected episode payment (as predicted in risk adjustment), multiplied by the average observed episode payment level across all providers nationally. The denominator for a provider's measure is the episode weighted national median of Episode Amounts across all providers. A cholecystectomy and common duct exploration episode begins 3 days prior to the initial (index) admission and extends 30 days following the discharge from the index hospital stay. For detailed measure specifications, we refer readers to the clinical episode-based payment measures report entitled, ''Measure Specifications: Hospital Clinical Episode-Based Payment Measures for Aortic Aneurysm Procedure, Cholecystectomy and Common Duct Exploration, and Spinal Fusion'' and available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447*.

(e) Cohort

The proposed Chole and CDE Payment measure cohort includes Medicare FFS beneficiaries hospitalized for cholecystectomy and common duct exploration. Measure exclusions are discussed in more detail in section VIII.A.7.a.(5) of the preamble of this final rule below.

We invited public comment on our proposal to adopt the Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment (Chole and CDE Payment) measure to the Hospital IQR Program measure set for the FY 2019 payment determination and subsequent years as discussed in this section.

Comment: One commenter recommended that CMS modify the Chole and CDE Payment measure to only include Cholecystectomy procedures without CDE because of the low volume of these procedures in hospitals. The commenter cautioned that inclusion of CDE will diminish the measure's reliability because hospitals will be accountable for payments on procedures they rarely perform.

Response: We thank the commenter, but believe it is important to incentivize cost efficient care for cholecystectomies whether performed with or without CDE. Reliability calculations on the Chole and CDE Payment measure show

[135] Statistics based on Acumen's testing of episode definition on Medicare FFS population using Medicare Parts A and B claims.

that a majority of hospitals have at or above moderate reliability (above 0.4) when using a 30-episode case minimum.

We recognize that reliability may be limited for hospitals that perform a small number of procedures; however, we select appropriate case minimums for reporting before these measures are publicly reported on *Hospital Compare.*

After consideration of the public comment we received, we are finalizing the adoption of the Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment (Chole and CDE Payment) measure to the Hospital IQR Program for the FY 2019 payment determination and subsequent years as proposed.

(4) Spinal Fusion Clinical Episode-Based Payment (SFusion Payment) Measure

(a) Background

Inpatient hospital stays and associated services assessed by the proposed Spinal Fusion Clinical Episode-Based Payment (SFusion Payment) measure have high payments with substantial variation. In CY 2014, Medicare FFS beneficiaries experienced nearly 60,000 spinal fusion episodes triggered by related inpatient stays. Payment-standardized, risk-adjusted episode payment for these episodes (payment for the hospitalization plus the payment for clinically related services in the episode window) totaled over $2 billion in CY 2014, with a mean episode payment of over $35,000. There is substantial variation in spinal fusion episode payment—ranging from approximately $27,000 at the 5th percentile to approximately $56,000 at the 95th percentile—that is partially driven by variation in postdischarge payment clinically-related to the inpatient hospitalization.[136] These clinically-related postdischarge payments may be an indicator of the quality of care provided during the hospitalization. Specifically, higher quality hospital treatment may yield lower postdischarge payment.

(b) Overview of Measure

The SFusion Payment measure includes the set of medical services related to a hospital admission for a spinal fusion, including treatment, follow-up, and postacute care. The measure includes five clinical subtypes: (1) Anterior Fusion—Single; (2) Anterior Fusion—2 Levels; (3) Posterior/Posterior-Lateral Approach Fusion—Single; (4) Posterior/Posterior-Lateral Approach Fusion—2 or 3 Levels; and (5) Combined Fusions. The clinical subtypes are included in the measure construction to distinguish relatively homogeneous subpopulations of patients whose health conditions significantly influence the form of treatment and the expected outcomes and risks. The risk adjustment model is estimated separately for each clinical subtype, such that the measure compares observed spending for an episode of a given clinical subtype only to expected spending among episodes of that subtype. A similar measure, the Lumbar Spinal Fusion/Refusion Clinical Episode-Based Payment Measure, was proposed for inclusion in the Hospital IQR Program in the FY 2016 IPPS/LTCH PPS proposed rule (80 FR 24570 through 24571). Based on public comments regarding the heterogeneity of the spinal fusion patient population, we decided not to finalize the measure for the Hospital IQR Program at that time (80 FR 49668 through 49674). We have since refined the measure by including more granular subtypes of fusions of the lumbar spine to create more homogenous patient cohorts.

This proposed measure, like the NQF-endorsed MSPB measure (NQF #2158), assesses the payment for services initiated during an episode that spans the period immediately prior to, during, and following a beneficiary's hospital stay (the ''episode window,'' discussed in more detail below). In contrast to the MSPB measure, however, this measure includes Medicare payments for services during the episode window only if they are clinically related to the spinal fusion procedure that was performed during the index hospital stay.

(c) Data Sources

The proposed SFusion Payment measure is a claims-based measure. It uses Part A and Part B Medicare administrative claims data from Medicare FFS beneficiaries hospitalized for spinal fusion. The reporting period for the measure is 1 year (that is, the measure calculation includes eligible episodes occurring within a 1-year timeframe). For example, for the FY 2019 payment determination, the reporting period would be CY 2017.

(d) Measure Calculation

The proposed SFusion Payment measure sums the Medicare payment amounts for clinically related Part A and Part B services provided during the episode window and attributes them to the hospital at which the index hospital stay occurred. Medicare payments included in this episode-based measure are standardized and risk-adjusted. Similar to the MSPB measure's construction, this measure is expressed as a risk-adjusted ratio, which allows for ease of comparison over time, without need to adjust for inflation. The numerator is the Episode Amount, calculated as the average of the ratios of the observed episode payment over the expected episode payment (as predicted in risk adjustment), multiplied by the average observed episode payment level across all providers nationally. The denominator for a provider's measure is the episode weighted national median of Episode Amounts across all providers. A spinal fusion episode begins 3 days prior to the initial (index) admission and extends 30 days following the discharge from the index hospital stay.

For detailed measure specifications, we refer readers to the clinical episode-based payment measures report entitled, ''Measure Specifications: Hospital Clinical Episode-Based Payment Measures for Aortic Aneurysm Procedure, Cholecystectomy and Common Duct Exploration, and Spinal Fusion'' available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447*.

(e) Cohort

The proposed SFusion Payment measure cohort includes Medicare FFS beneficiaries hospitalized for spinal fusion. Measure exclusions are discussed in more detail in section VIII.A.7.a.(5) of the preamble of this final rule below.

We invited public comment on our proposal to adopt the Spinal Fusion Clinical Episode-Based Payment (SFusion Payment) measure to the Hospital IQR Program measure set for the FY 2019 payment determination and subsequent years as discussed in this section.

Comment: Several commenters supported the proposed inclusion of the SFusion Payment measure, noting the measure aligns with the NQS and can help incentivize improved care coordination between hospitals and postacute providers since the cost for these episodes is largely driven by variation in postacute care utilization. One commenter stated that inclusion of such a measure will provide CMS and providers with the information necessary to narrow the growing variation in payment rates associated with spinal fusion procedures, and bring quality to the forefront in this important field. This commenter also

[136] Statistics based on Acumen's testing of episode definition on Medicare FFS population using Medicare Parts A and B claims.

noted that studies conducted on the utility of ACTIFUSE (a bone void filler) indicate that surgical adjunct technologies exist that can help facilitate cost effectiveness while preserving positive patient outcomes. Another commenter noted that the updated version makes the lumbar fusion cohort more homogeneous.

Response: We thank the commenters for their support.

Comment: One commenter recommended that CMS only include subtypes 1, 2 and 3 in the proposed Spinal Fusion Clinical Episode-Based Payment Measure, noting that measuring subtypes 4 and 5 (posterior/posterior-lateral approach fusion—2 or 3 levels and combined fusions, respectively) would compromise validity because those subtypes include a wide breadth of procedures and heterogeneous patient population that would make comparisons potentially unreliable.

Response: We thank the commenter for the suggestion on the SFusion Payment measure. We believe that the Posterior/Posterior-lateral Approach Fusion—2 or 3 Levels and Combined Fusions subtypes do not include a wide breadth of procedures or heterogeneous populations. To create homogenous cohorts of patients for which we can reasonably compare resource use, the subtypes focus on patients hospitalized for fusions of the lumbar spine and elective cases of degenerative disease and do not include procedures that might indicate treatment for other clinical conditions such as trauma, congenital, neoplastic, or infectious processes. In addition, the measure uses risk adjustment to account for various levels of clinical complexity in the patient population that are beyond the influence of the attributed provider. The risk adjustment model aligns with the NQF-endorsed MSPB measure (NQF #2158) method as specified in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51624 through 51626).

In response to concerns about reliability, testing on the SFusion Payment measure shows that a majority of hospitals have at or above moderate reliability (above 0.4) when using a 20-episode case minimum.

Comment: One commenter expressed concern that CMS has released the grouping rules based on ICD–9 codes whereas implementation will be evaluating claims with ICD–10 codes for specific items included in the Spinal Fusion Grouping Rules.

Response: We thank the commenter for its concern regarding the ICD–10 transition. We plan to update the measure for ICD–10–CM/PCS diagnosis and procedure codes prior to implementation of the measures.

Comment: A few commenters specifically did not support the proposal to include the SFusion Payment measure. One commenter stated that the measure does not account for the patient's diagnosis and does not appear to account for other important patient complexity variables such as SDS factors, obesity, tobacco use, and population health variables. This commenter noted that these factors are outside of the provider's control, add to the complexity of the case, and clearly impact patient outcomes and therefore should be accounted for within the risk adjustment of the measure.

Response: We thank the commenters for their input and note that the measure does account for the patient's procedure and diagnosis to limit the cohort of patients to those with high frequency elective cases of degenerative disease. To create homogenous patient cohorts, MS–DRGs indicating spinal fusions performed to treat other clinical conditions such as malignancy or infection were not included in the list of episode triggers. Of note, risk adjustment methodology also incorporates diagnostic information and is discussed further below. Furthermore, in developing the episodes, we separated more complex cases (multi-level fusions) from less complex cases (single-level fusions) into clinical subtypes. We also separated anterior, posterior, and combined approach fusions and limited our number of levels involved in fusion. These characteristics were related to the indication for the fusion, and were a reasonable way to infer more diagnostic information. We removed procedures and DRGs that were mostly used in trauma, congenital, neoplastic, or infectious cases, and concentrated on cases that mostly occurred with degenerative disease.

In response to the comments about risk adjusting for SDS factors, we refer readers to section VIII.A.6.a.(1) in the preamble of this final rule where we respond to similar comments.

In regard to the concern about not including population health variables, these measures rely on Medicare administrative data and therefore are limited to variables found in this data source. Codes for obesity and tobacco are also not included in the risk adjustment model, as the clinical experts who specified the measure determined that these codes were unlikely to be uniformly coded on Medicare claims. We believe that the other risk adjustment variables adequately adjust for patient case mix by accounting for Hierarchical Condition Categories (HCCs), clinical case mix categories, and prior inpatient and ICU length of stay. The measure's risk adjustment methodology does account for a range of diagnoses reflecting comorbidities that could impact spinal fusion episode spending, including diabetes and other organ system disease. We refer readers to the measure's risk adjustment methodology available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447*.

Comment: One commenter noted that stakeholders have no information on the conditions and services being grouped into the episode and counted in the overall cost of the episode. To be transparent, the commenter suggested that CMS should specify a list of services it is proposing for inclusion in each grouping option for the SFusion Payment measure.

Response: We refer readers to the detailed specifications for all of the clinical episode-based payment measures, which we referred readers to in the proposed rule (81 FR 25189), in the Measure Specifications: Hospital Clinical Episode-Based Payment Measures for Aortic Aneurysm Procedure, Cholecystectomy and Common Duct Exploration, and Spinal Fusion file posted on the QualityNet Web page at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447*. These specifications provide details on the conditions and services being grouped into the episode and counted in the overall cost of the episode for the SFusion Payment measure.

Comment: Another commenter noted that the North American Spine Society (NASS) expressed concern about the measure. This commenter encouraged CMS to work with applicable parties to select and develop a more accurate and useful measure.

Response: The SFusion Payment measure was developed in collaboration with a team of clinicians with a range of expertise including neurosurgery. For a complete list of the clinical experts whose input considered for these clinical episode-based payment measures, we refer readers to the report available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447*. In addition, all three measures were reviewed by the MAP and will be submitted to NQF for endorsement as part of the next Cost and Resource Use project. We will continue to engage with stakeholders in

soliciting input on ways to refine these measures.

After consideration of the public comments we received, we are finalizing the adoption of the Spinal Fusion Clinical Episode-Based Payment (SFusion Payment) measure to the Hospital IQR Program for the FY 2019 payment determination and subsequent years as proposed.

(5) Exclusion Criteria

For a full list of the MS–DRG, procedure, and diagnosis codes used to identify beneficiaries included in the final cohort for each of the proposed episode-based payment measures, we refer readers to the report entitled, ''Measure Specifications: Hospital Clinical Episode-Based Payment Measures for Aortic Aneurysm Procedure, Cholecystectomy and Common Duct Exploration, and Spinal Fusion'' available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447.*

Episodes for beneficiaries that meet any of the following criteria are excluded from all three measures: (1) Lack of continuous enrollment in Medicare Part A and Part B from 90 days prior to the episode through the end of the episode with traditional Medicare fee-for-service as the primary payer; (2) Death date during episode window; or (3) Enrollment in Medicare Advantage anytime from 90 days prior to the episode through the end of the episode.

In addition, claims that meet any of the following criteria do not trigger, or open, an episode for all three measures: (1) Claims with data coding errors, including missing date of birth or death dates preceding the date of the trigger event; (2) Claims with standardized payment ≤0; (3) Admissions to hospitals that Medicare does not reimburse through the IPPS system (for example, cancer hospitals, critical access hospitals, hospitals in Maryland); or (4) Transfers (by which a transfer is defined based on the claim discharge code) are not considered index admissions. In other words, these cases do not generate new episodes; neither the hospital that transfers a patient to another hospital, nor the receiving hospital will have an index admission or associated admission attributed to them.

(6) Standardization

Standardization, or payment standardization, is the process of adjusting the allowed charge for a Medicare service to facilitate comparisons of resource use across geographic areas. Medicare payments included in these proposed episode-based measures would be standardized according to the standardization methodology previously finalized for the MSPB measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51627). The methodology removes geographic payment differences, such as wage index and geographic practice cost index, incentive payment adjustments, and other add-on payments that support broader Medicare program goals, such as add-on payments for indirect graduate medical education (IME) and add-ons for serving a disproportionate share of uninsured patients.[137]

(7) Risk Adjustment

Risk adjustment uses patient claims history to account for case-mix variation and other factors. The steps used to calculate risk-adjusted payments align with the NQF-endorsed MSPB measure (NQF #2158) method as specified in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51624 through 51626). For more details on the specifications for the risk adjustment employed in the proposed episode-based payment measures, we refer readers to the report entitled, ''Measure Specifications: Hospital Clinical Episode-Based Payment Measures for Aortic Aneurysm Procedure, Cholecystectomy and Common Duct Exploration, and Spinal Fusion'' available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228775614447.*

We did not receive any comments regarding the exclusion criteria for the three clinical episode-based payment measures. We refer readers to our discussions above, where we finalize the three clinical episode-based payment measures as proposed.

b. Adoption of Excess Days in Acute Care After Hospitalization for Pneumonia (PN Excess Days) Measure

(1) Background

Pneumonia is a priority area for outcomes measurement because it is a common condition associated with considerable morbidity, mortality, and healthcare spending. Pneumonia was the third most common principal discharge diagnosis among patients with Medicare in 2011.[138] Pneumonia also accounts for a large fraction of hospitalization costs, and it was the seventh most expensive condition billed to Medicare, accounting for 3.7 percent of the total national costs for all Medicare hospitalizations in 2011.[139]

Some of the costs for pneumonia can be attributed to high acute care utilization for postdischarge pneumonia patients in the form of readmissions, observation stays, and emergency department (ED) visits. Patients admitted for pneumonia have disproportionately high readmission rates, and that readmission rates following discharge for pneumonia are highly variable across hospitals in the United States.[140] [141]

For the previously adopted Hospital IQR Program measure, Hospital 30-Day All-Cause Risk-Standardized Readmission Rate (RSRR) following Pneumonia Hospitalization (NQF #0506) (hereinafter referred to as READM–30–PN) (80 FR 49654 through 49660), publicly reported 30-day risk-standardized readmission rates for pneumonia ranged from 12.9 percent to 24.8 percent for the time period between July 2012 and June 2015.[142] However, during the postdischarge period, patients are not only at risk of requiring readmission. ED visits represent a significant proportion of postdischarge acute care utilization. Two recent studies conducted in patients of all ages have shown that 9.5 percent of patients return to the ED within 30 days of hospital discharge and approximately 12 percent of these patients are discharged from the ED, and thus are not captured by the READM–30–PN Measure.[143] [144]

[137] An overview of payment standardization can be found in the ''CMS Price (Payment) Standardization—Basics'' document available at: *http://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPages%2FQnetTier4&cid=1228772057350.*

[144] Vashi AA, Fox JP, Carr BG, et al.: Use of hospital-based acute care among patients recently

In addition, over the past decade, the use of observation stays has rapidly increased. Specifically, between 2001 and 2008, the use of observation services increased nearly three-fold,[145] and significant variation has been demonstrated in the use of observation services.

Thus, in the context of the previously adopted and publicly reported READM–30–PN measure, the increasing use of ED visits and observation stays has raised concerns that the READM–30–PN measure does not capture the full range of unplanned acute care in the postdischarge period. In particular, some policymakers and stakeholders have expressed concern that high use of observation stays in some cases could replace readmissions, and hospitals with high rates of observation stays in the postdischarge period may therefore have low readmission rates that do not more fully reflect the quality of care.[146]

In response to these concerns, we improved on a previously developed measure, which is not currently part of the Hospital IQR Program measure set, titled, ''30-Day Post-Hospital Pneumonia Discharge Care Transition Composite'' (NQF #0707—NQF endorsement removed). The improved measure entitled Excess Days in Acute Care after Hospitalization for Pneumonia (PN Excess Days) is a risk-adjusted outcome measure for pneumonia that incorporates the full range of acute care use that patients may experience postdischarge: hospital readmissions, observation stays, and ED visits. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25190 through 25192), we proposed this PN Excess Days measure for inclusion in the Hospital IQR Program for the FY 2019 payment determination and subsequent years.

The proposed PN Excess Days measure assesses all-cause acute care utilization for postdischarge pneumonia patients for several reasons. First, from the patient perspective, acute care utilization for any cause is undesirable. It is costly, exposes patients to additional risks of medical care, interferes with work and family care, and imposes significant burden on caregivers. Second, limiting the measure to inpatient utilization may make it susceptible to gaming. Finally, this measure includes all-cause acute care utilization because it is often hard to exclude quality concerns and accountability based on the documented cause of a hospital visit.

Although the original measure was NQF-endorsed, this improved measure has not yet been NQF-endorsed. Section 1886(b)(3)(B)(IX)(bb) of the Act provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. While we considered other existing measures related to care transitions and postdischarge acute care utilization that have been endorsed by NQF or other consensus organizations, we were unable to identify any NQF-endorsed (or other consensus organization endorsed) measures that assess the full range of postdischarge acute care use that patients may experience. Existing process measures capture many important domains of care transitions such as education, medication reconciliation, and follow-up, but all require chart review and manual abstraction. Existing outcome measures are focused entirely on readmissions or complications and do not include observation stays or ED visits. We are not aware of any other measures that assess the quality of transitional care by measuring 30-day risk-standardized days in acute care (hospital readmissions, observation stays, and ED visits) following hospitalization for pneumonia that have been endorsed or adopted by a consensus organization, and we have not found any other feasible and practical measures on this topic. However, we note that this measure has been submitted to NQF for endorsement proceedings as part of the All-Cause Admissions and Readmissions project in January 2016.

The proposed PN Excess Days measure was developed in conjunction with the previously adopted Hospital IQR Program measures, Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction (AMI Excess Days) (80 FR 49690) and Hospital 30-Day Excess Days in Acute Care after Hospitalization for Heart Failure (HF Excess Days) (80 FR 49690). All three measures assess the same outcome and use the same risk-adjustment methodology. They differ only in the target population and the specific risk variables included.

When we finalized the AMI Excess Days and HF Excess Days measures for the FY 2018 payment determination and subsequent years, stakeholders expressed concern about the interaction between Medicare payment policy regarding admissions spanning two midnights and the AMI Excess Days and HF Excess Days measures (80 FR 49686 through 49687). We continue to believe that the ''2-midnight'' policy or any changes to such policy will not influence the outcome of Excess Days in Acute Care measures, as all postdischarge days in acute care are captured whether they are billed as inpatient or outpatient days (80 FR 49686 through 49687).

The proposed PN Excess Days measure (MUC ID 15–391) was included on a publicly available document entitled ''2015 Measures Under Consideration List'' for December 1, 2015 (available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367*) and has been reviewed by the NQF MAP Hospital Workgroup. The measure was conditionally supported pending the examination of SDS factors and NQF review and endorsement of the measure update, as referenced in the MAP 2016 Final Recommendations Report (available at: *http://www.qualityforum.org/map/*).[147] We refer readers to section VIII.A.6.a.(1) of the preamble of this final rule for a discussion of our policy on SDS factors. As stated above, we note that this measure has been submitted to NQF for endorsement proceedings as part of the All-Cause Admissions and Readmissions project in January 2016.

(2) Overview of Measure

The proposed PN Excess Days measure is a risk-standardized outcome measure that compares the number of days that patients, discharged from a hospital for pneumonia, are predicted to spend in acute care across the full spectrum of possible events (hospital readmissions, observation stays, and ED visits) to the days that patients are expected to spend based on their degree of illness as defined using principal diagnosis and comorbidity data from administrative claims.

(3) Data Sources

The proposed PN Excess Days measure is claims-based. It uses Part A and Part B Medicare administrative

discharged from the hospital. *JAMA: the journal of the American Medical Association.* Jan 23 2013;309(4):364–371.

[145] Venkatesh AK GB, Gibson Chambers JJ, Baugh CW, Bohan JS, Schuur JD. Use of Observation Care in US Emergency Departments, 2001 to 2008. *PLoS One.* September 2011;6(9):e24326.

[146] Carlson J. Readmissions are down, but observational-status patients are up and that could skew Medicare numbers. Modern Healthcare. 2013.

[147] Spreadsheet of MAP 2016 Final Recommendations Available at: *http://www.qualityforum.org/map/.*

claims data from Medicare FFS beneficiaries hospitalized for pneumonia. To determine eligibility for inclusion in the measure, we also use Medicare enrollment data. As proposed, the measure would use 3 years of data. For example, for the FY 2019 payment determination, the reporting period would be July 2014 through June 2017.

(4) Outcome

The outcome of the proposed PN Excess Days measure is the excess number of days patients spend in acute care (hospital readmissions, observation stays, and ED visits) per 100 discharges during the first 30 days after discharge from the hospital, relative to the number spent by the same patients discharged from an average hospital. The measure defines days in acute care as days spent: (1) In an ED; (2) admitted to observation status; or (3) admitted as an unplanned readmission for any cause within 30 days from the date of discharge from the index pneumonia hospitalization. Readmission days are calculated as the discharge date minus the admission date. Admissions that extend beyond the 30-day follow-up period are truncated on day 30. Observation days are calculated by the hours in observation, rounded up to the nearest half day. Based on the recommendation of our TEP convened as part of developing this measure, an ED treat-and-release visit is counted as one half day. ED visits are not counted as a full day because the majority of treat-and-release visits last fewer than 12 hours.

''Planned'' readmissions are those planned by providers for anticipated medical treatment or procedures that must be provided in the inpatient setting. This measure excludes planned readmissions using the planned readmission algorithm previously developed for the READM–30–PN measure (78 FR 50786 through 50787). The planned readmission algorithm is a set of criteria for classifying admissions as planned among the general Medicare population using Medicare administrative claims data. The algorithm identifies admissions that are typically planned and may occur within 30 days of discharge from the hospital. The planned readmission algorithm has three fundamental principles: (1) A few specific, limited types of care are always considered planned (transplant surgery, maintenance chemotherapy/immunotherapy, rehabilitation); (2) otherwise, a planned readmission is defined as a non-acute readmission for a scheduled procedure; and (3) admissions for acute illness or for complications of care are never planned. A more detailed discussion of exclusions follows in section VIII.A.7.b.(6) of the preamble of this final rule.

The measure counts all use of acute care occurring in the 30-day postdischarge period. For example, if a patient returns to the ED three times, the measure counts each ED visit as a half-day. Similarly, if a patient has two hospitalizations within 30 days, the days spent in each are counted. We take this approach to capture the full patient experience of need for acute care in the postdischarge period.

(5) Cohort

We defined the eligible cohort using the same criteria as the previously adopted Hospital IQR Program measure, READM–30–PN (80 FR 49654 through 49660). The READM–30–PN cohort criteria are included in a report posted on our Measure Methodology Web page, under the ''Downloads'' section in the ''AMI, HF, PN, COPD, and Stroke Readmission Updates'' zip file on our Web site at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.*

The cohort includes Medicare FFS patients aged 65 years or older: (1) With a principal discharge diagnosis of pneumonia, a principal discharge diagnosis of aspiration pneumonia, or a principal discharge diagnosis of sepsis (not including severe sepsis) who also have a secondary diagnosis of pneumonia present on admission; (2) enrolled in Part A and Part B Medicare for the 12 months prior to the date of admission, and enrolled in Part A during the index admission; (3) who were discharged from a non-Federal acute care hospital; (4) who were not transferred to another acute care facility; and (5) who were alive at discharge.

The measure cohort is also harmonized with the previously adopted Hospital IQR Program measure, the MORT–30–PN measure (80 FR 49837), and the newly adopted refined cohort for the PN Payment measure discussed in section VIII.A.6.a. of the preamble of this final rule.

For the ICD–9–CM and ICD–10–CM codes that define the measure development cohort, we refer readers to the ''Excess Days in Acute Care after Hospitalization for Pneumonia Version 1.0'' in the Pneumonia Excess Days in Acute Care zip file on our Web site at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.*

(6) Exclusion Criteria

The proposed PN Excess Days measure excludes the following admissions from the measure cohort: (1) Hospitalizations without at least 30 days of postdischarge enrollment in Part A and Part B FFS Medicare, because the 30-day outcome cannot be assessed in this group since claims data are used to determine whether a patient was readmitted, was placed under observation, or visited the ED; (2) discharged against medical advice, because providers did not have the opportunity to deliver full care and prepare the patient for discharge; and (3) hospitalizations for patients with an index admission within 30 days of a previous index admission, because additional pneumonia admissions within 30 days are part of the outcome, and we choose not to count a single admission both as an index admission and a readmission for another index admission.

(7) Risk-Adjustment

The proposed PN Excess Days measure adjusts for variables that are clinically relevant and have strong relationships with the outcome. The measure seeks to adjust for case-mix differences among hospitals based on the clinical status of the patient at the time of the index admission. Accordingly, only comorbidities that convey information about the patient at that time or in the 12 months prior, and not complications that arise during the course of the index hospitalization, are included in the risk adjustment. The measure does not adjust for patients' admission source or their discharge disposition (for example, skilled nursing facility) because these factors are associated with the structure of the healthcare system, not solely patients' clinical comorbidities. Patients' admission source and discharge disposition may be influenced by regional differences in the availability of postacute care providers and practice patterns. These regional differences might exert undue influence on results. In addition, patients' admission source and discharge disposition are not audited and are not as reliable as diagnosis codes. The proposed PN Excess Days measure uses the same risk-adjustment variables as the READM–30–PN measure (73 FR 48614).

The outcome is risk adjusted using a two-part random effects model. This statistical model, often referred to as a ''hurdle'' model, accounts for the structure of the data (patients clustered within hospitals) and the observed distribution of the outcome.

Specifically, it models the number of acute care days for each patient as: (1) A probability that they have a non-zero number of days; and (2) a number of days, given that this number is non-zero. The first part is specified as a logit model, and the second part is specified as a Poisson model, with both parts having the same risk-adjustment variables and each part having a random effect. This is an accepted statistical method that explicitly estimates how much of the variation in acute care days is accounted for by patient risk factors, how much by the hospital where the patient is treated, and how much is explained by neither. This model is used to calculate the predicted (including random effects) and expected (assuming random effects are zero) number of days for each patient. The average difference between the predicted and expected number of days for each patient for each hospital is used to construct the risk-standardized Excess Days in Acute Care. For more details about risk-adjustment for this proposed measure, we refer readers to the ''Pneumonia Excess Days in Acute Care'' zip file on our Web site at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.*

(8) Calculating Excess Acute Care Days

The proposed PN Excess Days measure is calculated as the difference between the average of the predicted number of days spent in acute care for patients discharged from each hospital and the average number of days that would have been expected if those patients had been cared for at an average hospital, and then the difference is multiplied by 100 so that the measure result represents PN Excess Days per 100 discharges. We multiply the final measure by 100 to be consistent with the reporting of the previously adopted READM–30–PN measure that is reported as a rate (that is, a 25 percent rate is equivalent to 25 out of 100 discharges) (80 FR 49654 through 49660), as well as the AMI Excess Days (80 FR 49690) and HF Excess Days (80 FR 49685) measures. A positive result indicates that patients spend more days in acute care postdischarge than expected if admitted to an average performing hospital with a similar case mix; a negative result indicates that patients spend fewer days in acute care than expected if admitted to an average performing hospital with a similar case mix. A negative PN Excess Days measure score reflects better quality.

We invited public comment on our proposal to adopt the PN Excess Days measure for the FY 2019 payment determination and subsequent years as described above.

Comment: Several commenters supported the proposed adoption of the PN Excess Days measure. Commenters noted adoption of this measure demonstrates a movement away from the use of clinical process measures and toward outcome measures in quality measurement. Commenters believed that the proposed measure addresses the unintended consequence of shifting patients outside of inpatient care. In addition, one commenter indicated that this measure aligns with the NQS and addresses a condition that is a significant driver of cost for the Medicare program. Lastly, one commenter noted that variation in measure performance resulting in excess days in acute care for pneumonia patients will likely be driven by exacerbation of pneumonia leading to more critical, and potentially preventable conditions, such as sepsis.

Response: We thank the commenters for their support.

Comment: Several commenters did not support the proposed inclusion of the PN Excess Days measure, stating that only measures that have been endorsed by the NQF should be considered for inclusion in the Hospital IQR Program measure set. Commenters encouraged CMS to work collaboratively with stakeholders to ensure that policies allow hospitals to provide the best care for patients in the most appropriate setting as determined by the physician.

Response: As we noted above, section 1886(b)(3)(B)(IX)(bb) of the Act provides that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. While we considered other existing measures related to care transitions and postdischarge acute care utilization that have been endorsed by NQF or other consensus organizations, we were unable to identify any NQF-endorsed (or other consensus organization endorsed) measures that assess the full range of postdischarge acute care use that patients may experience.

Existing process measures capture many important domains of care transitions such as education, medication reconciliation, and follow-up, but all require chart review and manual abstraction. Existing outcome measures are focused entirely on readmissions or complications and do not include observation stays or ED visits. We are not aware of any other measures that assess the quality of transitional care by measuring 30-day risk-standardized days in acute care (hospital readmissions, observation stays, and ED visits) following hospitalization for pneumonia that have been endorsed or adopted by a consensus organization, and we have not found any other feasible and practical measures on this topic. However, we note that this measure has been submitted to NQF for endorsement proceedings as part of the All-Cause Admissions and Readmissions project in January 2016.

Furthermore, the PN Excess Days measure's cohort was reviewed by clinical experts and a TEP and was subject to separate public input prior to being proposed for the Hospital IQR Program. This measure was also included on a publicly available document entitled ''2015 Measures Under Consideration List'' for December 1, 2015 (available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367*) and has been reviewed by the NQF MAP Hospital Workgroup. The measure was conditionally supported pending the examination of SDS factors and NQF review and endorsement of the measure update, as referenced in the MAP 2016 Final Recommendations Report (available at: *http://www.qualityforum.org/map/*).[148] We will continue to work collaboratively with stakeholders in soliciting input on ways to refine this measure in the future.

Comment: Several commenters did not support the inclusion of the proposed measure, noting that the risk-adjustment mechanism does not take SDS factors into consideration.

Response: We refer readers to section VIII.A.6.a.(1) of the preamble of this final rule where we have previously responded to similar comments.

Comment: Some commenters did not support the proposal to adopt the PN Excess Days measure because they believe that the measure addresses outcomes already captured by the current readmission and MSPB measures. One commenter requested more information about how the impact and performance differs from the current readmission measure.

Response: Although the MSPB measure may include similar events, it

[148] Spreadsheet of MAP 2016 Final Recommendations Available at: *http://www.qualityforum.org/map/.*

specifically examines resource use through Medicare payment for all Medicare beneficiaries, whereas the PN Excess Days measure examines excess days in acute care following discharge after hospitalization for pneumonia. The PN Excess Days measure is intended to provide patients and providers a perspective on variation among hospitals in the number of days spent in acute care during the 30-day postdischarge period as compared to what would be expected at an average hospital, in contrast to the MSPB measure which assesses total spending per beneficiary. The MSPB measure also includes spending in non-acute settings such as SNFs, which are not part of the Excess Days outcome. Thus, the Excess Days measure captures a range of specific postdischarge outcomes that are important to patients, such as readmissions, observation stays, and ED visits. The cohort includes Medicare FFS patients aged 65 years or older: (1) With a principal discharge diagnosis of pneumonia, a principal discharge diagnosis of aspiration pneumonia, or a principal discharge diagnosis of sepsis (not including severe sepsis) who also have a secondary diagnosis of pneumonia present on admission; (2) enrolled in Part A and Part B Medicare for the 12 months prior to the date of admission, and enrolled in Part A during the index admission; (3) who were discharged from a non-Federal acute care hospital; (4) who were not transferred to another acute care facility; and (5) who were alive at discharge.

In response to the commenter's request about how performance for the PN Excess Days measure differs from the current readmission measure, we interpret the commenter to be referring to the READM–30–PN measure. That measure and the PN Excess Days measure assess different outcomes. Although both measures count readmission, the READM–30–PN measure only informs a hospital if a patient had a readmission, and does not include all postdischarge outcomes that matter to patients, such as having to return to the ED or spending time in the hospital under observation, like the PN Excess Days measure does. The PN Excess Days measure provides patients a more comprehensive and patient-centered perspective on the 30-day postdischarge experience because it includes not only readmissions, but also ED visits and observation stays and captures the numbers of days in these settings.

Comment: One commenter believed that the proposed PN Excess Days measure would not add additional value and does not address the effects of the ''2-midnight'' policy.

Response: We understand that commenters have concerns about the interaction between Medicare payment policy regarding admissions spanning two midnights and the PN Excess Days measure. The ''2-midnight'' policy provides guidance as to when an inpatient admission is appropriate for payment under Medicare Part A, but does not help beneficiaries to select providers or to understand postdischarge acute care use. The proposed PN Excess Days measure aims to capture all postdischarge acute care days, regardless of whether they are considered outpatient or inpatient. Therefore, the ''2-midnight'' policy or any changes to such policy will not influence the outcome of these measures, as all postdischarge days in acute care are captured whether they are billed as outpatient or inpatient days. When we finalized the AMI Excess Days and HF Excess Days measures for the FY 2018 payment determination and subsequent years, stakeholders expressed concern about the interaction between Medicare payment policy regarding admissions spanning two midnights and the AMI Excess Days and HF Excess Days measures (80 FR 49686 through 49687). We continue to believe that the ''2-midnight'' policy or any changes to such policy will not influence the outcome of Excess Days in Acute Care measures, as all postdischarge days in acute care are captured whether they are billed as inpatient or outpatient days (80 FR 49686 through 49687).

Comment: Several commenters expressed concern that hospitals might be penalized twice for the same readmission, once through the existing readmission measure in Hospital Readmissions Reduction Program and again through the ''excess days'' measure in Hospital VBP Program (if and when the ''excess days'' measures are incorporated into the Hospital VBP Program).

Response: The Hospital VBP Program cannot adopt this measure, as section 1886 (o)(2)(A) of the Act prohibits readmission measures under the Hospital VBP Program. With respect to commenters' expressed concern that hospitals might be penalized twice for the same readmission, since readmission measures cannot be adopted into the Hospital VBP Program, hospitals cannot be penalized through the existing readmission measure in Hospital Readmissions Reduction Program and through the ''excess days'' measure for the same condition in Hospital VBP Program.

For the Hospital IQR Program, the Excess Days measures are calculated using Medicare administrative claims data, and regardless of hospitals' performance on the measures, hospitals would receive credit for submitting the information under the Hospital IQR Program. Therefore, we do not believe hospitals would be penalized twice because they are not being asked to submit additional information and payment will not be adjusted based on performance of this measure. The PN Excess Days measure is not being proposed for use in a pay-for-performance program (such as the Hospital VBP Program), only for use in the pay-for-reporting Hospital IQR Program.

Comment: Some commenters had reservations about the interpretability of the measure score and providers' ability to take meaningful actions that would have an impact on patient outcomes.

Response: We disagree that providers do not have the ability to take meaningful actions that would have an impact on patient outcomes as a result of adopting the PN Excess Days measure. The measure spotlights the excess number of days patients spend in acute care (hospital readmissions, observation stays, and ED visits) per 100 discharges during the first 30 days after discharge from the hospital, relative to the number spent by the same patients discharged from an average hospital. We believe the information provided to hospitals through this measure will help inpatient and outpatient providers better understand the trajectory of care for patients that have been discharged from their facility. Specifically, hospitals will be able to assess whether patients discharged from their facility have readmissions, observation stays, and/or ED visits during the first 30 days after discharge from the hospital. Because the measure provides more granular information regarding patient discharge outcomes, this will assist hospitals in developing targeted quality improvement activities aimed at improving transitions of care. We believe that the measure will reduce readmissions, observation stays, and/or ED visits by encouraging hospitals to further invest in interventions to improve hospital care by better assessing the readiness of patients for discharge and facilitating quality transitions to outpatient status.

Comment: Some commenters suggested that CMS provide hospital-specific, confidential reports to hospitals to allow them to undertake quality improvement efforts, without including the measure in the Hospital

IQR Program or publicly reporting measure data.

Response: We disagree that the measure should not be included in the program or publicly reported as this is an important aspect of quality that addresses the NQS and CMS Quality Strategy priority to promote effective communication and coordination of care that should be measured. Hospitals will have the opportunity to review their data via their hospital-specific reports (HSRs) during the preview period before public reporting of this measure.

Comment: Several commenters did not support the proposal to adopt the PN Excess Days measure due to a lack of clear or consistent evidence to suggest hospitals are using observation stays and ED visits to avoid being penalized for readmissions. Commenters also noted that recent research from ASPE suggests that hospitals are not using observation status as a way to avoid triggering a readmission or to decrease readmission rates.

Response: We understand the commenters' concern regarding the uncertainty of hospitals' use of observation stays in place of readmissions. The development of this measure was not primarily motivated by a concern that hospitals are using ED visits or observation stays to avoid readmission, but rather to provide a more comprehensive perspective on postdischarge events that are important to patients.

Comment: One commenter noted that the PN Excess Days measure does not account for situations when it may be appropriate for a patient to return to the hospital for care. The commenter stated that there are factors beyond the hospitals' control that may contribute to higher excess days. A few commenters did not support the adoption of the proposed PN Excess Days measure because the measure combines readmissions, observation stays, and ED visits into a single number of days, but each of these episodes reflect widely different approaches to patient-centered care and cannot be interpreted from a single number. One commenter expressed concern with the decision to equate the costs and intensity in observation and ED care with that of inpatient care when they are treated differently for payment purposes.

Response: We do not dismiss the importance of hospital-level care and support hospitals using the level of care most appropriate for each particular patient's condition. We agree with the commenter that some returns to the acute care setting are necessary. The goal is not to avoid all postdischarge acute care service utilization, but to identify excess use of acute care postdischarge. Acute care utilization after discharge (that is, return to the ED, observation stay, and readmission), for any reason, is disruptive to patients and caregivers, costly to the healthcare system, and puts patients at additional risk of hospital-acquired infections and complications. Although some factors are outside hospitals' control, when appropriate care transition processes are in place (for example, a patient is discharged to a suitable location, communication occurs between clinicians, medications are correctly reconciled, timely follow-up is arranged), fewer patients return to an acute care setting, whether for an ED visit, observation stay, or hospital readmission during the 30 days postdischarge. Numerous studies have found an association between quality of inpatient or transitional care and early (typically 30-day) readmission rates and ED visits for a wide range of conditions including PN.[149] [150] [151] [152] [153] [154]

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49688), similar concerns were raised for two related measures, AMI and HF Excess Days, around combining readmissions, observations stays, and ED visits into a single number. We believe from a patient perspective, it is the count of total days that is most meaningful and representative of the disruption, which is why we combine day counts for each type of event and do not separately report rates of each type of event. This day count is also valuable for hospitals, because a hospital with a high number of ED visits may still be able to achieve a low number of total days in acute care by actively coordinating care from the ED and avoiding rehospitalizations. The measure combines these three visit types based on the concept that the rate of each type of event is not as relevant to patients as the total days that they spend in acute care settings. Therefore, the PN Excess Days measure provides a broader perspective on postdischarge events than the current READM–30–PN measure and is intended to incentivize improvements in care transitions from the hospital so that patients are less likely to return to the acute setting.

Regarding the commenter's concern with the decision to equate the costs and intensity in observation and ED care with that of inpatient care, we agree that all acute care utilization is not equal in its disruption, cost, or risk to patients. In the PN Excess Days measure, the weight of events (such as observation or ED care) is determined by the intensity of care delivered to patients. Prolonged acute care is more costly and worse from a patient perspective than a brief ED visit. That is why we elected to report the PN Excess Days measure as a count of days: Events lasting longer with more cost and disruption (such as readmissions), therefore, naturally weigh more than brief events (such as ED visits) in the overall day count.

Comment: One commenter specifically disagreed with counting ED visits as half days, because the majority of ED visits last much less time than that.

Response: We appreciate the commenter's concern on considering ED treat-and-release visits as half a day. The average length of stay for a treat-and-release patient from the ED is approximately four hours.[155] [156] Furthermore, based on this information, we received feedback from the TEP advising that we consider a treat-and-release ED visit to be equivalent to one half day. A shorter length of stay may not capture the full burden on the patient to return to the hospital (for example, travel time and lost work time).

Comment: Some commenters expressed concern that ''excess days'' do not represent an actionable or meaningful measure of quality for the provider because more complex patients with comorbidities may require more days in an acute care setting.

Response: We disagree with the commenters' concern that ''excess days'' do not represent an actionable or meaningful measure of quality for the

provider. We have developed the PN Excess Days measure to try to provide important patient-centered information to providers. The measure supports existing hospital incentives to further invest in interventions and tools to improve hospital care, better respond to individual patient preferences, better assess patient readiness for discharge, and facilitate transitions to outpatient status. Such interventions and tools will reduce the likelihood of patients having any return to the hospital and make it more likely that patients who do return have less severe illnesses which may require fewer days of care.

Comment: Some commenters opposed the addition of the PN Excess Days measure, noting that the measure includes a cohort of patients with multiple risk levels and is not a clear indicator of quality.

Response: We understand that hospitals have complex patients with varying comorbidities. Although the cohort may contain patients with different disease severity, and therefore, different levels of risk, the measure accounts for this range of severity and risk because it is risk-adjusted for 41 factors that are clinically relevant and have strong relationships with the outcome of acute care utilization. Furthermore, the measure is intended to help patients and providers understand variations among hospitals in the days that are spent by patients in acute care settings following a discharge for pneumonia. The cohort for the PN Excess Days measure is aligned with the cohort for the READ–30–PN measure. For more details about the risk-adjustment methodology, we refer readers to the ''Excess Days in Acute Care after Hospitalization for Pneumonia Version 1.0'' methodology report in the Pneumonia Excess Days in Acute Care zip file on our Web site at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

The measure's cohort was reviewed by clinical experts and a TEP and was subject to a separate period for public input that was publicly posted on CMS' Public Comment Web site for measures under development, prior to being proposed for the Hospital IQR Program. During measure development, public comment is sought via several avenues of communication. These include: (1) Posting the call for public comment to the CMS Measures Management System (MMS) Web site (*https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/CallforPublicComment.html*); (2) sending emails to stakeholders, including via CMS listservs; and (3) conducting outreach through the Electronic Clinical Quality Improvement (eCQI) Resource Center. These stakeholders agreed with harmonizing the cohort and risk-adjustment model of the PN Excess Days measure with those of the READM–30–PN measure. As a result, we believe this is a clinically coherent cohort. As it is our practice, we will continue to monitor how hospital performance may be influenced by hospital type.

Comment: Commenters expressed concern that no link to measure specifications was provided in the proposed rule.

Response: As noted in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25192), for measure specifications, we refer readers to the ''Excess Days in Acute Care after Hospitalization for Pneumonia Version 1.0'' methodology report in the Pneumonia Excess Days in Acute Care zip file on our Web site at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

After consideration of the public comments we received, we are finalizing the adoption of Excess Days in Acute Care after Hospitalization for Pneumonia (PN Excess Days) measure for the FY 2019 payment determination and subsequent years as proposed.

c. Summary of Previously Adopted and Newly Finalized Hospital IQR Program Measures for the FY 2019 Payment Determination and Subsequent Years

The table below outlines the Hospital IQR Program measure set for the FY 2019 payment determination and subsequent years, and includes both previously adopted measures and measures newly finalized in this final rule. Measures finalized for removal in section VIII.A.3.b. of the preamble of this final rule are not included in this chart.

HOSPITAL IQR PROGRAM MEASURE SET FOR THE FY 2019 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Short name	Measure name	NQF #
	NHSN	
CAUTI	National Healthcare Safety Network (NHSN) Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure.	0138
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure.	1717
CLABSI	National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure.	0139
Colon and Abdominal Hysterectomy SSI.	American College of Surgeons—Centers for Disease Control and Prevention (ACS–CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure.	0753
HCP	Influenza Vaccination Coverage Among Healthcare Personnel	0431
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure.	1716
	Chart-abstracted	
ED–1 *	Median Time from ED Arrival to ED Departure for Admitted ED Patients	0495
ED–2 *	Admit Decision Time to ED Departure Time for Admitted Patients	0497
Imm-2	Influenza Immunization	1659
PC–01 *	Elective Delivery	0469
Sepsis	Severe Sepsis and Septic Shock: Management Bundle (Composite Measure)	0500
VTE–6	Incidence of Potentially Preventable Venous Thromboembolism	(+)

HOSPITAL IQR PROGRAM MEASURE SET FOR THE FY 2019 PAYMENT DETERMINATION AND SUBSEQUENT YEARS—Continued

Short name	Measure name	NQF #
	Claims-based Outcome	
MORT–30–AMI	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0230
MORT–30–CABG	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery.	2558
MORT–30–COPD	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	1893
MORT–30–HF	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Heart Failure (HF) Hospitalization.	0229
MORT–30–PN	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization.	0468
MORT–30–STK	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Ischemic Stroke.	N/A
READM–30–AMI	Hospital 30-Day All-Cause Risk-Standardized Readmission Rate (RSRR) Following Acute Myocardial Infarction (AMI) Hospitalization.	0505
READM–30–CABG	Hospital 30-Day, All-Cause, Unplanned, Risk-Standardized Readmission Rate (RSRR) Following Coronary Artery Bypass Graft (CABG) Surgery.	2515
READM–30–COPD	Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate (RSRR) Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization.	1891

Safe Surgery Checklist	Safe Surgery Checklist Use	N/A

* Measure listed twice, as both chart-abstracted and electronic clinical quality measure.
** Newly finalized measures for the FY 2019 payment determination and for subsequent years.
*** Measure name has been shortened. Please refer to annually updated electronically clinical quality measure specifications on the CMS eCQI Resource Center Page for further information: *https://www.healthit.gov/newsroom/ecqi-resource-center*.
+ NQF endorsement has been removed.

8. Changes to Policies on Reporting of eCQMs

For a discussion of our previously finalized eCQMs and policies, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50807 through 50810; 50811 through 50819), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50241 through 50253; 50256 through 50259; and 50273 through 50276), and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49692 through 49698; and 49704 through 49709).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25194 through 25196), we proposed two changes to our policies with respect to eCQMs reporting to require that hospitals: (1) Submit data for an increased number of eCQMs as further detailed below; and (2) report a full year of data. These proposals were made in conjunction with our proposals discussed in section VIII.A.3.b.(3) of the preamble of this final rule to remove 13 eCQMs from the Hospital IQR Program and proposals discussed in sections VIII.A.10.d. and VIII.E.2.b. of the preamble of this final rule to align requirements for the Hospital IQR and the Medicare and Medicaid EHR Incentive Programs.

In addition, we are clarifying that for three measures (ED–1, ED–2, and PC–01), our previously finalized policy that hospitals must submit a full year of chart-abstracted data on a quarterly basis, regardless of whether data also are submitted electronically, continues to apply.

a. Requirement That Hospitals Report on an Increased Number of eCQMs in the Hospital IQR Program Measure Set for the CY 2017 Reporting Period/FY 2019 Payment Determination and Subsequent Years

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49698), we finalized our policy to require hospitals to submit one quarter of data (either Q3 or Q4) for 4 self-selected eCQMs for the CY 2016 reporting period/FY 2018 payment determination by February 28, 2017. Furthermore, in that final rule (80 FR 49694), we signaled our intent to propose increasing the reporting requirement to 16 eCQMs in future rulemaking. In the proposed rule, we proposed to require reporting of a full calendar year of data for all available eCQMs in the Hospital IQR Program measure set for the CY 2017 reporting period/FY 2019 payment determination and subsequent years.

Requiring hospitals to electronically report a greater number of eCQMs furthers our goal of expanding electronic reporting in the Hospital IQR Program, which we believe will improve patient outcomes by providing more robust data to support quality improvement efforts. As stated above, this proposal is made in conjunction with our proposals discussed in section VIII.A.3.b.(3) of the preamble of this final rule to remove 13 eCQMs from the Hospital IQR Program and proposals discussed in sections VIII.A.10.d. and VIII.E.2.b. of the preamble of this final rule to align requirements for the Hospital IQR and the Medicare and Medicaid EHR Incentive Programs. In addition, as discussed in section VIII.A.3.b.(3) of the preamble of this final rule, we believe that removing certain eCQMs for which the chart-abstracted versions have been determined to be ''topped-out'' will reduce certification burden and implementation hurdles, enabling hospitals to focus efforts on successfully implementing a smaller subset of eCQMs. In the proposed rule, we stated that if our proposals to remove 13 eCQMs in section VIII.A.3.b.(3) of the preamble of the proposed rule were finalized as proposed, hospitals would be required to report on a total 15 eCQMs for the CY 2017 reporting period/FY 2019 payment determination. While the number of required eCQMs would increase as compared to that required for the CY 2016 reporting period/FY 2018 payment determination (that is, from 4 to 15 eCQMs), we believe that a coordinated reduction in the overall number of eCQMs (from 28 to 15 eCQMs) in both the Hospital IQR and Medicare and Medicaid EHR Incentive Programs will reduce certification burden on hospitals and improve the quality of reported data by enabling hospitals to focus on a smaller, more specific subset of eCQMs.

In crafting this proposal, we also considered proposing to require a lesser number of eCQMs—that hospitals submit 8 of the available eCQMs (that is, in other words, 8 of the proposed 15 eCQMs as discussed above) for the CY 2017 reporting period/FY 2019 payment determination. Specifically, hospitals would submit a full calendar year of data on an annual basis for 8 of the available eCQMs whether reporting only for the Hospital IQR Program or if reporting for both the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program for the CY 2017 reporting period/FY 2019 payment determination. Reporting on all eCQMs in the Hospital IQR Program measure set would begin with the CY 2018 reporting period/FY 2020 payment determination and subsequent years.

Ultimately, we chose to propose to require reporting on all the proposed eCQMs for the CY 2017 reporting period/FY 2019 payment determination, because we believe that requiring hospitals to report measures electronically is consistent with our goals to move towards eCQM reporting and to align with the Medicare and

Medicaid EHR Incentive Programs. We believe that the FY 2019 payment determination is the appropriate time to require eCQM reporting because hospitals have had several years to report data electronically for the Medicare and Medicaid EHR Incentive Programs and Hospital IQR Program (3 years of voluntary reporting and 3 years of reporting as part of a pilot). Based upon data collected by CMS, currently, 95 percent of hospitals attest to successful eCQM reporting under the Medicare and Medicaid EHR Incentive Programs.

We invited public comment on our proposal to require hospitals to report on all eCQMs in the Hospital IQR Program measure set beginning with the CY 2017 reporting period/FY 2019 payment determination.

Comment: A few commenters supported the proposed requirement that hospitals report on all eCQMs in the Hospital IQR Program measure set because: (1) The majority of hospitals have attested to having implemented these eCQMs in the Meaningful Use program and many have now had five years of experience; (2) almost all performance related issues in these measures stem from difficulty aligning data sources, which in turn causes clinical workflow and data mapping as the main problems, but fixing these almost always improves the performance scores; (3) CMS will not use these data for payment adjustments and public reporting, which should give eligible hospitals and CAHs some level of comfort; (4) eligible hospitals and their vendors are unlikely to submit any eCQM data electronically on a volunteer basis; (5) CMS needs to have these data for the type of analysis necessary for improvement; and (6) the proposal aligns with the EHR Incentive Program and continues to tie hospital payment to submission of quality data.

Response: We thank the commenters for their support of our original proposal.

Comment: Many commenters supported the concept of electronic reporting but did not support the proposed requirement that hospitals report on all eCQMs in the Hospital IQR Program measure set beginning with the CY 2017 reporting period because they believed the significant increase in number of required eCQMs with such an aggressive timeline would pose an undue burden on hospitals. Commenters raised specific issues such as difficulty making required changes to health IT systems, documentation or utilization of EHRs in much more granular detail than is often necessary for clinical care, and workflow process changes in the short period of time between the publication of this final rule and the beginning of the CY 2017 reporting period. Commenters expressed concern about the significant expenditure of resources that additional required eCQM reporting imposes on hospitals in terms of both staff time and finances. Several commenters did not support the proposed requirement that hospitals report on all eCQMs in the Hospital IQR Program because of concerns about general feasibility, accuracy, validity, and reliability of electronically-submitted measures.

Commenters also expressed concern that the rush to implement the changes necessary to satisfy reporting requirements for an additional nine eCQMs by CY 2017 would result in errors and unreliable, inaccurate data submissions. One commenter noted that the dramatic increase in number of required eCQMs over such a short period of time could cause delays in coding the files and therefore, cause delays in submitting the eCQMs by the established deadline. In addition, the proposed timeline fails to allow sufficient time if problems arise with the Quality Reporting Document Architecture Category I (QRDA I) files and/or pre-submission validation efforts. The commenter requested that CMS consider moving the deadline to a more feasible date such as March 31, 2018 or later. Another commenter expressed concern that hospitals currently are struggling with the degree of technical difficulty involved in extracting the measures from their EHRs and noted that hospitals have had limited experience with eCQM submission (the first required transmission of four measures is not until the third or fourth quarter of CY 2016). The commenter urged CMS to reconsider expansion of this requirement until a review of the CY 2016 transmission results has been completed and hospitals have received feedback.

Several commenters suggested that CMS consider amending the proposal to require an addition of 2 to 4 eCQMs required for a total of 6 to 8, for the CY 2017 reporting period. One commenter recommended that CMS reduce the proposed requirement to report on 8 eCQMs. Other commenters requested that CMS retain the current requirement of 4 eCQMs until hospitals have successfully operationalized reporting complete and accurate data on existing required eCQMs before adding new measures.

Response: We appreciate commenters sharing their concerns about the challenges associated with eCQM reporting, including the significant expenditure of resources required to make necessary changes to health IT systems, documentation or utilization of EHRs, and workflow process changes and acknowledge commenters' feedback that many hospitals may not be ready to successfully report on all of the available eCQMs beginning with the CY 2017 reporting period/FY 2019 payment determination. In response to commenter concerns that the proposed timeline fails to allow sufficient time if problems arise with the QRDA I files and/or pre-submission validation efforts, that we should push back the deadline, and that hospitals have had limited experience with eCQM submission, we disagree. Hospitals have had several years to report data electronically for the Medicare and Medicaid EHR Incentive Programs and Hospital IQR Program (3 years of voluntary reporting and 3 years of reporting as part of a pilot).

More specifically, previously we have requested electronic QRDA I submission. As described in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50905), electronic reporting pilots for the EHR Incentive Program from 2012 and 2013 included electronic reporting using the QRDA I file format. Further, in that same rule, we encouraged the use of QRDA I files since we finalized a proposal that would allow hospitals to begin voluntarily reporting eCQMs (78 FR 50817 through 50818). Therefore, we believe that hospitals have had adequate time to understand and correct any processing issues that may arise during data submission and we believe that the CY 2017 reporting period/FY 2019 payment determination is the appropriate time to require additional eCQM reporting. Delaying the implementation of electronic reporting would hinder our efforts to validate, and thereby improve the reliability and validity of electronic data.

We believe that increasing the requirements for hospitals to report measures electronically is consistent with our goal to make progress towards eventual reporting on all eCQMs in the Hospital IQR Program, but we also appreciate commenters' feedback to continue to do so in a stepwise manner. We believe that retaining the reporting requirements previously established for the CY 2016 reporting period/FY 2018 payment determination (that is, require reporting on 4 eCQMs) would not help in this improvement approach.

We believe that increasing the number of required eCQMs to be reported from 4, as currently required, but requiring a lesser number of eCQMs than originally proposed (that is, all available eCQMs)

would continue to allow hospitals flexibility and choice in reporting eCQMs, while still furthering our goal of moving towards full implementation of reporting on all eCQMs in a stepwise manner while being responsive to hospitals' concerns about timing, readiness, and burden associated with the increased number of measures required to be reported. However, we note that it is still our intent to require reporting on all eCQMs in the Hospital IQR Program in the near future. We believe that reducing the required number of eCQMs from all, as proposed, to 8 for the CY 2017 and CY 2018 reporting periods balances hospitals' request to have more time to improve and refine their eCQM reporting capabilities, including to address challenges such as data mapping issues, while still furthering CMS' goals to expand electronic data reporting and validation.

In determining the number 8, we considered that reporting of 8 eCQMs is about midway between the current required reporting of 4 eCQMs and the proposed required reporting of all 15 eCQMs. We note that hospitals have had several years to report data electronically for the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program (3 prior years of pilot reporting and 3 prior years of voluntary reporting). In addition, because 95 percent of hospitals currently attest to successful eCQM reporting under the EHR Incentive Program, we believe that the majority of hospitals should be ready to successfully report on more than 4 eCQMs beginning with the CY 2017 reporting period/FY 2019 payment determination. We believe that only requiring 6 eCQMs (only 2 more than already required) as suggested by some commenters, does not adequately advance our goal of moving toward requiring all eCQMs in the near future. We must balance the importance of keeping pace with evolving electronic standards and the timing cycle for the regulatory adoption of standards when adopting policies for the Hospital IQR Program.

As described in section VIII.A.11.b.(3) of the preamble of this final rule, we intend to address concerns about the reliability of electronic data through validation. In order to be able to effectively validate eCQM data, we need to continuously assess more data. Moreover, we believe that it is appropriate to require reporting and validation of eCQMs given that measures available now and those being developed for the future are increasingly based on electronic standards (80 FR 49696). Lastly, requiring 8 eCQMs promotes alignment between the Hospital IQR Program measure set and the Medicare and Medicaid EHR Incentive Programs.

Therefore, after consideration of the public comments we received, we are finalizing a modified version of our proposal. Instead of requiring hospitals to report on all eCQMs in the Hospital IQR Program measure set beginning with the CY 2017 reporting period/FY 2019 payment determination, we are finalizing a policy to require submission of 8 self-selected eCQMs out of the available eCQMs in the Hospital IQR Program for the CY 2017 reporting period/FY 2019 payment determination and CY 2018 reporting period/FY 2020 payment determination. In other words, hospitals would submit a full calendar year (that is, 4 quarters) of data by an annual submission deadline for 8 of the available eCQMs whether reporting only for the Hospital IQR Program or if reporting for both the Hospital IQR Program and the Medicare and Medicaid EHR Incentive Programs for both the FY 2019 and 2020 payment determinations. We intend to determine requirements for beyond the FY 2020 payment determination in future rulemaking.

Although we are not finalizing our original proposal to require reporting on all eCQMs, we encourage hospitals to continue refining their electronic reporting implementation activities to successfully achieve electronic data capture and reporting despite mapping and integration issues or to work with their vendors to do so. In addition, we encourage early testing and the use of presubmission testing tools to reduce errors and inaccurate data submissions in eCQM reporting. As time passes, we expect that hospitals will continue to build and refine their EHR systems and gain more familiarity with reporting eCQM data, resulting in more accurate data submissions with fewer errors. We believe that the best way to encourage hospitals to invest in improving their EHR systems is by requiring reporting of additional eCQMs.

Comment: Some commenters recommended that CMS increase its education and outreach efforts to help hospitals better prepare for eCQM reporting. Other commenters recommended that CMS continue outreach to EHR vendors, hospital quality staff, and other affected stakeholders to identify and address structural problems prior to increasing the number of required eCQMs. Further, the commenter requested that CMS take into consideration the factors associated with difficulties in eCQM reporting, such as new software, changes to workflows, training staff, and testing, that may require additional time to vet as a means of ensuring hospital readiness.

Response: As we move forward with advancing electronic submission of quality measures and eCQM validation, we will bolster our education and outreach efforts and ensure that all affected stakeholders have the opportunity to provide feedback on the implementation of eCQM reporting. We will continue to share these results in education and outreach to hospitals. We will also consider the issues associated with new software, workflow changes, training, et cetera as we continue to improve our education and outreach efforts for eCQM submission and validation.

Comment: A few commenters did not support required reporting of any eCQMs in the Hospital IQR Program measure set because of challenges associated with eCQM reporting. Some commenters noted that the infrastructure and reporting functionality for eCQMs are not mature enough to facilitate mandatory electronic reporting for hospitals. Other commenters indicated that EHR vendors are not prepared for the functional and operational demands of an increase in eCQM reporting. A few commenters urged CMS to reach out to EHR vendors and other stakeholders to identify underlying structural problems and barriers to successful reporting on these measures. One commenter stated that the increase in required eCQMs may jeopardize hospitals' efforts to meet the current requirements, as vendors are not prepared to handle providers' requests to augment their eCQMs on an annual basis. Further, this commenter urged CMS to align vendors and providers requiring vendors to support all eCQMs in certified EHR products that are required by CMS. A few commenters expressed concern about the role of the EHR vendors, not the hospitals, in using the correct version of specifications.

Another commenter expressed the opinion that although eCQMs are supposed to reduce provider burden for quality reporting, in reality they increase provider burden by disrupting workflow and requiring providers to document detailed information in structured fields which may not appropriately reflect the clinical situation, while negatively impacting the quality of the data being reported. The commenter urged CMS to set standards for EHR vendors to ensure the EHR is structured in a way that fits in with the clinical work flow to restore focus to patient-centered care that

promotes high quality outcomes and lower costs. One commenter also noted that the eCQM specifications have serious flaws that prove challenging with current clinical workflows, given how EHRs track orders and documentation and in some cases the measure specifications do not accurately measure the quality of care delivered, absent the development of manual workarounds that divert time and resources from patient care. These commenters recommended delaying any mandatory reporting of eCQMs until these concerns are resolved.

Response: We thank the commenters for their recommendations but note that we believe requiring electronic reporting aligns with CMS and HHS policy goals to promote quality through performance measurement and that in the intermediate- to long-term, electronic reporting will both improve the accuracy of the data and reduce reporting burden for providers. Our focus is to improve hospital quality. However, we encourage hospitals that retain vendors to work closely together to ensure that a contract is in place which supports the hospital's quality reporting requirements and the annual update of quality measures. We believe that vendor retention would help to alleviate some of the concerns associated with the infrastructure and reporting functionality for eCQMs as expressed by some commenters.

When hospitals work with their vendors to ensure that EHRs are appropriately structured in a way that fits in with the clinical work flow to yield reliable data through eCQMs, we believe that eCQMs promote high quality outcomes and lower costs while ultimately decrease reporting burden on hospitals.

In response to commenters' concerns that EHR vendors are not prepared for the functional and operational demands of an increase in eCQM reporting, we note that hospitals have had several years to report data electronically for the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program (3 years of pilot reporting and 3 years of voluntary reporting). As stated previously, 95 percent of hospitals attest to successful electronic clinical reporting under the Medicare EHR Incentive program. We thank commenters for their suggestion to reach out to EHR vendors and other stakeholders to identify underlying structural problems and barriers to successful reporting on these measures, and we will continue to work with stakeholders to overcome barriers to successful eCQM reporting.

We appreciate the commenter's concern that an increase in required eCQMs may jeopardize hospitals' efforts to meet the current requirements, as vendors are not prepared to handle providers' requests to augment their eCQMs on an annual basis, but we believe that our finalized policy requiring a lesser number of eCQMs than originally proposed (that is, all available eCQMs) provides hospitals with sufficient time to augment their eCQMs and satisfy electronic reporting requirements. We will take the commenter's note about the alignment of vendors and their concern about the role of the EHR vendors, not the hospitals, in using the correct version of specifications, into account as we work to improve our education and outreach efforts.

In response to concerns about the burden and difficulty with technical mapping, we recognize that technical mapping may initially be burdensome for some hospitals, however, we believe that the efforts to properly map data elements to structured data fields will be beneficial in both improved accuracy of the data reported and reduced reporting burden in the intermediate- to long-term. In addition, we believe that if hospitals and EHR vendors and health IT developers continue to refine EHR systems to appropriately structure them commensurate with the clinical work flow, this will lead to improved accuracy, reliability, and completeness of the eCQM data, which will promote high quality outcomes and lower costs while ultimately decreasing reporting burden on hospitals as compared with chart-abstraction of quality measure data.

Finally, we refer readers to our modified final policy to only require 8 eCQMs as discussed above. We believe this policy balances the burden on hospitals and vendors with our policy goal to move towards increased electronic reporting. In addition, as we describe in section VIII.A.11.b.(3) of the preamble of this final rule, we are modifying our validation process to include electronic clinical quality measures. The implementation of eCQM data validation will be able to better reconcile the observed measure specification issues.

Comment: A few commenters expressed concern that requiring reporting on all available eCQMs would require facilities to provide data for measures that reflect services they do not provide. Commenters acknowledged the ''zero denominator'' reporting option, but maintained that reporting a zero denominator would still place undue burden on facilities. One commenter stated that the increase in reporting would force facilities to implement new builds, new workflows, and could potentially have to do substantial rework with the Clinical Quality Language (CQL) [157] implementation for measures not previously reported. A few commenters asked for clarification about whether they would be required to submit eCQM data for PC–05 and CAC–3 since they have not previously submitted data on these measures.

One commenter requested that CMS increase the minimum case exemption threshold for eCQMs because it is difficult to implement eCQMs when there are low benefits to the hospital due to small patient populations. Another commenter expressed the opinion that reporting on an increased number of eCQMs has no direct correlation to improvement in quality because there are instances where a facility would be required to report on an eCQM that refers to care that is not provided at that hospital. Some commenters suggested that reporting for all of the available eCQMs should not be mandatory and that hospitals should be allowed to select which specific eCQMs to report on to ensure the information captured would prove meaningful.

Response: We acknowledge the commenters' concern with small patient populations and will explore the minimum case exemption threshold for eCQMs as we continue to evolve our electronic reporting requirements in future rulemaking. We currently allow hospitals to enter a value of zero to demonstrate that they had no clinical cases. We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50323 through 50324) where we discuss the details of our requirements for the minimum exemption threshold. As previously stated in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49695), for the CY 2017 reporting period/FY 2019 payment determination and CY 2018 reporting period/FY 2020 payment determination, utilization of the zero denominator declaration and case threshold exemptions are considered as part of the criteria for successful submissions when reporting eCQMs for the to the Hospital IQR and Medicare and Medicaid EHR Incentive Programs. Therefore, we do not believe any undue

[157] Clinical Quality Language (CQL) is an HL7 draft standard that is part of the effort to harmonize standards between electronic clinical quality measures (eCQMs) and clinical decision support (CDS). CQL provides the ability to express computer logic that is human readable yet structured enough for processing a query electronically. More information is available at the eCQI Resource Center at: *https://ecqi.healthit.gov/cql.*

burden will be placed on hospitals that elect to utilize this declaration, as it is a policy that has been in place for 2 calendar years of reporting. The submission of zero denominator declarations and case threshold exemptions for the CY 2016 reporting period continues to be completed through the QualityNet Secure Portal.

Further, as we learn more through eCQM validation, we intend to publicly report the eCQM data results so that hospitals that do not provide care for certain populations will be able to benchmark (evaluate by comparison with results provided by hospitals that do provide care for those populations) data. We understand the importance of having accurate measure data, however, the only way to readily identify issues is to review more data. We believe that our finalized policy to require submission of only 8 eCQMs serves to incrementally increase electronic reporting, as suggested by commenters, while also allowing us to collect data derived from EHRs to further our plans for electronic data collection and validation. In addition, the finalized policy to require submission of 8 eCQMs allows hospitals the flexibility to select the eCQMs that are least burdensome and do not require new builds, new workflows, or rework with the CQL implementation for measures not previously reported. Implementation of any new measure not previously reported will impose some additional burden, but our finalized policy enables hospitals to choose and prioritize which eCQMs to build into their systems in the order most convenient for their particular circumstances and case mix. Moreover, allowing hospitals to select 8 eCQMs addresses the commenter's concern that reporting on an increased number of eCQMs has no direct correlation to improvement in quality because there would not be instances where a facility would be required to report on an eCQM that refers to care that is not provided at that hospital; hospitals have the option of reporting those eCQMs that are most relevant to their patient population to ensure that information captured proves meaningful. We refer readers to section VIII.A.8.a. of the preamble of this final rule for details about our finalized policy to require submission of only 8 eCQMs.

Comment: Some commenters stated that requiring hospitals to collect electronic data for measures that still have flawed specifications is inefficient and burdensome.

Response: We disagree that specifications are flawed and encourage hospitals to work with vendors to gain experience with the eCQM specifications and how to fully integrate them into their EHRs. We believe that our modified policy to require submission of 8 self-selected eCQMs out of the available eCQMs in the Hospital IQR Program provides hospitals flexibility to select eCQMs for which they have familiarity with the technical specifications and for services they do provide.

Comment: One commenter cited difficulty manipulating the reporting Structured Query Language (SQL), obscure or unnecessary measure data points, the redundancy of the measure data points, and the bottleneck created by the role of EHR vendors and developers in the reporting workflow. Specifically, the commenter stated that modifications of the SQL require the acquisition of professionals with specialized skills in the functionality and utility of CEHRT, a strong working knowledge of programming and an understanding of the eCQM process. The commenter asserted that highly-skilled professionals are expensive to acquire and difficult to retain within hospitals.

Response: In response to the commenter that cited difficulty manipulating the reporting SQL, obscure or unnecessary measure data points, the redundancy of the measure data points, and the bottleneck created by the role of CEHRT vendors in the reporting workflow, we believe that increased reporting would help to mature workflows, and over time, mitigate some, if not all, of these additional concerns. We acknowledge the commenter's assertion that highly-skilled professionals are expensive to acquire and difficult to retain within hospitals, however, we believe that as more professionals gain knowledge, training, and experience with electronic standards and reporting and fill this need in the labor market, this challenge will be reduced. In addition, we encourage hospitals to work with and retain their vendors to fulfill their EHR system needs. When hospitals work more closely with their vendors to ensure that EHRs are appropriately structured in a way that fits in with the clinical work flow to yield reliable data through eCQMs, we believe that eCQMs promote high quality outcomes and lower costs while ultimately decrease reporting burden on hospitals. We encourage hospitals to be educated about the existing practices, while still reserving the right to establish protocols that most accurately and efficiently support their clinical workflow.

Comment: One commenter stated that the best practice guidelines released by the EHR vendor or developer often require use of EHR functions or physician documentation in a much more granular detail than is often necessary for clinical care.

Response: We disagree that the best practice guidelines released by the CEHRT vendor require physician documentation or utilization of EHR sections in a much more detailed manner than is necessary for clinical care. We believe that detailed documentation of care provided in EHRs will help bolster the clinical care that is offered and will provide information that is invaluable for quality reporting programs to facilitate better patient outcomes.

Comment: One commenter recommended that CMS develop a system or strategy for notification of eCQMs likely to be retired in the next 12 to 24 months as well as a system or strategy that alerts hospitals about eCQMs that are being considered for addition to the Hospital IQR Program in the next 2 years. Another commenter requested that CMS provide a 2-year lead time prior to eCQM requirements because it takes significant time to implement these measures.

Response: We appreciate the commenter's recommendation to notify hospitals of eCQMs likely to be retired as well as eCQMs that are being considered for addition to the Hospital IQR Program in the next 2 years. We intend to continue using the rulemaking process with notice and comment period to establish and communicate timelines for implementation, as well as to remove and adopt new measures. In response to commenters' request for more advance notice as to eCQM reporting requirements, in this final rule we are finalizing a modification from our proposal with requirements for both the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determination. We note that in the FY 2016 IPPS/LTCH PPS final rule, we signaled our intent to increase the number of eCQMs required for reporting (80 FR 49693 through 49698) and to remove 13 eCQMs (80 FR 49644 through 49645) in future rulemaking. We also noted in that rule (80 FR 49698 through 49704) that we would consider alternative measure types (hybrid measures) in future rulemaking.

Further, in section VIII.A.9.c. of the preamble of this final rule, we discuss future considerations of behavioral health measures, some of which could potentially be developed as eCQMs in the future. We also refer readers to the Hospital OQR Program discussion in the FY 2017 OPPS/ASC PPS proposed rule

(81 FR 45721) for additional discussion of possible future eCQMs that are under development for the outpatient hospital setting. In addition to using the rulemaking process, we will continue to provide ongoing education and outreach to stakeholders through Special Open Door Forums (information available at: *https://www.cms.gov/outreach-and-education/outreach/opendoorforums/ODFspecialODF.html*) and periodic training sessions. In addition, stakeholders may learn about and provide feedback on newly developed eCQMs during the measure development process, the NQF public comment period, and/or the MAP's pre-rulemaking public comment period.

Comment: One commenter suggested that AMI–8a not be included among the required eCQMs because it is not discrete data.

Response: While we acknowledge that there may be challenges associated with electronic reporting of AMI–8a due to the non-discrete data which could pose collection issues because the values are spread over a range of data points, we do not believe these challenges warrant removal of the measure from the Hospital IQR Program at this time. As stated in section VIII.10.d.(2) of the preamble of this final rule, hospitals may continue to either use abstraction or pull the data from non-certified sources in order to then input these data into CEHRT for capture and reporting QRDA I. We recognize and support the use of third-party vendors to assist in data submission in required formats as needed to reduce burden on hospitals.

Comment: One commenter recommended that CMS launch an effort to develop a clinical quality measurement infrastructure necessary to transition federal pay-for-performance programs into utilizing both process improvement measurement and outcomes measurement derived from CEHRT to alleviate the reporting burden associated with collecting data from different parts of the EHR enterprise. Another commenter recommended that CMS include measures for which critical data elements are entered directly into the CEHRT or can be obtained through provider financial systems flowing to the CEHRT to minimize the need for data abstracted from non-certified systems which necessitates double data entry by providers. Further, one commenter believed that redundant structured data points require a duplication of work efforts.

Response: We thank the commenters for their suggestions. As we have previously stated, we believe that reporting measures as eCQMs is valuable and we are working to refine the eCQM measure set in the Hospital IQR and Medicare and Medicaid EHR Incentive Programs, as well as to develop and adopt eCQMs for other quality reporting programs, with the longer-term goal of using eCQMs for value-based purchasing programs. We continuously strive to develop strategies and systems to facilitate fully transitioning to eCQMs across providers and programs in a way that minimizes reporting burdens for hospitals and increases the validity of the data.

Comment: One commenter expressed concern that the proposed list of eCQMs does not allow for comparison with chart-abstracted measures and suggested that there should be greater overlap between eCQMs and chart-abstracted measures. Other commenters expressed concern that eCQM data submission to CMS has not been fully tested at this point and recommended that expanding the required number of eCQMs should be delayed until there has been successful transmission of data. Until EHR standards are better structured to yield reliable data through eCQMs, one commenter urged CMS to defer to chart abstraction so that the clinical team can focus on quality care and the abstractors can abstract and report high quality data without diverting the attention of the clinical team from patient care to documentation and quality reporting.

Response: As described in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50258), we have received anecdotal comments about performance level differences between chart-abstracted and eCQM data. We do not have sufficient data to be able to confirm or refute the accuracy of those comments (79 FR 50258). In order to substantiate or refute the existence of performance-level differences between eCQM data and chart-abstracted measure data, we believe that we must collect more eCQM data and develop a process for validating the accuracy of that data. We believe that adopting an eCQM validation process in the Hospital IQR Program, as discussed in section VIII.11.b. of the preamble of this final rule and analyzing the results from eCQM data validation, beginning with an analysis of CY 2016 reported data, will allow us to examine concerns about the accuracy of eCQM data so that we may begin publicly reporting eCQM data in future years.

Comment: One commenter requested clarification about when eCQM data will be made publicly available. Several commenters explicitly supported CMS' decision to continue to not publicly report eCQM data until the data are verified and reliable, noting that one quarter's worth of data would not provide a statistically valid sample from which to assess a hospital's performance and that it would be premature to report these data due to challenges associated with reliability and validity. Another commenter specifically recommended that the data collected by eCQMs not be publicly reported on *Hospital Compare* until electronic reporting improves and benchmarks are freely available.

One commenter made the following recommendations with respect to future public reporting of eCQM data: (1) One year prior to the proposed inclusion year, the eCQM should be announced in the proposed rule for the following year, with the opportunity for public comments; (2) in the first year, data should be reported to CMS to assure validity and plausibility, but not publicly reported; and (3) assuming that year one results are demonstrated to be valid and plausible, the data should be collected and reported publicly in year two and subsequent years. In addition, this commenter recommended that CMS provide additional education about how to interpret the publicly reported data because publicly reported scores can be confusing to consumers.

Response: We thank the commenters for their support. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50815 through 50818), we adopted a policy under which we would only publicly report eCQM data in the Hospital IQR Program if we deem that the data are accurate enough to be publicly reported (78 FR 50816). We believe that our current policy to delay public reporting of eCQM data submitted by hospitals for the CY 2017 reporting period/FY 2019 payment determination in conjunction with the adoption of an eCQM validation process in this final rule is consistent with our stated policy on eCQM public reporting.

We agree with the commenters that suggested we implement a quality process to ensure that eCQMs are accurate, which is why we are finalizing our proposal to examine electronic measures through our validation process and refer readers to section VIII.A.11.b.(3) of the preamble of this final rule for more details. We believe that implementing an eCQM validation process in the Hospital IQR Program and analyzing the results from eCQM data validation, beginning with an analysis of CY 2017 reported data, will allow us to examine concerns about the accuracy of eCQM data so that we may begin publicly reporting eCQM data in the future.

With respect to the commenter's suggestions about future public reporting of eCQM data, we will take

these recommendations into account as we continue to develop and refine our electronic reporting policies.

Comment: One commenter requested clarification on the meaning of ''all available eCQMs.'' The commenter asked if the term refers to submitting all the 2017 eCQMs in 2017, submitting all the 2017 eCQMs applicable to their patient populations, or only submitting the 2017 eCQMs currently built in their CEHRT systems. The commenter noted that if ''all available eCQMs'' means all available for 2017 (and not what is available in the current EHR build), hospitals will be required to reengage their vendors to allocate valuable HIT resources currently focused on complying with the new 2016 IPPS electronic submission requirements and timeline.

Response: We define the term ''all available eCQMs'' to mean all of the eCQMs included in the Hospital IQR Program measure set at the beginning of CY 2017 for the FY 2019 payment determination. We recognize the challenges associated with eCQM reporting and encourage hospitals to continue refining their electronic reporting implementation activities to successfully achieve electronic data capture and reporting despite mapping and integration issues or work with their vendors to do so. However, instead of requiring all available eCQMs as proposed, we are only requiring 8 eCQMs and refer readers to our final policy for eCQMs as discussed above.

Comment: Several commenters expressed concern that hospitals unable to submit eCQMs would be penalized under the Medicare EHR Incentive Program in addition to the Hospital IQR Program. The commenters believed that a provider that is unable to submit eCQM data should only be penalized under the Medicare EHR Incentive Program and not by both programs.

Response: We disagree that the requirements for electronic reporting in the Hospital IQR Program duplicates penalties. In an effort to align with the Medicare and Medicaid EHR Incentive Programs, we have specified that hospitals meeting electronic reporting requirements for the Hospital IQR Program will be considered to have successfully reported the eCQM requirement to the Medicare and Medicaid EHR Incentive Programs as well. In addition, we note that our data show that 95 percent of hospitals already attest to successful eCQM reporting under the EHR Incentive Program and, accordingly, we believe that the majority of hospitals will be able to successfully report eCQMs, meeting both the Medicare and Medicaid EHR Incentive Programs' CQM reporting requirements and the Hospital IQR Program requirements. Finally, for hospitals that find they are unable to meet the eCQM submission deadline and meet our criteria for an eCQM-related Extraordinary Circumstances Extension/Exemption (ECE), we note that we are adopting our proposal to extend the deadline for requesting an eCQM-related ECE to April 1 following the end of the reporting calendar year, as discussed in section VIII.A.15.b. of the preamble of this final rule.

Comment: One commenter supported CMS' efforts to align the Hospital IQR Program with the EHR Incentive Programs but did not support the proposed requirement that hospitals report on all eCQMs in the Hospital IQR Program measure set because providers invest considerable resources to revise and validate the eCQMs and face the following challenges: (1) Consistent with findings of CMS' eCQM validation pilot, significant discrepancies between manually abstracted measures and eCQMs; (2) eCQM vendor tools are not able to generate accurate measure results because EHRs were not designed to capture data elements required for eCQM reporting during the course of care requiring clinical staff to enter data in multiple places to ensure the data are available for eCQM reporting; and (3) hospitals with multiple vendor systems across clinical departments have encountered difficulty ensuring these disparate systems are interfacing appropriately with quality measure systems and appropriately mapping data fields in order to generate the required QRDA I files for submission to CMS. The commenter observed that as a result of these challenges, hospitals have not had an opportunity to strategically refine their systems to capture the necessary data elements and conduct the requisite testing. The commenter urged CMS to continue the 2016 reporting requirements in 2017 to give hospitals time to thoughtfully modify their internal processes in concert with their vendors to improve eCQM reporting.

Response: We thank the commenter for this support. As described in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50258), we have received anecdotal comments about performance level differences between chart-abstracted and eCQM data. We stated that we did not have sufficient data to be able to confirm or refute the accuracy of those comments (79 FR 50258). In order to substantiate or refute the existence of performance-level differences between eCQM data and chart-abstracted measure data, we believe that we must collect more eCQM data and develop a process for validating the accuracy of that data. Further, the 2015 eCQM Validation Pilot did not compare manual chart-abstracted data to eCQM data, rather, the data elements for validation were derived from the hospitals' EHR. We received many comments that suggested we implement a quality process to ensure that eCQMs are accurate, which is why we are finalizing our proposal to implement an eCQM validation process in section VIII.A.11.b of the preamble of this final rule. We believe analysis of results from eCQM data validation will serve to alleviate concerns about the accuracy of eCQM data so that we may begin publicly reporting eCQM data in future years. We recognize the challenges associated with electronic reporting and encourage hospitals to work with their vendors to achieve electronic capture and reporting despite mapping and integration issues.

As stated above, we believe that the best way to encourage hospitals to invest in improving their EHR systems is by requiring reporting of additional eCQMs. Consequently, we believe that retaining the reporting requirements from FY 2016 would not help in this improvement approach. However, as previously stated, we are modifying our proposal to finalize requirement of 8 eCQMs in direct response to commenters' suggestions that we incrementally increasing the reporting requirements. Lastly, we believe that our finalized policy to require the submission of only 8 eCQMs for the CY 2017 and CY 2018 reporting periods, which provides an additional full year for refining reporting capabilities on 8 eCQMs, will provide hospitals adequate time to address mapping issues.

Comment: Some commenters questioned whether the proposal to increase the number of required eCQMs for reporting functions to promote better quality care. The commenters expressed the opinion that this proposal seems to drive a particular data collection mechanism, and while they supported the continued use of EHRs to collect meaningful data, they are concerned about the feasibility and accuracy of eCQMs.

Response: While we appreciate the commenter's concern about whether an increase in the number of eCQMs will promote better quality of care, we believe that if hospitals and EHR vendors continue to refine EHR systems to appropriately structure them commensurate with the clinical work flow, this will lead to improved accuracy, reliability, and completeness

of the eCQM data, which will promote higher quality outcomes and lower costs while ultimately decreasing reporting burden on hospitals as compared with chart-abstraction for quality measure data. We note that 2015 is not the first year CMS has requested eCQM data submission. As described in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50905), electronic reporting pilots for the EHR Incentive Program from 2012 and 2013 included eCQM reporting. We understand the importance of having feasible and accurate measure data, however, the only way that we will be able to readily identify issues is to assess more data. We believe that our policy to only require submission of 8 eCQMs serves to incrementally increase electronic reporting, as suggested by commenters, while also allowing us to collect data derived from EHRs to further our plans for electronic data collection and validation. Moreover, we believe that it is appropriate to require reporting and validation of eCQMs because measures available now and those being developed for the future are increasingly based on electronic standards (80 FR 49696).

Comment: A few commenters recommended that CMS maintain the current eCQM reporting requirement and allow hospitals to voluntarily report on additional eCQMs. The commenter stated that this approach would allow more time for the reconciliation and upgrading of the resources necessary (that is, EHRs) to handle additional measure specifications. One commenter suggested requiring a smaller number of eCQMs, specifically, the following six measures: CAC–3—Pediatric Asthma—Home Management Plan of Care Given to Patient/Caregiver; ED–1—Median Time from ED Arrival to ED Departure for Admitted ED Patients; ED–2—Admit Decision time to ED departure Time for Admitted Patients; EHDI–1a—Newborn Hearing Screening Prior to Discharge; PC–01—Early Elective Delivery; PC–05—Exclusive Breastfeeding.

Response: We appreciate the commenters' recommendation to maintain the current eCQM reporting requirement and allow hospitals to voluntarily report on additional eCQMs, however hospitals have already had 3 years to voluntarily report on eCQMs. As stated above, we believe that mandatory reporting is necessary to advance our policy goal to move facilities towards reporting electronic measures. In response to overwhelming concern about the issues related to the proposal to require reporting on all available eCQMs, we direct the commenter to our finalized policy to require submission of 8 eCQMs, described in section VIII.A.8.a. of the preamble to this final rule. Rather than requiring hospitals to report on particular eCQMs, as suggested by one commenter, we hope that allowing hospitals to self-select 8 eCQMs based upon their own patient mix and consistent with internal quality improvement efforts will increase flexibility and reduce burden.

After consideration of the public comments we received, we are finalizing a modified version of our proposal. Specifically, instead of requiring hospitals to report on all available eCQMs for the CY 2017 reporting period/FY 2019 payment determination and subsequent years as proposed, we are finalizing a policy that hospitals must report on at least 8 self-selected eCQMs from the available eCQMs in the Hospital IQR Program for the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determination. We intend to propose to increase the number of required eCQMs for reporting in the Hospital IQR Program for the CY 2019 reporting period/FY 2021 payment determination and future years through rulemaking.

b. Requirement That Hospitals Report a Full Year of eCQM Data

In the FY 2016 IPPS/LTCH PPS final rule, we finalized our policy to require hospitals to submit one quarter of data (either Q3 or Q4) for 4 self-selected eCQMs for the CY 2016 reporting period/FY 2018 payment determination by February 28, 2017 (80 FR 49698). As previously stated, we believe that the CY 2017 reporting period/FY 2019 payment determination is the appropriate time to require increased eCQM reporting because hospitals have had several years to report data electronically for the Medicare and Medicaid EHR Incentive Programs and for the Hospital IQR Program. Therefore, we proposed that for the CY 2017 reporting period/FY 2019 payment determination and subsequent years, hospitals must submit one year's worth (that is, four quarters) of eCQM data for each required eCQM. For example, for the ED–1 eCQM, hospitals would be required to submit one year of data (covering Q1, Q2, Q3, and Q4), instead of just one quarter of data (either Q3 or Q4) as previously required.

We sought to proactively address some stakeholder concerns associated with increasing the number of eCQMs for which reporting will be required by aligning data submission deadlines between the Hospital IQR Program and the Medicare EHR Incentive Program to help reduce some reporting burden on hospitals. We note that deadlines for the Medicaid EHR Incentive Program differ by State, and therefore our proposal to align data submission deadlines for eCQMs applies only to the Hospital IQR Program and the Medicare EHR Incentive Program and not to the Medicaid EHR Incentive Program. For more details on Hospital IQR Program reporting requirements and eCQM submission deadlines, we refer readers to section VIII.A.10.d.(5) of the preamble of this final rule.

We invited public comment on our proposal to require hospitals to report a full year of eCQM data.

Comment: Several commenters supported the proposed requirement that hospitals report a full year of eCQM data.

Response: We thank the commenters for their support.

Comment: Many commenters did not support the proposed requirement that hospitals report a full year of eCQM data because of the burden it would impose on hospitals. One commenter indicated that the increase would be four times greater than previous years and would cause increased difficulties for hospitals transitioning to a new EHR system. Commenters noted that EHR vendors are still struggling to overcome the barriers encountered during the first year of eCQM reporting because the designing, building, reviewing, and testing that takes place between hospitals and vendors is extremely expensive and extensive. A few commenters suggested an incremental approach requiring reporting on only 8 eCQMs for two quarters for the first increase. Several commenters specifically expressed concern that the period of time between when the final rule is published and the beginning of the CY 2017 reporting period is too short to make the appropriate health IT and workflow adjustments to accommodate transmission of a full year of eCQM data.

One commenter noted that requiring hospitals to submit a full year of eCQM data for the CY 2017 reporting period would require hospitals to begin data collection on a full year of data prior to completion of the first deadline to report only one quarter of data which is February 28, 2017.

Another commenter acknowledged that once an eCQM is in place, it can continue to gather data beyond implementation, but expressed concern that the ability of EHR vendors and health care providers to have all 15 eCQMs in place by January 1, 2017 is unreasonable. The commenter suggested that CMS continue the current reporting

period of one of the two final quarters of the reporting year.

Response: We appreciate the commenters' concerns that reporting a full year of eCQM data may impose a greater burden on hospitals than reporting one quarter of eCQM data, but in response to the commenter's concern that the increase would be four times greater than previous years and would cause increased difficulties for hospitals transitioning to a new EHR system, we disagree. We believe that the burden associated with submitting a full year of eCQM data will not be substantially greater than the burden associated with transmission of a single quarter of data. As described in section VII.A.10.d of the preamble of this final rule, the CMS data receiving system requires that each QRDA I file include data for one patient, per quarter, per reporting CCN. Whether hospitals and vendors are transitioning to a new EHR or utilizing an established system, this reinforces the importance of reporting eCQMs from a properly certified and successfully mapped system. Once hospitals establish their protocols to ensure this is maintained, hospitals and vendors should not experience much added burden reporting an additional 3 quarters of data. The CMS data receiving system will re-open late spring 2017 to receive test QRDA I files and production QRDA I files for the CY 2017 reporting period eCQM data submissions. Providing this option allows hospitals and vendors greater flexibility to submit QRDA I files on a quarterly, semi-annual, or annual basis rather than waiting to submit all QRDA I files during the last two months of the submission period.

We encourage all hospitals to submit files early, as well as to use one of the available presubmission testing tools for electronic reporting—such as the CMS Pre-submission Validation Application (PSVA), which can be downloaded from the Secure File Transfer (SFT) section of the QualityNet Secure Portal at: *https://cportal.qualitynet.org/QNet/pgm_select.jsp*. We refer readers to section VIII.A.11.b.(5) of the preamble of this of this final rule for more information about the PSVA.

In response to the commenter's concern that EHR vendors are still struggling to overcome the barriers encountered during the first year of eCQM reporting because the designing, building, reviewing, and testing that takes place between hospitals and vendors is extremely expensive and extensive, we acknowledge the time, effort, and resources that hospitals expend on building these measures. However, we disagree with commenters' suggestion to take an incremental approach requiring reporting on only 8 eCQMs for two quarters for the first increase. Although reporting a full year of eCQM data for the CY 2017 reporting period would require hospitals to begin data collection on a full year of data prior to completion of the first deadline to report only one quarter of data which is February 28, 2017, we believe that hospitals have had adequate time to prepare. We disagree that the period of time between when the final rule is published and the beginning of the CY 2017 reporting period is too short to make the appropriate health IT and workflow adjustments to accommodate transmission of a full year of eCQM data. We believe that the FY 2019 payment determination is the appropriate time to require reporting of a full year of eCQM data because hospitals have had several years to report data electronically for the Medicare and Medicaid EHR Incentive Programs and Hospital IQR Program (3 years of voluntary reporting and 3 years of reporting as part of a pilot). In addition, we believe that our finalized policy requiring a lesser number of eCQMs than originally proposed (that is, 8 eCQMs instead of all available eCQMs) provides hospitals with sufficient time to augment their eCQMs and satisfy electronic reporting requirements. We believe this policy will also lessen burden on hospitals.

Comment: Some commenters expressed concern that the increase in the volume of information being reported might increase susceptibility to inaccurate data. A few commenters did not support the proposed requirement that hospitals report a full year of eCQM data because they believed the proposal is premature due to hospitals' inability to ensure that eCQM data is accurate and reliable.

Response: We believe that collecting as much data from hospitals as feasible is an important step toward helping hospitals to report more accurate and reliable data. In section VIII.A.11.b. of the preamble of this final rule, we outline an addition to the Hospital IQR Program validation process to include validation of eCQM data. Analysis of validation results will help us to better understand the difficulties hospitals are experiencing in reporting eCQM data and enable us to provide assistance to help resolve those issues, ultimately resulting in more accurate and reliable data which will improve patient outcomes.

Comment: One commenter suggested that CMS should delay this proposal and focus more on validating eCQM data prior to requiring that hospitals report the data on all eCQMs for a full year in the Hospital IQR Program.

Response: We disagree with the commenter's suggestion that we delay this proposal and focus more on validating eCQM data prior to requiring hospitals report data on all eCQMs for a full year in the Hospital IQR Program because we believe that collecting as much data from hospitals as feasible is an important step toward helping hospitals to report more accurate and reliable data.

Comment: Some commenters expressed concern that this effort will take resources away from true quality improvement efforts.

Response: We disagree and believe that when EHRs are appropriately structured in a way that fits in with the clinical work flow to yield reliable data through eCQMs, eCQMs promote higher quality outcomes and lower costs while ultimately decrease reporting burden on hospitals as compared with chart-abstraction. Moreover, we believe that it is appropriate to require reporting and validation of eCQMs given that measures available now and those being developed for the future are increasingly based on electronic standards (80 FR 49696).

Comment: One commenter questioned whether CMS has considered its ability to receive data submissions for hundreds of thousands of cases from hospitals within a 2 month period (January 1 through the Feb 28).

Response: We are working to ensure that CMS infrastructure is in place to receive the full volume of eCQM data transmissions (for 8 eCQMs) from hospitals by the February 28, 2018 deadline for the CY 2017 reporting period and February 28, 2019 for the CY 2018 reporting period. As stated above, the CMS data receiving system will re-open late spring 2017 to receive test QRDA I files and production QRDA I files for the CY 2017 reporting period eCQM data submissions. Providing this option allows hospitals and vendors greater flexibility to submit QRDA I files on a quarterly, semi-annual, or annual basis rather than waiting to submit all QRDA I files during the last two months of the submission period. As of the publication of this final rule, the CMS data receiving system is open to receive QRDA I test file submissions to allow hospitals and vendors to prepare and test their files for CY 2016 eCQM reporting requirements before the system will be available to receive production files.

Comment: A few commenters noted that upgrading CEHRT to a new edition of certification criteria during the same reporting period (CY 2017) that would

require hospitals report a full year of eCQM data could pose additional implementation difficulties. Other commenters suggested as an alternative to annual reporting of a full year of eCQM data, that CMS require quarterly submission of the eCQM data, with submission being required four and a half months after the end of the reporting quarter to align the e-submission requirements with the Hospital IQR Program chart-abstracted reporting requirements and with other quality reporting programs, such as the SNF Quality Reporting Program and the EHR Incentive Program, to ensure sufficient time for providers to final-bill code all cases for a reporting quarter before being required to generate QRDA files for submission to CMS, and to alleviate pressure on providers, vendors, and the QualityNet team to put together and submit the required information for eCQM data submission. Finally, a few commenters noted that upgrading CEHRT to a new edition of certification criteria during the same reporting period (CY 2017) that would require hospitals report a full year of eCQM data could pose additional implementation difficulties. One commenter expressed the opinion that quarterly reporting would reduce the volume of data that vendors and CMS must process at one time, give providers more frequent benchmarking of their performance on these measures, and make the timing of electronic reporting consistent with reporting of chart-abstracted measures.

Response: We thank commenters for their suggestions. While we acknowledge that upgrading to a new edition of certified EHR during the same reporting period that would require hospitals report a full year of eCQM data could pose additional implementation difficulties, we believe that setting an annual submission deadline at two months following the end of the reporting calendar year provides hospitals more time to make necessary modifications to their health IT systems. This annual submission deadline will allow hospitals the flexibility to submit production files on a quarterly, semi-annual, or annual basis. In addition, we encourage hospitals to test their preparedness to submit eCQM data prior to the submission deadline of the applicable reporting period by using one of the available presubmission testing tools for electronic reporting as discussed in section VIII.A.11.b.(5) of the preamble of this final rule.

Comment: One commenter expressed concern that CMS would increase the amount of data electronically submitted without the benefit of lessons learned from the first year of the electronic submission requirement. The commenter urged CMS not to increase the amount of eCQM data reported for CY 2017 until experience from the 2016 data submission is available to inform proposals.

Response: We acknowledge the commenter's concern that we are increasing the amount of data electronically submitted, by increasing the eCQM reporting requirement from one quarter of data to a full year of data, before data from the first year of required eCQM submission for CY 2016 are available for us to analyze and garner lessons learned, but we disagree that we should delay our proposal to require submission of a full year of data. Hospitals have had several years to report data electronically for the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program (3 years of pilot reporting and 3 years of voluntary reporting). As stated previously, 95 percent of hospitals attest to successful electronic clinical reporting under the Medicare EHR Incentive program. As stated above, we believe that collecting as much data from hospitals as feasible is an important step toward helping hospitals to report more accurate and reliable data.

In section VIII.A.11.b. of the preamble of this final rule, we outline an addition to the Hospital IQR Program validation process to include validation of eCQM data. Analysis of validation results will help us to better understand the difficulties hospitals are experiencing in reporting eCQM data and enable us to provide assistance to help resolve those issues, ultimately resulting in more accurate and reliable data which will improve patient outcomes. Therefore, we believe the CY 2017 reporting period is the appropriate time to move forward with our proposed requirement that hospitals report a full year of eCQM data.

Comment: One commenter expressed concern with the proposals to align the EHR Incentive Programs and the Hospital IQR Program because there are differences in the reporting time periods between the MU measure reporting and the eCQM reporting. The commenter requested that CMS change the eCQM reporting period in FY 2017 to one quarter to align with the MU.

Response: We refer readers to section VIII.E.2.b. of the preamble of this final rule in which reporting time periods for the Medicare and Medicaid EHR Incentive Programs are aligning with the Hospital IQR Program to require that hospitals report a full year of eCQM data by the same submission deadline.

After consideration of the public comments we received, we are finalizing the proposal that for the CY 2017 reporting period/FY 2019 payment determination and subsequent years, hospitals must submit one year's worth (that is, 4 quarters) of eCQM data for each required eCQM by the annual submission deadline as proposed.

c. Clarification Regarding Data Submission for ED–1, ED–2, PC–01, STK–4, VTE–5, and VTE–6

In the FY 2016 IPPS/LTCH PPS final rule, we finalized our policy that hospitals must continue to submit data on ED–1, ED–2, PC–01, STK–4, VTE–5, and VTE–6 via chart abstraction as previously required and that the results will be publicly displayed (80 FR 49695 through 49698). We also finalized a policy that hospitals may choose to submit electronic data on any of these 6 measures in their eCQM form, in addition to the chart-abstraction requirements, in order to meet the eCQM reporting requirement to report 4 self-selected eCQMs out of 28 available eCQMs (80 FR 49695 through 49698).

For the FY 2019 payment determination and subsequent years, as discussed in section VIII.A.3.b.(3)(a)(ii) of the preamble of this final rule, we are finalizing our proposal to remove the electronic version of the STK–4 measure. As discussed in section VIII.A.3.b.(3)(d) of the preamble of this final rule, we are finalizing our proposal to remove the electronic versions of the VTE–5 and VTE–6 measures. Lastly, in section VIII.A.3.b.(2) of the preamble of this final rule, we are finalizing our proposal to remove the chart-abstracted versions of the STK–4 and VTE–5 measures. Because these proposals are being finalized as proposed, the STK–4 and VTE–5 measures are completely removed from the Hospital IQR Program measure set, but the VTE–6 measure continues to be included in its chart-abstracted form. Therefore, for the FY 2019 payment determination and subsequent years, we are clarifying that requirements for the chart-abstracted versions of ED–1, ED–2, PC–01, and VTE–6 remain the same as previously finalized—that hospitals must continue to submit data via chart abstraction (covering each of Q1, Q2, Q3, and Q4) as previously required and that the results will be publicly displayed.

We received the following comments on clarifying the reporting requirements for ED–1, ED–2, PC–01, and VTE–6.

Comment: A few commenters recommended that the Hospital IQR Program continue to require hospitals to submit chart-abstracted data for measures ED–1, ED–2, and PC–01 and

that these measures should be prioritized for eCQM data collection as well to facilitate data validation. The commenters requested that CMS make publicly available the results of analysis comparing chart-abstracted data with eCQM data for measures that are reported in both forms because it would provide valuable information to inform decisions about keeping or retiring measures and it would highlight issues ascribed to differences between chart-abstraction methods and eCQM measure specifications to help vendor and provider communities understand these issues. Lastly, commenters encouraged CMS to require CEHRT to adopt a standardized definition of ''admit decision'' and recommended that CMS consult with existing consensus definitions and experts in the field to help identify potential variance in the chart-abstracted version and the eCQM versions of these measures.

Response: We thank the commenters for their support and suggestions and will take these into consideration in developing future policy. In addition, we direct readers to the Office of the National Coordinator for recommendations on developing or new standards for health IT which should be considered for future adoption.[158]

Comment: Some commenters expressed concern that the submission of eCQM data would not replace chart-abstracted and claims-based measures, which must still be submitted in addition to eCQMs. The commenters suggested that CMS allow hospitals to select the format in which to report, to encourage more hospitals to make eCQMs more accurate. Further, the commenters suggested that if hospitals submit eCQM data for measures ED–1 and ED–2, that they not be required to submit chart-abstracted data for these measures because chart-abstraction is redundant and costly. The commenters requested that CMS consider flexibility in requirements for submission of different measure types because maintaining different reporting mechanisms is a daunting task for hospitals and requires expertise in different areas of health IT, as well as in clinician workflow and medical coding. One commenter specifically requested that chart-abstracted measures be removed when an eCQM is available because reporting on the same measure in two forms duplicates efforts, creates variation in the data, and takes time away from hospitals improving their electronic medical record systems. Another commenter also noted that clinician documentation for the generation of clinical quality measures is no easy feat, and that CMS should be more cognizant of this. The commenter recommended that CMS slow the pace of eCQM reporting and focus on testing and validation of measures instead.

Response: We thank the commenters for their suggestion that we allow hospitals to select the format in which to report on measures specified both as eCQMs and as chart-abstracted measures, however, we believe that in order to collect the highest quality data, at this time, submission of data in both forms for the ED–1, ED–2, PC–01, and VTE–6 measures is necessary. As described in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50258), we have received anecdotal comments about performance level differences between chart-abstracted and eCQM data. We do not have sufficient data to be able to confirm or refute the accuracy of those comments (79 FR 50258). In order to substantiate or refute the existence of performance-level differences between eCQM data and chart-abstracted measure data, we believe that we must collect more eCQM data and develop a process for validating the accuracy of that data.

Moreover, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50815 through 50818), we adopted a policy under which we would only publicly report eCQM data in the Hospital IQR Program if we determined that the data are accurate enough to be reported. We believe that our current policy to delay public reporting of eCQM data submitted by hospitals for the CY 2017 reporting period/FY 2019 payment determination in conjunction with the adoption of an eCQM validation process in this final rule is consistent with our stated policy on eCQM public reporting. Until we have determined that eCQM data are accurate enough to be publicly reported, we believe it is important to collect the chart-abstracted data on ED–1, ED–2, PC–01, and VTE–6 to be able to continue publicly reporting, since these measures are not topped out like the previously removed chart-abstracted measures and data on the PC–01 chart-abstracted measure is used in the Hospital VBP Program. We acknowledge that maintaining different reporting mechanisms is costly and may appear redundant to hospitals and that it requires expertise in different areas of health IT, as well as in clinician workflow, and medical coding. Nevertheless, we believe the value of the additional data outweighs the burden of collecting the data in both forms.

We disagree that reporting on the same measure in two forms duplicates efforts, creates variation in the data, and takes time away from hospitals improving their electronic medical record systems. Until eCQM data is validated and ready to be publicly reported, it is important to have sufficient data on the chart-abstracted versions of the measures to continue publicly reporting on them. In addition, because hospitals can choose which four eCQMs they report for CY 2016 and which 8 eCQMs they report for CY 2017 and CY 2018, it may be several more years before we have collected sufficient, reliable data for publicly reporting on these measures using eCQM data alone. We believe that reporting chart-abstracted data will supplement eCQM data on the same measure and that reporting data in both forms will facilitate eCQM validation efforts.

Comment: One commenter supported the retention of VTE–6 in chart-abstracted form because chart abstractors can manually find required data elements in clinical notes and not structured data fields, but the commenter noted that this rationale should be extended to many, if not all, of the chart abstracted measures that are being considered for eCQM reporting. The commenter encouraged CMS to utilize chart-abstraction rather than an eCQM as the preferred method of data collection and reporting for public reporting and pay-for-performance programs because, while labor intensive, chart-abstraction focuses data collection to a select set of professionals who can be trained to provide high quality data for use in public reporting and pay-for-performance programs and free clinical providers and physicians to focus on providing patient-centered care without the distraction of documenting in structured fields to the detail required for the purposes of eCQM reporting.

Response: We appreciate the commenter's recommendation to continue utilizing chart abstraction for quality reporting until EHR systems are more mature, but as we stated in section VII.A.8.a. of the preamble of this final rule, when hospitals work with their vendors to ensure that EHRs are appropriately structured in a way that fits in with the clinical work flow to yield reliable data through eCQMs, we believe that eCQMs promote high quality outcomes and lower costs while ultimately decrease reporting burden on hospitals as compared with chart-abstraction.

In summary, for the FY 2019 payment determination and subsequent years, we

[158] Office of the National Coordinator, Health IT Certification Program *www.healthit.gov.*

clarify that requirements for the chart-abstracted versions of ED–1, ED–2, PC–01, and VTE–6 remain the same as previously finalized—that hospitals must continue to submit data via chart abstraction (covering each of Q1, Q2, Q3, and Q4) as previously required and that the results will be publicly displayed. This is regardless of whether data also are submitted electronically in accordance with the applicable submission requirements.

9. Possible New Quality Measures and Measure Topics for Future Years

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25196 through 25199), we provided information about new quality measures and measure topics under consideration for future inclusion in the Hospital IQR Program. We are considering to propose in future rulemaking: (1) A refined version of the Stroke Scale for the Hospital 30-Day Mortality Following Acute Ischemic Stroke Hospitalization Measure; (2) a new measure, the National Healthcare Safety Network (NHSN) Antimicrobial Use Measure (NQF #2720); and (3) one or more potential measures of behavioral health for the inpatient hospital setting, including measures previously adopted for the IPFQR Program (80 FR 46694), for adoption into the Hospital IQR Program measure set. Also, we are considering public reporting of Hospital IQR Program data stratified by race, ethnicity, sex, and disability on *Hospital Compare.* These topics are further discussed below.

a. Potential Inclusion of the National Institutes of Health (NIH) Stroke Scale for the Hospital 30-Day Mortality Following Acute Ischemic Stroke Hospitalization Measure Beginning as Early as the FY 2022 Payment Determination

(1) Background

Mortality following stroke is an important adverse outcome that can be measured reliably and objectively and is influenced by the quality of care provided to patients during their initial hospitalization; therefore, mortality is an appropriate measure of quality of care following stroke hospitalization.[159] [160] Specifically, post-stroke mortality rates have been shown to be influenced by critical aspects of care such as response to complications, speediness of delivery of care, organization of care, and appropriate imaging.[161] [162] [163] [164] Therefore, we are refining the previously adopted CMS Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) following Acute Ischemic Stroke Hospitalization Measure (hereafter referred to as the Stroke 30-day Mortality Rate) (78 FR 50802) by changing the measure's risk adjustment to include stroke severity. We are considering proposing this refinement to the measure in the future.

The previously adopted Stroke 30-day Mortality Rate (78 FR 50802) includes 42 risk variables, but does not include an assessment of stroke severity. For more details on the measure as currently adopted and implemented, we refer readers to its measure methodology report and measure risk-adjustment statistical model in the AMI, HF, PN, COPD, and Stroke Mortality Update zip file on our Web site at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.*

In the future, we are considering proposing a refinement to the Stroke 30-day Mortality Rate for several reasons. First, the refined measure would allow for more rigorous risk adjustment by incorporating the NIH Stroke Scale (discussed in more detail below) as an assessment of stroke severity.[165] Second, the inclusion of the NIH Stroke Scale is aligned with and supportive of clinical guidelines, as use of the NIH Stroke Scale to assess stroke severity upon acute ischemic stroke patient presentation is Class I recommended in the American Heart Association and American Stroke Association (AHA/ASA) guidelines.[166] Third, clinicians and stakeholders, including AHA, ASA, and other professional organizations, highlight the importance of including an assessment of stroke severity in risk-adjustment models of stroke mortality. Therefore, the refined Stroke 30-day Mortality Rate is responsive to comments received from the feedback of measure developers during measure development, the TEP, and the NQF endorsement process (78 FR 50802). Fourth, in addition to a modestly higher c-statistic, which evaluates the measure's ability to discriminate or differentiate between high and low performing hospitals, the refined Stroke 30-day Mortality Rate includes a more parsimonious risk model than the publicly reported stroke mortality measure, with a total of 20 risk adjustment variables including the NIH Stroke Scale, compared to the current use of 42 risk adjustment variables.

Initial stroke severity score, such as the NIH Stroke Scale score, is one of the strongest predictors of mortality in ischemic stroke patients,[167] [168] [169] and is part of the national guidelines on stroke care.[170] The NIH Stroke Scale is a 15-item neurologic examination stroke scale used to provide a quantitative measure of stroke-related neurologic deficit. The NIH Stroke Scale evaluates the effect of acute ischemic stroke on a patient's level of consciousness, language, neglect, visual-field loss, extra-ocular movement, motor strength, ataxia (the loss of full control of bodily movements), dysarthria (difficult or unclear articulation of speech), and sensory loss. The NIH Stroke Scale was designed to be a simple, valid, and reliable tool that can be administered at the bedside consistently by neurologists, physicians, nurses, or therapists. In

[170] Jauch EC, Saver JL, Adams HP, Jr., et al. Guidelines for the early management of patients with acute ischemic stroke: a guideline for healthcare professionals from the American Heart Association/American Stroke Association. *Stroke.* Mar 2013;44(3):870–947.

October 2016, codes for the NIH Stroke Scale are expected to be added to the International Statistical Classification of Diseases and Related Health Problems 10th Revision (ICD–10). The currently adopted measure covers 3 years of claims data using administrative claims from July 2011–June 2014. In order to give hospitals time to adjust to reporting the NIH Stroke Scale, we are considering this measure refinement for as early as the July 2017 through June 2020 reporting period (3 years of data), which would correspond to the FY 2022 payment determination in the Hospital IQR Program.

The measure refinement was developed in collaboration with the AHA/ASA. We sought to update the current publicly reported measure to include an assessment of stroke severity at this time, because it has become feasible to do so due to both the increased use of the NIH Stroke Scale related to the AHA/ASA guidelines that recommend administering the NIH Stroke Scale on all stroke patients, as well as due to the upcoming availability to obtain the scores through claims data (incorporation into ICD–10).

The Stroke 30-day Mortality Rate (MUC ID 15–294) with the refined risk adjustment was included on a publicly available document entitled ''List of Measures under Consideration for December 1, 2015'' with identification number MUC ID 15–294, (available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367*) and has been reviewed by the MAP. The MAP conditionally supported this measure pending NQF review and endorsement and asked that CMS consider a phased approach in regards to implementation to avoid multiple versions of the same measure.[171] The MAP also noted that mortality is not the most meaningful outcome for stroke patients and to consider cognitive or functional outcomes such as impaired capacity.[172] The Stroke 30-day Mortality Rate with the refined risk adjustment was submitted to NQF for endorsement in the neurology project on January 15, 2016.

(2) Overview of Measure Change

The measure cohort for the refined measure would not be substantively different from the currently adopted, publicly reported Stroke 30-day Mortality Rate. In addition, the data sources, three-year reporting period, inclusion and exclusion criteria, as well as the assessment of the outcome of mortality would all align with the currently adopted measure.

(3) Risk Adjustment

The statistical modeling, measure calculation, and risk-adjustment calculation for this refined measure would align with the currently adopted Stroke 30-day Mortality Rate. However, we reselected risk variables, resulting in a final model with 20 risk-adjustment variables including the NIH Stroke Scale as an assessment of stroke severity. For the full measure specifications of the refined measure, we refer readers to the AMI, HF, PN, COPD, and Stroke Mortality Update zip file on our Web site at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

In summary, we are considering proposing in the future a refinement of the Stroke 30-day Mortality Rate, which would change the risk adjustment to include an assessment of stroke severity, in the Hospital IQR Program for as early as the July 2017–June 2020 reporting period/FY 2022 payment determination and for subsequent years.

We invited comments on the possibility of a future proposal of refinements to the previously adopted Hospital 30-Day Mortality Following Acute Ischemic Stroke Hospitalization Measure to include the NIH Stroke Scale beginning as early as the FY 2022 payment determination.

Comment: All commenters supported the inclusion of the NIH Stroke Scale score in the Stroke 30-day Mortality Rate measure for future inclusion in the Hospital IQR Program. Commenters noted it is a significant improvement over the current Stroke 30-Day Mortality Rate measure, which uses an administrative claims-based risk adjustment model that does not include stroke severity. Some commenters suggested that the current lack of risk adjustment for stroke severity could cause misclassification of hospital performance, and that the more rigorous risk adjustment facilitated by the NIH Stroke Scale will help ensure that the measure accurately risk adjusts for different hospital populations without unfairly penalizing high-performance providers.

In addition, commenters agreed that the NIH Stroke Scale is well validated (having been vetted by the ASA and the AHA), highly reliable, widely used, and a strong predictor of mortality and short- and long-term functional outcomes. Several commenters supported the proposed timeframe for the implementation of the refined Stroke 30-Day Morality Rate measure, noting that data for the measure would not be required until FY 2020, which allows hospitals sufficient time to adjust to reporting NIH Stroke Scale scores.

Response: We thank the commenters for their support.

Comment: One commenter recommended that CMS also account for decline or improvement in status that could be related to interventions, by incorporating the NIH Stroke Scale score administered at discharge. Commenters suggested that CMS consider whether the measure will risk adjust for the score taken upon admission, during the first 24 hours of the admission, or upon discharge. A commenter urged CMS to consider standardizing the qualifications of the individual administering the NIH Stroke Scale. In addition, one commenter requested clarification as to how the NIH Stroke Scale score would be reported to CMS.

Response: In regard to the timing of the NIH Stroke Scale score, we note that the intent of the risk adjustment for stroke severity is to account for patients' clinical status at the time they are admitted to the hospital. Therefore, the refined Stroke 30-Day Morality Rate measure would utilize the initial NIH Stroke Scale score, administered upon admission. We refer readers to the current clinical guidelines describing the qualifications and appropriate administration of the NIH Stroke Scale. As noted in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25196), the NIH Stroke Scale is expected to be added to ICD–10 in October 2016, and could therefore be reported via claims submitted to CMS. We will take the additional suggestions into consideration for future policy.

Comment: A few of commenters supported the inclusion of the NIH Stroke Scale for the Stroke 30-day Mortality Rate measure for future inclusion in the Hospital IQR Program, pending NQF endorsement. One commenter added that it would also support using the refined Stroke 30-Day Morality Rate measure once it has been field-tested by hospitals. Commenters noted that mortality is not the only outcome for stroke patients that should be measured and recommended that CMS work with measurement stakeholders and developers to explore more measures that are highly meaningful to patients, such as cognitive or functional outcomes. These commenters acknowledged that the addition of the NIH Stroke Scale scores is a technical improvement, but cautioned CMS in moving forward in

[171] Spreadsheet of MAP 2016 Final Recommendations Available at: *http://www.qualityforum.org/map/*.

[172] Spreadsheet of MAP 2016 Final Recommendations Available at: *http://www.qualityforum.org/map/*.

implementation of this measure until it is clear that the measure provides an unambiguous and unbiased signal of the underlying quality of care provided by the hospital.

Response: We thank commenters for their suggestions and support. The refined Stroke 30-Day Morality Rate measure was submitted to the NQF neurology project on January 15, 2016. We will continue to move forward with the NQF endorsement process for the measure. We will take this feedback regarding the timing of implementation and future stroke outcomes measures into consideration as we conduct implementation planning for the measure. We thank the commenters for their feedback and we will consider it as we develop future policy.

b. Potential Inclusion of National Healthcare Safety Network (NHSN) Antimicrobial Use Measure (NQF #2720)

(1) Background

The emergence of antibiotic drug resistance is a clinical and public health problem that threatens the effective prevention and treatment of bacterial infections. The CDC estimates that each year at least two million people become infected with bacteria that are resistant to antibiotics, and at least 23,000 people die as a direct result of these drug-resistant bacterial infections. In addition, antibiotic resistance contributes an estimated $20 billion in excess direct healthcare costs.[173]

In order to promote the efficiency and coordination of efforts to detect, prevent, and control antibiotic resistance, HHS announced in 2015 the establishment of the Presidential Advisory Council on Combating Antibiotic-Resistant Bacteria (Advisory Council).[174] The Advisory Council makes recommendations to the Secretary regarding policies to support the implementation of the National Strategy for Combating Antibiotic-Resistant Bacteria [175] and the National Action Plan for Combating Antibiotic-Resistant Bacteria.[176] Evidence is accumulating that programs dedicated to optimizing inpatient antibiotic use, known as antimicrobial stewardship programs (ASPs), may slow the emergence of antibiotic resistance and improve appropriateness of antimicrobial use and patient outcomes.[177] [178] [179] Therefore, the CDC and several professional societies have published guidelines and resources to support hospitals in implementing antimicrobial stewardship programs.[180]

In the future, we are considering proposing the NHSN Antimicrobial Use measure to advance national efforts to reduce the emergence of antibiotic resistance by enabling hospitals and CMS to assess national trends of antibiotic use to facilitate improved stewardship by comparing antibiotic use that hospitals report to antibiotic use that is predicted based on nationally aggregated data. The measure was included on a publicly available document entitled ''List of Measures Under Consideration for December 1, 2015,'' [181] in compliance with section 1890A(a)(2) of the Act. The measure received conditional support, pending CDC recommendation that the measure is ready for use in public reporting as referenced in the MAP 2016 Final Recommendations.[182] The MAP recognized the high importance of antimicrobial stewardship and conditionally supported the inclusion of this measure in the Hospital IQR Program while acknowledging that additional testing may be necessary to address feasibility issues for public reporting, quality implications of measuring the amount of antibiotics used versus appropriate use of antibiotics, and risk-adjustment. Further, MAP noted these issues should be addressed before the measure is reported on *Hospital Compare*.[183] The measure received endorsement from NQF on December 10, 2015.[184]

(2) Overview of Measure

The NHSN Antimicrobial Use measure assesses antibiotic use in hospitals based on medication administration data that hospitals collect electronically at the point of care. The measure compares antibiotic use that hospitals report, via electronic file submissions to the CDC's NHSN, to antibiotic use that is predicted based on nationally aggregated data. Data on administered antibiotics are required to be extracted from an electronic medication administration record (eMAR) [185] and/or bar coded medication administration (BCMA) system.[186] The antibiotic use data that are in scope for this measure include antibiotic agents administered to adult and pediatric patients in a specified set of ward and intensive care unit (ICU) locations. Locations include adult and pediatric medical, medical/surgical, and surgical wards and adult and pediatric medical, medical/surgical, and surgical ICUs as defined by the NHSN at: *http://www.cdc.gov/nhsn/PDFs/pscManual/15LocationsDescriptions_current.pdf*.

The measure is comprised of a discrete set of risk-adjusted summary ratios, known as Standardized Antimicrobial Administration Ratios (SAARs), which summarize observed-to-predicted antibacterial use for one of sixteen antibiotic agent-patient care location combinations. The specific antibiotic agent-location combinations were selected based on extensive consultation with infectious disease physicians and pharmacists at the forefront of ASPs. The specified categories of antibiotic agents include:

- Broad spectrum agents predominantly used for hospital-onset/multi-drug resistant bacteria;
- Broad spectrum agents predominantly used for community-acquired infection;
- Anti-MRSA agents; and
- Agents predominantly used for surgical site infection prophylaxis.

[183] Ibid.

[184] *http://www.qualityforum.org/QPS/2720*.

[185] eMAR is defined as technology that automatically documents the administration of medication into CEHRT using electronic tracking sensors (for example, radio frequency identification (RFID)) or electronically readable tagging such as bar coding (77 FR 54034).

[186] Barcode Medication Administration (BCMA) System is defined as a system that allows users to electronically document medications at the bedside or other points-of-care using an electronically readable format. More information. Available at: *http://www.ahrq.gov/downloads/pub/advances/vol3/wideman.pdf*.

The SAARs are designed to serve as high value targets or high-level indicators for hospital ASPs to assess hospital antimicrobial use. A SAAR that is not significantly different from 1.0 indicates ''expected'' antibiotic use. A SAAR that is above 1.0 may indicate excessive antibiotic use or a SAAR that is below 1.0 may indicate antibiotic underuse. We note that the SAARs do not provide a definitive indication of antibiotic appropriateness of use. Outlier SAAR values should prompt hospitals to do further analysis to assess overuse, underuse, or inappropriate use of antibacterial medications. In addition, the SAARs may be used by hospital ASPs to identify opportunities to improve antibiotic use and gauge the impact of stewardship efforts.

(3) Data Sources

The data submission and reporting standard procedures for the NHSN Antimicrobial Use measure have been set forth by the CDC for NHSN participation, in general, and for submission of measure data. We refer readers to the CDC's NHSN Web site (*http://www.cdc.gov/nhsn*) for detailed data submission and reporting procedures. Although the NHSN Antimicrobial Use measure is not specified as an eCQM, manual data entry is not available. Data must be electronically extracted from an eMAR [187] and/or BCMA system.[188] The format for data submission must adhere to the data format prescribed by the CDC HL7 Clinical Data Architecture (CDA) Implementation Guide available at: *http://www.cdc.gov/nhsn/cdaportal/toolkits/guidetocdaversions.html*.

(4) Measure Calculation

Each SAAR is an observed to expected ratio and is calculated by dividing the numerator, or total number of observed antimicrobial days (days of therapy reported by a healthcare facility for a specified category of antimicrobial agents in a specified patient care location or group of locations), by the denominator, or expected (predicted on the basis of nationally aggregated antimicrobial use data for a healthcare facility's use of a specified category of antimicrobial agents in a specified patient care location or group of locations) number of antimicrobial days, for each antibiotic agent category-patient care location combination. The total number of observed antimicrobial days for each patient care location is defined as the aggregated sum of days for which any amount of a specific antibiotic agent within an antibiotic agent category was administered as documented in the eMAR or BCMA system. The predicted number of antimicrobial days for each patient care location is determined by multiplying the observed days present by the corresponding antimicrobial use rate in the standard population obtained from the relevant regression model. Hospital patient care locations other than adult and pediatric medical, medical/surgical, and surgical wards and adult and pediatric medical, medical/surgical, and surgical ICUs are excluded from this measure. For more information regarding the specifications for the Antimicrobial Use measure, we refer readers to the NHSN Antimicrobial Use and Resistance Module (AUR): *http://www.cdc.gov/nhsn/PDFs/pscManual/11pscAURcurrent.pdf*.

We invited public comment on the possibility of future inclusion of the NHSN Antimicrobial Use measure (NQF #2720).

Comment: Many commenters supported the future inclusion of the NHSN Antimicrobial Use measure in the Hospital IQR Program indicating that it is critically important to reduce the amount of unnecessary antibiotic prescriptions, help practitioners and public health officials alike assess antibiotic use in hospitals based on medication administration data that hospitals collect thereby helping to combat a growing clinical and public health concern (antimicrobial resistance), and improve the appropriateness of both antimicrobial use and patient outcomes. In addition, one commenter noted that the measure will enable facilities to monitor antibiotic use and guide stewardship efforts in hospitals but recommended further validation and testing to ensure accurate and meaningful application of the measure prior to its inclusion. The commenter noted that inclusion of the measure would encourage facilities to: (1) Benchmark antibiotic use; (2) assess appropriateness of antibiotic prescribing; and (3) target stewardship interventions and gauge their impact.

Another commenter noted that in order for measures of this kind to become widely used, a broad interoperability standard needs to be adopted across all vendors providing accessibility to the requisite electronic drug administration data. A third commenter added that CMS is the only entity that can address the overuse of antibiotics through its Conditions of Participation and public reporting and payment accountability tools. The commenter encouraged CMS to target this measure for public reporting that is subsequently tied to payment incentive programs. Similarly, another commenter stated that reporting of antibiotic use data to the NHSN Antibiotic Use Reporting (AUR) module is of great importance because doing so would provide vital statistics on which stewardship of use of antibiotics can be assessed, and help facilities evaluate their antimicrobial utilization over time. The commenter noted that there are currently no national data on antibiotic use, and at the broadest level it is difficult to chart national improvement without having systematically collected antibiotic use data from all acute care hospitals in the U.S. Lastly, one commenter urged CMS to recognize that hospital antimicrobial stewardship is only one aspect of the multifaceted and worldwide efforts needed to address the increasing challenge of antimicrobial resistance.

Response: We thank the commenters for supporting the future inclusion of the Antimicrobial Use measure. We will take these comments and suggestions into consideration in developing future policy.

Comment: One commenter supported future inclusion of the NHSN Antimicrobial Use measure in the Hospital IQR Program, but suggested that this measure should be voluntary because required reporting at this time would place an undue burden on hospitals without a fully integrated IT system.

Response: We thank the commenter for supporting the proposed future inclusion of the Antimicrobial Use measure and will consider the commenter's suggestion in developing future policy.

Comment: One commenter did not support future inclusion of the Antimicrobial Use Measure, because better methods are available for prescribing antibiotics than what is described in the measure text, such as adherence to the local facility antibiogram for the type of infection present and technologic identification of gene resistance markers. The commenter also suggested that the measure data that is provided is aged and indicated that the usage of the measure's data for payment purposes is counterproductive to clinical improvement.

[187] eMAR is defined as technology that automatically documents the administration of medication into CEHRT using electronic tracking sensors (for example, radio frequency identification (RFID)) or electronically readable tagging such as bar coding (77 FR 54034).

[188] Barcode Medication Administration (BCMA) System is defined as a system that allows users to electronically document medications at the bedside or other points-of-care using an electronically readable format. More information available at: *http://www.ahrq.gov/downloads/pub/advances/vol3/wideman.pdf*.

Response: We acknowledge the commenter's concern, but note that the NHSN Antimicrobial Use Measure assesses antibiotic use (the amount of antibiotics used) rather than appropriateness of use. The measure result is not a definitive measure of appropriateness and should not be interpreted in isolation to assess prescribing practices. Instead, the Antimicrobial Use measure should prompt hospitals to do further analysis of prescribing practices to assess overuse, underuse, or appropriateness of use. This additional analysis to assess appropriateness of use may include consulting the facility antibiogram, the facility antimicrobial stewardship program, as well as other evidence based treatment guidelines as appropriate.

We disagree with commenter's suggestion that NHSN measure data is ''aged'' and ''counterproductive to clinical improvement.'' The NHSN has various analytic functions that enable hospitals to analyze their own surveillance data at any time. We encourage hospitals to use these functions for continuous quality improvement efforts. Additional information regarding analysis is available on the NHSN Web site at: *http://www.cdc.gov/nhsn/ps-analysis-resources/index.html*.

Comment: One commenter questioned whether the use of ''days of therapy'' (DOT) is an adequate component of measurement, indicating that not all health information systems will be able to extract a clean result for this data point. Instead, the commenter suggested that the ''defined daily dose'' (DDD) be the unit of measurement, as it is more readily available, more easily obtained, and provides useful information.

Response: We appreciate the commenter's observations about summarizing antimicrobial consumption using DDD. A major reason why NHSN opted to use DOT is that DDD is not applicable in children (aged >1 month) due to the large variation in body weight within this population. Further, NHSN's experience with antimicrobial use surveillance—in which over 140 hospitals ranging widely in bed size, information technology resources, and geographic location have successfully submitted antimicrobial use data to NHSN—suggests that DOT data can be consistently collected and reported to NHSN. While investments in a technical solution are necessary to enable data extraction, aggregation, and reporting, the NHSN experience provides clear evidence that information technology vendors and, in some instances, health systems themselves, are capable of developing and deploying those solutions.

Comment: A few commenters expressed concern about the vendor tool currently used to collect data for the measure. Commenters indicated that the tool is inefficient and urged the CDC to correct the problems with the tool prior to program inclusion. One commenter noted that hospitals have difficulty reporting directly to the module which requires a direct HL7 feed, a functionality not offered by many EHR vendors, and because the measure requires additional testing and validation before introduction into public reporting or payment programs.

Response: While the CDC continuously strives to be abreast of issues that arise with vendor tools and to provide feedback as a method of aiding in the maintenance of vendor tools, we will share the commenters' concerns with the CDC. We will also take these comments into consideration in developing future CMS policy.

Comment: One commenter suggested that the NHSN Antimicrobial Use measure assess administration of antibiotics in the ED and those used pre-operatively, noting that if hospitals only gather data from eMAR or barcode-administration, the data on administration of antibiotics will be overlooked, and therefore, the overall measure results will be skewed. The commenter urged that CMS evaluate the administration of antibiotics in the ED and operating room.

Response: We appreciate commenter's suggestion to include the emergency department (ED) and operating room (OR) in the measure and will share it with the CDC. Although the ED and OR are not included in the measure, the NHSN Antibiotic Use and Resistance Module does allow for optional submission of ED and OR data. For more information, we refer readers to: *http://www.cdc.gov/nhsn/acute-care-hospital/aur/*.

Comment: One commenter supported the potential inclusion of the NHSN Antimicrobial Use measure but recommended that the measure be specified as an eCQM rather than a chart-abstracted measure.

Response: We thank the commenter for this support and we will share the recommendation with the CDC.

Comment: A few commenters did not support the inclusion of the NHSN Antimicrobial Use measure. A few commenters believed the measure would place an information handling burden on hospitals, especially smaller hospitals that would likely have to contract with an outside vendor. The commenter encouraged CMS to consider another alternative for reporting progress on antibiotic stewardship. Another commenter stated that the measure is too broad and the measure calculation is unclear.

Response: We acknowledge the commenters' concerns and will consider them should we propose to adopt the measure in future rulemaking. For more information regarding measure calculation, we refer readers to the Antibiotic Use and Resistance Module manual available at: *http://www.cdc.gov/nhsn/pdfs/pscmanual/11pscaurcurrent.pdf*.

Comment: Many commenters supported the concept of antimicrobial stewardship and inclusion of an antimicrobial use measure in the Hospital IQR Program, but did not support inclusion of this NHSN Antimicrobial Use measure for various reasons. Specifically, several commenters objected to the measure because Standardized Antimicrobial Administration Ratios (SAARs) measure the amount of antibiotics used but does not account for the appropriateness of antibiotic use nor does it separate community hospitals from academic hospitals when defining the expected number. Commenters noted that including this measure in the Hospital IQR Program and publicly reporting it on *Hospital Compare* may create incentives for providers to lower the number of antimicrobial days to improve their SAAR irrespective of the appropriateness of antimicrobial use.

Commenters urged CMS to explore the use of a measure that looks at both number of antimicrobial days and the appropriateness of use to promote true antimicrobial stewardship and improved patient outcomes. One commenter suggested that CMS develop process metrics around the appropriate use of diagnostic test(s) that help determine if antibiotic use is appropriate by first identifying the microbe causing the infection prior to prescribing the antibiotic in cases where patient health status allows for the diagnostic first and also the time to effective treatment.

Some commenters also expressed concern that the testing sample used to develop the measure was too small which could lead to unintended consequences of reporting the measure on a nation scale and the use of the measure in public reporting may result in misleading comparisons complexity of the patient population can contribute to differences in antibiotic use rates. These commenters suggested that CMS conduct large-scale pilot studies to further evaluate and validate the metric

prior to including the SAAR as part of the measure set.

For all of these reasons, some commenters expressed concern that these data have a high probability of misinterpretation by the public and may provide inaccurate justification for hospitals to avoid dedicating resources to antimicrobial stewardship programs if their SAARs are already within goal. Other commenters expressed concern about issues related to feasibility of public reporting, risk-adjustment, and providing hospitals sufficient time for technical set-up required with this measure.

Response: We acknowledge commenters' concerns regarding public reporting, risk adjustment, and technical feasibility and will consider the comments them should we propose to adopt the measure in future rulemaking.

Comment: One commenter suggested that CMS explore additional hospital strategies to support efforts to reduce the threat of multidrug resistant organisms in the hospital setting. One noted approach was addressing infection control through the use of technology that relies on antiseptics, such as ionic silver and molecular iodine. Another noted approach was the use of silver antimicrobial dressings, following surgeries conducted on geriatric patients. This tactic can be an important part of protocols to reduce surgical site infections and further combat antibiotic resistance. Lastly, the commenter mentioned that combining antimicrobial agents with anti-biofilm agents would be effectual because the anti-biofilm would disrupt biofilm to expose associated organisms to antibiotics.

Response: We thank the commenter for these suggestions and we will consider them for the future.

Comment: Several commenters expressed the opinion that the NHSN Antimicrobial Use measure is appropriate for use in quality improvement efforts, but not for public reporting at this time. The commenters urged CDC and CMS to work together to refine the measure should it be considered in the future for public reporting.

Response: We thank the commenters for their suggestions and we will continue to work with colleagues at the CDC to improve the measure's feasibility for potential future public reporting.

c. Potential Measures for Behavioral Health in the Hospital IQR Program

Although the IPFQR Program incorporates measures of inpatient psychiatric treatment (80 FR 46694), the Hospital IQR Program does not include any measures directly related to behavioral health. Based on MedPAC analyses, over a third of Medicare inpatient psychiatric admissions are treated ''in acute care hospital beds not within distinct-part psychiatric units.'' [189] Thus, there may be a gap in understanding the quality of care given to inpatient psychiatric patients not paid for under the IPFQR Program.

To address this gap, we invited public comments on potential behavioral health quality measures appropriate to include in the Hospital IQR Program in future years, including the possible use of one or more measures previously adopted in the IPFQR Program (80 FR 46417). The comments we received and our responses are set forth below.

Comment: Several commenters supported the future inclusion of behavioral health quality measures in the Hospital IQR Program. One commenter noted that in small community hospitals, patients with alcohol or drug abuse issues for medical detox, withdrawal, or overdose are not routinely admitted to psychiatry after medical treatment, which is largely problematic. Therefore, including measures of behavioral health in the Hospital IQR Program to address these behavioral issues will help to improve outcomes for this patient population. Another commenter was particularly interested in measures that examine health conditions such as schizophrenia and bipolar disorder and noted that successful implementation of behavioral health measures in the Hospital IQR Program should lead to subsequent inclusion in the Hospital VBP Program. A few commenters specifically requested that tobacco cessation and substance abuse treatment measures be included because of their importance in treating inpatient populations. Another commenter recommended the addition of the ''Substance Use Screening'' measures, ''Tobacco Use'' measures, the ''Screening for Metabolic Disorders'' measure, the ''Hours of Physical Restraint Use'' measure, and the ''Seclusion Use'' measure.

Response: We thank the commenters for this support of behavioral health measures in the Hospital IQR Program to improve patient outcomes. We will consider these recommendations should we propose to adopt behavioral health measures in future rulemaking.

Comment: Some commenters supported the future inclusion of behavioral health quality measures in the Hospital IQR Program, but only if the population for these measures is correctly identified and reliable. These commenters urged CMS to consider measures that better reflect the quality of inpatient psychiatric care than Tobacco and Substance Use, stating that these measures are currently structured so that the inpatient stay can be focused on stabilizing the patient to be transferred to the next appropriate level of care. The commenters urged CMS to recognize the patient's right to refuse treatment so that if a hospital educates and offers treatment to a patient, and the patient refuses treatment for substance abuse, the measure would not capture this as a reflection of poor care, but rather exclude the patient from the measure population.

Commenters encouraged CMS to consider adopting the HBIPS–5 measure (Discharge on multiple anti-psychotic medications with appropriate justification for use), the Transition of Care Measures for all inpatients (not just those with a psychiatric diagnosis), the Screening for Metabolic Disorders with antipsychotic medications measure, and other measures that capture the change in a patient's presenting psychiatric condition between admission and discharge.

Response: We appreciate commenters' recommendations and will consider them in developing future policy.

Comment: One commenter requested specific examples of measures from the IPFQR Program to be able to give feedback. The commenter recognized that there are measures from the IPFQR Program that may be appropriate for the Hospital IQR Program, but indicated that inclusion of these measures would require time to implement workflows. On the other hand, some commenters cautioned CMS about adopting measures from the IPFQR Program. Specifically, some commenters stated that while the hospital-based inpatient psychiatric services (HBIPS) measures are the most appropriate for this population, these measures have been phased-out over time in favor of measures that are less applicable to this specific patient population. Therefore, commenters urged CMS to collaborate with stakeholders to develop new measures of behavioral health.

Response: We thank commenters for sharing their suggestions and concerns. We understand that the addition of any new measures may cause workflow concerns, and we will consider these issues when evaluating any behavioral health measures we propose to adopt in future rulemaking.

[189] Medicare Payment Advisory Commission (U.S.). (2010). MedPAC June 2010 Report to the Congress: Washington, DC: MedPAC, available at: *http://www.medpac.gov/documents/reports/Jun10_Ch06.pdf?sfvrsn=0.*

Comment: One commenter did not support including quality measures of behavioral health in the Hospital IQR Program in the future because introducing these measures within an inpatient medical facility would introduce workflow documentation challenges and likely result in unintended consequences. Further, the commenter suggested that prior to any measure migration there be a review of the appropriate regulations (that is, HIPAA or State-specific guidance) regarding the sharing of sensitive mental health data.

Response: We acknowledge commenter's concerns and recommendations regarding the use of behavioral health measures in the Hospital IQR Program and will consider them should we propose behavioral health measures in future rulemaking.

d. Potential Public Reporting of Quality Measures Data Stratified by Race, Ethnicity, Sex, and Disability and Future Hospital Quality Measures That Incorporate Health Equity

We sought comment on the possibility of including Hospital IQR Program measure data stratified by race, ethnicity, sex, and disability on *Hospital Compare,* if feasible and appropriate (that is, statistically appropriate, etc.) in the future. By stratification, we mean that we would report quality measures for each group of a given category (age, race, sex, and disability status). For example, if we were to report the Hospital-Wide All-Cause Unplanned Readmission Measure (HWR) (NQF #1789) stratified by sex, we would report a hospital's measure result for females and then again separately for males, in addition to reporting a hospital's unstratified rate, as is currently displayed. In addition, we also sought comment on potential hospital quality measures, including composite measures, for inclusion in the Hospital IQR Program measure set and thus, future postings on *Hospital Compare,* that could help consumers and stakeholders not only assess the measurement of the quality of care furnished by hospitals in inpatient settings, but also monitor trends in health equity. Any data pertaining to these areas that are recommended for collection through measure reporting for the Hospital IQR Program and public disclosure on *Hospital Compare,* would be addressed through a separate and future notice-and-comment rulemaking.

We invited public comment on the possibility of future inclusion of stratified quality measures data on *Hospital Compare* and on stratification categories, including any categories not specified in this preamble. We also sought comment on potential future hospital quality measures that incorporate health equity. The comments we received and our responses are set forth below.

Comment: Several commenters supported future reporting of measures in the Hospital IQR Program stratified by race, ethnicity, sex, and disability status if feasible and statistically appropriate. Commenters noted that stratification would contribute to greater transparency for consumers and provide an incentive for hospitals to improve the reporting of these factors. A few commenters recommended that CMS consider stratifying by additional factors including primary language and other social determinants of health because this type of data will enable more accurate evaluation in coverage gaps and disparities, particularly among minority and vulnerable populations, and are essential to improving the impact of adult immunization efforts and expanding coverage. Another commenter encouraged CMS to include age, income, and education level along with any of the above demographic factors it may use in stratification of measure reporting and suggested that CMS consider enabling multiple cross-cutting factors to be applied to any stratification to facilitate stratification by more than one factor at the same time. Another commenter recommended that CMS also consider stratification by age bands.

Several commenters also expressed the opinion that a uniform approach to data collection and stratification is necessary to ensure appropriate comparisons. One commenter suggested that, in order for the stratification information that would be shared to be meaningful, the standards used for the Hospital IQR Program for race, ethnicity, and sex must align with the Medicare and Medicaid EHR Incentive Programs. Further, this commenter stated that a standardized definition of ''disability'' needs to be developed, as currently one does not exist. Another commenter urged CMS to engage in a national dialogue on this important matter and to consider the Health Research and Educational Trust (HRET) Disparities Toolkit as an appropriate place to start discussion regarding a uniform data collection. Another commenter urged CMS to engage in a national dialogue on this important matter as these conversations are also ongoing across the health insurance exchange and MA markets.

Response: We thank the commenters for their support and suggestions. We will consider these recommendations should we propose to adopt stratified measure reporting in future rulemaking.

Comment: Several commenters supported use of performance measure stratification as a tool to identify and reduce health disparities, but urged CMS to continue to explore appropriate risk adjustment of measures, including risk adjustment for SDS factors. Commenters stated that differences in performance measure outcomes due to actual variation in the quality of care provided to subgroups of patients should not be tolerated.

Response: We thank the commenters for their support and recommendations. We will consider these recommendations should we propose to adopt stratified measure reporting in future rulemaking.

Comment: A few commenters did not support future reporting of measures in the Hospital IQR Program stratified by race, ethnicity, sex, or disability status. One commenter raised specific concerns about the method of data collection, indicating that patient demographic information is collected by entry level registration staff who are often not skilled in collecting sensitive information. In addition, the commenter stated that the inclusion of this information would pose additional administrative burden. Another commenter believed that the reasons for variation in performance by patient characteristics may or may not be related to hospital performance, and this type of reporting therefore raises more questions than it answers and could lead to misinterpretation and unintended consequences.

Response: We thank commenters for voicing their concerns and will consider them should we propose to adopt stratified measure reporting in future rulemaking.

Comment: One commenter suggested that CMS and AHRQ continue to conduct research on the impact of socioeconomic determinants upon health care outcomes. The commenter also requested that the results of this research be shared publicly.

Response: As we have previously noted, we have not risk-adjusted measures for SDS factors because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. However, as stated in section VIII.A.6.a.(1) of the preamble of this final rule, several measures developed by CMS have been brought to NQF since the beginning of the SDS trial. CMS, in compliance with NQF's guidance, has tested sociodemographic factors in the measures' risk models and made recommendations about whether or not

to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our outcome measures.

Furthermore, ASPE is conducting research to examine the impact of SDS on quality measures, resource use, and other measures under the Medicare program as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how they apply to our quality programs at such time as they are available. Moreover, we will continue to collaborate with colleagues across HHS to evaluate the impact of SDS factors on healthcare outcomes and to develop an effective and transparent method for communicating results to the public.

Comment: Several commenters warned that it may not be a simple task to stratify measures by race, ethnicity, sex, and disability because specific considerations are required for every measure and each reporting mechanism to implement such a requirement. Specifically, one commenter noted that small denominator sample sizes are inherently problematic, and, if further stratified by factors such as race, age, and gender, will skew the reliability of the measure data. Therefore, the commenter stated that the stratified data should not be used for financial accountability programs. Instead, the commenter recommended that CMS develop educational material that will assist stakeholders in interpreting stratified quality measures. Another commenter supported the concept of CMS gathering data in the ways that can best lead to improved outcomes, but requested at minimum 18 months to implement changes.

Response: We thank commenters for voicing their concerns and will consider them in should we propose to adopt stratified measure reporting in future rulemaking.

Comment: One commenter acknowledged the importance of the policy aim to better understand health disparities and health equity, but recommended delaying the inclusion of stratified measures in the Hospital IQR Program until the collection of race, ethnicity, and disability data have matured. The commenter noted that CMS requires the capture of REAL (race, ethnicity, age, and language) data as part of the Medicare and Medicaid EHR Incentive Programs, but that this activity is relatively new and the quality of the REAL data captured through the EHRs needs to be studied to determine whether it can be used for this purpose. The commenter noted that Hospital Engagement Networks (HENs) are required to work with hospitals to standardize the collection of REAL data. This work, it stated, will continue in the future through the newly created Hospital Improvement Innovation Networks (HIINs), which will be required to identify gaps in the collection of REAL data in their network and to provide interventions and assistance to reduce these gaps leading to improvement of the quality of REAL data in the next few years.

Response: We appreciate the comments regarding ongoing efforts to standardize and improve the collection of race, ethnicity, age, and language data. In addition, we acknowledge commenter's recommendation for delaying stratification and will consider these comments should we propose to adopt stratified measure reporting in future rulemaking.

Comment: One commenter expressed interest in learning the submission requirements for patient characteristics data provided for quality measures. The commenter also noted that the benefit of health equity data would need to be weighed against any new data collection burden.

Response: Submission requirements for patient characteristics vary from measure to measure. If in the future we move forward with a proposal to stratify measure data by race, ethnicity, sex, and disability on *Hospital Compare,* we will balance the benefit health equity data would provide against any new data collection burden associated with measures not currently subject to REAL requirements. We thank the commenters for their feedback and suggestions and we will consider them as we develop future policies.

10. Form, Manner, and Timing of Quality Data Submission

a. Background

Sections 1886(b)(3)(B)(viii)(I) and (b)(3)(B)(viii)(II) of the Act state that the applicable percentage increase for FY 2015 and each subsequent year shall be reduced by one-quarter of such applicable percentage increase (determined without regard to sections 1886(b)(3)(B)(ix), (xi), or (xii) of the Act) for any subsection (d) hospital that does not submit data required to be submitted on measures specified by the Secretary in a form and manner, and at a time, specified by the Secretary. Previously, the applicable percentage increase for FY 2007 and each subsequent fiscal year until FY 2015 was reduced by 2.0 percentage points for subsection (d) hospitals failing to submit data in accordance with the description above. In accordance with the statute, the FY 2016 payment determination began the second year that the Hospital IQR Program will reduce the applicable percentage increase by one-quarter of such applicable percentage increase.

In order to participate in the Hospital IQR Program, hospitals must meet specific procedural, data collection, submission, and validation requirements. For each Hospital IQR Program payment determination, we require that hospitals submit data on each specified measure in accordance with the measure's specifications for a particular period of time. The data submission requirements, Specifications Manual, and submission deadlines are posted on the QualityNet Web site at: *http://www.QualityNet.org/*. Hospitals must register and submit quality data through the secure portion of the QualityNet Web site. There are safeguards in place in accordance with the HIPAA Security Rule to protect patient information submitted through this Web site.

b. Procedural Requirements for the FY 2019 Payment Determination and Subsequent Years

The Hospital IQR Program's procedural requirements are codified in regulation at 42 CFR 412.140. We refer readers to these codified regulations for participation requirements, as further explained by the FY 2014 IPPS/LTCH PPS final rule (78 FR 50810 through 50811). In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25199), we did not propose any changes to these procedural requirements.

However, as discussed below in section VIII.A.11. of the preamble of this final rule, we proposed to amend § 412.140(d)(2) in connection with our proposal to modify our validation processes beginning with the FY 2020 payment determination.

c. Data Submission Requirements for Chart-Abstracted Measures

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51640 through 51641), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53536 through 53537), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50811) for details on the Hospital IQR Program data submission requirements for chart-abstracted measures. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25199), we did not propose any changes to the data submission requirements for chart-abstracted measures.

d. Alignment of the Hospital IQR Program With the Medicare and Medicaid EHR Incentive Programs for Eligible Hospitals and CAHs

(1) Background

We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50256 through 50259) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49709) for our policies aligning eCQM data reporting and submission periods on a calendar year basis for both the Medicare EHR Incentive Program for eligible hospitals and CAHs and the Hospital IQR Program for the FY 2017 payment determination and subsequent years for the Hospital IQR Program.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25199 through 25201), we proposed the following changes to the Hospital IQR Program to further align eCQM data reporting for the Hospital IQR Program with the Medicare and Medicaid EHR Incentive Programs: (1) Maintaining the eCQM data certification process we previously adopted for the FY 2018 payment determination, including requiring hospitals to report eCQM data using EHR technology certified to either the 2014 or 2015 Edition of the Office of the National Coordinator for Health Information Technology's (ONC's) certification criteria for health information technology and which meets the electronic health record technology (CEHRT) definition for the CY 2017 reporting period/FY 2019 payment determination; and (2) requiring the use of EHR technology certified to the 2015 Edition beginning with the CY 2018 reporting period/FY 2020 payment determination and subsequent years.

In addition, we proposed to require eCQM data submission by the end of 2 months following the close of the reporting period calendar year for the CY 2017 reporting period/FY 2019 payment determination and subsequent years to further align eCQM data reporting for the Hospital IQR Program with the Medicare EHR Incentive Program. These proposals are discussed in more detail below.

(2) Continuation of eCQM Certification Processes for the FY 2019 Payment Determination and Requirements for Subsequent Years

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708), we finalized policies regarding eCQM certification for the FY 2018 payment determination. Specifically, we finalized that: (1) Hospitals can report using EHR technology certified to either the 2014 or 2015 Edition for the CY 2016 reporting period/FY 2018 payment determination since certification to the 2015 Edition is expected to be available in 2016; and (2) hospitals must submit eCQM data via Quality Reporting Document Architecture Category I (QRDA I) file format (80 FR 49706–49708). In addition, hospitals may use third parties to submit QRDA I files on their behalf (80 FR 49706) and can either use abstraction or pull the data from non-certified sources in order to then input these data into CEHRT for capture and reporting QRDA I (80 FR 49706).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25200), we proposed to continue these eCQM certification policies. Specifically, for the CY 2017 reporting period/FY 2019 payment determination (not subsequent years), we proposed to require that hospitals report using EHR technology certified to either the 2014 or 2015 Edition as previously required. We note that we proposed to change these policies, however, for the CY 2018 reporting period/FY 2020 payment determination as discussed in the following section.

In addition, for the CY 2017 reporting period/FY 2019 payment determination and subsequent years, we proposed that hospitals: (1) Must submit eCQM data via QRDA I files as previously required; (2) may continue to use a third party to submit QRDA I files on their behalf; and (3) may continue to either use abstraction or pull the data from non-certified sources in order to then input these data into CEHRT for capture and reporting QRDA I. This would align the Hospital IQR Program with the Medicare EHR Incentive Program. We refer readers to section VIII.E.2.c. of the preamble of this final rule for discussion of the certification requirements for the Medicare EHR Incentive Program.

We invited comment on these proposals. In addition, we refer readers to section VIII.A.11.b.(5) of the preamble of this final rule where we encourage hospitals to take advantage of eCQM pre-submission testing tools to help reduce submission errors related to improperly formatted QRDA I files.

Comment: One commenter supported alignment with the Medicare and Medicaid EHR Incentive Programs to use the QRDA I standard, to permit the use of third party entities to submit QRDA I files, and to use CEHRT for capturing and reporting data in QRDA I. The commenter expressed concern that requiring electronic submission of eCQM data using the most recent version of CEHRT might create a disconnect in the timing cycle of the regulatory adoption of standards and the rapid evolution of electronic standards for eCQM reporting. The commenter recommended that CMS and ONC collaborate to establish a regulatory framework that is more responsive to the speed at which standards are developed, maintained, upgraded, and improved. One commenter supported the intent to align the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program reporting requirements to reduce provider burden and minimize confusion about reporting criteria across various quality reporting programs, but expressed concern about the expansion of eCQMs with the current state of EHR technology. One commenter urged CMS, as part of its certification process, to seek stakeholder input and to define standards for EHR organization and structure that allows for documentation to fit into the clinical workflow and interact with providers at the point-of-contact to guide them to provide timely and appropriate care.

Response: We thank the commenter for this support. We appreciate the commenter's concerns about the current timeframe of evolving electronic standards and the timing cycle for the regulatory adoption of standards. We will continue to seek stakeholder input and collaborate with colleagues at ONC to define standards for EHR organization and structure that allows for documentation to fit into the clinical workflow and to ensure that our policies are responsive to evolving electronic standards to the greatest extent feasible.

Comment: One commenter recommended that CMS not require a hospital to combine eCQM data from two CEHRT solutions if a hospital switches vendors during a reporting quarter or year but rather to submit only one QRDA I file from the CEHRT solution on which the hospital was utilizing for a majority of the reporting quarter because QRDA I files do not allow for combining data from multiple sources while ensuring that patient data is not repeated as a result of the combination.

Response: We thank the commenter for this suggestion, but we disagree that QRDA I files do not allow for combining data from multiple sources while ensuring that patient data are not repeated. We expect that QRDA I files submitted for the Hospital IQR Program electronic reporting requirement are one patient per file per quarter and cumulative in nature, thus allow for the combination of data from multiple sources to contain all the episodes of care and the measures associated with the patient file for the same reporting quarter. When QRDA I files are

submitted, the following four key elements are utilized to identify the file:

- CMS Certification Number (CCN);
- CMS Program Name;
- EHR Patient ID; and
- Reporting period specified in the Reporting Parameters Section.

Utilization of the four key elements for file identification, and the requirement to ensure the QRDA I file is cumulative and representative of one quarter of data, greatly reduces the likelihood of receiving repeated patient data. We note, however, that the system will overwrite the original file with the most recent submission if all four key elements are an exact match.

We refer readers to the succession management criteria outlined within the CMS Implementation Guide for Quality Reporting Document Architecture Category I and Category III Eligible Professional Programs and Hospital Quality Reporting (HQR) Version 1.0 for additional details. The document is updated annually and posted on the eCQM Library on the CMS Web site available at: *https://www.cms.gov/regulations-and-guidance/legislation/ehrincentiveprograms/ecqm_library.html.*

Comment: A few commenters requested clarification on the use of abstraction to extract data from non-certified sources into CEHRT for capture and reporting through QRDA I files. One commenter expressed concern that a hospital might chart-abstract data to complete the data set necessary to report on an eCQM because this duplicative transcription process could lead to errors and conflict with the medical record maintained in the certified EHR. Some commenters expressed the opinion that clinical data used to satisfy eCQM reporting should originate from a credible source, and if not, abstraction of data from a non-certified source would undermine the integrity of the EHR Incentive Program. The commenters recommended that chart-abstraction should never be permitted for eCQMs and that reporting should be based solely on information available in CEHRT through the normal record management process in place at the hospital. One commenter urged CMS to utilize chart abstraction for quality reporting until the EHR transformation is made to allow clinicians to focus on delivering high quality patient focused care without the distraction of eCQM reporting using an EHR structure that has yet to evolve to support true meaningful use.

Response: We appreciate the commenters' concerns about information from non-certified sources into CEHRT for capture and reporting through QRDA I files. Ideally, information available in CEHRT through normal record management process should be in place and used to report on eCQMs. However, many hospitals are still undergoing the time consuming and labor intensive process of data mapping their EHR systems. Data mapping is necessary in order to be able to capture required data elements, such as diagnostic study results/reports or other measure information, in discrete structured data fields to support the eCQMs because they are often found as free text in clinical notes or PDF documents attached to the medical record instead.

In recognition of the reality that hospitals are in a state of transition, it is our intent to allow hospitals some flexibility in reporting methods if necessary during this period of transition. Therefore, at this time, we will continue to permit the use of abstraction to extract data from non-certified sources into CEHRT for capture and reporting through QRDA I files. However, we encourage hospitals to continue making progress to fully achieve electronic data capture and reporting or to work with their vendors to do so. We acknowledge the commenters' concerns that using chart-abstracted data to complete the data set necessary to report on an eCQM could result in a duplicative transcription process that could lead to errors and conflict with the medical record maintained in the CEHRT, but we believe that the potential for error exists any time providers enter information into an EHR. In order to identify mismatches and inaccuracies in data, in this final rule we are finalizing a policy to validate eCQM data beginning with the FY 2020 payment determination. We refer readers to section VIII.A.11.b. of the preamble of this final rule for more details on the validation process for eCQM data.

Comment: One commenter expressed concern with these proposals because a number of hospitals have not successfully submitted QRDA I files and CEHRT is not capable of generating QRDA I files for submission without modifications. The commenter suggested that CMS provide more detailed guidance, education, and support on QRDA I file generation and release lessons learned to improve the process.

Response: We note that our data show that 95 percent of hospitals already attest to successful eCQM reporting under the Medicare EHR Incentive Program and, accordingly, we believe that the majority of hospitals will successfully report eCQMs. We recognize that technical mapping may be potentially burdensome, but we disagree that CEHRT is not capable of generating QRDA I files for submission without modifications. We encourage hospitals to work with their vendors to overcome these issues. We encourage all hospitals to submit files early, as well as to use one of the available presubmission testing tools for electronic reporting—such as the CMS Pre-Submission Validation Application (PSVA), which can be downloaded from the Secure File Transfer (SFT) section of the QualityNet Secure Portal at *https://cportal.qualitynet.org/QNet/pgm_select.jsp.* We refer readers to section VIII.A.11.b.(5) of the preamble of this final rule for more information about the PSVA. In addition, we acknowledge the commenter's suggestion to put additional focus on QRDA I file generation in our education and outreach activities for the Hospital IQR Program.

After consideration of the public comments we received, we are finalizing that hospitals must report using EHR technology certified to either the 2014 or 2015 Edition for the CY 2017 reporting period/FY 2019 payment determination (not subsequent years) as proposed. We also refer readers to section VIII.A.10.d.(5) of the preamble of this final rule, in which we finalize alignment of this policy in the Medicare and Medicaid EHR Incentive Programs. We are also finalizing, for the CY 2017 reporting period/FY 2019 payment determination and subsequent years, that hospitals: (1) Must submit eCQM data via QRDA I files as previously required; (2) may use a third party to submit QRDA I files on their behalf; and (3) may either use abstraction or pull the data from non-certified sources in order to then input these data into CEHRT for capture and reporting QRDA I as proposed.

(3) Required Use of EHR Technology Certified to the 2015 Edition for the FY 2020 Payment Determination and Subsequent Years

As stated in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705), some commenters requested that hospitals be given the opportunity to use the most recent version of CEHRT (2015 Edition) for the CY 2016 reporting period/FY 2018 payment determination if they are able. We believe this requirement will mitigate the existing vendor issue of system comparability between hospitals and vendors and facilitate consistency regarding the version of CEHRT to which vendors are certified by establishing uniformity in the version of the product used. Therefore, in the FY

2017 IPPS/LTCH PPS proposed rule (81 FR 25200), we proposed to require the use of EHR technology certified to the 2015 Edition beginning with the CY 2018 reporting period for the FY 2020 payment determination and subsequent years. This would align the Hospital IQR Program with the Medicare and Medicaid EHR Incentive Programs. We also refer readers to section VIII.E.2.c. of the preamble of this final rule for discussion of the certification requirements for the Medicare and Medicaid EHR Incentive Programs.

We invited public comment on our proposal to require the use of EHR technology certified to the 2015 Edition for the CY 2018 reporting period/FY 2020 payment determination and subsequent years as stated above.

Comment: Several commenters supported the proposals to align the CEHRT requirements, measure set, and deadlines between the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program because these proposals will decrease the burden on organizations that currently report for both programs.

Response: We thank the commenters for their support.

Comment: One commenter expressed concern that the vendor community will not have adequate time to deliver the updated products to the market place in time for all providers to meet the 2018 reporting, which would require use of version 2015 CEHRT. The commenter explained that the proposed changes in eCQM reporting would necessitate sufficient time for vendors and providers to test and deploy CEHRT. The commenter acknowledged that measures need to evolve, but stated that a balance needs to be reached such that the churn around development and deployment is not endless. For this reason, the commenter urged CMS to make greater strides to enact a ''predictable'' cycle from measure development to provider data submission.

Response: We note that the 2015 Edition certification criteria is available for testing beginning in 2016,[190] but EHR technology certified to the 2015 Edition will not be required until the CY 2018 reporting period. We recognize there is burden associated with development and deployment, but we believe requiring use of the most recent version of CEHRT is important in allowing us to collect relevant electronic data. In addition, we are finalizing a modified version of our proposal to require reporting on only 8 self-selected eCQMs (instead of all eCQMs) to reduce burden, in part so that hospitals and vendors can focus on implementation of the 2015 Edition. We refer readers to section VIII.A.8.a. of the preamble of this final rule for more details on this modification. We believe that these modified requirements provide sufficient time for hospitals to test and deploy CEHRT. While we appreciate the commenter's suggestion that we strive to enact a ''predictable'' cycle from measure development to provider data submission, we must balance the importance of keeping pace with evolving electronic standards and the timing cycle for the regulatory adoption of standards when adopting policies for the Hospital IQR Program.

After consideration of the public comments we received, we are finalizing the required use of EHR technology certified to the 2015 Edition for the CY 2018 reporting period/FY 2020 payment determination and subsequent years as proposed. We also refer readers to section VIII.A.10.d.(5) of the preamble of this final rule, in which we finalize alignment of policies in the Medicare and Medicaid EHR Incentive Programs.

(4) Electronic Submission Deadlines for the FY 2019 Payment Determination and Subsequent Years

We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50256 through 50259) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708) for our previously adopted policies to align eCQM data reporting and submission periods for both the Medicare EHR Incentive Program for eligible hospitals and CAHs and the Hospital IQR Program for the FY 2018 payment determination.

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50249 through 50252), we finalized our policy that hospitals may voluntarily report 16 electronic measures by submitting one quarter of eCQM data from CY Q1 (January 1–March 31, 2015), CY Q2 (April 1–June 30, 2015), or CY Q3 (July 1–September 30) by November 30, 2015. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49693 through 49698), for the FY 2018 payment determination, we finalized a policy that hospitals must submit one quarter of data (either Q3 or Q4 of CY 2016) for at least 4 eCQMs by the submission deadline of February 28, 2017.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25200), in order to align the Hospital IQR Program eCQM data submission deadline with that of the Medicare EHR Incentive Program, which requires eCQM data submission by the end of two months following the close of the reporting period calendar year (80 FR 62896 through 62897), we proposed to establish an eCQM submission deadline for the Hospital IQR Program which requires eCQM data submission by the end of two months following the close of the calendar year for the CY 2017 reporting period/FY 2019 payment determination and subsequent years. For example, for the CY 2017 reporting period/FY 2019 payment determination, hospitals would be required to submit eCQM data for the Hospital IQR Program by February 28, 2018, which is the end of 2 months following the close of the calendar year (December 31, 2017). This would align the Hospital IQR Program with the Medicare EHR Incentive Program deadlines. We note that deadlines for the Medicaid (not Medicare) EHR Incentive Program differ by State, and therefore our proposal to align data submission deadlines for eCQMs applies only to the Hospital IQR Program and the Medicare EHR Incentive Program and not to the Medicaid EHR Incentive Program. For more information about the Medicaid EHR Incentive Program for eligible hospitals and CAHs, we refer readers to: *https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/Eligible_Hospital_Information.html.*

We invited public comment on our proposal to align the Hospital IQR Program eCQM submission deadline with that of the Medicare EHR Incentive Program for the CY 2017 reporting period/FY 2019 payment determination and subsequent years as discussed above.

Comment: One commenter expressed support for the policy that the submission period for reporting eCQMs electronically is the two months following the close of the calendar year because this policy allows for continued improvement over the course of the year without the interruption of submission.

Response: We thank the commenter for its support. With regard to the submission period for eCQM reporting, however, we note that we are finalizing our proposal to require eCQM data submission by the end of 2 months following the close of the reporting period calendar year for the CY 2017 reporting period/FY 2019 payment determination and subsequent years. We wish to clarify that the submission period would not be limited to only a two-month submission window from the end of the reporting period to the end of 2 months following the close of the reporting period as commenter suggested (for example, for CY 2017

[190] 2015 Edition CEHRT Information available at: *https://www.healthit.gov/sites/default/files/final2015certedfactsheet.022114.pdf.*

reporting, a submission window of January 1, 2018 through February 28, 2018). We anticipate that following the close of the CMS data receiving system for CY 2016 reporting period eCQM data submissions, we will re-open the system in late spring 2017 to be able to receive both QRDA I test files and QRDA I production files for CY 2017 reporting period eCQM data submissions. This would allow hospitals and vendors greater flexibility to submit QRDA I files earlier as soon as each calendar quarter ends rather than waiting to submit all QRDA I files during the last two months of the submission period.

We encourage all hospitals and vendors to submit QRDA I files early, as well as to use one of the presubmission testing tools for electronic reporting, such as the CMS Pre-Submission Validation Application (PSVA), to allow additional time for testing and to make sure all required data files are successfully submitted by the deadline. The PSVA can be downloaded from the Secure File Transfer (SFT) section of the QualityNet Secure Portal at: *https://cportal.qualitynet.org/QNet/pgm_select.jsp.* We refer readers to section VIII.A.11.b.(5) of the preamble of this of this final rule for more information about the PSVA. We also refer readers to section VIII.E.2.b. of the preamble of this final rule in which the submission deadline for the Medicare EHR Incentive Program is finalized.

Comment: A few commenters supported the effort to align the proposals for both the Hospital IQR Program and the EHR Incentive Programs, but expressed concern about the same challenges in reporting all eCQMs in both the Medicare and Medicaid EHR Incentive Programs and in the Hospital IQR Program. The commenters urged CMS to maintain the current requirements in the Hospital IQR Program and the Medicare and Medicaid EHR Incentive Programs for CY 2017 to give hospitals time to plan and prepare.

Response: We thank the commenters for their support. We refer readers to section VIII.A.8.a. of the preamble of this final rule for our discussion of the modified required number of eCQMs and our final policy.

Comment: A commenter expressed concern with the proposals to align the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program because there are differences in the available and required number of eCQMs for reporting between IQR and the Medicare and Medicaid EHR Incentive Programs. The commenter requested that CMS require the same number of eCQMs regardless of how the eCQMs are reported.

Response: We are aligning the programs and finalizing the same number of eCQMs that will be required to be reported for the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program (that is, 8 of the available eCQMs in the programs). We refer readers to section VIII.A.8.a. of the preamble of this final rule in which we finalize a modified policy to require 8 eCQMs, and section VIII.E.2. of the preamble of this final rule in which the measure set and the required number of eCQMs to be reported for the Medicare and Medicaid EHR Incentive Programs are finalized. We note that as part of our alignment efforts, a hospital may report the same eCQMs for the Hospital IQR Program and the Medicare and Medicaid EHR Incentive Programs. With regard to the available set of eCQMs, the Medicare and Medicaid EHR Incentive Programs have one additional eCQM available, ED–3 (Median Time from ED Arrival to ED Departure for Discharged ED Patients), that is applicable only for the outpatient hospital setting (77 FR 54083 through 54087), and would not count towards meeting Hospital IQR Program eCQM reporting requirements.

After consideration of the public comments we received, we are finalizing the alignment of the Hospital IQR Program eCQM submission deadline with that of the Medicare EHR Incentive Program—the end of two months following the close of the calendar year—for the CY 2017 reporting period/FY 2019 payment determination and subsequent years as proposed. We also refer readers to section VIII.E.2.b. of the preamble of this final rule where we discuss submission deadlines in the Medicare EHR Incentive Program.

(5) Summary of Alignment

We are finalizing our proposals to align the Hospital IQR Program with the Medicare and Medicaid EHR Incentive Programs as summarized below:

ALIGNMENT OF HOSPITAL IQR PROGRAM WITH BOTH THE MEDICARE AND MEDICAID EHR INCENTIVE PROGRAMS

- Removal of 13 eCQMs.
- Requirement for submission of 8 self-selected eCQMs out of the available eCQMs for the CY 2017 reporting period/FY 2019 payment determination.*
- Requirement for annual submission of four quarters of eCQM data.
- Required use of EHR technology certified to the 2014 or 2015 Edition of CEHRT for CY 2017 reporting period/FY 2019 payment determination.**

*The Hospital IQR Program is also finalizing the required reporting of 8 eCQMs for the CY 2018 reporting period/FY 2020 payment determination.

**The Hospital IQR Program is also finalizing the required use of EHR technology certified to the 2015 Edition for the CY 2018 reporting period/FY 2020 payment determination. We note that in the proposed rule (81 FR 25200 through 25201), this chart stated ''Proposed use of 2015 CEHRT for CY 2018 reporting period/FY 2020 payment determination'' for the Hospital IQR Program and both the Medicare and Medicaid EHR Incentive Programs. The Medicare and Medicaid EHR Incentive Programs have not finalized this policy for CY 2018 reporting period/FY2020 payment determination. Technical revisions made here for accuracy.

ALIGNMENT OF HOSPITAL IQR PROGRAM WITH ONLY THE MEDICARE EHR INCENTIVE PROGRAM

- Required submission of eCQM data by the end of 2 months following the close of the reporting period calendar year.*

*We note that in the proposed rule (81 FR 25200 through 25201), this chart stated ''proposed submission of eCQM data 2 months following the close of the calendar year'' and did not accurately capture our proposal and final policy that submission would be required *by the end* of 2 months following the close of the reporting period calendar year. Technical revisions made here for accuracy.

e. Sampling and Case Thresholds for the FY 2019 Payment Determination and Subsequent Years

We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50221), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53537), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50819) for details on our sampling and case thresholds for the FY 2016 payment determination and subsequent years. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 24588), we revised our sampling and case thresholds policy so that, for the FY 2018 payment determination and subsequent years, hospitals will be required to submit population and sample size data only for those measures that a hospital submits as chart-abstracted measures under the Hospital IQR Program.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25201), we did not propose any changes to our sampling and case thresholds policy; however, we did receive several comments related to this policy.

f. HCAHPS Requirements for the FY 2019 Payment Determination and Subsequent Years

We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50220), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51641 through 51643), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53537 through 53538), and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50819 through 50820) for details on previously-adopted HCAHPS requirements. We also refer hospitals and HCAHPS survey vendors to the official HCAHPS Web site at *http://www.hcahpsonline.org* for new information and program updates regarding the HCAHPS Survey, its administration, oversight, and data adjustments. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25201), we did not propose any changes to the HCAHPS requirements.

g. Data Submission Requirements for Structural Measures for the FY 2019 Payment Determination and Subsequent Years

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51643 through 51644) and the FY 2013 IPPS/LTCH PPS final rule (77 FR 53538 through 53539) for details on the data submission requirements for structural measures. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25201), we did not propose any changes to data submission requirements for structural measures.

h. Data Submission and Reporting Requirements for HAI Measures Reported via NHSN

For details on the data submission and reporting requirements for HAI measures reported via the CDC's NHSN Web site, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51629 through 51633; 51644 through 51645), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53539), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50821 through 50822), and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50259 through 50262). The data submission deadlines are posted on the QualityNet Web site at: *http://www.QualityNet.org/*. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25201), we did not propose any changes to data submission and reporting requirements for HAI measures reported via the NHSN.

11. Modifications to the Existing Processes for Validation of Hospital IQR Program Data

a. Background

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53539 through 53553), we finalized the processes and procedures for validation of chart-abstracted measures in the Hospital IQR Program for the FY 2015 payment determination and subsequent years; the FY 2013 IPPS/LTCH PPS final rule also contains a comprehensive summary of all procedures finalized in previous years that are still in effect. We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50822 through 50835), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50262 through 50273), and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49710 through 49712) for detailed information on the modifications to these processes finalized for the FY 2016, FY 2017, and FY 2018 payment determinations and subsequent years.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25201 through 25204), we proposed to update the validation process in order to incorporate a process for validating eCQM data.

b. Modifications to the Existing Processes for Validation of Hospital IQR Program Data

(1) Background

In the proposed rule, we proposed to update the existing process for validation of Hospital IQR Program data, which has previously included up to 600 hospitals for chart-abstracted validation, to also include eCQM validation of up to 200 hospitals, for a total of up to 800 hospitals for validation for the FY 2020 payment determination and subsequent years. Specifically, 200 hospitals would be randomly selected for eCQM validation but among those hospitals some may be granted Extraordinary Circumstances Exemption (ECEs) or meet other exclusion criteria (discussed in additional detail below) potentially resulting in a number totaling less than 200 hospitals that actually participate in eCQM validation. Furthermore, we proposed that hospitals would be required to submit timely and complete medical record information from the Electronic Health Records (EHRs) for at least 75 percent of sampled records, but would not be scored on the basis of measure accuracy for FY 2020 payment determinations.

As we stated in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53555), determining the equivalence of eCQM data and chart-abstracted measures data requires extensive testing given that the data for the Hospital IQR Program support public reporting for both the Hospital IQR and the Hospital VBP Programs; in addition, for the Hospital VBP Program, the data are used to calculate hospitals' performance on a subset of measures which tie payment directly to measure performance. As described in the Hospital IQR Program discussion in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50258), we have received anecdotal comments about performance level differences between chart-abstracted and eCQM data. We stated that we did not have sufficient data to be able to confirm or refute the accuracy of those comments (79 FR 50258). In order to substantiate or refute the existence of performance-level differences between eCQM data and chart-abstracted measure data, we believe that we must collect more eCQM data and develop a process for validating the accuracy of those data.

As a result, we conducted a validation pilot test for eCQMs (discussed below). Our findings from this pilot test have informed what we believe the initial future direction of eCQM validation in the Hospital IQR Program should be. In the proposed rule, we proposed to adopt a validation process for eCQM data submissions beginning in spring of CY 2018, as further explained below.

(2) Validation Pilot Test

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50269 through 50273), we finalized a proposal to conduct a validation pilot test for eCQMs in FY 2015. The results of the pilot test yielded measure record matching rates (that is, the rates of medical record abstracted values as compared to the values reported in the QRDA I file) of

less than 50 percent for all of the measures reported. For all measures, the inconsistencies between abstracted values and values reported in the QRDA I files appear to be mainly due to missing data rather than actual differences in reported versus abstracted values. The highest rate of accuracy was 48 percent on both the STK–04 and VTE–1 eCQMs. In addition, all of the participating hospitals demonstrated significant difficulty in reporting the ED–1 and ED–2 eCQMs due to the ED Admit Date/Time data element, which contributed to the ED measure mismatch rates. Specifically, hospitals systematically reported a later date and time for the decision to admit a patient to the hospital in the QRDA I file than that identified by the Clinical Data Abstraction Center (CDAC) in the review of the medical record.

Follow-up interviews conducted by CDAC revealed that low accuracy rates and reporting difficulties were a result of a lack of targeted outreach and education efforts at the time of the pilot to adequately prepare participating hospitals for the specific reporting mechanisms. In order to improve data accuracy and diminish reporting difficulties, the CMS Education and Outreach contractor (EOC) as well as the Validation Support Contractor (VSC) plan to continue to conduct provider education follow-up and refine the validation process. We will work in conjunction with the EOC and VSC to enlarge the cohort of eligible hospitals that are able to successfully submit QRDA I files, as well as encourage hospitals that were not able to successfully submit QRDA I files to participate in follow-up interviews. These follow-up interviews will inform the eCQM validation process moving forward, and allow us to derive ''best reporting practices'' to consider once we begin scoring the measures. Additional details about the 2015 Validation Pilot are available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1140537256076*.

(3) Validation of eCQMs Beginning Spring CY 2018/FY 2020 Payment Determination

In response to the findings of the pilot test and in light of our proposal to increase the number of eCQMs on which hospitals are required to submit data for the Hospital IQR Program discussed in section VIII.A.8.a. of the preamble of this final rule, we believe that it is increasingly important to validate eCQM data to ensure the accuracy of future information submitted by hospitals and reported to the public. Therefore, we proposed to adopt a validation process for eCQM data submissions beginning in Spring of CY 2018, as further explained below.

(a) Number and Selection of Hospitals

We proposed to validate eCQM data submitted by up to 200 hospitals selected via random sample. Furthermore, we proposed that the following hospitals be excluded from this random sample of 200 hospitals selected for eCQM validation:

- Any hospital selected for chart-abstracted measure validation; and
- Any hospital that has been granted a Hospital IQR Program ''Extraordinary Circumstances Exemption'' for the applicable eCQM reporting period.

We acknowledge that the burden associated with both the chart-abstracted and eCQM validation processes would be significant. We do not intend to impose an undue burden on any hospital by requiring that it be subject to more than one of these processes in a program year. Thus, if a hospital is selected for chart-abstracted targeted or random validation, we proposed that hospital would be excluded from the eCQM validation sample.

In addition, although our targeted criteria permit that a hospital may be selected for chart-abstracted validation even if it has been granted an Extraordinary Circumstances Exemption with respect to one or more chart-abstracted measures for the applicable data collection period (77 FR 53552 through 53553), if a hospital is granted an Extraordinary Circumstances Exemption with respect to eCQM reporting for the applicable eCQM reporting period, we proposed that the hospital would be excluded from the eCQM validation sample due to its inability to supply data for validation. We note that due to these proposed exclusions, the total number of hospitals validated for eCQMs might be less than 200.

Adding the proposed eCQM validation would result in a total of up to 800 hospitals in the validation process, as described in the below tables.

Current Validation Process Number of Hospitals	
Chart-Abstracted Random	400
Chart-Abstracted Targeted	200
Total	600

Proposed Validation Process Number of Hospitals	
Chart-Abstracted Random	400
Chart-Abstracted Targeted	200
eCQM Random	200
Total	800

We believe that as we expand the required reporting of eCQMs in the Hospital IQR Program, we need to validate eCQM data to ensure the accuracy of information submitted by hospitals and reported to the public, as well as for future consideration of eCQMs for potential use in the Hospital VBP Program. In addition, during the first round of eCQM validation, we could better assess strategies to offset the resources required to conduct a scored method of eCQM validation for future rulemaking cycles.

We invited public comment on our proposals for the FY 2020 payment determination and subsequent years to: (1) Validate eCQM data submitted by up to 200 hospitals selected via random sample; and (2) to exclude any hospital selected for chart-abstracted measure validation as well as any hospital that has been granted a Hospital IQR Program ''Extraordinary Circumstances Exemption'' for the applicable eCQM reporting period as discussed above.

Comment: Several commenters supported the proposal to modify the existing validation process for the Hospital IQR Program to include validation of eCQM data for a variety of reasons. One commenter believed validation of eCQM data will promote transparency about the quality of the eCQM data being submitted as well as identify challenges inherent with data validity and eCQM reporting. The commenter recommended that CMS validate the accuracy of the content in the structured fields to see how consistent it is with the rest of the medical record because unless the accuracy of the structured fields is assured, the quality of the data reported by eCQM reporting will continue to be suspect and unfit for use in public reporting or pay-for-performance programs.

Response: We thank the commenters for their support and we will take recommendations related to the validation of the content in the structured files and its impact on medical record accuracy into consideration as we implement the validation of eCQM data. We understand the importance of reliable and valid information and share the commenter's desire to ensure the integrity of the data provided for public

reporting and pay-for-performance programs.

Comment: One commenter expressed concern that insufficient testing could result in unintended consequences to patient safety and health care quality, but expressed concern that the validation pilot may be too narrow for an accurate review. Another commenter noted that data extracted from EHRs differ from the data obtained from chart-abstracted measures and, therefore, currently are not reliable for display in a public reporting program.

Response: We acknowledge the commenter's concern about insufficient testing resulting in unintended consequences. We recognize that we must thoroughly evaluate the electronic data provided to us in order to promote patient safety and health care quality. We appreciate the commenter's concern that the validation pilot may be too narrow for an accurate review and to address this concern we are expanding the validation process for eCQM data to include 200 hospitals initially. After the first year of validation data is evaluated, we will be able to more accurately determine the most appropriate mechanisms for validating the information and consider if we need to expand the number of participating hospitals.

In response to the commenter's point about differing data extraction methods, we recognize that performance-level differences between eCQM data and chart-abstracted measure data may exist, however, we believe that we must collect more eCQM data and develop a process for validating the accuracy of those data. Further, we do not intend to publicly report eCQM data from the CY 2017 reporting period.

Comment: One commenter supported the proposed modifications to the existing validation process to include the validation of eCQM data, but expressed concern that the validation pilot focused only on the apparent lack of outreach and education to explain the mismatch between QRDA I and medical record abstraction to explain low level of accuracy. The commenter noted that other possible explanations for low accuracy include: Process workflows; data definitional issues; non-structured data requiring manual input; and the level of data completeness and reliability captured in CEHRT. The commenter recommended that CMS pursue additional strategies to increase the validity and reliability of the QRDA I reported measures. Also, because of the demonstrably poor concordance between eCQMs and their chart-abstracted counterparts, the commenter recommended that penalties be limited to pay-for-reporting, rather than pay-for-performance, programs until there are significantly better results. A few commenters expressed concern with the proposal to begin validating eCQM data because hospitals and vendors require more education and guidance to accurately report eCQM data. The commenters suggested that CMS improve the resources available to healthcare organizations regarding the implementation of eCQMs beyond validation. Another commenter expressed interest in engaging with CMS to further provide education to ensure that providers and vendors alike are aligned.

Response: We thank the commenter for these observations and we will consider these factors as we implement the validation process for eCQM data. The findings of the validation pilot revealed that hospitals indicated that they encountered difficulties in mapping the information in the EHR systems to the QRDA I specifications due to the use of unstructured data fields and multiple sources of information for various events. As stated in the proposed rule (81 FR 25202), the inconsistencies between abstracted values and values reported in the QRDA I files appear to be mainly due to missing data rather than actual differences in reported versus abstracted values. The highest rate of accuracy was 48 percent on both the STK–04 and VTE–1 eCQMs. In addition, all of the participating hospitals demonstrated significant difficulty in reporting the ED–1 and ED–2 eCQMs due to the ED Admit Date/Time data element, which contributed to the ED measure mismatch rates. Specifically, hospitals systematically reported a later date and time for the decision to admit a patient to the hospital in the QRDA I file than that identified by the Clinical Data Abstraction Center (CDAC) in the review of the medical record. The difficulties in mapping, which were caused by missing information, resulted in failure of the data to be translated to QRDA I. During the pilot, hospitals also indicated that much of the required information is documented in the hospital EHR system through free text notes, dictation, and scanned PDF documents, rather than discrete data fields. For this reason, data elements could not be extracted or mapped to create the data elements in the QRDA I files. In addition, hospitals indicated that clinical workflows and the use of clinical terminology did not align with the eCQM specifications at the time of the pilot, which hindered efficient data mapping by hospitals and their vendors. For more details on the eCQM validation pilot test, titled ''The Hospital IQR eCQM Pilot Summary,'' we refer readers to the pilot test findings available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1140537256076*.

As a result of these findings, we have updated the eCQM specifications to improve implementation and will continue outreach and education efforts, particularly regarding data mapping techniques/requirements to improve submission efforts moving forward. We appreciate the commenter's interest in education and outreach and encourage the commenter to engage with CMS. In addition, we will take the commenters' feedback into consideration as we provide education and outreach to hospitals and vendors about the eCQM validation requirements and we will solicit feedback on additional strategies to increase the validity and reliability of the QRDA I reported measures. We intend to continuously evolve our resources to ensure that healthcare organizations are equipped with the tools and knowledge to not only successfully submit eCQM data for validation, but to ensure that accurate and reliable data are submitted as part of regular eCQM reporting, prior to validation.

We note that accuracy of the data submitted for eCQM validation will have no impact on determination of the hospital's APU for at least the first year of validation in CY 2018; however, hospitals selected for eCQM validation still must submit timely (within 30 days of the records request) and sufficient (at least 75 percent complete) medical records to receive a full APU for the FY 2020 payment determination. We refer readers to section VIII.A.11.b.(3)(e) of the preamble of this final rule where we finalize our eCQM validation scoring policies.

Comment: A few commenters recommended delaying implementation of the proposal to begin validating eCQM data because the current timeline does not allow providers enough time to implement new processes in order to prevent receiving a penalty under the proposed validation policies. One commenter specifically recommended delaying validation by 24 months to allow providers to learn the rules of validation. Another commenter noted that the EHR vendor guidance for mapping data elements is not sufficient for full automation of the data extraction process such that most of the mapping is completed by hospital staff using their own procedures, resulting in a heavy burden for hospitals as well as

high potential for inconsistency in measure reporting output, even among hospitals using the same EHR vendor product. The commenter recommended delaying implementation of the eCQM data validation proposal to allow more time for vendors to develop standardized procedures and hospitals to implement efficient workflows based on these standardized procedures and encouraged CMS to ensure that hospitals are reasonably able to comply with these new requirements. A commenter stated that the experience of participants in the eCQM data validation pilot suggests that more time is needed before data validation can be successfully implemented in the broader Hospital IQR Program.

Response: We thank the commenters for their recommendations, but we disagree with the suggestion to delay implementation of an eCQM validation process. We note that we will not conduct the first validation of eCQM data until spring of 2018 to validate data from the CY 2017 reporting period and that the measures accuracy of data submitted for eCQM validation will have no impact on determination of the hospital's APU for purposes of the Hospital IQR Program for at least the first year this validation process is in effect. We believe this timeline does allow providers enough time to implement new processes and to learn the requirements of validation in order to prevent receiving a penalty under the validation policies.

We acknowledge that the data extraction process has been such that most of the mapping is completed by hospital staff using their own procedures, resulting in a high potential for inconsistency in measure reporting output, even among hospitals using the same EHR vendor product. It is precisely those types of inconsistencies on which we would be able to provide feedback to participating hospitals when sharing their validation results. Precisely because the results of the validation pilot demonstrated that there were significant inaccuracies in reported eCQM data, we believe that validation of eCQM data is critically important in order to guide improvement efforts and to tailor education and outreach to help hospitals improve the quality of the data they submit.

To address the suggestion of the creation of standardized data extraction procedures, we will utilize any input provided from EHR vendors during our education and outreach efforts that might be beneficial in such procedures. We also recognize that hospitals may have their own unique workflows, so input from both hospitals and EHR vendors would be utilized to help establish ''best practices.''

Comment: Some commenters acknowledged the importance of eCQM validation, but expressed concerns about the process, specifically, variable methods of recording data within the EHR at the user level, non-intuitive data collection requirements imposed by the measures and/or product design, the differences between manually-abstracted and electronically-abstracted measures, and the workflow changes required for chart review. One commenter recommended that CMS consider the EHR vendor role in the validation plan, and work with vendors to understand some of these variations, as well as to identify EHR system functional requirements and query vendors as to current product capabilities relative to these requirements.

Response: Our proposed eCQM validation process is intended to help hospitals identify and correct inconsistencies associated with varying methods of recording data within the EHR and different interpretations of data collection requirements at the user level in order to improve the accuracy of data reported. Instituting an eCQM validation process will help us to better understand how to help hospitals resolve these data reporting concerns. We acknowledge that many hospitals will most likely continue to have concerns about the accuracy of their data in the first few years of required eCQM reporting. It is for this reason that we have proposed and are finalizing that the measures accuracy of data submitted for eCQM validation will have no impact on determination of the hospital's APU for at least the first year (that is, the FY 2020 payment determination).

In response to the commenter's recommendation that we consider the EHR vendor role in the validation plan and work with vendors to understand some of these variations, identify EHR system functional requirements, and query vendors as to current product capabilities relative to these requirements, we acknowledge that EHR vendors could provide feedback invaluable to the eCQM validation process. We will make efforts, to the extent feasible, to include vendors in our outreach and education efforts, to provide them an opportunity to share their knowledge related to EHR system functional requirements and product capabilities that can inform the validation process and help to improve it over time.

Comment: One commenter recommended that, rather than focusing on validating eCQM data, CMS only include an eCQM in a quality reporting program if it has been fully tested by CMS to ensure the measure functions as intended, is deemed feasible by an appropriate process that considers the views of multiple applicable stakeholders, is fully field tested, and is endorsed by NQF.

Response: We note that our data show that 95 percent of hospitals already attest to successful eCQM reporting under the Medicare EHR Incentive Program and, accordingly, we believe that the majority of hospitals will successfully report eCQMs. Hospitals have had several years to report data electronically for the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program (3 years of pilot reporting and 3 years of voluntary reporting), which demonstrate that the eCQMs included in the Hospital IQR Program measure set function as intended and are feasible. In addition, as noted in the table in section VIII.A.7.c. of the preamble of this final rule, almost all of the eCQMs available in the Hospital IQR Program measure set for the FY 2019 payment determination are endorsed by the NQF (only the CAC–3 and STK–08 eCQMs are not NQF-endorsed). Whenever feasible, we adopt measures that are NQF-endorsed, but note that, sometimes, there are important areas of clinical concern for which NQF-endorsed measures do not exist. In these instances, we may elect to adopt measures that have not yet been NQF-endorsed.

Comment: A number of commenters recommended that CMS share the findings from the 2015 eCQM Validation Pilot as a method of keeping stakeholders informed about the validation process. The commenters noted that sharing this information will improve eCQM reporting accuracy and also facilitate an educational forum that allows hospitals and stakeholders to understand how to better implement eCQMs. One commenter also stated CMS' transparency with the results will allow hospitals to better understand the results and their general applicability to the greater hospital community.

Response: We agree with commenters and note that a summary of the findings from the eCQM validation pilot test we conducted, titled ''The Hospital IQR eCQM Pilot Summary,'' is available on the QualityNet Web site at: *http://www.QualityNet.org/.* Stakeholders were notified of the availability of this summary of the findings on June 13, 2016 via email. To access the summary, select the ''Data Validation'' link from

the ''Hospitals-Inpatient'' tab. On the Data Validation Overview page, select the ''Resources'' link in the left-side navigation pane. A list of communications regarding the Hospital IQR Program is available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier2&cid=1228765304720*.

Comment: One commenter recommended that CMS extend the EHR pilot testing beyond two hospitals and two EHR systems, to gather adequate information to understand how the eCQMs will work. The commenter further recommended that CMS collect a minimum of one year's worth of data from all hospitals and vendors chosen to participate in the EHR pilot testing, and explained that these data should be considered ''test'' data and not released publicly, but instead be released to hospitals for feedback to CMS. One commenter recommended additional testing of the eCQMs to avoid the unnecessary use of resources by facilities and CMS. Another commenter recommended that the implementation of eCQM data validation be delayed and that CMS convene stakeholders to discuss issues arising from the pilot project, clarify operational validation procedures based on that input, and then implement a larger pilot test before proposing and finalizing a validation process.

Response: The CMS eCQM validation pilot included 29 hospitals and 29 EHR systems, which we believe is an adequate sample size for a pilot. We disagree that eCQM validation should be delayed or that we should conduct another pilot because implementation of a validation process is intended to help hospitals identify and correct inconsistencies in eCQM data to improve the accuracy of data reported. Instituting an eCQM validation process will help us to better understand how to help hospitals resolve these data reporting concerns. Additional validation pilots would rely on voluntary participation by hospitals, which will produce a small sample size, as noted above with the 29 participating hospitals in the previous pilot.

We believe that implementing a broader validation process with mandatory participation better serves to achieve our goals of improving the accuracy of data reported and help us to better understand how to help hospitals resolve data reporting concerns because it will include a larger sample size. The objective of eCQM validation is to be responsive to concerns related to the reliability and validity of eCQM data, and ultimately to be able to confirm the accuracy of data sufficient for public reporting. If we continue to conduct pilot studies, we will continue to have inconclusive results based on a small sample size. We note that our data show that 95 percent of hospitals already attest to successful eCQM reporting under the Medicare EHR Incentive Program and, accordingly, we believe that the majority of hospitals will successfully report eCQMs; therefore, we do not believe additional testing is necessary or that implementation of an eCQM data validation process be delayed.

We note that we will not conduct the first validation of eCQM data until spring of 2018 to validate data from the CY 2017 reporting period, that the measures accuracy of data submitted for eCQM validation will have no impact on determination of the hospital's APU for at least the first year (that is, FY 2020 payment determination), and that the results of the validation will not be publicly reported. We believe that sharing eCQM validation results with hospitals will provide invaluable feedback that will enable them to identify issues and correct issues to improve their EHRs as well as the quality of their eCQM data.

Comment: One commenter expressed concern regarding the results of the eCQM validation pilot, which highlighted challenges for implementing eCQMs including the burden associated with mapping necessary data elements from the EHR to the appropriate QRDA format.

Response: We appreciate the commenter's concerns and acknowledge the burden associated with mapping necessary data elements from the EHR to the appropriate QRDA I format. We encourage hospitals to work with their vendors to resolve these issues. Precisely because the results of the validation pilot demonstrated that there were significant inaccuracies in reported eCQM data, we believe that validation of eCQM data is critically important in order to guide improvement efforts and to tailor education and outreach to help hospitals improve the quality of the data they submit.

Comment: One commenter opposed the eCQM validation proposal, stating that the addition of the eCQM validation process puts undue burden on facilities. The commenter noted that because QRDA I files contain information from the electronic medical record, submitting the complete medical record in PDF format will not provide the various codifications contained in the EHR. Further, the commenter added that the data reported will be more accurate and valuable if the rollout includes fewer, well-tested measures.

Response: We believe that appropriately mapped QRDA I files contain information from the EHR, and that submitting the complete medical record in PDF format will provide the various information contained in the EHR. We recognize that technical mapping may be potentially burdensome and we encourage hospitals to work with their vendors to overcome these issues. When hospitals work with their vendors to ensure that EHRs are appropriately structured in a way that fits in with the clinical work flow to yield reliable data through eCQMs, we believe that eCQMs promote higher quality outcomes and lower costs while ultimately decrease reporting burden on hospitals as compared with chart-abstraction of quality measure data.

We disagree that reporting or validation of eCQMs puts undue burden on facilities. We believe that it is appropriate to require reporting and validation of eCQMs given that measures available now and those being developed for the future are increasingly based on electronic standards (80 FR 49696). We also note that progress on the meaningful use of electronic health data is a national priority, as evidenced by the HITECH Act and the EHR Incentive Programs' Meaningful Use requirements. We believe that collection of eCQM data will enable hospitals to efficiently capture and calculate quality data that can be used to address quality at the point of care and track improvements over time. We also believe that the removal of 13 eCQMs, as detailed in section VIII.A.3.b. of the preamble of this final rule for the FY 2019 payment determination and subsequent years, appropriately addresses that implementation of the validation process includes fewer, well-tested measures as suggested by the commenter. We acknowledge that there are initial costs, but believe that long-term benefits associated with electronic data capture outweigh those costs. For these reasons, we believe that it is appropriate to require hospitals to report on an increasing number of eCQMs, as well as to implement a process to validate the data as these go hand-in-hand.

Comment: One commenter expressed concern with the proposal to validate eCQM data because the sample size may not be large enough to ensure selection of 200 hospitals. The commenter suggested that additional hospitals be included in the random sample to provide the ability to substitute hospitals into the sample if they are

needed and to ensure that the match rate is 90 percent.

Response: We acknowledge that among those hospitals selected for eCQM validation, some may be granted Extraordinary Circumstances Exemptions or meet other exclusion criteria (discussed in additional detail below) potentially resulting in a number totaling less than 200 hospitals that actually participate in eCQM validation. We believe that the sample size of 200 hospitals, consistent with the targeted sample size for chart-abstracted validation, will be sufficient even taking into account the possibility that some hospitals selected for validation may not participate in validation if they satisfy any of the exclusion criteria. We may consider increasing the sample size in the future.

Comment: One commenter supported the proposal to modify the existing validation process to include validation of eCQM data, but recommended changes to the proposed validation methodology. Specifically, the commenter recommended that CMS: compare performance rates for all populations within an eCQM to their chart-abstracted counterparts, which would require comparable chart abstracted specifications; convene a multi-stakeholder group to address the detailed methodology of comprehensive data validation prior to submission and conduct an audit post-submission; and establish a National Test Collaborative for fully testing new eCQMs prior to their implementation in CMS programs.

Response: We thank the commenter for its suggestions, and we will take them into consideration as we implement the validation process for eCQM data. In response to the commenter's suggestion that we compare performance rates for all populations within an eCQM to their chart-abstracted counterparts, we do not have data available to conduct such comparisons at this time, but as our eCQM validation process matures, we will take this recommendation into consideration in the future. However, we note that eCQM data and chart-abstracted data are not always one hundred percent comparable due to the use of structured data fields in eCQMs and free text in chart-abstracted measures. In response to the commenter's suggestion that we convene a multi-stakeholder group to address the detailed methodology of comprehensive data validation prior to submission and conduct an audit post-submission, we acknowledge the importance of having multi-stakeholder input to inform pre and post submission validation efforts, and we believe that input from such a group would be meaningful as we continue to evolve our validation policies. Currently, we gather this type of input from Technical Expert Panels (TEPs) that assist in evaluating the information collected during field testing as a part of the eCQM development process. In addition, we gather feedback from stakeholders via public comment during both the alpha and beta testing phases of measure development. As such, we will make every effort to engage stakeholders in a similar manner, through outreach and education about eCQM validation. In response to the commenter's point about establishing a National Test Collaborative, we will take this recommendation into consideration in the future.

Comment: One commenter expressed concern that the validation methodology could negatively impact hospitals because the CMS contractor will look at free text fields, which likely are not reviewed by the CEHRT tool.

Response: We acknowledge the commenter's concerns, but we disagree that the validation methodology could negatively impact hospitals because as we have stated above, accuracy of the data submitted for eCQM validation will have no impact on determination of the hospital's APU for at least the first year and the results of the validation will not be publicly reported. Further, as discussed in section VIII.A.10.d.(5) of the preamble of this final rule, we are finalizing the required use of EHR technology certified to the 2015 Edition beginning with the CY 2018 reporting period, to better ensure that the information provided in the free text fields has been adequately reviewed.

After consideration of the public comments we received, for the FY 2020 payment determination and subsequent years, we are finalizing our proposals to: (1) Validate eCQM data submitted by up to 200 hospitals selected via random sample; and (2) to exclude any hospital selected for chart-abstracted measure validation as well as any hospital that has been granted a Hospital IQR Program ''Extraordinary Circumstances Exemption'' for the applicable eCQM reporting period as proposed.

(b) Number of Cases

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25203), we proposed to randomly select 32 cases (individual patient-level reports) from the QRDA I file submitted per hospital selected for eCQM validation. Each randomly selected case (individual patient-level report) contains eCQM data elements [191] for one patient for one or more eCQMs available in the program's eCQM measure set. The CDAC would then request that each of the selected hospitals submit patient medical record data for each of their 32 randomly selected cases (transmitted by the hospital to the Clinical Data Warehouse) within 30 days of the medical records request date. We refer readers to our discussion in section VIII.A.11.b.(3)(c) of the preamble of this final rule, below, for more information on our submission requirements.

Based on the statistical properties of estimates as discussed below, we believe that a sample size of 32 cases is necessary to assess hospital performance on eCQMs. More specifically, at the individual hospital level, if we assume the average agreement rate between the QRDA I file data and data abstracted from the patient medical record is around 90 percent, and we want the hospital's confidence interval to vary by no more than plus or minus 10 percentage points (80 to 100 percent), then we need to select at least 32 cases per year. Also, 32 cases aligns with the number of cases currently selected for chart-abstracted validation of clinical process of care measures. We currently select eight cases per quarter per hospital, which equates to 32 cases annually (79 FR 50264).

We invited public comment on our proposal to randomly select 32 cases from the QRDA I file submitted per hospital selected for eCQM validation for the FY 2020 payment determination and subsequent years as discussed above.

We did not receive any comments on this proposal, and therefore, we are finalizing our proposal to randomly select 32 cases from the QRDA I file submitted per hospital selected for eCQM validation for the FY 2020 payment determination and subsequent years as proposed.

(c) Submission Requirements

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25203), we proposed to require hospitals selected for eCQM validation to submit timely and complete medical record information to CMS on eCQMs selected for the validation sample. These are defined below.

[191] A data element is a representation of a clinical concept that represents a patient state or attribute. This may be a diagnosis, lab value, sex, etc., which is encoded using standardized terminologies. The e-specifications for an eCQM include the data elements, logic, and definitions for that measure, available from: *https://www.cms.gov/Regulations-and-Guidance/Legislation/EHRIncentivePrograms/Electronic_Reporting_Spec.html.*

Consistent with the Hospital IQR Program chart-abstracted and NHSN validation submission deadline, which is 30 calendar days following the medical records request date listed on the CDAC request form (76 FR 51645), we proposed to require eCQM validation submission by 30 calendar days following the medical records request date listed on the CDAC request form for the FY 2020 payment determination and subsequent years. Also, we proposed to require sufficient patient level information (defined below) necessary to match the requested medical record to the original Hospital IQR Program submitted eCQM measure data record for the FY 2020 payment determination and subsequent years. Sufficient patient level information is defined as the entire medical record that sufficiently documents the eCQM measure data elements, which would include but would not be limited to, patient arrival date and time, inpatient admission date, and discharge date from inpatient episode of care. Lastly, we proposed that, if selected as part of the random sample for eCQM validation, a hospital would be required to submit records in PDF file format through QualityNet using the Secure File Transfer (SFT) for the FY 2020 payment determination and subsequent years. The data submission deadlines and additional details about the eCQM validation procedures would be posted on the QualityNet Web site at: *http://www.QualityNet.org/*.

We invited public comment on our proposals regarding eCQM validation submission requirements for the FY 2020 payment determination and subsequent years as discussed above.

Comment: A few commenters supported the validation of eCQM data, but recommended the timeline for submission be extended from 30 to 60 days to allow hospitals sufficient time to work with their EHR vendor on compiling data and to reduce overall administrative burden.

Response: We thank the commenters for their support and their recommendation to extend the submission timeline to 60 days. However, we have selected the 30 day timeline to be consistent with chart-abstracted and NHSN timelines for validation. We believe that aligning the timelines between chart-abstracted and eCQM validation will minimize confusion and burden on hospitals.

Comment: One commenter expressed concern about the timing of the request for the validation information for eCQMs. Specifically, the commenter took issue with the expansion of work required if a hospital is selected for both chart-abstracted and eCQM validation, since the selection for each process is random. Moreover, the commenter advised that the eCQM data request should not occur at the same time the quarterly request goes out for the chart-abstracted cases.

Response: As stated in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25202), we acknowledge that the burden associated with both the chart-abstracted and eCQM validation processes would be significant. We do not intend to impose an undue burden on any hospital by requiring that it be subject to more than one of these processes in a program year. For this reason, we proposed that if a hospital is selected for chart-abstracted targeted or random validation, that hospital would be excluded from the eCQM validation sample. We refer readers to section VIII.A.11.b.(3)(a) of the preamble of this final rule, above, where we finalize our exclusions.

Comment: A few commenters requested clarification about what constitutes ''sufficient patient level information'' to successfully pass validation, including a list of specific information to provide for each eCQM that can be consistently applied across vendors and providers. Commenters wanted to know which specific patient data would be required for validation purposes and whether the medical record data includes all encounters for a patient or only one encounter for a patient.

Response: As we stated in the proposed rule (81 FR 25203), sufficient patient level information is defined as the entire medical record that sufficiently documents the eCQM measure data elements, which would include but would not be limited to, patient arrival date and time, inpatient admission date, and discharge date from inpatient episode of care. Any patient information captured in the QRDA I file should also be reflected in the PDF submission of the patient's EHR. Medical record data include all encounters for a patient. The data submission deadlines and additional details about the eCQM validation procedures will be posted on the QualityNet Web site at: *http://www.QualityNet.org/*.

Comment: A few commenters supported the proposal to validate eCQM data, but suggested that the data elements for validation be listed by data element per measure. The commenters stated that this approach of providing measure-specific details of the expected data elements needed for the purpose of eCQM validation would make it more apparent to hospitals which data are expected for eCQM validation. The commenters further stated that having this specified list will streamline the process of data submission by easing the burden of making sure the necessary information is supplied.

Response: We thank the commenters for their support and we will consider the suggestion that data elements for validation be listed by data element per measure in the future. At this time, we believe that providing measure-specific details would be premature. As we learn from the first year of validation results, we will refine the process to ensure it most efficiently captures the necessary information while easing burden on hospitals.

After consideration of the public comments we received, we are finalizing, for the FY 2020 payment determination and subsequent years, the requirements to: (1) Require eCQM validation submission by 30 calendar days following the medical records request date listed on the CDAC request form; (2) require sufficient patient level information necessary to match the requested medical record to the original Hospital IQR Program submitted eCQM measure data record; and (3) require hospitals selected as part of the random sample for eCQM validation to submit records in PDF file format through QualityNet using the Secure File Transfer (SFT) as proposed.

(d) Scoring: Summary of Previously Adopted Chart-Abstracted Measure Validation Scoring

We refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50226 through 50227), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53539 through 53553), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50832 through 50833), and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50268 through 50269), for a detailed description of our previously adopted scoring methodology for chart-abstracted measure data.

We note that in the proposed rule (81 FR 25203), we did not propose any changes to our chart-abstracted measures validation. We are providing this information as background for our discussion of eCQM validation scoring. Under the current validation process for the Hospital IQR Program there are 600 hospitals (400 randomly sampled and 200 targeted) selected for validation on a yearly basis. As stated above, those selected for chart-abstracted measure validation would not be eligible for selection to participate in eCQM validation. For chart-abstracted measure validation, the CDAC contractor requests hospitals to submit eight randomly selected medical charts on a quarterly basis from which data were

abstracted and submitted by the hospital to the Clinical Data Warehouse (for a total of 32 charts per year). Under the validation methodology, once the CDAC contractor receives the charts, it re-abstracts the same data submitted by the hospitals and calculates the percentage of matching Hospital IQR Program measure numerators and denominators for each measure within each chart submitted by the hospital. Each selected case has multiple measures included in the validation score. Consistent with previous years, each quarter and clinical topic is treated as a stratum for variance estimation purposes (70 FR 47423).

As in previous years, for the FY 2020 payment determination, the overall validation score from the chart-abstracted measure validation will be used to determine a hospital's overall annual payment update. Specifically, if a hospital fails chart-abstracted validation, it would not receive the full annual payment update. If a hospital passes chart-abstracted validation, and also meets the other Hospital IQR Program requirements, it would be eligible to receive the full annual payment update. Consistent with previous years, a hospital must attain at least a 75 percent validation score (the percentage of matching Hospital IQR Program measure numerators and denominators for each measure within each chart submitted by the hospital) based upon chart-abstracted data validation to pass the validation requirement and to be eligible for a full annual payment update, if all other Hospital IQR Program requirements are met.

(e) Scoring: eCQM Validation Scoring

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25203 through 25204), for the FY 2020 payment determination, for hospitals selected for eCQM validation, we proposed to require submission of at least 75 percent of sampled eCQM measure medical records in a timely and complete manner. However, unlike chart-abstracted validation, which requires a hospital to attain at least a 75 percent validation score, we proposed that the accuracy of eCQM data (the extent to which data abstracted for validation matches the data submitted in the QRDA I file) submitted for validation would not affect a hospital's validation score for the FY 2020 payment determination only. This is further explained below.

Public comments on the FY 2015 IPPS/LTCH PPS final rule suggested further refinements to the process for eCQM validation. Specifically, several commenters urged CMS to implement the recommendations of a March 2014 Government Accountability Office (GAO) report to develop a comprehensive data collection strategy, which includes testing for and mitigation of reliability issues arising from variance in certified EHR systems tested to different CQM specifications (79 FR 50272). Commenters in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49711) expressed concern over the barriers hospitals encounter associated with reporting eCQMs and encouraged CMS to ensure that a diverse group of hospitals and certified EHRs are represented to inform an assessment of the work required to make eCQM validation feasible, reliable, and valid. In response to these concerns, in light of operational capacity limitations, and due to the time necessary to analyze eCQM validation results, we proposed that eCQM data would be validated, but initially (meaning for the FY 2020 payment determination only), the measure accuracy would not affect hospitals' validation scores.

In other words, although hospitals would be required to submit eCQM data in a timely and complete manner, we proposed that hospitals would not be required to attain at least a 75 percent validation score to pass the validation requirement and to be eligible for a full annual payment update. Hospitals that submit at least 75 percent of sampled eCQM measure medical records (even if those records do not produce a validation score of at least 75 percent) in a timely manner (that is, within 30 days of the date listed on the CDAC medical records request) would not be subject to payment reduction. However, hospitals that fail to submit timely and complete information for at least 75 percent of requested records would not meet the eCQM validation requirement and would be subject to payment reduction. For example, if a hospital submits timely and complete information for at least 75 percent of requested records, but comparison of the QRDA I file and the abstracted data results in a validation score of 28 percent, the hospital would still pass validation and be eligible for a full annual payment update.

Hospitals that pass either chart-abstracted or eCQM validation requirements would receive their full annual payment update, assuming all other Hospital IQR Program requirements are met. Hospitals that fail to attain at least a 75 percent validation score for chart-abstracted validation or fail to submit timely and complete data for 75 percent of requested records for eCQM validation, would not receive their full annual payment update.

In addition, we proposed to update our regulations at 42 CFR 412.140(d)(2) to reflect the above proposals and to specify that the 75 percent score would only apply to chart-abstracted validation.

We invited public comment on our eCQM validation scoring proposals for the FY 2020 payment determination as discussed above.

Comment: A few commenters expressed support for the proposal that eCQM data submitted for validation would not affect a hospital's validation score for the FY 2020 payment determination.

Response: We thank the commenters for their support.

Comment: One commenter did not support the policy that hospitals would be penalized for failing to submit 75 percent of the sampled eCQM data because multiple factors beyond a hospital's control, including failure on the part of the EHR vendor, can impact the capture of data. The commenter stated that hospitals should not be penalized if they have made a good faith effort to accurately submit the data.

Response: We disagree with the commenter that hospitals should not be penalized for failing to submit 75 percent of sampled records. If selected for validation, a hospital would be required to submit at least 75 percent of sampled records. The accuracy of that data will have no impact on determination of the hospital's APU for at least the first year. In other words, if the data in those records does not match the data in the QRDA I files submitted, for example, if a data field in a patient's EHR is not correctly mapped to the QRDA I file such that the EHR indicates arrival time in the Emergency Department at 11:00am but the QRDA I file indicates some other time or leaves the value of that data field blank, the hospital would not receive any penalty for the mismatch.

The purpose of these validation efforts is to ensure that the data provided is reliable, feasible and valid. We believe that submission of 75 percent of the requested records is a necessary threshold to ensure that we have an adequate amount of data to assess and validate. Some commenters expressed concern that the initial sample size of 200 hospitals potentially could be too small, but we believe that establishing a submission threshold of 75 percent of the requested records will ensure that we receive an adequate amount of data to provide reliable and valid results for the sample size of 200 hospitals. We encourage hospitals to work with their vendors to ensure that EHRs are appropriately structured in a

way that fits in with the clinical work flow to yield reliable data through eCQMs. We believe that eCQMs promote high quality outcomes and lower costs while ultimately decrease reporting burden on hospitals. If, however, the hospital has experienced an unforeseen circumstance beyond the hospital's control that may meet our criteria for an Extraordinary Circumstances Exemption (ECE), we suggest that the hospital submit an ECE request.

After consideration of the public comments we received, we are finalizing for the FY 2020 payment determination only and as proposed: (1) To require submission of at least 75 percent of sampled eCQM measure medical records in a timely and complete manner; and (2) that the accuracy of eCQM data submitted for validation would not affect a hospital's validation score. We are also finalizing to update our regulations at 42 CFR 412.140(d)(2) to reflect the above proposals and to specify that the 75 percent score required to receive full APU would only apply to chart-abstracted validation as proposed.

(4) Reimbursement for eCQM Validation

To align with the chart-abstracted validation process, which reimburses hospitals at a rate of $3.00 per chart (78 FR 50956) for submitting charts electronically via Secure File Transfer (SFT), we proposed (81 FR 25204) to similarly reimburse hospitals at a rate of $3.00 per chart for submitting charts electronically via Secure File Transfer (SFT) for eCQM validation for the FY 2020 payment determination and subsequent years. We also refer readers to section X.B.6. of the preamble of this final rule for more information regarding the collection of information for eCQM validation.

We invited public comment on our proposal to reimburse hospitals at a rate of $3.00 per chart for eCQM validation for the FY 2020 payment determination and subsequent years as discussed above.

We did not receive any comments on this proposal, and therefore, we are finalizing our policy to reimburse hospitals at a rate of $3.00 per chart for eCQM validation for the FY 2020 payment determination and subsequent years as proposed.

(5) eCQM Pre-Submission Testing

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25204), we encouraged hospitals to test their eCQM submissions prior to annual reporting using an available CMS pre-submission validation tool for electronic reporting—the Pre-Submission Validation Application (PSVA), which can be downloaded from the Secure File Transfer (SFT) section of the QualityNet Secure Portal at: *https://cportal.qualitynet.org/QNet/pgm_select.jsp*. The PSVA is a downloadable tool that operates on a user's system to allow submitters to catch and correct errors prior to data submission to CMS. It provides validation feedback within the submitter's system and allows valid files to be separated and submitted while identifying invalid files for error correction.[192] While the PSVA does not guarantee the accuracy of data in a hospital's QRDA I file, it helps to reduce submission errors related to improperly formatted QRDA I files. Pre-submission testing would assist in proactively identifying inconsistencies in data mapping, a process used in data warehousing by which different data models are linked to each other using a defined set of methods to characterize the data in a specific definition.[193]

12. Data Accuracy and Completeness Acknowledgement (DACA) Requirements for the FY 2019 Payment Determination and Subsequent Years

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53554) for previously-adopted details on DACA requirements. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25204), we did not propose any changes to the DACA requirements.

13. Public Display Requirements for the FY 2019 Payment Determination and Subsequent Years

We refer readers to the FY 2008 IPPS/LTCH PPS final rule (72 FR 47364), the FY 2011 IPPS/LTCH PPS final rule (75 FR 50230), the FY 2012 IPPS/LTCH PPS final rule (76 FR 51650), the FY 2013 IPPS/LTCH PPS final rule (77 FR 53554), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50277), and the FY 2016 final rule (80 FR 49712 through 49713) for details on public display requirements. The Hospital IQR Program quality measures are typically reported on the *Hospital Compare* Web site at: *http://www.medicare.gov/hospitalcompare*, but on occasion are reported on other CMS Web sites such as *https://data.medicare.gov*. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25204), we did not propose any changes to our public display requirements.

14. Reconsideration and Appeal Procedures for the FY 2019 Payment Determination and Subsequent Years

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51650 through 51651), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836), and 42 CFR 412.140(e) for details on reconsideration and appeal procedures for the FY 2017 payment determination and subsequent years. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25204 through 25205), we did not propose any changes to the reconsideration and appeals procedures.

15. Changes to the Hospital IQR Program Extraordinary Circumstances Extensions or Exemptions (ECE) Policy

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51651 through 51652), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50836 through 50837), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50277), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49713), and 42 CFR 412.140(c)(2) for details on the Hospital IQR Program ECE policy. We also refer readers to the QualityNet Web site at *http://www.QualityNet.org/* for our current requirements for submission of a request for an extension or exemption.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25205), we proposed to update our ECE policy by: (1) Extending the general ECE request deadline for non-eCQM circumstances from 30 to 90 calendar days following an extraordinary circumstance; and (2) establishing a separate submission deadline for ECE requests related to eCQM reporting circumstances to be April 1 following the end of the reporting calendar year. We proposed that these policies would apply beginning in FY 2017 as related to extraordinary circumstance events that occur on or after October 1, 2016.

a. Extension of the General ECE Request Deadline for Non-eCQM Circumstances

In the past, we have allowed hospitals to submit an ECE request form for non-eCQM measures within 30 calendar days following an extraordinary event that prevents them from providing data for non-eCQM measures (76 FR 51652). In certain circumstances, however, it may be difficult for hospitals to timely evaluate the impact of a certain extraordinary event within 30 calendar days. We believe that extending the deadline to 90 calendar days would

[192] PSVA Demonstration and eCQM Question and Answer Session. Available at: *http://www.qualityreportingcenter.com/wp-content/uploads/2016/03/3-10-16-eCQM_PSVA-Demonstration_FINAL508.pdf*.

[193] Data Mapping Definition Available at: *https://www.techopedia.com/definition/6750/data-mapping*.

allow hospitals more time to determine whether it is necessary and appropriate to submit an ECE request and to provide a more comprehensive account of the ''event'' in their ECE request form to CMS. For example, if a hospital has suffered damage due to a hurricane on January 1, it would have until March 31 to submit an ECE form via the QualityNet Secure Portal, mail, email, or secure fax as instructed on the ECE form. This proposed timeframe (90 calendar days) also aligns with the ECE request deadlines for the Hospital VBP Program (78 FR 50706), the HAC Reduction Program (80 FR 49580), and the Hospital Readmissions Reduction Program (80 FR 49542 through 49543), all of which at least partially rely on the same data collection.

We invited public comment on our proposal related to the Hospital IQR Program's ECE policy for non-eCQM circumstances beginning FY 2017 as related to extraordinary circumstance events that occur on or after October 1, 2016 as described above.

Comment: Several commenters supported the proposal to extend the current submission deadline for ECE requests for non-eCQM measures to 90 days because it promotes alignment with existing quality reporting programs.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to extend the general ECE request deadline for non-eCQM circumstances to 90 calendar days following an extraordinary circumstance event beginning FY 2017 as related to extraordinary circumstance events that occur on or after October 1, 2016 as proposed.

b. Establishment of Separate Submission Deadline for ECE Requests Related to eCQMs

In addition, we proposed to establish a separate submission deadline for ECE requests with respect to eCQM reporting, such that hospitals must submit a request by April 1 following the end of the reporting calendar year. We proposed that this deadline for ECE requests with respect to eCQM reporting would first apply with an April 1, 2017 deadline and apply for subsequent eCQM reporting years. For example, for data collected for the CY 2016 reporting period (through December 31, 2016), hospitals would have until April 1, 2017 to submit an ECE request. This timeframe also aligns with the Medicare and Medicaid EHR Incentive Programs' typical annual hardship request deadline (77 FR 54104 through 54109), which we believe would help reduce burden for hospitals.

We invited public comment on our proposal for the Hospital IQR Program's ECE policy related to eCQMs beginning FY 2017 as related to extraordinary circumstance events that occur on or after October 1, 2016 as described above.

Comment: Several commenters supported the proposal to establish a submission deadline for ECE requests for eCQMs because it promotes alignment with the Medicare and Medicaid EHR Incentive Programs. In addition, commenters stated that this alignment would allow facilities to adequately respond to events and assure patient safety prior to submitting the request for an extension or exemption.

Response: We thank the commenters for their support.

Comment: A few commenters asked for clarification on the circumstance for which an ECE request would be granted. Specifically, the commenters asked if a hospital would be granted an exemption if its EMR is under transition due to a change in vendors during the reporting period. In addition, a commenter asked whether, during the transition phase, the hospital would be required to include and report on all the required eCQMs in both the older and newer EHR. Further, some commenters recommended that CMS develop an expansive definition of ''extraordinary circumstances,'' which provides detail on applicable technology difficulties (that is, switching EHR or third-party data eCQM submission vendors during the reporting period).

Response: Our current policy allows hospitals to utilize the existing ECE form to request an exemption from the Hospital IQR Program's eCQM reporting requirement for the applicable program year based on hardships preventing hospitals from electronically reporting. Such hardships could include, but are not limited to, infrastructure challenges (hospitals must demonstrate that they are in an area without sufficient internet access or face insurmountable barriers to obtaining infrastructure) or unforeseen circumstances, such as vendor issues outside of the hospital's control (including a vendor product losing certification) (80 FR 49695). With respect to the question of whether a hospital would be required to include and report on all the required eCQMs in both the older and newer EHR during an EHR transition phase, we note that ECE requests are considered on a case by case basis. Our decision whether to grant an ECE will be based on the specific circumstances of the hospital and the evidence submitted to us as part of the ECE request form.

After consideration of the public comments we received, we are finalizing for beginning FY 2017 as related to extraordinary circumstance events that occur on or after October 1, 2016, our proposals to establish: (1) A separate submission deadline for ECE requests with respect to eCQM reporting; and (2) a deadline of April 1 following the end of the reporting calendar year for ECE requests related to eCQM reporting as proposed.

B. PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

1. Background

Section 3005 of the Affordable Care Act added new sections 1866(a)(1)(W) and (k) to the Act. Section 1866(k) of the Act establishes a quality reporting program for hospitals described in section 1886(d)(1)(B)(v) of the Act (referred to as ''PPS-Exempt Cancer Hospitals'' or ''PCHs'') that specifically applies to PCHs that meet the requirements under 42 CFR 412.23(f). Section 1866(k)(1) of the Act states that, for FY 2014 and each subsequent fiscal year, a PCH must submit data to the Secretary in accordance with section 1866(k)(2) of the Act with respect to such fiscal year. For additional background information, including previously finalized measures and other policies for the PCHQR Program, we refer readers to the following final rules: FY 2013 IPPS/LTCH PPS final rule (77 FR 53556 through 53561); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50838 through 50846); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50277 through 50288); and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49713 through 49723).

2. Criteria for Removal and Retention of PCHQR Program Measures

We have received public comments on past proposed rules asking that we clarify our policy for measure retention and removal. We generally retain measures from the previous year's PCHQR Program measure set for subsequent years' measure sets, except when we specifically propose to remove or replace a measure. With respect to measure removal, we believe it is important to be transparent in identifying criteria that we would use to evaluate a measure for potential removal from the PCHQR Program. We also believe that we should align these criteria between our programs whenever possible.

Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25205

through 25206), we proposed the following measure removal criteria for the PCHQR Program, which are based on criteria established in the Hospital IQR Program (80 FR 49641 through 49642):

- Measure performance among PCHs is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made (''topped-out'' measures);
- A measure does not align with current clinical guidelines or practice;
- The availability of a more broadly applicable measure (across settings or populations) or the availability of a measure that is more proximal in time to desired patient outcomes for the particular topic;
- Performance or improvement on a measure does not result in better patient outcomes;
- The availability of a measure that is more strongly associated with desired patient outcomes for the particular topic;
- Collection or public reporting of a measure leads to negative unintended consequences other than patient harm; and
- It is not feasible to implement the measure specifications.

For the purposes of considering measures for removal from the program, we would consider a measure to be ''topped-out'' if there is statistically indistinguishable performance at the 75th and 90th percentiles and the truncated coefficient of variation is less than or equal to 0.10.

However, we recognize that there are times when measures may meet some of the outlined criteria for removal from the program, but continue to bring value to the program. Therefore, we proposed the following criteria for consideration in determining whether to retain a measure in the PCHQR Program, which also are based on criteria established in the Hospital IQR Program (80 FR 49641 through 49642):

- Measure aligns with other CMS and HHS policy goals;
- Measure aligns with other CMS programs, including other quality reporting programs; and
- Measure supports efforts to move PCHs towards reporting electronic measures.

We welcomed public comments on these proposed measure removal and retention criteria.

Comment: One commenter supported the proposed criteria for the removal and retention of measures, and recommended flexibility in determining whether measures are ''topped out,'' expressing concern that the proposed criteria could lack validity when applied to the small cohort of PCHs.

Response: We thank the commenter for its support. Although there are only 11 PCHs, we believe if they are all achieving performance within the top quartile that it is reasonable to review the measure to determine whether it has been ''topped out.''

Comment: A commenter recommended that, if the measure retention and removal criteria are adopted, CMS remove three existing PCHQR measures as topped out (NQF #0223, Adjuvant Chemotherapy is Considered or Administered Within 4 Months (120 Days) of Diagnosis to Patients Under the Age of 80 with AJCC III (Lymph Node Positive) Colon Cancer; NQF #0559, Combination Chemotherapy is Considered or Administered Within 4 Months (120 Days) of Diagnosis for Women Under 70 with AJCC T1cN0M0, or Stage IB–III Hormone Receptor Negative Breast Cancer; and NQF #0220, Adjuvant Hormonal Therapy).

Response: We thank the commenter for the recommendation and will consider this recommendation in the future.

After consideration of the public comments we received, we are finalizing the measure removal and retention policy as proposed.

3. Retention and Update to Previously Finalized Quality Measures for PCHs Beginning With the FY 2019 Program Year

a. Background

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53556 through 53561), we finalized five quality measures for the FY 2014 program year and subsequent years. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50837 through 50847), we finalized one new quality measure for the FY 2015 program year and subsequent years and 12 new quality measures for the FY 2016 program year and subsequent years. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50278 through 50280), we finalized one new quality measure for the FY 2017 program year and subsequent years. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49713 through 49719), we finalized three new CDC NHSN measures for the FY 2018 program year and subsequent years, and finalized the removal of six previously finalized measures for fourth quarter (Q4) 2015 discharges and subsequent years. We refer readers to the final rules referenced in section VIII.B.1. of the preamble of this final rule for more information regarding these previously finalized measures.

Comment: One commenter supported the continued inclusion of the Influenza Vaccination Coverage Among Healthcare Personnel (HCP) in the PCHQR Program.

Response: We thank the commenter for its support.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25206), we did not propose for FY 2019 to remove any of the measures previously finalized for the FY 2018 program year from the PCHQR measure set. However, we did propose to update the Oncology: Radiation Dose Limits to Normal Tissues (NQF #0382) measure, described below.

b. Update of Oncology: Radiation Dose Limits to Normal Tissues (NQF #0382) Measure for FY 2019 Program Year and Subsequent Years

Beginning with the FY 2019 program year, we proposed to update the specifications of the Oncology: Radiation Dose Limits to Normal Tissues (NQF #0382) measure. This measure was originally finalized in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50841 through 50842). In November 2014, subsequent to our adoption of the measure in the PCHQR Program, updated specifications were endorsed by the NQF.

The updated measure specifications expand the patient cohort to include patients receiving 3D conformal radiation therapy for breast or rectal cancer in addition to patients receiving 3D conformal radiation therapy for lung or pancreatic cancers (the original cohort).[194] For additional information about the original measure cohort, we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50842), in which we introduced the measure to the PCHQR Program. In 2012, breast cancer was the most common cancer among women, and the second most common cause of cancer related deaths for women.[195] For 2016, the National Institutes of Health estimates that there will be approximately 135,000 new cases of colorectal cancer in the United States, with approximately 39,000 of these cases being rectal cancer.[196]

As these cancer types are so prevalent, we believe that the expansion of the measure cohort to include breast and rectal cancer patients is important

[194] Available at: *http://www.qualityforum.org/QPS/0382.*

[195] CDC Breast Cancer Statistics. Available at: *http://www.cdc.gov/cancer/breast/statistics/.*

[196] NIH Colorectal Cancer Incidence and Mortality. Available at: *http://www.cancer.gov/types/colorectal/hp/rectal-treatment-pdq.*

to ensuring the delivery of high quality care in the PCH setting. In compliance with section 1890A(a)(2) of the Act, this measure update was included in a publicly available document, ''List of Measures under Consideration for December 1, 2015.'' [197] The MAP, a multi-stakeholder group convened by the NQF, reviews the measures under consideration for the PCHQR Program, among other Federal programs, and provides input on those measures to the Secretary. The MAP's 2016 recommendations for quality measures under consideration are captured in the following document: ''Process and Approach for MAP Pre-Rulemaking Deliberations 2015–2016'' (*http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=81599*). The MAP expressed conditional support for the update of Oncology: Radiation Dose Limits to Normal Tissues. The MAP's conditional support was solely pending annual NQF review, and was not based on significant concerns. We considered the input and recommendations provided by the MAP, and the importance of aligning with NQF-endorsed specifications of measures whenever possible in proposing this update for the PCHQR Program.

We welcomed public comments on this proposal for the Oncology: Radiation Dose Limits to Normal Tissues measure cohort expansion for the FY 2019 program year and subsequent years.

Comment: Two commenters supported the expansion of the Oncology: Radiation Dose Limits to Normal Tissue (NQF #0382) measure specifications to include breast and rectal cancers. One commenter that supported the expansion urged delay until the expansion received NQF endorsement.

Response: We thank the commenters for their support. We believe it is important to continue to expand the PCHQR measures to provide meaningful information to patients and facilities. The NQF endorsed the measure with the expanded cohort in 2014. We are aligning our measure with the updated NQF-endorsed specifications. Of note, the 2015 MAP's conditional support was based only on NQF's regular, annual update, out of which we expect to arise no significant concerns. NQF review is still underway for the annual updates to this measure; the expanded cohort, however, was endorsed by NQF in 2014. Our proposal would expand the cohort pursuant to NQF's 2014 endorsement of the cohort expansion and is not impacted by the regular annual review process in which NQF engages on all measures. We considered the MAP's recommendations, and the importance of aligning with NQF-endorsed specifications of measures whenever possible, when we proposed this update for the PCHQR Program.

After consideration of the public comments we received, we are finalizing the update to the measure specifications as proposed.

4. New Quality Measure Beginning With the FY 2019 Program Year

a. Considerations in the Selection of Quality Measures

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53556), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50837 through 50838), and the FY 2015 IPPS/LTCH PPS final rule (79 FR 50278), we indicated that we have taken a number of principles into consideration when developing and selecting measures for the PCHQR Program, and that many of these principles are modeled on those we use for measure development and selection under the Hospital IQR Program. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25206), we did not propose any changes to the principles we consider when developing and selecting measures for the PCHQR Program.

Section 1866(k)(3)(A) of the Act requires that any measure specified by the Secretary must have been endorsed by the entity with a contract under section 1890(a) of the Act (the NQF is the entity that currently holds this contract). Section 1866(k)(3)(B) of the Act provides an exception under which, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25206 through 25210), using the principles for measure selection in the PCHQR Program, we proposed one new measure, described below.

b. Adoption of the Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy Measure

We proposed to adopt the Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy measure for the FY 2019 program year and subsequent years. Cancer care is a priority area for outcome measurement because cancer is an increasingly prevalent condition associated with considerable morbidity and mortality. In 2015, there were more than 1.6 million new cases of cancer in the United States.[198] Each year, about 22 percent of cancer patients receive chemotherapy,[199] with Medicare payments for cancer treatment totaling $34.4 billion in 2011 or almost 10 percent of Medicare fee-for-service (FFS) spending.[200] With an increasing number of cancer patients receiving chemotherapy in a hospital outpatient department,[201] a growing body of peer-reviewed literature identifies unmet needs in the care provided to these patients. This gap in care may be due to reasons including: (1) Delayed onset of side effects that patients must manage at home; (2) patients assuming that little can be done and not seeking assistance; and (3) limited access to and communication with providers who can tailor care to the individual.[202] As a result, cancer patients that receive chemotherapy in a hospital outpatient department require more frequent acute care in the hospital setting and experience more adverse events than cancer patients that are not receiving chemotherapy.[203] [204] [205]

[203] Sadik, M., K. Ozlem, M. Huseyin, B. AliAyberk, S. Ahmet, and O. Ozgur. ''Attributes of

Unmet patient needs resulting in admissions and ED visits related to chemotherapy treatment pose a heavy financial burden and affect patients' quality of life. Based on available commercial claims data, in 2010 the national average cost of a chemotherapy-related admission was $22,000, and the average cost of a chemotherapy-related ED visit was $800.[206] Furthermore, admissions and ED visits can reduce patients' quality of life by affecting their physical and emotional well-being, disrupting their schedules, decreasing their desire to engage in work and social activities, and increasing the burden on their family.[207] [208]

Hospital admissions and ED visits among cancer patients are often caused by manageable side effects. Chemotherapy treatment can have severe, predictable side effects. Recent studies of cancer outpatients show the most commonly cited symptoms and reasons for unplanned hospital visits following chemotherapy treatment are pain, anemia, fatigue, nausea and/or vomiting, fever and/or febrile neutropenia, shortness of breath, dehydration, diarrhea, and anxiety/depression.[209] These hospital visits may be due to conditions related to the cancer itself or to side effects of chemotherapy. However, treatment plans and guidelines exist to support the management of these conditions. PCHs that provide outpatient chemotherapy should implement appropriate care to minimize the need for acute hospital care for these adverse events. Guidelines from the American Society of Clinical Oncology, National Comprehensive Cancer Network, Oncology Nursing Society, Infectious Diseases Society of America, and other professional societies recommend evidence-based interventions to prevent and treat common side effects and complications of chemotherapy. Appropriate outpatient care should reduce potentially avoidable hospital admissions and ED visits for these issues and improve cancer patients' quality of life.

This measure aims to assess the care provided to cancer patients and encourage quality improvement efforts to reduce the number of unplanned inpatient admissions and ED visits among cancer patients receiving chemotherapy in a PCH outpatient setting. Improved PCH management of these potentially preventable symptoms—including anemia, dehydration, diarrhea, emesis, fever, nausea, neutropenia, pain, pneumonia, or sepsis—could reduce unplanned admissions and ED visits for these conditions. Measuring unplanned admissions and ED visits for cancer patients receiving outpatient chemotherapy would provide PCHs with an incentive to improve the quality of care for these patients by taking steps to prevent and better manage side effects and complications from treatment. In addition, this measure meets two National Quality Strategy priorities: (1) Promoting effective communication and coordination of care; and (2) promoting the most effective prevention and treatment practices for the leading causes of mortality.

We proposed to adopt this measure under the exception authority in section 1866(k)(3)(B) of the Act under which, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization.

This proposed measure aligns with the two process measures we adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50842 through 50843) for FY 2016 and subsequent years: (1) Clinical Process/Oncology Care—Plan of Care for Pain (NQF #0383); and (2) Clinical Process/Oncology: Medical and Radiation—Pain Intensity Quantified (NQF #0384). These NQF-endorsed measures focus on processes of care related to cancer care. Process measures NQF #0383 and NQF #0384, which are not risk-adjusted, support the purpose of the proposed measure by reinforcing that providers of outpatient care should screen for and manage symptoms such as pain. The proposed measure improves upon these two measures in two key ways: (1) It does not target a specific symptom, but rather assesses the overall management of 10 important symptoms that studies have identified as frequent reasons for ED visits and inpatient admissions in this population; and (2) it assesses the care outcomes that matter to patients, rather than measuring processes to detect and treat these conditions. Furthermore, we are not aware of any other measures a consensus organization has endorsed or adopted that assess the quality of outpatient cancer care by measuring unplanned inpatient admissions and ED visits.

The 2015 MAP supported this measure on the condition that it is reviewed and endorsed by NQF. We refer readers to the Spreadsheet of MAP 2016 Final Recommendations available at: *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=81593*. In particular, MAP members recommended considering the measure for sociodemographic status (SDS) adjustment in the ongoing NQF trial period and reviewing it to ensure that the detailed specifications meet the purpose of the measure and align with current cancer care practice.

We understand the important role that SDS plays in the care of patients. However, we continue to have concerns about holding hospitals to different standards for the outcomes of their patients of diverse sociodemographic status because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. We routinely monitor the impact of sociodemographic status on hospitals' results on our measures.

The NQF is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF will issue recommendations on future permanent inclusion of sociodemographic factors.

During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial. CMS, in compliance with NQF's guidance, has tested sociodemographic factors in the measures' risk models and made recommendations about whether or not to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our outcome measures. We submitted this measure to NQF with appropriate consideration for SDS for endorsement proceedings as part of the NQF Cancer Consensus Development Project in March 2016 and it is currently undergoing review. However, the measure we are adopting for the PCHQR Program does not include this adjustment.

Furthermore, the Office of the Assistant Secretary for Planning and Evaluation (ASPE) is conducting research to examine the impact of sociodemographic status on quality measures, resource use, and other measures under the Medicare program as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how they apply to our quality programs at such time as they are available.

In addition, several MAP members noted the alignment of this measure concept with other national priorities, such as improving patient experience, and other national initiatives to improve cancer care, as well as the importance of this measure to raise awareness and create a feedback loop with providers.

This Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy measure is a risk-standardized outcome measure for patients age 18 years or older who are receiving PCH-based outpatient chemotherapy treatment for all cancer types except leukemia; it measures inpatient admissions or ED visits within 30 days of each outpatient chemotherapy encounter for any of the following qualifying diagnoses: Anemia, dehydration; diarrhea; emesis; fever; nausea; neutropenia; pain; pneumonia; or sepsis, as these are associated with commonly cited reasons for hospital visits among cancer patients receiving chemotherapy.[210]

The proposed measure uses 1 year of Medicare FFS Part A and Part B administrative claims data with respect to beneficiaries receiving chemotherapy treatment in a PCH outpatient setting. The qualifying diagnosis on the admission or ED visit claim must be: (1) The primary diagnosis; or, (2) a secondary diagnosis accompanied by a primary diagnosis of cancer.

We limited the window for identifying the outcomes of admissions and ED visits to 30 days after PCH outpatient chemotherapy treatment encounters, as existing literature suggests the vast majority of adverse events occur within that time frame [211] [212] [213] and we also observed this during testing. In addition, the technical expert panel (TEP) supported this time window because: (1) It helps link patients' experiences to the facilities that provided their recent treatment while accounting for variations in time between outpatient treatment encounters; (2) it supports the idea that the admission is related to the management of side effects of treatment and ongoing care, as opposed to progression of the disease or other unrelated events; and (3) clinically, 30 days after each outpatient chemotherapy treatment is a reasonable timeframe to observe related side effects.

The measure identifies outcomes separately for the inpatient admissions and ED visits. A patient can qualify only once for one of the two outcomes in each measurement period. If patients experience both an inpatient admission and an ED visit after outpatient chemotherapy during the measurement period, the measure counts them toward the inpatient admission outcome because this outcome represents a more significant deterioration in patient quality of life, and is more costly. Among those with no qualifying inpatient admissions, the measure counts qualifying standalone ED visits. As a result, the rates provide a comprehensive performance estimate of quality of care. We calculate the rates separately because the severity and cost of an inpatient admission differ from those of an ED visit, but both adverse events are significant quality indicators and represent outcomes of care that are important to patients.

The measure attributes the outcome to the PCH where the patient received chemotherapy treatment during the 30 days before the outcome. If a patient received outpatient chemotherapy treatment from more than one PCH in the 30 days before the outcome, the measure would attribute the outcome to all the PCHs that provided treatment. For example, if a patient received an outpatient chemotherapy treatment at PCH A on January 1, a second treatment at PCH B on January 10, and then experienced a qualifying inpatient admission on January 15, the measure would count this outcome for both PCH A and PCH B because both PCHs provided outpatient chemotherapy treatment to the patient within the 30-day window. However, if a patient received an outpatient chemotherapy treatment from PCH A on January 1, and a second treatment from PCH B on March 1, and then experienced a qualifying inpatient admission on March 3, the measure would attribute this outcome only to PCH B. In measure testing, using Medicare FFS claims data from July 1, 2012, to June 30, 2013, only 5 percent of patients in the cohort received outpatient chemotherapy treatment from more than one facility during that year.

For additional methodology details, including the code sets used to identify the qualifying outcomes, we refer readers to the CMS Web site at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html* under ''Hospital Outpatient Chemotherapy.''

This measure includes all adult Medicare FFS patients because this would enable us to more broadly assess the quality of care provided by the PCH.

This measure focuses on treatments in the PCH outpatient setting because of the increase in hospital-based chemotherapy, which presents an opportunity to coordinate care. From 2008 to 2012, the proportion of Medicare patients receiving hospital-based outpatient chemotherapy increased from 18 to 29 percent, and this trend is likely to continue. As currently specified, the measure identifies chemotherapy treatment using ICD–9–CM procedure and encounter

codes and Current Procedural Terminology (CPT)/Healthcare Common Procedure Coding System (HCPCS) procedure and medication procedure codes. It excludes procedure codes for oral chemotherapy because it is challenging to identify oral chemotherapy without using pharmacy claims data and, according to our TEP, most oral chemotherapies have fewer adverse reactions that result in admissions. We have developed a ''coding crosswalk'' between the ICD–9–CM codes and the ICD–10 codes that became effective beginning on October 1, 2015, and we will test this crosswalk prior to implementation. For detailed information on the cohort definition, including the ICD–9–CM, ICD–10, CPT, and HCPCS codes that identify chemotherapy treatment, we refer readers to the Data Dictionary appendix to the measure Technical Report at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html* under ''Hospital Outpatient Chemotherapy.''

The measure excludes three groups of patients: (1) Patients with a diagnosis of leukemia at any time during the measurement period because of the high toxicity of treatment and recurrence of disease, and because inpatient admissions and ED visits may reflect a relapse, rather than poorly managed outpatient care; (2) patients who were not enrolled in Medicare FFS Parts A and B in the year before the first outpatient chemotherapy treatment encounter during the measurement period (because the risk-adjustment model uses claims data for the year before the first chemotherapy treatment encounter during the period to identify comorbidities); and (3) patients who do not have at least one outpatient chemotherapy treatment encounter followed by continuous enrollment in Medicare FFS Parts A and B in the 30 days after the encounter (because the measure cannot assess the 30-day outcome in this group since it uses claims data to determine whether a patient had an ED visit or a hospital inpatient admission).

Risk adjustment takes into account important demographic and clinically-relevant patient characteristics that have strong relationships with the outcome. It seeks to adjust for differences in patient demographics, clinical comorbidities, and treatment exposure, which vary across patient populations and influence the outcome but do not relate to quality. Specifically, the measure adjusts for: (1) The patient's age at the start of the measurement period; (2) sex; (3) comorbidities that convey information about the patient in the 12 months before his or her first outpatient chemotherapy treatment encounter during the measurement period; (4) cancer type; and (5) the number of outpatient chemotherapy treatments the patient received at the reporting PCH during the measurement period.

We developed two risk-adjustment models, one for each dependent variable described above—qualifying inpatient admissions and qualifying ED visits. The separate models are necessary to enable the use of the most parsimonious model with variables tailored to those that are most predictive for each of the measure's two mutually exclusive outcomes. The measure algorithm first searches for a qualifying inpatient admission, and for those patients that do not have a qualifying inpatient admission, searches for a qualifying ED visit. Therefore, the patient-mix and predictive risk factors for each outcome is slightly different. The statistical risk-adjustment model for inpatient admissions includes 20 clinically relevant risk-adjustment variables that are strongly associated with the risk of one or more hospital admissions within 30 days following an outpatient chemotherapy treatment encounter in a hospital outpatient setting; the statistical risk-adjustment model for ED visits includes 15 clinically relevant risk-adjustment variables that are strongly associated with risk of one or more ED visits within 30 days following an outpatient chemotherapy treatment encounter in a hospital outpatient setting (3 comorbidities and 2 cancer types significant for inpatient admissions are not significant for ED visits).

The measure uses hierarchical logistic modeling, similar to the approach used in the CMS inpatient hospital 30-day risk-standardized mortality and readmission outcome measures, such as the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Acute Myocardial Infarction (AMI) Hospitalization.[214] This approach appropriately accounts for both differences in patient-mix and the clustering of observations within PCHs. The measure calculates the PCH-specific risk-adjusted rate as the ratio of the PCH's ''predicted'' number of outcomes to ''expected'' number of outcomes multiplied by the national observed outcome rate. It estimates the expected number of outcomes for each PCH using the PCH's patient-mix and the average PCH-specific intercept (that is, the average intercept among all PCHs in the sample). The measure estimates the predicted number of outcomes for each PCH using the same patient-mix, but an estimated PCH-specific intercept.

The measure calculates two rates, one for each mutually exclusive outcome (qualifying inpatient admissions and qualifying ED visits). It derives the two rates (also referred to as the PCH-level risk-standardized admission rate (RSAR) and risk-standardized ED visit rate (RSEDR)), from the ratio of the numerator to the denominator multiplied by the national observed rate. The numerator is the number of predicted (meaning adjusted actual) patients with the measured adverse outcome. The denominator is the number of patients with the measured adverse outcome the PCH is expected to have based on the national performance with the PCH's case mix. The national observed rate is the national unadjusted number of patients who have an adverse outcome among all the qualifying patients who had at least one chemotherapy treatment encounter in a PCH. If the ''predicted'' number of outcomes is higher (or lower) than the ''expected'' number of outcomes for a given hospital, the risk-standardized rate will be higher (or lower) than the national observed rate.

For more detailed information on the calculation methodology, we refer readers to the methodology report at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html* under ''Hospital Outpatient Chemotherapy.''

We would publicly report the RSAR and RSEDR for all participating PCHs with 25 or more eligible patients per measurement period to maintain a reliability of at least 0.4 (as measured by the interclass correlation coefficient, ICC). If a PCH does not meet the 25 eligible patient threshold, we would include a footnote on the *Hospital Compare* Web site indicating that the number of cases is too small to reliably measure that PCH's rate. These patients and PCHs would still be included when calculating the national rates for both the RSAR and RSEDR.

To prepare PCHs for public reporting, we would conduct a confidential national reporting (dry run) of measure results prior to public reporting. The objectives of the dry run are to: (1) Educate PCHs and other stakeholders about the measure; (2) allow PCHs to review their measure results and data prior to public reporting; (3) answer questions from PCHs and other stakeholders; (4) test the production and

[214] Methodology reports for these measures are available at the following link: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.*

reporting process; and (5) identify potential technical changes to the measure specifications that might be needed. We have not yet determined the measurement period to use for the dry run calculations, but acknowledge the importance of including some data based on ICD–10 codes to evaluate the success of the ''coding crosswalk.''

We invited public comment on our proposal to adopt the Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy measure for the FY 2019 program year and subsequent years.

Comment: A few commenters supported the inclusion of the Admissions and Emergency Department Visits for Patients Receiving Outpatient Chemotherapy measure into the PCHQR program.

Response: We thank the commenters for their support.

Comment: Several commenters generally opposed the adoption of the proposed new measure because the MAP conditionally supported it pending NQF endorsement, and the NQF has not formally announced its decision. Other commenters opposed the adoption of the measure because of general concerns with its validity and reliability, providing examples of ICD–10 codes not related to chemotherapy or inpatient admissions in which a patient received treatment for pain and nausea but in which the pain and nausea was not related to chemotherapy treatment. One commenter supported the measure provided it has been tested for validity and reliability.

Response: We thank the commenters for their views regarding the MAP review and NQF endorsement. In evaluating and selecting the measure for inclusion in the PCHQR Program, we considered whether there were other available measures that have been endorsed or adopted by the NQF, and were unable to identify any other NQF-endorsed measures that assess admissions and ED visits following outpatient chemotherapy. We developed the measure using the same rigorous process that we have used to develop other publicly reported outcomes measures. As part of that process, we sought and received extensive input on the measure from stakeholders and clinical experts.

We disagree with commenters regarding the proposed measure's reliability and believe that this measure is sufficiently reliable to be included in the PCHQR Program. Measure reliability was calculated using a split sample of one year of data. We randomly split the patient cohort at each hospital into two equal halves, calculated the measure using each half, and then calculated the agreement between these two (the ''test'' and the ''retest''). Following this test-retest methodology, we calculated the Pearson correlation between the performance rate estimates in each half-year sample to assess reliability. We found the RSAR to have a reliability of 0.41 (95 percent confidence interval (CI): 0.37–0.45) and the RSEDR to have a reliability of 0.27 (95 percent CI: 0.22–0.33) which, according to Cohen's classification, represent moderate and borderline weak-to-moderate reliability, respectively.[215] The 95 percent CI gives us a reasonable estimate of the true reliability range.

Our reliability estimate was arguably limited by our use of a half year of split data. We expected our reliability to be higher if we increased the amount of data we used. Therefore, after submitting the measure to NQF for endorsement review, we conducted additional calculations of the reliability testing score, this time using the Intraclass Correlation Coefficient (ICC) and the Spearman-Brown prophecy formula. The Spearman-Brown prophecy formula is an accepted statistical method that estimates the ICC based on what would be expected if the sample size was increased. It therefore provides us with an estimate of what the reliability score would be if CMS were to use a full year of data for public reporting rather than the six months of data that we used. Using the Spearman-Brown prophecy formula, we estimated that our measure will have an ICC of 0.63 (95 percent CI: 0.58–0.68) for RSAR and 0.47 percent (95 percent CI: 0.40–0.53) for RSEDR using a full year of data.

The NQF considers ICC values ranging from 0.41 to 0.60 as ''moderate'' reliability, and 0.61 to 0.80 as ''strong'' reliability. Our calculated ICC values of 0.63 for RSAR and 0.47 for RSEDR are interpreted as ''strong'' and ''moderate'' reliability, respectively.

We also disagree with the concerns regarding the validity of the measure. This measure is an important signal of high quality care and is specified in a way to appropriately differentiate between cancer hospitals providing high and low quality care for these patients. This measure assesses an aspect of care with documented unmet patient needs resulting in reduction of patient's quality of life and increase in healthcare utilization and costs. Several studies[216] [217] [218] illustrate a gap in care for outpatients as they are ''invisible'' from the system when they return home following treatment.

There are currently no outcome measures in the PCHQR Program, and there remains a gap in care that leads to acute, potentially preventable hospitalizations. We note that, on average, cancer patients receiving chemotherapy have one hospital admission and two ED visits per year, and therefore we believe it would be a disservice to patients to delay inclusion of the current outcome measure in quality reporting and quality improvement initiatives. This is why we proposed to adopt this outcome measure for the PCHQR Program under the Secretary's authority set forth at section 1866(k)(3)(B) of the Act.

Comment: Several commenters opposed the adoption of the proposed new measure as currently specified because of concerns that the diagnoses and symptoms that are the subject of the measure, such as pneumonia, could be due to causes other than chemotherapy side effects and are not appropriate to combine. One commenter also stated that the list of ICD–10 codes contained in the measure submission documents includes codes for diagnoses that are unrelated to chemotherapy, and further suggested that the measure does not differentiate between chemotherapy-related and unrelated admissions and emergency department visits.

Response: Given the increase in outpatient hospital-based chemotherapy, understanding and minimizing related unplanned admissions and ED visits is a high priority. The 10 conditions that the measure captures are commonly cited reasons for hospital visits among patients receiving chemotherapy in the hospital outpatient setting, and are potentially preventable through appropriately managed outpatient care and increased communication with the

[218] McKenzie, H., L. Hayes, K. White, K. Cox, J. Fethney, M. Boughton, and J. Dunn. ''Chemotherapy Outpatients' Unplanned Presentations to Hospital: A Retrospective Study.'' Supportive Care in Cancer, vol. 19, no. 7, 2011, pp. 963–969.

patient. This measure will help identify unplanned admissions and ED visits in patients receiving outpatient chemotherapy by reviewing claims in which these 10 conditions, considered potentially preventable through appropriately-managed outpatient care, are listed as a primary diagnosis or a secondary diagnosis accompanied by a primary diagnosis of cancer. Admissions and emergency department visits for these conditions is a potential signal of poor quality care and poor care coordination. While the goal is not to reach zero admissions and ED visits, the premise is that reporting this information will promote an improvement in patient care over time for two reasons. First, transparency in publicly reporting this measure will raise hospital and patient awareness of unplanned hospital visits following chemotherapy. Second, this reporting will incentivize hospital outpatient departments to incorporate quality improvement activities into their chemotherapy care planning in order to improve care coordination and reduce the number of these visits. We also believe that making PCHs aware of their performance, as well as the performance that might be expected given the PCH's case mix is helpful in supporting efforts to improve outcomes. The measure is intended to improve symptom management and care coordination for cancer patients who are undergoing chemotherapy.

We thank the commenter for its suggestion regarding the list of ICD–10 codes. We identified the codes representing the 10 outcome conditions with input from cancer care experts following an inclusive and patient-centric approach to developing the code sets. Cancer and chemotherapy treatment can impact the entire body and it can be challenging to differentiate whether the condition is related to the treatment, cancer, or another disease. We will consider this feedback during ongoing measure evaluation.

Comment: A number of commenters recommended that there be additional or broader denominator exclusions from the measure. Specifically, commenters urged that patients with hematologic malignancies beyond leukemia, such as lymphoma and multiple myeloma, be excluded from the measure as patients with leukemia are currently excluded. Commenters also recommended exclusions for a wide variety of other factors including, but not limited to, patients enrolled in clinical trials and patients receiving palliative care.

Response: We thank the commenters for their suggestions on additional denominator exclusions. We specified the measure to be as inclusive as possible; we excluded, based on clinical rationales, only those patient groups for which hospital visits were not typically a quality signal or for which risk adjustment would not be adequate. Based on feedback from earlier public comments suggesting that exclusion of all patients with a hematologic malignancy would be too broad, and our analyses showing that patients with lymphoma and multiple myeloma have similar rates of admission and ED visits when compared with patients with other cancer types, we decided during development to limit the exclusion criteria to only those patients with leukemia. As part of continued evaluation, we will consider reviewing rates stratified by cancer type to track the impact and inform future measure revisions.

We do not exclude patients enrolled in clinical trials because there are many challenges associated with systematically identifying these patients and collecting information on applicable clinical trials. We cannot identify these patients using claims data and many cancer patients participate in clinical trials.

We do not exclude patients receiving palliative care because published literature shows that all patients receiving outpatient chemotherapy, regardless of the reason for chemotherapy (palliative or curative) may experience a gap in care that leads to acute, potentially preventable hospitalizations. Improving patients' quality of life by keeping patients out of the hospital is a main goal of cancer care, especially at the end of life.

Comment: A few commenters recommended that there be additional numerator exclusions from the measure. Specifically, commenters recommended that we exclude planned admissions and admissions/ED visits without a POA flag. Some commenters also recommended numerator exclusions for a wide variety of other factors including, but not limited to, surgeries within 30 days of admission, patients coded with non-adherence to medication, patients with pain due to disease, and admissions with an ''elective'' admission type.

Response: We thank the commenters for their suggested numerator exclusions. This measure focuses on infusion-based chemotherapy administered in a hospital outpatient department based on filed claims. Therefore, if a patient does not show up for an appointment the encounter is not included in our calculation, thereby controlling for medication adherence. In addition, the outcomes assessed may be due to conditions related to the cancer itself or to side effects of chemotherapy. Pain is an important and common symptom of cancer and requires close outpatient management. We use a specific set of codes to identify admissions and ED visits for 10 potentially preventable symptoms—including anemia, dehydration, diarrhea, emesis, fever, nausea, neutropenia, pain, pneumonia, or sepsis—none of which are ''elective'' admissions. We will take other suggestions, such as the use of POA flags, under advisement in future evaluation work.

Comment: Commenters identified concerns regarding the risk-adjustment methodology, including the measure's use of administrative data not capturing certain information for risk adjustment or stratification, such as cancer staging, chemotherapy toxicity levels, or patient genetic information.

Response: We cannot identify cancer staging, chemotherapy toxicity levels, or patient genetic information using claims data. However, we believe that the risk-adjustment methodology as specified is valid. The measure is risk adjusted to help account for the variation in patient mix and aggressiveness of treatment, adjusting for demographic factors such as age and sex, comorbidities, cancer type, and the number of treatments during the measurement period. For example, aggressiveness can range by cancer type and age, which are accounted for in our model. Also, we adjust for the number of treatments which may also be an indicator of treatment aggressiveness.

Comment: Several commenters identified other general concerns with the measure specifications, including concerns with appropriately capturing neutropenic fever and the associated 30-day window; the reliance on a pneumonia diagnosis as a proxy for neutropenic fever and its categorization as a preventable complication within 30 days of outpatient chemotherapy; and the exclusion of patients taking oral chemotherapy from the denominator.

Response: We thank the commenters for their consideration and feedback. During measure development, the technical expert panel recommended expanding the diagnoses and symptoms that are the subject of the measure to include both neutropenia and fever to avoid missing any diagnoses of neutropenic fever since a single ICD–9 code for neutropenic fever does not exist. Because the diagnosis of neutropenia requires lab results and is often not coded on a claim, we were further advised to expand the measure to include pneumonia and sepsis as the

most common sequelae of neutropenic fever. We limited the window for identifying the outcomes of admissions and ED visits to 30 days after hospital outpatient chemotherapy treatment because existing literature suggests the vast majority of adverse events occur within that time frame, as was observed during testing.

The decision to not include patients receiving only oral chemotherapy was made during development for several reasons, including attribution and timing. Attributing a prescription to a hospital-based outpatient setting is challenging; patients are likely to receive care from multiple physicians, in multiple settings, and not all physicians are employed by the hospital. Therefore, not all claims for that provider are attributable to the hospital. In addition, the measure algorithm uses the chemotherapy encounter date at the index for the 30-day window to follow patients to ascertain whether they experience an admission or ED visit. Identifying a specific index date on which oral chemotherapy was started is not feasible, since claims data only includes information on the date the prescription was filled, without information on what day the patient started taking the medication. We note, however, that patients receiving oral chemotherapy in combination with infusion-based chemotherapy are included in the cohort. We will take into consideration the inclusion of patients only receiving oral chemotherapy in future evaluation work.

Comment: One commenter recommended that if we adopt the measure for the PCHQR, we retire two currently active measures: NQF #0383, Plan of Care for Pain, and NQF #0384, Pain Intensity Quantified.

Response: We thank the commenter for the recommendation and will consider it in the future. The process measures, which are not risk-adjusted, support the purpose of the proposed measure by reinforcing that those providing outpatient care should screen for and manage symptoms such as pain and anemia/fatigue. We believe that having these process measures, which are directly within the control of the PCH, complements the newly adopted outcome measure. However, we recognize that having all three measures in the program may place undue burden on facilities. We will continue to assess the appropriateness of including all three measures after we have more data on the correlation between PCH performance on each of the three measures.

After consideration of the public comments we received, we are finalizing the adoption of the Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy measure as proposed.

In summary, the previously finalized and newly finalized measures for the PCHQR Program for the FY 2019 program year and subsequent years are listed in the table below.

PREVIOUSLY FINALIZED AND NEWLY FINALIZED PCHQR MEASURES FOR THE FY 2019 PROGRAM YEAR AND SUBSEQUENT YEARS

Short name	NQF No.	Measure name
		Safety and Healthcare-Associated Infection (HAI)
CLABSI	0139	National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection Outcome Measure.
CAUTI	0138	National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infections Outcome Measure.
SSI	0753	American College of Surgeons—Centers for Disease Control and Prevention (ACS–CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure [currently includes SSIs following Colon Surgery and Abdominal Hysterectomy Surgery].
CDI	1717	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure.
MRSA	1716	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* Bacteremia Outcome Measure.
HCP	0431	Influenza Vaccination Coverage Among Healthcare Personnel.
		Clinical Process/Cancer Specific Treatment
N/A	0223	Adjuvant Chemotherapy is Considered or Administered Within 4 Months (120 days) of Diagnosis to Patients Under the Age of 80 with AJCC III (lymph node positive) Colon Cancer.
N/A	0559	Combination Chemotherapy is Considered or Administered Within 4 Months (120 days) of Diagnosis for Women Under 70 with AJCC T1cN0M0, or Stage IB—III Hormone Receptor Negative Breast Cancer.***
N/A	0220	Adjuvant Hormonal Therapy.
		Clinical Process/Oncology Care Measures
N/A	0382	Oncology: Radiation Dose Limits to Normal Tissues.*
N/A	0383	Oncology: Plan of Care for Pain—Medical Oncology and Radiation Oncology.
N/A	0384	Oncology: Medical and Radiation—Pain Intensity Quantified.
N/A	0390	Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Prostate Cancer Patients.
N/A	0389	Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low Risk Prostate Cancer Patients.
		Patient Engagement/Experience of Care
HCAHPS	0166	HCAHPS.
		Clinical Effectiveness Measure
EBRT	1822	External Beam Radiotherapy for Bone Metastases.

PREVIOUSLY FINALIZED AND NEWLY FINALIZED PCHQR MEASURES FOR THE FY 2019 PROGRAM YEAR AND SUBSEQUENT YEARS—Continued

Short name	NQF No.	Measure name
Claims Based Outcome Measure		
N/A	N/A	Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy.**

* Finalized update in FY 2019 program year.
** Newly finalized for FY 2019 program year.
*** In previous final rules, this measure was titled ''Combination Chemotherapy is Considered or Administered Within 4 months (120 days) of Diagnosis for Women Under 70 with AJCC T1c, or Stage II or III Hormone Receptor Negative Breast Cancer. This name change is consistent with NQF updates to the measure name and reflects an update in the AJCC staging, does not reflect a change in the measure inclusion criteria, and is not considered substantive.

5. Possible New Quality Measure Topics for Future Years

We discussed future quality measure topics and quality measure domain areas in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50280), and in the FY 2016 IPPS/LTCH PPS final rule (80 FR4979), we discussed public comment and specific suggestions for measure topics addressing the following CMS Quality Strategy domains: Making care affordable; communication and coordination; and working with communities to promote best practices of healthy living. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25211), we welcomed public comment and specific suggestions for measure topics that we should consider for future rulemaking.

Comment: One commenter thanked CMS for its thoughtful approach to measure development. The commenter urged CMS to incorporate additional outcomes measures into the PCHQR Program, such as patient-reported outcomes measures, condition-specific outcome sets, and an unplanned readmissions measure.

Response: We thank the commenter for its support as we continuously work to develop and implement meaningful quality measures.

Comment: One commenter urged CMS to include stakeholders throughout the measure development process.

Response: We look forward to continuing collaboration efforts with stakeholders through the various mechanisms currently in place, such as the Technical Expert Panels and notice and comment periods during rulemaking.

6. Maintenance of Technical Specifications for Quality Measures

We maintain technical specifications for the PCHQR Program measures, and we periodically update those specifications. The specifications may be found on the QualityNet Web site at: *https://qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier2&cid=1228774479863*.

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50281), we adopted a policy under which we use a subregulatory process to make nonsubstantive updates to measures used for the PCHQR Program. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25211), we did not propose any changes to this policy.

7. Public Display Requirements

a. Background

Under section 1866(k)(4) of the Act, we are required to establish procedures for making the data submitted under the PCHQR Program available to the public. Such procedures must ensure that a PCH has the opportunity to review the data that are to be made public with respect to the PCH prior to such data being made public. Section 1866(k)(4) of the Act also provides that the Secretary must report quality measures of process, structure, outcome, patients' perspective on care, efficiency, and costs of care that relate to services furnished in such hospitals on the CMS Web site. The measures that we have finalized for public display are shown in the table below.

PREVIOUSLY FINALIZED MEASURES FOR PUBLIC DISPLAY

Measure name	First year of public display
• Adjuvant Chemotherapy is Considered or Administered Within 4 Months (120 days) of Diagnosis to Patients Under the Age of 80 with AJCC III (lymph node positive) Colon Cancer (NQF #0223).	2014.
• Combination Chemotherapy is Considered or Administered Within 4 Months (120 days) of Diagnosis for Women Under 70 with AJCC T1c, or Stage II or III Hormone Receptor Negative Breast Cancer (NQF #0559).	
• Adjuvant Hormonal Therapy (NQF #0220)	2015.
• Oncology: Radiation Dose Limits to Normal Tissues (NQF #0382)	2016.
• Oncology: Oncology: Plan of Care for Pain—Medical Oncology and Radiation Oncology (NQF #0383).	
• Oncology: Oncology: Medical and Radiation—Pain Intensity Quantified (NQF #0384).	
• Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Prostate Cancer Patients (NQF #0390).	
• Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low Risk Prostate Cancer Patients (NQF #0389).	
• HCAHPS (NQF #0166).	
• CLABSI (NQF #0139)	No Later Than 2017.
• CAUTI (NQF #0138).	

b. Additional Public Display Requirements

As we strive to publicly display data as soon as possible on a CMS Web site, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25211 through 25212), we proposed the following update to our public display polices. We believe it is best to not specify in rulemaking the exact timeframe during the year for publication as doing so may prevent earlier publication. In the FY 2017 IPPS/LTCH PPS proposed rule, we proposed, then, to make these data

available as soon as it is feasible during the year, starting with the first year for which we are publishing data for each measure. We will continue to propose in rulemaking the first year for which we intend to publish data for each measure. We intend to make the data available on at least a yearly basis.

As stated above, we are required to give PCHs an opportunity to review their data before the data are made public. Because we proposed to make the data for this program available as soon as possible, and the timeframe for this publication may change year-to-year, we did not propose to specify in rulemaking the exact dates for review. However, we proposed that the time period for review would be approximately 30 days in length. We proposed to announce the exact timeframes on a CMS Web site and/or on our applicable listservs.

We welcomed public comments on these updates to our public display and preview policies.

We did not receive any public comments. Therefore, for the reasons discussed above, we are finalizing these proposals.

c. Public Display of Additional PCHQR Measure

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25212), we proposed to publicly display one additional PCHQR measure beginning with FY 2017 program year data (which is data collected during CY 2015). This proposal would mean that we would display the measure data during CY 2017, and that we would use a CMS Web site and/or our applicable listservs to announce the exact timeframe. This measure is External Beam Radiotherapy for Bone Metastases (NQF #1822), which we adopted in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50278 through 50280). We believe that it is important to share data collected under the PCHQR Program with healthcare consumers through publication on public Web sites to help inform healthcare choices. We intend to make this data publicly available at the first opportunity.

We welcomed public comment on our proposal to display this measure beginning with the FY 2017 program year data and for subsequent years.

Comment: One commenter supported the proposed public display of data related to the External Beam Radiotherapy for Bone Metastases measure beginning in 2017. The commenter indicated it would welcome the opportunity to collaborate with CMS on best ways to display the data.

Response: We thank the commenter for the support.

After consideration of the public comment we received, we are finalizing the public display of data related to the External Beam Radiotherapy for Bone Metastases measure beginning in 2017 as proposed.

d. Public Display of Updated Measure

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49720 through 49722), we finalized public display of the Oncology: Radiation Dose Limits to Normal Tissues measure in 2016 and subsequent years. In the proposed rule (81 FR 25212) we stated that we proposed that if our proposal to update this measure (described in section VIII.B.3.b. of the preamble of the proposed rule) was finalized, we proposed to begin displaying on *Hospital Compare* data using the updated measure cohort as soon as feasible after the updated data is collected in CY 2017. We intend to denote the cohort expansion on *Hospital Compare* to ensure that consumers are informed about the expansion.

We welcomed public comment on our proposals regarding public display of this updated measure.

Comment: One commenter asked that CMS clarify the data collection dates for the proposed cohort expansion.

Response: PCHs would submit data for the expanded cohort during CY 2017, this data will be submitted according to the data submission schedule that was finalized in the 2015 IPPS/LTCH PPS final rule (79 FR 50283).

After consideration of the public comment we received, we are finalizing this policy as proposed.

e. Postponement of Public Display of Two Measures

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50281 through 50282), we finalized public display of the CLABSI and CAUTI measures beginning no later than 2017 and subsequent years. However, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25212) we proposed to defer the public reporting of these two measures' data. At present, all PCHs are reporting CLABSI and CAUTI data to the NHSN under the PCHQR Program; however, due to the low volume of data produced and reported by this small number of facilities, we need additional time to work with CDC to identify an appropriate timeframe for public reporting and collaborate on the analytic methods that will be used to summarize the CLABSI and CAUTI data for public reporting purposes.

We invited public comment on our proposal to defer the public reporting of the CLABSI and the CAUTI measures.

Comment: Two commenters supported CMS's decision to defer the public display of CLABSI and CAUTI data pending collaboration with the CDC.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to continue to defer public reporting of the CLABSI and CAUTI measures pending further collaboration with the CDC.

Our previously finalized and newly finalized public display requirements are summarized in the table below.

PREVIOUSLY FINALIZED AND NEWLY FINALIZED PUBLIC DISPLAY REQUIREMENTS

Measures	Public reporting
Summary of Finalized and Newly Finalized Public Display Requirements	
• Adjuvant Chemotherapy is Considered or Administered Within 4 Months (120 days) of Diagnosis to Patients Under the Age of 80 with AJCC III (lymph node positive) Colon Cancer (NQF #0223).	2014 and subsequent years.
• Combination Chemotherapy is Considered or Administered Within 4 Months (120 days) of Diagnosis for Women Under 70 with AJCC T1cN0M0, or Stage IB—III Hormone Receptor Negative Breast Cancer (NQF #0559).	
• Adjuvant Hormonal Therapy (NQF #0220)	2015 and subsequent years.
• Oncology: Radiation Dose Limits to Normal Tissues (NQF #0382)*	2016 and subsequent years.
• Oncology: Plan of Care for Pain—Medical Oncology and Radiation Oncology (NQF #0383).	
• Oncology: Medical and Radiation—Pain Intensity Quantified (NQF #0384)	
• Prostate Cancer: Adjuvant Hormonal Therapy for High Risk Prostate Cancer Patients (NQF #0390)	

PREVIOUSLY FINALIZED AND NEWLY FINALIZED PUBLIC DISPLAY REQUIREMENTS—Continued

Measures	Public reporting
• Prostate Cancer: Avoidance of Overuse of Bone Scan for Staging Low Risk Prostate Cancer Patients (NQF #0389) • HCAHPS (NQF #0166) • CLABSI (NQF #0139)**	Deferred.
• CAUTI (NQF #0138)**. • External Beam Radiotherapy for Bone Metastases (NQF #1822)***	Beginning at the first opportunity in 2017 and for subsequent years.

* Update newly finalized for display for the FY 2019 program year and subsequent years in this finalized rule—expanded cohort will be displayed as soon as feasible.
** Deferral newly finalized in this final rule.
*** Measure newly finalized for public display in this final rule.

8. Form, Manner, and Timing of Data Submission

Section 1866(k)(2) of the Act requires that, beginning with the FY 2014 PCHQR program year, each PCH must submit to the Secretary data on quality measures specified under section 1866(k)(3) of the Act in a form and manner, and at a time, as specified by the Secretary.

Data submission requirements and deadlines for the PCHQR Program are generally posted on the QualityNet Web site at: *http://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier3&cid=1228772864228*.

The newly finalized measure for FY 2019 (Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy) is a claims-based measure; therefore, there are no additional data submission requirements for this measure. As this measure uses 1 year of Medicare administrative claims data, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25212 through 25213), we proposed to calculate this measure on a yearly basis, beginning with data from July 1, 2016 through June 30, 2017, and then to calculate the measure for subsequent years using data from July 1 through June 30.

We did not receive any comments on this proposal. Therefore, for the reasons discussed above, we are finalizing the reporting schedules as proposed.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25213), we did not propose any changes to previously finalized data submission requirements.

9. Exceptions From PCHQR Program Requirements

In our experience with other quality reporting and performance programs, we have noted occasions when providers have been unable to submit required quality data due to extraordinary circumstances that are not within their control (for example, natural disasters). We do not wish to increase their burden unduly during these times. Therefore, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50848), we finalized our policy that, for the FY 2014 program year and subsequent years, PCHs may request and we may grant exceptions (formerly referred to as waivers) with respect to the reporting of required quality data when extraordinary circumstances beyond the control of the PCH warrant. When exceptions are granted, we will notify the respective PCH.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25213), we did not propose any changes to this PCHQR exception process.

C. Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

1. Background and Statutory Authority

We seek to promote higher quality and more efficient health care for Medicare beneficiaries, and our efforts are furthered by quality reporting programs coupled with public reporting of that information.

Section 3004(a) of the Affordable Care Act amended section 1886(m)(5) of the Act, requiring the Secretary to establish the Long-Term Care Hospital Quality Reporting Program (LTCH QRP). The LTCH QRP applies to all hospitals certified by Medicare as LTCHs. Beginning with the FY 2014 payment determination and subsequent years, the Secretary is required to reduce any annual update to the LTCH PPS standard Federal rate for discharges occurring during such fiscal year by 2 percentage points for any LTCH that does not comply with the requirements established by the Secretary.

Section 1886(m)(5) of the Act requires that for the FY 2014 payment determination and subsequent years, each LTCH submit data on quality measures specified by the Secretary in a form and manner, and at a time, specified by the Secretary. For more information on the statutory history of the LTCH QRP, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50286).

The Improving Medicare Post-Acute Care Transformation Act of 2014 (IMPACT Act) imposed new data reporting requirements for certain post-acute care (PAC) providers, including LTCHs. For information on the statutory background of the IMPACT Act, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49723 through 49724).

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49723 through 49728), we reviewed and finalized the activities and the timeline and sequencing of such activities that would occur under the LTCH QRP. In addition, we established our approach for identifying cross-cutting measures and process for the adoption of measures, including the application and purpose of the Measure Application Partnership (MAP) and the notice-and-comment rulemaking process. For information on these topics, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49723).

2. General Considerations Used for Selection of Quality, Resource Use, and Other Measures for the LTCH QRP

For a detailed discussion of the considerations we use for the selection of LTCH QRP quality measures, such as alignment with the CMS Quality Strategy,[219] which incorporates the three broad aims of the National Quality Strategy,[220] we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50286 through 50287) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49728). Overall, we strive to promote high quality and efficiency in the delivery of health care to the beneficiaries we serve. Performance improvement leading to the highest

[219] *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityInitiativesGenInfo/CMS-Quality-Strategy.html.*

[220] *http://www.ahrq.gov/workingforquality/nqs/nqs2011annlrpt.htm.*

quality health care requires continuous evaluation to identify and address performance gaps and reduce the unintended consequences that may arise in treating a large, vulnerable, and aging population. Quality reporting programs, coupled with public reporting of quality information, are critical to the advancement of health care quality improvement efforts. Valid, reliable, relevant quality measures are fundamental to the effectiveness of our quality reporting programs. Therefore, selection of quality measures is a priority for us in all of our quality reporting programs.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25215), we proposed to adopt for the LTCH QRP one measure that we are specifying under section 1899B(c)(1) of the Act to meet the Medication Reconciliation domain, that is, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP. Further, we proposed for the LTCH QRP to adopt three measures to meet the resource use and other measure domains identified in section 1899B(d)(1) of the Act. These measures include: (1) Total Estimated Medicare Spending Per Beneficiary (MSBP): MSPB–PAC LTCH QRP; (2) Discharge to Community: Discharge to Community-PAC LTCH QRP; and (3) Measures to reflect all-condition risk-adjusted potentially preventable hospital readmission rates: Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP.

In our development and specification of measures, we employ a transparent process in which we seek input from stakeholders and national experts and engage in a process that allows for pre-rulemaking input on each measure, as required by section 1890A of the Act. To meet this requirement, we provided the following opportunities for stakeholder input: Our measure development contractor convened technical expert panels (TEPs) that included stakeholder experts and patient representatives on July 29, 2015, for the Drug Regimen Review Conducted with Follow-Up for Identified Issues measures; on August 25, 2015, September 25, 2015, and October 5, 2015, for the Discharge to Community measures; on August 12 and 13, 2015, and October 14, 2015 for the Potentially Preventable 30-Day Post-Discharge Readmission Measures; and on October 29 and 30, 2015, for the Medicare Spending Per Beneficiary measures. In addition, we released draft quality measure specifications for public comment for the Drug Regimen Review Conducted with Follow-Up for Identified Issues measures from September 18, 2015, to October 6, 2015; for the Discharge to Community measures from November 9, 2015, to December 8, 2015; for the Potentially Preventable 30-Day Post-Discharge Readmission Measures from November 2, 2015 to December 1, 2015; and for the Medicare Spending Per Beneficiary measures from January 13, 2016 to February 5, 2016. We implemented a public mailbox, *PACQualityInitiative@cms.hhs.gov*, for the submission of public comments. This PAC mailbox is accessible on our PAC quality initiatives Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-of-2014-Data-Standardization-and-Cross-Setting-MeasuresMeasures.html.*

In addition, we sought public input from the NQF-convened MAP Post-Acute Care, Long-Term Care (PAC/LTC) Workgroup during the annual in-person meeting held December 14 and 15, 2015. The MAP, composed of multi-stakeholder groups, is tasked to provide input on the selection of quality and efficiency measures described in section 1890(b)(7)(B) of the Act.

The MAP reviewed each IMPACT Act-related measure proposed for use in the LTCH QRP in the FY 2017 IPPS/LTCH PPS proposed rule. For more information on the MAP's recommendations, we refer readers to the MAP 2016 Final Recommendations to HHS and CMS public report at: *http://www.qualityforum.org/Publications/2016/02/MAP_2016_Considerations_for_Implementing_Measures_in_Federal_Programs_-_PAC-LTC.aspx.*

For measures that do not have NQF endorsement, or which are not fully supported by the MAP for use in the LTCH QRP, we proposed for the LTCH QRP for the purposes of satisfying the measure domains required under the IMPACT Act measures that closely align with the national priorities identified in the National Quality Strategy (*http://www.ahrq.gov/workingforquality/*) and for which the MAP supports the measure concept. Further discussion as to the importance and high-priority status of these proposed measures in the LTCH setting is included under each quality measure section in the preamble of this final rule.

Although we did not solicit feedback on General Considerations Used for Selection of Quality, Resource Use, and Other Measures for the LTCH QRP, we received one comment, which is summarized and discussed below.

Comment: One commenter stated that CMS should recognize burden of data collection and focus on measures that are the most clinically relevant and actionable to the facility and patients. In addition, the commenter recommended that CMS use minimum standards in the development of new measures so that they are as clear and consistent across facilities as possible.

Response: We note that we strive to strike a balance between minimizing burden and addressing gaps in quality of care as we continue to expand the LTCH QRP. We interpret the commenter's suggestion that CMS apply minimum standards in its measure development to suggest that we simplify our approach to quality measure development itself. We will take recommendations into consideration in future measure development.

We also received several comments related to the proposed measures, the IMPACT Act, NQF endorsement, the NQF MAP review process, and the use of TEPs, which are summarized and discussed below.

Comment: Several commenters expressed appreciation for CMS' efforts to implement the requirements of the IMPACT Act and standardize quality measures across PAC settings as required by the IMPACT Act. One commenter noted the importance of functional measures and value of assessing patients' functional status consistently, and is pleased that the IMPACT Act is moving in that direction. Also, one commenter indicated achieving standardized and interoperable patient assessment data will allow for better cross-setting comparisons of quality and will support the development of better quality measures with uniform risk standardization.

Response: We believe that standardizing patient assessment data will allow for the exchange of data among PAC providers in order to facilitate care coordination and improve patient outcomes. We appreciate the importance of functional status measures and will consider inclusion of additional measures.

Comment: Several commenters urged CMS to delay implementation of proposed measures until NQF has completed its review and had endorsed measures that are appropriate for the specific characteristics of the LTCH patient population. One commenter requested that CMS provide a timeline for submission of the proposed measures to NQF. In addition, commenters recommended NQF endorsement prior to public reporting. One commenter suggested that CMS seek NQF's formal consensus development process instead of a time-

limited endorsement, as it was perceived the time-limited endorsement was not sufficient.

Response: We received several comments regarding the NQF endorsement status for the proposed measures, and acknowledge the commenters' recommendation to submit the measures to the NQF prior to implementation. We wish to clarify that the proposed measures are not currently under review for endorsement due to the rigorous timelines associated with the measure development process and meeting the statutory deadlines. However, we intend to seek NQF endorsement in the near future. While we appreciate the importance of consensus endorsement and intend to seek such endorsement, we must balance the need to address gaps in quality and adhere to statutorily required timelines as in the case of the quality and resource use measures as proposed to address the IMPACT Act. We further note that we consider and propose appropriate measures that have been endorsed by the NQF whenever possible. However, when this is not feasible because there is no NQF-endorsed measure, we utilize our statutory authority that allows the Secretary to specify a measure for the LTCH QRP that is not NQF-endorsed where, as in the case for the proposed measures, we have not been able to identify other measures that are endorsed or adopted by a consensus organization. While we appreciate the importance of consensus endorsement and intend to seek such endorsement, we must balance the need to address gaps in quality and adhere to statutorily required timelines as in the case of the quality and resource use measures that we proposed to address the IMPACT Act.

In regard to the comments regarding time-limited endorsement, NQF uses time-limited endorsement for measures that meet all of NQF's endorsement criteria with the exception of field testing and that are critical to advancing quality improvement. When measures are granted this 2-year endorsement rather than the traditional 3-year period, measure developers must test the measure and return results to NQF within the 2-year window. We again note that we have not yet sought endorsement of the proposed measures, time-limited or otherwise.

Comment: Several commenters noted the NQF-convened MAP PAC/LTC Workgroup did not support the proposed measures; instead, it recommended that CMS delay measure implementation until the measures were fully developed and tested and brought back to the NQF for further consideration. One commenter further stated that TEP members and other stakeholders who provided feedback in the measure development process did not support measures moving forward without further testing.

Response: We interpret this comment to address the activities of the MAP, a multi-stakeholder partnership convened by NQF that provides input to the U.S. Department of Health and Human Services (HHS) on its selection of measures for certain Medicare programs. We would like to clarify that the MAP ''encouraged continued development'' for the proposed measure. According to the MAP, the term ''encourage continued development'' is applied when a measure addresses a critical program objective or promotes alignment and the measure is in an earlier stage of development. In contrast, the MAP uses the phrase ''do not support'' when it does not support the measures at all.

Since the MAP provided a recommendation of ''encourage continued development'' for the proposed measures during the December 2015 NQF-convened MAP PAC/LTC Workgroup meeting, further refinement of measure specifications and testing of measure validity and reliability have been performed. These efforts have included: A pilot test in 12 PAC settings, including LTCHs, to determine the feasibility of assessment items for use in calculation of the measure Drug Regimen Review Conducted with Follow-Up for Identified Issues; and further development of risk-adjusted models for the measures, Discharge to Community, Medicare Spending per Beneficiary, and Potentially Preventable 30-Day Post-Discharge Readmission Measure. Additional information regarding testing is further described in the specific measure sections in the preamble of this final rule.

For these reasons, we believe that the measures have been fully and robustly developed, and believe they are appropriate for implementation and should not be delayed.

Comment: Several commenters, including MedPAC, expressed concern regarding the standardization and interoperability of the proposed measures as they perceived the measures to have different inclusion/exclusion criteria, episode constructions and risk factors, and, therefore, do not meet the mandate of the IMPACT Act. Commenters expressed further concern about future implications of such variations and recommend delaying implementation until measures are standardized and interoperable across PAC settings. One commenter further indicated that the measure titles were different for each setting, pointing out the words ''LTCH QRP'' or ''Long-Term Care Hospital'' to designate a difference in the measure. One commenter stated implementing the quality measures in an unstandardized fashion would result in additional costs in the future for aligning measures between PAC providers.

MedPAC suggested that the measures use uniform definitions, specifications, and risk-adjustment methods, conveying that findings from their work on a unified PAC payment system suggest there is overlap or similar care provided for Medicare beneficiaries with similar needs across PAC settings. As a result of this work, MedPAC urged that the IMPACT Act measures be standardized to facilitate quality comparison across PAC settings to inform a Medicare beneficiary's choice of where to seek care and provide an opportunity for CMS to evaluate the value of PAC services, noting that differences in rates should reflect differences in quality of care rather than differences in the way rates are constructed.

Response: We wish to clarify that the IMPACT Act requires that the patient assessment instruments be modified to enable the submission of standardized data, for purposes such as interoperability. However, measures themselves are not ''interoperable.''

CMS, in collaboration with our measure contractors, developed the proposed measures with the intent to standardize the measure methodology so that we are able to detect variation among PAC providers in order to be able to assess differences in quality of care. For example, the patient assessment-based quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, was developed across PAC settings with uniform definitions and specifications. This measure is not risk adjusted. The standardized development of this assessment-based measure follows the mandate of the IMPACT Act to develop standardized patient assessment-based measures for the four PAC settings (section 1899B(c)(1) of the Act). The resource use and other measures, Discharge to the Community-PAC LTCH QRP and Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP, were developed to be uniform across the PAC settings in terms of their definitions, measure calculations, and risk-adjustment approach where applicable.

There is variation in each measure primarily due to the data sources for

each PAC setting. The risk-adjustment approach for the resource use and other IMPACT Act measures is aligned, but is tailored to each measure based on measure testing results. Adjusting for relevant case-mix characteristics in each setting improves the validity and explanatory power of risk adjustment models, and helps ensure that any differences in measure performance reflect differences in the care provided rather than differences in patient case-mix. We employ this approach to measure development to enable appropriate cross-setting comparisons in PAC settings and to maximize measure reliability and validity. It should be noted that sections 1899B(c)(3)(B) and 1899B(d)(3)(B) of the Act require that quality measures and resource use and other measures be risk adjusted, as determined appropriate by the Secretary.

Comment: Several commenters expressed concerns regarding the validity and reliability of IMPACT Act measures and encouraged CMS to conduct further analysis of data to ensure comparability across PAC settings, prior to implementation and public reporting of data.

Response: We have tested for validity and reliability all of the IMPACT Act measures, and the results of that testing is available in the document, Measure Specifications for Measures Adopted in the FY 2017 LTCH QRP Final Rule, posted on the CMS LTCH QRP Web page at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html.*

Comment: A few commenters requested that CMS proceed cautiously to ensure new measures are associated with minimal administrative and data collection burden, but also expressed appreciation of CMS efforts to implement the IMPACT Act.

Response: We appreciate the importance of avoiding undue burden on providers and will continue to evaluate and consider any unnecessary burden associated with implementation of the LTCH QRP. We wish to note that the three resource measures are claims-based, and will require no additional data collection by providers and thus result in minimal increases in burden. The measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues—PAC LTCH QRP, is calculated using assessment data and requires the addition of three items to the LTCH Continuity Assessment Record and Evaluation (CARE) Data Set, also requiring minimal additional burden. We address the issue of burden further under section I.M. of Appendix A of this final rule.

Comment: One commenter expressed concern regarding CMS' approach to implementing the requirements of the IMPACT Act and requested CMS consider greater flexibility with regard to regulatory requirements.

Response: We appreciate the comment regarding the requirements associated with the proposed quality measures for the IMPACT Act. We note that any flexibility we may have with regard to regulatory requirements is constrained by the statutory requirements of the IMPACT Act. However, we do, and will continue to, monitor the effects of policy changes affecting PAC facilities to ensure appropriate patient access and care and will consider greater flexibility as feasible and appropriate.

Comment: Several commenters urged CMS to engage in several activities which would afford greater transparency with stakeholders regarding measure development. These commenters also requested that measures undergo field testing with providers prior to implementation. Commenters also requested that more detailed measure specifications be posted in order to enable providers to evaluate measure design decisions. Commenters requested that LTCH providers be provided with confidential preview reports as a part of a ''dry run'' process as this would enable providers to review data and provide CMS with feedback on potential technical issues with proposed measure. Finally, the commenters requested that measure data be provided to LTCHs on a patient level on a quarterly basis, similar to other quality reporting programs, in order to make effective use of the data and improve performance.

Response: With regard to the testing and analytic results provided for these measures, since the December 2015 MAP meeting, further refinement of measure specifications and testing of measure validity and reliability have been performed.

We refer readers to the Measure Specifications for Measures Adopted in the FY 2017 LTCH QRP Final Rule, posted on the CMS LTCH QRP Web page at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html,* which includes detailed information regarding measure specifications, including results of the final risk adjustment models for the resource use measures. For resource use measures, our testing results are within range for similar outcome measures finalized in public reporting and value-based purchasing programs, including the All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512), previously adopted into the LTCH QRP.

We appreciate the comment requesting that we provide performance data on LTCH QRP measures on a more frequent, such as quarterly, basis in order to promote quality improvement. We wish to note that the proposed claims-based measures are based on 2 consecutive years of data in order to ensure a sufficient sample size to reliably assess LTCHs' performance. However, we will investigate the feasibility and usability of providing LTCHs with information more frequently, such as unadjusted counts of potentially preventable readmissions (PPRs) and discharge data. We also appreciate the commenters' suggestions related to the implementation of dry run activities, such as confidential reports, for the purposes of identifying any technical issues prior to public reporting, as was successfully provided in the fall of 2015 for the All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512).

We intend to provide confidential feedback reports beginning in October 2017, as described in section VIII.C.15. of the preamble of this final rule, and we believe that the reports could serve as an opportunity for LTCHs to provide to us any technical issues they may discover. However, we note that, as described in section VIII.C.14. of the preamble of the proposed rule, we are unable at this time to provide patient level information for the claims-based measure, for example, the readmission measures, because such data comes from a separate entity. Finally, we wish to note that we intend to continue refining specifications and we will consider pilot testing in addition to the performance testing that we currently conduct.

3. Policy for Retention of LTCH QRP Measures Adopted for Previous Payment Determinations

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53614 through 53615), for the purpose of streamlining the rulemaking process, we adopted a policy that, when we initially adopt a measure for the LTCH QRP for a payment determination and all subsequent years, it would remain in effect until the measure was actively removed, suspended, or replaced. For further information on how measures are considered for removal, suspension, or replacement, we refer readers to the

FY 2013 IPPS/LTCH PPS final rule (77 FR 53614 through 53615).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25214), we did not propose any changes to the policy for retaining LTCH QRP measures adopted for previous payment determinations.

4. Policy for Adopting Changes to LTCH QRP Measures

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53615 through 53616), we adopted a subregulatory process to incorporate NQF updates to LTCH quality measure specifications that do not substantively change the nature of the measure. Substantive changes will be proposed and finalized through rulemaking. For further information on what constitutes a substantive versus a nonsubstantive change and the subregulatory process for nonsubstantive changes, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53615 through 53616). In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25214), we did not propose any changes to the policy for adopting changes to LTCH QRP measures.

5. Quality Measures Previously Finalized for and Currently Used in the LTCH QRP

A history of the LTCH QRP quality measures adopted for the FY 2014 payment determinations and subsequent years is presented in the table below. The year in which each quality measure was first adopted and implemented, and then subsequently readopted or revised, if applicable, is displayed. The initial and subsequent annual payment determination years are also shown in this table. For more information on a particular measure, we refer readers to the IPPS/LTCH PPS final rule and associated page numbers referenced in this table.

QUALITY MEASURES PREVIOUSLY FINALIZED FOR AND CURRENTLY USED IN THE LTCH QRP

Measure title	IPPS/LTCH PPS Final rule	Data collection start date	Annual payment determination: Initial and subsequent APU years
National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (NQF #0138).	Adopted an application of the measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51745 through 51747).	October 1, 2012	FY 2014 and subsequent years.
	Adopted the NQF endorsed version and expanded measure (with standardized infection ratio [SIR]) in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53616 through 53619).	January 1, 2013	FY 2015 and subsequent years.
National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (NQF #0139).	Adopted an application of the measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51747 through 51748).	October 1, 2012	FY 2014 and subsequent years.
	Adopted the NQF endorsed and expanded measure (with SIR) in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53616 through 53619).	January 1, 2013	FY 2015 and subsequent years.
Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678).	Adopted an application of the measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51748 through 51750).	October 1, 2012	FY 2014 and subsequent years.
	Adopted the NQF endorsed version in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50861 through 50863).	January 1, 2013	FY 2015 and subsequent years.
	Adopted in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49731 through 49736) to fulfill IMPACT Act requirements.	January 1, 2016	FY 2018 and subsequent years.
Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680).	Adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53624 through 53627).	January 1, 2014	FY 2016 and subsequent years.
	Revised data collection timeframe in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50858 through 50861).	October 1, 2014	FY 2016 and subsequent years.
	Revised data collection timeframe in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50289 through 50290).	October 1, 2014	FY 2016 and subsequent years.
Influenza Vaccination Coverage among Healthcare Personnel (NQF #0431).	Adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53630 through 53631).	October 1, 2014	FY 2016 and subsequent years.
	Revised data collection timeframe in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50857 through 50858).	October 1, 2014	FY 2016 and subsequent years.
All-Cause Unplanned Readmission Measure for 30-Days Post-Discharge from Long-Term Care Hospitals (NQF #2512).	Adopted in FY 2014 IPPS/LTCH PPS final rule (78 FR 50868 through 50874).	N/A	FY 2017 and subsequent years.
	Adopted the NQF endorsed version in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49730 through 49731).	N/A	FY 2018 and subsequent years.
National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-resistant Staphylococcus aureus (MRSA) Bacteremia Outcome Measure (NQF #1716).	Adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50863 through 50865).	January 1, 2015	FY 2017 and subsequent years.

QUALITY MEASURES PREVIOUSLY FINALIZED FOR AND CURRENTLY USED IN THE LTCH QRP—Continued

Measure title	IPPS/LTCH PPS Final rule	Data collection start date	Annual payment determination: Initial and subsequent APU years
National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Clostridium difficile Infection (CDI) Outcome Measure (NQF #1717).	Adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50865 through 50868).	January 1, 2015	FY 2017 and subsequent years.
National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure (NQF #N/A).	Adopted in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50301 through 50305).	January 1, 2016	FY 2018 and subsequent years.
Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674).	Adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50874 through 50877).	January 1, 2016	FY 2018 and subsequent years.
	Revised data collection timeframe in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50290 through 50291).	April 1, 2016	FY 2018 and subsequent years.
	Adopted an application of the measure in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49736 through 49739) to fulfill IMPACT Act requirements.	April 1, 2016	FY 2018 and subsequent years.
Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631).	Adopted in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50291 through 50298).	April 1, 2016	FY 2018 and subsequent years.
Application of Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631).	Adopted an application of the measure in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49739 through 49747) to fulfill IMPACT Act requirements.	April 1, 2016	FY 2018 and subsequent years.
Functional Outcome Measure: Change in Mobility among Long-Term Care Hospital Patients Requiring Ventilator Support (NQF #2632).	Adopted in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50298 through 50301).	April 1, 2016	FY 2018 and subsequent years.

Although we did not solicit feedback, we received a comment about Quality Measures Previously Finalized for and Currently Used in the LTCH QRP. The comment is summarized and discussed below.

Comment: One commenter supported the continued inclusion of the previously adopted measure, Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431) in the LTCH QRP for the FY 2018 payment determination and subsequent years.

Response: We thank the commenter for their support of this measure and its continued inclusion in the LTCH QRP.

6. LTCH QRP Quality, Resource Use and Other Measures Finalized for the FY 2018 Payment Determination and Subsequent Years

For the FY 2018 payment determinations and subsequent years, in addition to the quality measures we are retaining under our policy described in section VIII.C.3. of the preamble of this final rule, we proposed three new measures. These measures were developed to meet the requirements of the IMPACT Act. They are:

- MSPB–PAC LTCH QRP;
- Discharge to Community-PAC LTCH QRP; and
- Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP.

The measures are described in more detail below.

For the risk-adjustment of the resource use and other measures, we understand the important role that sociodemographic status plays in the care of patients. However, we continue to have concerns about holding providers to different standards for the outcomes of their patients of diverse sociodemographic status because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. We routinely monitor the impact of sociodemographic status on providers' results on our measures.

The NQF is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF will issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial. CMS, in compliance with NQF's guidance, has tested sociodemographic factors in the measures' risk models and made recommendations about whether or not to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our outcome measures.

Furthermore, the Office of the Assistant Secretary for Planning and Evaluation (ASPE) is conducting research to examine the impact of sociodemographic status on quality measures, resource use, and other measures under the Medicare program as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how they apply to our quality programs at such time as they are available.

We received several comments on the impact of sociodemographic status (SDS) on quality measures, resource use, and other measures, which are summarized and discussed below.

Comment: Several commenters indicated their support for the inclusion of SDS adjustment in quality measures, resource use, and other measures. Commenters suggested that failure to account for these patient characteristics could penalize LTCHs for providing care to a more medically-complex and socioeconomically disadvantaged patient population and affect provider performance. Some commenters expressed concerns about standardization and interoperability of the measures as it pertains to risk adjusting, particularly for SDS characteristics. Many commenters recommended incorporating socioeconomic status (SES) factors as risk-adjusters for the measures, and several commenters suggested conducting additional testing and/or NQF endorsement prior to implementation of these measures.

Several commenters, including MedPAC, did not support risk adjustment of measures by SES or SDS status. One commenter did not support such risk adjustment because it can hide disparities and create different standards of care for LTCHs based on the demographics in the facility. MedPAC reiterated that risk adjustment can hide disparities in care and suggests risk adjustment reduces pressure on providers to improve quality of care for low-income Medicare beneficiaries. Instead, MedPAC supported peer provider group comparisons with providers of similar low-income beneficiary populations. Another commenter stated that SDS factors should not be included in measures that examine the patient during an LTCH stay, but should only be considered for measures evaluating care after the LTCH discharge.

Response: We appreciate the considerations and suggestions conveyed regarding the measures and the importance in balancing appropriate risk adjustment along with ensuring access to high quality care. We note that in the measures that are risk-adjusted, we do take into account characteristics associated with medical complexity, as well as factors such as age where appropriate to do so. For those cross-setting PAC measures, such as those intended to satisfy the IMPACT Act domains that use the patient assessment-based data elements for risk adjustment, we have either made such items standardized, or intend to do so as feasible. With regard to the incorporation of additional factors, we have and will continue to take such factors into account, which would include further testing as part of our ongoing measure development monitoring activities. As discussed previously, we intend to seek NQF endorsement for our measures.

With regard to the suggestions pertaining to the incorporation of socioeconomic factors as risk-adjusters for the measures, including in those measures that pertain to after the patient was discharged from the LTCH, additional testing and/or NQF endorsement prior to implementation of these measures, comments that pertain to potential consequences associated with such risk adjusters and alternative approaches to grouping comparative data, we wish to reiterate that as previously discussed, NQF is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF will issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial. CMS, in compliance with NQF's guidance, has tested sociodemographic factors in the measures' risk models and made recommendations about whether or not to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our outcome measures.

Furthermore, the Office of the Assistant Secretary for Planning and Evaluation (ASPE) is conducting research to examine the impact of sociodemographic status on quality measures, resource use, and other measures under the Medicare program as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how they apply to our quality programs at such time as they are available.

a. Measure To Address the IMPACT Act Domain of Resource Use and Other Measures: Total Estimated MSPB–PAC LTCH QRP

We proposed an MSPB–PAC LTCH QRP measure for inclusion in the LTCH QRP for the FY 2018 payment determination and subsequent years. Section 1899B(d)(1)(A) of the Act requires the Secretary to specify resource use measures, including total estimated Medicare spending per beneficiary, on which PAC providers, consisting of LTCHs, Inpatient Rehabilitation Facilities (IRFs), Skilled Nursing Facilities (SNFs), and Home Health Agencies (HHAs), are required to submit necessary data specified by the Secretary.

Rising Medicare expenditures for PAC as well as wide variation in spending for these services underlines the importance of measuring resource use for providers rendering these services. Between 2001 and 2013, Medicare PAC spending grew at an annual rate of 6.1 percent and doubled to $59.4 billion, while payments to inpatient hospitals grew at an annual rate of 1.7 percent over this same period.[221] A study commissioned by the Institute of Medicine found that variation in PAC spending explains 73 percent of variation in total Medicare spending across the United States.[222]

We reviewed the NQF's consensus-endorsed measures and were unable to identify any NQF-endorsed resource use measures for PAC settings. Therefore, we proposed this MSPB–PAC LTCH QRP measure under the Secretary's authority to specify non-NQF-endorsed measures under section 1899B(e)(2)(B) of the Act. Given the current lack of resource use measures for PAC settings, our MSPB–PAC LTCH QRP measure will provide valuable information to LTCHs on their relative Medicare spending in delivering services to approximately 122,000 Medicare beneficiaries.[223]

The MSPB–PAC LTCH QRP episode-based measure will provide actionable and transparent information to support LTCHs' efforts to promote care coordination and deliver high quality care at a lower cost to Medicare. The MSPB–PAC LTCH QRP measure holds LTCHs accountable for the Medicare payments within an ''episode of care'' (episode), which includes the period during which a patient is directly under the LTCH's care, as well as a defined period after the end of the LTCH treatment, which may be reflective of and influenced by the services furnished by the LTCH. MSPB–PAC

[221] MedPAC, ''A Data Book: Health Care Spending and the Medicare Program,'' (2015). 114.

[222] Institute of Medicine, ''Variation in Health Care Spending: Target Decision Making, Not Geography,'' (Washington, DC: National Academies 2013). 2.

[223] Figures for 2013. MedPAC, ''Medicare Payment Policy,'' Report to the Congress (2015). xvii–xviii.

LTCH QRP episodes, constructed according to the methodology described below, have high levels of Medicare spending with substantial variation. In FY 2013 and FY 2014, Medicare FFS beneficiaries experienced 178,538 MSPB–PAC LTCH QRP episodes triggered by admission to an LTCH. The mean payment-standardized, risk-adjusted episode spending for these episodes is $67,181. There is substantial variation in the Medicare payments for these MSPB–PAC LTCH QRP episodes—ranging from approximately $27,502 at the 5th percentile to approximately $115,291 at the 95th percentile. This variation is partially driven by variation in payments occurring after LTCH treatment.

Evaluating Medicare payments during an episode creates a continuum of accountability between providers that should improve post-treatment care planning and coordination. While some stakeholders throughout the measure development process supported the MSPB–PAC measures and believed that measuring Medicare spending was critical for improving efficiency, others believed that resource use measures did not reflect quality of care in that they do not take into account patient outcomes or experience beyond those observable in claims data. However, LTCHs involved in the provision of high quality PAC care as well as appropriate discharge planning and post-discharge care coordination would be expected to perform well on this measure since beneficiaries would likely experience fewer costly adverse events (for example, avoidable hospitalizations, infections, and emergency room usage). Further, it is important that the cost of care be explicitly measured so that, in conjunction with other quality measures, we can publicly report which LTCHs are involved in the provision of high quality care at lower cost.

We developed MSPB–PAC measures for each of the four PAC settings. We proposed an LTCH-specific MSPB–PAC measure in the FY 2017 IPPS/LTCH proposed rule (81 FR 25216 through 25220), an IRF-specific MSBP–PAC measure in the FY 2017 IRF proposed rule (81 FR 24197 through 24201), a SNF-specific MSPB–PAC measure in the FY 2017 SNF PPS proposed rule (81 FR 24258 through 24262), and an HHA-specific MSBP–PAC measure in the CY 2017 HH PPS proposed rule (81 FR 43760 through 43764). The four setting-specific MSPB–PAC measures are closely aligned in terms of episode construction and measure calculation. Each MSPB–PAC measure assesses Medicare Part A and Part B spending during an episode, and the numerator and denominator are defined similarly. However, setting-specific measures allow us to account for differences between settings in payment policy, the types of data available, and the underlying health characteristics of beneficiaries. For example, the MSPB–PAC LTCH QRP measure reflects the dual payment rate of the LTCH PPS by comparing episodes triggered by each payment rate case only with episodes of the same type, as detailed below.

The MSPB–PAC measures mirror the general construction of the IPPS hospital MSPB measure, which was adopted for Hospital IQR Program beginning with the FY 2014 program, and was implemented in the Hospital VBP Program beginning with the FY 2015 program. The measure was endorsed by the NQF on December 6, 2013 (NQF #2158).[224] The hospital MSPB measure evaluates hospitals' Medicare spending relative to the Medicare spending for the national median hospital during a hospital MSPB episode. It assesses Medicare Part A and Part B payments for services performed by hospitals and other healthcare providers during a hospital MSPB episode, which is comprised of the periods immediately prior to, during, and following a patient's hospital stay.[225] [226] Similarly, the MSPB–PAC measures assess all Medicare Part A and Part B payments for fee-for-service (FFS) claims with a start date during the episode window (which, as discussed in this section, is the time period during which Medicare FFS Part A and Part B services are counted towards the MSPB–PAC LTCH QRP episode). There are differences between the MSPB–PAC measures and the hospital MSPB measure to reflect differences in payment policies and the nature of care provided in each PAC setting. For example, the MSPB–PAC measures exclude a limited set of services (for example, for clinically unrelated services) provided to a beneficiary during the episode window while the hospital MSPB measure does not exclude any services.[227]

MSPB–PAC episodes may begin within 30 days of discharge from an inpatient hospital as part of a patient's trajectory from an acute to a PAC setting. An LTCH stay beginning within 30 days of discharge from an inpatient hospital would therefore be included once in the hospital's MSPB measure, and once in the LTCH's MSPB–PAC measure. Aligning the hospital MSPB and MSPB–PAC measures in this way creates continuous accountability and aligns incentives to improve care planning and coordination across inpatient and PAC settings.

We sought and considered the input of stakeholders throughout the measure development process for the MSPB–PAC measures. We convened a TEP consisting of 12 panelists with combined expertise in all of the PAC settings on October 29 and 30, 2015, in Baltimore, Maryland. A follow-up email survey was sent to TEP members on November 18, 2015, to which 7 responses were received by December 8, 2015. The MSPB–PAC TEP Summary Report is available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/Downloads/Technical-Expert-Panel-on-Medicare-Spending-Per-Beneficiary.pdf*. The measures were also presented to the MAP PAC/LTC Workgroup on December 15, 2015. As the MSPB–PAC measures were under development, there were three voting options for members: encourage continued development; do not encourage further consideration; and insufficient information.[228] The MAP PAC/LTC Workgroup voted to ''encourage continued development'' for each of the MSPB–PAC measures.[229] The MAP PAC/LTC Workgroup's vote of ''encourage continued development'' was affirmed by the MAP Coordinating Committee on January 26, 2016.[230] The MAP's concerns about the MSPB–PAC measures, as outlined in their final report, ''MAP 2016 Considerations for Implementing Measures in Federal Programs: Post-Acute Care and Long-Term Care,'' and Spreadsheet of Final Recommendations were taken into consideration during the measure development process and are discussed

as part of our responses to public comments, described below.[231] [232]

Since the MAP's review and recommendation of continued development, CMS continued to refine risk adjustment models and conduct measure testing for the IMPACT Act measures in compliance with the MAP's recommendations. The IMPACT Act measures are both consistent with the information submitted to the MAP and support the scientific acceptability of these measures for use in quality reporting programs.

In addition, a public comment period, accompanied by draft measures specifications, was originally open from January 13 to 27, 2016 and extended to February 5, 2016. A total of 45 comments on the MSPB–PAC measures were received during this 3.5 week period. The comments received also covered each of the MAP's concerns as outlined in their Final Recommendations.[233] The MSPB–PAC Public Comment Summary Report is available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/Downloads/2016_03_24_mspb_pac_public_comment_summary_report.pdf* and the MSPB–PAC Public Comment Supplementary Materials are available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/Downloads/2016_03_24_mspb_pac_public_comment_summary_report_supplementary_materials.pdf*. These documents contain the public comments (summarized and verbatim), along with our responses including statistical analyses. The MSPB–PAC LTCH QRP measure, along with the other MSPB–PAC measures, as applicable, will be submitted for NQF endorsement when feasible.

To calculate the MSPB–PAC LTCH QRP measure for each LTCH, we first define the construction of the MSPB–PAC LTCH QRP episode, including the length of the episode window as well as the services included in the episode. Next, we apply the methodology for the measure calculation. The specifications are discussed further in this section. More detailed specifications for the MSPB–PAC measures, including the MSPB–PAC LTCH QRP measure, are available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*.

(1) Episode Construction

An MSPB–PAC LTCH QRP episode begins at the episode trigger, which is defined as the patient's admission to an LTCH. The admitting facility is the attributed provider, for whom the MSPB–PAC LTCH QRP measure is calculated. The episode window is the time period during which Medicare FFS Part A and Part B services are counted towards the MSPB–PAC LTCH QRP episode. Because Medicare FFS claims are already reported to the Medicare program for payment purposes, LTCHs will not be required to report any additional data to CMS for calculation of this measure. Thus, there will be no additional data collection burden from the implementation of this measure.

Our MSPB–PAC LTCH QRP episode construction methodology differentiates between episodes triggered by standard payment rate cases and site neutral payment rate cases, reflecting the LTCH dual-payment policy detailed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623). Standard and site neutral episodes would be compared only with standard and site neutral episodes respectively. Differences in episode construction between standard and site neutral episodes are noted in this section; they otherwise share the same definition.

The episode window is comprised of a treatment period and an associated services period. The treatment period begins at the trigger (that is, on the day of admission to the LTCH) and ends on the day of discharge from that LTCH. Readmissions to the same facility occurring within 7 or fewer days do not trigger a new episode, and instead are included in the treatment period of the original episode. When two sequential stays at the same LTCH occur within 7 or fewer days of one another, the treatment period ends on the day of discharge for the latest LTCH stay. The treatment period includes those services that are provided directly or reasonably managed by the LTCH that are directly related to the beneficiary's care plan. The associated services period is the time during which Medicare Part A and Part B services (with certain exclusions) are counted towards the episode. The associated services period begins at the episode trigger and ends 30 days after the end of the treatment period. The distinction between the treatment period and the associated services period is important because clinical exclusions of services may differ for each period. Certain services are excluded from the MSPB–PAC LTCH QRP episodes because they are clinically unrelated to LTCH care, and/or because LTCHs may have limited influence over certain Medicare services delivered by other providers during the episode window. These limited service-level exclusions are not counted towards a given LTCH's Medicare spending to ensure that beneficiaries with certain conditions and complex care needs receive the necessary care. Certain services that are determined to be outside of the control of an LTCH include planned hospital admissions, management of certain preexisting chronic conditions (for example, dialysis for end-stage renal disease (ESRD), and enzyme treatments for genetic conditions), treatment for preexisting cancers, organ transplants, and preventive screenings (for example, colonoscopy and mammograms). Exclusion of such services from the MSPB–PAC LTCH QRP episode ensures that facilities do not have disincentives to treat patients with certain conditions or complex care needs.

An MSPB–PAC episode may begin during the associated services period of an MSPB–PAC LTCH QRP episode in the 30 days post-treatment. One possible scenario occurs where an LTCH discharges a beneficiary who is then admitted to an IRF within 30 days. The IRF claim would be included once as an associated service for the attributed provider of the first MSPB–PAC LTCH QRP episode and once as a treatment service for the attributed provider of the second MSPB–PAC IRF QRP episode. As in the case of overlap between hospital and PAC episodes discussed earlier, this overlap is necessary to ensure continuous accountability between providers throughout a beneficiary's trajectory of care, as both providers share incentives to deliver high quality care at a lower cost to Medicare. Even within the LTCH setting, one MSPB–PAC LTCH QRP episode may begin in the associated services period of another MSPB–PAC LTCH QRP episode in the 30 days post-treatment. The second LTCH claim would be included once as an associated service for the attributed LTCH of the first MSPB–PAC LTCH QRP episode and once as a treatment

[233] National Quality Forum, Measure Applications Partnership, ''Spreadsheet of MAP 2016 Final Recommendations'' (February 1, 2016) *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=81593*.

service for the attributed LTCH of the second MSPB–PAC LTCH QRP episode. Again, this ensures that LTCHs have the same incentives throughout both MSPB–PAC LTCH QRP episodes to deliver quality care and engage in patient-focused care planning and coordination. If the second MSPB–PAC LTCH QRP episode were excluded from the second LTCH's MSPB–PAC LTCH QRP measure, that LTCH would not share the same incentives as the first LTCH of the first MSPB–PAC LTCH QRP episode. The MSPB–PAC LTCH QRP measure was designed to benchmark the resource use of each attributed provider against what their spending is expected to be as predicted through risk adjustment. As discussed further in this section, the measure takes the ratio of observed spending to expected spending for each episode and then takes the average of those ratios across all of the attributed provider's episodes. The measure is not a simple sum of all costs across a provider's episodes, thus mitigating concerns about double counting.

(2) Measure Calculation

Medicare payments for Part A and Part B claims for services included in MSPB–PAC LTCH QRP episodes, defined according to the methodology above, are used to calculate the MSPB–PAC LTCH QRP measure. Measure calculation involves determination of the episode exclusions, the approach for standardizing payments for geographic payment differences, the methodology for risk adjustment of episode spending to account for differences in patient case mix, and the specifications for the measure numerator and denominator. The measure calculation is performed separately for MSPB–PAC LTCH QRP standard and site neutral episodes to ensure that they are compared only to other standard and site neutral episodes, respectively. The final MSPB–PAC LTCH QRP measure combines the two ratios to construct one LTCH score as described in this section.

(a) Exclusion Criteria

In addition to service-level exclusions that remove some payments from individual episodes, we exclude certain episodes in their entirety from the MSPB–PAC LTCH QRP measure to ensure that the MSPB–PAC LTCH QRP measure accurately reflects resource use and facilitates fair and meaningful comparisons between LTCHs. The episode-level exclusions are as follows:

- Any episode that is triggered by an LTCH claim outside the 50 states, District of Columbia, Puerto Rico, and U.S. Territories.
- Any episode where the claim(s) constituting the attributed LTCH's treatment have a standard allowed amount of zero or where the standard allowed amount cannot be calculated.
- Any episode in which a beneficiary is not enrolled in Medicare FFS for the entirety of a 90-day lookback period (that is, a 90-day period prior to the episode trigger) plus episode window (including where a beneficiary dies), or is enrolled in Part C for any part of the lookback period plus episode window.
- Any episode in which a beneficiary has a primary payer other than Medicare for any part of the 90-day lookback period plus episode window.
- Any episode where the claim(s) constituting the attributed LTCH's treatment include at least one related condition code indicating that it is not a prospective payment system bill.

(b) Standardization and Risk Adjustment

Section 1899B(d)(2)(C) of the Act requires that the MSPB–PAC measures are adjusted for the factors described under section 1886(o)(2)(B)(ii) of the Act, which include adjustment for factors such as age, sex, race, severity of illness, and other factors that the Secretary determines appropriate. Medicare payments included in the MSPB–PAC LTCH QRP measure are payment-standardized and risk-adjusted. Payment standardization removes sources of payment variation not directly related to clinical decisions and facilitates comparisons of resource use across geographic areas. We proposed to use the same payment standardization methodology as that used in the NQF-endorsed hospital MSPB measure. This methodology removes geographic payment differences, such as wage index and geographic practice cost index (GPCI), incentive payment adjustments, and other add-on payments that support broader Medicare program goals including indirect graduate medical education (IME) and hospitals serving a disproportionate share of uninsured patients (DSH).[234]

Risk adjustment uses patient claims history to account for case-mix variation and other factors that affect resource use but are beyond the influence of the attributed LTCH. To assist with risk adjustment, we create mutually exclusive and exhaustive clinical case-mix categories using the most recent institutional claim in the 60 days prior to the start of the MSPB–PAC LTCH QRP episode. The beneficiaries in these clinical case mix categories have a greater degree of clinical similarity than the overall LTCH patient population, and allow us to more accurately estimate Medicare spending. Our MSPB–PAC LTCH QRP measure, adapted for the LTCH setting from the NQF-endorsed hospital MSPB measure, uses a regression framework with a 90-day hierarchical condition category (HCC) lookback period and covariates including the clinical case mix categories, MS–LTC–DRGs, HCC indicators, age brackets, indicators for originally disabled, ESRD enrollment, and long-term care status, and selected interactions of these covariates where sample size and predictive ability make them appropriate. We sought and considered public comment regarding the treatment of hospice services occurring within the MSPB–PAC LTCH QRP episode window. Given the comments received, we proposed to include the Medicare spending for hospice services but risk adjust for them, such that MSPB–PAC LTCH QRP episodes with hospice are compared to a benchmark reflecting other MSPB–PAC LTCH QRP episodes with hospice services. We believe that this strikes a balance between the measure's intent of evaluating Medicare spending and ensuring that providers do not have incentives against the appropriate use of hospice services in a patient-centered continuum of care.

We understand the important role that sociodemographic status, beyond age, plays in the care of patients. However, we continue to have concerns about holding hospitals to different standards for the outcomes of their patients of diverse sociodemographic status because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. We will monitor the impact of sociodemographic status on hospitals' results on our measures.

The NQF is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF will issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations as well

[234] QualityNet, ''CMS Price (Payment) Standardization—Detailed Methods'' (Revised May 2015) *https://qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier4&cid=1228772057350.*

as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial. CMS, in compliance with NQF's guidance, has tested sociodemographic factors in the measures' risk models and made recommendations about whether or not to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our outcome measures.

Furthermore, the Office of the Assistant Secretary for Planning and Evaluation (ASPE) is conducting research to examine the impact of sociodemographic status on quality measures, resource use, and other measures under the Medicare program as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how they apply to our quality programs at such time as they are available.

While we conducted analyses on the impact of age by sex on the performance of the MSPB–PAC LTCH QRP risk-adjustment model, we did not propose to adjust the MSPB–PAC LTCH QRP measure for socioeconomic factors at this time. As this MSPB–PAC LTCH QRP measure will be submitted for NQF endorsement, we prefer to await the results of this trial and study before deciding whether to risk adjust for socioeconomic factors. We will monitor the results of the trial, studies, and recommendations. We invited public comment on how socioeconomic and demographic factors should be used in risk adjustment for the MSPB–PAC LTCH QRP measure.

Comment: Several commenters recommended that the MSPB–PAC LTCH QRP risk adjustment model include variables for SES/SDS factors. A commenter recommended that a ''fairer'' approach than using SES/SDS factors as risk adjustment variables would be to compare resource use levels that have not been adjusted for SES/SDS factors across peer providers (that is, providers with similar shares of beneficiaries with similar SES characteristics).

Response: With regard to the suggestions that the model include sociodemographic factors and the suggestion pertaining to an approach with which to convey data comparisons we refer readers to section VIII.C.6. of the preamble of this final rule, where we also discuss these topics.

Comment: Some commenters recommended that additional variables be included in risk adjustment to better capture clinical complexity. A few commenters suggested the inclusion of functional and cognitive status and other patient assessment data. A few commenters suggested patients who transfer from one short stay hospital to another in the pre-admission period may indicate clinical complexity and should be excluded from the measure. One commenter recommended that caregiver support be included in the risk adjustment model.

Response: We thank the commenters for their suggestions. The MSPB–PAC LTCH QRP measure is claims-based and does not incorporate other sources of data which might indicate the availability of family or caregiver support. As noted in the MSPB–PAC Public Comment Summary Report, a link for which has been provided above, even where data on caregiver support is available, there may be inherent subjectivity in determining the availability of such support. We believe that the other risk adjustment variables already included in the risk adjustment model adequately adjust for patients who transfer from one short stay hospital to another prior to admission to the LTCH by accounting for HCCs, clinical case mix categories, and prior inpatient and ICU length of stay. More details of the MSPB–PAC LTCH QRP risk adjustment model are in the MSPB–PAC Measure Specifications, a link for which has been provided above.

We recognize the importance of accounting for beneficiaries' functional and cognitive status in the calculation of predicted episode spending. We considered the potential use of functional status information in the risk adjustment models for the MSPB–PAC measures. However, we decided not to include this information derived from the current setting-specific assessment instruments given the move towards standardized data as mandated by the IMPACT Act. We will revisit the inclusion of functional status in these measures' risk adjustment models in the future when the standardized functional status data mandated by the IMPACT Act become available. Once they are available, we will take a gradual and systematic approach in evaluating how they might be incorporated. We intend to implement any changes if appropriate based on testing.

(c) Measure Numerator and Denominator

The MPSB–PAC LTCH QRP measure is a payment-standardized, risk-adjusted ratio that compares a given LTCH's Medicare spending against the Medicare spending of other LTCHs within a performance period. Similar to the hospital MSPB measure, the ratio allows for ease of comparison over time as it obviates the need to adjust for inflation or policy changes.

The MSPB–PAC LTCH QRP measure is calculated as the ratio of the MSPB–PAC Amount for each LTCH divided by the episode-weighted median MSPB–PAC Amount across all LTCHs. To calculate the MSPB–PAC Amount for each LTCH, one calculates the average of the ratio of the standardized spending for LTCH standard episodes over the expected spending (as predicted in risk adjustment) for LTCH standard episodes, and the average of the ratio of the standardized spending for LTCH site neutral episodes over the expected spending (as predicted in risk adjustment) for LTCH site neutral episodes. This quantity is then multiplied by the average episode spending level across all LTCHs nationally for standard and site neutral episodes. The denominator for an LTCH's MSPB–PAC LTCH QRP measure is the episode-weighted national median of the MSPB–PAC Amounts across all LTCHs. An MSPB–PAC LTCH QRP measure of less than 1 indicates that a given LTCH's Medicare spending is less than that of the national median LTCH during a performance period. Mathematically, this is represented in equation (A) below:

$$(A)\ MSPB\text{-}PAC\ LTCH\ Measure_j = \frac{MSPB\text{-}PAC\ Amount_j}{National\ Median\ MSPB\text{-}PAC\ Amount}$$

$$= \frac{\left(\frac{1}{n_j}\sum_{i\in\{I_j\}}\frac{Y_{ij}}{\widehat{Y_{ij}}}\right)\left(\frac{1}{n}\sum_j\sum_{i\in\{I_j\}}Y_{ij}\right)}{Episode-Weighted\ Median\ of\ LTCH\ Providers'MSPB\text{-}PAC\ Amount}$$

Where

- Y_{ij} = attributed standarized spending for episode *i* and provider *j,*
- Y_{ij} = expected standarized spending for episode *i* and provider *j,* as predicted from risk adjustment
- n_j = number of episodes for provider *j*
- n = total number of episodes nationally
- $i\in [I_j]$ = all episodes *i* in the set of episodes attributed to provider *j.*

(3) Data Sources

The MSPB–PAC LTCH QRP resource use measure is an administrative claims-based measure. It uses Medicare Part A and Part B claims from FFS beneficiaries and Medicare eligibility files.

(4) Cohort

The measure cohort includes Medicare FFS beneficiaries with an LTCH treatment period ending during the data collection period.

(5) Reporting

We intend to provide initial confidential feedback to providers, prior to public reporting of this measure, based on Medicare FFS claims data from discharges in CY 2015 and CY 2016. We intend to publicly report this measure using claims data from discharges in CY 2016 and CY 2017.

We proposed to use a minimum of 20 episodes for reporting and inclusion in the LTCH QRP. For the reliability calculation, as described in the measure specifications identified and for which a link has been provided above, we used two years of data (FY 2013 and FY 2014) to increase the statistical reliability of this measure. The reliability results support the 20 episode case minimum, and 98.83 percent of LTCHs had moderate or high reliability (above 0.4).

We invited public comment on our proposal to adopt the MSPB–PAC LTCH QRP measure for the LTCH QRP.

Comment: Several commenters expressed concern about the lack of NQF endorsement for the MSPB–PAC LTCH QRP measure; some believed that the measure should not be finalized until NQF endorsement is obtained.

Response: We thank the commenters for their concern regarding the lack of NQF endorsement and refer readers to section VIII.C.2. of the preamble of this final rule, where we also discuss this topic.

Comment: Several commenters noted the MAP did not endorse the proposed measure, believing that the measure should not be finalized until the support of the MAP is obtained.

Response: We appreciate the comments about the NQF MAP committee and refer readers to section VIII.C.2. of the preamble of this final rule, where we also discuss this topic.

Comment: Several commenters supported a period during which providers would be able to preview and correct measure and quality data.

Response: We appreciate the comments, and refer readers to section VIII.C.14. of the preamble of this final rule, where we discuss this topic in detail.

Comment: Some commenters recommended an initial confidential data preview period for providers, prior to public reporting.

Response: Providers will receive a confidential preview report with 30 days for review in advance of their data and information being publically displayed.

Comment: Some commenters supported an LTCH-specific MSPB–PAC measure, citing important differences (for example, patient characteristics and nature of care provided) between LTCH and other PAC settings.

Response: We thank the commenters for their support.

Comment: Some commenters recommended that the measure be tested for reliability and validity prior to finalization.

Response: As noted in the proposed rule (81 FR 25220), the MSPB–PAC LTCH QRP measure has been tested for reliability using two years of data (FY 2013 and FY 2014). The reliability results support the 20 episode case minimum, and 98.83 percent of LTCHs had moderate or high reliability (above 0.4). Further details on the reliability calculation are provided in the MSPB–PAC Measure Specifications document, a link for which has been provided above.

Comment: A few commenters noted that the MSPB–PAC measures are resource use measures that are not a standalone indicator of quality.

Response: We appreciate the comment regarding the MSPB–PAC measures as resource use measures. The MSPB–PAC LTCH QRP measure is one of four QRP measures that were proposed in the FY 2017 IPPS/LTCH proposed rule for inclusion in the LTCH QRP: In addition to the MSPB–PAC LTCH QRP measure, these proposed measures were the Discharge to Community-PAC LTCH QRP (81 FR 25220 through 25223), the Potentially Preventable 30-day Post-Discharge Readmission Measure for LTCH QRP (81 FR 25223 through 25225), and the Drug Regimen Review Conducted With Follow-Up for Identified Issues—PAC LTCH QRP (81 FR 25225 through 25228). As part of the LTCH QRP, the MSPB–PAC LTCH QRP measure will be paired with quality measures; we refer readers to section VIII.C.5. of the preamble of this final rule for a discussion of quality measures previously finalized for use in the LTCH QRP. We believe it is important that the cost of care be explicitly measured so that, in conjunction with other quality measures, we can publicly report which LTCHs are involved in the provision of high-quality care at lower cost.

Comment: One commenter expressed general support for the MSPB–PAC LTCH QRP measure, provided it has been tested for reliability and validity.

Response: We thank the commenter for their support. We appreciate the thoughtful feedback and engagement with the development and finalization of the MSPB–PAC LTCH QRP measure.

Comment: One commenter believed that the measure is a burden for providers.

Response: We thank the commenter for their concern. The MSPB–PAC LTCH QRP measure relies on Medicare FFS claims, which are reported to the Medicare program for payment purposes. PAC providers will not be required to report additional data to CMS for calculation of this measure.

Comment: One commenter recommended the use of uniform single MSPB–PAC measure that could be used to compare providers across settings, but recognized that CMS does not have

a uniform PPS for all the PAC settings currently. In the absence of a single PAC PPS, the commenter recommended a single MSPB–PAC measure for each setting that could be used to compare providers within a setting. Under a single measure, the episode definitions, service inclusions/exclusions, and risk adjustment methods would be the same across all PAC settings.

Response: We thank the commenter. The four separate MSPB–PAC measures reflect the unique characteristics of each PAC setting and the population it serves. The four setting-specific MSPB–PAC measures are defined as consistently as possible across settings given the differences in the payment systems for each setting, and types of patients served in each setting. We have taken into consideration these differences and aligned the specifications, such as episode definitions, service inclusions/exclusions and risk adjustment methods for each setting, to the extent possible while ensuring the accuracy of the measures in each PAC setting.

Each of the measures assess Medicare Part A and Part B spending during the episode window which begins upon admission to the provider's care and ends 30 days after the end of the treatment period. The service-level exclusions are harmonized across settings. The definition of the numerator and denominator is the same across settings. However, specifications differ between settings when necessary to ensure that the measures accurately reflect patient care and align with each setting's payment system. For example, LTCHs and IRFs are paid a stay-level payment based on the assigned MS–LTC–DRG and Case-Mix Group (CMG), respectively, while SNFs are paid a daily rate based on the Resource Utilization Group (RUG) level, and HHAs are paid a rate based on a 60-day period as determined by the Home Health Resource Group (HHRG) for standard home health claims. While the definition of the episode window is consistent across settings and is based on the period of time that a beneficiary is under a given provider's care, the duration of the treatment period varies to reflect how providers are reimbursed under the PPS that applies to each setting. The length of the post-treatment period is consistent between settings. There are also differences in the services covered under the PPS that applies to each setting: For example, durable medical equipment, prosthetics, orthotics, and supplies (DMEPOS) claims are covered LTCH, IRF, and SNF services but are not covered HHA services. This affects the way certain first-day service exclusions are defined for each measure.

We recognize that beneficiaries may receive similar services as part of their overall treatment plan in different PAC settings, but believe that there are some important differences in beneficiaries' care profiles that are difficult to capture in a single measure that compares resource use across settings.

Also, the risk adjustment models for the MSPB–PAC measures share the same covariates to the greatest extent possible to account for patient case mix. However, the measures also incorporate additional setting-specific information where available to increase the predictive power of the risk adjustment models. For example, the MSPB–PAC LTCH QRP risk adjustment model uses MS–LTC–DRGs and Major Diagnostic Categories (MDCs), and the MSPB–PAC IRF QRP model includes Rehabilitation Impairment Categories (RICs). The HH and SNF settings do not have analogous variables that directly reflect a patient's clinical profile.

We will continue to work towards a more uniform measure across settings as we gain experience with these measures, and we plan to conduct further research and analysis about comparability of resource use measures across settings for clinically similar patients, different treatment periods and windows, risk adjustment, service exclusions and other factors.

Comment: One commenter recommended that proposed quality measures obtain the support of a TEP including LTCH representatives to ensure the applicability of the measures to the LTCH setting.

Response: We thank the commenter for their recommendation. As discussed in the proposed rule (81 FR 25217), we note that we convened a TEP consisting of 12 panelists with combined expertise in all of the PAC settings, including LTCHs, on October 29 and 30, 2015, in Baltimore, Maryland. While TEPs do not formally support or endorse measures, their feedback on risk adjustment, episode windows, exclusions, and other key elements of measure construction were incorporated into measure development. The MSPB–PAC TEP Summary Report is available, a link for which has been provided above.

Comment: One commenter recommended that LTCH site neutral and standard payment rate episodes be reported separately, rather than being aggregated into one MSPB–PAC LTCH QRP measure. Commenters believed that this would more accurately reflect resource use and be more helpful for providers.

Response: We thank the commenter for their concerns. While LTCH site neutral and LTCH standard patients are paid based on different rates, high quality and efficient treatment of any LTCH patient requires similar processes of care as well as strong care coordination and care transition planning. We believe therefore that performance scores on this measure will offer LTCHs information that will enable them to make meaningful improvements to their care. We will, however, take this comment into consideration as we continue to refine the measure.

Comment: One commenter recommended that adjacent LTCH stays be collapsed based on a 9-day gap, rather than the 7-day gap as proposed. A 9-day gap length would align with the LTCH interrupted stays policy rather than the proposed 7-day gap.

Response: We thank the commenter for their recommendation. As discussed in the MSPB–PAC Public Comment Summary Report, a link for which has been provided above, and to clarify the commenter's concern, a 9-day gap length would not align with the interrupted stays policy as an LTCH interrupted stay is reimbursed by Medicare as one claim under the LTCH PPS. Therefore, the treatment period begins at the episode trigger (that is, admission to the LTCH) and ends at the beneficiary's final discharge from the LTCH. The treatment period does not end when the patient leaves the LTCH for an acute care hospital, IRF, or SNF, nor does the patient's return to the same LTCH from those settings within the allowed number of days under the interrupted stays policy, trigger a new episode. The period during which the beneficiary is away from the LTCH and covered by the interrupted stays policy is included in the treatment period as it is treated as a single, albeit interrupted, LTCH stay under the LTCH PPS.

Comment: One commenter suggested that a 180-day associated services period would better reflect the post-discharge pathways for LTCH patients.

Response: We thank the commenter for their feedback and engagement with the MSPB–PAC LTCH QRP measure. As discussed in the MSPB–PAC Public Comment Summary Report, a link for which has been provided above, the 30-day post-treatment period was favored by the TEP panelists as an appropriate length of time during which a PAC provider can be held accountable for Medicare Part A and Part B spending, subject to certain clinically unrelated service exclusions. While a longer period such as 180 days may reflect care trajectory for an LTCH beneficiary, it

would also capture services that may be less influenced by the attributed PAC provider. Also, the 30-day post-treatment period is consistent with the NQF-endorsed hospital MSPB measure and aligns with widely adopted quality measures for readmissions and mortality.

Comment: One commenter recommended that a geographic-specific (for example, State or regional) median should be used instead of the national median, citing differences in cost, patient population, and regulation.

Response: We appreciate the commenter's input. We clarify that, as noted in the proposed rule (81 FR 25219), we proposed to use the same payment standardization methodology as that used in the NQF-endorsed hospital MSPB measure to account for variation in Medicare spending. This methodology removes geographic payment differences, such as wage index and geographic practice cost index (GPCI), incentive payment adjustments, and other add-on payments that support broader Medicare program goals, including indirect graduate medical education (IME) and hospitals serving a disproportionate share of uninsured patients (DSH). We believe that this approach accounts for the differences that the commenter raises while also maintaining consistency with the NQF-endorsed hospital MSPB measure's methodology for addressing regional variation through payment standardization.

Comment: One commenter suggested that descriptive statistics on the measure scores by provider-level characteristics (for example, rural/urban status and bed size) would be useful to evaluate measure design decisions.

Response: We thank the commenter for their input. The following table shows the MSPB–PAC LTCH provider scores by provider characteristics, calculated using FY 2013 and FY 2014 data.

MSPB–PAC LTCH Provider Scores by Provider Characteristics

Provider characteristic	Number of providers	Mean score	Score percentile						
			1st	10th	25th	50th	75th	90th	99th

Comment: One commenter expressed concern that the public may interpret the MSPB–PAC measures to be applicable across PAC settings.

Response: We appreciate the commenter's concern. While the MSPB–PAC measures are defined as consistently as possible between settings, they compare only providers within each setting. We believe that this distinction is clear as each MSPB–PAC measure will be part of their respective setting's QRP, including the MSPB–PAC LTCH QRP measure which is being finalized as part of the LTCH QRP.

In summary, after consideration of the public comments we received, we are finalizing the specifications of the MSPB–PAC LTCH QRP resource use measure, as proposed. A link for the MSPB–PAC Measure Specifications has been provided above.

We are finalizing the definition of an MSPB–PAC LTCH QRP episode, beginning from episode trigger. An episode window comprises a treatment period beginning at the trigger and ended upon discharge, and associated services period beginning at the trigger and ending 30 days after the end of the treatment period. Readmissions to the same LTCH within 7 or fewer days do not trigger a new episode and are instead included in the treatment period of the first episode.

We exclude certain services that are clinically unrelated to LTCH care and/or because LTCHs may have limited influence over certain Medicare services delivered by other providers during the episode window. We also exclude certain episodes in their entirety from the MSPB–PAC LTCH QRP measure, such as where a beneficiary is not enrolled in Medicare FFS for the

entirety of the lookback period plus episode window.

We are finalizing the inclusion of Medicare payments for Part A and Part B claims for services included in the MSPB–PAC LTCH QRP episodes to calculate the MSPB–PAC LTCH QRP measure.

We are finalizing our proposal to risk adjust using covariates including age brackets, HCC indicators, prior inpatient stay length, ICU stay length, clinical case mix categories, indicators for originally disabled, ESRD enrollment, and long-term care status, hospice claim in episode window, and MS–LTC–DRGs. The measure also adjusts for geographic payment differences such as wage index and GPCI, and adjust for Medicare payment differences resulting from IME and DSH.

We calculate the individual providers' MSPB–PAC Amount which is inclusive of MSPB–PAC LTCH QRP observed episode spending over the expected episode spending as predicted through risk adjustment. Standard and site neutral episode spending is compared only with standard and site neutral episode spending, respectively. Individual LTCHs' scores are calculated as their individual MSPB–PAC Amount divided by the median MSPB–PAC amount across all LTCHs.

b. Measure To Address the IMPACT Act Domain of Resource Use and Other Measures: Discharge to Community-Post Acute Care (PAC) Long-Term Care Hospital Quality Reporting Program

Sections 1899B(d)(1)(B) and 1899B(a)(2)(E)(ii) of the Act require the Secretary to specify a measure to address the domain of discharge to community by SNFs, LTCHs, and IRFs by October 1, 2016, and HHAs by January 1, 2017. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25220 through 25223), we proposed to adopt the measure, Discharge to Community-PAC LTCH QRP, for the LTCH QRP for the FY 2018 payment determination and subsequent years as a Medicare FFS claims-based measure to meet this requirement.

This measure assesses successful discharge to the community from an LTCH setting, with successful discharge to the community including no unplanned rehospitalizations and no death in the 31 days following discharge from the LTCH. Specifically, this measure reports an LTCH's risk-standardized rate of Medicare FFS patients who are discharged to the community following an LTCH stay, and do not have an unplanned readmission to an acute care hospital or LTCH in the 31 days following discharge to community, and who remain alive during the 31 days following discharge to community. The term ''community,'' for this measure, is defined as home or self care, with or without home health services, based on Patient Discharge Status Codes 01, 06, 81, and 86 on the Medicare FFS claim.[235] [236] This measure is conceptualized uniformly across the PAC settings, in terms of the definition of the discharge to community outcome, the approach to risk adjustment, and the measure calculation.

Discharge to a community setting is an important health care outcome for many patients for whom the overall goals of PAC include optimizing functional improvement, returning to a previous level of independence, and avoiding institutionalization. Returning to the community is also an important outcome for many patients who are not expected to make functional improvement during their LTCH stay, and for patients who may be expected to decline functionally due to their medical condition. The discharge to community outcome offers a multi-dimensional view of preparation for community life, including the cognitive, physical, and psychosocial elements involved in a discharge to the community.[237] [238]

In addition to being an important outcome from a patient and family perspective, patients discharged to community settings, on average, incur lower costs over the recovery episode, compared with those discharged to institutional settings.[239] [240] Given the high costs of care in institutional settings, encouraging LTCHs to prepare patients for discharge to community, when clinically appropriate, may have cost-saving implications for the Medicare program.[241] Also, providers have discovered that successful discharge to community was a major driver of their ability to achieve savings, where capitated payments for PAC were in place.[242] For patients who require long-term care due to persistent disability, discharge to community could result in lower long-term care costs for Medicaid and for patients' out-of-pocket expenditures.[243]

Analyses conducted for ASPE on PAC episodes, using a 5 percent sample of 2006 Medicare claims, revealed that relatively high average, unadjusted Medicare payments are associated with discharge to institutional settings from IRFs, SNFs, LTCHs or HHAs, as compared with payments associated with discharge to community settings.[244] Average, unadjusted Medicare payments associated with discharge to community settings ranged from $0 to $4,017 for IRF discharges, $0 to $3,544 for SNF discharges, $0 to $4,706 for LTCH discharges, and $0 to $992 for HHA discharges. In contrast, payments associated with discharge to non-community settings were considerably higher, ranging from $11,847 to $25,364 for IRF discharges, $9,305 to $29,118 for SNF discharges, $12,465 to $18,205 for LTCH discharges, and $7,981 to $35,192 for HHA discharges.[245]

Measuring and comparing facility-level discharge to community rates is expected to help differentiate among facilities with varying performance in this important domain, and to help avoid disparities in care across patient groups. Variation in discharge to community rates has been reported within and across post-acute settings; across a variety of facility-level characteristics, such as geographic location (for example, regional location, urban or rural location), ownership (for

example, for-profit or nonprofit), and freestanding or hospital-based units; and across patient-level characteristics, such as race and gender.[246] [247] [248] [249] [250] [251] Discharge to community rates in the IRF setting have been reported to range from about 60 to 80 percent.[252] [253] [254] [255] [256] [257] Longer-term studies show that rates of discharge to community from IRFs have decreased over time as IRF length of stay has decreased.[258] [259] Greater variation in discharge to community rates is seen in the SNF setting, with rates ranging from 31 to 65 percent.[260] [261] [262] [263] A multi-center study of 23 LTCHs demonstrated that 28.8 percent of 1,061 patients who were ventilator-dependent on admission were discharged to home.[264] A single-center study revealed that 31 percent of LTCH hemodialysis patients were discharged to home.[265] In the LTCH Medicare FFS population, using CY 2012–2013 national data, we found that approximately 25 percent of patients were discharged to the community. One study noted that 64 percent of beneficiaries who were discharged from the home health episode did not use any other acute or post-acute services paid by Medicare in the 30 days after discharge.[266] However, significant numbers of patients were admitted to hospitals (29 percent) and lesser numbers to SNFs (7.6 percent), IRFs (1.5 percent), home health (7.2 percent) or hospice (3.3 percent).[267]

Discharge to community is an actionable health care outcome, as targeted interventions have been shown to successfully increase discharge to community rates in a variety of post-acute settings.[268] [269] [270] [271] Many of these interventions involve discharge planning or specific rehabilitation strategies, such as addressing discharge barriers and improving medical and functional status.[272] [273] [274] [275] The effectiveness of these interventions suggests that improvement in discharge to community rates among PAC patients is possible through modifying provider-led processes and interventions.

A TEP convened by our measure development contractor was strongly supportive of the importance of measuring discharge to community outcomes, and implementing the measure, Discharge to Community-PAC LTCH QRP in the LTCH QRP. The panel provided input on the technical specifications of this measure, including the feasibility of implementing the measure, as well as the overall measure reliability and validity. A summary of the TEP proceedings is available on the PAC Quality Initiatives Downloads and Videos Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html*.

measure through a public comment period held from November 9, 2015, through December 8, 2015. Several stakeholders and organizations, including the MedPAC, among others, supported this measure for implementation. The public comment summary report for this measure is available on the CMS Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html*.

The NQF-convened MAP met on December 14 and 15, 2015, and provided input on the use of this Discharge to Community-PAC LTCH QRP measure in the LTCH QRP. The MAP encouraged continued development of the measure to meet the mandate of the IMPACT Act. The MAP supported the alignment of this measure across PAC settings, using standardized claims data. More information about the MAP's recommendations for this measure is available at: *http://www.qualityforum.org/Publications/2016/02/MAP_2016_Considerations_for_Implementing_Measures_in_Federal_Programs_-_PAC-LTC.aspx*.

Since the MAP's review and recommendation of continued development, we have continued to refine risk-adjustment models and conduct measure testing for this measure, as recommended by the MAP. This measure is consistent with the information submitted to the MAP, and the original MAP submission and our continued refinements support its scientific acceptability for use in quality reporting programs. As discussed with the MAP, we fully anticipate that additional analyses will continue as we submit this measure to the ongoing measure maintenance process.

We reviewed the NQF's consensus-endorsed measures and were unable to identify any NQF-endorsed resource use or other measures for PAC focused on discharge to community. In addition, we are unaware of any other PAC measures for discharge to community that have been endorsed or adopted by other consensus organizations. Therefore, we proposed the measure, Discharge to Community-PAC LTCH QRP, under the Secretary's authority to specify non—NQF-endorsed measures under section 1899B(e)(2)(B) of the Act.

We proposed to use data from the Medicare FFS claims and Medicare eligibility files to calculate this measure. We proposed to use data from the ''Patient Discharge Status Code'' on Medicare FFS claims to determine whether a patient was discharged to a community setting for calculation of this measure. In all PAC settings, we tested the accuracy of determining discharge to a community setting using the ''Patient Discharge Status Code'' on the PAC claim by examining whether discharge to community coding based on PAC claim data agreed with discharge to community coding based on PAC assessment data. We found excellent agreement between the two data sources in all PAC settings, ranging from 94.6 percent to 98.8 percent. Specifically, in the LTCH setting, using 2013 data, we found 95.6 percent agreement in coding of community and non-community discharges when comparing discharge status codes on claims and the Discharge Location (item A2100) codes on the LTCH Continuity Assessment Record and Evaluation (CARE) Data Set Version 1.01. We further examined the accuracy of the ''Patient Discharge Status Code'' on the PAC claim by assessing how frequently discharges to an acute care hospital were confirmed by follow-up acute care claims. We discovered that 88 percent to 91 percent of IRF, LTCH, and SNF claims with acute care discharge status codes were followed by an acute care claim on the day of, or day after, PAC discharge. We believed these data support the use of the claims ''Patient Discharge Status Code'' for determining discharge to a community setting for this measure. In addition, this measure can feasibly be implemented in the LTCH QRP because all data used for measure calculation are derived from Medicare FFS claims and eligibility files, which are already available to CMS.

Based on the evidence discussed above, we proposed to adopt the measure, Discharge to Community-PAC LTCH QRP, for the LTCH QRP for FY 2018 payment determination and subsequent years. This measure is calculated using 2 years of data. We proposed a minimum of 25 eligible stays in a given LTCH for public reporting of the measure for that LTCH. Because Medicare FFS claims data are already reported to the Medicare program for payment purposes, and Medicare eligibility files are also available, LTCHs will not be required to report any additional data to us for calculation of this measure. The measure denominator is the risk-adjusted expected number of discharges to community. The measure numerator is the risk-adjusted estimate of the number of patients who are discharged to the community, do not have an unplanned readmission to an acute care hospital or LTCH in the 31-day post-discharge observation window, and who remain alive during the post-discharge observation window. The measure is risk-adjusted for variables such as age and sex, principal diagnosis, comorbidities, ventilator status, ESRD status, and dialysis, among other variables. For technical information about the proposed measure, including information about the measure calculation, risk adjustment, and denominator exclusions, we referred readers to the document titled, Proposed Measure Specifications for Measures Proposed in the FY 2017 LTCH QRP NPRM, available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*.

We stated in the proposed rule that we intend to provide initial confidential feedback to LTCHs, prior to public reporting of this measure, based on Medicare FFS claims data from discharges in CY 2015 and 2016. We intend to publicly report this measure using claims data from discharges in CY 2016 and 2017. We plan to submit this measure to the NQF for consideration for endorsement.

As noted above, in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53615 through 53616), we adopted a subregulatory process to incorporate updates to LTCH quality measure specifications that do not substantively change the nature of the measure. In that rule, we noted that we expect to make this determination on a measure-by-measure basis and that examples of non-substantive changes to measures might include exclusions for a measure. For the proposed Discharge to Community-PAC LTCH QRP measure, we have added an exclusion of patients/residents with a hospice benefit in the postdischarge observation window, in response to comments received during measure development and our ongoing analysis and testing. The rationale for the exclusion of patients/residents with a hospice benefit in the post-discharge observation window aligns with the rationale for exclusion of discharges to hospice. Based on testing, we found that patients/residents with a postdischarge hospice benefit have a much higher death rate in the postdischarge observation window compared with patients/residents without a hospice benefit. We determined that the addition of this hospice exclusion enhances the measure by excluding patients/residents with a high likelihood of postdischarge death and improves the national observed discharge to community rate for LTCHs by approximately 0.7 percent. With the

addition of this hospice exclusion, we do not believe burden is added, nor that the addition of this exclusion is a substantive change to the overall measure. Failure to include this hospice exclusion could lead to unintended consequences and access issues for terminally-ill patients/residents in our PAC populations.

We invited public comment on our proposal to adopt the measure, Discharge to Community-PAC LTCH QRP, for the LTCH QRP. The comments we received on this topic, with their responses, appear below.

Comment: Several commenters, including MedPAC, expressed support for the Discharge to Community-PAC LTCH QRP measure. Commenters stated that the discharge to community measure is very aligned with principles of patient-centered care as patients show a preference for care outside of institutional settings, and that successful transitions to the community are expected to decrease potentially preventable readmissions. One commenter noted that measuring the rate that the various PAC settings discharge patients to the community, without an admission (or readmission) to an acute care hospital within 30 days, is one of the most relevant patient-centered measures that exists in the PAC area. Another commenter stated that LTCHs should be encouraged to discharge patients to community-based care settings (home or self care, with or without home health services) where literature shows that average spending per beneficiary is less than in institutional based care settings. One commenter supported the proposed measure, provided it had been tested for validity and reliability. One commenter noted that achieving a standardized and interoperable patient assessment data set and stable quality measures as quickly as possible will allow for better cross-setting comparisons and the evolution of better quality measures with uniform risk standardization.

Response: We thank the commenters for their support of the Discharge to Community-PAC LTCH QRP measure, and appreciate their recognition of the patient-centeredness of this measure, its potential to decrease post-discharge readmissions, and its potential to reduce spending. In our measure development process, we conduct reliability and validity testing for all measures. We will continue to conduct this testing with all future measure development and/or modification. We also thank commenters for their support of standardized and interoperable patient assessment data and quality measures. As mandated by the IMPACT Act, we are moving toward the goal of standardized patient assessment data and quality measures across PAC settings.

Comment: Several commenters stated that the Discharge to Community-PAC LTCH QRP measure is not an appropriate measure of quality for the LTCH setting, stating that the primary function of LTCHs is to provide critical, acute, or sub-acute levels of care and to discharge patients to the appropriate lower acuity setting when they no longer require these levels of care. Commenters stated that keeping patients until they are ready to be discharged to the community is not a goal of LTCHs.

Response: We appreciate the commenters' concerns. We understand that patient populations and goals of care differ across PAC settings, and that LTCHs care for higher acuity patients when compared with other PAC settings. Nonetheless, successful discharge to community, when appropriate, is an important goal many PAC patients share, regardless of the provider from which they are receiving services. We would like to note that in order to account for differences in case-mix across settings, this measure is risk-adjusted.

We understand that discharge to community rates for LTCHs, on average, are expected to be lower compared with rates for other PAC settings, given the higher acuity case-mix in LTCHs. Our analysis has shown that approximately 26 percent of LTCH patients are discharged to the community. This measure will allow us to compare discharge to community rates across LTCHs, and monitor facilities with unexpectedly low rates given their case-mix. It is not our intention to attribute lower discharge to community rates of LTCHs to lower quality of care compared with other PAC settings. Further, we do not expect facilities to achieve a 100 percent discharge to community rate for this measure.

Comment: Several commenters emphasized that a lower acuity PAC setting is often an appropriate and successful discharge destination for LTCH patients. Some commenters recommended that discharges to lower acuity PAC settings, such as IRF or SNF, be considered successful discharges to community, while others recommended that discharges to lower acuity PAC settings be excluded from the measure because otherwise they would be wrongly treated as unfavorable outcomes. One commenter specifically recommended that patients who move from SNF to hospital to LTCH and back to SNF be considered an appropriate discharge outcome for this measure; this commenter also recommended that patients with such a trajectory be excluded from the measure. Another commenter specifically recommended that discharges from an LTCH to an IRF be considered successful discharges to community.

Response: We appreciate that for several LTCH patients, discharge to lower acuity PAC settings such as IRF or SNF represents a successful and positive discharge outcome. However, we would like to clarify that this measure is intended to specifically capture discharge to community settings, namely home or self care, with or without home health services, based on Patient Discharge Status Codes 01, 06, 81, and 86 on the Medicare FFS claim.[276] This measure is not intended to capture discharges to all lower levels of care. Since IRFs and SNFs are not community settings, including IRF and SNF discharges in the definition of discharge to community would reduce the validity of our measure. Nonetheless, we recognize that discharge to a community setting is not an expected outcome for every PAC patient. Therefore, we risk adjust for baseline patient characteristics in this measure to adjust for case-mix in each setting. In addition to adjusting for variables such as principal diagnosis and comorbidities, in the LTCH setting we adjust for ventilator use. We believe it is important to track discharge destination outcomes of all LTCH patients. Therefore, we have not excluded discharges to lower acuity PAC settings from the measure, nor have we excluded patients who were in a SNF prior to their acute or LTCH stay. As stated above, this measure will allow us to compare discharge to community rates across LTCHs, and monitor facilities with unexpectedly low rates given their case-mix. We believe that successful discharge to community, when appropriate, is an important goal many LTCH patients share.

Comment: Several commenters, including MedPAC, were concerned about the reliability and/or validity of the Patient Discharge Status Code on the PAC claim, some referencing MedPAC and other studies that questioned the accuracy of this code. They strongly recommended that CMS address inconsistencies in reporting of the Patient Discharge Status Code, and confirm its accuracy through additional testing. MedPAC recommended that CMS confirm discharge to a community

[276] National Uniform Billing Committee Official UB–04 Data Specifications Manual 2017, Version 11, July 2016, Copyright 2016, American Hospital Association.

setting with the absence of a subsequent claim to a hospital, IRF, SNF, or LTCH, in order to ensure that discharge to community rates reflect actual facility performance; other commenters supported this recommendation. One commenter shared its analysis that between 3.7 percent and 7.4 percent of those successfully discharged to the community as identified by the discharge status on the LTCH, IRF, or SNF claim had a subsequent short-term care hospital (STCH), LTCH, IRF, or SNF claim in the 31-day post-discharge window.

Response: We are committed to developing measures based on reliable and valid data. This measure does confirm the absence of hospital or LTCH claims following discharge to a community setting. Unplanned acute or LTCH readmissions following the discharge to community, including those on the day of LTCH discharge, are considered unfavorable outcomes. We will consider verifying the absence of IRF and SNF claims following discharge to a community setting as we continue to refine this measure. Nonetheless, we would like to note an ASPE report on PAC relationships found that, following discharge to community settings from IRFs, LTCHs, or SNFs in a 5 percent Medicare sample, IRFs or SNFs were very infrequently reported as the next site of PAC.[277] We would also like to clarify that an institutional claim that does not immediately follow a discharge to community would, in most instances, be indicative of a discharge to a community setting followed by a readmission. It should not be interpreted as evidence of an inaccurate discharge to community code on the PAC claim.

Because the discharge to community measure is a measure of discharge destination from the PAC setting, we have chosen to use the PAC-reported discharge destination (from the Medicare FFS claims) to determine whether a patient/resident was discharged to the community (based on discharge status codes 01, 06, 81, 86). We assessed the reliability of the claims discharge status code(s) by examining agreement between discharge status on claims and assessment instruments for the same stay in all four PAC settings. We found between 94 and 99 percent agreement in coding of community discharges on matched claims and assessments in each of the PAC settings. We also assessed how frequently discharges to acute care, as indicated on the PAC claim, were confirmed by follow-up acute care claims, and found that 88 percent to 91 percent of IRF, LTCH, and SNF claims indicating acute care discharge were followed by an acute care claim on the day of, or day after, PAC discharge. We believe that these data support the use of the ''Patient Discharge Status Code'' from the PAC claim for determining discharge to a community setting for this measure.

The use of the claims discharge status code to identify discharges to the community was discussed at length with the TEP convened by our measure development contractor. TEP members did not express significant concerns regarding the accuracy of the claims discharge status code in coding community discharges, nor about our use of the discharge status code for defining this quality measure. A summary of the TEP proceedings is available on the PAC Quality Initiatives Downloads and Videos Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html.*

Comment: A few commenters recommended that baseline long-stay nursing facility residents be excluded from the measure, as they could not be reasonably expected to discharge to the community after their PAC stay. One commenter expressed concern that the discharge to community measure fails to consider when a patient's ''home'' is a custodial nursing facility and the patient's post-acute episode involves a discharge back to his or her ''home.'' The commenter encouraged CMS to modify the discharge to community measure so it is able to distinguish baseline custodial nursing facility residents who are discharged back to their nursing facility. One commenter cited data that discharge to community rates were much lower for LTCH patients who had an indication of a prior nursing home stay compared with those who did not. Another commenter noted that these residents have a very different discharge process back to the nursing facility compared with patients discharged to the community. This commenter recommended that different measures be developed for this population, such as return to prior level of function, improvement in function, prevention of further functional decline, development of pressure ulcers, or accidental falls. This commenter also recognized CMS' current efforts in monitoring transitions of care and quality requirements in long-term care facilities. One commenter suggested that CMS use the Minimum Data Set to identify and exclude baseline nursing facility residents.

Similar to the above comments, other commenters emphasized the importance of risk adjustment for pre-hospitalization living setting, noting that some patients could reasonably never be expected to return to the community based on their permanent living setting prior to their acute care hospital stay. These commenters conveyed that it was unreasonable to expect PAC providers to discharge to the community those patients who may have permanently lived in a non-community setting prior to the acute hospital stay, and that risk adjustment should account for this.

Response: We appreciate the commenters' concerns and their recommendations to exclude baseline nursing facility residents from the discharge to community measure, to distinguish baseline custodial nursing facility residents who are discharged back to the nursing facility after their LTCH stay, and to risk adjust for pre-hospitalization living setting when assessing discharge to community outcomes. We recognize that patients/residents who permanently lived in a nursing facility or other long-term care facility at baseline may not be expected to discharge back to a home and community based setting after their PAC stay. We also recognize that, for baseline nursing facility residents, a discharge back to their nursing facility represents a discharge to their baseline residence. We agree with the commenter about the differences in discharge planning processes when discharging a patient/resident to the community compared with discharging them to a long-term nursing facility. However, using Medicare FFS claims alone, we are unable to accurately identify baseline nursing facility residents. In addition, there are no claims data on pre-hospital living setting that we could use for risk adjustment. Potential future modifications of the measure could include the assessment of the feasibility and impact of excluding baseline nursing facility residents from the measure or risk adjusting for pre-hospital living setting, through the addition of patient assessment-based data. However, we note that, currently, the IRF-Patient Assessment Instrument (IRF–PAI) is the only PAC assessment that contains an item related to pre-hospital baseline living setting.

Comment: One commenter recommended that the measure exclude patients who have been discharged to

[277] Gage B, Morley M, Spain P, Ingber M. Examining Post Acute Care Relationships in an Integrated Hospital System Final Report. RTI International; 2009.

the community and expire within the post-discharge observation window. The commenter supported this recommendation by explaining that the types of patients treated in each PAC setting varied greatly and that including post-discharge death in the measure could lead to an inaccurate reflection of the quality of care furnished by the PAC. The commenter further cited MedPAC data indicating that, compared with other Medicare beneficiaries, the LTCH patient population is disproportionately more disabled, elderly, and frail.

Response: Including 31-day post-discharge mortality outcomes is intended to identify successful discharges to community, and to avoid the potential unintended consequence of inappropriate community discharges. We have found, through our analyses on our measure development sample, that death in the 31 days following discharge to community is an infrequent event; 2.73 percent of LTCH Medicare FFS beneficiaries discharged to community died in the 31 days following discharge. We do not expect facilities to achieve a 0 percent death rate in the measure's postdischarge observation window; one focus of the measure is to identify facilities with unexpectedly high rates of death for quality monitoring purposes.

We agree with the commenter about the differences in case-mix across the PAC settings. Therefore, we risk adjust this measure for several case-mix variables, such as age, diagnoses from the prior acute stay, comorbidities in the year preceding PAC admission, length of prior acute stay, number of prior hospitalizations in the past year, and ventilator use.

Comment: Several commenters suggested that the discharge to community measure adjust for sociodemographic and socioeconomic factors. Commenters were concerned that provider performance on the measure will depend on patient-related sociodemographic and socioeconomic factors such as availability of home and community supports, financial resources, race, and dual eligibility, which are outside of the provider's control.

Response: We understand the importance of home and community supports, sociodemographic, and socioeconomic factors for ensuring a successful discharge to community outcome. The discharge to community measure is a claims-based measure, and note that currently, there are no standardized data on variables such as living status or home and community supports across the four PAC settings. As we refine the measure in the future, we will consider testing and adding additional relevant data sources and standardized items for risk adjustment of this measure. With regard to the suggestions pertaining to risk adjustment for sociodemographic and socioeconomic factors, we refer the readers to section VIII.C.6. of the preamble of this final rule for a more detailed discussion of the role of SES/SDS factors in risk adjustment of our measures.

Comment: Some commenters emphasized the relationship between functional gains made by patients during their LTCH stay and their ability to discharge to the community. One commenter stated that return to one's previous home represents part of the goal of care; in addition, it is also important that the patient is able to function to the greatest possible extent in the home and community setting and achieve the highest quality of life possible. The commenter recommended that CMS delay its proposal to adopt this measure until it incorporated metrics that assess whether patients achieved their functional and independence goals based on their plan of care and their specific condition.

Other commenters suggested that the measure include risk adjustment for functional status. One commenter noted that functional status is associated with increased risk of 30-day all-cause hospital readmissions, and since readmissions and discharge to community are closely related, functional status risk adjustment is also important for this measure. Another commenter suggested that, for cross-setting standardization, the SNF and LTCH measures should also include risk adjustment that is similar to the risk adjustment for Case-Mix Groups (CMGs) in the IRF setting and Activities of Daily Living in the HHA setting.

Response: We agree that it is important to assess various aspects of patient outcomes that are indicative of successful discharge from the LTCH setting. We also agree that functional status may be related to discharge to community outcomes, and that it is important to test admission functional status risk adjustment when assessing discharge to community outcomes. The discharge to community measure does include functional status risk adjustment in the IRF setting using CMGs from claims, and in the home health setting using Activities of Daily Living from claims. There are no data related to functional status in LTCH claims. Nevertheless, we would like to note that, in other work, we have found admission functional status to not be as strong a predictor of resource use [278] or functional outcomes [279] in LTCHs relative to other PAC settings.

As mandated by the IMPACT Act, we are moving toward the goal of collecting standardized patient assessment data for functional status across PAC settings. The LTCH QRP includes three NQF endorsed functional status quality measures: Functional Outcome Measure: Change in Mobility among Long-Term Care Hospital Patients Requiring Ventilator Support (NQF #2632); Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631); and Application of Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631).

Once standardized functional status data become available across settings, it is our intent to use these data to assess patients' functional gains during their PAC stay, and to examine the relationship between functional status, discharge destination, and patients' ability to discharge to the community. As we examine these relationships between functional outcomes and discharge to community outcomes in the future, we will assess the feasibility of leveraging these standardized patient assessment data to incorporate functional outcomes into the discharge to community measure. Standardized cross-setting patient assessment data will also allow us to examine interrelationships between the quality and resource use measures in each PAC setting, and to understand how these measures are correlated.

Comment: One commenter suggested that CMS risk adjust for additional variables for the LTCH discharge to community measure, including principal diagnosis associated with the LTCH stay, multiple organ failure, do not resuscitate (DNR) status in the LTCH and prior short-term acute care hospital stay, and prior nursing home stay. The commenter noted that, in their analyses, they found that principal diagnosis groups such as cancer diagnoses, adult respiratory failure, and aspiration pneumonia based on the LTCH stay

[278] Post-Acute Care Payment Reform Demonstration: Final Report, Volume 4 of 4. March 2012. *https://www.cms.gov/Research-Statistics-Data-and-Systems/Statistics-Trends-and-Reports/Reports/Downloads/PAC-PRD_FinalRpt_Vol4of4.pdf.*

[279] Long-Term Care Hospital (LTCH) Functional Outcome Measure: Change in Mobility Among Patients Requiring Ventilator Support (NQF #2632). *http://www.qualityforum.org/QPS/2632.*

were associated with significantly lower discharge to community rates.

Response: We thank the commenter for their suggestions. With regard to using principal diagnosis from the prior acute claim, our approach is consistent with that of claims-based NQF-endorsed readmissions measures for PAC settings. We are adjusting for the medical condition that was the precursor to the LTCH admission. Using surgical categories, we also adjust for whether the patient had surgery in the prior acute stay. Our risk adjustment models are comprehensive, and adjust for all diagnoses and procedures on the prior acute claim, as well as several comorbidities based on the year preceding PAC admission. We adjust for the principal diagnosis groups mentioned by the commenter including cancer diagnoses, adult respiratory failure, and aspiration pneumonia, all of which are significant predictors of lower discharge to community rates.

With regard to risk adjustment for prior nursing home stay, we plan to assess the feasibility and impact of identifying and excluding baseline long-stay nursing facility residents in future measure modifications. We will also consider other risk adjustment suggestions made by the commenters, as we refine the measure.

Comment: One commenter stated that ventilator use is included as a risk adjuster in the LTCH setting only, but should be used across all settings. This commenter also requested information on the hierarchical logistic regression modeling and variables that will be used for risk adjustment.

Response: We would like to clarify that risk adjustment for ventilator use is included in both LTCH and SNF settings. We investigated the need for risk adjustment for ventilator use in IRFs, but found that less than 0.01 percent of the IRF population (19 patient stays in 2012, and 9 patient stays in 2013) had ventilator use in the IRF. Given the low frequency of ventilator use in IRFs, any associated estimates would not be reliable, and therefore, ventilator use is not included as a risk adjuster in the IRF setting measure. However, we will continue to assess this risk adjuster for inclusion in the IRF model for this measure.

For details on measure specifications, modeling, and calculations, we refer readers to the Measure Specifications for Measures Adopted in the FY 2017 LTCH QRP Final Rule, posted on the CMS LTCH QRP Web page at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*.

Comment: One commenter noted that requiring a maximum of a 30-day gap between an acute care discharge and a PAC admission can, in some cases, result in selection on severity in the PAC stay. If a long intervening stay in an LTCH delays an admission to a lower intensity level of care, such as a SNF, that admission would be excluded from the SNF measure if the gap between acute discharge and SNF admission is more than 30 days. The commenter stated that such a patient would have a higher unobserved severity than a patient admitted within 30 days of acute discharge, and that excluding such a patient would lower the case-mix of SNF cases to their advantage, when comparing discharge to community rates between LTCHs and SNFs. The commenter recommended that the 30-day maximum gap between acute discharge and PAC admission be limited only to the first PAC stay in a PAC sequence. The commenter also asked whether the qualifying acute care stay in the 30 days preceding PAC admission had to immediately precede the PAC admission, or whether it was acceptable to have another intervening PAC stay between the acute discharge and index PAC admission.

Response: We thank the commenter for their comment, which touches on a number of measure aspects that interact. First, the preference expressed in expert panels has been to limit the time lag between the acute discharge and the provider being evaluated. Second, the presence of a long intervening PAC stay could either indicate a more severe patient, or alternatively a more recovered patient when the next PAC provider admits the patient; the bias cannot be assumed to be unidirectional. That said, the purpose of the commenter's recommendation is to capture, in a limited way, some of the unmeasured severity distinguishing beneficiaries across different PAC settings. We agree with the commenter's intent, but do not believe this would have a substantive effect when comparing settings, or improve comparisons of providers of the same type. Nonetheless, in future years, we will consider evaluating the impact of the commenter's suggestion on measure performance.

To address the commenter's question, the qualifying acute care stay within the past 30 days does not need to immediately precede the index PAC admission. For example, if a patient has an acute care stay, an LTCH stay, and a SNF stay within a 30-day window, the SNF stay is a candidate to for measure inclusion even though the acute care stay did not immediately precede SNF admission.

Comment: One commenter requested information about how the surgical procedure categories in the risk adjustment variables are grouped from the Agency for Healthcare Research and Quality (AHRQ) Clinical Classifications Software (CCS) procedure categories listed in the Hospital-Wide All-Cause Unplanned Readmission Measure specifications.

Response: We appreciate the commenter's request for information. The surgical indicators are based on those developed for the Hospital-Wide All-Cause Unplanned Readmission (CMS/Yale) measure (NQF #1789).[280] Further information about the AHRQ CCS procedure categories is available in the Measure Specifications for Measures Adopted in the FY 2017 LTCH QRP Final Rule, posted on the CMS LTCH QRP Web page at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*.

Comment: One commenter requested information on how planned discharges to an acute care hospital or LTCH were identified and excluded from the discharge to community measure. Specifically, the commenter asked whether discharges were considered planned if the discharge status code on the acute care claim preceding the PAC stay was ''91'' for LTCHs, ''90'' for IRFs, and ''83'' for SNFs, where code ''91'' indicates ''Discharged/transferred to a Medicare certified long term care hospital (LTCH) with a planned acute care hospital inpatient readmission,'' ''90'' indicates ''Discharged/transferred to an inpatient rehabilitation facility (IRF) including rehabilitation distinct part units of a hospital with a planned acute care hospital inpatient readmission'' and ''83'' indicates ''Discharged/transferred to a skilled nursing facility (SNF) with Medicare certification with a planned acute care hospital inpatient readmission.''

Response: We would like to clarify that the determination of planned discharge is not based on the discharge status code on the prior acute care claim indicating a planned acute care readmission (that is, codes 81 through 95). These discharge status codes are not associated with a time frame for planned readmission, and are not used to determine whether a discharge was planned or unplanned. We determine

[280] Hospital-Wide All-Cause Readmission Measure (HWR) (CMS/Yale). *www.qualityforum.org/QPS/1789* (NQF #1789).

whether an observed discharge was planned based on diagnosis and procedure codes reported on inpatient acute or LTCH claims following discharge to community. We identify planned admissions using the planned readmissions algorithm used in the following PAC readmission measures: (1) Skilled Nursing Facility 30-Day All-Cause Readmission Measure (SNFRM) (NQF #2510); (2) All-Cause Unplanned Readmission Measure for 30 Days Post Discharge from Inpatient Rehabilitation Facilities (NQF #2502); and (3) All-Cause Unplanned Readmission Measure for 30 Days Post Discharge from Long Term Care Hospitals (NQF #2512).

For the IRF and SNF settings, we exclude stays with planned discharges to an acute care hospital or LTCH that occur on the day of, or day after, PAC discharge. For the LTCH setting, we exclude planned discharges to an acute care hospital on the day, of or day after, LTCH discharge. We note that PAC claims indicating discharge to a community are not excluded if they are followed by a subsequent planned acute care or LTCH admission; rather these stays are treated as successful discharge to community outcomes.

Comment: One commenter asked whether an unplanned readmission that follows a planned readmission in the post-discharge observation window would be considered an unfavorable outcome for the discharge to the community measure.

Response: An unplanned readmission that follows a planned readmission in the post-discharge observation window is not considered an unfavorable outcome for the discharge to the community measure. For this measure, we examine the first readmission that falls within the observation window following discharge to community. If the first readmission is unplanned, it is considered an unsuccessful discharge to community outcome. If the first readmission is planned, it is considered a successful discharge to community outcome. Any unplanned readmissions following the first planned readmission do not impact the discharge to community outcome.

Comment: One commenter requested information on the mapping of ICD–9 codes to the CMS-Hierarchical Condition Categories (HCCs) used as risk adjustment variables in the model.

Response: We appreciate the commenter's request for information. We used Version 21 of the HCCs based on ICD–9 codes, but will transition to Version 22 with ICD–10 codes.

Comment: One commenter noted that the various PAC settings served patients with different levels of clinical severity, and the resulting standardized rates thus varied by patient mix as well as by care quality.

Response: We agree with the commenter that the different PAC settings serve patients with different levels of clinical severity. Using risk adjustment, it is not possible to capture the full clinical complexity of patients and the stage of their medical conditions across PAC settings. Therefore, the most appropriate way to capture the differences in the clinical complexity of patients is to separate the provider types and compare like providers to each other. Though there are occasions in which a beneficiary will be choosing the type of PAC provider, those choices are often limited by availability of providers and personal circumstances with regard to availability of caregivers. There is no implication in the measures that care in an LTCH is of lower quality than care in other PAC settings, because the average discharge to community rate for LTCH patients is lower than that of other PAC settings. It is fairer, at present, to capture case-mix differences that are unobservable by doing measure comparisons within provider type.

Comment: One commenter encouraged CMS to provide PAC settings with access to measure performance data as early as possible so providers have time to adequately review these data, and implement strategies to decrease readmissions where necessary.

Response: We intend to provide initial confidential feedback to PAC providers, prior to public reporting of this measure, based on Medicare FFS claims data from discharges in CY 2015 and 2016.

Comment: Several commenters were concerned that the measure may result in unintended consequences such as increased LTCH length of stay to get the patient ready for discharge to community, or inappropriate discharges to community for patients who may benefit from lower acuity PAC services.

Response: We thank the commenters for sharing their concerns about potential unintended consequences of increased LTCH length of stay or inappropriate community discharges for this measure. To avoid the unintended consequence of inappropriate discharges to community, we monitor unplanned acute and LTCH readmissions and death in the 31-day post-discharge observation window. We will consider monitoring IRF, SNF, and nursing facility admissions following discharge to a community setting as we continue to refine this measure. As with all our measures, we will monitor for unintended consequences as part of measure monitoring and evaluation to ensure that measures do not reduce quality of care or access for patients, result in disparities for patient sub-groups, or adversely affect healthcare spending.

Comment: One commenter expressed that use of data preceding measure implementation date to determine a baseline rate of discharge to community could be problematic because they expected changes in data following measure implementation and efforts to improve coding. The commenter recommended measure reporting using data collected after measure implementation.

Response: As stated in section VIII.C.6.b. of the preamble of the proposed rule, data from CY 2015–2016 will be used as the basis for initial confidential feedback reports, and data from CY 2016–2017 will be used for public reporting. We appreciate the recommendation to align the baseline period with the implementation date; however, in order to ensure the reliability of the measure we need two consecutive years of data, which requires us to use data from CY 2016–2017 for public reporting. We believe the reliability of the measure is more important than aligning the baseline and implementation dates.

Comment: Several commenters were concerned that the LTCH discharge to community measure was not NQF-endorsed before being adopted for the LTCH QRP. Some commenters noted that the LTCH patient population is different from those of other settings, making NQF endorsement particularly important. The commenters asked CMS to refrain from implementing the discharge to community measure for the LTCH QRP until it has been endorsed by NQF.

Response: We thank the commenters for their comments regarding NQF endorsement. We would like to clarify that the discharge to community measure has been fully developed and tested. We plan to submit the Discharge to Community-PAC LTCH QRP measure to the NQF for consideration for endorsement.

After consideration of the public comments we received, we are finalizing our proposal to adopt the measure, Discharge to Community-PAC LTCH QRP as a Medicare FFS claims-based measure for the FY 2018 payment determination and subsequent years, with the added exclusion of patients with a hospice benefit in the 31-day postdischarge observation window. For measure specifications, we refer readers to the Measure Specifications for

Measures Adopted in the FY 2017 LTCH QRP Final Rule, posted on the CMS LTCH QRP Web page at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*..

c. Measure To Address the IMPACT Act Domain of Resource Use and Other Measures: Potentially Preventable 30-Day Post-Discharge Readmission Measure for Long-Term Care Hospital Quality Reporting Program

Sections 1899B(a)(2)(E)(ii) and 1899B(d)(1)(C) of the Act require the Secretary to specify measures to address the domain of all-condition risk-adjusted potentially preventable hospital readmission rates by SNFs, LTCHs, and IRFs by October 1, 2016, and HHAs by January 1, 2017. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25223 through 25225), we proposed the measure Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP as a Medicare FFS claims-based measure to meet this requirement for the FY 2018 payment determination and subsequent years.

The measure assesses the facility-level risk-standardized rate of unplanned, potentially preventable hospital readmissions for Medicare FFS beneficiaries in the 30 days post-LTCH discharge. The LTCH admission must have occurred within up to 30 days of discharge from a prior proximal hospital stay which is defined as an inpatient admission to an acute care hospital (including IPPS, CAH, or a psychiatric hospital). Hospital readmissions include readmissions to a short-stay acute care hospital or an LTCH, with a diagnosis considered to be unplanned and potentially preventable. This measure is claims-based, requiring no additional data collection or submission burden for LTCHs. Because the measure denominator is based on LTCH admissions, each Medicare beneficiary may be included in the measure multiple times within the measurement period. Readmissions counted in this measure are identified by examining Medicare FFS claims data for readmissions to either acute care hospitals (IPPS or CAH) or LTCHs that occur during a 30-day window beginning two days after LTCH discharge. This measure is conceptualized uniformly across the PAC settings, in terms of the measure definition, the approach to risk adjustment, and the measure calculation. Our approach for defining potentially preventable hospital readmissions is described in more detail below.

Hospital readmissions among the Medicare population, including beneficiaries that utilize PAC, are common, costly, and often preventable.[281] [282] MedPAC and a study by Jencks et al. estimated that 17 to 20 percent of Medicare beneficiaries discharged from the hospital were readmitted within 30 days. MedPAC found that more than 75 percent of 30-day and 15-day readmissions and 84 percent of 7-day readmissions were considered ''potentially preventable.'' [283] In addition, MedPAC calculated that annual Medicare spending on potentially preventable readmissions would be $12 billion for 30-day, $8 billion for 15-day, and $5 billion for 7-day readmissions in 2005.[284] For hospital readmissions from one PAC setting, SNFs, MedPAC deemed 76 percent of readmissions as ''potentially avoidable''–associated with $12 billion in Medicare expenditures.[285] Mor et al. analyzed 2006 Medicare claims and SNF assessment data (Minimum Data Set), and reported a 23.5 percent readmission rate from SNFs, associated with $4.3 billion in expenditures.[286] Fewer studies have investigated potentially preventable readmission rates from the remaining PAC settings.

We have addressed the high rates of hospital readmissions in the acute care setting as well as in PAC. For example, we developed the following measure: All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512), as well as similar measures for other PAC providers (NQF #2502 for IRFs and NQF #2510 for SNFs).[287] These measures are endorsed by the NQF, and the NQF endorsed LTCH measure (NQF #2512) was adopted into the LTCH QRP in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49730 through 49731). Note that these NQF endorsed measures assess all-cause unplanned readmissions.

Several general methods and algorithms have been developed to assess potentially avoidable or preventable hospitalizations and readmissions for the Medicare population. These include the Agency for Healthcare Research and Quality's (AHRQ's) Prevention Quality Indicators, approaches developed by MedPAC, and proprietary approaches, such as the 3M™ algorithm for Potentially Preventable Readmissions.[288] [289] [290] Recent work led by Kramer et al. for MedPAC identified 13 conditions for which readmissions were deemed as potentially preventable among SNF and IRF populations.[291] [292] Although much of the existing literature addresses hospital readmissions more broadly and potentially avoidable hospitalizations for specific settings like long-term care, these findings are relevant to the development of potentially preventable readmission measures for PAC.[293] [294] [295]

Potentially Preventable Readmission Measure Definition: We conducted a comprehensive environmental scan, analyzed claims data, and obtained input from a TEP to develop a definition and list of conditions for which hospital readmissions are potentially preventable. The Ambulatory Care Sensitive Conditions and Prevention Quality Indicators, developed by AHRQ, served as the starting point in this work. For patients in the 30-day post-PAC discharge period, a potentially preventable readmission (PPR) refers to a readmission for which the probability of occurrence could be minimized with adequately planned, explained, and implemented post-discharge instructions, including the establishment of appropriate follow-up ambulatory care. Our list of PPR conditions is categorized by 3 clinical rationale groupings:

- Inadequate management of chronic conditions;
- Inadequate management of infections; and
- Inadequate management of other unplanned events.

Additional details regarding the definition for potentially preventable readmissions are available in the document titled, Proposed Measure Specifications for Measures Proposed in the FY 2017 LTCH QRP NPRM, available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*.

This measure focuses on readmissions that are potentially preventable and also unplanned. Similar to the All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512), this measure uses the current version of the CMS Planned Readmission Algorithm as the main component for identifying planned readmissions. A complete description of the CMS Planned Readmission Algorithm, which includes lists of planned diagnoses and procedures, can be found on the CMS Web site at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*. In addition to the CMS Planned Readmission Algorithm, this measure incorporates procedures that are considered planned in PAC settings, as identified in consultation with TEPs. Full details on the planned readmissions criteria used, including the CMS Planned Readmission Algorithm and additional procedures considered planned for PAC, can be found in the document titled, Proposed Measure Specifications for Measures Proposed in the FY 2017 LTCH QRP NPRM, available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*.

The measure, Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP, assesses potentially preventable readmission rates while accounting for patient demographics, principal diagnosis in the prior hospital stay, comorbidities, and other patient factors. While estimating the predictive power of patient characteristics, the model also estimates a facility-specific effect, common to patients treated in each facility. This measure is calculated for each LTCH based on the ratio of the predicted number of risk-adjusted, unplanned, potentially preventable hospital readmissions that occur within 30 days after an LTCH discharge, including the estimated facility effect, to the estimated predicted number of risk-adjusted, unplanned inpatient hospital readmissions for the same patients treated at the average LTCH. A ratio above 1.0 indicates a higher than expected readmission rate (worse) while a ratio below 1.0 indicates a lower than expected readmission rate (better). This ratio is referred to as the standardized risk ratio (SRR). The SRR is then multiplied by the overall national raw rate of potentially preventable readmissions for all LTCH stays. The resulting rate is the risk-standardized readmission rate (RSRR) of potentially preventable readmissions.

An eligible LTCH stay is followed until: (1) The 30-day post-discharge period ends; or (2) the patient is readmitted to an acute care hospital (IPPS or CAH) or LTCH. If the readmission is unplanned and potentially preventable, it is counted as a readmission in the measure calculation. If the readmission is planned, the readmission is not counted in the measure rate.

This measure is risk adjusted. The risk adjustment modeling estimates the effects of patient characteristics, comorbidities, and select health care variables on the probability of readmission. More specifically, the risk-adjustment model for LTCHs accounts for demographic characteristics (age, sex, original reason for Medicare entitlement), principal diagnosis during the prior proximal hospital stay, body system specific surgical indicators, prolonged mechanical ventilation indicator, comorbidities, length of stay during the patient's prior proximal hospital stay, length of stay in the intensive care and coronary care unit (ICU and CCU), and number of acute care hospitalizations in the preceding 365 days.

The measure is calculated using 2 consecutive calendar years of FFS claims data, to ensure the statistical reliability of this measure for facilities. In addition, we proposed a minimum of 25 eligible stays for public reporting of the measure.

A TEP convened by our measure contractor provided recommendations on the technical specifications of this measure, including the development of an approach to define potentially preventable hospital readmission for PAC. Details from the TEP meetings, including TEP members' ratings of conditions proposed as being potentially preventable, are available in the TEP summary report available on the CMS Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html*. We also solicited stakeholder feedback on the development of this measure through a public comment period held from November 2 through December 1, 2015. Comments on the measure varied, with some commenters supportive of the measure, while others either were not in favor of the measure, or suggested potential modifications to the measure specifications, such as including standardized function data. A summary of the public comments is also available on the CMS Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html*.

The MAP encouraged continued development of the proposed measure. Specifically, the MAP stressed the need to promote shared accountability and ensure effective care transitions. More information about the MAP's recommendations for this measure is available at: *http://www.qualityforum.org/Publications/2016/02/MAP_2016_Considerations_for_Implementing_Measures_in_Federal_Programs_-_PAC-LTC.aspx*. At the time, the risk-adjustment model was still under development. Following completion of that development work, we were able to test for measure validity and reliability as identified in the measure specifications document provided above. Testing results are within range for similar outcome measures finalized in public reporting

and value-based purchasing programs, including the All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512) adopted into the LTCH QRP.

We reviewed the NQF's consensus endorsed measures and were unable to identify any NQF endorsed measures focused on potentially preventable hospital readmissions. We are unaware of any other measures for this IMPACT Act domain that have been endorsed or adopted by other consensus organizations. Therefore, we proposed the Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP, under the Secretary's authority to specify non-NQF endorsed measures under section 1899B(e)(2)(B) of the Act, for the LTCH QRP for the FY 2018 payment determination and subsequent years, given the evidence previously discussed above.

We plan to submit the measure to the NQF for consideration of endorsement. We stated in the proposed rule that we intended to provide initial confidential feedback to LTCHs, prior to public reporting of this measure, based on 2 calendar years of data from discharges in CY 2015 and 2016. We also stated that we intended to publicly report this measure using data from CY 2016 and 2017.

We invited public comment on our proposal to adopt the measure, Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP. We received several comments, which are summarized with our responses below.

Comment: MedPAC supported this measure and believes that LTCHs should be held accountable for readmissions in the post-discharge readmission window.

Response: We thank commenters for their support of this measure.

Comment: One commenter specifically supported the inclusion of infectious conditions in the ''inadequate management of infections'' and ''inadequate management of other unplanned events'' categories in the measure's definition of potentially preventable hospital readmissions, noting that many of these conditions are preventable using appropriate infection prevention interventions. Another commenter recommended the removal of several PPR conditions including influenza, dehydration/electrolyte imbalance, C. *difficile* infection, and urinary tract infection/kidney infection, and expressed concern that these conditions rely too heavily on patient and caretaker responsibility or may be caused by unforeseen circumstances after LTCH discharge.

One commenter stated that this measure will be particularly important for Medicare beneficiaries with chronic conditions, including diabetes, chronic obstructive pulmonary disorder, asthma, atrial fibrillation, and hypertension. Another commenter expressed concern over being ''penalized'' for readmissions that are clinically unrelated to a patient's original reason for LTCH admission. Another commenter recommended that only readmissions associated with active diagnoses being treated in the LTCH should be considered potentially preventable. Commenters also encouraged CMS to undertake additional empirical testing to ensure that the codes for readmissions are associated with the identified categories.

Response: We appreciate the comments in support of this measure domain and the list of PPR conditions developed for this measure. In response to the comment that suggested several conditions be removed from the definition, we note that as described in the proposed rule, the definition for potentially preventable readmissions for this measure was developed based on existing evidence and was reviewed by a TEP, which included clinicians and PAC experts. We also conducted a comprehensive environmental scan to identify conditions for which readmissions may be considered potentially preventable. Results of this environmental scan and details of the TEP input received were made available in the PPR TEP summary report available on the CMS Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html*. We also made revisions to this list of conditions for which readmissions may be considered potentially preventable based on stakeholder feedback received during the public comment period. A summary of the public comments is also available on the CMS Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html*.

Though readmissions may be considered potentially preventable even if they may not appear to be clinically related to the patient's original reason for LTCH admission, there is substantial evidence that the conditions included in the definition may be preventable with adequately planned, explained, and implemented post-discharge instructions, including the establishment of appropriate follow-up ambulatory care. Furthermore, this measure is based on Medicare FFS claims data and it may not always be feasible to determine whether a subsequent readmission is or is not clinically related to the reason why the patient was receiving LTCH care. We intend to conduct ongoing evaluation and monitoring, and will assess the appropriateness and consequences of all PPR conditions, including infections and dehydration as mentioned specifically by one commenter.

Comment: MedPAC commented that the measure definition and risk adjustment should be identical across PAC settings so that potentially preventable readmission rates can be compared across settings. One commenter recommended that a measure for potentially preventable readmission post-discharge from an acute care hospital, regardless of PAC setting, would allow for better alignment across settings and clarity of potentially preventable readmissions. Another commenter recommended the measure be adjusted for patient clinical differences between PAC settings to allow for cross-setting quality comparisons. Other commenters expressed concern over adapting standards from other settings for LTCH, and recommended that the measure be tailored to LTCH patients.

Response: The PPR definition (that is, list of conditions for which readmissions would be considered potentially preventable) is aligned for measures with the same readmission window, regardless of PAC setting. Specifically, the post-PAC discharge PPR measures that were developed for each of the PAC settings contain the same list of PPR conditions. Although there are some minor differences in the specifications across these potentially preventable readmissions measures (for example, years of data used to calculate the measures to ensure reliability and some of the measure exclusions necessary to attribute responsibility to the individual settings), the IMPACT Act PPR measures are standardized. As described for all IMPACT Act measures in section VIII.C.2. of the preamble of this final rule, above, the statistical approach for risk adjustment is also aligned across the measures; however, there is variation in the exact risk adjusters. The risk adjustment models are empirically driven and differ between measures as a consequence of case mix differences, which is necessary to ensure that the estimates are valid.

Comment: Some commenters expressed concern over the overlap

between the proposed PPR measure and the existing all-cause readmission measure adopted for the LTCH QRP. Commenters expressed concern that public reporting of more than one hospital readmission measure for LTCHs may result in confusion among the public and that this could potentially pose challenges for quality improvement for LTCHs. Some commenters believed that CMS should use one readmission measure in the LTCH QRP, rather than multiple readmission measures.

Response: The All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512) was adopted for the LTCH QRP prior to the IMPACT Act. With regard to overlap with the existing LTCH QRP readmission measure, retaining the all-cause measure will allow us to monitor trends in both all-cause and PPR rates in order to assess the extent to which changes in facility performance for one measure are reflected in the other. We are committed to ensuring that measures in the LTCH QRP are useful in assessing quality and will evaluate the readmission measures in the future.

Comment: One commenter supported the risk adjustment methodology but several expressed concerns over the risk adjustment approach for the proposed PPR measure. Several commenters proposed additional clinical characteristics as risk adjusters including the LTCH primary diagnosis, presence of multiple chronic conditions, being ''hospital dependent,'' having multiple organ failure, and dialysis. Additional patient characteristics that commenters recommended for testing were patients identified as ''do not resuscitate'' during the prior acute stay, availability of home resources and supports, and functional status.

One commenter requested that CMS clarify whether patients with an artificial airway and no mechanical ventilation are included in the mechanical ventilation risk adjustment category. Another commenter requested detail on the AHRQ CCS groups included in the surgical procedure categories and also inquired about which version of the HCCs were used in the risk adjustment model.

Several commenters expressed concern that the measure is not adjusted for sociodemographic factors that may affect utilization. One commenter supported testing the measure for SDS, and cited research they conducted showing variation in race across PAC settings; they also found that dually eligible LTCH patients had significantly higher odds of PPRs.

Response: We appreciate the comments regarding the risk adjustment approach and suggestions for specific risk adjusters for the PPR measure. We wish to clarify that this measure is based on claims data and not all suggested risk adjusters are available. However, our measure development contractor (RTI International) conducted additional testing on some of the suggested risk adjusters and did not find strong evidence supporting the inclusion of these as risk adjusters in a potentially preventable readmission model. With regard to dialysis, this factor has been shown to be a significant predictor for PPR and the measure risk-adjusts for patients' dialysis using the HCC. We intend to evaluate the feasibility of including functional and cognitive status when standardized assessment data become available.

LTCH patients with an artificial airway that are not on mechanical ventilation are not included in the prolonged mechanical ventilation risk adjuster, which is based on the procedure code 96.72 on the LTCH claim.

In response to specific technical questions on the risk adjustment approach, we wish to clarify that the surgical procedure indicators are based on those surgical/gynecological AHRQ CCS group categories developed for the Hospital-Wide All-Cause Unplanned Readmission measure and are available in the SAS programs that are maintained and available by request. This measure was developed using version 21 of the HCCs; however, when the measure is calculated using data post ICD–10 transition, we intend to use version 22 of the HCCs.

The Office of the Assistant Secretary for Planning and Evaluation (ASPE) is conducting research to examine the impact of sociodemographic status on quality measures, resource use, and other measures and, as previously discussed, NQF is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. We refer readers to section VIII.C.6. of the preamble of this final rule, where we also discuss this topic.

Comment: One commenter asked for clarification on whether a qualifying LTCH stay could be preceded by a PAC stay in the 30 days within discharge from the acute hospital. The commenter also asked if an unplanned readmission following a planned readmission in the 30-days post-discharge from the LTCH would be a counted as a readmission in this measure.

Response: We thank the commenter for their question regarding the verification of the measure exclusions. The commenter was correct in its interpretation of the measure exclusion of no short-term acute care hospital stay within the 30 days preceding a PAC admission. The exclusion does not require the short-term acute care hospital stay immediately precede the PAC admission. For example, if a patient had a short-term acute care hospital stay, a SNF stay, and an LTCH stay within a 30-day window, the LTCH stay is a candidate to be an index admission even though it was immediately preceded by a SNF stay and not a short-term acute care hospital stay.

In response to the unplanned readmission question, we would like to reiterate that only the first readmission in the post-discharge window is examined in this measure. Since the second readmission was not captured for analysis, an unplanned readmission following a planned readmission would not count as an unfavorable outcome.

Comment: Several commenters expressed concern that the measure is not NQF-endorsed, and some commenters had additional concerns over measure testing and development. Some commenters recommended that CMS should only adopt measures endorsed by the NQF in quality reporting programs or urged CMS to submit the measures through the NQF endorsement process as soon as feasible and prior to LTCH reporting.

Response: With regard to NQF endorsement, as noted in the proposed rule, we intend to submit this measure to NQF for consideration of endorsement. In addition, we noted that we reviewed the NQF's consensus endorsed measures and were unable to identify any NQF endorsed measures focused on potentially preventable hospital readmissions. We are unaware of any other measures for this IMPACT Act domain that have been endorsed or adopted by other consensus organizations. Therefore, we proposed the Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP, under the Secretary's authority to specify non-NQF endorsed measures under section 1899B(e)(2)(B) of the Act, for the LTCH QRP.

We would like to clarify that the MAP encouraged continued development of the proposed measure. More information about the MAP's recommendations for this measure is available at: *http://www.qualityforum.org/Publications/2016/02/MAP_2016_Considerations_*

for_Implementing_Measures_in_Federal_Programs_-_PAC-LTC.aspx.

We also wish to note that we conducted additional testing since the MAP meeting. We developed the risk adjustment model and evaluated facilities' PPR rates. Results of these analyses were provided in the appendix of the measure specification made available at the time of the proposed rule. We found that testing results were similar to the All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512). The finalized risk-adjustment models and coefficients are included in the final measure specifications available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*. We will make additional testing results available in the future.

Comment: A few commenters questioned the accuracy of claims data being used for this measure. One commenter suggested a baseline period concurrent with measure implementation to mitigate this concern. Another commenter recommended that CMS supplement claims data with validated administrative data.

Response: We appreciate the comment about the baseline period and implementation for the measure. As stated in section VIII.C.6.c. of the preamble of the proposed rule, data from CY 2015–2016 will be used as the basis for initial confidential feedback reports and data from CY 2016–2017 would be used for public reporting. We appreciate the recommendation to align the baseline period with the implementation date; however, in order to ensure the reliability of the measure we need 2 consecutive years of data, which requires us to use data from CY 2016–2017 for public reporting. We believe the reliability of the measure is more important than aligning the baseline and implementation dates.

We appreciate the commenter's concern over the accuracy of claims data. However, we wish to clarify that claims data have been validated for the purposes of assessing hospital readmissions and are used for several NQF-endorsed measures adopted for CMS programs, including the LTCH QRP. Several studies have been conducted to examine the validity of using Medicare hospital claims to calculate several NQF-endorsed quality measures for public reporting.[296] [297] [298] In addition, although assessment and other data sources may be valuable for risk adjustment, we are not aware of another data source aside from Medicare claims data that could be used to reliably assess potentially preventable hospital readmissions for this measure.

Comment: One commenter recommended that CMS use the potentially preventable readmission measure in order to determine best practices for LTCHs and inform LTCHs of their patient population. The commenter also urged CMS to review the impact of readmission measures used across PAC programs to ensure they create consistent improvement incentives across the system.

Response: We thank commenters for their comments related to the usability of the measure. We agree that this measure will be valuable in developing best practices and as a feedback mechanism assessing PPR outcomes for LTCHs. As we continually evaluate and monitor the PAC quality reporting programs, we will take the commenter's suggestion in consideration to ensure that this and other readmission measures are creating consistent incentives for PAC providers.

After consideration of the public comments we received, we are finalizing our proposal to adopt the measure, Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP. For measure specifications, we refer readers to the Measure Specifications for Measures Adopted in the FY 2017 LTCH QRP Final Rule document available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html.*

7. LTCH QRP Quality Measure Finalized for the FY 2020 Payment Determination and Subsequent Years

a. Background

We also proposed to adopt one new quality measure to meet the requirements of the IMPACT Act for the FY 2020 payment determination and subsequent years. The measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, addresses the IMPACT Act quality domain of Medication Reconciliation.

b. Quality Measure To Address the IMPACT Act Domain of Medication Reconciliation: Drug Regimen Review Conducted With Follow-Up for Identified Issues-Post Acute Care Long-Term Care Hospital Quality Reporting Program

Sections 1899B(a)(2)(E)(i)(III) and 1899B(c)(1)(C) of the Act require the Secretary to specify a quality measure to address the domain of medication reconciliation by October 1, 2018 for IRFs, LTCHs, and SNFs, and by January 1, 2017 for HHAs. We proposed to adopt the quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, for the LTCH QRP as a patient-assessment based, cross-setting quality measure to meet the IMPACT Act requirements with data collection beginning April 1, 2018 for the FY 2020 payment determination and subsequent years.

This measure assesses whether PAC providers were responsive to potential or actual clinically significant medication issue(s) when such issues were identified. Specifically, the quality measure reports the percentage of patient stays in which a drug regimen review was conducted at the time of admission and timely follow-up with a physician occurred each time potential clinically significant medication issues were identified throughout that stay. For this quality measure, drug regimen review is defined as the review of all medications or drugs the patient is taking to identify any potential clinically significant medication issues. The quality measure utilizes both the processes of medication reconciliation and a drug regimen review, in the event an actual or potential medication issue occurred. The measure informs whether the PAC facility identified and addressed each clinically significant medication issue and if the facility responded or addressed the medication issue in a timely manner. Of note, drug regimen review in PAC settings is generally considered to include medication reconciliation and review of the patient's drug regimen to identify potential clinically significant medication issues.[299] This measure is applied uniformly across the PAC settings.

Medication reconciliation is a process of reviewing an individual's complete

and current medication list. Medication reconciliation is a recognized process for reducing the occurrence of medication discrepancies that may lead to Adverse Drug Events (ADEs).[300] Medication discrepancies occur when there is conflicting information documented in the medical records. The World Health Organization regards medication reconciliation as a standard operating protocol necessary to reduce the potential for ADEs that cause harm to patients. Medication reconciliation is an important patient safety process that addresses medication accuracy during transitions in patient care and in identifying preventable ADEs.[301] The Joint Commission added medication reconciliation to its list of National Patient Safety Goals (2005), suggesting that medication reconciliation is an integral component of medication safety.[302] The Society of Hospital Medicine published a statement in agreement of the Joint Commission's emphasis and value of medication reconciliation as a patient safety goal.[303] There is universal agreement that medication reconciliation directly addresses patient safety issues that can result from medication miscommunication and unavailable or incorrect information.[304] [305] [306]

The performance of timely medication reconciliation is valuable to the process of drug regimen review. Preventing and responding to ADEs is of critical importance as ADEs account for significant increases in health services utilization and costs,[307] [308] [309] including subsequent emergency room visits and re-hospitalizations.[310] Annual health care costs from ADEs in the United States are estimated at $3.5 billion, resulting in 7,000 deaths annually.[311] [312]

Medication errors include the duplication of medications, delivery of an incorrect drug, inappropriate drug omissions, or errors in the dosage, route, frequency, and duration of medications. Medication errors are one of the most common types of medical errors and can occur at any point in the process of ordering and delivering a medication. Medication errors have the potential to result in an ADE.[313] [314] [315] [316] [317] [318] Inappropriately prescribed medications are also considered a major healthcare concern in the United States for the elderly population, with costs of roughly $7.2 billion annually.[319]

There is strong evidence that medication discrepancies occur during transfers from acute care facilities to PAC facilities. Discrepancies occur when there is conflicting information documented in the medical records. Almost one-third of medication discrepancies have the potential to cause patient harm.[320] An estimated 50 percent of patients experienced a clinically important medication error after hospital discharge in an analysis of two tertiary care academic hospitals.[321]

Medication reconciliation has been identified as an area for improvement during transfer from the acute care facility to the receiving PAC facility. PAC facilities report gaps in medication information between the acute care hospital and the receiving PAC setting when performing medication reconciliation.[322] [323] Hospital discharge has been identified as a particularly high risk time point, with evidence that medication reconciliation identifies high levels of discrepancy.[324] [325] [326] [327] [328] [329] Also, there is evidence that medication reconciliation discrepancies occur throughout the patient stay.[330] [331] For older patients, who may have multiple comorbid conditions and thus multiple medications, transitions between acute and PAC settings can be further

complicated,[332] and medication reconciliation and patient knowledge (medication literacy) can be inadequate post-discharge.[333] The quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, provides an important component of care coordination for PAC settings and would affect a large proportion of the Medicare population who transfer from hospitals into PAC services each year. For example, in 2013, 1.7 million Medicare FFS beneficiaries had SNF stays, 338,000 beneficiaries had IRF stays, and 122,000 beneficiaries had LTCH stays.[334]

A TEP convened by our measure development contractor provided input on the technical specifications of this quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, including components of reliability, validity and the feasibility of implementing the measure across PAC settings. The TEP supported the measure's implementation across PAC settings and was supportive of our plans to standardize this measure for cross-setting development. A summary of the TEP proceedings is available on the PAC Quality Initiatives Downloads and Videos Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html*.

We solicited stakeholder feedback on the development of this measure by means of a public comment period held from September 18 through October 6, 2015. Through public comments submitted by several stakeholders and organizations, we received support for implementation of this measure. The public comment summary report for the measure is available on the CMS Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html*.

The NQF-convened MAP met on December 14 and 15, 2015 and provided input on the use of this measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP. The MAP encouraged continued development of the quality measure to meet the mandate added by the IMPACT Act. The MAP agreed with the measure gaps identified by CMS including medication reconciliation and stressed that medication reconciliation be present as an ongoing process. More information about the MAP's recommendations for this measure is available at: *http://www.qualityforum.org/Publications/2016/02/MAP_2016_Considerations_for_Implementing_Measures_in_Federal_Programs_-_PAC-LTC.aspx*.

Since the MAP's review and recommendation of continued development, we have continued to refine this measure in compliance with the MAP's recommendations. The measure is consistent with the information submitted to the MAP and supports its scientific acceptability for use in quality reporting programs. Therefore, we proposed this measure for implementation in the LTCH QRP as required by the IMPACT Act.

We reviewed the NQF's endorsed measures and identified one NQF-endorsed cross-setting and quality measure related to medication reconciliation, which applies to the SNF, LTCH, IRF, and HHA settings of care: Care for Older Adults (COA), (NQF #0553). The quality measure, Care for Older Adults (COA), (NQF #0553) assesses the percentage of adults 66 years and older who had a medication review. The Care for Older Adults (COA), (NQF #0553) measure requires at least one medication review conducted by a prescribing practitioner or clinical pharmacist during the measurement year and the presence of a medication list in the medical record. This is in contrast to the quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, which reports the percentage of patient stays in which a drug regimen review was conducted at the time of admission and that timely follow-up with a physician occurred each time one or more potential clinically significant medication issues were identified throughout that stay.

After review of both quality measures, we decided to propose the quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP for the following reasons:

- The IMPACT Act requires the implementation of quality measures, using patient assessment data that are standardized and interoperable across PAC settings. The quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, employs three standardized patient-assessment data elements for each of the four PAC settings so that data are standardized, interoperable, and comparable; whereas, the Care for Older Adults (COA) (NQF #0553) quality measure does not contain data elements that are standardized across all four PAC settings.
- The quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, requires the identification of potential clinically significant medication issues at the beginning, during, and at the end of the patient's stay to capture data on each patient's complete PAC stay; whereas, the Care for Older Adults (COA) (NQF #0553) quality measure only requires annual documentation in the form of a medication list in the medical record of the target population.
- The quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, includes identification of the potential clinically significant medication issues and communication with the physician (or physician designee) as well as resolution of the issue(s) within a rapid timeframe (by midnight of the next calendar day); whereas, the Care for Older Adults (COA) (NQF #0553) quality measure does not include any follow-up or timeframe in which the follow-up would need to occur.
- The quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, does not have age exclusions; whereas, the Care for Older Adults (COA) (NQF #0553) quality measure limits the measure's population to patients aged 66 and older.
- The quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, would be reported to LTCHs quarterly to facilitate internal quality monitoring and quality improvement in areas such as patient safety, care coordination, and patient satisfaction; whereas the Care for Older Adults (COA) (NQF #0553) quality measure would not enable quarterly quality updates, and thus data comparisons within and across PAC providers would be difficult due to the limited data and scope of the data collected.

Therefore, based on the evidence discussed above, we proposed to adopt the quality measure entitled, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, for the LTCH QRP for the FY 2020 payment determination and subsequent years. We plan to submit the

[332] Chhabra, P. T., et al. (2012). ''Medication reconciliation during the transition to and from long-term care settings: a systematic review.'' Res Social Adm Pharm 8(1): 60–75.

[333] Kripalani S, Roumie CL, Dalal AK, et al. Effect of a pharmacist intervention on clinically important medication errors after hospital discharge: A randomized controlled trial. Ann Intern Med. 2012:157(1):1–10.

[334] March 2015 Report to the Congress: Medicare Payment Policy. Medicare Payment Advisory Commission; 2015.

quality measure to the NQF for consideration for endorsement.

The calculation of the quality measure would be based on the data collection of three standardized items to be included in the LTCH CARE Data Set. The collection of data by means of the standardized items would be obtained at admission and discharge. For more information about the data submission required for this measure, we refer readers to section VIII.C.9. of the preamble of this final rule.

The standardized items used to calculate this quality measure do not duplicate existing items currently used for data collection within the LTCH CARE Data Set. The measure denominator is the number of patient stays with a discharge or expired assessment during the reporting period. The measure numerator is the number of stays in the denominator where the medical record contains documentation of a drug regimen review conducted at: (1) Admission; and (2) discharge with a lookback through the entire patient stay, with all potential clinically significant medication issues identified during the course of care and followed up with a physician or physician designee by midnight of the next calendar day. This measure is not risk adjusted. For technical information about this measure, including information about the measure calculation and discussion pertaining to the standardized items used to calculate this measure, we refer readers to the document titled, Proposed Measure Specifications for Measures Proposed in the FY 2017 LTCH QRP NPRM, available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*.

Data for the quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, would be collected using the LTCH CARE Data Set with submission through the Quality Improvement Evaluation System (QIES) Assessment Submission and Processing (ASAP) system.

We invited public comment on our proposal to adopt the quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP for the LTCH QRP.

Comment: Several commenters, including MedPAC, expressed support for the quality measure. Commenters supported the medication reconciliation concept, and several commenters conveyed that preventing and responding to adverse drug events that account for increases in health service utilization and cost is critically important. Further, several commenters expressed appreciation to CMS for proposing a quality measure to address the IMPACT Act domain, Medication Reconciliation, acknowledging the importance of medication reconciliation for addressing patient safety issues. MedPAC further noted that the medication reconciliation and follow-up process can help reduce medication errors that are especially common among patients who have multiple health care providers and multiple comorbidities. One commenter recommended that CMS consider adopting the measure for FY 2019 payment determination.

Response: We agree that medication reconciliation is an important patient safety process for addressing medication accuracy during transitions in patient care and identifying preventable adverse drug events (ADEs), which may lead to reduced health services utilization and associated costs. We appreciate the commenter's request that CMS adopt the measure for FY 2019 payment determination; however, the adoption of the measure has been proposed for adoption for the LTCH QRP for FY 2020 payment determination and subsequent years.

Comment: Several commenters requested guidance regarding the definition of ''clinically significant medication issues.'' Several commenters were concerned that the phrase could be interpreted differently by the many providers involved in a patient's treatment, and that this could result in a challenge to collect reliable, accurate, and comparable data for this quality measure. One commenter stated that there are likely to be variations in measure performance that are not based on differences in care, but rather on differences in data collection. In addition, one commenter requested that CMS clarify when medication issues are identified, by providing further guidance regarding the definition of the term ''identified.'' Several commenters requested further clarification of the measure and conveyed their concern that there are four measures or sub-measures embedded in the description of the measure and stated that, without additional clarification, it may be difficult for providers to utilize the measure for quality improvement purposes.

Response: For this measure, potential clinically significant medication issues are defined as those issues that, in the clinician's professional judgment, warrant interventions, such as alerting the physician and/or others, and the timely completion of any recommended actions (by midnight of the next calendar day) so as to avoid and mitigate any untoward or adverse outcomes. The definition of ''clinically significant'' in this measure was conceptualized during the measure development process. For purposes of the measure, the decision regarding whether or not a medication issue is ''clinically significant'' will need to be made on a case-by-case basis, but we also intend to provide additional guidance and training on this issue

We would like to clarify that the measure is one measure, comprised of three assessment items used to calculate each LTCH facilities observed score. The items used to calculate the measure are collected by the LTCH CARE Data Set. Items used to calculate the proposed measure include: Items N2001 (Drug Regimen Review Item) and N2003 (Medication Follow-Up Item), collected at admission, and item N2005 (Medication Intervention Item) collected at discharge. Each of the three items are collected in order to report the percentage of patient/resident stays in which a drug regimen review was conducted at the time of admission and timely follow-up with a physician occurred each time potential clinically significant medication issues were identified throughout that stay. The measure is collected admission and at discharge to include data collected throughout the entire patient stay. LTCHs are able to use the data collected for this measure at admission, discharge, or at any time point for internal quality improvement purposes.

Comment: Several commenters expressed concern related to burden and expenses related to this measure. Specifically, the commenters expressed concern that the reporting and tracking requirements for the measure items will increase resource use and costs for LTCHs. The commenters also expressed concern that the costs will be cumulative since future PAC measures will be developed to fulfill the mandate of the IMPACT Act. Therefore, the commenters recommended that CMS narrow the scope of the measure to reduce costs for LTCHs.

Response: We are very sensitive to the issue of burden associated with data collection and have proposed only the minimal number of items needed to calculate the quality measure. We emphasize that this measure follows standard clinical practice requirements of ongoing review, documentation, and timely reconciliation of all patient medications, with appropriate follow-up to address all clinically significant medication concerns.

Comment: Several commenters expressed concerns that the measure is not NQF-endorsed and does not have full support from the NQF-convened MAP or the TEP. One commenter noted that the MAP recommended continued development for the measure. Several commenters recommended that CMS obtain NQF endorsement for the measure prior to implementation. Further, commenters requested that the measure be modified to address the specific needs of the LTCH population.

Response: Since the time of the MAP consideration, with our measure contractor, we tested this measure in a pilot test involving twelve PAC facilities (IRF, SNF and LTCH), representing variation across geographic location, size, profit status, and clinical record collection system. Two clinicians in each facility collected data on a sample of 10 to 20 patients for a total of 298 records (147 qualifying pairs). Analysis of agreement between coders within each participating facility indicated a 71 percent agreement for item DRR–01 [335] Drug Regimen Review (admission); 69 percent agreement for item DRR–02 [336] Medication Follow-up (admission); and 61 percent agreement for DRR–03 [337] Medication Intervention (during stay and discharge). Overall, pilot testing enabled CMS to verify feasibility of the measure. Furthermore, measure development included convening a TEP to provide input on the technical specifications of this quality measure, including components of reliability, validity and the feasibility of implementing the measure across PAC settings. The TEP included stakeholders from the LTCH setting and supported the measure's implementation across PAC settings and was supportive of our plans to standardize this measure for cross-setting development. A summary of the TEP proceedings is available on the PAC Quality Initiatives Downloads and Videos Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/Post-Acute-Care-Quality-Initiatives/IMPACT-Act-of-2014/IMPACT-Act-Downloads-and-Videos.html*.

As noted above, we plan to conduct further testing on this measure once we have started collecting data from the PAC settings. Once we have completed this additional measure performance testing, we plan to submit to NQF for endorsement.

Comment: Several commenters, including MedPAC, encouraged CMS to develop a measure to evaluate medication reconciliation throughout the care continuum. Commenters, including MedPAC, suggested CMS focus on discharge from the PAC setting and evaluate whether the PAC sends a medication list to the patient's primary care physician or to the next PAC provider. One commenter recommended that CMS add a medication management measure to fully address patients' medication management routine needs in order to prepare patients for discharge to PAC settings or the community.

Response: PAC facilities are expected to document information pertaining to the process of a drug regimen review, which includes medication reconciliation, in the patient's discharge medical record. Further, it is standard practice for patient discharge records to include a medication list to be transferred to the admitting PAC facility. We will take the recommendation into consideration for future measure development in accordance with the IMPACT Act, which emphasizes the transfer of interoperable patient information across the continuum of care.

After consideration of the public comments we received, we are finalizing our proposal to adopt the measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP measure for the LTCH QRP for FY 2020 payment determination and subsequent years, as described in the Measure Specifications for Measures Adopted in the FY 2017 LTCH QRP Final Rule, available at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*.

8. LTCH QRP Quality Measures and Measure Concepts Under Consideration for Future Years

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25228), we invited comment on the importance, relevance, appropriateness, and applicability of each of the quality measures listed in the table below for future years in the LTCH QRP. We are developing a measure related to the IMPACT Act domain, ''Accurately communicating the existence of and providing for the transfer of health information and care preferences of an individual to the individual, family caregiver of the individual, and providers of services furnishing items and services to the individual, when the individual transitions.'' We are considering the possibility of adding quality measures that rely on the patient's perspective; that is, measures that include patient-reported experience of care and health status data. We recently posted a ''Request for Information to Aid in the Design and Development of a Survey Regarding Patient and Family Member Experiences with Care Received in Long-Term Care Hospitals'' (80 FR 72722 through 72725).

Also, we are considering a measure focused on pain that relies on the collection of patient-reported pain data, and another that documents whether a patient has an Advance Care Plan. Finally, we are considering measures related to patient safety: Venous Thromboembolism Prophylaxis, Ventilator Weaning (Liberation) Rate, Compliance with Spontaneous Breathing Trial (SBT) (including Tracheostomy Collar Trial (TCT) or Continuous Positive Airway Pressure (CPAP) Breathing Trial) by Day 2 of the LTCH Stay, and Patients Who Received an Antipsychotic Medication.

LTCH QRP Quality Measures Under Consideration for Future Years

IMPACT Act Domain	Accurately communicating the existence of and providing for the transfer of health information and care preferences of an individual to the individual, family caregiver of the individual, and providers of services furnishing items and services to the individual, when the individual transitions.
• IMPACT Act Measure	• Transfer of health information and care preferences when an individual transitions.
NQS Priority	Patient- and Caregiver-Centered Care.
• Measures	• Patient Experience of Care. • Percent of Patients with Moderate to Severe Pain. • Advance Care Plan.
NQS Priority	Patient Safety.

[335] DRR pilot items DRR–01, DRR–02 and DRR–03 are equivalent to the proposed rule DRR PAC instrument items N. 2001, N. 2003 and N. 2005.

[336] DRR pilot items DRR–01, DRR–02 and DRR–03 are equivalent to the proposed rule DRR PAC instrument items N. 2001, N. 2003 and N. 2005.

[337] DRR pilot items DRR–01, DRR–02 and DRR–03 are equivalent to the proposed rule DRR PAC instrument items N. 2001, N. 2003 and N. 2005.

LTCH QRP QUALITY MEASURES UNDER CONSIDERATION FOR FUTURE YEARS—Continued

• Measures	• Ventilator Weaning (Liberation) Rate. • Compliance with Spontaneous Breathing Trial (SBT) (including Tracheostomy Collar Trial (TCT) or Continuous Positive Airway Pressure (CPAP) Breathing Trial) by Day 2 of the LTCH Stay. • Patients Who Received an Antipsychotic Medication. • Venous Thromboembolism Prophylaxis.

We received several comments about LTCH QRP quality measures under consideration for future years which are summarized with our responses below.

Comment: Several commenters recommended that CMS adopt malnutrition-related quality measures in the LTCH QRP to promote early identification of Medicare beneficiaries diagnosed with or at risk for malnutrition, as identification of these conditions is critical to improving outcomes and patient safety by reducing complications such as infections, falls and pressure ulcers. Commenters also recommended that CMS require the inclusion of nutritional status and a nutrition care plan as necessary health information that is transferred to an individual, a caregiver, or provider of services as a component of the Transfer of Health Information for Individuals and Care Preferences quality measure. One commenter recommended that CMS adopt a malnutrition-related composite quality measure in the LTCH QRP and other related care settings and programs. Another commenter acknowledged CMS' past recognition of malnutrition as an important patient safety issue. A commenter recommended that CMS adopt a disease-related malnutrition-related quality measures(s) in the LTCH QRP to reduce the risk of associated adverse outcomes. Specifically, the commenter encouraged the use of the American Society for Parenteral and Enteral Nutrition's publication on malnutrition characteristics and diagnosis.

Response: We will take the suggestions into consideration as we develop future measures for the LTCH QRP and other quality reporting programs. We agree with the commenters' rationale for consideration of adopting malnutrition quality measures, including a malnutrition care composite measure, and for including nutritional status and a nutrition care plan during transitions of care to an individual, a caregiver or provider as they are important components of care for LTCH patients.

Comment: One commenter remarked on the limited number of items in the LTCH CARE Data Set related to communication, cognition, and swallowing and noted that these domains are important in treating individuals with neurological disorders. The commenter encouraged CMS to adopt a specific screening instrument, the Montreal Cognitive Assessment (MoCA), or similar screening tools and assessment tools (CARE–C) to best meet the needs of Medicare beneficiaries and the IMPACT Act. Another commenter requested that CMS add a functional cognition assessment item to the LTCH discharge assessment and that this information be provided to the next provider when a patient is transferred. The commenter also noted the important role that occupational therapists play in such an assessment. The commenter offered to collaborate with CMS to develop future measures in the area of cognitive function.

Response: We agree that future measure development should include other areas of function, such as communication, cognition, and swallowing, and are important components of functional assessment and improvement for patients who receive care in PAC settings, including LTCHs. We will continue to engage stakeholders as we develop and implement quality measures to meet the requirements of the IMPACT Act, and we will take these suggested quality measure concepts and recommendations into consideration in our ongoing measure development and testing efforts.

Comment: One commenter did not support the Venous Thromboembolism (VTE) Prophylaxis measure, since it was previously adopted by LTCHs and would add burden without adding usefulness.

Response: We thank the commenter for their comments on the Venous Thromboembolism (VTE) Prophylaxis measure under consideration for future implementation in the LTCH QRP and will take into consideration the commenter's recommendations.

Comment: One commenter supported the Ventilator Weaning (Liberation) Rate and Compliance with Spontaneous Breathing Trial (SBT) (including Tracheostomy Collar Trial (TCT) or Continuous Positive Airway Pressure (CPAP) Breathing Trial) by Day 2 of the LTCH Stay quality measures for implementation in LTCHs. The commenter emphasized the importance of specifying inclusion and exclusion criteria and risk adjustment.

Response: We will take the suggestions into consideration to inform our ongoing measure development efforts. Our measure development contractor, RTI International, will continue to engage members of a TEP originally convened in April 2014. This TEP is providing ongoing advisement to our measure development contractor on all aspects, including the measures denominator, numerator, inclusion and exclusion criteria, risk adjustment, as well as development and feasibility of data elements.

Comment: One commenter recognized the importance of advance care planning in LTCHs to establish patient preferences regarding medical treatment, as many LTCH patients are unable to make medical care decisions on their own.

Response: We thank the commenter for the comment and agree with the importance of advanced care plans as they relate to the critically chronically ill and vulnerable patient population in LTCHs. We will take this comment into consideration as we develop future measures for the LTCH QRP.

Comment: One commenter expressed support for the inclusion of a patient-reported experience of care measure in the LTCH QRP. The commenter supported accepting proxy responses from family members and caregivers to support accurate and reliable results at the facility level due to the acuity of the patients in LTCHs. The commenter also recommended that CMS continue their efforts to develop a patient experience survey to collect this valuable data and incorporate voluntary reporting into the LTCH QRP as quickly as possible. Another commenter believes that data collection for the Patient Experience of Care quality measure would be difficult if the measure were dependent on collecting data from a patient satisfaction survey, such as the HCAHPS survey. The commenter stated that it would be difficult to assess patient experience by requiring LTCHs to collect data from these severely ill patients, since they are less likely to be satisfied with their care. In addition, the commenter stated that a patient satisfaction survey would create a significant cost burden for providers

and require significant resources for data collection.

Response: While we recognize the difficulty in surveying this patient population, we also believe that patient experience of care is an important element of quality in the LTCH setting. We will continue to take these and future stakeholder inputs under advisement to inform our ongoing quality measure development.

Comment: One commenter supported the future proposal of the IMPACT Act Transfer of Health Information and Care Preferences measure. Another commenter encouraged the inclusion of measures that capture the role of family caregivers in supporting care transitions, quality outcomes, and individual care preferences. The commenter also emphasized the importance of acknowledging and measuring the unique needs of family members when making difficult care decisions, noting the particular importance in the LTCH setting due to the high acuity of LTCH patients. One commenter requested more information about the measure specifications before proposing the measure for the LTCH QRP.

Response: As we move through the development of this measure concept, we will consider the inclusion of the role of family caregivers in supporting care transitions, quality outcomes, and individual care preferences. In addition, we will take these recommendations regarding measure specifications into consideration in our ongoing measure development and testing efforts.

Comment: One commenter supported the inclusion of the antipsychotic quality measure in the LTCH QRP (measure listed on the Nursing Home Compare Web site). However, the commenter cautioned against adapting the pre-existing, non-NQF endorsed antipsychotic measures currently used in nursing homes, indicating that these process measures do not provide a linkage to clinical outcomes or intermediate outcomes. Another commenter also expressed concern about this measure not being appropriate for the LTCH setting.

Response: We appreciate commenters' feedback on this potential measure development area. We acknowledge that measuring the use of antipsychotic medication is important for the aging Medicare population. However, as LTCH patients may differ from the general Medicare population, we recognize the importance of engaging stakeholders if we do adopt/develop such a measure for use in the LTCH setting. We will take the commenters' recommendations into consideration in our measure development and testing efforts, as well as in our ongoing efforts to identify and propose appropriate measures for the LTCH QRP in the future.

Comment: One commenter encouraged CMS to consider new measures in the context of the measurement gap areas identified by the Core Quality Measures Collaborative (CQMC).

Response: We will take the comment and suggestion into consideration as we develop future measures for the LTCH QRP.

9. Form, Manner, and Timing of Quality Data Submission for the FY 2018 Payment Determination and Subsequent Years

a. Background

Section 1886(m)(5)(C) of the Act requires that, for the FY 2014 payment determination and subsequent years, each LTCH submit to the Secretary data on quality measures specified by the Secretary. In addition, section 1886(m)(5)(F) of the Act requires that, for the fiscal year beginning on the specified application date, as defined in section 1899B(a)(2)(E) of the Act, and each subsequent year, each LTCH submit to the Secretary data on measures specified by the Secretary under section 1899B of the Act. The data required under sections 1886(m)(5)(C) and (F) of the Act must be submitted in a form and manner, and at a time, specified by the Secretary. As required by section 1886(m)(5)(A)(i) of the Act, for any LTCH that does not submit data in accordance with sections 1886(m)(5)(C) and (F) of the Act for a given fiscal year, the annual payment for discharges occurring during the fiscal year must be reduced by 2 percentage points.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49749 through 49752), we:

- Adopted timing for new LTCHs to begin reporting quality data under the LTCH QRP for the FY 2017 payment determination and subsequent years; and
- Adopted new deadlines that allow 4.5 months (approximately 135 days) after the end of each calendar year quarter for quality data submission, beginning with quarter 4 of 2015 (October 2015 through December 2015). The new deadlines apply to all LTCH QRP quality measures (except Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431)) for the FY 2017 and FY 2018 payment determinations and subsequent years.

b. Timeline for Data Submission under the LTCH QRP for the FY 2018 Payment Determination and Subsequent Years

The table below presents the data collection period, data submission (for the LTCH CARE Data Set-assessment based and CDC measures) and data correction timelines for quality measures affecting the FY 2018 and subsequent years' payment determinations.

SUMMARY DETAILS ON THE LTCH CARE DATA SET AND CDC NHSN DATA COLLECTION PERIOD AND DATA SUBMISSION TIMELINE FOR PREVIOUSLY ADOPTED QUALITY MEASURES AFFECTING THE FY 2018 PAYMENT DETERMINATION AND SUBSEQUENT YEARS *

Quality measure	Submission method	Data Collection/submission quarterly reporting period(s)	Quarterly review and correction period and data submission deadlines for payment determination	First APU determination affected
NQF #0678: Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (76 FR 51748 through 51750).	LTCH CARE Data Set/QIES ASAP.	1/1/16–3/31/16, 4/1/16–6/30/16, 7/1/16–9/30/16, 10/01/16–12/31/16; Quarterly for each subsequent calendar year.	8/15/16 (Q1), 11/15/16 (Q2), 2/15/17 (Q3), 5/15/17 (Q4); Approximately 135 days after the end of each quarter.	FY 2018.
NQF #0138: NHSN Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (76 FR 51745 through 51747).	CDC NHSN	1/1/16–3/31/16, 4/1/16–6/30/16, 7/1/16–9/30/16, 10/01/16–12/31/16; Quarterly for each subsequent calendar year.	8/15/16 (Q1), 11/15/16 (Q2), 2/15/17 (Q3), 5/15/17 (Q4); Approximately 135 days after the end of each quarter.	FY 2018.

SUMMARY DETAILS ON THE LTCH CARE DATA SET AND CDC NHSN DATA COLLECTION PERIOD AND DATA SUBMISSION TIMELINE FOR PREVIOUSLY ADOPTED QUALITY MEASURES AFFECTING THE FY 2018 PAYMENT DETERMINATION AND SUBSEQUENT YEARS *—Continued

Quality measure	Submission method	Data Collection/submission quarterly reporting period(s)	Quarterly review and correction period and data submission deadlines for payment determination	First APU determination affected
NQF #0139: NHSN Central-Line Associated Bloodstream Infection (CLABSI) Outcome Measure (76 FR 51747 through 51748).	CDC NHSN	1/1/16–3/31/16, 4/1/16–6/30/16, 7/1/16–9/30/16, 10/01/16–12/31/16; Quarterly for each subsequent calendar year.	8/15/16 (Q1), 11/15/16 (Q2), 2/15/17 (Q3), 5/15/17 (Q4); Approximately 135 days after the end of each quarter.	FY 2018.
NQF #1716: NHSN Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (78 FR 50863 through 50865).	CDC NHSN	1/1/16–3/31/16, 4/1/16–6/30/16, 7/1/16–9/30/16, 10/01/16–12/31/16; Quarterly for each subsequent calendar year.	8/15/16 (Q1), 11/15/16 (Q2), 2/15/17 (Q3), 5/15/17 (Q4); Approximately 135 days after the end of each quarter.	FY 2018.
NQF #1717: NHSN Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure (78 FR 50865 through 50868).	CDC NHSN	1/1/16–3/31/16, 4/1/16–6/30/16, 7/1/16–9/30/16, 10/01/16–12/31/16; Quarterly for each subsequent calendar year.	8/15/16 (Q1), 11/15/16 (Q2), 2/15/17 (Q3), 5/15/17 (Q4); Approximately 135 days after the end of each quarter.	FY 2018.
NHSN Ventilator-Associated Event (VAE) Outcome Measure (79 FR 50301 through 50305).	CDC NHSN	1/1/16–3/31/16, 4/1/16–6/30/16, 7/1/16–9/30/16, 10/01/16–12/31/16; Quarterly for each subsequent calendar year.	8/15/16 (Q1), 11/15/16 (Q2), 2/15/17 (Q3), 5/15/17 (Q4); Approximately 135 days after the end of each quarter.	FY 2018.
NQF #0680: Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (77 FR 53624 through 53627).	LTCH CARE Data Set/QIES ASAP.	10/1/15–12/31/15, 1/1/16–3/31/16**.	5/15/16, 8/15/16**	FY 2018
NQF #0431: Influenza Vaccination Coverage Among Healthcare Personnel (77 FR 53630 through 53631).	CDC NHSN	10/1/16–3/31/17, 10/1–3/31 for subsequent years.	5/15/17, 5/15 for subsequent years.	FY 2018.
NQF #2512: All-Cause Unplanned Readmission Measure for 30-Days Post-Discharge from Long-Term Care Hospitals (78 FR 50868 through 50874).	Medicare FFS Claims Data.	N/A	N/A	FY 2018.
NQF #0674: Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (80 FR 49736 through 49739).	LTCH CARE Data Set/QIES ASAP.	4/1/16–6/30/16, 7/1/16–9/30/16, 10/1/16–12/31/16; Quarterly for each subsequent calendar year.	11/15/16 (Q2), 2/15/17 (Q3), 5/15/17 (Q4); Quarterly approximately 135 days after the end of each quarter for subsequent years.	FY 2018.
NQF #2631: Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (79 FR 50298 through 50301).	LTCH CARE Data Set/QIES ASAP.	4/1/16–6/30/16, 7/1/16–9/30/16, 10/1/16–12/31/16; Quarterly for each subsequent calendar year..	11/15/16 (Q2), 2/15/17 (Q3), 5/15/17 (Q4); Quarterly approximately 135 days after the end of each quarter for subsequent years.	FY 2018.
NQF #2631: Application of Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (80 FR 49739 through 49747).	LTCH CARE Data Set/QIES ASAP.	4/1/16–6/30/16, 7/1/16–9/30/16, 10/1/16–12/31/16; Quarterly for each subsequent calendar year.	11/15/16 (Q2), 2/15/17 (Q3), 5/15/17 (Q4); Quarterly approximately 135 days after the end of each quarter for subsequent years.	FY 2018.
NQF #2632: Functional Outcome Measure: Change in Mobility Among Long-Term Care Hospital Patients Requiring Ventilator Support (79 FR 50298 through 50301).	LTCH CARE Data Set/QIES ASAP.	4/1/16–6/30/16, 7/1/16–9/30/16, 10/1/16–12/31/16; Quarterly for each subsequent calendar year.	11/15/16 (Q2), 2/15/17 (Q3), 5/15/17 (Q4); Quarterly approximately 135 days after the end of each quarter for subsequent years.	FY 2018.

* We refer readers to the table below for an illustration of the CY quarterly data collection/submission quarterly reporting periods and correction and submission deadlines for all APU years.

** For this measure, Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine, we refer readers to the proposals on data submission for this measure, which we are finalizing, in section VIII.C.9.d. of the preamble of this final rule. These proposals for the FY 2019 payment determination and for FY 2020 payment determination and subsequent years are illustrated in the tables in that section.

Further, in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49749 through 49752), we established that the LTCH CARE Data Set-based and CDC NHSN measures finalized for adoption into the LTCH QRP would follow a calendar year schedule with quarterly reporting periods, followed by quarterly review and correction periods and submission deadlines. This pattern is illustrated in the table below and is in place for all APU years unless otherwise specified. We also wish to illustrate that for the measures finalized for use in the LTCH QRP that use the LTCH CARE Data Set or CDC NHSN data sources, payment determination would subsequently use the data collection and deadlines shown below unless otherwise specified.

ANNUAL CY LTCH CARE DATA SET AND CDC NHSN DATA COLLECTION/SUBMISSION REPORTING PERIODS AND DATA SUBMISSION/CORRECTION DEADLINES FOR PAYMENT DETERMINATIONS

Proposed CY data collection quarter	Data collection/submission quarterly reporting period.	Quarterly review and correction periods and data submission deadlines for payment determination	
Quarter 1	January 1–March 31*, **	April 1–August 15*	Deadline: August 15.*, **
Quarter 2	April 1–June 30	July 1–November 15	Deadline: November 15.
Quarter 3	July 1–September 30	October 1–February 15	Deadline: February 15
Quarter 4	October 1–December 31*, **	January 1–May 15*	Deadline: May 15.*, **

*The annual data submission time frame for the measure, Influenza Vaccination Coverage among Healthcare Personnel, is October 1 through March 31 of the subsequent year with a reporting deadline of May 15 in that subsequent year.

**For the measure, Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine, we refer readers to the proposals on data submission for this measure, which we are finalizing in section VIII.C.9.d. of the preamble of this final rule. These proposals for the FY 2019 payment determination and for FY 2020 payment determination and subsequent years are illustrated in the tables in that section.

c. Timeline and Data Submission Mechanisms for the FY 2018 Payment Determination and Subsequent Years for the LTCH QRP Resource Use and Other Measures—Claims-Based Measures

The MSPB–PAC LTCH QRP measure; Discharge to Community-PAC LTCH QRP measure and Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP, which we are finalizing in this final rule, are Medicare FFS claims-based measures. Because claims-based measures can be calculated based on data that are already reported to the Medicare program for payment purposes, no additional information collection would be required from LTCHs. As discussed in section VIII.C.6. of the preamble of this final rule, these measures would use 2 years of claims-based data beginning with CY 2015 and CY 2016 claims to inform confidential feedback reports for LTCHs, and CYs 2016 and 2017 claims data for public reporting.

We invited public comments on this proposal. We did not receive comments related to data submission mechanisms for these measures. For comments related to the measures, we refer readers to section VIII.C.6. of the preamble of this final rule, above. For comments related to the future public display of these measures, we refer readers to section VIII.C.14. of the preamble of this final rule.

We are finalizing the timeline and data submission mechanisms for FY 2018 payment determination and subsequent years as proposed.

d. Revisions to the Previously Adopted Data Collection Period and Submission Deadlines for Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) for the FY 2019 Payment Determination and Subsequent Years

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53624 through 53627), we adopted the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure for the FY 2016 payment determination and subsequent years. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50858 through 50861), we finalized the data submission timelines and submission deadlines for the measures for FY 2016 and FY 2017 payment determinations. We refer readers to the FY 2013 and FY 2014 IPPS/LTCH PPS final rules for a more detailed discussion of the measure, timelines and deadlines.

In these previous rules, we finalized that LTCHs were required to perform data collection in alignment with the influenza vaccination season (IVS); that is, obtaining the vaccination status of patients who are in an LTCH for one or more days between the dates of October 1 of a given year through March 31 of the subsequent year, or what the CDC terms the Influenza Vaccination Season (IVS), but for only those patients whose corresponding admissions and discharges occurred during the IVS. Through analysis of the quality data submitted for this measure, we discovered that only requiring LTCHs to submit patient influenza vaccination data during the IVS (October 1 of a given year through March 31 of the subsequent year) inadvertently limits the data collection to only a subset of patients whose stays at an LTCH qualify for inclusion in the measure calculation. This measure is structured in such a way that all patients in an LTCH for one or more days during the IVS are included in the measure. For those patients, an LTCH should have the opportunity to demonstrate the Influenza vaccination status of these patients on either their LTCH CARE Data Set admission assessment or on their discharge assessment (planned, unplanned, or expired). By limiting data collection to only those assessments obtained during the IVS, per our previously finalized policy, CMS inadvertently excluded the collection of Influenza vaccination status data on those patients who were in an LTCH for at least one day during the IVS, but for whom the associated LTCH CARE Data Set admission and/or discharge assessments occurred outside of the IVS (prior to October 1 or after March 31).

For these reasons, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25230 through 25232), we proposed that beginning with the FY 2019 payment determination and subsequent years, which includes the CY 2016/2017 IVS, data collection and submission for the measure Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) will be required year-round, thus including all patients in the LTCH one or more days during the IVS (October 1 of any given CY through March 31 of the subsequent CY), regardless of the associated LTCH

CARE Data Set admission and discharge dates. This includes, for example, a patient that is admitted September 15 of a given year, and discharged April 1 of the subsequent year (thus, in the LTCH during the IVS). This policy will enable the important data collection necessary to indicate that a patient who had an admission or a discharge outside of the IVS, but was in the facility during the vaccination season, ensuring that the data collected and submitted to CMS is representative of the status of all patients within the IVS, rather than only a subset of those who had both admissions and discharges within the IVS.

Further, our proposal effectively changes the data collection and submission timeline for this measure to include 4 calendar quarters, that is based on the influenza *season* (July 1 of any given year through June 30 of the subsequent year), rather than on the calendar year. For the purposes of APU determination and for public reporting, data calculation and analysis uses data from an influenza vaccination season, which takes place within the *influenza season* itself. While the influenza vaccination season is October 1 of a given year (or when the vaccine becomes available) through March 31 of the subsequent year, this timeframe rests within a greater time period of the *influenza season,* which spans 12 months—that is, July 1 of a given year through June 30 of the subsequent year, as defined by the CDC. Thus, for this measure, we utilize data from a timeframe of 12 months that mirrors the influenza season which is July 1 of a given year through June 30 of the subsequent year. In addition, for the APU determination, we review data submitted beginning on July 1 of the calendar year 2 years prior to the calendar year of the APU effective date and ending June 30 of the subsequent calendar year, one year prior to the calendar year of the APU effective date. For example, and as provided in the below for the FY 2020 (October 1, 2019) APU determination, we review data submission beginning July 1, 2017 through June 30, 2018 for the 2017/2018 influenza vaccination season (October 1, 2017 [or when the vaccine becomes available] through March 31, 2018), so as to capture all data that an LTCH will have submitted with regard to the 2017/2018 influenza vaccination season itself, which resides within the associated influenza season. We will use assessment data from the influenza season so as to ensure full capture of vaccination status in the IVS that resides within the influenza season period, as well for public reporting. Further, because we enable the opportunity to review and correct data for all assessment based LTCH CARE Data Set measures within the LTCH QRP, we continue to follow quarterly data collection/submission reporting period(s) and their subsequent quarterly review and correction periods with data submission deadlines for public reporting and payment determinations. However, rather than using a standard CY timeframe, these quarterly data collection/submission periods and their subsequent quarterly review and correction periods and submission deadlines begin with CY quarter 3, July 1, of a given year and end CY quarter 2, June 30, of the following year.

The revisions to the data collection period for the measure Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680), will ultimately have the effect of helping LTCHs capture Influenza vaccination data on any LTCH patients that were in their hospital for one or more days during the IVS, by ensuring that such patient's admission and discharge assessments, regardless of the date of those assessments, capture potential influenza vaccination data, and allow the appropriate inclusion of patients and thus the accurate calculation of data for this measure. Lastly, this clarification will also remove any ambiguity and ensure that LTCHs are receiving credit for recording the vaccination status of all patients that were in their hospital for at least one day during any given IVS, regardless of the date(s) of their admission and/or discharge.

We would like to note that in order to implement the newly proposed revision to the data collection timeframes and submission deadlines for this measure, the FY 2019 payment determination will only be based on three CY quarters, as this policy will not go into effect until October 1, 2016, which is the start of the 2016/2017 IVS. Because of this, we are not requiring LTCHs to respond to the Influenza vaccination items on the LTCH CARE Data Set admission or discharge assessments that take place during Q3 2016 (7/1/16–9/30/16), as this quarter will occur prior to the effective date of this policy, if finalized. This is illustrated in the table for the FY 2019 payment determination, below. All subsequent payment determinations will be based on four CY quarters, as discussed above, beginning with Q3 of CY 2017 for the FY 2020 payment determination. This is illustrated in table for the FY 2020 payment determination and subsequent years, below.

FY 2019 PAYMENT DETERMINATION: * SUMMARY DETAILS ON DATA COLLECTION PERIOD AND DATA SUBMISSION TIMELINE FOR PREVIOUSLY ADOPTED QUALITY MEASURE, NQF #0680 PERCENT OF RESIDENTS OR PATIENTS WHO WERE ASSESSED AND APPROPRIATELY GIVEN THE SEASONAL INFLUENZA VACCINE

Finalized Measure:

- Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) (77 FR 53624 through 53627)

Submission method	Data collection/submission quarterly reporting period(s)	Quarterly review and correction periods data submission deadlines for payment determination *	APU determination affected
LTCH CARE Data Set/QIES ASAP System.	CY 16 Q4 ..... 10/1/16–12/31/16.	1/1/2017–5/15/17 deadline.	
	CY 17 Q1 ..... 1/1/17–3/31/17.	4/1/2017–8/15/17 deadline.	
	CY 17 Q2 ..... 4/1/17–6/30/17.	7/1/17–11/15/17 deadline	FY 2019.

* This table refers to the FY 2019 payment determination only. We refer readers to the table below for all subsequent FY payment determinations for this measure.

FY 2020 PAYMENT DETERMINATION AND SUBSEQUENT YEARS: SUMMARY DETAILS ON DATA COLLECTION PERIOD AND DATA SUBMISSION TIMELINE FOR PREVIOUSLY ADOPTED QUALITY MEASURE, PERCENT OF RESIDENTS OR PATIENTS WHO WERE ASSESSED AND APPROPRIATELY GIVEN THE SEASONAL INFLUENZA VACCINE (SHORT STAY) (NQF #0680)

Finalized Measure:

- NQF #0680 Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (77 FR 53624 through 53627)

Submission method	Data collection/submission quarterly reporting period(s)	Quarterly review and correction periods data submission deadlines for payment determination *	APU determination affected
LTCH CARE Data Set/QIES ASAP System.	CY 17 Q3 ..... 7/1/17–9/30/17	10/1/17–2/15/18 deadline.	
	Q3 (7/1–9/30)	10/1–2/15.

	Q4 (10/1–12/31)	1/1–5/15	FY 2020.
	CY 18 Q1 ..... 1/1/18–3/31/18.	4/1/2018–8/15/18 deadline	Subsequent Years.
	Q1 (1/1–3/31)	4/1–8/15.	
	CY 18 Q2 ..... 4/1/18–6/30/18.	7/1/18–11/15/18 deadline.	
	Q2 (4/1–6/30)	7/1/18–11/15/18 deadline.	

We invited comment on our proposal to revise the data collection and submission timeframe for the measure Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680), beginning with the FY 2019 payment determination and subsequent years.

Comment: One commenter supported the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure and the proposed revisions to data collection.

Response: We appreciate the commenter's support for this measure and its continued inclusion in the LTCH QRP, and the proposed revisions to data collection.

After consideration of the public comment we received, we are finalizing our proposal to revise the data collection period and submission deadlines for Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) for the FY 2019 payment determination and subsequent years.

e. Timeline and Data Submission Mechanisms for the Newly Finalized LTCH QRP Quality Measure for the FY 2020 Payment Determination and Subsequent Years

As discussed in section VIII.C.7. of the preamble of this final rule, we proposed that the data for the proposed quality measure, Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP, affecting the FY 2020 payment determination and subsequent years be collected by completing data elements that would be added to the LTCH CARE Data Set with submission through the QIES ASAP system. Data collection would begin on April 1, 2018. More information on LTCH reporting using the QIES ASAP system is located at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Technical-Information.html.*

For the FY 2020 payment determination, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25232 through 25233), we proposed to collect CY 2018 Q2 through Q4 data, that is, beginning with admissions on April 1, 2018 through discharges on December 31, 2018, to remain consistent with the usual April release schedule for the LTCH CARE Data Set, to give LTCHs sufficient time to update their systems so that they can comply with the new data reporting requirements, and to give us sufficient time to determine compliance for the FY 2020 payment determination. The proposed use of 3 quarters of data for the initial year of assessment data reporting in the LTCH QRP, to make compliance determinations related to the applicable FY APU, is consistent with the approach we used previously for the SNF, IRF, and Hospice QRPs.

The table below presents the proposed data collection period and data submission timelines for the new proposed LTCH QRP quality measure for the FY 2020 payment determination. We invited public comments on this proposal.

DETAILS ON THE PROPOSED DATA COLLECTION PERIOD AND DATA SUBMISSION TIMELINE FOR RESOURCE USE AND OTHER MEASURES AFFECTING THE FY 2020 PAYMENT DETERMINATION

Quality measure	Submission method	Data collection/submission quarterly reporting period	Quarterly review and correction periods and data submission deadlines for payment determination	APU determination affected
Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP.	LTCH CARE Data Set/QIES ASAP.	4/1/18–6/30/18 (Q2), 7/1/18–9/30/18 (Q3), 10/1/18–12/31/18 (Q4).	11/15/18 (Q2), 2/15/19 (Q3), 5/15/19 (Q4).	FY 2020.

Following the close of the reporting quarters for the FY 2020 payment determination, LTCHs would have the already established additional 4.5 months to correct their quality data and that the final deadline for correcting data for the FY 2020 payment determination would be May 15, 2019 for these measures. We also proposed that for the FY 2021 payment determination and subsequent years, we would collect data using the calendar year reporting cycle as described in section VIII.C.9.c. of the preamble of this final rule, and illustrated in the table below. We invited public comments on this proposal.

PROPOSED DATA COLLECTION PERIOD AND DATA CORRECTION DEADLINES AFFECTING THE FY 2021 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Quality measure	Submission method	Proposed CY data collection quarter	Proposed data collection/ submission quarterly reporting period	Proposed quarterly review and correction periods and data submission deadlines for payment determination
Drug Regimen Review Conducted with Follow-Up for Identified Issues PAC LTCH QRP.	LTCH CARE Data Set/QIES ASAP.	Quarter 1	January 1–March 31	April 1–August 15.
		Quarter 2	April 1–June 30	July 1–September 30.
		Quarter 3	July 1–November 15	October 1–February 15.
		Quarter 4	October 1–December 31	January 1–May 15.

We did not receive any public comments on the proposed data collection periods and data submission timelines for the new proposed LTCH QRP quality measure for the FY 2020 and FY 2021 payment determinations and subsequent years.

We are finalizing the timeline and data submission mechanisms for FY 2020 and FY 2021 payment determination and subsequent years as proposed. For comments related to the measure, we refer readers to section VIII.C.7. of the preamble of this final rule, above.

10. LTCH QRP Data Completion Thresholds for the FY 2016 Payment Determination and Subsequent Years

In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50311 through 50314), we finalized LTCH QRP thresholds for completeness of LTCH data submissions. To ensure that LTCHs are meeting an acceptable standard for completeness of submitted data, we finalized the policy that, beginning with the FY 2016 payment determination and for each subsequent year, LTCHs must meet or exceed two separate data completeness thresholds: One threshold set at 80 percent for completion of quality measures data collected using the LTCH CARE Data Set submitted through the QIES and a second threshold set at 100 percent for quality measures data collected and submitted using the CDC's NHSN.

In addition, we stated that we would apply the same thresholds to all measures adopted as the LTCH QRP expands and LTCHs begin reporting data on previously finalized measure sets. That is, as we finalize new measures through the regulatory process, LTCHs will be held accountable for meeting the previously finalized data completion threshold requirements for each measure until such time that updated threshold requirements are proposed and finalized through a subsequent regulatory cycle.

Further, we finalized the requirement that an LTCH must meet or exceed both thresholds to avoid receiving a 2 percentage point reduction to their annual payment update for a given fiscal year, beginning with FY 2016 and for all subsequent payment updates. For a detailed discussion of the finalized LTCH QRP data completion requirements, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50311 through 50314). In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25233), we did not propose any changes to these policies.

11. LTCH QRP Data Validation Process for the FY 2016 Payment Determination and Subsequent Years

Validation is intended to provide added assurance of the accuracy of the data that will be reported to the public as required by sections 1886(m)(5)(E) and 1899B(g) of the Act. In the FY 2015 IPPS/LTCH PPS proposed rule (79 FR 28275 through 28276), we proposed, for the FY 2016 payment determination and subsequent years, a process to validate the data submitted for quality purposes. However, in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50314 through 50316), we did not finalize the proposal; instead we decided to further explore suggestions from commenters before finalizing the LTCH data validation process that we proposed. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49752 through 49753), we did not propose any new policies related to data accuracy validation. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25233), we did not propose a data validation policy because we are developing a policy that could be applied to several PAC quality reporting programs. We intend to propose a data validation policy through future rulemaking.

Although we did not solicit feedback specifically regarding data validation, we received one comment which is summarized and discussed below.

Comment: One commenter supported CMS' determination that it was not necessary to propose a data validation policy because there is a policy under development that could be applied to several PAC QRPs.

Response: We appreciate the commenter's support. We intend to propose a data validation policy through the notice and comment process in the **Federal Register** through future rulemaking.

12. Change to Previously Codified LTCH QRP Submission Exception and Extension Policies

We refer readers to § 412.560(c) for requirements pertaining to submission exception and extension for the FY 2017 payment determination and subsequent years. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25233 through 25234), we proposed to revise § 412.560(c) to change the timing for submission of these exception and extension requests from 30 days to 90 days from the date of the qualifying event which is preventing an LTCH from submitting their quality data for the LTCH QRP. We proposed the increased time allotted for the submission of the requests from 30 to 90 days to be consistent with other quality reporting programs; for example, the Hospital IQR Program also proposed to extend the deadline to 90 days in section VIII.C.15.a. of the preamble of the proposed rule (81 FR 25205). We believe that this increased time will assist providers experiencing an event in having the time needed to submit such a request. With the exception of this one change, we did not propose any

additional changes to the exception and extension policies for the LTCH QRP at this time.

We invited public comments on the proposal to revise § 412.560(c) to change the timing for submission of these exception and extension requests from 30 days to 90 days from the date of the qualifying event which is preventing an LTCH from submitting their quality data for the LTCH QRP.

Comment: Several commenters supported changing the timing for submission of exception and extension requests from 30 to 90 days from the date of the qualifying event preventing an LTCH from submitting their LTCH QRP data. One commenter stated that it helps to align the LTCH QRP with other quality reporting programs, and allows LTCHs to better cope with unforeseeable events.

Response: We thank the commenter for their support.

After consideration of the public comments we received, we are finalizing our proposal to revise § 412.560(c) to change the timing for submission of these exception and extension requests from 30 days to 90 days from the date of the qualifying event which is preventing an LTCH from submitting their quality data for the LTCH QRP.

13. Previously Finalized LTCH QRP Reconsideration and Appeals Procedures

We refer readers to § 412.560(d) for a summary of our finalized reconsideration and appeals procedures for the LTCH QRP for FY 2017 payment determination and subsequent years. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25234), we did not propose any changes to this policy. However, we wish to clarify that in order to notify LTCHs found to be noncompliant with the reporting requirements set forth for a given payment determination, we may include the QIES mechanism in addition to U.S. mail, and we may elect to utilize the MACs to administer such notifications.

14. Policies Regarding Public Display of Measure Data for the LTCH QRP and Procedures for the Opportunity To Review and Correct Data and Information

a. Public Display of Measures

Section 1886(m)(5)(E) of the Act requires the Secretary to establish procedures for making the LTCH QRP data available to the public. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49753 through 49755), we finalized our proposals to display performance data for the LTCH QRP quality measures by fall 2016 on a CMS Web site, such as the *Hospital Compare,* after a 30-day preview period, and to give providers an opportunity to review and correct data submitted to the QIES ASAP system or to the CDC NHSN. The procedures for the opportunity to review and correct data are provided in the section VIII.C.14.b. of the preamble of this final rule, below. In addition, we finalized the proposal to publish a list of LTCHs that successfully meet the reporting requirements for the applicable payment determination on the LTCH QRP Web site at: *https://www.cms.gov/medicare/quality-initiatives-patient-assessment-instruments/ltch-quality-reporting/*. In the FY 2016 IPPS/LTCH PPS final rule, we also finalized that we would update the list after the reconsideration requests are processed on an annual basis.

Also, in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49753 through 49755), we finalized that the display of information for fall 2016 contains performance data on four quality measures:

- Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678);
- NHSN CAUTI Outcome Measure (NQF #0138);
- NHSN CLABSI Outcome Measure (NQF #0139); and
- All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512).

The measures Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678), NHSN CAUTI Outcome Measure (NQF #0138), and NHSN CLABSI Outcome Measure (NQF #0139) are based on data collected beginning with the first quarter of 2015 or discharges beginning on January 1, 2015. With the exception of the All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512), rates are displayed based on 4 rolling quarters of data and would initially use discharges from January 1, 2015 through December 31, 2015 (CY 2015) for Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678) and data collected from January 1, 2015 through December 31, 2015 for NHSN CAUTI Outcome Measure (NQF #0138) and NHSN CLABSI Outcome Measure (NQF #0139). For the readmissions measure, data will be publicly reported beginning with data collected for discharges beginning January 1, 2013, and rates would be displayed based on 2 consecutive years of data. For LTCHs with fewer than 25 eligible cases, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25234 through 25235), we proposed to assign the LTCH to a separate category: ''The number of cases is too small (fewer than 25) to reliably tell how well the LTCH is performing.'' If an LTCH has fewer than 25 eligible cases, the LTCH's readmission rates and interval estimates would not be publicly reported for the measure.

Calculations for all four measures are discussed in detail in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49753 through 49755).

Comment: Several commenters, including MedPAC, supported public reporting of quality measures. MedPAC encouraged ongoing development and public reporting for cross-cutting measures for all provider settings.

Response: We appreciate MedPAC's and other commenters' support for the public reporting of LTCH quality measures. We will continue to move forward with cross-cutting measure and public reporting of these measures to meet the mandate of the IMPACT Act.

Comment: A few commenters discussed the requirements of the Affordable Care Act and the IMPACT Act for publicly reporting the measures that are implemented into the LTCH QRP and expressed concern-regarding such public reporting. The commenters suggested that previously finalized measures are not suited for cross-PAC provider comparison, as opposed to LTCH-to-LTCH comparison using comparable data that are risk adjusted, for example, as in the case with the use of the Standardized Infection Ratio, and that using such data for cross-comparison purposes could be misleading to those who use the publicly reported data.

Response: We appreciate commenters' concern about the use of cross-setting quality measures and provider comparability in satisfaction of our requirements to publicly report the data and information. We interpret the commenters' comments to suggest that the measures previously finalized in FY 2016 IPPS/LTCH PPS final rule (80 FR 49753 through 49755), such as the CDC Healthcare Associated Infection (HAI) measures (which use the Standardized Infection Ratio) that is, NHSN CAUTI Outcome Measure (NQF #0138), NHSN CLABSI Outcome Measure (NQF #0139) and the All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512) are appropriate for LTCH-to-LTCH quality comparison. We wish to clarify that such comparison is their intended application at this time rather than across PAC provider comparison.

We further interpret the commenters to be expressing concern surrounding the other measure that we also finalized for public reporting, ''The Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678),'' inferring that the measure, which satisfies the IMPACT Act quality measure domain of Skin Integrity, would not be appropriate for cross-PAC comparison because it is not further risk adjusted for LTCHs. We note that this measure is risk adjusted uniformly across the PAC providers (LTCHs, IRFs, SNFs and HHAs) and, given that the measure's risk adjustment factors take into account frailty and comorbidities, we did not believe that further setting-specific risk adjustment was warranted. The measure was finalized for use to satisfy the domain described; however as of fall 2016, the measure will initially be publicly reported for LTCH-based public reporting only. With regard to cross-PAC provider comparability, we will continue to examine risk adjustment and other factors as part of our ongoing measure development work and continue to monitor for additional factors that would take into account greater risk as we continue to collect the data.

Pending the availability of data, we proposed to publicly report data in CY 2017 on 4 additional measures beginning with data collected on these measures for the first quarter of 2015, or discharges beginning on January 1, 2015: (1) Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716); (2) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure (NQF #1717); and beginning with the 2015–16 influenza vaccination season these two measures; (3) Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431); and (4) Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680).

Standardized infection ratios (SIRs) for the Facility-wide Inpatient Hospital-onset MRSA Bacteremia Outcome Measure (NQF #1716) and Facility-wide Inpatient Hospital-onset CDI Outcome Measure (NQF #1717) will be displayed based on 4 rolling quarters of data and will initially use MRSA Bacteremia and CDI events that occurred from January 1, 2015 through December 31, 2015 (CY 2015), for calculations. We proposed that the display of these ratios will be updated quarterly.

Rates for the Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431) will initially be displayed for personnel working in the reporting facility October 1, 2015 through March 31, 2016. Rates for the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) will also initially be displayed for patients in the LTCH during the influenza vaccination season, from October 1, 2015, through March 31, 2016. We proposed that the display of these rates will be updated annually for subsequent influenza vaccination seasons.

Calculations for the MRSA Bacteremia and CDI Healthcare Associated Infection (HAI) measures adjust for differences in the characteristics of hospitals and patients using a Standardized Infection Ratio (SIR). The SIR is a summary measure that takes into account differences in the types of patients that a hospital treats. For a more detailed discussion about SIR, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49753). The MRSA Bacteremia and CDI SIRs may take into account the laboratory methods, bed size of the hospital, and other facility-level factors. It compares the actual number of HAIs in a facility or State to a national benchmark based on previous years of reported data and adjusts the data based on several factors. A confidence interval with a lower and upper limit is displayed around each SIR to indicate that there is a high degree of confidence that the true value of the SIR lies within that interval. A SIR with a lower limit that is greater than 1.0 means that there were more HAIs in a facility or State than were predicted, and the facility is classified as ''Worse than the U.S. National Benchmark.'' If the SIR has an upper limit that is less than 1, the facility had fewer HAIs than were predicted and is classified as ''Better than the U.S. National Benchmark.'' If the confidence interval includes the value of 1, there is no statistical difference between the actual number of HAIs and the number predicted, and the facility is classified as ''No Different than U.S. National Benchmark.'' If the number of predicted infections is less than 1.0, the SIR and confidence interval are not calculated by CDC.

Calculations for the Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431) are based on reported numbers of personnel who received an influenza vaccine at the reporting facility or who provided written documentation of influenza vaccination outside the reporting facility. The sum of these two numbers is divided by the total number of personnel working at the facility for at least 1 day from October 1 through March 31 of the following year, and the result is multiplied by 100 to produce a compliance percentage (vaccination coverage). No risk adjustment is applicable to these calculations. More information on these calculations and measure specifications is available at: *http://www.cdc.gov/nhsn/pdfs/hps-manual/vaccination/4-hcp-vaccination-module.pdf*. We proposed that this data will be displayed on an annual basis and would include data submitted by LTCHs for a specific, annual influenza vaccination season. A single compliance (vaccination coverage) percentage for all eligible healthcare personnel will be displayed for each facility.

We invited public comment on our proposal to begin publicly reporting in CY 2017 pending the availability of data on Facility-wide Inpatient Hospital-onset MRSA Bacteremia Outcome Measure (NQF #1716); Facility-wide Inpatient Hospital-onset CDI Outcome Measure (NQF #1717); and Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431).

Comment: Several commenters specifically supported the public reporting of the CDC NHSN measures.

Response: We appreciate the commenters' support for public reporting of healthcare-associated infections and shared commitment towards improving quality and promoting patient safety.

After consideration of the public comments we received, we are finalizing our proposal to begin publicly reporting in CY 2017 pending the availability of data on: The Facility-wide Inpatient Hospital-onset MRSA Bacteremia Outcome Measure (NQF #1716); the Facility-wide Inpatient Hospital-onset CDI Outcome Measure (NQF #1716); and the Influenza Vaccination Coverage Among Healthcare Personnel measure (NQF #0431).

For the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680), we proposed to display rates annually based on the influenza season to avoid reporting for more than one influenza vaccination within a CY. For example, in 2017 we would display rates for the patient vaccination measure based on discharges starting on July 1, 2015, to June 30, 2016. We proposed this approach because it includes the entire influenza vaccination season (October 1, 2015, to March 31, 2016).

Calculations for Percent of Residents or Patients Who Were Assessed and

Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) will be based on patients meeting any one of the following criteria: patients who received the influenza vaccine during the influenza season; patients who were offered and declined the influenza vaccine; and patients who were ineligible for the influenza vaccine due to contraindication(s). The facility's summary observed score will be calculated by combining the observed counts of all the criteria. This is consistent with the publicly reported patient influenza vaccination measure for *Nursing Home Compare.* In addition, for the patient influenza measure, we will exclude LTCHs with fewer than 20 stays in the measure denominator. For additional information on the specifications for this measure, we refer readers to the LTCH Quality Reporting Measures Information Web page at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Measures-Information.html*.

We invited public comments on our proposal to begin publicly reporting the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure on discharges from July 1 of the previous calendar year to June 30 of the current calendar year. We invited comments on the public display of the measure Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (NQF #0680) in 2017 pending the availability of data.

Comment: Several commenters supported the public reporting of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (NQF #0680) and Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431) across settings. Commenters believed that surveillance is a key component in the prevention and management of influenza outbreaks and the need for a multi-faceted approach.

Response: We appreciate the commenters' support for public reporting of the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (NQF #0680) and Influenza Vaccination Coverage Among Healthcare Personnel (NQF #0431) across settings.

After consideration of the public comments we received, we are finalizing our proposal to begin publicly reporting the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) measure on discharges from July 1st of the previous calendar year to June 30th of the current calendar year in 2017 pending the availability of data.

In addition, we requested public comments on whether to include in the future, public display comparison rates based on CMS regions or U.S. census regions for Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678); All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512); and Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) for CY 2017 public display.

Comment: One commenter supported regional comparison for the LTCH quality measures. The commenter had no preference for the type of region and encouraged more granular evaluation such as State comparison.

Response: We appreciate the commenter's support for publicly displaying regional comparison rates for these quality indicators and their encouragement on providing state comparison rates. We are currently determining the feasibility of including State comparison rates for these quality indicators.

b. Procedures for the Opportunity To Review and Correct Data and Information

Section 1899B(g) of the Act requires the Secretary to establish procedures for public reporting of LTCHs' performance, including the performance of individual LTCHs, on quality measures specified under section 1899B(c)(1) of the Act and resource use and other measures specified under section 1899B(d)(1) of the Act (collectively, IMPACT Act measures) beginning not later than 2 years after the applicable specified application date under section 1899B(a)(2)(E) of the Act. Under section 1899B(g)(2) of the Act, the procedures must ensure, including through a process consistent with the process applied under section 1886(b)(3)(B)(viii)(VII) of the Act, which refers to public display and review requirements in the Hospital IQR Program, that each LTCH has the opportunity to review and submit corrections to its data and information that are to be made public prior to the information being made public.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49754), and as illustrated in the second table in section VIII.C.9.e. of the preamble of this final rule, we finalized that once the provider has an opportunity to review and correct quarterly data related to measures submitted via the QIES ASAP system or CDC NHSN, we would consider the provider to have been given the opportunity to review and correct this data. We wish to clarify that although the correction of data (including claims) can occur after the submission deadline, if such corrections are made after a particular quarter's submission and correction deadline, such corrections will not be captured in the file that contains data for calculation of measures for public reporting purposes. To have publicly displayed performance data that is based on accurate underlying data, it will be necessary for LTCHs to review and correct this data before the quarterly submission and correction deadline.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25235 through 25237), we restated and proposed additional details surrounding procedures that would allow individual LTCHs to review and correct their data and information on measures that are to be made public before those measure data are made public.

For assessment-based measures, we proposed a process by which we will provide each LTCH with a confidential feedback report that will allow the LTCH to review its performance on such measures and, during a review and correction period, to review and correct the data the LTCH submitted to CMS via the CMS QIES ASAP system for each such measure. In addition, during the review and correction period, the LTCH will be able to request correction of any errors in the assessment-based measure rate calculations.

We proposed that these confidential feedback reports will be available to each LTCH using the Certification and Survey Provider Enhanced Reports (CASPER) system. We refer to these reports as the LTCH Quality Measure (QM) Reports. We proposed to provide monthly updates to the data contained in these reports as data become available. We proposed to provide the reports so that providers will be able to view their data and information at both the facility and patient level for its quality measures. The CASPER facility level QM Reports may contain information such as the numerator, denominator, facility rate, and national rate. The CASPER patient-level QM Reports may contain individual patient information which will provide information related to which patients were included in the quality measures

to identify any potential errors for those measures in which we receive patient-level data. Currently, we do not receive patient-level data on the CDC measure data received via the NHSN system. In addition, we would make other reports available in the CASPER system, such as LTCH CARE Data Set assessment data submission reports and provider validation reports, which will disclose the LTCH's data submission status providing details on all items submitted for a selected assessment and the status of records submitted.

We refer LTCHs to the CDC NHSN system Web site for information on obtaining reports specific to NHSN submitted data at: *http://www.cdc.gov/nhsn/ltach/index.html.* Additional information regarding the content and availability of these confidential feedback reports would be provided on an ongoing basis on our Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html.*

As previously finalized in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49750 through 49752) and illustrated in the second table in section VIII.C.9.c. of the preamble of this final rule, LTCHs will have approximately 4.5 months after the reporting quarter to correct any errors of their assessment-based data (that appear on the CASPER-generated QM reports) and NHSN data used to calculate the measures. During the time of data submission for a given quarterly reporting period and up until the quarterly submission deadline, LTCHs can review and perform corrections to errors in the assessment data used to calculate the measures and can request correction of measure calculations. However, as already established, once the quarterly submission deadline occurs, the data is ''frozen'' and calculated for public reporting and providers can no longer submit any corrections. We encourage LTCHs to submit timely assessment data during a given quarterly reporting period and review their data and information early during the review and correction period so that they can identify errors and resubmit data before the data submission deadline.

As noted above, the assessment data will be populated into the confidential feedback reports, and we intend to update the reports monthly with all data that have been submitted and are available. We believe that the data collection/submission quarterly reporting periods plus 4.5 months to review and correct the data is sufficient time for LTCHs to submit, review and, where necessary, correct their data and information. These timeframes and deadlines for review and correction of such measures and data satisfy the statutory requirement that LTCHs be provided the opportunity to review and correct their data and information and are consistent with the informal process hospitals follow in the Hospital IQR Program.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49753 through 49755), we finalized the data submission/correction and review period. Also, we afford LTCHs a 30-day preview period prior to public display during which LTCHs may preview the performance information on their measures that will be made public. We would like to clarify that we will provide the *preview* report using the CASPER system, with which LTCHs are familiar. The CASPER preview reports inform providers of their performance on each measure which will be publicly reported. Please note that the CASPER preview reports for the reporting quarter will be available after the 4.5 month correction period and the applicable data submission/correction deadline have passed and are refreshed on a quarterly basis for those measures publicly reported quarterly, and annually for those measure publicly reported annually. We proposed to give LTCHs 30 days to review the preview report beginning from the date on which they can access the report.

As already finalized, corrections to the underlying data will not be permitted during this time; however, LTCHs may ask for a correction to their measure calculations during the 30-day preview period. We proposed that if CMS determines that the measure, as it is displayed in the preview report, contains a calculation error, we can suppress the data on the public reporting Web site, recalculate the measure and publish it at the time of the next scheduled public display date. This process is consistent with informal processes used in the Hospital IQR Program. We stated that, if finalized, we intend to utilize a subregulatory mechanism, such as our LTCH QRP Web site, to provide more information about the preview reports, such as when they will be made available and explain the process for how and when providers may ask for a correction to their measure calculations. We invited public comment on these proposals to provide preview reports using the CASPER system, giving LTCHs 30 days review the preview report and ask for a correction, and to use a subregulatory mechanism to explain the process for how and when providers may ask for a correction.

In addition to assessment-based measures and CDC measure data received via the NHSN system, we have also proposed claims-based measures for the LTCH QRP. The claims-based measures include those proposed to meet the requirements of the IMPACT Act as well as the All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from LTCHs (NQF #2512) which was finalized for public display in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49753 through 49755). As noted in above, section 1899B(g)(2) of the Act requires prepublication provider review and correction procedures that are consistent with those followed in the Hospital IQR Program. Under the Hospital IQR Program's informal procedures, for claims-based measures, we provide hospitals 30 days to preview their claims-based measures and data in a preview report containing aggregate hospital-level data. We proposed to adopt a similar process for the LTCH QRP.

Prior to the public display of our claims-based measures, in alignment with the Hospital IQR, HAC Reduction and Hospital VBP Programs, we proposed to make available through the CASPER system, a confidential preview report that will contain information pertaining to claims-based measure rate calculations, for example, facility and national rates. The data and information will be for feedback purposes only and could not be corrected. This information will be accompanied by additional confidential information based on the most recent administrative data available at the time we extract the claims data for purposes of calculating the measures. Because the claims-based measures are recalculated on an annual basis, these confidential CASPER QM reports for claims-based measures will be refreshed annually. As previously finalized in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49753 through 49755), LTCHs will have 30 days from the date the preview report is made available in which to review this information.

The 30-day preview period is the only time when LTCHs will be able to see claims-based measures before they are publicly displayed. LTCHs will not be able to make corrections to underlying claims data during this preview period, nor will they be able to add new claims to the data extract. However, LTCHs may request that we correct our measure calculation if the LTCH believes it is incorrect during the 30-day preview period. We proposed that if we agree that the measure, as it is displayed in the preview report, contains a calculation error, we can suppress the

data on the public reporting Web site, recalculate the measure, and publish it at the time of the next scheduled public display date. This process will be consistent with informal policies followed in the Hospital IQR Program. If finalized, we intend to utilize a subregulatory mechanism, such as our LTCH QRP Web site, to explain the process for how and when providers may contest their measure calculations.

The proposed claims-based measures—The MSPB–PAC LTCH QRP; Discharge to Community-PAC LTCH QRP and Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP—use Medicare administrative data from hospitalizations for Medicare FFS beneficiaries. Public reporting of data will be based on 2 consecutive calendar years of data, which is consistent with the specifications of the proposed measures. We proposed to create data extracts using claims data for the proposed claims based measures—The MSPB–PAC LTCH measure; Discharge to Community-PAC LTCH QRP and Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP—at least 90 days after the last discharge date in the applicable period, which we will use for the calculations. For example, if the last discharge date in the applicable period for a measure is December 31, 2017 for data collection January 1, 2016 through December 31, 2017, we will create the data extract on approximately March 31, 2018 at the earliest, and use that data to calculate the claims-based measures for that applicable period. Since LTCHs will not be able to submit corrections to the underlying claims snapshot nor add claims (for those measures that use LTCH claims) to this data set at the conclusion of the at least 90-day period following the last date of discharge used in the applicable period, at that time we will consider LTCH claims data to be complete for purposes of calculating the claims-based measures.

We proposed that beginning with data that will be publicly displayed in 2018, claims-based measures will be calculated using claims data at least 90 days after the last discharge date in the applicable period, at which time we will create a data extract or snapshot of the available claims data to use for the measures calculation. This timeframe allows us to balance the need to provide timely program information to LTCHs with the need to calculate the claims-based measures using as complete a data set as possible. As noted, under this procedure, during the 30-day preview period, LTCHs will not be able to submit corrections to the underlying claims data or to add new claims to the data extract. This is for two reasons: first, for certain measures, the claims data used to calculate the measures may not be derived from the LTCH's claims, but are from the claims of another provider. For example, the measure Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP uses claims data submitted by the hospital to which the patient was readmitted, which may not be the LTCH. For the claims that are not those of the LTCH, the LTCH cannot make corrections to them. Second, even where the claims used to calculate the measures are those of the LTCH, it will not be not possible to correct the data after it is extracted for the measures calculation. This is because it is necessary to take a static ''snapshot'' of the claims in order to perform the necessary measure calculations.

We seek to have as complete a data set as possible. We recognize that the proposed at least 90 day ''run-out'' period when we would take the data extract to calculate the claims-based measures, is less than the Medicare program's current timely claims filing policy under which providers have up to 1 year from the date of discharge to submit claims. We considered a number of factors in determining that the proposed at least 90 day run-out period is appropriate to calculate the claims-based measures. After the data extract is created, it takes several months to incorporate other data needed for the calculations (particularly in the case of risk-adjusted or episode-based measures). We then need to generate and check the calculations. Because several months lead time is necessary after acquiring the data to generate the claims-based calculations, if we were to delay our data extraction point to 12 months after the last date of the last discharge in the applicable period, we would not be able to deliver the calculations to LTCHs sooner than 18 to 24 months after the last discharge. We believe this would create an unacceptably long delay both for LTCHs and for us to deliver timely calculations to LTCHs for quality improvement.

We invited public comment on these proposals, which are summarized and discussed below.

Comment: One commenter supported CASPER monthly confidential feedback reports.

Response: We appreciate the commenter's support for providing monthly confidential feedback reports.

Comment: Several commenters suggested that LTCHs be able to correct data during the 30-day preview period, and that CMS address any potential issues such as system errors and revise confirmed errors before the calculation results are made public. Commenters further suggested that the 30-day preview period was intended by Congress to enable correction of the data prior to public reporting. In addition, the commenters noted that CMS will be updating the NHSN system to permit changes to the CDC quality data. One commenter recommended that CMS conduct a ''dry run'' in which LTCHs receive confidential preview reports prior to publicly reporting measures so that LTCHs can become familiar with the methodology, understand the measure results, know how well they are performing, and have an opportunity to give CMS feedback on potential technical issues with the measures.

Response: We interpret the commenter to be referring to the preview reports that will be provided prior to public reporting and appreciate their concern about correcting data during the 30-day preview period and addressing any potential issues. Section 1886(m)(5)(E) of the Act requires the Secretary to establish procedures for making the LTCH QRP data available to the public and to ensure that LTCHs have the opportunity to review any such data with respect to the LTCH prior to its release to the public. In addition, section 1899B(g) of the Act, as added by the IMPACT Act, requires the Secretary to establish procedures for making information available to the public regarding the performance of individual PAC providers with respect to IMPACT Act measures beginning no later than two years after the applicable specified application date.

We implemented the 30-day preview period to be consistent with other public reporting programs such as the Hospital IQR Program. We provide opportunity for assessment-based data and NHSN data to be reviewed and corrected prior to their freeze dates, and LTCHs will have up until the run off period ends for ensuring their data used in the claims-based measures are accurate prior to the data file being used to calculate the measures. The 30-day preview period serves as the final opportunity for providers to review their data and alert CMS should they find an error in the measure calculation or any component thereof. While LTCHs will not have the opportunity to correct the underlying data during the 30-day preview period before public display, there will be a process by which LTCHs may request a review of their data should they disagree with quality measure calculations, or the components of such calculations (numerators and denominators), as

displayed on their preview reports. We will also consider suppressing quality reporting data if any systemic issues, such as on the part of the QIES ASAP system or the CDC's NHSN is discovered. We refer readers to the LTCH QRP Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html,* for further information on public reporting, such as the process of accessing reports, and where we will provide an email address should LTCHs have questions regarding any of the above-mentioned reports or processes.

With regard to the commenter's suggestion that we provide a dry run, we wish to convey that we intend to offer providers information related to their measures so that they become familiar with the measure's methodology and can utilize their confidential preview reports which they will receive prior to the public reporting of new LTCH QRP measures. LTCHs will also receive other confidential reports such as the LTCH facility and patient level QM Reports as well as an additional confidential facility-level report to incorporate the quarterly freeze dates, for example, the *Review and Correct* Report. We believe that these various reports will provide an indication on how well the LTCH is performing as well as opportunities to provide CMS feedback on technical issues with the measures. Therefore, no additional dry run period is warranted.

Finally, with regard to the commenter's suggestion that we will be updating the NHSN system to permit changes to the CDC quality data, we interpret the commenter to be suggesting that we are working to update the CDC NHSN submission system, and we wish to clarify that at this time we are not doing so. That said, we also wish to clarify that providers have 4.5 months from the end of a reporting quarter until the freeze date to enter corrections into their CDC HAI measure data prior to the file being transmitted from the CDC to CMS.

Comment: Several commenters recommended that CMS create an *LTCH Compare* Web site to separate LTCH and short-term acute care hospital performance data due to different patient populations and federal requirements. One commenter voiced their concern that LTCHs and short-term acute care hospitals are different venues. LTCHs treat sicker, more medically complex patients and therefore their quality metrics are different. A separate Web page would allow patients, families, and providers to compare quality performance data with other LTCHs and not provide an incorrect impression of the care provided in LTCHs.

Response: We appreciate commenters' suggestion on creating a separate *LTCH Compare* Web site. CMS is currently developing a separate *Compare* Web site for the reporting of LTCH quality measures similar to other PAC provider types. The *LTCH Compare* Web site is scheduled to be publicly available in late fall 2016.

Comment: One commenter suggested providing more frequent updates and requested patient-level data for the claims-based measures.

Response: The decision to update claims-based measures on an annual basis was to ensure that the amount of data received during the reporting period was sufficient to generate reliable measure rates. However, we will explore the feasibility of providing LTCHs with information more frequently. We believe that we are limited in our ability to provide patient-level information that stems from claims submitted by providers other than LTCHs, but we will explore the feasibility of providing patient-level data.

Comment: Several commenters noted that CMS will publish a list of LTCHs that comply with the LTCH QRP each year on its Web site.

Response: We intend to publish a list of LTCHs that comply with the LTCH QRP each year on our Web site, and it will be updated to reflect changes made as a result of appeals.

After consideration of the public comments we received, we are finalizing our proposals related to procedures for the opportunity to review and correct data and information.

15. Mechanism for Providing Feedback Reports to LTCHs

Section 1899B(f) of the Act requires the Secretary to provide confidential feedback reports to PAC providers on their performance to the measures specified under sections 1899B(c)(1) and (d)(1) of the Act, beginning 1 year after the specified application date that applies to such measures and PAC providers. As discussed earlier, the reports we proposed to provide for use by LTCHs to review their data and information will be confidential feedback reports that will enable LTCHs to review their performance on the measures required under the LTCH QRP. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25237 through 25238), we proposed that these confidential feedback reports will be available to each LTCH using the CASPER system. Data contained within these CASPER reports will be updated as previously described, on a monthly basis as the data become available except for our claims-based measures which are only updated on an annual basis.

We intend to provide detailed procedures to LTCHs on how to obtain their confidential feedback CASPER reports on the LTCH QRP Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html.*

We proposed to use the CMS QIES ASAP system to provide quality measure reports in a manner consistent with how providers obtain various reports to date. The QIES ASAP system is a confidential and secure system with access granted to providers, or their designees.

We sought public comment on this proposal to satisfy the requirement to provide confidential feedback reports to LTCHs.

Comment: One commenter encouraged CMS to provide instructions on how to obtain CASPER reports and suggestion training for LTCHs on how to improve their measures via these confidential feedback reports.

Response: We will provide LTCHs with detailed instructions and training regarding how to obtain and interpret these reports. For additional information on this and other training opportunities, please refer to the CMS LTCH Quality Reporting Training Web page at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/LTCH-Quality-Reporting-Training.html.*

After consideration of the public comment we received, we are finalizing our proposal to provide confidential feedback reports to LTCHs as proposed.

D. Inpatient Psychiatric Facility Quality Reporting (IPFQR) Program

1. Background

a. Statutory Authority

Section 1886(s)(4) of the Act, as added and amended by sections 3401(f) and 10322(a) of the Affordable Care Act, requires the Secretary to implement a quality reporting program for inpatient psychiatric hospitals and psychiatric units.

Section 1886(s)(4)(A)(i) of the Act requires that, for FY 2014 [338] and each

[338] The statute uses the term ''rate year'' (RY). However, beginning with the annual update of the inpatient psychiatric facility prospective payment system (IPF PPS) that took effect on July 1, 2011 (RY 2012), we aligned the IPF PPS update with the annual update of the ICD–9–CM codes, effective on October 1 of each year. This change allowed for

subsequent fiscal year, the Secretary must reduce any annual update to a standard federal rate for discharges occurring during the fiscal year by 2.0 percentage points for any inpatient psychiatric hospital or psychiatric unit that does not comply with quality data submission requirements with respect to an applicable fiscal year.

As provided in section 1886(s)(4)(A)(ii) of the Act, the application of the reduction for failure to report under section 1886(s)(4)(A)(i) of the Act may result in an annual update of less than 0.0 percent for a fiscal year, and may result in payment rates under section 1886(s)(1) of the Act being less than the payment rates for the preceding year. In addition, section 1886(s)(4)(B) of the Act requires that the application of the reduction to a standard Federal rate update be noncumulative across fiscal years. Thus, any reduction applied under section 1886(s)(4)(A) of the Act will apply only with respect to the fiscal year rate involved and the Secretary may not take into account the reduction in computing the payment amount under the system described in section 1886(s)(1) of the Act for subsequent years.

Section 1886(s)(4)(C) of the Act requires that, for FY 2014 (October 1, 2013 through September 30, 2014) and each subsequent year, each psychiatric hospital and psychiatric unit must submit to the Secretary data on quality measures as specified by the Secretary. The data must be submitted in a form and manner and at a time specified by the Secretary. Under section 1886(s)(4)(D)(i) of the Act, unless the exception of subclause (ii) applies, measures selected for the quality reporting program must have been endorsed by the entity with a contract under section 1890(a) of the Act. The National Quality Forum (NQF) currently holds this contract.

Section 1886(s)(4)(D)(ii) of the Act provides an exception to the requirement for NQF endorsement of measures: In the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary.

Section 1886(s)(4)(E) of the Act requires the Secretary to establish procedures for making public the data submitted by inpatient psychiatric hospitals and psychiatric units under the IPFQR Program. These procedures must ensure that a facility has the opportunity to review its data prior to the data being made public. The Secretary must report quality measures that relate to services furnished by the psychiatric hospitals and units on the CMS Web site.

b. Covered Entities

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53645), we established that the IPFQR Program's quality reporting requirements cover those psychiatric hospitals and psychiatric units paid under Medicare's IPF PPS (42 CFR 412.404(b)). Generally, psychiatric hospitals and psychiatric units within acute care and critical access hospitals that treat Medicare patients are paid under the IPF PPS. Consistent with prior rules, we continue to use the term ''inpatient psychiatric facility'' (IPF) to refer to both inpatient psychiatric hospitals and psychiatric units. This usage follows the terminology in our IPF PPS regulations at 42 CFR 412.402. For more information on covered entities, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53645).

c. Considerations in Selecting Quality Measures

Our objective in selecting quality measures is to balance the need for information on the full spectrum of care delivery and the need to minimize the burden of data collection and reporting. We have focused on measures that evaluate critical processes of care that have significant impact on patient outcomes and support CMS and HHS priorities for improved quality and efficiency of care provided by IPFs. We refer readers to section VIII.F.4.a. of the FY 2013 IPPS/LTCH PPS final rule (77 FR 53645 through 53646) for a detailed discussion of the considerations taken into account in selecting quality measures.

Before being proposed for inclusion in the IPFQR Program, measures are placed on a list of measures under consideration, which is published annually by December 1 on behalf of CMS by the NQF. In compliance with section 1890A(a)(2) of the Act, measures that we proposed for the IPFQR Program in the proposed rule were included in a publicly available document: ''List of Measures under Consideration for December 1, 2015'' (*http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=81172*). The Measure Applications Partnership (MAP), a multi-stakeholder group convened by the NQF, reviews the measures under consideration for the IPFQR Program, among other Federal programs, and provides input on those measures to the Secretary. The MAP's 2016 recommendations for quality measures under consideration are captured in the following document: ''Process and Approach for MAP Pre-Rulemaking Deliberations 2015–2016—Final Report, February 2016'' (*http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=81599*). We considered the input and recommendations provided by the MAP in selecting all measures for the IPFQR Program, including those discussed below.

2. Retention of IPFQR Program Measures Adopted in Previous Payment Determinations

The current IPFQR Program includes 16 mandatory measures. In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53646 through 53652), we adopted 6 measures for the FY 2014 payment determination and subsequent years. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50889 through 50895), we added 2 measures for the FY 2016 payment determination and subsequent years. In the FY 2015 IPF PPS final rule (79 FR 45963 through 45974), we adopted another 2 measures for the FY 2016 payment determination and subsequent years, and finalized 4 measures for the FY 2017 payment determination and subsequent years. In the FY 2016 IPF PPS final rule (80 FR 46694 through 46714), we removed 1 measure beginning with the FY 2017 payment determination; we also adopted 5 measures and removed 2 measures beginning with the FY 2018 payment determination. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25239), we indicated that we are retaining 15 of these previously adopted measures and proposed to update one measure, as discussed below.

Comment: Many commenters expressed concerns about implementation of the Screening for Metabolic Disorders Transition Record with Specified Elements Received by Discharged Patients (Discharges from an Inpatient Facility to Home/Self Care or

annual payment updates and the ICD–9–CM coding update to occur on the same schedule and appear in the same **Federal Register** document, promoting administrative efficiency. To reflect the change to the annual payment rate update cycle, we revised the regulations at 42 CFR 412.402 to specify that, beginning October 1, 2012, the RY update period would be the 12-month period from October 1 through September 30, which we refer to as a ''fiscal year'' (FY) (76 FR 26435). Therefore, with respect to the IPFQR Program, the terms ''rate year,'' as used in the statute, and ''fiscal year'' as used in the regulation, both refer to the period from October 1 through September 30. For more information regarding this terminology change, we refer readers to section III. of the RY 2012 IPF PPS final rule (76 FR 26434 through 26435).

Any Other Site of Care) (NQF #0647), and Timely Transmission of Transition Record (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0647). Commenters were primarily concerned with the increased burden of data collection associated with these measures. Some commenters were unsure of how to abstract the Transition Record measures and referred to having unanswered questions regarding the technical specifications of these measures, even following CMS Webinars.

Response: The Screening for Metabolic Disorders, Transition Record with Specified Elements Received by Discharged Patients (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0647), and Timely Transmission of Transition Record (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0648) measures were finalized in the FY 2016 IPF PPS final rule (80 FR 46706, 46709 and 46713) for the FY 2018 payment determination and subsequent years with one modification from the proposals. This modification was to only require reporting on the last two quarters of the reporting period (July 1, 2016–December 1, 2016) for the first year these measures were in the IPFQR Program (that is, for the FY 2018 payment determination). In other words, data collection for these measures was scheduled to begin on July 1, 2016.

However, as discussed in the previous comment, we continued to receive stakeholder concerns in response to this proposed rule. In addition, we received many questions regarding how to operationalize these measures during our Webinar on these measures on January 21, 2016. Specifically, during the Webinar there were questions regarding the data elements required for the Transition Record measure, questions regarding what tests would be sufficient, and questions about when the tests should be administered to meet the requirements of the Screening for Metabolic Disorders measure.[339] Following this Webinar, we continued to receive questions directly from stakeholders regarding the operationalization of these measures. These questions continued to focus on uncertainty around data elements required for the Transition Record measures and uncertainty around the specific tests required and associated timeline for the Screening for Metabolic Disorders measure. On June 8, 2016, we provided updated technical specifications for the implementation of Transition Record with Specified Elements Received by Discharged Patients (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0647) and Timely Transmission of Transition Record (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0648). These updated technical specifications are available in the IPFQR Program Manual at: *http://www.qualityreportingcenter.com/wp-content/uploads/2016/06/IPF_CY2016_IPFQRManual_Guide_20160607_FINAL.pdf1_.pdf*. In addition, CMS provided an updated tool for collection of all three measures to assist facilities in data collection and submission.

Due to these updates, we postponed data collection and implementation of these three measures until January 1, 2017 for the FY 2019 payment determination and subsequent years via an IPFQR Program listserv announcement sent on June 9, 2016. This delay is intended to provide IPFs with sufficient time to understand the updated specifications and train personnel to appropriately abstract data based on these updated specifications and use the updated data collection tool for submission. To summarize, we delayed data collection and are not requiring submission of Transition Record with Specified Elements Received by Discharged Patients (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0647), Timely Transmission of Transition Record (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0648) and Screening for Metabolic Disorders for the FY 2018 payment determination. We refer readers to the chart in section VIII.D.5. of the preamble of this final rule for an updated list of measures for the FY 2018 payment determination.

Comment: Several commenters thanked CMS for delaying implementation of Screening for Metabolic Disorders, Transition Record with Specified Elements Received by Discharged Patients (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0647), and Timely Transmission of Transition Record (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0648) until January 1, 2017.

Response: We thank the commenters for their support.

3. Update to Previously Finalized Measure: Screening for Metabolic Disorders

In the FY 2016 IPF PPS final rule (80 FR 46709 through 46713), we finalized our proposal to include the Screening for Metabolic Disorders measure in the IPFQR Program for the FY 2018 payment determination and subsequent years. In that final rule, we described the denominator as IPF patients discharged with one or more routinely scheduled antipsychotic medications during the measurement period. We also listed the following denominator exclusions: (1) Patients for whom a screening could not be completed within the stay due to the patient's enduring unstable medical or psychological condition; and (2) patients with a length of stay equal to or greater than 365 days, or less than 3 days.

In the FY 2016 IPF PPS final rule (80 FR 46717 through 46718), we finalized the CMS global sample methodology for 10 IPFQR Program measures eligible for sampling, including the Screening for Metabolic Disorders measure. Seven of these 10 measures have denominator exclusions for patients with short length of stay within an IPF. Of these 7 measures, the Screening for Metabolic Disorders measure is the only one with an exclusion for less than 3 days; the other 6 all have denominator exclusions for length of stay less than or equal to 3 days. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25239), we proposed to update the length of stay exclusion for the Screening for Metabolic Disorders measure to exclude patients with a length of stay equal to or greater than 365 days, or less than or equal to 3 days. We anticipate that this update will reduce burden on IPFs because it will allow IPFs to use the same sample for as many measures as possible, by aligning the denominator exclusions.

We welcomed public comments on this proposed denominator exclusion.

Comment: Many commenters supported the proposal to change the length of stay exclusion for the ''Screening for Metabolic Disorders'' measure. Several of these commenters noted that this supports the goal of the global sample to reduce provider burden.

Response: We thank the commenters for their support.

After consideration of the public comments we received, we are finalizing our proposal to change the length of stay exclusion for the ''Screening for Metabolic Disorders'' measure to exclude patients with a

[339] Slides from and a Q&A transcript from this Webinar are available at: *https://www.qualitynet.org/dcs/ContentServer?c=Page&pagename=QnetPublic%2FPage%2FQnetTier2&cid=1228773668169*.

length of stay equal to or greater than 365 days, or less than or equal to 3 days. As discussed above, we note that we have delayed measure implementation until January 1, 2017 for the FY 2019 payment determination and subsequent years.

4. New Quality Measures for the FY 2019 Payment Determination and Subsequent Years

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25239 through 25243), we proposed two new measures for the FY 2019 payment determination and subsequent years:

- SUB–3 Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge and the subset measure SUB–3a Alcohol & Other Drug Use Disorder Treatment at Discharge (NQF #1664) (SUB3 and SUB–3a); and
- 30-day all-cause unplanned readmission following psychiatric hospitalization in an IPF.

The sections below outline our rationale for proposing these measures.

a. SUB–3 Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge and the Subset Measure SUB–3a Alcohol & Other Drug Use Disorder Treatment at Discharge (NQF #1664) (SUB–3 and SUB3a)

Individuals with mental illness experience substance use disorders (SUDs) at a much higher rate than the general population.[340] Nearly 18 percent of the 43.6 million adults aged 18 years and older who had a mental illness in 2013 met the criteria for a SUD. Of those who met the criteria for a SUD, 26.7 percent used illicit drugs.[341] Illicit drug use is particularly high among adults with serious mental illnesses.[342] Misuse and abuse of prescription drugs among individuals with mental illnesses, in particular opioids, are also of growing concern.

Individuals with co-occurring mental disorders and SUDs, the combination of one or more mental disorders and one or more SUDs, experience far more physical illnesses and episodes of care than individuals with a single diagnosis.[343] These co-occurring disorders tend to go undetected and untreated, especially among the elderly population, which experiences more adverse effects than the non-elderly adult population.[344] Treatment of only one disorder for individuals who have two or more mental and SUDs often leads to poor functioning and poor treatment compliance that inhibits full recovery, increases the risk of relapse, and can lead to other high-risk illnesses, such as coronary heart disease, diabetes, infections, and respiratory disease.[345] [346] Furthermore, individuals with undetected, untreated or undertreated co-occurring disorders are more likely to experience homelessness, incarceration, additional medical illness, suicide, and early death.[347]

Due to the prevalence of substance abuse among individuals with mental illness, and the negative effects therefrom, we believe it is imperative to assess IPFs' efforts to offer treatment options for patients who screen positive for drug and alcohol use. As described under the Measure Description section of the NQF Web page regarding this measure, the SUB–3 measure includes hospitalized patients age 18 years and older ''who are identified with an alcohol or drug use disorder who receive or refuse at discharge a prescription for FDA-approved medications for alcohol or drug use disorder, OR who receive or refuse a referral for addictions treatment.'' [348] The SUB–3a subset measure includes hospitalized patients age 18 years and older ''who receive a prescription for FDA-approved medications for alcohol or drug use disorder OR a referral for addictions treatment.'' [349] The numerator of the SUB–3 measure includes ''patients who received or refused at discharge a prescription for medication for treatment of alcohol or drug use disorder OR received or refused a referral for addictions treatment.'' [350] The numerator of the SUB–3a subset measure includes ''patients who received a prescription at discharge for medication for treatment of alcohol or drug use disorder OR a referral for addictions treatment.'' [351] The denominators of both the SUB–3 measure and SUB–3a subset measure include ''hospitalized inpatients 18 years of age and older identified with an alcohol or drug use disorder'' subject to a list of exclusions.[352] Further information on this measure, including the denominator exclusions, can be found in the measure detail sheet on the NQF's Web site (*http://www.qualityforum.org/QPS/1664*) or in the section of the Specifications Manual for National Hospital Inpatient Quality Measures on Substance Use Measures at: *http://www.qualitynet.org/dcs/BlobServer?blobkey=id&blobnocache=true&blobwhere=1228890516540&blobheader=multipart%2Foctet-stream&blobheadername1=Content-Disposition&blobheadervalue1=attachment%3Bfilename%3D2.6.2_SUB_v5_1.pdf&blobcol=urldata&blobtable=MungoBlobs*.

We previously adopted the SUB–1 measure (Alcohol Use Screening (NQF #1661)) (78 FR 50890 through 50892) and the SUB–2 (Alcohol Use Brief Intervention Provided or Offered) and the subset measure SUB–2a (Alcohol Use Brief Intervention (NQF #1663)) measure (80 FR 46699 through 46701). While the SUB–1 measure assesses ''hospitalized patients 18 years of age and older who are screened during the hospital stay using a validated screening questionnaire for unhealthy alcohol use,'' [353] the SUB–2 and SUB–2a measure assesses ''hospitalized patients who screened positive for unhealthy alcohol use who received or refused a brief intervention during the hospital stay'' [354] and ''hospitalized patients 18 years and older who received the brief intervention during the hospital stay,'' [355] respectively. The SUB–1 measure and the SUB–2 and SUB–2a measure combined provide a greater understanding of the rate at which patients are screened for potential alcohol abuse and the rate at which those who screen positive accept the offered interventions.

Despite the value created by the inclusion of the SUB–1 measure and the SUB–2 and SUB–2a measure in the IPFQR Program measure set, neither fully captures hospitalized patients 18 years of age and older with other SUDs because these measures focus on alcohol use only. In the past, commenters have urged CMS to include measures related to illicit and opioid drugs in our measure set (80 FR 46701) stating that co-occurring substance use disorders are prevalent in many patients with psychiatric diagnoses and the SUB–3

[355] Ibid.

and SUB–3a measure will ensure that patients continue to receive treatment after discharge.[356] While the SUB–3 and SUB–3a measure does not guarantee that patients would continue to receive treatment for substance use disorders after discharge, the addition of the SUB–3 and SUB–3a measure to the existing measure set would encourage IPFs to offer and provide FDA-approved medication OR a referral for addictions treatment to patients with co-occurring drug or alcohol use disorders at discharge. This measure would also provide information regarding the rate at which these treatment options are accepted by patients. The SUB–3 and SUB–3a measure also provides a fuller picture of the entire episode of care. In addition, aggregated data from the SUB–1 measure, SUB–2 and SUB–2a measure, and the SUB–3 and SUB–3a measure from each IPF would help provide patients with adequate consumer information to guide their decision-making process in selecting a treatment facility, specifically for patients that are diagnosed with a substance use disorder.

Furthermore, we believe that this measure set promotes the National Quality Strategy priority of Effective Prevention and Treatment for leading causes of mortality, starting with cardiovascular disease. It is notable that the high prevalence of SUDs among adults age 65 years and older contributes to serious medical conditions, including cardiovascular disease and liver disease. The proposed measure also supports HHS' Opioid Abuse Reduction Initiative to reduce prescription opioid and heroin related overdose, death, and dependence.[357] We also note that the addition of SUB–3 and SUB–3a in the measure set could encourage interventions and promote prevention of conditions that are associated with alcohol and drug use disorders, including disorders associated with the misuse of prescription drugs.

For these reasons, we included the SUB–3 and SUB–3a measure in our ''List of Measures under Consideration for December 1, 2015'' (*http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=81172*). The MAP provided input on the measure and supported its inclusion in the IPFQR Program in its report ''Process and Approach for MAP Pre-Rulemaking Deliberations 2015–2016—Final Report, February 2016'' available at: *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=81599*. Moreover, this measure is NQF-endorsed for the IPF setting, in conformity with the statutory criteria for measure selection under section 1886(s)(4)(D)(i) of the Act.

Therefore, we proposed to adopt the SUB–3 and SUB–3a measure for the FY 2019 payment determination and subsequent years. We welcomed public comment on this proposal.

Comment: Several commenters supported the inclusion of the SUB–3/3a measure in the IPFQR Program citing reasons including: Encouraging IPFs to offer and provide addiction treatment for patients with co-occurring drug or alcohol disorders; helping to ensure patients continue to receive treatment after discharge; and complementing the SUB–1, SUB–2/2a measure set. One commenter observed that the requirements for this measure, as outlined in the proposed rule, seem reasonable for IPFs.

Response: We thank the commenters for their support.

Comment: Several commenters recommended enhancing the SUB–3a measure. For example, commenters suggested referral to evidence-based behavioral therapies which complement Medication Assisted Therapy (MAT) or discharge to counties for assessment for care evaluation be included in the numerator of this measure.

Response: We thank these commenters for their suggestions. When feasible and practicable, we consider that it is important to implement measures as they are specified, especially after measures are NQF-endorsed. We encourage commenters to suggest these changes to the measure's steward, The Joint Commission, so that any changes to the measure can be properly specified, tested, and endorsed for these changes as part of the measure maintenance process.

Comment: Many commenters recommended that CMS not adopt SUB–3 and SUB–3a for the IPFQR Program, citing concerns that these measures are not specified for IPFs, they are not related to the primary reason patients seek IPF care, they evaluate patient compliance rather than quality of care, and they do not provide useful public information as they are not based on evidence-based practices.

Response: As we stated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50891), although the SUB measures were developed using all hospitalizations in general acute care, the SUB–3/3a measure is equally applicable to freestanding IPFs and psychiatric units within acute care hospitals because substance use disorders (SUDs) are a common comorbidity for populations hospitalized in these settings and offering SUD treatment at discharge when a comorbid SUD has been identified is a part of high quality care regardless of the treatment setting. In addition, we note that the NQF has endorsed this measure for both the Hospital/Acute Care Facility setting and the Behavioral Health/Psychiatric: Inpatient setting. Furthermore, we maintain that it is important that providers understand gaps in patient compliance so they can modify their discharge processes to influence and encourage compliance. We believe that this measure will provide information regarding the rate at which these treatment options are offered to and accepted by patients who screened positive for drug and alcohol use disorders and may present an opportunity to improve treatment rates. In addition, the aggregated data from the SUB–1 measure, SUB–2 and SUB–2a measure, and the SUB–3 and SUB–3a measure from each IPF will provide patients with important consumer information to guide their decision-making process in selecting a treatment facility. Furthermore, we note that the MAP supported this measure for the IPFQR Program and refer readers to their final recommendations at: *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=81593*.

Comment: Several commenters recommended that CMS not adopt SUB–3 and SUB–3a for the IPFQR Program, citing concerns that these measures are not consistent with the screening and treatment provided by IPFs. These commenters observed that IPFs provide a more comprehensive screening than required by the SUB measures, and that treatment is more intensive than that required by the measure.

Response: We note that the SUB–3/3a measure is focused on a facility's discharge procedures for patients who screened positive for an SUD during their stay in the IPF. This measure does not address inpatient treatment provided by the IPF during the patient's stay. We believe that offering patients who have screened positive for SUD a prescription for medication for treatment of alcohol or drug use disorder or a referral for addictions treatment represents a minimum standard for discharge and we expect that IPFs which provide more intensive interventions than described in the measure will meet the criteria for this measure.

[356] 80 FR 46701.

[357] ASPE. ''Opioid Abuse in the U.S. and HHS Actions to Address Opioid-Drug Related Overdoses and Deaths.''

Comment: One commenter recommended that CMS not adopt SUB–3 and SUB–3a for the IPFQR Program, citing concerns that treatment for SUD is more appropriate for the non-acute setting. This commenter acknowledged that screening for these disorders is appropriate for the acute setting.

Response: We thank the commenter for the support of screening for SUD in the inpatient setting. We would like to clarify that the numerator for SUB–3 is ''The number of patients who received or refused at discharge a prescription for medication for treatment of alcohol or drug use disorder OR received or refused a referral for addictions treatment;'' and the numerator for SUB–3a is ''The number of patients who received a prescription at discharge for medication for treatment of alcohol or drug use disorder OR a referral for addictions treatment.'' We note that this measure is focused on inpatient facilities providing patients with the appropriate tools for continuing or beginning treatment for SUD after discharge in the non-acute setting. Furthermore, as stated above, we note that the MAP supported this measure for the IPFQR Program and we refer readers to their final recommendations at: *http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=81593*. We also note that the NQF endorsed this measure for the following care settings: Behavioral Health/Psychiatric: Inpatient, Hospital/Acute Care Facility.[358]

Comment: Several commenters recommended that CMS not adopt SUB–3 and SUB–3a for the IPFQR Program until CMS has demonstrated that this is an area with variation across IPFs, as all IPFs should already be meeting the criteria for this measure, and therefore the measure will not demonstrate meaningful variation across providers.

Response: We agree with the commenters that SUB–3 and SUB–3a represent the standard of care for SUD treatment and referral within the IPF setting. However, based on the data published on *Hospital Compare* for the 2016 Program year, there is significant variation in facility performance on the SUB–1 measure (Alcohol Use Screening), the only SUB measure for which data are currently available for the IPFQR Program. Facility performance ranges between 0.0 percent and 100.0 percent, with a mean performance of 77.4 percent and a coefficient of variance of 0.35. Because the SUB–3/3a measure depends on the identification of alcohol and substance abuse disorders, IPF performance on the SUB–1 measure indicates that there is likely variation in performance across providers on the SUB–3/3a measure as well.

Comment: One commenter expressed concern that this measure may create an incentive for hospitals to refer patients to treatment for which the patients do not have coverage, such as Partial Hospitalization Programs and Intensive Outpatient Programs.

Response: We understand the commenter's concern regarding affordability of treatment. We agree that IPFs should consider patient's insurance coverage and cost of care when providing referrals.

Comment: One commenter expressed concern that addition of a chart-abstracted measure to the IPFQR Program is too burdensome for IPFs because they are already updating processes for other measures.

Response: We appreciate the commenter sharing its thoughts on the burden of data collection. We believe that the requirements associated with reporting on this measures strike a reasonable balance between IPF burden and providing useful information to IPFs, CMS, and the public on the quality of care provided in IPFs.

After consideration of the public comments we received, we are finalizing our proposal to adopt both SUB–3: Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge and subset measure SUB–3a: Alcohol & Other Drug Use Disorder Treatment at Discharge (NQF #1664) for the FY 2019 payment determination and subsequent years as proposed.

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53657 through 53658) and FY 2014 IPPS/LTCH PPS final rule (78 FR 50901 through 50902), we finalized policies for population, sampling, and minimum case thresholds. In the FY 2016 IPF PPS final rule, we made one change to these requirements (80 FR 46717 through 46719) in finalizing a policy in which IPFs may take one, global, sample for all measures for which sampling is permitted. This policy was adopted to decrease burden on IPFs and streamline policies and procedures. We also refer readers to section VIII.D.8.c. of the preamble of this final rule for additional information about population and sampling requirements.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25240), we proposed to allow sampling for the SUB–3 and SUB–3a measure and proposed to include the SUB–3 and SUB–3a measure in the list of measures covered by the global sample. We welcomed public comment on this proposal.

We did not receive any public comments on this proposal. Therefore, for the reasons discussed above, we are finalizing our proposal to include SUB–3: Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge and subset measure SUB–3a: Alcohol & Other Drug Use Disorder Treatment at Discharge (NQF #1664) in the list of measures covered by the global sample for the FY 2019 payment determination and subsequent years as proposed.

b. 30-Day All-Cause Unplanned Readmission Following Psychiatric Hospitalization in an IPF

The MAP, composed of national stakeholders, identified readmissions as a key gap area in the IPFQR Program in a January 2015 report.[359] A goal of the CMS Quality Strategy is to ''promote effective communication and coordination of care'' across different care settings and providers. In addition, readmission following discharge from IPFs is undesirable for patients because readmissions represent a deterioration in patients' mental and/or physical health status. Furthermore, an analysis of Medicare claims data for calendar years 2012 and 2013 showed that among the 716,174 IPF admissions for Medicare beneficiaries, more than 20 percent resulted in readmission to an IPF or a short-stay acute care hospital within 30 days of discharge.[360] Risk-standardized readmission rates ranged from 11 percent to 35 percent, indicating wide variation across IPFs and clear opportunity for improvement. Finally, MedPAC estimates of Medicare payments to IPFs in 2012 indicated that the average payment per discharge was nearly $10,000.[361] Therefore, reducing readmissions would substantially reduce costs. For these reasons, we developed a facility-level outcome measure of all-cause, unplanned

[358] For detailed measure information, we refer readers to: *http://www.qualityforum.org/QPS/1664*.

readmissions following discharge from a qualifying IPF admission. This measure would provide an important indicator of the quality of care patients receive in the IPF setting.

Although not all readmissions are preventable, there is evidence that improvements in the quality of care for patients in the IPF setting can reduce readmission rates which, in turn, would reduce costs to Medicare and the burden to patients and their caregivers. For example, a study of 30-day behavioral health readmissions using a multistate Medicaid database found that connecting patients to services they will need post-discharge can help prevent readmissions. A 1-percent increase in the percentage of patients receiving follow-up care within 7 days of discharge was associated with a 5 percent reduction in the probability of being readmitted.[362] Other studies have also found that transitional interventions such as pre- and post-discharge patient education, structured needs assessments, medication reconciliation/education, transition managers, and inpatient/outpatient provider communication have been effective in reducing early psychiatric readmissions. A systematic review of such interventions observed reductions of 13.6 percent to 37.0 percent of readmissions.[363]

The proposed readmission measure would complement the portfolio of facility-level, risk-standardized readmission measures in the acute care setting that CMS quality reporting and pay-for-performance programs currently use. These programs include, among others, the Hospital IQR Program, which requires facilities to report on condition-specific risk-standardized readmission measures (including Acute Myocardial Infarction (AMI), Heart Failure (HF), Pneumonia, and elective Hip/Knee replacements, among others).[364] In addition, the Hospital IQR Program requires reporting on a Hospital-Wide All-Cause Unplanned Readmissions measure (READM–30–HWR) as finalized in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53521 through 53528). The Hospital Readmissions Reduction Program, a pay-for-performance program for subsection (d) hospitals or hospitals paid under section 1814(b)(3) of the Act, also uses risk-standardized condition-specific readmission measures (including AMI, HF, and Pneumonia, among others).[365]

The proposed IPF readmission measure, 30-day all-cause unplanned readmission following psychiatric hospitalization in an IPF, estimates a facility-level, risk-standardized readmission rate for unplanned, all-cause readmissions within 30 days of discharge from an IPF. Detailed information about the development of this measure as well as final measure specifications can be downloaded from the CMS Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/CallforPublicComment.html#17* (on this page, the file is listed as ''Inpatient Psychiatric Facility (IPF) Outcome and Process Measure Development and Maintenance'' under ''Downloads.'') The denominator for this measure includes Medicare FFS beneficiaries aged 18 years and older who are admitted to and discharged alive from an IPF with a principal diagnosis of a psychiatric disorder. Admissions to IPFs for nonpsychiatric disorders, which account for only 1.1 percent of admissions, were not included in the measure cohort because IPFs are expected to admit patients who need inpatient care for psychiatric causes.[366] Therefore, nonpsychiatric admissions could represent either admissions that were initiated for presumed or preliminary psychiatric diagnoses but later were changed to nonpsychiatric primary diagnoses during the admission or admissions with unreliable data.

Eligible index admissions require enrollment in Medicare Parts A and B for 12 months prior to the index admission, the month of admission, and at least 30 days post-discharge. Admissions to IPFs are excluded from the denominator if any of the following apply:

- Subsequent admission on day of discharge (Day 0) or within 2 days post-discharge (Day 1-Day 2) due to transfers to another inpatient facility on Day 0 or 1 or billing procedures for interrupted stays, which do not allow for identification of readmissions to the same IPF within 3 days;
- Patient discharged against medical advice (AMA) because the provider would not have an opportunity to provide optimal care; and
- Unreliable patient data (for example, has a death date but also admission afterwards).

The numerator for the IPF readmission measure is defined as any admission to an IPF or acute care hospital that occurs on or between days 3 and 30 post-discharge, except those considered planned by the CMS Planned Readmission Algorithm, Version 3.0.[367] The all-cause, unplanned, 30-day readmission rate is harmonized with other readmission measures that are endorsed by NQF and in use by CMS programs. For the timeframe for measurement, literature supports the connection between 30-day readmissions and the quality of care provided during the index admission.[368] [369] [370] [371] [372] This timeframe also supports interventions that have been developed on a wide range of patient populations that focus on reducing 30-day readmission rates.[373] [374] [375] [376] [377] Finally, a

workgroup of relevant clinical experts agreed that the 30-day time period captures complications that may be attributable to the IPF.

An all-cause readmission rate was selected because it promotes a holistic approach to the treatment of patients with psychiatric disorders, who often have comorbid medical conditions. From the patient and caregiver perspective, these readmissions indicate a deterioration in the patient's condition. In addition, the relationship between principal discharge diagnosis of the index admission and the principal discharge diagnosis of the readmission may be complex and difficult to determine based only on principal diagnosis codes. For example, a patient discharged with bipolar disorder may be readmitted because of a suicide attempt or self-harm due to poorly controlled symptoms of bipolar disorder. A measure that looks only for readmissions with principal discharge diagnoses of bipolar disorder would miss these readmissions.

The IPF readmission measure uses Medicare FFS claims and enrollment data over a 24-month measurement period to calculate the measure results. Twenty-four months was determined to provide an adequate number of cases and reliable results. Because this measure is not limited to a single diagnosis, a 24-month measurement period gives sufficient sample size. The IPF measure had 4.2 percent of IPFs with fewer than 25 cases in the 24-month measurement period from January 2012 to December 2013. For comparison, the HWR measure had 3.8 percent of hospitals with fewer than 25 cases in the 12-month measurement period from July 2013 to June 2014.

We recognize that the risk of readmission is influenced by patient factors, so the measure is risk-adjusted to account for differences in the patients served across IPFs. Hierarchical logistic regression is used to estimate a risk standardized readmission rate for each facility. Factors considered in the risk-adjustment model include patient demographics, principal discharge diagnoses of the index admission, comorbidities in claims during the 12 months prior to the index admission or during the index admission with the exception of complications of care, and several risk variables specific to the IPF patient population. Risk factors were selected for inclusion in the final risk model if they were positively selected at least 70 percent of the time in a stepwise backward elimination process. The final risk model includes age, gender, 13 principal discharge diagnosis Agency for Healthcare Research and Quality (AHRQ) Clinical Classification Software (CCS) categories, 38 comorbidity CMS Hierarchical Condition Categories (CC), history of discharge against medical advice, history of suicide or self-harm, history of aggression, and the hospital as a random effect. For more information about factors used in calculating the risk-standardized readmission rate, we refer readers to the CMS Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/CallforPublicComment.html#17*. (On this page, the file is listed as ''Inpatient Psychiatric Facility (IPF) Outcome and Process Measure Development and Maintenance'' under ''Downloads.'')

We understand the importance of the role that sociodemographic status plays in the care of patients. However, we continue to have concerns about holding hospitals to different standards for the outcomes of their patients of diverse sociodemographic status because we do not want to mask potential disparities or minimize incentives to improve the outcomes of disadvantaged populations. We routinely monitor the impact of sociodemographic status on hospitals' results on our measures.

The NQF is currently undertaking a 2-year trial period in which new measures and measures undergoing maintenance review will be assessed to determine if risk-adjusting for sociodemographic factors is appropriate. This trial entails temporarily allowing inclusion of sociodemographic factors in the risk-adjustment approach for some performance measures. At the conclusion of the trial, NQF will issue recommendations on future permanent inclusion of sociodemographic factors. During the trial, measure developers are encouraged to submit information such as analyses and interpretations, as well as performance scores with and without sociodemographic factors in the risk adjustment model. Several measures developed by CMS have been brought to NQF since the beginning of the trial. CMS, in compliance with NQF's guidance, has tested sociodemographic factors in the measures' risk models and made recommendations about whether or not to include these factors in the endorsed measure. We intend to continue engaging in the NQF process as we consider the appropriateness of adjusting for sociodemographic factors in our outcome measures.

Furthermore, the Office of the Assistant Secretary for Planning and Evaluation (ASPE) is conducting research to examine the effect of sociodemographic status on quality measures, resource use, and other measures under the Medicare program, as directed by the IMPACT Act. We will closely examine the findings of the ASPE reports and related Secretarial recommendations and consider how they apply to our quality programs at such time as they are available.

As part of the measure development process for this measure, we solicited public comments on the measure via the CMS Public Comment Web page. As part of our comment solicitation, we provided the Measure Information Form (MIF), Data Dictionary, and the Measure Technical Report to the public to inform their review of the measure. We accepted public comments from November 25, 2015 through December 11, 2015. The significant majority of stakeholders who provided comments on the measure design supported this measure because of the importance of measuring readmissions in this population. Commenters who provided input on the methodology agreed that it appears to be scientifically acceptable, and those who provided input on the feasibility agreed with our belief that the measure is feasible as designed. After review and evaluation of all the public comments received, we did not identify any areas in which the measure needed to be modified. For specific information regarding the comments we received, we refer readers to the CMS Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/MMS/CallforPublicComment.html#17*. (On this page, the file is listed as ''Inpatient Psychiatric Facility (IPF) Outcome and Process Measure Development and Maintenance'' under ''Downloads.'')

While section 1886(s)(4)(D)(ii) of the Act authorizes the Secretary to specify a measure that is not endorsed by NQF, the proposed IPF readmission measure was submitted to NQF for endorsement on January 29, 2016, and we anticipate the measure will receive endorsement prior to the release of the final rule. However, the exception to the requirement to specify an endorsed measure states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization. We have reviewed NQF-endorsed and other consensus-endorsed measures related to all-cause unplanned readmissions and believe that none are

appropriate to the inpatient psychiatric setting. Therefore, no equivalent readmission measure that is endorsed by a consensus organization is available for use in the IPFQR Program.

For the reasons stated above, we proposed the IPF readmission measure described in this section for the FY 2019 payment determination and subsequent years. We welcomed public comment on this proposal.

Comment: A few commenters supported inclusion of the Thirty-Day All-Cause Unplanned Readmission Following Psychiatric Hospitalization in an IPF measure in the IPFQR Program.

Response: We thank the commenters for their support.

Comment: Many commenters recommended that CMS postpone adoption of the 30-Day All-Cause Unplanned Readmission Following Psychiatric Hospitalization in an IPF measure until it has been NQF endorsed and risk-adjusted for sociodemographic factors. Several commenters observed that some IPFs treat a disproportionate share of disadvantaged patients, and that sociodemographic factors influence the IPF's ability to manage chronic psychiatric conditions. Other commenters observed that this measure may reflect on community resources, such as availability of outpatient treatment, rather than IPF quality. One commenter asked that CMS provide additional detail on the variables included in the risk-adjustment algorithm for this measure.

Response: We appreciate the commenters' concern for appropriate risk adjustment and NQF endorsement. We note that this measure (MUC15–1082) was included on the ''List of Measures Under Consideration for December 1, 2015'' (*http://www.qualityforum.org/WorkArea/linkit.aspx?LinkIdentifier=id&ItemID=81172*) that is used by the MAP to consider measures for use in CMS programs. The MAP noted the importance of addressing readmissions for patients admitted for psychiatric disorders and conditionally supported this measure for use in the IPFQR Program, pending NQF review, including the examination of SDS risk factors, and endorsement. We refer readers to *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=75367* (on this site download ''MAP 2015–2016 Preliminary Recommendations'' or ''MAP 2016 Considerations for Implementing Measures Draft Report'') for additional information on the MAP consideration and recommendations.

The 30-Day All-Cause Unplanned Readmission Following Psychiatric Hospitalization in an IPF measure was submitted to NQF for consideration on January 29, 2016. As part of the submission, we evaluated the impact and appropriateness of including sociodemographic status (SDS) factors in the risk model; as part of the NQF SDS 2-year trial described earlier. The domains of SDS risk factors that were considered for inclusion in the risk model were income, education, and access to care.

While most SDS risk factors had an association with readmission in the univariate models, it is worth noting that SDS risk factors indicating that a patient resides in a mental health or primary care shortage area were associated with lower risk of readmission, contrary to the commenters concern that readmissions would be increased in these settings. Another noteworthy finding was that the association between readmission and all of the SDS risk factors was attenuated once clinical variables were added to the risk model. Therefore, when we compared the results of a model with both SDS risk factors and clinical risk factors to one with only clinical risk factors we found that the inclusion of SDS risk factors did not improve model performance. Because of the negligible impact on model performance, the complexity of operationalizing variables that utilize census-level data, and concerns about the potential to partially mask a quality signal, these factors were not included in the final risk model for the measure as submitted to the NQF. For more detail about the SDS risk factors that were considered and the results of the analyses we refer readers to the NQF Supplemental Document for this measure, available at: *http://www.qualityforum.org/ProjectTemplateDownload.aspx?SubmissionID=2860*.

The NQF Committee met on June 9, 2016 to consider the measure for endorsement. During this meeting, the committee reviewed the measure testing results, which included the SDS evaluation as discussed above, and final measure specifications with adjustment for clinical risk factors. Ninety-five percent of the committee members voted in support of the measure as specified in the final technical report without inclusion of SDS factors in the risk model.[378] Review for a final NQF endorsement decision is anticipated in the fall of 2016. The complete NQF submission with the results of the SDS testing and final technical report is located at the following link: *http://www.qualityforum.org/ProjectTemplateDownload.aspx?SubmissionID=2860*.

Comment: A few commenters expressed concerns because the measure is not risk-adjusted for involuntary admissions. One commenter recommended that CMS evaluate stratification by IPFs that are designated for involuntary patients and those that are not.

Response: We appreciate the commenters' concerns relating to the impact of involuntary admissions on readmission rates and evaluated this as a risk factor during measure development. Patients admitted involuntarily, as assessed by an indication in the claims data, accounted for 3 percent of all IPF admissions and had a lower unadjusted readmission rate than the general IPF patient population (17 percent compared to 19 percent, respectively). Based on these findings, the measure development expert workgroup,[379] convened by the measure development team, concluded that the ''involuntary'' admission indicator in the claims data does not capture all incidences of involuntary admissions and might, therefore, result in erroneous associations. However, we will take the suggestion to stratify the measure results by IPFs that are and are not designated for involuntary admission into consideration for the future.

Comment: Many commenters recommended that CMS not adopt the 30-Day All-Cause Unplanned Readmission Following Psychiatric Hospitalization in an IPF measure citing concerns that inclusion of all-cause readmissions in this measure may unfairly reflect on IPFs for unrelated readmissions and that the inclusion of these readmissions may impact the ability of IPFs to use the measure results for quality improvement. One commenter expressed concern that CMS has not appropriately studied the link between psychiatric admissions and acute care readmissions.

Response: We appreciate the commenters' views. This measure evaluates an all-cause, unplanned readmission rate in order to capture adverse events experienced by patients following discharge from an IPF. There are several reasons to measure both psychiatric and nonpsychiatric readmissions following psychiatric admissions: (1) The measure will encourage improved integration of

[378] The transcript from this discussion is available at: *http://www.qualityforum.org/ProjectMaterials.aspx?projectID=80625*. For information on this measure, see Day 2 of the transcript.

[379] *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*. (The Technical Report can be downloaded from the ''Inpatient Psychiatric Facility Readmission Measure'' folder).

physical and behavioral health care, which is important for adults living with serious mental illness because they die on average 25 years earlier than the general population, largely due to preventable conditions, such as cardiovascular disease, diabetes, and infectious diseases;[380] (2) readmissions, regardless of cause, are disruptive to patients and their families or caregivers;[381] (3) readmission due to medical conditions may actually be related to the previous psychiatric index admission (for example, a patient may be readmitted for a hip fracture that was caused by adverse effects of psychotropic medications prescribed by the IPF, or a patient with poorly managed depression may neglect management of his/her comorbid diabetes);[382] and (4) the designation of the principal versus secondary diagnosis may be somewhat arbitrary making it difficult to determine if the readmission is related to the previous psychiatric treatment, especially if patients present with complex problems that involve both mental and physical issues (for example, using 2012–2013 Medicare fee-for-service claims data, 93 percent of readmissions to an acute care hospital with a non-psychiatric diagnosis following discharge from an IPF had a secondary diagnosis of mental illness).

Reporting an all-cause readmission rate will provide quality improvement teams within IPFs with a more complete picture of their patients' recovery than if the readmission rate included a more limited set of post-discharge admission events (for example, only psychiatric readmissions). We believe this information would help IPFs improve quality at their facilities.

We also note that we have aligned and harmonized this measure with the Hospital-Wide Readmission measure previously adopted in the Hospital IQR Program to measure all-cause readmissions.[383] This will allow for easier interpretation of measure rates, especially among IPFs that are part of larger hospital systems.

Comment: Several commenters recommended against adoption of the 30-Day All-Cause Unplanned Readmissions Following Psychiatric Hospitalization in an IPF measure citing concerns with the validity of the evidence for this measure. Specifically, they expressed concern that the chronic nature of some psychiatric and substance use disorders may necessitate readmissions within 30 days in some instances. Furthermore, many of these commenters noted that not all strategies to reduce readmissions in Medicare patients are available to this disabled subset of Medicare patients.

Response: We appreciate the commenters' concerns and recognize that some readmissions are unavoidable. However, we note that there have been improvements in all-cause readmission rates among patients admitted to the hospital setting for conditions evaluated by readmission measures adopted by CMS.[384]

While not all interventions to reduce readmissions in the hospital setting may be applicable to this disabled patient population, the evidence supporting processes that can be adopted by IPFs to influence readmission rates in this population is robust and valid. Specifically, we noted several interventions cited in the technical report that were identified from clinical guidelines and systematic reviews of multiple studies[385] involving patients with chronic psychiatric conditions (for example, administering evidence-based treatments to patients with bipolar disorder and discharge planning in mental health). Many of the interventions, such as connecting patients to intensive case management, are specifically targeted toward patients with severe mental disability.

Furthermore, the NQF committee that reviewed this measure in June 2016 agreed that the evidence sufficiently supported this measure with 95 percent of steering committee members in agreement that it passed the ''importance'' criterion, which includes a review of the validity of the evidence.[386]

Comment: One commenter's support for the adoption of the Thirty-Day All-Cause Unplanned Readmissions Following Psychiatric Hospitalization in an IPF measure was contingent on the measure having been tested for validity and reliability.

Response: We tested for validity and reliability as part of the measure development process. We refer readers to the technical report for this measure, which includes a detailed description of the validity and reliability testing. This report can be found at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html.* (The Technical Report can be downloaded from the ''Inpatient Psychiatric Facility Readmission Measure'' folder.)

Comment: Several commenters requested information about the sample size for the measure and recommended reducing the lag between claims being generated by facilities and public reporting.

Response: Public reporting of claims-based measures requires some lag time to ensure that the measure is calculated on final action claims and includes a long enough timeframe to ensure most facilities have enough cases to calculate reliable measure rates. The readmission measure for the IPFQR Program uses a measurement period of 24 months. Consistent with readmissions measures for other programs, the 30-Day All-Cause Readmission Following Psychiatric Hospitalization in an IPF will be publicly reported on *Hospital Compare* for IPFs that meet a case threshold of 25 cases per measurement period. With a 2-year measurement period, 96 percent of IPFs would have enough cases for public reporting. For comparison, the Hospital-Wide Readmission measure in the Hospital IQR Program, is able to report rates for 96 percent of hospitals with a one-year measurement period.[387]

Comment: Many commenters requested that CMS address how the planned readmission algorithm was adapted for psychiatric patients.

Response: We carefully considered how to identify appropriate planned

[387] This measure was adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53521 through 53528). Technical specifications for this measure are available at: *http://altarum.org/sites/default/files/uploaded-publication-files/Rdmsn_Msr_Updts_HWR_0714_0.pdf.*

readmissions following discharge from an IPF. We convened a workgroup of clinical experts to review the existing planned readmission algorithm, which is used by the Hospital-Wide Readmission measure in the acute care setting,[388] which excludes planned procedures and select diagnoses from the readmission outcome, in the context of patients discharged with psychiatric illness. The expert workgroup convened to inform measure development confirmed that the algorithm was appropriate for use in the IPF setting because readmissions for the planned procedures and select diagnoses would also be considered planned among patients discharged with a psychiatric diagnosis in the previous 30 days. The workgroup carefully evaluated electroconvulsive therapy (ECT) (ICD–9–CM 94.26 and 94.27), which is the only potentially planned procedure in the algorithm that is specifically to treat psychiatric conditions and confirmed that it was appropriately categorized as potentially planned by the algorithm. This therapy accounts for over 40 percent of all potentially planned procedures in this patient population.[389] Information on the planned readmission algorithm specifications and testing for use in this measure is located in the technical report at the following link: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/HospitalQualityInits/Measure-Methodology.html*.

Comment: Several commenters expressed concern that CMS would impose a penalty based on performance on the 30-Day All-Cause Unplanned Readmission Following Psychiatric Hospitalization in an IPF while not providing adequate financial resources to improve and expand outpatient services.

Response: We understand the commenter's concerns regarding payment policies for treatment of psychiatric illness in the outpatient setting; however, outpatient payment is beyond the scope of this proposed rule. Moreover, the IPFQR Program does not penalize IPFs based on performance; it is a pay for reporting program.

After consideration of the public comments we received, we are finalizing the 30-Day All-Cause Unplanned Readmission Following Psychiatric Hospitalization in an IPF measure for the FY 2019 payment determination and subsequent years as proposed.

5. Summary of Finalized Measures for the FY 2018 Payment Determination and Subsequent Years and for the FY 2019 Payment Determination and Subsequent Years

The measures that we have previously finalized for the FY 2018 payment determination and subsequent years are set forth in the table below. We note that this table does not include Screening for Metabolic Disorders, Transition Record with Specified Elements Received by Discharged Patients (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0647), and Timely Transmission of Transition Record (Discharges from an Inpatient Facility to Home/Self Care or Any Other Site of Care) (NQF #0648) because we have postponed these measures until the FY 2019 payment determination and subsequent years, as discussed in section VIII.D.2. of the preamble of this final rule.

FINALIZED MEASURES FOR FY 2018 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

NQF #	Measure ID	Measure
0640	HBIPS–2	Hours of physical restraint use.
0641	HBIPS–3	Hours of seclusion use.
0560	HBIPS–5	Patients discharged on multiple antipsychotic medications with appropriate justification.
0576	FUH	Follow-Up After Hospitalization for Mental Illness.
1661	SUB–1	Alcohol Use Screening.
1663	SUB–2 and SUB–2a	Alcohol Use Brief Intervention Provided or Offered and the subset measure Alcohol Use Brief Intervention.
1651	TOB–1	Tobacco Use Screening.
1654	TOB–2 and TOB–2a	Tobacco Use Treatment Provided or Offered and the subset measure Tobacco Use Treatment.
1656	TOB–3 and TOB–3a	Tobacco Use Treatment Provided or Offered at Discharge and the subset measure Tobacco Use Treatment at Discharge.
1659	IMM–2	Influenza Immunization.
N/A	N/A	Influenza Vaccination Coverage Among Healthcare Personnel.
N/A	N/A	Assessment of Patient Experience of Care.
N/A	N/A	Use of an Electronic Health Record.

The new measures that we are finalizing for the IPFQR Program for the FY 2019 payment determination and subsequent years are set forth in the table below.

FINALIZED NEW IPFQR PROGRAM MEASURES FOR THE FY 2019 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

National quality strategy priority	NQF #	Measure ID	Measure
Effective Treatment and Prevention.	1664	SUB–3 and SUB–3a	SUB–3 Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge and SUB–3a Alcohol & Other Drug Use Disorder Treatment at Discharge.
Communication/Care Coordination.	N/A (Under review for endorsement).	N/A	30-Day All-Cause Unplanned Readmission Following Psychiatric Hospitalization in an IPF.

[388] Ibid.

[389] Calculated from Medicare fee-for-service administrative claims data from 2012–2013.

For the IPFQR Program, the total number of measures for the FY 2019 payment determination and subsequent years is 18, as set forth in in the table below.

FINALIZED MEASURES FOR FY 2019 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

NQF #	Measure ID	Measure
0640	HBIPS–2	Hours of physical restraint use.
0641	HBIPS–3	Hours of seclusion use.

* New measures finalized for the FY 2019 payment determination and future years.
** Measures previously finalized for the FY 2018 payment determination and subsequent years, but postponed to FY 2019 payment determination and subsequent years through a subregulatory process described in section VIII.D.2. of the preamble of this final rule.

6. Possible IPFQR Program Measures and Topics for Future Consideration

As we have indicated in prior rulemaking (79 FR 45974 through 45975), we seek to develop a comprehensive set of quality measures to be available for widespread use for informed decision-making and quality improvement in the IPF setting. Therefore, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25243), we stated that through future rulemaking, we intend to propose new measures for adoption that will help further our goals of achieving better health care and improved health for Medicare beneficiaries who obtain inpatient psychiatric services through the widespread dissemination and use of quality information.

We welcomed public comments on possible new measures.

Comment: One commenter recommended moving to electronic clinical quality measures (eCQMs) to reduce burden on providers.

Response: We agree that moving to eCQMs is important and will ultimately reduce burden. At this time, we are not operationally able to implement eCQM reporting, not all of our measures are electronically specified, and not all IPFs have EHRs for collection of eCQM data. However, we continue to work toward transitioning to electronic eCQMs in the future.

Comment: Several commenters recommended that CMS develop and adopt an additional measure for identifying individuals with substance use disorders. Some of these commenters specifically suggested that CMS evaluate HBIPS–1 for adoption in the IPFQR Program.

Response: We thank these commenters for their suggestions and will consider measures for identifying individuals with substance use disorders, such as the HBIPS–1 measure in the future.

Comment: Many commenters recommended that CMS focus on measures that are meaningful to patients. Some commenters recommended that CMS only adopt measures specifically associated with the primary reasons that patients seek care from an IPF.

Response: We agree with the commenters that the IPFQR Program should focus on measures that are meaningful to patients. However, we continue to believe that there also is value in including measures that are not directly tied to the reason that the patient seeks care from an IPF, such as those reflecting professional standards for quality care or evidence-based factors associated with better outcomes. We also believe that limiting the program to measures that specifically apply to psychiatric services creates a false demarcation between non-psychiatric and psychiatric care, and ignores the broader responsibility of the facility for the overall health of the patient.

Comment: Several commenters requested that CMS consider the tradeoff between burden and clinical value, specifically the measure's usefulness in improving care, when proposing new measures for the IPFQR Program.

Response: When proposing measures for the IPFQR Program, our objective is to balance the need for information on the full spectrum of care delivery with the need to minimize the burden of data collection and reporting. To that end, we focus on measures that evaluate critical processes of care that have significant impact on patient outcomes and support CMS and HHS priorities for improved quality and efficiency of care provided by IPFs. Because we are sensitive to the need to minimize the burden on IPFs, we address this issue during Technical Expert Panels (TEPs) as part of our measure development process. We also refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR

53645 through 53646) for our considerations for the development and selection of measures for the IPFQR Program.

Comment: Several commenters requested that CMS pursue development of a patient and caregiver perception of care measure focused on the psychiatric patient population.

Response: We thank the commenters for their recommendations. We believe that patient and family engagement measures are important, and we will consider this suggestion as we develop future measures.

Comment: One commenter urged CMS to consider the use of psychiatric scales and instruments which are commonly used in IPF settings and specifically suggested the 24 item Behavior and Symptom Identification Scale (Basis 24).

Response: We thank the commenter for its suggestion and will consider measures related to the use of specific diagnostic or assessment tools, such as the Basis-24 tool [390] in the future.

We thank the commenters for their feedback and suggestions and we will consider them as we develop future policy.

7. Public Display and Review Requirements

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25243 through 25244), we proposed to change to how we specify the timeframes for public display of data and the associated preview period for IPFs to review the data that will be made public.

Under section 1886(s)(4)(E) of the Act, we are required to establish procedures for making the data submitted under the IPFQR Program available to the public. Such procedures must ensure that an IPF has the opportunity to review its data that are to be made public prior to such data being made public. Section 1866(s)(4)(E) of the Act also provides that the Secretary must report quality measures of process, structure, outcome, patients' perspective on care, efficiency, and costs of care that relate to services furnished in such hospitals on the CMS Web site.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50897 through 50898), we stated that we would publicly display the data submitted by IPFs for the IPFQR Program on a CMS Web site in April of each calendar year following the start of the respective payment determination year. For example, we publicly displayed the data for the FY 2015 payment determination in April 2015. We strive to publicly display data as soon as possible on a CMS Web site, as this provides consumers with healthcare information and furthers our goal of transparency. Therefore, we believe it is best to not specify in rulemaking the exact timeframe for publication, as doing so may prevent earlier publication. We proposed, then, to make these data available as soon as it is feasible. We intend to make the data available on *Hospital Compare* on at least a yearly basis.

We also are required to give each IPF an opportunity to review its data before the data are made public. This purpose of this preview period is to ensure that each IPF is informed of the IPF level data that the public will be able to see for its facility, and to submit measure rate errors resulting from CMS calculations of IPF submitted patient-level claims and Web-based measure numerator and denominator data. It is not for the purpose of correcting an IPF's possible submission errors. As finalized in the 2015 IPF PPS final rule (79 FR 45976), IPFs have the entire data submission period to review and correct claims data element and Web-based measure numerator and denominator count data they have submitted to CMS. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50897 through 50898), we stated that the preview period would be 30 days and would begin approximately 12 weeks prior to the public display of the data.

Because we proposed to make the data for the IPFQR Program available as soon as possible, and the timeframe for publication may change from year-to-year, we proposed to no longer specify the dates for review in rulemaking, nor to specify in rulemaking that the preview period will begin approximately 12 weeks prior to publicly displaying the data. Instead, we proposed to announce the exact timeframes through subregulatory guidance, including on a CMS Web site and/or on our applicable listservs. We also proposed to continue our policy that the time period for review will be approximately 30 days in length.

As noted earlier, we wish to publicly display data as early as possible. For the FY 2017 payment determination, it may be technically feasible for us to display the data as early as December 2016. We previously finalized that the preview period would be 30 days and would be approximately 12 weeks prior to the public display date (in the FY 2014 IPPS/LTCH PPS final rule, 78 FR 50897 through 50898). However, in this case (for the FY 2017 payment determination), 12 weeks prior to December 1, 2016 is in mid-September 2016, which is 2 weeks before the usual effective date of the IPPS/LTCH PPS final rule. Therefore, for FY 2017 only, if it is technically feasible to display the data as early as December 2016, we proposed a 2-week preview period that would start on October 1, 2016. However, as a courtesy, and to give IPFs 30 days for review if they so choose, we proposed to provide IPFs with their data as early as mid-September. The actual dates will be dependent on technical feasibility and will ensure that IPFs have 30 days to preview their data. We believe that this proposal complies with prior policies while still allowing us to display data as soon as possible for the FY 2017 payment determination.

We invited public comment on these proposals.

Comment: Many commenters supported the objective of publicly displaying the data as soon as possible to improve transparency, but requested that CMS clarify that IPFs will continue to have a 30-day preview period. These commenters further requested that CMS clarify how it will ensure there is sufficient time between the preview period and public display to correct any inaccuracies in the data since CMS is no longer providing the approximately 30 day preview period beginning 12 weeks prior to publicly posting the data.

Response: We thank the commenters for their support. As noted above, we are not changing the duration of the preview period from the previously finalized ''approximately 30 days'' and as such we will continue to ensure that IPFs have approximately 30 days to preview their data prior to publication on *Hospital Compare.* As we clarified in the proposed rule (81 FR 25244), the purpose of this preview period is to allow each IPF to see its facility level data prior to that data being made public, not to correct an IPF's possible submission errors. In the event that an IPF identifies measure rate errors resulting from CMS calculations of IPF submitted data, we will ensure that these errors are corrected prior to making the data publicly available.

After consideration of the public comments we received, for the FY 2018 payment determination and subsequent years we are finalizing our proposals to: (1) No longer specify the dates of preview period or data publication in rulemaking; (2) make the data for the IPFQR Program available as soon as possible; (3) announce the exact timeframes through subregulatory guidance, including on a CMS Web site and/or on our applicable listservs; and (4) continue our policy that the time period for review will be approximately

[390] For more information on the Basis-24 tool, we refer readers to the following: *http://www.ebasis.org/basis24.php.*

30 days in length as proposed. For the FY 2017 payment determination only, we are also finalizing our proposal that if it is technically feasible to display the data in December 2016, we would provide data to IPFs for a 2-week preview period that would start on October 1, 2016, as proposed. Moreover, we are finalizing as proposed that as a courtesy, for the FY 2017 payment determination only, if we are able to display the data in December 2016, we would ensure that IPFs have approximately 30 days for review if they so choose by providing IPFs with their data as early as mid-September.

8. Form, Manner, and Timing of Quality Data Submission

a. Procedural and Submission Requirements

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25244), we did not propose any changes to the procedural and submission requirements for the FY 2019 payment determination and subsequent years, and we refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50898 through 50899) for more information on these previously finalized requirements.

b. Change to the Reporting Periods and Submission Timeframes

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50901), we finalized requirements for reporting periods and submission timeframes for the IPFQR Program measures. In the FY 2016 IPF PPS final rule, we made one change to these requirements (80 FR 46715 and 46716). We refer readers to these rules for further information.

c. Population and Sampling

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53657 through 53658) and FY 2014 IPPS/LTCH PPS final rule (78 FR 50901 through 50902), we finalized policies for population, sampling, and minimum case thresholds. In the FY 2016 IPF PPS final rule, we made one change to these requirements in finalizing a policy in which IPFs may take one, global sample for all measures for which sampling is permitted (80 FR 46717 through 46719). This policy was adopted to decrease burden on IPFs and streamline policies and procedures. We refer readers to these rules for further information.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25240), we proposed to allow sampling for the SUB–3 and SUB–3a measure. In other words, we proposed to include the SUB3 and SUB–3a measure in the list of measures covered by the global sample. We refer readers to section VIII.D.4.a. of the preamble of this final rule where we finalize our proposal to include both SUB–3: Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge and subset measure SUB–3a: Alcohol & Other Drug Use Disorder Treatment at Discharge (NQF #1664) in the list of measures covered by the global sample for the FY 2019 payment determination and subsequent years as proposed.

d. Data Accuracy and Completeness Acknowledgement (DACA) Requirements

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25244), we did not propose any changes to the DACA requirements, and we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53658) for more information on these requirements.

9. Reconsideration and Appeals Procedures

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53658 through 53660), we adopted a reconsideration and appeals process, later codified at 42 CFR 412.434, by which an IPF can request a reconsideration of its payment update reduction if an IPF believes that its annual payment update has been incorrectly reduced for failure to meet all IPFQR Program requirements and, if dissatisfied with a decision made by CMS on its reconsideration request, may file an appeal with the Provider Reimbursement Review Board. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25244), we did not propose any changes to the Reconsideration and Appeals Procedure and refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53658 through 53660) and the FY 2014 IPPS/LTCH PPS final rule (78 FR 50953) for further details on the reconsideration process.

10. Exceptions to Quality Reporting Requirements

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25244), we did not propose any changes to the exceptions to quality reporting requirements. For more information, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53659 through 53660), where we initially finalized the policy as ''Waivers from Quality Reporting,'' and the FY 2015 IPF PPS final rule (79 FR 45978), where we renamed the policy as ''Exceptions to Quality Reporting Requirements.''

E. Clinical Quality Measurement for Eligible Hospitals and Critical Access Hospitals (CAHs) Participating in the EHR Incentive Programs in 2017

1. Background

The HITECH Act (Title IV of Division B of the ARRA, together with Title XIII of Division A of the ARRA) authorizes incentive payments under Medicare and Medicaid for the adoption and meaningful use of certified electronic health record (EHR) technology (CEHRT). Eligible hospitals and CAHs may qualify for these incentive payments under Medicare (as authorized under sections 1886(n) and 1814(l) of the Act, respectively) if they successfully demonstrate meaningful use of CEHRT, which includes reporting on clinical quality measures (CQMs) using CEHRT.

Sections 1886(b)(3)(B) and 1814(l) of the Act also establish downward payment adjustments under Medicare, beginning with FY 2015, for eligible hospitals and CAHs that are not meaningful users of CEHRT for certain associated reporting periods. Section 1903(a)(3)(F)(i) of the Act establishes 100 percent Federal financial participation (FFP) to States for providing incentive payments to eligible Medicaid providers (described in section 1903(t)(2) of the Act) to adopt, implement, upgrade and meaningfully use CEHRT.

Under sections 1886(n)(3)(A) and 1814(l)(3)(A) of the Act and the definition of ''meaningful EHR user'' under 42 CFR 495.4, eligible hospitals and CAHs must report on CQMs selected by CMS using CEHRT, as part of being a meaningful EHR user under the Medicare EHR Incentive Program. The set of CQMs from which eligible hospitals and CAHs will report under the EHR Incentive Program beginning in FY 2014 is listed in Table 10 of the EHR Incentive Program Stage 2 final rule (77 FR 54083).

In order to further align CMS quality reporting programs for eligible hospitals and CAHs and avoid redundant or duplicative reporting among hospital programs, the Medicare and Medicaid Programs; Electronic Health Record Incentive Program—Stage 3 and Modifications to Meaningful Use in 2015 Through 2017 (hereinafter referred to as the 2015 EHR Incentive Programs Final Rule) [391] (80 FR 62890) indicated our intent to address CQM reporting requirements for the Medicare and

[391] Medicare and Medicaid Programs: Electronic Health Record Incentive Program—Stage 3 and Modifications to Meaningful Use in 2015 Through 2017; final rule (80 FR 62761 through 62955) (''2015 EHR Incentive Programs Final Rule'').

Medicaid EHR Incentive Programs for eligible hospitals and CAHs for 2016, 2017, and future years in the IPPS rulemaking. We believe that receiving and reviewing public comments for various CMS quality programs at one time while simultaneously finalizing the requirements for these programs would provide us with an opportunity to better align these programs for eligible hospitals and CAHs, allow more flexibility within the Medicare and Medicaid EHR Incentive Programs, and add overall value and consistency. To further achieve this goal, the 2015 Edition final rule (80 FR 62652) published by ONC indicated that it would address certification policy regarding the reporting of CQMs for eligible hospitals and CAHs in or in conjunction with the annual IPPS rulemaking to better align with the reporting goals of other CMS programs.

2. CQM Reporting for the Medicare and Medicaid EHR Incentive Programs in 2017

a. Background

In the EHR Incentive Program Stage 2 final rule, we outlined the CQMs available for use in the EHR Incentive Programs beginning in 2014 for eligible hospitals and CAHs in Table 10 at 77 FR 54083 through 54087. In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25245), we proposed to maintain the existing requirements established in earlier rulemaking for the reporting of CQMs under the EHR Incentive Programs in 2017, unless otherwise indicated in the proposed rule. These requirements include reporting on 16 CQMs covering at least 3 NQS domains for eligible hospitals and CAHs (77 FR 54079). We noted in the proposed rule (81 FR 25245) that the proposals would apply to both the Medicare and Medicaid EHR Incentive Programs, with the exception of the submission period proposed policy.

As we expect to expand the current measures to align with the National Quality Strategy and the CMS Quality Strategy [392] and incorporate updated standards and terminology in current CQMs, including updating the electronic specifications for these CQMs, and creating de novo CQMs, we plan to expand the set of CQMs available for reporting under the EHR Incentive Programs in future years. We will continue to engage stakeholders to provide input on future proposals for CQMs as well as request comment on future electronic specifications for new and updated CQMs.

In addition, we are transitioning from the quality data model (QDM) expression language to the clinical quality language (CQL) specification, which defines a representation for the expression of clinical knowledge that can be used within both the clinical decision support (CDS) and CQM domains. The QDM logic expression is tightly coupled to the QDM logic model and based on capabilities of the health level 7 (HL7) reference information model (RIM), an object model which does not have significant ability to express mathematical logic such as addition, subtraction, division, and multiplication. The QDM logic expression requires multiple, often repetitious lines of logic to compare relationships among different activities, usually by indicating the time of one activity with the time of the other activity. Also, software cannot easily parse QDM logic directly from the Healthcare Quality Measures Format (HQMF), the HL7 standard for representing a clinical quality measure as an electronic document. Using QDM logic expression in HQMF often require significant human interaction and interpretation to program or configure software, such as EHRs, to calculate a measure. In general, the CQL is a mathematical expression language that can be parsed by software to calculate results, without needing human interpretation to implement the expressed logic. The CQL includes basic math and allows description of relationship among activities in a simple, direct manner, which significantly reduces the lines of logic. With a modest effort, it represents a change that is straightforward to learn and interpret compared to the existing QDM logic statements.

The CQL specification defines two components: CQL—author-friendly domain specific language; and expression logical model—computable extensible markup language (XML). The CQL leverages best practices and lessons learned from the quality data model, health e-decisions, and electronic CQM and clinical decision support (CDS) communities. The CQL is designed to work with any data model, more expressive and robust than the QDM logic, and is a HL7 draft standard for trial use (DSTU). The CQL includes: Datatypes; data retrieval and queries; timing phrases and operators; variable and function declaration; input parameters with default values; conditional logic, Boolean logic, and value comparison; simple arithmetic and aggregate functions; operations on value sets, lists, intervals, sets and dates/times; and shared libraries. We anticipate the incorporation of the CQL into the CQM electronic specifications as we support the development and testing of this standard. We anticipate starting this work effort in 2016 with the expectation that extensive development and testing will continue, at minimum, through the fall of 2017. We will not implement CQL until the development and testing phases show success for utilization with the CQMs. We are engaging the participation of hospitals and other providers, health IT developer, measure developer, and other stakeholder communities as we undertake this effort at all stages of development and testing. For further information, we refer readers to the eCQI Resource Center Web page (*https://ecqi.healthit.gov/*).

b. CQM Reporting Period for the Medicare and Medicaid EHR Incentive Programs in CY 2017

In the 2015 EHR Incentive Programs Final Rule (80 FR 62892 through 62893), beginning in CY 2017 and for subsequent years, we established a CQM reporting period of one full calendar year (consisting of four quarterly data reporting periods) for CQM reporting for eligible hospitals and CAHs participating in the Medicare and Medicaid EHR Incentive Programs, with a limited exception for providers demonstrating meaningful use for the first time under the Medicaid EHR Incentive Program, for whom the CQM reporting period is any continuous 90-day period within the calendar year. We believe that one full calendar year of data will result in more complete and accurate data. Providers will be able to submit one full calendar year of data for both the EHR Incentive Program and the Hospital IQR Program, thereby reducing the reporting burden. We continue to assess electronically submitted data for accuracy and reliability. If data are determined to be flawed, such data will be identified by CMS in order to preserve the integrity of data used for differentiating performance.

We also established a reporting period for CQMs of any continuous 90-day period within CY 2017 for eligible hospitals and CAHs that are demonstrating meaningful use for the first time in either the Medicare or Medicaid EHR Incentive Programs (80 FR 62892 through 62893). In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25245 through 25246), we proposed the following submission periods for the Medicare EHR Incentive Program, as well as requirements for eligible

[392] Available at: *http://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/QualityInitiativesGenInfo/CMS-Quality-Strategy.html.*

hospitals and CAHs reporting CQMs electronically.

• Eligible hospitals and CAHs Reporting CQMs by Attestation:

++ For eligible hospitals and CAHs demonstrating meaningful use for the first time in 2017, the reporting period is any continuous 90-day period within CY 2017. The submission period for attestation is the 2 months following the close of the calendar year, ending February 28, 2018.

++ For eligible hospitals and CAHs that demonstrated meaningful use in any year prior to 2017, the reporting period is the full CY 2017 (consisting of four quarterly data reporting periods). The submission period for attestation is the 2 months following the close of the calendar year, ending February 28, 2018.

• Eligible hospitals and CAHs Reporting CQMs Electronically: For eligible hospitals and CAHs demonstrating meaningful use for the first time in 2017 or that have demonstrated meaningful use in any year prior to 2017, the reporting period is the full CY 2017 (consisting of four quarterly data reporting periods). The submission period for reporting CQMs electronically is the 2 months following the close of the calendar year, ending February 28, 2018.

In regard to the Medicaid EHR Incentive Program, we provide States with the flexibility to determine the submission periods for reporting CQMs.

For the reporting period in CY 2017, we did not propose new CQMs. However, section 1886(n)(3)(B)(iii) of the Act requires that, in selecting measures for eligible hospitals and CAHs for the Medicare EHR Incentive Program, and establishing the form and manner for reporting measures, the Secretary shall seek to avoid redundant or duplicative reporting with reporting otherwise required, including reporting under section 1886(b)(3)(B)(viii) of the Act, the Hospital IQR Program. In the interest of avoiding redundant or duplicative reporting with the Hospital IQR Program, we proposed to remove 13 CQMs from the set of CQMs available for eligible hospitals and CAHs to report for the EHR Incentive Programs, beginning with the reporting periods in CY 2017. We proposed to remove such measures for both the Medicare and Medicaid EHR Incentive Programs.

We anticipate that this coordinated reduction in the overall number of CQMs reported electronically in both the Hospital IQR and the Medicare and Medicaid EHR Incentive Programs would reduce the challenges associated with electronic reporting for hospitals and improve the quality of reported data by enabling hospitals to focus on a smaller, more specific subset of electronic CQMs. For the list of measures we proposed to remove from the Hospital IQR Program and the Medicare and Medicaid EHR Incentive Programs, as well as the rationale in support of our proposals to remove these measures, we refer readers to the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25175 through 25178). All of the remaining measures listed in Table 10 of the EHR Incentive Program Stage 2 final rule (77 FR 54083 through 54087) would be available for eligible hospitals and CAHs to report for the Medicare and Medicaid EHR Incentive Programs. From that available set of measures, we proposed the following reporting criteria for eligible hospitals and CAHs beginning with the reporting periods in CY 2017:

• For attestation: If only participating in the EHR Incentive Program, report on all 16 available CQMs.

• For electronic reporting—

++ If only participating in the EHR Incentive Program, report on 15 of the 16 available CQMs (among the 16 available CQMs, the Outpatient Quality Reporting (OQR) Program CQM (Emergency Department (ED)–3, NQF 0496) is not required to be reported on for electronic reporting, in which 15 of the 16 available CQMs can be selected to meet this reporting requirement); or

++ If participating in the EHR Incentive Program and the Hospital IQR Program, report on all 15 available CQMs (the electronic reporting of the Outpatient Quality Reporting (OQR) Program CQM (ED–3, NQF 0496) is not applicable when reporting on CQMs for both programs, which results in the reporting of 15 available CQMs).

We also considered an alternative proposal to require eligible hospitals and CAHs to select and report electronically on 8 CQMs for the reporting periods in CY 2017 and all available CQMs beginning with the reporting periods in CY 2018, which was further outlined in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25195). We noted our intent is to align, to the extent possible, the EHR Incentive Program reporting requirements with the Hospital IQR Program reporting requirements established in this final rule. We believe that the alignment of these programs will serve to reduce hospital reporting burden and encourage the adoption and meaningful use of CEHRT by eligible hospitals and CAHs. We invited public comment on these proposals.

Comment: Many commenters did not support the proposed requirement that hospitals report a full year of CQM data because of the burden it would impose on hospitals. One commenter indicated that the increase would be four times greater than previous years and would cause increased difficulties for hospitals transitioning to a new EHR system. Some commenters expressed concern that the increase in the volume of information being reported might increase susceptibility to inaccurate data. Commenters noted that EHR vendors are still struggling to overcome the barriers encountered during the first year of CQM reporting because designing, building, reviewing, and testing that takes place between hospitals and vendors is extremely expensive and extensive. Commenters also expressed concern that this effort will take resources away from true quality improvement efforts. One commenter acknowledged that once a CQM is in place, it can continue to gather data beyond implementation, but expressed concern regarding the ability of EHR vendors and health care providers to have all CQMs in place by January 1, 2017. The commenter suggested that CMS continue the current reporting period of one of the two final quarters of the reporting year.

Several commenters specifically expressed concern that the time period between when the final rule is published and the beginning of the CY 2017 reporting period is too short to make the appropriate health IT and workflow adjustments to accommodate transmission of a full year of CQM data. One commenter noted that requiring hospitals to submit a full year of CQM data for the CY 2017 reporting period would require hospitals to begin data collection on a full year of data prior to completion of the first deadline to report only one quarter of data which is February 28, 2017. Another commenter questioned whether CMS has considered its ability to receive data submissions for hundreds of thousands of cases from hospitals within a two-month period (January 1 through the February 28).

A few commenters expressed concern with the proposals to align the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program because there are differences in the available and required number of CQMs for reporting between the Hospital IQR Program and the Medicare and Medicaid EHR Incentive Programs, particularly relating to the reporting of CQMs electronically (a full year) or by attestation (any continuous 90-day period) under the EHR Incentive Programs. One commenter encouraged CMS to change the CQM reporting period for both Hospital IQR Program and the Medicare

and Medicaid EHR Incentive Programs in CY 2017 to a 90-day period reflecting the proposed reporting period for attestation under the Medicare and Medicaid EHR Incentive Programs.

Response: We appreciate the commenters' concerns that reporting a full year of CQM data may impose a greater burden on hospitals than reporting one quarter of CQM data, but in response to the commenter's concern that the increase would be four times greater than previous years and would cause increased difficulties for hospitals transitioning to a new EHR system, we disagree. We believe that the burden associated with submitting a full year of CQM data will not be substantially greater than the burden associated with submitting a single quarter of data. Once CQMs are properly certified and mapped to successfully collect data for one quarter, collecting data for an additional 3 quarters should not require much additional burden. We believe that electronic reporting is an important step in the use of CEHRT, in which a full year reporting period that consists of data for four quarterly reporting periods is a critical component to making progress in electronic reporting.

In response to concerns that the reporting of a full year (consisting of four quarterly data reporting periods) of CQM data would cause the CMS receiving system to be susceptible to inaccurate data due to an increased volume of submitted CQM data, we believe that accuracy will be improved over time by assessing an increased volume of CQM data. Through the assessment of more data, we are able to identify and address issues surrounding CQM data more quickly. We continue to assess electronically submitted data for accuracy and reliability. If data are determined to be flawed, such data will be identified by CMS in order to preserve the integrity of data used for differentiating performance. We believe that, with the advancement of technology and the use of electronic measures, even more precise, accurate, and reliable data will be captured for analysis.

We appreciate commenters sharing their concerns about the challenges associated with electronic reporting, including the significant expenditure of resources required to make necessary changes to health IT systems, documentation or utilization of EHRs, and workflow process changes. We encourage eligible hospitals and CAHs to continue refining their electronic reporting implementation activities to successfully achieve electronic data capture and reporting despite mapping and integration issues or to work with their vendors to do so. We acknowledge commenters' concerns about the timing of the publication of the final rule in relation to the CY 2017 reporting period, and encourage early testing and the use of presubmission testing tools to reduce errors and inaccurate data submissions in CQM reporting. As time passes, we expect that hospitals will continue to build and refine their EHR systems and gain more familiarity with reporting CQM data, resulting in more accurate data submissions with fewer errors. We believe that the best way to encourage eligible hospitals and CAHs to invest in improving their EHR systems is by requiring reporting of additional CQMs.

In response to concerns regarding the ability of the our receiving systems to receive the significant volume of data submissions during the 2-month submission period, we have worked to continually develop and improve our CQM receiving system and are working to ensure that the infrastructure is in place to receive the full volume of CQM data submissions from eligible hospitals and CAHs by the February 28, 2018 deadline for the CY 2017 reporting period.

We disagree with commenters that a 90-day reporting period should apply for all eligible hospitals and CAHs, regardless of the reporting method (electronic reporting or attestation) or whether they have successfully demonstrated meaningful use in a prior year. While we are allowing a reporting period of any continuous 90-day period for eligible hospitals and CAHs reporting CQMs by attestation that demonstrate meaningful use for the first time in CY 2017, we believe a full-year reporting period (consisting of four quarterly data reporting periods) is appropriate for eligible hospitals and CAHs that have demonstrated meaningful use in a prior year, as well as for all eligible hospitals and CAHs that choose to report electronically regardless of whether they have previously demonstrated meaningful use.

Comment: As an alternative to the annual reporting of a full year of CQM data, a few commenters suggested that CMS require quarterly submission of the CQM data, with submission being required four-and-a-half months after the end of the reporting quarter to align the electronic submission requirements with the Hospital IQR Program chart-abstracted reporting requirements and with other quality reporting programs, such as the SNF Quality Reporting Program and meaningful use, to ensure sufficient time for providers to final-bill code all cases for a reporting quarter before being required to generate QRDA files for submission to CMS, and to alleviate pressure on providers, vendors, and the QualityNet team to put together and submit the required information for electronic CQM data submission. A few commenters noted that upgrading to a new edition of certified EHR technology during the same reporting period (CY 2017) that would require hospitals report a full year of CQM data could pose additional implementation difficulties. One commenter expressed the opinion that quarterly reporting would reduce the volume of data that vendors and CMS must process at one time, give providers more frequent benchmarking of their performance on these measures, and make the timing of electronic reporting consistent with reporting of chart-abstracted measures.

Response: We thank commenters for their suggestions and acknowledge their concerns regarding a two-month timeframe allotted for submitting a full year of CQM data. We agree with commenters that there may be advantages with an extended submission period, therefore, in this final rule, we are finalizing a modification to the proposed submission period regarding the electronic reporting of CQMs. We anticipate that following the close of the CMS data receiving system for the CY 2016 reporting period, we will re-open the system in late spring 2017 to be able to receive both QRDA I test files and QRDA I production files for the CY 2017 reporting period (consisting of four quarterly reporting periods). We believe that a longer submission period will provide eligible hospitals and CAHs with the flexibility to submit a full year of CQM data quarterly, bi-annually, or annually. This greater flexibility will allow eligible hospitals, CAHs, and vendors the flexibility to submit QRDA I files as soon as each calendar quarter ends, rather than waiting to submit all QRDA I files during the last two months of the submission period. We encourage all eligible hospitals, CAHs, and vendors to submit QRDA I files early, as well as to use one of the presubmission testing tools for electronic reporting, such as the CMS Pre-Submission Validation Application (PSVA), to allow additional time for testing and to make sure all required data files are successfully submitted by the deadline. The PSVA can be downloaded from the Secure File Transfer (SFT) section of the QualityNet Secure Portal at: *https://cportal.qualitynet.org/QNet/pgm_select.jsp.* We refer readers to section VIII.A.11.b.(4) of the preamble of this of this final rule for more information about the PSVA.

Comment: The majority of commenters supported the proposed removal of 13 CQMs from the EHR Incentive Programs beginning in CY 2017 in an effort to move quality measurement toward outcomes measures. Many commenters stated their belief that these measures were topped out, and that the measures' complexity could not be captured in an electronic form. A number of commenters also stated their belief that the CQM measure specifications were not feasible to implement. Others noted removing these measures would decrease administrative burden, minimize confusion among providers and provide alignment among the Hospital IQR Program the EHR Incentive Programs.

Response: We thank the commenters for their support of our proposal to remove 13 CQMs in an effort to move quality measurement toward outcomes measures. Therefore, for the reasons stated in section VIII.A.3.b.(3) of the preamble of this final rule, we are finalizing our proposal to remove the 13 CQMs beginning with the reporting periods in CY 2017.

Comment: Several commenters supported CMS' efforts to reduce reporting burden on hospitals, but expressed concern with the timeline of the proposal to remove 13 CQMs for CY 2017 because hospitals may need time to adjust workflows and work with health IT vendors to add support for measures not previously supported and ensure valid CQMs are submitted. Commenters encouraged CMS to consider the time, effort, and resources expended on reporting on these measures when deciding to remove them from the EHR Incentive Programs. One commenter noted that EHR vendors will phase out support for these measures and clinicians may become skeptical about benefits to workflow changes related to future measures if measures are continuously added and removed. Another commenter urged CMS to provide more lead time for the removal of measures that hospitals have dedicated so many resources to developing and implementing. Specifically, the commenter requested that for CY 2017, CMS maintain the current requirements of reporting four CQMs out of the current list of 28, in order to give hospitals more time to plan and prepare for implementation of additional CQMs in future years.

Response: We understand the commenters' concern with removing CQMs that have been previously reported and implemented in an existing EHR workflow, and we acknowledge the time, effort, and resources that hospitals expend on reporting on these measures. However, our decision to remove measures from the EHR Incentive Program and the Hospital IQR Program is an extension of our programmatic goal to continually refine the measure set and ensure that it consists of quality performance standards. We believe that a reduction in the overall number of CQMs reduces certification burden on eligible hospitals and CAHs and improves the quality of reported data by enabling hospitals to focus on a smaller, more specific subset of CQMs.

We encourage eligible hospitals and CAHs that retain vendors to work closely together to ensure that a contract is in place which supports the hospital's quality reporting requirements and the annual update of quality measures. Also, we encourage eligible hospitals and CAHs to continue refining their electronic reporting implementation activities to successfully achieve electronic data capture and reporting despite mapping and integration issues or to work with their vendors to do so. We encourage early testing and the use of presubmission testing tools to reduce errors and inaccurate data submissions in CQM reporting. We will work to provide hospitals with the education, tools, and resources necessary to enhance their workflows to more seamlessly account for the removal or addition of CQMs.

Comment: A few commenters suggested that topped-out measures should not be removed from the Medicare and Medicaid EHR Incentive Programs measure set. One commenter opposed the proposal to remove the CQMs that are topped out, stating that the measures should not be retired until the CQM reporting process has matured. The commenter further stated that allowing hospitals the option to electronically report topped-out measures would provide them with an opportunity to test the accuracy of their EHR reporting systems. Another commenter requested that any topped-out CQM that is removed from the EHR Incentive Programs be kept on reserve so that performance can be monitored as necessary to ensure that performance and/or adherence to best practices do not decline. In addition, the commenter suggested that an alternative use of topped-out measures is inclusion as components of composite measures. A commenter recommended that CMS implement a periodic auditing system of measures designated as topped-out. The commenter expressed the opinion that such a system would ensure that performance remains satisfactorily high and also detect reductions in the quality of care.

Response: While we recognize the benefit of continuing the inclusion of topped-out measures until the CQM reporting process has further matured or for the assurance that performance remains satisfactorily high and the ability to detect reductions in the quality of care, retaining such measures in the Medicare and Medicaid EHR Incentive Programs measure set or as part of components of composite measures, or implementing a periodic auditing system of topped-out measures requires the maintenance of the topped-out measures. We must balance the costs of continued monitoring of a successful measure with high levels of performance with the adoption of other measures where there are opportunities for improvement in clinical quality.

Comment: A few commenters did not support the removal of measures because it may hinder on-going measurement and reduce performance improvements. One commenter requested that CMS maintain a library of measures that are not included in the program so that vendors and hospitals can still support monitoring and improving these removed measures.

Response: We disagree with commenters that the removal of these measures may hinder measurement and reduce performance improvement. Although eligible hospitals and CAHs are not reporting data for measures that have been removed from the Hospital IQR Program and EHR Incentive Programs, if the CQM specifications are maintained by the measure developer, eligible hospitals and CAHs are encouraged to continue to monitor data for their own efforts to improve quality. We appreciate the commenter's suggestion to maintain a library of CQMs that have been removed and will take it into consideration.

Comment: Several commenters did not support the proposed requirement that hospitals report on all CQMs in the Medicare and Medicaid EHR Incentive Programs because of concerns about general feasibility, accuracy, validity, and reliability of electronically-submitted measures. Several commenters suggested that CMS consider amending the proposal to require an addition of 2 to 4 CQMs to the CY 2016 required number of CQMs, which would require the reporting a total of 6 to 8 CQMs for the CY 2017 reporting period. A few commenters suggested an incremental approach requiring only 8 CQMs for two quarters for the first increase. Other commenters requested that CMS retain the current requirement of 4 CQMs until hospitals

have successfully operationalized reporting complete and accurate data on existing required CQMs before adding new measures. Commenters indicated that EHR vendors are not prepared for the functional and operational demands of an increase in CQM reporting. Further, commenters argued that requiring hospitals to collect electronic data for measures that still have flawed specifications and/or for services the hospitals do not provide is inefficient and burdensome. One commenter also noted that the CQM specifications have flaws that prove challenging with current clinical workflows, given how EHRs track orders and documentation and in some cases the measure specifications do not accurately measure the quality of care delivered, absent the development of manual workarounds that divert time and resources from patient care. These commenters recommended delaying any mandatory reporting of CQMs until these concerns are resolved.

Commenters also expressed concern that CQM data submission to CMS has not been fully tested at this point and recommended that expanding the required number of CQMs should be delayed until there has been successful transmission of data. Commenters noted that the infrastructure and reporting functionality for CQMs are not mature enough to facilitate mandatory electronic reporting for hospitals. Commenters recommended that CMS continue outreach to EHR vendors, hospital quality staff, and other affected stakeholders to identify and address structural problems prior to increasing the number of required CQMs.

Response: We believe that increasing the requirements for hospitals to report measures electronically is in line with our goals to make progress towards eventual electronic reporting on all CQMs in the Medicare and Medicaid EHR Incentive Programs. Retaining the reporting requirements from CY 2016 would not be in alignment with our goal to move toward the electronic reporting of all available CQMs. Eligible hospitals and CAHs have been engaged in the process of reporting CQM data electronically for the EHR Incentive Programs and Hospital IQR Program for several years (three years of pilot reporting and three years of voluntary reporting). However, we recognize the challenges associated with electronic reporting and encourage eligible hospitals and CAHs to continue refining their electronic reporting implementation activities and work with their vendors to achieve electronic capture and reporting despite mapping and integration issues. We encourage eligible hospitals and CAHs to work closely with their vendors to ensure that a contract is in place which supports the hospital's quality reporting requirements and the annual update of those measures. Reliable, accurate data and the engagement of electronic reporting are critical to advancing our goal of increasing the electronic reporting of CQMs. We recognize the importance of having feasible and accurate measure data and in order to readily identify issues, we need to assess more data. We believe that, with the advancement of technology and the use of electronic measures, even more precise, accurate, and reliable data will be captured for analysis.

In response to the commenters' concerns relating to vendors not being prepared for the functional and operational demands of an increase in CQM reporting, we note that CQM electronic specifications are posted at least 6 months prior to the start of the reporting period, and well in advance of the submission window. We believe this timeframe allows an adequate amount of time for vendors to make those updates while ensuring that the CQMs are still current and clinically valid once implemented.

We appreciate commenters sharing their concerns regarding flaws with measure specifications, the maturity of infrastructure and reporting functionality for CQMs, and CMS testing of CQM data submission. We note that measure specifications are updated routinely to account for changes, including, but not limited to, changes in billing and diagnosis codes and changes in medical practices. In order for CQMs to remain current and clinically valid, the specifications must be updated on a regular basis. We disagree with commenters that CQM reporting should be delayed until agreement is achieved regarding the maturity of CQM specifications. We believe that CQMs have matured since their inception, and any delay in the CQM reporting requirements would inhibit progress toward the eventual electronic reporting of all CQMs for the Medicare and Medicaid EHR Incentive Programs.

In this final rule, we are adopting a modification of our proposal and requiring the reporting of only 8 CQMs for eligible hospitals and CAHs that choose to report electronically, in response to commenters' suggestion of incrementally increasing the reporting requirements. We believe that this modification balances the concerns raised by commenters while simultaneously advancing our goal of increased CQM electronic reporting. While the number of CQMs required to report increases from 4 CQMs (as established for the CY 2016 reporting period) to 8 CQMs for the CY 2017 reporting period, we believe that a coordinated reduction in the overall number of CQMs in both the Hospital IQR Program (from 28 to 15 available CQMs) and Medicare and Medicaid EHR Incentive Programs (from 29 to 16 available CQMs) will reduce certification burden on hospitals and improve the quality of reported data by enabling hospitals to focus on a smaller, more specific subset of CQMs. It is one of our goals to expand electronic reporting in the Medicare and Medicaid EHR Incentive Programs. We intend to introduce additional CQMs into the Medicare and Medicaid EHR Incentive Programs as CQMs that support the programs goals become available.

After consideration of the public comments we received, we are finalizing the following policies. We are finalizing a modification to our proposal regarding the number of CQMs required for eligible hospitals and CAHs that report electronically for the Medicare and Medicaid EHR Incentive Programs and will require reporting on 8 CQMs beginning with the CY 2017 reporting period, which eligible hospitals and CAHs may select from the set of available CQMs listed in the table below. We are finalizing as proposed the removal of 13 CQMs from the set of CQMs available for eligible hospitals and CAHs to report for the Medicare and Medicaid EHR Incentive Programs, beginning with the reporting periods in CY 2017. For the list of CQMs we are removing, we refer readers to section VIII.A.3.b.(3) of the preamble of this final rule. All 16 of the remaining measures listed in Table 10 of the EHR Incentive Program Stage 2 final rule (77 FR 54083 through 54087) are available for eligible hospitals and CAHs to report for the Medicare and Medicaid EHR Incentive Programs. The following table lists the remaining 16 CQMs available for eligible hospitals and CAHs to report for the Medicare and Medicaid EHR Incentive Programs beginning in CY 2017.

CQMS FINALIZED FOR ELIGIBLE HOSPITALS AND CAHS BEGINNING WITH CY 2017

Short name	Measure name	NQF #
	Electronic Clinical Quality Measures (eCQMs)	
AMI–8a	Primary PCI Received Within 90 Minutes of Hospital Arrival	0163
ED–3	Median Time from ED Arrival to ED Departure for Discharged ED Patients	0496
CAC–3	Home Management Plan of Care Document Given to Patient/Caregiver	+
ED–1*	Median Time from ED Arrival to ED Departure for Admitted ED Patients	0495
ED–2*	Admit Decision Time to ED Departure Time for Admitted Patients	0497
EHDI–1a	Hearing Screening Prior to Hospital Discharge	1354
PC–01	Elective Delivery (Collected in aggregate, submitted via Web-based tool or electronic clinical quality measure)	0469
PC–05	Exclusive Breast Milk Feeding***	0480
STK–02	Discharged on Antithrombotic Therapy	0435
STK–03	Anticoagulation Therapy for Atrial Fibrillation/Flutter	0436
STK–05	Antithrombotic Therapy by the End of Hospital Day Two	0438
STK–06	Discharged on Statin Medication	0439
STK–08	Stroke Education	+
STK–10	Assessed for Rehabilitation	0441
VTE–1	Venous Thromboembolism Prophylaxis	0371
VTE–2	Intensive Care Unit Venous Thromboembolism Prophylaxis	0372

+ NQF endorsement has been removed.

The CQM reporting periods in CY 2017 for the Medicare and Medicaid EHR Incentive Programs are set out below. For the Medicare EHR Incentive Program, we are finalizing the proposed submission periods for eligible hospitals and CAHs reporting CQMs by attestation and are finalizing with modification the proposed submission periods for eligible hospitals and CAHs electronically reporting CQMs. We are providing States with the flexibility to determine the submission periods for reporting CQMs for their Medicaid EHR Incentive Program.

• Eligible hospitals and CAHs Reporting CQMs by Attestation:

++ For eligible hospitals and CAHs demonstrating meaningful use for the first time in 2017, the reporting period is any continuous 90-day period within CY 2017. The submission period for attestation is the 2 months following the close of the calendar year, ending February 28, 2018.

++ For eligible hospitals and CAHs that demonstrated meaningful use in any year prior to 2017, the reporting period is the full CY 2017 (consisting of four quarterly data reporting periods). The submission period for attestation is the 2 months following the close of the calendar year, ending February 28, 2018.

• Eligible hospitals and CAHs Reporting CQMs Electronically: For eligible hospitals and CAHs demonstrating meaningful use for the first time in 2017 or that have demonstrated meaningful use in any year prior to 2017, the reporting period is the full CY 2017 (consisting of four quarterly data reporting periods). The submission period for reporting CQMs electronically begins in late spring 2017 and continues through the 2 months following the close of the calendar year, ending February 28, 2018.

As we continue to align the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program, we are finalizing the same number of CQMs to be reported electronically for both programs. However, we are finalizing a policy under which eligible hospitals and CAHs reporting electronically will be required to report on 8 available CQMs. Thus, in this final rule, we are finalizing a modified version of our proposed reporting criteria regarding the number of CQMs eligible hospitals and CAHs are required to report electronically, starting with the reporting periods in CY 2017:

• For attestation: If only participating in the EHR Incentive Program, report on all 16 available CQMs.

• For electronic reporting: If only participating in the EHR Incentive Program, or participating in both the EHR Incentive Program and the Hospital IQR Program, report on 8 of the available CQMs.

For CY 2018 and future calendar years, we plan to continue to align the CQM reporting requirements for the Medicare and Medicaid EHR Incentive Programs with the Hospital IQR Program reporting requirements established in this final rule and future rules.

c. CQM Reporting Form and Method for the Medicare EHR Incentive Program in 2017

As finalized in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49759 through 49760), we removed the QRDA–III as an option for reporting under the Medicare EHR Incentive Program for eligible hospitals and CAHs. For the reporting periods in 2016 and future years, we are requiring QRDA–I for CQM electronic submissions for the Medicare EHR Incentive Program. As noted in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49760), States would continue to have the option, subject to our prior approval, to allow or require QRDA–III for CQM reporting.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49578 through 49579), we established the following options for CQM submission for eligible hospitals and CAHs in the Medicare EHR Incentive Program for the reporting periods in 2017:

• Eligible hospital and CAH options for Medicare EHR Incentive Program participation *(single program participation)*—

++ Option 1: Attest to CQMs through the EHR Registration & Attestation System; or

++ Option 2: Electronically report CQMs through QualityNet Portal.

• Eligible hospital and CAH options for electronic reporting for multiple programs *(for example, EHR Incentive Program plus Hospital IQR Program participation)*—electronically report through QualityNet Portal.

As stated in the 2015 EHR Incentive Programs Final Rule (80 FR 62894), in 2017, eligible hospitals and CAHs have two options to report CQM data, either through attestation or use of established methods for electronic reporting where feasible. However, starting in 2018, eligible hospitals, and CAHs participating in the Medicare EHR Incentive Program must electronically report CQMs using CEHRT where feasible; and attestation to CQMs will no longer be an option except in certain

circumstances where electronic reporting is not feasible. Therefore, we encourage eligible hospitals and CAHs to begin electronically reporting CQMs as soon as feasible.

For the Medicaid EHR Incentive Program, States will continue to be responsible for determining whether and how electronic reporting of CQMs would occur, or if they wish to allow reporting through attestation. Any changes that States make to their CQM reporting methods must be submitted through the State Medicaid Health IT Plan (SMHP) process for CMS review and approval prior to being implemented.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25246 through 25247), we proposed to continue our policy that electronic submission of CQMs will require the use of the most recent version of the CQM electronic specification for each CQM to which the EHR is certified. In the event that an eligible hospital or CAH has certified EHR technology that is certified to the 2014 Edition and not certified to all 16 CQMs that would be available for reporting in 2017 under our proposals, we proposed to require that an eligible hospital or CAH would need to have its EHR technology certified to all such CQMs in order to meet the reporting requirements for 2017. For electronic reporting in 2017, this means eligible hospitals and CAHs would be required to use the Spring 2016 version of the CQM electronic specifications available on the eCQI Resource Center Web page (*https://ecqi.healthit.gov/*). We solicited public comment on this proposal.

Comment: One commenter expressed concern that the vendor community will not have adequate time to deliver the updated products to the market in time for all providers to meet the reporting requirements for CY 2107, which would require use of EHR technology certified to the 2015 Edition. The commenter explained that the proposed changes in CQM reporting necessitates sufficient time for vendors and providers to test and deploy CEHRT. The commenter acknowledged that measures need to evolve, but stated that a balance needs to be reached such that the churn around development and deployment is not endless. Therefore, the commenter urged CMS to make greater strides to enact a ''predictable'' cycle from measure development to provider data submission.

Response: We believe requiring use of the most recent version of the CQM electronic specification for each CQM is important in allowing us to collect relevant clinical and electronic data. We note that the commenter's statement regarding the use of EHR technology certified to the 2015 Edition is not accurate and clarify that CMS proposed to accept the use of EHR technology certified to the 2014 or 2015 Edition for CQM reporting in 2017. We further note that, consistent with prior policy, a provider may continue to use their current certified health IT module for CQMs as an EHR certified for CQMs under the 2014 Edition certification criteria and it does not need to be recertified each time it is updated to a more recent version of the CQMs (80 FR 62889). With the continuing evolution of technology and clinical standards, as well as the need for a predictable cycle from measure development to provider data submission, on December 31, 2015, we published in the **Federal Register** (80 FR 81824 through 81828) a Request for Information: Certification Frequency and Requirements for the Reporting of Quality Measures Under CMS Programs. We requested comments on the establishment of an ongoing cycle for the introduction and certification of new measures, the testing of updated measures, and the testing and certification of submission capabilities in future rulemaking. We intend to address such policies in future rulemaking.

Comment: One commenter expressed concern that requiring electronic submission of CQM data using the most recent version of the CQM electronic specification for each CQM may create a disconnect in the timing cycle of the regulatory adoption of standards and the rapid evolution of electronic standards for CQM reporting. The commenter recommended that CMS and ONC collaborate to establish a regulatory framework that is more responsive to the speed at which standards are developed, maintained, upgraded and improved.

Response: We appreciate the commenter's concerns about the rapidly evolving electronic standards and the timing cycle for the regulatory adoption of standards; we will continue to collaborate with colleagues at ONC to ensure that our policies are responsive to evolving electronic standards to the greatest extent feasible.

Comment: Several commenters supported the proposals to align the CERHT requirements, measure set, and deadlines between the Medicare and Medicaid EHR Incentive Programs and the Hospital IQR Program because these proposals would decrease the burden on organizations who currently report for both programs.

Response: We thank the commenters for this support.

Comment: A few commenters supported the alignment of the reporting requirements for the EHR Incentive Programs and the Hospital IQR Program, which would reduce provider burden and minimize confusion about reporting criteria across various quality reporting programs. However, these commenters expressed concern about the expansion of CQMs with the current state of EHR technology. One commenter urged CMS, as part of its certification process, to seek stakeholder input and to define standards and structure for EHR vendors that allows documentation to fit into the clinical workflow and interact with providers at the point-of-contact to guide them to provide timely and appropriate care. One commenter urged CMS to utilize chart abstraction for quality reporting until the EHR transformation is made to allow clinicians to focus on delivering high quality patient focused care without the distraction of CQM reporting using an EHR structure that has yet to evolve to support true meaningful use.

Response: We thank the commenters for this support. We will continue to seek stakeholder input to define standards and structure for EHR vendors that allows documentation to fit into the clinical workflow and interact with providers at the point-of-contact to guide them to provide timely and appropriate care. We appreciate the commenter's recommendation to utilize chart abstraction for quality reporting until EHR systems are more mature. However, when eligible hospitals and CAHs work with their vendors to ensure that EHRs are appropriately structured in a way that fits in with the clinical work flow to yield reliable data through electronic CQMs, we believe that electronic CQMs promote high quality outcomes, lower costs, and ultimately decrease reporting burden on hospitals as compared with chart-abstracted CQMs.

After consideration of the public comments we received, we are finalizing our proposal to continue the policy that electronic submission of CQMs will require the use of the most recent version of the CQM electronic specification for each CQM to which the EHR is certified. In the event that an eligible hospital or CAH has certified EHR technology that is certified to the 2014 Edition and not certified to the 16 available CQMs (as established in this final rule) that would be available for reporting in 2017 under our finalized polices, we are finalizing our proposal that requires an eligible hospital or CAH to have its EHR technology certified to such CQMs in order to meet the reporting requirements for 2017.

As noted in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49759), an EHR certified for CQMs under the 2014 Edition certification criteria does not need to be recertified each time it is updated to a more recent version of the CQMs. We proposed to accept the use of EHR technology certified to the 2014 or 2015 Edition for CQM reporting in 2017. Certification to the 2015 Edition is expected to be available beginning in 2016. (For further information on CQM reporting, we refer readers to the EHR Incentive Program Web site where guides and tip sheets are available for each reporting option (*http://www.cms.gov/ehrincentiveprograms*).) As noted in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49759), we encourage health IT developers to test any updates, including any updates to the CQMs and CMS reporting requirements based on the CMS Implementation Guide for Quality Reporting Document Architecture (QRDA) Category I and Category III (CMS Implementation Guide for QRDA) for Eligible Professional Programs and Hospital Quality Reporting (HQR), on an annual basis.

The form and method of electronic submission are further explained in subregulatory guidance and the certification process. For example, the following documents are updated annually to reflect the most recent CQM electronic specifications: The CMS Implementation Guide for QRDA; program specific performance calculation guidance; and CQM electronic specifications and guidance documents. These documents are located on the eCQI Resource Center Web page: (*https://ecqi.healthit.gov/*).

We invited public comments on these proposals.

We did not receive comments on our proposed policy. Therefore, we are finalizing our proposal to accept the use of EHR technology certified to the 2014 or 2015 Edition for CQM reporting in 2017.

IX. MedPAC Recommendations

Under section 1886(e)(4)(B) of the Act, the Secretary must consider MedPAC's recommendations regarding hospital inpatient payments. Under section 1886(e)(5) of the Act, the Secretary must publish in the annual proposed and final IPPS rules the Secretary's recommendations regarding MedPAC's recommendations. We have reviewed MedPAC's March 2016 ''Report to the Congress: Medicare Payment Policy'' and have given the recommendations in the report consideration in conjunction with the policies set forth in this final rule. MedPAC recommendations for the IPPS for FY 2017 are addressed in Appendix B to this final rule.

For further information relating specifically to the MedPAC reports or to obtain a copy of the reports, contact MedPAC at (202) 653–7226, or visit MedPAC's Web site at: *http://www.medpac.gov.*

X. Other Required Information

A. Requests for Data From the Public

In order to respond promptly to public requests for data related to the prospective payment system, we have established a process under which commenters can gain access to raw data on an expedited basis. Generally, the data are now available on compact disc (CD) format. However, many of the files are available on the Internet at: *http://www.cms.hhs.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html.* We listed the data files and the cost for each file, if applicable, in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25247 through 25249).

Commenters interested in discussing any data files used in construction of this final rule should contact Michael Treitel at (410) 786–4552.

B. Collection of Information Requirements

1. Statutory Requirement for Solicitation of Comments

Under the Paperwork Reduction Act of 1995, we are required to provide 60-day notice in the **Federal Register** and solicit public comment before a collection of information requirement is submitted to the Office of Management and Budget (OMB) for review and approval. In order to fairly evaluate whether an information collection should be approved by OMB, section 3506(c)(2)(A) of the Paperwork Reduction Act of 1995 requires that we solicit comment on the following issues:

- The need for the information collection and its usefulness in carrying out the proper functions of our agency.
- The accuracy of our estimate of the information collection burden.
- The quality, utility, and clarity of the information to be collected.
- Recommendations to minimize the information collection burden on the affected public, including automated collection techniques.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25249 through 25257), we solicited public comment on each of these issues for the following sections of this document that contain information collection requirements (ICRs) (except for the ICRs addressed under section X.B.5. of the preamble of this final rule).

2. ICRs for Add-On Payments for New Services and Technologies

Section II.H.1. of the preambles of the proposed rule (81 FR 25031 through 25033) and this final rule discusses add-on payments for new services and technologies. Specifically, this section states that applicants for add-on payments for new medical services or technologies for FY 2018 must submit a formal request. A formal request includes a full description of the clinical applications of the medical service or technology and the results of any clinical evaluations demonstrating that the new medical service or technology represents a substantial clinical improvement. In addition, the request must contain a significant sample of the data to demonstrate that the medical service or technology meets the high-cost threshold.

We believe the burden associated with this requirement is exempt from the PRA under 5 CFR 1320.3(c), which defines the agency collection of information subject to the requirements of the PRA as information collection imposed on 10 or more persons within any 12-month period. This information collection does not impact 10 or more entities in a 12-month period. For FYs 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, and 2017, we received 1, 4, 5, 3, 3, 5, 5, 7, 9, and 9 applications, respectively. (We note that 2 applications received for FY 2017 that were discussed in the proposed rule are not addressed in this final rule because the technology did not receive FDA approval by July 2016.)

We did not receive any public comments regarding this information collection.

3. ICRs for the Occupational Mix Adjustment to the FY 2017 Wage Index (Hospital Wage Index Occupational Mix Survey)

Section III.E. of the preambles of the proposed rule (81 FR 25064 through 25065) and this final rule discuss the occupational mix adjustment to the proposed and final FY 2017 wage index. While the preamble does not contain any new ICRs, we note that there is an OMB approved information collection request associated with the hospital wage index.

Section 304(c) of Public Law 106–554 amended section 1886(d)(3)(E) of the Act to require us to collect data at least once every 3 years on the occupational mix of employees for each short-term, acute care hospital participating in the Medicare program in order to construct

an occupational mix adjustment to the wage index. We collect the data via the occupational mix survey.

The burden associated with this information collection requirement is the time and effort required to collect and submit the data in the Hospital Wage Index Occupational Mix Survey to CMS. The aforementioned burden is subject to the PRA; it is currently approved under OMB control number 0938–0907.

We did not receive any public comments regarding this information collection.

4. Hospital Applications for Geographic Reclassifications by the MGCRB

Section III.J.3. of the preambles of the proposed rule (81 FR 25069) and this final rule discuss changes to the proposed and final wage index based on hospital reclassifications. As stated in that section, under section 1886(d)(10) of the Act, the MGCRB has the authority to accept short-term IPPS hospital applications requesting geographic reclassification for wage index and to issue decisions on these requests by hospitals for geographic reclassification for purposes of payment under the IPPS.

The burden associated with this application process is the time and effort necessary for an IPPS hospital to complete and submit an application for reclassification to the MGCRB. The burden associated with this requirement is subject to the PRA. It is currently approved under OMB control number 0938–0573.

We did not receive any public comments regarding this information collection.

5. ICRs for Application for GME Resident Slots

The information collection requirements associated with the preservation of resident cap positions from closed hospitals, addressed under section IV.J.3. of the preamble of this final rule, are not subject to the Paperwork Reduction Act, as stated in section 5506 of the Affordable Care Act.

6. ICRs for the Notice of Observation Treatment by Hospitals and CAHs

In section IV.L. of the preambles of the proposed rule (81 FR 25131 through 25134) and this final rule, we discuss our implementation of the NOTICE Act (Pub. L. 114–42), which amended section 1866(a)(1) of the Act to require hospitals and CAHs to provide written and oral notification to Medicare beneficiaries receiving observation services as outpatients for more than 24 hours. We have developed a standardized format for the notice (the MOON), which will be disseminated during the normal course of related business activities. The standardized notice discussed in this final rule is simultaneously being subject to public review and comment through the Office of Management and Budget (OMB) Paperwork Reduction Act process before implementation under OMB control number 0938–new.

In the proposed rule, we estimated that it would take hospitals and CAHs 5 minutes (0.0833 hour) to complete and deliver each notice. We estimated an annual cost burden of $5,461,430 or approximately $889.19 per hospital or CAH.

Comment: A number of commenters suggested that CMS had underestimated the burden. Some commenters believed that the estimates did not account fully for the costs that hospitals and CAHs will incur for business functions such as system programming, creating internal operating procedures, scanning, and translation. One commenter suggested that CMS break out the burden separately for CAHs and non-CAHs. One commenter was concerned that the burden on smaller, rural hospitals would be particularly large. One commenter recommended that the estimated delivery time should be increased.

Response: We believe the burden estimate in the proposed rule appropriately took into account the time to gather and enter the necessary data and information (including the information to be inserted into the free-text fields), review the instructions, complete and review necessary responses, and deliver the notice to the beneficiary. The burden estimates were not intended to include time spent on customary and usual business practices. We did not break out the impact on CAHs and non-CAHs separately, as we anticipate a general, comparable burden on CAHs and hospitals.

As discussed below, we have reassessed our proposed burden estimate and for this final rule and we have increased the estimated time for hospitals to prepare and deliver the MOON from 5 minutes to 15 minutes. This increase addresses the public comments received on the proposed rule related to the burden specific to the requirements for delivery of the MOON; for example, the population of a free text field on the MOON to indicate why a beneficiary is receiving outpatient observation services. We believe the increase from 5 minutes to 15 minutes adequately accounts for additional time spent complying with the MOON delivery requirements.

For this final rule, we estimate that it will take hospitals and CAHs 15 minutes (0.25 hour) to complete and deliver each notice. In 2014, there were approximately 1,399,999 claims for Medicare outpatient observation services lasting greater than 24 hours furnished by 6,142 hospitals and CAHs.[393] The annual hour burden is estimated to be 350,000 (1,399,999 responses × 0.25 hour). To derive average cost, we used data from the U.S. Bureau of Labor Statistics' May 2014 National Occupational Employment and Wage Estimates for all salary estimates (*http://www.bls.gov/oes/current/oes_nat.htm*). In this regard, we used the mean hourly wage of $33.55 and the cost of fringe benefits, $33.55 (calculated at 100 percent of salary), to determine an adjusted hourly wage of $67.10. This is necessarily a rough adjustment because fringe benefits and overhead costs vary significantly from employer to employer, methods of estimating these costs vary widely from study to study, and hospitals vary widely both in terms of size and geographic location. Nonetheless, there is no practical alternative and we believe that doubling the hourly wage to estimate total cost is a reasonable accurate estimation method. The cost per response is approximately $16.78 based on an hourly salary rate of $67.10 and the 15-minute response estimate. By multiplying the annual responses by $16.78, the annual cost burden estimate is $23,491,983 (1,399,999 responses × $16.78) or approximately $3,824.81 per hospital or CAH ($23,491,983/6,142).

7. ICRs for the Hospital Inpatient Quality Reporting (IQR) Program

The Hospital IQR Program (formerly referred to as the Reporting Hospital Quality Data for Annual Payment (RHQDAPU) Program) was originally established to implement section 501(b) of the MMA, Public Law 108–173. This program expanded our voluntary Hospital Quality Initiative. The Hospital IQR Program originally consisted of a ''starter set'' of 10 quality measures. The collection of information associated with the original starter set of quality measures was previously approved under OMB control number 0938–0918. All of the information collection requirements previously approved under OMB control number 0938–0918 have been combined with the information collection request currently approved under OMB control number 0938–1022. We no longer use OMB control number 0938–0918.

[393] Source: CMS Office of Enterprise and Data Analytics.

We added additional quality measures to the Hospital IQR Program and submitted the information collection request to OMB for approval. This expansion of the Hospital IQR Program measures was part of our implementation of section 5001(a) of the Deficit Reduction Act of 2005 (DRA). Section 1886(b)(3)(B)(viii)(III) of the Act, added by section 5001(a) of the DRA, requires that the Secretary expand the ''starter set'' of 10 quality measures that were established by the Secretary as of November 1, 2003, to include measures ''that the Secretary determines to be appropriate for the measurement of the quality of care furnished by hospitals in inpatient settings.'' The burden associated with these reporting requirements is currently approved under OMB control number 0938–1022.

In section VIII.A.3.b. of the preamble of this final rule, we are finalizing our proposal to remove 13 eCQM versions of measures, 2 ''topped-out'' chart-abstracted measures, and 2 structural measures, beginning with the FY 2019 payment determination. However, we note that the total number of measures removed is 15 because the STK–4 and VTE–5 measures were removed twice—once in the chart-abstracted form and again in electronic form.

The 13 eCQM versions of measures we are removing are: (1) AMI–2: Aspirin Prescribed at Discharge for AMI (NQF #0142); (2) AMI–7a: Fibrinolytic Therapy Received Within 30 minutes of Hospital Arrival; (3) AMI–10: Statin Prescribed at Discharge; (4) HTN: Healthy Term Newborn (NQF #0716); (5) PN–6: Initial Antibiotic Selection for Community-Acquired Pneumonia (CAP) in Immunocompetent Patients (NQF #0147); (6) SCIP–Inf–1a: Prophylactic Antibiotic Received within 1 Hour Prior to Surgical Incision (NQF #0527); (7) SCIP–Inf–2a: Prophylactic Antibiotic Selection for Surgical Patients (NQF #0528); (8) SCIP–Inf–9: Urinary Catheter Removed on Postoperative Day 1 (POD1) or Postoperative Day 2 (POD2) with Day of Surgery Being Day Zero; (9) STK–4: Thrombolytic Therapy (NQF #0437); (10) VTE–3: Venous Thromboembolism Patients with Anticoagulation Overlap Therapy (NQF #0373); (11) VTE–4: Venous Thromboembolism Patients Receiving Unfractionated Heparin (UFH) with Dosages/Platelet Count Monitoring by Protocol (or Nomogram); (12) VTE–5: Venous Thromboembolism Discharge Instructions; and (13) VTE–6: Incidence of Potentially Preventable Venous Thromboembolism. The two chart-abstracted measures we are removing are: (1) STK–4: Thrombolytic Therapy (NQF #0437); and (2) VTE–5: Venous Thromboembolism Discharge Instructions. The two structural measures we are removing are: (1) Participation in a Systematic Clinical Database Registry for Nursing Sensitive Care; and (2) Participation in a Systematic Clinical Database Registry for General Surgery.

We believe that removing 13 eCQMs will reduce burden for hospitals, as they will have a smaller number of eCQMs from which to select. As finalized in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49698), hospitals are required to select 4 out of 28 available eCQMs on which to report data beginning with the FY 2018 payment determination. As discussed below, in this rule, we are not finalizing our proposal that hospitals must report on all of the available eCQMs in the Hospital IQR Program. Instead, we are finalizing a modified version of our proposal and requesting that, for the CY 2017 reporting period/FY 2019 payment determination and CY 2018 reporting period/FY 2020 payment determination, hospitals must report on 8 of the available eCQMs in the Hospital IQR Program. Because 13 eCQMs are being removed from a pool of 28 eCQMs, hospitals will then have a total pool of only 15 eCQMs to choose from, which will decrease the burden associated with selecting and reporting data. However, because we are now requiring hospitals to submit data on 8 of the available eCQMs included in the Hospital IQR Program measure set, the modest reduction in burden associated with the decreased number of eCQMs from which hospitals may choose, will be offset by the increased burden associated with submitting data on 8 eCQMs instead of 4 eCQMs. We discuss the burden associated with our finalized proposal to require the submission of 8 of the available eCQMs included in the Hospital IQR Program measure set below.

We also believe that there will be a reduction in burden for hospitals as a result of the removal of the two chart-abstracted measures listed above (STK–4 and VTE–5). Due to the burden associated with the collection of chart-abstracted data (based on updated measure record abstraction time estimates from the third quarter in 2014 through the second quarter in 2015, the number of reporting periods in a calendar year, and the number of IPPS hospitals reporting), we estimate that the removal of STK–4 will result in a burden reduction of approximately 303,534 hours and approximately $9.9 million across all 3,300 IPPS hospitals participating in the Hospital IQR Program for the FY 2019 payment determination.

In addition, we estimate that the removal of VTE–5 will result in a burden reduction of approximately 1,437,843 hours and approximately $47.2 million across all 3,300 IPPS hospitals participating in the Hospital IQR Program for the FY 2019 payment determination. More specifically, for both the STK and VTE measure sets, we calculated the hours of burden by taking the difference in the burden estimates from this FY 2017 IPPS/LTCH PPS final rule and the burden estimates from the FY 2016 IPPS/LTCH PPS final rule. With regard to STK–4, because it is the only STK measure left in the Hospital IQR Program, and in this FY 2017 IPPS/LTCH PPS final rule, we are finalizing our proposal to remove it, we calculated the total burden hours as follows: 0 hours (time required to report in CY 2017) − 303,534 hours (time required to report in CY 2016) = − 303,534 hours for the STK measure set. With regard to the VTE measure set, we used an updated estimate (based on data from the third quarter of 2014 through second quarter of 2015), that the time per record (that is, to report all 4 of the VTE measures in the Hospital IQR Program during the noted time period) is 28 minutes; thus, we estimate a burden reduction of 7 minutes for removing 1 VTE measure. Based on this estimate, we deducted 21 minutes from the 28-minute estimate to account for the removal of VTE–1, VTE–2, and VTE–3 in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49645) and subsequent removal of VTE–5 in this final rule, for a total of 7 minutes to report on the one remaining VTE chart-abstracted measure in the Hospital IQR Program. We then calculated the estimated total hours of burden per hospital for reporting the remaining VTE measure as follows: 7 minutes per record/60 minutes per hour × 4 reporting quarters per year × 198.05 records per hospital per quarter = 92 burden hours per hospital. Because there are 3,300 IPPS hospitals, we then multiplied 92 hours per hospital × 3,300 hospitals to get a total annual burden estimate of 304,997 hours to report the 1 remaining measure in the VTE measure set. The reduction in the total burden hours for VTE from this FY 2017 IPPS/LTCH PPS final rule and the FY 2016 IPPS/LTCH PPS final rule, is calculated as follows: 304,997 (FY 2017 total annual estimate) − 1,742,840 (FY 2016 total annual estimate) = − 1,437,843 hours for the VTE measure set. We note that this burden estimate is revised based on the updated estimates mentioned above, and as such, is different from what we stated in the proposed rule (81 FR 25251). In the FY

2017 IPPS/LTCH PPS proposed rule, we used the incorrect time estimate (3 minutes) associated with the removal of one VTE measure.

We believe that there will be a negligible burden reduction due to the removal of two structural measures. Consistent with previous years (80 FR 49762), we estimate a burden of 15 minutes per hospital to report all four previously finalized structural measures and to complete other forms (such as the Extraordinary Circumstances Extension/Exemption Request Form). Therefore, our burden estimate of 15 minutes per hospital remains unchanged because we believe the reduction in burden associated with removing these two structural measures will be sufficiently minimal that it will not substantially impact this estimate.

In addition, in section VIII.A.6. of the preamble of this final rule, we discuss refinements to two previously adopted measures beginning with the FY 2018 payment determination: (1) Expanding the cohort for the Hospital-Level, Risk-standardized Payment Associated with a 30-Day Episode-of-Care for Pneumonia (NQF #2579); and (2) adopting the modified Patient Safety and Adverse Events Composite (NQF #0531). Because these claims-based measures can be calculated based on data that are already reported to the Medicare program for payment purposes, we believe no additional burden on hospitals will result from the refinements to these two claims-based measures.

Also, in section VIII.A.7. of the preamble of this final rule, we discuss our adoption of four claims-based measures to the Hospital IQR Program measure set beginning with the FY 2019 payment determination: (1) Aortic Aneurysm Procedure Clinical Episode-Based Payment Measure; (2) Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment Measure; (3) Spinal Fusion Clinical Episode-Based Payment Measure; and (4) Excess Days in Acute Care after Hospitalization for Pneumonia. Because these claims-based measures can be calculated based on data that are already reported to the Medicare program for payment purposes, we believe no additional burden on hospitals will result from the addition of these four claims-based measures.

For the FY 2019 payment determination and the FY 2020 payment determination, in section VIII.A.8. of the preamble of this final rule, we are requiring hospitals to submit data for 8 of the available eCQMs included in the Hospital IQR Program measure set in a manner that will permit eligible hospitals to align Hospital IQR Program requirements with some requirements under the Medicare and Medicaid EHR Incentive Programs. This is a modification from our proposal, which was to require all available eCQMs in the Hospital IQR Program measure set. Specifically, hospitals will be required to submit a full calendar year of data on 8 of the 15 eCQMs in the Hospital IQR Program measure set, on an annual basis, for the CY 2017 reporting period/FY 2019 payment determination and the CY 2018 reporting period/FY 2020 payment determination. We believe that the burden associated with submitting a full year of eCQM data will not be substantially greater than the burden associated with transmission of a single quarter of data. As described in section VII.A.10.d of the preamble of this final rule, the CMS data receiving system requires that each QRDA I file include data for one patient, per quarter, per reporting CCN. Once hospitals establish their protocols to ensure this is maintained, hospitals and vendors should not experience much added burden reporting an additional 3 quarters of data. However, in our conservative estimates here, we calculate as if burden is four times as much in an abundance of caution.

We believe that the total burden associated with the eCQM reporting policy will be similar to that previously outlined in the Medicare EHR Incentive Program Stage 2 final rule (77 FR 54126 through 54133). In that final rule, the burden estimate for a hospital to report all 16 eCQMs is 2 hours and 40 minutes (160 total minutes or 10 minutes per measure) per submission for a 3-month period (77 FR 54127). We believe that this estimate is accurate and appropriate to apply to the Hospital IQR Program because we are aligning the eCQM reporting requirements between both programs. Therefore, using the estimate of 10 minutes per measure, we anticipate that our finalized policies to require: (1) Reporting on 8 of the available eCQMs (8 eCQMs for the CY 2017 reporting period/FY 2019 payment determination); and (2) submission of one year of eCQM data (covering Q1, Q2, Q3, and Q4), will result in a burden of 80 minutes per quarter per hospital to report one medical record containing information on all the required eCQMs. In total, for the FY 2019 payment determination, we expect our policy to require hospitals to report data on 8 eCQMs for 4 quarters (as compared to our previously finalized requirement to report data on 4 eCQMs for 1 quarter) to represent a burden increase of 15,400 hours across all 3,300 IPPS hospitals participating in the Hospital IQR Program. This figure was derived by calculating the difference between the FY 2017 burden estimate of 17,600 hours (80 minutes per record/60 minutes per hour × 4 reporting quarters per year × 1 record per hospital per quarter × 3,300 hospitals) and the FY 2016 burden estimate of 2,200 hours (20 minutes per record/60 minutes per hour × 1 reporting quarter per year × 1 record per hospital per quarter × 3,300 hospitals) (80 FR 49763), for an incremental increase of 15,400 hours.

Furthermore, we estimate that reporting these eCQMs can be accomplished by staff with a mean hourly wage of $16.42 per hour.[394] However, obtaining data on other overhead costs is challenging. Overhead costs vary greatly across industries and firm sizes. In addition, the precise cost elements assigned as ''indirect'' or ''overhead'' costs, as opposed to direct costs or employee wages, are subject to some interpretation at the firm level. Therefore, we have chosen to calculate the cost of overhead at 100 percent of the mean hourly wage. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly from employer to employer and because methods of estimating these costs vary widely from study to study. Nonetheless, there is no practical alternative, and we believe that doubling the hourly wage to estimate total cost is a reasonably accurate estimation method. This is a change from how we have accounted for the cost of overhead in our previous rules regarding the Hospital IQR Program. In calculating labor cost, we estimate an hourly labor cost of $32.84 ($16.42 base salary + $16.42 fringe) and a cost increase of $505,736 (15,400 additional burden hours × $32.84 per hour) across approximately 3,300 hospitals participating in the Hospital IQR Program to report a full calendar year of data for 8 eCQMs, on an annual basis.

We did not propose any changes to our validation requirements related to chart-abstracted measures, but provided some background information as basis for our eCQM validation proposals. As noted in the FY 2016 IPPS/LTCH IPPS final rule (80 FR 49762 and 49763), for validation of chart-abstracted data for the FY 2018 payment determination and subsequent years, we require hospitals to provide 72 charts per hospital per year (with an average page length of 1,500), including 40 charts for HAI validation and 32 charts for clinical process of care validation, for a total of

[394] Occupational Outlook Handbook. Available at: *http://www.bls.gov/oes/2012/may/oes292071.htm.*

108,000 pages per hospital per year. We reimburse hospitals at 12 cents per photocopied page (79 FR 50346) for a total per hospital cost of $12,960. For hospitals providing charts digitally via a re-writable disc, such as encrypted CD–ROMs, DVDs, or flash drives, we will reimburse hospitals at a rate of 40 cents per digital media (80 FR 49837), and additionally hospitals will be reimbursed $3.00 per record (78 FR 50956). For hospitals providing charts via secure file transfer, we will reimburse hospitals at a rate of $3.00 per record (78 FR 50835).

In section VIII.A.11. of the preamble of this final rule, beginning in spring 2018 for the FY 2020 payment determination, we discuss our expansion the existing validation process for the Hospital IQR Program data to include a random sample of up to 200 hospitals for validation of eCQMs in the Hospital IQR Program. In previous years (79 FR 50347), we estimated a total burden of 16 hours (960 minutes) for the submission of 12 records, which will equal 1 hour and 20 minutes per record (960 minutes/12 records). Applying the time per individual submission of 1 hour and 20 minutes (or 80 minutes) for the 32 records that hospitals submit beginning with the FY 2020 payment determination, we estimate a total burden of approximately 43 hours (1 hour and 20 minutes × 32 records) for each hospital selected for participation in eCQM validation. We estimate that approximately 43 hours of work for up to 200 hospitals will increase the eCQM validation burden hours from 0 hours (as this is the first instance where eCQM validation is being added as a requirement) to 8,533 labor hours.

As previously stated, with respect to eCQMs, the labor performed can be accomplished by staff, with a mean hourly wage of $16.42.[395] Further, in calculating labor costs, we have chosen to calculate the cost of overhead at 100 percent of the mean hourly wage. Therefore, we estimate a fully burdened labor rate of $32.84 ($16.42 base salary + $16.42 fringe) per hour. Therefore, using these assumptions, we estimate an hourly labor cost of $32.84 and a cost increase of $280,224 (8,533 additional burden hours × $32.84 per hour) across the (up to) 200 hospitals selected for eCQM validation, on an annual basis. Consistent with the chart-abstraction validation process, we will reimburse hospitals providing records via secure file transfer, at a rate of $3.00 per record.

Lastly, in section VIII.A.15. of the preamble of this final rule, we discuss our adoption of updates to our Extraordinary Circumstances Extensions or Exemptions (ECE) policy by: (1) Extending the general ECE request deadline for non-eCQM circumstances from 30 to 90 calendar days following an extraordinary circumstance; and (2) establishing a separate submission deadline for ECE requests with respect to eCQM reporting circumstances of April 1 following the end of the reporting calendar year. Consistent with previous years, we estimate a burden of 15 minutes per hospital to report all forms (including the ECE request form) and structural measures. We believe that the updates to the ECE deadlines will have no effect on burden for hospitals, because we are not making any changes that will increase the amount of time necessary to complete the form. In addition, the burden associated with the completion of this form is included in the 15 minutes allocated for all forms and structural measures.

In summary, under OMB number 0938–1022, we estimate a total burden decrease of approximately 1,717,444 hours, for a total cost decrease of approximately $56.4 million across approximately 3,300 hospitals participating in the Hospital IQR Program as a result of the policies in this final rule.

ANNUAL RECORDKEEPING AND REPORTING REQUIREMENTS UNDER OMB CONTROL NUMBER 0938–1022

Activity	Estimated time per record (minutes) FY 2017	Number reporting quarters per year FY 2017	Number of hospitals reporting	Average number records per hospital per quarter	Annual burden (hours) per hospital	Annual burden (hours) across hospitals FY 2017	Net difference in annual burden hours (FY 2017–FY 2016)
Removal of Stroke (STK–4) measure	0	4	3,300	39	0	0	−303,534
Removal of Venous thromboembolism (VTE–5)	25	4	3,300	198	92	304,997	−1,437,843
Reporting on 8 electronic Clinical Quality Measures	80	4	3,300	1	5.33	17,600	15,400
eCQM Validation	80	4	200	8	43	8,533	8,533

Total Change in Burden Hours: −1,717,444.
Total Cost Estimate: Hourly Wage ($32.84) × Change in Burden Hours (−1,717,444) = −$56,400,861.

This estimate excludes the burden associated with the NHSN and HCAHPS measures, both of which are submitted under separate information collection requests and are approved under OMB control numbers 0920–0666 and 0938–0981, respectively. The burden estimates in this final rule are the estimates for which we are requesting OMB approval.

We received the following public comments regarding our burden estimates.

Comment: Some commenters expressed concern about the amount of change required for documenting new measures, which creates challenges in accurately reflecting patient severity of illness. As an example, one commenter noted that last year's severe sepsis and septic shock measure (SEP–1) introduced requirements for documentation that have not been easily implemented. Therefore, this commenter indicated that the value of very specific documentation has to be weighed against the value for patient care that it brings. Likewise, other commenters expressed concern regarding the number of measures required by Medicare hospital performance and reporting programs

[395] Occupational Outlook Handbook. Available at: *http://www.bls.gov/oes/2012/may/oes292071.htm.*

and the burden associated with reporting, monitoring, and transmitting data for these quality measures. These commenters cited the Institute of Medicine (IOM)'s April 2015 Vital Signs report on Core Metrics for Health and Health Care Progress and recommended that CMS adopt the IOM 15 core measure areas, along with 39 additional priority measures, in which to provide benchmarks and improve overall health system performance, which, they argue, would reduce overall measure burden across all programs by creating a streamlined measure set that provides the most value for patients and providers.

Response: We understand that many of the requirements of the Hospital IQR Program increase the reporting burden on hospitals, and, before proposing any measure, we critically weigh this burden against the benefit we believe will be achieved in the improvement of quality of care. We also note that, this year, every new measure we proposed is claims-based; claims-based measures do not require additional documentation from providers. Thus, there should be no increase in burden based on new measures in this final rule. As we move forward, we will continue to consider the number of measures in this and other programs and consider the aggregate effect of reporting.

8. ICRs for PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

As discussed in sections VIII.B. of the preambles of the proposed rule (81 FR 25205 through 25213) and this final rule, section 1866(k)(1) of the Act requires, for purposes of FY 2014 and each subsequent fiscal year, that a hospital described in section 1886(d)(1)(B)(v) of the Act (a PPS-exempt cancer hospital, or a PCH) submit data in accordance with section 1866(k)(2) of the Act with respect to such fiscal year.

We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 28124), the FY 2014 IPPS/LTCH PPS final rule (78 FR 50957 through 50959), the FY 2015 IPPS/LTCH PPS final rule (79 FR 50347 through 50348), and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49764) for a detailed discussion of the burden for the program requirements that we have previously adopted. Below we discuss only any changes in burden that will result from the proposals we are finalizing in this final rule.

In section VIII.B.3.b. of the preamble of this final rule, we are finalizing our proposal that PCHs submit data on the Oncology: Radiation Dose Limits to Normal Tissues (NQF #0382) measure for an expanded cohort of patients. In the FY 2015 IPPS/LTCH PPS final rule (79 FR 50285) we finalized a sampling methodology for Clinical Process/Oncology Care Measures, which includes the Oncology: Radiation Dose Limits to Normal Tissues measure. Because our previous burden estimates were based on the maximum sample of 25 patients for this measure, the expansion of the patient cohort will increase the pool of patients from which the sample can be drawn but will not raise the burden for this measure beyond that which we described in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50347 through 50348).

In section VIII.B.4.b. of the preamble of this final rule, we are finalizing our proposal to adopt the Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy measure beginning with the FY 2019 program year. This is a claims-based measure, and therefore, does not require PCHs to submit any new data. Thus, this measure will not pose any new burden on PCHs.

In summary, as a result of our finalized policies, we do not anticipate any changes to previously finalized burden estimates.

9. ICRs for the Hospital Value-Based Purchasing (VBP) Program

In section IV.H. of the preambles of the proposed rule (81 FR 25099 through 25177) and this final rule, we discuss requirements for the Hospital VBP Program. Specifically, in this final rule, with respect to quality measures, we are finalizing our proposals to: include selected ward non-Intensive Care Unit (ICU) locations in certain NHSN measures beginning with the FY 2019 program year; adopt the Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Acute Myocardial Infarction (AMI) and the Hospital-Level, Risk-Standardized Payment Associated with a 30-Day Episode-of-Care for Heart Failure (HF) measures beginning with the FY 2021 program year; update the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia (PN) Hospitalization (Updated Cohort) measure beginning with the FY 2021 program year; and adopt the Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Coronary Artery Bypass Graft (CABG) Surgery measure beginning with the FY 2022 program year.

As required under section 1886(o)(2)(A) of the Act, the additional and updated measures are required for the Hospital IQR Program. Therefore, their inclusion in the Hospital VBP Program does not result in any additional burden because the Hospital VBP Program uses data that are required for the Hospital IQR Program. Therefore, the burden associated with these reporting requirements is currently approved under OMB control number 0938–1022.

10. ICRs for the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

As discussed in section VIII.C.5 of the preambles of the proposed rule (81 FR 25214 through 25215) and this final rule, we are retaining the following 13 previously finalized quality measures for use in the LTCH QRP:

LTCH QRP Quality Measures Previously Adopted for the FY 2014 Payment Determinations and Subsequent Years

Measure title	IPPS/LTCH PPS Final rule	Annual payment determination: Initial and subsequent APU years
National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure (NQF #0138).	Adopted an application of the measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51745 through 51747); Adopted the NQF endorsed version and expanded measure (with standardized infection ratio [SIR]) in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53616 through 53619).	FY 2014 payment determination and subsequent years.

LTCH QRP QUALITY MEASURES PREVIOUSLY ADOPTED FOR THE FY 2014 PAYMENT DETERMINATIONS AND SUBSEQUENT YEARS—Continued

Measure title	IPPS/LTCH PPS Final rule	Annual payment determination: Initial and subsequent APU years
National Healthcare Safety Network (NHSN) Central Line-Associated Bloodstream Infection (CLABSI) Outcome Measure (NQF #0139).	Adopted an application of the measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51747 through 51748); Adopted the NQF endorsed and expanded measure (with SIR) in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53616 through 53619).	FY 2014 payment determination and subsequent years.
Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678).	Adopted an application of the measure in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51748 through 51750); Adopted the NQF endorsed version in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50861 through 50863); Adopted in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49731 through 49736) to fulfill IMPACT Act requirements.	FY 2014 payment determination and subsequent years.
Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680).	Adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53624 through 53627); Revised data collection timeframe in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50858 through 50861); Revised data collection timeframe in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50289 through 50290).	FY 2016 payment determination and subsequent years.
Influenza Vaccination Coverage among Healthcare Personnel (NQF #0431).	Adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53630 through 53631); Revised data collection timeframe in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50857 through 50858).	FY 2016 payment determination and subsequent years.
National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset Methicillin-Resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure (NQF #1716).	Adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50863 through 50865).	FY 2017 payment determination and subsequent years.
National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure (NQF #1717).	Adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50865 through 50868).	FY 2017 payment determination and subsequent years.
All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from Long-Term Care Hospitals (NQF #2512).	Adopted in FY 2014 IPPS/LTCH PPS final rule (78 FR 50868 through 50874); Adopted the NQF endorsed version in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49730 through 49731).	FY 2017 payment determination and subsequent years.
National Healthcare Safety Network (NHSN) Ventilator-Associated Event (VAE) Outcome Measure.	Adopted in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50301 through 50305).	FY 2018 payment determination and subsequent years.
Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674).	Adopted in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50874 through 50877); Revised data collection timeframe in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50290 through 50291); Adopted an application of the measure in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49736 through 49739) to fulfill IMPACT Act requirements.	FY 2018 payment determination and subsequent years.
Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631).	Adopted in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50291 through 50298).	FY 2018 payment determination and subsequent years.
Functional Outcome Measure: Change in Mobility among Long-Term Care Hospital Patients Requiring Ventilator Support (NQF #2632).	Adopted in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50298 through 50301).	FY 2018 payment determination and subsequent years.
Application of Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631).	Adopted an application of the measure in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49739 through 49747) to fulfill IMPACT Act requirements.	FY 2018 payment determination and subsequent years.

As discussed in section VIII.C.6 and VIII.C.7 of the preamble of this final rule, we are finalizing the addition of the following four measures for use in the LTCH QRP:

LTCH QRP QUALITY MEASURES NEWLY FINALIZED FOR THE FY 2018 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Measure title	Annual payment determination: Initial and subsequent APU years
Potentially Preventable 30-Day Post-Discharge Readmission Measure for LTCH QRP *	FY 2018 payment determination and subsequent years.

LTCH QRP QUALITY MEASURES NEWLY FINALIZED FOR THE FY 2018 PAYMENT DETERMINATION AND SUBSEQUENT YEARS—Continued

Measure title	Annual payment determination: Initial and subsequent APU years
Discharge to Community-PAC LTCH QRP *	FY 2018 payment determination and subsequent years.
MSPB–PAC LTCH QRP *	FY 2018 payment determination and subsequent years.
Drug Regimen Review Conducted with Follow-Up for Identified Issues—PAC LTCH QRP **	FY 2020 payment determination and subsequent years.

* Finalized in this FY 2017 IPPS/LTCH PPS final rule for the FY 2018 payment determination and subsequent years.
** Finalized in this FY 2017 IPPS/LTCH PPS final rule for the FY 2020 payment determination and subsequent years.

Currently, LTCHs use two separate data collection mechanisms to report quality data to CMS. Six of the 13 measures being retained in this FY 2017 IPPS/LTCH PPS final rule are currently collected via the CDC's NHSN. The NHSN is a secure, Internet-based HAI tracking system maintained and managed by the CDC. The NHSN enables health care facilities to collect and use data about HAIs, adherence to clinical practices known to prevent HAIs, and other adverse events within their organizations. NHSN data collection occurs via a Web-based tool hosted by the CDC and is provided free of charge to facilities. In the proposed rule, we did not propose any new quality measures that would be collected via the CDC's NHSN. Therefore, at this time, there will be no additional burden related to this submission method. Any burden related to NHSN-based quality measures we have retained in this final rule has been previously discussed in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50443 through 50445) and FY 2016 IPPS/LTCH PPS final rule (80 FR 49766) and has been previously approved under OMB control number 0920–0666, with an expiration date of November, 31, 2016.

In addition to the previously finalized All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge From LTCHs (NQF #2512), we are finalizing our proposals to add three Medicare FFS claims-based measures in this final rule: Potentially Preventable 30 Day Post-Discharge Readmission Measure for LTCH QRP; Discharge to Community-PAC LTCH QRP; and MSBP–PAC LTCH QRP. Because these claims-based measures will be calculated based on data that are already reported to the Medicare program for payment purposes, we believe no additional information collection will be required from the LTCHs. We did not propose new assessment-based quality measures in the LTCH QRP in the proposed rule for the FY 2018 payment determination and subsequent years.

The remaining assessment-based quality measure data are reported to CMS by LTCHs using the LTCH CARE Data Set. In section VIII.C.9.d. of the preamble of this of this final rule, we discuss our proposal to expand the data collection timeframe for the measure Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) (77 FR 53624 through 53627), beginning with the FY 2019 payment determination. The data collection time frame and associated data submission deadlines are currently aligned with the Influenza Vaccination Season (IVS) (October 1 of a given year through March 31 of the subsequent year), and only require data collection during the 2 calendar year quarters that align with the IVS. We are finalizing our proposal to expand the data collection timeframe from just 2 quarters (covering the IVS) to a full four quarters or 12 months. We refer readers to section VIII.C.9.d. of the preamble of this final rule for further details on the expansion of data collection for the Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680), including data collection timeframes and associated submission deadlines. We originally finalized this measure for use in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53624 through 53627). Although we finalized data collection for this measure to coincide with the IVS, we originally proposed year-round data collection. The associated PRA package, which was approved under OMB control number 0938–1163, included burden calculations that aligned with our original proposal for year-round data collection. All subsequent PRA packages, and the PRA package that is currently under review, included burden calculations reflecting year-round (12 month) data collection for this measure. Because of this, the change in the data collection timeframe for this measure, and any associated burden related to increased data collection, has already been accounted for in the total burden figures included in this section of the preamble of this final rule.

For the FY 2020 payment determination and subsequent years, we are finalizing our proposal to use one new assessment based quality measure in the LTCH QRP: Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP. This is a cross-setting measure that satisfies the required addition of a quality measure under the domain of medication reconciliation, as mandated by section 1899B of the Act, as added by the IMPACT Act. In addition to the newly finalized Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP quality measure, the remaining six measures, outlined below, will continue to be collected utilizing the LTCH CARE Data Set.

The LTCH CARE Data Set Version 2.01 has been approved under OMB control number 0938–1163. The LTCH CARE Data Set Version 2.01 contains data elements related to patient demographic data, various voluntary questions, as well as data elements related to the following quality measures:

- Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (Short Stay) (NQF #0678);
- Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680).

We have submitted a revision to the PRA package that addressed the changes from LTCH CARE Data Set Version 2.01 to Version 3.00. The LTCH CARE Data Set Version 3.00, which was implemented April 1, 2016, contains those data elements included in Version 2.01, as well as additional data elements in order to allow for the collection of data associated with the following quality measures:

- Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674) (previously finalized in the FY 2016 IPPS/LTCH PPS final rule);

• Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631) (previously finalized in the FY 2015 IPPS/LTCH PPS final rule);

• Functional Outcome Measure: Change in Mobility Among Long-Term Care Hospital Patients Requiring Ventilator Support (NQF #2632) (previously finalized in the FY 2015 IPPS/LTCH PPS final rule); and

• Application of Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF # 2631) (previously finalized in the FY 2016 IPPS/LTCH PPS final rule).

The LTCH CARE Data Set Version 4.00, effective April 1, 2018, will contain those data elements included in Version 3.00, as well as additional data elements in order to allow for the collection of data associated with the newly finalized quality measure: Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP.

Each time we add new data elements to the LTCH CARE Data Set related to newly proposed or finalized LTCH QRP quality measures, we are required by the PRA to submit the expanded data collection instrument to OMB for review and approval. Section 1899B(m) of the Act, as added by IMPACT Act, provides that the PRA requirements do not apply to section 1899B of the Act and the sections referenced in section 1899B(a)(2)(B) of the Act that require modifications in order to achieve the standardization of patient assessment data. We believe that the LTCH CARE Data Set Version 3.00 falls under the PRA provisions in section 1899B(m) of the Act. We believe that all additional data elements added to the LTCH CARE Data Set Version 3.00 are for the purpose of standardizing patient assessment data, as required under section 1899B(a)(2)(B) of the Act. As noted above, the LTCH CARE Data Set Version 3.00 will be updated to Version 4.00, effective April 1, 2018, to include data elements for the newly finalized Drug Regimen Review Conducted with Follow-Up for Identified Issues- PAC LTCH QRP quality measure. For the reasons discussed above, we believe that the LTCH CARE Data Set Version 4.00 also falls under the PRA provisions in section 1899B(m) of the Act.

A comprehensive list of all data elements included in the LTCH CARE Data Set Version 3.00 is available in the LTCH QRP Manual which is accessible on the LTCH QRP Web site at: *https://www.cms.gov/Medicare/Quality-Initiatives-Patient-Assessment-Instruments/LTCH-Quality-Reporting/index.html*. For a discussion of burden related to LTCH CARE Data Set Version 3.00, we refer readers to section I.M. of Appendix A of this final rule.

We discuss and respond to public comments we received on these information collection requirements in the section I.M. of Appendix A of this final rule.

11. ICRs for the Inpatient Psychiatric Facility Quality Reporting (IPFQR) Program

Section 1886(s)(4) of the Act, as added and amended by sections 3401(f) and 10322(a) of the Affordable Care Act, requires the Secretary to implement a quality reporting program for inpatient psychiatric hospitals and psychiatric units. We refer to this program as the Inpatient Psychiatric Facility Quality Reporting (IPFQR) Program.

In section VIII.D. of the preambles of the proposed rule (81 FR 25238 through 25244) and this final rule, we are finalizing the following measure-related changes: To update a previously finalized measure (Screening for Metabolic Disorders); and to adopt two new measures beginning with the FY 2019 payment determination (SUB–3 Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge and subset measure SUB–3a Alcohol & Other Drug Use Disorder Treatment at Discharge (NQF #1664), and Thirty-day all-cause unplanned readmission following psychiatric hospitalization in an IPF). In addition, we are finalizing our proposal to include SUB–3: Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge and subset measure SUB–3a: Alcohol & Other Drug Use Disorder Treatment at Discharge (NQF #1664) in the list of measures covered by the global sample for the FY 2019 payment determination and subsequent years as proposed. We also are finalizing that we will make the data for the IPFQR Program available as soon as possible and to no longer specify in rulemaking when measure data will be publicly available, when the approximately 30-day preview period will occur, or that the preview period will begin approximately 12 weeks before the public display date, but rather to announce these using subregulatory guidance. Lastly, for the FY 2017 payment determination only, we are also finalizing our proposal that, if it is technically feasible to display the data in December 2016, we will provide data to IPFs for a 2-week preview period that will start on October 1, 2016 as proposed. Moreover, we are finalizing as proposed that as a courtesy, for the FY 2017 payment determination only, if we are able to display the data in December 2016, we will ensure that IPFs have approximately 30 days for review if they so choose by providing IPFs with their data as early as mid-September.

We refer readers to the FY 2015 IPF PPS final rule (79 FR 45978 through 45980) and the FY 2016 IPF PPS final rule (80 FR 46720 through 46721) for a detailed discussion of the burden for the IPFQR Program requirements that we have previously adopted. Below we discuss only the changes in burden resulting from the newly finalized policies in this final rule. Although we are finalizing provisions that impact policies beginning in both the FY 2017 and FY 2019 payment determinations, IPFs must take steps to comply with all of these policies beginning in FY 2017. For example, data collection for the measures that affect FY 2019 payment determination begins in FY 2017, and the changes to the public display dates take effect beginning with the posting of data that informs the FY 2017 payment determination on *Hospital Compare* during FY 2017. For purposes of calculating burden, we will attribute the costs to the year in which these costs begin; for the purposes of all of the newly finalized policies in this final rule, that year is FY 2017.

We believe that approximately 1,684 [396] IPFs will participate in the IPFQR Program for requirements occurring in FY 2017 and subsequent years. Based on program data, we believe that each IPF will submit measure data on approximately 848 [397] cases per year. In prior rulemaking, we estimated that the time required to chart-abstract data for chart-abstracted measures is 12 minutes per case per measure.[398] Based on the experience of other quality reporting programs, such as the Hospital IQR Program, we are updating this estimate to 15 minutes (that is, 0.25 hour) per case per measure. We are only finalizing one new chart-abstracted measure this year: SUB–3/subset SUB–3a. The other measure that we are finalizing, Thirty-day all-cause unplanned readmission following psychiatric hospitalization in an IPF, is claims-based and, therefore, does not require IPFs to report any additional data.

We estimate that reporting data for the IPFQR Program measures can be

[396] In the FY 2016 IPF PPS final rule, we estimated 1,617 IPFs and are adjusting that estimate by +67 to account for more recent data.

[397] In the FY 2016 IPF PPS final rule, we estimated 431 cases per year and are adjusting that estimate by +417 to account for more recent data.

[398] 80 FR 46720.

accomplished by staff with a mean hourly wage of $16.42.[399] However, obtaining data on other overhead costs is challenging. Overhead costs vary greatly across industries and firm sizes. In addition, the precise cost elements assigned as ''indirect'' or ''overhead'' costs, as opposed to direct costs or employee wages, are subject to some interpretation at the firm level. Therefore, we have chosen to calculate the cost of overhead at 100 percent of the mean hourly wage. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly from employer to employer and because methods of estimating these costs vary widely from study to study. Nonetheless, there is no practical alternative, and we believe that doubling the hourly wage to estimate total cost is a reasonably accurate estimation method. In calculating the labor cost, we estimate an hourly labor cost of $32.84 ($16.42 base salary + $16.42 fringe). The following table presents the mean hourly wage, the cost of fringe benefits (calculated at 100 percent of salary), and the adjusted hourly wage.

OCCUPATIONAL EMPLOYMENT AND WAGE ESTIMATES

Occupation title	Occupation code	Mean hourly wage ($/hr)	Fringe benefit (at 36.25% in $/hr)	Adjusted hourly wage ($/hr)
Medical Records and Health Information Technician	29–2071	16.42	16.42	32.84

We do not believe that our update to a previously finalized measure will affect our previous burden estimate for that measure. As noted above, one of our newly finalized measures is claims-based and will not result in increased burden. Therefore, increased burden will occur primarily as a result of our newly finalized chart-abstracted measure. We estimate that this measure will result in an increase in burden of 212 hours per IPF (1 measure × (848 cases/measure × 0.25 hour/case)) or 357,008 hours across all IPFs (212 hours/IPF × 1,684 IPFs). The increase in costs will be approximately $6,962 per IPF (212 hours × $32.84/hour) or $11,724,143 across all IPFs (357,008 hours × 32.84/hour).

Consistent with our estimates in the FY 2015 IPF PPS final rule (79 FR 45979), we believe the estimated burden for training personnel on the revised data collection and submission requirements will be 2 hours per IPF or 3,368 hours (2 hours/IPF × 1,684 IPFs) across all IPFs. Therefore, we estimate the cost for this training will be $65.68 ($32.84/hour × 2 hours) for each IPF or $110,605 ($32.84/hour × 3,368 hours) for all IPFs.

Finally, IPFs must submit to CMS aggregate population counts for Medicare and non-Medicare discharges by age group and diagnostic group, and sample size counts for measures for which sampling is performed (that is, measures eligible for the global sample). Because the population for the SUB–3 and SUB–3a measure is nearly identical to the population for both the SUB–1 measure and the SUB–2 and SUB–2a measure, we believe that the addition of 1 chart-abstracted measure will lead to a negligible change in burden associated with nonmeasure data collection.

In section VIII.D.7. of the preamble of this final rule, we are finalizing our proposal to specify in subregulatory guidance, when measure data will be publicly available and when the preview period will occur, instead of in rulemaking as we have previously done. We are no longer specifying how far in advance of the public display date the preview period will occur. We do not believe this policy will result in any change in burden because it does not require IPFs to report any more or less data. Rather, the timeline for public display of that data is simply shifting.

In the table below, we set out a summary of annual burden estimates.

ANNUAL RECORDKEEPING AND REPORTING REQUIREMENTS UNDER OMB CONTROL NUMBER 0938–1171 (CMS–10432)

Finalized action [preamble section]	Respondents	Responses per respondent	Burden per response (hours)*	Total annual burden (hours)	Labor cost ($/hr)	Total cost ($)
Add NQF #1664 [VIII.D.4.a.]	1,684	848	0.25	357,008	32.84	11,724,143
Add Readmissions Measure [VIII.D.4.b.]	1,684	0	0	0	32.84	0
Training	1,684	1	2	3,368	32.84	110,605
Shift Public Display Timeline [VIII.D.7.]	1,684	0	0	0	32.84	0
	1,684			360,376	32.84	11,834,748

12. ICRs for the Electronic Health Record (EHR) Incentive Programs and Meaningful Use

In section VIII.E. of the preambles of the proposed rule (81 FR 25244 through 25247) and this final rule, we discuss our proposals to align the Medicare and Medicaid EHR Incentive Programs reporting and submission timelines for electronically submitted clinical quality measures for eligible hospitals and CAHs with the Hospital IQR Program's reporting and submission timelines for the FY 2019 payment determination. Because these newly finalized policies for data collection in this final rule will align with the reporting requirements in place for the Hospital IQR Program, and eligible hospitals and CAHs still have the option to submit their clinical quality measures via attestation for the Medicare and Medicaid EHR Incentive Programs for CY 2017 reporting, we do not believe there is any additional burden for this collection of information. However, starting with CY 2018 reporting, eligible hospitals and CAHs participating in the Medicare EHR Incentive Programs must electronically report CQMs using CEHRT where feasible; and attestation to CQMs will no longer be an option except in certain

[399] *http://www.bls.gov/ooh/healthcare/medical-records-and-health-information-technicians.html.*

circumstances where electronic reporting is not feasible (80 FR 62894).

We did not receive any public comments regarding this information collection. We refer readers to the table in section X.B.7. of the preamble of this final rule for burden estimates relating to the reporting of 8 CQMs.

List of Subjects

42 CFR Part 405

Administrative practice and procedure, Health facilities, Health professions, Kidney diseases, Medicare, Reporting and recordkeeping, Rural areas, X-rays.

42 CFR Part 412

Administrative practice and procedure, Health facilities, Medicare, Puerto Rico, Reporting and recordkeeping requirements.

42 CFR Part 413

Health facilities, Kidney diseases, Medicare, Puerto Rico, Reporting and recordkeeping requirements.

42 CFR Part 489

Health facilities, Medicare, Reporting and recordkeeping requirements.

For the reasons set forth in the preamble of this final rule, the Centers for Medicare and Medicaid Services confirms, as final, the interim final rules that appeared in the August 17, 2015 (80 FR 49594) and April 21, 2016 (81 FR 23428) **Federal Register**s and further amends 42 CFR Chapter IV as set forth below:

PART 405—FEDERAL HEALTH INSURANCE FOR THE AGED AND DISABLED

■ 1. The authority citation for part 405 continues to read as follows:

Authority: Secs. 205(a), 1102, 1862(a), 1869, 1871, 1874, 1881, and 1886(k) of the Social Security Act (42 U.S.C. 405(a), 1302, 1395x, 1395y(a), 1395ff, 1395hh, 1395kk, 1395rr, and 1395ww(k)), and sec. 353 of the Public Health Service Act (42 U.S.C. 263a).

■ 2. Section 405.926 is amended by adding paragraph (u) to read as follows:

§ 405.926 Actions that are not initial determinations.

* * * * *

(u) Issuance of notice to an individual entitled to Medicare benefits under Title XVIII of the Act when such individual received observation services as an outpatient for more than 24 hours, as specified under § 489.20(y) of this chapter.

PART 412—PROSPECTIVE PAYMENT SYSTEMS FOR INPATIENT HOSPITAL SERVICES

■ 3. The authority citation for Part 412 is revised to read as follows:

Authority: Secs. 1102 and 1871 of the Social Security Act (42 U.S.C. 1302 and 1395hh), sec. 124 of Pub. L. 106–113 (113 Stat. 1501A–332), sec. 1206 of Pub. L. 113–67, sec. 112 of Pub. L. 113–93, and sec. 231 of Pub. L. 114–113.

■ 4. Section 412.64 is amended by adding paragraph (d)(1)(vii) and revising paragraphs (h)(4) introductory text and (h)(4)(vi) introductory text to read as follows:

§ 412.64 Federal rates for inpatient operating costs for Federal fiscal year 2005 and subsequent fiscal years.

* * * * *

(d) * * *

(1) * * *

(vii) For fiscal year 2017, the percentage increase in the market basket index (as defined in § 413.40(a)(3) of this chapter) for prospective payment hospitals, subject to the provisions of paragraphs (d)(2) and (3) of this section, less a multifactor productivity adjustment (as determined by CMS) and less 0.75 percentage point.

* * * * *

(h) * * *

(4) For discharges on or after October 1, 2004 and before October 1, 2017, CMS establishes a minimum wage index for each all-urban State, as defined in paragraph (h)(5) of this section. This minimum wage index value is computed using the following methodology:

* * * * *

(vi) For discharges on or after October 1, 2012 and before October 1, 2017, the minimum wage index value for the State is the higher of the value determined under paragraph (h)(4)(iv) of this section or the value computed using the following alternative methodology:

* * * * *

■ 5. Section 412.103 is amended by adding a new paragraph (b)(6) to read as follows:

§ 412.103 Special treatment: Hospitals located in urban areas and that apply for reclassification as rural.

* * * * *

(b) * * *

(6) *Lock-in date for the wage index calculation and budget neutrality.* In order for a hospital to be treated as rural in the wage index and budget neutrality calculations under § 412.64(e)(1)(ii), (2), and (4) and (h) for the payment rates for the next Federal fiscal year, the hospital's filing date must be no later than 70 days prior to the second Monday in June of the current Federal fiscal year and the application must be approved by the CMS Regional Office in accordance with the requirements of this section.

* * * * *

■ 6. Section 412.106 is amended by revising paragraph (g)(1)(iii)(C) to read as follows:

§ 412.106 Special treatment: Hospitals that serve a disproportionate share of low-income patients.

* * * * *

(g) * * *

(1) * * *

(iii) * * *

(C)(*1*) For fiscal years 2014 and 2015, CMS will base its estimates of the amount of hospital uncompensated care on the most recent available data on utilization for Medicaid and Medicare SSI patients, as determined by CMS in accordance with paragraphs (b)(2)(i) and (4) of this section.

(*2*) For fiscal year 2016, CMS will base its estimates of the amount of hospital uncompensated care on utilization data for Medicaid and Medicare SSI patients, as determined by CMS in accordance with paragraphs (b)(2)(i) and (4) of this section, using data on Medicaid utilization from 2012 or 2011 cost reports from the most recent HCRIS database extract, the 2012 cost report data submitted to CMS by IHS hospitals, and the most recent available data on Medicare SSI utilization.

(*3*) For fiscal year 2017, CMS will base its estimates of the amount of hospital uncompensated care on utilization data for Medicaid and Medicare SSI patients, as determined by CMS in accordance with paragraphs (b)(2)(i) and (4) of this section, using data on Medicaid utilization from 2011, 2012, and 2013 cost reports from the most recent HCRIS database extract, the 2011 and 2012 cost report data submitted to CMS by IHS hospitals, and the most recent available 3 years of data on Medicare SSI utilization (or, for Puerto Rico hospitals, a proxy for Medicare SSI utilization data).

* * * * *

■ 7. Section 412.140 is amended by revising paragraph (d)(2) to read as follows:

§ 412.140 Participation, data submission, and validation requirements under the Hospital Inpatient Quality Reporting (IQR) Program.

* * * * *

(d) * * *

(2) A hospital meets the chart-abstracted validation requirement with respect to a fiscal year if it achieves a

75-percent score, as determined by CMS.

* * * * *

■ 8. Section 412.160 is amended by revising the definitions of ''Achievement threshold (or achievement performance standard)'', ''Benchmark'', and ''Cited for deficiencies that pose immediate jeopardy'' to read as follows:

§ 412.160 Definitions for the Hospital Value-Based Purchasing (VBP) Program.

* * * * *

Achievement threshold (or achievement performance standard) means the median (50th percentile) of hospital performance on a measure during a baseline period with respect to a fiscal year, for Hospital VBP Program measures other than the measures in the Efficiency and Cost Reduction domain, and the median (50th percentile) of hospital performance on a measure during the performance period with respect to a fiscal year, for the measures in the Efficiency and Cost Reduction domain.

* * * * *

Benchmark means the arithmetic mean of the top decile of hospital performance on a measure during the baseline period with respect to a fiscal year, for Hospital VBP Program measures other than the measures in the Efficiency and Cost Reduction domain, and the arithmetic mean of the top decile of hospital performance on a measure during the performance period with respect to a fiscal year, for the measures in the Efficiency and Cost Reduction domain.

Cited for deficiencies that pose immediate jeopardy means that, during the applicable performance period, the Secretary cited the hospital for immediate jeopardy on at least three surveys using the Form CMS–2567, Statement of Deficiencies and Plan of Correction. CMS assigns an immediate jeopardy citation to a performance period as follows: (1) If the Form CMS–2567 only contains one or more EMTALA-related immediate jeopardy citations, CMS uses the date that the Form CMS–2567 is issued to the hospital; (2) If the Form CMS–2567 only contains one or more Medicare conditions of participation immediate jeopardy citations, CMS uses the survey end date generated in ASPEN; and (3) If the Form CMS–2567 contains both one or more EMTALA-related immediate jeopardy citations and one or more Medicare conditions of participation immediate jeopardy citations, CMS uses the survey end date generated in ASPEN.

* * * * *

■ 9. Section 412.170 is amended by revising the definition of ''Applicable period'' to read as follows:

§ 412.170 Definitions for the Hospital-Acquired Condition Reduction Program.

* * * * *

Applicable period is, unless otherwise specified by the Secretary, with respect to a fiscal year, the 2-year period (specified by the Secretary) from which data are collected in order to calculate the total hospital-acquired condition score under the Hospital-Acquired Condition Reduction Program.

* * * * *

■ 10. Section 412.204 is amended by revising paragraph (d) introductory text and adding paragraph (e) to read as follows:

§ 412.204 Payment to hospitals located in Puerto Rico.

* * * * *

(d) *FY 2005 through December 31, 2015.* For discharges occurring on or after October 1, 2004 and before January 1, 2016, payments for inpatient operating costs to hospitals located in Puerto Rico that are paid under the prospective payment system are equal to the sum of—

* * * * *

(e) *January 1, 2016 and thereafter.* For discharges occurring on or after January 1, 2016, payments for inpatient operating costs to hospitals located in Puerto Rico that are paid under the prospective payment system are equal to 100 percent of a national prospective payment rate for inpatient operating costs, as determined under § 412.212.

■ 11. Section 412.256 is amended by revising paragraph (a)(1) to read as follows:

§ 412.256 Application requirements.

(a) * * *

(1) An application must be submitted to the MGCRB according to the method prescribed by the MGCRB, with an electronic copy of the application sent to CMS.

* * * * *

■ 12. Section 412.374 is amended by revising paragraph (b) introductory text and adding paragraph (e) to read as follows:

§ 412.374 Payments to hospitals located in Puerto Rico.

* * * * *

(b) *FY 2005 through FY 2016.* For discharges occurring on or after October 1, 2004 and on or before September 30, 2016, payments for capital-related costs to hospitals located in Puerto Rico that are paid under the prospective payment system are equal to the sum of the following:

* * * * *

(e) *FY 2017 and subsequent fiscal years.* For discharges occurring on or after October 1, 2016, payments for capital-related costs to hospitals located in Puerto Rico that are paid under the prospective payment system are based on 100 percent of the Federal rate, as determined under § 412.308.

■ 13. Section 412.503 is amended by adding definitions of ''MSA'', ''MSA-dominant area'', and ''MSA-dominant hospital'' and revising the definitions of ''Outlier payment'' and ''Subsection (d) hospital'', to read as follows:

§ 412.503 Definitions.

* * * * *

MSA means a Metropolitan Statistical Area, as defined by the Executive Office of Management and Budget.

MSA-dominant area means an MSA in which an MSA-dominant hospital is located.

MSA-dominant hospital means a hospital that has discharged more than 25 percent of the total subsection (d) hospital Medicare discharges in the MSA (not including discharges paid by a Medicare Advantage plan) in which the hospital is located.

* * * * *

Outlier payment means an additional payment beyond the long-term care hospital standard Federal payment rate or the site neutral payment rate (including, when applicable, the blended payment rate), as applicable, for cases with unusually high costs.

* * * * *

Subsection (d) hospital means, for purposes of § 412.522, a hospital defined in section 1886(d)(1)(B) of the Social Security Act and includes any hospital that is located in Puerto Rico and that would be a subsection (d) hospital as defined in section 1886(d)(1)(B) of the Social Security Act if it were located in one of the 50 States.

* * * * *

■ 14. Section 412.507 is amended by revising paragraph (a) and adding paragraph (b)(3) to read as follows:

§ 412.507 Limitation on charges to beneficiaries.

(a) *Prohibited charges.* Except as provided in paragraph (b) of this section, a long-term care hospital may not charge a beneficiary for any covered services for which payment is made by Medicare, even if the hospital's costs of furnishing services to that beneficiary

are greater than the amount the hospital is paid under the prospective payment system.

(1) If Medicare has paid at the full LTCH prospective payment system standard Federal payment rate, that payment applies to the hospital's costs for services furnished until the high-cost outlier threshold is met.

(2) If Medicare pays less than the full LTCH prospective payment system standard Federal payment rate and payment was not made at the site neutral payment rate (including, when applicable, the blended payment rate), that payment only applies to the hospital's costs for those costs or days used to calculate the Medicare payment.

(3) For cost reporting periods beginning on or after October 1, 2016, for Medicare payments to a long-term care hospital described in § 412.23(e)(2)(ii), that payment only applies to the hospital's costs for those costs or days used to calculate the Medicare payment.

(4) If Medicare has paid at the full site neutral payment rate, that payment applies to the hospital's costs for services furnished until the high-cost outlier is met.

(b) * * *

(3) For cost reporting periods beginning on or after October 1, 2016, a long-term care hospital described in § 412.23(e)(2)(ii) may only charge the Medicare beneficiary for the applicable deductible and coinsurance amounts under §§ 409.82, 409.83, and 409.87 of this chapter, for items and services as specified under § 489.20(a) of this chapter, and for services provided during the stay for which benefit days were not available and that were not the basis for adjusted LTCH prospective payment system payment amount under § 412.526.

■ 15. Section 412.522 is amended by adding paragraph (c)(2)(v) to read as follows:

§ 412.522 Application of site neutral payment rate.

* * * * *

(c) * * *

(2) * * *

(v) The limitation on long-term care hospital admissions from referring hospitals specified in § 412.538.

* * * * *

■ 16. Section 412.523 is amended by adding paragraph (c)(3)(xiii) to read as follows:

§ 412.523 Methodology for calculating the Federal prospective payment rates.

* * * * *

(c) * * *

(3) * * *

(xiii) *For long-term care hospital prospective payment system fiscal year beginning October 1, 2016, and ending September 30, 2017.* The LTCH PPS standard Federal payment rate for the long-term care hospital prospective payment system beginning October 1, 2016, and ending September 30, 2017, is the standard Federal payment rate for the previous long-term care hospital prospective payment system fiscal year updated by 1.75 percent and further adjusted, as appropriate, as described in paragraph (d) of this section.

* * * * *

■ 17. Section 412.525 is amended by adding paragraph (d)(6), to read as follows:

§ 412.525 Adjustments to the Federal prospective payment.

* * * * *

(d) * * *

(6) The limitation on long-term care hospital admissions from referring hospitals specified in § 412.538.

■ 18. The section heading of § 412.534 is revised to read as follows:

§ 412.534 Special payment provisions for long-term care hospitals-within-hospitals and satellites of long-term care hospitals, effective for discharges occurring in cost reporting periods beginning on or before September 30, 2016.

* * * * *

■ 19. The section heading of § 412.536 is revised to read as follows:

§ 412.536 Special payment provisions for long-term care hospitals and satellites of long-term care hospitals that discharge Medicare patients admitted from a hospital not located in the same building or on the same campus as the long-term care hospital or satellite of the long-term care hospital, effective for discharges occurring on or before September 30, 2016 or in cost reporting periods beginning on or before June 30, 2016.

* * * * *

■ 20. Section 412.538 is added to read as follows:

§ 412.538 Limitation on long-term care hospital admissions from referring hospitals.

(a) *Scope.* (1) The provisions of this section apply to all long-term care hospitals excluded from the hospital inpatient prospective payment system under § 412.23(e), except as specified in paragraph (a)(2) of this section, effective for—

(i) Discharges occurring in cost reporting periods beginning on or after October 1, 2016 (for long-term care hospitals that formerly would have been subject to § 412.534); or

(ii) Discharges occurring on or after October 1, 2016 in cost reporting periods beginning on or after July 1, 2016 (for long-term care hospitals that would not have been formerly subject to § 412.534).

(2) Notwithstanding the preceding paragraphs of this section, the provisions of this section do not apply to—

(i) A long-term care hospital described in § 412.23(e)(2)(ii); or

(ii) A long-term care hospital described in § 412.23(e)(2)(i) that meets the criteria in § 412.22(f).

(3) For purposes of this section, all long-term care hospitals described in paragraph (a)(1) of this section and all referring hospitals are as identified by CCN.

(b) *Discharges at or below the applicable percent threshold.* For any long-term care hospital that is not exempted by paragraph (a)(2) of this section with discharges occurring as described in paragraph (a)(1) of this section, of which no more than the applicable percent threshold (as defined in paragraph (e) of this section) was admitted to the long-term care hospital from a single referring hospital, payments are the amount otherwise payable under this subpart without adjustment under this section.

(c) *Discharges in excess of the applicable percent threshold.* For any long-term care hospital that is not exempted by paragraph (a)(2) of this section with discharges occurring as described in paragraph (a)(1) of this section, of whom more than the applicable percentage threshold (as defined in paragraph (e) of this section) was admitted to the long-term care hospital from a single referring hospital, payments for the Medicare discharges that caused the long-term care hospital to exceed or remain in excess of such threshold are paid at the lesser of the amount otherwise payable under this subpart without adjustment under this section or the amount equivalent to the hospital inpatient prospective payment system amount as defined in paragraph (f) of this section. Payments for discharges not in excess of the applicable percentage threshold (as defined in paragraph (e) of this section) are the amount otherwise payable under this subpart without adjustment under this section.

(d) *Determination of exceeding the applicable percentage threshold.*

(1) *General.* The determination of whether a long-term care hospital (as described in paragraph (a)(1)) of this section has exceeded its applicable percentage threshold (as defined in paragraph (e) of this section) in regard to discharges described in paragraph (a)(1) of this section that were admitted

from a single referring hospital is made by comparing the long-term care hospital's percentage of Medicare discharges occurring as described in paragraph (a)(1) of this section (as calculated under paragraph (d)(2) of this section) to the long-term care hospital's applicable percentage threshold in paragraph (e) of this section.

(2) *Percentage of Medicare discharges.* For each referring hospital, the percentage of Medicare discharges admitted to the long-term care hospital is calculated by dividing the amount in paragraph (d)(2)(i) of this section by the amount in paragraph (d)(2)(ii) of this paragraph.

(i) The number of the long-term care hospital's Medicare discharges in the cost reporting period that were admitted from a single referring hospital on whose behalf an outlier payment was not made to that referring hospital, and for whom payment was not made by a Medicare Advantage plan.

(ii) The long-term care hospital's total number of Medicare discharges in its cost reporting period for whom payment was not made by a Medicare Advantage plan.

(e) *Applicable percentage threshold.* (1) *General.* For the purposes of this section, except as provided for in paragraphs (e)(2) and (3) of this section, ''applicable percentage threshold'' means 25 percent.

(2) *Special treatment of exclusively rural long-term care hospitals.* In the case of a long-term care hospital that is located in a rural area as defined in § 412.503, the applicable percentage threshold means 50 percent. If a long-term care hospital has multiple locations, all locations of the long-term care hospital must be in a rural area (as defined in § 412.503) in order to be treated as rural under this section.

(3) *Special treatment for long-term care hospitals located in an MSA with an MSA-dominant hospital.* In the case of a long-term care hospital that admits Medicare patients from a referring MSA-dominant hospital (as defined in § 412.503), the applicable percentage threshold means the MSA-dominant hospital's percentage of total subsection (d) hospital Medicare discharges in the MSA in which the long-term care hospital is located during the cost reporting period for which the adjustment under this section is made, but in no case is less than 25 percent or more than 50 percent. The determination of the applicable percentage threshold in this paragraph does not include discharges paid by a Medicare Advantage plan. If a long-term care hospital has multiple locations payable under this subpart, all locations of the long-term care hospital must be in an MSA with an MSA-dominant hospital in order to be treated as such under this section.

(f) *Determining the amount equivalent to the hospital inpatient prospective payment system amount.*—(1) As specified in paragraphs (b) and (c) of this section, CMS calculates an amount payable under subpart O that is equivalent to an amount that would be paid for the services provided if such services had been provided in an inpatient prospective payment system hospital (that is, the amount that would be determined under the rules at § 412.1(a)). This amount is based on the sum of the applicable hospital inpatient prospective payment system operating standardized amount and capital Federal rate in effect (as set forth in section § 412.529(d)(4)) at the time of the long-term care hospital discharge.

(2) In addition to the payment amount under paragraph (f)(1) of this section, an additional payment for high-cost outlier cases is based on the applicable fixed-loss amount established for the hospital inpatient prospective payment system in effect at the time of the long-term care hospital discharge.

■ 21. Section 412.560 is amended by revising paragraph (c)(1) to read as follows:

§ 412.560 Participation, data submission, and other requirements under the Long-Term Care Hospital Quality Reporting (LTCHQR) Program.

* * * * *

(c) * * *

(1) A long-term care hospital that wishes to request an exception or extension with respect to quality data reporting requirements must submit its request to CMS within 90 days of the date that the extraordinary circumstances occurred.

* * * * *

PART 413—PRINCIPLES OF REASONABLE COST REIMBURSEMENT; PAYMENT FOR END-STAGE RENAL DISEASE SERVICES; OPTIONAL PROSPECTIVELY DETERMINED PAYMENT RATES FOR SKILLED NURSING FACILITIES

■ 22. The authority for Part 413 is revised to read as follows:

Authority: Secs. 1102, 1812(d), 1814(b), 1815, 1833(a), (i), and (n), 1861(v), 1871, 1881, 1883 and 1886 of the Social Security Act (42 U.S.C. 1302, 1395d(d), 1395f(b), 1395g, 1395l(a), (i), and (n), 1395x(v), 1395hh, 1395rr, 1395tt, and 1395ww); and sec. 124 of Pub. L. 106–113 (113 Stat. 1501A–332), sec. 3201 of Pub. L. 112–96 (126 Stat. 156), sec. 632 of Pub. L. 112–240 (126 Stat. 2354), sec. 217 of Pub. L. 113–93 (129 Stat. 1040), and sec., 204 of Pub. L. 113–295 (128 Stat. 4010).

■ 23. Section 413.17 is amended by revising paragraph (d)(1) introductory text to read as follows:

§ 413.17 Cost to related organizations.

* * * * *

(d) * * *

(1) An exception is provided to this general principle if the provider demonstrates by convincing evidence to the satisfaction of the contractor, that—

* * * * *

■ 24. Section 413.24 is amended by revising paragraphs (f)(4)(i), (ii), and (iv) to read as follows:

§ 413.24 Adequate cost data and cost finding.

* * * * *

(f) * * *

(4) * * *

(i) As used in this paragraph, ''provider'' means a hospital, skilled nursing facility, home health agency, hospice, organ procurement organization, histocompatibility laboratory, rural health clinic, federally qualified health center, community mental health center, or end-stage renal disease facility.

(ii) Effective for cost reporting periods beginning on or after October 1, 1989 for hospitals, cost reporting periods ending on or after February 1, 1997 for skilled nursing facilities and home health agencies, cost reporting periods ending on or after December 31, 2004 for hospices, and end-stage renal disease facilities, and cost reporting periods ending on or after March 31, 2005 for organ procurement organizations, histocompatibility laboratories, rural health clinics, Federally qualified health centers, and community mental health centers, a provider is required to submit cost reports in a standardized electronic format. The provider's electronic program must be capable of producing the CMS standardized output file in a form that can be read by the contractor's automated system. This electronic file, which must contain the input data required to complete the cost report and to pass specified edits, must be forwarded to the contractor for processing through its system.

* * * * *

(iv) Effective for cost reporting periods ending on or after September 30, 1994 for hospitals, cost reporting periods ending on or after February 1, 1997 for skilled nursing facilities and home health agencies, cost reporting periods ending on or after December 31, 2004 for hospices and end-stage renal disease facilities, and cost reporting

periods ending on or after March 31, 2005 for organ procurement organizations, histocompatibility laboratories, rural health clinics, Federally qualified health centers, and community mental health centers, a provider must submit a hard copy of a settlement summary, a statement of certain worksheet totals found within the electronic file, and a statement signed by its administrator or chief financial officer certifying the accuracy of the electronic file or the manually prepared cost report. During a transition period (first two cost-reporting periods on or after December 31, 2004 for hospices and end-stage renal disease facilities, and the first two cost-reporting periods on or after March 31, 2005 for organ procurement organizations, histocompatibility laboratories, rural health clinics, Federally qualified health centers, community mental health centers), providers must submit a hard copy of the completed cost report forms in addition to the electronic file. The following statement must immediately precede the dated signature of the provider's administrator or chief financial officer:

I hereby certify that I have read the above certification statement and that I have examined the accompanying electronically filed or manually submitted cost report and the Balance Sheet and Statement of Revenue and Expenses prepared by _____(Provider Name(s) and Number(s)) for the cost reporting period beginning ___and ending ___and that to the best of my knowledge and belief, this report and statement are true, correct, complete and prepared from the books and records of the provider in accordance with applicable instructions, except as noted. I further certify that I am familiar with the laws and regulations regarding the provision of health care services, and that the services identified in this cost report were provided in compliance with such laws and regulations.

* * * * *

■ 25. Section 413.79 is amended by revising paragraphs (k)(1)(i) and (ii) and (k)(2), (3), (4), and (7)(ii) and (iii) to read as follows:

§ 413.79 Direct GME payments: Determination of the weighted number of FTE residents.

* * * * *

(k) * * *

(1) * * *

(i) For rural track programs started prior to October 1, 2012, for the first 3 years of the rural track's existence, the rural track FTE limitation for each urban hospital will be the actual number of FTE residents, subject to the rolling average at paragraph (d)(7) of this section, training in the rural track at the urban hospital. For rural track programs started on or after October 1, 2012, prior to the start of the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track's existence, the rural track FTE limitation for each urban hospital will be the actual number of FTE residents, subject to the rolling average at paragraph (d)(7) of this section, training in the rural track at the urban hospital.

(ii) For rural track programs started prior to October 1, 2012, beginning with the fourth year of the rural track's existence, the rural track FTE limitation is equal to the product of the highest number of residents, in any program year, who during the third year of the rural track's existence are training in the rural track at the urban hospital and are designated at the beginning of their training to be rotated to the rural hospital(s) for at least two-thirds of the duration of the program for cost reporting periods beginning on or after April 1, 2000, and before October 1, 2002, or for more than one-half of the duration of the program effective for cost reporting periods beginning on or after October 1, 2003, and the number of years those residents are training at the urban hospital. For rural track programs started on or after October 1, 2012, beginning with the start of the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track's existence, the rural track FTE limitation is calculated in accordance with paragraph (e)(1) of this section.

(2) If an urban hospital rotates residents to a separately accredited rural track program at a rural nonprovider site(s) for two-thirds of the duration of the program for cost reporting periods beginning on or after April 1, 2000, and before October 1, 2003, or for more than one-half of the duration of the program for cost reporting periods beginning on or after October 1, 2003, the urban hospital may include those residents in its FTE count, subject to the requirements under § 413.78(d) through (g). The urban hospital may include in its FTE count those residents in the rural track, not to exceed its rural track FTE limitation, determined as follows:

(i) For rural track programs started prior to October 1, 2012, for the first 3 years of the rural track's existence, the rural track FTE limitation for each urban hospital will be the actual number of FTE residents, subject to the rolling average specified in paragraph (d)(7) of this section, training in the rural track at the urban hospital and the rural nonprovider site(s). For rural track programs started on or after October 1, 2012, prior to the start of the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track's existence, the rural track FTE limitation for each urban hospital will be the actual number of FTE residents, subject to the rolling average specified in paragraph (d)(7) of this section, training in the rural track at the urban hospital and the rural nonprovider site(s).

(ii)(A) For rural track programs started prior to October 1, 2012, beginning with the fourth year of the rural track's existence, the rural track FTE limitation is equal to the product of—

(*1*) The highest number of residents in any program year who, during the third year of the rural track's existence, are training in the rural track at—

(*i*) The urban hospital and are designated at the beginning of their training to be rotated to a rural nonprovider site(s) for at least two-thirds of the duration of the program for cost reporting periods beginning on or after April 1, 2000 and before October 1, 2003, or for more than one-half of the duration of the program for cost reporting periods beginning on or after October 1, 2003; and

(*ii*) The rural nonprovider site(s); and

(*2*) The number of years in which the residents are expected to complete each program based on the minimum accredited length for the type of program.

(B) For rural track programs started on or after October 1, 2012, beginning with the start of the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track's existence, the rural track FTE limitation is calculated in accordance with paragraph (e)(1) of this section.

(3) For rural track programs started prior to October 1, 2012, if an urban hospital rotates residents in the rural track program to a rural hospital(s) for less than two-thirds of the duration of the program for cost reporting periods beginning on or after April 1, 2000, and before October 1, 2003, or for one-half or less than one-half of the duration of the program for cost reporting periods beginning on or after October 1, 2003, the rural hospital may not include those residents in its FTE count (if the rural track is not a new program under paragraph (e)(3) of this section, or if the rural hospital's FTE count exceeds that hospital's FTE cap), nor may the urban hospital include those residents when calculating its rural track FTE limitation. For rural track programs started on or after October 1, 2012, if an urban hospital rotates residents in the rural track program to a rural hospital(s)

for one-half or less than one-half of the duration of the program, the rural hospital may not include those residents in its FTE count (if the rural track is not a new program under paragraph (e)(3) of this section, or if the rural hospital's FTE count exceeds that hospital's FTE cap), nor may the urban hospital include those residents when calculating its rural track FTE limitation.

(4)(i) For rural track programs started prior to October 1, 2012, if an urban hospital rotates residents in the rural track program to a rural nonprovider site(s) for less than two-thirds of the duration of the program for cost reporting periods beginning on or after April 1, 2000 and before October 1, 2003, or for one-half or less than one-half of the duration of the program for cost reporting periods beginning on or after October 1, 2003, the urban hospital may include those residents in its FTE count, subject to the requirements under § 413.78(d) through (g), as applicable. The urban hospital may include in its FTE count those residents in the rural track, not to exceed its rural track limitation, determined as follows:

(A) For the first 3 years of the rural track's existence, the rural track FTE limitation for the urban hospital will be the actual number of FTE residents, subject to the rolling average specified in paragraph (d)(7) of this section, training in the rural track at the rural nonprovider site(s).

(B) Beginning with the fourth year of the rural track's existence, the rural track FTE limitation is equal to the product of—

(*1*) The highest number of residents in any program year who, during the third year of the rural track's existence, are training in the rural track at the rural nonprovider site(s) or are designated at the beginning of their training to be rotated to the rural nonprovider site(s) for a period that is less than two-thirds of the duration of the program for cost reporting periods beginning on or after April 1, 2002, and before October 1, 2003, or for one-half or less than one-half of the duration of the program for cost reporting periods beginning on or after October 1, 2003; and

(*2*) The length of time in which the residents are training at the rural nonprovider site(s) only.

(ii) For rural track programs started on or after October 1, 2012, if an urban hospital rotates residents in the rural track program to a rural nonprovider site(s) for one-half or less than one-half of the duration of the program, the urban hospital may include those residents in its FTE count, subject to the requirements under § 413.78(g). The urban hospital may include in its FTE count those residents in the rural track, not to exceed its rural track limitation, determined as follows:

(A) Prior to the start of the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track's existence, the rural track FTE limitation for the urban hospital will be the actual number of FTE residents, subject to the rolling average specified in paragraph (d)(7) of this section, training in the rural track at the rural nonprovider site(s).

(B) Beginning with the start of the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural track's existence, the rural track FTE limitation is equal to the product of—

(*1*) The highest number of residents in any program year who, during the fifth year of the rural track's existence, are training in the rural track at the rural nonprovider site(s) or are designated at the beginning of their training to be rotated to the rural nonprovider site(s) for a period that is for one-half or less than one-half of the duration of the program; and

(*2*) The ratio of the length of time in which the residents are training at the rural nonprovider site(s) only to the total duration of the program.

* * * * *

(7) * * *

(ii)(A) For rural track programs started prior to October 1, 2012, effective October 1, 2014, if an urban hospital started a rural track training program under the provisions of this paragraph (k) with a hospital located in a rural area and, during the 3-year period that is used to calculate the urban hospital's rural track FTE limit, that rural area subsequently becomes an urban area due to the most recent OMB standards for delineating statistical areas adopted by CMS and the most recent Census Bureau data, the urban hospital may continue to adjust its FTE resident limit in accordance with this paragraph (k) and subject to paragraph (k)(7)(iii) of this section for the rural track programs started prior to the adoption of such new OMB standards for delineating statistical areas.

(B) For rural track programs started on or after October 1, 2012, effective October 1, 2014, if an urban hospital started a rural track training program under the provisions of this paragraph (k) with a hospital located in a rural area and, during the 5-year period that is used to calculate the urban hospital's rural track FTE limit, that rural area subsequently becomes an urban area due to the most recent OMB standards for delineating statistical areas adopted by CMS and the most recent Census Bureau data, the urban hospital may continue to adjust its FTE resident limit in accordance with this paragraph (k) and subject to paragraph (k)(7)(iii) of this section for the rural track programs started prior to the adoption of such new OMB standards for delineating statistical areas.

(iii)(A) For rural track programs started prior to October 1, 2012, effective October 1, 2014, if an urban hospital started a rural track training program under the provisions of this paragraph (k) with a hospital located in a rural area and that rural area subsequently becomes an urban area due to the most recent OMB standards for delineating statistical areas adopted by CMS and the most recent Census Bureau data, regardless of whether the redesignation of the rural hospital occurs during the 3-year period that is used to calculate the urban hospital's rural track FTE limit, or after the 3-year period used to calculate the urban hospital's rural track FTE limit, the urban hospital may continue to adjust its FTE resident limit in accordance with this paragraph (k) based on the rural track programs started prior to the change in the hospital's geographic designation. In order for the urban hospital to receive or use the adjustment to its FTE resident cap for training FTE residents in the rural track residency program that was started prior to the most recent OMB standards for delineating statistical areas adopted by CMS, one of the following two conditions must be met by the end of a period that begins when the most recent OMB standards for delineating statistical areas are adopted by CMS and continues through the end of the second residency training year following the date the most recent OMB delineations are adopted by CMS: The hospital that has been redesignated from rural to urban must reclassify as rural under § 412.103 of this chapter, for purposes of IME only; or the urban hospital must find a new site that is geographically rural consistent with the most recent geographical location delineations adopted by CMS. In order to receive an adjustment to its FTE resident cap for an additional new rural track residency program, the urban hospital must participate in a rural track program with sites that are geographically rural based on the most recent geographical location delineations adopted by CMS.

(B) For rural track programs started on or after October 1, 2012, effective October 1, 2014, if an urban hospital started a rural track training program

under the provisions of this paragraph (k) with a hospital located in a rural area and that rural area subsequently becomes an urban area due to the most recent OMB standards for delineating statistical areas adopted by CMS and the most recent Census Bureau data, regardless of whether the redesignation of the rural hospital occurs during the 5-year period that is used to calculate the urban hospital's rural track FTE limit, or after the 5-year period used to calculate the urban hospital's rural track FTE limit, the urban hospital may continue to adjust its FTE resident limit in accordance with this paragraph (k) based on the rural track programs started prior to the change in the hospital's geographic designation. In order for the urban hospital to receive or use the adjustment to its FTE resident cap for training FTE residents in the rural track residency program that was started prior to the most recent OMB standards for delineating statistical areas adopted by CMS, one of the following two conditions must be met by the end of a period that begins when the most recent OMB standards for delineating statistical areas are adopted by CMS and continues through the end of the second residency training year following the date the most recent OMB delineations are adopted by CMS: The hospital that has been redesignated from rural to urban must reclassify as rural under § 412.103 of this chapter, for purposes of IME only; or the urban hospital must find a new site that is geographically rural consistent with the most recent geographical location delineations adopted by CMS. In order to receive an adjustment to its FTE resident cap for an additional new rural track residency program, the urban hospital must participate in a rural track program with sites that are geographically rural based on the most recent geographical location delineations adopted by CMS.

* * * * *

§ 413.200 [Amended]

■ 26. In § 413.200, amend paragraph (c)(1)(i) by removing the phrase ''three months'' and adding in its place the phrase ''5 months''.

PART 489—PROVIDER AGREEMENTS AND SUPPLIER APPROVAL

■ 27. The authority citation for Part 489 is revised to read as follows:

Authority: Secs. 1102 1819, 1820(E), 1861, 1864(M), 1866, 1869, and 1871 of the Social Security Act (42 U.S.C. 1302, 1395i–3, 1395x, 1395aa(m), 1395cc, 1395ff, and 1395(hh)).

■ 28. Section 489.20 is amended by adding paragraph (y) to read as follows:

§ 489.20 Basic commitments.

* * * * *

(y) In the case of a hospital or critical access hospital, to provide notice, as specified in paragraphs (y)(1) and (2) of this section, to each individual entitled to Medicare benefits under Title XVIII of the Act when such individual receives observation services as an outpatient for more than 24 hours. Notice must be provided to the individual not later than 36 hours after observation services are initiated or sooner if the individual is transferred, discharged, or admitted. Notice may be provided before such individual receives 24 hours of observation services as an outpatient.

(1) *Written notice.* Hospitals and critical access hospitals must use a standardized written notice, as specified by the Secretary, which includes the following information:

(i) An explanation of the status of the individual as an outpatient receiving observation services and not as an inpatient of the hospital or critical access hospital and the reason for status as an outpatient receiving observation services; and

(ii) An explanation of the implications of such status as an outpatient on services furnished by the hospital or critical access hospital (including services furnished on an inpatient basis), such as Medicare cost-sharing requirements, and subsequent eligibility for Medicare coverage for skilled nursing facility services.

(2) *Oral notice.* The hospital must give an oral explanation of the written notification described in paragraph (y)(1) of this section.

(3) *Signature requirements.* The written notice specified in paragraph (y)(1) of this section must either—

(i) Be signed by the individual who receives observation services as an outpatient or a person acting on the individual's behalf to acknowledge receipt of such notification; or

(ii) If the individual who receives observation services as an outpatient or the person acting on behalf of the individual refuses to provide the signature described in paragraph (y)(1) of this section, is signed by the staff member of the hospital or critical access hospital who presented the written notification and includes the name and title of the staff member, a certification that the notification was presented, and the date and time the notification was presented.

Dated: July 25, 2016.

Andrew M. Slavitt,

Administrator, Centers for Medicare & Medicaid Services.

Dated: July 27, 2016.

Sylvia M. Burwell,

Secretary, Department of Health and Human Services.

Note: The following Addendum and Appendixes will not appear in the Code of Federal Regulations.

Addendum—Schedule of Standardized Amounts, Update Factors, Rate-of-Increase Percentages Effective With Cost Reporting Periods Beginning On or After October 1, 2016, and Payment Rates for LTCHs Effective for Discharges Occurring On or After October 1, 2016

I. Summary and Background

In this Addendum, we are setting forth a description of the methods and data we used to determine the prospective payment rates for Medicare hospital inpatient operating costs and Medicare hospital inpatient capital-related costs for FY 2017 for acute care hospitals. We also are setting forth the rate-of-increase percentage for updating the target amounts for certain hospitals excluded from the IPPS for FY 2017. We note that, because certain hospitals excluded from the IPPS are paid on a reasonable cost basis subject to a rate-of-increase ceiling (and not by the IPPS), these hospitals are not affected by the figures for the standardized amounts, offsets, and budget neutrality factors. Therefore, in this final rule, we are setting forth the rate-of-increase percentage for updating the target amounts for certain hospitals excluded from the IPPS that will be effective for cost reporting periods beginning on or after October 1, 2016.

In addition, we are setting forth a description of the methods and data we used to determine the LTCH PPS standard Federal payment rate that will be applicable to Medicare LTCHs for FY 2017.

In general, except for SCHs and MDHs, for FY 2017, each hospital's payment per discharge under the IPPS is based on 100 percent of the Federal national rate, also known as the national adjusted standardized amount. This amount reflects the national average hospital cost per case from a base year, updated for inflation.

SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: The Federal national rate (including, as discussed in section IV.F. of the preamble of this final rule, uncompensated care payments under section 1886(r)(2) of the Act); the

updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge.

We note that section 205 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10, enacted on April 16, 2015) extended the MDH program (which, under previous law, was to be in effect for discharges on or before March 31, 2015 only) for discharges occurring on or after April 1, 2015, through FY 2017 (that is, for discharges occurring on or before September 30, 2017).

Under section 1886(d)(5)(G) of the Act, MDHs historically were paid based on the Federal national rate or, if higher, the Federal national rate plus 50 percent of the difference between the Federal national rate and the updated hospital-specific rate based on FY 1982 or FY 1987 costs per discharge, whichever was higher. However, section 5003(a)(1) of Pub. L. 109–171 extended and modified the MDH special payment provision that was previously set to expire on October 1, 2006, to include discharges occurring on or after October 1, 2006, but before October 1, 2011. Under section 5003(b) of Pub. L. 109–171, if the change results in an increase to an MDH's target amount, we must rebase an MDH's hospital-specific rates based on its FY 2002 cost report. Section 5003(c) of Pub. L. 109–171 further required that MDHs be paid based on the Federal national rate or, if higher, the Federal national rate plus 75 percent of the difference between the Federal national rate and the updated hospital-specific rate. Further, based on the provisions of section 5003(d) of Pub. L. 109–171, MDHs are no longer subject to the 12-percent cap on their DSH payment adjustment factor.

As discussed in section IV.A. of the preamble of this final rule, prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. As a result, CMS calculated the Puerto Rico-specific standardized amount. Section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount under the amendments to section 1886(d)(9)(E) of the Act, there is no longer a need for us to calculate a Puerto Rico-specific standardized amount. For operating costs for inpatient hospital discharges occurring in FY 2017 and subsequent fiscal years, consistent with the provisions of section 1886(d)(9)(E) of the Act as amended by section 601 of Pub. L. 114–113, subsection (d) Puerto Rico hospitals will continue to be paid based on 100 percent of the national standardized amount. Because Puerto Rico hospitals are now paid 100 percent of the national standardized amount and are subject to the same national standardized amount as subsection (d) hospitals that receive the full update, our discussion below does not include references to the Puerto Rico standardized amount or the Puerto Rico-specific wage index.

As discussed in section II. of this Addendum, we are making changes in the determination of the prospective payment rates for Medicare inpatient operating costs for acute care hospitals for FY 2017. In section III. of this Addendum, we discuss our policy changes for determining the prospective payment rates for Medicare inpatient capital-related costs for FY 2017. In section IV. of this Addendum, we set forth the rate-of-increase percentage for determining the rate-of-increase limits for certain hospitals excluded from the IPPS for FY 2017. In section V. of this Addendum, we discuss policy changes for determining the LTCH PPS standard Federal payment rate for LTCHs paid under the LTCH PPS for FY 2017. The tables to which we refer to in the preamble of this final rule are listed in section VI. of this Addendum and are available via the Internet on the CMS Web site.

II. Changes to Prospective Payment Rates for Hospital Inpatient Operating Costs for Acute Care Hospitals for FY 2017

The basic methodology for determining prospective payment rates for hospital inpatient operating costs for acute care hospitals for FY 2005 and subsequent fiscal years is set forth under § 412.64. The basic methodology for determining the prospective payment rates for hospital inpatient operating costs for hospitals located in Puerto Rico for FY 2005 and subsequent fiscal years is set forth under §§ 412.211 and 412.212. Below we discuss the factors we used for determining the prospective payment rates for FY 2017.

In summary, the standardized amounts set forth in Tables 1A, 1B, and 1C that are listed and published in section VI. of this Addendum (and available via the Internet on the CMS Web site) reflect—

- Equalization of the standardized amounts for urban and other areas at the level computed for large urban hospitals during FY 2004 and onward, as provided for under section 1886(d)(3)(A)(iv)(II) of the Act.
- The labor-related share that is applied to the standardized amounts to give the hospital the highest payment, as provided for under sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act. For FY 2017, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), there are four possible applicable percentage increases that can be applied to the national standardized amount. We refer readers to section IV.B. of the preamble of this final rule for a complete discussion on the FY 2017 inpatient hospital update. Below is a table with these four options:

FY 2017	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is NOT a meaningful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a meaningful EHR user
Market Basket Rate-of-Increase	2.7	2.7	2.7	2.7
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0.0	0.0	−0.675	−0.675

FY 2017	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is NOT a meaningful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a meaningful EHR user
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0.0	−2.025	0.0	−2.025
MFP Adjustment under Section 1886(b)(3)(B)(xi) of the Act	−0.3	−0.3	−0.3	−0.3
Statutory Adjustment under Section 1886(b)(3)(B)(xii) of the Act	−0.75	−0.75	−0.75	−0.75
Applicable Percentage Increase Applied to Standardized Amount	1.65	−0.375	0.975	−1.05

We note that section 1886(b)(3)(B)(viii) of the Act, which specifies the adjustment to the applicable percentage increase for ''subsection (d)'' hospitals that do not submit quality data under the rules established by the Secretary, is not applicable to hospitals located in Puerto Rico.

In addition, section 602 of Public Law 114–113 amended section 1886(n)(6)(B) of the Act to specify that Puerto Rico hospitals are eligible for incentive payments for the meaningful use of certified EHR technology, effective beginning FY 2016, and also to apply the adjustments to the applicable percentage increase under section 1886(b)(3)(B)(ix) of the Act to Puerto Rico hospitals that are not meaningful EHR users, effective FY 2022. Accordingly, because the provisions of section 1886(b)(3)(B)(ix) of the Act are not applicable to hospitals located in Puerto Rico until FY 2022, the adjustments under this provision are not applicable for FY 2017.

- An adjustment to the standardized amount to ensure budget neutrality for DRG recalibration and reclassification, as provided for under section 1886(d)(4)(C)(iii) of the Act.
- An adjustment to ensure the wage index changes are budget neutral, as provided for under section 1886(d)(3)(E)(i) of the Act. We note that section 1886(d)(3)(E)(i) of the Act requires that when we compute such budget neutrality, we assume that the provisions of section 1886(d)(3)(E)(ii) of the Act (requiring a 62-percent labor-related share in certain circumstances) had not been enacted.
- An adjustment to ensure the effects of geographic reclassification are budget neutral, as provided for under section 1886(d)(8)(D) of the Act, by removing the FY 2016 budget neutrality factor and applying a revised factor.
- As discussed below and in section III.G. of the preamble of this final rule, an adjustment to offset the cost of the 3-year hold harmless transitional wage index provisions provided by CMS as a result of the implementation of the new OMB labor market area delineations (beginning with FY 2015).
- An adjustment to remove the FY 2016 outlier offset and apply an offset for FY 2017, as provided for under section 1886(d)(3)(B) of the Act.
- As discussed below and in section II.D. of the preamble of this final rule, a recoupment to meet the requirements of section 631 of ATRA to adjust the standardized amount to offset the estimated amount of the increase in aggregate payments as a result of not completing the prospective adjustment authorized under section 7(b)(1)(A) of Public Law 110–90 until FY 2013.
- As discussed below and in section IV.P. of the preamble of this final rule, we are applying a (1/0.998) adjustment to the FY 2017 payment rates using our authority under sections 1886(d)(5)(I)(i) and 1886(g) of the Act to permanently prospectively remove the 0.2 percent reduction to the rate put in place in FY 2014 to offset the estimated increase in IPPS expenditures associated with the projected increase in inpatient encounters that was expected to result from the new inpatient admission guidelines under the 2-midnight policy.
- As discussed below and in section IV.P. of the preamble of this final rule, we are applying a temporary one-time prospective increase to the FY 2017 payment rates of 0.6 percent or a factor of 1.006 using our authority under sections 1886(d)(5)(I)(i) and 1886(g) of the Act to address the effects of the 0.2 percent reduction to the payment rate for the 2-midnight policy in effect for FY 2014, FY 2015, and FY 2016.

For FY 2017, consistent with current law, we applied the rural floor budget neutrality adjustment to hospital wage indexes. Also, consistent with section 3141 of the Affordable Care Act, instead of applying a State-level rural floor budget neutrality adjustment to the wage index, we applied a uniform, national budget neutrality adjustment to the FY 2017 wage index for the rural floor. We note that, in section III.H.2.b. of the preamble to this final rule, we are extending the imputed floor policy (both the original methodology and alternative methodology) for FY 2017. Therefore, for FY 2017, in this final rule, we are continuing to include the imputed floor (calculated under the original and alternative methodologies) in calculating the uniform, national rural floor budget neutrality adjustment, which will be reflected in the FY 2017 wage index.

In prior fiscal years, CMS made an adjustment to ensure the effects of the rural community hospital demonstration program required under section 410A of Public Law 108–173, as amended by sections 3123 and 10313 of Public Law 111–148, which extended the demonstration program for an additional 5 years, were budget neutral as required under section 410A(c)(2) of Public Law 108–173. As discussed in section IV.K.3. of the preamble to this final rule, given the small number of participating hospitals and the limited time of participation during FY 2017, as we proposed, we are foregoing the process of estimating the costs attributable to the demonstration for FY 2017 and instead analyzing the set of finalized cost reports for reporting periods beginning in FY 2016 when they become available. In addition, we discuss how we will reconcile the budget neutrality offset amounts identified in the IPPS final rules for FYs 2011 through 2016 with the actual costs of the demonstration for those years, considering the fact that the demonstration will end December 31, 2016. We stated that we believe it would be appropriate to conduct this analysis for FYs 2011 through 2016 at one time, when all of the finalized cost reports for cost reporting periods beginning in FYs 2011 through 2016 are available. Such an aggregate analysis encompassing the cost experience through the end of the period of performance of the demonstration represents an administratively streamlined method, allowing for the determination of any appropriate final adjustment to the IPPS rates and obviating the need for

multiple fiscal-year-specific calculations and regulatory actions. Given the general lag of 3 years in finalizing cost reports, we expect any such analysis to be conducted in FY 2020. Therefore, for FY 2017, we are not making any adjustment to the standardized amounts for the rural community hospital demonstration program. We refer the reader to section IV.K. of the preamble of this final rule for a complete discussion on the rural community hospital demonstration program.

A. Calculation of the Adjusted Standardized Amount

1. Standardization of Base-Year Costs or Target Amounts

In general, the national standardized amount is based on per discharge averages of adjusted hospital costs from a base period (section 1886(d)(2)(A) of the Act), updated and otherwise adjusted in accordance with the provisions of section 1886(d) of the Act. The September 1, 1983 interim final rule (48 FR 39763) contained a detailed explanation of how base-year cost data (from cost reporting periods ending during FY 1981) were established for urban and rural hospitals in the initial development of standardized amounts for the IPPS.

Sections 1886(d)(2)(B) and 1886(d)(2)(C) of the Act require us to update base-year per discharge costs for FY 1984 and then standardize the cost data in order to remove the effects of certain sources of cost variations among hospitals. These effects include case-mix, differences in area wage levels, cost-of-living adjustments for Alaska and Hawaii, IME costs, and costs to hospitals serving a disproportionate share of low-income patients.

For FY 2017, we are continuing to use the national labor-related and nonlabor-related shares (which are based on the FY 2010-based hospital market basket) that were used in FY 2016. Specifically, under section 1886(d)(3)(E) of the Act, the Secretary estimates, from time to time, the proportion of payments that are labor-related and adjusts the proportion (as estimated by the Secretary from time to time) of hospitals' costs which are attributable to wages and wage-related costs of the DRG prospective payment rates. We refer to the proportion of hospitals' costs that are attributable to wages and wage-related costs as the ''labor-related share.'' For FY 2017, as discussed in section III. of the preamble of this final rule, we are continuing to use a labor-related share of 69.6 percent for the national standardized amounts for all IPPS hospitals (including hospitals in Puerto Rico) that have a wage index value that is greater than 1.0000. Consistent with section 1886(d)(3)(E) of the Act, we applied the wage index to a labor-related share of 62 percent of the national standardized amount for all IPPS hospitals (including hospitals in Puerto Rico) whose wage index values are less than or equal to 1.0000.

The standardized amounts for operating costs appear in Tables 1A, 1B, and 1C that are listed and published in section VI. of the Addendum to this final rule and are available via the Internet on the CMS Web site.

2. Computing the National Average Standardized Amount

Section 1886(d)(3)(A)(iv)(II) of the Act requires that, beginning with FY 2004 and thereafter, an equal standardized amount be computed for all hospitals at the level computed for large urban hospitals during FY 2003, updated by the applicable percentage update. Accordingly, we calculated the FY 2017 national average standardized amount irrespective of whether a hospital is located in an urban or rural location.

3. Updating the National Average Standardized Amount

Section 1886(b)(3)(B) of the Act specifies the applicable percentage increase used to update the standardized amount for payment for inpatient hospital operating costs. We note that, in compliance with section 404 of the MMA, in this final rule, we are using the revised and rebased FY 2010-based IPPS operating and capital market baskets for FY 2017 (which replaced the FY 2006-based IPPS operating and capital market baskets in FY 2014). As discussed in section IV.B. of the preamble of this final rule, in accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, we reduced the FY 2017 applicable percentage increase (which is based on IHS Global Insight, Inc.'s (IGI's) second quarter 2016 forecast of the FY 2010-based IPPS market basket) by the MFP adjustment (the 10-year moving average of MFP for the period ending FY 2017) of 0.3 percentage point, which is calculated based on IGI's second quarter 2016 forecast.

In addition, in accordance with section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we are further updating the standardized amount for FY 2017 by the estimated market basket percentage increase less 0.75 percentage point for hospitals in all areas. Sections 1886(b)(3)(B)(xi) and (xii) of the Act, as added and amended by sections 3401(a) and 10319(a) of the Affordable Care Act, further state that these adjustments may result in the applicable percentage increase being less than zero. The percentage increase in the market basket reflects the average change in the price of goods and services comprising routine, ancillary, and special care unit hospital inpatient services.

Based on IGI's 2016 second quarter forecast of the hospital market basket increase (as discussed in Appendix B of this final rule), the most recent forecast of the hospital market basket increase for FY 2017 is 2.7 percent. As discussed earlier, for FY 2017, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act, there are four possible applicable percentage increases that could be applied to the standardized amount. We refer readers to section IV.B. of the preamble of this final rule for a complete discussion on the FY 2017 inpatient hospital update to the standardized amount. We also refer readers to the table above for the four possible applicable percentage increases that will be applied to update the national standardized amount. The standardized amounts shown in Tables 1A through 1C that are published in section VI. of this Addendum and that are available via the Internet on the CMS Web site reflect these differential amounts.

Although the update factors for FY 2017 are set by law, we are required by section 1886(e)(4) of the Act to recommend, taking into account MedPAC's recommendations, appropriate update factors for FY 2017 for both IPPS hospitals and hospitals and hospital units excluded from the IPPS. Section 1886(e)(5)(A) of the Act requires that we publish our recommendations in the **Federal Register** for public comment. Our recommendation on the update factors is set forth in Appendix B of this final rule.

4. Methodology for Calculation of the Average Standardized Amount

The methodology we used to calculate the FY 2017 standardized amount is as follows:

- To ensure we are only including hospitals paid under the IPPS in the calculation of the standardized amount, we applied the following inclusion and exclusion criteria: include hospitals whose last four digits fall between 0001 and 0879 (section 2779A1 of Chapter 2 of the State Operations Manual on the

CMS Web site at: *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/som107c02.pdf*); exclude critical access hospitals at the time of this final rule; exclude hospitals in Maryland (because these hospitals are paid under an all payer model under section 1115A of the Act); and remove PPS-excluded cancer hospitals that have a ''V'' in the fifth position of their provider number or a ''E'' or ''F'' in the sixth position.

• As in the past, we adjusted the FY 2017 standardized amount to remove the effects of the FY 2016 geographic reclassifications and outlier payments before applying the FY 2017 updates. We then applied budget neutrality offsets for outliers and geographic reclassifications to the standardized amount based on FY 2017 payment policies.

• We do not remove the prior year's budget neutrality adjustments for reclassification and recalibration of the DRG relative weights and for updated wage data because, in accordance with sections 1886(d)(4)(C)(iii) and 1886(d)(3)(E) of the Act, estimated aggregate payments after updates in the DRG relative weights and wage index should equal estimated aggregate payments prior to the changes. If we removed the prior year's adjustment, we would not satisfy these conditions.

Budget neutrality is determined by comparing aggregate IPPS payments before and after making changes that are required to be budget neutral (for example, changes to MS–DRG classifications, recalibration of the MS–DRG relative weights, updates to the wage index, and different geographic reclassifications). We include outlier payments in the simulations because they may be affected by changes in these parameters.

• Consistent with our methodology established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50422 through 50433), because IME Medicare Advantage payments are made to IPPS hospitals under section 1886(d) of the Act, we believe these payments must be part of these budget neutrality calculations. However, we note that it is not necessary to include Medicare Advantage IME payments in the outlier threshold calculation or the outlier offset to the standardized amount because the statute requires that outlier payments be not less than 5 percent nor more than 6 percent of total ''operating DRG payments,'' which does not include IME and DSH payments. We refer readers to the FY 2011 IPPS/LTCH PPS final rule for a complete discussion on our methodology of identifying and adding the total Medicare Advantage IME payment amount to the budget neutrality adjustments.

• Consistent with the methodology in the FY 2012 IPPS/LTCH PPS final rule, in order to ensure that we capture only fee-for-service claims, we are only including claims with a ''Claim Type'' of 60 (which is a field on the MedPAR file that indicates a claim is an FFS claim).

• In order to further ensure that we capture only FFS claims, as we proposed, we are excluding claims with a ''GHOPAID'' indicator of 1 (which is a field on the MedPAR file that indicates a claim is not an FFS claim and is paid by a Group Health Organization).

• Consistent with our methodology established in the FY 2011 IPPS/LTCH PPS final rule (75 FR 50422 through 50423), we examine the MedPAR file and remove pharmacy charges for anti-hemophilic blood factor (which are paid separately under the IPPS) with an indicator of ''3'' for blood clotting with a revenue code of ''0636'' from the covered charge field for the budget neutrality adjustments. We also remove organ acquisition charges from the covered charge field for the budget neutrality adjustments because organ acquisition is a pass-through payment not paid under the IPPS.

• The Bundled Payments for Care Improvement (BPCI) initiative, developed under the authority of section 3021 of the Affordable Care Act (codified at section 1115A of the Act), is comprised of four broadly defined models of care, which link payments for multiple services beneficiaries receive during an episode of care. Under the BPCI initiative, organizations enter into payment arrangements that include financial and performance accountability for episodes of care. On January 31, 2013, CMS announced the first set of health care organizations selected to participate in the BPCI initiative. Additional organizations were selected in 2014. For additional information on the BPCI initiative, we refer readers to the CMS Center for Medicare and Medicaid Innovation's Web site at: *http://innovation.cms.gov/initiatives/Bundled-Payments/index.html.*

In the FY 2013 IPPS/LTCH PPS final rule (77 FR 53341 through 53343), for FY 2013 and subsequent fiscal years, we finalized a methodology to treat hospitals that participate in the BPCI initiative the same as prior fiscal years for the IPPS payment modeling and ratesetting process (which includes recalibration of the MS–DRG relative weights, ratesetting, calculation of the budget neutrality factors, and the impact analysis) without regard to a hospital's participation within these bundled payment models (that is, as if they are not participating in those models under the BPCI initiative). For FY 2017, as we proposed, we are continuing to include all applicable data from subsection (d) hospitals participating in BPCI Models 1, 2, and 4 in our IPPS payment modeling and ratesetting calculations.

• Consistent with our methodology established in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53687 through 53688), we believe that it is appropriate to include adjustments for the Hospital Readmissions Reduction Program and the Hospital VBP Program (established under the Affordable Care Act) within our budget neutrality calculations.

Both the hospital readmissions payment adjustment (reduction) and the hospital VBP payment adjustment (redistribution) are applied on a claim-by-claim basis by adjusting, as applicable, the base-operating DRG payment amount for individual subsection (d) hospitals, which affects the overall sum of aggregate payments on each side of the comparison within the budget neutrality calculations.

In order to properly determine aggregate payments on each side of the comparison, as we have done for the last 3 fiscal years, for FY 2017 and subsequent years, we are continuing to apply the hospital readmissions payment adjustment and the hospital VBP payment adjustment on each side of the comparison, consistent with the methodology that we adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53687 through 53688). That is, we applied the readmissions payment adjustment factor and the hospital VBP payment adjustment factor on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

For the purpose of calculating the FY 2017 readmissions payment adjustment factors, we used excess readmission ratios and aggregate payments for excess readmissions based on admissions from the prior fiscal year's applicable period because hospitals have had the opportunity to review and correct these data before the data were made public under the policy we adopted regarding the reporting of hospital-specific readmission rates, consistent with section 1886(q)(6) of the Act. For FY 2017, in this final rule, we calculated the readmissions payment adjustment factors using excess readmission ratios and aggregate payments for excess readmissions based on admissions from the finalized applicable period for FY 2017 as hospitals have had the

opportunity to review and correct these data under our policy regarding the reporting of hospital-specific readmission rates consistent with section 1886(q)(6) of the Act. We discuss our policy regarding the reporting of hospital-specific readmission rates for FY 2017 in section IV.G.3.f. of the preamble of this final rule. (For additional information on our general policy for the reporting of hospital-specific readmission rates, consistent with section 1886(q)(6) of the Act, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53399 through 53400).)

In addition, for FY 2017, in this final rule, for the purpose of modeling aggregate payments when determining all budget neutrality factors, we used proxy hospital VBP payment adjustment factors for FY 2017 that are based on data from a historical period because hospitals have not yet had an opportunity to review and submit corrections for their data from the FY 2017 performance period. (For additional information on our policy regarding the review and correction of hospital-specific measure rates under the Hospital VBP Program, consistent with section 1886(o)(10)(A)(ii) of the Act, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53578 through 53581), the CY 2012 OPPS/ASC final rule with comment period (76 FR 74544 through 74547), and the Hospital Inpatient VBP final rule (76 FR 26534 through 26536).)

- The Affordable Care Act also established section 1886(r) of the Act, which modifies the methodology for computing the Medicare DSH payment adjustment beginning in FY 2014. Beginning in FY 2014, IPPS hospitals receiving Medicare DSH payment adjustments will receive an empirically justified Medicare DSH payment equal to 25 percent of the amount that would previously have been received under the statutory formula set forth under section 1886(d)(5)(F) of the Act governing the Medicare DSH payment adjustment. In accordance with section 1886(r)(2) of the Act, the remaining amount, equal to an estimate of 75 percent of what otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals under age 65 who are uninsured and an additional statutory adjustment, will be available to make additional payments to Medicare DSH hospitals based on their share of the total amount of uncompensated care reported by Medicare DSH hospitals for a given time period. In order to properly determine aggregate payments on each side of the comparison for budget neutrality, prior to FY 2014, we included estimated Medicare DSH payments on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

To do this for FY 2017 (as we did for the last 3 fiscal years), we included estimated empirically justified Medicare DSH payments that will be paid in accordance with section 1886(r)(1) of the Act and estimates of the additional uncompensated care payments made to hospitals receiving Medicare DSH payment adjustments as described by section 1886(r)(2) of the Act. That is, we considered estimated empirically justified Medicare DSH payments at 25 percent of what would otherwise have been paid, and also the estimated additional uncompensated care payments for hospitals receiving Medicare DSH payment adjustments on both sides of our comparison of aggregate payments when determining all budget neutrality factors described in section II.A.4. of this Addendum.

- When calculating total payments for budget neutrality, to determine total payments for SCHs, we model total hospital-specific rate payments and total Federal rate payments and then include whichever one of the total payments is greater. As discussed in section IV.F. of the preamble to this final rule and below, we are continuing the FY 2014 finalized methodology under which we will take into consideration uncompensated care payments in the comparison of payments under the Federal rate and the hospital-specific rate for SCHs. Therefore, we included estimated uncompensated care payments in this comparison.

Similarly, for MDHs, as discussed in section IV. of the preamble to this final rule, when computing payments under the Federal national rate plus 75 percent of the difference between the payments under the Federal national rate and the payments under the updated hospital-specific rate, we are continuing to take into consideration uncompensated care payments in the computation of payments under the Federal rate and the hospital-specific rate for MDHs.

- We include an adjustment to the standardized amount for those hospitals that are not meaningful EHR users in our modeling of aggregate payments for budget neutrality for FY 2017. Similar to FY 2016, we are including this adjustment based on data on the prior year's performance. Payments for hospitals will be estimated based on the applicable standardized amount in Tables 1A and 1B for discharges occurring in FY 2017.

a. Recalibration of MS-DRG Relative Weights

Section 1886(d)(4)(C)(iii) of the Act specifies that, beginning in FY 1991, the annual DRG reclassification and recalibration of the relative weights must be made in a manner that ensures that aggregate payments to hospitals are not affected. As discussed in section II.G. of the preamble of this final rule, we normalized the recalibrated MS–DRG relative weights by an adjustment factor so that the average case relative weight after recalibration is equal to the average case relative weight prior to recalibration. However, equating the average case relative weight after recalibration to the average case relative weight before recalibration does not necessarily achieve budget neutrality with respect to aggregate payments to hospitals because payments to hospitals are affected by factors other than average case relative weight. Therefore, as we have done in past years, we are making a budget neutrality adjustment to ensure that the requirement of section 1886(d)(4)(C)(iii) of the Act is met.

For FY 2017, to comply with the requirement that MS–DRG reclassification and recalibration of the relative weights be budget neutral for the standardized amount and the hospital-specific rates, we used FY 2015 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2016 labor-related share percentages, the FY 2016 relative weights, and the FY 2016 pre-reclassified wage data, and applied the FY 2017 hospital readmissions payment adjustments and estimated FY 2017 hospital VBP payment adjustments; and
- Aggregate payments using the FY 2016 labor-related share percentages, the FY 2017 relative weights, and the FY 2016 pre-reclassified wage data, and applied the same FY 2017 hospital readmissions payment adjustments and estimated FY 2017 hospital VBP payment adjustments applied above.

Based on this comparison, we computed a budget neutrality adjustment factor equal to 0.999079 and applied this factor to the standardized amount. As discussed in section IV. of this Addendum, we also applied the MS–DRG reclassification and recalibration budget neutrality factor of 0.999079 to the hospital-specific rates that are effective for cost reporting periods beginning on or after October 1, 2016.

b. Updated Wage Index—Budget Neutrality Adjustment

Section 1886(d)(3)(E)(i) of the Act requires us to update the hospital wage

index on an annual basis beginning October 1, 1993. This provision also requires us to make any updates or adjustments to the wage index in a manner that ensures that aggregate payments to hospitals are not affected by the change in the wage index. Section 1886(d)(3)(E)(i) of the Act requires that we implement the wage index adjustment in a budget neutral manner. However, section 1886(d)(3)(E)(ii) of the Act sets the labor-related share at 62 percent for hospitals with a wage index less than or equal to 1.0000, and section 1886(d)(3)(E)(i) of the Act provides that the Secretary shall calculate the budget neutrality adjustment for the adjustments or updates made under that provision as if section 1886(d)(3)(E)(ii) of the Act had not been enacted. In other words, this section of the statute requires that we implement the updates to the wage index in a budget neutral manner, but that our budget neutrality adjustment should not take into account the requirement that we set the labor-related share for hospitals with wage indexes less than or equal to 1.0000 at the more advantageous level of 62 percent. Therefore, for purposes of this budget neutrality adjustment, section 1886(d)(3)(E)(i) of the Act prohibits us from taking into account the fact that hospitals with a wage index less than or equal to 1.0000 are paid using a labor-related share of 62 percent. Consistent with current policy, for FY 2017, we are adjusting 100 percent of the wage index factor for occupational mix. We describe the occupational mix adjustment in section III.E. of the preamble of this final rule.

To compute a budget neutrality adjustment factor for wage index and labor-related share percentage changes, we used FY 2015 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2017 relative weights and the FY 2016 pre-reclassified wage indexes, applied the FY 2016 labor-related share of 69.6 percent to all hospitals (regardless of whether the hospital's wage index was above or below 1.0000), and applied the FY 2017 hospital readmissions payment adjustment and the estimated FY 2017 hospital VBP payment adjustment; and
- Aggregate payments using the FY 2017 relative weights and the FY 2017 pre-reclassified wage indexes, applied the labor-related share for FY 2017 of 69.6 percent to all hospitals (regardless of whether the hospital's wage index was above or below 1.0000), and applied the same FY 2017 hospital readmissions payment adjustments and estimated FY 2017 hospital VBP payment adjustments applied above.

In addition, we applied the MS–DRG reclassification and recalibration budget neutrality adjustment factor (derived in the first step) to the payment rates that were used to simulate payments for this comparison of aggregate payments from FY 2016 to FY 2017. By applying this methodology, we determined a budget neutrality adjustment factor of 1.000209 for changes to the wage index.

We note that, in prior fiscal years, we used a three-step process and combined the recalibration and wage index budget neutrality factors into one factor by multiplying the recalibration adjustment factor by the wage index adjustment factor. Because these two adjustments are required under two different sections of the Act (sections 1886(d)(4)(C)(iii) and 1886(d)(3)(E)(i) of the Act) and the law requires that the wage index budget neutrality adjustment not take into account the requirement that we set the labor-related share for hospitals with wage indexes less than or equal to 1.0000 at the more advantageous level of 62 percent for FY 2017, we separated these two adjustments and applied them individually to the standardized amount. Applying these factors individually rather than as a combined factor has no effect mathematically on adjusting the standardized amount.

c. Reclassified Hospitals—Budget Neutrality Adjustment

Section 1886(d)(8)(B) of the Act provides that certain rural hospitals are deemed urban. In addition, section 1886(d)(10) of the Act provides for the reclassification of hospitals based on determinations by the MGCRB. Under section 1886(d)(10) of the Act, a hospital may be reclassified for purposes of the wage index.

Under section 1886(d)(8)(D) of the Act, the Secretary is required to adjust the standardized amount to ensure that aggregate payments under the IPPS after implementation of the provisions of sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act are equal to the aggregate prospective payments that would have been made absent these provisions. We note that the wage index adjustments provided for under section 1886(d)(13) of the Act are not budget neutral. Section 1886(d)(13)(H) of the Act provides that any increase in a wage index under section 1886(d)(13) shall not be taken into account in applying any budget neutrality adjustment with respect to such index under section 1886(d)(8)(D) of the Act. To calculate the budget neutrality adjustment factor for FY 2017, we used FY 2015 discharge data to simulate payments and compared the following:

- Aggregate payments using the FY 2017 labor-related share percentages, FY 2017 relative weights and FY 2017 wage data prior to any reclassifications under sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act, and applied the FY 2017 hospital readmissions payment adjustments and the estimated FY 2017 hospital VBP payment adjustments; and
- Aggregate payments using the FY 2017 labor-related share percentages, FY 2017 relative weights, and FY 2017 wage data after such reclassifications, and applied the same FY 2017 hospital readmissions payment adjustments and the estimated FY 2017 hospital VBP payment adjustments applied above.

We note that the reclassifications applied under the second simulation and comparison are those listed in Table 2 associated with this final rule, which is available via the Internet on the CMS Web site. This table reflects reclassification crosswalks for FY 2017, and applies the policies explained in section III. of the preamble to this final rule. Based on these simulations, we calculated a budget neutrality adjustment factor of 0.988224 to ensure that the effects of these provisions are budget neutral, consistent with the statute.

The FY 2017 budget neutrality adjustment factor was applied to the standardized amount after removing the effects of the FY 2016 budget neutrality adjustment factor. We note that the FY 2017 budget neutrality adjustment reflects FY 2017 wage index reclassifications approved by the MGCRB or the Administrator at the time of development of this final rule.

d. Rural Floor Budget Neutrality Adjustment

Under § 412.64(e)(4), we make an adjustment to the wage index to ensure that aggregate payments after implementation of the rural floor under section 4410 of the BBA (Pub. L. 105–33) and the imputed floor under § 412.64(h)(4) are equal to the aggregate prospective payments that would have been made in the absence of such provisions. Consistent with section 3141 of the Affordable Care Act and as discussed in section III.H. of the preamble of this final rule and codified at § 412.64(e)(4)(ii), the budget neutrality adjustment for the rural floor and the imputed floor is a national adjustment to the wage index.

As noted above and as discussed in section III.H.2. of the preamble of this final rule, we are extending the imputed floor policy (both the original methodology and alternative

methodology) for FY 2017. Therefore, in order to ensure that aggregate payments to hospitals are not affected, similar to prior years, for FY 2017, we follow our policy of including the imputed floor (calculated under the original and alternative methodologies) in the national rural floor budget neutrality adjustment to the wage index.

Similar to our calculation in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50369 through 50370), for FY 2017, we calculated a national rural Puerto Rico wage index. Because there are no rural Puerto Rico hospitals with established wage data, our calculation of the FY 2017 rural Puerto Rico wage index is based on the policy adopted in the FY 2008 IPPS final rule with comment period (72 FR 47323). That is, we used the unweighted average of the wage indexes from all CBSAs (urban areas) that are contiguous (share a border with) to the rural counties to compute the rural floor (72 FR 47323; 76 FR 51594). Under the new OMB labor market area delineations, except for Arecibo, Puerto Rico (CBSA 11640), all other Puerto Rico urban areas are contiguous to a rural area. Therefore, based on our existing policy, the FY 2017 rural Puerto Rico wage index was calculated based on the average of the FY 2017 wage indexes for the following urban areas: Aguadilla-Isabela, PR (CBSA 10380); Guayama, PR (CBSA 25020); Mayaguez, PR (CBSA 32420); Ponce, PR (CBSA 38660), San German, PR (CBSA 41900) and San Juan-Carolina-Caguas, PR (CBSA 41980).

To calculate the national rural floor and imputed floor budget neutrality adjustment factor, we used FY 2015 discharge data to simulate payments and the post-reclassified national wage indexes and compared the following:

- National simulated payments without the national rural floor and imputed floor; and
- National simulated payments with the national rural floor and imputed floor.

Based on this comparison, we determined a national rural floor and imputed floor budget neutrality adjustment factor of 0.993200. The national adjustment was applied to the national wage indexes to produce a national rural floor and imputed floor budget neutral wage index.

e. Wage Index Transition Budget Neutrality

As discussed in section III.G. of the preamble of this final rule, in the past, we have provided for transition periods when adopting changes that have significant payment implications, particularly large negative impacts.

Similar to FY 2005, for FY 2015, we determined that the transition to using the new OMB labor market area delineations would have the largest impact on hospitals that were located in an urban county that became rural under the new OMB delineations or hospitals deemed urban where the urban area became rural under the new OMB delineations. To alleviate the decreased payments associated with having a rural wage index, in calculating the area wage index, similar to the transition provided in the FY 2005 IPPS final rule, we finalized a policy to generally assign the hospitals in these counties the urban wage index value of the CBSA where they are physically located in FY 2014 for FYs 2015, 2016, and 2017. FY 2017 will be the final year of this 3-year transition policy. We note that the 1-year blended wage index transitional policy for all hospitals that experienced any decrease in their wage index value expired in FY 2015.

As discussed in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50372 through 50373), in the past, CMS has budget neutralized transitional wage indexes. We stated that because we established a policy that allows for the application of a transitional wage index only when it benefits the hospital, we believe that it would be appropriate to ensure that such a transitional policy does not increase aggregate Medicare payments beyond the payments that would be made had we simply adopted the OMB delineations without any transitional provisions. Therefore, as we did for FYs 2015 and 2016, for FY 2017, we used our exceptions and adjustments authority under section 1886(d)(5)(I)(i) of the Act to make an adjustment to the national standardized amounts to ensure that total payments for the effect of the 3-year transitional wage index provisions will equal what payments would have been if we had fully adopted the new OMB delineations without providing these transitional provisions. To calculate the transitional wage index budget neutrality factor for FY 2017, we used FY 2015 discharge data to simulate payments and compared the following:

- Aggregate payments using the OMB delineations for FY 2017, the FY 2017 relative weights, FY 2017 wage data after such reclassifications under sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act, application of the rural floor budget neutrality adjustment factor to the wage index, and application of the FY 2017 hospital readmissions payment adjustments and the estimated FY 2017 hospital VBP payment adjustments; and
- Aggregate payments using the OMB delineations for FY 2017, the FY 2017 relative weights, FY 2017 wage data after such reclassifications under sections 1886(d)(8)(B) and (C) and 1886(d)(10) of the Act, application of the rural floor budget neutrality adjustment factor to the wage index, application of the 3-year transitional wage indexes, and application of the same FY 2017 hospital readmissions payment adjustments and the estimated FY 2017 hospital VBP payment adjustments applied above.

Based on these simulations, we calculated a budget neutrality adjustment factor of 0.999994. Therefore, for FY 2017, we applied a transitional wage index budget neutrality adjustment factor of 0.999994 to the national average standardized amounts to ensure that the effects of these transitional wage indexes are budget neutral.

We note that the budget neutrality adjustment factor calculated above is based on the increase in payments in FY 2017 that will result from the final year of the 3-year transitional wage index policies. Therefore, we are applying this budget neutrality adjustment factor as a one-time adjustment to the FY 2017 national standardized amounts in order to offset the increase in payments in FY 2017 as a result of this final year of the 3-year transitional wage index. For FY 2017, we did not take into consideration the adjustment factor applied to the national standardized amounts in the previous fiscal year's update when calculating the current fiscal year transitional wage index budget neutrality adjustment factor (that is, this adjustment is not applied cumulatively).

f. Case-Mix Budget Neutrality Adjustment

(1) Background

Below we summarize the recoupment adjustment to the FY 2017 payment rates, as required by section 631 of the ATRA, to account for the increase in aggregate payments as a result of not completing the prospective adjustment authorized under section 7(b)(1)(A) of Public Law 110–90 until FY 2013. We refer readers to section II.D. of the preamble of this final rule for a complete discussion regarding our policies for FY 2017 in this final rule and previously finalized policies (including our historical adjustments to the payment rates) relating to the effect of changes in documentation and coding that do not reflect real changes in case-mix.

(2) Recoupment or Repayment Adjustment Authorized by Section 631 of the American Taxpayer Relief Act of 2012 (ATRA) to the National Standardized Amount

Section 631 of the ATRA amended section 7(b)(1)(B) of Public Law 110–90 to require the Secretary to make a recoupment adjustment totaling $11 billion by FY 2017. Our actuaries estimated that if CMS were to fully account for the $11 billion recoupment required by section 631 of the ATRA in FY 2014, a one-time −9.3 percent adjustment to the standardized amount would be necessary. It is often our practice to delay or phase-in payment rate adjustments over more than 1 year, in order to moderate the effect on payment rates in any 1 year. Therefore, consistent with the policies that we have adopted in many similar cases, for FY 2014, FY 2015 and FY 2016, we applied a −0.8 percent adjustment to the standardized amount. For FY 2017, as we proposed, we are applying a −1.5 percent adjustment to the standardized amount. We refer the reader to section II. D. 6. of the preamble to this final rule for a complete discussion on this adjustment. We note that, as section 631 of the ATRA instructs the Secretary to make a recoupment adjustment only to the standardized amount, this adjustment does not apply to the hospital-specific payment rates.

g. Adjustment to IPPS Rates Resulting From 2-Midnight Policy

As discussed in section IV. P. of the preamble to this final rule, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50906 through 50954), we adopted the 2-midnight policy effective for dates of admission on or after October 1, 2013. We used our authority under section 1886(d)(5)(I)(i) of the Act to make a reduction of 0.2 percent to the standardized amount, the Puerto Rico standardized amount, and the hospital-specific payment rate, and we used our authority under section 1886(g) of the Act to make a reduction of 0.2 percent to the national capital Federal rate and the Puerto Rico-specific capital rate, in order to offset the estimated increase of $220 million in IPPS expenditures in FY 2014 as a result of the 2-midnight policy.

In *Shands Jacksonville Medical Center, Inc.* v. *Burwell,* No. 14–263 (D.D.C.) and related cases, hospitals challenged the 0.2 percent reduction in IPPS rates to account for the estimated $220 million in additional FY 2014 expenditures resulting from the 2-midnight policy. In its Memorandum Opinion, issued September 21, 2015, the Court found that the ''Secretary's interpretation of the exceptions and adjustments provision is a reasonable one'' for this purpose. However, the Court also ordered the 0.2 percent reduction remanded back to the Secretary, without vacating the rule, to correct certain procedural deficiencies in the promulgation of the 0.2 percent reduction and reconsider the adjustment. In accordance with the Court's order, we published a notice with comment period that appeared in the December 1, 2015 **Federal Register** (80 FR 75107), which discussed the basis for the 0.2 percent reduction and its underlying assumptions and invited comments on the same in order to facilitate our further consideration of the FY 2014 reduction.

We still believe that the assumptions underlying the 0.2 percent reduction to the rates put in place beginning in FY 2014 were reasonable at the time we made them in 2013. Nevertheless, taking all the factors discussed in section IV. P of the preamble to this final rule into account, we believe it is appropriate to use our authority under section 1886(d)(5)(I)(i) to prospectively remove, beginning in FY 2017, the 0.2 percent reduction to the standardized amount and hospital-specific rates put in place beginning in FY 2014. The 0.2 percent reduction was implemented by including a factor of 0.998 in the calculation of the FY 2014 standardized amount and hospital-specific rates, permanently reducing the standardized amount and hospital-specific rates for FY 2014 and future years until the 0.998 is removed. As we proposed, we are permanently removing the 0.998 reduction beginning in FY 2017 by including a factor of (1/0.998) in the calculation of the FY 2017 standardized amount and hospital specific rate.

In addition, for the reasons discussed in section IV.P of the preamble of this final rule, we believe that it is appropriate to use our authority under section 1886(d)(5)(I)(i) to temporarily increase the standardized amount and hospital-specific rates, only for FY 2017, to address the effect of the 0.2 percent reduction to the standardized amount and hospital-specific rates in effect for FY 2014, the 0.2 percent reduction to the standardized amount and hospital-specific rates in effect for FY 2015 (recall the 0.998 factor included in the calculation of the FY 2014 payment rates permanently reduced the payment rates for FY 2014 and future years until it is removed), and the 0.2 percent reduction to the standardized amount and hospital-specific payment rates in effect for FY 2016. We believe that the most transparent, expedient, and administratively feasible method to accomplish this is a temporary one-time prospective increase to the FY 2017 standardized amount and hospital-specific rates of 0.6 percent (= 0.2 percent + 0.2 percent + 0.2 percent). Specifically, we are including a factor of 1.006 in the calculation of the standardized amount and the hospital-specific rates in FY 2017 and then removing this temporary one-time prospective increase by including a factor of (1/1.006) in the calculation of the standardized amount and hospital-specific rates for FY 2018.

We refer the reader to section IV.P. of the preamble to this final rule for a complete discussion.

h. Outlier Payments

Section 1886(d)(5)(A) of the Act provides for payments in addition to the basic prospective payments for ''outlier'' cases involving extraordinarily high costs. To qualify for outlier payments, a case must have costs greater than the sum of the prospective payment rate for the MS–DRG, any IME and DSH payments, uncompensated care payments, any new technology add-on payments, and the ''outlier threshold'' or ''fixed-loss'' amount (a dollar amount by which the costs of a case must exceed payments in order to qualify for an outlier payment). We refer to the sum of the prospective payment rate for the MS–DRG, any IME and DSH payments, uncompensated care payments, any new technology add-on payments, and the outlier threshold as the outlier ''fixed-loss cost threshold.'' To determine whether the costs of a case exceed the fixed-loss cost threshold, a hospital's CCR is applied to the total covered charges for the case to convert the charges to estimated costs. Payments for eligible cases are then made based on a marginal cost factor, which is a percentage of the estimated costs above the fixed-loss cost threshold. The marginal cost factor for FY 2017 is 80 percent, or 90 percent for burn MS–DRGs 927, 928, 929, 933, 934, and 935. We have used a marginal cost factor of 90 percent since FY 1989 (54 FR 36479 through 36480) for designated burn DRGs as well as a marginal cost factor of 80 percent for all other DRGs since FY 1995 (59 FR 45367).

In accordance with section 1886(d)(5)(A)(iv) of the Act, outlier payments for any year are projected to be not less than 5 percent nor more than 6 percent of total operating DRG payments (which does not include IME and DSH payments) plus outlier payments. When setting the outlier threshold, we compute the 5.1 percent target by dividing the total operating

outlier payments by the total operating DRG payments plus outlier payments. We do not include any other payments such as IME and DSH within the outlier target amount. Therefore, it is not necessary to include Medicare Advantage IME payments in the outlier threshold calculation. Section 1886(d)(3)(B) of the Act requires the Secretary to reduce the average standardized amount by a factor to account for the estimated proportion of total DRG payments made to outlier cases. More information on outlier payments may be found on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/outlier.html*.

(1) FY 2017 Outlier Fixed-Loss Cost Threshold

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50977 through 50983), in response to public comments on the FY 2013 IPPS/LTCH PPS proposed rule, we made changes to our methodology for projecting the outlier fixed-loss cost threshold for FY 2014. We refer readers to the FY 2014 IPPS/LTCH PPS final rule for detailed discussion of the changes.

As we have done in the past, to calculate the FY 2017 outlier threshold, we simulated payments by applying FY 2017 payment rates and policies using cases from the FY 2015 MedPAR file. Therefore, in order to determine the FY 2017 outlier threshold, we inflated the charges on the MedPAR claims by 2 years, from FY 2015 to FY 2017. As discussed in the FY 2015 IPPS/LTCH PPS final rule, we believe that a methodology that is based on 1-year of charge data will provide a more stable measure to project the average charge per case because our prior methodology used a 6-month measure, which inherently uses fewer claims than a 1-year measure and makes it more susceptible to fluctuations in the average charge per case as a result of any significant charge increases or decreases by hospitals. The methodology we proposed, and are finalizing, to calculate the charge inflation factor for FY 2017 and subsequent fiscal years is as follows:

- To produce the most stable measure of charge inflation, we applied the following inclusion and exclusion criteria of hospitals claims in our measure of charge inflation: include hospitals whose last four digits fall between 0001 and 0899 (section 2779A1 of Chapter 2 of the State Operations Manual on the CMS Web site at *https://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/som107c02.pdf*); included CAHs that were IPPS hospitals for the time period of the MedPAR data being used to calculate the charge inflation factor; included hospitals in Maryland; and removed PPS excluded cancer hospitals who have a ''V'' in the fifth position of their provider number or a ''E'' or ''F'' in the sixth position.
- We excluded Medicare Advantage IME claims for the reasons described in section I.A.4. of this Addendum. We refer readers to the FY 2011 IPPS/LTCH PPS final rule for a complete discussion on our methodology of identifying and adding the total Medicare Advantage IME payment amount to the budget neutrality adjustments.
- In order to ensure that we captured only FFS claims, we included claims with a ''Claim Type'' of 60 (which is a field on the MedPAR file that indicates a claim is an FFS claim).
- In order to further ensure that we captured only FFS claims, we excluded claims with a ''GHOPAID'' indicator of 1 (which is a field on the MedPAR file that indicates a claim is not an FFS claim and is paid by a Group Health Organization).
- We examined the MedPAR file and removed pharmacy charges for anti-hemophilic blood factor (which are paid separately under the IPPS) with an indicator of ''3'' for blood clotting with a revenue code of ''0636'' from the covered charge field. We also removed organ acquisition charges from the covered charge field because organ acquisition is a pass-through payment not paid under the IPPS.

In the FY 2016 IPPS/LTCH final rule (80 FR 49779–49780), we stated that commenters were concerned that they were unable to replicate the calculation of the charge inflation factor that CMS used in the proposed rule. In response to those comments, we stated that we continue to believe that it is optimal to use the most recent period of charge data available to measure charge inflation. In addition, similar to FY 2016, for FY 2017 we grouped claims data by quarter in the table below to allow the public access to these data and the ability to replicate the claims summary for the claims with discharge dates through September 30, 2015, that are available under the current LDS structure. In order to provide even more information in response to the commenters' request, similar to FY 2016, for FY 2017 we have made available on the CMS Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* (click on the link on the left titled ''FY 2017 IPPS Proposed Rule Home Page'' and then click the link ''FY 2017 Proposed Rule Data Files'') a more detailed summary table by provider with the monthly charges that were used to compute the charge inflation factor. In the proposed rule we stated that we would continue to work with our systems teams and privacy office to explore expanding the information available in the current LDS, perhaps through the provision of a supplemental data file for future rulemaking.

Quarter	Covered charges (January 1, 2014, through December 31, 2014)	Cases (January 1, 2014, through December 31, 2014)	Covered charges (January 1, 2015, through December 31, 2015)	Cases (January 1, 2015, through December 31, 2015)
1	$126,156,195,005	2,479,295	$134,250,323,661	2,546,078
2	122,171,248,575	2,445,370	126,880,227,174	2,416,569
3	119,364,629,662	2,364,553	122,165,668,615	2,308,537
4	124,733,843,923	2,436,787	90,677,073,204	1,696,180
Total	492,425,917,165	9,726,005	473,973,292,654	8,967,364

Under this methodology, to compute the 1-year average annualized rate-of-change in charges per case for FY 2017, as we proposed, we compared the average covered charge per case of $50,360 ($492,425,917,165/9,726,005) from the second quarter of FY 2014 through the first quarter of FY 2015 (January 1, 2014, through December 31, 2014) to the average covered charge per case of $52,855 ($473,973,292,654/8,967,364) from the second quarter of FY 2015 through the first quarter of FY 2016 (January 1, 2015, through December 31, 2015). This rate-of-change

was 4.4 percent (1.043957) or 9.8 percent (1.089846) over 2 years. The billed charges are obtained from the claim from the MedPAR file and inflated by the inflation factor specified above.

Comment: Many commenters were concerned with what they stated was a lack of transparency with respect to the charge inflation component of the fixed-loss threshold calculation. One commenter stated that it is unable to match the figures in the table from the proposed rule with publicly available data sources and that CMS did not disclose the source of the data. The commenter further stated that CMS has not made the necessary data available, or any guidance that describes whether and how CMS edited such data to arrive at the total of quarterly charges and charges per case used to measure charge inflation. Consequently, the commenter stated that the table provided in the proposed rule is not useful in assessing the accuracy of the charge inflation figure that CMS used in the proposed rule to calculate the outlier threshold. The commenter noted that CMS provided a detailed summary table by provider with the monthly charges that were used to compute the charge inflation factor. The commenters appreciated the additional data, but still believed that CMS has not provided enough specific information and data to allow the underlying numbers used in CMS' calculation of the charge inflation factor to be replicated and/or tested for accuracy. The commenter concluded that in the absence of more specific data and information about how the data were edited by CMS to arrive at the totals used in the charge inflation calculation, CMS has not provided adequate notice to allow for meaningful comment.

Response: We responded to a similar comment in the FY 2015 IPPS/LTCH final rule (79 FR 50375) and FY 2016 IPPS/LTCH final rule (80 FR 49779 through 49780) and refer readers to those final rules for our complete response. While the charge data may not be immediately available after the issuance of this final rule, we believe the data and supporting files we have provided will provide the commenters with additional information that can be verified once the charge data are available. We have produced the actual figures we used and disclosed our formula. We intend to post the actual charge data as soon as possible so that the public can verify the raw data with the figures we used in the calculation. As stated above and in the proposed rule, the charge data used to calculate the charge inflation factor are sourced from our MedPAR database.

In addition, as stated in last year's final rule, we continue to believe that it is optimal to use the most recent period of charge data available to measure charge inflation. Similar to last year, the commenters did not propose to use charge data from a different period to compute the charge inflation factor. If we computed the charge inflation factor using the latest data available to the public at the time of issuance of this final rule, we would need to compare charge data from FY 2014 (October 2013–September 2014) to FY 2015 (October 2014–September 2015), data which would be at least 10 months old compared to the charge data we currently use that are 4 months old.

Comment: One commenter requested that CMS add the claims data used to compute the charge inflation factor to the list of limited data set (LDS) files that can be ordered through the usual LDS data request process.

Response: There are limitations on how expeditiously we can add the charge data to the LDS. After consulting with our systems teams and privacy office, we do not anticipate being able to provide the charge data we currently use to calculate the charge inflation factor within the commenter's requested timeframe. We prefer using the latest data available at the time of the proposed and final rules to compute the charge inflation factor because we believe it leads to greater accuracy in the calculation of the fixed-loss cost outlier threshold. If the charge data are still not available for replication after the FY 2018 IPPS/LTCH PPS proposed rule, we would invite commenters to suggest alternative data sources that we could use to calculate the charge inflation factor (such as older data). As noted, we believe that using older data may not provide the same accuracy as the current data we use, and therefore the commenters should inform us which is more important to them, the need to have complete access to the data we use in our methodology or the greater accuracy provided by the use of more up-to-date data. As noted above, the data we currently use will eventually be publicly available for replication but not in the timeframe the commenter has requested. To summarize, we are confronted with a dilemma—either we use older data that commenters can access earlier, or we use the most up-to-date data which will be more accurate, but will not be available to the public until after publication of the proposed and final rules. We continue to believe the latter approach, using the best available data to produce a more accurate charge inflation factor, is preferable.

As we have done in the past, in the FY 2017 IPPS/LTCH proposed rule, we proposed to establish the FY 2017 outlier threshold using hospital CCRs from the December 2015 update to the Provider-Specific File (PSF)—the most recent available data at the time of the development of the proposed rule. As stated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we apply the following edits to providers' CCRs in the PSF. We believe that these edits are appropriate in order to accurately model the outlier threshold. We first search for Indian Health Service providers and those providers assigned the statewide average CCR from the current fiscal year. We then replace these CCRs with the statewide average CCR for the upcoming fiscal year. We also assign the statewide average CCR (for the upcoming fiscal year) to those providers that have no value in the CCR field in the PSF. We do not apply the adjustment factors described below to hospitals assigned the statewide average CCR.

For FY 2017, we proposed to continue to apply an adjustment factor to the CCRs to account for cost and charge inflation (as explained below). We proposed that, if more recent data become available, we would use those data to calculate the final FY 2017 outlier threshold.

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we adopted a new methodology to adjust the CCRs. Specifically, we finalized a policy to compare the national average case-weighted operating and capital CCR from the most recent update of the PSF to the national average case-weighted operating and capital CCR from the same period of the prior year.

Therefore, as we did for the last 3 fiscal years, we proposed to adjust the CCRs from the December 2015 update of the PSF by comparing the percentage change in the national average case-weighted operating CCR and capital CCR from the December 2014 update of the PSF to the national average case-weighted operating CCR and capital CCR from the December 2015 update of the PSF. We note that, in the proposed rule, we used total transfer-adjusted cases from FY 2015 to determine the national average case-weighted CCRs for both sides of the comparison. As stated in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50979), we believe that it is appropriate to use the same case count on both sides of the comparison because this will produce the true percentage change in the average case-weighted operating and capital CCR from 1 year

to the next without any effect from a change in case count on different sides of the comparison.

Using the proposed methodology above, for the proposed rule, we calculated a December 2014 operating national average case-weighted CCR of 0.280907 and a December 2015 operating national average case-weighted CCR of 0.272363. We then calculated the percentage change between the two national operating case-weighted CCRs by subtracting the December 2014 operating national average case-weighted CCR from the December 2015 operating national average case-weighted CCR and then dividing the result by the December 2014 national operating average case-weighted CCR. This resulted in a proposed national operating CCR adjustment factor of 0.969585.

We used the same methodology proposed above to adjust the capital CCRs. Specifically, for the proposed rule, we calculated a December 2014 capital national average case-weighted CCR of 0.024615 and a December 2015 capital national average case-weighted CCR of 0.024008. We then calculated the percentage change between the two national capital case-weighted CCRs by subtracting the December 2014 capital national average case-weighted CCR from the December 2015 capital national average case-weighted CCR and then dividing the result by the December 2014 capital national average case-weighted CCR. This resulted in a proposed national capital CCR adjustment factor of 0.975335.

As discussed above, for FY 2017, we applied the final year of the 3-year transitional wage index because of the adoption of the new OMB labor market area delineations. Also, as discussed in section III.B.3. of the preamble to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50160 and 50161) and in section III.H.3. of the preamble of this final rule, in accordance with section 10324(a) of the Affordable Care Act, we created a wage index floor of 1.0000 for all hospitals located in States determined to be frontier States. We note that the frontier State floor adjustments were calculated and applied after rural and imputed floor budget neutrality adjustments were calculated for all labor market areas, in order to ensure that no hospital in a frontier State will receive a wage index less than 1.0000 due to the rural and imputed floor adjustment. In accordance with section 10324(a) of the Affordable Care Act, the frontier State adjustment will not be subject to budget neutrality, and will only be extended to hospitals geographically located within a frontier State. However, for purposes of estimating the outlier threshold for FY 2017, it was necessary to apply the 3-year transitional wage indexes and adjust the wage index of those eligible hospitals in a frontier State when calculating the outlier threshold that results in outlier payments being 5.1 percent of total payments for FY 2017. If we did not take the above into account, our estimate of total FY 2017 payments would be too low, and, as a result, our outlier threshold would be too high, such that estimated outlier payments would be less than our projected 5.1 percent of total payments.

As we did in establishing the FY 2009 outlier threshold (73 FR 57891), in our projection of FY 2017 outlier payments, we proposed not to make any adjustments for the possibility that hospitals' CCRs and outlier payments may be reconciled upon cost report settlement. We stated that we continue to believe that, due to the policy implemented in the June 9, 2003 Outlier Final Rule (68 FR 34494), CCRs will no longer fluctuate significantly and, therefore, few hospitals will actually have these ratios reconciled upon cost report settlement. In addition, it is difficult to predict the specific hospitals that will have CCRs and outlier payments reconciled in any given year. We note that we have instructed MACs to identify to CMS for potential reconciliation any instances where: (1) A hospital's actual CCR for the cost reporting period fluctuates plus or minus 10 percentage points compared to the interim CCR used to calculate outlier payments when a bill is processed; and (2) the total outlier payments for the hospital exceeded $500,000.00 for that period. Our simulations assume that CCRs accurately measure hospital costs based on information available to us at the time we set the outlier threshold. For these reasons, we proposed not to make any assumptions regarding the effects of reconciliation on the outlier threshold calculation.

Comment: Commenters were concerned with CMS' decision not to consider outlier reconciliation in developing the outlier threshold and stated that CMS did not provide objective data concerning the number of hospitals that have been subjected to reconciliation and the amounts recovered during this process.

Response: The commenters' views were similar to comments received and responded to in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50376 through 50377), and we refer readers to that rule for our response.

As described in sections IV.G. and IV.H., respectively, of the preamble of this final rule, sections 1886(q) and 1886(o) of the Act establish the Hospital Readmissions Reduction Program and the Hospital VBP Program, respectively. We do not believe that it is appropriate to include the hospital VBP payment adjustments and the hospital readmissions payment adjustments in the outlier threshold calculation or the outlier offset to the standardized amount. Specifically, consistent with our definition of the base operating DRG payment amount for the Hospital Readmissions Reduction Program under § 412.152 and the Hospital VBP Program under § 412.160, outlier payments under section 1886(d)(5)(A) of the Act are not affected by these payment adjustments. Therefore, outlier payments will continue to be calculated based on the unadjusted base DRG payment amount (as opposed to using the base-operating DRG payment amount adjusted by the hospital readmissions payment adjustment and the hospital VBP payment adjustment). Consequently, we proposed to exclude the hospital VBP payment adjustments and the hospital readmissions payment adjustments from the calculation of the outlier fixed-loss cost threshold.

We note that, to the extent section 1886(r) of the Act modifies the DSH payment methodology under section 1886(d)(5)(F) of the Act, the new uncompensated care payment under section 1886(r)(2) of the Act, like the empirically justified Medicare DSH payment under section 1886(r)(1) of the Act, may be considered an amount payable under section 1886(d)(5)(F) of the Act such that it would be reasonable to include the payment in the outlier determination under section 1886(d)(5)(A) of the Act. As we have done since the implementation of uncompensated care payments in FY 2014, for FY 2017 we proposed allocating an estimated per-discharge uncompensated care payment amount to all cases for the hospitals eligible to receive the uncompensated care payment amount in the calculation of the outlier fixed-loss cost threshold methodology. We continue to believe that allocating an eligible hospital's estimated uncompensated care payment to all cases equally in the calculation of the outlier fixed-loss cost threshold will best approximate the amount we will pay in uncompensated care payments during the year because, when we make claim payments to a hospital eligible for such payments, we will be making estimated per-discharge uncompensated care payments to all cases equally. Furthermore, we continue to believe that using the estimated per-claim

uncompensated care payment amount to determine outlier estimates provides predictability as to the amount of uncompensated care payments included in the calculation of outlier payments. Therefore, consistent with the methodology used since FY 2014 to calculate the outlier fixed-loss cost threshold, for FY 2017, we proposed to include estimated FY 2017 uncompensated care payments in the computation of the outlier fixed-loss cost threshold. Specifically, we proposed to use the estimated per-discharge uncompensated care payments to hospitals eligible for the uncompensated care payment for all cases in the calculation of the outlier fixed-loss cost threshold methodology.

Using this methodology, we used the formula described in section I.C.1 of this Addendum to simulate and calculate the Federal payment rate and outlier payments for all claims. We proposed a threshold of $23,681 and calculated total operating Federal payments of $82,727,323,366 and total outlier payments of $4,445,892,903. We then divided total outlier payments by total operating Federal payments plus total outlier payments and determined that this proposed threshold met the 5.1 percent target. As a result, we proposed an outlier fixed-loss cost threshold for FY 2017 equal to the prospective payment rate for the MS–DRG, plus any IME, empirically justified Medicare DSH payments, estimated uncompensated care payment, and any add-on payments for new technology, plus $23,681.

Comment: One commenter believed that it is important that CMS accurately calculate prior year actual payment comparisons to the 5.1 percent target. The commenter asserted that it is not possible for CMS to appropriately modify the methodology to achieve an accurate result if CMS is not aware of, or misinformed about, inaccuracies resulting from the prior year's methodology. The commenter cited the FY 2016 IPPS/LTCH PPS proposed rule as an example where CMS indicated that actual outlier payments for FY 2015 would equal about 4.88 percent of overall payments, while in the FY 2017 IPPS/LTCH PPS proposed rule, CMS indicated that, for FY 2015, actual outlier payments would equal about 4.68 percent of MS–DRG payments.

The commenter stated that it was concerned that CMS believed the agency would reach the 5.1 percent target for FY 2015 (based on the estimate in the FY 2016 proposed rule) only to learn that the original estimate in the FY 2016 proposed rule was overestimated compared to the FY 2017 proposed rule. The commenter concluded it is critical that CMS not allow the use of incomplete data from prior years to affect its calculation of current period thresholds.

Another commenter noted that the final outlier threshold established by CMS is always significantly lower than the threshold set forth in the proposed rule. The commenter believed the decline is most likely due to the use of updated CCRs or other data in calculating the final threshold. The commenter stated this emphasizes that CMS must use the most recent data available when the agency calculates the outlier threshold. The commenter cited as an example that, in the proposed rule, CMS used data from the December 2015 PSF file, but at the time the proposed rule was issued, the March 2016 PSF file was available.

Response: We responded to similar comments in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50378 through 50379) and refer the reader to that rule for our response.

Comment: Some commenters believed that the outlier threshold should be further reduced because outlier payments this year are on target to fall below the 5.1 percent target. The commenter suggested that CMS consider calculating the threshold at the midpoint of the target (approximately 5.5 percent) in order to ensure that the final total of outlier payments is between the statutory requirements of 5 to 6 percent of total payments.

Another commenter recommended that that threshold be maintained at the FY 2016 outlier threshold because CMS has underpaid outlier payments in prior fiscal years. One commenter noted that CMS' estimate of FY 2015 outlier payments in the proposed rule was 4.68 percent, which is below the 5.1 percent target. The commenter believed that by applying a 2-year charge inflation factor and a 1-year CCR factor that CMS is inadvertently compounding its charge increase with lower costs and overstating the outlier threshold. The commenter suggested that CMS apply the following formula to compute the FY 2017 outlier threshold: Step 1—FY 2015 Difference = (5.1 percent Target − 4.68 percent estimate from FY 2015 = 0.42 percent)/4.68 percent estimate from FY 2015 = 8.97 percent; Step 2—Suggested FY 2017 Threshold = Threshold from FY 2015 of $24,626 * (100 − 8.97 from Step 1 = 91.03 percent) = $22,417.

Response: We responded to similar comments in the FY 2015 IPPS/LTCH final rule (78 FR 50379) and the FY 2016 IPPS/LTCH PPS final rule (80 FR 49783) and refer readers to those final rules for our complete responses.

Comment: One commenter was concerned that CMS constantly misestimates the 5.1 percent target. The commenter recommended that CMS conduct additional analysis to evaluate the methodology for incorporating uncompensated care and DSH payments into the outlier threshold calculation.

Response: As discussed above, we include updates to the uncompensated care payment calculation as part of the fixed-loss outlier threshold calculation. Without additional information or data analysis, we are unsure what exactly the commenter is referencing when the commenter stated that CMS should further evaluate the methodology for incorporating uncompensated care and DSH payments into the outlier threshold calculation. It would have been beneficial to us if the commenter had specifically identified the areas that CMS should review and suggested alternative approaches. We already conduct analysis of uncompensated care and DSH payments, but are open to other approaches. However, without more specificity, we cannot meaningfully respond to or adopt the commenter's suggestion.

After consideration of the public comments we received, we are not making any changes to our methodology in this final rule for FY 2017. Therefore, we are using the same methodology we proposed to calculate the final outlier threshold.

Similar to the table provided in the proposed rule, for this final rule, we are providing the following table that displays covered charges and cases by quarter in the periods used to calculate the charge inflation factor based on the latest claims data from the MedPAR file.

Quarter	Covered charges (April 1, 2014, through March 31, 2015)	Cases (April 1, 2014, through March 31, 2015)	Covered charges (April 1, 2015, through March 31, 2016)	Cases (April 1, 2015, through March 31, 2016)
1	$135,268,674,848	2,559,124	$100,321,539,956	1,825,635
2	122,486,434,387	2,450,512	127,944,664,075	2,432,402
3	119,706,545,046	2,370,067	124,301,570,497	2,340,555

Quarter	Covered charges (April 1, 2014, through March 31, 2015)	Cases (April 1, 2014, through March 31, 2015)	Covered charges (April 1, 2015, through March 31, 2016)	Cases (April 1, 2015, through March 31, 2016)
4	125,106,133,072	2,441,645	126,979,101,227	2,343,069
Total	502,567,787,353	9,821,348	479,546,875,755	8,941,661

Under our current methodology, to compute the 1-year average annualized rate-of-change in charges per case for FY 2017, we compared the average covered charge per case of $51,171 ($502,567,787,353/9,821,348) from the third quarter of FY 2014 through the second quarter of FY 2015 (April 1, 2014, through March 31, 2015) to the average covered charge per case of $56,361 ($479,546,875,755/8,941,661) from the third quarter of FY 2015 through the second quarter of FY 2016 (April 1, 2015, through March 31, 2016). This rate-of-change is 4.8 percent (1.048067) or 9.8 percent (1.098446) over 2 years.

As we have done in the past, we are establishing the FY 2017 outlier threshold using hospital CCRs from the March 2016 update to the Provider-Specific File (PSF)—the most recent available data at the time of development of this final rule. For FY 2017, we also are continuing to apply an adjustment factor to the CCRs to account for cost and charge inflation (as explained below).

Therefore, as we did for the last 3 fiscal years, we are adjusting the CCRs from the March 2016 update of the PSF by comparing the percentage change in the national average case-weighted operating CCR and capital CCR from the March 2015 update of the PSF to the national average case-weighted operating CCR and capital CCR from the March 2016 update of the PSF. We note that we used total transfer-adjusted cases from FY 2015 to determine the national average case-weighted CCRs for both sides of the comparison.

Using the methodology above, we calculated a March 2015 operating national average case-weighted CCR of 0.278734 and a March 2016 operating national average case-weighted CCR of 0.270034. We then calculated the percentage change between the two national operating case-weighted CCRs by subtracting the March 2015 operating national average case-weighted CCR from the March 2016 operating national average case-weighted CCR and then dividing the result by the March 2015 national operating average case-weighted CCR. This resulted in a national operating CCR adjustment factor of 0.96879.

We also used the same methodology above to adjust the capital CCRs. Specifically, we calculated a March 2015 capital national average case-weighted CCR of 0.024375 and a March 2016 capital national average case-weighted CCR of 0.023688. We then calculated the percentage change between the two national capital case-weighted CCRs by subtracting the March 2015 capital national average case-weighted CCR from the March 2016 capital national average case-weighted CCR and then dividing the result by the March 2015 capital national average case-weighted CCR. This resulted in a national capital CCR adjustment factor of 0.971819.

As discussed above, similar to the proposed rule, for FY 2017 we applied the following policies (see discussion above for more details):

- The final year of the 3-year transitional wage index because of the adoption of the new OMB labor market area delineations.
- In accordance with section 10324(a) of the Affordable Care Act, we created a wage index floor of 1.0000 for all hospitals located in States determined to be frontier States.
- As we did in establishing the FY 2009 outlier threshold (73 FR 57891), in our projection of FY 2017 outlier payments, we did not make any adjustments for the possibility that hospitals' CCRs and outlier payments may be reconciled upon cost report settlement.
- We excluded the hospital VBP payment adjustments and the hospital readmissions payment adjustments from the calculation of the outlier fixed-loss cost threshold.
- We used the estimated per-discharge uncompensated care payments to hospitals eligible for the uncompensated care payment for all cases in the calculation of the outlier fixed-loss cost threshold methodology.

Using this methodology, we used the formula described in section I.C.1. of this Addendum to simulate and calculate the Federal payment rate and outlier payments for all claims. We calculated a threshold of $23,570 and calculated total operating Federal payments of $83,347,416,971 and total outlier payments of $4,479,256,519. We then divided total outlier payments by total operating Federal payments plus total outlier payments and determined that this threshold met the 5.1 percent target. As a result, we are finalizing an outlier fixed-loss cost threshold for FY 2017 equal to the prospective payment rate for the MS–DRG, plus any IME, empirically justified Medicare DSH payments, estimated uncompensated care payment, and any add-on payments for new technology, plus $23,570.

(2) Other Changes Concerning Outliers

As stated in the FY 1994 IPPS final rule (58 FR 46348), we establish an outlier threshold that is applicable to both hospital inpatient operating costs and hospital inpatient capital-related costs. When we modeled the combined operating and capital outlier payments, we found that using a common threshold resulted in a lower percentage of outlier payments for capital-related costs than for operating costs. We project that the thresholds for FY 2017 will result in outlier payments that will equal 5.1 percent of operating DRG payments and 6.14 percent of capital payments based on the Federal rate.

In accordance with section 1886(d)(3)(B) of the Act, we reduced the FY 2017 standardized amount by the same percentage to account for the projected proportion of payments paid as outliers.

The outlier adjustment factors that were applied to the standardized amount based on the FY 2017 outlier threshold are as follows:

	Operating standardized amounts	Capital federal rate
National	0.948999	0.938575

We applied the outlier adjustment factors to the FY 2017 payment rates after removing the effects of the FY 2016 outlier adjustment factors on the standardized amount.

To determine whether a case qualifies for outlier payments, we apply hospital-specific CCRs to the total covered charges for the case. Estimated operating and capital costs for the case are calculated separately by applying separate operating and capital CCRs. These costs are then combined and compared with the outlier fixed-loss cost threshold.

Under our current policy at § 412.84, we calculate operating and capital CCR ceilings and assign a statewide average CCR for hospitals whose CCRs exceed 3.0 standard deviations from the mean of the log distribution of CCRs for all hospitals. Based on this calculation, for hospitals for which the MAC computes operating CCRs greater than 1.183 or capital CCRs greater than 0.17, or hospitals for which the MAC is unable to calculate a CCR (as described under § 412.84(i)(3) of our regulations), statewide average CCRs are used to determine whether a hospital qualifies for outlier payments. Table 8A listed in section VI. of this Addendum (and available only via the Internet on the CMS Web site) contains the statewide average operating CCRs for urban hospitals and for rural hospitals for which the MAC is unable to compute a hospital-specific CCR within the above range. Effective for discharges occurring on or after October 1, 2016, these statewide average ratios will replace the ratios posted on our Web site at: *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Tables.html*. Table 8B listed in section VI. of this Addendum (and available via the Internet on the CMS Web site) contains the comparable statewide average capital CCRs. As previously stated, the CCRs in Tables 8A and 8B will be used during FY 2017 when hospital-specific CCRs based on the latest settled cost report either are not available or are outside the range noted above. Table 8C listed in section VI. of this Addendum (and available via the Internet on the CMS Web site) contains the statewide average total CCRs used under the LTCH PPS as discussed in section V. of this Addendum.

We finally note that we published a manual update (Change Request 3966) to our outlier policy on October 12, 2005, which updated Chapter 3, Section 20.1.2 of the Medicare Claims Processing Manual. The manual update covered an array of topics, including CCRs, reconciliation, and the time value of money. We encourage hospitals that are assigned the statewide average operating and/or capital CCRs to work with their MAC on a possible alternative operating and/or capital CCR as explained in Change Request 3966. Use of an alternative CCR developed by the hospital in conjunction with the MAC can avoid possible overpayments or underpayments at cost report settlement, thereby ensuring better accuracy when making outlier payments and negating the need for outlier reconciliation. We also note that a hospital may request an alternative operating or capital CCR ratio at any time as long as the guidelines of Change Request 3966 are followed. In addition, as mentioned above, we published an additional manual update (Change Request 7192) to our outlier policy on December 3, 2010, which also updated Chapter 3, Section 20.1.2 of the Medicare Claims Processing Manual. The manual update outlines the outlier reconciliation process for hospitals and Medicare contractors. To download and view the manual instructions on outlier reconciliation, we refer readers to the CMS Web site: *http://www.cms.hhs.gov/manuals/downloads/clm104c03.pdf*.

(3) FY 2015 Outlier Payments

Our current estimate, using available FY 2015 claims data, is that actual outlier payments for FY 2015 were approximately 4.68 percent of actual total MS–DRG payments. Therefore, the data indicate that, for FY 2015, the percentage of actual outlier payments relative to actual total payments is lower than we projected for FY 2015. Consistent with the policy and statutory interpretation we have maintained since the inception of the IPPS, we do not make retroactive adjustments to outlier payments to ensure that total outlier payments for FY 2015 are equal to 5.1 percent of total MS–DRG payments. As explained in the FY 2003 Outlier Final Rule (68 FR 34502), if we were to make retroactive adjustments to all outlier payments to ensure total payments are 5.1 percent of MS–DRG payments (by retroactively adjusting outlier payments), we would be removing the important aspect of the prospective nature of the IPPS. Because such an across-the-board adjustment would either lead to more or less outlier payments for all hospitals, hospitals would no longer be able to reliably approximate their payment for a patient while the patient is still hospitalized. We believe that it would be neither necessary nor appropriate to make such an aggregate retroactive adjustment. Furthermore, we believe it is consistent with the intent of the language at section 1886(d)(5)(A)(iv) of the Act not to make retroactive adjustments to outlier payments. This section calls for the Secretary to ensure that outlier payments are equal to or greater than 5 percent and less than or equal to 6 percent of projected or estimated (not actual) MS–DRG payments. We believe this language reflects the intent of Congress regarding the prospectivity of the IPPS. We believe that an important goal of a PPS is predictability. Therefore, we believe that the fixed-loss outlier threshold should be projected based on the best available historical data and should not be adjusted retroactively. A retroactive change to the fixed-loss outlier threshold would affect all hospitals subject to the IPPS, thereby undercutting the predictability of the system as a whole.

We note that because the MedPAR claims data for the entire FY 2016 will not be available until after September 30, 2016, we are unable to provide an estimate of actual outlier payments for FY 2016 based on FY 2016 claims data in this final rule. We will provide an estimate of actual FY 2016 outlier payments in the FY 2018 IPPS/LTCH PPS proposed rule.

5. FY 2017 Standardized Amount

The adjusted standardized amount is divided into labor-related and nonlabor-related portions. Tables 1A and 1B listed and published in section VI. of this Addendum (and available via the Internet on the CMS Web site) contain the national standardized amounts that we are applying to all hospitals, except hospitals located in Puerto Rico, for FY 2017. The standardized amount for hospitals in Puerto Rico is shown in Table 1C listed and published in section VI. of this Addendum (and available via the Internet on the CMS Web site). The amounts shown in Tables 1A and 1B differ only in that the labor-related share applied to the standardized amounts in Table 1A is 69.6 percent, and the labor-related share applied to the standardized amounts in Table 1B is 62 percent. In accordance with sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act, we are applying a labor-related share of 62 percent, unless application of that percentage will result in lower payments to a hospital than would otherwise be made. In effect, the statutory provision means that we will apply a labor-related share of 62 percent for all hospitals whose wage indexes are less than or equal to 1.0000.

In addition, Tables 1A and 1B include the standardized amounts reflecting the applicable percentage increases for FY 2017.

The labor-related and nonlabor-related portions of the national average standardized amounts for Puerto Rico hospitals for FY 2017 are set forth in Table 1C listed and published in section VI. of this Addendum (and available via the Internet on the CMS Web site). Similar to above, section 1886(d)(9)(C)(iv) of the Act, as amended by section 403(b) of Public Law 108–173, provides that the labor-related share for hospitals located in Puerto Rico be 62 percent, unless the

application of that percentage would result in lower payments to the hospital.

The following table illustrates the changes from the FY 2016 national standardized amount to the FY 2017 national standardized amount. The second through fifth columns display the changes from the FY 2016 standardized amounts for each applicable FY 2017 standardized amount. The first row of the table shows the updated (through FY 2016) average standardized amount after restoring the FY 2016 offsets for outlier payments, demonstration budget neutrality, geographic reclassification budget neutrality, new labor market delineation wage index transition budget neutrality, retrospective documentation and coding adjustment under section 7(b)(1)(B) of Public Law 110–90 and an adjustment to the standardized amount using our authority under section 1886(d)(5)(I)(i) of the Act to permanently prospectively remove the 0.2 percent reduction to the payment rate established in FY 2014 to offset the estimated increase in IPPS expenditures as a result of the 2-midnight policy. The MS–DRG reclassification and recalibration and wage index budget neutrality adjustment factors are cumulative. Therefore, those FY 2016 adjustment factors were not removed from this table.

CHANGE OF FY 2016 STANDARDIZED AMOUNTS TO THE FY 2017 STANDARDIZED AMOUNTS

	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is NOT a meaningful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a meaningful EHR user
FY 2016 Base Rate after removing: 1. FY 2016 Geographic Reclassification Budget Neutrality (0.988169) 2. FY 2016 Rural Community Hospital Demonstration Program Budget Neutrality (0.999837) 3. National Standardized Amount for FY 2017 if Wage Index is less Than or Equal to 1.0000; Labor/Non-Labor Share Percentage (62/38).	Labor: $3,420.31; Nonlabor: $2,096.32.	Labor: $3,352.17; Nonlabor: $2,054.56.	Labor: $3,397.59; Nonlabor: $2,082.40.	Labor: $3,329.46; Nonlabor: $2,040.63.

B. Adjustments for Area Wage Levels and Cost-of-Living

Tables 1A through 1C, as published in section VI. of this Addendum (and available via the Internet on the CMS Web site), contain the labor-related and nonlabor-related shares that we used to calculate the prospective payment rates for hospitals located in the 50 States, the District of Columbia, and Puerto Rico for FY 2017. This section addresses two types of adjustments to the standardized amounts that are made in determining the prospective payment rates as described in this Addendum.

1. Adjustment for Area Wage Levels

Sections 1886(d)(3)(E) and 1886(d)(9)(C)(iv) of the Act require that we make an adjustment to the labor-related portion of the national prospective payment rate to account for area differences in hospital wage levels. This adjustment is made by multiplying the labor-related portion of the adjusted standardized amounts by the appropriate wage index for the area in which the hospital is located. In section III. of the preamble of this final rule, we discuss the data and methodology for the FY 2017 wage index.

2. Adjustment for Cost-of-Living in Alaska and Hawaii

Section 1886(d)(5)(H) of the Act provides discretionary authority to the Secretary to make such adjustments as the Secretary deems appropriate to take into account the unique circumstances of hospitals located in Alaska and Hawaii. Higher labor-related costs for these two States are taken into account in the adjustment for area wages described above. To account for higher nonlabor-related costs for these two States, we multiply the nonlabor-related portion of the standardized amount for hospitals located in Alaska and Hawaii by an adjustment factor.

In the FY 2013 IPPS/LTCH PPS final rule, we established a methodology to update the COLA factors for Alaska and Hawaii that were published by the U.S. Office of Personnel Management (OPM) every 4 years (at the same time as the update to the labor-related share of the IPPS market basket), beginning in FY 2014. We refer readers to the FY 2013 IPPS/LTCH PPS proposed and final rules for additional background and a detailed description of this methodology (77 FR 28145 through 28146 and 77 FR 53700 through 53701, respectively).

For FY 2014, in the FY 2014 IPPS/LTCH PPS final rule (78 FR 50985 through 50987), we updated the COLA factors published by OPM for 2009 (as these are the last COLA factors OPM published prior to transitioning from COLAs to locality pay) using the methodology that we finalized in the FY 2013 IPPS/LTCH PPS final rule.

Based on the policy finalized in the FY 2013 IPPS/LTCH PPS final rule, we are continuing to use the same COLA factors in FY 2017 that were used in FY 2016 to adjust the nonlabor-related portion of the standardized amount for hospitals located in Alaska and Hawaii. Below is a table listing the COLA factors for FY 2017.

FY 2017 COST-OF-LIVING ADJUSTMENT FACTORS: ALASKA AND HAWAII HOSPITALS

Area	Cost of living adjustment factor
Alaska:	
City of Anchorage and 80-kilometer (50-mile) radius by road	1.23
City of Fairbanks and 80-kilometer (50-mile) radius by road	1.23
City of Juneau and 80-kilometer (50-mile) radius by road	1.23
Rest of Alaska	1.25
Hawaii:	
City and County of Honolulu	1.25
County of Hawaii	1.19
County of Kauai	1.25
County of Maui and County of Kalawao	1.25

Based on the policy finalized in the FY 2013 IPPS/LTCH PPS final rule, the next update to the COLA factors for Alaska and Hawaii will occur in FY 2018.

C. Calculation of the Prospective Payment Rates

General Formula for Calculation of the Prospective Payment Rates for FY 2017

In general, the operating prospective payment rate for all hospitals (including hospitals in Puerto Rico) paid under the IPPS, except SCHs and MDHs, for FY 2017 equals the Federal rate (which includes uncompensated care payments).

SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: The Federal national rate (which, as discussed in section IV.F. of the preamble of this final rule, includes uncompensated care payments); the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge to determine the rate that yields the greatest aggregate payment.

The prospective payment rate for SCHs for FY 2017 equals the higher of the applicable Federal rate, or the hospital-specific rate as described below. The prospective payment rate for MDHs for FY 2017 equals the higher of the Federal rate, or the Federal rate plus 75 percent of the difference between the Federal rate and the hospital-specific rate as described below. For MDHs, the updated hospital-specific rate is based on FY 1982, FY 1987 or FY 2002 costs per discharge, whichever yields the greatest aggregate payment.

1. Operating and Capital Federal Payment Rate and Outlier Payment Calculation

Note: The formula below is used for actual claim payment and is also used by CMS to project the outlier threshold for the upcoming FY. The difference is the source of some of the variables in the formula. For example, operating and capital CCRs for actual claim payment are from the PSF while CMS uses an adjusted CCR (as described above) to project the threshold for the upcoming FY. In addition, charges for a claim payment are from the bill while charges to project the threshold are from the MedPAR data with an inflation factor applied to the charges (as described above).

Step 1—Determine the MS–DRG and MS–DRG relative weight for each claim based on the ICD–10–CM procedure and diagnosis codes on the claim.

Step 2—Select the applicable average standardized amount depending on whether the hospital submitted qualifying quality data and is a meaningful EHR user, as described above.

Step 3—Compute the operating and capital Federal payment rate:

—Federal Payment Rate for Operating Costs = MS–DRG Relative Weight × [(Labor-Related Applicable Standardized Amount × Applicable CBSA Wage Index) + (Nonlabor-Related Applicable Standardized Amount × Cost of Living Adjustment)] × (1 + IME + (DSH * 0.25))

—Federal Payment for Capital Costs = MS–DRG Relative Weight × Federal Capital Rate × Geographic Adjustment Fact × (l + IME + DSH)

Step 4—Determine operating and capital costs:

—Operating Costs = (Billed Charges × Operating cost-to-charge ratio)

—Capital Costs = (Billed Charges × Capital cost-to-charge ratio).

Step 5—Compute operating and capital outlier threshold (CMS applies a geographic adjustment to the operating and capital outlier threshold to account for local cost variation):

—Operating Cost-to-Charge Ratio to Total Cost-to-Charge Ratio = (Operating Cost-to-Charge Ratio)/(Operating Cost-to-Charge Ratio + Capital Cost-to-Charge Ratio)

—Operating Outlier Threshold = [Fixed Loss Threshold × ((Labor-Related Portion × CBSA Wage Index) + Nonlabor-Related portion)] × Operating Cost-to-Charge Ratio to Total Cost-to-Charge Ratio + Federal Payment with IME, DSH + Uncompensated Care Payment + New Technology Add-On Payment Amount

—Capital Cost-to-Charge Ratio to Total Cost-to-Charge Ratio = (Capital Cost-to-Charge Ratio)/(Operating Cost-to-Charge Ratio + Capital Cost-to-Charge Ratio)

—Capital Outlier Threshold = (Fixed Loss Threshold × Geographic Adjustment Factor × Capital CCR to Total CCR) + Federal Payment with IME and DSH

Step 6: Compute operating and capital outlier payments:

—Marginal Cost Factor = 0.80 or 0.90 (depending on the MS–DRG)

—Operating Outlier Payment = (Operating Costs—Operating Outlier Threshold) × Marginal Cost Factor

—Capital Outlier Payment = (Capital Costs—Capital Outlier Threshold) × Marginal Cost Factor

The payment rate is further adjusted for hospitals that qualify for a low-volume payment adjustment under section 1886(d)(12) of the Act and 42 CFR 412.101(b). The base-operating DRG payment amount is further adjusted by the hospital readmissions payment adjustment and the hospital VBP payment adjustment as described under sections 1886(q) and 1886(o) of the Act, respectively. Payments also are reduced by the 1-percent adjustment under the HAC Reduction Program as described in section 1886(p) of the Act. We also make new technology add-on payments in accordance with section 1886(d)(5)(K) and (L) of the Act. Finally, we added the uncompensated care payment to the total claim payment amount. As noted in the formula above, we take uncompensated care payments and new technology add-on payments into consideration when calculating outlier payments.

2. Hospital-Specific Rate (Applicable Only to SCHs and MDHs)

a. Calculation of Hospital-Specific Rate

Section 1886(b)(3)(C) of the Act provides that SCHs are paid based on whichever of the following rates yields the greatest aggregate payment: The Federal rate; the updated hospital-specific rate based on FY 1982 costs per discharge; the updated hospital-specific rate based on FY 1987 costs per discharge; the updated hospital-specific rate based on FY 1996 costs per discharge; or the updated hospital-specific rate based on FY 2006 costs per discharge to determine the rate that yields the greatest aggregate payment.

As noted above, section 205 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10) extended the MDH program through FY 2017 (that is, for discharges occurring on or before September 30, 2017). Currently MDHs are paid based on the Federal national rate or, if higher, the Federal national rate plus 75 percent of the difference between the Federal national rate and the greater of the updated hospital-specific rates based on either FY 1982, FY 1987 or FY 2002 costs per discharge.

For a more detailed discussion of the calculation of the hospital-specific rates, we refer readers to the FY 1984 IPPS interim final rule (48 FR 39772); the April 20, 1990 final rule with comment period (55 FR 15150); the FY 1991 IPPS final rule (55 FR 35994); and the FY 2001 IPPS final rule (65 FR 47082).

b. Updating the FY 1982, FY 1987, FY 1996, FY 2002 and FY 2006 Hospital-Specific Rate for FY 2017

Section 1886(b)(3)(B)(iv) of the Act provides that the applicable percentage increase applicable to the hospital-specific rates for SCHs and MDHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS). Because the Act sets the update factor for SCHs and MDHs equal to the update factor for all other IPPS hospitals, the update to the hospital-specific rates for SCHs and MDHs is subject to the amendments to section 1886(b)(3)(B) of the Act made by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, the applicable percentage increases to the hospital-specific rates applicable to SCHs and MDHs are the following:

FY 2017	Hospital submitted quality data and is a meaningful EHR user	Hospital submitted quality data and is NOT a meaningful EHR user	Hospital did NOT submit quality data and is a meaningful EHR user	Hospital did NOT submit quality data and is NOT a meaningful EHR user
Market Basket Rate-of-Increase	2.7	2.7	2.7	2.7
Adjustment for Failure to Submit Quality Data Under Section 1886(b)(3)(B)(viii) of the Act	0.0	0.0	−0.675	−0.675
Adjustment for Failure to be a Meaningful EHR User Under Section 1886(b)(3)(B)(ix) of the Act	0.0	−2.025	0.0	−2.025
MFP Adjustment Under Section 1886(b)(3)(B)(xi) of the Act	−0.3	−0.3	−0.3	−0.3
Statutory Adjustment Under Section 1886(b)(3)(B)(xii) of the Act	−0.75	−0.75	−0.75	−0.75
Applicable Percentage Increase Applied to Hospital-Specific Rate	1.65	−0.375	0.975	−1.05

For a complete discussion of the applicable percentage increase applied to the hospital-specific rates for SCHs and MDHs, we refer readers to section IV.B. of the preamble of this final rule.

In addition, because SCHs and MDHs use the same MS–DRGs as other hospitals when they are paid based in whole or in part on the hospital-specific rate, the hospital-specific rate is adjusted by a budget neutrality factor to ensure that changes to the MS–DRG classifications and the recalibration of the MS–DRG relative weights are made in a manner so that aggregate IPPS payments are unaffected. Therefore, the hospital-specific rate for an SCH or an MDH is adjusted by the MS–DRG reclassification and recalibration budget neutrality factor of 0.999079, as discussed in section III. of this Addendum. The resulting rate is used in determining the payment rate that an SCH or MDH will receive for its discharges beginning on or after October 1, 2016. We note that, in this final rule, for FY 2017, we are not making a documentation and coding adjustment to the hospital-specific rate. We refer readers to section II.D. of the preamble of this final rule for a complete discussion regarding our policies and previously finalized policies (including our historical adjustments to the payment rates) relating to the effect of changes in documentation and coding that do not reflect real changes in case-mix.

Also, as discussed above and in section IV.P. of the preamble of this final rule, we are making an adjustment to the hospital-specific rates using our authority under section 1886(d)(5)(I)(i) of the Act to permanently prospectively remove the 0.2 percent reduction to the payment rates established in FY 2014 to offset the estimated increase in IPPS expenditures as a result of the 2-midnight policy. In addition, as discussed above and in section IV.P. of the preamble of this final rule, we are applying a temporary one-time prospective increase to the FY 2017 hospital-specific rates of 0.6 percent by including a temporary one-time factor of 1.006 in the calculation of the hospital-specific rates, using our authority under section 1886(d)(5)(I)(i) of the Act, to address the effects of the 0.2 percent reduction to the rates for the 2-midnight policy in effect for FY 2014, FY 2015, and FY 2016.

III. Changes to Payment Rates for Acute Care Hospital Inpatient Capital-Related Costs for FY 2017

The PPS for acute care hospital inpatient capital-related costs was implemented for cost reporting periods beginning on or after October 1, 1991. Effective with that cost reporting period, over a 10-year transition period (which extended through FY 2001) the payment methodology for Medicare acute care hospital inpatient capital-related costs changed from a reasonable cost-based methodology to a prospective methodology (based fully on the Federal rate).

The basic methodology for determining Federal capital prospective rates is set forth in the regulations at §§ 412.308 through 412.352. Below we discuss the factors that we used to determine the capital Federal rate for FY 2017, which is effective for discharges occurring on or after October 1, 2016.

The 10-year transition period ended with hospital cost reporting periods beginning on or after October 1, 2001 (FY 2002). Therefore, for cost reporting periods beginning in FY 2002, all hospitals (except ''new'' hospitals under § 412.304(c)(2)) are paid based on the capital Federal rate. For FY 1992, we computed the standard Federal payment rate for capital-related costs under the IPPS by updating the FY 1989 Medicare inpatient capital cost per case by an actuarial estimate of the increase in Medicare inpatient capital costs per case. Each year after FY 1992, we update the capital standard Federal rate, as provided at § 412.308(c)(1), to account for capital input price increases and other factors. The regulations at § 412.308(c)(2) also provide that the capital Federal rate be adjusted annually by a factor equal to the estimated proportion of outlier payments under the capital Federal rate to total capital payments under the capital Federal rate. In addition, § 412.308(c)(3) requires that the capital Federal rate be reduced by an adjustment factor equal to the estimated proportion of payments for exceptions under § 412.348. (We note that, as discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53705), there is generally no longer a need for an exceptions payment adjustment factor.) However, in limited circumstances, an additional payment exception for extraordinary circumstances is provided for under § 412.348(f) for qualifying hospitals. Therefore, in accordance with § 412.308(c)(3), an exceptions payment adjustment factor may need to be applied if such payments are made. Section 412.308(c)(4)(ii) requires that the capital standard Federal rate be adjusted so that the effects of the annual DRG reclassification and the recalibration of DRG weights and changes in the geographic adjustment factor (GAF) are budget neutral.

Section 412.374 provides for blended payments to hospitals located in Puerto Rico under the IPPS for acute care hospital inpatient capital-related costs. Accordingly, historically, under the capital PPS, we have computed a separate payment rate specific to hospitals located in Puerto Rico using the same methodology used to compute the national Federal rate for capital-related costs. Effective with discharges occurring on or after October 1, 2004, in conjunction with the change to the operating payment methodology, we adopted a methodology for computing capital payments made to hospitals located in Puerto Rico based on a blend of 25 percent of the Puerto Rico capital rate and 75 percent of the national capital Federal rate (69 FR 49185). Effective with discharges on or after January 1, 2016, operating IPPS payments to hospitals located in Puerto Rico are now based on 100 percent of the Federal rate—the operating payment methodology is no longer a blend of 75 percent of the Federal rate and 25 percent of the Puerto Rico rate. Consistent with historical practice and under the authority of section 1886(g) of the Act, as discussed in section V.B.3. of the preamble of this final rule, we are making the capital IPPS payments to hospitals located in Puerto Rico based on 100 percent of the capital Federal rate, effective with discharges on or after October 1, 2016, and will no longer be based on the current 75/25 blended rate.

A. Determination of the Federal Hospital Inpatient Capital-Related Prospective Payment Rate Update

In the discussion that follows, we explain the factors that we used to determine the capital Federal rate for FY 2017. In particular, we explain why the FY 2017 capital Federal rate increases approximately 1.84 percent, compared to the FY 2016 capital Federal rate. As discussed in the impact analysis in Appendix A to this final rule, we estimate that capital payments per discharge will increase approximately 0.8 percent during that same period. Because capital payments constitute approximately 10 percent of hospital payments, a percent change in the capital Federal rate yields only approximately a 0.1 percent change in actual payments to hospitals.

1. Projected Capital Standard Federal Rate Update

a. Description of the Update Framework

Under § 412.308(c)(1), the capital standard Federal rate is updated on the basis of an analytical framework that takes into account changes in a capital input price index (CIPI) and several other policy adjustment factors.

Specifically, we adjust the projected CIPI rate-of-increase as appropriate each year for case-mix index-related changes, for intensity, and for errors in previous CIPI forecasts. The update factor for FY 2017 under that framework is 0.9 percent based on the best data available at this time. The update factor under that framework is based on a projected 1.2 percent increase in the FY 2010-based CIPI, a 0.0 percentage point adjustment for intensity, a 0.0 percentage point adjustment for case-mix, a 0.0 percentage point adjustment for the DRG reclassification and recalibration, and a forecast error correction of −0.3 percentage point. As discussed in section III.C. of this Addendum, we continue to believe that the CIPI is the most appropriate input price index for capital costs to measure capital price changes in a given year. We also explain the basis for the FY 2017 CIPI projection in that same section of this Addendum. Below we describe the policy adjustments that we are applying in the update framework for FY 2017.

The case-mix index is the measure of the average DRG weight for cases paid under the IPPS. Because the DRG weight determines the prospective payment for each case, any percentage increase in the case-mix index corresponds to an equal percentage increase in hospital payments.

The case-mix index can change for any of several reasons:

- The average resource use of Medicare patient changes (''real'' case-mix change);
- Changes in hospital documentation and coding of patient records result in higher-weighted DRG assignments (''coding effects''); and
- The annual DRG reclassification and recalibration changes may not be budget neutral (''reclassification effect'').

We define real case-mix change as actual changes in the mix (and resource requirements) of Medicare patients as opposed to changes in documentation and coding behavior that result in assignment of cases to higher-weighted DRGs, but do not reflect higher resource requirements. The capital update framework includes the same case-mix index adjustment used in the former operating IPPS update framework (as discussed in the May 18, 2004 IPPS proposed rule for FY 2005 (69 FR 28816)). (We no longer use an update framework to make a recommendation for updating the operating IPPS standardized amounts as discussed in section II. of Appendix B to the FY 2006 IPPS final rule (70 FR 47707).)

For FY 2017, we are projecting a 0.5 percent total increase in the case-mix index. We estimated that the real case-mix increase will equal 0.5 percent for FY 2017. The net adjustment for change in case-mix is the difference between the projected real increase in case-mix and the projected total increase in case-mix. Therefore, the net adjustment for case-mix change in FY 2017 is 0.0 percentage point.

The capital update framework also contains an adjustment for the effects of DRG reclassification and recalibration. This adjustment is intended to remove the effect on total payments of prior year's changes to the DRG classifications and relative weights, in order to retain budget neutrality for all case-mix index-related changes other than those due to patient severity of illness. Due to the lag time in the availability of data, there is a 2-year lag in data used to determine the adjustment for the effects of DRG reclassification and recalibration. For example, we have data available to evaluate the effects of the FY 2015 DRG reclassification and recalibration as part of our update for FY 2017. We estimate that FY 2015 DRG reclassification and recalibration resulted in no change in the case-mix when compared with the case-mix index that would have resulted if we had not made the reclassification and recalibration changes to the DRGs. Therefore, we are making a 0.0 percentage point adjustment for reclassification and recalibration in the update framework for FY 2017.

The capital update framework also contains an adjustment for forecast error. The input price index forecast is based on historical trends and relationships ascertainable at the time the update factor is established for the upcoming year. In any given year, there may be unanticipated price fluctuations that may result in differences between the actual increase in prices and the forecast used in calculating the update factors. In setting a prospective payment rate under the framework, we make an adjustment for forecast error only if our estimate of the change in the capital input price index for any year is off by 0.25 percentage point or more. There is a 2-year lag between the forecast and the availability of data to develop a measurement of the forecast error. Historically, when a forecast error of the CIPI is greater than 0.25 percentage point in absolute terms, it is reflected in the update recommended under this framework. A forecast error of −0.3 percentage point was calculated for the FY 2015 update, for which there are historical data. That is, current historical data indicate that the forecasted FY 2015 CIPI (1.5 percent) used in calculating the FY 2015 update factor was 0.3 percentage points higher than actual realized price increases (1.2 percent). This over-prediction was primarily due to prices from municipal bond yields declining in 2015 whereas the forecast projected an increase. Therefore, we are making a −0.3 percentage point adjustment for forecast error in the update for FY 2017.

Under the capital IPPS update framework, we also make an adjustment for changes in intensity. Historically, we calculated this adjustment using the same methodology and data that were used in the past under the framework for operating IPPS. The intensity factor for the operating update framework reflected how hospital services are utilized to produce the final product, that is, the discharge. This component accounts for changes in the use of quality-enhancing services, for changes within DRG severity, and for expected modification of practice patterns to remove noncost-effective services. Our intensity measure is based on a 5-year average.

We calculate case-mix constant intensity as the change in total cost per discharge, adjusted for price level changes (the CPI for hospital and related services) and changes in real case-mix. Without reliable estimates of the proportions of the overall annual intensity increases that are due, respectively, to ineffective practice patterns and the combination of quality-enhancing new technologies and complexity within the DRG system, we assume that one-half of the annual increase is due to each of these factors. The capital update framework thus provides an add-on to the input price index rate of increase of one-half of the estimated annual increase in intensity, to allow for increases within DRG severity and the adoption of quality-enhancing technology.

In this final rule, we are continuing to use a Medicare-specific intensity measure that is based on a 5-year adjusted average of cost per discharge for FY 2017 (we refer readers to the FY 2011 IPPS/LTCH PPS final rule (75 FR 50436) for a full description of our Medicare-specific intensity measure). Specifically, for FY 2017, we are using an intensity measure that is based on an average of cost per discharge data from the 5-year period beginning with FY 2010 and extending through FY 2014. Based on these data, we estimated that case-mix constant intensity declined during FYs 2010 through 2014. In the past, when we found intensity to be declining, we believed a zero (rather than a negative) intensity adjustment was appropriate. Consistent with this

approach, because we estimate that intensity declined during that 5-year period, we believe it is appropriate to continue to apply a zero intensity adjustment for FY 2017. Therefore, we are making a 0.0 percentage point adjustment for intensity in the update for FY 2017.

Above, we described the basis of the components used to develop the 0.9 percent capital update factor under the capital update framework for FY 2017 as shown in the following table.

CMS FY 2017 UPDATE FACTOR TO THE CAPITAL FEDERAL RATE

Capital Input Price Index*	1.2
Intensity	0.0
Case-Mix Adjustment Factors:	
Real Across DRG Change	0.5
Projected Case-Mix Change	0.5
Subtotal	1.2
Effect of FY 2015 Reclassification and Recalibration	0.0
Forecast Error Correction	−0.3
Total Update	0.9

*The capital input price index represents the FY 2010-based CIPI.

b. Comparison of CMS and MedPAC Update Recommendation

In its March 2016 Report to Congress, MedPAC did not make a specific update recommendation for capital IPPS payments for FY 2017. (We refer readers to MedPAC's Report to the Congress: Medicare Payment Policy, March 2016, Chapter 3, available on the Web site at: *http://www.medpac.gov*.)

2. Outlier Payment Adjustment Factor

Section 412.312(c) establishes a unified outlier payment methodology for inpatient operating and inpatient capital-related costs. A single set of thresholds is used to identify outlier cases for both inpatient operating and inpatient capital-related payments. Section 412.308(c)(2) provides that the standard Federal rate for inpatient capital-related costs be reduced by an adjustment factor equal to the estimated proportion of capital-related outlier payments to total inpatient capital-related PPS payments. The outlier thresholds are set so that operating outlier payments are projected to be 5.1 percent of total operating IPPS DRG payments.

For FY 2016, we estimated that outlier payments for capital would equal 6.35 percent of inpatient capital-related payments based on the capital Federal rate in FY 2016. Based on the thresholds as set forth in section II.A. of this Addendum, we estimate that outlier payments for capital-related costs will equal 6.14 percent for inpatient capital-related payments based on the capital Federal rate in FY 2017. Therefore, we are applying an outlier adjustment factor of 0.9386 in determining the capital Federal rate for FY 2017. Thus, we estimate that the percentage of capital outlier payments to total capital Federal rate payments for FY 2017 will be lower than the percentage for FY 2016.

The outlier reduction factors are not built permanently into the capital rates; that is, they are not applied cumulatively in determining the capital Federal rate. The FY 2017 outlier adjustment of 0.9386 is a 0.22 percent change from the FY 2016 outlier adjustment of 0.9365. Therefore, the net change in the outlier adjustment to the capital Federal rate for FY 2017 is 1.0022 (0.9386/0.9365). Thus, the outlier adjustment will increase the FY 2017 capital Federal rate by 0.22 percent compared to the FY 2016 outlier adjustment.

3. Budget Neutrality Adjustment Factor for Changes in DRG Classifications and Weights and the GAF

Section 412.308(c)(4)(ii) requires that the capital Federal rate be adjusted so that aggregate payments for the fiscal year based on the capital Federal rate after any changes resulting from the annual DRG reclassification and recalibration and changes in the GAF are projected to equal aggregate payments that would have been made on the basis of the capital Federal rate without such changes. Because we are determining capital IPPS payments to hospitals located in Puerto Rico based on 100 percent of the capital Federal rate beginning in FY 2017, we have not calculated a separate GAF for Puerto Rico, and therefore, we are not applying a separate budget neutrality adjustment for the Puerto Rico GAF. Similarly, the budget neutrality factor for DRG reclassifications and recalibration nationally is applied in determining the capital IPPS Federal rate, and is applicable for all hospitals, including those hospitals located in Puerto Rico.

To determine the national capital rate factors for FY 2017, we compared estimated aggregate capital Federal rate payments based on the FY 2016 MS–DRG classifications and relative weights and the FY 2016 GAF to estimated aggregate capital Federal rate payments based on the FY 2016 MS–DRG classifications and relative weights and the FY 2017 GAFs. To achieve budget neutrality for the changes in the national GAFs, based on calculations using updated data, we are applying an incremental budget neutrality adjustment factor of 0.9995 for FY 2017 to the previous cumulative FY 2016 adjustment factor of 0.9860, yielding an adjustment factor of 0.9855 through FY 2017.

We then compared estimated aggregate capital Federal rate payments based on the FY 2016 MS–DRG relative weights and the FY 2017 GAFs to estimated aggregate capital Federal rate payments based on the cumulative effects of the FY 2017 MS–DRG classifications and relative weights and the FY 2017 GAFs. The incremental adjustment factor for DRG classifications and changes in relative weights is 0.9996. The cumulative adjustment factor for MS–DRG classifications and changes in relative weights and for changes in the GAFs through FY 2017 is 0.9851. (We note that all the values are calculated with unrounded numbers.)

The GAF/DRG budget neutrality adjustment factors are built permanently into the capital rates; that is, they are applied cumulatively in determining the capital Federal rate. This follows the requirement under § 412.308(c)(4)(ii) that estimated aggregate payments each year be no more or less than they would have been in the absence of the annual DRG reclassification and recalibration and changes in the GAFs.

The methodology used to determine the recalibration and geographic adjustment factor (GAF/DRG) budget neutrality adjustment is similar to the methodology used in establishing budget neutrality adjustments under the IPPS for operating costs. One difference is that, under the operating IPPS, the budget neutrality adjustments for the effect of geographic reclassifications are determined separately from the effects of other changes in the hospital wage index and the MS–DRG relative weights. Under the capital IPPS, there is a single GAF/DRG budget neutrality adjustment factor for changes in the GAF (including geographic reclassification) and the MS–DRG relative weights. In addition, there is no adjustment for the effects that geographic reclassification has on the other payment parameters, such as the payments for DSH or IME.

The cumulative adjustment factor of 0.9991 (the product of the incremental national GAF budget neutrality adjustment factor of 0.9995 and the incremental DRG budget neutrality adjustment factor of 0.9996) accounts for the MS–DRG reclassifications and recalibration and for changes in the GAFs. It also incorporates the effects on the GAFs of FY 2017 geographic reclassification decisions made by the MGCRB compared to FY 2016 decisions. However, it does not account for

changes in payments due to changes in the DSH and IME adjustment factors.

As discussed in section V.C. of the preamble of this final rule, we are making an adjustment of (1/0.998) to the national capital Federal rate to remove the 0.2 percent reduction (an adjustment factor of 0.998) to the national capital Federal rate to offset the estimated increase in capital IPPS expenditures associated with the 2-midnight policy. This is consistent with the adjustment to the operating IPPS standardized amount and the hospital-specific payment rates. In addition, consistent with the approach for the operating IPPS standardized amount and hospital-specific payment rates and for the reasons discussed in sections IV.P. and V.C. of the preamble of this final rule, we are making a one-time prospective adjustment of 1.006 in FY 2017 to the national capital Federal rate to address the effect of the 0.2 percent reduction to the national capital Federal rates in effect for FY 2014, FY 2015, and FY 2016. We also are removing this one-time prospective adjustment through an adjustment of (1/1.006) to the national capital Federal rate in FY 2018, consistent with the approach for the operating IPPS standardized amount and hospital-specific payment rates (as discussed in section IV.P. of the preamble of this final rule). We refer readers to sections IV.P. and V.C. of the preamble of this final rule for a complete discussion of these issues.

4. Capital Federal Rate for FY 2017

For FY 2016, we established a capital Federal rate of $438.75 (as revised, in the FY 2016 IPPS/LTCH PPS correction notice CMS–1632–CN2 (80 FR 60060 and 60061)). We are establishing an update of 0.9 percent in determining the FY 2017 capital Federal rate for all hospitals. As a result of this update, the budget neutrality factors discussed earlier, and the adjustments to remove the 0.2 percent reductions (both the (1/0.998) adjustment to permanently remove the 0.2 percent reduction and the one-time 0.6 percent adjustment) resulting from the 2-midnight policy, we are establishing a national capital Federal rate of $446.81 for FY 2017. The national capital Federal rate for FY 2017 was calculated as follows:

- The FY 2017 update factor is 1.009, that is, the update is 0.9 percent.
- The FY 2017 budget neutrality adjustment factor that is applied to the capital Federal rate for changes in the MS–DRG classifications and relative weights and changes in the GAFs is 0.9991.
- The FY 2017 outlier adjustment factor is 0.9386.
- The 2-midnight policy adjustment to permanently remove the 0.2 percent reduction is (1/0.998).
- The 2-midnight one-time policy adjustment is 1.006.

(We note that, as discussed in section V.C. of the preamble of this final rule, we are not making an additional MS–DRG documentation and coding adjustment to the capital IPPS Federal rate for FY 2017.)

Because the FY 2017 capital Federal rate has already been adjusted for differences in case-mix, wages, cost-of-living, indirect medical education costs, and payments to hospitals serving a disproportionate share of low-income patients, we are not making additional adjustments in the capital Federal rate for these factors, other than the budget neutrality factor for changes in the MS–DRG classifications and relative weights and for changes in the GAFs.

We are providing the following chart that shows how each of the factors and adjustments for FY 2017 affects the computation of the FY 2017 national capital Federal rate in comparison to the FY 2016 national capital Federal rate. The FY 2017 update factor has the effect of increasing the capital Federal rate by 0.9 percent compared to the FY 2016 capital Federal rate. The GAF/DRG budget neutrality adjustment factor has the effect of decreasing the capital Federal rate by 0.09 percent. The FY 2017 outlier adjustment factor has the effect of increasing the capital Federal rate by 0.22 percent compared to the FY 2016 capital Federal rate. The permanent 2-midnight policy adjustment has the effect of increasing the capital Federal rate by 0.2 percent and the temporary 2-midnight policy adjustment has the effect of increasing the capital Federal rate by 0.6 percent. The combined effect of all the changes would increase the national capital Federal rate by approximately 1.84 percent compared to the FY 2016 national capital Federal rate.

COMPARISON OF FACTORS AND ADJUSTMENTS: FY 2016 CAPITAL FEDERAL RATE AND FY 2017 CAPITAL FEDERAL RATE

	FY 2016	FY 2017	Change	Percent change
Update Factor [1]	$1.0130	$1.009	1.009	0.9
GAF/DRG Adjustment Factor [1]	0.9976	0.9991	0.9991	−0.09
Outlier Adjustment Factor [2]	0.9365	0.9386	1.0022	0.22
Permanent 2-midnight Policy Adjustment Factor	N/A	1.002	1.002	0.2
One-Time 2-midnight Policy Adjustment Factor	N/A	1.006	1.006	0.6
Capital Federal Rate	438.75	446.81	1.0184	1.84

[1] The update factor and the GAF/DRG budget neutrality adjustment factors are built permanently into the capital Federal rates. Thus, for example, the incremental change from FY 2016 to FY 2017 resulting from the application of the 0.9991 GAF/DRG budget neutrality adjustment factor for FY 2017 is a net change of 0.9991 (or −0.09 percent).

[2] The outlier reduction factor is not built permanently into the capital Federal rate; that is, the factor is not applied cumulatively in determining the capital Federal rate. Thus, for example, the net change resulting from the application of the FY 2017 outlier adjustment factor is 0.9386/0.9365, or 1.0022 (or 0.22 percent).

In this final rule, we also are providing the following chart that shows how the final FY 2017 capital Federal rate differs from the proposed FY 2017 capital Federal rate as presented in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25280).

COMPARISON OF FACTORS AND ADJUSTMENTS: PROPOSED FY 2017 CAPITAL FEDERAL RATE AND FINAL FY 2017 CAPITAL FEDERAL RATE

	Proposed FY 2017	Final FY 2017	Change	Percent change
Update Factor [1]	$1.0090	$1.0090	1.0000	0.00
GAF/DRG Adjustment Factor [1]	0.9993	0.9991	0.9998	−0.02
Outlier Adjustment Factor [2]	0.9374	0.9386	1.0013	0.13
Permanent 2-midnight Policy Adjustment Factor	1.002	1.002	1.000	0.00
One-Time 2-midnight Policy Adjustment Factor	1.006	1.006	1.000	0.00
Capital Federal Rate	446.35	446.81	1.0010	0.10

B. Calculation of the Inpatient Capital-Related Prospective Payments for FY 2017

For purposes of calculating payments for each discharge during FY 2017, the capital Federal rate is adjusted as follows: (Standard Federal Rate) × (DRG weight) × (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + DSH Adjustment Factor + IME Adjustment Factor, if applicable). The result is the adjusted capital Federal rate.

Hospitals also may receive outlier payments for those cases that qualify under the thresholds established for each fiscal year. Section 412.312(c) provides for a single set of thresholds to identify outlier cases for both inpatient operating and inpatient capital-related payments. The outlier thresholds for FY 2017 are in section II.A. of this Addendum. For FY 2017, a case would qualify as a cost outlier if the cost for the case plus the (operating) IME and DSH payments (including both the empirically justified Medicare DSH payment and the estimated uncompensated care payment, as discussed in section II.A.4.g.(1) of this Addendum) is greater than the prospective payment rate for the MS–DRG plus the fixed-loss amount of $23,570.

Currently, as provided under § 412.304(c)(2), we pay a new hospital 85 percent of its reasonable costs during the first 2 years of operation unless it elects to receive payment based on 100 percent of the capital Federal rate. Effective with the third year of operation, we pay the hospital based on 100 percent of the capital Federal rate (that is, the same methodology used to pay all other hospitals subject to the capital PPS).

C. Capital Input Price Index

1. Background

Like the operating input price index, the capital input price index (CIPI) is a fixed-weight price index that measures the price changes associated with capital costs during a given year. The CIPI differs from the operating input price index in one important aspect—the CIPI reflects the vintage nature of capital, which is the acquisition and use of capital over time. Capital expenses in any given year are determined by the stock of capital in that year (that is, capital that remains on hand from all current and prior capital acquisitions). An index measuring capital price changes needs to reflect this vintage nature of capital. Therefore, the CIPI was developed to capture the vintage nature of capital by using a weighted-average of past capital purchase prices up to and including the current year.

We periodically update the base year for the operating and capital input price indexes to reflect the changing composition of inputs for operating and capital expenses. In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50603 through 50607), we rebased and revised the CIPI to a FY 2010 base year to reflect the more current structure of capital costs in hospitals. For a complete discussion of this rebasing, we refer readers to the FY 2014 IPPS/LTCH PPS final rule.

2. Forecast of the CIPI for FY 2017

Based on the latest forecast by IHS Global Insight, Inc. (second quarter of 2016), we are forecasting the FY 2010-based CIPI to increase 1.2 percent in FY 2017. This reflects a projected 1.6 percent increase in vintage-weighted depreciation prices (building and fixed equipment, and movable equipment), and a projected 2.7 percent increase in other capital expense prices in FY 2017, partially offset by a projected 1.6 percent decline in vintage-weighted interest expense prices in FY 2017. The weighted average of these three factors produces the forecasted 1.2 percent increase for the FY 2010-based CIPI as a whole in FY 2017.

IV. Changes to Payment Rates for Excluded Hospitals: Rate-of-Increase Percentages for FY 2017

Payments for services furnished in children's hospitals, 11 cancer hospitals, and hospitals located outside the 50 States, the District of Columbia and Puerto Rico (that is, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) that are excluded from the IPPS are made on the basis of reasonable costs based on the hospital's own historical cost experience, subject to a rate-of-increase ceiling. A per discharge limit (the target amount as defined in § 413.40(a) of the regulations) is set for each hospital based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage. (We note that, in accordance with § 403.752(a), RNHCIs are also subject to the rate-of-increase limits established under § 413.40 of the regulations.)

As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25281), the FY 2017 rate-of-increase percentage for updating the target amounts for the 11 cancer hospitals, children's hospitals, the short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, and RNHCIs is the estimated percentage increase in the IPPS operating market basket for FY 2017, in accordance with applicable regulations at § 413.40. Based on IHS Global Insight, Inc.'s 2016 first quarter forecast, we estimated that the FY 2010-based IPPS operating market basket update for FY 2017 would be 2.8 percent (that is, the estimate of the market basket rate-of-increase). However, we proposed that if more recent data became available for the final rule, we would use them to calculate the IPPS operating market basket update for FY 2017. Therefore, based on IHS Global Insight, Inc.'s 2016 second quarter forecast, with historical data through 2016 first quarter, we estimate that the FY 2010-based IPPS operating market basket update for FY 2017 is 2.7 percent (that is, the estimate of the market basket rate-of-increase). For children's hospitals, the 11 cancer hospitals, hospitals located outside the 50 States, the District of Columbia and Puerto Rico (that is, short-term acute

care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa), and RNHCIs, the FY 2017 rate-of-increase percentage that will be applied to the FY 2016 target amounts in order to determine the final FY 2017 target amounts is 2.7 percent.

The IRF PPS, the IPF PPS, and the LTCH PPS are updated annually. We refer readers to section VII. of the preamble of this final rule and section V. of the Addendum to this final rule for the update changes to the Federal payment rates for LTCHs under the LTCH PPS for FY 2017. The annual updates for the IRF PPS and the IPF PPS are issued by the agency in separate **Federal Register** documents.

V. Changes to the Payment Rates for the LTCH PPS for FY 2017

A. LTCH PPS Standard Federal Payment Rate for FY 2017

1. Background

In section VII. of the preamble of this final rule, we discuss our annual updates to the payment rates, factors, and specific policies under the LTCH PPS for FY 2017.

Under § 412.523(c)(3)(ii) of the regulations, for LTCH PPS rate years beginning RY 2004 through RY 2006, we updated the standard Federal rate annually by a factor to adjust for the most recent estimate of the increases in prices of an appropriate market basket of goods and services for LTCHs. We established this policy of annually updating the standard Federal rate because, at that time, we believed that was the most appropriate method for updating the LTCH PPS standard Federal rate for years after the initial implementation of the LTCH PPS in FY 2003. Therefore, under § 412.523(c)(3)(ii), for RYs 2004 through 2006, the annual update to the LTCH PPS standard Federal rate was equal to the previous rate year's Federal rate updated by the most recent estimate of increases in the appropriate market basket of goods and services included in covered inpatient LTCH services.

In determining the annual update to the standard Federal rate for RY 2007, based on our ongoing monitoring activity, we believed that, rather than solely using the most recent estimate of the LTCH PPS market basket update as the basis of the annual update factor, it was appropriate to adjust the standard Federal rate to account for the effect of documentation and coding in a prior period that was unrelated to patients' severity of illness (71 FR 27818). Accordingly, we established under § 412.523(c)(3)(iii) that the annual update to the standard Federal rate for RY 2007 was zero percent based on the most recent estimate of the LTCH PPS market basket at that time, offset by an adjustment to account for changes in case-mix in prior periods due to the effect of documentation and coding that were unrelated to patients' severity of illness. For RY 2008 through FY 2011, we also made an adjustment to account for the effect of documentation and coding that was unrelated to patients' severity of illness in establishing the annual update to the standard Federal rate as set forth in the regulations at §§ 412.523(c)(3)(iv) through (c)(3)(vii). For FYs 2012 through 2016, we updated the standard Federal rate by the most recent estimate of the LTCH PPS market basket at that time, including additional statutory adjustments required by sections 1886(m)(3)(A)(i) (citing sections 1886(b)(3)(B)(xi)(II), 1886(m)(3)(A)(ii), and 1886(m)(4) of the Act as set forth in the regulations at §§ 412.523(c)(3)(viii) through (c)(3)(xii).

Section 1886(m)(3)(A) of the Act, as added by section 3401(c) of the Affordable Care Act, specifies that, for rate year 2010 and each subsequent rate year, any annual update to the standard Federal rate shall be reduced:

- For rate year 2010 through 2019, by the other adjustment specified in section 1886(m)(3)(A)(ii) and (m)(4) of the Act; and
- For rate year 2012 and each subsequent year, by the productivity adjustment described in section 1886(b)(3)(B)(xi)(II) of the Act (which we refer to as ''the multifactor productivity (MFP) adjustment'') as discussed in section VII.E.2. of the preamble of this final rule.

Section 1886(m)(3)(B) of the Act provides that the application of paragraph (3) of section 1886(m) of the Act may result in the annual update being less than zero for a rate year, and may result in payment rates for a rate year being less than such payment rates for the preceding rate year. (As noted in section VII.E.2.a. of the preamble of this final rule, the annual update to the LTCH PPS occurs on October 1 and we have adopted the term ''fiscal year'' (FY) rather than ''rate year'' (RY) under the LTCH PPS beginning October 1, 2010. Therefore, for purposes of clarity, when discussing the annual update for the LTCH PPS, including the provisions of the Affordable Care Act, we use the term ''fiscal year'' rather than ''rate year'' for 2011 and subsequent years.)

For FY 2016, consistent with our historical practice, we established an update to the LTCH PPS standard Federal payment rate based on the full estimated LTCH PPS market basket increase of 2.4 percent and the 0.7 percentage point reductions required by sections 1886(m)(3)(A)(i) and 1886(m)(3)(A)(ii) with 1886(m)(4)(E) of the Act. Accordingly, at § 412.523(c)(3)(xii) of the regulations, we established an annual update of 1.7 percent to the standard Federal payment rate for FY 2016 (80 FR 49636 through 49637). In addition, as discussed in that same final rule, the annual update for FY 2016 was further reduced by 2.0 percentage points for LTCHs that failed to submit quality reporting data in accordance with the requirements of the LTCH QRP under section 1886(m)(5) of the Act.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25281), based on the best available data at that time, we proposed an annual update to the LTCH PPS standard Federal payment rate of 1.45 percent for FY 2017, which was based on the full estimated increase in the LTCH PPS market basket of 2.7 percent (based on the proposed rebased and revised 2013-based LTCH market basket present in that same proposed rule), less the proposed MFP adjustment of 0.5 percentage point consistent with section 1886(m)(3)(A)(i) of the Act, and less the 0.75 percentage point required by sections 1886(m)(3)(A)(ii) and (m)(4)(F) of the Act. For LTCHs that fail to submit the required quality reporting data for FY 2017 in accordance with the LTCH QRP, the annual update is further reduced by 2.0 percentage points as required by section 1886(m)(5) of the Act. Accordingly, we proposed an annual update to the LTCH PPS standard Federal payment rate of −0.55 percent for LTCHs that fail to submit the required quality reporting data for FY 2017 (that is, the proposed full update of 1.45 percent and less 2.0 percentage points for failure to submit quality reporting data as required by section 1886(m)(5) of the Act). Consistent with our historical practice, we also proposed to use the best data available to determine the update for FY 2017 in the final rule.

For FY 2017, in this final rule, based on the best available data, as we proposed, we are establishing an annual update to the LTCH PPS standard Federal payment rate of 1.75 percent, which is based on the full estimated increase in the LTCH PPS market basket of 2.8 percent, less the MFP adjustment of 0.3 percentage point consistent with section 1886(m)(3)(A)(i) of the Act, and less the 0.75 percentage point required by sections 1886(m)(3)(A)(ii) and (m)(4)(F) of the Act. (As discussed in section VII.E. of the preamble of this final rule, as we proposed, we are rebasing and revising the 2009-based

LTCH-specific market basket to reflect a 2013 base year.) For LTCHs that fail to submit the required quality reporting data for FY 2017 in accordance with the LTCH QRP, the annual update is further reduced by 2.0 percentage points as required by section 1886(m)(5) of the Act (as discussed in greater detail in section VII.E.2.c. of the preamble of this final rule). Accordingly, as we proposed, we are establishing an annual update to the LTCH PPS standard Federal payment rate of −0.25 percent for LTCHs that fail to submit the required quality reporting data for FY 2017. This −0.25 percent update was calculated based on the full estimated increase in the LTCH PPS market basket of 2.8 percent, less a MFP adjustment of 0.3 percentage point, less an additional adjustment of 0.75 percentage point required by the statute, and less 2.0 percentage points for failure to submit quality reporting data as required by section 1886(m)(5) of the Act.

2. Development of the FY 2017 LTCH PPS Standard Federal Payment Rate

We continue to believe that the annual update to the LTCH PPS standard Federal payment rate should be based on the most recent estimate of the increase in the LTCH PPS market basket, including any statutory adjustments. Consistent with our historical practice, for FY 2017, as we proposed, we applied the annual update to the LTCH PPS standard Federal payment rate from the previous year. Furthermore, in determining the LTCH PPS standard Federal payment rate for FY 2017, we also made certain regulatory adjustments, consistent with past practices. Specifically, in determining the FY 2017 LTCH PPS standard Federal payment rate, as we proposed, we applied a budget neutrality adjustment factor for the changes related to the area wage adjustment (that is, changes to the wage data and labor-related share) in accordance with § 412.523(d)(4). We also used more recent data to determine the update to the LTCH PPS standard Federal payment rate for FY 2017 in this final rule.

For FY 2016, we established an annual update to the LTCH PPS standard Federal payment rate of 1.7 percent based on the full estimated LTCH PPS market basket increase of 2.4 percent, less the MFP adjustment of 0.5 percentage point consistent with section 1886(m)(3)(A)(i) of the Act and less the 0.2 percentage point required by sections 1886(m)(3)(A)(ii) and (m)(4)(E) of the Act. Accordingly, at § 412.523(c)(3)(xii), we established an annual update to the LTCH PPS standard Federal payment rate for FY 2015 of 1.7 percent. That is, we applied an update factor of 1.017 to the FY 2015 Federal rate of $41,043.71 to determine the FY 2016 LTCH PPS standard Federal payment rate. We also applied an area wage level budget neutrality factor for FY 2016 of 1.000513 to the LTCH PPS standard Federal payment rate to ensure that any changes to the area wage level adjustment would not result in any change in estimated aggregate LTCH PPS payments. Consequently, we established a LTCH PPS standard Federal payment rate for FY 2016 of $41,762.85 (calculated as $41,043.71 × 1.017 × 1.000513) (80 FR 49797).

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25281, based on the best available data at that time, we proposed an annual update to the LTCH PPS standard Federal payment rate of 1.45 percent (as described above). Accordingly, under § 412.523(c)(3)(xiii), we proposed to apply a factor of 1.0145 to the FY 2017 LTCH PPS standard Federal payment rate of $41,762.85 to determine the proposed FY 2017 LTCH PPS standard Federal payment rate. Also, under proposed § 412.523(c)(3)(xiii), in conjunction with the provisions of § 412.523(c)(4), we proposed to apply an annual update to the LTCH PPS standard Federal payment rate of −0.55 percent (that is, a proposed update factor of 0.9945) for FY 2017 for LTCHs that fail to submit the required quality reporting data for FY 2017 as required under the LTCH QRP. Consistent with § 412.523(d)(4), we also proposed to apply an area wage level budget neutrality factor to the FY 2017 LTCH PPS standard Federal payment rate of 0.998723, based on the best available data at that time, to ensure that any proposed changes to the area wage level adjustment (that is, the proposed annual update of the wage index values and labor-related share) would not result in any change (increase or decrease) in estimated aggregate LTCH PPS standard Federal payment rate payments. Accordingly, we proposed an LTCH PPS standard Federal payment rate of $42,314.31 (calculated as $41,762.85 × 1.0145 × 0.998723) for FY 2017. For LTCHs that fail to submit quality reporting data for FY 2017, in accordance with the requirements of the LTCHQRP under section 1886(m)(5) of the Act, we proposed an LTCH PPS standard Federal payment rate of $41,480.12 (calculated as $41,762.85 × 0.9945 × 0.998723) for FY 2017.

In this final rule, as we proposed, based on the best available data, we are establishing an annual update to the LTCH PPS standard Federal payment rate of 1.75 percent, which was determined using the methodology previously described. Accordingly, under § 412.523(c)(3)(xiii), we applied a factor of 1.0175 to the FY 2017 LTCH PPS standard Federal payment rate of $41,762.85 to determine the FY 2017 LTCH PPS standard Federal payment rate. These factors are based on IGI's second quarter 2016 forecast, which are the best available data at this time. For LTCHs that fail to submit quality reporting data for FY 2017 under the LTCH QRP, under § 412.523(c)(3)(xiii), in conjunction with the provisions of § 412.523(c)(4), as we proposed, we reduced the annual update to the LTCH PPS standard Federal payment rate by an additional 2.0 percentage points, consistent with section 1886(m)(5) of the Act. In those cases, the LTCH PPS standard Federal payment rate is updated by −0.25 percent (that is, an update factor of 0.9975) for FY 2017 for LTCHs that fail to submit the required quality reporting data for FY 2017 as required under the LTCH QRP. Consistent with § 412.523(d)(4), we also applied an area wage level budget neutrality factor to the FY 2017 LTCH PPS standard Federal payment rate of 0.999593, which was determined using the methodology described below in section V.B.4. of this Addendum. We are applying this area wage level budget neutrality factor to the FY 2017 LTCH PPS standard Federal payment rate to ensure that any changes to the area wage level adjustment (that is, the annual update of the wage index values and labor-related share) will not result in any change (increase or decrease) in estimated aggregate LTCH PPS standard Federal payment rate payments. Accordingly, consistent with our proposal, we are establishing a LTCH PPS standard Federal payment rate of $42,476.41 (calculated as $41,762.85 × 1.0175 × 0.999593) for FY 2017. For LTCHs that fail to submit quality reporting data for FY 2017 in accordance with the requirements of the LTCHQRP under section 1886(m)(5) of the Act, we are establishing a LTCH PPS standard Federal payment rate of $41,641.49 (calculated as $41,762.85 × 0.9975 × 0.999593) for FY 2017. We note, as discussed in section VII.B. of the preamble of this final rule, under our application of the site neutral payment rate required under section 1886(m)(6) of the Act, this LTCH PPS standard Federal payment rate will only be used to determine payments for LTCH PPS standard Federal payment rate cases (that is, those LTCH PPS cases that meet the statutory criteria to be

excluded from the site neutral payment rate).

B. Adjustment for Area Wage Levels under the LTCH PPS for FY 2017

1. Background

Under the authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, we established an adjustment to the LTCH PPS standard Federal payment rate to account for differences in LTCH area wage levels under § 412.525(c). The labor-related share of the LTCH PPS standard Federal payment rate is adjusted to account for geographic differences in area wage levels by applying the applicable LTCH PPS wage index. The applicable LTCH PPS wage index is computed using wage data from inpatient acute care hospitals without regard to reclassification under section 1886(d)(8) or section 1886(d)(10) of the Act.

When we implemented the LTCH PPS, we established a 5-year transition to the full area wage level adjustment. The area wage level adjustment was completely phased-in for cost reporting periods beginning in FY 2007. Therefore, for cost reporting periods beginning on or after October 1, 2006, the applicable LTCH area wage index values are the full LTCH PPS area wage index values calculated based on acute care hospital inpatient wage index data without taking into account geographic reclassification under section 1886(d)(8) and section 1886(d)(10) of the Act. For additional information on the phase-in of the area wage level adjustment under the LTCH PPS, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 56015 through 56019) and the RY 2008 LTCH PPS final rule (72 FR 26891).

2. Geographic Classifications (Labor Market Areas) for the LTCH PPS Standard Federal Payment Rate

In adjusting for the differences in area wage levels under the LTCH PPS, the labor-related portion of an LTCH's Federal prospective payment is adjusted by using an appropriate area wage index based on the geographic classification (labor market area) in which the LTCH is located. Specifically, the application of the LTCH PPS area wage level adjustment under existing § 412.525(c) is made based on the location of the LTCH—either in an ''urban area,'' or a ''rural area,'' as defined in § 412.503. Under § 412.503, an ''urban area'' is defined as a Metropolitan Statistical Area (MSA) (which includes a Metropolitan division, where applicable), as defined by the Executive OMB and a ''rural area'' is defined as any area outside of an urban area. (Information on OMB's MSA delineations based on the 2010 standards can be found at: *http://www.whitehouse.gov/sites/default/files/omb/assets/fedreg_2010/06282010_metro_standards-Complete.pdf*).

The CBSA-based geographic classifications (labor market area definitions) currently used under the LTCH PPS, effective for discharges occurring on or after October 1, 2014, are based on the OMB labor market area delineations based on the 2010 Decennial Census data. The current statistical areas (which were implemented beginning with FY 2015) are based on revised OMB delineations issued on February 28, 2013, in OMB Bulletin No. 13–01. We adopted these labor market area delineations because they are based on the best available data that reflect the local economies and area wage levels of the hospitals that are currently located in these geographic areas. We also believe that these OMB delineations will ensure that the LTCH PPS area wage level adjustment most appropriately accounts for and reflects the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level. We noted that this policy was consistent with the IPPS policy adopted in FY 2015 under § 412.64(b)(1)(ii)(D) of the regulations (79 FR 49951 through 49963). (For additional information on the CBSA-based labor market area (geographic classification) delineations currently used under the LTCH PPS and the history of the labor market area definitions used under the LTCH PPS, we refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50180 through 50185).)

In general, it is our historical practice to update the CBSA-based labor market area delineations annually based on the most recent updates issued by OMB. Generally, OMB issues major revisions to statistical areas every 10 years, based on the results of the decennial census. However, OMB occasionally issues minor updates and revisions to statistical areas in the years between the decennial censuses. As discussed in the FY 2017 IPPS/LTCH proposed rule (81 FR 25282 through 25283), on July 15, 2015, OMB issued OMB Bulletin No. 15–01, which provides updates to and supersedes OMB Bulletin No. 13–01 that was issued on February 28, 2013. The attachment to OMB Bulletin No. 15–01 provides detailed information on the update to statistical areas since February 28, 2013. As discussed in section III.A.2. of the preamble of the proposed rule, the updates provided in OMB Bulletin No. 15–01 are based on the application of the 2010 Standards for Delineating Metropolitan and Micropolitan Statistical Areas to Census Bureau population estimates for July 1, 2012 and July 1, 2013. A copy of this bulletin may be obtained on the Web site at: *https://www.whitehouse.gov/omb/bulletins_/*.

OMB Bulletin No. 15–01 made the following changes that are relevant to the LTCH PPS CBSA-based labor market area (geographic classification) delineations:

- Garfield County, OK, with principal city Enid, OK, which was a Micropolitan (geographically rural) area, now qualifies as an urban area under new CBSA 21420 entitled Enid, OK.
- The county of Bedford City, VA, a component of the Lynchburg, VA CBSA 31340, changed to town status and is added to Bedford County. Therefore, the county of Bedford City is now part of the county of Bedford, VA. The CBSA remains Lynchburg, VA, 31340.
- The name of Macon, GA, CBSA 31420, as well as a principal city of the Macon-Warner Robins, GA combined statistical area, is now Macon-Bibb County, GA. The CBSA code remains as 31420.

We believe that these revisions to the CBSA-based labor market area delineations will ensure that the LTCH PPS area wage level adjustment most appropriately accounts for and reflects the relative hospital wage levels in the geographic area of the hospital as compared to the national average hospital wage level based on the best available data that reflect the local economies and area wage levels of the hospitals that are currently located in these geographic areas (81 FR 25282 through 25283). Therefore, as we proposed, we are adopting them under the LTCH PPS, effective October 1, 2016. Accordingly, the FY 2017 LTCH PPS wage index values in Tables 12A and 12B listed in section VI. of the Addendum of this final rule (which are available via the Internet on the CMS Web site) reflect the revisions to the CBSA-based labor market area delineations described above. We note that, as discussed in section III.C.2. of the preamble of this final rule, the revisions to the CBSA-based delineations also are being adopted under the IPPS, effective beginning October 1, 2016.

3. Labor-Related Share for the LTCH PPS Standard Federal Payment Rate

Under the payment adjustment for the differences in area wage levels under § 412.525(c), the labor-related share of

an LTCH's standard Federal payment rate payment is adjusted by the applicable wage index for the labor market area in which the LTCH is located. The LTCH PPS labor-related share currently represents the sum of the labor-related portion of operating costs (Wages and Salaries; Employee Benefits; Professional Fees Labor-Related, Administrative and Business Support Services; and All-Other: Labor-Related Services) and a labor-related portion of capital costs using the applicable LTCH PPS market basket. Additional background information on the historical development of the labor-related share under the LTCH PPS can be found in the RY 2007 LTCH PPS final rule (71 FR 27810 through 27817 and 27829 through 27830) and the FY 2012 IPPS/LTCH PPS final rule (76 FR 51766 through 51769 and 51808).

For FY 2013, we revised and rebased the market basket used under the LTCH PPS by adopting the newly created FY 2009-based LTCH-specific market basket. In addition, beginning in FY 2013, we determined the labor-related share annually as the sum of the relative importance of each labor-related cost category of the 2009-based LTCH-specific market basket for the respective fiscal year based on the best available data. (For more details, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53477 through 53479).) As noted previously, as we proposed, we are rebasing and revising the 2009-based LTCH-specific market basket to reflect a 2013 base year. In conjunction with that policy, as discussed in section VII.D.4.e. of the preamble of this final rule, we are establishing that the LTCH PPS labor-related share for FY 2017 is the sum of the FY 2017 relative importance of each labor-related cost category in the 2013-based LTCH market basket using the most recent available data. Specifically, as we discussed in the FY 2017 IPPS/LTCH proposed rule (81 FR 25283), we are establishing that the labor related share for FY 2017 will include the sum of the labor-related portion of operating costs from the 2013-based LTCH market basket (that is, the sum of the FY 2017 relative importance share of Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-related Services) and a portion of the Capital-Related cost weight from the 2013-based LTCH PPS market basket. Based on IGI's second quarter 2016 forecast of the 2013-based LTCH market basket, as we proposed, we are establishing a labor-related share under the LTCH PPS for FY 2017 of 66.5 percent. This labor-related share is determined using the same methodology as employed in calculating all previous LTCH PPS labor-related shares. Consistent with our historical practice, as we proposed, we used more recent data to determine the final FY 2017 labor-related share in this final rule.

Table VII–9 in section VII.D.4.e. of the preamble of this final rule shows the FY 2017 relative importance labor-related share using the 2013-based LTCH market basket and the FY 2016 relative importance labor-related share using the 2009-based LTCH-specific market basket. The labor-related share for FY 2017 is the sum of the FY 2017 relative importance of each labor-related cost category, and will reflect the different rates of price change for these cost categories between the base year (2013) and FY 2017. The sum of the relative importance for FY 2017 for operating costs (Wages and Salaries; Employee Benefits; Professional Fees: Labor-Related; Administrative and Facilities Support Services; Installation, Maintenance, and Repair Services; All Other: Labor-related Services) is 62.2 percent. The portion of capital-related costs that is influenced by the local labor market is estimated to be 46 percent (the same percentage applied to the 2009-based LTCH-specific market basket). Because the relative importance for capital-related costs under our policies is 9.43 percent of the 2013-based LTCH market basket in FY 2017, as we proposed, we took 46 percent of 9.43 percent to determine the labor-related share of capital-related costs for FY 2017 (0.46×9.43). The result is 4.3 percent, which we added to 62.2 percent for the operating cost amount to determine the total labor-related share for FY 2017. Therefore, the labor-related share under the LTCH PPS for FY 2017 is 66.5 percent. We note that the FY 2017 labor-related share using the 2013-based LTCH market basket is 4.5 percentage points higher than the FY 2016 labor-related share using the 2009-based LTCH-specific market basket. This is primarily due to, as discussed in greater detail in section VII.D.4.e. of the preamble of this final rule, the change in the quantity of labor, particularly for professional services, outpacing the change in quantity of products (which are not included in the labor-related share) between 2009 and 2013, which more than offsets the faster relative growth in prices for products.

4. Wage Index for FY 2017 for the LTCH PPS Standard Federal Payment Rate

Historically, we have established LTCH PPS area wage index values calculated from acute care IPPS hospital wage data without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act (67 FR 56019). The area wage level adjustment established under the LTCH PPS is based on an LTCH's actual location without regard to the ''urban'' or ''rural'' designation of any related or affiliated provider.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49798 through 49799), we calculated the FY 2016 LTCH PPS area wage index values using the same data used for the FY 2016 acute care hospital IPPS (that is, data from cost reporting periods beginning during FY 2012), without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act, as these were the most recent complete data available at that time. In that same final rule, we indicated that we computed the FY 2016 LTCH PPS area wage index values, consistent with the urban and rural geographic classifications (labor market areas) that were in place at that time and consistent with the pre-reclassified IPPS wage index policy (that is, our historical policy of not taking into account IPPS geographic reclassifications in determining payments under the LTCH PPS). As with the IPPS wage index, wage data for multicampus hospitals with campuses located in different labor market areas (CBSAs) are apportioned to each CBSA where the campus (or campuses) are located. We also continued to use our existing policy for determining area wage index values for areas where there are no IPPS wage data.

Consistent with our historical methodology, as discussed in the FY 2017 IPPS/LTCH proposed rule (81 FR 25283 through 25284), to determine the applicable area wage index values for the FY 2017 LTCH PPS standard Federal payment rate, under the broad authority of section 123 of the BBRA, as amended by section 307(b) of the BIPA, as we proposed, we used wage data collected from cost reports submitted by IPPS hospitals for cost reporting periods beginning during FY 2013, without taking into account geographic reclassification under sections 1886(d)(8) and 1886(d)(10) of the Act, because these data are the most recent complete data available. We also note that these are the same data we are using to compute the FY 2017 acute care hospital inpatient wage index, as discussed in section III. of the preamble of this final rule. We computed the FY 2017 LTCH PPS standard Federal payment rate area wage index values consistent with the ''urban'' and ''rural''

geographic classifications (that is, labor market area delineations, including the proposed updates, as previously discussed in section V.B.2. of this Addendum) and our historical policy of not taking into account IPPS geographic reclassifications under sections 1886(d)(8) and 1886(d)(10) of the Act in determining payments under the LTCH PPS. As we also proposed, we are continuing to apportion wage data for multicampus hospitals with campuses located in different labor market areas to each CBSA where the campus or campuses are located, consistent with the IPPS policy. Lastly, consistent with our existing methodology for determining the LTCH PPS wage index values, for FY 2017, as we proposed, we are continuing to use our existing policy for determining area wage index values for areas where there are no IPPS wage data. Under our existing methodology, the LTCH PPS wage index value for urban CBSAs with no IPPS wage data would be determined by using an average of all of the urban areas within the State and the LTCH PPS wage index value for rural areas with no IPPS wage data would be determined by using the unweighted average of the wage indices from all of the CBSAs that are contiguous to the rural counties of the State.

Based on the FY 2013 IPPS wage data that we used to determine the FY 2017 LTCH PPS standard Federal payment rate area wage index values in this final rule, there are no IPPS wage data for the urban area of Hinesville, GA (CBSA 25980). Consistent with the methodology discussed above, we calculated the FY 2017 wage index value for CBSA 25980 as the average of the wage index values for all of the other urban areas within the state of Georgia (that is, CBSAs 10500, 12020, 12060, 12260, 15260, 16860, 17980, 19140, 23580, 31420, 40660, 42340, 46660 and 47580), as shown in Table 12A, which is listed in section VI. of the Addendum to this final rule and available via the Internet on the CMS Web site). We note that, as IPPS wage data are dynamic, it is possible that urban areas without IPPS wage data will vary in the future.

Based on the FY 2013 IPPS wage data that we used to determine the FY 2017 LTCH PPS standard Federal payment rate area wage index values in this final rule, there are no rural areas without IPPS hospital wage data. Therefore, as was the case in the proposed rule, it is not necessary to use our established methodology to calculate a LTCH PPS standard Federal payment rate wage index value for rural areas with no IPPS wage data for FY 2017. We note that, as IPPS wage data are dynamic, it is possible that the number of rural areas without IPPS wage data will vary in the future. The FY 2017 LTCH PPS standard Federal payment rate wage index values that are applicable for LTCH PPS standard Federal payment rate discharges occurring on or after October 1, 2016, through September 30, 2017, are presented in Table 12A (for urban areas) and Table 12B (for rural areas), which are listed in section VI. of the Addendum of this final rule and available via the Internet on the CMS Web site.

5. Budget Neutrality Adjustment for Changes to the LTCH PPS Standard Federal Payment Rate Area Wage Level Adjustment

Historically, the LTCH PPS wage index and labor-related share are updated annually based on the latest available data. Under § 412.525(c)(2), any changes to the area wage index values or labor-related share are to be made in a budget neutral manner such that estimated aggregate LTCH PPS payments are unaffected; that is, will be neither greater than nor less than estimated aggregate LTCH PPS payments without such changes to the area wage level adjustment. Under this policy, we determine an area wage-level adjustment budget neutrality factor that will be applied to the standard Federal payment rate to ensure that any changes to the area wage level adjustments are budget neutral such that any changes to the area wage index values or labor-related share would not result in any change (increase or decrease) in estimated aggregate LTCH PPS payments. Accordingly, under § 412.523(d)(4), we apply an area wage level adjustment budget neutrality factor in determining the standard Federal payment rate, and we also established a methodology for calculating an area wage level adjustment budget neutrality factor. (For additional information on the establishment of our budget neutrality policy for changes to the area wage level adjustment, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51771 through 51773 and 51809).)

In this final rule, for FY 2017 LTCH PPS standard Federal payment rate cases, in accordance with § 412.523(d)(4), as we proposed, we applied an area wage level adjustment budget neutrality factor to adjust the LTCH PPS standard Federal payment rate to account for the estimated effect of the adjustments or updates to the area wage level adjustment under § 412.525(c)(1) on estimated aggregate LTCH PPS payments using a methodology that is consistent with the methodology we established in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51773). Specifically, as we proposed in the FY 2017 IPPS/LTCH proposed rule (81 FR 25284), we determined an area wage level adjustment budget neutrality factor that was applied to the LTCH PPS standard Federal payment rate under § 412.523(d)(4) for FY 2017 using the following methodology:

Step 1—We simulated estimated aggregate LTCH PPS standard Federal payment rate payments using the FY 2016 wage index values and the FY 2016 labor-related share of 62.0 percent (as established in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49798 and 49799).

Step 2—We simulated estimated aggregate LTCH PPS standard Federal payment rate payments using the FY 2017 wage index values (as shown in Tables 12A and 12B listed in the Addendum to this rule and available via the Internet on the CMS Web site) and the FY 2017 labor-related share of 66.5 percent (based on the latest available data as previously discussed previously in this Addendum).

Step 3—We calculated the ratio of these estimated total LTCH PPS standard Federal payment rate payments by dividing the estimated total LTCH PPS standard Federal payment rate payments using the FY 2016 area wage level adjustments (calculated in Step 1) by the estimated total LTCH PPS standard Federal payment rate payments using the FY 2017 area wage level adjustments (calculated in Step 2) to determine the area wage level adjustment budget neutrality factor for FY 2017 LTCH PPS standard Federal payment rate payments.

Step 4—We then applied the FY 2017 area wage level adjustment budget neutrality factor from Step 3 to determine the FY 2017 LTCH PPS standard Federal payment rate after the application of the FY 2017 annual update (discussed previously in section V.A.2. of this Addendum).

We note that, with the exception of cases subject to the transitional blend payment rate provisions in the first 2 years, under the dual rate LTCH PPS payment structure, only LTCH PPS cases that meet the statutory criteria to be excluded from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) are paid based on the LTCH PPS standard Federal payment rate. Because the area wage level adjustment under § 412.525(c) is an adjustment to the LTCH PPS standard Federal payment rate, we only used data from claims that

would have qualified for payment at the LTCH PPS standard Federal payment rate if such rate were in effect at the time of discharge to calculate the FY 2017 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor described above.

For this final rule, using the steps in the methodology previously described, we determined a FY 2017 LTCH PPS standard Federal payment rate area wage level adjustment budget neutrality factor of 0.999593. Accordingly, in section V.A.2. of the Addendum to this final rule, to determine the FY 2017 LTCH PPS standard Federal payment rate, we applied an area wage level adjustment budget neutrality factor of 0.999593, in accordance with § 412.523(d)(4). The FY 2017 LTCH PPS standard Federal payment rate shown in Table 1E of the Addendum to this final rule reflects this adjustment factor.

C. Cost-of-Living Adjustment (COLA) for LTCHs Located in Alaska and Hawaii

Under § 412.525(b), a cost-of-living adjustment (COLA) is provided for LTCHs located in Alaska and Hawaii to account for the higher costs incurred in those States. Specifically, we apply a COLA to payments to LTCHs located in Alaska and Hawaii by multiplying the nonlabor-related portion of the standard Federal payment rate by the applicable COLA factors established annually by CMS. Higher labor-related costs for LTCHs located in Alaska and Hawaii are taken into account in the adjustment for area wage levels previously described.

Under our current methodology, we update the COLA factors for Alaska and Hawaii every 4 years (at the same time as the update to the labor-related share of the IPPS market basket) (77 FR 53712 through 53713). This methodology is based on a comparison of the growth in the Consumer Price Indexes (CPIs) for Anchorage, Alaska, and Honolulu, Hawaii, relative to the growth in the CPI for the average U.S. city as published by the Bureau of Labor Statistics (BLS). It also includes a 25-percent cap on the CPI-updated COLA factors. (For additional details on our current methodology for updating the COLA factors for Alaska and Hawaii, we refer readers to section VII.D.3. of the preamble of the FY 2013 IPPS/LTCH PPS final rule (77 FR 53481 through 53482).)

As discussed in the FY 2017 IPPS/LTCH proposed rule (81 FR 25284 through 25285), we continue to believe that determining updated COLA factors using this methodology will appropriately adjust the nonlabor-related portion of the LTCH PPS standard Federal payment rate for LTCHs located in Alaska and Hawaii. Under our current policy, we update the COLA factors using the methodology described above every 4 years; the first year began in FY 2014 (77 FR 53482). Therefore, in this final rule for FY 2017, under the broad authority conferred upon the Secretary by section 123 of the BBRA, as amended by section 307(b) of the BIPA, to determine appropriate payment adjustments under the LTCH PPS, as we proposed, we are continuing to use the COLA factors based on the 2009 OPM COLA factors updated through 2012 by the comparison of the growth in the CPIs for Anchorage, Alaska, and Honolulu, Hawaii, relative to the growth in the CPI for the average U.S. city as established in the FY 2014 IPPS/LTCH PPS final rule. (We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50998) for a discussion of the FY 2014 COLA factors.) Consistent with our historical practice, as we proposed, we are establishing that the COLA factors shown in the following table will be used to adjust the nonlabor-related portion of the LTCH PPS standard Federal payment rate for LTCHs located in Alaska and Hawaii under § 412.525(b).

COST-OF-LIVING ADJUSTMENT FACTORS FOR ALASKA AND HAWAII HOSPITALS UNDER THE LTCH PPS FOR FY 2017

Alaska:	
City of Anchorage and 80-kilometer (50-mile) radius by road	1.23
City of Fairbanks and 80-kilometer (50-mile) radius by road	1.23
City of Juneau and 80-kilometer (50-mile) radius by road	1.23
All other areas of Alaska	1.25
Hawaii:	
City and County of Honolulu	1.25
County of Hawaii	1.19
County of Kauai	1.25
County of Maui and County of Kalawao	1.25

D. Adjustment for LTCH PPS High-Cost Outlier (HCO) Cases

1. HCO Background

From the beginning of the LTCH PPS, we have included an adjustment to account for cases in which there are extraordinarily high costs relative to the costs of most discharges. Under this policy, additional payments are made based on the degree to which the estimated cost of a case (which is calculated by multiplying the Medicare allowable covered charge by the hospital's overall hospital CCR) exceeds a fixed-loss amount. This policy results in greater payment accuracy under the LTCH PPS and the Medicare program, and the LTCH sharing the financial risk for the treatment of extraordinarily high-cost cases.

We retained the basic tenets of our HCO policy in FY 2016 when we implemented the dual rate LTCH PPS payment structure under section 1206 of Public Law 113–67. LTCH discharges that meet the criteria for exclusion from site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) are paid at the LTCH PPS standard Federal payment rate, which includes, as applicable, HCO payments under § 412.523(e). LTCH discharges that do not meet the criteria for exclusion are paid at the site neutral payment rate, which includes, as applicable, HCO payments under § 412.522(c)(2)(i). In the same rule, we established separate fixed-loss amounts and targets for the two different LTCH PPS payment rates. Under this bifurcated policy, the historic 8 percent HCO target was retained for LTCH PPS standard Federal payment rate cases, with the fixed-loss amount calculated using only data from LTCH cases which would have been paid at the LTCH PPS standard Federal payment rate if that rate had been in effect at the time of those discharges. For site neutral payment rate cases, we adopted the operating IPPS HCO target (currently 5.1 percent) and set the fixed-loss amount for site neutral payment rate cases at the value of the IPPS fixed-loss amount. Under the HCO policy for both payment rates, an LTCH receives 80 percent of the difference between the estimated cost of the case and the applicable HCO

threshold, which is the sum of the LTCH PPS payment for the case and the applicable fixed-loss amount for such case.

In order to maintain budget neutrality, consistent with the budget neutrality requirement for HCO payments to LTCH PPS standard Federal rate payment cases, we also adopted a budget neutrality requirement for HCO payments to site neutral payment rate cases by applying a budget neutrality factor to the LTCH PPS payment for those site neutral payment rate cases. (We refer readers to § 412.522(c)(2)(i) of the regulation for further details). We note during the 2-year transitional period, the site neutral payment rate HCO budget neutrality factor does not apply to the LTCH PPS standard Federal payment rate portion of the blended rate at § 412.522(c)(3) payable to site neutral payment rate cases. (For additional details on the HCO policy adopted for site neutral payment rate cases under the dual rate LTCH PPS payment structure, including the budget neutrality adjustment for HCO payments to site neutral payment rate cases, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49617 through 49623).)

2. Determining LTCH CCRs Under the LTCH PPS

a. Background

As noted above, CCRs are used to determine payments for HCO adjustments for both payment rates under the LTCH PPS, and are also used to determine payments for SSO cases under § 412.529 as well as payments for site neutral payment rate cases. (We note that the provisions of § 412.529 are only applicable to LTCH PPS standard Federal payment rate cases.) Therefore, this discussion is relevant to all HCO, SSO, and site neutral payment rate calculations.

As noted earlier, in determining HCO, SSO, and the site neutral payment rate (regardless of whether the case is also an HCO) payments, we generally calculate the estimated cost of the case by multiplying the LTCH's overall CCR by the Medicare allowable charges for the case. An overall CCR is used because the LTCH PPS uses a single prospective payment per discharge that covers both inpatient operating and capital-related costs. The LTCH's overall CCR is generally computed based on the sum of LTCH operating and capital costs (as described in Section 150.24, Chapter 3, of the Medicare Claims Processing Manual (Pub. 100–4)) as compared to total Medicare charges (that is, the sum of its operating and capital inpatient routine and ancillary charges), with those values determined from either the most recently settled cost report or the most recent tentatively settled cost report, whichever is from the latest cost reporting period. However, in certain instances, we use an alternative CCR, such as the statewide average CCR, a CCR that is specified by CMS, or one that is requested by the hospital. (We refer readers to § 412.525(a)(4)(iv) of the regulations for further details regarding HCO adjustments for either LTCH PPS payment rate, § 412.529(f)(4) for SSO adjustments, and § 412.522(c)(1)(ii) for the site neutral payment rate, respectively.)

The LTCH's calculated CCR is then compared to the LTCH total CCR ceiling. Under our established policy, an LTCH with a calculated CCR in excess of the applicable maximum CCR threshold (that is, the LTCH total CCR ceiling, which is calculated as 3 standard deviations from the national geometric average CCR) is generally assigned the applicable statewide CCR. This policy is premised on a belief that calculated CCRs above the LTCH total CCR ceiling are most likely due to faulty data reporting or entry, and CCRs based on erroneous data should not be used to identify and make payments for outlier cases.

b. LTCH Total CCR Ceiling

Consistent with our historical practice, we used more recent data to determine the LTCH total CCR ceiling for this FY 2017 in this final rule. Specifically, in this final rule, using our established methodology for determining the LTCH total CCR ceiling based on IPPS total CCR data from the March 2016 update of the Provider Specific File (PSF), which is the most recent data available, we are establishing a LTCH total CCR ceiling of 1.297 under the LTCH PPS for FY 2017 in accordance with § 412.525(a)(4)(iv)(C)(*2*) for HCO cases under either payment rate, § 412.529(f)(4)(iii)(B) for SSOs, and § 412.522(c)(1)(ii) for the site neutral payment rate. (For additional information on our methodology for determining the LTCH total CCR ceiling, we refer readers to the FY 2007 IPPS final rule (71 FR 48118 through 48119).)

c. LTCH Statewide Average CCRs

Our general methodology for determining the statewide average CCRs used under the LTCH PPS is similar to our established methodology for determining the LTCH total CCR ceiling because it is based on ''total'' IPPS CCR data. (For additional information on our methodology for determining statewide average CCRs under the LTCH PPS, we refer readers to the FY 2007 IPPS final rule (71 FR 48119 through 48120).) Under the LTCH PPS HCO policy for cases paid under either payment rate at § 412.525(a)(4)(iv)(C)(2), the SSO policy at § 412.529(f)(4)(iii)(B), and the site neutral payment rate at § 412.522(c)(1)(ii), the MAC may use a statewide average CCR, which is established annually by CMS, if it is unable to determine an accurate CCR for an LTCH in one of the following circumstances: (1) New LTCHs that have not yet submitted their first Medicare cost report (a new LTCH is defined as an entity that has not accepted assignment of an existing hospital's provider agreement in accordance with § 489.18); (2) LTCHs whose calculated CCR is in excess of the LTCH total CCR ceiling; and (3) other LTCHs for whom data with which to calculate a CCR are not available (for example, missing or faulty data). (Other sources of data that the MAC may consider in determining an LTCH's CCR include data from a different cost reporting period for the LTCH, data from the cost reporting period preceding the period in which the hospital began to be paid as an LTCH (that is, the period of at least 6 months that it was paid as a short-term, acute care hospital), or data from other comparable LTCHs, such as LTCHs in the same chain or in the same region.)

Consistent with our historical practice of using the best available data and as we proposed, in this final rule, using our established methodology for determining the LTCH statewide average CCRs, based on the most recent complete IPPS ''total CCR'' data from the March 2016 update of the PSF, we are establishing LTCH PPS statewide average total CCRs for urban and rural hospitals that will be effective for discharges occurring on or after October 1, 2016 through September 30, 2017, in Table 8C listed in section VI. of the Addendum to this final rule (and available via the Internet on the CMS Web site). Consistent with our historical practice, as we proposed, we used more recent data to determine the LTCH PPS statewide average total CCRs for FY 2017 in this final rule.

Under the current LTCH PPS labor market areas, all areas in Delaware, the District of Columbia, New Jersey, and Rhode Island are classified as urban. Therefore, there are no rural statewide average total CCRs listed for those jurisdictions in Table 8C. This policy is consistent with the policy that we established when we revised our methodology for determining the applicable LTCH statewide average CCRs in the FY 2007 IPPS final rule (71

FR 48119 through 48121) and is the same as the policy applied under the IPPS. In addition, although Connecticut has areas that are designated as rural, in our calculation of the LTCH statewide average CCRs, there was no data available from short-term, acute care IPPS hospitals to compute a rural statewide average CCR or there were no short-term, acute care IPPS hospitals or LTCHs located in that area as of March 2016. (We note that, based on the best available data at the time of the proposed rule, there were no data available from short-term acute care IPPS hospitals (or LTCHs) located in the rural areas of North Dakota. However, based on the more recent data available for this final rule, there is now data available from short-term acute care IPPS hospitals in the rural areas of North Dakota from which to compute a rural statewide average CCR. Therefore, it is no longer necessary to use the national average total CCR for rural IPPS hospitals for rural North Dakota in Table 8C associated with this final rule, which is available via the Internet on the CMS Web site.) Therefore, consistent with our existing methodology, as we proposed, we used the national average total CCR for rural IPPS hospitals for rural Connecticut in Table 8C listed in section VI. of the Addendum to this final rule (and available via the Internet on the CMS Web site). Furthermore, consistent with our existing methodology, in determining the urban and rural statewide average total CCRs for Maryland LTCHs paid under the LTCH PPS, as we proposed, we are continuing to use, as a proxy, the national average total CCR for urban IPPS hospitals and the national average total CCR for rural IPPS hospitals, respectively. We used this proxy because we believe that the CCR data in the PSF for Maryland hospitals may not be entirely accurate (as discussed in greater detail in the FY 2007 IPPS final rule (71 FR 48120)).

d. Reconciliation of HCO and SSO Payments

Under the HCO policy for cases paid under either payment rate at § 412.525(a)(4)(iv)(D) and the SSO policy at § 412.529(f)(4)(iv), the payments for HCO and SSO cases are subject to reconciliation. Specifically, any such payments are reconciled at settlement based on the CCR that is calculated based on the cost report coinciding with the discharge. (We note the existing reconciliation process for HCO payments is also applicable to LTCH PPS payments for site neutral payment rate cases (80 FR 49610).) For additional information on the reconciliation policy, we refer readers to Sections 150.26 through 150.28 of the Medicare Claims Processing Manual (Pub. 100–4) as added by Change Request 7192 (Transmittal 2111; December 3, 2010) and the RY 2009 LTCH PPS final rule (73 FR 26820 through 26821).

e. Technical Change to the Definition of ''Outlier Payment''

The existing regulations at § 412.503 includes a definition of ''outlier payment,'' which was adopted when the LTCH PPS was implemented (67 FR 56049). This definition does not account for the dual rate LTCH PPS payment structure that began in FY 2016. Therefore, in this final rule, to account for our HCO policy for LTCH cases paid under either payment rate, as we proposed, we are revising the definition of ''outlier payment'' at § 412.503 to mean an additional payment beyond the LTCH PPS standard Federal payment rate or the site neutral payment rate (including, when applicable, the transitional blended rate), as applicable, for cases with unusually high costs.

We did not receive any public comments on our proposed technical revisions to the definition of ''outlier payment'' at § 412.503 to account for the dual rate LTCH PPS payment structure that began in FY 2016. Therefore, we are adopting this revision as final, without modification.

3. High-Cost Outlier Payments for LTCH PPS Standard Federal Payment Rate Cases

a. Establishment of the Fixed-Loss Amount for LTCH PPS Standard Federal Payment Rate Cases for FY 2017

When we implemented the LTCH PPS, we established a fixed-loss amount so that total estimated outlier payments are projected to equal 8 percent of total estimated payments under the LTCH PPS (67 FR 56022 through 56026). When we implemented the dual rate LTCH PPS payment structure beginning in FY 2016, we established that, in general, that the historical LTCH PPS HCO policy will continue to apply to LTCH PPS standard Federal payment rate cases. That is, the fixed-loss amount and target for LTCH PPS standard Federal payment rate cases is determined using the LTCH PPS HCO policy adopted when the LTCH PPS was first implemented, but we limited the data used under that policy to LTCH cases that would have been LTCH PPS standard Federal payment rate cases if the statutory changes had been in effect at the time of those discharges.

To determine the applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases, we estimate outlier payments and total LTCH PPS payments for each LTCH PPS standard Federal payment rate case (or for each case that would have been a LTCH PPS standard Federal payment rate case if the statutory changes had been in effect at the time of the discharge) using claims data from the MedPAR files. The applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases results in estimated total outlier payments being projected to be equal to 8 percent of projected total LTCH PPS payments for LTCH PPS standard Federal payment rate cases. We use MedPAR claims data and CCRs based on data from the most recent PSF (or from the applicable statewide average CCR if an LTCH's CCR data are faulty or unavailable) to establish an applicable fixed-loss threshold amount for LTCH PPS standard Federal payment rate cases.

In the FY 2017 IPS/LTCH PPS proposed rule (81 FR 25286 through 25287), we proposed to continue to use our current methodology to calculate an applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2017 using the best available data that would maintain estimated HCO payments at the projected 8 percent of total estimated LTCH PPS payments for LTCH PPS standard Federal payment rate cases (based on the payment rates and policies for these cases presented in that proposed rule). Specifically, based on the most recent complete LTCH data available (that is, LTCH claims data from the December 2015 update of the FY 2015 MedPAR file and CCRs from the December 2015 update of the PSF), we determined that a proposed fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2017 of $22,728 would result in estimated outlier payments projected to be equal to 8 percent of estimated FY 2017 payments for such cases. Under this proposal, we would continue to make an additional HCO payment for the cost of an LTCH PPS standard Federal payment rate case that exceeds the HCO threshold amount that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the adjusted LTCH PPS standard Federal payment rate payment and the fixed-loss amount for LTCH PPS standard Federal payment rate cases of $22,728). We also noted that the proposed fixed-loss amount for HCO cases paid under the LTCH PPS standard Federal payment rate in FY 2017 of $22,728 is notably higher than the FY 2016 fixed-

loss amount for LTCH PPS standard Federal payment rate cases of $16,423, and explains that the increase is largely attributable to rate-of-change in the Medicare allowable charges on the claims data in the MedPAR file. Based on the most recent available data at the time of the proposed rule, we found that the current FY 2016 HCO threshold of $16,423 results in estimated HCO payments for LTCH PPS standard Federal payment rate cases of approximately 9.1 percent of the estimated total LTCH PPS payments in FY 2016, which exceeds the 8 percent target by 1.1 percentage points. We also noted that fluctuations in the fixed-loss amount occurred in the first few years after the implementation of the LTCH PPS, due, in part, to the changes in LTCH behavior (such as Medicare beneficiary treatment patterns) in response to the new payment system and the lack of data and information available to predict how those changes would affect the estimate costs of LTCH cases. As we gained more experience with the effects and implementation of the LTCH PPS, the annual changes on the fixed-loss amount generally stabilized relative to the fluctuations that occurred in the early years of the LTCH PPS. Therefore, we did not propose any changes to our method for the inflation factor applied to update the costs of each case (that is, an inflation factor based on the most recent estimate of the proposed 2013-based LTCH market basket as determined by the Office of the Actuary) in determining the proposed fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2017. We stated our continued belief that it is appropriate to continue to use our historical approach until we gain experience with the effects and implementation of the dual rate LTCH PPS payment structure that began with discharges occurring in cost reporting periods beginning on or after October 1, 2015, and the types of cases paid at the LTCH PPS standard Federal payment rate under this dual rate payment structure. We stated that we may revisit this issue in the future if data demonstrate such a change is warranted, and would propose any changes in the future through the notice-and-comment rulemaking process. Furthermore, we invited public comments on potential improvements to the determination of the fixed-loss amount for LTCH PPS standard Federal payment rate cases, including the most appropriate method of determining an inflation factor for projecting the costs of each case when determining the fixed-loss threshold.

Comment: A few commenters expressed concern with the notable increase in the proposed FY 2017 fixed-loss amount for LTCH PPS standard Federal payment rate cases as compared to the current fixed-loss amount for such cases. Some of these commenters expressed general support for continuing to use a target amount of 8 percent for HCO payments for LTCH PPS standard Federal payment rate cases. Some commenters stated that they are concerned about the potential instability in the fixed-loss amount from year to year and requested that CMS continue to be transparent about the possible causes for such large year-to-year changes in the fixed-loss amount and how much of this variability may be attributable to the new dual rate LTCH PPS payment structure. Some commenters also expected that the fixed-loss amount would change in the final rule based on the use of more recent LTCH claims data from the MedPAR file and the latest CCRs from the PSF. In addition to using the most recent LTCH claims data and CCRs, some commenters suggested that CMS consider whether the new dual rate LTCH PPS payment structure warrants the use of other relevant data or a change in the inflation factor for projecting the costs of each case when determining the fixed-loss amount. One commenter stated that it is not reasonable for the HCO fixed-loss amount for LTCH PPS standard Federal payment rate cases to increase to such a high level, and suggested that the increase in the HCO fixed-loss amount be established at 7 percent, which would reflect the LTCH industry's average increase in charges.

Response: We understand the commenters' concern with the proposed increase to the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2017, and we appreciate the commenters' support for our proposed continued use of a HCO target amount of 8 percent for LTCH PPS standard Federal payment rate cases. (For information on the rationale for the existing 8 percent HCO ''target'' requirement, we refer readers to the August 30, 2002 LTCH PPS final rule (67 FR 56022 through 56024).) As we discussed in the proposed rule, based on the best available data at that time, we estimated that the current FY 2016 HCO fixed-loss amount of $16,423 results in estimated HCO payments for LTCH PPS standard Federal payment rate cases in excess of the 8 percent target by 1.1 percentage points. Similarly, based on the most recent available data for this final rule (discussed below), we found that the current FY 2016 HCO threshold of $16,423 results in estimated HCO payments for LTCH PPS standard Federal payment rate cases of approximately 9.0 percent of the estimated total LTCH PPS payments in FY 2016, which exceeds the 8 percent target by 1.0 percentage point. Maintaining the fixed-loss amount at the current level would result in HCO payments that are substantially more than the current regulatory 8 percent target that we apply to total payments for LTCH PPS standard Federal payment rate cases because a lower fixed-loss amount results in more cases qualifying as outlier cases, as well as higher HCO payments for qualifying cases because the maximum loss that an LTCH must incur before receiving an HCO payment (that is, the fixed-loss amount) would be smaller. For these reasons, we continue to believe it is necessary and appropriate to increase to the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2017 to maintain estimated HCO payments equal to 8 percent of estimated total LTCH PPS payments for such cases as required under § 412.525(a). In addition, for these reasons, we are not adopting the commenter's suggestion to only increase the fixed-loss amount for LTCH PPS standard Federal payment rate cases by the average increase in LTCHs' charges because the resulting fixed-loss amount would not maintain estimated HCO payments to equal 8 percent of estimated total LTCH PPS payments for such cases, as required under current policy.

As discussed in the proposed rule, fluctuations in the fixed-loss amount have occurred previously under the LTCH PPS, due, in part, to the changes in LTCH behavior in response to the changes in Medicare payments and the lack of data and information available to predict how those changes affect the estimate costs of LTCH cases. As was the case when there were fluctuations in the fixed-loss amount in the early years of the LTCH PPS, we expect annual changes to the fixed-loss amount to generally stabilize as experience is gained under the new dual rate LTCH PPS payment structure. We intend to continue to monitor annual changes in the HCO fixed-loss amount, including factors that cause any such changes. We appreciate the commenters' suggestions for potential improvements to the determination of the fixed-loss amount for LTCH PPS standard Federal payment rate cases, including the use of other relevant data or a change in the inflation factor for projecting the costs of each

case when determining the fixed-loss amount. As we indicated in the proposed rule, we may revisit this issue in the future if data demonstrate such a change is warranted, and would propose any changes in the future through the notice-and-comment rulemaking process. We note, as in greater detail discussed below, the fixed-loss amount for FY 2017 for LTCH PPS standard Federal payment rate cases we are establishing in this final rule, after consideration of public comments and based on the most recent LTCH claims data from the MedPAR file and the latest CCRs from the PSF, does result in a fixed-loss amount for such cases that is lower than the proposed fixed-loss amount, consistent with commenters' expectations.

After consideration of the public comments we received, for the reasons discussed above, we are finalizing our proposal to continue to use the current LTCH PPS HCO payment methodology for LTCH PPS standard Federal payment rate cases for FY 2017 without modification. Therefore, in this final rule, for FY 2017, we determined an applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases using data from LTCH PPS standard Federal payment rate cases (or cases that would have been LTCH PPS standard Federal payment rate cases had the dual rate LTCH PPS payment structure been in effect at the time of those discharges). The fixed-loss amount for LTCH PPS standard Federal payment rate cases will continue to be determined so that estimated HCO payments will be projected to equal 8 percent of estimated total LTCH PPS standard Federal payment rate cases. Furthermore, in accordance with § 412.523(d)(1), a budget neutrality factor will continue to be applied to LTCH PPS standard Federal payment rate cases to offset that 8 percent so that HCO payments for LTCH PPS standard Federal payment rate cases will be budget neutral. Below we present our calculation of the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2017, which is consistent with the methodology used to establish the FY 2016 LTCH PPS fixed-loss amount, as we proposed.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49803 through 49804), we presented our policies regarding the methodology and data we used to establish a fixed-loss amount of $16,423 for FY 2016 for LTCH PPS standard Federal payment rate cases, which was calculated based on the data and the rates and policies presented in that final rule in order to maintain estimated HCO payments at the projected 8 percent of total estimated LTCH PPS payments. Consistent with our historical practice of using the best data available, as we proposed, in determining the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2017, we used the most recent available LTCH claims data and CCR data, that is, LTCH claims data from the March 2016 update of the FY 2015 MedPAR file and CCRs from the March 2016 update of the PSF, as these data were the most recent complete LTCH data available at that time.

For FY 2017, as we proposed, we are continuing to use our current methodology to calculate an applicable fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2017 using the best available data that will maintain estimated HCO payments at the projected 8 percent of total estimated LTCH PPS payments for LTCH PPS standard Federal payment rate cases (based on the rates and policies for these cases presented in this final rule). Specifically, based on the most recent complete LTCH data available (that is, LTCH claims data from the March 2016 update of the FY 2015 MedPAR file and CCRs from the March 2016 update of the PSF), we determined a fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2017 that will result in estimated outlier payments projected to be equal to 8 percent of estimated FY 2017 payments for such cases. Under the broad authority of section 123(a)(1) of the BBRA and section 307(b)(1) of the BIPA, we are establishing a fixed-loss amount of $21,943 for LTCH PPS standard Federal payment rate cases for FY 2017. Under our policy, we will continue to make an additional HCO payment for the cost of an LTCH PPS standard Federal payment rate case that exceeds the HCO threshold amount that is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the adjusted LTCH PPS standard Federal payment rate payment and the fixed-loss amount for LTCH PPS standard Federal payment rate cases of $21,943).

We note that the fixed-loss amount of $21,943 for FY 2017 for LTCH PPS standard Federal payment rate cases is somewhat lower than the proposed FY 2017 fixed-loss amount of $22,728 for FY 2017 for such cases, but notably higher than the FY 2016 fixed-loss amount for LTCH PPS standard Federal payment rate cases of $16,423. As discussed in the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25287), the FY 2016 fixed-loss amount for LTCH PPS standard Federal payment rate cases was determined using LTCH claims data from the March 2015 update of the FY 2014 MedPAR file and CCRs from the March 2015 update of the PSF. Based on that data, the estimated outlier payments were projected to be equal to 8 percent of estimated FY 2016 payments for such cases (80 FR 49803). Using the more recent LTCH claims data (that is, FY 2015 LTCH discharges from the March 2016 update of the MedPAR file and CCRs from the March 2016 update of the PSF), we currently estimate that the FY 2016 fixed-loss amount of $16,423 results in estimated HCO payments for LTCH PPS standard Federal payment rate cases of approximately 9.0 percent of total estimated FY 2016 LTCH PPS payments to those cases, which exceeds the 8 percent target. While many factors contribute to this increase, we found that the rate-of-change in the Medicare allowable charges on the claims data in the MedPAR is a significant contributing factor. In the payment modeling used to estimate LTCH PPS payments for the FY 2016 IPPS/LTCH PPS final rule, for SSO and HCO cases paid as LTCH PPS standard Federal payment rate cases, we applied an inflation factor of 4.6 percent (determined by the Office of the Actuary) to update the 2014 costs of each case to 2016 (80 FR 49833). Upon examining FY 2014 LTCH and FY 2015 LTCH discharge data, we found that Medicare allowable charges for LTCH PPS standard Federal payment rate cases (had the dual rate LTCH PPS payment structure been in effect at the time of the discharges) increased approximately 7 percent. This higher inflation factor results in higher estimated costs for outlier cases and, therefore, more estimated outlier payments. For the reasons discussed above, we believe that it is necessary and appropriate to apply an increase to the fixed-loss amount for LTCH PPS standard Federal payment rate cases for FY 2017 to ensure that, for LTCH PPS standard Federal payment rate cases, estimated HCO payments will equal 8 percent of estimated total LTCH PPS payments for those cases as required under § 412.525(a).

b. Application of the High-Cost Outlier Policy to SSO Cases

Under our implementation of the dual rate LTCH PPS payment structure required by statute, LTCH PPS standard Federal payment rate cases (that is, LTCH discharges that meet the criteria for exclusion from the site neutral payment rate) will continue to be paid based on the LTCH PPS standard Federal payment rate, and will include all of the existing payment adjustments

under § 412.525(d), such as the adjustments for SSO cases under § 412.529. Under some rare circumstances, an LTCH discharge can qualify as an SSO case (as defined in the regulations at § 412.529 in conjunction with § 412.503) and also as an HCO case, as discussed in the August 30, 2002 final rule (67 FR 56026). In this scenario, a patient could be hospitalized for less than five-sixths of the geometric average length of stay for the specific MS–LTC–DRG, and yet incur extraordinarily high treatment costs. If the estimated costs exceeded the HCO threshold (that is, the SSO payment plus the applicable fixed-loss amount), the discharge is eligible for payment as an HCO. Therefore, for an SSO case in FY 2017, as we proposed, we are establishing that the HCO payment will be 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of the fixed-loss amount of $21,943 and the amount paid under the SSO policy as specified in § 412.529).

4. High-Cost Outlier Payments for Site Neutral Payment Rate Cases

Under § 412.525(a), site neutral payment rate cases receive an additional HCO payment for costs that exceed the HCO threshold that is equal to 80 percent of the difference between the estimated cost of the case and the applicable HCO threshold (80 FR 49618 through 49629). In the FY 2016 IPPS/LTCH PPS final rule, in examining the appropriate fixed-loss amount for site neutral payment rate cases issue, we considered how LTCH discharges based on historical claims data would have been classified under the dual rate LTCH PPS payment structure and the CMS' Office of the Actuary (OACT) projections regarding how LTCHs will likely respond to our implementation of policies resulting from the statutory payment changes. For FY 2016, at that time our actuaries projected that the proportion of cases that would qualify as LTCH PPS standard Federal payment rate cases versus site neutral payment rate cases under the statutory provisions would remain consistent with what is reflected in the historical LTCH PPS claims data. Although our actuaries did not project an immediate change in the proportions found in the historical data, they did project cost and resource changes to account for the lower payment rates. Our actuaries also projected that the costs and resource use for cases paid at the site neutral payment rate would likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate and would likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG, regardless of whether the proportion of site neutral payment rate cases in the future remains similar to what is found based on the historical data. In light of these projections and expectations, we discussed that we believed that the use of a single fixed-loss amount and HCO target for all LTCH PPS cases would be problematic. In addition, we discussed that we did not believe that it would be appropriate for comparable LTCH PPS site neutral payment rate cases to receive dramatically different HCO payments from those cases that would be paid under the IPPS (80 FR 49618 through 49619). For those reasons, in the FY 2016 IPPS/LTCH PPS final rule (FR 80 49619), we stated that we believe that the most appropriate fixed-loss amount for site neutral payment rate cases for a given fiscal year, beginning with FY 2016, would be the IPPS fixed-loss amount for that fiscal year. Accordingly, we established that for FY 2016, a fixed-loss amount for site neutral payment rate cases of $22,544, which was the same as the FY 2016 IPPS fixed-loss amount. (We note that the FY 2016 fixed-loss amount under the IPPS was updated, applicable for discharges on or after January 1, 2016, as a conforming change to the implementation of section 601 of the Consolidated Appropriations Act, 2016, which modified the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016 (Change Request 9523, Transmittal 3449, dated February 4, 2016).) Consistent with this change, the FY 2016 fixed-loss amount for site neutral payment rate cases under the LTCH PPS was updated, applicable for discharges on or after January 1, 2016, to $22,538, which is the same as the updated IPPS outlier fixed-loss cost threshold for FY 2016. (We refer readers to Change Request 9527, Transmittal 3445, dated January 29, 2016, which also updated the IPPS comparable amount calculation, applicable to discharges occurring on or after January 1, 2016, consistent with the conforming changes made as a result of the new IPPS payment requirement.)

In developing a fixed-loss amount for site neutral payment rate cases for FY 2017, as discussed in the FY 2017 IPPS/LTCH proposed rule (81 FR 25288), we considered the same factors we did developing a fixed-loss amount for such cases for FY 2016. For FY 2017, our actuaries currently project that the proportion of cases that will qualify as LTCH PPS standard Federal payment rate cases versus site neutral payment rate cases under the dual rate LTCH PPS payment structure provisions will remain consistent with what is reflected in the historical LTCH PPS claims data. Based on FY 2014 LTCH claims data, LTCH claims data, we found that approximately 55 percent of LTCH cases would have been paid the LTCH PPS standard Federal payment rate and approximately 45 percent of LTCH cases would have been paid the site neutral payment rate if those rates had been in effect at that time.) At this time, our actuaries continue to project no immediate change in these proportions. However, they do continue to project that the costs and resource use for cases paid at the site neutral payment rate would likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate and will likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG, regardless of whether the proportion of site neutral payment rate cases in the future remains similar to what is found based on the historical data. As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49619), this actuarial assumption is based on our expectation that site neutral payment rate cases would generally be paid based on an IPPS comparable per diem amount under the statutory LTCH PPS payment changes that began in FY 2016, which, in the majority of cases, is much lower than the payment that would have been paid if these statutory changes were not enacted. For these reasons, we continue to believe that the most appropriate fixed-loss amount for site neutral payment rate cases for FY 2017 is the IPPS fixed-loss amount for FY 2017.

Therefore, for FY 2017, we proposed that the applicable HCO threshold for site neutral payment rate cases is the sum of the site neutral payment rate for the case and the IPPS fixed-loss amount. That is, we proposed a fixed-loss amount for site neutral payment rate cases of $23,681, which is the same FY 2017 IPPS fixed-loss amount discussed in section II.A.4.g.(1) of the Addendum to that proposed rule. We stated that we continued to believe that this policy will reduce differences between HCO payments for similar cases under the IPPS and site neutral payment rate cases under the LTCH PPS and promote fairness between the two systems. Accordingly, for FY 2017, we proposed to calculate a HCO payment for site neutral payment rate cases with costs that exceed the HCO threshold amount,

which is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of site neutral payment rate payment and the fixed-loss amount for site neutral payment rate cases of $23,681).

Comment: Some commenters expressed support for our proposal to continue to use the FY 2017 IPPS fixed-loss amount and 5.1 percent HCO target for LTCH discharges paid at the site neutral payment rate in FY 2017. However, some commenters suggested that the IPPS fixed-loss amount and 5.1 percent HCO target not be used automatically for site neutral payment rate cases every year.

Response: We appreciate the commenters support for our proposal to continue to use the FY 2017 IPPS fixed-loss amount and 5.1 percent HCO target for LTCH discharges paid at the site neutral payment rate in FY 2017. Given the current expectation that cases paid at the site neutral payment rate would likely be similar to IPPS cases assigned to the same MS–DRG, we continue to believe the most appropriate fixed-loss amount for site neutral payment rate cases is the IPPS fixed-loss amount for that fiscal year. As we indicated in the FY 2016 IPPS/LTCH PS final rule (80 FR 49619), to the extent experience under the revised LTCH PPS indicates site neutral payment rate cases differ sufficiently from these expectations, we agree it would be appropriate to revisit in future rulemaking the most appropriate fixed-loss amount used to determine HCO payments for site neutral payment rate cases.

Comment: One commenter recommended that CMS apply geographic adjustments (that is, the wage index and COLA) to the fixed-loss amount when determining the HCO threshold for site neutral payment rate cases, consistent with the approach used under the IPPS.

Response: The LTCH PPS HCO policy does not include the application of geographic adjustments when determining the HCO threshold, and therefore, our current policy for determining the HCO threshold for site neutral payment rate cases, which we proposed to continue to use for FY 2017, is consistent with our longstanding LTCH PPS HCO policy. The LTCH PPS and IPPS HCO policies have historically differed with regard to this aspect of the HCO payment policy calculation. Moreover, the commenter offered little support to demonstrate that its recommended change, which we did not propose and are not accepting, would result in more appropriate HCO payments to site neutral payment rate cases paid under the LTCH PPS. We will keep this recommended change in mind as we consider potential refinements to the LTCH PPS HCO policy, including the HCO threshold for site neutral payment rate cases, in the future.

After consideration of the public comments we received, we are finalizing, without modification, our proposals to use the FY 2017 IPPS fixed-loss amount and 5.1 percent HCO target for LTCH discharges paid at the site neutral payment rate in FY 2017. Therefore, for FY 2017, as we proposed, we are establishing that the applicable HCO threshold for site neutral payment rate cases is the sum of the site neutral payment rate for the case and the IPPS fixed-loss amount. That is, we are establishing a fixed-loss amount for site neutral payment rate cases of $23,570, which is the same FY 2017 IPPS fixed-loss amount discussed in section II.A.4.g.(1) of the Addendum to this final rule. We continue to believe that this policy will reduce differences between HCO payments for similar cases under the IPPS and site neutral payment rate cases under the LTCH PPS and promote fairness between the two systems. Accordingly, under this policy, for FY 2017, we are calculating a HCO payment for site neutral payment rate cases with costs that exceed the HCO threshold amount, which is equal to 80 percent of the difference between the estimated cost of the case and the outlier threshold (the sum of site neutral payment rate payment and the fixed-loss amount for site neutral payment rate cases of $23,570). (We note that any site neutral payment rate case that is paid 100 percent of the estimated cost of the case (because that amount is lower than the IPPS comparable per diem amount) will not be eligible to receive a HCO payment because, by definition, the estimated costs of such cases will never exceed the IPPS comparable per diem amount by any threshold.)

In establishing a HCO policy for site neutral payment rate cases, we established a budget neutrality requirement at § 412.522(c)(2)(i). We established this requirement because we believe that the HCO policy for site neutral payment rate cases should be budget neutral, just as the HCO policy for LTCH PPS standard Federal payment rate cases are budget neutral, meaning that estimated site neutral payment rate HCO payments should not result in any change in estimated aggregate LTCH PPS payments. Under § 412.522(c)(2)(i), we adjust all payments for site neutral payment rate cases by a budget neutrality factor so that the estimated HCO payments payable for site neutral payment rate cases do not result in any increase in aggregate LTCH PPS payments. Specifically, under § 412.522(c)(2)(i), we apply a budget neutrality factor to the site neutral payment rate portion of the transitional blended rate payment (that is applicable to site neutral payment rate cases during the 2-year transition period provided by the statute) that is established based on an estimated basis. (We refer readers to 80 FR 49621 through 49622 and 49805.)

Under the approach adopted for applying the budget neutrality adjustment to the site neutral payment rate portion of the transitional blended rate payment in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49805), we explained that there is no need to perform any calculation of the site neutral payment rate case HCO payment budget neutrality adjustment under our finalized policy. This is because, as discussed in the proposed rule (81 FR 25288), based on our actuarial assumptions we project that our proposal to use the IPPS fixed-loss threshold for the site neutral payment rate cases would result in HCO payments for those cases that are similar in proportion as is seen in IPPS cases assigned to the same MS–DRG; that is, 5.1 percent. In other words, we estimated that HCO payments for site neutral payment rate cases would be 5.1 percent of the site neutral payment rate payments. Under the statutory transition period, payments to site neutral payment rate cases in FY 2017 will be paid under the blended transitional rate. As such, we stated that estimated HCO payments for site neutral payment rate cases in the FY 2017 policy will be projected to be 5.1 percent of the portion of the blended rate payment that is based on the estimated site neutral payment rate payment amount (and will not include the LTCH PPS standard Federal payment rate payment amount as specified in § 412.522(c)(2)(i)). To ensure that estimated HCO payments payable to site neutral payment rate cases in FY 2017 will not result any increase in estimated aggregate FY 2017 LTCH PPS payments, under the budget neutrality requirement at § 412.522(c)(2)(i), we explained it is necessary to reduce the site neutral payment rate portion of the blended rate payment by 5.1 percent to account for the estimated additional HCO payments payable to those cases in FY 2017. In order to achieve this, for FY 2017, we proposed to continue to apply a budget neutrality factor of 0.949 (that is, the decimal equivalent of a 5.1 percent reduction, determined as 1.0 − 5.1/100 =

0.949) to the site neutral payment rate portion of the blended rate payment (81 FR 25289). As stated previously, this adjustment is necessary so that the estimated HCO payments payable for site neutral payment rate cases do not result in any increase in aggregate LTCH PPS payments.

Comment: As was the case in the FY 2016 rulemaking cycle, commenters again objected to the proposed application of a high-cost outlier (HCO) budget neutrality adjustment to site neutral payment rate cases, stating that it results in savings to the Medicare program instead of being budget neutral. The commenters' primary objection was again based on their belief that, because the IPPS base rates used in the IPPS comparable per diem amount calculation of the site neutral payment rate include a budget neutrality adjustment for IPPS HCO payments (that is, a 5.1 percent adjustment on the operating IPPS standardized amount), an ''additional'' budget neutrality factor is not necessary and is, in fact, duplicative. Some of these commenters stated that, in addition to not applying a HCO budget neutrality adjustment to site neutral payment rate payments, its application in FY 2016 should be discontinued, and that a retroactive adjustment to the FY 2016 site neutral payment rate payments that have already occurred should be made to address this perceived error. In addition, some commenters also indicated that the HCO budget neutrality payment adjustment is inappropriate because it increases the payment difference between the IPPS payment amount for a case and the ''LTCH PPS payment amount'' (which we took to mean cases paid the IPPS comparable per diem amount under the site neutral payment rate) for similar cases. Other commenters stated that there is no statutory requirement for budget neutrality for HCO payments, and that any HCO budget neutrality adjustment for site neutral payment rate cases is therefore unwarranted. These commenters stated that there was nothing in their review of the rulemaking record that they read to mean that CMS would apply a HCO budget neutrality adjustment on an ongoing basis, and that they believed that a budget neutrality adjustment was only required for the first year of the LTCH PPS. A few other commenters stated that if CMS finalizes its proposal to apply a HCO budget neutrality adjustment for site neutral payment rate cases, then that budget neutrality adjustment should not be applied to site neutral payment rate cases that are paid at 100 percent of the estimated cost because they believed that doing so would violate the statute, which they understood to require payment at ''100 percent of the estimated cost for the services involved,'' without adjustment.

Response: We continue to disagree with the commenters who assert that a HCO budget neutrality adjustment for site neutral payment rate cases is inappropriate, unnecessary, or duplicative. We have made a budget neutrality adjustment for estimated HCO payments under the LTCH PPS under § 412.525 every year since its inception in FY 2003. Specifically, at § 412.523(d)(1), under the broad authority provided by section 123 of Public Law 106–113 and section 307 of Public Law 106–554, which includes the authority to establish adjustments, we established that the standard Federal rate (now termed the LTCH PPS standard Federal payment rate under the new dual rate system) would be adjusted by a reduction factor of 8 percent, the estimated proportion of outlier payments under the LTCH PPS (67 FR 56052). Thus, Congress was well aware of how we had implemented our HCO policy under the LTCH PPS under § 412.525 at the time of the enactment of section 1206 of Public Law 113–67.

Section 1206 of Public Law 113–67 defined the site neutral payment rate as the lower of the estimated cost of the case or the IPPS comparable per diem amount determined under paragraph (d)(4) of § 412.529, including any applicable outlier payments under § 412.525. The term ''IPPS comparable per diem amount'' was not new at the time of enactment. That term had already previously been defined under § 412.529(d)(4), which has been in effect since July 1, 2006, and used as a component of the payment adjustment formula for LTCH PPS SSO cases. From the July 1, 2006 inception of the IPPS comparable component of the LTCH PPS' SSO payment formula, we have budget neutralized the estimated HCO payments that we expected to pay to SSO cases including those paid based on the IPPS comparable per diem amount. Congress was also well aware of how we had implemented our ''IPPS comparable per diem amount'' concept in the SSO context at the time of the enactment of section 1206 of Public Law 113–67. As such, we believe Congress left us with the discretion to continue to treat the ''IPPS comparable per diem amount'' in the site neutral payment rate context as we have historically done with respect to LTCH PPS HCO payments made to discharges paid using the ''IPPS comparable per diem amount,'' that is, to adopt a policy in the site neutral context to budget neutralize HCO payments made to LTCH PPS discharges including those paid using the ''IPPS comparable per diem amount.''

In response to the commenters who believe that budget neutrality was only required in the first year of the LTCH PPS, we suspect that they are referencing the budget neutrality adjustment that was made to the LTCH PPS relative to the reasonable cost-based TEFRA payment system that preceded it. That initial budget neutrality adjustment is unrelated to our ongoing authority to make annual HCO budget neutrality adjustments for payments under the LTCH PPS, adjustments we adopted through prior notice-and-comment rulemaking using the broad authority provided by section 123 of Public Law 106–113 and section 307 of Public Law 106–554.

In response to commenters who stated that there is no statutory requirement to apply a budget neutrality adjustment for HCO payments, as discussed previously, the authorizing statutes grant the Secretary broad authority to determine appropriate adjustments under the LTCH PPS, and that although the statute did not ''require'' that a HCO policy be implemented in a budget neutral manner, we adopted such an approach through notice-and comment rulemaking when we initially implemented the LTCH PPS. As such, we have made a budget neutrality adjustment for estimated HCO payments under the LTCH PPS every year since its inception in FY 2003 under § 412.523(d)(1), where we established that the standard Federal rate is adjusted by a reduction factor of 8 percent, the estimated proportion of outlier payments under the LTCH PPS (67 FR 56052).

In response to commenters who indicated that the adjustment is inappropriate because it increases the payment difference between the IPPS comparable payment amount for a case and the LTCH PPS payment amount (that is, the site neutral payment rate) for similar cases, we note that the statutory requirement to take into account the estimated cost of the case if lower already creates a differential. In addition, the statute also specifies that the IPPS comparable amount is calculated as a per diem capped at the full amount as set forth under § 412.529(d)(4), which also creates a differential. Thus, the statute does not require or allow exact payment neutrality.

Finally, we disagree with the comment that applying the HCO budget neutrality adjustment to site neutral

payment rate payments that are paid at 100 percent of the estimated cost violates the statute. As noted above, CMS regularly uses its broad authorities under the authorizing statutes for the LTCH PPS to apply additional adjustments, where appropriate, to base payment amounts. For this reason, we are not adopting the commenter's request, and for FY 2017 we will apply a HCO budget neutrality adjustment factor to all site neutral payment rate cases (or the site neutral payment rate portion of the blended payment rate for all such cases), as proposed.

In summary, we continue to disagree with commenters that a HCO budget neutrality adjustment for site neutral payment rate cases is inappropriate, unnecessary or duplicative. As such, we will continue to use the IPPS comparable per diem amount (calculated in accordance with our historical practices, which predates enactment of section 1206 of Pub. L. 113–67), and we will continue to apply a HCO budget neutrality adjustment to all site neutral payment rate payments (or portion thereof in the blended payment rate context). For these reasons, we are not adopting the commenter's recommendation to discontinue the application of the HCO budget neutrality adjustment for site neutral payment rate cases in FY 2016, or their suggestion that we make a retroactive adjustment to the FY 2016 site neutral payment rate case payments that have already occurred.

Comment: One commenter noted that the HCO payment amount itself is being reduced under our proposed application of a budget neutrality factor to the site neutral payment rate portion of the blended payment rate, which is inconsistent with high-cost outlier payments for other LTCH PPS and IPPS cases, and requested that we treat all cases in the same manner.

Response: On review, we agree that our proposed application would be inconsistent with our budget neutrality treatment of HCO payments for other LTCH PPS and IPPS cases, and we agree with the commenter that we should remove this variance. As such, we are adopting a policy of not applying the 0.949 budget neutrality adjustment factor to any applicable HCO payment for the site neutral payment rate (or, during the transition, the site neutral payment rate portion of the blended payment rate).

After consideration of the public comments we received, we are finalizing our proposal to apply a budget neutrality adjustment for HCO payments made to site neutral payment rate cases, with one modification. That is, we will not apply the HCO budget neutrality adjustment to the HCO portion of the payment amount. To ensure that estimated HCO payments payable to site neutral payment rate cases in FY 2017 will not result any increase in estimated aggregate FY 2017 LTCH PPS payments, under the budget neutrality requirement at § 412.522(c)(2)(i), it is necessary to reduce the site neutral payment rate (or portion thereof in the blended payment rate context) by 5.1 percent to account for the estimated additional HCO payments payable to those cases in FY 2017. To effectuate this policy, for FY 2017, in this final rule we have adopted a budget neutrality policy under which we will apply a budget neutrality factor of 0.949 (that is, the decimal equivalent of a 5.1 percent reduction, determined as $1.0 - 5.1/100 = 0.949$) to the site neutral payment rate (or portion thereof in the blended payment rate context). This policy will be applied to cases paid at the IPPS comparable per diem amount and cases paid at 100 percent of the estimated cost.

E. Update to the IPPS Comparable/Equivalent Amounts to Reflect the Statutory Changes to the IPPS DSH Payment Adjustment Methodology

In the FY 2014 IPPS/LTCH PPS final rule (78 FR 50766), we established a policy for reflecting the changes to the Medicare IPPS DSH payment adjustment methodology provided for by section 3133 of the Affordable Care Act in the calculation of the ''IPPS comparable amount'' under the SSO policy at § 412.529 and the ''IPPS equivalent amount'' under the 25-percent threshold payment adjustment policy at § 412.534 and § 412.536. Historically, the determination of both the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' includes an amount for inpatient operating costs ''for the costs of serving a disproportionate share of low-income patients.'' Under the statutory changes to the Medicare DSH payment adjustment methodology that began in FY 2014, in general, eligible IPPS hospitals receive an empirically justified Medicare DSH payment equal to 25 percent of the amount they otherwise would have received under the statutory formula for Medicare DSH payments prior to the amendments made by the Affordable Care Act. The remaining amount, equal to an estimate of 75 percent of the amount that otherwise would have been paid as Medicare DSH payments, reduced to reflect changes in the percentage of individuals under the age of 65 who are uninsured, is made available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. The additional uncompensated care payments are based on the hospital's amount of uncompensated care for a given time period relative to the total amount of uncompensated care for that same time period reported by all IPPS hospitals that receive Medicare DSH payments.

To reflect the statutory changes to the Medicare DSH payment adjustment methodology in the calculation of the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' under the LTCH PPS, we stated that we will include a reduced Medicare DSH payment amount that reflects the projected percentage of the payment amount calculated based on the statutory Medicare DSH payment formula prior to the amendments made by the Affordable Care Act that will be paid to eligible IPPS hospitals as empirically justified Medicare DSH payments and uncompensated care payments in that year (that is, a percentage of the operating DSH payment amount that has historically been reflected in the LTCH PPS payments that is based on IPPS rates). We also stated that the projected percentage will be updated annually, consistent with the annual determination of the amount of uncompensated care payments that will be made to eligible IPPS hospitals. We believe that this approach results in appropriate payments under the LTCH PPS and is consistent with our intention that the ''IPPS comparable amount'' and the ''IPPS equivalent amount'' under the LTCH PPS closely resemble what an IPPS payment would have been for the same episode of care, while recognizing that some features of the IPPS cannot be translated directly into the LTCH PPS (79 FR 50766 through 50767).

For FY 2017, as discussed in greater detail in section IV.D.3.d.(2) of the preamble of this final rule, based on the most recent data available, our estimate of 75 percent of the amount that would otherwise have been paid as Medicare DSH payments (under the methodology outlined in section 1886(r)(2) of the Act) is adjusted to 55.36 percent of that amount to reflect the change in the percentage of individuals who are uninsured. The resulting amount was then used to determine the amount of uncompensated care payments that will be made to eligible IPPS hospitals in FY 2017. In other words, Medicare DSH payments prior to the amendments made by the Affordable Care Act will be adjusted to 41.52 percent (the product of 75 percent and 55.36 percent) and the

resulting amount will be used to calculate the uncompensated care payments to eligible hospitals. As a result, for FY 2017, we project that the reduction in the amount of Medicare DSH payments pursuant to section 1886(r)(1) of the Act, along with the payments for uncompensated care under section 1886(r)(2) of the Act, will result in overall Medicare DSH payments of 66.52 percent of the amount of Medicare DSH payments that would otherwise have been made in the absence of amendments made by the Affordable Care Act (that is, 25 percent + 41.52 percent = 66.52 percent).

In this final rule, for FY 2017, as we proposed, we are establishing that the calculation of the ''IPPS comparable amount'' under § 412.529 and the ''IPPS equivalent amount'' under new § 412.538 will include an applicable operating Medicare DSH payment amount that is equal to 66.52 percent of the operating Medicare DSH payment amount that would have been paid based on the statutory Medicare DSH payment formula but for the amendments made by the Affordable Care Act. Furthermore, consistent with our historical practice, as we proposed, we used more recent data, to determine this factor in this final rule.

F. Computing the Adjusted LTCH PPS Federal Prospective Payments for FY 2017

Section 412.525 sets forth the adjustments to the LTCH PPS standard Federal payment rate. Under the dual rate LTCH PPS payment structure, only LTCH PPS cases that meet the statutory criteria to be excluded from the site neutral payment rate are paid based on the LTCH PPS standard Federal payment rate. Under § 412.525(c), the LTCH PPS standard Federal payment rate is adjusted to account for differences in area wages by multiplying the labor-related share of the LTCH PPS standard Federal payment for a case by the applicable LTCH PPS wage index (the FY 2017 values are shown in Tables 12A through 12B listed in section VI. of the Addendum of this final rule and are available via the Internet on the CMS Web site). The LTCH PPS standard Federal payment is also adjusted to account for the higher costs of LTCHs located in Alaska and Hawaii by the applicable COLA factors (the FY 2017 factors are shown in the chart in section V.D. of this Addendum) in accordance with § 412.525(b). In this final rule, as we proposed, we are establishing an LTCH PPS standard Federal payment rate for FY 2017 of $42,476.41, as discussed in section V.A.2. of the Addendum to this final rule. We illustrate the methodology to adjust the LTCH PPS standard Federal payment rate for FY 2017 in the following example:

Example

During FY 2017, a Medicare discharge that meets the criteria to be excluded from the site neutral payment rate, that is an LTCH PPS standard Federal payment rate case, is from an LTCH that is located in Chicago, Illinois (CBSA 16974). The FY 2017 LTCH PPS wage index value for CBSA 16974 is 1.0460 (obtained from Table 12A listed in section VI. of the Addendum of this final rule and available via the Internet on the CMS Web site). The Medicare patient case is classified into MS–LTC–DRG 189 (Pulmonary Edema & Respiratory Failure), which has a relative weight for FY 2017 of 0.9012 (obtained from Table 11 listed in section VI. of the Addendum of this final rule and available via the Internet on the CMS Web site). The LTCH submitted quality reporting data for FY 2017 in accordance with the LTCHQRP under section 1886(m)(5) of the Act.

To calculate the LTCH's total adjusted Federal prospective payment for this Medicare patient case in FY 2017, we computed the wage-adjusted Federal prospective payment amount by multiplying the unadjusted FY 2017 LTCH PPS standard Federal payment rate ($42,476.41) by the labor-related share (66.5 percent) and the wage index value (1.0460). This wage-adjusted amount was then added to the nonlabor-related portion of the unadjusted LTCH PPS standard Federal payment rate (33.5 percent; adjusted for cost of living, if applicable) to determine the adjusted LTCH PPS standard Federal payment rate, which was then multiplied by the MS–LTC–DRG relative weight (0.9012) to calculate the total adjusted LTCH PPS standard Federal prospective payment for FY 2017 ($39,450.71). The table below illustrates the components of the calculations in this example.

LTCH PPS Standard Federal Prospective Payment Rate	$42,476.41
Labor-Related Share	× 0.665
Labor-Related Portion of the LTCH PPS Standard Federal Payment Rate	= $28,246.81
Wage Index (CBSA 16974)	× 1.0460
Wage-Adjusted Labor Share of LTCH PPS Standard Federal Payment Rate	= $29,546.16
Nonlabor-Related Portion of the LTCH PPS Standard Federal Payment Rate ($42,476.41x 0.335)	+ $14,229.60
Adjusted LTCH PPS Standard Federal Payment Amount	= $43,775.76
MS–LTC–DRG 189 Relative Weight	× 0.9012
Total Adjusted LTCH PPS Standard Federal Prospective Payment	= $39,450.71

VI. Tables Referenced in This Final Rule and Available Only Through the Internet on the CMS Web Site

This section lists the tables referred to throughout the preamble of this final rule and in this Addendum. In the past, a majority of these tables were published in the **Federal Register** as part of the annual proposed and final rules. However, similar to FYs 2012 through 2016, for the FY 2017 rulemaking cycle, the IPPS and LTCH tables will not be published in the **Federal Register** in the annual IPPS/LTCH PPS proposed and final rules and will be available only through the Internet. Specifically, all IPPS tables listed below, with the exception of IPPS Tables 1A, 1B, 1C, and 1D, and LTCH PPS Table 1E will be available only through the Internet. IPPS Tables 1A, 1B, 1C, and 1D, and LTCH PPS Table 1E are displayed at the end of this section and will continue to be published in the **Federal Register** as part of the annual proposed and final rules.

As discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49807), we streamlined and consolidated the wage index tables for FY 2016 and subsequent fiscal years.

As discussed in sections II.F.14., II.F.15.b., II.F.16., II.F.17.a., and II.F.19.a.1., a.3., and c.1. of the preamble of this final rule, we developed the following ICD–10–CM and ICD–10–PCS code tables for FY 2017: Table 6A—New Diagnosis Codes; Table 6B—New Procedure Codes; Table 6C—Invalid Diagnosis Codes; Table 6D—Invalid Procedure Codes; Table 6E—Revised Diagnosis Code Titles; Table 6F—Revised Procedure Code Titles; Table 6G.1—Secondary Diagnosis Order

Additions to the CC Exclusion List; Table 6G.2—Principal Diagnosis Order Additions to the CC Exclusion List; Table 6H.1—Secondary Diagnosis Order Deletions to the CC Exclusion List; Table 6H.2—Principal Diagnosis Order Deletions to the CC Exclusion List; Table 6I—Complete MCC List; Table 6I.1—Additions to the MCC List; Table 6I.2—Deletions to the MCC List; Table 6J.—Complete CC List; Table 6J.1—Additions to the CC List; Table 6J.2—Deletions to the CC List; Table 6K.—Complete List of CC Exclusions; Table 6L—Principal Diagnosis Is Its Own MCC List; Table 6M—Principal Diagnosis Is Its Own CC List; Table 6M.1—Additions to the Principal Diagnosis Is Its Own CC List; and Table 6P.—ICD–10–CM and ICD–10–PCS Codes for MCE and MS–DRG Changes. Table 6P contains multiple tables, 6P.1a through 6P.4k, that include the ICD–10–CM and ICD–10–PCS code lists and translations relating to specific MCE and MS–DRG changes. In addition, under the HAC Reduction Program established by section 3008 of the Affordable Care Act, a hospital's total payment may be reduced by 1 percent if it is in the lowest HAC performance quartile. However, as discussed in section IV.I. of the preamble of this final rule, we are not providing the hospital-level data as a table associated with this final rule. The hospital-level data for the FY 2017 HAC Reduction Program will be made publicly available once it has undergone the review and corrections process.

Finally, a hospital's Factor 3 is the proportion of the aggregate amount available for uncompensated care payments that a DSH eligible hospital will receive under section 3133 of the Affordable Care Act. For FY 2017, Factor 3 is the hospital's estimated number of Medicaid days and Medicare SSI days (or for a Puerto Rico hospital, a proxy for its Medicare SSI days) relative to the estimate of all DSH hospitals' Medicaid days and Medicare SSI days (or for Puerto Rico hospitals that are estimated to be eligible for DSH payments, a proxy for their Medicare SSI days). Table 18 associated with this final rule contains the FY 2017 uncompensated care payment Factor 3 for all hospitals and identifies whether or not a hospital is projected to receive DSH and, therefore, eligible to receive the additional payment for uncompensated care for FY 2017.

Readers who experience any problems accessing any of the tables that are posted on the CMS Web sites identified below should contact Michael Treitel at (410) 786–4552.

The following IPPS tables for this FY 2017 final rule are available only through the Internet on the CMS Web site at: *http://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html.* Click on the link on the left side of the screen titled, ''FY 2017 IPPS Final Rule Home Page'' or ''Acute Inpatient—Files for Download''.

Standardized amount	Rates if wage index is greater than 1		Rates if wage index is less than or equal to 1	
	Labor	Nonlabor	Labor	Nonlabor
National [1]	Not Applicable	Not Applicable	$3,420.31	$2,096.32

[1] For FY 2017, there are no CBSAs in Puerto Rico with a national wage index greater than 1.

TABLE 1D— CAPITAL STANDARD FEDERAL PAYMENT RATE—FY 2017

	Rate
National	$446.81

TABLE 1E—LTCH PPS STANDARD FEDERAL PAYMENT RATE—FY 2017

	Full Update (1.75 percent)	Reduced Update * (−0.25 percent)
Standard Federal Rate	$42,476.41	$41,641.49

* For LTCHs that fail to submit quality reporting data for FY 2017 in accordance with the LTCH Quality Reporting Program (LTCH QRP), the annual update is reduced by 2.0 percentage points as required by section 1886(m)(5) of the Act.

Appendix A: Economic Analyses

I. Regulatory Impact Analysis

A. Introduction

We have examined the impacts of this final rule as required by Executive Order 12866 on Regulatory Planning and Review (September 30, 1993), Executive Order 13563 on Improving Regulation and Regulatory Review (February 2, 2011), the Regulatory Flexibility Act (RFA) (September 19, 1980, Pub. L. 96–354), section 1102(b) of the Social Security Act, section 202 of the Unfunded Mandates Reform Act of 1995 (March 22, 1995, Pub. L. 104–4), Executive Order 13132 on Federalism (August 4, 1999), and the Congressional Review Act (5 U.S.C. 804(2)).

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. A regulatory impact analysis (RIA) must be prepared for major rules with economically significant effects ($100 million or more in any 1 year).

We have determined that this final rule is a major rule as defined in 5 U.S.C. 804(2). We estimate that the final changes for FY 2017 acute care hospital operating and capital payments will redistribute amounts in excess of $100 million to acute care hospitals. The applicable percentage increase to the IPPS rates required by the statute, in conjunction with other payment changes in this final rule, will result in an estimated $987 million increase in FY 2017 operating payments (or 0.9 percent change) and an estimated $66 million increase in FY 2017 capital payments (or 0.8 percent change). These changes are relative to payments made in FY 2016. The impact analysis of the capital payments can be found in section I.I. of this Appendix. In addition, as described in section I.J. of this Appendix, LTCHs are expected to experience

a decrease in payments by $363 million in FY 2017 relative to FY 2016.

Our operating impact estimate includes the −1.5 percent documentation and coding adjustment applied to the IPPS standardized amount, as discussed in section II.D. of the preamble of this final rule, which represents part of the recoupment required under section 631 of the ATRA. In addition, our operating payment impact estimate includes the 1.65 percent hospital update to the standardized amount (which includes the estimated 2.7 percent market basket update less 0.3 percentage point for the multifactor productivity adjustment and less 0.75 percentage point required under the Affordable Care Act). Our operating payment impact estimate also includes an adjustment of (1/0.998) to permanently remove the −0.2 percent reduction and a 1.006 temporary adjustment to address the effects of the 0.2 percent reduction in effect for FYs 2014 through 2016 as a result of the 2-midnight policy (we refer readers to section IV.P. of the preamble of this final rule for an explanation of these adjustments). The estimates of IPPS operating payments to acute care hospitals do not reflect any changes in hospital admissions or real case-mix intensity, which will also affect overall payment changes.

The analysis in this Appendix, in conjunction with the remainder of this document, demonstrates that this final rule is consistent with the regulatory philosophy and principles identified in Executive Orders 12866 and 13563, the RFA, and section 1102(b) of the Act. This final rule will affect payments to a substantial number of small rural hospitals, as well as other classes of hospitals, and the effects on some hospitals may be significant. Finally, in accordance with the provisions of Executive Order 12866, the Executive Office of Management and Budget has reviewed this final rule.

B. Statement of Need

This final rule is necessary in order to make payment and policy changes under the Medicare IPPS for Medicare acute care hospital inpatient services for operating and capital-related costs as well as for certain hospitals and hospital units excluded from the IPPS. This final rule also is necessary to make payment and policy changes for Medicare hospitals under the LTCH PPS.

C. Objectives of the IPPS

The primary objective of the IPPS is to create incentives for hospitals to operate efficiently and minimize unnecessary costs while at the same time ensuring that payments are sufficient to adequately compensate hospitals for their legitimate costs in delivering necessary care to Medicare beneficiaries. In addition, we share national goals of preserving the Medicare Hospital Insurance Trust Fund.

We believe that the changes in this final rule will further each of these goals while maintaining the financial viability of the hospital industry and ensuring access to high quality health care for Medicare beneficiaries. We expect that these changes will ensure that the outcomes of the prospective payment systems are reasonable and equitable while avoiding or minimizing unintended adverse consequences.

D. Limitations of Our Analysis

The following quantitative analysis presents the projected effects of our policy changes, as well as statutory changes effective for FY 2017, on various hospital groups. We estimate the effects of individual policy changes by estimating payments per case while holding all other payment policies constant. We use the best data available, but, generally, we do not attempt to make adjustments for future changes in such variables as admissions, lengths of stay, or case-mix.

E. Hospitals Included in and Excluded From the IPPS

The prospective payment systems for hospital inpatient operating and capital-related costs of acute care hospitals encompass most general short-term, acute care hospitals that participate in the Medicare program. There were 32 Indian Health Service hospitals in our database, which we excluded from the analysis due to the special characteristics of the prospective payment methodology for these hospitals. Among other short-term, acute care hospitals, hospitals in Maryland are paid in accordance with the Maryland All-Payer Model, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, 5 short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) receive payment for inpatient hospital services they furnish on the basis of reasonable costs, subject to a rate-of-increase ceiling.

As of July 2016, there were 3,330 IPPS acute care hospitals included in our analysis. This represents approximately 55 percent of all Medicare-participating hospitals. The majority of this impact analysis focuses on this set of hospitals. There also are approximately 1,336 CAHs. These small, limited service hospitals are paid on the basis of reasonable costs rather than under the IPPS. IPPS-excluded hospitals and units, which are paid under separate payment systems, include IPFs, IRFs, LTCHs, RNHCIs, children's hospitals, 11 cancer hospitals, and 5 short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. Changes in the prospective payment systems for IPFs and IRFs are made through separate rulemaking. Payment impacts of changes to the prospective payment systems for these IPPS-excluded hospitals and units are not included in this final rule. The impact of the update and policy changes to the LTCH PPS for FY 2017 is discussed in section I.J. of this Appendix.

F. Effects on Hospitals and Hospital Units Excluded From the IPPS

As of July 2016, there were 98 children's hospitals, 11 cancer hospitals, 5 short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands and American Samoa, and 18 RNHCIs being paid on a reasonable cost basis subject to the rate-of-increase ceiling under § 413.40. (In accordance with § 403.752(a) of the regulation, RNHCIs are paid under § 413.40.) Among the remaining providers, 263 rehabilitation hospitals and 870 rehabilitation units, and approximately 430 LTCHs, are paid the Federal prospective per discharge rate under the IRF PPS and the LTCH PPS, respectively, and 513 psychiatric hospitals and 1,113 psychiatric units are paid the Federal per diem amount under the IPF PPS. As stated previously, IRFs and IPFs are not affected by the rate updates discussed in this final rule. The impacts of the changes on LTCHs are discussed in section I.J. of this Appendix.

For children's hospitals, the 11 cancer hospitals, the 5 short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, and RNHCIs, the update of the rate-of-increase limit (or target amount) is the estimated FY 2017 percentage increase in the IPPS operating market basket, consistent with section 1886(b)(3)(B)(ii) of the Act, and §§ 403.752(a) and 413.40 of the regulations. As discussed in section IV. of the preamble of the FY 2014 IPPS/LTCH PPS final rule, we rebased the IPPS operating market basket to a FY 2010 base year. Therefore, we are using the percentage increase in the FY 2010-based IPPS operating market basket to update the target amounts for FY 2017 and subsequent fiscal years for children's hospitals, the 11 cancer hospitals, the 5 short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, and RNHCIs that are paid based on reasonable costs subject to the rate-of-increase limits. Consistent with current law, based on IHS Global Insight, Inc.'s second quarter 2016 forecast of the FY 2010-based IPPS market basket increase, we are estimating the FY 2017 update to be 2.7 percent (that is, the current estimate of the market basket rate-of-increase). However, the Affordable Care Act requires an adjustment for multifactor productivity (currently estimated to be 0.3 percentage point for FY 2017) and a 0.75 percentage point reduction to the market basket update, resulting in a 1.65 percent applicable percentage increase for IPPS hospitals that submit quality data and are meaningful EHR users, as discussed in section IV.B. of the preamble of this final rule. Children's hospitals, the 11 cancer hospitals, the 5 short-term acute care hospitals located in the Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa, and RNHCIs that continue to be paid based on reasonable costs subject to rate-of-increase limits under § 413.40 of the regulations are not subject to the reductions in the applicable percentage increase required under the Affordable Care Act. Therefore, for those hospitals paid under § 413.40 of the regulations, the update is the percentage increase in the FY 2010-based IPPS operating market basket for FY 2017, estimated at 2.7 percent, without the reductions described previously under the Affordable Care Act.

The impact of the update in the rate-of-increase limit on those excluded hospitals depends on the cumulative cost increases experienced by each excluded hospital since its applicable base period. For excluded hospitals that have maintained their cost increases at a level below the rate-of-increase limits since their base period, the major effect

is on the level of incentive payments these excluded hospitals receive. Conversely, for excluded hospitals with cost increases above the cumulative update in their rate-of-increase limits, the major effect is the amount of excess costs that would not be paid.

We note that, under § 413.40(d)(3), an excluded hospital that continues to be paid under the TEFRA system and whose costs exceed 110 percent of its rate-of-increase limit receives its rate-of-increase limit plus the lesser of: (1) 50 percent of its reasonable costs in excess of 110 percent of the limit; or (2) 10 percent of its limit. In addition, under the various provisions set forth in § 413.40, hospitals can obtain payment adjustments for justifiable increases in operating costs that exceed the limit.

G. Quantitative Effects of the Policy Changes Under the IPPS for Operating Costs

1. Basis and Methodology of Estimates

In this final rule, we are announcing final policy changes and final payment rate updates for the IPPS for FY 2017 for operating costs of acute care hospitals. The FY 2017 updates to the capital payments to acute care hospitals are discussed in section I.I. of this Appendix.

Based on the overall percentage change in payments per case estimated using our payment simulation model, we estimate that total FY 2017 operating payments will increase by 0.9 percent compared to FY 2016. In addition to the applicable percentage increase, this amount reflects the FY 2017 recoupment adjustment for documentation and coding described in section II.D. of the preamble of this final rule of -1.5 percent to the IPPS national standardized amounts. This amount also reflects the adjustment of (1/0.998) to permanently remove the 0.2 percent reduction and the 1.006 temporary adjustment to address the effects of the 0.2 percent reduction in effect for FYs 2014 through 2016 related to the 2-midnight policy, which are discussed in section IV.P. of the preamble of this final rule. The impacts do not reflect changes in the number of hospital admissions or real case-mix intensity, which will also affect overall payment changes.

We have prepared separate impact analyses of the changes to each system. This section deals with the changes to the operating inpatient prospective payment system for acute care hospitals. Our payment simulation model relies on the most recent available data to enable us to estimate the impacts on payments per case of certain changes in this final rule. However, there are other changes for which we do not have data available that will allow us to estimate the payment impacts using this model. For those changes, we have attempted to predict the payment impacts based upon our experience and other more limited data.

The data used in developing the quantitative analyses of changes in payments per case presented in this section are taken from the FY 2015 MedPAR file and the most current Provider-Specific File (PSF) that is used for payment purposes. Although the analyses of the changes to the operating PPS do not incorporate cost data, data from the most recently available hospital cost reports were used to categorize hospitals. Our analysis has several qualifications. First, in this analysis, we do not make adjustments for future changes in such variables as admissions, lengths of stay, or underlying growth in real case-mix. Second, due to the interdependent nature of the IPPS payment components, it is very difficult to precisely quantify the impact associated with each change. Third, we use various data sources to categorize hospitals in the tables. In some cases, particularly the number of beds, there is a fair degree of variation in the data from the different sources. We have attempted to construct these variables with the best available source overall. However, for individual hospitals, some miscategorizations are possible.

Using cases from the FY 2015 MedPAR file, we simulate payments under the operating IPPS given various combinations of payment parameters. As described previously, Indian Health Service hospitals and hospitals in Maryland were excluded from the simulations. The impact of payments under the capital IPPS, or the impact of payments for costs other than inpatient operating costs, are not analyzed in this section. Estimated payment impacts of the capital IPPS for FY 2017 are discussed in section I.I. of this Appendix.

We discuss the following changes:

- The effects of the application of the documentation and coding adjustment and the applicable percentage increase (including the market basket update, the multifactor productivity adjustment, and the applicable percentage reduction in accordance with the Affordable Care Act) to the standardized amount and hospital-specific rates.
- The effects of the adjustment of (1/0.998) to permanently remove the 0.2 percent reduction and the 1.006 temporary adjustment to address the effects of the 0.2 percent reduction in effect for FYs 2014 through 2016 related to the 2-midnight policy, as discussed in section IV.P. of the preamble of this final rule.
- The effects of the changes to the relative weights and MS–DRG GROUPER.
- The effects of the changes in hospitals' wage index values reflecting updated wage data from hospitals' cost reporting periods beginning during FY 2013, compared to the FY 2012 wage data, to calculate the FY 2017 wage index.
- The effects of the geographic reclassifications by the MGCRB (as of publication of this final rule) that will be effective for FY 2017.
- The effects of the rural floor and imputed floor with the application of the national budget neutrality factor to the wage index.
- The effects of the last year of the 3-year transition for hospitals that were located in an urban county that became rural under the new OMB delineations or hospitals that were deemed urban where the urban area became rural under the new OMB delineations.
- The effects of the frontier State wage index adjustment under the statutory provision that requires that hospitals located in States that qualify as frontier States to not have a wage index less than 1.0. This provision is not budget neutral.
- The effects of the implementation of section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, which provides for an increase in a hospital's wage index if a threshold percentage of residents of the county where the hospital is located commute to work at hospitals in counties with higher wage indexes. This provision is not budget neutral.
- The total estimated change in payments based on the FY 2017 policies relative to payments based on FY 2016 policies that include the applicable percentage increase of 1.65 percent (or 2.7 percent market basket update with a reduction of 0.3 percentage point for the multifactor productivity adjustment, and a 0.75 percentage point reduction, as required under the Affordable Care Act).

To illustrate the impact of the FY 2017 changes, our analysis begins with a FY 2016 baseline simulation model using: The FY 2016 applicable percentage increase of 1.7 percent and the documentation and coding recoupment adjustment of −0.8 percent to the Federal standardized amount; the FY 2016 MS–DRG GROUPER (Version 33); the FY 2016 CBSA designations for hospitals based on the new OMB definitions; the FY 2016 wage index; and no MGCRB reclassifications. Outlier payments are set at 5.1 percent of total operating MS–DRG and outlier payments for modeling purposes.

Section 1886(b)(3)(B)(viii) of the Act, as added by section 5001(a) of Public Law 109–171, as amended by section 4102(b)(1)(A) of the ARRA (Pub. L. 111–5) and by section 3401(a)(2) of the Affordable Care Act (Pub. L. 111–148), provides that, for FY 2007 and each subsequent year through FY 2014, the update factor will include a reduction of 2.0 percentage points for any subsection (d) hospital that does not submit data on measures in a form and manner and at a time specified by the Secretary. Beginning in FY 2015, the reduction is one-quarter of such applicable percentage increase determined without regard to section 1886(b)(3)(B)(ix), (xi), or (xii) of the Act, or one-quarter of the market basket update. Therefore, for FY 2017, we are establishing that hospitals that do not submit quality information under rules established by the Secretary and that are meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act will receive an applicable percentage increase of 0.975 percent. At the time that this impact was prepared, 86 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2017 because they failed the quality data submission process or did not choose to participate but are meaningful EHR users. For purposes of the simulations shown later in this section, we modeled the payment changes for FY 2017 using a reduced update for these hospitals.

For FY 2017, in accordance with section 1886(b)(3)(B)(ix) of the Act, a hospital that has been identified as not a meaningful EHR user will be subject to a reduction of three-quarters of such applicable percentage increase determined without regard to section 1886(b)(3)(B)(ix), (xi), or (xii) of the Act. Therefore, for FY 2017, we are establishing that hospitals that are identified as not meaningful EHR users and do submit quality information under section 1886(b)(3)(B)(viii) of the Act will receive an

applicable percentage increase of −0.375 percent. At the time that this impact analysis was prepared, 154 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2017 because they are identified as not meaningful EHR users that do submit quality information undersection 1886(b)(3)(B)(viii) of the Act. For purposes of the simulations shown in this section, we modeled the payment changes for FY 2017 using a reduced update for these 154 hospitals.

Hospitals that are identified as not meaningful EHR users under section 1886(b)(3)(B)(ix) of the Act and also do not submit quality data under section 1886(b)(3)(B)(viii) of the Act will receive an applicable percentage increase of −1.05 percent, which reflects a one-quarter reduction of the market basket update for failure to submit quality data and a three-quarter reduction of the market basket update for being identified as not a meaningful EHR user. At the time that this impact was prepared, 31 hospitals are estimated to not receive the full market basket rate-of-increase for FY 2017 because they are identified as not meaningful EHR users that do not submit quality data under section 1886(b)(3)(B)(viii) of the Act.

Each policy change, statutory or otherwise, is then added incrementally to this baseline, finally arriving at an FY 2017 model incorporating all of the changes. This simulation allows us to isolate the effects of each change.

Our final comparison illustrates the percent change in payments per case from FY 2016 to FY 2017. Two factors not discussed separately have significant impacts here. The first factor is the update to the standardized amount. In accordance with section 1886(b)(3)(B)(i) of the Act, we are updating the standardized amounts for FY 2017 using an applicable percentage increase of 1.65 percent. This includes our forecasted IPPS operating hospital market basket increase of 2.7 percent with a 0.3 percentage point reduction for the multifactor productivity adjustment and a 0.75 percentage point reduction as required under the Affordable Care Act. Hospitals that fail to comply with the quality data submission requirements and are meaningful EHR users will receive an update of 0.975 percent. This update includes a reduction of one-quarter of the market basket update for failure to submit these data. Hospitals that do comply with the quality data submission requirements but are not meaningful EHR users will receive an update of −0.375 percent, which includes a reduction of three-quarters of the market basket update. Furthermore, hospitals that do not comply with the quality data submission requirements and also are not meaningful EHR users will receive an update of −1.05 percent. Under section 1886(b)(3)(B)(iv) of the Act, the update to the hospital-specific amounts for SCHs and MDHs also is equal to the applicable percentage increase, or 1.65 percent if the hospital submits quality data and is a meaningful EHR user.

A second significant factor that affects the changes in hospitals' payments per case from FY 2016 to FY 2017 is the change in hospitals' geographic reclassification status from one year to the next. That is, payments may be reduced for hospitals reclassified in FY 2016 that are no longer reclassified in FY 2017. Conversely, payments may increase for hospitals not reclassified in FY 2016 that are reclassified in FY 2017.

2. Analysis of Table I

Table I displays the results of our analysis of the changes for FY 2017. The table categorizes hospitals by various geographic and special payment consideration groups to illustrate the varying impacts on different types of hospitals. The top row of the table shows the overall impact on the 3,330 acute care hospitals included in the analysis.

The next four rows of Table I contain hospitals categorized according to their geographic location: All urban, which is further divided into large urban and other urban; and rural. There are 2,515 hospitals located in urban areas included in our analysis. Among these, there are 1,380 hospitals located in large urban areas (populations over 1 million), and 1,135 hospitals in other urban areas (populations of 1 million or fewer). In addition, there are 815 hospitals in rural areas. The next two groupings are by bed-size categories, shown separately for urban and rural hospitals. The final groupings by geographic location are by census divisions, also shown separately for urban and rural hospitals.

The second part of Table I shows hospital groups based on hospitals' FY 2017 payment classifications, including any reclassifications under section 1886(d)(10) of the Act. For example, the rows labeled urban, large urban, other urban, and rural show that the numbers of hospitals paid based on these categorizations after consideration of geographic reclassifications (including reclassifications under sections 1886(d)(8)(B) and 1886(d)(8)(E) of the Act that have implications for capital payments) are 2,522, 1,372, 1,150, and 808, respectively.

The next three groupings examine the impacts of the changes on hospitals grouped by whether or not they have GME residency programs (teaching hospitals that receive an IME adjustment) or receive Medicare DSH payments, or some combination of these two adjustments. There are 2,266 nonteaching hospitals in our analysis, 815 teaching hospitals with fewer than 100 residents, and 249 teaching hospitals with 100 or more residents.

In the DSH categories, hospitals are grouped according to their DSH payment status, and whether they are considered urban or rural for DSH purposes. The next category groups together hospitals considered urban or rural, in terms of whether they receive the IME adjustment, the DSH adjustment, both, or neither.

The next three rows examine the impacts of the changes on rural hospitals by special payment groups (SCHs, RRCs, and MDHs). There were 189 RRCs, 324 SCHs, 148 MDHs, 126 hospitals that are both SCHs and RRCs, and 12 hospitals that are both MDHs and RRCs.

The next series of groupings are based on the type of ownership and the hospital's Medicare utilization expressed as a percent of total patient days. These data were taken from the FY 2013 or FY 2012 Medicare cost reports.

The next two groupings concern the geographic reclassification status of hospitals. The first grouping displays all urban hospitals that were reclassified by the MGCRB for FY 2017. The second grouping shows the MGCRB rural reclassifications.

TABLE I—IMPACT ANALYSIS OF CHANGES TO THE IPPS FOR OPERATING COSTS FOR FY 2017

	Number of hospitals [1]	Hospital rate update and documentation and coding adjustment (1) [2]	FY 2017 weights and DRG changes with application of recalibration budget neutrality (2) [3]	FY 2017 wage data under new CBSA designations with application of wage budget neutrality (3) [4]	FY 2017 MGCRB reclassifications (4) [5]	Rural and imputed floor with application of national rural and imputed floor budget neutrality (5) [6]	Application of the frontier wage index and out-migration adjustment (6) [7]	All FY 2017 changes (7) [8]

All Section 401 Reclassified Hospitals:	69	1.7	−0.2	0.0	0.0	0.0	1.0	1.7
Other Reclassified Hospitals (Section 1886(d)(8)(B))	48	1.2	−0.4	0.1	3.1	−0.3	0.0	0.9

[1] Because data necessary to classify some hospitals by category were missing, the total number of hospitals in each category may not equal the national total. Discharge data are from FY 2015, and hospital cost report data are from reporting periods beginning in FY 2012 and FY 2013.

[2] This column displays the payment impact of the hospital rate update and other adjustments, including the 1.65 percent adjustment to the national standardized amount and the hospital-specific rate (the estimated 2.7 percent market basket update reduced by 0.3 percentage point for the multifactor productivity adjustment and the 0.75 percentage point reduction under the Affordable Care Act), the -1.5 percent documentation and coding adjustment to the national standardized amount and the adjustment of (1/0.998) to permanently remove the -0.2 percent reduction, and the 1.006 temporary adjustment to address the effects of the 0.2 percent reduction in effect for FYs 2014 through 2016 related to the 2-midnight policy.

[3] This column displays the payment impact of the changes to the Version 34 GROUPER, the changes to the relative weights and the recalibration of the MS–DRG weights based on FY 2015 MedPAR data in accordance with section 1886(d)(4)(C)(iii) of the Act. This column displays the application of the recalibration budget neutrality factor of 0.999079 in accordance with section 1886(d)(4)(C)(iii) of the Act.

[4] This column displays the payment impact of the update to wage index data using FY 2013 cost report data and the OMB labor market area delineations based on 2010 Decennial Census data. This column displays the payment impact of the application of the wage budget neutrality factor, which is calculated separately from the recalibration budget neutrality factor, and is calculated in accordance with section 1886(d)(3)(E)(i) of the Act. The wage budget neutrality factor is 1.000209.

[5] Shown here are the effects of geographic reclassifications by the Medicare Geographic Classification Review Board (MGCRB) along with the effects of the continued implementation of the new OMB labor market area delineations on these reclassifications. The effects demonstrate the FY 2017 payment impact of going from no reclassifications to the reclassifications scheduled to be in effect for FY 2017. Reclassification for prior years has no bearing on the payment impacts shown here. This column reflects the geographic budget neutrality factor of 0.988224.

[6] This column displays the effects of the rural and imputed floor based on the continued implementation of the new OMB labor market area delineations. The Affordable Care Act requires the rural floor budget neutrality adjustment to be 100 percent national level adjustment. The rural floor budget neutrality factor (which includes the imputed floor) applied to the wage index is 0.9932. This column also shows the effect of the 3-year transition for hospitals that were located in urban counties that became rural under the new OMB delineations or hospitals deemed urban where the urban area became rural under the new OMB delineations, with a budget neutrality factor of 0.999997.

[7] This column shows the combined impact of the policy required under section 10324 of the Affordable Care Act that hospitals located in frontier States have a wage index no less than 1.0 and of section 1886(d)(13) of the Act, as added by section 505 of Pub. L. 108–173, which provides for an increase in a hospital's wage index if a threshold percentage of residents of the county where the hospital is located commute to work at hospitals in counties with higher wage indexes. These are not budget neutral policies.

[8] This column shows the estimated change in payments from FY 2016 to FY 2017.

a. Effects of the Hospital Update, Documentation and Coding Adjustment, and Other Adjustments (Column 1)

As discussed in section IV.B. of the preamble of this final rule, this column includes the hospital update, including the 2.7 percent market basket update, the reduction of 0.3 percentage point for the multifactor productivity adjustment, and the 0.75 percentage point reduction in accordance with the Affordable Care Act. In addition, as discussed in section II.D. of the preamble of this final rule, this column includes the FY 2017 documentation and coding recoupment adjustment of −1.5 percent on the national standardized amount as part of the recoupment required by section 631 of the ATRA and, as discussed in section IV.P. of the preamble of this final rule, the adjustment of (1/0.998) to permanently remove the 0.2 percent reduction and the 1.006 temporary adjustment to address the effects of the 0.2 percent reduction in effect for FYs 2014 through 2016 related to the 2-midnight policy. As a result, we are making a 1.0 percent update to the national standardized amount. This column also includes the 1.65 percent update to the hospital-specific rates which includes the 2.7 percent market basket update, the reduction of 0.3 percentage point for the multifactor productivity adjustment, and the 0.75 percentage point reduction in accordance with the Affordable Care Act. In addition, this column includes the adjustment to the hospital-specific rates of (1/0.998) to permanently remove the −0.2 percent reduction and the 1.006 temporary adjustment to address the effects of the 0.2 percent reduction in effect for FYs 2014 through 2016, which are discussed in section IV.P. of the preamble of this final rule. As a result, we are making a 2.45 percent update to the hospital-specific rates.

Overall, hospitals will experience a 1.0 percent increase in payments primarily due to the combined effects of the hospital update and the documentation and coding adjustment on the national standardized amount and the hospital update to the hospital-specific rate as well as the adjustment of (1/0.998) to permanently remove the −0.2 percent reduction and the 1.006 temporary adjustment to address the effects of the 0.2 percent reduction in effect for FYs 2014 through 2016 related to the 2-midnight policy to both the national standardized amount and the hospital-specific rate. Hospitals that are paid under the hospital-specific rate will experience a 2.45 percent increase in payments; therefore, hospital categories containing hospitals paid under the hospital-specific rate will experience higher than average increases in payments.

b. Effects of the Changes to the MS–DRG Reclassifications and Relative Cost-Based Weights With Recalibration Budget Neutrality (Column 2)

Column 2 shows the effects of the changes to the MS–DRGs and relative weights with the application of the recalibration budget neutrality factor to the standardized amounts. Section 1886(d)(4)(C)(i) of the Act requires us annually to make appropriate classification changes in order to reflect changes in treatment patterns, technology, and any other factors that may change the relative use of hospital resources. Consistent with section 1886(d)(4)(C)(iii) of the Act, we are calculating a recalibration budget neutrality factor to account for the changes in MS–DRGs and relative weights to ensure that the overall payment impact is budget neutral.

As discussed in section II.E. of the preamble of this final rule, the FY 2017 MS–DRG relative weights will be 100 percent cost-based and 100 percent MS–DRGs. For FY 2017, the MS–DRGs are calculated using the FY 2015 MedPAR data grouped to the Version 34 (FY 2017) MS–DRGs. The methodology to calculate the relative weights and the reclassification changes to the GROUPER are described in more detail in section II.G. of the preamble of this final rule.

The ''All Hospitals'' line in Column 2 indicates that changes due to the MS–DRGs

and relative weights will result in a 0.0 percent change in payments with the application of the recalibration budget neutrality factor of 0.999079 on to the standardized amount. Hospital categories that generally treat more surgical cases than medical cases will experience increases in their payments under the relative weights. Rural hospitals will experience a 0.4 percent decrease in payments because rural hospitals tend to treat fewer surgical cases than medical cases, while teaching hospitals with more than 100 residents will experience an increase in payments by 0.2 percent as those hospitals treat more surgical cases than medical cases.

c. Effects of the Wage Index Changes (Column 3)

Column 3 shows the impact of updated wage data using FY 2013 cost report data, with the application of the wage budget neutrality factor. The wage index is calculated and assigned to hospitals on the basis of the labor market area in which the hospital is located. Under section 1886(d)(3)(E) of the Act, beginning with FY 2005, we delineate hospital labor market areas based on the Core Based Statistical Areas (CBSAs) established by OMB. The current statistical standards used in FY 2017 are based on OMB standards published on February 28, 2013 (75 FR 37246 and 37252), and 2010 Decennial Census data (OMB Bulletin No. 13–01), as updated in OMB Bulletin No. 15–01. (We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 49951 through 49963) for a full discussion on our adoption of the OMB labor market area delineations based on the 2010 Decennial Census data, effective beginning with the FY 2015 IPPS wage index and to section III.A.2. of the preamble of this final rule for a discussion of OMB Bulletin No. 15–01.)

Section 1886(d)(3)(E) of the Act requires that, beginning October 1, 1993, we annually update the wage data used to calculate the wage index. In accordance with this requirement, the wage index for acute care hospitals for FY 2017 is based on data submitted for hospital cost reporting periods beginning on or after October 1, 2012 and before October 1, 2013. The estimated impact of the updated wage data using the FY 2013 cost report data and the OMB labor market area delineations on hospital payments is isolated in Column 3 by holding the other payment parameters constant in this simulation. That is, Column 3 shows the percentage change in payments when going from a model using the FY 2016 wage index, based on FY 2012 wage data, the labor-related share of 69.6 percent, under the OMB delineations and having a 100-percent occupational mix adjustment applied, to a model using the FY 2017 pre-reclassification wage index based on FY 2013 wage data with the labor-related share of 69.6 percent, under the OMB delineations, also having a 100-percent occupational mix adjustment applied, while holding other payment parameters such as use of the Version 34 MS–DRG GROUPER constant. The FY 2017 occupational mix adjustment is based on the CY 2013 occupational mix survey.

In addition, the column shows the impact of the application of the wage budget neutrality to the national standardized amount. In FY 2010, we began calculating separate wage budget neutrality and recalibration budget neutrality factors, in accordance with section 1886(d)(3)(E) of the Act, which specifies that budget neutrality to account for wage index changes or updates made under that subparagraph must be made without regard to the 62 percent labor-related share guaranteed under section 1886(d)(3)(E)(ii) of the Act. Therefore, for FY 2017, we are calculating the wage budget neutrality factor to ensure that payments under updated wage data and the labor-related share of 69.6 percent are budget neutral without regard to the lower labor-related share of 62 percent applied to hospitals with a wage index less than or equal to 1.0. In other words, the wage budget neutrality is calculated under the assumption that all hospitals receive the higher labor-related share of the standardized amount. The FY 2017 wage budget neutrality factor is 1.000209, and the overall payment change is 0.0 percent.

Column 3 shows the impacts of updating the wage data using FY 2013 cost reports. Overall, the new wage data and the labor-related share, combined with the wage budget neutrality adjustment, will lead to no change for all hospitals as shown in Column 3.

In looking at the wage data itself, the national average hourly wage increased 1.02 percent compared to FY 2016. Therefore, the only manner in which to maintain or exceed the previous year's wage index was to match or exceed the 1.02 percent increase in the national average hourly wage. Of the 3,309 hospitals with wage data for both FYs 2016 and 2017, 1,539 or 46.5 percent would experience an average hourly wage increase of 1.02 percent or more.

The following chart compares the shifts in wage index values for hospitals due to changes in the average hourly wage data for FY 2017 relative to FY 2016. Among urban hospitals, 4 will experience a decrease of 10 percent or more, and 14 urban hospitals will experience an increase of 10 percent or more. One hundred and nine urban hospitals will experience an increase or decrease of at least 5 percent or more but less than 10 percent. Among rural hospitals, 4 will experience an increase of at least 5 percent but less than 10 percent, but no rural hospitals will experience a decrease of greater than or equal to 5 percent but less than 10 percent. No rural hospital will experience increases of 10 percent or more, and no rural hospitals will experience decreases of 10 percent or more. However, 777 rural hospitals will experience increases or decreases of less than 5 percent, while 2,378 urban hospitals will experience increases or decreases of less than 5 percent. No urban hospitals but 23 rural hospitals will not experience any change to their wage index. These figures reflect changes in the ''pre-reclassified, occupational mix-adjusted wage index,'' that is, the wage index before the application of geographic reclassification, the rural and imputed floors, the out-migration adjustment, and other wage index exceptions and adjustments. (We refer readers to sections III.G. through III.L. of the preamble of this final rule for a complete discussion of the exceptions and adjustments to the wage index.) We note that the ''post-reclassified wage index'' or ''payment wage index,'' which is the wage index that includes all such exceptions and adjustments (as reflected in Tables 2 and 3 associated with this final rule, which are available via the Internet on the CMS Web site) is used to adjust the labor-related share of a hospital's standardized amount, either 69.6 percent or 62 percent, depending upon whether a hospital's wage index is greater than 1.0 or less than or equal to 1.0. Therefore, the pre-reclassified wage index figures in the following chart may illustrate a somewhat larger or smaller change than will occur in a hospital's payment wage index and total payment.

The following chart shows the projected impact of changes in the area wage index values for urban and rural hospitals.

FY 2017 percentage change in area wage index values	Number of hospitals	
	Urban	Rural
Increase 10 percent or more	14	0
Increase greater than or equal to 5 percent and less than 10 percent	70	4
Increase or decrease less than 5 percent	2,378	777
Decrease greater than or equal to 5 percent and less than 10 percent	39	0
Decrease 10 percent or more	4	0
Unchanged	0	23

d. Effects of MGCRB Reclassifications (Column 4)

Our impact analysis to this point has assumed acute care hospitals are paid on the basis of their actual geographic location (with the exception of ongoing policies that provide that certain hospitals receive payments on bases other than where they are geographically located). The changes in Column 4 reflect the per case payment impact of moving from this baseline to a

simulation incorporating the MGCRB decisions for FY 2017.

By spring of each year, the MGCRB makes reclassification determinations that will be effective for the next fiscal year, which begins on October 1. The MGCRB may approve a hospital's reclassification request for the purpose of using another area's wage index value. Hospitals may appeal denials of MGCRB decisions to the CMS Administrator. Further, hospitals have 45 days from publication of the IPPS proposed rule in the **Federal Register** to decide whether to withdraw or terminate an approved geographic reclassification for the following year.

The overall effect of geographic reclassification is required by section 1886(d)(8)(D) of the Act to be budget neutral. Therefore, for purposes of this impact analysis, we are applying an adjustment of 0.988224 to ensure that the effects of the reclassifications under section 1886(d)(10) of the Act are budget neutral (section II.A. of the Addendum to this final rule). Geographic reclassification generally benefits hospitals in rural areas. We estimate that the geographic reclassification will increase payments to rural hospitals by an average of 1.4 percent. By region, all the rural hospital categories will experience increases in payments due to MGCRB reclassifications.

New Table 2 listed in section VI. of the Addendum to this final rule and available via the Internet on the CMS Web site reflects the reclassifications for FY 2017.

e. Effects of the Rural Floor and Imputed Floor, Including Application of National Budget Neutrality (Column 5)

As discussed in section III.B. of the preamble of the FY 2009 IPPS final rule, the FY 2010 IPPS/RY 2010 LTCH PPS final rule, the FYs 2011, 2012, 2013, 2014, 2015, 2016 IPPS/LTCH PPS final rules, and this final rule, section 4410 of Public Law 105–33 established the rural floor by requiring that the wage index for a hospital in any urban area cannot be less than the wage index received by rural hospitals in the same State. We apply a uniform budget neutrality adjustment to the wage index. The imputed floor, which is also included in the calculation of the budget neutrality adjustment to the wage index, was extended in FY 2012 for 2 additional years and in FY 2014 and FY 2015 for 1 additional year. Prior to FY 2013, only urban hospitals in New Jersey received the imputed floor. As discussed in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53369), we established an alternative temporary methodology for the imputed floor, which resulted in an imputed floor for Rhode Island for FY 2013. For FY 2014 and FY 2015, we extended the imputed rural floor, as calculated under the original methodology and the alternative methodology. Due to the adoption of the new OMB labor market area delineations in FY 2015, the State of Delaware also became an all-urban State and thus eligible for an imputed floor. For FY 2016, we extended the imputed floor for 1 year, as calculated under the original methodology and the alternative methodology, through September 30, 2016. For FY 2017, we are extending the imputed rural floor for 1 year, as calculated under the original methodology and the alternative methodology, through September 20, 2017. As a result, New Jersey, Rhode Island, and Delaware will be able to receive an imputed floor through September 30, 2017. In New Jersey, 18 out of 64 hospitals will receive the imputed floor for FY 2017, 10 out of 11 hospitals in Rhode Island, and 2 out of 6 hospitals in Delaware.

The Affordable Care Act requires that we apply one rural floor budget neutrality factor to the wage index nationally, and the imputed floor is part of the rural floor budget neutrality factor applied to the wage index nationally. We have calculated a FY 2017 rural floor budget neutrality factor to be applied to the wage index of 0.9930, which will reduce wage indexes by 0.7 percent.

Column 5 shows the projected impact of the rural floor and imputed floor with the national rural floor budget neutrality factor applied to the wage index based on the OMB labor market area delineations. The column compares the post-reclassification FY 2017 wage index of providers before the rural floor and imputed floor adjustment and the post-reclassification FY 2017 wage index of providers with the rural floor and imputed floor adjustment based on the OMB labor market area delineations. Only urban hospitals can benefit from the rural and imputed floors. Because the provision is budget neutral, all other hospitals (that is, all rural hospitals and those urban hospitals to which the adjustment is not made) will experience a decrease in payments due to the budget neutrality adjustment that is applied nationally to their wage index.

We estimate that 397 hospitals will receive the rural and imputed floors in FY 2017. All IPPS hospitals in our model will have their wage index reduced by the rural floor budget neutrality adjustment of 0.9930 (or 0.7 percent). We project that, in aggregate, rural hospitals will experience a 0.2 percent decrease in payments as a result of the application of the rural floor budget neutrality because the rural hospitals do not benefit from the rural floor, but have their wage indexes downwardly adjusted to ensure that the application of the rural floor is budget neutral overall. We project hospitals located in urban areas will experience no change in payments because increases in payments by hospitals benefitting from the rural floor offset decreases in payments by nonrural floor urban hospitals whose wage index is downwardly adjusted by the rural floor budget neutrality factor. Urban hospitals in the New England region will experience a 1.0 percent increase in payments primarily due to the application of the rural floor in Massachusetts and the imputed floor in Rhode Island. Fifteen urban providers in Massachusetts are expected to receive the rural floor wage index value, including the rural floor budget neutrality adjustment, increasing payments overall to Massachusetts by an estimated $24 million. We estimate that Massachusetts hospitals will receive approximately a 0.7 percent increase in IPPS payments due to the application of the rural floor in FY 2017.

Urban Puerto Rico hospitals are expected to experience a 0.1 percent increase in payments as a result of the application of the rural floor.

There are 18 hospitals out of the 64 hospitals in New Jersey that will benefit from the extension of the imputed floor and will receive the imputed floor wage index value under the OMB labor market area delineations. Overall, New Jersey will receive a net increase of $10 million in payments taking into account the 18 hospitals that will benefit from the imputed floor and the application of the national rural floor and imputed floor budget neutrality adjustment to all hospitals in the state. There are 10 hospitals out of the 11 hospitals in Rhode Island that will benefit from the extension of the imputed floor and will receive the imputed floor wage index value. Overall, Rhode Island will receive a net increase of $17 million in payments taking into account the 10 hospitals that will benefit from the imputed floor and the application of the national rural floor and imputed floor budget neutrality adjustment to all hospitals in the state. There are 2 hospitals out of the 6 hospitals in Delaware that will benefit from the extension of the imputed floor and will receive the imputed floor wage index value. Overall, Delaware will see no net increase in payments (to the nearest million) taking into account the 2 hospitals that will benefit from the imputed floor and the application of the national rural floor and imputed floor budget neutrality adjustment to all hospitals in the state.

Column 5 also shows the projected effects of the last year of the 3-year hold harmless provision for hospitals that were located in an urban county that became rural under the new OMB delineations or hospitals deemed urban where the urban area became rural under the new OMB delineations. As discussed in section III.G.2. of the preamble of this final rule, under this transition, hospitals that were located in an urban county that became rural under the new OMB delineations were generally assigned the urban wage index value of the CBSA in which they were physically located in FY 2014 for a period of 3 fiscal years (that is, FYs 2015, 2016, and 2017). In addition, as discussed in section III.G.3. of the preamble of this final rule, under this transition, hospitals that were deemed urban where the urban area became rural under the new OMB delineations were generally assigned the area wage index value of hospitals reclassified to the urban CBSA (that is, the attaching wage index, if applicable) to which they were designated in FY 2014. For FY 2017, we are applying the 3-year transition wage index adjustments in a budget neutral manner, with a budget neutrality factor of 0.999994.

In response to a public comment addressed in the FY 2012 IPPS/LTCH PPS final rule (76 FR 51593), we are providing the payment impact of the rural floor and imputed floor with budget neutrality at the State level. Column 1 of the following table displays the number of IPPS hospitals located in each State. Column 2 displays the number of hospitals in each State that will receive the rural floor or imputed floor wage index for FY 2017. Column 3 displays the percentage of total payments each State will receive or contribute to fund the rural floor and imputed floor with national budget neutrality. The column compares the post-

reclassification FY 2017 wage index of providers before the rural floor and imputed floor adjustment and the post-reclassification FY 2017 wage index of providers with the rural floor and imputed floor adjustment. Column 4 displays the estimated payment amount that each State will gain or lose due to the application of the rural floor and imputed floor with national budget neutrality.

FY 2017 IPPS Estimated Payments Due to Rural and Imputed Floor With National Budget Neutrality

State	Number of hospitals (1)	Number of hospitals that will receive the rural floor or imputed floor (2)	Percent change in payments due to application of rural floor and imputed floor with budget neutrality (3)	Difference (in $ millions) (4)
Alabama	83	6	−0.3	−5

f. Effects of the Application of the Frontier State Wage Index and Out-Migration Adjustment (Column 6)

This column shows the combined effects of the application of section 10324(a) of the Affordable Care Act, which requires that we establish a minimum post-reclassified wage-index of 1.00 for all hospitals located in ''frontier States,'' and the effects of section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, which provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county, but work in a different area with a higher wage index. These two wage index provisions are not budget neutral and increase payments overall by 0.1 percent compared to the provisions not being in effect.

The term ''frontier States'' is defined in the statute as States in which at least 50 percent of counties have a population density less than 6 persons per square mile. Based on these criteria, 5 States (Montana, Nevada, North Dakota, South Dakota, and Wyoming) are considered frontier States and 50 hospitals located in those States will receive a frontier wage index of 1.0000. Overall, this provision is not budget neutral and is estimated to increase IPPS operating payments by approximately $58 million. Rural and urban hospitals located in the West North Central region will experience an increase in payments by 0.3 and 0.7 percent, respectively, because many of the hospitals located in this region are frontier State hospitals.

In addition, section 1886(d)(13) of the Act, as added by section 505 of Public Law 108–173, provides for an increase in the wage index for hospitals located in certain counties that have a relatively high percentage of hospital employees who reside in the county, but work in a different area with a higher wage index. Hospitals located in counties that qualify for the payment adjustment are to receive an increase in the wage index that is equal to a weighted average of the difference between the wage index of the resident county, post-reclassification and the higher wage index work area(s), weighted by the overall percentage of workers who are employed in an area with a higher wage index. There are an estimated 277 providers that will receive the out-migration wage adjustment in FY 2017. Rural hospitals generally qualify for the adjustment, resulting in a 0.1 percent increase in payments. This provision appears to benefit section 401 hospitals and RRCs in that they will experience a 1.0 percent and 0.5 percent increase in payments, respectively. This out-migration wage adjustment also is not budget neutral, and we estimate the impact of these providers receiving the out-migration increase will be approximately $30 million.

g. Effects of All FY 2017 Changes (Column 7)

Column 7 shows our estimate of the changes in payments per discharge from FY 2016 and FY 2017, resulting from all changes reflected in this final rule for FY 2017. It includes combined effects of the year to year change of the previous columns in the table.

The average increase in payments under the IPPS for all hospitals is approximately 0.9 percent for FY 2017 relative to FY 2016 and for this row is primarily driven by the changes reflected in Column 1. Column 7 includes the annual hospital update of 1.65 percent to the national standardized amount. This annual hospital update includes the 2.7 percent market basket update, the reduction of 0.3 percentage point for the multifactor productivity adjustment, and the 0.75 percentage point reduction under section 3401 of the Affordable Care Act. As discussed in section II.D. of the preamble of this final rule, this column also includes the FY 2017 documentation and coding recoupment adjustment of −1.5 percent on the national standardized amount as part of the recoupment required under section 631 of the ATRA. In addition, this column includes the adjustment of (1/0.998) to permanently remove the 0.2 percent reduction, and the 1.006 temporary adjustment to address the effects of the 0.2 percent reduction in effect for FYs 2014 through 2016 related to the 2-midnight policy, which are discussed in section IV.P. of the preamble of this final rule. Hospitals paid under the hospital-specific rate will receive a 1.65 percent hospital update in addition to the adjustment of (1/0.998) to permanently remove the 0.2 percent reduction, and the 1.006 temporary adjustment to address the effects of the 0.2 percent reduction in effect for FYs 2014 through 2016 previously described. As described in Column 1, the annual hospital update with the documentation and coding recoupment adjustment for hospitals paid under the national standardized amount, the adjustment of (1/0.998) to permanently remove the 0.2 percent reduction and the 1.006 temporary adjustment to address the effects of the 0.2 percent reduction in effect for FYs 2014 through 2016 for hospitals paid under the national standardized amount and hospitals paid under the hospital-specific rates, which are discussed in section IV.P. of the preamble of this final rule, combined with the annual hospital update for hospitals paid under the hospital-specific rates will result in a 1.0 percent increase in payments in FY 2017 relative to FY 2016. There are also interactive effects among the various factors comprising the payment system that we are not able to isolate which contribute to our estimate of the changes in payments per discharge from FY 2016 and FY 2017 in Column 7.

Overall payments to hospitals paid under the IPPS due to the applicable percentage increase and changes to policies related to MS–DRGs, geographic adjustments, and outliers are estimated to increase by 0.9 percent for FY 2017. Hospitals in urban areas will experience a 0.9 percent increase in payments per discharge in FY 2017 compared to FY 2016. Hospital payments per discharge in rural areas are estimated to increase by 1.2 percent in FY 2017.

3. Impact Analysis of Table II

Table II presents the projected impact of the changes for FY 2017 for urban and rural hospitals and for the different categories of hospitals shown in Table I. It compares the estimated average payments per discharge for FY 2016 with the estimated average payments per discharge for FY 2017, as calculated under our models. Therefore, this table presents, in terms of the average dollar amounts paid per discharge, the combined effects of the changes presented in Table I. The estimated percentage changes shown in the last column of Table II equal the estimated percentage changes in average payments per discharge from Column 7 of Table I.

TABLE II—IMPACT ANALYSIS OF CHANGES FOR FY 2017 ACUTE CARE HOSPITAL OPERATING PROSPECTIVE PAYMENT SYSTEM

[Payments per discharge]

	Number of hospitals	Estimated average FY 2016 payment per discharge	Estimated average FY 2017 payment per discharge	FY 2017 changes
	(1)	(2)	(3)	(4)
All Hospitals	3,330	11,542	11,648	0.9
By Geographic Location:				
Urban hospitals	2,515	11,890	11,996	0.9
Large urban areas	1,380	12,698	12,805	0.8
Other urban areas	1,135	10,922	11,028	1.0

H. Effects of Other Policy Changes

In addition to those policy changes discussed previously that we are able to model using our IPPS payment simulation model, we are making various other changes in this final rule. Generally, we have limited or no specific data available with which to estimate the impacts of these changes. Our estimates of the likely impacts associated with these other changes are discussed in this section.

1. Effects of Policy Relating to New Medical Service and Technology Add-On Payments

In section II.I. of the preamble to this final rule, we discuss seven applications (MAGEC® Spinal Bracing and Distraction System (MAGEC® Spine), MIRODERM Biologic Wound Matrix (MIRODERM), Idarucizumab, Titan Spine (Titan Spine Endoskeleton® nanoLOCK™ Interbody Device), Defitelio® (Defibrotide), GORE® EXCLUDER® Iliac Branch Endoprosthesis (IBE), Vistogard™ (Uridine Triacetate)) for add-on payments for new medical services and technologies for FY 2017, as well as the status of the new technologies that were approved to receive new technology add-on payments in FY 2016. We note that two of the applications (Andexanet Alfa and EDWARDS INTUITY Elite™ Valve System) discussed in the proposed rule did not receive FDA approval by July 1, 2016 in accordance with the regulations under § 412.87(c), and, therefore, are ineligible for consideration for new technology add-on payments for FY 2017.

As explained in the preamble to this final rule, add-on payments for new medical services and technologies under section 1886(d)(5)(K) of the Act are not required to be budget neutral. As discussed in section II.I.4. of the preamble of this final rule, we are approving five of the seven applications (MAGEC® Spine, Idarucizumab, Defitelio®, GORE® EXCLUDER® IBE and Vistogard™) for new technology add-on payments for FY 2017. As we proposed, in this final rule, we also are continuing to make new technology add-on payments in FY 2017 for CardioMEMS™ HF (Heart Failure) Monitoring System, Blinatumomab (BLINCYTO™), and the LUTONIX® Drug Coated Balloon (DCB) Percutaneous Transluminal Angioplasty (PTA) and IN.PACT™ Admiral™ Pacliaxel Coated Percutaneous Transluminal Angioplasty (PTA) Balloon Catheter (because all of these technologies are still within the 3-year anniversary of the product's entry onto the market). We note that new technology add-on payments per case are limited to the lesser of: (1) 50 Percent of the costs of the new technology; or (2) 50 percent of the amount by which the costs of the case exceed the standard MS–DRG payment for the case. Because it is difficult to predict the actual new technology add-on payment for each case, our estimates below are based on the increase in new technology add-on payments for FY 2017 as if every claim that would qualify for a new technology add-on payment would receive the maximum add-on payment. Based on the applicant's estimate for FY 2015, we currently estimate that new technology add-on payments for the CardioMEMS™ HF Monitoring System will increase overall FY 2017 payments by $11,315,625. Based on the applicant's estimate for FY 2016, we currently estimate that new technology add-on payments for BLINCYTO™ will increase overall FY 2017 payments by $4,593,034 (maximum add-on payment of $27,017.85 * 170 patients). Based on the weighted cost average for FY 2016 described in the FY 2016 IPPS/LTCH final rule (80 FR 49469 through 49470), we currently estimate that new technology add-on payments for LUTONIX® DCB PTA and IN.PACT™Admiral™ Pacliaxel Coated PTA Balloon Catheter will increase overall FY 2017 payments by $36,120,735 (maximum add-on payment of $1,035.72 * 8,875 patients for LUTONIX® DCB PTA Balloon Catheter; maximum add-on payment of $1,035.72 * 26,000 patients for IN.PACT™Admiral™ Pacliaxel Coated PTA Balloon Catheter). Based on the applicant's estimate for FY 2017, we currently estimate that new technology add-on payments for MAGEC® Spine will increase overall FY 2017 payments by $267,750 (maximum add-on payment of $15,750 * 17 patients). Based on the applicant's estimate for FY 2017, we currently estimate that new technology add-on payments for Idarucizumab will increase overall FY 2017 payments by $14,766,500 (maximum add-on payment of $1,750 * 8,438 patients). Based on the applicant's estimate for FY 2017, we currently estimate that new technology add-on payments for Defitelio® will increase overall FY 2017 payments by $5,161,200 (maximum add-on payment of $75,900 * 68 patients). Based on the applicant's estimate for FY 2017, we currently estimate that new technology add-on payments for the GORE® EXCLUDER® IBE will increase overall FY 2017 payments by $5,685,750 (maximum add-on payment of $5,250 * 1,083 patients). Based on the applicant's estimate for FY 2017, we currently estimate that new technology add-on payments for Vistogard™ will increase overall FY 2017 payments by $2,812,500 (maximum add-on payment of $37,500 * 75 patients).

2. Effects of the Changes to Medicare DSH Payments for FY 2017

As discussed in section IV.F. of the preamble of this final rule, under section 3133 of the Affordable Care Act, hospitals that are eligible to receive Medicare DSH payments will receive 25 percent of the amount they previously would have received under the former statutory formula for Medicare DSH payments. The remainder, equal to an estimate of 75 percent of what formerly would have been paid as Medicare DSH payments (Factor 1), reduced to reflect changes in the percentage of individuals under age 65 who are uninsured and additional statutory adjustments (Factor 2), is available to make additional payments to each hospital that qualifies for Medicare DSH payments and that has uncompensated care. Each hospital eligible for Medicare DSH payments will receive an additional payment based on its estimated share of the total amount of uncompensated care for all hospitals eligible for Medicare DSH payments. The uncompensated care payment methodology has redistributive effects based on the proportion of a hospital's uncompensated care relative to the uncompensated care for all hospitals eligible for Medicare DSH payments (Factor 3). For FY 2017, we are continuing to use low-income insured patient days as a proxy for uncompensated care, and the uncompensated care payment methodology has redistributive effects based on the proportion of a hospital's low-income insured patient days (sum of Medicaid patient days and Medicare SSI patient days) relative to the low-income insured patient days for all hospitals eligible for DSH payments. The reduction to Medicare DSH payments under section 3133 of the Affordable Care Act is not budget neutral.

In this FY 2017 IPPS/LTCH PPS final rule, we are establishing the amount to be distributed as uncompensated care payments to DSH eligible hospitals, which for FY 2017 is $5,977,483,146.86, or 75 percent of what otherwise would have been paid for Medicare DSH payment adjustments adjusted by a Factor 2 of 55.36 percent. For FY 2016, the amount available to be distributed for uncompensated care was $6,406,145,534.04, or 75 percent of what otherwise would have been paid for Medicare DSH payment adjustments adjusted by a Factor 2 of 63.69 percent. To calculate Factor 3 for FY 2017, we are using an average of data computed using Medicaid days from hospitals' 2011, 2012, and 2013 cost reports, Medicaid days from 2011 and 2012 cost report data submitted to CMS by IHS hospitals, and SSI days from the FY 2012, FY 2013, and FY 2014 SSI ratios. That is, for each hospital we are calculating an individual Factor 3 for cost reporting periods beginning during FYs 2011, 2012, and 2013, adding the individual amounts, and dividing the sum by three in order to calculate an average Factor 3 for the hospital.

The final FY 2017 policy of using data on low-income insured days from 3 years of cost reports to determine Factor 3, as described earlier, is in contrast to the methodology used in FY 2016, when we used Medicaid days from the more recent of a hospital's full year 2012 *or* 2011 cost report from the March 2015 update of the HCRIS database, Medicaid days from 2012 cost report data submitted to CMS by IHS hospitals, and SSI days from the FY 2013 SSI ratios to calculate Factor 3. In addition, as explained in section IV.F. of the preamble of this final rule, we are making two additional modifications to the Factor 3 methodology: (1) To create proxy Medicare SSI values for Puerto Rico hospitals and (2) to include all hospitals' cost reports that begin during FYs 2011, 2012, and 2013, even in the instance where a hospital has more than one cost report beginning during a given fiscal year. Because residents of Puerto Rico are not eligible for SSI benefits, we are imputing a Medicare SSI value for each Puerto Rico hospital equal to 14 percent of its Medicaid days. The final FY 2017 uncompensated care payment methodology is discussed in more detail in section IV.F. of the preamble of this final rule.

To estimate the impact of the combined effect of reductions in the percent of individuals under age 65 who are uninsured and additional statutory adjustments (Factor 2) and changes in Medicaid and SSI patient days (components of Factor 3) on the calculation of Medicare DSH payments, including both empirically justified Medicare DSH payments and uncompensated care payments, we compared total DSH payments estimated in the FY 2016 IPPS/LTCH PPS final rule to total DSH payments estimated in this FY 2017 IPPS/LTCH PPS final rule. For FY 2016, for each hospital, we calculated the sum of: (1) 25 percent of the estimated amount of what would have been paid as Medicare DSH in FY 2016 in the absence of section 3133 of the Affordable Care Act; and (2) 75 percent of the estimated amount of what would have been paid as Medicare DSH payments in the absence of section 3133 of the Affordable Care Act, adjusted by a Factor 2 of 63.69 percent and multiplied by a Factor 3 as stated in the FY 2016 IPPS/LTCH PPS final rule. For FY 2017, we calculated the sum of: (1) 25 percent of the estimated amount of what would be paid as Medicare DSH payments in FY 2017 absent section 3133 of the Affordable Care Act; and (2) 75 percent of the estimated amount of what would have been paid as Medicare DSH payments absent section 3133 of the Affordable Care Act, adjusted by a Factor 2 of 55.36 percent and multiplied by a Factor 3 as previously stated.

Our analysis included 2,426 hospitals that are projected to be eligible for DSH in FY 2017. It did not include hospitals that terminated their participation from the Medicare program as of July 1, 2016, Maryland hospitals, and SCHs that are expected to be paid based on their hospital-specific rates. In addition, low-income insured days from merged or acquired hospitals were combined into the surviving hospital's CCN, and the nonsurviving CCN was excluded from the analysis. In contrast to FY 2016, hospitals participating in the Rural Community Hospital Demonstration program, which is scheduled to end in FY 2017, are included in the analysis if projected to be eligible for DSH payments during FY 2017. The estimated impact of the changes in Factors 1, 2, and 3 across all hospitals projected to be eligible for DSH payments in FY 2017, by hospital characteristic, is presented in the following table.

MODELED DISPROPORTIONATE SHARE HOSPITAL PAYMENTS FOR ESTIMATED FY 2017 DSHS BY HOSPITAL TYPE: MODEL DSH $ (IN MILLIONS) FROM FY 2016 TO FY 2017

	Number of estimated DSHs (FY 2017)	FY 2016 final rule estimated DSH $* (in millions)	FY 2017 Final rule estimated DSH $* (in millions)	Dollar difference: FY 2017–FY 2016 (in millions)	Percent change**

Source: Dobson | DaVanzo analysis of 2011–2013 Hospital Cost Reports.

*Dollar DSH calculated by [0.25 * estimated section 1886(d)(5)(F) payments] + [0.75 * estimated section 1886(d)(5)(F) payments * Factor 2 * Factor 3]. When summed across all hospitals projected to receive DSH payments, DSH payments are estimated to be $9,767 million in FY 2016 and $9,549 million in FY 2017.

**Percentage change is determined as the difference between Medicare DSH payments modeled for the FY 2017 IPPS/LTCH PPS final rule (column 3) and Medicare DSH payments modeled for the FY 2016 IPPS/LTCH final rule (column 2) divided by Medicare DSH payments modeled for the FY 2016 final rule (column 2) 1 times 100 percent.

Changes in projected FY 2017 DSH payments from DSH payments in FY 2016 are primarily driven by three factors: (1) An increase in Factor 1 from $10.058 billion to $10.798 billion; (2) a reduction in the percent of uninsured (Factor 2) from 63.69 percent to 55.36 percent; and (3) a revised proxy methodology for calculating Factor 3 values. The impact analysis found that, across all projected DSH eligible hospitals, FY 2017 DSH payments are estimated at approximately $14.397 billion, or an increase of approximately 7.4 percent from FY 2016 DSH payments (approximately $13.411 billion). Although Factor 1 increased substantially, the reduction in Factor 2 offsets this and results in a net decrease in the amount available to be distributed in uncompensated care payments.

As seen in the above table, percent reductions greater than 2.2 percent indicate that hospitals within the specified category are projected to experience a greater reduction in DSH payments, on average, compared to the universe of FY 2017 projected DSH hospitals. Conversely, percent reductions that are less than 2.2 percent indicate a hospital type is projected to have a smaller reduction than the overall average. The variation in the distribution of payments by hospital characteristic is largely dependent on the change in a given hospital's number of Medicaid days and SSI days used in the Factor 3 computation.

Rural hospitals, grouped by geographic location, payment classification, and bed size, are projected to experience a larger reduction in DSH payments than urban hospitals. Overall, urban hospitals are projected to receive a 2.0 percent decrease in DSH payments, and rural hospitals are projected to receive a 6.4 percent decrease in

DSH payments. The smaller the rural hospital, the larger the projected reduction in DSH payments, with rural hospitals that have 0–99 beds projected to experience a 7.8 percent payment reduction, and larger rural hospitals with 100–249 beds and greater than 250 beds projected to experience a 5.2 and 5.9 percent payment reductions respectively. In contrast, the smallest urban hospitals (0–99 beds) are projected to receive a decrease in DSH payments of 2.2 percent. Larger urban hospitals (100–250 beds and 250+ beds) are projected to receive reductions of 2.6 and 1.8 percent respectively.

By region, projected DSH payment reductions for urban hospitals are largest in the South Atlantic and West South Central, with New England, Middle Atlantic, and West North Central hospitals also projected to receive reductions in DSH payments greater than the overall average. Urban hospitals in the East North Central, East South Central, Mountain, and Pacific regions are projected to receive reductions less than the overall average. Puerto Rico hospitals are expected to receive an 11.4 percent increase in DSH payments.

Teaching hospitals with fewer than 100 residents are projected to receive relatively larger reductions than nonteaching hospitals or hospitals with 100 or more residents, although all are fairly consistent with the national average. Voluntary, proprietary, and government hospitals are projected to receive payment reductions generally consistent with the national average, where government hospitals are projected to receive slightly smaller reductions in DSH payments and proprietary hospitals are projected to receive slightly larger reductions than the overall average. Hospitals with over 65 percent Medicare utilization are projected to receive a significant reduction in DSH payments, while lower Medicare utilization percentiles show smaller reductions.

Puerto Rico hospitals are projected to receive an increase in overall DSH payments, including both empirically justified DSH payments and uncompensated care payments, due to the finalized policy to create proxy values for SSI days for hospitals in Puerto Rico for purposes of calculating Factor 3 of the uncompensated care payment methodology. For FY 2017, Puerto Rico hospitals are projected to receive $116 million in overall DSH and uncompensated care payments, or an 11.4 percent increase from FY 2016 payments ($104 million). Of the estimated $116 million for FY 2017, we estimate that $78 million will be uncompensated care payments to Puerto Rico hospitals. This represents an increase of approximately 13.8 percent, or $9.5 million, in FY 2017 compared to the estimated $68 million in uncompensated care payments to Puerto Rico hospitals in FY 2016. Moreover, we estimate that uncompensated care payments to Puerto Rico hospitals for FY 2017 are 19.8 percent, or $12.9 million, higher with the finalized SSI proxy than they otherwise would have been without the finalized SSI proxy for FY 2017. In other words, without the finalized SSI proxy, we would have expected uncompensated care payments to Puerto Rico hospitals to decline by approximately $3.4 million between FY 2016 and FY 2017. We note that because the finalized SSI proxy for Puerto Rico hospitals increases the number of days in the denominator of Factor 3, this affects hospitals nationally. We estimate that uncompensated care payments to non-Puerto Rico hospitals for FY 2017 are approximately 0.15 percent lower with the finalized SSI proxy than they otherwise would have been without the finalized SSI proxy.

3. Effects of Reduction Under the Hospital Readmissions Reduction Program

In section IV.G. of the preamble of this final rule, we discuss our proposed and final policies for the FY 2017 Hospital Readmissions Reduction Program (established under section 3025 of the Affordable Care Act), which requires a reduction to a hospital's base operating DRG payments to account for excess readmissions. For FY 2017, the reduction is based on a hospital's risk-adjusted readmission rate during a 3-year period for acute myocardial infarction (AMI), heart failure (HF), pneumonia, chronic obstructive pulmonary disease (COPD), total hip arthroplasty/total knee arthroplasty (THA/TKA), and coronary artery bypass graft (CABG). This provision is not budget neutral. A hospital's readmission adjustment is the higher of a ratio of the hospital's aggregate payments for excess readmissions to their aggregate payments for all discharges, or a floor, which has been defined in the statute as 0.97 (or a 3.0 percent reduction). A hospital's base operating DRG payment (that is, wage-adjusted DRG payment amount, as discussed in section IV.G. of the preamble of this final rule) is the portion of the IPPS payment subject to the readmissions payment adjustment (DSH, IME, outliers and low-volume add-on payments are not subject to the readmissions adjustment). In this final rule, we estimate that 2,588 hospitals will have their base operating DRG payments reduced by their proxy FY 2017 hospital-specific readmissions adjustment. As a result, we estimate that the Hospital Readmissions Reduction Program will save approximately $528 million in FY 2017, an increase of $108 million over the estimated FY 2016 savings.

4. Effects of Changes Under the FY 2017 Hospital Value-Based Purchasing (VBP) Program

In section IV.H. of the preamble of this final rule, we discuss the Hospital VBP Program under which the Secretary makes value-based incentive payments to hospitals based on their performance on measures during the performance period with respect to a fiscal year. These incentive payments will be funded for FY 2017 through a reduction to the FY 2017 base operating DRG payment amounts for all discharges for participating hospitals for such fiscal year, as required by section 1886(o)(7)(B) of the Act. The applicable percentage for FY 2017 and subsequent years is 2 percent. The total amount available for value-based incentive payments must be equal to the total amount of reduced payments for all hospitals for the fiscal year, as estimated by the Secretary.

In section IV.H. of the preamble of this final rule, we estimate the available pool of funds for value-based incentive payments in the FY 2017 program year, which, in accordance with section 1886(o)(7)(C)(v) of the Act, will be 2.00 percent of base operating DRG payments, or a total of approximately $1.8 billion. This estimated available pool for FY 2017 is based on the historical pool of hospitals that were eligible to participate in the FY 2016 program year and the payment information from the March 2016 update to the FY 2015 MedPAR file.

The estimated impacts of the FY 2017 program year by hospital characteristic, found in the table below, are based on historical TPSs. We used the FY 2016 program year's TPSs to calculate the proxy adjustment factors used for this impact analysis. These are the most recently available scores that hospitals were given an opportunity to review and correct. The proxy adjustment factors use estimated annual base operating DRG payment amounts derived from the March 2016 update to the FY 2015 MedPAR file. The proxy adjustment factors can be found in Table 16A associated with this final rule (available via the Internet on the CMS Web site).

The impact analysis shows that, for the FY 2017 program year, the number of hospitals that will receive an increase in their base operating DRG payment amounts is higher than the number of hospitals that will receive a decrease. Among urban hospitals, those in the New England, South Atlantic, East North Central, East South Central, West North Central, West South Central, Mountain, and Pacific regions will have an increase, on average, in their base operating DRG payment amounts. Urban hospitals in the Middle Atlantic region will receive an average decrease in their base operating DRG payment amounts. Among rural hospitals, those in all regions will have an increase, on average, in their base operating DRG payment amounts.

On average, hospitals that receive a higher (50–65) percent of DSH payments will receive decreases in base operating DRG payment amounts. With respect to hospitals' Medicare utilization as a percent of inpatient days (MCR), those hospitals with an MCR above 65 percent will have the largest average increase in base operating DRG payment amounts.

Nonteaching hospitals will have an average increase, and teaching hospitals will experience an average decrease in base operating DRG payment amounts.

IMPACT ANALYSIS OF BASE OPERATING DRG PAYMENT AMOUNT CHANGES RESULTING FROM THE FY 2017 HOSPITAL VBP PROGRAM

Actual FY 2017 program year's TPSs will not be reviewed and corrected by hospitals until after this FY 2017 IPPS/LTCH PPS final rule has been published. Therefore, the same historical universe of eligible hospitals and corresponding TPSs from the FY 2016 program year are used for the updated impact analysis in this final rule.

5. Effects of Changes to the HAC Reduction Program for FY 2017

In section IV.I. of the preamble of this final rule, we discuss the changes to the HAC Reduction Program for FY 2017. The table and analysis below show the estimated cumulative effect of the measures and scoring system for the HAC Reduction Program in this final rule. In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49575 through 49576), we finalized a Total HAC Score methodology that assigns, for FY 2017, weights for Domain 1 and Domain 2 at 15 percent and 85 percent, respectively. Based on this methodology, the table below presents data on the estimated proportion of hospitals in the worst-performing quartile of the Total HAC Scores by hospital characteristic. We note that because scores will undergo a 30-day review and correction period by the hospitals that will not conclude until after the publication of this FY 2017 IPPS/LTCH PPS final rule, we are not providing hospital-level data or a hospital-level payment impact in conjunction with this FY 2017 IPPS/LTCH PPS final rule.

To estimate the impact of the FY 2017 HAC Reduction Program, we used, as previously finalized, AHRQ PSI 90 measure results based on Medicare FFS discharges from July 2013 through June 2015 and version 5.0.1 (recalibrated) of the AHRQ software. For the CLABSI, CAUTI, Colon and Abdominal Hysterectomy SSI, MRSA Bacteremia, and

CDI measure results, we used standardized infection ratios (SIRs) calculated with hospital surveillance data reported to the NHSN for infections occurring between January 1, 2013 and December 31, 2014.

To analyze the results by hospital characteristic, we used the FY 2017 Proposed Rule Impact File. This table includes 3,215 non-Maryland hospitals with a Total HAC Score FY 2017. Of these, 3,200 hospitals had information for geographic location, region, bed size, DSH percent, and teaching status; 3,178 had information for ownership; and 3,176 had information for MCR percent. Maryland hospitals and hospitals without a Total HAC Score are not included in the table below.

ESTIMATED PROPORTION OF HOSPITALS IN THE WORST-PERFORMING QUARTILE (>75TH PERCENTILE) OF THE TOTAL HAC SCORE FOR THE FY 2017 HAC REDUCTION PROGRAM

[By hospital characteristic]

Hospital characteristic	Number of hospitals [a]	Number of hospitals in the worst-performing quartile [b]	Percent of hospitals in the worst-performing quartile [c]
Total [d]	3,215	771	24.0
By Geographic Location:			
All hospitals:			
Urban	2,404	653	27.2
Rural	796	107	13.4
Urban hospitals:			
1–99 beds	592	91	15.4
100–199 beds	734	166	22.6
200–299 beds	440	134	30.5
300–399 beds	276	101	36.6
400–499	150	61	40.7
500 or more beds	212	100	47.2
Rural hospitals:			
1–49 beds	303	48	15.8
50–99 beds	289	29	10.0
100–149 beds	118	11	9.3
150–199 beds	45	9	20.0
200 or more beds	41	10	24.4
By Region:			
New England	134	42	31.3
Mid-Atlantic	365	131	35.9

By MCR Percent:			
0–24	472	148	31.4
25–49	2,106	481	22.8
50–64	518	104	20.1
65 and over	80	18	22.5

Source: FY 2017 HAC Reduction Program Final Rule results are based on AHRQ PSI 90 data from July 2013 through June 2015 and CDC CLABSI, CAUTI, SSI, CDI, and MRSA results from January 2014 to December 2015. Hospital Characteristics are based on the FY 2017 Proposed Rule Impact File updated on April 27, 2016.

[a] The total number of non-Maryland hospitals with a Total HAC Score with hospital characteristic data (3,200 for geographic location, bed size, and teaching status; 3,178 for type of ownership; and 3,176 for MCR) does not add up to the total number of non-Maryland hospitals with a Total HAC Score for the FY 2017 HAC Reduction Program (3,215) because 15 hospitals are not included in the FY 2017 Proposed Rule Impact File and not all hospitals have data for all characteristics.

[b] This column is the number of non-Maryland hospitals with a Total HAC Score within the corresponding characteristic that are estimated to be in the worst-performing quartile.

[c] This column is the percent of hospitals within each characteristic that are estimated to be in the worst-performing quartile. The percentages are calculated by dividing the number of non-Maryland hospitals with a Total HAC Score in the worst-performing quartile by the total number of non-Maryland hospitals with a Total HAC Score within that characteristic.

[d] Total excludes 47 Maryland hospitals and 64 non-Maryland hospitals without a Total HAC Score for FY 2017.

[e] A hospital is considered to be a DSH hospital if it has a DSH patient percentage greater than zero.

[f] A hospital is considered to be a teaching hospital if it has an IME adjustment factor for Operation PPS (TCHOP) greater than zero.

6. Effects of Policy Changes Relating to Direct GME and IME Payments for Rural Training Tracks at Urban Hospitals

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25308) and section IV.J. of the preamble of this final rule, we discuss our proposed and finalized policy to extend the period for establishing rural track FTE limitations from 3 years to 5 years for purposes of direct GME and IME payments to urban hospitals with rural track training programs. Specifically, we are revising the regulations to permit that, in the first 5 program years (rather than the first 3 program years) of the rural track's existence, the rural track FTE limitation for each urban hospital will be the actual number of FTE residents training in the rural training track at the urban hospital, and beginning with the urban hospital's cost reporting period that coincides with or follows the start of the sixth program year of the rural training track's existence, the rural track FTE limitation will take effect. This change addresses concerns expressed by the hospital community that rural training tracks, like any program, should have a sufficient amount of time for a hospital to ''grow'' and to establish a rural track FTE limitation that reflects the number of FTE residents that it will actually train, once the program is fully grown. In the proposed rule (81 FR 25308) and in section IV.J. of the preamble of this final rule, we explain that because we inadvertently did not also amend the separate direct GME and IME regulations regarding the growth window and effective date of FTE limitations for rural track training programs when we amended the regulations regarding the 5-year growth window in the FY 2013 IPPS/LTCH PPS final rule and regarding the additional changes we made in the FY 2015 IPPS/LTCH PPS final rule, we are making the effective date regarding the change in the growth window also effective for rural track training programs started on or after October 1, 2012. As stated in the proposed rule, mostly due to the relatively small size of rural track programs, we estimate that the proposal would cost approximately $1 million by the end of the 10-year period, a negligible cost. We are finalizing this policy as proposed, and therefore our estimate remains unchanged for the final rule.

7. Effects of Implementation of Rural Community Hospital Demonstration Program

In section IV.K. of the preamble of this final rule, for FY 2017, we discuss our implementation of section 410A of Public Law 108–173, as amended, which requires the Secretary to conduct a demonstration that would modify payments for inpatient services for up to 30 rural community hospitals. Section 410A(c)(2) requires that in conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration program under this section was not implemented.

As discussed in section IV.K. of the preamble of this final rule, in the IPPS final rules for each of the previous 12 fiscal years, we have estimated the additional payments made by the program for each of the participating hospitals as a result of the demonstration. In order to achieve budget neutrality, we have adjusted the national IPPS rates by an amount sufficient to account for the added costs of this demonstration. In other words, we have applied budget neutrality across the payment system as a whole rather than across the participants of this demonstration. The language of the statutory budget neutrality requirement permits the agency to implement the budget neutrality provision in this manner. The statutory language requires that aggregate payments made by the Secretary do not exceed the amount which the Secretary would have paid if the demonstration was not implemented but does not identify the range across which aggregate payments must be held equal.

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25130), we proposed a different methodology as compared to previous years for analyzing the costs attributable to the demonstration for FY 2017. The demonstration will have substantially phased out by the beginning of FY 2017. The 7 ''originally participating hospitals'', that is, those hospitals that were selected for the demonstration in 2004 and 2008, ended their participation in the 5-year extension period authorized by the Affordable Care Act prior to the start of FY 2016. In addition, we stated in the proposed rule that the participation period for the 14 hospitals that entered the demonstration following the extension of the demonstration mandated by the Affordable Care Act and that were still participating would end on a rolling basis according to the end dates of the hospitals' cost report periods, respectively, from April 30, 2016 through December 31, 2016. Of these 14 hospitals, 10 hospitals will end participation on or before September 30, 2016, leaving 4 hospitals participating for the last 3 months of CY 2016 (that is, the first 3 months of FY 2017). Given the small number of participating hospitals and the limited time of participation, we proposed to forego the process of estimating the costs attributable to the demonstration for FY 2017 and to instead analyze the set of finalized cost reports for reporting periods beginning in FY 2016 when they become available.

In previous IPPS/LTCH PPS final rules, we have determined the amount by which the actual costs of the demonstration for an earlier, previous year differed from the estimated costs of the demonstration set forth in the corresponding final rule for the corresponding fiscal year, and we incorporated that amount into the budget neutrality offset amount for the upcoming fiscal year. We note that we have calculated this difference between the actual costs of the demonstration for FYs 2005 through 2010, as determined from finalized cost reports once available, and estimated costs of the demonstration as identified in the applicable IPPS final rules for these years. In the proposed rule (81 FR 25130), we proposed to conduct this analysis for FYs 2011 through 2016 at one time, when all of the finalized cost reports for cost reporting periods beginning in FYs 2011 through 2016 are available. Given the general lag of 3 years in finalizing cost reports, we stated in the proposed rule that we expect any such analysis to be conducted in FY 2020.

Because, as discussed earlier, we proposed that we would not calculate and apply an estimated budget neutrality offset amount for FY 2017, but instead analyze the set of finalized cost reports for cost reporting periods beginning in FY 2016 when they become available, and proposed to reconcile the budget neutrality offset amounts for FYs 2011 through 2016 with the actual costs of the demonstration once the finalized cost reports for all of these years are available, we stated in the proposed rule that there would be no impact from the demonstration on the national IPPS rates for FY 2017 (81 FR 25308).

In this final rule, we are finalizing these proposals without modification. Thus, in this final rule, we are applying no budget neutrality offset amount to the national IPPS rates for FY 2017.

8. Effects of Implementation of the Notice of Observation Treatment and Implications for Care Eligibility Act (NOTICE Act)

In the proposed rule (81 FR 25131 through 25134) and in section IV.L. of the preamble of this final rule, we discuss implementation of section 1866(a)(1)(Y) of the Act as amended by the NOTICE Act (Pub. L. 114–42) and revisions to the basic commitments providers agree to as part of participating in Medicare under a provider agreement. These revisions specify a process for hospitals and CAHs to notify an individual, orally and in writing, regarding the individual's receipt of observation services as an outpatient for more than 24 hours and the implications of receiving such services. The statute mandates the Secretary develop a plain language written notice for this purpose. The written notice must be delivered no later than 36 hours after observation services are initiated (or, if sooner, upon release).

We developed a standardized format for the notice, which is undergoing OMB approval. The notice will be disseminated during the normal course of related business activities. In 2014, there were approximately 1,399,999 claims for Medicare outpatient observation services lasting greater than 24 hours furnished by 6,142 hospitals and CAHs.[400] We refer readers to section IX.B. of the preamble of this final rule for a discussion of the burden associated with this notice requirement.

9. Effects of Technical Changes and Correction of Typographical Errors in Certain Regulations Under 42 CFR Part 413 Relating to Costs to Related Organizations and Medicare Cost Reports

In the FY 2017 IPPS/LTCH proposed rule (81 FR 25134 through 25135) and in section IV.M. of the preamble of this final rule, we discuss a number of technical changes or corrections of typographical errors in 42 CFR part 413 relating to costs to related organizations and Medicare cost reports that need to be made. We believe that the impact of these technical changes and corrections is negligible.

[400] Source: CMS Office of Enterprise and Data Analytics.

10. Effects of Implementation of the Frontier Community Health Integration Project (FCHIP) Demonstration

In the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25140 through 25141) and in section VI.C. of the preamble of this final rule, we discuss the implementation of the FCHIP demonstration, which will allow eligible entities to develop and test new models for the delivery of health care services in eligible counties in order to improve access to and better integrate the delivery of acute care, extended care, and other health care services to Medicare beneficiaries in no more than four States. Budget neutrality estimates for CAHs selected for the demonstration will be based on the demonstration period, August 1, 2016 through July 31, 2019. The demonstration design includes three intervention prongs, under which specific waivers of Medicare payment rules will allow for enhanced payment: Telemedicine, nursing facility, and ambulance services. These waivers were formulated with the goal of increasing access to care with no net increase in costs.

We have specified the payment enhancements for the demonstration with the goal of maintaining the budget neutrality of the demonstration on its own terms (that is, the demonstration will produce savings from reduced transfers and admissions to other health care providers, thus offsetting any increase in payments resulting from the demonstration). However, because of the small size of this demonstration program and uncertainty associated with projected Medicare utilization and costs, we proposed a contingency plan (81 FR 25141) to ensure that the budget neutrality requirement in section 123 of Public Law 110–275 is met. Accordingly, if analysis of claims data for the Medicare beneficiaries receiving services at each of the participating CAHs, as well as of other data sources, including cost reports, shows that increases in Medicare payments under the demonstration during the 3-year period are not sufficiently offset by reductions elsewhere, we will recoup the additional expenditures attributable to the demonstration through a reduction in payments to all CAHs nationwide. The demonstration is projected to impact payments to participating CAHs under both Medicare Part A and Part B. Thus, in the event that we determine that aggregate payments under the demonstration exceed the payments that would otherwise have been made, we proposed that CMS would recoup payments through reductions of Medicare payments to all CAHs under both Medicare Part A and Part B. Because of the small scale of the demonstration, it would not be feasible to implement budget neutrality by reducing payments only to the participating CAH providers. We proposed to make the reduction to payments to all CAHs, not just those participating in the demonstration, because the FCHIP program is specifically designed to test innovations that affect delivery of services by this provider category. We believe that the language of the statutory budget neutrality requirement at section 123(g)(1)(B) of the Act permits the agency to implement the budget neutrality provision in this manner. The statutory language refers merely to ensuring that aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project was not implemented, and does not identify the range across which aggregate payments must be held equal.

Given the 3-year period of performance of the FCHIP demonstration and the time needed to conduct the budget neutrality analysis, we proposed that, in the event the demonstration is found not to have been budget neutral, any excess costs would be recouped over a period of three cost report periods, beginning in CY 2020. Therefore, in this final rule, we are finalizing this proposal, which has no impact for any national payment system for FY 2017.

I. Effects of Changes in the Capital IPPS

1. General Considerations

For the impact analysis presented below, we used data from the March 2016 update of the FY 2015 MedPAR file and the March 2016 update of the Provider-Specific File (PSF) that is used for payment purposes. Although the analyses of the changes to the capital prospective payment system do not incorporate cost data, we used the March 2016 update of the most recently available hospital cost report data (FYs 2013 and 2014) to categorize hospitals. Our analysis has several qualifications. We use the best data available and make assumptions about case-mix and beneficiary enrollment as described later in this section.

Due to the interdependent nature of the IPPS, it is very difficult to precisely quantify the impact associated with each change. In addition, we draw upon various sources for the data used to categorize hospitals in the tables. In some cases (for instance, the number of beds), there is a fair degree of variation in the data from different sources. We have attempted to construct these variables with the best available sources overall. However, it is possible that some individual hospitals are placed in the wrong category.

Using cases from the March 2016 update of the FY 2015 MedPAR file, we simulated payments under the capital IPPS for FY 2016 and FY 2017 for a comparison of total payments per case. Any short-term, acute care hospitals not paid under the general IPPS (for example, Indian Health Service hospitals and hospitals in Maryland) are excluded from the simulations.

The methodology for determining a capital IPPS payment is set forth at § 412.312. The basic methodology for calculating the capital IPPS payments in FY 2017 is as follows:

(Standard Federal Rate) × (DRG weight) × (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + DSH Adjustment Factor + IME adjustment factor, if applicable).

In addition to the other adjustments, hospitals may receive outlier payments for those cases that qualify under the threshold established for each fiscal year. We modeled payments for each hospital by multiplying the capital Federal rate by the GAF and the hospital's case-mix. We then added estimated payments for indirect medical education, disproportionate share, and outliers, if applicable. For purposes of this impact analysis, the model includes the following assumptions:

- We estimate that the Medicare case-mix index will increase by 0.5 percent in both FYs 2016 and 2017.
- We estimate that Medicare discharges will be approximately 11.0 million in FY 2016 and 11.1 million in FY 2017.
- The capital Federal rate was updated beginning in FY 1996 by an analytical framework that considers changes in the prices associated with capital-related costs and adjustments to account for forecast error, changes in the case-mix index, allowable changes in intensity, and other factors. As discussed in section III.A.1.a. of the Addendum to this rule, the update is 0.9 percent for FY 2017.
- In addition to the FY 2017 update factor, the FY 2017 capital Federal rate was calculated based on a GAF/DRG budget neutrality adjustment factor of 0.9991, a outlier adjustment factor of 0.9386, and an adjustment of (1/0.998) to permanently remove the 0.2 percent adjustment, as well as a temporary 2-midnight adjustment of 1.006. The 2-midnight adjustments are discussed in section V.C. of the preamble of this final rule and are consistent with the 2-midnight adjustments on the operating Federal rate. As discussed in section V.C. of the preamble of this final rule, we are not making an additional MS–DRG documentation and coding adjustment to the capital IPPS Federal rates for FY 2017.

2. Results

We used the actuarial model previously described in section I.I. of Appendix A of this final rule to estimate the potential impact of our changes for FY 2017 on total capital payments per case, using a universe of 3,330 hospitals. As previously described, the individual hospital payment parameters are taken from the best available data, including the March 2016 update of the FY 2015 MedPAR file, the March 2016 update to the PSF, and the most recent cost report data from the March 2016 update of HCRIS. In Table III, we present a comparison of estimated total payments per case for FY 2016 and estimated total payments per case for FY 2017 based on the FY 2017 payment policies. Column 2 shows estimates of payments per case under our model for FY 2016. Column 3 shows estimates of payments per case under our model for FY 2017. Column 4 shows the total percentage change in payments from FY 2016 to FY 2017. The change represented in Column 4 includes the 0.9 percent update to the capital Federal rate and other changes in the adjustments to the capital Federal rate. The comparisons are provided by: (1) Geographic location; (2) region; and (3) payment classification.

The simulation results show that, on average, capital payments per case in FY 2017 are expected to increase as compared to capital payments per case in FY 2016. This expected increase overall is due primarily to the approximately 1.84 percent increase in the capital Federal rate for FY 2017 as compared to the FY 2016 capital Federal rate. (For a discussion of the determination of the capital Federal rate, we refer readers to section III.A. of the Addendum to this final

rule.) Less than half of the hospitals in urban areas are expected to experience a slight increase in capital payments per case due to the effects of changes to the GAFs, while the remainder of these urban area hospitals would experience no change or a decrease in capital payments per case due to changes in the GAFs. For most hospitals in rural areas, changes in the GAFs are expected to increase capital payments, to a greater or lesser extent, except for two rural areas where changes in the GAFs are expected to decrease capital payments per case. These regional effects of the changes to the GAFs on capital payments are consistent with the projected changes in payments due to changes in the wage index (and policies affecting the wage index) as shown in Table I in section I.G. of this Appendix A.

The net impact of these changes is an estimated 0.8 percent change in capital payments per case from FY 2016 to FY 2017 for all hospitals (as shown in Table III).

The geographic comparison shows that, on average, most hospitals in all classifications (urban and rural) will experience an increase in capital IPPS payments per case in FY 2017 as compared to FY 2016. Capital IPPS payments per case for hospitals in ''large urban areas'' have an estimated increase of 0.7 percent, while hospitals in rural areas, on average, are expected to experience a 0.8 percent increase in capital payments per case from FY 2016 to FY 2017. Capital IPPS payments per case for ''other urban hospitals'' are estimated to increase 0.9 percent. The primary factor contributing to the small difference in the projected increase in capital IPPS payments per case for urban hospitals as compared to rural hospitals is the changes to the GAFs.

The comparisons by region show that the estimated increases in capital payments per case from FY 2016 to FY 2017 in urban areas range from a 4.2 percent increase for the Puerto Rico urban hospitals, and a 1.4 percent increase for the West South Central urban region to a 0.7 percent increase for the Mountain urban region. The New England urban region is expected to experience a 0.6 percent decrease in capital payments per case, largely due to changes in the GAFs as compared to the other urban hospitals. The 4.2 percent increase in capital payments per case for the Puerto Rico urban region is in part due to the change in the capital payment rate to 100 percent of the capital Federal rate rather than a blend of the capital Puerto Rico rate and the capital Federal rate, as discussed in section V.B.3. of the preamble of this final rule. For rural regions, the Middle Atlantic rural region is projected to experience the largest increase in capital IPPS payments per case of 1.6 percent, while the Mountain rural region is projected to experience a small decrease in capital IPPS payments per case of 0.4 percent. The change in the GAFs is the main factor for the projected decrease in the capital IPPS payments for the Mountain rural region compared to the other rural regions, as it is for the projected decrease in capital IPPS payments for the New England urban region.

Hospitals of all types of ownership (that is, voluntary hospitals, government hospitals, and proprietary hospitals) are expected to experience an increase in capital payments per case from FY 2016 to FY 2017. The increase in capital payments for voluntary and proprietary hospitals is estimated to be 0.8 percent and for government hospitals, the increase is estimated to be 0.7 percent.

Section 1886(d)(10) of the Act established the MGCRB. Hospitals may apply for reclassification for purposes of the wage index for FY 2017. Reclassification for wage index purposes also affects the GAFs because that factor is constructed from the hospital wage index. To present the effects of the hospitals being reclassified as of the publication of this rule for FY 2017, we show the average capital payments per case for hospitals for FY 2017. Urban reclassified hospitals are expected to experience an increase in capital payments of 1.0 percent; urban nonreclassified hospitals are expected to experience an increase in capital payments of 0.7 percent. The estimated percentage increase for rural reclassified hospitals is 1.0 percent, and for rural nonreclassified hospitals, the estimated percentage increase is 0.2 percent. Other reclassified hospitals (section 1886(d)(8)(B) of the Act) are expected to experience an increase in capital payments of 0.5 percent.

TABLE III—COMPARISON OF TOTAL PAYMENTS PER CASE

[FY 2016 payments compared to FY 2017 payments]

	Number of hospitals	Average FY 2016 payments/case	Average FY 2017 payments/case	Change
By Geographic Location:				
All hospitals	3,330	912	920	0.8
Large urban areas (populations over 1 million)	1,380	1,011	1,018	0.7
Other urban areas (populations of 1 million of fewer)	1,135	870	878	0.9
Rural areas	815	618	623	0.8
Urban hospitals	2,515	947	955	0.8
0–99 beds	659	768	774	0.7
100–199 beds	767	824	829	0.6
200–299 beds	446	865	871	0.7
300–499 beds	431	958	967	0.9
500 or more beds	212	1,139	1,149	0.9
Rural hospitals	815	618	623	0.8
0–49 beds	317	520	524	0.7
50–99 beds	292	577	582	0.8
100–149 beds	120	610	614	0.5
150–199 beds	46	669	673	0.7
200 or more beds	40	738	746	1.0
By Region:				
Urban by Region	2,515	947	955	0.8

J. Effects of Payment Rate Changes and Policy Changes Under the LTCH PPS

1. Introduction and General Considerations

In section VII. of the preamble of this final rule and section V. of the Addendum to this final rule, we set forth the annual update to the payment rates for the LTCH PPS for FY 2017. In the preamble of this final rule, we specify the statutory authority for the provisions that are presented, identify the proposed and final policies, and present rationales for our decisions as well as alternatives that were considered. In this section of Appendix A to this final rule, we discuss the impact of the changes to the payment rate, factors, and other payment rate policies related to the LTCH PPS that are presented in the preamble of this final rule in terms of their estimated fiscal impact on the Medicare budget and on LTCHs.

There are 420 LTCHs included in this impacts analysis, which includes data for 78 nonprofit (voluntary ownership control) LTCHs, 325 proprietary LTCHs, and 17 LTCHs that are government-owned and operated. (We note that, although there are currently approximately 430 LTCHs, for purposes of this impact analysis, we excluded the data of all-inclusive rate providers consistent with the development of the FY 2017 MS–LTC–DRG relative weights (discussed in section VII.C.3.c. of the preamble of this final rule).) In the impact analysis, we used the payment rate, factors, and policies presented in this final rule, which includes the continued transition to the site neutral payment rate required by section 1886(m)(6)(A) of the Act (discussed in section VII.B. of the preamble of this final rule), the 1.75 percent annual update to the LTCH PPS standard Federal payment rate in accordance with section 1886(m)(5)(C) of the Act (which is based on the full estimated increase of the revised and rebased LTCH

PPS market basket and the reductions required by sections 1886(m)(3) and (m)(4) of the Act), the update to the MS–LTC–DRG classifications and relative weights, the update to the wage index values and labor-related share, and the best available claims and CCR data to estimate the change in payments for FY 2017.

Under the dual rate LTCH PPS payment structure, payment for LTCH discharges that meet the criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) is based on the LTCH PPS standard Federal payment rate. Consistent with the statute, the site neutral payment rate is the lower of the IPPS comparable per diem amount as determined under § 412.529(d)(4), including any applicable outlier payments as specified in § 412.525(a); or 100 percent of the estimated cost of the case as determined under existing § 412.529(d)(2). In addition, there are two separate HCO targets—one for LTCH PPS standard Federal payment rate cases and one for site neutral payment rate cases. The statute also establishes a transitional payment method for cases that are paid the site neutral payment rate for LTCH discharges occurring in cost reporting periods beginning during FY 2016 and FY 2017. The transitional payment amount for site neutral payment rate cases is a blended payment rate, which is calculated as 50 percent of the applicable site neutral payment rate amount for the discharge as determined under new § 412.522(c)(1) and 50 percent of the applicable LTCH PPS standard Federal payment rate for the discharge determined under § 412.523.

Based on the best available data for the 420 LTCHs in our database that were considered in the analyses used for this final rule, we estimate that overall LTCH PPS payments in FY 2017 will decrease by approximately 7.1 percent (or approximately $363 million). This projection takes into account estimated payments for LTCH cases in our database that would have met the patient-level criteria and been paid the LTCH PPS standard Federal payment rate if those criteria had been in effect at the time of the discharge, and estimated payments for LTCH cases that would not have met the patient-level criteria and been paid under the site neutral payment rate if that rate had been in effect at the time of the discharge, as described in the following paragraph.

The statutory transitional payment method for cases that are paid the site neutral payment rate for LTCH discharges occurring in cost reporting periods beginning during FY 2016 or FY 2017 uses a blended payment rate, which is determined as 50 percent of the site neutral payment rate amount for the discharge and 50 percent of the standard Federal prospective payment rate amount for the discharge (§ 412.522(c)(3)). The transitional blended payment rate uses the same blend percentages (that is, 50 percent) for both years of the 2-year transition period. Therefore, when estimating FY 2017 LTCH PPS payments for site neutral payment rate cases for this impact analysis, the transitional blended payment rate was applied to all such cases because all discharges in FY 2017 will either be in the hospital's cost reporting period that began during FY 2016 or in the hospital's cost reporting period that will begin during FY 2017. However, when estimating FY 2016 LTCH PPS payments for site neutral payment rate cases for this impact analysis because the statute specifies that the site neutral payment rate effective date for a given LTCH is determined based on the date on which that LTCH's cost reporting period begins during FY 2016, we included an adjustment to account for this rolling effective date, consistent with the approach used for the LTCH PPS impact analysis presented in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49831). This approach accounts for the fact that LTCHs with discharges in FY 2016 that are in cost reporting periods that begin *before* October 1, 2015, continued to be paid for all discharges (including those that did not meet the patient-level criteria for exclusion from the site neutral payment rate) at the LTCH PPS standard Federal payment rate until the start of their first cost reporting period beginning *after* October 1, 2015.

For purposes of this impact analysis, to estimate total FY 2016 LTCH PPS payments for site neutral payment rate cases, we used the same approach as was used in the FY 2016 IPPS/LTCH PPS final rule. In summary, under this approach, we grouped LTCHs based on the quarter of FY 2016 their cost reporting periods began during FY 2016. For example, LTCHs with cost reporting periods that began during October through December 2015 began during the first quarter of FY 2016. For LTCHs grouped in each quarter of FY 2016, we modeled those LTCHs' estimated FY 2016 site neutral payment rate payments under the transitional blended payment rate based on the quarter in which the LTCHs in each group become subject to the site neutral payment rate. Then, we modeled for LTCHs grouped in each quarter of FY 2016, estimated FY 2016 payments under the LTCH PPS standard Federal payment rate based on the quarter in which the LTCHs in each group become subject to the site neutral payment rate. (For additional details on our method of taking into account the rolling effective date of the application of the site neutral payment rate when estimating payments for FY 2016, we refer readers to the description presented in FY 2016 IPPS/LTCH PPS final rule (80 FR 49831).) We continue to believe that this approach is a reasonable means of taking the rolling effective date into account when estimating FY 2016 payments.

Based on the fiscal year start dates recorded in the March 2016 update of the PSF, of the 420 LTCHs in our database of LTCH claims from the March 2016 update of the FY 2015 MedPAR files used for this final rule, the following percentages apply in the approach previously described: 9.9 percent of site neutral payment rate cases are from LTCHs whose cost reporting periods begin in the first quarter of FY 2016; 26.4 percent of site neutral payment rate cases are from LTCHs whose cost reporting periods begin in the second quarter of FY 2016; 10.3 percent of site neutral payment rate cases are from LTCHs whose cost reporting periods begin in the third quarter of FY 2016; and 53.4 percent of site neutral payment rate cases are from LTCHs whose cost reporting periods begin in the fourth quarter of FY 2016.

Comment: Some commenters requested that additional information be added to the publically available IPPS and LTCH PPS MedPAR files because they were made available in the FY 2016 rulemaking cycle, such as encrypted patient identifiers, encrypted admission and discharge dates, and the number of days the patient spent in the ICU in the immediately preceding IPPS hospital stay prior to admission to the LTCH. These commenters believed that such additional information is needed to determine which historical discharges were immediately preceded by a qualifying IPPS hospital stay and could be used to verify the payment rate designation (that is, site neural or standard) CMS has included in the publically available IPPS and LTCH MedPAR file.

Response: We understand that, for commenters who would like to replicate the proposed LTCH PPS payment rates, factors, and payment estimates presented in the proposed rule, it is necessary to be able to identify the LTCH discharges in the historical data that would be the LTCH PPS standard Federal payment rate cases and the ones that would be site neutral payment rate cases (had the statutory criteria been in effect at the time of the discharge). In response to a similar comment in the FY 2016 rule-making cycle, as requested by commenters, we have added the number of days that the patient spent in the ICU in an immediately preceding IPPS hospital stay prior to admission to the LTCH because this aggregated count of days conforms with CMS' privacy and security standards and does not result in the identification of specific beneficiaries. We believe that including the number of days spent in the ICU from the immediately preceding IPPS hospital stay to the publically available MedPAR file will allow the public to adequately corroborate the indicator of the historical LTCH discharges as a LTCH PPS standard Federal payment rate case or a site neutral payment rate case (had the statutory criteria been in effect at the time of the discharge).

As we explained in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49603), currently the publically available IPPS and LTCH PPS MedPAR files do not contain any specified direct patient identifiers consistent with CMS' privacy and security standards and as outlined in the HIPAA Privacy Rule. (For additional information on CMS' privacy and security standards under the HIPAA Privacy Rule, we refer readers to the CMS Web site at: *https://www.cms.gov/Regulations-and-Guidance/Administrative-Simplification/HIPAA-ACA/PrivacyandSecurityInformation.html*, and for additional information on CMS' publically available LDS files, we refer readers to the CMS Web site at: *http://cms.hhs.gov/Research-Statistics-Data-and-Systems/Files-for-Order/LimitedDataSets/index.html*.) It is for these reasons that, as noted by commenters, we added an identifier to the publically available FY 2014 LTCH MedPAR File to identify the historical LTCH discharges in that file as LTCH PPS standard Federal payment rate cases or site neutral

payment rate cases (had the statutory dual rate LTCH PPS payment structure been in effect at the time of the discharge). These are the same payment rate identifiers we used to develop the FY 2017 proposed payment rates, factors, and payment estimates as described in the proposed rule. We believe that the addition of this payment rate identifier to the publically available LTCH MedPAR file provides sufficient information for commenters to replicate and evaluate the proposed payment rates, factors, and payment estimates in the proposed rule. We will continue to consider adding the encrypted information requested by commenters to the publically available IPPS and LTCH PPS MedPAR files. However, we are not able to do so at this time because to add such specific direct patient identifiers would need to be done in conformance with CMS' privacy and security standards, including any requirements outlined in the HIPAA Privacy and Security Rules.

Based on the FY 2015 LTCH cases that were used for the analyses in this final rule, approximately 45 percent of those LTCH cases would have been classified as site neutral payment rate cases if the site neutral payment rate had been in effect in FY 2015 (that is, 45 percent of such LTCH cases would not have met the patient-level criteria for exclusion from the site neutral payment rate). Our Office of the Actuary estimates that the percent of LTCH PPS cases that will be paid at the site neutral payment rate in FY 2017 will not change significantly from the historical data. Taking into account the transitional blended payment rate and other changes that will apply to the site neutral payment rate cases in FY 2017, we estimate that aggregate LTCH PPS payments for these site neutral payment rate cases will decrease by approximately 23 percent (or approximately $388 million).

Approximately 55 percent of LTCH cases are expected to meet the patient-level criteria for exclusion from the site neutral payment rate in FY 2017, and will be paid based on the LTCH PPS standard Federal payment rate for the full year. We estimate that total LTCH PPS payments for these LTCH PPS standard Federal payment rate cases in FY 2017 will increase approximately 0.7 percent (or approximately $24 million). This estimated increase in LTCH PPS payments for LTCH PPS standard Federal payment rate cases in FY 2017 is primarily due to the combined effects of the 1.75 percent annual update to the LTCH PPS standard Federal payment rate for FY 2017 (discussed in section V.A. of the Addendum to this final rule) and an estimated decrease in HCO payments for these cases (discussed in section V.D.3. of the Addendum to this final rule).

Based on the 420 LTCHs that were represented in the FY 2015 LTCH cases that were used for the analyses in this final rule, we estimate that aggregate FY 2017 LTCH PPS payments will be approximately $4.771 billion, as compared to estimated aggregate FY 2016 LTCH PPS payments of approximately $5.134 billion, resulting in an estimated overall decrease in LTCH PPS payments of approximately $363 million. Because the combined distributional effects and estimated payment changes exceed $100 million, this final rule is a major economic rule. We note that this estimated $363 million decrease in LTCH PPS payments in FY 2017 (which includes estimated payments for LTCH PPS standard Federal payment rate cases and site neutral payment rate cases) does not reflect changes in LTCH admissions or case-mix intensity, which would also affect the overall payment effects of the policies in this final rule.

The LTCH PPS standard Federal payment rate for FY 2016 is $41,762.85. For FY 2017, we are establishing an LTCH PPS standard Federal payment rate of $42,476.41 (as compared to the proposed payment rate of $42,314.31), which reflects the 1.75 percent annual update to the LTCH PPS standard Federal payment rate and the area wage budget neutrality factor of 0.999593 to ensure that the changes in the wage indexes and labor-related share do not influence aggregate payments. For LTCHs that fail to submit data for the LTCH QRP, in accordance with section 1886(m)(5)(C) of the Act, we are establishing an LTCH PPS standard Federal payment rate of $41,641.49. This reduced LTCH PPS standard Federal payment rate reflects the updates previously described as well as the required 2.0 percentage point reduction to the annual update for failure to submit data under the LTCH QRP. We note that the factors previously described to determine the FY 2017 LTCH PPS standard Federal payment rate are applied to the FY 2016 LTCH PPS standard Federal rate set forth under § 412.523(c)(3)(xii) (that is, $41,762.85).

Table IV shows the estimated impact for LTCH PPS standard Federal payment rate cases. The estimated change attributable solely to the annual update to the LTCH PPS standard Federal payment rate is projected to result in an increase of 1.5 percent in payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017, on average, for all LTCHs (Column 6). In addition to the annual update to the LTCH PPS standard Federal payment rate for FY 2017, the estimated increase of 1.5 percent shown in Column 6 of Table IV also includes estimated payments for SSO cases that will be paid using special methodologies that are not affected by the annual update to the LTCH PPS standard Federal payment rate, as well as the reduction that is applied to the annual update of LTCHs that do not submit the required LTCH QRP data. Therefore, for all hospital categories, the projected increase in payments based on the LTCH PPS standard Federal payment rate to LTCH PPS standard Federal payment rate cases is somewhat less than the 1.75 percent annual update for FY 2017.

For FY 2017, we are updating the wage index values based on the most recent available data, and we are continuing to use labor market areas based on the OMB CBSA delineations (as discussed in section V.B. of the Addendum to this final rule). In addition, we are increasing the labor-related share from 62.0 percent to 66.5 percent under the LTCH PPS for FY 2017, based on the most recent available data on the relative importance of the labor-related share of operating and capital costs of the 2013-based LTCH market basket (as discussed in section VII.D. of the preamble of this final rule). We also are applying an area wage level budget neutrality factor of 0.999593 to ensure that the changes to the wage data and labor-related share do not result in a change in estimated aggregate LTCH PPS payments to LTCH PPS standard Federal payment rate cases, which decreases the LTCH PPS standard Federal payment rate by approximately 0.04 percent.

We currently estimate total HCO payments for LTCH PPS standard Federal payment rate cases will decrease from FY 2016 to FY 2017. Based on the FY 2015 LTCH cases that were used for the analyses in this final rule, we estimate that the FY 2016 HCO threshold of $16,423 (as established in the FY 2016 IPPS/LTCH PPS final rule) will result in estimated HCO payments for LTCH PPS standard Federal payment rate cases in FY 2016 that are above the estimated 8 percent target. Specifically, we currently estimate that HCO payments for LTCH PPS standard Federal payment rate cases will be approximately 9.0 percent of the estimated total LTCH PPS standard Federal payment rate payments in FY 2016. Combined with our estimate that FY 2017 HCO payments for LTCH PPS standard Federal payment rate cases will be 8.0 percent of estimated total LTCH PPS standard Federal payment rate payments in FY 2017, this results in the estimated decrease in HCO payments of approximately 1.0 percent between FY 2016 and FY 2017.

In calculating these estimated HCO payments, we increased estimated costs by our actuaries' projected market basket percentage increase factor. This increase in estimated costs also results in a projected increase in SSO payments in FY 2017 (because 100 percent of the estimated cost of the case is an option in the SSO payment formula (§ 412.529)). We estimate that these increased SSO payments in FY 2017 will increase total payments for LTCH PPS standard Federal payment rate cases by approximately 0.25 percent. (Payments for SSO cases represent approximately 14 percent of the estimated total FY 2017 payments for LTCH PPS standard Federal payment rate cases.)

Table IV shows the estimated impact of the payment rate and policy changes on LTCH PPS payments for LTCH PPS standard Federal payment rate cases for FY 2017 by comparing estimated FY 2016 LTCH PPS payments to estimated FY 2017 LTCH PPS payments. (As noted earlier, our analysis does not reflect changes in LTCH admissions or case-mix intensity.) The projected increase in payments from FY 2016 to FY 2017 for LTCH PPS standard Federal payment rate cases of 0.7 percent is attributable to the impacts of the change to the LTCH PPS standard Federal payment rate (1.5 percent in Column 6) and the effect of the estimated decrease in HCO payments for LTCH PPS standard Federal payment cases (− 1.0 percent), and the estimated increase in payments for SSO cases (0.25 percent). We note that these impacts do not include LTCH PPS site neutral payment rate cases for the reasons discussed in section I.J.3. of this Appendix.

As we discuss in detail throughout this final rule, based on the most recent available data, we believe that the provisions of this

final rule relating to the LTCH PPS, which are projected to result in an overall decrease in estimated aggregate LTCH PPS payments, and the resulting LTCH PPS payment amounts will result in appropriate Medicare payments that are consistent with the statute.

2. Impact on Rural Hospitals

For purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. As shown in Table IV, we are projecting a 0.7 percent increase in estimated payments for LTCH PPS standard Federal payment rate cases. This estimated impact is based on the FY 2015 data for the 21 rural LTCHs (out of 420 LTCHs) that were used for the impact analyses shown in Table VI.

3. Anticipated Effects of LTCH PPS Payment Rate Changes and Policy Changes

a. Budgetary Impact

Section 123(a)(1) of the BBRA requires that the PPS developed for LTCHs ''maintain budget neutrality.'' We believe that the statute's mandate for budget neutrality applies only to the first year of the implementation of the LTCH PPS (that is, FY 2003). Therefore, in calculating the FY 2003 standard Federal payment rate under § 412.523(d)(2), we set total estimated payments for FY 2003 under the LTCH PPS so that estimated aggregate payments under the LTCH PPS were estimated to equal the amount that would have been paid if the LTCH PPS had not been implemented.

Section 1886(m)(6)(A) of the Act establishes a dual rate LTCH PPS payment structure with two distinct payment rates for LTCH discharges beginning in FY 2016. Under this statutory change, LTCH discharges that meet the patient-level criteria for exclusion from the site neutral payment rate (that is, LTCH PPS standard Federal payment rate cases) are paid based on the LTCH PPS standard Federal payment rate. LTCH discharges paid at the site neutral payment rate are generally paid the lower of the IPPS comparable per diem amount, including any applicable HCO payments, or 100 percent of the estimated cost of the case. The statute also establishes a transitional payment method for cases that are paid at the site neutral payment rate for LTCH discharges occurring in cost reporting periods beginning during FY 2016 or FY 2017, under which the site neutral payment rate cases are paid based on a blended payment rate calculated as 50 percent of the applicable site neutral payment rate amount for the discharge and 50 percent of the applicable LTCH PPS standard Federal payment rate for the discharge.

As discussed in section I.J.1. of this Appendix, we project a decrease in aggregate LTCH PPS payments in FY 2017 of approximately $363 million. This estimated decrease in payments reflects the projected increase in payments to LTCH PPS standard Federal payment rate cases of approximately $25 million and the projected decrease in payments to site neutral payment rate cases of approximately $388 million under the dual rate LTCH PPS payment rate structure required by the statute beginning in FY 2016.

As discussed in section VII.B.7.b. of the preamble of this final rule, our actuaries project cost and resource changes for site neutral payment rate cases due to the site neutral payment rates required under the statute. Specifically, our actuaries project that the costs and resource use for cases paid at the site neutral payment rate will likely be lower, on average, than the costs and resource use for cases paid at the LTCH PPS standard Federal payment rate, and will likely mirror the costs and resource use for IPPS cases assigned to the same MS–DRG. While we are able to incorporate this projection at an aggregate level into our payment modeling, because the historical claims data that we are using in this final rule to project estimated FY 2017 LTCH PPS payments (that is, FY 2015 LTCH claims data) do not reflect this actuarial projection, we are unable to model the impact of the change in LTCH PPS payments for site neutral payment rate cases at the same level of detail with which we are able to model the impacts of the changes to LTCH PPS payments for LTCH PPS standard Federal payment rate cases. Therefore, Table IV only reflects changes in LTCH PPS payments for LTCH PPS standard Federal payment rate cases and, unless otherwise noted, the remaining discussion in section I.J.3. of this Appendix refers only to the impact on LTCH PPS payments for LTCH PPS standard Federal payment rate cases. In the following section, we present our provider impact analysis for the changes that affect LTCH PPS payments for LTCH PPS standard Federal payment rate cases.

b. Impact on Providers

Under the dual rate LTCH PPS payment structure, there are two distinct payment rates for LTCH discharges occurring in cost reporting periods beginning on or after October 1, 2016. Under that statute, any discharges that occur on or after October 1, 2015, but prior to the start of the LTCH's FY 2016 cost reporting period, will be paid at the LTCH PPS standard Federal payment rate. On or after the start of an LTCH's FY 2017 cost reporting period, discharges are paid based on the nature of the case. As described previously, LTCH PPS standard Federal payment rate cases are defined as LTCH discharges that meet the patient-level criteria to be excluded from the typically lower site neutral payment rate, and site neutral payment rate cases are defined as LTCH discharges that do not meet the patient-level criteria and generally will be paid the lower site neutral payment rate. However, for discharges occurring in cost reporting periods beginning in FY 2016 or 2017, the statute specifies that site neutral payment rate cases are paid based on a transitional payment method that is calculated as 50 percent of the applicable site neutral payment rate amount and 50 percent of the applicable LTCH PPS standard Federal payment rate.

The basic methodology for determining a per discharge payment for LTCH PPS standard Federal payment rate cases is currently set forth under §§ 412.515 through 412.536. In addition to adjusting the LTCH PPS standard Federal payment rate by the MS–LTC–DRG relative weight, we make adjustments to account for area wage levels and SSOs. LTCHs located in Alaska and Hawaii also have their payments adjusted by a COLA. Under our application of the dual rate LTCH PPS payment structure, the LTCH PPS standard Federal payment rate is generally only used to determine payments for LTCH PPS standard Federal payment rate cases (that is, those LTCH PPS cases that meet the statutory criteria to be excluded from the site neutral payment rate). LTCH discharges that do not meet the patient-level criteria for exclusion are paid the site neutral payment rate, which we are calculating as the lower of the IPPS comparable per diem amount as determined under § 412.529(d)(4), including any applicable outlier payments, or 100 percent of the estimated cost of the case as determined under existing § 412.529(d)(2). In addition, when certain thresholds are met, LTCHs also receive HCO payments for both LTCH PPS standard Federal payment rate cases and site neutral payment rate cases that are paid at the IPPS comparable per diem amount.

To understand the impact of the changes to the LTCH PPS payments for LTCH PPS standard Federal payment rate cases presented in this final rule on different categories of LTCHs for FY 2017, it is necessary to estimate payments per discharge for FY 2016 using the rates, factors, and the policies established in the FY 2016 IPPS/LTCH PPS final rule and estimate payments per discharge for FY 2017 using the rates, factors, and the policies in this FY 2017 IPPS/LTCH PPS final rule (as discussed in section VII. of the preamble of this final rule and section V. of the Addendum to this final rule). As discussed elsewhere in this final rule, these estimates are based on the best available LTCH claims data and other factors, such as the application of inflation factors to estimate costs for SSO and HCO cases in each year. The resulting analyses can then be used to compare how our policies applicable to LTCH PPS standard Federal payment rate cases affect different groups of LTCHs.

For the following analysis, we group hospitals based on characteristics provided in the OSCAR data, FY 2012 through FY 2013 cost report data in HCRIS, and PSF data. Hospital groups included the following:

- Location: Large urban/other urban/rural.
- Participation date.
- Ownership control.
- Census region.
- Bed size.

c. Calculation of LTCH PPS Payments for LTCH PPS Standard Federal Payment Rate Cases

For purposes of this impact analysis, to estimate the per discharge payment effects of our policies on payments for LTCH PPS standard Federal payment rate cases, we simulated FYs 2016 and 2017 payments on a case-by-case basis using historical LTCH claims from the FY 2015 MedPAR files that would have met the criteria to be paid at the LTCH PPS standard Federal payment rate if the statutory patient-level criteria had been in effect at the time of discharge for those cases. For modeling FY 2016 LTCH PPS payments, we used the FY 2016 standard Federal payment rate of $41,762.85, or $40,941.55 for LTCHs that failed to submit

quality data as required under the requirements of the LTCH QRP. Similarly, for modeling payments based on the FY 2017 LTCH PPS standard Federal payment rate, we used the FY 2017 standard Federal payment rate of $42,476.41, or $41,641.49 for LTCHs that failed to submit quality data as required under the requirements of the LTCH QRP. In each case, we applied the applicable adjustments for area wage levels and the COLA for LTCHs located in Alaska and Hawaii. Specifically, for modeling FY 2016 LTCH PPS payments, we used the current FY 2016 labor-related share (62.0 percent); the wage index values established in the Tables 12A through 12D listed in the Addendum to the FY 2016 IPPS/LTCH PPS final rule (which are available via the Internet on the CMS Web site); the FY 2016 HCO fixed-loss amount for LTCH PPS standard Federal payment rate cases of $16,423 (as discussed in section V.D. of the Addendum to that final rule) and the FY 2016 COLA factors (shown in the table in section V.C. of the Addendum to that final rule) to adjust the FY 2016 nonlabor-related share (38.0 percent) for LTCHs located in Alaska and Hawaii. Similarly, for modeling FY 2017 LTCH PPS payments, we used the FY 2017 LTCH PPS labor-related share (66.5 percent), the FY 2017 wage index values from Tables 12A and 12B listed in section VI. of the Addendum to this final rule (which are available via the Internet on the CMS Web site), the FY 2017 fixed-loss amount for LTCH PPS standard Federal payment rate cases of $21,943 (as discussed in section V.D.3. of the Addendum to this final rule), and the FY 2017 COLA factors (shown in the table in section V.C. of the Addendum to this final rule) to adjust the FY 2017 nonlabor-related share (33.5 percent) for LTCHs located in Alaska and Hawaii.

As previously discussed, our impact analysis reflects an estimated change in payments for SSO cases, as well as an estimated decrease in HCO payments for LTCH PPS standard Federal payment rate cases (as described previously in section I.J.1. of this Appendix). In modeling payments for SSO and HCO cases for LTCH PPS standard Federal payment rate cases, we applied an inflation factor of 4.8 percent (determined by the Office of the Actuary) to update the 2015 costs of each case.

The impacts that follow reflect the estimated ''losses'' or ''gains'' among the various classifications of LTCHs from FY 2016 to FY 2017 based on the payment rates and policy changes applicable to LTCH PPS standard Federal payment rate cases presented in this final rule. Table IV illustrates the estimated aggregate impact of the change in LTCH PPS payments for LTCH PPS standard Federal payment rate cases among various classifications of LTCHs. (As discussed previously, these impacts do not include LTCH PPS site neutral payment rate cases.)

- The first column, LTCH Classification, identifies the type of LTCH.
- The second column lists the number of LTCHs of each classification type.
- The third column identifies the number of LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria.
- The fourth column shows the estimated FY 2016 payment per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria (as described previously).
- The fifth column shows the estimated FY 2017 payment per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria (as described previously).
- The sixth column shows the percentage change in estimated payments per discharge for LTCH cases expected to meet the LTCH PPS standard Federal payment rate criteria from FY 2016 to FY 2017 due to the annual update to the standard Federal rate (as discussed in section V.A.2. of the Addendum to this final rule).
- The seventh column shows the percentage change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017 for changes to the area wage level adjustment (that is, the wage indexes and the labor-related share), including the application of the area wage level budget neutrality factor (as discussed in section V.B. of the Addendum to this final rule).
- The eighth column shows the percentage change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 (Column 4) to FY 2017 (Column 5) for all changes (and includes the effect of estimated changes to HCO and SSO payments).

TABLE IV—IMPACT OF PAYMENT RATE AND POLICY CHANGES TO LTCH PPS PAYMENTS FOR STANDARD PAYMENT RATE CASES FOR FY 2017

[Estimated FY 2016 payments compared to estimated FY 2017 payments]

[1] Estimated FY 2017 LTCH PPS payments for LTCH PPS standard Federal payment rate criteria based on the payment rate and factor changes applicable to such cases presented in the preamble of and the Addendum to this final rule.

[2] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017 for the annual update to the LTCH PPS standard Federal payment rate. The temporary exclusion from the site neutral payment rate provided by section 231 of Public Law 114–113 is not reflected in these estimated FY 2017 LTCH PPS payments.

[3] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017 for changes to the area wage level adjustment under § 412.525(c) (as discussed in section V.B. of the Addendum to this final rule).

[4] Percent change in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 (shown in Column 4) to FY 2017 (shown in Column 5), including all of the changes to the rates and factors applicable to such cases presented in the preamble and the Addendum to this final rule. We note that this column, which shows the percent change in estimated payments per discharge for all changes, does not equal the sum of the percent changes in estimated payments per discharge for the annual update to the LTCH PPS standard Federal payment rate (Column 6) and the changes to the area wage level adjustment with budget neutrality (Column 7) due to the effect of estimated changes in both estimated payments to SSO cases that are paid based on estimated costs and aggregate HCO payments for LTCH PPS standard Federal payment rate cases (as discussed in this impact analysis), as well as other interactive effects that cannot be isolated.

d. Results

Based on the FY 2015 LTCH cases (from 420 LTCHs) that were used for the analyses in this final rule, we have prepared the following summary of the impact (as shown in Table IV) of the LTCH PPS payment rate and policy changes for LTCH PPS standard Federal payment rate cases presented in this final rule. The impact analysis in Table IV shows that estimated payments per discharge for LTCH PPS standard Federal payment rate cases are expected to increase 0.7 percent, on average, for all LTCHs from FY 2016 to FY 2017 as a result of the payment rate and policy changes applicable to LTCH PPS standard Federal payment rate cases presented in this final rule. This estimated 0.7 percent increase in LTCH PPS payments per discharge was determined by comparing estimated FY 2017 LTCH PPS payments (using the payment rates and factors discussed in this final rule) to estimated FY 2016 LTCH PPS payments for LTCH discharges which will be LTCH PPS standard Federal payment rate cases if the dual rate LTCH PPS payment structure had been in effect at the time of the discharge (as described in section I.J.3. of this Appendix).

As stated previously, we are updating the LTCH PPS standard Federal payment rate for FY 2017 by 1.75 percent based on the estimate of the 2013-based LTCH PPS market basket increase (2.8 percent), the reduction of 0.3 percentage point for the MFP adjustment, and the 0.75 percentage point reduction consistent with sections 1886(m)(3) and (m)(4) of the Act. For LTCHs that fail to submit quality data under the requirements of the LTCH QRP, as required by section 1886(m)(5)(C) of the Act, a 2.0 percentage point reduction is applied to the annual update to the LTCH PPS standard Federal payment rate. As explained earlier in this section, for most categories of LTCHs (as shown in Table IV, Column 6), the estimated payment increase due to the 1.75percent annual update to the LTCH PPS standard Federal payment rate is projected to result in approximately a 1.5 percent increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases for all LTCHs from FY 2016 to FY 2017. This is because our estimate of the changes in payments due to the update to the LTCH PPS standard Federal payment rate also reflects estimated payments for SSO cases that are paid using special methodologies that are not affected by the update to the LTCH PPS standard Federal payment rate. Consequently, for certain hospital categories, we estimate that payments to LTCH PPS standard Federal payment rate cases may increase by less than 1.75 percent due to the annual update to the LTCH PPS standard Federal payment rate for FY 2017.

(1) Location

Based on the most recent available data, the vast majority of LTCHs are located in urban areas. Only approximately 5 percent of the LTCHs are identified as being located in a rural area, and approximately 3 percent of all LTCH PPS standard Federal payment rate cases are expected to be treated in these rural hospitals. The impact analysis presented in Table IV shows that the overall average percent increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017 for all hospitals is 0.7 percent. For rural LTCHs, the overall percent change for LTCH PPS standard Federal payment rate cases is estimated to be a 0.3 percent increase, while for urban LTCHs, we estimate the increase will be 0.7 percent. Large urban LTCHs are projected to experience an increase of 1 percent in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017, and other urban LTCHs are projected to experience an increase of 0.3 percent in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017, as shown in Table IV.

(2) Participation Date

LTCHs are grouped by participation date into four categories: (1) Before October 1983; (2) between October 1983 and September 1993; (3) between October 1993 and September 2002; and (4) October 2002 and after. Based on the most recent available data, the categories of LTCHs with the largest expected percentage of LTCH PPS standard Federal payment rate cases (approximately 44 percent) are in LTCHs that began participating in the Medicare program between October 1993 and September 2002, and they are projected to experience a 0.7 percent increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017, as shown in Table IV.

Approximately 2.9 percent of LTCHs began participating in the Medicare program before October 1983, and these LTCHs are projected to experience an average percent increase (0.8 percent) in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017, as shown in Table IV. Approximately 10 percent of LTCHs began participating in the Medicare program between October 1983 and September 1993. These LTCHs are projected to experience a larger than average increase (0.9 percent) in estimated payments for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017, which is primarily due to a projected larger than average increase in payments due to the changes to the area wage adjustment. LTCHs that began participating in the Medicare program after October 1, 2002, which treat approximately 41 percent of all LTCH PPS standard Federal payment rate cases, are projected to experience a 0.7 percent increase in estimated payments from FY 2016 to FY 2017.

(3) Ownership Control

LTCHs are grouped into three categories based on ownership control type: Voluntary, proprietary, and government. Based on the most recent available data, approximately 19 percent of LTCHs are identified as voluntary (Table IV). The majority (approximately 77 percent) of LTCHs are identified as proprietary, while government owned and operated LTCHs represent approximately 4 percent of LTCHs. Based on ownership type, voluntary LTCHs are expected to experience a lower than average increase in payments to LTCH PPS standard Federal payment rate cases of 0.3 percent. Proprietary LTCHs are expected to experience an average increase of 0.8 percent in payments to LTCH PPS standard Federal payment rate cases, while government owned and operated LTCHs are expected to experience a smaller than average increase of 0.5 percent in payments to LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017.

(4) Census Region

Estimated payments per discharge for LTCH PPS standard Federal payment rate cases for FY 2017 are projected to experience no change from FY 2016 for LTCHs located in the East South Central and West North Central regions, while LTCHs located in all other regions are projected to experience an increase in estimated payments per discharge in comparison to FY 2016. Of the 9 census regions, we project that the increase in estimated payments per discharge to LTCH PPS standard Federal payment rate cases will have the largest positive impact on LTCHs in the Pacific and Middle Atlantic regions (2.2 percent and 1.4 percent, respectively, as shown in Table IV), which is largely attributable to the changes in the area wage level adjustment.

In contrast, LTCHs located in the South Atlantic and West South Central regions are projected to experience the smallest increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017. The lower than national average estimated increase in payments of 0.2 percent among LTCHS located in the South Atlantic region and 0.4 percent among LTCHS located in the West South Central region is primarily due to estimated decreases in payments associated with the changes to the area wage level adjustment.

(5) Bed Size

LTCHs are grouped into six categories based on bed size: 0–24 beds; 25–49 beds; 50–74 beds; 75–124 beds; 125–199 beds; and greater than 200 beds. All bed size categories are projected to receive an increase in estimated payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017. We project that LTCHs with 75 or more beds and fewer than 125 beds, as well as LTCHs with more than 200 beds (that is, LTCHs in the 75–124 beds and 200+ beds categories), will experience a larger than average increase in payments for LTCH PPS standard Federal payment rate cases (1.1 percent). LTCHs with 25 or more beds but fewer than 50 beds (that is, LTCHs in the 25–49 beds category) are expected to experience a smaller than average increase in payments per discharge for LTCH PPS standard Federal payment rate cases from FY 2016 to FY 2017 (0.4 percent), mostly due to estimated decreases in payments from the area wage level adjustment.

4. Effect on the Medicare Program

As stated previously, we project that the provisions of this final rule will result in an increase in estimated aggregate LTCH PPS payments to LTCH PPS standard Federal payment rate cases in FY 2017 relative to FY 2016 of approximately $25 million (or approximately 0.7 percent) for the 420 LTCHs in our database. Although, as stated previously, the hospital-level impacts do not include LTCH PPS site neutral payment rate cases, we estimate that the provisions of this final rule will result in a decrease in estimated aggregate LTCH PPS payments to site neutral payment rate cases in FY 2017 relative to FY 2016 of approximately $388 million (or approximately 23 percent) for the 420 LTCHs in our database. Therefore, we project that the provisions of this final rule will result in a decrease in estimated aggregate LTCH PPS payments to all LTCH cases in FY 2017 relative to FY 2016 of approximately $363 million (or approximately 7.1 percent) for the 420 LTCHs in our database.

5. Effect on Medicare Beneficiaries

Under the LTCH PPS, hospitals receive payment based on the average resources consumed by patients for each diagnosis. We do not expect any changes in the quality of care or access to services for Medicare beneficiaries as a result of this final rule, but we continue to expect that paying prospectively for LTCH services will enhance the efficiency of the Medicare program.

K. Effects of Requirements for the Hospital Inpatient Quality Reporting (IQR) Program

In section VIII.A. of the preamble of this final rule, we discuss our requirements for hospitals to report quality data under the Hospital IQR Program in order to receive the full annual percentage increase for the FY 2019 payment determination.

In section VIII.A.3.b. of the preamble of this final rule, we discuss finalizing our proposals to remove 15 measures: 13 eCQMs (2 of which we are also finalizing to remove in their chart-abstracted form) and 2 structural measures. We are finalizing our proposal to remove the electronic versions of: (1) AMI–2: Aspirin Prescribed at Discharge for AMI (NQF #0142); (2) AMI–7a: Fibrinolytic Therapy Received Within 30 minutes of Hospital Arrival; (3) AMI–10: Statin Prescribed at Discharge; (4) HTN: Healthy Term Newborn (NQF #0716); (5) PN–6: Initial Antibiotic Selection for Community-Acquired Pneumonia (CAP) in Immunocompetent Patients (NQF #0147); (6) SCIP–Inf–1a: Prophylactic Antibiotic Received within 1 Hour Prior to Surgical Incision (NQF #0527); (7) SCIP–Inf–2a: Prophylactic Antibiotic Selection for Surgical Patients (NQF #0528); (8) SCIP Inf–9: Urinary Catheter Removed on Postoperative Day 1 (POD1) or Postoperative Day 2 (POD2) with Day of Surgery Being Day Zero; (9) STK–4: Thrombolytic Therapy (NQF #0437); (10) VTE–3: Venous Thromboembolism Patients with Anticoagulation Overlap Therapy (NQF #0373); (11) VTE–4: Venous Thromboembolism Patients Receiving Unfractionated Heparin (UFH) with Dosages/Platelet Count Monitoring by Protocol (or Nomogram); (12) VTE–5: Venous Thromboembolism Discharge Instructions; and (13) VTE–6: Incidence of Potentially Preventable Venous Thromboembolism.

We are also finalizing our proposal to remove: (1) STK–4: Thrombolytic Therapy (NQF #0437); and (2) VTE–5: Venous Thromboembolism Discharge Instructions in their chart-abstracted form. Finally, we are also finalizing our proposal to remove two structural measures: (1) Participation in a Systematic Clinical Database Registry for Nursing Sensitive Care; and (2) Participation in a Systematic Clinical Database Registry for General Surgery.

As further explained in section X.B.7. of the preamble of this final rule, we believe that there will be a reduction in burden for hospitals due to the removal of two chart-abstracted measures (STK–4 and VTE–5). Due to the burden associated with the collection of chart-abstracted data, we estimate that the removal of STK–4 will result in a burden reduction of approximately 303,534 hours across all hospitals participating in the Hospital IQR Program for the FY 2019 payment determination. We estimate that the removal of VTE–5 will result in a burden reduction of approximately 1,437,843 hours across all hospitals participating in the Hospital IQR Program for the FY 2019 payment determination. We believe that removing 13 eCQMs will reduce burden for hospitals. However, as we stated in the proposed rule, even though we are requiring hospitals to submit data on 8 of the available eCQMs included in the Hospital IQR Program measure set (discussed below), the modest reduction in burden associated with removing 13 eCQMs from which hospitals may choose to report will be offset by the increased burden associated with submitting data on 8 eCQMs, instead of 4 eCQMs as previously finalized. We also believe that there will be a negligible burden reduction due to the removal of the two structural measures.

Also, we are finalizing refinements to two previously adopted measures: (1) Expanding the population cohort for the Hospital-Level, Risk-Standardized 30-Day Episode-of-Care Payment Measure for Pneumonia; and (2) Patient Safety and Adverse Events Composite (NQF #0531). As further explained in section X.B.7. of the preamble of this final rule, we believe no additional burden on hospitals will result from the refinements to these two claims-based measures.

In addition, we are finalizing our proposals to add four claims-based measures to the Hospital IQR Program measure set beginning with the FY 2019 payment determination: (1) Aortic Aneurysm Procedure Clinical Episode-Based Payment Measure; (2) Cholecystectomy and Common Duct Exploration Clinical Episode-Based Payment Measure; (3) Spinal Fusion Clinical Episode-Based Payment Measure; and (4) Excess Days in Acute Care after Hospitalization for Pneumonia. We believe no additional burden on hospitals will result from the addition of these four claims-based measures.

We are finalizing a modified version of our eCQM proposals; instead of requiring hospitals to submit data for all available eCQMs in the Hospital IQR Program measure set for the FY 2019 payment determination and subsequent years as proposed, we are finalizing a lesser amount. For the FY 2019 payment determination and the FY 2020 payment determination, we are requiring hospitals to submit data for 8 of the available eCQMs included in the Hospital IQR Program measure set in a manner that will permit eligible hospitals to align Hospital IQR Program requirements with some requirements under the Medicare and Medicaid EHR Incentive Programs. Specifically, hospitals will be required to submit a full calendar year of data for 8 eCQMs, on an annual basis, for CY 2017 reporting for the FY 2019 payment determination and CY 2018 reporting for the FY 2020 payment determination, as further explained in section X.B.7. of the preamble of this final rule. We believe that the burden associated with submitting a full year of eCQM data will not be substantially greater than the burden associated with transmission of a single quarter of data. As described in section VII.A.10.d of the preamble of this final rule, the CMS data receiving system requires that each QRDA I file include data for one patient, per quarter, per reporting CCN. Once hospitals establish their protocols to ensure this is maintained, hospitals and vendors should not experience much added burden reporting an additional 3 quarters of data. However, in our conservative estimates here, we calculate as if burden is four times as much in an abundance of caution. In total, we expect that this newly finalized proposal will increase burden by 15,400 hours across all hospitals participating in the Hospital IQR Program. This figure was derived by calculating the difference between the FY 2017 burden estimate of 17,600 hours (80 minutes per record/60 minutes per hour × 4 reporting quarters per year × 1 record per hospital per quarter × 3,300 hospitals) and the FY 2016 burden estimate of 2,200 hours (20 minutes per record/60 minutes per hour × 1 reporting quarter per year × 1 record per hospital per quarter × 3,300 hospitals) (80 FR 49763), for an incremental increase of 15,400 hours.

As we noted in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49763), for validation of chart-abstracted data, we require hospitals to provide 72 charts per hospital per year (with an average page length of 1,500), including 40 charts for HAI validation and 32 charts for clinical process of care validation, for a total of 108,000 pages per hospital per year. We reimburse hospitals at 12 cents per photocopied page for a total per hospital cost of $12,960. For hospitals providing charts digitally via a re-writable disc, such as encrypted CD–ROMs, DVDs, or flash drives, we will reimburse hospitals at a rate of 40 cents per disc, and additionally hospitals will be reimbursed $3.00 per record. For hospitals providing charts via secure file transfer, we will reimburse hospitals at a rate of $3.00 per record. We will maintain these requirements for the FY 2019 payment determination and subsequent years.

In this final rule, we are expanding the existing validation process for Hospital IQR Program data to include a random sample of up to 200 hospitals for validation of eCQMs in the Hospital IQR Program. As further explained in section X.B.7. of the preamble of this final rule, we estimate that 43 hours of work for up to 200 hospitals reflects a total burden increase of 8,533 labor hours. We estimate an hourly labor cost of $32.84. Therefore, we estimate a cost increase of $280,224 (8,533 additional burden hours × $32.84 per hour) across the up to 200 hospitals selected for eCQM validation, on an annual basis.

Finally, we are updating our Extraordinary Circumstances Extensions or Exemptions (ECE) policy. We believe the updates will have no effect on burden for hospitals.

Historically, 100 hospitals, on average, that participate in the Hospital IQR Program do not receive the full annual percentage increase in any fiscal year due to the requirements of this program. We anticipate that, because of the new requirements for reporting we are finalizing for the FY 2019 payment determination, the number of hospitals not receiving the full annual percentage increase may be higher than average. At this time, information is not available to determine the precise number of hospitals that will not meet the requirements to receive the full annual percentage increase for the FY 2019 payment determination. If the number of hospitals failing to receive the full annual percentage increase does increase because of the new requirements, we anticipate that, over the long run, this number will decline as hospitals gain more experience with these requirements.

Under OMB number 0938–1022, considering the newly finalized policies above, we estimate a total burden decrease of 1,717,444 hours, at a total cost decrease of approximately $56.4 million across approximately 3,300 hospitals participating in the Hospital IQR Program for the FY 2019 payment determination. In implementing the Hospital IQR Program and other quality reporting programs, we have focused on measures that have high impact and support CMS and HHS priorities for improved quality and efficiency of care for Medicare beneficiaries.

L. Effects of Requirements for the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program

In section VIII.B. of the preambles of the proposed rule (81 FR 25205 through 25213) and this final rule, we discuss our policies for the quality data reporting program for PPS-exempt cancer hospitals (PCHs), which we refer to as the PPS-Exempt Cancer Hospital Quality Reporting (PCHQR) Program. The PCHQR Program is authorized under section 1866(k) of the Act, which was added by section 3005 of the Affordable Care Act.

In section VIII.B.3. of the preamble of this final rule, we are finalizing our proposed updates to one of the measures on which PCHs currently submit data: Oncology: Radiation Dose Limits to Normal Tissues (NQF #0382). In addition, in section VIII.B.4.b. of the preamble of this final rule, we are finalizing our proposal to add one claims-based quality measure for the PCHQR Program: Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy.

The impact of the newly finalized requirements for the PCHQR Program is expected to be minimal overall since beginning with Q1 2016 events, PCHs have been reporting Clinical Process/Oncology Care Measures using a sampling methodology which requires reporting no more than 25 cases per facility (79 FR 28259). As the measure cohort expansion for Oncology: Radiation Dose Limits to Normal Tissues (NQF #0382) does not expand the maximum required sample, we do not anticipate that this cohort expansion will significantly impact the operational burden for PCHs.

In addition, the Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy measure is a claims-based measure and, therefore, poses no additional burden for PCHs to submit data beyond that which they currently submit as part of the claims process.

One expected effect of the PCHQR Program is to keep the public informed of the quality of care provided by PCHs. We will display publicly the quality measure data collected under the PCHQR Program as required under the Act. These data will be displayed on the *Hospital Compare* Web site. The goals of making these data available to the public in a user-friendly and relevant format include, but are not limited to: (1) Allowing the public to compare PCHs in order to make informed health care decisions regarding care setting; and (2) providing information about current trends in health care. Furthermore, PCHs can use their own health care quality data for many purposes such as in risk management programs, healthcare associated infection prevention programs, and research and development activities, among others.

M. Effects of Requirements for the Long-Term Care Hospital Quality Reporting Program (LTCH QRP) for the FY 2018 Payment Determination and Subsequent Years

In section VIII.C.1. of the preambles of the proposed rule (81 FR 25213) and this final rule, we discuss the implementation of section 1886(m)(5) of the Act, which was added by section 3004(a) of the Affordable Care Act. Section 1886(m)(5) of the Act provides that, for rate year 2014 and each subsequent year, any LTCH that does not submit data to the Secretary in accordance with section 1886(m)(5)(C) and (F) of the Act shall receive a 2 percentage point reduction to the annual update to the standard Federal rate for discharges for the hospital during the applicable fiscal year.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49838 through 49839), we estimated that only a few LTCHs will not receive the full annual percentage increase in any fiscal year as a result of failure to submit data under the LTCH QRP. There are approximately 432 LTCHs currently reporting quality data to CMS. At the time that this analysis was prepared, 39, or approximately 9.5 percent, of 412 eligible LTCHs were determined to be noncompliant and therefore received a 2 percentage point reduction to their FY 2016 annual payment update.

Information is not available to determine the precise number of LTCHs that will not meet the requirements to receive the full annual percentage increase for the FY 2017 payment determination.

We believe that a majority of LTCHs will continue to collect and submit data for the FY 2017 payment determination and subsequent years because they will continue to view the LTCH QRP as an important step in improving the quality of care patients receive in the LTCHs. We believe that the burden associated with the LTCH QRP is the time and effort associated with data collection.

Currently, LTCHs use two separate data collection mechanisms to report quality data to CMS: The CDC's NHSN, which is used to report all Healthcare Associated Infections (HAI) (CAUTI, CLABSI, MRSA Bacteremia, CDI, VAE) and vaccination data, (Influenza Vaccination Coverage Among Healthcare Personnel measure); and the LTCH CARE Data Set, which is submitted to the QIES ASAP system.

The data collection burden associated with reporting quality measures via the CDC's NHSN is discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49838 through 49839). These measures are stewarded by the CDC, and the reporting burden is approved under OMB control number 0920–0666.

The All-Cause Unplanned Readmission Measure for 30 Days Post-Discharge from Long-Term Care Hospitals (NQF #2512) measure is calculated based on Medicare FFS claims data, and therefore does not have any associated data reporting burden for LTCHs.

The remaining assessment-based quality measure data are reported to CMS by LTCHs using the LTCH CARE Data Set. As of April 1, 2016, LTCHs use the LTCH CARE Data Set Version 3.00 (approved under OMB control number 0938–1163) which includes data elements related to the following quality measures: Percent of Residents or Patients with Pressure Ulcers That Are New or Worsened (NQF #0678), Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680); Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay) (NQF #0674); Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631); Application of Percent of Long-Term Care Hospital Patients with an Admission and Discharge Functional Assessment and a Care Plan That Addresses Function (NQF #2631); and Functional Outcome Measure: Change in Mobility Among Long-Term Care Hospital Patients Requiring Ventilator Support (NQF #2632).

In this final rule, we are retaining 13 previously finalized quality measures and are adding 4 measures for use in the LTCH QRP. In section VII.C.7. of the preamble of this final rule, we are finalizing our proposals to add three measures for the FY 2018 payment determination and subsequent years: (1) MSPB–PAC LTCH QRP; (2) Discharge to Community- PAC LTCH QRP; and (3) Potentially Preventable 30-Day Post-Discharge Readmission Measure for the PAC LTCH QRP. These three measures are Medicare claims-based measures, and because claims-based measures can be calculated based on data that are already reported to the Medicare program for payment purposes, we believe there will be no additional burden for any of these newly finalized measures.

In section VIII.C.9.d. of the preamble of this final rule, we are finalizing our proposal to expand the data collection timeframe for the measure Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680) (77 FR 53624 through 53627), beginning with the FY 2019 payment determination. The data collection time frame and associated data submission deadlines are currently aligned with the Influenza Vaccination Season (IVS) (October 1 of a given year through March 31 of the subsequent year), and only require data collection during the two calendar year quarters that align with the IVS. We are finalizing our proposal to expand the data collection timeframe from just two quarters (covering the IVS) to a full four quarters or 12 months. We refer readers to section VIII.C.9.d. of the preamble of this final rule for further details on the expansion of data collection for this measure, Percent of Residents or Patients Who Were Assessed and Appropriately Given the Seasonal Influenza Vaccine (Short Stay) (NQF #0680), including data collection timeframes and associated submission deadlines. We originally finalized this measure for use in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53624 through 53627). Although we finalized data collection for this measure to coincide with the IVS, we originally proposed year-round data collection. The associated PRA package, which was approved under OMB control number 0938–1163, included burden calculations that aligned with our original proposal for year-round data collection. All subsequent PRA packages, and the PRA package that is currently under review by OMB, included burden calculations reflecting year-round (12 month) data collection for this measure. Because of this, the newly finalized change in the data collection timeframe for this measure, and any associated burden related to increased data collection, has already been accounted for in the total burden figures included in this section of the preamble of this final rule.

In section VIII.C.7. of the preamble of this final rule, we are finalizing our proposal to adopt one measure for the FY 2020 payment determination and subsequent years: Drug Regimen Review Conducted with Follow-Up for Identified Issues- PAC LTCH QRP. In addition, we are finalizing our proposal that data for this measure will be collected and reported using the LTCH CARE Data Set Version 4.00 (effective April 1, 2018).

While reporting quality measure data involves collecting information, we believe that the burden associated with modifications to the LTCH CARE Data Set discussed in this final rule fall under the PRA exceptions provided in section 1899B(m) of the Act. Section 1899B(m) of the Act, which was added by the IMPACT Act, states that the PRA requirements do not apply to section 1899B of the Act and the sections referenced in section 1899B(a)(2)(B) of the Act that require modifications in order to achieve standardized patient assessment data. However, the PRA requirements and burden estimates will be submitted to OMB for review and approval when modifications to the LTCH CARE Data Set or other applicable PAC assessment instruments are not used to achieve standardized patient assessment data.

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49838 through 49840), we discussed burden estimates for the 13 previously finalized quality measures which we are retaining in this final rule using the LTCH CARE Data Set Version 2.01. Based on a revised PRA package for the LTCH CARE Data Set Version 3.00, we estimate the total cost for the previously finalized assessment-based measures was $13,929 per LTCH annually or $6,017,146 for all LTCHs annually. In addition, we estimate that the cost to report the previously finalized quality measures via the CDC's NHSN was $10,896 per LTCH annually or $4,706,857 for all LTCHs annually. The revised total estimate for all 13 previously finalized measures was $24,825 per LTCH annually or $10,724,003 for all LTCHs annually. The two estimates discussed above, as well as the comprehensive estimate discussed below, include overhead; however, obtaining data on other overhead costs is challenging. Overhead costs vary greatly across industries and firm sizes. In addition, the precise cost elements assigned as ''indirect'' or ''overhead'' costs, as opposed to direct costs or employee wages, are subject to some interpretation at the firm level. Therefore, we have chosen to calculate the cost of overhead at 100 percent of the mean hourly wage. This is necessarily a rough adjustment, both because fringe benefits and overhead costs vary significantly from employer to employer and because methods of estimating these costs vary widely from study to study. Nonetheless, there is no practical alternative, and we believe that doubling the hourly wage to estimate total cost is a reasonably accurate estimation method.

Because we are finalizing our proposal to add the Drug Regimen Review Conducted with Follow-Up for Identified Issues- PAC LTCH QRP measure in the LTCH CARE Data Set Version 4.00, the estimated burden and cost will increase. The additional data elements for this quality measure will take 6 minutes of nursing/clinical staff time to report data on admission and 4 minutes of nursing/clinical staff time to report data on discharge, for a total of 10 minutes. We believe that the additional LTCH CARE Data Set items we are newly finalizing will be completed by registered nurses and pharmacists. As a result, we estimate that the total cost related to the newly finalized Drug Regimen Review Conducted with Follow-Up for Identified Issues-PAC LTCH QRP measure will be $3,080 per LTCH annually, or $1,330,721 for all LTCHs annually. Because the three measures newly finalized in section VII.C.6. of the preamble of this final rule are claims-based and will be calculated based on data that are already reported to the Medicare program for payment purposes, we believe

that there will be no additional LTCH burden for any of these newly finalized measures.

Overall, we estimate the total cost for the 13 previously adopted measures and the 4 newly finalized measures will be $27,905 per LTCH annually or $12,054,724 for all LTCHs annually. This is an average increase of 14 percent to all LTCHs over the burden discussed in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49838 through 49840), which included all quality measures that LTCHs are required to report under the LTCH QRP, with the exception of those 4 newly finalized measures in this final rule.

We intend to continue to closely monitor the effects of the LTCH QRP on LTCHs and help facilitate successful reporting outcomes through ongoing stakeholder education, national trainings, LTCH announcements, Web site postings, CMS Open Door Forums, and general and technical help desks.

We received comments about the effects of requirements for the LTCH QRP, which we summarize and respond to below.

Comment: One commenter expressed concern about the burden associated with the development of new measures, data-collection and operational and technical data extraction. The commenter suggested that any of the quality reporting or pay-for-performance programs weigh the value of the data generated in proportion to the intensity of the data-collection effort and that the data be the most clinically relevant and actionable to the facility and its patients.

Response: Burden on providers is always a consideration for CMS, and we take this into account when developing quality measures for inclusion into our quality reporting programs. When developing new measures, we try to leverage existing data items whenever possible, and only include new items in existing data sets, when necessary to inform the calculation of these metrics. We will continue to take these and future stakeholder inputs into consideration to inform our ongoing measure development and refinement efforts.

Comment: One commenter expressed concerns about the complexities of the LTCH CARE Data Set transmittal process and associated costs implementing the LTCH CARE Data Set Version 4.00, effective April 1, 2018 after implementation of LTCH CARE Data Set Version 3.00.

Response: We thank the commenter for its comment and will consider the data transmittal process and associated cost burden as we develop the LTCH CARE Data Set Version 4.00. We have leveraged CMS claims as the data source, whenever possible and appropriate for newly introduced measures, in order to limit the burden on LTCHs. In addition, when possible, we leverage the use of existing data elements, again in an attempt to limit burden. Beyond this, we offer free software for LTCHs (LASER), allowing LTCHs to record and transmit the required LTCH CARE Data Set assessment based data. This free software, including instructions for installing and using the software, is located at: *https://www.qtso.com/laser.html*.

N. Effects of Updates to the Inpatient Psychiatric Facility Quality Reporting (IPFQR) Program

As discussed in section VIII.D. of the preambles of the proposed rule (81 FR 25238 through 25244) and this final rule and in accordance with section 1886(s)(4)(A)(i) of the Act, we will implement a 2.0 percentage point reduction in the FY 2019 market basket update for IPFs that have failed to comply with the IPFQR Program requirements for FY 2019, including reporting on the required measures. In section VIII.D. of the preamble of this final rule, we discuss how the 2 percentage point reduction will be applied. For FY 2016, of the 1,684 IPFs eligible for the IPFQR Program, 51 did not receive the full market basket update because of the IPFQR Program; 24 of these IPFs chose not to participate and 27 did not meet the requirements of the program. We anticipate that even fewer IPFs will receive the reduction for FY 2017 as IPFs become more familiar with the requirements. Thus, we estimate that this policy will have a negligible impact on overall IPF payments for FY 2017.

Based on the proposals we are finalizing in this final rule, we estimate a total increase in burden due to the newly finalized addition of a chart-abstracted measure set of 212 hours per IPF or 357,008 hours across all IPFs, resulting in a total increase in financial burden of approximately $6,962 per IPF or $11,724,143 across all IPFs. We also are finalizing that we will make the data for the IPFQR Program available as soon as possible and to no longer specify in rulemaking when measure data will be publicly available, when the approximately 30-day preview period will occur, or that the preview period will begin approximately 12 weeks before the public display date, but rather to announce these using subregulatory guidance. Lastly, for the FY 2017 payment determination only, we are also finalizing our proposal that, if it is technically feasible to display the data in December 2016, we will provide data to IPFs for a 2-week preview period that will start on October 1, 2016. Moreover, we are finalizing as proposed that, as a courtesy, for the FY 2017 payment determination only, if we are able to display the data in December 2016, we will ensure that IPFs have approximately 30 days for review if they so choose by providing IPFs with their data as early as mid-September.. However, we do not expect this will change the burden on IPFs. In addition, we are finalizing our proposal to include SUB–3: Alcohol & Other Drug Use Disorder Treatment Provided or Offered at Discharge and subset measure SUB–3a: Alcohol & Other Drug Use Disorder Treatment at Discharge (NQF #1664) in the list of measures covered by the global sample for the FY 2019 payment determination and subsequent years as proposed. Because the population for the SUB–3 and SUB–3a measure is nearly identical to the population for both the SUB–1 measure and the SUB–2 and SUB–2a measure (measures previously adopted into the IPFQR Program), we believe that the addition of 1 chart-abstracted measure will lead to a negligible change in burden associated with nonmeasure data collection. We also are finalizing our proposal to update the denominator exclusions for Screening for Metabolic Disorders to align with other measures eligible for the global sample. As this will not alter the number of cases that facilities are required to report on, we do not anticipate a change in IPF burden. We also estimate a total increase in burden for training personnel on chart abstraction and data collection for the newly finalized measures of 2 hours per IPF or 3,368 hours across all IPFs, resulting in a total increase in financial burden of $65.68 per IPF or $110,605 across all IPFs. Our estimate for the total increase in burden, including the newly finalized chart-abstracted measure set and training, is 360,376 hours across all IPFs, which at $32.84 labor cost per hour, totals $11,834,748. As discussed in section X.B.11. of the preamble of this final rule, we will attribute the costs associated with the newly finalized policies to the year in which these costs begin; for the purposes of all the changes made in this final rule, that year is FY 2017. Further information on these estimates can be found in section X.B.11. of the preamble of this final rule.

We intend to closely monitor the effects of this quality reporting program on IPFs and help facilitate successful reporting outcomes through ongoing stakeholder education, national trainings, and a technical help desk.

O. Effects of Requirements Regarding the Electronic Health Record (EHR) Incentive Programs and Meaningful Use

In section VIII.E. of the preambles of the proposed rule (81 FR 25244 through 25247) and this final rule, we discuss requirements for the Medicare and Medicaid EHR Incentive Programs. For CY 2017, we are finalizing the proposed CQM reporting period requirements pertaining to the Medicare and Medicaid EHR Incentive Programs; the number of CQMs eligible hospitals and CAHs are required to report by attestation; the removal of 13 CQMs from the set of CQMs available for eligible hospitals and CAHs to report; and the policy determining that the electronic submission of CQMs will require the use of the most recent version of the CQM electronic specification for each CQM to which the EHR is certified. In addition, we are finalizing a modified version of our proposed submission period requirements and the number of CQMs eligible hospitals and CAHs are required to report electronically for CY 2017. We note that these requirements will only apply for eligible hospitals and CAHs submitting CQMs electronically in CY 2017. Because these requirements for data collection will align with the reporting requirements in place for the Hospital IQR Program and because eligible hospitals and CAHs will still have the option to submit their clinical quality measures via attestation for the Medicare and Medicaid EHR Incentive Programs, we do not believe these requirements will have a significant impact.

P. Alternatives Considered

This final rule contains a range of policies. It also provides descriptions of the statutory provisions that are addressed, identifies the finalized policies, and presents rationales for

our decisions and, where relevant, alternatives that were considered.

Q. Overall Conclusion

1. Acute Care Hospitals

Table I of section I.G. of this Appendix demonstrates the estimated distributional impact of the IPPS budget neutrality requirements for the MS–DRG and wage index changes, and for the wage index reclassifications under the MGCRB. Table I also shows a projected overall increase of 0.9 percent in operating payments. As discussed in section I.G. of this Appendix, we estimate that operating payments will increase by approximately $987 million in FY 2017 relative to FY 2016. However, when we account for the impact of the changes in Medicare DSH payments and the impact of the additional payments based on uncompensated care in accordance with section 3133 of the Affordable Care Act, based on estimates provided by the CMS Office of the Actuary, consistent with our policy discussed in section IV.F. of the preamble of this final rule, we estimate that operating payments will increase by approximately $809 million relative to FY 2016. We currently estimate that the changes in new technology add-on payments for FY 2017 will decrease spending by approximately $20 million. In addition, the changes to the Hospital Readmissions Reduction Program for FY 2017 are estimated to decrease spending by $108 million, as a result of the inclusion of the refinement to the pneumonia readmissions measure that expanded the measure cohort, along with the addition of the CABG readmission measure, in the calculation of the FY 2017 payment adjustment factor. These estimates, combined with our estimated increase in FY 2017 operating payment of $809 million, will result in an estimated increase of approximately $680 million for FY 2017. We estimate that hospitals will experience a 0.8 percent increase in capital payments per case, as shown in Table III of section I.I. of this Appendix. We project that there will be a $66 million increase in capital payments in FY 2017 compared to FY 2016. The cumulative operating and capital payments will result in a net increase of approximately $746 million to IPPS providers. The discussions presented in the previous pages, in combination with the rest of this final rule, constitute a regulatory impact analysis.

2. LTCHs

Overall, LTCHs are projected to experience a decrease in estimated payments per discharge in FY 2017. In the impact analysis, we are using the rates, factors, and policies presented in this final rule, including updated wage index values and relative weights, and the best available claims and CCR data to estimate the change in payments under the LTCH PPS for FY 2017. Accordingly, based on the best available data for the 420 LTCHs in our database, we estimate that FY 2017 LTCH PPS payments will decrease approximately $363 million relative to FY 2016 as a result of the payment rates and factors presented in this final rule.

II. Accounting Statements and Tables

A. Acute Care Hospitals

As required by OMB Circular A–4 (available at *http://www.whitehouse.gov/omb/circulars/a004/a-4.pdf*), in the following Table V, we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this final rule as they relate to acute care hospitals. This table provides our best estimate of the change in Medicare payments to providers as a result of the changes to the IPPS presented in this final rule. All expenditures are classified as transfers to Medicare providers.

The costs to the Federal Government associated with the policies in this final rule are estimated at $746 million.

TABLE V—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES UNDER THE IPPS FROM FY 2016 TO FY 2017

Category	Transfers
Annualized Monetized Transfers	$746 million.
From Whom to Whom	Federal Government to IPPS Medicare Providers.

B. LTCHs

As discussed in section I.J. of this Appendix, the impact analysis of the payment rates and factors presented in this final rule under the LTCH PPS is projected to result in a decrease in estimated aggregate LTCH PPS payments in FY 2017 relative to FY 2016 of approximately $363 million based on the data for 420 LTCHs in our database that are subject to payment under the LTCH PPS. Therefore, as required by OMB Circular A–4 (available at *http://www.whitehouse.gov/omb/circulars/a004/a-4.pdf*), in Table VI, we have prepared an accounting statement showing the classification of the expenditures associated with the provisions of this final rule as they relate to the changes to the LTCH PPS. Table VI provides our best estimate of the estimated change in Medicare payments under the LTCH PPS as a result of the payment rates and factors and other provisions presented in this final rule based on the data for the 420 LTCHs in our database. All expenditures are classified as transfers to Medicare providers (that is, LTCHs).

The savings to the Federal Government associated with the policies for LTCHs in this final rule are estimated at $363 million.

TABLE VI—ACCOUNTING STATEMENT: CLASSIFICATION OF ESTIMATED EXPENDITURES FROM THE FY 2016 LTCH PPS TO THE FY 2017 LTCH PPS

Category	Transfers
Annualized Monetized Transfers	−$363 million.
From Whom to Whom	Federal Government to LTCH Medicare Providers.

III. Regulatory Flexibility Act (RFA) Analysis

The RFA requires agencies to analyze options for regulatory relief of small entities. For purposes of the RFA, small entities include small businesses, nonprofit organizations, and small government jurisdictions. We estimate that most hospitals and most other providers and suppliers are small entities as that term is used in the RFA. The great majority of hospitals and most other health care providers and suppliers are small entities, either by being nonprofit organizations or by meeting the SBA definition of a small business (having revenues of less than $7.5 million to $38.5 million in any 1 year). (For details on the latest standards for health care providers, we refer readers to page 36 of the Table of Small Business Size Standards for NAIC 622 found on the SBA Web site at: *http://www.sba.gov/sites/default/files/files/Size_Standards_Table.pdf.*)

For purposes of the RFA, all hospitals and other providers and suppliers are considered to be small entities. Individuals and States are not included in the definition of a small entity. We believe that the provisions of this final rule relating to acute care hospitals will have a significant impact on small entities as explained in this Appendix. Because we lack data on individual hospital receipts, we cannot determine the number of small proprietary LTCHs. Therefore, we are assuming that all LTCHs are considered small entities for the purpose of the analysis in section I.J. of this Appendix. MACs are not considered to be small entities. Because we acknowledge that many of the affected

entities are small entities, the analysis discussed throughout the preamble of this final rule constitutes our regulatory flexibility analysis. In the FY 2017 IPPS/LTCH PPS proposed rule, we solicited public comments on our estimates and analysis of the impact of our proposals on those small entities. Any public comments that we received and our responses are presented throughout this final rule.

IV. Impact on Small Rural Hospitals

Section 1102(b) of the Social Security Act requires us to prepare a regulatory impact analysis for any proposed or final rule that may have a significant impact on the operations of a substantial number of small rural hospitals. This analysis must conform to the provisions of section 604 of the RFA. With the exception of hospitals located in certain New England counties, for purposes of section 1102(b) of the Act, we define a small rural hospital as a hospital that is located outside of an urban area and has fewer than 100 beds. Section 601(g) of the Social Security Amendments of 1983 (Pub. L. 98–21) designated hospitals in certain New England counties as belonging to the adjacent urban area. Thus, for purposes of the IPPS and the LTCH PPS, we continue to classify these hospitals as urban hospitals. (We refer readers to Table I in section I.G. of this Appendix for the quantitative effects of the policy changes under the IPPS for operating costs.)

V. Unfunded Mandates Reform Act Analysis

Section 202 of the Unfunded Mandates Reform Act of 1995 (Pub. L. 104–4) also requires that agencies assess anticipated costs and benefits before issuing any rule whose mandates require spending in any 1 year of $100 million in 1995 dollars, updated annually for inflation. In 2016, that threshold level is approximately $146 million. This final rule will not mandate any requirements for State, local, or tribal governments, nor will it affect private sector costs.

VI. Executive Order 12866

In accordance with the provisions of Executive Order 12866, the Executive Office of Management and Budget reviewed this final rule.

Appendix B: Recommendation of Update Factors for Operating Cost Rates of Payment for Inpatient Hospital Services

I. Background

Section 1886(e)(4)(A) of the Act requires that the Secretary, taking into consideration the recommendations of MedPAC, recommend update factors for inpatient hospital services for each fiscal year that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Under section 1886(e)(5) of the Act, we are required to publish update factors recommended by the Secretary in the proposed and final IPPS rules, respectively. Accordingly, this Appendix provides the recommendations for the update factors for the IPPS national standardized amount, the hospital-specific rate for SCHs and MDHs, and the rate-of-increase limits for certain hospitals excluded from the IPPS, as well as LTCHs. In prior years, we have made a recommendation in the IPPS proposed rule and final rule for the update factors for the payment rates for IRFs and IPFs. However, for FY 2017 consistent with approach for FY 2016, we are including the Secretary's recommendation for the update factors for IRFs and IPFs in separate **Federal Register** documents at the time that we announce the annual updates for IRFs and IPFs. We also discuss our response to MedPAC's recommended update factors for inpatient hospital services.

II. Inpatient Hospital Update for FY 2017

A. FY 2017 Inpatient Hospital Update

As discussed in section IV.B. of the preamble to this final rule, for FY 2017, consistent with section 1886(b)(3)(B) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act, we are setting the applicable percentage increase by applying the following adjustments in the following sequence. Specifically, the applicable percentage increase under the IPPS is equal to the rate-of-increase in the hospital market basket for IPPS hospitals in all areas, subject to a reduction of one-quarter of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals that fail to submit quality information under rules established by the Secretary in accordance with section 1886(b)(3)(B)(viii) of the Act and a reduction of three-quarters of the applicable percentage increase (prior to the application of other statutory adjustments; also referred to as the market basket update or rate-of-increase (with no adjustments)) for hospitals not considered to be meaningful electronic health record (EHR) users in accordance with section 1886(b)(3)(B)(ix) of the Act, and then subject to an adjustment based on changes in economy-wide productivity (the multifactor productivity (MFP) adjustment), and an additional reduction of 0.75 percentage point as required by section 1886(b)(3)(B)(xii) of the Act. Sections 1886(b)(3)(B)(xi) and (b)(3)(B)(xii) of the Act, as added by section 3401(a) of the Affordable Care Act, state that application of the MFP adjustment and the additional FY 2017 adjustment of 0.75 percentage point may result in the applicable percentage increase being less than zero.

In the FY 2017 IPPS/LTCH PPS proposed rule, based on the most recent data available at that time, in accordance with section 1886(b)(3)(B) of the Act, we proposed to establish the FY 2017 market basket update used to determine the applicable percentage increase for the IPPS based on IHS Global Insight, Inc.'s (IGI's) first quarter 2016 forecast of the FY 2010-based IPPS market basket rate-of-increase with historical data through fourth quarter 2015, which was estimated to be 2.8 percent. Based on the most recent data available for this FY 2017 IPPS/LTCH PPS final rule, in accordance with section 1886(b)(3)(B) of the Act, we are establishing the FY 2017 market basket update used to determine the applicable percentage increase for the IPPS on the IHS Global Insight, Inc. (IGI's) second quarter 2016 forecast of the FY 2010-based IPPS market basket rate-of-increase with historical data through first quarter 2016, which is estimated to be 2.7 percent.

In accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, in section IV.B. of the preamble of the FY 2017 IPPS/LTCH PPS proposed rule (81 FR 25077), we proposed a multifactor productivity (MFP) adjustment (the 10-year moving average of MFP for the period ending FY 2017) of 0.5 percent. Therefore, based on IGI's first quarter 2016 forecast of the FY 2010-based IPPS market basket, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act (hereafter referred to as a hospital that submits quality data) and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act (hereafter referred to as a hospital that is a meaningful EHR user), we presented in the proposed rule four possible applicable percentage increases that could be applied to the standardized amount. Based on the most recent data available for this FY 2017 IPPS/LTCH PPS final rule, in accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, in section IV.B. of the preamble of this final rule, we are establishing a MFP adjustment (the 10-year moving average of MFP for the period ending FY 2017) of 0.3 percent.

In accordance with section 1886(b)(3)(B) of the Act, as amended by section 3401(a) of the Affordable Care Act, as discussed in section IV.B. of the preamble of this final rule, we are establishing the applicable percentages increases for the FY 2017 updates based on IGI's second quarter 2016 forecast of the FY 2010-based IPPS market basket, depending on whether a hospital submits quality data under the rules established in accordance with section 1886(b)(3)(B)(viii) of the Act and is a meaningful EHR user under section 1886(b)(3)(B)(ix) of the Act, as outlined in the table below.

FY 2017	Hospital submitted quality data and is a meaningful EHR User	Hospital submitted quality data and is NOT a meaningful EHR User	Hospital did NOT submit quality data and is a meaningful EHR User	Hospital did NOT submit quality data and is NOT a meaningful EHR User
Market Basket Rate-of-Increase	2.7	2.7	2.7	2.7
Adjustment for Failure to Submit Quality Data under Section 1886(b)(3)(B)(viii) of the Act	0.0	0.0	−0.675	−0.675
Adjustment for Failure to be a Meaningful EHR User under Section 1886(b)(3)(B)(ix) of the Act	0.0	−2.025	0.0	−2.025
MFP Adjustment under Section 1886(b)(3)(B)(xi) of the Act	−0.3	−0.3	−0.3	−0.3
Statutory Adjustment under Section 1886(b)(3)(B)(xii) of the Act	−0.75	−0.75	−0.75	−0.75
Applicable Percentage Increase Applied to Standardized Amount	1.65	−0.375	0.975	−1.05

B. Update for SCHs and MDHs for FY 2017

Section 1886(b)(3)(B)(iv) of the Act provides that the FY 2017 applicable percentage increase in the hospital-specific rate for SCHs and MDHs equals the applicable percentage increase set forth in section 1886(b)(3)(B)(i) of the Act (that is, the same update factor as for all other hospitals subject to the IPPS).

As discussed in section IV.N. of the preamble of this final rule, section 205 of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10, enacted on April 16, 2015) extended the MDH program (which, under previous law, was to be in effect for discharges on or before March 31, 2015 only) for discharges occurring on or after April 1, 2015, through FY 2017 (that is, for discharges occurring on or before September 30, 2017).

As previously mentioned, the update to the hospital-specific rate for SCHs and MDHs is subject to section 1886(b)(3)(B)(i) of the Act, as amended by sections 3401(a) and 10319(a) of the Affordable Care Act. Accordingly, depending on whether a hospital submits quality data and is a meaningful EHR user, we are establishing the same four possible applicable percentage increases in the table above for the hospital-specific rate applicable to SCHs and MDHs.

C. FY 2017 Puerto Rico Hospital Update

As discussed in section IV.A. of the preamble of this final rule, prior to January 1, 2016, Puerto Rico hospitals were paid based on 75 percent of the national standardized amount and 25 percent of the Puerto Rico-specific standardized amount. Section 601 of Public Law 114–113 amended section 1886(d)(9)(E) of the Act to specify that the payment calculation with respect to operating costs of inpatient hospital services of a subsection (d) Puerto Rico hospital for inpatient hospital discharges on or after January 1, 2016, shall use 100 percent of the national standardized amount. Because Puerto Rico hospitals are no longer paid with a Puerto Rico-specific standardized amount under the amendments to section 1886(d)(9)(E) of the Act, there is no longer a need for us to make an update to the Puerto Rico standardized amount. Hospitals in Puerto Rico are now paid 100 percent of the national standardized amount and, therefore, are subject to the same update to the national standardized amount discussed under section IV.B.1. of the preamble of this final rule. Accordingly, for FY 2017, we are establishing an applicable percentage increase of 1.65 percent to the standardized amount for hospitals located in Puerto Rico.

D. Update for Hospitals Excluded From the IPPS for FY 2017

Section 1886(b)(3)(B)(ii) of the Act is used for purposes of determining the percentage increase in the rate-of-increase limits for children's hospitals, cancer hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and America Samoa). Section 1886(b)(3)(B)(ii) of the Act sets the percentage increase in the rate-of-increase limits equal to the market basket percentage increase. In accordance with § 403.752(a) of the regulations, RNHCIs are paid under the provisions of § 413.40, which also use section 1886(b)(3)(B)(ii) of the Act to update the percentage increase in the rate-of-increase limits.

Currently, children's hospitals, PPS-excluded cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa are among the remaining types of hospitals still paid under the reasonable cost methodology, subject to the rate-of-increase limits. As we finalized in the FY 2015 IPPS/LTCH PPS final rule (79 FR 50156 through 50157), we are applying the FY 2017 percentage increase in the IPPS operating market basket to the target amount for children's hospitals, PPS-excluded cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. For this final rule, the current estimate of the IPPS operating market basket percentage increase for FY 2017 is 2.7 percent.

E. Update for LTCHs for FY 2017

Section 123 of Public Law 106–113, as amended by section 307(b) of Public Law 106–554 (and codified at section 1886(m)(1) of the Act), provides the statutory authority for updating payment rates under the LTCH PPS.

As discussed in section V.A. of the Addendum to this final rule, we are establishing an update to the LTCH PPS standard Federal rate for FY 2017 based on the full revised and rebased 2013-based LTCH PPS market basket increase estimate subject to an adjustment based on changes in economy-wide productivity and an additional reduction required by sections 1886(m)(3)(A)(ii)(I), 1886(m)(3)(A)(ii), and 1886(m)(4)(F) of the Act. In accordance with the LTCHQR Program under section 1886(m)(5) of the Act, we are reducing the annual update to the LTCH PPS standard Federal rate by 2.0 percentage points for failure of an LTCH to submit the required quality data. The MFP adjustment described in section 1886(b)(3)(B)(xi)(i) of the Act is currently estimated to be 0.3 percent for FY 2017. In addition, sections 1886(m)(3)(A)(ii) and 1886(m)(4)(F) Act require that the annual update for FY 2017 be reduced by the ''other adjustment,'' which is 0.75 percentage point. Based on the most recent data available for this final rule, that is, IGI's second quarter 2016 forecast of the FY 2017 LTCH PPS market basket increase, we are establishing an annual update to the LTCH PPS standard Federal rate of 1.75 percent (that is, the current FY 2017 estimate of the market basket rate-of-increase of 2.8 percent less an adjustment of 0.3 percentage point for MFP and less 0.75 percentage point). Accordingly, we are applying an update factor of 1.0175 percent in determining the LTCH PPS standard Federal rate for FY 2017. For LTCHs that fail to submit quality data for FY 2017, we are applying an annual update to the LTCH PPS standard Federal rate of -0.25 percent (that is, the annual update for FY 2017 of 1.75 percent less 2.0 percentage points for failure to submit the required quality data in accordance with section 1886(m)(5)(C) of the Act and our rules) by applying an update factor of 0.9975 percent in determining the LTCH PPS standard Federal rate for FY 2017.

III. Secretary's Recommendations

MedPAC is recommending an inpatient hospital update in the amount specified in current law for FY 2017. MedPAC's rationale for this update recommendation is described in more detail below. As mentioned above, section 1886(e)(4)(A) of the Act requires that the Secretary, taking into consideration the recommendations of MedPAC, recommend update factors for inpatient hospital services for each fiscal year that take into account the amounts necessary for the efficient and effective delivery of medically appropriate and necessary care of high quality. Consistent with current law, depending on whether a hospital submits quality data and is a meaningful EHR user, we are recommending the four applicable percentage increases to

the standardized amount listed in the table under section II. of this Appendix B. We are recommending that the same applicable percentage increases apply to SCHs and MDHs.

In addition to making a recommendation for IPPS hospitals, in accordance with section 1886(e)(4)(A) of the Act, we are recommending update factors for certain other types of hospitals excluded from the IPPS. Consistent with our policies for these facilities, we are recommending an update to the target amounts for children's hospitals, cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa of 2.7 percent.

For FY 2017, consistent with policy set forth in section VII. of the preamble of this final rule, for LTCHs that submit quality data, we are recommending an update of 1.75 percent to the LTCH PPS standard Federal rate. For LTCHs that fail to submit quality data for FY 2017, we are recommending an annual update to the LTCH PPS standard Federal rate of −0.25 percent.

IV. MedPAC Recommendation for Assessing Payment Adequacy and Updating Payments in Traditional Medicare

In its March 2016 Report to Congress, MedPAC assessed the adequacy of current payments and costs, and the relationship between payments and an appropriate cost base. MedPAC recommended an update to the hospital inpatient rates in the amount specified in current law. We refer the reader to the March 2016 MedPAC report, which is available for download at *www.medpac.gov* for a complete discussion on this recommendation. MedPAC expects Medicare margins to remain low in 2016. At the same time, MedPAC's analysis finds that efficient hospitals have been able to maintain positive Medicare margins while maintaining a relatively high quality of care.

Response: We agree with MedPAC and, consistent with current law, we are applying an applicable percentage increase for FY 2017 of 1.65 percent, provided the hospital submits quality data and is a meaningful EHR user, consistent with statutory requirements.

We note that, because the operating and capital prospective payment systems remain separate, we are continuing to use separate updates for operating and capital payments. The update to the capital rate is discussed in section III. of the Addendum to this final rule.

Department of Justice

28 CFR Part 32
Public Safety Officers' Benefits Program; Proposed Rule

DEPARTMENT OF JUSTICE

28 CFR Part 32

[Docket No.: OJP (BJA) 1722]

RIN 1121–AA86

Public Safety Officers' Benefits Program

AGENCY: Office of Justice Programs, Justice.

ACTION: Notice of proposed rulemaking.

SUMMARY: This rulemaking proposes to make the following changes to current regulations implementing the Public Safety Officers' Benefits (PSOB) Act: Revising provisions pertaining to the filing of an application for benefits, revising provisions that define when an individual is a public safety officer, when an officer has sustained a line-of-duty injury, when payment of benefits is prohibited, and when individuals are ineligible for payment; revising provisions pertaining to the admissibility, sufficiency, and evaluation of evidence submitted in PSOB claims; revising provisions concerning the fees that may be charged for representation in PSOB claims, establishing provisions that prescribe the scope of legal review of PSOB claims and the completeness of applications for benefits, and revising provisions pertaining to the definitions of permanent and total disability, payment of benefits, educational assistance, and other matters necessary to implement the aforementioned changes.

DATES: Written comments must be postmarked and electronic comments must be submitted on or before October 21, 2016. Comments received by mail will be considered timely if they are postmarked on or before that date. The electronic Federal Docket Management System (FDMS) will accept comments until Midnight Eastern Time at the end of that day.

ADDRESSES: Please address all comments regarding this rule by U.S. mail, to: Hope Janke, Bureau of Justice Assistance, Office of Justice Programs, 810 7th Street NW., Washington, DC 20531; or by telefacsimile to (202) 354–4135. To ensure proper handling, please reference OJP Docket No. [insert number] on your correspondence. Comments may also be sent electronically through *http://regulations.gov* using the electronic comment form provided on that site. An electronic copy of this document is also available at the *http://regulations.gov* Web site. OJP will accept attachments to electronic comments in Microsoft Word, WordPerfect, or Adobe PDF formats only.

FOR FURTHER INFORMATION CONTACT: Hope Janke, BJA, OJP, at (202) 514–6278, or toll-free at 1 (888) 744–6513.

SUPPLEMENTARY INFORMATION:

Table of Contents

I. Posting of Public Comments

Please note that all comments received are considered part of the public record and made available for public inspection online at *http://www.regulations.gov.* Information made available for public inspection includes personal identifying information (such as your name, address, etc.) voluntarily submitted by the commenter.

The Office of Justice Programs (OJP) does not require you to submit personal identifying information (such as your name, address, medical information etc.) as part of your comment. However, if you wish to submit such information, but do not wish it to be posted online, you must include the phrase ''PERSONAL IDENTIFYING INFORMATION'' in the first paragraph of your comment. You must also locate all the personal identifying information that you do not want posted online in the first paragraph of your comment and identify what information you want the agency to redact. Personal identifying information identified and located as set forth above will be placed in the agency's public docket file, but not posted online.

If you wish to submit confidential business information as part of your comment but do not wish it to be posted online, you must include the phrase ''CONFIDENTIAL BUSINESS INFORMATION'' in the first paragraph of your comment. You must also prominently identify confidential business information to be redacted within the comment. If a comment has so much confidential business information that it cannot be effectively redacted, the agency may choose not to post that comment (or to only partially post that comment) on *http://www.regulations.gov.* Confidential business information identified and located as set forth above will not be placed in the public docket file, nor will it be posted online.

If you wish to inspect the agency's public docket file in person by appointment, please see the **FOR FURTHER INFORMATION CONTACT** paragraph.

II. Executive Summary

A. Purpose of the Regulatory Action

1. Need for Regulatory Action

The Public Safety Officers' Benefits Act of 1976 (PSOB Act) was enacted to address the emotional and economic burden placed on the families of deceased public safety officers by providing the assurance of a federal benefit to such survivors.[1] As recently as 2012, the House Committee on the Judiciary reaffirmed this purpose stating ''[t]he [Public Safety Officers' Benefits Act] . . . is an important resource for the public safety officers and their families who would potentially face financial disaster because of the death or incapacitation of the public safety officer.'' [2]

As of February 1, 2016, 931 claims for benefits were pending before the agency: 761 initial claims for benefits pending at the PSOB Office, 123 appeals of PSOB Office determinations pending with Hearing Officers, and 47 appeals of Hearing Officer determinations pending with the BJA Director. A recent audit by the Department of Justice's Office of the Inspector General (OIG) found that although the PSOB Program processed 56% of determined claims within one year of filing, other claims took significantly longer to resolve.[3] A Business Process Improvement (BPI) review of the PSOB Program completed by an independent contractor in October 2015 noted, among other things, that ''the combination of the lengthy processing times and the growing backlog of open claims indicates significant changes are needed for the program to operate efficiently and process existing and new claims in a timely manner.''

To fulfill Congress' intent that the PSOB Program remain ''an important resource'' for public safety officers and their families, the proposed rulemaking would amend regulations implementing the Act to implement recommendations from the OIG audit and BPI review, simplify the process for claimants to establish eligibility, simplify the program, and implement statutory changes to the PSOB Act.

2. Statement of Authority for Regulatory Action

Under 42 U.S.C. 3796(a)–(b) (authorizing the agency to promulgate

[1] *See* S. Rep. No. 94–816, at 3–4, as reprinted in 1976 U.S.C.C.A.N. 2504, 2505.

[2] H.R. Rpt. 112–548 at 6 (Jun. 25, 2012).

[3] U.S. Dept. of Justice, Office of the Inspector General, *Audit of the Office of Justice Programs' Processing of Public Safety Officers' Benefit Programs Claims,* Audit Division 15–21 at 8 (July 7, 2015).

regulations for the determination of PSOB Program death and disability claims), 3796c(a) (authorizing the agency to promulgate regulations for (1) the determination of PSOB Program death and disability claims, (2) ''the recognition of agents or other persons representing claimants'' in PSOB death and disability claims, and (3) the establishment of ''the maximum fees which may be charged for services performed in connection with any claim''), 3796d–3(a) (authorizing the agency to promulgate regulations for implementing PSOB Educational Assistance programs), and 3782(a) (authorizing the agency to establish regulations ''necessary to the exercise of [its] functions''), the agency is authorized to promulgate regulations necessary to implement the PSOB Act. The agency has previously exercised its regulatory authority to define in regulations many of the terms essential to this rulemaking including ''public agency,'' ''injury,'' ''line of duty,'' ''line of duty injury,'' ''official capacity,'' ''firefighter,'' ''involvement [in crime and juvenile delinquency control or reduction],'' ''gross negligence,'' and ''voluntary intoxication.''

B. Summary of Major Provisions

The proposed rule would make the following changes in response to the Dale Long Public Safety Officers' Benefits Improvement Act of 2012 (Dale Long Act), as provided in sec. 1086 of Public Law 112–239:

- Revise the definition of ''child of a public safety officer;''
- Define ''line of duty activity or action'' for members of rescue squads and ambulance crews;
- Revise the definition of ''officially recognized or designated public employee member of a squad or crew;''
- Remove the definition of ''public employee member of a squad or crew;'' and
- Remove for purposes of educational assistance definitions of ''dependent,'' ''eligible dependent,'' and ''tax year.''

The proposed rule would make the following changes in response to identified ambiguities and gaps in existing regulations, as well as opportunities to simplify and improve the program's administration:

- Expand the definitions of ''firefighter,'' and ''involvement [in crime and juvenile delinquency control or reduction]'' (a necessary component to qualify as a ''law enforcement officer'') to include firefighter and law enforcement officer trainees who are participants in an official training program required for employment or certification as a firefighter or a law enforcement officer;
- Expand the definitions of ''line of duty activity or action'' and ''official capacity'' to include a public safety officer's actions to save human life in certain limited circumstances but without regard to jurisdiction;
- Introduce a definition of ''volunteer fire department'' which provides that a department satisfying the definition qualifies as an ''instrumentality'' of a public agency thereby enabling otherwise qualified volunteer firefighters to more easily establish ''public safety officer'' status;
- Replace the current standard for determining admissibility of evidence (the Federal Rules of Evidence) with the requirement that evidence be ''credible, probative, and substantial;''
- Replace existing prerequisite certification requirements for death and disability claims with a single provision authorizing PSOB determining officials to require that a claimant provide any evidence necessary to determine eligibility;
- Establish a limited exception to the requirement that a claimant must establish all issues by the standard of proof of ''more likely than not;'' when evidence is equivalent on a particular issue, the determining official will resolve such issue in the claimant's favor;
- Change from ''clear and convincing'' to ''more likely than not'' the standard of proof required to establish (1) an officer was injured because of his or her status as a public safety officer, (2) total and permanent disability, and (3) parent-child relationship;
- Expand the types of permissible fee arrangements for representative services, establish a definition for ''attorney'' and limit paid representation in PSOB claims to such individuals;
- Establish, consistent with authority in 42 U.S.C. 3796c(a) providing that the Bureau of Justice Assistance may prescribe in regulations ''the maximum fees which may be charged for services performed in connection with any claim,'' a cap on fees of 12 percent of the total payment available to a claimant and establish fee amounts that are presumptively reasonable in claims determined at the PSOB Office level (8 percent) and at the Hearing Officer or BJA Director level (10 percent);
- Revise the definition of ''totally disabled'' and related provisions to address circumstances when a claimant performs work that is compensated but not substantial; and
- Require individuals seeking benefits to file minimum required documents (a complete application) before the agency will treat the application as a claim for benefits.

C. Projected Costs and Benefits

The proposed rule is not economically significant as defined in Executive Orders 12866 and 13563. The estimated annual increase in PSOB Program death and disability benefit costs is $3,398,810, which equates to 10 additional determinations approving death or disability benefits as compared to the number of annual approvals under existing rules. There is no significant projected increase in administrative or personnel costs. OJP estimates that the rulemaking will result in (1) reduced burden for claimants in establishing eligibility for benefits, (2) timelier processing of all claims for death and disability benefits, and (3) improved delivery of benefits to eligible claimants.

III. Background

The Public Safety Officers' Benefits (PSOB) Program, 42 U.S.C. 3796 *et seq.* (established pursuant to the Public Safety Officers' Benefits Act of 1976), is administered by the Bureau of Justice Assistance (BJA) of the Office of Justice Programs (OJP), U.S. Department of Justice. Generally speaking, the PSOB Program provides a one-time financial benefit, currently adjusted for inflation at $339,881, to the statutorily-eligible survivors of public safety officers who die as the direct and proximate result of personal injuries sustained in the line of duty, as well as educational assistance for their spouses and eligible children. Alternatively, the PSOB Program also provides the same inflation-adjusted one-time financial benefit directly to public safety officers determined to be permanently and totally disabled as the direct and proximate result of personal injury sustained in the line of duty, as well as educational assistance for their spouses and eligible children.

Under 42 U.S.C. 3796(a), an individual seeking PSOB Program death benefits must establish the following: (1) That the deceased was a public safety officer as defined in 42 U.S.C. 3796b, (2) that the officer died as the direct and proximate result of an injury, (3) that the officer's injury was sustained in the line of duty, (4) that the claimant is an eligible beneficiary as identified in 42 U.S.C. 3796(a)(1)–(6), and (5) that no limitations in 42 U.S.C. 3796a, *e.g.,* the decedent's voluntary intoxication or gross negligence, bar recovery. Under 42 U.S.C. 3796(b), an individual seeking PSOB Program disability benefits must establish many of the same facts: (1) That the claimant was a public safety

officer as defined in 42 U.S.C. 3796b, (2) that the officer is permanently and totally disabled, (3) that such disability was the direct and proximate result of an injury, (4) that the officer's injury was sustained in the line of duty, and (5) that no limitations in 42 U.S.C. 3796a bar recovery. Under 42 U.S.C. 3796d–1, the spouse or child of a public safety officer determined to have been killed or permanently and totally disabled as the direct and proximate result of an injury sustained in the line of duty is eligible under 42 U.S.C. 3796d–1 to receive financial assistance for purposes of pursuing a program of higher education provided that the claimant is attending or has successfully completed a qualified education program.

The agency last published comprehensive regulations for the PSOB Program in December 2008. *See* 73 FR 76520 (Dec. 17, 2008). Since that time, the Dale Long Act was enacted, which made several significant amendments to the PSOB Act. Recently, in a separate notice of proposed rulemaking (NPRM) published in the **Federal Register** on on July 15, 2016, 81 FR 46019, the agency proposed regulations that would, among other things, implement the Dale Long Act's provisions offsetting certain payments, and ensure that the regulations reflect updated statutory language regarding the presumption in 42 U.S.C. 3796(k) covering certain heart attacks, strokes, and vascular ruptures. The present NPRM addresses other provisions in the Dale Long Act that the agency believes would benefit from rulemaking.

In addition to the Dale Long Act necessitating regulatory revisions, the agency has identified the need to revise its regulations to reflect current interpretations and practice. Since the last comprehensive regulatory revision in 2008, OJP has determined over 2,582 PSOB claims.[4] In so doing, it has identified ambiguities and gaps in existing regulations, as well as opportunities to simplify and improve the program's administration, while maintaining program integrity.

IV. Section-by-Section Analysis

Section 32.2 Computation of Time; Filing

Section 32.2 provides general definitions and guidance as to when something is ''filed'' with the PSOB Office or other PSOB determining officials. Other regulations, *e.g.,* 28 CFR 32.12(a), establish time frames for when a particular type of claim must be filed and provide that the BJA Director may waive the time requirements for good cause shown. Neither the PSOB Act nor its implementing regulations, however, defines what constitutes ''good cause.'' To establish uniform and transparent criteria for consistently evaluating what constitutes good cause, the proposed rule would add a new paragraph (e) describing the circumstances that may constitute good cause and warrant a waiver permitting an individual to file out of time. Under proposed § 32.2(e), circumstances beyond the individual's control such as lengthy illness or physical or mental incapacity, detrimental reliance on erroneous information provided by the public safety officer's agency, public agency determination of the officer's (or survivor's) eligibility or entitlement to death or disability benefits after the time for filing has passed, or other unavoidable circumstances showing that an individual could not have reasonably known about the time limits for filing may establish good cause. Examples of evidence establishing ''good cause' would include a statement or affidavit from the individual seeking the extension or other person with knowledge of the particular basis for the extension. The proposed rule would limit the scope of the aforementioned exceptions by providing that, consistent with current practice, a lack of knowledge about the PSOB Program is not a valid basis for establishing good cause.

In addition, in preparation for going to a ''paperless'' claims processing system, proposed § 32.2(h) would permit the BJA Director, after publishing a Notice in the **Federal Register** consistent with 5 U.S.C. 552(a)(1)(C), and providing reasonable notice through the PSOB Program Web site, to require that all claims and supporting documents be filed in electronic form.

Section 32.3 Definitions

Section 32.3 provides definitions applicable to all three PSOB Program components, death, disability, and education. OJP proposes to amend the existing definitions in § 32.3 as follows:

- *Agent:* Under 42 U.S.C. 3796c, the agency is authorized to promulgate ''regulations governing the recognition of agents or other persons representing claimants.'' The agency has exercised its regulatory authority to establish in current § 32.7 provisions governing the circumstances under which representatives may charge fees for representative services in a claim for benefits under the PSOB Act. However, the current rules do not define the categories of individuals authorized to provide representative services in PSOB claims and the agency believes that such definitions are necessary for the implementation of proposed rules providing the categories of individuals that may charge fees for representative services. The proposed rule would define ''agent'' as an individual who represents persons seeking PSOB Program benefits and is not an attorney.
- *Attorney:* Pursuant to the authority granted by 42 U.S.C. 3796c(a) providing that the agency may promulgate regulations for purposes of recognizing the agents or other persons representing claimants under the PSOB Act, the proposed rule would define the term ''attorney'' as a member in good standing of a State bar. The agency believes that membership in good standing in a State bar is a reliable indicator that such a person would be capable of providing competent and ethical representation in a claim before the agency. This rule is intended to work in conjunction with proposed § 32.7, which would limit the ability to seek fees for representative services to attorneys as defined in this provision.
- *Authorized commuting:* the proposed rule would clarify that a public safety officer's return travel from responding to a fire, rescue, or police emergency is considered to be in the line of duty.
- *Child of a public safety officer:* From the time of the enactment of the PSOB Act in 1976,[5] until January 1, 2013, an individual's status as a child was determined based on the individual's status at the time of the public safety officer's death. Effective January 2, 2013, for all claims pending before BJA on that date, or filed or accruing thereafter, an individual's status as a child is determined at the time of the public safety officer's fatal (or catastrophic, for disability claims), injury.'' The revised rule implements the statutory change by removing provisions inconsistent with the amendment such as those that refer to a ''child [] adopted by [the officer] after the injury date'' and retaining the requirement that an officer's parental rights must be intact as of the officer's injury date to establish that an individual was ''a child of a public safety officer.''
- *Department or agency:* The PSOB Act, for most purposes, defines a public safety officer as an individual serving a public agency in an official capacity as a law enforcement officer, firefighter, or chaplain. 42 U.S.C. 3796b(9)(A). As defined in 42 U.S.C. 3796b(8), the term

[4] Claims determined at the PSOB Office, Hearing Officer, and BJA Director levels between December 17, 2008 and February 1, 2016.

[5] Public Law 94–430, 90 Stat. 1346, 1347 (1976).

public agency generally refers to a unit of government at the federal, state, or local level, and includes subordinate entities of such governments such as a ''department'' or ''agency'' as well as an ''instrumentality'' of any of the aforementioned entities. Nothing in the statutory definition of ''public agency'' or the regulatory definitions of ''instrumentality'' or ''department or agency'' in 28 CFR 32.3 expressly addresses or covers those entities created by interstate compact, many of which perform public safety activity pursuant to the terms of the compact (*e.g.,* the Washington Metropolitan Area Transit Authority or the Port Authority of New York and New Jersey). Because OJP has consistently interpreted the terms ''public agency'' and ''department or agency'' to include such entities, it proposes to add a new provision in 28 CFR 32.3 (defining *Department or agency)* to make this interpretation clear. Under the proposed rule, the definition of ''department or agency'' would include an entity created by interstate compact between two or more States or between a State(s) and the District of Columbia with the consent of the United States Congress.

• *Determination:* Consistent with the proposed removal of current § 32.27, which provides claimants with the option to seek reconsideration of an adverse disability determination, the proposed rule would eliminate from the definition of ''determination'' reference to such a motion.

• *Divorce:* Under the current regulation, a spouse or purported spouse of an individual may be found to be ''divorced'' for purposes of the PSOB Program if, after the marriage or purported marriage, the spouse or purported spouse holds himself out as being divorced from, or otherwise not married to the individual, holds himself out as being married to another individual, or is a party to a marriage ceremony with another individual. The agency's experience with such non-judicial divorce, particularly with long-estranged parties, is that evidence of such acts is inherently unreliable. To make more reliable agency findings of divorce and simplify the administration of the program, the proposed rule would eliminate as a basis for finding ''divorce'' all dissolutions of marriage other than ordered by a court.

• *Employee:* The proposed rule would clarify, pursuant to the statutory limitation in 42 U.S.C. 3796a(5), that the term does not include any active-duty member of the armed forces.

• *Firefighter:* Absent from the language of the PSOB Act is any mention of whether public safety officer candidates or trainees qualify as public safety officers. In a recent report, the House Judiciary Committee noted that ''certain provisions of the [PSOB Act] have the effect of excluding from the program some classes or subclasses of safety officers and of trainees who might better be included under certain circumstances,'' including police academy and firefighter trainees.[6]

Under current regulations, a firefighter trainee, even if participating in a fire suppression exercise of the trainee's public agency that is mandatory for his or her certification or employment as a firefighter by his or her public agency, generally does not qualify as a ''public safety officer'' for purposes of the PSOB Act. This is because the regulatory definition of ''firefighter'' requires that a firefighter possess, among other things, the legal authority and responsibility to engage in the suppression of fire outside of the training environment to be considered a ''public safety officer.'' As a result, such trainees are ineligible except where a trainee has the legal authority and responsibility to act without limitation at the time of the injury.[7]

As demonstrated by the claims for death benefits submitted on behalf of trainees, the hazards faced while participating in training mandatory to serve a public agency as a firefighter (*e.g.,* the suppression of fire), are similar to that encountered in serving the public. Accordingly, OJP believes that a limited expansion of the current rule to include trainees is warranted.

The proposed rule expands the definition of ''firefighter'' to cover an individual who participates in an official training program of the officer's public agency involving the suppression of fire or hazardous-material response that is mandatory for the individual's employment or certification as a firefighter with a particular public agency. The proposed rule would permit payment on behalf of any individual who died or to any who was permanently and totally disabled as the direct and proximate result of an injury sustained while participating in such training.

• *Gross negligence:* Under 42 U.S.C. 3796a(3), the agency is prohibited from paying benefits when, at the time of the officer's fatal or catastrophic injury, the officer is performing his or her duties in a grossly negligent manner. Under the current definition in 28 CFR 32.3, ''gross negligence'' is established when the officer's performance of duty indicates an extraordinary departure from the appropriate degree of care, *e.g.,* a heedless, wanton, or reckless action, and occurs in the face of significant hazards, where serious injury or damage is likely to follow, or where great danger is readily apparent. The agency's experience is that the current rule is difficult to apply in part due to the multiple terms defining the degree of deviation from the standard of care required to establish such negligence as well as the breadth of circumstances under which such a deviation would establish such negligence.

The proposed rule streamlines the definition by using a single term, ''reckless,'' to describe the deviation from the appropriate standard of care, and by using a single set of conditions, ''under circumstances where it is highly likely that serious harm will follow,'' to describe the conditions under which such misconduct would implicate the statutory bar to payment in 42 U.S.C. 3796a(3). The proposed rule also provides that the standard for measuring a public safety officer's conduct is that of a similarly situated public safety officer. The proposed rule is intended to simplify the agency's application of this statutory bar to payment and limit its application to those circumstances in which it is apparent that the officer's gross negligence was a substantial contributing factor in the officer's injury.

• *Injury:* To establish an ''injury'' under current 28 CFR 32.3, a public safety officer must have sustained a traumatic physical wound or traumatized physical condition of the body that is the direct and proximate result of an external force or other factor listed in the definition, including, among other things, chemicals, bacteria, or climatic conditions.

The current rule expressly excludes from coverage as an injury ''occupational disease'' or ''any condition of the body caused or occasioned by stress or strain,'' both of which are defined further in 28 CFR 32.3. Under current regulations, conditions caused by stress or strain and thus excluded from coverage as an injury generally include those caused by physical exertion; chronic, cumulative, and progressive conditions; cardiovascular disease; and heart attacks, strokes, and vascular ruptures.

The agency's experience is that the current regulatory requirement that an

[6] H.R. Rpt. 112–548 at 8–9 (June 25, 2012).

[7] As a result of the current definition of ''firefighter,'' a trainee firefighter who is killed or permanently disabled while participating in an official training program of his or her public agency, that is mandatory for the trainee's certification or employment as a firefighter with that particular public agency, is ineligible for benefits under the PSOB Act by virtue of not qualifying as a ''public safety officer.''

injury must in all cases be the result of an external force or factor, taken together with the current ''stress or strain'' exclusion, excludes from coverage under the PSOB Act all physical conditions caused by exertion. As a result of the current definitions, an officer's death or disability from an acute and immediate physical condition such as exertional heatstroke or rhabdomyolysis [8] would not be eligible for benefits. While retaining the longstanding interpretation that an injury under the PSOB Act is a traumatic physical wound or traumatized physical condition of the body directly and proximately caused by external forces or factors, the proposed rule would provide, consistent with BJA's current interpretation, that injury also includes acute and immediate musculoskeletal strain or muscle damage, and heatstroke, each of which may be established as an acute condition, and without an external force or factor.

In addition, the agency's experience in determining claims suggests that the definition of injury should be revised to make clear current agency interpretations that may not be obvious or intuitive to claimants and other stakeholders. The current definition of injury does not reflect the agency's interpretation that an increase in the severity of an officer's pre-existing physical wound or condition—regardless of the cause of the pre-existing wound or condition—is an injury under the PSOB Act so long as the increase in severity is itself the direct and proximate result of a line of duty injury. The proposed rule would provide that such aggravation of pre-existing conditions would constitute an injury. In stating that certain aggravation of a pre-existing injury may constitute an injury for purposes of the PSOB Program, the proposed rule clarifies that a pre-existing injury is not automatically excluded from consideration as the substantial factor in an officer's death or permanent and total disability.

Based on the claims it has received, the agency believes that the regulatory definition of ''injury'' together with the separate definition of stress or strain, have proven very challenging for claimants to understand and apply, particularly to fatal heart attacks, strokes, and vascular ruptures. The agency believes that this is in part due to the absence from the current definitions the agency's longstanding interpretation that heart attacks and strokes, absent an external force or factor shown to have directly and proximately caused such condition, are not injuries. The agency's interpretation dates back to the first PSOB regulations published in 1977, 42 FR 23252, 23260 (May 6, 1977), and has been upheld in a series of court decisions.[9]

Heart attacks, strokes, and vascular ruptures are eligible for death benefits under the presumption created by the Hometown Heroes Survivors' Benefits Act of 2003 (Pub. L. 108–182) (Hometown Heroes Act) and amended by the Dale Long Public Safety Officers' Benefits Improvement Act of 2012 (Pub. L. 112–239). Together, these amendments have established a rebuttable presumption that a heart attack, stroke, or vascular rupture satisfying the requirements of 42 U.S.C. 3796(k) constitutes a personal injury sustained in the line of duty. Generally speaking, the presumption is established in cases where a public safety officer sustains heart attack, stroke, or vascular rupture while engaging in a situation involving ''nonroutine stressful or strenuous physical [line of duty] . . . activity'' or participating in a training exercise ''involving nonroutine stressful or strenuous physical activity'' (or within 24 hours of such engagement or participation) and the heart attack, stroke, or vascular rupture is the direct and proximate cause of the officer's death. Though not directly related to the definition of injury under § 32.3, in an NPRM published in the **Federal Register** on July 15, 2016, 81 FR 46019, the agency proposed regulations that would define the circumstances under which the presumption is rebutted in amended 42 U.S.C. 3796(k).

To make the agency's interpretation clear, the proposed rule would eliminate the separate definition of stress or strain and would incorporate those conditions excluded by that definition directly into the definition of injury. In so doing, the proposed rule would identify specific types of conditions excluded from the definition of injury including: ''any chronic, cumulative, or progressive condition of the body,'' and ''cardiovascular disease.'' To clarify for claimants and the general public that, under 42 U.S.C. 3796(k), certain heart attacks, strokes, and vascular ruptures may be presumed to be a personal injury, the proposed rule would so state.

Similarly, the current definition of injury does not, by itself, clearly reflect the agency's longstanding interpretation that mental health conditions including post-traumatic stress disorder (PTSD) or anxiety do not constitute an injury, and therefore, the basis of a disability, under the PSOB Act. By way of background, the Law Enforcement Assistance Administration (LEAA) defined the term ''traumatic injury'' in 1977 as excluding ''stress and strain.'' Referring to the legislative history of the PSOB Act, and, in particular, the definition of ''personal injury'' in the House Judiciary Committee Reports, the LEAA stated that ''[d]eaths caused by traumatic injuries do not therefore include deaths directly attributable to exertion or stress encountered in the performance of duty.'' [10] Further supporting LEAA's original interpretation, a 2001 case in the United States Court of Appeals for the Federal Circuit found permissible BJA's regulatory definition ''exclud[ing] from the definition of 'traumatic injury' stress and strain.'' [11] In explaining its conclusion, the court stated that ''the legislative history [of the PSOB Act] points away from an intent on the part of Congress to have the statutory term 'personal injury' include mental strain.'' [12] More recently, in a House Report describing, among other things, amendments to the statute authorizing payment of disability benefits, 42 U.S.C. 3796(b), the Committee on the Judiciary stated that ''a disability benefit is payable only when the Department determines that a public safety officer has sustained a line of duty injury whose direct *physical consequences* permanently prevent the performance of any gainful work.[13]

To better communicate the agency's longstanding interpretation regarding the ineligibility of mental health conditions for PSOB Program benefits, the revised definition of injury would expressly provide that mental health

[8] ''Rhabdomyolysis is the breakdown of muscle tissue that leads to the release of muscle fiber contents into the blood. These substances are harmful to the kidney and often cause kidney damage.'' It may be caused by, among other things, ''severe exertion, such as marathon running or calisthenics.'' National Institutes of Health (MedlinePlus), *Rhabdomyolysis, https://www.nlm.nih.gov/medlineplus/ency/article/000473.htm* (accessed Feb. 11, 2016).

[13] H.R. Rep. No. 112–548 at 13 (2012) (emphasis added).

conditions are excluded from consideration as an ''injury.''

• *Injury date:* Under current regulations defining ''injury date,'' such date generally means the time of the line of duty injury that directly and proximately resulted in the death or permanent and total disability of the public safety officer. Current regulations do not define when an injury occurs for purposes of 42 U.S.C. 3796(k) for purposes other than ''determining beneficiaries under the Act.'' As the ''injury date'' in a claim based on 42 U.S.C. 3796(k) is relevant for other purposes (*e.g.,* determining voluntary intoxication), the proposed rule would define injury date in such a claim. The proposed rule would provide that, for all purposes relating to 42 U.S.C. 3796(k), injury date means the time of the officer's qualifying engagement or participation referred to in the Act at 42 U.S.C. 3796(k)(1)).

• *Involvement:* Under current regulations, a law enforcement officer trainee, even while participating in an official training program that is mandatory for his or her certification or employment as a law enforcement officer (*e.g.,* firearms training), is generally not a ''public safety officer'' for purposes of the PSOB Act. This is because the regulatory definition of ''involvement'' requires that a law enforcement officer possess, among other things, the unrestricted ''legal authority and -responsibility'' to arrest or apprehend . . . persons for violations of criminal law to qualify as a ''public safety officer.'' As a result, such trainees are ineligible except in the unusual circumstances in which a trainee has the legal authority and responsibility to act as a law enforcement officer without limitation at the time of the injury.[14]

As demonstrated by the claims for death benefits submitted on behalf of trainees, the hazards faced while participating in training mandatory to be serve a public agency as a law enforcement officer (*e.g.,* firearms training, unarmed self-defense, or physical training) are similar to what may be encountered in serving the public. Accordingly, a limited expansion of the current rule to include such circumstances is warranted.

The proposed rule expands the definition of ''involvement'' to cover as a ''law enforcement officer'' any individual who participates in an official training program of the individual's public agency that is mandatory for that individual's employment or certification in certain law enforcement positions such as a police officer, corrections officer, probation officer, or equivalent. The proposed rule would permit payment on behalf of any individual who died or to any who was permanently and totally disabled as the direct and proximate result of an injury sustained while participating in such mandatory training.

• *Line of duty activity or action:* The proposed rule would provide that certain activities or actions of a law enforcement officer or firefighter, performed under emergency circumstances and necessary to save or protect human life, in any jurisdiction, would be deemed to be line of duty activity or action for purposes of the PSOB Act.

Under 42 U.S.C. 3796(a) and (b), the agency pays death or disability benefits when it determines that a public safety officer has died or become permanently and totally disabled as ''the direct and proximate result of a personal injury sustained in the line of duty.'' Under current regulations, a public safety officer's action or activity and resulting injury is ''in the line of duty'' only if it is an action or activity that the officer is legally authorized or obligated to perform as a public safety officer and the officer's public agency recognizes it as such.[15] Where an officer acts outside his or jurisdiction, even if acting in an emergency to save human life, such actions are generally outside the legal authority of the officer's public agency and, as a result, excluded from PSOB Act coverage as not ''in the line of duty.''

As guardians of the public, public safety officers are trained to and called upon to engage in extraordinary acts of self-sacrifice and bravery to save the lives of others. However, these acts may not always occur within an officer's jurisdiction. The regulations which require that an officer's public agency affirm, or at least, not deny, that a public safety officer had the legal authority and responsibility to perform such actions, as currently written, do not take into account the extraordinary situations which require an urgent and immediate response and do not afford a public safety officer an opportunity to seek approval or authorization to act.

Within the context of the PSOB Program, BJA recognizes that public safety officers, by virtue of their training, expertise, and experience, are often compelled to act where human life is endangered. Moreover, a public safety officer's training and experience make them uniquely qualified to intervene to save human life. Accordingly, BJA believes that the actions of public safety officers, *i.e.,* firefighters and law enforcement officers, in these extraordinary and limited circumstances should be covered by the PSOB Program.

As the PSOB Act does not define ''line of duty'' and expressly delegated to the agency in 42 U.S.C. 3796(c) the authority to promulgate implementing regulations, the agency may interpret the term ''line of duty'' in regulations so long as the interpretation is not arbitrary, capricious, or contrary to law.[16] The agency's proposed regulatory interpretation recognizes, consistent with the language of 42 U.S.C. 3796(a) and (b), that ''[t]he word 'duty' connotes a legal or moral obligation'' and that ''[i]n reference to public safety officers, 'duty' refers to the obligation to protect the public in their capacity as firefighters or police officers.'' [17] The proposed rule recognizes the connection between an injury sustained by an officer in the course of performing a lifesaving act, even an officer who may be off-duty and outside of his or her jurisdiction, and the officer's duty as a public safety officer to protect the public. Moreover, the proposed rule is consistent with existing provisions that deem an officer's injury to be in the line of duty even in circumstances when the officer may have been off duty and without regard to the officer's location—when ''such injury resulted from the injured party's status as a public safety officer.'' [18] Other provisions of federal law similarly recognize public safety officers' special role by granting rights beyond those enjoyed by the public at

[14] As a result of the current definition of ''involvement,'' a necessary element of the definition of ''law enforcement officer,'' a trainee police officer who is killed or permanently disabled while participating in an official training program of his or her public agency, that is mandatory for the trainee's certification or employment as a police officer with that particular public agency, is ineligible for benefits under the PSOB Act by virtue of not qualifying as a ''public safety officer.''

[15] See 28 CFR 32.3 (defining *Line of duty activity or action*).

[16] See *Hawkins* v. *United States,* 469 F.3d 993, 1004 (Fed. Cir. 2006) (providing that, as Congress did not define line of duty in the PSOB Act, ''the BJA's regulatory interpretation of 'line of duty' . . . must be upheld unless it is ''arbitrary, capricious, or manifestly contrary to the statute'') (other citation omitted). *Cf. Davis* v. *United States,* 50 Fed.Cl. 192, 200 (2001) (''Congress has spoken on the issue of 'line of duty' and its scope. A public safety officer is killed in the 'line of duty' when his or her death results from the performance of any duty required by law or terms of employment or as a consequence of his or her identity as a safety officer.'').

[17] *Davis* v. *United States,* 50 Fed.Cl. 192, 207 (2001).

[18] *See* 28 CFR 32.3 (defining *Line of duty injury*).

large [19] and recognizing that local public safety officers often serve the public in areas other than the officer's immediate jurisdiction.[20] Finally, in recognizing and covering the risks faced by public safety officers in carrying out their obligation to protect the public, the limited expansion in the proposed rule is also consistent with one of the purposes of the PSOB Act, to recruit and retain public safety officers.

The proposed rule would add to the definition of ''line of duty action or activity'' a narrow exception that would deem the extraordinary acts of a firefighter or law enforcement officer to save a human life as ''in the line of duty.'' To maintain the integrity and limited nature of the exception, such acts would be limited to those circumstances in which (1) the officer's actions constituted public safety activity, (2) the officer's actions were performed in the course of responding to an emergency situation requiring prompt actions to save human life, (3) the officer did not create the emergency situation to which he or she responded, (4) the human life the officer attempted to save or saved was other than that of the officer, and (5) the officer's acts were not contrary to the law of the jurisdiction in which performed.

Providing a narrowly drawn exception to the definition of line of duty is consistent with the purpose of the PSOB Act to extend coverage to firefighters and law enforcement officers who sacrifice their own their lives to save the life of others, or who are catastrophically injured while doing do. The proposed rule will further prevent the anomaly of such a public safety officer being recognized or honored posthumously for extraordinary acts of heroism through BJA programs such as the Public Safety Officer Medal of Valor [21] while at the same time being denied, or having their family denied, PSOB benefits because of narrowly drawn eligibility criteria do not take into account these extraordinary situations.

As provided in sec. 1086 of Public Law 112–239, the Dale Long Act amended the PSOB Act by adding a new provision defining as a public safety officer those members of a rescue squad or ambulance crew who, as authorized, are engaging in rescue activity or providing emergency medical services.[22] Notably, the amendment removed the requirement that an individual member be a ''public employee'' and expanded membership to ''officially recognized or designated employee or volunteer member[s]'' of public agencies as well as those employee or volunteer members of certain ''nonprofit entit[ies] serving the public.''

Under the proposed rule, the ''line of duty activity or action'' definition would reflect the Dale Long Act's expansion of PSOB Program coverage to employee or volunteer members of ambulance crews and rescue squads operated by certain nonprofit entities serving the public. The proposed rule would also implement the reduced scope of PSOB Program coverage in 42 U.S.C. 3796b(9)(D) for all employee and volunteer members of public agency and nonprofit entity ambulance squads and rescue crews based on statutory language limiting public safety officer status to those circumstances in which a member of an ambulance crew or rescue squad is actually engaging in rescue activity or providing emergency medical services.[23]

• *Line of duty injury:* Under current regulations, an injury is sustained in the line of duty if it was suffered during performance of a ''line of duty activity or a line of duty action'' or ''authorized commuting.'' [24] In such circumstances, it is the nature of the officer's actions that determines whether an injury is ''in the line of duty'' and therefore eligible for benefits. Existing PSOB regulations provide an exception to this general principle in that an injury is deemed to be in the line of duty if clear and convincing evidence demonstrates that the injury resulted from a public safety officer's status as a public safety officer. Under the current rule, it is the actions and motivation of the assailant that determine whether an injury is in the line of duty and eligible for benefits; consequently, every injury inflicted upon an off-duty public safety officer is not automatically considered to be in the line of duty. Rather, it must be shown that the motivation for injuring the officer was the officer's status as a public safety officer as opposed to a personal dispute or other event unrelated to the officer's status as a public safety officer.

The agency's experience is that this provision, although appropriately narrow, has proved particularly burdensome for claimants in those claims in which both the officer and the assailant are deceased and there is little or no evidence as to the motivation for injuring the officer. Adding to a claimant's challenges in establishing a line of duty injury in such claims, the current regulation also requires that such injury must be established by clear and convincing evidence rather than the standard of proof of ''more likely than not'' applicable to nearly all other determinations in the PSOB Program. The agency believes that two minor changes to the current regulation would enable claimants to establish eligibility in such claims and maintain the necessarily limited nature of the provision.

The proposed rule would change from ''convincing'' to ''more likely than not'' the standard of proof for establishing that an officer was injured due to the officer's status as a public safety officer. In doing so, the proposed rule would address those situations in which the only evidence of the assailant's intent to injure the officer is circumstantial. As an assailant's intent to injure an officer on account of the officer's status is often intertwined with or manifested in an intent to retaliate against an officer for actions taken in the line of duty by the officer injured or other public safety officers, the proposed rule would also clarify that injury sustained by a public safety officer in retaliation for line of duty actions or activities is a valid basis for establishing line of duty injury as a result of an officer's status.

• *Official capacity:* In addition to the requirement in 42 U.S.C. 3796b(9)(A) and implementing regulations that an individual must possess the qualifications applicable for the particular category of officer to establish public safety officer status, the evidence must also establish that the individual law enforcement officer and firefighter was serving a ''public agency in an official capacity'' at the time of injury. Public agency is defined in 42 U.S.C. 3796b(8) and generally refers to a unit of government at the federal, state, or

[19] *See, e.g.,* Law Enforcement Officers Safety Act of 2004, Public Law 108–277, 118 Stat. 865, *codified at* 18 U.S.C. 926B, 926C (granting ''qualified law enforcement officers'' the right to carry concealed weapons across state lines, notwithstanding provisions of state law prohibiting or limiting concealed weapons).

[20] *See, e.g.,* 5 U.S.C. 8191 (authorizing federal workers' compensation benefits to local law enforcement officers injured while pursuing or apprehending persons sought for crimes against the United States or material witnesses for federal prosecutions).

[21] Public Law 107–12, as amended, established the Public Safety Officer Medal of Valor, which is awarded by the President, in the name of Congress, to public safety officers for ''extraordinary valor above and beyond the call of duty.''

[22] 42 U.S.C. 3796b(9)(D).

[23] As the statutory language of the 2013 amendment limits the scope of coverage to circumstances in which the rescue squad or ambulance crew member is engaging in rescue activity or the provision of emergency medical services ''as authorized or licensed by law and by the applicable agency or entity,'' OJP is unable to establish in regulations an exception for actions taken to save human life outside the member's jurisdiction.

[24] 28 CFR 32.3 (defining *Line of duty injury*).

local level, subordinate entitles of such governments including a ''department'' or ''agency,'' or an instrumentality of any of the aforementioned entities ''Official capacity'' is not defined in the PSOB Act; however, the agency has exercised its regulatory authority to define it in 28 CFR 32.3 as based on two criteria. First, an individual must be officially acknowledged by the agency to be functionally within or part of the agency; an individual's status as a contractor, by itself, does not establish that an individual is functionally within a public agency. Second, the public agency must accept legal responsibility for the acts and omissions of the individual.

Under these existing definitions, an otherwise qualified firefighter or law enforcement officer who is recognized by his or her agency as functionally within or part of the agency, but acts in emergency circumstances to save human life outside his or her agency's jurisdiction or where he or she is otherwise not obligated to act, will generally not be found to be serving a public agency in an official capacity. This is because the firefighter's or law enforcement officer's acts and omissions in such circumstances will generally not be recognized by his or her own public agency as legally those of the agency.

As discussed in the analysis of the proposed revision to the ''line of duty'' regulation, it is not uncommon for public safety officers to respond to emergencies regardless of whether the emergency is in their jurisdiction. The PSOB regulations which require that a public agency affirm, or at least, not deny, that a public safety officer's acts or omissions while acting outside the officer's jurisdiction were legally those of the public agency, as currently written, do not take into account these extraordinary situations which require an urgent and immediate response and do not afford a public agency the opportunity to determine whether it will affirm, or at least not deny legal responsibility for an officer's acts or omissions while so acting.

Within the context of the PSOB Program, BJA recognizes that public safety officers, by virtue of their training, expertise, and experience, are often compelled to act where human life is endangered. Moreover, a public safety officer's training and experience make them uniquely qualified to intervene to save human life. Accordingly, BJA believes that the actions of public safety officers, *i.e.,* firefighters and law enforcement officers, in these extraordinary and limited circumstances should be covered by the PSOB Program.

As the PSOB Act did not define ''official capacity'' as to address whether an officer's off-duty actions could satisfy such requirement and expressly delegated to the agency in 42 U.S.C. 3796(c) the authority to promulgate implementing regulations, the agency may interpret the term ''official capacity'' in regulations so long as the interpretation is not arbitrary, capricious, or contrary to law.[25] Moreover, the proposed rule is consistent with existing provisions that deem an officer's injury to be in the line of duty without regard as to whether the officer was functioning in an official capacity at the time of his or her injury—when such injury resulted from the injured party's status as a public safety officer.[26]

As mentioned with regard to the proposed changes to ''line of duty,'' other provisions of federal law similarly recognize public safety officers' special role by granting rights beyond those enjoyed by the public at large [27] and recognizing that local public safety officers often serve the public outside the officer's immediate jurisdiction.[28] The proposed rule is consistent with the recognition afforded by those provisions. Finally, in recognizing and covering the risks faced by public safety officers in carrying out their obligation to protect the public, the limited expansion in the proposed rule is also consistent with one of the purposes of the PSOB Act: To recruit and retain public safety officers.

The proposed rule would add to the definition of ''official capacity'' a narrow exception that would deem the extraordinary acts of a firefighter or law enforcement officer to save a human life as ''serving a public agency in an official capacity.'' To maintain the integrity and limited nature of the exception, such acts would be limited to those determined to be ''line of duty activity or action'' under the proposed exception to that definition. This proposed change is intended to work in conjunction with the proposed change regarding line of duty.

- *Officially recognized or designated public employee member of a squad or crew:* As provided in sec. 1086 of Public Law 112–239, the proposed rule would revise the existing definition to cover members of ambulance squads and rescue crews who are employed by or volunteer for certain nonprofit entities serving the public.
- *On-site hazard management:* As currently defined in 28 CFR 32.3, the term ''fire suppression'' includes ''on-site hazard evaluation'' but the latter term is not defined and does not include the more comprehensive task, ''on-site hazard management.'' To account for this necessary component of firefighter work, the proposed rule would define on-site hazard management as including actions taken to provide scene security or direct traffic in support of a fire, rescue, or law enforcement emergency.
- *Parent-child relationship:* As defined in 28 CFR 32.3, the terms ''adopted child'' and ''stepchild'' require a PSOB determining official to determine whether a public safety officer had a ''parent-child relationship'' with a child. The current definition of parent-child relationship, *i.e.,* a relationship between a public safety officer and another individual where the officer acts as a parent, requires that the relationship be shown by convincing evidence. This higher standard of proof has delayed the processing of claims involving claimants seeking benefits on behalf of (or as) the stepchild or adopted child of a deceased officer. In nearly all such claims, additional evidence sought to meet the higher standard has confirmed the initial assessment of the determining official.

As the higher standard proof has been shown to add little certainty in what is inherently a subjective determination about the existence of a relationship that is known best by the persons directly involved in it, the agency proposes to revise it. The proposed rule would revise the definition parent-child relationship by changing the standard of proof from ''convincing evidence'' to the standard of ''more likely than not'' applicable in nearly all other PSOB Program determinations.

- *PSOB Counsel:* In 2013, the Attorney General directed that the PSOB claims process be streamlined through the consolidation of legal and other claims functions within BJA. Apart from a final rule revising the definition of ''PSOB Office'' that was published in the **Federal Register** in 2013, 78 FR 29233 (May 20, 2013), the agency has published no regulations identifying the entity or individual providing legal

[25] *See Groff* v. *United States,* 493 F.3d 1343, 1353 (Fed. Cir. 2007) (''Congress did not further define what it means to serve 'in an official capacity,' leaving the statute silent as to whether contract pilots fall within its ambit.'').

[26] *See* 28 CFR 32.3 (defining *Line of duty injury*).

[27] *See, e.g.,* Law Enforcement Officers Safety Act of 2004, Public Law 108–277, 118 Stat. 865, *codified at* 18 U.S.C. 926B, 926C (granting ''qualified law enforcement officers'' the right to carry concealed weapons across state lines, notwithstanding provisions of state law prohibiting or limiting concealed weapons).

[28] *See, e.g.,* 5 U.S.C. 8191 (granting federal workers' compensation benefits to local law enforcement officers injured while pursuing or apprehending persons sought for crimes against the United States or material witnesses for federal prosecutions).

review within BJA. In order to make more transparent the legal review process associated with PSOB claims, the proposed rule would identify PSOB Counsel as the legal staff in BJA responsible for performing legal review of claims for PSOB Program benefits and providing PSOB determining officials with legal advice in PSOB Program matters.

• *Public employee member of a squad or crew:* The agency proposes to remove this definition as a recent amendment to 42 U.S.C. 3796b(7) in sec. 1086 of Public Law 112–239 removed the ''public employee'' requirement from the definition of ''member of a rescue squad or ambulance crew.''

• *Stress or strain:* As discussed in the proposed revision of the definition of ''injury,'' the agency's experience is that the public has found the definition of stress or strain very difficult to understand and apply. For the reasons provided, the proposed rule would eliminate this definition in favor of incorporating the specific conditions that are excluded into the definition of injury. In so doing, the proposed rule would make clear those conditions that are excluded from the definition of injury, streamline the processing of claims, and help to reduce the number of claims filed that, as a matter of law, cannot be paid due to a lack of injury.

• *Suppression of fire:* As currently defined, the term refers to the work and activities connected with extinguishing or containing a fire, beginning with its discovery, and includes extinguishment, physical prevention, or containment of fire, including on-site hazard evaluation. ''On-site hazard evaluation'' is logically part of a larger task, ''on-site hazard management.'' The current definition does not take into account the individual members of fire departments that are deployed to provide on-site hazard management activities including traffic incident management at emergency scenes. These individuals, often referred to as ''fire police,'' are officially designated members of a fire department, receive formal training, and perform operational duties that, in the absence of fire police, would be required to be performed by another member of the department.

When an officially designated member has the legal authority and responsibility to qualify as a firefighter or law enforcement officer as defined in 28 CFR 32.3, and is otherwise serving a public agency in an official capacity, the individual qualifies as a public safety officer. However, in the majority of claims involving personnel whose specialized duties are limited to traffic incident management and other on-site hazard management tasks, the individual lacks the legal authority and responsibility to either engage in the suppression of fire (as currently defined), or arrest persons alleged to have violated the criminal laws, which precludes the individual from qualifying as a public safety officer as a firefighter or law enforcement officer.

The agency's experience is that, apart from engaging in actual fire suppression, personnel providing on-site hazard management are at risk for many of the same hazards encountered at the scene of a fire as do personnel who engage directly in the suppression of fire as firefighters. Fire police and similar fire department personnel are exposed to the hazards of the emergency response, the hazardous materials and toxins released into the air at the scene of the fire, as well as the hazards posed by their traffic control duties that kill or disable firefighters.[29] The proposed rule would expand the type of activities covered as fire suppression to include on-site hazard management, which would be addressed separately in a new definition in 28 CFR 32.3 and would include duties such as providing scene security and directing traffic in response to a fire emergency.

• *Voluntary intoxication at the time of the officer's fatal or catastrophic injury:* Under 42 U.S.C. 3796a(2), the agency is prohibited from paying benefits ''if the public safety officer was voluntarily intoxicated at the time of his fatal or catastrophic injury.'' Under the current regulation implementing 42 U.S.C. 3796a(2), a public safety officer is considered to be voluntarily intoxicated when a drug test establishes in the body of a public safety officer, the presence, in any amount, of a drug listed in the Schedules of Controlled Substances. *See e.g.,* 21 U.S.C. 812; 21 CFR, part 1308. In the overwhelming majority of claims, the officer is found to have been taking a prescribed drug consistent with such prescription and not intoxicated at the time of fatal or catastrophic injury. However, BJA and claimants expend significant resources in determining that this limitation is not implicated, which delays the processing of otherwise valid claims. To enable BJA to focus its inquiry on those drugs used as intoxicants and those that generally produce intoxication, the proposed rule would makes several substantive changes to the existing rule pertaining to how voluntary intoxication is determined with regards to drugs.

The proposed rule would, among other things, revise existing language to provide that voluntary intoxication is not automatically established when the presence of drugs in the body of the public safety officer is generally within prescribed limits and the public safety officer was not acting in an intoxicated manner immediately prior to the injury. To account for circumstances under which there is no witness available to attest as to whether an officer was acting in an intoxicated manner immediately before a fatal injury, the proposed rule would clarify, consistent with BJA's current interpretation, that voluntary intoxication is not implicated when convincing evidence establishes that the drug would not produce intoxication in the amount present in the officer's body.

• *Volunteer fire department:* Under 42 U.S.C. 3796b(9)(A), to be eligible for benefits as a public safety officer, a firefighter must be serving ''a public agency in an official capacity.'' Under the current definition of ''official capacity'' in 28 CFR 32.3, an otherwise qualified volunteer firefighter who is an officially recognized or designated member of a legally established volunteer fire department (VFD) cannot be considered to be serving a public agency in an official capacity and therefore cannot be a public safety officer, unless a public agency recognizes (or, at a minimum, does not deny) that the volunteer firefighter's acts and omissions are legally those of the public agency.

BJA's experience is that in most PSOB claims involving volunteer firefighters, the ''public agency'' and ''official capacity'' requirements for the individual volunteer firefighter are satisfied when the VFD establishes that it is an ''instrumentality'' of a public agency under 28 CFR 32.3 (defining *Instrumentality*) and that, as such, the public agency is legally responsible for the acts and omissions of its members. In a relatively recent trend, the agency has received claims in which a VFD does not fully qualify as an instrumentality despite providing fire protection to a public agency as a noncommercial, non-profit corporation. In nearly all claims in which a VFD does not qualify as an instrumentality, it is because the public agency denies legal responsibility for the acts and omissions of the VFD. Such denial is often manifested in a contract or similar agreement for services under which the public agency expressly states that it is not responsible for the acts or omissions

[29] Between 1996 and 2010, 253 firefighters were killed in vehicle collisions responding to and returning from incidents; 70 more were killed after being struck by vehicles at the scene of emergencies. U.S. Fire Administration, *Traffic Incident Management Systems,* FA–330/March 2012, 4–5, *https://www.usfa.fema.gov/downloads/pdf/publications/fa_330.pdf* (accessed Feb. 26, 2016).

of the VFD. Under such contracts, the public agency may require the VFD to obtain its own insurance (even as the public agency provides the VFD with funding for operations) and indemnify and hold harmless the public agency for its acts and omissions or those of its members. Such contracts may also refer to the volunteer firefighter members of such VFDs as ''independent contractors'' of the public agency despite the fact that the volunteer firefighters are officially recognized members of the VFD, itself a non-commercial, nonprofit corporation.

Since the enactment of the PSOB Act in 1976 and before the agency defined in regulations the terms ''official capacity'' and ''instrumentality,'' qualified members of legally organized VFDs have generally been considered to be public safety officers. To preserve this eligibility and address the trend of shifting liability, the proposed rule provides that a VFD qualifies as an instrumentality as defined in 28 CFR part 32 if it is legally established as a public entity or nonprofit entity serving the public, and it is legally established solely for the purpose of providing fire protection and related services on a noncommercial basis to or on behalf of a public agency or agencies. The proposed rule also provides that to qualify as an instrumentality under this provision, a VFD must provide fire protection to members of the public without preference or subscription fees. The proposed rule would preserve the existing PSOB Act coverage of volunteer firefighters serving the public in noncommercial, nonprofit VFDs and leave undisturbed the agency's longstanding interpretation that, as a general rule, commercial entities cannot establish status as a public agency or as an instrumentality of a public agency.

Section 32.5 Evidence

Under current § 32.5(a), claimants have ''the burden of persuasion as to all material issues of fact, and by the standard of proof of 'more likely than not.' '' The proposed rule would retain this standard of proof, and simplify the current description of claimants' burden by providing that claimants are responsible for establishing all elements of eligibility for the benefit they seek.

The proposed rule would replace the standard for evidentiary submissions in current § 32.5(c), Federal Rules of Evidence 301, 401, 402, 602–604, 701–704, 901–903, and 1001–1007, with a general standard for admissibility similar to that used in other federal benefit programs. *See e.g.,* 20 CFR 10.115 (providing that the evidence submitted in a claim for Office of Workers' Compensation benefits ''must be reliable, probative and substantial''). Although the Federal Rules of Evidence provide a precise set of rules for evaluating evidentiary submissions in litigation, BJA believes that a less formal and legalistic set of standards is better suited for an administrative, non-adversarial claims process in which most claimants are unrepresented. The proposed rule provides that a claimant's evidence must be worthy of belief (credible), tending to prove an issue (probative), and actually existing (substantial). The proposed rule would also provide that, when deemed necessary by a PSOB determining official, a claimant must produce original documents or other copies verified as true and exact by a custodian of such records.

Under current 28 CFR 32.5(i), BJA considers a public safety officer's response to a call to provide emergency service ''prima facie evidence'' that the activity was ''nonroutine'' for purposes of applying the presumption in 42 U.S.C. 3696(k). The agency's experience, which is substantiated by research showing that a public safety officer's sympathetic nervous system is activated with his or her receipt of an alarm, is that a public safety officer's response to an emergency call to perform public safety activity, which generally begins when an officer receives such call, also constitutes evidence of the response's physically stressful character. Accordingly, the proposed rule provides that a public safety officer's response to a call for emergency service shall also constitute prima facie evidence that the response was physically stressful for purposes of 42 U.S.C. 3796(k).

As stated, generally, the evidence of record in a claim must establish material issues of fact to the standard of proof of ''more likely than not.'' However, the unique circumstances of public safety work results in PSOB claims in which many of the incidents or injuries that are the basis of the claim may be without numerous witnesses or extensive documentation. To address the evidentiary challenges posed by the hazards and risks of public safety activity and the unpredictable nature of such work, the agency proposes a limited exception to this standard of proof by adding add a new § 32.5(k) that would address situations in which the proof on either side of an issue is equal. The proposed rule would provide that where the determining official determines the record evidence to be equivalent regarding a fact material to whether or not the circumstances of the death or injury of the officer warrant coverage as a death or permanent and total disability incurred in the line of duty under the Act, the determining official shall resolve the matter in favor of the claimant. The proposed rule makes clear that the absence of evidence in support of a particular fact does not establish that the evidence is equivalent and that the provision is not a substitute for actual evidence establishing or disproving a particular fact.

The proposed rule would also replace the prerequisite certification regulations at 28 CFR 32.15 and 32.25 with a single provision at § 32.5(l) authorizing PSOB determining officials to require from a claimant any proof necessary to establish facts of eligibility essential for death, disability, or education claims under the PSOB Act including proof of birth, death, disability, earnings, education, employment, and injury. Under the current rule, without a waiver from the BJA Director for good cause shown, BJA may not approve any death or disability claim unless the public safety officer's agency produces a certification as defined in § 32.3 and specific types of supporting documentation. For example, even in a claim for PSOB death benefits in which the public agency has paid death benefits to the public safety officer's survivors, BJA may not pay benefits without a certification (or, as appropriate a waiver for good cause shown) from the public safety officer's agency that the officer died as ''a direct and proximate result of a line of duty injury'', or that the public safety officer's survivors have received ''the maximum death benefits legally payable by the agency'' to similarly situated public safety officers.

BJA's experience is that the prerequisite certification regulations impose an extremely high level of precision on the claims process, often require the public safety officer's agency to make legal and medical conclusions they are not qualified to make, and produce delays in adjudication. The better course, and one keeping in line with other government claims programs would be to allow claimants and agencies to provide documents establishing eligibility from a variety of sources including but, not limited to, death certificates, autopsies, toxicology reports, coroner's reports, police reports, investigative reports, workers compensation determinations, State-law line of duty death determinations, insurance policies, newspaper and media reports, and statements from the officer's public agency. Taken together, such documents are more than adequate to establish the relevant facts and circumstances of a public safety officer's injury and the eligibility of beneficiary.

In replacing the prerequisite certification and waiver requirements with a process tailored to the facts of individual claims, the proposed rule would reduce administrative burden and improve the efficiency of the process by reducing delays for unnecessary documents and or waivers.

In a recent report on the PSOB Program, the OIG recommended that BJA implement ''an abandonment policy that gives claimants adequate opportunity to provide needed documentation to support their claims and ensures that the PSOB Office does not use its limited resources conducting outreach on claims, especially those which claimants do not intend to pursue.'' [30] To aid in implementing the OIG's finding, OJP proposes to define in a new § 32.5(m), the circumstances under which a claim is considered to be abandoned.

The proposed rule would consolidate most abandonment provisions in a single provision. Under the proposed rule, when a claimant or agency who does not furnish evidence necessary to a determination within one year of BJA's request, or a claimant fails to pursue in a timely fashion a determination on his or her claim, following appropriate notice BJA will consider the claim abandoned and take no further action on the claim unless it received a complete claim, including the specific information requested, within 180 days from notice of abandonment. Consistent with current practice, the claim would be considered as though never filed, and abandonment would not toll the time periods remaining for filing. In providing claimants with a one-year period to respond to requests for evidence, as well as a ''grace period'' in which claimants may reopen an abandoned claim, the proposed rule provides adequate time for claimants to provide documents supporting their claims while permitting BJA to dedicate its resources to those claims that can be decided on the evidence of record.

Section 32.7—Fees for Representative Services

Under 42 U.S.C. 3796c, the agency is authorized to promulgate ''regulations governing the recognition of agents or other persons representing claimants.'' The agency has exercised its regulatory authority to establish in current § 32.7 provisions governing the circumstances under which representatives may charge fees for representative services in a claim for benefits under the PSOB Act. Claimants for representative services provided in connection with a claim for PSOB Act benefits may not charge fees for representative services based on a stipulated, percentage, or contingency fee recovered and may not charge fees in excess of the amount permitted under the Equal Access to Justice Act, currently $125 per hour. All petitions seeking authorization to charge fees, whether contested by the PSOB claimant-beneficiary or not, are subject to a review for reasonableness based on the factors in § 32.7(c)(1)–(8). Additionally, the current rules do not address who may provide representation in PSOB claims, nor do they address whether non-attorney representatives may charge fees for representation.

The agency proposes to revise § 32.7 to limit paid representation to attorneys and support staff under their direct supervision, keep fees at a reasonable level consistent with the purpose of the program, and improve the processing of claims involving attorney representatives. The intent in so doing is to enable claimants to more easily obtain qualified representation in claims for PSOB death or disability benefits.

In conjunction with a proposed definition of the term ''attorney'' as a member in good standing of a State bar, the proposed rule would limit authorization to charge fees for representative services to such attorneys. The agency views limiting paid representation to attorneys as a means of ensuring that individuals providing paid representation in PSOB claims are capable of providing competent representation, are obligated to provide representation according to code of professional ethics, and are subject to oversight and compliance by an independent licensing body. As non-attorney representatives are not subject to similar testing, ethical requirements, and independent monitoring, the agency proposes to continue to permit them to provide representation but prohibit such individuals from charging claimants fees for representative services.

The proposed rule would permit fees for representative services to be based on a fixed fee, hourly rate, a percentage of benefits recovered, or a combination of such bases. To enable BJA to maintain its oversight role regarding fees, the proposed rule would require that claimants provide to the PSOB Office before seeking authorization to charge fees a copy of any fee agreement for representative services under the Act. To keep fees reasonable, the proposed rule would prohibit fees for representative services in excess of 12 percent of the total PSOB death or disability payment available to a claimant regardless of how the fee agreement is structured.[31] To expedite the review of fee petitions, the proposed rule would also establish a presumption of reasonableness for representative's fees not exceeding 8 percent of the total PSOB death or disability payment available to a claimant in a claim resolved at the PSOB Office level, and establish a presumption of reasonableness for representative's fees not exceeding 10 percent of the total PSOB death or disability payment available to a claimant in a claim resolved at the Hearing Officer or BJA Director level. These presumptions of reasonableness would be rebuttable if an examination of the factors in § 32.7(c) established that the fee is unreasonable.

Section 32.9 Complete Application

One of the recommendations of OJP's independent BPI review of the PSOB Program was that, to improve the efficiency of claims processing, BJA should require a minimum set of supporting information before assigning a claim number and routing the claim for review to reduce the time incomplete claims remain unresolved and to focus BJA resources on those claimants who need assistance in submitting an application for benefits.[32] Consistent with other government claims programs, the BPI review recommended that the PSOB Office shift its focus from a one-on-one outreach model to an approach that returns the responsibilities to the claimant and agency to gather, organize, and submit all required prior to filing a PSOB claim, and being assigned a claim number. Related to the minimum required documents concept, for BJA to establish and implement meaningful timeliness standards for its processing of claims, claims must necessarily be complete and ripe for determination before the ''clock'' starts on calculating the days required by BJA to process a claim to completion.

To improve the efficiency of claims processing pursuant to the BPI recommendation, the agency proposes to add a new § 32.9 defining what

[30] U.S. Dept. of Justice, Office of the Inspector General, *Audit of the Office of Justice Programs' Processing of Public Safety Officers' Benefit Programs Claims*, Audit Division 15–21 at 11 (July 7, 2015).

[31] By way of example, in a claim for benefits based on an officer's death that occurred in FY2014, the total benefit payable under 42 U.S.C. 3796(a) is $333,604.68. In a claim involving a surviving spouse and two children, an attorney representing the two children would be prohibited from charging fees in excess of $20,016.28, which represents 12% of the children's combined ½ share of benefits, $166,892.34.

[32] In a sample of claims reviewed, the BPI review found that an average of 148 days was spent on outreach in death and disability claims.

constitutes a ''complete application'' for benefits under the PSOB Act and implementing regulations prescribing BJA's obligations when it receives such an application. BJA's current practice when it receives an application for benefits that lacks the basic required documents to render a determination is to assign it a claim number, process it as a claim from the moment a claim form is received, and conduct biweekly outreach efforts to obtain from the applicant and the officer's public agency information required to establish eligibility for benefits. BJA's experience is that it allocates significant resources to repeatedly prompting applicants for benefits and public agencies as to what basic required documents they must submit to establish eligibility when BJA's resources could be reallocated to processing otherwise complete applications.

Under the proposed rule, following publication of a Notice in the **Federal Register** consistent with 5 U.S.C. 552(a)(1)(C), the PSOB Office would maintain and publish on the PSOB Program Web site a list of basic required documents that claimants would be required to file with applications for PSOB Program death, disability, and education benefits. These documents would represent the *absolute minimum* documentation BJA would accept before treating an application as a claim, devoting resources to processing it. This documentation, once submitted, would constitute a ''complete application.'' By precluding incomplete applications from being considered as claims in the first instance, the proposed rule would support the OIG and BPI recommendations and BJA's efforts to effectively allocate its resources and avoid issuing merits-based determinations denying benefits based on obviously incomplete applications, which would simply shift initial evidentiary development to determinations by Hearing Officers and the BJA Director.

The proposed rule provides that when BJA receives an application for benefits without the basic required documents (as indicated on the Web site), BJA will notify the applicant in writing of the evidence and information necessary to complete the application, and advise the applicant that BJA will not process the incomplete application as a claim for benefits until the remainder of the documents are received. For purposes of determining whether a claim was timely filed under proposed 28 CFR 32.12 and 32.22, an applicant's submission of either a claim form or report form, *i.e.*, a Report of Public Safety Officer's Death, Claim for Death Benefits, or Report of Public Safety Officers' Permanent And Total Disability, even though not constituting a complete application, would be sufficient to satisfy the requirement that a claim must be filed within three years of the officer's death or injury. To prevent applicants from being prejudiced based on an inability to provide necessary information, the proposed rule would provide that an application will not be considered incomplete if an applicant's inability to file basic required documents was the result of a public agency's refusal or inability to provide the information identified in this section if the applicant provides to the PSOB Office written justification for his or her inability to provide the information and the justification demonstrates that such inability to file evidence is not due to any fault of the applicant.

Section 32.10 PSOB Counsel

Nothing in the PSOB Act or implementing regulations prescribes the relationship between PSOB Counsel and PSOB determining officials. To make transparent the role of PSOB Counsel and the scope of Counsel's review in the PSOB claims process, proposed § 32.10 would require that PSOB determining officials seek legal advice from PSOB Counsel before determining a claim. However, the proposed rule would limit the scope of such advice to the interpretation of law under the PSOB Act and implementing regulations and, unless directed otherwise by the Assistant Attorney General for the Office of Justice Programs, PSOB Counsel would be precluded from reviewing findings of fact made by PSOB determining officials.

Section 32.12 Time for Filing a Claim

Under current § 32.12, unless the time for filing is extended by the BJA Director for good cause shown, a claimant (applicant under proposed § 32.9) must file a claim for PSOB Program death benefits before the later of three years from the date of the public safety officer's death, or one year after a final determination of survivors benefits or statement from the public agency that it was not legally authorized to pay survivors benefits on behalf of such an officer. Consistent with proposed § 32.5(l), and to simplify administration of the program, the proposed rule would eliminate provisions associated with the one-year requirement as well as all provisions referring to prerequisite certification and provide that no application shall be considered if it is filed with the PSOB Office more than three years after the public safety officer's death.

Section 32.13 Definitions

Section 32.13 provides definitions applicable to claims for PSOB Program death benefits. OJP proposes to add new definitions or revise existing definitions in § 32.13 as follows:

• *Beneficiary of a life insurance policy of a public safety officer:* Where it has been established that public safety officer died as the direct and proximate result of a personal injury sustained in the line of duty injury, and there is no surviving spouse, surviving child, or surviving individual designated by the officer to receive the PSOB Program death benefit, under 42 U.S.C. 3796(a)(4)(B), BJA will pay the surviving individual(s) designated by the public safety officer to receive benefits under the officer's most recently executed life insurance policy on file at the time of death with the public safety agency.

Under regulations in 28 CFR 32.13 defining ''beneficiary of a life insurance policy of a public safety officer,'' BJA may consider as revoked a life insurance beneficiary designation which lists a former spouse who, following the designation, was divorced from the public safety officer, unless it is demonstrated that the officer had no intentions of revoking the designation for his or her former spouse.

Similar to the regulation regarding former spouses, the proposed rule would add a new paragraph (3) permitting BJA to consider as revoked a designation in a life insurance policy of a beneficiary who dies after the public safety officer but before a determination can be made in favor of a living contingent beneficiary. In the circumstances described, the proposed rule would enable BJA to honor the public safety officer's designation of a contingent beneficiary rather than disregarding it in favor of the next category of eligible beneficiaries, surviving parents.

• *Engagement in a situation involving law enforcement, fire suppression, rescue, hazardous material response, emergency medical services, prison security, disaster relief, or other emergency response activity:* For a fatal heart attack, stroke, or vascular rupture to qualify for the statutory presumption of death resulting from a line of duty injury in 42 U.S.C. 3796(k), a public safety officer must, among other things, engage in a situation involving specific line-of-duty actions or participate in a training exercise as defined in 28 CFR

32.13.[33] A public safety officer engages in qualifying activity when he or she is actually engaging in law enforcement, suppressing fire, or performing one of the other types of activity currently defined in 28 CFR 32.13.

The agency's experience is that the ''engagement'' activities listed in the law, in some cases, necessarily require other activities to take place prior to a public safety engagement. For example, a firefighter may need to clear the snow from the driveway of a fire station, or change a flat tire on a fire truck before the public agency can engage in fire suppression. Although ''engagement in a situation involving . . . fire suppression'' generally begins with the department's or agency's request for a particular officer to perform this type of activity, under the current rules, it generally cannot be said to include the clearing of the station's driveway or the changing of a tire unless such action is performed in the course of the actual engagement.

The proposed rule would expand the current regulatory definition to cover only those line of duty actions or activities that, if not performed, would directly preclude the public agency from providing fire suppression, rescue, hazardous material response, emergency medical services, prison security, disaster relief, or other emergency response activity. Thus, the proposed definition would cover as part of an engagement under 42 U.S.C. 3796(k) a public safety officer's changing of a flat tire on a fire truck necessary for the public agency to engage in fire suppression.

• *Nonroutine strenuous physical activity:* To be eligible for the presumption in 42 U.S.C. 3796(k), a public safety officer must, among other things, either participate in a training exercise or in a situation involving nonroutine stressful or strenuous physical activity. The agency has defined ''nonroutine stressful or strenuous physical activity'' in regulations as two distinct terms: ''nonroutine stressful physical activity'' and ''nonroutine strenuous physical activity.''

Generally speaking, nonroutine strenuous physical activity is defined in 28 CFR 32.13 as line of duty activity that (1) is not excluded as clerical, administrative, or non-manual in nature, (2) is not routinely performed, and (3) requires ''an unusually-high level of physical exertion.'' Whether a public safety officer's activity constitutes an ''unusually high-level of physical exertion'' has often proven challenging for claimants to demonstrate and the agency to evaluate.[34]

To make clear what constitutes ''strenuous,'' and to facilitate more consistent decision making, the agency proposes to replace the term ''unusually-high'' with the term ''vigorous.'' The use of vigorous as a descriptor is appropriate as it is used by the Centers for Disease Control (CDC) to characterize physical activity that exceeds a moderate level of intensity.[35] Relevant to a standard that must be applied to public safety officers, the CDC's examples take into consideration an individual's age and weight. The proposed rule would not expand the type of physical activity considered to be strenuous, but rather would make claims processing more efficient by providing the public and the agency with a recognized standard that is more easily understood and applied.

• *Nonroutine stressful physical activity:* To be eligible for the presumption in 42 U.S.C. 3796(k), a public safety officer's participation in a training exercise or engagement in a situation involving law enforcement, etc., must also involve either nonroutine stressful physical activity or nonroutine strenuous physical activity. Generally speaking, nonroutine stressful physical activity is defined in current 28 CFR 32.13 as line of duty activity that (1) is not excluded as clerical, administrative, or non-manual in nature, (2) is not routinely performed, and (3) is not capable of being performed without minimal physical exertion. The ''stressful'' component of an officer's nonroutine stressful physical activity is evaluated differently according to whether the officer was (1) engaged in a situation involving law enforcement, fire suppression, rescue, hazardous material response, emergency medical services, prison security, disaster relief, or other emergency response activity, or (2) was participating in a training exercise.

Under current 28 CFR 32.13, an officer's engagement in a situation is considered ''stressful'' if, when viewed objectively, the circumstances of the engagement expose, or appear to expose, the officer to ''significant'' perils or harms not encountered by the public in the ordinary course and, as a result, cause the officer to suffer an ''unusually high'' degree of distress manifested by fear, apprehension, anxiety, or unease. Similarly, under the same regulation, an officer's participation in a training exercise is considered ''stressful'' if, when viewed objectively, the circumstances replicate situations that expose the officer to significant perils or harms, and, as a result, cause the officer to suffer an ''unusually-high'' degree of distress manifested by fear, apprehension, anxiety, or unease.

Similar to the agency's experience with implementing the term ''nonroutine strenuous physical activity,'' whether a public safety officer's activity exposes the officer to ''*significant*'' dangers or produces an ''*unusually-high*'' degree of distress has often proven challenging for claimants to demonstrate and the agency to evaluate. Although it is clear that a traffic stop, arrest of a suspect, response to a motor vehicle accident, or response to a structure fire each expose an officer to significant threats not ordinarily encountered by a member of the public when viewed objectively, produce in the officer some degree of distress, *i.e.*, ''fear or anxiety,'' it is difficult for BJA, the public agency, or the claimant to establish whether these circumstances expose the officer a significant peril or an ''unusually-high level'' of distress, *i.e.*, ''fear or anxiety.''

To make clear what constitutes ''stressful'' activity and to facilitate more consistent decision making, the agency proposes to eliminate in the regulatory definition the term ''significant,'' and to replace the term ''unusually-high'' with ''unusual.'' The elimination of these qualifiers will maintain the integrity of the statutory requirement that the activity be ''stressful'' while aligning the text of the regulation with circumstances faced by public safety officers and the agency's interpretation of such circumstances. The proposed rule would not expand the type of physical activity considered to be stressful, but rather would make claims processing more efficient by providing the public and the agency with a standard that is more easily understood and applied.

[33] The activities in which a public safety officer must engage to obtain the benefit of the presumption, *e.g.*, law enforcement, are defined in 28 CFR 32.3.

[34] *See* Department of Justice, Office of the Inspector General, *The Office of Justice Programs' Implementation of the Hometown Heroes Survivors Benefits Act of 2003*, I–2008–005 i (March 2008) (explaining that OIG conducted its review ''in response to concerns expressed by several members of Congress . . . that OJP's narrow interpretation of terms found in the Act—in particular the phrases ''nonroutine stressful or strenuous physical activity'' and ''competent medical evidence to the contrary''—might be resulting in a high rate of claims denials'').

[35] *See e.g.*, Centers for Disease Control, *General Physical Activities Defined by Level of Intensity, http://www.cdc.gov/nccdphp/dnpa/physical/pdf/PA_Intensity_table_2_1.pdf* (accessed Feb. 11, 2016).

Section 32.14 PSOB Office Determination

Consistent with proposed § 32.5(m), which consolidates all abandonment provisions into a single paragraph, the proposed rule would remove paragraph (b), which prescribes abandonment provisions for death claims.

Section 32.15 Prerequisite Certification

Consistent with proposed § 32.5(l), which replaces §§ 32.15 and 32.25, the proposed rule would remove § 32.15 which prescribes prerequisite certification requirements for death claims.

Section 32.16 Payment

Under current § 32.16(a), BJA may not pay more than one person on the basis of being a public safety officer's parent as a mother, or on that basis as a father. In cases where more than one parent qualifies as the officer's father, or as the officer's mother, the regulation currently limits BJA's payment to the ''one with whom the officer considered himself, as of the injury date, to have the closest relationship.'' The regulation also provides that a biological or legally adoptive parent whose parental rights have not been terminated is rebuttably presumed to have had the closest relationship with the officer.

BJA's experience is that there may exist circumstances in which more than two persons share with the public safety officer a close personal relationship as a parent. The proposed rule would retain the presumption that a biological or legally adoptive parent whose parental rights have not been terminated is presumed to be a ''parent,'' but permit BJA to pay in equal shares additional persons as the parent of a public safety officer when evidence demonstrates that there exists such a relationship as defined in 28 CFR 32.13.

Current regulations do not make clear the agency's interpretation regarding the payment of benefits to a surviving individual in a category of beneficiaries with more than one beneficiary. For example, in an approved PSOB claim in which the surviving parents are the appropriate beneficiaries under 42 U.S.C. 3796(a)(5), and one of the parents has not filed a claim for benefits but there is no evidence that the non-filing parent is deceased, agency practice is to hold the share payable to the surviving parent in the event that the non-filing parent may file a claim, or, if he or she failed to file a claim in the time prescribed, a request for an extension of time to file. To make clear the agency's interpretation and to provide for the timely payment of benefits to individuals determined to be eligible for benefits, BJA proposes to add a new § 32.6(d) that would address such situations. The proposed rule would consider deceased and therefore ineligible, any person, who, being 18 years of age, or older at the date of the public safety officer's injury, and not incapable of self-support as defined in 42 U.S.C. 3796b(3)(C), failed to file an application for benefits within the time prescribed for such filing. Thus, if one of two surviving parents failed to file a written claim, the agency would hold the non-filing parent's share until the time for filing had expired. After such time, the agency would pay the remaining one-half share to the filing parent. The proposed rule is intended to prevent an adult beneficiary's failure to file a claim for benefits from hindering BJA's ability to fairly and timely distribute program benefits amongst a public safety officer's eligible beneficiaries.

Section 32.22 Time for Filing a Claim

Under current § 32.22, unless the time for filing is extended by the BJA Director for good cause shown, a claimant must file a claim for PSOB Program disability benefits before the later of three years from the date of the public safety officer's injury, or one year after a final determination of disability benefits by the public agency or statement from the public agency that it was not legally authorized to pay disability benefits on behalf of such officer. Consistent with proposed § 32.5(l), and to simplify administration of the program, the proposed rule would eliminate provisions associated with the one-year requirement as well as all provisions referring to prerequisite certification, and provide that no application shall be considered if it is filed with the PSOB Office more than three years after the public safety officer's injury.

Section 32.23 Definitions

Section 32.23 provides definitions applicable to claims for PSOB disability benefits. OJP proposes to revise existing definitions in § 32.23 as follows:

- *Gainful work:* The proposed rule would redefine the term ''gainful work'' to provide a framework for PSOB determining officials to analyze whether any type or amount of work performed for pay disqualifies a claimant for PSOB Program disability benefits who has been found by medical professionals to be permanently and significantly disabled from a line of duty injury.

To establish eligibility for the payment of disability benefits under the PSOB Act, it is not enough that a claimant is unable to perform the duties of a public safety officer as the result of a line of duty injury.[36] Rather, the claimant must be permanently unable to perform any ''gainful work'' as the result of a line of duty injury.[37] ''Gainful work'' as currently defined in 28 CFR 32.23 generally refers to either full- or part-time activity for which an individual is paid or would ordinarily be paid Under current PSOB regulations, the agency determines whether a claimant is unable to perform any gainful work based upon a medical, and in some cases, vocational assessment, of the claimant's residual functional capacity, *i.e.,* what the claimant is capable of doing despite the disabling conditions he or she incurred in the line of duty.[38]

As a part of its assessment of disability, the agency also reviews a claimant's tax records to determine whether a claimant has received wages in return for work since the date of injury, or, as appropriate, since the date the officer was found disabled by his or her public agency or separated from his or her public agency by reason of disability. The agency has generally interpreted current regulations defining ''gainful work'' as precluding a finding of total disability when a claimant has, after his or her disability retirement or separation, and contemporaneous with the filing of an application for disability benefits, received any wages in return for work, regardless of the amount of wages received or the type of work for which the wages were paid.

In the overwhelming majority of cases, the current regulations defining ''gainful work'' work well. However, in some complex cases, a claimant found by both medical and vocational professionals to be totally and permanently disabled has nevertheless performed activity that either is actually compensated, (*e.g.,* a claimant with significant orthopedic and cognitive disabilities received $100 honorarium for serving on an organization's governance board), or is commonly compensated, (*e.g.,* a claimant with cognitive impairment resulting from a severe brain injury volunteers intermittently at a hospital by providing directions at an information desk). Despite each claimant having been found to be ''incapable of performing

[36] Under 42 U.S.C. 3796(b), the agency pays disability benefits when it ''determines that a public safety officer has become [both] permanently and totally disabled as the direct and proximate result of a personal injury sustained in the line of duty.''

[37] *See* 42 U.S.C. 3796b(1) (defining ''catastrophic injury'').

[38] 28 CFR 32.23 (defining *Residual functional capacity*).

any gainful work'' as demonstrated by objective medical examination and tests, under the current regulatory definition of ''gainful work,'' the claimant's performance of work that ''actually is compensated or commonly is compensated'' would generally disqualify them from disability benefits.

In such circumstances, the current definition's emphasis on whether work is actually or commonly paid as the single measure of what constitutes ''gainful'' work, without regard to the nature and quantity of work actually performed or the amount of payment received, does not provide an equitable framework for the PSOB determining official to determine whether the claimant is in fact totally disabled. The agency believes that evidence that a claimant received $150 for intermittent work activity that was offered and performed for therapeutic reasons, sheltered work, or was otherwise performed outside the scope of competitive employment, should not, *by itself,* preclude a finding of total disability under the PSOB Act.

As a result, the agency proposes to revise the definition of gainful work to provide that any such work activity must be both substantial and gainful. The proposed rule would define substantial work activity on the basis of whether the activities performed involved significant mental or physical activities and would provide examples of work activity that is and is not considered substantial. The proposed rule would define gainful work activity similarly to the current definition of gainful work by characterizing work activity as gainful if it is actually or commonly compensated, *i.e.,* performed for pay, but exclude from compensation reimbursement for incidental expenses such as parking or de minimis compensation.

The revised definition will enable the agency to fairly determine whether a claimant who has been determined, pursuant to a medical assessment, to be permanently and totally disabled but nonetheless performs some sort of paid work activity, should be awarded disability benefits.

• *Permanently disabled:* Under 28 CFR 32.23, permanent disability is shown when a medical assessment establishes ''to a degree of medical certainty,'' *i.e.,* by clear and convincing evidence, that a claimant's condition will progressively deteriorate or remain constant over his or her expected lifetime, or has reached maximum medical improvement. The higher standard of proof associated with ''medical certainty'' imposed by the current regulation but not required by law often requires the agency to conduct additional evidentiary development, particularly in claims with conflicting medical opinions. The agency's experience in applying the higher standard of proof is that it does not necessarily provide additional certainty as the determining official, as in other claims, makes determinations of eligibility by weighing the evidence, assessing its probative value, and determining which evidence is entitled to more weight and or credibility. As a result, the agency believes applying the standard of proof ''to a degree of medical probability'' would lessen the burden on claimants and the agency to establish permanent disability, would reduce delays in processing disability claims, and would not impact the integrity of the PSOB Program in any way. As a result, the agency proposes to revise the regulation to change the standard of proof required to establish a permanent level of disability from ''medical certainty'' to ''medical probability.''

• *Totally disabled:* Under current regulations in 28 CFR 32.23, total disability is shown when a medical assessment establishes ''to a degree of medical certainty,'' *i.e.,* by clear and convincing evidence, that a claimant's residual functional capacity (that which a medical and vocational assessment demonstrates that the claimant can do despite his or her disability) is such that he or she cannot perform any gainful work. For the reasons discussed in the proposed revision to the definition of ''permanent disabled,'' the agency proposes to revise the regulation to change the standard of proof required to establish such level of disability from ''medical certainty'' to ''medical probability.''

Section 32.24 PSOB Office Determination

Consistent with proposed § 32.5(o), which consolidates all abandonment provisions into a single paragraph, the proposed rule would remove paragraph (b), which prescribes abandonment provisions for disability claims. The proposed rule would also remove references to reconsideration of negative disability findings.

Section 32.25 Prerequisite Certification

Consistent with proposed § 32.5(l), which replaces §§ 32.15 and 32.25, the proposed rule would remove § 32.25, which prescribes prerequisite certification requirements for disability claims.

§ 32.27 Motion for Reconsideration of Negative Disability Finding

Under current § 32.27, a claimant whose claim is denied on the basis that the evidence has not established that the disability is total and permanent may move for reconsideration, under § 32.28, of the specific finding as to the total and permanent character of the claimed disability in lieu of requesting a Hearing Officer determination with respect to the same. Although providing an alternative to a Hearing Officer determination, the process is cumbersome, confusing to claimants, and since fiscal year 2011, fewer than 10 claimants have sought to take advantage of this provision. Due to its lack of use, BJA proposes to remove this rule, but would continue its application for those claims currently in the reconsideration process. For the reasons discussed, BJA also proposes to remove § 32.28 and provisions in § 32.29 referring to such motions.

§ 32.33 Definitions

Section 32.33 provides definitions applicable to PSOB education benefits. OJP proposes to add new definitions or revise existing definitions in § 32.33 as follows:

• *Child of an eligible public safety officer:* The proposed rule would clarify that an individual found to be an eligible beneficiary under 42 U.S.C. 3796(a)(6) (*i.e.,* a person who would be eligible for death benefits as a child but for his age), is not a child of an eligible public safety officer under subpart D, and thus not eligible for educational assistance under the provisions of 42 U.S.C. 3796d–1 through 42 U.S.C. 3796d–7.

• *Dependent:* The proposed rule would eliminate this definition, as the Dale Long Act (sec. 1086 of Pub. L. 112–239) removed the term from the PSOB Act.

• *Educational expenses:* The proposed rule would revise this definition to provide that such expenses refers to out-of-pocket expenses incurred by a claimant or claimant's family. The proposed rule is intended to provide that PSOB education benefits are to reimburse claimants for those expenses actually incurred for tuition, fees, and that other expenses and are not available when an educational institution has waived or otherwise discounted tuition, fees, or the cost of other expenses for the claimant. The proposed rule provides that in such circumstances, BJA would calculate reimbursement based on the actual costs incurred, not the amount of tuition or

fees charged before a waiver or other discount is applied.

• *Eligible dependent:* The proposed rule would eliminate this definition as the Dale Long Act (sec. 1086 of Pub. L. 112–239) removed the term from the PSOB Act.

• *Tax Year:* The proposed rule would remove this definition as the Dale Long Act (sec. 1086 of Pub. L. 112–239) removed the term from the PSOB Act.

Section 32.34 PSOB Office Determination

Consistent with proposed § 32.5(o), which consolidates all abandonment provisions into a single paragraph, the proposed rule would remove paragraph (b), which prescribes abandonment provisions for disability claims. Consistent with revisions to the definitions in § 32.33, the proposed rule would also remove references to ''threshold claims.''

Section 32.41 Scope of Subpart

The proposed rule would remove all references to § 32.27 consistent with the proposal to remove §§ 32.27, 32.28, and 32.29.

Section 32.42 Time for Filing Requests for Determination

The proposed rule would remove all references to § 32.27 consistent with the proposal to remove §§ 32.27, 32.28, and 32.29.

Section 32.44 Hearing Officer Determination

The proposed rule would, consistent with proposed § 32.10, require that Hearing Officers seek legal advice from PSOB Counsel before determining a claim. Consistent with proposed § 32.5(o), which consolidates all abandonment provisions into a single paragraph, the proposed rule would remove paragraph (c), which prescribes abandonment provisions for Hearing Officer determinations.

Section 32.45 Hearings

The proposed rule would clarify that, at a hearing, Hearing Officers are the only individual permitted to examine or question a claimant, other than a claimant's own representative, if any. The purpose of the proposed this rule is to preserve the non-adversarial nature of the Hearing Officer determination and to make clear that a hearing is not for purposes of providing claimants with the opportunity to engage in trial-type discovery as to other claimants.

Section 32.54 Director Determination

Consistent with proposed § 32.5(o), which consolidates all abandonment provisions into a single paragraph, the proposed rule would remove paragraph (b), which prescribes abandonment provisions for Director determinations.

V. Regulatory Requirements

Executive Order 12866 and 13563—Regulatory Planning and Review

This proposed rule has been drafted and reviewed in accordance with Executive Order 12866, ''Regulatory Planning and Review,'' section 1(b), Principles of Regulation, and in accordance with Executive Order 13563, ''Improving Regulation and Regulatory Review,'' section 1(b), General Principles of Regulation. Although not an economically significant rulemaking under Executive Orders 12866 and 13563, the Office of Justice Programs has determined that this proposed rule is a ''significant regulatory action'' under section 3(f) of the Executive Order, and accordingly this rule has been reviewed by the Office of Management and Budget (OMB).

Executive Orders 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). As explained below, the agency has assessed the costs and benefits of this proposed rule as required by Executive Order 12866 and has determined that the benefits of the proposed rule justify the costs.

A. Provisions That Define When an Individual Is a Firefighter

Based on the number of claims received in the past involving similar situations and the circumstances of such claims, OJP estimates that the revised provisions could increase approvals by approximately 1 claim per year. If all such claims were paid at the current rate, the annual PSOB Program death and disability benefit cost would be increased by $339,881. Based on amounts appropriated in FY2016 for PSOB Program death benefits (''such sums as necessary''—estimated at $71,323,000) and disability and education benefits ($16,300,000), the agency knows that it could pay the death claims from its current appropriations, and estimates that it could pay the disability claims from its current appropriations.

B. Provisions That Define When an Organization or Entity Is a Volunteer Fire Department

Under existing law and regulations, BJA currently determines that *certain* volunteer fire departments qualify as public agencies, and, as a result, that qualified firefighters serving such agencies qualify as public safety officers. In addition, the proposed definition of ''volunteer fire department'' does not expand the number or type of organizations that qualify as a public agency under the law but rather only codifies the agency's interpretation of the status of such organizations as a public agency based on existing provisions of law and regulations. As such, OJP estimates that there are no additional death or disability benefit costs associated with this provision.

C. Provisions Pertaining to the Filing of an Application for Benefits, That Define When an Individual Is a Public Safety Officer, When an Officer Has Sustained a Line of Duty Injury, an Officer Is Permanently and Total Disabled When Payment of Benefits Is Prohibited, When Individuals Are Ineligible for Payment, and Related Matters

Based on the number of claims received in the past involving similar situations and the circumstances of such claims, OJP estimates that the revised provisions, taken together, could increase approvals by approximately 9 claims per year. If all 9 claims were paid at the current rate, the annual PSOB Program death and disability benefit cost would be increased by $3,058,929. Based on amounts appropriated in FY2016 for PSOB Program death benefits (''such sums as necessary''—estimated at $71,323,000) and disability and education benefits ($16,300,000), the agency knows that it could pay the death claims from its current appropriations, and estimates that it could pay the disability claims from its current appropriations.

D. Provisions Pertaining to the Admissibility, Sufficiency, Evaluation, and Disclosure of Evidence Submitted in PSOB Claims, and Related Matters

The primary benefit of the proposed rules is that the revised requirements would reduce the burden on claimants to establish eligibility for benefits and provide a corresponding reduction in the agency's processing burden in gathering and evaluating such evidence. The agency estimates that this across-the-board reduction in burden for both claimants and the agency will translate into reduced processing time for claims,

more timely determinations, and improved delivery of benefits. In terms of benefit costs, the agency estimates that there will not be a significant increase in claims approved as compared to the previous regulatory criteria. Accordingly, the proposed rule does not significantly increase benefit costs.

E. Provisions Concerning the Fees That May Be Charged for Representation in PSOB Claims

The primary benefit of the proposed rule is that it makes it easier for individuals seeking benefits to obtain qualified representation. In eliminating restrictions on the types of fee agreements permitted in representation for PSOB claims, eliminating the maximum hourly rate for representative's fees in favor of a percentage-based maximum limit, and establishing a presumption of reasonableness for fees below certain amounts, the agency believes that the proposed rules would encourage more attorneys to provide representation in PSOB claims. A secondary benefit of the proposed rules is that, in eliminating automatic review of all petitions for fees, the proposed rule will reduce agency burden and permit the agency to reallocate these resources to processing claims. These provisions have no impact on benefit costs.

F. Provisions Establishing When an Application for Benefits Is Complete and Will Be Accepted for Processing as a Claim

The primary benefit of the proposed rule defining a ''complete application'' is that it will (1) provide clarity to applicants for benefits as to precisely what documents and information are required for the agency to begin processing the application as a claim, and (2) enable the agency to allocate its resources to those applications that are sufficiently complete to warrant a determination on the merits. A secondary benefit of the proposed rule is that, as the agency transitions further to an entirely paperless processing system, the proposed rule would facilitate processing by releasing for processing, with few exceptions, only complete applications. These provisions have no impact on benefit costs.

G. Provisions Establishing the Scope of Administrative Legal Review of PSOB Claims

The primary benefit of the proposed rule is that it makes transparent the role of PSOB Counsel in the processing of claims. These provisions have no impact on benefit costs, and no impact on administrative or personnel costs.

H. Provisions Pertaining to Educational Assistance and Other Matters Necessary To Implement the Proposed Rule

The primary benefit of the proposed rule is that it makes clear how educational expenses are calculated in the processing of such claims and implements recent amendments to the Act. These provisions have no impact on benefit costs.

I. Personnel and Training Costs for Agency Staff

As PSOB claims and applications under the provisions of the proposed rule would be processed by existing staff, the agency would not incur additional personnel costs in processing these claims. OJP acknowledges that there would be some costs associated with training current staff; however, OJP estimates that such costs would be nominal as such training is ordinarily conducted in-house by existing legal and program staff and is scheduled and conducted to minimize disruptions to claims processing.

This proposed rule would impose no costs on state, local, or tribal governments, or on the private sector.

Executive Order 13132—Federalism

This proposed rule would not have substantial direct effects on the States, on the relationship between the federal government and the States, or on distribution of power and responsibilities among the various levels of government. The PSOB program statutes provide benefits to individuals and do not impose any special or unique requirements on States or localities. Therefore, in accordance with Executive Order No. 13132, it is determined that this proposed rule does not have sufficient federalism implications to warrant the preparation of a Federalism Assessment.

Executive Order 12988—Civil Justice Reform

This proposed rule meets the applicable standards set forth in sections 3(a) & (b)(2) of Executive Order No. 12988. Pursuant to section 3(b)(1)(I) of the Executive Order, nothing in this proposed rule or any previous rule (or in any administrative policy, directive, ruling, notice, guideline, guidance, or writing) directly relating to the Program that is the subject of this rule is intended to create any legal or procedural rights enforceable against the United States, except as the same may be contained within part 32 of title 28 of the Code of Federal Regulations.

Regulatory Flexibility Act

This proposed rule would not have a significant economic impact on a substantial number of small entities for the following reasons: This proposed rule addresses federal agency procedures; furthermore, this proposed rule would make amendments to clarify existing regulations and agency practice concerning public safety officers' death, disability, and education benefits and would do nothing to increase the financial burden on any small entities. Therefore, an analysis of the impact of this proposed rule on such entities is not required under the Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*).

Paperwork Reduction Act of 1995

This proposed rule would impose or modify reporting or recordkeeping requirements under the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501 *et seq.*). The PRA requires certain actions before an agency can adopt or revise a collection of information, including publishing a summary of the collection of information and a brief description of the need for and proposed use of the information. 44 U.S.C. 3507.

The proposed rule includes paperwork requirements in three collections of information previously approved by OMB for the PSOB Program. OJP published in the **Federal Register** on January 11, 2016, a 60-day notice of ''Agency Information Collection Activities'' for each of the following forms: *Claim for Death Benefits* (OMB Number 1121–0024), *Report of Public Safety Officer's Death* (OMB Number 1121–0025), and *Public Safety Officers' Disability Benefits* (OMB Number 1121–0166). In calculating the burden associated with these forms/collections, OJP reviewed its previous burden estimates and updated these to reflect the time required for claimants to gather the many different documents necessary to establish eligibility for these benefits, *e.g.,* birth certificates, marriage certificates, divorce decrees (where applicable), public agency determinations as to death or disability benefits, medical records, etc. Information about the proposed collections is as follows:

Claim for Death Benefits—Overview of Information Collection

1. *Type of Information Collection:* Reinstatement with change of a previously approved collection.

2. *The Title of the Form/Collection:* Claim for Death Benefits.

3. *The agency form number, if any, and the applicable component of the*

Department sponsoring the collection: Bureau of Justice Assistance, Office of Justice Programs, United States Department of Justice.

4. *Affected public who will be asked or required to respond, as well as a brief abstract: Primary:* Eligible survivors of fallen public safety officers.

Abstract: BJA's Public Safety Officers' Benefits (PSOB) Office will use these Claim Form information to confirm the eligibility of applicants to receive Public Safety Officers' Death Benefits. Eligibility is dependent on several factors, including public safety officer status, an injury sustained in the line of duty, and the claimant status in the beneficiary hierarchy according to the PSOB Act. In addition, information to help the PSOB Office identify an individual is collected, such as Social Security numbers, telephone numbers, and email addresses. Changes to the claim form have been made in an effort to streamline the application process and eliminate requests for information that are either irrelevant or already being collected by other means.

OJP estimates that no more than 350 respondents will apply each year. Each application takes approximately 120 minutes to complete. OJP estimates that the total public burden (in hours) associated with the collection can be calculated as follows: Total Annual Reporting Burden: 350 × 120 minutes per application = 42,000 minutes/by 60 minutes per hour = 700 hours.

Public Safety Officer's Death—Overview of Information Collection

1. *Type of Information Collection:* Reinstatement with change of a previously approved collection.

2. *The Title of the Form/Collection:* Report of Public Safety Officer's Death.

3. *The agency form number, if any, and the applicable component of the Department sponsoring the collection:* Bureau of Justice Assistance, Office of Justice Programs, United States Department of Justice.

4. *Affected public who will be asked or required to respond, as well as a brief abstract: Primary:* Public safety agencies experiencing the death of a public safety officer according to the PSOB Act.

Abstract: BJA's Public Safety Officers' Benefits (PSOB) Office will use these Report of Public Safety Officer's Death Form information to confirm the eligibility of applicants to receive Public Safety Officers' Death Benefits. Eligibility is dependent on several factors, including public safety officer status, an injury sustained in the line of duty, and the claimant status in the beneficiary hierarchy according to these Act. In addition, information to help the PSOB Office identify an individual is collected, such as Social Security numbers, telephone numbers, and email addresses. Changes to the report form have been made in an effort to streamline the application process and eliminate requests for information that are either irrelevant or already being collected by other means.

OJP estimates that no more than 350 respondents will apply each year. Each application takes approximately 240 minutes to complete. OJP estimates that the total public burden (in hours) associated with the collection can be calculated as follows: Total Annual Reporting Burden: 350 × 240 minutes per application = 84,000 minutes/by 60 minutes per hour = 1,400 hours.

Public Safety Officers' Disability Benefits—Overview of Information Collection

1. *Type of Information Collection:* Reinstatement with change of a previously approved collection.

2. *The Title of the Form/Collection:* Public Safety Officer's Disability Benefits.

3. *The agency form number, if any, and the applicable component of the Department sponsoring the collection:* Bureau of Justice Assistance, Office of Justice Programs, United States Department of Justice.

4. *Affected public who will be asked or required to respond, as well as a brief abstract: Primary:* Public safety officers who were permanently and totally disabled in the line of duty.

Abstract: BJA's Public Safety Officers' Benefits (PSOB) Office will use the PSOB Disability Application information to confirm the eligibility of applicants to receive Public Safety Officers' Disability Benefits. Eligibility is dependent on several factors, including public safety officer status, injury sustained in the line of duty, and the total and permanent nature of the line of duty injury. In addition, information to help the PSOB Office identify individuals is collected, such as Social Security numbers, telephone numbers, and email addresses. Changes to the application form have been made in an effort to streamline the application process and eliminate requests for information that are either irrelevant or already being collected by other means.

OJP estimates that no more than 100 respondents will apply each year. Each application takes approximately 300 minutes to complete. OJP estimates that the total public burden (in hours) associated with the collection can be calculated as follows: Total Annual Reporting Burden: 100 × 300 minutes per application = 30,000 minutes/by 60 minutes per hour = 500 hours.

Unfunded Mandates Reform Act of 1995

This proposed rule would not result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more in any one year, and it will not significantly or uniquely affect small governments. The PSOB program is a federal benefits program that provides benefits directly to qualifying individuals. Therefore, no actions were deemed necessary under the provisions of the Unfunded Mandates Reform Act of 1995.

List of Subjects in 28 CFR Part 32

Administrative practice and procedure, Claims, Disability benefits, Education, Emergency medical services, Firefighters, Law enforcement officers, Reporting and recordkeeping requirements, Rescue squad.

Accordingly, for the reasons set forth in the preamble, part 32 of chapter I of title 28 of the Code of Federal Regulations is proposed to be amended as follows:

PART 32—PUBLIC SAFETY OFFICERS' DEATH, DISABILITY, AND EDUCATIONAL ASSISTANCE BENEFITS CLAIMS

■ 1. The authority citation for 28 CFR part 32 continues to read as follows:

Authority: 42 U.S.C. ch. 46, subch. XII; 42 U.S.C. 3782(a), 3787, 3788, 3791(a), 3793(a)(4) & (b), 3795a, 3796c–1, 3796c–2; sec. 1601, title XI, Pub. L. 90–351, 82 Stat. 239; secs. 4 through 6, Pub. L. 94–430, 90 Stat. 1348; secs. 1 and 2, Pub. L. 107–37, 115 Stat. 219.

■ 2. Amend § 32.2 by redesignating paragraphs (e) and (f) as paragraphs (f) and (g), respectively, and adding new paragraphs (e) and (h) to read as follows:

§ 32.2 Computation of time; filing.

* * * * *

(e) In determining whether an application, claim, or other document will be considered if filed after the time prescribed for such filing has passed, good cause for such filing (excluding a lack of knowledge about the PSOB Program) may be found if the individual acted with reasonable diligence after any circumstance contributing to the delay was removed, and the delay was attributable to—

(1) Circumstances beyond the individual's control such as not having reached the age of majority, extended illness, or mental or physical incapacity;

(2) Incorrect information provided by the public agency in which the public safety officer served, or another public

agency, related to the filing of a PSOB claim that the individual relied upon to his detriment;

(3) A determination of the officer's (or survivor's) eligibility or entitlement to death or disability benefits by the officer's public agency or other public agency, made after the time for filing has passed; or

(4) Other unavoidable circumstances demonstrating that the individual could not be reasonably expected to know about the time limits for filing an application or claim.

* * * * *

(h) The Director may, after publishing a Notice in the **Federal Register** consistent with 5 U.S.C. 552(a)(1)(C), and providing reasonable notice through the PSOB Program Web site, require all applications, claims, and supporting materials to be filed in electronic or other form as the Director shall prescribe.

* * * * *

■ 3. Amend § 32.3 as follows:

■ a. Add the definitions of *''Agent''* and *''Attorney''.*

■ b. In the definition of ''*Authorized commuting''* add '', including reasonable return travel'' after ''within his line of duty''.

■ c. Revise the definition of ''*Child of a public safety officer''.*

■ d. Remove the definition of *''Consequences of an injury that permanently prevent an individual from performing any gainful work''.*

■ e. Revise the definitions of ''*Department or agency''*, ''*Determination''*, ''*Divorce''*, ''*Employee''*, ''*Firefighter''*, ''*Gross negligence''*, ''*Injury''*, *''Injury date''*, ''*Involvement''*, ''*Line of duty activity or action''*, and ''*Line of duty injury''.*

■ f. Add the definition of *''Medical probability.''*

■ g. Revise the definitions of *''Official capacity''* and ''*Officially recognized or designated public employee member of a squad or crew''.*

■ h. Add the definition of *''On-site hazard management''.*

■ i. Revise the definition of ''*Parent-child relationship''.*

■ j. Add the definition of *''PSOB Counsel''.*

■ k. Remove the definitions of, and ''*Public employee member of a squad or crew,''* and ''*Stress or strain.''*

■ l. Revise the definitions of ''*Suppression of fire''* and ''*Voluntary intoxication''.*

■ m. Add the definition of *''Volunteer fire department''*

The revisions and additions read as follows:

§ 32.3 Definitions

* * * * *

Agent means an individual who provides representative services to an individual seeking benefits under the Act and is not an attorney as provided in this part.

* * * * *

Attorney means a member in good standing of a State bar.

* * * * *

Child of a public safety officer means an individual—

(1) Who meets the definition provided in the Act, at 42 U.S.C. 3796b(3), and

(2) With respect to whom the public safety officer's parental rights have not been terminated, as of the injury date.

* * * * *

Department or agency—An entity is a department or agency within the meaning of the Act, at 42 U.S.C. 3796b(8), and this part, only if the entity is—

(1) A court;

(2) An agency described in the Act, at 42 U.S.C. 3796b(9)(B) or (C);

(3) An entity created by interstate compact between two or more States or between a State or States and the District of Columbia with the consent (through consenting or enabling legislation, or similar mechanism) by the United States Congress; or

(4) Otherwise a public entity—

(i) That is legally an express part of the internal organizational structure of the relevant government;

(ii) That has no legal existence independent of such government; and

(iii) Whose obligations, acts, omissions, officers, and employees are legally those of such government.

* * * * *

Determination means the approval or denial of a claim, the determination described in the Act, at 42 U.S.C. 3796(c), or any recommendation under § 32.54(c)(3).

* * * * *

Divorce means a legally valid, *i.e.,* court-ordered, dissolution of marriage.

* * * * *

Employee does not include—

(1) Any independent contractor;

(2) Any individual who is not eligible to receive death or disability benefits from the purported employer on the same basis as a regular employee of such employer would; or

(3) Any active duty member of the armed forces.

* * * * *

Firefighter means (1) An individual who—

(i) Is trained in—

(A) Suppression of fire; or

(B) Hazardous-material response; and

(ii) Has the legal authority and responsibility to engage in the suppression of fire, as—

(A) An employee of the public agency he serves, which legally recognizes him to have such (or, at a minimum, does not deny (or has not denied) him to have such); or

(B) An individual otherwise included within the definition provided in the Act, at 42 U.S.C. 3796b(4); or

(2) An individual who is a participant in an official training program of the officer's public agency that is mandatory for that individual's employment or certification as a firefighter and such training program involves the suppression of fire or hazardous-material response.

* * * * *

Gross negligence means a reckless departure from the ordinary care used by similarly situated public safety officers under circumstances where it is highly likely that serious harm will follow.

* * * * *

Injury—(1) Injury means—

(i) A traumatic physical wound or a traumatized condition of the body, or the increase in severity of such an existing wound or condition, directly and proximately caused by—

(A) External force such as bullets or physical blows;

(B) Exposure to external factors such as chemicals, electricity, climatic conditions, infectious disease, radiation, virus, or bacteria;

(C) Heatstroke; or

(D) Acute and immediate musculoskeletal strain or muscle damage such as a disc herniation or rhabdomyolysis,

(ii) But does not include—

(A) Any occupational disease;

(B) Any chronic, cumulative, or progressive condition of the body;

(C) Cardiovascular disease; or

(D) Any mental health condition including post-traumatic stress disorder, depression, or anxiety.

(2) With respect to claims based on a fatal heart attack, stroke, or vascular rupture, injury also means the presumption of personal injury established when the requirements of 42 U.S.C. 3796(k) are satisfied.

* * * * *

Injury date—(1) In general, injury date means the time of the line of duty injury that—

(i) Directly and proximately results in the public safety officer's death, with respect to a claim under—

(A) Subpart B of this part; or

(B) Subpart D of this part, by virtue of his death; or

(ii) Directly (or directly and proximately) results in the public safety officer's total and permanent disability, with respect to a claim under—

(A) Subpart C of this part; or

(B) Subpart D of this part, by virtue of his disability.

(2) With respect to claims under the Act, at 42 U.S.C. 3796(k), injury date means the time of the public safety officer's qualifying engagement or participation referred to in the Act at 42 U.S.C. 3796(k)(1).

* * * * *

Involvement—An individual is involved in crime and juvenile delinquency control or reduction, or enforcement of the criminal laws (including juvenile delinquency), only if the individual is an officer, or in the case of an officer trainee, an employee, of a public agency and, in that capacity, is recognized by such agency, or the relevant government (or, at a minimum, not denied by such agency, or the relevant government) as having—

(1) Legal authority to arrest, apprehend, prosecute, adjudicate, correct or detain (in a prison or other detention or confinement facility), or supervise (as a parole or probation officer), persons who are alleged or found to have violated the criminal laws, or

(2) Legal authority to participate in an official training program of the officer's public agency that is mandatory for that individual's employment or certification as a police officer, corrections officer, probation officer, or their equivalent.

* * * * *

Line of duty activity or action—Activity or an action is performed in the line of duty if it is not described in the Act, at 42 U.S.C. 3796a(1), in the case of a public safety officer who is—

(1) A law enforcement officer or firefighter—

(i) Whose primary function (as applicable) is public safety activity, only if it is activity or an action that he is obligated or authorized by statute, rule, regulation, condition of employment or service, official mutual aid agreement, or other law, to perform (including any social, ceremonial, or athletic functions (or any official training programs of his public agency) to which he is assigned, or for which he is compensated), under the auspices of the public agency he serves, and such agency (or the relevant government) legally recognizes that activity or action to have been so obligated or authorized at the time performed (or, at a minimum, does not deny (or has not denied) it to have been such); or

(ii) Whose primary function is not public safety activity, only if—

(A) It is activity or an action that he is obligated or authorized by statute, rule, regulation, condition of employment or service, official mutual-aid agreement, or other law, to perform, under the auspices of the public agency he serves, and such agency (or the relevant government) legally recognizes that activity or action to have been so obligated or authorized at the time performed (or, at a minimum, does not deny (or has not denied) it to have been such); and

(B) It is performed (as applicable) in the course of public safety activity (including emergency response activity the agency is authorized to perform), or taking part (as a trainer or trainee) in an official training program of his public agency for such activity (including participation as a trainee in an official training program of his public agency that is mandatory for that individual's employment or certification as a firefighter, police officer, corrections officer, probation officer, or equivalent), and such agency (or the relevant government) legally recognizes it to have been such at the time performed (or, at a minimum, does not deny (or has not denied) it to have been such); or

(iii) Only if it constitutes public safety activity, is performed in the course of responding to an emergency situation that the officer did not create through his own actions, requires prompt decisions and action to save another human life, and is not contrary to the law of the jurisdiction in which performed;

(2) A member of a rescue squad or ambulance crew, only if it is activity or an action that he is obligated or authorized by statute, rule, regulation, condition of employment or service, official mutual-aid agreement, or other law, to perform, under the auspices of the public agency or nonprofit entity he serves, it is performed in the course of engaging in rescue activity or providing emergency medical services, and such agency (or the relevant government) or nonprofit entity legally recognizes it to have been such at the time performed (or, at a minimum, does not deny (or has not denied) it to have been such; or

(3) A disaster relief worker, only if, it is disaster relief activity, and the agency he serves (or the relevant government), being described in the Act, at 42 U.S.C. 3796b(9)(B) or (C), legally recognizes it to have been such at the time performed (or, at a minimum, does not deny (or has not denied) it to have been such); or

(4) A chaplain, only if—

(i) It is activity or an action that he is obligated or authorized by statute, rule, regulation, condition of employment or service, official mutual-aid agreement, or other law, to perform, under the auspices of the public agency he serves, and such agency (or the relevant government) legally recognizes it to have been such at the time performed (or, at a minimum, does not deny (or has not denied) it to have been such); and

(ii) It is performed in the course of responding to a fire-, rescue-, or police emergency, and such agency (or the relevant government) legally recognizes it to have been such at the time performed (or, at a minimum, does not deny (or has not denied) it to have been such).

* * * * *

Line of duty injury—An injury is sustained in the line of duty only if—

(1) It is sustained in the course of—

(i) Performance of line of duty activity or a line of duty action; or

(ii) Authorized commuting; or

(2) Such injury resulted from the injured party's status as a public safety officer, or was sustained in retaliation for line of duty actions taken by the officer or other public safety officers.

* * * * *

Medical probability—A fact is indicated to a degree of medical probability, when, pursuant to a medical assessment, the fact is indicated by a preponderance of such evidence as may be available.

* * * * *

Official capacity—An individual serves a public agency in an official capacity only if—

(1) He is officially authorized, -recognized, or -designated (by such agency) as functionally within or -part of it, and

(2) His acts and omissions, while so serving, are legally those of such agency, which legally recognizes them as such (or, at a minimum, does not deny (or has not denied) them to be such); or

(3) His acts and omissions while responding to an emergency for purposes of saving human life constitute a line of duty action or activity as defined in this part.

* * * * *

Officially recognized or designated employee or volunteer member of a rescue squad or ambulance crew means an employee or volunteer member of a rescue squad or ambulance crew who—

(1) Is officially recognized (or officially designated) as such an employee or volunteer member, by the public agency or nonprofit entity serving the public under whose auspices the squad or crew operates, and

(2) Is engaging in rescue activity or in the provision of emergency medical services as authorized or licensed by

law and by the applicable agency or entity.

* * * * *

On-site hazard management means on-site hazard evaluation and providing scene security or directing traffic in response to any fire, rescue, or law enforcement emergency.

* * * * *

Parent-child relationship means a relationship between a public safety officer and another individual, in which the officer has the role of parent (other than biological or legally-adoptive).

* * * * *

PSOB Counsel means the legal staff within BJA that provides programmatic legal advice to PSOB determining officials and performs legal review of PSOB Program claims and related matters.

* * * * *

Suppression of fire means extinguishment, physical prevention, containment of fire, and on-site hazard management.

* * * * *

Voluntary intoxication at the time of death or catastrophic injury means the following, as shown by any commonly accepted tissue, -fluid, or -breath test or by other competent evidence:

(1) With respect to alcohol,

(i) In any claim arising from a public safety officer's death in which the death was simultaneous (or practically simultaneous) with the injury, it means intoxication as defined in the Act, at 42 U.S.C. 3796b(5), unless convincing evidence demonstrates that the officer did not introduce the alcohol into his body intentionally; or

(ii) In any claim in which a public safety officer's death occurred after the injury date, unless convincing evidence demonstrates that the officer did not introduce the alcohol into his body intentionally, it means intoxication—

(A) As defined in the Act, at 42 U.S.C. 3796b(5); and

(B) As of the injury date; or

(2) With respect to drugs or other *s*ubstances, it means intoxication as defined in the Act, at 42 U.S.C. 3796b(5), as evidenced by—

(i) The officer acting in an intoxicated manner as of the injury date, unless convincing evidence demonstrates that the introduction of drugs or other substances was not an intentional act of the officer's; or

(ii) The presence (as of the injury date) in the body of the public safety officer of drugs or substances included on Schedules I–III of the drug control and enforcement laws (see 21 U.S.C. 812(a)), unless convincing evidence demonstrates that—

(A) The introduction of such drug or other substance was not an intentional act of the officer's, or

(B) The drug or other substance would not produce intoxication in the amount present in the public safety officer's body.

* * * * *

Volunteer fire department—a volunteer fire department is an instrumentality within the meaning of the Act at 42 U.S.C. 3796b(8) if—

(1) It is legally established as a nonprofit entity serving the public,

(2) It is legally established and operates solely for the purpose of providing fire protection and related services to or on behalf of a public agency or agencies, and

(3) It provides fire protection and related services to the public without preference or subscription.

■ 4. Amend § 32.5 as follows:

■ a. Revise paragraph (a).

■ b. Remove paragraphs (c) and (d)(3).

■ c. Redesignate paragraph (b) as paragraph (c).

■ d. In paragraph (i) add ''and physically stressful'' after ''non-routine''.

■ e. Add new paragraphs (b), (k), (l), and (m).

The revision and additions read as follows:

§ 32.5 Evidence.

(a) Except as otherwise may be expressly provided in the Act or this part, a claimant is responsible for establishing all issues of fact for the particular benefit sought by the standard of proof of ''more likely than not.''

(b) The evidence that a claimant produces, both circumstantial and direct, must be credible, probative, and substantial, and, when deemed necessary by a PSOB determining official, produced in original format or certified as a true and exact copy of a record by a custodian of such records or other person capable of verifying the authenticity of such records.

* * * * *

(k) In instances where the determining official finds that there is a balance of positive and negative evidence for an issue material to the particular benefit sought, the PSOB determining official will resolve the point in favor of the payment of benefits. Such a finding of equivalence must be based on reason, logic, common sense, and the determining official's experience, and, under no circumstances, may a lack of evidence in support of a particular fact be understood to establish or create such equivalence.

(l) A PSOB determining official may require from a claimant proof of birth, death, disability, earnings, education, employment, expenses, injury, relationship, marriage, or other information deemed necessary to establish eligibility for a benefit under the Act. A PSOB determining official may also require waivers, consents, or authorizations from claimants to obtain directly from third parties tax, medical, employment, or other information that the PSOB determining official deems relevant in determining the claimant's eligibility, and may request an opportunity to review original documents submitted in connection with the claim.

(m) In the absence of reasonable excuse or justification, when evidence necessary to a determination on a claim that has been requested in writing in connection with a complete claim for benefits is not filed with the PSOB Office within one year of the date of such request, or a claimant has otherwise failed to pursue in a timely fashion a determination on his or her claim, the claim will be considered as abandoned, as though never filed. Not less than 33 days prior to the PSOB determining official finding the claim to be abandoned, the PSOB Office shall serve the claimant with notice of intent to deem the claim abandoned. In the event of abandonment, the time periods prescribed for filing an initial application for benefits or other filing deadline are neither tolled nor applicable. A claimant may reopen an abandoned claim within 180 days from the date of abandonment provided claimant files with the PSOB Office a complete claim, including any information previously requested but not provided. After a claim for benefits has been abandoned and a complete claim has not been filed with the PSOB Office in the time prescribed for reopening such claim, no further action on the claim will be taken by the agency.

■ 5. Revise § 32.7 to read as follows:

§ 32.7 Fees for representative services.

(a) Only attorneys, as defined in this part, or an individual working under the direct supervision of an attorney and for whose conduct the attorney is responsible for under applicable Rules of Professional Conduct (*e.g.,* a paralegal), may charge fees for representative services provided in connection with any claim. Fees sought for representative services provided in connection with any claim must be reasonable. Subject to paragraphs (e) and (f) of this section, fees may be based on a fixed fee, hourly rate, a percentage

of benefits recovered, or a combination of such bases. An authorization under paragraph (c) of this section shall be based on consideration of the following factors:

(1) The nature of the services provided by the petitioner;

(2) The complexity of the claim;

(3) The level of skill and competence required to provide the petitioner's services;

(4) The amount of time spent on the claim by the petitioner;

(5) The level of administrative or judicial review to which the claim was pursued and the point at which the petitioner entered the proceedings;

(6) The ordinary, usual, or customary fee charged by other persons (and by the petitioner) for services of a similar nature; and

(b) Before submitting the petition described in paragraph (c) of this section, a person seeking to receive any amount of fees from a claimant for representative services provided in connection with any claim under the Act shall file with the PSOB Office a copy of the fee agreement.

(c) To receive fees for representative services provided in connection with any claim, a representative shall petition the PSOB Office for authorization under this section. Such petition shall include—

(1) An itemized description of the services;

(2) The total amount sought to be received, from any source, as consideration for the services;

(3) An itemized description of any representative or other services provided to (or on behalf of) the claimant in connection with other claims or causes of action, unrelated to the Act, before any public agency or non-public entity (including any insurer), arising from the public safety officer's death, disability, or injury;

(4) The total amount requested, charged, received, or sought to be received, from any source, as consideration for the services described in paragraph (c)(3) of this section;

(5) A statement of whether the petitioner has legal training or is licensed to practice law, and a description of any special qualifications possessed by the petitioner (other than legal training or a license to practice law) that increased the value of his services to (or on behalf of) the claimant;

(6) A certification that the claimant was provided, simultaneously with the filing of the petition, with—

(i) A copy of the petition; and

(ii) A letter advising the claimant that he could file his comments on the petition, if any, with the PSOB Office, within thirty-three days of the date of that letter; and

(7) A copy of the letter described in paragraph (c)(6)(ii) of this section.

(d) Unless, for good cause shown, the Director extends the time for filing, no petition under paragraph (a) of this section shall be considered if the petition is filed with the PSOB Office later than one year after the date of the final agency determination of the claim.

(e) No amount shall be authorized under this section for—

(1) Fees in excess of 12 percent of the total death or disability benefit payment available to a claimant regardless of how the fee agreement is structured; or

(2) Services provided in connection with—

(i) Obtaining or providing evidence or information previously obtained by the PSOB determining official;

(ii) Preparing the petition; or

(iii) Explaining or delivering an approved claim to the claimant.

(f) Fees otherwise qualifying under this section shall be presumed reasonable—

(1) In a claim determined by the PSOB Office that does not exceed 8 percent of the total death or disability benefit payment available to a claimant, or

(2) In a claim determined by the Hearing Officer or Director that does not exceed 10 percent of the total death or disability benefit payment available to a claimant.

(g) The presumptions in paragraph (f) of this section may be rebutted through an examination of the factors in paragraph (a) of this section establishing by clear and convincing evidence that the fee is unreasonable.

(h) Upon its authorizing or not authorizing the payment of any amount under paragraph (a) of this section, the PSOB Office shall serve notice of the same upon the claimant and the petitioner. Such notice shall specify the amount, if any, the petitioner is authorized to charge the claimant and the basis of the authorization.

(i) No agreement for representative services in connection with a claim shall be valid if the agreement provides for any consideration other than under this section. A person's receipt of consideration for such services other than under this section may, among other things, be the subject of referral by BJA to appropriate professional, administrative, disciplinary, or other legal authorities.

■ 6. Add § 32.9 to read as follows:

§ 32.9 Complete applications.

(a) Before an application for benefits under the Act will be processed as a claim, *i.e.,* assigned a claim number by the PSOB Office, determined by the PSOB Office, and reviewed for legal sufficiency, such application must be ''complete'' as provided in this section.

(b) Except as indicated in paragraph (d) of this section, an application for death benefits or disability benefits shall constitute a complete application only if all of the basic required documents identified on the ''PSOB Checklist of Required Documents for Filing a PSOB Death [or Disability, as appropriate] Benefits Claim,'' available at the PSOB Program Web site, are filed with the PSOB Office.

(c) If an applicant files with the PSOB Office an application for benefits that, pursuant to paragraph (b) of this section, is not complete, the PSOB Office will serve the applicant with written notice of the information necessary to complete the application and defer any further processing of the application and consideration as a claim until such Office receives all of the information described in paragraph (b).

(d) An applicant's inability to file evidence as a result of a refusal by a public agency in which the officer served to provide the information identified in this section (or the public agency's demonstrated inability to provide such information) shall not render an application incomplete if the applicant provides to the PSOB Office evidence demonstrating that such inability to file basic required documents is not due to any fault of the applicant.

■ 7. Add § 32.10 to read as follows:

§ 32.10 PSOB Counsel.

(a) Before determining a claim for benefits under the Act, PSOB determining officials shall seek legal advice from PSOB Counsel.

(b) Legal advice provided by PSOB Counsel to PSOB determining officials shall be limited to the interpretation and application of the PSOB Act and implementing regulations and law and regulations referenced in or having direct application to the PSOB Act or its implementing regulations.

(c) Unless otherwise ordered by the Assistant Attorney General for the Office of Justice Programs, the scope of PSOB Counsel's legal advice shall not include the review of findings of fact made by PSOB determining officials.

■ 8. Revise § 32.12 as follows:

§ 32.12 Time for filing claim.

(a) Unless, for good cause shown, as defined in § 32.2(e) of this part, the Director extends the time for filing, no application shall be considered if it is filed with the PSOB Office more than

three years after the public safety officer's death.

(b) An applicant may file with the PSOB Office such supporting documentary, electronic, video, or other nonphysical evidence and legal arguments as he may wish to provide.

■ 9. Amend § 32.13 as follows:

■ a. Revise the definition of ''*Beneficiary of a life insurance policy of a public safety officer*''.

■ b. Remove from the definition of ''*child-parent relationship*'' the phrase '', as shown by convincing evidence''.

■ c. Revise the definition of ''*Engagement in a situation involving law enforcement, fire suppression, rescue, hazardous material response, emergency medical services, prison security, disaster relief, or other emergency response activity*''.

■ d. Remove the definition of ''*Medical probability*''.

■ e. Revise the definitions of ''*Nonroutine strenuous physical activity'' and ''Nonroutine stressful physical activity*''.

The revisions read as follows:

§ 32.13 Definitions.

* * * * *

Beneficiary of a life insurance policy of a public safety officer—An individual (living or deceased on the date of death of the public safety officer) is designated as beneficiary of a life insurance policy of such officer as of such date, only if the designation is, as of such date, legal and valid (as a designation of beneficiary of a life insurance policy) and unrevoked (by such officer or by operation of law) or otherwise unterminated, except that—

(1) Any designation of an individual (including any designation of the biological or adoptive offspring of such individual) made in contemplation of such individual's marriage (or purported marriage) to such officer shall be considered to be revoked by such officer as of such date of death if the marriage (or purported marriage) did not take place, unless preponderant evidence demonstrates that—

(i) It did not take place for reasons other than personal differences between the officer and the individual; or

(ii) No such revocation was intended by the officer;

(2) Any designation of a spouse (or purported spouse) made in contemplation of or during such spouse's (or purported spouse's) marriage (or purported marriage) to such officer (including any designation of the biological or adoptive offspring of such spouse (or purported spouse)) shall be considered to be revoked by such officer as of such date of death if the spouse (or purported spouse) is divorced from such officer after the date of designation and before such date of death, unless preponderant evidence demonstrates that no such revocation was intended by the officer, and.

(3) Any designation of an individual, who was living on the date of the officer's death, but who dies before a determination of PSOB death benefits, shall be considered to be revoked by such officer on the date of the officer's death in favor of the officer's living contingent beneficiary or beneficiaries, if any.

* * * * *

Engagement in a situation involving law enforcement, fire suppression, rescue, hazardous material response, emergency medical services, prison security, disaster relief, or other emergency response activity—A public safety officer is so engaged only when, within his line of duty—

(1) He is in the course of actually—

(i) Engaging in law enforcement;

(ii) Suppressing fire;

(iii) Responding to a hazardous-material emergency;

(iv) Performing rescue activity;

(v) Providing emergency medical services;

(vi) Performing disaster relief activity;

(vii) Otherwise engaging in emergency response activity; or

(viii) Performing a line of duty activity or action, that had it not been performed immediately, would have rendered the public agency unable to perform the activities in paragraphs (1)(i) through (vii) of this section; and

(2) The public agency he serves (or the relevant government) legally recognizes him to have been in such course at the time of such engagement or activity (or, at a minimum, does not deny (or has not denied) him so to have been).

* * * * *

Nonroutine strenuous physical activity means line of duty activity that—

(1) Is not excluded by the Act, at 42 U.S.C. 3796(l);

(2) Is not performed as a matter of routine; and

(3) Entails a vigorous level of physical exertion.

Nonroutine stressful physical activity means line of duty activity that—

(1) Is not excluded by the Act, at 42 U.S.C. 3796(l);

(2) Is not performed as a matter of routine;

(3) Entails non-negligible physical exertion; and

(4) Occurs—

(i) With respect to a situation in which a public safety officer is engaged, under circumstances that objectively and reasonably—

(A) Pose (or appear to pose) dangers, threats, or hazards (or reasonably-foreseeable risks thereof), not faced by similarly-situated members of the public in the ordinary course; and

(B) Provoke, cause, or occasion unusual alarm, fear, or anxiety; or

(ii) With respect to a training exercise in which a public safety officer participates, under circumstances that objectively and reasonably—

(A) Simulate in realistic fashion situations that pose dangers, threats, or hazards; and

(B) Provoke, cause, or occasion unusual alarm, fear, or anxiety.

* * * * *

■ 10. Revise § 32.14 to read as follows:

§ 32.14 PSOB Office determination.

Upon its approving or denying a claim, the PSOB Office shall serve notice of the same upon the claimant (and upon any other claimant who may have filed a claim with respect to the same public safety officer). In the event of a denial, such notice shall—

(a) Specify the factual findings and legal conclusions that support it; and

(b) Provide information as to requesting a Hearing Officer determination.

§ 32.15 [Removed]

■ 11. Remove § 32.15.

§ 32,16 [Redesignated as § 32.15]

■ 12. Redesignate § 32.16 as § 32.15 and revise newly redesignated § 32.15 to read as follows:

§ 32.15 Payment.

(a) For purposes of determining who qualifies as a parent under 42 U.S.C. 3796(a)(5), any biological or legally-adoptive parent whose parental rights have not been terminated as of the injury date shall be presumed rebuttably to be one. If evidence demonstrates that additional individuals also qualify as the parent of a public safety officer, such payment shall be made in equal shares.

(b) Any amount payable with respect to a minor or incompetent shall be paid to his legal guardian, to be expended solely for the benefit of such minor or incompetent.

(c) If more than one individual should qualify for payment—

(1) Under the Act, at 42 U.S.C. 3796(a)(4)(i), payment shall be made to each of them in equal shares, except that, if the designation itself should manifest a different distribution, payment shall be made to each of them in shares in accordance with such distribution; or

(2) Under the Act, at 42 U.S.C. 3796(a)(4)(ii), payment shall be made to each of them in equal shares.

(d) In determining whether an eligible survivor exists under 42 U.S.C. 3796(a)(2), (4), (5), or (6) such that payment must be divided amongst such survivors, the PSOB determining official shall consider any person (other than as defined in 42 U.S.C. 3796b(3)(C)) not to have survived the public safety officer and thus ineligible, who, being 18 years of age or older at the date of the officer's fatal injury, has not filed an application for benefits under 42 U.S.C. 3796(a) within the time prescribed in this part.

§ 32.17 [Redesignated as § 32.16]

■ 13. Redesignate § 32.17 as § 32.16.

■ 14. Revise § 32.22 to read as follows:

§ 32.22 Time for filing claim.

(a) Unless, for good cause shown, as defined in § 32.2(e) of this part, the Director extends the time for filing, no application shall be considered if it is filed with the PSOB Office more than three years after the injury date.

(b) An applicant may file with the PSOB Office such supporting documentary, electronic, video, or other nonphysical evidence and legal arguments as he may wish to provide.

■ 15. Amend 32.23 as follows:

■ a. Revise the definition of ''*Gainful work*''.

■ b. Remove the definition of ''*Medical certainty*''.

■ c. Amend the definition of ''*Permanently disabled*'' and ''*Totally disabled*'' by removing in the introductory sentence ''certainty'' and adding in its place ''probability''.

The revision to read as follows:

§ 32.23 Definitions.

* * * * *

Gainful work means work activity that is both substantial and gainful.

(1) Substantial work activity means work activity that involves doing significant physical or mental activities such as work that requires a claimant to use his or her experience, skills, supervision, or contribute substantially to the operation of a business. Evidence that work activity may not be substantial includes—

(i) Work involving ordinary or simple tasks that a claimant cannot perform without more supervision or assistance than is usually given other people doing similar work,

(ii) Work involving minimal duties that make little or no demands on a claimant and that are of little or no monetary value to an employer;

(iii) Work performed under special conditions take into account a claimant's impairment such as work done in a sheltered workshop; and

(iv) Work offered despite a claimant's impairment because of family relationship, a past association with claimant's employer or other organization to which the claimant was affiliated with, or an employer's or affiliated organization's concern for claimant's welfare.

(2) Gainful work activity means full- or part-time work activity that actually is compensated or is commonly compensated, but compensation does not include reimbursement of incidental expenses such as parking, transportation, and meals, or de minimis compensation.

* * * * *

■ 16. Revise § 32.24 to read as follows:

§ 32.24 PSOB Office determination.

Upon its approving or denying a claim, the PSOB Office shall serve notice of the same upon the claimant. In the event of a denial, such notice shall—

(a) Specify the factual findings and legal conclusions that support it; and

(b) Provide information as to requesting a Hearing Officer determination.

§ 32.25 [Removed]

■ 17. Remove § 32.25.

§ 32.26 [Redesignated as § 32.25]

■ 18. Redesignate § 32.26 as § 32.25.

§§ 32.27 and 32.28 [Removed]

■ 19. Remove §§ 32.27 and 28.

§ 32.29 [Redesignated as § 32.26]

■ 20. Redesignate § 32.29 as § 32.26 and revise newly redesignated § 32.26 to read as follows:

§ 32.26 Request for Hearing Officer determination.

In order to exhaust his administrative remedies, a claimant seeking relief from the denial of his claim shall request a Hearing Officer determination under subpart E of this part. Consistent with § 32.8, any denial that is not the subject of such a request shall constitute the final agency determination.

■ 21. Amend § 32.33 as follows:

■ a. Revise the definition of ''*Child of an eligible public safety officer*''.

■ b. Remove the definition of ''*Dependent*''.

■ c. Revise the definition of ''*Educational expenses*''.

■ d. Remove the definitions of ''*Eligible dependent*'', and ''*Tax year*''.

The revisions read as follows:

§ 32.33 Definitions.

* * * * *

Child of an eligible public safety officer means the child of a public safety officer, which officer is an eligible public safety officer, but does not include any individual described in 42 U.S.C. 3796(a)(6).

* * * * *

Educational expenses means out-of-pocket expenses actually incurred by the claimant or claimant's family and excludes expenses not incurred by reason of a waiver, scholarship, grant, or equivalent reduction for such of the following as may be in furtherance of the educational, professional, or vocational objective of the program of education that forms the basis of a financial claim:

(1) Tuition and fees, as described in 20 U.S.C. 1087*ll*(1) (higher education assistance);

(2) Reasonable expenses for—

(i) Room and board (if incurred for attendance on at least a half-time basis);

(ii) Books;

(iii) Computer equipment;

(iv) Supplies;

(v) Transportation; and

(3) For attendance on at least a three-quarter-time basis, a standard allowance for miscellaneous personal expenses that is the greater of—

(i) The allowance for such expenses, as established by the eligible educational institution for purposes of financial aid; or

(ii) $200.00 per month.

* * * * *

■ 22. Revise § 32.34 to read as follows:

§ 32.34 PSOB Office determination.

In the event of the PSOB Office's denying a claim, the notice it serves upon the claimant shall—

(a) Specify the factual findings and legal conclusions that support the denial; and

(b) Provide information as to requesting a Hearing Officer determination.

■ 23. Revise § 32.41 to read as follows:

§ 32.41 Scope of subpart.

Consistent with § 32.1, this subpart contains provisions applicable to requests for Hearing Officer determination of claims denied under subpart B, C, or D of this part, and of claims remanded (or matters referred) under § 32.54(c).

■ 24. Revise § 32.42 to read as follows:

§ 32.42 Time for filing request for determination.

(a) Unless, for good cause shown, as defined in § 32.2(e) of this part, the Director extends the time for filing, no claim shall be determined if the request therefor is filed with the PSOB Office

later than thirty-three days after the service of notice of the denial (under subpart B, C, or D of this part) of a claim.

(b) A claimant may file with his request for a Hearing Officer determination such supporting documentary, electronic, video, or other non-physical evidence and legal arguments as he may wish to provide.

■ 25. Revise § 32.44 to read as follows:

§ 32.44 Hearing Officer determination.

(a) Before determining a claim, the Hearing Officer shall seek legal advice from PSOB Counsel.

(b) Upon his determining a claim, the Hearing Officer shall file a notice of the same simultaneously with the Director (for his review under subpart F of this part in the event of approval), the PSOB Office, which notice shall specify the factual findings and legal conclusions that support it, and PSOB Counsel.

(c) Upon a Hearing Officer's denying a claim, the PSOB Office shall serve notice of the same upon the claimant (and upon any other claimant who may have filed a claim with respect to the same public safety officer), which notice shall—

(1) Specify the Hearing Officer's factual findings and legal conclusions that support it; and

(2) Provide information as to Director appeals.

■ 26. Amend § 32.45 as follows:

■ a. In paragraph (d)(1) remove ''and'' after ''cumulative evidence:''.

■ b. In paragraph (d)(2), remove the period after ''witnesses'' and add in its place ''; and''.

■ c. Add paragraph (d)(3)

The addition reads as follows:

§ 32.45 Hearings

* * * * *

(d) * * *

(3) Shall be the only individual permitted to examine or question a claimant apart from that claimant's representative, if any.

* * * * *

§ 32.54 [Amended]

■ 27. Amend § 32.54 by removing paragraph (b) and redesignating paragraph (c) as paragraph (b).

Dated: August 2, 2016.

Karol V. Mason,

Assistant Attorney General.

Part IV

Department of Energy

10 CFR Part 430
Energy Conservation Program: Test Procedures for Cooking Products; Proposed Rule

DEPARTMENT OF ENERGY

10 CFR Part 430

[Docket No. EERE–2012–BT–TP–0013]

RIN 1904–AC71

Energy Conservation Program: Test Procedures for Cooking Products

AGENCY: Office of Energy Efficiency and Renewable Energy, Department of Energy.

ACTION: Supplemental notice of proposed rulemaking.

SUMMARY: On December 3, 2014, the U.S. Department of Energy (DOE) issued a supplemental notice of proposed rulemaking (SNOPR) to revise its test procedures for cooking products. As part of the December 2014 test procedure SNOPR, DOE proposed a change to the test equipment that would allow for measuring the energy efficiency of induction cooking tops. DOE also proposed methods to test non-circular electric surface units, electric surface units with flexible concentric cooking zones, full-surface induction cooking tops, and gas burners with high input rates. In this SNOPR, to address issues raised by interested parties regarding the ability of the previous cooking top proposals to adequately measure energy use during a representative average use cycle, DOE proposes to amend its test procedure for all conventional electric cooking tops to incorporate by reference the relevant selections from European standard EN 60350–2:2013 ''Household electric cooking appliances Part 2: Hobs—Methods for measuring performance'' (EN 60350–2:2013). DOE also revises its proposals for testing non-circular electric surface units, electric surface units with flexible concentric cooking zones, and full-surface induction cooking tops based on EN 60350–2:2013. Furthermore, DOE proposes to extend the test methods in EN 60350–2:2013 to measure the energy consumption of gas cooking tops by correlating test equipment diameter to burner input rate, including input rates that exceed 14,000 British thermal units per hour (Btu/h). DOE also proposes to modify the calculations of conventional cooking top annual energy consumption and integrated annual energy consumption to account for the proposed water-heating test method. DOE proposes to incorporate by reference test structures from American National Standards Institute (ANSI) Z21.1–2016 ''Household cooking gas appliances'' to standardize the installation conditions under which cooking tops are tested. DOE also proposes minor technical clarifications to the gas heating value correction and other grammatical changes to the regulatory text in appendix I that do not alter the substance of the existing test methods. With regard to conventional ovens, DOE proposes to repeal the regulatory provisions establishing the test procedure for conventional ovens under the Energy Policy and Conservation Act (EPCA). DOE has determined that the conventional oven test procedure may not accurately represent consumer use as it favors conventional ovens with low thermal mass and does not capture cooking performance-related benefits due to increased thermal mass of the oven cavity.

DATES: DOE will accept comments, data, and information regarding this SNOPR no later than September 21, 2016. See section V, ''Public Participation,'' for details.

Any comments submitted must identify the SNOPR for Test Procedures for Cooking Products, and provide docket number EE–2012–BT–TP–0013 and/or regulatory information number (RIN) number 1904–AC71. Comments may be submitted using any of the following methods:

1. *Federal eRulemaking Portal: www.regulations.gov.* Follow the instructions for submitting comments.

2. *Email: Induction-Cooking-Prod-2012-TP-0013@ee.doe.gov.* Include the docket number and/or RIN in the subject line of the message. Submit electronic comments in WordPerfect, Microsoft Word, PDF, or ASCII file format, and avoid the use of special characters or any form of encryption.

3. *Postal Mail:* Appliance and Equipment Standards Program, U.S. Department of Energy, Building Technologies Office, Mailstop EE–5B, 1000 Independence Avenue SW., Washington, DC, 20585–0121. Telephone: (202) 586–6636. If possible, please submit all items on a compact disc (CD), in which case it is not necessary to include printed copies.

4. *Hand Delivery/Courier:* Appliance and Equipment Standards Program, U.S. Department of Energy, Building Technologies Office, 950 L'Enfant Plaza SW., 6th Floor, Washington, DC, 20024. Telephone: (202) 586–6636. If possible, please submit all items on a CD, in which case it is not necessary to include printed copies.

For detailed instructions on submitting comments and additional information on the rulemaking process, see section V of this document (Public Participation).

Docket: The docket, which includes **Federal Register** notices, public meeting attendee lists and transcripts, comments, and other supporting documents/materials, is available for review at *www.regulations.gov.* All documents in the docket are listed in the *regulations.gov* index. However, some documents listed in the index, such as those containing information that is exempt from public disclosure, may not be publicly available.

A link to the docket Web page can be found at: *https://www.regulations.gov/#!docketDetail;D=EERE-2012-BT-TP-0013.* This Web page will contain a link to the docket for this notice on the *www.regulations.gov* site. The *www.regulations.gov* Web page will contain simple instructions on how to access all documents, including public comments, in the docket. See section VII for information on how to submit comments through regulations.gov.

FOR FURTHER INFORMATION CONTACT:

Ms. Ashley Armstrong, U.S. Department of Energy, Office of Energy Efficiency and Renewable Energy, Building Technologies Office, EE–2J, 1000 Independence Avenue SW., Washington, DC, 20585–0121. Telephone: (202) 586–6590. Email: *ashley.armstrong@ee.doe.gov.*

Ms. Celia Sher, U.S. Department of Energy, Office of the General Counsel, GC–33, 1000 Independence Avenue SW., Washington, DC, 20585–0121. Telephone: (202) 202–287–6122. Email: *Celia.Sher@hq.doe.gov.*

For further information on how to submit a comment, review other public comments and the docket, or participate in the public meeting, contact the Appliance and Equipment Standards Program staff at (202) 586–6636 or by email: *Induction-Cooking-Prod-2012-TP-0013@ee.doe.gov.*

SUPPLEMENTARY INFORMATION: DOE intends to incorporate by reference certain sections of the following industry standards into 10 CFR part 430:

(1) ANSI Standard Z21.1–2016—''Household cooking gas appliances'' (ANSI Z21.1).

- Copies of ANSI Z21.1, can be obtained from ANSI, 25 W 43rd Street, 4th Floor, New York, NY, 10036, or by going to *http://webstore.ansi.org/default.aspx.*

(2) EN 60350–2:2013 ''Household electric cooking appliances Part 2: Hobs—Methods for measuring performance'' (EN 60350–2:2013).

- Copies of EN 60350–2:2013, a European standard approved by the European Committee for Electrotechnical Standardization (CENELEC), can be obtained from the

British Standards Institute (BSI Group), 389 Chiswick High Road, London, W4 4AL, United Kingdom, or by going to *http://shop.bsigroup.com/.*

See section IV.M for a further discussion of these standards.

Table of Contents

I. Authority and Background

Title III of the Energy Policy and Conservation Act of 1975 (42 U.S.C. 6291, *et seq.;* ''EPCA'' or, ''the Act'') sets forth a variety of provisions designed to improve energy efficiency. (All references to EPCA refer to the statute as amended through the Energy Efficiency Improvement Act of 2015, Public Law 114–11 (Apr. 30, 2015).) Part B of title III, which for editorial reasons was redesignated as Part A upon incorporation into the U.S. Code (42 U.S.C. 6291–6309, as codified), establishes the ''Energy Conservation Program for Consumer Products Other Than Automobiles.'' These include cooking products,[1] and specifically conventional cooking tops [2] and conventional ovens,[3] the primary subject of this document. (42 U.S.C. 6292(a)(10))

Under EPCA, the energy conservation program consists essentially of four parts: (1) Testing, (2) labeling, (3) Federal energy conservation standards, and (4) certification and enforcement procedures. The testing requirements consist of test procedures that manufacturers of covered products must use as the basis for (1) certifying to DOE that their products comply with the applicable energy conservation standards adopted under EPCA, and (2) making representations about the efficiency of those products. Similarly, DOE must use these test procedures to determine whether the products comply with any relevant standards promulgated under EPCA.

[1] DOE's regulations define ''cooking products'' as one of the following classes: Conventional ranges, conventional cooking tops, conventional ovens, microwave ovens, microwave/conventional ranges and other cooking products. (10 CFR 430.2)

[2] Conventional cooking top means a class of kitchen ranges and ovens which is a household cooking appliance consisting of a horizontal surface containing one or more surface units which include either a gas flame or electric resistance heating. (10 CFR 430.2)

[3] Conventional oven means a class of kitchen ranges and ovens which is a household cooking appliance consisting of one or more compartments intended for the cooking or heating of food by means of either a gas flame or electric resistance heating. It does not include portable or countertop ovens which use electric resistance heating for the cooking or heating of food and are designed for an electrical supply of approximately 120 volts.(10 CFR 430.2)

A. General Test Procedure Rulemaking

Under 42 U.S.C. 6293, EPCA sets forth the criteria and procedures DOE must follow when prescribing or amending test procedures for covered products. EPCA provides in relevant part that any test procedures prescribed or amended under this section shall be reasonably designed to produce test results which measure energy efficiency, energy use or estimated annual operating cost of a covered product during a representative average use cycle or period of use and shall not be unduly burdensome to conduct. (42 U.S.C. 6293(b)(3))

In addition, if DOE determines that a test procedure amendment is warranted, it must publish proposed test procedures and offer the public an opportunity to present oral and written comments on them. (42 U.S.C. 6293(b)(2)) Finally, in any rulemaking to amend a test procedure, DOE must determine to what extent, if any, the proposed test procedure would alter the measured energy efficiency of any covered product as determined under the existing test procedure. (42 U.S.C. 6293(e)(1))

B. Test Procedures for Cooking Products

DOE's test procedures for conventional cooking tops, conventional ovens, and microwave ovens are codified at appendix I to subpart B of 10 CFR part 430 (appendix I).

DOE established the test procedures in a final rule published in the **Federal Register** on May 10, 1978. 43 FR 20108, 20120–28. DOE revised its test procedures for cooking products to more accurately measure their efficiency and energy use, and published the revisions as a final rule in 1997. 62 FR 51976 (Oct. 3, 1997). These test procedure amendments included: (1) A reduction in the annual useful cooking energy; (2) a reduction in the number of self-cleaning oven cycles per year; and (3) incorporation of portions of International Electrotechnical Commission (IEC) Standard 705–1988, ''Methods for measuring the performance of microwave ovens for household and similar purposes,'' and Amendment 2–1993 for the testing of microwave ovens. *Id.* The test procedures for conventional cooking products establish provisions for determining estimated annual operating cost, cooking efficiency (defined as the ratio of cooking energy output to cooking energy input), and energy factor (defined as the ratio of annual useful cooking energy output to total annual energy input). 10 CFR 430.23(i); appendix I. These provisions for conventional cooking products are not

currently used for compliance with any energy conservation standards because the present standards are design requirements; in addition, there is no EnergyGuide [4] labeling program for cooking products.

DOE subsequently conducted a rulemaking to address standby and off mode energy consumption, as well as certain active mode testing provisions, for residential dishwashers, dehumidifiers, and conventional cooking products. DOE published a final rule on October 31, 2012 (77 FR 65942, hereinafter referred to as the October 2012 Final Rule), adopting standby and off mode provisions that satisfy the EPCA requirement that DOE include measures of standby mode and off mode power in its test procedures for residential products, if technically feasible. (42 U.S.C. 6295(gg)(2)(A))

C. The January 2013 TP NOPR

On January 30, 2013, DOE published a notice of proposed rulemaking (NOPR) (78 FR 6232, hereinafter referred to as the January 2013 TP NOPR) proposing amendments to appendix I that would allow for measuring the active mode energy consumption of induction cooking products (*i.e.,* conventional cooking tops equipped with induction heating technology for one or more surface units [5] on the cooking top). DOE proposed to incorporate induction cooking tops by amending the definition of ''conventional cooking top'' to include induction heating technology. Furthermore, DOE proposed to require for all cooking tops the use of test equipment compatible with induction technology. Specifically, DOE proposed to replace the solid aluminum test blocks currently specified in the test procedure for cooking tops with hybrid test blocks comprising two separate pieces: an aluminum body and a stainless steel base. In the January 2013 TP NOPR, DOE also proposed amendments to include a clarification that the test block size be determined using the smallest dimension of the electric surface unit. 78 FR 6232, 6234 (Jan. 30, 2013).

D. The December 2014 TP SNOPR

On December 3, 2014, DOE published an SNOPR (79 FR 71894, hereinafter referred to as the December 2014 TP SNOPR), modifying its proposal from the January 2013 TP NOPR to more accurately measure the energy efficiency of induction cooking tops. DOE proposed to add a layer of thermal grease between the stainless steel base and aluminum body of the hybrid test block to facilitate heat transfer between the two pieces. DOE also proposed additional test equipment for electric surface units with large diameters (both induction and electric resistance) and gas cooking top burners with high input rates. 79 FR 71894 (Dec. 3, 2014). In addition, DOE proposed methods to test non-circular electric surface units, electric surface units with flexible concentric cooking zones, and full-surface induction cooking tops. *Id.*

In the December 2014 TP SNOPR, DOE also proposed to incorporate methods for measuring conventional oven volume, clarify that the existing oven test block must be used to test all ovens regardless of input rate, and provide a method to measure the energy consumption and efficiency of conventional ovens equipped with an oven separator. 79 FR 71894 (Dec. 3, 2014). On July 3, 2015, DOE published a final rule addressing the test procedure amendments for conventional ovens only. (80 FR 37954, hereinafter referred to as the July 2015 Final Rule). In this SNOPR, DOE is continuing the rulemaking to consider additional methodology for testing conventional cooking tops. In addition, based on further review of public comments and data provided by manufacturers, DOE is proposing in this SNOPR to repeal the regulatory provisions establishing the test procedures of conventional ovens.

II. Summary of the Supplemental Notice of Proposed Rulemaking

DOE received comments on the energy conservation standards NOPR for conventional ovens (80 FR 33030) published on June 10, 2015 (the June 2015 STD NOPR) highlighting uncertainty about whether the unique features of commercial-style ovens were appropriately accounted for when measuring energy consumption using the existing conventional oven test procedure. After review of these comments, DOE determined that additional investigation is required to establish a representative test procedure for conventional ovens. DOE is proposing to repeal the provisions in the existing cooking products test procedure relating to conventional ovens.

For conventional cooking tops, based on review of the public comments received in response to the December 2014 TP SNOPR, and a series of manufacturer interviews conducted in February and March 2015 to discuss key concerns regarding the hybrid test block method proposed in the December 2014 TP SNOPR, DOE is withdrawing its proposal for testing conventional cooking tops with a hybrid test block. Instead, DOE proposes to modify its test procedure to incorporate by reference the relevant sections of EN 60350–2:2013 ''Household electric cooking appliances Part 2: Hobs—Methods for measuring performance'' [6] (EN 60350–2:2013), which uses a water-heating test method to measure the energy consumption of electric cooking tops. EN 60530–2:2013 specifies heating a water load to a certain temperature at the maximum energy input setting for a single surface unit, and then reducing the energy input to the surface unit to a lower setting for an extended simmering period. The test method specifies the quantity of water to be heated in a standardized test vessel whose size is based on the diameter of the surface unit under test. For each surface unit, the test energy consumption is measured and then divided by the mass of the water load used to test each surface unit to calculate the energy consumed per gram of water. The measurements of energy consumption per gram of water calculated for each surface unit are averaged, then normalized to a single water quantity to determine the total energy consumption of the cooking top. Based on DOE's further review of a report on round robin testing commissioned by the European Committee of Domestic Equipment Manufacturers (CECED) [7] using a draft version of EN 60350–2:2013 conducted in 2011, review of the public comments received in response to the December 2014 TP SNOPR, and a series of manufacturer interviews conducted in February 2015, as well as further evaluation of DOE's own test data, DOE determined that the test methods to measure surface unit energy consumption specified in EN 60350–2:2013 produce repeatable and reproducible test results. DOE also notes that the test vessels specified in EN 60350–2:2013 are compatible with all cooking top technologies. Additionally, the range of test vessel diameters specified in EN 60350–2:2013 covers the full range of surface unit diameters available on the U.S. market. Moreover, incorporating EN 60350–2:2013 by reference has the benefit of harmonization with international testing

[4] For more information on the EnergyGuide labeling program, see: *www.access.gpo.gov/nara/cfr/waisidx_00/16cfr305_00.html.*

[5] The term surface unit refers to burners for gas cooking tops, electric resistance heating elements for electric cooking tops, and inductive heating elements for induction cooking tops.

[6] Hob is the British English term for cooking top.

[7] Italian National Agency for New Technologies, Energy and Sustainable Economic Development—Technical Unit Energy Efficiency (ENEA–UTEE), ''CECED Round Robin Tests for Hobs and Microwave Ovens—Final Report for Hobs,'' July 2011.

methods. Although DOE is proposing to incorporate the EN 60350–2:2013 method to measure the energy consumption of the cooking top, DOE is proposing to modify the water quantity used to normalize the total energy consumption of the cooking top, in order to estimate a representative annual energy consumption for the U.S. market.

In the December 2014 TP SNOPR, DOE proposed test methods for non-circular electric cooking top surface units and full-surface induction cooking tops with ''cook anywhere'' functionality. 79 FR 71894, 71905 (Dec. 3, 2014). In this SNOPR, DOE proposes, instead, to adopt the test methods and specifications for non-circular surface units and full-surface induction cooking tops included in EN 60350–2:2013. However, for surface units with flexible concentric sizes (*i.e.,* units with multiple zones of the same shape but varying shortest dimensions), DOE continues to propose that the surface unit be tested at each unique size setting. DOE also further clarifies in this SNOPR that for all cooking tops, specialty surface units such as bridge zones, warming plates, grills, and griddles are not covered by the proposed appendix I.

Only electric cooking tops are covered by the methods specified in EN 60350–2:2013. DOE is proposing to extend the water-heating test method to gas cooking tops by correlating the burner input rate and test vessel diameters specified in EN 30–2–1:1998 *Domestic cooking appliances burning gas—Part 2–1: Rational use of energy—General* (EN 30–2–1) to the test vessel diameters and water loads already included in EN 60350–2:2013. The range of gas burner input rates covered by EN 30–2–1 includes burners exceeding 14,000 British thermal units per hour (Btu/h), and thus provides a method to test gas burners with high input rates.

Although EN 60350–2:2013 includes a method to determine the normalized per-cycle energy consumption of the cooking top, it does not include a method to determine total annual energy consumption. DOE is proposing in this SNOPR to include a calculation of the annual energy consumption and integrated annual energy consumption of conventional cooking tops using the cooking frequency determined in the 2009 DOE Energy Information Administration (EIA) Residential Energy Consumption Survey (RECS).[8] The EIA RECS collects energy-related data for occupied primary housing units in the United States. DOE also reviewed recent field energy use survey data presented in the 2010 California Residential Appliance Saturation Study (CA RASS) [9] and the Florida Solar Energy Center (FSEC) [10] to determine whether the proposed test method and cooking frequency based on RECS data produce an annual energy consumption representative of consumer use. Based on this CA RASS and FSEC field use data, and based on testing of a sample of products, DOE determined that the estimated annual active mode cooking top energy consumption using the proposed test method and cooking frequency based on RECS data does not adequately represent consumer use. As a result, DOE is proposing to normalize the cooking frequency to account for differences between the duration of a cooking event represented in the RECS data and DOE's proposed test load for measuring the energy consumption of the cooking top. DOE is proposing to use the resulting normalized number of cooking cycles per year multiplied by the normalized per-cycle energy consumption and the number of days in a year (365) to calculate annual active mode cooking energy consumption for the cooking top.

DOE also proposes to define the term ''combined cooking product'' as a cooking product that combines a conventional cooking product with other appliance functionality, which may or may not include another cooking product. Examples of such ''combined cooking products'' include conventional ranges, microwave/conventional cooking tops, microwave/conventional ovens, and microwave/conventional ranges. In this SNOPR, DOE is proposing to clarify that the active mode test procedures in appendix I apply to the conventional cooking top component of a combined cooking product. However, the combined low-power of these products can only be measured for the combined product and not the individual components. Thus, DOE is proposing a method to apportion the combined low-power mode energy consumption measured for the combined cooking product to the individual cooking top component of the combined cooking product using the ratio of component cooking hours per year to the total cooking hours per year of the combined cooking product.

DOE is also aware that the installation test conditions currently specified in appendix I are not clearly defined. Thus, DOE is proposing to incorporate by reference test structures from the ANSI standard Z21.1–2016—''Household cooking gas appliances'' (ANSI Z21.1) to standardize the conditions under which cooking tops are tested.

DOE also notes that section 2.9.4 of the existing test procedure in appendix I does not clearly state what temperature and pressure conditions should be used to correct the gas heating value. DOE is proposing to clarify that the measurement of the heating value of natural gas or propane specified in section 2.9.4 in appendix I be corrected to standard pressure and temperature conditions in accordance with the U.S. Bureau of Standards, circular C417, 1938.

Finally, DOE is proposing minor technical grammatical corrections to certain sections of appendix I that serve as clarifications and do not change the substance of the test method.

III. Discussion

A. Products Covered by This Test Procedure Rulemaking

As discussed in section I.A, DOE has the authority to amend test procedures for covered products. 42 U.S.C. 6292(a)(10) of EPCA covers kitchen ranges and ovens. In a final rule issued on September 8, 1998 (63 FR 48038), DOE amended its regulations to substitute the term ''kitchen ranges and ovens'' with ''cooking products''. DOE regulations currently define ''cooking products'' as consumer products that are used as the major household cooking appliances. They are designed to cook or heat different types of food by one or more of the following sources of heat: gas, electricity, or microwave energy. Each product may consist of a horizontal cooking top containing one or more surface units and/or one or more heating compartments. They must be one of the following classes: conventional ranges, conventional cooking tops, conventional ovens, microwave ovens, microwave/conventional ranges and other cooking products.[11] (10 CFR 430.2)

[11] As discussed in the January 2013 TP NOPR and December 2014 TP SNOPR, DOE proposed to amend the definition of ''conventional cooking top'' to include products that feature electric inductive heating surface units. 78 FR 6232, 6234–6235 (Jan.

Continued

In this SNOPR, DOE is addressing test procedures for conventional cooking tops and is proposing to repeal the test procedures for conventional ovens In addition, because DOE regulations currently continue to use the term ''kitchen ranges and ovens'' and other terms to describe the product that is the subject of this rulemaking, DOE proposes in this SNOPR to consistently refer to the product as ''cooking products'' in DOE's regulations codified at 10 CFR parts 429 and 430.

DOE notes that certain residential household cooking appliances combine a conventional cooking product component with other appliance functionality, which may or may not perform a cooking-related function. Examples of such ''combined cooking products'' include a conventional range, which combines a conventional cooking top and one or more conventional ovens; a microwave/conventional cooking top, which combines a microwave oven and a conventional cooking top; a microwave/conventional oven, which combines a microwave oven and a conventional oven; and a microwave/conventional range, which combines a microwave oven and a conventional oven in separate compartments and a conventional cooking top. Because combined cooking products may consist of multiple classes of cooking products, any potential conventional cooking top or oven energy conservation standard would apply to the individual components of the combined cooking product. Thus, the cooking top test procedures proposed in this SNOPR also apply to the individual conventional cooking top portion of a combined cooking product. Because combined cooking products are a kind of cooking product that combines a conventional cooking product with other appliance functionality and not a distinct product class, DOE is proposing to remove the definitions of the various kinds of combined cooking products that are currently included in 10 CFR 430.2, and then add a definition of ''combined cooking product'' to appendix I, as this definition would be related to the test of combined cooking products and is not a unique product class itself. DOE also notes that the definitions of conventional cooking top, conventional oven, microwave oven, and other cooking products refer to these products as classes of cooking products. Because these are more general product categories and not specific product classes, DOE is proposing to amend the definitions of conventional cooking top, conventional oven, microwave oven, and other cooking products in 10 CFR 430.2 to reflect this clarification.

In its product testing conducted in support of the December 2014 TP SNOPR, DOE observed that for combined cooking products, the annual combined low-power mode energy consumption can only be measured for the combined cooking product and not the individual components. In order to calculate the integrated annual energy consumption of the conventional cooking top component separately, DOE is proposing in this SNOPR to allocate a portion of the combined low-power mode energy consumption measured for the combined cooking product to the conventional cooking top component using the estimated annual cooking hours for the given components comprising the combined cooking product. Similarly for microwave ovens, in order to calculate the annual combined low-power mode energy consumption for the microwave oven component separately, DOE is proposing to allocate a portion of the combined low-power mode energy consumption measured for the combined cooking product to the microwave oven component, based on the estimated annual cooking hours for the given components comprising the combined cooking product. Section III.H provides a complete discussion of the derivation of integrated annual energy consumption for the individual components of a combined cooking product.

Gas Cooking Products With High Input Rates

In the December 2014 TP SNOPR, DOE proposed to amend the conventional cooking top test procedure in appendix I to measure the energy use of gas surface units with high input rates and noted that the current definition for ''conventional cooking top'' in 10 CFR 430.2 already covers conventional gas cooking products with higher input rates (including commercial-style gas cooking products), as these products are household cooking appliances with surface units or compartments intended for the cooking or heating of food by means of a gas flame. DOE considers a cooking top burner with a high input rate to be a burner rated greater than 14,000 Btu/h. 79 FR 71894, 71897 (Dec. 3, 2014).

Sub-Zero Group, Inc. (Sub-Zero) commented that cooking with larger cooking vessels and high performance burners requires increased grate-to-burner spacing to maximize air flow and improve burner combustion, which in turn impacts efficiency as measured by the test procedure. According to Sub-Zero, a ''one size fits all'' test procedure is inequitable and would place gas cooking tops with higher input rates at a market disadvantage. (Sub-Zero, TP No. 20 at p. 3) [12] Sub-Zero also commented that the proposed test procedure does not accurately measure the performance and efficiency of the larger, higher-output components and leads to misleading results. (Sub-Zero, TP No. 20 at pp. 2–3) Sub-Zero believes that due to the lack of data, test procedure complexities, and the limited potential for energy savings, DOE should exempt high-performance products (*i.e.,* commercial-style cooking tops) from standards until adequate further analysis is conducted such that these products can be accurately and fairly evaluated. (Sub-Zero, TP No. 20 at p. 3)

As discussed further in the following sections, and specifically in section III.F of this notice, DOE is proposing that the energy consumption of conventional gas cooking tops be measured using a range of test vessel diameters and water loads that are selected based on input rate of the burner, including those with burners having input rates greater than 14,000 Btu/h (including commercial-style gas cooking tops). The current definition for ''conventional cooking top'' in 10 CFR 430.2 already covers conventional gas cooking products with higher input rates, as these products are household cooking appliances with surface units or compartments intended for the cooking or heating of food by means of a gas flame.

B. Repeal of the Conventional Oven Test Procedure

The existing test procedure to measure the active mode annual energy consumption of conventional ovens in appendix I involves setting the oven controls to achieve an average internal cavity temperature that is 325 degrees Fahrenheit (°F) ± 5 °F higher than the room ambient air temperature and measuring the amount of energy required to raise the temperature of an aluminum block test load from room temperature to 234 °F above its initial temperature. The measured energy

30, 2013); 79 FR 71894, 71897 (Dec. 3, 2014). As DOE did not receive any additional comments on this proposal, DOE is maintaining these proposed modifications in this SNOPR.

[12] A notation in the form ''Sub-Zero, TP No. 20 at p. 3'' identifies a written comment (1) made by Sub-Zero on the Test Procedure for cooking products; (2) recorded in document number 20 that is filed in the docket of this cooking products test procedures rulemaking (Docket No. EERE–2012–BT–TP–0013) and available for review at *www.regulations.gov;* and (3) which appears on page 3 of document number 20.

consumption includes the energy input during the time the load is being heated plus the energy consumed during fan-only mode. In the July 2015 TP Final Rule, DOE did not modify the active mode test method but proposed to incorporate methods for measuring conventional oven volume according to an Association of Home Appliance Manufacturers (AHAM) procedure,[13] to clarify that the existing oven test block must be used to test all ovens regardless of input rate, and to measure the energy consumption and efficiency of conventional ovens equipped with an oven separator. 80 FR 37954.

As part of the concurrent energy conservation standards rulemaking analysis, DOE received comments regarding the representativeness of the active mode oven test procedure in appendix I for commercial-style cooking products. Sub-Zero commented that ''high performance'' (*i.e.,* commercial-style) ovens include the following design features that enhance cooking performance (professional quality baking, broiling, roasting, slow bake, proofing, and other functions) but negatively impact efficiency and are not accounted for in the existing test procedure:

- Heavier gauge materials which extend product life and enhance product quality, cooking functionality and durability;
- Configurations that allow for up to six-rack baking capability with full extension, heavy-gauge oven racks to support large loads and provide enhanced safety and ergonomic benefit;
- Full oven-height dual convection blowers to optimize cooking air flow;
- Hidden bake elements that enhance customer safety, cleanability and heat distribution for better cooking performance;
- Controls and software to maximize the long-term reliability of oven cavity porcelain when employing a hidden bake element; and
- Cooling fans for the electronic printed circuit boards that provide precise oven control and touch-screen user interface for cooking modes and other features. (Sub-Zero, STD No. 25 at pp. 3, 5–6) [14]

BSH also noted that commercial-style ovens include unique design features as identified by Sub-Zero, and listed the following additional design features associated with commercial-style products:

- Soft-close hinges to handle constant loading and unloading of the oven to eliminate the noise of slamming doors;
- A variety of modes and options not typically found in residential-style products (*e.g.,* rapid steam generator, additional convection heating element, high power combination modes such as convection broil and steam convection);
- Powerful heating elements to maintain set temperatures during sessions of loading and unloading food (*e.g.,* caterers and entertainers at large house parties); and
- Very large usable baking space, *e.g.,* two ovens in a 60-inch range that operate independently to provide more versatility in cooking with each cavity capable of cooking one to three racks of food. In addition, commercial-style ovens can accommodate commercial baking pans that are more than twice the size of standard residential baking pans. (BSH, STD No. 41 at p. 2)

BSH and Miele also commented that DOE should consider whether a different test procedure is needed that adequately measures commercial-style products' energy use and accounts for the enhanced cooking performance. (BSH, STD No. 41 at p. 3; Miele, STD No. 42 at pp. 1–2) Miele commented that the DOE test procedure does not adequately reflect the energy use of commercial-style products because it does not account for the effects of door openings and the energy required for thermal recovery. Miele noted that the added mass of commercial-style ovens provides the advantage of requiring less energy and time to recover from a door opening, which alters the quality of foods being cooked. (Miele, STD No. 42 at pp. 1–2)

Based on DOE's review of these comments and additional data provided by manufacturers, DOE determined that commercial-style ovens typically incorporate design features (*e.g.,* heavier-gauge cavity construction, high input rate burners, extension racks) that result in inherently lower efficiencies than for residential-style ovens with comparable cavity sizes, due to the greater thermal mass of the cavity and racks when measured using the test procedure adopted in the July 2015 TP Final Rule. Furthermore, DOE concludes that certain additional factors that are not currently addressed in the test procedure, such as the impact of door openings on thermal recovery, could, if included in the test procedure, alter the efficiencies of commercial-style ovens relative to the efficiencies of residential-style ovens. For these reasons, DOE is proposing to repeal the provisions in appendix I for measuring conventional oven integrated annual energy consumption (IAEC). In addition, because DOE is proposing to repeal the provisions for measuring conventional oven IAEC, DOE is also proposing to remove the reference to AHAM OV–1–2011 ''Procedures for the Determination and Expression of the Volume of Household Microwave and Conventional Ovens'' contained in 10 CFR 430.3.

C. Hybrid Test Block Method

DOE received a number of comments from interested parties on the cooking top active mode test procedure proposed in the December 2014 TP SNOPR. In February and March of 2015, DOE also conducted a series of interviews with manufacturers representing the majority of the U.S. market to discuss key issues with the proposed cooking top test procedure. The concerns of interviewed manufacturers were similar to those expressed in the written comments on the proposal, but were collected from a larger group of manufacturers. Overall, interested parties' major concerns with the hybrid test block method, as proposed, included the thermal grease specification, the fabrication of the hybrid test block, the proposed test block diameters, and the representativeness, repeatability, and reproducibility of the hybrid test block method. Given the feedback from interested parties, and for the reasons discussed in the following sections, DOE is no longer proposing to amend appendix I to require hybrid test blocks and is instead proposing to incorporate by reference the relevant sections of the water-heating test method for measuring the energy consumption of cooking tops in EN 60350–2:2013.

1. Thermal Grease

In the December 2014 TP SNOPR, DOE proposed that a layer of thermal grease should be applied evenly between the contacting surfaces of the stainless steel base and the aluminum body of the hybrid test block for all test block sizes. The amount of thermal grease applied to the test block depended on the test block diameter. DOE also proposed a minimum thermal conductivity for the grease and that the layer of thermal grease be periodically reapplied, as DOE observed that the grease would dry out after several tests. 79 FR 71894, 71906–71908 (Dec. 3, 2014).

[13] The test standard published by the AHAM titled, ''Procedures for the Determination and Expression of the Volume of Household Microwave and Conventional Ovens,'' Standard OV–1–2011.

[14] A notation in the form ''Sub-Zero, STD No. 25 at p. 3'' identifies a written comment (1) made by Sub-Zero on the Energy Conservation Standards for conventional ovens; (2) recorded in document number 25 that is filed in the docket of the cooking product energy conservation standards rulemaking (Docket No. EERE–2014–BT–STD–0005) and available for review at *www.regulations.gov;* and (3) which appears on page 3 of document number 25.

General Electric Appliances (GE) commented in response to the December 2014 TP SNOPR that it was not able to replicate the DOE test results using the proposed test methods. (GE, TP No. 17 at p. 2) Specifically, GE observed during its testing that the aluminum body slid off the stainless steel base, the thermal grease dried out, and the amount of grease between the blocks changed from one test to another. *Id.* During individual manufacturer interviews, multiple manufacturers also confirmed the block-sliding phenomenon and the issues with dried out grease. Additionally, AHAM, BSH Home Appliances Corporation (BSH), and GE noted that DOE did not specify an operating temperature range nor application thickness for the thermal grease, and also noted that the thermal conductivity and viscosity of the grease might change over time or after repeated use at high temperatures. (BSH, TP No. 16 at p. 11; GE, TP No. 17 at p. 2; AHAM, TP No. 18 at p. 3)

After further investigation into the properties of the thermal grease used during the testing conducted to support the December 2014 TP SNOPR, DOE agrees that further specifications would be necessary to ensure that the hybrid test block method is sufficiently repeatable and reproducible. DOE became aware, through discussions with a thermal grease supplier, that thermal grease formulations are not required to be rated according to a test standard. Additionally, although such a test standard exists, the grease supplier commented that the rating method is for a specific set of conditions and materials, and may not be reflective of all applications. Thus, different thermal greases with the same published characteristics may perform differently when used with the hybrid test blocks. DOE's research also suggests that effective thermal conductivity depends on how the thermal grease fills the microscopic crevices of the test block surface, meaning that the effective thermal conductivity of the grease could change from test block to test block depending on how the metal was machined. Some thermal greases also have temperature- and time-dependent stabilization periods which are not explicitly defined by the grease supplier, leading to further opportunities for variation in performance with each application. Depending on the allowable operating temperature range, some thermal greases may dry out more quickly than others, suggesting that simply specifying a maximum number of runs for a given application of grease is not sufficient. Moreover, DOE does not believe it is practical to specify and measure the thickness for the layer of applied grease. The required amount and thickness would vary both with the material properties of the grease as well as the technique used to apply the grease to the test block surface.

AHAM also commented that the hybrid test block, as proposed, is not yet appropriate for testing induction technologies because of the variability in the temperature gradient between its steel base and aluminum body with respect to different heating elements, which in turn affects the efficiency result. (AHAM, TP No. 18 at p. 3) BSH commented that by basing its analysis exclusively on only nine different appliances in the December 2014 TP SNOPR, DOE did not completely consider the diversity of induction technology. (BSH, TP No. 16 at p. 1) DOE notes that it initially proposed to add a layer of thermal grease to the hybrid test block to facilitate heat transfer between the base and body of the hybrid test block, specifically when used with induction cooking technology. If heat does not transfer from the stainless steel base to the aluminum body at a fast enough rate, the sensors and control algorithms designed to limit the surface temperature of the surface unit may turn off or limit power to the surface unit to prevent it from overheating and damaging the cooking top. Although adding thermal grease to the hybrid test block helped to minimize this issue for the cooking tops in DOE's test sample, during recent interviews, a few manufacturers noted that they use a lower temperature threshold and different control strategies to prevent overheating in induction heating elements. As a result, these manufacturers stated that they were unable to complete a test of an induction surface unit without the unit overheating.

For the reasons described in this preamble, DOE has determined that thermal grease cannot be specified without significant further study or further modification in the construction of the hybrid test block.

2. Test Block Diameter and Composition

In addition to the two existing test block diameters specified in appendix I for the testing of conventional cooking tops, DOE proposed in the December 2014 TP SNOPR an additional test block diameter for electric surface units having a smallest dimension of 10 inches or greater and for gas surface units with input rates greater than or equal to 14,000 Btu/h. 79 FR 71894, 71904 (Dec. 3, 2014). DOE based its assessment on a review of the electric surface unit diameters and pan sizes available on the market, as well as investigative testing of the carbon monoxide emissions and measured efficiencies of various test block sizes on gas cooking tops with high-input rate burners. DOE tentatively concluded that, by adding only one larger additional test block diameter, the test procedure would appropriately capture cooking tops designed to be used with large cookware, without increasing the test burden for manufacturers. *Id.*

During manufacturer interviews, most manufacturers highlighted the need for DOE to specify larger test block sizes to test electric surface units having 12-inch and 13-inch diameters and gas surface units with high input rates. In written comments, BSH, GE, and AHAM asserted that the proposed test block sizes do not adequately reflect the surface unit sizes currently available on the market, given that some electric surface units exceed 11 inches in diameter. (BSH, TP No. 16 at p. 5; GE, TP No. 17 at p. 2; AHAM, TP No. 18 at p. 2) Sub-Zero also noted that there are a variety of large cooking zones on electric cooktops, induction cooktops, and gas burner systems that the proposed test block diameters would not adequately evaluate. Sub-Zero stated that these products would be disadvantaged if the test equipment does not match the size of the surface unit. (Sub-Zero, TP No. 20 at p. 3) Sub-Zero further stated that for gas burners, caps can be as large as 4 inches in diameter and when combined with gas burner designs that project the flame horizontally in order to evenly distribute heat to a cooking utensil with a large footprint, rather than focusing an intense flame towards the center, the surface contact of the burner will be greatly minimized if used with a small-diameter test block. (Sub-Zero, TP No. 20 at p. 3)

DOE notes that most user instruction manuals for conventional cooking tops, regardless of heating technology type, specify that pot or pan size should match the size of the surface unit. After reviewing public comments and information received during manufacturer interviews, and further review of the surface unit diameters available on the market, DOE acknowledges that it should consider additional test equipment diameters for the testing of conventional cooking tops. The test equipment should be reasonably matched to the diameter of the surface unit or the gas burner input rate. In section III.D of this notice, DOE describes the range of test vessel

diameters and water loads it is proposing to incorporate by reference from EN 60350–2:2013 as part of this SNOPR.

During the interviews conducted in February and March of 2015, multiple manufacturers commented that they had difficulty obtaining the proposed hybrid test block materials in the diameter and thickness proposed in the December 2014 TP SNOPR. GE also commented in response to the December 2014 TP SNOPR that the components of the proposed hybrid test block, especially for the stainless steel base, had not been proven to be easily procured in the required diameter and to the flatness tolerances specified by DOE, nor had the durability of this thickness been assessed. (GE, TP No. 17 at p. 2) Although DOE did not have difficulty procuring the proposed hybrid test block materials in the diameters and flatness tolerances specified, manufacturer comments regarding the difficulties of producing the test block factored into DOE's decision to consider alternative cooking top test methods discussed in the following sections.

Energy Innovations commented that the DOE test procedure test results as presented in the December 2014 TP SNOPR represent the heat transfer efficiency from the cooking top to the cooking utensil, rather than the cooking efficiency, and appear to be reasonable for determining the energy efficiency of cooking in a covered utensil without significant losses due to escaped steam. (Energy Innovations, TP No. 15 at pp. 9–10) Energy Innovations commented that much energy is wasted in generating steam, and thus the actual cooking efficiency is much lower than the heat transfer efficiency. (Energy Innovations, TP No. 15 at p. 9) Energy Innovations also commented that cooking with a covered utensil prevents steam from escaping the utensil and greatly reduces the amount of energy required to maintain a boiling state of the contents. (Energy Innovations, TP No. 15 at p. 5) However, Energy Innovations presented survey data in which 81 percent of respondents reported not using covered utensils most of the time, and 28 percent reported conducting most of their cooking without the cover at all. (Energy Innovations, TP No. 15 at p. 8) For this reason, Energy Innovations commented that DOE should develop a multiplicative factor representative of how consumers actually use cooking utensils to convert heat transfer efficiency to an estimate of the real-world energy efficiency. (Energy Innovations, TP No. 15 at pp. 9–10)

As discussed in section III.D of this notice, DOE is proposing in this SNOPR to incorporate by reference the water-heating test methods provided in EN 60350–2:2013. The proposed test method requires the use of test vessels with lids with holes to allow for evaporation of water to simulate the energy uptake of a food load during the simmering phase of the test. DOE welcomes comment on whether the proposed test method accurately reflects real-world use.

D. Water-Heating Test Method

The test method to measure the energy consumption of electric cooking tops provided in EN 60350–2:2013 is similar to the existing DOE test procedure for conventional cooking tops specified in appendix I in that it consists of two phases. The first phase of the EN 60350–2 test requires heating a test load to a calculated ''turndown temperature'' at the maximum energy input setting. During the second phase of the test, the energy input rate is reduced to a setting that will maintain the water temperature above 194 °F (a simmering temperature) but as close to 194 °F as possible without additional adjustment of the low-power setting. The test ends 20 minutes after the temperature first increases above 194 °F.

To determine the turndown temperature, EN 60350–2:2013 requires an initial test to determine the number of degrees that the temperature continues to rise after turning the unit off from the maximum energy input setting. For the test load, EN 60350–2:2013 specifies a quantity of water to be heated in a standardized test vessel. The test vessel consists of a thin-walled stainless steel cylinder attached to a flat, stainless steel 430 base plate. The test method also specifies an aluminum lid with vent holes and a small center hole to fix the thermocouple in the center of the pot. There are eight standardized cooking vessel diameters ranging from 4.7 inches to 13 inches, one of which is selected to test a given surface unit based on the diameter of the surface unit. The amount of water also varies with test vessel diameter. Table III.1 lists the full range of test vessel diameters, water loads, and the corresponding surface unit diameters as specified in EN 60350–2:2013 for electric cooking tops. EN 60350–2:2013 also classifies the specified test vessels into categories representing different cookware types.

TABLE III.1—EN 60350–2:2013 TEST VESSEL DIAMETER AND WATER LOAD

Test vessel diameter inches (mm)	Mass of the water load lbs (kg)	Corresponding surface unit diameter inches (mm)	Standard cookware category
4.72 (120)	1.43 (0.65)	3.93 ≤ x < 5.12 (100 ≤ x < 130)	A
5.91 (150)	2.27 (1.03)	5.12 ≤ x < 6.30 (130 ≤ x < 160)	
7.09 (180)	3.31 (1.50)	6.30 ≤ x < 7.48 (160 ≤ x < 190)	B
8.27 (210)	4.52 (2.05)	7.48 ≤ x < 8.66 (190 ≤ x < 220)	C
9.45 (240)	5.95 (2.70)	8.66 ≤ x < 9.84 (220 ≤ x < 250)	
10.63 (270)	7.54 (3.42)	9.84 ≤ x < 11.02 (250 ≤ x < 280)	D
11.81 (300)	9.35 (4.24)	11.02 ≤ x < 12.20 (280 ≤ x < 310)	
12.99 (330)	11.33 (5.14)	12.20 ≤ x < 12.99 (310 ≤ x ≤ 330)	

The number of test vessels needed to assess the energy consumption of the cooking top is based on the number of controls that can be independently but simultaneously operated on the cooking top. By assessing the number of independent controls and not just the marked surface units, the test procedure accounts for cooking tops with cooking zones that do not have limitative markings. Each independently controlled surface unit or area of a ''cooking zone'' is tested individually. The temperature of the water and the total input energy consumption is measured throughout the test. Total cooking top energy consumption is determined as the average of the energy consumed during each independent test divided by the mass of the water load used for the test. This average energy consumption in Watt-hours (Wh) is then normalized to a standard water load size (1,000 grams (g)) to determine the average per-cycle energy consumption of the cooking top. Normalizing to a single load size ensures that

manufacturers are not penalized for offering a variety of surface unit diameters to consumers.

For cooking tops with standard circular electric surface units, the test vessel with a diameter that best matches the surface unit diameter is selected. Different surface units on the cooking top could be tested with the same test vessel diameter. However, if the number of independent controls/surface units for the cooking top exceeds two, the selected test vessels must come from at least two cookware categories. This means that one or more of the surface units on the cooking top will be tested with the next best-fitting test vessel in another cookware category. By adding this requirement, EN 603050–2:2013 accounts for the variety of cookware that would be used on the cooking top and prevents the test procedure from penalizing cooking tops that have a range of surface unit sizes with a range of surface unit input rates.

For cooking tops without defined surface units, such as cooking tops with full-surface induction cooking zones, EN 60350–2:2013 specifies a method to select the appropriate test position for each test vessel based on a pattern starting from the geometric center of the cooking zone. Instead of requiring that test vessels be selected based on best fit, the test vessel diameters are explicitly defined, and vary with the number of controls, to capture how different cookware types may be used on the unmarked cooking surface.

1. Representativeness of the Water-Heating Test Method

To support its analysis in the January 2013 TP NOPR, DOE conducted water-heating tests using test loads and test methods derived from a draft amendment to the IEC Standard 60350–2 Edition 1.0 ''Household electric cooking appliances—Part 2: Hobs—Method for measuring performance'' (IEC 60350–2).[15] 78 FR 6232, 6239–6240 (Jan. 30, 2013). In the January 2013 TP NOPR, DOE acknowledged that water provides a heating medium that is more representative of actual consumer use because many foods cooked on a cooking top have a relatively high liquid content. However, DOE noted that a water heating test method could introduce additional sources of variability not present for metal block heating. *Id.*

In support of the December 2014 TP SNOPR, DOE performed further investigative testing using a modified version of the IEC 60350–2 water-heating test method. When compared to the hybrid test block method, DOE found the water-heating test method to be less repeatable and continued to propose the use of the hybrid test block. 79 FR 71894, 71900–71903 (Dec. 3, 2014).

In response to DOE's proposal to use the hybrid test block method as opposed to a water-heating test method, BSH commented that the proposed hybrid test block method did not include certain specifications necessary for test procedure reproducibility, such as test load sizing and positioning, and recommended that DOE consider the specifications in IEC Standard 60350–2. (BSH, No. 16 at p. 1) Additionally, interviewed manufacturers that produce and sell products in Europe uniformly supported the use of a water-heating test method and harmonization with IEC Standard 60350–2 for measuring the energy consumption of electric cooking tops. These manufacturers cited the benefits of adopting a test method similar to the IEC water-heating method as including: (1) Compatibility with all electric cooking top types, (2) additional test vessel diameters to account for the variety of surface unit sizes on the market, and (3) the test load's ability to represent a real-world cooking top load.

Pacific Gas and Electric Company (PG&E), Southern California Gas Company (SCGC), San Diego Gas and Electric (SDG&E), and Southern California Edison (SCE) (collectively, the California investor-owned utilities (IOUs)) also recommended that DOE require a water-heating test method to measure the cooking efficiency of conventional cooking tops. Specifically, the California IOUs requested that DOE align the cooking product test methods with existing industry test procedures, such as American Society for Testing and Materials (ASTM) standard F1521–12, ''Standard Test Methods for Performance of Range Tops'', and IEC Standard 60350–2. (California IOUs, TP No. 19 at p. 1) The California IOUs commented that aligning test procedures with existing industry test procedures will reduce the burden of new test materials and procedures on laboratories and manufacturers. (California IOUs, TP No. 19 at p. 2) According to the California IOUs, the differences in test procedure standard deviation between the hybrid test block and water-heating test method as presented in the December 2014 TP SNOPR did not sufficiently show that the hybrid test block method is more repeatable than a water-heating method. (California IOUs, TP No. 19 at p. 2) Additionally, the California IOUs believe cooking efficiencies derived using a water-heating test method are more representative of the actual cooking performance of cooking tops as opposed to a test procedure using hybrid test blocks, since many foods prepared on cooking tops have relatively high liquid content. (California IOUs, TP No. 19 at p. 1)

As discussed in section III.C of this notice, review of public comments and information received during manufacturer interviews led DOE to determine that the hybrid test block method, as proposed in the December 2014 TP SNOPR, may not be sufficiently repeatable and reproducible. Thus, as suggested by interested parties, DOE performed further evaluation of its own water-heating test data and reviewed additional studies on the repeatability and reproducibility of the water-heating test method to determine whether the water-heating test method specified in EN 60350–2:2013 should be considered.

In the December 2014 TP SNOPR, DOE found that the reproducibility of the water-heating test method, as determined by comparing the surface unit efficiency measured at two different test laboratories, was similar to that of the hybrid test block method. 79 FR 71894, 71901 (Dec. 3, 2014). DOE also evaluated the repeatability of the surface unit efficiency results by assessing the standard deviation of the measured surface unit efficiency for a selected number of tests. The average standard deviation for the proposed hybrid test method across all test surface unit types was 0.67 percent for the 9-inch test block and 1.17 percent for the 6.25-inch block. Conversely, the average standard deviation across all surface unit types for the water-heating method was 1.25 percent for the 9.5-inch test vessel and 2.21 percent for the 5.9-inch test vessel. 79 FR 71894, 71902 (Dec. 3, 2014).

Although the average standard deviations of the measured surface unit efficiency were slightly higher for the water-heating test method, DOE notes that it evaluated a modified version of the procedures in the draft amendment to IEC 60350–2 by using only the two test vessels that had diameters closest to the diameters specified for the existing test blocks in appendix I (6.25 inches and 9 inches). 79 FR 71894, 71900–71903 (Dec. 3, 2014). As part of this testing, DOE also used the ambient test

[15] On April 25, 2014, IEC made available the draft version of IEC Standard 60350–2 Edition 2.0 Committee Draft (IEC 60350–2 CD). DOE notes that the draft amendment to IEC 60350–2 on which testing for the January 2013 NOPR was based includes the same basic test method as the 2014 IEC 60350–2 CD. DOE also notes that the European standard EN 60350–2:2013 is based on the draft amendment to IEC 60350–2. DOE believes that the IEC procedure, once finalized, will retain the same basic test method as currently contained in EN 60350–2:2013.

conditions specified in appendix I to directly compare the repeatability of the water-heating and hybrid test block test methods. 79 FR 71894, 71902 (Dec. 3, 2014). DOE notes that ambient air pressure and temperature could significantly impact the amount of water that evaporates during the test and the temperature at which the water begins to boil. Appendix I allows a relatively large tolerance, ±9 °F, for ambient air temperature that may have contributed to increased test variability observed for the water-heating test method. Conversely, EN 60350–2:2013 specifies an ambient temperature tolerance of ±3.6 °F (2 °C) for the cooking top energy consumption test. EN 60350–2:2013 also specifies an absolute air pressure range of 0.901 to 1.05 atmospheres (atm).

For the testing conducted for the January 2013 TP NOPR and the December 2014 TP SNOPR, DOE also developed its own set of efficiency calculations for purposes of comparison with the hybrid test block method. In comments received during manufacturer interviews, manufacturers stated that it was inappropriate to calculate efficiency with a water-heating method because, despite including a measurement of the mass of the water before and after the test, it is unknown what precise quantity of water is lost to boiling as some water may condense on the underside of the lid and drop back into the test vessel. To address this issue, DOE reviewed the coefficients of variation for the measured surface unit energy consumption presented in the December 2014 TP SNOPR, which DOE originally evaluated only to assess the variability of energy consumption in relation to the cooking top efficiency calculation, and not the variation between the water-heating and hybrid test block test methods. 79 FR 71894, 71902–03 (Dec. 3, 2014). The average coefficient of variation for both the modified water-heating test method and the hybrid test block method was very similar (0.024 versus 0.025).

DOE is aware of round robin testing performed in 2011 by CECED to evaluate the repeatability and reproducibility of a draft version EN 60350–2:2013.[16] Three cooking top technologies were tested: Induction, smooth electric radiant, and electric solid plate, at 12 different test facilities. While solid plate cooking top technology is not available on the U.S. market, DOE anticipates that the results obtained for this technology type are most similar to those obtained for electric coil cooking tops because the electric resistance heating element is in direct contact with the cooking vessel. The test facilities conducting the round robin testing were divided into two groups, one group of manufacturer test labs and another group of independent test labs. Only a single surface unit, approximately 7 inches in diameter (180 mm), was measured for each cooking top.

DOE reviewed its test results from the December 2014 TP SNOPR and compared these to the measured surface unit energy consumption standard deviations observed during the 2011 CECED Round Robin Testing. Table III.2 presents repeatability results from the 2011 CECED Round Robin Testing for the average measured surface unit efficiency for each cooking top technology type. Table III.3 presents repeatability results from the December 2014 TP SNOPR for the average measured surface unit efficiency for selected cooking tops in the DOE test sample.

TABLE III.2—AVERAGE STANDARD DEVIATION OF THE MEASURED ENERGY CONSUMPTION—2011 CECED ROUND ROBIN TEST SAMPLE

	Induction	Radiant	Solid plate	Average
Draft IEC 60350–2 Water-heating Test Method: [a]				
Standard Deviation (*Wh*)	2.27	7.39	3.15	.....
Standard Deviation (*%*)	0.87%	2.69%	1.14%	1.57%

[a] DOE notes that the European standard EN 60350–2:2013 is derived from IEC 60350–2:2011 but includes the draft amendments to IEC 60350–2 specified in in the IEC document TC59X/217/DC. DOE believes that the draft IEC procedure, once finalized, will retain the same basic test method as contained in EN 60350–2:2013.

TABLE III.3—AVERAGE STANDARD DEVIATION OF THE MEASURED ENERGY CONSUMPTION—DOE TEST SAMPLE FROM THE DECEMBER 2014 TP SNOPR

	Induction 1	Induction 2	Radiant	Coil	Average
DOE Hybrid Test Block:					
Standard Deviation (*Wh*)	3.37	8.25	9.88	8.51	.....
Standard Deviation (*%*)	1.20%	2.32%	2.83%	2.98%	2.33%
DOE Modified Water-Heating Method:					
Standard Deviation (*Wh*)	12.31	8.08	5.91	8.93	.....
Standard Deviation (*%*)	3.04%	2.67%	1.28%	2.31%	2.33%

The average standard deviation for surface unit measured energy consumption, as determined by the 2011 CECED Round Robin Testing, is less than 3 percent for all cooking top technology types. Although DOE established in this preamble that the modified water-heating test results are not comparable to the results obtained for the 2011 CECED Round Robin Testing, DOE still notes that the average percent standard deviation for the surface units in the DOE test sample tested according to the modified water-heating test method shown in Table III.3, is higher than for the 2011 CECED Round Robin Testing shown in Table III.2. Additionally, the average percent standard deviation for the surface unit energy consumption measured using the hybrid test block method is equal to that of the modified water-heating test method when averaged for all cooking top technology types.

The 2011 CECED Round Robin Testing also included an evaluation of the reproducibility of test results. The

[16] Italian National Agency for New Technologies, Energy and Sustainable Economic Development—Technical Unit Energy Efficiency (ENEA–UTEE), ''CECED Round Robin Tests for Hobs and Microwave Ovens—Final Report for Hobs,'' July 2011.

report calculated reproducibility as the square root of the sum of the between-laboratory variance and the mean of the within-laboratory variances (taken over all laboratories). When considering all 12 test facilities, the average reproducibility of the measured total energy consumption was below 3 percent for each cooking top technology type, with an average of 2.75 percent.

Based on DOE's review of the test data discussed in this preamble, DOE preliminarily concludes that the EN 60350–2:2013 water-heating method proposed as a part of this SNOPR is sufficiently repeatable and reproducible.

2. Incorporating by Reference EN 60350–2:2013

In this SNOPR, DOE is proposing to incorporate by reference only certain sections of EN 60350–2:2013, as the full test procedure also includes test methods to measure heat distribution and other forms of cooking performance not related to the energy consumption of the cooking top. Specifically, DOE is proposing to incorporate Section 5, ''General conditions for the measurements,'' which outlines the test room and test equipment conditions; Section 6.2, ''Cooking zones per hob,'' which outlines how to determine the number of controls and the dimensions of the cooking zones; and Section 7.1, ''Energy consumption and heating up time,'' which outlines both the test methods and equipment required to measure cooking top energy consumption. However, DOE is proposing to omit Section 7.1.Z5, ''Procedure for measuring the heating up time,'' as it is not required to calculate the overall energy consumption of the cooking top and would increase manufacturer test burden. Additionally, DOE is proposing to omit Section 7.1.Z7, ''Evaluation and calculation,'' as DOE is proposing to normalize the measured cooking top energy consumption to a standard water load size of 2,853 g for both electric and gas cooking tops instead of the 1,000 g currently specified in EN 60350–2:2013, as discussed in section III.G. DOE is also proposing to incorporate by reference Annex ZA through Annex ZD, which provide further requirements for measuring the energy consumption, clarify test vessel construction, and provide examples for how to select the appropriate test vessels. DOE also proposes to include many of the definitions related to the measure of cooking top energy consumption specified in Section 3 of EN 60350–2:2013. However, due to differences in terminology between the United States and Europe, such as the use of the word hob for cooking top, DOE is proposing to explicitly define relevant terms from Section 3 of EN 60350–2:2013 in appendix I.

E. Multi-Ring and Non-Circular Surface Units

In the December 2014 TP SNOPR, DOE specified that for electric cooking tops, test equipment for non-circular surface units should be selected based on the surface unit's shortest dimension. 79 FR 71894, 71896 (Dec. 3, 2014). BSH and AHAM commented that using the smallest dimension of a noncircular electric surface unit is not always appropriate for determining the proper test equipment size because the induction market includes products that have different printings and shapes of cooking zones, and in cases where there is no clearly defined printing diameter, there is no suitable way to define the dimension of a surface unit. (BSH, TP No. 16 at p. 7; AHAM, TP No. 18 p. 2) BSH and AHAM also commented that specifying a position for test equipment on flexible induction units is important. According to these commenters, the positioning of the test equipment can have significant influence on the efficiency result. (BSH, TP No. 16 at p. 7; AHAM, TP No. 18 p. 2) BSH and AHAM further requested that DOE consider adopting the center position description from the draft IEC 60350–2 procedure for full surface induction units in order to make results more repeatable and reproducible. (BSH, TP No. 16 at p. 9; AHAM, TP No. 18 p. 3) GE also asked that DOE clearly define the placement of test equipment, prior to finalizing the SNOPR or any cooking top efficiency standard. (GE, TP No. 17 at p. 2)

As discussed in section III.C.1 of this notice, DOE is proposing to incorporate by reference specific provisions in EN 60350–2:2013. For cooking zones that include a circular and an elliptical or rectangular part, DOE is proposing, as per Section 7.Z1 in EN 60350–02:2013, that only the circular section be tested. Additionally, Section 7.1.Z4 and Annex ZA of EN 60350–2:2013, which would be incorporated by reference, define the center of elliptical and rectangular surface units by their geometric centers and provide the required test positions of test vessels on these kinds of surface units.

In the December 2014 TP SNOPR, DOE specified that for electric cooking tops, surface units with flexible concentric sizes (*i.e.,* units with multiple zones of the same shape but varying shortest dimensions) should be tested at each unique size setting. 79 FR 71894, 71896 (Dec. 3, 2014). Many smooth—electric radiant cooking tops have ''multi-ring'' elements that have multiple concentric heating elements for a single surface unit. When a single ring is energized, this corresponds to the smallest-diameter surface unit available. When two rings are energized, the diameter of the surface unit increases. This continues for as many concentric heating elements as are available for the surface unit. Multiple heating elements give the user flexibility to adjust the surface unit to fit a certain cookware size. Results from DOE testing presented in the December 2014 TP SNOPR showed a significant decrease in efficiency at the smaller-diameter settings as compared to the largest-diameter setting of a multi-ring surface unit. Because of the observed differences in efficiency, DOE proposed that each distinct diameter setting for a multi-ring surface unit be tested as a separate surface unit. For example, if the surface unit has three settings with outer diameters of 12, 9, and 6 inches, each setting would be tested separately with the appropriately sized test equipment, and the results would be factored into the overall energy consumption calculation as if they were individual surface units. 79 FR 71894, 71906 (Dec. 3, 2014).

GE and AHAM commented that DOE should not require measurement of the individual inner zones of multi-ring surface units with flexible concentric sizes, as doing so may lead to results that would not be indicative of actual product performance or be precise enough for standards-setting purposes. (GE, TP No. 17 at p. 2; AHAM, TP No. 18 p. 3) During manufacturer interviews, manufacturers stated that requiring that each setting be tested separately would increase the test burden. Furthermore, manufacturers noted that the ability to match the surface unit diameter to the pan size is an important consumer utility that might be penalized by the proposed test procedure. However, several manufacturers also independently confirmed that using the inner ring of a multi-ring burner is inherently less efficient because some of the generated heat will be lost to the portion of the heating element that is not energized.

According to EN 60350–2:2013, only the energy consumption of the largest diameter of a multi-ring surface unit is measured, unless an additional test vessel category is needed to meet the requirements of the test procedure, in which case one of the smaller-diameter settings of the surface unit that matches the next best-fitting test vessel diameter is tested. However, DOE is proposing to require each setting of the multi-ring

surface unit be tested independently. DOE notes that each setting could be used as an individual surface unit, and thus should factor into the calculated annual energy consumption of the cooking top. Each diameter setting of the multi-ring surface unit would be tested and included as a unique surface unit in the average energy consumption calculation for the cooking top. DOE welcomes consumer usage data demonstrating if and how these surface units are used differently than surface units without an adjustable diameter.

In the December 2014 TP SNOPR, DOE also discussed other non-circular cooking top elements such as bridge zones, warming plates, grills, and griddles that are not intended for use with a typical circular piece of cookware. Appropriate test blocks for these heating elements would depend on the intended function of each surface unit. DOE did not propose to require testing these surface units because the additional equipment necessary for the test method to be representative would place an unreasonable burden on test laboratories and manufacturers. Additionally, DOE stated that it expects use of these types of surface units to be much less frequent than the standard surface units used for circular pots and pans. 79 FR 71894, 71906 (Dec. 3, 2014).

GE commented that DOE should not require measuring the efficiency of warming plates, griddles, grills or other elements for which there is not an appropriately shaped and sized test block. (GE, TP No. 17 at p. 2) BSH and AHAM requested that DOE clarify whether the exclusion of bridge zones includes products with a bridge mode (which connects two surface units together as a single zone), and whether a flexible cooking area is considered a bridge mode. (BSH, TP No. 16 at p. 10; AHAM, TP No. 18 at p. 3) BSH and AHAM requested that roaster extensions also be excluded. (BSH, TP No. 16 at p. 10; AHAM, TP No. 18 at p. 3) After considering these comments, DOE is maintaining its proposal to exclude testing of bridge zones, warming plates, grills, and griddles in determining the energy consumption of a cooking top. DOE is also proposing to exclude roaster extensions from test. Furthermore, DOE is clarifying that it is not proposing to require testing of bridge modes that couple several surface units together for use as a warming plate or for use with a roasting pan, but is proposing to test the individual circular heating elements if they can be used independently of the bridge mode. DOE is also clarifying that a flexible cooking area, *i.e.,* a full-surface induction cooking zone, able to heat multiple items of cookware simultaneously, with independent control options for each piece of cookware, does not constitute a bridge mode.

In the December 2014 TP SNOPR, DOE specified that full-surface induction cooking tops with ''cook anywhere'' functionality should be tested with multiple test equipment diameters in the center of the usable cooking surface. 79 FR 71894 71905 (Dec. 3, 2014). These full-surface induction cooking tops have no clearly defined cooking zones. The location of the cookware is detected when it is placed on the surface, and multiple cookware can be independently controlled and used on the cooking top simultaneously. Annex ZA of EN 60350–2:2013, which DOE is proposing to incorporate by reference as discussed in section III.D of this notice, specifies that for a cooking area without limitative marking, *e.g.,* a full-surface induction zone, the number of controls is defined by the number of cookware items that can be used independently and simultaneously, and the number of controls determines the number of tests.

F. Extending EN 60350–2:2013 to Gas Cooking Tops

DOE notes that the test methods specified in the relevant sections of EN 60350–2:2013 were intended for use with only electric cooking tops. To extend this method to gas cooking tops, DOE reviewed another European water-heating test standard, EN 30–2–1:1998 *Domestic cooking appliances burning gas—Part 2–1: Rational use of energy—General,* which includes test methods specifically for gas cooking tops. EN 30–2–1 is similar to the electric cooking top water-heating test method in that it specifies a series of test vessels and water loads that are dependent on a nominal characteristic of the surface unit. EN 30–2–1 specifies the diameter of the test vessel and the mass of the water load based on the heat input of the gas burner being tested.

The methods of test in EN 60305–2:2013 and EN 30–2–1 differ slightly, so if DOE were to incorporate both by reference, the resulting measured energy consumption of gas and electric cooking tops would not be comparable. For example, EN 30–2–1 specifies an aluminum test vessel, without a lid, instead of a stainless steel vessel. Additionally, the procedure to determine the efficiency of a gas burner in EN 30–2–1 includes a heat-up phase at the maximum burner setting but does not capture energy consumed during a simmering phase. DOE is not aware of data showing that consumers cook food differently with gas cooking tops than with electric cooking tops. For these reasons, DOE is proposing to extend the test methods specified for electric cooking tops in EN 60350–2:2013 to gas cooking tops, but to specify test vessels and water loads based on the correlation between input rate of the burner and test vessel size in EN 30–2–1. Figure III.1 compares the test vessels in EN 30–2–1 to EN 603050–2.

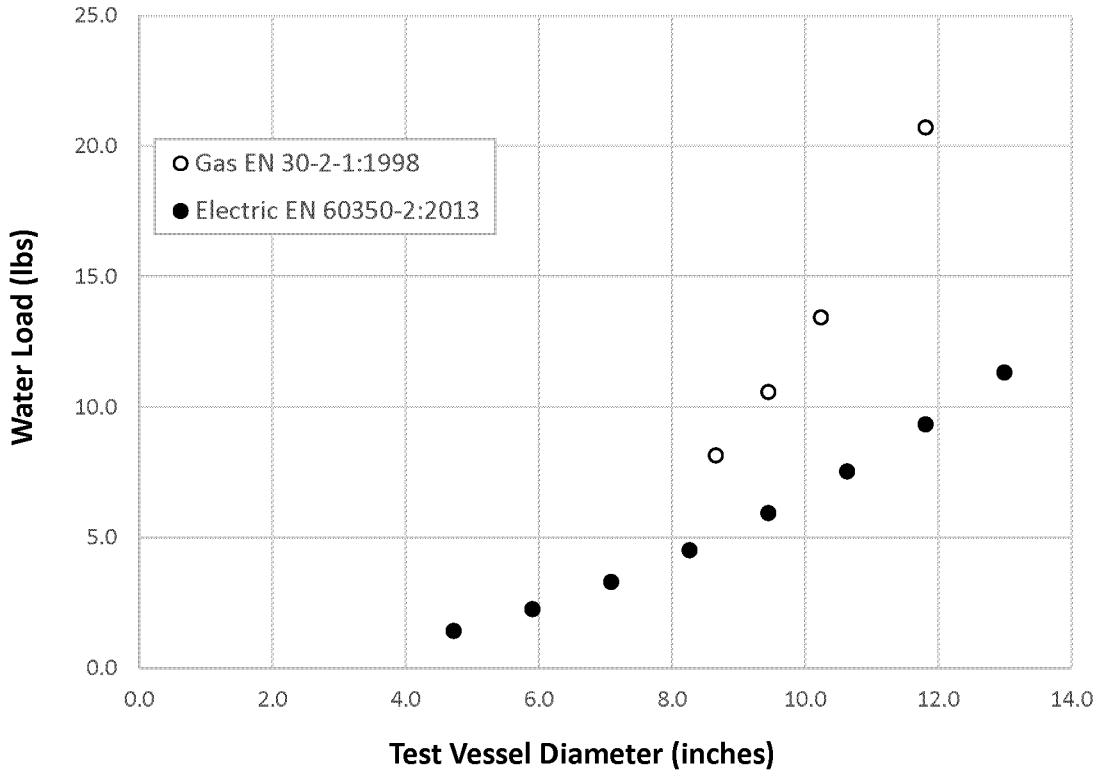

Figure III.1 Test Vessel Water Load versus Diameter as Specified in EN 30-2-1 and EN 60350-2:2013

DOE notes that for comparable test vessel diameters specified in the two test procedures, the water loads vary significantly. However, DOE is not aware of any data suggesting that a representative test load should be significantly different for gas cooking tops than for electric cooking tops. As a result, DOE is proposing to use the test vessel diameters and the corresponding water loads from EN 60350–2:2013 that most closely match the test vessel diameters specified in EN 30–2–1 to test conventional gas cooking tops. Proposing to use the same test vessels and water loads as specified for electric cooking tops, as well as the same general test method, reduces the burden on manufacturers by minimizing the amount of new test equipment required to be purchased. Table III.4 lists DOE's proposal for gas cooking top test vessel diameter and water load by nominal burner input rate.

TABLE III.4—PROPOSED TEST VESSEL DIAMETERS AND WATER LOADS FOR THE TEST OF CONVENTIONAL GAS COOKING TOPS

Nominal gas burner input rate		Test vessel diameter (inches (mm))	Mass of the water load (lbs (kg))
Minimum Btu/h (kW)	Maximum Btu/h (kW)		
3,958 (1.16)	5,596 (1.64)	8.27 (210)	4.52 (2.05)
5,630 (1.65)	6,756 (1.98)	9.45 (240)	5.95 (2.70)
6,790 (1.99)	8,053 (2.36)	10.63 (270)	7.54 (3.42)
8,087 (2.37)	14,331 (4.2)	10.63 (270)	7.54 (3.42)
>14,331 (4.2)	.....	11.81 (300)	11.33 (4.24)

Unlike electric cooking tops, DOE is not proposing to require a minimum number of cookware categories for the test of a gas cooking top. Given that the diameter of the gas flame cannot be adjusted when the burner is at its maximum setting, only the best fitting test vessel, as specified in Table III.4, would be used for the surface unit test. DOE is also proposing to maintain the gas test conditions and measurements currently specified in appendix I for the test of gas cooking tops because gas testing is not addressed in EN 60350–2:2013.

DOE seeks comment on its proposed test vessel diameters and water loads for the test of conventional gas cooking tops. DOE also seeks comment on whether a representative water load for gas cooking tops should differ significantly from those for electric cooking tops. DOE requests input on whether the range of gas burner input rates derived from European standard EN 30–2–1 appropriately captures the burner input rates available on the U.S. market.

G. Annual Energy Consumption

In section 4.2.2 of the existing test procedure in appendix I, the annual energy consumption for electric and gas cooking tops is specified as the ratio of the annual useful cooking energy output to the cooking efficiency measured with a test block. The cooking efficiency is the average of the surface unit efficiencies measured for the cooking top. The annual useful cooking energy output was determined during the initial development of the cooking products test procedure in 1978. It correlated cooking field data to results obtained using the aluminum test block method and the DOE test procedure. In subsequent analyses for cooking products energy conservation standards and updates to the test procedure, the annual useful cooking energy output was scaled to adjust for changes in consumer cooking habits.

In this SNOPR, DOE is proposing to incorporate by reference relevant sections of EN 60350–2:2013, which does not include a method to determine surface unit efficiency and thus, cooking top efficiency. DOE also noted in section III.D.1 of this notice the repeatability and reproducibility issues related to specifying an efficiency metric for the water-heating test method. As a result, DOE is proposing to include a method to calculate both annual energy consumption and integrated annual energy consumption using the average of the test energy consumption measured for each surface unit of the cooking top, normalized to a representative water load size.

Section 7.1.Z7.2 of EN 60350–2:2013 specifies that the energy consumption of the cooking top be normalized to 1,000 g of water. However, DOE notes that 1,000 g of water may not be representative of the average load used with cooking tops found in the U.S. market. According to the table of standardized test vessel diameters and water amounts listed in Table III.1, a load size of 1,000 g approximately corresponds to a test vessel diameter of 6 inches, which, according to the following analysis, is not the most representative test vessel diameter. To determine the representative load size for both electric and gas cooking tops, DOE first reviewed the surface unit diameters and input rates for cooking tops (including those incorporated into combined cooking products) available on the market. As discussed in section III.D, section 7.1.Z2 of EN 60350–2 includes methodology for selecting the test vessel diameter and a corresponding water load for each surface unit based on the number of surface units on the cooking top and the diameter of each surface unit. Using this methodology, DOE determined the test vessel diameters and water load sizes that would be required for the test of each cooking top model. Based on this analysis, DOE determined that the average water load size for both electric and gas cooking top models available on the market was 2,853 g. As a result, DOE is proposing to calculate the normalized cooking top energy consumption for electric products as

$$E_{CTE} = \frac{2853g}{n_{tv}} \times \sum_{tv=1}^{n_{tv}} \frac{E_{tv}}{m_{tv}}$$

and the normalized cooking top energy consumption for gas products as

$$E_{CTG} = \frac{2853g}{n_{tv}} \times \sum_{tv=1}^{n_{tv}} \frac{E_{tv}}{m_{tv}}$$

Where:

E_{CTE} is the energy consumption of an electric cooking top calculated per 2,853 g of water, in Wh;

E_{CTG} is the energy consumption of a gas cooking top calculated per 2,853 g of water, in Wh;

E_{tv} is the energy consumption measured for a given test vessel, tv, in Wh;

m_{tv} is the mass of water in the test vessel, in g; and,

n_{tv} is the number of test vessels used to test the complete cooking top.

To extrapolate the cooking top's normalized test energy consumption to an annual energy consumption, DOE considered cooking top usage data available through EIA RECS, which collects energy-related data for occupied primary housing units in the United States. The 2009 RECS collected data from 12,083 housing units representing almost 113.6 million households. RECS provides values for the frequency of household cooking events by product class as listed in Table III.5.

TABLE III.5—RECS 2009 AVERAGE MEALS PER DAY FOR CONVENTIONAL COOKING TOPS

Cooking top type	RECS average cooking frequency (meals per day)
Electric	1.21
Smooth Electric[a]	1.21
Gas	1.25

[a] Smooth Electric as listed here includes both smooth electric radiant and induction cooking tops.

However, RECS does not provide details about the cooking load (*e.g.,* load size or composition) nor the duration of the cooking event. As a result, DOE is proposing to normalize the number of cooking cycles to account for differences between the duration of a cooking event represented in the RECS data and DOE's proposed test load for measuring the energy consumption of the cooking top to calculate the annual energy consumption.

To evaluate the difference between field energy use and test energy consumption, DOE reviewed recent survey data of residential cooking presented in the 2010 CA RASS and the FSEC, from which DOE determined that the representative average annual energy consumption of conventional electric ranges is 287.5 kWh/year. In appendix 7A of the technical support document (TSD) for the conventional ovens energy conservation standards NOPR (80 FR 33030 (June 10, 2015)), DOE provides a methodology to disaggregate the range energy consumption into two portions—one allocated to the oven and the other portion allocated to the cooking top. This methodology assumes that the annual cooking energy consumption of a cooking top is a fraction of that of a standard oven, and that the ratio of annual useful cooktop energy output to standard oven useful energy output in a range has not changed over time. This methodology also assumes that this ratio for electric cooking products applies to gas cooking products as well. After applying these assumptions, the resulting field energy use estimates of the average annual energy consumption of an electric cooking top and gas cooking top were 114 kWh/yr and 858 kBtu/yr, respectively.

For comparison of the proposed test procedure to the field energy use estimates, DOE conducted testing on a select number of cooking tops, capturing all product classes and a range of cooking top features. DOE estimated the annual energy consumption of a conventional cooking top by multiplying the normalized test energy consumption of the cooking top by the cooking frequency in Table III.5 and the number of days in a year (365). The maximum annual energy consumption for electric cooking tops and gas cooking tops in the DOE test sample were 234.9 kWh/yr and 1,925 kBtu/yr respectively. The significant difference between the annual energy consumption determined using the proposed test procedure and the cooking frequency presented in Table III.5 compared to the field energy consumption data, presented in this preamble, confirms the need to adjust the number of cooking cycles per year used in the annual energy consumption calculation to account for differences between consumer use of the cooking top represented by the EIA RECS data

and the proposed water heating test method.

Using the average ratio between the maximum annual energy consumption measured in the DOE test sample and the estimated field energy use of both gas and electric cooking tops, DOE proposes to apply a normalization factor of 0.47 to the number of cycles per year such that,

$N_{CE} = 441.5 \times 0.47 = 207.5$ cooking cycles per year, the average number of cooking cycles per year normalized for duration of a cooking event estimated for electric cooking tops.

$N_{CG} = 456.3 \times 0.47 = 214.5$ cooking cycles per year, the average number of cooking cycles per year normalized for duration of a cooking event estimated for gas cooking tops.

DOE is proposing to calculate the annual energy consumption of a conventional cooking top by multiplying the normalized test energy consumption of the cooking top by the normalized cooking frequency and the number of days in a year (365). Integrated annual energy consumption for the cooking top would in turn be calculated by adding the annual conventional cooking top combined low-power mode energy consumption.

H. Calculation of Annual Energy Consumption of Combined Cooking Products

As discussed in section III.A, DOE notes that the test procedures proposed in this SNOPR apply to conventional cooking tops, including the individual cooking top component of a combined cooking product. However, DOE also notes that the annual combined low-power mode energy consumption can only be measured for the combined cooking product as a whole and not for the individual components. To determine the integrated annual energy consumption of the conventional cooking top component of a combined cooking product, DOE is proposing to allocate a portion of the combined low-power mode energy consumption for the combined cooking product to the conventional cooking top component based on the ratio of the annual cooking hours for the cooking top to the sum of the annual cooking hours for all components making up the combined cooking product. DOE is also proposing to use the same apportioning method to determine the annual low-power mode energy consumption for the microwave oven component of a combined cooking product.

For conventional cooking tops, DOE determined the annual cooking hours to be 213.1 hours based on the total inactive mode and off mode hours specified in the current version of appendix I, sections 4.2.2.1.2 and 4.2.2.2.2. For conventional ovens, DOE similarly determined the annual cooking hours to be 219.9 based on the total inactive mode and off mode hours specified in the current version of appendix I, section 4.1.2.3 using the annual hours already established for a conventional oven. For microwave ovens, DOE determined the number of annual cooking hours to be 44.9 hours based on consumer usage data presented in the February 4, 2013 NOPR proposing active mode test procedures for microwave ovens. 78 FR 7940, 7950.

Based on this, DOE is proposing to calculate the integrated annual energy consumption for the conventional cooking top component of a combined cooking product as the sum of the annual energy consumption and the portion of the combined cooking product's annual combined low-power mode energy consumption allocated to the cooking top component. Because appendix I currently contains test procedures for microwave ovens that measure only standby mode and off mode test energy consumption, DOE is including an annual combined low-power mode energy consumption calculation for the microwave oven component of a combined cooking product. As discussed in section III.G of this SNOPR, DOE is proposing to repeal the test procedures for conventional ovens. As a result, DOE is not proposing to incorporate methods to calculate the integrated annual energy consumption for the conventional oven component of a combined cooking product.

DOE also proposes to modify the requirements in 10 CFR 430.23 to align with the changes proposed for appendix I, clarifying test procedures for the measurement of energy consumption for combined cooking products.

I. Installation Test Conditions

DOE notes that section 2.1 of appendix I defines installation test conditions for some cooking products but does not explicitly describe the installation test conditions required for conventional cooking tops. The test conditions described for freestanding ''kitchen ranges'' specify that the product be installed with the back directly against, or as near as possible to, a vertical wall which extends at least 1 foot above and on either side of the appliance, and that a drop-in, built-in, or wall-mounted cooking product be installed in an enclosure in accordance with the manufacturer's instructions.

During interviews conducted in February and March 2015, manufacturers commented that the installation conditions described in the existing DOE test procedure are outdated. Specifically, manufacturers explained that certain conventional cooking tops, conventional ovens, and combined cooking products, such as conventional ranges, are designed to be used in a few different installation configurations. They stated that manufacturer installation guides may contain several sets of instructions, and the existing DOE test procedure does not sufficiently define which set should be selected for test. Manufacturers also commented that the installation configuration may impact the measured energy consumption. Because they are already required to test products according to ANSI Z21.1 for safety purposes, manufacturers suggested that DOE consider specifying the same test cabinetry in appendix I to minimize burden and ensure that all products are tested using a standardized cabinetry.

DOE agrees with manufacturers that a standardized test cabinetry should be specified for all cooking product types to ensure that test results are comparable across manufacturers and are repeatable and reproducible. For testing conventional cooking tops and combined components, DOE is proposing in this SNOPR to incorporate by reference the following test structures specified in ANSI Z21.1 sections 5.1 and 5.19:

- Figure 7, ''Test structure for built-in top surface cooking units and open top broiler units;''
- Figure 5, ''Test structure for floor-supported units not having elevated cooking sections;'' and
- Figure 6, ''Test structure for floor-supported units having elevated cooking sections.''

Although ANSI Z21.1 pertains to gas cooking appliances, DOE is proposing to require these test structures for both gas and electric conventional cooking products. ANSI Z21.1 definitions for the various installation configurations also differ slightly from those specified by DOE in the existing appendix I. According to ANSI Z21.1, a ''built-in unit'' is defined as a cooking appliance designed to be recessed into, placed upon, or attached to the construction of a building other than the floor, while a ''floor-supported'' unit is a cooking appliance for installation directly on the floor without requiring supporting cabinetry or structure. However, DOE notes that its definition for ''built-in'' in appendix I also applies to ''slide-in'' products that may be floor supported. In this SNOPR, DOE is proposing to further

clarify its definition of ''built-in'' to mean a product that is enclosed in surrounding cabinetry, walls, or other similar structures on at least three sides, and that can be supported by surrounding cabinetry (*e.g.,* drop-in cooking tops) or the floor (*e.g.,* slide-in conventional ranges). DOE is also proposing to revise its definition for freestanding cooking products to mean a product that is supported by the floor and is not designed to be enclosed by surrounding cabinetry, walls, or other similar structures.

In addition, DOE notes that in general, where the test procedure references manufacturer instructions used to determine the installation conditions for the unit under test, those instructions must be those normally shipped with product, or if only available online, the version of the instructions available online at the time of test. DOE recognizes that some manufacturer instructions may specify that the cooking product may be used in multiple installation conditions (*i.e.,* built-in and freestanding). DOE notes that because built-in products are installed in configurations with more surrounding cabinetry that may limit airflow and venting compared to freestanding products, products capable of built-in installation configurations may require additional features such as exhaust fans or added insulation to meet the same safety requirements (*e.g.,* surface temperature requirements specified in Table 12 of ANSI Z21.1) that impact energy use of the unit. As a result, DOE is proposing that if the manufacturer instructions specify that the cooking product may be used in multiple installation conditions, it should be installed according to the built-in configuration.

J. Technical Clarification to the Correction of the Gas Heating Value

DOE notes that section 2.9.4 in the existing test procedure appendix I specifies that the heating value of natural gas or propane must be corrected for local temperature and pressure conditions, but does not clearly state what conditions should be used for this correction. DOE notes that the test procedure for residential gas clothes dryers in 10 CFR 430 subpart B, appendix D2, specifies that the heating value should be corrected to standard temperature and pressure conditions in accordance with U.S. Bureau of Standards, circular C417, 1938. DOE notes other test procedures (*e.g.,* residential water heaters (10 CFR 430 subpart B, appendix E)) also specify that the temperature and pressure conditions should be corrected to standard temperature and pressure conditions. As a result, DOE is proposing to clarify that the measurement of the heating value of natural gas or propane specified in appendix I be corrected to standard pressure and temperature conditions in accordance with the U.S. Bureau of Standards, circular C417, 1938. This clarification ensures that the same correction methods are used by all operators of the test.

K. Grammatical Changes to Certain Sections of Appendix I

In an effort to clarify the text in certain sections of appendix I, DOE has provided minor grammatical corrections or modifications. DOE also notes that the watt meter requirements specified in 2.9.1.2 in the existing appendix I are no longer used in the test procedure. As a result, DOE is also proposing to remove this section. These minor proposed modifications do not change the substance of the test methods or descriptions provided in these sections.

L. Compliance With Other EPCA Requirements

EPCA requires that any new or amended test procedures for consumer products must be reasonably designed to produce test results which measure energy efficiency, energy use, or estimated annual operating cost of a covered product during a representative average use cycle or period of use, and must not be unduly burdensome to conduct. (42 U.S.C. 6293(b)(3))

DOE tentatively concludes that the amended test procedures proposed herein would produce test results that measure the energy consumption of conventional cooking tops during representative use, and that the test procedures would not be unduly burdensome to conduct.

While the test procedures proposed in this SNOPR differ from the method currently included in appendix I for testing cooking tops, the essential method of test which includes an initial temperature rise of the test load and a simmering phase, is performed in approximately the same amount of time as the existing test procedure in appendix I. The existing test equipment in appendix I would be replaced with the eight test vessels described in section 7.1.Z2 of EN 60350–2:2013. DOE estimates current testing represents a cost of roughly $700 per test for labor, with a one-time investment of $2,000 for test equipment ($1,000 for test blocks and $1,000 for instrumentation). The proposed reusable test vessels would represent an additional one-time expense of $5,000 for the test vessels. Although manufacturers would be required to purchase and construct the test structures described in section III.I of this notice, many manufacturers stated during interviews that because these test structures are already used for gas product compliance testing required in ANSI Z21.1, these structures are already available in-house. DOE also notes that the only additional instrumentation required would be an absolute pressure transducer to measure the ambient air pressure of the test room. DOE estimates the cost of this transducer to be $100 or less for a model compatible with typical existing data collection systems used by the manufacturer. The allowable range of room air pressure specified in EN 60350–2:2013 is wide enough that a pressurized test chamber would not be required. Air pressure at elevations less than 3000 feet above sea level falls within the range. DOE does not believe this additional cost represents an excessive burden for test laboratories or manufacturers given the significant investments necessary to manufacture, test and market consumer appliances. Given the similarities (in terms of the test equipment, test method, the time needed to perform the test, and the calculations necessary to determine IAEC, DOE asserts that the newly proposed amended test procedure for cooking tops would not be unreasonably burdensome to conduct as compared to the existing test procedure in appendix I.

IV. Procedural Issues and Regulatory Review

A. Review Under Executive Order 12866

The Office of Management and Budget (OMB) has determined that test procedure rulemakings do not constitute ''significant regulatory actions'' under section 3(f) of Executive Order 12866, Regulatory Planning and Review, 58 FR 51735 (Oct. 4, 1993). Accordingly, this action was not subject to review under the Executive Order by the Office of Information and Regulatory Affairs (OIRA) in OMB.

B. Review Under the Regulatory Flexibility Act

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) requires preparation of an initial regulatory flexibility analysis (IFRA) for any rule that by law must be proposed for public comment and a final regulatory flexibility analysis for any such rule that an agency adopts as a final rule, unless the agency certifies that the rule, if promulgated, will not have a significant economic impact on a substantial number of small entities. As required by Executive Order

13272, ''Proper Consideration of Small Entities in Agency Rulemaking,'' 67 FR 53461 (August 16, 2002), DOE published procedures and policies on February 19, 2003, to ensure that the potential impacts of its rules on small entities are properly considered during the DOE rulemaking process. 68 FR 7990. DOE has made its procedures and policies available on the Office of the General Counsel's Web site: *http://energy.gov/gc/office-general-counsel.*

DOE reviewed this proposed rule under the provisions of the Regulatory Flexibility Act and the procedures and policies published on February 19, 2003. The proposed rule would amend the test method for measuring the energy efficiency of conventional cooking tops, including methods applicable to induction cooking products and gas cooking tops with higher input rates.

The Small Business Administration (SBA) considers a business entity to be a small business, if, together with its affiliates, it employs less than a threshold number of workers or earns less than the average annual receipts specified in 13 CFR part 121. The threshold values set forth in these regulations use size standards and codes established by the North American Industry Classification System (NAICS) that are available at: *http://www.sba.gov/sites/default/files/files/Size_Standards_Table.pdf.* The threshold number for NAICS classification code 335221, titled ''Household Cooking Appliance Manufacturing,'' is 750 employees; this classification includes manufacturers of residential conventional cooking products.

Most of the manufacturers supplying conventional cooking products are large multinational corporations. DOE surveyed the AHAM member directory to identify manufacturers of residential conventional cooking tops. DOE then consulted publicly-available data, purchased company reports from vendors such as Dun and Bradstreet, and contacted manufacturers, where needed, to determine if they meet the SBA's definition of a ''small business manufacturing facility'' and have their manufacturing facilities located within the United States. Based on this analysis, DOE estimates that there are nine small businesses that manufacture conventional cooking products covered by the proposed test procedure amendments.

For the reasons stated in the preamble, DOE has tentatively concluded that the proposed rule would not have a significant impact on small manufacturers under the applicable provisions of the Regulatory Flexibility Act. The proposed rule would amend DOE's test procedures for cooking tops by incorporating testing provisions from EN 60350–2:2013 to address active mode energy consumption for all conventional cooking top technology types, including induction surface units and surface units with higher input rates. The amended test procedure would be used to develop and test compliance with any future energy conservation standards for cooking tops that may be established by DOE. The proposed test procedure amendments involve the measurement of active mode energy consumption through the use of a water-heating test method that requires different test equipment than is currently specified for conventional cooking tops. The test equipment consists of a set of eight stainless steel test vessels. DOE estimates the cost for this new equipment to be approximately $5,000–$10,000, depending on the number of sets the manufacturer wishes to procure. Additionally, DOE estimates a cost of approximately $33,450 for an average small manufacturer to test a full product line of induction surface units and surface units with high input rates not currently covered by the existing test procedure in appendix I. This estimate assumes $700 per test, as described in section III.L of this notice, with up to 48 total tests per manufacturer needed, assuming 11 models [17] with either four or six individual surface unit tests per cooking top model. This cost is small (0.21 percent) compared to the average annual revenue of the nine identified small businesses, which DOE estimates to be over $16 million.[18]

For combined cooking products, DOE is proposing to modify the calculation of the IAEC of a combined cooking product by apportioning the combined low-power mode energy consumption measured for the combined cooking product to each individual component making up the combined cooking product. These modifications require the same methodology, test equipment, and test facilities used to measure the combined low-power mode energy consumption of stand-alone cooking products and therefore would not result in any additional facility or testing costs.

The incorporation by reference of the test structures from ANSI Z21.1 to standardize the installation conditions used during the test of conventional cooking tops are not expected to significantly impact small manufacturers under the applicable provisions of the Regulatory Flexibility Act. DOE estimates a cost of $500 for an average small manufacturer to fabricate the test structures for the test of cooking tops and combined cooking products, which is negligible when compared to the average annual revenue of the nine identified small businesses. Additionally, small manufacturers of gas cooking appliances likely already use these test structures to perform safety testing according to ANSI Z21.1.

For these reasons, DOE tentatively concludes and certifies that the proposed rule would not have a significant economic impact on a substantial number of small entities. Accordingly, DOE has not prepared a regulatory flexibility analysis for this rulemaking. DOE will transmit the certification and supporting statement of factual basis to the Chief Counsel for Advocacy of the SBA for review under 5 U.S.C. 605(b).

C. Reduction Act of 1995

Manufacturers of conventional cooking products must certify to DOE that their products comply with any applicable energy conservation standards. In certifying compliance, manufacturers must test their products according to the DOE test procedures for conventional cooking products, including any amendments adopted for those test procedures. DOE has established regulations for the certification and recordkeeping requirements for all covered consumer products and commercial equipment, including conventional cooking products. (76 FR 12422 (March 7, 2011). The collection-of-information requirement for the certification and recordkeeping is subject to review and approval by OMB under the Paperwork Reduction Act (PRA). This requirement has been approved by OMB under OMB control number 1910–1400. DOE requested OMB approval of an extension of this information collection for three years, specifically including the collection of information proposed in the present rulemaking, and estimated that the annual number of burden hours under this extension is 30 hours per company. In response to DOE's request, OMB approved DOE's information collection requirements covered under OMB control number 1910–1400 through November 30, 2017. 80 FR 5099 (Jan. 30, 2015).

Notwithstanding any other provision of the law, no person is required to

[17] DOE considered different configurations of the same basic model (where surface units were placed in different positions on the cooking top) as unique models.

[18] Estimated average revenue is based on financial information provided for the small businesses in reports provided by Dun and Bradstreet.

respond to, nor shall any person be subject to a penalty for failure to comply with, a collection of information subject to the requirements of the PRA, unless that collection of information displays a currently valid OMB Control Number.

D. Review Under the National Environmental Policy Act of 1969

In this proposed rule, DOE proposes test procedure amendments that it expects will be used to develop and implement future energy conservation standards for conventional cooking products. DOE has determined that this rule falls into a class of actions that are categorically excluded from review under the National Environmental Policy Act of 1969 (42 U.S.C. 4321 *et seq.*) and DOE's implementing regulations at 10 CFR part 1021. Specifically, this proposed rule would amend the existing test procedures without affecting the amount, quality or distribution of energy usage, and, therefore, would not result in any environmental impacts. Thus, this rulemaking is covered by Categorical Exclusion A5 under 10 CFR part 1021, subpart D, which applies to any rulemaking that interprets or amends an existing rule without changing the environmental effect of that rule. Accordingly, neither an environmental assessment nor an environmental impact statement is required.

E. Review Under Executive Order 13132

Executive Order 13132, ''Federalism,'' 64 FR 43255 (August 4, 1999) imposes certain requirements on agencies formulating and implementing policies or regulations that preempt State law or that have Federalism implications. The Executive Order requires agencies to examine the constitutional and statutory authority supporting any action that would limit the policymaking discretion of the States and to carefully assess the necessity for such actions. The Executive Order also requires agencies to have an accountable process to ensure meaningful and timely input by State and local officials in the development of regulatory policies that have Federalism implications. On March 14, 2000, DOE published a statement of policy describing the intergovernmental consultation process it will follow in the development of such regulations. 65 FR 13735. DOE has examined this proposed rule and has determined that it would not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government. EPCA governs and prescribes Federal preemption of State regulations as to energy conservation for the products that are the subject of this proposed rule. States can petition DOE for exemption from such preemption to the extent, and based on criteria, set forth in EPCA. (42 U.S.C. 6297(d)) No further action is required by Executive Order 13132.

F. Review Under Executive Order 12988

Regarding the review of existing regulations and the promulgation of new regulations, section 3(a) of Executive Order 12988, ''Civil Justice Reform,'' 61 FR 4729 (Feb. 7, 1996), imposes on Federal agencies the general duty to adhere to the following requirements: (1) Eliminate drafting errors and ambiguity; (2) write regulations to minimize litigation; (3) provide a clear legal standard for affected conduct rather than a general standard; and (4) promote simplification and burden reduction. Section 3(b) of Executive Order 12988 specifically requires that Executive agencies make every reasonable effort to ensure that the regulation: (1) Clearly specifies the preemptive effect, if any; (2) clearly specifies any effect on existing Federal law or regulation; (3) provides a clear legal standard for affected conduct while promoting simplification and burden reduction; (4) specifies the retroactive effect, if any; (5) adequately defines key terms; and (6) addresses other important issues affecting clarity and general draftsmanship under any guidelines issued by the Attorney General. Section 3(c) of Executive Order 12988 requires Executive agencies to review regulations in light of applicable standards in sections 3(a) and 3(b) to determine whether they are met or it is unreasonable to meet one or more of them. DOE has completed the required review and determined that, to the extent permitted by law, the proposed rule meets the relevant standards of Executive Order 12988.

G. Review Under the Unfunded Mandates Reform Act of 1995

Title II of the Unfunded Mandates Reform Act of 1995 (UMRA) requires each Federal agency to assess the effects of Federal regulatory actions on State, local, and Tribal governments and the private sector. Public Law 104–4, sec. 201 (codified at 2 U.S.C. 1531). For a proposed regulatory action likely to result in a rule that may cause the expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector of $100 million or more in any one year (adjusted annually for inflation), section 202 of UMRA requires a Federal agency to publish a written statement that estimates the resulting costs, benefits, and other effects on the national economy. (2 U.S.C. 1532(a), (b)) The UMRA also requires a Federal agency to develop an effective process to permit timely input by elected officers of State, local, and Tribal governments on a proposed ''significant intergovernmental mandate,'' and requires an agency plan for giving notice and opportunity for timely input to potentially affected small governments before establishing any requirements that might significantly or uniquely affect small governments. On March 18, 1997, DOE published a statement of policy on its process for intergovernmental consultation under UMRA. 62 FR 12820; also available at *http://energy.gov/gc/office-general-counsel.* DOE examined this proposed rule according to UMRA and its statement of policy and determined that the rule contains neither an intergovernmental mandate, nor a mandate that may result in the expenditure of $100 million or more in any year, so these requirements do not apply.

H. Review Under the Treasury and General Government Appropriations Act, 1999

Section 654 of the Treasury and General Government Appropriations Act, 1999 (Pub. L. 105–277) requires Federal agencies to issue a Family Policymaking Assessment for any rule that may affect family well-being. This proposed rule would not have any impact on the autonomy or integrity of the family as an institution. Accordingly, DOE has concluded that it is not necessary to prepare a Family Policymaking Assessment.

I. Review Under Executive Order 12630

DOE has determined, under Executive Order 12630, ''Governmental Actions and Interference with Constitutionally Protected Property Rights'' 53 FR 8859 (March 18, 1988), that this regulation would not result in any takings that might require compensation under the Fifth Amendment to the U.S. Constitution.

J. Review Under Treasury and General Government Appropriations Act, 2001

Section 515 of the Treasury and General Government Appropriations Act, 2001 (44 U.S.C. 3516 note) provides for agencies to review most disseminations of information to the public under guidelines established by each agency pursuant to general guidelines issued by OMB. OMB's guidelines were published at 67 FR 8452 (Feb. 22, 2002), and DOE's

guidelines were published at 67 FR 62446 (Oct. 7, 2002). DOE has reviewed this proposed rule under the OMB and DOE guidelines and has concluded that it is consistent with applicable policies in those guidelines.

K. Review Under Executive Order 13211

Executive Order 13211, ''Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use,'' 66 FR 28355 (May 22, 2001), requires Federal agencies to prepare and submit to OMB, a Statement of Energy Effects for any proposed significant energy action. A ''significant energy action'' is defined as any action by an agency that promulgated or is expected to lead to promulgation of a final rule, and that: (1) Is a significant regulatory action under Executive Order 12866, or any successor order; and (2) is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (3) is designated by the Administrator of OIRA as a significant energy action. For any proposed significant energy action, the agency must give a detailed statement of any adverse effects on energy supply, distribution, or use should the proposal be implemented, and of reasonable alternatives to the action and their expected benefits on energy supply, distribution, and use.

The proposed regulatory action to amend the test procedure for measuring the energy efficiency of conventional cooking tops is not a significant regulatory action under Executive Order 12866. Moreover, it would not have a significant adverse effect on the supply, distribution, or use of energy, nor has it been designated as a significant energy action by the Administrator of OIRA. Therefore, it is not a significant energy action, and, accordingly, DOE has not prepared a Statement of Energy Effects.

L. Review Under Section 32 of the Federal Energy Administration Act of 1974

Under section 301 of the Department of Energy Organization Act (Pub. L. 95–91; 42 U.S.C. 7101), DOE must comply with section 32 of the Federal Energy Administration Act of 1974, as amended by the Federal Energy Administration Authorization Act of 1977. (15 U.S.C. 788; FEAA) Section 32 essentially provides in relevant part that, where a proposed rule authorizes or requires use of commercial standards, the notice of proposed rulemaking must inform the public of the use and background of such standards. In addition, section 32(c) requires DOE to consult with the Attorney General and the Chairman of the Federal Trade Commission (FTC) concerning the impact of the commercial or industry standards on competition.

The proposed rule incorporates testing methods contained in certain sections of the following commercial standards: EN 60350–2:2013 ''Household electric cooking appliances Part 2: Hobs—Methods for measuring performance'', and ANSI Z21.1–2016 ''Household cooking gas appliances.'' While the proposed test procedure is not exclusively based on the provisions in these industry standards, many components of the test procedure have been proposed to be adopted without amendment. The Department has evaluated these standards and is unable to conclude whether they fully comply with the requirements of section 32(b) of the FEAA, (*i.e.*, that they were developed in a manner that fully provides for public participation, comment, and review). DOE will consult with the Attorney General and the Chairman of the FTC concerning the impact of these test procedures on competition, prior to prescribing a final rule.

M. Description of Materials Incorporated by Reference

In this SNOPR, DOE proposes to incorporate by reference certain sections of the test standard published by ANSI, titled ''Household cooking gas appliances,'' ANSI Z21.1–2016. ANSI Z21.1 is an industry accepted test procedure that provides a basic standard for safe operation of residential gas cooking appliances. The test procedure proposed in this SNOPR references various sections of ANSI Z21.1 that address test setup and describe the various installation test structures used to test combined cooking products and conventional cooking tops. ANSI Z21.1 is readily available on ANSI's Web site at *http://webstore.ansi.org/default.aspx.*

DOE also proposes to incorporate by reference certain sections of the test standard published by CENELEC, titled ''Household electric cooking appliances Part 2: Hobs—Methods for measuring performance,'' EN 60350–2:2013. EN 60350–2:2013 is an industry accepted European test procedure that measures cooking top energy consumption and performance. DOE has determined that EN 60350–2:2013, with the proposed clarifications discussed in sections III.E, III.F, and III.G, provides test methods for determining the annual energy use metrics and are applicable to all residential conventional cooking tops sold in the United States. The test procedure proposed in this SNOPR references various sections of EN 60350–2:2013 that address test setup, instrumentation, test conduct, and measurement procedure. EN 60350–2:2013 is readily available on the British Standards Institute's Web site at *http://shop.bsigroup.com/.*

V. Public Participation

A. Submission of Comments

DOE will accept comments, data, and information regarding this proposed rule no later than the date provided in the **DATES** section at the beginning of this proposed rule. Interested parties may submit comments using any of the methods described in the **ADDRESSES** section at the beginning of this notice.

Submitting comments via regulations.gov. The *regulations.gov* Web page will require you to provide your name and contact information. Your contact information will be viewable to DOE Building Technologies staff only. Your contact information will not be publicly viewable except for your first and last names, organization name (if any), and submitter representative name (if any). If your comment is not processed properly because of technical difficulties, DOE will use this information to contact you. If DOE cannot read your comment due to technical difficulties and cannot contact you for clarification, DOE may not be able to consider your comment.

However, your contact information will be publicly viewable if you include it in the comment or in any documents attached to your comment. Any information that you do not want to be publicly viewable should not be included in your comment, nor in any document attached to your comment. Persons viewing comments will see only first and last names, organization names, correspondence containing comments, and any documents submitted with the comments.

Do not submit to *regulations.gov* information for which disclosure is restricted by statute, such as trade secrets and commercial or financial information (hereinafter referred to as Confidential Business Information (CBI)). Comments submitted through *regulations.gov* cannot be claimed as CBI. Comments received through the Web site will waive any CBI claims for the information submitted. For information on submitting CBI, see the Confidential Business Information section.

DOE processes submissions made through *regulations.gov* before posting. Normally, comments will be posted within a few days of being submitted. However, if large volumes of comments are being processed simultaneously, your comment may not be viewable for

up to several weeks. Please keep the comment tracking number that *regulations.gov* provides after you have successfully uploaded your comment.

Submitting comments via email, hand delivery, or mail. Comments and documents submitted via email, hand delivery, or mail also will be posted to *regulations.gov*. If you do not want your personal contact information to be publicly viewable, do not include it in your comment or any accompanying documents. Instead, provide your contact information on a cover letter. Include your first and last names, email address, telephone number, and optional mailing address. The cover letter will not be publicly viewable as long as it does not include any comments.

Include contact information each time you submit comments, data, documents, and other information to DOE. If you submit via mail or hand delivery, please provide all items on a CD, if feasible. It is not necessary to submit printed copies. No facsimiles (faxes) will be accepted.

Comments, data, and other information submitted to DOE electronically should be provided in PDF (preferred), Microsoft Word or Excel, WordPerfect, or text (ASCII) file format. Provide documents that are not secured, written in English and free of any defects or viruses. Documents should not contain special characters or any form of encryption and, if possible, they should carry the electronic signature of the author.

Campaign form letters. Please submit campaign form letters by the originating organization in batches of between 50 to 500 form letters per PDF or as one form letter with a list of supporters' names compiled into one or more PDFs. This reduces comment processing and posting time.

Confidential Business Information. According to 10 CFR 1004.11, any person submitting information that he or she believes to be confidential and exempt by law from public disclosure should submit via email, postal mail, or hand delivery two well-marked copies: One copy of the document marked confidential including all the information believed to be confidential, and one copy of the document marked non-confidential with the information believed to be confidential deleted. Submit these documents via email or on a CD, if feasible. DOE will make its own determination about the confidential status of the information and treat it according to its determination.

Factors of interest to DOE when evaluating requests to treat submitted information as confidential include: (1) A description of the items; (2) whether and why such items are customarily treated as confidential within the industry; (3) whether the information is generally known by or available from other sources; (4) whether the information has previously been made available to others without obligation concerning its confidentiality; (5) an explanation of the competitive injury to the submitting person which would result from public disclosure; (6) when such information might lose its confidential character due to the passage of time; and (7) why disclosure of the information would be contrary to the public interest.

It is DOE's policy that all comments may be included in the public docket, without change and as received, including any personal information provided in the comments (except information deemed to be exempt from public disclosure).

B. Issues on Which DOE Seeks Comment

Although DOE welcomes comments on any aspect of this proposal, DOE is particularly interested in receiving comments and views of interested parties concerning the following issues:

1. Repeal of the Conventional Oven Test Procedure

DOE welcomes comment on its proposal to repeal the provisions in appendix I for measuring conventional oven IAEC. (See section III.B of this notice.)

2. Gas Burners With High Input Rates

DOE welcomes comment on what constitutes a representative test load for gas burners with high input rates. DOE is especially interested in consumer usage data demonstrating how consumers might use burners with high input rates differently than those with standard input rates. (See section III.A of this notice.)

3. Hybrid Test Blocks

DOE seeks comment on its decision to no longer propose the use of hybrid test blocks for the test of conventional cooking tops, given the outstanding issues associated with thermal grease and test block construction. (See section III.B of this notice.)

4. Representativeness of the Water-Heating Test Method for Electric Surface Units

DOE seeks comment on its proposal to incorporate by reference certain sections of EN 60350–2:2013 and specifically on whether the proposed test vessels and water loads are representative of actual consumer loads used with electric surface units. (See section III.D.1 of this notice.)

5. Non-Circular and Flexible Electric Surface Units

DOE invites comments on whether the specifications included in EN 60350–2:2013 are appropriate for determining the test vessel size and position for non-circular surface units and full-surface induction zones. DOE also invites comments on its proposal to test surface units with flexible concentric sizes at each unique size setting. DOE also welcomes comments on its proposal to not require testing of certain electric and gas cooking top surface units, such as bridge zones, warming plates, grills and griddles, in determining cooking top efficiency. (See section III.E of this notice.)

6. Representativeness of the Water-Heating Test Method for Gas Surface Units

DOE seeks comment on its proposal to extend the water-heating test method to gas cooking tops by correlating surface unit input rate to test vessel diameter and the mass of the water load. DOE also seeks comment on its proposed test vessel diameters and water loads for the test of conventional gas cooking tops and whether a representative water load for gas cooking tops should differ significantly from that of electric cooking tops. Additionally, DOE seeks input regarding whether the range of gas burner input rates derived from EN 30–2–1 appropriately captures the burner input rates available on the U.S. market. (See section III.F of this notice.)

7. Annual Energy Consumption Calculation

DOE seeks comment on its proposed method and calculation to determine the annual energy consumption and integrated annual energy consumption of conventional cooking tops. (See section III.G of this notice.)

8. Combined Cooking Products

DOE seeks comment on its proposed method and calculation to determine the integrated annual energy consumption for the conventional cooking top component of a combined cooking product and the combined annual low-power mode energy consumption for the microwave oven component of a combined cooking product. (See section III.H of this notice.)

9. Installation Test Conditions

DOE seeks comment on its proposal to incorporate by reference certain test structures from ANSI Z2.1 as required

installation test conditions for use with conventional cooking tops and combined cooking products. DOE seeks comment on its proposal to clarify the definitions for built-in and freestanding cooking products to appropriately reflect how these products are installed in the field. (See section III.I of this notice.)

VI. Approval of the Office of the Secretary

The Secretary of Energy has approved publication of this proposed rule.

List of Subjects in 10 CFR Part 430

Administrative practice and procedure, Confidential business information, Energy conservation, Household appliances, Imports, Incorporation by reference, Intergovernmental relations, Small businesses.

Issued in Washington, DC, on August 5, 2016.

Kathleen B. Hogan,

Deputy Assistant Secretary for Energy Efficiency, Energy Efficiency and Renewable Energy.

For the reasons stated in the preamble, DOE is proposing to amend part 430 of chapter II of title 10, Code of Federal Regulations as set forth below:

PART 430—ENERGY CONSERVATION PROGRAM FOR CONSUMER PRODUCTS

■ 1. The authority citation for part 430 continues to read as follows:

Authority: 42 U.S.C. 6291–6309; 28 U.S.C. 2461 note.

■ 2. Section 430.2 is amended by:
■ a. Removing the definitions for ''Conventional range,'' ''Microwave/conventional cooking top,'' ''Microwave/conventional oven,'' and ''Microwave/conventional range;'' and
■ b. Revising the definitions for ''Conventional cooking top,'' ''Conventional oven'', ''Cooking products'', ''Microwave oven'', and ''Other cooking products''.

The revisions read as follows:

§ 430.2 Definitions.

* * * * *

Conventional cooking top means a category of cooking products which is a household cooking appliance consisting of a horizontal surface containing one or more surface units that utilize a gas flame, electric resistance heating, or electric inductive heating. This includes any conventional cooking top component of a combined cooking product.

* * * * *

Conventional oven means a category of cooking products which is a household cooking appliance consisting of one or more compartments intended for the cooking or heating of food by means of either a gas flame or electric resistance heating. It does not include portable or countertop ovens which use electric resistance heating for the cooking or heating of food and are designed for an electrical supply of approximately 120 volts. This includes any conventional oven(s) component of a combined cooking product.

Cooking products means consumer products that are used as the major household cooking appliances. They are designed to cook or heat different types of food by one or more of the following sources of heat: Gas, electricity, or microwave energy. Each product may consist of a horizontal cooking top containing one or more surface units and/or one or more heating compartments.

* * * * *

Microwave oven means a category of cooking products which is a household cooking appliance consisting of a compartment designed to cook or heat food by means of microwave energy, including microwave ovens with or without thermal elements designed for surface browning of food and convection microwave ovens. This includes any microwave oven(s) component of a combined cooking product.

* * * * *

Other cooking products means any category of cooking products other than conventional cooking tops, conventional ovens, and microwave ovens.

* * * * *

■ 3. Section 430.3 is amended:
■ a. By redesignating paragraphs (e)(16) through (e)(19) as paragraphs (e)(17) through (e)(20) and adding new paragraph (e)(16);
■ b. By removing paragraph (i)(7) and redesignating (i)(8) as (i)(7);
■ c. Redesignating paragraph (l) through (v) as paragraph (m) through (w), respectively; and
■ d. By adding new paragraph (l).

The revisions and additions read as follows:

§ 430.3 Materials incorporated by reference.

* * * * *

(e) * * *

(16) ANSI Z21.1–2016, (''ANSI Z21.1''), *Household cooking gas appliances,* (2016), IBR approved for appendix I to subpart B.

* * * * *

(l) *CENELEC.* European Committee for Electrotechnical Standardization, available from the HIS Standards Store, *https://www.ihs.com/products/cenelec-standards.html.*

(1) EN 60350–2:2013, (''EN 60350–2:2013''), *Household electric cooking appliances Part 2: Hobs—Methods for measuring performance,* (2013), IBR approved for appendix I to subpart B.

(2) [Reserved]

* * * * *

■ 4. Section 430.23 is amended by revising paragraph (i) to read as follows:

§ 430.23 Test procedures for the measurement of energy and water consumption.

* * * * *

(i) *Cooking products.* (1) Determine the integrated annual electrical energy consumption for conventional electric cooking tops, including any integrated annual electrical energy consumption for combined cooking products according to sections 4.1.2.1.2 and 4.2.2.1 of appendix I to this subpart. For conventional gas cooking tops, the integrated annual electrical energy consumption shall be equal to the sum of the conventional cooking top annual electrical energy consumption, $E_{CCE,}$ as defined in section 4.1.2.2.2 or 4.2.2.2, and the conventional cooking top annual combined low-power mode energy consumption, E_{CTSO}, as defined in section 4.1.2.2.3, or the annual combined low-power mode energy consumption for the conventional cooking top component of a combined cooking product, E_{CCTLP}, as defined in section 4.2.2.2 of appendix I to this subpart.

(2) Determine the annual gas energy consumption for conventional gas cooking tops according to section 4.1.2.2.1 of appendix I to this subpart.

(3) Determine the integrated annual energy consumption for conventional cooking tops according to sections 4.1.2.1.2, 4.1.2.2.2, 4.2.2.1, and 4.2.2.2, respectively, of appendix I to this subpart. Round the integrated annual energy consumption to one significant digit.

(4) The estimated annual operating cost corresponding to the energy consumption of a conventional cooking top, shall be the sum of the following products:

(i) The integrated annual electrical energy consumption for any electric energy usage, in kilowatt-hours (kWh) per year, as determined in accordance with paragraph (i)(1) of this section, times the representative average unit cost for electricity, in dollars per kWh, as provided pursuant to section 323(b)(2) of the Act; plus

(ii) The total annual gas energy consumption for any natural gas usage,

in British thermal units (Btu) per year, as determined in accordance with paragraph (i)(2) of this section, times the representative average unit cost for natural gas, in dollars per Btu, as provided pursuant to section 323(b)(2) of the Act; plus

(iii) The total annual gas energy consumption for any propane usage, in Btu per year, as determined in accordance with paragraph (i)(2) of this section, times the representative average unit cost for propane, in dollars per Btu, as provided pursuant to section 323(b)(2) of the Act.

(5) Determine the standby power for microwave ovens, excluding any microwave oven component of a combined cooking product, according to section 3.2.3 of appendix I to this subpart. Round standby power to the nearest 0.1 watt.

(6) For convertible cooking appliances, there shall be—

(i) An estimated annual operating cost and an integrated annual energy consumption which represent values for the operation of the appliance with natural gas; and

(ii) An estimated annual operating cost and an integrated annual energy consumption which represent values for the operation of the appliance with LP-gas.

(7) Determine the estimated annual operating cost for convertible cooking appliances that represents natural gas usage, as described in paragraph (i)(6)(i) of this section, according to paragraph (i)(4) of this section, using the total annual gas energy consumption for natural gas times the representative average unit cost for natural gas.

(8) Determine the estimated annual operating cost for convertible cooking appliances that represents LP-gas usage, as described in paragraph (i)(6)(ii) of this section, according to paragraph (i)(4) of this section, using the representative average unit cost for propane times the total annual energy consumption of the test gas, either propane or natural gas.

(9) Determine the integrated annual energy consumption for convertible cooking appliances that represents natural gas usage, as described in paragraph (i)(6)(i) of this section, according to paragraph (i)(3) of this section, when the appliance is tested with natural gas.

(10) Determine the integrated annual energy consumption for convertible cooking appliances that represents LP-gas usage, as described in paragraph (i)(6)(ii) of this section, according to paragraph (i)(3) of this section, when the appliance is tested with either natural gas or propane.

(11) Other useful measures of energy consumption for conventional cooking tops shall be the measures of energy consumption that the Secretary determines are likely to assist consumers in making purchasing decisions and that are derived from the application of appendix I to this subpart.

* * * * *

■ 7. Appendix I to subpart B of part 430 is revised to read as follows:

Appendix I to Subpart B of Part 430—Uniform Test Method for Measuring the Energy Consumption of Cooking Products

Note: Any representation related to active mode energy consumption of conventional cooking tops made after February 21, 2017 must be based upon results generated under this test procedure. Any representation related to standby and off mode power of conventional cooking tops, combined products, and microwave ovens must be based upon results generated under this test procedure.

Upon the compliance date(s) of any energy conservation standard(s) for cooking products, use of the applicable provisions of this test procedure to demonstrate compliance with the energy conservation standard will also be required.

1. Definitions

The following definitions apply to the test procedures in this appendix, including the test procedures incorporated by reference:

1.1 *Active mode* means a mode in which the product is connected to a mains power source, has been activated, and is performing the main function of producing heat by means of a gas flame, electric resistance heating, electric inductive heating, or microwave energy.

1.2 *ANSI Z21.1* means the test standard published by the American National Standards Institute titled, ''Household cooking gas appliances,'' Publication Z21.1 (2016) (incorporated by reference; see § 430.3).

1.3 *Built-in* means the product is enclosed in surrounding cabinetry, walls, or other similar structures on at least three sides, and can be supported by surrounding cabinetry or the floor.

1.4 *Combined cooking product* means a household cooking appliance that combines a cooking product with other appliance functionality, which may or may not include another cooking product. Combined cooking products include the following products: conventional range, microwave/conventional cooking top, microwave/conventional oven, and microwave/conventional range.

1.5 *Combined low-power mode* means the aggregate of available modes other than active mode, but including the delay start mode portion of active mode.

1.6 *Cooking area* is an area on a conventional cooking top surface heated by an inducted magnetic field where cookware is placed for heating, where more than one cookware item can be used simultaneously and controlled separately from other cookware placed on the cooking area, and that is either—

(1) An area where no clear limitative markings for cookware are visible on the surface of the cooking top; or

(2) An area with limitative markings.

1.7 *Cooking zone* is a conventional cooking top surface that is either a single electric resistance heating element or multiple concentric sizes of electric resistance heating elements, an inductive heating element, or a gas surface unit that is defined by limitative markings on the surface of the cooking top and can be controlled independently of any other cooking area or cooking zone.

1.8 *Cooking top control* is a part of the conventional cooking top used to adjust the power and the temperature of the cooking zone or cooking area for one cookware item.

1.9 *Cycle finished mode* is a standby mode in which a conventional cooking top provides continuous status display following operation in active mode.

1.10 *Drop-in* means the product is supported by horizontal surface cabinetry.

1.11 *EN 60350–2:2013* means the CENELEC test standard titled, ''Household electric cooking appliances Part 2: Hobs—Methods for measuring performance,'' Publication 60350–2 (2013) (incorporated by reference; see § 430.3).

1.12 *Freestanding* means the product is supported by the floor and is not specified in the manufacturer's instructions as able to be installed such that it is enclosed by surrounding cabinetry, walls, or other similar structures.

1.13 *IEC 62301 (First Edition)* means the test standard published by the International Electrotechnical Commission, titled ''Household electrical appliances—Measurement of standby power,'' Publication 62301 (First Edition 2005–06) (incorporated by reference; see § 430.3).

1.14 *IEC 62301 (Second Edition)* means the test standard published by the International Electrotechnical Commission, titled ''Household electrical appliances—Measurement of standby power,'' Publication 62301 (Edition 2.0 2011–01) (incorporated by reference; see § 430.3).

1.15 *Inactive mode* means a standby mode that facilitates the activation of active mode by remote switch (including remote control), internal sensor, or timer, or that provides continuous status display.

1.16 *Maximum power setting* means the maximum possible power setting if only one cookware item is used on the cooking zone or cooking area of a conventional cooking top.

1.17 *Normal non-operating temperature* means a temperature of all areas of an appliance to be tested that is within 5 °F (2.8 °C) of the temperature that the identical areas of the same basic model of the appliance would attain if it remained in the test room for 24 hours while not operating with all oven doors closed.

1.18 *Off mode* means any mode in which a cooking product is connected to a mains power source and is not providing any active mode or standby function, and where the mode may persist for an indefinite time. An

indicator that only shows the user that the product is in the off position is included within the classification of an off mode.

1.19 *Standard cubic foot (or liter (L)) of gas* means that quantity of gas that occupies 1 cubic foot (or alternatively expressed in L) when saturated with water vapor at a temperature of 60 °F (15.6 °C) and a pressure of 30 inches of mercury (101.6 kPa) (density of mercury equals 13.595 grams per cubic centimeter).

1.20 *Standby mode* means any mode in which a cooking product is connected to a mains power source and offers one or more of the following user-oriented or protective functions which may persist for an indefinite time:

(1) Facilitation of the activation of other modes (including activation or deactivation of active mode) by remote switch (including remote control), internal sensor, or timer;

(2) Provision of continuous functions, including information or status displays (including clocks) or sensor-based functions. A timer is a continuous clock function (which may or may not be associated with a display) that allows for regularly scheduled tasks and that operates on a continuous basis.

1.21 *Thermocouple* means a device consisting of two dissimilar metals which are joined together and, with their associated wires, are used to measure temperature by means of electromotive force.

1.22 *Symbol usage.* The following identity relationships are provided to help clarify the symbology used throughout this procedure.

A—Number of Hours in a Year
C—Specific Heat
E—Energy Consumed
H—Heating Value of Gas
K—Conversion for Watt-hours to Kilowatt-hours or Btu to kBtu
Ke—3.412 Btu/Wh, Conversion for Watt-hours to Btu
M—Mass
n—Number of Units
P—Power
Q—Gas Flow Rate
T—Temperature
t—Time
V—Volume of Gas Consumed

2. Test Conditions

2.1 *Installation.* Install a freestanding combined cooking product with the back directly against, or as near as possible to, a vertical wall which extends at least 1 foot above the appliance and 1 foot beyond both sides of the appliance, and with no side walls. Install a drop-in or built-in cooking top in the test enclosure specified in Figure 7 of ANSI Z21.1 (incorporated by reference; see § 430.3) according to the manufacturer's instructions. Install a built-in combined cooking product other than a microwave oven/conventional oven in the test enclosure specified in Figure 5 or 6 of ANSI Z21.1 in accordance with the manufacturer's instructions. If the manufacturer's instructions specify that the cooking product may be used in multiple installation conditions, install the appliance according to the built-in configuration. Completely assemble the product with all handles, knobs, guards, and similar components mounted in place. Position any electric resistance heaters, gas burners, and baffles in accordance with the manufacturer's instructions.

2.1.1 *Conventional electric cooking tops.* Connect these products to an electrical supply circuit with voltage as specified in section 2.2.1 of this appendix with a watt-hour meter installed in the circuit. The watt-hour meter shall be as described in section 2.8.1.1 of this appendix. For standby mode and off mode testing, install these products in accordance with Section 5, Paragraph 5.2 of IEC 62301 (Second Edition) (incorporated by reference; see § 430.3), disregarding the provisions regarding batteries and the determination, classification, and testing of relevant modes.

2.1.2 *Conventional gas cooking tops.* Connect these products to a gas supply line with a gas meter installed between the supply line and the appliance being tested, according to manufacturer's specifications. The gas meter shall be as described in section 2.8.2 of this appendix. Connect conventional gas cooking tops with electrical ignition devices or other electrical components to an electrical supply circuit of nameplate voltage with a watt-hour meter installed in the circuit. The watt-hour meter shall be as described in section 2.8.1.1 of this appendix. For standby mode and off mode testing, install these products in accordance with Section 5, Paragraph 5.2 of IEC 62301 (Second Edition) (incorporated by reference; see § 430.3), disregarding the provisions regarding batteries and the determination, classification, and testing of relevant modes.

2.1.3 *Microwave ovens, excluding any microwave oven component of a combined cooking product.* Install the microwave oven in accordance with the manufacturer's instructions and connect to an electrical supply circuit with voltage as specified in section 2.2.1 of this appendix. Install the microwave oven also in accordance with Section 5, Paragraph 5.2 of IEC 62301 (Second Edition) (incorporated by reference; see § 430.3), disregarding the provisions regarding batteries and the determination, classification, and testing of relevant modes. A watt meter shall be installed in the circuit and shall be as described in section 2.8.1.2 of this appendix.

2.1.4 *Combined cooking products standby mode and off mode.* For standby mode and off mode testing of combined cooking products, install these products in accordance with Section 5, Paragraph 5.2 of IEC 62301 (Second Edition) (incorporated by reference; see § 430.3), disregarding the provisions regarding batteries and the determination, classification, and testing of relevant modes.

2.2 *Energy supply.*

2.2.1 *Electrical supply.*

2.2.1.1 *Voltage.* For the test of conventional cooking tops, maintain the electrical supply requirements specified in Section 5.2 of EN 60350–2:2013 (incorporated by reference; see § 430.3). For microwave oven testing, maintain the electrical supply to the unit at 240/120 volts ±1 percent. For combined cooking product standby mode and off mode measurements, maintain the electrical supply to the unit at 240/120 volts ±1 percent. Maintain the electrical supply frequency for all products at 60 hertz ±1 percent.

2.2.1.1 *Gas burner adjustments.* Test conventional gas cooking tops with all of the gas burners adjusted in accordance with the installation or operation instructions provided by the manufacturer. In every case, adjust the burner with sufficient air flow to prevent a yellow flame or a flame with yellow tips.

2.2.2.2 *Natural gas.* For testing convertible cooking appliances or appliances which are designed to operate using only natural gas, maintain the natural gas pressure immediately ahead of all controls of the unit under test at 7 to 10 inches of water column (1743.6 to 2490.8 Pa). The regulator outlet pressure shall equal the manufacturer's recommendation. The natural gas supplied should have a heating value of approximately 1,025 Btu per standard cubic foot (38.2 kJ/L). The actual gross heating value, H_n, in Btu per standard cubic foot (kJ/L), for the natural gas to be used in the test shall be obtained either from measurements made by the manufacturer conducting the test using equipment that meets the requirements described in section 2.8.4 of this appendix or by the use of bottled natural gas whose gross heating value is certified to be at least as accurate a value that meets the requirements in section 2.8.4 of this appendix.

2.2.2.3 *Propane.* For testing convertible cooking appliances with propane or for testing appliances which are designed to operate using only LP-gas, maintain the propane pressure immediately ahead of all controls of the unit under test at 11 to 13 inches of water column (2740 to 3238 Pa). The regulator outlet pressure shall equal the manufacturer's recommendation. The propane supplied should have a heating value of approximately 2,500 Btu per standard cubic foot (93.2 kJ/L). Obtain the actual gross heating value, H_p, in Btu per standard cubic foot (kJ/L), for the propane to be used in the test either from measurements made by the manufacturer conducting the test using equipment that meets the requirements described in section 2.8.4 of this appendix, or by the use of bottled propane whose gross heating value is certified to be at least as accurate a value that meets the requirements described in section 2.8.4 of this appendix.

2.2.2.4 *Test gas.* Test a basic model of a convertible cooking appliance with natural gas or propane. Test with natural gas any basic model of a conventional cooking top that is designed to operate using only natural gas as the energy source. Test with propane gas any basic model of a conventional cooking top which is designed to operate using only LP gas as the gas energy source.

2.3 *Air circulation.* Maintain air circulation in the room sufficient to secure a reasonably uniform temperature distribution, but do not cause a direct draft on the unit under test.

2.5 *Ambient room test conditions*

2.5.1 *Active mode ambient room air temperature.* During the active mode test for conventional cooking tops, maintain the ambient room air temperature and pressure specified in Section 5.1 of EN 60350–2:2013 (incorporated by reference; see § 430.3).

2.5.2 *Standby mode and off mode ambient temperature.* For standby mode and off mode testing, maintain room ambient air temperature conditions as specified in Section 4, Paragraph 4.2 of IEC 62301 (Second Edition) (incorporated by reference; see § 430.3).

2.6 *Normal non-operating temperature.* All areas of the appliance to be tested must attain the normal non-operating temperature, as defined in section 1.17 of this appendix, before any testing begins. Measure the applicable normal non-operating temperature using the equipment specified in sections 2.8.3.1 and 2.8.3.2 of this appendix.

2.7 *Conventional cooking top test vessels*

2.7.1 *Conventional electric cooking top test vessels.* The test vessels and water amounts required for the test of conventional electric cooking tops must meet the requirements specified in Section 7.1.Z2 of EN 60350–2:2013 (incorporated by reference; see § 430.3).

2.7.2 *Conventional gas cooking top test vessels.* The test vessels for conventional gas cooking tops must be constructed according to Section 7.1.Z2 of EN 60350–2:2013 (incorporated by reference; see § 430.3). Use the following test vessel diameters and water amounts to test gas cooking zones having the burner input rates as specified:

Nominal gas burner input rate		Test vessel diameter inches (mm)	Mass of the water load lbs (kg)
Minimum Btu/h (kW)	Maximum Btu/h (kW)		
3,958 (1.16)	5,596 (1.64)	8.27 (210)	4.52 (2.05)
5,630 (1.65)	6,756 (1.98)	9.45 (240)	5.95 (2.70)
6,790 (1.99)	8,053 (2.36)	10.63 (270)	7.54 (3.42)
8,087 (2.37)	14,331 (4.2)	10.63 (270)	7.54 (3.42)
>14,331 (4.2)		11.81 (300)	11.33 (4.24)

2.8 *Instrumentation.* Perform all test measurements using the following instruments, as appropriate:

2.8.1 *Electrical Measurements.*

2.8.1.1 *Watt-hour meter.* The watt-hour meter for measuring the electrical energy consumption of conventional cooking tops must have a resolution as specified in Table Z1 of Section 5.3 of EN 60350–2:2013 (incorporated by reference; see § 430.3). The watt-hour meter for measuring the electrical energy consumption of microwave ovens must have a resolution of 0.1 watt-hour (0.36 kJ) or less and a maximum error no greater than 1.5 percent of the measured value.

2.8.1.2 *Standby mode and off mode watt meter.* The watt meter used to measure standby mode and off mode power must meet the requirements specified in Section 4, Paragraph 4.4 of IEC 62301 (Second Edition) (incorporated by reference; see § 430.3). For microwave oven standby mode and off mode testing, if the power measuring instrument used for testing is unable to measure and record the crest factor, power factor, or maximum current ratio during the test measurement period, measure the crest factor, power factor, and maximum current ratio immediately before and after the test measurement period to determine whether these characteristics meet the requirements specified in Section 4, Paragraph 4.4 of IEC 62301 (Second Edition).

2.8.2 *Gas Measurements.*

2.8.2.1 *Positive displacement meters.* The gas meter to be used for measuring the gas consumed by the gas burners of the conventional cooking top must have a resolution of 0.01 cubic foot (0.28 L) or less and a maximum error no greater than 1 percent of the measured valued for any demand greater than 2.2 cubic feet per hour (62.3 L/h).

2.8.3 *Temperature measurement equipment.*

2.8.3.1 *Room temperature indicating system.* For the test of microwave ovens, the room temperature indicating system must have an error no greater than ±1 °F (±0.6 °C) over the range 65° to 90 °F (18 °C to 32 °C). For conventional cooking tops, the room temperature indicating system must be as specified in Table Z1 of Section 5.3 of EN 60350–2:2013 (incorporated by reference; see § 430.3).

2.8.3.2 *Temperature indicator system for measuring surface temperatures.* Measure the temperature of any surface of a conventional cooking top by means of a thermocouple in firm contact with the surface. The temperature indicating system must have an error no greater than ±1 °F (±0.6 °C) over the range 65° to 90 °F (18 °C to 32 °C).

2.8.3.3 *Water temperature indicating system.* For the test of conventional cooking tops, the test vessel water temperature indicating system must be as specified in Table Z1 of Section 5.3 of EN 60350–2:2013 (incorporated by reference; see § 430.3).

2.8.3.4 *Room air pressure indicating system.* For the test of conventional cooking tops, the room air pressure indicating system must be as specified in Table Z1 of Section 5.3 of EN 60350–2:2013 (incorporated by reference; see § 430.3).

2.8.4 *Heating Value.* Measure the heating value of the natural gas or propane with an instrument and associated readout device that has a maximum error no greater than ±0.5% of the measured value and a resolution of ±0.2% or less of the full scale reading of the indicator instrument. Correct the heating value of natural gas or propane to standard pressure and temperature conditions in accordance with U.S. Bureau of Standards, circular C417, 1938.

2.8.5 *Scale.* The scale used to measure the mass of the water amount must be as specified in Table Z1 of Section 5.3 of EN 60350–2:2013 (incorporated by reference; see § 430.3).

3. Test Methods and Measurements

3.1. *Test methods.*

3.1.1 *Conventional cooking top.* Establish the test conditions set forth in section 2, *Test Conditions,* of this appendix. Turn off the gas flow to the conventional oven(s), if so equipped. The temperature of the conventional cooking top must be its normal non-operating temperature as defined in section 1.17 and described in section 2.6 of this appendix. For conventional electric cooking tops, select the test vessel and test position according to Sections 6.2.Z1, 7.1.Z2, 7.1.Z3, 7.1.Z4, and Annex ZA of EN 60350–2:2013 (incorporated by reference; see § 430.3). For conventional gas cooking tops, select the appropriate test vessel from the test vessels specified in section 2.7.2 of this appendix based on the burner input rate. Use the test methods set forth in Section 7.1.Z6 of EN 60350–2:2013 to measure the energy consumption of electric and gas cooking zones and electric cooking areas. Do not test specialty cooking zones that are for use only with non-circular cookware, such as bridge zones, warming plates, grills, and griddles.

3.1.1.1 *Conventional cooking top standby mode and off mode power except for any conventional cooking top component of a combined cooking product.* Establish the standby mode and off mode testing conditions set forth in section 2, *Test Conditions,* of this appendix. For conventional cooktops that take some time to enter a stable state from a higher power state as discussed in Section 5, Paragraph 5.1, Note 1 of IEC 62301 (Second Edition) (incorporated by reference; see § 430.3), allow sufficient time for the conventional cooking top to reach the lower power state before proceeding with the test measurement. Follow the test procedure as specified in Section 5, Paragraph 5.3.2 of IEC 62301 (Second Edition) for testing in each possible mode as described in sections 3.1.1.1.1 and 3.1.1.1.2 of this appendix. For units in which power varies as a function of displayed time in standby mode, set the clock time to 3:23 at the end of the stabilization period specified in Section 5, Paragraph 5.3 of IEC 62301 (First Edition), and use the average power approach described in Section 5, Paragraph 5.3.2(a) of IEC 62301 (First Edition), but with a single test period of 10 minutes +0/−2 sec after an additional stabilization period until the clock time reaches 3:33.

3.1.1.1.1 If the conventional cooking top has an inactive mode, as defined in section 1.15 of this appendix, measure and record the average inactive mode power of the conventional cooking top, P_{IA}, in watts.

3.1.1.1.2 If the conventional cooking top has an off mode, as defined in section 1.18

of this appendix, measure and record the average off mode power of the conventional cooking top, P_{OM}, in watts.

3.1.2 *Combined cooking product standby mode and off mode power.* Establish the standby mode and off mode testing conditions set forth in section 2, *Test Conditions,* of this appendix. For combined cooking products that take some time to enter a stable state from a higher power state as discussed in Section 5, Paragraph 5.1, Note 1 of IEC 62301 (Second Edition) (incorporated by reference; see § 430.3), allow sufficient time for the combined cooking product to reach the lower power state before proceeding with the test measurement. Follow the test procedure as specified in Section 5, Paragraph 5.3.2 of IEC 62301 (Second Edition) for testing in each possible mode as described in sections 3.1.2.1 and 3.1.2.2 of this appendix. For units in which power varies as a function of displayed time in standby mode, set the clock time to 3:23 at the end of the stabilization period specified in Section 5, Paragraph 5.3 of IEC 62301 (First Edition), and use the average power approach described in Section 5, Paragraph 5.3.2(a) of IEC 62301 (First Edition), but with a single test period of 10 minutes +0/−2 sec after an additional stabilization period until the clock time reaches 3:33.

3.1.2.1 If the combined cooking product has an inactive mode, as defined in section 1.15 of this appendix, measure and record the average inactive mode power of the combined cooking product, P_{IA}, in watts.

3.1.2.2 If the combined cooking product has an off mode, as defined in section 1.18 of this appendix, measure and record the average off mode power of the combined cooking product, P_{OM}, in watts.

3.1.3 *Microwave oven.*

3.1.3.1 *Microwave oven test standby mode and off mode power except for any microwave oven component of a combined cooking product.* Establish the testing conditions set forth in section 2, *Test Conditions,* of this appendix. For microwave ovens that drop from a higher power state to a lower power state as discussed in Section 5, Paragraph 5.1, Note 1 of IEC 62301 (Second Edition) (incorporated by reference; see § 430.3), allow sufficient time for the microwave oven to reach the lower power state before proceeding with the test measurement. Follow the test procedure as specified in Section 5, Paragraph 5.3.2 of IEC 62301 (Second Edition). For units in which power varies as a function of displayed time in standby mode, set the clock time to 3:23 and use the average power approach described in Section 5, Paragraph 5.3.2(a) of IEC 62301 (First Edition), but with a single test period of 10 minutes +0/−2 sec after an additional stabilization period until the clock time reaches 3:33. If a microwave oven is capable of operation in either standby mode or off mode, as defined in sections 1.20 and 1.18 of this appendix, respectively, or both, test the microwave oven in each mode in which it can operate.

3.2 *Test measurements.*

3.2.1 *Conventional cooking top test energy consumption.*

3.2.1.1 *Conventional cooking area or cooking zone energy consumption.,* Measure the energy consumption for each electric cooking zone and cooking area, in watt-hours (kJ) of electricity according to section 7.1.Z6.3 of EN 60350–2:2013 (incorporated by reference; see § 430.3). For electric cooking zones with multiple concentric sizes, each concentric size is treated as a separate cooking zone. Each unique size must be tested individually with the appropriate test vessel size based on the dimensions of each concentric cooking zone as measured in section 6.2.Z2 of EN 60350–2:2013. For the gas surface unit under test, measure the volume of gas consumption, V_{CT}, in standard cubic feet (L) of gas and any electrical energy, E_{IC}, consumed by an ignition device of a gas heating element or other electrical components required for the operation of the conventional gas cooking top in watt-hours (kJ).

3.2.1.2 *Conventional cooking top standby mode and off mode power except for any conventional cooking top component of a combined cooking product.* Make measurements as specified in section 3.1.1.1 of this appendix. If the conventional cooking top is capable of operating in inactive mode, as defined in section 1.15 of this appendix, measure the average inactive mode power of the conventional cooking top, $P_{IA,}$ in watts as specified in section 3.1.1.1.1 of this appendix. If the conventional cooking top is capable of operating in off mode, as defined in section 1.18 of this appendix, measure the average off mode power of the conventional cooking top, P_{OM}, in watts as specified in section 3.1.1.1.2 of this appendix.

3.2.2 *Combined cooking product standby mode and off mode power.* Make measurements as specified in section 3.1.2 of this appendix. If the combined cooking product is capable of operating in inactive mode, as defined in section 1.15 of this appendix, measure the average inactive mode power of the combined cooking product, $P_{IA,}$ in watts as specified in section 3.1.2.1 of this appendix. If the combined cooking product is capable of operating in off mode, as defined in section 1.18 of this appendix, measure the average off mode power of the combined cooking product, P_{OM}, in watts as specified in section 3.1.2.2 of this appendix.

3.2.3 *Microwave oven standby mode and off mode power except for any microwave oven component of a combined cooking product.* Make measurements as specified in Section 5, Paragraph 5.3 of IEC 62301 (Second Edition) (incorporated by reference; see § 430.3). If the microwave oven is capable of operating in standby mode, as defined in section 1.20 of this appendix, measure the average standby mode power of the microwave oven, P_{SB}, in watts as specified in section 3.1.3.1 of this appendix. If the microwave oven is capable of operating in off mode, as defined in section 1.18 of this appendix, measure the average off mode power of the microwave oven, P_{OM}, as specified in section 3.1.3.1.

3.3 *Recorded values.*

3.3.1 Record the test room temperature, T_R, at the start and end of each conventional cooktop or combined cooking product test, as determined in section 2.5 of this appendix.

3.3.2 Record the relative air pressure at the start of the test and at the end of the test in hectopascals (hPa).

3.3.3 For conventional cooking tops and combined cooking products, record the standby mode and off mode test measurements P_{IA} and P_{OM}, if applicable.

3.3.4 For each test of an electric cooking area or cooking zone, record the values listed in 7.1.Z6.3 in EN 60350–2:2013 (incorporated by reference; see § 430.3) and the total test electric energy consumption, E_{TV}.

3.3.5 For each test of a conventional gas surface unit, record the gas volume consumption, V_{CT}; the time until the power setting is reduced, t_c; the time when the simmering period starts, t_{90}; the initial temperature of the water; the water temperature when the setting is reduced, T_c; the water temperature at the end of the test, T_s; and the electrical energy for ignition of the burners, E_{IC}.

3.3.6 Record the heating value, H_n, as determined in section 2.2.2.2 of this appendix for the natural gas supply.

3.3.7 Record the heating value, H_p, as determined in section 2.2.2.3 of this appendix for the propane supply.

3.3.8 For microwave ovens except for any microwave oven component of a combined cooking product, record the average standby mode power, P_{SB}, for the microwave oven standby mode, as determined in section 3.2.3 of this appendix for a microwave oven capable of operating in standby mode. Record the average off mode power, P_{OM}, for the microwave oven off mode power test, as determined in section 3.2.3 of this appendix for a microwave oven capable of operating in off mode.

4. Calculation of Derived Results From Test Measurements

4.1 *Conventional cooking top.*

4.1.1 *Conventional cooking top energy consumption.*

4.1.1.1 *Energy consumption for electric cooking tops.* Calculate the energy consumption of a conventional electric cooking top, E_{CTE}, in Watt-hours (kJ), using the following equation:

$$E_{CTE} = \frac{2853g}{n_{tv}} \times \sum_{tv=1}^{n_{tv}} \frac{E_{tv}}{m_{tv}}$$

Where:

n_{tv} = the total number of tests conducted for the conventional electric cooking top

E_{tv} = the energy consumption measured for each test with a given test vessel, tv, in Wh

m_{tv} is the mass of water used for the test, in g.

4.1.1.2 Gas *energy consumption for conventional gas cooking tops.* Calculate the energy consumption of the conventional gas cooking top, E_{CTG}, in Btus (kJ) using the following equation:

$$E_{CTG} = \frac{2853g}{n_{tv}} \times \sum_{tv=1}^{n_{tv}} \frac{E_{tvg}}{m_{tv}}$$

Where:

n_{tv} = the total number of tests conducted for the conventional gas cooking top
m_{tv} = the mass of the water used to test a given cooking zone or area
E_{tvg} = ($V_{CT} \times H$), the gas energy consumption measured for each test with a given test vessel, tv, in Btu (kJ)

Where:

V_{CT} = total gas consumption in standard cubic feet (L) for the gas surface unit test as measured in section 3.2.1.1 of this appendix.
H = either H_n or H_p, the heating value of the gas used in the test as specified in sections 2.2.2.2 and 2.2.2.3 of this appendix, expressed in Btus per standard cubic foot (kJ/L) of gas.

4.1.1.3 *Electrical energy consumption for conventional gas cooking tops.* Calculate the energy consumption of the conventional gas cooking top, E_{CTGE}, in Watt-hours (kJ) using the following equation:

$$E_{CTGE} = \frac{2853g}{n_{tv}} \times \sum_{tv=1}^{n_{tv}} \frac{E_{IC}}{m_{tv}}$$

Where:

n_{tv} = the total number of tests conducted for the conventional gas cooking top
m_{tv} = the mass of the water used to test a given cooking zone or area
E_{IC} = the electrical energy consumed in watt-hours (kJ) by a gas surface unit as measured in section 3.2.1.1 of this appendix.

4.1.2 *Conventional cooking top annual energy consumption.*

4.1.2.1 *Conventional electric cooking top.*

4.1.2.1.1 *Annual energy consumption of a conventional electric cooking top.* Calculate the annual energy consumption of a conventional electric cooking top, E_{CA}, in kilowatt-hours (kJ) per year, defined as:

$E_{CA} = E_{CTE} \times K \times N_{CE}$

Where:

K = 0.001 kWh/Wh conversion factor for watt-hours to kilowatt-hours.
N_{CE} = 207.5 cooking cycles per year, the average number of cooking cycles per year normalized for duration of a cooking event estimated for conventional electric cooking tops.
E_{CTE} = energy consumption of the conventional electric cooking top as defined in section 4.1.1.1 of this appendix.

4.1.2.1.2 *Integrated annual energy consumption of a conventional electric cooking top.* Calculate the integrated annual electrical energy consumption, E_{IAEC}, of a conventional electric cooking top, except for any conventional electric cooking top component of a combined cooking product, in kilowatt-hours (kJ) per year, defined as:

$E_{IAEC} = E_{CA} + E_{CTLP}$

Where:

E_{CA} = the annual energy consumption of the conventional electric cooking top as defined in section 4.1.2.1.1 of this appendix.

E_{CTLP} = conventional cooking top annual combined low-power mode energy consumption = $[(P_{IA} \times S_{IA}) + (P_{OM} \times S_{OM})] \times K$,

Where:

P_{IA} = conventional cooking top inactive mode power, in watts, as measured in section 3.1.1.1.1 of this appendix.
P_{OM} = conventional cooking top off mode power, in watts, as measured in section 3.1.1.1.2 of this appendix.
If the conventional cooking top has both inactive mode and off mode annual hours, S_{IA} and S_{OM} both equal 4273.4;
If the conventional cooking top has an inactive mode but no off mode, the inactive mode annual hours, S_{IA}, is equal to 8546.9, and the off mode annual hours, S_{OM}, is equal to 0;
If the conventional cooking top has an off mode but no inactive mode, S_{IA} is equal to 0, and S_{OM} is equal to 8546.9;
K = 0.001 kWh/Wh conversion factor for watt-hours to kilowatt-hours.

4.1.2.2 *Conventional gas cooking top*

4.1.2.2.1 *Annual gas energy consumption of a conventional gas cooking top.* Calculate the annual gas energy consumption, E_{CCG}, in kBtus (kJ) per year for a conventional gas cooking top, defined as:

$E_{CCG} = E_{CTG} \times K \times N_{CG}$

Where:

N_{CG} = 214.5 cooking cycles per year, the average number of cooking cycles per year normalized for duration of a cooking event estimated for conventional gas cooking tops.
E_{CTG} = gas energy consumption of the conventional gas cooking top as defined in section 4.1.1.2 of this appendix.
K = 0.001 conversion factor for Btu to kBtu.

4.1.2.2.2 *Annual electrical energy consumption of a conventional gas cooking top.* Calculate the annual electrical energy consumption, E_{CCE}, in kilowatt-hours (kJ) per year for a conventional gas cooking top, defined as:

$E_{CCE} = E_{CTGE} \times K \times N_{CG}$

Where:

N_{CG} = 214.5 cooking cycles per year, the average number of cooking cycles per year normalized for duration of a cooking event estimated for conventional gas cooking tops.
E_{CTGE} = secondary electrical energy consumption of the conventional gas cooking top as defined in section 4.1.1.3 of this appendix.
K = 0.001 conversion factor for Wh to kWh.

4.1.2.2.3 *Integrated annual energy consumption of a conventional gas cooking top.* Calculate the integrated annual energy consumption, E_{IAEC}, of a conventional gas cooking top, except for any conventional gas cooking top component of a combined cooking product, in kBtus (kJ) per year, defined as:

$E_{IAEC} = E_{CC} + (E_{CTSO} \times K_e)$

Where:

$E_{CC} = E_{CCG} + (E_{CCE} \times K_e)$ the total annual energy consumption of a conventional gas cooking top

Where:

E_{CCG} = the primary annual energy consumption of a conventional gas cooking top as determined in section 4.1.2.2.1 of this appendix.
E_{CCE} = the secondary annual energy consumption of a conventional gas cooking top as determined in section 4.1.2.2.2 of this appendix.
K_e = 3.412 Btu/Wh (3.6 kJ/Wh), conversion factor of watt-hours to Btus.

E_{CTSO} = conventional cooking top annual combined low-power mode energy consumption = $[(P_{IA} \times S_{IA}) + (P_{OM} \times S_{OM})] \times K$,

Where:

P_{IA} = conventional cooking top inactive mode power, in watts, as measured in section 3.1.1.1.1 of this appendix.
P_{OM} = conventional cooking top off mode power, in watts, as measured in section 3.1.1.1.2 of this appendix.
If the conventional cooking top has both inactive mode and off mode annual hours, S_{IA} and S_{OM} both equal 4273.4;
If the conventional cooking top has an inactive mode but no off mode, the inactive mode annual hours, S_{IA}, is equal to 8546.9, and the off mode annual hours, S_{OM}, is equal to 0;
If the conventional cooking top has an off mode but no inactive mode, S_{IA} is equal to 0, and S_{OM} is equal to 8546.9;
K = 0.001 kWh/Wh conversion factor for watt-hours to kilowatt-hours.

4.2 *Combined cooking products.*

4.2.1 *Combined cooking product annual combined low-power mode energy consumption.* Calculate the combined cooking product annual combined low-power mode energy consumption, E_{CCLP}, defined as:

$E_{CCLP} = [(P_{IA} \times S_{IA})] + [(P_{OM} \times S_{OM})] \times K$,

Where:

P_{IA} = combined cooking product inactive mode power, in watts, as measured in section 3.1.2.1 of this appendix.
P_{OM} = combined cooking product off mode power, in watts, as measured in section 3.1.2.2 of this appendix.
S_{TOT} equals the total number of inactive mode and off mode hours per year, 8,329.2;
If the combined cooking product has both inactive mode and off mode, S_{IA} and S_{OM} both equal $S_{TOT}/2$;
If the combined cooking product has an inactive mode but no off mode, the

inactive mode annual hours, S_{IA}, is equal to S_{TOT}, and the off mode annual hours, S_{OM}, is equal to 0;

If the combined cooking product has an off mode but no inactive mode, S_{IA} is equal to 0, and S_{OM} is equal to S_{TOT};

K = 0.001 kWh/Wh conversion factor for watt-hours to kilowatt-hours.

4.2.2 *Integrated annual energy consumption of any conventional cooking top component of a combined cooking product.*

4.2.2.1 *Integrated annual energy consumption of any conventional electric cooking top component of a combined cooking product.* Calculate the integrated annual energy consumption of a conventional electric cooking top component of a combined cooking product, E_{IAEC}, in kilowatt-hours (kJ) per year and defined as:

$E_{IAEC} = E_{CA} + E_{CCTLP}$

Where,

E_{CA} = the annual energy consumption of the conventional electric cooking top as defined in section 4.1.2.1.1 of this appendix.

E_{CCTLP} = annual combined low-power mode energy consumption for the conventional cooking top component of a combined cooking product, in kWh (kJ) per year, calculated as:

$$E_{CCTLP} = E_{CCLP} \times \frac{H_{CT}}{H_T}$$

Where:

E_{CCLP} = combined cooking product annual combined low-power mode energy consumption, determined in section 4.2.1 of this appendix.

H_{CT} = 213.1 hours per year, the average number of cooking hours per year for a conventional cooking top.

$H_T = H_{OV} + H_{CT} + H_{MWO}$

Where:

H_{OV} = average number of cooking hours per year for a conventional oven, which is equal to 219.9 hours per year. If the combined cooking product does not include a conventional oven, then H_{OV} = 0.

H_{MWO} = average number of cooking hours per year for a microwave oven, which is equal to 44.9 hours per year. If the combined cooking product does not include a microwave oven, then H_{MWO} = 0.

4.2.2.2 *Integrated annual energy consumption of any conventional gas cooking top component of a combined cooking product.* Calculate the integrated annual energy consumption of a conventional gas cooking top component of a combined cooking product, E_{IAEC}, in kBtus (kJ) per year and defined as:

$E_{IAEC} = E_{CC} + E_{CCTLP} \times K_e)$

Where,

$E_{CC} = E_{CCG} + E_{CCE}$, the total annual energy consumption of a conventional gas cooking top,

Where:

E_{CCG} = the annual gas energy consumption of a conventional gas cooking top as determined in section 4.1.2.2.1 of this appendix.

E_{CCE} = the annual electrical energy consumption of a conventional gas cooking top as determined in section 4.1.2.2.2 of this appendix.

K_e = 3.412 kBtu/kWh (3,600 kJ/kWh), conversion factor for kilowatt-hours to kBtus.

E_{CCTLP} = annual combined low-power mode energy consumption for the conventional cooking top component of a combined cooking product, in kWh (kJ) per year, calculated as:

$$E_{CCTLP} = E_{CCLP} \times \frac{H_{CT}}{H_T}$$

Where:

E_{CCLP} = combined cooking product annual combined low-power mode energy consumption, determined in section 4.2.1 of this appendix.

H_{CT} = 213.1 hours per year, the average number of cooking hours per year for a conventional cooking top.

$H_T = H_{OV} + H_{CT} + H_{MWO}$

Where:

H_{OV} = average number of cooking hours per year for a conventional oven, which is equal to 219.9 hours per year. If the combined cooking product does not include a conventional oven, then H_{OV} = 0.

H_{MWO} = average number of cooking hours per year for a microwave oven, which is equal to 44.9 hours per year. If the combined cooking product does not include a microwave oven, then H_{MWO} = 0.

4.2.3 *Annual combined low-power mode energy consumption for any microwave oven component of a combined cooking product.* Calculate the annual combined low-power mode energy consumption of a microwave oven component of a combined cooking product, E_{CMWOLP}, in kWh (kJ) per year, and defined as:

$$E_{CMWOLP} = E_{CCLP} \times \frac{H_{MWO}}{H_T}$$

Where:

E_{CCLP} = combined cooking product annual combined low-power mode energy consumption, determined in section 4.2.1 of this appendix.

H_{MWO} = 44.9 hours per year, the average number of cooking hours per year for a microwave oven.

$H_T = H_{OV} + H_{CT} + H_{MWO}$

Where:

H_{OV} = average number of cooking hours per year for a conventional oven, which is equal to 219.9 hours per year. If the combined cooking product does not include a conventional oven, then H_{OV} = 0.

H_{CT} = average number of cooking hours per year for a conventional cooking top, which is equal to 213.1 hours per year. If the combined cooking product does not include a conventional cooking top, then H_{CT} = 0.

[Docket ID: FEMA–2015–0006]

RIN 1660–AA85

Updates to Floodplain Management and Protection of Wetlands Regulations To Implement Executive Order 13690 and the Federal Flood Risk Management Standard

AGENCY: Federal Emergency Management Agency, DHS.

ACTION: Notice of proposed rulemaking.

SUMMARY: The Federal Emergency Management Agency (FEMA) proposes to amend its regulations on ''Floodplain Management and Protection of Wetlands'' to implement Executive Order 13690, which establishes the Federal Flood Risk Management Standard (FFRMS). FEMA also proposes a supplementary policy (FEMA Policy: 078–3) that would further clarify how FEMA applies the FFRMS.

DATES: Comments must be received no later than October 21, 2016.

ADDRESSES: You may submit comments, identified by Docket ID: FEMA–2015–0006, by one of the following methods:

Federal eRulemaking Portal: http://www.regulations.gov. Follow the instructions for submitting comments.

Mail/Hand Delivery/Courier: Regulatory Affairs Division, Office of Chief Counsel, Federal Emergency Management Agency, 8NE–1604, 500 C Street SW., Washington, DC 20472–3100.

To avoid duplication, please use only one of these methods. All comments received will be posted without change to *http://www.regulations.gov*, including any personal information provided. For instructions on submitting comments, see the Public Participation portion of the **SUPPLEMENTARY INFORMATION** section.

I. Public Participation

We encourage you to participate in this rulemaking by submitting comments and related materials. We will consider all comments and materials received during the comment period.

If you submit a comment, identify the agency name and the Docket ID for this rulemaking, indicate the specific section of this document to which each comment applies, and give the reason for each comment. You may submit your comments and materials by electronic means, mail, or delivery to the address under the **ADDRESSES** section. Please submit your comments and materials by only one means.

Regardless of the method used for submitting comments or material, all submissions will be posted, without change, to the Federal e-Rulemaking Portal at *www.regulations.gov,* and will

include any personal information you provide. Therefore, submitting this information makes it public. You may wish to read the Privacy Act notice that is available via a link on the homepage of *www.regulations.gov.*

Viewing comments and documents: For access to the docket to read background documents or comments received, go to the Federal e-Rulemaking Portal at *http://www.regulations.gov.* Background documents and submitted comments may also be inspected at the Office of Chief Counsel, Federal Emergency Management Agency, 500 C Street SW., 8NE–1604, Washington, DC 20472–3100.

II. Executive Summary

The Federal Emergency Management Agency (FEMA) is proposing to amend 44 CFR part 9 ''Floodplain Management and Protection of Wetlands'' and issue a supplementary policy to implement the Federal Flood Risk Management Standard (FFRMS) that was established by Executive Order 13690. 44 CFR part 9 describes the 8-step process FEMA uses to determine whether a proposed action would be located within or affect a floodplain, and if so, whether and how to continue with or modify the proposed action. Executive Order 13690 and the FFRMS changed the Executive Branch-wide guidance for defining the ''floodplain'' with respect to ''federally funded projects'' (*i.e.*, actions involving the use of Federal funds for new construction, substantial improvement, or to address substantial damage to a structure or facility). For FEMA Federally Funded Projects, FEMA proposes to use the updated definition of ''floodplain'' contained in the FFRMS. As discussed further below, the FFRMS allows the agency to define ''floodplain'' using any of three ''approaches.'' In many cases, each of these approaches would result in a larger floodplain and a requirement to design projects such that they are resilient to a higher vertical elevation. For actions that do not meet the definition of FEMA Federally Funded Project, FEMA would continue to use the historical definition of floodplain, *i.e.*, the area subject to a one percent or greater chance of flooding in any given year (or the area subject to a 0.2 percent annual chance of flooding in any given year for critical actions). Finally, the proposed rule would require the use, where possible, of natural systems, ecosystem processes, and nature-based approaches in the development of alternatives for all actions proposed in a floodplain.

FEMA estimates that for the 10-year period after the rule goes into effect, the benefits would justify the costs. Flooding is the most common and costly type of natural disaster in the United States, and floods are expected to be more frequent and more severe over the next century due in part to the projected effects of climate change. This proposed rule would ensure that FEMA Federally Funded Projects are designed to be resilient to both current and future flood risks.

III. Background

Below, FEMA describes in more specific detail the basis for this proposed rule. Section III.A. describes Executive Order 11988 and the Water Resources Council's 1978 ''Floodplain Management Guidelines'' (1978 Guidelines). Executive Order 11988 along with the 1978 Guidelines established an 8-step decision-making process by which Federal agencies carry out Executive Order 11988's direction to avoid the long- and short-term adverse impacts associated with the occupancy and modification of the floodplain and avoid the direct or indirect support of floodplain development whenever there is a practicable alternative. Section III.B. describes FEMA implementing regulations at 44 CFR part 9, which closely follow the model decision-making process. Section III.C. describes how lessons learned from major events, including Hurricane Sandy, prompted reevaluation of the prevailing standard for determining whether a proposed action was located within a floodplain.

Section III.D. describes the development of Executive Order 13690 and the Federal Flood Risk Management Standard. Lessons learned from major flood events, including Hurricane Sandy, prompted reevaluation of the prevailing standard. Pursuant to direction from the President's Climate Action Plan and to build on the work of the Hurricane Sandy Rebuilding Task Force, the Mitigation Framework Leadership Group developed the Federal Flood Risk Management Standard. Subsequently, the President issued Executive Order 13690 to establish the Federal Flood Risk Management Standard, and to amend Executive Order 11988. Executive Order 13690 directs agencies to issue or amend their existing regulations and procedures to comply with the Order. Section III.E. describes the substantive components of the Federal Flood Risk Management Standard and Section III.F. describes FEMA's proposed approach to implement the required changes.

A. Executive Order 11988, ''Floodplain Management''

The President issued Executive Order 11988, (42 FR 26951, May 25, 1977) in furtherance of the National Flood Insurance Act of 1968, as amended (42 U.S.C. 4001 *et seq.*); the Flood Disaster Protection Act of 1973, as amended (Pub. L. 93–234, 87 Stat. 975); and the National Environmental Policy Act of 1969 (NEPA) (42 U.S.C. 4321 *et seq.*).[1] Executive Order 11988 requires Federal agencies to avoid, to the extent possible, the long- and short-term adverse impacts associated with the occupancy and modification of floodplains, where there is a practicable alternative. It requires each Federal agency to provide leadership and take action to reduce the risk of flood loss, to minimize the impact of floods on human safety, health, and welfare, and to restore and preserve the natural and beneficial values served by floodplains in carrying out its responsibilities for: (1) Acquiring, managing, and disposing of Federal lands and facilities; (2) providing federally undertaken, financed, or assisted construction and improvements; and (3) conducting Federal activities and programs affecting land use, including but not limited to water and related land resources planning, regulating, and licensing activities. It states that each agency has a responsibility to evaluate the potential effects of any actions it may take in a floodplain; to ensure that its planning, programs, and budget requests reflect consideration of flood hazards and floodplain management; and to prescribe procedures to implement the policies and requirements of the Executive Order.

In order to meet these requirements, each agency, before taking an action, must determine whether the proposed action will occur in a floodplain.[2] Prior to being revised in 2015, Executive Order 11988 defined the word ''floodplain'' to include, at a minimum, the ''area subject to a one percent or

[1] The National Flood Insurance Act and the Flood Disaster Protection Act establish a multi-purpose program to provide flood insurance, minimize the damage caused by flood losses, and guide the development of proposed construction, where practicable, away from floodplains. NEPA requires Federal agencies to analyze the environmental impacts of proposed actions and evaluate alternatives to those actions, which includes the evaluation of floodplains.

[2] Any action FEMA takes, including its provision of grants for disaster assistance, first undergoes an analysis pursuant to Executive Order 11988 (unless the action is specifically exempted from the requirements of the Order). The grant recipient, therefore, generally provides information to FEMA about the practicability of alternatives outside the floodplain and other information to assist in the analysis.

greater chance of flooding in any given year.'' [3] The Executive Order defines agency ''action'' to include actions that the agency takes directly (such as when a Federal agency builds a new facility for its own operations) as well as actions that a non-Federal entity takes using Federal funding (such as a State or local government building a new facility using Federal grant funding).

If the action will occur in a floodplain, the agency must consider alternatives to avoid adverse effects and incompatible development in the floodplain. If the agency finds that the only practicable alternative requires the action to occur in the floodplain, the agency must, prior to taking the action, design or modify the action in order to minimize potential harm to or within the floodplain. Additionally, the agency must prepare and circulate a notice containing an explanation of why the action is proposed to be located in the floodplain. Particularly relevant to FEMA, the Executive Order also requires agencies to provide appropriate guidance to applicants for grant funding to encourage them to evaluate the effects of their proposals in floodplains prior to submitting grant applications.

Executive Order 11988 requires agencies to prepare implementing procedures in consultation with the Water Resources Council (WRC),[4] FEMA, and the Council on Environmental Quality (CEQ). As noted, in 1978, the WRC issued ''Floodplain Management Guidelines,'' (1978 Guidelines), the authoritative interpretation of Executive Order 11988.[5] The 1978 Guidelines provided a section-by-section analysis, defined key terms, and outlined an 8-step decision-making process for carrying out the directives of Executive Order 11988.

B. 44 CFR Part 9, ''Floodplain Management and Protection of Wetlands''

FEMA promulgated regulations implementing Executive Order 11988 at 44 CFR part 9, ''Floodplain Management and Protection of Wetlands.'' [6] Part 9 closely follows the 1978 Guidelines in setting forth FEMA's policy and procedures for floodplain management relating to disaster planning, response and recovery, and hazard mitigation. Part 9 applies to FEMA disaster and non-disaster assistance programs, including Public Assistance (PA), Individual Assistance (IA), Hazard Mitigation Assistance (HMA), and grants processed by FEMA's Grant Programs Directorate (GPD) (involving grants for preparedness activities). Pursuant to section 8 of Executive Order 11988, Part 9 does not apply to assistance provided for emergency work essential to save lives and protect property and public health and safety, performed pursuant to sections 403 and 502 of the Robert T. Stafford Disaster Relief and Emergency Assistance Act, as amended (42 U.S.C. 5170b and 5192). In addition, FEMA does not apply Part 9 to non-grant, site-specific actions under the National Flood Insurance Program (NFIP),[7] such as the issuance of individual flood insurance policies, the adjustment of claims, or the issuance of individual flood insurance maps. FEMA does not apply Part 9 to site-specific actions under the NFIP because the establishment of programmatic criteria, rather than the application of the programmatic criteria to individual situations, is the action with the potential to influence/affect floodplains.[8]

As noted, Part 9 outlines the 8-step decision-making process FEMA follows in applying Executive Order 11988 to its actions:

Step (1) Floodplain determination (44 CFR 9.7). Under Step 1, FEMA must determine if a proposed agency action is located in or affects the base floodplain (or, for critical actions, the 500-year floodplain). The base floodplain is the area subject to inundation by the base flood, which is that flood which has a 1 percent chance of occurrence in any given year (also known as the 1 percent annual chance flood or 100-year flood). A ''critical action'' is any activity for which even a slight chance of flooding would be too great.[9] The minimum floodplain of concern for critical actions is 500-year floodplain, which is the area subject to inundation from a flood having a 0.2 percent chance of occurring in any given year. The 500-year floodplain generally covers a larger area than the base floodplain. FEMA's regulations state that in each instance where the 8-step process refers to the base floodplain, an agency should substitute the 500-year floodplain for the base floodplain if the proposed action is a critical action.

FEMA follows a specific regulatory sequence in order to make its floodplain determination. First, FEMA must consult the Flood Insurance Rate Map (FIRM), the Flood Boundary Floodway Map (FBFM), and the Flood Insurance Study (FIS) for the area. A FIRM is an official, detailed map issued by the NFIP, showing elevations and boundaries of the 1 percent annual chance floodplain and the 0.2 percent annual chance floodplain.[10] The FBFM is a version of a flood map that shows only the floodway [11] and flood boundaries. An FIS report is an examination, evaluation and determination of flood hazards and, if appropriate, corresponding water surface elevations. If a FIRM is not available, FEMA must obtain a Flood Hazard Boundary Map (FHBM) which is a less detailed map than a FIRM and shows the approximate areas of the base floodplain. If data on flood elevations, floodways, or coastal high hazard areas are needed, or if the map does not delineate the flood hazard boundaries in the vicinity of the proposed site, FEMA must seek detailed information from a list of sources included in the

[3] This is also referred to as the 100-year floodplain or the base floodplain.

[4] The Water Resources Council, established by statute (42 U.S.C. 1962a–1), is charged with maintaining a continuing study and preparing an assessment biennially, or at such less frequent intervals as the Council may determine, of the adequacy of supplies of water necessary to meet the water requirements in each water resource region in the United States and the national interest therein; and maintaining a continuing study of the relation of regional or river basin plans and programs to the requirements of larger regions of the Nation and of the adequacy of administrative and statutory means for the coordination of the water and related land resources policies and programs of the several Federal agencies. It is responsible for appraising the adequacy of existing and proposed policies and programs to meet such requirements, and making recommendations to the President with respect to Federal policies and programs.

[5] 43 FR 6030, Feb. 10, 1978. A PDF copy of the 1978 Guidelines can be found at this link: *http://portal.hud.gov/hudportal/documents/huddoc?id=DOC_14216.pdf.*

[6] FEMA published an interim final rule on December 27, 1979 (44 FR 76510) and a final rule on September 9, 1980 (45 FR 59520). Note that this part also implements a related Executive Order 11990, ''Protection of Wetlands.'' See 42 FR 26961, May 25, 1977.

[7] A complete list of FEMA programs to which part 9 does not apply appears at 44 CFR 9.5. The exemption for actions under the NFIP is located at 44 CFR 9.5(f).

[8] For example, part 9 requires FEMA to apply the 8-step process to a programmatic determination of categories of structures to be insured, but does not require FEMA to apply an 8-step review to a determination of whether to insure each individual structure. See 45 FR 59520, Sept. 9, 1980 (59523).

[9] The concept of critical actions evolved during the drafting of the 1978 Guidelines and reflects a concern that the impacts of floods on human safety, health, and welfare for many activities could not be minimized unless a higher degree of protection than the base flood was provided. See Interagency Task Force on Floodplain Management, Further Advice on Executive Order 11988 Floodplain Management (1980) available at *http://www.gsa.gov/graphics/pbs/FEDERAL_EMERGENCY_MANAGEMENT_AGENCY_R2F-a8-k_0Z5RDZ-i34K-pR.pdf.*

[10] FEMA estimates that only 18 percent of mapped flood zones have detailed floodplain boundaries of the 0.2 percent annual chance floodplain.

[11] The floodway is the channel of a river or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than a designated height. See 44 CFR 59.1.

regulations. See 44 CFR 9.7(c)(1)(ii). If the sources listed do not have or know of detailed information and are unable to assist in determining whether or not the proposed site is in the base floodplain, FEMA must seek the services of a licensed consulting engineer experienced in this type of work. If, however, a decision involves an area or location within extensive Federal or State holdings or a headwater area, and no FIS, FIRM, FBFM, or FHBM is available, FEMA will seek information from the land administering agency before seeking information and/or assistance from the list of sources included in the regulations. Then, if none of the sources listed has information or can provide assistance, FEMA will seek the services of an experienced Federal or other engineer.

Step (2) Early public review (44 CFR 9.8). FEMA must make public its intent to locate a proposed action in the base floodplain. FEMA must provide adequate information to enable the public to have an impact on the decision outcome for all proposed actions having potential to affect, adversely, or be affected by floodplains. For each action having national significance for which notice is provided, FEMA uses the **Federal Register** as the minimum means for notice, and will provide notice by mail to national organizations reasonably expected to be interested in the action. 44 CFR 9.8(c)(5) describes the contents of the public notice, such as a description of the action, the degree of hazard involved, a map of the area, or other identification of the floodplain, and identification of the responsible agency official.

Step (3) Practicable alternatives (44 CFR 9.9). If the action is in the floodplain, FEMA will identify and evaluate practicable alternatives to carrying out a proposed action in floodplains, including the following: Alternative sites outside the floodplain; alternative actions which serve essentially the same purpose as the proposed action, but which have less potential to affect or be affected by the floodplain; and ''no action.'' The floodplain site itself must be a practicable location in light of the other factors. Under 44 CFR 9.9(c), FEMA will analyze several factors in determining the practicability of the alternatives described in 44 CFR 9.9(b), namely natural environment, social concerns, economic aspects, and legal constraints. 44 CFR 9.9(d) states that FEMA will not locate the proposed action in the floodplain, if a practicable alternative exists outside the floodplain or wetland. For critical actions, FEMA will not locate the proposed action in the 500-year floodplain, if a practicable alternative exists outside the 500-year floodplain. Even if no practicable alternative exists outside the floodplain, in order to carry out the action the floodplain or wetland must itself be a practicable location in light of the review required under Step 3.

Step (4) Impact of chosen alternative (44 CFR 9.10). FEMA must identify if the action has impacts in the floodplain or directly or indirectly supports floodplain development that has additional impacts in the floodplain. If the proposed action is outside the floodplain and has no identifiable impacts or support, the action can be implemented (Step 8). 44 CFR 9.10(b) provides that FEMA will identify the potential direct and indirect adverse impacts associated with the occupancy and modification of floodplains and the potential direct and indirect support of floodplain development that could result from the proposed action. FEMA's identification of such impacts shall be to the extent necessary to comply with the requirements of Executive Order 11988 to avoid floodplain locations unless they are the only practicable alternatives and to minimize harm to and within floodplains and wetlands.

Step (5) Minimize impacts (44 CFR 9.11). If the proposed action has identifiable impacts in the base floodplain or directly or indirectly supports development in the floodplain, FEMA must minimize these effects and restore and preserve the natural and beneficial floodplain values served by floodplains. 44 CFR 9.11(b) states generally that FEMA will design or modify its actions so as to minimize harm to or within the floodplain; will minimize destruction, loss, or degradation of wetlands; will restore and preserve natural and beneficial floodplain values; and will preserve and enhance natural and beneficial wetland values. Pursuant to 44 CFR 9.11(c), FEMA will more specifically minimize potential harm to lives and the investment at risk from the base flood, or, in the case of critical actions, from the 500-year flood; potential adverse impacts the action may have on others; and potential adverse impacts the action may have on floodplain values. Pursuant to 44 CFR 9.11(d), FEMA will not allow new construction or substantial improvement in a floodway, and will not allow new construction in a coastal high hazard area, except for a functionally dependent use [12] or a structure or facility which facilitates an open space use. For a structure which is a functionally dependent use, or which facilitates an open space use, FEMA will not allow construction of a new or substantially improved structure in a coastal high hazard area unless it is elevated on adequately anchored pilings or columns, and securely anchored to such piles or columns so that the lowest portion of the structural members of the lowest floor (excluding the pilings or columns) is elevated to or above the base flood level (the 500-year flood level for critical actions) (including wave height). Regarding elevation of structures, 44 CFR 9.11(d)(3) states that there will be no new construction or substantial improvement of structures unless the lowest floor of the structures (including basement) is at or above the level of the base flood, and there will be no new construction or substantial improvement of structures involving a critical action unless the lowest floor of the structure (including the basement) is at or above the level of the 500-year flood.

Step (6) Reevaluate alternatives (44 CFR 9.9). FEMA must reevaluate the proposed action. Pursuant to 44 CFR 9.9(e), upon determination of the impact of the proposed action to or within the floodplain and of what measures are necessary to comply with the requirement to minimize harm to and within the floodplains, FEMA will determine whether: the action is still practicable at a floodplain site in light of the exposure to flood risk and the ensuing disruption of natural values, the floodplain site is the only practicable alternative, there is a potential for limiting the action to increase the practicability of previously rejected non-floodplain sites and alternative actions, and minimization of harm to or within the floodplain can be achieved using all practicable means. Pursuant to 44 CFR 9.9(e)(2), FEMA will take no action in a floodplain unless the importance of the floodplain site clearly outweighs the requirement of Executive Order 11988 to avoid direct or indirect support of floodplain development; reduce the risk of flood loss; minimize the impact of floods on human safety, health, and welfare; and restore and preserve floodplain values.

Step (7) Findings and public explanation (44 CFR 9.12). If FEMA finds that the only practicable alternative is to take the action in the floodplain, it must give public notice of the reasons for this finding. 44 CFR

[12] A functionally dependent use means a use which cannot perform its intended purpose unless it is located or carried out in close proximity to water (*e.g.*, bridges and piers). See 44 CFR 9.4.

9.12(e) describes the requirements for the content of such notice, such as a statement of why the proposed action must be located in an area affecting or affected by a floodplain or wetland, a description of all significant facts considered in making this determination, identification of the responsible official, and a map of the relevant area.

Step (8) Implementation (Multiple sections of 44 CFR and applicable program guidance). FEMA may implement the proposed action after it allows a reasonable period for public response and reviews the implementation and post-implementation to ensure compliance with the minimization standards in 44 CFR 9.11. Implementation of the requirements of Executive Order 11988 is integrated into the specific regulations and procedures of the grant program under which the action is proposed to take place. After the proposed action is implemented, the FEMA program providing the funding determines, under its applicable regulations and procedures, whether the grant recipient has completed the prescribed mitigation.

C. Reevaluation of the 1 Percent Chance or 100-Year Flood Standard

In the aftermath of Hurricane Sandy, the President issued Executive Order 13632,[13] which created the Federal Interagency Hurricane Sandy Rebuilding Task Force (Sandy Task Force). The Sandy Task Force was chaired by the Secretary of the Department of Housing and Urban Development (HUD), which led the effort in coordination with multiple Federal partners. The Sandy Task Force was supported by an advisory group composed of State, local, and Tribal elected leaders. Pursuant to direction from Executive Order 13632 to remove obstacles to resilient rebuilding, the Sandy Task Force reevaluated the 1 percent chance/100-year standard. In April 2013, the Sandy Task Force announced a new Federal flood risk reduction standard which required elevation or other flood-proofing to 1 foot above [14] the best available and most recent base flood elevation and applied that standard to all Federal disaster recovery investments in Sandy-affected communities.[15] The Sandy Task Force called for all major Sandy rebuilding projects in Sandy-affected communities using Federal funding to be elevated or otherwise flood-proofed according to this new flood risk reduction standard.

In May 2013, DHS issued the National Mitigation Framework (NMF) to establish a common platform and forum for coordinating and addressing how the Nation manages risk through mitigation capabilities.[16] The NMF established the Mitigation Framework Leadership Group (MitFLG) to promote coordination of mitigation efforts across the Federal Government. Its goal is broader than the goal of the Sandy Task Force, as it focuses on enabling achievement of a secure and resilient Nation by developing, employing and coordinating core mitigation capabilities to reduce the loss of life and property. The MitFLG is responsible for assessing the effectiveness of mitigation core capabilities as they are developed and deployed across the Nation. The MitFLG facilitates information exchange, coordinates policy implementation recommendations on national-level issues, and oversees the successful implementation of the NMF. The MitFLG is composed of representatives from the Department of Agriculture, the Department of Commerce, the Department of Defense, the Department of Energy, the Environmental Protection Agency, the General Services Administration, the Department of Health and Human Services, DHS, HUD, the Department of the Interior, the Department of Justice, the Small Business Administration, and the Department of Transportation. FEMA also chairs the MitFLG.[17]

In June 2013, the President issued a Climate Action Plan [18] that directs agencies to take appropriate actions to reduce risk to Federal investments, specifically directing agencies to build on the work done by the Sandy Task Force and to update their flood risk reduction standards for ''federally-funded . . . projects'' to ensure that ''projects funded with taxpayer dollars last as long as intended.'' [19] In November 2013, the President's State, Local, and Tribal Leaders Task Force on Climate Preparedness and Resilience (Climate Task Force) convened, with 26 Governors, mayors, and local and Tribal leaders serving as members. After a year-long process of receiving input from State, local, Tribal, and territorial governments; private businesses; trade associations; academic organizations; civil society; and other stakeholders, the Task Force provided a recommendation to the President in November 2014. In order to ensure resiliency, Federal agencies, when taking actions in and around floodplains, should include considerations of the effects of climate change, including sea level rise, more frequent and severe storms, and increasing river flood risks. The Climate Task Force also recommended that the best available climate data should be used in siting and designing projects receiving Federal funding, and that margins of safety, such as freeboard and setbacks, should be included.[20]

D. Issuance of Executive Order 13690 and the Federal Flood Risk Management Standard, and Revision of the 1978 Guidelines

The MitFLG developed the FFRMS reflecting the best available science, lessons learned, and input and recommendations gathered from the Sandy Task Force, the Climate Action Plan, and the Climate Task Force. As a result of MitFLG's efforts, on January 30, 2015, the President issued Executive Order 13690, ''Establishing a Federal Flood Risk Management Standard (FFRMS) and a Process for Further Soliciting and Considering Stakeholder Input.'' [21] Executive Order 13690 amended Executive Order 11988 and established the FFRMS. It also set forth a process by which additional input from stakeholders is solicited and considered before agencies implement the FFRMS. It required FEMA to publish, on behalf of the MitFLG, an updated version of the Implementing Guidelines (revised to incorporate the changes required by Executive Order 13690 and the FFRMS) in the **Federal Register** for notice and comment. After receipt and adjudication of comments, Executive Order 13690 required the MitFLG to submit to the WRC

[13] 77 FR 74341, Dec. 14, 2012.

[14] This is also known as ''freeboard.'' ''Freeboard'' is a factor of safety usually expressed in feet above a flood level for purposes of floodplain management. Freeboard tends to compensate for the many unknown factors that could contribute to flood heights greater than the height calculated for a selected size flood and floodway conditions, such as wave action, bridge openings, and the hydrologic effect of urbanization of the watershed. See *www.fema.gov/freeboard.*

[20] President's State, Local, and Tribal Leaders Task Force on Climate Preparedness and Resilience, *Recommendations to the President,* (2014), available at *http://www.whitehouse.gov/sites/default/files/docs/task_force_report_0.pdf at 7.*

[21] 80 FR 6425 Feb. 4, 2015.

recommendations for finalizing the draft Guidelines. Finally, Executive Order 13690 required the WRC to issue final Guidelines to provide guidance to agencies on the implementation of Executive Order 11988, as amended, consistent with the FFRMS. After the completion of this process, Executive Order 13690 directs agencies to issue or amend their existing regulations and procedures to comply with the Order. The MitFLG is required to reassess the FFRMS annually, after seeking stakeholder input, and provide recommendations to the WRC to update the FFRMS if warranted. The WRC is required to update the FFRMS at least every 5 years.

FEMA, on behalf of MitFLG, published a **Federal Register** notice for a 60-day notice and comment period seeking comments on a draft of the Revised Guidelines on February 5, 2015.[22] In response to multiple requests, the MitFLG later extended the comment period for an additional 30 days to end on May 6, 2015.[23] Periodically during the public comment period, the Administration (through FEMA and CEQ) sent advisories to representatives from Governors' offices nationwide announcing the issuance of Executive Order 13690 and inviting comments on the draft Revised Guidelines. The Administration also attended or hosted over 25 meetings across the country with State, local, and Tribal officials (including 26 mayors) and interested stakeholders to discuss Executive Order 13690 and the draft Revised Guidelines. The MitFLG held 9 public listening sessions across the country[24] that were attended by over 700 participants from State, local, and Tribal governments and other stakeholder organizations to facilitate feedback on the draft Revised Guidelines. The MitFLG published notice of these public listening sessions in the **Federal Register**.[25]

The public comment period closed on May 6, 2015. The MitFLG received over 2700[26] comments. The MitFLG adjudicated the comments and presented its recommendations to the WRC, as required by Executive Order 13690. The WRC issued the final Revised Guidelines on October 8, 2015.[27] The Revised Guidelines contain an updated version of the FFRMS (located at Appendix G of the Revised Guidelines), reiterate key concepts from the 1978 Guidelines, and explain the new concepts resulting from the Executive Order 13690 and the FFRMS. In response to public comments, the FFRMS was updated to clarify the distinction between actions and Federally Funded Projects.

E. Substantive Components of the FFRMS

The FFRMS is a flexible framework to increase resilience against flooding and help preserve the natural values of floodplains. Incorporating this standard into existing agency processes will ensure that agencies expand management from the current base flood level to a higher vertical elevation and corresponding horizontal floodplain so that Federally Funded Projects will last as long as intended. In addition, the FFRMS encourages the use of natural features and nature-based approaches in the development of alternatives for all Federal actions.

Under the FFRMS, an agency may establish the floodplain for Federally Funded Projects using any of the following approaches: (1) Climate-Informed Science Approach (CISA): Utilizing the best-available, actionable hydrologic and hydraulic data and methods that integrate current and future changes in flooding based on climate science; (2) Freeboard Value Approach (FVA): Freeboard (base flood elevation + X, where X is 3 feet for critical actions and 2 feet for other actions); (3) 0.2 percent annual chance Flood Approach (0.2PFA): 0.2 percent annual chance flood (also known as the 500-year flood); or (4) the elevation and flood hazard area that result from using any other method identified in an update to the FFRMS.[28] Each of the approaches is described in further detail below.

FFRMS Approach 1: CISA

The FFRMS states that the CISA is the preferred approach, and that Federal agencies should use this approach when data to support such an analysis are available. For areas vulnerable to coastal flood hazards, the CISA includes the regional sea-level rise variability and lifecycle of the Federal action. This includes use of the Department of Commerce's National Oceanic and Atmospheric Administration's (NOAA's) or similar global mean sea-level-rise scenarios. These scenarios would be adjusted to the local relative sea-level conditions and would be combined with surge, tide, and wave data using state-of-the-art science in a manner appropriate to policies, practices, criticality, and consequences (risk).[29] For areas vulnerable to riverine flood hazards (*i.e.,* flood hazards stemming from a river source), the CISA would account for changes in riverine conditions due to current and future changes in climate and other factors such as land use, by applying state-of-the-art science in a manner appropriate to policies, practices, criticality, and consequences (risk).

The CISA for critical actions would utilize the same methodology as used for non-critical actions that are subject to Executive Order 11988, but with an emphasis on criticality as one of the factors for agencies to consider when conducting the analysis.

FFRMS Approach 2: FVA

The FFRMS defines freeboard values as an additional 2 feet added to the base flood elevation, or, for critical actions, an additional 3 feet added to the base flood elevation. In other words, the floodplain established by the FFRMS–FVA is the equivalent of the 1 percent annual chance floodplain, plus either 2 or 3 feet of vertical elevation, as applicable based on criticality, as well as a corresponding increase in the horizontal extent of the floodplain. The increased horizontal extent will not be the same in every case. As shown in the next two illustrations, when the same vertical increase is applied in multiple Federally Funded Projects in different areas, the amount of the increase in the horizontal extent of the respective floodplains will depend upon the topography of the area surrounding the proposed location of the Federally Funded Project. FFRMS–FVA Illustration A reflects an area with relatively flat topography on either side of the flooding source (*i.e.,* river or stream) channel. This is generally representative of coastal plains, portions of the Midwest, and other areas with less variation in topography. FFRMS–FVA Illustration B reflects an area with steep topography on either side of the

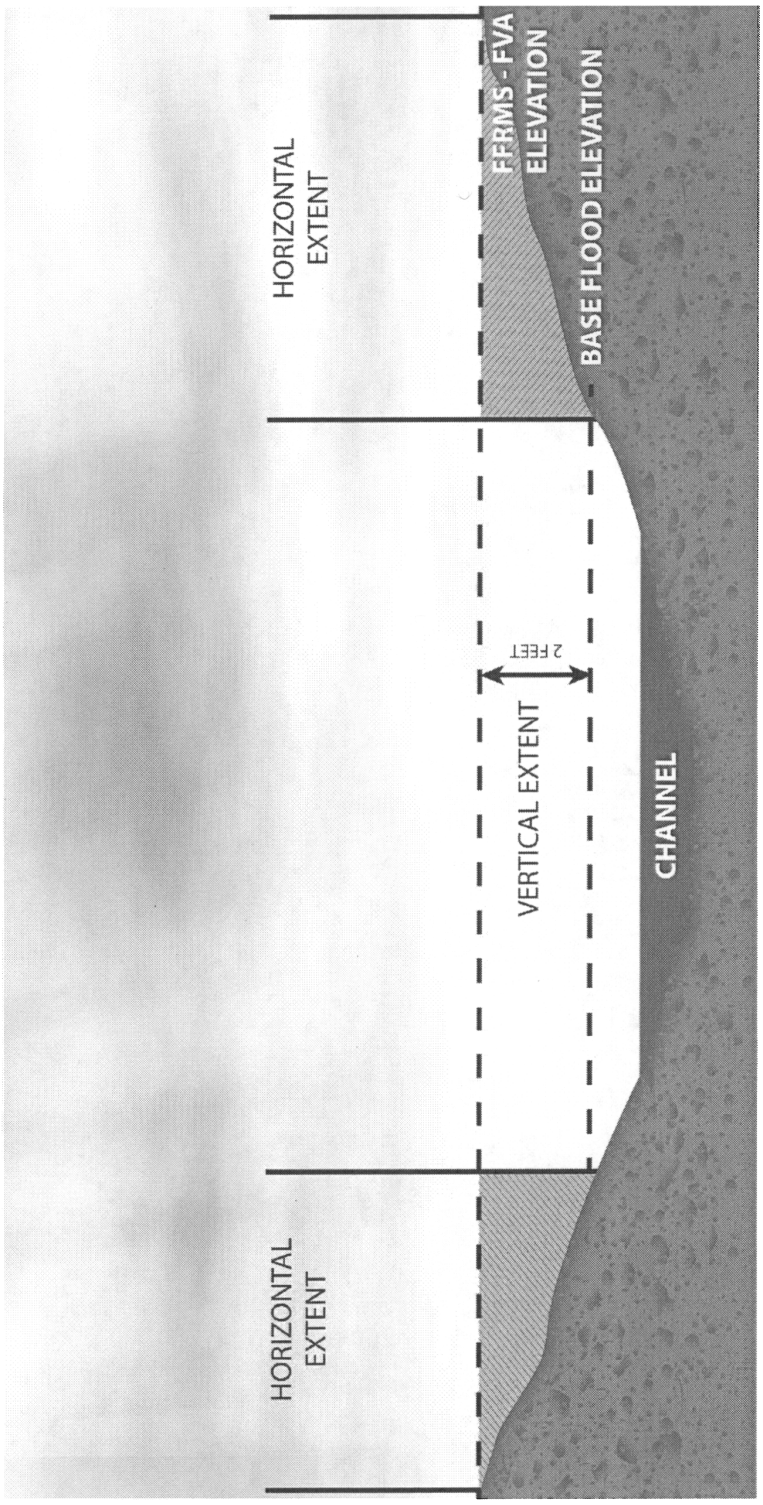
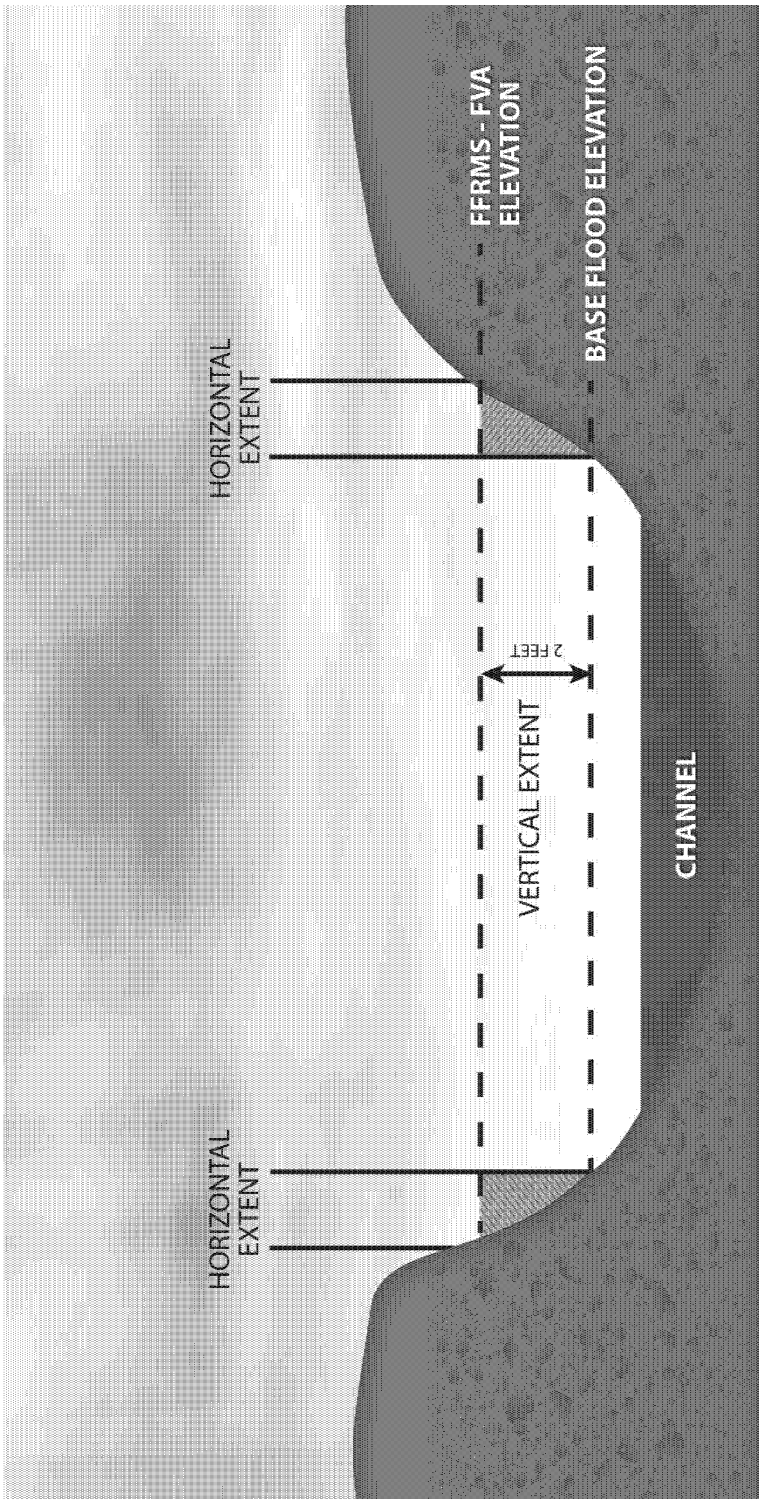
flooding source channel. This is representative of mountainous areas or areas with changes in elevation near the flooding source. With the same addition of 2 feet to the base flood elevation applied to both example locations, the increase to the horizontal extent of the floodplain in FFRMS–FVA Illustration A is comparatively larger than the increase to the horizontal extent of the floodplain in FFRMS–FVA Illustration B. These illustrations visually depict the fact that the horizontal increase to the floodplain will not be uniform when applying the same increase to establish the FVA and will vary depending on local topography.

BILLING CODE 9111–66–P

FFRMS-FVA Illustration A





FFRMS-FVA Illustration B

BILLING CODE 9111–66–C

FFRMS Approach 3: 0.2PFA

Agencies may use available 0.2 percent annual chance (or ''500-year'') flood data as the basis of the FFRMS elevation and corresponding floodplain extent. The FFRMS notes that the 0.2 percent annual chance flood hazard data produced by FEMA in coastal areas only considers storm-surge hazards; these data do not include local wave action or storm-induced erosion that are considered in the computation of base flood elevations. The FFRMS encourages agencies to obtain or develop the necessary data, including wave heights, to ensure that any 0.2 percent annual chance flood data applied will achieve an appropriate level of flood resilience for the proposed investment.

FFRMS Approach 4: Update to FFRMS

Executive Order 13690 requires the MitFLG to reassess the FFRMS annually, after seeking stakeholder input, and provide recommendations to the WRC to update the FFRMS if

warranted. It requires the WRC to update the FFRMS at least every 5 years.

Further Guidance on Application of the FFRMS Approaches To Establishing the Floodplain

The FFRMS states that when an agency does not use CISA in a coastal flood hazard area, the agency must use, at a minimum, the applicable FVA (*i.e.,* the base flood elevation plus 3 feet for critical actions, or the base flood elevation plus 2 feet for other actions). In cases where the FEMA 0.2 percent annual chance flood elevation does not include wave height, or a wave height has not been determined, the FFRMS notes that the result will likely either be lower than the current base flood elevation or the base flood elevation plus applicable freeboard. The FFRMS states that the 0.2 percent annual chance elevation should not be used in these cases.

When actionable science is not available and an agency opts not to follow the CISA for riverine flood hazard areas, the FFRMS states that an agency may also select either the FVA, or 0.2 percent annual chance flood elevation approach, or a combination of approaches, as appropriate. It states that the agency is not required to use the higher of the elevations, but may opt to do so.

F. FEMA's Implementation of Executive Order 13690 and FFRMS

When Executive Order 13690 was issued, FEMA evaluated the application of Executive Order 13690 and the FFRMS with respect to its existing authorities and programs. The FFRMS establishes a flexible standard to improve resilience against the impact of flooding—to design for the intended life of the Federal investment. FEMA supports this principle. With more than $260 billion in flood damages across the Nation since 1980, it is necessary to take action to responsibly use Federal funds, and FEMA must ensure it does not needlessly make repeated Federal investments in the same structures after flooding events. In addition, the FFRMS will help support the thousands of communities across the Country that have strengthened their State and local floodplain management codes and standards to ensure that infrastructure and other community assets are resilient to flood risk. FEMA recognizes that the need to make structures resilient also requires a flexible approach to adapt for the needs of the Federal agency, local community, and the circumstances surrounding each project or action.

FEMA intends to implement Executive Order 13690, the FFRMS, and the Revised Guidelines through this proposed rule and supplementary policy, which would (1) add or revise definitions to be consistent with those included in Executive Order 13690 and the Revised Guidelines; (2) incorporate the use of the FFRMS approaches for establishing the floodplain into FEMA's existing 8-step process; and (3) include the requirement to consider the use of nature-based approaches where possible when developing alternatives for developing in the floodplain.

Making the Initial Floodplain Determination

As stated above, Executive Order 13690 and the FFRMS changed the definition of ''floodplain'' with respect to ''Federally Funded Projects'' (*i.e.,* actions involving the use of Federal funds for new construction, substantial improvement, or to address substantial damage to a structure or facility). The FFRMS allows the agency to define ''floodplain'' using any of three approaches. For actions which do not meet the definition of a Federally Funded Project, an agency should continue to use the historical definition of floodplain, *i.e.* the area subject to a 1 percent or greater chance of flooding in any given year (or the area subject to a 0.2 percent annual chance of flooding in any given year for critical actions). This means that one of the first steps an agency must take is to determine whether to use the FFRMS definition of the floodplain or the historical definition of the floodplain. Figure 1 illustrates the process by which FEMA would decide which floodplain would apply to an action or FEMA Federally Funded Project.

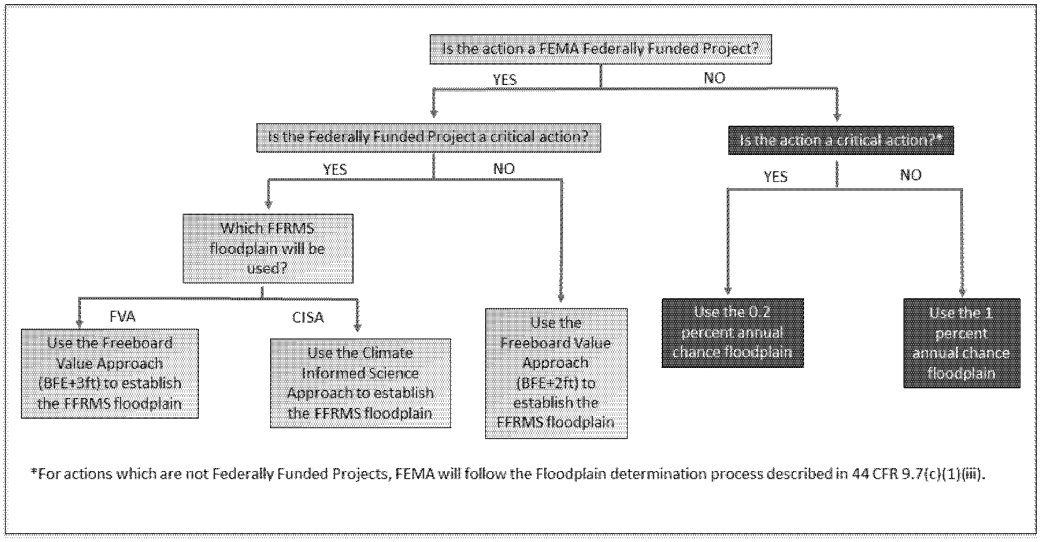


Figure 1: Process to Establish the Appropriate Floodplain for the 8-Step Decision-Making Process

Selection Between the FFRMS Approaches

Executive Order 13690 requires the MitFLG to reassess the FFRMS annually, after seeking stakeholder input, and provide recommendations to the WRC to update the standard if warranted based on accurate and actionable science that takes into account changes to climate and other changes in flood risk. At a minimum, Executive Order 13690 requires an update to the FFRMS at least every 5 years.[30] This requires a balancing approach in selecting between the FFRMS approaches: Agencies must be flexible enough to account for updates to the FFRMS and yet also implement a framework that is standardized enough to be easily understood by and consistently applied to stakeholders.

Consistent with the flexibility built into Executive Order 13690, FEMA proposes to implement the FFRMS by adopting the flexible framework proposed in Executive Order 13690 in its entirety instead of mandating a particular approach in its regulations. Under this proposal, FEMA would provide additional guidance (more readily capable of revisions and updates) that addresses which approach FEMA would use for different types of actions and how FEMA would tailor its application of the various approaches depending on the type and criticality of the action. Specifically, FEMA's supplementary policy selects the use of the FFRMS–FVA to establish the floodplain for non-critical actions. For critical actions, FEMA would allow the use of the FFRMS–FVA floodplain or the FFRMS–CISA, but only if the elevation established under the FFRMS–CISA is higher than the elevation established under the FFRMS–FVA.

FEMA proposes to use the FFRMS–FVA as the baseline approach for both critical and non-critical FEMA Federally Funded Projects for several reasons. First, a choice to use the FFRMS–FVA would reflect the practical need for standardization at this stage of implementation. The FFRMS–FVA elevation is computed using the 1 percent annual chance elevation, and FEMA may use the same historical sequence it has followed to determine the 1 percent annual chance elevation for the purposes of establishing the FFRMS–FVA elevation. This would still allow for the use of widely available FEMA products such as FIRMs, FBFMs, and FISs. By following the same historical sequence and utilizing known mapping products, FEMA staff would need relatively minimal additional training to be able to use these products to determine the horizontal extent of the FFRMS–FVA floodplain. In addition, the familiarity of the process and products to be used in most projects would benefit stakeholders by providing a consistent methodology which stakeholders would similarly be able to use to determine where FEMA will require application of the FFRMS. Second, requiring the use of the FFRMS–FVA as the minimum elevation for critical actions would be consistent with FEMA's policy to encourage communities to adopt higher standards, including freeboard standards, than the minimum floodplain management criteria under the NFIP.[31] Generally, adoption of a freeboard tends to compensate for the many unknown factors that could contribute to flood heights greater than the height calculated for a selected size flood and floodway conditions, such as wave action, bridge openings, and the hydrological effect of urbanization of the watershed.[32] Consistent with FEMA's policy, 22 States and an additional 596 localities have adopted freeboard requirements ranging from 1 to 3 feet.[33] FEMA supports that adoption by requiring that all of its projects are consistent with more restrictive Federal, State, or local floodplain management standards.[34]

FEMA considered proposing the use of the FFRMS–CISA instead of FFRMS–FVA to reflect the FFRMS's designation of the FFRMS–CISA as the preferred approach and to reflect that the FFRMS–FVA sets a general level of protection, whereas FFRMS–CISA uses a more site-specific approach to predict flood risk based on future conditions.

However, there are several reasons why that course of action is not appropriate at this time. First, actionable climate data are not currently available for all locations. For coastal floodplains, one of the primary considerations associated with the FFRMS–CISA is determining what the projected future sea level rise will be for the area in which the project will be completed. There are multiple interagency reports, published scientific journals, and agency tools that provide scenario-based projections of sea level rise for coastal floodplains. However, FEMA is not aware of an analogous approach for riverine floodplains that accounts for uncertainties due to climate change with respect to projected future precipitation and associated flooding.[35] Instead, the Revised Guidelines suggest the agency would need to conduct a hydrology study that is informed by expected changes in climate and land use factors and incorporate this analysis into its current method for determining the floodplain.[36] FEMA expects that more data will be developed supporting broader-based inland and riverine application of the FFRMS–CISA as agencies implement the FFRMS and that this data will be considered and incorporated into future updates of the FFRMS. FEMA requests comment on the availability of actionable, planning, and project-scale climate data with respect to coastal and riverine floodplains.

Second, in addition to the data challenges, there are a number of factors to be considered in deciding how to apply the FFRMS–CISA that might result in a decision-making process that could unnecessarily delay recovery in the wake of a disaster event for non-critical actions. The Revised Guidelines recommend that the FFRMS–CISA methodology account for project-specific factors such as the risk to which the action will be exposed, the anticipated level of investment, and the lifecycle of the action.[37] For example, an applicant might consider a construction project that is in a coastal floodplain and find that there are multiple projections for what the sea level rise may be in 100 years. The most aggressive projection might indicate that the project should be elevated 10 feet above the 1 percent annual chance flood elevation. However, the applicant might decide that this project is not intended to be functional for 100 years or that the applicant's budget might justify using a lesser projection now and plan for future upgrades to the structure or facility. There may be a way to standardize this type of decision-making process as the FFRMS–CISA is more broadly used; however, the current lack of a standardized methodology for making these decisions and the need to engage in such project-specific considerations in conjunction with stakeholders could result in uncertainty and delay. In light of the above concerns, FEMA requests comment regarding how FEMA could implement

the FFRMS–CISA for non-critical actions using a publicly-accessible, standardized, predictable, flexible, and cost-effective methodology.

FEMA also considered whether it should alter its proposal for use of the FFRMS–CISA in relation to the FFRMS–FVA (or FFRMS–0.2PFA). FEMA specifically welcomes comment on each of the potential alternatives outlined below. FEMA could choose a more protective approach in which it would determine the elevations established under FFRMS–CISA, FFRMS–FVA and the FFRMS–0.2PFA for critical actions and only allow the applicant to use the highest of the three elevations. This approach would ensure that applicants were building to the most protective level, would avoid potential inconsistencies with FEMA's policy to encourage adoption of freeboard standards by local communities, and would prevent a scenario where an applicant was allowed to build to a lower elevation than previously required for critical actions under FEMA's implementation of Executive Order 11988.[38] FEMA believes that its proposed policy is sufficiently protective and would be less expensive to administer and implement than the alternative approach described above, but nonetheless welcomes comment on this alternative approach.

Also alternatively, FEMA could choose to allow use of the FFRMS–CISA, even if the resulting elevation is lower than the application of the FFRMS–FVA. This approach would give FEMA and its grantees more flexibility in implementing the standard, would enable FEMA and its grantees to build to an elevation based on the best available science taking criticality into account, and would provide a pathway to relief for those areas that experience declining flood risks.[39] FEMA believes that the need for standardization, administrability, and adequate protection all counsel in favor of its policy, but welcomes comments on this alternative approach as well.

FEMA is not proposing to use the FFRMS–0.2PFA because of the limited national availability of information on the 0.2 percent annual chance flood elevation and the additional costs associated with producing this information when not available. The FFRMS–0.2PFA floodplain, like the FFRMS–FVA floodplain, would have a greater horizontal extent and require higher elevation standards when compared to the 1 percent annual chance floodplain. However, while most areas of the country have 1 percent annual chance floodplain information and the necessary topographical information to determine the horizontal extent under the FVA, far fewer are mapped with 0.2 percent annual chance floodplain information. This is because although all FEMA-mapped flood zones have either detailed or approximate 1 percent annual chance floodplain boundaries, FEMA estimates that only 18 percent of mapped flood zones have detailed floodplain boundaries of the 0.2 percent annual chance floodplain.[40] Finally, in coastal areas, the FFRMS requires Federal agencies to use the FFRMS–FVA as the minimum elevation, when not using the FFRMS–CISA, because the 0.2 percent annual chance flood information depicted on FEMA FIRMs and in the FISs in coastal areas consider storm-surge hazards, but not wave action.[41] FEMA recognizes that the FFRMS–0.2PFA may result in a higher elevation than the FFRMS–FVA in some circumstances. However, based on the foregoing reasons, FEMA expects it will be clearer, less costly, and provide more certainty to stakeholders, if FEMA selects the FFRMS–FVA as the primary approach.

Based on the foregoing reasons, FEMA proposes to combine approaches and use the FFRMS–FVA to establish the floodplain for non-critical actions and allow the use of the FFRMS–FVA floodplain or the FFRMS–CISA for critical actions, but only if the elevation established under the FFRMS–CISA is higher than the elevation established under the FFRMS–FVA. This proposal balances flexibility with standardization, is consistent with FEMA's encouragement to communities to adopt higher floodplain management standards, reflects the priority that FEMA places on ensuring adequate planning for critical actions, and may yield important lessons with respect to potential future applications of the FFRMS–CISA.

In addition to seeking comments on FEMA's proposed approach to implementation generally, FEMA specifically seeks public comments on the impact of the proposed elevation requirement on the accessibility of covered facilities under the Fair Housing Act, the Americans with Disabilities Act (ADA), the Architectural Barriers Act (ABA), and Section 504 of the Rehabilitation Act of 1973. Elevating buildings as a flood damage mitigation strategy will likely have a negative impact on affected communities' disabled and elderly populations, unless those buildings are made accessible. Although all ADA title II and III facilities, ABA facilities, and Section 504 covered facilities are subject to accessibility requirements, single-family properties are generally not subject to accessibility requirements unless they are public housing (ADA title II) or a social service establishment (ADA title III). Consequently, even if the homes of people with disabilities are made accessible, a community's single- and multi-family housing stock may become largely inaccessible through elevation requirements. If the only accessible homes in a community are those currently occupied by people with disabilities, those people will likely be isolated. As occupants age or become disabled, they may have no option to remain in their homes or to age in place because adding an accessible route into an existing single- or multi-family building will be costly or impossible. It is therefore crucial for community sustainability and integration of people with disabilities that those buildings that *are* subject to accessibility requirements be made to comply.

In light of the substantial community impact of elevating housing and other buildings, along with the challenges associated with the traditional options for making elevated buildings accessible (*i.e.,* elevators, lifts, and ramps), FEMA invites comments on strategies it could employ to increase the accessibility of properties so affected in the event the proposed increase in elevation is adopted. Additionally, FEMA invites comments on the cost and benefits of such strategies, including data that supports the costs and benefits.

Determining the Corresponding Horizontal Extent of the FFRMS Floodplain

Once an agency has made the determination that an action is a Federally Funded Project that requires use of the FFRMS floodplain, and then made a determination which of the FFRMS approaches to apply, the agency must then decide where the FFRMS floodplain lies. There are no federally produced maps depicting the boundary of the FFRMS-floodplain established by the FVA or CISA, and FEMA maps depicting the 0.2 percent annual

[38] There may be some areas of the country where application of the FFRMS–CISA and the FFRMS–FVA could result in a lower elevation than the FFRMS–0.2PFA which under existing regulations is the elevation requirement for critical actions.

[39] While FEMA believes that the average flood risk will generally continue to increase nationwide due to climate change, there is considerable uncertainty in projecting flood risk at more granular levels. Some areas may experience declines in flood risk due to reduced rainfall or other unpredictable changes to the floodplain.

[40] FEMA riverine flood hazard data inventory information comes from the Coordinated Needs Management Strategy dataset.

[41] See Revised Guidelines at 57.

floodplain are only available in some areas. However, a map of the FFRMS floodplain is not required to determine if the location of a proposed Federally Funded Project is within the FFRMS floodplain. The floodplain determination can generally be made by comparing the ground elevation at the proposed site to the elevation established using the applicable FFRMS approach. If the ground elevation is less than the FFRMS elevation, than the site is in the FFRMS floodplain. Therefore, in order to complete the floodplain determination, FEMA intends to rely on two-dimensional information on a map to determine the location of the proposed site relative to the FFRMS floodplain. To do so, FEMA will need point information on (1) the FFRMS elevation and (2) the ground elevation of the proposed site. Once FEMA establishes the FFRMS elevation and the ground elevation based on available information, FEMA would compare the two values to determine if the proposed FEMA Federally Funded Project location is in the FFRMS floodplain.

Establishing the FFRMS Elevation Under Each of the Approaches

In order to make the floodplain determination and establish the proper elevation under each approach, FEMA intends to leverage its existing processes in each of its grant programs for ensuring compliance with Executive Order 11988. Although the specifics of the processes may vary somewhat from program to program, FEMA generally uses the following steps. During the initial stages of project development, FEMA informs applicants of all applicable Federal, State and local requirements which might apply to their projects to include Executive Order 11988 and the 8-step process. Once applicants have identified potential projects, FEMA works with them to assess the proposed project location and determine whether it is in the floodplain and therefore whether it is necessary to apply the 8-step process. FEMA is available to assist applicants with the 8-step process and FEMA reviews the project application to ensure that the project scope of work is in compliance with Executive Order 11988 requirements. FEMA will continue to perform these steps in its implementation of Executive Order 13690 and the FFRMS. When making the floodplain determination under the FFRMS, FEMA intends to investigate what flood information is available in order to select the best available information.[42] FEMA would rely on a range of available data to establish the FFRMS elevation for each of the approaches.

The FFRMS–CISA elevation is established using the best available, actionable climate-informed science. The Revised Guidelines provide guidance to agencies on the application of the CISA approach in coastal and riverine areas.[43] In particular, FEMA will use Appendix H of the Revised Guidelines titled ''Climate-Informed Science Approach and Resources'' to guide its decision-making. Appendix H outlines guidance on risk-based framing (*i.e.,* how agencies may consider current and future flood risks over the lifetime of the investment/project) followed by specific considerations and methods to consider climate change. Because the CISA uses a scenario-based analysis to establish an elevation by assessing a range of possible future conditions and considering the nature of the affected action, the anticipated lifecycle of the action, and the tolerance for risk associated with the action, use of the CISA would be based on project-specific decisions. FEMA may consider information presented by the applicant or any other Federal agency in this evaluation and will ultimately determine whether the methodology is appropriate for the action being considered and meets the relevant criteria.

FEMA recognizes that the FFRMS–CISA is a new and developing process and that there is uncertainty in the considerations and factors that will come up during an FFRMS–CISA analysis. As such, FEMA is not able to develop an exhaustive set of regulatory criteria for determining whether a given methodology or elevation is appropriate. However, FEMA recognizes that regulatory transparency reduces uncertainty for its grantees, and it will consider providing further guidance and information in the future as the agency's experience in implementing FFRMS–CISA grows.

Appendix H of the Revised Guidelines provides the following criteria to define the CISA, which FEMA will consider when developing further guidance and information: (1) Uses existing sound science and engineering methods (*e.g.,* hydrologic and hydraulic analysis and methodologies) as have historically been used to implement Executive Order 11988, but supplemented with best available climate-related scientific information when appropriate (depending on the agency-specific procedures and type of federal action); (2) is consistent with the climate science and related information found in the latest National Climate Assessment report or other best-available, actionable science; (3) combines information from different disciplines (*e.g.,* new perspectives from the atmospheric sciences, oceanographic sciences, coastal sciences, and hydrologic sciences in the context of climate change) in addition to traditional science and engineering approaches; and, (4) includes impacts from projected land cover and land use changes (which may alter hydrology due to increased impervious surface), long-term coastal and/or riverine erosion, and vertical land movement (for determining local changes to sea level) expected over the lifecycle of the action.

The FFRMS describes the FFRMS–FVA elevation as the addition of 2 or 3 feet to the 1 percent annual chance flood elevation. FEMA would leverage the process described in 44 CFR 9.7(c)(1)(iii) to search for the best available flood hazard information to establish the 1 percent annual chance flood elevation. This process recognizes that information on flood hazards at proposed sites may range from detailed data obtained from FEMA flood studies, to information which approximates the geographic area of the floodplain, to areas with no information. Where FEMA has issued a detailed study, FEMA could obtain the 1 percent annual chance flood elevation from the FIRM or FIS. In areas where FEMA has issued a limited study, FEMA would then seek detailed information from the list of sources in 44 CFR 9.7(c)(1)(iii)(B)(*1*)–(*8*).

For example, where an effective FIRM displays a 1 percent annual floodplain with limited detail, local sources such as a Floodplain Administrator, Flood Control Districts, or Transportation departments may have detailed information on file which was produced for development within the floodplain, for watershed plans, or for infrastructure designs. Where detailed information is not available from FEMA studies or other sources, but approximate flood information is available from a FEMA FIRM, FEMA may use simplified methods to develop a 1 percent annual chance flood elevation as presented in FEMA publication 265, entitled ''Managing Floodplain Development in Approximate A zones: A Guide for Obtaining and Developing Base (100-Year) Flood Elevations.''[44] A 1 percent

[42] See § 9.7(c)(1)(iii) of this proposed rule.

[43] See the Revised Guidelines at Appendix H ''Climate-Informed Science Approach and Resources.''

[44] FEMA, Managing Floodplain Development in Approximate Zone A: A Guide for Obtaining and Developing Base (100-Year) Flood Elevations

Continued

annual chance flood elevation developed using a simplified approach may yield an acceptable level of accuracy for the purpose of establishing whether a proposed FEMA Federally Funded Project is within the FFRMS–FVA floodplain. Where no flood hazard information is available, or where more accurate information on the 1 percent annual chance elevation is necessary for the purposes of complying with other sections of Part 9, such as § 9.11, FEMA publication 265 also provides guidance on detailed engineering methodologies to develop a 1 percent annual chance flood elevation. FEMA may rely on staff engineers to complete the engineering analysis, or FEMA may rely on information submitted as part of an application, where the applicant has obtained design and engineering services to develop the project scope of work.

The FFRMS–0.2PFA elevation is the elevation of the 0.2 percent annual chance flood. If FEMA were to use this approach in the future, FEMA could follow the same process to establish the 0.2 percent annual chance flood elevation as it would to establish the 1 percent annual chance flood elevation. FEMA would first rely on the 0.2 percent annual chance flood elevation reported in a FEMA FIS, then seek information from additional sources, before finally seeking the assistance of an engineer.

Establishing the Ground Elevation

FEMA may use available topographic information from the USGS to establish the ground elevation for a proposed location of a FEMA Federally Funded Project. Additionally, FEMA may also rely on information on the ground elevation submitted by an applicant as part of their project application.

IV. Discussion of the Proposed Rule

As noted above, this proposed rule would implement Executive Order 13690, the FFRMS, and the Revised Guidelines as part of FEMA's floodplain management regulations. Below, we provide a brief summary of a number of the major provisions of the proposed rule, followed by a section-by-section description of these and other changes.

Major Provisions

Conforming Changes to Definitions

FEMA proposes to amend § 9.4 to reflect the new definitions required by Executive Order 13690 and the FFRMS. As noted above, the most significant definitional change introduced by Executive Order 13690 and the FFRMS is the change to the meaning of ''floodplain.'' As discussed in more detail below, in order to harmonize this change in § 9.4 FEMA proposes to revise a number of existing definitions, and remove other definitions. In addition, FEMA proposes to revise the remaining sections of 44 CFR part 9 that refer generally to the floodplain, or refer specifically to the base (or 100-year) floodplain or the 500-year floodplain, for clarity.

Distinction Between ''FEMA Federally Funded Projects'' and Other FEMA Actions

As noted above, the first Step in the 8-step process is to determine whether the proposed action is in the floodplain. Because Executive Order 13690 and the October 8, 2015 version of FFRMS revise the definition of the ''floodplain'' that must be used for ''Federally Funded Projects,'' FEMA proposes to revise the first Step to require FEMA to first determine whether the proposed action falls within the definition of ''FEMA Federally Funded Project.'' Under the proposed rule, if FEMA determines that the action is a FEMA Federally Funded Project, *i.e.,* if FEMA determines that the action uses FEMA funds for new construction, substantial improvement, or to address substantial damage to a structure or facility, the FFRMS floodplain applies. If, on the other hand, FEMA determines that the action does not fall under the definition of a FEMA Federally Funded Project, the 1 percent annual chance floodplain (or the 0.2 percent annual chance floodplain for critical actions) applies.

Emphasis on Nature-Based Approaches

Executive Order 13690 requires that agencies use, where possible, natural systems, ecosystem processes, and nature-based approaches in the development of alternatives for Federal actions in the floodplain. FEMA proposes to incorporate this requirement into § 9.9, which addresses the requirement to consider practicable alternatives when determining whether to locate an action in the floodplain. This requirement applies regardless of whether the proposed action is a FEMA Federally Funded Project. To further explain this requirement, FEMA proposes to add a definition of ''nature-based approaches,'' meaning features designed to mimic natural processes and provide specific services such as reducing flood risk and/or improving water quality.

Section-by-Section Analysis

A. Authority Citation

FEMA proposes to add a reference to Executive Order 13690.

B. Section 9.1—Purpose of Part

FEMA proposes to add ''as amended'' to reflect Executive Order 13690's amendment of Executive Order 11988.

C. Section 9.2—Policy

FEMA proposes to add language to paragraph 9.2(b)(3) to reflect the policy statement from Executive Order 13690 that the United States must improve the resilience of communities and Federal assets against the impacts of flooding based on the best-available and actionable science. This statement of policy is complementary to the longstanding goals of Executive Order 11988 to reduce the risk of flood loss, but reflects an updated Federal policy of resilience and risk reduction that takes the effects of climate change and other threats into account.

D. Section 9.3—Authority

FEMA proposes to add reference to Executive Order 13690, which amended Executive Order 11988.

E. Section 9.4—Definitions

In Section 9.4, FEMA proposes to add terms for ''0.2 Percent Annual Chance Flood,'' ''0.2 Percent Annual Chance Floodplain,'' ''1 Percent Annual Chance Flood or Base Flood,'' ''1 Percent Annual Chance Flood Elevation or Base Flood Elevation,'' ''1 Percent Annual Chance Floodplain or Base Floodplain,'' ''Associate Administrator,'' ''Emergency Work,'' ''Federal Flood Risk Management Standard (FFRMS),'' ''Federal Flood Risk Management Standard Floodplain,'' ''FEMA Federally Funded Project,'' FIMA, and ''Nature-Based Approaches;'' to remove the definitions of ''Base Flood,'' ''Base Floodplain,'' ''Emergency Actions,'' ''Five Hundred Year Floodplain,'' and ''Mitigation Directorate;'' and to revise the definitions of ''Critical Action,'' ''Floodplain,'' ''New Construction,'' ''Orders,'' and ''Substantial Improvement.''

0.2 Percent Annual Chance Flood. FEMA proposes to define the term ''0.2 percent annual chance flood'' to mean the flood which has a 0.2 percent chance of being equaled or exceeded in any given year. This was previously known as the ''500-year flood.'' FEMA proposes to use the term ''0.2 percent annual chance flood'' and discontinue using that term interchangeably with the term ''500-year flood.'' The term ''500-year flood'' can cause confusion as it

(1995), available at *https://www.fema.gov/media-library/assets/documents/1911.*

could be interpreted to mean that the area will only flood once every 500 years, instead of reflecting its true meaning, which is the annual risk of flooding in the area.

0.2 Percent Annual Chance Floodplain. FEMA proposes to define the term ''0.2 percent annual chance floodplain'' to mean the area subject to flooding by the 0.2 percent annual chance flood.

1 Percent Annual Chance Flood or Base Flood. FEMA proposes to retitle the current definition of ''base flood'' as ''1 percent annual chance flood or base flood.'' This reflects the fact that Executive Order 13690 uses the term ''base flood'' and the Revised Guidelines use the term ''1 percent annual chance flood.'' There is no substantive difference between the two terms and they may be used interchangeably. The ''1 percent annual chance flood'' means the flood that has a 1 percent chance of being equaled or exceeded in any given year. In the current definition of ''base flood,'' the term is also equated with the ''100-year flood;'' however, FEMA proposes to discontinue use of the term ''100-year flood'' because this term can cause confusion. It can be interpreted to mean that the area will only flood once every 100 years instead of reflecting its true meaning, which is the annual risk of flood in the area.

1 Percent Annual Chance Flood Elevation or Base Flood Elevation. FEMA proposes to define the term ''1 percent annual chance flood elevation or base flood elevation'' to mean the computed elevation to which floodwater is anticipated to rise during the 1 percent annual chance flood or base flood. FEMA also proposes to incorporate the explanation from the current definition of ''base flood'' about how the term is used in the NFIP to indicate the minimum level of flooding to be used by a community in the community's floodplain management regulations. The elevation indicates how high to elevate a structure in order to protect it from the risk of flooding in a base flood.

1 Percent Annual Chance Floodplain or Base Floodplain. FEMA proposes to define the term ''1 percent annual chance floodplain or base floodplain'' to mean the area subject to flooding by the 1 percent annual chance flood or base flood. A floodplain is generally a lowland or flat area near water that has a greater chance of flooding than higher areas and areas farther from water. This definition would describe the minimum area that FEMA looks at when it determines whether an action will take place in a floodplain.

Associate Administrator. FEMA proposes to define ''Associate Administrator'' as the Associate Administrator of the Federal Insurance and Mitigation Administration. This reflects the current title of this position, and adding it to the definitions section allows for ease of use throughout Part 9, rather than having to reprint the entire title each time it is used.

Base Flood and Base Floodplain. FEMA proposes to remove the definitions of the ''base flood'' and ''base floodplain'' as FEMA proposes to incorporate them in the definitions of the ''1 percent annual chance flood or base flood'' and ''1 percent annual chance floodplain or base floodplain.''

Critical Action. FEMA proposes to revise the definition of ''critical action'' to remove the requirement that the minimum floodplain of concern in the event of a critical action is the 500-year floodplain. There would no longer be a set requirement that an applicant use a particular approach to establishing the floodplain when the project is a critical action. Instead, FEMA and the applicant would follow the sequence described in § 9.7 when making the floodplain determination. FEMA would be required to determine whether the project meets the new definition of ''FEMA Federally Funded Project'' in § 9.4. If the project is a Federally Funded Project, then FEMA would establish the floodplain by using one of the FFRMS approaches (which require the applicant to consider whether an action is a critical action). If the project is not a Federally Funded Project, then FEMA would use, at a minimum, the 1 percent annual chance floodplain for non-critical actions and the 0.2 percent annual chance floodplain for critical actions.

Emergency Work. The current definition of ''emergency actions'' is emergency work essential to save lives and protect property and public health and safety performed under certain sections of the Robert T. Stafford Disaster Relief and Emergency Assistance Act (Stafford Act) and corresponding FEMA regulations. FEMA proposes to change the term to ''emergency work'' to clearly differentiate between the work under the specific sections of the Stafford Act that was exempted entirely from the requirements of Executive Order 11988 and the new exceptions to the application of the FFRMS (which include non-specific references to emergency actions) created by Executive Order 13690. FEMA also proposes to update the citations to the specific sections of the Stafford Act and FEMA regulations, as the citations are outdated in the current definition.

Federal Flood Risk Management Standard (FFRMS). FEMA proposes to add a definition of ''FFRMS,'' which is the Federal flood risk management standard established by Executive Order 13690 to be incorporated into existing processes used to implement Executive Order 11988. FEMA proposes to add a definition for FFRMS because this rule proposes to implement it and therefore refers to it throughout the proposed changes to Part 9.

Federal Flood Risk Management Standard (FFRMS) Floodplain. FEMA proposes to define the ''FFRMS floodplain'' consistent with the definition in Executive Order 13690, which is the floodplain that is established using one of four approaches: CISA, FVA, 0.2PFA, and the elevation and flood hazard area that result from using any other method identified in an update to the FFRMS.

FEMA proposes to define the ''CISA'' as the elevation and flood hazard area that result from using the best-available, actionable hydrologic and hydraulic data and methods that integrate current and future changes in flooding based on climate science. This approach will also include an emphasis on whether the action is a critical action as one of the factors to be considered when conducting the analysis.

FEMA proposes to define the ''FVA'' as the elevation and flood hazard area (the horizontal extent of the floodplain) that result from using the freeboard value, reached by adding an additional 2 feet to the base flood elevation for non-critical actions and by adding an additional 3 feet to the base flood elevation for critical actions.

FEMA proposes to define the ''0.2PFA'' as the area subject to flooding by the 0.2 percent annual chance flood. The 0.2 percent annual chance flood is a flood that has a 0.2 percent chance of happening in any given year. It is a flood that covers greater area that is less frequent than the 1 percent chance floodplain.

Finally, FEMA proposes to add a fourth approach, the elevation and flood hazard area that result from using any other method identified in an update to the FFRMS.

FEMA Federally Funded Project. FEMA proposes to add a definition of ''FEMA Federally Funded Project'' to mean actions where FEMA funds are used for new construction, substantial improvement, or to address substantial damage to a structure or facility. FEMA's proposed definition mirrors the language in the FFRMS and the Revised Guidelines.

FIMA. FEMA proposes to revise the definition of the Federal Insurance Administration to mean the Federal Insurance and Mitigation Administration to reflect the current title of the organization.

Five Hundred Year Floodplain. FEMA proposes to remove the definition of the five hundred year floodplain as a standalone term and designated floodplain and to instead substitute the term to 0.2 percent annual chance floodplain. The 0.2 percent annual chance floodplain is the floodplain covering an area where the chance of flood is 0.2 percent in any given year.

Floodplain. FEMA currently defines ''floodplain'' as the lowland and relatively flat areas adjoining inland and coastal waters including, at a minimum, that area subject to a 1 percent or greater chance of flooding in any given year. FEMA proposes to revise the definition to remove the phrase ''including, at a minimum, the area subject to a one percent or greater chance of flooding in any given year.'' This is because the FFRMS expands the consideration from the 1 percent annual chance (base) floodplain.

The current definition also states that wherever the term ''floodplain'' appears in Part 9, if a critical action is involved, ''floodplain'' means the area subject to inundation from a flood having a 0.2 percent chance of occurring in any given year (500-year floodplain). FEMA proposes to remove this provision from the definition of floodplain because there is no longer a set requirement that an applicant use a particular approach to establishing the floodplain when there is a critical action. Instead, FEMA and the applicant must follow the sequence described in § 9.7 when making the floodplain determination. FEMA must determine whether the project meets the new definition of ''FEMA Federally Funded Project'' in § 9.4. If the project is a FEMA Federally Funded Project, then FEMA must establish the floodplain by using one of the FFRMS approaches (which require the applicant to consider whether an action is a critical action). If the project does not meet the definition of FEMA Federally Funded Project (*i.e.* the project is not ''new construction, substantial improvement, or repairs to address substantial damage to a structure or facility''), then FEMA must use, at a minimum, the 1 percent annual chance floodplain for non-critical actions and the 0.2 percent annual chance floodplain for critical actions.

FEMA proposes to add that the floodplain may be more specifically categorized as the 1 percent annual chance (base) floodplain, the 0.2 percent annual chance floodplain, or the FFRMS floodplain (as defined above). ''Floodplain'' is a flexible, general term, but in establishing the correct floodplain to use, it will be necessary to determine whether the action is a Federally Funded Project and whether it is a critical action.

Mitigation Directorate. FEMA proposes to remove the definition of the ''Mitigation Directorate'' as it is now included in the definition of ''FIMA.''

Nature-Based Approaches. FEMA proposes to add a definition of ''nature-based approaches.'' Executive Order 13690 added a provision requiring agencies to use nature-based approaches where possible and this term has not previously been defined. FEMA proposes to define nature-based approaches as the features (sometimes referred to as ''green infrastructure'') designed to mimic natural processes and provide specific services such as reducing flood risk and/or improving water quality. Nature-based approaches are created by human design (in concert with and to accommodate natural processes) and generally, but not always, must be maintained in order to reliably provide the intended level of service. Nature-based approaches are sometimes referred to as green infrastructure and may include, for example, green roofs, or downspout disconnection that reroutes drainage pipes to rain barrels, cisterns, or permeable areas instead of the storm sewer. The proposed definition mirrors the language of the WRC Revised Guidelines.

New Construction. FEMA proposes to remove the parenthetical ''including the placement of a mobile home'' from the definition of new construction because retaining the clause would have unintended effects, given the new definition of FEMA Federally Funded Projects. The application of the FFRMS is required for any action which meets the definition of ''Federally Funded Project.'' ''FEMA Federally Funded Project'' is defined as an action where FEMA funds are used for new construction, substantial improvement, or to address substantial damage to a structure or facility. If FEMA continued to define the placement of a mobile home as ''new construction,'' it would be required to apply the FFRMS to any placement of a mobile home. As described further in the discussion of § 9.13, FEMA does not intend to require the application of the FFRMS in the placement of mobile homes for the purpose of temporary housing.

Orders. FEMA proposes to revise the definition of ''orders'' to include Executive Order 13690.

Substantial Improvement. FEMA proposes to update the reference to the Stafford Act, because the citation is outdated in the current definition.

F. Section 9.5—Scope

FEMA proposes to add an effective date provision to this section, indicating that the revisions proposed to Part 9, which implement the changes required by Executive Order 13690 and the FFRMS, would apply to new actions that are commenced on or after the effective date of the final rule. This is to clarify that current Part 9, including use of the base floodplain (or 500-year floodplain for critical actions), would still apply to actions that are in the planning or development stage or undergoing implementation as of the effective date of the final rule revising Part 9. Only new actions would be subject to revised Part 9 so that the changes would not be applied retroactively to projects which have already been reviewed for compliance with Executive Order 11988 and may have incurred designed expenses to meet the current floodplain management standards. Any new actions would be subject to revised Part 9, including the changes required under Executive Order 13690 and the FFRMS, such as determining whether to use the base floodplain or FFRMS floodplain for the action and using nature-based approaches to mitigate harm when development in the floodplain is not avoidable.

FEMA proposes to update the citations to the Stafford Act sections and references to organizations and titles in paragraphs (c)–(g) as they are not current. FEMA also proposes to update paragraph (c)(8) as it refers to a defunct title for the Individuals and Households program and includes programs that no longer exist.

FEMA also proposes to eliminate the cross references in the last sentence of paragraph 9.5(f)(1), because they relate to regulatory provisions (44 CFR 9.9(e)(6) and 9.11(e)(4)) that FEMA proposes to remove in this rule. FEMA describes its rationale for eliminating the cited text later in this preamble.

G. Section 9.6—Decision-Making Process

Section 9.6 sets out the floodplain management and wetlands protection decision-making process to be followed by FEMA in applying Executive Orders 11988 and 11990 to its actions. There are eight Steps the agency must follow. Step 1 states that FEMA will determine whether the proposed action is located in the 100-year floodplain or, for critical actions, the 500-year floodplain. FEMA

proposes to remove the specific requirement to use the 100-year (1 percent annual chance) floodplain or 500-year (0.2 percent annual chance) floodplain for critical actions and instead use the general term ''floodplain.'' Instead, FEMA proposes to refer the reader to section 9.7(c) of the regulations, which describes (1) the flexible framework that FEMA would apply to FEMA Federally Funded Project under Executive Order 13690 and the FFRMS, as well as (2) the historical framework that FEMA would continue to apply to actions that do not qualify as FEMA Federally Funded Projects.

H. Section 9.7—Determination of Proposed Action's Location

Paragraph (a) of section 9.7 states that the purpose of the section is to establish FEMA's procedures for determining whether any action as proposed is located in or affects the base floodplain (or the 500-year floodplain for a critical action) or a wetland (*i.e.,* Step 1 of the 8-step decision-making process described in section 9.6). As in section 9.6, FEMA proposes to simply refer to ''floodplain'' rather than base floodplain or 500-year floodplain, because Executive Order 13690 and the FFRMS's flexible framework to determining which floodplain is appropriate depending on the type and criticality of the action means the floodplain must be established using the process set forth in paragraph 9.7(c) and may be something other than the floodplain established using the 1 percent annual chance flood or 0.2 percent annual chance flood.

Paragraph (b) of § 9.7 states that information about the 100-year and 500-year floods may be needed to comply with the regulations in Part 9. FEMA proposes to update this statement to reflect that information about the 1 percent annual chance (base) floodplain, 0.2 percent annual chance floodplain, and the FFRMS floodplain may be needed.

Paragraph (c) of § 9.7 outlines the sequence FEMA must follow in making the floodplain determination. FEMA proposes to implement the change to the definition of floodplain required by Executive Order 13690 and the FFRMS in § 9.7(c), ''Floodplain determination.'' As an initial step, FEMA would determine whether the project is a *FEMA Federally Funded Project* as defined in § 9.4. If the project is a FEMA Federally Funded Project, FEMA would establish the FFRMS floodplain and associated flood elevation using one of the four approaches outlined in the proposed section. For example, FEMA would likely be required to apply the FFRMS floodplain to construction projects under FEMA's Public Assistance program authorized under Section 406 of the Stafford Act, Hazard Mitigation Grant Program authorized under Section 404 of the Stafford Act, and Flood Mitigation Assistance Program authorized under Section 1366 of the National Flood Insurance Act. However, it is likely that certain other grant programs or actions would not be required to apply the FFRMS floodplain, because the actions funded do not involve construction activities. This may include grants provided for disaster planning through FEMA's Pre-Disaster Mitigation Program authorized under Section 203 of the Stafford Act and grants for planning and training awarded through programs administered by FEMA's Protection and National Preparedness Office. Each grant program FEMA funds would be required to determine whether the 1 percent annual chance, 0.2 percent annual chance, or FFRMS floodplain applies to the particular action.

FEMA proposes to implement the FFRMS in its regulations by adopting the flexible framework proposed in Executive Order 13690 in its entirety, instead of mandating a particular approach. Under this proposal, FEMA would provide additional guidance (more readily capable of revisions and updates) that addresses which approach FEMA would use for different types of actions and how FEMA would tailor its application of the various approaches depending on the type and criticality of the action. Executive Order 13690 makes clear that the intent of providing a flexible framework is to acknowledge that the impacts of flooding are anticipated to increase over time due to the effects of climate change and other threats. In order to determine what those impacts may be, there is value in using the best-available, actionable hydrologic and hydraulic data and methods that integrate current and future changes in flooding based on climate science, rather than relying solely upon the 1 percent annual chance flood standard, which does not account for or provide any factor of safety to mitigate against the possibility that flood risk may increase over time.

Executive Order 13690 provides an exception to use of the FFRMS when the action is in the interest of national security, where the action is an emergency action, where application to a Federal facility or structure is demonstrably inappropriate, or where the action is a mission-critical requirement related to a national security interest or an emergency action. FEMA proposes to adopt these exceptions in their entirety. It is important to note that an exception to using the FFRMS under any of the reasons listed in this section does not exempt the action from the requirements of Executive Order 11988 altogether. Instead, if one of FEMA's actions were excepted under this provision, FEMA would still be required to apply the 1 percent annual chance floodplain for non-critical actions and the 0.2 percent annual chance floodplain for critical actions. FEMA does have the authority to exempt certain actions from any application of the requirements of Executive Order 11988 and those actions which are exempted are enumerated in Section 9.5(c).

FEMA proposes that if it determines that the action is not a FEMA Federally Funded Project, *i.e.,* that the action does not involve the use of FEMA funds for new construction, substantial improvement, or to address substantial damage to a structure or facility, the proposed action may be evaluated using the 1 percent annual chance floodplain for non-critical actions and the 0.2 percent annual chance floodplain for critical actions. The sequence for making that determination remains relatively unchanged. The Regional Administrator (RA) first consults the FEMA FIRM, the FBFM and the FIS. If neither a FIRM nor a FBFM is available, the RA consults the FHBM. The regulation provides a list of sources to consult in the event the FHBM is not available. FEMA proposes to update this list of sources to those suggested in the Revised Guidelines, which were updated to reflect current titles and new available resources.[45] Finally, if none of these sources have the information necessary to comply with the Orders, the RA seeks the services of an engineer experienced in this type of work. If a decision involves an area or location within extensive Federal or State holdings or a headwater area, and no FIS, FIRM, FBFM, or FHBM is available, FEMA seeks information from the land administering agency before seeking information and/or assistance from the list of sources or an engineer.

Additionally, FEMA is proposing to change the paragraph structure of § 9.7 for clarity.

I. Section 9.8—Public Notice Requirements

The only proposed change is to paragraph 9.8(c)(5)(ii), to correct a typographical error.

[45] FEMA proposes to update this list of sources to reflect the WRC's Revised Guidelines.

J. Section 9.9—Analysis and Reevaluation of Practicable Alternatives

FEMA proposes to add the requirement to use natural systems, ecosystem processes, and nature-based approaches in the development of alternatives for Federal actions in the floodplain to § 9.9(b). Under § 9.9, FEMA must make a preliminary determination (Step 3 of the 8-step process) as to whether the floodplain is the only practicable location for the action. Part of that analysis involves considering whether there are alternative actions that serve essentially the same purpose as the proposed action but which have less potential to affect or be affected by a floodplain. Under this proposed rule, during the course of the aforementioned analysis, FEMA would consider whether using natural systems, ecosystem processes and nature-based approaches might have less of an effect on the floodplain.

FEMA proposes to remove paragraph (d)(2) of § 9.9, which prohibits FEMA from locating a proposed critical action in the 500-year floodplain. This is because under this proposed rule, critical actions would no longer be subject to a specific requirement related to the 500-year floodplain. Instead, FEMA would follow the sequence described in § 9.7 when making the floodplain determination. As noted above, FEMA would determine whether the project meets the new definition of ''FEMA Federally Funded Project'' in § 9.4. If FEMA determined that the project is a FEMA Federally Funded Project, then FEMA would establish the floodplain by using one of the FFRMS approaches (which require the applicant to consider whether an action is a critical action). If FEMA determined that the project is not a FEMA Federally Funded Project, then FEMA would use, at a minimum, the 1 percent annual chance floodplain for non-critical actions and the 0.2 percent annual chance floodplain for critical actions. After FEMA completed that process, it would apply the appropriate floodplain to the remainder of the 8-step process. Therefore, FEMA proposes to revise paragraph (d)(1) to specify that the ''floodplain'' is the floodplain established in § 9.7(c).

FEMA proposes to eliminate paragraph 9.9(e)(6). Section 9.9(e)(6) prohibits FEMA from providing a new or renewed contract for flood insurance for a structure if the Regional Director has chosen the ''no action'' option provided for in § 9.9(e)(5). This provision was temporarily suspended via a November 28, 1980 **Federal Register** Notice of intent not to enforce certain regulation concerning denial of flood insurance coverage. (45 FR 79069) FEMA ultimately did not ever implement this provision and does not intend to do so now; therefore, FEMA is proposing to remove it from the regulation.

K. Section 9.11—Mitigation

FEMA proposes to remove the reference to the base flood and the 500-year flood from paragraph 9.11(c) and instead reference the floodplain as established in § 9.7(c) when describing its intent to minimize potential harm to lives and the investment at risk. Again, this is because there is no longer a set requirement related only to the base floodplain or the 500-year floodplain when there is a critical action. Instead, FEMA must follow the sequence described in § 9.7 when making the floodplain determination.

In paragraph 9.11(d), FEMA proposes to revise the text to reflect that the minimization standards are applicable to all of FEMA's grant programs. Currently, paragraph 9.11(d) states that the minimization standards are applicable to only FEMA's implementation of the Disaster Relief Act of 1974. Some of FEMA's grant programs are authorized under other legislation.

In paragraphs 9.11(d)(2) and 9.11(d)(3)(i)–(ii), FEMA proposes to specifically require elevation of the lowest floor of a building to the FFRMS floodplain during the construction of new or substantially improved structures. As described above, FEMA must follow the sequence described in § 9.7 when making the floodplain determination. FEMA must determine whether the project meets the new definition of ''FEMA Federally Funded Project'' in § 9.4. The definition of ''FEMA Federally Funded Project'' is an action where FEMA funds are used for new construction, substantial improvement, or to address substantial damage to a structure or facility. ''Substantial Improvement'' as defined in § 9.4 includes all actions taken to address substantial damage to a structure or facility. Because paragraphs 9.11(d)(2) and 9.11(d)(3)(i)–(ii) specifically reference new construction or substantial improvement, FEMA must establish the floodplain in these circumstances by using one of the FFRMS approaches (which require the applicant to consider whether an action is a critical action). FEMA multi-hazard mitigation guidance can be consulted for technical information on elevation methods for new construction and the retrofitting of existing structures with various types of foundations.[46] For example, in the case of structures with basements, the structure may be elevated on solid foundation walls by creating a new masonry-enclosed area on top of an abandoned and filled-in basement or elevated on an open foundation by filling in the old basement.[47] If the structure with a basement is non-residential, the applicant may elect to dry floodproof the structure rather than elevate. In this case, basements may be dry floodproofed using the same techniques as spaces above grade, including the creation of continuous impermeable walls, creating flood resistance in core interior areas, adding sealants on openings, installing flood shields for openings in exterior walls, and installing backflow valves and internal drainage systems.[48]

For the same reasons as stated above, in paragraph 9.11(d)(9), FEMA proposes to remove the reference to the base flood or, in the case of critical actions, the 500-year flood from paragraph 9.11(d)(9) and instead reference the floodplain as established in § 9.7(c) when describing the requirements for the replacement of building contents, material and equipment.

FEMA proposes to revise paragraphs 9.11(e)(1) and (e)(2) by adding ''and Mitigation'' to the title of the ''Federal Insurance Administration'' to reflect the current title of the organization, the ''Federal Insurance and Mitigation Administration.'' FEMA also proposes to revise paragraphs 9.11(e)(2)(ii), 9.11(e)(3)(i)(E), and 9.11(e)(3)(ii) by replacing ''FIA'' with ''FIMA'' to again reflect the change in title.

Finally, FEMA proposes to eliminate paragraph 9.11(e)(4). Paragraph 9.11(e)(4) provides that where the Regional Director has been precluded from providing assistance for a new or substantially improved structure in a floodway, FEMA may not provide a new or renewed policy of flood insurance for that structure. As noted in the regulation, this provision was temporarily suspended via a November 28, 1980 **Federal Register** Notice of intent not to enforce certain regulation concerning denial of flood insurance

coverage. (45 FR 79069) FEMA ultimately did not implement this provision and does not intend to do so now; therefore, FEMA is removing it from the regulation.

L. Section 9.13—Particular Types of Temporary Housing

FEMA proposes to specifically designate the use of the 1 percent annual chance (base) floodplain when evaluating whether to take a temporary housing action. See proposed § 9.13(d)(1). FEMA proposes to specifically prohibit housing an individual or family in the 1 percent annual chance (base) floodplain, unless the Regional Administrator has complied with the provisions in proposed § 9.9 to determine that the site is the only practicable alternative. See proposed § 9.13(d)(3). FEMA proposes to designate the 1 percent annual chance (base) floodplain as the floodplain of choice when taking temporary housing actions for several reasons: (1) The temporary nature of the assistance means there is not an opportunity to improve community resilience or floodplain management long term, which is the intent of the FFRMS; (2) expansion of the base floodplain to the FFRMS floodplain and prohibiting placement of temporary housing in the FFRMS floodplain may result in the temporary housing of individuals and families many miles from their homes, which is not practicable; and (3) it is not always feasible to elevate mobile homes, when they are being placed as temporary housing.

FEMA proposes to add the sentence ''actual elevation levels will be based on manufacturer specifications and applicable Agency guidance'' to reflect the fact that it is not always feasible to elevate mobile homes. See proposed § 9.13(d)(4)(i). Since mobile homes are often the last resort for temporary housing and they are being placed temporarily, it is not always practicable to elevate mobile homes to a given level. However, the proposed rule would require that such homes be elevated to the fullest extent practicable.

In paragraph 9.13(d)(4)(ii), FEMA proposes to substitute ''44 CFR parts 59–60'' for ''44 CFR part 59 *et seq.''* to be clear what specific sections of the regulations the language references.

FEMA also proposes to require the elevation of a mobile home to at least the level of the FFRMS floodplain, if FEMA intends to sell or otherwise dispose of mobile homes in the FFRMS floodplain. See proposed § 9.13(e)(2). The reason for this requirement is that any sale or disposal of a mobile home no longer constitutes temporary housing; FEMA believes that any unit intended for permanent placement should be protected to the fullest extent practicable, because the probability that a flood will occur within the floodplain is greater over the anticipated lifespan of a permanent structure than a temporary structure, and so the benefit of hazard mitigation is greater to the permanent structure than the temporary structure. Further, any sale or disposal of a mobile home must meet NFIP requirements of residential structures by elevating the lowest floor. Mobile homes placed in the floodplain for the purposes of temporary housing must meet the criteria of the NFIP or any more restrictive standards unless the community has granted a variance. See proposed § 9.13(d)(4)(ii).

Additionally, FEMA is proposing to change the paragraph structure of § 9.13. No substantive changes are intended as a result of this restructuring.

M. Section 9.17—Instructions to Applicants

In paragraph 9.17(a), FEMA proposes to add ''as amended'' to reflect Executive Order 13690's amendment of Executive Order 11988.

In paragraph 9.17(b), FEMA proposes to update the reference to the WRC's 1978 Guidelines to the full title for the Revised Guidelines.

N. Section 9.18—Responsibilities

In paragraph 9.18(b), FEMA proposes to update the references to the FIA and the title of Associate Administrator.

In paragraph 9.18(b)(2), FEMA proposes to add ''as amended'' to reflect Executive Order 13690's amendment of Executive Order 11988.

O. Appendix A to Part 9—Decision-Making Process for E.O. 11988

FEMA proposes to remove ''Appendix A to Part 9—Decision-Making Process for E.O. 11988'' in its entirety. The graphic is no longer accurate. Further, given that Executive Order 13690 deliberately created a flexible approach to establishing the FFRMS and also requires update of the FFRMS every 5 years, there is no utility to including the appendix in regulation. Instead, FEMA would include a revised version of the appendix to include the new decision-making process and the definition of the FFRMS floodplain in its policy implementing the FFRMS.

V. Response to Leadership Intent Comments

On November 17, 2015, FEMA's Federal Insurance and Mitigation Administration released for public comment FEMA's Overview of FEMA's Intent to Implement the FFRMS (Intent). Continuing our commitment to an open, collaborative, stakeholder-focused process in implementing the FFRMS, FEMA shared this framework for public comment on FEMA's Web site through December 17, 2015.

FEMA received 12 comments in response to the Intent. Of the 12 comments received, 10 comments were supportive, 1 comment was opposed, and 1 comment was not germane.[49]

The 10 comments received in support of the Intent came from a variety of sources, including local governments, associations, environmental action organizations, and commenters that chose to reply in their private capacity. Following is a discussion of the comments submitted.

The adverse comment came from a local government official. The official stated that the CISA would be ''a means to extort money from citizens based on a junk science forecasts/models of which so called projections have been outrageously inaccurate.'' The commenter did not provide any support for the statement. FEMA disagrees with the commenter's assessment that Climate-Informed Science Approach (CISA) is based on ''junk science forecasts/models.'' Scientists compare models' projections of historical climate trends to the historical records climate variables to measure the confidence of the models' abilities to accurately predict future climate conditions.[50] Many peer reviewed studies of climate models have found in general that climate model simulations of historical global temperature and other climactic variables are comparable to the historical recorded observations of those variables.[51] These studies provide confidence in accuracy of climate models' projections of future climate conditions.

The 2014 United States National Climate Assessment (Assessment) concluded that ''[g]lobal trends in temperature and many other climate variables provide consistent evidence of

[49] The comments are available in the docket for this rulemaking.

[50] Risbey et al. 2014. Well-estimated global surface warming in climate projections selected for ENSO phase. ''Nature Climate Change'', 4, 835–840.

[51] See Covey et al. 2003. An overview of results from the coupled model intercomparison project (CIMP). ''Global and Planetary Change'', 37, 103–133; and Cubasch *et al.* 2013. Introduction. In: ''Climate Change 2013: The Physical Science Basis. Contribution of Working Group I to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change'' [Stocker *et al.* (eds)]. Cambridge University Press, Cambridge at 131.

a warming planet.'' [52] These trends ''are based on a wide range of observations, analyzed by many independent research groups around the world.'' [53] The Assessment reported that confidence is very high [54] that global sea level has risen during the past century and that it will continue to rise, and there is medium confidence that global sea level rise will be in the range of 1–4 feet by 2100.[55] The Assessment further reports that although changes in overall precipitation are uncertain in many U.S. areas, there is high degree of certainty that the heaviest precipitation events will increase everywhere, and by large amounts.[56] The approaches to establish a higher vertical elevation and corresponding floodplain provided in the FFRMS are intended to address these future flood risks.

Within the 10 supportive comments, the commenters provided suggestions and asked questions concerning FEMA's proposed framework. One local government agreed that the CISA should be used in ''calculating the [FFRMS] flood level and floodplain,'' but stated that:

> [Allowing a different set of standards for FFRMS and NFIP not only allows for non-compliance with the NFIP i[t] encourages it. How will FEMA discipline a community for not complying with the NFIP when they provided the funding for the project under FFRMS. This is a double standard and will create legal issues if not revised.

FEMA disagrees that implementing the FFRMS encourages noncompliance with NFIP standards. FEMA acknowledges that it is proposing to provide an option to use the CISA for critical facilities, but notes that under this proposal, the CISA would only be allowed if the elevation is higher than the elevation established using the FVA. This precaution would eliminate the possibility that the CISA elevation used for a FEMA Federally Funded Project would be less than the base flood elevation required as the minimum standard of the NFIP. Additionally, FEMA has complied and will continue to comply with local floodplain management standards that are more restrictive. FEMA is not proposing to amend § 9.11(d)(6), which prohibits FEMA from taking any action that is inconsistent with the NFIP standards or any more restrictive Federal, State, or local floodplain management standards.

One commenter was concerned with the issue of coordination between Federal agencies, stating:

> The Background [to the Intent document] states that ''Federal agencies have the flexibility to select from the approaches of the FFRMS to establish the floodplain for a given action.'' While flexibility may be warranted, the interagency coordination provision must come into play in establishing the ''floodplain'' by various agencies. The Framework language needs to be revised from ''. . . should coordinate early . . .'' to ''. . . shall coordinate early.'' This needs to be a required action whereby the most protective, conservative delineation of the floodplain is achieved and applied by all [F]ederal agencies for all purposes.

FEMA agrees with this comment and in the supplementary policy, FEMA proposes that when FEMA is funding a FEMA Federally Funded Project with, or in the same area as, another Federal agency, FEMA will coordinate with the applicable Federal agency early in the planning process.

Multiple commenters stated that the use of the FVA may create a disincentive to update flood maps. Their concern was that the use of the FFRMS–FVA rather than the FFRMS–CISA might create a sense that flood map updates and associated funding are less critical because of the safety standard provided by freeboard. Commenters stated that:

> [t]he freeboard provision is a positive, protective step, however, it should not become a default standard to replace updated flood mapping.

FEMA disagrees with the statement that using the FVA will eliminate the desire to update flood maps. FEMA has stated that the FFRMS will not affect FEMA's flood mapping standards. While FEMA's FIS and FIRMs may be used as sources of best available information to establish the FFRMS elevation, the primary function of FIS and FIRMs is not to establish the FFRMS. The production of FIS and FIRMs are managed for other purposes, such as to serve the mission of the NFIP.

Two commenters requested that FEMA address how changing flood hazard information will be used in establishing the FFRMS elevation. One commenter stated:

> [i]n all the talk I hear about flood mitigation and resolution I never hear any discussion as how standard measurements, what you call base line, do not take into account or even look at how those base lines have moved due to erosion.

Another commenter asked:

> On occasion, FEMA has issued Advisory Base Flood Elevations (ABFEs) following a major flooding event, when it has been determined that the effective [Base Flood Elevations (BFEs)] significantly underestimate the base flood [. . .] What will FEMA consider to be the advisory ''BFE'' when adding freeboard under EO 13690?

Section 2(a)(1) of the Executive Order directs agencies to use approaches based on the best available information and FEMA's effective FIRM. Because flood risk can change over time, FEMA's mapping program continually updates its inventory of flood hazard information. Flood zone designations may be established or revised when new and more accurate information becomes available because of a FEMA-contracted restudy or because the community makes the information available to FEMA. More accurate information may include more accurate or updated topographic information which would capture changes in the ground elevation due to factors including erosion. Information from a preliminary FIRM or ABFE may serve as best available information if the information shows that a site previously located outside the floodplain is now in the floodplain, or that the existing FEMA Base Flood Elevation has increased. In response to the commenter's question, when determining what is the appropriate ''BFE'' when adding freeboard under Executive Order 13690, FEMA would use the best available information.

One comment received from a local government stated that the FVA is one-size fits-all, and the FVA would not reflect local conditions when establishing the FFRMS elevation. FEMA uses the best available information to establish the base flood elevation, which reflects local flooding conditions. Therefore, FEMA disagrees with the comment that the FVA would not reflect local conditions.

Five commenters stated that FEMA should use the 0.2 percent annual chance floodplain approach (500-year floodplain) to establish the minimum FFRMS elevation and floodplain for critical actions. One commenter stated that:

> In some instances, the 500-year floodplain may provide a higher elevation than the other options, and in those instances the 500-year floodplain should be used. Critical actions are actions for which even a slight chance of flooding would be too great. As such, an all three FFRMS approaches should be considered to achieve the highest level of protection.

Another commenter stated the FVA may provide too restrictive a standard when the FVA elevation is higher than the 0.2 percent annual chance floodplain elevation:

---

[52] Walsh et al. 2014: Ch. 2: Our Changing Climate. ''Climate Change Impacts in the United States: The Third National Climate Assessment,'' J. M. Melillo, Terese (T.C.) Richmond, and G. W. Yohe, Eds., U.S. Global Change Research Program, 19–67.

[53] *Id.*

[54] ''Very high'' is the highest confidence level used in the Assessment. *See id.* at 61.

[55] *Id.* at 66.

[56] *Id.* at 33.

For example, in areas where the 500-year water surface is less than 2 feet above the 100-year water surface, the freeboard value approach may be overly conservative and go well above the 500-year level protection.

FEMA recognizes that the FVA may be more or less conservative than the 0.2PFA. However, FEMA is proposing in the supplementary policy to select to use the FVA but not the 0.2PFA. FEMA feels it is more pragmatic to only establish the elevation using one approach to manage the level of effort and costs needed to establish the FFRMS elevation. Additionally, by establishing only one FFRMS approach as the default approach, FEMA believes the supplementary policy would be clearer for stakeholders and applicants to identify which FFRMS approach FEMA would require for FEMA Federally Funded Projects. When using the CISA, the supplementary policy proposes that FEMA would evaluate if the CISA methodology is appropriate to the action being considered. In accordance with the Revised Guidelines, the CISA methodology should consider the criticality of the action. Flood elevations informed by the CISA can be adjusted to be higher to account for the increased consequences associated with flood damage.[57] This consideration should assist FEMA in making appropriate decisions about data sources to use in the CISA analysis to account for the flood risk to the FEMA Federally Funded Project.

Four commenters generally stated FEMA should require use of the CISA for critical and/or non-critical actions. Specifically, one commenter stated:

FEMA has an obligation to protect taxpayer dollars and thus to use climate informed science when its experts determine the data is adequate to accurately calculate the FFRMS flood level and floodplain.

Another commenter stated:

Failure to evaluate sea level rise over the next several decades would be an egregious oversight when deciding what to build, where to build, and how to build in coastal environments.

Executive Order 13690 and the FFRMS do not prescribe a particular approach regardless of the individual circumstance. Instead, they intentionally provide for flexibility in application to allow Federal agencies to develop an implementation approach that meets the needs and mission of the particular agency. FEMA had to take into account many considerations when making its determination, such as: (1) Consistency: The need to create an approach which would allow stakeholders and applicants to consistently determine which standard FEMA would apply to FEMA Federally Funded Projects; (2) disaster considerations: the ability to implement the approaches in both a non-disaster and post-disaster environment. In a post-disaster environment, FEMA needs to be able to make decisions quickly to assist communities in their recovery. Other considerations included cost as well as resilience. FEMA balanced consideration of the preference in the FFRMS for the CISA against these implementation considerations when making the decision to propose optional use of the CISA. FEMA is not proposing to require the CISA for non-critical projects; however, as the FFRMS is reevaluated annually and updated in 5 years as required by Executive Order 13690, this may change.

Four commenters stated that FEMA should comply with State, Tribal, territorial, or local government flood risk standards, when those standards are more restrictive than the FFRMS. One comment stated:

Any critical or non-critical FEMA actions or FEMA-funded projects should thus comply with all applicable [S]tate and local floodplain protection standards.

FEMA has and will continue to comply with more restrictive local floodplain management standards. FEMA is not proposing to amend § 9.11(d)(6), which prohibits FEMA from taking an action if it is inconsistent with any more restrictive Federal, State, local, Tribal, and territorial, floodplain management standards.

One comment received from an environmental action organization stated that:

The threshold for what constitutes substantial improvement/damage should be a maximum of 50%. A cumulative approach to calculate substantial improvement/damage over projects' lifetimes should be utilized.

FEMA is not proposing to amend the definition of substantial improvement in § 9.4. Substantial improvement is defined as any repair, reconstruction or other improvement of a structure or facility, which has been damaged in excess of, or the cost of which equals or exceeds, 50 percent of the market value of the structure or replacement cost of the facility. FEMA is not proposing to adopt a cumulative approach to calculate substantial improvement because FEMA does not track improvements made by applicants, without FEMA funding, to their own public facilities. If a local community has adopted a cumulative approach to calculating substantial improvement or substantial damage, FEMA will comply with the more restrictive local standard in accordance with § 9.11(d)(6).

Another commenter addressed use of the emergency action exception of the FFRMS:

While we support the provision in EO 13690 that exempts emergency action from the Federal Flood Risk Management Standard, we urge the agency to narrowly define what constitutes an emergency action [. . .] [P]ermanent work under the PA Program (PA) [. . .] should not be classified as emergency work for the purposes of exemption.

FEMA is not proposing to exempt permanent work (Categories C–G) funded by the Public Assistance program under the emergency action exception of the FFRMS.

Two commenters encouraged FEMA to address how structural flood risk management systems will affect the FFRMS floodplain. One commenter stated:

Structural flood risk management systems are intended to reduce flood risk—not eliminate flood risk. As such, the agency should evaluate flood risks if building behind such structures, including the risk of flooding should the structure fail or be breached.

FEMA will consider the factors described in section 1.B.6 of the Revised Guidelines, Structural Flood Risk Management Systems, when considering whether an action which is landward of a structural flood risk management system is in the FFRMS floodplain. Per the direction in the Revised Guidelines, flood control structures' status on effective FIRMs will not be the sole resource used to determine if a project is within the FFRMS floodplain. FEMA determinations of accreditation status, Zone AR,[58] and Zone A99 [59] may not convey the full hazard to projects landward of a flood control structure.[60] Additional information, as fully listed in the Revised Guidelines, would need to be gathered to inform the determination of if the project is within the FFRMS floodplain.

One commenter suggested FEMA should adopt a comprehensive definition of resilience, stating:

[57] Revised Guidelines at 55.

[58] Zone AR is defined as the area of special flood hazard that results from the decertification of a previously accredited flood protection system that is determined to be in the process of being restored to provide base flood protection. Mandatory flood insurance purchase requirements and floodplain management standards apply. See 44 CFR 64.3(a)(1).

[59] Zone A99 is defined as the area of special flood hazard where enough progress has been made on a protective system, such as dikes, dams, and levees, to consider it complete for insurance rating purposes. See 44 CFR 64.3(a)(1).

[60] See Revised Guidelines at 58.

> The more comprehensive definition laid out in [the Water Resources, Reform and Development Act of 2014] provides guidelines that FEMA can incorporate into its guidance [and][. . .] gives more detail and guidance to regulators and the regulated community, thereby increasing certainty.

FEMA is not proposing to define resilience in Part 9. There is no universal definition of resilience, nor is one associated with FEMA's implementation of Executive Order 13690. Section 9.11 requires FEMA to minimize potential harm to the investment at risk from flooding. With the exception of specific minimization standards in § 9.11(d), FEMA does not specify the techniques which must be used to achieve minimization of harm and improve the resilience of actions within the floodplain.

The same commenter also supported the inclusion of structures and facilities in the Revised Guidelines, stating:

> FEMA has expanded the scope of the guidelines by including their application to [F]ederal ''facilities,'' in addition to structures [. . .] By expanding the scope of the guidelines to include roads and bridges, FEMA has made an important step toward establishing more resilient and disaster-resistant communities located within [F]ederal floodplains.

However, FEMA disagrees with the comment that FEMA has expanded the scope of the guidelines. Executive Order 11988 applies to Federal actions, meaning (a) acquiring, managing and disposing of Federal lands and facilities; (b) providing federally undertaken, financed or assisted construction and improvements; and (c) conducting Federal activities and programs affecting land use, including, but not limited to, water and related land resources, planning, regulating and licensing activities. The definition of action encompasses providing federally assisted construction to both structures and facilities.

Finally, one commenter suggested FEMA should incorporate the FFRMS into agency regulations and procedures within 18 months, requesting:

> [p]lease identify which regulations, and guidance, documents will require amendment.

FEMA has identified the regulations which will require amendment to implement Executive Order 13690 and the FFRMS in this Notice of Proposed Rulemaking.

VI. FFRMS FY 2016 Appropriations Language

Section 750 of Division E of the Consolidated Appropriations Act, 2016 (Act) (Pub. L. 114–113, 129 Stat. 2242) provides that none of the funds made available under that Act or any other Act could be used to (1) implement, administer, carry out, modify, revise or enforce Executive Order 13690 other than for (a) acquiring, managing, or disposing of Federal lands or facilities; (b) providing federally undertaken, financed, or assisted construction or improvements; or (c) conducting Federal activities or programs affecting land use, including water and related land resources planning, regulating, and licensing activities; or (2) implement Executive Order 13690 in a manner that modifies the non-grant components of the National Flood Insurance Program.

FEMA does not interpret this prohibition on the use of appropriated funds to have any effect on this rulemaking or its policy development. Paragraph 750(a)(1) effectively allows for action to be taken to implement Executive Order 13690 as long as it is within the original scope of responsibilities outlined in Section 1 of Executive Order 11988. Subsection (a)(2) prohibits FEMA from implementing Executive Order 13690 in a way that modifies the non-grant components of the NFIP. Neither this rulemaking nor FEMA's policy development goes beyond the scope of Section 1 of Executive Order 11988 or modifies the non-grant components of the NFIP. Although FEMA has always applied the 8-step decision-making process to program-wide NFIP actions, such actions do not qualify as FEMA Federally Funded Projects under this rule. Therefore, the prohibition on the use of appropriated funds does not apply to this Notice of Proposed Rulemaking.

VII. Regulatory Analyses

A. Executive Order 12866, Regulatory Planning and Review & Executive Order 13563, Improving Regulation and Regulatory Review

Executive Orders 13563 and 12866 direct agencies to assess the costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). Executive Order 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This rule has been designated a ''significant regulatory action'' although not economically significant, under section 3(f) of Executive Order 12866. Accordingly, the rule has been reviewed by the Office of Management and Budget.

As noted, FEMA is proposing to amend 44 CFR part 9, ''Floodplain Management and Protection of Wetlands'' and issue a supplementary policy to implement the Executive Order 13690 and the FFRMS.

The FFRMS is a flexible framework to increase resilience against flooding and to help preserve the natural values of floodplains. FEMA is proposing to incorporate the FFRMS into its existing processes, to ensure that the floodplain for FEMA Federally Funded Projects is expanded from the current base flood level to a higher vertical elevation and corresponding horizontal floodplain and that, where possible, natural systems, ecosystem processes, and nature-based approaches would be used when developing alternatives to locating Federal actions in the floodplain.

FEMA estimates that for the 10-year period after the rule goes into effect, the benefits would justify the costs. Flooding is the most common type of natural disaster in the United States, and floods are expected to be more frequent and more severe over the next century due to the projected effects of climate change.[61] The ocean has warmed, polar ice has melted, and porous landmasses have subsided.[62] Global sea level has risen by about 8 inches since reliable record keeping began in 1880 and is projected to rise another 1 to 4 feet by 2100.[63] Floods are costly natural disasters; between 1980 and 2013, the United States suffered more than $260 billion in flood-related damages.[64] This proposed rule would help protect Federal investments from future floods, and would help minimize harm in floodplains, by changing how FEMA defines the floodplain for FEMA-funded new construction and substantial improvement (*i.e.,* ''Federally Funded Projects''). The expected costs of this proposed rule are primarily due to increased elevation or floodproofing requirements of structures in the FFRMS floodplain, with the majority of these costs expected to be incurred by FEMA itself through several

grant programs, which will be either passed through to taxpayers or result in lower levels of Government services. FEMA grant recipients would bear approximately 25 percent of the project costs for those grant programs that have a cost-share requirement. The cost components of this proposed rule relate to grants under FEMA's IA, PA, HMA, and GPD programs, as well as FEMA facilities and the Integrated Public Alert Warning System (IPAWS). To estimate the cost of the proposed elevation requirements FEMA uses data from the NFIP. Table 1 and Table 2 show the costs and benefits by program, that FEMA has available, annualized for the first 10 years. Most of the estimated costs come from PA Category C, which includes replacements of bridges.

IA Projects

IA Permanent Housing Construction (PHC) projects and sales of Manufactured Housing Units (MHUs) would be affected by the proposed rule. Although floodproofing is a valid option in some instances, FEMA regulations prohibit the floodproofing of residential structures. In these cases, elevation is the only option. FEMA calculated the cost of elevating structures under PHC

structures by adding the cost of elevating projects between 1 foot and 3 feet above the BFE, depending on location and type of project. FEMA subtracted certain costs that it determined to be part of the baseline. Specifically, numerous States and localities have existing freeboard requirements that would result in elevation costs and benefits regardless of this proposed rule, so costs and benefits for these areas were reduced based on existing requirements. The total PHC cost is estimated to range between $1,690 and $24,071 per year for FEMA (PHCs are funded fully by FEMA). FEMA estimates that an average of 2.22 PHCs per year would be subject to FFRMS requirements. IA also includes the sale of MHUs. The total MHU cost is estimated to range between $238 and $3,383 per year. FEMA estimates that an average of 4.88 MHUs per year would be subject to FFRMS requirements. An MHU elevation must be paid fully by an IA grant recipient who ultimately purchases the MHU.

PA Projects

PA Categories C, D, E, F, and G projects would be affected by the proposed rule, but FEMA is only able to provide partial estimates of costs associated with Categories C (Roads and Bridges) and E (Public Buildings).

FEMA cannot estimate the costs of improving flood resiliency of roads because of the highly project-specific nature of road projects, and numerous options for making roads resilient. Damage to roads during flood events can be caused by erosion and scour, inundation by floodwater, or debris blockage, and can be worsened by issues such as misaligned culverts, insufficient culvert capacity, embankment erosion, road and shoulder damage, and obstructions that reduce culvert capacity. A sampling of mitigation actions that can improve the resiliency of a road to flooding include installing low water crossings, increasing culvert size, installing a relief culvert, adding rip rap to a road embankment to provide slope protection, installing structures such as aprons and baffle structures that dissipate the energy of floodwater, realigning culverts, and installing road shoulder subsurface drains.[65]

FEMA considers all PA Category C grants used to replace publicly-owned bridges to be critical actions for the purposes of this analysis. There are a variety of techniques that can be used to floodproof a bridge, but the specific techniques depends on the specific bridge, location, and circumstances. FEMA estimates that the costs of this proposed rule for Category C bridge grants would range from a low of $5,645,515 per year to a high of $33,873,085 per year. FEMA estimates that an average of 7.10 PA Category C bridge projects per year would be subject to FFRMS requirements. The total cost to the PA program is estimated to be between $5,904,826 and $37,310,281 per year. With the 75 percent cost share, the cost to FEMA would be between $4,428,620 and $27,982,711 per year, while the cost to grant recipients would be between $1,476,207 and $9,327,570 per year.

FEMA used data from PA grant approvals from 2006–2015 and used a multi-step process to estimate the range of costs for elevating Category E structures. FEMA estimates that the elevation cost for Category E non-critical actions would be a low of $219,301 per year and a high of $3,123,171 per year. FEMA estimates that an average of 19.19 PA Category E projects per year would be subject to FFRMS requirements. In addition, FEMA estimates that the total cost for Category E critical actions would range from a low of $40,009 per year to a high of $314,026 per year.

HMA Projects

FEMA used data from HMA grant approvals for elevation and floodproofing of structures from 2006–2015 and a multi-step process to estimate the range of costs for elevating or floodproofing these structures. FEMA estimates that the total cost for HMA non-critical actions for elevation projects would range from a low of $138,999 per year to a high of $1,979,591 per year. In addition, FEMA estimates that the total cost for HMA critical actions for elevation projects would range from a low of $10,858 per year to a high of $85,229 per year. FEMA estimates that an average of 73.69 HMA elevation projects per year would be subject to FFRMS requirements. The total cost for HMA non-critical actions for floodproofing projects would be a low of $2,188 per year and a high of $31,165 per year. In addition, FEMA estimates that the total cost for HMA critical actions for floodproofing projects would be a low of $176 per year and a high of $1,397 per year. FEMA estimates that an average of 4.70 HMA floodproofing projects per year would be subject to FFRMS requirements. FEMA estimates the total cost of this rule for the HMA program to be between $152,221 and $2,097,382 per year. With the 75 percent cost share, the cost to FEMA would be between $114,165 and $1,573,037 per year, while the cost to grant recipients would be between $38,055 and $524,346 per year.

HMA also funds various other types of projects, such as minor flood control, property acquisition, generators, and mitigation reconstruction, but FEMA is unable to estimate the potential costs associated with these projects because the manner in which each applicant meets the resiliency standards will be fact-specific and dependent upon the nature of the design and purpose of the project. Additional minor mitigation measures would have to be taken for these projects, if located in the expanded FFRMS floodplain. FEMA requests public comments.

The costs of the proposed rule would be from IA, PA, and HMA programs, as well as administrative costs. FEMA expects minimal costs associated with GPD and IPAWS because these programs do not fund new construction or substantial improvement projects. These projects are also by nature typically resilient from flooding. FEMA facilities may also be subject to additional requirements due to the implementation of the proposed rule.

FEMA estimates that the total additional grants costs as a result of the proposed rule would be between $906,696 and $7.8 million per year for FEMA and between $301,906 and $2.6 million per year for grant recipients due to the increased elevation or floodproofing requirements of FEMA Federally Funded Projects.

In addition, FEMA expects to incur some administrative costs as a result of this proposed rule. FEMA estimates initial training costs of around $100,000 the first two years after the rule is implemented, and administrative and training costs of around $16,000 per year thereafter. FEMA estimates that the total annual cost of this rule after year two would be between $6.1 million and $39.5 million.

FEMA estimates the quantified cost of this proposed rule over the next 10 years would range between $60.1 million and $394.7 million. The present value (PV) of these estimated costs using a 7 percent discount rate would range between $42.9 million and $277.3 million. The PV using a 3 percent discount rate would range between $52.0 million and $336.7 million. These costs would be split between FEMA (75 percent) and recipients (25 percent) of FEMA grants in the floodplain. The low estimates of the 10-year costs of this rule, discounted at 3 percent and 7 percent are presented in Table 3. The high estimates of the 10-year costs of

[65] See FEMA, ''FEMA B–797 Hazard Mitigation Field Book: Roadways'', (2010), available at *http://www.fema.gov/media-library/assets/documents/19299.*

this rule, discounted at 3 percent and 7 percent are presented in Table 4.

TABLE 3—10-YEAR COST TOTALS USING 3 PERCENT AND 7 PERCENT DISCOUNT RATES (LOW ESTIMATE, 2015$)

Year	FEMA Admin. costs	FEMA Grant costs	Recipient cost share	Undiscounted annual costs	Annual costs discounted at 3%	Annual costs discounted at 7%
1	$135,291	$4,544,475	$1,514,499	$6,194,265	$6,013,850	$5,789,033

Annualized					39,474,575	39,478,109

Benefits

FEMA anticipates that the benefits of the proposed rule would justify the costs. FEMA has provided qualitative benefits, including the reduction in damage to properties and contents from future floods, potential lives saved, public health and safety benefits, reduced recovery time from floods, and increased community resilience to flooding.

FEMA believes this proposed rule would result in savings in time and money from a reduced recovery period after a flood and increased safety of individuals. Generally, if properties are protected, there would be less damage, resulting in less clean-up time. In addition, higher elevations help to protect people, leading to increased safety. FEMA is unable to quantify these benefits, but improving the resiliency of bridges has significant qualitative benefits, including: Protecting evacuation and escape routes; limiting blockages of floodwaters passing under the bridge that may lead to more severe flooding upstream; and, avoiding the cost of replacing the bridge again if it is damaged during a subsequent flood. Any estimates of these savings would be dependent on the specific circumstances and FEMA is not able to provide a numeric value on these savings.

A 2008 FEMA report analyzes potential savings from damage avoidance associated with including freeboard in the construction of new residential structures in coastal areas at various freeboard levels.[66] According to this report, in some contexts a dollar spent on elevation activities could result in a $1.30 to $8.92 return on investment, due to damage avoidance only. This report shows that the benefits of incorporating freeboard exceed the costs for certain projects located in coastal flood zones. However, the report's scope is limited to new construction of houses in coastal areas. Due to the relatively narrow scope of the study, FEMA has not used the results of this report to estimate monetized benefits of freeboard to the nationwide projects that would be affected by this rule. FEMA requests information and studies from the public that examine the benefits of freeboard for a more diverse set of projects, such as non-residential structures, retrofitting substantial improvement projects, projects in non-coastal floodplains. If FEMA receives additional information that informs an estimate of the monetized benefits of freeboard to a broad range of structures, we may provide a monetized estimate of benefits in the final rule.

For more in-depth review of these costs and benefits, please see the Regulatory Evaluation, which can be found in the docket for this rulemaking.

B. Regulatory Flexibility Act

This section considers the effects that this proposed rule would have on small entities as required by the Regulatory Flexibility Act (RFA, 5. U.S.C. 601 *et seq.,* Pub. L. 96–354) as amended by the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA). The RFA generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act or any other statute unless the agency certifies that the rule will not have a ''significant economic impact on a substantial number of small entities.'' 5 U.S.C. 605(b). Small entities include small businesses, small organizations, and small governmental jurisdictions.

FEMA prepared an Initial Regulatory Flexibility Analysis (IRFA) for this proposed rule. This analysis is detailed in this section and represents FEMA's assessment of the impacts of this proposed rule on small entities. Section 1 outlines FEMA's initial assessment of small entities that would be affected by the proposed regulations. Section 2 presents FEMA's analysis and summarizes the steps taken by FEMA to comply with the RFA.

1. Initial Assessment of Small Entities Affected by the Proposed Regulations

The proposed rule would affect FEMA grant recipients that receive Federal funds for new construction, substantial improvement to structures, or to address substantial damage to structures and facilities. Many of these grants are available to local governmental jurisdictions and non-profit organizations. FEMA does not provide grants to for-profit businesses.

2. Analysis and Steps Taken To Comply With the Regulatory Flexibility Act

The following IRFA addresses the following requirements of the RFA:

(1) A description of the reasons why action by the agency is being considered;

(2) a succinct statement of the objectives of, and legal basis for, the proposed rule;

(3) a description of and, where feasible, an estimate of the number of small entities to which the proposed rule will apply;

(4) a description of the projected reporting, recordkeeping and other compliance requirements of the proposed rule, including an estimate of the classes of small entities which will be subject to the requirement and the type of professional skills necessary for preparation of the report or record;

(5) an identification, to the extent practicable, of all relevant Federal rules which may duplicate, overlap or conflict with the proposed rule;

(6) a description of any significant alternatives to the proposed rule which accomplish the stated objectives of applicable statutes and which minimize any significant economic impact of the proposed rule on small entities. Consistent with the stated objectives of applicable statutes, the analysis shall discuss significant alternatives such as: The establishment of differing compliance or reporting requirements or timetables that take into account the resources available to small entities; the clarification, consolidation, or simplification of compliance and reporting requirements under the rule for such small entities; the use of performance rather than design standards; and an exemption from coverage of the rule, or any part thereof, for such small entities.

2.1 Description of the Reasons Why Action by the Agency Is Being Considered

On January 30, 2015, the President issued Executive Order 13690, which amended Executive Order 11988 and established a new flood risk management standard called the FFRMS. Executive Order 13690 directs agencies to issue or amend their existing regulations and procedures to comply with the Order; therefore, FEMA is updating its regulations at 44 CFR part 9 and issuing an FFRMS policy.

The FFRMS is intended to reduce flood risk by expanding the floodplain with respect to Federally Funded Projects, revising the definition of the floodplain, adding a definition of ''critical action,'' and requiring agencies to use natural systems, ecosystem processes, and nature-based approaches in the development of alternatives for Federal actions in the floodplain.

2.2 Succinct Statement of the Objectives of, and Legal Basis for, the Proposed Rule

FEMA is responsible for publishing information on floodplain areas and identifying special hazards. FEMA is also responsible for several grant programs that use Federal funds to assist in construction or reconstruction following a disaster, as well as grants for hazard mitigation and recovery. These grants can potentially be used for locations within a floodplain.

To meet the requirements of section 2(d) of Executive Order 11988, requiring agencies to issue or amend existing regulations and procedures to implement the Executive Order, FEMA promulgated regulations which are located at 44 CFR part 9. FEMA is revising 44 CFR part 9 to reflect the changes to Executive Order 11988 made via Executive Order 13690.

The objective of the proposed rule is to revise the regulations for locating FEMA Federally Funded Projects in an expanded floodplain to reduce the risk of flooding to those projects. In addition, for actions that are determined to be ''critical actions'' as defined by the proposed rule, the proposed rule would impose more stringent elevation and resiliency requirements. This is necessary to protect actions where even a slight chance of flooding is too great.

The rule would also require the use of nature-based approaches, where possible, when considering alternatives for development in the floodplain. Nature-based approaches can include both natural and engineered features. The objective of requiring the use, where possible, of nature-based approaches is to help to restore the floodplain's natural processes. The use of nature-based approaches may result in reduced flood risks. In addition, nature-based approaches have less potential to degrade the natural and beneficial values of floodplains. Some examples of nature-based approaches could include restoring wetland functions along a coastal or riverine system to create a living shoreline or using green infrastructure measures to reduce runoff.

2.3 Description Of and Where Feasible, an Estimate of the Number of Small Entities To Which the Proposed Rule Will Apply

This rule would affect certain recipients of FEMA grants. These would primarily be PA and HMA grant recipients, which include States, Tribal governments, local governments and certain non-profit organizations. The PA grant recipients would include Categories C, D, E, F, and G projects however, FEMA is only able to provide reasonable estimates of the number of entities and costs associated with Categories C (roads and bridges) and E (public buildings). IA and GPD are not discussed in this analysis. IA provides grants directly to individuals and individuals are not small entities as defined in 5 U.S.C. 601(6). FEMA finds that this rule would likely have no effect on GPD grants because GPD projects are not typically substantial improvement or new construction.

PA provides grants to States, Tribal governments, local governments and certain non-profit organizations for rebuilding, replacement, or repair of public and non-profit facilities damaged

by disasters. Where such rebuilding, replacement or repair involves new construction, substantial improvement, and repair of substantial damage of structures in the expanded FFRMS floodplain, PA recipients would incur additional costs to comply with proposed elevation and floodproofing requirements. Out of a population [67] of 20,341 individual PA Category E grant recipients, a random sample of 96 recipients [68] shows that 79 projects (approximately 82 percent) would meet the definition of small entities under the Regulatory Flexibility Act. This was made up of 45 small governments, 33 private non-profits, and one Tribal government. According to historical data, there have been an average of 44 new construction, substantial improvement, or repair of substantial damage PA Category E projects annually over the past 10 years with approximately 19 of these located in the 1 percent annual chance floodplain or expanded FFRMS floodplain. Therefore, FEMA estimates that 16 small entities would be affected each year through PA Category E projects (19 × 82 percent). As discussed earlier, FEMA did not include Categories D, F, and G projects therefore the total number of affected entities could be higher.

HMA provides mitigation grants to States, Tribal governments, local governments and certain non-profit organizations to, among other things, relocate property outside of the floodplain, or to elevate or floodproof structures to the flood level. As noted in the Regulatory Evaluation, HMA has funded an average of 67 projects per year from 2006–2015. Unlike PA grants, the majority of HMA grants are for projects located in the floodplain, so for this analysis FEMA assumes that all HMA projects are in the floodplain. FEMA has estimated that the freeboard requirements would expand the floodplain by 16.8 percent based on studies conducted in 24 U.S. counties with varied topography. With the 16.8 percent expansion of the floodplain, HMA would have an additional 11 projects per year (67 × 16.8 percent = 11) for a total of 78 projects located in the 1 percent annual chance floodplain or expanded FFRMS floodplain. Assuming 82 percent [69] of HMA grant recipients are small entities, the proposed rule would affect approximately 64 small entities per year (78 projects × 82 percent).

2.4 Description of the Projected Reporting, Recordkeeping, and Other Compliance Requirements of the Proposed Rule, Including an Estimate of the Classes of Small Entities Which Will Be Subject to the Requirement and the Type of Professional Skills Necessary for Preparation of the Report or Record

FEMA will not be changing the application process for its grant programs. The majority of the costs of this proposed rule would fall on FEMA. Small entities, like all entities, would be subject to additional costs associated with floodproofing, elevation of structures, and flood resiliency measures required by the proposed rule. For the purposes of this analysis, and based on historical data, FEMA presents the costs such that most projects would choose to elevate because of the additional level of safety elevation provides over floodproofing and a historically higher number of projects that involved elevation as opposed to floodproofing.[70] FEMA uses an NFIP report to estimate the cost of the proposed elevation requirements.[71] The report provides estimates for the cost of elevating structures as a percentage of total construction cost.

According to HMA data, the average cost of floodproofing is 50 percent of the cost of freeboard elevation. Floodproofing involves sealing off areas below the flood level so that water cannot enter, or altering the use of these areas so that flood waters may pass through without causing serious damage. Non-residential structures where elevation is not feasible may be floodproofed rather than elevated. Additionally, floodproofing preexisting properties may be less costly than elevating an existing property. So, where a project may floodproof rather than elevate, costs may be lower for some projects than the costs presented here. However, for existing properties that choose to elevate rather than floodproof, costs may be higher for some projects than the costs presented here because the NFIP report cost estimates are for when freeboard is included in the design of a structure. FEMA requests comments on these assumptions.

The Federal cost-share of eligible PA work is generally 75 percent, so PA recipients would be required to fund 25 percent of the costs to comply with the requirements of the proposed rule.[72] FEMA estimates that the average annual cost of the proposed rule for PA Category E projects would be between $13,648 and $180,905 [73] per project. Using the Federal cost share, each small entity would have an average expected cost between $3,412 ($13,648 × 25 percent cost share) and $45,226 ($180,905 × 25 percent).

The cost-sharing arrangement for HMA is 75 percent Federal and 25 percent recipient, so HMA recipients would be required to fund 25 percent of the costs to comply with the requirements of the proposed rule. FEMA estimates the average cost of the proposed rule for HMA projects would be between $1,952 and $26,890 annually.[74] Using the Federal cost share, each small entities would have an average cost between $488 ($1,952 × 0.25) and $6,722 ($26,890 × 0.25).

Reporting and recordkeeping is not expected to change with the exception of minor changes to FEMA's Mitigation Grant Program/e-Grants system. This is an automated grant application and management system that would have one question changed as a result of this proposed rule. FEMA would still make the determination if a project would take place in an FFRMS floodplain. (See

[67] PA Category C grant recipients (Roads & Bridges) were not included in this population as the dataset that FEMA used lists the project grantees (States and Tribes), and not subgrantees (local governments and private non-profits). Therefore FEMA is not able to estimate the number of small entities affected by Category C grants. Over the past 10 years, PA has funded the replacement of 71 bridges. FEMA requests data and/or comments to determine how many bridge replacement project grants go to small entities.

[68] The population of PA Category E projects includes all ''Public Buildings'' grants from 2006–2015. Because of the large population, a random sample of 96 projects was drawn, using a confidence level of 95 percent and a 10 percent confidence interval.

[69] In FEMA's dataset, HMA recipients only included project titles and not the name of the grantee. This prevented FEMA from determining if a grant recipient was a small entity. Since PA and HMA provide funding to similar entities (States, Tribal governments, local governments and certain non-profit organizations) for disaster related activity, FEMA used the percentages of small entity grant recipients found in PA Category E as a proxy for HMA small entities.

[70] According to historical HMA data, there have been an average of 63 elevation projects and only 4 floodproofing projects per year.

[71] FEMA, ''2008 Supplement to the 2006 Evaluation of the national Flood Insurance Program's Building Standards'' Table 3. *http://www.fema.gov/media-library-data/20130726-1911-25045-9876/2008_freeboard_report.pdf.*

[72] In extraordinary circumstances the Federal share for PA may be 90 percent when actual Federal obligations exceed a qualifying threshold. See 44 CFR 206.47.

[73] According to the Regulatory Evaluation for this proposed rule, FEMA estimates the average annual cost for 19 PA Category E projects is between $259,311 and $3,437,197. The estimated cost per project is between $13,648 ($259,311/19) and $180,905 ($3,437,197/19). For information about how FEMA arrived at these estimates, please see the Regulatory Evaluation for this proposed rule located in the docket.

[74] According to the Regulatory Evaluation for this proposed rule, FEMA estimates the annual cost for 78 HMA projects is between $152,221 and $2,097,382. The estimated cost per project is between $1,952 ($152,221/78 projects) and $26,890 ($2,097,382/78 projects). For information about how FEMA arrived at these estimates, please see the Regulatory Evaluation for this proposed rule located in the docket.

the Paperwork Reduction Act section of this preamble below for information about the proposed revision to this collection of information.)

2.5 Identification, to the Extent Practicable, of Relevant Federal Rules Which may Duplicate, Overlap, or Conflict With the Proposed Rule

This rule does not duplicate, overlap, or conflict with other Federal rules as the proposed rule only relates for FEMA Federally Funded Projects. Existing FEMA rules relating to compliance with Executive Order 11988, Floodplain Management are being modified to comply with Executive Order 13690, which amends Executive Order 11988.

2.6 Description of Any Significant Alternatives to the Proposed Rule Which Accomplish the Stated Objectives of Applicable Statutes and Which Minimize Any Significant Economic Impact of the Proposed Rule on Small Entities

The standards proposed in this rule represent FEMA's efforts to implement Executive Order 13690, which establishes executive branch-wide policy in this area. Small entities would have the option to relocate outside of the floodplain. This may be preferable in cases where property can be obtained and new facilities built for less cost than elevating or floodproofing to the freeboard level in the floodplain, and the recipient has the ability to relocate.

Executive Order 13690 allows several approaches to determine the FFRMS floodplain, but FEMA is proposing to adopt the FFRMS–FVA in most cases. The FFRMS–FVA uses the most easily attainable data for elevation and floodproofing standards and is the most consistent with existing State and local regulations. As a result, FEMA's proposed approach would reduce the burden on small entities by not requiring a separate set of Federal requirements that are more likely to be different from existing State and local requirements. Section F of this NPRM, FEMA's Implementation of Executive Order 13690 and FFRMS, describes the FFRMS approaches allowed by Executive Order 13690 and FEMA's considerations when selecting between the FFRMS approaches.

FEMA invites all interested parties to submit data and information regarding the potential economic impact that would result from adoption of the proposals in this proposed rule. FEMA will consider all comments received in the public comment process.

C. Unfunded Mandates Reform Act

Pursuant to Section 201 of the Unfunded Mandates Reform Act of 1995 (Public Law 104–4, 2 U.S.C. 1531), each Federal agency shall, unless otherwise prohibited by law, assess the effects of Federal regulatory actions on State, local, and Tribal governments, and the private sector (other than to the extent that such regulations incorporate requirements specifically set forth in law). Section 202 of the Unfunded Mandates Reform Act of 1995 (2 U.S.C. 1532) further requires that before promulgating any general notice of proposed rulemaking that is likely to result in the promulgation of any rule that includes any Federal mandate that may result in expenditure by State, local, and Tribal governments, in the aggregate, or by the private sector, of $100 million or more (adjusted annually for inflation) in any 1 year, and before promulgating any final rule for which a general notice of proposed rulemaking was published, the agency shall prepare a written statement detailing the effect on State, local, and Tribal governments and the private sector. The proposed rule would not result in such an expenditure, and thus preparation of such a statement is not required.

D. National Environmental Policy Act (NEPA) of 1969

Section 102 of the National Environmental Policy Act of 1969 (NEPA), Public Law 91–190, 83 Stat. 852 (Jan. 1, 1970) (42 U.S.C. 4321 *et seq.*) requires agencies to consider the impacts of their actions on the quality of the human environment. The Council on Environmental Quality's procedures for implementing NEPA, 40 CFR 1500 through 1508, require Federal agencies to prepare Environmental Impact Statements (EIS) for major Federal actions significantly affecting the quality of the human environment. Each agency can develop categorical exclusions to cover actions that have been demonstrated to not typically trigger significant impacts to the human environment individually or cumulatively. Agencies develop environmental assessments (EA) to evaluate those actions that do not fit an agency's categorical exclusion and those actions for which a categorical exclusion applies but extraordinary circumstances exist. At the end of the EA process the agency will determine whether to make a Finding of No Significant Impact or whether to initiate the EIS process.

Rulemaking is a major Federal action subject to NEPA. Categorical exclusion A3 included in the list of exclusion categories at Department of Homeland Security Instruction Manual 023–01–001–01, Revision 01, Implementation of the National Environmental Policy Act, Appendix A, issued November 6, 2014, covers the promulgation of rules, issuance of rulings or interpretations, and the development and publication of policies, orders, directives, notices, procedures, manuals, and advisory circulars. The purpose of this proposed rule is to update the Floodplain Management and Protection of Wetland requirements to adopt the approaches outlined in Executive Order 13690 to establish the floodplain and associated flood elevation that must be used in the decision-making process to be followed by FEMA in applying Executive Orders 11988 and 13690 to its actions. The decision-making process requires FEMA to determine whether a proposed action is located in a wetland and/or the floodplain. FEMA is required to take mitigative measures, if it makes the determination to carry out an action in the floodplain. The rule would also add a requirement to use natural systems, ecosystem processes, and nature-based approaches in the development of alternatives for Federal actions in a floodplain. The result of applying the approaches outlined in Executive Order 13690 to establish the floodplain and associated flood elevation may be additional structures elevated or structures elevated to a higher level. Federal assistance for the reconstruction, elevation, retrofitting, upgrading to current codes and standards, and improvements to pre-existing facilities when the immediate project area has already been disturbed and when those actions do not alter basic functions, do not exceed the capacity of other system components, or modify intended land use are categorically excluded under Department of Homeland Security Instruction Manual 023–01–001–01, Revision 01, Implementation of the National Environmental Policy Act, Appendix A (N7). New construction upon or improvement of land where the proposed use is compatible with applicable planning and zoning standards and coastal management programs, the site is in a developed or previously-disturbed site, the proposed use will not substantially increase the number of motor vehicles in the area, the site and scale of construction are consistent with nearby buildings, and the construction or improvement will not result in uses that exceed the existing support infrastructure capacities are categorically excluded under Department of Homeland

Security Instruction Manual 023–01–001–01, Revision 01, Implementation of the National Environmental Policy Act, Appendix A (E2). No extraordinary circumstances exist that will trigger the need to develop an EA or EIS. See Department of Homeland Security Instruction Manual 023–01–001–01, Revision 01, Implementation of the National Environmental Policy Act, section (V)(B)(2). An EA will not be prepared because a categorical exclusion applies to this rulemaking action and no extraordinary circumstances exist.

E. Paperwork Reduction Act (PRA) of 1995

As required by the Paperwork Reduction Act of 1995 (PRA), Public Law 104–13, 109 Stat. 163, (May 22, 1995) (44 U.S.C. 3501 *et seq.*), FEMA may not conduct or sponsor, and a person is not required to respond to, a collection of information unless the collection of information displays a valid control number.

In this proposed rule, FEMA is seeking a revision to the already existing collection of information, OMB Control Number 1660–0072, because FEMA is proposing to replace question E.1. on screenshot #10 in order to comply with the proposed FFRMS requirements. Currently, 1660–0072's screenshot #10, E.1. reads: ''Does a Flood Insurance Rate Map (FIRM), Flood Hazard Boundary Map (FHBM), hydrologic study, or some other source indicate that the project is located in or will affect a 100-year floodplain, a 500-year floodplain if a critical facility, an identified regulatory floodway, or an area prone to flooding?'' We are proposing to change it to: ''Does a Flood Insurance Rate Map (FIRM), Flood Hazard Boundary Map (FHBM), hydrologic study, or some other source indicate that the project is located in or will affect a floodplain (including a base floodplain, 500-year floodplain, or FFRMS floodplain), an identified regulatory floodway, or an area prone to flooding?'' This proposed rule serves as the 60-day comment period for this proposed change pursuant to 5 CFR 1320.11. FEMA invites the general public to comment on the proposed collection of information.

Collection of Information

Title: Mitigation Grant Program/e-Grants.

Type of Information Collection: Revision of a currently approved collection.

OMB Number: 1660–0072.

FEMA Forms: FEMA Form 101–0–0–1, Benefit Cost Determination; FEMA Form 093–0–0–1, Environmental Review; FEMA Form 080–0–0–12, Project Narrative-Sub-grant Application.

Abstract: The FEMA pre-disaster mitigation grant programs—FMA and PDM—both utilize an automated grant application and management system known as e-Grants to apply for these grants. These programs provide funding to allow for the reduction or elimination of the risks to lives and property from hazards. The e-Grants system also provides the mechanism to provide quarterly reports of the financial status of the project and the final closeout report.

Affected Public: State, local and Tribal Governments.

Estimated Number of Respondents: 56.

Estimated Number of Responses: 5,264.

Estimated Total Annual Burden Hours: 43,848.

Estimated Cost: There are no operation and maintenance, or capital and start-up costs associated with this collection of information.

Comments

Comments may be submitted as indicated in the **ADDRESSES** caption above. Comments are solicited to (a) evaluate whether the proposed data collection is necessary for the proper performance of the agency, including whether the information shall have practical utility; (b) evaluate the accuracy of the agency's estimate of the burden of the proposed collection of information, including the validity of the methodology and assumptions used; (c) enhance the quality, utility, and clarity of the information to be collected; and (d) minimize the burden of the collection of information on those who are to respond, including through the use of appropriate automated, electronic, mechanical, or other technological collection techniques or other forms of information technology, *e.g.,* permitting electronic submission of responses.

F. Privacy Act

Under the Privacy Act of 1974, 5 U.S.C. 552a, an agency must determine whether implementation of a proposed regulation would result in a system of records. A ''record'' is any item, collection, or grouping of information about an individual that is maintained by an agency, including, but not limited to, his/her education, financial transactions, medical history, and criminal or employment history and that contains his/her name, or the identifying number, symbol, or other identifying particular assigned to the individual, such as a finger or voice print or a photograph. See 5 U.S.C. 552a(a)(4). A ''system of records'' is a group of records under the control of an agency from which information is retrieved by the name of the individual or by some identifying number, symbol, or other identifying particular assigned to the individual. An agency cannot disclose any record, which is contained in a system of records, except by following specific procedures.

In accordance with DHS policy, FEMA has completed a Privacy Threshold Analysis for this proposed rule. This proposed rule does not affect the 1660–0072 OMB Control Number's current compliance with the Privacy Act of 1974, as amended, or the E-Government Act of 2002. OMB Control Number 1660–0072 is covered by the DHS/FEMA/PIA–006—FEMA National Emergency Management Information System Mitigation Electronic Grants Management System Privacy Impact Assessment (PIA). As a result, no update to DHS/FEMA/PIA–006 is necessary. OMB Control Number 1660–0072 is covered under the System of Records Notice (SORN) for DHS/FEMA–009 Hazard Mitigation, Disaster Public Assistance, and Disaster Loan Programs, 79 FR 16015, Mar. 24, 2014. This proposed rule does not create a new system of records and no update to this SORN is necessary.

G. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

Executive Order 13175, ''Consultation and Coordination With Indian Tribal Governments,'' 65 FR 67249, Nov. 9, 2000, applies to agency regulations that have Tribal implications, that is, regulations that have substantial direct effects on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes. Under this Executive Order, to the extent practicable and permitted by law, no agency shall promulgate any regulation that has Tribal implications, that imposes substantial direct compliance costs on Indian Tribal governments, and that is not required by statute, unless funds necessary to pay the direct costs incurred by the Indian Tribal government or the Tribe in complying with the regulations are provided by the Federal Government, or the agency consults with Tribal officials.

FEMA has reviewed this proposed rule under Executive Order 13175 and

has determined that this rule does not have a substantial direct effect on one or more Indian Tribes, on the relationship between the Federal Government and Indian Tribes, or on the distribution of power and responsibilities between the Federal Government and Indian Tribes.

Part 9 applies to FEMA disaster and non-disaster assistance programs, including PA, Individual Assistance, HMA, and grants processed by GPD. Pursuant to section 8 of Executive Order 11988, Part 9 does not apply to assistance provided for emergency work essential to save lives and protect property and public health and safety, performed pursuant to sections 403 and 502 of the Stafford Act, as amended (42 U.S.C. 5170b and 5192).

Indian Tribes have the same opportunity to participate in FEMA's grant programs as other eligible participants, and participation is voluntary. The requirements of this rule do not affect Tribes differently than other grant recipients. Therefore, FEMA does not expect this proposed rule to have a substantial direct effect on one or more Indian Tribes or impose substantial direct compliance costs on Indian Tribal governments, but will consider any information provided in comments to inform its analysis of this issue as part of a final rule.

Notwithstanding FEMA's conclusion that this proposed rule does not have tribal implications, FEMA recognizes the importance of engaging with Tribes with respect to the FFRMS. FEMA therefore summarizes below the extensive engagement process that precedes this rule, including significant engagement with Tribal leaders. As noted above, in the aftermath of Hurricane Sandy, the President issued Executive Order 13632,[75] which created the Federal Interagency Hurricane Sandy Rebuilding Task Force (Sandy Task Force). This Task Force was chaired by the Secretary of HUD, who led the effort in coordination with multiple Federal partners, as well as an advisory group composed of State, local, and Tribal elected leaders.

In June 2013, the President issued a Climate Action Plan which directs agencies to take the appropriate actions to reduce risk to Federal investments, specifically directing agencies to build on the work done by the Sandy Task Force and update their flood risk reduction standards for ''federally-funded projects'' to ensure that ''projects funded with taxpayer dollars last as long as intended.'' In November 2013, the Climate Task Force convened, with 26 Governors, mayors, and local and Tribal leaders serving as members. After a year-long process of receiving input from across State, local, Tribal and territorial governments; private businesses; trade associations; academic organizations; civil society; and other stakeholders, the Task Force provided a recommendation to the President in November 2014 that, in order to ensure resiliency, Federal agencies, when taking actions in and around floodplains, should include considerations of the effects of climate change, including sea level rise, more frequent and severe storms, and increasing river flood risks.

Executive Order 13690 amended Executive Order 11988 and established the FFRMS. It also set forth a process by which additional input from stakeholders could be solicited and considered before agencies took any action to implement the FFRMS. It required FEMA to publish, on behalf of the MitFLG, an updated draft version of the 1978 Guidelines[76] revised to incorporate the changes required by Executive Order 13690 and the FFRMS in the **Federal Register** for notice and comment. After the MitFLG received and adjudicated the comments, Executive Order 13690 required the MitFLG to submit to the WRC recommendations for finalizing the draft Guidelines.

FEMA, on behalf of MitFLG, published a **Federal Register** notice for a 60-day notice and comment period seeking comments on a draft of the Revised Guidelines, 80 FR 6530, Feb. 5, 2015. Additionally, on February 27, 2015, FEMA wrote to Tribal Leaders specifically asking for their comments regarding the Executive Order establishing the FFRMS.

In response to multiple requests, the MitFLG extended the comment period for an additional 30 days to end on May 6, 2015. The Administration also attended or hosted over 25 meetings across the country with State, local, and Tribal officials (including 26 mayors) and interested stakeholders to discuss Executive Order 13690 and the Guidelines. The MitFLG held 9 public listening sessions across the country that were attended by over 700 participants from State, local, and Tribal governments and other stakeholder organizations to discuss the Guidelines. There were Tribal representatives at both the Ames, Iowa and Sacramento, California listening sessions; however, the specific Tribes that they were representing were not identified. The MitFLG published notice of these public listening sessions in the **Federal Register**.

The public comment period closed on May 6, 2015. Two Tribes submitted formal comments on the Guidelines during the **Federal Register** comment period. The MitFLG adjudicated all comments and presented its adjudication and recommendations to the WRC as required. The WRC issued the Revised Guidelines on October 8, 2015 and the corresponding Notice published in the October 22, 2015 **Federal Register** at 80 FR 64008.

FEMA welcomes Tribal comments on all aspects of this proposed rule.

H. Executive Order 13132, Federalism

Executive Order 13132, ''Federalism,'' 64 FR 43255, Aug. 10, 1999, sets forth principles and criteria that agencies must adhere to in formulating and implementing policies that have federalism implications, that is, regulations that have ''substantial direct effects on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government.'' Federal agencies must closely examine the statutory authority supporting any action that would limit the policymaking discretion of the States, and to the extent practicable, must consult with State and local officials before implementing any such action.

FEMA has reviewed this proposed rule under Executive Order 13132 and has determined that this rule does not have a substantial direct effect on the States, on the relationship between the national government and the States, or on the distribution of power and responsibilities among the various levels of government, and therefore does not have federalism implications as defined by the Executive Order.

Part 9 applies to FEMA disaster and non-disaster assistance programs, including Public Assistance, Individual Assistance, HMA, and grants processed from GPD. Pursuant to section 8 of Executive Order 11988, Part 9 does not apply to assistance provided for emergency work essential to save lives and protect property and public health and safety, performed pursuant to section 403 and 502 of the Stafford Act, as amended (42 U.S.C. 5170b and 5192). The proposed rule does not significantly affect the rights, roles, and responsibilities of States, and involves no preemption of State law nor does it limit State policymaking discretion.

[75] 77 FR 74341, Dec. 14, 2012.

[76] The 1978 Guidelines were the original interpretation of Executive Order 11988.

I. Executive Order 12898, Environmental Justice

Under Executive Order 12898, ''Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations,'' (59 FR 7629, Feb. 16, 1994), as amended by Executive Order 12948, (60 FR 6381, Feb. 1, 1995), FEMA incorporates environmental justice into its policies and programs. The Executive Order requires each Federal agency to conduct its programs, policies, and activities that substantially affect human health or the environment, in a manner that ensures that such programs, policies, and activities do not have the effect of excluding persons from participation in programs, denying persons the benefits of programs, or subjecting persons to discrimination because of race, color, national origin or income level.

FEMA does not expect this rule to have a disproportionately high and adverse human health or environmental effect on low income or minority populations, but will consider any information provided in comments to inform its analysis of this issue as part of a final rule.

J. Executive Order 12630, Taking of Private Property

This rule will not effect a taking of private property or otherwise have taking implications under Executive Order 12630, ''Governmental Actions and Interference With Constitutionally Protected Property Rights'' (53 FR 8859, Mar. 18, 1988).

K. Executive Order 12988, Civil Justice Reform

This NPRM meets applicable standards in sections 3(a) and 3(b)(2) of Executive Order 12988, ''Civil Justice Reform'' (61 FR 4729, Feb. 7, 1996), to minimize litigation, eliminate ambiguity, and reduce burden.

L. Executive Order 13045, Protection of Children From Environmental Health Risks and Safety Risks

This NPRM will not create environmental health risks or safety risks for children under Executive Order 13045, ''Protection of Children From Environmental Health Risks and Safety Risks'' (62 FR 19885, Apr. 23, 1997).

M. Federal Participation in the Development and Use of Voluntary Consensus Standards and in Conformity Assessment Activities, OMB Circular A–119

''Voluntary consensus standards'' are standards developed or adopted by voluntary consensus standards bodies, both domestic and international. These standards include provisions requiring that owners of relevant intellectual property have agreed to make that intellectual property available on a non-discriminatory, royalty-free or reasonable royalty basis to all interested parties. OMB Circular A–119 directs agencies to use voluntary consensus standards in their regulatory actions in lieu of government-unique standards except where inconsistent with law or otherwise impractical. The policies in the Circular are intended to reduce to a minimum the reliance by agencies on government-unique standards.

Consistent with President Obama's Climate Action Plan,[77] the National Security Council staff coordinated an interagency effort to create a new flood risk reduction standard for Federally Funded Projects. The views of Governors, mayors, and other stakeholders were solicited and considered as efforts were made to establish a new flood risk reduction standard for Federally Funded Projects. The FFRMS is the result of these efforts.

List of Subjects in 44 CFR Part 9

Flood plains and Reporting and recordkeeping requirements.

For the reasons discussed in the preamble, FEMA proposes to amend 44 CFR part 9, as follows:

PART 9—FLOODPLAIN MANAGEMENT AND PROTECTION OF WETLANDS

■ 1. The authority citation for part 9 is revised to read as follows:

Authority: E.O. 11988 of May 24, 1977. 3 CFR, 1977 Comp., p. 117; E.O. 11990 of May 24, 1977, 3 CFR, 1977 Comp. p. 121; Reorganization Plan No. 3 of 1978, 43 FR 41943, 3 CFR, 1978 Comp., p. 329; E.O. 12127 of March 31, 1979, 44 FR 19367, 3 CFR, 1979 Comp., p. 376; E.O. 12148 of July 20, 1979, 44 FR 43239, 3 CFR, 1979 Comp., p. 412, as amended; 42 U.S.C. 5201; E.O. 13690, 80 FR 6425.

■ 2. Revise § 9.1 to read as follows:

§ 9.1 Purpose of part.

This regulation sets forth the policy, procedure, and responsibilities to implement and enforce Executive Order 11988, Floodplain Management, as amended, and Executive Order 11990, Protection of Wetlands.

■ 3. Amend § 9.2 by revising paragraph (b)(3) to read as follows:

§ 9.2 Policy.

* * * * *

(b) * * *

(3) Reduce the risk of flood loss to life and property and improve the resilience of communities and Federal assets against the impacts of flooding based on the best-available and actionable science;

* * * * *

■ 4. In § 9.3:

■ a. Amend paragraph (a) by adding ''and was amended by Executive Order 13690, January 30, 2015,'' to the end of the phrase; and

■ b. Revise the third sentence of paragraph (d).

The revision reads as follows:

§ 9.3 Authority.

* * * * *

(d) * * * Section 2(d) of Executive Order 11988 and Section 3(c) of Executive Order 13690 require issuance of new or amended regulations and procedures to satisfy their substantive and procedural provisions. * * *

■ 5. In § 9.4:

■ a. Add in alphanumeric order definitions for ''0.2 Percent Annual Chance Flood,'' ''0.2 Percent Annual Chance Floodplain,'' ''1 Percent Annual Chance Flood or Base Flood,'' ''1 Percent Annual Chance Flood Elevation or Base Flood Elevation,'' ''1 Percent Annual Chance Floodplain or Base Floodplain,'' and ''Associate Administrator;''

■ b. Remove the definitions of ''Base Flood'' and ''Base Floodplain;''

■ c. Revise the definition of ''Critical Action;''

■ d. Remove the definition of ''Emergency Actions;''

■ e. Add in alphabetical order definitions for ''Emergency Work,'' ''Federal Flood Risk Management Standard (FFRMS),'' ''Federal Flood Risk Management Standard Floodplain,'' ''FEMA Federally Funded Project,'' and ''FIMA;''

■ f. Remove the definitions of ''Five Hundred Year Floodplain'' and ''FIA,''

■ g. Revise the definition of ''Floodplain;''

■ h. Remove the definition of ''Mitigation Directorate;''

■ i. Add in alphabetical order a definition for ''Nature-Based Approaches;'' and

■ j. Revise the definitions of ''New Construction,'' ''Orders,'' and ''Substantial Improvement.''

The additions and revisions read as follows:

§ 9.4 Definitions.

0.2 Percent Annual Chance Flood means the flood which has a 0.2 percent

[77] The White House, ''President Obama's Climate Action Plan, 2nd Anniversary Progress Report—Continuing to cut carbon, pollution, protect American communities, and lead internationally.'' June 2015. *https://www.whitehouse.gov/sites/default/files/docs/cap_progress_report_final_w_cover.pdf.*

chance of being equaled or exceeded in any given year.

0.2 Percent Annual Chance Floodplain means the area subject to flooding by the 0.2 percent annual chance flood.

1 Percent Annual Chance Flood or Base Flood means the flood that has a 1 percent chance of being equaled or exceeded in any given year.

1 Percent Annual Chance Flood Elevation or Base Flood Elevation means the computed elevation to which floodwater is anticipated to rise during the 1 percent annual chance or base flood. The specific term ''base flood elevation'' or BFE is used in the National Flood Insurance Program (NFIP) and shown on FEMA Flood Insurance Rate Maps (FIRMs) and on the flood profiles in the FEMA Flood Insurance Study (FIS) Reports to indicate the minimum level of flooding to be used by a community in its floodplain management regulations.

1 Percent Annual Chance Floodplain or Base Floodplain means the area subject to flooding by the 1 percent annual chance or base flood.

* * * * *

Associate Administrator means the Associate Administrator of the Federal Insurance and Mitigation Administration.

* * * * *

Critical Action means an action for which even a slight chance of flooding is too great. Critical actions include, but are not limited to, those which create or extend the useful life of structures or facilities:

(1) Such as those which produce, use or store highly volatile, flammable, explosive, toxic or water-reactive materials;

(2) Such as hospitals and nursing homes, and housing for the elderly, which are likely to contain occupants who may not be sufficiently mobile to avoid the loss of life or injury during flood and storm events;

(3) Such as emergency operation centers, or data storage centers which contain records or services that may become lost or inoperative during flood and storm events; and

(4) Such as generating plants, and other principal points of utility lines.

* * * * *

Emergency Work means work essential to save lives and protect property and public health and safety performed under sections 403 and 502 of the Robert T. Stafford Disaster Relief and Emergency Assistance Act of 1988 (42 U.S.C. 5170b and 5192). See 44 CFR part 206, subpart C.

* * * * *

Federal Flood Risk Management Standard (FFRMS) means the Federal flood risk management standard established by Executive Order 13690 to be incorporated into existing processes used to implement Executive Order 11988.

Federal Flood Risk Management Standard (FFRMS) Floodplain means the floodplain established using one of the following approaches:

(1) Climate-Informed Science Approach (CISA)—the elevation and flood hazard area that result from using a climate-informed science approach that uses the best-available, actionable hydrologic and hydraulic data and methods that integrate current and future changes in flooding based on climate science. This approach will also include an emphasis on whether the action is a critical action as one of the factors to be considered when conducting the analysis;

(2) Freeboard Value Approach (FVA)—the elevation and flood hazard area that result from using the freeboard value, reached by adding an additional 2 feet to the base flood elevation for non-critical actions and by adding an additional 3 feet to the base flood elevation for critical actions;

(3) 0.2 Percent Annual Chance Flood Approach (0.2PFA)—the area subject to flooding by the 0.2 percent annual chance flood; or

(4) The elevation and flood hazard area that result from using any other method identified in an update to the FFRMS.

FEMA Federally Funded Project means actions where FEMA funds are used for new construction, substantial improvement, or to address substantial damage to a structure or facility.

* * * * *

FIMA means the Federal Insurance and Mitigation Administration.

* * * * *

Floodplain means the lowland and relatively flat areas adjoining inland and coastal waters. The floodplain may be more specifically identified as the 1 percent annual chance (base) floodplain, the 0.2 percent annual chance floodplain, or the FFRMS floodplain. ''Floodplain'' does not include areas subject only to mudflow until FIMA adopts maps identifying ''M'' Zones.

* * * * *

Nature-Based Approaches means the features (sometimes referred to as ''green infrastructure'') designed to mimic natural processes and provide specific services such as reducing flood risk and/or improving water quality. Nature-based approaches are created by human design (in concert with and to accommodate natural processes) and generally, but not always, must be maintained in order to reliably provide the intended level of service.

New Construction means the construction of a new structure or facility or the replacement of a structure or facility which has been totally destroyed.

* * * * *

Orders means Executive Order 11988, Floodplain Management, as amended by Executive Order 13690, and Executive Order 11990, Protection of Wetlands.

* * * * *

Substantial Improvement means any repair, reconstruction or other improvement of a structure or facility, which has been damaged in excess of, or the cost of which equals or exceeds, 50% of the market value of the structure or replacement cost of the facility (including all ''public facilities'' as defined in the Robert T. Stafford Disaster Relief and Emergency Assistance Act of 1988) before the repair or improvement is started, or if the structure or facility has been damaged and is proposed to be restored, before the damage occurred. If a facility is an essential link in a larger system, the percentage of damage will be based on the relative cost of repairing the damaged facility to the replacement cost of the portion of the system which is operationally dependent on the facility. The term ''substantial improvement'' does not include any alteration of a structure or facility listed on the National Register of Historic Places or a State Inventory of Historic Places.

* * * * *

■ 6. In § 9.5:

■ a. Revise paragraph (a)(3) and the last sentence in paragraph (c) introductory text, and paragraphs (c)(1) through (12);

■ b. Remove paragraphs (c)(13) and (14);

■ c. Revise the last sentence of paragraph (d) introductory text, paragraphs (d)(1) through (3), paragraph (d)(4) introductory text, the second sentence of paragraph (e), paragraph (f)(1), paragraph (f)(2) introductory text, and the fourth and fifth sentences of paragraph (g) introductory text.

The revisions read as follows:

§ 9.5 Scope.

(a) * * *

(3) The amendments to this part incorporating the changes required by Executive Order 13690 and the FFRMS apply to new actions commenced on or after.

* * * * *

(c) * * * The provisions of these regulations do not apply to the following (all references are to the

Robert T. Stafford Disaster Relief and Emergency Assistance Act of 1988, Public Law 93–288, as amended, except as noted):

(1) Assistance provided for emergency work essential to save lives and protect property and public health and safety performed pursuant to sections 403 and 502;

(2) Emergency Support Teams (section 303);

(3) Unemployment Assistance (section 410);

(4) Emergency Communications (section 418);

(5) Emergency Public Transportation (section 419);

(6) Fire Management Assistance (Section 420);

(7) Community Disaster Loans (section 417), except to the extent that the proceeds of the loan will be used for repair of facilities or structures or for construction of additional facilities or structures;

(8) The following Federal Assistance to Individuals and Households Program (section 408) categories of financial assistance:

(i) Housing needs or expenses, except for restoring, repairing or building private bridges, purchase of mobile homes and provision of structures as minimum protective measures;

(ii) Personal property needs or expenses;

(iii) Transportation expenses;

(iv) Medical/dental expenses;

(v) Funeral expenses;

(vi) Flood insurance premium;

(vii) Temporary Housing.

(9) Use of existing resources in the temporary housing assistance program [section 408], except that Step 1 (§ 9.7) shall be carried out;

(10) Debris removal (section 407), except those grants involving non-emergency disposal of debris within a floodplain or wetland;

(11) Repairs or replacements under section 406, of less than $5,000 to damaged structures or facilities;

(12) Placement of families in existing resources and Temporary Relocation Assistance provided to those families so placed under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, Public Law 96–510.

(d) * * * The references are to the Robert T. Stafford Disaster Relief and Emergency Assistance Act of 1988, Public Law 93–288, as amended.

(1) Actions performed under the Federal Assistance to Individuals and Households Program (section 408) for restoring or repairing a private bridge, except where two or more individuals or families are authorized to pool their grants for this purpose.

(2) Small project grants (section 422), except to the extent that Federal funding involved is used for construction of new facilities or structures.

(3) Replacement of building contents, materials and equipment. (sections 406 and 422).

(4) Repairs under section 406 to damaged facilities or structures, except any such action for which one or more of the following is applicable:

* * * * *

(e) * * * This finding will be made in consultation with the Federal Insurance and Mitigation Administration and the Council on Environmental Quality as provided in section 2(d) of Executive Order 11988.

* * *

(f) *The National Flood Insurance Program (NFIP).* (1) Most of what is done by FIMA in administering the National Flood Insurance Program is performed on a program-wide basis. For all regulations, procedures or other issuances making or amending program policy, FIMA shall apply the 8-step decision-making process to that program-wide action. The action to which the 8-step process must be applied is the establishment of programmatic standards or criteria, not the application of programmatic standards or criteria to specific situations. Thus, for example, FIMA would apply the 8-step process to a programmatic determination of categories of structures to be insured, but not to whether to insure each individual structure. The two prime examples of where FIMA does take site specific actions which would require individual application of the 8-step process are property acquisition under section 1362 of the National Flood Insurance Act of 1968, as amended, and the issuance of an exception to a community under § 60.6(b) of this chapter.

(2) The provisions set forth in this regulation are not applicable to the actions enumerated below except that the FIMA Associate Administrator shall comply with the spirit of the Orders to the extent practicable:

* * * * *

(g) * * * The references are to the Robert T. Stafford Disaster Relief and Emergency Assistance Act of 1988, Public Law 93–288. The above requirements apply to repairs, under section 406, between $5,000 and $25,000 to damaged structures of facilities except for:

* * * * *

■ 7. In § 9.6, in paragraph (b), revise *Step 1* to read as follows:

§ 9.6 Decision-making process.

* * * * *

(b) * * *

Step 1. Determine whether the proposed action is located in a wetland and/or a floodplain; and whether it has the potential to affect or be affected by a floodplain or wetland (see § 9.7);

* * * * *

■ 8. In § 9.7, revise paragraphs (a), (b), and (c) to read as follows:

§ 9.7 Determination of proposed action's location.

(a) The purpose of this section is to establish Agency procedures for determining whether any action as proposed is located in or affects a floodplain or a wetland.

(b) *Information needed.* (1) The Agency shall obtain enough information so that it can fulfill the requirements of the Orders to:

(i) Avoid floodplain and wetland locations unless they are the only practicable alternatives; and

(ii) Minimize harm to and within floodplains and wetlands. In all cases, FEMA shall determine whether the proposed action is located in a floodplain or wetland. In the absence of a finding to the contrary, FEMA may assume that a proposed action involving a facility or structure that has been flooded is in the floodplain. Information about the 1 percent annual chance (base) floodplain, 0.2 percent annual chance floodplain, and FFRMS floodplain and location of floodways and coastal high hazard areas may also be needed to comply with these regulations, especially § 9.11.

(2) The following additional flooding characteristics shall be identified by the Regional Administrator as appropriate:

(i) Velocity of floodwater;

(ii) Rate of rise of floodwater;

(iii) Duration of flooding;

(iv) Available warning and evacuation time and routes;

(v) Special problems:

(A) Levees;

(B) Erosion;

(C) Subsidence;

(D) Sink holes;

(E) Ice jams;

(F) Debris load;

(G) Pollutants;

(H) Wave heights;

(I) Groundwater flooding;

(J) Mudflow.

(c) *Floodplain determination.* (1) In making the floodplain determination, FEMA shall follow this sequence:

(i) Determine whether the project is a FEMA Federally Funded Project as defined in § 9.4. If the project is a FEMA Federally Funded Project, FEMA shall establish the FFRMS floodplain and

associated flood elevation by using one of the following approaches:

(A) Climate-Informed Science Approach (CISA): The elevation and flood hazard area that result from using a climate-informed science approach that uses the best-available, actionable hydrologic and hydraulic data and methods that integrate current and future changes in flooding based on climate science. This approach will also include an emphasis on whether the action is a critical action as one of the factors to be considered when conducting the analysis;

(B) Freeboard Value Approach (FVA): The elevation and flood hazard area that result from using the freeboard value, reached by adding an additional 2 feet to the base flood elevation as determined using the process defined in paragraph (c)(1)(iii) of this section for non-critical actions and by adding an additional 3 feet to the base flood elevation as determined in paragraph (c)(1)(iii) of this section for critical actions;

(C) 0.2 Percent Annual Chance Flood Approach (0.2PFA): The area subject to flooding by the 0.2 percent annual chance flood; or

(D) The elevation and flood hazard area that result from using any other method identified in an update to the FFRMS.

(ii) Notwithstanding any other provision of FEMA regulations, FEMA may select among and prioritize the approaches in paragraph (c)(1)(i) of this section by separate policy. In addition, FEMA may provide an exception to using the FFRMS floodplain for FEMA Federally Funded Projects and instead use the 1 percent annual chance (base) floodplain for non-critical actions or the 0.2 percent annual chance floodplain for critical actions where the action is in the interest of national security, where the action is an emergency action, where application to a Federal facility or structure is demonstrably inappropriate, or where the action is a mission-critical requirement related to a national security interest or an emergency action.

(iii) If the project is not a FEMA Federally Funded Project as defined in § 9.4, FEMA shall use, at a minimum, the 1 percent annual chance floodplain for non-critical actions and the 0.2 percent annual chance floodplain for critical actions. FEMA shall establish the floodplain and associated elevation by following this sequence:

(A) The Regional Administrator shall consult the FEMA Flood Insurance Rate Map (FIRM), the Flood Boundary Floodway Map (FBFM), and the Flood Insurance Study (FIS).

(B) If a detailed map (FIRM or FBFM) is not available, the Regional Administrator shall consult a FEMA Flood Hazard Boundary Map (FHBM). If data on flood elevations, floodways, or coastal high hazard areas are needed, or if the map does not delineate the flood hazard boundaries in the vicinity of the proposed site, the Regional Administrator shall seek the necessary detailed information and assistance from other sources, such as the following Sources of Maps and Technical Information:

(*1*) U.S. Department of Agriculture: Natural Resources Conservation Service;

(*2*) Department of Defense: U.S. Army Corps of Engineers;

(*3*) Department of Commerce: National Oceanic and Atmospheric Administration;

(*4*) Department of Homeland Security: FEMA;

(*5*) Department of the Interior: Bureau of Reclamation; U.S. Fish and Wildlife Service; United States Geological Survey;

(*6*) Tennessee Valley Authority;

(*7*) Department of Transportation;

(*8*) Environmental Protection Agency;

(*9*) General Services Administration; or

(*10*) States and Regional Agencies.

(C) If the sources listed do not have or know of the information necessary to comply with the Orders' requirements, the Regional Administrator shall seek the services of a Federal or other engineer experienced in this type of work.

(2) If the determination of the floodplain involves an area or location within extensive Federal or State holdings or a headwater area, and an FIS, FIRM, FBFM, or FHBM is not available, the Regional Administrator shall seek information from the land administering agency before information and/or assistance is sought as described in paragraph (c)(1)(iii)(B) of this section. If none of these sources has information or can provide assistance, the services of an experienced Federal or other engineer shall be sought as described in paragraph (c)(1)(iii)(C) of this section.

* * * * *

■ 9. In § 9.8, revise paragraph (c)(5)(ii) to read as follows:

§ 9.8 Public notice requirements.

* * * * *

(c) * * *

(5) * * *

(ii) Based on the factors in paragraph (c)(3) of this section, a map of the area or other identification of the floodplain and/or wetland areas which is of adequate scale and detail so that the location is discernible; instead of publication of such map, FEMA may state that such map is available for public inspection, including the location at which such map may be inspected and a telephone number to call for information;

* * * * *

■ 10. In § 9.9:

■ a. In paragraph (b)(2), remove ''; and'' and add a period in its place and add a sentence to the end of paragraph (b)(2);

■ b. Revise paragraph (d)(1);

■ c. Remove paragraph (d)(2);

■ d. Redesignate paragraph (d)(3) as paragraph (d)(2); and

■ e. Lift the suspension of paragraph (e)(6) and remove the paragraph.

The addition and revision read as follows:

§ 9.9 Analysis and reevaluation of practicable alternatives.

* * * * *

(b) * * *

(2) * * * In developing the alternative actions, the Agency shall use, where possible, natural systems, ecosystem processes, and nature-based approaches; and

* * * * *

(d) * * *

(1) The Agency shall not locate the proposed action in the floodplain as established by § 9.7(c) or in a wetland if a practicable alternative exists outside the floodplain or wetland.

■ 11. In § 9.11:

■ a. Revise paragraph (c)(1);

■ b. Revise the first sentence of paragraph (d) introductory text, the second sentence of paragraph (d)(2), and paragraphs (d)(3) and (d)(9);

■ c. Revise paragraphs (e)(1), (e)(2) introductory text, and (e)(2)(ii) introductory text;

■ d. Revise the last sentence in the undesignated paragraph following the National Flood Insurance Program address in paragraph (e)(3)(i)(E);

■ e. Revise paragraph (e)(3)(ii); and

■ f. Lift the suspension of paragraph (e)(4) and remove the paragraph.

The revisions read as follows:

§ 9.11 Mitigation.

* * * * *

(c) * * *

(1) Potential harm to lives and the investment at risk in the floodplain as established in § 9.7(c);

* * * * *

(d) * * * The Agency shall apply at a minimum, the following standards to its actions to comply with the requirements of paragraphs (b) and (c), of this section (except as provided in § 9.5(c), (d), and (g) regarding categories of partial or total exclusion). * * *

* * * * *

(2) * * * There shall be no construction of a new or substantially improved structure in a coastal high hazard area unless it is elevated on adequately anchored pilings or columns, and securely anchored to such piles or columns so that the lowest portion of the structural members of the lowest floor (excluding the pilings or columns) is elevated to or above the FFRMS floodplain.* * *

(3) *Elevation of structures.* (i) There shall be no new construction or substantial improvement of structures unless the lowest floor of the structures (including basement) is at or above the level of the FFRMS floodplain.

(ii) There shall be no new construction or substantial improvement of structures involving a critical action unless the lowest floor of the structure (including the basement) is at or above the level of the FFRMS floodplain.

(iii) If the subject structure is nonresidential, FEMA may, instead of elevating the structure, approve the design of the structure and its attendant utility and sanitary facilities so that below the flood level the structure is water tight with walls substantially impermeable to the passage of water and with structural components having the capability of resisting hydrostatic and hydrodynamic loads and effects of buoyancy.

(iv) The provisions of paragraphs (d)(3)(i), (ii), and (iii) of this section do not apply to the extent that the Federal Insurance and Mitigation Administration has granted an exception under § 60.6(b) of this chapter (formerly 24 CFR 1910.6(b)), or the community has granted a variance which the Regional Administrator determines is consistent with § 60.6(a) of this chapter (formerly 24 CFR 1910.6(a)). In a community which does not have a FIRM in effect, FEMA may approve a variance from the standards of paragraphs (d)(3)(i), (ii), and (iii) of this section, after compliance with the standards of § 60.6(a) of this chapter.

* * * * *

(9) In the replacement of building contents, materials and equipment, the Regional Administrator shall require as appropriate, disaster proofing of the building and/or elimination of such future losses by relocation of those building contents, materials and equipment outside or above the floodplain as established in § 9.7(c).

(e) * * *

(1) The Federal Insurance and Mitigation Administration shall make identification of all coastal high hazard areas a priority;

(2) Beginning October 1, 1981, the Federal Insurance and Mitigation Administration of FEMA may only provide flood insurance for new construction or substantial improvements in a coastal high hazard area if:

* * * * *

(ii) The structure is rated by FEMA–FIMA based on a system which reflects the capacity to withstand the effects of the 100-year frequency flood including, but not limited to, the following factors:

* * * * *

(3)(i) * * *

(E) * * * *Unless a property owner is seeking an adjustment of the rate prescribed by FEMA–FIMA, this information need not be submitted.*

(ii) FIMA shall notify communities with coastal high hazard areas and federally related lenders in such communities, of the provisions of this paragraph. Notice to the lenders may be accomplished by the Federal instrumentalities to which the lenders are related.

* * * * *

■ 12. In § 9.13,

■ a. Revise paragraph (d)(1) and the first sentence of paragraph (d)(3) introductory text;

■ b. Add a sentence to the end of paragraph (d)(4)(i); and

■ c. Revise the first sentence of paragraph (d)(4)(ii), and revise paragraph (e).

The revisions and addition read as follows:

§ 9.13 Particular types of temporary housing.

* * * * *

(d) * * *

(1) The temporary housing action shall be evaluated in accordance with the provisions of § 9.7 to determine if it is in or affects the 1 percent annual chance (base) floodplain or wetland.

* * * * *

(3) An individual or family shall not be housed in the 1 percent annual chance (base) floodplain or wetland unless the Regional Administrator has complied with the provisions of § 9.9 to determine that such site is the only practicable alternative. * * *

* * * * *

(4) * * *

(i) * * * Actual elevation levels will be based on manufacturer specifications and applicable Agency guidance.

(ii) No mobile home or readily fabricated dwelling may be placed if such placement is inconsistent with the criteria of the National Flood Insurance Program (44 CFR parts 59–60) or any more restrictive Federal, State, or local floodplain management standard. * * *

* * * * *

(e)(1) FEMA shall not sell or otherwise dispose of mobile homes or other readily fabricated dwellings which would be located in floodways or coastal high hazard areas. FEMA shall not sell or otherwise dispose of mobile homes or other readily fabricated dwellings which would be located in floodplains or wetlands unless there is full compliance with the 8-step process. Given the vulnerability of mobile homes to flooding, a rejection of a non-floodplain location alternative and of the no-action alternative shall be based on—

(i) A compelling need of the family or individual to buy a mobile home for permanent housing; and

(ii) A compelling requirement to locate the unit in a floodplain.

(2) FEMA shall not sell or otherwise dispose of mobile homes or other readily fabricated dwellings in the FFRMS floodplain unless they are elevated at least to the level of the FFRMS floodplain.

(3) The Regional Administrator shall notify the Assistant Administrator for Mitigation of each instance where a floodplain location has been found to be the only practicable alternative for a mobile home sale.

■ 13. In § 9.17, revise the first sentence of paragraph (a) and paragraph (b) introductory text to read as follows:

§ 9.17 Instructions to applicants.

(a) * * * In accordance with Executive Orders 11988, as amended, and 11990, the Federal executive agencies must respond to a number of floodplain management and wetland protection responsibilities before carrying out any of their activities, including the provision of Federal financial and technical assistance.

* * *

(b) *Responsibilities of Applicants.* Based upon the guidance provided by the Agency under § 9.16, that guidance included in the U.S. Water Resources Council's ''Guidelines for Implementing Executive Order 11988, Floodplain Management, and Executive Oder 13690, Establishing a Federal Flood Risk Management Standard and a Process for Further Soliciting and Considering Stakeholder Input,'' and based upon the provisions of the Orders and this regulation, applicants for Agency assistance shall recognize and reflect in their application:

* * * * *

■ 14. In § 9.18, revise the second sentence of paragraph (b)(1) and the first

sentence of paragraph (b)(2) to read as follows:

§ 9.18 Responsibilities.

* * * * *

(b) * * *

(1) * * * When a decision of a Regional Administrator relating to disaster assistance is appealed, the Associate Administrator for FIMA may make determinations under these regulations on behalf of the Agency.

(2) Prepare and submit to the Office of Chief Counsel reports to the Office of Management and Budget in accordance with section 2(b) of Executive Order 11988, as amended, and section 3 of Executive Order 11990. * * *

Appendix A to Part 9 [Removed]

■ 15. Remove appendix A to part 9.

Dated: August 15, 2016.

W. Craig Fugate,

Administrator, Federal Emergency Management Agency.
