(ii) Obtaining diagnosis, care, or preventive care from a health care provider by the employee;

(iii) Caring for the employee’s child, parent, spouse, domestic partner, or any other individual related by blood or affinity whose close association with the employee is the equivalent of a family relationship who has any of the conditions or needs for diagnosis, care, or preventive care referred to in paragraphs (c)(1)(i) or (ii) of this section or is otherwise in need of care; or

(iv) Domestic violence, sexual assault, or stalking, if the time absent from work is for the purposes otherwise described in paragraphs (c)(1)(i) or (ii) of this section or to obtain additional counseling, seek relocation, seek assistance from a victim services organization, take related legal action, including preparation for or participation in any related civil or criminal legal proceeding, or assist an individual related to the employee as described in paragraph (c)(1)(iii) of this section in engaging in any of these activities.

(2) A contractor shall account for an employee’s use of paid sick leave in increments of no greater than 1 hour. (i) A contractor may not reduce an employee’s accrued paid sick leave by more than the amount of time the employee is actually absent from work, and a contractor may not require an employee to use more leave than is necessary to address the circumstances that precipitated the need for the leave, provided that the leave is counted using an increment of no greater than 1 hour.

(ii) The amount of paid sick leave used may not exceed the hours an employee would have worked if the need for leave had not arisen.

(iii) If it is physically impossible for an employee using paid sick leave to commence or end work mid-way through a shift, such as if a flight attendant or a railroad conductor is scheduled to work aboard an airplane or train, or a laboratory employee is unable to enter or leave a sealed “clean room” during a certain period of time, and no equivalent position is available, the entire period that the employee is forced to be absent constitutes paid sick leave. The period of the physical impossibility is limited to the period during which the contractor is unable to permit the employee to work prior to the use of paid sick leave or return the employee to the same or an equivalent position due to the physical impossibility after the use of paid sick leave.

(3) A contractor shall provide to an employee using paid sick leave the same regular pay and benefits the employee would have received had the employee not been absent from work. Regular pay means payments that would be included in the calculation of the employee’s regular rate for hours worked under the Fair Labor Standards Act as set forth in 29 CFR part 778.

(4) A contractor may not limit the amount of paid sick leave an employee may use per year or at once on any basis other than the amount of paid sick leave an employee has available.

(5) An employee is encouraged to make a reasonable effort to schedule preventive care or another foreseeable need to use paid sick leave to suit the needs of both the contractor and employee, and a contractor may ask an employee to make a reasonable effort to schedule foreseeable paid sick leave so as not to disrupt unduly the contractor’s operations, but a contractor may not make an employee’s use of paid sick leave contingent on the employee’s finding a replacement worker to cover any work time to be missed or on the
fulfillment of the contractor’s operational needs.

(d) Request for leave. (1) A contractor shall permit an employee to use any or all of the employee’s available paid sick leave upon the oral or written request of an employee that includes information sufficient to inform the contractor that the employee is seeking to be absent from work for a purpose described in paragraph (c)(1) of this section and, to the extent reasonably feasible, the anticipated duration of the leave. (i) An employee’s request to use paid sick leave need not include a specific reference to the Executive Order or this part or even use the words “sick leave” or “paid sick leave,” and a contractor may not require an employee to provide extensive or detailed information about the need to be absent from work or the employee’s family or family-like relationship with an individual for whom the employee is requesting to care. (ii) Although an employee shall make a good faith effort to provide a reasonable estimate of the length of the requested absence from work, a contractor shall permit the employee to return to work earlier, or continue to use available paid sick leave for longer, than anticipated. (iii) The employee’s request shall be directed to the appropriate personnel pursuant to a contractor’s policy or, in the absence of a formal policy, any personnel who typically receive requests for other types of leave or otherwise address scheduling issues on behalf of the contractor. (iv) The contractor shall maintain the confidentiality of any medical or other personal information contained in an employee’s request to use paid sick leave as required by § 13.25(d).

(2) If the need for leave is foreseeable, the employee’s request shall be made at least 7 calendar days in advance. If the employee is unable to request paid sick leave at least 7 calendar days in advance, the request shall be made as soon as is practicable. When an employee becomes aware of a need to use paid sick leave less than 7 calendar days in advance, it should typically be practicable for the employee to make a request for leave either the day the employee becomes aware of the need to use paid sick leave or the next business day. In all cases, however, the determination of when an employee could practicably make a request must take into account the individual facts and circumstances.

(3) (i) A contractor may communicate its goodwill to use paid sick leave either orally or in writing (including electronically, if the contractor customarily corresponds with or makes information available to its employees by such means). (ii) A contractor shall communicate any denial of a request to use paid sick leave in writing (including electronically, if the contractor customarily corresponds with or makes information available to its employees by such means), with an explanation for the denial. Denial is appropriate if, for example, the employee did not provide sufficient information about the need for paid sick leave; the reason given is not consistent with the uses of paid sick leave described in paragraph (c)(1) of this section; the employee did not indicate when the need would arise; the employee has not accrued, and will not have accrued by the date of leave anticipated in the request, a sufficient amount of paid sick leave to cover the request (in which case, if the employee will have any paid sick leave available for use, only a partial denial is appropriate); or the request is to use paid sick leave during time the employee is scheduled to be performing non-covered work. If the denial is based on insufficient information provided in the request, such as if the employee did not state the time of an appointment with a health care provider, the contractor must permit the employee to submit a new, corrected request. If the denial is based on an employee’s request to use paid sick leave during time she is scheduled to be performing non-covered work, the denial must be supported by records adequately segregating the time spent on covered and non-covered contracts. (iii) A contractor shall respond to any request to use paid sick leave as soon as is practicable after the request is made. Although the determination of when it is practicable for a contractor to provide a response will take into account the individual facts and circumstances, it should in many circumstances be practicable for the contractor to respond to a request immediately or within a few hours. In some instances, however, such as if it is unclear at the time of the request whether the employee will be working on or in connection with a covered or non-covered contract at the time for which paid sick leave is requested, as soon as practicable could mean within a day or no longer than within a few days.

(e) Certification or documentation for leave of 3 or more consecutive full workdays. (1) (i) A contractor may require certification issued by a health care provider to verify the need for paid sick leave used for a purpose described in paragraphs (c)(1)(i), (ii), or (iii) of this section only if the employee is absent for 3 or more consecutive full workdays. The contractor shall protect the confidentiality of any certification as required by § 13.25(d). (ii) A contractor may only require documentation from an appropriate individual or organization to verify the need for paid sick leave used for a purpose described in paragraph (c)(1)(iv) of this section only if the employee is absent for 3 or more consecutive full workdays. The source of such documentation may be any person involved in providing or assisting with the care, counseling, relocation, assistance of a victim services organization, or related legal action, such as, but not limited to, a health care provider, counselor, representative of a victim services organization, attorney, clergy member, family member, or close friend. Self-certification is also permitted. The contractor may only require that such documentation contain the minimum necessary information establishing a need for the employee to be absent from work. The contractor shall not disclose any verification information and shall maintain confidentiality about the domestic abuse, sexual assault, or stalking, as required by § 13.25(d).

(2) If certification or documentation is to verify the illness, injury, or condition, need for diagnosis, care, or preventive care, or activity related to domestic violence, sexual assault, or stalking of an individual related to the employee as described in paragraph (c)(1)(iii) of this section, a contractor may also require the employee to provide reasonable documentation or a statement of the family or family-like relationship. This documentation may take the form of a simple written statement from the employee or could be a legal or other document proving the relationship, such as a birth certificate or court order. (3) (i) A contractor may only require certification or documentation if the contractor informs the employee that the certification or documentation will be required to verify the use of paid sick leave if the employee is absent for 3 or more consecutive full workdays. The contractor may inform an employee of this requirement each time the employee requests to use or does use paid sick leave, or the contractor may inform employees of a general policy to require certification or documentation for absences of 3 or more consecutive full workdays if it does so in a manner reasonably calculated to provide actual notice of the requirement to employees. (ii) A contractor may only require the employee to provide certification or documentation within 30 days of the
first day of the 3 or more consecutive full workdays of paid sick leave but may not set a shorter deadline for its submission.

(iii) While a contractor is waiting for or reviewing certification or documentation, it must treat the employee’s otherwise proper request for 3 or more consecutive full workdays of paid sick leave as valid. If the employee provides certification or documentation that is insufficient to verify the employee’s need for paid sick leave, the contractor shall notify the employee of the deficiency and allow the employee at least 5 days to provide new or supplemental certification or documentation. If after 30 days the employee has not provided any certification or documentation, or if after the 5 or more days allowed for resubmission the employee has either provided no new or supplemental certification or documentation or the new certification or documentation is still insufficient to verify the employee’s need for paid sick leave, the contractor may, within 10 calendar days of the employee’s deadline for providing sufficient certification or documentation, retroactively deny the employee’s request to use paid sick leave. In such circumstances, the contractor may recover the value of the pay and benefits the employee received but to which the employee was not entitled, including through deduction from any sums due to the employee (e.g., unpaid wages, vacation pay, profit sharing, etc.), provided such deductions do not otherwise violate applicable Federal, State, or local wage payment or other laws.

(4) A contractor may contact the health care provider or other individual who created or signed the certification or documentation only for purposes of authenticating the document or clarifying its contents. The contractor may not request additional details about the medical or other condition referenced, seek a second opinion, or otherwise question the substance of the certification. To make such contact, the contractor must use a human resources professional, a leave administrator, or a management official. The employee’s direct supervisor may not contact the employee’s health care provider unless there is no other appropriate individual who can do so. The requirements of the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule, set forth at 45 CFR parts 160 and 164, must be satisfied when individually identifiable health information of an employee is shared with a contractor by a HIPAA-covered health care provider.

(f) Interaction with other laws and paid time off policies. (1) General. Nothing in Executive Order 13706 or this part shall excuse noncompliance with or supersede any applicable Federal or State law, any applicable law or municipal ordinance, or a collective bargaining agreement requiring greater paid sick leave or leave rights than those established under the Executive Order and this part.

(2) SCA and DBA requirements. (i) Paid sick leave required by Executive Order 13706 and this part is in addition to a contractor’s obligations under the Service Contract Act and Davis-Bacon Act. A contractor may not receive credit toward its prevailing wage or fringe benefit obligations under those Acts for any paid sick leave provided in satisfaction of the requirements of Executive Order 13706 and this part.

(ii) A contractor may count the value of any paid sick time provided in excess of the requirements of Executive Order 13706 and this part (and any other law) toward its obligations under the Service Contract Act or Davis-Bacon Act in keeping with the requirements of those Acts.

(3) FMLA. A contractor’s obligations under the Executive Order and this part have no effect on its obligations to comply with, or ability to act pursuant to, the Family and Medical Leave Act. Paid sick leave may be substituted for (that is, may run concurrently with) unpaid FMLA leave under the same conditions as other paid time off pursuant to § 825.207 of this title. As to time off that is designated as FMLA leave and for which an employee uses paid sick leave, all notices and certifications that satisfy the FMLA requirements set forth at § 825.300 through 300.308 of this title will satisfy the request for leave and certification requirements of paragraphs (d) and (e) of this section.

(4) State and local paid sick time laws. A contractor’s compliance with a State or local law requiring that employees be provided with paid sick time does not excuse the contractor from compliance with any of its obligations under the Executive Order 13706 or this part. A contractor may, however, satisfy its obligations under the Order and this part by providing paid sick time that fulfills the requirements of a State or local law provided that the paid sick time is accrued and may be used in a manner that meets or exceeds all of the requirements of the Order and this part including but not limited to the accrual and use provisions of this section and the prohibitions on interference and discrimination in § 13.6. Where the requirements of an applicable State or local law and the Order and this part differ, satisfying both will require a contractor to comply with the requirement that is more generous to employees.

(5) Paid time off policies. (i) The paid sick leave requirements of Executive Order 13706 and this part need not have any effect on a contractor’s voluntary paid time off policy, whether provided pursuant to a collective bargaining agreement or otherwise.

(ii) A contractor’s existing paid time off policy (if provided in addition to the fulfillment of Service Contract Act or Davis-Bacon Act obligations, if applicable) will satisfy the requirements of the Executive Order and this part if the paid time off is made available to all employees described in § 13.3(a)(2) (other than those excluded by § 13.4(e)); may be used for at least all of the purposes described in paragraph (c)(1) of this section; is provided in a manner and an amount sufficient to comply with the rules and restrictions regarding the accrual of paid sick leave set forth in paragraph (a) of this section and regarding maximum accrual, carryover, reinstatement, and payment for unused leave set forth in paragraph (b) of this section; is provided pursuant to policies sufficient to comply with the rules and restrictions regarding use of paid sick leave set forth in paragraph (c) of this section, regarding requests for leave set forth in paragraph (d) of this section, and regarding certification and documentation set forth in paragraph (e) of this section, at least with respect to any paid time off used for the purposes described in paragraph (c)(1) of this section; and is protected by the prohibitions against interference, discrimination, and recordkeeping violations described in § 13.6 and the prohibition against waiver of rights described in § 13.7, at least with respect to any paid time off used for the purposes described in paragraph (c)(1) of this section.

(iii) A contractor satisfying the requirements of the Executive Order and this part with a paid time off policy that provides more than 56 hours of leave per accrual year may choose to either provide all paid time off as described in paragraph (f)(5)(ii) of this section or track, and make and maintain records reflecting, the amount of paid time off an employee uses for the purposes described in paragraph (c)(1) of this section, in which case the contractor need only provide, for each accrual year, up to 56 hours of paid time off the employee requests to use for such purposes in compliance with the Order and this part.
§ 13.6 Prohibited acts.
(a) Interference. (1) A contractor may not in any manner interfere with an employee’s accrual or use of paid sick leave as required by Executive Order 13706 or this part.

(2) Interference includes, but is not limited to, miscalculating the amount of paid sick leave an employee has accrued, denying or unreasonably delaying a response to a proper request to use paid sick leave, discouraging an employee from using paid sick leave, reducing an employee’s accrued paid sick leave by more than the amount of such leave used, transferring the employee to work on non-covered contracts to prevent the accrual or use of paid sick leave, disclosing confidential information contained in certification or other documentation provided to verify the need to use paid sick leave, or making the use of paid sick leave contingent on the employee’s finding a replacement worker or the fulfillment of the contractor’s operational needs.

(b) Discrimination. (1) A contractor may not discharge or in any other manner discriminate against any employee for:

(i) Using, or attempting to use, paid sick leave as provided for under Executive Order 13706 and this part;

(ii) Filing any complaint, initiating any proceeding, or otherwise asserting any right or claim under Executive Order 13706 or this part;

(iii) Cooperating in any investigation or testifying in any proceeding under Executive Order 13706 or this part; or

(iv) Informing any other person about his or her rights under Executive Order 13706 or this part.

(2) Discrimination includes, but is not limited to, a contractor’s considering any of the activities described in paragraph (b)(1) of this section as a negative factor in employment actions, such as hiring, promotions, or disciplinary actions, or a contractor’s counting paid sick leave under a no fault attendance policy.

(c) Recordkeeping. A contractor’s failure to make and maintain or to make available to authorized representatives of the Wage and Hour Division records for inspection, copying, and transcription as required by § 13.25, or any other failure to comply with the requirements of § 13.25, constitutes a violation of Executive Order 13706, this part, and the underlying contract.

§ 13.7 Waiver of rights.
Employees cannot waive, nor may contractors induce employees to waive, their rights under Executive Order 13706 or this part.

§ 13.8 Multemployer plans or other funds, plans, or programs.
(a) A contractor may fulfill its obligations under Executive Order 13706 and this part jointly with other contractors—that is, as though all of the contractors are a single contractor—through a multiemployer plan that provides paid sick leave in compliance with the rules and requirements of Executive Order 13706 and this part. Regardless of what functions the plan performs, each contractor remains responsible for any violation of the Order or this part that occurs during its employment of the employee.

(b) Nothing in this part prohibits a contractor from providing paid sick leave through a fund, plan, or program. Regardless of the manner in which a contractor provides paid sick leave or what functions any fund, plan, or program performs, the contractor remains responsible for any violation of the Order or this part with respect to any of its employees.

Subpart B—Federal Government Requirements

§ 13.11 Contracting agency requirements.
(a) Contract clause. The contracting agency shall include the Executive Order paid sick leave contract clause set forth in Appendix A of this part in all covered contracts and solicitations for such contracts, as described in § 13.3, except for procurement contracts subject to the FAR. The required contract clause directs, as a condition of payment, that all employees performing work on or in connection with covered contracts shall be provided paid sick leave as required by Executive Order 13706 and this part. For procurement contracts subject to the FAR, contracting agencies must use the clause set forth in the FAR developed to implement this rule. Such clause will accomplish the same purposes as the clause set forth in Appendix A and be consistent with the requirements set forth in this rule.

(b) Failure to include the contract clause. Where the Department of Labor or the contracting agency discovers or determines, whether before or subsequent to a contract award, that a contracting agency made an erroneous determination that Executive Order 13706 and this part did not apply to a particular contract and/or failed to include the applicable contract clause in a contract to which the Executive Order and this part apply, the contracting agency, on its own initiative or within 15 calendar days of notification by an authorized representative of the Department of Labor, shall incorporate the contract clause in the contract retroactive to commencement of performance under the contract through the exercise of any and all authority that may be needed (including, where necessary, its authority to negotiate or amend, its authority to pay any necessary additional costs, and its authority under any contract provision authorizing changes, cancellation, and termination).

(c) Withholding. A contracting officer shall, upon his or her own action or upon written request of the Administrator, withhold or cause to be withheld from the prime contractor under the covered contract or any other Federal contract with the same prime contractor, so much of the accrued payments or advances as may be considered necessary to pay employees the full amount owed to compensate for any violation of Executive Order 13706 or this part. In the event of any such violation, the agency may, after authorization or by direction of the Administrator and written notification to the contractor, take action to cause suspension of any further payment, advance, or guarantee of funds until such violations have ceased.

Additionally, any failure to comply with the requirements of Executive Order 13706 or this part may be grounds for termination of the right to proceed with the contract work. In such event, the contracting agency may enter into other contracts or arrangements for completion of the work, charging the contractor in default with any additional cost.

(d) Suspending payment. A contracting officer shall, upon his or her own action or upon the direction of the Administrator and notification of the contractor, take action to cause suspension of any further payment, advance, or guarantee of funds to a contractor that has failed to make available for inspection, copying, and transcription any of the records identified in § 13.25.

(e) Actions on complaints—(1) Reporting time frame. The contracting agency shall forward all information listed in paragraph (e)(2) of this section to the Office of Government Contracts Enforcement, Wage and Hour Division, U.S. Department of Labor, 200 Constitution Avenue NW., Washington, DC 20210 within 14 calendar days of receipt of a complaint alleging contractor noncompliance with Executive Order 13706 or this part or within 14 calendar days of being contacted by the Wage and Hour Division regarding any such complaint.

(2) Report contents. The contracting agency shall forward to the Office of Government Contracts Enforcement,
§ 13.11(a).
leave contract clause referred to in
applicable Executive Order paid sick
leave contract clause was
included in the contract;
(iv) Information concerning known
settlement negotiations between the
parties, if applicable; and
(v) Any other relevant facts known to
the contracting agency or other
information requested by the Wage and
Hour Division.

§ 13.12 Department of Labor requirements.
(a) Notice.—(1) Wage Determinations
OnLine Web site. The Administrator
will publish and maintain on Wage
Determinations OnLine (WDOL), http://
www.wdol.gov, or any successor site, a
notice that Executive Order 13706
creates a requirement to allow
employees performing work on or in
connection with contracts covered by
Executive Order 13706 and this part to
accrue and use paid sick leave, as well as
an indication of where to find more
complete information about that
requirement.
(2) Wage determinations. The
Administrator will publish on all wage
determinations issued under the Davis-
Bacon Act and the Service Contract Act
a notice that Executive Order 13706
creates a requirement to allow
employees performing work on or in
connection with contracts covered by
Executive Order 13706 and this part to
accrue and use paid sick leave, as well as
an indication of where to find more
complete information about that
requirement.

(b) Notification to a contractor of the
withholding of funds. If the
contractor wishes to distinguish
a contractor's paid time off policy satisfies
requirements of Executive Order
13706 and this part as described in
§ 13.5(f)(5), leave must be designated in
records as paid sick leave pursuant to
Executive Order 13706;
(10) A copy of any written responses to
employees' requests to use paid sick
leave, including explanations for any
denials of such requests, as required under
§ 13.5(d)(3);
(11) Any records relating to the
certification and documentation a
contractor may require an employee to
provide under § 13.5(e), including
copies of any certification or
documentation provided by an
employee;
(12) Any other records showing any
tracking of or calculations related to an
employee's accrual and/or use of paid
sick leave;
(13) The relevant covered contract;
(14) The regular pay and benefits
provided to an employee for each use of
paid sick leave; and
(15) Any financial payment made for
unused paid sick leave upon a
separation from employment intended,
pursuant to § 13.5(b)(5), to relieve a
employee of a job or a position;
(b) The contractor shall include in any
covered subcontracts the applicable
Executive Order paid sick leave contract
clause referred to in § 13.11(a) and shall
require, as a condition of payment, that
the subcontractor include the contract
clause in any lower-tier subcontracts.
The prime contractor and any upper-tier
contractor shall be responsible for the
compliance by any subcontractor or
lower-tier subcontractor with the
requirements of Executive Order 13706
and this part, whether or not the
contract clause was included in the
subcontract.

§ 13.22 Paid sick leave.
The contractor shall allow all
employees performing work on or in
connection with a covered contract to
accrue and use paid sick leave as
required by Executive Order 13706 and
this part.

§ 13.23 Deductions.
The contractor may make deductions
from the pay and benefits of an
employee who is using paid sick leave
only if such deduction qualifies as a:
(a) Deduction required by Federal,
State, or local law, such as Federal or
State withholding of income taxes;
(b) Deduction for payments made to
third parties pursuant to court order;
(c) Deduction directed by a voluntary
assignment of the employee or his or her
authorized representative;
(d) Deduction for the reasonable cost
or fair value, as determined by the
Administrator, of furnishing such
employee with "board, lodging, or other
facilities," as defined in 29 U.S.C.
203(m) and 29 CFR part 531;
(e) Deduction, to the extent permitted
by law, for the purpose of recouping pay
and benefits provided for paid sick
leave as to which the contractor
retroactively denied the employee's
request pursuant to § 13.5(e)(3)(iii) or
because the contractor approved the use of
the paid sick leave based on a
fraudulent request.

§ 13.24 Anti-kickback.
All paid sick leave used by employees
performing work on or in connection with
covered contracts must be paid free and
without subsequent deduction
(except as set forth in § 13.23), rebate, or
kickback on any account. Kickbacks
directly or indirectly to the contractor or
to another person for the contractor's
benefit for the whole or part of the paid
sick leave are prohibited.

§ 13.25 Records to be kept by contractors.
(a) The contractor and each
subcontractor performing work subject to
Executive Order 13706 and this part
shall make and maintain during the
course of the covered contract, and
preserve for no less than 3 years
thereafter, records containing the
information specified in paragraphs
(a)(1) through (a)(15) of this section for
each employee and shall make them
available for inspection, copying, and
transcription by authorized
representatives of the Wage and Hour
Division of the U.S. Department of
Labor:
(1) Name, address, and Social
Security number of each employee;
(2) The employee's occupation(s) or
classification(s);
(3) The rate or rates of wages paid
(including all pay and benefits
provided);
(4) The number of daily and weekly
hours worked;
(5) Any deductions made;
(6) The total wages paid (including all
pay and benefits provided) each pay
period;
(7) A copy of notifications to
employees of the amount of paid sick
leave the employees have accrued as
required under § 13.5(a)(2);
(8) A copy of employees' requests to
use paid sick leave, if in writing, or, if
not in writing, any other records
reflecting such employee requests;
(9) Dates and amounts of paid sick
leave used by employees (unless a
contractor's paid time off policy satisfies
requirements of Executive Order
13706 and this part as described in
§ 13.5(f)(5), leave must be designated in
records as paid sick leave pursuant to
Executive Order 13706);
(10) A copy of any written responses to
employees' requests to use paid sick
leave, including explanations for any
denials of such requests, as required under
§ 13.5(d)(3);
(11) Any records relating to the
certification and documentation a
contractor may require an employee to
provide under § 13.5(e), including
copies of any certification or
documentation provided by an
employee;
(12) Any other records showing any
tracking of or calculations related to an
employee's accrual and/or use of paid
sick leave;
(13) The relevant covered contract;
(14) The regular pay and benefits
provided to an employee for each use of
paid sick leave; and
(15) Any financial payment made for
unused paid sick leave upon a
separation from employment intended,
pursuant to § 13.5(b)(5), to relieve a
contractor from the obligation to
reinstate such paid sick leave as
otherwise required by § 13.5(b)(4).
(b) Segregation of time.
between an employee’s covered and non-covered work (such as time spent performing work on or in connection with a covered contract versus time spent performing work on or in connection with non-covered contracts or time spent performing work on or in connection with a covered contract in the United States versus time spent performing work outside the United States, or to establish that time spent performing solely in connection with covered contracts constituted less than 20 percent of an employee’s hours worked during a particular workweek), the contractor must keep records or other proof reflecting such distinctions. Only if the contractor adequately segregates the employee’s time will time spent on non-covered work be excluded from hours worked counted toward the accrual of paid sick leave. Similarly, only if that contractor adequately segregates the employee’s time may a contractor properly deny an employee’s request to take leave under § 13.5(d) on the ground that the employee was scheduled to perform non-covered work during the time she asked to use paid sick leave.

(2) If a contractor estimates covered hours worked by an employee who performs work in connection with covered contracts pursuant to § 13.5(a)(1)(i) or (iii), the contractor must keep records or other proof of the verifiable information on which such estimates are reasonably based. Only if the contractor relies on an estimate that is reasonable and based on verifiable information will an employee’s time spent in connection with non-covered contracts be excluded from hours worked counted toward the accrual of paid sick leave. If a contractor estimates the amount of time an employee spends performing in connection with covered contracts, the contractor must permit the employee to use her paid sick leave during any work time for the contractor.

(c) If a contractor is not obligated by the Service Contract Act, Davis-Bacon Act, or Fair Labor Standards Act to keep records of an employee’s hours worked, such as because the employee is employed in a bona fide executive, administrative, or professional capacity as those terms are defined in 29 CFR part 541, and the contractor chooses to use the assumption permitted by § 13.5(a)(1)(iii), the contractor is excused from the requirement in paragraph (a)(4) of this section to keep records of the employee’s number of daily and weekly hours worked.

(d)(1) Records relating to medical histories for domestic violence, sexual assault, or stalking, created by or provided to a contractor for purposes of Executive Order 13706, whether of an employee or an employee’s child, parent, spouse, domestic partner, or other individual related by blood or affinity whose close association with the employee is the equivalent of a family relationship, shall be maintained as confidential records in separate files/records from the usual personnel files.

(2) If the confidentiality requirements of the Genetic Information Nondiscrimination Act of 2008 (GINA), section 503 of the Rehabilitation Act of 1973, and/or the Americans with Disabilities Act (ADA) apply to medical information contained in records or documents that the contractor created or received in connection with compliance with the recordkeeping or other requirements of this part, the records and documents must also be maintained in compliance with the confidentiality requirements of the GINA, section 503 of the Rehabilitation Act of 1973, and/or ADA as described in § 1635.9 of this title, 41 CFR 60-741.23(d), and § 1630.14(c)(1) of this title, respectively.

(3) The contractor shall not disclose any documentation used to verify the need to use 3 or more consecutive days of paid sick leave for the purposes listed in § 13.5(c)(i)(iv) as described in § 13.5(d)(2) and shall maintain confidentiality about any domestic abuse, sexual assault, or stalking, unless the employee consents or when disclosure is required by law.

(e) The contractor shall permit authorized representatives of the Wage and Hour Division to conduct interviews with employees at the worksite during normal working hours. (f) Nothing in this part limits or otherwise modifies the contractor’s recordkeeping obligations, if any, under the Davis-Bacon Act, the Service Contract Act, the Fair Labor Standards Act, the Family and Medical Leave Act, Executive Order 13658, their implementing regulations, or other applicable law.

§ 13.27 Timing of pay.

The contractor shall compensate an employee for time during which the employee used paid sick leave no later than one pay period following the end of the regular pay period in which the paid sick leave was used.

Subpart D—Enforcement

§ 13.41 Complaints.

(a) Any employee, contractor, labor organization, trade organization, contracting agency, or other person or entity that believes a violation of the Executive Order or this part has occurred may file a complaint with any office of the Wage and Hour Division. No particular form of complaint is required. A complaint may be filed orally or in writing. If the complainant is unable to file the complaint in English, the Wage and Hour Division will accept the complaint in any language.

(b) It is the policy of the Department of Labor to protect the identity of its confidential sources and to prevent an unwarranted invasion of personal privacy. Accordingly, the identity of any individual who makes a written statement as a complaint or in the course of an investigation, as well as any other person or organization, trade organization, or other representative of the Wage and Hour Division, or any individual who believes an alleged violation has occurred may file a complaint with any office of the Wage and Hour Division.

(c) The Administrator may investigate possible violations of the Executive Order or this part either as the result of a complaint or at any time on his or her own initiative. As part of the investigation, the Administrator may conduct interviews with the relevant contractor, as well as the contractor’s employees at the worksite during normal work hours; inspect the relevant contractor’s records (including contract documents and payrolls, if applicable); make copies and transcriptions of such records; and require the production of

§ 13.26 Notice.

(a) The contractor must notify all employees performing work on or in connection with a covered contract of the paid sick leave requirements of Executive Order 13706 and this part by posting a notice provided by the Department of Labor in a prominent and accessible place at the worksite so it may be readily seen by employees.

(b) Contractors that customarily post notices to employees electronically may post the notice electronically, provided such electronic posting is displayed prominently on any Web site that is maintained by the contractor, whether external or internal, and customarily used for notices to employees about terms and conditions of employment.

§ 13.42 Wage and Hour Division conciliation.

After receipt of a complaint, the Administrator may seek to resolve the matter through conciliation.

§ 13.43 Wage and Hour Division investigation.

The Administrator may investigate possible violations of the Executive Order or this part either as the result of a complaint or at any time on his or her own initiative. As part of the investigation, the Administrator may conduct interviews with the relevant contractor, as well as the contractor’s employees at the worksite during normal work hours; inspect the relevant contractor’s records (including contract documents and payrolls, if applicable); make copies and transcriptions of such records; and require the production of
any documentary or other evidence the Administrator deems necessary to determine whether a violation, including conduct warranting imposition of debarment, has occurred. Federal agencies and contractors shall cooperate with any authorized representative of the Department of Labor in the inspection of records, in interviews with employees, and in all aspects of investigations.

§ 13.44 Remedies and sanctions.

(a) Interference. When the Administrator determines that a contractor has interfered with an employee’s accrual or use of paid sick leave in violation of § 13.6(a), the Administrator will notify the contractor and the relevant contracting agency of the interference and request that the contractor remedy the violation. If the contractor does not remedy the violation, the Administrator shall direct the contractor to provide any appropriate relief to the affected employee(s) in the investigative findings letter issued pursuant to § 13.51. Such relief may include any pay and/or benefits denied or lost by reason of the violation; other actual monetary losses sustained as a direct result of the violation; or appropriate equitable or other relief. Payment of liquidated damages in an amount equaling any monetary relief may also be directed unless such amount is reduced by the Administrator because the violation was in good faith and the contractor had reasonable grounds for believing the contractor had not violated the Order or this part. Upon the final order of the Secretary that monetary relief is due, the Administrator may direct the relevant contracting agency to transfer the withheld funds to the Department of Labor for disbursement.

(b)(1) In the event of a dispute concerning contractor compliance, the Administrator will notify the contractor and the relevant contracting agency of the discrimination and request that the contractor remedy the violation. If the contractor does not remedy the violation, the Administrator shall direct the contractor to provide appropriate relief to the affected employee(s) in the investigative findings letter issued pursuant to § 13.51. Such relief may include, but is not limited to, employment, reinstatement, promotion, restoration of leave, or lost pay and/or benefits. Payment of liquidated damages in an amount equaling any monetary relief may also be directed unless such amount is reduced by the Administrator because the violation was in good faith and the contractor had reasonable grounds for believing the contractor had not violated the Order or this part. The Administrator may additionally direct that payments due on the contract or any other contract between the contractor and the Federal Government be withheld as may be necessary to provide any appropriate monetary relief. Upon the final order of the Secretary that monetary relief is due, the Administrator may direct the relevant contracting agency to transfer the withheld funds to the Department of Labor for disbursement.

(c) Recordkeeping. When a contractor fails to comply with the requirements of § 13.25 in violation of § 13.6(c), the Administrator will request that the contractor remedy the violation. If the contractor fails to produce required records upon request, the contracting officer, upon direction of an authorized representative of the Department of Labor, or under its own action, shall take such action as may be necessary to cause suspension of any further payment, advance, or guarantee of funds on the contract until such time as the violations are discontinued.

(d) Debarment. Whenever a contractor is found by the Secretary to have disregarded its obligations under the Executive Order or this part, such contractor and its responsible officers, and any firm, corporation, partnership, or association in which the contractor or responsible officers have an interest, shall be ineligible to be awarded any contract or subcontract subject to the Executive Order for a period of up to 3 years from the date of publication of the name of the contractor or responsible officer on the excluded parties list currently maintained on the System for Award Management Web site, http://www.SAM.gov. Neither an order of debarment on any contractor or its responsible officers from further Government contracts nor the inclusion of a contractor or its responsible officers on a published list of noncomplying contractors under this section shall be carried out without affording the contractor or responsible officers an opportunity for a hearing before an Administrative Law Judge.

(e) Civil actions to recover greater underpayments than those withheld. If the payments withheld under § 13.11(c) are insufficient to reimburse all monetary relief due, or if there are no payments to withhold, the Department of Labor, following a final order of the Secretary, may bring an action against the contractor in any court of competent jurisdiction to recover the remaining amount. The Department of Labor shall, to the extent possible, pay any sums it recovers in this manner directly to the employees who suffered the violation(s) of § 13.6(a) or (b). Any sum not paid to an employee because of inability to do so within 3 years shall be transferred into the Treasury of the United States as miscellaneous receipts.

(f) Retroactive inclusion of contract clause. If a contracting agency fails to include the applicable contract clause in a contract to which the Executive Order applies, the contracting agency, on its own initiative or within 15 calendar days of notification by an authorized representative of the Department of Labor, shall incorporate the contract clause in the contract retroactive to commencement of performance under the contract through the exercise of any and all authority that may be needed (including, where necessary, its authority to negotiate or amend, its authority to pay any necessary additional costs, and its authority under any contract provision authorizing changes, cancellation, and termination).

Subpart E—Administrative Proceedings

§ 13.51 Disputes concerning contractor compliance.

(a) This section sets forth the procedures for resolution of disputes of fact or law concerning a contractor’s compliance with this part. The procedures in this section may be initiated upon the Administrator’s own motion or upon request of the contractor.

(b)(1) In the event of a dispute described in paragraph (a) of this section in which it appears that relevant facts are at issue, the Administrator will notify the affected contractor(s) and the prime contractor (if different) of the investigative findings by certified mail to the last known address.

(2) A contractor desiring a hearing concerning the Administrator’s investigative findings letter shall request such a hearing by letter postmarked within 30 calendar days of the date of the Administrator’s letter. The request shall set forth those findings that are in dispute with respect to the violations and/or debarment, as appropriate, explain how the findings are in dispute including by making reference to any affirmative defenses.

(3) Upon receipt of a timely request for a hearing, the Administrator shall refer the case to the Chief
Administrative Law Judge by Order of Reference, to which shall be attached a copy of the investigative findings letter from the Administrator and response thereto, for designation to an Administrative Law Judge to conduct such hearings as may be necessary to resolve the disputed matters. The hearing shall be conducted in accordance with the procedures set forth in 29 CFR part 6.

(c)(1) In the event of a dispute described in paragraph (a) of this section in which it appears that there are no relevant facts at issue, and where there is not at that time reasonable cause to institute debarment proceedings under §13.52, the Administrator shall notify the contractor(s) of the investigative findings by certified mail to the last known address, and shall issue a ruling in the investigative findings letter on any issues of law known to be in dispute.

(2)(i) If the contractor disagrees with the factual findings of the Administrator or believes that there are relevant facts in dispute, the contractor shall so advise the Administrator by letter postmarked within 30 calendar days of the date of the Administrator’s letter. In the response, the contractor shall explain in detail the facts alleged to be in dispute and attach any supporting documentation.

(ii) Upon receipt of a timely response under paragraph (c)(2)(i) of this section alleging the existence of a factual dispute, the Administrator shall examine the information submitted. If the Administrator determines that there is a relevant issue of fact, the Administrator shall refer the case to the Chief Administrative Law Judge in accordance with paragraph (b)(3) of this section. If the Administrator determines that there is no relevant issue of fact, the Administrator shall so rule and advise the contractor accordingly.

(3) If the contractor desires review of the ruling issued by the Administrator under paragraph (c)(1) or the final sentence of (c)(2)(ii) of this section, the contractor shall file a petition for review thereof with the Administrative Review Board postmarked within 30 calendar days of the date of the ruling, with a copy thereof to the Administrator. The petition for review shall be filed in accordance with the procedures set forth in 29 CFR part 7.

(d) If a timely response to the Administrator’s investigative findings letter is not made or a timely petition for review is not filed, the Administrator’s investigative findings letter shall become the final order of the Secretary. If a timely response or petition for review is filed, the Administrator’s letter shall be inoperative unless and until the decision is upheld by an Administrative Law Judge or the Administrative Review Board or otherwise becomes a final order of the Secretary.

§13.52 Debarment proceedings.

(a) Whenever any contractor is found by the Secretary of Labor to have disregarded its obligations to employees or subcontractors under Executive Order 13706 or this part, such contractor and its responsible officers, and any firm, corporation, partnership, or association in which such contractor or responsible officers have an interest, shall be ineligible for a period up to 3 years to receive any contracts or subcontracts subject to Executive Order 13706 from the date of publication of the name or names of the contractor or persons on the excluded parties list currently maintained on the System for Award Management Web site, http://www.SAM.gov.

(b)(1) Whenever the Administrator finds reasonable cause to believe that a contractor has committed a violation of Executive Order 13706 or this part which constitutes a disregard of its obligations to employees or subcontractors, the Administrator shall notify by certified mail to the last known address or by personal delivery, the contractor and its responsible officers (and any firms, corporations, partnerships, or associations in which the contractor or responsible officers are known to have an interest), of the finding. The Administrator shall afford such contractor and any other parties notified an opportunity for a hearing as to whether debarment action should be taken under Executive Order 13706 or this part. The Administrator shall furnish to those notified a summary of the investigative findings. If the contractor or any other parties notified wish to request a hearing as to whether debarment action should be taken, such a request shall be made by letter to the Administrator postmarked within 30 calendar days of the date of the investigative findings letter from the Administrator, and shall set forth any findings which are in dispute and the reasons therefor, including any affirmative defenses to be raised. Upon receipt of such timely request for a hearing, the Administrator shall refer the case to the Chief Administrative Law Judge by Order of Reference, to which shall be attached a copy of the investigative findings letter from the Administrator and the response thereto, for designation of an Administrative Law Judge to conduct such hearings as may be necessary to determine the matters in dispute.

(2) Hearings under this section shall be conducted in accordance with the procedures set forth in 29 CFR part 6. If no hearing is requested within 30 calendar days of the letter from the Administrator, the Administrator’s findings shall become the final order of the Secretary.

§13.53 Referral to Chief Administrative Law Judge; amendment of pleadings.

(a) Upon receipt of a timely request for a hearing under §13.51 (where the Administrator has determined that relevant facts are in dispute) or §13.52 (debarment), the Administrator shall refer the case to the Chief Administrative Law Judge by Order of Reference, to which shall be attached a copy of the investigative findings letter from the Administrator and response thereto, for designation of an Administrative Law Judge to conduct such hearings as may be necessary to decide the disputed matters. A copy of the Order of Reference and attachments thereto shall be served upon the respondent. The investigative findings letter from the Administrator and response thereto shall be given the effect of a complaint and answer, respectively, for purposes of the administrative proceedings.

(b) At any time prior to the closing of the hearing record, the complaint (investigative findings letter) or answer (response) may be amended with the permission of the Chief Administrative Law Judge and upon such terms as the Administrative Law Judge may approve. For proceedings pursuant to §13.51, such an amendment may include a statement that debarment action is warranted under §13.52. Such amendments shall be allowed when justice and the presentation of the merits are served thereby, provided there is no prejudice to the objecting party’s presentation on the merits. When issues not raised by the pleadings are reasonably within the scope of the original complaint and are tried by express or implied consent of the parties, they shall be treated in all respects as if they had been raised in the pleadings, and such amendments may be made as necessary to make them conform to the evidence. The presiding Administrative Law Judge may, upon reasonable notice and upon such terms as are just, permit supplemental pleadings setting forth transactions, occurrences, or events that have happened since the date of the pleadings and that are relevant to any of the issues involved. A continuance in the hearing may be granted or the record
left open to enable the new allegations to be addressed.

§13.54 Consent findings and order.
(a) At any time prior to the receipt of evidence or, at the Administrative Law Judge’s discretion prior to the issuance of the Administrative Law Judge’s decision, the parties may enter into consent findings and an order disposing of the proceeding in whole or in part.
(b) Any agreement containing consent findings and an order disposing of a proceeding in whole or in part shall also provide:
(1) That the order shall have the same force and effect as an order made after full hearing;
(2) That the entire record on which any order may be based shall consist solely of the Administrator’s findings letter and the agreement;
(3) A waiver of any further procedural steps before the Administrative Law Judge and the Administrative Review Board regarding those matters which are the subject of the agreement; and
(4) A waiver of any right to challenge or contest the validity of the findings and order entered into in accordance with the agreement.
(c) Within 30 calendar days after receipt of an agreement containing consent findings and an order disposing of the disputed matter in whole, the Administrative Law Judge shall, if satisfied with its form and substance, accept such agreement by issuing a decision based upon the agreed findings and order. If such agreement disposes of only a part of the disputed matter, a hearing shall be conducted on the matters remaining in dispute.

§13.55 Administrative Law Judge proceedings.
(a) Jurisdiction. The Office of Administrative Law Judges has jurisdiction to hear and decide appeals concerning questions of law and fact from the Administrator’s investigative findings letters issued under §§13.51 and 13.52.
(b) Proposed findings of fact, conclusions, and order. Within 30 calendar days of filing of the transcript of the testimony or such additional time as the Administrative Law Judge may allow, each party may file with the Administrative Law Judge proposed findings of fact, conclusions of law, and a proposed order, together with a supporting brief expressing the reasons for such proposals. Each party shall serve such proposals and brief on all other parties.
(c) Decision. (1) Within a reasonable period of time after the time allowed for filing of proposed findings of fact, conclusions of law, and order, or within 30 calendar days of receipt of an agreement containing consent findings and order disposing of the disputed matter in whole, the Administrative Law Judge shall issue a decision. The decision shall contain appropriate findings, conclusions, and an order, and be served upon all parties to the proceeding.
(2) If the respondent is found to have violated Executive Order 13706 or this part, and if the Administrator requested debarment, the Administrative Law Judge shall issue an order as to whether the respondent is to be subject to the excluded parties list, including findings that the contractor disregarded its obligations to employees or subcontractors under the Executive Order or this part.
(d) Limit on scope of review. The Equal Access to Justice Act, as amended, does not apply to proceedings under this part. Accordingly, Administrative Law Judges shall have no authority to award attorney’s fees and/or other litigation expenses pursuant to the provisions of the Equal Access to Justice Act for any proceeding under this part.
(e) Orders. If the Administrative Law Judge concludes a violation occurred, the final order shall mandate action to remedy the violation, including any monetary or equitable relief described in §13.44. Where the Administrator has sought imposition of debarment, the Administrative Law Judge shall determine whether an order imposing debarment is appropriate.
(f) Finality. The Administrative Law Judge’s decision shall become the final order of the Secretary, unless a timely petition for review is filed with the Administrative Review Board.

§13.56 Petition for review.
(a) Filing. Within 30 calendar days after the date of the decision of the Administrative Law Judge (or such additional time as is granted by the Administrative Review Board), any party aggrieved thereby who desires review thereof shall file a petition for review of the decision with supporting reasons. Such party shall transmit the petition in writing to the Administrative Review Board with a copy thereof to the Chief Administrative Law Judge. The petition shall refer to the specific findings of fact, conclusions of law, or order at issue. A petition concerning the decision on debarment shall also state the disregard of obligations to employees and/or subcontractors, or with thereof, as appropriate. A party must serve the petition for review, and all briefs, on all parties and the Chief Administrative Law Judge. It must also timely serve copies of the petition and all briefs on the Administrator, Wage and Hour Division, and on the Associate Solicitor, Division of Fair Labor Standards, Office of the Solicitor, U.S. Department of Labor, Washington, DC 20210.
(b) Effect of filing. If a party files a timely petition for review, the Administrative Law Judge’s decision shall be inoperative unless and until the Administrative Review Board issues an order affirming the decision, or the decision otherwise becomes a final order of the Secretary. If a petition for review concerns only the imposition of debarment, however, the remainder of the decision shall be effective immediately. No judicial review shall be available unless a timely petition for review to the Administrative Review Board is first filed.

§13.57 Administrative Review Board proceedings.
(a) Authority—(1) General. The Administrative Review Board has jurisdiction to hear and decide in its discretion appeals concerning questions of law and fact from investigative findings letters of the Administrator issued under §13.51(c)(1) or the final sentence of §13.51(c)(2)(ii), Administrator’s rulings issued under §13.58, and decisions of Administrative Law Judges issued under §13.55. In considering the matters within the scope of its jurisdiction, the Administrative Review Board shall act as the authorized representative of the Secretary and shall act fully and finally on behalf of the Secretary concerning such matters.
(2) Limit on scope of review. (i) The Administrative Review Board shall not have jurisdiction to pass on the validity of any provision of this part. The Administrative Review Board is an appellate body and shall decide cases properly before it on the basis of substantial evidence contained in the entire record before it. The Administrative Review Board shall not receive new evidence into the record.
(ii) The Equal Access to Justice Act, as amended, does not apply to proceedings under this part. Accordingly, the Administrative Review Board shall have no authority to award attorney’s fees and/or other litigation expenses pursuant to the provisions of the Equal Access to Justice Act for any proceeding under this part.
(b) Decisions. The Administrative Review Board’s final decision shall be issued within a reasonable period of time following receipt of the petition for review and shall be served upon all
parties by mail to the last known address and on the Chief Administrative Law Judge (in cases involving an appeal from an Administrative Law Judge’s decision).

(c) Orders. If the Administrative Review Board concludes a violation occurred, the final order shall mandate action to remedy the violation, including, but not limited to, any monetary or equitable relief described in §13.44. Where the Administrator has sought imposition of debarment, the Administrative Review Board shall determine whether an order imposing debarment is appropriate.

(d) Finality. The decision of the Administrative Review Board shall become the final order of the Secretary.

§13.58 Administrator ruling.

(a) Questions regarding the application and interpretation of the rules contained in this part may be referred to the Administrator, who shall issue an appropriate ruling. Requests for such rulings should be addressed to the Administrator, Wage and Hour Division, U.S. Department of Labor, Washington, DC 20210.

(b) Any interested party may appeal to the Administrative Review Board for review of a final ruling of the Administrator issued under paragraph (a) of this section. The petition for review shall be filed with the Administrative Review Board within 30 calendar days of the date of the ruling.

Appendix A to Part 13—Contract Clause

The following clause shall be included by the contracting agency in every contract, contract-like instrument, and solicitation to which Executive Order 13706 applies, except for procurement contracts subject to the Federal Acquisition Regulation (FAR):

(a) Executive Order 13706. This contract is subject to Executive Order 13706, the regulations issued by the Secretary of Labor in 29 CFR part 13 pursuant to the Executive Order, and the following provisions.

(b) Paid Sick Leave. (1) The contractor shall permit each employee (as defined in 29 CFR 13.2) engaged in the performance of this contract by the prime contractor or any subcontractor, regardless of any contractual relationship that may be alleged to exist between the contractor and employee, to earn not less than 1 hour of paid sick leave for every 30 hours worked. The contractor shall additionally allow accrual and use of paid sick leave as required by Executive Order 13706 and 29 CFR part 13. The contractor shall particularly comply with the accrual, use, and other requirements set forth in 29 CFR 13.5 and 13.6, which are incorporated by reference in this contract.

(2) The contractor shall provide paid sick leave to all employees when due free and clear and without subsequent deduction (except as otherwise provided by 29 CFR 13.24), rebate, or kickback on any account. The contractor shall provide pay and benefits for paid sick leave used no later than one pay period following the end of the regular pay period in which the paid sick leave was taken.

(3) The prime contractor and any upper-tier subcontractor shall be responsible for the compliance by any subcontractor or lower-tier subcontractor with the requirements of Executive Order 13706, 29 CFR part 13, and this clause.

(c) Withholding. The contracting officer shall, upon its own action or upon written request of an authorized representative of the Department of Labor, withheld or cause to be withheld from the prime contractor under this or any other Federal contract with the same prime contractor, so much of the accrued payments or advances as may be considered necessary to pay employees the full amount owed to compensate for any violation of the requirements of Executive Order 13706, 29 CFR part 13, or this clause, including any penalties for benefits denied or lost by reason of the violation; other actual monetary losses sustained as a direct result of the violation, and liquidated damages.

(d) Contract Suspension/Contract Termination/Contractor Debarment. In the event of a failure to comply with Executive Order 13706, 29 CFR part 13, or this clause, the contracting agency may on its own action or after authorization or by direction of the Department of Labor and written notification to the contractor, take action to cause suspension of any further payment, advance, or guarantee on any contract or project. Where violations have ceased. Additionally, any failure to comply with the requirements of this clause may be grounds for termination of the right to proceed with the contract work. In such event, the Government may enter into other contracts or arrangements for completion of the work, charging the contractor in default with any additional cost. A breach of the contract clause may be grounds for debarment as a contractor and subcontractor as provided in 29 CFR 13.52.

(e) The prime contractor required by Executive Order 13706, 29 CFR part 13, and this clause is in addition to a contractor’s obligations under the Service Contract Act and Davis-Bacon Act, and a contractor may not receive credit toward its prevailing wage or fringe benefit obligations under those Acts for any paid sick leave provided in satisfaction of the requirements of Executive Order 13706 and 29 CFR part 13.

(f) Nothing in Executive Order 13706 or 29 CFR part 13 shall excuse noncompliance with or supersede any applicable Federal or State law, any applicable law or municipal ordinance, or a collective bargaining agreement requiring greater paid sick leave or leave rights than those established under Executive Order 13706 and 29 CFR part 13.

(g) Recordkeeping. (1) Any contractor performing work subject to Executive Order 13706 and 29 CFR part 13 must keep and maintain, for no less than three (3) years from the completion of the work on the contract, records containing the information specified in paragraphs (i) through (xv) of this section for each employee and shall make them available for inspection, copying, and transcription by authorized representatives of the Wage and Hour Division of the U.S. Department of Labor:

(i) Name, address, and Social Security number of each employee;

(ii) The employee’s occupation(s) or classification(s);

(iii) The rate or rates of wages paid (including all pay and benefits provided);

(iv) The number of daily and weekly hours worked;

(v) Any deductions made;

(vi) The total wages paid (including all pay and benefits provided) each pay period;

(vii) A copy of notifications to employees of the amount of paid sick leave the employee has accrued, as required under 29 CFR 13.5(a)(2);

(viii) A copy of employees’ requests to use paid sick leave, if in writing, or, if not in writing, any other records reflecting such employee requests;

(ix) Dates and amounts of paid sick leave taken by employees (unless a contractor’s paid time off policy satisfies the requirements of Executive Order 13706 and 29 CFR part 13 as described in §13.5(f)(5), leave must be designated in records as paid sick leave pursuant to Executive Order 13706);

(x) A copy of any written responses to employees’ requests to use paid sick leave, including explanations for any denials of such requests, as required under 29 CFR 13.5(d)(3);

(xi) Any records reflecting the certification and documentation a contractor may require an employee to provide under 29 CFR 13.5(e), including copies of any certification or documentation provided by an employee;

(xii) Any other records showing any tracking of or calculations related to an employee’s accrual or use of paid sick leave;

(xiii) The relevant covered contract;

(xiv) The regular pay and benefits provided to an employee for each use of paid sick leave; and

(xv) Any financial payment made for unused paid sick leave upon a separation from employment pursuant to 29 CFR 13.5(b)(5), to relieve a contractor from the obligation to reinstate such paid sick leave as otherwise required by 29 CFR 13.5(b)(4).

(2) If a contractor wishes to distinguish between an employee’s covered and non-covered work, the contractor must keep records or other proof reflecting such distinctions. Only if the contractor adequately segregates the employee’s time will time spent on non-covered work be excluded from hours worked counted toward the accrual of paid sick leave. Similarly, only if that contractor adequately segregates the employee’s time may a contractor properly refuse an employee’s request to use paid sick leave on the ground that the employee was scheduled to perform non-covered work during the time she asked to use paid sick leave.

(ii) If a contractor estimates covered hours worked by an employee who performs work in connection with covered contracts pursuant to 29 CFR 13.5(a)(ii), the contractor must keep records or other proof of the verifiable information on which such
estimates are reasonably based. Only if the contractor relies on an estimate that is reasonable and based on verifiable information will an employee’s time spent in connection with non-covered work be excluded from hours worked counted toward the accrual of paid sick leave. If a contractor estimates the amount of time an employee spends performing in connection with covered contracts, the contractor must permit the employee to use her paid sick leave during any work time for the contractor.

(3) In the event a contractor is not obligated by the Service Contract Act, the Davis-Bacon Act, or the Fair Labor Standards Act to keep records of an employee’s hours worked, such as because the employee is exempt from the FLSA’s minimum wage and overtime requirements, and the contractor chooses to use the assumption permitted by 29 CFR 13.5(a)(1)(iii), the contractor is excused from the requirement in paragraph (1)(d) of this section to keep records of the employee’s number of daily and weekly hours worked.

(4)(i) Records relating to medical histories or domestic violence, sexual assault, or stalking, created for purposes of Executive Order 13706, whether of an employee or an employee’s child, parent, spouse, domestic partner, or other individual related by blood or affinity whose close association with the employee is the equivalent of a family relationship, shall be maintained as confidential records in separate files/records from the usual personnel files.

(ii) If the confidentiality requirements of the Genetic Information Nondiscrimination Act of 2008 (GINA), section 503 of the Rehabilitation Act of 1973, and/or the Americans with Disabilities Act (ADA) apply to records or documents created to comply with the recordkeeping requirements in this contract clause, the records and documents must also be maintained in compliance with the confidentiality requirements of the GINA, section 503 of the Rehabilitation Act of 1973, and/or ADA as described in 29 CFR 1635.9, 1635.23(d), and 1630.14(c)(1), respectively.

(iii) The contractor shall not disclose any documentation used to verify the need to use 3 or more consecutive days of paid sick leave for the purposes listed in 29 CFR 13.5(c)(1)(vi) as described in 29 CFR 13.5(c)(1)(vi) and shall maintain confidentiality about any domestic abuse, sexual assault, or stalking, unless the employee consents or when disclosure is required by law.

(5) The contractor shall permit authorized representatives of the Wage and Hour Division to conduct interviews with employees at the worksite during normal working hours.

(6) Nothing in this contract clause limits or otherwise modifies the contractor’s recordkeeping obligations, if any, under the Davis-Bacon Act, the Service Contract Act, the Fair Labor Standards Act, the Family and Medical Leave Act, Executive Order 13658, their respective implementing regulations, or any other applicable law.

(h) The contractor (as defined in 29 CFR 13.2) shall in accordance with the terms of this contract clause include this clause in any covered lower-tier subcontracts.

(i) Certification of Eligibility. (1) By entering into this contract, the contractor (and officials thereof) certifies that neither it (nor he or she) nor any person or firm who has an interest in the contractor’s firm is a person or firm ineligible to be awarded Government contracts by virtue of the sanctions imposed pursuant to section 5 of the Service Contract Act, section 3(a) of the Davis-Bacon Act, or 29 CFR 5.12(a)(1).

(2) No part of this contract shall be subcontracted to any person or firm whose name appears on the list of persons or firms ineligible to receive Federal contracts currently maintained on the System for Award Management Web site, http://www.SAM.gov.

(j) Interference/Discrimination. (1) A contractor may not in any manner interfere with an employee’s accrual or use of paid sick leave as required by Executive Order 13706 or 29 CFR part 13. Interference includes, but is not limited to, miscalculating the amount of paid sick leave an employee has accrued, denying or unreasonably delaying a response to a proper request to use paid sick leave, discouraging an employee from using paid sick leave, reducing an employee’s accrued paid sick leave by more than the amount of such leave used, transferring an employee to work on non-covered contracts to prevent the accrual or use of paid sick leave, disclosing confidential information contained in certification or other documentation provided to verify the need to use paid sick leave, or making the use of paid sick leave contingent on the employee’s finding a replacement worker or the fulfillment of the contractor’s operational needs.

(2) A contractor may not discharge or in any other manner discriminate against any employee for—

(i) Using, or attempting to use, paid sick leave as provided for under Executive Order 13706 and 29 CFR part 13;

(ii) Filing any complaint, initiating any proceeding, or otherwise asserting any right or claim under Executive Order 13706 and 29 CFR part 13;

(iii) Cooperating in any investigation or testifying in any proceeding under Executive Order 13706 and 29 CFR part 13;

(iv) Informing any other person about his or her rights under Executive Order 13706 and 29 CFR part 13, or this clause.

(l) Notice. The contractor must notify all employees performing work on or in connection with a covered contract of the paid sick leave requirements of Executive Order 13706, 29 CFR part 13, and this clause by posting a notice provided by the Department of Labor in a prominent and accessible place at the worksite so it may be readily seen by employees. Contractors that customarily post notices to employees electronically may post the notice electronically, provided such electronic posting is displayed prominently on any Web site that is maintained by the contractor, whether external or internal, and customarily used for notices to employees about terms and conditions of employment.

(m) Disputes concerning labor standards. Disputes related to the application of Executive Order 13706 to this contract shall not be subject to the general disputes clause of the contract. Such disputes shall be resolved in accordance with the procedures of the Department of Labor set forth in 29 CFR part 13. Disputes within the meaning of this contract clause include disputes between the contractor (or any of its subcontractors) and the contracting agency, the U.S. Department of Labor, the employees or their representatives.

[Docket No. FAR 2016–0051, Sequence No. 5]

Federal Acquisition Regulation; Federal Acquisition Circular 2005–91; Introduction

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Summary presentation of interim and final rules.

SUMMARY: This document summarizes the Federal Acquisition Regulation (FAR) rules agreed to by the Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (Councils) in this Federal Acquisition Circular (FAC) 2005–91. A companion document, the Small Entity Compliance Guide (SECG), follows this FAC. The FAC, including the SECG, is available via the Internet at http://www.regulations.gov.

SUPPLEMENTARY INFORMATION:

Summaries for each FAR rule follow. For the actual revisions and/or amendments made by these rules, refer to the specific item numbers and subjects set forth in the documents following these item summaries. FAC 2005–91 amends the FAR as follows:

Item I—Prohibition on Contracting With Corporations With Delinquent Taxes or a Felony Conviction (FAR Case 2015–011)

DoD, GSA, and NASA are adopting as final, without change, an interim rule which amended the FAR to implement sections of the Consolidated and Further Continuing Appropriations Act, 2015. The rule prohibits the Federal Government from entering into a contract with any corporation having a delinquent Federal tax liability or a felony conviction under any Federal law, unless the agency has considered suspension or debarment of the corporation and has made a determination that this further action is not necessary to protect the interests of the Government.

This final rule will not have a significant economic impact on a substantial number of small entities.

Item II—Updating Federal Contractor Reporting of Veterans’ Employment (FAR Case 2015–036)

DoD, GSA, and NASA are adopting as final, without change, an interim rule amending the FAR to implement a final rule issued by the Department of Labor’s Veterans’ Employment and Training Service (VETS) that revised the regulations at 41 CFR part 61 implementing the reporting requirements under the Vietnam Era Veterans’ Readjustment Assistance Act (VEVRAA), as amended and the Jobs for Veterans Act (JVA) (Pub. L. 107–288). VEVRAA requires Federal contractors and subcontractors to annually report on the total number of their employees who belong to the categories of veterans protected under VEVRAA, as amended by the JVA, and the total number of those protected veterans who were hired during the period covered by the report. The VETS rule requires contractors and subcontractors to comply with its revised reporting requirements using the Form VETS–4212, in lieu of the VETS–100 and VETS–100A, beginning with the annual report filed in 2015.

There is no significant impact on small entities imposed by the FAR rule.

Item III—Non-Retaliation for Disclosure of Compensation Information (FAR Case 2016–007) (Interim)

DoD, GSA, and NASA are issuing an interim rule amending the FAR to implement Executive Order (E.O.) 13665, Non-Retaliation for Disclosure of Compensation Information, amending Executive Order 11246, Equal Opportunity in Federal Employment. The E.O. was signed April 8, 2014. The interim rule is also implementing the final rule issued by the Office of Federal Contract Compliance Programs (OFCCP) of the Department of Labor (DOL) to implement the E.O. The DOL final rule was published in the Federal Register at 80 FR 54934, on September 11, 2015, entitled Government Contractors, Prohibitions Against Pay Secrecy Policies and Actions. E.O. 11246, originally issued September 24, 1965, establishes nondiscrimination and affirmative action obligations in employment for Federal contractors and subcontractors. It prohibits employment discrimination because of race, color, religion, sex, sexual orientation, gender identity, and national origin. E.O. 13665 amends E.O. 11246 and its Equal Opportunity Clause by incorporating, as a covered
prohibition, discriminating against employees and job applicants who inquire about, discuss, or disclose the compensation of the employee or applicant or another employee or applicant. Federal contractors and subcontractors must disseminate this nondiscrimination provision, using language prescribed by the Director of OFCCP, including incorporating the provision into existing employee manuals or handbooks and posting it. There is no significant impact on small entities imposed by the FAR rule.

Item IV—Sole Source Contracts for Women-Owned Small Businesses (FAR Case 2015–032)

DoD, GSA, and NASA are adopting as final, with a minor edit, an interim rule that amends the FAR to implement regulatory changes made by the Small Business Administration (SBA) in its final rule as published in the Federal Register at 80 FR 55019, on September 14, 2015. SBA’s final rule implements the statutory requirements of paragraph (a)(3) of section 825 of the Carl Levin and Howard P. ‘Buck’ McKeon National Defense Authorization Act for Fiscal Year 2015, Public Law 113–291, which grants contracting officers the authority to award sole source contracts to economically disadvantaged women-owned small business (EDWOSB) concerns and to women-owned small business (WOSB) concerns eligible under the WOSB Program. The anticipated price, including options, must not exceed $6.5 million for manufacturing North American Industry Classification System (NAICS) codes, or $4 million for other NAICS codes. This rule may have a positive economic impact on women-owned small businesses.

Item V—Unique Identification of Entities Receiving Federal Awards (FAR Case 2015–022)

DoD, GSA, and NASA are issuing a final rule amending the FAR to redesignate the terminology for unique identification of entities receiving Federal awards. The change to the FAR eliminates references to the proprietary Data Universal Numbering System (DUNS®) number, and provides appropriate references to the Web site where information on the unique entity identifier used for Federal contractors will be located. The Government does not intend to move away from the use of the DUNS® number in the short term. This final rule also establishes definitions of “unique entity identifier”, and “electronic funds transfer (EFT) indicator”. There is no significant impact on small entities imposed by the FAR rule.

Item VI—Consolidation and Bundling (FAR Case 2014–015)

This final rule amends regulatory changes made by the SBA in its final rule which published in the Federal Register at 78 FR 61113 on October 2, 2013, concerning consolidation and bundling. SBA’s final rule implements sections 1312 and 1313 of the Small Business Jobs Act of 2010 (Pub. L. 111–240), as well as section 1671 of the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2013 (Pub. L. 112–239). The FAR final rule adds coverage on consolidations and reorganizes coverage on bundling at FAR 7.107. Before conducting a consolidated acquisition estimated to exceed $2,000,000, the Senior Procurement Executive or Chief Acquisition Officer must make a written determination that the consolidation is necessary and justified. This rule may have a positive economic impact on any small business entity that participates in the Federal procurement arena.

Item VII—Amendment Relating to Multi-Year Contract Authority for Acquisition of Property (FAR Case 2016–006)

DoD, GSA, and NASA are amending FAR subpart 17.1 to implement section 811 of the NDAA for FY 2016 (Pub. L. 114–92). Section 811 amended subsection (a)(1) of 10 U.S.C. 2306b by striking “substantial” and inserting “significant”. This rule makes conforming changes at FAR 17.105–1(b)(1) to state that the head of an agency may enter into a multi-year contract for supplies, if the use of such a contract will result in significant savings of the total estimated costs of carrying out the program through annual contracts. This change applies to the DoD, NASA, and the Coast Guard.

This final rule is not required to be published for public comment, because it addresses an internal decision by the contracting officer to enter into a multi-year contract for supplies if certain objects are met. These requirements affect only the internal operating procedures of the Government.

Item VIII—New Designated Country—Ukraine and Moldova (FAR Case 2016–009)

This final rule amends the FAR to add Ukraine and Moldova as new designated countries under the World Trade Organization Government Procurement Agreement (WTO GPA). This final rule has no significant impact on the Government and contractors, including small business entities.

Item IX—Contractors Performing Private Security Functions (FAR Case 2014–018)

This final rule amends FAR 25.302 and the clause at 52.225–26, both entitled “Contractors Performing Private Security Functions Outside the United States.”

This rule removes the DoD-unique requirements, which have been incorporated in the Defense Federal Acquisition Regulations Supplement (DFARS). This rule also adds the definition of “full cooperation” to FAR clause 52.225–26 in order to affirm that the contract clause does not foreclose any contractor rights arising in law, the FAR, or the terms of the contract when cooperating with any Government-authorized investigation into incidents reported pursuant to the clause.

This rule will not create any new reporting, recordkeeping, or other compliance requirements. The impact of this rule on small business is not expected to be significant.

Item X—Limitation on Allowable Government Contractor Employee Compensation Costs (FAR Case 2014–012)

This final rule converts the interim rule published in the Federal Register at 79 FR 35865 on June 24, 2014 to a final rule with minor changes including a table summarizing the employee compensation limits and applicability dates is added at 31.205–6(p); several paragraphs are reorganized; redundant text is removed; reference links are added for clarity.

This final rule amends the Federal Acquisition Regulation (FAR) to implement section 702 of the Bipartisan Budget Act of 2013. Section 702 revises the allowable compensation cost limit for contractor and subcontractor employees to be $487,000, as adjusted annually to reflect the change in the Employment Cost Index for all workers as calculated by the Bureau of Labor Statistics. Also, section 702 allows for the narrowly targeted exceptions to this allowable cost limit for scientists, engineers or other specialists, upon an agency determination that such exceptions are needed to ensure that the executive agency has continued access to needed skills and capabilities. Because most contracts awarded to small businesses use simplified acquisition procedures or are awarded on a competitive, fixed-price basis, the impact of this compensation limitation on small businesses will be minimal.
Item XI—Technical Amendments

Editorial changes are made at FAR 1.603–1, 4.1400, 22.805, 23.704, 26.103, and 52.234–1.

Dated: September 19, 2016.

Federal Acquisition Regulation; Prohibition on Contracting With Corporations With Delinquent Taxes or a Felony Conviction

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Final rule.

SUMMARY: DoD, GSA, and NASA have adopted as final, without changes, an interim rule amending the Federal Acquisition Regulation (FAR) to implement sections of the Consolidated and Further Continuing Appropriations Act, 2015, to prohibit the Federal Government from entering into a contract with any corporation having a delinquent Federal tax liability or a felony conviction under any Federal law, unless the agency has considered suspension or debarment of the corporation and has made a determination that this further action is not necessary to protect the interests of the Government.

SUPPLEMENTARY INFORMATION:

I. Background

DoD, GSA, and NASA published an interim rule in the Federal Register at 80 FR 75903 on December 4, 2015, to implement sections 744 and 745 of Division E of the Consolidated and Further Continuing Appropriations Act, 2015 (Pub. L. 113–235) and section 523 of Division B of the same act. Three respondents submitted comments on the interim rule.

II. Discussion and Analysis

The Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (the Councils) reviewed the public comments in the development of the final rule. A discussion of the comments are provided as follows:

A. Summary of Public Comments

There were no changes made in the final rule as a result of the three public comments.

B. Analysis of Public Comments

1. Need for the Rule

Comment: Two respondents expressed support for the interim rule. According to the respondents, this rule will facilitate more rigorous scrutiny of companies with a recent Federal conviction or unpaid Federal taxes and will help ensure that Federal contractors conduct themselves with the highest degree of integrity and honesty.

Response: Noted.

Comment: The other respondent said the rule is unnecessary, given the existing statutory and regulatory framework. This respondent noted that tax and criminal statutes already include penalties for tax delinquency and felony conviction, such as the Internal Revenue Code (title 26) and the Criminal Code (title 18). Furthermore, the respondent noted that the FAR already includes Federal tax delinquency and criminal malfeasance as causes for debarment. The respondent stated that agencies already reliably utilize suspension and debarment processes.

Response: This rule is necessary to implement the requirements of sections 744 and 745 of Division E, title VIII of the Consolidated and Further Continuing Resolution Appropriations Act, 2015, as well as section 523 of Division B, title V of the same act (affects Commerce, Justice, NASA, and some related agencies). These appropriations act restrictions, although having some overlap with existing laws, have specific provisions that are not identical to existing laws and regulations, and must be implemented in order to avoid misuse of appropriated funds.

2. Meaning of “Corporation”

Comment: One respondent requested clarification as to what entities are and are not corporations for the purposes of this rule. The respondent stated that the term “corporation” could encompass C corporations, S corporations, and limited liability corporations (LLCs), among others. The respondent is concerned that if the rule applies to LLCs and S corporations, through which tax liability falls at the individual rather than the corporate level, that failure of one shareholder to pay taxes could adversely affect all shareholders. Likewise, the respondent is concerned how the rule would be applied if a shareholder or member of the entity is convicted of a felony.

The respondent is also concerned about how this rule applies to a joint venture and teaming. First, can a corporation avoid disclosure of a felony conviction if it becomes a member of a joint venture? Second, if the joint venture is a corporate entity, are the underlying entities that make up the joint venture required to disclose tax delinquencies and felonies?

Response: No change is made. The term “corporation” is used throughout the FAR without definition. If a term is used in the FAR without definition, then it has the standard dictionary definition. A corporation is a legal entity that is separate and distinct from the entities that own, manage, or control it. It is organized and incorporated under the jurisdictional authority of a governmental body, such as a State or the District of Columbia. The law does not specify any particular type of
corporation. The most common type of corporation in the U.S. is the subchapter C corporation—authorized under State law, and subject to tax under subchapter C of the Internal Revenue Code (IRC). Most publicly traded corporations are C corporations. The IRC and other governing statutes authorize specialized corporations including the subchapter S corporation (e.g., per the IRC and State laws), professional corporation (PC) e.g., per State laws), and limited liability company (LLC) (e.g., per State laws).

Section 744 applies to “any corporation that has any unpaid Federal tax liability . . . .” Section 745 applies to “any corporation that was convicted of a felony criminal violation under any Federal law . . . .” Any corporation, including pass-through entities such as the S corporation and the LLC, may have an unpaid Federal tax liability—there are Federal tax liabilities other than corporate income tax liability. While the S corporation and LLC may not incur Federal income tax liabilities as pass-through entities, they may incur Federal employment tax liabilities under subtitle C of 26 U.S.C. for payroll tax withholdings, social security and Medicare taxes; as well as various Federal excise tax liabilities, e.g., under subtitle D of 26 U.S.C. on communications and air transportation facilities and services, coal, medical devices, group health plans, and failure to maintain minimum essential health insurance coverage; and under subtitle E of 26 U.S.C. on alcohol and tobacco, machine guns, some other firearms, and structured settlement factoring transactions.

The corporation is an artificial construct, a legally created entity that generally has the same rights and responsibilities as a natural person. Thus, the corporation is not automatically immune from being convicted of a felony criminal violation under any Federal law merely because it is an artificial entity. A corporation can commit crimes as it can be held criminally liable for the illegal act of its directors, officers, employees, agents, or shareholders under the legal doctrine of respondeat superior. A corporation cannot be jailed if convicted. Otherwise, it faces the same consequences as a natural person following conviction. Depending on the facts and circumstances, any corporation may be convicted of a felony criminal violation under any Federal law, separate and apart from any felony criminal conviction of any of its directors, officers, employees, agents, or shareholders. While the liabilities of the corporate entity are separate from the liabilities of its shareholders generally because they are separate legal entities, the shareholders may become liable for corporate liabilities under the legal doctrine of piercing the corporate veil. Under certain facts and circumstances, a court may pierce the corporate veil and ignore the legal separateness of the corporation and its shareholders, and hold the shareholders and other principals personally liable for what would otherwise be corporate liabilities. Joint ventures and other teaming arrangements are temporary business arrangements where two or more parties agree to work together to achieve a specific task or objective, e.g., usually a new project, business activity, or a contract. A joint venture or other teaming arrangement is not necessarily a corporation—it all depends upon the legal structure and arrangement chosen for the temporary relationship formed by the members of the teaming arrangement. FAR 9.601 defines two types of teaming arrangements: Two or more companies form a partnership or joint venture entity to act as a potential prime contractor—the joint venture teaming arrangement; or a potential prime contractor agrees with one or more companies to have them act as its subcontractors under a specified Government contract or acquisition program—the prime-subcontractor teaming arrangement. In either type of teaming arrangement, the parties to the arrangement may be existing or newly created entities, or a combination thereof. With respect to the prime-subcontractor teaming arrangement, the prime contractor is subject to the rule if it is a corporation. With respect to the joint venture teaming arrangement, the joint venture can take many legal forms, including as a C corporation, LLC, or partnership. If the prime contractor(s) in the joint venture teaming arrangement is a corporation, it is subject to the rule. Conversely, if the prime contractor(s) in the joint venture teaming arrangement is(are) not a corporation, it is not subject to the rule, i.e., the legal form of the joint venture teaming arrangement will determine whether the joint venture prime contractor(s) is(are) subject to the rule. See FAR 4.102 for the signatories for the various prime contractor entity types. If the signatory for the prime contractor is a corporation, it is subject to the rule.

If the offeror or contractor is uncertain as to its legal status as a corporation, the offeror or contractor needs to consult with its legal counsel to determine whether it is a corporation subject to sections 744 and 745.

3. Finality of Felony Criminal Conviction

Comment: One respondent noted that the rule requires contractors to report assessed, unpaid Federal tax liability only when all judicial and administrative remedies have been exhausted or have lapsed. The respondent noted, however, that the rule requires a contractor to disclose conviction of a felony criminal violation under any Federal law within the preceding 24 months, but does not provide any consideration as to whether the contractor has appealed the decision and such an appeal is pending. The respondent recommends that the rule should require disclosure of convictions only after all judicial remedies have been exhausted.

Response: No change is made. The disclosure requirements of this rule are based on the statutory requirements of section 744 and 745. Section 745 applies to “any corporation that was convicted of a felony criminal violation under any Federal law within the preceding 24 months.” Unlike section 744 which requires the exhaustion of all judicial and administrative remedies for any unpaid Federal tax liability, the plain text of section 745 does not require the exhaustion of all judicial and administrative remedies for a felony criminal violation conviction before it is applicable.

4. Response Time for Debarring Official

Comment: One respondent is concerned that the lack of requirement for a reasonable response time for a debarring official to make a decision under this rule will likely delay the procurement process. The respondent recommends that the debarment official should be required to make a determination within five business days of receiving the inquiry from a contracting officer. According to the respondent, after the five days expires, the determination should automatically default to no suspension or debarment.

Response: No change is made. Sections 744 and 745 do not require the suspending or debarring official to issue a determination to suspend or debar a corporation in accordance with the normal suspension and debarment process (see FAR subpart 9.4). If statutory text similar to the text of these sections is in an appropriations act, the funds appropriated by such an act are prohibited from being used to award to a corporation that has delinquent Federal taxes or has been convicted of a Federal felony unless the suspending or debarring official makes a positive determination that suspension or
debarment is not necessary to protect the interests of the Government.

5. Out of Scope

Comment: Two respondents recommended that because this rule has a zero tolerance for tax delinquencies, the FAR Council should remove the $3,500 threshold for reporting of tax delinquencies at FAR 9.104–5(a)(2) and paragraph (a)(1)(i)(D) of the provision at 52.209–5. Certification Regarding Responsibility Matters. The respondents also recommended expanding the certification provision at FAR 52.209–12 to include reporting of State and local tax delinquencies.

Response: These recommendations are outside the scope of this rule, which is to implement sections 744 and 745 of division E and section 523 of division B of the Consolidated and Further Continuing Resolution Appropriations Act, 2015. The certification at FAR 52.209–5(a)(1)(i)(D) with regard to delinquent Federal taxes was inserted in the FAR under FAR Case 2006–011 at the request of the Senate Permanent Subcommittee on Investigations. The certification in FAR 52.209–5 covers delinquent Federal taxes in excess of $3,500 within the past three years, is required in all solicitations when the contract value is expected to exceed the simplified acquisition threshold, and is used along with other factors in the determination of contractor responsibility. The representations in this final rule are based on an annual appropriations act funding restriction, and are required to be included in all solicitations when awards are made with such restricted appropriated funds. There is no de minimis amount of delinquent Federal taxes which does not need to be reported. These requirements are only in effect with respect to the affected appropriated funds when the funding restrictions are included in the specific annual appropriations act. The law does not restrict the award with appropriated funds to entities with regard to State and local tax delinquencies. Thus, there are no representations required as to the status of State and local tax delinquencies. 41 U.S.C. 1304, as implemented at FAR 1.107, prohibits the inclusion of non-statutory certifications unless justified in writing to the Administrator for Federal Procurement Policy.

III. Applicability to Acquisitions Not Greater Than the Simplified Acquisition Threshold and Commercial Items (Including Commercially Available Off-the-Shelf (COTS) Items)

The FAR Council and the Administrator for Federal Procurement Policy have determined that it would not be in the best interest of the Federal Government to exempt acquisitions with estimated value not greater than the simplified acquisition threshold and contracts for the acquisition of commercial items (including COTS items) from the application of these acquisitions act restrictions.

IV. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives before a rule is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

V. Regulatory Flexibility Act

DoD, GSA, and NASA have prepared a Final Regulatory Flexibility Analysis (FRFA) consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. The FRFA is summarized as follows:

This rule implements sections 744 and 745 of Division E of the Consolidated and Further Continuing Appropriations Act, 2015 (Pub. L. 113–253) (and similar provisions in subsequent appropriations acts) to prohibit using any of the funds made available under that or any other act to enter a contract with any corporation with any delinquent Federal tax liability or a felony conviction, unless the agency has considered suspension or debarment of the corporation and has made a determination that this further action is not necessary to protect the interests of the Government.

The rule also implements section 523 of Division B of the Consolidated and Further Continuing Appropriations Act, 2015 (Pub. L. 113–253) (and similar provisions in subsequent appropriations acts). This section prohibits award of any contract in an amount greater than $5,000,000, unless the offeror affirmatively certifies that it has filed all Federal tax returns required during the three years preceding the certification; has not been convicted of a criminal offense under the Internal Revenue Code of 1986; and has not, more than 90 days prior to certification, been notified of any unpaid Federal tax assessment for which the liability remains unsatisfied, unless the assessment is the subject of an installment agreement or offer in compromise that has been approved by the Internal Revenue Service and is not in default, or the assessment is the subject of a non-frivolous administrative or judicial proceeding.

DoD, GSA, and NASA published an interim rule in the Federal Register at 80 FR 75990 on December 4, 2015, to implement sections 744 and 745 of Division E of the Consolidated and Further Continuing Appropriations Act, 2015 (Pub. L. 113–253) and section 523 of Division B of the same act. Three respondents submitted comments on the interim rule. No comments were received from the public relative to the initial regulatory flexibility analysis.

Based on current data with regard to active registrants in the System for Award Management (SAM), the rule will apply to approximately 65,000 small business concerns, which are required to complete the annual representations and certifications at least once per year in order to keep their registration in SAM current.

The information collection requirement imposed by this rule is minimal—a brief representation, and in some cases also a certification, each estimated to require an average of 6 minutes to complete.

DoD, GSA, and NASA were unable to identify any significant alternatives that would reduce the impact on small businesses and still meet the objectives of the statute. However, other than the potential for not receiving award if the small entity is delinquent in payment of Federal taxes or has been convicted of a felony, there is no significant economic impact on small entities because the information collection burden imposed by the rule is minimal.

Interested parties may obtain a copy of the FRFA from the Regulatory Secretariat. The Regulatory Secretariat has submitted a copy of the FRFA to the Chief Counsel for Advocacy of the Small Business Administration.

VI. Paperwork Reduction Act

The Paperwork Reduction Act (44 U.S.C. Chapter 35) applies. The rule contains information collection requirements. OMB has cleared this information collection requirement under OMB Control Number 9000–0193, titled: Prohibition on Contracting with Corporations with Delinquent Taxes or a Felony Conviction.

List of Subjects in 48 CFR Parts 1, 4, 9, 12, and 52

Government procurement.

Dated: September 19, 2016.

William F. Clark,
Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Interim Rule Adopted as Final Without Change

Accordingly, the interim rule amending 48 CFR parts 1, 4, 9, 12, and 52, which published in the Federal Register at 80 FR 75990 on December 4,
I. Background

DoD, GSA, and NASA published an interim rule in the Federal Register at 80 FR 75908 on December 4, 2015, to implement a final rule issued by VETS of the Dol that was published in the Federal Register at 79 FR 57463 on September 25, 2014. The VETS of Dol rule rescinded the regulations at 41 CFR part 61–250 and revised the regulations at 41 CFR part 61–300, which implemented the reporting requirements under the Vietnam Era Veterans’ Readjustment Assistance Act (VEVRAA), as amended and the Jobs for Veterans Act (JVA) (Pub. L. 107–288).

VEVRAA requires Federal contractors and subcontractors to annually report on the total number of their employees who belong to the categories of veterans protected under VEVRAA, as amended by the JVA, and the total number of those protected veterans who were hired during the period covered by the report. No public comments were submitted on the interim rule.

II. Discussion and Analysis

The Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (the Councils) did not receive any comments on the interim rule; accordingly the Councils are finalizing the interim rule without change.

III. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

IV. Regulatory Flexibility Act

DoD, GSA, and NASA have prepared a Final Regulatory Flexibility Analysis (FRFA) consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. The FRFA is summarized as follows:

This rule is issued as final, without change, an interim rule published in the Federal Register at 80 FR 75908 on December 4, 2015, implementing changes to 41 CFR 61–250 and 61–300 which was published in the Federal Register at 79 FR 57463 on September 25, 2014, by the Veterans’ Employment and Training Service (VETS) of the Department of Labor (DOL). The objective of the VETS rule is to revise the current regulations implementing 38 U.S.C. 4212. The VETS rule rescinded obsolete regulations at 41 CFR 61–250, changed the manner in which Federal Contractors report veterans’ employment data, updated terminology, and revised the annual report, the report name, and methods of filing the report. No public comments were submitted in response to the initial regulatory flexibility analysis or the interim rule.

V. Paperwork Reduction Act

The Paperwork Reduction Act (44 U.S.C chapter 35) applies. The rule contains information collection requirements that are subject to review and approval by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 et seq.). However, the applicable information collections are derived from the requirements of the 41 CFR part 61–300 regulations implementing the reporting requirements under VEVRAA; see detailed discussion in DOL’s rule under the Paperwork Reduction Act section which was published in the Federal Register at 79 FR 57463 on September 25, 2014. OMB assigned OMB Control Numbers 1250–0004, OFCCP Recordkeeping and Reporting Requirements, 38 U.S.C. 4212, Vietnam Era Veterans’ Readjustment Assistance Act of 1974, as amended, and 1293–0005, Federal Contractor Veterans’ Employment Report.

List of Subjects in 48 CFR Parts 1, 22, and 52

Government procurement.
DEPARTMENT OF DEFENSE

GENERAL SERVICES ADMINISTRATION

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

48 CFR Parts 1, 22, and 52

A. The DOL regulation implements E.O. 12665 by revising the equal opportunity clause to prohibit contractors from discharging, or in any manner discriminating against, any employee or applicant for employment because the employee or applicant inquired about, discussed, or disclosed the compensation of the employee or applicant for employment opportunity.

II. Discussion and Analysis

A. The DOL regulation implements E.O. 12665 by revising the equal opportunity clause to prohibit contractors from discharging, or in any manner discriminating against, any employee or applicant for employment because the employee or applicant inquired about, discussed, or disclosed the compensation of the employee or applicant for employment opportunity.

B. The FAR implements E.O. 11246 in FAR subpart 22.8, FAR clause 52.222–26, Equal Opportunity, and related clauses. This interim rule adds the new discrimination prohibition and incorporates the definitions “compensation,” “compensation information,” and “essential job functions” from the DOL final rule (41 CFR 60–1.3) within FAR subpart 22.8 and the clauses that are prescribed in FAR subpart 22.8 as follows:

1. 22.802, General. Inserts the new discrimination prohibition.

2. 52.222–26, Equal Opportunity. Inserts definitions for the terms “compensation,” “compensation information,” and “essential job functions,” and 52.222–26(c)(5), which prohibits contractors from discharging, or in any manner discriminating against, any employee or applicant for employment because the employee or applicant inquired about, discussed, or disclosed the compensation of the employee or applicant for employment opportunity.

C. Conforming changes were made in the FAR clauses 52.212–5, 52.213–4, and 52.244–6.
regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is a significant regulatory action and, therefore, was subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This interim rule is not a major rule under 5 U.S.C. 604.

IV. Regulatory Flexibility Act
DoD, GSA, and NASA do not expect this interim rule to have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. However, an initial regulatory flexibility analysis (IRFA) has been prepared consistent with 5 U.S.C. 603. The analysis is summarized as follows:

This interim rule is necessary to implement E.O. 13665, Non-Retaliation for Disclosure of Compensation Information (amending E.O. 11246, Equal Opportunity in Federal Employment) as implemented by the final rule issued by the DoL at 41 CFR part 60–1, published in the Federal Register at 80 FR 54934, on September 11, 2015.

The objective of this rule is to provide for a uniform policy for the Federal Government to prohibit Federal contractors from discriminating against employees and job applicants who inquire about, discuss, or disclose their own compensation or the compensation of other employees or applicants.

The rule will apply to all entities, both small and other than small. Based on the most current data available in the System for Award Management (SAM), there are 328,552 small contractor firms with fewer than 500 employees and 315,902 small contractor firms with less than $35.5 million in revenue. Thus, the total number of small contractor firms that may be impacted by the rule range from 315,902 to 328,552.

Recordkeeping and reporting requirements of the rule involve regulatory familiarization and administrative costs associated with incorporating revised language into policies, instructions, notices to employees, and subcontracts. In implementing the additional prohibition, the rule requires that contractors and subcontractors disseminate the nondiscrimination provision, using language prescribed by the Director of the Office of Federal Contract Compliance Programs (OFCCP), including incorporating the nondiscrimination provision into existing employee manuals and handbooks and posting it electronically or in conspicuous places available to employees and applicants. An analysis of estimated costs of the regulatory changes was performed in the DOL final rule published in the Federal Register at 80 FR 54934, on September 11, 2015. DoL estimated the total cost of their final rule at $85.00 per company.

The rule does not duplicate, overlap, or conflict with any other Federal rules. DoD, GSA, and NASA are not aware of any significant alternatives to the rule that would accomplish the stated objectives of the E.O. and the DOL implementing regulations.

It is necessary for the rule to apply to small entities, because E.O. 11246, as amended, applies when a contractor has contracts or subcontracts with the Government in any 12-month period which have an aggregate total value (or can reasonably be expected to have an aggregate total value) exceeding $10,000 that are not completely exempted. Every effort has been made to minimize the burdens imposed on small entities.

The Regulatory Secretariat Division has submitted a copy of the IRFA to the Chief Counsel for Advocacy of the Small Business Administration. A copy of the IRFA may be obtained from the Regulatory Secretariat Division. DoD, GSA, and NASA invite comments from small business concerns and other interested parties on the expected impact of this rule on small entities.

DoD, GSA, and NASA will also consider comments from small entities concerning the existing regulations in parts affected by the rule in accordance with 5 U.S.C. 610. Interested parties must submit such comments separately and should cite 5 U.S.C 610 (FAR Case 2016–007), in correspondence.

V. Paperwork Reduction Act
The Paperwork Reduction Act (44 U.S.C chapter 35) does apply; however, the information collection authorization is under the DOL final rule issued by the Office of Federal Contract Compliance Programs (OFCCP) of the Department of Labor (DOL), which was published in the Federal Register at 80 FR 54934, on September 11, 2015, entitled “Government Contractors, Prohibitions Against Pay Secrecy Policies and Actions,” and is assigned OMB Control Number 1250–0008, Prohibitions Against Pay Secrecy Policies and Actions. This information collection expires December 31, 2018. The other information collection requirements cited at 1.106 that apply to FAR clause 52.225–26, assigned OMB control numbers 1250–0001 and 1250–0003, cover the general recordkeeping provisions of the laws administered by OFCCP.

VI. Determination To Issue an Interim Rule
A determination has been made under the authority of the Secretary of Defense (DoD), the Administrator of General Services (GSA), and the Administrator of the National Aeronautics and Space Administration (NASA) that urgent and compelling reasons exist to promulgate this interim rule without prior opportunity for public comment. It is important that the FAR is immediately revised to include the requirements of E.O. 13665, entitled “Non-Retaliation for Disclosure of Compensation Information” and the Department of Labor implementing regulation published in the Federal Register at 80 FR 54934, on September 11, 2015 that requires the Federal Government to establish a uniform policy that prohibits Federal contractors from discriminating against employees and job applicants who inquire about, discuss, or disclose their own compensation or the compensation of other employees or applicants. This action is necessary because DOL’s final rule became effective on January 11, 2016, and section 6 of the E.O. expressly states that the order “shall apply to contracts entered into on or after the effective date of rules promulgated by the Department of Labor.” Issuance of an interim rule allows for the requirements to be included in solicitations and contracts immediately and puts contractors on clear notice of legal responsibilities that are already in effect. If the FAR rule is not issued as an interim rule, this new requirement will not be incorporated into contracts, and contractors will be put at unnecessary risk of non-compliance with the E.O. and labor rule. More importantly, this may unnecessarily delay action by contractors in providing the important protections for contractor employees that the E.O. and labor rule are designed to provide. However, pursuant to 41 U.S.C. 1707 and FAR 1.501–3(b), DoD, GSA, and NASA will consider public comments received in response to this interim rule in the formation of the final rule.

List of Subjects in 48 CFR Parts 1, 22, and 52

Government procurement.

Dated: September 19, 2016.

William F. Clark, Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Therefore, DoD, GSA, and NASA amend 48 CFR parts 1, 22, and 52 as set forth below:

1. The authority citation for 48 CFR parts 1, 22, and 52 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.
PART 1—FEDERAL ACQUISITION REGULATIONS SYSTEM

1.106 [Amended]

2. Amend section 1.106 in the table by removing from FAR segment “52.222–26” the OMB control number “1250–0003” and adding “1250–0001, 1250–0003, and 1250–0008” in its place.

PART 22—APPLICATION OF LABOR LAWS TO GOVERNMENT ACQUISITIONS

3. Amend section 22.802 by revising paragraph (a) to read as follows:

22.802 General.

(a) Executive Order 11246, as amended, sets forth the Equal Opportunity clause and requires that all agencies—

(1) Include this clause in all nonexempt contracts and subcontracts (see 22.807); and

(2) Act to ensure compliance with the clause and the regulations of the Secretary of Labor—

(i) To promote the full realization of equal employment opportunity for all persons, regardless of race, color, religion, sex, sexual orientation, gender identity, or national origin; and

(ii) To prohibit contractors from discharging, or in any other manner discriminating against, any employee or applicant for employment because the employee or applicant inquired about, discussed, or disclosed the compensation of the employee or applicant or another employee or applicant. This prohibition against discrimination does not apply to instances in which an employee who has access to the compensation information of other employees or applicants as a part of such employee’s essential job functions discloses the compensation of such other employees or applicants to individuals to whom such employee otherwise have access to such information, unless such disclosure is in response to a formal complaint or charge, in furtherance of an investigation, proceeding, hearing, or action, including an investigation conducted by the employer, or is consistent with the contractor’s legal duty to furnish information.

4. Amend section 22.809 by revising the introductory text to read as follows:

22.809 Enforcement.

Upon written notification to the contracting officer, the Deputy Assistant Secretary may direct one or more of the following actions, as well as administrative sanctions and penalties, be taken against contractors found to be in violation of E.O. 11246, the regulations of the Secretary of Labor, or the applicable contract clauses:

PART 52—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

5. Amend section 52.212–5 by—

(a) Revising the date of the clause and paragraphs (b)(28) and (e)(1)(v); and

(b) In Alternate II, revising the date of the alternate and paragraph (e)(1)(i)(E).

The revisions read as follows:

52.212–5 Contract Terms and Conditions Required to Implement Statutes or Executive Orders—Commercial Items.

52.222–26 Equal Opportunity.

52.222–26 Equal Opportunity.

(a) * * *

(b) * * *

(c) * * *

(d) * * *

(e) * * *

(f) * * *

(g) * * *

(h) * * *

(i) * * *

(j) * * *

(k) * * *

(l) * * *

52.213–4 Terms and Conditions—Simplified Acquisitions (Other Than Commercial Items).

Terms and Conditions—Simplified Acquisitions (Other Than Commercial Items) (Sept 2016)

(a) * * *

(1) * * *

(2) * * *

(viii) 52.244–6, Subcontracts for Commercial Items (Sept 2016). * * *

7. Amend section 52.222–26 by—

(a) Revising the date of the clause;

(b) Adding to paragraph (a), in alphabetical order, the definitions “Compensation”, “Compensation Information”, and “Essential Job Functions”;

(c) Redesignating paragraphs (c)(5) through (11) as paragraphs (c)(6) through (12), respectively;

(d) Adding new paragraph (c)(5):

(e) Removing from newly designated paragraph (c)(12) “contracting officer” and adding “Director of OFCCP” in its place;

(f) Removing from paragraph (d) “41 CFR 60–1.” and adding “41 CFR part 60–1.” in its place.

The revision and additions read as follows:

52.222–26 Equal Opportunity.

52.222–26 Equal Opportunity.

(c) * * *

Compensation means any payments made to, or on behalf of, an employee or offered to an applicant as remuneration for employment, including but not limited to salary, wages, overtime pay, shift differentials, bonuses, commissions, vacation and holiday pay, allowances, insurance and other benefits, stock options and awards, profit sharing, and retirement.

Compensation Information means the amount and type of compensation provided to employees or offered to applicants, including, but not limited to, the desire of the Contractor to attract and retain a particular employee for the value the employee is perceived to add to the Contractor’s profit or productivity; the availability of employees with like skills in the marketplace; market research about the worth of similar jobs in the relevant marketplace; job analysis, descriptions, and evaluations; salary and pay structures; salary surveys; labor union agreements; and Contractor decisions, statements and policies related to setting or altering employee compensation.

Essential Job Functions means the fundamental job duties of the employment position an individual holds. A job function may be considered essential if—

(1) The access to compensation information is necessary in order to perform that function or another routinely assigned business task; and

(2) The function or duties of the position include protecting and maintaining the privacy of employee personnel records, including compensation information.

(c) * * *

(v) The Contractor shall not discharge or in any other manner discriminate against any employee or applicant for employment because such employee or applicant has inquired about, discussed, or disclosed the compensation of the employee or applicant or another employee or applicant. This prohibition against discrimination does not apply to instances in which an employee who has access to the compensation information of other employees or applicants as a part of such employee’s essential job functions discloses the compensation of such other employees or applicants to individuals who do not otherwise have access to such information, unless such disclosure is in
response to a formal complaint or charge, in furtherance of an investigation, proceeding, hearing, or action, including an investigation conducted by the employer, or is consistent with the Contractor’s legal duty to furnish information.

(ii) The Contractor shall disseminate the prohibition on discrimination in paragraph (c)(3)(ii) of this clause, using language prescribed by the Director of the Office of Federal Contract Compliance Programs (OFCCP), to employees and applicants by—

(A) Incorporation into existing employee manuals or handbooks; and

(B) Electronic posting or by posting a copy of the provision in conspicuous places available to employees and applicants for employment.

8. Amend section 52.244–6 by revising the date of the clause and paragraph (c)(1)(vi) to read as follows:

52.244–6 Subcontracts for Commercial Items.

Subcontracts for Commercial Items (Sept 2016)

(c)(1) * * * *

(vi) 52.222–26, Equal Opportunity (Sept 2016) (E.O. 11246).

* * * *

Federal Acquisition Regulation; Sole Source Contracts for Women-Owned Small Businesses

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and the National Aeronautics and Space Administration (NASA). ACTION: Final rule.

SUMMARY: DoD, GSA, and NASA have adopted as final, with a minor edit, an interim rule amending the Federal Acquisition Regulation (FAR) to implement regulatory changes made by the Small Business Administration (SBA) that provide for authority to award sole source contracts to economically disadvantaged women-owned small business concerns and to women-owned small business concerns eligible under the Women-Owned Small Business (WOSB) Program.

FOR FURTHER INFORMATION CONTACT: Ms. Mahruba Uddowla, Procurement Analyst, at 703–605–2868 for clarification of content. For information pertaining to status or publication schedules, contact the Regulatory Secretariat Division at 202–501–4755. Please cite FAC 2005–91, FAR Case 2015–032.

SUPPLEMENTARY INFORMATION:

I. Background

DoD, GSA, and NASA published an interim rule in the Federal Register at 80 FR 81888 on December 31, 2015, to implement regulatory changes that the SBA has made in its final rule published in the Federal Register at 80 FR 55019, on September 14, 2015, concerning sole source award authority under the WOSB Program. SBA’s final rule implements the statutory requirements of paragraph (a)(3) of section 825 of the Carl Levin and Howard P. “Buck” McKeon National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2015, Public Law 113–291, granting contracting officers the authority to award sole source contracts to economically disadvantaged women-owned small business (EDWOSB) concerns and to WOSB concerns eligible under the WOSB Program. Four respondents submitted comments on the interim rule.

II. Discussion and Analysis

The Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (the Councils) reviewed the public comments in the development of the final rule. All four respondents expressed support of the interim rule. Therefore, no further change to the interim rule is required as a result of the public comments, but there is a minor edit to 19.1505(a)(1).

III. Applicability to Contracts at or Below the Simplified Acquisition Threshold and for Commercial Items, Including Commercially Available Off-the-Shelf Items

This rule adopts as final the amendments to the FAR clauses at 52.219–29, Notice of Set-Aside for, or Sole Source Award to, Economically Disadvantaged Women-owned Small Business Concerns, and 52.219–30, Notice of Set-Aside for, or Sole Source Award to, Women-Owned Small Business Concerns Eligible Under the Women-Owned Small Business Program, in order to implement paragraph (a)(3) of section 825 of the NDAA for FY 2015. The Federal Acquisition Regulatory Council, pursuant to the authority granted in 41 U.S.C. 1905 and 1906, and the Administrator, Office of Federal Procurement Policy, pursuant to the authority granted in 41 U.S.C 1907, have determined that the application of this statutory authority to contracts at or below the simplified acquisition threshold and to contracts for commercial items and commercially available off-the-shelf items, is in the best interests of the Federal Government.

IV. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

V. Regulatory Flexibility Act

DoD, GSA, and NASA have prepared a Final Regulatory Flexibility Analysis (FRFA) consistent with the Regulatory Flexibility Act 5 U.S.C. 601, et seq. The FRFA is summarized as follows:

This rule implements paragraph (a)(3) of section 825 of the Carl Levin and Howard P. “Buck” McKeon National Defense Authorization Act for Fiscal Year 2015, Public Law 113–291, (Fiscal Year 2015 NDAA). Section 825 of the Fiscal Year 2015 NDAA included language granting contracting officers the authority to award sole source contracts to Women-Owned Small Businesses (WOSBs) and Economically Disadvantaged Women-Owned Small Businesses (EDWOSBs) under the WOSB Program. The purpose of this rule is to finalize the procedures whereby Federal agencies may award sole source contracts to WOSBs and EDWOSBs eligible under the WOSB Program. The rule provides an additional tool for Federal agencies to ensure that WOSBs have an equal opportunity to participate in Federal contracting and ensures consistency among SBA’s socioeconomic small business contracting programs.
The interim rule, published at 80 FR 81888, on December 31, 2015, put the WOSB Program on a level playing field with other SBA Government contracting programs with sole source authority and provided an additional, needed tool for agencies to meet the statutorily mandated goal of 5 percent of the total value of all prime contract and subcontract awards for WOSBs. There were no significant issues raised by the public in response to the initial Regulatory Flexibility Analysis provided in the interim rule.

This rule may have a positive economic impact on WOSB concerns. The Dynamic Small Business Supplemental Search (DSBS) lists approximately 41,500 firms as either WOSBs or EDWOSBs under the WOSB Program. An analysis of the Federal Procurement Data System from April 1, 2011 (the implementation date of the WOSB Program), through September 1, 2015, revealed that there were approximately 17,353 women-owned small business concerns that received obligated funds from Federal contract awards, task or delivery orders, and modifications to existing contracts, in an industry where a WOSB or EDWOSB sole source is authorized, and where the contract is valued at or below the thresholds for sole source contracts to WOSBs or EDWOSBs. Of those 17,353 women-owned small business concerns, 328 EDWOSBs and 974 WOSBs were eligible to participate in the WOSB Program (i.e., received set-asides under the WOSB Program), and could have received sole source awards. This rule could affect a smaller number of EDWOSBs and WOSBs than those eligible under the WOSB Program since the sole source authority can only be used where a contracting officer conducts market research in an industry where a WOSB or EDWOSB set-aside is authorized, and cannot identify two or more eligible EDWOSB or WOSB concerns that can perform at a fair and reasonable price, but identifies one WOSB or EDWOSB that can perform. In addition, the sole source authority for WOSBs and EDWOSBs is limited to contracts valued at $6.5 million or less for manufacturing contracts and $4 million or less for all other contracts.

This rule does not impose any new reporting, recordkeeping or other compliance requirements for small businesses. This rule does not duplicate, overlap, or conflict with any other Federal rules.

Interested parties may obtain a copy of the FRFA from the Regulatory Secretariat Division. The Regulatory Secretariat Division has submitted a copy of the FRFA to the Chief Counsel for Advocacy of the Small Business Administration.

VI. Paperwork Reduction Act

The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35).

Federal Acquisition Regulation; Unique Identification of Entities Receiving Federal Awards

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Final rule.

SUMMARY: DoD, GSA, and NASA are issuing a final rule amending the Federal Acquisition Regulation (FAR) to redesignate the terminology for unique identification of entities receiving Federal awards. The change to the FAR removes the proprietary standard or number.

SUPPLEMENTARY INFORMATION:

I. Background

DoD, GSA, and NASA published a proposed rule in the Federal Register at 80 FR 72035 on November 18, 2015, to redesignate the terminology for unique identification of entities receiving Federal awards. The change to the FAR eliminates references to the proprietary Data Universal Numbering System (DUNS®) number, and provides appropriate references to the Web site where information on the unique entity identifier used for Federal contractors will be located. This final rule also establishes definitions of “unique entity identifier”, and “electronic funds transfer (EFT) indicator”. Ten respondents submitted comments on the proposed rule.

II. Discussion and Analysis

The Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (the Councils) reviewed the comments in the development of the final rule. All ten respondents agreed with the rule. No changes were made to the rule as a result of those comments. A discussion of the comments is provided as follows:

A. Analysis of Public Comments

1. Alternatives to and Considerations for the Evaluation of a Nonproprietary Entity Identifier

Comment: Six respondents provided an alternative to the current entity identifier (e.g., Legal Entity Identifier (LEI), Contractor and Government Entity (CAGE) code) and four respondents provided additional considerations for the evaluation of alternatives for the entity identifier.

Response: The scope of this rule is limited to removing the proprietary standard or number. The Office of Management and Budget (OMB) and the Department of Treasury, in collaboration with the General Services Administration and the Award Committee for E-Government, are establishing a process for considering alternatives to existing entity identifiers, including soliciting information about viable options from and reaching out about nonproprietary alternatives to all sectors, including private companies, nonprofits, and Federal Government...
providers. The analysis of the alternatives for the entity identifier and the analysis of considerations for the evaluation of alternatives for the entity identifier are beyond the scope of the case. However, the FAR Council will share these recommendations with the agencies conducting the analysis and implementing the changes.

2. Challenges to Statements Made in the Proposed Rule Federal Register Preamble

Comment: One respondent believed that the statement that the “current requirement limits competition by using a proprietary number and organization to meet the identification need as well as the need for other business information associated with that number” incorrectly suggests that the business information is only accessible through usage of the DUNS number. This respondent also challenged the assertion that the Government is not currently in a position to move away from use of the DUNS number in the short term. This respondent recommended that Government agencies consider expanding their acquisitions of business information services through competitive procurements.

Response: There is nothing in the FAR linking business information services to the use of the DUNS number. Agencies are free to procure business information services as deemed appropriate. Regarding the short term ability of the Government to move away from the use of the DUNS number, the Government is in the process of determining requirements. The unique entity identifier provides multiple pieces of business information and serves multiple functions. Analysis will be conducted to ensure the replacement satisfies the full range of information needed. The Government is establishing a process for considering alternatives to existing entity identifiers, including soliciting information about viable options from and reaching out about nonproprietary alternatives to all sectors, including private companies, nonprofits, and Federal government providers. The analysis of alternatives is anticipated to be completed in fiscal year 2017. The scope of this rule is limited to removing the proprietary standard or number hence removing the impediment in anticipation of the change. The Government is interested in reducing cost and that is the reason we are pursuing this case. Recommendations regarding business information services are beyond the scope of the case.

B. Other Changes

Conforming changes were made to the following forms: Standard Forms 294, 330, and 1447, and Optional Form 307. These form changes will be made to be “Previous Edition Usable” in order to avoid Government agencies and Federal contractors having to make unnecessary system changes to accommodate nonsustained changes to forms.

III. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

IV. Regulatory Flexibility Act

DoD, GSA, and NASA have prepared a Final Regulatory Flexibility Analysis (FRFA) consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. The FRFA is summarized as follows:

The rule removes a proprietary standard or number for the unique identification of entities receiving Federal awards. The current requirement limits competition by using a proprietary number and organization to meet the identification needs. Unique identification of such entities is critical to ensure Federal dollars are awarded to responsible parties, awardees are paid in a timely manner, and awards are appropriately recorded and reported. This is currently accomplished in the FAR by using the proprietary Data Universal Numbering System (DUNS®) number from Dun and Bradstreet. This rule eliminates references to the proprietary standard or number and provides appropriate references to the Web site where information on the unique entity identifier used for Federal contractors will be designated. Although the Government does not intend to move away from use of the DUNS number in the short term, elimination of regulatory references to a proprietary entity identifier will provide opportunities for future competition that can reduce costs to taxpayers.

No public comments were submitted in response to the initial regulatory flexibility analysis.

The final rule is internal to the Government and does not directly impose any requirements on the vendor community.

However, the rule may affect certain entities if those entities have arranged certain of their business systems to utilize, accept, or otherwise recognize the existing unique identifier (DUNS number) and should that unique identifier be changed at some point to another identifier. As of June 2015, there were 380,092 unique and active DUNS numbers designated in the System for Award Management and attributed to Government contracting.

There is no change to recordkeeping as a result of this rule.

There are no known significant alternative approaches to the rule that would meet the requirements.

Interested parties may obtain a copy of the FRFA from the Regulatory Secretariat. The Regulatory Secretariat has submitted a copy of the FRFAs to the Chief Counsel for Advocacy of the Small Business Administration.

V. Paperwork Reduction Act

The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35).

List of Subjects in 48 CFR Parts 2, 4, 9, 12, 19, 52, and 53

Government procurement.

Dated: September 19, 2016.

William F. Clark,
Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Therefore, DoD, GSA, and NASA amend 48 CFR parts 2, 4, 9, 12, 19, 52, and 53 as set forth below:

1. The authority citation for 48 CFR parts 2, 4, 9, 12, 19, 52, and 53 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

PART 2—DEFINITIONS OF WORDS AND TERMS

2. Amend section 2.101, in paragraph (b)(2) by—

a. Removing the definitions “Data Universal Numbering System (DUNS) number” and “Data Universal Numbering System +4 (DUNS+4) number”;

b. Adding, in alphabetical order, the definition “Electronic Funds Transfer (EFT) indicator”;

c. Revising paragraph (1) of the definition “Registered in the System for Award Management (SAM) database”;

d. Adding, in alphabetical order, the definition, “Unique entity identifier”.

The revisions and additions read as follows:
2.101 Definitions.
  (a) * * * * *
  (b) * * * * 
  (2) * * * * 

Electronic Funds Transfer (EFT) indicator means a four-character suffix to the unique entity identifier. The suffix is assigned at the discretion of the commercial, nonprofit, or Government entity to establish additional System for Award Management records for identifying alternative EFT accounts (see subpart 32.11) for the same entity.
  * * * * *

Registered in the System for Award Management (SAM) database * * * *
(1) The Contractor has entered all mandatory information, including the unique entity identifier and the Electronic Funds Transfer indicator (if applicable), the Commercial and Government Entity (CAGE) code, as well as data required by the Federal Funding Accountability and Transparency Act of 2006 (see subpart 4.14), into the SAM database;
  * * * * *

Unique entity identifier means a number or other identifier used to identify a specific commercial, nonprofit, or Government entity. See www.sam.gov for the designated entity for establishing unique entity identifiers.
  * * * * *

PART 4—ADMINISTRATIVE MATTERS

3. Amend section 4.601 by removing the definition “Generic DUNS number” and adding, in alphabetical order, the definition “Generic entity identifier” to read as follows:

4.601 Definitions.
  * * * * *

Generic entity identifier means a number or other identifier assigned to a category of vendors and not specific to any individual or entity.
  * * * * *

4. Amend section 4.605 by revising paragraph (b), the heading of paragraph (c), and paragraphs (c)(1) and (2) introductory text; and removing from paragraph (c)(2)(i)(C) “DUNS number” and adding “unique entity identifier” in its place.

The revisions read as follows:

4.605 Procedures.
  * * * * *

(b) Unique entity identifier. The contracting officer shall identify and report a unique entity identifier for the successful offeror on a contract action. The unique entity identifier shall correspond to the successful offeror’s name and address as stated in the offer and resultant contract, and as registered in the System for Award Management database in accordance with the provision at 52.204–7, System for Award Management. The contracting officer shall ask the offeror to provide its unique entity identifier by using either the provision at 52.204–6, Unique Entity Identifier, the provision at 52.204–7, System for Award Management, or the provision at 52.212–1, Instructions to Offerors—Commercial Items. (For a discussion of the Commercial and Government Entity (CAGE) Code, which is a different identifier, see subpart 4.18.)

(c) Generic entity identifier. (1) The use of a generic entity identifier should be limited, and only used in the situations described in paragraph (c)(2) of this section. Use of a generic entity identifier does not supersede the requirements of provisions 52.204–6, Unique Entity Identifier or 52.204–7, System for Award Management (if present in the solicitation) for the contractor to have a unique entity identifier assigned.

(2) Authorized generic entity identifiers, maintained by the Integrated Award Environment (IAE) program office (http://www.gsa.gov/portal/content/165036), may be used to report contracts in lieu of the contractor’s actual unique entity identifier only for—
  * * * * *

4.607 Solicitation provisions and contract clause.
  * * * * *

(c) Insert the clause at 52.204–12, Unique Entity Identifier Maintenance, in solicitations and resultant contracts that contain the provision at 52.204–6, Unique Entity Identifier.

6. Amend section 4.1103 by—

(a) * * * (1) Offerors shall provide the contracting officer the CAGE code assigned to that offeror’s location prior to the award of a contract action above the micro-purchase threshold, when there is a requirement to be registered in the System for Award Management (SAM) or a requirement to have a unique entity identifier in the solicitation.
  * * * * *

4.1402 [Amended]

7. Amend section 4.1402 by removing from paragraph (b), last sentence, “DUNS number” and adding “entity identifier” in its place.

4.1705 [Amended]

8. Amend section 4.1705 by removing from paragraphs (a) and (b) “DUNS number” and adding “entity identifier” in their places.

9. Amend section 4.1800 by revising paragraph (b) to read as follows:

4.1800 Scope of subpart.
  * * * * *

(b) For information on the unique entity identifier, which is a different identifier, see 4.605 and the provisions at 52.204–6, Unique Entity Identifier, and 52.204–7, System for Award Management.

10. Amend section 4.1802 by revising paragraph (a)(1) and removing from paragraph (b) “DUNS Number” and adding “unique entity identifier” in its place.

The revision reads as follows:

4.1802 Policy.

(a) * * * (1) Offerors shall provide the contracting officer the CAGE code assigned to that offeror’s location prior to the award of a contract action above the micro-purchase threshold, when there is a requirement to be registered in the System for Award Management (SAM) or a requirement to have a unique entity identifier in the solicitation.
  * * * * *

4.1804 [Amended]

11. Amend section 4.1804 by removing from paragraph (a)(1) “Data Universal Numbering System Number” and adding “Unique Entity Identifier” in its place.
PART 9—CONTRACTOR QUALIFICATIONS

9.404 [Amended]

■ 12. Amend section 9.404 by revising paragraph (b)(6) to read as follows:

9.404 System for Award Management Exclusions.

(b) * * *

(6) Unique Entity Identifier; * * * * *

PART 12—ACQUISITION OF COMMERCIAL ITEMS

12.301 [Amended]

■ 13. Amend section 12.301 by removing from paragraphs (d)(1) and (2) “DUNS Number” and adding “unique entity identifier” in their places.

PART 19—SMALL BUSINESS PROGRAMS

19.704 [Amended]

■ 14. Amend section 19.704 by removing from paragraphs (a)(10)(v) and (vi) “DUNS number” and adding “unique entity identifier” in their places.

PART 52—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

■ 15. Revise section 52.204–6 to read as follows:

52.204–6 Unique Entity Identifier.

As prescribed in 4.607(b), insert the following provision:

Unique Entity Identifier (Oct 2016)

(a) Definitions. As used in this provision—Electronic Funds Transfer (EFT) indicator means a four-character suffix to the unique entity identifier. The suffix is assigned at the discretion of the commercial, nonprofit, or Government entity to establish additional System for Award Management records for identifying alternative EFT accounts (see subpart 32.11) for the same entity.

Unique entity identifier means a number or other identifier used to identify a specific commercial, nonprofit, or Government entity. See www.sam.gov for the designated entity for establishing unique entity identifiers.

(b) The Offeror shall enter, in the block with its name and address on the cover page of its offer, the annotation “Unique Entity Identifier” followed by the unique entity identifier that identifies the Offeror’s name and address exactly as stated in the offer. The Offeror also shall enter its EFT indicator, if applicable. The unique entity identifier will be used by the Contracting Officer to verify that the Offeror is registered in the SAM database.

(c) If the Offeror does not have a unique entity identifier, it should contact the entity designated at www.sam.gov for establishment of the unique entity identifier directly to obtain one. The Offeror should be prepared to provide the following information:

(1) Company legal business name.
(2) Tradestyle, doing business, or other name by which your entity is commonly recognized.
(3) Company physical street address, city, state and Zip Code.
(4) Company mailing address, city, state and Zip Code (if separate from physical).
(5) Company telephone number.
(6) Date the company was started.
(7) Number of employees at your location.
(8) Chief executive officer/key manager.
(9) Line of business (industry).
(10) Company headquarters name and address (reporting relationship within your entity).

(End of provision)

52.204–7 System for Award Management.

*b * * * *

System for Award Management

(a) Definitions. As used in this provision—

Electronic Funds Transfer (EFT) indicator means a four-character suffix to the unique entity identifier. The suffix is assigned at the discretion of the commercial, nonprofit, or Government entity to establish additional System for Award Management records for identifying alternative EFT accounts (see subpart 32.11) for the same entity.

Registered in the System for Award Management (SAM) database means that—

(1) The Offeror has entered all mandatory information, including the unique entity identifier and the EFT indicator, if applicable, the Commercial and Government Entity (CAGE) code, as well as data required by the Federal Funding Accountability and Transparency Act of 2006 (see subpart 4.14) into the SAM database;

Unique entity identifier means a number or other identifier used to identify a specific commercial, nonprofit, or Government entity. See www.sam.gov for the designated entity for establishing unique entity identifiers.

*b * * *

52.204–10 Reporting Executive Compensation and First-Tier Subcontract Awards.

*b * * *

Reporting Executive Compensation and First-Tier Subcontract Awards (Oct 2016)

*b * * *

18. Revise section 52.204–12 to read as follows:

52.204–12 Unique Entity Identifier Maintenance.

As prescribed in 4.607(c), insert the following clause:

Unique Entity Identifier Maintenance (Oct 2016)

(a) Definition. Unique entity identifier, as used in this clause, means a number or other identifier used to identify a specific commercial, nonprofit, or Government entity. See www.sam.gov for the designated entity for establishing unique entity identifiers.

(b) The Contractor shall ensure that the unique entity identifier is maintained with the entity designated at the System for Award Management (SAM) for establishment of the unique entity identifier throughout the life of the contract. The Contractor shall
communicate any change to the unique entity identifier to the Contracting Officer within 30 days after the change, so an appropriate modification can be issued to update the data on the contract. A change in the unique entity identifier does not necessarily require a novation be accomplished.

(End of clause)

19. Amend section 52.204–13 by—
   a. Revising the date of the clause;
   b. Amending paragraph (a) by—
      1. Removing the definitions “Data Universal Numbering System (DUNS) number” and “Data Universal Numbering System +4 (DUNS+4) number”;
   2. Adding, in alphabetical order, the definition “Electronic Funds Transfer (EFT) indicator”;
   3. Revising paragraph (1) of the definition “Registered in the System for Award Management (SAM) database”; and
   4. Adding, in alphabetical order, the definition “Unique entity identifier” and
      c. Revising paragraph (c)(3):
         The Offeror should indicate that it is an appropriate modification can be issued to update the data on the contract. A change in the unique entity identifier does not necessarily require a novation be accomplished.

20. Amend section 52.204–14 by—
   a. Revising the date of the clause; and
   b. Removing from paragraph (f)(1)(i) “DUNS number” and adding “unique entity identifier” in its place.

The revision reads as follows:

52.204–14 Service Contract Reporting Requirements.

* * * * *

Service Contract Reporting Requirements (Oct 2016)

* * * * *

21. Amend section 52.204–15 by—
   a. Revising the date of the clause; and
   b. Removing from paragraph (f)(1)(i) “DUNS number” and adding “unique entity identifier” in its place.

The revision reads as follows:

52.204–15 Service Contract Reporting Requirements for Indefinite-Delivery Contracts.

* * * * *

System for Award Management Maintenance (Oct 2016)

(a) Definitions.

Electronic Funds Transfer (EFT) indicator means a four-character suffix to the unique entity identifier. The suffix is assigned at the discretion of the commercial, nonprofit, or Government entity to establish additional System for Award Management (SAM) records for identifying alternative EFT accounts (see subpart 32.11) for the same entity.

Registered in the System for Award Management (SAM) database means that—
   1. The Contractor has entered all mandatory information, including the unique entity identifier and the EFT indicator (if applicable), the Commercial and Government Entity (CAGE) code, as well as data required by the Federal Funding Accountability and Transparency Act of 2006 (see subpart 4.14), into the SAM database;
   * * * * *

Unique entity identifier means a number or other identifier used to identify a specific commercial, nonprofit, or Government entity. See www.sam.gov for the designated entity for establishing unique entity identifiers.

* * * * *

(c) * * *

(3) The Contractor shall ensure that the unique entity identifier is maintained with the entity designated at www.sam.gov for establishment of the unique entity identifier throughout the life of the contract. The Contractor shall communicate any change to the unique entity identifier to the Contracting Officer within 30 days after the change, so an appropriate modification can be issued to update the data on the contract. A change in the unique entity identifier does not necessarily require a novation be accomplished.

22. Amend section 52.212–1 by revising the date of the provision and paragraph (j) to read as follows:

52.212–1 Instructions to Offerors—Commercial Items.

* * * * *

Instructions to Offerors—Commercial Items (Oct 2016)

* * * * *

(j) Unique entity identifier. (Applies to all offers exceeding $3,500, and offers of $3,500 or less if the solicitation requires the Contractor to be registered in the System for Award Management (SAM) database.) The Offeror shall enter, in the block with its name and address on the cover page of its offer, the annotation “Unique Entity Identifier” followed by the unique entity identifier that identifies the Offeror’s name and address. The Offeror also shall enter its Electronic Funds Transfer (EFT) indicator, if applicable. The EFT indicator is a four-character suffix to the unique entity identifier. The suffix is assigned at the discretion of the Offeror to establish additional SAM records for identifying alternative EFT accounts (see subpart 32.11) for the same entity. If the Offeror does not have a unique entity identifier, it should contact the entity designated at www.sam.gov for unique entity identifier establishment directly to obtain one. The Offeror should indicate that it is an Offeror for a Government contract when contacting the entity designated at www.sam.gov for establishing the unique entity identifier.

23. Amend section 52.212–3 by—
   a. Revising the date of the provision; and
   b. Removing from the introductory text of paragraph (p) “DUNS Number” and adding “unique entity identifier” in its place.

The revision reads as follows:

52.212–3 Offeror Representations and Certifications—Commercial Items.

* * * * *

Offeror Representations and Certifications—Commercial Items (Oct 2016)

* * * * *

24. Amend section 52.212–5 by revising the date of the clause and paragraphs (b)(4), (b)(6), (b)(7), and (b)(17)(i) to read as follows:

52.212–5 Contract Terms and Conditions Required to Implement Statutes or Executive Orders—Commercial Items.

* * * * *

Contract Terms and Conditions Required to Implement Statutes or Executive Orders—Commercial Items (Oct 2016)

* * * * *

25. Amend section 52.213–4 by revising the date of the clause and paragraph (b)(1)(i) to read as follows:

52.213–4 Terms and Conditions—Simplified Acquisitions (Other Than Commercial Items)

* * * * *

Terms and Conditions—Simplified Acquisitions (Other Than Commercial Items) (Oct 2016)

* * * * *

* * * * *

* * * * *

28. Amend section 52.212–3 by—
   a. Removing the date of the provision; and
   b. Removing from the introductory text of paragraph (p) “DUNS Number” and adding “unique entity identifier” in its place.

The revision reads as follows:

52.212–3 Offeror Representations and Certifications—Commercial Items.

* * * * *

Offeror Representations and Certifications—Commercial Items (Oct 2016)

* * * * *

29. Amend section 52.212–5 by revising the date of the clause and paragraphs (b)(4), (b)(6), (b)(7), and (b)(17)(i) to read as follows:

52.212–5 Contract Terms and Conditions Required to Implement Statutes or Executive Orders—Commercial Items.

* * * * *

Contract Terms and Conditions Required to Implement Statutes or Executive Orders—Commercial Items (Oct 2016)

* * * * *

30. Amend section 52.213–4 by revising the date of the clause and paragraph (b)(1)(i) to read as follows:

52.213–4 Terms and Conditions—Simplified Acquisitions (Other Than Commercial Items)

* * * * *

Terms and Conditions—Simplified Acquisitions (Other Than Commercial Items) (Oct 2016)

* * * * *

U.S.C. 6101 note) (Applies to contracts valued at $30,000 or more).

26. Amend section 52.219–9 by—
   a. Revising the section heading;
   b. Revising the date of the clause;
   c. Removing from paragraph (d)(10)(vi) “DUNS number,” and adding “unique entity identifier,” in its place.

   The revisions read as follows:

52.219–9 Small Business Subcontracting Plan.

PART 53—FORMS

53.214 [Amended]
   27. Amend section 53.214 by removing from paragraph (d) “SF 1447 (Rev. 2/2012)” and adding “SF 1447 (Rev. 8/2016)” in its place.

53.215–1 [Amended]
   28. Amend section 53.215–1 by removing from paragraph (e) “OF 307 (9/97)” and adding “OF 307 (Rev. 8/2016)” in its place.

53.236–2 [Amended]
   30. Amend section 53.236–2 by removing from paragraph (b) “SF 330 (Rev. 3/2013)” and adding “SF 330 (Rev. 8/2016)” in its place.

31. Revise section 53.301–294 to read as follows:

BILLING CODE 6820–EP–P
SUBCONTRACTING REPORT FOR INDIVIDUAL CONTRACTS
(See instructions on reverse)

OMB Control Number: 9000-0006
Expiration Date: 2/28/2019

Paperwork Reduction Act Statement - This information collection meets the requirements of 44 USC § 3507, as amended by section 2 of the Paperwork Reduction Act of 1995. You do not need to answer these questions unless we display a valid Office of Management and Budget (OMB) control number. The OMB control number for this collection is 9000-0006. We estimate that it will take 13.5 hours to read the instructions, gather the facts, and answer the questions. Send only comments relating to our time estimate, including suggestions for reducing this burden, or any other aspects of this collection of information to: General Services Administration, Regulatory Secretariat Division (MV/ICB), 1800 F Street, NW, Washington, DC 20405.

STANDARD FORM 294 (REV. 8/2016) PAGE 2
GENERAL INSTRUCTIONS
1. This report is not required for small businesses.
2. This report is not required for commercial items for which a commercial plan has been approved, nor from large businesses in the Department of Defense (DOD) Test Program for Negotiation of Comprehensive Subcontracting plans. The Summary Subcontract Report (SSR) is required for contractors operating under one of these two conditions and should be submitted to the Government in accordance with the instructions on that form.
3. This form collects subcontract award data from prime contractors/subcontractors that: (a) hold one or more contracts over $700,000 (over $1,500,000 for construction of a public facility); and (b) are required to report subcontracts awarded to small business (SB), women-owned small business (WOSB), HUBZone small business (HUBZone SB), veteran-owned small business (VOSB) and service-disabled veteran-owned small business concerns under a subcontracting plan. For the Department of Defense (DOD), the National Aeronautics and Space Administration (NASA), and the Coast Guard, this form also collects subcontract award data for Historically Black Colleges and Universities (HBCUs) and Minority Institutions (Mi)s.
4. This report is required for each contract containing a subcontracting plan and must be submitted to the administrative contracting officer (ACO) or contracting officer (CO) if an ACO is assigned, semi-annually, during contract performance for the periods ended March 31st and September 30th. A separate report is required for each contract at contract completion. Reports are due 30 days after the close of each reporting period unless otherwise directed by the contracting officer. Reports are required when due, regardless of whether there has been any subcontracting activity since the inception of the contract or since the previous report.
5. Only subcontracts involving performance in the United States or its outlying areas should be included in this report with the exception of subcontracts under a contract awarded by the State Department or any other agency that has statutory or regulatory authority to require subcontracting plans for subcontracts performed outside the United States and its outlying areas.
6. Purchases from a corporation, company, or subcontractor that is an affiliate of the prime/subcontractor are not included in this report.
7. Subcontract award data reported on this form by prime contractors/subcontractors shall be limited to awards made to their immediate subcontractors. Credit cannot be taken for awards made to lower tier subcontractors unless you have been designated to receive an SB and SDB credit from an Alaska Native Corporation (ANC) or Indian tribe.
8. FAR 19.703 sets forth the eligibility requirements for participating in the subcontracting program.
9. Actual achievements must be reported on the same basis as the goals set forth in the contract. Examples of goals in the plan do not include indirect and overhead items, the achievements shown on this report should not include them either.

SPECIFIC INSTRUCTIONS
BLOCK 2: For the Contractor Identification Number, enter the unique entity identifier that identifies the specific contractor establishment. If there is no unique entity identifier that identifies the exact name and address entered in Block 1, contact the entity designated at SAM for establishment of the unique entity identifier.

BLOCK 4: Check only one. Note that all subcontract award data reported on this form represents activity since the inception of the contract through the date indicated on this block.

BLOCK 5: Check whether this report is a "Regular," "Final," and/or "Revised" report. A "Final" report should be checked only if the contractor has completed the contract or subcontract reported in Block 7. A "Revised" report is a change to a report previously submitted for the same period.

BLOCK 6: Identify the department or agency administering the majority of subcontracting plans.

BLOCK 7: Indicate whether the reporting contractor is submitting this report as a prime contractor or subcontractor and the prime contract or subcontract number.

BLOCK 8: Enter the name and address of the Federal department or agency awarding the contract or the prime contractor awarding the subcontract.

BLOCK 9: Check the appropriate block to indicate whether indirect costs are included in the dollar amounts in blocks 10a through 18. To ensure comparability between the goal and actual columns, the contractor may include indirect costs in the actual column only if the subcontracting plan included indirect costs in the goal.

BLOCKS 10a through 18: Under "Current Goal," enter the dollar and percent goals in each category (SB, SDB, WOSB, VOSB, service-disabled VOSB, and HUBZone SB) from the subcontracting plan approved for this contract. If the original goals agreed upon at contract award have been revised as a result of contract modifications, enter the original goals in Block 19. The amounts entered in Blocks 10a through 18 should reflect the revised goals. There are no goals for Blocks 17 and 18. Under "Actual Cumulative," enter actual subcontract achievements (dollars and percent) from the inception of the contract through the date of the report shown in Block 4. In cases where indirect costs are included, the amounts should include both direct awards and an appropriate prorated portion of indirect awards. However, the dollar amounts reported under "Actual Cumulative" must be for the same period of time as the dollar amounts shown under "Current Goal." For a contract with options, the current goal should represent the aggregate goal since the inception of the contract. For example, if the contractor is submitting the report during Option 2 of a multiple year contract, the current goal would be the cumulative goal for the base period plus the goal for Option 1 and the goal for Option 2.

BLOCK 10b: Report all subcontracts awarded to SBs including subcontracts to SDBs, WOSBs, VOSBs, service-disabled VOSBs, and HUBZone SDBs. For DOD, NASA, and Coast Guard contracts, include subcontracting awards to HBCUs and Mi's. Include subcontracts awarded to ANCs and Indian tribes that are not small businesses and that are not certified by the SBA as SDBs where you have been designated to receive their SB and SDB credit. Where your company and other companies have been designated by an ANC or Indian tribe to receive SB and SDB credit for a subcontract awarded to the ANC or Indian tribe, report only the portion of the total amount of the subcontract that has been designated to your company.

BLOCK 10c: Report all subcontracts awarded to SBs including subcontracts to SDBs and other-than-SB subcontractors that are not small businesses and that are not certified by the SBA as SDBs where you have been designated to receive their SB and SDB credit. Where your company and other companies have been designated by an ANC or Indian tribe to receive SB and SDB credit for a subcontract awarded to the ANC or Indian tribe, report only the portion of the total amount of the subcontract that has been designated to your company for DOD, NASA, and Coast Guard contracts, and include subcontracting awards to HBCUs and Mi's.

BLOCK 11: Report all subcontracts awarded to SDBs (including WOSBs, VOSBs, service-disabled VOSBs, and HUBZone SDBs). Include subcontracts awarded to ANCs and Indian tribes that have not been certified by SBA as SDBs. Where your company and other companies have been designated by an ANC or Indian tribe to receive their SDB credit for a subcontract awarded to the ANC or Indian tribe, report only the portion of the total amount of the subcontract that has been designated to your company.

BLOCK 12: Report all subcontracts awarded to WOSBs (including SDBs, VOSBs (including service-disabled VOSBs), and HUBZone SDBs that are also WOSBs).

BLOCK 13: (For contracts with DOD, NASA, and Coast Guard) Report all subcontracts with HBCUs/Mi's. Complete the column under "Current Goal" only when the subcontracting plan establishes a goal.

BLOCK 14: Report all subcontracts awarded to HUBZone SBs (including WOSBs, VOSBs (including service-disabled VOSBs), and SDBs that are also HUBZone SDBs).

BLOCK 15: Report all subcontracts awarded to VOSBs (including service-disabled VOSBs (including service-disabled VOSBs, and SDBs that are also VOSBs).

BLOCK 16: Report all subcontracts awarded to service-disabled VOSBs (including SDBs, VOSBs, and HUBZone SDBs that are also service-disabled VOSBs).

BLOCK 17: Report all subcontracts awarded to ANCs and Indian tribes that are reported in Block 11, but have not been certified by SBA as SDBs.
32. Revise section 53.301–330 to read as follows:

ARCHITECT-ENGINEER QUALIFICATIONS

PURPOSE

Federal agencies use this form to obtain information from architect-engineer (A-E) firms about their professional qualifications. Federal agencies select firms for A-E contracts on the basis of professional qualifications as required by 40 U.S.C. chapter 11, Selection of Architects Engineers, and Part 36 of the Federal Acquisition Regulation (FAR).

The Selection of Architects and Engineers statute requires the public announcement of requirements for A-E services (with some exceptions provided by other statutes), and the selection of at least three of the most highly qualified firms based on demonstrated competence and professional qualifications, according to specific criteria published in the announcement.

The Act then requires the negotiation of a contract at a fair and reasonable price starting first with the most highly qualified firm.

The information used to evaluate firms is from this form and other sources, including performance evaluations, any additional data requested by the agency, and interviews with the most highly qualified firms and their references.

GENERAL INSTRUCTIONS

Part I presents the qualifications for a specific contract.

Part II presents the general qualifications of a firm or a specific branch office of a firm. Part II has two uses:

1. An A-E firm may submit Part II to the appropriate central, regional or local office of each Federal agency to be kept on file. A public announcement is not required for certain contracts, and agencies may use Part II as a basis for selecting at least three of the most highly qualified firms for discussions prior to requesting submission of Part I. Firms are encouraged to update Part II on file with agency offices, as appropriate, according to FAR Part 36. If a firm has branch offices, submit a separate Part II for each branch office seeking work.

2. Prepare a separate Part II for each firm that will be part of the team proposed for a specific contract and submitted with Part I. If a firm has branch offices, submit a separate Part II for each branch office that has a key role on the team.

INDIVIDUAL AGENCY INSTRUCTIONS

Individual agencies may supplement these instructions. For example, they may limit the number of projects or number of pages submitted in Part I in response to a public announcement for a particular project. Carefully comply with any agency instructions when preparing and submitting this form. Be as concise as possible and provide only the information requested by the agency.

DEFINITIONS

Architect-Engineer Services: Defined in FAR 2.101.

Branch Office: A geographically distinct place of business or subsidiary office of a firm that has a key role on the team.

Discipline: Primary technical capabilities of key personnel, as evidenced by academic degree, professional registration, certification, and/or extensive experience.

Firm: Defined in FAR 36.102.

Key Personnel: Individuals who will have major contract responsibilities and/or provide unusual or unique expertise.

SPECIFIC INSTRUCTIONS

Part I - Contract-Specific Qualifications

Section A. Contract Information

1. Title and Location. Enter the title and location of the contract for which this form is being submitted, exactly as shown in the public announcement or agency request.

2. Public Notice Date. Enter the posted date of the agency's notice on the Federal Business Opportunity website (FedBizOpps), other form of public announcement or agency request for this contract.

3. Solicitation or Project Number. Enter the agency's solicitation number and/or project number, if applicable, exactly as shown in the public announcement or agency request for this contract.

Section B. Architect-Engineer Point of Contact

4-B Name, Title, Name of Firm, Telephone Number, Fax (Facsimile) Number and E-mail (Electronic Mail) Address. Provide information for a representative of the prime contractor or joint venture that the agency can contact for additional information.
Section C. Proposed Team.

9-11. Firm Name, Address, and Role in This Contract. Provide the contractual relationship, name, full mailing address, and a brief description of the role of each firm that will be involved in performance of this contract. List the prime contractor or joint venture partners first. If a firm has branch offices, indicate each individual branch office that will have a key role on the team. The named subcontractors and outside associates or consultants must be used, and any change must be approved by the contracting officer. (See FAR Part 52 Clause "Subcontractors and Outside Associates and Consultants (Architect-Engineer Services)"). Attach an additional sheet in the same format as Section C if needed.

Section D. Organizational Chart of Proposed Team.

As an attachment after Section C, present an organizational chart of the proposed team showing the names and roles of all key personnel listed in Section E and the firm they are associated with as listed in Section C.

Section E. Resumes of Key Personnel Proposed for this Contract.

Complete this section for each key person who will participate in this contract. Group by firm, with personnel of the prime contractor or joint venture partner firms first. The following blocks must be completed for each resume:

14. Years Experience. Total years of relevant experience (block 14a), and years of relevant experience with current firm, but not necessarily the same branch office (block 14b).

15. Firm Name and Location. Name, city and state of the firm where the person currently works, which must correspond with one of the firms (or branch office of a firm, if appropriate) listed in Section C.

16. Education. Provide information on the highest relevant academic degree(s) received. Indicate the area(s) of specialization for each degree.

17. Current Professional Registration. Provide information on current relevant professional registration(s) in a State or possession of the United States, Puerto Rico, or the District of Columbia according to FAR Part 36.

18. Other Professional Qualifications. Provide information on any other professional qualifications relating to this contract, such as education, professional registration, publications, organizational memberships, certifications, training, awards, and foreign language capabilities.

19. Relevant Projects. Provide information on up to five projects in which the person had a significant role that demonstrates the person's capability relevant to her/his proposed role in this contract. These projects do not necessarily have to be any of the projects presented in Section F for the project team if the person was not involved in any of those projects or the person worked on other projects that were more relevant than the team projects in Section F. Use the check box provided to indicate if the project was performed with any office of the current firm. If any of the professional services or construction projects are not complete, leave Year Completed blank and indicate the status in Brief Description and Specific Role (block 3).

Section F. Example Projects Which Best Illustrate Proposed Team's Qualifications for this Contract.

Select projects where multiple team members worked together, if possible, that demonstrate the team's capability to perform work similar to that required for this contract. Complete one Section F for each project. Present ten projects, unless otherwise specified by the agency. Complete the following blocks for each project:

20. Example Project Key Number. Start with "1" for the first project and number consecutively.

21. Title and Location. Title and location of project or contract. For an indefinite delivery contract, the location is the geographic scope of the contract.

22. Year Completed. Enter the year completed of the professional services (such as planning, engineering study, design, or surveying), and/or the year completed of construction, if applicable. If any of the professional services or the construction projects are not complete, leave Year Completed blank and indicate the status in Brief Description of Project and Relevance to this Contract (block 24).

23a. Project Owner. Project owner or user, such as a government agency or installation, an institution, a corporation or private individual.

23b. Point of Contact Name. Provide name of a person associated with the project owner or the organization which contracted for the professional services, who is very familiar with the project and the firm's (or firms') performance.

23c. Point of Contact Telephone Number. Self-explanatory.

24. Brief Description of Project and Relevance to this Contract. Indicate scope, size, cost, principal elements and special features of the project. Discuss the relevance of the example project to this contract. Enter any other information requested by the agency for each example project.
25. Firms from Section C involved with this Project. Indicate which firms (or branch offices, if appropriate) on the project team were involved in the example project, and their roles. List in the same order as Section C.

Section G. Key Personnel Participation in Example Projects.

This matrix is intended to graphically depict which key personnel identified in Section E worked on the example projects listed in Section F. Complete the following blocks (see example below).

26. and 27. Names of Key Personnel and Role in this Contract. List the names of the key personnel and their proposed roles in this contract in the same order as they appear in Section E.

28. Example Projects Listed in Section F. In the column under each project key number (see block 29) and for each key person, place an "X" under the project key number for participation in the same or similar role.

29. Example Projects Key. List the key numbers and titles of the example projects in the same order as they appear in Section F.

Section H. Additional Information.

30. Use this section to provide additional information specifically requested by the agency or to address selection criteria that are not covered by the information provided in Sections A-G.

Section I. Authorized Representative.

31. and 32. Signature of Authorized Representative and Date. An authorized representative of a joint venture or the prime contractor must sign and date the completed form. Signing attests that the information provided is current and factual, and that all firms on the proposed team agree to work on the project. Joint ventures selected for negotiations must make available a statement of participation by a principal of each member of the joint venture.

33. Name and Title. Self-explanatory.

Part II - General Qualifications

See the "General Instructions" on page 1 for firms with branch offices. Prepare Part II for the specific branch office seeking work if the firm has branch offices.

1. Solicitation Number. If Part II is submitted for a specific contract, insert the agency's solicitation number and/or project number, if applicable, exactly as shown in the public announcement or agency request.

2a-2e. Firm (or Branch Office) Name and Address. Self-explanatory.

3. Year Established. Enter the year the firm (or branch office, if applicable) was established under the current name.

4. Unique Entity Identifier. Insert the unique entity identifier issued by the entity designated at SAM. See FAR part 4.6.

5. Ownership.

a. Type. Enter the type of ownership or legal structure of the firm (sole proprietor, partnership, corporation, joint venture, etc.).

b. Small Business Status. Refer to the North American Industry Classification System (NAICS) code in the public announcement, and indicate if the firm is a small business according to the current size standard for that NAICS code (for example, Engineering Services (part of NAICS 541330), Architectural Services (NAICS 541310), Surveying and Mapping Services (NAICS 541370)). The small business categories and the internet website for the NAICS codes appear in FAR part 19. Contact the requesting agency for any questions. Contact your local U.S. Small Business Administration office for any questions regarding Business Status.

6a-6c. Point of Contact. Provide this information for a representative of the firm that the agency can contact for additional information. The representative must be empowered to speak on contractual and policy matters.

7. Name of Firm. Enter the name of the firm if Part II is prepared for a branch office.

8a-8c. Former Firm Names. Indicate any other previous names for the firm (or branch office) during the last six years. Insert the year that this corporate name change was effective and the associated unique entity identifier. This information is used to review past performance on Federal contracts.

9. Employees by Discipline. Use the relevant disciplines and associated function codes shown at the end of these instructions and list in the same numerical order. After the listed disciplines, write in any additional disciplines and leave the function code blank. List no more than 20 disciplines. Group remaining employees under "Other Employees" in column b. Each person can be counted only once according to his/her primary function. If Part II is prepared for a firm (including all branch offices), enter the number of employees by disciplines in column c(1). If Part II is prepared for a branch office, enter the number of employees by discipline in column c(2) and for the firm in column c(1).

10. Profile of Firm's Experience and Annual Average Revenue for Last 5 Years. Complete this block for the firm or branch office for which this Part II is prepared. Enter the experience categories which most accurately reflect the firm's technical capabilities and project experience. Use the relevant experience categories and associated profile codes shown at the end of these instructions, and list in the same numerical order. After the listed experience categories, write in any unlisted relevant project experience categories and leave the profile codes blank. For each type of experience, enter the appropriate revenue index number to reflect the professional services received annually (averaged over the last 5 years) by the firm or branch office for performing that type of work. A particular project may be identified with one experience category or it may be broken into components, as best reflects the capabilities and types of work performed by the firm. However, do not double count the revenues received on a particular project.

11. Annual Average Professional Services Revenues of Firm for Last 3 Years. Complete this block for the firm or branch office for which this Part II is prepared. Enter the appropriate revenue index numbers to reflect the professional services revenues received annually (averaged over the last 3 years) by the firm or branch office. Indicate Federal work (performed directly for the Federal Government, either as the prime contractor or subcontractor), non-Federal work (all other domestic and foreign work, including Federally-assisted projects), and the total. If the firm has been in existence for less than 3 years, see the definition for "Annual Receipts" under FAR 19.101.

12. Authorized Representative. An authorized representative of the firm or branch office must sign and date the completed form. Signing attests that the information provided is current and factual. Provide the name and title of the authorized representative who signed the form.

**STANDARD FORM 1447 (REV. 8/2016)**

Prescribed by GSA - FAR (48 CFR) 52.214(d)
34. Revise section 53.302–307 to read as follows:

53.302–307 Optional Form 307, Contract Award.
DEPARTMENT OF DEFENSE
GENERAL SERVICES ADMINISTRATION

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

48 CFR Parts 2, 5, 7, 8, 10, 12, 15, 16, 19, and 52

[FR Doc. 2016–23198 Filed 9–29–16; 8:45 am]
BILLING CODE 6820–EP–C

A. Summary of Significant Changes

This final rule makes the following significant changes from the proposed rule:
• FAR 2.101—Amends the definition of “Small Business Teaming Arrangement” to note the differences applicable to DoD because of the DoD Pilot Mentor-Protégé Program. A similar change is made at FAR 52.207–6.
• FAR 7.104(d)—Amends the conditions under which the small business specialist must notify the agency Office of Small and Disadvantaged Business Utilization or the Office of Small Business Programs to be consistent with 13 CFR 125.2(c)(4)(ii).
• FAR 7.105(b)(1)(iv)—The second sentence no longer mentions consolidation since SBA’s implementing rule does not require the identification of incumbent contractors and contracts affected by the consolidation.
• FAR 7.107–1(b)—Adds an exception for acquisitions from a mandatory source to the requirements at FAR 7.107 for acquisitions involving consolidation, bundling, or substantial bundling.
• FAR 7.107–1—The coverage formerly at FAR 7.107–1 on necessary and justified bundling for consolidation and bundling has been separated and moved to 7.107–2 and 7.107–3, due to differences in the statutory and regulatory requirements.
• FAR 7.107–2(e)—Provides procedures for consolidation corresponding to those for bundling at FAR 7.107–3(c)(now at 7.107–3(f)), to address the determination that consolidation is necessary and justified when the expected benefits do not meet the quantifiable dollar thresholds for a substantial benefit but are critical to the agency’s mission success.
• FAR 7.107–5(c)—Removes the phrase “(even if additional requirements have been added or some have been deleted)” and adds a subparagraph (4) which requires that the notice to SBA include a list of requirements that have been added or deleted for the follow-on bundled or consolidated procurement.

II. Discussion and Analysis

The Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (the Councils) reviewed the comments in the development of the final rule. A discussion of the comments and the changes made to the rule as a result of those comments are provided as follows:

A. Support for the Rule

Comment: One respondent expressed general support for the rule and that the proposed changes are positive which will provide much needed transparency and ensure that unnecessary and unjustified bundling do not become the contracting standard.

Response: Noted.

B. Experiences With Consolidation

Comment: Two respondents commented on their experience with consolidation and/or bundling: the adverse impact on small businesses’ ability to compete in this environment; and expressed, had this rule been in effect, their experience very likely could have been different.

Response: Noted.

C. Need for Table of Thresholds

Comment: One respondent requested that a table of dollar thresholds may be useful to clarify the differences between consolidation and bundling.

Response: With regard to the use of a table to clarify the differing dollar thresholds associated with these terms, the preferred approach is to provide the guidance for processing a consolidated or bundled requirement in the area of the FAR where the respective subject matter is addressed. For example, the dollar threshold for triggering the Senior Procurement Executive’s or Chief Acquisition Officer’s determination of necessary and justified consolidation is discussed in the area of the FAR, 7.107–2, which addresses consolidation. Similarly, the dollar thresholds for substantial bundling and the attendant requirements for processing these acquisitions are provided at FAR 7.107–4. The FAR is arranged in this manner to allow contracting officers to quickly turn to the area of the FAR where the requisite guidance needed for their given situation is provided.
d. Mixing of Consolidation and Bundling

Comment: Three respondents commented that the rule appeared to incorrectly or unnecessarily use the terms consolidation and bundling synonymously, by applying the same requirements to both. The respondents identified the following areas in the rule where they believed that this occurred:

○ FAR 7.103(u)(2). This paragraph currently urges acquisition planners to avoid unnecessary and unjustified bundling that precludes participation of small business as prime contractors. The rule proposes that planners also avoid unnecessary and unjustified consolidation. One respondent believes that a consolidation that precludes participation of small business as the prime would automatically be bundling and as such, the rule is proposing an unnecessary change.

○ FAR 7.104(d). This paragraph currently requires coordination with the small business specialist when an acquisition meets the dollar thresholds for substantial bundling, unless the acquisition is set aside for small business. The small business specialist is required to notify the agency’s small business office (e.g., Office of Small and Disadvantaged Business Utilization) when the acquisition involves unjustified or unnecessary bundling or is not identified as bundling. The rule proposes to also require notification when the acquisition involves unjustified or unnecessary consolidation or is not identified as consolidation. It was pointed out that the coordination exemption for set-asides conflicts with the proposed notification requirement in cases where consolidation results in a small business set-aside because the small business specialist would not be coordinated with in such cases so they would not be able to provide the notification.

○ FAR 7.105(b)(1)(iv). The rule proposes to require that for consolidated contract requirements, the acquisition plan identify the incumbent contractors and contracts affected by the consolidation. The FAR currently only requires this for bundled contract requirements. One respondent stated the proposed additional burden could result in listing thousands of contracts for a strategic sourcing acquisition and that there is no statutory requirement for said identification.

○ FAR 7.107–1. This subsection provides guidance on how consolidation and bundling could be determined necessary and justified. One respondent asked why the same requirements have to be met for both consolidation and bundling.

○ FAR 7.107–2(a). One respondent asked why there is a requirement for coordination with the Office of Small and Disadvantaged Business Utilization (OSDBU) and/or a negative impact analysis on small businesses for consolidation if the consolidation results in a small business set-aside. The respondent believes that if the acquisition is not set aside then it would automatically be bundling and that bundling has the same justification process as consolidation.

○ FAR 7.107–5. One respondent pointed out that this subsection starts out talking about bundling then in paragraph (c) mixes in consolidated requirements, which the respondent believes is mixing two completely different situations that are not synonymous.

○ FAR 15.034(c). The rule proposes to require that there be evaluation factors related to a small business subcontracting plan for consolidated requirements. Currently, the FAR only requires this for bundling. Two respondents pointed out that if a consolidated requirement is set aside for small business, a small business subcontracting plan would not be required.

Response: The Councils reviewed the areas of the rule identified by the respondents to ensure that the appropriate requirements were being applied to consolidation. The final rule has been revised at—

• FAR 7.104(d) to remove “consolidation” in several places from the conditions under which the small business specialist must notify the agency Office of Small and Disadvantaged Business Utilization or the Office of Small Business Programs to be consistent with 13 CFR 125.2(c)(4)(ii); and
• FAR 7.105(b)(1)(iv) to no longer mention consolidation in the second sentence, since sections 1312 and 1313 of the Small Business Jobs Act and SBA’s implementing regulations at 13 CFR 125.2 do not require the small business identification of incumbent contractors for consolidated requirements.

The final rule has also been revised at FAR 15.034(c) to clarify that consolidated requirements which are set aside for small business will not be required to use the small business subcontracting-related evaluation factors. While SBA’s regulations at 13 CFR 125.2(d)(4) require small business subcontracting plan-related evaluation factors be used for all consolidated acquisitions, implementing this requirement in the FAR would be problematic. Because FAR 15.035(a)(5) requires that small business offerors get the highest rating for these factors, every offeror would receive the same rating for such factors in the scenario where a consolidated acquisition is set aside for small business, which would make use of such evaluation factors conflict with FAR 15.034(b)(2), which requires that evaluation factors support meaningful comparison and discrimination between and among competing proposals.

The final rule retains the proposed changes (with some further edits) to FAR 7.103(u)(2), 7.104(d), 7.107–1, 7.107–2, 7.107–5, and 19.202–1 as those changes are consistent with sections 1312 and 1313 of the Small Business Jobs Act and SBA’s implementing regulations at 13 CFR 125.2. The Councils note that the rule does not have a requirement for a 30-day notification to incumbent small business contractors for consolidated requirements, as one respondent stated, nor does the rule automatically define a consolidated requirement that is not set aside for small business as bundling.

2. Applicability

a. AbilityOne

Comment: One respondent asked whether the requirements for consolidation are necessary for acquisition of services from the Procurement List maintained by the Committee for Purchase From People Who Are Blind or Severely Disabled (also known as the AbilityOne Commission), which is considered a mandatory source in accordance with FAR 8.002. The respondent requested the rule clarify how the mandatory sources relate to the consolidation requirements at FAR 7.107–2.

Response: For requirements that are on the Procurement List, the required source(s) to fulfill that work are already designated by the U.S. AbilityOne Commission. There would be no potential impact on small business participation or even on AbilityOne nonprofit agency participation if multiple Procurement List requirements are consolidated, because the sources will remain the same in accordance...
with those listed on the Procurement List. For that reason, it would not be necessary to engage in the market research or analysis required in FAR 7.107–1 and 7.107–2 if the potential consolidation only involves required sources of supply and services such as requirements on the Procurement List. This same rationale applies to acquisitions from other mandatory sources. Therefore, the final rule has been revised at 7.107–1 to clarify that the consolidation and bundling requirements at 7.107 do not apply to acquisitions for which there are mandatory sources pursuant to FAR 8.002, “Priorities for use of mandatory Government sources,” or FAR 8.003, “Use of other mandatory sources.” The purpose of section 1313 of the Small Business Jobs Act was to limit the use of contract consolidation because of the anticipated negative impact of such an acquisition strategy on small business. However, requirements for which there is a mandatory source are not available to small business and as such, consolidation would result in no impact to small business, negative or positive. Further, neither 41 U.S.C. 8504 (the statutory authority behind the AbilityOne Program) nor 18 U.S.C. 4124(a) (another mandatory source—Federal Prison Industries) requires consolidation analyses for acquisitions done under their programs. Since application of the consolidation requirements would only create burden for the acquisition process and no benefit to small business, the Councils have determined, as a way of harmonizing different statutes, to exempt those consolidated contracts that can be met through one of the mandatory sources identified in FAR 8.002 or 8.003.

b. Blanket Purchase Agreements (BPAs)

Comment: One respondent recommended changes to multiple parts of the FAR in order to apply the bundling and consolidation analysis requirements to BPAs, especially Federal Supply Schedule (FSS) BPAs. The recommendation was based on the respondent’s assumption that the Councils did not intend to exclude BPAs from bundling or consolidation analysis. The respondent requested that if the recommended changes were not made, that the final rule should address the applicability of bundling and consolidation requirements to BPAs.

Response: The statutory definition of “bundling of contract requirements” at paragraph (o) of 15 U.S.C. 657q, Consolidation of contract requirements, and SBA’s implementing regulations at 13 CFR 125.1(c) and (e), only mention “contract” in terms of bundling and consolidation. BPAs are not contracts and therefore neither statute nor the implementing regulations apply the consolidation and bundling analysis requirements to them; however, orders under BPAs are treated as contracts in SBA’s regulations at 13 CFR 125.1(d). The FAR definitions of “consolidation” and “bundling” apply to task or delivery orders, including those issued under BPAs.

c. 8(a)

Comment: One respondent requested that the requirement for a consolidation determination and findings (D&F) be waived for consolidation affecting or relating to sole source awards under the 8(a) program, due to concerns over potentially longer procurement lead times. Moreover, the respondent suggested that the requirement for a consolidation D&F conflicts FAR 6.302–5(b)(4) and the intent of paragraph 8(a) of the Small Business Act.

Response: Neither the statute nor SBA’s final rule waived or exempted consolidations under or relating to the 8(a) Program; therefore, the new requirement is, in fact, applicable to all consolidations with an estimated total dollar value exceeding $2 million, even those where the new consolidated award will be made via sole source contract under the 8(a) Program.

3. Definitions

a. “Acquisition Planning Team” and “Planner”

Comment: One respondent requested definitions of “acquisition planning team” and “planner,” in relation to the requirement at FAR 7.104 that small business is to be a discipline that is represented on the acquisition planning team.

Response: These are not new terms introduced to the FAR by this rule. “Planner” is currently defined at FAR 7.101 to mean the designated person or the office responsible for developing and maintaining a written plan, or for the planning function in those acquisitions not requiring a written plan.

“Acquisition planning” is defined in FAR 2.101. FAR 7.104 addresses the composition of the acquisition planning team, i.e., the planner shall form a team consisting of all those who will be responsible for significant aspects of the acquisition, such as contracting, fiscal, legal, and technical personnel. This rule adds small business personnel to this list of functional experts that comprise the acquisition planning team.

b. “Bundling” and “Consolidation”

Comment: One respondent finds the definitions of “bundling” and “consolidation” useful to clearly set forth the requirements.

Response: Noted.

Comment: One respondent was concerned whether the statement in the definition of “bundling or bundled contract” that “this definition does not apply to contracts that will be awarded and performed entirely outside the United States” was intended to limit the applicability of the rule based on where the contract will be awarded and performed.

Response: This issue will be considered under FAR case 2016–002, Applicability of Small Business Regulations Outside the United States.

4. Acquisition Planning (FAR 7.104 and 7.105)

Comment: With regard to the clarification at FAR 7.104(a) that small business is to be a discipline that is represented in the acquisition planning team, one respondent stated that SBA will be working with at least a DD Form 2579 on most actions, so depending on the dollar amount is that sufficient? The respondent questioned the formality of the SBA involvement.

Response: The small business specialist on the acquisition planning team will probably be a representative of the agency small business office, not the SBA. The SBA will be working with, at a minimum, a DoD Form 2579, Small Business Coordination Record, or equivalent when reviewing acquisitions for consolidation or bundling. Currently, SBA’s regulations at 13 CFR 125.2(c)(1)(v) require that an agency must notify the SBA within 30 days prior to the issuance for a bundled or consolidated contract and also requires that the DoD Form 2579 or
The formality of SBA’s involvement is expanded upon by FAR 19.202–
1(0)(1)(iii), which further requires agencies to provide a copy of the acquisition package to the SBA procurement center representative if the proposed requirement is for a bundled requirement. This acquisition package includes “all information relative to the justification of contract bundling, including the acquisition plan or strategy.” This rule also requires this information for consolidation. If the acquisition involves substantial bundling, the agency must provide the requirements listed at FAR 7.107(e), moved in the final rule to 7.107–4.

Comment: One respondent commented that the thresholds proposed in FAR 7.104(d) for consultation with the cognizant small business specialist should be compared to current FAR or Defense Federal Acquisition Regulation Supplement (DFARS) thresholds for such review. The respondent was concerned that these thresholds would likely result in a much larger workload that should be coordinated with SBA.

Response: The requirements to coordinate with the small business specialist when a requirement meets the thresholds for substantial bundling already exist in the current FAR at 7.104(d)(1). The thresholds currently listed in FAR 7.104(d)(2)(i) still exist and are the thresholds used to differentiate “bundling” from “substantial bundling”. However, FAR 7.104 is being amended to remove the substantial bundling thresholds, which will be relocated in a new section, FAR 7.107–4 for clarity and consistency purposes. Therefore, there is no increase in workload for the small business specialists due to the threshold.

Comment: One respondent stated that most FAR/DFARS language speaks to acquisition planning and not strategies.

Response: Acquisition strategies are heavily considered in both the FAR and DFARS. As stated in the acquisition planning definition at FAR 2.101, acquisition planning includes developing the overall strategy for managing the acquisition. FAR 7.107–3(f)(2) in the final rule (formerly FAR 7.107(c)(2)) indicates that the acquisition strategy must provide for maximum practicable participation by small business concerns. FAR 7.107–4(b) in the final rule (formerly FAR 7.107(e)) goes further and describes additional elements for the acquisition strategy when there is substantial bundling.

5. Additional Requirements—
Consolidation, Bundling, or Substantial Bundling (FAR 7.107)

a. General Requirements (FAR 7.107–1)

Comment: One respondent acknowledged numerous benefits to the rule and how it will standardize the management of requirements bundling across Government agencies. This standardized approach was noted to provide more visibility into Government contracting. The respondent additionally lauded FAR 7.107–1(b) for its identification of the possible benefits that may be attained from bundling or consolidation such as cost savings; price-reduction; quality improvements, etc. Furthermore, the respondent supported the thresholds in the rule for the Government to use to substantiate the benefits of bundling or consolidation including the threshold in FAR 7.107–1(e) requiring cost savings based on administrative or personnel costs must be at least 10 percent to prevent potential misleading justifications about administrative costs.

Response: Noted.

Comment: One respondent commented on the appropriateness of the Senior Procurement Executive (SPE) or Chief Acquisition Officer (CAO) making the determination of cost savings of consolidated requirements. Of particular concern, the respondent felt the determination should be the responsibility of the customer/requirements owner.

Response: Generally, FAR determinations that pertain to the acquisition process are made by acquisition professionals (e.g., CAO, SPE, contracting officer, etc.). Paragraph (c)(2)(B) of 15 U.S.C. 657q.

Consolidation of contract requirements, requires the determination of cost savings under a consolidated requirement be made by the SPE or CAO. The language used in the rule provides flexibility as to who would actually write or provide any supporting document as the SPE or CAO are only required to make the determination.

Comment: One respondent commented that Government agencies are required to meet 10 percent savings requirement for consolidation, even though they are potentially still setting aside for small businesses. If they cannot meet that savings objective then they cannot consolidate requirements and therefore cannot save the taxpayer money. This requirement will also cause the Government to expend its needed resources in order to ensure enough personnel to provide proper oversight of multiple orders.

Response: The Councils reviewed the comment and have included in FAR 7.107–2(e) the similar authority contained in the final rule for FAR 7.107–3(f), which allows specific senior officials under certain circumstances to determine that consolidation is necessary and justified, even though expected benefits do not meet the quantifiable dollar thresholds for a substantial benefit. Section 1313 provides that a SPE or CAO may determine that an acquisition strategy involving consolidation is necessary and justified if the benefits of the acquisition strategy substantially exceed the benefits of each of the possible alternative contracting approaches identified that would involve a lesser degree of consolidation. In the preamble to the SBA final rule, SBA indicated (published in the Federal Register at 78 FR 61120) that since the Small Business Jobs Act does not define the terms “substantially exceed” or “benefits” for contractual consolidation, SBA used the definitions for those terms currently set forth in the bundling regulations in 13 CFR 125. Therefore, it is reasonable, in implementation of these thresholds in the FAR, to provide the same procedures set forth at 13 CFR 125.2(d)(2)(ii) with regard to the authority to make a determination that consolidation is necessary and justified even though the benefits do not meet the thresholds for substantial benefits, but in the aggregate are critical to the agency’s mission success.

b. Consolidation (FAR 7.107–2)

Comment: One respondent discussed the consolidation of contract requirements specified at FAR 7.107–2 and expressed that the $2 million dollar threshold which would require a justification is adequate, without being overly burdensome. Additionally, the respondent commented that the review process and the impact analysis on small businesses when contract consolidation is being contemplated are preventive measures to ensure consolidation is justified.

Response: Noted.

c. Bundling (FAR 7.107–3)

Comment: One respondent recommended additional guidance to be provided to clarify the term “measurably substantial” when agencies are quantifying specific benefits to be achieved from bundling. FAR 7.107–3(b) requires an agency to quantify the specific benefits identified through market research and other techniques to explain how their impact would be measurably substantial (see 10.001(a)(2)(iv) and (a)(3)(vii)).
The respondent is also concerned that after market analysis and cost analysis is complete, if the benefits do not meet the thresholds for a substantial benefit, the military service acquisition executive, Deputy Secretary, or equivalent position may still determine that bundling is necessary and justified. The respondent is concerned that this section could convert itself to a catch-all for any acquisition that does not meet the requirements but the Agency still feels compelled to bundle.

Response: The SBA regulations at 13 CFR 125.2(d)(2)(iii) require the benefits to be measurably substantial in order for the bundling to be necessary and justified. This requirement is implemented at FAR 7.107–3(a).

Benefits of bundling are measurably substantial if individually, in combination, or in the aggregate the anticipated financial benefits are equivalent to—

(1) Ten percent of the estimated contract or order value (including options) if the value is $94 million or less; or

(2) Five percent of the estimated contract or order value (including options) or $9.4 million, whichever is greater, if the value exceeds $94 million.

The final rule now incorporates at FAR 7.107–3(d) the discussion of substantial benefits that was located at FAR 7.107–1(d). The benefits are measurably substantial when the agency can quantify the specific benefits identified through the use of market research and other techniques.

If the thresholds are not met, FAR 7.107–3(f) requires a high level determination, without power of delegation, that the expected benefits are critical for the agency’s mission success, and that the acquisition strategy provides for maximum practicable participation by small business concerns. These protections are sufficient to ensure that agencies are not able to use this exception as a catch-all for acquisitions that do not meet the requirements.

d. Substantial Bundling (FAR 7.107–4)

Comment: One respondent found the separate definition and discussion on substantial bundling at FAR 7.107–4 to be helpful as it sets forth and distinguishes the requirements of substantial bundling from consolidation and bundling (FAR 7.107–2 and 7.107–3, respectively). The respondent further commented that the documentation requirements of specific benefits to be derived from substantial bundling are a positive protection for small businesses.

Response: Noted.

6. Notification (FAR 7.107–5)

a. Notification to Small Businesses

Comment: Two respondents commented on the requirements at FAR 7.107–5(a) to notify each small business performing a contract that it intends to bundle the requirement with one or more other requirements at least 30 days prior to the issuance of the solicitation for the bundled requirement. Both respondents considered that the 30 day time period was insufficient. One respondent stated that the Government must know this far in advance of 30 days. The other respondent noted that 30 days does not provide adequate time for the small business to coordinate with the designated SBA Procurement Center representative or designated contact. The respondent suggested at least 45 calendar days.

One respondent asked what the documentation requirements are for this in the contract file.

Response: This final rule implements the SBA regulations (see 13 CFR 125.2(d)(5)), which specify a time period of at least 30 days prior to the issuance of the solicitation. Those regulations and FAR 7.107–5(a)(3) require documentation of the notification in the contract file. The contracting officer has discretion on how best to document the contract file.

b. Notification to the Public

Two respondents commented on the requirement at FAR 7.107–5(b) that the agency notify the public of the rationale for a bundled requirement, via the agency’s Web site.

Comment: One respondent asked whether this reporting duty can be delegated to the chief acquisition executive/senior procurement executive or head of the contracting activity.

Response: The statute requires the head of the agency to post this information to the agency Web site, but does not prohibit redelegation. FAR 1.108(b) states that each authority is delegable unless specifically stated otherwise. Therefore, the actual posting can be delegated to an appropriate level within the agency.

Comment: Another respondent supported the proposed amendments to require publication on the Web site but noted that the requirement was only mandatory for any bundled requirements for which the agency has solicited offers or issued an award, whereas the agency is only encouraged to provide notification to FedBizOpps before the issuance of the solicitation.

The other respondent recommended that this presolicitation notification to the public should be mandatory.

Response: This FAR rule is implementing the SBA regulations at 13 CFR 125.2(d)(6) and the statute, which mandate publication of bundled requirements on agency Web sites on an annual basis. The SBA regulations only encourage providing such notification before issuance of the solicitation, and do not specify FedBizOpps or any particular Web site as the location of such posting.

c. Notification to SBA

Comment: One respondent commented that the requirement to notify SBA of each follow-on bundled or consolidated contract will provide more complete data regarding whether consolidation or bundling actually was a positive outcome for the agency. According to the respondent, including the historical data of the amount of savings and benefits that resulted from the consolidation or bundling and then comparing it to whether such benefits will continue in a follow-on contract will provide an excellent opportunity for analysis.

Response: Noted.

7. Provision (FAR 52.207–6)

Comment: One respondent requested information on the provision in the proposed rule to be included in each solicitation for any multiple-award contract above the substantial bundling threshold. The respondent had concerns that this rule appeared to indicate that the normal requirement is to set up multiple-award contracts only for large business and overlooks the process for set-aside contracts. This respondent suggested that the provision should provide for a higher evaluation of a large business teaming with a small business, or if it has a substantial small business subcontracting plan.

Response: The provision at FAR 52.207–6 is required by section 1312(a) of the Small Business Jobs Act of 2010 and the SBA regulations. The statute requires “a provision soliciting bids from any responsible source, including responsible small business concerns and teams or joint ventures of small business concerns.”

C. Other Changes

At FAR 2.101 and in the clause at 52.207–6, the definition of “Small Business Teaming Arrangement” has been amended to add a subparagraph in paragraph (2) to explain that for DoD, a Small Business Teaming Arrangement may include two business concerns in a mentor-protégé relationship in the Department of Defense Pilot Mentor-Protégé Program (see section 831 of the National Defense Authorization Act for
Fiscal Year 1991 (Pub. L. 101–510; 10 U.S.C. 2302 note) only so long as both the mentor and the protégé are small. There is no exception to joint venture size affiliation for offers received from Small Business Teaming Arrangements under the Department of Defense Pilot Mentor-Protégé Program. In addition, a clarification is added in paragraph (3) of the definition, that this exception to affiliation applies in the case of a solicitation of offers for a bundled contract with a reserve (as stated at 13 CFR 121.103(b)(9)).

The definition of “Bundling” at FAR 2.101 has been amended for clarity and to remove the proposed reference to the description of substantial bundling in part 7. The definition of “Consolidation” has been amended to remove redundant terms. The phrase “contract requirements” is removed for clarity wherever it is associated with bundling and consolidation in the final rule, since bundling and consolidation apply to orders as well as contracts.

For consistency, the final rule amends the text at FAR 5.205(g) to reflect the specific text at FAR 7.107–5(b)(2), instead of paraphrasing.

The final rule contains a number of editorial corrections to the cross-reference at FAR 7.107–3(b).

At FAR 7.107–3(f), the identification of officials authorized to make the determination in the Department of Defense that bundling is necessary and justified, even if the anticipated savings do not meet the specified thresholds, has been amended to more closely reflect the SBA regulation at 13 CFR 125.2(d)(2)(iii).

At FAR 7.107–4(a)(1), the final rule adds language which conforms to other proposed changes for subpart 7.1, which consists of spelling out “task order or delivery order” whenever talking about requirements associated with bundling or consolidation. The use of this distinct terminology is due to FAR subpart 7.1 already having a definition for “order” which does not accurately describe the orders to which bundling and consolidation requirements apply. Consequently, because there is no conflicting definition of “order” in FAR subparts 8.4 or 16.5, the final rule has been amended to remove the proposed use of the distinct terminology in those subparts.

The final rule contains a number of editorial changes such as the addition of cross-references in FAR 7.107–2, 7.107–3, and 7.107–6, removal of redundant text in 7.107–5(a), and the deletion of “significant” from 19.201(c)(5)(i) as there is no definition for “significant bundling”.

III. Applicability to Commercial Items, Including Commercially Available Off-the-Shelf (COTS) Items

This rule creates provision FAR 52.207–6, Solicitation of Offers from Small Business Concerns and Small Business Teaming Arrangements or Joint Ventures (Multiple-Award Contracts), in order to implement paragraph (a) of section 1312 of the Small Business Jobs Act of 2010. This paragraph concerns 15 U.S.C. 644, Awards or Contracts, and therefore applies as a matter of law to COTS items. The Federal Acquisition Regulatory Council, pursuant to the authority granted in 41 U.S.C. 1906, List of laws inapplicable to procurements of commercial items, and the Administrator for Federal Procurement Policy, pursuant to the authority granted in 41 U.S.C. 1907, List of laws inapplicable to procurements of commercially available off-the-shelf items, have determined that it would not be in the best interest of the Federal Government to exempt solicitations for the acquisition of commercial items from the applicability of paragraph (a) of section 1312, entitled “Leadership and Oversight,” of the Small Business Jobs Act, or to exempt solicitations for the acquisition of commercial items or for COTS from the applicability of paragraph (a) of section 1313, entitled “Consolidation of Contract Requirements”. The FAR provision 52.207–6, Solicitation of Offers from Small Business Concerns and Small Business Teaming Arrangements or Joint Ventures (Multiple-Award Contracts), has been written so that the application of the provision is carefully tailored, consistent with the statute. The provision is a notice to offerors that imposes no burdens, but simply encourages small business concerns and small business teaming arrangements or joint ventures of small business concerns to submit offers on multiple-award contracts above the substantial bundling threshold of the Federal agency. Therefore, the potential benefits to small business entities outweigh any potential drawback of application to acquisitions of commercial items.

The consolidation requirements of section 1313 should apply to all contracts and subcontracts above the threshold(s) specified in the statute, including contracts and subcontracts for the acquisition of commercial items and COTS. The statute requires agencies to ensure increased consideration of small businesses in connection with the establishment of multiple-award contracts and acquisitions that consolidate contracts. Not applying these requirements to the maximum extent possible would exclude a significant number of acquisitions which would not help to protect the interests of small businesses and boost their opportunities in the Federal marketplace. Not applying the consolidation requirements to the acquisition of commercial items or COTS would limit the full implementation of the Small Business Jobs Act of 2010. For all of these reasons, it is in the best interest of the Federal Government to apply the consolidation requirements to all contracts and subcontracts above the threshold(s) specified in the statute.

IV. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is a significant regulatory action and, therefore, was subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

V. Regulatory Flexibility Act

DoD, GSA, and NASA have prepared a Final Regulatory Flexibility Analysis (FRFA) consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. The FRFA is summarized as follows:

The final rule amends the FAR to provide uniform guidance on consolidation and bundling consistent with SBA’s final rule which was published in the Federal Register at 78 FR 61113 on October 2, 2013, which implements Sections 1312 and 1313 of the Small Business Jobs Act of 2010 (Pub. L. 112–240) and section 1671 of Pub. L. 112–239.

The rule requires the head of the agency to publish on the agency Web site a list and rationale for bundled contracts; requires solicitation for multiple-award contracts above the substantial bundling threshold to include a provision soliciting bids from any responsible source; requires agencies to publish bundling policy on agency Web site; provides for a definition of “consolidation;” and, prohibits an agency from carrying out consolidation of requirements over $2 million until certain actions are taken.

The objective of this rule is to alleviate the adverse effects of contract bundling and consolidation on small business concerns competing for Federal contracts. This rule
provides a balance between the benefits of bundling and consolidation and the obstacles they create for small businesses.

There were no significant issues raised by the public in response to the initial Regulatory Flexibility Analysis provided in the proposed rule.

This rule may have a positive economic impact on any small business entity that wishes to participate in the Federal procurement arena. Analysis of the SAM database indicates there are currently approximately 307,846 small business registrants that can potentially benefit from the implementation of this rule. This rule does not impose any new reporting, recordkeeping or other compliance requirements.

Interested parties may obtain a copy of the FRFA from the Regulatory Secretariat. The Regulatory Secretariat has submitted a copy of the FRFA to the Chief Counsel for Advocacy of the Small Business Administration.

VI. Paperwork Reduction Act

The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35).

List of Subjects in 48 CFR Parts 2, 5, 7, 8, 10, 12, 15, 16, 19, and 52

Government procurement.

Dated: September 19, 2016.

William F. Clark,
Director, Office of Government-wide Acquisition Policy; Office of Acquisition Policy; Office of Government-wide Policy.

Therefore, DoD, GSA, and NASA amend 48 CFR parts 2, 5, 7, 8, 10, 12, 15, 16, 19, and 52 as set forth below:

1. The authority citation for 48 CFR parts 2, 5, 7, 8, 10, 12, 15, 16, 19, and 52 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

PART 2—DEFINITIONS OF WORDS AND TERMS

2. Amend section 2.101, in paragraph (b)(2) by—

a. Removing the definition “Bundled contract”;

b. Revising the definition “Bundling”; and

c. Adding, in alphabetical order, the definitions “Consolidation, or consolidated requirement” and “Small Business Teaming Arrangement”.

The revision and additions read as follows:

2.101 Definitions.

Bundling—

(1) Means a subset of consolidation that combines two or more requirements for supplies or services, previously provided or performed under separate smaller contracts (see paragraph (2) of this definition), into a solicitation for a single contract, a multiple-award contract, or a task or delivery order that is likely to be unsuitable for award to a small business concern (even if it is suitable for award to a small business with a Small Business Teaming Arrangement) due to—

(i) The diversity, size, or specialized nature of the elements of the performance specified;

(ii) The aggregate dollar value of the anticipated award;

(iii) The geographical dispersion of the contract performance sites; or

(iv) Any combination of the factors described in paragraphs (1)(i), (ii), and (iii) of this definition.

(2) “Separate smaller contract” as used in this definition, means a contract that has been performed by one or more small business concerns or that was suitable for award to one or more small business concerns.

(3) This definition does not apply to a contract that will be awarded and performed entirely outside of the United States.

Consolidation or consolidated requirement—

(1) Means a solicitation for a single contract, a multiple-award contract, a task order, or a delivery order to satisfy—

(i) Two or more requirements of the Federal agency for supplies or services that have been provided to or performed for the Federal agency under two or more separate contracts, each of which was lower in cost than the total cost of the contract for which offers are solicited; or

(ii) Requirements of the Federal agency for construction projects to be performed at two or more discrete sites.

(2) Separate contract as used in this definition, means a contract that has been performed by any business, including small and other than small business concerns.

Small Business Teaming Arrangement—

(1) Means an arrangement where—

(i) Two or more small business concerns have formed a joint venture; or

(ii) A small business offeror agrees with one or more other small business concerns to have them act as its subcontractors under a specified Government contract. A Small Business Teaming Arrangement between the offeror and its small business subcontractor(s) exists through a written agreement between the parties that—

(A) Is specifically referred to as a “Small Business Teaming Arrangement”; and

(B) Sets forth the different responsibilities, roles, and percentages (or other allocations) of work as it relates to the acquisition;

(2)(i) For civilian agencies, may include two business concerns in a mentor-protégé relationship when both the mentor and the protégé are small or the protégé is small and the concerns have received an exception to affiliation pursuant to 13 CFR 121.103(h)(3)(ii) or (iii).

(ii) For DoD, may include two business concerns in a mentor-protégé relationship in the Department of Defense Pilot Mentor-Protégé Program (see section 831 of the National Defense Authorization Act for Fiscal Year 1991 (Pub. L. 101–510; 10 U.S.C. 2302 note)) when both the mentor and the protégé are small. There is no exception to joint venture size affiliation for offers received from teaming arrangements under the Department of Defense Pilot Mentor-Protégé Program; and

(3) See 13 CFR 121.103(b)(9) regarding the exception to affiliation for offers received from Small Business Teaming Arrangements in the case of a solicitation of offers for a bundled contract with a reserve.

PART 5—PUBLICIZING CONTRACT ACTIONS

3. Amend section 5.205 by adding paragraph (g) to read as follows.

5.205 Special situations.

(9) Notification to the public of rationale for bundled requirement. The agency is encouraged to provide notification of the rationale for any bundled requirement to the GPE before issuing the solicitation of any bundled requirement (see 7.107–5(b)(2)).

PART 7—ACQUISITION PLANNING

4. Amend section 7.103 by revising paragraph (u)(2) to read as follows:

7.103 Agency-head responsibilities.

(u) * * *

5. Amend section 7.104 by removing from paragraph (a) “contracting,” and
adding “contracting, small business,” in its place; and revising paragraph (d) to read as follows:

7.104 General procedures.
* * * * *
(d) The planner shall coordinate the acquisition plan or strategy with the cognizant small business specialist when the strategy contemplates an acquisition meeting the thresholds in 7.107–4 for substantial bundling unless the contract or task order is included in the order. The small business specialist will notify the cognizant small business specialist when the strategy involves—

(1) Bundling that is unnecessary or unjustified; or

(2) Bundled or consolidated requirements not identified as such by the agency (see 7.107).
* * * * *

■ 6. Amend section 7.105 by revising paragraph (b)(1) to read as follows:

7.105 Contents of written acquisition plans.
* * * * *
(b) Plan of action—(1) Sources. (i) Indicate the prospective sources of supplies or services that can meet the need.

(ii) Consider required sources of supplies or services (see part 8) and sources identifiable through databases including the Governmentwide database of contracts and other procurement instruments intended for use by multiple agencies available at https://www.contractdirectory.gov/contractdirectory/

(iii) Include consideration of small business, veteran-owned small business, service-disabled veteran-owned small business, HUBZone small business, small disadvantaged business, and women-owned small business concerns (see part 19).

(iv) Consider the impact of any consolidation or bundling that might affect participation of small businesses in the acquisition (see 7.107) (15 U.S.C. 644(e) and 15 U.S.C. 657q). When the proposed acquisition strategy involves bundling, identify the incumbent contractors and contracts affected by the bundling.

(v) Address the extent and results of the market research and indicate their impact on the various elements of the plan (see part 10).
* * * * *

■ 7. Revise section 7.107 to read as follows:

7.107 Additional requirements for acquisitions involving consolidation, bundling, or substantial bundling.
* 8. Add sections 7.107–1 through 7.107–6 to read as follows:

7.107–1 General.
(a) If the requirement is considered both consolidated and bundled, the agency shall follow the guidance regarding bundling in 7.107–3 and 7.107–4.

(b) The requirements of this section 7.107 do not apply—

(1) If a cost comparison analysis will be performed in accordance with OMB Circular A–76 (except 7.107–4 still applies);

(2) To orders placed under single-agency task-order contracts or delivery-order contracts, when the requirement was considered in determining that the consolidation or bundling of the underlying contract was necessary and justified; or

(3) To requirements for which there is a mandatory source (see 8.002 or 8.003), including supplies and services that are on the Procurement List maintained by the Committee for Purchase From People Who Are Blind or Severely Disabled or the Schedule of Products issued by Federal Prison Industries, Inc. This exception does not apply—

(i) When the requiring agency obtains a waiver in accordance with 8.604 or an exception in accordance with 8.605 or 8.706; or

(ii) When optional acquisitions of supplies and services permitted under 8.713 are included.

7.107–2 Consolidation.
(a) Consolidation may provide substantial benefits to the Government. However, because of the potential impact on small business participation, before conducting an acquisition that is a consolidation of requirements with an estimated total dollar value exceeding $2 million, the senior procurement executive or chief acquisition officer shall make a written determination that the consolidation is necessary and justified in accordance with 15 U.S.C. 657q, after ensuring that—

(1) Market research has been conducted;

(2) Any alternative contracting approaches that would involve a lesser degree of consolidation have been identified;

(3) The determination is coordinated with the agency’s Office of Small Disadvantaged Business Utilization or the Office of Small Business Programs;

(4) Any negative impact by the acquisition strategy on contracting with small business concerns has been identified; and

(5) Steps are taken to include small business concerns in the acquisition strategy.

(b) The senior procurement executive or chief acquisition officer may determine that the consolidation is necessary and justified if the benefits of the acquisition would substantially exceed the benefits that would be derived from each of the alternative contracting approaches identified under paragraph (a)(2) of this subsection, including benefits that are quantifiable in dollar amounts as well as any other specifically identified benefits.

(c) Such benefits may include cost savings or price reduction and, regardless of whether quantifiable in dollar amounts—

(1) Quality improvements that will save time or improve or enhance performance or efficiency;

(2) Reduction in acquisition cycle times;

(3) Better terms and conditions; or

(4) Any other benefits.

(d) Benefits. (1) Benefits that are quantifiable in dollar amounts are substantial if individually, in combination, or in the aggregate the anticipated financial benefits are equivalent to—

(i) Ten percent of the estimated contract or order value (including options) if the value is $94 million or less; or

(ii) Five percent of the estimated contract or order value (including options) or $9.4 million, whichever is greater, if the value exceeds $94 million.

(e) Benefits that are not quantifiable in dollar amounts shall be specifically identified and otherwise quantified to the extent feasible.

(3) Reduction of administrative or personnel costs alone is not sufficient justification for consolidation unless the cost savings are expected to be at least 10 percent of the estimated contract or order value (including options) of the consolidated requirements, as determined by the senior procurement executive or chief acquisition officer (15 U.S.C. 657q(c)(2)(B)).

(e)(1) Notwithstanding paragraphs (a) through (d) of this subsection, the approving authority identified in paragraph (e)(2) of this subsection may determine that consolidation is necessary and justified when—

(i) The expected benefits do not meet the thresholds for a substantial benefit at paragraph (d)(1) of this subsection but are critical to the agency’s mission success; and

(ii) The procurement strategy provides for maximum practicable participation by small business.

(2) The approving authority is—
(i) For the Department of Defense, the senior procurement executive; or
(ii) For the civilian agencies, the Deputy Secretary or equivalent.

(f) If a determination is made that consolidation is necessary and justified, the contracting officer shall include it in the acquisition strategy documentation and provide it to the Small Business Administration (SBA) upon request.

7.107–3 Bundling.

(a) Bundling may provide substantial benefits to the Government. However, because of the potential impact on small business participation, before conducting an acquisition strategy that involves bundling, the agency shall make a written determination that the bundling is necessary and justified in accordance with 15 U.S.C. 644(e). A bundled requirement is considered necessary and justified if the agency would obtain measurably substantial benefits as compared to meeting its agency’s requirements through separate smaller contracts or orders.

(b) The agency shall quantify the specific benefits identified through the use of market research and other techniques to explain how their impact would be measurably substantial (see 10.001(a)(2)(iv) and (a)(3)(viii)).

(c) Such benefits may include, but are not limited to—

(1) Cost savings;
(2) Price reduction;
(3) Quality improvements that will save time or improve or enhance performance or efficiency;
(4) Reduction in acquisition cycle times, or
(5) Better terms and conditions.

(d) Benefits are measurably substantial if individually, in combination, or in the aggregate the anticipated financial benefits are equivalent to—

(1) Ten percent of the estimated contract or order value (including options) if the value is $94 million or less; or
(2) Five percent of the estimated contract or order value (including options) or $9.4 million, whichever is greater, if the value exceeds $94 million.

(e) Reduction of administrative or personnel costs alone is not sufficient justification for bundling unless the cost savings are expected to be at least ten percent of the estimated contract or order value (including options) of the bundled requirements.

(f) Notwithstanding paragraphs (a) through (e) of this subsection, the approving authority identified in paragraphs (f)(2) or (f)(3) of this subsection may determine that bundling is necessary and justified when—

(i) The expected benefits do not meet the thresholds for a substantial benefit but are critical to the agency’s mission success; and
(ii) The acquisition strategy provides for maximum practicable participation by small business concerns.

(g) In assessing whether cost savings and/or price reduction would be achieved through bundling, the agency and SBA shall—

(1) Compare the price that has been charged by small businesses for the work that they have performed; or
(2) Where previous prices are not available, compare the price, based on market research, that could have been or could be charged by small businesses for the work previously performed by other than a small business.

(h) If a determination is made that bundling is necessary and justified, the contracting officer shall include it in the acquisition strategy documentation and provide it to SBA upon request.

7.107–4 Substantial bundling.

(a)(1) Substantial bundling is any bundling that results in a contract task or delivery order with an estimated value of—

(i) $8 million or more for the Department of Defense;
(ii) $6 million or more for the National Aeronautics and Space Administration, the General Services Administration, and the Department of Energy; or
(iii) $2.5 million or more for all other agencies.

(2) These thresholds apply to the cumulative estimated dollar value (including options) of—

(i) Multiple-award contracts;
(ii) Task orders or delivery orders issued against a GSA Schedule contract; or
(iii) Task orders or delivery orders issued against a task-order or delivery-order contract awarded by another agency.

(b) In addition to addressing the requirements for bundling (see 7.107–3), when the proposed acquisition strategy involves substantial bundling, the agency shall document in its strategy—

(1) The specific benefits anticipated to be derived from substantial bundling;
(2) An assessment of the specific impediments to participation by small business concerns as contractors that result from substantial bundling;
(3) Actions designed to maximize small business participation as contractors, including provisions that encourage small business teaming;
(4) Actions designed to maximize small business participation as subcontractors (including suppliers) at any tier under the contract, or order, that may be awarded to meet the requirements;
(5) The determination that the anticipated benefits of the proposed bundled contract or order justify its use; and
(6) Alternative strategies that would reduce or minimize the scope of the bundling, and the rationale for not choosing those alternatives.

7.107–5 Notifications.

(a) Notifications to current small business contractors of agency’s intent to bundle. (1) The contracting officer shall notify each small business performing a contract that it intends to bundle the requirement at least 30 days prior to the issuance of the solicitation for the bundled requirement.

(2) The notification shall provide the name, phone number and address of the applicable SBA procurement center representative (PCR), or if an SBA PCR is not assigned to the procuring activity, the SBA Office of Government Contracting Area Office serving the area in which the buying activity is located.

(3) This notification shall be documented in the contract file.

(b) Notification to public of rationale for bundled requirement. (1) The agency shall publish on its Web site a list and rationale for any bundled requirement for which the agency solicited offers or issued an award. The notification shall be made within 30 days of the agency’s data certification regarding the validity and verification of data entered in the Federal Procurement Data System to the Office of Federal Procurement Policy (see 4.604).

(2) In addition, the agency is encouraged to provide notification of the rationale for any bundled requirement to the GPE, before issuance of the solicitation (see 5.201).

(c) Notification to SBA of follow-on bundled or consolidated requirements. For each follow-on bundled or consolidated requirement, the contracting officer shall obtain the following from the requiring activity and notify the SBA PCR no later than 30 days prior to issuance of the solicitation:

(1) The amount of savings and benefits achieved under the prior consolidation or bundling;
(2) Whether such savings and benefits will continue to be realized if the contract remains consolidated or bundled.
(3) Whether such savings and benefits would be greater if the procurement requirements were divided into separate solicitations suitable for award to small business concerns.

(4) List of requirements that have been added or deleted for the follow-on.

(d) Public notification of bundling policy. In accordance with 15 U.S.C. 644(c)(2)(A)(ii), agencies shall publish the Governmentwide policy regarding contract bundling, including regarding the solicitation of teaming and joint ventures, on their agency Web site.

7.107–6 Solicitation provision.

The contracting officer shall insert the provision at 52.207–6, Solicitation of Offers from Small Business Concerns and Small Business Teamings Arrangements or Joint Ventures (Multiple-Award Contracts), in solicitations for multiple-award contracts above the substantial bundling threshold of the agency (see 7.107–4(a)).

PART 8—REQUIRED SOURCES OF SUPPLIES AND SERVICES

9. Amend section 8.404 by revising paragraph (c)(2) to read as follows:

8.404 Use of Federal Supply Schedules.

(c) * * * * *

(2) Shall comply with all FAR requirements for a consolidated or bundled contract when the order meets the definition at 2.101(b) of “consolidation” or “bundling”; and

PART 10—MARKET RESEARCH

10. Amend section 10.001 by—

(a) Revising the introductory text of paragraph (a);

(b) Revising paragraphs (a)(2)(iv) and (a)(2)(vi)(B);

(c) Removing from the end of paragraph (a)(3)(v) “efficiency; and” and adding “efficiency;” in its place;

(d) Redesignating paragraphs (a)(3)(vi) and (a)(7) as paragraphs (a)(3)(vii) and (viii), respectively;

(e) Adding a new paragraph (a)(3)(vi); and

(f) Revising the newly designated paragraph (a)(3)(vii); and

(g) Revising paragraph (c).

The revisions and addition reads as follows:

10.001 Policy.

(a) Agencies shall—

* * * * *

(2) * * * *

(iv) Before soliciting offers for acquisitions that could lead to consolidation or bundling (15 U.S.C. 644(c)(2)(A) and 15 U.S.C. 657q);

* * * * *

(vi) * * * *

(B) Disaster relief to include debris removal, distribution of supplies, reconstruction, and other disaster or emergency relief activities (see 26.205); and

(3) * * * *

(vi) Determine whether consolidation is necessary and justified (see 7.107–2) (15 U.S.C. 657q);

(vii) Determine whether bundling is necessary and justified (see 7.107–3) (15 U.S.C. 644(e)(2)(A)); and

(c) If an agency contemplates consolidation or bundling, the agency—

(1) When performing market research, should consult with the agency small business specialist and the local Small Business Administration procurement center representative (PCR). If a PCR is not assigned, see 19.402(a); and

(2) Shall notify any affected incumbent small business concerns of the Government’s intention to bundle the requirement and how small business concerns may contact the appropriate Small Business Administration procurement center representative (see 7.107–5(a)).

* * * * *

PART 12—ACQUISITION OF COMMERCIAL ITEMS

11. Amend section 12.301 by redesignating paragraphs (d)(4) through (8) as paragraphs (d)(5) through (9), respectively; and adding a new paragraph (d)(4) to read as follows:

12.301 Solicitation provisions and contract clauses for the acquisition of commercial items.

* * * * *

(d) * * *

(4) Insert the provision at 52.207–6, Solicitation of Offers from Small Business Concerns and Small Business Teamings Arrangements or Joint Ventures (Multiple-Award Contracts), as prescribed at 7.107–6.

* * * * *

PART 15—CONTRACTING BY NEGOCIATION

12. Amend section 15.304 by revising paragraphs (c)(3)(ii) and (c)(4) to read as follows:

15.304 Evaluation factors and significant subfactors.

* * * * *

(c) * * *

(3) * * *

(i) For solicitations that are not set aside for small business concerns, involving consolidation or bundling, that offer a significant opportunity for subcontracting, the contracting officer shall include a factor to evaluate past performance indicating the extent to which the offeror attained applicable goals for small business participation under contracts that required subcontracting plans (15 U.S.C. 637(d)(4)(G)(ii)).

* * * * *

(iii) Shall comply with all FAR requirements for a consolidated or bundled contract when the order meets the definition at 2.101(b) of “consolidation” or “bundling”.

* * * * *

PART 16—TYPES OF CONTRACTS

13. Amend section 16.505 by revising paragraph (a)(6)(iii) to read as follows:

16.505 Ordering.

(a) * * * *

(8) * * *

(iii) Shall comply with all FAR requirements for a consolidated or bundled contract when the order meets the definition at 2.101(b) of “consolidation” or “bundling”.

* * * * *

PART 19—SMALL BUSINESS PROGRAMS

15. Amend section 19.201 by revising paragraphs (c)(5)(i), (c)(11)(ii), and (c)(11)(iii) to read as follows:

19.201 General policy.

* * * * *

(i) Identify proposed solicitations that involve bundling and work with the agency acquisition officials and SBA to revise the acquisition strategies for such
Solicitation of Offers From Small Business Concerns and Small Business Teaming Arrangements or Joint Ventures (Multiple-Award Contracts) (Oct 2016)

(a) Definition. “Small Business Teaming Arrangement,” as used in this provision—
(i) Means an arrangement—
(ii) Where—
(A) Is specifically referred to as a “Small Business Teaming Arrangement”; and
(B) Sets forth the different responsibilities, roles, and percentages (or other allocations) of work as it relates to the acquisition;
(iii) For civilian agencies, may include two business concerns in a mentor-protégé relationship when both the mentor and the protégé are small and the concerns have received an exception to affiliation pursuant to 13 CFR 121.103(b)(3)(ii) or (iii).

(ii) For DoD, may include two business concerns in a mentor-protégé relationship in the Department of Defense Pilot Mentor-Protégé Program (see section 831 of the National Defense Authorization Act for Fiscal Year 1991 (Pub. L. 101–510; 10 U.S.C. 2302 note)) when both the mentor and the protégé are small. There is no exception to joint venture size affiliation for offers received from teaming arrangements under the Department of Defense Pilot Mentor-Protégé Program; and
(iii) The proposed acquisition is for a consolidated or bundled requirement. (See 7.107–5(a) for mandatory 30-day notice requirement to incumbent small business concerns.) The contracting officer shall provide all information relative to the justification for the consolidation or bundling, including the acquisition plan or strategy, and if the acquisition involves substantial bundling, the information identified in 7.107–4. The contracting officer shall also provide the same information to the agency Office of Small and Disadvantaged Business Utilization.

(b) The Government is soliciting and will consider offers from any responsible source, including responsible small business concerns and offers from Small Business Teaming Arrangements or joint ventures of small business concerns.

[End of provision]

End of provision

SUPPLEMENTARY INFORMATION:
I. Background

DoD, GSA, and NASA are amending FAR subpart 17.1 to implement section 811 of the NDAA for FY 2016 (Pub. L. 114–92). Section 811 amended subsection (a)(1) of 10 U.S.C. 2306b by striking “substantial” and inserting “significant.” This rule makes conforming changes at FAR 17.105–1(b)(1) to state that the head of an agency may enter into a multi-year contract for supplies, if the use of such a contract will result in significant savings of the total estimated costs of carrying out the program through annual contracts. This change applies to the DoD, NASA, and the Coast Guard.

II. Publication of This Final Rule for Public Comment Is Not Required by Statute

Publication of proposed regulations, 41 U.S.C. 1707, is the statute which applies to the publication of the Federal Acquisition Regulation; Amendment Relating to Multi-Year Contract Authority for Acquisition of Property

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Final rule.

SUMMARY: DoD, GSA, and NASA are issuing a final rule amending the Federal Acquisition Regulation (FAR) to implement a section of the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2016, to require that “significant” savings would be achieved by entering into a multi-year contract.

FOR FURTHER INFORMATION CONTACT: Mr. Michael O. Jackson, Procurement Analyst, at 202–208–4949, for clarification of content. For information pertaining to status or publication schedules, contact the Regulatory Secretariat at 202–501–4755. Please cite FAC 2005–91, FAR Case 2016–006.

BILLING CODE 6820–EP–P
Acquisition Regulation. Paragraph (a)(1) of the statute requires that a procurement policy, regulation, procedure, or form (including an amendment or modification thereof) must be published for public comment if it relates to the expenditure of appropriated funds, and has either a significant effect beyond the internal operating procedures of the agency issuing the policy, regulation, procedure, or form, or has a significant cost or administrative impact on contractors or offerors. This final rule is not required to be published for public comment, because it addresses an internal decision by the head of agency to enter into a multi-year contract for supplies if certain criteria are met. These requirements affect only the internal operating procedures of the Government.

III. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

IV. Regulatory Flexibility Act

The Regulatory Flexibility Act does not apply to this rule because this final rule does not constitute a significant FAR revision within the meaning of FAR 1.501–1 and 41 U.S.C. 1707 does not require publication for public comment.

V. Paperwork Reduction Act

The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. Chapter 35).

List of Subject in 48 CFR Part 17

Government procurement.

Dated: September 19, 2016.

William F. Clark,
Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Therefore, DoD, GSA, and NASA amend 48 CFR part 17 as set forth below:

PART 17—SPECIAL CONTRACTING METHODS

1. The authority citation for 48 CFR part 17 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

17.105–1 [Amended]

2. Amend section 17.105–1 by removing from paragraph (b)(1) “substantial” and adding “significant” in its place.

[FR Doc. 2016–23201 Filed 9–29–16; 8:45 am]

BILLING CODE 6820–EP–P

DEPARTMENT OF DEFENSE

GENERAL SERVICES ADMINISTRATION

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

48 CFR Parts 22, 25, and 52

RIN 9000–AN25

Federal Acquisition Regulation; New Designated Countries—Ukraine and Moldova

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Final rule.

SUMMARY: DoD, GSA, and NASA are issuing a final rule amending the Federal Acquisition Regulation (FAR) to add Ukraine and Moldova as new designated countries under the World Trade Organization Government Procurement Agreement (WTO GPA).

SUPPLEMENTARY INFORMATION:

I. Background

Ukraine and Moldova recently became parties to the WTO GPA on May 18, 2016, and July 14, 2016, respectively. The Trade Agreements Act (19 U.S.C. 2501 et seq.) provides the authority for the President to waive the Buy American statute and other discriminatory provisions for eligible products from countries that have signed an international trade agreement with the United States (such as the WTO GPA). The President has delegated this authority to the U.S. Trade Representative.

The U.S. Trade Representative has determined that Ukraine and Moldova will provide appropriate reciprocal competitive Government procurement opportunities to United States products and services. The U.S. Trade Representative published notices in the Federal Register waiving the Buy American statute and other discriminatory provisions for eligible products from Ukraine at 81 FR 31292 on May 18, 2016, and Moldova at 81 FR 50045 on July 29, 2016.

II. Discussion and Analysis

Therefore, this rule adds Ukraine and Moldova to the list of WTO GPA countries wherever it appears in the FAR, whether as a separate definition, part of the definition of “designated country,” or “Recovery Act designated country,” or as part of the list of countries exempt from the prohibition of acquisition of products produced by forced or indentured child labor (FAR 22.1503, 25.003, 52.222–19, 52.225–5, 52.225–11, and 52.225–23).

Conforming changes are made to FAR 52.212–5, Contract Terms and Conditions Required to Implement Statute or Executive Orders—Commercial Items, and 52.213–4, Terms and Conditions—Simplified Acquisitions (Other Than Commercial Items).

III. Publication of This Final Rule for Public Comment Is Not Required by Statute

“Publication of proposed regulations,” 41 U.S.C. 1707, is the statute that applies to the publication of the Federal Acquisition Regulation. Paragraph (a)(1) of the statute requires that a procurement policy, regulation, procedure, or form (including an amendment or modification thereof) must be published for public comment if it relates to the expenditure of appropriated funds, and has either a significant effect beyond the internal operating procedures of the agency issuing the policy, regulation,
procedures, or forms, or has a significant cost or administrative impact on contractors or offerors. This final rule is not required to be published for public comment, because it has no significant cost or administrative impact on contractors or offerors. It is just updating the lists of designated countries, in order to conform to the determinations by the U.S. Trade Representative.

IV. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

V. Regulatory Flexibility Act

The Regulatory Flexibility Act does not apply to this rule because this final rule does not constitute a significant FAR revision within the meaning of FAR 1.501–1 and 41 U.S.C. 1707 and does not require publication for public comment.

VI. Paperwork Reduction Act

The Paperwork Reduction Act does apply, because the rule affects the response of an offeror that is offering a product of Ukraine or Moldova to the information collection requirements in the provisions at FAR 52.212–3(e)(5), 52.225–6, and 52.225–11. The offeror no longer needs to list a product from Ukraine or Moldova under “other end products,” because Ukraine and Moldova are now designated countries. These information collection requirements are currently approved under OMB Control Numbers 9000–0025, titled: Trade Agreements Certificate; 9000–0136, titled: Commercial Item Acquisitions; and 9000–0141, Buy American—Construction, respectively. The impact, however, is negligible.

List of Subjects in 48 CFR Parts 22, 25, and 52

Government procurement.

Dated: September 19, 2016.

William F. Clark,
Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Therefore, DoD, GSA, and NASA amend 48 CFR parts 22, 25, and 52 as set forth below:

1. The authority citation for 48 CFR parts 22, 25, and 52 continues to read as follows:
   Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

PART 22—APPLICATION OF LABOR LAWS TO GOVERNMENT ACQUISITIONS

22.1503 [Amended]

2. Amend section 22.1503 by removing from paragraph (b)(4) “Malta,” and “Taiwan,” and adding “Malta, Moldova,” and “Taiwan, Ukraine,” in their places, respectively.

PART 25—FOREIGN ACQUISITION

25.003 [Amended]

3. Amend section 25.003 by—
   a. Removing from the definition “Designated country”, paragraph (1), the words “Malta,” and “Matsu [Chinese Taipei]”)” and adding “Malta, Moldova,” and “Matsu (Chinese Taipei)” in their places, respectively; and
   b. Removing from the definition “World Trade Organization Government Procurement Agreement (WTO GPA) country” “Malta,” and “Taiwan,” and adding the words “Malta, Moldova,” and “Taiwan, Ukraine,” in their places, respectively.

PART 52—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

4. Amend section 52.212–5 by revising the date of the clause and paragraphs (b)(26) and (49) to read as follows:

52.212–5 Contract Terms and Conditions Required To Implement Statutes or Executive Orders—Commercial Items. * * * * *

Contract Terms and Conditions Required To Implement Statutes or Executive Orders—Commercial Items (Oct 2016) * * * * *

(b) * * *

(49) 52.225–5, Trade Agreements (Oct 2016) (19 U.S.C. 2501, et seq., 19 U.S.C. 3301 note). * * * * *
Security Functions

Contractors Performing Private Security Functions

I. Background

DoD, GSA, and NASA published a proposed rule in the Federal Register at 80 FR 30202 on May 27, 2015, to implement section 862 of the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2008 (Pub. L. 110–181) (as amended by other NDAA’s, see 10 U.S.C. 2302 Note). This rule amends FAR 25.302, Contractors performing private security functions outside the United States, and the associated clause at 52.225–26 to remove the DoD-unique requirements, which were incorporated in the Defense Federal Acquisition Regulation Supplement (DFARS) on June 30, 2016 (81 FR 42559). This rule also adds the definition of “full cooperation” to FAR clause 52.225–26 in order to affirm that the contract clause does not foreclose any contractor rights arising in law, the FAR, or the terms of the contract when cooperating with any Government-authorized investigation into incidents reported pursuant to the clause.

One respondent submitted comments on the proposed rule.

II. Discussion and Analysis

The Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (the Councils) reviewed the public comment in the development of the final rule.

A. Summary of Significant Changes

There were no changes made to the rule as a result of the one comment received. There were no comments on the Regulatory Flexibility Analysis.

B. Analysis of Public Comments

A discussion of the comment follows:

Employing quasi-military armed forces:

Comment: The respondent did not comment on any of the proposed changes in the proposed rule. The respondent commented on the alleged employment of mercenaries by contractors performing private security functions overseas and further stated that this is prohibited as codified at 5 U.S.C. 3181. The respondent recommended a change to the FAR to make it clear that the U.S. Government will not employ mercenaries.

Response: The respondent’s comments are not within the scope of this rule.

III. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

IV. Regulatory Flexibility Act

DoD, GSA, and NASA have prepared a Final Regulatory Flexibility Analysis (FRFA) consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. The FRFA is summarized as follows:

The objective of this rule is to amend FAR 25.302, Contractors performing private security functions outside the United States, and the associated clause at 52.225–26 to remove the DoD-unique requirements, which will be incorporated in the Defense Federal Acquisition Regulation Supplement (DFARS). The rule also adds a definition of “full cooperation” to FAR clause 52.225–26 in order to affirm that the contract clause does not foreclose any contractor rights arising in law, the FAR, or the terms of the contract when cooperating with any Government-authorized investigation into incidents reported pursuant to the clause.

No comments were received from the public relative to the initial regulatory flexibility analysis.

DoD, GSA, and NASA do not expect this final rule to have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. Based on data available in the Federal Procurement Data System (FPDS), DoD awarded 403 contracts in FY 2013 in support of a designated contingency operation outside of the United States, of which 63 contracts (15.6 percent) were awarded to small businesses. Therefore, it is estimated that this rule will apply to approximately 63 small businesses. This rule does not create any new reporting, recordkeeping, or other compliance requirements.

There are no known significant alternatives to the rule. The impact of this rule on small businesses is not expected to be significant because it is removing DoD-unique requirements from the FAR, to be incorporated in the DFARS.

Interested parties may obtain a copy of the FRFA from the Regulatory Secretariat. The Regulatory Secretariat has submitted a copy of the FRFA to the
Chief Counsel for Advocacy of the Small Business Administration.

V. Paperwork Reduction Act

This rule does not affect the information collection requirements in FAR clause 52.225–26, currently approved under OMB Control Number 9000–0184, titled: Contractors Performing Private Security Functions Outside the United States, in accordance with the Paperwork Reduction Act (44 U.S.C. chapter 35). The estimated total annual public hour and cost burden in OMB control number 9000–0184 was calculated based on data for the contracts and subcontracts of non-DoD agencies, because DoD’s information collection was previously approved under OMB control number 0704–0460. Therefore, removing the DoD-unique requirements from the FAR does not impact the approved estimates for OMB clearance 9000–0184.

List of Subject in 48 CFR Parts 25 and 52

Government procurement.

Dated: September 19, 2016.

William F. Clark,
Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Therefore, DoD, GSA, and NASA amend 48 CFR parts 25 and 52 as set forth below:

1. The authority citation for 48 CFR parts 25 and 52 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

PART 25—FOREIGN ACQUISITION

25.302–2 [Amended]

2. Amend section 25.302–2 by removing from the definition “Other significant military operations” the phrase “(see 25.302–3(b)[2]).” and adding “(see 25.302–3(a)(2)).” in its place.

3. Amend section 25.302–3 by—

a. Revising paragraph (a);

b. Removing paragraph (b); and

c. Redesignating paragraphs (c) through (e) as paragraphs (b) through (d), respectively.

The revision reads as follows:

25.302–3 Applicability.

(a) This section applies to contracts that require performance outside the United States—

(1) In an area of combat operations as designated by the Secretary of Defense; or

(2) In an area of other significant military operations as designated by the Secretary of Defense, and only upon agreement of the Secretary of Defense and the Secretary of State.

25.302–4 [Amended]

4. Amend section 25.302–4 by—

a. Removing from paragraph (a)(1) “(PSCs) Operating in Contingency Operations, Combat Operations, or Other Significant Military Operations” and adding “Operating in Contingency Operations” in its place; and

b. Removing from paragraph (a)(2) “to cooperate” and adding “to fully cooperate” in its place.

5. Amend section 25.302–6 by revising paragraph (a) to read as follows:

25.302–6 Contract clause.

(a) Use the clause at 52.225–26, Contractors Performing Private Security Functions Outside the United States, in solicitations and contracts for performance outside the United States in an area of—

(1) Combat operations, as designated by the Secretary of Defense; or

(2) Other significant military operations, as designated by the Secretary of Defense and only upon agreement of the Secretary of Defense and the Secretary of State.

PART 52—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

6. Amend section 52.212–5 by—

a. Revising the date of the clause, paragraphs (b)[51] and (e)(1)[xviii]; and

b. Amending Alternate II by—

i. Revising the date of Alternate II;

ii. Adding a new paragraph (f)(1)[T].

The revisions read as follows:

52.212–5 Contract Terms and Conditions Required To Implement Statutes or Executive Orders—Commercial Items.

Contract Terms and Conditions Required To Implement Statutes or Executive Orders—Commercial Items (Oct 2016)

7. Amend section 52.213–4 by revising the date of the clause and paragraph (a)[2][viii] to read as follows:

52.213–4 Terms and Conditions—Simplified Acquisitions (Other Than Commercial Items).

8. Amend section 52.225–26 by—

a. Revising the introductory text and the date of the clause; and

b. Revising the introductory text of paragraph (a); and adding in alphabetical order, the definitions “Area of combat operations”, “Full cooperation”, and “Other significant military operations”;

c. Revising paragraph (b);

d. Removing from paragraph (c)[2](i) “(PSCs) Operating in Contingency Operations, Combat Operations, or Other Significant Military Operations” and adding “Operating in Contingency Operations” in its place;

f. Removing from paragraph (c)[3] “Cooperate” and adding “Provide full cooperation” in its place; and

f. Revising paragraph (f).

The revisions read as follows:

52.225–26 Contractors Performing Private Security Functions Outside the United States.

As prescribed in 25.302–6, insert the following clause:

Contractors Performing Private Security Functions Outside the United States (Oct 2016)

(a) Definitions. As used in this clause—

Area of combat operations means an area of operations designated as such by the Secretary of Defense when enhanced coordination of contractors performing private security functions working for Government agencies is required.
Full cooperation—
(1) Means disclosure to the Government of the information sufficient to identify the nature and extent of the incident and the individuals responsible for the conduct. It includes providing timely and complete responses to Government auditors’ and investigators’ requests for documents and access to employees with information;
(2) Does not foreclose any Contractor rights arising in law, the FAR, or the terms of the contract. It does not require—
(i) The Contractor to waive its attorney-client privilege or the protections afforded by the attorney work product doctrine; or
(ii) Any officer, director, owner, or employee of the Contractor, including a sole proprietor, to waive his or her attorney-client privilege or Fifth Amendment rights; and
(3) Does not restrict the Contractor from—
(i) Conducting an internal investigation; or
(ii) Defending a proceeding or dispute arising under the contract or related to a potential or disclosed violation.

Other significant military operations means activities, other than combat operations, as part of a contingency operation outside the United States that is carried out by United States Armed Forces in an uncontrolled or unpredictable high-threat environment where personnel performing security functions may be called upon to use deadly force.

* * * * *

(b) Applicability. If this contract is performed both in a designated area and in an area that is not designated, the clause only applies to performance in the following designated areas—
(1) Combat operations, as designated by the Secretary of Defense; or
(2) Other significant military operations, as designated by the Secretary of Defense, and only upon agreement of the Secretary of Defense and the Secretary of State.

* * * * *

(f) Subcontracts. The Contractor shall include the substance of this clause, including this paragraph (f), in all subcontracts that will be performed outside the United States in areas of—
(1) Combat operations, as designated by the Secretary of Defense; or
(2) Other significant military operations, upon agreement of the Secretaries of Defense and State that the clause applies in that area.

* * * * *

II. Discussion and Analysis

The Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (the Councils) reviewed the public comments in the development of the final rule. A discussion of the comments is provided as follows:

A. Summary of Significant Changes

This final rule adopts the interim rule with four changes for clarification.
• The first clarification entails the addition of a table to FAR 31.205–6(p) that summarizes the applicability dates contained in this FAR section.
• The second clarification concerns the reorganization of the FAR text. Existing FAR paragraph 31.205–6(p)[4] has become new paragraph (p)[1], with existing paragraph (p)[1] becoming new paragraph (p)[2]. Existing FAR paragraphs 31.205–6(p)[2] and (p)[3] have become new paragraphs (p)[3] and (p)[4], respectively.
• The third clarification entails the removal of the following redundant FAR 31.205–6 text:
  • Paragraph (p)[2][ii] text “Costs incurred after January 1, 1998.”
  • Paragraph (p)[3][ii] text “Costs incurred after January 1, 2012.”
  • Paragraph (p)[4][ii] text “Costs incurred on or after June 24, 2014.”
• The fourth clarification entails reference links in paragraphs (p)[2] and (p)[3] (see https://www.whitehouse.gov/omb/procurement_index_exec_comp/)
and another reference link in paragraph (p)(4) (see http://www.whitehouse.gov/omb/procurement/cecp). Additionally, some statutory references and explanatory text were added in FAR paragraphs 31.205–6(p)(3) and (p)(4).

B. Analysis of Public Comments

The Regulatory Secretariat Division received responses from three respondents to the interim rule, which are discussed below:

1. Support for the Rule

Comment: One respondent strongly supported the interim rule and applauded the FAR issuing agencies for meeting the statutory deadline for issuance of this rule.

Response: The Government notes the public support for this rule.

2. Application of Rule to Nonprofit Organizations

Comment: One respondent stated that the rule only referenced FAR 31.205–6. Respondent questioned whether this means that the new compensation cap will only apply to contractors or subcontractors that follow this FAR section; would a nonprofit organization that complies with FAR subpart 31.7 be exempt from the compensation cap; or will FAR subpart 31.7 be amended as well.

Response: A nonprofit organization that complies with FAR subpart 31.7 is not exempt from the compensation cap in this rule. Previously, FAR 31.702 referenced the Office of Management and Budget (OMB) Circular Number A–122, Cost Principles for Non-Profit Organizations. The recent FAR case 2014–023 updated the reference from OMB Circular A–122 to the revised OMB Uniform Guidance at 2 CFR 200, as in effect on the date of the contract, which references the statutory compensation ceilings. These cost principles reference the compensation cap contained in this FAR rule.

3. Retroactive Application of Rule Not Appropriate

Comment: The interim rule stated that the revised compensation cap “will apply to the costs of compensation for all contractor and subcontractor employees for contracts awarded, and cost incurred, on or after June 24, 2014.” One respondent stated that reading this sentence literally, the interim rule provides that all executive compensation costs are subject to the revised cap no matter when the contracts to which such costs are allocated were awarded which makes application of the rule retroactive which is inappropriate.

Response: The rule applies to costs incurred on contracts awarded on or after June 24, 2014, and does not apply retroactively to contracts awarded before June 24, 2014. For further clarification, Table 31.1 has been added as a summary of the applicability of the three compensation caps.

4. Application of Rule to Fixed-Price Contracts

Comment: One respondent requested that specific preamble language be included in the final rule that reinforces the existing FAR part 31 language which specifies the application of the cost principles to fixed-price contracts whenever cost analysis is performed. Respondent also stated that by allowing fixed-price contracts that are subject to cost analysis to evade this compensation cap defeats Congressional intent and costs taxpayers significantly.

Response: The reinforcement of this existing FAR part 31 language is unnecessary. This FAR rule revises FAR 31.205–6 specifically regarding the allowability of executive compensation. Other FAR cost principle sections such as 31.102 remain unchanged in their application and use, including when the cost principles are applicable to fixed-price contracts.

III. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is a significant regulatory action and, therefore, was subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

IV. Regulatory Flexibility Act

DoD, GSA, and NASA have prepared a Final Regulatory Flexibility Analysis (FRFA) consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. The FRFA is summarized as follows:

DoD, GSA, and NASA do not expect this rule to have a significant economic impact on a substantial number of small entities within the meaning of the Regulatory Flexibility Act, 5 U.S.C. 601. et seq. because, an analysis of data in the Federal Procurement Data System (FPDS) revealed that most contracts awarded to small entities are awarded on a fixed-price basis, and do not require application of the cost principle contained in this rule.

The rule imposes no reporting, recordkeeping, or other information collection requirements. The rule does not duplicate, overlap, or conflict with any other Federal rules, and there are no known significant alternatives to the rule.

Interested parties may obtain a copy of the FRFA from the Regulatory Secretariat. The Regulatory Secretariat has submitted a copy of the FRFA to the Chief Counsel for Advocacy of the Small Business Administration.

V. Paperwork Reduction Act

The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Act (44 U.S.C. chapter 35).

List of Subject in 48 CFR Part 31

Government procurement.

Dated: September 19, 2016.

William F. Clark,
Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Interim Rule Adopted As Final With Changes

Accordingly, the interim rule amending 48 CFR part 31 which was published in the Federal Register at 79 FR 35865 on June 24, 2014, is adopted as a final rule with the following changes:

PART 31—CONTRACT COST PRINCIPLES AND PROCEDURES

1. The authority citation for 48 CFR part 31 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

2. Amend section 31.205–6 by revising paragraph (p) to read as follows:

31.205–6 Compensation for personal services.

(p) Limitation on allowability of compensation.

* * * * *

FRFA consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, et seq. The FRFA is summarized as follows:
TABLE 31–1—EMPLOYEE COMPENSATION LIMITS

<table>
<thead>
<tr>
<th>Contract award date</th>

<tr>
<td>On/after June 24, 2014</td>
<td>All Executive Agencies</td>
<td>All Employees</td>
<td>(p)(4).</td>
</tr>
</tbody>
</table>

(1) Definitions. As used in this paragraph (p)—

(i) Compensation means the total amount of wages, salary, bonuses, deferred compensation (see paragraph (k) of this subsection), and employer contributions to defined contribution pension plans (see paragraphs (j)(4) and (q) of this subsection), for the fiscal year, whether paid, earned, or otherwise accruing, as recorded in the contractor’s cost accounting records for the fiscal year.

(ii) Senior executive means—

(A) Prior to January 2, 1999—The Chief Executive Officer (CEO) or any individual acting in a similar capacity at the contractor’s headquarters;

(B) Effective January 2, 1999, the five most highly compensated employees in management positions at the contractor’s headquarters, other than the CEO; and

(C) If the contractor has intermediate home offices or segments that report directly to the contractor’s headquarters, the five most highly compensated employees in management positions at each such intermediate home office or segment.

(iii) Fiscal year means the fiscal year established by the contractor for accounting purposes.

(iv) Contractor’s headquarters means the highest organizational level from which executive compensation costs are allocated to Government contracts.

(ii) Senior executive compensation limit for contracts awarded before June 24, 2014—(i) Applicability. This paragraph (p)(3) applies to DoD, NASA, and the Coast Guard for contracts awarded on or after December 31, 2011, and before June 24, 2014.

(ii) Costs incurred after January 1, 2012, for the compensation of any contractor employee in excess of the benchmark compensation amount determined applicable for the contractor fiscal year by the Administrator, Office of Federal Procurement Policy (OFPP), under 41 U.S.C. 1127 as in effect prior to June 24, 2014, are unallowable (10 U.S.C. 2324(e)(1)(P) and 41 U.S.C. 4304(a)(16), as in effect prior to June 24, 2014). This limitation is the sole statutory limitation on allowable employee compensation costs incurred after January 1, 1998, under contracts awarded before June 24, 2014, and applies whether or not the affected contracts were previously subject to a statutory limitation on such costs. (Note that pursuant to section 804 of Pub. L. 105–261, the definition of "senior executive" in paragraph (p)(1) of this section has been changed for compensation costs incurred after January 1, 1999.) See https://www.whitehouse.gov/omb/procurement_index_exec_comp/.

(iii) Exceptions. An agency head may establish one or more narrowly targeted exceptions for scientists, engineers, or other specialists upon a determination that such exceptions are needed to ensure that the executive agency has continued access to needed skills and capabilities. In making such a determination, the agency shall consider, at a minimum, for each contractor employee in a narrowly targeted excepted position—

(A) The amount of taxpayer funded compensation to be received by each employee; and

(B) The duties and services performed by each employee.

BILLING CODE 6820–EP–P
PART 4—ADMINISTRATIVE MATTERS

4.1400 [Amended]

PART 22—APPLICATION OF LABOR LAWS TO GOVERNMENT ACQUISITIONS

22.805 [Amended]

PART 23—ENVIRONMENT, ENERGY AND WATER EFFICIENCY, RENEWABLE ENERGY TECHNOLOGIES, OCCUPATIONAL SAFETY, AND DRUG-FREE WORKPLACE

23.704 [Amended]

PART 26—OTHER SOCIOECONOMIC PROGRAMS

6. Amend section 26.103 by revising paragraph (b) to read as follows:

26.103 Procedures.

(b) In the event of a challenge to the representation of a subcontractor, the contracting officer shall refer the matter to the U.S. Department of the Interior, Bureau of Indian Affairs (BIA), Attn: Acquisition Management Director, 12220 Sunrise Valley Drive, Reston, VA 20191. The BIA will determine the eligibility and notify the contracting officer.

PART 52—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

7. Amend section 52.234–1 by revising the section and clause headings and the definition “Title III project contractor” to read as follows:

52.234–1 Industrial Resources Developed Under Title III, Defense Production Act.

Industrial Resources Developed Under Title III, Defense Production Act (Sep 2016)
**SUPPLEMENTARY INFORMATION:**

</tbody>
</table>

**DoD, GSA, and NASA are adopting as final, without change, an interim rule, which amended the FAR to implement section of the Consolidated and Further Continuing Appropriations Act, 2015. The rule prohibits the Federal Government from entering into a contract with any corporation having a delinquent Federal tax liability or a felony conviction under any Federal law, unless the agency has considered suspension or debarment of the corporation and has made a determination that this further action is not necessary to protect the interests of the Government. This final rule will not have a significant economic impact on a substantial number of small entities.**

**DoD, GSA, and NASA are adopting as final, without change, an interim rule amending the FAR to implement Executive Order (E.O.) 13665, Non-Retaliolation for Disclosure of Compensation Information, amending Executive Order 11246, Equal Opportunity in Federal Employment. The E.O. was signed April 8, 2014. The interim rule is also implementing the final rule issued by the Office of Federal Contract Compliance Programs (OFCCP) of the Department of Labor (DOL) to implement the E.O. The DOL final rule was published in the Federal Register at 80 FR 54934, on September 11, 2015, entitled Government Contractors, Prohibitions Against Pay Secrecy Policies and Actions. E.O. 11246, originally issued September 24, 1965, establishes nondiscrimination and affirmative action obligations in employment for Federal contractors and subcontractors. It prohibits employment discrimination because of race, color, religion, sex, sexual orientation, gender identity, and national origin. E.O. 13665 amends E.O. 11246 and its Equal Opportunity Clause by incorporating, as a covered prohibition, discriminating against employees and job applicants who inquire about, discuss, or disclose the compensation of the employee or applicant or another employee or applicant. Federal contractors and subcontractors must disseminate this nondiscrimination provision, using language prescribed by the Director of OFCCP, including incorporating the provision into existing employee manuals or handbooks and posting it. There is no significant impact on small entities imposed by the FAR rule.**

**DoD, GSA, and NASA are adopting as final, with a minor edit, an interim rule that amends the FAR to implement regulatory changes made by the Small Business Administration (SBA) in its final rule as published in the Federal Register at 80 FR 55019, on September 14, 2015. SBA’s final rule implements the statutory requirements of paragraph (a)(3) of section 825 of the Carl Levin and Howard P. ‘Buck’ McKeon National Defense Authorization Act for Fiscal Year 2015, Public Law 113–291, which grants contracting officers the authority to award sole source contracts to economically disadvantaged women-owned small business (EDWOSB) concerns and to women-owned small business (WOSB) concerns eligible under the WOSB Program. The anticipated price, including options, must not exceed $6.5 million for manufacturing North American Industry Classification System (NAICS) codes, or $4 million for other NAICS codes. This rule may have a positive economic impact on women-owned small businesses.**

**DoD, GSA, and NASA are issuing a final rule amending the FAR to redesignate the terminology for unique identification of entities receiving Federal awards. The change to the FAR eliminates references to the proprietary Data Universal Numbering System (DUNS®) number, and provides appropriate references to the Web site where information on the unique entity identifier used for Federal contractors**
will be located. The Government does not intend to move away from the use of the DUNS® number in the short term. This final rule also establishes definitions of “unique entity identifier”, and “electronic funds transfer (EFT) indicator”. There is no significant impact on small entities imposed by the FAR rule.

Item VI—Consolidation and Bundling (FAR Case 2014–015)

This final rule incorporates regulatory changes made by the SBA in its final rule which published in the Federal Register at 78 FR 61113 on October 2, 2013, concerning consolidation and bundling. SBA’s final rule implements sections 1312 and 1313 of the Small Business Jobs Act of 2010 (Pub. L. 111–240), as well as section 1671 of the National Defense Authorization Act (NDAA) for Fiscal Year (FY) 2013 (Pub. L. 112–239). The FAR final rule adds coverage on consolidations and reorganizes coverage on bundling at FAR 7.107. Before conducting a consolidated acquisition estimated to exceed $2,000,000, the Senior Acquisition Executive or Chief Acquisition Officer must make a written determination that the consolidation is necessary and justified. This rule may have a positive economic impact on any small business entity that participates in the Federal procurement arena.

Item VII—Amendment Relating to Multi-Year Contract Authority for Acquisition of Property (FAR Case 2016–006)

DoD, GSA, and NASA are amending FAR subpart 17.1 to implement section 811 of the NDAA for FY 2016 (Pub. L. 114–92). Section 811 amended subsection (a)(1) of 10 U.S.C. 2306b by striking “substantial” and inserting “significant”. This rule makes conforming changes at FAR 17.105–1(b)(1) to state that the head of an agency may enter into a multi-year contract for supplies, if the use of such a contract will result in significant savings of the total estimated costs of carrying out the program through annual contracts. This change applies to the DoD, NASA, and the Coast Guard.

This final rule is not required to be published for public comment, because it addresses an internal decision by the contracting officer to enter into a multi-year contract for supplies if certain objects are met. These requirements affect only the internal operating procedures of the Government.

Item VIII—New Designated Country—Ukraine and Moldova (FAR Case 2016–009)

This final rule amends the FAR to add Ukraine and Moldova as new designated countries under the World Trade Organization Government Procurement Agreement (WTO GPA). This final rule has no significant impact on the Government and contractors, including small business entities.

Item IX—Contractors Performing Private Security Functions (FAR Case 2014–018)

This final rule amends FAR 25.302 and the clause at 52.225–26, both entitled “Contractors Performing Private Security Functions Outside the United States.”

This rule removes the DoD-unique requirements, which have been incorporated in the Defense Federal Acquisition Regulations Supplement (DFARS). This rule also adds the definition of “full cooperation” to FAR clause 52.225–26 in order to affirm that the contract clause does not foreclose any contractor rights arising in law, the FAR, or the terms of the contract when cooperating with any Government-authorized investigation into incidents reported pursuant to the clause.

This rule will not create any new reporting, recordkeeping, or other compliance requirements. The impact of this rule on small business is not expected to be significant.

Item X—Limitation on Allowable Government Contractor Employee Compensation Costs (FAR Case 2014–012)

This final rule converts the interim rule published in the Federal Register at 79 FR 35865 on June 24, 2014 to a final rule with minor changes including a table summarizing the employee compensation limits and applicability dates is added at 31.205–6(p); several paragraphs are reorganized; redundant text is removed; reference links are added for clarity.

This final rule amends the Federal Acquisition Regulation (FAR) to implement section 702 of the Bipartisan Budget Act of 2013. Section 702 revises the allowable compensation cost limit for contractor and subcontractor employees to be $487,000, as adjusted annually to reflect the change in the Employment Cost Index for all workers as calculated by the Bureau of Labor Statistics. Also, section 702 allows for the narrowly targeted exceptions to this allowable cost limit for scientists, engineers or other specialists, upon an agency determination that such exceptions are needed to ensure that the executive agency has continued access to needed skills and capabilities.

Because most contracts awarded to small businesses use simplified acquisition procedures or are awarded on a competitive, fixed-price basis, the impact of this compensation limitation on small businesses will be minimal.

Item XI—Technical Amendments

Editorial changes are made at FAR 1.603–1, 4.1400, 22.805, 23.704, 26.103, and 52.234–1.

Dated: September 19, 2016.

William F. Clark,

BILLING CODE 6820–EP–P
Endangered and Threatened Wildlife and Plants; Endangered Status for 49 Species From the Hawaiian Islands; Final Rule
DEPARTMENT OF THE INTERIOR

Fish and Wildlife Service

50 CFR Part 17

RIN 1018–BB07

Endangered and Threatened Wildlife and Plants: Endangered Status for 49 Species From the Hawaiian Islands

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Final rule.

SUMMARY: We, the U.S. Fish and Wildlife Service (Service), determine endangered status under the Endangered Species Act of 1973 (Act), as amended, for 10 animal species, including the Hawaii DPS of the band-rumped storm-petrel (Oceanodroma castro), the orangeblack Hawaiian damselfly (Megalogrion xanthomelas), the anchialine pool shrimp (Procaris hawaiiana), and seven yellow-faced bees (Hylaenus anthracinus, H. assimulans, H. facilis, H. hilaris, H. kuakea, H. longicpes, and H. mana), and 39 plant species (Asplenium diellacinatum (no common name, NCN), Calamagrostis expansa (Maui reedgrass), Cyanea kauaerulensus (NCN), Cyclorosus boydiae (kupukupu makalii), Cyperus neokunthianus (NCN), Cyrtandra hematos (haiwale), Deparia kaalana (NCN), Dryopteris glabra var. pulsiata (holi), Exocarpos menziesii (heau), Festuca hawaiensis (NCN), Gardenia renyi (nanu), Huperzia stemmermanniae (NCN), Hypolepis hawaiensis var. mauienis (olua), Joinvillea ascensens ssp. ascensens (ohe), Kadua fluviatilis (kamapua), Kadua haupuenensis (NCN), Labordia lorenziana (NCN), Lepidium orbiculare (anaunau), Microlepia strigosa var. mauienis (NCN), Myrsine fosbergii (kolea), Nothocrum latifolium (alea), Ochrosia hali (NCN), Palicourea measurens (bolei), Phyllostegia brevidens (NCN), Phyllostegia helleri (NCN), Phyllostegia stachyoides (NCN), Portulaca villosa (iihi), Pritchardia bakeri (Baker’s loulu), Pseudognaphalium sandweissium var. molokaiense (enaena), Ranunculus hawaiensis (makou), Ranunculus maulienis (makou), Sanicula sandweissae (NCN), Santalum involutum (ililahi), Schiedea diffusa ssp. diffusa (NCN), Schiedea pubescens (maolii), Sicyos lanceoloides (anunu), Sicyos macrophyllus (anunu), Solanum net (popolo), Stenogyne kaalae ssp. sherffii (NCN), and Wikstroemia skottsbergiana (akia), as endangered species.

This rule makes final the listing of 10 animal species (the Hawaii DPS of the band-rumped storm-petrel (Oceanodroma castro), the orangeblack Hawaiian damselfly (Megalogrion xanthomelas), the anchialine pool shrimp (Procaris hawaiiana), and seven yellow-faced bees (Hylaenus anthracinus, H. assimulans, H. facilis, H. hilaris, H. kuakea, H. longicpes, and H. mana), and 39 plant species (Asplenium diellacinatum (no common name, NCN), Calamagrostis expansa (Maui reedgrass), Cyanea kauaerulensus (NCN), Cyclorosus boydiae (kupukupu makalii), Cyperus neokunthianus (NCN), Cyrtandra hematos (haiwale), Deparia kaalana (NCN), Dryopteris glabra var. pulsiata (holi), Exocarpos menziesii (heau), Festuca hawaiensis (NCN), Gardenia renyi (nanu), Huperzia stemmermanniae (NCN), Hypolepis hawaiensis var. mauienis (olua), Joinvillea ascensens ssp. ascensens (ohe), Kadua fluviatilis (kamapua), Kadua haupuenensis (NCN), Labordia lorenziana (NCN), Lepidium orbiculare (anaunau), Microlepia strigosa var. mauienis (NCN), Myrsine fosbergii (kolea), Nothocrum latifolium (alea), Ochrosia hali (NCN), Palicourea measurens (bolei), Phyllostegia brevidens (NCN), Phyllostegia helleri (NCN), Phyllostegia stachyoides (NCN), Portulaca villosa (iihi), Pritchardia bakeri (Baker’s loulu), Pseudognaphalium sandweissium var. molokaiense (enaena), Ranunculus hawaiensis (makou), Ranunculus maulienis (makou), Sanicula sandweissae (NCN), Santalum involutum (ililahi), Schiedea diffusa ssp. diffusa (NCN), Schiedea pubescens (maolii), Sicyos lanceoloides (anunu), Sicyos macrophyllus (anunu), Solanum net (popolo), Stenogyne kaalae ssp. sherffii (NCN), and Wikstroemia skottsbergiana (akia), as endangered species.

Delineation of critical habitat requires identification of the physical or biological features essential to the species’ conservation. A careful assessment of the biological needs of the species and the areas that may have the physical or biological features essential for the conservation of the species and that may require management considerations or protections, and thus qualify for designation as critical habitat, is required. We require additional time to analyze the best available scientific data in order to identify specific areas appropriate for critical habitat designation and to analyze the impacts of designating such areas as critical habitat. Accordingly, we find designation of critical habitat to be “not determinable” at this time.

The basis for our action. Under the Act, we can determine that a species is endangered or threatened species based on any of five factors: (A) The present or threatened destruction, modification, or curtailment of its habitat or range; (B) overutilization for commercial, recreational, scientific, or educational purposes; (C) disease or predation; (D) the inadequacy of existing regulatory mechanisms; or (E) other natural or manmade factors affecting its continued existence. We have determined that these 49 species are experiencing population-level impacts as the result of the following current and ongoing threats:

• Habitat loss and degradation due to urbanization; nonnative feral ungulates (hoofed mammals, e.g., pigs, goats, axis deer, black-tailed deer, moufflon, and cattle); nonnative plants; wildfire; and water extraction.
• Predation or herbivory by nonnative feral ungulates, rats, slugs, bullfrogs, Jackson’s chameleons, ants, and wasps.
• Stochastic events such as landslides, flooding, drought, tsunami, and hurricanes.
• Human activities such as recreational use of anchialine pools, dumping of nonnative fish and trash into anchialine pools, and manmade structures and artificial lighting.
• Vulnerability to extinction due to small numbers of individuals and occurrences and lack of regeneration.
• Competition with nonnative plants and nonnative invertebrates.

Existing regulatory mechanisms and conservation efforts are not adequate to ameliorate the impacts of these threats on any of the 49 species such that listing is not warranted. Environmental effects from climate change are likely to exacerbate the impacts of these threats.

Peer review and public comment. We sought comments from independent specialists to ensure that our designation is based on scientifically sound data, assumptions, and analyses. We invited these peer reviewers to comment on our listing proposal. We also considered all comments and information we received during two comment periods, including at one public hearing.
Previous Federal Actions

Please refer to the proposed listing rule for the 49 species from the Hawaiian Islands (80 FR 58820; September 30, 2015) for a detailed description of previous Federal actions concerning these species.

Summary of Comments and Recommendations

On September 30, 2015, we published a proposed rule to list 49 species (39 plants and 9 animals) from the Hawaiian Islands as endangered throughout their ranges and the Hawaiian population (distinct population segment (DPS)) of the band-rumped storm-petrel as endangered (80 FR 58820). The comment period for the proposed rule lasted 60 days, ending November 30, 2015. We published a public notice of the proposed rule in the local Honolulu Star Advertiser, West Hawaii Today, Hawaii Tribune-Herald, Molokai Dispatch, The Maui News, and The Garden Island newspapers at the beginning of the comment period. We received two requests for a public hearing. On January 22, 2016 (81 FR 3767), we reopened the comment period for an additional 30 days, ending on February 22, 2016, and we announced a public meeting and public hearing for the proposed rule. We again published a public notice in local newspapers and provided the public notice to local media. For both comment periods, we requested that all interested parties submit comments or information concerning the proposed listing of the 49 species. We contacted all appropriate State and Federal agencies, county governments, elected officials, scientific organizations, and other interested parties and invited them to comment. The public meeting and hearing were held in Hilo, Hawaii, on February 9, 2016.

During the comment periods, we received a total of 41 unique public comment letters (including comments received at the public hearing) on the proposed listing of the 49 species. Of the 41 commenters, 21 were peer reviewers, 3 were Federal agencies (Hawaii Volcanoes National Park, Haleakala National Park, and Kaloko-Honokohau and Puuhonua o Honaunau National Historical Parks (NHPs)), 4 were State of Hawaii agencies (Hawaii Department of Health, Hawaii Department of Land and Natural Resources Division of Aquatic Resources, Hawaii Division of Forestry and Wildlife, and Hawaii Department of Hawaiian Home Lands), and 13 were nongovernmental organizations or individuals (including those who provided comments or testimony at the public hearing). The National Park Service (NPS) provided new information about the numbers and range of species in this rule that occur on NPS lands, and about graduate research on the orangeblack Hawaiian damselfly. We appreciate the time and effort taken by all commenters to submit their views and information, and we have incorporated all substantive new information, e.g., from the National Park Service, into this final rule. However, we received some comments from the public on the possible future designation of critical habitat and on a variety of other topics. To the extent that comments do not pertain to the proposed listing rule, we do not address them in this final rule. In this final rule, we address only those comments relevant to the listing of the 49 species from the Hawaiian Islands.

All substantive information related to the listing action provided during the comment periods has either been incorporated directly into this final rule, or is addressed below. For readers’ convenience, we have combined similar comments into a single comment and response.

Peer Review

In accordance with our peer review policy published in the Federal Register on July 1, 1994 (59 FR 3427), we solicited expert opinions from 29 knowledgeable individuals with scientific expertise on one or more of the 49 Hawaiian Islands species, which include 39 plants, a seabird, a damselfly, an anchialine pool shrimp, and seven yellow-faced bees, and their habitats. This expertise also included familiarity with the geographic region in which these species occur and conservation biology principles. We received responses from 21 of these individuals. We reviewed all comments we received from the peer reviewers for substantive issues and new information regarding the 49 species. Of these 21 peer reviewers, 18 provided comments or new information on one or more of the 49 species. Ten peer reviewers stated support for the proposed listing, and 11 were neutral regarding the proposed listing. These peer reviewers generally supported our methodology and conclusions. Peer reviewer comments are either addressed below or are incorporated into this final rule as appropriate.

(1) Comment: One peer reviewer stated that sea-level rise and coastal inundation collectively are also potential future threats to the welfare of Procaris hawaiana, because they may cause further loss of anchialine pool habitat.

Our Response: We have added sea-level rise and coastal inundation as threats to P. hawaiana and its habitat under the discussion in this rule titled “Climate Change” (Factor E. Other Natural or Manmade Factors Affecting Their Continued Existence).

(2) Comment: One peer reviewer stated that because sea-level rise could increase surface connectivity between currently isolated anchialine pools, invasion by nonnative fish would be exacerbated.

Our Response: In this rule, we have added surface connectivity to our summary description of the status and stressors to P. hawaiana as a factor likely to exacerbate the threat posed by nonnative fish to this species and its anchialine pool habitat (see Anchialine pool shrimp (Procaris hawaiana), under Summary of Biological Status of the 49 Hawaiian Islands Species).

(3) Comment: One peer reviewer recommended that the island of Lanai, and coastal habitat, be included as habitat for the band-rumped storm-petrel, as birds were observed during the breeding season transiting this habitat, which is conducive to nesting where crevices and ledges are numerous and can provide some protection from feral cats (Felis catus), goats (Capra hircus), and mouflon (Ovis gmelini musimon).

Our Response: We have added coastal habitat on Lanai in our description of habitat for the band-rumped storm-petrel in this final listing rule.

(4) Comment: One peer reviewer recommended that coastal habitat on leeward east Maui be included for the band-rumped storm-petrel, as remains of a chick were found there in 1999.

Our Response: We understand that coastal habitat on east Maui may be part of the species’ historical range, but we have not added coastal areas on leeward east Maui as currently occupied habitat for the band-rumped storm-petrel in this final rule. Unlike coastal Lanai, in coastal areas on leeward east Maui, no indication of the species’ presence or use of this habitat has been observed for 17 years.

(5) Comment: One peer reviewer stated that predation by bullfrogs (Lithobates catesbeianus) should be included as a threat to the orangeblack Hawaiian damselfly, and that impacts of backswimmers (Notonectidae family) and caddisflies (Trichoptera order) on the damselfly are speculative.

Our Response: We have included in this final rule that bullfrogs are a threat to the orangeblack Hawaiian damselfly, and clarified that the effects of
Caddisflies are not well understood. Comments from State Agencies

(6) Comment: The Hawaii Department of Land and Natural Resources’ Division of Forestry and Wildlife did not comment in support of, or in opposition to, the proposed listing of the 49 species from the Hawaiian Islands. District botanists from Kauai, Oahu, Maui, and Hawaii Island provided plant species occupancy by island. Our Response: We appreciate the information provided regarding the 49 plant species from the Hawaiian Islands, and have incorporated it into the Summary of Biological Status of the 49 Hawaiian Islands Species for the appropriate species in this final rule.

(7) Comment: The Hawaii Department of Health acknowledged that protecting wildlife and plants can often be important for human and environmental health. They further commented that managing and controlling wild ungulates is necessary for 95 percent of these proposed plant species, the orangeblack Hawaiian damselfly (Megalagrion xanthomelas orangeblack Hawaiian damselfly), and the yellow-faced bees (Hyleaeus spp.), but that it is also essential to preventing erosion, and, therefore, protecting water quality. Fire is a natural process that is now unnaturally frequent, intense, and destructive to the Hawaiian Islands, in part due to invasive grasses. Mitigating wildfires is essential to caring for 38 percent of the plant species, the damselfly, and yellow-faced bees, but it also limits the release of air pollutants that are known to be harmful to human health. Protection of coastal and wetland habitat such as that populated by the anchialine pool shrimp (Procaris hawaiiana) limits further human pressures on our sensitive coastlines and aquatic environments.

Our Response: We agree that managing and controlling ungulates would provide significant conservation benefits to listed plant and animal species, and would also prevent erosion and protect water quality of the islands and near shore reefs. We also acknowledge that nonnative grasses contribute to the increase in numbers and intensity of wildfires in Hawaii. Protection of coastal habitat (through nonnative plant and ungulate control, and prevention of wildfires) would provide a conservation benefit to the anchialine pool shrimp, and to other species that depend on coastal habitat.

(8) Comment: The Hawaii Department of Land and Natural Resources Division of Acitve Native Species Act (ANSA) concurred that the information in the proposed rule for the anchialine pool shrimp, Procaris hawaiiana, is the most accurate and up-to-date information available, and supported listing the species as endangered under the Act (16 U.S.C. 1531 et seq.). Our Response: We appreciate this support for the proposed listing of the anchialine pool shrimp, Procaris hawaiiana.

(9) Comment: The Department of Hawaiian Home Lands (DHHL) asked that the Secretary of the Interior consider the effects of designation of endangered species that may potentially have critical habitat on Hawaiian Home Lands in a similar manner to the effects such designation has on tribal lands, including the impact on tribal sovereignty. DHHL is aware that Secretarial Order 3206, issued in June 1997, establishes guidelines for the Service when dealing with Indian tribes relating to endangered species. Secretarial Order 3206 recognizes that, in order to respect the cultural and social aspects of Indian tribes, some environmental actions on Indian tribal lands are not appropriate, and it calls on the Service to preserve endangered species while respecting tribal authority over their own lands. While native Hawaiians are not an “Indian tribe” under the Order, DHHL’s mission, to place native Hawaiians on its lands for residential, agricultural, and pastoral homesteading purposes, is analogous to the circumstances of Indian tribes. The Department also recommends that the Secretaries of the Interior and Commerce, in determining endangered species and critical habitat designations, consult directly with the Hawaiian Homes Commission, DHHL, Office of Native Hawaiian Relations, and beneficiaries of the Hawaiian Homes Commission Act to include native intelligence and knowledge on species, habitat, and place-based management and protection.

Our Response: In accordance with the President’s memorandum of April 29, 1994 (Government-to-Government Relations With Native American Tribal Governments; 59 FR 22951), Executive Order 13175 (Consultation and Coordination With Indian Tribal Governments), and the Department of the Interior’s manual at 512 DM 2, we readily acknowledge our responsibility to communicate meaningfully with recognized Federal Tribes on a government-to-government basis. In accordance with Secretarial Order 3206 of June 5, 1997 (American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act) we further acknowledge our responsibilities to work directly with tribes in developing programs for healthy ecosystems; to incorporate native intelligence and knowledge of species, habitat, and place-based management and protection; to acknowledge that tribal lands are not subject to the same controls as Federal public lands; to remain sensitive to Indian culture; and to make information available to tribes. In addition, a 2004 consolidated appropriations bill (Pub. L. 108–199, see section 148) established the Office of Native Hawaiian Relations within the Secretary of the Interior’s Office, and its duties include effectuating and implementing the special legal relationship between the Native Hawaiian people and the United States, and fully integrating the principle and practice of meaningful, regular, and appropriate consultation with the Native Hawaiian people by assuring timely notification of and prior consultation with the Native Hawaiian people before any Federal agency takes any actions that may have the potential to significantly affect Native Hawaiian resources, rights, or lands. A 2011 memorandum of understanding (MOU) signed by the Department of the Interior states that “Federal agencies are required to consult with Native Hawaiian organizations before taking any action that may have the potential to significantly affect Native Hawaiian resources, rights, or lands.” Although native Hawaiians are not technically a “recognized Federal tribe” as referenced in the above Executive and Secretarial Orders, we endeavor to fully engage and work directly with native Hawaiians as much as possible. At the time we published our proposed rule (80 FR 58820; September 30, 2015), we notified several Hawaiian organizations including the DHHL, Kamehameha Schools, the Office of Hawaiian Affairs, the Kahoolawe Island Reserve Commission (KIRC), and Kahea-The Hawaiian-Environmental Alliance. We contacted the Department of the Interior’s Office of Native Hawaiian Relations on September 28, 2015, to inform them of our proposed listing action. We also conducted in-person meetings with staff of the Department of Hawaiian Home Lands, Kamehameha Schools, and KIRC. We considered all comments and recommendations provided by these organizations in developing this final listing rule. At the time we prepare a proposed critical habitat rule for these species, we will notify these groups and organizations, and carefully consider any comments and new information they provide regarding habitat for these species.
Public Comments

Seven public commenters supported listing of all 49 Hawaiian Islands species. Seven public commenters opposed the listing of the 49 Hawaiian Islands species, and one of these commenters supported the intent of listing but opposed designation of critical habitat on their lands.

(10) Comment: One commenter supported this rule because of the facts and analysis stated in the proposed rule. Two commenters stated that humans need to be a voice for plants and animals, and that this listing will positively impact the conservation of many animals and positively lead other conversations in the right direction.

Our Response: We appreciate the comments and believe that listing status will help provide conservation benefits to the species and their habitats.

(11) Comment: One commenter stated that the 49 species also play a pivotal role in promoting tourism and building the economy of Hawaii and that they deserve to be put onto the Lists of Endangered and Threatened Wildlife and Plants. Two commenters stated that listing these species will attract wildlife enthusiasts and nature lovers from all around the world, and their spending and tourism helps to build and maintain sources of revenue in Hawaii; most markets within the islands depend on the tourism dollars that wildlife attracts.

Our Response: We do not consider economic consequences in our decisions to list or not list species as endangered or threatened under the Act. Section 4(b)(1)(a) of the Act specifies that listing determinations be made “solely on the basis of the best scientific and commercial data available.”

(12) Comment: One commenter stated that the potential negative impacts of listing to landowners is very small, as the vast majority of the habitat for these rare species occurs on State and Federal lands, or in private lands devoted to conservation.

Our Response: We agree that many of the 49 species occur or were known from State and Federal lands, or in undeveloped areas already dedicated to conservation. However, listing a species as endangered or threatened is based on the species’ biological status; the development of a proposed rule for critical habitat for these species will be completed in a separate rule, and the effects of critical habitat on landowners will be analyzed upon preparation of that proposed rule.

(13) Comment: One commenter stated that island residents have entirely lost historical and cultural opportunities and rights as a result of species protection enforcement and that those in the field of endangered species protection have a single focus, with little or no concern for cultural and historical values. Another commenter stated that this listing would cause a further loss for the public of cultural, historical, and economic resources. A third commenter stated that native Hawaiian society believes they should be able to manage their people, land, and resources autonomously.

Our Response: Listing a species as endangered or threatened does not cause loss of historical and cultural opportunities; in fact, it highlights the need to protect the characteristics that are unique to the Hawaiian Islands. We acknowledge that some economic impacts are a possible consequence of listing a species under the Act; for example, there may be costs to the landowner associated with the development of a habitat conservation plan (HCP). In other cases, if the landowner does not acquire a permit for incidental take (for animals), the landowner may choose to forego certain activities on their property to avoid violating the Act, resulting in potential lost income. However, the Act does not provide for the consideration of such impacts when making a listing decision. Section 4(b)(1)(a) of the Act specifies that listing determinations be made “solely on the basis of the best scientific and commercial data available.” The language provided by Congress in the Act thus precludes such costs from consideration in association with a listing determination. We work collaboratively with private landowners, and strongly encourage those with listed species on their property to work with us to develop incentive-based measures such as strategic habitat areas (SHAs) and HCPs, which have the potential to provide conservation measures that effect positive results for the species and their habitat while providing regulatory relief for landowners. The conservation and recovery of endangered and threatened species, especially of those in Hawaii that occur nowhere else in the world, and the ecosystems upon which they depend, is the ultimate objective of the Act, and the Service recognizes the vital importance of voluntary, nonregulatory conservation measures that provide incentives for landowners in achieving that objective. In regards to land management by native Hawaiians, see our response to Comment (9), above. The Act does provide for the consideration of potential economic impacts in the process of designating critical habitat (limited to activities that are funded, authorized, or carried out by a Federal agency), and that analysis will be conducted as we prepare a rule proposing critical habitat for the multi-island species.

(14) Comment: Four commenters were concerned that listing a species would entail removal of nonnative species with cultural significance, or removal of those used for food and sport hunting, and that control of nonnative ungulates would not be conducted humanely.

Our Response: Habitat destruction and modification by ungulates is a threat to 37 of the 39 plants, and to 9 of the 10 animals proposed for listing. Herbivory by ungulates is a threat to 27 of the 39 plants proposed for listing. Hawaii was inhabited as early as the 2nd century; therefore, hunting of game mammals is a relatively recent activity (Tomich 1986, p. 1). The first Polynesian settlers brought domestic pigs of southeast Asia (Sus scrofa or a species derived from Sus scrofa vittatus) with them that were small in size, domesticated, and allowed to run freely around habitations (Tomich 1986, p. 120). Cook brought English pigs on his first voyage to Hawaii and landed a boar and sow on Niihau in 1778 (Tomich 1986, p. 121). Goats and European boars were introduced and released (on Niihau in 1778) by ship captains with the intent of establishing feral populations of these animals to be an available food source in future visits to the islands. Cattle (Bos taurus) and domestic sheep (Ovis aries) were released in 1794, by Vancouver. Deer were released later; first, axis deer in 1867, and then mule deer (black-tailed deer) in 1961 (Tomich 1986, pp. 127, 133, 141, 150, 158). These ungulates multiplied rapidly, with immense negative impacts to native vegetation (Loope 1988, pp. 274–276). The need for control of feral cattle was recognized as early as 1918, by C.S. Judd (Tomich 1986, p. 146). The commenter may be referring to the Federal court order mandating the removal of sheep and goats for protection of the palila (Loxioides bailleui), an endangered bird endemic to Hawaii. Aerial hunting is an efficient control methods and was chosen by the State to comply with this order. Carcasses taken during hunts (in both 2014 and 2015) were available to the permitted public for salvage (DLNR 2014, in litt.; DLNR 2015, in litt.). Aerial hunting is not conducted by the Service in Hawaii.

(15) Comment: One commenter stated that once species are listed for protection under the Act, there is no public recourse.

Our Response: There is public recourse after a rulemaking is published in the Federal Register. Under the Act,
an interested person may petition to add a species to, or to remove a species from, either of the Lists of Endangered and Threatened Wildlife and Plants. Within 12 months of the petition, the Secretary will make a finding as to whether the petition presents substantial scientific or commercial information indicating that the petitioned action may be warranted. Persons may also petition to designate or revise a critical habitat designation. Our petition regulations are set forth at 50 CFR 424.14.

(16) Comment: Two commenters expressed concern that the magnitude of the proposed listing rule and the subsequent designation of critical habitat will have negative effects on Hawaii’s economy, property values, and land use.

Our Response: We understand there is confusion and concern about the effects of listing the 49 multi-island species. Listing provides certain protections to the species under the Act. Section 7 of the Act states that each Federal agency (through consultation) shall insure that any action authorized, funded, or carried out by the agency is not likely to jeopardize the continued existence of any endangered or threatened species. For endangered species of fish or wildlife, section 9 of the Act prohibits any person subject to the jurisdiction of the United States to import or export; “take” (defined as harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt any of these actions) within the United States or the territorial sea of the United States; take upon the high seas; deliver, receive, carry, transport, or ship in interstate or foreign commerce in the course of a commercial activity; or sell or offer for sale in interstate or foreign commerce. For endangered plants of fish or wildlife, section 9 of the Act prohibits any person subject to the jurisdiction of the United States to import or export; deliver, receive, carry, transport, or ship in interstate or foreign commerce in the course of a commercial activity; sell or offer for sale in interstate or foreign commerce; remove and reduce the species to possession from areas under Federal jurisdiction; maliciously damage or destroy any such species on areas under Federal jurisdiction; or remove, cut, dig up, or damage or destroy any species in knowing violation of any State law or regulations or in the course of any violation of a State criminal trespass law. Section 10 of the Act provides for permitting of actions that may enhance the propagation or survival of the species, or that may “take” a species. We acknowledge that some economic impacts are a possible consequence of listing a species under the Act; for example, there may be costs to the landowner associated with the development of an HCP. In other cases, if the landowner does not acquire a permit for incidental take, the landowner may choose to forego certain activities on their property to avoid violating the Act, resulting in potential lost income. However, the statute does not provide for the consideration of such impacts when making a listing decision. Listing determinations are made “solely on the basis of the best scientific and commercial data available.” This rule only lists the 49 species from the Hawaiian Islands; it does not designate critical habitat.

(17) Comment: Two commenters stated that listing species and designating critical habitat on private property in Hawaii will alienate ranchers, a group that can help with species and habitat conservation. The commenters state that conservation can best be achieved by cooperation and coordination with private landowners.

Our Response: This rule only addresses the listing of 49 species from the Hawaiian Islands and does not designate critical habitat. We agree that partnerships can provide benefits for listed species and their habitat through development of conservation plans and implementation of management actions.

(18) Comment: One commenter stated that the Service should include the public now, not after designating critical habitat, with outreach, public forums, presentations, and meetings on every island for community groups, industry and business groups, the Soil and Water Conservation Districts, the Farm Bureau, Hawaii Cattlemen’s Council, and schools.

Our Response: As described above, the publication of the proposed listing rule did not include a critical habitat proposal. We opened a 60-day comment period on the proposed listing rule, obtained extensive peer review, published notices in numerous local newspapers, reopened the comment period, and held a public hearing and information meeting. We considered all comments we received in preparing this final listing rule, and this rule incorporates new, substantive information provided to us by commenters.

Summary of Changes From the Proposed Rule

In preparing this final rule, we reviewed and fully considered comments from the public and peer reviewers on the proposed rule, and incorporated the following substantive changes into this final rule. None of the new information we received changed our evaluation of the threats to these species or our determinations in this final rule that they are endangered.

(1) We made revisions to the demographic status or distribution of 31 species of plants, based on comments from peer reviewers, by correcting current locations or numbers of individuals for: Asplenium diellaciniatum, Calamagrostis expansa, Cyanea kaauaulesiensis, Cyclosorus boydaiae, Cyrtandra hematos, Dryopteris glabra var. pusilla, Exocarpos menziesii, Gardenia renyi, Huperzia stemmermanniae, Joinvillea ascendens ssp. ascendens, Kadua fluviatilis, Microlepia strigosa var. maulensis, Myrsine fosbergii, Nothocentrum latifolium, Ochrosia haleakalae, Phyllostegia brevidens, P. helleri, P. stachyoides, Portulaca villosa, Pritchardia barkeri, Pseudognaphalium sandwicensium var. molokaeness, Ranunculus hawaiensis, R. maulensis, Sanicula sandwicensis, Santalum involutum, Schiedea diffusa ssp. diffusa, S. pubescens, Sicyos lanceoloides, S. macrophyllus, Stenogyne kaalae ssp. sherffii, and Wikstroemia skottsbergiana.

(2) We made revisions to specific threats to 31 plant species, based on comments from peer reviewers, including: Asplenium diellaciniatum, Calamagrostis expansa, Cyanea kaauaulesiensis, Cyclosorus boydaiae, Cyperus neokanthianthus, Cyrtandra hematos, Deparia kaalaena, Dryopteris glabra var. pusilla, Exocarpos menziesii, Huperzia stemmermanniae, Hypolepis hawaiensis var. maulensis, Joinvillea ascendens ssp. ascendens, Kadua fluviatilis, K. haupuensis, Labordia lorenciana, Lepidium orbiculare, Microlepia strigosa var. maulensis, Myrsine fosbergii, Nothocentrum latifolium, Ochrosia haleakalae, Phyllostegia brevidens, P. helleri, P. stachyoides, Portulaca villosa, Sanicula sandwicensis, Santalum involutum, Schiedea diffusa ssp. diffusa, S. pubescens, Sicyos lanceoloides, Solanum nelsonii, and Wikstroemia skottsbergiana.

(3) We corrected the taxonomy for the nonnative plant, California grass, from Brachiaria mutica to Urochloa mutica.

(4) We added further references concerning genetic research that supports differences in populations of the band-rumped storm-petrel breeding in different oceans and archipelagos.

(5) We added additional information on current nesting sites of the band-rumped storm-petrel on Lehua Island, Kauai, Molokai (coastal), Maui (coastal), Hawaii Island (Hawaii Volcanoes National Park), and subalpine habitat
(8) We added caddisflies as potential threats to the orangeblack Hawaiian damselfly by Jackson’s chameleons, predation of the orangeblack Hawaiian damselfly on coastal areas (Hylaeus anthracinus, H. facilis, H. longiceps).

(9) We made revisions to the demographic status or distribution of the yellow-faced bees Hylaeus anthracinus, H. facilis, and H. longiceps.

(10) We added tsunami as a threat to all seven yellow-faced bees.

We changed “Australian colletid” to “‘alien Hylaeus’ bees, and included competition with sweat bees (Lasiosglossum spp.) as a threat to the yellow-faced bees.

We noted that transmission of diseases carried by nonnative insects through shared food sources could be a threat to the yellow-faced bees, but we have no specific evidence of this type of disease transmission.

We added drought as a potential threat to all seven yellow-faced bees.

We added infiltration of waste water, fertilizers, or pesticides resulting from development activities as a potential threat to the anchialine pool shrimp.

We added sea-level rise and coastal inundation as a potential threat to Solanum nelsonii, as occurrences in low-lying coastal areas are at risk, and to the anchialine pool shrimp, as these events could increase connectivity of anchialine pools leading to further incursion by nonnative fish from one pool to another.

Background

Please refer to the proposed listing rule for the 49 species from the Hawaiian Islands (80 FR 58820; September 30, 2015), available at http://www.regulations.gov (see ADDRESSES), for the following information:

Hawaiian Islands Species Addressed in This Final Rule

Table 1A (plants) and Table 1B (animals), below, provide the common name, scientific name, and range (by Hawaiian Island) for the 49 species addressed in this final rule.
Summary of Biological Status of the 49 Hawaiian Islands Species

The Act directs us to determine whether any species is an endangered species or a threatened species because of any one of the factors listed in section 4(a)(1). We summarize, below, the biological condition of, and factors affecting, each of the 49 species and determine whether each species is endangered or threatened. The summaries below include only brief lists of factors affecting each species. Each of these factors is fully considered, in detail, in the subsequent section.

Summary of Factors Affecting the 49 Species From the Hawaiian Islands.

Climate Change Vulnerability Assessment for the Hawaiian Plants

Twenty-seven of the plant species described below were evaluated for their vulnerability to climate change as part of a comprehensive vulnerability analysis of native Hawaiian plants, as indicated in Table 2 (Fortini et al. 2013, 134 pp.). This analysis used “climate envelopes” (geographic ranges encompassing suitable climate for each species, as defined by temperature and moisture (Fortini et al. 2013, p. 17)) developed from field records by Price et al. (2012) to project each species’ potential range in the year 2100. The location and spatial extent of these future ranges, and their overlap with current ranges, allows calculation of a vulnerability score. Estimates of vulnerability based on climate-envelope modeling are conservative in that they do not take into account potential changes in interspecific interactions such as predation, disease, pollination, herbivory by these animals (Anderson et al. 2007, in litt.; Hawaii Administrative

these ongoing threats and further reduce the likelihood that these species will persist in the future.

Plants

Asplenium diellaciniatum (no common name, NCN), a terrestrial or epipetric (growing on rocks) fern in the spleenwort family (Aspleniaceae), is endemic to Kauai (Palmer 2003, p. 117). Little is known of the historical distribution of this species. It was described from a collection from “Halemanu,” the Knudsen homestead area on western Kauai. Currently, this fern is found in montane mesic forest at Kawaiiki and Kalaumahulu Ridge (Palmer 2003, p. 117; HBMP 2010; Lorence et al. 2013, p. 167) in 3 occurrences, totaling approximately 100 individuals, 30 of which are in an ungulate exclusion (TNCH 2007; HBMP 2010; Lorence et al. 2013, p. 167; Wood 2013, in litt.; Plant Extinction Prevention Program (PEPP) 2014, pp. 33, 59; Kishida 2015, in litt.; Williams 2015, in litt.).

Feral pigs (Sus scrofa), goats (Capra hircus), and black-tailed deer (Odocoileus hemionus columbianus) modify and destroy the habitat of Asplenium diellaciniatum on Kauai, with evidence of the activities of these animals reported in the areas where A. diellaciniatum occurs (Service 1999, p. 72; HBMP 2010). Feral pigs, goats, and black-tailed deer also forage on A. diellaciniatum. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; Hawaii Administrative
Rule–Hawaii Department of Land and Natural Resources (HAR–DLNR) 2010, in litt.). Nonnative plants, such as Adiantum hispidulum (rough maidenhair fern), Blechnum appendiculatum (no common name), Erigeron karvinskianus (daisy fleabane), and Rubus argutus (prickly Florida blackberry), compete with Asplenium diellaciniatum, modify and destroy native habitat, and displace native plant species by competing for water, nutrients, light, and space; they may also produce chemicals that inhibit growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; Williams 2015, in litt.). Additionally, the small number of individuals of Asplenium diellaciniatum limits this species’ ability to adapt to environmental change.

The remaining occurrences of Asplenium diellaciniatum are at risk; Asplenium diellaciniatum numbers are decreasing on Kauai, and both the species and its habitat continue to be negatively affected by destruction and modification by ungulates and by direct competition by nonnative plants, combined with herbivory by nonnative ungulates. Because of the threats described above, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Calamagrostis expansa (Maui reedgrass), a perennial in the grass family (Poaceae), is known from the islands of Maui and Hawaii (O’Connor 1999, p. 1509; Wagner and Herbst 2003, p. 59). Historically, C. expansa was known from wet forest, open bogs, and bog margins on Maui at 17 locations on east Maui, and in a large occurrence covering nearly the entire summit on west Maui, and was discovered in 7 occurrences totaling approximately 750 individuals on the island of Hawaii in 1995 (O’Connor 1999, p. 1509; HBMP 2010; Smithsonian National Museum of Natural History (NMNH) Botany Collections 2014, in litt.; Vetter 2015, in litt.). Currently, this species is known from 13 to 33 occurrences totaling fewer than 750 individuals. This species is rhizomatous (growing from underground stems), making it difficult to determine exact numbers of distinct individuals and populations, and botanists’ estimations vary. On the island of Maui, there are 2 occurrences in the west Maui Mountains (approximately 100 individuals) and from 7 to as many as 40 occurrences in the east Maui Mountains (totaling at least 200 individuals), often along ridges above 6,000 feet (1,830 meters (m)), or on raised hummocks in wet forest and bogs, in the montane wet ecosystem (Wood 2005a, in litt.; TNCH 2007; Welton 2008 and 2010, in litt.; Fay 2010, in litt.; HBMP 2010; Oppenheimer 2010, in litt.; Vetter 2015, in litt.). Most of the east Maui occurrences are in exclosures (Duvall 2015, in litt.). On the island of Hawaii, there are 3 occurrences in the Kohala Mountains (totaling several hundred individuals) and 1 occurrence of 6 individuals last observed in 2004 in Upper Waiakea Forest Reserve, in the montane wet ecosystem (Perry 2006, in litt.; TNCH 2007; HBMP 2010; Perry 2015, in litt.).

Feral pigs modify and destroy the habitat of Calamagrostis expansa on Maui and Hawaii, with evidence of the activities of feral pigs reported in the areas where C. expansa occurs on east Maui, and on Hawaii Island in the Kohala Mountains and in the Waiakea Forest Reserve (Hobdy 1996, in litt.; Perlman 1996, in litt.; Wood 1996, in litt.; Perry 2006, in litt.; HBMP 2010). Some occurrences on east and west Maui are currently fenced; however, ungulate and weed control activities must be maintained to provide continued protection (Duvall 2015, in litt.). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.; Rats have been attributed by biologists as a threat to C. expansa at Laupahoehoe National Area Reserve (NAR) on Hawaii Island, by consuming seeds (HBMP 2010). Nonnative plants compete with this species and modify and destroy native habitat, negatively affecting C. expansa on east and west Maui and Hawaii Island. Additionally, the small number of individuals limits this species’ ability to adapt to environmental change. Fortini et al. (2013, p. 68) found that, as environmental conditions are altered by climate change, C. expansa is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to C. expansa described above (see “Climate Change” under Factor E. Other Natural or Manmade Factors Affecting Their Continued Existence, below).

The remaining occurrences of Calamagrostis expansa are at risk: C. expansa populations are decreasing on Maui and Hawaii Island, and this species continues to be negatively affected by habitat modification and destruction by feral pigs, and by direct competition from nonnative plants, combined with herbivory by feral pigs and rats. This species is vulnerable to the effects of climate change, and the likelihood of its persistence with the impacts of climate change, exacerbated by the ongoing threats, is low. We find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Cyanea kauaulaensis (CN), a shrub in the bellflower family (Campanulaceae), is endemic to Maui (Oppenheimer and Lorence 2012, p. 15). Cyanea kauaulaensis occurs on leeward west Maui, on talus or basalt boulder-strewn slopes along perennial streams from 2,400 to 3,000 ft (730 to 900 m), in the lowland wet ecosystem (TNCH 2007; HBMP 2010; Oppenheimer and Lorence 2012, pp. 17–18). This species was first collected during a botanical survey in 1989. Further surveys (in 2008, 2009, and 2011) revealed more individuals, and study of the collections indicated that it was a new species of Cyanea. Currently, C. kauaulaensis is known from Kauaula Valley (approximately 100 individuals) (Oppenheimer and Lorence 2012, pp. 15–16, 20; Duvall 2015, in litt.; Oppenheimer 2015, in litt.). The greatest threat to this species currently are the low numbers of occurrences and individuals, its limited range, poor seedling recruitment, and loss of pollinators and dispersal agents (Oppenheimer and Lorence 2012, pp. 20–21; Duvall 2015, in litt.). Rats and slugs are noted as a threat to Cyanea kauaulaensis because of their herbivory and seed predation. Additionally, nonnative plants modify and destroy native habitat and outcompete native species, negatively affecting C. kauaulaensis and its habitat. Although feral ungulates are present on west Maui, the known occurrences of C. kauaulaensis may be less at risk from this particular threat because of their location in extremely steep and rugged terrain; however, erosion, landslides, flooding, and drying due to climate change affect this species because of the terrain where it occurs (Oppenheimer and Lorence 2012, pp. 20–21; Duvall 2015, in litt.). The remaining occurrence of Cyanea kauaulaensis is at risk. Because of the threats described above, we find that this species is endangered throughout all of its range, and,
Metrosideros-Acacia of stream courses in dense-wet exposed, rocky, or moss-covered banks. Typical habitat for C. boydiae (Thelypteridae) (Pukui and Elbert 1986, p. 186; Palmer 2003, pp. 87–88). C. boydiae is a small to medium-sized member of the Thelypteroid family. The species is known from near sea level to 4,400 ft (1,350 m), with other native ferns, grasses, and dwarfed woody species, in the lowland wet and montane wet ecosystems. (Hillebrand 1888, p. 572; Medeiros et al. 1993, p. 87; Wagner [W.H.] et al. 1999, p. 156; TNCH 2007; HBMP 2010; Gates 2015, in litt.). Historically, this fern was known from near sea level to 4,400 ft (1,350 m) on Oahu, Maui, and Hawaii Island. (Hillebrand 1888, p. 572; Medeiros et al. 1993, pp. 86–87; Palmer 2003, pp. 87–88). Currently, C. boydiae is found on east Maui, in 13 occurrences totaling approximately 400 individuals (Palmer 2003, pp. 87–88; Oppenheimer 2008, in litt.; Fay 2010, in litt.; HBMP 2010; Welton 2010, in litt.). On east Maui, there are at least 11 occurrences (over 1,000 individuals) in the lowland wet and montane wet ecosystems, and on Oahu there are 2 occurrences in the Koolau Mountains in the montane wet ecosystem, totaling 40 individuals, and one historic occurrence in Kaluanui Drainage, but the status of the species at this location is currently unknown (Palmer 2003, pp. 87–88; Wood 2007a, in litt.; Kam 2008, in litt.; Oppenheimer 2008 and 2010, in litt.; HBMP 2010; Welton 2010, in litt.; Oppenheimer 2015, in litt.). The historical occurrence of C. boydiae on the island of Hawaii was found in the lowland wet ecosystem (HBMP 2010).

Feral pigs modify and destroy the habitat of Cyclosorus boydiae on Oahu and Maui, with evidence of their activities reported at three occurrences of C. boydiae on east Maui and at two occurrences on Oahu. However, on east Maui, two of the five occurrences are protected in Haleakalā National Park (Wood 2007a, in litt.; HBMP 2010; Kawai 2011, in litt.). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction, and establish and spread of nonnative plants. Currently, there are fewer than 100 individuals at two locations on Molokai (Duvall 2015, in litt.; Oppenheimer 2015, in litt.). Feral pigs and goats modify and destroy the habitat of Cyrtandra hematos on Molokai, with evidence of the activities of feral pigs reported in the areas where this species was last observed (HBMP 2010). Habitat modifications resulting from activities of feral pigs that affect C. neokunthianus include direct destruction of this species and other native plants, disruption of topsoil leading to erosion, and establishment and spread of nonnative plants. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Additionally, nonnative plants modify and destroy native habitat and outcompete native species, also negatively affecting habitat of C. neokunthianus on west Maui. Nonnative animals and plants (Duvall 2015, in litt.). Because of the threats described above, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Cyperus neokunthianus is at risk and continues to be negatively affected by modification and destruction by nonnative animals and plants (Duvall 2015, in litt.). Because of the threats described above, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.
Destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.) are sometimes undertaking to nonnative plants. Additional, nonnative plants modify and destroy native habitat and outcompete this and other native species for water, nutrients, light, and space, or a nonnative plant may produce chemicals that inhibit growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; Service 2015, in litt.). This species experiences reduced reproductive vigor due to low numbers and lack of regeneration, leading to diminished capacity to adapt to environmental changes, and thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilsen 1997, p. 361).

This species hybridizes with C. grayana (Oppenheimer 2015, in litt.; Fortini et al. 2013, p. 72) found that, as environmental conditions are altered by climate change, C. hematos is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions.

Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to C. hematos described above.

The remaining occurrences of Cyrtandra hematos are at risk. The known individuals are restricted to a small area on Molokai and continue to be negatively affected by habitat modification and destruction by ungulates and nonnative plants, and by direct competition with nonnative plants. The low number of remaining individuals limits this species’ ability to adapt to environmental changes. Hybridization results in a reduction of the numbers of C. hematos. The effects of climate change are likely to further exacerbate these threats. We find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Dryopteris kaalaana (NCCN), a small, terrestrial fern in the ladyfern family (Athriaceae), is recognized as a distinct taxon by Palmer (2003, pp. 109–111) and Christenhusz et al. (2013, p. 16). This fern is historically known from the islands of Kauai, Maui, and Hawaii, on rocky stream banks and in wet forest, in the lowland mesic and lowland wet ecosystems (Palmer 2003, pp. 109–111; TNCH 2007; HBMP 2010; Oppenheimer and Bustumante 2014, p. 103; PEPF 2014, p. 95). Deparia kaalaana was presumed extinct on all three islands where it previously occurred until one individual was discovered on east Maui, growing along a perennial stream on the western side of a small pool with other native ferns and herbaceous plants (Oppenheimer and Bustomante 2014, pp. 103–107; PEPF 2014, p. 95).

Feral pigs modify and destroy habitat of Deparia kaalaana by facilitating the spread of nonnative plants, which converts vegetation communities from native to nonnative (Cuddihy and Stone 1990, p. 63; Oppenheimer and Bustomante 2014, p. 106). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as Blechnum appendiculatum (NCCN), Clidemia hirta (Koster’s curse), Hedychium gardnerianum (kahili ginger), Prunella vulgaris (selfheal), and Rubus argutus, are capable of displacing all of the riparian habitat elements, including native plants, in the area where D. kaalaana occurs. Nonnative species such as Deroceras laeve and Limax maximus are common in the area and can consume young plants (Joe and Daehler 2008, pp. 252–253). Flash floods and drought can damage and destroy this species at its only known location. A single catastrophic event may result in extirpation of the remaining individual.

The remaining occurrence of Deparia kaalaana is at risk, and both the species and its habitat on Hawaii, Maui, and Kauai continues to be negatively affected by modification and destruction by nonnative ungulates, and by direct competition with nonnative plants, combined with herbivory by nonnative ungulates and slugs. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to D. kaalaana described above. We find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Dryopteris glabra var. pusilla (holi) is a small, terrestrial fern in the wood fern family (Dryopteridaceae) (Palmer 2003, p. 144). Habitat for D. glabra var. pusilla is deep shade on rocky, mossy streambeds in wet forest at about 4,000 ft (1,200 m), in the montane wet ecosystem on Kauai (Palmer 2003, p. 144; TNCH 2007; HBMP 2010). Historically, D. glabra var. pusilla was known from the Kawailoa stream area (HBMP 2010). Currently, this variety is known from fewer than 250 individuals in the Alakai Wilderness Preserve on Kauai (National Tropical Botanical Garden [NTBG] Herbarium Database 1995, in litt.; HBMP 2010; Wood 2015, in litt.).

Dryopteris glabra var. pusilla is at risk from habitat modification and destruction by nonnative plants, feral pigs, and black-tailed deer (Wood 2015, in litt.). Most individuals occur in the Alakai Wilderness Preserve; however, only portions of the Preserve are fenced to prevent ungulate incursion. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants modify and destroy native habitat and outcompete this and other native species for water, nutrients, light, and space, or a nonnative plant may produce chemicals that inhibit growth of other plants, also negatively affecting habitat of D. glabra var. pusilla (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74). Herbivory by rats and slugs is a threat to D. glabra var. pusilla (Wood 2015, in litt.). In addition, the limited number of occurrences and few individuals lead to a diminished capacity to adapt to environmental changes, thereby lessening the probability of long-term persistence, and a single catastrophic event may result in extirpation of remaining occurrences. Landslides along streambanks have been known to destroy populations of this fern (Wood 2015, in litt.).

Fortini et al. (2013, p. 74) found that, as environmental conditions are altered by climate change, D. glabra var. pusilla is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to D. glabra var. pusilla described above. Because of these threats, we find that this variety is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Exocarpos menziesii (heau) is a shrub in the sandalwood family (Santalaceae) (Wagner et al. 1999, p. 1218). This species occurs in Metrosideiros shrubland or drier forest areas, and on lava flows with sparse vegetation, from 4,000 to 6,900 ft (1,200 to 2,100 m), in the montane dry ecosystem on the island of Hawaii (Wagner et al. 1999, p.
1218; TNCH 2007), and historically occurred in the lowland mesic (Lanai and Hawaii Island) and montane mesic ecosystems (Hawaii Island) (TNCH 2007; Bishop Museum 2014). *Exocarpos menziesii* is historically known from the island of Lanai and was wide-spread on the island of Hawaii (Wagner et al. 1999, p. 1218; TNCH 2007; Bishop Museum 2014). Currently, there are seven scattered occurrences on Hawaii Island, six of which consist of only a few individuals, the seventh totals an estimated 1,600 individuals (PEPP 2013, pp. 10, 33; Thomas 2014, in litt.; Evans 2015a, in litt.; Orlando 2015, in litt.; Perry 2015, in litt.). There are no currently known occurrences of this species on Lanai.

Feral goats, mouflon, and sheep modify and destroy the habitat of *Exocarpos menziesii* on Hawaii Island, and may forage on this species, with evidence of the activities of these animals reported in the areas where this species occurs (Service 2015, in litt.). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Feral ungulate management is incorporated into the U.S. Army’s Pohakuloa Training Area (PTA) management plan, and plants at PTA may be provided some protection within fenced management units in the training area (Evans 2015a, in litt.); however, it is reported that feral goats are still being removed from within the fenced area (Nadig 2015, in litt.). Any individuals of *E. menziesii* outside of fenced exclosures or outside of the managed area are at risk. Additionally, nonnative plants modify and destroy native habitat and outcompete this and other native species for water, nutrients, light, and space, or a nonnative plant may produce chemicals that inhibit growth of other plants, also negatively affecting habitat of *E. menziesii* (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74).

Occurrences and numbers of individuals have declined on the island of Hawaii (HBMP 2010; Thomas 2014, in litt.), where *E. menziesii* was once widely distributed from the south to the west sides of the island, and are now restricted to seven locations. Consequently, *E. menziesii* experiences reduced reproductive vigor due to reduced levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby reducing the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361). Fire is a likely threat to this species; although the U.S. Army has constructed firebreaks and has standard operating procedures (SOPs) in place for prevention and suppression of wildfires at the PTA, wildfires may encroach from other areas (U.S. Army Garrison 2013, in litt.). The small number of individuals outside the larger occurrence at the PTA limits this species’ ability to adapt to environmental changes. Fortini et al. (2013, p. 76) found that, as environmental conditions are altered by climate change, *E. menziesii* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *E. menziesii* described above.

The remaining occurrences of *Exocarpos menziesii* are at risk from modification and destruction by feral goats, mouflon, and sheep; from herbivory by these ungulates; and by the small number of remaining occurrences. Fire is a likely threat to this species. The effects of climate change are likely to exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range. *Festuca hawaiiensis* (NCN) is a cespitose (growing in tufts or clumps) annual in the grass family (Poaceae) (O’Connor 1999, p. 1547). Typical habitat for this species is dry forest at 6,500 ft (2,000 m), in the montane dry ecosystem (O’Connor 1999, p. 1547). Historically, *F. hawaiiensis* occurred at Hualalai and Puu Huluhulu on the island of Hawaii, and possibly at Ulapakua on Maui; however, it is no longer found at these sites (O’Connor 1999, p. 1547). Currently, *F. hawaiiensis* is only known from the U.S. Army’s PTA on the island of Hawaii (HBMP 2010). These remaining four occurrences are within an area of less than 10 square miles (mi) (26 square kilometers (km)) and total approximately 1,500 individuals (U.S. Army Garrison 2013, in litt.; Evans 2015a, in litt.). Habitat destruction and modification by feral goats and sheep is a threat to *Festuca hawaiiensis*. These ungulates also browse on native plants such as grasses, iqiku (> *Cenchrus setaceus*; fountain grass), are naturalized in the area and outcompete *F. hawaiiensis* and other native plants. 

Occurrences and numbers of individuals are declining on the island of Hawaii, and *F. hawaiiensis* experiences reduced reproductive vigor due to reduced levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby reducing the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361; HBMP 2010). Fire is a likely threat to this species, especially because of the ingress of nonnative grass species. Although the U.S. Army has constructed firebreaks and has SOPs in place for prevention and suppression of wildfires at the PTA, fires may encroach from other areas, exacerbated by fuel loads provided by nonnative grasses (U.S. Army Garrison 2013, in litt.). Fortini et al. (2013, p. 76) found that, as environmental conditions are altered by climate change, *F. hawaiiensis* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *F. hawaiiensis* described above.

The remaining occurrences of *Festuca hawaiiensis* are at risk; *F. hawaiiensis* occurrences have decreased on Hawaii Island, as it no longer occurs at Hualalai and Puu Huluhulu, and the species may be extirpated from Maui. This species continues to be negatively affected by habitat modification and destruction by ungulates and by direct competition with nonnative plants, combined with herbivory by ungulates. Fire is a likely threat to the species and its habitat. The effects of climate change are likely to further exacerbate these threats. Because
of the threats described above, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Gardenia remyi (nanu) is a tree in the coffee family (Rubiacaeae) (Wagner et al. 1999, p. 1133). Typical habitat for G. remyi is mesic to wet forest from 190 to 3,000 ft (60 to 760 m), in the lowland mesic (Kauai, Molokai, and Hawaii Island) and lowland wet ecosystems (Kauai, Molokai, Maui, and Hawaii Island) (Wagner et al. 1999, p. 1133; TNCH 2007; HBMP 2010; Oppenheimer 2015, in litt.). Historically, this species was found on the island of Hawaii at Wao Kele O Puna NAR, Waiakea Forest Reserve, Pahoa, and Hakalau Nui. On Maui, this species was known from Wailuaiaki and Waikami in the Koolau Forest Reserve, and from Papaoa and Kipahulu. On Molokai, this species was known from Keopukalao, Pukoo, Honomuni, Halawa, and Kaluaha (HBMP 2010). On Kauai, this species ranged across the island, and was known from Haleleka, Kealia, Moloha, and Lihue-Koloa Forest Reserves, including Hanakapi'ai Valley, Mahaulepu, and east Wahiawa Bog. Currently, G. remyi is known from 16 occurrences totaling approximately 90 individuals on the islands of Hawaii, Maui, Molokai, and Kauai (Wood 2005b, in litt.; Oppenheimer 2006, in litt.; Perry 2006, in litt.; Welton 2008, in litt.; Agorastos 2010, in litt.; HBMP 2010; Perlman 2010, in litt.). An occurrence on east Maui has been observed to decline from 14 individuals in 1992, to only 1 individual by 2015 (Duvall 2015, in litt.).

Habitat modification and destruction by feral pigs, goats, and axis deer negatively affects Gardenia remyi and areas suitable for its reintroduction (Perry, in litt. 2006; PEP 2008, p. 102; HBMP 2010). Feral pigs and signs of their activities have been reported at occurrences of G. remyi on the island of Hawaii, on Kauai, on east and west Maui, and on Molokai. Goats and signs of their activities are reported at the occurrences G. remyi on Kauai and Molokai. Axis deer and signs of their activities are reported at the occurrences of G. remyi on Molokai (HBMP 2010). Herbivory by these ungulates is a threat to G. remyi, as they browse on leaves and other parts of almost any woody or fleshy plant species. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as Clidemia hirta, Hedychium gardnerianum, Psidium cattleianum (strawberry guava), and Tibouchina herbacea on Hawaii Island (Perry 2006, in litt.); Lantana camara (lantana), Psidium guajava, and Rubus argutus on Kauai (Wood 2004, in litt.); Ageratina adenophora (Maui pamakani), Rubus rosifolius (thimbleberry), and T. herbacea on Maui (HBMP 2010); and C. hirta and P. cattleianum on Molokai (HBMP 2010), modify and destroy native habitat of G. remyi and outcompete this and other native plants for water, nutrients, light, and space in areas where G. remyi occurs on these islands. Landslides are a threat to occurrences and habitat of G. remyi on Hawaii Island (Perry 2006, in litt.). Lack of pollination was suggested as the cause for abortion of immature fruits that were seen among plants on Hawaii Island (PEPP 2010, p. 73). Similarly, Agorastos (2011, in litt.) reported no viable seed production in the wild or within ex situ collections and no recruitment in the wild among the 14 individuals observed on the island of Hawaii, Maui, and Molokai, for unknown reasons (Duvall 2015, in litt.; Oppenheimer 2015, in litt.). Some species of Gardenia are dioecious (male and female flowers on separate plants) and although the breeding system of G. remyi is currently unknown, this may be a cause of failure to produce viable seed in isolated individuals (Lorence 2015, in litt.). Predation of seeds by rats is reported as a threat to individuals on Kauai (NTBG 2008, in litt.). Fortini et al. (2013, p. 76) found that, as environmental conditions are altered by climate change, G. remyi is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to G. remyi described above.

The remaining occurrences of Gardenia remyi are at risk. Gardenia remyi continues to be negatively affected by habitat modification and destruction by ungulates, and by direct competition from nonnative plants, combined with herbivory by ungulates and seed predation by rats. Natural events such as landslides are a threat to occurrences on the island of Hawaii. Pollination and seed production are therefore limited. Low numbers of individuals (90 total individuals distributed across 4 islands) makes this species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes. The effects of climate change are likely to exacerbate these threats. Because of the threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Huperzia stemmermanniae (NCN) is an epiphytic hanging fir-moss (a fern ally) in the club moss family (Lycopodiaceae) (Palmer 2003, pp. 257–259). This species is epiphytic on rough bark of living trees or fallen logs in Metrosideros polymorpha-Acacia koa forest on the island of Hawaii, from 3,200 to 3,800 ft (975 to 1,160 m), in the montane wet ecosystem (Medeiros et al. 1996b, p. 93; Palmer 2003, pp. 257, 259; TNCH 2007; HBMP 2010). There is little information available on the historical range of this species. Huperzia stemmermanniae was first collected in 1981, from two occurrences totaling 10 individuals in Laupahoehoe NAR on the island of Hawaii, and was mistakenly identified as H. mannii (Medeiros et al. 1996b, p. 93; HBMP 2010). One individual occurred in Kaapahu Valley on east Maui, but has not been relocated since 1995 (Perry 2006, in litt.; Welton 2008, in litt.; HBMP 2010; Conry 2012, in litt.; Perry 2015, in litt.). In 2006, there were estimated to be as many as 20 individuals in Laupahoehoe (Perry 2006, in litt.). Currently, there are only five individuals remaining due to prolonged drought conditions (Perry 2015, in litt.). Feral pigs, goats, axis deer, and cattle modify and destroy the habitat of Huperzia stemmermanniae on Maui, and feral pigs modify and destroy the habitat of this species on Hawaii Island (Medeiros et al. 1996b, p. 96; Wood 2003, in litt.; HBMP 2010). Herbivory by these ungulates is a threat to H. stemmermanniae. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as Clidemia hirta, Miconia calvescens, Psidium cattleianum, and Cyathea cooperi (Australian tree fern), modify and destroy the forest habitat that supports the native species upon which this epiphytic plant grows, and drought also negatively affects this species and its habitat (Medeiros et al. 1996b, p. 96; Perry 2006, in litt.; HBMP 2010). Huperzia stemmermanniae is a small fern that is epiphytic on rough bark of living trees or fallen logs in Metrosideros polymorpha-Acacia koa forest on the island of Hawaii, from 3,200 to 3,800 ft (975 to 1,160 m), in the montane wet ecosystem (Medeiros et al. 1996b, p. 93; Palmer 2003, pp. 257, 259; TNCH 2007; HBMP 2010).
experiences reduced reproductive vigor due to reduced levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361; HBMP 2010). Fortini et al. (2013, p. 77) found that, as environmental conditions are altered by climate change, H. stemmermanniae is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to H. stemmermanniae described above.

The remaining occurrences of Hypolepis stemmermanniae are at risk. The known individuals are restricted to a small area on Hawaii Island, and this species continues to be negatively affected by habitat modification and destruction. The low numbers of individuals H. stemmermanniae reduces the probability of its long-term persistence. The effects of climate change are likely to further exacerbate these threats. Because of the threats described above, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Hypolepis hawaiiensis var. mauensis (oula) is a small terrestrial member of the bracken fern family (Dennstaedtiaceae), and is recognized as a distinct taxon by Palmer (2003, pp. 168–169). Hypolepis hawaiiensis var. mauensis occurs in wet forest, predominately in the montane wet ecosystem (Palmer 2003, pp. 168–170; Oppenheimer 2015, in litt.). This variety is historically known from west Maui (Palmer 2003, pp. 168–170). Currently, 5 to 10 individuals are known from openings between bogs on west Maui, and a few individuals are known from east Maui (Maui Nui Task Force (MNTF) 2010, in litt.).

Nonnative plants, such as Tibouchina herbacea, modify and destroy the habitat of Hypolepis hawaiiensis var. mauensis on east and west Maui (HBMP 2010; MNTF 2010, in litt.). Nonnative plants also displace this and other native plant species by competing for water, nutrients, light, and space, or they may produce chemicals that inhibit growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stones 1990, p. 74; MNTF 2010, in litt.). Herbivory by slugs is a threat (Oppenheimer 2015, in litt.). This fern experiences reduced reproductive vigor due to low numbers of individuals, leading to diminished capacity to adapt to environmental changes, and thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361). Fortini et al. (2013, p. 78) found that, as environmental conditions are altered by climate change, H. hawaiiensis var. mauensis is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to H. hawaiiensis var. mauensis described above.

The remaining occurrences of Hypolepis hawaiiensis var. mauensis are at risk. Nonnative plants modify and destroy native habitat, and also outcompete native plants, and this plant is threatened by herbivory by slugs. This fern is also vulnerable to the impacts of climate change, and the small number of remaining individuals limits its ability to adapt to environmental change. Because of these threats, we find that this variety is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Joinvillea ascendens ssp. ascendens (oula) is an erect perennial herb in the joinvillea family (Joinvilleaceae) (Wagner et al. 1999, p. 1450). Joinvillea ascendens ssp. ascendens occurs in wet to mesic Metrosideros polymorpha-Acacia koa lowland and montane forest, and along intermittent streams, from 1,000 to 4,300 ft (305 to 1,300 m); in the lowland mesic (Kauai and Oahu), lowland wet (Oahu, Molokai, Maui, and Hawaii Island), montane wet (Kauai, Oahu, Molokai, Maui, and Hawaii Island) and montane mesic ecosystems (Kauai) (TNCH 2007; HBMP 2010). Historically, this subspecies was found in widely distributed occurrences on the islands of Kauai, Oahu, Molokai, Maui, and Hawaii Island (HBMP 2010). On Kauai, this subspecies was wide-ranging across the mountains and into coastal areas (HBMP 2010). On Oahu, this subspecies was known from the summit area of the Waianae Mountains, and ranged along the entire length of the Koolau Mountain range. On Molokai, this subspecies was known from the eastern half of the island ranging from Pelekuum Preserve and east to Halawa Valley. On west Maui, this subspecies occurred in the summit area, and on the northeastern side of east Maui it ranged from the Koolau FR to Kaapahulu (Gates 2015, in litt.). On Hawaii Island, it occurred almost island-wide. Currently, J. ascendens ssp. ascendens is still found on the same islands, in only 56 occurrences totaling approximately 200 individuals (HBMP 2010; Conry 2012, in litt.).

Nonnative ungulates modify and destroy habitat on all of the islands where Joinvillea ascendens ssp. ascendens occurs (Moses 2006, in litt.; Oppenheimer 2006, in litt.; Welton and Haas 2006, p. 16; HBMP 2010; Perlman 2010, in litt.). Herbivory by feral pigs, goats, axis deer, black-tailed deer, and rats is a threat to this subspecies (HBMP 2010; Williams 2015, in litt.). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Many nonnative plant species, such as Passiflora tarminiana (banana poka), Rubus ellipticus (yellow Himalayan raspberry), and Setaria palmifolia (palmglass) on Hawaii Island; Clidemia hirta, Psidium cattleianum, and P. guajava on Kauai; C. hirta and Tibouchina herbacea on Maui; Juncus effusus (Japanese mat rush) on Molokai; and C. hirta and P. cattleianum on Oahu, modify and destroy habitat and outcompete this subspecies (HBMP 2010). Randomly occurring natural events, such as landslides, are a threat to the occurrences of J. ascendens ssp. ascendens on Kauai and Molokai (HBMP 2010). Fire is likely to be a threat to this subspecies in the drier areas of the Waianae Mountains of Oahu (HBMP 2010). This subspecies is usually found as widely separated individuals. Seedlings have rarely been observed in the wild, and, although mature seeds germinate in cultivation, these seedlings also rarely survive to maturity. It is uncertain if this rarity of reproduction is typical, or if it is related to habitat disturbance, or possibly a lack of soil mycorrhizae (symbiotic relationship between fungi and plants) required for successful establishment (Wagner et al. 1999, p. 1451; Oppenheimer 2015, in litt.). Fortini et al. (2013, p. 76) found that, as environmental conditions are altered by climate change, J. ascendens ssp. ascendens is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with...
more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *J. ascendens* ssp. *ascendens* described above.

The remaining occurrences of *Joinvillea ascendens* ssp. *ascendens* are at risk. The known individuals continue to be negatively affected by habitat modification and destruction by ungulates, compounded with herbivory by ungulates and rats. The small number of remaining individuals, smaller distribution, and poor recruitment in the wild limits this subspecies’ ability to adapt to environmental changes. Destruction by fire, landslides, rockfalls, and floods can occur at any time. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this subspecies is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

*Kadua fluviatilis* (previously *Hedyotis fluviatilis*) (kamapuaa) is a climbing shrub in the coffee family (Rubiaceae) family (Wagner et al. 1999, pp. 1142–1144). Typical habitat for this species on Kauai is mixed native shrubland and *Metrodiosero* forest from 750 to 2,200 ft (230 to 680 m), in the lowland mesic ecosystem (TNCH 2007; HBMP 2010); and in open shrubland with sparse tree cover in the lowland mesic ecosystem (Wood 1998, in litt.; TNCH 2007). On Oahu, *K. fluviatilis* occurs along rocky streambanks in wet *Metrodiosero* forest from 820 to 1,990 ft (250 to 607 m) in the lowland wet ecosystem (TNCH 2007; HBMP 2010).

Historically, *Kadua fluviatilis* was known from the island of Kauai in at least 5 occurrences ranging from the north coast across the central plateau to the south coast, and from the island of Oahu in at least 11 occurrences in the northern Koolau Mountains (HBMP 2010; Williams 2015, in litt.). Currently, during surveys on Oahu in 2013, only 20 to 25 individuals were observed in one occurrence (Wood 2005b, in litt., NTBG 2009, in litt.; HBMP 2010; Ching Harbin 2015, in litt.). On Kauai, *K. fluviatilis* is known from two occurrences totaling approximately 500 individuals (HBMP 2010).

Feral pigs and goats modify and destroy habitat of *Kadua fluviatilis* (HBMP 2010). Evidence of the activities of feral pigs has been reported at the occurrence of *Kadua haupuensis* and Oahu (Wood 1998, in litt.; HBMP 2010). Feral goats and evidence of their activities have been observed at one location on Kauai (HBMP 2010). Herbivory by feral pigs and goats is a threat to *K. fluviatilis.* Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plant species, such as *Lantana camara, Passalum conjugatum* (Hilo grass), *Psidium cattleianum, P. guajava, Rubus rosifolius,* and *Schinus terebinthifolius* (Christmas berry), degrade habitat and outcompete this and other native species for water, nutrients, light, and space, or may produce chemicals that inhibit growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; Wood 1998, in litt.; HBMP 2010). *Kadua fluviatilis* is negatively affected by landslides on Kauai (HBMP 2010). Fortini et al. (2013, p. 78) found that, as environmental conditions are altered by climate change, *K. fluviatilis* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *K. fluviatilis* described above.

The remaining occurrences of *Kadua fluviatilis* are at risk. Numbers of occurrences and individuals are decreasing on Kauai and Oahu, from 16 occurrences to 3, and from over 1,000 individuals to about 500 individuals (HBMP 2010; OTFM 2014, in litt.). This species continues to be negatively affected by habitat modification and destruction by feral pigs and goats, stochastic events such as landslides, and direct competition from nonnative plants, combined with herbivory by nonnative ungulates. Climate change is likely to further exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

*Labordia lorenciana* (NCN) is a small shrub in the Logania family (Loganiaceae) (Wood et al. 2007, pp. 195–197). This species occurs on the island of Kauai at 3,800 ft (1,160 m), in forest in the montane mesic ecosystem (Wood et al. 2007, pp. 197–198). Currently, there are four known individuals. Additional surveys for *L. lorenciana* have not been successful; however, experts believe this species may occur in other areas (Wood et al. 2007, p. 196).

*Labordia lorenciana* is at risk from habitat modification and destruction and herbivory by nonnative mammals, displacement of individuals through competition with nonnative plants, stochastic events, and problems associated with small populations. Feral pigs, goats, and black-tailed deer modify and destroy the habitat of *L. lorenciana* (Wood et al. 2007, p. 198; Kishida 2015, in litt.). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plant species, such as *Caesalpinia decapetala* (wait-a-bit), *Passiflora laurifolia* (yellow granadilla), and various nonnative grasses, modify and destroy native habitat, outcompete native plants, and pose a threat to the natural occurrence of *K. haupuensis.* The small number of remaining individuals limits this species’ ability to adapt to environmental change. Because of these threats, we find that *K. haupuensis* is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

*Labordia lorenciana* is at risk from habitat modification and destruction and herbivory by nonnative mammals, displacement of individuals through competition with nonnative plants, stochastic events, and problems associated with small populations. Because of these threats, we find that *K. haupuensis* is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.
destruction and modification by nonnative plants, and competition with nonnative plants including Lantana camara, Passiflora tarminiana, Psidium cattleianum, and Rubus argutus, is a threat to Labordia lorenciana, as these nonnative plants have the ability to spread rapidly and cover large areas in the forest understory (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; Wood et al. 2007, p. 198). Randomly occurring natural events, such as landslides, flash floods, fallen tree limbs, and fire, are threats to L. lorenciana where it occurs on Kauai (Wood et al. 2007, p. 198).

This species experiences reduced reproductive vigor as there is no in situ seedling recruitment and a very small number of individuals remain (Wood et al. 2007, p. 198). Infestation by the black twig borer (Xylosandrus compactus) is a threat to this species (Kishida 2015, in litt.). Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

**Lepidium orbiculare** (anaunau) is a small, many-branched shrub in the mustard family (Brassicaceae) (St. John 1981, pp. 371–373; Wagner et al. 1999, p. 409). This species occurs in mesic forest on the island of Kauai, in the lowland mesic ecosystem (Wagner et al. 1999, p. 409; TNCH 2007; HBMP 2010; PEPP 2014, p. 34). Historically, this species was known from widely scattered occurrences on Kauai (Wagner et al. 1999, p. 409). Currently, there is one occurrence of fewer than 50 individuals (Wagner et al. 2012, p. 19; PEPP 2014, p. 34; Smithsonian Institution 2015, in litt.).

Feral pigs and goats have been documented to modify and destroy habitat of other rare and endangered native plant species at the same location on Kauai (Lorence et al. 2010, p. 140; Kishida 2015, in litt.); therefore, we consider that activities of feral pigs and goats also pose a threat to **Lepidium orbiculare**. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.).

Nonnative plants, such as Melinis minutiflora (molasses grass) and Stachytarpheta jamaicensis (Jamaica vervain), degrade native habitat, outcompete native plants, and are found at the location of **L. orbiculare** (HBMP 2010). Landslides are an additional threat to this species.

Because there are fewer than 50 individuals, **L. orbiculare** experiences reduced reproductive vigor due to reduced levels of genetic variability, leading to diminished capacity to adapt to environmental changes, and thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361; PEPP 2014, p. 34).

The remaining occurrence of **Lepidium orbiculare** is at risk and the species continues to be negatively affected by the threats described above. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

**Microlepia strigosa var. maueriensis** (NCN) is a terrestrial, medium-sized fern in the bracken fern family (Dennstaedtiaceae) (Palmer 2003, p. 186). Typical habitat for **M. strigosa var. maueriensis** is mesic to wet forest from 1,400 to 6,000 ft (425 to 1,830 m), in the lowland mesic (Oahu), montane mesic (Hawaii Island), and montane wet (Maui and Hawaii Island) ecosystems (Palmer 2003, p. 186; TNCH 2007; HBMP 2010). Little is known of the historical locations of **M. strigosa var. maueriensis**; however, it was wide-ranging on the islands of Hawaii, Maui, and Oahu (HBMP 2010). Currently, **M. strigosa var. maueriensis** is known from nine occurrences totaling fewer than 100 individuals on the islands of Oahu (about 40 individuals), Maui (fewer than 20 individuals on east and west Maui), and Hawaii (35 individuals last observed in 2004) (Palmer 2003, p. 186; Lau 2007, pers.comm.; Oppenheimer 2007 and 2008, in litt.; Welton 2008, in litt.; Ching 2011, in litt.; Ching Harbin 2015, in litt.; Oppenheimer 2015, in litt.).

**Habitat modification and destruction by feral pigs and goats is a threat to Microlepia strigosa var. maueriensis** (Oppenheimer 2007, in litt.; Bily 2009, in litt.; HBMP 2010). Herbivory by feral pigs is a threat to **M. strigosa var. maueriensis** (Oppenheimer 2007, in litt.; Bily 2009, in litt.; HBMP 2010). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.).

**Microlepia strigosa var. maueriensis** is at risk from hybridization with other species and varieties of Microlepia is a threat to this plant on Oahu and is compounded by the low number of individuals (Kawelo 2010, in litt.). Because of these threats, we find that this variety is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

**Myrsine fosbergii** (kolea) is a branched shrub or small tree in the myrsine family (Myrsinaceae) (Wagner et al. 1999, p. 940). Typical habitat for this species on Oahu is Metrosideros-Diospyros (ohia-lama) lowland mesic forest and Metrosideros-Cheirodendron (ohia-olapa) montane wet forest, often on watercourses or stream banks, from 900 to 4,300 ft (270 to 1,300 m), in the lowland mesic, lowland wet, and montane wet ecosystems (TNCH 2007; HBMP 2010; Wagner et al. 2012, p. 53). **Myrsine fosbergii** was historically known from the summit ridges of the Koolau Mountains of Oahu (HBMP 2010). This species was first collected on Kauai in 1987. Currently, on Oahu, there are fewer than 30 individuals in the Koolau Mountains (lowland mesic and lowland wet ecosystems) (HBMP 2010; OTFM 2014, in litt.; Reynolds 2015, in litt.; Sailer 2015, in litt.). Propagation attempts of the Oahu plant have been unsuccessful (Ching Harbin 2015, in litt.). On Kauai, this species was once widely scattered in the northwest and central areas, but is currently known from only 55 remaining individuals (Wood 2005e and 2007c, in litt.; HBMP 2010).

**Myrsine fosbergii** is at risk from habitat modification and destruction by nonnative ungulates and plants. On Oahu, evidence of the activities of feral pigs has been reported at all summit occurrences (HBMP 2010). On Kauai, evidence of the activities of feral pigs has been reported at the remaining occurrence (Wood 2005e and 2007c, in litt.; HBMP 2010), and evidence of the activities of feral goats has also been reported (HBMP 2010). Herbivory by feral pigs and goats is a threat to **M. fosbergii** (Wood 2005e and 2007c, in litt.; HBMP 2010). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.;
Nonnative plants, such as Axonopus fissifolius (narrow-leaved carpetgrass), Cledenia hirta, Erigeron karvinskianus, Psidium cattleianum, P. guajava, and Rubus rosifolius, compete with M. fosbergii and modify and destroy its native habitat on Oahu and Kauai (HBMP 2010). Hybridization is a threat to this species, as M. fosbergii hybridizes with other Myrsine species, and the number of non-hybrid individuals may actually be lower than estimated (Ching Harbin 2015, in litt.). Fortini et al. (2013, p. 82) found that, as environmental conditions are altered by climate change, M. fosbergii is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to M. fosbergii described above.

The remaining occurrences of Myrsine fosbergii are at risk from the threats described above. The effects of climate change are likely to exacerbate the threats described above. Because of these threats, we find that M. fosbergii is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Nothocestrum latifolium (aiea) is a small tree in the nightshade family (Solanaceae) (Symon 1999, p. 1263). Typical habitat for this species is dry to mesic forest in the dry cliff (Kauai, Oahu, Lanai, and Maui), lowland dry (Oahu, Lanai, and Maui), and lowland mesic (Oahu, Molokai, Lanai, and Maui) ecosystems (TNCH 2007; HBMP 2010). Historically, N. latifolium was known from the Waianae Mountains of Oahu, Molokai, Lanai, and Maui (HBMP 2010; Sailer 2015, in litt.). This species was collected once on Kauai in 1986, but has not been observed there before or after that time (Symon 1999, p. 1263; BISH 50405–Montgomery; Williams 2015, in litt.). Currently, on the island of Oahu, there is one individual remaining, with only one of the other previously extant individuals represented in an ex situ collection (Moses 2006, in litt.; Starr 2006, in litt.; HBMP 2010; Kawakami 2010, in litt.; Kawelo 2010, in litt.; Welton 2010, in litt.; Ching 2011, in litt.; Ching Harbin 2015, in litt.; Sailer 2015, in litt.). On Molokai, there are a few individuals on the central south slope (Oppenheimer 2015, in litt.). There are 18 occurrences totaling approximately 1,600 individuals on east and west Maui (Ching 2011, in litt.; HBMP 2010; Oppenheimer 2015, in litt.). On Lanai, no individuals were found during surveys in 2012, and this species may be extirpated from this island, although there are plans to continue surveying suitable habitat (PEPP 2012, p. 129; Oppenheimer 2015, in litt.). In summary, the species’ range on each island has decreased dramatically since 2001 (Kawelo 2005 and 2010, in litt.; HBMP 2010; Oppenheimer 2011, in litt.).

Feral pigs (Oahu, Maui, Kauai), goats (Maui, Kauai), mouflon (Lanai), feral cattle (Maui), axis deer (Lanai, Maui), and black-tailed deer (Kauai) modify and destroy habitat of Nothocestrum latifolium (HBMP 2010; Oppenheimer 2015, in litt.). Herbivory by these animals also poses a threat to this species. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as Fraxinus uhdei (tropical ash), Guervilloa robusta (silk oak), Lantana camara, Leucaena leucocephala (koa haole), Melinis minutiflora, Passiflora suberosa (huehue haole), Schinus terebinthifolius, and Toona ciliata (Australian red cedar), outcompete N. latifolium and modify and destroy habitat at all known occurrences. Wildfire, and fire caused by military training activities, is a threat to this species and its habitat (Sailer 2015, in litt.). Low numbers of individuals limits this species’ ability to adapt to environmental change. Infestation by the black twig borer is a threat to N. latifolium (Ching Harbin 2015, in litt.). This species continues to decline, and, for unknown reasons, there is an observed lack of regeneration in N. latifolium in the wild (HBMP 2010; Duvall 2015, in litt.). Fortini et al. (2013, p. 83) found that, as environmental conditions are altered by climate change, N. latifolium is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions.

Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to N. latifolium described above.

The remaining occurrences of Nothocestrum latifolium are at risk from the threats described above. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Ochrosia haleakalae (holei) is a tree in the dogbane family (Apocynaceae) (Wagner et al. 1999, p. 218). Typical habitat for this species is dry to mesic forest, sometimes wet forest, and often lava, from 2,300 to 4,000 ft (700 to 1,200 m), in the dry cliff (Maui), lowland mesic (Maui and Hawaii Island), and montane mesic (Maui) ecosystems (Medeiros et al. 1986, pp. 27–28; Wagner et al. 1999, p. 218; TNCH 2007; HBMP 2010). Historically, this species was known from east Maui and Hawaii Island (HBMP 2010). Currently, O. haleakalae is known from 4 occurrences totaling about 15 individuals on the island of Maui (Medeiros 2007, in litt.; Oppenheimer 2008, in litt.; HBMP 2010; Oppenheimer 2015, in litt.). On Hawaii Island, there are two occurrences totaling at least 150 individuals in Hawaii Volcanoes National Park, with 150 outplanted in nearby kipuka (vegetated areas surrounded by lava flows), and one individual in the Laupahoehoe section of Hilo Forest Reserve (Pratt 2005, in litt.; Bio 2008a, in litt.; HBMP 2010; Pratt 2011, in litt.; Conry 2012, in litt.; Orlando 2015, in litt.; Perry 2015, in litt.). Feral pigs and goats modify and destroy the habitat of Ochrosia haleakalae on Maui and Hawaii Island; in addition, cattle modify and destroy the habitat of this species on Maui (Medeiros 1995, in litt.; Pratt 2005, in litt.; Oppenheimer 2015, in litt.). Herbivory by these animals also poses a threat to this species. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plant species, such as Cestrum diurnum (day cestrum), Fraxinus uhdei, Psidium cattleianum, P. guajava, Rubus argutus, Setaria palmifolia (palmgrass), and Toona ciliata, modify and destroy habitat and outcompete native plants, including O. haleakalae (HBMP 2010). In dry areas, wildfires affecting the habitat of this species are exacerbated by the presence of introduced grass species such as Pennisetum clandestinum (kikuyu grass) (HBMP 2010; Oppenheimer 2015, in litt.). Herbivory and seed predation by slugs and rats is a threat to this species (Oppenheimer 2015, in litt.). There is low to no reproduction observed in the wild, and this reduced reproductive value is due to reduced levels of genetic variability resulting from low numbers of individuals. This decreases the
species’ capacity to adapt to environmental changes, and thereby lessens the probability of its long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361; Duvall 2015, in litt.). Fortini et al. (2013, p. 83) found that, as environmental conditions are altered by climate change, *O. haleakalae* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *O. haleakalae* described above.

*Ochrosia haleakalae* is at risk from habitat degradation and loss by feral pigs, goats, cattle, and nonnative plants; the displacement of individuals due to competition with nonnative plants for space, nutrients, water, air, and light; herbivory by feral pigs, goats, and cattle; seed predation by slugs and rats; and by the small number of remaining individuals. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

*Phyllostegia brevidens* (NCN) is a scendent (climbing) subshrub in the mint family (Lamiaceae) (Wagner et al. 1999, pp. 814–815). This species occurs in wet forest on the islands of Maui and Hawaii from 2,900 to 3,200 ft (880 to 975 m), in the lowland wet (Maui), montane wet (Hawaii Island), and wet cliff (Maui) ecosystems (Wagner et al. 1999, pp. 814–815; TNCH 2007; HBMP 2010). *Phyllostegia brevidens* is historically known from Hilo Forest Reserve, Mauna Kea, and Kulani on Hawaii Island; and from Kipahulu Valley on Maui (Haleakala National Park) (Wagner et al. 1999, p. 815; HBMP 2010; Smithsonian Institution 2015, in litt.). Currently, there is one individual on the island of Maui and two individuals on Hawaii Island (PEPP 2009, p. 90; Wagner et al. 2012, p. 46; PEPP 2014, p. 136; Gates 2015, in litt.; Oppenheimer 2015, in litt.; Perry 2015, in litt.).

Feral pigs modify and destroy habitat of this species on Maui (PEPP 2014, p. 136). The two remaining individuals on Hawaii Island are currently fenced (Perry 2015, in litt.); however, owing to the potential for accidental damage or vandalism (irrespective of maintenance), fences do not guarantee protection from ungulate ingress. Herbivory by feral pigs also poses a threat to this species on Maui. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as *Chlidemia hirta* and *Hedychium gardnerianum*, modify and destroy habitat and outcompete *P. brevidens* on Maui (PEPP 2009, p. 90). Herbivory by slugs is a threat to the remaining individual on Maui (PEPP 2014, p. 136). In addition, natural events such as landslides and erosion are threats to the occurrence on Maui (PEPP 2014, p. 136). The small number of remaining individuals limits this species’ ability to adapt to environmental change. Fortini et al. (2013, p. 84) found that, as environmental conditions are altered by climate change, *P. brevidens* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *P. brevidens* described above.

The remaining occurrences of *Phyllostegia brevidens* are at risk. The species continues to be negatively affected by habitat modification and destruction by ungulates and nonnative plants, and by direct competition from nonnative plants. This species experiences reduced reproductive vigor due to reduced levels of genetic variability, leading to diminished capacity to adapt to environmental changes, and thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361). Fortini et al. (2013, p. 84) found that, as environmental conditions are altered by climate change, *P. helleri* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *P. helleri* described above.

The remaining occurrence of *Phyllostegia helleri* on Kauai (HBMP 2010) is at risk. The numbers of individuals are decreasing on Kauai, as this species was wide-ranging on the island, extending from the north and east sides throughout the central plateau, and is now known from only one occurrence of four individuals. These four individuals continue to be negatively affected by habitat modification and destruction by ungulates and nonnative plants, direct competition by nonnative plants, and by seed predation by rats. Natural events such as landslides may damage or destroy the remaining four individuals. The small number of remaining individuals limits this species’ ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that *P. helleri* is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is
endangered or threatened in a significant portion of its range.  

*Phyllostegia stachyoides* (NCN) is a weakly erect to climbing shrub in the mint family (Lamiaceae) (Wagner et al. 1999, p. 823). This species occurs in mesic to wet forest from 3,600 to 4,600 ft (1,000 to 1,400 m), in the montane wet (Hawaii Island, Maui, and Molokai) and montane mesic (Hawaii Island and Maui) ecosystems (Wagner et al. 1999, p. 823; TNCH 2007; HBMP 2010).

*Phyllostegia stachyoides* is historically known from the eastern and central Molokai, west Maui, and wide-ranging occurrences on Hawaii Island (Wagner et al. 1999, p. 823; HBMP 2010; VanDeMark 2016, in litt.). Currently, occurrences on west Maui total about 15 individuals (Oppenheimer 2015, in litt.). Those on Molokai occur at 5 locations and total fewer than 30 individuals (Orlando 2015, in litt.; PEPP 2012, p. 156). Plants on Hawaii Island are now considered to be *P. ambigua* (VanDeMark 2016, in litt.). Feral goats,轴 deer modify and destroy the habitat of *Phyllostegia stachyoides* on Maui, with evidence of the activities of these animals reported in areas where this species occurs (HBMP 2010; PEPP 2014, p. 141).

Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as *Ageratina adenophora*, *Erigeron herbacea*, *Tibouchina herbacea*, compete with *P. stachyoides*, modify and destroy its native habitat, and displace other native plant species, and pose a threat to the known occurrences on Hawaii Island, Maui, Kahoolawe, and Molokai (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; PEPP 2014, pp. 141–142). Herbivory by slugs and rats on leaves and nutlets of *P. stachyoides* poses a threat to this species at known locations on Maui and Molokai (PEPP 2014, pp. 140–142). On Maui, stochastic events such as floods and drought (with ensuing erosion) pose a threat to small, isolated occurrences of *P. stachyoides*; rockfalls and landslides are a threat to occurrences on Molokai (PEPP 2014, pp. 140–142). This species experiences reduced reproductive vigor due to reduced levels of genetic variability, leading to diminished capacity to adapt to environmental changes, and thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pinson 1997, p. 361). Fortini et al. (2013, p. 86) found that, as environmental conditions are altered by climate change, *P. villosa* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *P. stachyoides* described above.

The remaining occurrences of *Phyllostegia stachyoides* are at risk. The known individuals are restricted to small areas on west Maui and Molokai, and continue to be negatively affected by habitat modification and destruction by ungulates and by direct competition with nonnative plants, combined with herbivory by slugs and rats. The small number of remaining individuals limits this species’ ability to adapt to environmental changes. Flooding, drought, and the effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

*Portulaca villosa* (ihi) is a perennial herb in the purslane family (Portulacaceae) (Wagner et al. 1999, p. 1074). *Portulaca villosa* occurs on dry, rocky, clay, lava, or coralline reef sites, from sea level to 1,600 ft (490 m), in the coastal (Lehua, Kaula, Oahu, Kahoolawe, Maui, and Hawaii Island) and lowland dry (Oahu, Molokai, Lanai, Kahoolawe, Maui, and Hawaii Island) ecosystems, and one reported occurrence in the montane dry (Hawaii Island) ecosystem (Wagner et al. 1999, p. 1074; TNCH 2007; HBMP 2010).

*Portulaca villosa* is historically known from all the main Hawaiian Islands except Ni‘ihau and Kauai (Wagner et al. 1999, p. 1074). *Portulaca villosa* has been observed on the small islets of Kaula and Lehua (west of Kauai and Ni‘ihau), and on Nihoa (NWHI); however, the current status of these occurrences is unknown. This species has not been observed on Oahu since the 1960s, when it was locally abundant at Ko‘olau‘ipu‘u (HBMP 2010). Historically, on the island of Hawaii, this species occurred in the coastal area of Hawaii Volcanoes National Park west of Kama‘oko‘a, but was extirpated in 1993 by lava flows (Orlando 2015, in litt.). On the island of Lanai, two individuals were last observed in 1996 (HBMP 2010). Currently, *P. villosa* is known from a few individuals on Molokai; 74 individuals on east Maui, and 24 individuals on west Maui, fewer than 15 individuals on Kahoolawe, and five occurrences totaling 10 individuals on Hawaii Island (MNTF 2010, in litt.; Evans 2015a, in litt.). Axis deer (Maui and Lanai), goats (Maui, mouflon (Lanai), and cattle (Hawaii Island) modify and destroy the habitat of *Portulaca villosa* (HBMP 2010; Oppenheimer 2015, in litt.). These ungulates also forage directly on this species. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as *Lantana camara*, *Nicotiana glauca* (tree tobacco), *Pennisetum ciliare* (buffelgrass), and *Prosopis pallida* (kiawe, mesquite), compete with *Portulaca villosa*, modify and destroy its native habitat, displace other native plant species, and pose a threat to the known occurrences on Hawaii Island, Maui, Kahoolawe, and Molokai (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74). *P. villosa* occurs in drier coastal and lowland habitats, all of which are affected by wildfires. Some coastal habitat includes exposed cliffs, which erode and cause landslides and rockfalls in areas where *P. villosa* occurs (Kahoolawe), posing a threat to this species (HBMP 2010). This species experiences reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, and thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pinson 1997, p. 361). Fortini et al. (2013, p. 86) found that, as environmental conditions are altered by climate change, *P. villosa* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *P. villosa* described above.

The remaining occurrences of *Portulaca villosa* are at risk; the numbers of individuals are decreasing on Maui, Molokai, and Hawaii Island, and the species continues to be negatively affected by continued habitat modification and destruction by feral ungulates and nonnative plants, and by competition with nonnative plants. Because of its small and isolated remaining occurrences, natural events such as rockfalls, landslides, and wildfires may pose a threat to this species. The small number of remaining individuals limits this species’ ability to
adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Pritchardia bakeri (Baker’s loulu) is a small to medium-sized tree in the palm family (Arecaceae) (Hodel 2009, pp. 173–179; Hodel 2012, pp. 70–73). This species occurs in the lowland mesic ecosystem in the Koolau Mountains on Oahu, from 1,500 to 2,100 ft (457 to 640 m), in disturbed, wind-swept, and mostly exposed shrubby or grassy areas, and sometimes on steep slopes in these areas (Bacon et al. 2012, pp. 1–17; Hodel 2012, pp. 71–73). Currently, occurrences total fewer than 100 individuals (Ching Harbin 2015, in litt.). Habitat modification and destruction by feral pigs impact the range and abundance of Pritchardia bakeri. Ungulates in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants compete with and degrade and destroy native habitat of P. bakeri, and displace native plant species by competing for water, nutrients, light, and space, or they may produce chemicals that inhibit growth of other plants (Smith 1985, pp. 180–250; Vitousek 1987 in Cuddihy and Stone 1990, p. 74). Stochastic events such as hurricanes modify and destroy the habitat of P. bakeri, and can directly damage or kill plants. Rats eat the fruit before they mature, leading to minimal or no recruitment (Hodel 2012, pp. 42, 73). This species experiences reduced reproductive vigor due to low levels of genetic variability caused by seed predation by rats and widely separated occurrences, leading to diminished capacity to adapt to environmental changes, and thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361; Hodel 2012, p. 73).

The remaining occurrences of Pritchardia bakeri are at risk; the known individuals are restricted to small areas on Oahu, and continue to be negatively affected by habitat degradation and loss by feral pigs and nonnative plants, fruit predation by rats, and the small number and reduced range of remaining individuals. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to P. bakeri described above. Based on these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Pseudognaphalium sandwicensium var. molokaiense (enaena) is a perennial herb in the sunflower family (Asteraceae) (Wagner et al. 1999, p. 321). Typical habitat for this variety is strand vegetation in dry consolidated dunes, in the coastal ecosystem (Wagner et al. 1999, p. 321; TNCH 2007; HBMP 2010). Historically, this variety was known from Molokai, Oahu, Maui, and Lanai (HBMP 2010; MNTF 2010, in litt.). Currently, P. sandwicensium var. molokaiense is known only from two locations on Molokai (as many as 20,000 individuals, depending on rainfall), and from fewer than 25 individuals on the northwest coast of Maui (Moses 2006, in litt.; Starr 2006, in litt.; Kallstrom 2008, in litt.; Oppenheimer 2015, in litt.). This variety was last observed on Lanai in 1960, and on Oahu (5 individuals) in the 1980s (HBMP 2010).

Goats and axis deer modify and destroy the habitat of Pseudognaphalium sandwicensium var. molokaiense, with evidence of the activities of these animals reported in the areas where this plant occurs (Moses 2006, in litt.; Starr 2006, in litt.; Kallstrom 2008, in litt.; HBMP 2010). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Additionally, nonnative plants, such as Atriplex semibaccata (Australian saltbush), Chenopodium murale (aheahea, goosefoot), Penissetum ciliare, Prosopis pallida, and Setaria parviflora (foxtail), compete with and displace native plant species by competing for water, nutrients, light, and space, or they may produce chemicals that inhibit growth of other plants (Smith 1985, pp. 180–250; Vitousek 1987 in Cuddihy and Stone 1990, p. 74; Moses 2006, in litt.). This variety experiences reduced reproductive vigor due to low levels of genetic variability caused by seed predation by rats and widely separated occurrences, leading to diminished capacity to adapt to environmental changes, and thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361; Hodel 2012, p. 73).

The remaining occurrences of Pseudochnaphalium sandwicensium var. molokaiense on Molokai and Maui are at risk; individuals no longer occur on Oahu and Lanai. Occurrences on Maui and Molokai continue to be negatively affected by habitat modification and destruction by ungulates, and by direct competition with nonnative plants. The small number of remaining occurrences limits this plant’s ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this variety is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Ranunculus hawaiensis (makou) is an erect or ascending perennial herb in the buttercup family (Ranunculaceae) (Duncan 1999, p. 1088). Typical habitat is mesic forest on grassy slopes and scree, and in open pastures, from 6,000 to 7,600 ft (1,800 to 2,000 m), in the montane mesic (Hawaii Island), montane dry (Hawaii Island), and subalpine (Hawaii Island and Maui) ecosystems (Bio 2008a, in litt; Pratt 2007, in litt.; Duncan 1999, p. 1088; TNCH 2007; HBMP 2010). Historically, R. hawaiensis was wide-ranging on the island of Hawaii. On Maui, this species was known from Haleakala National Park (HBMP 2010). In the 1980s and 1990s, this species numbered several hundred individuals on both islands. Currently, there are six occurrences totaling 14 individuals on Hawaii Island (Bio 2008a, in litt.; PEPP 2008, p. 108; Pratt 2008, in litt.; HBMP 2010; Agarostos 2011, in litt.; Imoto 2013, in litt.; Orlando 2015, in litt.). On Maui, a few individuals were observed on a cliff in 1994; however, this occurrence was not relocated in further surveys (PEPP 2013, p. 177). Additionally, no individuals were re-observed in Haleakala National Park (DLNR 2006, p. 61).

Feral pigs, mouflon, and cattle modify and destroy the habitat of Ranunculus hawaiensis on Hawaii Island, with
evidence of the activities of these animals reported in the areas where this species occurs (HBMP 2010). These ungulates also forage on *R. hawaiensis*. Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as *Ehrharta stipoides* (meadow ricegrass), *Holcus lanatus* (common velvetgrass), and various grasses, modify and destroy native habitat, outcompete native plants, and have been reported in areas where *R. hawaiensis* occurs (HBMP 2010). Drought and erosion pose a threat in the areas of the last known occurrences of *R. hawaiensis* on Maui (PEPP 2013, p. 177). This species experiences reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, and thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilsun 1997, p. 361). Fortini et al. (2013, p. 86) found that, as environmental conditions are altered by climate change, *R. hawaiensis* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *R. hawaiensis* described above.

The remaining occurrences of *Ranunculus hawaiensis* are at risk; the known individuals are restricted to small areas on Hawaii Island and continue to be negatively affected by habitat modification and destruction by feral ungulates, and by direct competition with nonnative plants, combined with predation by ungulates. Drought and erosion pose a threat in the areas of the last known occurrences on Maui. The small number of remaining individuals’ ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

*Ranunculus mauiensis* (makou) is an erect to weakly ascending perennial herb in the buttercup family (*Ranunculaceae*) (Duncan 1999, p. 1089). Typical habitat for *R. mauiensis* is open sites in mesic to wet forest and along streams, from 3,500 to 5,600 ft (1,060 to 1,700 m), in the montane wet (Kauai, Oahu, Molokai, and Maui), montane mesic (Kauai, Molokai, Maui, and Hawaii Island), and wet cliff (Molokai and Maui) ecosystems (Duncan 1999, p. 1089; TNCH 2007; HBMP 2010). Historically, *R. mauiensis* was known from Kauai, Oahu, Molokai, Maui, and Hawaii (HBMP 2010). Oahu occurrences have not been observed since the 1800s, and Hawaii Island occurrences have not been observed since 1980 (HBMP 2010). Currently, *R. mauiensis* is known from Kauai (53 individuals) and east Maui (112 individuals). Two individuals formerly known from Molokai have not been observed on recent surveys (Billy 2007, in litt.; Perlman 2007a, in litt.; Wood 2007b, in litt.; HBMP 2010; PEPP 2010, p. 105; Bakutis 2011, in litt.; PEPP 2011, p. 161; PEPP 2013, p. 177; Oppenheimer 2015, in litt.).

Feral pigs, goats, axis deer, black-tailed deer, and cattle modify and destroy the habitat of *Ranunculus mauiensis* on Kauai, Molokai, and Maui, with evidence of the activities of these animals reported in the areas where this species occurs (HBMP 2010; PEPP 2014, pp. 155–156). Ungulates are managed in Hawaii as game animals (except for cattle), but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as *Buddleja asiatica* (dog tail), *Cilia hirta*, *Erigeron karvinskianus*, *Hedychium gardnerianum*, *Lantana camara*, *Passiflora edulis* (passion fruit), *P. tarminiana*, *Psidium cattleianum*, *Rubus argutus*, *R. rosifolius*, and *Tibouchina herbacea*, modify and destroy the native habitat of *Ranunculus mauiensis* and displace native plant species by competing for water, nutrients, light, and space; they may also produce chemicals that inhibit the growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; HBMP 2010; PEPP 2014, p. 155). Herbivory by slugs (Maui) and seed predation by rats (Maui, Kauai) are both reported as threats to *R. mauiensis* (HBMP 2010; PEPP 2014, pp. 154–155). Stochastic events such as drought (Maui), landslides (Kauai), and fire (Maui) are also reported as threats to *R. mauiensis* (HBMP 2010). Erosion is a threat to occurrences on Maui and Kauai (PEPP 2014, pp. 155–156). This species experiences reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby lessening the probability of its long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilsun 1997, p. 361). Fortini et al. (2013, p. 86) found that, as environmental conditions are altered by climate change, *R. mauiensis* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *R. mauiensis* described above.

The remaining occurrences of *Ranunculus mauiensis* are at risk, the known individuals are restricted to small areas on Kauai and Maui, and continue to be negatively affected by habitat modification and destruction by ungulates, direct competition with nonnative plants, and herbivory and predation by slugs and rats. Because of its small, isolated occurrences, landslides, drought, and erosion also negatively affect this species. The small number of remaining individuals limits this species’ ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

*Sanicula sandwicensis* (NCl) is a stout, erect, perennial herb in the parsley family (*Apiaceae*) (Constance and Affolter 1999, p. 210). This species occurs from 6,500 to 8,500 ft (2,000 to 2,600 m) in shrubland and woodland on the islands of Maui and Hawaii Island, in the montane mesic (Hawaii Island and Maui), montane dry (Hawaii Island), and subalpine (Hawaii Island and Maui) ecosystems (Constance and Affolter 1999, p. 210; TNCH 2007; NTBG Database 2011). *Sanicula sandwicensis* is historically known from Haleakala on Maui and from Mauna Kea, Mauna Loa, and Hualalai on Hawaii Island (Constance and Affolter 1999, p. 210). Currently, there are more than 50 individuals of *S. sandwicensis* on east and west Maui (MNTF 2010, in litt.; PEPP 2011, pp. 162–164; Oppenheimer 2015, in litt.). In 2008, an occurrence of fewer than 20 individuals was found in Hawaii Volcanoes National Park (Benitez et al. 2008, p. 93). Following ungulate removal, this occurrence increased to as many as 45 individuals, with many juvenile plants
A single individual was found farther east at about 7,400 ft (Orlando 2015, in litt.). Feral pigs and goats modify and destroy the habitat of *Sanicula sandwicensis* on Maui, with evidence of the activities of these animals reported in the areas where this species occurs (PEPP 2011, pp. 162–164; Oppenheimer 2015, in litt.). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants modify and destroy the habitat of *S. sandwicensis* and displace native plant species by competing for water, nutrients, light, and space; they may also produce chemicals that inhibit the growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; PEPP 2011, pp. 162–164). Those nonnative plants observed to directly affect *S. sandwicensis* and its habitat are *Ageratina adenophora*, *Anthoxanthum odoratum* (sweet vernalgrass), *Epilobium ciliatum* (willow herb), *Holcus lanatus* (common velvetgrass), *Pinus spp.*, *Prunella vulgaris*, and *Rubus argutus* (PEPP 2011, pp. 162–164). Stochastic events such as drought, flooding, and fires are all reported to pose threats to this species (PEPP 2011, pp. 162–164). Erosion is a threat to occurrences on Maui (PEPP 2011, pp. 162–163). Herbivory by rats also is a threat because they eat the taproots of this plant (Oppenheimer 2015, in litt.). This species experiences reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby lessening the probability of its long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361). Fortini et al. (2013, p. 88) found that, as environmental conditions are altered by climate change, *S. sandwicensis* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unable to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *S. sandwicensis* described above.

The remaining occurrences of *Sanicula sandwicensis* are at risk; the known individuals are restricted to small areas on Maui and Hawaii Island and continue to be negatively affected by habitat modification and destruction by feral pigs and goats and by direct competition with nonnative plants. Stochastic events such as drought, flooding, erosion, and fires are threats to this species. The small number of remaining individuals limits this species’ ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

*Sanalum involutum* (ilihau) is a shrub or small tree in the sandalwood family (Santalaceae) (Harbaugh et al. 2010, pp. 827–838). Habitat for *S. involutum* is mesic and wet forest on Kauai, from 400 to 2,500 ft (120 to 750 m), in the lowland mesic and lowland wet ecosystems (TNCH 2007; Harbaugh et al. 2010, pp. 827–838). Historically, this species was known from northern Kauai at Kee, Hanakaiapiai, and Wainiha, and from southern Kauai at Wahiawa, but has not been observed in these areas for 30 years (Harbaugh et al. 2010, p. 835). Currently, approximately 50 to 100 individuals occur in isolated forest pockets on Kauai (Harbaugh et al. 2010, p. 835; Wood 2015, in litt.). Feral pigs and goats modify and destroy the habitat of *Sanalum involutum* on Kauai, with evidence of the activities of these animals reported in the areas where this species occurs (Harbaugh et al. 2010, pp. 835–836; Wood 2015, in litt.). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants modify and destroy the native habitat of *S. involutum* and displace native plant species by competing for water, nutrients, light, and space; they may also produce chemicals that inhibit the growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; HBMP 2010). Nonnative plants reported to pose threats to this species (Harbaugh et al. 2010, pp. 835–836; Wood 2015, in litt.). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals as well (Anderson et al. 2007, in litt.; Oppenheimer 2015, in litt.). Wildfire is a threat to this species in mesic areas of Kauai (Harbaugh et al. 2010, pp. 835–836). This species experiences reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby lessening the probability of its long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361).

The remaining occurrences of *Santalum involutum* are at risk; the known individuals are restricted to a small area on Kauai and continue to be negatively affected by habitat modification and destruction by ungulates, direct competition with nonnative plants, and by herbivory and fruit predation by rats. The small number of remaining individuals limits this species’ ability to adapt to environmental changes. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *S. involutum* described above. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

*Schiedea diffusa* ssp. *diffusa* (NCN) is a reclining or weakly climbing vine in the pink family (Caryophyllaceae) (Wagner et al. 1999, pp. 511–512; Wagner et al. 2005, pp. 103–106). *Schiedea diffusa* ssp. *diffusa* occurs in wet forest from 3,000 to 5,300 ft (915 to 1,600 m) on Molokai, and to 6,700 ft (2,050 m) on Maui, in the lowland wet (Maui) and montane wet (Maui and Molokai) ecosystems (Wagner et al. 1999, p. 512; TNCH 2007; HBMP 2010). Historically, on Molokai, this subspecies was known from Kawela to Waikolu valleys, and on Maui it was widespread on both the east and west mountains (Wagner et al. 2005, p. 106). Currently, *S. diffusa* ssp. *diffusa* is known only from east Maui in scattered occurrences (fewer than 50 individuals total), in a much smaller range, with some remaining in Haleakala National Park (HBMP 2010; Gates 2015, in litt.). Two occurrences were observed within Hanawi NAR in 2005; however, their current status is unknown (Vetter 2015, in litt.). On Molokai, there were two occurrences totaling fewer than 10 individuals; however, these have not been seen since the 1990s (HBMP 2010; Oppenheimer 2015, in litt.).

Feral pigs modify and destroy the habitat of *Schiedea diffusa* ssp. *diffusa* on Maui and Molokai, with evidence of the activities of these animals reported in the areas where this subspecies occurs (HBMP 2010; PEPP 2014, p. 159). Ungulates are managed on Maui as game animals, but public hunting does not adequately control the numbers of
Ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as Adiantum raddianum (NCN), Ageratina adenophora, Hypochaeris radicata (hair cat’s ear), Juncus planifolius (rush), Passiflora tarminiana, Prunella vulgaris, Rubus argutus, and R. rosifolius, modify and destroy the native habitat of S. diffusa ssp. diffusa and displace native plant species by competing for water, nutrients, light, and space; they may also produce chemicals that inhibit the growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; HBMP 2010; PEPP 2014, p. 159). Herbivory by slugs and seed predation by rats are both reported as threats to this subspecies (HBMP 2010; PEPP 2014, p. 159; DuVall 2015, in litt.). This subspecies experiences reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby lessening the probability of its long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361). The remaining occurrences of Schiedea diffusa ssp. diffusa are at risk. The known individuals are restricted to small areas on Maui and to continue to be negatively affected by habitat modification and destruction by ungulates, direct competition with nonnative plants, and herbivory and predation by slugs and rats. The small number of remaining individuals limits this subspecies’ ability to adapt to environmental changes. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate these threats to S. pubescens ssp. diffusa described above. Because of these threats, we find that this subspecies is endangered throughout all of its range and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Schiedea pubescens (maiolii) is a reclining or weakly climbing vine in the pink family (Caryophyllaceae) (Wagner et al. 1999, p. 519; Wagner et al. 2005, pp. 99–102). This species occurs in diverse mesic to wet Metrosideros forest from 2,000 to 4,000 ft (640 to 1,220 m) in the lowland wet, montane wet, montane mesic, and wet cliff ecosystems (Wagner et al. 1999, 519; Wagner et al. 2005, p 100; TNCH 2007; HBMP 2010). Historically, on Molokai, this species was known from Kalae to Pukoo ridge; on Lanai, it was known from the Lanaihale summit area but has not been observed since 1922; on Maui, it was known from the western mountains at Olowalu, Kaanapali, and Waihee, with a possible occurrence the eastern mountains at Makawao (HBMP 2010). Currently, this species is known from one occurrence on Molokai totaling fewer than 30 individuals. The occurrence on east Maui has not been re-observed, but this species is found at seven locations on west Maui (Wood 2001, in litt.; Oppenheimer 2006, in litt.; Bakutis 2010, in litt.; HBMP 2010; MNTF 2010, in litt.; Oppenheimer 2010, in litt.; PEPP 2014, pp. 162–163; Oppenheimer 2015, in litt.). It was determined that the report of 4 to 6 individuals of S. pubescens at the PTA on Hawaii Island was a misidentification of individuals from the species Schiedea hawaiensis (Wagner et al. 2005, pp. 93, 95).

Feral pigs, goats, axis deer, and cattle modify and destroy the habitat of Schiedea pubescens on Maui and Molokai, with evidence of the activities of these animals reported in the areas where this species occurs (HBMP 2010; PEPP 2014, p. 162). Ungulates are managed in Hawaii as game animals (except for cattle), but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as Buddleja asiatica, Cestrum nocturnum (night cestrum), Glidemia hirta, Erigeron karvinskianus, Psidium cattleianum, Rubus rosifolius, and Tibouchina herbacea, modify and destroy the native habitat of S. pubescens and displace native plant species by competing for water, nutrients, light, and space; they may also produce chemicals that inhibit the growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; HBMP 2010; PEPP 2014, pp. 162-163). Herbivory by slugs and seed predation by rats are both reported to be threats to S. pubescens on Maui (HBMP 2010; PEPP 2014, p. 162; DuVall 2015, in litt.). Stochastic events such as drought, erosion, fire, and flooding are also reported as threats to S. pubescens (HBMP 2010; PEPP 2014, pp. 162; Oppenheimer 2015, in litt.). This species is outcrossing; however, very low population sizes may have reduced its genetic variation (Weller 2015, in litt.). Fortini et al. (2013, p. 88) found that, as environmental conditions are altered by climate change, S. pubescens is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to S. pubescens described above.

The remaining occurrences of Schiedea pubescens are at risk. The known individuals are restricted to small areas on Molokai and Maui, and continue to be negatively affected by habitat modification and destruction by ungulates, direct competition with nonnative plants, and herbivory and predation by slugs and rats. Landslides, flooding, fire, and drought impact this species. The small number of remaining individuals limits this species’ ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Sicyos lanceoloideus (anunu) is a perennial vine in the gourd family (Cucurbitaceae) (Telford 1999, p. 581; Wagner and Shannon 1999, p. 444). Sicyos lanceoloideus occurs on ridges or spurs in mesic forest from 1,800 to 2,700 ft (550 to 800 m), in the dry cliff (Oahu), lowland mesic (Oahu, Kauai), and montane mesic (Kauai) ecosystems (Telford 1999, p. 581; TNCH 2007; HBMP 2010). Sicyos lanceoloideus was historically found at Kalalau Valley and Waimea Canyon on Kauai and in the Waiakea Mountains on Oahu (Telford 1999, p. 581). Currently, on Kauai, there are four individuals in three locations (Kishida 2015, in litt.). On Oahu, this species occurs in 5 locations in the Waiakea Mountains totaling fewer than 35 individuals (HBMP 2010; U.S. Army 2014 database). Because this species is a vine, determining exact numbers is difficult (PEPP 2013, p. 189). In addition, occurrences and numbers vary widely as individuals have been observed to persist for fewer than 7 years (Sailer 2015, in litt.). Feral pigs, goats, and black-tailed deer modify and destroy the habitat of Sicyos lanceoloideus on Kauai and Oahu, with evidence of the activities of these animals reported in the areas where this species occurs (HBMP 2010; PEPP 2013, p. 189; PEPP 2014, p. 166; Williams 2015, in litt.). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in
Nonnative plants, such as *Clidemia hirta*, *Lantana camara*, *Melia azedarach* (chinaberry), *Paspalum urvillei* (vasey grass), *Possiflora edulis*, *Pluchea carolinensis* (sourbush), *Psidium cattleianum*, *P. guajava*, *Ricinus communis* (castor bean), *Rubus argutus*, *Schinus terebinthifolius*, and *Stachytarpheta jamaicensis*, modify and destroy the native habitat of *Sicyos lanceoloideus*, and displace native plant species by competing for water, nutrients, light, and space; they may also produce chemicals that inhibit the growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; HBMP 2010; Sailer 2015, in litt.). Drought is a threat to the occurrence in the Waianae Mountains of Oahu (Sailer 2015, in litt.). Because of the small remaining number of individuals, this species experiences reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby lessening the probability of its long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilsen 1997, p. 361). Fortini et al. (2013, p. 89) found that, as environmental conditions are altered by climate change, *S. lanceoloideus* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *S. lanceoloideus* described above.

The remaining occurrences of *Sicyos lanceoloideus* are at risk. The known individuals are restricted to small areas on Kauai and Oahu and continue to be negatively affected by habitat modification and destruction by ungulates, direct competition with nonnative plants, and stochastic events such as drought or fire. The small number of remaining individuals limits this species’ ability to adapt to environmental change. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range. *Sicyos macrophyllus* (anunu) is a perennial vine in the gourd family (Cucurbitaceae) (Telford 1999, p. 578; Wagner and Shannon 1999, p. 444). Typical habitat is wet *Metroiseros polymorpha* forest and *Sophora chrysophylla-Myoporum sandwicense* (mamane-naio) forest, from 4,000 to 6,600 ft (1,200 to 2,000 m) in the montane mesic (Hawaii Island), montane wet (Maui), and montane dry (Hawaii Island) ecosystems (Telford 1999, p. 578; TNCH 2007; HBMP 2010). Historically, *S. macrophyllus* was known from Puuwaawaa, Lapaohoeho, Punu, and South Kona on Hawaii Island, and from Kipahulu Valley on the island of Maui (HBMP 2010). Currently, *S. macrophyllus* is known from 10 occurrences totaling between 24 and 26 individuals on Hawaii Island (Bio 2008, pers. comm.; Pratt 2008, in litt.; HBMP 2010; Evans 2015b, in litt.; Orlando 2015, in litt.). This species has been outplanted at several sites in Hawaii Volcanoes National Park and is persisting (Orlando 2015, in litt.). The individual on Maui has not been observed since 1987 (HBMP 2010). Feral pigs, mouflon, and cattle modify and destroy the habitat of *Sicyos macrophyllus* on the island of Hawaii, with evidence of the activities of these animals reported in the areas where this species occurs (HBMP 2010). Ungulates are managed in Hawaii as game animals (except for cattle), but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as *Cenchrus setaceus*, *Delairea odorata* (German ivy), *Ehrharta stipoides*, and *Pennisetum clandestinum*, modify and destroy the native habitat of *S. macrophyllus* and displace native plant species by competing for water, nutrients, light, and space; they may also produce chemicals that inhibit the growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; HBMP 2010). Seed predation by rats is reported to pose a threat to this species (HBMP 2010). Stochastic events such as fire are also reported as a threat to *S. macrophyllus* (HBMP 2010). This species experiences reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby lessening the probability of its long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilsen 1997, p. 361). Fortini et al. (2013, p. 89) found that, as environmental conditions are altered by climate change, *S. macrophyllus* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *S. macrophyllus* described above.

The remaining occurrences of *Sicyos macrophyllus* are at risk. The only known individuals are restricted to small areas on Hawaii Island and continue to be negatively affected by habitat modification and destruction by ungulates, direct competition with nonnative plants, and seed predation by rats. Fire is also a threat to this species. The small number of remaining individuals limits this species’ ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range. *Solanum nelsonii* (popolo) is a sprawling or trailing shrub up to 3 ft (1 m) tall, in the nightshade family (Solanaceae) (Symon 1999, pp. 1273–1274). Typical habitat for this species is coral rubble or sand in coastal sites up to 490 ft (150 m), in the coastal ecosystem (Symon 1999, pp. 1273–1274; TNCH 2007; HBMP 2010). Historically, *S. nelsonii* was known from Kaauhalu, Kamilo, and Kaulana Bay, and South Point (5 individuals total) on Hawaii Island; from Kealea Bay, Kawaewae, and Leahi on Niihau; and from the Northwest Hawaiian Islands of Nihoa, Layasan, Pearl and Hermes, and Kure Atoll (Green Island) (Lamoureux 1963, p. 6; Clapp et al. 1977, p. 36; HBMP 2010). This species was last collected on Niihau in 1949 (HBMP 2010). The only known individual on Maui was reported to have disappeared in the mid-1990s after cattle had been allowed to graze in its last known habitat (HBMP 2010; Duvall 2015, in litt.). *S. nelsonii* occurs in the coastal ecosystem on the islands of Hawaii and Molokai (approximately 50 individuals), and on the Northwest Hawaiian Islands of Kure (an unknown number of individuals), Midway (approximately 260 individuals on Sand, Eastern, and Spit islands), Layasan (approximately 490 individuals), Pearl and Hermes (30 to 100 individuals), and Nihoa (8,000 to 15,000 individuals) (Aruch 2006, in litt.; Rehkermer 2006, in litt.; Tangalin 2006, in litt.; Bio 2008 a and 2008b, in litt.; Vanderlip 2011, in litt.; Conry 2012, in litt.; PEPP 2013, pp. 190–191).
Axis deer and feral cattle modify and destroy the habitat of *Solanum nelsonii* on the main Hawaiian islands of Maui, Molokai, and Hawaii, with evidence of the activities of these animals reported in the areas where this species occurs (HBMP 2010). Ungulates are managed in Hawaii as game animals (except for cattle), but public hunting does not adequately control the numbers of ungulates to eliminate habitat modification and destruction, and herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as *Lantana camara, Leucaena leucocephala, Pennisetum ciliare, Prosopis pallida,* and *Setaria verticillata* (bristly foxtail), modify and destroy the native habitat of *S. nelsonii* both on the main Hawaiian Islands and on some of the Northwest Hawaiian Islands (HBMP 2010). Nonnative plants displace native plant species by competing for water, nutrients, light, and space, or they may produce chemicals that inhibit the growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; PEPP 2008, p. 110; HBMP 2010). Seed predation by rats has been reported as a threat to *S. nelsonii* on Molokai (PEPP 2014, p. 167). Stochastic events such as drought, erosion, fire, and flooding are also reported as threats to *S. nelsonii* (HBMP 2010; PEPP 2014, p. 167). In 2011, a tsunami swept over Midway Atoll’s Eastern Island and Kure Atoll’s Green Island, inundating *S. nelsonii* plants, spreading plastic debris, and destroying seabird nesting areas, reaching about 500 ft (150 m) inland (DOFAW 2011, in litt.; Starr 2011, in litt.; USFWS 2011, in litt.). Occurrences of this species on the main Hawaiian Islands and on some of the Northwest Hawaiian Islands experienced reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby lessening the probability of its long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361). The effects of climate change resulting in sea-level rise will alter environmental conditions and ecosystem that support this species. Fortini et al. (2013, p. 89) found that, as environmental conditions are altered by climate change, *S. nelsonii* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot measure, estimate, or quantify specific impacts, we do expect the effects of climate change to exacerbate the threats to *S. nelsonii* described above.

The remaining occurrences of *Solanum nelsonii* on the main Hawaiian Islands are restricted to small areas of Molokai and Hawaii Island, and continue to be negatively affected by habitat modification and destruction by ungulates, direct competition with nonnative plants, and herbivory and predation by rats. Even though most individuals of *S. nelsonii* in the Northwestern Hawaiian Islands are found on lands managed by the Service as part of the Hawaiian Islands National Wildlife Refuge, the relatively isolated occurrences of *S. nelsonii* there are negatively affected by nonnative plants. The small number of remaining individuals limits this species’ ability to adapt to environmental changes. A tsunami occurred and impacted habitat for this species, and sea level rise associated with global warming will modify and destroy habitat for *S. nelsonii* in the low-lying Northwestern Hawaiian Islands. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range. *Stenogyne kaalae* ssp. *sherfii* (NCN) is a climbing vine in the mint family (Lamiaceae) (Wagner and Weller 1999, pp. 448–449; Weller and Sakai 1999, p. 838). This species occurs in the Koolau Mountains of Oahu, in diverse forest from 1,500 to 1,600 ft (450 to 490 m) in the lowland wet ecosystem (Wagner and Weller 1999, pp. 448–449; TNCH 2007; HBMP 2010; U.S. Army 2014 database). *Stenogyne kaalae* ssp. *sherfii* is historically known from diverse mesic forest in the Waianae Mountains of Oahu, and from the lowland wet ecosystem of the Koolau Mountains (although, as described in the proposed rule, it was thought to be a different species, *S. sherfii*, until the mid-1990s). This subspecies occurred within a very small range in the northern Koolau Mountains, but now all wild individuals are extirpated. There are propagules from collections from those plants that have been outplanted in the same areas (PEPP 2014, p. 169; Ching Harbin 2015, in litt.). Feral pigs modify and destroy the habitat of *Stenogyne kaalae* ssp. *sherfii* on Oahu, with evidence of the activities of these animals reported in the areas where this subspecies occurred (HBMP 2010; PEPP 2014, p. 169). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat destruction and modification, and herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants, such as *Blechnum appendiculatum* (NCN), *Clematis hirta, Cyclorosus parasitucus* (NCN), *Psidium cattleianum,* and *Rubus rosoldius,* destroy and modify the native habitat of *S. kaalae* ssp. *sherfii* and displace native plant species by competing for water, nutrients, light, and space; they may also produce chemicals that inhibit the growth of other plants (Smith 1985, pp. 180–250; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; HBMP 2010). This subspecies experiences reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby lessening the probability of its long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361). Fortini et al. (2013, p. 90) found that, as environmental conditions are altered by climate change, *S. kaalae* ssp. *sherfii* is unlikely to tolerate or adapt to projected changes in temperature and moisture, and is unlikely to be able to move to areas with more suitable climatic conditions. Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate these threats. Because of these threats, we find that this subspecies is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

*Wikstroemia skottsbergiana* (akia) is a shrub or small tree in the akia family (Thymelaceae) (Peterson 1999, p. 1290). *Wikstroemia skottsbergiana* occurs in wet forest on the island of Kauai, in the lowland wet ecosystem (Peterson 1999, p. 1290; TNCH 2007). *Wikstroemia skottsbergiana* is historically known from the Waihawa Mountains, Hanalei Valley, and Kauhau Valley, on the island of Kauai (Peterson 1999, p. 1290). Currently, this species is limited to 30
individuals at one location (PEPP 2012, p. 26; Wood 2015, in litt.).

Feral pigs and goats destroy and modify the habitat of Wikstroemia skottsbergiana on Kauai, with evidence of the activities of these animals reported in the areas where this species occurs (DLNR 2005, in litt.; Wood 2015, in litt.). Ungulates are managed in Hawaii as game animals, but public hunting does not adequately control the numbers of ungulates to eliminate habitat destruction and modification or herbivory by these animals (Anderson et al. 2007, in litt.; HAR–DLNR 2010, in litt.). Nonnative plants destroy and modify the native habitat of Wikstroemia skottsbergiana and displace native plant species by competing for water, nutrients, light, and space; they may also produce chemicals that inhibit the growth of other plants (Smith 1985, pp. 180–230; Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74; HBMP 2010). Predation of seeds by rats is a threat to this species (DLNR 2005, in litt.). Landslides are a threat to the only known occurrence of this species (Wood 2015, in litt.). This species experiences reduced reproductive vigor due to low levels of genetic variability, leading to diminished capacity to adapt to environmental changes, thereby lessening the probability of its long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361; DLNR 2005, in litt.).

The remaining occurrences of Wikstroemia skottsbergiana are at risk. The known individuals are restricted to a very small area on Kauai and continue to be negatively affected by habitat modification and destruction by ungulates, direct competition with nonnative plants, and seed predation by rats. The small number of remaining individuals limits this species’ ability to adapt to environmental changes.

Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to Wikstroemia skottsbergiana described above. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

**Animals**

**Band-Rumped Storm-Petrel (Oceanodroma castro)—Hawaii Population**

The band-rumped storm-petrel, a small seabird, is a member of the family Hydrobatidae (order Procellariiformes) and a member of the Northern Hemisphere subfamily Hydrobatinae (Slottbacker 2002, p. 2). This seabird is found in several areas of the subtropical Pacific and Atlantic Oceans (del Hoyo et al. 1992 in Bird Life International 2015, in litt.). The Atlantic breeding populations are restricted to islands in the eastern portions: Cape Verde, Ascension, Madeira, and the Azores Islands (Allan 1962, p. 274; Harrison 1983, p. 274). Wintering birds may occur as far west as the mid-Atlantic; however, Atlantic breeding populations are not within the borders of the United States or in areas under U.S. jurisdiction. These separated breeding areas occur in the Pacific: in Japan, Hawaii, and Galapagos (Richardson 1957, p. 19; Harris 1969, p. 96; Harrison 1983, p. 274). The Japanese population, which breeds on islets off the east coast of Japan (Hidejima and Sanganjima in Allan 1962, p. 274; Harris 1969, p. 96), ranges within 860 mi (1,400 km) east and south of the breeding colonies. Populations in Japan and Galapagos total as many as 23,000 pairs (Boersma and Groom 1993, p. 114); however, a recent survey on Hidejima Island revealed only 117 burrows, some of which were occupied by Leach’s storm petrels (Oceanodroma leucorhoa) (Biodiversity Center of Japan 2014, p. 1). Surveyors noted that the nesting area had been affected by extensive erosion caused by the 2011 earthquake and tsunami (Biodiversity Center of Japan 2014, p. 1).

When Polynesians arrived about 1,500 years ago, the band-rumped storm-petrel probably was common on all of the main Hawaiian Islands (Harrison et al. 1990, pp. 47–48). As evidenced by bones found in middens on Hawaii Island (Harrison et al. 1990, pp. 47–48) and in excavation sites on Oahu and Molokai (Olson and James 1982, pp. 30, 33), band-rumped storm-petrels were once numerous enough to be harvested for food and possibly for their feathers (Harrison et al. 1990, p. 48).

In Hawaii, band-rumped storm-petrels are known to nest in remote cliff locations on Kauai and Lehua Island, in steep open to vegetated cliffs, and in little vegetated, high-elevation lava fields on Hawaii Island (Wood et al. 2002, p. 17–18; VanderWerf et al. 2007, pp. 1, 5; Joyce and Holmes 2010, p. 3; Banko 2015 in litt.; Raine 2015, in litt.). Vocalizations were heard in Haleakala Crater on Maui in 1992 (Johnston 1992, in Wood et al. 2002, p. 2), on Lanai (Penniman 2015, in litt.), and in Hawaii Volcanoes National Park (Orlando 2015, in litt.). Based on the scarcity of known breeding colonies on Kauai and their remote, inaccessible locations today compared to prehistoric population levels and distribution, the band-rumped storm-petrel appears to be significantly reduced in numbers and range following human occupation of the Hawaiian Islands, likely as a result of predation by nonnative mammals and habitat loss.

Taxonomists have typically combined the Pacific populations of band-rumped storm-petrel into a single taxon, and currently the American Ornithologist’s Union’s (AOU) regards the species as monotypic (in litt.). However, molecular studies are ongoing and indicate genetic differences between populations in different oceans and archipelagos (Friesen et al. 2007b, pp. 18590–18592; Smith et al. 2007, p. 770; Taylor et al., in prep in Raine 2015, in litt.) and between sympatric populations that breed in different seasons (e.g., in the Galapagos Islands; Smith and Friesen 2007, pp. 1599–1560; Smith et al. 2007, p. 756).

Band-rumped storm-petrels are regularly observed in coastal waters around Kauai, Niihau, and Hawaii Island (Harrison et al. 1990, p. 49; Holmes and Joyce 2009, 4 pp.), and in “rafts” (regular concentrations) of a few birds to as many as 100, possibly awaiting nighttime before coming ashore to breeding colonies. Kauai likely has the largest population, with an estimated 221 nesting pairs in cliffs along the north shore of the island in 2002, and additional observations on the north and south side of the island in 2010 (Harrison et al. 1990, p. 49; Wood et al. 2002, pp. 2–3; Holmes and Joyce 2009, 4 pp.; Joyce and Holmes 2010, pp. 1–3). Audio detections for Kauai indicate this species may be predominantly breeding on the Na Pali coast and Waimea Canyon, with a very small number in Wainiha Valley (Raine 2015, in litt.). The band-rumped storm-petrel is also known from Lehua Island (as detected there by auditory surveys) (VanderWerf et al. 2007, p.1; Raine 2015, in litt.), Maui (Mitchell et al. 2005, in litt.), Kaho’olawe ( Olson 1992, pp. 38, 112), Lanai (Penniman 2015, in litt.) and Hawaii Island (Mitchell et al. 2005, in litt.; Orlando 2015, in litt.). Additional surveys have been conducted on several islands in recent years, including surveys confirming the presence of band-rumped storm-petrels at the PTA on Hawaii Island, but further data are not yet available (Swift 2015, in litt.). The species likely once nested in coastal Maui, where the remains of a chick were found in 1999, and islands such as Niihau and Kaua’a, where surveys have not been conducted in many years and a suitable nesting habitat and may harbor the species (Penniman 2015, in litt.). We do
not have a current estimate of total numbers in Hawaii at this time.

Nesting sites are in burrows and in crevices, holes, or protected ledges along cliff faces, where a single egg is laid (Allan 1962, p. 274–275; Harris 1969, pp. 104–105; Slotterback 2002, p. 11). Predation by nonnative animals on nests and adults during the breeding season is the greatest threat to the Hawaiian population of the band-rumped storm-petrel. These predators include feral cats (Felis catus), barn owls (Tyto alba), small Indian mongoose (Herpestes auropunctatus), black rats (Rattus rattus), Norway rats (R. norvegicus), and Polynesian rats (R. exulans) (Scott et al. 1986, p. 1, 363–364; Tonich 1986, pp. 37–45; Harrison et al. 1990, pp. 47–48; Slotterback 2002, p. 19; Raine 2015, in litt.). Attraction of fledglings to artificial lights and collisions with structures, such as communication towers and utility lines, is also a threat (Reed et al. 1985, p. 377; Telfer et al. 1987, pp. 412–413; Harrison et al. 1990, p. 49; Banko et al. 1991, p. 651; Cooper and Day 1998, p. 18; Podolsky et al. 1998, pp. 21, 27–30; Holmes and Joyce 2009, p. 2). Monitoring of power lines on Kauai has recorded over 1,000 strikes by seabirds annually (mostly Newell’s shearwaters (Puffinus newelli); Travers et al. 2014, pp. 19, 42) that may result in injury or death. Recent studies of attraction of seabirds to artificial lights indicate that 40 percent of those downed by exhaustion (from circling the lights) are killed by collisions with cars or other objects (Anderson 2015, p. 4–13). The small numbers of these birds and their nesting areas on remote cliffs make population-level impacts difficult to document. However, the band-rumped storm-petrel has similar behavior, life-history traits, and habitat needs to the Newell’s shearwater, a threatened species that has sustained major losses as a result of light attraction and collisions with lines or other objects (Banko et al. 1991, p. 651; Banko 2015, in litt.; Raine 2015, in litt.). Therefore, we conclude that these are threats to the band-rumped storm-petrel as well.

Erosion and landslides at nest sites caused by the actions of nonnative ungulates is a threat in some locations on the island of Kauai (Raine 2015, in litt.). Nonnative plants outcompete native plants and can also affect nesting sites of the band-rumped storm-petrel by accelerating erosion, leading to landslides and rockfalls (Wood et al. 2002, pp. 7–19). Regulatory mechanisms (e.g., the Endangered Species Act (MBTA; 16 U.S.C. 703 et seq.)) contribute minimally to the active recovery and management of this species (USFWS 2013, in litt.).

The small population size and limited distribution of the band-rumped storm-petrel in Hawaii is a threat to this population (Soule 1987, p. 8; Lande 1988, pp. 1455, 1458–1459; Harrison et al. 1990, p. 50; Furness 2003, p. 33).

During the breeding season, a single hurricane or landslide caused by erosion could cause reproductive failure and kill a significant number of adult birds. Commercial fisheries and ocean pollution have negative impacts to seabirds, and also are likely to have negative impacts to the band-rumped storm petrel, although the information about the impacts of fisheries and plastics on storm-petrel species is limited. In this rule, our listing determination applies only to the Hawaiian population of the band-rumped storm-petrel (see Distinct Population Segment (DPS) Analysis, below). Because of the deleterious and cumulative effects to the band-rumped storm-petrel caused by the threats described above, we find that the Hawaii population is endangered throughout its range, and, therefore, we find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Yellow-Faced Bees (Hylaeus spp.)

Bees in the genus Hylaeus (family Colletidae), which includes the seven species in this final rule, are commonly known as yellow-faced bees or masked bees for their yellow-to-white facial markings. All Hylaeus bees roughly resemble small wasps in appearance; however, Hylaeus bees have plumose (branched) hairs on the body that are longest on the sides of the thorax, which readily distinguish them from wasps (Michener 2000, in litt.). Bees in the family Colletidae are also referred to as plasterer bees because they line their nests with a self-secreted, cellophane-like material. Eggs hatch and develop into larvae (immature stage) and as larvae grow, they molt through three successive stages (instars), then change into pupae (a resting form) in which they metamorphose and emerge as adults (Michener 2000, in litt.). The diet of the larval stages is unknown, although it is presumed the larvae feed on stores of pollen and nectar collected and deposited in the nest by the adult female.

Yellow-Faced Bee (Hylaeus anthracinus)

Hylaeus anthracinus was historically known from numerous coastal and lowland dry forest habitats up to 2,000 ft (610 m) in elevation on the islands of Hawaii, Maui, Lanai, Molokai, and Oahu, and in some areas was “locally abundant.” Between 1997 and 1998, surveys for Hawaiian Hylaeus were conducted at 43 sites that were either historical collecting localities or potential suitable habitat. Hylaeus anthracinus was observed at 13 of the 43 survey sites, but was not found at any of the 9 historically occupied sites (Daly and Magnacca 2003, p. 217).

Several of the historical collection sites have been urbanized or are dominated by nonnative vegetation (Liebherr and Polhemus 1997, pp. 346–347; Daly and Magnacca 2003, pp. 55; Magnacca 2007, pp. 186–188). There has been a dramatic decline in abundance or presence of H. anthracinus since surveys conducted in 1999 through 2002, noted on surveys conducted between 2011 and 2013 (Magnacca 2015, in litt.). Currently, H. anthracinus is known from 15 small patches of coastal and lowland dry forest habitat (Magnacca 2005a, in litt., p. 2); 5 locations on the island of Hawaii in the coastal ecosystem; 2 locations on Maui in the coastal and lowland dry ecosystems; 1 location on Kauai in the lowland dry ecosystem; 3 locations on Molokai in the coastal ecosystem, and 4 locations on Oahu in the coastal ecosystem (Daly and Magnacca 2003, p. 217; Magnacca 2005a, in litt., p. 2; Magnacca and King 2013, pp. 13–14; Graham 2015, in litt.). These 15 locations supported small populations of H. anthracinus, but the number of individual bees is unknown. In 2004, a single individual was collected in montane dry forest on the island of Hawaii (possibly a vagrant); however, the presence of additional individuals has not been confirmed at this site (Magnacca 2005a, in litt., p. 2).

Although this species was previously unknown from the island of Kahoolawe, it was observed at one location on the island in 2002 (Daly and Magnacca 2003, p. 55). Additionally, during surveys between 1997 and 2008, H. anthracinus was absent from 17 other sites with potentially suitable habitat from which other species of Hylaeus were collected (Daly and Magnacca 2003, pp. 4, 55) on Hawaii Island, Maui, Lanai, Molokai, and Oahu.

Habitat destruction and modification by urbanization and land use conversion lead to the direct fragmentation of foraging and nesting areas used by Hylaeus anthracinus. Habitat destruction and modification by nonnative plants adversely impacts native plant species by modifying the availability of light, altering soil-water regimes, modifying nutrient cycling, altering the fire characteristics...
Habitat modification and destruction by nonnative animals such as feral pigs, goats, axis deer, and cattle, is considered one of the primary factors underlying degradation of native vegetation in the Hawaiian Islands, and these habitat changes also remove food sources and nesting sites for *H. anthracinus* (Graham 2015, in litt.).

Fire is a threat to *H. anthracinus*, as it destroys native coastal and lowland plant communities on which the species depends, and opens habitat for increased invasion by nonnative plants. Because of the greater frequency, intensity, and duration of fires that have resulted from the human alteration of landscapes and the introduction of nonnative plants, especially grasses, fires are now more destructive to the coastal and lowland dry ecosystems (Brown and Smith 2000, p. 172). A single grass-fueled fire often kills most native trees and shrubs in the area (D’Antonio and Vitousek 1992, p. 74) and could destroy food and nesting resources for *H. anthracinus*. The number and size of wildfires are increasing in the main Hawaiian Islands; however, their occurrences and locations are unpredictable, and could affect habitat for yellow-faced bees at any time (Gima 1998, in litt.; County of Maui 2009, Ch. 3, p. 3; Hamilton 2009, in litt.; Honolulu Advertiser 2010, in litt.; Pacific Disaster Center 2011, in litt.). Random, naturally occurring events such as hurricanes, tsunami, and drought can also modify and destroy habitat of *H. anthracinus* by creating disturbed areas conducive to invasion by nonnative plants and by eliminating food and nesting resources (Kitayama and Mueller-Dombois 1995, p. 671; Businger 1998, pp. 1–2; Magnacca 2015, in litt.). Predation by nonnative ants including the big-headed ant (*Pheidole megacephala*), the yellow crazy ant (*Anoplolepis gracilipes*), *Solenopsis pupavana* (NCN), and *S. geminata* (NCN) on *Hylaeus* egg, larvae, and pupal stages is a threat to *H. anthracinus*, and ants also compete with *H. anthracinus* for their nectar food and nesting resources (Howarth 1985, p. 155; Hopper et al. 1996, p. 9; Holway et al. 2002, pp. 188, 209; Daly and Magnacca 2003, p. 9; Lach 2008, p. 155; Graham 2015, in litt.).

Predation by nonnative yellow jacket wasps (*Vespula pensylvanica*) is a threat to *H. anthracinus* because the wasp is an aggressive, generalist predator, and occurs in great numbers in many habitat types, from sea level to over 8,000 ft (2,450 m), including areas where *H. anthracinus* and other yellow-faced bees occur (Gambino et al. 1987, p. 169; Graham 2015, in litt.).

Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees *Lasioglossum* spp.), and alien *Hylaeus* bees for nectar and pollen, and by exclusion from foraging, is a potential threat to *H. anthracinus* (Magnacca 2007, p. 188; Graham 2015, in litt.; Magnacca 2015, in litt.). The small number of populations and individuals of *H. anthracinus* makes this species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as hurricanes, tsunami, and drought (Daly and Magnacca 2003, p. 3; Magnacca 2007, p. 173; Magnacca 2015, in litt.). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *H. anthracinus* described above. In addition, disease has been suggested as a threat, as pathogens carried by nonnative bees, wasps, and ants could be transmitted to *H. anthracinus* through shared food sources (Graham 2015, in litt.); however, we have no reports of this type of disease transmission at this time.

The remaining populations of *Hylaeus anthracinus* and its habitat are at risk. The known individuals are restricted to 15 locations on Hawaii, Maui, Kahoolawe, Molokai, and Oahu, and continue to be negatively affected by habitat destruction and modification by urbanization and land-use conversion, and by habitat destruction and removal of food and nesting sites by nonnative ungulates and nonnative plants. Habitat destruction by fire is a threat. Randomly occurring events such as hurricanes and drought modify habitat and remove food and nesting sources for *H. anthracinus*. Predation by nonnative ants and wasps is a threat. Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees for food and nesting sites is a threat. The small number of remaining populations limits this species’ ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that *H. anthracinus* is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

**Yellow-Faced Bee (Hylaeus assimulans)**

Historically, *Hylaeus assimulans* was known from numerous coastal and lowland dry forest habitats up to 2,000 ft (610 m) in elevation on the islands of Maui (coastal and lowland dry ecosystems), Lanai (lowland dry ecosystem), and Oahu (coastal and lowland dry ecosystem). There are no collections from Molokai although it is likely *H. assimulans* occurred there because all other species of *Hylaeus* known from Maui, Lanai, and Oahu also occurred on Molokai (Daly and Magnacca 2003, pp. 217–229). Between 1997 and 1998, surveys for Hawaiian *Hylaeus* were conducted at 25 sites on Maui, Kahoolawe, Lanai, Molokai, and Oahu. *Hylaeus assimulans* was absent from 6 of its historical localities on Maui, Lanai, and Oahu, and was not observed at the remaining 19 sites with potentially suitable habitat (Daly and Magnacca 2003, pp. 56, 217; Magnacca 2005b, in litt., p. 2; Magnacca 2007, pp. 177, 181, 183; Xerces Society 2009, p. 4). Currently, *H. assimulans* is known from a few small patches of coastal and lowland dry forest habitat (Magnacca 2005b, in litt., p. 2) in two locations on Maui in the lowland dry ecosystem, one location on Kahoolawe in the coastal ecosystem, and two locations on Lanai in the lowland dry ecosystem (Daly and Magnacca 2003, p. 58; Magnacca 2005b, in litt., p. 2). This species has likely been extirpated from Oahu because it has not been observed since Perkin’s 1899 surveys, and was not found during recent surveys of potentially suitable habitat on Oahu at Kaena Point, Makapuu, and Kalaeloa (Daly and Magnacca 2003, p. 217; Magnacca 2005b, in litt., p. 2).

Habitat destruction and modification by urbanization and land use conversion lead to fragmentation of, and eventual loss, of foraging and nesting areas used by *Hylaeus assimulans*. Habitat destruction and modification by nonnative plants (*Asystasia gangetica* (Chinese violet), *Atriplex semibaccata*, *Cenchrus ciliaris* (buffelgrass), *Chloris barbata* (swollen fingergrass), *Digitaria insularis* (sourgrass), *Leucaena leucocephala*, *Melinis minutiflora*, *Pluchea indica* (Indian beebalm), *P. carolinensis, Pyrostegia venusta, Schinus terebinthifolius*, and *Verbena encelioides* (golden crown-beard))
adversely impact native plant species by modifying the availability of light, altering soil-water regimes, modifying nutrient cycling, altering fire characteristics, and ultimately converting native-dominated plant communities to nonnative plant communities, and results in removal of food sources and nesting sites for *H. assimulans* (Xerces Society 2009, p. 21; 76 FR 55170, September 6, 2011, p. 55184). Habitat modification and destruction by nonnative animals such as feral pigs, goats, axis deer, and cattle is considered one of the primary factors underlying destruction of native vegetation in the Hawaiian Islands, and these habitat changes also remove food sources and nesting sites of *H. assimulans* (Stone 1983, pp. 262–263; Cuddihy and Stone 1990, pp. 60–66, 73). Fire is a threat to *H. assimulans*, as it destroys native plant communities on which the species depends, and opens habitat for increased invasion by nonnative plants. Because of the greater frequency, intensity, and duration of fires that have resulted from the human alteration of landscapes and the introduction of nonnative plants, especially grasses, fires are now more destructive to the coastal and lowland dry ecosystems (Brown and Smith 2000, p. 172), and a single grass-fueled fire often kills most native trees and shrubs in the area (D’Antonio and Vitousek 1992, p. 74) and could destroy food and nesting resources for *H. assimulans*. The numbers of wildfires and the acreages involved are increasing in the main Hawaiian Islands; however, their occurrences and locations are unpredictable, and could affect habitat for yellow-faced bees at any time (Gima 1998, in litt.; County of Maui 2009, ch. 3, p. 3; Hamilton 2009, in litt.; Honolulu Advertiser 2010, in litt.; Pacific Disaster Center 2011, in litt.). Random, naturally occurring events such as hurricanes, tsunami, and drought modify and destroy habitat of *H. assimulans* by creating disturbed areas conducive to invasion by nonnative plants, eliminating food and nesting sources (Kitayama and Mueller-Do nmbois 1995, p. 671; Businger 1998, pp. 1–2; Magnacca 2015, in litt.). Predation by nonnative ants (the big-headed ant, the yellow crazy ant, *Solenopsis pupuana*, and *S. geminata*) on *Hylaeus* egg, larvae, and pupal stages is a threat to *H. assimulans*; additionally, ants compete with *H. assimulans* for their nectar food source (Howarth 1985, p. 153; Hopper et al. 1996, p. 9; Holway et al. 2002, pp. 188, 189; Magnacca 2005c, p. 9; Lach 2008, p. 155). Predation by nonnative western yellow jacket wasps is a threat to *H. assimulans* because the wasp is an aggressive, generalist predator, and occurs in great numbers in many habitat types, from sea level to over 8,000 ft (2,450 m), including areas where *H. assimulans* and other yellow-faced bees occur (Gambino et al. 1987, p. 169). Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative unguulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien *Hylaeus* bees) for nectar and pollen is a threat to *H. assimulans* (Magnacca 2007, p. 188; Graham 2015, in litt.; Magnacca 2015, in litt.). The small number of populations and individuals of *H. assimulans* makes this species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as hurricanes and drought (Daly and Magnacca 2003, p. 3; Magnacca 2007, p. 173). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *H. assimulans* described above.

The remaining populations of *Hylaeus assimulans* and its habitat are at risk. The known individuals are restricted to 5 locations: 2 on Maui, 1 on Kahoolawe, and 2 on Lanai, and is likely extirpated from Oahu. This species continues to be negatively affected by habitat destruction and modification by urbanization and land-use conversion, and by habitat destruction and removal of food and nesting sites by nonnative unguulates and nonnative plants. Habitat destruction by fire is a threat. Randomly occurring events such as hurricanes and drought modify habitat and remove food and nesting sources for *H. assimulans*. Predation by nonnative ants and wasps is a threat. Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative unguulates. Competition with nonnative bees for food and nesting sites is a threat. The small number of remaining populations limits this species’ ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that *H. assimulans* is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

**Yellow Faced Bee (Hylaeeus facilis)** Historically, *Hylaeus facilis* was known from Maui, Lanai, Molokai, and Oahu, in dry shrubland to wet forest from sea level to 3,000 ft (1,000 m) (Gagne and Cuddihy 1999, p. 93; Daly and Magnacca 2003, pp. 81, 83). Perkins (1899, p. 77) remarked *H. facilis* was among the most common and widespread *Hylaeus* species on Oahu, Maui, Lanai, and Molokai (Magnacca 2007, p. 183). Although the species was collected in a wide range of habitat types, it likely prefers dry to mesic forest and shrubland (Magnacca 2005c, in litt., p. 2), which are increasingly rare and patchily distributed habitats (Smith 1985, pp. 227–233; Juvi k and Juvi k 1998, p. 124; Gagne and Cuddihy 1999, pp. 66–67, 75; Magnacca 2005c, in litt., p. 2). Researchers believe that the wet forest site on Oahu where *H. facilis* was observed likely had a more open understory (more mesic conditions), and represented an outlier or residual population (Perkins 1899, p.76; Liebherr and Polhemus 1997; p. 347). *Hylaeus facilis* has almost entirely disappeared from most of its historical range (Maui, coastal and lowland mesic; Lanai, lowland dry and lowland mesic; and Oahu, coastal and lowland dry) (Daly and Magnacca 2003, p. 7; Magnacca 2007, p. 183). Between 1998 and 2006, 39 sites on Maui, Lanai, Molokai, and Oahu were surveyed, including 13 historical sites. *Hylaeus facilis* was absent from all 13 locations (Magnacca 2007, p. 183) and was not observed at 26 additional sites with potentially suitable habitat (Daly and Magnacca 2003, pp. 7, 81–82; Magnacca 2007, p. 183). Likely extirpated from Lanai, *H. facilis* is currently known from only two locations, one on Molokai in the coastal ecosystem, and one on Oahu in the coastal ecosystem (Daly and Magnacca 2003, pp. 81–82; Magnacca 2005c, in litt., p. 2). In addition, in 1990, a single individual was collected on Maui near Makawao at 1,500 ft (460 m); however, this site is urbanized and devoid of native plants, and it is likely this collection was a vagrant individual. Habitat destruction and modification by urbanization and land use conversion lead to fragmentation of, and eventual loss of, foraging and nesting areas used by *Hylaeus facilis*. Habitat destruction and modification by nonnative plants adversely impacts native plant species by modifying the availability of light, altering soil-water regimes, modifying nutrient cycling, altering the fire characteristics, and ultimately converting non-native plant communities to non-native plant communities, and results in removal of
food sources and nesting sites for the *H. facilis*. In addition to the nonnative plant species noted above that modify and destroy habitat of *H. assimulans*, *Urochloa mutica*, *Prosopis pallida*, *H. assimulans*, and destroy habitat of plant species noted above that modify and destroy habitat of *H. facilis* (Cuddihy and Stone 1990, p. 105; Hawaii Division of Forestry and Wildlife (DOFAW) 2007, pp. 20–22). Habitat modification and destruction by nonnative animals such as feral pigs, goats, axis deer, and cattle is considered one of the primary factors underlying destruction of native vegetation in the Hawaiian Islands, and these habitat changes also remove food sources and nesting sites for *H. facilis* (Stone 1985, pp. 262–263; Cuddihy and Stone 1990, pp. 66–67). Fire is a threat to *H. facilis*, as it destroys native plant communities on which the species depends, and opens habitat for increased invasion by nonnative plants. Because of the greater frequency, intensity, and duration of fires that have resulted from the human alteration of landscapes and the introduction of nonnative plants, especially grasses, fires are now more destructive to the coastal and lowland dry ecosystems (Brown and Smith 2000, p. 172), and a single grass-fueled fire often kills most native trees and shrubs in the area (D’Antonio and Vitousek 1992, p. 74) and could destroy food and nesting resources for *H. facilis*. The numbers of wildfires and the acreages involved are increasing in the main Hawaiian Islands; however, their occurrences and locations are unpredictable, and could affect habitat for yellow-faced bees at any time (Gima 1998, in litt.; County of Maui 2009, ch. 3, p. 3; Hamilton 2009, in litt.; Honolulu Advertiser 2010, in litt.; Pacific Disaster Center 2011, in litt.). Random, naturally occurring events such as hurricanes, tsunami, and drought modify and destroy habitat of *H. facilis* by creating disturbed areas conducive to invasion by nonnative plants, eliminating food and nesting resources (Kitayama and Mueller-Dombois 1995, p. 671; Businger 1998, pp. 1–2; Magnacca 2015, in litt.). Predation by nonnative ants (the bigheaded ant, the yellow crazy ant, *Solenopsis papauna*, and *S. geminata*) on *Hylaeus* egg, larvae, and pupal stages is a threat to *H. facilis*; additionally, ants compete with *H. facilis* for their nectar food source (Howarth 1985, p. 155; Hopper et al. 1996, p. 9; Holway et al. 2002, pp. 186, 209; Daly and Magnacca 2003, p. 9; Lach 2008, p. 153). Predation by nonnative wasps is a threat to *H. facilis* because the wasp is an aggressive, generalist predator, and occurs in great numbers in many habitat types, from sea level to over 8,000 ft (2,450 m), including areas where *H. facilis* and other yellow-faced bees occur (Gambino et al. 1987, p. 169). Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien *Hylaeus* bees) for nectar and pollen is a threat to *H. facilis* (Magnacca 2007, p. 180; Magnacca 2015, in litt.). The small number of populations and individuals of *H. facilis* makes this species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as hurricanes and drought (Daly and Magnacca 2003, p. 3; Magnacca 2007, p. 173). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to *H. facilis* described above.

The remaining populations of *Hylaeus facilis* and its habitat are at risk. The known individuals are restricted to one location on Molokai and one location on Oahu, and continue to be negatively affected by habitat destruction and modification by urbanization and land-use conversion, and by habitat destruction and removal of food and nesting sites by nonnative ungulates and nonnative plants. Habitat destruction by fire is a threat. Randomly occurring events such as fires and drought modify habitat and remove food and nesting sources for *H. facilis*. Predation by nonnative ants and wasps is a threat. Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees for food and nesting sites is a threat. The small number of remaining populations limits this species’ ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that *H. facilis* is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Yellow-Faced Bee (*Hylaeus hilaris*)

Historically, *Hylaeus hilaris* was known from coastal habitat on Maui, Lanai, and Molokai; and lowland dry habitat on Maui. It is believed to have occurred along much of the coast of these islands because its primary hosts, *Anthracinus*, *H. assimulans*, and *H. longiceps* likely occurred throughout this habitat. First collected on Maui in 1879, *H. hilaris* has only been collected twice in the last 100 years. *Hylaeus hilaris* was absent from three of its historical population sites revisited by researchers between 1998 and 2006 (Magnacca 2007, p. 181). It was also not observed in 2003 at 10 additional sites with potentially suitable habitat (Daly and Magnacca 2003, pp. 103, 106). Currently, the only known population of *H. hilaris* is located on Molokai, in the coastal ecosystem (Daly and Magnacca 2003, pp. 103, 106; Magnacca 2005d, in litt., p. 2; Magnacca 2007, p. 181).

Because *Hylaeus hilaris* is an obligate parasite on *H. anthracinus*, *H. assimulans*, and *H. longiceps*, its occurrences are determined by the remaining populations of these three species. Habitat destruction and modification by urbanization and land use conversion leads to fragmentation of, and eventual loss of, foraging and nesting areas of *H. hilaris*, and of those *Hylaeus* species that *H. hilaris* is dependent upon. Habitat destruction and modification by nonnative plants adversely impacts native plant species by modifying the availability of light, altering soil-water regimes, modifying nutrient cycling, altering the fire characteristics, and ultimately converting native dominated plant communities to nonnative plant communities, and results in removal of food sources and nesting sites for the *Hylaeus* species that *H. hilaris* is dependent upon. Nonnative plant species that modify and destroy habitat of *H. hilaris* are noted in the description for *H. assimulans*, above. Habitat modification and destruction by nonnative animals such as feral pigs, goats, axis deer, and cattle is considered one of the primary factors underlying destruction of native vegetation in the Hawaiian Islands, and these habitat changes also remove food sources and nesting sites for the host species of *H. hilaris* (Stone 1985, pp. 262–263; Cuddihy and Stone 1990, pp. 60–66, 73). Fire is a threat to *H. hilaris*, as it destroys native plant communities, and opens habitat for increased invasion by nonnative plants. Because of the greater frequency, intensity, and duration of fires that have resulted from the human alteration of landscapes and the introduction of nonnative plants, especially grasses, fires are now more destructive to the coastal and lowland dry ecosystems (Brown and Smith 2000, p. 172), and a single fire often kills most native trees and shrubs in the area (D’Antonio and Vitousek
1992, p. 74) and could destroy food and nesting resources for H. hilaris. The numbers of wildfires and the acres involved are increasing in the main Hawaiian Islands; however, their occurrences and locations are unpredictable, and could affect habitat for yellow-faced bees at any time (Gima 1998, in litt.; County of Maui 2009, ch. 3, p. 3; Hamilton 2009, in litt.; Honolulu Advertiser 2010, in litt.; Pacific Disaster Center 2011, in litt.). Random, naturally occurring events such as hurricanes, tsunami, and drought can modify and destroy habitat of H. hilaris by creating disturbed areas conducive to invasion by nonnative plants, eliminating food and nesting sources of its host species (Kitayama and Mueller-Dombois 1995, p. 671; Businger 1998, pp. 1–2; Magnacca 2015, in litt.). Predation by nonnative ants (the big-headed ant, the long-legged ant, Solenopsis papuana, and S. geminata) on Hylaeus egg, larvae, and pupal stages is a threat to H. hilaris; additionally, ants compete with the yellow-faced bees that H. hilaris is dependent on for their food resources (Howarth 1985, p. 155; Hopper et al. 1996, p. 9; Holway et al. 2002, pp. 188, 209; Daly and Magnacca 2003, p. 9; Lach 2008, p. 155). Predation by nonnative western yellow jacket wasps is a threat to H. hilaris because the wasp is an aggressive, generalist predator, and occurs in great numbers in many habitat types, from sea level to over 8,000 ft (2,450 m), including areas where H. hilaris and other yellow-faced bees occur (Gambino et al. 1987, p. 169). Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien Hylaeus bees) for nectar and pollen is a threat to H. hilaris because of these threats, we find that H. hilaris is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Yellow-Faced Bee (Hylaeus kuakea)

Because the first collection of Hylaeus kuakea was not made until 1997, its historical range is unknown (Magnacca 2005e, in litt., p. 2; Magnacca 2007, p. 184). Phylogenetically, H. kuakea belongs in a species-group primarily including species inhabiting mesic forests (Magnacca and Danforth 2006, p. 405). Only four individuals (all males) have been collected from two different sites in the Waianae Mountains of Oahu in the lowland mesic ecosystem (Magnacca 2007, p. 184). The species has never been collected in any other habitat type or area, including some sites that have been more thoroughly surveyed (Magnacca 2011, in litt.). Not all poten
tially suitable habitat has been surveyed due to the remote and rugged locations, small size, raresness, and distant spacing among large areas of nonnative forest (Smith 1985, pp. 227–233; Juvik and Juvik 1998, p. 124; Wagner et al. 1999, pp. 66–67, 75).

Habitat destruction and modification by foral pigs leads to fragmentation of, and eventual loss of, foraging and nesting areas of Hylaeus kuakea. Habitat destruction and modification by nonnative plants adversely impacts native plant species by modifying the availability of light, altering soil-water regimes, modifying nutrient cycling, altering the fire characteristics, and ultimately altering plant communities to nonnative plant communities, and results in removal of food sources and nesting sites for H. kuakea. Nonnative plant species that modify and destroy habitat of H. kuakea are noted in the descriptions for H. assimulans and H. facilis, above. Fire is a threat to H. kuakea because it destroys native plant communities and opens habitat for increased invasion by nonnative plants. Because of the greater frequency, intensity, and duration of fires that have resulted from the human alteration of landscapes and the introduction of nonnative plants, especially grasses, fires are now more destructive, including in lowland mesic areas (Brown and Smith 2000, p. 172), and a single grass-fueled fire often kills most native trees and shrubs in the area (D’Antonio and Vitousek 1992, p. 74) and could destroy food and nesting resources for H. kuakea. The numbers of wildfires and the acres involved are increasing in the main Hawaiian Islands; however, their occurrences and locations are unpredictable, and could affect habitat for yellow-faced bees at any time (Gima 1998, in litt.; County of Maui 2009, ch. 3, p. 3; Hamilton 2009, in litt.; Honolulu Advertiser 2010, in litt.; Pacific Disaster Center 2011, in litt.). Random, naturally occurring events such as hurricanes and drought can modify and destroy habitat of H. kuakea by creating disturbed areas conducive to invasion by nonnative plants, eliminating food and nesting sources of its host species (Kitayama and Mueller-Dombois 1995, p. 671; Businger 1998, pp. 1–2; Magnacca 2015, in litt.). Predation by nonnative ants (the big-headed ant, the long-legged ant, Solenopsis papuana, and S. geminata) on Hylaeus egg, larvae, and pupal stages is a threat to H. hilaris; additionally, ants compete with the yellow-faced bees that H. hilaris is dependent on for their food resources (Howarth 1985, p. 155; Hopper et al. 1996, p. 9; Holway et al. 2002, pp. 188, 209; Daly and Magnacca 2003, p. 9; Lach 2008, p. 155). Predation by nonnative western yellow jacket wasps is a threat to H. hilaris because the wasp is an aggressive, generalist predator, and occurs in great numbers in many habitat types, from sea level to over 8,000 ft (2,450 m), including areas where H. hilaris and other yellow-faced bees occur (Gambino et al. 1987, p. 169). Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien Hylaeus bees) for nectar and pollen is a threat to H. hilaris because of these threats, we find that H. hilaris is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Yellow-Faced Bee (Hylaeus kuakea)

Because the first collection of Hylaeus kuakea was not made until 1997, its historical range is unknown (Magnacca 2005e, in litt., p. 2; Magnacca 2007, p. 184). Phylogenetically, H. kuakea belongs in a species-group primarily including species inhabiting mesic forests (Magnacca and Danforth 2006, p. 405). Only four individuals (all males) have been collected from two different sites in the Waianae Mountains of Oahu in the lowland mesic ecosystem (Magnacca 2007, p. 184). The species has never been collected in any other habitat type or area, including some sites that have been more thoroughly surveyed (Magnacca 2011, in litt.). Not all poten
tially suitable habitat has been surveyed due to the remote and rugged locations, small size, raresness, and distant spacing among large areas of nonnative forest (Smith 1985, pp. 227–233; Juvik and Juvik 1998, p. 124; Wagner et al. 1999, pp. 66–67, 75).

Habitat destruction and modification by foral pigs leads to fragmentation of, and eventual loss of, foraging and nesting areas of Hylaeus kuakea. Habitat destruction and modification by nonnative plants adversely impacts native plant species by modifying the availability of light, altering soil-water regimes, modifying nutrient cycling, altering the fire characteristics, and ultimately altering plant communities to nonnative plant communities, and results in removal of food sources and nesting sites for H. kuakea. Nonnative plant species that modify and destroy habitat of H. kuakea are noted in the descriptions for H. assimulans and H. facilis, above. Fire is a threat to H. kuakea because it destroys native plant communities and opens habitat for increased invasion by nonnative plants. Because of the greater frequency, intensity, and duration of fires that have resulted from the human alteration of landscapes and the introduction of nonnative plants, especially grasses, fires are now more destructive, including in lowland mesic areas (Brown and Smith 2000, p. 172), and a single grass-fueled fire often kills most native trees and shrubs in the area (D’Antonio and Vitousek 1992, p. 74) and could destroy food and nesting resources for H. kuakea. The numbers of wildfires and the acres involved are increasing in the main Hawaiian Islands; however, their occurrences and locations are unpredictable, and could affect habitat for yellow-faced bees at any time (Gima 1998, in litt.; County of Maui 2009, ch. 3, p. 3; Hamilton 2009, in litt.; Honolulu Advertiser 2010, in litt.; Pacific Disaster Center 2011, in litt.). Random, naturally occurring events such as hurricanes and drought can modify and destroy habitat of H. kuakea by creating disturbed areas conducive to invasion by nonnative plants, eliminating food and nesting sources of its host species (Kitayama and Mueller-Dombois 1995, p. 671; Businger 1998, pp. 1–2). Predation by nonnative ants (the big-headed ant, the long-legged ant, Solenopsis papuana, and S. geminata) on Hylaeus egg, larvae, and pupal stages is a threat to H. kuakea; additionally, ants compete with H. kuakea for their nectar food source (Howarth 1985, p. 155; Hopper et al. 1996, p. 9; Holway et al. 2002, pp. 188, 209; Daly and Magnacca 2003, p. 9; Lach 2008, p. 155). Predation by nonnative western yellow jacket wasps is a threat to H. kuakea because the wasp is an aggressive, generalist predator, and occurs in great numbers in many habitat types, from sea level to over 8,000 ft (2,450 m), including areas where H. kuakea and other yellow-faced bees occur (Gambino et al. 1987, p. 169). Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien Hylaeus bees) for nectar and pollen is a threat to H. hilaris because of these threats, we find that H. hilaris is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.
species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as hurricanes and drought (Daly and 2003, p. 3; Magnacca et al. 2007, p. 173). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to H. kuakea described above.

The remaining populations of Hyleaeus kuakea and its habitat are at risk. The known individuals are restricted to mesic forest in one area of the coastal region (Oahu), and continue to be negatively affected by habitat destruction and removal of food and nesting sites by nonnative ungulates and nonnative plants. Habitat destruction by fire is a threat. Randomly occurring events such as hurricanes and drought may modify and destroy habitat and remove food and nesting sources for H. kuakea. Predation by nonnative ants and wasps is a threat. Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien Hylaeus bees) for nectar and pollen is a threat to H. longiceps (see Magnacca et al. 2007, p. 188; Graham et al. 2015, in litt.). The small number of populations and individuals of H. longiceps makes this species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as hurricanes and drought (Daly and Magnacca 2003, p. 3; Magnacca et al. 2007, p. 173). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to H. longiceps described above.

The remaining population of Hyleaeus longiceps and its habitat are at risk. The known individuals are restricted to seven locations, three on Lanai, two on Oahu, and one each on Maui and Molokai, and continue to be negatively affected by habitat destruction and removal of food and nesting sites by nonnative ungulates and nonnative plants, and by recreational use vehicles on Lanai. Habitat destruction by fire is a threat. Randomly occurring events such as hurricanes and drought may modify habitat and remove food and nesting sources for H. longiceps. Predation by nonnative ants and wasps is a threat. Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien Hylaeus bees) for nectar and pollen is a threat to H. longiceps (see Magnacca et al. 2007, p. 188; Graham et al. 2015, in litt.). The small number of populations and individuals of H. longiceps makes this species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as hurricanes and drought (Daly and Magnacca 2003, p. 3; Magnacca et al. 2007, p. 173). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to H. longiceps described above.

The remaining population of Hyleaeus longiceps and its habitat are at risk. The known individuals are restricted to seven locations, three on Lanai, two on Oahu, and one each on Maui and Molokai, and continue to be negatively affected by habitat destruction and removal of food and nesting sites by nonnative ungulates and nonnative plants, and by recreational use vehicles on Lanai. Habitat destruction by fire is a threat. Randomly occurring events such as hurricanes and drought may modify habitat and remove food and nesting sources for H. longiceps. Predation by nonnative ants and wasps is a threat. Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien Hylaeus bees) for nectar and pollen is a threat to H. longiceps (see Magnacca et al. 2007, p. 188; Graham et al. 2015, in litt.). The small number of populations and individuals of H. longiceps makes this species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as hurricanes and drought (Daly and Magnacca 2003, p. 3; Magnacca et al. 2007, p. 173). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to H. longiceps described above.

The remaining population of Hyleaeus longiceps and its habitat are at risk. The known individuals are restricted to seven locations, three on Lanai, two on Oahu, and one each on Maui and Molokai, and continue to be negatively affected by habitat destruction and removal of food and nesting sites by nonnative ungulates and nonnative plants, and by recreational use vehicles on Lanai. Habitat destruction by fire is a threat. Randomly occurring events such as hurricanes and drought may modify habitat and remove food and nesting sources for H. longiceps. Predation by nonnative ants and wasps is a threat. Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien Hylaeus bees) for nectar and pollen is a threat to H. longiceps (see Magnacca et al. 2007, p. 188; Graham et al. 2015, in litt.). The small number of populations and individuals of H. longiceps makes this species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as hurricanes and drought (Daly and Magnacca 2003, p. 3; Magnacca et al. 2007, p. 173). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to H. longiceps described above.

The remaining population of Hyleaeus longiceps and its habitat are at risk. The known individuals are restricted to seven locations, three on Lanai, two on Oahu, and one each on Maui and Molokai, and continue to be negatively affected by habitat destruction and removal of food and nesting sites by nonnative ungulates and nonnative plants, and by recreational use vehicles on Lanai. Habitat destruction by fire is a threat. Randomly occurring events such as hurricanes and drought may modify habitat and remove food and nesting sources for H. longiceps. Predation by nonnative ants and wasps is a threat. Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien Hylaeus bees) for nectar and pollen is a threat to H. longiceps (see Magnacca et al. 2007, p. 188; Graham et al. 2015, in litt.). The small number of populations and individuals of H. longiceps makes this species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as hurricanes and drought (Daly and Magnacca 2003, p. 3; Magnacca et al. 2007, p. 173). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to H. longiceps described above.

The remaining population of Hyleaeus longiceps and its habitat are at risk. Habitat destruction by fire is a threat. Randomly occurring events such as hurricanes and drought may modify habitat and remove food and nesting sources for H. longiceps. Predation by nonnative ants and wasps is a threat. Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees (honeybees, carpenter bees, sweat bees, and alien Hylaeus bees) for nectar and pollen is a threat to H. longiceps (see Magnacca et al. 2007, p. 188; Graham et al. 2015, in litt.). The small number of populations and individuals of H. longiceps makes this species more vulnerable to extinction because of the higher risks from genetic bottlenecks, random demographic fluctuations, and localized catastrophes such as hurricanes and drought (Daly and Magnacca 2003, p. 3; Magnacca et al. 2007, p. 173). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the threats to H. longiceps described above.
unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Yellow-Faced Bee (Hylaeus mana)

Hylaeus mana is known only from lowland mesic forest dominated by native Acacia koa in the Koolau Mountains of Oahu, at 1,400 ft (430 m). Few other Hylaeus species have been found in this type of forest on Oahu (Daly and Magnacca 2003, p. 138). This type of native forest is increasingly rare and patchily distributed because of competition and encroachment into habitat by nonnative plants (Smith 1985, pp. 227–233; Juvik and Juvik 1998, p. 124; Wagner et al. 1999, pp. 66–67, 75). Decline of this forest type could lead to decline in populations and numbers of H. mana. Three additional population sites were discovered on Oahu in 2012, including a new observation of the species at the original site (Magnacca and King 2013, pp. 17–18). The three new sites are within a narrow inland mesic forest at 1,400 ft (430 m), bordered by nonnative plant habitat at lower elevations and wetter native forest habitat above (Magnacca and King 2013, pp. 17–18). Hylaeus mana was most often observed on Santalum freycinetianum var. freycinetianum, which suggests that H. mana may be closely associated with this plant species (Magnacca and King 2013, p. 18). Additional surveys may reveal more populations; however, the extreme rarity of this species, its absence from many survey sites, the fact that it was not discovered until very recently, and the limited range of its possible host plant, all suggest that few populations remain (Magnacca 2005g, in litt., p. 2; Magnacca and King 2013, pp. 17–18).

Habitat destruction and modification by feral pigs leads to fragmentation of, and eventual loss of, foraging and nesting areas of Hylaeus mana (Daly and Magnacca 2003, pp. 217–229). Habitat destruction and modification by nonnative plants adversely impacts native plant species used by H. mana as a food source by modifying the availability of light, altering soil-water regimes, modifying nutrient cycling, altering the fire characteristics, and ultimately converting native dominated plant communities to nonnative plant communities. Nonnative plant species that modify and destroy habitat of H. mana are noted in the descriptions for H. assimulans and H. facilis, above, and can outcompete native canopy species such as Acacia koa, the known preferred native canopy type of H. mana (GISD 2011, in litt.; State of Hawaii 2013, in litt. [S.C.R. No. 74]). Fire is a threat to H. mana, as it destroys native plant communities on which the species depends, and opens habitat for increased invasion by nonnative plants. Because of the greater frequency, intensity, and duration of fires that have resulted from the human alteration of landscapes and the introduction of nonnative plants, especially grasses, fires are now more destructive, including in lowland mesic ecosystems (Brown and Smith 2000, p. 172). A single grass-fueled fire often kills most native trees and shrubs in the area (D’Antonio and Vitousek 1992, p. 74) and could destroy food and nesting resources for H. mana. The numbers of wildfires and the acres involved are increasing in the main Hawaiian Islands; however, their occurrences and locations are unpredictable, and could affect habitat for yellow-faced bees at any time (Gima 1998, in litt.; County of Maui 2009, ch. 3, p. 3; Hamilton 2009, in litt.; Honolulu Advertiser 2010, in litt.; Pacific Disaster Center 2011, in litt.). Random, naturally occurring events such as hurricanes and drought can modify and destroy habitat of H. mana by creating disturbed areas conducive to invasion by nonnative plants (Kitayama and Mueller-Dombois 1995, p. 671; Businger 1998, pp. 1–2). Predation and competition for food sources by nonnative ants and the nonnative western yellow jacket wasp are threats to H. mana (see H. kuakea, above) (Howarth 1985, p. 155; Gambino et al. 1987, p. 169; Hopper et al. 1996, p. 9; Holway et al. 2002, pp. 188, 209; Daly and Magnacca 2003, p. 9; Lach 2008, p. 155). Existing regulatory mechanisms and agency policies do not address the primary threats to the yellow-faced bees and their habitat from nonnative ungulates. Competition with nonnative bees for nectar and pollen is a threat to H. mana as hives and their habitat from nonnative ungulates. Competition with nonnative bees for food and nesting sites is a threat. The small number of remaining populations limits this species’ ability to adapt to environmental changes. The effects of climate change are likely to further exacerbate these threats. Because of these threats, we find that H. mana is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Orangeblack Hawaiian Damselfly (Megalagrion xanthomelas)

The orangeblack Hawaiian damselfly was once Hawaii’s most abundant damselfly species likely because of its ability to use a variety of aquatic habitats for breeding sites. Historically, the orangeblack Hawaiian damselfly probably occurred on all of the main Hawaiian Islands (except Kahoalawe) in suitable aquatic habitat within the anchialine pool, coastal, lowland dry, and lowland mesic ecosystems (Perkins 1913, p. clxxviii; Zimmerman 1948, p. 379; Polhemus 1996, p. 30). Its historical range on Kauai is unknown. On Oahu, it was recorded from Honolulu, Kaimuki, Koko Head, Pearl City, Wai'alua, the Waianae Mountains, and Waianae (Polhemus 1996, pp. 31, 33). On Molokai, it was known from Kainalu, Meyer’s Lake (Kalapaapa Peninsula), Kaunakakai, Mapulehu, and Palau (Polhemus 1996, pp. 33–41). On Lanai, small populations occurred on Maunalei Gulch, and in ephemeral coastal ponds at the mouth of Maunalei Gulch drainage, at Keomuku, and in a mixohaline (brackish water) habitat at Lopa (Polhemus 1996, pp. 37–41; HBMP 2010). On Maui, this species was recorded from a unspecified locality in the west Maui Mountains (Polhemus 1996, pp. 41–42; Polhemus et al. 1999, pp. 27–29). On Hawaii Island, it was known from Hilo, Kona, and Naalehu (Polhemus 1996, pp. 42–47).

Currently, the orangeblack Hawaiian damselfly occurs on Oahu, Molokai, Lanai, Maui, and Hawaii Island. In 1994, on Oahu, a very small population...

Past and present land use and water management practices, including agriculture, urban development, ground water development, and destruction of perched aquifer and surface water resources, and feral ungulates (pigs, goats, axis deer), modify and destroy habitat of the orangeblack Hawaiian damselfly (Harriss et al. 1993, pp. 9–13; Meier et al. 1993, pp. 181–183). Nonnative plant species such as Urochloa mutica form dense, monotypic stands that can completely eliminate any open water habitat of the orangeblack Hawaiian damselfly (Smith 1985, p. 186). Stochastic events such as drought, flooding, and hurricanes can also modify and destroy habitat, and kill individuals. Predation by the orangeblack Hawaiian damselfly by nonnative fish and nonnative aquatic invertebrates on the orangeblack Hawaiian damselfly is a significant threat; predation by Jackson’s chameleons (Trioceros jacksonii) may also occur (Sailer 2015, in litt.). Hawaiian damselflies evolved with few, if any, predatory fish, and the reduced defensive and evasive behaviors of most of the fully aquatic species, including the orangeblack Hawaiian damselfly, makes them particularly vulnerable to predation by nonnative fish (Englund 1999, pp. 225–225, 235; Haines 2015, in litt.). The damselfly is not observed in any bodies of water that support nonnative fish (Henrickson 1989, p. 183; McPeek 1990a, pp. 92–96). Nonnative backswimmers (aquent true bugs: Heteroptera) are voracious predators and frequently feed on prey much larger than themselves, such as tadpoles, small fish, and other aquatic invertebrates and may be a potential threat to damselfly’s aquatic larvae (naiads) (Borror et al. 1989, p. 296). In addition, the nonnative bullfrog (Rana catesbeiana, Lithobates catesbeianus), found in ponds and along stream, is a generalist predator, and eats insects and crustaceans as well as a wide variety of small vertebrates (Bury and Whelan 1985, p. 4). Predation by the bullfrog is a threat to the orangeblack Hawaiian damselfly (Englund et al. 2007, pp. 215, 219; Haines 2015, in litt.). Also, caddisflies (Trichoptera spp.) compete with native aquatic invertebrates for resources and space (Flint et al. 2003, p. 38; Haines 2015, in litt.) and reduce prey abundance for orangeblack Hawaiian damselfly larvae.

Hawaii State law (State Water Code) does not provide for permanent or minimal instream flow standards, and channel modifications or revisions to flow standards can be undertaken at any time by the Water Commission, without regard for changes that degrade or destroy habitat, food resources, or aquatic life stages of the orangeblack Hawaiian damselfly. Therefore, existing regulatory mechanisms do not adequately address the threat of modification and destruction of the aquatic habitat of the orangeblack Hawaiian damselfly (Hawaii Administrative Rule (HAR)-State Water Code, title 13, chapter 169–36; Tongo 2010, in litt.).

The remaining populations and habitat of the orangeblack Hawaiian damselfly are at risk; numbers are decreasing on Oahu, Molokai, Lanai, Maui, and Hawaii Island, and both the species and its habitat continue to be negatively affected by modification and destruction by development and water management practices, drought, feral ungulates, and by nonnative plants, combined with predation by nonnative fish and other nonnative vertebrates. Competition with caddisflies is a potential threat to the orangeblack Hawaiian damselfly. The orangeblack damselfly was once the most common Hawaiian damselfly in the State, and occurred in any suitable aquatic habitat. Populations no longer occur on Kauai. The Oahu populations were described from seven locations, and this species now only occurs at one location. The populations on Molokai have declined from five to three. Populations on Lanai have declined from four to one in an artificial pond. On Maui, there are only two populations, one on east Maui, and one on west Maui. Of the 21 known populations on Hawaii Island, only 14 remain. Because of the dramatic decline in numbers and populations, and because of the ongoing threats described above, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Anchialine Pool Shrimp (Procaris hawaiana)

The shrimp family Procarididae is represented by a small number of species globally, with only two species within the genus Procaris (Magnacca 2015, in litt.). Procaris hawaiana is an endemic anchialine pool shrimp species known only from the islands of Maui and Hawaii. The second species, P. ascensionis, is restricted to similar habitat on Ascension Island in the South Atlantic Ocean. Of the anchialine pools on Hawaii Island, only 25 are known to contain P. hawaiana. During nocturnal-diurnal surveys conducted from 2009 to 2010, 19 pools within Manuka NAR were found to contain P. hawaiana. Five additional pools located on unencumbered State land adjacent to Manuka NAR also contained P. hawaiana. An additional separate pool also contains P. hawaiana, along with the endangered anchialine pool shrimp Veterecaris chaceorum (Holthuis 1973, pp. 12–19; Maciolek 1983, pp. 607–614; Brock 2004, pp. 30–57). On Maui, P. hawaiana occurs in two anchialine pools (Holthuis 1973, pp. 12–19; Maciolek 1983, pp. 607–614; Brock 2004, pp. 30–57).

Like other anchialine pool shrimp species, Procaris hawaiana inhabits extensive networks of water-filled interstitial spaces (cracks and crevices) leading to and from the open pools where they can be detected, a trait which has precluded accurate estimates of population size (Holthuis 1973, p. 36; Maciolek 1983, pp. 613–616). Surveys for many rare species of anchialine pool shrimp, including P. hawaiana, often involve baiting in likely habitat to determine presence or absence. Absence, and presumably extirpation, of shrimp species from suitable habitat is the best or only measure of species decline as population sizes are not easily determined or monitored (Holthuis 1973, pp. 7–12; Maciolek 1983, pp. 613–616), but owing to the potential for shrimp to move between pools through subterranean connections, the lack of sighting on one or several visits to a site is not definitive evidence that the species is extirpated (Kinzie 2015, in litt.). Extirpation of anchialine pool shrimp has been documented definitively in some cases; for example, Halocaridina rubra disappeared from an anchialine pool at Honokohau Harbor (Hawaii Island) as a result of the use of the pool for dumping of used oil, grease, and oil filters (Brock 2004, p. 14). To date, however, P. hawaiana is not known to have been extirpated from any of the pools where
it has been documented to occur (Wada 2016, in litt.).

Habitat modification and destruction by human activities is a significant threat to Procaris hawaiana. It is estimated that up to 90 percent of existing anchialine pools in Hawaii have been destroyed by filling and bulldozing (Baily-Brock and Brock 1993, p. 354; Brock 2004, p. i). Anchialine pools are used as dumping pits for bottles, cans, and used oil and grease, and these activities are a known cause of the disappearance of other anchialine pool shrimp species from the pools. Trampling damage from use of anchialine pools for swimming and bathing has been documented (Brock 2004, pp. 13–17). Although a permit from the State is required to collect anchialine pool shrimp, unpermitted collection of shrimp is ongoing (Fuku-Bonsai 2015, in litt.). A single person with a handnet could do irreparable damage to a population of P. hawaiana (Yamamoto 2015, in litt.), but collection by permitted individuals is not prohibited at State Parks or City and County property where some anchialine pools occur. Predation by nonnative fish is a direct threat to P. hawaiana. Nonnative fish (tilapia, Oreochromis mossambica) also outcompete native herbivorous species of shrimp that serve as a prey-base for P. hawaiana, disrupting the delicate ecological balance in the anchialine pool system, and leading to decline of the pools and the shrimp inhabiting them (Brock 2004, pp. 13–17). Although anchialine pools within State of Hawaii NARs are provided some protection, these areas are remote and signage does not prevent human use and damage of the pools (see Factor B). The persistence of P. hawaiana is hampered by the small number of extant populations and the small geographic range of the known populations. The populations of P. hawaiana are at risk of extinction because of their increased vulnerability to loss of individuals from disturbance, habitat destruction, and the effects of invasive species and because of the reduction in genetic variability that may make the species less able to adapt to changes in the environment (Harmon and Braude 2010, pp. 125–128). In addition, large-scale water extraction from underground water sources negatively affects the habitat and P. hawaiana directly (Conry 2012, in litt.). A threat from development upslope of anchialine pool habitat is infiltration of waste water or application of fertilizer and pesticides into the ground water system of the anchialine pools and consequently affect the pool’s ecosystem health, food sources of the pool shrimp, or the pool shrimp directly (Kinzie 2015, in litt.; Yamamoto et al. 2015, pp. 75–83). Sea-level rise and coastal inundation resulting from the effects of climate change is a threat to P. hawaiana (Sakihara 2015, in litt.). Sea-level rise would increase surface connectivity between isolated anchialine pools, and exacerbate the spread of nonnative fish into pools not yet occupied by nonnative fish (Sakihara 2015, in litt.).

Procaris hawaiana and its habitat are at risk. There are a total of 700 known anchialine pools in the State of Hawaii. Procaris hawaiana is restricted to 25 anchialine pools out of 600 on Hawaii Island and to 2 anchialine pools on Maui. These 27 anchialine pools continue to be negatively affected by habitat destruction and modification by human use of the pools for bathing and for dumping of trash and nonnative fish; filling and bulldozing; water extraction; contamination; predation by and competition with nonnative fish; and collection for the aquarium trade. The small number of populations (27) limits this species’ ability to adapt to environmental changes. Because of these threats, we find that this species is endangered throughout all of its range, and, therefore, find that it is unnecessary to analyze whether it is endangered or threatened in a significant portion of its range.

Distinct Population Segment (DPS) Analysis

Band-Rumped Storm-Petrel (Oceanodroma castro)

Under the Act, we have the authority to consider for listing any species, subspecies, or, for vertebrates, any distinct population segment (DPS) of these taxa if there is sufficient information to indicate that such action may be warranted. To guide the implementation of the DPS provisions of the Act, we and the National Marine Fisheries Service (National Oceanic and Atmospheric Administration—Fisheries), published the Policy Regarding the Recognition of Distinct Vertebrate Population Segments Under the Endangered Species Act (DPS Policy) in the Federal Register on February 7, 1996 (61 FR 4722). Under our DPS Policy, we use two elements to assess whether a population segment under consideration for listing may be recognized as a DPS: (1) The population segment’s discreteness from the remainder of the species to which it belongs and (2) the significance of the population segment to the species to which it belongs. If we determine that a population segment being considered for listing is a DPS, then the population segment’s conservation status is evaluated based on the five listing factors established by the Act to determine if listing it as either endangered or threatened is warranted. In the proposed rule (80 FR 58820; September 30, 2015), we evaluated the Hawaii population of the band-rumped storm-petrel to determine whether it meets the definition of a DPS under our DPS Policy.

Discreteness

Under the DPS Policy, a population segment of a vertebrate taxon may be considered discrete if it satisfies either one of the following conditions: (1) It is markedly separated from other populations of the same taxon as a consequence of physical, physiological, ecological, or behavioral factors (quantitative measures of genetic or morphological discontinuity may provide evidence of this separation); or (2) it is delimited by international governmental boundaries within which differences in control of exploitation, management of habitat, conservation status, or regulatory mechanisms exist that are significant in light of section 4(a)(1)(D) of the Act. The Hawaii population of the band-rumped storm-petrel meets the first criterion: it is markedly separated from other populations of this species by physical (geographic) and physiological (genetic) factors, as described below.

The band-rumped storm-petrel is widely distributed in the tropics and subtropics, with breeding populations in numerous island groups in the Atlantic and in Hawaii, Galapagos, and Japan in the Pacific (Harrison 1983, p. 274; Carboneras et al. 2014, p. 1 and Fig. 2). The geographic separation of these breeding populations is widely recognized, with strong genetic differentiation between the two ocean basins and among individual populations (Friesen et al. 2007a, p. 1768; Smith et al. 2007, p. 768). Whether individual populations merit taxonomic separation remains unclear, and further study is needed (Friesen et al. 2007b, p. 18591; Smith et al. 2007, p. 770; reviewed in Howell 2012, pp. 349, 369–370); some populations, such as those in the Galapagos and Cape Verde islands, may warrant full species status (Smith et al. 2007, p. 770). Like other storm-petrels, the band-rumped storm-petrel is a highly pelagic (open-ocean) seabird (Howell 2012, p. 349). In addition, like other species in the seabird order Procellariiformes, band-rumped storm-petrels exhibit strong philopatry, or fidelity to their natal sites.
VerDate Sep<11>2014 22:14 Sep 29, 2016 Jkt 238001 PO 00000 Frm 00036 Fmt 4701 Sfmt 4700 E:\FR\FM\30SER5.SGM 30SER5

relatedness (1) between Atlantic and p. 1599). Genetic analysis found low (in Galapagos; Smith and Friesen 2007, in different seasons on the same island)

768), even between populations nesting in the eastern tropical Pacific conducted since 1988 show that the density of band-rumped storm-petrels attenuates north and northwest of Galapagos and that the species rarely occurs in a broad area southeast of Hawaii (Pitman, Ballance, and Joyce 2015, unpublished). This pattern suggests a gap in the at-sea distribution of this species, and low likelihood of immigration on an ecological timescale, between Hawaii and Galapagos. We are not aware of any data describing the at-sea distribution of this species between Hawaii and Japan, but the absence of breeding records from western Micronesia (Pyle and Enbring 1985, p. 59) indicates a distributional gap between these two archipelagoes as well. Other than occasional encounters in their foraging habitat, the vast expanses of ocean between Japan, Hawaii, and Galapagos provide for no other sources of potential connectivity between band-rumped storm-petrel populations in the Pacific, such as additional breeding sites.

Even those disparate breeding populations of pelagic seabirds that do overlap at sea may remain largely isolated otherwise and exhibit genetic differentiation (e.g., Walsh and Edwards 2005, pp. 290, 293). Despite the birds’ capacity to move across large areas of ocean, genetic differentiation among breeding populations of band-rumped storm-petrels is high (Friesen et al. 2007b, p. 18590; Smith et al. 2007, p. 768), even between populations nesting in different seasons on the same island (in Galapagos; Smith and Friesen 2007, p. 1599). Genetic analysis found low relatedness (1) between Atlantic and Pacific populations; (2) among Japan, Hawaii, and Galapagos populations; or (3) among Cape Verde, Ascension, and northeast Atlantic breeding populations (Smith et al. 2007, p. 768). Hawaiian birds have not been well-sampled for genetic analysis, but the few individuals from Hawaii included in a rangewide analysis showed that Hawaiian birds differed from all other populations, and were most closely related to birds from Japan (Friesen et al. 2007b, p. 18590).

We have determined that the Hawaii population of the band-rumped storm-petrel is discrete from the rest of the taxon because its breeding and foraging range are markedly separated from those of other populations. The Hawaii population is geographically isolated from populations in Japan and Galapagos, as well as from populations in very distant island groups in the central and western Atlantic Ocean. Molecular evidence indicates that the genetic structure of the species reflects the spatial or temporal separation of individual populations; scant molecular data from Hawaii suggest that this holds for the Hawaii population as well.

**Significance**

Under our DPS Policy, once we have determined that a population segment is discrete, we consider its biological and ecological significance to the larger taxon to which it belongs. This consideration may include, but is not limited to: (1) Evidence of the persistence of the discrete population segment in an ecological setting that is unusual or unique for the taxon, (2) evidence that loss of the population segment would result in a significant gap in the range of the taxon, (3) evidence that the population segment represents the only surviving natural occurrence of a taxon that may be more abundant elsewhere as an introduced population outside its historical range, or (4) evidence that the discrete population segment differs markedly from other populations of the species in its genetic characteristics. We have found substantial evidence that the Hawaii population of the band-rumped storm-petrel meets two of the significance criteria listed above: the loss of this population would result in a significant gap in the range of the taxon, and this population persists in a unique ecological setting. As described above, the physical isolation that defines the discreteness of Hawaii population is likely reflected in genetic differentiation from other populations, but at this time we lack sufficient data to consider genetic characteristics as an independent factor in our determination of the Hawaii population’s significance to the rest of the taxon. Genetic patterns on an ocean-basin or species-wide scale, however, have implications for connectivity and potential gaps in the band-rumped storm-petrel’s range (described below).

Dispersal between populations of seabird species with ranges fragmented by large expanses of ocean may play a vital role in the persistence of individual populations (Bicknell et al. 2012, p. 2872). No evidence currently exists of such dispersal among Pacific populations of band-rumped storm-petrels at frequencies or in numbers that would change the population status between years, for example, by providing immigrants that compensate for breeding failure or adult mortality resulting from predation, as has been hypothesized for Leach’s storm-petrel in the Atlantic (Bicknell et al. 2012, p. 2872). Given the remnant population of band-rumped storm-petrels in Hawaii and recently documented decline in Japan (Biodiversity Center of Japan 2014, p. 1), we would not expect to see exchange on such short timescales. However, genetic evidence is suggestive of exchange between these two populations on an evolutionary timescale (Friesen et al. 2007b, p. 18590).

The loss of this population would result in a significant gap in the range of the band-rumped storm-petrel. As noted above, seabirds in the order Procellariiformes, including the band-rumped storm-petrel, exhibit very high natal site fidelity, and so are slow to recolonize extirpated areas or range-gaps (Jones 2010, p. 1214), and may lack local adaptations; they thus face a potentially increased risk of extinction with the loss of individual populations (Smith et al. 2007, p. 770). The Hawaii population of the band-rumped storm petrel constitutes the entire Central Pacific distribution of the species, located roughly half-way between the populations in Galapagos and Japan (see Figure 1, below), and its loss would create a gap of approximately 8,500 mi (13,680 km) between them and significantly reducing the likelihood of connectivity and genetic exchange. Such exchange would be reliant on chance occurrences, such as severe storms that could result in birds being displaced to the opposite side of the Pacific Ocean basin, and such chance dispersal events would not necessarily result in breeding.
The Hawaii population of the band-rumped storm-petrel is significant also because it persists in a unique ecological setting. This is the only population of the species known to nest at high-elevation sites (above 6,000 ft (1,800 m)) (Banko et al. 1991, pp. 651–653; Athens et al. 1991, p. 95). In prehistory, the species likely nested in lowland habitats and more accessible habitats in Hawaii as well as in the high-elevation and otherwise remote areas where the species is found today; archaeological evidence suggests that band-rumped storm-petrels were once sufficiently common at both high (5,260 and 6,550 ft (1,600 and 2,000 m)) and low elevations on Hawaii Island to be used as a food source by humans (Ziegler pers. comm. in Harrison et al. 1990, pp. 47–48; Athens et al. 1991, pp. 65, 78–80; Banko et al. 1991, p. 650). In lowland areas, the species was common enough for the Hawaiians to name it and to identify it by its call (Harrison et al. 1990, p. 47; Banko et al. 1991, p. 650).

In addition to the impacts of harvest by humans in prehistory, seabirds in Hawaii, including the band-rumped storm-petrel, were negatively affected by the proliferation of nonnative predators such as rats and pigs, and, later, cats and mongoose, and by loss of habitat (reviewed in Duffy 2010, pp. 194–196). Predation and habitat loss combined likely led to the extirpation of the band-rumped storm-petrel from coastal and lowland habitats and other accessible nesting areas, as occurred in the
endangered Hawaiian petrel (Pterodroma sandwichensis) and threatened Newell's shearwater (Puffinus newelli), which have similar nesting habits and life histories (Olsen and James 1982, p. 43; Slotterback 2002, p. 6; Troy et al. 2014, pp. 315, 325–326). The band-rumped storm-petrel's persistence in sites such as the Southwest Rift Zone (6,900 ft (2,100 m)) on Mauna Loa (Hawaii Island) has required them to surmount physiological challenges posed by nesting in high-elevation conditions (cold temperatures, low humidity, and less oxygen). They may possess special adaptations for this, such as reduction in porosity and other eggshell modifications to reduce the loss of water and carbon dioxide during incubation at high elevation (Rahn et al. 1977, p. 3097; Carey et al. 1982, p. 716; Carey et al. 1983, p. 349). In sum, the remnant distribution of band-rumped storm-petrel breeding sites in only the most remote and rugged terrain in Hawaii reflects the conditions necessary for the species’ persistence in Hawaii (relatively undisturbed habitat in areas least accessible to predators) and also reflects unique adaptations that facilitate the species’ persistence in high-elevation areas.

We have determined that the Hawaii population of band-rumped storm-petrel is significant to the rest of the taxon. Its loss would result in a gap in the range of the species of more than 8,500 mi (13,680 km), reducing and potentially precluding connectivity between the two remaining populations in the Pacific Basin. In addition, the Hawaii population nests at high elevation on some islands, constituting a unique ecological setting represented nowhere else in the species’ breeding range.

**DPS Conclusion**

We have evaluated the Hawaii population of band-rumped storm-petrel to determine if it meets the definition of a DPS, considering its discreteness and significance as required by our policy. We have found that this population is markedly separated from other populations by geographic distance, and this separation is likely reflected in the population’s genetic distinctiveness. The Hawaii population is significant to the rest of the species because its loss would result in a significant gap in the species’ range; Hawaii is located roughly half-way between the other two populations in the Pacific Ocean, and little or no evidence exists of current overlap at sea between the Hawaii population and either the Japan or Galapagos populations. The Hawaii population of band-rumped storm-petrel also nests at high elevation in Hawaii—conditions at high elevation constitute an ecological setting unique to the species. We conclude that the Hawaii population of band-rumped storm-petrel is a distinct vertebrate population segment under our February 7, 1996, DPS Policy (61 FR 4722), and that it warrants review for listing under the Act. Therefore, we have incorporated the Hawaii DPS of the band-rumped storm-petrel in our evaluation of threats affecting the other 48 species addressed in this rule (summarized above; see also Summary of Factors Affecting the 49 Species From the Hawaiian Islands, below).

### Summary of Factors Affecting the 49 Species From the Hawaiian Islands

Section 4 of the Act (16 U.S.C. 1533), and its implementing regulations (50 CFR part 424), set forth the procedures for adding species to the Federal Lists of Endangered and Threatened Wildlife and Plants. A species may be determined to be an endangered or threatened species due to one or more of the five factors described in section 4(a)(1) of the Act: (A) The present or threatened destruction, modification, or curtailment of its habitat or range; (B) overutilization for commercial, recreational, scientific, or educational purposes; (C) disease or predation; (D) the inadequacy of existing regulatory mechanisms; and (E) other natural or manmade factors affecting its continued existence. Listing actions may be warranted based on any of the above threat factors, singly or in combination. Each of these factors is discussed below.

In considering factors that might constitute threats to a species, we must look beyond the exposure of the species to a factor to evaluate whether the species responds to the factor in a way that causes impacts to the species or is likely to cause impacts in the future. If a species responds negatively to such exposure, the factor may be a threat and, during the status review, our aim is to determine whether impacts are or will be of an intensity or magnitude to place the species at risk. The factor is a threat if it drives, or contributes to, the risk of extinction of the species such that the species warrants listing as an endangered or threatened species as those terms are defined by the Act. This does not necessarily require empirical proof of a threat. The combination of exposure and some corroborating evidence of how the species is likely affected could suffice. In sum, the mere identification of factors that could affect a species is not sufficient to compel a finding that listing is appropriate; we require evidence that these factors act on the species to the point that the species meets the definition of an endangered or threatened species.

If we determine that the threats posed to a species by one or more of the five listing factors are, or are likely to become, of such magnitude and/or intensity that the species meets the definition of either endangered or threatened under section 3 of the Act, that species may then be listed as endangered or threatened. The Act defines an endangered species as “in danger of extinction throughout all or a significant portion of its range,” and a threatened species as “likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.” The threats to each of the individual 49 species are summarized in Table 2, and discussed in detail below.

We acknowledge that the specific threats to the individual species in this final rule are not all completely understood. Scientific study of each of the 49 species is limited because of their rarity and the challenging logistics associated with conducting field work in Hawaii (areas are typically remote, difficult to access, challenging work environments, and expensive to survey in a comprehensive manner). However, information is available on many of the threats that act on Hawaiian ecosystems, and, for some ecosystems, these threats are well studied and understood. Each of the native species that occurs in Hawaiian ecosystems suffers from exposure to those threats to differing degrees. For the purposes of our listing determination, the best available scientific information leads us to conclude that the threats that act at the ecosystem level also act on each of the species that occurs in those ecosystems. In some cases we have additionally identified species-specific threats, such as loss of host plants.

The following threats affect the 49 species in one or more of the ecosystems addressed in this rule:

1. **Modification and destruction of habitat**, including streams, ponds, and anchialine pools, by urban development and water extraction. Human activities also contribute to increased sedimentation in anchialine pools.

2. **Habitat destruction and modification** by feral ungulates including pigs, goats, axis deer, black-tailed deer, mouflon, sheep, and cattle. The disturbance of soils by these animals causes erosion and creates fertile seedbeds for nonnative plants, leading to further habitat degradation. Ungulates also trample seedlings.
(3) Habitat destruction and modification by nonnative plants. Nonnative plants modify availability of light, alter soil-water regimes, modify nutrient cycling, alter fire regimes, and ultimately convert native dominated plant communities to nonnative plant communities. They also cause or contribute to loss of host plants used for food and nesting by the yellow-faced bees.

(4) Habitat destruction by wildfires caused naturally or by humans. Fires also destroy the native plant seedbank, and contribute to habitat conversion of native forest to nonnative grasslands (grass/fire cycle).

(5) Habitat destruction and modification, or direct damage and death, by stochastic events including drought, erosion, flooding, tree falls, rock falls, landslides, hurricanes, and tsunamis.

(6) Illegal collection of anchialine pool shrimp for personal use or commercial trade.

(7) Herbivory or defoliation of native plants by ungulates, rats, slugs, and black twig borers, which have been observed to contribute to the decline or death of 35 of the 39 plant species (except *Cyperus neokunthianus*, *Cyrtandra hematos*, *Lepidium orbiculare*, and *Stenogyne kaalae ssp. sherffii*).

Herbivory also destroys seeds and fruit and contributes to lack of reproduction in the wild and low genetic diversity compounding the decline of native plants.

(8) Predation of the band-rumped storm-petrel by rats, barn owls, cats, and mongoose.

(9) Predation of the orange-black Hawaiian damselfly by bullfrogs, backswimmers, Jackson’s chameleons, and nonnative fish.

(10) Predation of the anchialine pool shrimp by nonnative fish.

(11) Predation of *Hylaeus* bees by ants and wasps.

(12) Competition for food and nesting sites of the *Hylaeus* yellow-faced bees by nonnative ants, wasps, and bees, and competition for food and habitat of the orange-black Hawaiian damselfly by caddisflies. Competition for space and food resources of the anchialine pool shrimp by nonnative fish.

(13) Injury and mortality of the band-rumped storm-petrel caused by artificial lighting, communication towers, and power lines.

(14) Injury and mortality of the band-rumped storm-petrel by the activities of fisheries and encounters with marine debris.

(15) Low numbers and/or no reproduction of all 49 species exacerbated by one or more of the above threats, combined with inability of the species to adapt to sea-level rise or other factors associated with climate change.

Existing regulatory mechanisms do not ameliorate these threats for any of the 49 species such that listing is not warranted. Each of the threats listed above is discussed in more detail below, and summarized in Table 2.

Habitat Destruction and Modification by Agriculture and Urban Development

Past land use practices such as agriculture or urban development have resulted in little or no native vegetation below 2,000 ft (600 m) throughout the Hawaiian Islands (TNC 2006). These land use practices negatively affect the anchialine pool, coastal, lowland dry, and lowland mesic ecosystems, including streams and wetlands that occur within these areas. Hawaii’s agricultural industries (e.g., sugar cane, pineapple) have been declining in importance, and large tracts of former agricultural lands are being converted into residential areas or left fallow (TNC 2007). In addition, Hawaii’s population has increased almost 10 percent in the past 10 years, further increasing demands on limited land and water resources in the islands (Hawaii Department of Business, Economic Development and Tourism 2013, in litt.). Development and urbanization of anchialine pool, coastal, lowland dry, and lowland mesic ecosystems on Oahu, Molokai, Maui, Lanai, and Hawaii Island are a threat to some species:

- On Oahu, the plant Cyclosorus boydiae, the orangeblack Hawaiian damselfly and the yellow-faced bee Hyla eus anthracinus, H. assimilans, H. facilis, and H. longiceps.
- On Molokai, the orangeblack Hawaiian damselfly and the yellow-faced bees Hyla eus anthracinus, H. facilis, H. hilaris, and H. longiceps.
- On Maui, the plant Cyclosorus boydiae, the orangeblack Hawaiian damselfly, the anchialine pool shrimp Procaris hawaiana, and the yellow-faced bees Hyla eus anthracinus, H. assimilans, H. facilis, H. hilaris, and H. longiceps.
- On Lanai, the orangeblack Hawaiian damselfly and the yellow-faced bees Hyla eus anthracinus, H. assimilans, H. facilis, H. hilaris, and H. longiceps.

Although we are unaware of any comprehensive, site-by-site assessment of wetland development in Hawaii (Erikson and Puttock 2006, p. 40), Dahl (1990, p. 7) estimated that at least 12 percent of lowland to upper-elevation wetlands in Hawaii had been converted to non-wetland habitat by the 1980s. If only coastal plain (below 1,000 ft (300 m)) marshlands and wetlands are considered, it is estimated that 30 percent were developed or converted to agricultural use (Kosaka 1990, in litt.). Records show the modification and reduction in area of these marshlands and wetlands that provided habitat for many damselfly species, including the orangeblack Hawaiian damselfly (Englund 2001, p. 236; Rees and Reed 2013, Fig 2S). Once modified, these areas then lack the aquatic habitat features that the orangeblack Hawaiian damselfly requires for essential life-history needs, such as pools of intermittent streams, ponds, and coastal springs (Polhemus 1996 pp. 30–31, 36). Although the filling of wetlands is regulated by section 404 of the Clean Water Act (33 U.S.C. 1251 et seq.), the loss of riparian or wetland habitats utilized by the orangeblack Hawaiian damselfly may still occur due to Hawaii’s population growth and development, with concurrent demands on limited developable land and water resources. The State’s Commission of Water Resource Management (CWRM) recognizes the need to update the 2008 water resource protection plan, and an update is currently under development (CWRM 2014, in litt.). In addition, marshes have been slowly filled and converted to meadow habitat as a result of sedimentation from increased storm water runoff from upslope development, the accumulation of uncontrolled growth of invasive vegetation, and blockage of downslope drainage (Wilson Okamoto & Associates, Inc. 1993, pp. 3–4–3–5). Agriculture and urban development have thus contributed to habitat destruction and modification, and continue to be a threat to the habitat of the orangeblack Hawaiian damselfly and the fern, Cyclosorus boydiae.

On Hawaii Island, it is estimated that up to 90 percent of the anchialine pools have been destroyed or altered by human activities, including bulldozing and filling of pools (Brock 2004, p. 1; Bailey-Brock and Brock 1993, p. 354). Dumping of trash and nonnative fish has affected anchialine pools on this island (Brock 2004, pp. 13–17) (see Factor E. Other Natural or Manmade Factors Affecting Their Continued Existence, below). Brock also noted that garbage like bottles and cans appear to have no net negative impact, while the dumping of used oil, oil filters, and grease has resulted in the disappearance of the anchialine pool shrimp Halocaridina rubra from a pool adjacent to Honokohau Harbor on Hawaii Island. Lua O Palahemo (where Procaris hawaiana occurs) on Hawaii Island is accessible to the public, and dumping has occurred there (Brock 2004, pp. 13–17). We are not aware of any dumping activity within two Maui anchialine pools known to be occupied by P. hawaiana; however, this threat remains a possibility (Brock 2004, pp. 13–17).

Destruction and modification of Hyla eus habitat by urbanization and land use conversion, including agriculture, has led to the fragmentation of foraging and nesting habitat of these species. In particular, because native host plant species are known to be essential to the yellow-faced bees for foraging of nectar and pollen, any further loss of this habitat may reduce their long-term chances for recovery. Additionally, further destruction and modification of Hyla eus habitat is also likely to facilitate the introduction and spread of nonnative plants within these areas (see “Habitat Destruction and Modification by Nonnative Plants,” below).

Habitat Destruction and Modification by Nonnative Ungulates

Nonnative ungulates have greatly affected the native vegetation, as well as the native fauna, of the Hawaiian...
Islands. Impacts to the native species and ecosystems accelerated following the arrival of Captain James Cook in 1778. The Cook expedition and subsequent explorers intentionally introduced a European race of pigs (i.e., boars) and other livestock such as goats to serve as food sources for seagoing explorers (Tomich 1986, pp. 120–121; Loope 1998, p. 752). The mild climate of the islands, combined with lack of competitors or predators, led to the successful establishment of large populations of these feral mammals, to the detriment of native Hawaiian species and ecosystems (Cox 1992, pp. 116–117). The presence of introduced mammals is considered one of the primary factors underlying the modification and destruction of native vegetation and habitats of the Hawaiian Islands (Cox 1992, pp. 118–119). All of the 11 ecosystems on the main islands (except Kahoolawe) are currently affected by habitat destruction resulting from the activities of various combinations of nonnative ungulates, including pigs (Sus scrofa), goats (Capra hircus), axis deer (Axis axis), black-tailed deer (Odocoileus hemionus columbianus), sheep (Ovis aries), mouflon (Ovis gmelini musimon) and mouflon-sheep hybrids, and cattle (Bos taurus). Habitat destruction or modification by ungulates is a threat to 37 of the 39 plant species, the band-rumped storm-petrel, the orangeblack Hawaiian damselfly, and the seven yellow-faced bees (see Table 2).

**Pigs (Sus scrofa)**

The destruction or modification of habitat by pigs is currently a threat to four of the ecosystems (lowland mesic, lowland wet, montane wet, and montane mesic) in which these species occur. Feral pigs are known to cause deleterious impacts to ecosystem processes and functions throughout their worldwide distribution (Campbell and Long 2009, p. 2319). Pigs have been described as having the most pervasive and disruptive nonnative influences on the unique ecosystems of the Hawaiian Islands and are widely recognized as one of the greatest current threats (Aplet et al. 1991, p. 56; Anderson and Stone 1993, p. 195; Anderson et al. 2007, in litt.). Introduced European pigs hybridized with smaller, domesticated Polynesian pigs, became feral, and invaded forested areas, especially mesic and wet forests, from low to high elevations; they are present on all the main Hawaiian Islands except Lanai and Kahoolawe, where they have been eradicated (Tomich 1986, pp. 120–121; Munro (1911–1930) 2007, p. 85). By the early 1900s, feral pigs were already recognized as a serious threat to these areas, and an eradication project was conducted by the Hawaii Territorial Board of Agriculture and Forestry, which removed 170,000 pigs from forests Statewide (Diong 1982, p. 63). Feral pigs are extremely destructive and have both direct and indirect impacts on native plant communities. While rooting in the earth in search of invertebrates and plant material, pigs directly affect native plants by disturbing and destroying vegetative cover and by trampling plants and seedlings. It has been estimated that at a conservative rooting rate of 2 square yards (sq yd) (1.7 square meters (sq m)) per minute and only 4 hours of foraging per day, a single pig could disturb over 1,600 sq yd (1,340 sq m) (or approximately 0.3 acres (ac) (0.1 hectares (ha)) of groundcover per week (Anderson et al. 2007, in litt.). Feral pigs are a major vector for the establishment and spread of invasive nonnative plant species, such as Passiflora tarminiana and Psidium cattleianum, by dispersing seeds carried on their hooves and coats and in their feces (which also serve to fertilize disturbed soil) (Diong 1982, pp. 169–170; Matson 1990, p. 245; Siemann et al. 2009, p. 547). Pigs also feed directly on native plants such as Hawaiian tree ferns. Pigs preferentially eat the core of tree-fern trunks, and these cored trunks then fill with rainwater and serve as breeding sites for introduced mosquitoes that spread avian malaria, with devastating consequences for Hawaii’s native forest birds (Baker 1975, p. 79). Additionally, rooting pigs contribute to erosion, especially on slopes, by clearing vegetation and creating large areas of disturbed soil (Smith 1985, pp. 190, 192, 196, 200, 204, 230–231; Stone 1985, pp. 254–255, 262–264; Medeiros et al. 1986, pp. 27–28; Scott et al. 1986, pp. 360–361; Tomich 1986, pp. 120–126; Cuddihy and Stone 1990, pp. 64–65; Aplet et al. 1991, p. 56; Loope et al. 1991, pp. 1–21; Gagne and Cuddihy 1999, p. 52; Nogueira-Filho et al. 2009, pp. 3677–3682; Dunkell et al. 2011, pp. 175–177). The resulting erosion alters native plant communities by damaging individual plants, contributing to watershed degradation, and changing nutrient availability for plants; erosion also affects aquatic animals by increasing sedimentation in streams and pools (Vitousek et al. 2009, pp. 3074–3086; Nogueira-Filho et al. 2009, p. 3681; Cuddihy and Stone 1992, p. 667). The following 15 plants are at risk from erosion and disturbance resulting from the activities of feral pigs: Cyclosorus boydiae, Dryopteris glabra var. pusilla, Gardenia reynii, joinvillea ascendens ssp. ascendens, Kadua fluitatiol, K. haupuensis, Labordia lorenciana, Lepidium orbiculare, Phyllostegia brevidens, P. helleri, P. stachyoides, Ranunculus hawaiiensis, R. mauensis, Sanicula sandwicensis, and Schiedea pubescens. Thirty-two of the 39 plants (all except for Cyanea kauaulaensis, Exocarpos menziesii, Festuca hawaiiensis, Hypolepis hawaiiensis var. mauensis, Portulaca villosa, Pseudognaphalium sandwicensium var. molokaiense, and Solanum nelsonii) are at risk of habitat destruction and modification by feral pigs, and the orangeblack Hawaiian damselfly and six of the seven yellow-faced bees (all except Hylaeus longiceps) are at risk of habitat destruction and modification by feral pigs (see Table 2).

**Goats (Capra hircus)**

Feral goats currently destroy and modify habitat in 10 of the 11 ecosystems (coastal, lowland mesic, lowland wet, montane wet, montane mesic, montane dry, subalpine, dry cliff, and wet cliff) in which these species occur. Goats, native to the Middle East and India, were successfully introduced to the Hawaiian Islands in the late 1700s. Actions to control feral goat populations began in the 1920s (Tomich 1986, pp. 152–153). However, goats still occupy a wide variety of habitats on all the main islands (except for Kahoolawe; see below), where they consume native vegetation, trample roots and seedlings, strip tree bark, accelerate erosion, and promote the invasion of nonnative plants (van Riper and van Riper 1982, pp. 34–35; Stone 1985, p. 261; Kessler 2010, pers. comm.). Kahoolawe was negatively affected by ungulates beginning in 1793, with introduction of goats and the addition of sheep (up to 15,000) and cattle (about 900) by ranchers between 1858 and 1941, with the goat population estimated to be as high as 50,000 individuals by 1986 (KIRC 2011, in litt.; KIRC 2015, in litt.). Beginning in 1941, the U.S. military used the entire island as a bombing range, and in 1994, control of Kahoolawe was returned to the State and the Kahoolawe Island Reserve Commission. The remaining ungulates were eradicated in 1993 (McLeod 2014, in litt.). Because they are able to access extremely rugged terrain, and have a high reproductive capacity (Clark and Cuddihy 1980, pp. C–19–C2–20; Culliney 1988, p. 336; Cuddihy and Stone 1990, p. 64), goats are believed to have completely eliminated some plant species from certain islands (Atkinson and Atkinson 2000, p. 21). Goats are
move into urban and forested areas in search of food (Waring 1996, p. 5; Nishibayashi 2001, in litt.). Like goats, axis deer are highly destructive to native vegetation and contribute to erosion by eating young trees and young shoots of plants before they become established. Other axis deer impacts include stripping bark from mature trees, creating trails, promoting erosion by destabilizing substrate, creating gullies that convey water, and dislodging stones from ledges that can result in rockfalls and landslides that directly damage vegetation (Cuddihy and Stone 1990, pp. 63–64). Feral goats forage along some cliffs where band-rumped storm-petrels nest on Kauai, and may trample nests and increase erosion (Scott et al. 1986, pp. 8, 352–357; Tomich 1986, pp. 152–153). The band-rumped storm-petrel and the following 12 plants are at risk from landslides or erosion caused by feral goats: Gardenia remyi, Joinvillea ascendens ssp. ascendens, Kadua fluviatilis, Labordia lorenciana, Lepidium orbiculare, Hypolepis hawaiiensis (Medeiros 2010, pers. comm.), axis deer:

On Molokai, axis deer likely occur at all elevations from sea level to almost 5,000 ft (1,500 m) at the summit area (Kessler 2011, pers. comm.). The most current population estimate for axis deer on the island of Molokai is between 4,000 and 5,000 individuals (Anderson 2003, p. 119). Little management for deer control has been implemented on Molokai, and this figure from more than a decade ago is likely an underestimate of the axis deer population on this island today (Scott et al. 1986, p. 360; Anderson 2003, p. 30; Hess 2008, p. 4). On Lanai, axis deer were reported to number approximately 6,000 to 8,000 individuals in 2007 (The Aloha Insider 2015, in litt.). On Maui, five adult axis deer were released east of Kihei in 1959 (Hobdy 1993, p. 207; Hess 2008, p. 2). In 2013, the Maui Axis Deer Working Group estimated that there may be 8,000 deer on southeast Maui alone, based on helicopter surveys (Star Advertiser 2015, in litt.; WCities 2010, in litt.). On Maui, axis deer are primary grazers, but also browse a variety of plants including to livestock and poultry health (BigIsland.com 2011, in litt.; Martin 2012, in litt.). This emergency rule became permanent on June 21, 2012, when House Bill 2593 was enacted into law as Act 194 (State of Hawaii 2012, in litt.). The following 16 species in this rule are at risk from the activities of axis deer: Gardenia remyi, Huperzia stermmermanniae, Joinvillea ascendens ssp. ascendens, Nothocestrum latifolium, Phyllostegia stachyoides, Portulaca villosa, Pseudognaphalium sandwicensium var. molokaiense, Ranunculus mauliensis, Schiedea pubescens, Solanum nelsonii, the orangeblack Hawaiian damselfly, and five of the yellow-faced bees (Hylaenus anthracinus, H. assimulans, H. facilis, H. hilaris, and H. longiceps).

Black-Tailed Deer (Odocoileus hemionus columbianus)

Black-tailed deer destroy and modify habitat in 5 of the 11 ecosystems (lowland mesic, lowland wet, montane wet, montane mesic, and dry cliff) in which these species occur. The black-tailed deer is one of nine subspecies of mule deer (Natural History Museum 2015, in litt.). Black-tailed deer were first introduced to Kauai in 1961, for the purpose of sport hunting (Tomich 1986, pp. 131–134). Currently, these deer are only known from the western side of the island, where they feed on a variety of nonnative plants (Mitchell et al. 2005, p. 6–32).
native (e.g., Acacia koa and Coprosma spp.) and nonnative plants (van Riper and van Riper 1982, pp. 42–46; Tomich 1986, p. 134). In addition to their direct impacts on native plants (browsing), black-tailed deer likely affect native plants indirectly by serving as a primary vector for the spread of introduced plants by carrying their seeds or other propagules on their coats and hooves and in feces. Black-tailed deer have been noted as a cause of habitat alteration in the Kauai ecosystems (NTBG 2007, in litt.; HBMP 2010). Seven of the 39 plants (Asplenium diellaciniatum, Dryopteris glabra var. pusilla, Joinvillea ascendens ssp. ascendens, Labordia lorenciana, Nothocestrum latifolium, Ranunculus mautensis, and Sicyos lanceoloides) are at risk of habitat destruction and modification by black-tailed deer.

Sheep (Ovis aries)

Four of the ecosystems on Hawaii Island (lowland dry, lowland mesic, montane mesic, montane dry) in which these species occur are currently threatened by habitat destruction and modification due to the activities of feral sheep. Sheep were introduced to Hawaii Island in 1791, when Captain Vancouver brought five rams and two ewes from California (Tomich 1986, pp. 156–163). Soon after, stock was brought from Australia, Germany, and the Mediterranean for sheep production (Tomich 1986, pp. 156–163; Cuddihy and Stone 1990, pp. 65–66), and by the early 1930s, herds reached close to 40,000 individuals (Scowcroft and Conrad 1992, p. 627). Capable of acquiring the majority of their water needs by consuming vegetation, sheep can inhabit dry forests in remote regions of the mountains of Mauna Kea and Mauna Loa, including the saddle between the two volcanoes. Feral sheep browse and trample native vegetation and have decimated large areas of native forest and shrubland on Hawaii Island (Tomich 1986, pp. 156–163; Cuddihy and Stone 1990, pp. 65–66). Browsing results in the erosion of top soil that alters moisture regimes and micro-environments, leading to the loss of native plants and animals (Tomich 1986, pp. 156–163; Cuddihy and Stone 1990, pp. 65–66). In addition, nonnative plant seeds are dispersed into native forest by adhering to sheep’s wool coats (DOFAW 2002, p. 3). In 1962, game hunters intentionally crossbred feral sheep with mouflon sheep and released them on Mauna Kea, where they have done extensive damage to the montane dry ecosystem (Tomich 1986, pp. 156–163). Over the past 30 years, attempts to protect the vegetation of Mauna Kea and the saddle area between the two volcanoes have been only sporadically effective (Hess 2008, pp. 1, 4).

Currently, a large population of sheep (and mouflon hybrids) extends from Mauna Kea into the saddle and northern part of Mauna Loa, including State forest reserves, where they trample and browse all vegetation, including endangered plants (Hess 2008, p. 1). One study estimated as many as 2,500 mouflon within just the Kauai district of the Kauhuku Unit (Volcanoes National Park) in 2006 (Hess et al. 2006, p. 10). Two of the 39 plants, Exocarpos menziesii and Festuca hawaiiensis, and the yellow-faced bee Hyleaeus anthracinus, are reported to be at risk of habitat destruction and modification by feral sheep (see Table 2).

Mouflon (Ovis gmelini musimon)

Mouflon destroy and modify habitat in 6 of the 11 ecosystems on Maui, Lanai, and Hawaii Island (lowland dry, lowland mesic, montane mesic, montane dry, and montane wet). Mouflon (Ovis gmelini musimon) can be found (on a dry cliff) in which these species occur. Native to central Asia, mouflon were introduced to the islands of Lanai and Hawaii in the 1950s as game species, and are now widely established on these islands (Tomich 1986, pp. 163–168; Cuddihy and Stone 1990, p. 66; Hess 2008, p. 1). Due to their high reproductive rate, the original population of 11 mouflon on the island of Hawaii increased to more than 2,500 individuals in 36 years, even though they were hunted for game (Hess 2008, p. 3). Mouflon have decimated vast areas of native shrubland and forest through grazing, browsing, and trampling (Hess 2008, p. 3). Mouflon also create trails and pathways through vegetation, resulting in soil compaction and increased runoff and erosion. In some areas, the interaction of browsing and soil compaction has led to a shift from native forest to grassy scrublands (Hess 2008, p. 3). Mouflon only gather in herds when breeding, thus complicating control techniques and hunting efficiency (Hess 2008, p. 3; Ikagawa 2011, in litt.). Currently, many of the current and proposed fence enclosures on Hawaii Island constructed to protect rare species and habitat are designed to exclude feral pigs, goats, and sheep and are only 4 ft (1.3 m) in height; a fence height of at least 6 ft (2 m) is necessary to exclude mouflon (Ikagawa 2011, in litt.). Five of the 39 plant species (Exocarpos menziesii, Nothocestrum latifolium, Portulaca villosa, Ranunculus macrophyllus, and Sicyos macrophyllus), and the yellow-faced bee Hyleaeus assimilans, are at risk from habitat destruction and modification resulting from the activities of mouflon (see Table 2).

Cattle (Bos taurus)

Cattle destroy and modify habitat in 7 of the 11 ecosystems on Maui and Hawaii Island (coastal, lowland dry, lowland mesic, lowland wet, montane wet, montane mesic, and montane dry) in which these species occur. Cattle, the wild progenitors of which were native to Europe, northern Africa, and southwestern Asia, were introduced to the Hawaiian Islands in 1793, and large feral herds (as many as 12,000 on the island of Hawaii) developed as a result of restrictions on killing cattle decreed by King Kamehameha I (Cuddihy and Stone 1990, p. 40). While small cattle ranches were developed on Kauai, Oahu, Molokai, west Maui, and Kahoolawe, very large ranches of tens of thousands of acres were created on east Maui and Hawaii Island (Stone 1985, pp. 258, 260; Broadbent 2010, in litt.). Feral cattle have decimated the islands of Molokai, Maui, and Hawaii. Feral cattle destroy and modify habitat in 7 of the 11 ecosystems on Maui and Hawaii Island (coastal, lowland dry, lowland mesic, lowland wet, montane wet, montane mesic, and montane dry). Feral cattle quickly degrade grassland pasture, and plant cover remains reduced for many years following removal of cattle from an area. Increased nitrogen availability through the feces of cattle contributes to the ingress of nonnative plant species (Kohala Mountain Watershed Partnership [KMWP] 2007, pp. 54–55; Laws et al. 2010, in litt.). Furthermore, several alien grasses and legumes purposely introduced for cattle forage have become invasive weeds (Tomich 1986, pp. 140–150; Cuddihy and Stone 1990, p. 29). According to Kessler (2011, pers. comm.) approximately 300 individuals roam east Maui as high as the subalpine ecosystem (i.e., 9,800 ft [3,000 m]), and feral cattle are occasionally observed on west Maui. Feral cattle (more than 100 individuals) are reported from remote regions of Hawaii Island, including the back of Pololu and Waipio Valleys in the Kohala Mountains, and the Kona Unit of the Hakalau Forest National Wildlife Refuge (NWR) [KMWP 2007, p. 55; USFWS 2010, pp. 3–15, 4–86]. Nine of the 39 plant species (Hypeperzia stemmermanniae, Nothocestrum latifolium, Ochrosia haleakalae, Portulaca villosa, Ranunculus hawaiiensis, R. macrophyllus, Schiedea pubescens, Sicyos macrophyllus, and Solanum nelsonii) and four of the...
yellow-faced bees (Hyleus anthracinus, H. assimulans, H. facilis, and H. hilaris) are currently at risk of habitat destruction or modification due to the activities of feral cattle.

In summary, 37 of the 39 plant species (all except Cyanea kauaulaensis and Hypolepis hawaiiensis var. mautiensis), and 9 of the 10 animals (except for the anchialine pool shrimp Procratis hawaiiensis), are at risk of habitat destruction and modification by ungulates including pigs, goats, axis deer, black-tailed deer, sheep, mouflon, and cattle (see Table 2). The effects of these nonnative animals include the destruction of vegetative cover, trampling of plants and seedlings, direct consumption of native vegetation, soil disturbance and sedimentation (erosion and landslides), dispersal of nonnative plant seeds by animals, alteration of soil nitrogen availability, and creation of open, disturbed areas conducive to further invasion by nonnative pest plant species. All of these impacts also can lead to the conversion of a native plant community to one dominated by nonnative species (see "Habitat Destruction and Modification by Nonnative Plants," below). In addition, because these animals inhabit terrain that is often steep and remote, foraging and trampling contributes to severe erosion of watersheds and degradation of streams and wetlands (Cuddihy and Stone 1990, p. 59; Dunkell et al. 2011, pp. 175–194).

Habitat Destruction and Modification by Nonnative Plants

Ten of the 11 ecosystems (excluding anchialine pool ecosystem) and the species in this rule that are associated with them are currently at risk of habitat destruction and modification by nonnative plants. Native vegetation on all of the main Hawaiian Islands has undergone extreme alteration because of past and present land management practices, including ranching, deliberate introduction of nonnative plants and animals, and agriculture (Cuddihy and Stone 1990, pp. 27, 58). The original native flora of Hawaii (present before human arrival) consisted of about 1,000 taxa, 89 percent of which are endemic (Wagner et al. 1999, pp. 3–6). Over 800 plant taxa have been introduced to the Hawaiian Islands. These were brought to Hawaii for food or for cultural reasons, to reforest areas destroyed by grazing feral and domestic animals, or for horticultural or agricultural purposes; some were introduced unintentionally (Scott et al. 1988, pp. 361–363; Cuddihy and Stone 1990, p. 73). Individual descriptions of 114 nonnative plant species that negatively affect the 49 species are provided in our proposed rule (80 FR 58820, September 30, 2015; see pp. 58869–58881).

Fourteen of these nonnative plants are included in the Hawaii Noxious Weed List (Hawaii Department of Agriculture HAR 1981-title 4, subtitle 6, chapter 68).

Nonnative plants adversely affect native habitat in Hawaii by (1) modifying the availability of light, (2) altering soil-water regimes, (3) modifying nutrient cycling, and (4) altering fire regimes of native plant communities (i.e., the "grass/fire cycle") that converts native-dominated plant communities to nonnative plant communities; see below) (Smith 1985, pp. 180–181; Cuddihy and Stone 1990, p. 74; D’Antonio and Vitousek 1992, p. 73; Vitousek et al. 1997, p. 6). The contribution of nonnative plants to the extinction of native species in the lowland and upland habitats of Hawaii is well-documented (Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74).

The most commonly observed effect of nonnative plants on native species is displacement through competition. Competition occurs for water or nutrients, or it may involve allelopathy (chemical inhibition of growth of other plants), shading, or precluding sites for seedling establishment (Vitousek et al. 1987 in Cuddihy and Stone 1990, p. 74).

Alteration of fire regimes represents an ecosystem-level change caused by the invasion of nonnative plants, primarily grasses (D’Antonio and Vitousek 1992, p. 73). Grasses generate standing dead material that burns readily, and grass tissues with large surface-to-volume ratios dry out quickly, contributing to flammability (D’Antonio and Vitousek 1992, p. 73).

The finest size classes of grass material ignite and spread fires under a broader range of conditions than do woody fuels or even surface litter (D’Antonio and Vitousek 1992, p. 73). The grass life form allows rapid recovery following fire because there is little above-ground vegetative structure. Grasslands also support a microclimate in which surface temperatures are hotter, contributing to drier vegetation that favors fire (D’Antonio and Vitousek 1992, p. 73). In summary, nonnative plants directly and indirectly affect the 39 plants and 9 of the 10 animals in this rule (except the anchialine pool shrimp) by destroying and modifying their habitat, by removing their native host plants, or by direct competition.

Habitat Destruction and Modification by Fire

Seven of the 11 ecosystems (coastal, lowland dry, lowland mesic, montane mesic, montane dry, subalpine, and dry cliff) and the species in this rule that are associated with them are at risk of destruction and modification by fire. Fire is an increasing, human-exacerbated threat to native species and ecosystems in Hawaii. The pre-settlement fire regime in Hawaii was characterized by infrequent, low-severity events, as few natural ignition sources existed (Cuddihy and Stone 1990, p. 91; Smith and Tunison 1992, pp. 395–397). It is believed that prior to human colonization fuel was sparse in wet plant communities and only seasonally flammable in mesic and dry plant communities. The only ignition sources were volcanism and lightning (Baker et al. 2009, p. 43). Although Vogl (1969, in Cuddihy and Stone 1990, p. 91) proposed that naturally occurring fires may have been important in the development of some of the original Hawaiian flora, Mueller-Dombois (1981, in Cuddihy and Stone 1990, p. 91) asserts that most natural vegetation types of Hawaii would not carry fire before the introduction of alien grasses. Smith and Tunison (in Cuddihy and Stone 1990, p. 91) state that native plant fuels typically have low flammability. Existing fuel loads were often discontinuous, and rainfall in many areas on most islands was moderate to high. Fires inadvertently or intentionally set by the Polynesian settlers probably contributed to the initial decline of native vegetation in the drier plains and foothills. These early settlers practiced slash-and-burn agriculture that created open lowland areas suitable for the opportunistic invasion and colonization of nonnative, fire-adapted grasses (Kirch 1982, pp. 5–6; Cuddihy and Stone 1990, pp. 30–31). Beginning in the late 18th century, Europeans and Americans introduced plants and animals that further degraded native Hawaiian ecosystems. Ranching and the creation of pasturelands in particular created highly fire-prone areas of nonnative grasses and shrubs (D’Antonio and Vitousek 1992, p. 67). Although fires were infrequent in mountainous regions, extensive fires have recently occurred in lowland dry and lowland mesic areas, leading to grass/fire cycles that convert native dry forest and native wet forest to nonnative grassland (D’Antonio and Vitousek 1992, p. 77).

Because of the greater frequency, intensity, and duration of fires that have resulted from the human alteration of landscapes and the introduction of nonnative plants, especially grasses, fires are now more destructive to native Hawaiian ecosystems (Brown and Smith 2000, p. 172), and a single grass-fueled
fire often kills most native trees and shrubs in the area (D’Antonio and Vitousek 1992, p. 74). Fire destroys dormant seeds of native plants, as well as individual plants and animals themselves, even in steep, inaccessible areas or near streams and ponds. Successive fires remove habitat for native species by altering microclimate conditions, creating conditions more favorable to nonnative plants. Nonnative grasses (e.g., Cenchrus setaceus; fountain grass), many of which may be fire-adapted, produce a high fuel load that allow fire to burn areas that would not otherwise burn easily, regenerate quickly after fire, and establish rapidly in burned areas (Fujikawa and Fuji 1980 in Cudihy and Stone 1990, p. 93; D’Antonio and Vitousek 1992, pp. 70, 73–74; Tunison et al. 2002, p. 122). Native woody plants may recover to some degree, but fire tips the competitive balance toward nonnative species (National Park Service 1989 in Cudihy and Stone 1990, p. 93). During a post-burn survey on Hawaii Island, in an area of native Diospyros forest with undergrowth of the nonnative grass Pennisetum setaceum (Cenchrus setaceus), Takeuchi (1991, p. 2) noted that “no regeneration of native canopy is occurring within the Puuwaawaa burn area.” Takeuchi also stated that “burn events served to accelerate a decline process already in place, compressing into days a sequence which would ordinarily have taken decades” (Takeuchi 1991, p. 4), and concluded that, in addition to increasing the number of fires, the nonnative Pennisetum acted to suppress establishment of native plants after a fire (Takeuchi 1991, p. 6).

For many decades, fires have affected rare or endangered species and their habitats on Molokai, Lanai, and Maui (Gima 1998, in litt.; Hamilton 2009, in litt.; Honolulu Advertiser 2010, in litt.; Pacific Disaster Center 2011, in litt.). These three islands experienced approximately 1.290 brush fires between 1972 and 1999 that burned a total of 64,250 ac (26,000 ha) (County of Maui 2009, ch. 3, p. 3; Pacific Disaster Center 2011, in litt.). Between 2000 and 2003, the annual number of wildfires on these islands jumped from 118 to 271; of these, several burned more than 5,000 ac (2.023 ha) each (Pacific Disaster Center 2011, in litt.). On Molokai, between 2003 and 2004, three wildfires each burned 10,000 ac (4,050 ha) (Pacific Disaster Center 2011, in litt.). From August through early September 2009, a wildfire burned approximately 8,000 ac (3,237 ha), including 600 ac (243 ha) of the remote Makakupaia section of the Molokai Forest Reserve, a small portion of The Nature Conservancy’s (TNC’s) Kamokou Preserve, and encroached on Onini Gulch, Kalamaula, and Kawela (Hamilton 2009, in litt.). Species at risk because of wildfire on Molokai include the plants Joinvillea ascenden s.s. ascendens, Nothocentrum latilatilum, Portulaca villosa, Ranunculus mauliensis, Schiedea pubescens, and Solanum nelsonii, and the yellow-faced bees Hylaenus anthracinus, H. facilis, H. hilaris, and H. longiceps.

Several wildfires have occurred on Lanai in the last decade. In 2006, a wildfire burned 600 ac (243 ha) between Manele Road and the Palawai Basin, about 3 mi (4 km) south of Lanai City (The Maui News 2006, in litt.). In 2007, a brush fire at Mahana burned about 30 ac (12 ha), and in 2008, another 1,000 ac (405 ha) were burned by wildfire in the Palawai Basin (The Maui News 2007, in litt.; KITV Honolulu 2008, in litt.). Species at risk because of wildfire on Lanai include Exocarpos menziesii, Nothocentrum latilatilum, Portulaca villosa, Schiedea pubescens; and the yellow-faced bees Hylaenus anthracinus, H. assimilis, H. facilis, H. hilaris, and H. longiceps. On west Maui, wildfires burned more than 8,650 ac (3,501 ha) between 2007 and 2010 (Honolulu Advertiser 2010, in litt.; Shimogawa 2010, in litt.). These fires encroached into the West Maui Forest Reserve, on the ridges of Olowalu and Kealalaloa, which is habitat for several endangered plants. In 2007, on west Maui, a fire consumed 600 ac (240 ha), increasing invasion of the area by nonnative plants (Pinus spp.) (Pacific Disaster Center 2007, in litt.; The Maui News 2011, in litt.). Species at risk because of wildfire on west and east Maui include the plants Festuca hawaiensis, Joinvillea ascendens s.s. ascendens, Nothocentrum latilatilum, Ocrhysa haleakalae, Portulaca villosa, Ranunculus mauliensis, Sanicula sandwicensis, Schiedea pubescens, Sicyos macrophyllus, and Solanum nelsonii, and the yellow-faced bees Hylaenus anthracinus, H. assimilis, H. facilis, H. hilaris, and H. longiceps.

Several recent fires on Oahu in the Waianae Mountain range have affected rare and endangered species. Between 2004 and 2005, wildfires burned more than 360 ac (146 ha) in Honoluluui Preserve, habitat of more than 90 rare and endangered plants and animals (TNC 2005). In 2006, a fire at Kaena Point State Park burned 60 ac (24 ha), and encroached on endangered plants in Mauna Loa Forest Reserve. In 2007, there was a significant fire at Kaunakaha that crossed 12 gulches, eventually encompassing 5,655 ac (2,289 ha) that negatively affected eight endangered plant species and their habitat (Abutilon sandwicense, Bonamia menziesii, Colubrina oppositifolia, Eugenia koolauensis, Euphorbia haeleoleana, Hibiscus brackenridgei ssp. mokuleianus, Nototrichium humile, and Schiedea hookeri) (U.S. Army Garrison 2007b, Appendices pp. 1–5). This fire provided ingress for nonnative ungulates (cattle, goats, and pigs) into previously undisturbed areas, and opened dense native vegetation to the invasive grass Urochloa maxima (Panicum maximum, guinea grass), also a food source for cattle and goats. The grass was observed to generate blades over 2 ft (0.6 m) in length only 2 weeks following the fire (U.S. Army Garrison 2007b, Appendices pp. 1–5). In 2009, two smaller fires burned 200 ac (81 ha) at Manini Pali (Kaena Point State Park) and almost 4 ac (1.5 ha) at Makua Cave. Both of these fires burned into area designated as critical habitat, although no individual plants were directly affected (U.S. Army Natural Resource Program 2009, Appendix 2, 17 pp.).

Most recently, in 2014, two fires affected native forest, one in the Oahu Forest National Wildlife Refuge (350 ac, 140 ha), on the leeward side of the Ko’olau Mountains (DLNR 2014, in litt.), and one above Makakilo, in the Waianae Mountains, just below Honoluluui FR, that burned more than 1,000 ac (400 ha) (KHON 2014, in litt.). The Makakilo fire took over 2 weeks to contain. Species at risk because of wildfire on Oahu include the plants Joinvillea ascendens s.s. ascendens, Nothocentrum latilatilum, Portulaca villosa, Ranunculus mauliensis, and Sicyos lanceoloides, and the yellow-faced bees Hylaenus anthracinus, H. assimilis, H. facilis, H. kaukea, H. longiceps, and H. mana.

In 2012, on Kauai, a wildfire that was possibly started by an unauthorized campfire burned 40 ac (16 ha) in the Na Pali-Kona Forest Reserve on Molii Ridge, forcing closure of a hiking trail. Fortunately, several endangered and threatened plants in the adjacent Kula NAR were not impacted (KITV 2012, in litt.). The same year, another wildfire burned over 650 ac (260 ha) on Hikimoe Ridge, and threatened the Puu Ka Pele section of Waimea Canyon State Park (Hawaii News Now 2012, in litt.; Star Advertiser 2012, in litt.). Species at risk of because wildfire on Kauai include the plants Joinvillea ascendens s.s. ascendens, Labordia lorenciana, Nothocentrum latilatilum, Ranunculus mauliensis, Santalum involutum, and Sicyos lanceoloides.
In the driest areas on the island of Hawaii, wildfires are exacerbated by the uncontrolled growth of nonnative grasses such as *Cenchrus setaceus* (Fire Science Brief 2009, in litt.). Since its introduction to the island in 1917, this grass now covers more than 200 square mi (500 square km) of the leeward areas of the island (Joint Fire Science Brief [JFSB] 2009, in litt.). In the past 50 years, three wildfires on the leeward side encompassed a total of 20,000 ac (12,140 ha) (JFSB 2009, in litt.). These wildfires traveled great distances at rates of 4 to 8 miles per hour (mph) (7 to 12 kilometers per hour [kph]), burning 2.5 ac (1 ha) to 6 ac (2.5 ha) per minute (the equivalent of 6 to 8 football fields per minute) (Burn Institute 2009, p. 4). Between 2002 and 2003, three successive lava-ignited wildfires in the east rift zone of Hawaii Volcanoes National Park affected native forests in lowland dry, lowland mesic, and lowland wet ecosystems (JFSB 2009, p. 3), cumulatively burning an estimated 11,225 ac (4,543 ha) (Wildfire News, June 9, 2003; JFSB 2009, p. 3). These fires destroyed over 95 percent of the canopy cover and encroached upon forest areas that were previously thought to have low susceptibility to wildfires. After the fires, nonnative ferns were observed in higher elevation rainforest where they had not previously been seen, and were believed to inhibit the recovery of the native *Metrosideros polymorpha* (ohia) trees (JFSP 2003, pp. 1–2). Nonnative grasses invaded the burn area, increasing the risk of fire encroaching into the surrounding native forest (Aimsworth 2011, in litt.). Extreme drought conditions also contributed to the number and intensity of wildfires on Hawaii Island (Armstrong and Media 2010, in litt.; Loh 2010, in litt.). This “extreme” drought classification for Hawaii was recently lifted to “moderate”; however, drier than average conditions persist, and another extreme drought event may occur (NOAA 2015, in litt.). In addition, El Niño conditions in the Pacific (see “Climate Change” under Factor E, below), a half-century of decline in annual rainfall, and intermittent dry spells have contributed to the conditions favoring wildfires in all the main Hawaiian Islands (Marcus 2010, in litt.). Species at risk because of wildfire on Hawaii Island include the plants *Exocarpos menziesii*, *Festuca hawaiiensis*, *Joinvillea ascendens* ssp. *ascendens*, *Ochrosia haleakalae*, *Portulaca villosa*, *Ranunculus mauliensis*, *Sanicula sandwicensis*, *Sicyos macrophyllus*, and *Solanum nelsonii*, and the yellow-faced bee *Hyleus anthracinus*.

In summary, fire is a threat to 14 plant species and their habitat (*Exocarpos menziesii*, *Festuca hawaiiensis*, *Joinvillea ascendens* ssp. *ascendens*, *Labordia lorenciana*, *Nothocestrum latifolium*, *Ochrosia haleakalae*, *Portulaca villosa*, *Ranunculus mauliensis*, *Sanicula sandwicensis*, *Santalum involutum*, *Schiedea pubescens*, *Sicyos lanceoloides*, *S. macrophyllus*, and *Solanum nelsonii*), and all seven yellow-faced bees because these species and their habitat are located in or near areas that were burned previously, or in areas considered at risk because of fire due to the cumulative and compounding effects of drought and the presence of highly flammable nonnative grasses.

**Habitat Destruction and Modification by Hurricanes**

Ten of the 11 ecosystems (all except the anchialine pool ecosystem) where these species occur are at risk of habitat destruction and modification by hurricanes. Hurricanes exacerbate the impacts of other threats such as habitat destruction and modification by ungulates and competition with nonnative plants. By destroying native vegetation, hurricanes open the forest canopy, modify the availability of light, and create disturbed areas conducive to invasion by nonnative pest species (see “Habitat Destruction and Modification by Nonnative Plants”, above) (Asner and Goldstein 1997, p. 148; Harrington et al. 1997, pp. 539–540). In addition, hurricanes adversely affect native Hawaiian stream habitat by defoliating and topping vegetation, thus loosening the surrounding soil and increasing erosion. Along with catastrophic flooding, this soil and vegetative debris can be washed into streambeds (by hurricane-induced rain or subsequent rain storms), resulting in the scouring of stream bottoms and channels (Polhemus 1993a, 88 pp.). Natural disasters such as hurricanes can be particularly devastating to Hawaiian plant and animal species that persist in low numbers and in restricted ranges (Mitchell et al. 2005, p. 4–3).

Hurricanes affecting Hawaii were only rarely reported from ships in the area from the 1800s until 1949. Between 1950 and 1997, 22 hurricanes passed near or over the Hawaiian Islands, 5 of which caused serious damage (Businger 1998, pp. 1–2). In November 1982, Hurricane Iwa struck the Hawaiian Islands with wind gusts exceeding 100 mph (209 kmh) and 160 kilometers per hour (knh), causing extensive damage, especially on the islands of Kauai, Ni‘ihau, and Oahu (Businger 1998, pp. 2, 6). Many forest trees were destroyed (Perlman 1992, pp. 1–9), which opened the canopy and facilitated the invasion of native forest by nonnative plants (Kitayama and Mueller-Dombois 1995, p. 671). Hurricanes therefore exacerbate the threats posed by nonnative plants, as described in “Habitat Destruction and Modification by Nonnative Plants,” above. In September 1992, Hurricane Iniki, a category 4 hurricane with maximum sustained winds of 130 mph (209 kmh, 113 knots), passed directly over the island of Kauai and close to the island of Oahu, causing significant damage to Kauai and along Oahu’s southwestern coast (Blake et al. 2007, pp. 20, 24). Biologists documented damage to the habitat of six endangered plant species on Kauai, and one plant on Oahu. Polhemus (1993a, pp. 86–87) documented the extirpation of the scarlet Kauai damselfly (*Megalagron vagabundum*) (a species related to *M. xanthomelas*), from the entire Hanakapiai Stream system on the island of Kauai as a result of the impacts of Hurricane Iniki. Damage by future hurricanes will further alter the remaining native-plant-dominated habitat for rare plants and animals in native ecosystems of Kauai, Oahu, and other Hawaiian Islands (Bellingham et al. 2005, p. 681) (see “Climate Change” under Factor E. Other Natural or Manmade Factors Affecting Their Continued Existence, below).

In summary, hurricanes exacerbate other habitat threats, such as competition with nonnative plants, as well as result in direct habitat destruction. This is a particular problem for the plant *Pritchardia bakeri*, the band-rumped storm-petrel, the orangeblack Hawaiian damselfly, and all seven yellow-faced bees.

**Habitat Modification and Destruction Due to Landslides, Rockfalls, Treefall, Flooding, Erosion, Drought, and Tsunamis**

Habitat destruction and modification by landslides, rockfalls, treefall, flooding, erosion, and drought (singly or in combination) is a threat to all 11 ecosystems in which these species occur. Landslides, rockfalls, treefall, flooding, and erosion change native plant and animal communities by destabilizing substrates, damaging or destroying individual plants, and altering hydrological patterns. In the open sea near Hawaii, rainfall averages 25 to 30 inches (in) (630 to 760 millimeters per year) but over the islands may receive up to 15 times this amount in some places, caused by
Dryopteris glabra var. Cyclosorus boydiae, Deparia kaalaana, plant species (and resilience of the species. range, resulting in reduced redundancy occurrences of species that persist in (see Table 2). These events could eliminate one or more isolated occurrences of species that persist in low numbers and a limited geographic range, resulting in reduced redundancy and resilience of the species.

Landslides, rockfalls, treefall, flooding, and erosion are threats to 20 plant species (Cyanaea kaauaensis, Cyclcosorus boydiae, Deparia kaalaana, Dryopteris glabra var. pusilla, Gardenia remyi, Joinvillea ascendens ssp. ascendens, Kadua flaviatilis, K. haupuenisi, Labordia lorenciana, Lepidium orbiculare, Phyllostegia brevidens, P. helleri, P. stachyoides, Portulaca villosa, Pseudognaphalium sandwicensium var. molokaiense, Ranunculus hawaiiensis, R. mauiensis, Sanicula sandwicensis, Schiedea pubescens, and Solanum nelsonii) and to the band-rumped storm-petrel and the orangeblack Hawaiian damselfly. Landslides, rockfalls, and erosion can directly affect nests and nesting habitat of the band-rumped storm-petrel. Destabilization of cliff habitat leads to additional landslides and alteration of hydrological patterns, affecting the availability of soil moisture. Landslides also destroy and modify riparian and stream habitat, impact physical damage, and create disturbed areas leading to invasion by nonnative plants, as well as damaging or destroying plants directly. Kadua haupuenisi, Labordia lorenciana, Lepidium orbiculare, Phyllostegia brevidens, and P. helleri are known only from a few individuals in single occurrences on cliffs or steep-walled stream valleys, and one landslide could extirpate a species by direct destruction. Monitoring data presented by the Plant Extinction Prevention Program (PEPP) and botanical surveys suggest that flooding is a likely threat to eight plant species, Cyanaea kaauaensis, Cyclcosorus boydiae. Deparia kaalaana, Labordia lorenciana, Phyllostegia stachyoides, Sanicula sandwicensis, Schiedea pubescens, and Solanum nelsonii, as some individuals occur on stream banks (Wood et al. 2007, p. 198; PEPP 2011, pp. 162–164; Oppenheimer and Lorence 2012, pp. 20–21; PEPP 2013, p. 54; PEPP 2014, pp. 95, 142). The nailed life stage of the orangeblack Hawaiian damselfly would be destroyed by flooding if an individual is carried out of suitable habitat or into areas occupied by nonnative fish.

Drought is reported to be a threat to 10 plants (Cyclcosorus boydiae, Deparia kaalaana, Huperzia hawaiiensis, Phyllostegia stachyoides, Ranunculus hawaiiensis, R. mauiensis, Sanicula sandwicensis, Schiedea pubescens, Sicyos lanceoloides, and Solanum nelsonii), the orangeblack Hawaiian damselfly (directly or by desiccation of streams and ponds), and all seven yellow-faced bees (Magnaccia 2007, pp. 181, 183; Polhemus 2008, p. 26; Chu et al. 2010, pp. 4887, 4891, 4898; PEPP 2011, pp. 162–164; Fortini et al. 2013, p. 2; PEPP 2013, p. 177; PEPP 2014, pp. 140–142, 154–156, 162, 166–167). Between 1860 and 2002, there were 49 periods of drought on Oahu, 30 periods of drought on Molokai, Lanai, and Maui, and at least 18 severe or severe drought events on Hawaii Island (Giambelluca et al. 1991, pp. 3–4; Hawaii Commission on Water Resource Management (CWRM) 2009, in litt.; Hawaii Civil Defense 2011, pp. 14–14–12). The most severe drought events over the past 15 years were associated with the El Nino phenomenon (Hawaii Civil Defense 2011, p. 14–3). In 1998, the city of Hilo had the lowest January total rainfall (0.014 in) ever observed for any month since records have been kept, with average rainfall being almost 10 in for January (Hawaii Civil Defense 2011, p. 14–3). Currently, the State remains under abnormally dry to moderate drought conditions, with the onset of another El Nino event (U.S. Drought Monitor 2015, in litt., National Weather Service 2015, in litt.). Drought events dry up streams, irrigation ditches, and reservoirs, and deplete groundwater supplies (Hawaii CWRM 2009, in litt.). Recent episodes of drought have driven axis deer farther into forested areas in search of food, increasing their negative impacts on native vegetation from herbivory, bark stripping, and trampling (see Factor C. Disease or Predation, below) (Waring 1996, in litt.; Nishibayashi 2001, in litt.). Drought events could eliminate one or more isolated populations of a species that currently persists in low numbers and a limited geographic range, resulting in reduced redundancy and resilience of the species or extinction.

Tsunamis destroy and modify habitat for species in Northwestern Hawaiian Islands and in low-lying coastal areas of the main Hawaiian Islands. Tsunamis in Hawaii are caused by earthquakes, submarine landslides, and volcanic eruptions that may occur within the archipelago or in distant parts of the Pacific. These events disturb the ocean’s surface, and gravity combined with the water’s motion produces a series of long-period waves that travel quickly and can reach heights of 32 ft (10 m) or more when reaching land. Major tsunamis occur worldwide about once every 10 years, on average, and almost 60 percent of those occur in the Pacific Ocean (Pacific Tsunami Warning Center, http://ptwc.weather.gov/ptwc/faq.php#8, accessed June 2016). In 2011, a tsunami caused by an earthquake in Japan reached Hawaii and the Northwestern Hawaiian Islands. The tsunami swept over Midway Atoll’s Eastern Island and Kure Atoll’s Green Island, where it inundated plants, spread plastic debris, killed thousands of seabirds, and destroyed seabird nesting areas as it traveled about 500 ft (150 m) inland (DOFAW 2011, in litt.; Starr 2011, in litt.; USFWS 2011, in litt.). This threat could occur at any time and negatively affect occurrences and habitat of the plant Solanum nelsonii and the yellow-faced bees Hyleaeus anthracinus, H. assimilans, H. facilis, H. hilaris, and H. longiceps.

Habitat Destruction and Modification by Water Extraction

Freshwater habitats on all the main Hawaiian Islands have been severely altered and degraded because of past and present land and water management practices, including agriculture, urban development, and development of ground water, perched aquifer, and surface water resources (Harris et al. 1993, p. 11; Meier et al. 1993, p. 181). Extensive modification of lentic (standing water) habitat in the Hawaiian Islands began about 1100 A.D. with a rapid increase in the human population (Harris et al. 1993, p. 9; Kirch 1982, pp. 5–6). Hawaiians cultivated Colocasia esculenta (kalo, taro) by creating shallow, walled ponds, or loi, in marshes and riparian areas (Meier et al. 1993, p. 181; Handy and Hardy 1972, p. 58). By 1778, virtually all valley bottoms with permanent stream flow and most basin marshes were converted to taro cultivation (Handy and Hardy 1972, pp. 396, 411). Hawaiians also modified wetlands by constructing fishponds, many of which were primarily fresh water, fed by streams or springs (Meier
et al. 1993, p. 181). Despite this habitat modification by early Hawaiians, many areas of extensive marshland remained intact and were used by the native damselflies. Over time, however, many of the wetlands formerly used for taro were drained and filled for dry-land agriculture or development (Stone 1989, p. 129; Meier et al. 1993, pp. 181–182). In addition, marshes are slowly filled and converted to meadow habitat due to increased sedimentation resulting from increased storm water runoff from upslope development and blockage of downslope drainage (Wilson Okamoto and Associates, Inc. 1993, p. 3–5).

Presently the most significant threat to the remaining natural ponds and marshes in Hawaii, habitat for the orangeblack Hawaiian damselfly, is the nonnative grass species Urochloa mutica. This sprawling, perennial grass was first observed on Oahu in 1924, and now occurs on all the main islands (O’Connor 1999, p. 1504). This species forms dense, monotypic stands that can completely eliminate any open water by layering of its trailing stems (Smith 1985, p. 186).

Similar to the loss of wetlands in Hawaii, the loss of streams has been significant and began with the early Hawaiians who modified stream systems by diverting water to irrigate taro. However, these Hawaiian-made diversions were closely regulated and were not permitted to take more than half the stream flow, and were typically used to flood taro loi only periodically (Handy and Handy 1972, pp. 58–59). The advent of sugarcane plantations in 1835 led to more extensive stream diversions. These systems were typically designed to tap water at upper elevation sources (above 980 ft (300 m)) by means of concrete weirs. All or most of the stream flow was diverted into fields or reservoirs (Takasaki et al. 1969, p. 65; Harris et al. 1993, p. 10). By the 1930s, major water diversions had been developed on all the main islands, and currently one-third of Hawaii’s perennial streams are diverted (Harris et al. 1993, p. 10). In addition to diverting water for agriculture and domestic water supply, streams have been diverted for use in producing hydroelectric power (Hawaii Stream Assessment 1990, p. 96). Surface flow has also been diverted into channels, and the perched aquifers which fed the streams have been tapped by means of tunnels (Stearns and Vaskv 1935, pp. 365, 378–434; Stearns 1965, p. 291, 301–303). Many of these aquifers are the sources of springs, which contribute flow to streams. The draining of these aquifers causes springs to become dry (Stearns and Vaskv 1935, pp. 380, 388; USGS 2000, in litt.). Most remaining streams that are not already diverted have been, and continue to be, seriously degraded by the activities of feral ungulates and by nonnative plants. Channelization has not been restricted to lower reaches, and it results in the loss of riparian vegetation, increasing flow velocity, illumination, and water temperature (Parrish et al. 1984, pp. 83–84). These conditions make the channels unsuitable as habitat for the orangeblack Hawaiian damselfly.

Water extraction (e.g., withdrawal of subsurface fresh water for development and human use) from underground fresh water sources increases salinity levels of anchialine pools and negatively affect the anchialine pool shrimp, Procarisawaiiana, which relies on the delicate balance of mixohaline (brackish water) habitats (Conry 2012, in litt.; National Park Service 2016, in litt.). Water extraction also negatively affects the plant Cyclosorus boydiae and the orangeblack Hawaiian damselfly by degrading or destroying habitat for these species (Harris et al. 1993, pp. 9–13; Medeiros et al. 1993, p. 88; Meier et al. 1993, pp. 181–183; Palmer 2003, p. 88).

Habitat Destruction and Modification by Climate Change

Climate change affects the habitat of the 49 species. Discussion of climate change impacts is included in our complete discussion of climate change under Factor E. Other Natural or Manmade Factors Affecting Their Continued Existence, below.

Summary of Factor A

Habitat destruction and modification of the habitat of each of the 49 species addressed in this rule is occurring throughout the entire range of each of the species. These impacts include the effects of agriculture and urban development, introduced ungulates, nonnative plants, fire, hurricanes, landslides, rockfalls, treefall, flooding, erosion, drought, tsunami, and water extraction.

Habitat destruction and modification by agriculture and urban development is an ongoing and serious threat to the plant Cyclosorus boydae, the orangeblack Hawaiian damselfly, the anchialine pool shrimp Procarisawaiiana, and the yellow-faced bees Hylaenus anthracinus, H. assimulans, H. facilis, H. hilaris, and H. longiceps. Conversion of wetland and other aquatic habitat (i.e., water extraction) for agriculture and urban development is expected to continue into the future, and affects the orangeblack Hawaiian damselfly by removing habitat required for hunting and breeding. Water extraction affects the orangeblack Hawaiian damselfly because it (1) reduces the amount and distribution of stream habitat; (2) reduces stream flow and habitat; and (3) leads to an increase in water temperature, which causes physiological stress to the damselfly naids. Water extraction affects the delicate balance of the anchialine pool ecosystem, including salinity and biota, negatively affecting the anchialine pool shrimp, Procarisawaiiana. Loss of stream-course habitat affects Cyclosorus boydae because this is the only habitat where this riparian species occurs.

The threat of habitat destruction and modification by ungulates is ongoing as ungulates currently occur in all ecosystems on which these species depend except the anchialine pool system. Introduced ungulates pose a threat to 37 of the 39 plants (except for Cyannea kauaualuenis and Hypolepis hawaiiensis var. mauliensis), and 9 of the 10 animal species (all except for the anchialine pool shrimp) in this rule that occur in these 10 ecosystems because ungulates: (1) Directly affect the species by trampling and grazing (see Factor C discussion, below); (2) increase soil disturbance and erosion; (3) create open, disturbed areas conducive to nonnative plant invasion by dispersing fruits and seeds, which results in conversion of a native-dominated plant community to a nonnative-dominated plant community; and (4) increase marsh and stream disturbance and sedimentation, which negatively affects these aquatic habitats.

Habitat destruction and modification by nonnative plants is a serious and ongoing current threat to all 39 plant species because nonnative plants: (1) Adversely affect microhabitat by modifying the availability of light; (2) alter soil-water regimes; (3) modify nutrient cycling processes; (4) alter fire ecology, leading to incursions of fire-tolerant nonnative plant species into native habitat; (5) outcompete, and possibly directly inhibit (through allelopathy) the growth of native plant species; and (6) alter the substrate such that erosion leading to rockfalls and landslides may increase. Each of these processes can convert native-dominated plant communities to nonnative plant communities (Cuddihy and Stone 1990, p. 74; Vitousek 1992, pp. 33–35).

The threat of habitat destruction and modification by fire to 14 plant species (Exocarpos menziesii, Festuca hawaiiensis, Joinvillea ascendens sp. ascendens, Labordia lorenciana, Notocentrum latifolium, Ochnosia haleakalae, Portulaca villosa, Ranunculus mauliensis, Sanicula
dryopteris glabra var.
cyclosorus boydiae, deparia kaalaana, cyanea kauaulaensis, species (that persist as one or several small, potential of driving to extinction species resilient to such disturbances. A single because they persist in low numbers in damselfly (Polhemus 1993a, pp. 86–87). Final hurricanes can alter and are likely for the band-rumped storm-petrel. Finally, hurricanes can open the forest habitat, a particular problem for species like storm-petrels that return to the same nest site each year (Schreiber et al. 2002, p. 186; Hass et al. 2012, pp. 252–253). Hurricanes also destroy nesting habitat, a particular problem for species like storm-petrels that return to the same nest site each year (Schreiber 2002, p. 186). These hurricane impacts are likely for the band-rumped storm-petrel. Finally, hurricanes can alter and directly damage streams and wetlands used by the orangeblack Hawaiian damselfly (Polhemus 1993a, pp. 86–87). The impacts from hurricanes can be particularly devastating to these species because they persist in low numbers in restricted ranges and are therefore less resilient to such disturbances. A single destructive hurricane holds the potential of driving to extinction species that persist as one or several small, isolated populations.

Landslides, rockfalls, treefalls, flooding, and erosion (singly or combined) are a threat to 20 plant species (cyanea kaualaeensis, cyclosorus boydiae, deparia kaalaana, dryopteris glabra var. pusilla, gardenia remyi, j poison lauaescalens sap, ascends, kadia fluviatilis, k. haupuensis, labordia lorenciana, lepidium orbiculare, phyllostegia brevidens, p. helleri, p. stachyoides, portulaca villosa, pseudognaphalium sandwicensium var. molokaiaense, ranunculus haawainaensis, r. mauensis, sanicula sandwicensis, schiedea sandwicensis, schiedea pubescens, and solanum nelsonii), the band-rumped storm-petrel, and the orangeblack Hawaiian damselfly by destabilizing substrates, damaging and killing individuals, altering hydrological patterns, and destroying or modifying habitat—all resulting in changes to native plant and animal communities. Drought is a threat to 10 plant species (cyclosorus boydiae, deparia kaalaana, huperzia stemmermanniae, phyllostegia stachyoides, ranunculus haawainaensis, r. mauensis, sanicula sandwicensis, schiedea pubescens, sicinos lanceoleoides, and solanum nelsonii), the orangeblack Hawaiian damselfly (directly or by desiccation of streams and ponds), and all seven yellow-faced bee species (and the host plants upon which all seven yellow-faced bees depend).

Habitat destruction and modification by over-washing of low-lying areas by tsunamis is a threat to coastal species, including solanum nelsonii, hylaeus anthracinus, h. assimulans, h. facilis, h. hilaris, and h. longiceps.

Factor B. overuse or Modification for Commercial, Recreational, Scientific, or Educational Purposes Plants

We are not aware of any threats to the 39 plant species that would be attributed to overuse for commercial, recreational, scientific, or educational purposes.

Animals

Anchialine Pool Shrimp

Illegal collection is a threat to the anchialine pool shrimp procaris hawaiiensis because of inadequate monitoring and enforcement at the pools where this species occurs. All terrestrial and aquatic invertebrates (including anchialine pool shrimp) are protected under (1) the state of Hawaii revised statutes (1993) chapter 195D-4 license; and (2) dlnr chapter 124: indigenous wildlife, endangered and threatened wildlife, and introduced wild birds. Collection of plants and animals is prohibited in the state natural area reserves (Nars) Ahihikinau (maui) and manuka (hawaii island), but enforcement of prohibitions is insufficient to prevent illegal collecting at these remote sites. Collecting is not prohibited in state parks or city and county property where some anchialine pools occur, and is not expressly prohibited at lua o palahemo (hawaii island), and thus no regulatory protection of these shrimp exists at the remaining five anchialine pools outside of manuka nar that are known to contain P. hawaiiensis. A native invertebrate research and collecting permit issued by DLNR's Division of forestry and Wildlife is required to collect anchialine pool shrimp for research or commercial purposes, and the commercial market is supported by legal, permitted collection. We expect that permit holders, whether they are collecting for scientific or commercial purposes, adhere to the conditions of their permit and do not pose a threat to P. hawaiiensis. However, we consider illegal collection of this anchialine pool shrimp, P. hawaiiensis, to be an ongoing threat because, despite the prohibition on collecting within the Nars and the permitting process for collection elsewhere, collection can occur at any time owing to insufficient patrolling or other monitoring or enforcement at the pools where P. hawaiiensis occurs.

Factor C. Disease or Predation Disease

We are not aware of any current threats to the 49 species that would be attributable to disease. Disease may be a potential threat to the yellow-faced bee hylaeus anthracinus, as pathogens carried by nonnative bees, wasps, and ants could be transmitted through shared food sources (Graham 2015, in litt.); however, we have no evidence of this type of disease transmission at this time.

Predation

Hawaii's plants and animals evolved in nearly complete isolation from continental influence. Successful, natural colonization of these remote volcanic islands is infrequent, and many organisms never succeeded in establishing populations. As an example, Hawaii lacks native ants and conifers, has very few families of birds, and has only had two native species of land mammal, both insectivorous bats (Loope 1998, p. 748; Ziegler 2002, pp. 244–245). In the absence of grazing or browsing mammals, plants that became established did not need mechanical or chemical defenses against mammalian herbivory such as thorns, prickles, and toxins. Because the evolutionary pressure to either produce or maintain such defenses was lacking, Hawaiian plants either lost or never developed these adaptations (Carlquist 1980, p. 173). Likewise, native Hawaiian birds...
and insects experienced no evolutionary pressure to develop defense mechanisms against mammalian or invertebrate predators that were not historically present on the islands. The native flora and fauna are thus particularly vulnerable to the impacts of introduced nonnative species, as discussed below.

**Introduced Ungulates**

In addition to the habitat impacts discussed above (see “Habitat Destruction and Modification by Introduced Ungulates” under Factor A. The Present or Threatened Destruction, Modification, or Curtailment of Their Habitat or Range), grazing and browsing (predation) by introduced ungulates are a threat to the following 27 plant species in this proposal (see Table 2, above):

**Habitat or Range**

Discussed above (see “Habitat Destruction and Modification by Introduced Ungulates’’ under Factor A. The Present or Threatened Destruction, Modification, or Curtailment of Their Habitat or Range). Grazing and browsing (predation) by introduced ungulates are a threat to the following 27 plant species in the proposal (see Table 2, above):

**Present or Threatened Destruction,** **Introduced Ungulates” under Factor A. The Present or Threatened Destruction, Modification, or Curtailment of Their Habitat or Range.**

 Introduced Ungulates'’ under Factor A. The Present or Threatened Destruction, Modification, or Curtailment of Their Habitat or Range.**

**Present or Threatened Destruction,** **Introduced Ungulates** introduced nonnative species, as historically present on the islands. The introduced ungulates in the areas where these species occur and the results of studies involving similar species or ecosystems conducted in Hawaii and elsewhere (Diong 1982, p. 144). Beach (1997, pp. 3–4) found that feral pigs in Texas spread disease and parasites, and their rooting and wallowing behavior led to spoilage of watering holes and loss of soil through leaching and erosion. Rooting activity by pigs also decreased the survivability of some plant species through disruption at root level of mature plants and seedlings (Beach 1997, pp. 3–4; Anderson et al. 2007, in litt.). In Hawaii, pigs dig up forest ground cover consisting of delicate and rare species of orchids, ferns, mints, lobelias, and other taxa, including their roots, tubers, and rhizomes (Stone and Anderson 1988, p. 137). The following plants are particularly at risk of herbivory by feral pigs: Calamagrostis expansa on Maui and Hawaii Island (HBMP 2010); Cyclosorus boydii on Oahu (HBMP 2010); Deparia kaalaana on Maui (HBMP 2010); Gardenia remyi on Maui (HBMP 2010); and Deparia kaalaana on Maui (HBMP 2010). Feral goats consume a variety of plants for food and have been observed to browse on (but are not limited to) native plant species in the following genera: Argyroxyphium, Canavalia, Chamaesyce, Erythrina, Plantago, Schiedea, and Stenogyne (Cuddihy and Stone 1990, p. 64; Warren 2004, p. 462; Wood 2007, pers. comm.). A study conducted on the island of Hawaii demonstrated that native Acacia koa seedlings are unable to survive due to browsing and grazing by goats (Spatz and Mueller-Dombois 1973, p. 874). If goats remained in the area in high numbers, mature trees eventually died and with them the root systems that supported suckers and vegetative reproduction. When feral goats were excluded by fences for 3 years, there was a positive height-growth response of A. koa suckers (Spatz and Mueller-Dombois 1973, p. 873). Another study at Puuwaawaa on Hawaii Island demonstrated that prior to management actions in 1985, regeneration of endemic shrubs and trees in a goat-grazed area was almost totally lacking, contributing to the invasion of forest understory by exotic grasses and weeds. After the removal of goats, A. koa and native Metrosticerus seedlings were observed germinating by the thousands (HDLNR 2002, p. 52). Based on these studies, and other comparisons of fenced and unfenced areas, it is clear that goats devastate native Hawaiian ecosystems (Loope et al. 1988, p. 277). Because feral goats occur in 10 of the 11 ecosystems (all except anchialine pool) discussed in this proposal, the results of the studies described above indicate that goats likely also alter these ecosystems and directly damage or destroy native plants. Browsing or grazing by feral goats poses a particular threat to the following plant species: Exocarpos menziesii on Hawaii Island (NTBG Herbarium Database 2014, in litt.), Gardenia remyi on Hawaii Island (Wood 2001b, in litt.).
Axis Deer

Axis deer are known to consume a wide range of forage items throughout their native range and in areas where they have been introduced (Anderson 1999, p. 3). Although they prefer to graze on grass, axis deer have been documented to eat over 75 species of plants, including all plant parts. (Anderson 1999, p. 3). They exhibit a high degree of opportunism regarding their choice of forage, and consume progressively less palatable plants until no edible vegetation remains (Dinerstein 1987, in Anderson 1999, p. 5; Medeiros 2010, pers. comm.). Axis deer on Maui follow a cycle of grazing and browsing in open lowland grasslands during the rainy season (November through March) and then migrating to the lava flows of montane mesic forest during the dry summer months to graze and browse on many native plant species, for example, Abutilon menziesii (kooloaula, listed endangered), Erythrina sandwicensis (ukiuki), and Sophora chrysophylla (maalii), the primary food source of the endangered forest bird, the palila (Loxioideae ballelui) (Scowcroft and Sakai 1983, p. 495). Feral sheep reductions were initiated in palila habitat; however, even after most were removed, tree bark stripping continued and some mamane populations did not recover (Pratt and Jacobi in Pratt et al. 2009, p. 151). Sheep browse (eating shoots, leaves, flowers, and bark) on the native Sophora chrysophylla (mamane), and Mouflon and Sheep

Mouflon, feral domestic sheep, and mouflon-sheep hybrids browse native vegetation on Lanai and Hawaii Island. Domestic sheep have been raised on Kauai, Lanai, Kahoolawe, and Hawaii, but today sheep farming only occurs on Hawaii Island on Mauna Kea and Hualalai (Pratt and Jacobi in Pratt et al. 2009, p. 151). Sheep browse (eating shoots, leaves, flowers, and bark) on the native Sophora chrysophylla (mamane), and Leptocoryphyla tamaeameae (pukiawe) comprised more than 30 percent of axis deer rumen volume. During the driest summer months, axis deer are observed in coastal areas in search of food (Medeiros 2010, pers. comm.). Because axis deer occur in 10 of the 11 ecosystems on Molokai, Lanai, and Maui (all except anchialine pool), the results from the studies above, in addition to direct observations from field biologists, suggest that axis deer can also alter these ecosystems and directly damage or destroy native plants. Browsing or grazing by axis deer poses a threat to the following plant species: Gardenia renyi on Molokai (HBMP 2010), Huperzia stemmerrmanniae on Maui (HBMP 2010), Joinvillea ascendens ssp. ascendens on Maui (PEPP 2014, pp. 108–109), Nothocestrum latifolium on Lanai (PEPP 2012, p. 129), Portulaca villosa on Lanai (HBMP 2010), Pseudognaphalium sandwicensium var. molekaiense on Molokai (Wood 2005c, in litt.; Kallstrom 2008, in litt.; MNTF 2010), Ranunculus mauensis on Maui (PEPP 2013, p. 178; PEPP 2014, pp. 154–155), Schiedea pubescens on Molokai and Lanai (Wood 2004, in litt.; Rowland 2006, in litt.; Oppenheimer 2001, in litt.), and Solanum nelsonii on Molokai (PEPP 2012, p. 156; PEPP 2013, pp. 190–191; PEPP 2014, p. 167). Axis deer may also damage or destroy native host plants of the yellow-faced bees Hylaesus anthracinus, H. assimilans, H. facilis, and H. hilarris.

Black-Tailed Deer

Black-tailed deer are extremely adaptable, and in their native range (U.S. Pacific coast) inhabit every principal ecosystem including open grasslands, agricultural land, shrubland, woodland, mountain forests, semi-deserts, and high mountain ecosystems (NRCS 2005, in litt.). Their home range size varies in the continental United States, but has been estimated to from 1 to 4 sq mi (2.5 to 10 km) and sometimes as large as 30 sq mi (78 sq km), with adults defending small areas when caring for fawns (NRCS 2005, in litt.). We do not know their home range size on Kauai; however, the island is only 562 sq mi (1,456 sq km) in size. Black-tailed deer are primarily browsers, but as they have a smaller rumen compared to other browsers in relation to their body size, they must select the most nutritious plants and parts of plants (Mule Deer Foundation 2011, in litt.). Their diet consist of a diversity of living, wilted, dry, or decaying vegetation, including leaves, needles, succulent stems, fr answering plants. Mouflon-sheep hybrids browse native plants (U.S. Pacific coast) habit the endangered Gardenia brighamii (nanu), and Swedberg and Walker (1976, in Anderson 2003, pp. 124–25) report four native plants. Osteomeles anthyllidifolia (uulei) and Leptocoryphyla tamaeameae (pukiawe)
cuneatum (hinahina) and Silene hawaiensis, and Lanai occurrences of Gardenia brighamii (Benitez et al. 2008, p. 57; Mehrhoff 1993, p. 11). While moufflon were introduced to Lanai and Hawaii Island as game mammals, a private game ranch on Maui has added moufflon to its stock, and it is likely that over time some individuals may escape (Hess 2010, pers. comm.; Kessler 2010, pers. comm.). Browsing and grazing by moufflon, feral domestic sheep, and moufflon-sheep hybrids poses a threat to the plant species Exacarpos menziesii on Hawaii Island (Keitt and Island Conservation 2008, pp. 90, 92; NPS 2013, pp. 1, 124); Festuca hawaiensis on Hawaii Island (Oppenheimer 2001, in litt.; HBMP 2007, in litt.); Nothocestrum latifolium on Lanai (PEPP 2012, p. 129); Portulaca villosa on Lanai (HBMP 2010); Ranunculus hawaiensis on Hawaii Island (HBMP 2010); and Sicyos macrophyllus on Hawaii Island (PEPP 2010, p. 111; HBMP 2010); and Solanum nelsonii on Molokai (Wood 1999, in litt.; HBMP 2010). Because feral cattle occur in 6 of the 11 ecosystems (lowland dry, lowland mesic, lowland wet, montane wet, montane mesic, and subalpine) in which these species occur on Molokai, Hawaii, and Maui, and Hawaii Island, the results from the studies cited above, in addition to direct observations from field biologists, indicate that grazing by feral cattle can directly damage or destroy these plants.

Blackbuck

The blackbuck antelope (Antelope cervicapra) is an endangered species from India brought to a private game reserve on Molokai about 15 years ago from an Indian zoo (Kessler 2010, pers. comm.). According to Kessler (2010, pers. comm.), a few individuals escaped captivity and established a wild population of unknown size on the low, dry plains of western Molokai. Blackbuck primarily use grassland habitat for grazing. In India, foraging consumption and nutrient digestibility are high in the moist winter months and low in the dry summer months (Jhala 1997, pp. 1348, 1351). Although most plant species are grazed intensely when they are green, some are grazed only after they are dry (Jhala 1997, pp. 1348, 1351). Because the foraging dynamics of blackbuck antelope in Hawaii and possible habitat effects are unknown at this time, we do not currently consider this ungulate a threat to the four native plant species known from dry areas on Molokai: Gardenia remyi, Nothocestrum latifolium, Portulaca villosa, and Pseudognaphalium sandwicensium var. molokaiense, or to the yellow-faced bees Hylaeeus anthracinus and H. assimulans on Lanai, herbivory by feral sheep and moufflon also may consume host plants of the other species on Lanai: H. facilis, H. hilaris, and H. longiceps.

Feral Cattle

Grazing by cattle is considered one of the most important factors in the destruction of Hawaiian forests (Baldwin and Fagerlund 1943, pp. 118–122). Feral cattle are currently found only on the islands of Molokai, Maui, and Hawaii (Tomich 1986, pp. 140–144; de Sa et al. 2013, 29 pp.). Cattle consume tree seedlings and browse saplings (Cuddihy 1984, p. 16). In Hawaii Volcanoes National Park (Hawaii Island), Cuddihy reported that there were twice as many native plant species as nonnatives in areas that had been fenced to exclude cattle (Cuddihy 1984, pp. 16, 34). Loss of the native sandalwood on Lanai is attributed to cattle (Skottsberg 1953 in Cuddihy 1984, p. 16). Browsing and grazing by feral cattle poses a threat to the following plant species: Huperzia stemmerrmanniae on Maui and Hawaii Island (Medeiros et al. 1996b, p. 96); Nothocestrum latifolium on Molokai and Maui (HBMP 2010); Ochrosia haleakalae on Maui (HBMP 2010); Ranunculus hawaiensis on Hawaii Island (HBMP 2010); R. mauliensis on Maui and Hawaii Island (PEPP 2012, p. 144; PEPP 2017, p. 78; PEPP 2013, pp. 154–155; HBMP 2010); Schiedea pubescens on Maui (Wood 2005d, in litt.; HBMP 2010); Sicyos macrophyllus on Hawaii Island (PEPP 2010, p. 111; HBMP 2010); and Solanum nelsonii on Molokai (Wood 1999, in litt.; HBMP 2010). Because feral cattle occur in 6 of the 11 ecosystems (lowland dry, lowland mesic, lowland wet, montane wet, montane mesic, and subalpine) in which these species occur on Molokai, Hawaii, and Maui, and Hawaii Island, the results from the studies cited above, in addition to direct observations from field biologists, indicate that grazing by feral cattle can directly damage or destroy these plants.

Other Introduced Vertebrates

Rats

Three species of introduced rats occur in the Hawaiian Islands. Studies of Polynesian rat (Rattus exulans) DNA suggest they first appeared in the islands along with emigrants from the Marquesas Islands (French Polynesia) in about 400 A.D., with a second introduction around 1100 A.D. (Ziegler 2002, p. 315). The black rat (R. rattus) and the Norway rat (R. norvegicus) arrived in the islands more recently, as stowaways on ships sometime in the late 19th century (Atkinson and Atkinson 2000, p. 23), and by stripping bark and cutting small branches (wig cutting) in search of moisture and nutrients, with detrimental impacts to dry to wet habitats, while the Norway rat is typically found in urban areas or agricultural fields (Tomich 1986, p. 41). The black rat is widely distributed throughout the main Hawaiian Islands and can be found in a range of ecosystems and as high as 9,000 ft (2,700 m), but it is most common at low-to-mid-elevations (Tomich 1986, pp. 38–40). Sugihara (1997, p. 194) found both the black and Polynesian rats up to 7,000 ft (2,000 m) on Maui, but found the Norway rat only at lower elevations. Rats are omnivorous and eat almost any type of food (Nelson 2012, in litt.). Rats occur in 7 of the 11 ecosystems (coastal, lowland mesic, lowland wet, montane wet, montane mesic, montane dry, and wet cliff), and predation or herbivory by rats is a threat to 19 plants (Calamagrostis expansa (Maui and Hawaii Island; HBMP 2010), Cyannea kauauensis (Maui; PEPP 2012, pp. 71–72; PEPP 2014, p. 73), Dryopteris glabra var. pusilla (Kauai; Wood 2015, in litt.); Gardenia remyi (Kauai, Molokai, Maui, and Hawaii Island; Wood 2004, in litt.; HBMP 2010); Joinvillea ascendens ssp. ascendens (Kauai, Oahu, Molokai, Maui, and Hawaii Island; PEPP 2014, p. 109), Kadua haupuensis (Kauai; Lorence et al. 2010, p. 140). Labordia lorenciana (Kauai; Wood et al. 2007, p. 198), Ochrosia haleakalae (Maui; Oppenheimer 2015, in litt.); Phyllostegia helleri (Kauai; HBMP 2010), P. stachyoides (Molokai, Molokai, and Hawaii Island; PEPP 2012, p. 133; PEPP 2013, pp. 158–159; PEPP 2014, pp. 140–142), Pritchardia bakeri (Oahu; Hodel 2012, pp. 42, 73), Ranunculus mauiensis (Kauai, Oahu, Molokai, Maui, and Hawaii Island; HBMP 2010), Sanicula sandwicensis (Maui and Hawaii Island; PEPP 2012, p. 148), Santalum involutum (Kauai; Harbaugh et al. 2010, pp. 835–836), Schiedea diffusa ssp. diffusa (Molokai, Maui; HBMP 2010), S. pubescens (Molokai, Lanai, and Maui; Wood 2005d, in litt.; HBMP 2010). Sicyos macrophyllus (Maui and Hawaii Island; Pratt 2008, in litt.), Solanum nelsonii (NWHI, Niihau, Molokai, Maui, and Hawaii Island; PEPP 2012, p. 156; PEPP 2014, p. 167), and Wikstroemia skottsbergiana (Kauai; Mitchell et al. 2005, in litt.) and to the band-rumped storm-petrel (Lehua, Kauai, Maui, Kahoolawe, Lanai, and Hawaii Island; Pyle and Pyle 2009, in litt.).
plants’ vigor and regeneration (Abe and Umeno 2011, pp. 27–39; Nelson 2012, pp. 1–4, 8–9). Studies in New Zealand have demonstrated that differential regeneration as a consequence of rat predation alters species composition of forested areas (Cuddihy and Stone 1990, pp. 68–69). Rats have caused declines or even the total elimination of island plant species (Campbell and Atkinson 1999 in Atkinson and Atkinson 2000, p. 24). In the Hawaiian Islands, rats may consume as much as 90 percent of the seeds produced by some native plants, and in some cases prevent regeneration of forest species completely (Cuddihy and Stone 1990, pp. 68–69). Hawaiian plants with fleshy fruit, such as Cyanea and Pritchardia, are particularly susceptible to rat predation (Cuddihy and Stone 1990, pp. 67–69). Predation of seeds by rats poses a serious and ongoing threat to all the Hawaiian Pritchardia palms, including P. bakeri, because rats are able to consume every seed in a fruiting stalk, preventing successful reproduction (Hodel 2012, pp. 42, 73). Fossil pollen records indicate that Pritchardia palms were once among the dominant species of coastal, lowland, and interior forests of Hawaii (Burney et al. 2001, pp. 630–631; Chapin et al. 2007, p. 21); today, complete coverage by all age classes of Pritchardia occurs only on small islets currently unoccupied by rats (Athen 2009, p. 1498). Because rats occur in seven of the ecosystems in which these species occur, the results from these studies, in addition to direct observations by field biologists, suggest that predation by rats can directly damage or destroy native plants.

**Rat Impacts on the Band-Rumped Storm-Petrel: Introductory predators are the most serious threat facing the band-rumped storm-petrel. Rats occur on all the main Hawaiian Islands, and populations are also high on Lehua; however, attempts to control rats on Lehua are ongoing (Parks and Fisher 2011, 48 pp.). Ground-, crevice-, and burrow-nesting seabirds, as well as their eggs and young, are highly susceptible to predation by rats; storm-petrels are the most susceptible of seabirds to rat predation and have experienced population-level impacts and extirpation as a result (Simons 1984, p. 1073; Jones et al. 2008, pp. 20–21). Evidence from the islands of Hawaii and Maui show that the Hawaiian petrel, a much larger seabird that nests in some of the same areas as the band-rumped storm-petrel, suffers huge losses to introduced predators (Johnston 1992, in litt.; Hodges and Nagata 2001, pp. 308–310; Hu et al. 2001, p. 234). The effects of introduced predators on the breeding success of the band-rumped storm-petrel are probably similar to the documented effects on the breeding success of Hawaiian petrels because these birds are similarly vulnerable. Population modeling showed that consistent predation of Hawaiian petrels, where reproductive success was reduced to 35 percent and adult survival was 80 percent, could drive a population to extinction in 20 to 30 years (Simons 1984, pp. 1071–1073). Rat bones were collected from a band-rumped storm-petrel nest on a sheer cliff on Kauai, and two live rats were observed moving along small rock ledges in the same area (Wood et al. 2002, p. 8), demonstrating that even remote and otherwise inaccessible nest sites are not safe from these predators. Because rats are present in all three ecosystems in which the band-rumped storm-petrel occurs (coastal, dry cliff, and wet cliff), predation by rats likely results in decreases in the numbers and populations of the band-rumped storm-petrel. We do not anticipate a reduction of this threat in the near future.

**Barn Owl Impacts on the Band-Rumped Storm-Petrel:** Two species of owls, the native pueo (Asio flammeus sandwichensis) and the introduced barn owl (Tyto alba), are known to prey on native Hawaiian birds. For example, between 1996 and 1998, 10 percent of nest failures of the puaiohi (small Kauai thrush, Myadestes palmeri), an endangered forest bird, on Kauai were attributed to owls (Snetsinger et al. 1994, p. 47; Snetsinger et al. 2005, pp. 72, 79). The band-rumped storm petrel only comes to land after dark, and likely avoids predation by the pueo, which hunts in daylight (Hawaiian DOFAW 2005). The nonnative barn owl, however, is a nocturnal hunter and may prey on the storm-petrel. Barn owls were introduced to Kauai, Oahu, Molokai, and Hawaii Island between 1958 and 1963, to control rats and mice in sugar cane plantations, and now they occur on all of the main islands (USFWS 2013, p. 9). Barn owls are well-known predators of storm-petrels and other seabirds on islands (LeCorre and Jouventin 1997, p. 215; Velarde et al. 2007, p. 286; Guerra et al. 2014, p. 182; Ringer et al. 2015, p. 79). Direct impacts of barn owls on band-rumped storm-petrels in Hawaii are not well documented, but evidence and numerous anecdotal reports exist of barn owls preying on seabirds in the main Hawaiian islands, including the threatened petrel and endangered Hawaiian petrel, and including on Kauai and Lehua, where band-rumped storm-petrels are known to nest (summarized in USFWS 2013, pp. 11–12). Because barn owls occur throughout the range of the band-rumped storm-petrel in Hawaii, they are likely to be predators of these seabirds.

**Cat Impacts on the Band-Rumped Storm-Petrel:** Cats (Felis catus) were introduced to Hawaii in the early 1800s, and are present on all the main Hawaiian Islands (Tomich 1986, p. 102). Native mammalian carnivores are absent from oceanic islands because of their low dispersal ability, but once introduced, are significant predators on seabird colonies and terrestrial birds that have no innate defenses against predation by these animals (Scott et al. 1986, p. 363; Ainley et al. 1997, p. 24; Ziegler 2002, p. 243; Hess and Banko 2006, in litt.; Nogales et al. 2013, p. 804). Cats may have contributed to the extinction of the Hawaiian rail (Porzana sandwichensis) (Stone 1985 in Stone and Scott 1985, p. 266). Although cats are more common at lower elevations, there are populations in areas completely isolated from human presence, including montane forests and alpine areas of Maui and Hawaii Island (Lindsey et al. in Pratt et al. 2009, p. 277; Scott et al. 1986, p. 363). Examination of the stomach contents of feral cats at Hakalau Forest NWR (Hawaiian Island) found native and introduced birds to be the most common prey item (Banko et al. 2004, p. 162). Cats are believed to prey on roosting or incubating adult band-rumped storm-petrels and young, as evidenced by carcasses found in Hawaiian Volcanoes National Park depredated by cats (Hu, pers. comm. in Slotterback 2002, in litt.; Hess et al. 2008, pp. 11, 14). Predation by cats is well known for the endangered Hawaiian petrel, which has some accessible and well-studied nesting areas; this species shares life-history and evolutionary traits with the band-rumped storm-petrel that make both vulnerable to nonnative mammalian predators. We expect the band-rumped storm-petrel to experience impacts of cat predation similar to those documented in the Hawaiian petrel. On Mauna Loa (Hawaiian Island), feral cats were major predators of Hawaiian petrels (Hu et al. 2001, p. 234), and on Haleakala (Maui), almost half of the known mortalities of Hawaiian petrels between 1964 and 1996 were attributed to cats (Natividad Hodges and Nagata 2001, p. 312; Hu et al. 2001, p. 234). Population modeling of the Hawaiian petrel indicated that the petrel population would be unable to
Mongoose Impacts on the Band-Rumped Storm-Petrel

The small Indian mongoose (Herpestes auropunctatus) was introduced to Hawaii in 1883, to control rodents in sugar cane plantations (Tomich 1986, pp. 95–96). This species quickly became widespread on Oahu, Molokai, and Hawaii Island, from sea level to elevations as high as 7,000 ft (2,130 m) (Tomich 1986, pp. 93–94). Mongooses have been sighted, and two captured, on Kauai, but it is still uncertain if the species is established there or how large populations might be (Kauai Invasive Species Committee 2013, in litt.; The Garden Island 2012, in litt.; Hess et al. in Pratt et al. 2009, p. 429). Mongooses are omnivorous, are known to prey on Hawaiian birds and their eggs, and are considered a likely factor in the decline of the endangered Hawaiian goose (nene, Branta sandvicensis) (Tomich 1986, p. 97). They are known or suspected predators on other Hawaiian birds, including the Hawaiian crow (ala, Corvus hawaiiensis), Hawaiian duck (koloa, Anas wyvilliana), Hawaiian coot (ale keokeo, Fulica alai), Hawaiian stilts (sea, Himantopus mexicanus knudseni), Hawaiian gallinule (ula, Gallinula chloropus sandvicensis), Hawaiian petrel, and Newell’s shearwater. Bird extinctions in other areas are attributed to mongooses, such as the loss of the barred-wing rail (Nesocolopoeus poecilopterus) in Fiji, and the Jamaica petrel (Pterodroma caribbaea) (Hays and Conant 2007, p. 6). Birds extirpated from islands occupied by mongooses retain their populations on islands known to be mongoose-free (Hays and Conant 2007, p. 7). In Hawaii, mongooses occur in all four ecosystems in which the band-rumped storm petrel occurs, they are likely to be significant predators of these birds.

Nonnative Fish Impacts on the Orangeblack Hawaiian Damselfly

Predation by nonnative fishes is a threat to the orangeblack Hawaiian damselfly. Similar to the aquatic insects, Hawaii has a low diversity of freshwater fishes, with only five native species in two families (gobies (Gobiidae) and sleepers (Eleotridae)) that occur on all the main islands (Devick 1991, p. 196). Information on these five species indicates that the Hawaiian damselflies probably experienced limited natural predation pressure from these native fishes (Kido 1997, p. 493; Englund 1999, p. 236). Conversely, fish predation has been an important factor in the evolution of behavior in damselfly naïads in continental systems (Johnson 1991, p. 13). Some species of damselflies, including the native Hawaiian species, are not adapted to coexist with some fish species, and are found in bodies of water without fish (Henrikson 1988, pp. 179–180; McPeek 1990a, pp. 92–93). The naïads of these species tend to occupy more exposed positions and engage in conspicuous foraging behavior that makes them susceptible to predation by fishes (Macan 1977, p. 47; McPeek 1990b, p. 1722). The introduction of nonnative fishes has been implicated in the extirpation of a species related to the orangeblack Hawaiian damselfly, the endangered Pacific Hawaiian damselfly (Megalagrion pacificum), from Oahu, Kauai, and Lanai, and from many streams on the remaining islands where it occurs (Moore and Gagne 1982, pp. 1–4). More than 70 species of fish have been introduced into Hawaiian freshwater habitats (Devick 1991, p. 189; Englund and Eldredge in Staples and Cowie 2001, p. 32; Englund 2004, in litt., p. 27). The impact of fish introductions prior to 1900 cannot be assessed because this predates the initial collection of damselflies in Hawaii (Perkins 1913, p. cxxvii). In 1903, two species, the mosquito fish (Gambusia affinis) and the sulfine molly (Poecilia latipinna), were introduced for biological control of mosquitoes (Van Dine 1907, pp. 6–9). In 1922, three additional species were established for mosquito control, the green swordtail (Xiphophorus helleri), the moonfish (Xiphophorus maculatus), and the guppy (Poecilia reticulata). By 1935, the orangeblack Hawaiian damselfly was found only in waters without introduced fishes (Williams 1936, p. 289; Zimmerman 1948b, p. 341; Polhemus 1993b, p. 591; Englund 1998, p. 235). Beginning about 1980, a large number of new fish introductions began in Hawaii, originating primarily from the aquarium fish trade (Devick 1991, p. 189). This recent wave of fish introductions on Oahu corresponded with the drastic decline and range reduction of other Hawaiian damselfly species: The endangered oceanic Hawaiian damselfly (Megalagrion oceanicum), the endangered crimson Hawaiian damselfly (M. leptodemas), and the endangered blackline Hawaiian damselfly (M. nigrohamatum nigrolineatum). Currently, these damselflies are found only in drainages or higher parts of stream systems where nonnative fish are not yet established (Englund and Polhemus 1994, pp. 8–9; Englund 2004, in litt., p. 27). In summary, Hawaiian damselflies evolved with few, if any, predatory fishes and the lack of defensive behavior makes the orangeblack Hawaiian damselfly particularly vulnerable to, and are threatened by, predation by nonnative fish.

Nonnative Fish Impacts on the Anchialine Pool Shrimp

In Hawaii, the introduction of nonnative fishes into anchialine pools and the ensuing predation by nonnative fishes is considered the greatest threat to native shrimp within anchialine pool systems (Bailey-Brock and Brock 1993, p. 354). These impacts are discussed further under Factor E. Other Natural or Manmade Factors Affecting Their Continued Existence, below.

Bullfrog Impacts on the Orangeblack Hawaiian Damselfly

Native to the eastern United States and the Great Plains region, the bullfrog (Rana catesbeiana, Lithobates catesbeiana), was first introduced to Hawaii in 1899, to help control insects, and has become established on all the main Hawaiian Islands (Bryan 1931, pp. 62–63; Bury and Whelan 1985, p. 1; Lever 2003, p. 203). The bullfrog is flexible in both habitat and food requirements (McKeown 1996, pp. 24–27; Bury and Whelan 1984, pp. 3–7; Lever 2003, pp. 203–204), and can utilize any water source within a temperature range of 60 to 75 degrees Fahrenheit (°F) (16 to 24 degrees Celsius (°C)) (DesertUSA 2008). Englund et al. (2007, pp. 215, 219) found a strong correlation between the presence of bullfrogs and the absence of Hawaiian damselflies in their study of streams on all the main Hawaiian Islands. Because bullfrogs are omnivorous feeders and occur in the same habitat as the orangeblack Hawaiian damselfly, we consider predation by bullfrogs a threat to the orangeblack Hawaiian damselfly.
Introduced Invertebrates

Slugs
Herbivory by nonnative slugs is a threat to 10 of the 39 plant species (Cyanea kauaulaensis (Maui); Deparia kaalana (Maui), Dryopteris glabra var. pusilla (Kauai), Hypeollops hawaiiensis var. mauiensis (Maui), Ochrosia haleakalae (Maui, Hawaii Island), Phyllostegia brevidens (Maui), P. stachyoides (Molokai, Maui), Ranunculus mauiensis (Molokai, Maui), Schiedea diffusa (Maui), and S. pubescens (Molokai, Maui)) through mechanical damage, destruction of plant parts, and mortality (see Table 2) (Joe 2006, p. 10; HBMP 2010; PEPP 2011, pp. 149, 170; PEPP 2012, pp. 71–72, 117–118, 133, 144–145, 153; PEPP 2013, pp. 54, 67, 91, 125–126, 158–159, 177–178, 185; Oppenheimer and Bustamente 2014, p. 106; PEPP 2014, pp. 73, 112–114, 136, 141–142, 154–156, 159, 162–163). Slugs are known to infest a wide variety of common plant taxa, including rare native plant species (Davis 1970, p. 39; Extension Entomology and US–CTAHR Integrated Pest Management Program 2006, p. 1). This insect pest burrows into branches, introduces a pathogenic fungus as food for its larvae, and lays its eggs (Davis 1970, p. 39). Twigs, branches, and entire plants can be damaged or killed from an infestation (Extension Entomology and UH–CTAHR Integrated Pest Management Program 2006, in litt.). On the Hawaiian Islands, the black twig borer has many hosts, disperses easily, and is probably present at most elevations up to 2,500 ft (762 m) (Howarth 1985, pp. 152–153). The black twig borer is reported as a threat to Labordia lorenciana and Nothocestrum latifolium (Ching-Harbin 2015, in litt.; Kishida 2015, in litt.).

Backswimmers
Backswimmers are aquatic true bugs (Heteroptera) in the family Notonectidae, so called because they swim upside down. Backswimmers are voracious predators and frequently feed on prey much larger than themselves, such as tadpoles, small fish, and other aquatic invertebrates including damselfly naiads (Borror et al. 1989, p. 296; Zalom 1978, p. 617). Backswimmers (several species) were introduced in recent times. Buenoa pallipes (NCN) has been recorded from Hawaii Island, Oahu, Maui, and Kauai (Zimmerman 1948, pp. 232–233; Larsen 1996, p. 40). This species is found in streams and can be abundant in lowland ponds and reservoirs. It feeds on any suitably sized insect, including damselfly naiads (Zalom 1978, p. 617). Two additional species of backswimmers have become established in Hawaii, Anisops kuroiwae (NCN) on Maui and Lanai, and Notonecta indica (NCN) on Hawaii Island, Oahu, and Maui (Larsen 1996, pp. 39–40). Predation by backswimmers is a threat to the orangeblack Hawaiian damselfly (Haines 2015, in litt.).

Ants
At least 47 species of ants are known to be established in the Hawaiian Islands (Hawaii Ants 2006, 11 pp.). No native ant species occur in Hawaii, and the native yellow-faced bee species in Hawaii evolved in the absence of predation pressure from ants. Ants are known to prey upon Hawaiian yellow-faced bee (Hylasaeus) species, with observations of drastic reductions in yellow-faced bee populations in ant-infested areas (Medeiros et al. 1986, pp. 45–46; Reimer 1994, p. 17; Stone and Logue 1983, in litt.; Cotet et al. 1992, pp. 1313, 1317, 1320). The presence of ants in nearly all of the low-elevation habitat sites currently and historically occupied by yellow-faced bee species may preclude these species’ recovery in some of these areas (Reimer 1994, pp. 17–18; Daly and Magnacca 2003, pp. 9–10). Although the primary impact of ants on Hawaii’s native invertebrate fauna is via predation, they also compete for nectar (Reimer 1994, p. 17; Howarth 1985, p. 155; Hopper et al. 1996, p. 9; Holway et al. 2002, pp. 188, 209; Daly and Magnacca 2003, p. 9; Lach 2008, p. 155) and nest sites (Krushelnický et al. 2005, pp. 6–7). Some ant species may affect yellow-faced bee species indirectly as well, by consuming seeds of native host plants, thereby reducing the plants’ recruitment and fecundity (Bond and Slingsby 1984, p. 1031). The threat of ant predation on the yellow-faced bees is amplified by the fact that most ant species have winged reproductive adults and can quickly expand their range by establishing new colonies in suitable habitat (Staples and Cowie 2001, p. 55). In addition, these attributes allow some ants to destroy otherwise geographically isolated populations of native arthropods (Nafus 1993, pp. 19, 22–23). Several studies suggest a serious ecosystem-level effect of invasive ants on plant pollination (Krushelnický et al. 2005, p. 9; Lach 2008, p. 155). Where ranges overlap, ants compete with native pollinators such as yellow-faced bees and preclude them from pollinating native plants (Howarth 1985, p. 157), potentially leading to a decrease in availability of the bees’ native plant food sources. Lach (2008, p. 155) found that yellow-faced bees that regularly consume pollen from flowers of Pieris microporphyra (ohia) were entirely absent from trees with flowers visited by the ant Pheidole megacephala.

The four most aggressive ant species in Hawaii are the big-headed ant (Pheidole megacephala), the yellow crazy ant (Anoplolepis gracilipes), the tropical fire ant (Solenopsis geminata), and S. papuana (NCN). The big-headed ant is native to central Africa and was first reported in Hawaii in 1879 (Krushelnický et al. 2005, p. 24). This species occurs from coastal to mesic habitat up to 4,000 ft (1,220 m) in elevation. With few exceptions, native insects have been eliminated in habitats where the big-headed ant is present (Perkins 1913, p. xxxix; Gagne 1979, p. 81; Gillespie and Reimer 1993, p. 22).

Native habitat of the yellow crazy ant is not known, but it is speculated that the species originated in West Africa (Perkins 1913, p. xxxix; Gagne 1979, p. 81; Gillespie and Reimer 1993, p. 22).
Despite surveys having not been conducted to ascertain this species’ presence in each of the known habitats occupied by the seven yellow-faced bees, we know that the yellow crazy ant occurs adjacent to some of the identified populations sites based upon observations of their expanding range and their preference for coastal and dry forest habitat (as indicated where the species is most commonly collected) (Antweil 2015, in litt.; Magnacca and King 2013, pp. 13–14). Direct observations indicate that Hawaiian arthropods are susceptible to predation by this ant species. Gillespie and Reimer (1993, pp. 21, 26) and Hardy (1979, pp. 37–38) documented the complete elimination of native spiders from mesic and dry forests after they were invaded by the big-headed ant and the yellow crazy ant. Lester and Tavite (2004, p. 291) found that the yellow crazy ant in the atolls of Tokelau (Central Polynesia) form very high densities in a relatively short period of time with locally serious consequences for invertebrate diversity. Densities of 3,600 individuals collected in pitfall traps within a 24-hour period were observed, as well as predation on invertebrates ranging from crabs to other ant species. Results from these and other studies (Reimer et al. 1990, p. 47) indicate that yellow crazy ants have the potential as predators to profoundly affect endemic insect fauna in areas they occupy. We believe that the yellow crazy ant is a threat to populations of the Hawaiian yellow-faced bees in areas within their range.

Solenopsis punctata, native to the Pacific region but not to Hawaii, is the only abundant, aggressive ant that has invaded intact mesic and wet forest, as well as coastal and lowland dry ecosystems. First detected in 1967, this species occurs from sea level to over 3,600 ft (1,100 m) on all of the main Hawaiian Islands, and is still expanding its range (Reimer et al. 1990, p. 42; Reimer 1993, p. 14). Studies have been conducted to ascertain the presence of this ant species on indigenous invertebrates (Gillespie and Reimer 1993, p. 21). Although surveys have not been conducted to ascertain the presence of S. punctata in each of the known ecosystems occupied by the seven yellow-faced bees, because of the expanding range of this introduced ant species, and its widespread occurrence in coastal to wet habitats, it is a possible threat to all known populations of the seven yellow-faced bees.

Solenopsis geminata is also considered a significant threat to native invertebrates in Hawaii (Wong and Wong 1988, p. 171). Found in drier areas of all the main Hawaiian Islands, it displaced Pheidole megacephala as the dominant ant in some localities more than 20 years ago (Wong and Wong 1988, p. 175). Known to be a voracious predator, this ant species was documented to significantly increase native fruit fly mortality in field studies in Hawaii (Wong and Wong 1988, p. 175). Solenopsis geminata is included among the eight species ranked as having the highest potential risk to New Zealand species in a detailed pest risk assessment for the country (GISD 2011, in litt.), and is included as one of the five ant species listed among the “100 of the World’s Worst Invaders” (Manaaki Landcare Research 2015, in litt.). In addition to predation, S. geminata workers tend honeydew-producing members of the Homoptera suborder, especially mealybugs, which can affect plants directly and indirectly through the spread of disease (Manaaki Landcare Research 2015, in litt.). Although surveys have not been conducted to ascertain the presence of S. punctata in each of the known seven yellow-faced bees’ habitat sites, because of its expanding range and widespread presence, S. geminata is a threat to all known populations of the seven yellow-faced bees.

Although we have no direct information that correlates the decrease in populations of the seven yellow-faced bees in this final rule due to the establishment of nonnative ants, predation of and competition with other yellow-faced bee species by ants has been documented, resulting in clear reductions in or absence of populations (Magnacca and King 2013, p. 24). We expect similar predation impacts to the seven yellow-faced bees to continue as a result of the widespread presence of ants throughout the Hawaiian Islands, their highly efficient and non-specific predatory behavior, and their ability to quickly disperse and establish new colonies. Therefore, we conclude that predation by nonnative ants represents a serious threat to the continued existence of the seven yellow-faced bees, now and into the future.

Wasps
Predation by the western yellow jacket wasp (Vespula pensylvanica) is a serious and ongoing threat to the seven yellow-faced bees (Gambino et al. 1987, p. 170; Wilson et al. 2009, pp. 1–5). The western yellow jacket is a social wasp species native to mainland North America. It was first reported on Oahu in the 1930s (Sherley 2000, p. 121), and an aggressive race became established in 1977 (Gambino et al. 1987, p. 170). In temperate climates, the western yellow jacket wasp has an annual life cycle, but in Hawaii’s tropical climate, colonies of this species persist year-round, allowing growth of large populations (Gambino et al. 1987, p. 170) and thus a greater impact on prey populations. Most colonies occur between 2,000 and 3,500 ft (600 and 1050 m) in elevation (Gambino et al. 1990, p. 1088), although they can also occur at sea level. The western yellow jacket wasp is known to be an aggressive, generalist predator and has been documented preying upon Hawaiian yellow-faced bee species (Gambino et al. 1987, p. 170; Wilson et al. 2009, p. 2). It has been suggested that the western yellow jacket wasp may compete for nectar with native Hawaiian invertebrates, but we have no information to suggest this represents a threat to the seven yellow-faced bees. Predation by the western yellow jacket wasp is a significant threat to the seven yellow-faced bee species because of the wasps’ presence in habitat combined with the small number of occurrences and small population sizes of the Hawaiian yellow-faced bees.

Summary of Factor C
We are unaware of any information that indicates that disease is a threat to the 39 plant species. We are also unaware of any information that indicates that disease is a threat to the band-rumped storm-petrel, the orangeblack Hawaiian damselfly, or the anchialine pool shrimp, Procarios hawaiana. It has been suggested that transmission of disease from alien invertebrates by mutual flower visitation is a threat to the seven yellow-faced bees (Hylaeus spp.), but we currently have no evidence that this is occurring.

We consider predation and herbivory by one or more of the nonnative animal species (pigs, goats, axis deer, black-tailed deer, sheep, mouflon, cattle, rats, barn owls, cats, mongooses, fish, slugs, ants, black twig borers, and wasps) to pose an ongoing threat to 35 of the 39 plant species and to all 10 animal species throughout their ranges for the following reasons:

1. Observations and reports have documented that pigs, goats, axis deer, black-tailed deer, sheep, mouflon, and cattle browse 27 of the 39 plant species, in addition to other studies demonstrating the negative impacts of ungulate browsing on native plant species of the Islands. If the numbers and range of blackbuck antelope increase, their browsing will be a threat to native plants that occur on Molokai,
including host plants for the yellow-faced bees.

(2) Nonnative rats and slugs (either singly or combined) cause mechanical damage to plants and destruction of plant parts (blooms, flowers, fruits, and seeds), and are considered a threat to 22 of the 39 plant species.

(3) Rats also prey upon adults, juveniles, and eggs of the band-rumped storm-petrel, and are linked with the dramatic decline of many closely related bird species. Because rats are found in all of the ecosystems in which the band-rumped storm-petrel occurs, we consider predation by rats to be a serious and ongoing threat.

(4) Barn owls and cats have established populations in the wild on all the main islands, and mongooses have established populations on all the main islands except for Kauai. All of these nonnative animals are known to prey on ground- and burrow-nesting seabirds. Predation by these animals is a serious and ongoing threat to the band-rumped storm-petrel.

(5) The absence of Hawaiian damselflies (including the orangeblack Hawaiian damselfly) from ponds, pools, and other aquatic habitat on the main Hawaiian Islands is strongly correlated with the presence of predatory nonnative fish; numerous observations and reports suggest nonnative predatory fishes eliminate native damselflies from these habitats. Accordingly, predation by nonnative fishes is a serious and ongoing threat to the orangeblack Hawaiian damselfly. Predation by bullfrogs, backswimmers, and Jackson's chameleons, and competition with caddisflies are threats to the orangeblack Hawaiian damselfly.

(6) Once introduced to anchialine pools, nonnative fish, through predation and competition for food sources, directly affect anchialine pool shrimp, including Procaris hawaiana, and also disrupt anchialine pool ecology.

(7) Damage and destruction by the black twig borer is a threat to two plant species, Labordia lorenciana and Notocestrum latifolium.

(8) Predation by nonnative ants and wasps poses a threat to all seven yellow-faced bees.

These threats are serious and ongoing, act in concert with other threats to the species, and are expected to continue or increase in magnitude and intensity into the future without effective management actions to control or eradicate them. The effects of these threats suggest the need for immediate implementation of recovery and conservation methods.

Factor D. The Inadequacy of Existing Regulatory Mechanisms

Overview

Currently, no existing Federal, State, or local laws, treaties, or regulations specifically conserve or protect 48 of the 49 species (except the band-rumped storm-petrel by the Migratory Bird Treaty Act (MBTA; 16 U.S.C. 703–712)), or adequately address the threats to any of the 49 species (see Table 2). There are a few small programs and organizations that conduct vegetation monitoring and nonnative species and predator control, but these activities are nonregulatory, and neither continuation of these conservation efforts nor funding for them is guaranteed.

Federal laws pertaining to the 49 species addressed here include Executive Order (E.O.) 13112, the MBTA, the Lacey Act (16 U.S.C. 3371–3378; 18 U.S.C. 42–43), the Federal Noxious Weed List (7 CFR 360.200), and the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). The U.S. Department of Agriculture (USDA) inspects propagative and restricted plant materials and animals, and implements “Special Local Needs” rules for pesticide use, but only on a species-by-species basis. The Department of Homeland Security-Customs and Border Protection (CBP) is responsible for inspecting commercial, private, and military vessels and aircraft, and related cargo and passengers arriving from foreign locations. However, CBP focuses on quarantine issues involving non-propagative plant materials; wooden packing materials, timber, and products; internationally regulated commercial species under CITES; and federally listed noxious plants, seeds, soils, and pests of concern to the continental United States, such as pests to mainland U.S. forests and agriculture.

Hawaii State law regarding natural resource protections include those under Hawaii Revised statutes (HRS): Plant and nondomestic animal quarantine and microorganism import (HRS 11–3–150A) and noxious weed control (HRS 11–3–152); flood control (HRS 12–2), water and land development (HRS 12–174), and State water code (HRS 12–2–174D); wildlife (general wildlife, hunting, game birds, game mammals, and wild birds and other wildlife) (HRS 12–4–183D); aquatic resources and wildlife-alien aquatic organisms (HRS 12–5–187A); general and miscellaneous, invasive species council (HRS 12–6–194); conservation of aquatic life, wildlife, and land plants (HRS 12–6–195D); and Natural Area Reserves (NARS) (HRS 12–6–195). These laws are interpreted and implemented under Hawaii administrative rules (HAR). Applicable HARs include: Noxious weed rules (HAR 4–6–68); plant and nondomestic animal quarantine, microorganism import rules (HAR 4–6–ch 71A, 71C), and plant intrastate rules (HAR 4–6–72); rules regulating game mammal hunting (HAR 13–5–2-ch 123; indigenous wildlife, endangered and threatened wildlife, and introduced wild birds (HAR 13–5–2-ch 124); protection of in-stream uses of water (HAR 13–7-ch 169), and NARS system (HAR 13–9-ch 208–210).

Private and local programs that provide protections, and that help to implement Federal and State environmental regulations, laws, and rules for one or more of the 49 species, include the Hawaii Invasive Species Committee (HISC), the Coordinating Group on Alien Pest Species (CGAPS), and the Hawaii Association of Natural Area Reserves (HARN), and the Hawaii State law regarding natural resources, including the Plant Extinction Protection Program (PEPP) was created to protect Hawaii’s rare plant species in need of immediate conservation efforts, by monitoring, propagating, outplanting, and providing some protection from threats.

We discuss Federal and State regulatory mechanisms, along with agencies and groups authorized to implement them, and the coordination between them, below.

Federal Regulatory Mechanisms

On February 3, 1999, Executive Order (E.O.) 13112 was signed establishing the National Invasive Species Council (NISC). This E.O. requires that a Council of Departments dealing with invasive species be created to prevent the introduction of invasive species; provide for their control; and minimize the economic, ecological, and human health impacts that invasive species cause. Invasive species include aquatic plant and animal species, terrestrial plants and animal species, and plant and animal pathogens. This E.O. was reviewed in 2005 (NISC 2005). NISC uses a cooperative approach to enhance the Federal Government’s response to the threat of invasive species, and emphasizes prevention, early detection and rapid response, and sharing of information. See our discussion below concerning the Hawaii Invasive Species Committee (HISC) regarding the effectiveness of this law.

The MBTA is the domestic law that implements the United States’ commitment to four international conventions (with Canada, Japan, Mexico, and Russia) for the protection
of shared migratory bird resources. The MBTA regulates most aspects of take, possession, transport, sale, purchase, barter, export, and import of migratory birds and prohibits the killing, capturing, and collecting of individuals, eggs, and nests, unless such action is authorized by permit. While the MBTA does prohibit actions that directly kill a covered species, unlike the Endangered Species Act (Act), it does not prohibit habitat modification that indirectly kills or injures a covered species, affords no habitat protection when the birds are not present, and provides only very limited mechanisms for addressing chronic threats to covered species, such as nonnative predators.

The Lacey Act authorizes the Secretary of the Interior to list as “injurious” any wildlife deemed to be harmful to human beings, to the interests of agriculture, horticulture, forestry, or to wildlife or the wildlife resources of the United States. The Service inspects arriving wildlife products, and enforces the injurious wildlife provisions of the Lacey Act. Among other provisions, the Lacey Act prohibits importation of injurious mammals, birds, fish, amphibians and reptiles listed in the Lacey Act or which are declared by the Secretary of the Interior through regulation to be injurious to human beings, agriculture, horticulture, forestry or wildlife; however, these prohibitions do not apply to plants and organisms other than those listed or designated by regulations as injurious wildlife (USFWS 2016, in litt.). The current list of animals considered as “injurious wildlife” is provided at 50 CFR part 16. The list includes fruit bats, mongoose, European rabbits and hares, wild dogs, rats or mice, raccoon dogs, brushtail possum (the species introduced to New Zealand), starlings, house sparrows, mynas, dachsh, Java sparrows, red-whiskered bulbuls, walking catfish, mitten crabs, zebra mussels, fish in the snakehead family, four species of carp, salmonoids, brown tree snakes, and pythons (USFS 2012, 50 CFR part 16). The Lacey Act requires declarations of importation only for formal entries (i.e., commercial shipments), but not for informal entries (i.e., personal shipments) (USDA–APHIS 2015, in litt.). Additionally, a species may still be imported or transported across State lines while it is being considered for addition to the list of “injurious wildlife” (Fowler et al. 2007, pp. 357–358). Mongoose, rabbits, rats, mice, house sparrows, mynas, Java sparrows, and red-whiskered bulbuls are already established in Hawaii, are difficult and costly to control, or are not controlled at all. None of the aquatic species on the injurious species list is present in Hawaii.

The continued spread of injurious species indicates the limited effectiveness of the Lacey Act in preventing introductions of such species to the State (Fowler et al. 2007, p. 357). As an example of continued introduction of nonnative species in Hawaii, opossums (Didelphis virginiana) have been found in shipping containers on Oahu in 2005, 2011, and most recently in 2015 (Star Advertiser 2015b, in litt.). This species is not included on the Lacey Act’s list of injurious wildlife. Opossums are omnivorous scavengers, consuming a wide variety of food items including insects, small vertebrates, bird eggs, slugs and snails, and fruits and berries (Oregon Department of Fish and Wildlife 2015, in litt.; Clermont College 2013, in litt.). If opossums were to establish wild populations in Hawaii, their predation on ground-nesting seabirds, small mammals, slugs could negatively affect the band-rumped storm petrel, the orangeblack Hawaiian damselfly, one or more of the 39 plants, and endangered snail species.

The Department of Agriculture–Animal and Plant Health Inspection Service–Plant Protection and Quarantine (USDA–APHIS–PPQ) inspects propagative plant material, provides identification services for arriving plants and animals, conducts pest risk assessments, and other related matters, but focuses on pests of wide concern across the United States (HDOA 2009, in litt.). The USDA–APHIS–PPQ’s Restricted Plants List restricts the import of a limited number of noxious weeds. If not specifically prohibited, current Federal regulations allow plants to be imported from international ports with some restrictions. The Federal Noxious Weed List (see 7 CFR 360.200; USDA 2012) includes more than 100 of the many globally known invasive plants, 21 of which are already established in Hawaii. Plants on the list do not require a weed risk assessment prior to importation from international ports.

A local organization (under the Institute of Pacific Islands Forestry-USFS), Pacific Island Ecosystems at Risk (PIER) has compiled a complete list of those plant species that are a threat to ecosystems in the Pacific Islands, and those that are potentially invasive and are present in the Pacific Region, along with a weed-risk assessment for most of them (Hawaii.org, last update May 15, 2013). There are over 1,000 plant species on the PIER list, and, in our proposed rule (80 FR 58820, September 30, 2015; see pp. 58869–58881), we discuss 114 of these invasive plants that currently have the greatest impacts on the 49 species. In addition, the USDA–APHIS–PPQ is in the process of finalizing rules to include a weed risk assessment for plants newly imported to Hawaii (and that may not yet appear on the PIER list).

Water extraction is a threat to the plant species (Cyclosorus boydiae), the orangeblack Hawaiian damselfly, and the anchialine pool shrimp Procaris hawaiiana. The U.S. Army Corps of Engineers (COE) has regulatory jurisdiction under section 404 of the Clean Water Act (33 U.S.C. 1251 et seq.) for activities that would result in a discharge of dredged or fill material into waters of the United States; however, in issuing permits for such activities, the COE does not typically establish minimal instream flow standards (IFS) as a matter of policy (U.S. Army 1985, RGL 85–6).

State Regulatory Mechanisms

The Hawaii Endangered Species law (HRS 195D) prohibits take, possession, sale, transport or commerce in designated species. This includes aquatic as well as terrestrial animal species, and terrestrial plants (not freshwater or marine plants). This State law also recognizes as endangered or threatened those species determined to be endangered or threatened pursuant to the Act. This Hawaii law states that a threatened species (under the Act) or an indigenous species may be determined to be an endangered species under State law. Protection of these species is under the authority of the Hawaii’s Department of Land and Natural Resources, and under administrative rule (HAR 13–5–2–Ch 124). Although this State law can address threats such as habitat modification, light attraction, and line collision through HCPs that address the effects of individual projects or programs, it does not address the pervasive threats to the 49 species posed by nonnative predators and feral ungulates.

The importation of nondomestic animals, including aquatic species and microorganisms, is regulated by a permit system (HAR 4–71) managed through the Hawaii Department of Agriculture (HDOA). In addition, transport of plants and plant parts between Hawaiian Islands is managed through the HDOA (HAR 4–6–72), but only for those species that have already been determined to be pest species. The objective of these administrative rules is to implement the requirements of HRS 11–3–150A. The list of nondomestic
animals (HAR 4–71) is defined by providing a list of those animals considered domestic: dog, cat, horse, ass (burro or donkey), cattle and beefalo, sheep, goat, swine, pot-bellied pig, alpaca, llama, rabbit, chicken, turkeys, pigeons, ducks, geese, and their hybrids. Examples of regulated pests are listed at HAR 4–72, including nonnative insects, slugs, insects, plants, and plant viruses that can damage or harm commercial crops. The HDOA’s Board of Agriculture maintains lists of nondomestic animals that are prohibited from entry, animals without entry restrictions, or those that require a permit for import and possession. The HDOA requires a permit to import animals, and conditionally approves entry for individual possession, businesses (e.g., pets and resale trade, retail sales, and food consumption), or institutions. However, habitat destruction and modification, and predation, by feral domestic animals (such as goat and cats, respectively) are two primary threats to the 49 species not addressed by the HDOA prohibitions and permitting process.

The State of Hawaii allows importation of most plant taxa, with limited exceptions, if shipped from domestic ports (HLRB 2002; USDA–APHIS–PPQ 2010; CGAPS 2009). Hawaii’s plant import rules (HAR 4–70) regulate the importation of 13 plant taxa of economic interest, including pineapple, sugarcane, palms, and pines. Certain horticultural crops (e.g., orchids) may require import permits and biosecurity requirements that include treatment or quarantine or both either prior to or following entry into the State.

Critical biosecurity gaps include inadequate staffing, facilities, and equipment for Federal and State inspectors devoted to invasive species interdiction (HLRB 2002; USDA–APHIS–PPQ 2010; CGAPS 2009). In recognition of these gaps, a State law has been passed that allows the HDOA to collect fees for quarantine inspection of fresh entering Hawaii (Act 36 (2011) HRS 150A–5.3). Legislation enacted in 2011 (H.B. 1568) requires commercial harbors and airports to provide biosecurity and inspection facilities to facilitate the movement of cargo through ports. This bill is a significant step toward optimizing biosecurity capacity in the State, but only time will determine its effectiveness (Act 2011 (11)). We believe there is a need for all civilian and military port and airport operations and construction to make biosecurity concerns a core objective.

As an example, the threat of introduction of nonnative species is evidenced by the 2013 discovery of presence of the nonnative coconut rhinoceros beetle (CRB, Oryctes rhinoceros), which quickly spread from its known point of introduction across the island of Oahu in a few months (HISC 2014, in litt. + maps; HDOA 2014, in litt.). The CRB is considered one of the most damaging insects to coconut and African oil palm trees in southern and southeast Asia, as well as the western Pacific Islands, and could devastate populations of native and nonnative palm trees in Hawaii (Giblin-Davis 2001 in HISC 2014, in litt.). A rapid response team headed by HDOA (with USDA, University of Hawaii, U.S. Navy, and other partners) has set up pheromone traps island-wide, and capture and range delineation efforts are ongoing, along with funding for support services to control the CRB (HISC 2014, in litt.). However, existing regulatory mechanisms did not prevent the introduction of this pest species into Hawaii. These regulatory mechanisms, such as HAR 71A and HAR 71C (regarding release of nonnative species) and H.B. 1568 (pertaining to State law to enforce biosecurity measures), therefore, are inadequate to prevent introduction of nonnative species. Efforts to control the CRB continue, but whether those efforts will be effective is unknown at this time.

Hawaii’s noxious weed law was enacted to prevent the introduction and transport of noxious weeds or their seeds or vegetative reproductive parts into any area that is reasonably free of those noxious weeds (HRS 11–3–152), and it states that the Hawaii Department of Agriculture shall take necessary measures to restrict the introduction and establishment of specific noxious weeds in such areas. Hawaii administrative rule (HAR 4–6–68) further defines the term “noxious weed” and the criteria for designation of plants as such and criteria for designation of a noxious weed “free area.” The list of noxious weeds, compiled in 1992, consists of 79 plant species, 49 of which were not yet established in Hawaii. Since that time, 20 species on the list have become established in Hawaii: Bocconia frutescens (plume poppy), Cereus uruguayanus (spiny tree cactus), Chromolaena odorata (siamweed), Crotalaria jubata (Andean pampas grass), Cyrtospermum japonicum (Scotch broom), Hyptis suaveolens (wild spikenard), Malachra alceifolia (malachra), Melastoma spp. (melastoma; two species now established, M. candidum [chirueun], M. Miconia spp. (miconia; M. calvescens now on four islands), Passiflora pulchella (wingleaf passionfruit), Piper aduncum (spiked pepper), Prosopis juliflora (algarroba), Pueraria phaseoloides (tropical kudzu), Rubus sieboldii (Molucca raspberry), Senecio madagascariensis (fireweed), Solanum elaeagnifolium (silverleaf nightshade), Solanum robustum (shrubby nightshade), Solanum torvum (turkeyberry), and Spartium junceum (Spanish broom). Thus, despite State legislation and regulations addressing invasive and noxious species, their entry into the State continues.

The State manages the use of surface and ground water resources through the Commission on Water Resource Management (CWRM), as mandated by the State Water Code (HRS 174, HAR 13–168–196). The State considers all natural flowing surface water (streams, springs, seeps) as State property (HRS 174C), and the DLNR has management responsibility for the aquatic organisms in these waters (HRS Annotated 1988, Title 12 1992 Cumulative Supplement). In Hawaii, instream flow is regulated by establishing standards on a stream-by-stream basis. The standards currently in effect represent flow conditions in 1987 (status quo), the year the administrative rules (State Water Code) were adopted (HRS 174C–71, HAR title 13, ch 169–44–49). Because of the complexity of establishing instream flow standards (IFS) for 376 perennial streams, the Commission retains interim IFS at status quo levels as set in 1987 (CWRM 2009, in litt.; CWRM 2014, in litt.). In the Waiahole Ditch Combined Hearing on Oahu (1991–2006), the Hawaii Supreme Court determined that status quo interim IFS were not adequate, and required the Commission to reassess the IFS for Waiahole Ditch and other streams Statewide (Cast No. CCH–OA95–1; Maui Now.com, in litt.). The Commission has been gathering information to fulfill this requirement since 2006, but no IFS recommendations have been made to date (CWRM 2008, p. 3–153; CWRM 2014, in litt.).

In addition, in the Hawaii Stream Assessment Report (HDLNR 1990; prepared in coordination with the National Park Service (NPS)), the Commission identified high-quality rivers and streams (and portions thereof) that may be placed within a Wild and Scenic River System. This report ranked 70 out of 176 analyzed rivers and streams as outstanding high-quality habitat, and recommended that streams meeting certain criteria be protected from further development (HDLNR 1990, pp. xxii–xxiv). However, there is no mechanism within the State’s Water Code to designate and set aside these
streams, or to identify and protect stream habitat. Accordingly, damselfly populations (including the orangeblack Hawaiian damselfly) are at risk of continued loss of habitat.

Hawaii’s DLNR Division of Aquatic Resources (DAR) is responsible for conserving, protecting, and enhancing the State’s renewable resources of aquatic life and habitat (HDLNR 2015, in litt.; DLNR–DAR 2003, p. 3–13). The release of live nonnative fish or other nonnative aquatic life into any waters of the State is prohibited (HRS 187A–6.5), and DAR has the authority to seize, confiscate, or destroy as a public nuisance any of these prohibited species (HRS 187A–2; HRS 187A–6.5). However, the DAR recognizes that nonnative species continue to enter the State and move between islands (DLNR–DAR 2003, p. 2–12).

There are no existing regulatory mechanisms that specifically protect Hawaii’s anchialine pools (habitat for the anchialine pool shrimp Procraris hawaiiensis orangeblack Hawaiian damselfly); however 2 anchialine pools on Maui and 12 anchialine pool on Hawaii Island are located within State NARs. State NARs were created to preserve and protect samples of Hawaii’s ecosystems and geological formations, and are monitored. Designation as a State NAR prohibits the removal of any native organism and the disturbance of pools (HAR 13–209–4). Though signs are posted at NARs to notify the public that anchialine pools are off-limits to bathers, off-road vehicle use around the pools, and other activities, the anchialine pools are in remote areas and the State does not have sufficient funding to effectively enforce those restrictions.

Nonnative ungulates pose threats of habitat destruction and modification and predation (herbivory) to 37 of the 39 plants species, and of habitat destruction and modification to 9 of the 10 animals in this rule (see Table 2). The State provides opportunities to the public to hunt game mammals (ungulates including feral pigs and goats, axis deer, black-tailed deer, and moufflon, sheep and moufflon-sheep hybrids) on 91 State-designated public hunting areas (within 45 units) on all the main Hawaiian Islands except Kahoolawe and Niihau (HAR–DLNR 2010, 13–123; HDLNR 2009b, pp. 25–30). On Niihau, public hunting opportunities are managed by a private business (Niihau Safaris Inc. 2015, in litt.). The State’s management objectives for game mammals range from maximum hunting opportunities (i.e., “sustained yield”) in some areas to removal by State staff or their designees from other areas (HAR–DLNR 2010, p. 12–123; HDLNR 2009b, pp. 25–30). Thirty of the 39 plant species, the band-rumped storm-petrel, the orangeblack Hawaiian damselfly, and three yellow-faced bees have populations in areas where habitat is used for game enhancement and game populations are maintained at levels for public hunting (Holmes and Joyce 2009, 4 pp.; HAR–DLNR 2010, p. 12–123; HBMP 2010). Public hunting areas are defined, but not fenced, and game mammals have unrestricted access to most areas across the landscape, regardless of underlying land-use designation. While fences are sometimes built to protect areas from game mammals, the current number and locations of fences are not adequate to prevent habitat destruction and modification for 46 of the 49 species. One additional State regulation (HRS 12–183D) was enacted recently to prevent intra-island transport of axis deer only. There are no other State regulations than those described above that address protection of the species and their habitat from feral ungulates.

Under statutory authorities provided by HRS title 12, subtitle 4, 183D Wildlife, the DLNR maintains HAR ch 124 (2014), which defines “injurious wildlife” as “any species or subspecies of animal except game birds and game mammals which is known to be harmful to agriculture, aquaculture, indigenous wildlife or plants, or constitute a nuisance or health hazard and is listed in the exhibit entitled Exhibit 5, Chapter 13–124, List of Species of Injurious Wildlife in Hawaii.” Under HAR 13–124–3(d), “no person shall, or attempt to: (1) Release injurious wildlife into the wild; (2) Transport them to island or locations within the State where they are not already established and living in a wild state; and (3) Export any such species or the dead body or parts thereof, from the State. Permits for these actions may be considered on a case-by-case basis.” This law was enacted after an incident in 2012 of interisland transport of axis deer (for hunting purposes) to Hawaii Island, which was without axis deer previously.

Local Mechanisms

Local biologists and botanists recognize the urgent need to address the importation of nonnative, invasive species, and are working to implement actions required; however, their funding is not guaranteed. We discuss the four primary groups below.

In 1995, the Coordinating Group on Alien Pest Species (CGAPS), a partnership of managers from Federal, State, County, and private agencies and organizations involved in invasive species work in Hawaii, was formed in an effort to coordinate policy and funding decisions, improve communication, increase collaboration, and promote public awareness (CGAPS 2009). This group facilitated the formation of the Hawaii Invasive Species Council (HISC), which was created by gubernatorial executive order in 2002, to coordinate local initiatives for the prevention of introduction and for control of invasive species by providing policy-level direction and planning for the State department responsible for invasive species issues (CGAPS 2009). In 2003, the Governor signed into law Act 85, which conveys statutory authority to the HISC to continue to coordinate approaches among the various State and Federal agencies, and international and local initiatives, for the prevention and control of invasive species (HDLNR 2003, p. 3–15; HISC 2009, in litt.; HRS 194–2). Some of the recent priorities for the HISC include interagency efforts to control nonnative species such as the plants Miconia calvescens (miconia) and Cortaderia spp. (pampas grass), coqui frogs (Eleutherodactylus coqui), the CRB, and ants (HISCO 2009, 2013, and 2015, in litt.; OISC 2015, in litt.; http://dlnr.hawaii.gov/hisc). Budget cuts beginning in 2009 restricted State funding support of HISC, resulting in a serious setback of conservation efforts (HISCO 2009; HISC 2015). The Hawaii Association of Watershed Partnerships comprises 11 separate partnerships on six Hawaiian Islands. These partnerships are voluntary alliances of public and private landowners, “committed to the common value of protecting forested watersheds for water recharge, conservation, and other ecosystem services through collaborative management” (http://hawp.org/partnerships). Funding for the partnerships is provided through a variety of State and Federal sources, public and private grants, and in-kind services provided by the partners and volunteers. However, budget cuts of 40 to 60 percent have occurred since 2009, with serious impacts to the positive contributions of these groups to implementing the laws and rules that can protect and control threats to one or more of the 49 species.

Another group was established to coordinate State and Federal agency efforts in the protection of rare endemic plant species in the State and Guam and the Commonwealth of the Northern Mariana Islands (CNMI), Hawaii’s Plant Extinction Prevention Program (PEPP). This program identifies and supports the “rarest of the rare” plant species in
need of immediate conservation efforts. The goal of PEPP is to prevent the extinction of plant species that have fewer than 50 individuals remaining in the wild.

These four partnerships, CGAPS, HISC, HAWP, and PEPP, are stop-gap measures that attempt to address issues that are not resolved by individual State and Federal agencies. The capacity of State and Federal agencies and their non-governmental partners in Hawaii to provide sufficient inspection services, enforce regulations, and mitigate or monitor the effects of nonnative species is limited due to the large number of taxa currently causing damage (CGAPS 2009). Many invasive, nonnative species established in Hawaii currently have limited but expanding ranges, and they cause considerable concern. Resources available to reduce the spread of these species and counter their negative effects are limited. Control efforts are focused on a few invasive species that cause significant economic or environmental damage to commercial crops and public and private lands. Comprehensive control of an array of nonnative species and management to reduce disturbance regimes that favor them remain limited in scope. If current levels of funding and regulatory support for control of nonnative species are maintained, the Service expects existing programs to continue to exclude, or, on a very limited basis, control these species only in the highest priority areas. Threats from established nonnative species are ongoing and are expected to continue into the future.

As an example of current and future challenges for biosecurity in Hawaii, a strain of the plant rust *Puccinia psidii* (ohia rust) was first noticed affecting stands of the nonnative rose apple (*Syzygium jambos*) and the native *Metrosideros* (ohia) seedlings (both in the plant family Myrtaceae) in nurseries in 2005. *Metrosideros* spp. are a dominant component of native forest in Hawaii, providing watershed protection and habitat for native wildlife. The Hawaii Board of Agriculture recommended a quarantine rule be passed against the introduction of all new strains of ohia rust (through transmission on Myrtaceae species used in the horticulture trade), to prevent destruction of ohia forests and the risk to agriculture and horticulture industries (Environment Hawaii 2015, pp. 1,8–9). However, the rule remains in draft form and under review (HDOA 2015, in litt.), accessed August 1, 2016). An example of the failure of biosecurity in Hawaii and the speed with which a new invader can cause widespread destruction is the introduction of the gall wasp *Quadrastichus erythrinae*. This highly destructive wasp was first detected in Taiwan in 2003. Despite evidence of its rapid advance across the Pacific Basin with concomitant loss of populations of native and ornamental trees in the genus *Erythrina*, this wasp arrived and naturalized in Hawaii in 2005 (Gramling 2005, p. 1). The wasp dispersed throughout the main Hawaiian Islands within weeks, and as a result, the endemic wiliwili, *Erythrina sandwicensis*, was quickly devastated (Rubinoff et al. 2010, p. 24).

On the basis of the information provided above, existing State and Federal regulatory mechanisms are not preventing the introduction of nonnative species and pathogens into Hawaii via interstate and international pathways, or via intrastate movement of nonnative species between islands and watersheds. Nor do these mechanisms address the current threats posed to the 49 species by established nonnative species. Therefore, State and Federal regulatory mechanisms do not adequately protect the 49 species, or their habitats, from the threat of new introductions of nonnative species or the continued expansion of nonnative species populations on and between islands and watersheds. The impacts from these threats are ongoing and are expected to continue into the future.

**Summary of Factor D**

Existing State and Federal regulatory mechanisms are not preventing the introduction into Hawaii of nonnative species or controlling the spread of nonnative species between islands and watersheds, or establishing or maintaining instream flow standards. Water extraction is a threat to one plant, *Cyclosorus boydiae*, to the orangeblack Hawaiian damselfly, and the anchialine pool shrimp (Factor A). Habitat-altering ungulates and nonnative plants (Factor A) pose major ongoing threats to all 49 species addressed in this rule. Thirty-five of the 39 plants and all 10 animals experience the threat of predation or herbivory by nonnative animals (Factor C). The seven yellow-faced bees and the orangeblack Hawaiian damselfly experience competition with nonnative insect species (Factor E). The intentional or inadvertent introduction of nonnative species and their spread within Hawaii, and the damage caused by existing populations of nonnative species, continues despite existing regulatory mechanisms designed to address this threat (in all its manifestations described above) to all 49 species. Regulatory mechanisms effectively address maintenance of instream flow, springs, seeps, and anchialine pools or address the threats of water extraction and stream modification for the anchialine pool shrimp and orangeblack Hawaiian damselfly. All of these threats are ongoing and are expected to continue into the future; therefore, we conclude the existing regulatory mechanisms are inadequate to reduce or eliminate these threats to the 49 species.

**Factor E. Other Natural or Manmade Factors Affecting Their Continued Existence**

Other factors that pose a threat to some or all of the 49 species include artificial lighting and structures, ingestion of marine debris and plastics, dumping of trash and the introduction of nonnative fish into anchialine pools, recreational use of and sedimentation of anchialine pools, low numbers of individuals and populations, hybridization, lack of or declining regeneration, competition with nonnative invertebrates, and loss of host plants. Each threat is discussed in detail below, along with identification of which species are affected by these threats. The impacts of climate change to these species and their ecosystems have the potential to exacerbate all of the threats described below.

**Artificial Lighting and Structures Effects on the Band-Rumped Storm-Petrel**

Artificial lights are a well-documented threat to night-flying seabirds such as petrels, shearwaters, and storm-petrels (Croxall et al. 2012, p. 28). A significant impact to the band-rumped storm-petrel results from the effects of artificial (night) lighting on fledglings and, to a lesser degree, on adults. Lighting of roadways, resorts, ballparks, residences, and other development, as well as on cruise ships out at sea, both attracts and confuses night-flying storm-petrels and other seabirds (Harrison et al. 1990, p. 49; Reed et al. 1985, p. 377; Telfer et al. 1987, pp. 412-413; Banko et al. 1991, p. 651). Storm-petrels use the night sky to navigate and possibly to search for bioluminescent marine prey (Telfer et al. 1987, p. 412). Artificial lights can attract night-flying seabirds and result in “fallout” (birds becoming grounded) when birds become confused and exhaust themselves circling around lights or collide with buildings, powerlines, or other structures. Once grounded, these birds are at risk of predation or being run over by cars (Reed et al. 1985, p. 377; Telfer et al. 1987, p. 410). Vulnerability to artificial lighting varies among species and age classes and is influenced by season, lunar phase, and weather conditions.
Young birds are more likely than adults to become disoriented by manmade light sources (Montevetchi 2006, pp. 101–102). Over a 12-year period (1978 to 1990), Harrison et al. (1990, p. 49) reported that 15 band-rumped storm-petrels, 13 of which were fledglings, were recovered on Kauai as a result of fallout. Between 1991 and 2008, another 21 band-rumped storm-petrels were collected on Kauai (Holmes and Joyce 2009, p. 2). Currently, fallout due to light pollution is recorded almost annually on Kauai (Kauai Island Utility Cooperative 2015, in litt.). In addition, band-rumped storm-petrels may be attracted to lights at sea and collide with boats; this source of injury and mortality has been documented for other storm-petrel species (e.g., Black 2005, p. 67). The actual extent of such loss and its overall impact on the band-rumped storm-petrel population in Hawaii is not known because scavengers often prevent the detection or recovery of the dead or injured birds, and the scattered and remote nesting areas of this species preclude demographic monitoring to quantify the impacts of this source of mortality. However, given the probable small total number of band-rumped storm-petrels nesting in Hawaii and the threats they face from nonnative predators such as rats and cats, any additional mortalities are likely to have negative impacts on the population.

A related threat to seabirds in Hawaii, including the band-rumped storm-petrel, is collision with structures such as communication towers and utility lines (Cooper and Day 1998, pp. 16–18; Podolsky et al. 1998, pp. 23–33). Several seabird species that nest in the Hawaiian Islands, including the Newell’s Townsend’s shearwater (federally listed as threatened), the Hawaiian petrel (federally listed as endangered), and the band-rumped storm-petrel, regularly commute between inland nest sites and the ocean. These birds commute at night, when manmade obstacles such as communication towers and utility lines are difficult to see. They strike these unseen obstacles, and often die or are injured as a result. An early study estimated that 340 Newell’s Townsend’s shearwater fledglings die annually on the eastern and southern shores of Kauai as a result of collisions (Podolsky et al. 1998, p. 30); however, current analyses for all seabirds on Kauai indicate the number of collisions with utility lines is much higher, over 2,000 strikes per year (using site-specific strike rates), but numbers of birds that hit utility lines is site-dependent (Travers et al. 2014, pp. 19, 29–37; Service 2015, in litt., Slide 21). Absent preventative measures, the impact to the band-rumped storm-petrel from artificial lighting and collisions with structures is expected to increase as the human population grows and development continues on the Hawaiian Islands.

Other Human Effects on the Band-Rumped Storm-Petrel

Other factors that may negatively affect the band-rumped storm-petrel include commercial fisheries interactions and alteration of prey base upon which the band-rumped storm-petrel depends. Commercial fisheries are known to adversely affect certain species of seabirds (Furness 2003, pp. 33–35). Seabirds are caught in fishing gear and suffer mortality by drowning. Seabirds also come into contact with and consume deep-water fish to which they would not normally have access, and can become contaminated by high levels of heavy metals in these fish (Furness 2003, p. 34). Commercial fisheries also cause depletion of small pelagic schooling fish, a significant food source for seabirds (Furness 2003, p. 34). The potential effects of these activities have not been assessed for the band-rumped storm-petrel; however, storm-petrels have been observed to attend fishing vessels (e.g., Yorio and Caillé 1999, p. 21; Yeh et al. 2013, p. 146), and the effects of fishery interactions on this species are likely to be similar to those documented for other seabird species in the same order (Procellariiformes or tubenoses; albatrosses and petrels). In addition, plastics and other debris in the open ocean can be ingested accidentally by band-rumped storm-petrels and pose a threat to this species (Ryan 1989, p. 629). Although a study by Moser and Lee (1992, p. 85) found no evidence of plastic ingestion by band-rumped storm-petrels, the sample size was very small (4 individuals) and inadequate to conclusively determine whether this species suffers from ingestion of plastics. Other species of storm-petrels have been documented to ingest plastics (Bond and Lavers 2013, p. 3; Ryan 2015, p. 20; Wilcox et al. 2015, p. 3), and band-rumped storm-petrels are likely to do so also. Many closely related seabirds do suffer ill effects from ingestion of plastics, including physical damage to the digestive tract, effects of toxins carried on the plastics, and resulting mortality (Ryan 1989, pp. 623–629; Tanaka et al. 2013, pp. 2–3).

Effects of Recreational Use, and Dumping of Trash and Nonnative Fish Into Anchialine Pools

On Hawaii Island, it is estimated that up to 90 percent of the anchialine pools have been destroyed or altered by human activities (Brock 2004, p. 1). The more recent human modification of anchialine pools includes bulldozing and filling of pools (Bailey-Brock and Brock 1993, p. 354). Trampling damage from use of anchialine pools for swimming and bathing has been documented (Brock 2004, pp. 13–17). Historically, pools were sometimes modified with stone walls and steps by Hawaiians who used them for bathing. There are no documented negative impacts to pond biota as a result of this activity; however, introduction of soaps and shampoos is of concern (Brock 2004, p. 15).

The depressional features of anchialine pools make them susceptible to dumping. Refuse found in degraded pools and pools that have been filled with rubble have been dated to about 100 years old, and the practice of dumping trash into pools continues today (Brock 2004, p. 15). For example, Lua O Palahem (Hawaii Island) is located approximately 560 ft (170 m) from a sandy beach frequented by visitors who fish and swim. There are multiple dirt roads that surround the pool making it highly accessible. Plastic bags, paper, fishing line, water bottles, soda cans, radios, barbed wire, and a bicycle have been documented within the pool (Kensley and Williams 1986, pp. 417–418; Bozanic 2004, p. 1; Wada 2010, in litt.). Introduction of trash involving chemical contamination into anchialine pools, as has been observed elsewhere on Hawaii Island (Brock 2004, pp. 15–16), drastically affects water quality and results in local extirpation of anchialine pool shrimp species.

Anchialine pool habitats can gradually disappear when wind-blown materials accumulate through a process known as senescence (Maciolek and Brock 1974, p. 3; Brock 2004, pp. 11, 35–36). Conditions promoting rapid senescence include an increased amount of sediment deposition, good exposure to light, shallowness, and a weak connection with the water table, resulting in sediment and detritus accumulating within the pool instead of being flushed away with tidal exchanges and ground water flow (Maciolek and Brock 1974, p. 3; Brock 2004, pp. 11, 35–36). Sediment accumulation affects the health of Hawaiian anchialine pool systems in which the anchialine pool...
shrimp, *Procaris hawaiana*, and the orangeblack Hawaiian damselfly occur.

In general, the accidental or intentional introduction and spread of nonnative fishes (bait and aquarium fish) is considered the greatest threat to anchialine pools in Hawaii (Brock 2004, p. 16). Maciolek (1983, p. 612) found that the abundance of shrimp in a given population is indirectly related to predation by fish. Lua O Palahemo is vulnerable to the intentional dumping of nonnative bait and aquarium fishes because the area is accessible to vehicles and human traffic, although due to its remote location, it is not monitored regularly by State agency staff. The release of mosquito fish and tilapia into the Waikoloa Anchialine Pond Preserve (WAAPA) at Waikoloa, North Kona, Hawaii, resulted in the infestation of all ponds within an approximately 3-ha (8-ac) area, which represented about two-thirds of the WAAPA. Within 6 months, all native hypogean (subterranean) shrimp species disappeared (Brock 2004, p. iii). Nonnative fish drive anchialine species out of the lighted, higher productivity portion of the pools, into the surrounding water table bed rock, subsequently leading to the decimation of the benthic community structure of the pool (Brock 2004, p. iii). In addition, nonnative fish prey on and exclude native hypogean shrimp that are usually a dominant and essential faunal component of anchialine pool ecosystems (Brock 2004, p. 16; Bailey-Brock and Brock 1993, pp. 338–355).

The loss of the shrimp changes ecological succession by reducing herbivory of macroalgae, allowing an overgrowth and change of pool flora. This overgrowth changes the system from clear, well-flushed basins to a system characterized by heavy sedimentation and poor water exchange, which increases the rate of pool senescence (Brock 2004, p. 16). Nonnative fishes, unlike native fishes, are able to complete their life cycles within anchialine pool habitats, and remain a permanent detrimental presence in all pools in which they are introduced (Brock 2004, p. 16). In Hawaii, the most frequently introduced fishes are those in the Poeciliidae family (freshwater fish which bear live young) and include mosquito fish, various mollies (*Poecilia* spp.), and tilapia, that prey on and exclude the herbivorous aquatic animals upon which *Procaris hawaiana* feeds. More than 90 percent of the 600 to 700 anchialine habitats in the State of Hawaii were degraded between 1974 and 2004, due to the introduction of nonnative fishes (Brock 2004, p. 24). According to Brock (2012, pers. comm.), sometime in the 1980s, nonnative fishes were introduced into Lua O Palahemo. It is our understanding that the fish were subsequently removed by illegal use of a fish poison (EPA 2007, pp. 22–23; Finlayson et al. 2010, p. 2), and to our knowledge the pool is currently free of nonnative fish; however, nonnative fish could be introduced into the pool at any time.

### Low Numbers of Individuals and Populations

Species that undergo significant habitat loss and degradation, and other threats resulting in population decline, range reduction, and fragmentation, are inherently highly vulnerable to extinction because of localized catastrophes such as hurricanes, floods, rockfalls, landslides, treefalls, and drought; climate change impacts; demographic stochasticity; and the increased risk of genetic bottlenecks and inbreeding depression (Gillpin and Soulé 1986, pp. 24–34). These conditions are easily reached by island species and especially species endemic to single islands that face numerous threats such as those described above (Pimm et al. 1988, p. 757; Mangel and Tier 1994, p. 607).

Populations that have been diminished and isolated by habitat loss, predation, and other threats exhibit reduced levels of genetic variability, which diminishes the species’ capacity to adapt to environmental changes, thereby lessening the probability of long-term persistence (Barrett and Kohn 1991, p. 4; Newman and Pilson 1997, p. 361). Very small, isolated plant populations are also more susceptible to reduced reproductive vigor due to ineffective pollination, inbreeding depression, and hybridization. This is particularly true for functionally unisexual plants like *Myrsine foshbergii* of which some individuals are functionally dioecious (male and female flowers occur on separate individuals). Isolated individuals have difficulty in achieving natural pollen exchange, which decreases the production of viable seed. Populations are also affected by demographic stochasticity, through which populations are skewed toward either male or female individuals by chance. The problems associated with small occurrence size and vulnerability to random demographic fluctuations or natural catastrophes are further magnified by interactions with other threats, such as those discussed above (see Factor A and Factor C, above).

### Plants

The effects resulting from having a reduced number of individuals and occurrences poses a threat to all 39 plant species addressed in this proposal. We consider the following 19 species to be especially vulnerable to extinction due to threats associated with small occurrence size or small number of occurrences because:

- The only known occurrences of *Cyanea kauaulaensis*, *Labordia lorenciana*, *Lepidium orbiculare*, and *Phyllostegia helleri* are threatened either by landslides, rockfalls, treefalls, drought, or erosion, or a combination of these factors.
- *Cyanea kauaulaensis*, *Cytandra hematos*, *Gardenia remyi*, *Joinvillea ascendens* spp. *ascendens*, *Labordia lorenciana*, *Nothocestrum latifolium*, and *Ochrosia baleakaalae* numbers are declining, and they have not been observed regenerating in the wild.
- The only known wild individuals of *Cyperus neokunthianus*, *Kadua haupuensis*, and *Stenogyne kaalae* spp. *sherfii* are extirpated; there is one remaining individual of *Deparia kaalae*, and only three individuals of *Phyllostegia brevidens*. *Kadua haupuensis* and *Stenogyne kaalae* spp. *sherfii* only exist in propagation.
- The following single-island endemic species are known from fewer than 250 individuals: *Asplenium diellaciniatum*, *Cyanea kauaulaensis*, *Cyperus neokunthianus*, *Cytandra hematos*, *Dryopteris glabra* var. *pusilla*, *Hypeolepis hawaiiensis* var. *mauiensis*, *Kadua haupuensis*, *Labordia lorenciana*, *Lepidium orbiculare*, *Phyllostegia helleri*, *Pritchardia bakeri*, *Santalum involutum*, *Stenogyne kaalae* spp. *sherfii*, and *Wikstroemia skottsbergiana*.

### Animals

Like most native island biota, the Hawaiian population of band-rumped storm-petrel, the orangeblack Hawaiian damselfly, the anchialine pool shrimp (*Procaris hawaiana*), and the seven yellow-faced bees are particularly sensitive to disturbances due to their diminished numbers of individuals and populations, and small geographic ranges.

The band-rumped storm-petrel is represented in Hawaii by very small numbers of populations, and perhaps not more than a few hundred individuals (Harrison et al. 1990, p. 49). A single human-caused action such as establishment of mongoose on Kauai, or a hurricane during the breeding season, could cause reproductive failure and the mortality of a significant percentage of the remaining individuals. Threats to this species include habitat destruction and modification, landslides and erosion, hurricanes, predation, injury...
and mortality from lights and structures, and other human factors (such as commercial fisheries). The effects of these threats are compounded by the current low number of individuals and populations of band-rumped storm-petrel.

We consider the orangeblack Hawaiian damselfly vulnerable to extinction due to impacts associated with low numbers of individuals and low numbers of populations because this species is known from only five of eight Hawaiian Islands (Hawaii Island, Maui, Lanai, Molokai, and Oahu) where it occurred historically, and because of the current reduction in numbers on each of those five islands. Jordan et al. (2007, p. 247) conducted a genetic and comparative phylogeography analysis (a study of historical processes responsible for genetic divergence within a species) of four Hawaiian Megalagrion species, including the orangeblack Hawaiian damselfly. This analysis demonstrated Megalagrion populations with low genetic diversity are at greater risk of decline and extinction than those with high genetic diversity. The authors found that low genetic diversity was observed in populations known to be bottlenecked or relictual (groups of animals or plants that exist as a remnant of a formerly widely distributed group), including populations of the orangeblack Hawaiian damselfly. The following threats to this species have all been documented: habitat destruction and modification by agriculture and urban development, droughts, floods, hurricanes; predation by nonnative fish, backswimmers, bullfrogs, and Jackson’s chameleons; competition with caddisflies; and water extraction from streams and ponds. The effects of these threats are compounded by the current low number of individuals and populations of the orangeblack Hawaiian damselfly.

We consider the anchialine pool shrimp, Procaris hawaiiana, vulnerable to extinction due to impacts associated with low numbers of individuals and populations because this species is known from only 25 of over 500 assessed anchialine pools on Hawaii Island, and from only 2 anchialine pools on Maui. Threats to P. hawaiiana include: Habitat destruction and modification; agriculture and urban development; commercial trade; dumping of nonnative fish and trash into anchialine pools; recreation; and water extraction. The effects of these threats are compounded by the low number of individuals and populations of P. hawaiiana.

We consider the seven Hawaiian yellow-faced bee species vulnerable to extinction due to impacts associated with low numbers of individuals and populations. The seven yellow-faced bee species currently occur in only 22 locations (with some overlap) on six main Hawaiian Islands, and are vulnerable to habitat change and stochastic events due to low numbers and occurrences (Daly and Magnacca 2003, p. 3; Magnacca 2007, p. 173). *Hylaeus anthracinus* occurs in 15 total locations from Hawaii Island, Maui, Kahoolawe, Molokai, and Oahu, but has not been recently observed in its last known location on Lanai; *H. assimulans* is found in 5 total locations on Maui, Lanai, and Kahoolawe, but has not been observed recently on Oahu or Molokai; *H. facilis* is found in 2 total locations on Oahu and Molokai, but has not been observed recently from Lanai and Maui; *H. hilaaris* is known from one population on Molokai and has not been observed recently from Lanai and Maui; *H. kuakea* is known from one small area on Oahu; *H. longiceps* is known from 6 total locations on Maui, Lanai, Molokai, and Oahu, but has not been collected from several historical locations on those islands; and *H. mana* is known from 3 locations on Oahu. Threats to these species include agriculture and urban development; habitat destruction and modification by nonnative ungulates, nonnative plants, tsunamis, fire, drought, and hurricanes; the effects of climate change on habitat; loss of host plants; and predation or competition by nonnative ants, wasps, and bees. The effects of these threats are compounded by the low numbers of individuals and populations of the seven yellow-faced bees.

### Hybridization

Natural hybridization is a frequent phenomenon in plants and can lead to the creation of new species (Orians 2000, p. 1949), or sometimes to the decline of species through genetic assimilation or “introgression” (Ellstrand 1992, pp. 77, 81; Levin et al. 1996, pp. 10–16; Rhymer and Simberloff 1996, p. 85). Hybridization, however, is especially problematic for rare species that come into contact with species that are abundant or more common (Rhymer and Simberloff 1996, p. 83). We consider hybridization to be a threat to *Cytandra hematos*, *Mircrolepia strigosa* var. *mauiensis*, and *Myrsine fosbergii* because it will lead to extinction of the original genotypically distinct species and varieties, as noted by biologists’ observations of occurrences (Kawelo et al. in litt.; Ching Harbin 2015, in litt.; Oppenheimer 2015, in litt.).

### Competition With Nonnative Invertebrates

There are 15 known species of nonnative bees in Hawaii (Snelling 2003, p. 342), including two nonnative *Hylaeus* species (Magnacca 2007, p. 188). Most nonnative bees inhabit areas dominated by nonnative vegetation and do not compete with Hawaiian bees for foraging resources (Daly and Magnacca 2003, p. 13); however, the European honey bee (*Apis mellifera*) is an exception. This social species is often very abundant in areas with native vegetation and aggressively competes with *Hylaeus* for nectar and pollen (Hopper et al. 1996, p. 9; Daly and Magnacca 2003, p. 13; Snelling 2003, p. 345). The European honey bee was first introduced to the Hawaiian Islands in 1875, and currently inhabits areas from sea level to the upper tree line boundary (Howarth 1985, p. 156). Individuals of the European honey bee have been observed foraging on *Hylaeus* host plants such as *Scaevola ssp.* and *Sesbania tomentosa* (ohai) (Hopper et al. 1996, p. 9; Daly and Magnacca 2003, p. 13; Snelling 2003, p. 345). Although we lack information indicating Hawaiian *Hylaeus* populations have declined because of competition with the European honey bee for nectar and pollen, it does forage in *Hylaeus* habitat and excludes *Hylaeus* species (Magnacca 2007b, p. 188; Lach 2008, p. 155). *Hylaeus* species do not occur in native habitat where there are large numbers of European honey bee individuals, but the impact of smaller, more moderate populations is not known (Magnacca 2007, p. 188). Nonnative, invasive bees are widely documented to decrease nectar volumes and usurp native pollinators (Lach 2008, p. 155). There are also indications that populations of the European honey bee...
are not as vulnerable as Hylaeus species to predation by nonnative ant species (see Factor C, Disease or Predation, above). As described above, Hylaeus bees that collect pollen from flowers of the native tree Metrosideros polymorpha were absent from trees with flowers visited by the big-headed ant, while visits by the European honey bee were not affected (Lach 2008, p. 155). As a result, Lach (2008, p. 155) concluded that the European honey bee may have a competitive advantage over Hylaeus species because it is not excluded by the big-headed ant. Other nonnative bees found in areas of native vegetation and overlapping with native Hylaeus population sites include Ceratina species (carpenter bees), Hylaeus albonitens (Australian colletid bees), H. strenuus (NCN), and Lasiosglossum impavidum (NCN) (Magnacca 2007, p. 188; Magnacca and King 2013, pp. 19–22).

Loss of Host Plants Through Competition

The seven yellow-faced bees are dependent upon native flowering plants for their food resources, pollen and nectar, and for nesting sites. Introduced invertebrates outcompete native Hylaeus for use of host plants for pollen, nectar, and nesting sites. This effect is compounded by the impacts of nonnative ungulates on native host plants for Hylaeus (see discussion under Factors A and C, above). Nonnative plants are a threat to the seven yellow-faced bees and their host plants because they (1) Degrade habitat and outcompete native plants; (2) increase the intensity, extent, and frequency of fire, converting native shrubland and forest to land dominated by nonnative grasses; and (3) as a result of fire, cause the loss of the native host plants upon which the yellow-faced bees depend (Factor A). Drought, fire, and water extraction lead to loss of host plants within the known ranges of populations of yellow-faced bees, and are discussed under Factor A, The Present or Threatened Destruction, Modification, or Curtailment of Their Habitat or Range, above.

Competition With Caddisflies

Caddisflies (Order Trichoptera), a nonnative aquatic insect, were first observed and identified in Hawaii in the 1940s (Flint et al. 2003, p. 31); several species are established on all the main Hawaiian Islands. They may have been introduced inadvertently with aquatic plants released into streams (Flint et al. 2003, p. 37). Stream sampling showed that caddisflies accounted for 57 percent of the stream benthos (flora and fauna in stream sediment) in upper elevation Kauai streams (Englund et al. 2000, p. 23; Flint et al. 2003, p. 38), and caddisflies now inhabit every Oahu stream. Caddisflies compete with native aquatic invertebrate for resources and space (Haines 2015, in litt.), which may reduce prey abundance for naiads of the orangeblack Hawaiian damselfly. In addition, caddisflies provide a food source for introduced fish species, contributing to successful establishment of nonnative fish (Flint et al. 2003, p. 38), an additional threat to the orangeblack Hawaiian damselfly.

Climate Change

Our analyses under the Act include consideration of ongoing and projected changes in climate, and the impacts of global climate change and increasing temperatures on Hawaii ecosystems are the subjects of active research. Global temperature has increased over the past century, and particularly since the mid-20th century (IPCC 2014, p. 5), and this increase in temperature is correlated to emissions of carbon dioxide and other greenhouse gases, which have increased more since 1970 than in prior periods (IPCC 2014, pp. 13–14). Analysis of the historical record indicates surface temperature in Hawaii has been increasing since the early 1900s, with relatively rapid warming over the past 30 years. The average increase since 1975 has been 0.48 °F (0.27 °C) per decade for annual mean temperature at elevations above 2,600 ft (800 m) and 0.16 °F (0.09 °C) per decade for elevations below 800 m (Giambelluca et al. 2008, pp. 3–4). Relative to average global temperature from 1886 to 2005, the average ambient air temperature is likely to increase globally by at least 0.5 to 4.7 °F (0.3 to 2.6 °C) by the year 2100 (IPCC 2013, p. 20). Based on models using climate data downscaled for Hawaii, the ambient temperature is projected to increase by 3.8 to 7.7 °F (2.1 to 4.3 °C), depending upon elevation and the emission scenario (Liao et al. 2015, p. 4344). On the main Hawaiian Islands, predicted changes associated with increases in temperature include a shift in vegetation zones upslope, a similar shift in animal species’ ranges, changes in mean precipitation with unpredictable effects on local environments, increased occurrence of drought cycles, and increases in intensity and numbers of hurricanes (Loose and Giambelluca 1998, pp. 514–515; U.S. Global Change Research Program (US–GCRP) 2009, pp. 10, 12, 17–18, 32–33; Giambelluca 2013, p. 6). Additionally, sea level is rising as a result of expansion of warming ocean water; the melting of ice sheets, glaciers, and ice caps; and the addition of water from terrestrial systems (Climate Institute 2011, in litt.), and sea-level rise negatively affects species occurring in low-lying coastal areas including Solanum nelsonii (Starr 2011, in litt.) and affects the stability of anchialine pools systems that are habitat for Procaris hawaiana (Sakihara 2015, in litt.).

The forecast of changes in precipitation is highly uncertain because it depends, in part, on how the El Niño–La Niña weather cycle (an episodic feature of the ocean-atmosphere system in the tropical Pacific having important global consequences for weather and climate) might change (State of Hawaii 1998, pp. 2–10). The historical record indicates that Hawaii tends to be dry (relative to a running average) during El Niño phases and wet during La Niña phases (Chen and Chu 2005, pp. 4809–4810). However, over the past century, the Hawaiian Islands have experienced a decrease in precipitation of just over 9 percent (US National Science and Technology Council 2008, p. 61) and a trend of decrease (from the long-term mean) is evident in recent decades (Chu and Chen 2005, pp. 4802–4803; Diaz et al. 2005, pp. 1–3). Stream-gauge data provide corroborating evidence of a long-term decrease in precipitation and stream flow on the Hawaiian Islands (Oki 2004, p. 4). This long-term drying trend, coupled with existing ditch diversions and periodic El Niño-caused drying events, has created a pattern of severe and persistent stream dewatering events (Polhemus 2008, in litt., p. 26). Models of future rainfall downscaled for Hawaii generally project increasingly wet windward slopes and mild to extreme drying of leeward areas in particular by the middle and end of the 21st century (Timm and Diaz 2009, p. 4262; Elison Timm et al. 2015, pp. 95, 103–105). Altered seasonal moisture regimes can have negative impacts on plant growth cycles and overall negative impacts on native ecosystems (US–GCRP 2009, pp. 32–33). Long periods of decline in annual precipitation result in a reduction of moisture availability, an increase in drought frequency and intensity, and a self-perpetuating cycle of nonnative plant invasion, fire, and erosion (US–GCRP 2009, pp. 32–33; Warren 2011, pp. 221–226) (see “Habitat Destruction and Modification by Fire,” above). Overall, the documented and projected increase in variance of precipitation events will change patterns of water availability for the species (Parmesan and Matthews 2006, p. 340), changes that point to changes in
plant communities as a consequence over the coming decades.

Tropical cyclone frequency and intensity are projected to change as a result of increasing temperature and changing circulation associated with climate change over the next 100 to 200 years (Vecchi and Soden 2007, pp. 1068–1069, Figures 2 and 3; Emanuel et al. 2008, p. 360, Figure 8; Yu et al. 2010, p. 1371, Figure 14). In the central Pacific, modeling projects an increase of up to two additional tropical cyclones per year in the main Hawaiian Islands by 2100 (Murakami et al. 2013, p. 2, Figure 1d). In general, tropical cyclones with the intensities of hurricanes have been an uncommon occurrence in the Hawaiian Islands. From the 1800s until 1949, hurricanes were only rarely reported from ships in the area. Between 1950 and 1997, 22 hurricanes passed near or over the Hawaiian Islands, and 5 of these caused serious damage (Businger 1998, in litt.). A recent study shows that, with a possible shift in the path of the subtropical jet stream northward, away from Hawaii, more storms will be able to approach and reach the Hawaiian Islands from an easterly direction, with Hurricane Iselle in 2014 being an example (Murakami et al. 2015, p. 751).

As described above (see Climate Change Vulnerability Assessment for the Hawaiian Plants, above, and Table 2), 27 of the 39 plant species in this proposal were included in the recent analysis of the vulnerability of Hawaiian plants to climate changes conducted by Fortini et al. (2013, 134 pp.). All 27 species scored as moderately to extremely vulnerable, as did most other species in the analysis that are already considered to be of conservation concern (because they face multiple non-climate threats) (Fortini et al. 2013, pp. 25, 37). The specific impacts of climate change effects on the habitat, biology, and ecology of individual species are largely unknown and remain a subject of study. However, in the assessment of more than 1,000 Hawaiian plants, including those already listed as endangered or threatened, a strong relationship emerged between climate vulnerability scores and current threats and conservation status (Fortini et al. 2013, p. 5). Therefore, we anticipate that the 13 plant species not analyzed are likely to be similarly vulnerable to climate change effects. The projected landscape- or island-scale changes in temperature and precipitation, as well as the potentially catastrophic impacts of projected increases in storm frequency and intensity, also point to likely adverse impacts of climate change on all 10 of the animal species considered in this proposal because they rely on abiotic conditions, such as water temperature, or habitat elements, such as host plants and prey species, likely to be substantially altered by climate change.

Although we lack information about the specific effects of current and projected climate change on these species, we anticipate that increased ambient temperature and hurricane intensity, changing precipitation patterns, and sea-level rise and inundation will create additional stresses on these species because they are vulnerable to these disturbances. For example, projected warmer temperatures and increased storm severity resulting from climate change are likely to exacerbate other threats to the species, such as by enhancing the spread of nonnative invasive plants into these species’ native ecosystems in Hawaii. The drying trend, especially on leeward sides of islands, creates suitable conditions for increased invasion by nonnative grasses and enhances the risk of wildfire. Sea-level rise threatens ecosystems and species nearest the coast, including the anchialine pool ecosystem.

The risk of extinction as a result of the effects of climate change increases when a species’ range and habitat requirements are restricted, its habitat decreases, and its numbers and number of populations decline (IPCC 2014, pp. 14–15). The fragmented range, diminished number of populations, and low total number of individuals have compromised the range-wide redundancy and resilience of these 49 species. Therefore, we would expect them to be particularly vulnerable to the habitat impacts of the effects of climate change (Loope and Giambelluca 1998, pp. 504–505; Pounds et al. 1999, pp. 611–612; Still et al. 1999, p. 610; Benning et al. 2002, pp. 14,246–14,248; Giambelluca and Luke 2007, pp. 13–15). Although we cannot predict the timing, extent, or magnitude of specific impacts, we do expect the effects of climate change to exacerbate the current threats to these species, such as habitat loss and degradation.

In summary, based on the best available information, we conclude that climate change effects, including increased inter-annual variability of ambient temperature, precipitation, and hurricanes, are likely to impose additional stresses on all 11 ecosystems and all of the 49 species we are listing in this rule, thus exacerbating current threats to these species. These 49 species persist with small population sizes and highly restricted or fragmented ranges. They thus face increased immediate risk from stochastic events such as hurricanes, which can extinguish an important proportion of the remaining individuals, and from long-term, landscape-scale environmental changes because reduced populations often lack ecological or genetic adaptive capacity (Fortini et al. 2013, pp. 3–5).

In addition to impacts resulting from changes in terrestrial habitat and disturbance regimes, climate change affects aquatic habitat. For example, physiological stress in the orangeblack Hawaiian damselfly is caused by increased water temperatures to which the species is not adapted (Pounds et al. 1999, pp. 611–612; Still et al. 1999, p. 610; Benning et al. 2002, pp. 14,246, 14248). All of these aspects of climate change and their impacts on native species and ecosystems will be exacerbated by human demands on Hawaii’s natural resources; for example, decreased availability of fresh water will magnify the impact of human water consumption on Hawaii’s natural streams and reservoirs (Giambelluca et al. 1991, p. v). Climate change impacts contribute to the multiple threats affecting the status of all of these species, and the effects of climate change are projected to increase in the future.

Summary of Factor E

We consider the threat from artificial lighting and structures to be a serious and ongoing threat to the band-rumped storm-petrel in Hawaii because these threats cause injury and mortality, resulting in a loss of breeding individuals and juveniles, and are expected to continue into the future. Injury or mortality or loss of food sources caused by the activities of commercial fisheries, and injury or mortality resulting from ingestion of plastics and marine debris, are likely to contribute to further decline in the Hawaiian population of the band-rumped storm-petrel.

We consider the threats from recreational use of, and dumping of trash and introduction of nonnative fish into, the pools that support the anchialine pool shrimp Procris hawaiana to be serious threats that have the potential to occur at any time, although their occurrence is not predictable. The use of anchialine pools for dumping of trash leads to accelerated sedimentation in the pool, exacerbating conditions leading to its senescence. Changing the anchialine pool system by dumping of trash, introduction of nonnative fish, and sedimentation also affects habitat for the orangeblack Hawaiian damselfly. In
addition, recreational use of off-road vehicles contributes to increased sedimentation in anchialine pools, and has been noted to affect the habitat of the orangeblack Hawaiian damselfly on Lanai.

We consider the impacts from limited numbers of individuals and populations to be a serious and ongoing threat to all 39 plant species, and especially for the following 19 plants: Asplenium diellacinatum, Cyanea kauaulaensis, Cyperus neokunthianus, Cyrtandra hematos, Deparia kaalaana, Dryopteris glabriz var. pusilla, Gardenia remyi, Hypolepis hawaiensis var. mauienisi, Joinvillea ascendens ssp. ascendens, Kadua haupuensis, Labordia lorenciana, Lepidium orbiculare, Myrsine fosbergii, Phyllostegia brevidens, P. helleri, Pritchardia bakeri, Santalum involutum, Stenogyne kaalae ssp. sherriffii, and Wikstroemia skottsbergiana, as low numbers and small occurrences of these plants result in greater vulnerability to stochastic events and can result in reduced levels of genetic variability leading to diminished capacity to adapt to environmental changes. Under these circumstances, the likelihood of long-term persistence is diminished, and the likelihood of extirpation or extinction is increased. This threat applies to the entire range of each of these species. We also consider the impacts from limited numbers of individuals and populations to be a serious and ongoing threat to the band-rumped storm-petrel, the orangeblack Hawaiian damselfly, the anchialine pool shrimp (Procaris hawaiiensis), and to the yellow-faced bees (Hylaeus anthracinus, H. assimulans, H. facilis, H. hilaris, H. kuakea, H. longiceps, and H. mana). Nonnative wasps and bees are aggressive and can prevent use of the native host plants required for food and nesting by all seven yellow-faced bees. Competition with caddisflies is a threat to the orangeblack Hawaiian damselfly. Based on current and projected changes in climate, increasing temperature, changing precipitation regimes, increases in storm severity, and sea-level rise will likely exacerbate the threats to these 49 species. The effects of climate change on these species include, but are not limited to, physiological stress caused by increased water or air temperature or lack of moisture, the long-term destruction and modification of habitat, increased competition by nonnative species, and changes in disturbance regimes that lead to changes in the size and productivity of nonnative plants (e.g., fire, drought, flooding, and hurricanes).

**Determination for 49 Species**

Section 4 of the Act (16 U.S.C. 1533), and its implementing regulations at 50 CFR part 424, set forth the procedures for adding species to the Federal Lists of Endangered and Threatened Wildlife and Plants. Under section 4(a)(1) of the Act, we may list a species based on (A) the present or threatened destruction, modification, or curtailment of its habitat or range; (B) overutilization for commercial, recreational, scientific, or educational purposes; (C) disease or predation; (D) the inadequacy of existing regulatory mechanisms; or (E) other natural or manmade factors affecting its continued existence. Listing actions may be warranted based on any of the above threat factors, singly or in combination.

We have carefully assessed the best scientific and commercial information available, past, present, and future threats to each of the 49 species. We find that all of these species face threats that are ongoing and are expected to continue into the future throughout their ranges. Habitat destruction and modification by agriculture and urban development, and conversion of wetland habitat or water extraction resulting from such activity, is a threat to one plant, Cyclosorus boydiae, and seven animals (the orangeblack Hawaiian damselfly, the anchialine pool shrimp (Procaris hawaiiensis), Hylaenus anthracinus, H. assimulans, H. facilis, H. hilaris, and H. longiceps) (Factor A). Habitat destruction and modification by nonnative feral ungulates poses a threat to 46 of the 49 species (except for Cyanea kauaulaensis, Hypolepis hawaiensis var. mauienisi, and the anchialine pool shrimp (Procaris hawaiiensis)) (Factor A). Habitat destruction and modification by nonnative plants poses a threat to all 39 plant species and 9 of the 10 animals (except for Procaris hawaiiensis) (Factor A). Fourteen of the plant species (Exocarpos menziesii, Festuca hawaiensis, Joinvillea ascendens ssp. ascendens, Labordia lorenciana, Nothocestrum latifolium, Ochreria haleakalae, Portalaca villosa, Ranunculus mauerisi, Sanicula sandwicensis, Santalum involutum, Schiedea pubescens, Sicyos lanceoloides, S. macrophyllus, and Solanum nelsonii) and all seven yellow-faced bees are at risk of habitat destruction and modification by fire. Habitat loss and mortality resulting from hurricanes is a threat to the plant Pritchardia bakeri, the band-rumped storm-petrel, the orangeblack Hawaiian damselfly, and all seven yellow-faced bees (Factor A). Twenty of the plant species (Cyanea kauaulaensis, Cyclosorus boydiae, Deparia kaalaana, Dryopteris glabra var. pusilla, Gardenia remyi, Joinvillea ascendens ssp. ascendens, Kadua fluviatilis, K. haupuensis, Labordia lorenciana, Lepidium orbiculare, Phyllostegia brevidens, P. helleri, P. stachyoides, Portalaca villosa, Pseudognaphalium sandwicensium var. molokaiense, Ranunculus hawaiensis, R. mauienisi, Sanicula sandwicensis, Schiedea pubescens, and Solanum nelsonii), the band-rumped storm-petrel, and the orangeblack Hawaiian damselfly are threatened by the destruction and modification of their habitats from, either singly or in combination, landslides, rockfalls, treefalls, flooding, or tsunamis (Factor A). Habitat loss or degradation and loss of host plants, mortality, and water extraction due to drought is a threat to all 49 species (Cyclusors boydiae, Deparia kaalaana, Huperzia stemmernanniae, Phyllostegia...
stachyoideae, Ranunculus hawaiensis, R. maulensis, Sanicula sandwicensis, Schiedea pubescens, Sicyos lanceoleaudeus, and Solanum nelsonii; the orangeblack Hawaiian damselfly; and all seven yellow-faced bees (Factor A and Factor E). Unpermitted collection for commercial purposes poses a serious threat to the anchialine pool shrimp Procaris hawaiana (Factor B). Predation or herbivory is a serious and ongoing threat to 35 of the 39 plant species (by feral pigs, goats, axis deer, black-tailed deer, cattle, sheep, mouflon, rats, slugs, and the black twig borer); to the band-rumped storm petrel (by barn owls, cats, rats, and mongoose); and to the seven yellow-faced bees (by ants and wasps) (Factor C). Predation by bullfrogs, blackswimmers, nonnative fish, and Jackson’s chameleons is a threat to the orangeblack Hawaiian damselfly (Factor C). Predation by nonnative fish is a threat to the anchialine pool shrimp (Factor C). The existing regulatory mechanisms do not adequately address these threats to the 49 species (Factor D). Injury and mortality caused by artificial lighting and structures are serious and ongoing threats to the band-rumped storm-petrel (Factor E). The threats of injury or mortality, or loss of food sources, caused by the activities of commercial fisheries, and injury or mortality resulting from ingestion of plastics and marine debris, can contribute to further decline of the Hawaiian population of the band-rumped storm-petrel (Factor E). Recreational use of, and dumping of trash and nonnative fish into, anchialine pools is a threat to the anchialine pool shrimp and also to the orangeblack Hawaiian damselfly that uses that habitat (Factor E). Competition by ants, wasps, and bees for the food and nesting resources, including loss of native host plants, is a threat to all seven yellow-faced bees. Competition with caddisflies is a threat to the orangeblack Hawaiian damselfly (Factor E). These threats are exacerbated by these species’ inherent vulnerability to extinction from stochastic events at any time because of their endemicity, low numbers of individuals and populations, and restricted habitats. There are serious and ongoing threats to all 49 species due to factors associated with low numbers of individuals and populations (Factor E). The threat of low numbers to seven plants (Cyanea kauaulaensis, Cyrtandra hematos, Gardenia remyi, Joinvillea ascendens ssp. ascendens, Kadua fluvialitis, Kadua haupuenisi, Labordia lorenciana, Lepidium orbiculare, Microlepis strigosae, Mattuserss, Joinvillea ascendens ssp. ascendens, Kadua fluvialitis, Kadua haupuenisi, Labordia lorenciana, Lepidium orbiculare, Microlepis strigosae, Mysine fosbergii, Nothocestrum latifolium, Ochrosia haleakalae, Phyllostegia brevidens, Phyllostegia helleri, Phyllostegia stachyoideae, Portulaca villosa, Pritchardia bakeri, Pseudognaphalium sandwicensium var. molokaiensis, Ranunculus hawaiensis, Ranunculus maulensis, Sanicula sandwicensis, Santalum involutum, Schiedea diffusa ssp. diffusa, Schiedea pubescens, Sicyos lanceoleaudeus, Sicyos macrophyllus, Solanum nelsonii, Stenogyne kaalae ssp. sferfii, and Wikstroemia skottsbergiana; and the following animals: the Hawaii DPS of the band-rumped storm-petrel (Oceanodroma castro), the orangeblack Hawaiian damselfly (Megaglarion megalophrys), and the yellow-faced bees Hyleaens anthracinus, Hyleaens assimilans, Hyleaens facilis, Hyleaens hilaris, Hyleaens kauakea, Hyleaens longiceps, and Hyleaens mana.

Under the Act and our implementing regulations, a species may warrant listing if it is in danger of extinction or likely to become so throughout all or a significant portion of its range (SPR). Under our SPR policy (79 FR 37578, July 1, 2014), if a species is endangered or threatened through a significant portion of its range and the population in that significant portion is a valid DPS, we will list the DPS, if it is in danger of extinction, rather than the entire taxonomic species or subspecies. We have determined that the Hawaii population of the band-rumped storm-petrel is a valid DPS, and we are listing that DPS. Each of the other 48 species endemic to the Hawaiian Islands that we are listing in this rule is highly restricted in its range, and the threats occur throughout its range. Therefore, we assessed the status of each species throughout its entire range. In each case, the threats to the survival through these species’ ranges and are not restricted to any portion of the range. Accordingly, our assessment and determination applies to each species throughout its entire range. Likewise, we assessed the status of the Hawaii DPS of the band-rumped storm-petrel throughout the range of the DPS and have determined that the threats occur throughout the DPS and are not restricted to any particular portion of the DPS. Because we have determined that these 48 species and one DPS are endangered throughout all of their ranges, no portion of their ranges can be “significant” for purposes of the definitions of “endangered species” and “threatened species.” See the Final Policy of Interpretation of the Phrase “Significant Portion of Its Range” in the Endangered Species Act’s Definitions of “Endangered Species” and “Threatened Species” (79 FR 37578, July 1, 2014).

Available Conservation Measures

Conservation measures provided for species listed as endangered or threatened species under the Act include recognition, recovery actions, requirements for Federal protection, and prohibitions against certain practices. Recognition through listing results in public awareness and conservation by Federal, State, and local agencies; private organizations; and individuals. The Act encourages cooperation with the States and requires that recovery actions be carried out for all listed species. The protection required by Federal agencies and the prohibitions against certain activities are discussed, in part, below.
The primary purpose of the Act is the conservation of endangered and threatened species and the ecosystems upon which they depend. The ultimate goal of such conservation efforts is the recovery of these listed species, so that they no longer need the protective measures of the Act. Subsection 4(f) of the Act calls for the Service to develop and implement recovery plans for the conservation of endangered and threatened species. The recovery planning process involves the identification of actions that are necessary to halt or reverse the species’ decline by addressing the threats to its survival and recovery. The goal of this process is to restore listed species to a point where they are secure, self-sustaining, and functioning components of their ecosystems.

Recovery planning includes the development of a recovery outline shortly after a species is listed and preparation of a draft and final recovery plan. The recovery outline guides the immediate implementation of urgent recovery actions and describes the process to be used to develop a recovery plan. Revisions of the plan may be done to address continuing or new threats to the species, as new substantive information becomes available. The recovery plan identifies site-specific management actions that set a trigger for review of the five factors that control whether a species remains endangered or may be downlisted or delisted, and methods for monitoring recovery progress. Recovery plans also establish a framework for agencies to coordinate their recovery efforts and provide estimates of the cost of implementing recovery tasks. Recovery teams (composed of species experts, Federal and State agencies, nongovernmental organizations, and stakeholders) are often established to develop recovery plans. When completed, the recovery outline, draft recovery plan, and the final recovery plan will be available on our Web site (http://www.fws.gov/endangered), or from our Pacific Islands Fish and Wildlife Office (see FOR FURTHER INFORMATION CONTACT).

Implementation of recovery actions generally requires the participation of a broad range of partners, including other Federal agencies, States, nongovernmental organizations, businesses, and private landowners. Examples of recovery actions include habitat restoration (e.g., restoration of native vegetation), research, captive propagation and reintroduction, and outreach and education. The recovery of many listed species cannot be accomplished solely on Federal lands because their range may occur primarily or solely on non-Federal lands. To achieve recovery of these species requires cooperative conservation efforts on all lands.

Following publication of this final listing rule, funding for recovery actions will be available from a variety of sources, including Federal budgets, State programs, and cost share grants for non-Federal landowners, the academic community, and nongovernmental organizations. In addition, pursuant to section 6 of the Act, the State of Hawaii will be eligible for Federal funds to implement management actions that promote the protection or recovery of the 49 species. Information on our grant programs that are available to aid species recovery can be found at: http://www.fws.gov/grants.

Please let us know if you are interested in participating in recovery efforts for one or more of these 49 species. Additionally, we invite you to submit any new information on these species whenever it becomes available and any information you may have for recovery planning purposes (see FOR FURTHER INFORMATION CONTACT).

Section 7(a) of the Act, as amended, requires Federal agencies to evaluate their actions with respect to any species that is proposed or listed as endangered or threatened and with respect to its critical habitat, if any is designated. Regulations implementing this interagency cooperation provision of the Act are codified at 50 CFR part 402. Section 7(a)(2) of the Act requires Federal agencies to ensure that activities they authorize, fund, or carry out are not likely to jeopardize the continued existence of a listed species or destroy or adversely modify its critical habitat. If a Federal action may affect a listed species or its critical habitat, the responsible Federal agency must enter into consultation with the Service. Federal agency actions within the species’ habitat that may require conference or consultation or both as described in the preceding paragraph include, but are not limited to, actions within the jurisdiction of the Natural Resources Conservation Service (NRCS), the U.S. Army Corps of Engineers, the U.S. Fish and Wildlife Service, and branches of the Department of Defense (DOD). Examples of these types of actions include activities funded or authorized under the Farm Bill Program, Environmental Quality Incentives Program, Ground and Surface Water Conservation Program, Clean Water Act (33 U.S.C. 1251 et seq.), Partners for Fish and Wildlife Program, and DOD construction activities related to training or other military missions.

The Act and its implementing regulations set forth a series of general prohibitions and exceptions that apply to endangered wildlife. The prohibitions of section 9(a)(1) of the Act, codified at 50 CFR 17.21, make it illegal for any person subject to the jurisdiction of the United States to take (which includes harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect; or to attempt any of these) endangered wildlife within the United States or the high seas. In addition, it is unlawful to import; export; deliver, receive, carry, transport, or ship in interstate or foreign commerce in the course of commercial activity; or sell or offer for sale in interstate or foreign commerce any listed species. It is also illegal to possess, sell, deliver, carry, transport, or ship any such wildlife that has been taken illegally. Certain exceptions apply to employees of the Service, the National Marine Fisheries Service, other Federal land management agencies, and State conservation agencies.

We may issue permits to carry out otherwise prohibited activities involving endangered species. Regulations governing permits are codified at 50 CFR 17.22. With regard to endangered wildlife, a permit may be issued for scientific purposes, to enhance the propagation or survival of the species, or for incidental take in connection with otherwise lawful activities. There are also certain statutory exemptions from the prohibitions, which are found in sections 9 and 10 of the Act. With respect to endangered plants, prohibitions outlined at 50 CFR 17.61 make it illegal for any person subject to the jurisdiction of the United States to import or export, transport in interstate or foreign commerce in the course of a commercial activity, sell or offer for sale in interstate or foreign commerce, or to remove and reduce to possession any such plant species from areas under Federal jurisdiction. In addition, for endangered plants, the Act prohibits malicious damage or destruction of any such species on any area under Federal jurisdiction, and the removal, cutting, digging up, or damaging or destroying of any such species on any other area in knowing violation of any State law or regulation, or in the course of any violation of a State criminal trespass law. Exceptions to these prohibitions are outlined at 50 CFR 17.62.

We may issue permits to carry out otherwise prohibited activities involving endangered plants under certain circumstances. Regulations governing permits are codified at 50 CFR 17.62. With regard to endangered plants, the Service may issue a permit...
authorizing any activity otherwise prohibited by 50 CFR 17.61 for scientific purposes or for enhancing the propagation or survival of endangered plants.

It is our policy, as published in the Federal Register on July 1, 1994 (59 FR 34272), to identify to the maximum extent practicable at the time a species is listed, those activities that would or would not constitute a violation of section 9 of the Act. The intent of this policy is to increase public awareness of the effect of a listing on proposed and ongoing activities within the range of a listed species. Based on the best available information, activities that may potentially result in a violation of section 9 of the Act include but are not limited to:

1. Unauthorized collecting, handling, possessing, selling, delivering, carrying, or transporting of the species, including import or export across State lines and international boundaries, except for properly documented antique specimens of these taxa at least 100 years old, as defined by section 100(h)(1) of the Act;

2. Activities that take or harm the band-rumped storm-petrel, the orangeblack Hawaiian damselfly, the anchialine pool shrimp (Procaris hawaiiana), and the seven yellow-faced bees by causing significant habitat modification or degradation such that it causes actual injury by significantly impairing essential behavior patterns. This may include introduction of nonnative species that compete with or prey upon the 10 animal species or the unauthorized release of biological control agents that attack the life stage of any of these 10 species; and

3. Damaging or destroying any of the 39 plant species in violation of the Hawaii State law prohibiting the take of listed species.

Questions regarding whether specific activities would constitute a violation of section 9 of the Act should be directed to the Pacific Islands Fish and Wildlife Office (see FOR FURTHER INFORMATION CONTACT). Requests for copies of the regulations concerning listed species and general inquiries regarding prohibitions and permits may be addressed to the U.S. Fish and Wildlife Service, Pacific Region, Ecological Services, Endangered Species Permits, Eastside Federal Complex, 911 NE. 11th Avenue, Portland, OR 97232–4181 (telephone 503–231–6131; facsimile 503–231–6243).

Required Determinations

National Environmental Policy Act (42 U.S.C. 4321 et seq.)

We have determined that environmental assessments and environmental impact statements, as defined under the authority of the National Environmental Policy Act (NEPA; 42 U.S.C. 4321 et seq.), need not be prepared in connection with listing a species as an endangered or threatened species under the Endangered Species Act. We published a notice outlining our reasons for this determination in the Federal Register on October 25, 1983 (48 FR 49244).

3. Amend §17.12(h), the List of Endangered and Threatened Plants, as follows:

b. By adding entries for *Asplenium diellaciniatum*, *Cyclosorus boydiae*, *Deparia kaalaana*, *Dryopteris glabra* var. *pusilla*, *Huperzia stemmermanniae*, *Hypolepis hawaiiensis* var. *mauiensis*, and *Microlepia strigosa* var. *mauiensis* in alphabetical order under FERNS AND ALLIES.

The additions read as follows:

§17.12 Endangered and threatened plants.

FEDERAL REGISTER

Vol. 81 Friday,  
No. 190 September 30, 2016

Part VI

Department of the Interior

Fish and Wildlife Service

50 CFR Part 16
Injurious Wildlife Species; Listing 10 Freshwater Fish and 1 Crayfish; Final Rule
Injurious Wildlife Species; Listing 10 Freshwater Fish and 1 Crayfish

AGENCY: Fish and Wildlife Service, Interior.

ACTION: Final rule.

SUMMARY: The U.S. Fish and Wildlife Service (Service) is amending its regulations to add to the list of injurious fish the following freshwater fish species: Crucian carp (Carassius carassius), Eurasian minnow (Phoxinus phoxinus), Prussian carp (Carassius gibelio), roach (Rutilus rutilus), stone moroko (Pseudorasbora parva), Nile perch (Lates niloticus), Amur sleeper (Percottus glenii), European perch (Perca fluviatilis), zander (Sander lucioperca), and wels catfish (Silurus glanis). In addition, the Service also amends its regulations to add the freshwater crayfish species common yabby (Cherax destructor) to the list of injurious crustaceans. These listings will prohibit the importation of any live animal, gamete, viable egg, or hybrid of these 10 fish and 1 crayfish into the United States, except as specifically authorized. These listings also prohibit the interstate transportation of any live animal, gamete, viable egg, or hybrid of these 10 fish and 1 crayfish, except as specifically authorized. With this final rule, the importation and interstate transportation of any live animal, gamete, viable egg, or hybrid of these 10 fish and 1 crayfish may be authorized only by permit for scientific, medical, educational, or zoological purposes, or without a permit by Federal agencies solely for their own use. This action is necessary to prevent the introduction and spread within the United States of species (the Eurasian minnow and stone moroko) that were accidentally introduced when they were unintentionally transported in shipments with desirable animal, gamete, viable egg, or hybrid of these 10 fish and 1 crayfish. We also solicited peer review at the same time. In this final rule, we used public comments and peer review to inform our final determinations. The need for the action to add 11 nonnative species to the list of injurious wildlife under the Lacey Act (the Act; 18 U.S.C. 42, as amended) and announced the availability of the draft economic analysis and the draft environmental assessment of the proposed rule. The 60-day comment period ended on December 29, 2015. We also solicited peer review at the same time. In this final rule, we used public comments and peer review to inform our final determinations.

DATES: This rule is effective on October 31, 2016.

ADDRESSES: This final rule is available on the Internet at http://www.regulations.gov under Docket No. FWS-HQ-FAC-2013-0095. Comments and materials received, as well as supporting documentation used in the preparation of this rule, will also be available for public inspection by appointment during normal business hours at: U.S. Fish and Wildlife Service; 5275 Leesburg Pike; Falls Church, VA 22041.
environment, these species have survived and established, expanded their nonnative range, preyed on native wildlife species, and competed with native species for food and habitat. Since it would be difficult to eradicate, manage, or control the spread of these 11 species; it would be difficult to rehabilitate or recover habitats disturbed by these species; and because introduction, establishment, and spread of these 11 species would negatively affect agriculture, and native wildlife or wildlife resources, the Service is amending its regulations to add these 11 species as injurious under the Lacey Act. This listing prohibits the importation and interstate transportation of any live animal, gamete, viable egg, or hybrid in the United States, except as specifically authorized.

The Service solicited three independent scientific peer reviewers who all submitted individual comments in written form. We also received comments from 20 State agencies, regional and U.S.-Canada governmental alliances, commercial businesses, conservation organizations, nongovernmental organizations, and private citizens during the 60-day public comment period. We reviewed all comments for substantive issues and new information regarding the proposed designation of the 11 species as injurious wildlife. None of the peer or public comments necessitated any substantive changes to the rule, the environmental assessment, or the economic analysis. Comments received provided a range of opinions on the proposed listing: (1) Unequivocal support for the listing with no additional information included; (2) unequivocal support for the listing with additional information provided; (3) equivocal support for the listing with or without additional information included; and (4) unequivocal opposition to the listing with additional information included. We consolidated comments and our responses into key issues in the “Summary of Comments Received on the Proposed Rule” section.

This final rule is not significant under Executive Order (E.O.) 12866. E.O. 12866 Regulatory Planning and Review (Panetta 1993) and the subsequent document, Economic Analysis of Federal Regulations under E.O. 12866 (U.S. Office of Management and Budget 1996) require the Service to ensure that proper consideration is given to the effect of this final action on the business community and economy. With respect to the regulations under consideration, analysis that comports with the Circular A–4 would include a full description and estimation of the economic benefits and cost associated with the implementation of the regulations. The economic effects to three groups would be addressed: (1) Producers; (2) consumers; and (3) society. Of the 11 species, only one population of one species (zander) is found in the wild in the United States. Of the 11 species, 4 species (crucian carp, Nile perch, wels catfish, yabby) have been imported in small numbers since 2011, and 7 species are not in U.S. trade. To our knowledge, the total number of importation events of those 4 species from 2011 to 2015 is 25, with a declared total value of $5,789. Therefore, the economic effect in the United States is negligible for those four species and nil for the seven not in trade. The final economic analysis that the Service prepared supports this conclusion (USFWS Final Economic Analysis 2016).

Previous Federal Actions

On October 30, 2015, we published a proposed rule in the Federal Register (80 FR 67026) to list the crucian carp, Eurasian minnow, Prussian carp, roach, stone moroko, Nile perch, Amur sleeper, European perch, zander, wels catfish, and common yabby to the list of injurious fish and crustaceans as injurious wildlife under the Act. The proposed rule established a 60-day public comment period ending on December 29, 2015, and announced the availability of the draft economic analysis and the draft environmental assessment of the proposed rule. We also solicited peer review at the same time.

For the injurious wildlife evaluation in this final rule, in addition to information used for the proposed rule, we considered: (1) Comments from the public comment period for the proposed rule, (2) comments from three peer reviewers, and (3) new information acquired by the Service by the end of the public comment period. We present a summary of the peer review comments and the public comments and our responses to them following the Lacey Act Evaluation Criteria section in this final rule.

Summary of Changes From the Proposed Rule

We fully considered comments from the public and the peer reviewers on the proposed rule. This final rule incorporates changes to our proposed rule based on the comments we received that are discussed under Summary of Comments Received on the Proposed Rule and newly available information that became available after the close of the comment period. Specifically, we made one change to the common yabby that did not result in a change to the final determination to that species but may be worth singling out. We removed “Potential Impacts to Humans” as one of the factors for considering the yabby as injurious. We found that while the common yabby may directly impact human health by transferring metal contaminants through consumption and may require consumption advisories, these advisories are not expected to be any more stringent than those for crayfish species that are not considered injurious. Therefore, none of the 11 species in this final rule is being listed as injurious wildlife because of potential impacts to humans.

Background

The regulations contained in 50 CFR part 16 implement the Act. Under the terms of the Act, the Secretary of the Interior is authorized to prescribe by regulation those wild mammals, wild birds, fish, mollusks, crustaceans, amphibians, reptiles, and the offspring or eggs of any of the foregoing that are injurious to human beings, to the interests of agriculture, horticulture, forestry, or to wildlife or the wildlife resources of the United States. The lists of injurious wildlife species are found in title 50 of the Code of Federal Regulations (CFR) at §§ 16.11 through 16.15.

The purpose of listing the crucian carp, Eurasian minnow, Prussian carp, roach, stone moroko, Nile perch, Amur sleeper, European perch, zander, and wels catfish and the common yabby (hereafter “11 species”) as injurious wildlife is to prevent the harm that these species could cause to the interests of agriculture, wildlife, and wildlife resources through their accidental or intentional introduction, establishment, and spread into the wild in the United States. The Service evaluated each of the 11 species individually, and we determined each species to be injurious based on its own traits.

Consistent with the statutory language and congressional intent, it is the Service’s longstanding and continued position that the Lacey Act prohibits both the importation into the United States and all interstate transportation between States, the District of Columbia, the Commonwealth of Puerto Rico, or any territory or possession of the United States, including interstate transportation between States within the Continental United States, of injurious wildlife, regardless of the preliminary injunction decision in U.S. Association of Reptile Keepers v. Jewell, No. 13–2007 (D.D.C. May 12, 2015). The
Service’s interpretation of 18 U.S.C. 42(a)(1) finds support in the plain language of the statute, the Lacey Act’s purpose, legislative history, and congressional ratification. First, the statute’s use of the disjunctive “or” to separate the listed geographic entities indicates that each location has independent significance. Second, Congress enacted the Lacey Act in 1900 for the purpose of, among other things, regulating the introduction of species in localities, not merely large territories, where they have not previously existed. See 16 U.S.C. 701. Third, the legislative history of Congress’ many amendments to the Lacey Act since its enactment in 1900 shows that Congress intended, from the very beginning, for the Service to regulate the interstate shipment of certain injurious wildlife. Finally, recent Congresses have made clear that Congress interprets 18 U.S.C. 42(a)(1) as prohibiting interstate transport of injurious wildlife between the States within the continental United States. In amending §42(a)(1) to add zebra mussels and bighead carp as injurious wildlife without making other changes to the provision, Congress repeated and ratified the Service’s interpretation of the statute as prohibiting all interstate transport of injurious species.

The prohibitions on importation and all interstate transportation are both necessary to prevent the introduction, establishment, and spread of injurious species that threaten human health or the interests of agriculture, horticulture, forestry, or the wildlife or wildlife resources of the United States. By listing these 11 species as injurious wildlife, both the importation into the United States and interstate transportation between States, the District of Columbia, the Commonwealth of Puerto Rico, or any territory or possession of the United States of live animals, gametes, viable eggs, or hybrids is prohibited, except by permit for zoological, educational, medical, or scientific purposes (in accordance with permit regulations at 50 CFR 16.22), or by Federal agencies without a permit solely for their own use, upon filing a written declaration with the Director of Customs and the U.S. Fish and Wildlife Service Inspector at the port of entry. In addition, no live specimens of these 11 species, gametes, viable eggs, or hybrids imported or transported under a permit could be sold, donated, traded, loaned, or transferred to any other person or institution unless such person or institution has a permit issued by the Service. The rule would not prohibit intrastate transport of the listed fish or crayfish species. Any regulations pertaining to the transport or use of these species within a particular State would continue to be the responsibility of that State.

How the 11 Species Were Selected for Consideration as Injurious Species

While the Service recognizes that not all nonnative species become invasive, it is important to have some understanding of the risk that nonnative species pose to the United States. The Ecological Risk Screening Summary (ERSS) approach was developed to address the need described in the National Invasive Species Management Plan (NISC 2008). The Plan states that prevention is the first-line of defense. One of the objectives in the Plan is to “[d]evelop fair and practical screening processes that evaluate different types of species moving intentionally in trade.” The ERSS process, and the associated Risk Assessment Mapping Program, were peer-reviewed by risk assessment experts from the United States, Canada, and Mexico. Those experts support the use of those tools for U.S. national risk assessment, and associated risk management. The Service utilizes a rapid screening process to provide a prediction of the invasive potential of nonnative species and to prioritize which species to consider for listing. Rapid screens categorize risk as either high, low, or uncertain and have been produced for two thousand foreign aquatic fish and invertebrates for use by the Service and other entities. Each rapid screen is summarized in an Ecological Risk Screening Summary (ERSS; see “Rapid Screening” below for explanation regarding how these summaries were done). The Service selected 11 species with a rapid screen result of “high risk” to consider for listing as injurious. We put these 11 species through a subsequent risk analysis to evaluate each species for invasiveness (see “Injurious Wildlife Evaluation Criteria” section below). These 11 species have a high climate match (see Rapid Screening) in parts of the United States, a history of invasiveness outside of their native range (see Need for the Final Rule), are not yet found in U.S. ecosystems (except for one species in one lake), and have a high degree of certainty regarding these results. The ERSS reports for each of the 11 species are available on the Service’s Web site (http://www.fws.gov/injuriouswildlife/Injurious_prevention.html).

The practice of using history of invasiveness and climate match to determine species to include in peer-reviewed studies over the years. Here are some examples: Kolar and Lodge (2002) found that discriminant analysis revealed that successful fishes in the establishment stage grew relatively faster, tolerated wider ranges of temperature and salinity, and were more likely to have a history of invasiveness than were failed fishes. They also correlated traits of invasiveness with stages of invasion to predict rate of spread for specific species and predicted that the roach, Eurasian minnow, and European perch would spread quickly, while the zander would spread slowly (the other seven species in this final rule were not studied). Hayes and Barry (2008) found that climate and habitat match, history of successful invasion, and number of arriving and released individuals are consistently associated with successful establishment. Bomford et al. (2010) found that “Relative to failed species, established species had better climate matches between the country where they were introduced and their geographic range elsewhere in the world. Established species were also more likely to have high establishment success rates elsewhere in the world.” Recently, Howeth et al. (2016) showed that climate match between a species’ native range and the Great Lakes region predicted establishment success with 75 to 81 percent accuracy.

All 11 species are documented to be highly invasive internationally (see Species Information for each species). Nine of the freshwater fish species (Amur sleeper, crucian carp, Eurasian minnow, European perch, Prussian carp, roach, stone moroko, wels catfish, and zander) have been introduced and established populations within Europe and Asia. The Prussian carp was recently found to be established in waterways in southern Alberta, Canada (Elgin et al. 2014), near the U.S. border. Another freshwater fish species, the Nile perch, has been introduced to and become invasive in new areas of central Africa. The freshwater crayfish, the common yabby, has been introduced to and established populations in new areas of Australia and in Europe. Most of the 11 species were introduced intentionally for aquaculture, recreational fishing, or ornamental purposes. The Eurasian minnow and the stone moroko were accidentally mixed with and introduced with shipments of fish stocked for other intended purposes.

Need for the Final Rule

Consistent with 18 U.S.C. 42, the Service aims to prevent the introduction, establishment, and spread of all 11 species within the United States due to concerns regarding the
potential injurious effects of the 11 species on the interests of agriculture or to wildlife or wildlife resources of the United States. The threat posed by these 11 species is evident in their history of invasiveness (establishment and spread) in other countries and their high risk of establishment as demonstrated by a high climate match within the United States.

All of these species have wide distribution ranges where they are native and where they are invasive, suggesting they are highly adaptable and tolerant of new environments and opportunistic when expanding from their native range. Based on the results of rapid screening assessments and our injurious wildlife evaluation, we anticipate that these 11 species will become invasive if they are introduced into waters of the United States. Furthermore, if introduced and established in one area of the United States, these species could then spread to other areas of the country through unintentional or intentional interstate transport, such as for aquaculture, recreational and commercial fishing, bait, ornamental display, and other possible uses.

Listing Process

The Service promulgates regulations under the Act in accordance with the Administrative Procedure Act (APA; 5 U.S.C. 551 et seq.). We published a proposed rule for public notice and comment. We solicited peer review under Office of Management and Budget (OMB) guidelines “Final Information Quality Bulletin for Peer Review” (OMB 2004). We also prepared a draft economic analysis (including analysis of potential effects on small businesses) and a draft environmental assessment, both of which we made available to the public. For this final rule, we prepared a final economic analysis and a final environmental assessment.

This final rule is based on an evaluation using the Service’s Injurious Wildlife Evaluation Criteria (see Injurious Wildlife Evaluation Criteria, below, for more information). We use these criteria to evaluate whether a species does or does not qualify as injurious under the Act. These criteria include the likelihood and magnitude of release or escape, of survival and establishment upon release or escape, and of spread from origin of release or escape. These criteria also examine the impact on wildlife resources and ecosystems (such as through hybridizing, competition for food or habitat, predation on native species, and pathogen transfer), on endangered and threatened species and their respective habitats, and on human beings, forestry, horticulture, and agriculture. Additionally, criteria evaluate the likelihood and magnitude of wildlife or habitat damages resulting from measures to control the proposed species. The analysis using these criteria serves as a basis for the Service’s regulatory decision regarding injurious wildlife species listings. The objective of such a listing is to prohibit importation and interstate transportation and thus prevent the species’ likely introduction, establishment, and spread in the wild, thereby preventing injurious effects consistent with 18 U.S.C. 42.

We evaluated each of the 11 species individually and are listing all 11 species because we determined each of these species to be injurious. The final rule contains responses to comments we received on the proposed rule, states the final decision, and provides the justification for that decision. Each of the species determined to be injurious will be added to the list of injurious wildlife found in 50 CFR 16.13.

To assist us with making our determination under the injurious wildlife evaluation criteria, we used information from available sources, including the Centre for Agricultural Bioscience International (CABI) reports (called full datasheets) from their Invasive Species Compendium (CABI ISC) that were specific to each species for biological and invasiveness information as well as primary literature and import data from our Office of Law Enforcement.

Introduction Pathways for the 11 Species

The primary potential pathways for the 11 species into the United States are through commercial trade in the live animal industry, including aquaculture, recreational fishing, bait, and ornamental display. Some could arrive unintentionally in water used to carry other aquatic species. Aquatic species may be imported into many designated ports of entry, including Miami, Los Angeles, Baltimore, Dallas-Fort Worth, Detroit, Chicago, and San Francisco. Once imported, aquatic species could be transported throughout the country for aquaculture, recreational and commercial fishing, bait, display, and other possible uses.

Aquaculture is the farming of aquatic organisms, such as fish, crustaceans, mollusks, and plants, for food, pets, stocking for fishing, and other purposes. Aquaculture usually occurs in a controlled setting where the water is contained in a pond or in a tank, and is separate from lakes, ponds, rivers, and other natural waters. The controlled setting allows the aquaculturist to maintain proper conditions for each species being raised, which promotes optimal feeding and provides protection from predation and disease. However, Bartley (2011) states that aquaculture is the primary reason for the deliberate movement of aquatic species outside of their range, and Casal (2006) states that many countries are turning to aquaculture for human consumption, and that has led to the introduction and establishment of these species in local ecosystems. Although the farmed species are normally safely contained, outdoor aquaculture ponds have often flooded from major rainfall events and merged with neighboring natural waters, allowing the farmed species to escape by swimming or floating to nearby watersheds. Once a species enters a watershed, it has the potential to establish and spread throughout the watershed, which then increases the risk of spread to neighboring watersheds through further flooding. Other pathways for aquaculture species to enter natural waters include intentional stocking programs, and through unintentional stocking when the species is inadvertently included in a shipment with an intended species for stocking (Bartley 2011), release of unwanted ornamental fish, and release of live bait by fishermen.

Stocking for recreational fishing is a common pathway for invasive species when an aquatic species is released into a water body where it is not native. Often it takes repeated releases before the fish (or other animal) becomes established. The type of species that are typically selected and released for recreational fishing are predatory, grow quickly and to large sizes, reproduce abundantly, and are adaptable to many habitat conditions (Fuller et al. 1999). These are often the traits that also contribute to the species becoming invasive (Copp et al. 2005c; Kolar and Lodge 2001, 2002).

Live aquatic species, such as fish and crayfish, are frequently used as bait for recreational and commercial fishing. Generally, bait animals are kept alive until they are needed, and leftover individuals may be released into convenient waterbodies (Litvak and Mandrak, 1993; Ludwig and Leitch, 1996). For example, Kilian et al. (2012) reported that 65 and 69 percent of Maryland anglers using fishes and crayfishes, respectively, released their unused bait, and that a nonnative, potentially invasive species imported into the State as bait is likely to be released into the wild. Often, these individuals survive, establish, and cause
harm to that waterbody (Fuller et al. 1999; Kilian et al. 2012). Litvak and Mandrak (1993) found that 41 percent of anglers released live bait after use. Their survey found nearly all the anglers who released their bait thought they were doing a good thing for the environment. When the authors examined the purchase location and the angling destination, they concluded that 18 of the 28 species found in the dealers’ bait tanks may have been used outside their native range. Therefore, it is not surprising that so many species are introduced in this manner; Ontario, Canada, alone has more than 65 legal baitfish species, many of which are not native to some or all of Ontario (Cudmore and Mandrak 2005). Ludwig and Leitch (1996) concluded that the probability of at least 1,000 bait release events from the Mississippi Basin to the Hudson Bay Basin in 1 year is close to 1 (a certainty).

Ornamental aquatic species are species kept in aquaria and aquatic gardens for display for entertainment or public education. The first tropical freshwater fishes became available in trade in the United States in the early 1900s (Duggan 2011), and there is currently a large variety of freshwater and saltwater fishes in the ornamental trade. The trade in ornamental crayfish species is more recent but is growing rapidly (Gherardi 2011). The most sought-after species frequently are not native to the display area. Ornamental species may accidentally escape from outdoor ponds into neighboring waterbodies 1999; Fuller et al. 2005; Gherardi 2011). They may also be released outdoors intentionally when owners no longer wish to maintain them, despite laws in most States prohibiting release into the wild.

The invasive range of many of the species in this final rule has expanded through intentional release for commercial and recreational fishing (European perch, Nile perch, Prussian carp, roach, wels catfish, zander, and common yabby), as bait (Eurasian minnow, roach, common yabby), and as ornamental fish (Amur sleeper, stone moroko), and unintentionally (Amur sleeper, crucian carp, Eurasian minnow, and stone moroko) with shipments of other aquatic species. All 11 species have been proven that they are capable of naturally dispersing through waterways.

The main factor influencing the chances of these 11 species establishing in the wild would be the propague pressure, defined as the frequency of release events (propague number) and number of individuals released (propague size) (Williamson 1996; Colautti and MacIsaac 2004; Duncan 2011). This factor increases the odds of both genders being released and finding mates and of those individuals being healthy and vigorous. After a sufficient number of unintentional or intentional releases, a species may establish in those regions suitable for its survival and reproduction. Thus, continuing to allow the importation and interstate transport of these 11 species subsequently increases the risk of any of these species becoming established and spreading in the United States.

An additional factor indicating an invasive species’ likelihood of successful establishment and spread is a documented history of these same species successfully establishing and spreading elsewhere outside of their native ranges. All 11 species have been introduced, become established, and been documented as causing harm in countries outside of their native ranges. For example, the stone moroko’s native range includes southern and central Japan, Taiwan, Korea, China, and the Amur River basin (Copp et al. 2010). Since the stone moroko’s original introduction to Romania in the early 1960s, this species has invaded nearly every European country and additional regions of Asia (Welcomme 1988; Copp et al. 2010; Froese and Pauly 2014g).

The demonstrated ability of each of these species to become established, spread, and cause harm outside of their native range, in conjunction with the risk they would pose to U.S. ecosystems, warrants listing all 11 species as injurious under the Lacey Act. The objective of this listing is to prohibit importation and interstate transportation of these species and thus prevent their likely introduction, establishment, and spread in the wild and associated harms to the interests of agriculture, or wildlife or wildlife resources of the United States.

Species Information

We obtained our information on a species’ biology, history of invasiveness, and climate matching from a variety of sources, including the U.S. Geological Survey Nonindigenous Aquatic Species (NAS) database, CABI datasheets, ERSS reports, primary literature, and peer and public comments. We queried the NAS database (http://nas.er.usgs.gov/) to confirm that 10 of the 11 species are not currently established in U.S. ecosystems. The zander is established in a lake in North Dakota (Fuller 2009). The CABI ISC (http://www.cabi.org/isc/) is an encyclopedic resource containing datasheets on more than 1,500 invasive species and animal diseases. The Service contracted with CABI for many of the species-specific datasheets that we used in preparation of this final rule. The datasheets were prepared by experts on the species, and each datasheet was reviewed by expert peer reviewers.

**Crucian Carp (Carassius carassius)**

The crucian carp was first described and cataloged by Linnaeus in 1758, and is part of the order Cypriniformes and family Cyprinidae (ITIS 2014). The family Cyprinidae, or the carp and minnow family, is a stone moroko group that includes 2,963 freshwater species (Froese and Pauly 2014d). The taxonomic status of the crucian carp has been reported to be confused and it is commonly misidentified with other *Carassius spp.* (Godard and Copp 2012).

**Native Range and Habitat**

The crucian carp inhabits a temperate climate (Riehl and Baensch 1991). The native range includes much of north and central Europe, extending from the North Sea and Baltic Sea basins across northern France and Germany to the Alps and through the Danube River basin and eastward to Siberia (Godard and Copp 2012). The species inhabits freshwater lakes, ponds, rivers, and ditches (Godard and Copp 2012). This species can survive in water with low dissolved oxygen levels, including aquatic environments with greatly reduced oxygen (hypoxic) or largely devoid of dissolved oxygen (anoxic) (Godard and Copp 2012).

**Nonnative Range and Habitat**

Crucian carp have been widely introduced to and established in Croatia, Greece, southern France (Holčík 1991; Godard and Copp 2012), Italy, and England (Kottelat and Freyhof 2007), Spain, Belgium, Israel, Switzerland, Chile, India, Sri Lanka, Philippines (Holčík 1991; Froese and Pauly 2014a), and Turkey (Innal and Erk’akan 2006). In the United States, crucian carp may have been established within Chicago (Illinois) lakes and lagoons in the early 1900s (Meek and Hildebrand 1910; Schofield et al. 2005), but they apparently died out because currently no such population exists (Welcomme 1988; Schofield et al. 2005; Schofield et al. 2013).

Several other fish species, including the Prussian carp, the common carp (*Cyprinus carpio*), and a brown variety of goldfish (*Carassius auratus*) have been misidentified as crucian carp (Godard and Copp 2012). Crucian carp may have been accidentally introduced to some regions in misidentified shipments of ornamental fishes (Wheeler 2000; Hickley and Chare 2004). However, no known populations
of crucian carp currently exist in the United States.

**Biology**

Crucian carp generally range from 20 to 45 centimeters (cm) (8 to 18 inches (in)) long with a maximum of 50 cm (19.5 in) (Godard and Copp 2012). Specimens have been reported to weigh up to 3 kilograms (kg) (6.6 pounds (lb)) (Froese and Pauly 2014a). These fish have an olive-gray back that transitions into brassy green along the sides and brown on the body (Godard and Copp 2012).

Crucian carp can live up to 10 years (Kottelat and Freyhof 2007) and reach sexual maturity at one and a half years but may not begin spawning until their third year (Godard and Copp 2012). Crucian carp are batch spawners (release multiple batches of eggs per season) and may spawn one to three times per year (Aho and Holopainen 2000, Godard and Copp 2012). Crucian carp feed during the day and night on plankton, benthic (bottom-dwelling) invertebrates, plant materials, and detritus (organic material) (Kottelat and Freyhof 2007).

Crucian carp can harbor the virus causing the fish disease Spring Viraemia of Carp (SVC) (Ahne et al. 2002) and several parasitic infections (*Dactylogyrus* gill flukes disease, *Trichodinidosis*, skin flukes, false fungal infection (*Epistylis* sp.), and turbidity of the skin) (Froese and Pauly 2014b). SVC is a disease that, when found, is required to be reported to the Office International des Epizooties (OIE) (World Organisation of Animal Health) (Ahne et al. 2002). The SVC virus infects carp species but may be transmitted to other fish species. The virus is shed with fecal matter and urine, and often infects through waterborne transmission (Ahne et al. 2002). Additionally, SVC may result in significant morbidity and mortality with an approximate 70 percent fatality among juvenile fish and 30 percent fatality in adult fish (Ahne et al. 2002). Thus, the spread of SVC may have serious effects on native fish stocks.

OIE-notifiable diseases affect animal health internationally. OIE-notifiable diseases meet certain criteria for consequences, spread, and diagnosis. For the consequences criteria, the disease must have either been documented as causing significant production losses on a national or multinational (zonal or regional) level, or have scientific evidence that indicates that the diseases will cause significant morbidity or mortality in wild aquatic animal populations, or be an agent of public health concern. For the spread criteria, the disease’s infectious etiology (cause) must be known or an infectious agent is strongly associated with the disease (with etiology unknown). In addition for the spread criteria, there must be a likelihood of international spread (via live animals and animal products) and the disease must not be widespread (several countries or regions of countries without specific disease). For the diagnosis criteria, there must be a standardized, proven diagnostic test for disease detection (OIE 2012). These internationally accepted standards, including those that document the consequences (harm) of certain diseases, offer supporting evidence of injuriousness.

**Invasiveness**

This species demonstrates many of the strongest traits for invasiveness. The crucian carp is capable of securing and ingesting a wide range of food, has a broad native range, and is highly adaptable to different environments (Godard and Copp 2012). While foraging along the substrate, Crucian carp can increase turbidity (cloudiness of water) in lakes, rivers, and streams with soft bottom sediments. Increased turbidity reduces light availability to submerged plants and can result in harmful ecosystem changes, such as phytoplankton survival and nutrient cycling. Crucian carp can breed with other carp species, including the common carp (Wheeler 2000). Hybrids of crucian carp and common carp can affect fisheries, because such hybrids, along with the introduced crucian carp, may compete with native species for food and habitat resources (Godard and Copp 2012).

**Eurasian Minnow (Phoxinus phoxinus)**

The Eurasian minnow was first described and cataloged by Linnaeus in 1758, and belongs to the order Cypriniformes and family Cyprinidae (ITIS 2014). Although Eurasian minnow is the preferred common name, this fish species is also referred to as the European minnow.

**Native Range and Habitat**

The Eurasian minnow inhabits a temperate climate, and the native range includes much of Eurasia within the basins of the Atlantic, North and Baltic Seas, and the Arctic and the northern Pacific Oceans (Froese and Pauly 2014e). Eurasian minnows can be found in a variety of habitats ranging from brackish (estuarine; slightly salty) to freshwater streams, rivers, ponds, and lakes located within the coastal zone to the mountains (Sandlund 2008). In Norway, they are found at elevations up to 2,000 m (6,562 ft). These minnows prefer shallow lakes or slow-flowing streams and rivers with stony substrate (Sandlund 2008).

**Nonnative Range and Habitat**

The Eurasian minnow’s nonnative range includes parts of Sweden and Norway, United Kingdom, and Egypt (Sandlund 2008), as well as other drainages juxtaposed to native waterways. The Eurasian minnow was initially introduced as live bait, which was the main pathway of introduction throughout the 1900s (Sandlund 2008). The inadvertent introduction of this minnow species in the transport water of brown trout (*Salmo trutta*) that were intentionally stocked into lakes for recreational angling has contributed to their spread (Sandlund 2008). From these initial stockings, minnows have dispersed naturally downstream and established in new waterways, and have spread to new waterways through tunnels constructed for hydropower development. These minnows have also been purposely introduced as food for brown trout and to control the Tune fly (in Simuliidae) (Sandlund 2008).

The Eurasian minnow is expanding its nonnative range by establishing populations in additional waterways bordering the native range. Waterways near where the minnow is already established are most at risk (Sandlund 2008).

**Biology**

The Eurasian minnow has a torpedo-shaped body measuring 6 to 10 cm (2.3 to 4 in) with a maximum of 15 cm (6 in). Size and growth rate are both highly dependent on population density and environmental factors (Lien 1981; Mills 1987, 1988; Sandlund 2008). These minnows have variable coloration but are often brownish-green on the back with a whitish stomach and brown and black blotches along the side (Sandlund 2008).

The Eurasian minnow’s life-history traits (age, size at sexual maturity, growth rate, and lifespan) may be highly variable (Mills 1988). Populations residing in lower latitudes often have smaller body size and younger age of maturity than those populations in higher altitudes and latitudes (Mills 1988). Maturity ranges from less than 1 year to 6 years of age, with a lifespan as long as 13 to 15 years (Sandlund 2008). The Eurasian minnow spawns annually with an average fecundity between 200 to 1,000 eggs (Sandlund 2008). This minnow usually cohabitates with salmonid fishes (Kottelat and Freyhof 2007).
2007). The Eurasian minnow feeds mostly on invertebrates (crustaceans and insect larvae) as well as some algal and plant material (Lien 1981).

Invasiveness

The Eurasian minnow demonstrates many of the strongest traits for invasiveness. The species is highly adaptable to new environments and is difficult to control (Sandlund 2008). The species can become established within varying freshwater systems, including lowland and high alpine areas, as well as in brackish water (Sandlund 2008). Introductions of the Eurasian minnow can cause major changes to nonnative ecosystems by affecting the benthic community (decreased invertebrate diversity) and disrupting trophic-level structure (Sandlund 2008). This occurrence affects the ability of native fish to find food as well as disrupts native spawning. The Eurasian minnow has been shown to reduce recruitment of brown trout by predation (Sandlund 2008). Although brown trout are not native to the United States, they are closely related to our native trout and salmon, and thus Eurasian minnows could be expected to reduce the recruitment of native trout.

In addition, Eurasian minnows are carriers of parasites and have increased the introduction of parasites to new areas. Such parasites affected native snails, mussels, and different insects within subalpine lakes in southern Norway following introduction of the Eurasian minnows (Sandlund 2008). Additionally, Zietara et al. (2008) used molecular methods to link the parasite Gyrodactylus aphyae from Eurasian minnows to the new hosts of Atlantic salmon (Salmo salar) and brown trout.

Prussian Carp (Carassius gibelio)

The Prussian carp was first described and cataloged by Bloch in 1782, and belongs to the order Cypriniformes and family Cyprinidae (ITIS 2014). While some have questioned the taxonomy of Prussian carp, genetic studies have suggested that it is distinct Carassius species (Elgin et al. 2014). However, the species is not monophyletic (characterized by descent from a single ancestral group) and therefore possibly two distinct species (Kalous et al. 2012, Elgin et al. 2014). In fact, one clade (represents a single lineage) of Prussian carp is more closely related to goldfish (C. auratus) than to the second clade of Prussian carp (Kalous et al. 2012). The Prussian carp is very similar in appearance to other Carassius spp. and common carp (Cyprinus carpio), and are often difficult to differentiate (Britton 2011).

Native Range and Habitat

The Prussian carp inhabits a temperate climate (Baensch and Riehl 2004). The species is native to regions of central Europe and eastward to Siberia. It is also native to several Asian countries, including China, Georgia, Kyrgyzstan, Mongolia, Turkey, and Turkmenistan (Britton 2011). The Prussian carp resides in a variety of fresh stillwater bodies and rivers. This species also inhabits warm, shallow, eutrophic (high in nutrients) waters with submerged vegetation or regular flooding events (Kottelat and Freyhof 2007). This species can live in polluted waters with pollution and low oxygen concentrations (Britton 2011).

Nonnative Range and Habitat

The Prussian carp has been introduced to many countries within central and Western Europe. This species was first introduced to Belgium during the 1600s and is now prevalent in its freshwater systems. The Prussian carp was also introduced to Belarus and Poland during the 1940s for recreational fishing and aquaculture. This carp species has dispersed and expanded its range using the Vistula and Bug River basins (Britton 2011). During the mid to late 1970s, this carp species invaded the Czech Republic river system from the Danube River via the Morava River. Once in the river system, the fish expanded into tributary streams and connected watersheds. Throughout its nonnative range, this species has been stocked with common carp and misidentified as crucian carp (Britton 2011). From the original stocked site, the Prussian carp has dispersed both naturally and with human involvement.

The Prussian carp's current nonnative range includes the Asian countries of Armenia, Turkey, and Uzbekistan and the European countries of Belarus, Belgium, Czech Republic, Denmark, Estonia, France, Germany, Poland, and Switzerland (Britton 2011). The species has recently invaded the Iberian Peninsula (Ribeiro et al. 2015). The species was recently found to be established in waterways in southern Alberta, Canada (Elgin et al. 2014).

Biography

The Prussian carp has a silvery-brown body with an average length of 20 cm (7.9 in) and reported maximum length of 35 cm (13.8 in) (Kottelat and Freyhof 2007, Froese and Pauly 2014c). This species has a reported maximum weight of 3 kilograms [kg; 6.6 pounds [lb] (Froese and Pauly 2014c)). The Prussian carp lives up to 10 years (Kottelat and Freyhof 2007). This species can reproduce in a way very rare among fish. Introduced populations often include, or are solely composed of, triploid females that can undergo natural gynogenesis, allowing them to use the sperm of other species to activate (but not fertilize) their own eggs (Vetemaa et al. 2005, Britton 2011). Thus, the eggs are viable without being fertilized by male Prussian carp.

The Prussian carp is a generalist omnivore and consumes a varied diet that includes plankton, benthic invertebrates, plant material, and detritus (Britton 2011).

The parasite Thelohanellus wuhanensis (Wang et al. 2001) and black spot disease (Posthodiplomastoma) have been found to affect the Prussian carp (Markovic et al. 2012).

Invasiveness

The Prussian carp is a highly invasive species in freshwater ecosystems throughout Europe and Asia. This fish species grows rapidly and can reproduce from unfertilized eggs (Vetemaa et al. 2005). Prussian carp have been implicated in the decline in both the biodiversity and population of native fish (Vetemaa et al. 2005, Lusk et al. 2010). The presence of this fish species has been linked with increased water turbidity (Civelli 1995), which in turn alters both the ecosystem's trophic-level structure and nutrient availability.

Roach (Rutilus rutilus)

The roach was first described and cataloged by Linnaeus in 1758, and belongs to the order Cypriniformes and family Cyprinidae (ITIS 2014).

Native Range and Habitat

The roach inhabits temperate climates (Riehl and Baensch 1991). The species' native range includes regions of Europe and Asia. Within Europe, it is found north of the Pyrenees and Alps and eastward to the Ural River and Eya drainages (Caspian Sea basin) and within the Aegean Sea basin and watershed (Kottelat and Freyhof 2007). In Asia, the roach's native range extends from the Sea of Marmara basin and lower Sakarya Province (Turkey) to the Aral Sea basin and Siberia (Kottelat and Freyhof 2007).

This species often resides in nutrient-rich lakes, medium to large rivers, and backwaters. Within rivers, the roach is limited to areas with slow currents.

Nonnative Range and Habitat

This species has been introduced to several countries for recreational fishing...
or as bait. Once introduced, the roach has moved into new water bodies within the same country (Rocabayera and Veiga 2012). In 1889, the roach was brought from England to Ireland for use as bait fish. Some of these fish accidentally escaped into the Cork Blackwater system. After this initial introduction, this fish species was deliberately stocked in nearby lakes. The roach has continued its expansion throughout Ireland’s watersheds, and by 2000, had invaded every major river system within Ireland (Rocabayera and Veiga 2012).

This species has been reported as invasive in north and central Italy, where it was introduced for recreational fishing (Rocabayera and Veiga 2012). The roach was also introduced to Madagascar, Morocco, Cyprus, Portugal, the Azores, Spain, and Australia (Rocabayera and Veiga 2012).

Biology

The roach has an average body length of 25 cm (9.8 in) and reported maximum length of 50 cm (19.7 in) (Rocabayera and Veiga 2012). The maximum published weight is 1.84 kg (4 lb) (Froese and Pauly 2014f). The roach can live up to 14 years (Froese and Pauly 2014f). Male fish are sexually mature at 2 to 3 years and female fish at 3 to 4 years. A whole roach population typically spawns within 5 to 10 days, with each female producing 700 to 77,000 eggs (Rocabayera and Veiga 2012). Eggs hatch approximately 12 days later (Kottelat and Freyhoff 2007).

The roach has a general, omnivorous diet, including benthic invertebrates, zooplankton, plants, and detritus (Rocabayera and Veiga 2012). Of the European cyprinids (carps, minnows, and their relatives), the roach is one of the most efficient molluscivores (Winfield and Winfield 1994).

Parasitic infections, including worm catarracts (Diplostomum spathaceum), black spot disease (diplostomiasis), and tapeworm (Ligula intestinalis), have all been found associated with the roach (Rocabayera and Veiga 2012). It has the pathogen bacterium Aeromonas salmonicida, which causes furunculosis (skin ulcers) in several fish species (Wiklund and Dalsgaard 1998).

Invasiveness

The main issues associated with invasive roach populations include competition with native fish species, hybridization with native fish species, and altered ecosystem nutrient cycling (Rocabayera and Veiga 2012). The roach is a highly adaptive species and adapts to a different habitat or diet to avoid predation or competition (Winfield and Winfield 1994). The roach also has a high reproductive potential and spawns earlier than other native fish (Volta and Jepsen 2008, Rocabayera and Veiga 2012). This trait allows larvae to have a competitive edge over native fish larvae (Volta and Jepsen 2008).

The roach can hybridize with other cyprinids, including rudd (Scardinius erythrophthalmus) and bream (Abramis brama), in places where it has invaded. The new species (roach-rudd cross and roach-bream cross) then compete for food and habitat resources with both the native fish (rudd, bream) and invasive fish (roach) (Rocabayera and Veiga 2012).

Within nutrient-rich lakes or ponds, large populations of roach create adverse nutrient cycling. High numbers of roach consume large amounts of zooplankton, which results in algal blooms, increased turbidity, and changes in nutrient availability and cycling (Rocabayera and Veiga 2012).

Stone Moroko (Pseudorasbora parva)

The stone moroko was first described and cataloged by Temminick and Schlegel in 1846 and belongs to the order Cypriniformes and family Cyprinidae (ITIS 2014). Although the preferred common name is the stone moroko, this fish species is also called the topmouth gudgeon (Froese and Pauly 2014g).

Native Range and Habitat

The stone moroko inhabits a temperate climate (Baensch and Riehl 1993). Its native range is Asia, including southern and central Japan, Taiwan, Korea, China, and the Amur River basin. The stone moroko resides in freshwater lakes, ponds, rivers, streams, and irrigation canals (Copp 2007).

Nonnative Range and Habitat

The stone moroko was introduced to Romania in the early 1960s with a Chinese carp shipment (Copp et al. 2010). By 2000, this fish species had invaded nearly every other European country and additional countries in Asia (Copp 2007). This species was primarily introduced unintentionally with fish shipped purposefully. Natural dispersal also occurred in most countries (Copp 2007).

Within Asia, the stone moroko has been introduced to Afghanistan, Armenia, Iran, Kazakhstan, Laos, Taiwan, Turkey, and Uzbekistan (Copp 2007). In Europe, this fish species is native but introduced in some countries, such as Albania, Austria, Belgium, Bulgaria, Czech Republic, Denmark, France, Germany, Greece, Hungary, Italy, Lithuania, Moldova, Montenegro, Netherlands, Poland, Romania, Russia, Serbia, Slovakia, Spain, Sweden, Switzerland, Ukraine, and the United Kingdom (Copp 2007). The stone moroko has also been introduced to Algeria and Fiji (Copp 2007).

Biology

The stone moroko is a small fish with an average body length of 8 cm (3.1 in), maximum reported length of 11 cm (4.3 in) (Froese and Pauly 2014g), and an average body mass of 17 to 19 grams (0.04 lb) (Witkowski 2011). This fish species is grayish black with a lighter belly and sides. Juveniles have a dark stripe along the side that disappears with maturity (Witkowski 2011).

This fish species can live up to 5 years (Froese and Pauly 2014g). The stone moroko becomes sexually mature and begins spawning at 1 year (Witkowski 2011). Females release several dozen eggs per spawning event and spawn several times a year. The total number of eggs spawned per female ranges from a few hundred to a few thousand eggs (Witkowski 2011). Male fish aggressively guard eggs until hatching (Witkowski 2011).

The stone moroko maintains an omnivorous diet of small insects, fish, mollusks, planktonic crustaceans, fish eggs, algae (Froese and Pauly 2014g), and plants (Kottelat and Freyhof 2007). The stone moroko is an unaffected carrier of the pathogenic parasite Sphaerothecum destruens (Gozlan et al. 2005, Pinder et al. 2005). This parasite is transferred to water from healthy stone morokos. Once in the water, this parasite has infected Chinook salmon (Oncorhynchus tshawytscha), Atlantic salmon, sunbleak (Leucaspius delineatus), and fathead minnows (Pimephales promelas) (Gozlan et al. 2005). Sphaerothecum destruens infects the internal organs, resulting in spawning failure, organ failure, and death (Gozlan et al. 2005).

Invasiveness

The stone moroko has proven to be a highly invasive fish, establishing invasive populations in nearly every European country over a 40-year span (Copp et al. 2010). This fish species has proven to be adaptive and tolerant of a variety of habitats, including those of poorer quality (Beyer et al. 2007). This species’ invasiveness is further aided by multiple spawning events and the guarding of eggs by the male until hatching (Kottelat and Freyhof 2007). In many areas of introduction and establishment (for example, United
Kenyan and Ugandan waters to promote perch occurred in 1962 and 1963 in Victoria. At the time of introduction, the effects of Nile perch on fish Lake Kyoga (1954 and 1955) to gauge spread to the Kenyan side. A breeding introduced on the Ugandan side and nearby Lake Albert. This species was Lake Victoria in Africa, was first brackish lakes and freshwater lakes, °C (82 °F) and an upper lethal temperature of 38 °C (100 °F) (Kitchell et al. 1997). The species’ native distribution includes much of central, western, and eastern Africa. The species is common in the Nile, Chad, Senegal, Volta, and Zaire River basins and brackish Lake Mariout near Alexandria, Egypt, on the Mediterranean coast (Azeroual et al. 2010, Witte 2013). Nile perch reside in brackish lakes and freshwater lakes, rivers, stream, reservoirs, and irrigation channels (Witte 2013).

Native Range and Habitat
The Nile perch inhabits a tropical climate with an optimal water temperature of 28 °C (82 °F) and an upper lethal temperature of 38 °C (100 °F) (Kitchell et al. 1997). The species’ native distribution includes much of central, western, and eastern Africa. The species is common in the Nile, Chad, Senegal, Volta, and Zaire River basins and brackish Lake Mariout near Alexandria, Egypt, on the Mediterranean coast (Azeroual et al. 2010, Witte 2013). Nile perch reside in brackish lakes and freshwater lakes, rivers, stream, reservoirs, and irrigation channels (Witte 2013).

Nonnative Range and Habitat
The Nile perch, which is not native to Lake Victoria in Africa, was first introduced to the lake in 1954 from nearby Lake Albert. This species was introduced on the Ugandan side and spread to the Kenyan side. A breeding population existed in the lake by 1962 (Witte 2013).

The Nile perch was also introduced to Lake Kyoga (1954 and 1955) to gauge the effects of Nile perch on fish populations similar to that of Lake Victoria. At the time of introduction, people were unaware that this species had already been introduced unofficially into Lake Victoria (Witte 2013). Additional introductions of Nile perch occurred in 1962 and 1963 in Kenyan and Ugandan waters to promote a commercial fishery. Since its initial introduction to Lakes Victoria and Kyoga, this fish species has been accidentally and deliberately introduced to many of the neighboring lakes and waterways (Witte 2013). The increase in Nile perch population was first noted in Kenyan waters in 1979, in Ugandan waters 2 to 3 years later, and in Tanzanian waters 4 to 5 years later (Witte 2013). There are currently only a few lakes in the area without a Nile perch population (Witte 2013).

The Nile perch was also introduced into Cuba for aquaculture and sport in 1982 and 1983 (Welcomme 1988), but we have no information on the subsequent status. Nile perch were stocked in Texas waters in 1978, 1979, and 1984 (88, 14, and 26 fish respectively in Victor Braung Lake); in 1981 (68,119 in Coleto Creek Reservoir); and in 1983 (1,310 in Fairfield Lake) (Fuller et al. 1999, TPWD 2013a). These introductions were unsuccessful at establishing a self-sustaining population (Howells and Garret 1992, Howells 1992). Today, Nile perch are a prohibited exotic species in Texas (TPWD 2013b, 2016).

Invasiveness
The Nile perch has been listed as one of the 100 “World’s Worst” Invaders by the Global Invasive Species Database (http://www.issg.org) (Snoeks 2010, ISSG 2015). During the 1950s and 1960s, this fish was introduced to several East African lakes for commercial fishing. This fish is now prevalent in Lake Victoria and constitutes more than 90 percent of demersal (bottom-dwelling) fish mass within this lake (Witte 2013). Since its introduction, native fish populations have declined or disappeared (Witte 2013). Approximately 200 native haplochromine cichlid species have become locally extinct due to predation and competition (Snoeks 2010, Witte 2013).

According to Gophen (2015), the Lake Victoria ecosystem was unique and comprised at least 400 endemic species of haplochromine fishes. Historically, the food web structure was naturally balanced, with short periods of anoxia in deep waters and dominance of diatomides alg species. During the 1980s, Nile perch became the dominant fish. The haplochromine species were depleted, and the whole ecosystem was modified. Algal assemblages were changed to Cyanobacteria; anoxia became more frequent and occurred in shallower waters. The effect of the Nile perch predation and its ecological implications in Lake Victoria is also confirmed by the elimination of planktivory by the haplochromine fish. Consequently, this loss has resulted in significant shifts to the trophic-level structure and loss of biodiversity of this lake’s ecosystem.
Amur Sleeper (\textit{Perccottus glenii})

The Amur sleeper was first described and cataloged by B.I. Dybowski in 1877, as part of the order Perciformes and family Odontobutidae (Bogutskaya and Naseka 2002, ITIS 2014). The Amur sleeper is the preferred common name of this freshwater fish, but this fish is also called the Chinese sleeper or rotan (Bogutskaya and Naseka 2002, Froese and Pauly 2014). In this final rule, we will refer to the species as the Amur sleeper.

Native Range and Habitat

The Amur sleeper inhabits a temperate climate (Baensch and Riehl 2004). The species’ native distribution includes much of the freshwater regions of northeastern China, northern North Korea, and eastern Russia (Reshetnikov and Schliewen 2013). Within China, this species is predominantly native to the lower to middle region of the Amur River watershed, including the Zeya, Sunguri, and Ussuri tributaries (Bogutskaya and Naseka 2002, Grabowska 2011) and Lake Khanka (Courtenay 2006). The Amur sleeper’s range extends northward to the Tugur River (Siberia) (Grabowska 2011) and southward to the Sea of Japan (Bogutskaya and Naseka 2002, Grabowska 2011). To the west, the species does not occur in the Amur River upstream of Dzhalinda (Bogutskaya and Naseka 2002).

The Amur sleeper inhabits freshwater lakes, ponds, canals, backwaters, flood plains, oxbow lakes, and marshes (Grabowska 2011). This fish is a poor swimmer, thriving in slow-moving waters with dense vegetation and muddy substrate and avoiding main river currents (Grabowska 2011). The Amur sleeper can live in poorly oxygenated water and can also survive in dried out or frozen water bodies by burrowing into and hibernating in the mud (Bogutskaya and Naseka 2002, Grabowska 2011).

Although the Amur sleeper is a freshwater fish, there are limited reports of it appearing in saltwater environments (Bogutskaya and Naseka 2002). These reports seem to occur with flood events and are likely a consequence of these fish being carried downstream into these saltwater environments (Bogutskaya and Naseka 2002).

Nonnative Range and Habitat

This species’ first known introduction was in western Russia. In 1912, Russian naturalist I.L. Zakivskii brought four Amur sleepers to the Lisy Nos settlement (St. Petersburg, Russia) (Reshetnikov 2004, Grabowska 2011). These four fish were held in aquaria until 1916, when they were released into a pond, where they subsequently established a population before naturally dispersing into nearby water bodies (Reshetnikov 2004, Grabowska 2011). In 1948, additional Amur sleepers were introduced to Moscow for use in ornamental ponds by members of an expedition (Bogutskaya and Naseka 2002, Reshetnikov 2004). These fish escaped the ponds into which they had been stocked and spread to nearby waters in the city of Moscow and Moscow Province (Reshetnikov 2004).

Additionally, Amur sleepers were introduced to new areas when they were unintentionally shipped to fish farms in fish stocks, such as silver carp (\textit{Hypophthalmichthys molitrix}) and grass carp (\textit{Ctenopharyngodon idella}). From these initial introductions, the Amur sleepers were able to expand from their native range through escape, release, and transfer between fish farms (Reshetnikov 2004). Additionally, Amur sleepers tolerate being transported and have been moved from one waterbody to another by anglers as bait (Reshetnikov 2004). The Amur sleeper is an invasive species in western Russia and 16 additional countries: Mongolia, Belarus, Ukraine, Lithuania, Latvia, Estonia, Poland, Hungary, Romania, Slovakia, Serbia, Bulgaria, Moldova, Kazakhstan, Croatia, and recently Germany, where it is dispersing up the Danube River into western Europe (Reshetnikov and Schliewen 2013). The Amur sleeper is established within the Baikal, Baltic, and Volga water basins of Europe and Asia (Bogutskaya and Naseka 2002) and the Danube of Europe (Reshetnikov and Schliewen 2013). The occurrence of the Amur sleeper in a far-western region of Europe is highly troublesome because this invasive and hardy predator represents a major threat to European freshwater shallow lentic water-body ecosystems where the Amur sleeper is capable of depleting diversity in species of macroinvertebrates, amphibians, and fish (Reshetnikov and Schliewen 2013).

Biology

The Amur sleeper is a small-to medium-sized fish with a maximum body length of 25 cm (9.8 in) (Grabowska 2011) and weight of 250 g (0.6 lb) (Reshetnikov 2003). As with other fish species, both body length and weight vary with food supply, and larger Amur sleeper specimens have been reported from its nonnative range (Bogutskaya and Naseka 2002).

Body shape is fusiform with two dorsal fins, short pelvic fins, and rounded caudal fin (Grabowska 2011). The Amur sleeper has dark coloration of greenish olive, brownish gray, or dark green with dark spots and pale yellow to blue-green flecks (Grabowska 2011). Males are not easily discerned from females except during breeding season. Breeding males are darker (almost black) with bright blue-green spots (Grabowska 2011).

The Amur sleeper lifespan is from 7 to 10 years. Within native ranges, the fish rarely lives more than 4 years, whereas in nonnative ranges, the fish generally lives longer (Bogutskaya and Naseka 2002, Grabowska 2011). The fish reaches maturity between 2 and 3 years of age (Grabowska 2011) and has at least two spawning events per year. The number of eggs per spawning event varies with female size. In the Wloclawski Reservoir, which is outside of the Amur sleeper’s native range, the females produced an average of 7,766 eggs per female (range 1,963 to 23,479 eggs) (Grabowska et al. 2011). Male Amur sleepers are active in prenatal care by guarding eggs and aggressively defending the nest (Bogutskaya and Naseka 2002, Grabowska et al. 2011).

The Amur sleeper is a voracious, generalist predator that eats invertebrates (such as freshwater crayfish, shrimp, mollusks, and insects), amphibian tadpoles, and small fish (Bogutskaya and Naseka 2002). Reshetnikov (2003) found that the Amur sleeper significantly reduced species diversity of fishes and amphibians where it was introduced. In some small water bodies, Amur sleepers considerably decrease the number of species of aquatic macroinvertebrates, amphibian larvae, and fish species (Reshetnikov 2003, Pauly 2014, Kottelat and Freyhof 2007).

The predators of Amur sleepers include pike, perch, snakeheads (\textit{Channa} spp.), and gulls (\textit{Laridae}) (Bogutskaya and Naseka 2002). It is believed that this species is primarily controlled by snakeheads in their native range. Eggs and juveniles are fed on by a variety of insects (Bogutskaya and Naseka 2002).

The Amur sleeper reportedly has high parasitic burdens of more than 40 parasite species (Grabowska 2011). The host-specific parasites, including \textit{Nippotaenia mogurndae} and \textit{Gyroactylus percotti}, have been transported to new areas along with the introduced Amur sleeper (Kosuthová et al. 2004, Grabowska 2011). The cestode (taeniform) \textit{Nippotaenia mogurndae} was first reported in Europe in the River Latorica in east Slovakia in 1998, after...
this same river was invaded by the Amur sleeper (Koštúthová et al. 2004). This parasite may be able to infect other fish species (Koštúthová et al. 2008). Thus, the potential for the Amur sleeper to function as a parasitic host could aid in the transmission of parasites to new environments and potentially to new species (Koštúthová et al. 2008, Koštúthová et al. 2009).

Invasiveness

The Amur sleeper is considered one of the most widespread, invasive fish species in European freshwater ecosystems within the last several decades (Copp et al. 2005a, Grabowska 2011, Reshetnikov and Ficetola 2011). Reshetnikov and Ficetola (2011) indicate that there are 13 expansion centers for this fish outside of its native range. Once this species has been introduced, it has proven to be capable of establishing sustainable populations (Reshetnikov 2004). Within the Vistula River (Poland), the Amur sleeper has averaged an annual expansion of its range by 88 kilometers (km) (54.5 miles (mi) per year) (Grabowska 2011). A recent study (Reshetnikov and Ficetola 2011) suggests many other regions of Europe and Asia, as well as the northeastern United States and southeastern Canada, have suitable climates for the Amur sleeper and are at risk for an invasion.

The Amur sleeper demonstrates many of the strongest traits for invasiveness: It consumes a highly varied diet, is fast growing with a high reproductive potential, easily adapts to different environments, and has an expansive native range and proven history of increasing its nonnative range by itself and through human-mediated activities (Grabowska 2011). Where it is invasive, the Amur sleeper competes with native species for similar habitat and diet resources (Reshetnikov 2003, Kottelat and Freyhof 2007). This fish has also been associated with the decline in populations of the European mudminnow (Umbrina krameri), crucian carp, and belica (Leucaspius delineatus) (Grabowska 2011). This species hosts parasites that may be transmitted to native fish species when introduced outside of its native range (Koštúthová et al. 2008, Koštúthová et al. 2009).

European Perch (Perca fluviatilis)

The European perch is first described and catalogued by Linnaeus in 1758, and is part of the order Perciformes and family Percidae (ITIS 2014). European perch is the preferred common name, but this species may also be referred to as the Eurasian perch or redfin perch (Allen 2004, Froese and Pauly 2014).

Native Range and Habitat

The European perch inhabits a temperate climate (Riehl and Baensch 1991, Froese and Pauly 2014). This species’ native range extends throughout Europe and regions of Asia, including Afghanistan, Armenia, Azerbaijan, Georgia, Iran, Kazakhstan, Mongolia, Turkey, and Uzbekistan (Froese and Pauly 2014). The fish resides in a variety of habitats that includes estuaries and freshwater lakes, ponds, rivers, and streams (Froese and Pauly 2014).

Nonnative Range and Habitat

The European perch has been intentionally introduced to several countries for recreational fishing, including Ireland (in the 1700s), Australia (in 1862), South Africa (in 1913), Morocco (in 1990), and Cyprus (in 1971) (FAO 2014, Froese and Pauly 2014). This species was introduced intentionally to Turkey for aquaculture (FAO 2004) and unintentionally to Algeria when it was included in the transport water with carp intentionally brought into the country (Kara 2012, Froese and Pauly 2014). European perch have also been introduced to China (in the 1970s), Italy (in 1860), New Zealand (in 1867), and Spain (no date) for unknown reasons (FAO 2014). In Australia, this species was first introduced as an effort to introduce wildlife familiar to European colonizers (Arthington and McKenzie 1997). The European perch was first introduced to Tasmania in 1862, Victoria in 1868, and to southwest Western Australia in 1892 and the early 1900s (Arthington and McKenzie 1997). This species has now invaded western Victoria, New South Wales, Tasmania, Western Australia, and South Australian Gulf Coast (NSW DPI 2013). In the 1980s, the European perch invaded the Murray River in southwestern Australia (Hutchison and Armstrong 1993).

Biology

The European perch has a maximum length of 60 cm (24 in) (Kottelat and Freyhof 2007, Froese and Pauly 2014) and an average body weight of 1.2 kg (2.6 lb) with a maximum weight of 4.75 kg (10.5 lb) (Froese and Pauly 2014). European perch color varies with habitat. Fish in well-lit shallow habitats tend to be darker, whereas fish residing in poorly lit areas tend to be lighter. These fish may also absorb carotenoids (nutrients that cause color) from their diet (crustaceans), resulting in reddish-yellow color (Allen 2004). Male fish are not easily externally differentiated from female fish (Allen 2004).

The European perch lives up to 22 years (Froese and Pauly 2014), although the average is 6 years (Kottelat and Freyhof 2007). This fish may participate in short migrations prior to spawning in February through July, depending on latitude and altitude (Kottelat and Freyhof 2007). Female fish are sexually mature at 2 to 4 years and males at 1 to 2 years (Kottelat and Freyhof 2007). The European perch is a generalist predator with a diet of zooplankton, macroinvertebrates (such as copepods and crustaceans), and small fish (Kottelat and Freyhof 2007, Froese and Pauly 2014).

The European perch can also carry the OIE-notifiable disease epizootic haematopoietic necrosis (EHN) virus (NSW DPI 2013). Several native Australian fish (including the silver perch (Bidyanus bidyanus) and Murray cod (Maccullochella peeli)) are extremely susceptible to the virus and have had significant population declines over the past decades with the continued invasion of European perch (NSW DPI 2013).

Invasiveness

The European perch has been introduced to many new regions through fish stocking for recreational use. The nonnative range has also expanded as the fish has swum to new areas through connecting waterbodies (lakes, river, and streams within the same watershed). In New South Wales, Australia, these fish are a serious pest and are listed as Class 1 noxious species (NSW DPI 2013). These predatory fish have been blamed for the local extirpation of the mudminnow (Galaxiella munda) (Moore 2008, ISSG 2010) and depleted populations of native invertebrates and fish (Moore 2008). This species reportedly consumed 20,000 rainbow trout (Oncorhynchus mykiss) fry from an Australian reservoir in less than 3 days (NSW DPI 2013). The introduction of these fish in New Zealand and China has severely altered native freshwater communities (Closs et al. 2003). European perch form dense populations, forcing them to compete amongst each other for a reduced food supply. This competition results in stunted fish that are less appealing to the recreational fishery (NSW DPI 2013).

Zander (Sander lucioperca)

The zander was first described and catalogued by Linnaeus in 1758, and belongs to the order Perciformes and family Percidae (ITIS 2014). Although
its preferred common name in the United States is the zander, this fish species is also called the pike-perch and European walleye (Godard and Copp 2011, Froese and Pauly 2014).

Nonnative Range and Habitat

The zander’s native range includes the Caspian Sea, Baltic Sea, Black Sea, Aral Sea, North Sea, and Aegean Sea basins. In Asia, this fish is native to Afghanistan, Armonia, Azerbaijan, Georgia, Iran, Kazakhstan, and Uzbekistan. In Europe, the zander is native to much of eastern Europe (Albania, Austria, Czech Republic, Estonia, Germany, Greece, Hungary, Latvia, Lithuania, Moldova, Poland, Romania, Russia, Serbia, Slovakia, Ukraine, and Serbia and Montenegro) and the Scandinavian Peninsula (Finland, Norway, and Sweden) (Godard and Copp 2011, Froese and Pauly 2014). The northernmost records of native populations are in Finland up to 64° N (Larsen and Berg 2014).

The zander resides in brackish coastal estuaries and freshwater rivers, lakes, and reservoirs. The species prefers turbid, slightly eutrophic waters with high dissolved oxygen concentrations (Godard and Copp 2011). The zander can survive in salinities up to 20 parts per thousand (ppt), but prefers environments with salinities less than 12 ppt and requires less than 3 ppt for reproduction (Larsen and Berg 2014).

Nonnative Range and Habitat

The zander has been repeatedly introduced outside of its native range for recreational fishing and aquaculture and also to control cyprinids (Godard and Copp 2011, Larsen and Berg 2014). This species has been introduced to much of Europe, parts of Asia (China, Kyrgyzstan, and Turkey), and northern Africa (Algeria, Morocco, and Tunisia). Within Europe, the zander has been introduced to Belgium, Bulgaria, Croatia, Cyprus, Denmark, France, Italy, the Netherlands, Portugal, the Azores, Slovenia, Spain, Switzerland, and the United Kingdom (Godard and Copp 2011, Froese and Pauly 2014). In Denmark, although the zander is native, stocking is not permitted to prevent the species from being introduced into lakes and rivers where it is not presently found and where introduction is not desirable (Larsen and Berg 2014).

The zander has been previously introduced to the United States. Juvenile zanders were stocked in Spiritwood Lake (North Dakota) in 1989 for recreational fishing (Fuller et al. 1999, Fuller 2006, USCS NAS 2014). Although previous reports indicated that zanders did not become established in Spiritwood Lake, there have been documented reports of captured juvenile zanders from this lake (Fuller 2009). In 2009, the North Dakota Game and Fish Department reported a small, established population of zanders within Spiritwood Lake (Fuller 2009), and a zander caught in 2013 was considered the State record (North Dakota Game and Fish 2013).

Biology

The zander has an average body length of 50 cm (1.6 ft) and maximum body length of 100 cm (3.3 ft). The maximum published weight is 20 kg (44 lb) (Froese and Pauly 2014). The zander has a long, slender body with yellow-gray fins and dark bands running from the back down each side (Godard and Copp 2011).

The zander’s age expectancy is inversely correlated to its body growth rate. Slower-growing zanders may live up to 20 to 24 years, whereas faster-growing fish may live only 8 to 9 years (Godard and Copp 2011). Female zanders typically spawn in April and May and produce approximately 150 to 400 eggs per gram of body mass. After spawning, male zanders protect the nest and fan the eggs with their tails (Godard and Copp 2011).

The zander is piscivorous, and its diet includes smelt (Osmerus eperlanus), ruffe (Gymnocephalus cernuus), European perch, vendace (Coregonus albula), roach, and other zanders (Kangur and Kangur 1998).

Several studies have found that zanders can be hosts for multiple parasites (Godard and Copp 2011). The nematode Anisakis, which is known to infect humans through fish consumption, has been documented in the zander (Eslami and Mokhayer 1977, Eslami et al. 2011). A study in the Polish section of Vistula Lagoon found 26 species of parasites associated with the zander, which was more than any of the other 15 fish species studied (Robiecki 2002, 2006).

Invasiveness

The zander has been intentionally introduced numerous times for aquaculture, recreational fishing, and occasionally for biomanipulation to remove unwanted cyprinids (Godard and Copp 2011). Biomanipulation is the management of an ecosystem by adding or removing species. The zander migrates for spawning, which further expands its invasive range. It is a predatory fish that is well-adapted to turbid water and low-light habitats (Sandset and Karas 2002). The zander competes with and preys on native fish. The zander is also a vector for the trematode Bucephalus polymorphus, which has been linked to a decrease in native French cyprinid populations (Kvach and Mierzejewska 2011).

Wels Catfish (Silurus glanis)

The wels catfish was first described and cataloged by Linnaeus in 1758, and belongs to the order Siluriformes and family Siluridae (ITIS 2014). The preferred common name is the wels catfish, but this fish is also called the Danube catfish, European catfish, and sheatfish (Rees 2012, Froese and Pauly 2014).

Native Range and Habitat

The wels catfish inhabits a temperate climate (Baensch and Riehl 2004). The species is native to eastern Europe and western Asia, including the North Sea, Baltic Sea, Caspian Sea, and Aral Sea basins (Rees 2012, Froese and Pauly 2014). The species resides in slow-moving rivers, backwaters, shallow floodplain channels, and heavily vegetated lakes (Kottelat and Freyhof 2007). The wels catfish has also been found in brackish water of the Baltic and Black Seas (Froese and Pauly 2014). The species is a demersal (bottom-dwelling) species that prefers residing in crevices and root habitats (Rees 2012).

Nonnative Range and Habitat

The wels catfish was introduced to the United Kingdom and western Europe during the 19th century. The species was first introduced to England in 1880 for recreational fishing at the private Bedford manor estate of Woburn Abbey. Since then, wels catfish have been stocked both legally and illegally into many lakes and are now widely distributed throughout the United Kingdom (Rees 2012). This species was introduced to Spain, Italy, and France for recreational fishing and aquaculture (Rees 2012). Wels catfish were introduced to the Netherlands as a substitute predator to control cyprinid fish populations (De Groot 1985) after the native pike were overfished. The wels catfish has also been introduced to Algeria, Belgium, Bosnia-Hercegovina, China, Croatia, Cyprus, Denmark, Finland, Portugal, Syria, and Tunisia, although they are not known to be established in Algeria or Cyprus (Rees 2012).

Biology

The wels catfish commonly grows to 3 m (9.8 ft) in body length with a maximum length of 5 m (16.4 ft) and is the largest catfish (Rees 2012). The maximum published weight is 306 kg (675 lb) (Rees 2012).
This species has a strong, elongated, scaleless, mucus-covered body with a flattened tail. The body color is variable but is generally mottled with dark greenish-black and creamy-yellow sides. Wels catfishes possess six barbels; two long ones on each side of the mouth, and four shorter ones under the jaw (Rees 2012).

Although the maximum reported age is 80 years (Kottelat and Freyhof 2007), the average lifespan of a wels catfish is 15 to 30 years. This species becomes sexually mature at 3 to 4 years of age. Nocturnal spawning occurs annually and aligns with optimal temperature and day length between April and August (Kottelat and Freyhof 2007, Rees 2012). The number of eggs produced per female, per year is highly variable, and depends on age, size, geographic location, and other factors. Studies in Asia have documented egg production of a range of approximately 8,000 to 467,000 eggs with the maximum reported being 700,000 eggs (Copp et al. 2009). Male fish will guard the nest, repeatedly fanning their tails to ensure proper ventilation until the eggs hatch 2 to 10 days later (Copp et al. 2009). Young catfish develop quickly and, on average, achieve a 38- to 48-cm (15- to 19-in) total length within their first year (Copp et al. 2009).

This species is primarily nocturnal and will exhibit territorial behavior (Copp et al. 2009). The wels catfish is a solitary ambush predator but is also an opportunistic scavenger of dead fish (Copp et al. 2009). Juvenile catfish typically eat invertebrates. Adult catfish are generalist predators with a diet that includes fish (at least 55 species), crayfish, small mammals (such as rodents), and waterfowl (Copp et al. 2009, Rees 2012). Wels catfish have been observed beaching themselves to prey on land birds located on river banks (Cucherousset 2012).

Juvenile wels catfish can carry the highly infectious SVC (Hickley and Chare 2004). This disease is recognized worldwide and is classified as a notifiable animal disease by the World Organization for Animal Health (OIE 2014). The wels catfish is also a host to another pair of walking legs. The common yabby is a crayfish. Crayfish are invertebrates with hard shells. They can live and breathe underwater, and they crawl along the substrate on four pairs of walking legs (Holdich and Reeve 1988); the pincers are considered another pair of walking legs. The common yabby was first described and cataloged by Clark in 1936 and belongs to the phylum Arthropoda, order Decapoda, and family Parastacidae (ITIS 2014). This freshwater crustacean can also be called the yabby or the common crayfish. The term “yabby” is also commonly used for crayfish in Australia.

Native Range and Habitat

The common yabby is native to eastern Australia and extends from South Australia, northward to southern parts of the Northern Territory, and eastward to the Great Dividing Range (Eastern Highlands) (Souty-Grosset et al. 2006, Gherardi 2012). The common yabby inhabits temperate and tropical climates. In aquaculture, the yabby tolerates the wide range of water temperatures from 1 to 35 °C (34 to 95 °F), with an optimal water temperature of 25 °C (77 °F) (Withnall 2000). Growth halts below 15 °C (59 °F) and above 34 °C (93 °F), partial hibernation (decreased metabolism and feeding) occurs below 16 °C (61 °F), and death occurs when temperatures rise above 36 °C (97 °F) (Gherardi 2012). The common yabby can also survive drought for several years by sealing itself in a deep burrow (burrows well over 5 m; 16.4 ft have been found) and aestivating (the crayfish’s respiration, pulse, and digestion nearly cease) (NSW DPI 2015).

Invasiveness

The wels catfish is a habitat-generalist that tolerates poorly oxygenated waters and has been introduced to the United Kingdom and western Europe for aquaculture, research, pest control, and recreational fishing (Rees 2012). Although this species has been intentionally introduced for aquaculture and fishing, it has also expanded its nonnative range by escaping from breeding and stocking facilities (Rees 2012). This species is tolerant of a variety of warm-water habitats, including those with low dissolved oxygen levels. The invasive success of the wels catfish will likely be further enhanced with the predicted increase in water temperature with climate change (2 to 3 °C by 2050) (Rahel and Olden 2008, Britton et al. 2010a).

The major risks associated with invasive wels catfish to the native fish population include disease transmission (SVC) and competition for habitat and prey species (Rees 2012). This fish species also excretes large amounts of phosphorus and nitrogen (estimated 83- to 286-fold and 17- to 56-fold, respectively) (Boulêtreau et al. 2011) into the ecosystem and consequently greatly disrupts nutrient cycling and transport (Schaus et al. 1997, McIntyre et al. 2008, Boulêtreau et al. 2011). Because of their large size, multiple wels catfish in one location magnify these effects and can greatly increase algae and plant growth (Boulêtreau et al. 2011), which reduces water quality.

Common Yabby (Cherax destructor)

Unlike the 10 fish in this rule, the yabby is a crayfish. Crayfish are invertebrates with hard shells. They can live and breathe underwater, and they crawl along the substrate on four pairs of walking legs (Holdich and Reeve 1988); the pincers are considered another pair of walking legs. The common yabby was first described and cataloged by Clark in 1936 and belongs to the phylum Arthropoda, order Decapoda, and family Parastacidae (ITIS 2014). This freshwater crustacean can also be called the yabby or the common crayfish. The term “yabby” is also commonly used for crayfish in Australia.

This species is primarily nocturnal and will exhibit territorial behavior (Copp et al. 2009). The wels catfish is a solitary ambush predator but is also an opportunistic scavenger of dead fish (Copp et al. 2009). Juvenile catfish typically eat invertebrates. Adult catfish are generalist predators with a diet that includes fish (at least 55 species), crayfish, small mammals (such as rodents), and waterfowl (Copp et al. 2009, Rees 2012). Wels catfish have been observed beaching themselves to prey on land birds located on river banks (Cucherousset 2012).

Juvenile wels catfish can carry the highly infectious SVC (Hickley and Chare 2004). This disease is recognized worldwide and is classified as a notifiable animal disease by the World Organization for Animal Health (OIE 2014). The wels catfish is also a host to another pair of walking legs. The common yabby is a crayfish. Crayfish are invertebrates with hard shells. They can live and breathe underwater, and they crawl along the substrate on four pairs of walking legs (Holdich and Reeve 1988); the pincers are considered another pair of walking legs. The common yabby was first described and cataloged by Clark in 1936 and belongs to the phylum Arthropoda, order Decapoda, and family Parastacidae (ITIS 2014). This freshwater crustacean can also be called the yabby or the common crayfish. The term “yabby” is also commonly used for crayfish in Australia.

Native Range and Habitat

The common yabby is native to eastern Australia and extends from South Australia, northward to southern parts of the Northern Territory, and eastward to the Great Dividing Range (Eastern Highlands) (Souty-Grosset et al. 2006, Gherardi 2012). The common yabby inhabits temperate and tropical climates. In aquaculture, the yabby tolerates the wide range of water temperatures from 1 to 35 °C (34 to 95 °F), with an optimal water temperature of 25 °C (77 °F) (Withnall 2000). Growth halts below 15 °C (59 °F) and above 34 °C (93 °F), partial hibernation (decreased metabolism and feeding) occurs below 16 °C (61 °F), and death occurs when temperatures rise above 36 °C (97 °F) (Gherardi 2012). The common yabby can also survive drought for several years by sealing itself in a deep burrow (burrows well over 5 m; 16.4 ft have been found) and aestivating (the crayfish’s respiration, pulse, and digestion nearly cease) (NSW DPI 2015).

This species can tolerate a wide range of dissolved oxygen concentrations and salinities (Mills and Geddes 1980) but prefers salinities less than 8 ppt (Withnall 2000, Gherardi 2012). Growth ceases at salinities above 8 ppt (Withnall 2000). This correlates with Beatty’s (2005) study where all yabbies found in waters greater than 20 ppt were dead. Yabbies have been found in ponds where the dissolved oxygen was below 1 percent saturation (NSW DPI 2015).

The common yabby resides in a variety of habitats, including desert mound springs, alpine streams, subtropical creeks, rivers, billabongs (small lake, oxbow lake), temporary lakes, swamps, farm dams, and irrigation channels (Gherardi 2012). The yabby is found in mildly turbid waters and muddy or silted bottoms. The common yabby digs burrows that connect to waterways (Withnall 2000). Burrowing can result in unstable and collapsed banks (Gherardi 2012).

Nonnative Range and Habitat

The common yabby is commercially valuable and is frequently imported by countries for aquaculture, aquariums, and research (Gherardi 2012); it is raised in aquaculture as food for humans (NSW DPI 2015). This species has spread throughout Australia, and its nonnative range extends to New South Wales east of the Great Dividing Range, Western Australia, and Tasmania. This crayfish species was introduced to Western Australia in 1932 for commercial aquaculture from where it escaped and established in rivers and irrigation dams (Souty-Grosset et al. 2006). Outside of Australia, this species has been introduced into Italy and Spain where it has become established (Gherardi 2012). The common yabby has been introduced to China, South Africa, and Zambia for aquaculture (Gherardi 2012) but has not become established in the wild in those countries. The first European introduction occurred in 1983, when common yabbies were transferred from a California farm to a pond in Girona, Catalonia, Spain (Souty-Grosset et al. 2006). This crayfish species became established in Zaragoza Province, Spain, after being introduced
in 1984 or 1985 (Souty-Grosset et al. 2006).

Biology

The common yabby has been described as a “baby lobster” because of its relatively large body size for a crayfish and because of its unusually large claws. Yabbies have a total body length up to 15 cm (6 in) with a smooth external carapace (exoskeleton) (Souty-Grosset et al. 2006, Gherardi 2012). Body color can vary with geographic location, season, and water conditions (Withnall 2000). Most captive-cultured yabbies are blue-gray, whereas wild yabbies may be green-beige to black (Souty-Grosset et al. 2006, Withnall 2000). Yabbies in the aquarium trade can be blue or white and go by the names blue knight and white ghost (LiveAquaria.com 2014a, b).

Most common yabbies live 3 years with some living up to 6 years (Souty-Grosset et al. 2006, Gherardi 2012). Females can be distinguished from males by the presence of gonopores at the base of the third pair of walking legs; while males have papillae at the base of the fifth pair of walking legs (Gherardi 2012). The female yabby becomes sexually mature before it is 1 year old (Gherardi 2012). Spawning is dependent on day length and water temperatures. When water temperatures rise above 15 °C (59 °F), the common yabby will spawn from early spring to mid-summer. When the water temperature is consistently between 18 and 20 °C (64 to 68 °F) with daylight of more than 14 hours, the yabby will spawn up to five times a year (Gherardi 2012). Young females produce 100 to 300 eggs per spawning event, while older (larger) females can produce up to 1,000 eggs (Withnall 2000). Incubation is also dependent on water temperature and typically lasts 19 to 40 days (Withnall 2000).

The common yabby grows through molting, which is shedding of the old carapace and then growing a new one (Withnall 2000). A juvenile yabby will molt every few days, whereas, an adult yabby may molt only annually or semiannually (Withnall 2000).

The common yabby is an opportunistic omnivore with a carnivorous summer diet and herbivorous winter diet (Beatty 2005). The diet includes fish (Gambusia holbrooki), plant material, detritus, and zooplankton. The yabby is also cannibalistic, especially where space and food are limited (Gherardi 2012).

The common yabby is affected by at least 11 species for food and habitat (Beatty et al. 2006, Souty-Grosset et al. 2006, Gherardi 2012). Twenty-three bacteria species have been found in the yabby as well (Jones and Lawrence 2001). The crayfish plague is an OIE-reportable disease. Twenty-three bacteria species have been found in the yabby as well (Jones and Lawrence 2001).

Invasiveness

The common yabby has a quick growth and maturity rate, high reproductive potential, and generalist diet. These attributes, in addition to the species’ tolerance for a wide range of freshwater habitats, make the common yabby an efficient invasive species. Additionally, the invasive range of the common yabby is expected to expand with climate change (Gherardi 2012). Yabbies can also live on land and travel long distances by walking between water bodies (Gherardi 2011).

The common yabby may reduce biodiversity through competition and predation with native species. In its nonnative range, the common yabby has proven to out-compete native crayfish species for food and habitat (Beatty 2006, Gherardi 2012). Native freshwater crayfish species are also at risk from parasitic infections from the common yabby (Gherardi 2012).

Summary of the Presence of the 11 Species in the United States

Only one of the 11 species, the zander, is known to be present in the wild within the United States. There has been a small established population of zander within Spiritwood Lake (North Dakota) since 1989. Crucian carp were reportedly introduced to Chicago lakes and lagoons during the early 1900s. Additionally, Nile perch were introduced to Texas reservoirs between 1978 and 1985. However, neither the crucian carp nor the Nile perch established populations, and these two species are no longer present in the wild in U.S. waters. Although these species are not yet present in the United States (except for one species in one lake), all 11 species have a high climate match in parts of the United States and have been introduced, become established, spread, and been documented as causing harm in countries outside of their native ranges in habitats and ecosystems similar to those found in the United States. Acting now to prohibit both their importation and interstate transportation and thereby prevent the species’ likely introduction, establishment, and spread in the wild and associated harm to the interests of agriculture or to wildlife or wildlife resources of the United States is critical.

Rapid Screening

The first step that the Service performed in selecting species to evaluate for listing as injurious was to prepare a rapid screen to assess which species out of thousands of foreign species not yet found in the United States should be categorized as high-risk of invasiveness. We compiled the information in Ecological Risk Screening Summaries (ERSS) for each species to determine the Overall Risk Assessment of each species.

The Overall Risk Assessment incorporates scores for the history of invasiveness, climate match between the species’ range (native and invaded ranges) and the United States, and certainty of assessment.

The climate match analysis (Australian Bureau of Rural Sciences 2010) incorporates 16 climate variables (eight for rainfall and eight for temperature) to calculate climate scores that can be used to calculate a Climate 6 ratio. The Climate 6 score (or ratio) is determined by this formula: (Sum of the Counts for Climate Match Scores 6–10)/ (Sum of all Climate Match Scores). This ratio was shown to be the best predictor of success of introduction of exotic freshwater fish (Bomford 2008). Using the Climate 6 ratio, species can be categorized as having a low (0.000 to 0.055), medium (greater than 0.005 to less than 0.103), or high (greater than 0.103) climate match (Bomford 2008; USFWS 2013b). The climate match score is a calculation that ranges from 0 to 10. It compares the 16 climate variables as one point (source climate station) to another point (target station). The equation calculates a figurative “distance” between every source and target station, then selects the highest score (best match and closest “distance”). This distance is then normalized on a score from 0 to 10 to make it easier to understand and to calculate ratios. The 16 climate parameters used to estimate the extent of climatically matched habitat in the CLIMATE program are in Table 1 (Bomford et al. 2010).

We use Climate 6 scores because that system was peer reviewed (Bomford 2008). In Bomford’s seminal risk assessment manual, she stated, “The generic model is based on Climate 6 (as opposed to Climate 5, 7 or 8), since Climate 6 was shown to be the best predictor of success of introduction,” referring to exotic freshwater fish. We believe that the categorical system provided by generating and using the Climate 6 Ratio is effective for our current needs. For more information on how the climate match scores are derived, please see the revised Standard Operating Procedures (USFWS 2016).

As explained in the proposed rule, the Service expanded the source ranges (native and nonnative distribution) of several species for the climate match from those listed in the ERSSs. The revised source ranges included additional locations referenced in FishBase (Froese and Pauly 2014), the CABI ISC, and the Handbook of European Freshwater Fishes (Kottelat and Freyhof 2007). Additional source points were also specifically selected for the stone moroko’s distribution within the United Kingdom (Pinder et al. 2005). There were no revisions to the climate match for the Nile perch, Amur sleeper, or common yabby. The target range for the climate match included the States, District of Columbia, Guam, Puerto Rico, and the U.S. Virgin Islands.

The Overall Risk Assessment was found to be high for all 11 species. All 11 species have a high risk for history of invasiveness. Overall climate match to the United States ranged from medium for the Nile perch to high for the remaining nine fish and one crayfish species. The certainty of assessment (with sufficient and reliable information) was high for all species.

Injurious Wildlife Evaluation Criteria

Once we determined that all 11 species were good candidates for further and more in-depth evaluation because of their overall invasive risk, we used the criteria below to evaluate whether each of these species qualifies as injurious under the Act. The analysis using these criteria serve as a general basis for the Service’s injurious wildlife listing decisions. Biologists within the Service evaluate both the factors that contribute to and the factors that reduce the likelihood of injuriousness:

1. Factors that contribute to being considered injurious:
   - The likelihood of release or escape;
   - Potential to survive, become established, and spread;
   - Impacts to wildlife resources or ecosystems through hybridization and competition for food and habitats, habitat degradation and destruction, predation, and pathogen transfer;
   - Impacts to endangered and threatened species and their habitats;
   - Impacts to human beings, forestry, horticulture, and agriculture; and
   - Wildlife or habitat damages that may occur from control measures.

2. Factors that reduce the likelihood of the species being considered as injurious:
   - Ability to prevent escape and establishment;
   - Potential to eradicate or manage established populations (for example, making organisms sterile);
   - Ability to rehabilitate disturbed ecosystems;
   - Ability to prevent or control the spread of pathogens or parasites; and
   - Any potential ecological benefits to introduction.

For this final rule, a hybrid is defined as any progeny (offspring) from any cross involving a parent from 1 of the 11 species. These progeny would likely have the same or similar biological characteristics of the parent species (Ellstrand and Schierenbeck 2000, Mallet 2007), which, according to our analysis, would indicate that they are injurious to the interests of agriculture, or to wildlife or wildlife resources of the United States.

Factors That Contribute to Injuriousness for Crucian Carp

Current Nonnative Occurrences

This species is not currently found within the United States. The crucian carp has been introduced and become established in Croatia, Greece, France, Italy, and England (Cirivelli 1995, Kottelat and Freyhof 2007).

Potential Introduction and Spread

Potential pathways of introduction into the United States include stocking for recreational fishing and through misidentified shipments of ornamental fish (Wheeler 2000, Hickley and Chare 2004, Innal and Ek-rahan 2006, Sayer et al. 2011). Additional crucian carp may be misidentified as other carp species, such as the Prussian carp or common carp, and thus they are likely underreported (Godard and Copp 2012).

The crucian carp prefers a temperate climate (as found in much of the United States) and tolerates high summer air temperatures (up to 35 °C (95 °F)) and can survive in poorly oxygenated waters (Godard and Copp 2012). The crucian carp has an overall high climate match with a Climate 6 ratio of 0.355. This species has a high climate match throughout much of the Great Lakes region, southeastern United States, and southern Alaska and Hawaii. Low matches occur in the desert Southwest.

If introduced, the crucian carp is likely to spread and become established in the wild due to its ability to be a habitat and diet generalist and adapt to new environments, its long lifespan (maximum 10 years), and its ability to establish outside of the native range.

Potential Impacts to Native Species (including Threatened and Endangered Species)

As mentioned previously, the crucian carp can compete with native fish species, alter the health of freshwater habitats, hybridize with other invasive and injurious carp species, and serve as a vector of the OIE-reportable fish disease SVC (Ahne et al. 2002, Godard and Copp 2012). The introduction of crucian carp to the United States could result in increased competition with native fish species for food resources (Welcomme 1988). The crucian carp consumes a variety of food resources, including plankton, benthic invertebrates, plant materials, and detritus (Kottelat and Freyhof 2007). With this varied diet, crucian carp would directly compete with numerous native species.

The crucian carp has a broad climate match throughout the country, and thus its introduction and establishment could further stress the populations of numerous endangered and threatened amphibian and fish species through competition for food resources.

The ability of crucian carp to hybridize with other species of

Current Nonnative Occurrences

This species is not currently found within the United States. The crucian carp has been introduced and become established in Croatia, Greece, France, Italy, and England (Cirivelli 1995, Kottelat and Freyhof 2007).

Potential Introduction and Spread

Potential pathways of introduction into the United States include stocking for recreational fishing and through misidentified shipments of ornamental fish (Wheeler 2000, Hickley and Chare 2004, Innal and Ek-rahan 2006, Sayer et al. 2011). Additional crucian carp may be misidentified as other carp species, such as the Prussian carp or common carp, and thus they are likely underreported (Godard and Copp 2012).

The crucian carp prefers a temperate climate (as found in much of the United States) and tolerates high summer air temperatures (up to 35 °C (95 °F)) and can survive in poorly oxygenated waters (Godard and Copp 2012). The crucian carp has an overall high climate match with a Climate 6 ratio of 0.355. This species has a high climate match throughout much of the Great Lakes region, southeastern United States, and southern Alaska and Hawaii. Low matches occur in the desert Southwest.

If introduced, the crucian carp is likely to spread and become established in the wild due to its ability to be a habitat and diet generalist and adapt to new environments, its long lifespan (maximum 10 years), and its ability to establish outside of the native range.

Potential Impacts to Native Species (including Threatened and Endangered Species)

As mentioned previously, the crucian carp can compete with native fish species, alter the health of freshwater habitats, hybridize with other invasive and injurious carp species, and serve as a vector of the OIE-reportable fish disease SVC (Ahne et al. 2002, Godard and Copp 2012). The introduction of crucian carp to the United States could result in increased competition with native fish species for food resources (Welcomme 1988). The crucian carp consumes a variety of food resources, including plankton, benthic invertebrates, plant materials, and detritus (Kottelat and Freyhof 2007). With this varied diet, crucian carp would directly compete with numerous native species.

The crucian carp has a broad climate match throughout the country, and thus its introduction and establishment could further stress the populations of numerous endangered and threatened amphibian and fish species through competition for food resources.

The ability of crucian carp to hybridize with other species of
Cyprinidae (including common carp) may exacerbate competition over limited food resources and ecosystem changes and, thus, further challenge native species (including native threatened or endangered fish species). Crucian carp harbor the fish disease SVC and additional parasitic infections. Although SVC also infects other carp species, the virus causing this disease can also be transmitted through the water column to native fish species causing fish mortalities. Mortality rates from SVC have been documented up to 70 percent among juvenile fish and 30 percent among adult fish (Ahne et al. 2002). Therefore, as a vector of SVC, this fish species may also be responsible for reduced wildlife diversity. Crucian carp may outcompete native fish species, thus replacing them in the trophic scheme. Large populations of crucian carp can result in considerable predation on aquatic plants and invertebrates. Changes in ecosystem cycling and wildlife diversity may have negative effects on the aesthetic, recreational, and economic benefits of the environment.

Potential Impacts to Humans
We have no reports of the crucian carp being directly harmful to humans.

Potential Impacts to Agriculture
The introduction of crucian carp is likely to affect agriculture by contaminating commercial aquaculture. This fish species can harbor SVC, which can infect numerous fish species, including common carp, koi (C. carpio), crucian carp, bighead carp (Hypophthalmichthys nobilis), silver carp, and grass carp (Ahne et al. 2002). This disease can cause serious fish mortalities, and thus can detrimentally affect the productivity of several species in commercial aquaculture facilities, including grass carp, goldfish, koi, fathead minnows (Pimephales promelas), and golden shiner (Notemigonus crysoleucas) (Ahne et al. 2002, Goodwin 2002).

Factors That Reduce or Remove Injuriousness for Crucian Carp
Control
Lab experiments indicate that the piscicide rotenone (a commonly used natural fish poison) could be used to control a crucian carp population (Ling 2003). However, rotenone is not target-specific (Wynne and Masser 2010). Depending on the applied concentration, rotenone kills other aquatic species in the water body. Some fish species are more susceptible than others, and the use of this piscicide may kill native species. Control measures that would harm other wildlife are not recommended as mitigation plans to reduce the injurious characteristics of this species and, therefore, do not meet control measures under the Injurious Wildlife Evaluation Criteria.

No other control methods are known for the crucian carp, but several other control methods are currently being used or are in development for introduced and invasive carp species of other genera. For example, the U.S. Geological Survey (USGS) is developing a method to orally deliver a piscicide (Micromatrix) specifically to invasive bighead carp and silver carp (Luoma 2012). This developmental control measure is expensive and not guaranteed to prove effective for any carp.

Potential Ecological Benefits for Introduction
We are not aware of any documented ecological benefits for the introduction of crucian carp.

Factors That Contribute to Injuriousness for Eurasian Minnow

Injuriousness for Eurasian Minnow
Current Nonnative Occurrences
This species is not currently found within the United States. The Eurasian minnow was introduced to new waterways in its native range of Europe and Asia (Sandlund 2008). This fish species also has been introduced outside of its native range to new locations within Norway (Sandlund 2008, Hesthagen and Sandlund 2010).

Potential Introduction and Spread
Likely pathways of introduction include release or escape when used as live bait, unintentional inclusion in the transport water of intentionally stocked fish (often with salmonids), and intentional introduction for vector (insect) management (Sandlund 2008). Once introduced, this species can spread and establish in nearby waterways.

The Eurasian minnow prefers a temperate climate (Froese and Pauly 2014e). This minnow is capable of establishing in a variety of aquatic ecosystems ranging from freshwater to brackish water (Sandlund 2008). The Eurasian minnow has an overall high climate match to the United States with a Climate 6 ratio of 0.397. The highest climate matches are in the northern States, including Alaska. The lowest climate matches are in the Southeast and Southwest. If introduced to the United States, the Eurasian minnow is highly likely to spread and become established in the wild due to this species’ traits as a habitat generalist and generalist predator, with adaptability to new environments, high reproductive potential, long lifespan, extraordinary mobility, social nature, and proven invasiveness outside of the species’ native range.

Potential Impacts to Native Species (including Endangered and Threatened Species)
Introduction of the Eurasian minnow can affect native species through several mechanisms, including competition over resources, predation, and parasite transmission. Introduced Eurasian minnows have a more serious effect in waters with fewer species than those waters with a more developed, complex fish community (Museth et al. 2007). In Norway, dense populations of the Eurasian minnow have resulted in an average 35 percent reduction in recruitment and growth rates in native brown trout (Museth et al. 2007). In the United States, introduced Eurasian minnow populations would likely compete with and adversely affect Atlantic salmon, State-managed brown trout, and other salmonid species.

Eurasian minnow introductions have also disturbed freshwater benthic invertebrate communities (Næstad and Brittain 2010). Increased predation by Eurasian minnows has led to shifts in invertebrate populations and changes in benthic diversity (Hesthagen and Sandlund 2010). Many of the invertebrates consumed by the Eurasian minnow are also components of the diet of the brown trout, thus exacerbating competition between the introduced Eurasian minnow and brown trout (Hesthagen and Sandlund 2010). Additionally, Eurasian minnows have been shown to consume vendace (a salmonid) larvae (Huusko and Sutela 1997). If introduced, the Eurasian minnow’s diet may include the larvae of U.S. native salmonids, including salmon and trout species (Oncorhynchus and Salvelinus spp.).

The Eurasian minnow serves as a host to parasites, such as Gyrodactylus apthya, that it can transmit to other fish species, including salmon and trout (Zúñiga et al. 2008). Once introduced, these parasites would likely spread to native salmon and trout species. Depending on pathogenicity, parasites of the Gymodactylus species may cause high fish mortality (Bakke et al. 1992).

Potential Impacts to Humans
We have no reports of the Eurasian minnow being harmful to humans.
Potential Impacts to Agriculture

The Eurasian minnow may impact agriculture by affecting aquaculture. This species harbors a parasite that may infect other fish species and can cause high fish mortality (Bakke et al. 1992). Eurasian minnow populations can adversely impact both recruitment and growth of brown trout. Reduced recruitment and growth rates can reduce the economic value associated with brown trout aquaculture and recreational fishing.

Factors That Reduce or Remove Injuriousness for Eurasian Minnow

Control

Once introduced, it is difficult and costly to control a Eurasian minnow population (Sandlund 2008). Eradication may be possible from small waterbodies in cases where the population is likely to serve as a center for further spread, but no details are given on how to accomplish such eradication (Sandlund 2008). Control may also be possible using habitat modification or biocontrol (introduced predators); however, we know of no published accounts of long-term success by either method. Both control measures of habitat modification and biocontrol cause wildlife or habitat damages and are expensive mitigation strategies and, therefore, are not recommended or considered appropriate under the Injurious Wildlife Evaluation Criteria as a risk management plan for this species.

Potential Ecological Benefits for Introduction

There has been one incidence where the Eurasian minnow was introduced as a biocontrol for the Tune fly (Simuliidae) (Sandlund 2008). However, we do not have information on the success of this introduction. We are not aware of any other documented ecological benefits associated with the Eurasian minnow.

Factors That Contribute to Injuriousness for Prussian Carp

Current Nonnative Occurrences

This species is not found within the United States. However, it was recently reported to be established in waterways in southern Alberta, Canada, which is the first confirmed record in the wild in North America (Elgin et al. 2014). The Prussian carp has been introduced to many countries of central and Western Europe. This species’ current nonnative range includes the Asian countries of Armenia, Turkey, and Uzbekistan and the European countries of Belarus, Georgia, Czech Republic, Denmark, Estonia, France, Germany, Poland, and Switzerland (Britton 2011); it also includes the Iberian Peninsula (Ribeiro et al. 2015).

Potential Introduction and Spread

Potential pathways of introduction include stocking for recreational fishing and aquaculture. Once introduced, the Prussian carp will naturally disperse to new waterbodies. The Prussian carp prefers a temperate climate and resides in a variety of freshwater environments, including those with low dissolved oxygen concentrations and increased pollution (Britton 2011). The Prussian carp has an overall high climate match with a Climate 6 ratio of 0.414. This fish species has a high climate match to the Great Lakes region, northern Plains, some western mountain States, and parts of California. The Prussian carp has a medium climate match to much of the United States, including southern Alaska and regions of Hawaii. This species has a very low climate match to the southeastern United States, especially Florida and along the Gulf Coast. This species is not found within the United States but has been recently discovered as established in Alberta, Canada (Elgin et al. 2014); the climate match was run prior to this new information, so the results do not include any actual locations in North America.

If introduced, the Prussian carp is likely to spread and establish as a consequence of its tolerance to poor-quality environments, rapid growth rate, very rare ability to reproduce from unfertilized eggs (gynogenesis), and proven invasiveness outside of the native range.

Potential Impacts to Native Species (including Threatened and Endangered Species)

The Prussian carp is closely related and behaviorally similar to the crucian carp (Godard and Copp 2012). As with crucian carp, introduced Prussian carp may compete with native fish species, alter freshwater ecosystems, and serve as a vector for parasitic infections. Introduced Prussian carp have been responsible for the decreased biodiversity and overall populations of native fish (including native Cyprinidae), invertebrates, and plants (Anseeuw et al. 2007, Lusk et al. 2010). Thus, if introduced to the United States, the Prussian carp will likely affect numerous native Cyprinid species, including chub, dace, shiner, and minnow fish species (Froese and Pauly 2014c). Several of these native Cyprinids, the lauter sturdi dace (Chrosomus saylori) and humpback chub (Gila cypha), are listed as endangered or threatened under the Endangered Species Act.

Potential Impacts to Humans

We have no reports of the Prussian carp being harmful to humans.

Potential Impacts to Agriculture

The Prussian carp may impact agriculture by affecting aquaculture. As mentioned in the Potential Impacts to Native Species section, Prussian carp harbor several types of parasites that may cause physical deformations, decreased growth, and decrease in body condition (Ondračková et al. 2002). Impaired fish physiology and health detract from the productivity and value of commercial aquaculture.
Factors That Reduce or Remove Injuriousness for Prussian Carp

Control

We are not aware of any documented control methods for the Prussian carp. The piscicide rotenone has been used to control the common carp and crucian carp population (Ling 2003) and may be effective against Prussian carp. However, rotenone is not target-specific (Wynne and Masser 2010). Depending on the applied concentration, rotenone kills other aquatic species in the water body. Some fish species are more susceptible than others, and, even if effective against Prussian carp, the use of this piscicide may kill native species (Allen et al. 2006). Control measures that would harm other wildlife are not recommended as mitigation to reduce the injurious characteristics of this species and, therefore, do not meet control measures under the Injurious Wildlife Evaluation Criteria.

Potential Ecological Benefits for Introduction

We are not aware of any documented ecological benefits for the introduction of the Prussian carp.

Factors That Contribute to Injuriousness for Roach

Current Nonnative Occurrences

This species is not found in the United States. The roach has been introduced and become established in England, Ireland, Italy, Madagascar, Morocco, Cyprus, Portugal, the Azores, Spain, and Australia (Rocabayera and Veiga 2012).

Potential Introduction and Spread

Potential introduction pathways include stocking for recreational fishing and use as bait fish. Once introduced, released, or escaped, the roach naturally disperses to new waterways within the watershed.

This species prefers a temperate climate and can reside in a variety of freshwater habitats (Riehl and Baensch 1991). Hydrologic changes, such as weirs and dams that extend aquatic habitats that are otherwise scarce, enhance the potential spread of the roach (Rocabayera and Veiga 2012). The roach has an overall high climate match to the United States with a Climate 6 ratio of 0.387. Particularly high climate matches occurred in southern and central Alaska, the Great Lakes region, and the western mountain States. The Southeast and Southwest have low climate matches. If introduced, the roach is likely to spread and establish due to its highly adaptive nature toward habitat and diet choice, high reproductive potential, ability to reproduce with other cyprinid species, long lifespan, and extraordinary mobility. This species has also proven invasive outside of its native range.

Potential Impacts to Native Species (including Endangered and Threatened Species)

Potential effects to native species from the introduction of the roach include competition over food and habitat resources, hybridization, altered ecosystem nutrient cycling, and parasite and pathogenic bacteria transmission. The roach is a highly adaptive species and will switch between habitats and food sources to best avoid predation and competition from other species (Winfield and Winfield 1994). The roach consumes an omnivorous generalist diet, including benthic invertebrates (especially mollusks), zooplankton, plants, and detritus (Rocabayera and Veiga 2012). With such a varied diet, the roach would be expected to compete with numerous native fish species from multiple trophic levels. The trophic level is the position an organism occupies in a food chain. Such species may include shiners, daces, chubs, and stonerollers, several of which are federally listed as endangered or threatened.

Likewise, introduction of the roach would be expected to detrimentally affect native mollusk species (including mussels and snails), some of which may be federally endangered or threatened. One potentially affected species is the endangered Higgins’ eye pearly mussel (Lampsilis higginsii), which is native to the upper Mississippi River watershed, where there is high climate match for the roach species. Increased competition with and predation on native species may alter trophic cycling and diversity of native aquatic species.

The roach can hybridize with other fish species of its subfamily (Leuciscinae), including rudd and bream (Pitts et al. 1997, Kottelat and Freyhof 2007). In Ireland, the roach has hybridized with the rudd (Scardinius erythrophthalmus) and the bream (Abramis brama); all three are in the subfamily Leuciscinae. Although the bream is not found in the United States, the rudd is already considered invasive in the Great Lakes (Fuller et al. 1999, Kapuscinski et al. 2012). Hybrids of roaches and rudds could exacerbate the potential adverse effects (competition) of each separate species (Rocabayera and Veiga 2012). Furthermore, the roach will likely be able to hybridize with some U.S. native species in the same subfamily, which includes minnows.

Potential Impacts to Humans

We have no reports of the roach being harmful to humans.

Potential Impacts to Agriculture

The roach may affect agriculture by decreasing aquaculture productivity if they are unintentionally introduced into aquaculture operations in the United States, such as when invaded watersheds flood aquaculture ponds or by accidentally being included in a shipment of fish, then outcompeting and preying on the aquacultured fish, spreading pathogens, or hybridizing with farmed fish. Hybridization can reduce the reproductive success and productivity of the commercial fisheries and aquaculture facilities.

Roaches harbor several parasitic infections (Rocabayera and Veiga 2012) that can impair fish physiology and health. The pathogenic bacterium Aeromonas salmonicida infects the roach, causing furunculosis (Wiklund and Dalsgaard 1998). The disease can be spread through a fish’s open sore. This disease affects both farmed and wild fish. The causative bacteria A. salmonicida has been isolated from fish in U.S. freshwaters (USFWS 2011). The roach may spread these parasites and bacteria to new environments and native fish species.

Potential Impacts to Aquatic Environment

Large populations of the roach may alter nutrient cycling in lake ecosystems. Increased populations of roach may prey heavily on zooplankton, thus resulting in increased phytoplankton communities and algal blooms (Rocabayera and Veiga 2012). These changes alter nutrient cycling and can consequently affect native aquatic species that depend on certain nutrient balances.

Several parasitic infections, including worm cataracts, black spot disease, and tapeworms, have been associated with the roach (Rocabayera and Veiga 2012). The pathogenic bacterium Aeromonas salmonicida also infects the roach, causing furunculosis (Wiklund and Dalsgaard 1998). This disease causes skin ulcers and hemorrhaging. The disease can be spread through a fish’s open sore. This disease affects both farmed and wild fish. The causative bacteria A. salmonicida has been isolated from fish in U.S. freshwaters (USFWS 2011). The roach may spread these parasites and bacteria to new environments and native fish species.

Potential Impacts to Aquatic Environment

Large populations of the roach may alter nutrient cycling in lake ecosystems. Increased populations of roach may prey heavily on zooplankton, thus resulting in increased phytoplankton communities and algal blooms (Rocabayera and Veiga 2012). These changes alter nutrient cycling and can consequently affect native aquatic species that depend on certain nutrient balances.

Several parasitic infections, including worm cataracts, black spot disease, and tapeworms, have been associated with the roach (Rocabayera and Veiga 2012). The pathogenic bacterium Aeromonas salmonicida also infects the roach, causing furunculosis (Wiklund and Dalsgaard 1998). This disease causes skin ulcers and hemorrhaging. The disease can be spread through a fish’s open sore. This disease affects both farmed and wild fish. The causative bacteria A. salmonicida has been isolated from fish in U.S. freshwaters (USFWS 2011). The roach may spread these parasites and bacteria to new environments and native fish species.
Factors That Reduce or Remove Injuriousness for Roach

Control
An introduced roach population would be difficult to control (Rocabayera and Veiga 2012). Application of the piscicide rotenone may be effective for limited populations of small fish. However, rotenone is not target-specific (Wynne and Masser 2010). Depending on the applied concentration, rotenone kills other aquatic species in the water body. Some fish species are more susceptible than others, and the use of this piscicide may kill native species. Control measures that would harm other wildlife are not recommended as mitigation to reduce the injurious characteristics of this species and, therefore, do not meet control measures under the Injurious Wildlife Evaluation Criteria.

Potential Ecological Benefits for Introduction
We are not aware of any documented ecological benefits for the introduction of the roach.

Factors That Contribute to Injuriousness for Stone Moroko

Current Nonnative Occurrences
This fish species is not found within the United States. The stone moroko has been introduced and become established throughout Europe and Asia. Within Asia, this fish species is invasive in Afghanistan, Armenia, Iran, Kazakhstan, Laos, Taiwan, Turkey, and Uzbekistan (Copp 2007). In Europe, this fish species’ nonnative range includes Albania, Austria, Belgium, Bulgaria, Czech Republic, Denmark, France, Germany, Greece, Hungary, Italy, Lithuania, Moldova, Montenegro, the Netherlands, Poland, Romania, Russia, Serbia, Slovakia, Spain, Sweden, Switzerland, Ukraine, and the United Kingdom (Copp 2007). The stone moroko’s nonnative range also includes Algeria and Fiji (Copp 2007).

Potential Introduction and Spread
The primary introduction pathways are as unintentional inclusion in the transport water of intentionally stocked fish shipments for both recreational fishing and aquaculture, released or escaped bait, and released or escaped ornamental fish. Once introduced, the stone moroko naturally disperses to new waterways within a watershed. Since the 1960s, this fish has invaded nearly every European country and many Asian countries (Copp et al. 2005).

The stone moroko inhabits a temperate climate (Baensch and Riehl 1993) and a variety of freshwater habitats, including those with poor dissolved oxygen concentrations (Copp 2007). The stone moroko has an overall high climate match to the United States with a Climate 6 ratio of 0.557. This species has a high or medium climate match to most of the United States. The highest matches are in the Southeast, Great Lakes, central plains, and West Coast.

If introduced, the stone moroko is highly likely to establish and spread. This fish species is a habitat generalist and diet generalist and is quick growing, highly adaptable to new environments, and highly mobile. Additionally, the stone moroko has proven invasive outside of its native range (Copp 2007, Kottelat and Freyhof 2007, Witkowski 2011, Yalçın-Ozdilek et al. 2013).

Potential Impacts to Native Species (including Endangered and Threatened Species)

In much of the stone moroko’s nonnative range, the introduction of this species has been linked to the decline of native freshwater fish species (Copp 2007). The stone moroko could potentially adversely affect native species through predation, competition, disease transmission, and altering freshwater ecosystems (Witkowski 2011).

Stone moroko introductions have mostly originated from unintentional inclusion in the transport water of intentionally stocked fish species. In many stocked ponds, the stone moroko actually outcompetes the farmed fish species for food resources, which results in decreased production of the farmed fish (Witkowski 2011). The stone moroko’s omnivorous diet includes insects, fish, fish eggs, molluscs, planktonic crustaceans, algae (Froese and Pauly 2014g), and plants (Kottelat and Freyhof 2007). With this diet, the stone moroko would compete with many native U.S. freshwater fish, including minnow, dace, sunfish, and darter species.

In the United Kingdom, Italy, China, and Russia, the introduction of the stone moroko correlates with dramatic declines in native fish populations and species diversity (Copp 2007). The stone moroko first competes with native fish for food resources and then predates on the eggs, larvae, and juveniles of these same native fish species (Pinder 2005, Britton et al. 2007). In England, where stone morokos were introduced, they dominated the fish community quickly, and the other fish species exhibited decreased birth rates and reproduction, as well as shifts in their trophic levels (Britton et al. 2010b).

The stone moroko is a vector of the pathogenic, rosette-like agent Sphaerothecum destruens (Gozlan et al. 2005, Pinder et al. 2005), which is a documented pathogen of farmed and wild European fish. The stone moroko is a healthy host for this nonspecific pathogen that could threaten aquaculture trade, including that of salmonids (Gozlan et al. 2009). This pathogen infects a fish’s internal organs causing spawning failure, organ failure, and death (Gozlan et al. 2005). This pathogen has been documented as infecting the sunbleak (Leucaspis delineatus), which are native to eastern Europe, and Chinook salmon (Oncorhynchus tshawytscha), Atlantic salmon, and the fathead minnow (Pimephales promelas), all three of which are native to the United States (Gozlan et al. 2005).

The stone moroko consumes large quantities of zooplankton. The declines in zooplankton population results in increased phytoplankton populations, which in turn causes algal blooms and unnaturally high nutrient loads (eutrophication). These changes can cause imbalanced nutrient cycling, decrease dissolved oxygen concentrations, and adversely impact the health of native aquatic species.

Potential Impacts to Humans
We have no reports of the stone moroko being harmful to humans.

Potential Impacts to Agriculture
The stone moroko may affect agriculture by decreasing aquaculture productivity. This species often contaminates farmed fish stocks and competes with the farmed species for food resources, resulting in decreased aquaculture productivity (Witkowski 2011). The stone moroko is an unaffected carrier of the pathogenic, rosette-like agent Sphaerothecum destruens (Gozlan et al. 2005, Pinder et al. 2005). This pathogen is transmitted through water and causes reproductive failure, disease, and death to farmed fish. This pathogen is not species-specific and has been known to infect cyprinid and salmonid fish species. Sphaerothecum destruens is responsible for disease outbreaks in North American salmonids and causes mortality in both juvenile and adult fish (Gozlan et al. 2009). If this pathogen was introduced to an aquaculture facility, it is likely to spread and infect numerous fish, resulting in high mortality. Further research is needed to ascertain this pathogen’s prevalence in the wild environment (Gozlan et al. 2009).
Factors That Reduce or Remove Injuriousness for Stone Moroko

Control

An established, invasive stone moroko population would be both difficult and costly to control (Copp 2007). Additionally, this fish species has a higher tolerance for the piscicide rotenone than most other fish belonging to the cyprinid group (Allen et al. 2006). Application of rotenone for stone moroko control may kill native aquatic fish species. Control measures that would harm other wildlife are not recommended as mitigation to reduce the injurious characteristics of this species and, therefore, do not meet control measures under the Injurious Wildlife Evaluation Criteria.

Potential Ecological Benefits for Introduction

We are not aware of any documented ecological benefits for the introduction of the stone moroko.

Factors That Contribute to Injuriousness for Nile Perch

Current Nonnative Occurrences

This species is not currently found within the United States. The Nile perch is invasive in the Kenyan, Tanzanian, and Ugandan watersheds of Lake Victoria and Lake Kyoga (Africa). This species has also been introduced to Cuba (Welcomme 1998).

Potential Introduction and Spread

This species was stocked in Texas reservoirs, although this population failed to establish (Fuller et al. 1999, Howells 2001). However, with continued release events, we anticipate that the Nile perch is likely to establish in parts of the United States, including the Southeast, Southwest, Hawaii, Puerto Rico, and U.S. Virgin Islands. Likely introduction pathways include use for aquaculture and recreational fishing. Over the past 60 years, the Nile perch has invaded, established, and become the dominant fish species within this species’ nonnative African range (Witte 2013).

The Nile perch prefers a tropical climate and can inhabit a variety of freshwater and brackish habitats (Witte 2013). The Nile perch has an overall medium climate match to the United States with a Climate 6 ratio of 0.038. Of the 11 species in this rule, the Nile perch has the only overall medium climate match. However, this fish species has a high climate match to the Southeast (Florida and Gulf Coast), Southwest (California), Hawaii, Puerto Rico, and the U.S. Virgin Islands.

If introduced into the United States, the Nile perch is likely to establish and spread due to this species’ nature as a habitat generalist and generalist predator, long lifespan, quick growth rate, high reproductive potential, extraordinary mobility, and proven invasiveness outside of the species’ native range (Witte 2013, Asíla and Ogari 1988, Ribbinick 1982).

Potential Impacts to Native Species (including Endangered and Threatened Species)

Potential impacts of introduction of the Nile perch include outcompeting and preying on native species, altering habitats and trophic systems, and disrupting ecosystem nutrient cycling. The Nile perch can produce up to 15 million eggs per breeding cycle (Asíla and Ogari 1988), likely contributing to this species’ efficiency and effectiveness in establishing an introduced population.

Historical evidence from the Lake Victoria (Africa) basin indicate that the Nile perch outcompeted and preyed on at least 200 endemic fish species, leading to their extinction (Kaufman 1992, Snoeks 2010, Witte 2013). Many of the affected species were haplochromine cichlid fish species, and the populations of native lung fish (Protopterus aethiopicus) and catfish species (Bagrus docmak, Xenoclarias eupogon, Synodontis victoria) also witnessed serious declines (Witte 2013). By the late 1980s, only three fish species, including the cyprinid Rastrineobolas argentea and the introduced Nile perch and Nile tilapia (Oreochromis niloticus), were common in Lake Victoria (Witte 2013).

The haplochromine cichlid species comprised 15 subtrophic groups with varied food (detritus, phytoplankton, algae, plants, mollusks, zooplankton, insects, prawns, crabs, fish, and parasites) and habitat preferences (Witte and Van Oljen 1990, Van Oljen 1996). The depletion of so many fish species has drastically altered the Lake Victoria ecosystem’s trophic-level structure and biodiversity. These changes resulted in abnormally high lake eutrophication and frequency of algal blooms (Witte 2013).

The depletion of the native fish species in Lake Victoria by Nile perch led to the loss of income and food for local villagers. Nile perch was not a suitable replacement for traditional fishing. Fishing for this larger species required equipment that was prohibitively more expensive, required processing that could not be done by the wife and children, required the men to be away for extended periods, and decreased the availability of fish for household consumption (Witte 2013).

If introduced into the United States, Nile perch are expected to prey on small native fish species, such as mudminnows, cyprinids, sunfishes, and darters. Nile perch would likely prey on, compete with, and decrease the species diversity of native cyprinid fish. Nile perch are expected to compete with larger native fish species, including largemouth bass (Micropterus salmoides) and smallmouth bass (Micropterus dolomieu), blue catfish (Ictalurus furcatus), channel catfish (Ictalurus punctatus), and flathead catfish (Pylodictis olivaris). These native fish species are not only economically important to both commercial and recreational fishing, but are integral components of freshwater ecosystems.

Potential Impacts to Humans

We have no reports of the Nile perch being harmful to humans.

Potential Impacts to Agriculture

We are not aware of any reported effects to agriculture. However, Nile perch may affect aquaculture if they are unintentionally introduced into aquaculture operations in the United States, such as when invaded watersheds flood aquaculture ponds or by accidentally being included in a shipment of fish, by outcompeting and preying on the aquacultured fish.

Factors That Reduce or Remove Injuriousness for Nile Perch

Control

Nile perch grow to be large fish with a body length of 2 m (6 ft) and maximum weight of 200 kg (440 lb) (Ribbinick 1987). Witte (2013) notes that this species would be difficult and costly to control. We are not aware of any documented reports of successfully controlling or eradicating an established Nile perch population.

Potential Ecological Benefits for Introduction

We are not aware of any documented ecological benefits for the introduction of the Nile perch.

Factors That Contribute to Injuriousness for the Amur Sleeper

Current Nonnative Occurrences

This species has not been reported within the United States. The Amur sleeper is invasive in Europe and Asia in the countries of Belarus, Bulgaria, Croatia, Estonia, Hungary, Latvia, Lithuania, Moldova, Poland, Romania, Serbia, Slovakia, Ukraine, Russia, and Japan.
Potential Introduction and Spread

Although the Amur sleeper has not yet been introduced to the United States, the likelihood of introduction, release, or escape is high as evidenced by the history of introduction over a broad geographic region of Eurasia. Since its first introduction outside of its native range in 1916, the Amur sleeper has invaded 15 Eurasian countries and become a widespread, invasive fish throughout European freshwater ecosystems (Copp et al. 2005, Grabowska 2011). The introduction of the Amur sleeper has been attributed to release and escape of aquarium and ornamental fish, unintentional and intentional release of Amur sleepers used for bait, and the unintentional inclusion in the transport water of intentionally stocked fish (Reshetnikov 2004, Grabowska 2011, Reshetnikov and Ficetola 2011).

Once this species has been introduced, it has proven to be capable of establishing (Reshetnikov 2004). The established populations can have rapid rates of expansion. Upon introduction into the Vistula River in Poland, the Amur sleeper expanded its range by 44 km (27 mi) the first year and up to 197 km (122 mi) per year thereafter (Grabowska 2011).

Most aquatic species are constrained in distribution by temperature, dissolved oxygen levels, and lack of flowing water. However, the Amur sleeper has a wide water temperature preference (Baensch and Riehl 2004), can live in poorly oxygenated waters, and may survive in dried-out or frozen water bodies by burrowing into and hibernating in the mud (Grabowska 2011). The Amur sleeper has an overall high climate match to the United States with a Climate 6 ratio of 0.376. The climate match is highest in the Great Lakes region (Ohio, Indiana, Illinois, Michigan, Wisconsin, and Minnesota), central and high Plains (Iowa, Nebraska, and Missouri), western mountain States (South Dakota, North Dakota, Montana, Wyoming, and Colorado), and central to eastern Alaska.

If introduced, the Amur sleeper would be expected to establish and spread in the wild due to this species’ ability as a habitat generalist, generalist predator, rapid growth, high reproductive potential, adaptability to new environments, extraordinary mobility, and a history of invasiveness outside of the native range.

Potential Impacts to Native Species (including Endangered and Threatened Species)

The Amur sleeper is a voracious generalist predator whose diet includes crustaceans, insects, and larvae of mollusks, fish, and amphibian tadpoles (Bogutskaya and Naseka 2002, Reshetnikov 2008). Increased predation with the introduction of the Amur sleeper has resulted in decreased species richness and decreased population of native fish (Grabowska 2011). In some areas, the Amur sleeper’s eating habits have been responsible for the dramatic decline in juvenile fish and amphibian species (Reshetnikov 2003). Amur sleepers prey on juvenile stages and can cause decreased reproductive success and reduced populations of the native fish and amphibians (Mills et al. 2004). Declining lower trophic-level populations (invertebrates) also result in increased competition among native predatory fish, including the European mudminnow (Umbra krameri) (Grabowska 2011).

Two species similar to the European mudminnow, the eastern mudminnow (Umbra pygmaea) and the central mudminnow (Umbra limi), are native to the eastern United States. Both of these species are integral members of freshwater ecosystems, with the eastern mudminnow ranging from New York to Florida (Froese and Pauly 2014a), and the central mudminnow residing in the freshwater of the Great Lakes, Hudson Bay, and Mississippi River basins (Froese and Pauly 2014a). Introduced Amur sleepers could prey on and reduce the population of native U.S. mudminnow species.

The introduction or establishment of the Amur sleeper is also expected to reduce native wildlife biodiversity. In the Selenga River (Russia), the Amur sleeper competes with the native Siberian roach (Rutilus rutilus lacustris) and Siberian dace (Leuciscus leuciscus baikalensis) for food resources. This competition results in decreased populations of native fish species, which may result in economic losses and negative effects on commercial fisheries (Litvinov and O’Gorman 1996, Grabowska 2011).

Species similar to Siberian roach and Siberian dace that are native to the United States include those of the genus Chrosomus, such as the blackside dace (Chrosomus cumberlandensis), northern redbelly dace (C. eos), southern redbelly dace (C. erythrogaster), and Tennessee dace (C. tennesseensis). Like with the Siberian roach and the Siberian dace, introduced populations of the Amur sleeper may compete with native dace fish species, resulting in population declines of these native species.

Additionally, the Amur sleeper harbors parasites, including Nippotaenia mogurnda and Gyrodactylus percotti. The introduction of the Amur sleeper has resulted in the simultaneous introduction of both parasites to the Amur sleeper’s nonnative range. These parasites have expanded their own nonnative range and successfully infected new hosts of native fish species (Kosuthová et al. 2008).

Potential Impacts to Humans

We have no reports of Amur sleeper being harmful to humans.

Potential Impacts to Agriculture

The Amur sleeper may affect agriculture by decreasing aquaculture productivity. This fish species hosts parasites, including Nippotaenia mogurnda and Gyrodactylus percotti. These parasites may switch hosts (Kosuthová et al. 2008) and infect farmed species involved in aquaculture. Increased parasite load impairs a fish’s physiology and general health, and consequently may decrease aquaculture productivity.

Factors That Reduce or Remove Injuriosity for Amur Sleeper

Control

Once introduced and established, it would be difficult, if not impossible, to control or eradicate the Amur sleeper. All attempts to eradicate the Amur sleeper once it had established a reproducing population have been unsuccessful (Litvinov and O’Gorman 1996). Natural predators include pike, snakeheads, and perch (Bogutskaya and Naseka 2002). Not all freshwater systems have these or similar predatory species, and thus would allow the Amur sleeper population to be uncontrolled.

Some studies have indicated that the Amur sleeper may be eradicated by adding calcium chloride (CaCl₂) or ammonium hydroxide (NH₄OH) to the water body (Grabowska 2011). However, this same study found that the Amur sleeper was one of the most resistant fish species to either treatment. Thus, the use of either treatment would likely negatively affect many other native organisms and is not considered a viable option. Control measures that would harm other wildlife are not recommended as mitigation to reduce the injurious characteristics of this species and, therefore, do not meet control measures under the Injurious Wildlife Evaluation Criteria.
Potential Ecological Benefits for Introduction

We are not aware of any documented ecological benefits for the introduction of the Amur sleeper.

Factors That Contribute to Injuriousness for European Perch

Current Nonnative Occurrences

This fish species is not found within the United States. However, the European perch has been introduced and become established in several countries, including Ireland, Italy, Spain, Australia, New Zealand, China, Turkey, Cyprus, Morocco, Algeria, and South Africa.

Potential Introduction and Spread

The main pathway of introduction is through stocking for recreational fishing. Once stocked, this fish species has expanded its nonnative range by swimming through connecting waterbodies to new areas within the same watershed.

The European perch prefers a temperate climate (Riehl and Baensch 1991, Froese and Pauly 2014k). This species can reside in a wide variety of aquatic habitats ranging from freshwater to brackish water (Froese and Pauly 2014k). The European perch has an overall high climate match to the United States, with a Climate 6 ratio of 0.438, with locally high matches to the Great Lakes region, central Texas, western mountain States, and southern and central Alaska. Hawaii ranges from low to high matches. Much of the rest of the country has a medium climate match.

If introduced to the United States, the European perch is likely to spread and establish in the wild as a generalist predator that is able to adapt to new environments and outcompete native fish species. Additionally, this species has proven to be invasive outside of its native range.

Potential Impacts to Native Species (including Threatened and Endangered Species)

The European perch can impact native species through outcompeting and preying on them and by transmitting disease. This introduced fish species competes with other European native species for both food and habitat resources (Closs et al. 2003) and has been implicated in the local extirpation (in Western Australia) of the Macquarie perch (Macquaria australasica) in their native habitats. The continued spread of this virus (with the introduction of the European perch) has been partly responsible for declining populations of native Australian fish species (NSW DPI 2013). This virus is currently restricted to Australia but could expand its international range with the introduction of the European perch to new waterways where native species would have no natural resistance.

Potential Impacts to Humans

We have no reports of the European perch being harmful to humans.

Potential Impacts to Agriculture

The European perch may affect agriculture by decreasing aquaculture productivity. The European perch may potentially spread the viral disease EHN (NSW DPI 2013) to farmed fish in aquaculture facilities. Although this virus is currently restricted to Australia, this disease can cause mass fish mortalities and is known to affect other fish species (NSW DPI 2013).

Factors That Reduce or Remove Injuriousness for European Perch

Control

It would be extremely difficult to control or eradicate a population of European perch. However, Closs et al. (2003) examined the feasibility of physically removing (by netting and trapping) European perch from small freshwater environments. Although these researchers were able to reduce population numbers through repeated removal efforts, European perch were not completely eradicated from any of the freshwater lakes. Biological controls or chemicals might be effective; however, they would also have lethal effects on native aquatic species. Control measures that would harm other wildlife are not recommended as mitigation to reduce the injurious characteristics of this species and, therefore, do not meet control measures under the Injurious Wildlife Evaluation Criteria.

Potential Ecological Benefits for Introduction

We are not aware of any documented ecological benefits for the introduction of the European perch.

Factors That Contribute to Injuriousness for Zander

Current Nonnative Occurrences

The zander was intentionally introduced into Spiritwood Lake (North Dakota) in 1989 for recreational fishing. The North Dakota Game and Fish Department reports that a small, established population occurs in this lake (Fuller 2009) and that a 32-in (81.3-cm) zander was caught by an angler in 2013 (North Dakota Game and Fish 2013). This was the largest zander in the lake reported to date, which could indicate that the species is finding suitable living conditions. We are not aware of any other occurrences of zanders within the United States. This fish species has been introduced and become established through much of...
Europe, regions of Asia (China, Kyrgyzstan, and Turkey), and Africa (Algeria, Morocco, and Tunisia). Within Europe, zanders have established populations in Belgium, Bulgaria, Croatia, Cyprus, Denmark, France, Italy, the Netherlands, Portugal, the Azores, Slovenia, Spain, Switzerland, and the United Kingdom.

Potential Introduction and Spread

The zander has been introduced to the United States, and a small population exists in Spiritwood Lake, North Dakota. Primary pathways of introduction have originated with recreational fishing and aquaculture stocking. The zander has also been introduced to control unwanted cyprinids (Godard and Copp 2011). Additionally, the zander disperse unaided into new waterways.

The zander prefers a temperate climate (Froese and Pauly 2014). This species resides in a variety of freshwater and brackish environments, including turbid waters with increased nutrient concentrations (Godard and Copp 2011). The overall climate match to the United States is high with a Climate 6 ratio of 0.374. The zander has high climate matches in the Great Lakes region, northern Plains, western mountain States, and Pacific Northwest. Medium climate matches include southern Alaska, western mountain States, central Plains, and mid-Atlantic and New England regions. Low climate matches occur in Florida, along the Gulf Coast, and desert Southwest regions.

If introduced, the zander would likely establish and spread as a consequence of its nature as a generalist predator, ability to hybridize with multiple fish species, extraordinary mobility, long lifespan (maximum 24 years) (Godard and Copp 2011), and proven invasiveness outside of the native range.

Potential Impacts to Native Species (including Endangered and Threatened Species)

The zander may affect native fish species by outcompeting and preying on them, transferring pathogens to them, and hybridizing with them. The zander is a top-level predator and competes with other native piscivorous fish species. In Western Europe, increased competition from introduced zanders resulted in population declines of native northern pike and European perch (Linfield and Rickards 1979). If introduced to the United States, the zander is projected to compete with native top-level predators such as the closely related walleye (Sander vitreus), sauger (Sander canadensis), and northern pike.

The zander’s diet includes juvenile smelt, ruffe, European perch, vendace, roach, and other zanders (Kangur and Kangur 1998). The zander also feeds on juvenile brown trout and Atlantic salmon (Jepsen et al. 2000; Koed et al. 2002). Increased predation on juvenile and young fish disrupts the species’ life cycle and reproductive success. Decreased reproductive success results in decreased populations (and sometimes extinction) (Crivelli 1995) of native fish species. If introduced, zander could decrease native populations of cyprinids (minnows, daces, and chub species), salmonids (Atlantic salmon and species of Pacific salmon (Oncorhynchus spp.), and yellow perch.

The zander is a vector for the trematode parasite Bucephalus polymorphus (Poulet et al. 2009), which has been linked to decreased native cyprinid populations in France (Lambert 1997, Kvach and Mierzejewska 2011). This parasite may infect native cyprinid species and result in their population declines.

The zander can hybridize with both the European perch and Volga perch (Sander volgensis) (Godard and Copp 2011). Our native walleye and sauger also hybridize (Hearn 1986, Van Zee et al. 1996, Fiss et al. 1997), providing further evidence that species of this genus can readily hybridize. Hence, there is concern that zander may hybridize with walleye (Fuller 2009) and sauger (P. Fuller, pers. comm. 2015). Zander hybridizing with native species could result in irreversible changes to the genetic structure of native species (Schwenk et al. 2008). Hybridization can reduce the fitness of a native species and, in some cases, has resulted in drastic population declines leading to endangered classification and, in rare cases, even extinction (Mooney and Cleland 2001).

Potential Impacts to Humans

We are not aware of any documented reports of the zander being harmful to humans.

Potential Impacts to Agriculture

The zander may impact agriculture by affecting aquaculture. This species is a vector for the trematode parasite Bucephalus polymorphus (Poulet et al. 2009), which has been linked to decreased native cyprinid populations in France (Lambert 1997, Kvach and Mierzejewska 2011). This parasite may infect and harm native U.S. cyprinid species involved in the aquaculture industry.

Factors That Reduce or Remove Injuriousness for Zander

Control

An established population of zanders would be both difficult and costly to control (Godard and Copp 2011). In the United Kingdom (North Oxford Canal), electrofishing was unsuccessful at eradicating localized populations of zander (Smith et al. 1996).

Potential Ecological Benefits for Introduction

Zanders have been stocked for biomanipulation of small planktivorous fish (cyprinid species) in a small, artificial impoundment in Germany to improve water transparency with some success (Drenner and Hambright 1999). However, in their discussion on using zanders for biomanipulation, Mehner et al. (2004) state that the introduction of nonnative predatory species, which includes the zander in parts of Europe, is not recommended for biodiversity and bioconservation purposes. We are not aware of any other documented ecological benefits of a zander introduction.

Factors That Contribute to Injuriousness for Wels Catfish

Current Nonnative Occurrences

This fish species is not found in the wild in the United States. The wels catfish has been introduced and become established in China; Algeria, Syria, and Tunisia; and the European countries of Belgium, Bosnia-Herzegovina, Croatia, Cyprus, Denmark, Finland, France, Italy, Portugal, Spain, and the United Kingdom (Rees 2012).

Potential Introduction and Spread

The wels catfish has not been introduced to U.S. ecosystems. Potential pathways of introduction include stocking for recreational fishing and aquaculture. This catfish species has also been introduced for biocontrol of cyprinid species in Belgium and through the aquarium and pet trade (Rees 2012). Wels catfish were introduced as a biocontrol for cyprinid fish in the Netherlands, where it became invasive (Rees 2012). Once introduced, this fish species can naturally disperse to connected waterways.

The wels catfish prefers a temperate climate. This species inhabits a variety of freshwater and brackish environments. This species has an overall high climate match in the United States with a Climate 6 ratio of 0.302. High climate matches occur in the Great Lakes, western mountain States, West Coast, and southern Alaska. All other
regions had a medium or low climate match.

If introduced, the wels catfish is likely to establish and spread. This species is a generalist predator and fast growing, with proven invasiveness outside of the native range. Additionally, this species has a long lifespan (15 to 30 years, maximum of 80 years) (Kottelat and Freyhof 2007). This species has an extremely high reproductive rate (30,000 eggs per kg of body weight), with the maximum recorded at 700,000 eggs (Copp et al. 2009). The wels catfish is highly adaptable to new warmwater environments, including those with low dissolved oxygen levels (Rees 2012). The invasive success of this species is likely to be further enhanced by increases in water temperature expected to occur with climate change (Rahel and Olden 2008, Britton et al. 2010a).

Potential Impacts to Native Species (including Threatened and Endangered Species)

The wels catfish may affect native species through outcompeting and preying on native species, transferring diseases to them, and altering their habitats. This catfish is a giant predatory fish (maximum 5 m (16.4 ft), 306 kg (675 lb)) (Copp et al. 2009; Rees 2012) that will likely compete with other top trophic-level, native predatory fish for both food and habitat resources. Stable isotope analysis, which assesses the isotopes of carbon and nitrogen from food sources and consumers to determine trophic-level cycling, suggests that the wels catfish has the same trophic position as the northern pike (Svyranta et al. 2010). Thus, U.S. native species at risk of competition with the wels catfish are top predatory piscivores and may include species such as the northern pike, walleye, and sauger. Additionally, the wels catfish can be territorial and unwilling to share habitat with other fish (Copp et al. 2009).

Typically utilizing an ambush technique but also known to be an opportunistic scavenger (Copp et al. 2009), the wels catfish are generalist predators and may consume native invertebrates, fish, crayfish, eels, small mammals, birds (Copp et al. 2009), and amphibians (Rees 2012). In France, the stomach contents of wels catfish revealed a preference for cyprinid fish, mollusks, and crayfish (Svyranta et al. 2010). Birds, amphibians, and small mammals also contributed to the diet of these catfish (Copp et al. 2009). This species has been observed beaching itself to prey on land birds on a river bank (Cucherousset 2012). Native cyprinid fish potentially affected include native chub, dace, and minnow fish species, some of which are federally endangered or threatened. Native freshwater mollusks and amphibians may also be affected, some of which are also federally endangered or threatened. Increased predation on native cyprinids, mollusks, crustaceans, and amphibians can result in decreased species diversity and increased food web disruption.

The predatory nature of the wels catfish may also lead to species extirpation (local extinction) or the extinction of native species. In Lake Bushko (Bosnia), the wels catfish is linked to the extirpation of the endangered minnow-nase (Chondrostoma phoxinus) (Froese and Pauly 2014m). Although nase species are native to Europe, the subfamily Leuciscinae includes several native U.S. species, such as dace and shiner species, which may be similar enough to serve as prey for the catfish.

The wels catfish is a carrier of the virus that causes SVC and may transmit this virus to native fish (Hickley and Chare 2004). The spread of SVC can deplete native fish stocks and disrupt the ecosystem food web. SVC transmission would further compound adverse effects of both competition and predation by adding disease to already-stressed native fish.

Additionally, this catfish species excretes large amounts of phosphorus and nitrogen to the freshwater environment (Schaus et al. 1997, McIntyre et al. 2008). In France, where wels catfish is invasive, this large species aggregates in groups averaging 25 individuals, thus creating the highest biogeochemical hotspots ever reported for freshwater systems for phosphorus and nitrogen (Boulêtreau et al. 2011). Excessive nutrient input can disrupt nutrient cycling and transport (Boulêtreau et al. 2011) that can result in increased eutrophication, increased frequency of algal blooms, and decreased dissolved oxygen levels. These decreases in water quality can affect both native fish and mollusks.

Potential Impacts to Humans

Wels catfish can achieve a giant size, have large mouths, and are able to beach themselves to hunt and return to the water. There are anecdotal reports of exceptionally large wels catfish biting or dragging people into the water, as well as reports of a human body in a wels catfish’s stomach, although it is not known if the person was attacked or scavenged after drowning (Der Standard 2006; Zaragoza Province in 1984 and 1985 (Souty-Grosset et al. 2006). This crayfish species became established in Spain after repeated introduction to the Zaragoza Province in 1984 and 1985 (Souty-Grosset et al. 2006).

Potential Introduction and Spread

The common yabby has moved throughout Australia, and its nonnative range extends to New South Wales east of the Great Dividing Range, Western Australia, and Tasmania. This crayfish species was introduced to Western Australia in 1932, for commercial farming for food from where it escaped and established in rivers and irrigation dams (Souty-Grosset et al. 2006). Outside of Australia, this species has been introduced to China, South Africa, Zambia, Italy, Spain, and Switzerland (Gherardi 2012) for aquaculture and fisheries (Gherardi 2012). The first European introduction occurred in 1983, when common yabbies were transferred from a California farm to a pond in Girona, Catalonia (Spain) (Souty-Grosset et al. 2006). This crayfish species became established in Spain after repeated introduction to the Zaragoza Province in 1984 and 1985 (Souty-Grosset et al. 2006).
The common yabby is present or established in the wild within California. Primary pathways of introduction include importation for aquaculture, aquariums, bait, and research. Once it is found in the wild, the yabby can disperse on its own in water or on land.

The common yabby prefers a tropical climate but tolerates a wide range of water temperatures from 1 to 35 °C (34 to 95 °F) (Withnall 2000). This crayfish can also tolerate both freshwater and brackish environments with a wide range of dissolved oxygen concentrations (Mills and Geddes 1980). The overall climate match to the United States was high, with a Climate 6 ratio of 0.209 with a high climate match to the central Appalachians and Texas.

If introduced, the common yabby is likely to establish and spread within U.S. waters. This crayfish species is a true diet generalist with a diet of plant material, detritus, and zooplankton that varies with seasonality and availability (Beatty 2005). Additionally, this species has a quick growth (Beatty 2005) and maturity rate, high reproductive potential, and history of invasiveness outside of the native range. The invasive range of the common yabby is expected to expand with climate change (Gherardi 2012). The yabby can also hide for years in burrows up to 5 m (16.4 ft) deep during droughts, thus essentially being invisible to anyone looking to survey or control them (NSW DPI 2015).

**Potential Impacts to Native Species (including Endangered and Threatened Species)**

Potential impacts to native species from the common yabby include outcompeting native species for habitat and food resources, preying on native species, transmitting disease, and altering habitat. Competition between crayfish species is often decided by body size and chela (pincer claw) size (Lynas 2007, Gherardi 2012). The common yabby has large chelae (Austin and Knott 1996) and quick growth rate (Beatty 2005), allowing this species to outcompete smaller, native crayfish species. This crayfish species will exhibit aggressive behavior toward other crayfish species (Gherardi 2012). In laboratory studies, the common yabby successfully evicted the smooth marron (Cherax cainii) and gilgie (Cherax quinquecarinatus) crayfish species from their burrows (Lynas et al. 2007). Thus, introduced common yabbies may compete with crustaceans for burrowing space and, once established, aggressively defend their territory.

The common yabby consumes a similar diet to other crayfish species, resulting in competition over food resources. However, unlike most other crayfish species, the common yabby switches to an herbivorous, detritus diet when preferred prey is unavailable (Beatty 2006). This prey-switching allows the common yabby to outcompete native species (Beatty 2006). If introduced, the common yabby could affect macroinvertebrate richness, remove surface sediment deposits resulting in increased benthic algae, and compete with native crayfish species for food, space, and shelter (Beatty 2006). Forty-eight percent of U.S. native crayfish are considered imperiled (Taylor et al. 2007, Johnson et al. 2013). The yabby’s preference for small fishes, such as eastern mosquitofish Gambusia holbrooki (Beatty 2006), could pose a potential threat to small native fishes.

The common yabby eats plant detritus, algae and macroinvertebrates (such as snails) and small fish (Beatty 2006). Increased predation pressure on macroinvertebrates and fish may reduce populations to levels that are unable to sustain a reproducing population. Reduced populations or the disappearance of certain native species further alters trophic-level cycling. For instance, species of freshwater snails are food sources for numerous aquatic animals (fish, turtles) and also may be used as an indicator of good water quality (Johnson 2009). However, in the past century, more than 500 species of North American freshwater snails have become extinct or extirpated, vulnerable, threatened, or endangered by the American Fisheries Society (Johnson et al. 2013). The most substantial population declines have occurred in the southeastern United States (Johnson 2009), where the common yabby has a medium to high climate match. Introductions of the common yabby could further exacerbate population declines of snail species.

In laboratory simulations, this crayfish species also exhibited aggressive and predatory behavior toward turtle hatchlings (Bradzell et al. 2002). These results spurred concern about potential aggressive and predatory interactions in Western Australia between the invasive common yabby and that country’s endangered western swamp turtle (Pseudemydura umbrina) (Bradzell et al. 2002). These six freshwater turtle species that are federally listed in the United States (USFWS Final Environmental Assessment 2016), all within the yabby’s medium or high climate match. The common yabby is susceptible to the crayfish plague (Aphanomyces astaci), which affects European crayfish stocks (Souty-Grosset et al. 2006). North American crayfish are known to be chronic, unaffected carriers of the crayfish plague (Souty-Grosset et al. 2006). However, the common yabby can carry other diseases and parasites, including burn spot disease Psorospermium sp. (Jones and Lawrence 2001), Cherax destructor bacilliform virus (Edgerton et al. 2002), Cherax destructor systemic parvo-like virus (Edgerton et al. 2002), Pleistophora sp., microsporidian (Edgerton et al. 2002), Thekolabia sp. (Jones and Lawrence 2001, Edgerton et al. 2002, Moodie et al. 2003), Vavraia parastacida (Edgerton et al. 2002), Microphallus minutus (Edgerton et al. 2002), Polymorphus biziurie (Edgerton et al. 2002), and many others (Jones and Lawrence 2001, Longshaw 2011).

**Potential Impacts to Agriculture**

The common yabby’s burrowing behavior undermines levees, berms, and earthen dams (Withnall 2000). Several crayfish species, including the common yabby, can live in contaminated waters and accumulate high heavy-metal contaminants within their tissues (King et al. 1999, Khan and Nugegoda 2003, Gherardi 2012, Gherardi 2011). The contaminants can then pass on to humans if they eat these crayfish. Heavy metals vary in toxicity to humans, ranging from no or little effect to causing skin irritations, reproductive failure, organ failure, cancer, and death (Hu 2002, Martin and Griswold 2009). While the common yabby may directly impact human health by transferring metal contaminants within their tissues to food through consumption (Gherardi 2012) and may require consumption advisories, these advisories are not expected to be more stringent than those for crayfish species that are not considered injurious and, thus, we do not find that common yabby are injurious to humans.

**Potential Impacts to Humans**

The common yabby may affect agriculture by decreasing aquaculture productivity. The common yabby can host to a variety of diseases and parasitic infections, including the
crayfish plague, burn spot disease, Psorospermium sp., and thelohaniasis (Jones and Lawrence 2001, Souty-Grosset et al. 2006). These diseases and parasitic infections can be contagious to other crayfish species (Vogt 1999), resulting in impaired physiological functions and death. Crayfish species (such as red swamp crayfish (Procambarus clarkii)) are involved in commercial aquaculture, and increased incidence of death and disease would reduce this industry’s productivity and value.

Factors That Reduce or Remove Injuriousness for the Common Yabby

Control

In Europe, two nonnative populations of the common yabby have been eradicated by introducing the crayfish plague. Since this plague is not known to affect North American crayfish species (although they are carriers), this tactic may be effective against an introduced common yabby population (Souty-Grosset et al. 2006). However, this control method is not recommended because it could introduce the pathogen that causes this disease into the environment and has the potential to mutate and harm native crayfish. Control measures that would harm native wildlife are not recommended as mitigation to reduce the injurious characteristics of this species and, therefore, do not meet control measures under the Injurious Wildlife Evaluation Criteria.

Potential Ecological Benefits for Introduction

We are not aware of any potential ecological benefits for introduction of the common yabby.

Conclusions for the 11 Species

**Crucian Carp**

The crucian carp is highly likely to survive in the United States. This fish species prefers a temperate climate and has a native range that extends through north and central Europe. The crucian carp has a high climate match throughout much of the continental United States, Hawaii, and southern Alaska. If introduced, the crucian carp is likely to become established and spread due to its ability as a habitat generalist, diet generalist, and adaptability to new environments, long lifespan, and proven invasiveness outside of its native range.

The Service finds the crucian carp to be injurious to agriculture and to wildlife and wildlife resources of the United States because the crucian carp:

- Is likely to escape or be released into the wild;
- Is able to survive and establish outside of its native range;
- Is successful at spreading its range;
- Has negative impacts of competition, hybridization, and disease transmission on native wildlife (including endangered and threatened species);
- Has negative impacts on humans by reducing wildlife diversity and the benefits that nature provides; and
- Has negative impacts on agriculture by affecting aquaculture.

**Prussian Carp**

The Prussian carp is highly likely to survive in the United States. This fish species prefers a temperate climate and has a current range (native and nonnative) that extends throughout Eurasia. In the United States, the Prussian carp has a high climate match to the Great Lakes region, central Plains, western mountain States, and California. This fish species has a medium climate match to much of the continental United States, southern Alaska, and regions of Hawaii. Prussian carp have already established in southern Canada near the U.S. border, validating the climate match in northern regions. If introduced, the Prussian carp is likely to establish and spread due to its tolerance to poor-quality environments, rapid growth rate, ability to reproduce from unfertilized eggs, and proven invasiveness outside of its native range.

The Service finds the Prussian carp to be injurious to agriculture and to wildlife and wildlife resources of the United States because the Prussian carp:

- Is likely to escape or be released into the wild;
- Is able to survive and establish outside of its native range;
- Is successful at spreading its range;
- Has negative impacts of competition, habitat alteration, hybridization, and disease transmission on native wildlife (including threatened and endangered species);
- Has negative impacts on humans by reducing wildlife diversity and the benefits that nature provides; and
- Has negative impacts on agriculture by affecting aquaculture.

In addition, preventing, eradicating, or reducing established populations of the Prussian carp, controlling its spread to new locations, or recovering ecosystems affected by this species would be difficult.

**Roach**

The roach is highly likely to survive in the United States. This fish species prefers a temperate climate and has a current range (native and nonnative) throughout Europe, Asia, Australia, Morocco, and Madagascar. The roach has a high climate match to southern states (including Washington, the Great Lakes region, and western mountain States), and a medium climate match to most of the United States. If introduced, the roach is likely to establish and spread due to its highly adaptive nature toward habitat and diet choice, high reproductive potential, ability to reproduce with other cyprinid species, long lifespan, mobility, and
proven invasiveness outside of its native range.

The Service finds the roach to be injurious to agriculture and to wildlife and wildlife resources of the United States because the roach:

- is likely to escape or be released into the wild;
- is able to survive and establish outside of its native range;
- is successful at spreading its range;
- has negative impacts of competition, predation, hybridization, altered habitat resources, and disease transmission on native wildlife (including endangered and threatened species);
- has negative impacts on humans by reducing wildlife diversity and the benefits that nature provides; and
- has negative impacts on agriculture by affecting aquaculture.

In addition, preventing, eradicating, or reducing established populations of the roach, controlling its spread to new locations, or recovering ecosystems affected by this species would be difficult.

**Stone Moroko**

The stone moroko is highly likely to survive in the United States. This fish species prefers a temperate climate and has a current range (native and nonnative) throughout Europe, Asia, and Fiji. The stone moroko has a high climate match to the southeastern United States, Great Lakes region, central Plains, northern Texas, desert Southwest, and West Coast. If introduced, the stone moroko is likely to establish and spread due to its traits as a habitat generalist, diet generalist, rapid growth rate, high reproductive potential, extraordinary mobility, and proven invasiveness outside of its native range.

The Service finds the stone moroko to be injurious to the interests of wildlife and wildlife resources of the United States because the stone moroko:

- is likely to escape or be released into the wild;
- is able to survive and establish outside of its native range;
- is successful at spreading its range;
- has negative impacts of competition, predation, and habitat alteration on native wildlife (including endangered and threatened species); and
- has negative impacts on humans by reducing wildlife diversity and the benefits that nature provides.

In addition, preventing, eradicating, or reducing established populations of the stone moroko, controlling its spread to new locations, or recovering ecosystems affected by this species would be difficult.

**Nile Perch**

The Nile perch is highly likely to survive in the United States. This fish species is a tropical invasive, and its current range (native and nonnative) includes much of central, western, and eastern Africa. In the United States, the Nile perch has an overall medium climate match to the United States. However, this fish species has a high climate match to the Southeast, California, Hawaii, Puerto Rico, and the U.S. Virgin Islands. If introduced, the Nile perch is likely to establish and spread due to its nature as a habitat generalist, generalist predator, long lifespan, quick growth rate, high reproductive potential, extraordinary mobility, and proven invasiveness outside of its native range.

The Service finds the Nile perch to be injurious to agriculture and to wildlife and wildlife resources of the United States because of the Nile perch:

- Past history of being released into the wild;
- ability to survive and establish outside of its native range;
- success at spreading its range;
- negative impacts of competition, predation, and disease transmission on native wildlife (including endangered and threatened species);
- negative impacts on humans by reducing wildlife diversity and the benefits that nature provides; and
- negative impacts on agriculture by affecting aquaculture.

In addition, preventing, eradicating, or reducing established populations of the Nile perch, controlling its spread to new locations, or recovering ecosystems affected by this species would be difficult.

**European Perch**

The European perch is highly likely to survive in the United States. This fish species prefers a temperate climate and has a current range (native and nonnative) throughout Europe, Asia, Australia, New Zealand, South Africa, and Morocco. In the United States, the European perch has a medium to high climate match to the majority of the United States except the desert Southwest. This species has especially high climate matches in the southeastern United States, Great Lakes region, central to southern Texas, western mountain States, and southern to central Alaska. If introduced, the European perch is likely to establish and spread due to its nature as a generalist predator, ability to adapt to new environments, ability to outcompete native species, and proven invasiveness outside of its native range.

The Service finds the European perch to be injurious to agriculture and to wildlife and wildlife resources of the United States because the European perch:

- is likely to escape or be released into the wild;
- is able to survive and establish outside of its native range;
- is successful at spreading its range;
- has negative impacts of competition, predation, and disease transmission on native wildlife (including endangered and threatened species);
- has negative impacts on humans by reducing wildlife diversity and the benefits that nature provides; and
• has negative impacts on agriculture by affecting aquaculture.
In addition, preventing, eradicating, or reducing established populations of the European perch, controlling its spread to new locations, or recovering ecosystems affected by this species would be difficult.

**Zander**

The zander is highly likely to survive in the United States. This fish species prefers a temperate climate and has a current range (native and nonnative) throughout Europe, Asia, and northern Africa. In the United States, the zander has a high climate match to the Great Lakes region, northern Plains, western mountain States, and Pacific Northwest. Medium climate matches extend from southern Alaska, western mountain States, central Plains, and mid-Atlantic, and New England regions. If introduced, the zander is likely to establish and spread due to its nature as a generalist predator, ability to hybridize with other fish species, extraordinary mobility, long lifespan, and proven invasiveness outside of its native range.

The Service finds the zander to be injurious to agriculture and to wildlife and wildlife resources of the United States because the zander:
• Is likely to escape or be released into the wild;
• Is able to survive and establish outside of its native range;
• Is successful at spreading its range;
• Has negative impacts of competition, predation, parasite transmission, and hybridization with native wildlife (including endangered and threatened species);
• Has negative impacts on humans by reducing wildlife diversity and the benefits that nature provides; and
• Has negative impacts on agriculture by affecting aquaculture.
In addition, preventing, eradicating, or reducing established populations of the zander, controlling its spread to new locations, or recovering ecosystems affected by this species would be difficult.

**Wels Catfish**

The wels catfish is highly likely to survive in the United States. This fish species prefers a temperate climate and has a current range (native and nonnative) throughout Europe, Asia, and northern Africa. This fish species has a high climate match to much of the United States. Very high climate matches occur in the Great Lakes region, western mountain States, and the West Coast. If introduced, the wels catfish is likely to establish and spread due to its traits as a generalist predator, quick growth rate, long lifespan, high reproductive potential, adaptability to new environments, and proven invasiveness outside of its native range.

The Service finds the wels catfish to be injurious to agriculture and to wildlife and wildlife resources of the United States because the wels catfish:
• Is likely to escape or be released into the wild;
• Is able to survive and establish outside of its native range;
• Is successful at spreading its range;
• Has negative impacts of competition, predation, disease transmission, and habitat alteration on native wildlife (including endangered and threatened species);
• Has negative impacts on humans by reducing wildlife diversity and the benefits that nature provides; and
• Has negative impacts on agriculture by affecting aquaculture.
In addition, preventing, eradicating, or reducing established populations of the wels catfish, controlling its spread to new locations, or recovering ecosystems affected by this species would be difficult.

**Common Yabby**

The common yabby is highly likely to survive in the United States. This crustacean species prefers a subtropical climate and has a current range (native and nonnative) that extends to Australia, Europe, China, South Africa, and Zambia. The common yabby has a high climate match to the eastern United States, Texas, and parts of Washington. If introduced, the common yabby is likely to establish and spread due to its traits as a diet generalist, quick growth rate, high reproductive potential, and proven invasiveness outside of its native range.

The Service finds the common yabby to be injurious to the interests of agriculture, and to wildlife and the wildlife resources of the United States because the common yabby:
• Is likely to escape or be released into the wild;
• Is able to survive and establish outside of its native range;
• Is successful at spreading its range;
• Has negative impacts of competition, predation, and disease transmission on native wildlife (including endangered and threatened species);
• Has negative impacts on humans by reducing wildlife diversity and the benefits that nature provides; and
• Has negative impacts on agriculture by affecting aquaculture.
In addition, preventing, eradicating, or reducing established populations of the common yabby, controlling its spread to new locations, or recovering ecosystems affected by this species would be difficult.

**Summary of Injurious Wildlife Factors**

Based on the Service’s evaluation of the criteria for injuriousness, substantive information we received during the public comment period and from the peer reviewers, along with other available information regarding the 11 species, the Service concludes that all 11 species should be added to the list of injurious species under the Lacey Act.

The Service used the injurious wildlife evaluation criteria (see Injurious Wildlife Evaluation Criteria) and found that all 11 species are injurious to wildlife and wildlife resources of the United States and 10 are injurious to agriculture. Because all 11 species are injurious, the Service is adding these 11 species to the list of injurious wildlife under the Act. Table 2 shows a summary of the evaluation criteria for the 11 species.

### Summary of Comments Received on the Proposed Rule

**Peer Review Summary**

In accordance with peer review guidance of the Office of Management and Budget “Final Information Quality Bulletin for Peer Review,” released December 16, 2004 (OMB 2004), and Service guidance, we solicited expert opinion on information contained in the October 30, 2015 (80 FR 67026), proposed rule for 11 species and supplemental documents from knowledgeable individuals selected from specialists in the relevant taxonomic group and ecologists with scientific expertise that includes familiarity with one or more of the disciplines of invasive species biology, invasive species risk assessment, aquatic species biology, aquaculture, and fisheries. In 2015, we posted our peer review plan on the Service’s Headquarters Science Applications Web site (http://www.fws.gov/science/peer_review_agenda.html), explaining the peer review process and providing the public with an opportunity to comment on the peer review plan. We received no comments regarding the peer review plan. The Service solicited independent scientific reviewers who submitted individual comments in written form. We avoided using individuals who might have strong support for or opposition to the subject and individuals who were likely to experience personal gain or loss (such as financial or prestige) because of the Service’s decision. Department of the Interior employees were not used as peer reviewers.

We received responses from the three peer reviewers we solicited:

- All three answered “yes” to the following two questions of a general nature that we posed to them: Did the Service provide an accurate and adequate review and analysis of the potential effects from the 11 species as categorized under the injurious wildlife evaluation criteria? Is the Service’s analysis of the criteria logical and supported by evidence?

  - The three reviewers also answered “yes” to the following two questions with one reviewer having one or more comments on each: Does the science used and assumptions made support the conclusions? Did the Service cite necessary and pertinent literature to support their scientific analyses?

  - Finally, two reviewers answered “yes” to these two questions, while one answered “no” and provided comments: Are the uncertainties and assumptions clearly identified and characterized? Are the potential implications of the uncertainties for the technical conclusions clearly identified?

We also requested that the reviewers provide comments that were specific to the proposed rule, the economic analysis, and the environmental assessment. We reviewed all comments for substantive issues and any new information they provided. We consolidated the comments and responses into key issues in this section. We provided comments and responses specifically regarding the environmental assessment at the end of the final environmental assessment. We revised the final rule, economic analysis, and environmental assessment to reflect peer reviewer comments and new scientific information where appropriate.

**Peer Review Comments—General (Some Also Apply to the Environmental Assessment)**

(PR1) Comment: Selection for 11 freshwater animals is directly related to ERSS output, which is detailed and defensible. However, several other species meet the same criteria as those selected. Was there other criteria used to select the 11 species for this proposed rule? Based upon these criteria, I would expect to see many other fish species proposed for listing as Injurious Wildlife Species.

Our Response: We agree that other species are high risk that we did not evaluate in this rule. Because of the amount of work required to evaluate each species and prepare the documentation, we are not able to evaluate all the species at one time. We chose many species in this rule because of their risk to the Great Lakes region and Mississippi River Basin, which face a widespread ecosystem crisis if native aquatic populations collapse due to invasions of nonnative fish, mollusks, or crustaceans, as well as a corresponding economic crisis if the commercial fishing industries collapse due to the same. We plan to evaluate and then propose for injurious listing more of the high-risk species as appropriate and as our resources allow.

(PR2) Comment: What significant impact could crucian carp have in the United States? Hybridization with nonnatives, such as goldfish and common carp, may not be concerning to resource managers. Increased turbidity is a negative impact, but habitat types that these fish could live in likely have highly turbid water currently. The largest concern and the one that makes me support listing this species is the documented movement of these fish as hitchhikers in fish shipments.

Our Response: The crucian carp possesses many of the strongest traits for invasiveness. It is a temperate-climate species, so it has a high climate match in much of the United States, and it is adaptable to different environments. The species is capable of securing a wide range of food, such as plankton, benthic invertebrates, and plants. With this varied diet, crucian carp would
directly compete with numerous native species. Habitat degradation is projected to be high, with the greatest degradation in lakes, rivers, and streams with soft bottom sediments. Reduced light levels in habitats with submerged aquatic vegetation would probably cause major alterations in habitat. Infected crucian carp may spread SVC to cultured fish stocks or other cyprinids in U.S. waters (ERSR 2014 Crucian carp). We summarized these threats in the draft environmental assessment (under the Direct Effects section of Environmental Consequences for the No Action alternative). The ability of crucian carp to hybridize with other cyprinids may be more of a threat to aquacultured fish than to native fish, but we also consider that possibility. Because of these combined threats we consider the crucian carp as injurious.

*(PR3) Comment:* It should be mentioned that the Prussian carp is similar to the crucian carp and they are also known to hybridize. Such a situation creates added problems, so listing both under the Lacey Act reduces confusion with regulations or prohibitions.

**Our Response:** Prussian carp are closely related to crucian carp and goldfish, and it is likely that they also would hybridize with closely related species if given the opportunity. One paper that documents *Carassius* hybridization discovered that the species identified as gibel (or Prussian) carp were really crucian carp (Hanfling and Harley 2003). We are listing the Prussian carp for other threats, and while the listing of both species may indeed reduce confusion with regulations, that is not a criteria for listing.

*(PR4) Comment:* A more recent paper on the Amur sleeper that includes mention of its introduction in more countries than listed in the draft environmental assessment is Reshetnikov and Schliewen (2013).

**Our Response:** We have incorporated into the rule and the final environmental assessment the information of the additional countries and spread from Reshetnikov and Schliewen (2013).

*(PR5) Comment:* Regarding LEMIS (LEMIS 2016) import records (which are used in the economic analysis), based on my own research some species recorded as being imported are wrongly identified. Some of the 11 species targeted here for Lacey Act listing may be coming into this country from foreign sources but identified under an incorrect name. It would be worthwhile to mention which of the species have the greatest chance of being misidentified.

**Our Response:** We agree that many species of fish, including some we are listing with this final rule, are similar in appearance to others and could be misidentified on import. This could mean that a species listed as injurious by this rule is imported under a name of a species that is not regulated. For example, Crucian and Prussian carp could be mistaken for goldfish. In fact, one commenter noted a case where crucian carp were advertised for sale in Chicago’s Chinatown, but they were live goldfish. Nile perch is similar to barramundi (*Lates calcarifer*). The Eurasian minnow superficially resembles many other cyprinids or minnows, as do the stone moroko and the roach. Small wels catfish may be mistaken for walking catfish (*Clarias* spp.). The Amur sleeper may be confused with other species of its own family, as well as many species in the families Eleotridae and Gobiidae. There are more than 30 species in the genus *Clarias* and they have similar descriptions. This comment was made regarding the draft economic analysis, and therefore, we looked at the effect of misidentifications on the economic results. However, the total numbers of imports of any of the 11 species were so small that misidentification is likely insignificant for the economic impact. With regard to the listing effectiveness, there will be an increased risk that a species will be introduced, established, and spread if an injurious species is misidentified and brought into the U.S. or transported across State lines. Finally, the fact that a species we are evaluating for listing resembles another species (listed or not) does not affect our final determination. Under the Lacey Act, we do not have the authority to list a species due to the similarity of appearance.

*(PR6) Comment:* It is the responsibility of the authors to provide clear documentation regarding the biology and known or potential impacts of these species. I went to one link that took me to a home page (www.cabi.org/isc), and I had to search for the paper. At a minimum, a link should go directly to the Web site that provides the supporting information. I prefer citations of peer-reviewed scientific journal articles or books. The only reason to cite a web source is if the information is not provided in any published source.

**Our Response:** The Service has been searching for several years for a more efficient method to locate information that was not published by Americans or English-speaking authors (and, thus, not easy for the Service to locate) on species that are not native to the United States. Papers may be published in journals and reports around the world and in many languages. One organization, CAB International (CABI), has helped solve this problem for us and others by soliciting an expert to prepare a full datasheet (report) on a particular invasive species. This expert gathers the available papers internationally; CABI will professionally translate relevant papers. The resulting datasheet is reviewed by three other experts. Then CABI makes the datasheet accessible worldwide at no cost at http://www.cabi.org/isc. We used the full datasheets on all 11 species for basic information and for leads to find primary sources. We did verify with the primary sources that we were able to locate and that were in English. We provided the direct links to all 11 of the CABI datasheets to the peer reviewers. In the Draft Environmental Assessment, we provided the link to the CABI Web site, but we will link directly to the species for the final rule. Although we are not required to provide links to all of the sources we use, we provided a list of references on www.regulations.gov for this docket (FWS–HQ–FAC–2013–0095). We also must maintain a copy of each source for our records.

*(PR7) Comment:* Two reviewers noted that the economic analysis was redundant with the environmental assessment. One suggested that the economic analysis was unnecessary because of the lack of quantitative information.

**Our Response:** The economic analysis is a stand-alone document developed to support determinations that are required for this rulemaking. The analysis addresses specific topics required by Executive Order 12866, the Small Business Regulatory Enforcement Fairness Act (SBREFA), and other mandates. We prepared the environmental assessment in accordance with the criteria of the National Environmental Policy Act (NEPA; 42 U.S.C. 4321 et seq.). The two documents have different purposes, but the findings are based on some of the same information. The economic analysis interprets the impacts in terms of benefit-cost analysis and economic welfare measures. The environmental assessment describes impacts on the human environment from the listing action and other alternatives. At this time, the actual injury to the United States from these species is minimal, if any, so only a qualitative discussion is possible.

*(PR6) Comment:* Some sentences are convoluted, and a few are potentially
misleading. Clarity could be improved by simply writing more concisely and breaking up larger sentences.

Our Response: The commenter gave no specific examples, but we have strived to improve the clarity of our sentences in the rule and supplemental documents.

(PR9) Comment: Although not a major problem, it should be noted that more and more ichthyologists and fish biologists capitalize the common names of fishes.

Our Response: The Service chooses to capitalize only the proper names used to name species in rulemaking documents, as we do for all other classes of animals.

(PR10) Comment: The wels catfish is a large catfish. Its adult and maximum size should be emphasized, since it is a predator with a very large mouth. The subsection relating to potential harm to humans borders on sensationalism. Neither of the supporting citations are scientific publications.

Our Response: We can find no scientific documentation of human attacks. However, we mention the species’ potentially giant size, large mouth, predatory nature, and ability to beach itself and then return to the water as traits that collectively provide the means to harm humans. While we mention the anecdotal reports, we have no documentation to confirm harm to humans and thus do not consider wels catfish injurious to humans.

Peer Review Comments—Ecological Risk Screening Summaries

(PR11) Comment: A reviewer expressed difficulty in finding more information in the rule and supplemental documents regarding the rapid screening (ERSS) method. The reviewer located the standard operating procedures for the rapid screening as cited in the draft environmental assessment but found it not sufficiently informative. For example, the 16 climate variables were not explained. The authors should explain what a Climate 6 ratio is.

Our Response: We have added the 16 climate variables in Table 1 under the heading “Rapid Screening” above, as well as other information on the rapid screening method, particularly on climate matching (Climate 6 ratio). In addition, we revised the “Standard Operating Procedures: Rapid Screening of Species Risk of Establishment and Impact in the U.S.” (USFWS 2014) to be more complete and comprehensible (USFWS 2016).

(PR12) Comment: The authors cite Bomford (2008) with regard to climate match. Did they use the adjustments Bomford mentions for evaluating fish or aquatic organisms?

Our Response: We assume that the reviewer is talking about Bomford’s algorithm for Australia (Bomford 2008). We did not use that algorithm, which includes the raw Climate 6 score, along with other factors. Instead, we use only the Climate 6 score, which Bomford said was shown to be the best predictor of success of introduction (Howeth et al. 2016).

(PR13) Comment: It would be worthwhile to mention for any of the 11 species which native species are most closely related or similar and thus may be impacted or even replaced.

Our Response: A species does not need to be closely related or similar to affect or even replace another. However, in response to this comment, we have added relevant information in the rule and in the environmental assessment wherever we had such information available.

Public Comments Summary

We reviewed all 20 comments we received during the 60-day public comment period (80 FR 67026; October 30, 2015) for substantive issues and new information regarding the proposed designation of the 11 species as injurious wildlife.

We received comments from State agencies, regional and U.S.–Canada governmental alliances, commercial businesses, industry associations, conservation organizations, nongovernmental organizations, and private citizens. One comment came from Zambia, and two were anonymous. Comments received provided a range of opinions on the proposed listing: (1) Unequivocal support for the listing with no additional information included; (2) unequivocal support for the listing with additional information provided; (3) equivocal support for the listing with or without additional information included; and (4) unequivocal opposition to the listing with additional information included. One comment was about an unrelated subject and beyond the scope of this rulemaking.

We received public comments specifically on the rule, but no comments specifically addressing the environmental assessment or the economic analysis. Some commenters addressed the eight questions we posed in the proposed rule. We consolidated comments and responses into key issues in this section.

Public Comments—General

(1) Comment: Comments from several alliances and governmental organizations representing the Great Lakes States and the Canadian Province of Ontario strongly support the listing of the 11 species. In addition, the States of Michigan and New York also support the listing as proposed. New York DEC states, “A unified approach between state, regional and federal actions is the most effective way to protect the Great Lakes Basin from AIS.” The State of Louisiana also supports the listing.

Our Response: The Service appreciates the affirmation that listing the 11 species will benefit these widespread and cross-border jurisdictions.

(2) Comment: A representative of public zoos and aquaria requests to continue working with the Service’s permitting office to ensure that members can obtain injurious wildlife permits for educational and scientific purposes in a timely fashion for these species.

Our Response: The Service will continue to work with this organization and others in the permitting process for educational and scientific purposes, and in accordance with our regulations, as we have in the past.

(3) Comment: A commenter suggests more information could be provided on the level of additional assessment beyond the ERSS report that is required for a national management action, such as injurious wildlife listing. For example, a strong and explicit risk management component, particularly one involving stakeholders, is lacking.

Our Response: Injurious wildlife listing is a regulatory action (adds to or changes an existing regulation). The Service’s regulatory decision is based on our injurious wildlife listing criteria, which include components of risk assessment and risk management. By using these criteria, the Service evaluates factors that contribute to or remove the likelihood of a species becoming injurious to the interests identified under 18 U.S.C. 42.

(4) Comment: A commenter requests additional explanation of the types of species that warrant injurious species listing be added to the Service’s Web site with careful evaluation of the proposed criteria to avoid the potential to set unwarranted precedent or generate other unintended consequences.

Our Response: The types of species we may list as injurious under our authority are wild mammals, wild birds, fish, mollusks, crustaceans, amphibians, reptiles, and the offspring, eggs, or hybrids of any of the aforementioned, which are injurious to human beings, to the interests of agriculture, horticulture, forestry, or to the wildlife or wildlife resources of the United States. The Service uses its Injurious Wildlife...
Evaluation Criteria to evaluate whether a species does or does not qualify as injurious under the Act. This information is posted on [http://www.fws.gov/injuriouswildlife/index.html](http://www.fws.gov/injuriouswildlife/index.html).

(5) Comment: A commenter states that many regulations involving aquatic species already exist with individual States. The State of Florida, for example, has been conducting risk assessments on species of concern for decades. These studies have produced significant data that may be useful in the Federal process.

Our Response: The Service welcomes any such risk assessment from the States. The public comment period is an excellent time to submit such documents because the information can be used to develop the final rule. However, we received no risk assessments for the 11 species during this public comment period.

(6) Comment: A commenter states that the barred zander was selected for aquaculture in Iowa, Florida, and Massachusetts despite being a high-risk species as defined in the “Generic Nonindigenous Aquatic Organisms Risk Analysis Review Process” (ANSTF 1996). They justified this action by explaining that the species is a sustainable seafood choice and that the production facilities must be indoors. The organization offers assistance to the Service to obtain information for other species that could be cultured in the United States.

Our Response: The Service understands the need for the aquaculture industry to provide sustainable seafood choices. The species mentioned in the comment is not one of the proposed species and will not be affected by this final rule. We selected the 11 proposed species because they were high-risk for invasiveness and because they are not yet cultured in the United States or, in the case of the Nile perch (a relative of the barramundi), in very limited culture. Therefore, the economic effect on the industry would be negligible if any. We developed the ERSS process to assist the industry with selecting species for culturing that are low-risk to the environment, and we encourage any entity that has a need to import a species not yet commonly in U.S. trade to select low-risk species to help avoid unforeseen consequences.

(7) Comment: The Service recently sought public comment on changes to the procedures used by the public to develop and submit petitions to list species under the authority granted by the Endangered Species Act. A proposed change was to require a petitioner to identify and evaluate State regulations and programs that protect and conserve species within their boundaries for the explicit purpose of providing information that encompasses Federal, State and private conservation efforts. We recommend that the Service adopt a similar approach in evaluating nonnative species risk.

Our Response: None of the 11 species in the proposed rule was petitioned for listing, so this comment is beyond the scope of this rulemaking. In general, the public, including State agencies, can submit this type of information during the public comment period. We posed several questions in our proposed rule that seek this type of information, including:

1. What regulations does your State or Territory have pertaining to the use, possession, sale, transport, or production of any of the 11 species in this proposed rule? What are relevant Federal, State, or local rules that may duplicate, overlap, or conflict with the proposed Federal regulation?
2. What would it cost to eradicate individuals or populations of any of the 11 species, or similar species, if found in the United States? What methods are effective?
3. What State-protected species would be adversely affected by the introduction of any of the 11 species?
4. How could the proposed rule be modified to reduce any costs or burdens for small entities consistent with the Service’s requirements?

Public Comments—Ecological Risk Screening Summaries

(8) Comment: Two State agencies commented that they utilized the Service’s ERSSs for supporting information to assist them in developing restrictions on potentially invasive species.

- With support from Michigan’s Governor, Rick Snyder, and the Michigan Legislature, Public Act 537 of 2014 was passed requiring the development of a permitted species list in Michigan. Additionally, this public act requires the review of all species that the Service lists as an injurious wildlife species. Four of the 11 species proposed as injurious are currently listed as prohibited in Michigan (stone moroko, zander, wels catfish, and the common yabby). If all 11 species proposed are approved for listing as injurious, Michigan will respond by reviewing the 7 species not currently regulated in Michigan to consider a prohibition or restriction.
- New York State Department of Environmental Conservation’s invasive species experts reviewed 25 of the 63 high-risk species identified by the Service during the assessment process as posing an ecological risk to New York State. Many of these species were included on the 6 NYCCR Part 575 list, Prohibited and Regulated Invasive Species, which became effective March 2015. NYDEC plans to evaluate the remaining high-risk species identified by the Service for future updates to the regulations.

Our Response: We are pleased that our efforts to produce the ERSSs are specifically useful to the States of Michigan and New York.

(9) Comment: A commenter understood that the [ERSS](http://www.fws.gov/fisheries/ANS/species_erss.html) methodology would be directed at species not in trade.

Our Response: The ERSSs were not intended to be specifically for species not in trade. We do not often know whether a species is in trade or not in trade at the time the ERSS is prepared; that information is discovered during the rapid screening process itself. We posted the purpose and use of the ERSSs in late 2012 in several places on the Service’s public Web site, such as:

- The Invasive Species Prevention page ([http://www.fws.gov/injuriouswildlife/Injurious_prevention.html](http://www.fws.gov/injuriouswildlife/Injurious_prevention.html)) has been continuously available since December 2012 and states that “Some species that we assess may already be in trade in the United States but are considered low risk because they have not become invasive over a long period. Others may be in trade and we do not have enough information to know whether they have become invasive (these would likely be uncertain risk). In addition, due to the large number of species in trade, some species may be in trade in this country that we do not know are in trade. Thus, we are seeking information from the public as to what species are in trade or are otherwise present in the United States.”
- The [Species Ecological Risk Screening Summaries page ([http://www.fws.gov/fisheries/ANS/species_erss.html](http://www.fws.gov/fisheries/ANS/species_erss.html))](http://www.fws.gov/fisheries/ANS/species_erss.html) was posted on November 2, 2015, and gives more examples of ERSSs of species already in trade in the United States, so that an agency from an
as-yet unaffected State may determine if the climate match would support that agency taking restrictive action. Those examples also show species that are low risk because they have been in U.S. trade for decades and have not established.

(10) Comment: Several commenters stated that a Federal regulatory decision should not be solely based on the ERSS model.

Our Response: We agree, and our determinations are based on more than the ERSS reports. Our determinations are based on the ERSS reports, the Service’s evaluation of the criteria for injuriousness, substantive information we received during the public comment period and from the peer reviewers, along with other available information regarding the 11 species. We stated in the proposed rule under “How the 11 Species Were Selected for Consideration as Injurious Species” (80 FR 67027; October 30, 2015) that “[t]he Service selected 11 species with a rapid screen result of “high risk” to consider for listing as injurious,” explaining how we prioritized which species to evaluate further. Only species with high-risk conclusions from ERSSs were considered for further evaluation in this rulemaking. In our proposed rule, we further explained how we got the information that we used for our determination (80 FR 67030; October 30, 2015): “We obtained our information on a species’ biology, history of invasiveness, and climate matching from a variety of sources, including the U.S. Geological Survey Nonindigenous Aquatic Species (NAS) database, Centre for Agricultural Bioscience International’s Invasive Species Compendium (CABI ISIC), ERSS reports, and primary literature * * *. The Service contracted with CABI for many of the species-specific datasheets that we used in preparation of this proposed rule. The datasheets were prepared by world experts on the species, and each datasheet was reviewed by expert peer reviewers. The datasheets served as sources of compiled information that allowed us to prepare this proposed rule efficiently.”

We further explained how we used the compiled information in the evaluation process that we developed specifically for evaluating species for listing as injurious (80 FR 67039; October 30, 2015; see “Injurious Wildlife Evaluation Criteria”) and have used for previous rules. We used primary literature extensively, and those sources are cited in the proposed rule and listed in the supporting document “References for Proposed Rule of 11 Species” posted on www.regulations.gov.

(11) Comment: Clear errors are present in many of the ERSS reports regarding climate matching, especially for tropical species (the commenter gives the examples of the guppy (Poecilia reticulata) and the black acara (Gichlasoma bimaculatum)). Taking database information at face value, while often done during rapid screens, is clearly not appropriate for a risk analysis that would support national regulatory decisions.

Our Response: The ERSS process is a risk screening process that is designed to be quick and simple. Data are reviewed and compiled to help us decide whether a species should be evaluated more closely. We acknowledge that an ERSS may miss or misinterpret data on a species being assessed. We agree that, for national regulatory decisions, we should not take rapid screen information at face value only. That is why we use many other sources of information for the subsequent injurious evaluation utilizing our injurious wildlife listing criteria. These results are published in our rules and often utilize additional sources of information that may rectify any errors in the ERSS.

(12) Comment: The ERSS tool has a methodological bias to return an overall high-risk assignment due to the combination of history of invasion and climate match, while there is only one combination that will result in a low-risk designation. With the ease of obtaining a medium climate match using this tool, this is an unacceptable precedent that could lead to proposed listings of numerous ornamental species that have been in production in Florida for decades and are vital to the Florida aquaculture industry.

Our Response: About 2,000 species have been assessed for risk using the ERSS approach; currently most are in draft needing final review. Only about 10 percent of those 2,000 species are characterized as high risk. Therefore, ERSS results are rarely characterizing species risk as high, even with either medium or high climate-match scores for the United States. Unlike some semi-quantitative scoring systems that characterize risk without climate mapping (such as Fish Invasiveness Screening Kit (FISK)), the ERSS system relies on climate-matching that gives a national score and maps the climate match for all U.S. States. Maps of climate match for species whose scores are medium show locations where climate permits. Thus, we do not rely only on climate scores. Instead, we rely on climate scores and maps that show locations where climate match is high. Also, the ERSS system is designed not to classify any species, regardless of the climate match score and associated category, as high risk without a scientifically defensible history of invasiveness. For example, the Nile perch is one of the 10 percent of species out of the 2,000 species that have been assessed as high. Although the climate match score for this species is medium, the climate match is high in portions of several U.S. jurisdictions.

An ERSS indicating a high risk for a species does not mean that the species will be listed as injurious wildlife. The ERSS is a way to prioritize species on which the Service should focus its regulatory, nonregulatory risk management, or management actions. The commenter is correct that a high history of invasiveness and a high climate match equals high risk, and that a high history of invasiveness and a medium climate match also equals high risk. The former is clearly reasonable. However, a high history of invasiveness and a medium climate match also produces a high overall risk because the climate match is conservative for two reasons. One is that factors other than climate may limit a species distribution in its native land, such as the existence of predators, diseases, and major terrain barriers that may not be present in the newly invaded land. Therefore, the areas at risk of invasion may span a climate range greater than that extracted mechanically from the native range boundaries (Roddia et al. 2011). The second reason is that protection of natural resources, especially when the effects of introduced species are disputed or unknown. Accepting the higher risk rating reflects a “precautionary” or conservative approach and counteracts the uncertainty often associated with biological invasions (ANSTF 1996).

The commenter’s concern about setting a precedent for ornamental species in production in Florida is unfounded because the ERSSs merely serve as a way for the Service to focus its limited resources and regulatory efforts on species at greatest risk of adversely affecting human beings, the interests of agriculture, horticulture, forestry, or wildlife, or the wildlife resources of the United States. We will continue to use more detailed risk analyses by utilizing the injurious wildlife listing criteria. These analyses can be found in this final rule.

(13) Comment: Although the Ecological Risk Screen Standard Operating Procedures have been reviewed by several experts in the field, some methodological issues could be
evaluated to improve the effectiveness of the tool. It is not clear if this tool has been thoroughly tested and validated using a wide range of species across a continuum of risk such as has been done with other risk screening tools (such as Fish Invasiveness Screening Kit (FISK)). For example, it is common to test and validate the method by answering the questions: What percentage of species considered invasive does the tool correctly identify as high risk, and what percentage of species that are not invasive does it correctly identify as low risk?

Our Response: The ERSS process is based on scientific literature and risk screening approaches, as well as peer review of those approaches per OMB policies for influential science. We also measured the approach in postdiction on a number of species, including bighead carps, grass carps, silver carps, green swordtails, and several species of snakeheads. Although we did not compile the postdiction testing into a final report, the positive results ultimately led to the Service developing the ERSS process. The practice of using history of invasiveness and climate match to determine risk has been validated in peer-reviewed studies over the years. The following are some examples: Kolar and Lodge (2002) found that discriminant analysis revealed that successful fishes in the establishment stage grow relatively faster, tolerated wider ranges of temperature and salinity, and were more likely to have a history of invasiveness than were failed fishes. Hayes and Barry (2008) found that climate and habitat match, history of successful invasion, and number of arriving and released individuals are consistently associated with successful establishment. Bomford (2003) recommended that, because a history of establishing exotic populations elsewhere is a significant predictor of establishment success for exotic mammals and birds introduced to Australia, this variable should be considered as a key factor when assessing the risk that other exotic species could establish there. Bomford et al. (2010) later found that “Relative to failed species, established species had better climate matches between the country where they were introduced and their geographic range elsewhere in the world. Established species were also more likely to have high establishment success rates elsewhere in the world.” Recently, Howeth et al. (2016) showed that climate match between a species’ native range and the Great Lakes region predicted establishment success with 75 to 81 percent accuracy.

(14) Comment: A commenter cites the risk assessment framework used by the U.S. Department of Agriculture–Animal and Plant Health Inspection Service–Plant Protection and Quarantine (USDA–APHIS–PPQ) for determining the risk of nonnative plants. The method and variants of it have been tested by many entities. Additional expert review and testing of the Service’s method as well as the generated ERSS reports would provide valuable information on the performance, uses, and limitations of Ecological Risk Screening.

Our Response: The Service has conducted its risk analysis (80 FR 67039; October 30, 2015; see “Injurious Wildlife Evaluation Criteria”) based on factors that are specific to injurious wildlife listing. The ERSSs are rapid screens and are used as a way to prioritize which species to evaluate further (see our response to Comment 10).

(15) Comment: A commenter opines that stakeholders from the public and private sectors with expertise in aquatic biology and ecology, natural resource management, biology, and aquaculture should further analyze screening results through a comprehensive regulatory risk analysis. The commenter also encourages the Service to have the ERSS reports reviewed by subject matter experts prior to their release and use in management decisions.

Our Response: Well before the publication of the proposed rule for these 11 species, this commenter had requested by letter to the Service in 2012 that the Service conduct peer review under the OMB Peer Review Guidelines (OMB 2004) on the ERSS process. We completed that peer review in 2013. No substantive changes were needed to the ERSS process. Because the ERSSs are rapid screens, we believe that having a good foundation for the process is sufficient, and that a detailed peer-review process of individual ERSSs is not required. These reports are also publically available, and comments can be submitted on individual reports at prevent_invasives@fws.gov.

Public Comments—Nile Perch

(16) Comment: Currently, Florida Department of Agriculture and Consumer Services (FDACS) has certified aquaculture facilities cultivating Nile perch (Lates niloticus). These farms are in compliance with current Federal and State laws. Listing L. niloticus as injurious species would not further prevent escapement of these species in Florida.

Our Response: The Service commends the State of Florida for exemplary regulations designed “to prevent the escape of all life stages of nonnative aquatic species into waters of the State” (quoted from the comment by FDACS, December 22, 2015). While we agree that Florida’s laws may indeed be sufficient to prevent escape of Nile perch into Florida’s ecosystems, the Service must look at a national scale to ensure that none of the 11 species is introduced into, becomes established, or spreads across the United States.

(17) Comment: There may be a substantial impact to the emerging food fish aquaculture industry in Florida by prohibiting the import and interstate movement of live Lates niloticus (Nile perch) or their gametes.

Our Response: Neither this commenter nor the other commenters that mentioned culturing of Nile perch in Florida stated how many facilities are currently raising Nile perch, how many Nile perch they raise, or their market value. In fact, the Florida Fish and Wildlife Conservation Commission stated in their public comment (December 29, 2015), “Food production in Florida is primarily limited to four species of tilapia * * * . The number of aquaculture facilities currently raising Nile perch is limited at this time.” Another commenter stated, “The Nile perch [Lates niloticus] is not cultured in the United States * * *.” A third commenter from Florida discussed the Nile perch ERSS at length but did not state whether Nile perch are currently being cultured in Florida or any State. We do note that live culturing will not be prohibited by this rulemaking nor will the transportation of dead Nile perch to other States. Export of live fish directly from a designated port in Florida will remain unaffected by this rulemaking as well.

(18) Comment: A commenter with a national focus states that Nile perch is not cultured in the United States, and a Federal rule effectively eliminates any opportunity to culture this species in regions where it has little or no chance of successfully surviving in the wild. Nile perch is already regulated in the States and regions of the nation where it might survive in nature, and, therefore, a Federal rule is redundant.

Our Response: The commenter did not provide information on what regulations currently exist or what States the commenter thinks species cannot survive in. In our internet search for regulations in southern tier States, we found these States regulate the Nile perch in some way: Mississippi (MDAC 2016), Arizona (AGFD 2013), and Texas (TPL 2016); these States apparently do not regulate Nile perch: Alabama (ADCNR 2015), California (CDFW 2013),
Georgia (Justia 2015; not confirmed), Hawaii (HDOA 2006), Louisiana (Louisiana 2015), and New Mexico (NMDFG 2010). Based on this information, we do not believe that this Federal rule is redundant.

(19) Comment: Several commenters disagree with our conclusion that the Nile perch is highly likely to survive in the United States and could successfully reproduce and thrive to yield similar ecological effects as those in Lake Victoria (Africa). The ERSS report and the analysis completed for the Federal Register notice for this species should be reviewed and revised. Another commenter stated that Nile perch is unlikely to survive outside of captivity in the United States except in warm areas, such as southern Florida, Hawaii, Puerto Rico, and more questionably interior portions of southern California. The ERSS report overestimates the climate match of this species to include the interior portions of southern California, Puerto Rico, and more questionably insular islands, as well as some southern States. We also note that some introduced species have defied the expected physiological tolerances, such as the red swamp crayfish, which is native to the Gulf coastal plain from New Mexico to the western panhandle of Florida and north through the southern Mississippi River drainage to southern Illinois. The species has been reported in Alaska, Washington, Maine, Michigan, Hawaii, and many other States (Nagy et al. 2016). As a generalization among taxa, introduced ranges often reflect a greater climatic range than was found in the native range because other dispersal barriers (biotic and abiotic) may be absent in the introduced range (Rodda et al. 2011).

(20) Comment: A commenter stated that the historic claims on our summary of the Nile perch, that it has decimated the species of East African lakes to extinction, are out of date and unproven and are more likely due to immigration of large numbers of people, causing deforestation, eutrophication, and pollution. Another commenter stated that many of the impacts to African lakes discussed in the Nile perch ERSS are confounded by other elements of environmental change and are highly unlikely to occur in the United States. Our Response: The former commenter gave no supporting documentation that is more recent and “proven” to show that Nile perch are not the cause of the changes in Lake Victoria. We looked for more recent studies than in our proposed rule and found that Gophen’s plankton and fish community study (2015) states, “The concept of the Nile Perch predation impact and its ecological implications is also confirmed by the elimination of the Haplochromines’s planktivory. * * * * The Lake Victoria ecosystem was unique included above [sic] 400 endemic species of Haplochromine fishes. The food web structure was naturally balanced during that time with short periods of anoxia in deep waters and dominance of diatomides algal species. Nile Perch (Lates niloticus) was introduced and during the 1980’s the became the dominant fish. The Haplochromine species were deleted and the whole ecosystem was modified. Algal assemblages were changed to Cyanobacteria, anoxia became more frequent and in shallower waters.” This statement supports, if not enhances, our claim that the Nile perch caused the local extinction of at least 200 haplochromine cichlid fish species, thereby altering the plankton balance. We do not dispute that other factors were also acting on the health of Lake Victoria in the last few decades, thus exacerbating the effects of losing so many native fishes. However, the fact that so many species’ local extirpation are directly linked to the Nile perch meets one of the injurious listing factors.

The latter commenter states that the elements of environmental change (referring to land use changes and cultural practices) are highly unlikely to occur in the United States. We agree with this statement but believe that the United States also has land use changes and cultural practices that may be different but that also lead to adverse ecological disturbance.

(21) Comment: The distribution of Nile Perch in its native and introduced range is primarily within the tropics of sub-Saharan Africa, a tropical equatorial rainforest climate zone, with the exception of the Nile River, which flows primarily through a hot, desert climate, and some East African lakes. The contiguous United States lacks the tropical equatorial rainforest zone. The commenter’s own CLIMATCH analysis indicated that almost none of the many stations distributed across tropical West Africa and the central tropics contributed to match in the United States.

Our Response: Climate match is not an exact predictor. Factors other than climate may limit a species’ native distribution, including the existence of predators, diseases, and other local factors (such as major terrain barriers), which may not be present when a species is released in a new country. Therefore, the areas at risk of invasion often span a climate range greater than that extracted mechanically from the native range boundaries. For example, an aquatic species that was historically confined to a small watershed may be able to thrive in larger, dissimilar watersheds if transported there. For the Nile perch, the historic range covers a large area of Africa, in countries from the western to the eastern coast and north to the Mediterranean Sea. Habitats include rivers and lakes of varying sizes and brackish as well as fresh water. In our methodology, we used a grid with a width of within 50 km (31 mi) of an occurrence are used in the analysis. We recognize that this is an unusual circumstance with the elevated plateau being located very close to the east African Rift Lakes and possibly skewing the results.

(22) Comment: The State of Texas stocked Nile perch in the late 1970s and early 1980s into reservoirs receiving heated effluents from power plants. At least two of the reservoirs were in southern Texas where the ERSS report gives no supporting documentation that the Nile perch caused the local extinction of at least 200 haplochromine cichlid fish species, thereby altering the plankton balance. We do not dispute that other factors were also acting on the health of Lake Victoria in the last few decades, thus exacerbating the effects of losing so many native fishes. However, the fact that so many species’ local extirpation are directly linked to the Nile perch meets one of the injurious listing factors.

Our Response: We mentioned the Nile perch stockings that took place in Texas in our proposed rule (80 FR 67033, October 30, 2015). To elaborate, the State of Texas stocked a mixture of approximately 70,000 larvae of *Lates* spp. (which could be *L. angustifrons*, *L. maria*, or *L. niloticus*) from 1978 to 1984 in one reservoir (Howells and Garrett 1992). Larvae are very susceptible to predation or changes in water chemistry. It is not surprising that they did not survive. Although there are many factors to consider, expected survivorship of stocked larvae is generally 0.1 percent to 0.001 percent (pers. comm., Gary Whelan, Program Manager, Michigan Department of Natural Resources). A mixture of 1,500 juvenile and adult *Lates* spp. was introduced to two reservoirs in Texas over 6 years (Howells and Garrett 1992).
When the State abandoned the project in 1985, the remaining 14 individuals (including 6 Nile perch) were stocked in a third reservoir with no public access. One was found dead in 1992 after a cold snap of 5–6 °C (Howells and Garrett 1992). The 14-year-old fish weighed approximately 27 kg (59.5 lb), up from 5.9 kg (13 lb) when released in 1985 (ibid.). This occurrence does not constitute establishment of the species, but it does show that with even a small number of individuals released, some can survive. We do not know why the larvae failed; there may be some other factor besides the water temperature of the artificial reservoir, such as water quality or food supply, or the larvae may have not been acclimated. As we stated in the proposed rule and again in this final rule (see Introduction Pathways for the 11 Species), propague pressure (the frequency of release events and the numbers of individuals released) is a major factor in the 11 species establishing in the wild by increasing the odds of both genders being released and finding mates and of those individuals being healthy, vigorous, and fit (able to leave behind reproducing offspring). Therefore, a larger propague pressure of Nile perch could be expected to have a higher chance of establishment.

(23) Comment: It is unclear why the original CLIMATCH in the ERSS for Nile Perch included Hawaii and Puerto Rico, regions that would increase the Climate 6 match, but did not include Alaska, a region that would decrease the match. The supplemental CLIMATCH map posted online subsequently has Alaska but was not used to determine climate match in the proposed rule. The other species on the proposed list were evaluated originally for the conterminous United States in their ERSS reports but had online supplemental maps including Alaska that were used for the climate match in the proposed rule.

Our Response: We are not clear why the commenter believes that the supplemental map was not used to determine climate match in the proposed rule. The original Climate 6 match in the ERSSs for all 11 species were run without Alaska for a different purpose. We ran the climate matches again with Alaska, because we needed to include all States (and we updated some information), and we used those scores in the proposed rule. We posted the revised maps in the docket on www.regulations.gov and on our Web site at http://www.fws.gov/injurious/list-1-tropical-freshwater-species.html. We utilized the other ERSS information because it was appropriate for our purpose. The Climate 6 score in the ERSS is 0.068. With Alaska added, the Climate 6 score is 0.038, which is lower as the commenter correctly predicted, and this score is what we used in the proposed and final rule.

(24) Comment: A commenter is concerned that the ERSS for Nile perch did not utilize more primary literature. Information mainly came from secondary or tertiary source databases that summarize information on Nile Perch, and that is what the listing is based on.

Our Response: The ERSSs are rapid screens that may use primary, secondary, or other literature. That setup serves the purpose of a rapid screen. The injurious wildlife evaluations are not based entirely on the ERSSs. The ERSSs are used as an initial filter for the Service to decide if a species warrants further evaluation. The Service uses that result to prioritize species that we should put through the subsequent injurious evaluation process. As we proceed through the injurious wildlife evaluation process, we do utilize primary literature to support our justification, as is evidenced by our citations and “Literature Cited 2015” reference list posted with the docket on www.regulations.gov. Through the injurious wildlife evaluation process, we theoretically could find a discrepancy with the ERSS that leads us to remove that species from evaluation for listing, but that situation did not happen with this rulemaking. The primary literature that we have used supports the ERSSs.

(25) Comment: A commenter has concerns with listing the Nile perch because it sets a potential precedent for listing tropical species, including important aquaculture and aquarium fishes.

Our Response: Nile perch would not be the first tropical-climate fish species in aquaculture or aquarium trade that the Service has listed as injurious. In 1969, we listed the entire family Claridae (34 FR 1930; November 29, 1969), which includes the walking catfish (Clarias batrachus) and the whitespotted clarias (C. fuscus), both of tropical origin and of food-source value. It is likely that others of the 100 species that we listed then also fell into that category, but the two mentioned were already in U.S. trade. More recently, we listed the entire family of snakeheads as injurious (67 FR 62193; October 4, 2002) (28 species at the time of listing). All snakeheads are assessed as food fish in their native lands, and many are valued as pets outside of their native lands. At least 10 snakehead species are of tropical origin (Courtenay and Williams 2004).

Public Comments—Zander

(26) Comment: The zander has existed and even exhibited limited natural reproduction and recruitment in Spiritwood Lake, ND, for over two decades, but it has hardly been injurious. No hybridization with walleye has been documented, and no negative impacts on native species have occurred. Given their preferred habitats, zanders would be more suited farther south in manmade, warm, turbid, eutrophic reservoirs prevalent across much of the Great Plains. If State fish and wildlife agencies want to provide quality fishing experiences, they could choose to import eggs and treat them for pathogens and create triploids to prevent natural reproduction.

Our Response: We use the term “injurious” specifically for species that have been through the injurious listing evaluation process in accordance with the Act. The commenter’s description of the zander in Spiritwood Lake not being injurious likely means the more common usage of “injurious” that no specific harms have been detected in that lake. However, the commenter states that the zander would be more suited to warmer waters across much of the Great Plains, and this statement supports our determination, assisted by the climate match, that the zander is likely to survive, become established, and spread if introduced across a large part of the United States.

Triploidy is used for control of other invasive species and for market production (such as farmed salmon), but it is risky as a tool for introducing an injurious species to new ecosystems. Because treatments to produce triploids seldom result in 100 percent triploid fish, each individual must be verified triploid before they can be stocked (Rottman et al. 1991). Some may be diploids and, therefore, able to reproduce. Also, triploid fish may grow larger because the energy normally needed for reproduction can be redirected to body growth (Tiwary et al. 2004). Larger growth, especially for a species that may live up to 20 to 24 years, could have a major negative effect on aquatic food webs. To our knowledge, triploidy in zanders has not been done, and we do not know if there are approved treatments for pathogens on zander eggs.

Public Comments—Yabby

(27) Comment: The proposed rule presents the yabby as a vector for crayfish plague (Aphanomyces astaci)
because the fungal disease has the potential to cause large-scale mortality of freshwater crayfish in Australia. This fungus is endemic to the United States, and crayfish native to the United States are carriers resistant to the disease. Because European crayfish are not resistant to the plague, it is not highly likely that the yabby will survive in the United States and very unlikely that the yabby poses an invasion risk to the United States.

Our Response: We noted in the proposed rule that the crayfish plague is not known to affect North American crayfish species. We acknowledged the plague’s potential role as a biological control of yabbies if the species does become invasive in the United States. We also mentioned other pathogens that yabbies can carry that are more likely to be problematic for native crayfish. If yabbies are introduced into ecosystems with native crayfish, it is possible that some individuals will succumb to the crayfish plague. However, yabbies that do not contract or succumb to the disease are likely to spread and establish due to the species’ traits of a general diet, quick growth rate, high reproductive potential, and proven invasiveness outside of its native range.

Because of the injuriousness of the species, we believe yabbies should be listed.

Required Determinations

Regulatory Planning and Review

Executive Order 12866 provides that the Office of Information and Regulatory Affairs (OIRA) in the Office of Management and Budget will review all significant rules. The Office of Information and Regulatory Affairs has determined that this rule is not significant.

Executive Order (E.O.) 13563 reaffirms the principles of E.O. 12866 while calling for improvements in the nation’s regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. The executive order directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. E.O. 13563 emphasizes further that the regulatory system must allow for public participation and an open exchange of ideas. We have developed this rule in a manner consistent with these principles.

Regulatory Flexibility Act

Under the Regulatory Flexibility Act (as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA) of 1996 (5 U.S.C. 601, et seq.), whenever a Federal agency is required to publish a notice of rulemaking for any proposed or final rule, it must prepare and make available for public comment a regulatory flexibility analysis that describes the effect of the rule on small entities (that is, small businesses, small organizations, and small government jurisdictions). However, no regulatory flexibility analysis is required if the head of an agency certifies that the rule would not have a significant economic impact on a substantial number of small entities (5 U.S.C. 605(b)).

The Service has determined that this final rule will not have a significant economic impact on a substantial number of small entities. Of the 11 species, only one population of one species (zander) is found in the wild in one lake in the United States. Of the 11 species, four (crucian carp, Nile perch, wels catfish, and yabby) have been imported in only small numbers since 2011; and seven species are not in U.S. trade. To our knowledge, the total number of importation events of those 4 species from 2011 to 2015 is 23, with a declared total value of $5,789.

Therefore, businesses derive little or no revenue from the sale of the 11 species, and the economic effect in the United States of this final rule is negligible for 4 species and nil for 7. The final economic analysis that the Service prepared supports this conclusion (USFWS Final Economic Analysis 2016). In addition, none of the species requires control efforts, and the rule would not impose any additional reporting or recordkeeping requirements. Therefore, we certify that this final rulemaking will not have a significant economic effect on a substantial number of small entities, as defined under the Regulatory Flexibility Act (5 U.S.C. 601 et seq.).

Unfunded Mandates Reform Act

The Unfunded Mandates Reform Act (2 U.S.C. 1501 et seq.) does not apply to this final rule since it would not produce a Federal mandate or have a significant or unique effect on State, local, or tribal governments or the private sector.

Takings

In accordance with E.O. 12630 (Government Actions and Interference with Constitutionally Protected Private Property Rights), the final rule does not have significant takings implications. Therefore, a takings implication assessment is not required since this rule would not impose significant requirements or limitations on private property use.

Federalism

In accordance with E.O. 13132 (Federalism), this final rule does not have significant federalism effects. A federalism summary impact statement is not required since this rule would not have substantial direct effects on the States, in the relationship between the Federal Government and the States, or on the distribution of power and responsibilities among the various levels of government.

Civil Justice Reform

In accordance with E.O. 12988, the Office of the Solicitor has determined that this final rule does not unduly burden the judicial system and meets the requirements of sections 3(a) and 3(b)(2) of the E.O. The rulemaking has been reviewed to eliminate drafting errors and ambiguity, was written to minimize litigation, provides a clear legal standard for affected conduct rather than a general standard, and promotes simplification and burden reduction.

Paperwork Reduction Act of 1995

This final rule does not contain any collections of information that require approval by OMB under the Paperwork Reduction Act of 1995 (44 U.S.C. 3501 et seq.). This final rule will not impose recordkeeping or reporting requirements on State or local governments, individuals, businesses, or organizations. We may not conduct or sponsor a person is not required to respond to a collection of information unless it displays a currently valid OMB control number.

National Environmental Policy Act

The Service has reviewed this final rule in accordance with the criteria of the National Environmental Policy Act (NEPA; 42 U.S.C. 4321 et seq.). Department of the Interior NEPA regulations (43 CFR part 46), and the Departmental Manual in 516 DM 8. This rulemaking action is being taken to protect the natural resources of the United States. A final environmental assessment and a finding of no significant impact (FONSI) have been prepared and are available for review by written request (see FOR FURTHER INFORMATION CONTACT) or at www.regulations.gov under Docket No. FWS-HQ-FAC–2013–0095. By adding the 11 species to the list of injurious
wildlife, the Service intends to prevent their introduction and establishment into the natural areas of the United States, thus having no significant impact on the human environment. The final environmental assessment was based on the proposed listing of the 11 species as injurious and was revised based on comments from peer reviewers and the public.

Government-to-Government Relationship With Tribes

In accordance with the President’s memorandum of April 29, 1994, Government-to-Government Relations with Native American Tribal Governments (59 FR 22951, E.O. 13175, and the Department of the Interior’s manual at 512 DM 2, we readily acknowledge our responsibility to communicate meaningfully with recognized Federal tribes on a government-to-government basis. In accordance with Secretarial Order 3206 of June 5, 1997 (American Indian Tribal Rights, Federal-Tribal Trust Responsibilities, and the Endangered Species Act), we readily acknowledge our responsibilities to work directly with tribes in developing programs for healthy ecosystems, to acknowledge that tribal lands are not subject to the same controls as Federal public lands, to remain sensitive to Indian culture, and to make information available to tribes. We have evaluated potential effects on federally recognized Indian tribes and have determined that there are no potential effects. This final rule involves the prevention of importation and interstate transport of 10 live fish species and 1 crayfish, as well as their gametes, viable eggs, or hybrids, that are not native to the United States. We are unaware of trade in these species by tribes as these species are not currently in U.S. trade, or they have been imported in only small numbers since 2011.

Effects on Energy

On May 18, 2001, the President issued Executive Order 13211 on regulations that significantly affect energy supply, distribution, or use. Executive Order 13211 requires agencies to prepare Statements of Energy Effects when undertaking certain actions. This final rule is not expected to affect energy supplies, distribution, or use. Therefore, this action is not a significant energy action and no Statement of Energy Effects is required.

Fish, Imports, Reporting and recordkeeping requirements, Transportation, Wildlife.

Final Regulation Promulgation

For the reasons discussed within the preamble, the U.S. Fish and Wildlife Service amends part 16, subchapter B of chapter I, title 50 of the Code of Federal Regulations, as follows:

PART 16—INJURIOUS WILDLIFE

1. The authority citation for part 16 continues to read as follows:

Authority: 18 U.S.C. 42.

2. Amend §16.13 by revising paragraph (a)(2)(v) and adding paragraphs (a)(2)(vi) through (x) to read as follows:

§16.13 Importation of live or dead fish, mollusks, and crustaceans, or their eggs.

(a) * * * (v) Any live fish, gametes, viable eggs, or hybrids of the following species in family Cyprinidae:

(A) Carassius carassius (crucian carp).
(B) Carassius gibelio (Prussian carp).
(C) Hypophthalmichthys harmandi (largescale silver carp).
(D) Hypophthalmichthys molitrix (silver carp).
(E) Hypophthalmichthys nobilis (bighead carp).
(F) Mylopharyngodon piceus (black carp).
(G) Phoxinus phoxinus (Eurasian minnow).
(H) Pseudorasbora parva (stone moroko).
(I) Rutilus rutilus (roach).
(ii) Any live fish, gametes, viable eggs, or hybrids of Lates niloticus (Nile perch), family Centropomidae.
(iii) Any live fish, gametes, viable eggs, or hybrids of Percottus glenii (Amur sleeper), family Odontobutidae.
(iv) Any live fish, gametes, viable eggs, or hybrids of the following species in family Percidae:

(A) Perca fluviatilis (European perch).
(B) Sander lucioperca (zander).
(ix) Any live fish, gametes, viable eggs, or hybrids of Silurus glanis (wels catfish), family Siluridae.
(x) Any live crustacean, gametes, viable eggs, or hybrids of Cherax destructor (common yabby), family Parastacidae.

* * * * * * *

Dated: September 13, 2016.

Karen Hyun,
Principal Deputy Assistant Secretary for Fish and Wildlife and Parks.

Federal Register / Vol. 81, No. 190 / Friday, September 30, 2016 / Rules and Regulations

### ELECTRONIC RESEARCH

#### World Wide Web

Full text of the daily Federal Register, CFR and other publications is located at: [www.fdsys.gov](http://www.fdsys.gov).

Federal Register information and research tools, including Public Inspection List, indexes, and Code of Federal Regulations are located at: [www.ofr.gov](http://www.ofr.gov).

#### E-mail

**FEDREGTOC** (Daily Federal Register Table of Contents Electronic Mailing List) is an open e-mail service that provides subscribers with a digital form of the Federal Register Table of Contents. The digital form of the Federal Register Table of Contents includes HTML and PDF links to the full text of each document.

To join or leave, go to [https://public.govdelivery.com/accounts/USGPO1FED/lists/publaws-l.html](https://public.govdelivery.com/accounts/USGPO1FED/lists/publaws-l.html). For subscription services that notifies subscribers of recently enacted laws, follow the instructions to join, leave, or manage your subscription.

**PENS** (Public Law Electronic Notification Service) is an e-mail service that notifies subscribers of recently enacted laws.

To subscribe, go to [http://listserv.gsa.gov/archives/publaws-l.html](http://listserv.gsa.gov/archives/publaws-l.html) and select *Join or leave the list* (or change settings); then follow the instructions.

**FEDREGTOC** and **PENS** are mailing lists only. We cannot respond to specific inquiries.

#### Reference questions

Send questions and comments about the Federal Register system to: foireg.info@nara.gov

The Federal Register staff cannot interpret specific documents or regulations.

#### CFR Checklist

Effective January 1, 2009, the CFR Checklist no longer appears in the Federal Register. This information can be found online at [http://bookstore.gpo.gov/](http://bookstore.gpo.gov/).

### FEDERAL REGISTER PAGES AND DATE, SEPTEMBER

<table>
<thead>

680..............................62850, 65615

*Editorial Note: Proclamation number 9494 will not be used because a proclamation number 9494 appeared on the Public Inspection List on Friday September 16, 2016, but was withdrawn by the issuing agency before publication in the Federal Register.
LIST OF PUBLIC LAWS

Note: No public bills which have become law were received by the Office of the Federal Register for inclusion in today's List of Public Laws.

Last List September 27, 2016

Public Laws Electronic Notification Service (PENS)

PENS is a free electronic mail notification service of newly enacted public laws. To subscribe, go to http://listserv.gsa.gov/archives/publaws-l.html

Note: This service is strictly for E-mail notification of new laws. The text of laws is not available through this service. PENS cannot respond to specific inquiries sent to this address.
